As to the ordinary diet at Aleppo, it consists of a considerable proportion of animal food, which is cut in small pieces and blended with rice, herbs, and strong sauces. The lower people live mostly on rice, but the, milk, new cheese, greens and summer fruits, with a very small proportion of mutton. Their ordinary bread is formed into flat cakes, and made of wheaten flour, not well fermented and ill baked. Leaves of a superior quality are framed over with the seeds of tamarind, or fenian flower. The Piahaw and Borjde are common dines. M. d'Arvieux remarks, that a greater quantity of fruit is consumed at Aleppo, than in any three cities in Europe of equal size. The butter brought to Aleppo is made of the milk of goats, cows, sheep, and buffaloes, and is churned in goat-skins, and thus brought to market. Coffee, without sugar or milk, is in use among people of all ranks; this is drank constantly after meals, and in all familiar visits presented with the pipe. It was introduced into Syria about the middle of the 16th century. See Coffee. Tobacco is smoked immediately by all the men, and by many of the women. Their tobacco is brought from different parts of Syria, particularly from Latakia, and is much milder than the American. See Tobacco. The tobacco pipes are made of the twigs of cherry-tree, almond, rose or jasmine, dexterously straightened and bored, in length from three to fix feet, and decorated with silver or gilt ornaments, with mouth-pieces of amber or ivory; the bowl is made of reddish clay and often changed. See Kalian and Margeell. The practice of taking snuff, though the Porte, about the year 1760, granted a monopoly for making and vending Rappee snuff at Aleppo, is much less common than that of smoking. The culion of taking opium is held at Aleppo almost equally scandalous with
with that of drinking wine, and is Practised by few openly, except by persons regardless of their reputation. The bagno, or hummus, is much referred to by persons of both sexes. The people of Aleppo in general lead a sedentary life. Dancing is not reckoned a genteel accomplishment for people of condition, and even among the vulgar it is seldom practised, unless by such as make it their trade. Chefs, and a kind of back-gammon, which they are paid to have learned from the Pagans, are played by both sexes. They have two other games unknown in England, called mansala and tab-waduk. The former is played by two persons, and the success depends chiefly on memory and a readiness in counting. The latter is a mixed game: the movement of the pins on the board being determined by calling four small flat sticks, on one side white and black on the other. They are particularly described by M. d'Arville and Nichilius. The Turks play merely for amusement; gaming being prohibited by the Koran. The natives of every denomination observe very regular hours. They rise with the sun, and are in bed between nine and ten at night. The women never appear in the street after it is dark. The coffee-houses, as we have before observed, are not frequented by persons of the first rank, but by all others indiscriminately. They are entertained by a band of music, a puppet-show, and a story-teller. The Alkappen have, in general, a correct ear, and are fond of music. The instrumental music is of two kinds: martial and loud, intended for the field, and the less solemn, adapted to the chamber. A band of music, belonging to the castle, smaller than that of the bazaar, performs regularly twice a day from the battlements; and the bazaar's band performs also twice a day in the court of the seraglio. The feasts of the natives, who are frugal in their domestic economy, have every appearance of plenty and hospitality; and all great entertainments are commonly attended by a set of buffoons, who are partly musicians, and others, who for hire assume the character of professed jesters.

The first class of the inhabitants of Aleppo consists of Turks, comprehending all Mahometans, and they amount according to Russell, to about 200,000. These are a mixed race, partly defended from those who inhabited the city before it was subdued by the emperor Selim in 1516; partly from such as came to settle in the new conquest, and from others drawn thither by commerce from most of the Ottoman provinces. They are united under the same government and belong to the sect of Sonnites. The merchants at Aleppo are numerous, and some of them are esteemed opulent. The trades are divided into different companies, under their respective masters, or sheiks or sheikhs. The mechanics are, in general, industrious and frugal; and the Alkappen possess the art of tent-making unrivalled; the tents for the sultan and great officers of the Porte being usually made in this city; and many hands are employed in the flax and cotton manufactures. The keffiyahs, or small mantles, in the city and suburbs, are inhabited by a considerable number of Arabs. These are called Bidowens or Bidowins, and the men are employed in various kinds of manual labour.

In the suburbs of Aleppo there are many families of Turkmans, who are a stout hardy people, chiefly employed in agriculture, or as camel drivers in the caravans; and there are also a great number of Kusdeens, who are similarly employed.

With regard to nuptial contracts and ceremonies at Aleppo, they are similar to those generally observed among the Turks. When a matrimonial engagement is projected, the proposal is intimated to the mother of the intended bride, and the relations on both sides proceed to make the necessary inquiries. If the result prove satisfactory, the young woman is formally demanded of her parents by the father of the young man. Substitutes are then appointed to stipulate the necessary conditions; and these proxies adjust the sum to be paid to the bride’s father, with other articles of the marriage contract. When the money is paid, the contract is regularly signed and sealed, and then the Cadi grants his licence for the marriage. About ten days before the wedding, the bride is invited by her female relations to the bagnio, and there she is entertained till the day preceding the marriage, when they proceed to apply the henna. At Aleppo it is customary for the father of the bride to make some addition to what is paid by the bridegroom, and to lay it out for the benefit of his daughter; but among the Bidowen inhabitants and in the villages, the father usually retains a part of what he received for his daughter; and in this respect they may be said to feel their daughters. This custom of purchasing wives is practised by all the oriental Christians, as well as the Turks, and appears from the sacred writings, to have been the ancient practice. Accordingly, among the Arabs, daughters constitute the riches of a family. On the nuptial day, the women go in procession from the bridegroom’s house to fetch the bride, who is brought home amidst the acclamations of the women, accompanied by her mother, and several other female relations. The procession is in the day time, and at Aleppo, they do not carry tapers, as some travellers have reported. On their arrival in the house, the remainder of the day is spent in feasting and music. When the bride, covered with a veil of red gauze, and dressed in her wedding garment, has been introduced to her husband, the relations withdraw, and continue feasting till morning; and the nuptial rejoicings last several days. The mother for the most part fiddles her child, unless prevented by incapacity, and the child is seldom kept at the breast less than two years, sometimes three or four; and the mother often fiddles during the whole time of pregnancy. During the first week the child is swaddled, and then dressed in clothes which are more loose and easy; and as soon as they are able, they are left at liberty to crawl about on the carpet. When children can support themselves, they are usually carried from side to side by the shoulders; and on being fagged with the expression used by Faizah, ch. V. v. 4, upon which bishop Lowth comments (Notes on Faizah, p. 258). In this latter part of a letter, literally that which is now used by the Arab women. The difference of carrying a child in the bosom or on the shoulder, referred to in the same passage, and noticed by Harmer (Obs. on Scripture, vol. ii. p. 366), must be owing to their different ages, without regard to sex.

In the funeral ceremonies practised at Aleppo, the women perform a conspicuous part. When a person is dangerously ill, one or two sheiks are employed to read portions of the Koran, and to pray by the bedside. At the approach of death, the attendants turn the face of the dying person towards the kebail, that is, towards Mecca. When he expires, the women in the chamber give the alarm, by shrieking as if they were distressed, and are soon joined by all the other females in the harem. This conclamation is termed the Wulwaly, and is so thrilling as to be heard, especially in the night, at a prodigious distance. Schultens in his Commentary on Job x. 15, (tom. i. p. 278), considers the Arabic Wulwaly as corresponding to the Hebrew טלע, and to the Greek πέτον, and πέτον, and he supposes that the former Greek word was applied in a joyful sense. However, the Arabic wulwaly is applicable only to distress and affliction, and seems to have a greater affinity to the latter term than to the former, which was commonly used by the Greeks on joyful occasions. See Mark, v. 38. Plutarch refers to this practice in his account of Pontius.
fainting on the day of Cæsar’s death, when herulia, ap-
predning that she was dead, waited over her. (Brutus, 
Oper. tom. i. 991.) We also learn from Cicero, (de legibus, 
lib. ii. oper. tom. iii. p. 221, ed. Olivet,) that the extrava-
gnant exclamations of women at funerals was prohibited by the 
twelve tables. See PRACTICE. In a few hours the corpse 
is prepared for interment by ablation, and by sprinkling all 
the natural passages with cotton, sprinkling parts of it with 
a powder composed of spikenard and other aromatic herbs, 
and wrapping it up in a cotton winding-sheet. Over the 
hair, at the head of which is fixed a baton, on which the 
man’s turban, or the attire of the female head, is placed, is 
thrown a black pall, and over this the bell wearing apparel of 
the deceased. The funeral procession is attended by 
the acquaintance and kindred of the deceased; a number of the 
flakes, some of whom incessantly repeat Ullah, Ullah, 
and others chant verder of the Koran; and one person is 
the chief mourner, who manifests her grief, real or fictitious, 
by the most extravagant and frantic cries and gestures.— 
Other mourners are sometimes hired, who, at intervals, join 
in the general wailery. A funeral service is performed by 
the imam in some neighbouring mosque, and the corpse is 
then deposited in the grave, in a reclining posture, with 
the head to the west, and the face turned towards Mecca. 
A handful of earth is then thrown by the imam, or chelk, 
after a funeral service, into the grave, which is also done 
by others who fland near, and at the same time pro-
nounce a short benediction; after which the grave is 
filled up. The funeral service in life among the Kürdese is very 
lasonic, and is as follows: “If thou hast taken away, thou 
shalt restore; if thou hast given, it shall be restored to thee; 
and if thou doubtest this, thou shalt now be convinced.” 
The funeral service, recited by the iman at the grave, is as 
follows: “O man! from earth thou wast at first created, 
and to the earth thou dost now return: this transitory 
shade being the first step of thy progress to the mansions of 
eternity. If, in thy actions in life, thou hast been ben- 
ificent, God will pardon thy transgressions; and if thou 
hast not, fill the mercy of God has no bounds. But re-
member what thou didst profess in this world, that God is 
thy Lord, and Mahomed thy prophet—and thy belief in 
all the prophets and apostles, and that God's forgivingness 
is amply extended.” The sepulchre is visited by the near 
relations on the third, seventh, and fortieth day after the 
interment: they also celebrate the anniversary: solemn 
prayers are offered at the tomb for the repose of the deca-
red, and victims and money are distributed to the poor. 
The tomb is beset by the women, in their visits, with 
flowers and aromatic herbs; and the wailery is repeated. 
The men make no alteration in their dres as a mode of 
mourning; but the women lay aside their jewels, dres in 
their plainest garments, and wear on the head an embroi-
dered handkerchief of a dusky brick-clay colour. They 
commonly mourn 3 months for a husband, and fix for a father. 

The governor of Aleppo is usually a vizir bahaw, or 
a bahaw with three tails; though sometimes the province is 
confessed on an inferior bahaw of two tails. He seldom 
remains in office for more than 12 months at a time, though 
the office may be renewed in the face person; and infiuences 
occur, in which he has been continued for several successive 
years. The regular revenue of the bahaw is barely suffi-
cient to defray two-thirds of his annual expenses, including 
the fums which he is obliged to remit to Contantinople, in 
order to secure the interest of friends at the Porte. To 
this circumstance is owing the nefarious practice of making 
avanias upon the people, or raising money by false pre-
tences, in order to supply the deficiency. According to M. 

Volney gives nearly the same account with d'Arvieux; but he men-
tions an intance of one bahaw, who, within 12 or 13 
years, raised, by extraordinary extortions, in 5 months, 
160,000 l. 

A cadi, or judge, appointed by the Porte for one year, 
is sent annually from Contantinople, who brings with him 
his principal officer. A deputy, called Nabi, sits in the outer 
court, to hear inferior caufes, while affairs of moment are 
decided by the cadi in perfon. There are three or four 
subordinate tribunals in different parts of the town, which 
are farmed of the cadi by certain effendees, who, under 
his authority, determine petty fuits; but from these an 
appeal lies to the superior court of the cadi, or the great 
Mahkamy, which is the name of the old palace, where he 
resides. The cadi has no established falary; but he finds 
means to raise a handsome revenue, though not merely 
from the legal perquisites of office, which, however, are 
very considerable. The mufiti is nominated annually by 
the Porte; and he gives a fitva, or an opinion upon all 
cases that are laid before him; for which his fee is little 
more than a fluffling. The nakub, or chief of the threeces 
or greenheads, is nominated at Contantinople, and either 
annually confirmed, or changed. He judges in particular 
cases, and to his tribunal the threeces are amenable. The 
moftali, formerly called difter-dar, is reckoned the second 
perfon of the city in the civil line, and is usually appointed 
by the Divan, a temporary governor on the demise of the 
bahaw, till orders are received from the Porte. He is far-
master-general of the land-tax, the customs, and the capita-
tion-tax; his influence is extensive; he is much courted by 
the agus or land-renters, as well as by the merchants; and 
he lives splendidly. Volney states the moftali’s annual farm 
at 46,000/. besides 4 or 5000/., which he is obliged to 
pay to the officers at the Porte. The bahaw, moftali, 
cadi, mutti, nakub, and fardar or aga of the janizaries 
are, by their offices, members of the Divan, or council. 
The janizaries of Aleppo are mostly perfons who live in a 
domestic manner, in the exercise of their respective trades. 
They have no pay, but being enrolled in one of the odas or 
chambers at Contantinople, they enjoy in time of peace 
several privileges and exemptions. In war-time they are 
liable to be called out, and are obliged to provide them-
seats with arms, and to march to the camp at their own 
expenoe, as they receive no regular pay till they arrive there. 
Out of thefe is formed a city guard, under the command 
of the fardar, who holds his appointment from the janizary 
aga of Contantinople. They have a peculiar dres, and the 
attendants of the fardar, when he appears abroad, as well 
as himself, are distingugished by particular turbans. 

These janizaries were formerly subject to regular exercie 
and discipline; but within the last 50 or 60 years, says 
Volney, there no longer remains the flight trace of their 
ancient good order. When the bahaw or pacha abuses his 
authority, they are always the first to crect the standard of 
petition. The Turkish government revenges itself, it is true, 
by ordering the most active mutineers to be tríangled; but, 
in the first opportunity, the janizaries create other chief-
as, and affairs return to their usual course. The pachas, thus 
thwarted, have taken foreign soldiery into their service, who 
have neither friends nor families in the country. There are
of two forts cavalry and infantry. The cavalry, who alone merit the name of soldiers, assume for this reason the appellation of Drusda or Delchi, and likewise that of Delibabes and Layed, from whence we have formed Levantis. Their arms are short sabres, pilguls, muskets, and lances. They wear a kind of felt cap, nine or ten inches high, without any projecting rim; and their saddles are made in the English manner. In the rest of their clothing and accoutrements, they resemble the Mamalukes. Indeed, they are more like banditti than soldiers, and frequently act as such. Almost all the cavalry in Syria are Turkmans, Curds or Caramanians, who, after exercising the occupation of robbers in their own country, seek employment and an asylum near the peron of the pacha; and they often lay waste the country and pilage the peasants by open force. The infantry are a corps in every respect inferior to the former. Within the last 50 or 60 years, the peasants of Tunis, Algiers, and Morocco, have, under the name of Mograbins, or Men of the West, fought employment in Syria and Egypt; and they compose the infantry of the pacha. Their whole accoutrements and baggage are confined to a rusty firelock, a large knife, a leathern bag, a cotton shirt, a pair of drawers, a red cap, and sometimes slippers. Their pay is about 10s. and 10l. per month, out of which they furnish themselves with arms and clothing; but they are maintained at the expense of the pacha. The pay of the cavalry is double, besides which each horseman has his horse and ration, which is a measure of chopped straw and 15 pounds of barley a day. These troops are divided by ranks or colours, consisting of about 10 men each, under the command of an aga, who reduces their number in order to parcel out their pay. The superior agas tolerate this abuse, and the pacha overlooks it for the sake of the emolument derived from this species of fraud.

On the demise of a bashaw, the mohabiti takes possession of his effects till a capugi-bashaw, from Constantinople, comes to receive them in the name of the sultan. The estates of merchants, and of other public persons, descends to the heirs, agreeably to established laws, which allow a certain portion only to be devised by will, and the cadis is supposed to see strict justice done to the heirs. The property of merchants, strangers, who die in the public khanes, is subject to the inspection and care of the mohabiti, who detains it till it is claimed by the legal heir.

Crimes of a capital kind are very rare at Aleppo. The usual capital punishments are hanging, beheading, strangling, and impaling. Janizaries are strangled, not with a bow-string, but by a cord put round the neck, and then twisted with a stick in the manner of a tourniquet. The bodies of all who are executed remain for some days exposed to public view. Theft is uncommon; when it occurs, it is sometimes punished by amputation of the hand, but more commonly with the ball-nosed, which is performed with rods about the size of a small walking-stick; and this is the usual punishment for offences of an inferior kind. Banishment to the island of Cyprus, and the maritime towns of Syria, is chiefly employed for removing turbulent members from the city or the divan.

The agas are those who chiefly farm the lands; and the peasants are entitled to one-third of the produce, from which they annually deduct a part of what may have been advanced by the aga to stock the farm, and also a certain proportion of the avanits, that are from time to time imposed on the villages. These peasants are simply clothed, indifferently lodged, and live chiefly on coarse bread, leban, or a preparation of milk, pulse, barley and melons; but seldom take animal food. However, habit and ignorance mitigate the rigour of their condition, which they bear with patience, exercising out of the scanty pittance of the fruits of their labour, a spirit of hospitality.

The Europeans, or Franks, as they are called, residing at Aleppo, are English, French, Venetian, Dutch, and Tucian, or Imperial subjects. The language in common use is the Italian. The English factory consists of a consul and 10 merchants, a chaplain, chancellor, physician, and an officer named a chauffe, who walks before the consul, carrying a staff tipped with silver, and takes care of all letters and dispatches. The number of English houses in 1772 was reduced to four, and in 1783 to two. There are two druggomans or interpreters, Greek natives of Aleppo, who speak the Italian, but can seldom read or write any other language, besides the Arabic and Turkish. They have salaries from the Levant Company. Two janizaries are also kept in constant pay, who attend at the house of the consul, and walk before him when he goes abroad. The French factory is more numerous than the English, each merchant having a clerk or writer, or a person under that title, who afterwards becomes a partner in the house. The residence of the French in the Levant is limited to a certain number of years, after which they are to return to France. They have salaries from the Levant Company. Two janizaries are also kept in constant pay, who attend in the consul's house, and walk before him when he goes abroad. The French factory is more numerous than the English, each merchant having a clerk or writer, or a person under that title, who afterwards becomes a partner in the house. The residence of the French in the Levant is limited to a certain number of years, after which they are to return to France. They have salaries from the Levant Company. Two janizaries are also kept in constant pay, who attend in the consul's house, and walk before him when he goes abroad.
private merchants without permission; the eulogium on goods is very favorably rated; and in all fruits at the marketplace, above the amount of an incon siderable sum, they have a right to decline the competency of the court, and to remove the cause to Conftantinople. In consequence of the regard publicly paid by the government to the Europeans, they are commonly treated with civility by people of all ranks.

The Christian inhabitants of Aleppo are said by Ruffell to amount to 57,000; of which number the Greeks compose 13,500; the Armenians 6,750; and the Maronites 3,050; and the remainder consists of strangers, occasionally resident in the city. Each of the four Christian nations has a church, and enjoys perfect toleration under the Mohammedan government. The Greek nation was once opulent and flourishing; but it has long declined, and is now reduced to a very low condition. This decline is ascribed partly to the decay of commerce, and principally to the contests that have subsisted between those who adhere to the patriarch of the Greek church, and those who acknowledge the supremacy of the pope. The Greek language is almost obsolete at Aleppo. The Armenians are divided into two parties, the orthodox and the feliaminate; besides their own language, they speak the Arabic and Turkish; but their church service is performed in the learned Armenian, which is different from the language vulgarly spoken. The Syrians of Aleppo are mostly rec lassified to the Roman church. The Maronites are more connected with the Franks than the other sects. They acknowledge the supremacy of the pope, and have added many rites, borrowed from the church of Rome, to their own. Divine service is performed in Arabic. The native Christians have no monasteries at Aleppo, but contribute towards the support of several in ancient Lebanon and its vicinity. For the regulation of expenses, and the transference of benefices at the fagho, each of the Christian nations has a public agent or waksh; who, being elected in an assembly of the principal persons of the respective nations, is confirmed in his office by the bailiwick, and invested with a pectoral, as a mark of honour. The turban, usually worn by the Christians, differs somewhat in form from that of the Turks, and the face is blue and white striped; their drawers are red, and their draves is, upon the whole, more plain. In their mode of eating, they generally follow the Turks. Their women, when they appear abroad, wear a veil of white linen, and keep more at home than the Turkish ladies. They are extravagant in the article of drees, which varies in some circumstances from the Turkish fashion. They are more formal in their address, and their courtesy borders too much on servility. The men are generally rather favoring than affable; but those in easy circumstances are hospitably social. Those of them who have obtained protection, under the appellation of honorary interpreters, are distinguished by a peculiar furred cap and yellow dippers.

The computed number of Jews at Aleppo, says Ruffell, is about 5,000. They have one synagogue, which possesses a MS of the Old Testament, which, as they pretend, is of high antiquity. For its antiquity, they urge the concurrent tradition of their rabbies, and their submission to its authority in disputed passages, and also a prayer at the end of it for the preservation of the temple; from which they conclude, that it must have been written before the expedition of Titus, their prayers afterwards having been offered up for the restoration, and not the preservation of the temple of Jerusalem. A specimen of this MS was examined by Dr. Kennicott, who did not find sufficient reason for assigning such high antiquity to it as the Jews do. The Jews are distinguished by their violet-coloured baboono; and their turban, which is lower than that of the Christians. Few of them apply either to manufactures, or to manual trades; most of them are bankers or merchants; the others are brokers, grocers or peddlers. The established banker of the feragho is a Jew, and the private bankers of most of the grandees are likewise Jews. The Jews are generally more sober than the Christians. The lower people live chiefly on bread, pulse, herbs, and roots, dressed with the expiated oil of oleum; and they are of all people the most slovenly and dirty. Some of the women are handomely, but the proportion of such is small. Their head-dresses differ considerably from that of the Turkish and Christian ladies; and is commonly richly decked with pearls. Their boots and slippers are of a violet colour. Their veil is white, and in the presence of strangers they always wear it. The chief priest of the Jews is, by way of eminence, called the Khakan; and the priests are distinguished from the other Jews by the fize and colour of the turban, and by the long wide fleeces of their outer garments. The Khakan exercises temporal as well as spiritual authority, and his decisions are generally more respected than those of the bishop are by the Christians, but his civil jurisdiction is very limited.

The rate of literature at Aleppo is much degenerated from that of ancient times, when it was more respectable. There are indeed public day-schools adjoining to some of the principal mosques, but their colleges for students in advanced life are few in number, and poorly encouraged. They are more properly seminaries of pedantry and superflitious than of science, and they are chiefly frequented by the ruddics of the richer class, who dedicate themselves to the service of the mosque. Grammar and school-divinity are the subjects chiefly taught at college. The discourses, which assume an appearance of respect for learning, have no liberal notion of science. Altronomy, which was once a favourite study among the Arabs, is at present wholly neglected. Although they have books on the subject in their libraries and some instruments, yet for little is known of the science at Aleppo, that a person who is found capable of calculating eclipses has, on this account, the reputation of a most profound astronomer. Almanacks are seldom constructed at Aleppo, but are brought thither from Constantinople or Cairo. As to mathematical studies, they are little attended to by the modern Arabs; nor have natural history and the experimental part of philosophy made any progress amongst them for several centuries. History is little regarded by the literati at Aleppo. Their knowledge of distant states, and of the revolutions of empire in the western world is very partial and imperfect; and even their own history, before the appearance of their prophet, remains in great obscurity. Their geographical knowledge also lies within very narrow bounds; nor have they any good maps, except such as have been imported from Europe. Superstition has banished painting from Syria, and music, degraded by fashion to a mercenary profession, is rather tolerated than encouraged; poetry, which was formerly much cultivated among the Arabs, has very perceptibly declined and languished; so that the modern Aleppo bard never attempt any performance beyond a dirge, a ballad, or an epigram. Although the medical practitioners at Aleppo are numerous, their knowledge of medicine is superficial, perverted by prejudice, and accompanied with pedantic affectation, arrogance and obstinacy. A very competent judge affirms their general practice to consist in specious triviality. Their knowledge of anatomy
is acquired by reading, and not from digestion; and both anatomy and physiology remain precisely in the state in which they were transmitted by Galen. Their ignorance of the circulation of the blood leaves them quietly in possession of the ancient doctrines, which were held sacred before that important discovery. With a copious Materia Medica, and a large collection of compound remedies, their practice is confined to a few official preparations. The precious stones, pearls, bazaars, and leaf gold are in high esteem. The principal cordials are the confessions of Alkermes and Hyacinth. The few chemical preparations that are in use are brought from Constantinople, and the Aleppo pharmacy is chiefly confined to the distillation of simple waters, and the preparations of syrups, conserves and decorations; for spirituous waters, tinctures and elixirs are proscribed by the law of Mohammed. Some few individuals, however, are to be found, who are not only more learned, but in their practice sagacious, active and rational; and who, allowing for the disadvantages under which they labour, are entitled to merit in their profession. Surgery is less cultivated than physic.

Of the quadrupeds found in Aleppo and its vicinity, we may mention two varieties of the cow, buffaloes, two varieties of sheep, as many of the goat; wild hogs, gazelles or antelopes; two sorts of hare, the hedge-hog, the jerboa; four varieties of the camel; three varieties of the ass; various breeds of mules, horses, dogs, cats, varieties of mice, the mole, two varieties of bats, foxes and wolves; an animal called the sheep, the hyena, the lynx, and the panther. The markets of Aleppo are plentifully supplied with poultry; the cock and hen, turkeys, geese, ducks and pigeons. They have also abundance of game in the different seasons, &c. Dr. Ruffell has given an ample catalogue of the ornithology of Aleppo. The conspicuous situation of Aleppo brings thither a great number of fowls and affords the curious a singular amusement. If, from the terraces after dinner, a motion be made of throwing bread, numerous flocks of birds, which were floating in the air, at a height which rendered them invisible, will descend and fly about the place; having been accustomed to receive morsels of bread which have been scattered for amusement. For an account of the carrier pigeons of Aleppo, see Carrier Pigeon.

The river Kowick supplies several species and varieties of fish; but it does not afford a sufficient quantity for the Aleppo markets: so that the Christians, in their great lents, are supplied from the rivers Orontes and Eurphates, from the lake of Antioch, and also from another lake near Marea. Amongst the reptiles, we might enumerate the frogs, which abound on the banks of the Kowick, and from the croaking of which it is said to have derived its name. These are of a large size, and so delicious, that some European epicures have declared it was almost worth while to make a journey to Syria, for the sole purpose of regaling on them. The Kowick also furnishes a particular kind of crab, (cancer fluviatilis) which is much esteemed. This river likewise affords tortoises in abundance. The silk-worm is a most material object to Syria, being the chief source of its commerce with Europe. The bee is also of great importance, on account of the consumption of honey and wax. Among the noxious animals, the scorpion is the principal. The scorpions, snakes and serpents, are found in Aleppo and its vicinity. Few housetops are exempt from bugs, fleas, and muletoes. The common fly and horse fly are troublesome; but of the insect tribes, the locust is the most dreadful in its depredation: this fets all the defensive arts of man at defiance; and def-

flies, in a few days, the beautiful verdure of extensive tracts of cultivated country. Dr. Ruffell has given a catalogue of the reptiles, serpents, insects, and worms that are found in this country, and also a catalogue of Aleppo plants, with ample marks.

The epidemic diseases most prevalent in Aleppo are continual fevers, intermittent and remittent fevers, regular and anomalous, erumpent fevers, commonly attended with diarrhea; the dysentery, quinvix, pleurisy, pernicious, rheumatism and ophthalmia. The spotted and chronic diseases are, with few exceptions, nearly the same as in Britain. Those which are most common at Aleppo, are pulmonary complaints, spitting of blood, and consumption; obstructions of the abdominal viscera, cachexy, jaundice, dropsy, inguinal ruptures, the hemorrhoids and worms. The typhus is common, and various other cutaneous eruptions; but the true or confirmed leprous is now become obsolete in Syria. The vesicular itch is also very common in this country. The Europeans from after their arrival at Aleppo are subject to a fever, which has been distinguished by the name of Pena, or gout. The disease attacks but once; and the English are rather more liable to it than the Provencals and Italians. The natives of Aleppo and European strangers, after some residence here, are subject to a singular kind of eruption; which, from the supposed time of its duration, is denominated the bout of a year, or the ring-worm or pimple of Aleppo; but by the Europeans and Turks, it is called d'Allep, the Aleppo evil, and the Aleppo ulcer. No part of the body or limbs is exempt from this eruption, but it most commonly fixes on the face and leaves a scar, with which almost all the inhabitants are disfigured. Vonkey suspects that it proceeds from the quality of the water. Dr. Ruffell has particularly described it; and he observes, that the mercurial plaster was the most efficacious remedy. The most calamitous and destructive diseases to which Aleppo and its vicinity have been subject is the Plague. The means which are practiced by the Europeans for their preservation, consist either in a retreat from the city, or in being themselves up in their town-houses, in such a manner as effectually to prevent all intercourse or communication, by which the infection might be received from without. Besides the common regulations adopted by the Europeans at Aleppo, and which have the function of long experience, Dr. Ruffell recommended some further precautions, which we shall here transcribe for the information of those who have no access to his comprehensive and valuable work. The first of these precautions is, in the general regimen of life, to guard against excesses of all kinds, violent passions of the mind, and immediate evacuations. 2. In respect to diet, not to live more sparingly than at other times, nor to lessen the quantity of wine; perhaps one or two glasses extraordinary might rather be beneficial; and the free use of acid liquors (such as very weak four punch) was, in the summer, found not only grateful to the palate, but salutary. 3. Never to venture abroad in the morning fasting. 4. When in the chamber of the sick, or in an apartment, or any thing suspected of infection, carefully to avoid swallowing the saliva; and, at the same time, to breathe through the double folds of a handkerchief moistened with plain vinegar, or vinegar impregnated with rue. 5. To refrain inspiration as much as possible, while employed in examining the pulse, or such other circumstances of the sick as require drawing close to the bed; and upon coming out of the chamber, to wash the mouth, face and hands with vinegar. 6. On the return home, after visiting the infected, or
passing through the Bazar, 10 undress and expose the clothes in the open air; and before dressing in fresh clothes, to wash once more with vinegar. 7. The only preparation used internally, was a large dose, twice a day, of extract of bark; drinking after it a draught of wine and water, acidulated with excir of vitriol. These precautions, observed by the Doctor himself, were attended with incalts.

Aleppo, slightly defended by the ruined walls and towers of its castle, and exposed to the approaches of assailants by the rising grounds that envelop it, is a place of no importance in time of war, though it be the key of Syria to the north; but, considered as a commercial city, it is the emporium of Armenia, and the Diarbekir; sends caravans to Bagdad and into Persia; and communicates with the Persian Gulf, and India by Baffa, with Egypt and Mecca by Damascus, and with Europe by Scandercoon or Alexandr fan and Latakia. Commerce is here principally carried on by barter. The chief commodities are raw or spun cotton, coarse linens, fabricated in the villages, silk flax, manufactured in the city, copper, coarse cloths like those of Rouen, goat's hair, brought from Natah, the gall-nuts of the Curdellans, the merchandise of India, such as shawls and muslins, and piffchio nuts of the growth of the neighbourhood. The articles supplied by Europe are the Langudoc cloths, cochineal, indigo, sugar, and some other groceries. The coffee of America, though prohibited, is introduced, and serves to mix with that of Mocha. Ruell's Natural History of Aleppo, 2 vol. 410. 1794. paflim.—Volney's Travels into Syria, &c. vol. ii. p. 159, &c. For the coins, weights, and measures of Aleppo, see Syria.

Aleppo, old, now Kinnsarsen, the ruined remains of the ancient Chalics, of which there are vestiges of the foundation of walls without a single house standing. This ancient city surrendered on capitulation to the Saracens, in the 17th year of the Hegira, A. D. 639, soon after their invasion of Syria.

Aleppo, Bashawlick of Pachalic of, one of the five pachalics of Syria, is a province of great extent, reaching eastward from the bay of Scandercoon to the banks of the Euphrates, and from 40 miles north of the city, extending about 50 miles to the south eal. But it is now not so extensive as it was in former times. Kililis, which was formerly dependent on Aleppo, is erected into a distinct province, on account of the frequent depredations of the Kurdeens, who inhabit the neighbouring mountains; and since the year 1752 an alteration has taken place with respect to Bylan, which, together with Caramoat, Scandercoon, Byas, and the adjacent mountains, has been put under the government of a native of Bylan, who for that purpose was created a bashaw of two tails. At present the pachalic on the north is bounded by the village Baillik, situated in the road to Aintab, eastward, by the Defert, Bab at the distance of ten hours east-north-east, and Hagiial, about the same distance to the south-south-east, being among the last inhabited villages: on the south it is bounded by the Great Defert, between the flats of which and the west, or west north-west, are situated the most fertile and populous parts of the forest. Sirmen is the last town southward; and Antioch, with its dependencies, may be reckoned the western boundary, which, till a late period, reached to the sea: Scandercoon and Byas being then the two frontier maritime towns. About one half of the villages which stood formerly on the books of the province, are said to be totally deserted. Many of the inhabitants of this mountainous tract acknowledge scarcely any authority but that of their own chieftains; and the champaign, in many places, is either desart, or only occupied transiently by the wander-

ing tribes of Turkmans, Beqdeles, and Rufians, from the north, or by the Bidouweens and Chingans; who, though they pay an annual tribute, can hardly, in other respects, be reckoned subjects of the province. The oppression of the agas, the destructive marches of the grandees through the province, and the roving of the ruffian troops of Levants out of pay, oblige the peasant tenants to remove; so that vall tracts of the beautiful plains in the Bashawlick, are shamefully overrun with thistles, whilst the mountainous parts, better secured from oppression, are finely cultivated, full of people, and present on every side thriving hamlets.

Such is the account given of this pachalic by Dr. Ruell. Volney describes it, as extending from the Euphrates to the Mediterranean, between two lines, one drawn from Scandercoon to Beer, along the mountains, the other from Beer to the sea by Mare and the bridge of Shogar, and as containing two plains, that of Antioch to the west, and that of Aleppo to the east: the north and sea coast being occupied by considerably high mountains, known to the ancients by the names of Aranous and Rhous. The soil of this pachalic is generally fat and loamy: the greatest part of the lands lies waste, and the traces of cultivation are scarcely discernible in the environs of the towns and villages.

Of the European merchants, who have resided at Aleppo 20 years, have witnessed the depopulation of the greater part of the environs of the city. The traveller sees nothing in this and other pachalics of Syria, but houfes in ruins, cits perished uselefs, and fields abandoned. Those who cultivated them are fled into the towns where the population is absorbed, and where the individual conceals himself among the crowd from the rapacious hand of despo\i\-lin. Its principal produce consists of wheat, barley, and cotton, which are found in the flat country: in the mountains they cultivate the vine, mulberry, olive, and fig-trees. The sides of the hills, towards the sea-coast, are appropriated to tobacco, and the territory of Aleppo to piffchios. The palmage is abandoned to the wandering Turkmen and Curds. For other particulars, see the article of Aleppo. Ruell's Hist. vol. i. p. 314. 339. Volney's Travels, vol. ii. p. 139, &c.

ALEK, a river of Siberia, which joins the Atiga at Ale-

urka.

ALEREA, Ardantes, in Ancient Geography, a city of Gaul, belonging to the Biturges Cubi, and placed by M. d'Arville between Ermodurum and Argentomagus.

ALERIA, a town of Corsica, situated on an eminence in the east side of the island, near the mouth of the river Ro-

tanus, according to Ptolemys. Herodotus (ib. c. 167. p. 78.) mentions it under the name of Alalia, and says it was founded by the Phoenicians. Diodorus Siculus (ib. v. c. 12.

Vol. 1. p. 345.) calls it Kalares, Calaris, and says that it was built by the Phoenicians. Sylla established a colony in it, and, on this account, has been represented as its founder. It is now in ruins, and altogether abandoned on account of its unhealthy situation, though in former times it has been a con-

iderable city, and the site of a bishopric.

ALERION, in Heraldry. See ALLERION.

ALES, Alexander, in Biography, a divine of Augs-

burg, was born at Edinburgh, April 23d, 1500, and having made a considerable progress in the school of divinity, engaged in the controversy of the day against Luther. He also took a part in the dispute with Patrick Hamilton, and endeavoured to pro\efy him to the catholic religion; but in the progress of the conference, he himself began to entertain doubts, which were increased by the constancy of this Scots martyr at the stake. The persecution he suffered drove him into Germany, where he was at length converted to the protest-
ant faith. Encouraged by the national change of religion, which took place on the marriage of Henry VIII. with Anna Bulken, he removed to London in 1535; and here he was highly esteemed by Cranmer, Latimer, and Thomas Cromwell. When these favourites lost their interest at court, Ales retired to Germany, and was appointed professor of divinity by the elector of Brandenburg, at Frankfort upon the Oder, in 1539. Upon some dispute he withdrew to Leipzig, where he was chosen professor of divinity, and where he died in March 1577. He was much esteemed by Melchior, and was extolled by Camerarius as a very great divine, a subtle disputant, and a man of dintionished worth and learning. He wrote Commentaries on the Gospel of St. John, and the Epistles to Timothy; an Exposition of the Psalms; a Justification against Osander; on the Trinity, and an Answer to the thirty-two Articles of the Louvain Divines. Gen. Diit.

ALESA, ALEFSA, or ALESAH, in Ancient Geography, a very ancient city of Sicily, built according to Diodorus Siculus (lib. xiv. c. 15. tom. i. p. 651.), by Archonides of Herbita, about the 14th year of the 94th Olympiad, or 503 years before Christ. It flood, he says, upon an eminence, about eight frides from the sea; near place, as Ptolemy conjectures, where the city of Carmon now stands, on the river Aulus, or Trami di Calonia. The inhabitants were called Alesini and Helosini, and, as Diodorus and Cicero inform us, were exempted by the Romans from taxes. Near Alesa was a fountain, which, as Solinus pretends, used to bubble up at the sound of a flute, so that it could not be kept within the bason.

ALESBURY, in Geography. See AYLESBURY.

ALESENI, in Ancient Geography, a people of Aria, whom Strabo places in Babylonia towards the Persian gulf.

ALESHAM, or AYLESHAM, in Geography, a town of England, in Norfolk, near the river Thurn; 12 miles north from Norwich, and 121 north-north-east from London.

ALESIA, or, as it is sometimes written, ALEXIA, in Ancient Geography, a confederate town of Celtic Gaul, belonging to the Mandubii, situated, according to Cesar, (Bell. Gall. lib. vii. c. 68.) on a high hill, washed on two fides by two rivers, and of such antiquity, that Diodorus Siculus (lib. v. c. 24. tom. 1. p. 340.) describes the building of it to Hercules in his war against Ceyon. It was so strongly fortified, that when Cesar besieged and took it, Velleius Paternus represents the undertaking as more the work of a god than of a man. After Cesar destroyed this city, it was rebuilt, and maintained a confederate rank under the Roman emperors. Pliny (H. N. tom. ii. p. 660.) says, that the art of filvinger the ornaments of horses was invented in this city. It is suppos'd to be the present Aloste.

The mountain on which it flood is said to be Mount Aauxois, which is 160 toises high, and the foot of it is washed by two rivers, viz. the Oze and the Ozerain.

ALESIAS, a village of Lacomia, in the road from The-rapnus to Tuyetras, where, as Panormus informs us (lib. iii. Lacon. c. xx. p. 260.), Myles, the son of Lelex, first taught the art of grinding corn by a mill; and where an heroic monument was erected to Leclademom, the son of Tuyetras.

ALESIUM, a town of Greece, in the interior of the country, at some distance south-east from Elis.

ALESONE, in Geography, a town of European Tur- key, 20 miles north-west of Larisa.

ALESONE, a town of France, in Languedoc, in the generality of Toulouse and diocese of Narbonne.

ALESSANDRIA. See ALEXANDRIA.

ALESSANO, a small town and bishop's see of Naples,
The first species may be preferred through the winter under a hot-bed frame. The roots of the second fort may be planted in pots filled with light earth, and sheltered in winter in a dry airy glass-case. In May they may be placed abroad in a sheltered situation, and often refreshed with water in warm weather. The fourth fort is sufficiently hardy to live abroad in mild winters, when planted in a warm border and dry soil. It is propagated by seeds, sown in pots, and sheltered under a hot-bed frame; the plants, when they come up in spring, should be gradually exposed to the open air; and when they are large enough, fome may be planted in pots, and others in a warm border, where they should be sheltered during the ensuing winter. The Ceylon, China, and Sweet-scented species are too tender to live through the winter in England, unless they are placed in a warm stove; and they will not produce their flowers, if the plants are not plunged into a tan-bod. The creeping roots of the Ceylon and China forts send up many heads, which should be cut off in June, and, after having been laid in the stove for a fortnight, that the wounded part may heal, they should be planted in small pots of light sandy earth, and plunged into a moderate hot-bed of tanner's bark, giving them but little water till they have put out good roots; they should then be treated like other tender succulent plants, and be never fet abroad in summer. The seventh species is easily propagated from the side heads, which it puts out after flowering.

ALETUM, Guich-Alet, in Ancient Geography, a town of the Gauls, mentioned in the Notitia Imperii, and placed by M. d'Anville upon the sea-coast, north-west of the territory of the Rhedones. It was formerly a bishop's see, which, in the 12th century, was transferred to St. Malo, about a mile from it.

ALEVAIA, in Geography, a river of Siberia, which runs into the Penziakof sea. N. lat. 62°. E. long. 157° 15'.

ALEURITES, Arctopus, Larinaeay, of Aegopum, mel, parts of the tree having anew scattered over them, in Botany, a genus of the monoea monadelphia class and order, of the natural order of

triccosae, and euphorbia of Jullius; the characters of which are, that the flowers are male and female: the calyx of the male is a perianthium, three-cleft, very short, the clefts ovate and obtuse; the corolla has five petals, oblong, spreading, obtuse, much longer than the calyx; the stamens have five filaments, somewhat curved, very short, at the bases of the petals; the stamens are numerous filaments, connate into a conic columnar receptacle, the anthers roundish. The female flowers are few, in the same corymb; the calyx, corolla, and nectary as in the male, but larger; the pistillum has a

germ coneic superior, the style none, the stigmas two, very short; the pericarpium a large, globose, two-seeded berry; the seeds are two, globose, coated with a double bark. There is one species, viz. A. teloba, which is a tree of the islands of the South Sea.

ALEUROMANCY, Aleuromantia, derived from A.I. lume, wool, and subus, divination, in Antiquity, is the name with what was otherwise called Alphiotomantia and Christomantia, and means an ancient kind of divination by means of meal or flour.

ALEURSKA, in Geography, a town of Siberia, at the confluence of the Agila and Aler, 64 miles north-east of Nertchinsk.

ALEUTIAN, or Aleutinsky Islands, a group or chain of islands, on the north-east of Kamtchatka, and near the continent of America, belonging to Asiatic Russia. These islands were partly discovered by Behring in 1741, and the rest at several periods since his time. The most considerable of them amount to 40 in number, and they may be justly considered as a branch of the Kamtchadal mountains continued in the sea. Some have erroneously included Behring's-land and the Copper-Island in this group; but they are usually distinguished from them. South-east of the Copper-Island, within 150 or 200 versts between the 55th and 57th degrees of north latitude, lie three small islands, known by the names of Artab, Shemya, and Smitshet; and these, with a few others, were denominated by the Russians Aleutskie Otworo. because a bold rock, in the channel of these last, is called abot. In the sequel this name was extended to the whole chain; though a part of it, namely, as far as the island Yamblik, is named the Andreanofski, and the rest, lying further towards America, the Fox-Islands. The Russian charts divide the long Archipelago, known under the name of the Aleutian and Fox-islands, into several Archipelagoes under different names. On these Aleutian islands, and on upwards of 200 leagues of coast, which extend beyond the polar circle, the indefatigable Russians have formed those numerous settlements or factories that support the fur-trade, from which the empire of Russia derives such great advantages in its commercial concerns, and exchanges with the empire of China. This Archipelago, known, in the most extensive sense, by the collective name of the Alitern-islands, forms with the north-west coast of America and the north-east coast of Asia a large basin of about 1,200 leagues in circuit, which communicates towards the south with the great Boreal ocean, by as many straits as the islands form channels between them; and towards the north, under the 66th parallel, with the Arctic Frozen Ocean, by Behring's strait alone. The survey of these islands, more anciently discovered by the Russians, and of the adjacent parts of the two continents, was made by Captain Cook in his third voyage in 1778. If the Russians, then, can deferently claim the priority of the discovery, no one can withhold from the adventurous and persevering Captain Cook the glory and the merit of having fixed the distance of the two continents, and their respective extent, to the east for Asia, and to the west for America; and, by his researches and observations, of having opened a career to the navigators of the European nations, who should be devisors of availing themselves of the benefits which the discovery of these coasts presents to the speculations and enterprizes of commerce. We shall here add, that in advancing towards the north-west, Cook made Behring's Mount St. Elias towards the latitude of 60° 30'. He anchored in a large bay, which he named Prince William's found; and thence steering again to the south-west, he discovered and ascended a river, on which, after his death, the gratitude of his nation imposed the name of Cook's

River.
ALE

ALE

RIVER. He then crossed the east shore of the peninsula of Alaska, and touched at the island of Oonalashka, which is separated from the south-west point of the peninsula only by the island of Okhotsk: these two islands are the nearest to the continent, and the most eastern of that Archipelago, or long chain of islands of various sizes, which extends from east to west, on a line bending towards the south, to within 350 leagues of the main land, if we consider Behring's island as the extremity of the chain. Capt. Cook extended his course into the north of Behring's bath, and made alternately the coasts of America and Asia; in the former he perceived the outline of a large bay, which he called Bristol Bay; and standing toward the middle of the bay, he saw the Matsviflin island of the Russians, which he named Gore's Island, and farther to the northward he distinguished the islands called Clerke's Islands. To the east-north-east of these, on the continent of America, he discovered Norton found; he then passed Behring's Strait, and advanced into the Arctic Frozen Ocean, as far as the parallel of 70° 44'. A plain of ice obstructed his progress nearer towards the pole. Here he might stay with the poet Regnard, when he reached the northern rocks of Lapland:

"Hic tandem rectimus nobis uti defuit orbis."

From comparing Cook's progress northwards with that of Captain Flippis it appears, that the ocean is navigable much further towards the north, between Europe and America, than between America and Asia; for Captain Flippis, in his "Voyage to the North Pole," reached very near the 8th parallel, whereas Captain Cook could not penetrate beyond the latitude of 71° 10' 6. See Marchand's Voyage round the World in 1790, 1791, and 1792, by Fleuriot. Vol. i. Introduction annin. A Russofian expedition for making discoveries in the north-eastern sea was proposed by Catherine II. in 1784, and the conduct of it entrusted with Capt. Billings, an Englishman, Capt. Behring, the grandson of the Behring already mentioned, and some others. After wintering at Kamtschatka, these navigators explored, in the summer of 1790, the whole chain of the Aleutian islands, which seem to be of volcanic origin; and they proceeded to explore the large eastern islands explored by Capt. Cook, Oonalashka and Kajdak, the bay of Cape St. Elias, &c., and returned to winter at Kamtschatka. In the summer of 1791 they renewed their search for a northern passage through the Frozen Ocean, and pursued their route from Gore's and Clerke's islands to the continent of America. From the account of their expedition, published at Gottingen by Blumenbach, we learn, that a principal ornament of the ladies of the Aleutian islands consists of a pair of the long talks of a wild bear, cut down to a smaller size, which are stuck into two holes, one on each side of the under lip, from which they project, and give the wearer an appearance similar to that of the Walrus; and this is considered as a beauty almost irresistible. In these islands, when they were first discovered, more than 60 families were found, whose language had no relation either to that of Kamtschatka, or to any of the oriental languages of Asia; it is a dialect of the language spoken in the other islands adjacent to America, which seems to indicate that they have been peopled by the Americans, and not by the Aborigines. They have no wood in these islands besides that which is floated to them by the sea, and this wood seems to come from the south; for the camphor-tree of Japan has been found on the coasts of these islands. The inhabitants of these islands are, in proportion to their dimensions, tolerably numerous, and they are at present tributary to the Russian empire. See Fox-islands.

ALEXANDER THE GREAT, in Biography and Ancient History, was the son of Philip, King of Macedon, by Olympias, daughter of Neoptolemus, who was son of Alectes, king of Epirus. He was born at Peiraeus, the capital of Macedonia, in the first year of the 106th Olympiad, B.C. 356. His natural disposition, which is said to have been excellent, was perhaps corrupted by the mercenary ambition of his first preceptor, Lycurgus, the Acrarian; and neither the counsel and example of Leonidas, his mother's relation, nor the instructions of Aristeas, were sufficient to counteract its pernicious effects. It was, however, a singular advantage to Alexander that he was placed under the tuition of this great philosopher. Soon after his birth Philip wrote to Aristeas, informing him, that he designed to place this son that was just born under his instruction. "I return thanks to the Gods," says he, "not so much for having given him to me, as for his having been given during the life of Aristeas; and I may justly promise myself, that you will make him a faithful, worthy of us both, and a king of Macedonia." Accordingly, at the proper season, he invited his attention to him by the offer of a considerable stipend, and he afterwards recompensed it by rebuilding Stagira, the native place of Aristeas, which he had destroyed; reinhabiting the inhabitants, who had fled from it, or who had been made slaves; and affording them a fine park in its vicinity for their ladies and assemblies. The pupil seems to have conceived an early and affectionate attachment to his master, whom he thought himself bound to love as much as if he had been his father; and to this purpose he declared, "That he was indebted to the one for living, and to the other for living well." His progress in every kind of science corresponded to the natural talents which he possessed, and to the distinguished abilities of his tutor. He devoted himself with singular affability to the study of metaphysics, mathematics, and morals; he was no less solicitous to be a matter of rhetoric, both in the theory and practice of it; and to his soliloquy in this respect we owe Aristeas's treatise on rhetoric, which, with a jealousy altogether unbecoming a great character, he required the author not to communicate to any but himself. His taste for classical literature is likewise manifest in the very ardent esteem which he professed for Homer, whose poems he denounced, as Pliny (H.N. lib. vii. c. 29, tom. i. p. 341.) informs us, "the most precious production of the human mind." He particularly admired the Iliad, which might probably contribute to give his mind a decided direction to military glory. The passage, as we are told, which pleased him most, was that (II. iii. v. 172.) which represents Agamemnon as "a good king and a brave warrior." He had also a taste for the arts in general; he knew their importance and utility; and music, painting, sculpture, and architecture flourished in his reign, because they found in him a competent judge, and, as some say, a munificent protector. In his exercises he distinguished the useful from the fanciful; in his diversions he declined whatever was unmannerly; and in his studies he despised whatever was trivial or pedantic. In early life he manifested a genius and disposition formed for great and splendid actions. Emulation and ambition were the predominant passions both of his youthful and riper years. When he conversed with the Persian ambassadors at his father's court, at the age of no more than seven years, the subjects of his inquiry were, not the palaces and retinue of their king, but the character and manners of their forefathers, the number and discipline of his army, the road that led into Upper Asia, and "the number of days' march from Macedonia to Susa." When he was requested to enter his name among the Olympic competitors, he replied, "So I would, if I were to have kings for antagonists." On occasion of his taming the famous horse Bucephalus, which none
of his father's grazon would venture to mount, Philip was no. tvoted, that he had to him, "My son, seek a kingdom more worthy of thee, for Macedonia is below thy merit." Besides the qualities which we have recited, the youth of Alexander was distinguished by temperance, chaldty, and self-command. His untail respect for his mother, whom Philip divorced, produced a disagreement between him and his father; and it was increased by a suspicion, which they entertained, that he would be disinherited, and one of Philip's children, by another wife, preferred to him. However, before this period, when he was 16 years of age, he was appointed regent of Macedonia during his father's absence; and his conduct manifested such prudence and bravery, that he was afterwards employed in several military enterprises, in which he behaved with great honour to himself, and singular satisfaction to Philip, whose life he had preferred by his refolute and fearless interposition. In the battle of Chaeronea, at the age of 18, he signalized himself by his valor, and greatly contributed to the victory. Before Philip undertook his projected expedition into Asia, he recalled his son from Epirus, with whom he and his mother had retired, and was apparently reconciled to him; but when his father was assassinated by Pausanias, whom he had grievously offended, Alexander and his mother were suspected of being privy to the conspiracy. The suspicion, however, seems to have been groundless; and the first act of his reign was the just punishment of the murderers. In the 20th year of his age, B. C. 336, he succeeded to the throne of Macedon; and commenced his military career by marching into Thessaly to overawe the Greeks, who were disposed to emancipate themselves from the Macedonian yoke, and by causing Attalus, who encouraged their revolt, to be put to death. Having succeeded in this enterprise, he marched into Thrace, defeated the Triballi, who inhabited the modern Bulgaria, and drove them beyond the Danube; he also made the Getæ to fly at his approach; subdued several barbarous nations, and established a treaty of peace, in which the Cætes, a fierce and high-spirited people, and others, were comprehended. During his absence in these expeditions, the cities of Greece, infuriated by the eloquence and influence of Demosthenes, formed a powerful alliance against him. The report of his death had induced the Thebans to revolt; and, having murdered two officers of the Macedonian garrison, they were preparing to besiege the citadel. Alexander, receiving intelligence of this event, hastened to Greece, B. C. 335, passed the Straits of Thermopylae, and entered Bœotia before the Thebans were undeceived as to his death. To those who accompanied him he spoke in the following manner: "Demosthenes, in his orations, called me a child when I was in Illyria and among the Triballi; he called me a young man when I was in Thessaly; and I must now shew him, before the walls of Athens, that I am a man grown." The city of Thbes, which was bravely defended by the inhabitants, animated by a love of liberty, was at length taken by storm, with a dreadful slaughter; the buildings were razed, the house of Pindar, the poet, excepted from a respect to its owner; the inhabitants were sold for slaves, and the lands distributed among the soldiers; this conduct struck the Greek states with terror. Athens sent a deputation to Alexander, imploring his clemency; but he demanded the surrender of ten orators, whom he supposed to have been the chief instruments in forming the league which Philip his father had defeated at Chaeronea. On this occasion Demosthenes recited to the people the fable of the Wolves and the Dogs; in which it is supposed, "that the wolves told the sheep, that if they desired to be at peace with them, they must deliver up to them the dogs who were their guard." Alexander having relented, by the interference of Demades, whom he had honoured with his friendship, waved the enforcement of his demand. Having re-established the tranquility of Greece he went to Corinth, where his office of generalissimo was recognized and settled. At Aegæ he held a grand council of state and war, in order to deliberate upon his expedition into Asia. Antipater and Parmenio recommended delay, but Alexander had formed his purpose; and having offered sacrifices, and entertained his friends with feasts, and distributed among them the crown-lords, Perdiccas asked him what he reserved for himself? "Hope," replied Alexander. "The fame hope ought therefore to satisfy us," was the rejoinder of Perdiccas. Accordingly he assembled his army, and prepared for his march into Asia. When one of his attendants asked him why he succeeded so well in quelling the dangerous tumults in Asia, he answered, "It was by delaying nothing." In the 22d year of his age, B. C. 334, Alexander crossed the Hellespont into Asia, with an army of about 50,000 foot, and 4 or 5000 horse. Parmenio, who commanded the infantry, passed over with the greatest part of the army from Selœs to Abydos; and Alexander crossed first the Strymon, afterwards the Hebrus, and after 20 days march arrived at Selœs. Having prepared for his expedition by a variety of superfluous ceremonies, to which he was attached, he proceeded to Ilium, where he sacrificed to the heroes buried in the neighbourhood, and particularly to Achilles, to Minerva, and to the ghost of Priam. In his march he preferred Lamphus, which he had determined to destroy on account of its adherence to the Persians; and this he did in consequence of the interposition of Anaximenes. "I swear solemnly," says Alexander to Anaximenes, who met him on the road, and the object of whose interview he suspected, "that I will not do what you desire me." "My request, then," said the old man, smiling, "is, that you would burn Lamphus." The Persians collected a large force to meet him on the banks of the river Granicus, May 22, B. C. 334; but, after an obstinate resistance, they were routed with great slaughter. The consequence of this victory was the surrender of Sardis, the chief town of Lydia, and the possession of the whole country as far as the river Hermus.

Alexander proceeded to Ephesus, and restored the democracy; and by an edict he established the popular government in all the Greek cities. At Miletus, which he besieged and took, he dispersed his fleet, and advanced to the siege of Halicarnassus, which was abandoned by the Persians, and then to Tralles, which he took and levelled with the ground. Having demolished Halicarnassus, he appointed Adiæ, who claimed the title of queen of Caria, and who delivered up to him Alinda, governor-general of all Caria; and this conduct induced many of the princes of the Lœger to revolt from the Persians, and to put themselves under his protection. Alexander ingratiated himself with the army, by permitting the soldiers who were married to spend the winter with their wives in Macedonia; a practice conformable to the law of Mœsæ, (Deut. xxiv. 5,) and which Aëtobote probably learnt of some Jew, and recommended to his pupil. While the king was busily preparing for the next campaign, an attempt was made upon his life by the corruption and treachery of an officer of his army; but it was discovered and prevented from taking effect.

The next campaign was opened early in the spring; and Alexander, taking possession in his march of the cities of Lydia and Pamphylia, proceeded to Phrygia; and at Gordium, the capital, he was deferent of seeing the famous chariot to which the Gordian knot was tied. The oracle had foretold, according to an ancient tradition of the country, that the man
man who could unite it should possess the empire of Asia; Alexander, persuaded that this prediction related to himself, after many fruitless trials, exclaimed, "It is not matter which way it be united," and cut it with his sword. Having subdued Paphlagonia and Cappadocia, he advanced by easy marches into Cilicia, and arrived in the country called Cyrus's Camp. Through a narrow strait, called the Pas of Cilicia, he marched with his army to Tarus, where Parmenio arrived just in time to prevent its being set fire to by the Persians. Alexander, heated and fatigued by this rapid march, plunged into the river Cydnus, which ran through this city, and was instantly seized with a shivering, which his attendants thought would prove fatal to him. His danger alarmed the whole army, and they expressed their apprehensions with lamentation and tears. In these circumstances, and whilst the speedy arrival of Darius was expected, Alexander confided his friends and physicians, and intimated to them that the condition of his affairs would not admit either of slow remedies or timid physicians. "A speedy death," says he, "is more eligible than a slow cure." Philip, an Alexandrian, one of his physicians, who tenderly loved him, and had attended him from his youth, offered to give him a dose, which would be speedy in its effects, and defined three days to prepare it. In the mean while Alexander received a letter from Parmenio, who had been left in Cappadocia; the purport of which was to bid him beware of Philip, because Darius had bribed him by the promise of a thousand talents, and his sister in marriage. But his confidence in a physician, whose fidelity he had experienced from his infancy, prevailed over his fears, and removed all his doubts. The contents of the letter he did not divulge. When Philip came to administer his medicine, Alexander took it from under his bolster, and gave it to Philip to read; at the same time, fixing his eyes on the physician, he swallowed the draught without hesitation, or without discovering the least suspicion. The effects of the medicine were very violent, but the skill of the physician prevailed, and his fidelity was proved. Alexander recovered, and in three days presented himself to the joyful gratulations of the army.

During this interval Darius was on his march, and Alexander advanced to meet him near Ilissus, in the month of October, B.C. 333. The army of Darius consisted of 600,000 men; but by insatiable counsels, and a vain confidence in the number of his forces, he had quitted an open and level country, and prepared to engage in a close and mountainous situation, where his multitude could only embarrass him in action. Victory was for some time obstinately disputed; Alexander received a wound in his thigh; but at length the Persian emperor fled, and his immense army was thrown into confusion. A dreadful carnage succeeded, and the tent of Darius, with his mother, wife, and daughters, came into the possession of the conqueror. When Alexander had performed the offices of duty and compassion to the dead and wounded, he entered the tent where the queens were lodged, accompanied only by his favourite Hephaestion. The queen, mistaking Hephaestion for the king, paid her respects to him as such; but as soon as Sygigamis, the mother of Darius, had discovered the mistake, she fell prostrate at the feet of Alexander, and begged his pardon. The king raised her from the ground, and said to her, "Dear mother, you are not mistaken; he also is an Alexander." Alexander, after this respectful visit, declined exposing himself to the danger of human frailty, and solemnly resolved never to see the queen of Darius any more. At this time, the fourth year of his reign, Alexander was young, victorious, and free, or unengaged in marriage, as has been observed of Scipio on a like occasion—"Et juvenis, et cælestis, et victor." After this victory, Alexander pursued his march to Syria, Parmenio went to Damascus, and posed himself of the treasures of Darius. The king proposed to visit Tyre, that he might have an opportunity of sacrificing to the Tyrian Hercules; but the Tyrians resolved not to admit a Macedonian within their gates. Alexander was incensed, and determined to besiege the city; and this siege, one of the most famous which history records, lasted for seven months; at length the place was stormed and utterly destroyed. The king, on this occasion, incurred deserved reproach by his cruelty towards a people, who had only offended by bravely defending their country. Thousands were put to the sword, two thousand were crucified, and the rest sold for slaves. After having depopulated the city, he colonized it anew, and loaded of being the founder of a city which he had ruined. This event took place, August 20th, B.C. 332.

From Tyre Alexander proceeded to Jerusalem, with the intention of punishing the Jews for affording relief to the Tyrians during the siege; but on his approach he met Jaddua, the high priest, in his pontifical habit, accompanied by the priests in their sacred vestments, and the people clothed in white. When the procession drew near, Alexander bowed before the priest, and paid him religious adoration; allying to Parmenio as the reason of this conduct, that the figure of a person in such habit had appeared to him at Dium, in Macedonia, and afforded him of the divine guidance, and of ultimate success in his expedition. After this interview, Alexander accompanied Jaddua to Jerusalem, sacrificed in the temple, and conferred great favours on the Jewish nation. Such is the account given by Josephus, but the whole is rejected as fabulous by many judicious writers. Considering, however, the superstitious temper of Alexander, and his friendly conduct to the Jews, it is not altogether improbable. From Jerusalem Alexander proceeded to Gaza, beleaguered it, and took it by storm: from Gaza he marched to Ptolemais, left a garrison in it, and sailed up the Nile. He afterwards marched through the deserts to Heliopolis, and crossing the river, he arrived at Memphis, where he offered pompeous sacrifices not only to the Grecian gods, but to the Egyptian Apis. From Memphis he sailed down the river to the sea, fixed on a spot in the midst of the Lynian deserts. The senior priest of this temple flattered him with the title of the son of Jupiter, which Alexander joyfully accepted; and he was farther assured that he should be the monarch of the world. From this journey, which had proved so successful, he returned as from a triumph; and from this time, in all his letters and decrees, used the following style: "Alexander, king, son of Jupiter Ammon."

During his abode at Memphis, he settled the affairs of Egypt; and in the spring marched towards the east against Darius. In his way to Tyre, which was the place appointed for the general rendezvous of his forces, he heard that Andromachus, whom he had appointed governor of Syria and Palestine, had been massacred at Samaria; and, in order to avenge this audacious act, he put those that were concerned in it to death, banished the rest from Samaria, and placed his younger brother on the throne, and divided part of their territories among the Jews.

From Tyre he directed his march to Thapsacus, and having crossed the Euphrates, he advanced towards new conquests. On his march he was informed of the death of
Statira, the captive queen of Darius; and this event de-

Babylon, but he was pursued, had laid waste the country, in order to deprive him of provisions and forage. This Bessus was a principal agent in procuring the death of Darius, and he had assumed the imperial purple, under the title of Artaxerxes. Alexander having found an opening that led into Media, directed a city to be built there, which he called Alexandria; and he also founded several other towns in its vicinity. From hence he penetrated into Bactria, and took Armon and Bactra, the two strongest cities of the country; he then passed the river Oxus in pursuit of Bessus, who, although defeated by 7 or 8,000 Bactrians, had withdrawn with a few adherents over this river to Nautaeus, a city of Sogdiana. When Alexander arrived at a small city inhabited by the Brachides, he was guilty of an act of savage cruelty, which fixed an indelible stain on his memory. The fact, though omitted by Arrian, is related by Curtius (lib. vii. c. 5. tom. ii. p. 520. Ed. Smakenb.) and referred to by Strabo (lib. xiv. tom. ii. p. 787.) Here Bessus, depo伊斯 of all the emblems of royalty, and stripped even of his garments, was brought in chains to Alexander; who, having ordered his nose and ears to be cut off, delivered him up to Oxatres, the brother of Darius, by whom he was sent to Ecbatana, where he suffered a cruel death; some say that he was crucified. Plutarch relates, that being fastened by his limbs to trees which were bent together, he was torn asunder by their elastic force, when they were allowed to return to their natural position.

Alexander pursued his march to Maracanda, the capital of Sogdiana, known by the modern name of Samarcand, and by long and dangerous stages advanced to the river Iaxartes, erroneously called by Arrian, Curtius, and others, Tanais. On the side of this river he was surpliced by the barbarians, who, rushing suddenly from their lurking holes in the mountains, and fighting with bows and slings, killed many of the Macedonians, and took others prisoners. The king himself was wounded in the conflict; but the barbarians were at length overpowered and defeated with great slaughter. Soon after this transaction he formed a treaty with the Abian Scytheans, who, from the time of Cyrus, had lived in freedom and independence, and who were distinguished by the equality and liberty that subsisted among them, and by their love of poverty and justice. Whili he was forming a plan for building a city on the river Iaxartes, in order to curb the nations he had already conquered, and those he intended to subdue, he was diverted from the execution of his design by the revolt of the Sogdians and Bactrians; and, directing his arms against their combined forces, he took and destroyed in a few days seven of their cities. The capture of Cyropolis, which was one of them, and which was the greatest and most populous of the whole country, was vigorously resented by the inhabitants; but it was at last taken, and razed to the very foundations. In these differentriages the enemy are said to have lost above 120,000 men; and in one of them Alexander, as well as Craterus and many of his principal officers, were wounded. He then returned to the Iaxartes, marked
marked a space of about three leagues in circumference, and
built a city, which was called Alexandria. In less than 20
days the ramparts were raised, and the houses built; and,
in order to people it, he emancipated all the prisoners he could
find, settled it in several Macedonians, who were worn out in
the service, and permitted many natives of the country, at
their own request, to inhabit it. His next conflict was with
the Sicyonians, whom he defeated with difficulty, and to
whom, as he had other objects in view, he granted a peace on
their own terms. The Samos, who were a powerful nation,
submitted to him, and, by an embassy, requetted his friend-
ship.
At this time Alexander received a reinforcement of upwards
of 16,000 men from Macedonia and Greece, and was thus
enabled to subdue all those who rebelled; and, to curb them
for the future, he built several fortresses in Magna Graecia.
He was gradually throwing off both the habit and manners of
a Macedonian prince, and assuming those of an eastern despot.
He was also surrounded by a number of sycophants, who are,
and ever will be, says one of his biographers, the bane of
princes, and the curse of nations. Thence, by indulging his
humour and soothing his passions, precipitated him into ex-
travagances of conduct, and deprived him of that equani-
mity and moderation, which were necessary for preserving the
acquisitions he had made. One faithful friend declined con-
curring in this general adulation. At a banquet which
succeeded the sacrifices performed at the anniversary festival
of Bacchus, the honour of which Alexander had transferred
to the Dioscuri, i.e. to Caistor and Pollux, some of the
attendants extolled the actions of the Macedonian prince above those of Caistor and Pollux, and even of Her-
cules. Clytus remonstrated, alleging, that "he could not
bear to hear such indignities offered to the gods, or the ex-
cult of ancient heroes undervalued, to tickle the ears of a liv-
ing prince." As to Alexander's actions, they allowed they
were great and glorious, but he maintained that they were
not supernatural; that the army had shared in them, and
that they had a right to participate in the praise belonging to
them. Alexander was indignant; and as Clytus pro-
cceeded in the same strain, and affirmed that he had preferred the
life of the king at the battle of the Græcians, stretching
out his arm and saying, "this hand, O Alexander, saved thee;" the king rushed upon him, and endeavoured to kill
him, but was prevented by the intervention of friends. At
length, however, when his friends tured, he seized a lance, or
long Macedonian pike, and laid Clytus dead on the spot. His
passion soon subsided, and, reflecting on the deed he had per-
petrated, he indulged excessive grief, refused food for three
days, neglected his apparel, and, as some say, would have
slain himself with the pike that killed Clytus. Flattered,
however, by the army, and perverted by the detestable doc-
trine of Anaxarchus of Abdera, the sophist, who taught him,
"that a sovereign prince do what he will, all his actions
are just and lawful," he soon became more composed and
triumphant, and lectures of this kind were more acceptable
to his mind, already corrupted, than the honest and moral
discourses addresed to him, with a view of settling his mind, by
Callisthenes, the disciple and relation of Aristotle.
His ser-
vile attendants renewed their adulation, attempted to per-
suade him that he was more than man, and that he was un-
just and disloyal in his subjects not to own his divinity; and
some of the most officious of them, amongst whom Anaxar-
chus was the chief, endeavoured to engage the Greeks as
well as the Asiatics to pay him adoration. Alexander was
pleased; and was highly provoked by a speech of Callis-
thenes, who attempted to awaken in his mind more sober
thoughts. His reasoning was ineffectual; and it was deter-
mined that when the king drank to any guest, he should im-
mediately rise, adore him, and having received a kiss from
the king, depart.
Six or seven circumstances that have been now recited,
produced a new conspiracy against the king; and the con-
spirators, being discovered, were floned to death by the
army. Callisthenes was apprehended, and, as some say,
carried about in chains, till he died a natural death, but
according to others, he was first racked and then crucified.
The death of Callisthenes, says Seneca (Nat. Quaet. lib.
vi. c. 25.), is an eternal reproach to Alexander, and a crime
of so horrid a nature, that no quality, however excellent,
or military exploit, however illustrious, can ever efface its
infamy. In favour of Alexander it is said, that he killed
many thousand Persians; that he dethroned and killed Da-
rus, the most powerful king of the earth; that he conquered
innumerable provinces and nations, penetrated as far as the
ocean, and extended the bounds of his empire from the most
remote part of Thrace to the extremities of the Euphrates.
In answer to these particulars, "Yes," says Seneca,
"but he murdered Callisthenes;" a crime of so heinous a
nature, that it entirely obliterates the glory of all his other
actions.
The only strong hold which the rebels still retained was
the Sogdian rock, or the rock of Oxus, into which Ox-
yartes, the Bactrian, had conveyed his wife and family. It
was defended by Arimazes, with 30,000 soldiers under his
command, and furnished with provisions for two years. It
was deemed by its situtation impregnable; and therefore,
when Alexander, before he commenced the siege, summoned
the garrison to submit, the commander insulted him, and
asked "whether Alexander, who was able to do all things,
could also fly; and whether nature, in a sudden, had given
him wings?" Alexander was highly exasperated, and eddicated
from the mountaineers in his army 300 of the most active
and dexterous, directing them to seek a path to the top of
the rock; to which the greater number of them at morn ascended by means of wedges and ropes. When Alexander
received the appointed signal, he sent a message to the
commander, summoning him to surrender, and informing
him, "that he had now a corps of winged soldiers." The
whole Macedonian camp surrounded with the shout of "vi-
tory," and the Barbarians surrounded the place at differ-
cence. Alexander's repentment was invincible, and regard-
less of the dictates of humanity, he ordered Arimazes and the
principal nobility of the country who fought shelter in his
camp to be surrounded with roods, and afterwards to be fixed
to crosses at the foot of the rock. After the reduction of
Sogdia, he marched into the country of the Parthians,
where was another fortress, called the rock of Choriames,
which was also deemed impregnable. After the siege was
begun, Choriames, the commander, was induced by Ox-
yartes to surrender it; and having been enrolled in the number of
Alexander's friends, he was entrusted with the charge of it,
and in return for this honourable treatment, supplied the
Macedonian army with provisions. On one of these occa-
sions, Roxana, the daughter of Oxyartes, who was esteemed
the most beautiful woman in Asia, after the death of the
wife of Darius, fell into the hands of the conqueror; and
such was the influence of her charms, that he publicly ep-
pointed her.
India was the next object to which Alexander directed his
attention. Accordingly he dispatched a herald to Taxiles,
and the other princes on this side the river Indus, enjoining
their submission; and Hephaestion, with part of the army,
was dispatched to join Taxiles and the rest of the Indian princes, who were come out to meet them, and to reduce the country as far as this river. This commission was easily and speedily executed. Alexander bent his march towards the river Choaspes, and reduced several places in his progress, among which Ainda was one of the most considerable. He proceeded against the Apii and Aissaeri, whom he successively defeated, notwithstanding obstinate resistance; but having invested Magaza, the capital of the latter people, he was wounded in the leg, and the army was repeatedly repulsed. At length, however, the Indians were compelled to submit; and by an act of piety, which Diodorus Siculus declare to be condemn'd, they were all put to the sword. Platarch relates, that the king for this barbarous action, Ora and Bazaer, and the rock of Aouson, to which the inhabitants of the latter place retired, were next reduced; and Alexander proceeded to the river Indus, where Hephaestion and Perdiccas had already provided a bridge of boats for the passage of the army. Having refreshed his troops in the territory of his friend and ally, Taxiles, Alexander passed the Indus, B.C. 327; and advanced forward to the Hydaspes, known in modern times by the name of the Betah or Chelum, or, according to the orthography of Major Rennell, Belut and Hyllum, where Porus with a large army lay encamped to dispute his passage. When he approached the banks of this river, he found that the people with whom he had to contend were not to be subdued so easily as the Persians, and other Asiatics. The Indians were not only a very tall and robust, but also a very hardy and well disciplined people; and their king Porus, a prince of high spirit, invincible courage, and good conduct. Alexander, however, after encountering great difficulties, on account of the inundations to which the Indian rivers are subject at the time of his march, which was Midsummer, or about the height of the rainy season, passed the Hydaspes; and having vanquished a detachment under the command of the son of Porus, who was slain in the action, he encountered Porus himself at the head of 4,000 horse, 30,000 foot, 300 chariots and 200, or as Q. Curtius says (lib. viii. 13.) 85 elephants. The dispute, though short, was very bloody. Porus behaved with singular prudence and intrepidity; but the Indians were completely routed after a great slaughter. Porus, compelled to submit, was conducted to Alexander, who received him with respect, and treated him with kindness. When he was asked "how he wished to be treated?" Porus replied, "as a king." "That for my own sake," said Alexander, "I shall do." "And therein," rejoined Porus, "is comprehended all that I can ask." Alexander gave him his liberty, restored his kingdom with additional provinces; and Porus, in return, became his true friend and constant ally. For perpetuating the remembrance of this victory two cities were built; one called Nicea, and the other Bucephala. Passing the river Acenies, he entered the territories of another Porus, and in pursuit of him crossed the Hydpositories, and having conquered the whole kingdom of this prince, he gave it to Porus his ally. In the midst of this success Alexander received advice, that the Cathei, Oxydrace, and Malli, the most warlike nations in India, were confederated against him, and had assembled a great army. He determined immediately to attack them; and though they made a vigorous defence, they were put to flight; and soon after, their city of Sangala was taken by storm and razed. He then prepared to pass the Hyphasis, having nothing in view, as Arrian says, but to seek new enemies. Here he was told that after passing this river, he must travel 11 days through deserts, and that he would then arrive at the Ganges, the largest river in India; and that farther in the country were the Ganga and Brahmi, who were collecting a great force in order to oppose his entering into their dominions. Rumours of this kind were spread through the army, and produced no inconsiderable degree of disturbance and murmurs. Unable to allay the ferment that was prevailing among the troops and to satisfy them, that they had any object in view which could warrant their being led on to new difficulties and toils, he was constrained to terminate his progress, and to prepare for his return. When his purpose was made known to the army, he was saluted with loud acclamations and received the thanks of his followers; "brave soldiers," they said, "he who was invincible had suffered himself to be overcome by their prayers." On the banks of the Hyphasis, the modern Beyah, which were the limits of his conquests, he caused to be erected 12 altars, on which sacrifices were offered. These altars, if we may believe the biographer of Apollonius Tyanaeus, were still remaining, with legal inscriptions, that when fantastic fopliht visited India 373 years after Alexander's expedition. Philol. vita Apoll. lib. ii. c. 43. ed. Olariz.

Having exhibited public shows in the Grecian manner, he added all the conquered country to the dominions of Porus, and began his retrograde march towards the river Hydrous. From thence he proceeded to the Acenies, and marched on to the Hydaspes, propelling to embark on the river Indus, and to pass by this river to the ocean. Whilst he was marching near these rivers, he observed many crocodiles, and that the country produced beans like those of Egypt; and hence he inferred, that he had discovered the source of the Nile, and prepared a fleet to sail down the Hydaspes to Egypt. Strabo. Geog. lib. xv. p. 1020. This circumstance shows, that the knowledge of the Greeks, in his age, did not extend beyond the limits of the Mediterranean. The breadth of the Panjab, as it is now called, through which Alexander passed, from Ludhana on the Setlege to Attock on the Indus, is computed to be 250 geographical miles, in a straight line; and his march, computed in the same manner, did not exceed above 200 miles. But in his advance and return, his troops were to spread over the country, and all his movements were so exactly measured and delineated by men of science, whom he kept in pay for the purpose, that he acquired a very extensive and accurate knowledge of that part of India.

Having prepared a fleet, consisting of 80 vessels of three banks of oars, and about 2000 lighter ships and transports, and having offered sacrifices to the gods, he embarked, and at the signal of the sound of a trumpet the fleet began to move. Having arrived at the confluence of the Acenies with the Hydaspes, where the three united streams roll with great rapidity into the Indus, many of his vessels were lost, he himself was in danger, and Nearchus, the commander of the fleet, not a little perplexed. When the danger was past, and the fleet and army were joined, Alexander went to shore; and began his march through a desert country, in order to reduce the Malli and Oxydrace, who were raising forces to oppose him. He surprised them, unprepared and unexpected his arrival; many of them were slain in the field, and the rest fled into the city and shut the gates. In forming their principal city, Alexander, with a romantic valour, which approached to fool-hardiness, scaled the walls, and leaped down into the city, accompanied by only three of his guards. Whilst he personally encountered a severe attack, he was wounded, and fainted among seas of blood; two of his guards, who were themselves wounded, covered him with their shields; till the soldiers from without ascended the walls, threw themselves into the city, and by an act of the
the most undaunted resolution, refused their sovereign; though, when he was carried out upon his shield to the camp, his recovery was very doubtful. As soon as he was able, he rejoined his forces and was received in the camp with great joy.

His first thoughts were now directed to the increase of his fleet; and having accomplished this object, having given order for erecting a city in the commodious situation afforded by the confluence of two great rivers, and having conferred upon Oxyartes, the father of his Roxana, the government of Paropamisus, with some additional territories, he embarked on board his fleet and continued his voyage. But as he proceeded, he was occasionally employed in reducing some Indian princes, who were either negligent in paying him the attention and respect to which he conceived himself entitled, or who actually took up arms against him. Of this number were Muzianus, the soverign of one of the richest and most populous kingdoms in India; Oxyartes, another Indian prince, who was taken prisoner, and Sambas, whose capital Sindomana opened its gates to receive him. Muzianus afterwards revolted; and Alexander directed him to be carried back into his own dominions, to be there crucified, together with all the Brahmins who were about him, and who had infligted him to this revolt. The king next failed to Patala, the modern Tatta, an island formed by two branches of the river Indus, where he ordered an haven and convenient docks to be constructed for his ships; and when he had careened his fleet, he fell down the right-hand branch of the river towards the ocean. As they approached the sea, they were exposed to great danger for want of skillful pilots; and therefore, after having gratified his vanity by entering the ocean beyond the Indus, performing religious rites in honour of Neptune, and surveying two small islands, he returned to Patala. Having surveyed the other branch of the Indus, and found a place of safety for his fleet, he gave directions to Necrathus to conduct the fleet, by the ocean, at the proper season, through the Persian gulf, up the river Tigris, to meet him and his army in Mesopotamia; and he departed with the army in order to march back by land to Babylonia. From the researches of Major Kennell we learn, that the distance of that place on the Hydaspe, where Alexander fitted out his fleet, from the ocean, cannot be less than a thousand British miles. Considering the various operations by which he was retarded, and the slow navigation of such a fleet as he conducted, it is no wonder that he was above nine months before he reached the ocean. When we attend to the various movements of his troops, the number of cities which they took, and the different states which they subdued, he may be justly said to have explored the countries through which he passed.

Alexander, having left Patala, crossed the Arabis, and marched through the country of the Ortes, whose capital he seized and converted into a new and noble city, which he committed to the government of Hephaestion. He then purified his arduous march through Gedrosia; and in the whole of his progress suffered much from sickness, excessive heats and fatigue, and also from famine and thirst; so that he brought back from India the fourth part of his army, which had consisted of 120,000 foot, and 15,000 horse. In these circumstances, trying and distressing as they were, he maintained an invincible resolution and patience, and by his example encouraged the perseverance of his troops.

Having relieved and refitted his army at the capital of Gedrosia, he prepared his march into Caramania, a very plentiful country, where his attendants were amply recompensed for the hardships and fatigues they had endured. Here he punished those governors who were charged with maladministration, some of whom were put to death; and redressed the various grievances which the people had suffered during his absence. He then continued his march through Caramania, and was joined by Neanthes, his admirals; and turning aside to Persia, he visited the tomb of Cyrus, at Pasargadae; ordered Orizes, the governor of Persia, who was charged with many atrocious crimes, to be crucified, and placed Pausias, who had fixed his life in a city of the Malls, in his room; and commanded Baryaxes, a Mede, who had usurped the title and tiara of king, to be put to death. In these marches Calanus, an Indian Brahman, who had accompanied Alexander, finding his health declining, requested to have a funeral-pike prepared; on the top of which he stretched himself at full length, and remained without voice or motion in the midst of the flames.

At Susa, to which Alexander next marched, he put to death Abulites and his son Oxathres, who were charged with enormous crimes in the administration of public affairs; and he attempted to unite the Macedonians and Persians by forming alliances between the noblest families of Persia and the principal persons of his own court; and he himself set them an example by taking two wives of the royal blood of Persia, viz. Statira, the daughter of Darius, and Parysatis, the daughter of Ochus. He also bestowed fortunes on those Persian ladies of high rank, who were married to his own principal officers. He likewise paid the debts of his army; and conferred rewards and promotions on those who had distinguished themselves in his service, without distinction of country.

Alexander, having still a curiosity to see the ocean, and to explore the maritime parts of his empire, went down from Susa upon the river Eukles; and having crossed the Persian gulf to the mouth of the Tigris, went up that river to the army, which was previously encamped, under the command of Hephaestion, on its banks, near the city of Opis. Here he issued an edict that those Macedonians, who were either unable or unwilling to make any more campaigns, might have their discharge, and return home, and that those who chose to remain with him should be duly encouraged. This edict, which was intended to please the army, produced a contrary effect, and excited a mutiny, which was quelled by extraordinary resolution and intrepidity. Whilst the soldiers surrounded the tribunal on which he was seated, all clamouring for their discharge, reproaching him with the favours which he had conferred on the Barbarians, and inflaming their passions against those who had offended them, he leaped into the midst of them, ordered his guards to seize 13 of the ringleaders, whom he pointed out, and commanded their immediate execution. This act terrified them into silence and submission; and then remounting his tribunal, he pointed out to them, in an eloquent speech, the injustice of his own conduct and the folly of theirs. He afterwards promoted the Persian nobility to the principal commands in his army; and by thus seeming to transfer his confidence to them, he humbled the Macedonians, and induced them to deliver up the authors of the sedition, and earnestly to seek reconciliation and favour; which they obtained, and which were succeeded by a solemn festival at which 9000 persons were present.

At Ecbatana, whither he next went, he offered sacrifices, and exhibited sports and games; which were followed by a royal banquet; but his joy on this occasion was unexpectedly interrupted by the sudden illness and death of Hephaestion.
From Ecbatana he marched against the Cœleans, and subdued them; and he then pursued his course towards Babylon, where he formed a variety of projects, for improving the city and extending his dominions. He proposed invading and conquering Arabia, draining the Babylonian fens, and constructing in the city a bath, capable of containing a thousand galleys. But before he could execute any of these grand schemes, he was seized with a fever, which, as some fay, was occasioned, or at least aggravated, by excess of drinking, and which in a few days terminated in his death. He died on the 21st of April, in the second year of the 114th Olympiad, B.C. 323; after he had lived 32 years and eight months, and reigned 12 years and eight months. When his principal courtiers, perceiving his death to be inevitable, asked him to whom he left the empire, he answered, "to the most worthy;" and when Perdiccas enquired at what time they should pray him divine honours, he replied, "when you are happy;" and having pronounced these words, he expired. When Alexander's corpse had been embalmed after the manner of the Egyptians and Chaldeans, Arides, his half-brother, who had been declared king, was appointed to convey it to the temple of Jupiter Ammon. Two whole years (see Appian, lib. xiii. c. 30. tom. ii. p. 688.) were employed in preparing for this magnificent funeral, which made Olympias bewail the fate of her son, who having had the ambition to rank himself among the gods, was so long deprived of burial, a privilege allowed to the mound of mortals. The funeral procession, conducted by Arides, was singularly splendid; and some of our readers may probably be amused by the following brief account of it. It was preceded by pioneers, who cleared the way; and it con- fisted first and principally of a superb chariot in which the remains of the king were conveyed. The naves and spokes of the axle-trees of this carriage were covered with gold, and their extremities, made of gold, represented the muscles of lions biting a dart. It was drawn by 64 mules, harnessed to four draught-beans or poles; and these mules were adorned with crowns of gold, and collars enriched with precious stones and golden bells. On the chariot was erected a pavement of solid gold, 12 feet wide and 18 feet long, supported by Ionic columns; and the inside was ornamented with jewels, diffused in the form of shells. The circumference was beautified with a fringe of golden net-work, to the threads of which were suspended large bells, the sound of which might be heard at a great distance. The external decorations consisted of four relieves. The first represented Alexander seated in a military chariot, with a splendid sceptre in his hand, and surrounded on one side with a troop of Macedonians in arms, and on the other with an equal number of armed Persians; and these were preceded by the king's eunuchs. In the second were seen elephants harnessed, with a band of Indians seated before, and a band of Macedonians, scated behind, and armed for battle. The third exhibited several squadrons of horse in military array. The fourth represented ships prepared for battle. The entrance of the pavilion was guarded by golden lions. The four corners were adorned with statues of gold, representing victories, with trophies of arms in their hands. Under the pavilion was placed a square throne of gold, adorned with the heads of animals, with golden circles round their necks, and to which were attached crowns, glittering with the most brilliant colours, and such as were carried about at the celebration of sacred solemnities. At the foot of the throne was placed the coffin of Alexander, formed of beaten gold, and half filled with aromatic spices and perfumes; and the coffin was covered by a pall of purple, wrought with gold.

The arms of the Monarch were disposed in the manner in which he used to wear them, between the coffin and the throne. The outside of the pavilion was covered with purple flowered with gold; and the top terminated in a large golden crown, resembling a cluster of olive branches. The rays of the sun, which darted on this diadem, as the charriot moved, caused it to emit a kind of rays resembling those of lightning. The charriot was followed by the royal guards, armed and magnificently arrayed. Among the numerous attendants and spectators, who were assembled on this occasion, Ptolemy advanced, with a numerous guard of his best troops, as far as Syrtes, to meet the procession. He prevented their depositing the corpse in the temple of Jupiter Ammon, and caused it to be conveyed, first to the city of Memphis, and thence to Alexandria. Here he reared a magnificent temple to the memory of Alexander, and rendered him all the honours which were aually paid to demi-gods and heroes by Pagan antiquity. Freminhens, in his supplement to Livy (lib. xxxii. c. 65. tom. vi. p. 910 ed. Drakenb.), relates, after Leo Africanus, who lived in the 15th century, that the tomb of Alexander was to be seen in his time, and that it was reverenced by the Mahometans, as the monument not only of an illustrious king, but of a great prophet.

As to the issue of Alexander, we may observe in general, that by Barbina, or Arsinoe, the daughter of Artabazus, and the widow of Memnon, a lady of great beauty and merit, he had a son named Hercules, who was afterwards murdered; by Roxana, the bell beloved of his wives, he had a polthious son, named Alexander, who for a time enjoyed the title of king; by Cleopatra, queen of part of India, he had a son named Alexander, who succeeded his mother in her kingdom; by Statira, the daughter of Darius, he had no children, nor by Parysatis, the daughter of Ochus.

As to the extent of the Macedonian empire, and the distribution of it after his death; see Empire.

As to his person, Alexander was of a middle size, with his neck somewhat awry, with full eyes, and a fierce majestic countenance. Either through tule or vanity he would never suffer any portraiture to be formed of him except by the greatest artists of his age; Praxiteles in sculpture, Ly-ippus in eall metal, and Apelles in painting.

As to his talents and character, they have been diversly appreciated by his biographers. From his more ancient biographers, whose memoirs are in a great measure lost, i.e. Ptolemy's writers have compiled the history of his life, namely, Diodorus Siculus, Plutarch, Arrian, Q. Curtius, and Trogus, abridged by Julian. The Baron de St. Croix, in his "Critical Inquiry into the Life of Alexander the Great by the ancient Historians," which first appeared in the memoirs of the French Academy of Inscriptions and Belles Lettres, and obtained the premium of that society in 1772, and of which Sir R. Chayton published an English translation, with notes and observations, in 1793, has appreciated the merit and veracity of these historians. Historians, says another writer, have considered him either as an enterprising and successful prince, the glory of whose great actions scarcely suffered the blemishes in his personal conduct to be seen, which is the light in which Arrian has placed him; or they make his virtues and vices alike conspicuous, which seems to have been the view of Curtius. Philosophers and moral writers have dealt more freely with him, and have therefore seldom run into high panegyrics, Plutarch only excepted; who in his orations on the fortune and virtue of Alexander, speaks as a rhetorician. The Satirist Lucian hath described him with great spirit and with consummate judgment; but he
he seems to have kept his eye too closely on the latter scenes of his life, when his fortune, not his merit, was at its greatest height. It is justly observed by Livy (ib. ix. e. 18.), that Alexander appears very different, according to the times or feasons in which we consider him. He discovers in him a kind of double Alexander: the one wise, temperate, judicious, brave, intrepid, but at the same time prudent and circumspect; the other immered in all the vanitiments of an haughty prosperity; vain, proud, arrogant, foly; softened by delights, and abandoned to intemperance and excesses; in a word, resembling Darius rather than Alexander, and having made the Macedonions degenerate into all the vices of the Persians, by the new turn of mind, and the new manners he assumed after his conquests. M. Rollin, guided by this clue, contemplates him in two different periods of his life, and corresponding aspects of his character: first, from his youth to the battle of Issus and the siege of Tyre; and secondly, from that victory to his death. In the first period, we acknowledge and admire a happy disposition, cultivated and improved by education. He had a great, noble, and generous soul, which was delighted in bestowing favours and doing service. He was also actuated by a high degree of emulation and love of glory; he was ambitious to exerceeds of body and mind, and to a sober and temperate mode of living. No prince in the world had a nobler education than Alexander; so that he was conversant in eloquence, poetry, polite learning, the whole circle of arts, and the most abstracted and sublime sciences; and in the progress of his years he was a favourite and promoter of literature and the arts, and attached to his train poets, orators, and philosophers. Under Arifotle he enjoyed singular advantages of instruction; nor was he indifensible of their value; and he rendered essential service to science by the presents which he conferred on his preceptor, for enabling him to pursue his enquiries in natural history. He also employed men of talents of every decription, and liberally rewarded them. In the early life of Alexander we perceive and admire the judgment manifested in his conversation with the Persian ambassadors; the wisdom with which he acted as regent during his father's abfence, and by which he pacified the feuds that had broken out in Macedonia; and the valour by which he distinguished himself in the battle of Choronea. The first years of his reign were, perhaps, all circumstances considered, the most glorious of his life. At 20 years of age, he appeased intestine feuds, subjebted foreign enemies, disarmed Greece, when most of its fates were combined against him; and in three years accomplished the plan which his father had projected. For effecting these purpofes, in trepitude and prudence, courage and prudence of mind, those qualities which form the character of the true hero, were indispensable. In the former part of his expedition against Darius, the fame qualities are manifest. When he was scarce 20 years old, with dangers, domestic and foreign, threatening him, with a treasury not only exhausted but encompassed with debts, with an army much inferior to that of the Persians, Alexander turns his eyes towards Babylon and Sufa, and projects the conquest of a vast empire. The swiftnes of the execution corresponded to the wisdom of the project. Having gained the affection of his officers by an unparalleled liberality, and the attachment of his feldiers by cœdence and affability, he astonifhed his enemies by bold enterprizes, terrified them by examples of severity, and won them by acts of humanity and clemency. The paffage of the Granicus, followed by a famous victory; the two celebrated fiegues of Miletus and Halicarnafus, exhibited to Asia a young conqueror, to whom no part of military fe-

ence was unknown. When he allowed to those whom he conquered, and who readily submitted, the enjoyment of their liberties and ancient laws, observers were led to believe, that the conqueror had no other view than to make nations happy, and to procure them an easy and lasting peace. The two battles of Issus and Arbela, with the siege of Tyre, proved, that Alexander possifed the qualities of a great soldier; ftrell in chufing the field of battle; prudence of mind in influing proper orders even in the heat of action; courage animated by pressing dangers; impetuous activity, tempered and guided by caution and circumspection; and an invincible firmness and constancy, neither disconcerted by unforefeen obftacles nor discouraged by difficulties. The circumjance which rages Alexander above most conquerors, and, as it were, above himself, was his conduct toward the mother, wife, and daughters of Darius; all of them princesses, whose beauty was not to be paralleled through the whole of Asia. If this conduct towards the family of Darius had been accompanied with the grant of a peace, which he appledicated on terms so humiliating to himself, and so advantageous to Alexander, the conqueror would have risen still higher in our esteem. Alexander, it is fair, had a soul capable of friendship; he endeavoured himself to his officers and feldiers, by his attention and familiarity; he grieved for them when they were sick, rejoiced in their recovery, and participated in whatever befell them.

If we follow Alexander to the second period of his history, after the battle of Issus, we shall fee the virtues and noble qualities of this prince degenerate on a sudden, and make way for the greatest vices and the most brutal paffions. Was ever enterprife more wild and extravagant than that of crossing the deferts of Libya, and interrupting the course of his victories, in order to purchase a title, that of the fon of Jupiter Ammon, which, in reality, only served to render him contemptible. The drunkennefs and debauchery to which he addicted himself, and the follies and crimes of which he was guilty in his feaons of intoxication, degrade his character, and expose it to just arrhorrence and contempt. What shall we say of his marking his footsteps with fire and blood, of his burning cities and slaughterling their inhabittants? of his burning Peripolis, murdering Clytus, putting Philotas to the torture, disgracing Parmenio, an old, Tried, faithful friend, and putting both father and fon to death, and of permitting Callisthenes, the philosopher, to die in a dungeon, or in a worfe mode? what apology can be made for his wanton cruelties? the devastation of whole countries, the slaughter of millions of inhabitants, the crucifixion of an Indian prince, and the punishment of many Brahamins, whose only crime had been that of encouraging their countrymen to defend their liberties against a lawless invader? well might the Gentoo annals call him "a most mighty robber and murderer." How justly does the author of the fifth book of Maccabees characterize him, by saying that "he butchered kings," καταστραφηκει τα δια 

A L E
dreds of their respective countries, as Q. Curtius calls them) were as free of being recommended as an Aniolot or a Xenophon, and were preferred by this famous hero, even to his own relations and generals. He was not less liberal to fingers, harpers, and pipers; on whom he bestowed at one caroufal, above 10,000 talents, as we may naturally suppose, for chanting his bloody victories and refounding his praise.

If we examine his character as a warrior and a conqueror, and trace his military exploits to their moving spring; it is natural to direct our enquiry to the justice of the war in which he engages, without a regard to which he is not a conqueror and a hero, but an usurper and a robber. If we allow that the Persians were the invaded enemies of the Greeks, what right had Alexander over the great number of nations who did not even know the name of Greece, and had never done or designed him the least injury? The Scythian ambassador spoke justly, when he said: "What have we to do with thee? we never once set foot in thy country. Are not those who live in woods allowed to be ignorant of thee, and the place from whence thou comest? Thou boastest, that the only design of thy marching is to extirpate robbers; and thou stylist, art the greatest robber in the world!" To the same effect was the answer of the pirate, when Alexander questioned him, what right he had to infest the seas? "The fame that thou halt to infest the universe; but because I do this in a small ship, I am called a robber; and because thou art the same part with a great fleet, thou art entitled a conqueror." Upon the principle now stated, what idea ought we to form of Alexander's last conquests? Was ever ambition more extravagant, or rather more furious, than that of this prince? It is related that Alexander, when he was told by Anaxargus the philosopher, that there was an infinite number of worlds, wept in thinking, that it would be impossible for him to conquer them all, since he had not yet conquered one. Val. Max. lib. viii. c. 14. Is it wrong in Seneca, (Nat. Quell. lib. iii. in pr.) to compare these pretended heroes, who have gained renown no otherwise than by the ruin of nations, to a conflagration and a flood, which lay waste and destroy, or to wild beasts that subsist merely by blood and slaughter? Alexander, continues this writer, (De Benef. lib. i. c. 15.) an unjust robber from his youth, a cruel ravager of provinces, an infamous murderer of his friends, makes his happiness and glory to consist in rendering himself formidable to all mortals; forgetting that, not only the fiercest animals, but even the vilest, make themselves feared by their poisons. If the conquests of Alexander are examined in themselves separately from their moving spring, we shall find that they are frequently effected by a kind of valour nearly allied to a boldness that is blind, rash, and impetuous; that has no other guide besides a feeble's ardour for fable glory and a wild desire of distinguishing itself by any methods, let them be ever so unlawful. To form an accomplished general, prudence must soften and direct the too fiery temper of valour; as this latter must animate and warm the coldness and floseness of prudence. Do these characteristicks belong to Alexander? When we follow him to sieges and battles, are we not perpetually alarmed for his own safety, and that of his army? and do we not conclude, that they are every moment upon the point of being destroyed? Plutarch, in pronouncing the eulogy of Alexander, as an accomplished hero, gives a long detail of the various wounds he received; and intimates, that his courage was thus rendered more conspicuous. But it has been observed in praise of Hannibal, that he was never wounded in all his battles. It ought also to be observed, in estimating the character of Alexander, as a conqueror and warrior, what Livy has suggested (lib. ix. c. 17.), who were the enemies with whom he combated. "Had he marched," says this writer, "against the Romans, he would soon have found, that he was no longer combating against a Darius, who, encompassed with gold and purple, the vain equipage of his grandeur, and dragging after him a multitude of women and eunuchs, came as a prey rather than as an enemy; and whom Alexander conquered without much blood, and without wanting any other merit, than that of daring to despise what was really contemptible. He would have found Italy very different from India, through which he marched in a riotous manner, his army quite stupefied with wine; particularly when he should have seen the forests of Apulia, the mountains of Lucania, and the still recent footsteps of the defeat of Alexander his uncle, king of Epirus, who there lost his life." Alexander, therefore, partly owed his conquest to the weaknesses of his enemies. After all it cannot be denied, that Alexander possessed very great qualities: but they were those which were fitted to inspire admiration rather than esteem; while the worst rendered him a pest of mankind, and refembled him, as an excellent biographer observes, "to one of those baleful meteors, which dazzle as they fly, but ruin where they fall." He possessed talents, says Dr. Robertson, (Hist. Amer. vol. i. p. 20.) which, notwithstanding the violent passions that incited him, at some times, to the wildest actions and the most extravagant enterprises, fitted him not only to conquer, but to govern the world. If we throw into the scale of his errors and vices, the presumptuous idea he entertained of his merit; the high contempt he had for other men, not excepting his own father; his ardent thirst of praise and flattery; his ridiculous notion of fancying himself the son of Jupiter; of ascribing divinity to himself; of requiring a free, victorious people to pay him a servile homage, and to prostrate themselves ignominiously before him; his abandoning himself to flamefully to wine; his violent anger, which rives to brutal ferocity; the unjust and barbarous execution of his bravest and most faithful officers, and the murder of his most worthy friends in the midst of feasts and carousals: Can any one, says Livy, (lib. ix. c. 17.) believe, that all these imperfections do not fully the reputation of a conqueror? But Alexander's frantic ambition, which knew neither law nor limits; the rash intrepidity with which he braves dangers, without the least reason or necessity; the weaknesses and ignorance of the nations, totally unskilled in war, against whom he fought; do not these curvate the reasons for which he is thought to have merited the surname of Great, and the title of Hero? Rollin, in clozing the estimate of Alexander's character, observes, that we do not find that he possessed the first, the most essential and most excellent virtues of a great prince, so as to be the father, the guardian, and shepherd of his people; to govern them by good laws; to make their trade, both by sea and land, to flourish; to encourage and protect arts and sciences; to establish peace and plenty, and not suffer his subjects to be in any manner aggrieved or injured; to maintain an agreeable harmony between all orders of the state, and make them confpire, in due proportion, to the public welfare; to employ himself in doing justice to all his subjects, to hear their disputes and reconcile them; to consider himself as the father of his people, consequently as obliged to provide for all their necessities, and to procure them the several enjoyments of life. He adds, Alexander seems possessed of such qualities only as are of the second rank.
ignominious death. By these guards Alexander was advanced to the throne, A. D. 221. The Senate concurred, and immediately invested him with the various titles and power; annexed to the imperial dignity. At the same time they offered him the name of Antoninus, and the surname of Great; but these he modestly declined. Alexander was a diletant and dutiful youth, of only 17 years of age; the reins of government were in the hands of his mother and grandmother; and after the death of the latter, Mama remembered the sole regent of her son and of the empire. With her consent he married the daughter of a patrician, who afterwards became the object of her jealousy and cruelty, and was banished by her indulgence, which Alexander durst not oppose, into Africa. It has been said, indeed, by Lampridus, that the father was detected in a conspiracy, and that the repudiation of the daughter was the consequence of his crime. But Herodian represents him as innocent. Under her direction, and with the approbation of the Senate, a council of State was appointed, consisting of 16 of the wisest and most virtuous senators. At the head of this number, as praetorian prefect, was Ulpian, distinguished by his knowledge and respect for the laws of Rome; and the prudent formula of this arbitration restored order and authority to the government. The city, by their influence, was purged from the superfetation and luxury, which Helogobalas had introduced; his worthless creatures were also removed from every department of public administration; and their places were supplied with men of virtue and ability. Learning, and the love of justice, became the only recommendations for civil offices. Valour, and the love of discipline, were the only qualifications for military employments. But the most important object of Mama's solicitude was that of forming the character of the young emperor. His excellent understanding encouraged cultivation, and led him daily to value the advantages of virtue, the pleasures of knowledge, and the necessity of labour. The natural mildness and moderation of his temper prevented him from the allurements of passion and the allurements of vice. His unalterable affection for his mother, and his respect for the wife, Ulpian, guarded his inexperienced youth from the poison of flattery. As Mama had probably embraced the profession of Christianity, it is no wonder that Alexander was very indulgent to the Christians, and would not suffer them to be persecuted on account of their religious tenets. He himself seems to have been well acquainted with the Christian morals; for he frequently repeated the golden rule of the gospel, “Do as you would be done by,” cau sed it to be inscribed over the gates of his palace, and on several public edifices; and observed it in his own conduct, with the greatest exactness.

The simple journal of his ordinary occupations,” says a popular historian, “exhibits a pleasing picture of an accomplished emperor, and with some allowance for the difference of manners, might well deserve the imitation of modern princes. Alexander rose early; the first moments of the day were consecrated to private devotion, and his domestic chapel was filled with the images of those heroes, who, by improving or reforming human life, had deserved the grateful reverence of posterity. But, as he deemed the service of mankind the most acceptable worship of the gods, the greatest part of his morning hours was employed in his council, where he discussed public affairs, and determined private causes, with a patience and discretion above his years. The dryness of business was relieved by the charms of literature; and a portion of time was always set apart for his favourite studies of poetry, history, and philosophy. The works of Virgil and Horace, the republics of Plato and Cicero,
formed his taste, enlarged his understanding; and gave him the noblest ideas of man and government. The exercises of the body succeeded to those of the mind; and Alexander, who was tall, active, and robust, surpassed most of his equals in the gymnastic arts. Refreshed by the use of the bath and a light dinner, he resumed, with new vigour, the business of the day; and, till the hour of supper, the principal meal of the Romans, he was attended by his secretaries, with whom he read and answered the multitude of letters, memorials, and petitions, that must have been addressed to the master of the greatest part of the world. His table was served with the most frugal simplicity, and whenever he was at liberty to consult his own inclination, the company consisted of a few select friends, men of learning and virtue, amongst whom Ulpian was constantly invited. Their conversation was familiar and instructive; and the pauses were occasionally enriched by the recital of some pleasing composition, which supplied the place of the dancers, comedians, and even gladiators, to frequently summoned to the table of the rich and luxurious Romans. The deeds of Alexander was plain and modest, his demeanour courtly and affable; at the proper hours his palace was open to all his subjects: but the voice of a critic was heard, as in the Eleusinian mysteries, pronouncing the same inhuman admonition; "Let none enter these holy walls, unless he is conscious of a pure and innocent mind."

His kindness, through a prince of sound judgment and good disposition, and though he owed many of the excellencies he possessed to her wisdom and attention, was more fond of pomp than himself; and did not approve the plainness and popularity of his behaviour. "Take cars," said she to him one day, "you weaken not your authority, and render it contemptible.

"I render it," he answered, "more secure and more durable.

While he was kind, and sometimes severe, in his administration of public justice, and in the punishment of those who oppressed the public, he was naturally mild and gentle: and though he practised rigid economy, and exercised self-denial in every thing that pertained to his own gratification, he was liberal and beneficent. In the course of his reign he made three general distributions of provisions to the people, and three large legacies in money to the soldiers. To the indigent and distressed he gave lands, flocks, cattle, and all necessary implements of husbandry; rightly judging, that this mode of exercising his liberality was more beneficial and less humiliating than the giving of gold and silver. If he granted pecuniary assistance, it was by way of loan; and he established a bank, where all who wanted money found it at a moderate interest, and on some occasion he lent without interest. It was a saying of this emperor; "Imperium in virtute, non in decore;" i. e. "The majesty of the empire consists in virtue, and not in an ostentation of riches." Although he was very religious, his offerings in the temples were not magnificent. He often repeated the words of Persius (Sat. ii. v. 69.) "In facro quid facit aurum?" "What has gold to do with Sacred things?" His respect for virtue extended to the dead, as well as to the living. Accordingly he collected in Trajan's statue the statues of the desirous emperors of Rome, and of the famous Roman commanders, and adorned them with inscriptions, setting forth their great exploits and eminent virtues. In his palace he had two chapels, in which the principal objects of his veneration were ranged in two classes, the one destined to virtue, and the other to talents. In the first were placed the good emperors, among whom he very erroneously ranked Alexander the Great; and next to them the wise men, by whose salutary lessons mankind had been benefited; and here were blended Abraham, Orpheus, Apollonius Tyaneus, and Jesus Christ. The second chapel was devoted to military heroes, and men conspicuous in the republic of letters, Achilles, Cicero, Virgil, whom he called the Plato of the poets, and some others. In order to encourage the progress of letters and of science in general, he allotted pensions to rhetoricians, grammarians, physicians, architects, men skilled in mechanics, and even to alchemists and astrologers. He established schools for all these arts, and provided for the instruction of the poor without expense to them. His life, however, has not been free from blemishes. His preference for his mother was considered as carried to a culpable excess, more especially as she, with all her good qualities, was addicted to vanity and avarice. He gave her name to several buildings, which, as we learn from Annalinius Marcellinus (lib. xxvii. p. 372.), they retained in the fourth century; and caused her to be honoured with the title of Augusta, mother of her country, of the armies, and of the Senate. He was also charged, and not altogether without foundation, with being of a voluptuous and inquisitive temper; and with being inclined to vanity; which latter weakness he indicated by his aversion of praise and his affectation of being regarded as a Roman and of the family of Marcelli, and not a Syrian. His timidity likewise betrayed him into imbecility of conduct; particularly with reference to the praetorian guards, who by their mutiny produced a civil war in Rome, that lasted three days, and that terminated in the massacre of Ulpian. Although this wife man, who was the friend of the laws and of the people, sheltered himself from theeditious rage of this class of perfons in the emperor's palace, and was murdered even in his presence, he had not resolution sufficient to avenge this atrocious crime in the manner it deserved. Such indeed was the weakness of government, that the tyranny of the army threatened with inftant death his most faithful ministers, provided that they were only suspected of an intention to correct their intolerable disorders. The historian Dion Cassius, who had commanded the Pannonian legions with a spirit of ancient discipline, and whom the emperor recompensed by appointing him his colleague in the consulship, was compelled to retire, by his advice, from the city, and to spend the greatest part of his consulship at his villas in Campania, and the remainder of his days in Bithynia, his native country. Dion. Cafl. Hift. lib. lxxx. p. 1371.

On another occasion, however, he manifested a becoming firmness and magnanimity. When some of the soldiers at Antioch had excited a sedition in the legion to which they belonged, and interrupted his mild expostulations by their clamours, he addressed them in the following dignified and spirited language: "Refrce your spirits, till you take the field against the Perians, the Germans, and the Sarmatians. Be silent in the presence of your sovereign and benefactor, who bestows upon you the corn, the clothing, and the money of the provinces. Be silent, or I shall no longer bear you soldiers, but citizens: if those indeed who disclaim the laws of Rome deferve to be ranked among the menial of the people. When their branded arms threatened even his person; "your courage," he exclaimed, "would be more nobly displayed in the field of battle; me you may defy; you cannot intimidate; and the severe justice of the republic would punish your crime, and revenge my death." The clamour continuing, the emperor, with a loud voice, pronounced the decisive sentence: "Citizens, lay down your arms, and depart in peace to your respective habitations." Such was the effect of the sentence, that the clamour was instantly silenced; the soldiers confessed their crime, and supplicated forgiveness; nor were they returned to their rank in the army, till he had punished with death those
A L E

those tribunes, whose connivance had occasioned the mutiny. The grateful legion served the emperor, whilst living, and revenged him when dead. The difference of his temper and conduct on the occasions above recited must be ascribed to the different vigour of mind, which he possessed in his youth and in his ripen age. When he became capable of taking the government into his own hands, and of exerting his genius and courage, no prince could more effectually command the awe, as no one ever more deferved the love, of his soldiery. It was a frequent declamation of Alexander, "the soldier does not fear his commanders, unless he be fed and clothed, and has some money in his purse." And whilst he furnished them with mules and camels to carry part of their baggage in their marches, he used to say, "that he took more care of his soldiers than of himself, because it was on them that the welfare of the republic depended;" and he perfected the plan which other emperors had concerted for securing to the troops a decent and comfortable retreat in their old age.

Whilst Artaxerxes, the restorer of the Persian monarchy, was preparing to invade the Roman dominions, Alexander sent ambassadors in order to diffuse him from engaging the two empires in a long and dangerous war. The mission was received with contempt; nor did any of Alexander's remonstrances avail to prevent the Persian monarch from ravaging Mesopotamia and entering Cappadocia. The emperor, therefore, resolved to march against him in person. In the spring of the year 233, Alexander, with an army of the prætorian guards and part of the hardy legions of Europe, advanced towards the frontiers of the Roman dominions to meet the great king, which was the haughty style assumed by Artaxerxes in his embassies; whose force conflicted, as history, fiercely credible, reports, of 120,000 horse, clothed in complete armour of steel, of 700 elephants, with towers filled with archers on their backs, and 1800 chariots armed with spears. Of the event of the battle which ensued, historians have given very contradictory accounts. Herodian affirms, and Mr. Gibbon acquiesces in his account, that the plan of Alexander for the conduct of the war, however judiciously concerted, totally failed. The emperor himself, influenced by his mother's counsels, and perhaps by his own fears, deserted the brave troops and the fairest prospect of victory; and after continuing in Mesopotamia an inactive and inglorious summer, led back to Antioch an army diminished by sickness and provoked by disappointment. But the Persian monarch, in several obstinate engagements against the veteran legions of Rome, lost the flower of his troops; and instead of expelling the Romans from the continent of Asia, found himself unable to wrest from their hands the little province of Mesopotamia. Crevier and many other modern writers chafe rather to follow Lampridius, whose account is entirely different from that of Herodian. The Persians, says this last author, were totally defeated, and Alexander approved himself an intrepid soldier and a skillful general. The great king fled before his valour; an immense booty and the conquest of Mesopotamia were the immediate fruits of this signal victory. Alexander, it is said, having taken care to guard Mesopotamia with several well garrisoned forts, returned to Rome. A. D. 254, to give the senate an account of his exploits, and was received by persons of all ranks with the greatest demonstrations of joy; and obtained a signal triumph. His triumphal car was drawn by four elephants; the air resounded with acclamations, and the shouting attendants unceasingly exclaimed, "Rome is happy, whilst the sees Alexander alive and victorious."

Soon after his triumph, Alexander, accompanied by his

mother, marched against the Germans, who had passed the Rhine, and who were making incursions into every part of Gaul. Upon his arrival in Gaul, he sent ambassadors to the barbarians in order to treat with them; and if Herodian may be credited, to purchase peace, which he preferred to the precarious Ihms of a war. Having passed the winter in the neighbourhood of the Rhine, he employed himself in introducing discipline among the licentious legions of Gaul. His attempts for this purpose produced different in the army, which were aggravated by a peron, originally a barbarian of mean origin, whose father was a Goth and mother an Alan, and who had been raised from the lowest station to the rank of a general officer. This peron was proclaimed emperor by the seditious soldiery; and made his way to the throne by the massacre both of Alexander and his mother. This event happened on the 19th of March, A. D. 235, when Alexander was in his 27th year, and after he had reigned 13 years. The untimely death of Alexander was universally regretted. The soldiery, who were not concerned in the plot, manifested their repentance by a speedy vengeance in immediately killing the murderers of their prince. The senate decried both to him and his mother divine honours; appointed for them altars, prayers, and sacrifices; and invested, in honour of the deceased emperor, an annual feast, which was celebrated on the first of October, the day of his nativity. Crevier's Rom. Emp. vol. viii. Book xxiv. p. 275-350. Anc. Uni. Hist. vol. xii. p. 432-449. Gibbon's Hist. vol. i. p. 238, 249, 337. vol. ii. p. 450.

Alexander Ægeus, a disciple of Sofogenes, and preceptor of Neo, by whom he is said to have been corrupted, is known as the author of a commentary on Aristotle's Meteorology; which has been attributed to Alexander Aphrodisius. Suidas. Fab. Bib. Graec. lib. iii. c. 11.

Alexander Ætolus, a grammarian of Pleuron, in Ætolia, was contemporary of Aratus, and celebrated among the seven writers of tragedy, called the pia alae in the time of Ptolemy Philadelpius. He also wrote elegies, cited by Athenæus (lib. xiv. p. 669.), and other poems, commended by Servius on the 10th Æanid of Virgil, and referred to by Athenæus (vi. p. 283. 296.) Suidas. Fabr. Bib. Graec. lib. ii. c. 19.

Alexander Aphrodisius, so called from a city of Caria, where he was born, was an eminent philosopher of the school of Aristotle, at the close of the second or beginning of the third century. He was appointed public professor of the Aristotelian philosophy under the Roman emperors, Septimius Severus and Caracalla; either at Athens or Alexandria, and dedicated the first fruits of his labours, which is an excellent treatise, "On Fate," affording the doctrine of Divine Providence, to these emperors. He was supposed to have so well understood the speculations of his master, and to have so satisfactorily explained them, that he was respected by his contemporaries as an excellent preceptor, and followed by succeeding Aristotelians among the Greeks, Latins and Arabsians, as the chief interpreter of Aristotle. He obtained the appellation of "The Commentator," on account of the number and value of his Commentaries. Hottinger and Herbelot affirm, that Arabic translations of his commentaries are still extant. In his book concerning the soul, he maintained, that it is not a distinct substance by itself, but the form of an organized body: he denies its immortality, and affirms, that to maintain the possibility of its excising separately from the body, was as absurd as to say that two and two make five. The works of this philosopher full extant are his book "De Fate," published from the press of Aldus, at Venice, in 1534, with a translation by Guilius, 12mo. at Amster-
dam, in 1638; and in London, with a new Latin translation, in 1688, 8vo. his Commentaries on Aridotle's Topics, Analytics, Metaphysics, Physics, Rhetoric, &c. first published at Venice, in the 16th century, and many of them afterwards reprinted in different places; but since the study of Aristotle has been neglected, his best commentator is forgotten. The principal of his medical works is his "Treatise on Fever," translated into Latin by Valla, of which Haller has given an analysis; Bib. Med. Pract. vol. i. p. 227. Faby. Bib. Grec. vol. iv. c. 25. Brucker's Philol. by Enfield, vol. ii. p. 102.

Alexander, Cornelius, harbored Polyhlfos, on account of the numerous histories written by him, a celebrated historian and grammarian, was born, according to Suidas, at Miletus; but, according to others, at Cotyæum, a city of Phrygia, and having been a slave, was sold to Cornelius Lentulus, to whom he was preceptor; and from whom he obtained his freedom and the name of Cornelius. He flourished about 80 years before Christ. From Suidas we learn, that he was the disciple of Crates, and that he was at Rome in and before the time of Sylla. He perished in the flames of his house at Laurentum; and his wife became distracted by the event, and hanged herself. Suidas further adds, that he wrote innumerable works; and particularly live books concerning Rome, in which he says, that a Hebrew female, called Mofa, was the author of the Hebrew law. His works in history and philosophy are cited by Plutarch, Laertius, and other ancient writers. Clemens Alexandrinus (Strum. lib. i. tom. i. p. 356, ed. Potter) cites a book concerning the Jews, in which Alexander mentions letters of Solomon to Vaphres, king of Egypt, and to the king of the Phoenicia of the Tyrians, and their respective answers. He refers also (tom. i. p. 538.) to remarks made by Alexander on the mode of living in use among the Indian Brachmans; he reports (tom. i. p. 357.) from a book of Alexander concerning the Pythagoric Symbols, that Pythagoras was a disciple of Nazaratus, an Assyrian, erroneously supposed by some to be the same with the prophet Ezekiel, and that he had also received instruction from the Galli and Brachmans. Eusebius, (in his Prep. Evang., lib. ix. c. 17.) makes a long extract from Alexander's book concerning the Jews, and extols the author's well-known great ingenuity and various learning. This is probably the work referred to by Justin Martyr, in his "Exhortation to the Greeks," when he mentions those who represent Moses as the leader of the Jews. Plutarch (de Mufca, Op. tom. ii. p. 1132.) and Athenæus (lib. xi.) speak of him as a writer in music; and his acquaintance with natural history may be inferred from Pliny's frequent references to his works. Fabr. Bib. Grec. lib. v. c. 38. tom. ix. p. 439.

Alexander Pseuephontis, an artful and prodigal impostor, was born at Abonotichos, in Paphagonia, and practised his delusions in the reign of the emperor Aurelius, towards the close of the second century. He poiffed himself by nature a variety of talents and accomplishments, by the misapplication of which he was qualified for imposing upon the credulity of the vulgar. Delitute of principle, he engaged with a countryman and disciple of Apollonius Tyaneus, who, under the mask of a medical profecion, exercised the trade of an impostor and magician, and deluded those who applied to him by pretending to reveal secrets in concerns of love, and of lost and hidden property. Alexander was an useful servant and an apt scholar; and when his master died, piffed his leisons and followed his trade. Such was his success, that he infatuated a rich Macedonian woman, and induced her to follow him and his associate from Bithynia to Macedon and to Pella, to contribute by her fortune to their support. Having procured, in the neighbourhood of Pella, one of those large serpents, which are perfectly harmless and very tractable, and with which that country abounds, they determined by means of this animal to establish an oracle, which should impose upon those persons who were eager to gain the knowledge of futurity, and who by their credulity were susceptible of delusion. In their way to Abonotichos, the proposed scene of their operations, they visited Chalcedon and formed a party, by whose assistance they had access to the temple of Apollo, where they hid tablets of brass on which it was written, that Ateulpis, with his father Apollo, would soon make Abonotichos the place of their residence. The inhabitants of this place were so completely delled, that they laid the foundation of a temple to Ateulpis, with whose presence they expected soon to be honoured. Alexander, by a pretended oracle, caused himself to be declared a descendant of the hero Perius, and the son of Podalirius, which his stupid countrymen believed, though they well knew that his father and mother were perfoms of the meanest condition. With a drefs and accompaniments, suited to this high original, he entered his native town. Having hidden a goose's egg, in which he had put a young serpent, near the foundations of the temple, and having previously performed a variety of superstitious ceremonies, he went with a crowd of attendants in search of his egg; and when he had found it, he declared that Ateulpis, who was worshipped under that form, was actually arrived, and the people received him with acclamation. Alexander proceeded with his imposture by exhibiting his serpent, prepared for the purpose, to the deluded multitude, who believing himself possessed of the power of working miracles, and misled by his affected enthusiasm, were suitably disposed for every thing that followed. From Abonotichos the delusion spread through all the neighbouring nations, and the people fainted from Galatia, Bithynia, and Thrace, to see the new god, whom the prophet called Glycon. Money was procured to finish the temple, and the god was to make it the place of his abode, and to give oracular answers to those who consulted him. The oracle was confuted by a billet, which Alexander contrived to open secretly; and he adapted the answer to the purport of its contents. By degrees he made his god pronounce oracles with his own voice, by the assistance of a person that was concealed behind him; and these oracles were delivered only to the rich and powerful. This practice became a gainful trade, and the impostor derived from it a yearly income, which amounted to 7 or 800 thousand drachmas, and which enabled him to live sumptuously, and to purse those debaucheries to which he was inclined, and to which he had been habituated from his youth. It was not long before the reputation of this profligate reached Rome; and Rutilianus, a superflitious fanot of the first rank, was deceived by him, and thus the number of those who consulted him was prodigiously augmented. Rutilianus, who believed the doctrine of the transmigration of souls, desirous of being informed under what form he had lived in former ages, and whose soul he now poiffed, received an answer which served him as a basis for a numerous and the impostor, which gave him such influence over the crudulous fanot, that he converted many others to his belief, and induced them to be exalted to the rank of the gods. Lucian, who blends fiction with his humorous account of Alexander's impostures, relates, among other instances of his delusion, the following incident. Rutilianus, having procured for him access to the emperor, delivered him an oracle, commanding that, in the war between Marcus Aurelius and the Quadi and Marcomanni, two lions should be thrown alive into the Iler, with speics and a fucces, and promising, that the consequence would be victory, glory and peace. The order was exeuted, and
and the kings, who swam on shore into the enemies' country, were destroyed; but the Romans were soon afterwards totally defeated. Alexander, for preferring his reputation, calmly said, that the oracle had foretold a victory, but had not declared whether it would happen to the Romans or their enemies.

Amidst the successes of Alexander, he found himself attacked by two classes of adversaries, who determined to unmask his imposture. These were the Christians and the Epicureans. In order to counteract their influence, he began the ceremony of the pretended mysteries, which he instituted in imitation of the Eleusinian, with proclaiming, "Hence all Christians!" and the choir rejoined, "Hence all Epicureans." He also often repeated, that Pontus was full of Atheists and Christians, and that these enemies of the gods ought to be forestalled; and what he advised, he endeavoured more than once to execute. Lucian, who once endeavoured to enslave him, had nearly lost his life in the attempt. The impostor, however, determined to destroy him; and with this view he received him politely, and, at his departure, made him presents, and furnished him with a veil and rovers. When he was at sea, he observed the pilot weeping, and disputing in a mysterious manner with the seamen. At length the honest pilot disclosed the secret, and with great concern informed Lucian, that he had received orders to throw him into the sea; but that he had lived with honour for 60 years, and that he could not prevail with himself to render his old age infamous, and incur the displeasure of the gods by murder. Lucian was put on shore, and escaped the villainy of the impostor. This delusion lasted 20 years; but it is said, that Alexander terminated his life in a tragic manner; being destroyed by worms, which proceeded from a mortification in the foot, leg, and thigh. Lucian's Alexander feu Pseudomantis apud oper. tom. ii. p. 207. Crevier's Rom. Em. vol. vii. p. 346—357. See imposture and truth admirably contrived in the character and conduct of St. Paul, and this Alexander, by Lord Lyttelton in his "Conversion, &c. of St. Paul," Works, vol. ii. p. 54, &c. 8vo.

Alexander the Sophist, was born in Seleucia, a city of Cilicia, and educated under Favorinus, Adrian's great favourite, who taught him the art of speaking, in which he excelled, and for which he is highly commended by Philostratus. The first office he filled was that of ambassador from Seleucia to the emperor Antioch; and he was afterward interpreter for the Greek tongue to M. Aurelius. He spent the greatest part of his life in the schools of Antioch, Rome, and Tarus; and he visited almost all the parts of Egypt. Whilfe he was at Athens he acquired great fame by the extemporaneous orations which he delivered, and received very distinguished tokens of favour from Herod. He died, as some say, in Gaul, but according to others in Italy, at the age of 65, or by some accounts, 68 years. Philostratus de Vitis Sophitarum, apud oper. p. 570. ed. Olearii.

Alexander Trallian, a learned and ingenious physician of Tralles, a city of Lydia, flourished at Rome in the time of the emperor Julian, about the middle of the sixth century. Friend is very copious in his account, and profuse in his encomiums on the works of this great man, whom he considers as one of the best practical physicians among the ancients.

Like Hippocrates he travelled over various countries, over Italy, France, Spain, and Egypt, to improve himself in knowledge; and is said to have acquired a competent acquaintance with the languages of the different countries through which he paffed. He invented several compositions, and improved many of those in common use. He was liberal in administering preparations of iron, internally, which before his time was little, if at all, done. He followed the practice of Hippocrates and Galen, though not servilely, but as preferring it to that of Attius and Orbadius, with whose works he appears to have been well acquainted. He was not however free from some of the errors of the age in which he lived, being credulous and superstitious, and having great faith in charms and amulets. He has given no account of the diseases peculiar to women, which Friend justly thinks, confidering the general estimation he was in, and the extent of his practice, is very singular.

His works were first printed in Greek by Robert Stephens, at Paris, 1548, in folio; in Greek and Latin, at Ba&ep, 1556, Julian. Guinthero Interpretae. For an account of various other editions, see Haller's Bib. Med. Prac. vol. i. p. 305.—Haller's edition was printed at Lyons, in 1774.

Alexander Janneus, king of the Jews, was the third son of Hyrcanus, and succeeded his brother Aristobulus in the year before Christ 106. Queen Salome, the widow of Aristobulus, took him and his two brothers out of prison, and placed Alexander on the throne. His fourth brother endeavoured to deprive him of the crown, and was put to death; but the youngest, whose name was Abfalom, was favoured with his protection, as long as he lived. Alexander, being a subtle and warlike prince, began his reign with leading an army against Ptolemais; but his own dominions being invaded during his absence by Ptolemy Lathyrus, he was obliged to raise the siege and return to defend them. On the banks of the Jordan he was defeated, with the loss of 30,000 men, besides those that were taken prisoners, and if he had not been succoured by Cleopatra, Lathyrus would have forced his way into Judæa. Alexander, after an interview with Cleopatra at Ptolemais, returned to Jerusalem; and having recruited his broken army, he marched against Gadara and took it. He next proceeded against Amathus, and reduced it after a very short siege; but he was soon obliged to relinquish it in consequence of a defeat by Theodotus, the son of Zeno, tyrant of Philadephia, in which he lost many men, his baggage, and the whole of the treasure which he had taken possession of at Amathus. The next place against which he directed his arms was Gaza, which had afforded protection and asilance to Lathyrus; and on this account, as soon as the town was betrayed to him, he revenged himself on the inhabitants after leading them to exspect clemency and moderation, by abandoning them to the fury of his soldiers. However, this act of vengeance, executed with singular severity, provoked the citizens to refit to the utmost of their power; so that he lost of his own men as many as he destroyed of the enemy. He then reduced the city to a heap of ruins. On his return to Jerusalem, the people, exasperated by the Pharisees, who were constantly caballing against him, insulted him with the most opprobrious language, exclaiming that such a flave as he was unworthy of either the pontifical or regal dignity, and proceeded even to violence against his person. Although he took effectual measures to secure himself from further insult and injury, he was wearied with their clamours and marched out of Jerusalem, in order to gratify his inclination for war. Having taken and destroyed the city of Amathus, he proceeded against the Arabians, whom he subdued, and then laid the Moabites and Mountaineers of Gilead under tribute. Near Gadara he fell into an ambush, and it was with great difficulty that he escaped and regained his own capital. During his absence, his inverte enemies, the Pharisees,
caused a rebellion, which brought on a civil war, that lasted six years. Demetrius, surnamed Eucaerus, assaulted the rebels with a considerablc force; and after some previous skirmishes Alexander was defeated, and forced to retire for shelter to the mountains. This defeat, however, induced the Jews who had joined Demetrius to defect him, and join the army of Alexander; and Demetrius, alarmed by this defection, left Judea. This circumstance afforded Alexander an opportunity to march against the rebellions Jews; but though he defeated them in every engagement, the fury of their resentment continued till a decisive battle put an end to the war. In this last action he cut off the greatest part of their army, and drove the rest into Bethome, which he besieged and captured. Josephus, who being a zealous Pharisee, may possibly have exaggerated, informs us, that he caused 800 of the principal captives to be carried to Jerusalem, where they were all crucified at the same time and place; and that whilst they were hanging on the crosses, he ordered their wives and children to be butchered before their faces. It is added by the historian, that a banquet was prepared for himself and his comhunists, so near to this horrible scene, that they might behold and enjoy the torture and diffrets of the sufferers.

After this event, the rebels dispersed; nor were the Pharisees able to make any effort against him as long as he lived. The succeeding years of his life were employed in extending his conquests through Syria, Idumea, Arabia and Phoenicia; and in establishing his character as a warlike and victorious prince. His return to Jerusalem, after an expedition of three years' continuance, was the occasion of loud acclamations on the part of his subjects. But from this time he devoted himself to drinking and other debaucheries; which at length brought on a quartan ague, that prevailed till the day of his death, which happened about three years after his return. His ambition for making new conquests still continued; but his strength being exhausted both by fatigue and intemperance, he died in his camp before Regaba, a fortress in the Gerasene territory beyond Jordan, which he was besieging, in the 27th year of his reign, in the year before Christ 70. He left two sons, Hyrcanus and Aristobulus; but decreed by his will, that his wife Alexandra should govern the kingdom during her life, and appoint for her successor either of them, according to her own pleasure. Alexandra, by conciliating the Pharisees, according to the advice of her husband, secured their influence with the people; so that they celebrated the funeral of the deceased king with great pomp, and confirmed her as a sovereign administratrix of the nation. Her eldest son Hyrcanus was appointed high priest, and the direction of all affairs of importance was committed to the Pharisees. Their resentment against those who had opposed him in the late reign still continued; and they contrived every method that was practicable for destroying them. This conduct, to which they faw no end, induced them to assemble, and with Aristobulus at their head to wait on the queen and to implore her protection. The queen, having forborne herself and the government to the Pharisees, could devise no means for their liberty, that were likely to be effectual. At length she complied with their request, and confented that they should disperse themselves into places where he had garrisons. In the year before Christ 70, Alexandra was feized with a disorder which threatened her life; and when Aristobulus perceived her danger, he repaired to his friends, in the garrisoned towns, and they arranged themselves in great numbers under his standard; hoping that he would exert himself for abolishing the odious and oppressive tyranny of the Pharisees, and well knowing, that no service of this kind could be expected from his brother Hyrcanus, who had been educated by his mother in a blind submission to this fact. The Pharisees were alarmed, and accompanied Hyrcanus to the queen, in order to represent what had occurred, and to demand her assent. The impaired state of her health would not admit of her interference, and leaving the care of the government to them, she appointed Hyrcanus her heir general, and soon after expired. Accordingly he took possession of the throne, and raised an army to oppose his brother, who was supported by the people. A battle near Jericho decided the quarrel. Hyrcanus, abandoned by the greatest part of his troops, who went over to his brother, was obliged to fly to Jerusalem, and afterwards to seek an asylum in the castle of Baris, whilst his partisans, who were chiefly of the sect of the Pharisees, took refuge in the temple. In a little while they, as well as Hyrcanus, submitted to Aristobulus, and in the year before Christ 69, he obtained both the high-priesthood and the crown. Josephus Ant. lib. iii. c. 12—15. tom. i. p. 666—675. Bell. Jud. lib. i. c. 4. tom. ii. p. 59—62. Anc. Un. Hist. vol. iii. p. 114—123. Rollin's Anc. Hist. vol. viii. p. 4—11.

Alexander, Balas, king of Syria, was, as some say, the natural son of Antiochus Epiphanes, but according to others, a young man of mean extraction at Rhodes, named Balas, surnamed by Heracleides, at the instigation of Ptolemy, Attalus, and Ariarathes, to perforate the son of Antiochus Epiphanes, and under that title, to lay claim to the crown of Syria, in opposition to Demetrius. After he had been acknowledged by the three kings above-mentioned, Heracleides, who conducted the imposture, took him to Rome, in the year before Christ 153, and together with him Lacedaemon, the real daughter of Antiochus Epiphanes, and presented them to the senate, who received them graciously, and passed a decree in their favour; though, as Polybius affirms, (Lagat. xxiii. p. 966,) the whole city was convinced of the imposture. The senate not only acknowledged Balas under the assumed name of Alexander, but decreed, that their allies should affix him in his endeavours for recovering the rights of his father. Thus countenanced by the Roman senate, he landed in Syria, and found no difficulty in raising troops, which, together with the succours afforded him by Ptolemy, Attalus and Ariarathes, enabled him to make himself master of Ptolemais, the reduction of which induced a great number of perfons who were disaffected to Demetrius to join him. Demetrius and Alexander were competitors for the favour and support of Jonathan, who had succeeded Judas Macabeus in the command of the Jewish forces, and strove to outvie each other in their alluring offers. Alexander, however, prevailed; and with him Jonathan formed an alliance. These two competitors took the field at the head of their respective armies; and though Alexander was defeated, he maintained his ground; and being supplied by his powerful allies with fresh succours, he succeeded in a second battle, in which Demetrius was killed, before Christ 150. Alexander, having gained possession of the whole Syrian empire, sent an embassy to Egypt, demanding Cleopatra, the daughter of Ptolemy, in marriage; and the king not only complied with his request, but attended her in person, and the nuptials were solemnized at Ptolemais in a very splendid and magnificent manner. Alexander could not bear his elevation and prosperity, but became indolent and debauched, and committed the management of his affairs to a profligate and tyrannical favourite, whose name was Ammonius, and who conducted himself with a degree of deploratif and cruelty, which exposted him and
and his master to the hatred of the whole nation. Demetrius, the eldest of the deceased king's sons, availed himself of this opportunity for recovering his right; and was acknowledged by Apollonius, governor of Cæcilia and Phenice. When Alexander was routed out of his lethargy, and perceived the danger of his situation, he applied to his father-in-law, Ptolemy, for assistance; and he marched to his relief with an army, which the author of the second book of Maccabees compares to the sand of the seashore.

Upon his arrival at Ptolemais he was informed, or as others say, he pretended, that Alexander was plotting against his life, and that Ammonius had charged himself with the execution of this detestable scheme of treachery. Ptolemy complained to the king of Syria of this plot, and demanded the criminal to be delivered up to him; but Alexander refusing to comply, Ptolemy concluded that he was privy to the design, and that Ammonius was only executing his master's orders.

Upon this real or feigned plea, Ptolemy determined to turn his arms against his son-in-law, and sent ambassadors to young Demetrius, offering him his daughter Cleopatra, the wife of Alexander, and promising to settle him on the throne of his ancestors. Demetrius accepted the offer, and when the news of this event reached Antioch, Ammonius was put to death by the populace; but the inhabitants of the city refused to declare in favour of Demetrius. However, such was the hatred they had conceived against Alexander, that they entered into a confederacy against him, and opened their gates to Ptolemy, offering to put the crown on his head. This prince, says Josephus, knowing how to fet bounds to his ambition, rejected the proposal, and with singular self-denial and generosity, declared, that he could not, without the most flagrant injustice, place himself on the throne of Syria, by excluding the lawful heir. He proceeded to recommend Demetrius by an eloquence on his character, and by pleading himself as a guarantee for his future conduct, at the same time undertaking to assuage him, and to teach him the art of governing. These disinterested representations of Ptolemy had the desired effect. Demetrius was proclaimed king of Syria, and placed on the throne of his ancestors. Alexander, who was then in Cilicia, assembled a numerous army and advanced to Antioch. Ptolemy met him, and a bloody engagement ensued, in which Alexander was defeated; and his adherents abandoning him, espoused the cause of Demetrius. Upon this Alexander fled to Arabia, and seeking refuge in the house of Zakud or Zabel, or as Diodorus Siculus (in Excerpta Photicii cod. 244.) calls him, Diccles, was murdered by his treacherous host. Ptolemy was wounded mortally by Alexander's friends; and when the head of the murdered prince was brought to him as a present from the Arabian, the joy he felt on the occasion soon put an end to his life. Demetrius, without any further opposition, took possession of his father's dominions, and styled himself from this victory Nicator, or the conqueror. Alexander Balas had reigned, according to Josephus, five, but according to the history of the Maccabees, six years, reckoning from the 166th year of the era of the Seleucidae to the 167th, which was the first year of the reign of Demetrius Nicator. This happened in the year before Christ 145. Such is the account which Josephus gives of the troubles of Syria, and the death of Alexander Balas. But the author of the history of the Maccabees varies much from him, especially in what relates to the character of Ptolemy Philometor, whom Josephus highly commends; whereas the author of the first book of the Maccabees represents him as an ambitious and pernicious prince, who trampled under foot the most sacred laws of nature and justice, to raise himself on the ruins of his son-in-law. Josephus Antiq. lib. xiii. c. 2. 4, tom. i. p. 624—625. Diodorus Sic. tom. ii. p. 592. 1 Maccabees xi. 4—12. Ant. Un. Hist. vol. viii. p. 224—225.

Alexander, bishop of Jerusalem, was a disciple of Panteenus and Clement of Alexandria, towards the close of the second century, and distinguished in his mature years by the firmness and zeal with which he maintained his Christian profession at a period of severe persecution. In the 12th year of the emperor Severus, A.D. 204, when he was bishop of the church in Cappadocia, he was imprisoned for his profession of the Christian faith; and his fidelity and constancy on this occasion induced the church at Jerusalem to choose him as a companion to Narcissus, whose advanced age of 167 years rendered him incapable of performing the duties of his office. His imprisonment seems to have continued from the year 204 to the year 211, at which time it appears from a letter written by him to the church of Antioch he was not released from confinement. About this time, however, or soon after, he visited the church at Jerusalem, and was promoted to the bishopric of that church. Of the revelation and visions which are said to have preceded his election, it is not necessary to give any account in this place; as they are not likely to obtain much credit. His known character and tried integrity obviously recommended him to this choice, and he approved himself worthy of it by a course of service and suffering that lasted 39 years. When the perfection of the Christians was renewed under the emperor Decius, Alexander, now venerable for his old age and grey hairs, as Eusebius expresses himself, was summoned to the governor's tribunal at Cæsarea, and about the year 256, avowing his profession, before the tribunal, he was cast into prison, where his confinement and sufferings terminated in his death, A.D. 251. From the fragments of his history that remain, and that are chiefly preferred by Eusebius in his "Ecclesiastical History," (p. 212. 216. 222. ed. Valer.) we learn, that Alexander erected a library at Jerusalem, which continued in his time, and furnished materials for his history. It appears also from the testimony of Origen, with whom Alexander was intimate, that he was not only eminently pious and devout, but peculiarly distinguished by his humility, meekness and gentleness; that he was a frequent and agreeable preacher; that he was a person of competent knowledge and learning, having been educated by Panteneus and Clement, and maintaining an intimate friendship with Origen and Clement, two of the most learned men that ever lived, and that he was also a patron of learning. We are also indebted to him for his glorious testimony to the truth of the Christian religion, and his own remarkable example of steadfastness in the faith of Christ, of which he made two confessions before heathen magistrates, at the distance of above 40 years from each other, for the last of which he suffered an imprisonment, under which he made a happy end. And certainly the succession of bishops and churches in the land of Judea, where the preaching, miracles and sufferings of Christ and his first apostles, are placed by the evangelists, under so many difficulties and troubles, affords a strong argument for the truth of those great and extraordinary facts, upon which the Christian religion is founded. Lardner's Works, vol. ii. p. 391—397. Cave. Hist. Liter. Sac. iii. tom. i. p. 100. ed. Oxon.

Alexander, bishop of Alexandria, succeeded Achillas in this see, in the year 312 or 313. In his time commenced the Arian controversy, in which he appears to have engaged with an ardour that was blended with a very considerable degree of bitterness of spirit. He calls Arius and his followers...
Alexander, Benedictus, of Verona, physician to the emperor Maximilian, taught anatomy and medicine with great reputation, at maxima frequentia auditorum, Catiliani says, at Padua, towards the end of the 15th century.

His work has been several times reprinted. See Biblog. Anat. Specimen Jacobi Douglas, p. 62. Also, Pet. Catalliani Vitae Illust. Medicorum, p. 159.

Alexander, Massylas, of Vicenza in Italy, practiced medicine there for twenty-five years. In 1578, he was made principal of the college of medicine at Venice. Having held this office, with great reputation, nine years, he went to Padua, ubi fenti confectus, Douglas says, obit, 1598. This physician was used to say, "fe malle cum Galeno errare, quam cum recentioribus vera dicere." He left a treatise, "De Urinis et pulibus," published 1568, at Frankfort, and "Opera Medica," published at Lyons, 1634. Douglas Biblog. Spec. p. 197.

Alexander, bishop of Lincoln, in the 12th century, was by birth a Norman, educated under his uncle, bishop of Salisbury, and by his interest promoted to the episcopal see in 1123. Having been accustomed in early life to a splendid mode of living, he affected a degree of flate, and indulged to expenses which were suitable neither to his character nor fortune. Henry of Huntingdon, in the dedication of his history to him, which is penned in the language of fervile adulation, calls him "the flower and top of the kingdom and nation;" and he informs us, that at the court of Rome he was styled "the Magnificent." St. Bernard, in a letter addressed to him about a year before his death, acts the part of a more honest friend, and cautions him "not to be dazzled with the lustre of secular grandeur, nor to look upon any worldly advantage as permanent; nor value his fortune more than himself; to guard against the flattery of prosperity, for fear of a turn of misfortune, which will last longer; not to be charmed with the transient satisfactions of life; for that scene will quickly be shut up, and make way for another both lasting and uncomfortable." He also advices him "not to deceive himself with any distant prospect of death; for such delusive hopes lead directly to danger and surprize, and are the likeliest way to hurry a man into the other world without preparation." In the course of his life, he did not seem to have been duly regarded by the court; in imitation of the barons and some of the bishops, he built three castles; one at Danbury, another at Slateford, and a third at Newark. He likewise founded two monasteries.

King Stephen was, not without reason, offended by these flately edifices and strong fortresses; and when he determined to take the castles from the barons, he seized that at Newark; in consequence of which the bishop was imprisoned for seven months, and with difficulty obtained his liberty. From this time he employed his thoughts and time in ornamenting his church, which he had rebuilt with a stone roof the year after his consecration; increasing the number of its prebends, and augmenting its revenue with several manors and cattles; and at length he rendered it the most flately and flourishing of any in the kingdom. He went twice to Rome, viz. in 1142 and

alexandros apollates, enemies of Christ, and impious; and adds, that they had done their utmost to exceed all past heretics, and to approach nearer to Antichrist; accordingly he communicated them from the church. He is called, however, by Theodoret (Eccl. Hist. p. 79, ed. Vales.) the Great Alexander, and a very excellent defender of the evangelical doctrine. Alexander was present at the council of Nice in 325, and died at Alexandria, before the end of that year, or some time in 326, within five months after the breaking up of the council, or after his return home from it. His writings consisted of epistles sent to bishops in several parts of the world, which, according to Epiphanius, (H. I. ix. n. 4.) amounted to 70 in number, and were extant in his time. Of these two now remain; one in Socrates (Hist. Eccl. lib. i. c. 6, p. 100, ed. Vales.) addressed to the bishops of Alexandria, and another in Theodoret (H. E. lib. i. c. 4, p. 8.) to Alexander, bishop of Byzantium, with fragments of some others. Fabr. Bibl. Grec. tom. viii. p. 341.

In thesese epistles several books of the New Testament, particularly St. Paul's epistles, are frequently quoted, and the epistle to the Hebrews received by Alexander as Paul's. He expresses a high respect for the scriptures, which he calls "divine;" and though he professes great regard to the wisdom and piety of ancient writings, near the days of the apostles, he seems not to have considered them as decisive and of authority in matters of religion, as he has not frequently cited them. Lardner's Works, vol. iv. p. 103—105.

Cave H. L. tom. i. p. 173.

Alexander, of Lycope, a city of Thesbai, was, as Fabricius (Bibl. Grec. tom. v. p. 250.) supposes, first a Heathen and Manichee, and afterwards a Catholic Christian, in which opinion Cave (De Scriptoribus Eccl. incerti atetatis, p. 2. H. L. tom. ii.) concurs, and a writer, probably of the fourth century. Photius calls him archbishop of Cyropolis; but Beaufobre argues, that he was a mere Heathen or Pagan philosopher, and Tilllemont adopts the same opinion. Dr. Lardner observes, that if he was ever a Manichee, he must have been at that time a Christian, as the Manichees were Chrlissians; but it is not easy to determine what he was afterwards, when he wrote against them. This excellent writer inclines to think that he was a Gentile, and places him at the year of Christ 350. He seems to have been well acquainted with the Manichees and other Chrlissians; and to have had some knowledge of the scriptures of the Old and New Testament, to which he occasionally refers. He expresses himself, with respect and commendation, concerning Chrliss and the Christian philosophy, which he represents as "simple, and intended, by plain precepts, without nic disquisitions and intricate reasonings, to promote virtue among all sorts of men, and even among the lower ranks, and common people." He was evidently, says Lardner, a learned and rational man. His work, intitled, "αγάστηρ, Μαντικοεις, δεξαμενος," against the opinions of the Manichees, was published in Gr. and Latt. by Combechius, in tom. ii. Actarium Patr. Græc. Novellum, at Paris, in 1672, fol. It is extant also in MS. in the Caâresian library. Fabricius, ubi supra, Cave, H. L. ubi supra. Lardner's Works, vol. iii. p. 384, vol. viii. 349—511.

Alexander was the name of one of the martyrs of Lyons, A. D. 177. He was a Phyrgian by nation, and by profession a physician; he had lived many years in Gaul, and was known almost to all men for his love of God and boldness in preaching the word. When he fled before the tribunal, to which he was cited, he boldly confessed that he was a Christian; upon which the enraged prelud condemned him to the wild beasts. When he had undergone
ALE

1144; and after his first visit, he returned as the pope's legate, and called a synod, in which he published several useful canons. In 1147 he visited the pope in France; and there fell sick, so that he returned with difficulty to England, where he soon died, in the 24th year of his prelacy. Biog. Brit.

ALEXANDER I, pope, was a Roman by birth, and bishop of Rome during the reigns of Trojan and Adrian, from the year 1089 to the year 1105. He is said to have introduced the use of holy water and other ceremonies. He was enrolled as a martyr, and canonized as a saint. Bower's Hist. Popes, vol. i. p. 21.

ALEXANDER II, pope, was a native of Milan, of the name of Anselm, and removed from the fee of Lucca to that of Rome, in the year 1061. He was elected pope by the influence of Hildebrand, who was at the head of the ecclesiastical faction at Rome, in opposition to the empress Agnes, widow of Henry III. who was regent during the minority of her son Henry IV. and who supported the lay-faction, in the contest that subsisted between the clergy and laity. By her influence Cadalous, bishop of Parma, was elected pope, under the name of Honorius II. The dispute was terminated by a council at Mentana in 1064, and Alexander, by a signal triumph of the church over the civil power, was declared lawful pope. The discipline and privileges of the clergy were the principal objects of this pontiff's attention; and the subordinate instrument of conducting his measures was Peter Damian, a monk, and a zealous defender of the monastic orders. Having acquired a power thus paramount to every other, Alexander laid hold of every opportunity that occurred for interfering in the feudal concerns of kingdoms and princes. With a view of extending the influence and increasing the emoluments of the papal see, he sanctioned the project of William, duke of Normandy, for the conquest of England; denounced excommunication against Harold as a perjured usurper; and sent William a consecrated banner, and a ring with one of St. Peter's hairs in it; thus, as Hume says (Hist. vol. i. p. 186), "covering over safely all the ambition and violence of that invasion with the broad mantle of religion." His views were accomplished; William succeeded; the authority of the pope was confirmed; and his legates, till this time unknown in England, exercised arbitrary power.

Alexander extended his authority to other countries as well as to England. He not only prohibited the young emperor from divorcing his wife Bertha, but, in 1073, summoned him to appear at Rome, and to account for his conduct in the dilapidation of church benefices for providing his army with supplies. Henry was indignant; but the dispute was closed by the death of the pope in 1073. The increase of papal tyranny, under the direction of Hildebrand, to whom this pope was subservient, and by whom he was succeeded, discriminates his pontificate. Many of his letters on public affairs are extant; and one of them, addressed to the bishops of Spain for the purpose of restraining the cruelties which they exercised towards the Jews, does honour to his humanity. For an account of these letters, amounting in number to 45, see Dupin's Eccl. Hist. vol. iv. p. 29; and also Bower's Hist. Popes, vol. v. p. 224.

ALEXANDER III. Pope, was born at Sienna, where he was bishop under the name of Roland, and succeeded Adrian IV. in 1159. At the time of his aecession to the papal chair, Frederic I. was making vigorous attempts for reducing the power of the Roman see; and cardinal Odo- van was elected pope under the name of Victor IV. in opposition to Alexander. After the death of Victor, in 1164, cardinal Guy was chosen by the influence of the emperor, and denominated Paschal III. But the whole interest of the Roman clergy was exerted in favour of Alexander, who, in the former pontificate, had been compelled to retire into France, and he now returned to Rome, and was restored to his see. Councils were summoned to settle the dispute. The council of Wurtzburg, convened by the emperor in 1166, produced an union of the nobility and clergy in support of the rights of Paschal; and the council of Lateran, called by Alexander in 1167, deposed the emperor, and abrogated the oath of allegiance by which his subjects were bound to him as their lawful sovereign. At length an appeal was made to the sword; and though Frederic was at first successful, and upon the death of Paschal procured the election of John, Abbot of Strum, as his successor, under the name of Calixtus III., he was in the issue obliged to give up the contest, and in a treaty of peace, made with Alexander at Venice in 1177, to acknowledge him as lawful pontiff. The pride of Alexander knew no bounds on occasion of this triumph. When Frederic was prostrate at his feet, he addressed him with the words of the Psalms, "Thou shalt tread upon the lion and adder; the young lion and the dragon thou shalt trample under foot;" and when the emperor replied, "Not to you, but to Peter," the pope answered, "To me, and to Peter." This story is discredited by some writers, but believed by others, and the truth of it is confirmed by concurrent circumstances, for which we refer to Dupin. After the establishment of Alexander, he treated his rival Calixtus III., with condescension and kindness, and appointed him to the see of Benevento. The pope, securely seated in the papal chair, directed his attention towards securing the independence, and maintaining the prerogatives and privileges of the triple crown; and in order to prevent the disorders likely to arise in future from equal factions, he obtained a canon in the third council of Lateran, held at Rome in 1179, which enacted, that the right of election to the pontifical dignity should not only be vested in the cardinals alone, but that two-thirds of the votes of the electors should be necessary for rendering it legal. Thus the people, and even the Roman clergy, were entirely excluded from all participation in the honour of conferring this important dignity. At this council, the right of recommending and nominating to the faintly order was taken away from councils and bishops, and canonization was ranked among the greater and more important causes, the cognizance of which belonged to the pontiff alone. In this year he exercised that tyranny over princes, which had been usurped by the popes from the time of Gregory VII. in conferring the title of king, with the enfeigns of royalty, upon Alphonso I. duke of Portugal, by an arrogant bull, in which he treats him as a vassal. Whilst he was in France, he had supported the cause of Thomas Beckett against his sovereign Henry II., and in 1164, when the confilutions of Clarendon, which af- fered the king's jurisdiction over the clergy, were sent to him for confirmation, he rejected and annulled them. When Becket was banished, he received him kindly; obtained for him a pension from the French king, abrogated the sentence that had been passed upon him; reinstated him with his dignity, and appointed him his legate in England. After the murder of this arrogant prelate, Alexander, who had kept the king in awe during the whole of the contest, by the terror of excommunication, compelled him to undergo a very severe penance; and having forgiven him, swelled bulls at his desire, against his son, and canonized the arch-bishop. Alexander, as a rigorous defender of the catholic faith,
Alexander IV. pope, was born in 1431, at Valencia in Spain, and by the interdict of his uncle, pope Calixtus III., was appointed cardinal in 1455; and afterwards archbishop of Valencia, and vice-chancellor of Rome. The enmities of this last office enabled him to maintain the flate of a prince, and supplied him with the means of licentiousness and extravagance, to which he was addicted from his youth. Under pope Sixtus IV., he was legate in Spain; and at last by affirming a nullity, which his conduct did not justify, and by bribing the cardinals, he was elected, at the age of 61, to succeed pope Innocent VIII. in 1492. He then changed his original name of Rodrigo Borgia for that of Alexander VI. By Vanozza, a Roman lady, with whom he had continued an illicit connection for many years, he had five children. His second son was Cesare Borgia, who was a monster of debauchery and cruelty, and who is said to have quarrelled with his elder brother for the favour of his sister Lucretia, and to have killed him, and thrown his body into the Tiber. Notwithstanding his infamous character he was the favourite of his father, who trampled with contempt on every obstacle, which the demands of justice, the dictates of reason, and the remonstrances of religion laid in his way, in order to aggran­dize his children, and enrich himself. In his political con­nections he was faithless and treacherous; and formed al­iances with the purpose of violating them. Having engaged

Alexander V. pope, was born in the isle of Candia, about the year 1339. His original name was Philippo, and his parents were poor, that in his childhood he was under a necessity of begg­ing his bread. An Italian monk took him under his protection and instruction, and procured his admission into his order of friars minors. By his recommendation he became a student at Oxford, and afterwards took his degree of doctor in divinity at Paris. Having passed through several gradations of preferment, being first bishop of Vicenza, then of Novara, and at length archbishop of Milan, cardinal, and legate of pope Innocent VII. in Lombardy, he was unanimously elected pope by the cardinals, at a coun­cil in Pisa, in the year 1409. This pontiff was good-lu­moured and liberal; and having no speedy relations and dependants, for whom he was under an obligation of pro­viding, he had the means of extending his generosity to those that were connected with the church, particularly to the mendicant orders of monks, who were distinguished by his patronage and favour. Such was his munificence during his pontificate, that he used to say, "When I became a bishop, I was rich; when a cardinal, poor; and when pope, a beggar." He seems, however, to have counteracted the mildness and liberality of his natural disposition by the orders transmuted to the archbishop of Prague, enjoining him to proceed with rigour against Hifs and his followers. This zealous reformer, confiding in the known candour of the pontiff, instead of personally appearing at Rome, in compliance with the summons that had been sent him, commissioned two friends to plead his cause, saying, on his own part, "I appeal from Alexander ill-informed, to Alexander well-in­formed." When Alexander proposed to visit Rome, where he was expected, he was persuaded by Balthasar Cossia to ac­company him to Bologna. Whilst he was at this city he died, as some say, by the contrivance of Cossia, in the year 1410, having possessed the papal seat little more than ten months; and Cossia, by his influence with the cardinals, and a recommendation from Louis of Anjou, king of Sicily, was chosen to succeed him. Dupin, Eccl. Hist. vol. v. p. 8, &c.

Alexander VI. pope, was born in 1431, at Valencia in Spain, and by the interdict of his uncle, pope Calixtus III., was appointed cardinal in 1455; and afterwards archbishop of Valencia, and vice-chancellor of Rome. The enmities of this last office enabled him to maintain the flate of a prince, and supplied him with the means of licentiousness and extravagance, to which he was addicted from his youth. Under pope Sixtus IV., he was legate in Spain; and at last by affirming a nullity, which his conduct did not justify, and by bribing the cardinals, he was elected, at the age of 61, to succeed pope Innocent VIII. in 1492. He then changed his original name of Rodrigo Borgia for that of Alexander VI. By Vanozza, a Roman lady, with whom he had continued an illicit connection for many years, he had five children. His second son was Cesare Borgia, who was a monster of debauchery and cruelty, and who is said to have quarrelled with his elder brother for the favour of his sister Lucretia, and to have killed him, and thrown his body into the Tiber. Notwithstanding his infamous character he was the favourite of his father, who trampled with contempt on every obstacle, which the demands of justice, the dictates of reason, and the remonstrances of religion laid in his way, in order to aggran­dize his children, and enrich himself. In his political con­nections he was faithless and treacherous; and formed al­iances with the purpose of violating them. Having engaged

Charles
Charles VIII, in an enterprise for the conquest of the kingdom of Naples, he entered into a league with the Venetians and with Maximilian, to rob him of the fruits of his victory; and, after having obtained a large remittance from the sultan Bajazet, in order to enable him to carry on war against this king of France, he delivered up to him Zizim, the brother of Bajazet. His perfidy was only exceeded by his hypocrisy; for, notwithstanding his notorious vices, he proposed to the Christian princes to march at the head of an army against the Turks; and under this pretext he inflated a bull for a jubilee in 1500, by which he contrived to enrich his treasury. Of his presumption, as well as of his hypocrisy, we have a curious specimen in his division of America between the Spaniards and the Portuguese. For this purpose he appointed that a line, supposed to be drawn from pole to pole, a hundred leagues to the westward of the Azores, should serve as a limit between them; and, in the plenitude of his power, he beheaded all to the call of this imaginary line upon the Portuguese, and all to the west of it upon the Spaniards. At the same time he professed, that zeal for propagating the Christian faith, which was the consideration urged by Ferdinand in soliciting a bull for this purpose, was his chief motive for inflating it. In consequence of this bull, a great number of Franciscans and Dominicans were employed, with the avowed design of influencing and converting the Americans, both in the isles and on the continent.

The profligate career of this execrable hypocrite and tyrant was continued till the year 1503, when the poison which he and his son Cesar had prepared for others, and particularly for Adrian, a wealthy cardinal, who found in the way of his avarice and ambition, by a happy mistake, terminated his own days. Some writers, amongst whom is Voltaire, have disputed this account of Alexander's death; but Guicciardini and other reputable historians attest it. The life and actions of this pontiff shew, says Molheim, that there was a Nero among the popes as well as among the emperors. The crimes and enormities which history has imputed to this papal Nero, evidently prove him to have been not only detestable of all religious and virtuous principles, but even regardless of decency, and hardened against the very feelings of shame. Besides other infinities of infamous licentiousness with which he is chargeable, he is accused of incest with his own daughter. And though it may be possible that the malignity of his enemies may have forged false accusations against him, and in some infinities exaggerated the horror of his real crimes, yet there is upon record an authentic list of undoubted facts, which, by both their number and atrocity, are sufficient to render the name of Alexander VI. odious and detestable in the eyes of such as have the smallest tincture of virtuous principles and feelings. His infatiable avarice is pointedly expressed, says one of his biographers, in the following lines:

"Vendit Alexander claves, altaria, Christum, Vendere jure potest; emarat ille prius."

"Christ's altars, keys, and Christ himself, Were barr'd by this pope for pelf:
But who shall say he did not well?
That which he bought, he fear might sell."

Alexander VII., pope, was born of the illustrious family of Chigi, at Sienna, in 1590, and recommended by the marquis Pallavicini to pope Urban VIII. Having been inquisitor at Malta, and legate at Ferrara, he was nuncio in Germany, and employed at Munster in conducting the conferences that were intended to restore the peace of Europe. Some writers relate, that at this time he had formed the design of abjuring popery, and embracing the protestant religion, but that he was deterred from executing his purpose by the fate of a civilian, who had been poisoned on a similar account; and that he was confirmed in his religion by the elevation to the cardinalship. Upon his return from this mission, he was appointed bishop of Imola, in Romagna, and afterwards cardinal and secretary to the pope. His next advancement was to the papal chair, to which he was introduced by the unanimous suffrage of the 64 cardinals, which he contrived to obtain by that dissimulation and address, of which he is said to have been complete master. After his election, in 1655, he ordered his collars to be placed under his bed in his apartments in the Vatican, that it might serve to him as a memento of mortality; when he was robed in the pontificial habit, he appeared to have a hair-cloth under his shirt; and when a wealthy female, signora Olympia, waited upon him with congratulation, he dismissed her with a cold repulse, saying, "It is not decent for a woman to enter the dwelling of the father of the church." That the whole of this appearance of humility and self-denial was a farce, was sufficiently verified by his future conduct. The distaining feature of his character, next to his craft and dissimulation, was an attachment to his relations, for whom he provided by all the offices and honours which he could command. His zeal for religion, and his concern for terminating the wars which distracted the Christian world, seem to have subsided after his elevation to the pontificate; nor did he take any pains to conciliate the crowds of France and Spain. The five propositions of Janfenus, which contained the sum of his doctrine, had been condemned by Innocent X.; but the Janfensitists had contrived to evade this sentence by a subtle dissimulation, which allowed them to acknowledge that these propositions were justly condemned by the pope; but at the same time to maintain, that they were not contained in the book of Janfenus in the sense in which they were condemned. The benefit of this artful dissimulation they were not permitted long to enjoy. At the instigation of their enemies, Alexander VII., the successor of Innocent, issued a bull, in 1656, declaring, that the five propositions which had been condemned were the tenets of Janfenus actually contained in his book. He proceeded, in 1655, to send into France the form of a declaration to this purpose, which was to be subscribed by all those who wished to any prelature in the church. This declaration produced the most deplorable divisions and tumults. It was vigorously opposed by the Janfensitists, who maintained, that in matters of fact the pope was fallible, especially when his decisions were personal, and not confirmed by a general council; and, consequently, that they were under no obligation to subscribe this papal declaration, which had merely for its object a matter of fact. Notwithstanding this unwilful and intolerant bull, Alexander is said to have been liberal in his sentiments; to have disapproved of the severities exercised towards the Vaudois in Piedmont, and to have treated the protestants who visited Rome with condescension. It is further related, that when some English gentlemen presented themselves at his feet to pay him the customary homage, upon finding that they were protestants, he courteously said, "Ride, you shall not commit what you think an idolatry: I will not give you my blessing, but I pray God you may be worthy to receive it." To the Jesuits this pontiff manifested a peculiar partiality; for though Innocent X. had, in 1645, condemned the indulgence which these artful missionaries had
Alexander ab Alexandro, so called, because his Christian and family names were Alexander, was born at Naples in 1461. He relinquished the practice of the law, to which he was at first devoted, because, in the exercise of this profession, his integrity was in danger of being corrupted; and he preferred a small fortune, in the tranquility of retirement, and with the approbation of his own mind, to the pursuit of gain, with the hazard of his conscience. Against the power and favour of the great, he himself says, an advocate would find it impossible to support his clients; and the tide of suits depended not so much on the justice of the cause, as on the will and favour of an indolent or corrupt judge; so that it was fruitless to study with diligence and labour controverted points of law, with the varieties of its cafes; and he adds, that the provisions of law, though wisely contrived, were often insubordinately set aside and perverted. To such circumstances, and with these views and apprehensions, he acted honourably in declining a profession, which he could not exercise at the period, and in the country in which he lived, with advantage to those by whom he was employed, and without incurring self-reproach. From the works of the ancients, to which he had been accustomed to direct his attention, he made a collection of passages relating to the history and customs of the Greeks and Romans, which he arranged in five books, under the title of "Des Genes"; a work which manifests more learning than judgment or taste: An edition of this work, with notes of various writers, was published in two volumes, 8vo, at Leyden, 1673. The author appears to have been erudite and superficial, as he gives a vague account of dreams and spectres, and of haunted apartments in his house at Rome. He died in this city about the year 1523. Gen. Dict.

Alexander ab Alexandro, proto-medicus of Sicily, in which island he was born early in the 15th century; left a work on the duties and privileges of the office he held, which was afterwards published: "Constitutiones et regularitates jurisprudentialis Regni protomediticus Sicilie elucidata, scripta" Haller says, circa A. 1429, edita Panormi, 1564, 4to, a I Philippo Ingraffia.

Alexander Noel, or Natalis, a Dominican friar, and one of the most laborious writers of the 17th century, was born at Rouen, in Normandy, in 1579. Having been admitted into the order of Dominican friars, in 1655, he went to pursue his studies in philosophy and divinity, at the great convent in Paris; and was appointed, at the completion of his studies, to teach philosophy in the same convent. He continued in the exercise of this office for 12 years; and declining that of a preacher, he devoted himself entirely to the study of the scriptures and ecclesiastical history, and was created a doctor of the Sorbonne in 1675. By Colbert, the minister, with whose esteem he was honoured, he was introduced to his son, who was afterwards archbishop of Roan; and in this connection he enjoyed the advantage of those conferences that were held in an assembly of persons of the most distinguished learning, formed by the minister for the improvement of his son. These conferences led him to conceive the design of writing an ecclesiastical history. The first volume of this work, which he executed with great ability, and which was intitled, "Selecit Hitoriae Ecclesiasticae capita, et in loca ejusdem insignia Dissertationes Historiae Chronologicae, Dogmatice," was published in 1676. It consists of 26 volumes in 8vo, the last four of which were not published till 1686. In the first volume he gives a history of the first age of the church, with an account of the persecutions which it suffered, the succession of popes, the heresies which arose, and the councils which condemned them, the writers in favour of Christianity, and the kings and emperors who reigned during the
the first century. To this volume are annexed 28 valuable and much esteemed dissertations, upon such points as have been the subjects of dispute in history, chronology, criticism, or doctrine. The history of the second century was published in 1677 in two volumes, and to it are subjoined the dissertation against M. Daille, with regard to fasting, lent, confirmation, and the use of the fathers; and another dissertation concerning the time of celebrating Easter; and he also treats of the version of the Septuagint, &c. &c. The third century was published in 1678; and in three dissertations he has collected what relates to the life, manners, ordination, fall, errors, and defenders of St. Cyprian. The history of the fourth century, compiled in three volumes, and containing 25 dissertations, was printed at Paris in 1679. In the three following years he published his history of the 5th, 6th, 7th, 8th, 9th, and 10th centuries; and that of the 11th and 12th centuries in 1683; and in these volumes there are several excellent dissertations. His sentiments on the subjects of some of these dissertations exposed him to the resentment of the court of Rome, which induced him to publish his writings in 1684. Nevertheless, he published in the same year, in three volumes, the history of the 13th and 14th centuries, in which he defended the rights of kings against the pretensions of the court, though he vindicates those princes who employed fire and sword against the Albigenses. He at last completed this work in 1686, by publishing four volumes, containing the history of the 15th and 16th centuries. The history of the Council of Trent occupies the greatest part of the last volume. Of this voluminous work, containing many curious particulars, there have been many editions. In 1689 he published a work of the same kind upon the Old Testament, in six volumes in 8vo, which extends from the creation of the world to the birth of Christ, and which period he has divided into six ages. From 1678 to 1680 he also published several other dissertations. In 1689 our author published his "Theologia Dogmatica et Moralis secundum Ordinem Catholici Concilii Tridentini, in quinque libros tributam," i.e., "Polite and moral Divinity, according to the order of the Council of the Council of Trent, in five books;" printed at Paris in ten volumes in 8vo. and at Venice in 1698. But another volume having been added in 1701, this work was printed at Paris, in two volumes in folio, in 1703, with a collection of Latin letters. He also published, in 1704, Commentaries on the four Gospels; in 1710, upon St. Paul's and the seven Canonical Epistles; and he also wrote a Commentary upon the Prophets Isaiah, Jeremiah, and Baruch, which was never printed; and he likewise published several other treatises, which we shall not recite. His application, as we may naturally conceive, was intense; and towards the latter part of his life he was afflicted with the los of his sight, which he bore with great calmness and resignation. He died in 1724, in the 86th year of his age. His piety, humility, and disinterestedness rendered him the object of general esteem. Gen. Dict.

Alexander, of Paris, a French poet, flourished in the 12th century, and was born at Bernai, in Normandy. He removed to Paris, and became, in some measure, the founder of French poetry. He adopted verses of 12 syllables, as well adapted to heroic subjects. His poem of "Alexander the Great," was favourably received in the court of Philip Augustus: it is a sort of metrical version of a life of Alexander then current, intermixed with facts alluding to the history of France at that period. The metre of some passages is strong, and the verification harmonious. Some have supposed that the name of Alexandrines, applied to lines of 12 syllables, has been taken from this work, in reference either to its author or to its object. Gen. Biog.
peer of that kingdom, by the title of Viscount Stirling. In 1632 he was raised to the dignity of Earl of Stirling, at his Majesty's coronation, in the palace of Holyrood-house. He discharged the office of secretary of state with great reputation till his death, in 1640. About three years before his death was published a new edition of his poems, viz. "The Four Monarchick Tragedies," "Dooms-day," "The Parnassus," and "Jonathan," an heroic poem, which was now first published. The style and verisimilitude, particularly of the plays, are polished, and the plans, as far as the subjects are concerned, improved. The author's tragedies and other poems were well received at the time of their first publication. King James called the author his "Philosophical Poet," and Michael Drayton commends them; calls the author "My Alexander," and wishes to be known as the friend of a writer, "whose muse was like his mind;" and John Davies of Hereford, in a book of epigrams, published about the year 1661, praises the tragedies of the author; and says, "that Alexander the Great had not gained more glory with his sword than this Alexander had gained by his pen." Mr. Addington, after perusing the several works of the author, testified his approbation of them, by saying, "That he had read them over with the greatest satisfaction." "They compose," says a biographer of unquestionable judgment, "a very respectable portion of the literature of that age; though their gravity and proximity are not much suited to the taste of the present." It does not appear that his plays were ever acted. They are rather dramatic poems for perusal in the closet.

Alexander Nucam, or Nequam, an eminent English writer of the 12th and 13th centuries, was born at St. Alban's, in Hertfordshire, and pursued his studies, with successful affluence, in the universities of Italy and France. At Paris he was esteemed a prodigy of genius and learning; and applauded as an excellent philosopher, a profound divine, and a good rhetorician and poet, considering the age in which he lived. His school at Paris, where he read lectures in 1180, was thronged with scholars. About the year 1180 he returned to England; and, having become a canon-regular of the order of St. Augustin, he was made abbot of Exeter in 1215, and died in 1227. His epitaph, written after the old mofhik manner, in Latin rhyme, is as follows:

"Eclipat inaptur sapientiam, Sol fepelitur; 
Cui si par unus, minus eft fihile famus: 
Vir bene difcere, et in omnii mai fecutus, 
Difcebat Nequam, vitam duxit tanum sequam."

The sense is this:

"Learning's eclipse, the Sun himself's obfcur'd; 
Our foos were left, he had left one superior: 
Accomplished was his mind, his manners pleasing, 
And though his name was ill, his life was good."

He wrote several works, which are preserved in MS. in the libraries of England and other countries; such as "Comentaria super quatuor Evangelia;" "Expositio super Ecclesiasten;" "Expositio super Cantica;" "Elucidarium Bibliothecae," in which are some expressions inconsistent with the doctrine of transubstantiation; "Laudes divinae Sapientiae," which is the fame with the work, "De Naturis rerum;" and contains, amongst a variety of other matter, a large account of the three cities most celebrated for learning, Athens, Rome, and Paris. Gen. Dict. Cave. H. L. tom. ii. p. 286.

Alexander I. king of Scotland, was the son of Malcolm III., and succeeded his brother Edgar in 1107. His character was distinguished by a degree of vigour and impec- tuosity, which gave him the appellation of "the fierce;" and which, though previously concealed by his pious and devotion, discovered themselves on his accession to the throne. His conduct both in the northern and southern parts of the kingdom was so feverish, that he owed the insurrections into submission; but a conspiracy was at length formed against his life, and the traitors, who were engaged in the execution of it, obtained admission into his bed-chamber at night, whilst he lodged at a castle in the Carle of Gowrie. Alexander, after having killed six of them, made his escape. Having reduced his own kingdom to order, he visited his brother-in-law Henry I. of England, and assailed him in terminating a difference between him and the Welsh. He cloe'd his reign in enacting and enforcing civil and ecclesiastical regulations, did a bachelor in the 17th year of it, and was succeeded by his younger brother, David. Mod. Un. Hist. vol. xii. p. 45.

Alexander II., king of Scotland, succeeded his father William the Lion, in 1214, in his 16th year. His attempt to recover the possession of Northumberland was retaliated by a deterrent expedition into Scotland, conducted by John, king of England. Whilst John was thus employed, Alexander reduced Northumberland; and, being forced to discontinue his pursuit of the English king, who was burning the towns, ravaging the country, and advancing towards the capital, he entered England by the way of Carlisle, which he took and fortified, and proceeded as far as Richmond, in Yorkshire, retaliating upon the adherents of John severities similar to those which his own subjects had suffered. But his proffes was impeded, and he was compelled to return through Wiltmorland to his own kingdom.

In 1221, he married the princess Joan, eldest sister of Henry III. of England, who contributed to preserve peace between the two kingdoms. After her death in 1239, they were again embroiled; but by the mediation of the earl of Cornwall, Henry's brother, and the archbishop of York, they were again reconciled. Alexander, in his voyage to quell some commotions that were excited in Argyllshire, fell sick, and being put on shore on an island called Kennercy, on that coast, died, in the 51st year of his age, and 35th of his reign. His successor was his son by his second queen, the daughter of Egelrand de Coeyne, one of the most powerful of the French nobility. Mod. Un. Hist. vol. xii. p. 77.

Alexander III. of Scotland, was son of the preceding, and succeeded his father at the age of nine years, in 1249. His marriage with Margaret, the daughter of Henry III. of England, was soon after solemnized in the presence of the two courts at York. On this occasion Alexander paid homage to Henry for his English possessions; and, on being prevailed to perform his homage for the crown of Scotland, he declined it. Alexander, upon his return to Scotland, found that the Cummins, a family of very great influence, had formed a strong party against his English connections, under the plea that Scotland was never any better than a province of England; and both the king and queen were committed to close custody in the castle of Edinburgh, where they were debarred from seeing any company, or associating with each other, and prohibited from all concern in the government. When Henry heard of their situation, he determined to relieve them, and for this purpose assembled his military tenants at York, and marched to the borders; and by his emissaries, whom he dispatched to the castle of Edinburgh, released the royal pair, and afterwards dispossessed the intruders. The king then assumed the exerise of the regal power; and, as soon as he was of age, pardoned the Cummins and their adherents, upon their submitting to his authority.
authority. However, in 1263, Haquin, king of Norway, appeared on the coast with a fleet of 160 ships, to make good his pretensions to the Western Islands; and, disembarking his troops, made himself master of the castle of Ayr, and advanced into the country. Alexander, having assembled an army, met him at a place called Largs; and, after a long and doubtful contest, the Scots army was victorious. Of the Norwegians, 16,000 are said to have perished in the field, and the Scots lost 5000. The ships of Haquin were so much wrecked the day after the battle, that he could scarcely procure a vessel to carry him and a few friends to the Orkneys, where he soon after died of grief. His son and successor, Magnus, concluded a treaty with Alexander; and, in consideration of his receiving 1000 marks of silver in two years, and an annual payment of 100 marks for ever after, renounced all claim to those islands. As a further cement of friendship, Margaret, Alexander's daughter, was betrothed to Eric, the son and heir of Magnus. In 1256, Alexander and his queen repaired to the English court, where they were sumptuously entertained; and when the queen was delivered, they both returned to their own kingdom. During the war between Henry and his barons, Alexander assisted him with 5000 men, and preferred the northern fortresses against all their attempts. Upon the accession of Edward 1. to the throne of England, Alexander, with his family, was present at his coronation, and soon after paid him homage for his English estates. In the parliament, held at Westminster in 1282, Alexander attended as the first peer of England. In 1283 he left his son Alexander, in the 26th year of his age; and his death was soon followed by that of his father, the queen of Norway, who left an only daughter.

Alexander, having no surviving issue besides this infant prince, was urged by the nobility and the states of the kingdom to marry; and in compliance with this request, he was married to Isabella, daughter to the Court of Dreux in France. This excellent prince was soon after killed, whilst he was hunting, by his horse's rushing down a high precipice, A.D. 1285, in the 45th year of his age, and the 37th of his reign. He was succeeded by Margaret, his grand-daughter, and heir of his crown, who did not long survive him. Scotland was now in a very critical state. Edward 1. was acquiring an influence in the kingdom, which no other English monarch ever possessed, and revived the claim of sovereignty, to which his father Henry had never pretended. The death of Alexander was, therefore, much regretted; and the services he had performed to the kingdom demanded a tribute of respect to his memory. He had introduced many excellent regulations of government; he had divided the kingdom into parts, in each of which he occasionally resided, with a view of preserving the public peace, and for the purpose of more easily administering justice to all ranks of people; and he had greatly contributed to diminish the burdens of the feudal system, and to restrain the licence and oppressions of the nobility. The death of Alexander III. forms a remarkable era in the Scottish history. Mod. Un. Hist. vol. xii. p. 79, &c.

Alexander, king of Poland, was a younger son of Casimir, and as duke of Lithuania, elected from motives of policy to succeed Albert in 1501. The archbishop of Gnesen resided for some time in affiling at his coronation; and absolutely refused to concur in the ceremony for his queen, the princess of Muscovy, because she adhered to the doctrines of the Greek church. This indignity was redressed by her father, who, in consequence of it, laid siege to Smolensko, but, upon the arrival of Alexander, relinquished the enterprise, and concluded a truce for six years. The fatigue of this expedition so much affected Alexander, that he fell into a chronic disorder, which only terminated with his life. During his illness, the Moldavians and Tartars made an irruption into Lithuania; and Alexander was carried in a litter, at the head of his army, to oppose them. The two armies met near Wilna, and after a fierce contest, in which 20,000 Tartars fell, the Poles were victorious. Alexander received the news of this victory whilst he was dying; and, making signs to express his gratitude, he expired in 1501, at the age of 45, after a reign of five years in Poland, and 14. in Lithuania. In his nature he was short and robust; his figure was long, his eyes sparkling, and his carriage majestic. His genius was heavy, his taciturnity very remarkable, but his sentiments were generous and humane. He was a great patron of the liberal arts, and profuse in his grants under this character, and particularly to musicians; so that his donations were revoked, and a law was passed, called Statutum Alexandrinum, which prohibited the king from disposing of the revenue without the consent of the senate or diet. Mod. Un. Hist. vol. xxx. p. 410.

Alexander Nefsky, or Nefsky, grand duke of Russia, both a saint and hero of that country, was born in 1218, and distinguished by his strength and courage, and by the vigour of his character. He was betimes inspired with a passion for conquest by the inconstant wars in which his father Yuriolof was engaged with the Tartars and Mongols. Upon the death of Fedor, his elder brother, he became sole viceroy of Novogorod. He married a princess of the province of Polotze; and for the purpose of defending his government against the attacks of the Tchudes or Ethonians, he drew a line of forts along the river Shelon, which falls into the Ilmen lake. While Yorololf was engaged with the Tartars in 1239, a combined army of Swedes, Danes, and knights of the Teutonic Order, formed an expedition against Novogorod, and landed from their ships on the banks of the Neva. Alexander, after receiving a haughty embassy, determined to risk the event of a battle. Having im pondered the affidavit of heaven in the presence of his people, he prepared for an engagement. The attack was begun at fix in the morning, and the two armies were closely engaged during the whole day. When night put an end to the contest, the field of battle was covered with the bodies of the slain. This battle, in which Alexander is said to have wounded with his own sword the king of the northern nations, is embellished with a variety of fictions; but the event of it was highly honourable to the courage and success of the young prince. From the river Neva, near which the battle was fought, he obtained the surname of Nevelot. The remainder of his life was employed in exertions of valour and activity against the invaders of his country. He defeated the Tartars in several contests. In 1245 he raised the siege of Novogorod, and gained a victory over the Germans, Danes, and Tchudes, on the borders of the Ilmen lake. After his father's death he paid a visit to the Tartar khan, who acknowledged, that though he had heard much to his praise, he far exceeded everything that had been reported concerning him. In 1252, upon his return from a second visit to the khan, he ascended the throne as grand prince of Vladimir. With a very considerable force he now undertook an expedition against Sweden, and coming off victorious, he fo far conformed to the then submitting practice of war, as to raise all the countries which he had captured, and returned to Russia with a multitude of prisoners, and heaps of spoil. On occasion of a difference which happened between the Russians, and particularly the inhabitants of Novogorod, and the Tartars, with respect to the humiliating and burdensome tribute which was exacted by the latter, Alexander, in 1258, attempted to pacify the discontented, and to induce them
them to submit, without resistance, to a superior power. In order to give effect to his conciliatory endeavours, he took the national payment on himself, and thus acquired the complacency of the Novgorodians as well as of the Tartars. But discontent continuing to prevail, and resistance having arisen to a degree so alarming in several places, that the Tartarian collectors were musered; the Tartars were excessively exasperated against the Russians, and the Russian princes were commanded to appear before the khan. Alexander undertook the hazardous business of attempting, by a personal interview, to avert the khan's wrath on account of the murder of his deputies. After a delay of twelve months he at last succeeded, and obtained a promise that the khan would forgive what had happened, and forego his purpose of raising an army; and in his return home he died suddenly at Gorodetz, in the year 1262, with circumstances that render it extremely probable, that in the camp of the khan poison had been administered to him shortly before his departure. For his various and signal services, and acts of valour, which in those days were deemed miraculous, the grateful admiration of his countrymen raised him to the rank of one of the national saints. Peter the Great, availing himself of the vexation that was paid to the memory of this distinguished hero, founded, in 1712, a monastery near his new city of Peterburgh, on the spot which was reported to have been the scene of Alexander's victory; and in 1723 he caused the bones of the great duke to be brought thither. This monastery has been gradually enlarged by severai sovereigns since the time of Peter; and the late emperior has built a magnificent church within its walls, and a sumptuous mausoleum for himself and his descendants. The shrine of the saint, which was caused to be made by Elizabeth, is of maffy silver. The order of knighthood of St. Alexander Nevskii was instituted by Peter the Great in 1722; but as he died before the knights were appointed, this was done by Catherine I. in June 1725. The badge of this order is a golden eight-pointed star, enamelled with red, with the figure of St. Alexander in armour on horseback. At the four corners of the cross are as many gold spread-eagles, crowned. A broad, deep red, watered ribbon is worn over the left shoulder; the motto is in Russian characters, signifying, "For labour and patriotism." The feast is held on the 30th of August. The monarch and the knights attend masses at Kazan church, and go a pilgrimage on foot to the monastery of the saint, at the distance of three versts, and attend masses again before his silver shrine, and then return to the winter palace, where they partake of a sumptuous dinner, under a discharge of cannon. In 1790 the number of knights amounted to 122. Tooke's Life of Cath. II. vol. ii. p. 373. Cox's Travels into Russia.

ALEXANDERS, in Botany. See Smyrnium.

ALEXANDRIA, Mons, in Ancient Geography, a mountain of Mytil, on the sea-coast, forming a part of Mount Ida, where Paris pronounced judgment on the three goddesses, Strabo. 

ALEXANDRETTA, now called Scandrean by the Turks, in Geography, is the port of Aleppo in Syria, and situated in the gulf of Ajasza, near the sea coast. N. lat. 36° 32' 10'. E. long. 36° 26'. Its nearest distance from Aleppo, in a straight line, is between 60 and 70 miles; but the usual road for caravans, through Antioch, is computed to be between 90 and 100 miles.

Ancient and modern travellers, from Maryton and Teixiera to Volney, concur in representing the wretched condition of this village, which owes its existence, as the habitation of human beings, to its being the port and road that lead to Aleppo. In this road vessels anchor on a solid bot-
tiful harbour formed by the Isle of Pharos, about 12 miles west of the Canopic branch of the Nile, in N. lat. 31° 10'. and E. long. 30° 19'. It is probable, says a popular historian, that the opposition and efforts of the republic of Tyre, which gave Alexander to long and to sever a check in the career of his victories, led him to perceive the vast resources of a maritime power, and suggested to him the idea of the immense wealth which the Tyrians derived from their commerce, especially that with the East Indies. As soon, therefore, as he had accomplished the destruction of Tyre, and reduced Egypt to submission, he formed the plan of rendering the empire, which he designed to establish, the centre of commerce as well as the seat of dominion. With this view he founded a great city, which he honoured with his own name, near one of the mouths of the river Nile, that by the Mediterranean sea and the vicinity of the Arabian gulf, it might command the trade of both the east and west. He had no sooner conceived the design than he hastened to execute it. Accordingly he himself drew the plan of the intended city, and fixed upon several places where the temples and public squares were to be erected. It is said, that as there were no instruments at hand proper for this purpose, a quantity of meal was scattered over the ground, and that thus the circuit of the walls was marked out: and it is added that Aristan-der, the king's footsore, interpreted this new mode of determining the site of the walls as a presage of the abundance which would distinguish the city. The situation of Alexandria, it must be allowed, was selected with such discernment, that it soon became the chief commercial city in the world; and in this respect the design of its founder was fully accomplished. During the subduence of the Grecian empire in Egypt and in the east, and amidst all the successive revolutions in those countries, through a period of about 1800 years, from the time of the Ptolemies to the discovery of the navigation by the Cape of Good Hope, commerce, particularly that of the East Indies, continued to flow in the channel, which the sagacity and foresight of Alexander had prepared. Although some part of the Indian commerce was conducted by means of the river Oxus and the city of Saurasia into the Caspian sea, and thence by land to Trape- zond, and passing to the Euxine and other neighbouring seas, centered in the city of Corinth; yet a considerable part of it, especially such as was carried on at the coast of Malabar and in the Persian gulf, came up the Red Sea; and goods which were landed at Elam, now Suez, were conveyed over land to the Nile, and then by water to Alexandria.

This city, says a modern traveller, was a league and a half long by one-third in breadth, which made the circumference of its walls about four leagues. Quintus Curtius (lib. iv. c. 8. tom. i. p. 22.) makes them 80 stadia, or a little more than nine miles. According to Pliny (H. N. lib. v. c. 10. tom. i. p. 258.) they were 15 miles. Strabo (lib. xvi. tom. ii. p. 1143.) makes the length of the city 30 stadia, and the breadth between seven and eight stadia; and Diodorus Siculus (lib. xvi. tom. ii. p. 319.) Ed. Welfel, makes the circuit 6 stadia, or somewhat more than 11 miles; and he says, that the city was peopled by 300,000 free inhabitants, besides at least an equal number of slaves. The Lake Mareotic bathed its walls on the north, and the Mediterranean on the north. It was intersected lengthwise by straight parallel streets. This direction left a free passage to the northerly wind, which alone conveys coolness and salubrity into Egypt. A street two thousand feet wide began at the gate of the sea, and terminated at the gate of Canopus. It was decorated by magnificent houses, by temples, and by public buildings. In this extensive range the eye was never tired with admiring the marble, the porphyry, and the obelisks, which were defined at some future day to embellish Rome and Constantinople. This street, the handomest in the universe, was intersected by another of the same breadth, which formed a square, at their juncture, half a league in circumference. From the middle of this great place the two gates were to be seen at once, and vessels arriving under full sail from the north and from the south. A mole of a mile in length, called Hept Stadium, stretched from the continent to the Isle of Pharos, and divided the great harbour into two. That which is to the northward preferred the name of the founder, and was called the Great Port. A dyke, drawn from the island to the rock on which Pharos was built, secured it from the westerly winds. The other was called Eunopylos, or the Safe Return. The former is called at present the New, and is the port to which the vessels of Europe resort; the latter is the Old Harbour, and is to that which those only from Turkey are admitted: a bridge that joins the mole to the city served for a communication between them. It was raised on lofty piers sunk into the sea, and left a free passage for the ships. The palace, which advanced beyond the promontory of Lochius, extended as far as the dyke, and occupied more than a quarter (a third or fourth, says Strabo), of the city. Each of the Ptolemies added to its magnificence. It contained within its inclosure the museum, an asylum for learned men, groves and buildings worthy of royal majesty, and a temple where the body of Alexander was deposited in a golden coffin. Pericles, it is said, undertook to convey the body of Alexander to the temple of Jupiter Ammon, agreeably to the will of that prince; but Ptolemy, son of Lagus, carried it off, and placed it in the palace of Alexandria. The infamous Seleucus Cibyrotactus violated this monument, carried off the golden coffin, and put a glass one in its place. In the great harbour was the little island of Anti-Rhodes, where a theatre and a royal place of residence. Within the harbour of Eunopylos was a smaller one, called Kibotos, or Cibotus, q. d. the harbour of the arch, dug by the hand of man, which communicated with the Lake Mareotic by a canal. Between this channel and the palace was the admirable temple of Serapis, and that of Neptune, near the great place where the market was held. Alexandria extended likewise along the southern banks of the lake. Its eastern part presented to view the Gymnasium, with its porticoes more than 600 feet long, supported by several rows of marble pillars. Without the gate of Canopus was a spacious circus for the chariot races. Beyond that the suburb of Nicaeopolis ran along the sea-shore, and seemed a second Alexandria. A superb amphitheatre was built there, with a race-ground, for the celebration of the Quinquennalia, or feasts that were celebrated every fifth year. Such is the description, says Savary, (Letters on Egypt, vol. i. p. 29.) left us of Alexandria by the ancients, and above all by Strabo.

This famous city, second only to Rome itself, was built by Dinocrates, a celebrated architect, who acquired great reputation by rebuilding the temple of Diana at Ephesus, which Herodes had burnt.

Alexandria owed much of its celebrity as well as of its population to the Ptolemies. Ptolemy Soter, one of Alexander's captains, who, after the death of this monarch, was first governor of Egypt, and afterwards assumed the title of king, made this city the place of his residence, about 300 years before Christ. This prince founded an academy, called the Museum, in which a society of learned men devoted themselves to philosophical studies, and the improvement of all the other sciences; and he also gave them a library, which was prodigiously increased by its successors. He likewise induced the merchants of Syria and Greece to reside in this city, and to make it a principal mart of their commerce.
commerce. His son and successor, Ptolemy Philadelphus, pursued the designs of his father, and completed the tower of Pharos, brought the rock of the god Serapis from Egypt, and erected the famous temple of Serapis, and improved the Alexandrian Library. He also continued the canal projected and begun by Neco, and carried on by Darius Hystaspis, which was intended for joining the Nile to the Red Sea, and had the glory of completing it. Ptolemy Euergetes instituted the example of his predecessors, encouraged trade, and contributed to the wealth of Alexandria, and the prosperity of the kingd. m. But the influence that was thus produced occasioned luxury and licentiousness, so that the voluptuaries of Alexandria became proverbial:

"Ne Alexandria virum permitte dulciter." Quinctilian.

For about 350 years, from the commencement of the reign of Ptolemy Soter to the death of Cleopatra, Alexandria continued in subjection to the Ptolemies; but most of them devoted themselves to various kinds of indulgence and pleasure, became effeminate and dandily, and by their example contributed to that corruption and relaxation, which prevailed among their subjects, and ultimately terminated in the ruin of this famous city. Ptolemy Philometor, in particular, was a monster of vice and cruelty. About the year B.C. 156, he put to death or banished most of those persons who had been in favour with his brother Philometor, and who had been employed during his reign, and permitted his foreign troops to plunder and massacre at discretion. Many of the inhabitants of Alexandria, terrified by his savage conduct, and in order to avoid his cruelty, retired into foreign countries, and left the city almost a desert. Of these there were grammarians, philosophers, geometers, physicians, philosophers, and other matters in the liberal sciences, who disseminated the polite arts and general science through Greece, Asia Minor, and the islands, and indeed to every place whither they fled. In order to supply the places of these fugitives, Ptolemy enjoined proclamations to be made in all the neighbouring countries, that persons of any nation, who were distressed of settling at Alexandria, should receive suitable encouragement. The proposal was accepted by many, and the houses and privileges which belonged to the former inhabitants were allotted to these new settlers, and thus the city was repopulated. About this time Scipio Africanus the younger, and other Romans, were deputed on an embassy to Alexandria; and Justin says of him, that whilst he visited and conferred with curiosity the rarities of Alexandria, he was himself a sight to the whole city; "Dum infpiciat urbem, sisset cubiculo Alexandrinsium fuit," so different were his aspect and manners from those of the Alexandrians. The new inhabitants, whom Ptolemy had invited into the city, soon found reason to dislike their situation, and to hate their new sovereign. Cruel and timid as he was, he determined to massacre all the young men of the city; and for this purpose he caused the Gymnæum, or place of exercise in which they were assembled, to be invaded by his foreign troops, and put them all to the sword.

When Julius Caesar, B.C. 48, in his pursuit of Pompey, landed at Alexandria, he found the city in great commotion, without law and without government. Having arbitrated between Ptolemy XII. and Cleopatra, and decreed that they should reign jointly in Egypt, Pothinus inflamed the Alexandrians to rebel the decree, and to concur in driving Caesar out of the city. Accordingly he brought 20,000 troops to effect his purpose, but Caesar supported the attack; and in order to prevent any injury from their flet, to which they next had recourse, he caust it to be set on fire, and plundered himself of the tower of Pharos, which he Garrisou. Some of the vessels that were on fire came so near, that the flames caught the houses adjoining to the quay, and spread through that quarter of the city, which was called Bruchion, and destroyed the library that was placed there, consisting of 300,000 volumes. In a decisive battle with the whole army of Ptolemy, Caesar, assisted by a considerable body of Jews, obtained a complete victory. Ptolemy, in endeavouring to make his escape in a boat, was drowned in the Nile; and Caesar returned to Alexandria, which, together with the whole of Egypt, submitted to the victor. Before he left this city, he confirmed all the privileges which the Jews enjoyed, in gratitude to them for their assistance, and ordered a column to be erected, in which these privileges were engraved, with the decree that confirmed them. The emperor Caligula was inclined to favour the Alexandrians, because they manifested a readiness to confer divine honours on him; and conceived the horrid design of massacring the chief senators and knights of Rome, A.D. 40, and then of abandoning the city, and of settling at Alexandria. At this time the Jews who inhabited this city, and who had continued to enjoy the privileges of citizens, granted to them by Alexander, under the Ptolemies, and who had obtained a confirmation of them from Julius Caesar, became obnoxious to the Alexandrians. Their number, as they occupied two parts in five of the city, and amounted in the whole of Egypt to a million, and also the prerogatives that enfranchised them, excited envy and jealousy, and their fellow-citizens wanted only a pretence for destroying them. They had been for some time restrained from doing them injury; but under the government of Flaccus, A.D. 40, who permitted the statues of Caesar to be set up in the oratories of the Jews, they were grievously oppressed. He took occasion, in consequence of some diffusions and seditions that occurred, to publish a decree, by which, without offering them a hearing, they were declared strangers in Alexandria; and he also restricted them to one of the five districts into which the city was divided; and their houses, which they were compelled to abandon, were plundered, whilst, destitute of any settled abode, they were obliged to wander about the fields and the sea-shore, without shelter, property, and even the means of subsistence. Those who fell into the hands of their enemies were tortured in the most cruel manner, and destroyed by a lingering and painful death. The streets, market-places, and theatres were defiled with blood; neither sex nor age was distinguished; and none of them was spared. This writer affirms no other cause for these barbarities than the rage and fury of the Alexandrians. When Flaccus was recalled, the Jews obtained some reprieve; but they were soon alarmed by the order of Caius to have his own statue set up in the temple of Jerusalem. In the mean while they sent a deputation to the emperor, at the head of which was Philo, to petition the restoration of their citizenship and their oratories. Before the object of their embassy was settled, Caius died; and Claudius declared in favour of the Jews, whom he re-established in the possession of all the privileges they had enjoyed in Alexandria from the time of the foundation of that city. When Adrian visited Egypt, A.D. 130, he expressed a great desire of the inhabitants of Alexandria in parti. A letter written from thence, and addressed to the Confu Servian, he says, "the city of Alexandria is rich and powerful, with great trade, which produces plenty. Nobody is idle there; some blow glafs, others make paper; many are employed about linen and making of cloths: all have some trade. All, whether Jews or Christians, acknowledge but one God, their interest. I wish that this city, by its grandeur and riches, the first of all Egypt, was furnished with better inhabitants."

Nothing
Nothing equals their ingratitude; I have granted them every thing they could desire; I have restored their ancient privileges; I have given them new ones; in consequence of this they were grateful to me when present; but I had scarcely turned my back when they insolently attacked my son Verus, and I believe you know what they have said of Antoninus, &c. &c. &c."

For Nero the Alexandrians built baths in the city, when they expected a visit from him in his way to Egypt; and bequeathed Cæcina Tufcus, the son of his nurse, whom he had made prefect of Egypt, pretended to make use of them, he was condemned to banishment. To Alexandria belonged the honour of being the first place where Vespasian was acknowledged and proclaimed, A. D. 69, and the emperor remained there whilst his generals and armies were fighting against Vitellius; and though he came hither for the purpose of starving Italy, by preventing its supplies of foreign corn, yet as soon as he heard of the death of Vitellius, and that Rome had submitted, the bell flaps of Alexandria were immediately laden with corn, and ordered to fail for their supply. Whilfit Vespasian continued in this city, he received ambassadors from the Vologeses, who offered him 40,000 Parthian horse; but peace was then restored to the Roman empire. During his stay in this place he was no favourite with the Alexandrians. They were fond of pomp and magnificence, and Vespasian loved simplicity. They had flattered themselves with the hopes of receiving a gratification, because they had been the first who acknowledged him for emperor; but on the contrary they were harassed with importunities, either new, or levied with uncommon rigour. The Alexandrians revenged themselves with snares and falsehoods, calling him Cypiofactes, a name which they had formerly given to one of their kings, who was cowardly and avaricious; but heaven, if we credit some Pagan writers, distinguished him by miracles. The emperor Severus, in his visit to Egypt, A. D. 202, granted the Alexandrians a council, the members of which had the title and privileges of senators, and suffrages in the administration of public affairs, and thus mitigated the rigour of the despotic government of the prefect instituted by Augustus. He also changed several laws in their favour; and they erected a column as a monument of their gratitude, called by Abulfeda the Pillar of Severus. It has already appeared that the Alexandrians were inclined to be fastidious, and that they deferved the character given to them by Herodotus, who says, that they loved to be merry at the expense even of their princes. In the case of Caracalla, whose vanity they ridiculed, because, though he was of small stature, deformed, and deformed of every kind of military merit, he had compared himself to Achilles and to Alexander, their railery was productive of very serious consequences. Whilfit the Alexandrians were preparing to receive him with joy and magnificence, when he visited the temple of Serapis, and the tomb of Alexander, he was meditating cruel retaliation. In the midst of peace, and on the slightest provocation, he inflicted his commands for a general massacre, A. D. 215. From a secure part of the temple of Serapis, he viewed and directed the slaughter of many thousand citizens, as well as strangers, without distinguishing either the number or the crime of the sufferers; since, as he coolly informed the senate, all the Alexandrians, those who had perished and those who had escaped, were alike guilty. Dion. (lib. xlvii. p. 1307.) represents it as a cruel massacre; Herodian (lib. iv. p. 155.) says, that it was also pernicious. The massacre was accompanied with the plunder both of temples and houses; and all strangers, except merchants, were driven from the city. The societies of learned men, who were maintained in the Museum, were abolished; and the different quarters of the city were separated from each other by walls and towers to prevent all communication between them. However, this defolation was but a temporary evil; for Caracalla being soon after killed, Alexandria recovered its splendour by its own resources, and soon became again the second city of the empire. Under the reign of Gallienus, Âmilian, who had been prefect of Egypt for some time, assumed the imperial purple, on occasion of a violent faction, which terminated in a ruinous war. All communication between the different quarters of Alexandria was cut off, and it was easier, says St. Dionysius, to go from one end of the world to the other than from Alexandria to Alexandria. The streets were filled with blood, and the dead bodies putrified, and, by their infection, brought on the plague. Âmilian, in vain, endeavored to appease the people. They were exasperated against him, and attacked him with stones and darts; upon which, in order to avert the imminent danger that threatened him, he declared himself emperor. The soldiers and the people, happy in the prospect of being relieved from the yoke of Gallienus, acknowledged his sovereign authority. At length he was attacked and defeated by Theodotus, the minister of Gallienus's vengeance. Upon this he retired to the Bruchium, a quarter of Alexandria, and sustained a siege, in which St. Anastasius and St. Eusebius, intimate friends, and afterwards bishops of Laodicea, were admired for their ingenuous charity in comforting and relieving the unhappy beggars, who perished with hunger. Anatolius was shut up in Bruchium, and Eusebius remained with the Romans. The former, moved with compassion to the wants and misery of the besieged, applied to the latter in order to obtain amity for those who should leave the garrison and surrender themselves. Having succeeded in his application, he immediately proposed surrendering the place, and making peace with the besiegers. The answer was, that no peace should be made. Anatolius then proposed, that all who were of no service should leave the place in disgrace, and they were kindly received and feasonably supplied by Eusebius. Âmilian was afterwards taken by Theodotus and sent to Gallienus, who ordered him to be strangled in prison. The various misfortunes that befell Alexandria fo depopulated this great city, that, after these calamities, the number of its inhabitants, from four to four score years of age, was not equal to that which had been usually reckoned before of those who were between 40 and 70. This difference was known by the registers that were kept for the gratuitous distribution of corn. Eusebius, Eccl. Hist. vii. 21. Diocletian, A. D. 296, marched against Achilles, who had usurped the government of Egypt; and, having driven him to Alexandria, besieged the city, cut off the aqueducts which conveyed the waters of the Nile into every quarter of that immense city, and rendering his camp impregnable to the garrisons of the besieged multitude, he pushed his reiterated attacks with caution and vigour. After a siege of eight months, Alexandria, waited by the sword and by fire, implored the clemency of the conqueror, but it experienced the full extent of his severity. Many thousands of the citizens perished in a promiscuous slaughter, and there were few obnoxious persons in Egypt, who escaped a sentence either of death, or at least of exile. Eutropius, ix. 24. Orosius (vii. 25.) says, that he gave up the city to be plundered. As an apology for the severity of this emperor, it has been alleged that the seditions of Alexandria had often affected the tranquility and subsistence of Rome itself, and that his severity was counterbalanced by futile regulations.
of corn brought from Alexandria; and he employed the Alexandria fleet in virtually New Rome, as it was called, leaving to Old Rome only that of Africa. Socrat. ii. 13. Alexandria suffered in common with other places by the violent and destructive earthquake which shook the greatest part of the Roman empire, July 21st, A.D. 365; and this city annually commemorated this fatal day when 50,000 persons had lost their lives in the inundation.

It was in Alexandria chiefly that the Grecian philosophy was engrafted upon the stock of ancient oriental wildness. The Egyptian method of teaching by allegory was peculiarly favourable to such an union: and we may well suppose that when Alexander, in order to preserve by the arts of peace that extensive empire, which he had obtained by the force of arms, endeavoured to incorporate the customs of the Greeks with those of the Persian, Indian, and other eastern nations, the opinions as well as the manners of this feeble and obsequious race would, in a great measure, be accommodated to those of their conquerors. This influence of the Grecian upon the oriental philosophy continued long after the time of Alexander, and was one principal occasion of the confusion of opinions which occurs in the history of the Alexandrian and Christian schools. Alexander, when he built the city of Alexandria, with a determination to make it the seat of his empire, and peopled it with emigrants from various countries, opened a new mart of philosophy, which emulated the fame of Athens itself. A general indulgence was granted to the promiscuous crowd assembled in this rising city, whether Egyptians, Grecians, Jews, or others, to profess their respective systems of philosophy without molestation. The consequence was, that Egypt was soon filled with religious and philosophical sects of every kind; and particularly, that almost every Grecian felt found an advocate and professor in Alexandria. The family of the Ptolemies, as we have seen, who after Alexander obtained the government of Egypt, from motives of policy, encouraged this new establishment. Ptolemy Lagus, who had obtained the crown of Egypt by usurpation, was particularly careful to secure the interest of the Greeks in his favour, and with this view invited people from every part of Greece to settle in Egypt, and removed the schools of Athens to Alexandria. This enlightened prince spared no pains to raise the literary, as well as the civil, military, and commercial credit of his country. Under the patronage first of the Egyptian princes, and afterwards of the Roman emperors, Alexandria long continued to enjoy great celebrity as the seat of learning, and to send forth eminent philosophers of every sect to distant countries. It remained a school of learning, as well as a commercial emporium, till it was taken, as we shall see in the sequel of this article, and plundered of its literary treasures by the Saracens. Philosophy, during this period, suffered a grievous corruption from the attempt which was made by philosophers of different sects and countries, Grecian, Egyptian, and Oriental, who were assembled in Alexandria, to frame, from their different tenets, one general system of opinions. The respect which had long been universally paid to the schools of Greece, and the honours with which they were now adored by the Egyptian princes, induced other wise men, and even the Egyptian priests and philosophers themselves to submit to this innovation. Hence arose an heterogeneous mass of opinions, under the name of the Eclectic philosophy, and which has been the foundation of endless confusion, error and absurdity, not only in the Alexandrian school, but among Jews and Christians; producing among the former that sanguine kind of philosophy, which they called their cabala, and among the latter innumerable corruptions of the Christian faith. The Alexandrian school is celebrated

by Strabo (lib. xvii.) and by Ammianus (xii. 6.) Brucker's History of Philosophy, by Enfled, vol. i. p. 500.

At Alexandria there was, in a very early period of the Christian era, a Christian school of considerable eminence. St. Jerome says, the school at Alexandria had been in being from the time of St. Mark. Pantaenus, placed by Larder at the year 192, prefixed in it. St. Clement of Alexandria succeeded Pantaenus in this school about the year 190; and he was succeeded by Origen. Larder's Works, vol. ii. p. 203. As the extensive commerce of Alexandria, and its proximity to Palestine, gave an easy entrance to the new religion, it was at the school of this city that the Christian theology appears to have assumed a regular and oriental form: and when Adrian visited Egypt, he found a church composed of Jews and Greeks, sufficiently important to attract the notice of that inquisitive prince. The theological system of Plato was introduced into both the philosophical and Christian schools of Alexandria; and of course many of his sentiments and expressions were blended with the opinions and language of the professors and teachers of Christianiety. See Platonism.

The city of Alexandria, which had maintained its reputation for power and wealth, as well as for literature and science, for nearly 1000 years, and which had hitherto effeetable held in subjection by the Ptolemies, the Romans, and the Greek emperors, was at length captured by the Saracens, and in process of time totally ruined. In the year 638, Amrou, the general of Omar, invaded Egypt; and in the following year he commenced the siege of Alexandria. This siege is perhaps the most arduous and important enterprise in the annals of Saracen conquests. The first trading city in the world was abundantly replenished with the means of subsistence and defence. Her numerous inhabitants fought for the dearth of human rights, religion and property; and the enmity of the natives seemed to exclude them from the benefit of peace and toleration. The sea was continually open; and if Heraclius had been awake to the public diftrusts, fresh armies of Romans and barbarians might have been poured into the harbour, to save the second capital of the empire. A circumference of 10 miles would have scattered the forces of the Greeks, and favoured the stragglers of an active enemy; but the two sides of an oblong square were covered by the sea and the lake Mareotis, and each of the narrow ends exposed a front of no more than 10 furlongs. The efforts of the Arabs, however, were not inadequate to the difficulty of the attempt and the value of the prize. The faithful natives devoted their labours to the service of Amrou; and in every attack his sword and banner glittered in the van of the Moslems. The general, having been released from a temporary captivity, into which his imprudent valour had betrayed him, advanced towards the city doomed to destruction. At length, after a siege of fourteen months, and the loss of 23,000 men, the Saracens prevailed; the Greeks embarked their dispirited and diminished numbers; and the standard of Mahomet was planted on the walls of the capital of Egypt, Dec. 22, A.D. 642. "I have taken," said Amrou to the caliph, "the great city of the world. It is impossible for me to enumerate the variety of its riches and beauty; I shall content myself with observing, that it contains 4000 palaces, 4000 baths, 400 theatres or places of amuse ment, 12,000 shops for the sale of vegetable foods, and 40,000 tributary Jews. The town has been subdued by force of arms, without treaty or capitulation, and the Moslems are impatient to seize the fruits of their victory." According to the Arabian historians, Alexandria, at this time, consisted of three cities, viz. Menas, or the port, which included Pharos and the adjacent parts; Alexandria, properly so called, where the modern Scanderia stands; and Nekitas, or the
the Necropolis of Joscipus and Strabo. The commander of the faithful, on this occasion, rejected the idea of pillage, and directed his lieutenant to reverence the wealth and revenue of Alexandria for the public service and the propagation of the faith; the inhabitants were numbered; a tribute was imposed; the zeal and exertion of the Jacobites were curbed; and the Melchites, who submitted to the Arabian yoke, were indulged in the obscurer but tranquil exercise of their worship. The intelligence of this disgraceful and calamitous event affected the declining health of the emperor, and Heraclius died of a dropy about seven weeks after the loss of Alexandria. Under the minority of his grandson, the clamours of a people, deprived of their daily sufficiency, compelled the Byzantine court to undertake the recovery of the capital of Egypt. In the space of four years the harbour and fortifications of Alexandria were twice occupied by a fleet and army of Romans. They were twice expelled by the valor of Amrou. But the facility of the attempt, the repetition of the insult, and the obstinacy of the refitance, provoked him to swear, that if a third time he drove the infidels into the sea, he would render Alexandria as accessible on all sides as the house of a prostitute. Faithful to his promise, he disembarked several parts of the walls and towers, but the people were spared; and the Molch of Mercy was erected on the spot where the victorious general had dropped the fury of his troops. For the fate of the library, see Alexandria library.

Under the domination of the Arabs, Alexandria gradually lost its splendour. In the year 924 it was taken by the Magrebians, two years after the destruction by fire of its great church, called by the Arabs All Kafiaria, or Gafira, which had been formerly a Pagam temple, erected by queen Cleopatra, in honour of Saturn. The city was soon abandoned by the Magrebians, and in 928 the population of it was again regained. But when their fleet was afterwards defeated by that of the Caliph, the Magrebian general, Abul Kafis, retired from Alexandria, leaving in it a garrison of 300 men, who with the remaining inhabitants were removed by the Caliph's admiral, Thobaid, to an island in the Nile called Aboukir. According to Butchius, more than 200,000 of the wretched inhabitants perished this year.

In the year 875 the old walls had been demolished; its extent contracted to half its ancient dimensions, and those walls were built which exist at the present day. This second Alexandria, which may be called, says Savary, that of the Arabs, preferred by the disposition of its streets the form of a chequer. It had preserved a part of its public places and of its monuments. The Pharos fell exiled; and Alexandria in its decline still preserved an air of grandeur and magnificence that excited admiration.

Of the prosperity and wealth of Alexandria, as the emporium of commerce, we may form an idea by this single circumstance: that, after the defeat of Zenobia, a single merchant of this city, undertook to raise and pay an army out of the profits of his trade. Such were its resources, and the advantages derived from its commerce, that notwithstanding the tributes that were exacted from it by the Greeks and Romans, and the oppressions it suffered from the Saracens, it successively recovered its prosperity; and even in the 13th century, its old mart began to revive, and its port became again the center of commerce. But the dominion of the Turks, and the discovery of the Cape of Good Hope, in 1499, completed its ruin, and from that time it has fallen into decay. The Alexandria of the Arabs was miserably depopulated. Its large buildings fell into ruins, and under a government which discouraged even the appearance of wealth, no person could venture to repair them; and mean habitations were constructed, in lieu of them, on the sea coast.

The present state of Alexandria affords a scene of magnificent ruin and desolation. In the space of two leagues, enclosed by walls, nothing is to be seen but the remains of palaces, of capitals, and of obelisks, and whole mountains of shattered columns and monuments of ancient art heaped upon one another, and accumulated to a greater height than that of the houses. The famous tower of Pharos has been long since demolished, and a square cable, without tackle, ornament, or structure, called Marblon, erected in its place. The mole which joined the continent to the isle of Pharos is enlarged, and is now become a part of the main land. The island of Anti-Rhodes is in the middle of the present town, and is discoverable only by an eminence covered with ruins. The harbour Kibatos is choked up. The canal which conveyed the waters of the lake Marcolis has disappeared. This lake itself, through the negligence of the Turks in preserving the canals which conveyed the waters of the Nile, is no longer in existence, but is entirely occupied by the sands of Libya. The canal of Faunus, the only one which at present communicates with Alexandria, and without which that town could not subsist, since it has not a drop of fresh water, is half filled with mud and sand. Under the Roman empire, and even under the domination of the Arabs, it was navigable all the year, and served for the conveyance of merchandise. Its banks were shaded with date trees, covered with vineyards, and adorned with country houset. At present it has no water till about the end of August, and its supply is barely sufficient to fill the cisterns of the town. The fields adjoining it are stunted; the groves and gardens that surrounded the ancient city have disappeared, and without the walls there are only a few scattered trees, some sycamores and fig-trees, some date and caper trees, and kally, that shade the burning sands, which would otherwise impo-
placed, who gives notice, by a flag, of the ships that are coming into port. From this hill may be seen the sea, the whole extent of the city, and the parts in its vicinity. On the sea-coast there is a large baofon, cut out of the rock that forms the shore, having on its sides two beautiful falmons that are hewn out by the chisel with brushes across them. A canal of a zig-zag form, for the purpose of stopping the progress of the land by its different windings, conveys into them the water of the sea, pure and transparent as crystal. The water rises a little above the walk, when a person is seated on the stone bench, and the feet rest on a fine sand. The waves of the sea dash against the rock and foam in the canal. The swell enters, raises you up, and leaves you; and thus alternately entering and retiring, furnishes a constant supply of fresh water, and a coolness, which is grateful and delicious under a burning sky. This place is vaguely called the Bath of Cleopatra; and some ruins indicate its having been formerly ornamented.

The modern Alexandria is built near the brink of the sea on a kind of peninsula, situated between the two ports above-mentioned. The new port, assigned to Europeans, is clogged up with sand, which renders the entrance into it both difficult and dangerous, and in stormy weather endangers the bilging of the ships; and the bottom is rocky, so that the cables soon chafe and part; and thus vessels are driven against one another, and are sometimes lost. An instance of this kind happened in March 1773, when more than 40 vessels were dashed to pieces on the mole by a north-west gale. Similar accidents have also happened at different times; and under the Turkish government, which, as it is said, ruins the labours of pail ages and destroys the hopes of future time, no provision is likely to be made for preventing their occurring again. The other port, or the Emnoutis of the ancients, to the westward of the Pharos, is called the port of Africa; it is much larger than the former, and lies immediately under part of the town of Alexandria. It has much deep water, though many ships are continually throwing their ballast into it; and without doubt it will be at length filled up and thus joined to the continent. Christian vessels are not suffered to enter this port; and the only reason is, lest the Moorish women should be seen taking the air in the evening at open windows, and this has been thought sufficient to induce Christian powers to submit to the restraint, and to overbalance the constant loss of ships, property and men. The houses at Alexandria, like those of the Levant, have flat terrace roofs; they have no windows, and the apertures which supply their place are almost entirely obstructed by a wooden lattice projecting, of various forms, and so close, that the light can hardly force a passage. In those countries, more than any where else, such inventions, which transform a manison into a prison, are real jealousies, as Sommull says, or window-blinds. Narrow and awkwardly disposed streets are without pavement, as the city is without police; no public edifice, no private building arrests the eye of the traveller; and on the supposition that the fragments of the old city had not attracted his attention, he would find no object in the present town that could supply matter for a moment's thought. Turks, Arabsians, Barbarouises, Copts, Christians of Syria, and Jews, constitute a population which, according to Somnulz, may be estimated at 5000, as far as an estimation can be made in a country where no register of any thing is kept. Commerce attracts thither besides, from all the countries of the east, strangers whose residence is very transient. This motley assemblage of persons of different nations, jealous of and almost always hostile to each other, would present to the eye of the observer a

ALE

singular mixture of customs, manners and dres, if a reform

of thieves and robbers could repay the trouble of observation.

The present Alexandrians are, like their predecessors in former times, chargeable with a prouenence to sedition, which is aided and reftained by the severity of their government. The Britifh and French nations carry on a considerable commerce with Alexandria, and have each a convent residing there. Some Venetian ships also sail thither yearly, under the colours and protection of France. The subjects of those kingdoms who have no confult here are subjected to a tax by the Grand Seignior; but the Jews indemnify themselves for this disadvantage, by selling their commodities cheaper than other foreigners can afford to do; and they are also favoured by the farmers of the revenues, who know that the Jews have it in their power to lessen the quantity of merchandise that comes into their port, for the period of two years, which is the duration of their farm. The language spoken at Alexandria is the Arabic; but most of the Alexandrians, and those in particular whom commerce leads into an intercourse with the merchants of Europe, speak likewise the Italian. The morocco or lingua franca, which is a compound of bad Italian, Spanish and Arabic, is likewise spoken in this place. The government of Alexandria is like that of other places in Egypt; and is conducted by an aga, who has under him a kadi and sub-bafian, all nominated by the chief baha. It has a small garrison of soldiers, part of which are Janizaries and Affaffs; who are haughty and insolent, not only to strangers but to the mercantile and inoffensive part of the people. These are lodged in the farillons or cellars that guard the port, where the aga or governor that commands them also resides. But though the Pharos, according to established regulations, ought to be garrisoned by 500 Janizaries, it has never half that number, and not more than four cannons for its defence. The whole of the fortifications might safely be beat down by a single frigate; but a foreign army would experience great difficulty in maintaining possession of Alexandria for want of water; as the city has not any besides that which is conducted by canals into their refervoirs at the time of the overflowing of the Nile; so that it would be necessary to conquer the whole country, or at least those parts that lie on the banks of the river. Alexandria was taken by assault on the fourth of July, 1798, by the French army, under the command of Bonaparte, the present prince consuli of France; after putting to flight the Arabs and Mamalukes who defended it, and killing about 500 of them. The troops, that were left in possession of the town, when the army began its march across the Defart, having been forbidden, under penalty of death, from entering the houses or mosques of the Turks, on committing any violence on their persons, or those of their families, built huts of palm-branches without the city, to shelter themselves from the sun. The men of science, who accompanied the army, were lodged in the houses of the few Europeans resident at Alexandria, but a dozen of them were crowded together in one chamber, under the heat of a torrid climate. Miserably supplied both with food and water, molested with the flings of insects, and surrounded with filth and wretchedness, they at the same time contemplated in a city, once renowned for industry, commerce and activity, nothing but ruins, barbarism and poverty; stupid-looking citizens, with long pipes, indolently fitting in the public places, half starved and naked children, and the forms of bare-footed women, in blue serge gowns, and black fluff veils, flying the approach, or turning away with precipitation, whenever they met a Frenchman. The French beheld every where monuments of antiquity; but every where misplaced; pillars
A L E

pills of granite, inscribed with Egyptian hieroglyphics, ferved the streets, or divided by the law, served for their holds and benches; marble and porphyry basfs and capitals, baths and catacombs were found in ruins, with nothing entire but a bath of black granite, delinef for the museum of Paris; the pillar of Pompey, and the obficle of Cleo- patra, which were yet in good prefervation. When the blockade of the port by the English fleet, after the famous battle of Abukir, cut off the communication with Rosetta, and the supply of water was then impeded, Bonaparte caufed the canal which led from Rhamania to Alexandria, across a defert of 40 miles, to be cleaned; by which means not only this city received a larger supply of water and provifions, but the artillery was conveyed more expeditiously and conveniently by water to the general depot at Gifs, than it could have been by land. Bonaparte also drew plans for the better defence of the port of Alexandria and the city of Cairo; he also formed a great establishment for the mechanical arts; and with the concurrence of the fcientifc men who attended him formed a national academy, called the Institute. In the year 1801, Alexandria was taken by the English army, under the command of General Hutchinson, the news of which was announced fon after the preliminaries of peace between England and France were signed, by the refpective agents of the two countries; by one article of which Egypt is to be delivered up to the Sublime Ottoman Porte. Alexandria is fituated in N. lat. 31° 17' 25", E. long. 32° 16' 36". Nautical Almanac. According to Bruce (Travels, vol. i. p. 16.) N. lat. 31° 17' 32". E. long. 32° 17' 30". Anc. and Mod. Un. Hill. Rollin's Anc. Hist. Savary's Letters on Egypt, vol. i. letter 2. Sonnini's Travels through Upper and Lower Egypt. Gibbon's Decline, &c. of the Rom. Emp.

Alexandria was also a name given to several other cities; viz. a city of Arcadfa, on the river Arachthus, the Alexandropolis of Ifidore (Stephanus), and by fome thought to be the modern Cabila—another of Gedrodia, both built by order of Alexander the Great; (Pliny, H. N. lib. vi. c. 23.)—A third of Aria, near the lake Arius, according to Ptolemy; but according to Pliny (lib. vi. c. 23.) on the river Aria, built by Alexander, who settled a colony of Macedonians there. (Strabo, lib. xv. Ammianus lib. 22.)—A fourth in Bactriana, fo called, fays Pliny, (lib. vi. c. 23.) from its builder. —A fifth, an inland town of Carmania, built alfo by Alexander, and mentioned by Pliny, Ptolemy and Ammianus.—A sixth, in the country of the Dahe, in Sogdiana, (Ifidorus Claracensis.)—A seventh, in India, at the confluence of the Acenees and Indus, (Arrian, lib. v. c. 15.)—An eighth, built by Alexander the Great, between Ifus and the Straits which lead from Citica into Syria, called also Alexandria, and now Scanderoon. —A ninth, in Margiana, which was built by Alexander, and rebuilt, after it was demolished by the barbarians, by Antiochus the fon of Seleucus, and called Antiochia of Syria, and also Seleucia, watered by the river Mergus; 70 fadas in circuit, according to Pliny (lib. vi. c. 16.) who adds, that, after the defeat of Cæsuris, Orodes conveyed the captives to this place. —A tenth of the Oxiana, in Sogdiana, built by Alexander on the Oxus, near the confluence of Bactria, (Pliny lib. vi. c. 16.)—An eleventh, built by Alexander, at the foot of Mount Parapamisus, which was called Caucausus, (Pliny, lib. vi. c. 23.)—A twelfth, in Troas, called also Troas and Antigonia, ordered to be erected by Alexander, in commemoration of Troy, which had long ceased to exist. Antigonus, one of his lieutenants, laid the foundations of it, and gave his name to the city; but the name of Alex- ander was refored by Lyfmachus, who afterwards possessed, embellifhed and extended it. Having paffe under the domination of the Romans, it became, under Augustus, one of the handsomest cities of the camp. Under Adrian, Herodes Atticus conftrued a fuperb aqueduct, fome few traces of which are still to be fen. The walls of the city, of the houses, of the temples, and of other monuments, are built of a hard fide, done. The marble of Paros and that of Marmora are common here, and also feveral forks of granite. Near the rivulet to the fouth of the city are two springs of mineral waters, reforted to by the Turks and Grecians, which are recommended for disorders of the skin, the leprofy, and sphyphils. The harbour is of narrow extent, and almoft chocked up with fand. History does not mention the epoch in which this city was defroyed. It had no effidence when the Turks established themselves in this country. The environs present a fruitful soil, forming a plain, in which the cedun oak grows in abundance, and without culture. The ruins of this city are fix leagues to the fouth of Cape Sigenum. Olivier's Travels, &c. vol. ii. p. 46. —A thirteenth Alexandria, built by Alexander on the Jaxartes, bounding his victories towards Scythia.—A fifteenth in Adiabene, mentioned by Pliny, and as Hardouin fuggels, designed to perpetuate the remembrance of the defeat of Darius.—A fifteenth on the northern coaft of the Ifland of Cyprus, fouth of the promontory of Caluufa.—A feventeenth in Palestine, on the river Schan, to the fouth of Tyre, near the sea.

Alexandria, of ALEXANDRIA, farnamed Della Paglia, because the inhabitantsufe ftable for fuel instead of wood, or because the Germans contemptuoufly called it Palatina, or a fortrefs of fraw, a city of Italy, in the district of Alexandria or Alexandrino, belonging to the duchy of Milan, has a caflle, and is fituated in a marshy country, on the river Tenaro. It was built in honour of pope Alexander III. in 1179, and is faid to have 12,000 inhabitants. By this pope it was made a bifhopfip, suffragan of Milan, with feveral privileges annexed to it. The citadel is strong, but the fortifications are mean. It was ceded to the duke of Savoy in 1703; taken by prince Eugene, after three days' siege, in 1706, by the French in 1745, and retaken by the king of Sardina, to whom it belongs by the treaty of Utrecht, in 1746. It is 38 miles eaf of Turin, and 37 fourth-south-well of Milan. N. lat. 44° 48'. E. long. 8° 39'.

Alexandria, a town of New Rochell, in the government of Ekatariinofal, on the confines of Poland, 70 miles welf of Ekatariinofal, and 150 fourth-south-well of Know. N. lat. 45° 25'. E. long. 32° 54'.

Alexandria of Alexandrow, a town of Poland, in the palatinate of Volhynia, upon the river Horn, 50 miles call-north-eaft of Lucko.

Alexandria, a township in Grafton county, N. Hampshire, in America, containing 258 inhabitants; incorpofated in 1782. Alexandria, a township in Hunterdon county, New Jersey, containing 1503 inhabitants, including 40 slaves.

Alexandria, a small town in Huntingdon county, Pennsylvania, on the Franklinton branch of Juniatta river, 192 miles north-west of Philadelphia.

Alexandria, formerly called Belltown, a city of Virginia, fite in the southern bank of the Potomac river, in Fairfax county, about five miles south-west of the Federal city, and 250 from the sea; N. lat. 38° 45'. W. long. 77° 10'. Its situation is lofty and pleasant, and the streets are laid out upon the plan of Philadelphia. It contains 400 houses, well built, and 24,8 inhabitants. It bids fair, from the advantages of its situation, to be one of the most thriving commercial places on the continent.
ALEXANDRIA, Patriarch of, in Ecclesiastical History. See Patriarch.

ALEXANDRIAN, in a particular sense, is applied to all those who professed or taught the sciences in the school of Alexandria.

Thus, Clement is called Alexandrinus, or the Alexandrian, though some say he was born at Athens: the same epithet is applied to Apion, born at Oais; and to Arriarchus, by birth a Samothracian. The chief Alexandrian philosophers were Euclid, the famous geometer, the two ancient astronomers, Arithillus and Timocharis, Eratosthenes, Apollonius Pergaeus, Conon, Hipparchus, Ctesibius, Heron, Ptolemaus, Pappus, Theon, Hypatia the daughter of Theon, Ptolemy, and Philoponous and Didymus, the last mathematicians of this school. To these we may add Ammonius, Plotinus, Origen, Porphyry, Jamblichus, Sopater, Maximus and Dexamippus.

Alexandrian Copts, is a manuscript, consisting of four volumes, in a large quarto, or rather a folio size, which contains the whole Bible in Greek, including the Old and New Testament, with the Apocrypha, and some smaller pieces, but not quite complete. This manuscript is now preserved in the British Museum, where it was deposited in 1753. It was sent as a present to King Charles 1. from Cyril Lucas, a native of Crete, and patriarch of Constantinople, by Sir Thomas Rowe, ambassador from England to the Grand Seignior, in the year 1628. Cyril brought it with him from Alexandria, where, probably, it was written. In a schedule annexed to it, he gives this account: that it was written, as tradition informed them, by Thecla, a noble Egyptian lady, about thirteen hundred years ago, a little after the council of Nice. He adds, that the name of Thecla, at the end of the book, was erased; but that this was the case with other books of the Chalians, after Christianity was extinguished in Egypt by the Mahometans: and that recent tradition records the fact of the laceration and erasure of Thecla's name. The proprietor of this manuscript, before it came into the hands of Cyril Lucas, had written an Arabic transcription, expressing that this book was said to have been written with the pen of Thecla the martyr. Various disputes have arisen with regard to the place whence it was brought, and where it was written, to its antiquity, and of course to its real value. Some critics have belied upon it the highest commendation, whilst it has been equally depreciated by others. Of its most strenuous adversaries, Wetstein seems to have been the principal. The place from which it was sent to England was, without doubt, Alexandria, and hence it has been called Codex Alexandrinus. As to the place where it was written, there is a considerable difference of opinion. Matthias Muttiss, who was a contemporary, friend and deacon of Cyrilus, and who afterwards intrusted in the Greek language John Rudolph Wetstein, uncle of the celebrated editor of the Greek Testament, bears testimony, in a letter, written to Martin Bogdan, a physician in Bern, dated January 14, 1664, that it had been brought from one of the 22 monasteries in Mount Athos, which the Turks never destroyed, but allowed to continue upon the payment of tribute. Woide endeavours to weaken the evidence of Muttiss, and to render the testimony of the elder Wetstein unfidiculo: but Spohn, in his edition of the "Notitia Codicis Alexandrinii," p. 10-13, shews, that the objections of Woide are ungrounded. Allowing their reality, we cannot infer, that Cyrilus found this manuscript in Alexandria. Before he went to Alexandria he spent some time in Mount Athos, the repository and manufactory of manuscripts of the New Testament, whence a great number have been brought into the West of Europe, and a still greater number has been sent to Moscow. It is therefore probable, independently of the evidence of Muttiss, that Cyrilus procured it there either by purchase or by present, took it with him to Alexandria, and brought it thence on his return to Constantinople. But the question recurs, where was this copy written? The Arabic transcription above cited clearly proves, that it had been in Egypt, at some period or other, before it fell into the hands of Cyrilus. This transcription shews that it once belonged to an Egyptian, or that during some time it was preferred in Egypt, where Arabic has been spoken since the seventh century. Besides, it is well known that a great number of manuscripts of the Greek Bible have been written in Egypt. Woide has also pointed out a remarkable coincidence between the Cod. Alex. and the writings of the Copts. Michaelis alleges another circumstance as a probable argument of its having been written in Egypt. In Ezekiel xxvii. 18, both in the Hebrew and Greek text, the Tyrians are said to have fetched their wine from Chelba, or, according to Bochart, Chalybon. But as Chalybon, though celebrated for its wine, was unknown to the writer of this manuscript; he has altered it by a fanciful conjecture to "Cupel, or Zepho," wine from Hebron. This alteration was probably made by an Egyptian copyist, because Egypt was formerly supplied with wine from Hebron. The transcription, before mentioned, ascribes the writing of it to Thecla, an Egyptian lady of high rank, who could not have been, as Michaelis supposes, the martyr Thecla, placed in the time of St. Paul: but Woide replies, that a distinction must be made between Thecla martyr and Thecla proto-martyr.

With regard to these transcriptions we may observe, with a learned writer (Martius), that the true state of the case appears to be as follows: "Some centuries after the Codex Alexandrinus had been written, and the Greek transcriptions, and perhaps those other parts where it is more defective already lost, it fell into the hands of a Christian inhabitant of Egypt, who not finding the usual Greek transcription of the copyist, added in Arabic, his native language, the tradition either true or false, which had been preserved in the family or families to which the manuscript had belonged, "Memorant hunc codicum scriptum effe calamo Theclae martyris." In the 17th century, when oral tradition respecting this manuscript had probably ceased, it became the property of Cyrilus Lucas; but whether in Alexandria, or Mount Athos, is of no importance to the present inquiry. On examining the manuscript, he finds, that the Greek transcription is lost, but that there is a tradition recorded in Arabic by a former proprietor, which simply related that it was written by one Thecla a martyr, which is what he means by "memoria et traditione recent." Taking therefore upon trust, that one Thecla the martyr was really the copyist, he consults the annals of the church to discover in what age and country a person of this name and character existed, finds that an Egyptian lady of rank, called Thecla, suffused martyrdom between the time of the holding of the council of Nicea and the close of the fourth century; and concludes, without further ceremony, that she was the very identical copyist. Not satisfied with this discovery, he attempts to account for the loss of the Greek transcription, and ascribes it to the malice of the Saracens; being weak enough to believe that the enemies of Christianness would exert their vengeance on the name of a poor transcriber, and leave the four folio volumes themselves unharmed." The learned Woide, who has himself transcribed and published this manuscript, and must be better acquainted with it than any other person, affirms, that it was written by two different copyists; for
for he has observed a difference in the ink, and which is of greater moment, even in the strokes of the letters. The conjecture of Oudin, adopted by Wetstein, that the manuscript was written by an Acemetas, in the judgment of Michaelis, worthy of attention, (see Acemetas) and he adds, that this conjecture does not contradict the account that Thecla was the copyist, since there were not only monks but nuns of this order.

The antiquity of this manuscript has been also the subject of controversy. Grabe and Schulze think that it might have been written before the end of the fourth century, which, says Michaelis, is the very utmost period that can be allowed, because it contains the epistles of Athanasius. Oudin places it in the tenth century. Wetstein refers it to the fifth, and supposes that it was one of the manuscripts collected at Alexandria in 619, for the Syriac version. Dr. Semler refers it to the seventh century. Montfaucon (Pallaeog. Graec. i. p. 185) is of opinion, that neither the Cod. Alex. nor any Greek manuscript, can be said with great probability to be much prior to the sixth century. Michaelis apprehends, that this manuscript was written after Arabic was become the native language of the Egyptians, that is, one, or rather two centuries after Alexandria was taken by the Saracens, which happened in the year 640, because the transcriber frequently confounds M and B, which is often done in the Arabic; and he concludes, that it is not more ancient than the eighth century. Woide, after a great display of learning, with which he examines the evidence for the antiquity of the Cod. Alex. concludes, that it was written between the middle and the end of the fourth century. It cannot be allowed a greater antiquity, because it has not only the εἰρήνας Principal parts, but the εἰρήνας minora, or Ammonian sections, accompanied with the references to the canons of Eusebius. Woide's arguments have been objected to by Spoln in p. 42-109, of his edition of the "Notitia Codicis Alexandrini." Some of the principal arguments advanced by those who refer this manuscript to the fourth or fifth centuries are the following: the epistles of St. Paul are not divided into chapters like the Gospels, though this division took place so early as 396, when to each chapter was prefixed a supercription. The Cod. Alex. has the epistles of Clement of Rome; but these were forbidden to be read in the churches, by the council of Laodicea, in 364, and that of Carthage, in 419. Hence Schulze has inferred, that it was written before the year 364; and he produces a new argument for its antiquity, deduced from the last of the 14 hymns found in it after the palmas, which is supererogated εἰρήνας σωματικός, and is called the grand doxology; for this hymn has not the clause ἄνευ ἀρετῆς, ἀνατελλόμενον ἀμώματα, which was used between the years 434 and 446; and therefore the manuscript must have been written before this time. Wetstein thinks that it must have been written before the time of Jerome, because the Greek text of this manuscript was altered from the old Italic. He adds, that the transcriber was ignorant that the Arabs were called Hagarines, because he has written, 1 Chron. v. 20, ἄνευ ἁρίτης for ἄναπτος. Others allude that ἄρτης is a mere erratum; because ἄρτης occurs in the preceding verse, ἄρτης in 1 Chron. xxvii. 31, and ἄρτης in Pr. xxxii. 7. These arguments, says Michaelis, afford no certainty, because the Cod. Alex. must have been copied from a still more ancient manuscript; and if this were faithfully copied, the arguments apply rather to this than to the Alexandrian manuscript itself. It is the hand-writing alone, or the formation of the letters, with the want of accent, which can lead to any probable conclusion. The arguments alluded to prove that it is not so ancient as the fourth century, are such as these... Dr. Semler thinks, that the epistle of Athanasius, on the value and excellency of the Psalms, would hardly have been prefixed to them during his life. But it ought to be recollected, that Athanasius had many warm and fervent advocates. From this epistle Oudin has attempted to deduce an argument, that the manuscript was written in the tenth century. This epistle, he says, is spurious, and could not have been forged during the life of Athanasius, and the tenth century was fertile in spurious productions. Again, the Virgin Mary, in the superscription of the Song of the Blest Virgin, is titled εὐφροσύνη, a name which Wetstein says betrays the fifth century. Further, from the probable conjecture, that this manuscript was written by one of the order of the Acemetes, Oudin concludes against its antiquity; but Wetstein contents himself with affirming, that it could not have been written before the fifth century, because Alexander, who founded this order, lived about the year 420. From this statement, pursued more at large, Michaelis deduces a reason for paying less adoration to the Cod. Alex. than many eminent critics have done, and for the preference that is due, in many respects, to ancient versions, before any single manuscript, because the antiquity of the former, which is in general greater than that of the latter, can be determined with more precision.

As to the value of this manuscript, it has been differently appreciated by different writers. Wetstein, though he denounces it by A, the first letter of the alphabet, is no great admirer of it, nor does Michaelis estimate it highly, either on account of its internal excellence or the value of its readings. The principal charge which has been produced against the Alexandrian manuscript, and which has been strongly urged by Wetstein, is its having been altered from the Latin version. It is incredible, says Michaelis, who once agreed in opinion with Wetstein, but found occasion to alter his sentiments, that a transcriber who lived in Egypt, should have altered the Greek text from a Latin version, because Egypt belonged to the Greek diocese, and Latin was not understood there. On this subject Woide has eminently displayed his critical abilities, and ably defended the Greek manuscripts in general, and the Codex Alexandrinus in particular, from the charge of having been corrupted from the Latin. Griesbach concurs with Woide, in his "Symbola Critica," vol. i. p. 110-117; and both have contributed to confirm Michaelis in his new opinion. If this manuscript has been corrupted from a version, it is more reasonable to supplest the Coptic, the version of the country, in which it was written. Between this manuscript and both the Coptic and Syrian versions, there is a remarkable coincidence. Griesbach has observed, that this manuscript follows three different editions: the Byzantine in the Gospels, where its readings are of the least value; the Western edition in the Acts of the Apostles, and the Catholic Epistles, which form the middle division of this manuscript, and the Alexandrine in the Epistles of St. Paul. The transcriber, if this affection be true, must have copied the three parts of the Greek Testament from three different manuscripts, of three different editions. It is observable, that the readings of the Cod. Alex. coincide very frequently, not only with the Coptic and the old Syrian, but with the new Syrian and the Ethiopic; and this circumstance favours the hypothesis, that this manuscript was written in Egypt, because the new Syrian version having been collated with Egyptian manuscripts of the Greek Testament, and the Ethiopic version being taken immediately from them, have necessarily the readings of the Alexandrine edition.

This manuscript, as we have already observed, consists of four volumes: the three first of which contain the Old Testament, the fourth the New Testament, together with the
first Epistle of Clement to the Corinthians, and a fragment of the second. In the New Testament there is wanting the beginning as far as Matt. xxv. 6, &c. xvi. 17; likewise from John vi. 50, to viii. 52, and from 2 Cor. iv. 13, to xii. 7. The Psalms are preceded by the epistle of Athanasius to Marcellinus, and followed by a catalogue, containing those which are to be used in prayer for each hour, both of the day and of the night; also by 14 hymns, partly apocryphal, partly biblical, the eleventh of which is a hymn in praise of the Virgin Mary, entitled περί τιθέμενον της ημέρας; the hypotheces Eusebii are annexed to the Psalms, and his canones to the Gospels. This manuscript has neither accents nor marks of aspiration; it is written with capital, or as they are called, uncial letters; and there are no intervals between the words, but the sense of a passage is sometimes terminated by a point, and sometimes by a vacant space. Although abbreviations are not very numerous, yet this manuscript abbreviates ται, τα, τας, της, των, τωστ, των; and it has also other marks of abbreviation. Dr. Scmiller supposes, that the more ancient manuscripts from which the Cod. Alex. was copied, had a much greater number; from a false method of decapering, which marks, he explains many errors committed by the copyist of the latter. See his Note 23 to Wetstein's Prolegomena. Of these abbreviations, and the points annexed to certain letters, which before appeared unintelligible; and of the large initial letters, which are sometimes placed in a very extraordinary manner; and of other particulars, a full account may be seen in Woide's Preface, who has given a very accurate description of the manuscript in general. No manuscript has been more frequently and more accurately collated; and it was supposed, that the last extracts, made by Wetstein, would have rendered future labours of this kind superfluous; but Woide informs us, that Wetstein is chargeable with several omissions and errors, and has admitted into his collection of readings the mistakes of Mill. We are now in possession of a perfect impression of this manuscript, accompanied with so complete and so critical a collection of various readings, as is hardly to be expected from the edition of any other manuscript. Dr. Woide published it in 1786, with types cast for the purpose, line for line, without intervals between the words, as in the manuscript itself; the copy is so perfect a resemblance of the original, that it may supply its place: its title is "Novum Testamentum Graecum Codice MS. Alexandrino qui Londini in Bibliotheca Musei Britannici abbreviatum descriptum." It is a very splendid folio, and the preface of the learned editor contains an accurate description of the manuscript, with an exact list of all its various readings, that takes up no less than 89 pages, and each reading is accompanied with a remark, in which is given an account of what his predecessor, Junius, Walton, Fell, Mill, Grabe, and Wetstein, had performed or neglected. Those who are dextrae of further information concerning this manuscript, may consult the Prolegomena of Mill, Grabe, Wetstein, and Woide. See also Michaelis's Introduction to the New Testament, by Marsh, vol. ii. part i. p. 160—209, part ii. p. 648—660.

ALEXANDRIAN Library, called by Livy "Elegantiæ regum cursuque egerim opus," was first pointed out by Ptolemy Soter, for the use of the Academy, or Society of learned men, which he had founded at Alexandria. Before the books which he procured, his son Ptolemy Philadelphus added many more, and left in this library at his death a hundred thousand volumes; and the succeeding princes of this race enlarged it still more, till at length the books lodged in it amounted to the number of seven hundred thousand volumes. The method by which they are said to have collected these books was this: they seized all the books that were brought to the Greeks, or other foreigners, into Egypt, and lent them to the Academy, or Museum, where they were transcribed by persons employed for that purpose. The transcripts were then delivered to the proprietors, and the originals laid up in the library. Ptolemy Euergetes, for instance, borrowed of the Athenians the works of Sophocles, Euripides and Zeæhus, and only returned them the copies, which he caused to be transcribed in such a beautiful manner as possible; the originals he retained for his own library; presenting the Athenians with 15 talents for the exchange, that is, with three thousand pounds sterling and upwards. As the Museum was at first in the quarter of the city called Bruchion, the library was placed there; but when the number of books amounted to four hundred thousand volumes, another library, within the Serapeum, was erected by way of supplement to it, and on that account called the daughter of the former. The books lodged in this increased to the number of three hundred thousand volumes; and these two made up the number of seven hundred thousand volumes, of which the royal libraries of the Ptolemies were said to consist. In the war which Julius Caesar waged with the inhabitants of Alexandria, the library of Bruchion was accidentally, but unfortunately, burnt. But the library in the Serapeum still remained, and there Cleopatra deposited the two hundred thousand volumes of the Pergamanian library, with which she was prefeted by Marc Antony. These, and others added to them from time to time, rendered the new library of Alexandria more numerous and considerable than the former; and though it was plundered more than once during the revolutions which happened in the Roman empire, yet it was as frequently supplied with the fame number of books, and continued for many ages to be of great fame and use, till it was burnt by the Saracens in the 62d year of the Christian era. Abulpharagius, in his history of the roth dynasty, gives the following account of this catastrophe. John Philoponus, formed the Grammarian, a famous Peripatetic philosopher, being at Alexandria when the city was taken by the Saracens, was admitted to familiar intercourse with Amrou, the Arabian general, and promised to solicit a gift, ineligible in his opinion, but contemptible in that of the barbarians; and this was the royal library. Amrou was inclined to gratify his wish but his rigid integrity ferupled to alienate the least object without the content of the Caliph. He accordingly wrote to Omar, whose well known answer was dictated by the ignorance of a fanatic. "If these writings of the Greeks agree with the Koran, or book of God, they are ufeless, and need not be preferved; if they disagree, they are pernicious, and ought to be destroyed." The sentence of destruction was executed with blind obedience: the volumes of paper or parchment were distributed to the four thousand baths of the city; and such was their number, that six months were barely sufficient for the consumption of this precious fuel. Since the dynasties of Abulpharagius have been given to the world in a Latin version, this tale, as Mr. Gibbon (Hist. vol. ix. p. 440. calls it, has been repeatedly transcribed; and every scholar, with pious indignation, has deplored the irreparable wreck of the learning, the arts, and the genius of antiquity. "For my own part," says this Historian, adopting the feer of Renouard (Hist. Alex. Patriarch. p. 170.) "I am strongly tempted to deny both the fact and the consequences; the fact is indeed marvellous." "Read and wonder!" says the Historian himself; and the solitary report of a bargain who wrote at the end of six hundred years in the confines of Media, is overbalanced by the silence of two annals of a more early date, both Christians, both natives of Egypt, and the
most ancient of whom, the patriarch Eutychius, has amply
described the conquest of Alexandria. But this curious
anecdote will be vainly sought in the annals of Eutychius,
and the Saracenic history of Elmacin. The silence of Abul-
fedâ, Murtadi, and a crowd of Mollems, is less conclusive
from their ignorance of Christian literature. The rigid sen-
tence of Omar is repugnant to the sound and orthodox
precept of the Mahometan cauffals: they expressly declare, that
the religious books of the Jews and Christians, which are
acquired by the right of war, should never be committed to
the flames; and that the works of profane science, histo-
rians or poets, physicians or philosophers, may be lawfully
applied to the use of the faithful. 3 See Roland de Jure Mil-
itari Mohammedanorum, in the third volume of Differtations,
p. 37. The reason for not burning the religious books of
the Jews or Christians, is derived from the respect that is due
by the name of God. It should be considered, however, that
the positive evidence of an historian, of unquestionable credit
as Abulpharagis, cannot be set aside by an argument merely
negative. Mr. G. acknowledges, that "a mere destructive
zeal may perhaps be attributed to the first successors of Ma-
homet." His references to A. Gallius (Noctes Attice, I. vi.
c. 17.) Ammian Marcell. (l. xii. c. 16.) and Orofius (l. vi.
c. 15.), as speaking of the Alexandrian libraries in the first
tent, are foreign from the purpose; for these writers only
refer to the destruction of books at Alexandria in the time of
Julius Caesar; after which, large libraries must have been
continually accumulating, during the long period in which
the schools of philosophy flourished in that city. Brucker's
Hist. Philos. by Enfield, vol. ii. p. 228. On the subject of
this article, see Ammian Marcellin. l. xii. c. 16. p. 266.

lus, l. vi. c. 17. Idibus. Orig. l. vi. c. 3. Orofius, Hist.
ALEXANDRIN, in Geography, a small district of Italy,
in the duchy of Milan, in the environs of Alexandre
alleged by, to which it owes its name.
ALEXANDRIN, or ALEXANDRIAN, in Poetry, the name of
a kind of verse, which consists of twelve, or of twelve
and thirteen syllables, alternately; the rest, or pause, being
always on the sixth syllable.
It is said to have taken its name from a poem on the
life of Alexander, entitled, the Alexandriad; written, or
at least translated into this kind of verse by some French
poets; though others will have it so denominated from one
of the translators, Alexander Paris.
This verse is thought by some very proper in the epos,
and the more sublime kinds of poetry; for which reason it
is also called Heroic Verse.
it answers in our language to the hexameters in the
Greek and Latin; though, according to some, it rather
answers to the feanur of the ancient tragic poets. Chap-
man's translation of Homer confuts wholly of Alexan-
drians.

The advantages of the Alexandrian verse, are its keep-
ing the rhymes from coming so near, and consequently hin-
dering them from being so much perceived. To this may
be added, that coming nearer to the nature of prose, it is
fitter for theatrical dialogue, and supplies the office of the
ancient rhymes better than any other verse in rhyme.
ALEXANDRINUS, JULIUS, in Biography, born at
Trent, in the early part of the 16th century, was physician
Vol. L to the emperor Charles V., and afterwards to Maximilian II.
by whom he was highly esteemed. He also acquired reputa-
tion as a poet, particularly for his Pedotrophia, a poem,
published at Zurich, 1559, 8vo.

His medical works, which are numerous, and principally
compiled from the ancients, or written in defence of the
dogma of Galen, are of little value. For their titles see
Eloy's Dictionnaire Historique de la Medicine. He died at
Trent, his native city, in the year 1590, aged 84 years,
and was honoured with the following epitaph:

Cæfaribus si quis multos inferriit annos,
Acceptus magnis principibisque fuit.
Te, Juli, vate nec poësim medicurnque fateri.
Doctnra in equis gratia tanta fuit.

ALEXANDROV, in Geography, a town of Kuban
Tartary, in the Russian government of Caucasus, 16 leagues
west north-west of Ekaterinograd.

ALEXANDROVSKAIA, a fortress of Russia in the
government of Ekaterinopol, 36 leagues north-east of
Cherfon. N. lat. 47° 35'. E. long. 35° 14'. This is also
the name of another fortress in the same government, 38
leagues north-west of Cherfon.

ALEXICACUS, composed of αλεκα, I drive away,
and κσόνος, evil, is something that preserves the body
from harm or mischief, and alexicus amounts to much the
same with alexiterial.

ALEXICACUS, in Antiquity, was an attribute of Neptune,
whom the sullen fishers used to invoke under this appel-
loration, that their nets might be preferred from the ärceo,
or sword-fish, which used to tear them, and prevent the
affluence which it was pretended the dolphins used to give
the tunnics on this occasion. It was also an epithet of
Hercules, as the defender of men.

ALEXINTA, in Geography, a town of European
Turkey in Servia, six leagues north-north-east of Nissa.

ALEXIPHARMIC, in Medicine, expresses that prop-
erty which a remedy, either simple or compound, hath to
refit or destroy every thing of a poisonous or malignant
nature. The word is derived from αλεκα, akee, I expel,
and κσόνος, poison.

The ancients had a notion, that there was poison in all
malignant diseases, and in the generality of these whose
cause was unknown. Whence alexipharmica became a deno-
mination for all remedies and antidotes against malignant
diseases, and for amulets.

The study of poisons and antidotes appeared at an early
period among the physicians of Greece and Rome, and
continued as long as the Greek physic lasted; and hence
has arisen the number of antidotes and theriaca so fre-
quently mentioned by those ancient writers. But their
compositions for the correction of poisons were equally
injudicious and unsuccessful. Modern physicians, and par-
ticularly the Galenists, adopting the ideas of the ancients,
have transferred them from the cave of poisons taken into
the body, to that of noxious powers arising from contagion,
or in any other way. The cure of the diseases proceeding
from these, they have, therefore, attempted by the correc-
tion or expulsion of the morbid matter, and they have ad-
r ministered medicines for this purpose, under the titles of
alexipharmics and alexiterials.

Alexiterial, cardiae, antidote, alexipharmic, and counter-
poison,
post, are all terms nearly of the same signification; and so are theriacs, upon the supposition of their being fitted to expel the poison of animals.

Alexipharmics are ordinarily divided into such as are general; and these are, in particular, supposed only to combat some particular disease.—But this division is founded more on speculation than experience.

Alexipharmic medicines, in general, are aromatic and pungent to the taste.—Among the redb, it is true, there are some acid plants and juices: but there are only reckoned in the number, on account of their use in malignant and colliquative fevers.

Alexipharmics chiefly act by exciting or increasing a diaphoresis, or perforation; or by supporting the vigorous motion of the heart and arteries, which is always diminished in malignant diseases unattended by inflammation. In this latter kind wine may be reckoned among the principal alexipharmics. These medicines are also employed as diuretics against malignant and pellagrinal fevers: but they are to be used with caution.

It is dangerous to administer alexipharmics to young people of phthisic habits, without previous evacuations; and Celsus advises only to promote a sweat, when the marks of one approaching are evident.

Alexipharmics are described proper correctors of opium, when it produces lassitude, nausea, &c. They are also serviceable in those diseases which proceed from external cold, and obstructed perforation; as catarrh, rheumatism, fluxes, coughs, and glandular tumours. Alexipharmics make a large class of medicines: but the principal ones are these: 1. Of the animal kingdom, hartborm, bezoars, and the bones and teeth of different animals. 2. Of the vegetable kingdom, the leaves and flowers of all the aromatic plants, especially such as are umbelliferous. 3. Of the mineral kingdom, the different preparations of antimony, the dulcified spirit of vitriol, together with alcohol in all its forms and combinations. It does not appear, says Dr. Cullen, that the medicines given under the titles of alexipharmics and alexiterials are in any respect fitted to expel morbid matter. So far as they are adapted to this purpose, they are diaphoretics or sudorifics, and should be cautiously used. The terms, therefore, he thinks, should be expunged from the writings on the Materia Medica; for, though the medicines may be useful, yet when they are given under the false idea which the terms imply, they may lead to an erroneous practice. Cullen's Med. vol. i. p. 165.

ALEXIPPUS, in Biography, one of the physicians to Alexander the Great, and in high esteem, as Phutarch informs us, with that prince.

ALEXIS, Michaelowitz, of Mikulovitch, in Biography and History, czar of Russia, succeeded his father Michael Theodorowitch in 1646, at the age of 15 years. He was immediately crowned by the direction of Morosof, who became his prime minister, and engrossed to himself the whole power of government. In order the more effectual to secure his influence with the czar, he married him to one of the daughters of a nobleman of small fortune, attached to his interest, and took the father for his own wife. Although Morosof was in some respects an useful minister, by his attention to the army, by strengthening the frontiers against Poland and Sweden, and by erecting manufactories for arms, none of these services were sufficient to compensate the oppression which the people suffered under his administration. These grievances at length, viz. in 1648, produced an insurrection at Moscow; and the people demanded justice against Morosof and his confederates.

Two of their principal opponents were put to death, and the minister escaped merely by the intercession of the czar himself. About this time appeared an impostor, the son of a linen draper of Wologda, who, under various pretences laid claim to the throne. Neither the Swedes nor the Poles, whom he endeavoured to interest in his cause, afforded him any support; and after a short course of extravagance and profligacy, he fell into the hands of the Russians, who, after in vain attempting to obtain from him a confession by torture, put him to a cruel death. When these tumults were appeased, Alexis loaded the government, and exhibited promising tokens of capacity and vigour. Having settled a difficulty between Russia and Sweden by an embassy to Queen Christina, he directed his attention to Poland, and offered to employ his army in subduing the Cossacks, on condition of their conferring upon him the vacant crown. But the interest of France prevailing in favour of Calimir, the brother of Uladislaus their late king, Alexis declared war against the Poles, and inflicted the Cossacks, succeeded in recovering Smolensk, Wilna, Kiow, and the province of Czernichow, which had been ceded to the Russians by the late peace. Poland being at this time, viz. in 1656, invaded by Gustavus, king of Sweden, with a formidable army, Alexis made a truce with that kingdom; and as the Swedes had appropriated to themselves the duchy of Lithuania, which the czar looked upon as his conquest, he marched his army into Carelia, Ingria and Lithuania. At length, however, he thought it advisable, in 1658, to conclude a three years truce with Sweden; which, in 1661, was confirmed into a peace by the treaty of Cardis. By this treaty it was agreed, that, disregarding all that had passed between the two powers, every thing should remain as it had been settled by the treaty of peace made at Stolbova in 1617. The war of Alexis with Poland terminated more honourably for Russia. An armistice for 13 years, agreed upon at Andrufllos in Lithuania was the forerunner of a complete pacification, which was effected in 1686, and which referred to the empire Smolentso, Seweria, Czernichow, and Kiow. The king of Poland likewise relinquished the supremacy he had hitherto affected over the Cossacks to the czar; and these people became now a protected relative of the Russian empire. Notwithstanding this favourable issue of the czar's contest with the Poles, a formidable domestic rebellion obstructed the operation of the plans which he was pursuing for the good of his country. This was occasioned, in 1669, by Stenko (Stephen) Radzin, whose brother had been hanged by order of Dolgoruchi, the Russian commander; and as he had thus infringed upon the liberty of the Cossacks, they made this a pretext for arming against their sovereign, though there is reason to believe that ambition was the ruling principle of Radzin. Whatever was the motive, a civil war was the consequence, which was carried on with various successes, and equal cruelty on both sides. Radzin gained possession of Archangels, and being joined by a multitude of peasants, who murdered their lords, his army at one time amounted to 200,000 men. This rebellion was not suppressed till the year 1671, when Radzin was betray ed into the hands of the czar, and executed. The affairs of Poland, and the measures which Alexis had taken for making himself protector of the Cossacks, produced a misunderstanding between the Grand Seignior and the czar, which terminated in actual hostilities. Alexis endeavoured to engage all the Christitian potentates in his dispute, and to form a league against the Turks; and with this view he sent embassadors to several of them, and one to Rome, who refused
ALEXIS, a famous satirist, mentioned by Pliny, N. H. tom. ii. p. 649.

ALEXIS, a Greek comic poet, uncle to Menander, who flourished in the time of Alexander the Great, about 363 years before the Christian Era. Fragments of this poet may be found in "Vetulissimum Graecorum Bucolica Gnomica," &c. Crispin, 1578. 16to.

ALEXIS, William, a Benedictine monk, in the abbey of Lyra, was living in 1500, and has left several pieces of poetry, which were esteemed in their time. The principal are "Four Chants-Royaux," 16to. "Le Paffé-témes de tout hommes de toutes femmes," Paris, 4to. and 8vo, translated from a work of Innocent III. and describing the miseries of man, from the cradle to the grave. "Le grand blâr des faulx amours," 16to. and 4to; a Dialogue on the evils occasioned by love. Biog. Dict.

ALEXIS, a Plémont'f, was born of a noble family, and by his early application acquired the knowledge of the Latin, Greek, Hebrew, Chaldee, Arabic, and other languages. Alexis is supposed to be a feigned name; and the real name of this author, who wrote in the beginning of the 16th century, is apprehended to be Hieronymus Ruffellius; and he is said to have died in 1565. It has been generally alleged, though it be not strictly true, that he was the first person who mentioned ULTRAMARINE. His receipt, however, has been followed since that time as the best and most certain. His work "De Secretis," furnishes materials for the technological history of inventions. It was printed for the first time at Milan, in 1557; though Beckman apprehends that the first edition must have been of an older date. A French translation was printed at Antwerp in 1557. "The Secrets of Alexis," London, 1558, is mentioned by Ames in his "Typographical Antiquities," p. 296. Wecker, a physician at Colmar, translated this book into Latin, and enlarged it with additions, under the title of "De Secretis Libri XVII." The first edition, according to Haller, was published at Bâle, in 1559, 8vo. Many editions of it have since appeared. The last, by Zwinger, was published at Bâle in 1573. Alexis, it is said, urged by a curiosity to be acquainted with the secrets of nature, collected as much as he could during his travels for 57 years, and valued himself on concealing them; but when he was 82 years of age, he gave a poor man, whose disorder proved fatal, because he had not discovered an effectual remedy, of which he was possessed; upon which his conscience troubled him, that he became a hermit; and in his solitary retirement, arranged his secrets in an order fit for publication. Gen. Dict. Beck- man's Hist. Inventions, vol. ii. p. 351.

ALEXIS, in Entomology, a species of Papilio Phebus, with eaudated brown wings, and a carmine band under the posterior; found in India.

ALEXITERIAL, in Medicine, a term of the same import with alexipharmic; but chiefly applied to the milk-water of that name, and remedies against the poisonous bites of animals.

But it is said by some authors that alexiterials differ from alexipharmics: thus, alexipharmics signify medicines against poisons taken internally; whereas alexiterials are remedies against the poisons of venomous animals inflicted externally.

ALEXUS I. COMMENUS, in Biography and History, emperor of the East, was the son of John Commenus, the brother of the emperor Isaac, and born at Constantinople, A.D. 1048. He was endowed by nature with the choice gifts both of mind and body; these were cultivated by a liberal education, and exercised in the school of obedience.
and adversity. Alexius, and Isaac, his elder brother, distin-
guished themselves in the wars against the Turks, and adhered
to the emperor Michael Ducas, till he exchanged the empire
for a monastic habit and the title of archbishop of Ephesus.
On this occasion Alexius offered his services to Nicephorus
Botoniates, the successor of Michael; and with a noble
frankness addressed him: "Prince, my duty rendered me
your enemy; the decrees of God and the people have made
me your subject. Judge of my future loyalty by my past
opposition." His fidelity and valor, as well as his humanity,
were sufficiently evinced by his victorious exploits against
the three rebels, Urfel, Brycianus and Bafiliarius, who dis-
turbed the peace of the empire. But his refusal to march
against the fourth rebel, the husband of his sister, cancelled
the merit and the memory of his past services; and the two
brothers, driven into rebellion and supported by the army,
succeeded in deposing Botoniates. Isaac, though the elder
brother, was the first to invest Alexius with the name and
censures of royalty, and being hailed emperor by the army,
he marched immediately against Constantinople, which he
took and plundered; and the fleet was induced by the in-
fluence of George Palaeologus, to declare in his favour.
Botoniates regained the empire, and Alexius, without further
contest, ascended the throne, A.D. 1081. Having com-
pensated for the plunder of the churches and monasteries at
Constantinople, by every penance compatible with the pos-
session of the empire, he prepared for refraining the con-
quists of the Turks, who had feigned on several provinces,
and threatened to subvert the empire. The Turks, however,
made overtures of peace, which were accepted by Alexius,
in consequence of the hostilities that were meditated against
him in the west by Robert Guiscard, duke of Puglia and
Calabria. Robert, having landed at Bathrotum, in Epirus,
and advancing to Dyrrachium or Durazzo, which was
defended by a garrison under the command of George Pa-
ulegus, was there met by Alexius with a large army. In
a general action, which he commenced against the advice of
his wisest captains, Oct. 18, A.D. 1081, he sustained a
defeat, which was attended with great losses, and followed by
the surrender of Durazzo, Feb. 8, A.D. 1082. Alexius
was affiduous in raising new levies, and in order to obtain
necessary supplies, he profumed, in a manner very offensive
to the ecclesiastics, to borrow the superfluous ornaments of the
churches. He also formed an alliance with Henry, em-
peror of Germany, who invaded Calabria, and whose pro-
gress demanded the haft return of Robert. Bohemund,
the son of Robert, was appointed his lieutenant in the east;
but after reducing several places in Illyricum, he was con-
tained, by a mutiny in the army, to repair to his father in
Italy. In October, A.D. 1084, Robert returned the design
of his eastern conquests, and made a second expedition into
Greece. Alexius, apprehending an attack, had obtained
a very considerable succour to his naval forces from the re-
pubHc of Venice. By the union of the Greeks and Vene-
tians, the Adriatic was covered with an hostile fleet; but
by the vigilance of Robert and the concurrence of favourab.len
circumstances, the Norman troops were safely disembarked
on the coast of Epirus. The decision of the sea was dis-
puted in three engagements, in sight of the island of Corfu;
in the two former, the skill and numbers of the allies were
superior; but in the third, the Normans obtained a final and
complete victory. On this occasion, Anna Cornenena,
the daughter of Alexius, and the writer of his life, deplores
the loss of 13,000 of his subjects or allies. But in the isle
of Cephalonia, the projects of Robert were fatally blasted by
an epidemic disease; and he himself, in the 70th year of
his age, expired in his tent; not without the suspicion of
poison, which public rumour imputed to his wife, or to the
Greek emperor, Alexius, who had trembled for his empire,
and now rejoiced in his deliverance. The Normans withdrew
their forces from Greece, and tranquillity was restored.
This war was succeeded by another with the Scythians, who
passing the Danube, laid waste a great part of Thrace, and
were guilty of many horrid cruelties. The generals of
Alexius, who were first employed in opposing them, suf-
tained several defeats; but they were at length completely
subdued, with a very general slaughter, by the emperor
himself. His next attention was engaged by the Turks, and
again by the Scythians; but Alexius, having terminated his
campaigns with both these enemies by a peace, returned to
Constantinople; where he was informed, that the Western
Christians were making great preparations for the recovery
of the Holy Land, at that time possessed by the Turks and
Saracens. At the council of Placentia, held March, A.D.
1095, the ambassadors of Alexius appeared to plead the
distress of their sovereign and the danger of Constantinople,
which was divided only by a narrow sea from the victorious
Turks, the common enemies of the Christian name; and the
relief of Constantinople was included in the larger and
more distant project of the deliverance of Jerusalem. The
emperor's ambassadors had solicited a moderate succour, per-
haps of 10,000 soldiers; but when the Crusaders arrived,
A.D. 1096, he was astonished by their number, and fluc-
tuated between hope and fear, between timidity and courage.
His conduct was irresolute and ambiguous, and he has been
charged by the Latin writers, with the base treachery.
His gifts and promises, however, insensiblyfoothed the fierce
spirit of the Western strangers; and as a Christian warrior,
he rekindled their zeal for the protection of their holy
empire, which he engaged to second with his troops and
treasures. By his skill and diligence, Alexius prevented
the union of any two confederate armies, at the fame moment,
under the walls of Constantinople; and he contended himself,
either from pride or prudence, with extorting from the
French princes an oath of honour and fidelity, and a solemn
promise, that they would either restore, or hold, their Asiatic
conquests, as the humble and loyal vassals of the Roman
empire. Nice was the first object of attack on the part of
the Crusaders, and the means of conquest were supplied by
the prudence and industry of Alexius; he guarded with
jealous vigilance this important conquest, and the city was
delivered up to his lieutenant. When the crusaders after-
wards took possession of Antioch, they elected Bohemund
prince of that metropolis, alleging that Alexius had violat-
ed his agreement, and under various pretences, declined
affording them the least alli ance. The consequence of this
appointment was a war between Bohemond and Alexius,
who fitted out a powerful fleet, which obtained a complete
victory over that of the Crusaders, near Rhodes. He also re-
took Laodicea, which Bohemond had appropriated to himself,
as prince of Antioch. Alexius, by his endeavours to stop
the progress of the Christian princes in the East, incensed
the pope and the people to such a degree, that they con-
idered him as an enemy to the Christian name, and supplied
Bohemond with large succours to oppose him. Bohemond,
thus aided, laid siege to Durazzo; but the place held out
till the war was concluded by a negotiation. Alexius, dis-
engaged from this contest, marched in person against the
Turks, who renewed their incursions as far as Nice, and de-
feated them with great slaughter. They returned, however,
the next year, and being dispirited by succefive defeats, they
fied for peace and obtained it. The remaining part of the
life of Alexius was devoted to the purpose of healing the
divisions, which at that time rent the Greek church. After
a long
ALE

a long reign of 37 years, Alexius died, A.D. 1138, and

was succeeded in the empire by his son John Comnenus.

Of the character of this emperor the Greek and Latin

writers have given a very different account. In the biography

of his daughter, the celebrated Anna Comnena, it is lost in

a vague constellation of virtues, and the perpetual train of

panegyric and apology awakens our jealousy to question the

veracity of the historian and the merit of the hero. On the

other hand, the Latin writers, who have written the history

of the holy war, represent him as a monster of perfidy. The

circumstances of the times in which he lived, whilst they

afford a dispy of his political wisdom and military valour,

furnish some apology for the dissimulation and artifice to

which he occasionally recurred. To his relations and friends

he was grateful and liberal; and to his enemies tolerant and

forbearing. At the head of his armies he was bold in action,

skillful in stratagem, patient of fatigue, ready to improve his

advantages, and capable of rifting from his defeats with in-

exhaustible vigour. The discipline of the army was revived,

and a new generation of men and soldiers was created by the

example and precepts of their leader. In his intercourse

with the Latins, he was patient and artful; and he contrived

with superior policy to balance the interests and passions of

the champions of the first Crusade. In a long reign of 37

years, he fathomed and pardoned the envy of his equals; the

laws of public and private order were reformed; the arts of

wealth and science were cultivated; the limits of the empire

in Europe and Asia were enlarged; and the Comnenian

crown was transmitted to his children of the third and

fourth generation. Yet the difficulties of the times betrayed

some defects in his character; and he exposed his memory to

some just or ungenerous reproach. His happiness was

interrupted, and his health was impaired by public cares;

the patience of Constaninople was fatigued by the length

and severity of his reign; and before he expired, he had lost

the love and reverence of his subjects. Although he had

applied the riches of the church to the service of the state,

and thus incurred the displeasure of the clergy; yet they

applauded his theological learning and ardent zeal for the

orthodox faith, which he defended with his tongue, his pen,

and his sword. His character was degraded by the super-

flition of the Greeks; and whilst he founded an hospital for

the poor and infirm, he ordered the execution of an heretic,

who was burnt alive in the square of St. Sophia. The

iniquity of his moral and religious virtues was suspected by his

intimate associates. In his last hours, when he was pressed by

his wife Irene to alter the succession, he raised his head,

and breathed a pious exclamation on the vanity of the world.

The ingrate reply of the empress, says a popular historian,

may be inscribed as an epitaph upon his tomb: "You die,

as you have lived—all hypocriss." Gibbon's Hist. vol. xvi.

p. 294. vol. xi. p. 455, &c.

ALEXII. succeeded his father Manuel, as emperor of the Ealt, in 1180, at the age of 12 years. His mother

Maria, a princess of Antioch, assumed the government during the minority of her son, and his education was

neglected, that the might retain her absolute authority. During

this period, ANDRONICUS, who had long aspired to

the empire, attempted to attain the object of his ambition. Hav-

ing, notwithstanding the profligacy of his character, gained

a considerable degree of popularity, he was declared pro-

tector of the empire during the minority of Alexius; and

when he had caused the young prince to be solemnly crowned,

he contrived to be chosen his colleague in the empire. Not-

withstanding a solemn oath, that he accepted the dignity

merely for the purpose of protecting the young emperor and

supporting his authority, he soon caused him to be mur-

dered; and dragging him with a bow-string, terminated his

life in the third year of his reign, and 15th of his age. Anc.

ALEXII. III. Angelus, obtained the empire of the Ealt, A.D. 1157, by the exclusion of his brother Isaac

Angelus, whom he threw into prison and deprived of sight.

Indolent and devoted to pleasure, he committed the conduct

of public affairs to his wife Euphrosyne, who oppressed the

people, and sold the chief offices of state to the highest bidder.

In 1202 he released his brother Isaac, and called his son

Alexius, who was then about 12 years of age, to the court,

and treated him as his child. But the young prince, sided

by his father Irene, wife to Philip, emperor of Germany,

escaped from Constantinople, and landed safe in Sicily.

Philip, by means of his ambassadors, engaged the French

and Venetians in his support. A treaty for this purpose

having been concluded between them and Alexius, the army

of these united powers embarked for Corfu, which was the

place of rendezvous; and proceeded to Constaninople.

Upon their approach the usurper escaped; and in 1203 the

young prince was associated with his father Isaac in the

crown, and crowned with extraordinary pomp and solemnity.

The usurper, who had fled to Zamora, a city of Thrace, at

the foot of mount Hymus, after various adventures, fell

into the hands of his son-in-law, Theodore Lascaris, against

whom he had instigated the Turks, who put out his eyes,

and hurled him up in a prison at Nice, in Asia, where he died

173. Gibbon's Hist. vol. i. p. 185, &c.

ALEXII. IV., the son of Isaac Angelus, was crowned

associate with his father in the empire in 1203. The price

of his rescue and advancement to the throne involved him

in difficulties that were insuperable. This was no less than

the fulfilment of the Eastern empire to the pope, the

favour of the Holy Land, and a contribution, as soon as

he was invested with the crown, of 200 thousand marks of

silver. After his accession to the throne, he prevailed on

the Marquis of Montferrat, at the price of 1600 pounds of

gold, to lead him with an army round the provinces of Eu-

rope; but upon his return, as his father was defied on

account of his impieties, he was hated as an apostate, who

had renounced the manners and religion of his country. His

secret covenant with the Latins was divulged or suspected.

The people, and especially the clergy, were devoutly at-

tached to their faith and superstition; and every convent,

and every shop, refounded with the danger of the church

and the tyranny of the pope. Whilst complaints were mut-

tered against the emperor and his government, and quarrels

were fomented between the Greeks and Latins, Constan-

tinople was visited with a calamity which might be justly imputed

to the zeal and indiscretion of the Flemish pilgrims. A

conflagration spread, during eight days and nights, above a

league in front, from the harbour to the Propontis, over the

most populous regions of the city. By this outrage the

name of the Latins became still more unpopular. Upon

the return of Alexius, his youthful mind hesitated between

gratitude and patriotism; between the fear of his subjects

and that of his allies. By his feeble and fluctuating conduct

he lost the esteem and confidence of both; and whilst he

invited the Marquis of Montferrat to occupy the palace, he

suffered the nobles to conspire, and the people to arm, for

the delivery of their country. The Latins, regarding his

critical situation, repeated and enforced their demands,

and reminded the emperor, with menace and insult, of his

own
own engagements and of their services. The threats of the
Latins concurred with the dissatisfaction of the Greeks in
exciting a tumult among the people; of which a prince of
the house of Ducas, named Mourouze, perfidiously
availed himself to cause a vacancy of the throne. Alexius,
buried by the art of this false friend into a prison, was
frowned, stripped and loaded with chains; and, after staying
some days the biterms of death, he was poisoned, or
strangled, or beaten with clubs, A. D. 1204. The emperor
Isaac Angelus soon followed his son to the grave; if, indeed,
ALEVIN V. DUCAS, a man named Mourouze, on account of
the close junction of his black and shaggy eye-brows, was,
according to Ducaugue, second cousin of young Alexius,
whom he betrayed and dethroned, and succeeded to the em-
por on his death. The people having advanced him to the
throne, he found it necessary to prepare for the defence of
the metropolis of the empire. The princes of the Crusades
renewed their claims, and paying the fate of Alexius, the
late emperor, to which, indeed, they themselves had con-
tributed, resolved to revenge his death. Accordingly they
mustered all their forces in Asia, crossed the Straits, and
closely besieged the Imperial city, both by sea and land.
Mourouze, who was a man of warlike talent and expe-
rience, made a vigorous defence; but in a nocturnal attack,
his forces were overpowered; the city was taken and plundered,
and the capture of it was attended with a dreadful slaughter.
The emperor made his escape in the night with Euphrosyne,
wife of the late usurper Alexius Angelus, and her daughter
Eudoxia, for whose sake he had abandoned his lawful wife.
This happened, A. D. 1204. Mourouze sought an asylum in the camp of his father Alexius, in
Thrace, and was at first received with smiles and honours;
but as the wicked can never love, and should rarely trust,
their fellow-criminals, he was feized in the bath, deprived of
his eyes, stripped of his troops and treasures, and turned
out to wander an object of horror and contempt to those
who with more propriety could hate, and with more justice
could punish, the afflains of the emperor Isaac and his son.
As he was privately passing over into Asia, he was feized by
the Latins of Constantinople, and condemned, after an open
trial, for the murder of young Alexius, to an ignominious
death. His judges, having debated the mode of his ex-
ecution, resolved, that he should ascend the Theodosian
column, a pillar of white marble, 147 feet high, and be cast
down headlong from its summit, and dashed in pieces on the
pavement, in the presence of a great multitude of spectators.
225, 223, &c.
ALEVIN, CHARLES, an elegant historical poet, in the
reign of King Charles 1., was educated at Sidney college,
Cambridge, and afterwards settled as usher in a grammar
school in London. In 1621 he published two poems,
titled, "The Battles of Creaffey and Poictiers, under the
fortunes and valour of king Edward 111. of that name, and
his sonne Edward, prince of Wales, named the Black." Having
left the school in which he was usher, he was domestic tutor
to the son of Sir Edward Sherburne, afterwards clerk of the
ordinance and commissary general of the artillery to king
Charles, at the battle of Edgehill. In this situation he
wrote another elaborate poem, in honour of king Henry VII,
and that important battle which gained him the crown of
England. This poem was published in 1638, and entitled,
"The historie of that wise and fortunate prince Henrie, of
that name the seventh, king of Englaand; with that famed
batt alle, fought between the said king Henrie and Richard
111., named crook-baek, upon Redmore, near Bofworth,"
He died about the year 1640; before which time he pub-
lised a translation, "The History of Euralus and Lucro-
tin," from a story found among the Latin epistles of
ALEZONNE, in Geography. See Alezonne.
ALFABUCBLLIS, in Ancient Geography, a place of
Italy, assigned by Ptolemy to the Marit.
ALFACAR, in Geography, a town of Spain, five miles
north-call of Granada.
ALFANDEGA D'FE, a small district of Portugal, in
the province of Tras-o rz Montes, containing 15 parishes.
ALFANDIGA, the name of the custom-house at
Li-bon.
ALFAQES, among the Spanish Moriscoes, were the
clergy, or those who instructed them in the Mahometan
faith. The alfaques differed from the Morabites, who au-
terd to monks, or religious, among Christians.
ALFAQES, or ALFACQS, in Geography, a sea-port
town of Spain, in the province of Catalonia, on the coast
of the Mediterranean, situate on an island of the same
name at the mouth of the Ebro, three leagues south of
Tortoli.
ALFAQES, a town of Africa, in the kingdom of
Tunis.
AL-FARABI, or ABU NASIR, in Biography, a native of
Balch Farah, a town of Afa Minor, called by the Turks
Ottar, was a celebrated philosopher of the school of Bagdad,
and flourished in the 10th century. His parents were opulent,
but he preferred the study of philosophy to the acquisition
or possession of affluence. He studied mathematics and med-
cine, but chiefly excelled in logic. Such were his talents
and learning, that great men and princes were emulous to
confer upon him honours and emoluments. But Al-Farabi
delined every offer of this kind, and preferred, either
through his love of philosophy or from a natural gloominess
of temper, solitude, and an abstemious life. During
winter, he constantly slept on straw, his countenance was
always sorrowful, and he found consolation in nothing but
philosophy. Lamenting the imperfection and vanity of
human life, and dreading intercourse with the world as de-
structive of innocence, he employed his time in study, and
devoted his whole attention to the perusal of the writings of
Aristotle. He wrote 60 distinct treatises on the Aristotelian
philosophy, which were popular and much read among the
Arabians, and also among the Jews. Many of his books
were translated from Arabic into Hebrew. The subjects
on which he principally treated were logic, metaphysics,
and physics. Among his writings on the half of these subjects
are mentioned treatises on optics and astronomy. Abulf.
230.
ALFARO, in Geography, a town of Spain, in the
province of Old Castile, on the south side of the Ebro, and
on the borders of Navarre, nine miles north-west of Tudela.
ALFAS, small islands of the Red Sea, over against the
west side of Arabia Felix. They are only inhabited occa-
sionally by the Moors, who come thither from other islands
for the sake of the pearl fisheries. N. lat. 17° 10'. E. long.
45° 44'.
ALFATERN'A, in Ancient Geography. See Necera.
ALFAYATES, in Geography, a town of Portugal, in
the province of Beira, situate on an eminence, near the confines
of Spain, is walled and guarded, but contains only one
parish.
parish, and about 500 inhabitants: distant 150 miles north-east from Lisbon. N. lat. 40° 9', W. long. 5° 42'.

ALFDOUCH, a name given by the Moors to a fort of vernicelli, which they make of flour and water, and which they are very fond of in their entertainments.

ALFECCA, or ALFETA, in Astronomy, a name given to the star commonly called Ursa Minor.

ALFILLERAO, in Geography, a town of Portugal, in Estremadura, is a small place lying on the sea, and contains about 700 inhabitants.

ALFELD, a town of Germany, in the circle of Lower Saxony, and bishopric of Hildesheim, licite on the Leine, 30 miles south of Hanover, and 15 south of Hildesheim.

ALFELD, a town of Germany, in the circle of the Lower Rhine, four miles north of Nidendam.

ALFELDHA, a mountain of Peria, in the province of Kirman, 12 leagues south of Sirjan.

ALFENUS, VAKUS, in Biography, a Roman Civilian, was a native of Cremona, and a disciple of Servius Sulpitius. He flourished about the year of Rome, 754, or the first of the Christian era. Horace mentions him as a person who had been brought up in the mechanical occupation of a shoemaker, or, as others say, a barber; and who had quitted this humble station for a profession in which he had acquired reputation.

"Alfenus vafer, omni
Ab ejusri instrumento artis, claufaque taberna,
Sutor erat; lapios operis fic optimus omnis
Ett opifer, fic rex folliis." SAT. lib. i. fat. iii. v. 130.

"Shuffling Alfen, though he left his awl,
And threw away his lathe, and that his hall,
And broke his threads, yet was a clobber still:
Thus every tradesman, if he hath but skill,
Is wife, and therefore only king." CEECH.

Ammianus Marcellinus refers to Alfenus, (lib. xxx. c. 4. p. 458 ed. Grorov.) as a person whose authority was held in high estimation in matters of law. Aulus Gelius also, citing his works, (lib. vi. c. 5.) speaks of the author as a diligent inquirer into antiquities; "Rerum Antiquarum non incerius." He wrote 40 books ofDigests, which are mentioned in the index of the Pandects, and several books of Collections. Paulus, the Civilian, made an abridgment of his works. Some say that he was a confidant, and an old scholar on Horace's staff, that he was buried at the public expense. If this be the case, Alfenus, without enriching himself by his profession, had acquired an honest reputation, and exhibits an encouraging example to those who possess talents, for rifting from a lower sphere of life to eminence by professional merit. Gen. Dict.

ALFEE, in Geography, a town of Arabia, 24 leagues south of Medina.

ALFET, in Ancient Gauls, signified a large caldron, which contained boiling water, in which a person accosted plunged his hand and arm as far as the elbow, by way of trial or purgation.

ALFIDENA, in Geography, a town of Naples, in the province of Abruzzo Citera, 15 miles south-south-east of Sulmona; famous in the war of the Samnites.

ALFONSUS, in Biography. See ALPHONSUS.

ALFORD, Michael, an English Jesuit, was born in London, in 1587, and entered into the Society in 1607. Having studied theology and philosophy in Spain, and at Louvain, and having resided some years at Rome, he returned to England, where he was arrested, but afterwards released.

From that time he remained in England for 30 years as a missionary from the society. He died at St. Omer's, in 1652, and left two treatises in ecclesiastical history, viz. "Britannia illustrata," printed at Antwerp, 1641, in 400; and "Annalen Ecclesiasticorum Britannorum," printed also at Antwerp. Gen. Dict.

ALFORD, in Geography, a town of England, in the county of Lincoln, about six miles from the sea, 23 miles north of Bolton, and 142 miles north of London. It has a market on Tuesday, and two fairs on Whitsunday and Nov. 6, for cattle and sheep. It has a spring, which contains a purging fluid, and has been recommended in the fevers, jaundice, and other glandular obstructions, and also in disorders of the kidneys and bladder. N. lat. 53° 30'. E. long. 8° 15'.

ALFORD, a township of America, in Berkshire county, in the Massachusetts, containing 577 inhabitants, 145 miles west from Bolton.

ALFORDSTOWN, a small town in Moar county, North Carolina.

ALFRAKAN, Ahmed Een Kotheer Al Fargani, or, as others calls him, Mohammed Een Kithir Al For- gani, in Biography, a celebrated Arabian astronomer, was born at Fargan, in Sogdiana, now Samarinda, and flourished in the beginning of the ninth century, under the Caliphate of Al-Mamun. His work in Arabic, entitled, "The Elements of Astronomy," consists of 30 chapters or sections, and is formed upon the principles of Protony, whom the author often cites. Of this work we have a Latin translation by Johannes Hifpalensis, in the 12th century, printed at Ferrara, in 1453; and at Nuremberg, in 1537, with a preface by Melanchthon; another by James Chirchman, from the Hebrew version of James Antohi, at Frankfort, in 1590, to which the editor added an ample commentary; in which he compares the calendars of the Romans, Egyptians, Persians, Syrians, and Hebrews, and shews the correspondence of their years; and a third, which is the best, by Golus, with the Arabic text and valuable notes on the first nine chapters, printed in 1669, at Amsterdam, in 4to., after the death of the editor, which he did not live to finish. Mod. Un. Hist. vol. ii. p. 202. Hutton's Mat. Dict. vol. i. p. 63.

ALFRED, or ALFRED THE GREAT, in Biography, the glory of our Saxon monarchs, was the youngest son of Ethelwolf, king of the West Saxons, and was born at Wantage, in Berkshire, in the year 849. Ethelwolf, being a man of great piety, sent Alfred to Rome, when but five years of age, to receive confirmation, some say regal union, from the hand of pope Leo the Tenth; who, on performing the sacred rite, hailed him his son, and foretold, it is said, his future greatness.

His three elder brothers, Ethelbald, Ethelbert, and Ethelred, having regularly succeeded to the throne, and died after short reigns, Alfred assumed the sovereignty, and was crowned at Winchester, in 871. He had given early and manifold proofs of courage and ability; though his inclinations are known to have rather dispelled him to the calm pleasures of literature, than the tumult of war. But scarcely had he time to attend to his brother to the grave, ere he found occasion to fight for the crown to which he had succeeded; for the Danes had poured innumerable multitudes into the island; and in that very year eight battles were fought between them and the Saxons. The strength of the latter was almost equal, while that of the former was confidingly renewed, after every loss, by fresh hordes of their countrymen. At length a bloody engagement took place at Wilton, in Wiltshire; where, though the king was defeated with some
left, yet so great was the dread in which the Danes stood of Alfred's military fame, that they made a treaty with him, and retired from his dominions into those of the king of Mercia. Soon after, however, they broke their faith; for, meeting on the road to Mercia a body of English horse, advancing in an unprepared manner, as they relied on the late treaty of peace, they slew the greater number of them, and took possession of Exeter. The king presently marched against them with what forces he could collect, and beleaguered them there. At this juncture Alfred's fleet engaged a numerous one of the enemy, sunk many, and dispersed the rest; which, attempting to gain some of the English ports, were driven on the coasts and wholly lost. The Danes now again found for peace, and gave hostages; but in 877, having obtained new reinforcements, they entered Wiltshire in such numbers, and so weared out the Saxons, that the latter could no longer be persuaded to make head against them. Some retreated into Wales; others submitted to the usurpers; and Alfred himself found it necessary to be governed by circumstances. He, therefore, assumed a disguise, the most likely to conceal him; not giving up either his hopes or his courage; but waiting for a proper opportunity to recover his throne, and restore to their liberties his sorely oppressed people.

Having properly disposed of his family, and settled a mode of communication with his tried and faithful friends, he engaged himself in the service of his own near-herd, to take the care of his cows. Affer and another ancient writers relate, as a proof how completely Alfred was disguised, that one day the good woman of the house let a cake before the fire to bake, where the king was busily employed in trimming his bow and arrows; on coming back, and finding it burnt, through neglect of turning it in her absence, she supposed how she could have done, she chid him very severely for his inattention; and told him, that though he could not turn the cake, he knew he was ready enough to eat it. We find, however, that Alfred soon left this relation; and with his wife and some of his most valued friends, found a safe retreat in the isle of Athelney (Malden), in Somersetshire, which was secured by vall morasses around it, and accessible only by one very obscure passage. The following story, which we receive from William of Malmsbury, has been cited to shew the extremities to which this most illustrious monarch was now reduced. A pilgrim came to his castle and requelled alms. The queen informed Alfred, that they had only one small loaf remaining, which was insufficient for themselves and their friends, who were gone abroad in quest of fish and other food, though with small hopes of success. "Give the poor man one half of the loaf," said the king; "that he could feed 5000 men with five leaves and two fishes can certainly make that half of the loaf suffice for more than our necessities." The man was relieved accordingly; and the king's benevolence was recommended by the early arrival of his people with an unexpectedly ample store of fresh provisions. [A beautiful painting from this subject, by Mr. Well, was presented by the venerable Alderman Boydell some years since to the stationers company; in the court-room of whose hall it still remains an honourable specimen of the artist's talents, and a lasting memento, among many others, of the liberality of the donor.]

When the king had been about a year in this retreat, being informed that some of his subjects, under the brave Odun, Earl of Devonshire, had routed a great army of the Danes, killed their chiefs, and taken their magical standard, he issued letters, giving notice where he was, and inviting his nobility to come and consult with him. Before they came to a final determination, however, Alfred, disguised as an itinerant Harper, frollicked into the enemy's camp; where, without sulpiuation, he was admitted not only to the tents of the common soldiers, but even into those of the chief Danish commanders. Having examined every thing with great accuracy, he retired again to Athelney, and summoned with all privacy his faithful subjects to meet him in arms at Exeter, in the forest of Selwood, in Wiltshire. They obeyed the summons; and, fired with the hopes of liberty, fell upon the Danes with incredible alacrity, at a moment when the latter had not the least suspicion of a foe, and imagined Alfred to be a mere fugitive from them.

The attack was made at Athelney, now Eddington. Those of the enemy who escaped from this battle policed themselves of a neighbouring castle, or fort, almost ruined, which they fortified immediately, and in which they were quickly beleaguered by the victorious Saxons; but, after a long and close siege, the Danes were forced to surrender at discretion. Alfred, however, treated them like a merciful prince, giving up to such of them as should embrace the Christian religion, the whole kingdom of the East Angles, on condition that they should oblige the rest of their countrymen to quit the island, and prevent, as far as they were able, the landing of any more foreigners. For the performance of these articles he took hostages; and when, in pursuance of the treaty, Guthrum, the Danish chief, came, with thirty of his chief officers, to Alfred, to be baptized, the king anointed for him at the font, gave him the name of Ethelstan, and adopted him for a son. His friends and himself were nobly entertained for twelve days, and then dismissed with royal presents.

One advantage the Saxons derived from these Danish turning Christians; which was, that now they kept their oaths, and removed into the country which had been assigned to them, where they quietly settled themselves.

In 884 a new swarm of Danes landed in Kent, and laid siege to Rochester; but the inhabitants boldly defended the place till the king, reaching them with an army, compelled the enemy to raise the siege, and return once more to France. Alfred, having now some leisure, resolved to repair, refortify, and repopulate the ancient city of London, which he had lately recovered from the Danes; and meant to keep as a frontier. Accordingly, he placed a garrison in it, and made Eadeldan governor thereof, whom he had created Earl of Mercia, and to whom he gave his daughter Ethelfleda in marriage.

After some years of rest, however, Alfred was again called into the field; for the Danes, being foundly beaten in the west of France, in 893, came with a fleet of 250 sail on the east coast of Kent, and, landing, fixed themselves at Appledore. Shortly after came another fleet up the Thames, consisting of 80 vessels, and, having landed the soldiers, built a fort at Middleton, now Milton. Alfred drew together a considerable army; but, before he marched toward the enemy, compelled the Danes settled in Eex and Northumberland, to give him hostages for their good behaviour. He then moved toward the invaders, and prudently pitched his camp on a spot between the enemy's two armies, thereby preventing their junction. A great body, however, moved into Eex, and thence, crossing the river, came into Surry, at Farnham. Alfred drew together a considerable army; but, before he marched toward the enemy, compelled the Danes settled in Eex and Northumberland, to give him hostages for their good behaviour. He then moved toward the invaders, and prudently pitched his camp on a spot between the enemy's two armies, thereby preventing their junction. A great body, however, moved into Eex, and thence, crossing the river, came into Surry, at Farnham.
against Haftings (Hastings), and the other Danes, he marched suddenly to the Well; and, falling on the rebels before they were aware, pursued them to their ships with great slaughter. The enemy, falling next to Sussex, began to plunder the country near Chichester; but the order which Alfred had everywhere established suffered here, without his presence, for the defence of the place; and the rebels, meeting with a new repulse, in which many of them were killed, and some of their ships taken, were obliged again to put to sea. They now failed to join Haftings, the Danish chief, at Beamnecot, in Essex, who, thus strengthened, and encouraged by the absence of the king, ravaged all the lands belonging to Alfred in Mercia. The troops which the king had left in London for the security of that place, now, in turn, took their advantage of the absence of the Danish chief on his incursions in the Mercian district, suddenly attacked Beamnecot, and carried the place by storm, in which they found Haftings' wife and his two sons, who had been lately baptized. Thlese they made prisoners, and sent to Alfred; who, with greatness of soul unparalleled in these times, returned them to Haftings, with this message, "I make no war upon women and christian women." Haftings, returning from his pillaging expedition, gave up all for lost, and once more faced for peace; which Alfred, with his usual clemency, granted, on his giving fresh hostages for his fidelity in time to come.

Before Alfred had time to recruit himself, another Danish leader, whose name was Laf, came with a great army out of Northumberland, and destroyed all before him. Having invaded North Wales, plundering or destroying everything, this army divided itself, one body returning to Northumberland, the other marching into Essex, and taking possession of a small island called Melreseg (Mersea). Here, however, they did not long remain; for, having parted, some sailed up the river Thames, and others up the Lea-Road; where, drawing up their ships, they built a fort not far from London, which proved a great reliance upon the citizens, who went in a body and attacked it, but were repulsed with great loss. This obliged the king, when harvest-time came, to encamp with a body of troops in the neighbourhood of the city, in order to cover the reapers from the incursions of the Danes. Riding one day by the side of the river Lea, a thought struck him, that by narrowing the channel and cutting some trenches, and thus turning the course of the stream, he might render the Danish ships unable, by leaving them on dry ground. This was promptly executed; the pagans, struck with astonishment and dismay, quitted their ships and camp, and fled to Quatford, where they were finally broken and subdue. Such of the Danish ships as could be got off, the Londoners carried into their own road; the rest they burnt and destroyed.

The Danes, ever unquiet, in a short time began again to invade the territories of the Weal Saxons, both by land and sea; but their chief enterprises were in the way of piracy, under the command of Sigefert, a Northumbrian, who, well acquainted with Alfred's naval preparations, had framed vessels of a new construction, larger, longer, and swifter than the English; but the king, improving on his invention, caused a number of galleys to be built with all possible expedition, of still greater bulk, swifter in sailing, and loftier than those of the Danes, some of them carrying 60 rowers. With these, falling upon the enemy while they were exercising their ravages in the Weal, he took twenty of their ships; and, having tried all the prisoners at Winchester, he gave judgment that they should be hanged as piratical mur-
To probability, he is and certain and obvious and legible. He is not to be found in the records of his people; for in them the records are not to be found for every minute offence; a particular well worthy of notice and imitation.

"So strange and sudden a change (says Sir John Spelman) did Alfred's institutions produce in the kingdom, that whereas before there was no travelling without arms, there was soon not only safe passage, but all places became so secure, that when the king (for experiment's sake) caused golden bracelets to be hung up in the cross-ways, they seemed to deride the passerby, for no man durst by his hands on them. Virgins might safely travel anywhere alone. Nay, faith Ingulphus, if one left his money all night in the highway, he might come the next morning, and be sure to find it whole and untouched."

This glorious monarch seemed designed by providence for the period in which he lived, whether we view him in a military or a civil capacity, to rescue from total ruin a nation on the brink of destruction, averted from without by powerful enemies, and within by sloth, ignorance, and the want of almost every virtue. He was not deficient in any qualification that might render him beloved by his subjects, and dreaded by his enemies. Though of a weak bodily constitution, his mind was active, vigorous, and enterprising, and fitted to animate every branch of good government. He it was who first taught us to defend ourselves by a naval force, now the glory of our country and the terror of the world! His public virtues (sage Sir John) were worthy of the imitation of princes, and his private life was not stained with any vice: he was a tender husband and parent, the friend and companion of men of letters, learned himself, affable, generous, and, to conclude the whole, eminently pious. He erected public schools in different parts of the kingdom; founded, or at least repaired, the university of Oxford, gave preferment to none but such as had made some proficiency in knowledge; and having thus reigned upwards of 28 years, the delight of his own subjects, and the admiration of all Europe; he died the 25th October, A.D. 900, as some historians flate; but the variations are many between this and the following year.

That so great and good a prince should not have had his actions recorded by any one among the learned of his own subjects must appear surprising. This task, however, was left to be performed by a stranger (Alfr.) taken as it were from among his enemies, a people whose hatred to the Saxon name was notorious; for such at that time were the Welsh. This historian has not, perhaps, written with the elegance of more modern times; yet his life of Alfred is certainly far above what could be expected from the rudeness of the age in which he lived. His descriptions are nervous and spirited; and he conveys to us an image of the most perfect and accomplished monarch that ever graced the English throne.

It has been observed of Alfred, that, had he not been a king, he would have been eminently distinguised as a grammarian, a rhetorician, a philosopher, an historian, a musician, and architect. Of his original writings and translations the following account has been collected:

Historicus quondam fecit me Beda latinum, Alfred rex Saxo translatuli ille prius.

20. "Ætopi fakulae. Ætopi's fables," which he is said to have translated from the Greek both into Latin and Saxon.—21. "Pfallerin Davidicum, lib. i. David's Psalter, in one book." This was the last work that the king attempted, though surprising him before he had finished it; it was however completed by another hand, and published at London in 1640, in quarto, by Sir John Spelman.

The foregoing article has been chiefly compiled from Biog. Brit.—Hume.—Blackstone.—Spelman.—And Wife's Annales Alfredi Magni.

Alfred, an English bishop, was a monk of Malmebury, of the order of St. Bennet, and preferred to the see of Exeter. He flourished in the 11th century, and was one of the most learned men of his time. He wrote a treatise, "De Naturis Rerum," "The Life of

Alfred, of Beverley, an ancient historian, wrote his "Annales," published by Hearne, between the years 1148 and 1150, and borrowed his account of the British kings from Geoffrey of Monmouth. Biog. Dict.

ALFRETON, in Geography, a small market town of England, in the county of Derby, is said to have been founded by king Alfred. It has a considerable corn market on Friday. It is 15 miles north of Derby, and 142 north of London.

ALFTER, a borough, citadel and seignory in the electorate of Cologne and prefécture of Bonn, belonging to the counts of Salm-Reifferscheid.

ALGA, in Natural History, a species of millepora, with thin semicircular lamina, forming horizontal leaves; the millepora lichenoides of Solander and Ellis, found, of a red, purple, yellow and white colour, on the shores of Cornwall.

ALGÆ, in Botany, an order or division of the cryptogamia clafs of plants. — It is one of the seven families of natural tribes into which the vegetable kingdom is distributed in the Philosophia Botanica of Linnaeus; the 57th order of his fragments of a natural method; and the second genus of the fection marine aut fluviales in the clafs algen vulgo habite of Tournefort.

The plants belonging to this order are described as having their root, leaf, and stem, entire, or all one. The whole of the sea weeds and various other aquatic plants are comprehended under this division.

From their admitting of little distinction of root, leaf, or stem, and the parts of their flowers being equally incapable of description, the genera are distinguished by the situation of what is supposed to be the flowers or seeds, or by the resemblance which the whole plant bears to some other substance.

The parts of fructification are either found in fauces or tubercles, as in lichen; in hollow bladders, as in the fuci; or differed through the whole substance of the plants, as in the ulva. The substance of the plants has much variety; it is flesh-like or leather-like, membranaceous or fibrous, jelly-like or horn-like, or it has the resemblance of a calcareous earthy matter.

Mr. Valley has lately shewn that some of the plants that belong to this order possess a high degree of irritability.—Withering's Arrangement of British Plants, vol. i. p. 369.

Lamarck distributes the algæ into three fections; the first comprehends all those plants, whose fructification is not apparent or seems doubtful. Those commonly live in water, or upon moist bodies, and are membranous, gelatinous, or filamentous. To this fection he refers the byfü, conferva, ulva, tremella and varce. The plants of the second fection are distinguished by their apparent fructification, although it be little known, and they are formed of parts which have no particular and fenible opening or explosion at any determined period; their substance is ordinarily crustaceous or coriaceous. They include the taffella, ceratoferna and lichen. The third fection comprehends plants which have their fructification very apparent, and distinguished by characteristic parts which open at a certain period of maturity for the escape of the fecundating dust or seeds. These plants are more herbaceous, as to both their substance and their colour, than those of the other two fections, and are more nearly related to the mosses from which they do not essentially differ. Their flowers are often contained in articulated and very callictic filaments. To this fection are referred the riccia, bläna, anthococcs, targiona, hepatica, and jungermannia. In the Linnaean system the algæ are divided into two clæses, e. c. the terræfera and aquatica. The former include the anthococcs, bläna, riccia, lichen, and byfüs; and the latter are the alva, focus, and conserva. The fructification of the algæ, and particularly of those called aquaticæ, is denominated by a judicious botanist, the opperibium estra-terium. See observations on this order of plants by Dr. Goodenough and Mr. Woodward in the Linnaean Transatl., vol. iii. p. 84, &c.

ALGA, in Ancient Geography, an inland city of the island of Euboea, called by Strabo, the Euboic Algae, and also Æges, to distinguish it from two other cities of that name, one in Achaea, near the river Cratis, the other in Æolis. He conjectures, that from this place, in which was a temple of Neptune, the ÆGean Sea derived its name. See Ægæ.

ALGA, a port of Italy, which Antonine places three miles from Centumcellae.

ALGAGIOLA, a sea-port town of Corsica, defended by a caille, situated upon a rock, was almost destroyed by the mal-contentes in 1731, but soon afterwards rebuilt. N. lat. 42° 20'. E. long. 9° 45'.

ALGAIIRA, or ALIARA, in Geography, a river of Spain, joins the Cabriel, before its confluence with the Xucar.

ALGALA, or ALGALIE, in Surgery, the Arabian name of a hollow curved instrument employed for drawing off the urine, or searching for a stone, by introducing it into the bladder. The more common appellation of this tube is Catheter of Sound, which fee.

ALGARDI, ALESSANDRO, in Biography, an eminent artist, both as a sculptor and architect, was born at Bologna in 1598, and became a disciple of Julius Caesar Conventi, under whose instruction he acquired a reputation in sculpture little inferior to that of Michael Angelo Buonarroti. He also frequented the school of the Caracci, where he probably learned the art of engraving; his style, resembling that of Angolino Caracci, being bright and free, and his execution with the graver bold and open. Having studied at Mantua and Venice, he visited Rome in 1625, and became acquainted with Domenichino, by whom he was recommended to the statue work of the chapel Bandini, which he was painting. For some years he was chiefly employed in repairing antiques and modelling for goldsmiths; but his talents and reputation procured him superior work. Among his performances may be recounted a statue of St. Philip de Neri, in the facrcil of the fathers of the oratory at Rome; his group of the decollation of St. Paul for the Barnabite church at Bologna, and the tomb of Leo XI. at St. Peter's. One of his capital performances was a bas-relief in this cathedral, representing the story of Attila, 32 feet by 18, which was the labour of four years, and which gained him universal applause, with the honour of knighthood and the golden cres. His bronze figure of Innocent XI. is reckoned the fineft of the statues of the popes in Rome. A crucifix likewise, called, by way of distinction, Alard's crucifix, has been much celebrated, and often copied by many of the principal artistes. He was affiduous and quick in execution, but becoming corpulent and infirm, he was under a necessity of recurring to the assistance of his pupils, of whom he formed an eminent school. He died in 1654, at the age of 52 years. His disposition was lively, his conversation pleasant, and his manners irreproachable. He lived in celibacy, and left his property to his sifter. His works, which are held in high estimation, though the air of his heads...
is thought to be artificial and studied, and he is somewhat of a mannerist in the folds of his draperies, are chiefly at Rome and the neighbouring villas. Two plates, supposed to be his, are "Christ upon the Cross," a large upright print, and "the Deliverance of the Souls from Purgatory," a small oval. Strutt. Gen. Biog.

ALGAROTTI, Domenico, in Chemistry, is a white oxide of antimony, procured by adding pure water to the butter or oxymurate of antimony, whereby the metallic oxide is precipitated. This, when thoroughly calcinated and dried, forms the powder of algaroth, and is a very perfect oxide of antimony. It was first applied, as an internal medicine, by Algarotti, an Italian physician. It is not now to be found in the later pharmacopoeias of the London college, but if it were of any advantage to increase the number of antimonial medicines, it might deserve notice from the cafe with which it is prepared, and the apparent uniformity of its composition. It is retained by the Edinburgh pharmacopoeia, and in several parts of the continent as the basis of the chemic tartrate, or tartarized antimony. See Antimony, moriate, and tartrate of.

ALGAROTTI, Francis, in Biography, was born at Padua in 1712, and finished his studies in the university of Bologna. He commenced his travels at an early period, and, in his visit to England acquired a predilection for the Newtonian philosophy, which led him to write his "Newtonianismo par le Dames;" or, "Newtonianism for the Ladies," dated at Paris in 1736. This popular work is formed upon the model of Fontenelle's "Phantastique;" and is equally instructive and amusing. At Berlin Algarotti was kindly received by Frederick, king of Prussia, who conferred upon him the knighthood of the order of Merit, the title of count, and the post of chamberlain. By Stanislaus, king of Poland, who admitted him into his court, he was appointed a privy-counselor. His character was that of a man of letters, a philosopher, and one of the first connoisseurs in Europe in the arts of music, painting, sculpture, and architecture. He contributed much to the improvement of the Italian opera, and wrote verses in his own language replete with sentiment and imagery. An associate at Berlin represents him, somehow in the style of satire, "as full of wit, affectation, and self-love; a Frenchman in genius, an Italian in character, disagreeable in society, often exposed to royal whimsies, and receiving them as tokens of favour." After his return to Italy he died at Pisa, May 24, 1764. The monument which he erected for himself indicates both his taste and his vanity. The epitaph for his tomb was written by himself; "Hic jacet Algarottis, sed non omnia," A collection of his works, in Italian, was published at Leghorn in 1765, in four volumes, 8vo. They consist of his dialogues on the philosophy of Newton, of essays on the fine arts and on commerce, of dissertations on subjects of language, of historical disquisitions, and of miscellaneous, literary and philosophical. An edition of them, in French, was published at Berlin in 1772, in eight vols. 8vo.; and they have been also translated into English and other languages. They display genius and profound reflection, but are thought by competent judges deficient with respect to nature and simplicity. He designed and engraved, for his amusements, several plates of heads in groups, one of which, containing 15, in the antique style, is dated Feb. 15, 1744. Nouv. Dicr. Hall. Strutt.

ALGARVA, in Geography, the most southern province, ancienly a kingdom of Portugal, is bounded on the south and west by the ocean, and hence formerly called Canusus or wedge, on the east by Andalusia, from which it is separated by the Guadiana, and on the north by a ridge of hills, called Serra de Algarve and Serra de Monchique, which divides it from Alentejo. The greatest length of this province is about 90 miles, and its greatest breadth is about 28. The city of Lagos is properly the chief town of Algarve, though Tavira is now the residence of the governor, and Faro pos sesses the greatest part of its trade. According to the last enumeration in 1780, this small kingdom contained 93,472 inhabitants, of whom 6,521 were inhabitants, and 5,573 labourers. It lies close to the sea, and is well cultivated; but this cultivation does not extend more than two leagues inland, beyond which are desert hills. Corn is not grown in sufficient quantity for the consumption; the oil that is produced here is reckoned the best in Portugal, and exported. The wine is white, and good. Figs constitute the principal produce of Algarva, and it also abounds with almonds, particularly about Tavira, which are exported. This is the only province of Portugal from which dried figs are exported. Oranges are also cultivated, especially in the vicinity of Monchique and Faro; and these, together with oranges and Spanish reeds, are exported from Faro to England. Algarva is the first of the only country, Greece excepted, where Caprisification is practised; for there are some varieties of figs, which are very excellent, that fall to the ground immature, unless they are punctured by the ants. The common people live principally on fish, and are very poor, because the province, though capable of great cultivation, is shamefully neglected. A quantity of tunny-fish is taken on the coasts, and particularly in the neighbourhood of Lagos and Cape St. Vincent, and salted in May and June; the colour of it resembles that of smoked beef; and a storehouse for it is opened at Lisbon, where it is found to supply the place of cod. The inhabitants, in general, are leis reined and polite than the other Portuguese, but they are celebrated through the country for their wit and warmness. They are also considered as the best mariners in Portugal; and on this account many of them emigrate, and most of the boatmen at Lisbon come from this province. The mountains that separate this province from Alentejo, rise in height as they approach the north, and consist of argillaceous slate and sandstone. They are arid and barren, and only bear the cactus ladaniferus, with two other kinds of cactus. The province is for the most part surrounded by lime-stands, which exhibit few, if any, traces of cultivation. Olive-trees and fig-trees, and also the cere-trees (ceratonia silatica) grow abundantly in the corn-fields, and afford a plentiful shade. The fan palm (chamaerops calabria or Linnaeus) is very plentiful throughout the whole of this province; and its fan-shaped leaves are used for making the baskets in which figs are packed. Link's Travels through Portugal, p. 432, &c.

ALGAS, a river of Spain, which runs into the Mata rana, near Nonaspes, in Aragon.

ALGATRANE, a fort of pitch found in the bay formed by the point of the Cape of St. Helena, on the south of the Isle of Panta.

ALGAU. See Algow.

ALGAVAREIA, the language anciently spoken by the Moors of Spain, which was a fort of Arabic, and was contradistinguished from the Algamaia.

ALGAZEL, in Geography, a learned Arabian, about the beginning of the 12th century, was a native of Tos, or Tus, in Asia, and celebrated among the Mahometan theologians for his numerous tracts in defence of the Mahometan religion, against the Jews and Christian; particularly for his "Demonstration of Islamism," and his "Treatise on the Unity.
ALGEBRA, a general method of resolving mathematical problems, by means of equations: or, it is a method of computation by symbols, which have been invented for expressing the quantities that are the objects of this science, and also their mutual relation and dependence. These quantities might probably, in the infancy of the science, be denoted by their names at full length; these, being found inconvenient, were succeeded by abbreviations, or by their mere initials. And, at length, certain letters of the alphabet were adopted as general representations of all quantities; other symbols or signs were introduced to prevent circumlocution, and to facilitate the comparison of various quantities with one another; and, in consequence of the use of letters or species, and other general symbols, or indeterminate quantities, algebra obtained the appellation of species, literal, and universal arithmetic.

The term, algebra, is of Arabic original; but its etymology has been variously assigned by different writers. Among the Arabians, from whom it was immediately transmitted to us, this science was denominated al-gibra almucabalah; and as gibara signifies to restore, and kabala to compare or to oppose, the names formed from these words, with the prefix al, denote the science of restitution and comparison, or resolution and equation; and thus understood, they express its nature with sufficient precision. Accordingly, Lucas de Burgo, the first European author on algebra, calls it the rule of restoration and opposition. Others, however, have derived it from Geber, either the name of a celebrated mathematician, to whom they ascribe the invention of the science; or from the word gaber, which forms, with the particle al, the appellation algebra, signifying, according to Golins, in his Arabic lexicon, a reduction of broken numbers or fractions to integers. Herbelot says, that gaber or giber is never used by the Arabs for algebra, without adding the word mokabalah; but Dr. Russell (Hist. Aleppo. v. i. 167) observes, that, at Aleppo, and also in books, al-Gibr is used sometimes alone, as well as in conjunction with mokabalah. This science has been distinguished by other names, besides algebra. Lucas de Burgo calls it parte maggiore, or the greater art, by way of contradistinction to common arithmetic, which is denominated parte minore, or the lesser art. The Italians called it regola de la cosa, or rei; cosa with them signifying rei, or things, and being used in the same sense with ratios, or root; whence proceeded the terms rule of cofs, and coffic numbers, denoting the root, square, cube, and other powers. Other Italian and Latin writers have called algebra regular rei et census, or the rule of the root and square; census being used for improvement, or the square. By a corruption of censae were formed xensus, for the square, and the term zenzic applied to the square root. Hence also the characters $x$, $z$, $\chi$, deduced from the letters $x$, $z$, $\chi$, became the symbols of rei, xensus, and census; or, in our mode of expression, the root, square, and cube; just as $R$ and $s'$, formed from $R$, $s$, are used with us as the signs of radicals. Wallis's Algebra, c. i. p. 3.

Some authors have defined algebra, as the art of resolving mathematical problems; but this is rather the idea of analysis, or the analytic art in general, than of algebra, which is only a particular branch of it. Algebra, duly considered, consists of two parts: viz. the method of calculating magnitudes or quantities, represented by letters or other characters, and the mode of applying these calculations to the solution of problems. When algebra is applied to the solution of problems, all the quantities that are involved in the problem are expressed by letters, and all the conditions that serve to denote their mutual relation, and by which they are compared with one another, are signified by their appropriate characters, and they are thus thrown into one or more equations, as the case requires; these is called synthetic, or composition. When this has been done, the unknown quantity is discharged by a variety of analytical operations from those that are known, and brought to stand alone on one side of the equation, whilst the known quantities are on the other side; and thus its value is investigated and obtained. This process is called analysis or resolution; and hence algebra is a species of the analytic art, and is called the modern analysis, in contradistinction to the ancient analysis, which chiefly regarded geometry and its application.

The origin of algebra, like that of other sciences of ancient date and gradual progress, is not easily ascertained. The most ancient treatise on that part of analysis, which is properly called algebra, now extant, is that of Diophantus, a Greek author of Alexandria, who flourished about the year of our Lord 350, and who wrote 13 books, though only five, "Arithmeticon," of them are preserved, which were printed together with a single imperfect book on multangular numbers, in a Latin translation by Xylander, in 1575, and afterwards in Greek and Latin, with a Comment, in 1621 and 1670, by Gaspar Bachet, and M. Fermat. Toloze, fol. These books do not contain a treatise on the elementary parts of algebra, but merely collections of some difficult questions relating to square and cube numbers, and other curious properties of numbers, with their solutions. In his prefatory remarks, addressed to one Dionysius, for whose use Diophantus probably wrote, he recites the names and generation of the powers, the square, cube, 4th, 5th, 6th, &c., which he calls dynamis, cubus, dynamodinamis, dynamocubus, cubicubus, according to the sum of the indices of the powers, and he marks those powers with the Greek initials; and he expresses the unknown quantity by $x$, $y$, or the number, simply marking it in the solutions by the final $x$, and denoting the monads, or indefinite unit, by $y$. In his researches on the multiplication and division of simple species, he shews what powers they produce, and observes that minus (−) multiplied by minus, produces plus (+); and that minus multiplied by plus produces minus: the mark which he uses for minus is $\pi$ or the $\pi$ inverted and curtalled: but he has no mark for plus, expressing it by a word or conjunctive copulatives. Supposing his reader acquainted with the common operations, viz. addition, subtraction, multiplication and division of compound species, he proceeds to remark on the preparation of the equations that are deduced from the questions, which we call reduction of equations, by collecting like quantities together, adding quantities that are minus, and subtracting those that are plus, called by the modern treatment,
transposition, so as to bring the equation to simple terms, and then depressing it to a lower degree by equal division, when the powers of the unknown quantity are in every term: which preparation or reduction of the complex equation, being made, or reduced to what we call a final equation, this author proceeds no further, but merely says, what the root, or re. ignita, is, without giving any rules for finding it, or for the resolution of equations; thus intimating, that rules for this purpose were to be found in some other work, either of his own or of some other person. The chief excellence of Diophantus's collection of questions, which seems to be a series of exercises for rules which had been elsewhere given, is the neat mode of abridgment or notation, which being once made, the reduction to the final equation is easy and obvious. This work indicates much accurate knowledge of the science of algebra, in some of its most abstract parts. But as the author reduces all his notations to a simple equation, or a simple quadratic, it does not appear how far his knowledge extended to the resolution of compound or affected equations.

Algebra, however, seems not to have been wholly unknown to the ancient mathematicians, long before the age of Diophantus. We observe the traces and effects of it in many places, though it seems as if they had intentionally concealed it. Something of it appears in Euclid, or at least in Theon upon Euclid, who observes that Plato had begun to teach it. And there are other instances of it in Pappus, and more in Archimedes and Apollonius. But it should be observed, that the analysis used by these authors is rather geometrical than algebraical; this appears from the examples of it that occur in their works; and therefore, Diophantus is the first and only author among the Greeks, who has treated professedly of algebra. Our knowledge of the science was derived, not from Diophantus, but from the Moors or Arabs; but whether the Greeks or Arabsians were the inventors of it has been a subject of dispute. It is probable, however, that it was much more ancient than Diophantus, because his treatise seems to refer to works similar and prior to his own. Abulfaragius, an Arabic historian, in one place attributes the invention, or rather the arrangement of the principles and rules of the science, to Diophantus; and from him we learn that the arithmetic of Diophantus was translated into Arabic by Mahomet Ben-Yahya Baziani; but in another place he seems to ascribe it to Mahomet Ben Mufa, who is said to have lived about the year 850 or 900, and who was the first of the Arabs by whom this science was cultivated. Cardan attributes the invention of it to this Arabian, and apprehends that he obtained the appellation of Geber from this art. See Bib. Arab. et Hisp. tom. i. p. 370, cited by Ruffell in his Hist. of Aleppo, vol. ii. p. 409. Stevinus is of opinion that this science, and other parts of mathematics, were much more ancient among the Orientalists, than any learning they derived from the Greeks. Dr. Wallis adopts the sentiments of those who think that the Arabs derived this science, as well as the knowledge of numeral figures, from the Persians, and originally by their means from the Indians; and he alludes, as a presumptuous evidence of their not having derived it from the Greeks, that the name they give it, viz. al-giaib wa-al-makala, seems to have no affinity with any Greek name. We may here add, that some vestiges of algebraical calculation have been discovered among the Brahmins; particularly rules for the solution of certain arithmetical questions, with which it would seem that nothing but algebra could have furnished them. Asiatic Researches, vol. ii. p. 468, note 487, 495. But wherever algebra was invented or first cultivated, the science, and also the name of it, were transmitted to Europe, and particularly to Spain, by the Arabsians or Saracens, about the year 1100, or somewhat sooner. It seems to have taken the lead in the cultivation of this science, after its introduction into Europe: and Lucas Pacioli, or Lucas de Burgo, a minorite Franciscan friar, was the first author on the subject, who wrote several treatises in the years 1476, 1481, 1478, 1487, and 1509; but his principal work, entitled, "Summa Arithmetice et Geometricz, Proportionumque et Proportionaliatum," was published in Italian at Venice, in 1494, and again in 1523. In this work he mentions several writers, and particularly Leonardo Pifanos, placed by Volthus about the year 1400, or a little sooner, and laid to the first of the moderns who wrote of algebra, from whom he derived his knowledge of those sciences; and from the treatise of Leonard, not now extant, the contents of that of Lucas were chiefly collected. The age of Leonard of Pisa has been usually fixed to the end of the 13th century. But it now appears by a manuscript of this algebraist, discovered in a library of Italy, by M. Targioni Tozetti, and communicated to M. Coffelli, a canon regular of Parma, that he lived two centuries before this period, or at the commencement of the 13th century: and of course that Italy is indebted to him for its first knowledge of algebra. His proper name was Bonacci, and he was a merchant, who traded in the sea ports of Africa, and the Levant. Being ambitious of obtaining an acquaintance with the sciences that flourished amongst the Arabs, and particularly that of algebra, he travelled into their country. Accordingly his arithmetic was published in 1222, and a new enlarged edition of it appeared in 1228. At this time, however, algebra was not a part of arithmetic, but was distinguished from it by the title of "Ars Magna," or "Arte Maggiore." From the manuscript above-mentioned it appears, according to Coffelli's account of it, that Leonard had penetrated deeply into the secrets of the algebraic analysis; that he was particularly acquainted with the analysis of problems similar in kind to those of Diophantus, and with the resolution of equations of the second degree; and that he had written a treatise, entitled "De Numeri Quadrati," which is not extant, but which Coffelli has restored from some fragments of Lucas del Burgo. This Leonard, therefore, must not be confounded with another called Camillus Leonardus of Pefaro, author, as it is said, of a book entitled, "Liber deitteratus canonum aequatorii motuum coelestium calcule, &c." Pifaur. 1496, 410. Montucla Hist. Math. tom. ii. p. 716. This Leonard of Pisa made long voyages into Arabia and other eastern countries, in order to gain the knowledge of the mathematics. Montucla (tom. i. p. 536) mentions two other persons who previously to this discovery were thought to have preceded Leonard in this department of science, viz. Paul dell'Abaco, who lived towards the end of the 14th century, and who is supposed by Ximenes, to have been the first person in Italy who used algebraic equations; and also Prodocimo Belmando, or Beldomando, of Padua, who was supposed to have shared with Leonard the honour of introducing into Italy the knowledge of algebra. His book, entitled, "Dell Algorismus," was printed in 1483, but dated at the beginning of the 15th century. Lucas informs us, that algebra came originally from the Arabs, and never mentions Diophantus; from which circumstance it has been inferred that this Greek author was not then known in Europe. From the book of Lucas de Burgo, we learn, that the knowledge of the Europeans in his time, or about the year 1500, extended no further than to quadratic equations, of which they used only the positive roots; that they admitted only one unknown quantity; that they had no marks or signs for either
either quantities or operations, excepting some few abbreviations of the words or names; and that the art was merely employed in resolving certain numerical problems. If the science had been carried further in Africa than quadratic equations, which was probably the case, as we may infer from an Arabic manuscript, said to be on cubic equations, deposited in the library of the university of Leyden, by Warner, the Europeans had at this period obtained only an imperfect knowledge of it. The publication of the works of Lucas de Burgo promoted the study, and extended the knowledge of algebra; so that about the year 1505, Scipio Ferreus, professor of mathematics at Bononius, in Italy, discovered the first rule for solving one case of a compound cubic equation. The next Italian, who distinguished himself by the cultivation and improvement of algebra, was Hieronymus Cardanus, of Bononius, who published nine books of his arithmetical writings, in 1550, in Latin, at Milan, where he practiced his profession, and read lectures on mathematics; and in 1545, a tenth book, containing the whole doctrine of cubic equations. Cardan denominates algebra, after Lucas de Burgo and others, "Ars Magna quam vulgaris Coffian vorunt," or "Regula Algebraivaracce," and attributes the invention of it, on the authority of Leonard of Pisa, to Mahomet, the son of Moses, an Arabian. He adds, that this supposed inventor left four rules or cases, which perhaps only included quadratic equations; that afterwards three derivatives were added by an unknown author, supposed by some to have been Lucas Paciolius, and afterwards three other derivatives for the cubic and sixth power, by another unknown author; all which were resolved like quadratics; that then Scipio Ferreus, about 1505, found out the rule for the case "cubum et ternum numerorum equalium," or, as it is now written, \(x^3 + bx = c\), which he represents as a thing admirable; that the same discovery was made in 1535, by Tartalea, who, after a train of intricate dispositions, deduced it to him (Cardan); and that he and his former pupil, Lewis Ferrari, much augmented and extended the cases; and that all the demonstrations of the rules are his own, except three of Mahomet for quadratics, and two of Ferrari for cubics.

To Cardan's treatise on cubic equations is annexed, "Libellus de Aliza Regula," or the Algebraic Logigues, in which he treats of some of the more abstruse parts of arithmetic and algebra, especially cubic equations, with many additional attempts for the solution of the irreducible cases, \(x^3 = bx + c\).

From a minute and accurate detail of the contents of Cardan's treatise, given by Dr. Hutton, it appears, that the improvements in algebra, communicated by this author, are as follow. To the rules furnished by Tartalea for resolving these three cases of cubic equations, viz. \(x^3 + bx = c\), \(x^3 = bx + c\), and \(x^3 + c = bx\); he has added rules for all forms and varieties of cubic equations, demonstrating these rules geometrically, and fully discussing almost all sorts of transformations of equations in a manner before unknown. Cardan also appears to have been well acquainted with all the real roots of equations, both positive and negative, or, as he calls them, true and fictitious, both of which he occasionally used. He has also shewn that the even roots of positive quantities are either positive or negative; that the odd roots of negative quantities are real and negative; but that the even roots of them are impossible, or nothing as to common use. He also well knew the number and nature of the roots of an equation, partly from the signs of the terms, and partly from the magnitude and relation of the co-efficients. He also knew that the number of positive roots is equal to the number of changes of the signs of the terms; that the co-efficient of the 2d term of the equation is the difference between the positive and negative roots; that when the second term is wanting, the sum of the negative roots is equal to the sum of the positive roots; how to compose equations that shall have given roots; that changing the signs of the even terms changes the signs of all the roots; that the number of roots failed in pairs; that the impossible roots, as they are 10 called, were always in pairs; to change the equation from one form to another, by taking away any term from it; and to increase or diminish the roots by a given quantity. It appears also, that Cardan had a rule for extracting the cube root of such binomials as admit of extraction; that he often used the literal notation \(a, b, c, d, \&c.\); that he gave a rule for biquadratic equations, fusing all their cases; and that, in the investigation of that rule, he made use of an assumed indeterminate quantity, and afterwards found its value by the arbitrary assumption of a relation between the terms; that he applied algebra to the resolution of geometrical problems; and that he was well acquainted with the difficulty of the irreducible cases, and that he devoted much time and attention to the solution of it; and that, though he did not completely succeed, he laid down rules for many particular forms of it, and shewed how to approximate very nearly to the root in all cases whatever.

Tartalea, or Tartaglia, of Brescia, was a contemporary of Cardan, and published his book of algebra, entitled, "Quatuor Invenzioni diversi," in 1546, at Venice, where he resided as public lecturer in mathematics. This work was dedicated to Henry VIII. of England, and consists of nine books, the last of which contains all those questions that relate to arithmetic and algebra. These questions comprehend exercises of simple and quadratic equations, with complex calculations of radical quantities, evincing the skill of the author in the science of algebra. He retained the notation of forms of expression used by Lucas de Burgo, calling the 1st power of the unknown quantity "cosa," the 2d power "cena," the third "cubi," \&c.; and he expressed the names of all the operations in words, without any contractions, except the initial R for root, or radicality. What is most remarkable in this collection of questions is the discovery of the rules for cubic equations, together with the various circumstances that attended it. The first two of these were discovered by Tartalea in 1530, viz. those for \(x^3 + ax = c\), and \(x^3 = ax + c\); and the rules for the other two cases, viz. \(x^3 + bx = c\), and \(x^3 = bx + c\), were discovered, in 1535, at Venice. Under question 31, we have an account of the correspondence between Tartalea and Cardan on the subject of cubic equations, and on the manner in which Cardan drew from him his discoveries relating to them; for a more particular account of which, see the biographical article Cardan. Tartalea published at Venice, in 1556, &c. a very large work, in folio, on arithmetic, geometry, and algebra; the latter of which is imperfect, and extended no farther than quadratic equations, his death having prevented his completion of it.

The contemporaries of Tartalea and Cardan were Michael Stifelius and Scheubelius. The "Arithmetica integra" of Stifelius was printed at Norimberg in 1544, and is, says Dr. Hutton, an excellent treatise on arithmetic and algebra. The invention of the science is ascribed by this author to Geber, an Arabian alchemist. The improvements of Stifelius and other Germans beyond those of the Italians, recited in Cardan's book of 1539, were as follow. He introduced the characters \(+, -\), \(\sqrt{\cdot}\), for plus, minus, and root, or radix; and the initials \(\sqrt{2}, \sqrt{3}, \sqrt[3]{5}, \sqrt[5]{5}, \sqrt[5]{\sqrt[3]{5}}, \&c.\) for the powers 1, 2,
G and buf 2, Chrillopher J 1552, in the for but, in; and and Nunez, the Among cxpo.ieiits and q, numeral appears, or p - Such the 1567, 2 • but for Poituguefe. The following, verfalis," He is reduced a fundamental of particulars, and he denominates "radix collecti" but when they may be reduced to common furd, he unites them into one number. He proceeds in a similar manner with cubic furs and 4th roots. He remarks the different kinds of binomial and residual furs, correponding to the feveral irrational lines in the 10th book of Euclid's Elements; and gives the following general rule for extracting the root of any binomial or residual \( a \pm b \), in which one or both parts are furs, and \( a \) the greater quantity, viz. that the square root of it is 

\[
\sqrt{\frac{a + \sqrt{a^2 + b^2}}{2}} \pm \sqrt{\frac{a - \sqrt{a^2 - b^2}}{2}},
\]

which he illustrates by examples. As he takes no notice of cubic equations, it is probable that though they were known in Italy he had not heard of them in Germany.

Robert Recorde, in England, published the first part of his arithmetic in 1552, and the second part in 1557, under the title of "The Whetstone of Witte, which is the second parte of Arithmetike; containing the Extraction of Roots, the Coflike Practife, with the Rule of Equation ; and the Works of Surde Numbers." What is principally new in this work comprehends the extraction of the roots of compound algebraic quantities, the use of the terms binomial and residual, and the use of \( = \), as the sign of equality.

The Algebra of Poletarius was printed at Paris in 4to. in 1553, under this title, "Jacobi Peletarii Cenomani, de Oculta Parte Numerorum, quam Algebra vocant. Lib. duo." This work, containing an account of rational and irrational or furd quantities, is an ingenious treatise on those parts of the science that were then known, cubic equations excepted; and the discoveries or improvements of the author are the following, viz. that the root of an equation is one of the divisors of the absolute term; that trinomials may be reduced to simple terms by multiplying them by compound factors; and that a feries both of square and cube numbers may be constructed by addition only, that is, by adding successively their several orders of differences.

Peter Ramus wrote his Arithmetic and Algebra about the year 1566. He expresses the powers by \( l, g, r, b \) \& \( q \), the initials of latus, quadratus, cubus, and biquadra-
Recognitions, et Emendatione;" and were not published till the year 1615, by Alexander Anderson, an Ingenious Scot, with various corrections and additions. Vieta's improvements comprehend the following particulars: He first introduced the general use of the letters of the alphabet to denote indefinite given quantities. Accordingly he expresses unknown quantities by the vowels A, E, I, O, U, and the known ones by the consonants B, C, D, &c. He also invented many terms and forms of expression which are in present use; as co-efficient, affirmative and negative, pure and affected or affected, uncertain, homogeneum adjectives, homogeneous comparations, and the line or vinculum over compound quantities, thus $A + B$: And his method of arrangement is to place the homogeneously comparing, or absolutely known term on the right-hand side alone, and all the terms that contain the unknown quantity, with their proper signs, on the other side. He somewhat improved the rules and modes of reduction for cubic and other equations; he showed how to change the root of an equation in a given proportion: he deduced the cubic and biquadratic, &c. equations from quadratics, not in Harriot's way by composition, but by squaring and otherwise multiplying certain parts of the quadratic; and as some quadratic equations have two roots, the cubic and other equations raised from them will also have two roots and no more. In this way Vieta perceived the relation which the two roots bear to the co-efficients of the two lowest terms of cubic and other equations, when they have only three terms, namely, by comparing them with similar equations thus raised from quadratics; and, vice versâ, what the roots are in terms of such co-efficients. He also made some observations on the limits of the two roots of certain equations; he stated the general relation between the roots of certain equations and the co-efficients of the terms, when the terms are alternately plus and minus, and none of them are wanting, or the roots all positive. He extracted the roots of affected equations by a method of approximation similar to that for pure powers; and moreover, he gave the construction of certain equations, and exhibited their roots by means of angular sections.

In the History of Algebra, Albert Girard, an ingenious Dutch or Flemish mathematician, already mentioned, as the editor of Stevinus's arithmetic, who died about the year 1629, devotes particular notice, on account of his work, entitled, "Invention Nouvelle l'Algeeber, tant pour la Solution des Equations, que pour reconnoître le nombre des Solutions qu'elles reçoivent, avec plusieurs choses qui sont nécessaires à la perfection de cette divine Science," printed at Amsterdam in 1629, 4to. From an analysis of this work, it appears that Girard was the first person who understood the general doctrine of the formation of the co-efficients of the powers from the sums of the roots, and their products, &c. He was also the first who understood the use of negative roots in the solution of geometrical problems; who spoke of the imaginary roots, and understood that every equation might have as many roots real and imaginary, and no more, as there are units in the index of the highest power, and who applied the denomination of quantities left than nothing to the negative; and he was the first person who discovered the rules for summing the powers of the roots of any equation.

The next person who claims particular notice in the history of this science is Thomas Harriot, who died at the age of 60 years in 1621, and whose Algebra was published by his friend Walter Warner, in 1631. The book is a folio volume, and entitled, "Artis Analyticae Praxis, ad Equationes Algebraicas nova, expedita, et generali methodo, solvendas," a work, says Dr. Hutton, in all parts of it, shewing marks of great genius and originality, and the first instance of the modern form of algebra in which it has ever since appeared. On the foundation laid by Harriot, says Dr. Wallis (Algebra, p. 126), Des Cartes, without naming him, hath built the greatest part, if not the whole, of his algebra or geometry; without which, as he adds, "that whole superstructure of Des Cartes (I doubt) had never been." A summary of Harriot's improvements is as follows: He introduced the uniform use of the small letters $a, b, c, d, &c.$ expressing the unknown quantities by the vowels $a, e, i, o, u,$ and the known ones by the consonants $b, c, d, &c.$ and joining them together in the form of a word to represent the product of any number of these literal quantities; and prefixing the numeral co-efficient, separated from the quantity connected with it by a point, thus $a \cdot b$ for a root, he placed the index of the root after the radical mark $\sqrt{a}$, as $\sqrt{a^2}$, for the cube root. He also introduced the characters 7 and 2 for greater and less; and in the reduction of equations, he arranged the operations in separate files or lines, setting the explanations in the margin on the left hand, for each line. In these respects he introduced and established the form of algebra as it now exists. He also shewed the universal generation of all the compound or affected equations, by the continual multiplication of so many simple ones, or binomial roots; thus plainly exhibiting to the eye all the circumstances of the nature, mystery and number of the roots of equations, with the composition and relations of the co-efficients of the terms; from which many of the most important properties have been since deduced. He also improved the numeral exegesis, or extraction of the roots of all equations, by clear and explicit rules and methods, drawn from the foregoing generation or composition of affected equations of all degrees.

Oughtred, contemporary with Harriot, was born about the year 1573, and died in 1660. His "Clavis" was published in 1631. In this work he chiefly follows Vieta, in the notation by the capitals A, B, C, D, &c. and in the designation of products, powers and roots, with some few variations. To him we owe the separation of decimals from the integers after this manner, 21.56, and having the decimals annexed without a denominator. In algebraical multiplication Oughtred either joins the letters in a word, or connects them by the sign $\times$, introducing for the first time this character of multiplication; thus, $A \times A$, or $A^2$, but he omits the vinculum of Vieta. He also introduces many useful contractions in the multiplication and division of decimals, such as that of inverting the multiplier for reducing the number of decimals, and abbreviating the work, that of omitting one figure at a time, of the divisor, and that of dividing by the factors of a number instead of the number itself, and many others. He states proportion thus, 7.9 : 28.36: and denotes continued proportion by $\ldots$ With respect to the genesis and analysis of powers he follows Vieta; and he furnishes a table of the powers of the binomial $A + E$ as far as the 10th power, with all their terms and co-efficients, or unless, an expression which he adopts from Vieta. He gives particular directions for the reduction of equations, corresponding to their various forms; he uses the letter $u$ after $\sqrt{a}$, for universal, instead of the vinculum of Vieta; and he observes, that the signs of all the terms of the powers of $A + E$ are positive, and those of $A - E$ alternately positive and negative. He subjoins many properties of triangles and other geometrical figures, and the first instance of applying algebra to geometry, so as to investigate new geometrical properties; and after the algebraical solution of each problem, he commonly deduces and gives a geometrical construction adapted to it. He gives also a good
tact on angular sections; and concludes the work with the
numeral resolution of affected equations, in the manner of
Vieta, but more explicit.

In 1637 Des Cartes first published his geometry, which
may be considered as an application of algebra to geometry,
and not as a separate treatise on either of these sciences. As
Dr. Wallis has manifested too great a degree of partiality to
our countryman Harriot, and ascribed to him discoveries
which had been made by Vieta and others; and as Bombelli and
M. d. Gua, in the Memoirs of the Academy of Sciences for
1745, cited in the last edition of the Encyclopaedia, have
devoted far into the other extreme, in madly extolling the
discoveries of Vieta, and those of Des Cartes, to the prejudice
of Harriot, we shall avail ourselves of the analysis of Dr.
Hutton in giving a particular account of the improvements
and inventions of Des Cartes, that our readers may be able to
form their own judgment in this controversy. Montucla
indeed seems to have accorded an impartial account of the
discoveries both of Harriot and Des Cartes, intermingled
with reflections, which some may think less candid than
they ought to have been, on our illustrious countryman Dr.
Walls. Hist. des Mathem, tom. ii. p. 106—116. This excellent
historian of the mathematical sciences acknowledges, that Des Cartes might possibly have been in
debted to Harriot, though he thinks it very probable that the
principal discoveries of his geometry were anterior to the
date of the work of the English analyst. It ought however
to be recollected, that the work of Harriot was posthumous,
that he lived to the age of 68, and that his discoveries, at a
period when the spirit of enquiry was excited, might have
been communicated to men of science, between whom an
interest must have subsisted, long before he died. Montucla,
by a way of balancing the account between Des Cartes and Harriot,
or rather between Wallis and the partial advocates of Des
Cartes, intimates, that if Des Cartes was indebted to Harriot,
the latter was under no less important obligations to Vieta,
whose works were published before the year 1600. To
strengthen the presumption that this might have been the
cafe, he alleges, on the authority of Sherburn, the transla-
tor of Manilius, that Vieta had for some time employed an
English secretary, or amanuensis, whose name was Nathaniel
Torporky: and as this Torporky was frequently in familiar
intercourse with Harriot at the table of the Duke of North-
tumberland, he suggests the probability of his having com-
municated the ideas and manuscripts of Vieta, of which he
was the depositary to Harriot.

The geometry of Des Cartes (Apud Opera. tom. iii.
Francof. ad Moenum, 1695. 4to.) consists of three books.
The first is entitled, “De Problematibus, quse contruii
poufunt, adhibendo tantum rectas lineas et circulos.” In this
book the author shews how to accommodate arithmetical
computation to geometrical operations. For this purpose
he affirms a line to represent unity, and then, by means of
proportionals, teaches the method of multiplying, dividing,
and extracting of roots by lines. He proceeds to explain his
mode of notation, which is not different from that of other
authors. Affixing a and b for two quantities, their sum is
expressed by a + b, their difference by a — b, their product
by ab, their quotient by \( \frac{a}{b} \), the square of a by \( aa \) or \( a^2 \), its
cube by \( a^3 \), &c. the square root of \( a^2 + b^2 \) by \( \sqrt{a^2 + b^2} \),
and the cube root by \( \sqrt[3]{a^3 + b^3} \). He then
shews, as Stifelius had done, that there must be as many equa-
tions as there are unknown lines or quantities, and that all
of them must be reduced to one final equation, by extremi-
nating all the unknown letters except one; so that the final
equation will appear in the following forms, the character 20
being substituted for \( a = 0 \) equality, and the highest term or
power being on one side of the equation, and the other terms
with their proper signs on the other side:

\[ 20 \times b, \text{ or,} \]
\[ 20^2 - ac + b^2, \text{ or,} \]
\[ 20^2 + ac^2 + b^2 = c^2, \text{ or,} \]
\[ 20^2 + ac^2 + b^2 - c^2 + d^2, \text{ &c.} \]

Having defined plane problems, or such as can be re-
solved by right lines and circles, described on a plane
superficies, and having in the final equation only the 2d power of
the unknown quantity, he constructs such equations or quan-
dratics by means of the circle, and thus geometrically inves-
tigates the positive root or roots. But if the lines, by which
the roots are determined, neither cut nor touch, he observes
that the equation in this case has no possible root, or that the
problem is impossible. This book closes with the algebraical
solution of the celebrated problem, confounded by the
ancients, which is that of finding a point, or the locus of all
the points, from which a line may be drawn to meet any
number of given lines in given angles, the product of the
segments of some of them shall have a given ratio to that of
the red.

The second book is entitled, “De Natura Linearum Cur-
varam.” This is the first treatise of the kind on curve lines
produced by the moderns. The nature of the curve is here
expressed by an equation, containing two unknown or
variable lines, and others that are known or constant, as
\[ y^2 = cy + \frac{cxy}{b} + ay - ac. \] See Curve. We have in this
book a discovery of importance, as it is the first step towards
the arithmetic of infinites; and that is the method of tan-
gents, or of drawing a line perpendicular to a curve at any
point, which is an ingenious application of the general form
of an equation, generated in the method of Harriot, that has
two equal roots, to the equation of the curve. See Tan-
gent.

The third book, entitled, “De Constructione Problematum
Solidorum, et Solidae excedentiam,” commences with remarks
on the nature and roots of equations; and the author ob-
nerves, that they have as many roots as dimensions; and he
shews, after Harriot, that they may be obtained by multi-
plying a certain number of simple binomial equations to-
gether, as \( x - 2 \times 0, x - 3 \times 0, \) and \( x = 4 \times 0, \) which pro-
duce \( x^2 - 9x + 26x - 24 = 0, \) in which equation \( x \) has
three dimensions, and also three values, viz. 2, 3, and 4. He
here remarks, that some equations have their roots falsc, or,
as he expresses it, less than nothing, called by us negative,
and these he contradistinguishes to those that are true or
positive, which Cardan had before done. E. G. Let \( x + 5 = 0 \)
be multiplied by \( x^2 - 9x + 26 = 0, \) and we shall
have \( x^2 - 8x + 26 + 9x + 16x - 100 = \) 0, in which equa-
tion three roots, viz. 2, 3, and 4, are true, and one, viz. 5,
false. From the generation or composition of equations by
multiplication Des Cartes naturally deduces their resolu-
tion, depression, or composition, by dividing them by the
binomial factors which composed them; and hence he ob-
nerves, that this divisor is one of the binomial roots, and that
there can be no more roots than dimensions, or than such as
form with the unknown quantity \( x \) binomials that will ex-
cactly divide the equation, as Harriot had before shewn. Our
author adverts to other properties, most of which had been
noticed before; e.g. that equations may have as many true roots
as the terms have changes of the signs + and — , and as many
false
false ones as succedences of the same signs: which had before been partly shewn by Cardan and Vieta from the relation of the co-efficients and their signs, and more fully by Harriot. Hence Des Cartes was led to adopt Cardan's method of changing the true roots to false, and the false to true, by merely changing the signs of the even terms. He then directs his attention to other reductions or transmutations taught by Cardan, Vieta, and Harriot: such as increasing or diminishing the roots by any quantity, taking away the second term, and altering the roots in any proportion, and thus extracting the equation from fractions and radicals. Having observed (p. 76.) that the roots of equations, both true and false, may be either real or imaginary, which imaginary roots were first noticed by Albert Girard, as in the equation 

\[ x^2 - 6xx + 13x - 10 = 0, \]

that has only one real root, viz. 2; he proceeds to the depression of a cubic equation to a quadratic or plane problem, &c. that it may be constructed by the circle, by dividing it by one of the binomial factors, which, in Harriot's method, compose the equation. As Petarians had shewn that the simple root is one of the divisors of the known term of the equation, and Harriot had observed that this term is the continual product of all the roots; Des Cartes tried all the simple divisors of that term, till he finds one of them, which connected with the unknown quantity \( x \) by \( \pm \) or \( - \), will exactly divide the equation: and the same process serves for higher powers than the cubic. But when a divisor cannot be found in this way, in order to depress a biquadratic equation into a cubic one, he gives a new rule for dividing it into two quadratics, by means of a cubic equation, in the following manner (p. 79, &c.): Let

\[ x^4 - 2xx + 3yy \cdot \frac{9}{2} \rightarrow \infty, \]

and suppose it composed of these two

\[ + xx - yy + \frac{1}{2}yy \cdot \frac{7}{2} \rightarrow \infty. \]

Then find the root \( \frac{xy}{2} \) of the following cubic equation, viz. \( y^6 - 2yy^2 + \frac{pp}{4}y - yy \cdot qq \rightarrow \infty \), in which the sign of \( 2p \) is the same with that of \( p \) in the given biquadratic, but the sign of \( 4p \) contrary to that of \( r \) in the same equation; and the value of \( y \), deduced hence, and substituted for it in the two quadratics, and their two pairs of roots being taken, thefe are the four roots of the proposed biquadratic. E. C. Let the biquadratic be \( x^4 - 4xx + 8x + 35 \rightarrow \infty \), for which must be substituted \( y^4 - 8y^2 + 124yy - 64 \rightarrow \infty \); because the quantity called \( p \) being in this case \( -4 \), \( -8x \) must be substituted for \( 2y^2 \), and \( r \) being \( +35 \), \( \frac{16}{-140} \) \( yy \), or \( +124yy \), are the co-efficients of the terms of the two quadratic equations, and after multiplying the two together, determining their values by comparing the resulting terms with those of the proposed biquadratic equation. Des Cartes, after these reductions, in order to simplify and depress the equations as much as possible, proceeds to give the construction of solid and other higher problems, or of cubic and higher equations by means of parabolas and circles; observing, that the false roots are denoted by the ordinates to the parabola lying on the contrary side of the axis to the true roots: and he closes the book with illustrating these conftuctions by various problems concerning the trisection of an angle, and the investigation of two or four mean proportional.

Of the improvements contained in this work, it is observed by Dr. Hutton, that Des Cartes, with a view to the more easy application of equations to the construction of problems, mentions many particulars concerning the nature and reduction of equations, and states them in his own language and manner, which is usually more clear and explicit than that of others, and frequently accompanied with his own improvements. Here he chiefly followed Cardan, Vieta, and Harriot, especially the last; explaining some of their rules and discoveries more distinctly, and with some little variation in the notation, in which he puts the first letters of the alphabet for known, and the latter letters for unknown quantities, \( a \) for \( a a a \), &c. and \( \infty \) for \( = \). But Herigone had two years before used the same numeral exponents. Des Cartes explained or improved most parts of the reduction of equations, in their various transmutations, the number and nature of their roots, true and false, real and imaginary, as he calls them, or as they are denominated by Girard, involved; and also the depression of equations to lower degrees. His inventions and discoveries comprehend the application of algebra to the geometry of curve lines; the construction of equations of the higher orders, and a rule for resolving biquadratic equations by means of a cubic and two quadratics.

Fermat, who published Diophantus's arithmetic with valuable notes, was a contemporary of Des Cartes, and also a competitor for some of his most valuable discoveries. This ingenious mathematician, before the publication of Des Cartes's geometry, had applied algebra to curve lines, expressed them by an algebraic equation, and by the construction of equations of the 3d and 4th orders; and he had also discovered a method of tangents, and a method de maximis et minimis, approaching very nearly to the method of fluxions or increments, in the manner of treating the problems as well as in the algebraic notation and process. Fermat was also distinguished by his knowledge of the Diophantine problems.

At the period to which we have now referred, algebra had acquired a regular and permanent form; and from this time the writers on the whole, or detached parts of this science, became so numerous, that the limits of this article will scarce admit our quoting their names and publications, and much less doing justice to the improvements which this branch of mathematical science derived from their performances. In the course of our biographical articles, and on other occasions, we shall endeavour to supply the defects of the present cursory notice.

The geometry of Des Cartes engaged the attention of several mathematicians in Holland, where it was published; and also in France and England. Francis Schooten, professor of mathematics at Leyden, was one of the first cultivators of the new geometry; and in 1649 he published a translation of Des Cartes's geometry, from the French into Latin, with his own commentary and notes by M. de Beaune. In 1659, appeared an enlarged edition in two volumes, with several additional pieces by De Beaune, Hudde, Van Heurnet, De Witt, with some tracts by Schooten the editor. Rabel, a jefuit, published an elaborate commentary on the same
work; which was enriched with notes by James Bernoulli, and printed at Baill. Huygens also directed his attention to the algebraic analysis, and his inventions are cited by Schouten, who was his pupil. Sluusius, canon of Liege, published in 1659, "Mofolabunm, seu duo maxime proportionales per Circulum et Ellipsis, vel Hyperbolam, infinitis et rationibus," a new edition of which appeared in 1668, containing much valuable matter relating both to algebra and geometry.

But before the time of Des Cartes, as well as after the publication of his geometry, algebra engaged the attention of mathematicians. In 1619 several pieces of Van Collen, or Caten, were translated from Dutch into Latin, and published at Leyden, by W. Snell; one of which is a particular treatise on Surds. In 1621, Bachet published an edition of Diophantus with notes, and Fermat's edition, with additions, appeared in 1670. The same author published, in 1624, a treatise of mathematical recreations under the title of "Problèmes plaisans et délectables." Herigone, in 1634, published at Paris the first course of mathematics, in 5 vol. 8vo; containing a treatise on algebra, and bearing, says Hutton, evident marks of originality and ingenuity, in which he uses the notation by small letters, introduced three years before, by Harriot; he also expresses $x^2 + y^2$ by $a + b$, $x\cdot y$ by $a\cdot b$, and $x + y$ for equality, with other abbreviations. In his notation of powers and roots, he annexes to the letter the numerical exponents. Cavalierius, in 1635, published his "Indivisibles," and introduced a new era in analytical science and new modes of computation. He was followed in 1640 by Roberval, whose improvements in analytics were published in the early volumes of the memoirs of the Academy of Sciences, by De Billy, who published in 1643, "Nova Geometrica clavis Algebraa," and in 1670, "Diophantus redivivus;" and by Renaldine, who, in 1665, published in 4to, "Opus Mathematicum," both ancient and modern, with mathematical resolution and composition, enlarged and republished in folio, in 1665, 1667, and 1682, under the title of "Ars analytica Mathematica, in tres partes distributa," &c. This author uses the parentheses $(a + b)$ as a vinculum. In 1655, Dr. Wallis published his "Arithmetica Infinitorum," which greatly improved the indivisibles of Cavalierius, and led the way to infinite series, the binomial theorem, and the method of fluxions. The "Arithmetica Rhonii, or Rahni" Germanicae," was published in 1659, and translated into English in 1668, by Mr. Thomas Branker, with alterations and additions, by Dr. John Pell, who used a peculiar method of registering the steps of an algebraic process by means of marks and abbreviations in the margin, explaining each line or step, as Harriot had before done in words at length. Henschel was also the author of a German work, relating to equations, published in 1684. Mr. Kinckhuyzen, in 1661, published a treatise of algebra in Dutch, which Sir Isaac Newton, when professor of mathematics at Cambridge, used and improved, and which he designed to republish, with his method of fluxions and infinite series, but was prevented by the accidental burning of some of his papers. In 1667 Jacob Fergusun published his "Labyrinthus Algebrae," in 4to, Dutch; and in 1679, De Graaf gave a course of mathematics, in the same language and size. In 1665, or 1666, Sir Isaac Newton made several of his most valuable discoveries, though they were not published till a later period; such as the binomial theorem, the method of fluxions and infinite series, the quadrature, rectification, &c. of curves, the investigation of the roots of all sorts of equations, both numerical and literal, in infinite converging series, the reversion of series, &c.
the Philosophical Transactions the construction of cubic and
biquadratic equations, by a parabola and circle, with
improvements of the methods of Des Cartes, Baker, &c.; and
also a memoir on the number of the roots of equations,
with their limits and signs. M. Rolle, in 1699, published
in 4to, "Traité d’Algebre;" in 1699, "Une methode
pour resoudre les questions indeterminées;" and in 1704,
"Memoires fur l'inverse des Tangentes," and some other
pieces. Joseph Raphson, in 1690, published his "Ana-
lysis Equationum Universalis," which is a general
method of approximating to the roots of equations in
numbers. His "History of Fluxions" was published in
English and Latin in 1715. D. Halley published his "Currius
About the year 1691, &c. De Lagny published many
pieces on the resolution of equations in numbers; and in
1693 appeared a little volume, entitled, "Synopsis Alge-
braicae, opus posthumum Johannis Alexandri." An
ingenious tract on the numerical extraction of all roots, without
any previous reduction, was communicated in the Philo-
osophical Transactions, by Dr. Halley in 1691. This tract is
annexed to some editions of Newton's Universal Arith-
etic. Craig published, in 1694, in 4to, his treatise, "De
fig. curvel. quadraturis et locis geometricis," in which he
proposed a new formule for the construction of equations;
and this method was improved by Herman in 1737, in
Mem. of Peterburgh. Mr. John Ward of Cheteter, pub-
lished in 1695, "A Compendium of Algebra;" and in
1706, the first edition of "The Young Mathematician's
Guide," which has been much used. In 1696 the "Ana-
lyse des Infiniment Petits," of the Marquis de l'Hôpital,
was published, and a pothumous treatise by the same
author, entitled, "Traité Analytique des Sections Coniques,
et le Construction des lieux Geometriques," was pub-
lished in 1707. Mr. Ab. Dernouyr, in 1697, and succeeding
years, furnished the Philosophical Transactions with various
papers, containing improvements in algebra: in 1697, a
method of raising an infinite multinomial to any power,
or extracting any root of the same; in 1698, the extracti-
on of the root of an infinite equation; in 1707, an analys-
tical solution of certain equations of the 3d, 5th, 7th, &c.
degrees; in 1722, of algebraic fractions, and recurring fi-
eries; in 1738, the reduction of radicals into more simple
forms; and in 1730 he published "Miscellanea Analytica de Seci-
bus et Quadraturas," containing great improvements in
series, &c. Mr. Richard Sault published, in 4to, "A New
Treatise of Algebra, applied to numeral questions, and
geometry; with a converging series for all manner of ad-
jected equations," which series is Raphson's method of
approximation, which had been lately published. In 1698
Hugo d'Omer published his "Analyse Geometrique, &c;" in
which, by combining the algebraic analysis of the moder-
ners with that of the ancients, he resolved in an elegant
and simple manner many curious problems. In 1699 Hyac.
Christoph published at Naples, in 4to, a tract, entitled, "De
Constructione Equationum." Ozanum's algebra, contain-
ing the Diophantine analysis, was published in 1702, his
mathematical dictionary in 1691, and his course of maths-
tics, in 5 vols. 8vo, in 1693. In 1705, Dr. Harris, the
author of the "Lexicon Technicum," published a small
piece on algebra and fluxions. M. Guiniec published, in
1705, his "Application de l'Algebre a la Geometrie," in
4to. In 1706, Mr. Jones published his "Synopsis Pal-
nariorum Matheficos," which is a useful compendium of
the mathematical sciences; and in 1711, he published in
4to, a collection of Sir Isaac Newton's papers, entitled,
"Analysis per quantitatum fieries, fluxiones, ac differen-
tias; cum enumeratione linearum tertii ordinis." The first
edition of Newton's "Arithmetica Universalis, five de
Compositione et Resolutione Arithmetica liber," was pub-
lished by Whiston in 1707, and many editions have been
published since. It is of course included in Horsey's
edition of Newton's works. This tract was the text
book of the author at Cambridge; and though not de-
digned for publication, it contains many very consider-
able improvements in analytics; particularly in the nature
and transmutation of equations; the limits of their roots; the
number of impossible roots; the invention of divisors, both
fard and rational; the resolution of problems, arithmetical
and geometrical; the linear construction of equations; the
approximation to the roots of all equations, &c.
Commentaries have been published on this work for the
affin-
ities of beginners, by S'Gravafande, Caffilhon, Wilder, &c.
The "Analytique Demonbtre" of Reynen, was published
in 4to, in 1708, and in 1714, "La Science du Calcul;" and
reprinted with additions in 1736, under the title of
"Ufage de l'Analyse," &c. In 1709 an English transla-
tion of Alexander's algebra was published, with an appen-
dix, by Humphry Dilton. In 1715, Dr. Brooke Taylor
published his valuable work, entitled, "Methodus Incre-
mentorum;" and in the Philosophical Transactions for 1718,
an improvement of the method of approximating to the
roots of equations in numbers. M. Nicole, in 1717, com-
municated, in the Memoirs of the Academy of Sciences, a
tract on the calculation of finite differences, and in fol-
lowing years various other tracts on the same subject, and
also on the resolution of equations of the third degree, and
on the irreducible case in cubic equations. Ronayne, in 1717,
published a treatise on algebra; and in the same year Mr.
James Stirling published a work of improvement on analy-
tics, entitled, "Lineae tertii Ordinis;" and in 1730, "Me-
thodus Differentialis; five tractatus de summatione et
integratione serierum infinitarum;" with great improvements
on infinite series. Maclaurin, in 1726 and 1729, gave, in
the Philosophical Transactions, tracts on the imaginary
roots of equations, and afterwards his "Algebra," was pub-
lished from his pothumous papers, with its application to
curves. S'Gravafande's algebra, with a commentary on
Newton's "Arithm. appeared in 1727; and in 1728
Mr. Campbell communicated, in the Philosophical Tran-
s, an ingenious paper on the number of impossible roots of
equations, and the papers of Maclaurin and Campbell were
annexed to Gravafande's edition of the "Arithm. Univ." at
Leyden in 1732. Lecchi, a Jesuit, published the "Arithm.
Un." with an imperfect commentary, in 3 vols. 8vo, in
1752. Wolffius's algebra was published in 1732, in his
"Elementa Mathematicae Universae," in 5 vols. 4to. Mr.
John Kirkby's arithmetic and algebra were published in
1735, and in 1748 his doctrine of ultimats. Several
improvements in series, and other parts of algebra, are con-
tained in Mr. Thomas Simpson's "Essays," published in
1746, in his "Differentials;" and in his tracts, 1757,
and also in his "Algebra," first printed in 1745, and in his
"Select Exercises," in 1732. In 1740, Saunderson's
"Elements of Algebra," were published in 2 vols. 4to.
M. de la Caille, published in 1741, "Lecons de Mathema-
tiques; ou Elemla d'Algebra et Geometrie" and in the
same year M. de Gua, in the Memoirs of the Academy of
Sciences, communicated two articles on the number of po-
itive, negative, and imaginary roots of equations, with an
historical account of the improvements in algebra, in which
he severely censures Wallis for his partiality, whilst he
himself is, at least, equally faulty. M. Clairaut published
his "Elements d'Algebra," in 1746, in which he has many
improvements.
improvements, particularly with reference to the irreducible
roots in cubic equations. A fifth edition of this valuable trea-
tise, with notes and additions, was published at Paris in 1797,
in 2 vols. 8vo. He has also several papers on analytics, in
the Memoirs of the Academy of Sciences. In 1747, M.
Fontaine gave, in the same memoirs, a paper on the resolu-
tion of equations, and other papers in subsequent memoirs.
In 1748, Mademoiselle M. G. Agnelli, published at Milan
in Italian, "Analytical Institutions, in 2 vols. 4to. M.
Catton, in 1761, published in 2 vols. 4to, Newton’s Uni-
versal Arithmetic, with an ample commentary. In 1763,
Mr. Emerson published his "Increments," and in 1764 his
"Algebra." Mr. Landen published his "Reial Analysis," in 1764,
his "Mathematical Lucubrations," in 1765, and his "Mathematical Memoirs," in 1780. M.
Euler published his "Elements of Algebra," in the Ger-
man language in 1770, and in 1774, a French translation
was published, by J. Bernoulli, with the analysis of indeter-
dinate problems, by M. de la Grange. An English transla-
tion was published in 1797, in 2 vols. The memoirs of
Berlin and Petersburg abound, with various improvements
on series and other branches of analysis by this celebrated
mathematician.

Dr. Waring, late of Cambridge, has com-
 municated several valuable papers to the Philosophical Tran-
actions, and many of his improvements, are contained in his
separate publications, particularly the "Meditations Al-
gebraicae," published in 1770; the "Proprietates Alge-
braicarum Curvarum," in 1772; and the "Meditations Analyticae," in 1776. The first of these publications de-
 fines particular notice. The first chapter treats of the
transformation of algebraical equations into others, of which
the roots have given algebraical relation to the roots of the
given equations. The limits and number of impossible and
affirmative and negative roots of algebraical equations are the
subjects of the second chapter. The third chapter com-
prehends the investigation of the roots of equations or irrational
quantities, which have given relations to one another, the
resolution of equations, &c. &c. The fourth chapter is
principally conversant concerning more algebraical equations
and their reduction to one; and the fifth chapter treats of
rational and integral values of the unknown quantities of given
equations. Francis Maieres, Esq. claims honourable mention,
not only as an original writer, who has contributed to the ex-
planation and improvement of some of the most abstruse and
yet most interesting branches of algebra and analysis, but on
account of the labour and expense which he has bestowed
on the publication of the "Scriptores Logarithemici," in
three vols. 4to, 1791, 1796, containing many curious and
useful tracts, which are thus preserved from being lost, and
many valuable papers of his own on the binomial theorem,
series, &c. After this detail, for which we are in a con-
siderable degree indebted to the refection of Montuc and
Dr. Hutton, many authors who have, in separate treatises
or in occasional essays, contributed to the improvement of
algebra in general, or some particular branches of it, or who
have published treatises on the science, still remain unno-
 ticed; and we must content ourselves with merely mentioning
Franciscus Caligarius, Rudolphus, Adam Gigas or Rifie.,
Budde, R. Wentworth, Ant. Maria Floridus, Lazarus
Schonauer, Bernard Salignac, Leonard, Digges, and Ro-
bert Norman, in the 16th century, Christophorus Clavis, in
1668, Georgius Henefuchius, in 1609, Sebastian Kurz,
Coignet, Lalonde, Degrave, Mecher, the Bernoullis,
Malbranche, Wells, Dodson, Manfried, Regnault, Roin-
ing, Hammond, Lorgna, Hellins, de Grange, de la
Place, Bertrand, Kuhnus, Hales, Maclaylyn, Vince, Wood,
Manning, Froud, Bonnycastle, &c. &c. &c.

Algebra is a peculiar kind of Arithmetic, which takes
the quantity sought, whether it be a number, or a line, or
any other quantity as if it were granted; and by means of
one or more quantities given, proceeds by a train of de-
duction, till the quantity at first only supposed to be known,
or at least some power of it, is found to be equal to some
quantity or quantities which are known, and consequently
itself is known.

Algebra is of two kinds, numeral and literal.

Algebra, numeral, or vulgar, is that which is chiefly con-
cerned in the resolution of arithmetical questions. In this,
the quantity sought is represented by some letter or character;
but all the given quantities are expressed by numbers. Such
is the algebra of the more ancient authors, as Diophantus,
Pacioli, Stifelius, &c. This is thought by some to have
been an introduction to the art of keeping merchants’ ac-
counts by double entry.

Algebra specific, or literal, or the new algebra, is that in
which all the quantities, known and unknown, are expressed
or represented by their species, or letters of the alphabet.

There are inferences of this method from Cardan and others
at his time; but it was more generally introduced and
used by Vieta. Dr. Wallis (Algebra, p. 66.) apprehends,
that the name of specific arithmetic applied to algebra is given
to it with a reference to the sense in which the Civilians use
the word species. Thus, they use the names Titius, Ser-
promius, Caius, and the like, to represent indefinitely any
person in such circumstances; and cafes so proposed, they
call species. Vieta, accustomed to the language of the
civil law, gave, as Wallis supposes, the name of species to
the letters A, B, C, &c. which he used to represent inde-
finitely any number or quantity, so circumstanced as the
occasion required.

This mode of expression frees the memory and imagina-
tion from that labours or effort, which is required to keep
several matters, necessary for the discovery of the truth in-
volved, present to the mind; for which reason this art
may be properly denominated metaphysical geometry. Spe-
cious algebra is not like the numeral, confined to certain
kinds of problems; but serves universally for the investiga-
tion or invention of theorems, as well as the solution and dem-
oration of all kinds of problems, both arithmetical and
geometrical. The letters used in algebra do each of them
separately represent either lines or numbers, as the problem
is either arithmetical or geometrical; and together, they
represent planes, solids, and powers more or less high, as
the letters are in a greater or less number. For instance, if
there be two letters, a, b, they represent a rectangle, whose
sides are expressed, one by the letter a, and the other
by b; so that by their mutual multiplication they produce
the plane a b. Where the same letter is repeated twice,
as a a, they denote a square. Three letters a b c, re-
represent a solid or a rectangular parallelepiped, whose
three dimensions are expressed by the three letters a b c;
the length by a, the breadth by b, and the depth by c; so that
by their mutual multiplication, they produce the solid
a b c.

As the multiplication of dimensions is expressed by the mul-
tiplication of letters, and as the number of these may be so
great as to become incommodious, the method is only to write
down the root, and on the right hand to write the index of the
tower, that is, the number of letters of which the quantity
is expressed, or the number of which letters are multiply
ed four times into itself; and so of the rest. But as it is nec-
cessary, before any progress can be made in the science of algebra, to understand the
method of notation, we shall here give a general view of it.

In
In algebra, as we have already stated, every quantity, whether it be known or given, or unknown or required, is usually represented by some letter of the alphabet; and the given quantities are commonly denoted by the initial letters, \(a, b, c, d, \&c.\) and the unknown ones by the final letters, \(x, y, z, \&c.\) These quantities are connected together by certain signs or symbols, which serve to show their mutual relation, and at the same time to simplify the science and to reduce its operations into a less complex form. Accordingly the sign \(+\) or \(-\), signifies that the quantity, to which it is prefixed, is to be added to, and it is called a positive or affirmative quantity. Thus, \(a + b\) expresses the sum of the two quantities \(a\) and \(b\), so that if \(a = 5\), and \(b = 3\), \(a + b = 8\). If a quantity have no sign, \(+\) or \(-\), it is understood, and the quantity is affirmative or positive. The sign \(-\), minus or less, denotes that the quantity which it precedes is to be subtracted from, and it is called a negative quantity. Thus \(a - b\) expresses the difference of \(a\) and \(b\); so that if \(a\) being \(5\), and \(b = 3\), \(a - b = 2\). If more quantities than two were connected by these signs, the sum of those with the sign \(+\) must be subtracted from the sum of those with the sign \(-\). Thus, \(a + b + c - d\) represents the quantity which would remain, when \(c\) and \(d\) are taken from \(a + b\). So that if \(a = 7\), \(b = 6\), \(c = 5\), and \(d = 3\), \(a + b - c - d = 6\). If \(a = 7\), \(b = 6\), \(c = 5\), and \(d = 3\), \(a + b - c - d = 5\). If two quantities are connected by the sign \(\times\), as \(a \times b\), this mode of expression represents the difference of \(a\) and \(b\), when it is not known which of them is the greater.

The sign \(\times\) signifies that the quantities between which it stands are to be multiplied together, or it represents their product. Thus, \(a \times b\) expresses the product of \(a\) and \(b\); \(a \times b \times c\) denotes the product of \(a\), \(b\), and \(c\); \(a + b \times c\) denotes the product of the compound quantity \(a + b\) by the simple quantity \(c\); and \((a + b + c) \times (a - b + c) \times (a + b)\) represents the product of the three compound quantities, multiplied continuously one after another. Thus, if \(a = 5\), \(b = 4\), and \(c = 3\), then \(a + b + c \times a - b + c \times a + b = 12 \times 4 \times 8\). The line connecting the simple quantities and forming a compound one, placed over them, is called a vinculum. Quantities that are joined together without any intermediate sign form a product; thus \(a \times b\) is the same with \(a \times b\). When a quantity is multiplied into itself, or raised to any power, the usual mode of expression is to draw a line over the quantity and to place the number denoting the power at the end of it, which number is called the index or exponent.

Thus, \(a + b\)^2 denotes the same as \(a + b \times a + b\) or the second power, or square, of \(a + b\); and \(a + b\)^3 denotes the same as \(a + b \times a + b \times a + b\) or the third power, or cube, of \(a + b\). In expressing the powers of quantities represented by single letters, the line over the top is usually omitted; thus, \(a^2\) is the same as \(a \times a\), and \(b^3\) as \(b \times b \times b\). In the case of \(a + b\), the notation \((a + b)^n\) is used instead of \(a \times a \times \cdots \times a\), the sign of multiplication. Thus, \(a + b \times a + c\), and \(a + b \times a + c\), signify the same thing as \(a + b \times a + c\), or the product of \(a + b\) by \(a + c\).

The sign \(\div\) is the sign of division, as it denotes that the quantity preceding it is to be divided by the succeeding quantity. Thus, \(c \div b\) signifies that \(c\) is to be divided by \(b\); and \((a + b) \div a + c\), that \(a + b\) is to be divided by \(a + c\). The mark ) is sometimes used as a note of division; thus, \(a + c) \div b\) denotes that \(a + c\) is to be divided by \(b\). But the division of algebraic quantities is most commonly expressed by placing the divisor under the dividend with a line between them, like a vulgar fraction. Thus, \(\frac{a}{b}\) represents the quantity arising by dividing \(a\) by \(b\), or the quotient, and \(\frac{a + b}{a + c}\) represents the quotient of \(a + b\) divided by \(a + c\). Quantities thus expressed are called algebraic fractions. See Fraction.

The sign \(\sqrt{\ }\) expresses the square root of any quantity to which it is prefixed; thus \(\sqrt{25}\) signifies the square root of 25, because \(5 \times 5 = 25\); and \(\sqrt{a}\) denotes the square root of \(a\); and \(\sqrt{\frac{a + b}{b}}\) denotes the square root of \(\frac{a + b}{b}\), or of the quantity arising from the division of \(a + b\) by \(b\); but \(\sqrt{a + b + c}\), which has the separating line drawn under \(\sqrt{\ }\), signifies that the square root of \(a + b + c\) is to be first taken, and afterwards divided by \(d\); so that if \(a = 2, b = 3, c = 4,\) and \(d = 9\), then \(\sqrt{a + b + c}\) would be \(\sqrt{\frac{2 + 3 + 4}{9}}\) or \(\frac{9}{3}\), but \(\sqrt{\frac{a + b}{b}}\) would be \(\sqrt{\frac{2 + 3}{3}} = \frac{9}{3}\) or \(\sqrt{\frac{9}{3}}\), which is 3.

The sign \(\sqrt[3]{\ }\) with a figure over it is used to express the cubic or biquadratic root, &c., of any quantity; thus \(\sqrt[3]{a}\) denotes the cube root of \(a\); thus \(\sqrt[4]{a}\) denotes the cube root of \(4\); because \(4 \times 4 \times 4 = 4\); and \(\sqrt[4]{a + b + c}\) denotes the cube root of \(a + b + c\). In like manner \(\sqrt[4]{16}\) denotes the biquadratic root of 16, or \(\sqrt[4]{16}\); because \(2 \times 2 \times 2 \times 2 = 16\), or \(\sqrt[4]{a + b + c}\) denotes the biquadratic root of \(a + b + c\) and so of others. Quantities thus expressed are called radical quantities, or Surds; of which those, consisting of one term only, as \(\sqrt{a}\) and \(\sqrt[3]{a} \), are called simple Surds; and those consisting of several terms, or numbers, as \(\sqrt{a^2 - b}\) and \(\sqrt{a^2 - b + c}\), are denominated compound Surds. Another commodious method of expressing radical quantities is that which denotes the root by a vulgar fraction, placed at the end of a line drawn over the quantity given. In this notation, the square root is expressed by \(\frac{1}{2}\), the cube root by \(\frac{1}{3}\), the biquadratic root by \(\frac{1}{4}\), &c. Thus \(\sqrt{a}\) expresses the same quantity with \(\sqrt{a}\); i.e., the square root of \(a\), and \(\sqrt[n]{a}\) the same as \(\sqrt[n]{a + b}\); i.e., the cube root of \(a + b\); and \(\sqrt[3]{a}\) is the cube root of the square of \(a\) or the square of the cube root of \(a\); and \(a + z\) the seventh power of the biquadratic root of \(a + e\); and so of others; \(a + 1\) is \(a\), and \(a\) is \(a\). When the root of a quantity represented by a simple letter is to be expressed, the line over it may be omitted; so that \(\sqrt[n]{a}\) signifies the same as \(a^n\), and \(b\) the same as \(b^n\). Quantities that have no radical sign (\(\sqrt{\ }\)) or index annexed to them, are called rational quantities.

The sign \(=\), called the sign of equality, signifies that the
the quantities between which it occurs are equal. Thus
\[ 2 + 3 = 5, \]
shows that 2 more 3 is equal to 5; and
\[ x = a - b \]
does that \( x \) is equal to the difference of \( a \) and \( b \).

The mark \( \pm \) signifies that the quantities between which
it stands are proportional. As \( a : b :: c : d \) denotes that \( a \)
is in the same proportion to \( b \), as \( c \) is to \( d \); or that if \( a \) be
two, three, or four times, &c., as great as \( b \), \( c \) will be twice,
three, or four times, &c., as great as \( d \).

When any quantity is to be taken more than once, the number
which shows how many times it is to be taken must be pre-
fixed; thus \( 2a \) denotes that the quantity is to be taken 2
times, and \( 3bc \) or \( 3 \cdot b \cdot c \) denotes that \( 3 \cdot b \cdot c \) is to be taken 3
times, &c. The numbers thus prefixed are called co-efficients; and if a
quantity have no co-efficient, it is understood, and it is to
be taken only once.

Similar or like quantities are those that are expressed by
the same letters under the same powers, or which differ only in
their co-efficients; thus, \( 3b, 5b^2, \) and \( 8b^3 \), are like
quantities, and so are the radicals \( \frac{2\sqrt{b} + c}{a} \) and \( \frac{7\sqrt{b} + c}{a} \).

But unlike quantities are those which are expressed by
different letters, or by the same letters with different powers,
as \( 2ab, 5ab^2, \) and \( 3a^2b \).

When a quantity is expressed by a single letter, or by se-
veral single letters multiplied together, without any inter-
vening sign, as \( a, a^2, \) and \( ab \), it is called a simple
quantity. But the quantity which consists of two or more such simple
quantities, connected by the signs + or −, is called a com-
-pound quantity; thus, \( a - 2ab + 5abc \) is a compound
quantity; and the simple quantities \( a, 2ab, 5abc \), are
called its terms or members. If a compound quantity consists
of two terms, it is called a binomial; of 3 terms a trinomial,
or 4 terms, a quadirominal, &c. of many terms, a multino-
minal. If one of the terms of a binomial be negative, the
quantity is called a reducible quantity. The reciproca of any
quantity is that quantity inverted, or unity divided by it;
thus \( \frac{a}{b} \) is the reciprocal of \( \frac{b}{a} \), and \( \frac{1}{a} \) is the reciprocal of
\( a, \)

The letters by which any simple quantity is expressed
may be ranged at pleasure, and yet retain the same signifi-
cation; thus \( a \) and \( b \) are the same quantity, the product
of \( a \) and \( b \) being the same with that of \( b \) by \( a \). The several
terms of which any compound quantity consists may be dis-
persed in any order at pleasure, provided they retain their
proper signs. Thus, \( a - 2ab + 5abc \) may be written
\( a + 5abc - 2ab \) or \( -2ab + a + 5abc \), for all these
represent the same thing or the quantity which remains, when
from the sum of \( a \) and \( 3a^2b \) the quantity \( 2ab \) is deducted.

For the method of performing the several operations in
algebra, see Addition, Subtraction, Multiplica-
tion, Division, Fraction, Involution, Evolution,
Equation, Series and Surd. See also Application
of Algebra to Geometry, Binomial Theorem, Construc-
tion of Equations, and Reduction of Equations.

Algebra has been also applied to the consideration and
calculation of infinites; and from this application of it a new
and extensive branch of science has arisen, called the
discipline of Fluxions, or Analysis of Infinites, or the
Calculus Differentials. For an account of the rise and
proceeds of Algebra, as well as other branches of mathemat-
ics, see the last and most improved edition of Montucla's

ALGEBRAICAL, something that relates to algebra.

Thus we say, algebraical characters, or symbols, curves,
solutions, &c. An algebraical curve, is a curve, wherein
the relation of the abscissae to the ordinates may be de-

fixed by an algebraical equation. These are also called geo-
métrical lines, or curves, in contradistinction to mechanical
or transcendental ones. See Curve.

ALGEBRAIST, a person skilled in algebra.

ALGEBUS, in Surgery, from a hump, a suppresse gonorrhoea,
attended with pain in the genital and urinary organs. This
name field occurs, except in obsolete, See Gonorrhoea.

ALGEBUS, in Geography, is the name of a con-
siderable chain of mountains in Independent Tartary, which
extends from the river Yark and Ural, towards the Atalan
range.

ALGEMISI, or ALGIMEN, a small town of
Valencia, in Spain, not far from the river Xucar, near
which grows quantities of Pita, as it is called, or Am-
erican oboes,alyze, of which the people make cordage,
and the Catalans spin it of a sufficient fineness for making
lace; it is six leagues south of Valencia, and five north-
west of Gandia.

ALGENEB, or ALGENIS, in Alphabet, a fixed
part of the second magnitude, on the right side of PERSEUS.

ALGEO, or CARBON, in Geography, a river of European
Turkey, which runs into the sea, eight miles west-south-west
of Olimpia, a town in the Morea.

ALGERANCA, fland, one of the Cantaries, in the
North Atlantic Ocean. N. lat. 29° 23', W. long. 15° 58'.

ALGERI, or ALGHER, a small peopled city of Sar-
dinna, situated on a bay on the Western coast. It is a
bishop's see, and has a coral-cliffery. It is 79 miles north-
west of Cagliari. The bay of Algiers is spacious and affords
good anchorage; it is formed by the point of Cape
de Bana on the north, and by a point of land on the
south. N. lat. 40° 37', E. long. 6° 30'.

ALGECIRA, or ALGERRA, a sea-port town of Spain,
in the province of Andalutia, on the Straits of Gibraltar,
and 5 miles west from it. The Moors entered Spain by this town
in 715, and were dispossessed of it in 1344. It is said to have
been the first town in which cannon were used. The word
Algiers in Arabic signifies an island, and as the harbour
is formed by two islands, it has been called in the plural number
Algeiras. It was also called Old Gibraltar. The
harbour is now decayed, and the town lies in ruins.
N. lat. 36° 5', W. long. 5° 20'.

ALGEZIRA, or ALZORA, is also a town of Spain,
in the province of Valencia, situated on a small island on the river
Xucar, 20 miles south of Valencia. Though the town is
small, its timber trade has been extensive.

ALGECUR, a small town of Portugal, in the province
of Algarve, at the mouth of a small river near the Atlantic
Ocean, 17 miles north-west of Lagos. It contains about
800 inhabitants.

ALGHEMI, a country of Africa, on the Slave coast.

ALGHESI, THOMAS, in Biography. The father of
this writer, who was a furgon de eminence, at Florence,
took care to imbue his mind early with the principles of his
art. His instructor in anatomy was the celebrated Laurentius
Bellinus. At a proper age he was made furgon to the
hospital at Florence, where applying himself particularly
to the operation of lithotomy, which he performed with
singular facility and success, he acquired considerable reputation.
In 1703, he was made doctor in medicine at Padua. In
1707, he published a treatise on lithotomy, in 4to., written
in Italian, which contains, Haller says, Bib. Chim. vol. i.
p. 582, several original observations, the fruits of his own
experience. Exfalt etiam, he adds, hujus Authoris, De Manna
Egyptia involuita perpulchrum epistolam ad Valis-
nerium. He died September 1713, being only 44 years
of age, in consequence of the amputation of his left hand,
which had been wounded by the bursting of a suffl.
ALGIABARII, a Mahometan sect of predestination,
who attribute all the actions of men, good or evil, to
the agency or influence of God.
The Algiabarit stand opposed to the Alkadarii.

ALGIBARROTA, or ALJABARROTA, in Geography,
a small town of Portugal, in Estremadura, containing two
parishes and 1600 inhabitants. King John I. obtained in
this place a victory over the CaBilians in 1385.

ALGIDUM, in Ancient Geography, a town of Latium
or Italy, between Princes to the north-east, and Alba to
the south-west, near the mountains. It belonged to
the Equi, according to Dionysius Hal. (lib. xi. tom. i. p. 673.
d. Oxon.,) and Livy, (lib. iii. c. 58. tom. i. p. 693. ed.
Burman,) and had a temple of Diana on the top of a high
mountain, called by the same name. This temple was in
Greek denominated Artemisia, and hence the mountain was
called by the same name. It has been supposed that Algidi-
urn or Algibus was derived from gelidus, cold or freezing,
on account of the quality of its air. Horace refers to this
mountain, (lib. i. od. 21.) "Quercusque aut gelido prominit
Algido," and (lib. iii. od. 23.) "-Que nivali pacificatur
Algido," &c.

ALGiers, in Geography, a kingdom of Africa,
comprehends part of the ancient Mauritania, particularly
that which was called Mauritania Cæsariensis, and the an-
cient Numidia, and forms one of the most considerable dis-
tricts of that part of Africa which lies on the northern
coast, and which in later ages has been denominated Barba-
ary. The country derives its name from its metropolis, called
by the Turks Algæzâr, Al Jezâr, or Al Jezâria, in Arabic,
figurizing the Algæ, because there was an island before the
city, to which it hath been since joined by a mole. The
extent of this kingdom has been variously assigned by dif-
ferent writers. Saifon, who marks its boundaries by the
rivers Mullooa or Malva, and the Zaine, gives it a length
from east to west of 900 miles, De La Croix, 720. Latits,
reckoning 45 miles for one degree of longitude, 630; but if
with Dr. Shaw, we make the boundary of Algiers to the
west the Trara mountains, which separate it from the do-
minions of the emperor of Morocco, or Twun, which lies
40 miles to the eastward of the Mullooa, and that to the
city the river Zaine, formerly called Taûta, it will be found
to extend 450 miles, or from 6° 10'. W. long. to 9° 16'. E.
longitude. The breadth of Algiers is very unequal in dif-
dierent parts; for near Tlemcan it is not more than 40 miles,
from the Sahara to the sea-coast; near the sources of the
rivers Sigg and Shelif, it is about 65 miles, and this, in the
western part, may be taken at a medium for the extent of
what the Arabs call Tell, or land proper for tillage. But to the
call of Algiers, its breadth is much more considerable; par-
ticularly in the meridians of Boujiah or Buggia, and Bora,
where it extends above 100 miles, especially under that of
Algiers or Algéri, in lat. 36° 55' to Liulaljâ, situate among
the mountains of Atlas, in lat. 44° 50'. The Algerine do-
minions beyond the Tell, or more advanced parts of Atlas,
are very precarios and not easily defined, so that the nor-
thern skirts of the Sahara, or Desert, seem to be the proper
boundaries on that side. Accordingly, Algiers may be con-
sidered, in general, as bounded on the north by the Medi-
terranean, on the east by the river Zaine, which divides it
from Tunisia, on the west by the Mullooa, or by Twun,
and the mountains of Trara, which separate it from Mo-
rocco, and on the south by the Sahara, or Numidian desert.
If we take the medium difference of latitude to be 2° 30',
and the difference of longitude to be 6° 30', the superficial
extent of the whole kingdom would amount to about 4218,
or according to a more accurate astronomical calculation
of M. Von Zech, 4262 geographical square miles.

This kingdom has been divided by geographers into
many provinces, according to the several royalties into which
it was cantoned, at different periods, before and after the
time of the Turkish conquests. At present it contains,
according to Shaw, three principal divisions, viz. the province
of Tlemcan to the west, called by others Tremeen, and
Mascara; that of Teti or Titterie to the south; and
that of Constantina to the east; to which some have added,
as a distinct province, the territory of the city of
Algiers. The western province comprehends the towns of
Oran, Mustygannie, Tlemcan or Tremeen, Mascara, Shersheul, Ternis, besides several other more
inconsiderable places. In this province, coaling from the
Trara mountains, we meet with Twun, Cape Hone,
Tuckumbret, at the mouth of the river Tafa, the island
of Acra or Harligooma, &c. The principal rivers are the
Mala, Salt-river, Tafa, Sigg, Hibrâh, Maffran, and She-
lif. The mountains are Atlas and Trara. See Mascara. The
southern province has no towns along the coast; but in the
interior of the country the two chief towns are Belida and
Medca; the mountains are branches of the Atlas, the Boe-
jereh, the Anwall mountains on the river Yiffer, and that
of Jurjura and Felizia; and the rivers are the Haratet,
Ha-mmâ, Regya, Budowoe, Carec, Merdaa, and the Yiffer,
of which the last is the most considerable. See Tetteri.
The eastern province, called the Levantine government,
is the largest and richest. See Constantina.

The territory of Algiers is principally distinguished by
its capital, the metropolis of the kingdom. Within about half
a mile to the north-east of the city commences the plain of
Mettijiah, called by Abulfidh Bleded Kibech, i.e. a 700
country, which stretches 50 English miles in length and 20
in breadth, as far as the branch of the Atlas, at the foot
of which lies the town of Belida. This plain is better cul-
tivated than the other districts of the kingdom. It is wa-
tered by several springs and rivulets; particularly by the
Maffran, which, at its entrance into the sea, is a very con-
derable river, and little inferior to the Shelif, the Shiffa,
and the Haratet. The country fears and Maharcas, as
they call the farms of the principal inhabitants of Algiers,
are found in these plains; and it is chiefly from them that
the metropolis is supplied with provisions. Flax, alhena,
roots, potash, rice, fruit, and grain of all kinds, are pro-
duced here to such perfection, that the Mettiçiah may be
justly reckoned the garden of the whole kingdom. For the
nature of the soil, productions, inhabitants, population,
government, commerce, &c. of the kingdom in general, we
refer to the sequel of this article.

After the expulsion of the Greeks from Africa by the
Saracens, towards the close of the seventh century, (see
Africa,) the country was divided into a number of small
kingdoms and states, under chiefs of their own nation and
choice. This government continued till the year 1051, when
they were expelled by Abubeker ben Omar, or as the Spa-
nards call him, Abul Texchen, an Arab of the Zihflan
tribe, with the assistance of some powerful Marabouts; the
conqueror assumed the title of Amen al Minim, or chief of
the faithful, and his subjects were denominated Morabîtes,
and corruptly Almoravides. Texchen, having succeeded
in driving the Arab tyrants out of Numidia and Libya, and all
the western ports, reduced under his dominion the whole
province of Tingitania. He was succeeded by his son Josep,
who laid the foundation of the city of Morocco, which he
intended for the capital of his empire; but whilst he was
building
building this city, he deported an emissary to the Zeneti who inhabited Trencenec, under a pretense of reclaiming them to the true faith; but the Zeneti assembled in hostile array at Amal or Amfas, their capital, and invaded the dominions of Joseph with an army of 50,000 men. The Zeneti, assisted by the inhabitants of Fez, whose faction they expected, were overpowered by Joseph, so that about a million of persons are reckoned to have lost their lives in this contest, and their country was depopulated; but afterwards repopulated by a colony from Fez, who settled there under the protection of their reigning kings. Joseph directed his next attack against the inhabitants of Fez, whom he subdued and made tributary, and extended his conquests along the Mediterranean. He also pursued some Arabian chieftains, who had not submitted to him, into their retreats, in the deserts of Libya, and totally subdued them. The empire of the Moabites, which was thus established, and which promised permanence, was nevertheless of no long duration. This race was again expelled in the 12th century by Mohavedin, or Al Mohed, a Marabout, who dethronedbrahim Ali, the last emperor of the Zinghalian dynasty. This usurper and his successor, denominated Mohavedins, and they were afterwards called Moharades, Mohades; and Almoherides. However, they were extirpated by Abdurah, governor of Fez; and he was again stripped of his new conquests by the sheriffs of Haacen, the descendants of the Arabian princes of the 10th century. With a view of securing his new dominions, he divided Barbary into several small kingdoms or provinces, assigning to each a separate chief. On this occasion Algiers was divided between four of their native princes; one of whom had Trencene, and the other three had Tenez, Algers proper, and Bujeyas, and thus these four cities became the capitals of four distinct kingdoms. For some centuries these monarchs continued in mutual peace and amity; but disputes arose among them; and Abul-fariz, prince of Tenez, declared war against the king of Trencene. In a little while he became master of both Trencene and Bujeya. At his death he divided his kingdom between his three sons; one of whom had Tenez, another Jigari, and the third, whose name was Abdalain, had Bujeya. This last attacked the king of Trencenec, and having succeeded against him, the Algerines, who had been his tributaries, transferred their subjection and tribute to the conqueror, by which means he became so powerful, that if the Spaniards had not interfered, he would have made himself master of the whole of Barbary. Their interposition, however, checked his progress, and produced a signal change in the aspect of his affairs. In 1505 cardinal Ximenes, prime minister of Ferdinand V., king of Aragon, sent thither the count of Navarre with a powerful army and fleet, principally with a view of restraining the depredations of the Moors, who had been banished from Spain about 12 years before; and such was his success that he soon became master of Oran, Bujeyas, and other considerable places. The Algerines were alarmed; and fought the succour of Sehim Eutemia, a warlike Arabian prince, who fortified the fertile territory of Mettijiah. He marched to their assistance; but his co-operation was ineffectual; and the Spaniards, having landed a considerable number of forces near Algiers, reduced this capital to subjection, and compelled it to become tributary to Spain. They also erected a strong fort on the small island opposite to the city, and thus prevented the Algerine Corsairs from falling into or out of that harbour. On the death of Ferdinand in 1516, the Algerines made an effort for recovering their liberty; and they invited Barbarossa, who was then on a cruise with a squadron of galleys, to assist them in throwing off the Spanish yoke, promising him a gratuity corresponding to a service so important. The bold and adventurous Cor-
A young Arabian prince, the son of Eutemis, was at this time under the protection of the Marquis de Gomez at Oran. Eager to revenge the wrongs which his family had suffered, he proposed to the Marquis a very practicable plan for putting the city of Algiers into the possession of the Spanish monarch, and this scheme was laid before Cardinal Ximenes. The Cardinal approved it, and sent a fleet, with 10,000 forces, to drive Barbarossa and the Turks out of Algiers, and to restore young Selim Eutemis. But the fleet was dispersed by a storm; many of the Spaniards were drowned; and those who escaped to shore, were either killed by the Turks or made slaves. The Algerines, in concurrence with the Aragonians and Moors, made their next application to Hamidel Abbidas, king of Tenez, and requested his aid against Barbarossa and his adherents. This prince condescended, on condition that the kingdom of Algiers should be settled upon him and his descendants. When he entered the Algerine dominions at the head of 10,000 Moors, he was joined by the Spaniards of the whole country. Barbarossa, however, with 1000 Turkish musqueteers and 500 Grandes Moors, defeated this numerous army; pursued Hamidel to the gates of his capital, took the place, and obliged the inhabitants to acknowledge him as their sovereign. Barbarossa, having taken possession of Tenez, received an embassy from the inhabitants of Tremecen; who, dissatisfied with the reigning prince, because he had dethroned his nephew, requested his assistance to depose the usurper, and offered him the sovereignty. The invitation was readily accepted. Barbarossa obliged the king of Tremecen, after a severe engagement, to retire to his capital, where he was instantly beheaded by his subjects, and the conqueror received a fresh invitation to take possession of the kingdom. When Barbarossa, thus invested with new power, began to tyrannize over his subjects, the Tremecenians exasperated; and repenting of their having invited such a tyrant to their assistance, they deliberated on the best means for expelling him, and restoring their lawful prince. Their design, however, was discovered, and many of the conspirators were cruelly massacred. The prince had fortunately made his escape to Oran, and put himself under the protection of the Marquis of Gomez, who sent immediate advice of his situation to Charles V., lately arrived in Spain with a powerful fleet and army. This politic monarch foreseeing the advantage that was likely to redound to him from placing the prince of Tremecen on the throne, ordered for him a succour of 10,000 men, under the command of Gomez or Comares, the governor of Oran. This army, in its march, was joined by prince Selim, and a great number of Arabs and Moors from the adjacent countries. Their first enterprise was the attack of Calau, an important fortress situated between Tremecen and Algiers. This place, after vigorous defence, was compelled to surrender, and after a severe plunder, delivered into the hands of the king of Tremecen. Barbarossa, fearing a revolt on the part of his own subjects, and disappointed in his expectations of assistance from the king of Fez, kept close in his capital. But upon the approach of the enemy he marched out of Tremecen, and determined to force his way through the hostile army which was preparing to lay siege to the city, to the field. He was advised, however, by his council to return and to fortify himself in the city; but the inhabitants refused him entrance, and he was therefore under a necessity of retiring into the citadel, and of there waiting for an opportunity to escape. Here he defended himself valiantly, and made several successful sallies during a long siege; but apprehensive of famine from the failure of his provisions, he took the advantage of a subterranean passage, through which he privately conveyed himself and his treasure. His flight was discovered and he was pursued; but ordering a considerable quantity of his money, jewels, and plate to be scattered in the way, he hoped by this stratagem to divert the attention of his pursuers. The artifice failed; for the Spaniards general obliged the army to march on, till at length they overtook the fugitive on the banks of the river Haekka, about eight leagues from Tremecen. A bloody engagement ensued; but the Turks were overpowered by numbers; they were all massacred by the Spaniards, and Barbarossa, among the rest, in the 44th year of his age. This defeat occasioned great consternation at Algiers. The Turks to whom the defence of the city was committed were much alarmed; and they soon agreed, as the best measure for preventing a revolt, to cauce Hayradin, the brother of Barbarossa, to be proclaimed king of Algiers, and high admiral of the sea. In order to secure himself from an interruption, which his tyrannical and oppressive conduct had given him reason to apprehend, he dispatched an ambassador with magnanimous presents to Selim I., then emperor of Constantinople, to notify the death of his brother, and to make him an offer of submitting the kingdom to his protection, and to pay him an annual tribute in return for his assistance. The Sultan was pleased with this proposal; received Hayradin, called also Barbarossa, under his protection, and appointed him his bashaw or viceroy over the kingdom of Algiers. Thus powerfully protected and aided with troops, he prepared for executing two grand projects which he had for some time in contemplation. The first was the destruction of the Spanish fort, which was a great nuisance to his metropolis; and the other was to render Algiers a commodious harbour by building a mole from thence to the island, in order to shelter them from the weather and the north sea, as well as from the guns of the Spanish fort, to avoid which the ships were obliged to lie about a mile west of the town, where the anchorage was unsafe. Having succeeded in taking the Spanish fort, he employed no less than 10,000 Christian slaves in the accomplishment of his second project, so that his strong mole for the accommodation and security of his ships was completed in less than three years. The execution of these two important projects added so much strength and wealth not only to the city but to the kingdom, that Hayradin became an object of terror, not only to the Moors and Aragonians, but to the maritime Christian powers, more particularly to the Spaniards. The Sultan, either grateful for the services performed by Hayradin, or jealous of his power, advanced him to the dignity of captain bashaw of the empire, and appointed Hafian, or Haleen Aga, a Sardeian renegade, to succeed him as bashaw of Algiers. The depredations of Hafian on the coasts of Italy and of Spain roused the resentment of pope Paul III. and of the emperor Charles V. The pope published a bull, with a plenary abjuration of all sins, and the promise of the crown of martyrdom, to all who should fall in battle against the infidels of Barbary; and the emperor equipped a powerful fleet, which he determined to command in person, in order to subdue them. Accordingly Charles, with a fleet of 120 ships and 20 galiotes, and 30,000 chosen troops, accompanied by a great number of noblemen and gentlemen, who served at their own expense as volunteers, from motives of religion and glory, set sail towards the end of Summer in 1541, and after a tedious and perilous voyage from Majorca to Africa, appeared on the coast of Algiers. The fleet anchored at cape
cape Metafuz: about two small leagues to the east of Algiers, and the army landed without opposition. Haffan's force, which garnished the city, amounted only to about 800 Turks and five or 6000 Moors, without fire arms, poorly disciplined and accoutred. As Charles's army drew near the city, the inhabitants were much alarmed; but when Haffan was summoned to surrender, he returned, at some say, an ambiguous, and according to others, a fierce and haughty answer. On the second day, however, after the emperor's landing, the clouds began to gather, and the heavens presented a very threatening aspect. In the evening the rain fell, and the storm raged with violence through the whole night, so that the soldiers who had neither tents nor shelter, were much incommoded. The ground also became so wet, and the camp was so much overflowed with water, that they could neither lie down, nor stand withoutlinking to the ankles in the mud. Their matches also were extinguished, and their powder so moistened, that their muskets were useless. Haffan perceived their distress and availing himself of it, fell out with his soldiers to attack them. In this situation the whole army, with the emperor himself in person, was obliged to advance to support the dispirited and retreating troops, who were first engaged, before the enemy could be repulsed; and they at length, after spreading general confusion, and killing a great number of men, retired in good order. The hurricane, however, which still continued, produced a more dreadful disaster. The emperor's ships, on which depended the safety and subsistence of his whole army, were driven from their anchors; some of them dashed against each other, some were cast to pieces upon the rocks, many were forced ashore, and not a few were sunk in the waves. In less than an hour, 15 ships of war and 140 transports with 8000 men perished; and such of the unhappy crews as escaped the fury of the sea, were murdered without mercy by the Arabs, as soon as they reached the land. The emperor found in silent anguish and aloneness, beholding this fatal event, which at once blasted all his hopes of success, and buried in the deep the vast hopes which he had provided, both for annoying the enemy and for subduing his own troops. At last the storm abated, and afforded some hopes that the ships, which had escaped, might save the army from perishing by famine, and transport them back to Europe. The approach of evening, however, disappointed these expectations; the sea was covered with darkness; and it was impossible for the officers aboard the ships that had outlived the storm to send any intelligence to their companions who were ashore; thus they remained during the night in all the anguish of suspense and uncertainty. Next day, a boat dispatched by Doria, the admiral, against whose advice this expedition had been undertaken, reached land, with information, that having weathered out the storm, to which, during 50 years' knowledge of the sea, he had never seen any equal in fiercenes and horror, he had found it necessary to bear away with his shattered ships to cape Metafuz. He advised the emperor, as the face of the sky was still lowering and tempestuous, to march with all speed to that place, where the troops could reenrich with greater ease. Metafuz was three days' march from the emperor's camp; his provisions were consumed; and his followers, exhausted with fatigue, and dispirited with a succession of hardships, were in no condition to encounter new toils. But no alternative remained; they were ordered instantly to march; some of them could scarcely sustain the weight of their arms; others, spent with the toil of forcing their way through deep and almost impassable roads, sunk down and died; many perished by famine, as the whole army subsisted chiefly on roots and berries, or the flesh of horses, killed by the emperor's order and distributed among the several battalions; many were drowned in brooks, twain by the excessive rain, which, in paling them, they were obliged to wade up to the chin; and not a few were killed by the enemy, who, during the greatest part of their retreat, alarmed, harassed, and annoyed them night and day. At last they arrived at Metafuz and here they were supplied with plenty of provifion, and cheered with the prospect of safety. When the forces were embarked, a new storm arose, which by its fury scattered the fleet, and obliged them, separately, to make towards such ports in Spain or Italy as they could first reach. The emperor himself, after escaping great danger, and being forced into the port of Bugia, in Africa, where he was obliaged by contrary winds to remain several weeks, arrived at last in Spain in a very distressed condition.

Haffan, the baiehaw of Algiers, after this signal deliverance, undertook an expedition against Muley Hammed, king of Tremecen, who had submitted to Charles V., in order to be relorded to his kingdom; but this prince purchased peace for a large sum of money, and became his tributary. Soon after this expedition Haffan died in the 59th year of his age, and was succeeded by Haji, who was compelled to surrender his dignity, much respected, as he was by the Algerines to Haffan; the son of Tekelli, the brother of Barbofes, whom Sultan Solymann had been prevailed upon to appoint baiehaw of Algiers. Haffan was engaged in various enterprises against Tremecen, which was at length taken and plundered by him, and the head of Abdallah, the youngest son of the Sheriff, who had been killed in a previous engagement, was put into an iron cage, and placed on the principal gate of the city, called Bah Azonn, where it continued till the year 1573. During an interval of peace, Haffan erected some public edifices at Algiers, and performed other useful acts both at Algiers and in his acedepend of Tenez, which rendered his government popular, and his death an occasion of regret. His successor was Salha Rais, the fifth baiehaw of Algiers, and the first of Arabian extract, that ever governed the Algerines. Of this baiehaw, who was much respected, and who died in the 70th year of his age, it is said, that he was steady in all his resolutions and successful in all his enterprises. From Metafuz, where he died, his body was removed to Algiers and buried among the baiehaways, his predecessors, in a sepulchre near the sea-side, over which his unfortunate successor, Haffan Corfo, caufed a handsome dome to be erected. Corfo, who was advanced to the dignity of baiehaw by the interest of the Janizaries, was displaced in four months by Tekelli, a principal Turk of the grand Signior's court. He was at first opposed by the Algerines, but at last they were under a necessity of submitting to him. One of the first acts of his government was to condemn Corfo, who welcomed him on his arrival, and peaceably surrendered his dignity, to the chinnun, or hook; a dreadful punishment, on which he hung by the ribs three whole days, and expired in the most exquisite torture. Alifard, governor of Bugia, who was reckoned immensely rich, also fell a sacrifice to the inexorable Tekelli, who, after inflicting the cruel tortures of baffa-ding, burning and scarifying him, in order to obtain a discovery of his wealth, ordered him to be impaled alive. This act of cruelty and the ignominious punishment of Corfo, raised a general remembrance among the Janizaries. Yufef, governor of Tremecen, determined likewise to revenge his death; and at a time when the plague raged furiously at Algiers, and Tekelli had removed to an old demoliished town near the sea, about five miles westward, he secretly and speedily
sleefully marched to the place of his retirement, before Tekkelli had any apprehension of his design. Tekkelli fled, and was closely pursued by Yafeb, who at length overtook him and pierced him several times with his javelin, till he expired. This action was highly applauded by all the Janizaries; and upon Yafeb's entering into Algiers, he was received with universal acclamation, as their deliverer from the tyranny of Tekkelli, who fell a just sacrifice to his avance and cruelty, in the 50th year of his age and third month of his vice-royship. Yafeb was unanimously chosen baishaw of Algiers, and soon died, to the great grief of the Algerines, by whom he was buried in the same grave with the unfortunate Haffan Corfo.

The new viceroy appointed by the Porte was Haffan, the son of Hayradin, who had been displaced by Selim Kais, at the instigation of Raisan, and who had now the good fortune to be restored to his Algerine government. His first enterprise was directed against Tunis, in which he was defeated with great loss. The next year proved more glorious to the Algerines, who encountered the Spaniards in their expedition against Mollagan, under the command of the brave count d'Alcandela. "The cause of this defeat was the count's excess of valor, or rather his precipitance, in engaging the enemy before he received the supply of troops that were destined to this service; and the consequence was the loss of his own life, the total rout of his army, and the captivity of above 12,000 Spaniards, among whom was the son of the count, and many other noblemen and gentlemen.

Haffan, after this victory, returned to Algiers, laden with laurels and spoils. His next expedition was directed against Abdalaziz, prince of the Beni Abbas, who inhabited the mountains, and who had discontinued to pay the usual tribute to the Algerine state. Having for this purpose collected a large army, he commenced the war, which was soon terminated by the death of Abdalaziz, in consequence of a musket-ball, which penetrated his breast. About this time the Marfilian merchants began, with the permission of Haffan, to build a fort on the coast, at a small distance from Calle, where the French have since settled; but the fort was in a few years demolished by the Algerine forces, under pretense that the French had bought all the corn, and caused a famine in their kingdom.

Haffan, having married the king of Cuco's daughter, permitted the subjects of this prince to purchase ammunition at Algiers; and this traffic gave such offence, that the Janizaries made an insurrection, seized on the baishaw and some other officers, and sent them in iron to Constantineople, accusing Haffan to the Porte of having a design to make himself king of Algiers. Upon their arrival, they vindicated their conduct to the satisfaction of the Porte, and were set at liberty; but a new viceroy was sent to Algiers. The name of this baishaw was Ahamed, or Achmet: he was a favourite of the Sultan, and inaffably avaricious; and had bought his dignity with a view to the emoluments that were likely to accrue from it. He enjoyed it, however, only four months; and Haffan was restored. Such was the joy of the Algerines on his return, that even the women appeared on the terraces and balconies to welcome him. Having collected a very numerous and powerful army and fleet, he set out on his expedition against Marfa al Quibbir; intending, after the reduction of this place, to attempt that of Auran or Oran. This city was commanded by the count d'Alcandela, who succeeded his father; and the former by his brother Don Martin de Cordova, who had obtained his liberty, at an immense sum, and now made a most gallant defence against the Turks. Haffan, after having made several vigorous attacks both by sea and land, and suffering several repulses, very fatal to his troops, was obliged to retreat precipitately from the siege by the approach of the Genoese admiral Doria, who was advancing with a powerful succor from Genoa, Naples and Sicily. This Christian armada having raised its aim of intercepting the Algerine galleys, bore away for Pannon de Veiz, hoping to drive them out of that harbour, but it was shamefully repulsed by a few Turks that were then in garrison and compelled to fall away with not small loss and ignominy. The loss of this place in the course of the next year was much regretted by the Algerines and their baishaw, and also by Sultan Solymar. Haffan was displaced by Mahamed baishaw, the son of Selim Kais; and departed for Constantinople, where, three years after, viz. in 1570, he died in the 50th year of his age. Mahamed, upon his first arrival, performed several public-spirited acts, which attached to him the love of all the Algerines. Whilke he was consulting how to advance the Algerine power and wealth, a Spanish adventurer, named Gafcon, was meditating a design against him. This nothing less than to surplice the whole piratical navy in the bay, and to set all the ships on fire in the dead of the night. For this purpose he obtained the permission of king Philip II., and a supply of all necessary vessels and materials. Having advanced to the Mole-gate, and dispersed his men with their fire-works, the garrison, during the delay of the execution of his plot, was alarmed, and Gafcon was under a necessity of securing himself by flight; but being pursued and overtaken, he was brought back to Algiers; and the baishaw ordered a gibbet of considerable height to be erected on the spot where he landed, on which he was hoisted, and hung by the feet, that he might die in the most exquisite torture; and as an insult on his master, the king's commission was fastened to his toes. Soon after he was hanged, a strong representation was made in his favour, and in a little while the baishaw ordered him to be taken down. This lenity of the baishaw occasioned great murmurs among the people; and the unhappy Gafcon was ordered to be hanged by a pulley to the top of the execution wall and let down again upon the chimney or hook, which occasioned his instant death; and his body was hung up in terrorem. This unsuccessful project of Gafcon has procured for him a place among the Spanish martyrs. Mahamed, after enjoying his government for about 14 months, was removed in order to make way for the accession of the Cordial Halil Fartaz, or Scald-head, commonly known by the name of Ochali, who was appointed his successor by the Ottoman court. Ochali arrived at Algiers in 1586, when the war against the revolted Morefoes in Granada was at its height. Being solicited to affit them against the Spaniards, he contented that some few persons should go to this service as volunteers, but he declined taking any offensive and active part in it. In the first year of his government, he laid the foundation of the fortress called Bebel-wel-yed Castle. Next year he totally reduced the kingdom of Tunis, which was then under the protection of Spain, to the obedience of the Ottoman empire. Having continued a whole year at Tunis, he left the place, and assigned the office of his viceroy to a Sardinian renegade, named Ramadan Sardo, who became afterwards baishaw of Algiers. This person raised himself from the condition of a slave to this dignity, by his superior understanding and good conduct. He became master of the Arabic and Turkish language; read and wrote well; and having followed traffic for some time, he was adopted, on account of his good qualities, by Halil baishaw, who appointed him his deputy governor in the city of Fez; and in conference of the application
plection of the Algerines in his favour to the Sultan, he
was appointed bashaw of Algiers. In 1575, after governing
Algiers little more than three years, he was forced to resign
his office to Hafian Venedic bashaw, a Venetian renegade.
During the whole government of Ramadan, it was conducted
with so much justice and equity, that a single complaint was
not uttered against it. The conduct of his successor was
very different; his administration was so oppressive, that
complaints being preferred against him to the Porte, he was
recalled, after being in office three years and a quarter; and
a new bashaw, Jaffer Agra, an Hungarian renegade, ap-
pointed in his room, A.D. 1580. At the commencement
of his government, Algiers was reduced to the greatest mi-
nery by a famine, so that Seco Arabsians and Moors are said
to have died in the streets for want in six weeks, chiefly
through the avarice of Jaffer's predecessor, who quitted his
administration with immense wealth amidst the executions
of the people. Jaffer was of a generous disposition, and did
every thing in his power to relieve and mitigate the dif-
rts of the country; he also exercised strict justice against tho-
ese who abused the power with which they were entrusted.
A plot, however, was formed against him; but the execution
of it was prevented by some of the principal officers of the
Janizaries to whom it was proposed; who declared, that
they would prefer being cut in pieces to the ignominy of
priving treasons to the Sultan, and his worthy Jaffer Agra.
By the inconstancy of the Ottoman court Jaffer was dis-
placed, and the infamous Hafian restored to the dignity of
bashaw. He cluded his life at Constantinople by poison,
administered to him by the renegade Cigala, who succeeded
him in the poll of captain bashaw. The new bashaw of
Algiers was Memmi Armao, an Albanian. This officer
exhibited signal proofs of his great capacity and strict justice;
and gave much satisfaction, not only to the Algerines, but
to the Christian merchants who traded with them. During
his administration, A.D. 1585, Morat Rais ventured to fall
through the Straits of Gibraltar into the Atlantic, and
thence to the Canaries, and he was the first of the Barba-
ry Corsairs who engaged in an expedition of this kind. After
a government of two years, Memmi was succeeded in 1586
by the rapacious Arshad, who purchased the vice-royship
of Algiers for a large sum, and exercised his government by
violent extortions. His successor Hidir gained the office by
the same means, and conducted it in a manner so haughty
and tyrannical, that the Algerines were made very happy by
his recall in 1592; but such was his interest with the Porte,
that after a short interval he was nominated bashaw a second
time, to the great concern and mortification of the Algerines.
Muftapha succeeded in displacing this arbitrary and rapacious
tyrant, and secured the affectionate attachment of the people
by his courteous and generous treatment; though nothing remark-
able happened, during his administration, excepting that he
repaired the mole, fortifications, and other public buildings.
At the beginning of the 17th century the Algerines
complained to the Porte in very strong terms of remonstrance
of the oppressive conduct of the Turkish viceroys, and in
consequence of this remonstrance obtained leave to chuse
their own Deys. They engaged, that the usual tribute
should be faithfully transmitted to the Porte; to acknow-
ledge the grand Signior for their sovereign; to be ready
on all occasions to assist him with their forces and ship-
ping; to pay a due respect to his bashaws; and to
maintain them in a manner suitable to their dignity;
provided that the government of Algiers should be wholly
committed to the direction of the Dey and his douwan. The
great douwan proceeded to the election of a Dey from their
own body, and to enact a variety of laws and regulations
for the better maintenance of this new form of government.
This century, however, opened with a fresh attempt of the
Spaniards on the capital of this kingdom, under the conduct
of the famous John Andrew Doris, but the event of it, in
consequence of adverse winds, was unsuccessful. The Al-
gerines, in order to counteract these renewed attempts, de-
termined to direct their attention to the improvement of
their navy; and in 1616 they had so far succeeded, that it
confisted of 40 sail of ships, of between 200 and 400 tons,
divided into two squadrons; one of 18 sail lay before the
port of Malta, and the other, without the Straits, at the
cape of Santa Maria, between Lisfon and Seville, where they
attacked all Christian ships, without distinction, that came
in their way, and rendered themselves formidable to all the
maritime states of Christendom. The French were the first
who dared to resent this contemptuous breach of treaty;
and M. Beaulieu was sent with a fleet of 50 sail of men
of war and galleys against the Algerines; but upon his departure,
they returned to their accustomed depredations on the Spa-
nish coasts, which, being felt by the expelled Mo-
roes, were exposed to all the barbarity and resentment of
these exasperated infidels. In 1620, in consequence of the
carnal solicitations of the Spanish court, by means of Gou-
demar, an English squadron was sent into the Mediterranean,
under the conduct of Admiral Sir Robert Manufel. He di-
rected his course to the bay of Algiers, and attempted to
set fire to the shipping in the harbour, but returned without
doing much damage. As soon as he retired, the Algerine
Corsairs put to sea, and made prize of about 40 good ships
belonging to the subjects of the English sovereign. With
all the European powers, except the Dutch, the Algerines
were at open defence; but to them they lent a proposal,
A.D. 1625, addressed to the prince of Orange, that if they
would fit out 20 sail of ships to be employed in the next
year against the Spaniards, they would join them with 60
sail; but the proposal was not accepted. In the next year
the Cologics, or Crousics, i.e. the children of such Turks
as had been permitted to marry at Algiers, formed a con-
spiracy, and seized on the citadel of Algiers, and had very
nearly made themselves masters of that place. The plot was
discovered, and the insurgents were defeated with great
glaughter. About two years after this conspiracy, the Al-
gerine fleet underwent a memorable change, by which they
became soon after able to shake off the Ottoman yoke, and
to become an independent state under their own Deys.
The occasion of this revolution was a truce for 25 years,
which Amurath IV. had concluded with the emperor Fer-
dinand II. This truce was universally disapprob'd by the
Barbary Corsairs; and by none more than the Algerines,
who were become haughty and opulent in consequence of
their gainful depredations on the Christians for the last three
years. They and their neighbours unanimously resolved,
not to let up for three independent states, and to consider them-
selves as wholly unconnected in any treaties which were
made by the Porte with any Christian power. Having
adopted this resolution, the Algerines began to make prizes
of several ships belonging to powers at peace with the Otto-
man Porte, and even purloined some of them to the port of
Rhodes and carried them off. They did the same at Salamis,
in the isle of Cyprus, and at Alexandretta, they not only
feized a Dutch ship and a polacre, but ventured on shore,
plundered the magazines and warehous'd, and then set them
on fire. They also drove the French away from a new fort,
called the bastion of France, which Louis XIII. depending
on his league with the Turks, had erected on their coasts,
instead of that which had been formerly constructed by the
Marfillaes. The Porte considered these depredations as open
instances
invasions of defiance to his authority; but as he was much occupied by the Perian war and other disturbances in the East, his grand vizir and courtiers were allowed to compound with these pirates, by securing them. Having, for form sake, reprimanded and threatened them, they returned an insinuous reply, declaring that they were the only bulwark against the Spaniards, who were the sworn enemies of the Moslem name, and that if they paid a punctilious regard to every circumstance that could procure peace or liberty to trade with the Ottoman empire, they must do fire to all their shipping, and become more camel-drivers in order to obtain a subsistence. Accordingly the Algerines pursued their piratical excursions at sea for many years with impunity. Amongst other enterprises in which they engaged, they surprised the bateau of France upon their own coast, containing about 600 inhabitants, whom, with all their effects and ships, they carried off to Algiers. In the course of the following year they fitted out a fleet, with which they ranged the seas and seized all the Christian shipping that fell in their way; and they even meditated an attack upon Loretto, which would have proved a great prize. But in this object they were prevented from succeeding by contrary winds; however they made a descent on Puglia, in the kingdom of Naples, where they made captives of both sexes, and fleeing towards Dubatini, they ferried the Adriatic, and loading themselves with immense plunder, left those coasts in the utmost consternation. The Venetians, alarmed at their depredations, equipped a powerful fleet of 28 sail, under the command of Admiral Capello, who had orders to burn, sink, and take all the Barbary corsairs, wherever he found them. The Algerine admiral was overtaken by this fleet; and an obstinate conflict ensued, which terminated in the defeat of the Algerine; but Capello was recalled, and the republic were under a necessity of purchasing peace with the Porte, at the expense of 500,000 ducats. The news of this defeat and loss, which were owing to the aversion of the Algerine admiral, filled Algiers with exasperable grief and consternation; and the whole city was preparing for a general insurrection; but it was prevented by a proclamation of the baflaw and douwan, who expressly prohibited all complaints under the severest penalties. Application was made to the Porte for an order, that the Venetians, settled in the Levant, should indemnify them for the loss they had sustained. Their request was rejected, and they were under a necessity of repairing their losses at their own expense. One of their corsairs loaned a freight of 600 slaves of both sexes, which he had brought from the coast of Iceland. In two years after this disaster, the Algerines appeared at sea with a stronger and more numerous fleet than they had ever equipped before. This fleet, consisting of 65 sail, besides other galleys and inferior vessels, performed many exploits in different parts of the Mediterranean, which our limits will not allow us to recount. It is sufficient to observe, that the Algerines became quickly more powerful and more formidable than ever to the European powers, and plundered the subjects of England, France and Holland. As for Spain, Portugal and Italy, they determined never to make any peace with them, as they were sworn enemies to the Mahometan religion. In this height of power and grandeur, which the Algerine state had attained, the English, French and Dutch were glad to secure peace with it at any rate. About the latter end of the reign of Charles II, the British nation obtained from the Algerines that peace, which, with some renewals, additions, and alterations, hath subsisted to this day. The outrages committed by them on the coasts of Provence and Languedoc, induced Louis XIV. to equip a considerable fleet, and the command of it was assigned to the marquis Du Poque, vice-admiral of France. Sailing to their capital, he bombarded and cannonaded it with such fury, that in a little time the whole town was in flames, and the terrified inhabitants were preparing to leave the place; but the wind suddenly changing, he was obliged to return for Toulon. When the storm abated, the douwan assembled and ordered a fleet of galleys and galley ships to sail immediately for the coasts of Provence, where they committed dreadful ravages. The French apprised of this outrage, fitted out a new armament at Toulon and Marseilles; and the Algerines repaired their walls and fortified the town, in order to be ready for their expected attack. In May 1683, the French squadron cast anchor before Algiers, as it was determined to bomb bomb the town, and the execution of this purpose was attended with dreadful havoc. Upon this the whole government of the town fixed for peace; but some delay having taken place with regard to the surrender of the Algerines, hostilities were renewed; and the greater part of the city was reduced to ashes, and the fire burnt with such vehemence, that the sea was enlightened by it to the distance of two above leagues. The Algerine commander, in the midst of this scene, caused all the French who were in the town to be cruelly butchered, and ordered their consuls to be taken alive to the mouth of a mortar, and shot against their navy instead of a bomb. The French admiral, exasperated by this unheard of instance of inhumanity, did not leave Algiers, till he had utterly destroyed all their shipping, fortifications, buildings, and, indeed, almost all the lower part, and above two-thirds of the upper part of the city. After his departure the Algerines seriously thought of procuring a peace with France; and for this purpose they deputed an ambassador to supplicate pardon for the murder of the consul, which they attributed to the populace, and to sue for peace. The speech of their envoy on this occasion was a masterly address. The result of their submission was a ratification of the peace at Paris in the course of the following year: upon which the Dey and douwan proceeded to repair the dreadful dilapidations which the metropolis had suffered. In 1686, the Algerines concluded a treaty of peace with England, which was renewed in the second year of James II. and in the second year of King William's reign, and again in the reign of George II., when all former treaties with the Algerine Republic were ratified. The only remedy to which recourse has been had for the occasional violations of this treaty has been that of making reprisals, instances of which have frequently occurred. But it was not till after the capture of Gibraltar and Port Mahon, by Sir George Rooke, that Great Britain could have a sufficient check upon them to oblige them to the observance of treaties; and since this period they have been accustomed to pay a greater deference to the English than to any other European power. In the year 1728 the Algerines retook from the Spaniards the city of Oran, and were at great pains to strengthen it with new fortifications; but notwithstanding the precautions, it was retaken in 1737. The year 1710 was principally propitious to Algiers, upon several accounts; as, firstly, the afflication of their worthies Dey Ibrahim, furnamed the Madman; and, secondly, the election of the brave Hali to the throne; and, thirdly, the expulsion of the Turkish bashaw, the abolishment of that dignity by the courage and address of the new Dey, and the union of that office with that of the Dey. This introduced that form of government which still subsists in Algiers. Mod. Un. Hist. vol. xv. p. 1-93. Robertson's Hist. of Ch. V. p. 98-102. p. 239—258.
The Government of the Algerines consists of the Dey, who may be compared to the former Dutch Statesholders, and of a deewan, or Common Council. The Dey is chosen out of the army; each order, even the most inferior, having an equal right and title to that dignity with the highest. Every bold and aspiring soldier, however obscure his origin, may be considered as the heir apparent to the throne; nor does he wait for the accession till he himself shall have removed the present ruler, provided that he can protect himself by the same feyector which he plagues into the breach of his predecessor. Accordingly the succession at Algiers has been usually very rapid; and Dr. Shaw observes, that nectarly one in ten has had the good fortune to die in his bed, and those who have enjoyed their power for a longer period, have secured it, not so much by the attachment and good will of the people, as by their own fagacity in preserving the first tendency of an insurrection; and by their ability to check it by the death of the conspirators before they have had an opportunity of accomplishing their designs.

This fainthearted and discontented government has, however, in some degree subsided, and the power of the Dey is more permanent than it used to be, though he is still liable to be deprived of it by unforeseen revolution, arising from trivial circumstances, and unavoidable afflication. The whole body of the militia is concerned in the election of a new Dey, and every person, however low his rank, claims a right of voting. Every election is of course generally attended with tumult, and sometimes with serious contests and bloodshed. When the choice is determined, the person elected is crowned with words which signify, "God bless, or prosper you!" and he is then invested with the kaftan, or insignia of sovereignty, whilst the Cadi, or Chief Judge, addresses him with a congratulatory speech, and an exhortation to govern with equity, and to maintain the liberty, and promote the welfare of his subjects. The deewan, or divan, at first consisted of about 800 military officers, without whose counsel and consent the Dey could not act; and on extraordinary occasions, all the officers that resided at Algiers, amounting to above 1500, were summoned to assist. But since the Dey's have become more powerful and independent, the deewan is principally composed of thirty yiah-bahaws, with the mufti and cadi, upon some emergencies; and upon the election of a new Dey, the whole soldiery, as we have observed, are allowed to give their votes. Of late the deewan is little regarded; it is, indeed, formally convened, for the purpose of functioning measures previously concerted between the Dey and his friends; so that, in effect, the whole power is lodged in one person. The next officer in dignity and power to the Dey is the Aqsa, a general of the Janizaries, who is one of the oldest officers of the army, and enjoys his post for two months, and is succeeded by the chiah, or next senior officer, or eldest yiah-bahaw. During these two months, the keys of the metropolis are in his custody; all military orders are signed in his name, and the sentence of the Dey upon any soldier that has offended, is executed in the court of his palace. When he is disabled, he is considered as muzoul, or superannuated, and receives his pay, and is occasionally summoned to assist with his advice, but not with his vote, at the grand council. The next officer to the aqsa is the secretary of state, who registers all public acts; and next to him are 24 or 30 chiah-bahaws, or chief colonels, from whom are commonly chosen ambassadors to foreign courts, or messengers, to incite the orders of the Dey throughout the empire. Next to these are the boolok-bahaws, or eldest captains; after them the old-dah-bahaws, or lieutenants, 400 in number; and other military officers are vakhurs, or purveyors of the army, paymasters and feudal. The officers now enumerated, compose the douwan. The strength of this kingdom consists of its land and sea forces. Its strong cities are few, and it has fewer garrisons, which are weakly fortified and guarded. Dr. Shaw, in 1732, computed the whole force of Algerians to be 6500 military Turks and Colouisles, 2000 of whom were excused from duty, 1000 employed in revenue garrisons, and the rest divided among their cruizing vessels, or forming the three flying camps, which, every summer, entertain the provincial viceroys. To the Turkish troops may be added about 2000 zouaves, as the Moorish horde and foot are called. The deficiency of their army is supplied by recruits collected by their cruizing vessels once in five or six years, in the Levant; and thence are commonly shepherds, outlaws, and perfons of the lowest condition. Besides those, the Dey, on occasions of emergency, enrolls the coloques, or colouisles, who are the sons of such soldiers as have been permitted to marry at Algiers; but these are dangerous persons, and are not much encouraged, and when they are admitted into the army, they are excluded from the honour of being Dey, aga of the Janizaries, and other considerable offices and employments.

The officers of the Algerine army are the aga or general, 30 chiah-bahaws or colonels, 800 boolok-bahaws or captains, and about 400 old-dah-bahaws or lieutenants; and these several corps are attainted, not by money or interest, but by seniority. The pay of the army is very small, the youngest soldier receiving only 40s. per day, and the oldest, or thief in full pay, no more than 5s. 6d., of which 6d. make a dollar. The whole army, therefore, with regard to its demands upon the government, may be reduced to about 3500, that is, less than 200,000 dollars, or betwixt 30 and 40,000l. of our money, will defray its expense. Besides the pay, the chiah and boolok-bahaws, that are unmarried, have each eight loaves of bread a day, and the old-dah-bahaws and private soldiers, of the same condition, have four; each being about five ounces in weight, and these aper in value. In their battles or engagements, the spahies or cavalry, are of little service; their principal dependence is on the infantry. Their fighting is always at a distance; small parties, or platoons, continually advancing in full career from the main body; and after they have discharged their fire-arms, or their javelins, they as speedily retreat, and make way for others; and hence it happens, that if a few persons are killed, the battle is called bloody.

The naval force of Algiers is more formidable than its army. It commonly consists of 20 ships; one of which belongs to the government, and is assigned to the admiral; but all the rest belong to private persons. The Corsairs, though they are not allowed any concern in the affairs of state, nor in the election of the Dey, are held in great esteem, on account of the prizes they continually bring in, which are one main source of the public revenue, and the means of procuring them respect from the Christian powers for the security of their trade. The government claims an eighth part of all the prizes, slaves, cargo and vessel; the rei being divided amongst the proprietors and ship's company. Passengers are entitled to a share in their prizes. All the officers of the ships must be either Turks or Colouisles; the Moors not being allowed to come upon the quarter-deck, or into the gun-room, unless they are sent for; but Christian slaves are permitted to act as seamen or inferior officers, and allowed a share according to their abilities and behaviour. The Dey of Algiers pays no other revenue to the Porte than a certain number of fine boys, or youths, and some other annual presents. His own income is variously computed: some estimating it at 40,000 ducats, whilst others raise it to 40,000, and others to 600,000. Dr. Shaw computes the yearly taxes of the whole kingdom at 300,000 dollars;
The religion of the Algerines differs from that of the Turks only in their adopting a greater variety of superstitions. They acknowledge the Koran as the rule of their faith and practice, but are remiss in the observance of it. They have three principal officers, who preside in religious matters, viz. the Mufti, or High Priest; the Cadi, or Chief Judge in ecclesiastical, and some other concerns, civil and military, that are referred to him, and the grand Marabout. These three officers have their seats in the great dawan next under the Dey, and on his right hand. The cadi is obliged to attend at the court of justice once or twice a day, to hear and determine complaints. But affairs of moment are submitted to the Dey, or, in his absence, to the treasurer, master of the horse, or other principal officers of the regency, who sit in the gate of the palace, according to a custom recognized in Scripture (Deut. xxvii. 15. xxv. 7. Is. xxix. 21. Amos v. 10. Dan. ii. 49.) for that purpose. The caufe is thus quickly decided, and sentence executed in less than an hour. In cases of debt, the debtor is usually detained in prison till the bailiff seizes his effects and sells them; after sale, if there be an overplus, it is returned to the prisoner; if the amount falls short, he is released, and no further demands are made upon him. The ballinado, which is inflicted with small flicks about the size of the finger, which are brought in bundles to the place of punishment, is the punishment of small offenders, and it is applied to the belly, back, or soles of the feet, according to the nature of the crime, or the pleasure of the judge, who likewise appoints the number of strokes to be given. For clipping or debasing the public coin, the old Egyptian punishment of cutting off the hands of the transgressors is inflicted. When a Jew or Christian slave, or sbjebct, is guilty of murder, or any other capital crime, he is carried without the gates of the city, and burnt alive; but the Moors and Arabs are either impaled for the same crime, or else they are hung up by the neck over the battlements of the city walls, or else thrown upon the clashing or hooks, that are fixed over the walls below, where sometimes they break from one hook to another, and hang in the most exquisite torments, 30 or 40 hours. The Turks are not publicly punished, but sent to the house of the Aga, where, according to the quality of the offence, they are batinadoed or strangled. When the women offend, they are sent to some private house of correction; and if the crime be capital, as when they are taken in adultery, &c. they are tied up in a sack, carried out to sea, and drowned. The western Moors use the barbarous punishment of sawing the body of the criminal in two. See Matth. xxiv. 51. Luke xii. 46. Heb. xi. 37. For this purpose they prepare two boards, of a proper length and breadth, and having tied the criminal between them, they proceed to the execution by beginning at the head. A person of the first rank in that country, who had been ambassador at the British Court, was put to death in this manner.

As to the population of Algiers, it is not easily ascertained; but we may observe in general, that it is much less than in other countries of the same extent, where arts, sciences and industry are not so much restrained. Tracts of country are here uninhabited and uncultivated; not to add, that defpoticism, want of commercial intercourse in the inland provinces, and the frequent ravages of the plague, contribute to the diminution of the inhabitants. The soil of this country is generally fertile, and more especially towards the sea-coast and in the valleys. There are few forests, but tracts of thickets and brushwood are more common. The most woody part of the country, and that which supplies the greatest quantity of timber, is the district about Bugia. Upon the whole, the face of the country is mountainous, and in the
chairs of its mountains there are various minerals, particularly lead and copper. The fertility of the soil decreases in approaching Sahara or the Desert, although in its borders, and even in the Desert itself, there are some districts which are capable of cultivation, and in which produce corn, figs and dates. These regions are inhabited by Nomadical tribes, who, valuing themselves on their independence, endure with stoical and resignation, the inconveniences attending their condition, and scarce regret the want of the advantages and comforts that pertain to a civilized state of society. The cultivated parts of this country enjoy a wholesome and temperate air; and the climate is distinguished by the equality of its temperature; the barometer indicating all the changes of the weather from 29 to 30, 4, or within the space of 1, 3 inches. The winds generally blow from the east, or from the west by the north to the east; those from the east are common at Algiers from May to September, and then the westerly winds become the most frequent. The northerly winds, which blow from the Sahara, are usually hot and violent, but not frequent. When they blow for five or six days together in July and August, they are very suffocating, and the inhabitants sprinkle the floors of their rooms with water or vinegar. The quantity of rain that annually falls in Algiers is, at a medium, 27 or 28 inches; but in this climate little or no rain falls in the summer season, and in most parts of the Sahara they have no rain at all. The first rains fall in September, and sometimes a month later; after which, or about the middle of October, wheat is sown and beans are planted. Barley is sown about the end of November. If the latter rains fall, as usual, in the middle of April, the crop is deemed secure; and the harvest comes on in the end of May or beginning of June. The inhabitants cultivate, not only wheat and barley, but rice, Indian corn, and a kind of millet, called drab, which they prefer to barley in fattening their cattle, and which they are obliged to guard from the depredation of birds, by a screaming noise continued through the whole day. Here they tread out their corn after the primitive customs of the East, by spreading the sheaves open, and driving mules or horses round about the neddars or threshing-floors. When the grain is trodden out, they winnow it by throwing it up against the wind with a flowel; they then lodge it in the mattatoires, or subterraneous magazines. Of the pulse kiad, beans, lentils, kidney beans, and the chic pea, are the most abundant; and of the roots, herbs and fruits of the kitchen garden, they have a very considerable variety. For the zoology, ornithology, &c. of Algiers, see Bārbarā.

The inhabitants of the Algerine state are partly Turks, partly Moors, and partly Christians and Jews. The Turks have been established since the middle of the sixteenth century; they form the highest rank in the country, and possess all the offices and employments. According to the constitution of Algiers, no native can be a Turk; he alone is regarded as a genuine Turk, and entitled to the privileges of this class, who is descended from Mahometan parents, or born of a Mahometan mother, in the dominions of the Grand Seignior. The number of Turks at Algiers was formerly computed to be from 14 to 16,000; but they are now reduced to 9 or 10,000; and they are reckoned, with regard to their disposition and character, ignorant, proud, indolent, voluptuous, jealous and revengeful; but at the same time faithful, sincere, courageous and tolerant. With ideas of superiority, brought with them from their own country, and enlarged by the privileges which are granted to them at Algiers, the mere Turk considers himself far superior to the Moors, Christians and Jews. Their principal enjoyment consists in ease and inactivity. Besides the qualities we have already mentioned, the Turks are noted for their avarice. It is therefore proverbial. "Give a Turk money with one hand, and he will permit his eyes to be plucked out by the other." Nevertheless, he is faithful to his engagements, and a stranger to dissimulation. With regard to those who do not profess their religion, they are generally compassionate and tolerant; and infidues have occurred, in which Turks have exalted their Christian slaves to the observance of the external rites of Christian worship: but they despise and abhor apostates and renegades. As to their privileges, they pay no poll-tax, and they have an exclusive title to all the chief offices of the state: they cannot be punished except by the express order of the Dey; when condemned to die, they are strangled; they purchase the necessaries of life at a lower price than others; and from gardens and vineyards that are not enclosed by high walls, they may take as much fruit as they can eat; and their testimony, other circumstances being equal, is always held in higher estimation than that of the Moors, Jews and Christians.

The chiefs of persons next in rank and dignity to the Turks, consist of the Collices or Coloris, who are the children of Turks by women that are natives of Algiers. The number of these, in the vicinity of the capital, is considerable, and they compose some of the richest and most respectable families in the country. They form a middle class between the Turks and Moors, and resemble the former in courage, pride, jealousy, and voluptuouness, but are more laborious and diligent; and they partake of the perfidy and dissimulation of the Moors, and also of their propensity to superstition. In corporeal strength and form they are not inferior to the Turks; and they belong to the most intelligent and cultivated part of the inhabitants of Algiers, so that the most expert artificers and artificers are of this class.

Under the general name of Moors, who constitute another division of Algerines, are comprehended the Moors, properly so called, the Cabyles or Kabyles, mixed with Berbers or Brebers, and several Arabian tribes. The Moors are very distinct from the Negroes, as their natural colour, unchanged by the burning rays of the sun, is as white and beautiful as that of the natives of the South of France, of Spain and Italy. With respect to their moral character, they are inferior to the Turks. They are malicious, sullen, cowardly, revengeful, fanatical, ignorant, superstitious, fraudulent,avaricious, and among the lower classes, thievish and rapacious. But they are more active than the Turks, and they have an inclination for commerce and the mechanic arts. Those of them who live in cities and engage in commerce, are more polished and less edious in their disposition and manners; some of them are rich, and look down with contempt on the Turks, though they feethe them and secure their patronage by dissimulation and flattery. Of these some are addicted to study, but their knowledge extends little beyond the Koran and History. The less wealthy Moors are artificers, and some of them mariners. In the lowest class of Moors, inhabiting the cities, are found the most abandoned and profligate persons, who cannot be restrained from crimes of every kind, except by a degree of severity approaching to cruelty. The biscares, however, form a small exception. Of the Moors, who inhabit the country, few are wealthy; they are ignorant and rude, and strangers to the benefits and pleasures of social life. They retain the ancient custom of distinguishing themselves by families and tribes, which is lost among those who live in towns. Some of them lead a wandering life, and others gain a subsistence by cultivating the land for the richer among themselves, or for the Turks, or for the Collices. Among the Moorish tribes in the country polygamy prevails, but this practice does not prevail in towns.

The
The Moors are not admitted into the infantry of the Algerian flote, which is the most honourable and useful corps, but they compose the cavalry of the Dey, which is not much esteemed. The Moorish mountaineers are denominated Cabyles. The Arabian tribes, who inhabit the Algerine dominions, are those who, without blending with the Moors, or most ancient possessors of the country, have uniformly maintained their separation from others, partly in a state of independence, and partly as tributaries to the Dey. They are distinguished from the rest by their language, rude manners, and a peculiar mode of living; and also by a degree of pride which leads them to look upon themselves as better and more noble than others. They are also distinguished by their love of liberty. They live either in the desert, or on inaccessible ridges of mountains, divided into families and clans, under the patriarchal government of a chief, who may be considered as the judge, instructor, and leader of his tribe. Their wealth consists in their flocks and herds. Whenever they think themseives secure, they descend from the mountains into the plain country. The number of these marauders decreases every year. The Arab tribes that are the subjects of the Algerine flote, pay a small tribute, and are treated with great lenity, that they may not be provoked to unite with the Cabyles and the independent Arabs. The number of Jews in Algiers is not considerable; they are despised and oppressed, distinguished by a dress of dark colour, restrained from acquiring landed property, and forbidden to ride through the gates or in the city. If a Jew be attacked, he would incur danger by defending himself against the abuse of the Turks and Moors, and therefore they purchase the protection either of powerful Turks, or European consuls. The Algerine Jews are, in general, very superstitious and superfluous, and also cowardly, pernicious, avaricious, and addicted to cheating and fraud. In their own concerns they are amenable to the civil law, and have an elder amongst them, known by the appellation of "King of the Jews."

The number of negroes annually imported as slaves into Algiers, amounts to from 150 to 180; and their price varies from 50 to 150 sequins. The females are often kept as concubines by the wealthy Turks and Moors. Most of these slaves obtain their freedom, either gratuitously or by purchase; and during their slavery, they are treated with lenity, and severe usage is noticed and even punished by the government. Both negro and Christian slaves are employed at Algiers in the same offices with our dominical servants. But Jews and Christians are forbidden to keep negro slaves who profess the Mahometan religion. An emancipated slave becomes entitled to the same privileges with the Moors.

The Christians of Algiers are tractable and sedentary; and can hardly be reckoned in any class of inhabitants. They are feldom found in the open country. On the western coast the Spaniards occupy Oran and Mafalquieh; but the greater part of the citizens who reside there consist of fugitives from their native land, and derive a scanty subsistence from the garrison; and destitute of trade, agriculture and manufactures, pass their time in indolence and wretchedness. The Christians in other cities are, generally speaking, all slaves. Some of them are such as have been captured by the Algerine corsairs: of whom some are selected by the Dey, and the rest are sold in the market-place to the highest bidder. The other Christian slaves are such as enter of their own accord into a state of slavery; and these are for the most part defectors from the Spanish garrison at Oran and Mafalquieh; so that Oran is the nursery of this class of slaves, amounting annually to about 100. As to the treatment of these Christian slaves, those that are defectors from Oran, and those that are captured by the cruisers, are treated without discrimination; they are generally well kept, but overwhelmed with labour or cruel usage. Those who attend upon the Dey live sumptuously, and are richly clad, but they must indule themselves from society, and are seldom allowed to leave the palace. The young and most beautiful are exposed to the seduction of licentious courtiers. Others, who are the property of the flote, are employed in dock-yards and magazines, and are under the command of Turkish tall-masters. They labour in the hands of fun-fest, and their fare is coarse; and their accommodations at night, amidst the filth and vermin and corrupt air of the bagnios, are more intolerable than the fatigues of the day. The condition of slaves, purchased by private persons, is, upon the whole, preferable to that of those who belong to the flote. In the cities, they are employed as menial servants; in the country, they cultivate the vineyards and gardens. Who have an opportunity to acquire property, take taverns in the city, and gradually become rich. Those slaves who had been captured by the corsairs, often regain their liberty by being ransomed; but the Oranite slaves have seldom any hopes of deliverance. Sometimes the government of a country ransoms all its slaves without exception, which was the case with the French in 1784. Their number, however, is not commonly very great. In 1785, the year after the French ransomed, it amounted to about 2000. In 1786 and 1787, 500 Spaniards and Neapolitans were ransomed, and about 700 died of the plague; so that there remained about 800, most of whom were defectors from Oran.

As to those called renegades, there are few of them in this country. They are either Jews or Christians. The former, of whom there are commonly more women than men, renounce the faith of their ancestors, and embrace the predominant religion of the country, for the purpose of being revenged of their relations, or with a view to escape from merited and apprehended punishment, or from motives of ambition or interest. If such persons possess talents and render service to the government, they are esteemed equal to the Cololics, and have a chance of being advanced to honourable and lucrative employments. The admiral of the Algerine fleet was a renegade, and formerly a Jew. Of Christian renegades the number is not so great. The zeal to gain proselytes from Christianity is abated: such conversions are not now encouraged, and in many instances not permitted, as the proprietors of the slaves would be losers, and be deprived of the expected ransom. Renegades are despised and disdained, and not without reason, for most of them are in judgment and affliction attached neither to one religion nor to the other. Shaw's Travels. Pallin: Pitt's Account of the Religion and Manners of the Mahometans, ed. iv. 1738. Pallin: Mod. Un. Hist. vol. xiv. p. 455—456. 8vo.

Algiers, the capital of the country above described, was formerly called Meqams, from an African family of that name, and derives its present name Algiers, or Al-fedrin, the island, from its being in the vicinity of the caisson mound of the harbour, which, before the time of the Turkish conquest, was defiled from the continent. Some have supposed that this was the ancient Icosium; but Dr. Shaw is of opinion that the ruins of a Roman city on the banks of the river Hrach, the ancient Suvius, four miles to the south-east of Algiers, bids rather than Algiers to be the ancient Icosium. The city is situated on the declivity of a hill, and is built in the form of an amphitheatre. The house rises gradually above one another, and their roofs or terraces are flat and white, so that at sea it appears, fays Pitts, like the top-fail of a ship, or like a whitener's ground covered with linen. It is, fays Dr. Shaw, about a mile and a half in circuit, and is computed to contain about 2000 Christian slaves,
flavens, 15,000 Jews, and 100,000 Mahometans. But since
this time the number has been much reduced; and the number
of inhabitants is now estimated at about 80,000, in
which number are included several thousand Jewish families.
It is surrounded by high walls, 12 feet thick, flanked with
spire towers, but so decayed as to afford very little de-
tence. A ditch, 20 feet wide and seven deep, formerly en-
compassed the whole city, but is now almost filled with
rubbish. It has five gates, which are open from sun-rise to
sun-set; and without the walls seven castles or forts, of
which the greatest is that on the mole, all which are supplied
with cannon. Its best defence is towards the sea.
The mole, the work of Hayradin, the son of Barbaroffa, is built
on the small island that faces the town, in form of a large fe-
nicule, with a handomne opening into the haven, which
is 150 fathoms long, and 80 broad, and where the largest
vessels may ride so as to be secure from the violence of the
waves. The mole is defended by a cattle, which stands upon
the solid rock, and which also serves as a light-house. It has
three batteries of cannon. At the south end of the island
is another fort, consisting of three batteries, to defend the en-
trance of the harbour. There are also other forts along the
coast.
In the town there is but one handomne street, which
reaches from the east to the west end, and in which are the
bell-hops, the houses of the principal merchants, and the mar-
ket for corn and all provisions. All the other streets are so
narrow that two persons cannot walk abreast, and the middle
being much lower than the sides for the reception of water and
filth, the passage of camels, horses, mules and affies, renders it
still more inconvenient and disagreeable for foot passengers.
It is still more dangerous to meet with a Turkisb folder, to whom
the wealthiest Christian must give way, or be likely to be felt
the effects of his brutal remoncement. The houses are supposed
to be placed thus near to each other, either to shelter them
from the sun, or for the convenience of mutual support, by
means of props, when earthquakes occur. They are
built of brick or stone, mostly square, with a paved court in
the middle, somewhat like our old inns; round this court
there are galleries supported by columns, and over these a se-
cond range, and upon this upper gallery are the terraces,
which serve for walking or drying linen. Their chimney
risers in the form of a cupola on the four corners of the ver-
terace, and their houses are whitewashed every year. As the
houses are contiguous, a person may walk from one end of
the town to the other along the terraces, and in this way
they keep up an intercourse with each other. The houses
of private people are within meanly fitted up and furnish-
ed, but those of the rich are inured with marble, supported on
columns, and have their ceilings finely carved, painted and
 gilt. The most magnificent building is the palace of the
Dey, in the midst of the city, which has two spacious halls,
in one of which the dowan meets thrice a week. The bar-
 rackes for the Turkisb folderie are likewise grand edifices
and each of themcontains about 600; their mosques are nu-
merous, of which the larger are seven, and the baths are
many and spacious, but they are of different kinds, for the
accommodation of persons of every rank and condition.
Bes-
dies the public baths and those appropriated to women,
there are others called balios, which are loth some prians,
and in which their flames sleep every night. There are some
handome edifices without the walls of the town, and a great
number of tombs, some of which are adorned with chapels
and oratories, to which the men and women repair every Fri-
day. The city of Algiers, which had formerly neither wells
nor fountains, is now supplied with excellent water by two
aqueducts, which convey it from the adjacent mountains to
a number of fountains at convenient distances from one ano-
other. The territory about Algiers is very fertile; the hills
and valleys are every where ornamented with gardens, groves,
and country-feeding, which, besides the shade and recreation, afford a beautiful prospect towards
the sea. The gardens are flooded with plenty of fruit-trees, melons, and pot-herbs, and well watered by a multitude of
fountains and rivulets. Algiers, although it has many forts,
and though in former times it has encountered the assaults
of some of the greatest powers of Christendom, is but weakly
defended, and incapable of sustaining a regular siege. The
Spaniards, however, attacked it in 1775, both by land and
sea, with a force consisting of about 25,000 foot, and 2000
horse, 47 king's ships of different rates, and 346 transports,
and were repulsed with great losses. In 1783 and 1784, their
attacks were renewed, but without success. N. lat. 36°
40' 50". E. long. 2° 12' 45". The bay of Algiers lies to the
cal of the city, and the mole that forms the harbour is 500
paces long, and here is anchorage in 18 to 25 fathoms water.
Cape Matiou lies to the north-eaft extremity of the bay,
and Cape Caixies to the north-west of the city, and the
western limit of the bay.
ALGOA BAY, or Zwartkops, a bay of South Africa,
situate in S. lat. 35° 56'. E. long. 26° 53', and distant from
the Cape of Good Hope 800 miles. Mr. Barrow, a late
traveller, fuggests, that from the vicinity of this place to the
falt-pan, from the enfe of procuring bullocks in good condi-
tion, and from the abundance of excellent fish on the coast,
great benefits would accrue to the East India company, if
an establishment was formed for the preparation of salted
beef and fish. The river Zwartkops flows through a valley,
in which our traveller found a species of antelope, called the
riet-bok, or red-goat, hitherto undescribed by naturalists.
ALGODONALES ISLANDS lie on the coast of Peru,
in S. lat. 21° 56', and W. long. 72° 56', eight leagues north
from the harbour of Cobija, and afford fresh water.
ALGODRES, a district of Beira, in Portugal, contain-
ing eight parishes and 450 inhabitants.
ALGOIDES, in Botany, a name given by Vaillant to
a genus of plants, called by Micheli and Linnaceus Zanri-
cella.
ALGOL, or Medusa's Head, in Astronomy, a star of the
second magnitude, in the constellation Perseus. This star
has been subject to singular variations, appearing at different
times of different magnitudes, from the fourth to the se-
cond, which is its usual appearance. These variations were
noticed at the close of the last century by Montanari and
Maraldi; also by Flamstead, 1696 and 1711; but they
have been more accurately observed by Mr. Goodricke, at
York, in 1783, who has, by comparing a great variety of
observations, determined the period of their return to be 2°,
20°, 48°, 56°. As to the cause of this variation, Mr. Good-
ricke conjectures, that it may be owing either to the interpo-
fision of a large body revolving round Algol, or to some mo-
tion of its own, in consequence of which, part of its body,
covered with spots or such like matter, is periodically turned
towards the earth. M. de la Lande, comparing his own ob-
servations with those of Mr. Goodricke, and M. Wurm, of
Nurtingen, determines the period of variation to be 2°, 20°,
ALGOMEIZA, a name given to the fish Procon.
ALGONQUINS, in Geography, an Indian nation of
North America, which formerly possessed considerable
tracts of land along the north-west shores of the river St. Lawrence,
in Canada. As hunters and warriors they had no rivals, and
were
were long in alliance with the Iroquois; whom they agreed to protect from all invaders, whilst the Iroquois stipulated to pay them a tribute out of the produce of the earth, and to perform for them all the menial duties, such as faying the game, curing the flesh, and dressing the skins. At length the Iroquois associated with the Algonquins in their hunting matches and military expeditions; but by degrees the Algonquins became jealous of their allies and allies, and murdered several of their number. The Iroquois for some time flushed their resentment, but determining upon revenge, they applied to the study of the art of war, as it was practised among the savage nations; and having acquired a competent knowledge, which they improved by experience, they attacked the Algonquins with such fury, that, unless they had been preferred by the interposition of the French, their whole race would have been exterminated. They are daily decreasing in number, chiefly principally on fishing and hunting, and have scarcely any notion of agriculture. The Algonquins are now dispersed along the river Atawar, and occupy different parts of Upper Canada, above the lakes Huron, Ontario, and Superior. The lake of the Two Mountains, which may be deemed the commencement of the Utawas river, and which is about 20 miles long, and three wide, and surrounded by cultivated fields, is nominally in possession of the two tribes of Iroquois and Algonquins, whose village is situated in a delightful point of land under the hills, which, under the denomination of mountains, give a name to the lake. Near the extremity of the point their church is built, which divides the village into two parts, forming a regular angle along the water-side. On the cliff is the situation of the Algonquins, and on the west one of the Iroquois, containing in all of about 800 warriors. Each party has its missionary, and divine worship is performed, according to the rites of the Roman church, in their respective languages, in the same church: and so affluents, it is said, have their pastors been, that these people have been instructed in reading and writing in their own language, and are better taught than the Canadians of the country of the lower ranks; but notwithstanding these advantages, and though the establishment is nearly coeval with the colonization of the country, they do not advance towards a state of civilization, but retain their ancient habits, language and customs, and are becoming every day more depraved, indigent, and insignificant. The country round them, though capable of cultivation, presents only a few miserable patches of ground, fenced by the women with maize and vegetables. During the winter season they leave their habitations and their pastures to follow the chase, according to the custom of their forefathers. A tribe of the Algonquin nation occupies the parts adjacent to the lake Sepoongui. Some few families inhabit the island of St. Joseph, near the lake Huron; also a village, near the fall of St. Mary, about 50 miles farther towards the north-west, which are ravaged for one-half of the year, and in a state of intoxication for the other half, and the coasts of lake Superior, where they live chiefly on fish. The residence of the chief, or Sachem, of all the Algonquin tribes inhabiting different parts of the country, is at the trading establishment, situated on a high bank on the north side of the river La Pluie, in N. lat. 48° 37'. This chief is by way of distinction called Neetam, implying personal pre-eminence. In this place the elders met in council to treat of peace or war. Of this tribe some few are found near the Assiniboine river, who are in almost constant hostility with the Nadowas. These of them who occupy the country near lake Winnepic and its source, are employed in fur-hunting, so that they thus acquire the additional articles of cloth, blankets, &c. but their passion for rum puts it out of their power to supply themselves with real necessaries. The Al-

The Algonquins and Algonkians are supposed by some intelligent travelers to have been originally the same people, and to have inhabited the Atlantic coast, the banks of the river St. Lawrence, and adjacent countries. Their progress has been slower, and they are now found well and north as far as Athabasca. The language of the Algonquins is one of the three principal languages, or of those which have been called radic, or mother tongues, amongst the Indians of Canada. The other two are the Iroquois and the Huron. By means of an acquaintance with the Algonquian and Huron languages, a person may travel 1500 leagues in this country without an interpreter. The Algonquian language is said to exist only in the Hurons in smoothness and elegance. See Knitstoneaux. The Baron d'Houtan has given a small dictionary on the Algonquian language; Reland has also given a gloss on several words of the same. The firm is entitled, Mem. de l'Amer. Sept. Hag. 1703; the half is in his Diff. Mife. p. 3 Diff. 2. Mod. Un. Hill. vol. xxxv. p. 379. Mackenzie's Voyages, &c. through the Continent of North America, &c. p. 25, 65, &c.

ALGOR is used by some Medical Writers, to denote a preternatural coldness or chills in a part. Muys speaks, in this sense, of an algor of the arm, attended with an atrophy.

ALGORAB, in Astronomy, a fixed star of the third magnitude, in the right wing of the constellation Corvus.

ALGORITHM, or Algorism, an Arabic term, which some authors, and especially the Spaniards, make use of to signify the practical operation of several parts of Specious arithmetic or algebra. Sometimes it is also used for the practice of common arithmetic, by ten numeral figures.

Algorithm is properly the art of numbering truly and readily; and comprehends the six common rules of arithmetical algebra. It is sometimes called Logistica numerosa. We say the algorithm of integers, the algorithm of fractions, the algorithm of whole numbers, &c.

ALGOSAREIL, in Botany, a name used by Avicenna, and some other authors, for the common wild carrot, or Daucus sylvestris.

ALGOW, or Algo, in Geography, a canton of Germany, in the circle of Swabia, bounded on the north by the Danube, on the east by the Leck, on the west by the Hegow and the lake of Constance, and on the south by the county of Tyrol. It includes the marquisate of Burgau, the counties of Bregent and Montfort, the territory of the bishop of Augsburg, the abbey of Kempten, of the counts of Fuggar, Waldburg, Konigseck and Mindelheim; with the cities of Augsburg, Kempten, Memmingen, Huy, Lindau, Biberac and Wagen.

ALGOZO, a small place of Traz-oz-Montes, in Portugal, situated on the river Macas, containing 20 parishes, and about 400 inhabitants.

AlGUASIL, in the Spanish Policy, a ferjeant or official of a judge, or magistrate, appointed to see his decrees executed.

ALGUELL, in Geography, a town of Africa, in the empire of Morocco and province of Hec.

ALHABOR, among the Arabian Astronomers, is that star commonly called Sirius.

ALHIAGI, in Botany, a species of Hedysarum. The inhabitants of Mesopotamia and the eastern countries gather from this shrub a kind of manna, by means of the juice which transudes from its leaves; in the form of drops of various sizes, which is indurated by the heat of the sun. Tournefort has particularly described this tree, and made a distinct genus of it, under the name of Alhag. The shrub grows plentifully about Taurus; it has been also found in Tinos, and in many plains of Armenia and Georgia; and the manna is known in the Levant by the name of Terenjas.
The leaves are said to be of a hot dry nature, and the natives use the flowers as a purgative, one handful of which, boiled in water, fulfills for a dose. Let us return to our subject.

ALHAMBRA. in Geography, a pleasant town of Spain, in the province of Granada, situated in a narrow valley between high and very steep mountains; and having warm baths and medicinal waters that are much frequented. It was taken by the Moors, after a gallant defence, in 1481, and surrendered to the pillage of the Christian soldiers, who, besides pillaging an immense quantity of gold and jewels, made slaves of 3300 of the inhabitants. It is about 25 miles southwest of Granada, and 28 miles north-east of Malaga. N. lat. 36° 59'. W. long. 3° 46'.

ALHAMA, a town of Spain, in Cordova, near the Sierra Morena, nine leagues west of Cordova.

ALHAMA is also a town or village of Spain, in Aragon, celebrated for its medicinal waters.

ALHAMA de Saoa, a town of Spain, in Granada, situate on the river Almeria, ten miles north-north-west of Almeria.

ALHAMBRA, a town of Spain, in Aragon, seven miles north of Teruel.

ALHAMBRA is also a river of Spain, which joins the Guadalquivir at Teruel.

ALHAMBRA, one of the four wards of the ancient city of Granada, so called by the Moors from the red colour of its materials, Alhambra signifying a red house; and by the Spaniards in Sierra del Sol, because, by its elevation on a high mountain, it is exposed to the rising sun. The inhabitants consist of the descendants of the ancient Moors. In this district are two palaces, one built by the Moors, the other by Charles V. and Philip II. The first, which is very large, is environed with walls, towers, and battlements; and both command, by their eminence, an extensive and delightful prospect. Above the old Moorish palace is the magnificent and beautiful house of Xencarifa, which was also built by a Moorish prince; and on the top of the mountain stands a church dedicated to St. Helena. The Moorish palace, according to the description given of it by Stubbs in his Travels, appears to have been a most magnificent and astonishing edifice. The court to which you are first admitted, called the Comuna, or del Mosico, i.e. the common baths, is an oblong square, with a deep basin of clear water in the middle, into which is a descent by two flights of marble steps, and having on each side a perron of marble with a row of orange trees. A peristyle, paved with marble, runs round the court, and the arches are supported by pillars, in a style different from all the regular orders of architecture; and the cievings and walls are incrusted with flanco fret-work. In every division are Arabian sentences of different lengths, denoting "there is no conqueror but God;" and "obedience and honour to our Lord Abouaboulah." The cievings are gilt or painted, and the colours still retain their freshness; the lower part of the walls is Mochaic, disposed in fantastic knots and festoons. The porches resemble grotto-work; and that on the right-hand opens into an octagon vault under the emperor's palace, which forms a whispering-gallery, communicating between the offices of both houses. Opposite to the door by which you enter into the Comuna, is another leading into the cuarto de los leones, or apartment of the lions; which is an oblong court, 100 feet long, and 50 broad, encompassed by a colonnade, seven feet broad on the sides, and ten at the end. Two porticoes or cabinets, about 15 feet square, project into the court at two extremities. The square is paved with coloured tiles, and the colonnade with white marble. The walls are covered to the height of five feet from the ground with blue and yellow tiles, placed chequerwise. Above and below is a border of small leaf-shaped, enamelled blue and gold, with an Arabian motto on a bend, signifying, "No Conqueror but God." The columns that support the roof and gallery are of white marble, very slender, fantastically adorned, and irregularly disposed. The cievings of the portico is much more highly finished than that of the Comuna. The capitals are of various designs. Amidst the varieties of foliages, grotesques, and strange ornaments, there does not occur the slightest representation of animal life. About each arch is a large square of arabesques, surrounded with a rim of characters that are generally quotations from the Koran. Over the pillar is another square of beautiful foliages, and higher up is a kind of wooden cornice, enriched with carving as much as the flanco below. Over this projects a roof of red tiles, which disfigure this beautiful square, and which has been lately added when the Alhambra was repaired. In Moorish times the buildings were covered with large painted and glazed tiles, some of which still remain. In the centre of the court are twelve ill-formed lions muzzle, bearing upon their backs an enormous bason, out of which rives another of smaller size. When the pipes were kept in order, a volume of water was thrown up, which, falling into the bason, passed through these lions, and was discharged out of their mouths into a larger reservoir, communicating by channels with the jets d'eau in the apartments. This fountain is of white marble, adorned with festoons and Arabic ditiches, to this purpose. "Seest thou not how the water flows copiously like the Nile?" "This resembles a sea washing over its shores, threatening shipwreck to the mariner." "This water runs abundantly to give drink to the lions." "Terrible as the lion is working in the day of battle," "The Nile gives glory to the King, and the lofty mountains proclaim it." "This garden is fertile in delight; God takes care that no noxious animal shall approach it." "The fair princes that walk in this garden, covered with pearls, ornaments its beauty so much, that thou mayest doubt whether it be a fountain that flows, or the tears of her admirers." Beyond the colonnade, and on its south side, is a circular room used by the men as a place for drinking coffee, &c. And it was refresb in summer by a fountain. The form of this hall, the elegance of its cupola, the cheerful distribution of light from above, and the exquisite manner in which the flanco is designed, painted, and finished, exceed all powers of description. In this delightful scene, it is said, Abouaboulah assembled the Alencarrages, and caused their heads to be struck off into the fountain. At the head of a court are two rooms, which are suppos'd to have been tribunals, or audience chambers. Opposite to the Sala de las Alencarrages is the entrance into the Torre de las dos Hermanas, or the tower of the two sisters, so denominated from two very beautiful pieces of marble laid as flags in the pavement. This gate exceeds all the rest in profusion of ornaments, and in beauty of prospect, which it affords through a range of apartments, where a multitude of arches terminate in a large window open into the country. In a gleam of sunshining, the variety of tints and lights thrown upon this enfilade are uncommonly rich. The first hall is the concert-room where the women sat; the musicians played above in four balconies. In the middle is a jet d'eau. The marble pavement is much admired for both the size of the flags and evenness of the colour. The two sisters, which give name to the room, are slabs measuring 15 feet by 7½, without flaw or flaw. The walls, to a certain height, are mosaic, and, above, are divided into neat compartments of flanco. The cievings is a fretted cove. For preferring this vaulted roof,
and some other of the principal cupolas, the outward walls of the towers are raised 10 feet above the top of the dome, and support another roof over all, so that no injury can be occasioned by wet weather, or excessive heat and cold. From this hall you pass round the little myrtle garden of Lindaraxa into an additional building constructed at the east end by Charles V. His admired motto, "plus oultre," appears on every beam. This leads to a little tower, called, El tower, or the dressing-room of the Sultana; in one corner of which is a large marble flag, penetrated with holes, through which the smoke of perfumes ascended from furnaces below; and here, it is supposed, the Moorish queen fumigated and sweetened her person. The emperor caused this room to be painted with representations of his wars, and a variety of grotesques, which appear to be copies or imitations of those in the loggie of the Vatican. From hence you go through a long passage to the hall of ambassadors, which is magnificently decorated with innumerable varieties of mosaics, and the medallions of all the kings of Granada. This antechamber opens on the left hand into the Communa, and on the right into the great audience hall in the tower of Comares, which is a noble apartment, 36 feet square, 36 high to the cornice, and 18 from thence to the centre of the cupola. The lower range of windows is 19 feet high; the walls on three sides are 15 feet thick, and on the other side the whole wall is lined with mosaics of many colours, disposed in intricate knots, stars, and other figures. In every part various Arabic sentences are repeated.

The lower floor of the palace consisted of bed-chambers and summer-rooms; the most remarkable of which is the king's bed-chamber, which, by means of a gallery, communicated with the upper story. The beds were placed in two alcoves upon a raised pavement of blue and white tiles; but it has been repaired, and probably altered by Philip V. In the middle a fountain played for refreshing the apartment in hot weather. Behind the alcoves are small doors that lead to the royal baths. These consist of one small closet, with marble cillars, for washing children, two rooms for grown-up persons, and vaults for furnaces and boilers that supplied the baths with water and the stoves with vapour. The troughs are formed of large slabs of white marble; the walls are ornamented with party-coloured earthenware, and light is admitted by holes in the covering ceiling. At a small distance is a whispering-gallery, and a kind of labyrinth, that has been designed for the amusement of women and children. One of the passages is fenced off with a strong iron grate, and called the Parus of the Sultana; but it was more probably intended for preventing intruders from climbing into the women's quarters. Under the closet-room is a long gallery, called the King's Study; and adjoining to it are several vaults, Ibid. to be the burial-place of the royal family. In the retrospective view of this sumptuous palace, we need not wonder that the Moors thought of Granada with regret; and that they should still offer up prayers every Friday for the recovery of this city, which they regard as a terrestrial paradise.

ALHADAL, a term in the Arabic Pharmacy, signifying coloquint. The troches of alhaddal, trocchet al- handal, are a kind of troches, compounded of coloquint, bitilium, and gum tragacanth. The word is formed of the Arabic handal, or bandial, a name for coloquint. They are esteemed good purgatives, and are used on divers occasions.

ALHANDRA, in Geography, a town of Portugal, in Estremadura, containing two parishes, and about 1350 inhabitants.

ALHANGA, a small town of Spain, in Estremadura, belonging to the order of St. James, seated on an eminence, and defended by a strong, castellated wall, standing on a rock.

ALHAUR, a river of Asia, which runs into the Sakkaria, eight miles south of Amster.

ALHAUS, a town of Prussia, four miles south of Culm.

ALHAZEN, in Biography, a learned Arabic, lived in Spain about the close of the 11th, or beginning of the 12th century; though Montucla says, that it is not known what was the precise period in which he lived. He wrote a treatise on astrology; and another on optics, which was printed in Latin in the Thesaurus Optici of Kifher, in 1572. In this optical treatise he gives a tolerable description of the eye, and discourses largely concerning the nature of vision; maintaining that the crystalline humour is the most important organ for this purpose, without considering it as a lens, and asserting that vision is not completed till the ideas of external objects are conveyed by the optic nerves to the brain. He accounts for simple vision with two eyes, by supposing, that when two corresponding parts of the retina are affected, the mind perceives but one image; and he treats very minutely of optical deceptions, both in direct vision, and also in vision by reflected and refracted light. Alhazen pursued his inquiries into the nature of reflection much further, and with greater success, than the more ancient writers. He deduces from experimental and general reasoning several properties of atmospheric reflection, observing, that it increases the altitudes of all celestial objects; and he was the first who advanced the notion, that the stars are sometimes seen above the horizon by means of reflection, when they are really below it. He also observed, that refraction contracts the diameters and distances of the heavenly bodies, and that it is the cause of the twinkling of the stars.

Alhazen supposed, that the refraction of the atmosphere did not depend upon its vapours, but upon its different transparency, that is, as Montucla understands his meaning, the density of the gross air contiguous to the earth, and the other or subtle air that lies beyond it. In examining the effects of refraction, he endeavours to prove that it is so far from being the cause of the heavenly bodies appearing larger near the horizon, that it would make them appear less; two stars, he says, appearing nearer together in the horizon than near the meridian. This phenomenon he ranks among optical deceptions. We judge, says he, of distance, by comparing the angle under which objects appear with their supposed distance; so that if these angles be nearly equal, and the distance of one object be conceived to be greater than that of the other, it will be imagined to be the larger. And he adds, that the sky near the horizon is always imagined to be farther from us than any other part of the concave surface. In the writings of Alhazen, we find the first distinct account of the magnifying power of glasses, and he probably suggested the hints which led to the useful invention of spectacles; for, he says, that if an object be applied close to the base of a larger segment of glass, it will appear magnified; he also treats of the appearance of an object through a globe, and says, that he was the first that found out the refraction of rays into the eye. Alhazen's optics were much illustrated by Vitello in a treatise published in 1270. Smith's Optics, Remarks, § 89, p. 15. Pritchley's Hist. of Vision, 88. 1772. p. 17--20. Montucla's Hist. des Mathem. tom. i. p. 307.

ALHIAH, in Botany, a name by which Dr. Shaw and others have called a genus of plants, since named by Linnaeus Lawsonia. See ALCANNA.

ALHIJADAE, or ALIDAJ, the index or label of an astronomical or geometrical instrument, for taking of heights or distances. The word is Arabic, and it signifies the same thing. In Greek and Latin it is called distans, dioptra, and lineus fiducia, fiducial line. The alhijada is a kind of ruler, moveable
ALI

marched on the centre of the instrument, and carrying two
figs, which are erected perpendicularly at the two exter-

eral, in Astronomy, a fixed star of the third mag-
itude, in the constellation Capricorn. This is other-
wise called rostrum gallicum. Near this star, in the year 1600,
appeared a new star, which lasted twenty-one years, and then
disappeared again.

ALHUY'S Point, in Geography, is situated upon a river
falling into the Baltic, in a bay which bears nearly N. N. W.
a little westerly from the island of Bornholm. If a ship is a
league east of this point, the course will be due north to the
bottom of the bay, having the land all the way on the tur-
board, but the depth of the water is uncertain. It is in N.
lat. 55° 30'. E. long. 14° 30'. Malham's Naval Gaz.

ALI, in Biography, the son of Abu Taleb, who was un-
cler of Mahomet, and was eminently distinguished among the
Mahometans, both during the life and after the death of
their prophet. Ali was an early convert to the divine nifi-
ition of his cousin, and contributed, in no small degree, by his
 zeal and activity, to the success of his cause. Having been
taken in his infancy under the protection of Abubeker, the
father-in-law of Mahomet, and the ardent promoter of his
interest, he was directed by his patron to summon the kind-
dred of the prophet, to receive from him a solemn declara-
tion of his prophetic office. Mahomet, after announcing his
commission to his assembled relatives, asked them who would
become his vizir or vicegerent? Whilt they were hesitating,
Ali started up and exclaimed, with the enthusiasm that
marked his character, "I, O prophet of God, will be thy
vizir; I myself will beat out the teeth, pull out the eyes,
rip open the bellies, and cut off the legs of all who shall dare
to oppose thee." Upon this Mahomet embraced Ali with
great affection, and enjoined all who were present to regard
him as his deputy. To him he afterwards committed the
promulgation of the ninth chapter of the Koran; which com-
mission he executed at Mecca, by reading 29 or 30 verses of
this chapter to those who were assembled, and then announce-
ing to them four particulars which were strictly to be ob-

ferred, viz., "that no idolater is to come near the temple of
Mecca after this year;" "that no man is to presume to com-
plain of the Caaba naked for the future;" "that none but
true believers shall enter paradise;" and "that public faith
is to be kept." Ali was equally celebrated for his eloquence
and his valor; his surname of "the Lion of God, always
victorious," sufficiently evinces his military renown; and as he
succeeded his father in being chief of the illustrious family
of Hashem, and hereditary guardian of the city and temple
of Mecca, and had married Fatimah, the daughter of Maho-
met, his talents and his rank, as well as his near relation to
the prophet, and the personal favor by which he had been
distinguished, established claims of pre-eminence, which
aturally directed his views to the honour of succeeding Maho-
met in the regal office. To this honour he also aspired; but
he wisely declined contending for it during the three cal-
hipates of Abubeker, Omar, and Othman. Upon the as-
fallation of the last of these, Ali was unanimously elected
caliph. When he was urged by some of the chief Muds-
to accept the office, he said to them, "If you intend to re-
ognize my authority as the successor of Mahomet, I swear
to be faithful to me, or else permit me to take the oath of alle-
giance to one of you." As soon as he was elected, he hail-
tened to the mosque at Medina, at the time of prayer, in a
thin cotton gown, tied about him with a girdle, with a coarse
turban upon his head, carrying his slippers in one hand, and
in the other a bow, which he used as a walking stick, and
was there publicly inaugurated, in the 35th year of the He-
gira, A. D. 655. As soon as Ayehia, the daughter of Ab-
beker, and the widow of Mahomet, heard of Ali's election,
She expressed her disapprobation; having conceived an invin-
ducible prejudice against him, because, as it is said, he had dis-
covered her infidelity to the prophet; and Telha and Zobeir,
two persons of great influence, who had concurred in the
choice, fled to Bafforah, and there raised the standard of re-
bellion. Ali had also routed the renegades of a strong party,
by displacing those governors of the provinces, who had
been appointed by his predecessor Othman. Ayehia appeared
at the head of the malcontents at Bafforah, and there Ali
met them with an inferior force with regard to number, but
formed of veteran troops. Ayehia was mounted on a great
camel, in a pavilion reimbasing a fortress, from which
the sun ancient the day of battle was called the day of the
camel. Ali gained a complete victory. Telha was slain in
the engagement; Zobeir was afterwards assassinated; and Ayehia
was taken prisoner; and, after some submission, treated cour-
tously, and sent back to Medina. The next enterprise of
Ali was directed against Moawiyah, a former governor of
Syria, who had been proclaimed caliph, and was supported
by the house of Omnah, and by Amr, the conqueror of
Egypt. The army of Ali pitched their camp at the west-
ern banks of the Euphrates. Several skirmishes, and an in-
excitable challenge of Moawiyah to single combat,
the hostile forces engaged, and the contest was continued all
night, to the great disadvantage of the Syrians; and this
night was denominated by the Arab historians, "the valiant
night." As victory was likely soon to be decided in fa-
avour of Ali, Moawiyah, in concert with Amru, contrived an
artifice that might induce the caliph's men to desert. With
this view they ordered some of their men to carry lances,
bearing upon their points copies of the Koran, at the head
of the troops, and to cry out as they advanced, "This is the
book that ought to decide all differences between us; this is
the book of God between us and you, which absolutely pro-
hibits the effusion of human blood." Ali was thus compelled
by some of his troops, who threw down their arms, to found a
re-
treat, and thus to give up the contest in the moment of vic-
tory, and after having lost, as it is said, 25,000 men, and killed
45,000 of the enemy. The dispute was submitted to arbit-
ration, and the two parties, by whole award it was to be
determined, concurred in deposing Ali. Sentence was pro-
ounced on a tribunal erected between the two armies. Abu
Mula, one of the arbitrators, first pronounced his award:
"I depose from the caliphate both Ali and Moawiyah, in
the same manner as I take this ring off my finger." Amru,
the other arbitrator, immediately ascended the tribunal, and
said, "I concur with Abu Mula in deposing Ali, and con-
der the caliphate upon Moawiyah; I therefore invest that
prince with the supreme authority in the same manner as I
put this ring on my finger. And this I am the more dis-
posed to do, as he lies jolice on his side; having been de-
clared by Othman his successor, and being the most worthy
of the Muds to occupy the high station to which I now
advance him." Thus commenced that schism among the
Mahometans, which has produced animosity and mutual ex-
communication, and which is visible to this day in the rooted
antipathy that subsists betwixt the Turks and Persians. Ali
and his adherents were disaffected and irritated; but they
were under the necessity of acquiescing and retiring to Cufa,
where Ali was soon defeated by the Kharejites, i. e. as the
name imports, rebels or revolutionists. These were called
Mudhakmites, or judicarians, because the reason they gave for
their revolt was, that Ali had referred a matter concerning
the religion of God to the judgment of men; whereas, in
such case, the judgment belonged solely to God. The
Kharejites
Kharejites, not convinced by Ali's reasoning, associated in arms, and fixed upon Naharwan, about four miles to the east of the Tigris, for their place of rendezvous. Ali marched out against them, and having reclaimed most of them to their former attachment by persuasion, he destroyed the rest in battle, and gained again the possession of Arabia. But his rival Moawiyah established himself in Syria and Persia, and Amur was feigned upon him in his name. The Syrians also made an inursion into Ali's territories, exercised great cruelty, and committed many depredations. At this time three of the Kharejites happening to meet at Mecca, concerned in lamenting the miseries of the civil war which the people were enduring, and resolved to terminate them by assassinating the principal authors of them, viz. Ali, Moawiyah, and Amur. One of them hastened to Damascas, and wounded Moawiyah, but the wound, though dangerous, was not mortal. Another went to Egypt, and entering a mosque, where he expected to find Amur, mistook another person for him, and dispatched him, whilst Amur survived unhurt. The third conspirator, whose name was Abdalrahman, was more successful than either of his two profligate companions. Having arrived at Cufa, he engaged two associates, who joined in assassinating Ali at the door of the mosque, when Abdalrahman gave him the fatal blow. The expiring caliph left in charge with his son Hānif, in case of his death, to execute the assassin at once, thus humanely guarding against the lingering torments which usually accompanied the death of offenders. Ali, pierced as it is said, by a poisoned sword, expired on the fifth day after his wound, in the 63d, 57th, or 58th year of his age, for such are the different accounts that are given of his age, in the 40th year of the Hegira, A.D. 665. His sepulture at Cufa was concealed till the expiration of the caliphate of the Omansides; but in the year of the Hegira 357, A. D. 977, Addād ed Dowlat erected a superb monument over it, which has been decorated by the Persian kings, called, "the dome of the distributor of lights and graces," and regarded as a great object of the devotion of his votaries. A city, called Mehed Ali, has also been built to his honour, not far from the ruins of Cufa. Some of his most zealous devotees supplicate that he is still alive, and expect his advent in the clouds of heaven to fill the earth with justice. Ali, after the death of Patima, by whom he had three sons, Hānif, Housan, and Moahfain, the first of whom succeeded him, had eight other wives. The Mollem writers, particularly those of his time, speak highly of his corporeal, mental, and moral endowments. They extol his valour, munificence, and benignity of temper. Among them he also ranks high as to his learning. There are still extant his "Centiloquium," or collection of a hundred maxims or sentences, which has been translated from the Arabic into the Persian and Turkish, part of which has been published in English by Mr. Ockley; and also his "Divan," or collection of verses. But his most celebrated relic is a parchment, written in mystical characters, intermixed with figures, prophetic of all the events that are to happen in the world. This was a deposit in the hands of his family. Many of Ali's sayings and apothegms are recorded by authors: one of the most instructive is the following: "He who would be rich without wealth, powerful without subjects, and a subject without matter, has only to forsake sin and serve God."

The apellations by which Ali was honoured by the Arabs are very distinguishing and honourable. On account of his superior bravery, they called him "Al Haidar," the lion, and "the victorious Lion of God." They also designated him "Wafī," i.e. legatee or heir of Mahomet, and "Mortādī," q. d. beloved by, and acceptable to God.

He was also called by his followers, "the distributor of lights and graces;" and "the king of men."

Ali has given denomination to a sect or party among the Mahometans, who adhere to the right of succession of Ali, the fourth caliph, or successor of Mahomet, and the reform of Muuffiyanin introduced by him. The sectaries of Ali are more particularly called Shiites, and stand opposed to the Sunnites, or sect of Omar, who adhere to the law as left by Mahomet, Abubeker and Omar. The followers of Ali have possessed various states in Asia and Africa; and at present the Persians, part of the Ufque Tartars, and some Mahometan sovereigns of India are of the sect of Ali; whilst the Turks are of the sect of Omar, and hold Ali in execration. The distinguishing badge of Ali's followers is a red turban, which is worn by the Persians, who are hence called, in derision by the Turks, "Kililbacht," i.e. red heads. Mod. Un. Hist. c. ii. vol. i. Gen. Dict. Sale's Prel. Dife. to the Koran.

Ali BEY, an eastern adventurer, whose history and exploits have interested much attention, was probably born among the Abazans, a people inhabiting Mount Caucasus, and brought by the slave-merchants to one of the annual fairs at Cairo, where he was purchased by the brothers, Isaac and Yousef, Jews, employed in the custom-house, and by them presented to Ibrahim, a kiau, or veteran colonel of janizaries, who was then one of the most considerable men in Egypt. At this time he is supposed to have been 12 or 14 years of age. By the favour of his patron, to whom he rendered the usual services of the Mamlooks, he was taught to read and write, and to perform the customary exercises of a military kind, in which he displayed a fire and activity that obtained for him the appellation of dandala, or madman. At the age of 18 or 20 his beard was allowed to grow, or he was made free; and his patron gave him a wife and revenues, promoted him to the rank of kachef, or governor of a district; and at length procured him to be elected one of the 24 bey's. Thus favoured and advanced, his ambition was excited; and the death of Ibrahim, in 1757, opened a free course for the execution of his projects. After an absence of a few years, during which he had been engaged in a variety of intrigues, for rousing and displacing several chiefs, and two years of which he had passed in a state of exile in Said, or Upper Egypt, devising and maturing his plans of future dominion, he returned to Cairo in 1766; and in one night killed four beys, who were his enemies, banished four others, and thus became from that time the chief of the most numerous party. Not contented with the titular title and dependent office of bey, he aspired to the title and honour of Sultan of Egypt; and with these views he determined to throw off the supremacy of the Porte; and accordingly he expelled the pacha, refused the customary tribute, and in 1768, he proceeded to coin money in his own name. The attention of the Porte was so much occupied by other concerns that he was under a necessity of temporising; and Ali, well apprised of his situation, pushed forward his enterprises with success. He began with dispelling Hamman, an Arab sheik, of a port of the Said, which he had occupied, and where he had formed a power capable of giving disturbance; and towards the end of this year, 1769, he fitted out some vessels at Suez, which were ordered to seize on Djedda, the port of Mecca, whith a body of cavalry marched by land to take possession of Mecca itself, which was given up to plunder. The project which he had formed, in consequence of the suggession of a Venetian merchant, was to make Europe abandon the passage to the East Indies by the Cape of Good Hope, by substituting the ancient route of the Medi-

VOL. 1.
determined and the Red Sea. Flushed with success in the petty enterprises he had already accomplished, and flattered by his foreign courtiers, his ambition suggested to him more extensive conquests. Syria was the first object of his contemplation; and the war with the Russians, which broke out in 1769, and which occupied all the Turkish forces in the north, favoured his design. Besides, thee Daher, in actual rebellion against the Porte, would be a powerful and faithful ally; and the extortions of the pacha of Damascus disposed those he had oppressed for revolt, and made way for his obtaining the title of the deliverer of nations. Ali having laid his plan, detached in 1770 a corps of Mamlouks to take possession of Gaza, and thus to secure an entrance intoPalestine: and soon after he sent a larger army, to form a junction with Daher at Acre, and to proceed from thence to Damascus. Ofman, pasha of Damascus, was diligent in his preparations, and collected an army equally numerous and ill regulated. On the 6th of June 1771, the two armies met, and a decisive action took place, in which Mohammed, the friend of Ali, and Daher his ally, proved victorious. They immediately took possession of Damascus; but the battle refitted. At the moment when the signal of surrender was expected, Mohammed suddenly commanded a retreat, and all his cavalry turned towards Egypt. This singular revolution was at first attributed to a pretended report of the death of Ali Bey; but it was really owing to a conference which had passed the preceding night between a crafty agent of Ofman and Mohammed Bey, Ali's commander. Ali, though disappointed and chagrined, did not renounce his projects; he prepared, in conjunction with Daher, a second army for the campaign of 1772; but the event was unpropitious. The escape of Mohammed routed his jealousy and his fears; he beheld in him a dangerous rival, and revolved on his ruin. Having ordered the gates of Cairo to be shut, and no Mamlouk to be allowed to pass, he sentenced Mohammed into immediate exile in the Said. Mohammed, however, contrived to make his escape; and from this moment all was lost. The Mamlouks, wearied with the influence of Ali Bey, repaired to crowds to his rival, and in about six weeks he left the Said, with a strong force, and marched towards Cairo. Ali prepared to meet him; and in the month of April 1772, the two armies had a rencontre in the plains of El-Mafateb, at the gates of Cairo; the issue of which was, that Mohammed and his party entered the city, fabre in hand; and Ali Bey had barely time to escape with 800 of his Mamlouks. With this inconsiderable force he repaired to Gaza, and attempted to join his ally, Daher, at Acre, who, after some danger from which he was rescued, conducted him to Acre. Both Ali and Daher marched to the succour of Said, (Sidon) which was then besieged by the troops of Ofman, in conjunction with the Druzes. At their approach the Turks raised the siege, and retired to a place about a league north of the city, on the river Aouila. There, in July 1772, an engagement took place; and the Turkish army, three times more numerous than that of the two allies, was entirely defeated. The seven pachas, who commanded it, fled; and Said remained in the possession of Daher. Ali Bey and Daher, on their return to Acre, proceeded to chastise the inhabitants of Yafa or Jaffa, who had revolted; and after a siege of eight months the town capitulated in February 1773. Ali now determined to return to Cairo; and he was encouraged in his purpose by the promised succours of Daher, and of the Ruffians. This affiance was delayed, and Ali became impatient. In April 1773, quickened in the execution of his purpose, by fabricated letters, which he received from Cairo, he began his march at the head of his Mamlouks, and some troops furnished by Daher; but when he advanced into the Defart, which separates Gaza from Egypt, he fell into an ambush of 1600 Mamlouks, who were waiting his arrival. This corps was commanded by Mourad, a young bey, who, being enamoured of the wife of Ali Bey, had obtained a promise of her from Mohammed, in case he should bring him the head of Ali. The attack was impetuou; Mourad met with Ali in the crowd, wounded him in the forehead, made him prisoner, and conducted him to Mohammed. By his former master, Ali was received with perjuries of respect; but on the third day, this parade of civility and politeness terminated by the death of Ali Bey, who, according to some, died of his wounds; or, as others report, by poison.

Ali Bey was certainly a character of original vigour and capacity; and was superior in his views to what could have been expected from one who was bred in a school of barbarism and ignorance. He governed Egypt with a steady hand, and was particularly favourable to the Franks; but he undertook more than he had power or talents to perform, and exhausted his revenues in brutality and enterprises. He is also blamed for too soon resigning active labours to his lieutenants, and for placing unlimited confidence in his favourites, and winking at the exactions of his officers. His morals were those of his chiefs and country, where perjury and murder are allowable means in pursuing the objects of ambition; yet he was not devoid of generosity and a sense of justice. During his administration, several nests of robbers in Egypt were annihilated, villages which had been inhabited by the pirates of the Nile were razed; the communication between different parts of the country was free; the roads were no longer infested with robbers, nor was navigation interrupted by that spirit of pillage, which, since his death, has resumed its fatal activity. It was his wish, "that every man might be able to carry his purse in his hand, and leave his door open, even during the night, without running any risk."

Volney has pointed out the errors of Savary's account of this singular person and the source whence they were derived. Volney's Travels in Egypt and Syria, vol. i. c. 8. p. 114-142. Sonnini's Travels in Egypt, p. 391; 410. Gen. Biog.

ALI, in Geography, a town of Aisa, in the country of Georgia, 50 miles west of Teliia.

AIL, a town of Aisa, in the country of Georgia, in the province of Satabago; 22 miles south-west of Akalkaza.

ALLA, in Geography, a town of Aisa, in the country of Greece, in the province of Satabago; 22 miles south-west of Akalkaza.

ALLA, in Greek Antiquity, Io loco games celebrated at Rhodes on the 24th day of the month Corpica, corresponding to the Athenian Bedromion, in honour of the sun, Φως, or Abelos, who is said to have been born there; the inhabitants of which were hence called Παλαιοί, Heliadri. The victors were crowned with poplar. Strabo, tom. ii. p. 966.

ALIBADD, in Geography, a town of Peria, in the province of Tabrissian, 16 leagues south-west of Perabad.

ALICAMON, or Haliacmon, in Ancient Geography, a river of Macedon, separating it from Thessaly, rises in the Penész mountains, and running south-west, enters the bay of Thessalonika, between the cities of Pydna and Dlam.

ALJAKI, in Geography, a town of Poland in the province of Kiev, 20 miles south-east of Czerskys.

ALJAMELIA is a name which the Morefooses in Spain give to the language of the Spaniards.

Among other articles agreed on by the junta, which was appointed
appointed by the emperor Charles V. in 1526, in favour of the Moriscos, this was one, that the Moriscos should no longer speak Algarvarela, i.e. Moorish, or Arabic, but should all speak Aljamia, i.e. Spanish, as it was called by the Moors, and all their writings and contracts should be in that language. Geddes's Misc. Tracts, tom. i. p. 23.

ALIANA, in Geography, a bishoprick of Phrygia, subject to the metropolis of Laodicea.

ALIANNELO, a town of Italy in the kingdom of Naples, and province of Baisiliki, 27 miles call of Potenza.

ALIANO, a town of Naples, in the province of Baisiliki, 23 miles south-call of Potenza.

ALIANO is also a town of Naples, in the country of Lavora, two miles west of Gaeta.

ALIANSKOI, a fort of Russian Siberia, in the government of Kolivan, 120 miles south-west of Kolivan.

N. lat. 51° 50'. E. long. 79° 34'.

ALIBUCHA, in Natural History, the Arabian name for a large kind of rat, the Jebra of other writers, common in that country, and good to eat, according to Bochart, who thinks it the same as the jophan, mentioned in Leviticus, and there declared unclean. Levit. xi. 5.

Dr. Shaw thinks the fapanian to be the daman fard, or a species of rabbit.

ALIARDI, in Ancient Geography, a people of Africa, according to Ptolemey.

ALIARIA, a town of Comagena, placed by Antonin, in the route from Nicopolis to Edessa.

ALIARTUS. See Halartus.

ALIAS, in Law, a second or farther writ issued from the courts of Westminster, after copias, &c. sued out without effect.

ALIBACA, in Ancient Geography, a town placed by Ptolemey, in the Pentapolis.

ALIBANI, or Alibiania, in Geography, a town of Arabia, 140 miles south-east of Amazifirdin.

ALIBAG Rrei, a town of European Turkey in Bulgaria, eight leagues east of Silihria.

ALIBI, in Law, denotes the absence of the accused from the place where he is charged with having committed a crime; or his being elsewhere, as the word imports, at the time specified.

ALICA, in the Ancient Physic and Diet, a kind of food; but the various accounts given of it by authors, make it uncertain what it was; some representing it as a sort of grain, and others as an aliment made of grain.

The Greek word for alica was ὀλιγας, which term, and ῥοδας, seem to have been general names for all spelt or luted grain, beaten or ground into a pulp.

Ray, in his history, says the alica differs from the χολης, as the genus from the species.

ALICA, in Geography, a town of Italy in the duchy of Toulouse, 29 miles west south-west of Florence.

ALICANDRA, or Alidraca, in Ancient Geography, a town placed by Ptolemey in Media.

ALICANE, in Geography, a river towards the south-west part of the island of Ceylon, nearly east from Barbary isle, and south from Calture.

ALICANT, a small, but well-built, rich, populous, and fortified sea-port town of Spain, in the kingdom of Valencia. It is situated on the Mediterranean, between a mountain, on which the castle stands, and the sea; and it is well defended by iron battlements. This mountain is white, and being visible at a great distance, seems a guide to pilots. The bay in which it stands is sheltered on the eall by Cape
The bark of this tree, well beaten and macerated, yields a coarse thread, of which they make their ropes, and which macerated and dried, and beaten with bars of iron or wood, becomes like a large piece of cloth, with which the natives cover their middles from the girdle to the knees. The shell or rind of the fruit, which is hard like that of a gourd or calabash, being freed from its pulp, which in time of scarcity may be made into a nourishing soup, serves for vessels of various kinds, and gives to water, preserved in it, a pleasant aromatic taste. The small leaves are eaten in time of scarcity, and the large ones serve to cover houses, or being burned, to make good soap. Mod. Un. Hist. vol. xii. p. 23. 8vo.

ALICONEA, in Entomology, the name given by Cramer to the Papilio Julia.

ALICUDA, or Alicur, one of the Lipari islands, near the coast of Sicily. N. lat. 38° 31'. E. long. 14° 32'. This island is about six miles in circuit; its population is not so great as that of Felicuda, which contains about 650 inhabitants, and the houses are built at the south and south-east end of the island, on the declivities of the mountains about halfway up their ascent, in order to be guarded against the nightly surprizes and attack of the Tunisian Corsairs. Beelds Indian figs, and some olive-trees, these two islands contain many vines, from the grape of which a good wine is made, though it be not malmsey, nor the grape the pasilla or pasoline. The corn grown here is barley and wheat, which, together with the grapes, amount in value of produce to about 3000 Neapolitan crowns. The industry and patience of the people of Alicuda are incredible: they do not lose an inch of the ground they cultivate. Their soil is almost wholly interrupted by points of rocks, mazes of lava, clefts and crags; and yet they render tracks of this kind productive, by turning and breaking them with pointed spades: so that the Lipari are very favorably of them, that the people of Alicuda till their lands with the point of a knife. In all the Æolian isles there is not better bread than that of Alicuda. Three or four fishing boats belong to this island, which are mostly the property of the parish priest, and are employed for the augmentation of their ecclesiastical revenues, amounting to little more than 12 sequins. There is not a single spring of fresh water either in Alicuda or Felicuda; and therefore when it does not rain for several months, the difficulties of the inhabitants are extreme. They have no ferpents in these islands, as they furnish no food necessary for their sustenance. The people are exempted, on account of their poverty, from every kind of taxation, the tythes which they pay to the bishop excepted. These islanders, notwithstanding their extreme poverty, and inhabiting huts, formed of pieces of lava, scarcely admitting a ray of light, and appearing like the nests of birds hung to the cliffs, are singularly contented and happy. Their fare consists of black barley bread, and wild fruits, and sometimes, by way of dainty, salt fish, and their drink of pure water; and yet such is the temperature of the climate, and the fabulous quality of the air, that they enjoy, with little interruption, health of body and cheerfulness of mind. The vellages of fire are discernible in every part of this island, but the actual existence of volcanic eruptions and conflagration precedes the records of history. The volcanic materials, now found in it, and particularly examined by the accurate and industrious Spallanzani in his visit to this island, are pumices, tufas, and glaices, and great quantities of lava, in detached globules and continued currents, which have petroleum for their bane. Dolomieu was of opinion, that Felicuda and Alicuda had once formed a single conical mountain, which had been opened and separated on one side; but Spallanzani alleges several circumstances that evince the improbability of this opinion. Although these two islands exhibit numerous and indubitable characters of fire, no signs of it in a state of activity are now to be seen. The ancient name of Alicuda was Erivusa; and the author of the epitome of Stephanus says, that it was so named from the eris or heath which grows there plentifully. Strabo likewise (ib. vi.) informs us, that these two islands derived their names from plants. But in the time of Aristotle and Strabo, and other ancient writers, the confusions in these two islands, as they are unnoticed by them, must have been entirely extinguished. Spallanzani's Travels in the two Sicilies, vol. iii. c. 18.—vol. iv. c. 24.

ALICULA, in Antiquity, a kind of puerile habit worn by the Roman children. This was a sort of chlamys; some explained it by tunica manicata.

ALICYRNA, in Ancient Geography, a place of Greece, fituate, according to Steph. Byz. in Acarania, and according to the peripils of Sylax in Ttolia. It is probably the Icyrena of other authors, to the north of Calydon on the borders of the sea.

ALIDES, in the Mahometan History, the descendants of Ali, otherwise called Sulimines. See Ali.

ALIEIS, in Ancient Geography, a sea-port town of Peloponnesus, in Laconia, inhabited by fishermen, whence its Greek name.

ALIE-KRUUK, in Natural History, a Dutch name given to a kind of sea-fowl, the history of which is given by Swammerdam. Bib. Nat. tom. i. p. 180.

ALJEMBUT, or, as some write it, gembut, in Botany, a name given by the Arabs, Aviceena, and others, to a species of acacia, which they also call the Nabathuan pod, and curation, or filiga, and which some have supposed to be the same with the common carob; but they expressly disbelieve it, by laying that it is an altringent, whereas the other is gently purgative; and that the fruit of it was given in hemorrhages. Nay, Idefore goes so far as to say, that the acacia juice of the hops was made of its fruit, while unripe.

ALIEN, in Law, a stranger or person born out of the king's allegiance; or under the jurisdiction of some other sovereign, and not naturalized, or made a denizen.

Of these there are two kinds; viz. alien friends, who are of those countries which are at peace and league with us; and alien enemies, who are of countries at war with us; to which some add a third, viz. alien infidels.

A man born out of the land, but within the limits of the king's obedience beyond the seas; or of English parents out of the king's obedience, provided the parents at the time of the birth be of such obedience, is no alien, but a subject of the king, Ex. 2. 25 Edw. III. commonly called the statute De nativ. ultra mare.

By several more modern statutes, (7 Ann. c. 5. 10 Ann. c. 5. 4 Geo. II. c. 21, and 13 Geo. III. c. 21.) these restrictions are further taken off; so that all children born out of the king's allegiance whose fathers, or grandparents by the father's side, were natural born subjects, though their mothers were aliens, are now deemed to be natural born subjects themselves to all intents and purposes, unless their said ancestors were attainted, or banished beyond seas for high treason; or were at the birth of such children in the service of a prince at enmity with Great Britain. But the grandsons of such ancestors shall not be privileged in respect of the aliens duty, except they be protestants, and actually reside within
within the realm; nor shall be enabled to claim any estate or interest, unless the same be made within five years after the same shall accrue. The children of aliens born in England are, generally speaking, natural born subjects, and entitled to all the privileges of such. 1 Comm. 373.

By the Stat. 11 & 12 W. III. cap. 6, all persons being the king’s natural born subjects, may inherit as heirs to their ancestors, though their ancestors were aliens. Children of an ambassador in a foreign country by a woman who is an English woman, are natural born subjects by the common law. 7 Rep. 11. And if an English merchant living beyond sea, marries a wife there, and hath a child by her and dies, this child is born a denizen, and shall have the benefit of the law, notwithstanding the wife be an alien. Cro. Car. 655. Persons born in English plantations are natural born subjects.

An alien can hold no land by decret or purchase, or be tenant by courteous, or in dower; and if he purchase, the king shall have it; but he may purchase a house for years of habitation, during his residence, as necessary for trade. If an alien merchant leaves the kingdom, the king shall have the lease; if he be no merchant, the king shall have his lease for years, though it were for his habitation; and by the Stat. 32 Hen. VIII. there is a penalty for letting houses to aliens. 5 Rep. 502.—7 Rep. 18.—1 Inst. 2. 129.—2. Inst. 741.

By 13 Geo. III. c. 14, aliens are enabled to lend money on the security of mortgages of estates in the West India colonies, and may have every remedy to recover the money lent, except foreclosing the mortgage and obtaining possession of the land.

A devise of lands to an alien is void; and if a man be bound to an alien enemy in a bond, it is void to him, but the king shall have it. Aliens, however, may obtain goods and personal estate by trade, &c. and may bring actions for the same; and make a will and dispose of their personal estate; but an alien enemy cannot maintain any action whatever, nor obtain any thing lawfully within the realm. 1 Bull. 124. Termes de Ley. 36.

Aliens are not to be returned on any jury; but where an alien is party in a cause, the jury are to be half denizens and half aliens, except in cases of high treason. 2 Inst. 17. By Stat. 27 Ed. III. c. 8, if both parties are aliens, the inquest shall be all aliens. By the Stat. 12 W. III. cap. 2, aliens are incapable of being members of parliament, or of enjoying offices; neither have they any vote for the election of members. Hob. 271. Aliens likewise are by several acts of parliament put under several other restrictions, with regard to exercising trades, taking apprentices, and are likewise disabled from being factors in the plantations, &c. See Denizen and Naturalization.

A very great influx of Frenchmen into England having been occasioned in the years 1792 and 1793, by the troubles in France, and there being cause to suspect that some of them were sent here for dangerous and unjustifiable purposes, an act was passed, Stat. 3 Geo. III. c. 4, commonly called the Alien-hill, compelling the masters of ships arriving from foreign parts, under certain penalties, to give an account at every port of the number and names of every foreigner on board to the custom-house officers; appointing justices and others to grant passports to such aliens; and giving the king power to remove and to send them out of the kingdom on pain of transportation, and on their return, of death. The same act also directs an account to be delivered of the arms of aliens, which, if required, are to be delivered up, and aliens were not to go from one place to another in the kingdom without passports. This act was continued by several subsequent acts; by 3 Geo. III. c. 50, to Apr. 1, 1800, and from thence to the end of the then next session of parliament, and by 41 Geo. III. c. 24, till six months after the conclusion of a general peace.

Aliens duty, an import laid on all goods imported into England, by aliens, or denizens, and even on certain goods imported by natural subjects, if they be brought on foreign bottoms, over and above what is paid for the same goods imported by British, and in British shipping. 12 Stat. Car. 11.

Aliens duty is otherwise called petty customs, and navigation duty. This was first granted in 31 Ed. I. Fifth, dried or salted, and cod-fish, or herring, not caught in British vessels, and cured by British, pay a double aliens duty.

Aliens duty outwards, is taken off by the following acts. 12 Car. II. cap. 4.—25 Car. II. cap. 6.—5 Ann. cap. 27.—6 Ann. cap. 10.—7 Ann. cap. 7.—9 Ann. cap. 6.—8 Geo. I. cap. 15.—11 Geo. I. cap. 59.

Seaswage, package, and ballage, payable to the city of London, are properly alien duties. On what footing aliens are permitted to import foreign commodities into Great Britain. See Duty.

Alien is sometimes used, in Middle Age Writers, for exempt. Du-Cange.

Alien-amy, or alien friend. See Alien.

Alien priories, a subordinate kind of monasteries in England, belonging to, and independent of, other monasteries in foreign countries. In the reign of Henry V. the alien priories, or abbeys for foreign monks were suppressed, and their lands given to the crown. Vide Dudg. Monall. Abr. p. 44.

ALIENATION, Alienatio, in Jure, the act of making a thing another man’s; or the altering or transferring the property, and possession of lands, tenements, or other things from one man to another. To alienate, or alien in Mortmain, is to make over lands or tenements to a religious community, or other body politic. To alienate in Fee, is to sell the fee-simple of any land, or other incorporeal right.

All persons who have a right to lands may generally alienate them to others; but some alienations are prohibited; such as alienations by tenant for life, &c. whereby they incur a forfeiture of their estate. 1 Inst. 118.

By the statute of Edward I. a bar was put to alienations by what we call entails, which is an expedient for procuring perpetuities in families; but counter-expedients were devised to defeat this intent, and a practice was introduced of cutting off entails by fines, and of barring remainders and reversion by recoveries.

Estates in tail, for life or years, where the whole interest is not parted with, may be made with condition not to alienate to others, for the preservation of the lands granted in the hands of the first grantor.

The statute for alienations in Henry the Seventh’s time, had a great effect on the constitution of this kingdom: as among other regulations of that reign, it tended to throw the balance of power more into the hands of the people. By the Stat. 12 Car. II. cap. 24, fines for alienations are taken away; except fines due by particular customs of manors.

Crown lands are only alienable under a faculty of perpetual redemption.

The council of Lateran, held in 1123, forbids any clerk to alienate his benefice, prebend, or the like. By the laws of the ancient Jews, lands could only be alienated.
allocated for the space of fifty years. At each return of
the jubilee, all returned again to the primitive owners, or
their descendants, to whom the lands were originally allotted,
at the first distribution of Canaan.

Alienatio a familiar. See Abduction.

Alienation offer, is an office to which all rights of co-
ventants and entry, upon which fines are levied, and reco-
verys unfurred, are carried, to have fines for alienation fac-
and paid thereon.

ALIEU, or Alinus, in Ancient Geography, islands
placed by Phiny in the Adult gulf, near Ethiopia.

ALITE, in Geography, a town of Italy, in the kingdom
of Naples, and country of Lavora; five miles north of
Capua. This town, placed by M. d'Avville to the south-
west of Bourbonian and north-west of Beneventum, was for-
merly a Roman colony, and possessed by the Samnites.

ALIFORMES, which, in Anatomy, are called from
also wings, and forms, shapes, resembling wings. See Pter-
ygodæus externus et internus.

ALIFORMES praecox, are processes of the sphenoid bone,
under which article they will be described.

ALI MUNDI, Ali de regno, are phrases which often
occur in our ancient records and historians. Their meaning
has mentioned much dispute. Dr. Brady will have them
to signify only tenants in capite; which Mr. Tyrrle ende-
avors to refute, and shew that they denote the whole
commons of the kingdom. Hist. of Eng. tom. i. Appen.

ALI beats, in Ancient Geography, a people who inhabited
the western part of Arabia Felix; among whom gold, it is
said, was so abundant, that it was held in lower estimation
than copper and iron, which were probably very scarce.

ALIMA, among Mineralists, a kind of sand found in
gold mines, out of which lead is extracted.

ALIMALA, in Ancient Geography, a country of Asia

ALIMEA, or Halmusias, a district of Attica, be-
longing to the Leontid tribe, situate near the Phalerum,
and in the vicinity of Athens. In this district was a temple
consecrated to Ceres Theosphoria, or the legislatrix, and
to Proserpine, according to Pausanias, in Attic. lib. i. c. 31.
p. 76.

ALIMENA, in Zoology, a species of Papilio Nym-
phasis, with dentated cornu-
bean fasciae, and seven white marginal points, found in South
America and India.

ALIMENT, Ali mentum, formed of ali, to nourish,
in a physical sense, is whatever may be dissolved and turned
into chyle, so as to be afterwards converted into blood, for
augmenting the body, or repairing its continual waste. The
subject of aliments has been very diffusely and compre-
hensively discussed by Dr. Cullen, in his Med. Med. vol. i.
p. 317-408. See Chylification, Digestion, Drink,
Food, and Nutrition.

Aliment of plants. See Plants.

Alimentary, Alimental, something that relates
to aliment, or food.

Alimentary duct, or canal, is a denomination that has
been given to the whole of these passages which the food
permanates from the mouth to the anus. It is divided into the
gland, which is subdivided into the pharynx and esophagus,
the stomach, and the intestines. For an account of its
constitution, the reader is referred to these divisions.

This duct is said to be the true characteristic of an animal,
or propria quarto modo; there being no animal without it,
and whatever has it, being properly enough ranged under

the class of animals. Plants receive their nourishment by
the numerous fibres of their roots, but have no common
receptacle for digesting the food received, or for carrying off
the increasers. But in all, even the lowest degree of animal
life, we may observe a torrithal and intestines, even where
we cannot perceive the least formation of any organs of the
feezes, unless that common one of feeding, as in oysters. Phil.

Dr. Wallis deduces an argument from the structure of
the alimentary tube in man, to prove that he is not naturally
carnivorous. "To the cogency of which, Dr. Tyron makes

Alimentary duæ, is sometimes also understood of the
thoracic duct.

Alimentary bros, lex alimentaria, was an old law among
the Romans, whereby children were obliged to find suste-
ance for their parents.

Alimentary boys, Alimentarii pari, s. e. were certain
children maintained and educated by the munificence of the
emperors, in a fort of public places, not unlike our hos-
pitals.

Trajan was the first that brought up any of these aliment-
ary boys. He was imitated by Adrian. Antoninus Pius
had the same for a number of maidens, at the solicitation of
Faulina; and hence, in some medals of that emperor, we
read PELLARAE PAESTINIANAE. Alexander Severus did the
like, at the request of Mammea: and the maids thus edu-
cated are called Mammezane.

Alimentation is used by some naturalists, for
what we more ordinarily call Nutrition.

Alimentus, Cincius, in Biography, a Roman his-
torir, was a prætor in the consulship of Claudius Marcellus
and Marcus Valerius, in the year 152. B. C. Livy repre-
sents him as a diligent collector of historical facts; and as
an eminent writer, giving him the appellation of "maximus
auctor." Livy, lib. vii. lib. xxx. He wrote the history of
Hannibal, in whose hands he was a prisoner; and the
history of Gogias of Leontium, probably from materials
which he collected during his prætorship in Sicily. He was
also the author of a treatise on the military art, mentioned
by Aulus Gallus, (lib. xxvi. c. 4.) and Ammianus, (lib. iii.)
mentions him in his account of the foreign divinities, called
Novatians.

Alimne, in Ancient Geography, a town of Asia, in
Phrygia, supposed to be the same with that called also
Aleen.

Alimony, Almosia, properly signifies nourish-
ment, or maintenance; but in a modern sense, in law,
it denotes that portion, or allowance, which a married
woman sues for, upon any occasional separation from her
husband, wherein she is not charged with elopement or
adultery.

This was anciently called rationabile effervens, reasonable
maintenance, and was recoverable only in the spiritual court;
but now it is recoverable also in chancery.

Where a woman is divorced a mensa & thoro, she may sue
her husband in her own name for alimony, or maintenance,
out of his husband's estate, during the separation, either in
the chancery, or in the spiritual court; and it will be allowed,
except in the cases of elopement and adultery, as aforesaid.

1 Inf. 235.

Alinos, in Botany, the name given by some of the
Greek writers to the common liquorice. It has been thus
called, from its quality of pulling the appetite, and making
it insipid either of hunger or thirst.

Alina, in Ancient Geography, one of the three small
islands
ALIPTA, from αλήπτα, I anoint, in the Ancient Gymnastics, an officer appointed to anoint the athletes.

In which sense the alipta amount to the fame with what are otherwise called undiores, and jaturapect.

ALIPTERIUM, or alipterion, in Antiquity, a place in the ancient polis, where the athletes were anointed before their exercises.

The alipterium, or alipterion, was otherwise called eliothesion, and arniciarium; sometimes also corona.

ALIPTES, the name of a fountain near Ephesus.

ALIQUANT part, in Arithmetic, is that which will not measure or divide any number exactly. Or an aliquant part is that which being taken any number of times, is always greater or less than the whole.

Thus five is an aliquant part of 12; for being taken twice, it fails short; and when taken three times, it exceeds 12.

The aliquant parts of a pound, or 20s. are,

3s. an aliquant part composed of a tenth and 20th.
6s. of a 5th and a 10th.
7s. of a 4th and a tenth.
8s. of two 5ths.
9s. of a 4th and a 5th.
11s. of a half and a 20th.
12s. of a half and a 10th.
13s. of a half, a 10th, and a 20th.
14s. of a half and a 5th.
15s. of a half and a 4th.
16s. of a half, a fifth, and a 10th.
17s. of a half, a 4th, and a 10th.
18s. of a half and two 5ths.
19s. of a half, a 4th, and a 5th. See Multiplication.

ALIQUOT part, is such part of any number or quantity, as will exactly measure it, without any remainder. Or, it is a part, which being taken a certain number of times, becomes equal to the whole, or integer.

The word is formed of aliquoties, any number of times. Thus 3 is an aliquot part of 12; because, being taken four times, it will fulfil measure it.

All the aliquot parts of any number may be thus found. Divide the given number by its least divisor, and divide the quotient also by its least divisor, and so on always dividing the least quotient by its last divisor, till the quotient is obtained; and all the divisors, thus taken, are the prime aliquot parts of the given number. Then multiply continually together these prime divisors, viz. every two, every three, every four of them, &c.; and the products will be the other or compound aliquot parts of the given number. E.G.

Let the aliquot parts of 60 be required; first divide it by 2, and
and the quotient is 30; then 30 divided by 2 gives the quotient 15; and 15 divided by 3 gives 5, and 5 divided by 5 gives 1, and therefore, all the prime divisors or aliquot parts are 1, 2, 3, 5, 7, 15, 30; then the compound one obtained by multiplying every two, three, four, six, ten, fifteen, and thirty; and by multiplying every three, six, ten, fifteen, twenty, thirty, and all the aliquot parts of 30 are 1, 2, 3, 5, 10, 15, 30; 2, 5, 10, 15; 3, 10, 15; 5, 15; 2, 5, 3; 6, 10, 15; 7, 10, 15; 10, 15, 30; all the aliquot parts of 30 are.

To multiply by the help of aliquot parts, see Multiplication.

We must not confound an aliquot part with that of a commensurable; for every aliquot part is commensurable, but not vice versa. Thus four is commensurable with six, but is not an aliquot part of it. Phil. Trans. No. 41.

ALISÆ, in Ancient Geography, a name given by Josephus to the inhabitants of Eboe.

ALISANDERS, in Botany. See SMYRNIUM.

ALISANUS. See Rheuma.

ALISARNA, or HAlIsARNA, in Ancient Geography, a city of the Troas, in Asia Minor.

ALISCA, a town of Lower Pannonia. In the Notitia Imperii, it is called Alfota, and placed in Valeria, near the Danube.

ALISDACCA, a town of Media, according to Ptolem. E.

ALIST, or ALISIA STE. REINE, in Geography, a town of France, in the department of the Cote d'Or, eight miles north of Saumur-en-Auxois. This town was the ancient Alesia. The celebrity of this place in the time of the Romans is discernible in the vestiges of the Roman ways, which lead to and from it. After the fall of the Western empire, Alife was the chief place of an extended country, called Pago-Alisienis or Alisienis, whence was formed the Fr. Allois and Ausoir. The ravages of the Normans occasioned the removal of the relics of St. Reine, the martyrs, to Flavigny in the year 864. After the ancient Alife was ruined, the name continued to be appropriated to some dwellings that remained on the declivity of the adjoining mountain. The site of the ancient city is now cultivated ground; "Nunc feget ubi Troja fuit." The commerce of this place confided of chaplets, shrines, flowers, &c., for the accommodation of the pilgrims, who reforted hither from all parts of France, to celebrate the feast of St. Reine, which was kept twice a year. The fountain of St. Reine is a reservoir of clear and fresh water, about two feet square; and its water was formerly held in high estimation. But the place has long since lost its reputation.

ALISINCUM, Anzi, a town of Gaul, belonging to the Edui, between Auguntodunum to the call, and Deceitia to the south-west.

ALISO, in Geography, a town of Corsica, in the district of Capo Corso.

ALISSUM, a town of Elis, situate on a high mountain, between Elis and Olympia; the Achian of Steph. Byz. It had a river of the same name, according to Strabo.

ALISUS, or ALEXUS, a mountain of Arcadia, separating it from the Argolid.

ALISMA, from Stor, anxiety, or rather from Stor, the sea, Water Plantain, in Botany, a genus of the helenium polygonia class and order, of the natural order of tripetaloses and juncæ of Jullius: its characters are, that the perianthium is three-leaved, leaflets ovate, concave and permanent; the corolla three-petalled, petals roundish, large, flat and very spreading; the stamens have awl-shaped filaments, shorter than the corolla, anthers roundish; the pfilum has germs more than five, fylæs simple, stigma obtuse, the pericarpium are compripted, (many and aggregate, Smith,) and the seeds solitary and small.

There are nine species, viz. 1. A. plantago, great or broad water plantain, or greater thunmwort, with leaves ovate, acute, capüles obtusely triangular. This species is easily known by its smooth entire leaves on very long petioles; and by its purplish flowers growing in a kind of umbel, at the end of a long scape. The flowers are fully expanded about four in the afternoon. It grows in watery places, on the banks of pools, lakes and rivers, is perennial, and flowers in July. This plant possessey the poisonous quality of the ramunculi, to which order it is naturally allied. Dr. Smith mentions two varieties, viz. A. lanceolata of Withering, or narrow water plantain, and plantago aquatica leptomera phyloides of Dim. in Ray Synop., or greater water plantain.

2. A. flavum, damalonium flavum of Miller, with leaves ovate, acute, peduncles umbellate, capüles globose. This grows in Jamaica, Barbadoes, and several other places in the warm parts of America, in stagnant waters and swampy places; but being of no great beauty, and not easily preferred in England, it is not worth cultivating. 3. A. damalonium, damalonium A. of Miller, scar-headed water plantain, with leaves cordate-oblong, flowers fix-pointed, capüles awl-shaped, the flowers are white; fylæs fix, and capüles fix, divaricated, with a stellated appearance, of a hard texture, and so closely united at the base, as to appear like a single fruit. Stokes. This is a native of France, Siberia and England; is found, more rarely than the former, in ditches and stagnant waters, about London in several places, on Hounsford Heath, Winkfield plain, near Windsor, &c.; is perennial, and flowers in June and July. 4. A. cordifolium, with leaves heart-shaped, obtuse, flowers twelve-flowered, capüles hook-pointed. This species connects the genus alisma with that of fagittaria; and is found in North and South America. 5. A. natans, creeping or floating water plantain, with leaves ovate or elliptic, obtuse, peduncles foliatory, and capüles fringed. The leaves which swim on the surface are ovate, and thence under water linear. It is found in ditches, in France, Sweden, Germany, and Siberia: in the lakes of Bala and Lornberis, in North Wales; is perennial, and flowers in July and Augulf. 6. A. ramunculoides, small water plantain, with leaves linear-lanceolate, capüles pentagonous, incurved, globose-aggregate. The corolla is bluish-white, and opens about noon. It is a native of Sweden, Holland, France, Germany, Italy, and England, in marshes and moors; is perennial, and flowers in Augulf. 7. A. fuligulium, with leaves awl-shaped; a Virginian plant, the dwarf fagittata of Clayton, with a very tender white corolla, and fruticose leaves. 8. A. paraflgulium, with leaves heart-shaped, acute, petioles jointed; a native of Italy, in the marshes under the Apennines. 9. A. repens, with stems creeping, leaves lanceolate, petiolated, acute, a native of Spain, on the sandy banks of the river Manzanares; flowering in Augulf, and seeming to be the fame, though much smaller, with the alisma, which Abbé Poiret found on the Northern coast of Africa, described by Lamarck. Willdenow adds a 10th species, A. fagittata, with leaves fagittated, and capüles obovate, obtuse; found in Guinea. Martyn. Miller. Smith's Flor. Brit. vol. i. p. 400.
ALK

ALISO, ALSE, in Ancient Geography, a small river of Germany, mentioned by Dion Cassius. This was also the name of a castle built by Drusus in Germany for the convenience of the Sicambri.

ALISONTIA, ALSET, a river of Germany, which passing by Luxemburg, discharges itself into the Moselle.

ALISTA, a town placed by Ptolemy, in the southern part of the island of Cordica.

ALISTRES, a fort of Epirus, rebuilt by Justinian.

ALISUS, a town placed by Ptolemy in the northern part of Germany.

ALITAMBI, a people of Africa, placed by Ptolemy between Libya and mount Thala.

ALITES, formed from alta, a wing, in Antiquity, a name given to those birds which afforded auguries by their wings and flight. In this sense, a little land opposed to oscines, or birds, which gave auguries by their mouths, by singing, or croaking, &c. To the class of alites belong the buzzard, osprey, &c. To that of oscines, the crane, raven, owl, &c.

ALITROPES, in Ancient Geography, a town placed by Secaulx in a part of Greece, assigned by him to the Achaens, which was the district of Phthiotis, usually comprised in Thessaly.

ALJUBARROTA, in Geography. See Aljubarrot.

ALJUCEN, a small river of Spain, which runs into the Guadiana, not far from Montachet in Leon.

ALJUSTREL, a town of Portugal, in Alentejo, 16 miles W. S. W. of Beja, containing one parish, and about 1500 inhabitants.

ALIXEN, a town of France, in the department of Ardeche, two leagues E. N. E. of Valence.

ALKADARII, formed from the Arabic, alkaldar, which signifies decree, a feast among the Mahometans, who deny any eternal, fixed, divine decrees, and are affitters of free will. The Alkadarii are a branch of Moatazalites. They stand opposite to the Algibarri.

ALKENDA, in Botany, see Myrtus.

ALKHEST, or Alkahest, in Chemistry. This word, so famous in the last ages of alchemy, occurs, for the first time in the treatise of Paracelsus, De Viribus Membrorum, where it is mentioned as a sovereign remedy against dropsy and all diseases of the liver. Notwithstanding that its particular use is here expressly stated, without any hint of its other qualities, or the method of preparation; notwithstanding also that the term is not to be met with in any other of his writings, yet Van Helmont, giving his master credit for the knowledge of more mysteries than ever he himself has pretended to, has raised the alkalift from a mere medicine in the disorders of a particular organ to the lofty character of an universal solvent, and the most active of all the alchemical elements.

The origin of the word is variously derived from falkz-geif, spirit of a plant; al-geist, all spirit; i. e. a perfectly pure spirit; or al-geist, i. e. alkali el, according to a custom common with Paracelsus and other alchemists, of concealing the name of a substance by a denomination or transposition, of which a similar example occurs in the famous author of the word araph, for aroma-philosophorum.

The properties of the alkali, according to Van Helmont, are the following. It is a fluid of perfect simplicity and purity; it is never found native, but always prepared by art; it is capable of dissolving all substances into a liquor, which rises wholly in distillation, leaving no traces behind; at the same time that the alkali itself spontaneously separates from the body on which it has produced such a remarkable change. The substances thus acted upon retain, however, their essentinal properties, but by further digestion with the alkali, are all resolved to the fame indolent,センテル, stifid, elementary water. A murtuum of such surpising powers was immediately supposed to be of the utmost consequence in the higher alchemical procéesses; and the solemn affirmation of Helmont, that he was really in possession of such an agent, a quality credit even among many from whom a sober scepticism of such mysterious and unheard of qualities might have been expected. As Helmont never divulged the secret method of preparing the alkali, most of the succeeding alchemists of any eminence had each their particular theory on the subject; Beeker imagined it to be contained in sea salt; and Glauber, in his very ingenious tract, "De Mercurio Philosophorum," endeavours to prove it to be nitre; and indeed by taking the liberty, as this author does, of applying the nitre in solution or fusion, or separated into its acid and alkaline elements, there are few substances that are not capable of being thus brought into a fluid state.

In modern chemistry nothing is acknowledged as sure till it has the test of repeated and accurate experiment; and we now hear no more of the alkali than of the eur or metals, and the universal medicine. Boclaaave's Chemistry. Glauber, Opera, vol. i.

ALKHEST is also used in a more extensive sense, so as to comprehend all fixed salts volatilized, and reduced into a quinteence.

ALKHESTIC is used by some to denote the quality of bodies which are powerfully solvant.

In which sense, alkalific amounts to the same as the mendous; except that the former imports a greater degree of the solvative power than the latter. See Menstruum.

ALKEDAR, in Geography, a fortress of Asia, in the Arabian-lar, 106 miles west of Bagdad.

ALKALESCENT, denotes a substance slightly alkaline, or in which an alkali is beginning to be formed and to predominate. As the volatile alkali, or ammonia, is the only one which is usually observed to be produced by spontaneous change, the term alkalecent generally refers to the generation of this alkali, in certain vegetable and animal substances by the process of putrefaction or any similar decomposition. Some species of vegetables, especially the tetracyanhydrin plants, have received the name of alkalecent, because, when placed in circumstances favourable to fermentation, they have a peculiar tendency to form ammonia, which may be separated in a very sensible quantity, by the process of distillation.

ALKAL is the generic term for an order of arts of the highest importance, and the most familiar in chemistry.

Alkali is a word of Arabian origin, and it was employed by the Arabian chemists and physicians, to express the salt which was procured from the nates left after the combustion of several vegetables, particularly the salt kali of the desert, and several plants growing on the sea shore. The same salt is also found native in immense quantities, mixed with salt water, in the waters and on the shores of several lakes of Lower Egypt, and has been known, from time immemorial, by the name of natron, or the salt of the ancients. The Greeks and Romans were equally familiar with the alkaline salt contained in vegetable nates, which was termed putrefactive oil (xilinio oil, Plin.), whence the name of alkaline key, xilinum, or putrefactive oil, which is still retained. The use of the word alkali was at first confined to the salt which was yielded by the fixed or incombustible nates of vegetables; but the volatile salt, which rises in distillation of vegetable, and especially of animal matter, having been found to possess similar chemical properties with the fixed putrefactive salt, in the most essential
The properties common to all alkalies are the following: they have a highly acid taste, which acts with so much energy upon the tongue as to produce the sensation of burning, and unless they are much diluted, they very soon corrode the thin skin which covers it, and produce a small eczema or dead part, which, for a time, leaves a slight sore on that sensitive organ. They have an unctuous feel to the finger, not from any fluid nature in the alkaline, but because they directly diffuse the surface of the skin, and produce a kind of soap. They effect a remarkable change on several vegetable colours. The red of roses, and the blue of violets, are turned by them to a dull green; the red of archil or litmus, to a blue; the yellow of turmeric, the light brown of jalap root, liquoricise root, and of many other roots and woods, are all rendered much deeper in colour, approaching to a brick-red. They unite with sulphur, forming compounds which have the property of absorbing the oxygen from atmospheric air, and, when moistened, of giving out a peculiar fætid gas. These compounds have been denominated alkaline sulphate, or levers, and in the modern nomenclature, sulphates. They have a very powerful action on almost all vegetable and animal matters, producing speedy disorganization, and dissolving them into a thick pulp. With oils they form the well-known compound, soap. They are largely soluble in water, giving out heat on union with this liquid. They unite with every acid, and produce neutral salts of various degrees of solubility; in which, when the contents are mutually saturated, the distinguishing properties of both acid and alkali are neutralized, and no longer to be perceived. Owing to the very strong affinity which they bear for acids, they decompose the acid solutions of all metals and most earths. These are the most characteristic properties common to all alkalies; but there are others which are confined to one or other of the two species. These we shall enumerate, referring the reader for more particular information, to the individual articles.

The Volatile Alkali (Ammonia) is distinguished, (as its name implies) by its volatility. The pure form in which it is known to us is that of a gas, which is permanent at any degree of cold that has ever been applied to it, and unites readily with water in large quantity, from which, however, it may be again expelled by a heat much below boiling. It has never been procured in a solid form, unles combination with some other substance; nor as a liquid, except by its union with water. It differs remarkably from the fixed alkalies in having a very pungent smell, which highly stimulates the nostrils; and excites coughing and tears. Owing to the eafe with which it assumes a gaseous form, it is incapable of uniting with many substances which the fixed alkalies will diffuse, when allisted by fusion in a strong heat. The volatile alkali is weaker in all its affinities than the fixed. It is also the only one which is decidedly proved to be a compound substance; the nature of its conlunct parts (which are hydrogen and azote) having been ascertained by numerous experiments both of synthesis and analysis. See Ammonia.

The Fixed Alkalies. (Alkali fucrefamides, Laugefate, Geran-Alkali filio Ital.) are the proper fixivey alkalis, or those that are procured by lixiviation of the ashes of burnt vegetables. They may be obtained in a very pure solid form, either crySTALLized, or as a simple concrete. Besides the properties which have been mentioned as common to all alkalies, these posses considerable fixity in fire, and at a red heat they run into thin fusion. A higher heat, however, volatilizes them, and they fly off in fensible vapour. The fixed alkalies, when in fusion, will readily diffuse fliccous earth into the perfectly homogeneous transparent compound, glass. They also will diffuse by heat all the metallic oxides, and thereby receive various tints. They affit in the fusion of all earthly and metallic admixtures, and their degree of fixity in the fire enables them to combine more intimately than the volatile alkali, with sulphur, phosphorous and charcoal. When pure and solid, they are remarkably deliquecent, absorbing water from every surrounding medium; and hence they have been used by chemists to render the air of any vessel in which they are confined, perfectly dry. The fixed alkalies are two in number, Potash and Soda, the former being procured from the ashes of all vegetables except marine plants, and a few that grow near the sea shore, which yield the latter alkali. The former is also termed the vegetable alkali, and the latter, (owing to its being sometimes found native in the earth) is called the mineral alkali. The general properties of these two alkalies were long known, and they were long employed in various arts, before the circumstances by which they are disttinguished were well ascertained, and their separate existence established. The close resemblance which they bear to each other when pure, and the similarity in all their most remarkable chemical properties, prevented a proper distinction between them; and it was chiefly by the researches of Pott, Duhamel and Margraff, that the nature of the two alkalies was fully explained. The two neutral salts with which the older chemists were the most familiar, nitre and sea-falt, have for their bases, the former the vegetable, and the latter the mineral alkali; and it was principally by enquiries into the properties and decomposition of these neutral salts that the distinct nature of their alkaline bases was decided.

Potash and soda differ from each other in the strength of their affinity with acids, which is greater in the former; in some slight variation in their action on oils and animal fats; but chiefly in the neutral fals which they form with the acids, which in all cases differ in form of crystallization, in solubility, often in taste, and in several other particulars.

The intimate nature of the fixed alkalies is still unknown to us. From the very strong analogy with the volatile alkali, the component parts of which are fully established, it must be considered as highly probable that the fixed alkalies are compounds, though their decomposition has not yet been effected by any experiments which can be allowed to be unexceptionable. Fixed alkalies have been supposed to be generated by the process of combustion of vegetables; since no plants, even those whose ashes yield the molt of this falt, contain before combustion any fensible quantity of uncombined alkali. The accurate analyses of several of the modern chemists have however detected, in the native juices of plants, several neutral salts, whose alkaline bases are united to an acid which is easily destructible by fire. But for this, and other speculations on the nature of the fixed alkalies, we shall refer the reader to the article Potash.

Alka (Gauft or Pure). The alkaline salt procured from vegetable ashes, besides being mixed with other salts, and with earth, is always saturatated more or less completely with fixed air, or carbonic acid; so that the fixed alkali which was the subject of the experiments of all the chemists, till within a few years, was a salt compounded of carbonic acid and the alkaline bases. The beautiful experiments of Dr. Black fully illustrated this point, and shewed, that the reason of the greatly increased cauficity of alkalies, when mixed with quick-lime, was the loss of the carbonic acid, which had paffed from the alkali to the earth. Gauftic alkalies, therefor,
fore, are alkalies deprived of carbonic acid by quick-lime or any other method; and this is the only state in which, properly speaking, alkalies can be considered as pure; though even when they contain much of this volatile acid, the peculiar qualities of the alkaline part predominate so considerably as to enable them to exhibit (though in a weaker degree) all the chemical properties by which alkalies are characterized.

Alkali (Efferent or Mild), is opposed to the state of causticity, and expresses that degree of faturation with carbonic acid, which, as has just been mentioned, diminishes, but does not supprest, the characteristic properties of the alkali. Owing to the alkali obtained from vegetable ashes being always left after combustion in union with carbonic acid, efference with acids was considered by the older chemists as an essential character of alkalies in general, who thus ascribed to a property inherent in this genus of salts, an appearance which is now known to depend upon the expulsion of the gaseous acid. The terms caustic or pure, and efferent or mild, are applied to the volatile as well as to the fixed alkalies.

Alkali (Extemporaneous), is a mild vegetable alkali, prepared by deflagrating nitre with tartar. See Carbonate of Potash.

Alkali (Flour), is a solution of pure Ammonia in water.

Alkali (Philogistic), is prepared by calcining carbonated potash with bullock's blood or other animal matter, in which process it unites with the Prussic acid, formed during the calcination.

Alkali (of Tartar), or Salt of Tartar, is properly a mild vegetable fixed alkali, prepared by the combustion of tartar, which yields it in great purity. The name is used more extensively for any pure carbonated potash, and it is the term by which this salt is more generally known in common language and in medicine.

Alkaline Earths. It is by no means easy to draw the line accurately between alkalies and earths. The original idea of an earth, entertained by the ancient chemists, was that of a substance of considerable density, insoluble in water, without taste, smell, or any perceptible action on the organs of sense, entirely unfusable, and fixed in the most intense fire; and, in short, with properties as opposite as possible to those of a salt. This opinion principally attached to earth, considered as one of the four elements of which the material world was suppos'd to be constituted. The progress of chemical investigation having, however, discovered several species of earths, which could not by any means be proved to be compounds, in which the simple or universal earth was so disfigured as to lose some of its essential characters, it became necessary to alter and modify the original definition of an earth, and to allow to it more of a saline nature.

Some of the modern chemists, therefore, have adopted the term falsifiable, and others alkaline earths, in order to allow of more accuracy in systematical arrangement. By alkaline earth has been meant an earth which agrees with alkali in the property of solubility in water to a certain extent, and thereby rendering it rapid, of changing to green certain blue and red vegetable colours; of absorbing carbonic acid with eagerness, and of polishing, when pure, those caustic or acid qualities that so much distinguish the alkalies. Magnesia, lime, barytes and fironian, are the earths which may be termed alkaline, but the former is very imperfectly so, being scarcely more soluble in water than file; and though its habits with carbonic acid are partly similar to those of the alkalies, it does not acquire any taste, or any degree of causticity, by the loss of this gaseous acid. Barytes and fironian, on the other hand, approach nearer to an alkaline nature than lime, in being very largely soluble in water, and readily crystallizable from its solution in a determinate form. They have therefore been actually enumerated as alkalies by Fournier, who reckons the following; potash, soda, ammonia, barytes, and fironian. The two latter even stand before the three ancient alkalies in their order of affinity with molyblic acids, but, till the intimate nature of the fixed alkalies be fully cleared up, it will perhaps be proper to restrict the term alkali to the three above-mentioned, and to retain in the class of alkaline earths magnesia, lime, barytes, and fironian, all of which, however, they may be alkalies in many respects, differ from them in being unfusable for in very intense fire, and being entirely incapable of being volatilized by the utmost heat that has ever been applied to them.

Alkali, in Botany. See Salicornia.

Alkaline, in a general sense, something that has the properties of an Alkali.

In this sense we say, alkaline fea, alkaline limes, alkaline spirits, alkaline substances, &c.

Alkaline salts, considered in their reference to the Materia Medica, are known to possess antifeptic powers. Experiments upon them, out of the body, sufficiently indicate and attest these powers; but Dr. Cullen observes, that it is at the same time equally well known, that they are constantly induced with such an influence, that they cannot by themselves be introduced into the body without acting more by their stimulant than by their antiseptic powers. The volatile alkali may sometimes be an useful remedy in putrid fevers; but it cannot, as some have imagined, be given more freely on account of its antiseptic powers, as it can never be given copiously enough to have any effect on these qualities. The volatile alkaline salts shew their stimulant power in every dose, wherever the energy of the brain is weakened, and consequently the action of the heart is languid, or requires to be accelerated. In such cases this stimulus is among the safest, as it is always transient; and when their acrimony can be covered, so as to pass the mouth and fauces without irritation there, they may be given in large doses from 10 to 20 grains. These are prepared in two different ways; one of which is from solid ammoniac, which gives the ammoniac of the London Dispensatory, or the sal ammoniacus volatilis, and spiritus falis ammoniaci of the Edinburgh. These are the purest forms of the volatile alkali, the most free from any adhering animal substances; but whilst the process of preparing a volatile alkali from the bones or other solid parts of animals continues, there will come into the shops a salt and spirit that can hardly ever be so pure, from some impure animal substance adhering to it; and such an adherent may probably give some peculiar quality to the salt and spirit, and render it more antispasmodic. It cannot be very considerable in any doses of the salt or spirits given to adults, but it may produce more sensible effect in the spasmodic affections of infants. The liquid volatile alkali is commonly employed in its mild state; but by a distillation of the sal ammoniac with quick-lime, the alkali may be obtained in its caustic state. In this state it may be readily joined with spirit of wine, and gives the spiritus falis ammoniaci of the Edinburgh Dispen- satory, or the spiritus falis ammoniaci vinosus of that of London. The combination affords an excellent menstruum for dissolving the several fetid substances employed as antispasmodics, and renders them more suddenly diffusible, and perhaps gives them a greater effect in all spasmodic affections. The caustic volatile alkali is seldom administered alone; but if its acrimony be covered while it passeth the mouth and fauces, it may be very safely employed. Its chief use is external, and when smelled at the nose, it gives a more powerful stimulus than the mild alkali can do. Its acrimony is so considerable, that when applied to the skin, it readily
ALK

readily irritates, and even inflames it, and may be so managed, as to prove an useful stimulant and rubefacient in many cases. But this requires its being blended with a mild, expressed oil, so as to prevent its inflaming too much. See Volatile Oil. The fixed alkaline salts have been commonly administered as diuretics. Dr. Cullen has chiefly employed the vegetable fixed alkali, and has sometimes obtained its effects in a remarkable degree; but he has been often disappointed, which he ascribes to the neutralization of the alkali in the stomach, and in that state they could have no other effect than other neutrals, which is commonly inconsiderable, either as laxatives or diuretics. Alkalies do, however, occasionally manifest their diuretic power; and upon the supposition of their neutral state in the stomach, their considerable operation as diuretics cannot be fairly accounted for. Of this fact Dr. Cullen offers two explanations. One is, that the quantity of alkali thrown into the stomach may be more than the acid can there neutralize, and therefore some portion of it may reach the kidneys in its alkaline state, and prove a more powerful stimulant than any neutral salt would be; and on this ground a large quantity of alkali is always necessary to produce diuretic effects. Another explanation of the fact is as follows. As the acid of the stomach may be presumed to be of the nature of the fermented acid of vegetables, so an alkali joined with it must form a regenerated tartar, a foul diureticus, or kali acetatum; and if this be less purgative, and more diuretic than other neutrals, while it is also conveyed to the blood-vessels in larger quantity, we can understand why, from these circumstances, the fixed alkali may often appear diuretic. With respect to its operation as a diuretic, another conjecture may be offered. When it is given with bitters, after the manner of Sir John Pringle, it commonly proves diuretic; and Dr. Cullen imagined, that as the bitters are absorbents of acid, they might absorb so much of that present in the stomach, as to prevent its being fully applied to the alkali. As alkalies may be often prevented, by purging, from reaching the kidneys, their diuretic effect may be often more certainly secured by giving an opiate at the same time; and for the utility of this practice, see Dr. Mead on the subject of Dropy. Besides the laxative and diuretic powers of the fixed alkali, another is ascribed to it, which is that of dissolving the fluids, or the concretions which may happen to be formed in them, expressed by French writers under the denomination of fondant. Dr. Cullen does not allow it to puffles this power to any great degree, or to produce the effects in this way that have been ascribed to it. Cullen's Mat. Med. vol. i. p. 568. Vol. ii. p. 382. 512.

Alkaline acrimony, in Medicine, signifies a morbid quality in the blood, which is induced by a desire of and thirst after four things; lofs of appetite, and aversion to alkalifeant food, numerous eruptions, putrid ulcers on the lips, tongue, and other parts in the mouth, thicknes in the stomach, a frequent diarrhoea, a fever of heat, latitude, and general uneafines, a dilatation of the texture of the blood, the urine highcoloured and red. It produces a putrefidency in the blood, &c. and is to be remedied by the fame means as the fea- farmy and other putrid disorders.

ALKALIZATION. Alkalization, in Chemistry, the art of impregnating a liquor with an alkaline salt. This is done either to make it a better difsolvent, for some particular purposes; or to load the phlegm, so as it may not rise in distillation, whereby the spiritual parts may go over more pure.

Alkalization is a name applied to operations, by which alkaline properties are communicated to bodies; or to those by which alkali is extracted from bodies which contain it, or in which it may be formed; e.g., spirit of wine is said to be alkalized, when it has been digested upon alkali; a part of which it dissolves, and thence acquires alkaline properties. On the other hand, when a neutral salt is decomposed, in order to obtain its alkaline basis, this salt is to be alkalized. Vegetable substances when reduced to alkali, may also be said to be alkalized, because the alkali contains fixed alkali.

ALKAMARE, in Geography, a town of Persia, in the province of Irak-Agemi, 28 leagues east of Bagdad.

ALKANET, in Botany. See Anchusa.

ALKANSAS, or ARKANSAS, an Indian nation of Louisiana, on the west side of the Mississippi river, near the river of the same name, in N. lat. 34°. See Arkansas river.

ALKENNA. See Alkanna and Lawsonia.

ALKEKENG, in Botany. See Akephalus and Physalis.

Alkenengi, a medicinal fruit or berry, produced by the Physalis. Alkenengi, popularly also called winter-cherry; formerly used and much commended as an astringent, diuretic, and diuretic.

These berries were well known to the ancients, and are charateristically described by Dioscorides, under the denomination EKANNA. ALKENNA. They have an acidulous and not unpleasant taste, followed by a slight bitterness, which they are said to induce in a confiderable degree from the infefting calyx, if not gathered with great care. Although these berries are esteemed to be detergent and aperient, they have been chiefly recommended as a diuretic, operating without heat or irritation, in suppressions of urine, and for removing obstructions occasioned by gravel or mucus. With this intention the number of 6 to 12 cherries in subfance, or an ounce of the expressed juice has been the usual dose; but there seems to be no danger from a much larger quantity; for, we are told, that in some parts of Germany the country people eat them by handfuls with much benefit; and in Spain and Switzerland they often supply the place of other eatable fruits. Ray informs us, that a gouty person prevented the returns of the disorder by taking eight of these cherries at each change of the moon; and infames are recorded of their good effects in dropical and calculous complaints, but at present they are wholly disregarded.

The cherries may be dried so as to be pulverable, or the depreated juice infipidized with a gentle heat to the conference of a rob or extract, which Dioscorides commends, and in this state preferred for use. They have been sometimes mixed with opium. Dr. Cullen (Mat. Med. vol. ii. p. 553,) observes, that as it is allowed the berries take a taint from the leaves, it will always require some caution in employing any part of a plant which is taken from an order of a very poisonous kind. Lewis, Mat. Med. Woodville, Med. Bot. vol. iv. p. 34. Murray's Mat. Med. vol. i. p. 679.

ALKENDI, or ALKINDI, JACOB BEN ISAAC, in Biography, a celebrated Arabian philosopher and writer, was the son of the prefect of Cufa, under Muhammed Modi and Raffid, and flourished in the caliphate of Al-Mamon, or at the beginning of the ninth century. He acquired such eminence in literature and philosophy in the school of Bafioha, that he was called, by way of distinction, "The Philosopher." Although he yielded implicit obedience, in common with his contemporaries, to the authority of Aristote, and principally devoted himself to the office of interpreting and illustrating his writings, he directed his attention to other more important and useful studies. His name is mentioned among the mathematicians and astronomers of his age; and his medical writings, that are still extant, prove that he attained a very honourable rank among the Arabic physicians. Herbelot represents Alkindi as a Jew, who was persecuted on account of his religion; but the account of
his genealogy in the manuscript History of Philosophers, referred to by Dr. Ruffell, contradicts this statement; for his father's great grandfather is said to have been one of the companions of the prophet. This manuscript contains a catalogue of his writings; but the medical tract usually ascribed to him, and translated into Latin, under the title of "De Medicinarum Compositarum gradibus inveniendi," is not included. Abulfaragius mentions an anecdote concerning him, which furnishes a very amiable trait of the moderation and liberality of his temper towards a malicious adversary. While he was visiting the schools of Bagdad, to which the learned and fluentus usually resorted in his days, he gave great offence by promoting the study of philosophy, and endeavouring to reconcile the doctrines of Islamism with the principles of reason, to one Alhumafar, one of the interpreters of the Koran, who was alarmed at receiving knowledge that should undermine vulgar superstitions. Accordingly this zealot accused him of heresy and impiety. Alkendi, instead of fining this conduct, and countering, by his interest with the caliph, the design which Alhumafar had formed against his life, endeavored to subdue his adversary by leasons and admonitions of philosophy. Fully apprized of the influence of wisdom as a means of mellowing the disposition, he engaged a preceptor to instruct his adversary in mathematics and philosophy. Alhumafar was thus led to perceive the folly and baseness of his past conduct, and to offer himself as a pupil to the philosopher whom he had persecuted. Alkendi received him with confecension and kindness, and Alhumafar became an ornament to his school. Drucker's Hill. Phil. by Enfield, vol. ii. p. 237. Ruffell's Aleppo, vol. ii. Appendix, p. 9.

ALKERMES, in Medicine, &c. a term borrowed from the Arabs, denoting a celebrated remedy, of the form and consistence of a confection, whereas the kermes are the basis.

The other ingredients are rose-water, sugar, ambergris, musk, cinnamon, aloes wood, pearls, and leaf gold, &c. but the sweets are usually omitted.

The confecion alkermes was chiefly made at Montpelier, which place supplies most of Europe with it. It is said to be better made there than it can be elsewhere; the reason of which doubtless is, that the drug, which gives it the denomination, is no where found so plentifully as there. The manner of preparing the grain for making the confection is described in the Phil. Trans. N° 20.

It has been much used as a cordial; especially, says Dr. Quincy, among female preferibers, and in complaisance to them; but that author decries its value in that intention, and thinks it ought only to be regarded as a sweetener.

Count Marigli, in an inquiry into the composition of this medicine, shews, that many of the ingredients with which the ancients so plentifully loaded it, and which are still retained in it by the moderns, are not only useless, but hurtful; more particularly the lapix lavali, by many mistakenely held cordial, on account of the appearance of veins of gold in it; whereas, in reality, it is only a marlact of sulphur and vitriol, and contains a great quantity of acid, directly repugnant to the alkaline nature of the kermes, and highly prejudicial in diseases where the blood tends to coagulation.

ALKES, in Astronomy, a star in the constellation Crater.

ALKETH, in Geography, one of the Puloon islands, in the North Pacific Ocean.

ALKMAAR. See ALCMAAR.

ALKMAAR, Henry of, in Biography, a native of Alkmaar in Holland, and the reputed author of the celebrated fable of "Reynard the Fox;" a poem written in Low Dutch in the 15th century, which, under the allegory of a Society of Animals, satirizes the different vices of mankind. This poem has been very popular, and translated into all the languages of Europe. A German edition of it, by Gottfried, is adorned with figures, and enriched with learned dissertations. It now appears that this poem was actually written by Nicholas Baunmann, an Earl-Frieslander, and that he assumed the name of Henry Von Alkmaar, in order to secure himself from the inquiries of the ducal court of Juliers. Baunmann was a member of the council of duke Magnus of Juliers, who died in 1503; but being driven from court by means of a cabal, he composed this allegorical poem, for the purpose of satirizing his enemies, and painting the intrigues carried on there. Nouv. Dict. Hist.

ALKMAR, in Geography, a small island near that of Java, within sight of Batavia.

ALKOHOL. See ALCOHOL.

ALKORAN. See ALCORAN.

ALKUSSA, in Ichthyology, a name given by the Swedes to a fish, which they also called lake. It is a species of the Silurus, and is distinguished by Artedi by the name of the silurus, with only one cirrus, or beard, under the chin. The common silurus, which is the glama of the ancients, has four cirri.

ALKY of lead, among Alchemists, denotes a sweet substance procured from lead.

ALL in the Wind, a sea-phrase, which expresses the state of a ship's sails when they are parallel to the direction of the wind, so as to shake or shiver.

ALL Hands boy! the call by which the ship's company are summoned upon deck.

ALL Saints, in the Calendar, denotes a festival celebrated on the first of November, in commemeration of all the saints in general, which is otherwise called All-souls.

The number of saints being so excessively multiplied, it was found too burthensome to dedicate a feast-day to each. In reality there were not days enough, scarce hours enough, in the year for this purpose. Hence an expedient was had recourse to, by commemorating such in combination who had no peculiar days of their own. Boniface IV. in the ninth century, introduced the feast of All Saints into Italy, which was soon after adopted into the other churches.

ALL Saints, in Geography, islands near Guadaloupe island, in the West Indies.

ALL Saints, a parish in the diocess of George-town, South Carolina, containing 2225 inhabitants, of whom 429 are whites, and 1795 blacks. It sends a member to each house of the state-legislature.

ALL Saint's Bay, a spacious harbour near St. Salvador in Brazil, in South America, on the Atlantic Ocean. S. lat. 13° 5'. W. long. 38° 45'. This bay is 24 leagues wide, is interposed with a number of small but pleasant islands, and is of great benefit to the whole country. This is also the name of a Captainship in the middle division of Brazil, so called from the bay; bounded north by the Rio real, on the south by that of Los Ilheos, on the east by the ocean, and on the west by three unconquered nations of Indians. It is reckoned one of the richest and most fertile Captainships in Brazil, producing great quantities of cotton and sugar. It has several cities and towns, particularly St. Salvador, which is its capital.

ALL Stigita, in Italian Music, is said of discord, which we call passing notes, that appear in the melody, but are unnoticed in the harmony. These discord, Alla Stigita, require no preparation or resolution like notes in ligature.

ALL Souls, in the Calendar, denotes a feast-day held on the
the second of November, in commemoration of all the faithful deceased.

The feast of All Souls was first introduced in the 11th century, by Odilo, abbot of Cluny, who enjoined it on his own order; but it was not long before it became adopted by the neighbouring churches. Others say that it was established A.D. 998. See Juxtin’s Rem., on Eccle. Hist., vol. v. p. 11. p. 34.

ALLA, in Geography, a small town of Italy, in the valley of Trent, upon a small river which falls into the Adige. N. lat. 45° 43’; E. long. 13° 42’.

ALLA, or ALLA, a river of Poland, in Ducal Prussia, which runs into the Pregel, about five leagues above Königsberg.

ALLA, It. ALLA, i.e. all, joined to, or rather following, a sublimative, has the force of the word Rule in English; as alla Francesca, like the French, or in the French style or manner; alla Venetiana, in the Venetian manner. Thus, in music, alla breve implies a quick time, though the notes look slow, as when breves are played or sung like or as quick as semibreves, semiquavers like minim; and minims like crotchets. This measure is seldom found in secular music composed by authors subsequent to Corelli, Geminiani, and Handel. A bar in alla breve time contains two semibreves, performed as quick as minim; and as few black notes appear in such movements, which are generally fugato, or in fugue; musicians, in sport, term them white fugues. Alla Secco, in the Scots style; alla Polacca, Polish; alla zoppa, limping, as in movements full of binding or driving notes or ligatures; all’ottava, in the octave; all’ottava più alta, an octave higher; più basso, lower. In passages for the additional keys to pianofortes, all’uso implies that all the notes from this indication, included under the line drawn over them, till the words in loco (the usual pitch) occur, are to be played an octave higher. This precludes the trouble and fatigue to the eye of the glee singers, as ascending to C in allá diffusum would require five additional lines and spaces to be piled on the usual staff of five lines. Choral music is paid to all’ Palatinus, when the style of composition resembles that of this venerable father of ecclesiastical music.

ALLABA, or ALLAYA, in Ancient Geography, a town of Sicily, on the southern side of it, near the mouth of a river of the same name, and not far from Heraclea Minoa.

ALLAH, or ALL, an Arabic word, and the name which all who profess Mahometanin give to God, and make frequent repetitions of in their prayers.

ALLAHABAD, in Geography, a founth or province of Hindoostan, about 160 miles in length and 120 in breadth, bounded on the east by the province of Bahar, on the north by Oude, on the south by Bher, and on the west by Malwa and Agra. It contains, according to the division of Akbar, recorded in the Ajuen-Akbery, 10 circums or counties, divided into 177 pargannahs, or hundreds. Its revenue, according to the statement of Maurice, in his Indian Antiquities, is 3,310,695 lacs rupees. It furnishes 11,375 cavalry, 237,870 infantry, and 323 elephants. The greater part of it is in the possession of Azubah Dowlah, a tributary ally of the British power. The principal cities are Allahabad, Benares, and Iconpore.

Allahabad, a city of Hindoostan, situate at the confluence of the two great rivers Jumna and Ganges. It is composed of two towns—the old, which is near the Ganges, and the new, about a mile long and a half a mile wide, near the Jumna. It was called Allahabad by the emperor Akbar, who erected a strong fortres of stone in it, which occupies a large space of ground, and of which we have an elegant delineation by Mr. Hodges, in No. IV. of his Select Views in India. The tomb of Sultan Khufur is also an excellent specimen of Mahometan architecture; and a pillar 40 feet high, of one stone, covered with illegible inscriptions, is ascribed to tradition to Bima, one of the heroes of the Mahabarat. Allahabad is a feat of devotion so noted that it is denominated "the king of worshipped places." We also learn from the Ayeen-Akbery, that the territory round it, to the extent of 40 miles, is deemed holy ground. The Hindoos believe, that when a man dies in this place, whatever he wishes for he will obtain in his next regeneration. Although they teach that suicide in general will be punished with torments hereafter, yet they consider it as meritorious for a man to kill himself at Allahabad. There are various objects of veneration in and about this city, which are full visited with great devotion by an immense number of pilgrims. Dr. Robertson is of opinion, that the ancient Pahibothea is the modern city of Allahabad; but major Kennell has placed Palibothea on the same site with Patna. Robertson’s India, p. 39. p. 356. N. lat. 25° 27’; E. long. 82° 5’.

Allaknándara, a river of Tibet, which runs into the Ganges, about 20 miles south of Sinagur.

ALLAM, Andrew, in Biography, a writer of the 17th century, was born of mean parentage at Garfingdon near Oxford, in 1655; and after previous education at a private grammar school, was entered at St. Edmund’s Hall Oxford, in 1671: where he became tutor, moderator, lecturer in the chapel, and at length vice-principal. In 1680, he took orders, and in 1683 was made one of the masters of the schools. He died of the small-pox in 1685. He wrote epitaphs prefixed to the publications of other writers and additions to a book, entitled, “Anglice notitia,” and to “Helveticus Historical and Chronological Theatre;” and he also translated the “Life of Iphicrates,” laid the foundation of a “Notitia Ecclesiæ Anglicanae,” which was left unfinished, and asfifted Mr. Anthony Wood in compiling the “Athenæ Oxoniænsæ,” by whom he is mentioned with great commendation and respect. Biog. Brit.

Allamannda, so called from Mr. F. Allamand, a Dutch surgeon, who visited Guiana about 1769, and Rufia about 1776, and sent descriptions, figures, and specimens of plants to Linnaeus, in Botany, a genus of the pantanaria monogyna: chaf and order of the natural order of comorts, and apoënae of jussieu; the characters of which are, that the calyx is a perianthium one-leafed, five-parted, parts ovate and acute; the corolla one-petalled, funnel-shaped, tube cylinic, border semiquinquefoil, swelling, divisions spreading, obtuse; the flaminia, with scarcely any filaments, authors five, lagittate, converging, in the throat of the tube; the pistillum has a germ oval, surrounnded with a ring, stylo form, of the length of the tube, flima headed, contracted in the middle; pericarpium, an orbicular, lens-shaped, echi- nate, one-celled, two-valved capule; the seeds very many, imbricate, orbiculate, flat, edged with a membranous wing. There is one species, viz. A. cathartica, galariis of Allamand, orchia grandiflora of Aublet, a milky shrub, with firm twining and climbing on trees, which grows wild at Cayenne, in Guiana, &c, by the sea-side. The leaves are cathartick, and an infusion of them is used at Surinam, in the colic: introduced in 1785 by Baron Hake. Martyn.

Allamp, in Geography, a town of France, in the department of the Meurthe, and district of Toul, three leagues south of Toul.

Allan, a river of Scotland, which runs into the Firth of Forth near Stirling. Allan Water is also a river of the same country, which runs into the Tweed, about a mile north-west of Melros.

Allanche, a town of France, in the department of Cantal,
Cantal, and district of Murat, situate in a valley, and having a considerable commerce of cattle; four leagues and a half north north-west of St. Flour. N. lat. 45° 12'. E. long. 2° 54'.

ALLANTOIS, ALLANTOIDS, called also Farcinimalis, in Comparative Anatomy, is a thin transparent sac or bag, found amongst the membranes, involving the fetus of quadrupeds; it is connected with the urinary bladder of the young animal, by means of the urachus, and is supposed to serve the purpose of a reservoir for the urine.

Allpigili, Haller, and others have attributed this membrane to the chick during the period of incubation.

The word is derived from μαλαιξε, farciinem, a gut; and μαιξ, forma, shape; because, in many brutes, it has somewhat the appearance of an inflated intumescence.—For a further account, see Mammalia, in Comparative Anatomy.

ALLARD, Guy, in Biography, was born at Dauphine, about the middle of the 17th century, and acquired reputation by several works relating to the history of that province. His "Nobilissima du Dauphine avec les Armories," 12mo. Grenoble, 1714, and "Histoire des Maîtres Dauphinois," are his principal and most esteemed works.

ALLAT, in Mythology, derived from Alla, God, is the name of an idol among the Arabic and idolatrous Jews.

ALLATA, a town of Dalmatia, in the itinerary of Antonin.

ALLATIUS, or Allacci, Leo, in Biography, a voluminous writer of the 15th century, was born in the island of Chios, and at the age of nine years, after having been educated in the Greek church, removed to Calabria, where he enjoyed the patronage of the noble family of Spinaeli, and embraced the Catholic religion. At Rome he was admitted into the Greek college, where he acquired reputation by the study of polite learning, philosophy, and divinity. From Rome he went to Naples, and was made great vicar to the bishop of Anglina; and having settled for some time in his native country, he returned again to Rome, studied physics, and took his degree of doctor in that science. But the belles lettres being out of fashion in Italy, and his principal attention; and, instead of pursuing the practice of physics, he taught the Greek language in the college of his own nation. About the year 1622 he was employed by Gregory XV. in removing to Rome the library of Heidelberg, which the elector of Bavaria had presented to this pontiff; he was afterwards librarian to Cardinal Barberini; and at length pope Alexander VII. appointed him librarian of the Vatican. His publications, which consisted of editions of old MSS, translations from Greek authors, and original compositions, are very numerous. Some of the principal of the latter class are the following: "De Ecclesiæ Occidentalis et Orientalis perpetua confensione," 4to. Cologne 1648; "On purgatory," 8vo. Rome, 1655; "De patria Homeri," 8vo. Lyons, 1640; "De Septem orbis Speculaealis," 8vo. Rome, 1640; "Confutatio Fabule de Joanna papissa;" "De Pelleiis;" "De Georgiis;" "De Simeonibus." His retentive memory and application qualified him for compiling catalogues; accordingly he published a work of this kind under the title, "Apes Urbanus," in allusion to the bees borne in the arms of pope Urban VIII., which contained a history of the learned men of Rome for the years 1630, 1631, and 1632, with a catalogue of their works: and another tract of a similar kind, entitled, "Dramaturgia," giving an account of dramatic authors and their works, printed at Rome in 1635, and reprinted at Venice in 1755. Allatius also wrote several Greek poems, one upon the birth of Lewis XIV. in which he introduced Grecian speaking. Allatius was a diligent and rapid writer; and he is said to have written Greek 40 years with the same pen, the loft of which he lamented with tears. His erudition and industry are more commended than his judgment; and he is generally reproached for want of liberality and candour. His criticisms were harsh and ill-natured; his reflections on those who differed from him were coarse and vulgar, as well as severe; and his animosity and intolerance, in his conduct towards those who were not comprehended within the pale of the Romish church, to which he was a profiteer, and for which he was an ardent advocate, were such as led him to denounce against them the most cruel penalties. The Roman pontiff, as he maintained, was independent; judged the world without being accountable to any; his unjust commands were to be obeyed; and he had an absolute authority as legislator and judge, and was incapable of illusion and error. As for heretics and schismatics Allatius was of opinion, that they should be proscribed and exterminated; and if they perished in their heresy, put to death and consumed in the flames. In his zeal for uniting the Greek church to the Latin, and with this view for inimitating himself into the favour and confidence of pope Urban VIII., he is charged by F. Simon with insincerity and misrepresentation. The gentlemen of Port Royal have attempted a vindication of Allatius, particularly against the attacks of Mr. Claude.

Allatius was neither married nor took orders; and in accounting for this part of his indecisive conduct, when he was asked by pope Alexander VII. "why do you not enter into orders?" he replied, "Because I would be free to marry." "Why then," said the pope, "do you not marry?" "Because," replied Allatius again, "I would be at liberty to take orders." He died at Rome in the year 1669, at the age of 83 years.

ALLAY. See Alley.

ALLAZONIUM, in Ancient Geography, a town of Aisa in Myria, north part of Scipio.

ALLBURG, in Geography, a township of America, in Franklin county, Vermont, situate on Miliifique Bay, and containing 446 inhabitants.

ALLCHURCH, a village of Warwickshire, said to have been formerly seven miles in circumference, and having the Roman Icknield street passing through it. It was once a borough, with a market and several streets. The bishop of Worchester had a palace in it, and the church, parts of which are of Saxon architecture, contains many ancient monuments. It is situate five miles from Bromsgrove, in the road to Leicesters.

ALLECTUS, in Ancient Biography and History, the confidential friend and prime minister of Carausius, emperor of Britain, apprehending punishment for several crimes with which he was chargeable, murdered his master, A.D. 294, and usurped the imperial dignity, which he maintained for three years. During this period Conostantius was preparing for the recovery of Britain; and at length the principal squadron, destined for this enterprise, and assembled in the mouth of the Seine, was intrusted to the command of the prefect Asclepiodotus. The weather proved favourable, and under the cover of a thick fog, the invaders escaped the
the fleet of Alleclus, which had been stationed off the Isle of Wight to receive them, landed in safety on the western coast; and convinced the Britons, says Gibbon, "that a superiority of naval strength will not always protect their country from a foreign invasion. As soon as the troops were landed, the intrepid commander set fire to the ships, and marched forward to meet the enemy. The usurper had posted himself near London in expectation of an attack from Conflantius, who commanded the fleet of Boulogne; but upon hearing of the defeat of Alepiedotus, he made forced marches to oppose his progress. With a small body of harried and disheartened followers, Alleclus encountered the Imperial troops, and the engagement soon terminated in his complete defeat and death; so that a single battle decided the fate of this great island. When Conflantius landed on the shores of Kent, he was welcomed by the lord and unanimous acclamations of obedient subjechts; and Britain, after a separation of 10 years, was thus reëstablished, A. D. 297, to the body of the Roman empire. Crevier's Rom. Emp. vol. ii. p. 411. Gibbon's Hist. vol. ii. p. 127.

ALLEGHANY, or Alleghany County, in Geography, a district of Pennsylvania in America, extends from the junction of the river of that name with the Ohio, where its chief town Pittsburg is situated, to the New York line. It contains 10,309 inhabitants, including 159 slaves. More. Alleghany is also the most western county in Maryland, and has Pennsylvania on the north. The windings of the Potowmac river separate it from Virginia on the south, and Sideling-hill Creek divides it from Washington county on the east. It contains 4,009 inhabitants, including 258 slaves. Its chief town is Cumberland. More. Alleghany Mountains of America, situate between the Atlantic Ocean, the Mississippi river, and the lakes, are a long and broad range of mountains, formed of a great number of ridges, extending to the north-east and south-west, and nearly parallel to the sea-coast, about 900 miles in length, and 60 to 150 and 200 miles in breadth. The different ridges, which compose this immense range of mountains, bear appropriate names in the several states: viz. the Blue Ridge, the North Mountain or North Ridge, or Devil's Back-bone, Laurel Ridge, Jackon's Mountains, and Kittatiny Mountains. All these ridges, except the Alleghany, are broken through by rivers, which appear to have forced their way through solid rocks; and between the several ridges numerous tracts of fine arable and grazing land intervene. In those districts, however, which lie in the back parts of Pennsylvania, Mr. Evans, who travelled over them, observes, that scarcely one acre in 10 is capable of culture. The principal ridge is more appropriately called Alleghany, and distinguished by the appellation of the Back-bone of the United States. From the several ridges proceed innumerable branches or spurs. The general name of the whole range, taken collectively, seems not yet to have been determined. Mr. Evans calls them "the endless mountains;" others have called them "the Apalachian mountains," from a tribe of Indians, who live on a river which proceeds from this mountain, called the Apalachinola; but the most common name is the "Alleghany mountains" so called, probably from the principal ridge of the range. These mountains are not confinedly scattered, rising here and there in high peaks, overtopping each other; but they run along in uniform ridges, scarcely half a mile high. They spread towards the south, and some of them terminate in high perpendicular bluffs; others gradually subside into a level country, giving rise to the rivers which run to the southward into the Gulf of Mexico. More.

ALLEGANY RIVER, an American river of Pennsylvania, rises on the western side of the Alleghany mountains, and after running about 200 miles in a south-east direction, unites with Monongahela at Pittsburg; and both together form the Ohio. The lands on each side of this river, for 150 miles above Pittsburg, consist of white oak and chestnut ridges, and in many places of poor pitch pines, intermixed with tracts of good land and low meadows. This river, and the Ohio likewise, from its head waters until it enters Mississippi, are known and called by the name of Alleghany river, by the Senea and other tribes of the Six nations, who once inhabited it. Morfe.

ALLEGATA, in Antiquity, a word anciently subscribed at the bottom of receipts and constitutions of the emperors, as ignata, or isleta, was under other inscriptions. In this sense allegata imports as much as verified, viscripta. Allegata was a kind of subscription, somewhat less usual than data, propositum, accepta, subscripita, sucripta, or subscripta.

ALLEGATION, is used for the producing of acts or instruments, to authorize a thing. In the ecclesiastical courts, articles are drawn out in a formal allegation, or by libel, to set forth the complainant's ground of complaint against the injuring party, brought before the court by citation. To this succeeds the defendant's answer upon oath, when, if he denies or extenuates the charge, they proceed to proofs by witnesses examined, and their depositions taken down in writing, by an officer of the court. If the defendant has any circumstances to offer in his defence, he must also propound them in what is called his defensive allegation, to which he is entitled, in his turn, to the plaintiff's answer upon oath, and may from thence proceed to proofs as well as his antagonist.

Allegation, in a literary sense, denotes the act of citing or quoting an author, or passage of some book.

ALLEGEAS, or Allegias, in Commerce, a stuff manufactured in the East Indies. There are two sorts of them; some are of cotton, and others of several kinds of herbs, which are spun like flax and hemp. Their length and breadth are of eight ells, by five, six, or seven-eighths; and of twelve ells by three fourths, or five-eighths.

ALLEGIANCE, in Law, the legal faith and obedience, which every subject owes to his prince: or, it is the tie or ligament, which binds the subject to the king; in return for that protection which the king affords the subject.

This was anciently called ligantia, or liganz; from the Latin ligans, and allegans, to bind; q. d. ligamentum.
tenant or vassal. But when the acknowledgment was made to the inferior lord himself, who was vassal to no man, it was no longer called the oath of fealty, but the oath of allegiance; and therein the tenant swore to bear faith to his sovereign lord, in opposition to all men, without any saving or exception; “contra omnes homines fideltatem feclit.”

Land held by this exalted species of fealty was called “Feudum ligium,” a large fee, the vassals “homines ligii,” or liege men; and the sovereign their “dominium ligii,” or liege lord.

And when sovereign princes did homage to each other for lands held under their respective sovereignties, a distinction was always made between simple homage, which was only an acknowledgment of tenure, and liege homage, which included the fealty before mentioned, and the services consequent upon it. Thus, when Edward III., in 1329, did homage to Philip VI. of France, for his ducal dominons on that continent, it was warmly disputed of what species the homage was to be, whether liege or simple homage.

But with us in England, it becoming a settled principle of tenure, that all lands in the kingdom are holden of the king as their sovereign or lord paramount, no oath but that of fealty could be taken to inferior lords, and the oath of allegiance was necessarily confined to the person of the king alone. By an easy analogy the term of allegiance was soon brought to signify all other engagements, which are due from subjects to their prince, as well as those duties which were simple and merely territorial. And the oath of allegiance, as administered for upwards of 600 years, contained a promise “to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb,” and “terreine honour, and not to know or hear of any ill or dammage intended him, without defending him therefrom.”

At the revolution, the terms of this oath being thought to favour too much the notion of non-rebellion, the present form was introduced by the convention parliament, which is more general and indeterminate than the former; the subject only promising “that he will be faithful and bear true allegiance to the king,” without mentioning “his heirs,” or specifying in theleast wherein that allegiance consists. Accordingly, the convention of estates having offered the crown to the prince and princes of Orange, who accepted it, the old oaths of allegiance imposed by the flat, 1 Eliz. and 3 James I. were abrogated; and a new oath was drawn up to be taken by all the subjects of England, on penalty of being deprived of all employments, civil, military, and ecclesiastical. The form of the oath of allegiance by 1 Geo. flat. ii. c. 12, is “I, A. B. do freely, truly and solemnly promise and swear, that I will be faithful, and bear true allegiance to his majesty George. So help me God.” This oath may be tendered to all persons above the age of 12 years, whether natives, denizens, or aliens, either in the court-leet of the manor, or in the sheriff’s tourn, which is the court-leet of the county. See Prætories.

The Quakers are exempted from taking the oath of allegiance; and, in lieu thereof, are only enjoined a declaration of fidelity, 8 Geo. c. vi. The oath of allegiance, taken by the people to the king, is only the counterpart to the coronation oath, taken by the king to the people; and, as such, partakes of the nature of a covenant; that is, is conditional, and ceases on a violation of the contract by the prince; at least this is the doctrine of none of the chief advocates for the revolution. The anti-revolutioners, on the contrary, held the oath of allegiance to be absolute and unconditional. Archdeacon Paley, in his illustration of this oath, observes, that it excludes all intention to support the claims or pretensions of any other person or persons to the crown and government, than the reigning sovereign; and also all design, at the time, of attempting to deprive the reigning prince, for any reason whatever; and that it forbids the taking up of arms against the reigning prince, with views of private advancement, or from motives of personal resentment or dislike. On the other hand, this oath permits allegiance to the king, when his ill-behaviour or incapacity is such, as to make allegiance beneficial to the community; nor does it require obedience to such commands of the king as are unauthorized by the law, or that we should continue our allegiance to the king, after he is actually and absolutely deposed, driven into exile, carried away captive, or otherwise rendered incapable of exercising the regal office, whether by his fault or without it.

Besides this express engagement, the law also holds, that there is an implied, original and virtual allegiance, owing from every subject to his sovereign, antecedently to any express promise; and although the subject never swore any faith or allegiance in form. For as the king, by the very descent of the crown, is fully invested with all the right, and bound to all the duties of sovereignty, before his coronation; so the subject is bound to his prince by an intrinsic allegiance, before the superinduction of those outward bonds of oath, homage, and service, which were only instituted to remind the subject of his previous duty, and for the better securing its performance. The formal profession, therefore, or oath of subjection, is nothing more than a declaration in words of what was before implied in law.

Allegiance, both express and implied, is however distinguished by the law into natural and local; the former being also perpetual, and the latter temporary. Natural allegiance is such as is due from all men born within the king’s dominions immediately upon their birth; for immediately upon their birth, they are under the king’s protection; at a time too, when (during their infancy) they are incapable of protecting themselves. Natural allegiance, therefore, is a debt of gratitude, which cannot be forfeited, cancelled or altered, by any change of time, place or circumstance, nor by any thing but the united concurrence of the legislature. An Englishman who removes to France, or to China, owes the same allegiance to the king of England there as at home, and 20 years hence as well as now. For it is a principle of universal law, that the natural born subject of one prince cannot by any act of his own, no, not by swearing allegiance to another, put off or discharge his natural allegiance to the former; for this natural allegiance was intrinsic and primitive, and antecedent to the other, and cannot be divested without the concurrent act of that prince to whom it was first due.

Local allegiance is such as is due from an alien, or stranger born, for so long time as he continues within the king’s dominion and protection; and it ceases the instant such stranger transfers himself from this kingdom to another. Natural allegiance is, therefore, perpetual, and local, temporary only; and that for this reason, evidently founded upon the nature of government, that allegiance is a debt due from the subject, upon an implied contract with the prince, that so long as the one affords protection, so long the other will demand himself faithfully. As therefore the prince is always under a constant tie to protect his natural born subjects at all times, and in all countries, for this reason their allegiance due to him is equally universal and permanent. But, on the other hand, as the prince affords his protection to an alien, only during his residence in this realm, the allegiance of an alien is confined, in point of time, to the duration of such residence; and, in point of locality, to the dominions of the Britis empire. Blackstone’s Com. book i. ch. 15. vol. i. p. 368—371. 8vo. Paley’s Principles of Moral and Political Philosophy, book iii. ch. 18. vol. i. p. 203—207. 8vo.
ALLEGI, ALLEGORIE, in Biography, an Italian engraver, who flourished in 1746, and published the following plates, viz. a Virgin Mary, the Circumcision, the Stoning of St. Stephen, a small print of Rinaldo and Armida, and a large Architectural Opera scene. Strutt.

ALLEGORICAL, something containing an allegory.

The divines find divers ftemples in scripture; as a literal, a mystical, and an allegorical sense. See Prophecy, and Types.

ALLEGORY, Allegoria, a figure in Rhetoric, whereby we make use of terms which, in their proper significations, mean something else than what they are brought to denote; or it is a figure whereby we pay one thing, expecting it shall be understood of another, to which it alludes; or which, under the literal sense of the words, conceals a foreign or distant meaning.

An allegory is, properly, a continued metaphor, or a series of several metaphors in one or more sentences. Such is that beautiful allegory, in Horace, lib. i. Od. 14.

"O navis, referunt in mare te novi
Pleutus, &c."

Where the ship is usually held to stand for the republic, waves, for civil war; port, for peace and concord; ears, for soldiers; and mariners for magistrates. Thus also, in Prior's Henry and Emma, Emma describes her confiance to Henry in the following allegorical manner:

"Did I but purpose to embark with thee
On the smooth surface of a summer's sea,
While gentle zephyr play with prosperous gales,
And fortune's favour fills the dwelling seas;

But would forfake the ship, and make the shore,
When the winds whistle, and the tempeants roar?"

Cicero likewise speaking of himself (in Pison. c. 9. tom. vi. p. 187.), uses this allegorical language: "Nor was I so timorous, that after I had leisureed the ship of the state through the greatest storms and waves, and brought her safe into port, I should fear the cloud of your forehead, or your colleague's petulant breath. I saw other winds, I perceived other storms, I did not withdraw from other impending tempests; but I exposed myself singly to them for the common safety." Here the state is compared to a ship, and all the things that are paid of it under that image, are expressed in metaphors made use of to denote the dangers with which it had been threatened. We have also a very fine example of an allegory in the 86th Psalm; in which the people of Israel are represented under the image of a vine, and the figure is supported throughout with great correctness and beauty. Whereas, if instead of describing the vine as walled by the boil from the wood, and devoted by the wild beasts of the field, the Psaltist had said, it was afflicted by heatises or overcome by enemies, which is the real meaning, the figurative and the literal meaning would have been blended, and the allegory ruined. The learned Bishop Lowth (De Sacra Poëth Hebraeorum, Pral. 10. 11. p. 120—140.) has specified three forms of allegory that occur in sacred poetry. The 1st is that which rhetoricians call a continued metaphor. When several metaphors succeed each other, says Cicero (Orator. c. 27. tom. i. p. 520.) they alter the form of the composition; and this succession has very properly, in reference to the etymology of the word, been denominated by the Greeks αλλαγης, an allegory; although Aritotole, instead of considering it a new species of figure, has referred it to the class of metaphors. The principle of allegory in this sense of the term, and of the simple metaphor, is the same; nor is it an easy matter to restrict each to its proper limit, and to mark the precise termination of the one, and the commencement of the other. For examples of this kind, we refer to Metaphor. This eminently judicious critic observes, that when the Hebrew poets use the congeal figures of metaphor, allegory, and comparison, particularly in the prophetic poetry, they adopt a peculiar mode of doing it, and seldom dilate the imagery which they introduce by any fixed principle or standard. Not satisfied with a simple metaphor, they often run it into an allegory, or blend with it a direct comparison. The allegory sometimes follows, and sometimes precedes the simile: to this is added a frequent change of imagery, as well as of person and tenes; and thus are displayed an energy and boldness, both of expression and meaning, which are unconfined by any fixed rules, and which mark the discriminating genius of the Hebrew poetry. Thus, in Gen. xlii. 9. "Judah is a lion's whelp," this metaphor is immediately drawn out into an allegory, with a change of person: "From the prey, my son, thou art gone up," that is, to the mountains, which is understood; and in the succeeding sentences the person is again changed, the image is gradually advanced, and the metaphor is joined with a comparison that is repeated.

"He roopeneth down, he couceth as a lion:
And as a lioness; whom shall he ouceh him?"

A similar influence occurs in the prophecy, recorded in Psalm cx. 3, which explicitly foretells the abundant increase of the gospel on its first promulgation. This kind of allegory, however, sometimes assumes a more regular and perfect form, and then occupies the whole subject and compass of the discourse. An example of this kind occurs in Solomon's well-known allegory, Eccles. xii. 2—6, in which old age is so admirably depicted. There is also in Isaiah, xxvii. 24—29, an allegory, which, with no less elegance of imagery, is more simple and regular, as well as more just and complete, both in the form and the method of treating it. Another kind of allegory is that, which in the proper and more restricted sense, may be called a parable; and consists of a continued narration of some fictitious event, accompanied by way of similitude to the illustration of some important truth. The Greeks call these allegories μεταγορα, and apologues, and the Latinς fabula, or fables. See Parable. The third species of allegory, which often occurs in the prophetic poetry, is that in which a double meaning is couched under the same words, or when the same discourse, differently interpreted, designates different events, dissimilar in their nature and remote as to time. These different relations are denominated the literal and mythical senses. This kind of allegory, which the learned prelate calls mythical, seems to derive its origin from the principles of the Jewish religion; and it differs from the two former species in a variety of respects. In these allegories the writer may adopt any imagery that is most suitable to his fancy or inclination; but the only proper materials for this allegory must be supplied from the sacred rites of the Hebrews themselves, and it can only be introduced in relation to such things as are immediately connected with the Jewish religion, or their immediate opposites.

The former kinds partake of the common privileges of poetry; but the mythical allegory has its foundation in the nature of the Jewish economy, and is adapted solely to the poetry of the Hebrews. Besides, in the other forms of allegory, the exterior or ostensible imagery is mere fiction, and the truth lies altogether in the interior or remote sense; but in this allegory each idea is equally agreeable to truth. The exterior or ostensible image is itself a reality; and although it sustains another character, it does not wholly lay aside its own. There is also a great variety in the use and conduct of the mythical allegory; in the modes in which the corresponding images are arranged, and in which they are obscurred.
feared or eclipsed by one another. Sometimes the obvious or literal sense is so prominent and conspicuous, both in the words and significations, that the remote or figurative sense is scarcely permitted to glimmer through it. On the other hand, the figurative sense is more frequently found to beam forth with so much peripatetic and rhetorical, that the literal sense is quite cast into a shade, or becomes insensible. Sometimes the principal or figurative idea is exhibited to the attentive eye with a constant and equal light; and sometimes it unexpectedly glares upon us, and breaks forth with sudden and astonishing corruptions, like a flash of lightning bursting from the clouds. But the more or less of this figure, which poises the chief beauty and elegance, is, when the two images, equally conspicuous, run, as it were, parallel through the whole poem, mutually illustrating and correspondent to each other. The learned author has illustrated these observations by instances Telccted from the 2d and 72d Psalms. He adds, that the mystical allegory is, on account of the obscurity resulting from the nature of the figure, and the style of the composition, so agreeable to the nature of the prophecy, that it is the form which it generally, and indeed lawfully affumns, as best adapted to the prediction of future events. It describes events in a manner exactly conformable to the intention of prophecy; that is, in a dark, disguised and intricate manner, sketching out in a general way their form and outline, and seldom defending to a minutest description and exactness of detail. On this subject in its immediate connection with the double sense of prophecy, which some eminent critics and commentators have not only disputed, but absolutely rejected as groundless and fanciful, and leading to great uncertainty of interpretation; see PROPHECY.

Allegories were a favourite method of delivering instructions in ancient times; for what we call fables or parables, are no other than allegories; where, by words and actions attributed to beasts or inanimate objects, the dispositions of men are figured; and what we call the moral, is the unfigured sense or meaning of the allegory. An enigma or riddle is also a species of allegory; one thing represented or imagined by another; but purposely wrapped up under so many circumstances as to be rendered obscure. Where a riddle is not intended, it is always a fault in allegory to be too dark. The meaning should be easily seen through the figure employed to shadow it. However, the proper mixture of light and shade, in such compositions, the exact adjustment of all the figurative circumstances with the literal sense, so as neither to lay the meaning too bare and open, nor to cover and wrap it up too much, has ever been found an affair of great nicety; and there are few species of composition in which it is more difficult to write, so as to please and command attention than in allegories. In some of the visions of the Spectator, we have examples of allegories very happily executed. In the right management of allegories, care should be taken that the same kind of trope be carried through the whole, so as to compose one uniform and consistent line of ideas; otherwise they dress up a chimera, a thing that has no existence, and of which the mind can form no conception. Quintilian very justly observes (Inf. Orat. 1. viii. c. 6,) that "to begin with a tempest and end with a fire, would be very ridiculous and unnatural." It is likewise very necessary that the allusions be all plain and evident, especially where the name of the thing alluded to is not expressed. These are called pure allegories. But where the reference is not evident, it becomes a riddle, which is nothing else but an obscure allegory. To avoid this the best writers use what are generally called mixed allegories, or such as express the proper name of the thing which the whole similitude respects. Of this kind is that in the speech of Philip, king of Macedon, given by Julian (l. xxvii. c. 3.), where he says, "I perceive that cloud of a dreadful and bloody war arising in Italy, and a thunder-storm from the west, which will fill all places with a large flower of blood, wherever the tempest of victory shall carry it." The proper words "war," "blood," and "victory," being joined to the tropes "cloud," "flower," and "tempest," in this sentence, render the several parts of the similitude plain and evident. Quintilian thinks these allegories most beautiful, where the whole similitude is expressed, and those words, which in their proper sense relate to one of the two things, between which the comparison is made, are allegorically applied to the other: as when Cornelius Nepos says of Atticus (cap. x.), "If that pilot gains the greatest reputation, who prefers his ship in a boisterous and rocky sea, ought not he to be thought a man of singular prudence, who, arrived in safety through so many and so great civil tempests?" These are the allegories with which orators are chiefly concerned. See Ward's Oratory, vol. ii. p. 27—31. Blairs Lectures, vol. i. p. 396—399.

The Old Testament is supposed, by many, to be a perpetual allegory, or typical representation of the mysteries of the New. Mr. Collins, in his "Grounds and Reasons of the Christian Religion," pretends, that the Old Testament, literally understood, no where serves the purposes of Christianity; but if it be of any use, it must be understood allegorically. He first recommends allegory, as the only mode of reasoning proper for bringing men to the faith of Christ; and then ridicules this allegorical interpretation as absurd. p. 87, 90, 94, 160. In effect, allegories have entered into most religions. The Jews, we know, abound with them. Philo Judaeus has three books, of the allegories in the history of the fix days. Nor are the heathens without allegories in their religion: it may be even said, that the use of them is of a much earlier standing in the Gentile than in the Jewish world. Some of their philosophers, undertaking to give a rationale of their faith, and to shew the reason and scope of their fables, and the ancient histories of their gods, found it necessary to put another construction on them, and maintain, that they signified something very different from what they seemed to express. And hence came the word allegory, or a discourse that, in its natural sense, significeth something other than what fæces intended by it. This shift they had recourse to, in order to prevent people from being shocked with those absurdities which the poets had introduced into their religion; and to convince the world, that the gods of Greece had not been those vile persons which their histories represented them to be. By this means the history, as well as religion, of Greece, was at once converted into allegory; and the world left to seek for them both in a heap of fables, few of which have been satisfactorily solved, either by ancient or modern writers. The Jews, finding the advantages of this way of explaining religion, made use of it to interpret the fabled writings, so as to render them more palatable to the Pagans. The same method was adopted by the primitive writers of Christianity. The practice of allegorical interpretation, which the Jews had learned from the Egyptians, and which, before the time of Christ, was common among them, the early converts to Christianity brought out of the Jewish into the Christian church. Some traces of this method we find in the New Testament, particularly in St. Paul's argument against the Jewish advocates for the perpetual and universal obligation of the Mosaic ritual, drawn from the history of Abraham, in the epistle to the Galatians, ch. iv. 22; and in the typical application
application of the ceremonial appointment of Moses to the Christian intimation, in the epistle to the Hebrews. But a rks sober and judicious use was made of this kind of lan-
guage by the Christian fathers. This was more especially,
the case with those Gentile converts who had been educated
in the Alexandrian school, where, by the help of allegory,
the several systems of philosophy were mixed and confounded;
and with those Jewish Christians, who, by the same
means, had been instructed in the Cabalistic doctrines,
which, before this time, had sprung up in Egypt, and passed
thereinto in Judæa. Several of those sects of Christians,
who were called heretics, particularly the Valentinian Grift-
tics, made use of allegorical language, to disguise the unna-
tural alliance which they had introduced between the fanciful
degrees of the oriental philosophy and the simple doctrine
of Christ. The orthodox fathers of the church, too, de-
defended themselves with the same armour, both against heretics
and infidels, applying, with more ingenuity than judgment, the
symbolical method of interpretation to the sacred scriptures.
In the same manner in which Philo and other Alexandrian
Jews had corrupted the Jewish church, Clemens Alexan-
drinus, Origen, and other disciples of the Alexandrian
school, in the second century, introduced error and corruption
into the church of Christ. Whitty on the interpretation of
Scripture, Lond. 1744. Brucker's Hist. Philos. by

Allegories are distinguished into divers kinds, as verbal,
real, simple, allusive, physical, moral, political, theological, &c.
Allegory, simple, according to some writers, is that
which is taken from any kind of natural things.
Allegory, allusive, is that which relates to other words,
or things.
Allegory, verbal, is a thread, or series of metaphors;
or a continuation of the same trope, chiefly metaphor,
through many words. Such is that in Virgil:

"Claudite jam rivos puri, fat prata bibrurent."

Where the metaphor of watering the ground is carried on
to the fluntings of the slaves, &c.

Allegory, perpetual, or continued, is that where the al-
legorical thread is pursued through all the parts of a con-
 siderable discourse. Such are the books of Jonah, of Can-
ticles, of Job, not to say the whole Old Testament, accor-
ding to the hypotheses of divineines.

Allegories, physical, those wherein some point of na-
tural philosophy is represented: such in Homer, are Juno,
who represents the air; Jupiter, the ether, &c.

Allegories, medical, those wherein some secret of phyt-
ology is revealed: such is Solomon's description of old age, Eccle-
sev. xx. 1, &c, wherein, according to certain authors, the cir-
culation of the blood is indicated: such also, according to a
modern writer, is the story of the labours of Hercules.
For an illustration of Solomon's allegorical description of
old age, see Mead's Medica Sacra, chap. vi.

Allegories, chemical, those relating to chemistry: such,
according to Snider, and many moderns, is the story of the
Argonautic expedition, wherein the process of making gold
is exactly described: such also, according to Tellus, is the
name and title of Baal, Valentine, Benedictine, Monk: under
which are concealed the secrets of the philosophical mercury.

Allegories, moral, those whereby some useful moral
instruction is held forth: such, in Homer, is the victory of
Diomedes over Venus, or sufficiently: such also are the Py-
thagorean metempsychyphics, and the story of the judgment
of Hercules, related by Proclus. To which may be added,
the fables of avarice and luxury; of the grutes of grief, and
and others in the Spectators and Tatlers. Spectat. N° 55.
Trot. N° 97.

Allegories, poetical, those wherein some maxim of good
government is artistically wrapped up: such is that celebrated
one of Menonius Agrippa, whereby he prevailed on the Roman
people, who had withdrawn in discontent at the magistrates,
to return into the city: to which purpose he related them
the parable of a wear raked by the several parts of the human
body against the Roman.

Allegories, theological, those wherein some truth relat-
ing to the nature and attributes of God is copered.

Allegory is also used for the drawing of some words,
plainly and literally intended at first, from their natural and
proper meaning, to a foreign sense; for the better instructing
of our minds in some point of faith or manners. This co-
incides with what is otherwise called accommodation.

Allegory, in Painting, is used as in poetry, and
sometimes too licentiously, by painters, who, while they
enrich their pictures by allegories, offend the spectator,
especially in representations of modern history. Rubens,
his works are full of great and noble ideas, cannot be
justified in the licentious treatment of allegory in his famous
pictures representing the history of Marcus of Medecis, and
in several of others of that great master's works, which
could be mentioned. In the Luxembourg gallery Rubens has so
united the Christian ceremonies with heathen mythology as
greatly to offend the eye of the intelligent spectator, not-
withstanding the grandeur of the composition and richness
of the colouring, which are produced by this very means.
A great general has been represented crossing a river with
his troops; an armed warrior trudging over a stream of wa-
ter flowing from an urn held by a river god; which would,
it is apprehended, have been expressed with greater propriety
by the general holding his truncheon, while those troops, at
a distance, were represented as fording a river. Allegory
seems better employed in poetical subjects than in historical
representations. See more upon this subject under the
article Painting.

ALLEGRI, GREGORIO, in Biography, an eminent mu-
atical composer of the 17th century, was a native of Rome,
and by profession an ecclesiastic. He was a disciple of
Nei
who was contemporary with Palestrina, and his in-
imate friend. His abilities as a singer were incomparable,
and yet he was accounted an admirable master of harmony;
and to much was he esteemed by all the musical professors
of his time, that the pope, in order to appropriate him to his
service, appointed him to be one of the singers of his chas-
pel in 1629. To his extraordinary merit as a composer of
church music he joined a devout and benevolent disposition,
and an excellent moral character; for he not only afflict
the poor, by whom his door was usually crowded, to the
utmost of his power, but daily visited the prisons of Rome,
in order to bestow his alms on the maimed and dis-
tressed objects he could find in them. He set many parts of
the church service with such divine simplicity and purity of
harmony, that the lads of him was much felt and sincerely
lamented by the whole college of singers in the papal ser-
vice. He died Feb. 18th, 1652; and was buried in the
Chiesa Nuova, before the chapel of S. Filippo Neri, near
the altar of annunciation, where is a vault for the reception
of deceased singers belonging to the pope's church.

Among his works preferred, that are still in use, is the
famous Missa, which, for upwards of 150 years, has
been annually performed at the pope's church in Rome on
Wednesday and Good Friday in Passion week, and which in
appearance is so simple as to make those who have only seen it
on paper wonder whence its beauty and effect could arise, and
which owes its reputation more to the manner in which it is
performed than to the composition: the same music is many
times repeated to different words, and the fingers have, by
tradition, certain custom, expressions, and grace of con-
vention (certe espressioni e gruppi), which produce great ef-
sacts, such as swelling and diminishing the sounds altogether,
accelerating or retardating the measure at some particular
words, and singing some entire verses quicker than others.
This information was furnished to the author by signor SAN-
tarelli, the pope's maestro di capella. And Andrea Adami
affirms, in his Observazioni sopra le opere di Cl. Pont. 
1711, p. 56, "that after several vain attempts by preceding
composers, for more than a hundred years, to set the fame
words to the satisfaction of the heads of the church, Greg-
gorio Allegri succeeded so well as to merit eternal praise;
for with few notes, well modulated and well understood, he
composed such a Miserere as will continue to be sung on the
same day, every year, for ages yet to come; and one that
is conceived in such just proportions as will sustain future
times, and ravish, as at present, the soul of every hearer.

However, some of the great effects produced by this
piece may, perhaps, be justly attributed to the time, place,
and solemnity of the ceremonials used during the perform-
ance: the pope and conclaves are all prostrated on the
ground; the candles of the chapel and the torches of the
balustrade are extinguished one by one; and the last verse of
this plain is terminated by two choirs; the maestro di capella
beating time flower and flower, and the fingers dimin-
ishing or rather extinguishing the harmony, by little and
little, to a perfect point.

It is likewise performed by select voices, who have fre-
quent rehearsals, particularly on the Monday in Passion
week, which is wholly spent in repeating and polishing the
performance.

This composition used to be held so sacred, that it was
imagined excommunication would be the consequence of an
attempt to transcribe it.

Padri Martini said that there were never more than three
copies of it made by authority, "one of which was for the
emperor Leopold, one for the late king of Portugal, and the
other for himself." Of this last he favoured the author with
a transcript at Bologna, and signor Santarelli indulged him
with another from the archives of the pope's chapel. Upon
collating these two copies, they were found to differ very little
from each other.—Purcell, date of Music in France and Italy.

Before we quit a subject so interesting to the lovers of
church music, we shall add the following anecdote, with
which we were likewise favoured by signor Santarelli.

"The emperor Leopold, the first, not only a lover and pa-
tron of music, but a good composer himself, ordered his
ambassador at Rome to entreat the pope to permit him to
have a copy of the celebrated Miserere of Allegri, for the
use of the Imperial chapel at Vienna; which being granted,
he copied it by the maestro of the pope's chapel, and sent to
the emperor, who had then in his service some of the first figures of the age; but, notwithstanding the abilities of the performers, this composition was so far
from answering the expectations of the emperor and his
court in the execution, that he concluded the pope's maes-
tro di capella, in order to keep it a mystery, had put a
trick upon him, and sent him another composition. Upon
which, in great wrath, he sent an express to his holiness,
with a complaint against the maestro di capella, which
occurred his immediate disgrace, and dismissal from the
service of the papal chapel; and in so great a degree was
the pope offended, at the suppos'd imposition of his com-
poser, that, for a long time, he would neither see him nor
hear his defence. However, at length, the poor man got
one of the cardinals to mediate his cause, and to acquaint
his holiness that the style of singing in his chapel, particu-
larly in performing the Miserere, was such as could not be
expressed by notes, nor taught nor transmitted to any other
place, but by example, for which reason the piece in question,
though faithfully transcribed, must fail in its effect
when performed elsewhere. This holiness did not under-
stand music, and could hardly comprehend how the same
notes should sound differently in different places; how-
ever, he ordered his maestro di capella to write down his
defence, in order to be sent to Vienna, which was done;
and the emperor, seeing no other way of gratifying his
wishes with respect to this composition, begged of the
pope that some of the musicians in the service of his hol-
nies might be sent to Vienna, to instruct those in the service
of his chapel how to perform the Miserere of Allegri, in
the same expressive manner as in the Sistine chapel at Rome,
which was granted. But, before they arrived, a war broke
out with the Turks, which called the emperor from Vi-
nena; and the Miserere has never yet, perhaps, been truly
performed but in the pope's chapel.

With respect to the intrinsic worth of this renowned
Miserere, as a musical phenomenon, we know that more sublime
compositions have been produced, since Allegri's time, by
musicians of superior genius; but the words were thought
by the heads of the Roman church to be fit with so much
more propriety, reverence, and effect, than by any former
ecclesiastical composer whose productions had been allowed
admission into the service of the papal chapel during the
holy week, that, besides the manner in which it was per-
formed, its merit was perhaps somewhat exaggerated in
imagination by the mystery with which it was sedulously
preferred from profane examination.

ALLEGRINI, FRANCESCO, an engraver, who lived at
Florence, and flourished in 1760. By him we have many
portraits, from different masters. The image of St. Francis
d'Alfie is held in high estimation at Vienna, in the church
named l'Alberino. Strutt.

ALLEGRO, Ital. Majo, denotes gay, cheerful, quick.
The force of this term is augmented by the words più, afai,
and the superlative degree of comparison, as più allegro,
more quick; allegro afait, and allegroffino, very quick. It
has likewise its diminutives, as poco allegro, and allegrettto,
slow, gay, cheerful, or quick. Allegro is the degree of time
between Andante and Presto, which vce.
with the terms of conformity, he preferred the alternative, imposed by the act of uniformity, of quitting his living after having retained it for 20 years, and of ranking with about 2000 other sufferers, who were distinguished by the denomination of ejected ministers. Under the restraints and penalties of this act, he exercised his ministry in the house of Mr. More, who had been formerly a member of parliament, and who lived in his neighbourhood; and though he was reprimanded by the magistrates and imprisoned, his reputation for piety, learning, and exemplary conduct, procured a mitigation of the rigorous treatment with which he encountered. In consequence of "The Five-mile Act," he was under a necessity of removing from Batcomb to Frome-Selwood, where he continued in the discharge of his professional duties, notwithstanding the dangers to which he was exposed. In this situation he remained, till death terminated his trials and labours in 1681. He was distinguished by his plain, practical, and pathetic manner of preaching, and by his affability in the duties of his pastoral office, such as catechising, visiting the sick and instructing the ignorant. Although he was an avowed non-conformist, and rigidly attached to his principles, the moderation of his temper, as well as his general character, recommended him to the clergy and laity of sentiments different from his own, and he lived amongst them on terms of friendship and intercourse. Mr. Jenkins, vicar of Frome-Selwood, preached his funeral sermon, and bore testimony to his piety, meekness, and moderation. His works, which were all of the devotional kind, were much esteemed, and frequently reprinted. The principal of these was his "Vindiciae Pictatis," or, "A Vindication of Godliness, in the greatest finned and spiritualty of it, from the imputations of folly and fancy," which was published in 1665, without a printer's name, because it was not licensed; but all the copies of it were seized and sent to the king's kitchen for wastepaper. They were afterwards bought by the king's bookfeller, who had caused them to be seized, at a cheap rate, and sold; for which artifice he was brought on his knees to the council table, and the books were again sent to the king's kitchen and bilked, i.e. bruised over with ink, so as to be illegible. The other works of Allen were "Heaven opened, or a brief and plain discovery of the riches of God's covenant of grace," printed in 1666; "The World Conquered," 1668, 8vo.; "Godly Fear," 1674. 8vo.; "A Refutke to Backfiders, and a Spar for Loiterers," 1677, and 1684, 8vo.; "A Companion for Prayer," 1680, 12mo.; "Instructions about Heart-work," &c. 1681, 8vo. Calamy's Life of Baxter, vol. ii. Wood's Athen. Oxon. vol. ii. Biog. Brit.

ALLEIN, Joseph, a nonconformist divine, was born at Devizes, in Wilts, in 1634. Having manifested at a very early age an eminently pious disposition and an inclination for the ministry, he was educated with this view and sent to Oxford at the age of 16 years. At college he was distinguished by diligence in his studies and gravity in his deportment. In 1653 he became a tutor in the college of Corpus Christi, to which he belonged, and where, for the exercise of his gifts in prayer, he had performed the office of chaplain, which he preferred to a fellowship; and in this situation he was so affiduous and so successful, that many of his pupils occupied respectable situations both in the established church and among the nonconformists. In 1655 he left college, and was assistant minister at Taunton Magdalens, in Somersetshire, until the year 1662, when he was deprived for nonconformity. During this connection he was indefatigable in his ministerial services, and his conduct was so amiable and exemplary, as to secure the affectionate esteem and attachment of his parishioners. After his exclusion from the church, he persevered in his labours, and preached commonly six or seven, and sometimes 14 or 15 times a week; till in 1663 he was convicted of seditious libels, for which seven ministers and 50 quakers were closely confined and enduring similar sufferings. At this period Allen was convicted of having preached in the preceding May, and sentenced to pay 900 marks, and to remain in prison till the fine was paid. "I am glad," said he on receiving his sentence, "that it has appeared before my country, that whatever I am charged with, I have been guilty of nothing but doing my duty; and that all which appeared from the evidence was, that I sung a psalm, and instructed my family, others being there, and both in my own house." By an imprisonment of 12 months, Allen's constitution was impaired and the duration of his life shortened. After his release he renewed his labours, and his sufferings were all renewed; his health gradually declined; and in 1668 he finished his course, at the age of 35 years. His biographers, Anthony Wood excepted, bear testimony to his learning and charity. Zealous in his own mode of worshipping God, he was not, as ministers of the established church have testified, in the least bitter towards any Christians who worshipped in another manner. He preferred a great respect for the church, notwithstanding all his sufferings, and was eminently loyal to his prince, notwithstanding the severities of the times. His writings breathe a true spirit of piety, for which they have been always and deservedly esteemed. His works are, "An Explanation of the Assembly's Shorter Catechism," 1676, 8vo.; "A Call to Archippus," exhorting the ejected ministers to continue in their ministrations, 1664, 4to.; "An Alarm to the Unconverted," 1672, 8vo. and 12mo. of which 20,000 were sold, and after it was printed in 1675 under the title of "A Sure Guide to Heaven," 5000; "Christian Letters, full of Spiritual Instruction," 1672, 8vo.; "Cates of Conscience," 1672, 8vo.; "Remains, &c." 1672, 8vo.; and several other small practical pieces; besides an imperfect body of natural theology in Latin, which has not been printed. An account of his life and death is often annexed to his writings. Calamy's Baxter, vol. ii. p. 577, &c. Neal's HIst. of the Puritans, vol. ii. p. 670, 4to. Biog. Brit.

ALLELENGONY, in Antiquity, a kind of tax, or tribute, which the rich paid to the poor, when abluent in the armies.

ALLELOPHAGI, from ἀλλὰ, one another, and φάγει, I eat, in Natural History, a term used by Mousquet, and other writers on insects, to express a peculiar genus of flies, which feed on one another. They are thus called in distinction from another class, called the heterophagi, from their feeding on different substances, not on one another.

ALLELUJAH. See HALLELUJAH.

ALLEMAENGLIC, in Geography, a small Moravian settlement on Swatara river, in Pennsylvania.

ALLEMAND, a river of America, which falls into the Mississippi from the south-east, about 43 miles south of the Natchez.

ALLEMANNIC, in Music, an ancient movement in common time, moderately quick; supposed, from its title, to be of German invention. In almost every nation, or country for the harpsichord in Handel's time, there was a prelude, an almand, a farand, a courant, and a jig, which see. Rousseau says, the almand is a dance very common in Switzerland and Germany, as it became in England a few years ago. But the almand for dancing is very different from those in the works of Corelli, Handel, and Mattheson.
ALLEN, Thomas, a learned divine, was born in 1575, educated in the King's School at Worcester, and removed to Oxford in 1589, where he made a great progress in philosophy, and became a noted disputant. He took orders, but applied to the abstruse and critical parts of learning more than to preaching. He wrote in Latin "Observatio on St. Chryfolam's book upon Paulus," published in Sir H. Savile's edition of Chryfolam's works, and affix'd his name to this father's homilies on the Evangelists. Savile represents him "as a learned man, and no less skil'd in the Greek learning than in divinity." He died in 1636, and was buried in the chapel of Eton-college, of which he was a fellow. Biog. Brit.

ALLEN, Benjamin, M. D., published in the year 1700, at London, "The natural history of the chalybeate and purging waters in England," 8vo. This was reprinted in the year 1711. He gives the analysis of the several waters, which he places under the heads of chalybeate, saline, fulphrous, or mixed, and attributes their virtues to a subtle gas or spirit with which they suppose they are imbued. There are 60 memorials extant of the life of this writer.

ALLEN, John, M. D. F. R. S., published in the year 1719, "Synopsis universae Medicinae Practicae," 8vo. The work is dedicated to the president and fellows of the Royal College of Physicians, London; and comprises brief descriptions, and accounts of all the diseases incident to the human body, with the most approved modes of treating them; taken, as the author everywhere acknowledges, from the most eminent writers, ancient and modern. Of this work the author speaks very modestly, and particularly admonishes the reader not to content himself with the abstractions that he has given, "sed patius authores ipso ubicunque confutavit; num in "transfusibus," he adds, "eorum sententiar, veritatis et, me frequenter error, aut solam semem docum, aut imperius "recte tradidisse. Dulcia ex ipso fonte bilatam aqua." The work was, however, received with such avidity, not only in England but in all parts of Europe; in the space of a very few years, it passed through numerous editions, to which, from time to time, the author made such additions, as increased it to nearly double its original bulk. In the year 1734 he gave an English translation, which was published in two volumes, 8vo.; it had been before translated into French. The author appears to have practised medicine in London, but no particulars of his life have been published.

ALLEN, Florin Van, an engraver, who flourished in 1686. He drew the town of Vienna, in 1696, and engraved the town of Prague, a large, flight print, with many figures. Strutt.

ALLEN, Francis, an obscure engraver of Lubeck, who flourished in 1652.
ALLERSPERG, a town of Germany, in the circle of Franconia, six leagues south of Nuremberg.

ALLERTON, called in the Polish language Olszynka, is a small town with a castle in the province of Ermeland, situate on the river All, and built in 1697.

ALLERTON, a town of Germany, in the archduchy of Austria, seven miles north of Bavarian Waldhoven.

ALLESANI, a town of Corfica, 13 miles east-north-east of Corte.

ALLESTRY, Richard, in Biography, an English episcopahal divine, was born at Uppington, near the Wreken, in Shropshire, in the year 1619, and after receiving part of his education at Coventry, under Philemon Holland, the translator, was entered a commoner in Christ-church, Oxford, under the tuition of Richard Buby, afterwards Dr. Bull, the famous master of Westminister school. From a course of study and improvement, in which after he had taken the degree of bachelor of arts, he was chosen moderator in philosophy, the direction of the times suddenly called him forth to military service. In this new occupation, he and the other Oxford scholars, manifested their loyalty; but having been protected and supported by Sir John Byron, with a party of horse, Allestry and his associates returned to their studies. It was not long before their safety was again endangered by a republican party, who entered Oxford for the purpose of plundering the colleges. Allestry contrived secretly to remove the booty which they had collected; and as soon as it was known that he was the cause of their disappointment, they feized him, and would probably have treated him with severity, if they had not been suddenly called away by the earl of Effex. On a subsequent occasion he was taken prisoner by a party of horse, but when the parliament garrison at Broughton-house, whither he was conveyed, surrendered to the king's forces, he was released. Allestry refraining his studies, took his degree of master of arts. As soon, however, as he recovered from a disorder which threatened his life, and which had prevailed in the garrison at Oxford, he entered again into the king's service, and encountered the fatigues and hazards of a military life, in the humble station of a common soldier. In this service, blending the watchings of a soldier with the incursions of a scholar, he continued till the end of the war; and when the republican party became triumphant, he retired to his college. Here he was employed in the office of censor, and as private tutor to several students; and though he had no prospect of ecclesiastical preferment, he entered into holy orders. Still zealously attached to the royal party, he signed the decree passed in the university of Oxford, against the solemn league and covenant. In consequence of this act, he and other members of the university, with whom he concurred, were proscribed and banished from Oxford by the parliamentary visitors. To him, however, a short refuge was granted for settling his affairs, "because, as one of their number affected, 'he was an eminent man.'" During the depression of the royalists he found an asylum, and in the house of Francis Newport, Esq., in Shropshire, where he officiated as chaplain, and afterwards in that of Sir Anthony Cave, in Oxfordshire. His talents and fidelity rendered him an useful and active instrument in preparing the way for the restoration of Charles II. In one of his expeditions for this purpose he was seized at Dover by a party of soldiers, and committed to the jail of the king's friends at Lambeth house. Upon his release from confinement, he proposed to visit his friend Dr. Hammond, at Welwood, near Worcester; but when he approached his house, he met

his
his funeral procession. Of his esteem, however, he received a valuable testimony in the legacy of his library, which was bequeathed to him for this reason; because the tellator "well knew that the books in his hands would be useful weapons for the defence of the cause which he had during life so vigorously supported."

Soon after the Restoration, Allestry returned to Oxford, and took the degree of doctor in divinity. In recompense of his past services he was soon made a canon of Christ church, one of the king's chaplains in ordinary, and regius-professor of divinity. In 1665 the king conferred upon Dr. Allestry the provostship of Eton college, which he held till his death. To this college he was a munificent benefactor, by retaining his own dues in order to pay off its debts, and by erecting at his own expense the west side of the outward court of the college; nor was he less liberal in other respects, as he settled pensions on indigent persons and families, and distributed his income in occasional charities. At the instance of Dr. Allestry, and in compliance with the petition of the provost and fellows of King's college, Cambridge, the king paupered a grant under the broad seal, that, whereas formerly the fellowships of Eton were generally disposed of to persons of foreign education, for the future five of the seven fellows should be such as had been educated at Eton school, and were fellows of King's college. In 1679, Dr. Allestry, finding his health, and particularly his sight, much impaired, resigned his professorship of divinity; and in 1681 a drooping terminated his life, and he was buried in Eton chapel, under a monument of white marble, on which is inscribed a Latin epitaph, distinguished by its terseness and elegance. A biographer in an account of his life prefixed to his sermons represents Dr. Allestry as a man of uncommon talents and singular merit. "Memory, fancy, judgment, eloquence, great modesty, and no less assurance; a comprehension of things, and a facility of words; an aptness for the pleasant, and sufficiency for the rugged parts of knowledge; a courage to encounter, and an industry to master all things, make up the character of his happy genius. There was not in the world a man of clearer honesty and courage; no temptation could bridle him to do a base thing, or terror fright him from the doing a good one. This made his friendships as lastingly and inviolably as his life, without the dirty considerations of profit, or fly reserves of craft; not the pageantry of ceremonious address, or cold civility, much less the servile fawning of obsequious flattery." Whatever may be thought of his political principles, no doubt can be entertained of his constancy; and of the benevolence of his disposition, his numerous acts of liberality afford sufficient evidence. Of his literary talents, politeren can only judge by a volume of forty sermons, printed in folio at Oxford, in 1684; and excepting one singular instance of credulity which they furnish, they do no discredit to the memory of the author. His lectures, which gave satisfaction to those who heard them, he would never be prevailed upon to publish. His valuable library he left to his college. Biog. Brit.

ALLESTY, JACOB, a poet of the 17th century, was the son of a bookseller, in London, and entered Christ church, in Oxford, in 1651, at the age of 18 years. He took the degrees of bachelor and master of arts, and was music-reader in 1659, and terræ-filius in 1662, both which offices he executed with great applause, as he was esteemed a good philologist and poet. He died in 1686, in consequence, as it is said, of the vices of his youth, and was buried in the church of St. Thomas, at Oxford. The pieces of poetry, written by him, were printed in a book, entitled, "Examen Poeticum". Biog. Brit.

ALLEURI, or ALLODE, in Antiquity. See Allodium.

ALLEYARD, in Geography, a town of France, in the department of Here, and district of Grenoble, six leagues north-north-east of Grenoble.

ALLEYRE, the smallest copper coin that is struck in Sweden; it is not worth quite two deniers Tournois of France, or about 3d of English money.

ALLEVIARE, in Old Records, to levy or pay an accustomed fine or composition.

ALLEVIATION, denotes the art of making a thing lighter, and easier to bear or endure.

The word is originally Latin, compounded of ad, to; and levare, light.

In which sense, alleviation is synonymous with lightening, and lands opposed to aggravation.

ALLEX, in Geography, a town of France, in the department of the Drome, and district of Crest, on the north side of the Drome, 10 miles south of Valence.

ALLEY, WILLIAM, in Biography, bishop of Exeter, in the reign of Queen Elizabeth, was born at Great Wycomb, in Buckinghamshire, educated at Eton School, and removed to King's college, in Cambridge, in 1528. Here he took the degree of bachelor of arts, and afterwards pursued his studies at Oxford. He was a zealous reformer; and upon Queen Mary's accession he quitted his benefice, and travelled in the northern parts of England, where he was not known, gaining a decent subsistence by the practice of physic and the instruction of youth. When Queen Elizabeth ascended the throne, he came to London, and acquired such reputation in preaching the divinity lecture at St. Paul's, that he was consecrated to the see of Exeter in 1569; and in 1561 he was created doctor of divinity at Oxford. He died in 1570, as some say, according to others in 1571, and, as Fuller says, in 1576, and was buried at Exeter, in the middle of the choir. Over his tomb is a Latin inscription, representing him as "a zealous advocate for the truths of the Gospel, eminent for his virtues, and remarkably skilled in all the useful parts of learning." He wrote "The Poor Man's Library," a miscellany, in two volumes, containing lectures upon the Epistle of St. Peter, and "An Hebrew Grammar." When the version of the Bible was undertaken by command of Queen Elizabeth, this bishop translated the Pentateuch. "His Judgment concerning the Doctrine and Discipline of the Church," has been published by Strype in his Annals of Queen Elizabeth. Biog. Brit.

ALLEY, derived from aller, to go, in Gardening, signifies a narrow or confined path between beds, borders, or other compartments of a garden, and is chiefly formed for the convenience of going between them, in order to perform the necessary offices, such as hoeing and weeding the plants, and also to cut, pick, and collect the plants or fruits. Alleys are made of different breadths, according to the sizes of the beds or compartments; but in general a breadth from one to two feet is sufficient. In extensive kitchen-gardens, where borders are carried round near the walks, and immediately adjoining the main quarters of the ground, they should be divided from them by two feet alleys, for the convenience of carrying in dung, water, &c. and the large compartments should likewise be divided by one or two crofs alleys, with the same intention. Alleys between asparagus beds should confantly be two feet wide; these between strawberries, a foot and a half; but between beds of aromatic herbs, fifteen inches may be fully sufficient; and between beds of onions, leeks, carrots, parsnips, lettuce, endive, and all other small crops, the width of ten or twelve inches is as much as is requisite in general; and the same distance between beds of feeding and pricked-out cabbages, savoys, celery, &c. for the convenience of going in to weed, water, and draw the young plants for transplantation, will be the most convenient. Alleys are frequently intended both for

4 X

life
...and ornament in flower-gardens; therefore, between beds of tulips, hyacinths, ranunculuses, amonites, and other small garden-flowers that are bedded, they should in general be eighteen inches or two feet wide; and in order to have them ornamental, the beds should be edged with box, and the alleys filled with the best coloured fine gravel; or where that cannot be readily procured, with sand, shells, or other porous substances. See **Gravel Walks**.

**Alley, in Droll Husbandry**, implies the vacant space between the outermost row of corn on one bed, and the nearest row to it on the next parallel bed. In the practice of drilling it was at first supposed that narrow alleys would not answer the end for which they were intended; while, on the other hand, the making them very wide would be a loss of ground; about four feet, exclusive of the spaces or partitions, between the rows of corn in the beds, was therefore considered as the most suitable and convenient distance. But as it is obvious, that it is not necessary to make the alleys so wide in good soils as in those of inferior quality, and that some sorts of crops require much larger spaces than others; the intelligent husbandman should always decide what breadth is the most proper in different cases, and for different purposes; one circumstance must, however, be duly attended to, which is, that wide alleys are more easily and much better filled between than those that are narrower; for, when an alley is wide, the large furrow in the middle of it may be cut deep, there being then sufficient room to turn the earth over towards the rows, while, on the contrary, the earth where alleys are narrow cannot be thrifed deep enough, nor can room be found for what is turned over out of the furrows, without danger of burying some part of the rows of corn or other crops that may be cultivated. In hoeing these spaces the whole of them is not to be thrifed, either with the plough or cultivator, when the crop appears; neither of these instruments should go too near the rows of corn or other crop, for fear of rooting up the rows of corn or young plants; but a slip of earth, about six inches wide, is directed to be left untrenched on the outside of each bed, by which means the part of the alley that is to be thrifed will be reduced to the breadth of three feet; and even that space is lessened in the first ploughing before winter by a deep furrow, which is then cut close to, and all along those six-inch slips, and the earth taken out of each furrow is thrown into the great furrow in the middle of the alley, which it fills and arches up. These two side-furrows make together a breadth of about eighteen inches, and consequently leave, in the middle of the alley, a space of about eighteen inches more, on which is heaped up the earth thrown out of the two furrows; and thus the alleys are to remain during winter. By the first hoeing in the spring, the earth heaped up in the middle of the alleys is to be turned back towards the rows of corn. The two furrows that were opened before winter are then filled up, and a new one is cut in the middle of the alley. This business may be very easily performed with the common plough; two turns of that instrument being frequently sufficient for the purpose, one on each side of the alley, as near as possible to the beds. But when these two turns are not sufficient to form the furrows perfectly, or where too much earth remains between it and the bed, a third turn becomes necessary, and sometimes a fourth, in order to hollow the middle furrow as it ought to be. When this work is performed with the cultivator with two mould-boards, the instrument must be placed in the middle of the alley, and the horSES in one of the two furrows; the share readily entering a great depth into the earth, which was laid there by the left hoeing before winter, the horSES advancing, the ridge of the earth is divided into two parts, and fills up the furrows that were made before winter, on each side of the alley, close to the beds. Thus, the high furrow in the middle of the alley may be opened, and the whole operation performed by a single turn of the cultivator; by which so much time and labour is saved, that the farmer may afford one or two hirings more in the summer, which will be of great utility in many cases. See **Cultivator, Horse-hoeing, and Droll Husbandry**.

**Alleyn, in Perfecitatis**, is that which is larger at the entrance than at the exit; to give it the greater appearance of length. **ALLEYN, Edward, in Biography**, a celebrated comedian, was born in London in 1566, and trained at an early period to the stage, for which he was naturally qualified by a stately port and aspect, corporal agility, flexible genius, lively temper, retentive memory, and fluent eloquence. Before the year 1592 he seems to have acquired a very considerable degree of popularity in his profession; he was one of the original actors in the plays of Shakspeare, and a principal performer in some of those of Jonson; but it does not now appear what were the characters which he performed. They were probably the most dignified and majestic, for to these the portly and graceful figure of his person was well adapted. At length he became master of a company of players, and the proprietor of a play-house, called the Fortune, which he erected, at his own expense, near Whitecrofts-court; and he was also joint proprietor and master of the Royal Bear-Garden, on the Bank-side, in Southwark. By the profits accruing from these occupations, added to his paternal inheritances, and to the dowries of his two wives, by whom he had no children, he amassed a considerable property, which he bequeathed in a manner that has reconciled more to his honour than his profissional merit. The wealth thus acquired enabled him to lay the foundation of a college, for the maintenance of aged people, and the education of children, at Dulwich, in Surrey, which institution, called, "The College of God's Gift," subsists at this time in an improved and prosperous state. The liberal founder, before he was 48 years of age, began this building after the design, and under the direction, of Inigo Jones; and it is presumed that he expended eight or ten thousand pounds upon the college, chapel, &c. before the buildings and gardens were finished, which was about the year 1617. It is hardly necessary to mention a fabulous tradition concerning the origin of this college, recorded by Mr. Aubrey. The idle traditions, which deserves no credit, and needs no confutation, reports, that Mr. Alleyn, "playing a demon, with fix others, in one of Shakspeare's plays, was, in the midst of the play, spurried by the apparition of the devil, which so worked on his fancy, that he made a vow, which he performed at this place." After the founder had built this college, he met with difficulties in obtaining a charter for settling his lands in mortmain, that he might endow it, as he promised, with 800l. per annum, for the support and maintenance of one master, one warden, and four fellows, three of whom were to be ecclesiastics, and the other a skilful organist; all fix poor men, as many women, and twelve poor boys, who were to be maintained and educated till the age of 14 or 16 years, and then put out to honest trades and callings. The master and warden were to be unmarried, and always to be of the name of Allen or Alleyn. At length the opposition of the Lord Chancellor Bacon was overcome, and Alleyn's benefaction obtained the royal licence, and he had full power granted him to establish his foundation, by his Majesty's letters patent, under the great seal, bearing date June 21, 1619. When the college was finished, the founder and his wife resided in it, and conformed in every respect to the regulations established for the government of his almshouses. Having, by his will, liberally provided for his widow, and for founding 20 almshouses, in the parish of St. Botolph, with-
out Bishoptgate, in which he was born, and ten in St. Saviour’s parish, Southwark, and bequeathed several small legacies to his relations and friends, he appropriated the residue of his property to the use of the college. He died in 1626, in the 61st year of his age, and was buried in the chapel of his own college. The chapel, master’s apartments, &c. are in the front of this building, and the lodgings of the other inhabitants, &c. in the two wings, of which that on the call side was handsomely new built, in 1739, at the expense of the college. They have a small library of books, and a gallery of pictures, with that of the founder at full length. The inscription over the door concludes with these words: “Abi tu, et fac finmitter;” i.e. Go thou, and do likewise. Bifl. Brit.

A.I., in Botany. See CHENOPORIUM.
A.I.I., or SEMISIUS, in Antiquity Geography, a river of Britunia, in Italy.
A.I.I.A, a small river of Italy, in the territory of the Sabines, to which Virgil (lib. vii. v. 717.) annexes the epitaph of “infantum nuncith,” in allusion to the defeat of the Roman army by the Gauls on the banks of this river, when, in the year of Rome 363, 40,000 Romans were either killed or put to flight. Hence, “Alienis dies,” is in their almanacks marked as an unlucky day, i.e. the 18th of July, which was the anniversary of this battle. Livy (lib. vii. c. 37. tom. ii. p. 167.) represents this river as running down a very steep channel from the mountains of Cilurnum, at the 11th mile-stone, and mixing with the Tiber. Our ancestors, says Cicero (ad Attic. lib. ix. 5. tom. viii. p. 553.) deemed the day of the battle of Allia, more fatal than that of the capture of the city.

AIIANCE, in the Civil and Canon Law, the union or connection of two persons, or two families, by means of marriage; otherwise called affinity.

The word seems formed of the Latin adligatio, q. d. a tying together.

The law of the Twelve Tables forbids all alliance between persons of unequal rank and condition. And in Portugal, we are told, the daughters of the nobility are prohibited to ally with such as have never been in the wars.

AIIANCE is also extended to the leagues or treaties concluded between foreign princes and states, for their mutual safety and defence; in which sense they are the same with what we otherwise call confederacies, leagues, &c. Alliances make a species of treaties, which are usually divided into treaties of peace, of commerce, and of alliance, properly so called. There are sometimes particularly denominated foreign alliances.

Alliances are variably distinguished, according to their object, the parties in them, &c. Hence we read of equal, unequal, triple, quadruple, grand, offensive, defensive, &c. alliances. Unequal alliances, societas nequialia, are those wherein one of the contracting parties promises patronage or protection, and the other fidelity and observance; by which they stand contradistinguished from alliances, wherein the several powers treat on a par. Offensive alliance, is that whereby the parties oblige themselves jointly to attack some other power. This stands contradistinguished from defensive alliances.

Alliances, offensive and defensive, are those in which the contracting parties agree to regard as a common enemy any power that attacks either of them, as well as mutually to defend each other. Such was that between the Emperor and the States-General against France, concluded at Vienna the 12th of May, 1689, and which was the commencement of that which was called the general or grand alliance. To this treaty Spain was to be invited by the emperor, and England by the States, and it was stipulated that all the allies of either party were to be admitted, if they thought proper to accede. The triple alliance between England, Holland, and Sweden, in 1668, concluded by the negotiation of De Witt and Temple, was an event of importance in the history of Europe. England thus recovered her influence and credit in Europe. Temple was appointed for it. The French monarch and the court of Spain were greatly displeased; but they were obliged to acquiesce, as the whole of Europe seemed to rejoice with security under the wings of that powerful confederacy, which had been so happily formed for her protection. Another alliance of this kind was formed in 1701 between the kings of Great Britain and Denmark, and the States-General; and another between the Emperor, England, and Holland was concluded in the same year. A triple alliance was formed in 1716 between Great Britain, France, and the States-General. The intrigues of Cardinal Alberoni, prime-minister to Philip V. of Spain, produced various negotiations in 1716, from which at length sprung the treaty, called at first the triple alliance between Great Britain, France, and Holland; and, after the accession of the emperor, filled the quadruple alliance. The object of this alliance was to settle all disputed pretensions between Spain, Germany, and some of the Italian princes. The king of Sicily was admitted into this treaty; and at length the king of Spain himself was forced to accede to it; and Alberoni was banished by Philip V. But as some points were still controverted between the emperor and King of Spain, these were to be amicably determined in the congress opened at Cumbrey in 1721, under the mediation of his Britannic Majesty and the most Christian King. Puffendorf, Grotius, and other writers upon the laws of nature and nations, have distinguished alliances into personal and real. The former are those which are made with a king considered personably, so that they terminate with his life, and real are such as extend between states and nations, and which subsist and retain their obligation after the death of the king or ruling magistrates. It has been argued by others, that the admission of personal alliances is inconsistent with the foundation of political society, and that they tend to separate the sovereign from his subjects.

Though the title of allies, socii, of the Romans, was a sort of fervour, it was much coveted. Arrinathes, we are told by Polybius, offered a sacrifice to the gods by way of thanksgiving for having obtained this alliance. The reason was, that therefrom forwards people were sure not to receive any injuries except from them. Cesar informs us that a great number of kings had this honour. There were divers sorts of allies: some only united to them, by a participation of the privileges of the Romans, as the Latin and Hermiti; others by their very foundation, as the colonies; others by the benefactions they received from them as Manninian, Eumenes, and Attalus, who owed their kingdoms to Rome; others by free treaties, which lasted by a long alliance, became subjects, as the kings of Bithynia, Cappadocia, Egypt, and most of the cities of Greece; lastly, others by compulsion, treaties, and the law of substitution, as Philip and Antiochus. For they never granted peace to an enemy, without making an alliance with him; that is, they never subdued any people without using it as a means of subduing others.

The allies of Italy, socii Italici, were distinguished from other foreign allies. Of these there were two kinds: those distinguished by the name of prefectures, who were governed by Roman magistrates and laws, and those who retained the privilege of being governed by their own ancient laws, and were denominated autonomi. The Latin allies, socii latini, were those who enjoyed the jus Latii, and who held the first rank.
rank in the order of allies; of these there were three distinctions, viz. those who inhabited Latium, the Latin colonies, and those on whom were conferred the privileges of the Latin colonies, on account of some service which had been rendered by them to the Roman state, or by the peculiar favour of the Roman people and the emperors. There was a great difference between the allies and the auxiliaries, when they were admitted into the armies of the Roman empire. The allied troops were always taken from the allies of Italy, which had never been reduced into Roman provinces. The auxiliaries were furnished by the foreign allies. The allied troops maintained themselves at their own charge, and were supplied only with corn by the Romans; the latter were kept in pay by them. When the allies joined the Roman army, the confuls chose 12 out of their number to command them, under the name of prefects. They were of the same number, and possessed similar powers with the tribunes of legions. The places which they occupied in the army and camp were alligned by particular regulations. The allies of the provinces, socii provinciales, held the first rank among the foreign allies. The honour of this appellation was conferred on provinces, which submitted to the dominion of the Romans, and were governed by their own magistrates, according to the customs and laws of Rome, and paid an annual tribute to the senate. The socii immunes were those who had never been enemies to the Romans, and who were exempt from every kind of imposition. Such were Ptolemy, king of Egypt, and the Jews, who were the first of the eastern nations which solicited the friendship of Rome. Others, after having been enemies of the Romans, laid down their arms and contracted alliances with them.

The forms or ceremonies of alliances have been various in different ages and countries. The Romans conferred it on sovereigns by a deputation of senators, who accompanied it with a sceptre of ivory, the toga picta, and the titles of ally and friend of the Roman people. Among us, signing and swearing, sometimes at the altar, are the chief; and anciently eating and drinking together, chiefly offering sacrificies together, were the customary rites of ratifying an alliance. Among the Jews and Chaldeans, heifers or calves; among the Greeks, bulls or goats; and among the Romans, hogs were sacrificed on this occasion. Among the ancient Arabs, alliances were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a sharp flune, dipping herein a piece of their garments, and thereby with smearing seven flunes, at the same time invoking the gods Vrotalt and Ailat, i.e. according to Herodotus, Bacchus and Urania. Among the people of Colchis, the confirmation of alliances is said to be effected by one of the princes offering his wife's breasts to the other to suck, which he was obliged to do till blood flowed.

It has been disputed, whether the states of the empire have a right of making alliances without the emperor's participation; and whether the king of England be vested with absolute power of making alliances at discretion, without consent of parliament. Dr. Davenant afferts the negative. According to him, the contrary opinion owes its rise to the mere flattery of modern couriers, having no foundation in the ancient laws and constitution of the kingdom. King John and Richard II. were, according to this author, the first that attempted any thing like it. It is certain there occur numerous instances in history, where the king has afted, or the parliament have offered their advice, concerning the alliances to be made; but there are many others, at least of later times, wherein no footsteps of any such consultation appear. There are instances likewise where the parliament have declined giving any advice concerning such arduous matters.

**Alliance, in a figurative sense, is applied to any kind of union or connection; and in this sense the late bishop Warburton has used the term in his treatise, entitled, "The Alliance between Church and State," published in 1736. Some persons, however, who are advocates for a religious establishment, have objected to this use of the term; alleging, that alliance implies a contract formed by two or more independent powers; whereas the established church, being a part of the state, or one of its members, cannot properly be represented as entering into alliance with it. "The notion," says Lord Bolingbroke (Works, vol. iv. p. 515.) "of a formal alliance between the church and the state, as between two independent distinct powers, is a very groundless and whimsical notion." He informs us, that Dr. Senior, preaching before King Charles II. at Newmarket from Exod. i. 14, 15, 16, established on these texts a supposed alliance between the church and the state, or rather between the church and the king. "Warburton," he says, "took his hint possibly from it;" but of this we have no evidence besides his lordship's assertion. Others have objected to the sentiment implied in the expression. "Every other idea" of a church establishment, besides that of a scheme of instruction, and "every other end" that has been blended with that of the preservation and communication of religious knowledge, "as the making of the church an engine, or even an ally of the state; converting it into the means of strengthening or of diffusing influence; or regarding it as a support of regal in opposition to popular forms of government, have served only to debase the institution, and to introduce into it numerous corruptions and abuses." Paley's Principles of Moral and Political Philosophy, vol. ii. p. 305; ed. 6th. See Religious Establishment.

**Alliance Island, in Geography, an island in N.lat. 80° and E. long. 100°, discovered by a ship so called from Philadelphia in 1787.

**Allaria, in Botany, a species of Erysimum.

**Alllica, in Entomology, a species of Papilio Xymenitis, with wings dentated and of a dark yellow colour; with numerous black points intermixed with white; found, of a small size, in Siam.

**Allieni Forum, in Ancient Geography, a city of Italy, now generally thought to be Ferrara.

**Allier, in Geography, a river of France, which gives name to one of the departments. It rises near Chateau Neuf de Randon, in the department of Lozere, and joins the Loire three miles west of Nevers.

**Allier, department of, is formed of the ancient province, Bourbannos. It is bounded on the north, by the departments of Saone and Loire, Niether and Cher; on the eait, by those of Saone and Loire, and the Loire; on the south, by those of the Loire, Puy de Dome, and Creuse; and on the west, by those of Creuse and Cher. Its superficies is about 1,454,341 square acres, or 742,272 hectares; its population about 266,105 individuals; it is divided into four communal districts; and its chief town is Moulins.

**Alligation, in Antiquity, the basefand word of kinds of slaves, whom they kept locked up, or with fetters on.

The Romans had three degrees, or orders, of slaves or servants; the first employed in the management of their estates, the second in menial or lower functions of the family, the third called alligati, above mentioned.

**Alligation, in Arithmetie, a rule or operation by which questions are resolved, relating to the mixture of diverse commodities or ingredients together, with the value, effect, &c. thereof in composition.

The word is formed of alligare, to tie together, by reason, perhaps, of a sort of vincula, or circular ligatures, ordinarily used to connect the several numbers together.
Alligation is of two kinds, medial and alternate; to which some add a third, called partial.

Alligation medial teaches how to find the mean rate of a mixture, when the particular quantities that are mixed or compounded, and their respective mean rates, are given.

The several cases will come under the following rules.

I. The quantity of the ingredients, and the prices of each, being given; to find the price or value of some part of the mixture.

Rule. As the sum of the quantities given, is to the sum of the products of each ingredient by its price, so is any quantity of the mixture, to its value.

Example 1. A refiner, or goldsmith, hath 12 3/4 of gold at 4l. per 3/4, 9 3/4 at 4l. 5s. 3/4 at 4l. 6s. 8d. and 9 3/4 at 4l. 13s. 4d. per 3/4; what is an ounce worth of all these melted together?

\[ \frac{3}{4} \text{ of gold} \times 12 \text{ lb.} = 48 \]
\[ 8 \text{ lb.} = 34 \]
\[ 3 \text{ lb.} = 13 \]
\[ 9 \text{ lb.} = 42 \]

32 total = 137 lb.

Then as 32 : 137 :: 1 3/4 : 4l. or to 4l. 5s. 7 3/4.

By the same rule the value of any other quantity of that composition is to be found; as supposing 7 3/4.

For as 32 : 137 :: 7 : 29 3/4.

Example 2. Suppose it were required to mix 6 gallons of wine at 5s. a gallon, 8 at 6s. and 4 at 8s. what would be the value of the mixture per gallon?

\[ 6 \times 5 = 30 \]
\[ 8 \times 6 = 48 \]
\[ 4 \times 8 = 32 \]

Whole compound, 110 lb.

Then 18 = 110 (6 2/3 or 6 5/6) is the value found.

II. The prices of the several ingredients, and the sum paid or received for the mixture being given; to find what quantity of each was bought or sold. Divide the sum paid or received, by the sum of the particular prices; the quotient is the answer.

111. The ingredients of a mixture being given, to augment or diminish the mixture proportionally.

Rule. As the sum of the particular quantities of the compound given, is to the whole quantity proposed to be augmented or diminished; so is each particular quantity in the given compound, to the due proportion required of that species, fineness, &c.

Example. The compound in the foregoing instance is required to be augmented to 48 3/4; that is, 16 is to be added to 32, how much of each ingredient must be taken?

\[ \frac{12}{8} \text{ Then as 32 : 16 :: 3 : 1\frac{3}{4}} \]
\[ 9 \text{ lb.} = 4\frac{3}{4} \]

32 sum. = 16 sum.

So that there must be 18 3/4 of gold at 4 0 0 per 3.

\[ \frac{12}{12} \]
\[ 4 \times 5 = 0 \]
\[ 6 \times 8 = 48 \]

Sum = 48 for proof of the operation.

IV. The nature, quality, &c. of the several ingredients of a mixture being given, to find the temper or degree of fineness resulting from the whole. Place the several quantities of the mixture in rows; against which place orderly their several qualities or finenesses; and multiply each quantity by its own quality or degree of fineness; then, as the sum of the quantities is to the products, so is unity to the quality or fineness of the mixture.

V. The quantities of a mixture being given; to find the particular quantities of any ingredient in any part of the mixture.

Rule. As the total of the composition, is to the quantity of any simple in that composition, so is the total quantity proposed, to be proportionally compounded, to the quantity of each simple to be in that proposed quantity.

Example. How much of each ingredient (or price of gold mentioned in the first case) is in a pound, or 12 of the 32, being the compound given?

\[ \frac{12}{8} \text{ Then as 32 : 12 :: 3 : 1\frac{3}{4}} \]
\[ 9 \text{ lb.} = 4\frac{3}{4} \]

As 32 : 12 :: 3 : 1\frac{3}{4}.

VI. Given the total of a mixture, with the whole value, and the values of the several ingredients; to find the several quantities mixed, though unequally.

This case admits of two varieties: first, where the mixture is of two simples; and, secondly, when it consists of more than two. For the first, the rule is—Multiply the total of the mixture by the least value, subtract the product from the total value; and the remainder is the first dividend; then take the said least value from the greatest valued ingredient, and the remainder is the first divisor. The quotient of this division shews the quantity of the highest-priced ingredient, and the other is the complement to the whole.

Thus, still referring to the first example, and assuming the two first terms of it:

Gold at 4l. per 3.

Ditto at 4l. 5s.

Total of the composition = 20 3. Total value 8l. 20s.

\[ \times \frac{1}{80} \]

80 \( \div \) by 3l. 2 (8) the quantity of the highest-priced ingredient.

Secondly, when the quantities are more than two in number.

These kinds of questions, as in those of alligation alternate, admit of various answers, all of them true, and are called indeterminate problems. They are best done by parcel, two at a time, as in the preceding operation.

Alligation alternate is the method of finding the quantities of ingredients or simples necessary to form a compound of a given rate or quality; and it is the converse of alligation medial.

Alligation alternate shews the due proportion of several ingredients; and counterchanges the place of such excels or differences as arise between the mean price and the extremes; ascertaining that to the greater extreme which proceeds from the lesser; and contrariwise.

The rules which obtain in alligation alternate are as follows: every greater extreme is to be linked with one lesser. If either of the extremes be single, and the other extremes plural, the single extreme is to be linked to all the rest.
If both greater and lesser extremes be not plural, they may be linked to differently that several differences may be taken and a variety of answers may be made to the question, yet all true; but if one of the extremes be single, there can be but one answer.

The numbers being linked, take the difference of each from the mean or common price; and place this difference against the number it is linked to, alternately.

Every number, linked with more than one, must have all the differences of the numbers it is linked to, set against it.

These differences resolve the question, when the price of every one of the ingredients is given without their quantities: and the demand is to mix them so as to sell a certain quantity at a mean rate.

**Example 1.** A person would mix wheat at 42. a bushel with rye at 2s. 8d. so as to sell the mixture at 3s. 6d. a bushel, how much of each must he take?

Thus:

\[
\begin{array}{c|c|c}
   & 42 & 32 \\
62 & 48 & 56 \\
\end{array}
\]

**Example 2.** A vintner would mix Malaga, at 7s. 6d. a gallon, with Canary at 6s. 9d. and white wine at 4s. 3d. so as to sell the compound at 5s. 2d. a gallon: what quantity of each must he take?

\[
\begin{array}{c|c|c}
90 & 11 & 11 Malaga, \\
62 & 81 & 11 Canary, \\
51 & 19.28 & 47 White wine. \\
\end{array}
\]

N.B. The difference between 62 and 51 is 11, which is set against 81, and also against 90: the difference between 62 and 81 is 19, placed against 51: the difference between 62 and 90 is 28, which is also set against 51. Then 11, added to 28, is 47: and therefore the quantities required are 11, 11, 47.

But, in Alligation partial, when the quantity of one, with the price of all the ingredients, is given, and the demand is to know the quantities of the other ingredients; then, the rule of three is to be used.

Say, as the difference standing against the price of the given quantity is to the given quantity, so are the several other differences to the respective quantities required.

**Example 1.** If it be desired to mix 10 bushels of wheat, at 5s. with rye at 3s. 6d. and barley at 2s. 4d. so as to sell the mixture at 4s. per bushel, how much rye and barley must be taken?

\[
\begin{array}{c|c|c|c}
   & 60 & 12 & 26 \\
48 & 42 & 12 & 12 \\
Barley, & 28 & 12 & 12 \\
\end{array}
\]

Then 25 : 10 : 12 : 4 is the required quantity of rye and barley.

**Example 2.** How much Malaga at 7s. 6d. a gallon, Sherry at 5s. white wine at 4s. 3d. must be mixed with 24 gallons of Canary at 6s. 9d. so that the whole may be sold at 6s. per gallon?

\[
\begin{array}{c|c|c|c}
   & 90 & 21 & 9 \\
72 & 81 & 18 & 9 \\
\end{array}
\]

**Or thus:**

\[
\begin{array}{c|c|c|c}
   & 90 & 21 & 9 \\
72 & 81 & 12 & 9 \\
\end{array}
\]

Then, the quantity of Canary being given, say, by the first method 21 : 24 : each difference : its respective quantity : that is:

\[
\begin{array}{c|c|c}
   & 12 & 13 \frac{1}{2} \\
\end{array}
\]

**Second Method.**

\[
\begin{array}{c|c|c|c}
   & 12 & 13 \frac{1}{2} \\
\end{array}
\]

The operation by the last method is as follows:

\[
\begin{array}{c|c|c|c}
   & 24 & 36 \\
\end{array}
\]

The operation by the last method is as follows:

\[
\begin{array}{c|c|c|c}
   & 24 & 36 \\
\end{array}
\]

The operation by the last method is as follows:

\[
\begin{array}{c|c|c|c}
   & 24 & 36 \\
\end{array}
\]

The operation by the last method is as follows:

\[
\begin{array}{c|c|c|c}
   & 24 & 36 \\
\end{array}
\]

The operation by the last method is as follows:
The rule for this kind of alligation may be otherwise expressed and applied to all the cases above enumerated, thus: Having coupled the rates as before, then for any pair of differences, take their equimultiples, or multiply them by any number at pleasure; proceed in the same manner with any other pair; and you will thus have a new set of differences with which to work.

Example 1. A grocer would mix 20 lb. of sugar at 10d. with two other sorts at 8d. and 5d. so that the mixture may be sold at 7d.; how much must he take?

**Common Method.**

\[
\begin{array}{ccc|ccc}
10 & 2 & 2 & 2 & 10 & 10 \\
8 & 1.3 & 4 & 8 & 3 & 11 \\
\hline
20 & 1 & & & & \\
\end{array}
\]

The pair of differences against 10 and 5, being 2 and 1, are multiplied by 2; and they become 4 and 2: those against 8 and 5, being 2 and 3, are multiplied by 3, and they become 6 and 9; so that 4, 6, 11, will be the new set of differences.

Then, 4 : 12 \[\times\] 6 = 8 lb. at 8d.

11 : 33 \[\times\] 11 = 36 lbs. at 5d.

**Example 2.** A farmer would mix 42 lb. of wheat at 3s. with rye at 3l. and barley at 2s. and oats at 1s. per bushel, in order to obtain a quantity of 120 bushels, to be sold at 2s. 4d. per bushel; how much of each must be taken?

<table>
<thead>
<tr>
<th>Wheat</th>
<th>Rye</th>
<th>Barley</th>
<th>Oats</th>
</tr>
</thead>
<tbody>
<tr>
<td>48</td>
<td>45</td>
<td>24</td>
<td>22</td>
</tr>
</tbody>
</table>

\[
\begin{array}{ccc|ccc}
48 & 16 \times 3 & 48 \\
45 & 8 \times 5 & 40 \\
24 & 20 \times 3 & 60 \\
\hline & 168 & & & & \\
\end{array}
\]

Then 168 : 120 \[\times\] \[
\begin{array}{ccc|ccc}
48 & 34 \frac{2}{3} \text{ bushels of wheat,} \\
20 & 14 \frac{1}{3} \text{ bushels of rye,} \\
40 & 28 \frac{1}{3} \text{ bushels of barley,} \\
60 & 42 \frac{2}{3} \text{ bushels of oats.} \\
\hline & 168 & & & & \\
\end{array}
\]

But all questions of this kind are most easily and accurately solved by common algebra, which will enable us to determine their limits; as they form a sort of indeterminate problems, and admit of many, or an indefinite number of answers. For a further explanation of this rule and examples, we refer to Ward, Wallis, Malcolm, Emerson, and other writers on arithmetic and algebra.

We shall add an example, wherein both the kinds of alligation have place. Suppose a mixture of wine of 119 quarts, required to be made of wines of the following prices, 7d. 8d. 14d. and 15d. per quart; and so that the whole may be sold at 12d. per quart.

Having linked 8 to 14, and 7 to 15, and counterchanged their differences from the common price, 12d., the sum of their differences is found to be 14; by which dividing 119, the quotient is 8\(\frac{7}{29}\), or 8\(\frac{1}{2}\), or for convenience in operation \(\frac{1}{2}\).

\[
\begin{array}{ccc}
8 & 2 \\
14 & 4 \\
7 & 3 \\
15 & 5 \\
\hline
119
\end{array}
\]

**Quarts.**

\[
\begin{array}{ccc}
8 & \frac{7}{2}\times 2 = 14 & 7 \\
14 & \frac{7}{2}\times 4 = 14 & 7 \\
7 & \frac{7}{2}\times 3 = 10 & 5 \\
15 & \frac{7}{2}\times 5 = 21 & 3 \\
\hline
119
\end{array}
\]

**ALLIGATOR,** in Zoology, a name given to the American crocodile, a species of Lacerta, under which article it is described.

**ALLIGATOR Pear,** in Botany. See Laurus.

**ALLIONIA,** in Botany, so called in honour of Charles Allioni, professor of botany at Turin, a genus of the transversa monogynos class and order, of the natural order of aggregate and diffuse of Jussia; the characters of which are, that the calyx is a perianthium common to three flowers, simple, oblong, five-parted, the parts ovate, acute, permanent; and the pericarpium proper is oblong, superior; the corolla proper, one-petalled, funnel-shaped, edge quinquel, and erect; the style has seven stamens, longer than the corolla, bend to one side, anthers roundish; the pistillum is a gynoecium inferior, oblong, five-celled, longer than the stamens, stigma multifid and linear; no pericarpium; seeds solitary, oblong, five-celled and naked: the receptacle naked. Martyn enumerates two, and Gmelini three species, viz.: 1. A. villosa, with leaves heart-shaped and calyces quinquel, a native of Cumana, in South America. 2. A. incisa, with leaves obliquely ovate, and calyces triphyllous, a native of Perù, in rocks and sandy soils, introduced into the Paris garden from seeds sent by Dombey, flourishing there and perpetuating its seeds in the middle of summer. 3. A. altissima of Gmelini, with leaves lanceolate, opposite and roughish, and calyces pedicellated and solitary.

**ALLIOTH,** in Astronomy, a star in the tail of the Great Bear, whose observation is much used at sea.

It is also written alliot, and alov, and literally denotes a herse. The Arabs give this name to each of the three stars in the tail of the Great Bear, on account of their appearing like three herse, ranged for the drawing of the waggon, represented by four herse, called Charles's wagon.

**ALLIOTICUM,** from alliota, to vary, a Galenic medicament, which alters and purifies the blood, confining chiefly of the roots of dandelion, succory, fennel, and rai-

nus; with the herbs endive, common ox-eye, lettuce, for-
rel, fumitory, &c. See Alterative.

**ALLITERATION,** in Rhetoric, is a figure or decoration of language, chiefly used in poetry, and consisting in the repetition of the same letter or letters at certain intervals, whence its name is derived. This figure has been generally regarded either as trivial in itself, or as an instance of sall refinement; but for the use of it we might refer to the best authority, and it unquestionably facilitates the recitation of verse, contributes to both its sweetness and energy, serves to enforce the sentiment which it expresses, and aids the memory in retaining it. Pontanus, one of those ingenious Italians who flourished upon the revival of literature in Europe, has particularly described this figure, and furnished instances of it both from poetical and prose writers. It occurs in the repetition of the same letters, syllables, or words; and when it takes place in the first and last syllables, and even in the middle ones, it is, he says, wonderfully pleasing. The instances which he produces from Virgil are such as follow: "Seva sedans super arma." — "Tales catus Caffandra canebat." — "Infemtum infando indicio." — "Longe fale fava tonabant." — "Magno misere murmurante pontum," — "Quamque leona late liquidos." In the following instance, cited from Lucrétius, it is continued from one verce to another: —

"—Adverfo fabra feruntur
Flumine."—

Cicero (in Brut.) uses this figure: — "Nulla res magis penetrat in animos, coque fugiit, format, lectit"; and also (De Orat.) : "Quaude me facili tare, fumme foliet." For the use of this figure we may add to that of Virgil the superior authority of Homer. II. 2. 201.
Hermogenes quotes these lines as an example of the figure now described, which he calls by a Greek name, ἁρπαζοντα, parocheis, and defines to beauty in similar words, which under a different signification found the name. Aristotelie called this figure παρατεκσια, parameiosis; and the Latin rhetoricians called it Ammonitio. Gaius Cambrensis informs us that in the time of Henry 1. the English and the Welch were so attached to this verbal ornament in every highly finished composition, that nothing was by them esteemed elegantly delivered, no diction considered but as rude and rough, if it were not first amply refined with the polishing art of this figure. From this national taste may probably be derived some of our proverbial maxims, which, independently of the found, have no other merit.

Spenser and Shakspere adopted this practice. Spenser says—

"For not to have been dipt in | LothE lake
Could save the Sun of These froin to die;
But that blind bard did him immortal make
With verses, dipt in dew of Catiflie."

Thus Shakspere:

"Had my sweet Harry had but half their numbers,
This day might I, hanging on Heifer's neck,
Have talked." — Hen. IV. part 2. act 2.

Milton also followed them:

"For eloquence, the soul; song charms the sense.

P. L. ii. 556.

Again:

"Behemoth, biggest born of earth, upbeav'd
His vaunting —"  P. L. vii. 471.

Dryden employed this figure frequently, and, like Virgil, with singular simplicity and strength. E. G.

"Better to hunt in fields for health unhought,
Than see the doctor for a nauseous draught.
The wife for cure on exercise depend;
God never made his work for man to mend." — Fables.

Pope adopted the same figure, as in the following couplet:

"Eternal beauties grace the shining scene;
Fields ever fresh, and groves for ever green."

Gray, who professed to have learnt his verification from Dryden, seems also to have paid particular attention to this ornament, as in the following instances:

"Rain seize thee, ruthless King!"
"To bigborn Hoel's harp, or soft Llewelyn's lay."
"Weave the warp, and weave the woof!"
"Stamp we our vengeance deep, and ratify his doom."
"Regardless of the fearspring whirlwind's sway."
"Eyes that glow, and fangs that gria."
"Thoughts that breathe, and words that burn."
"Hawker's craft, and helm ring!" &c. &c.

ALLIUM, probably from αλους, to avoid, because some persons avoid the plant on account of its very disagreeable smell, or from αλοους, eschews, from the quickness of its growth, or from σαλιον, which signifies a head of garlic, and

GARLIC, in Botany, a genus of the Alliaria monogynia clata and order, of the natural order of Spatiacae and Aplphi-dei of Jullien: its characters are, the cally is a common path or sheath, roundish, thrumvilling, and many-flowered; the corolla consists of six oblong petals; the floral have six filaments, subulate, generally of the length of the corolla, the anthers are oblong and upright: the pellum has a germ, superior, short, bluntly three-cornered, the corners being marked with a grooved line, style stutile, stigma acute: the pericarpium is a capsule, very short, broad, three-lobed, three-valved; and the seeds are many and roundish. Professors Martin enumerates 45, Gmelin and Willdenow 53 species, distributed into several divisions. 1. Those with stem and leaves flat, and umbel capsule-bearing. 1. A. ampoloporum, great round-headed garlic; has umbel globose, flamen three-cuped, and petals with a rough keel; its stem is a foot or more in height, having leaves at the bottom, glaucons and succulent; the spathe is conical, one-leaved, and deciduous; it flowers in a clofe bar on peduncles which are about an inch in length; the flamen are somewhat longer than the corolla, which is of a pale purplish colour: this is eaten along with other pot-herbs; it communicates its flavour to the milk and butter of cows that eat it: it grows naturally in the East, in Switzerland, on the Holmes island in the mouth of the Severn, &c. is perennial, and flowers with us in July. 2. A. porrum, porrum fativum of Ray and Miller, common leek, has umbel globose, flamen three-cuped, and petals with a rough keel, root coated: it has a rather high stem, leafy at bottom, spathe shortly conical, deciduous: flowers in clofe large balls on purple peduncles in April or May: it is very like the former spice, and probably only a variety: it has perhaps been supposed that there are two sorts of leeks; but Martin has made trial of both, and found that they were the same; the difference being occasioned by sowing the seeds from old roots, and not from the feeding leeks, whereby they have degenerated, and become smaller and more narrow-leaved: this species was cultivated by Gerard in 1597, and probably at an earlier period: but its native place is not ascertained: it is highly esteemed in some places for culinary uses. 3. A. lancea, linear-leaved G. with umbel globose, flamen three-cuped, twice as long as the corolla, grows naturally in Siberia, and is called by Miller, who cultivated it in 1768, porrum ampoloprum. 4. A. Fuavolens, with umbel capitated, and flamen awl-shaped, twice as long as the corolla; grows in Austria. 5. A. deflexum, has three-cuped flamen, of the length of the corolla, leaves narrow and linear, and stalk declined. 6. A. rotundum, great round-headed G. with umbel sub-globe, flamen three-cuped, and side-flowers nodding, has the fruit and seeds of the second species or leek, and is a native of the southern parts of Europe. 7. A. Victorialis, long-rooted G. with umbel rounded, flamen lanceolate, longer than the corolla, and leaves elliptic; grows on the mountains of Switzerland, Italy, Austria, Silezia, and Savoy; cultivated in 1739 by Miller. 8. A. Sub-bifurcatum, hairy G. or Dioicordeis's Moly, with flamen awl-shaped, and lower leaves liniforte, is a native of Italy, Spain, Africa, and the Levant; was cultivated by Gerard in 1597; flowers in May. 9. A. magicum, Homer's G. or Moly, with simple flamen and bulb-bearing branches, was cultivated in 1596 by Gerard, and is preferred in gardens for the sake of variety; but it has a very strong scent. 10. A. Obligum, oblique-leaved G. with filiform flamen, thrice as long as the flower, and oblique leaves, is a native of Siberia, and cultivated here before 1768 by Miller. 11. A. Rancum, branched G. with globele umbel, flamen awl-shaped, longer, leaves linear and sub-convex, grows naturally
in Siberia, whence the seeds of this and the former fort were sent to Peterburgh, and from them the botanical garden, in which they are preserved for the sake of variety, was supplied. 12. A. Tataricum, Tartar. G. with umbel flat, flamen simple, and leaves semi-cylindrical, as native of Siberia, and introduced into Kew gardens in 1787 by Mr. Haneman. 13. A. roffum, rose G. with umbel flat topped, petals margiuate, and flamen very simple, grows naturally about Montpellier and in Piedmont, in the fields, olive-groves, and vineyards, and was cultivated in 1752 by Miller. 14. A. farctum has a globose umbel, simple flamen, linear leaves, and prickly sheaths. Gmelin.

15. A. II. with stem-leaves flat and umbel bulb-bearing. 16. A. farctum, common G. with compound bulb and three-cuped flamen, is said to be found wild in Sicily, and cultivated in 1751, or probably at a much earlier period. 17. A. Scordophyllum, Rocambole, with three-cuped flamen, crenulate leaves, and two-edged sheaths, is found wild in Sweden, Denmark, Germany, and Hungary, and cultivated here by Gerard in 1596: it has compound bulbs, but much smaller than those of garlic. The root is heart-shaped, solid, and generally flants sideway of the flalk: the leaves are rather broad and created at the edges: the flowers, which are collected into a sort of globular head, are of a pale purple colour: the stem generally rises from two to three feet in height, and produces many small bulbs at the top, that may be made use of as well as those of the root. 17. A. arenacrum, A. Scordophyllum of Flor. Dan. 2609, and G. with three-cuped flamen, columnar sheaths, awl-shaped, petals, and flowers slightly rough in the keel, distinguished from the last species by its round sheaths, and by its growing always in a sandy soil: bulbs, which are numerous, and blooms, are blue; flamen a little longer than the blossoms; leaves three or four, lower ones quickly withering, broad, edges hairy, or rather finely toothed, teeth not discernible without a glass; leaf-sheaths strongly keeled; stem two to five feet high; flowers few, on short stalks, small, purple, marked with a deeper line: it grows wild in Thuringia, Scania, Denmark, Switzerland, Italy, and in the woody and mountainous parts of the north of England, particularly about Lowther in Westmorland, Castle Howard in Yorkshire, Thorp-arch, and Hettlington-fields near York. It is perennial, and flowers in July. 18. A. cebilatum, ambolemopraefum proliferum of Lobs. t. 156. Moly montanum leucum charta, mountain G. with awl-shaped flamen, very long (acute, Smith) spathe; stem, when cultivated, four feet high; leaves a foot long, not half an inch broad, leaf-sheaths two, awl-shaped, unequal; umbel has few flowers, but many bulbs; bloom of a dull brown yellow colour, often changing to purple; the plant has but little of the garlic smell: it is found wild in Scania, Germany, Carniola, Italy, and Switzerland, and also in the rocky and mountainous parts of the north of England, near Settle in Yorkshire, in Hettlington-fields near York, and about Knareborough, on the rocks about Longhlede in Westmoreland, near Rampsay in the Isle of Thanet, and between Sandwich and Delf: it is perennial, and flowers in July.

111. A. with stem-leaves columnar, and capsule-bearing umbel. 19. A. pallescens, Moly montanum with a purple flower of Clusian, small round-headed G. with three-cuped flamen, longer than the corolla, and semi-columnar leaves, is a native of Switzerland, Italy, Germany, and Siberia, was cultivated in 1739 by Miller, and is thought by Haller not to be specifically distinct from A. decandens. 20. A. parvifolium, small-flowered G. with globose umbel, simple flamen, longer than the corolla, and awl-shaped spathe, is a native of the south of Europe, and introduced into Kew garden in 1781 by M. Thouin.

21. A. decandens, purple-headed G. with three-cuped flamen, and outer pedicels shorter, is a native of Italy and Switzerland, and cultivated in the Oxford garden in 1766: this species has two bulbs at the origin of the flals, the leaves being fulgent and channelled above, the flalk generally two or more feet in height, the flalk quadriquad, 22. A. megalanthum, multi-flowered G. of Bauhin and Rudbeck, with umbel flat-topped, mostly six-flowered, acute petals, simple flamen, and toothed leaves, grows wild in Provence, Narbonne, and Spain; brought by Saltmann, according to Culp. Bauhin, from the hills about Montpellier in 1598, and cultivated in his garden. 22. A. floreum, sulphur-coloured G. with flowers pendulous, ovate petals, and flamen longer than the corolla; thought by Gerard and Guian to be a variety of the last species; is probably the south of France, Italy, and Austria, and cultivated in 1758 by Miller. 24. A. Heracleum, with awl-shaped flamen, and pedicels marked by a dark line in the middle. Forth. Fl. Jor. Arab. p. 72: doubtful whether it be a distinct species. 25. A. fallax, pale-flowered G. with flowers pendulous, ovate; flamen simple, equaling the corolla; is a native of Italy, Spain, Montpellier, and Hungary; and introduced into the Kew garden in 1779 by Abbé Poiré. 26. A. umbelliferum, panicle G. with pedicels capillary, spread out, flamen awl-shaped, and very long spathe,joined by Gerard to the preceding, is a native of Italy, Austria, Switzerland, Carniola, Siberia, and the Levant; and introduced into the Kew garden in 1758 by Sign. Gius. Fabrioni. 27. A. siroca, a field G. of the Cassaba of Ray and Gerard, grow G. with three-cuped flamen; bulbs tapering, bowked back, often running into long hair-like points, compacted into a close head; blossom small, violet; flamen with two long bristles, projecting beyond the flowr; stem about two feet high; leaves smooth, hough, slender, and very long; umbel sheath of one leaf, broad at the base, ending in an awl-shaped point about an inch long, scored with green lines; bulbs numerous, white; and blooms few, small; there is a variety with a double head of bulbs: this species is a native of Switzerland, Germany, Italy, &c. and with us is frequent in dry pastures, communicating its rank taste to the milk and butter, and growing in old walls and among corn, chiefly in calcareous soil, near Worcester (Stokes): it is perennial, and flowers in July. 28. A. oleracea, purple striped, or streaked, field or wild G. with flamen simple, leaves, rough, (not rough, Withering) semi-columnar, narrowed underneath: the root a solid bulb, stem two or three feet high, upright or a little bent towards the top, smooth, not scored, solid; leaves hollow, bulbs numerous, egg-shaped, forming a roundish knob, between which arise several thread-shaped fruit-flals, each supporting a single flower, which is drooping, cylindrical, but somewhat bell-shaped; blossom white, green, with three dark purple streaks on each petal, or pale with purple lines; germ rather-flattened, six-angled; style slender, longer than the blossom; flamen shorter than the petals; with minute white dots, hardly visible to the naked eye, scattered over the whole plant: it is a native of Sweden, Germany, Switzerland, Italy, and Ingrin; and with us in Westmoreland, near York, near Brifton, at Fincham, Norwich, and Black Notley, Essex, and Skylight near Darlington, among corn, and about the borders of fields. It is perennial, and flowers in July. 29. A. Pallens, Pallens G. with umbel inflamed, flamen simple, equaling the corolla, and style very short; three-cornered capsule: is a native of Siberia.

IV. A. with leaves radical and flora naked. 30. A. mar- tan, porrum of Gmelin, flat-topped G. with fepe two-
edged, leaves linear, flat, and three-clefted flaminas; is a native of Siberia, and introduced into Kew garden in 1785 by Dr. W. Purcell.

31. A. officinarum, cepa officinarum of Moryson, cepa stellata of B链him, flax lot and echinulate, with scape columnar, leaves awl-shaped, umbel globose, and three-clefted flaminas: this species has a congested root confining of numerous oblong parts bound together by means of a thin delicate membranaceous coating, each of which sends forth two or three long filiform awl-shaped leaves from a flatly nearly like those of the common onion; the flower-plains issue from membranaceous sheaths, are round, nearly naked, and terminated by globular umbels of flowers, that have erect fasciate-shaped petals, of the length of the flaminas, and of a purplish colour: the roots are very purgant, have a strong but rather pleasant smell, on which account they are generally preferred to the onion for various purposes of cookery; was found by Haller in the vicinity of Haller, native, and cultivated in 1753. 32. A. fenum-cresci, Nardus-leaved onion or G. with scape two-edged, leaves linear, convex beneath, smooth, umbel roundish, and awl-shaped flaminas, joined by Haller and Scopoli to the A. anguifolium, is a native of Siberia, the Alps, Silezia, and the island of Sicily, and cultivated by Gerard in 1597. 33. A. Asenium, with columnar scape, leaves linear-lanceolated, flat, umbel flat-topped, and awl-shaped flaminas, grows naturally in the vine and olive yards of Austria. Willdenow.

34. A. odorum, sweet-scenting G. with scape nearly columnar, leaves linear, channelled, angular beneath, umbel flat-topped, is a native of the south of Europe, China, Japan, &c. 35. A. indorum, Carolina G. with scape naked, subtriangular to ovate, leaves linear, flat, keeled beneath, umbel bifid, and filiform floriferous, and simple flaminas, is a native of Carolina, introduced in 1776 by the Duches of Portland, and flowers in March and April. 36. A. angustifolium, cepa of Gmelin, angular-awl-shaped G. with scape two-edged, leaves linear-channelled, somewhat angular beneath, and flat-topped umbel, is a native of Siberia, Italy, Austria, Switzerland, and Germany, in moist places. 37. A. florum, with a three-cornered scape, linear leaves, finted with furrows beneath, falked umbel, obtuse petals and simple flaminas, is a native of the Cape of Good Hope. 38. A. nariniflo- ram, with a columnar scape, linear awl-shaped leaves, flataed, umbel, or umbel terminal inclined, pointed petals, or petals lanceolated, and simple flaminas, shorter than the corolla, is a native of the mountains in the southern parts of France. 39. A. polyanthus, with a four-cornered scape, linear obtuse leaves, and few-flowered umbel, is a native of the Alps of Piedmont. 40. A. nigra, A. multibulbofum of Jaquin and Murray, A. montifobarum of Gounan, both of which are in Gmelin's Linnaeus characterised as distinct species. Black G. with scape columnar, leaves linear, (lanceolat, Willd.) umbel hemispherical, petals erect, (patent, Willd.) spathes pointed and brand, (flaminas simple, Willd.) is a native of Provence, Italy, Austria, and the neighbourhood of Algiers, and cultivated in 1759 by Miller. 41. A. Canadianum, Canada tree onion, with scape columnar, leaves linear, and head bulb-bearing, is a native of North America; this species has a perennial root; smooth, flat, straight leaves, six or seven inches in length; stem cylindrical, smooth, nearly naked, hardly longer than the leaves; spathes ovate, sharpish, and pointed, flowers few and white, petals oval, the flaminas simple, nearly of the length of the corolla, having brownish red anthers. 42. A. urfum, A. sylvestre latifolium of Ray, broad-leaved G. or Ramilions, with scape three-sided, (semi-cylindrical, Smith) leaves lanceolated, petiolate, and flat-topped umbel, flowers large, numerous, and white; is a native of Sweden, Denmark, Germany, Switzerland, and Italy, in woods and moist shady places, and with us in England it is frequent in such situations. It is perennial, and flowers in May and June; the smell and taste, according to Haller and Scopoli, are very acrid: Dr. Smith says, that the plant has a strong smell of garlic, and that it affords to sheep and cattle a pasture not disagreeable; the milk is of coube nauseous and flatulent; and other plants near it do not flourish. 43. A. Chlinaum, Moly minus of Chufins, with columnar scape, linear, flat, ciliated leaves, few-flowered umbel, and obverted cone petals, a native of the southern parts of Europe. 44. A. tricafeum, three-cornered Moly, Moly of Parkinson and Ray, with scape and leaves three-sided, and fimple flaminas, is a native of Italy, and Spain about Narbonne, and cultivated in 1768 by Miller. 45. A. cepa, cepa of Miller and B链him, common onion, with scape swelling out below, and longer than the columnar leaves, is well known by its filiform leaves and swelling bulks: it differs from the garlic only in having a swelling pyriform bulk, that is considerably larger in the middle than at the extremities: the Latin name cepa, says Mr. Martyn, is derived from ceput, a head, on account of the form of its bulb, and for the same reason the Greeks called it karpos. Others derive it from γεώς xolice νησιον, or from γεώς and xolice for γεώς. The English and French name are deduced from the Latin unus, because the bulb never throws out any off-lets: the varieties of the common onion are, the Straffourgh, or common oval; the Spanish, silver skinned and red skinned; the Portugal great oval onion; and the Tripoli: all these vary from seeds, and there are several intermediate differences not worth enumerating. 46. A. Melo, yellow Moly, with scape sub-cylindrical, leaves lanceolate, effusive, and umbel level-topped, is a native of Hungary, on Monte Baldo, about Montpellier, and on the Pyrenees, and cultivated in 1604 by Edward Lord Zouch: it was formerly preferred in gardens for the sake of variety, but most persons have rooted it out on account of its very strong garlic taint. 47. A. tricoccus, three-seeded G. with scape naked, semi-columnar, leaves lanceolate-oblong, flat, smooth, umbel globular, and seeds solitary, is a native of North America, and introduced in 1770 by Mr. W. Young. 48. A. fishtomum, Welch onion, or ciboule, with scape equaling the columnar swelling leaves, is perennial, and does not form bulbs like the common onion: it was cultivated in 1629: the A. italicum of Pallus, a native of Sibera, is of a smaller size, and a variety of this species: in Gmelin's Linnaeus it is made a distinct species. 49. A. fuchnopraefum, cives or chives, or G. with scape equaling the columnar awl-diform leaves, is a native of Italy, Switzerland, Sweden, and Sibera: where a variety of this plant has been found and figured by Gmelin, in which the leaves are reflected, whereas in the common sort they are strait: it has been found with us very rarely in meadows and pastures, near Fast-castle on the borders of Berwicke, in Argyleshire, in Wiltshire, and near Kirby Moor-side, Yorkshire, and Carnmil Fell, in a small rivulet called Chivey Syke. This is a very small plant when compared with the former, the items naked and fideon exceeding five or six inches in length, the roots producing little or no bulbs, and the leaves hollow and awl-shaped: it has a very strong smell. 50. A. Strutum, Siberian G. A. fuch- nopraefum. Linn. spec. 14. Murray. Gotting. Com. 1753. t. 4. 4: Cepa palustria altiformis of Banch. and cepa alpina palustris tumuloida of Tournefort; with scape columnar, leaves semi-cylindrical, flaminas awl-shaped, petals lanceolate acute, is found in Siberia and the mountains of Silezia, and was introduced into the Kew garden in 1777 by Chevallier Murray. 51. A. felterianum, with a columnar scape, semi-cylindrical
feni-cylindric leaves, dense umbels, and subulated flaments longer than the corolla, is a native of Siberia, near the river Jenica. 52. A. capitata, with columnar flcape, capillaceous leaves, few-flowered umbel, and petals lanceolate acute. 53. A. tenififlora, slender-leaved G. with flcape columnar, empty; leaves awl-shaped, filiform; and heads loose and few-flowered (Gmelin), or columnar flcape; leaves linear, awl-shaped; umbel few-flowered, and petals roundish-ovate obtuse (Wildenow); is a native of Siberia: it is much eaten by the field-mice, and they lay up the roots for their winter food: the flaments in this and the preceding are shorter than the corolla. 54. A. Chama-Moly, ballard G. with flcape fearfully any, naked, capililes drooping, leaves flat ciliate, is a native of Italy and Spain, and flowers in January. 55. A. gracile, Jamaica G. with flcape naked, columnar, very long, leaves linear, channelled, flaments awl-shaped, connate at the base, is a native of Jamaica, was introduced in 1787 by Hinton East, Esq. and flowers in February. 56. A. Neapolitanum, Naples G. with flcape naked anepicycle, leaves lanceolate channelled, umbel scattered, is cultivated in the gardens near Naples, begins to grow spontaneously about the city, and flowers in March. A. orientalis, with flcape columnar, umbel bearing and few-flowered, and leaves awl-shaped and flat. Walt. Flor. Carol. p. 121. Gmelin’s Linnaeus. Martyn’s Miller. Wildenow’s Linnaeus. Smith’s Flor. Brit. vol. i. p. 355. Withering’s Bot. Arr. vol. ii. p. 332.

Allium, in Gardening, is applied to garlic, onion, and leek. Of the fist or garlic kind of plants, though there are a great number of species only few are valuable either for use or ornament in the garden. The kinds necessary to be taken notice of in this view are: 1st. The sativum or common garlic; 2d. Schoenoprasium or rocambole, which are official or culinary plants. 3d. Moly or common yellow moly. 4th. Subflorium or hairy white moly. 5th. Sphaerocephalon or spherical headed purple moly. 6th. Rosum or rose-coloured Montpellier garlic. 7th. Flavum or straw-coloured pendulous moly. 8th. Magicum or great purple moly. 9th. Victoriale or elliptical garlic. 10th. Descendent or oval purple-headed garlic: which are all of the flowering kind.

These different species are of the bulbous-rooted tribe, some having large bulbs, others not bigger than peas; they are perennial in root, but annual in leaf and flalk; they are all hardy plants, proper in almost any exposure and soil in the garden, and in general are very productive, but most of the foarts have a strong scent like the common garlic.

The common garlic has a large round white bulbous root, of an irregular form, with numerous fibres at the bottom, composed of many smaller bulbs denominated cloves, which are included in a common membranous covering; each of which being planted, grows, and in one season attains the size and structure of the parent bulb: the leaves are cauliante, or form a kind of flalk, which feldom spindles, except when the same roots remain in the ground two or three years, when they run up and bear a flower and small bulbs at the top. It deserves to be cultivated in the garden for the sake of its root, which is in great estimation for culinary and other domestic purposes. Indeed, the roots, as well as all the other parts of the plant, have a very acid taste, with an highly offensive smell, which has rendered its cultivation in gardens lfs desirable. It is a hardy plant, capable of growing in most sorts of soils and situations, and readily propagated either by roots or seeds.

Rocambole has very small compound bulbs, which grow in clusters; the flalk generally spindling two or three feet high, with many bulbs at its summit, which, as well as the root bulbs, are useful for the same purposes as garlic, though much inferior.

The latter or the flowery kinds have the flower-flaments rising immediately from the root, growing erect and attaining different heights, from twelve to thirty inches; in some the leaves are radical, in others cauline, or elevated with the flalk, some are broad like those of a tulip, others long and narrow like a daffodil, and some taper and rush-like; but in all the sorts the flaments are terminated by a sort of flower, from which is protruded an aggregate of many small flowers forming a kind of umbel. The flowers: singly are composed of six petals, which, though separately small, from many being collected into large heads, are very conspicuous. The allium moly, sativum, fubflorium, sphaerocephalon, rosum, and flavum, generally grow from twelve to fifteen or eighteen inches in height, and their umbels often continue in bloom for the space of a month or five weeks. But the magicum, victoriale and descendent, rise about a yard in height, producing large highly ornamented umbels. They mostly flower in May, June, and July, ripen plenty of seed, and many small bulbs on the flalk and umbel in several of them.

Method of propagation. In all the sorts it may be effected with the utmost facility by off-sents from the root, and in many of them by seed and the small bulbs contained on the flalk.

Common garlic is constantly propagated by the small bulbs that constitute the main root, which may be readily divided into a great number of separate cloves; these are to be planted in the spring, in beds four feet wide, a little raised in rows lengthways, at from six to nine inches distance from each other, and fix inches in every row, and two or three miles deep. The planting may be performed either by means of a blunt dibble or by drawing drills, and placing the cloves in them, afterwards covering them with the earth. When planted in this way they mostly shoot up their leaves in a month or six weeks, only requiring occasional small hoeing afterwards to kill the weeds that may arise.

About the end of July or beginning of August, the bulbs are generally full grown, as is evident from the yellow appearance and withering of the leaves; they must be then taken up, cleaned and dried in the sun, and afterwards tied or plaited in bunches to be hung up and preserved for use.

Rocambole may be propagated either by the off-sents of its roots, or by the cloves produced on the top of the flalks, which may be planted in Spring or Autumn; but in the Autumn planting, as about October or November, they generally grow considerably larger than when planted in the Spring season. The seeds are to be planted in the manner directed for garlic, and are commonly fit for use about July or August, according as they have been put in early or late. But it may be observed that the roots never acquire any very large fize.

The different flowering kinds propagate very rapidly by off-sents, which may be separated any time after the decay of the flower, taking only such as are large and fine, and planting them at once in the borders where they flower the following Summer.

The propagation by seed is best accomplished in a shady border in Spring, the plants being fit to transplant in such cases in the Autumn.

Of the second division, or the onion kind, the characters, &c. of which are the same as those of garlic, the species are these, 1st. Cepa, or common onion, the best garden varieties of which are the Stratburgh or common round onion, the oval long-keeping common onion, the Spanish large flat onion,
onion, the Spanish silver-skinned onion, the Spanish reddish-skinned onion, and the Portugal great roundish oval onion. 3d. Fischophenum or the Ciboule or Welsh onion. 3d. Schoenoprasum, raves or chives. 4. Afalocionum, echalot or shallot. 5. Carduens, or Canada-tree onion. All the first species and varieties have large bulbous roots, and the plants are biennial, or being sown in the Spring arrive at perfection in the root the same year, and next year shoot up into stalk, flower, and ripen feed, when the stalks quickly die and the individuals are annulated. But the second and third species never form any bulbs at bottom; they are, however, hardy and perennial, and may be continued many years by the roots according to the directions given below for them. And the fourth and fifth species are bulbous-rooted perennials, multiplying greatly by offsets, as is evident from their culture.

The method of propagation and culture in the onion kind. Common onion. Among the several varieties of the common onion, the Stralburgh is probably the best for general culture, having a hardstone bulb, mostly assuming a roundish oval shape. It is of firm growth, and generally keeps well for winter use. The Spanish onions are large and flat; the first is, however, of the mildest flavour; but all the varieties for the most part afford profitable crops, and none excel them for culinary purposes; but they seldom keep so well after Christmas as the Stralburgh or oval foot of onion. The Portugal onion is a very large hardstone bulb, of a roundish oval shape, though it rarely attains the size here, as in that climate, as is obvious from those annually imported from that kingdom. If, however, seeds sowed in Portugal be sown here, the bulbs will arrive at a much larger size than from such as are sowed in this country, especially where preferred two or three years successively, in which cases they are often so far degenerated, that the bulbs become flat, and not larger than the common onions. The mode of transplanting them at an early period, which is adopted in that country, may also have much effect in rendering the bulbs so large. From this foot of onion being very mild, it is much esteemed for sauces and other culinary uses.

All these kinds are propagated by seed sown annually; which for the general crop should always be performed from about the beginning of March until the latter end of March, though in cold wet sloughy soils it may be proper to defer sowing entirely until towards the middle of the latter of these months. But in cafes of omission in sowing at the times above recommended, it may be performed with tolerable success in the beginning or any time before the middle of April, but the crops of the February or March sowing always bulb more freely and acquire a much larger growth than those sown at later periods.

The most proper situation for crops of this kind is an open exposure, and where the soil is moderately light and rich in vegetable matter. Thus spots of the best mellow ground in the garden should always be chosen, with the addition, if possible, of a good coat of well rotten dung, dug well in, but not too deep, the surface being kept level, and while it is fresh flirled, well raked, and the feed sown, a point which is of importance to be attended to. The sowing when the surface is so wet or moist as to clog to the feet or rake in preparing it, should not however be performed.

The proper quantity of seed is in general about an ounce to every rod or pole of ground; but where it is not required, to have them thick for cuttings, two ounces for three rods may be sufficient. Great care should be taken to procure fresh feed, as but very little of that which is kept more than one year will vegetate.

The feed may either be sown over the whole of the piece or plot of ground, or it may first be divided into beds of four or five feet in width, allowing foot-wide alleys between them. In sowing, the feed should be put in with a regular spreading cast, and the surface, when very light, immediately trodden over evenly upon the feed; afterwards, where sown in beds, the alleys may be pared an inch or two deep and the earth cast over them, proceeding directly to rake in the feed regularly with an even hand, trimming off all the stones, roots, &c. See Sowing Seeds.

The method of sowing them in beds is the most eligible, where it is designed to draw or pull the young onions from time to time for market or family use; as, in such cafes, a person can stand in the alleys without treading upon the beds, which not only renders the surface hard, so as to injure the crop, but highly destractive, by trampling upon the plants themselves. It is likewise very convenient to stand in the alleys, in order to weed, thin, or hoe the crop as occasion may require. Although it is a common practice in the general culture of onions to sow them thick, in order to allow for drawing or drawing out the superabundant plants, by degrees as they are wanted; it would no doubt be a better mode to sow a piece particularly for general culling, exclusive of the main crop; because by daily thinning out the superfluous plants there is no avoiding treading upon, disturbing and loosening the remaining ones, by which they become planted in their growth, and by no means so fine. There is also another very common but injudicious practice, which is that of mixing other crops such as leek, lettuce, radish, carrot, &c. with these crops. It is productive of confusion, as well as obstruction to the chief crop, without producing any great advantage; nothing should therefore be admitted, except a very thin sprinkling of cobs lettuce in some cafes. In about fifteen or twenty days after the feed is sown the plants generally appear, and in a month or six weeks after that, in May and the beginning of June, they will be three or four inches high; when they should be well cleaned from weeds, and the main crop thinned to three or four inches distance. The weeding and thinning should be begun in due time, before the weeds branch and spread much, which may either be performed by the hand or small hoeing; the latter is the most expeditious method, as by it one man may do as much as three, and it is also the most beneficial to the plants; as by flirring the ground about them with the hoe, it greatly forwards their growth, as is mostly seen in a few days after the operation. This mode, however, is more particularly eligible for the larger principal crops, for which a good sharp one and blade about two inches, or not more than two and a half broad, is the best, taking the opportunity of dry weather for performing the business, carefully and carefully cutting up all weeds. Where the onions stand too close they should be cut out in a regular thinning order to about three inches distance; or in such crops as are not wanted for occasional cutting, they may be hoed out at once to about four or five inches, having regard to leave the strongest plants, as much as possible, for the continuing crops.

In the course of two or three weeks or something more, it will generally be proper to run over them again in the same manner, in order to cut up all advancing weeds, and any superabundant plants that may have escaped in the first hoeing; after this they seldom require any further culture, than that of pulling out such casual straggling weeds as may rife.

But where the crops are small, or where they are required for thinning or pullling by degrees, for use in their young green state and in small bulbs, the weeding and requisite thinning where they are in clusters, may generally be bell performed by
by the hand. In the advanced growth of the crop, when the superabundant plants are occasionally thinned out for use, as wanted, they should be drawn somewhat regular, so as to leave a sufficiency of the strongest plants remaining at moderate distances for a full crop to attain their full growth in large bulbs.

It is highly necessary to continue to keep the different crops very clear from hurtful weeds in their advancing growth during the months of May, June, and July, which being their principal growing feasons, if they are not kept free from weeds, and sufficiently thinned to proper distances in due time, they draw one another up, weak and slender, which much retards their bulbing. About the middle or latter end of June the continuing crops begin swelling a little at bottom in their bulbing order, but more fully in July; and in August the bulbs arrive to full growth, and are proper for taking wholly up. Towards the middle of August the crops in general should therefore be examined, and when the necks shrink and pull, and the leaves wither, it may be concluded that the bulbs are arrived at maturity, and have done growing.

They should then be pulled up, cleaned, dried, and hoed for use; this being done in dry weather on a piece of ground hoed, raked, and cleaned, in order to spread them on as they are pulled up, to dry and harden. They should lie in this way a week or a fortnight, being turned every day or two, when, if the weather proves dry, they will be duly prepared for keeping; the first opportunity should then be taken to houfe them. The bulbs must be first divested of all adhering earth, loose fins, and the groffest parts of the leaves and neck, rejecting all infectious and bruised ones, and then they may be carried into any dry upper room, out of the damp, spreading them on the floor as thinly as convenient. The closer the room is kept the better, but care must be taken to turn them over once in three weeks, and to clear out such as have any tendency to infection.

As in the culture of onions it frequently happens, that through badness of seed many are disappoointed of a crop, by waiting in expectation of the plants rising till it has been too late to sow again; in such cases recourse may be had to transplantation from other gardens, as a neighbouring one, where there are superfluous crops, or a bed or such part of one as is necessary may be purchased from a market gardener. This business should be done in May or early in June, and if possible in moist weather; having a spot of well-dung ground prepared, take up the plants with good roots, and plant them in rows six inches distant, and four inches asunder in each row, inferring the roots but moderately into the ground, for if planted too deep, they do not bulb well; giving them a good watering as soon as transplanted. By repeating the waterings occasionally for a week or fortnight, the plants will generally grow freely, and form tolerably handsome bulbs.

Onions for pickling are in great request in many places: such as are proper for this purpose should not be bigger than common round buttons, therefore in order to procure them in due quantity, some seed should be sown late, in a spot of light poor land; about the middle of April is probably the best time. It should be sown moderately thick, the plants requiring little thinning, except where they rise in very thick clusters. They bulb in June and July, and are generally fit to take up in August. In the Spring many of the keeping onions will unavoidably grow as they lie in the house; these may be planted out in rows, at six inches distance, and will serve to draw by way of callations.

**The Autumn or Michaelmas crop,** is generally sown in August, and the plants ripe before Michaelmas, and the Winter, some to be drawn occasionally for use in that season, but principally intended for Spring use, to be drawn up young for fallads, &c. and likewise where the Stradbally or any other variety of the common onion are sown, they, if permitted to stand, bulb to a tolerable size in June, and supply the kitchen or market as headed onions, till some of the Spring crop are bulbed.

But as the common onion is liable to be cut off in severe winters, it is always necessary to sow at the same time some beds of Welsh onions, which bid defiance to the most rigorous Winter frosts. August is the best season for sowing these crops; for if sown sooner they are not only apt to get too forward in growth before Winter, but to run up for seed earlier in the Spring; and therefore the proper time to sow the main crop is the first or second week of that month, or the second week for a late standing one, sowing them in beds four feet wide, with twelve inch alleys between; sow and rake in the seed as directed in the Spring crop, only let a much larger quantity be sown in this case. The plants generally appear in a fortnight, and numerous weeds, to which early attention must be had to clear them out by hand before they begin to spread; but the plants of this crop are not now to be thinned. But in November and December if they stand very thick, some of the largest may be occasionally thinned out for various uses.

**Sowing Shallots.** February is the proper time to plant onions in this view, though this is often done in October by those that have great quantities for sale. For this purpose, make choice of a due quantity of the largest and handsomest bulbs, rejecting all blemished ones, and such as have already made any effort to grow, and having made choice of a spot of ground well exposed to the sun, which being dug, proceed to plant the onions; strain a line, and with a hoe or spade open three drills, twelve inches asunder, and fix deep, place the bulbs therein nine inches distant, and rake the earth over them; measure off two feet for an alley, and plant three more rows as above, and in that manner proceed to the end; the wide space of two feet is by way of alley to go between, to hoe and clear off weeds as well as to flake and support the flasks of the plants when necessary. In June the flower-stalks will be shot to their full height, and the flower heads will be formed at top, to secure which, in erect position, drive some stout flake in the ground along each row, at two yards distance, and from flake to flake fallen double lines of packethread; and if these are tied together in the interval, between the items of the plants, it will effectually secure them. About the latter end of August the seed will be ripe, which is known by the capsules opening, and the black colour of the seed; the heads should be cut in a dry day and spread upon cloths in the sun, care being taken to remove them under cover in a safe of wet and at night; and when perfectly dry, beat or rub out the seed, cleaning it from the rubbish, and putting it up in bags for use.

As it is of the utmost importance to have good fresh seed, some to try its goodness, before they venture their general crop, sow a little in a pot, and place it in a moderate hotbed or near a fire; a more expeditious method however is to tie about a thimble full of the seed, loosely in a piece of linen rag, and put it into a vessel of hot water, suspended by a thread; in ten to fifteen or twenty minutes, pull it out, and if the seeds are good, they will, in that time, have germinated or sprouted, perhaps to the extent of a quarter of an inch in length.
ALL

As leek-feed is similar in its nature it may be tried by the
same means.

Cicalea or Welsh onion. This is a perennial plant, which
never forms any bulb at bottom; therefore deserves to be
cultivated only to be drawn as young green onions for fallads,
&c. in Spring; but on account of its strong taste, it is generally
inferior to those of the common onion. From the plants
being so extremely hardy as to survive the severest Winter, in
which, though their blades are cut off, the roots remain sound
and shoot forth with great vigour early in Sping, furnishing
useful supplies till May, when they generally run to seed;
from this singular habit they may be cultivated more or
less as a winter-standing crop, with advantage, for Spring
use.

They are perennial in root which increas by off-fets into
great clutters, but not to be propagated thereby for general
use, but by seed, the name as the former sorts of onion.
The best season for sowing them is August, in the manner
of the Autumn onion crops.

The plants mostly appear in twelve or fifteen days after
being sown, and towards Michaelmas should be carefully
hand-weeded. It is a peculiarity in this species of onion to
lose their tops in November or December, and remain
divested thereof till towards Candlemas, when the roots shoot
forth again; at that period it is proper to dig the alleys, and
spread about an inch depth of the earth evenly over the
surface of the beds, by which vigour is given to the roots,
and the plants are made to rise strong, and at the same time
the part within the earth blanched white and rendered more
tender and mild for eating, as well as more agreeable. Where
the sowing of a Michaelmas crop has been omitted, some
have grown towards the end of January, when the
plants will rise in February or March, and being hardy, con-
tinue growing, and be fit for drawing in the early Spring.
In order to save plenty of seed of this species of onion, it is
necessary to retain some plants for seeds. In the end of
March a parcel of strong young plants may be put out nine
inches distant, which produce feed in Augst. If the roots
be let remain in the following years they produce treble
the quantity; but as they increas into great clutters, the seeds
should be removed and parted every second or third
year.

Cives or Chinese. This is the smallest of all the onion kind,
ripening but a few inches high; but its roots are perennial, and
increas considerably into clutters, from which large tufts of
flender awl-shaped leaves issue, which are the principal part
used, the roots never forming any bulb, at least not bigger
than small peas. This is a hardy plant which merits a place
in every garden; its clutters of leaves rise early in Spring,
and are useful both in fallads and for culinary purporses, in
default of onions. The method of gathering it is to cut
the leaves off near the ground, by which a rich supply is
soon produced from the bottom. For occasionally the plants
in clutters may be slipped quite to the root in separate little
plants, resembling young onions, and used as substitutes for
them. It is easily increasd by dividing the roots in Spring,
and planting eight or ten of them together in holes at six
inches distance; in this way by Autumn they will multiply
into bunches of a large size.

Escolat or Shallot. This is a species of onion which is
bulbous-rooted, and which increas greatly by off-fets, the
largest of which are the proper parts of the plant for use.
The bulbs are oblong, irregular, and seldom grow large; as
they generally increas into clutters they do not swell like
roots that grow singly. From the roots are produced many
long, narrow, firm leaves in the Spring, and which wither
in July or August, when the roots are full grown; they are
then taken up, made dry and hauled, when they keep
in good perfection till the following Spring.

In the propagation of this plant the smaller roots or off-
fets are the best; these may be planted out in Autumn or
early in Spring: the end of October, or beginning of Nov-
ember, for the Autumn planting; and February and March
for that of the Spring, but not later than the beginning of
April. The Spring is the most general season of planting
them, but when planted in Autumn, in a dry light soil, they
tend to grow larger, and sooner attain full growth the following
Season; they are to be planted in beds four feet wide, in
rows length-ways, the beds six inches asunder; each off-let
infected singly, either by means of a dibble or placed in
drills not more than two or three inches deep; and the
distance as above in each row. They shoot up in leaves in
March or April, and the roots increas in growth till July or
August. The only culture which they require is that of
keeping them clean from weeds, by occasional hand weeding
and hoeing. Towards the end of July or beginning of August
the bulbs will have attained their full growth, as is seen by
the withering of the leaves. They should then be taken up in
a dry day, and spread in the sun to harden; the largest,
clean, and hauled for use, and the smaller off-fets reserved
for propagation.

As shallots are sometimes required early in the Summer
for immediate use in such cases as they have formed small bulbs towards the latter end of May or in June, a few may occasionally be taken up for prefer-
tent supply; permitting a principal crop to remain in order to
attain their full growth.

Cauda or Tree Onion. This deserves to be cultivated
both as a curiosity in producing the onion at top of the
stalk; and for the use of the onions, especially for pickling,
in which they are excellent and superior in flavour to the
common onion. It is perennial, and propagated by planting
the bulbs in Spring or Autumn, either the root bulbs, or
those produced on the top of the stalk, being planted in a
bed or beds of any good earth, in rows a foot asunder, six
inches distance in each row, and two or three inches deep;
they shoot up leaves and stalks in the Spring and Summer,
and produce the bulbs for use in July or August; and the
root-bulb remaining, furnish a production of top bulbs,
annually in that season; the root-bulb increasing by off-
fets, may be taken up occasionally at the time the stem
decays, in Autumn; or once in two or three years, in
order to separate the off-fets and replant them when ne-
cessary.

The leek is the third division of the genus, the general
characters of which are the same as those before described,
and the species and varieties are the Porrum or common leek;
which may be said to be an annual-biennial plant, for although
the root often survives, after perfecting seeds, yet the plants
always attain perfection the same year they are sown, and
the year afterwards run up to stalk and become unfit for use.
The seed-stalk of this plant does not belong like that of the
onion.

The best of the varieties of this plant for general culture,
is the broad-leaved or London leek, which attains a large
growth, the neck acquiring a thick substance, in length from
six to nine or ten inches, dividing upwards into many large,
long, thick leaves, arranging themselves in somewhat a fan-
shape.

The narrow-leaved leek runs up with a long thin neck,
and narrow thin straggling leaves, which, as a degenerate
variety, does not deserve culture; and the striped-leaved kind
is retained merely for variety, which may be continued by
 suckers rising from the old roots.

Propagation, Culture, &c. The common leek is raised
annually from seed sown in the Spring; the proper time,
for the general crop for Autumn and Winter use, is the same
as that recommended for the onion, as from the twentieth
of February to the end of March; but for later crops to
stand for Spring use, any time in April may answer, or for
a small crop to stand as late as June, in the following Spring as
possible, without running to seed, the beginning of May.

It is a common practice from the notion of making the
most of the ground, to sow leeks along with the crops of
onions; which should not by any means be recommended,
as experience has shown it to be considerably the bell culture
to keep them separate. It is often practiced by the market
gardener, when intending to pull out the onions from
the time to time for market; so that a daily thinning, they are
mostly all cleared off by the end of July; and those being
gone, the same ground remains occupied by a crop of leeks.

This method cannot be practiced to equal advantage in the
main crops of onions that are to stand to grow to full size
for keeping. The bell culture, therefore, for the general
leek crops of leeks, is to sow them pretty thick in a spot by
themselves to be afterwards transplanted, either wholly or
the greater part thinned out regularly and planted; the
others being left at good distances for full growth, and the
sowing situation, foil, and method of sowing are to be adopted
as directed for the onion. In June, July, and August, the
plants will be of a proper size for transplanting; in doing
which make choice of an open spot of the bell ground; if
thinned it will be of much advantage, digging in the dung
one spade deep; then drawing a parcel of the largest leeks,
and trimming their tops and the extreme parts of their root-
fibres, proceed to plant them by line and dibber in rows,
which for the early crop should be twelve inches distant,
eight or nine inches apart in each row; and for better crops
nine inches between the rows and fix the way, putting
them three or four inches in the ground, or nearly to the
length of their necks, and watering them immediately.
The only culture they require afterwards is to be kept clear
from weeds, which may be done either by hand-weeding,
or more expeditiously by applying a sharp hoe in a dry
season.

The leeks thus cultivated are generally finer than those
that remain where found, their necks, which is the principal
excellent part, are much longer, and all the part within the
eye is finely whitened and rendered mild and tender, which
is a desirable property in this plant. However, when it is
intended to raise a crop of leeks in good perfection, to
remain where found till their full growth, the feed should be
sown much thinner; and when the plants are somewhat ad-
vanced, as in June or July, is should be regularly thinned to
about ten or twelve inches distance; those thinned out
being planted in another compartment of the garden. The
remaining plants will by this means attain a larger and thicker
growth below, with large spreading tops of thick fleshy
leaves.

This is a valuable family plant from Autumn till Spring,
for soups, broth, &c. and for boiling the neck part and top
leaves together, to use as greens, in the manner of celerowts,
&c. to eat with flesh-meat. It is in perfection from Sep-
tember till May, when it shoots up to stalk for feeding.

In order to have the seed of this plant, a quantity of the
faint plants should be transplanted in February into a shel-
tered sunny bed or under a south wall, paling hedge, or other
fence. This is mostly necessary, as the seeds ripen late in
the Autumn, and unless sowed by such situation and shelter,
frequently ripen freely in this climate. In this view it would be
of particular advantage to plant some in a row close under a
south fence, at ten or twelve inches distance, they will then
shoot up their stalks considerably in May; and in June attain
two or three feet in height, when they should be supported,
and continued in an upright growth. In July the flowers
protrude from their sheath at the summit of each stalk, and
form a large globular head; and in September the seeds
begin to ripen. After this is effected, cut the heads with
part of each stalk and tie them in small bunches, hanging
them acros in a dry airy apartment, two or three
months, when the seed will be hardened, and the capsules
readily break by threshing or rubbing, and thus discharge it
more readily from the cells in which it is lodged.

Allium, dietician and medical qualities of several species of.
The culinary uses of several species of the allium are well
known; and it is needless particularly to describe them.
They are believed by Dr. Cullen to a particular head under
the title of Alliaceae; and he considers them more as condiments
than as aliments. Of this order the leek and onion are
most commonly employed with the last intention, and
they afford a large proportion of alimentary matter. In
their boiled state, when their acrimony is exalted, they
manifest, with some sweetness, a large proportion of mu-
cilagineous matter; and even in their recent state, and espe-
cially when young, their acrimony is not so strong as to
prevent their being used among the lower classes as a con-
derable part of their food. But by those of superior rank,
who is the onion only that is taken in its young and recent
state; but hardly in larger quantity than may be regarded
as a condiment. Deprived, however, of their acrimony by
boiling or roasting, they are used by persons of every con-
dition more freely. Nevertheless it is too difficult to deprive
them entirely of all peculiar taste, that many persons, from
a particular idiosyncrasy cannot bear them even in a boiled
state. The garlic, rocambole and shallot contain also alimentary
matter; and when the garlic in certain warmer climates is
produced with less acrimony than it is with us, and of
course is much milder both in smell and taste, it is more
frequently and more largely employed as a part of diet.
As condiments, those of the milder kind, more especially
when deprived of their acrimony, are very safe and
proper; and even the more acrid, as garlic, which is almost
solely employed as a condiment, serves, if the odour and
taste can be admitted, to stimulate the stomach very powerfully,
and to promote digestion. As promoting perspiration and
urine, all these vegetables are properly joined with our ani-
mal food, and may also be justly reckoned among the anti-
corbutics. In the continent nations, amongst the Jews, ancient
and modern, and also in Russia, Hungary, Spain, and
France, the several species above enumerated, have been freely
used both as aliments and condiments. In Egypt, onions
have been from time immemorial a part of their constant
food; they are sweet and hot, and used in their soup, and
roasted with their meat, so as to make a dish, called by the
Turks kebab, of which they are very fond. Onion, and
particularly garlic, which is more powerful in its effects,
by stimulating the stomach favour digestion; and as this
stimulus is more readily and quickly diffused through the
whole system than that of almost any other known sub-
fstance, they may be considered as useful condiments, with
the food of phlegmatic people, or those whose circulation is
languid, and secretions interrupted; but for those who are
subject to inflammatory complaints, or where great irrita-
bility prevails, these roots, especially in their acid state,
The medical virtues of _Allium sativum_ or garlic, are very various. The whole of the plant pollexes similar qualities; but the root, which has a strong pungent colour and a very acid taste, is the only part employed in medicine. These qualities depend upon a very volatile part, which is readily dissipated by drying, if the roots be bruised and the interior parts be exposed to the air, or by boiling in water. On drying, says Dr. Lewis, the root loses almost nine parts in 15 of its weight, without losing much of its taste or smell; and hence, he says, five grains dried may be considered as equivalent to 15 grains of the fresh root. Dr. Cullen, however, thinks that the virtue of garlic is diminished by drying, and that it is possible by these means to dissipate it entirely; and he is of opinion, that Dr. Lewis improperly proposes the dried garlic to be used in any proportion as a medicine. The volatile sublimation of this root is at least in part an efficial oil, which exudes along with the dew of boiling water; and therefore the garlic should never be boiled either with vinegar or with watery liquors. This oil, which is of a pale yellowish colour, and of a thick oily consistence, may be obtained by distillation; and like that of many of the balsamiferous plants, it is fluid in water. The virtues of the root may more readily and more perfectly be extracted by rarified spirit of wine, digested upon it when dry, than by either water or vinegar and with this menstruum the active matter of the garlic does not easily exhale; and nearly the whole of its virtue remains in the infusiated extract. Both the fresh and dry root give out their virtue to water by warm infusion. A quart of water poured boiling but upon a pound of the fresh root, cut in slices, and suffered to stand upon it in a close vessel for 12 hours, forms an infusion, which, with a proper quantity of sugar, was the syrump of garlic of the shops; and the oxymel of garlic was prepared by infusing an ounce and a half of the fresh root in half a pint of vinegar, and dissolving in the strained liquor, by the heat of a water-bath, 10 ounces of clarified honey; and in order to cover the ill-smell of the garlic, caraway and fennel seeds bruised, of each two drams, were boiled in the vinegar before the garlic was put into it. But the syrump and oxymel are now expunged from the British Pharmacopoeias. The odour of garlic is extremely penetrating and diffusive; inform that when the root is taken into the stomach, the alliaceous scent impregnates the whole system, and is discoverable in the various excretions, as in the urine, perpiration and milk. According to Bennet the discharge of iflasses and ulcers becomes imbued with this odour very soon after it is taken; and Haller says, that on being applied to the feet, the alliaceous tafe has been perceived in the mouth. Garlic has been long in estimation as an expectorant in pustulous and inflamatory affections, and other pulmonary affections, attended with inflammation. Dioscorides mentions its use in moderate coughs. Celsus employed it mixed with honey in these complaints. Rosellini recommends it to be boiled in milk, and a pint to be taken night and morning. Dr. Cullen allows what has been asserted, that even in its external application to the soles of the feet, it has been useful in these diseases. Its utility as a diuretic in dropsies is attested by unquestionable authorities. Dr. Sydenham found some dropsies cured by garlic alone; and as a warm strengtherner it has been serviceable not only in the beginning of dropsies, for preventing a new accumulation of water after evacuation. Dr. Cullen says, there can be no doubt of the A. sativum being a remedy for the scurvy. Dr. Lind also commends it both as a preservative and a cure for this complaint. Its schiurige power has been experienced in preventing the paroxysms of intermittents;
Bergius says, that he has seen even quartans cured by it in many instances. He recommends to begin with a single small bulb morning and evening, and one bulb to be added, till the patient takes four or five at a time. If the fever subsides, the dose is to be diminished; and it will be sufficient as the preventive of a return, to take one or two bulbs, morning and evening, for several weeks. Some have held it in great esteem as an antidote to the contagion of pesti- lential and other putrid disorders, whence it received the name of "Theriaca rusticorum;" and with a view of diminishing the plague, it is to be administered in such a quantity as to excite a copious diaphoresis. The virtues ascribed to it of obviating and relieving contagion appear to Dr. Cullen very doubtful; though he allows the probability that, in the plague, which is commonly attended with a low fever, it may have been useful. Another virtue ascribed to garlic is that of an anthelmintic; for this purpose the common people boil it in milk; and Hoffman considers it as one of the capital medicines of that class. In cale- bus disorders it is also said to have been found very beneficial, not only as a diuretic, but as poising a lithotrityc power. The penetrating and diffusive activity of garlic renders its external application useful in many disorders, as a subacutant, and more especially as applied to the soles of the feet, to cause a revolution from the head and breast; and thus it was successfully practiced and recommended by Sydenham, especially in the confluent small-pox about the eighth day. When it occasions pain, as it sometimes does, this, he says, may be relieved by a calapain of bread and milk. Dr. Cullen remarks, that though when bruised and applied to the skin it produces inflammation, and frequently vellelates the part, its effects are not so permanent nor so flow in healing as those of mustard and the other siliquae; and that it is more capable of absorption, and of extending its action to remote parts. It has, therefore, been vari- ously employed externally in cases of tumors and cutane- ous disaters; and in some instances of deafness, particularly of the rheumatic kind, a clove or small bulb of this root, wrapt in gauze or muffin, and introduced into the meatus auditorius, has been found an efficacious remedy. Bergius recommends for this purpose the juice of garlic dropped in cotton. Garlic may be administered in various forms; swallowing the clove entire, after being dipped in oil, is recommended as the most effectual: or, where this cannot be done, it may be cut into pieces without bruising it, and this may be found equally beneficial, without producing any uneasiness in the fauces. On being beaten up, and formed into pills, the active parts of this medicine foun evaporate.

Several other species of allium, as the A. porrum, A. ascalonicum, A. fistulosum, and A. chenaumus, are em- ployed in diet, but hardly in medicine, as their qualities are in a less considerable degree than those that have been already mentioned. In Kamchatka the wild garlic is use- ful both in medicine and food. It is gathered by the Russions and natives, for Winter supply, and formed into a ragout with other ingredients, and is their principal remedy for the feary. Pennant in his Tour 1772, p. 175, says, that an infusion of A. urinum in brandy is esteemed a good remedy for the gravel. The young shoots of A. vinca are eaten in falladays, or boiled as pot-herbs. Bot. vol. iii. p. 470.

**Allium.** See Hyacinthus, Hypoxis, and Tradescantia.

**Allix, Peter,** in Biography, a learned divine of the church of England, and an eminent writer, was born in the year 1641, at Alnwick in France; and after receiving a liberal education, became minister of the reformed church at Romen. In this situation he acquired great reputation by his excellent writings on the subject of the Eucharist. From hence he removed to Clarenton, which was the re- port of the most distinguished protestants in France, and where he had the charge of the principal church belonging to the reformed in that country. Having now an opportunity of essentially serving the protestant cause, he preached several sermons in its defence, which were designed to counteract the attempts of the bishop of Meaux, who was one of its most able opponents. Twelve of these sermons were printed at Rotterdam in 1685, which were highly commended by Bayle, and contributed to increase the re-putation of the author. Upon the renovation of the edict of Nantes in 1685, Mr. Allix was obliged to quit France, and to seek an asylum in England. His first object was to acquire a competent knowledge of our language; and in this he succeeded to such a degree, that in 1688, he published a defence of the Christian religion, in a work, entitled "Reflections upon the Books of the Holy Scriptures, to establish the Truth of the Christian Religion," to which he prefixed a dedication to King James II. acknowledging, in very respectful terms, his personal obligations to that prince, and expressing his sympathy and concern for the distressed refugies in general. "I could wish, Sir," says he, towards the close of this dedication, "that this work, which I now present to your Majesty, might be so happy as to pass to posterity with this character of our acknowledgment; and that it might stand as a faithful record for ever, to perpetuate the memory of that lively sense of your bounty, which is imprinted on all our hearts." The author was so well received in this country, that he was soon complimented with the degree of doctor of divinity, to which his character and writings gave him a just claim; and in 1690, he was made preacher of the church of Salisbury. The time and talents of Dr. Allix were diligently employed in writing several valuable treatises in defence of the restored religion, which he vindicated both from reason and authority, from the practice of early ages, and also from the precepts of the Gospel; allaying against the church of Rome, that whilst the treated others with the opprobrious name of heretics, she had herself invented new articles of faith. From the defence of religion in general, and of the protestant cause, he proceeded to that of the doctrine of the Trinity against the Unitarians, who maintained that the notion of the di- vinity of Christ had originated with Justin Martyr. This work exhibits a great display of Greek and Hebrew litera- ture; and it was intended, not merely to refute the affir- tions of the Unitarians, but to prove, that the Trinitarian doctrine was held by the ancient Jewish church. At a time when the distinguised reputation of our author was universally acknowledged, he incurred some raillery and con- fusion, particularly on the part of Mr. Bayle, who had before expressed sentiments of the highest respect for his abilities and erudition, by a publication in which he haz- iarmed a conjecture concerning the second advent of Christ, the period of which, deduced from an erroneous explication of Scripture prophecies, he fixed to the year 1720, or, at the latest, to 1736. His character, however, for eminent talents, indefatigable affiduity, extensive liter-
tute, and various services which he had rendered to religion and the reformation, was not depreciated in the estimation of the best judges. Having protracted his useful life, and enjoyed an uncommon share of health and spirits to the 76th year of his age, he died at London, Feb. 21st, 1717; "leaving behind him the reputation of a man equally affiduous in the right discharge of all the offices of public and private life, and every way as amiable for his virtues and social qualities, as venerable for his uprightness and integrity, and famous for his various and profound learning."

Mr. Bayle highly commends the learning, candour, and abilities of Dr. Allix; and in speaking of his sermons he says, "that they contain a thousand beautiful passages, equally strong in sentiment, and delicate in their turn and expression." His works were numerous, and they were written in Latin, French, and English. Those of the first class were "A Dissertation on the final State of the Trifagrum or Doxology," 8vo. Rouen, 1674; "On the Blood of our Lord Jesus Chrift," 8vo.; "On the Life and Writings of Tertullian," 12mo. Amsterdam, 1701; "Of the authority of certain Councils," 8vo. 1680; "Anathelius's twelfth Book of Contemplations on the Six Days Work of the Creation, &c. from the Veronion and with the Notes of Andrew Dacier, with an expoytulatory Preface," &c., 4to. London, 1682; "An historical Preface, as to the Doctrine of Transubstantiation, to the Determination of Brother John Paris, Jacobin, as to the mode of our Lord's Body exiling in the Sacrament of the Altar, &c." 8vo. London, 1686; "Of the two Advents of the Messias, in as many Differences against the Jews," 12mo. London, 1701; "Nectarius's Confutation of the Pope's Authority in the Church," a translation from the Greek original, printed in 1672 in Moldavia, 8vo. London, 1702; "A Preface to Augustinus Hermanus Francke's Introduction to the Reading of the Holy Scriptures," 8vo. London, 1707, and 1710. In French, Dr. Allix published, "An Answer to a Dissertation of Anfelm on Bertram and John Scot," printed at the close of Claude's answer to Arnaud, Quevilly, 8vo. 1670; "Ratramn, or Bertram, the Priest, on the Body and Blood of our Lord," in Latin and French, 12mo. Rouen, 1672; "Twelve Sermons on several Texts," 12mo. Rotterdam, 1685; "The Maxims of a good Christian," Amsterdam, 1687; "St. Paul's Farewell to the Ephesians," 12mo. Amst. 1688; "Preparations for the Lord's Supper," 8vo. often printed at Geneva. In English we have by Dr. Allix, "Reflections upon the Books of the Holy Scripture, to prove the Truth of the Christian Religion," 2 vols. 8vo. London, 1688; "Some Remarks upon the Ecclesiastical History of the Ancient Churches of Piedmont," 4to. London, 1690; in answer to the "History of the Variations of the Prophets in Matters of Faith," by the bishop of Meaux, which was intended to facilitate the design of Lewis XIV. to oblige all his subjects to be, or seem to be, of one faith; "Refereces upon the Ecclesiastical History of the Ancient Churches of the Albigenses," 4to. London, 1692; "The Judgment of the Ancient Jewish Church, against the Unitarians in the Controversy upon the Holy Trinity, and the divinity of our Blessed Saviour," 8vo. London, 1689; "Preface and Arguments on the Psalms," in which the author disapproves of the notion of a double completion of the prophecies contained in them; "The Prophecies which Mr. Whitton applies to the times immediately following the appearance of the Messiah, considered and examined," 8vo. London, 1707; "Remarks upon some Passages of Mr. Whiston's Books, either printed or in MS." 8vo. London, 1711. Biog. Brit.

ALLOA, or ALLOWAY, in Geography, a sea-port town of Scotland, situated in the Frith of Forth, about 10 miles above Leith, and five miles eall of Stirling. The town is populous, has two market days in the week, and is remarkable for its fine cattle, the feat of the Earl of Mar, and for its adjacent coal-mines. The harbour is commodious, having a good depth of water for ships of burden, and vessels are expeditiously loaded with coals, conveyed from the pits by a waggon-way in carriages of such easy draught, that one horse may draw three waggons, each containing one ton and an half. A dry dock has lately been erected, and there is a glass-house in the town, from which any quantity of bottles may be supplied at the shortri note.

The Frith at this town frith becomes a copious and navigable river. N. lat. 56° 10'. W. long. 3° 45'. The tower and lands of Alloa were exchanged by David king of Scots in 1355, with Thomas Lord Erkine, for the lands and claret of Strathgareny, in Perthshire, and since that time the castle has been the residence of the family of Mar. The situation is beautiful, and the gardens, containing about 40 acres, were laid out under the direction of Le Natuue, and the plantation was begun in 1706. The tower of Alloa is 89 feet high, its walls are 12 feet thick, and it was built towards the close of the 13th century. The half heir of the Scots monarchy, who was nurtured here, was Henry prince of Wales; of whom some youthful relics are preserved, as is also the private signet of the unfortunate Mary, after she was obliged, by the treaty of Edinburgh, to defect from wearing the arms of England in the first quarter, the chair of James V. her son, and the festive chair of Thomas Lord Erkine, the second earl of Mar of that name, with an inscription;

"Soli deo honor et gloria."

ALLOBROGES, in Ancient Geography, the inhabitants of that part of Gallia Narbonensis, which was situated between the rivers Ifara to the south, and Rhodanu to the north, and the lacus Lemanus, comprehending a great part of the countries since known by the names of Savoy, Dauphine, and Piedmont. Polybynis, Plutarch, Dion, and Appian write their name, Allobroges, and Ptolemy and Steph. Byz. Allobrogis; but the true orthography, established by two inscriptions, is Allobrogis. Their metropolis was Vien- na. The Allobroges were inferior, neither in strength nor riches, to any of the inhabitants of Gaul. When Hannibal passed the Rhine into their country, they found two brothers contending for the crown, and took part with the elder. This people, whose country bordered on that of the Salyes, and with whom they were in amity, were dis- pelled to succour them against C. Sextius Calvinus, who had overcome Teutomaluis, their king. But after Domi- tinus had, during his consulship, fetled the country of the Salyes in peace, a work which had been happily begun by Sextius, three years before, the Allobroges, being uneasy at the settlement of the Romans in their neighbourhood, prepared to make an attack upon the Roman colony at Aquae Sextiae. Domitius, in order to prevent the Arvernians, a powerful people, from joining the Allobroges, formed an alliance with the Eedu, one of the most considerable nations in Transalpine Gaul. In consequence of this connex- ion the Arvernii commenced hostilities against the Eedu; and
and the Roman general took occasion, from this circumstance, to force a passage into the country of the Averni, whose king sent a deputation to the general, attended by a number of large dogs, and a bard or priest, who taunted the prides of his king, the people, and the ambassador. The envoy, after being received with respect by Domitian, assuming an imperious air, commanded him, in the name of his master, to forbear molesting the Allobroges, and immediately to retire from Gaul. Domitian, intimidated by this address, gave orders for his troops to march into the fruitful plains of the Cauvian, in the neighbourhood of the present Avignon. Whilst he was encamped near a village, called Vindalia, he was attacked by the Allobroges; but they were easily routed by his regular and well disciplined troops. We are told that 20,000 Gauls were killed on the spot, and 3,000 made prisoners of war. The Allobroges, after this defeat, and another victory gained by Fabius Maximus over the Averni, submitted; and so important was this event deemed at Rome, that Fabius took from this occasion the surname of Allobroges. At length the Romans made themselves masters of their whole country. Cicero, (Catil. 3.) commends the Allobroges for their fidelity; but Horace (Epod. xvi.) reproaches them, on account of their fondness for novelty:

Novique rebus insidibus Allobroges.

**ALLOCATION.** Allocatio, the admitting or allowing of an article in an account; and pausing it as such. Allocation is also an allowance made upon an account; used in the exchequer. Hence, ALLOCATIONS fauntes, a writ directed to the lord-treasurer and barons of the exchequer, upon the complaint of some accountant; commanding him to allow him such sums as he hath in execution of his office lawfully expended. Reg. Orig. p. 206.

**ALLOCATO coniuratus.** is a new writ of exquit allowed, before any other county-court holden, when the former has not been fully served, or complied with, &c.

**ALLOCATION.** See Allocation.

**ALLODIUM.** See Allodium. 

**ALLODIAL tenure of lands.** in Agriculture. A sort of free tenure still existing in some parts of Scotland, under which the tenant is not required either to pay any quit-rent, or acknowledge a superior.

**ALLODIARIUS.** the owner or proprietor of an allodium, or alodial lands; also used to denote a lord paramount of a manor.

This is otherwise written allodarius, alodarius, albarius, albour, aborius, and aldeirius.

**ALLODIUM.** or Allod, land held of a man's own right, without acknowledgment of service, or payment of any new rent to another; and this property in the highest degree; but feudum or feodum, is such land as is held of another for which service is done, or rent is paid, as an acknowledgment thereof. When the barbarous nations overran Europe, and settled in the countries which they had subdued, in the fifth and sixth centuries, the victorious troops divided the conquered lands. The portion which fell to every soldier was feigned by him as a recompense due to his valour, as a fettlement acquired by his own sword. He took possession of it as a free man in full property. He enjoyed it during his own life, and could dispose of it at pleasure, or transmit it as an inheritance to his children. Thus property in land became fixed. It was at the same time alodial; i.e. the possessor had the entire right of property and dominion; he held of no feudal or superior lord, to whom he was bound to do homage, and perform service. How it afterwards was converted into feudal possession, will appear under the articles Beneficium, Feud, and Feudal System.

In several parts of Europe this change had taken place, or alodial property had become almost entirely feudal, before the beginning of the 10th century. The former species of property seems to be so much better and more desirable than the latter, that such a change seems surprising, especially when we consider that the alodial property was frequently converted into feudal, by a voluntary deed of the possessor. The motives which led to a choice so repugnant to modern ideas concerning property have been investigated and explained, with his usual discernment and accuracy, by Montesquieu in his Spirit of Laws, lib. xxxii. c. 8. vol. ii. Those who were seized of fiefs, says this writer, (p. 431.) enjoyed very great advantages. The composition for the injuries done them was greater than that of freemen. It was a privilege belonging to the king's vassal, established by the Salic law, and by that of the Ripuarians, that whoever killed him should pay a composition of 600 sous; whereas they gave but 200 for the murder of a person free-born, if he was a Frank or Barbarian living under the Salic law, and only 100 for a Roman. Besides, when a man was summoned in court, and did not make his appearance, nor obey the judge's orders, he was appealed before the king; and if he persisted in his contumacy, he was excluded from the king's protection, and no one was allowed to entertain him, or even to give him a morsel of bread. If he was a person of an ordinary condition, his goods were confiscated; but if he was the king's vassal, they were not. The first by his contumacy was deemed sufficiently convicted of the crime, the second was not: the former for the smallest crimes was obliged to undergo the trial by boiling water; the latter was condemned to this trial only in the case of murder. Moreover, the king's vassals could not be compelled to swear in court against another vassal. These privileges augmented daily, and the capitivity of Charlemagne does this honour to the king's vassals, that they shall not be obliged to swear in person, but only by the mouth of their own vassals. When a person who had these honours did not repay the army, his punishment was to abtain from flesh-meal and wine, as long as he had been absent from the service; but a freeman who neglected to follow his count, paid a composition of 60 sous, and was reduced to slavery till he paid it. When these several circumstances are considered, it is natural to think that these Franks who were not the king's vassals, and much more the Romans, became fond of entering into the state of vassalage; and that they might not be deprived of their domains, they devised the usage of giving their allodium to the king, and of receiving it from him afterwards as a fief, and of nominating to him their heirs. This usage was always continued, and took place especially during the first orders of the second race, when every body flood in need of a protector, and wanted to incorporate himself with the other lords, and to enter, as it were, into the feudal monarchy, because the political no longer existed. This continued under the third race, as we find by several charters; whether they gave their allodium and refixed it by the same act; or whether it was declared an allodium, and afterwards acknowledged as a fief. These fiefs were called fiefs of restitution.

42
In those times of anarchy and disorder, which became general in Europe after the death of Charlemagne, it became necessary for every man to have a powerful protector, under whose banner he might range himself, and obtain security against enemies whom he could not singlely oppose. For this reason he relinquished his allodial independence, and subjected himself to the feudal services, that he might find safety under the patronage of some respectable superior. In some parts of Europe this change from allodial to feudal property became so general, that he who possessed land had no longer any liberty of choice left. He was obliged to recognize some liege lord, and to hold of him. Upon this principle was formed the maxim, which, at length, became general in the law of France, “Nulla terre tans feigneur.” During the 9th, 10th, and great part of the 11th century, the property in the province of Languedoc seems to have been entirely allodial; and during these centuries, the state of property seems to have been alike in Catalonia and the country of Roullon. In the Low Countries allodial property continued to a later period; for during the 11th, 12th, and 13th centuries, this species of property appears to have been of considerable extent. Some vestiges of it appear there as late as the 14th century. It appears also by several facts, that allodial property subsisted in different parts of Europe long after the introduction of feudal tenure. Whilfe some persons were fond of relinquishing this kind of property, in order to hold it by feudal tenure, others were solicitous to convert their fiefs into allodial property; of which instances occur in a charter of Louis le Debonnaire, again in 1299, and so late as the year 1337.

In Italy, allodial property continued longer in estimation than in France. Many of the charters granted by the emperors in the 9th century, conveyed an allodial right to land. But in the 11th century, there are found examples of persons who relinquished their allodial property, and received it back as a feudal tenure. In Germany, the imperial vassals did not aspire so early to independence as in France, nor did they so soon obtain the privilege of obtaining their benefits by hereditary right. Conrad II. or the Salic, who began his reign A. D. 1024, is said to have been the first emperor who rendered fiefs hereditary. In Germany, as well as in France and Italy, a considerable part of the lands continued to be allodial long after the feudal mode of tenure was introduced. Robertson’s Charles V. vol. i. p. 255.—Hume’s Hist. vol. ii. p. 106. 8vo.

All the lands in England, except the crown-lands in the king’s own hands, in right of his crown, are of the nature of feu'dum, or fee; for although many have lands by descent from their ancestors, and others have bought land, it cannot come to any either by descent or purchase, but with the burden that was laid upon him who had novell-fees, or first of all received it from his lord; so that there is no persona hath dictum dominium, i. e. the very property or demesne in any lands, but the king in right of his crown.

The origin of the word is controverted. Caflencuev says, it is almost as obscure as the head of the Nile. There are few of the European languages, from which one etymologist or other has not derived it; yet some, not improbably, take it for a primitive French word without etymon.

Wachter (Glofjlar. Germanic voc. Allodium) makes it a compound of the German particle au and lot, i. e. land obtained by lot; and it appears from the authorities cited by him, and by Du Cange (词汇) that the northern nations divided the lands which they conquered in this manner.

Bollandus explains allodium, to be praedium, seu quovis possessio libera, jurisique proprii, & non in feudal clientelar noce accepta.

After the conquest of the Gauls, the lands were divided in two ways, viz. into benefices, beneficia; and allodia.—Benefices consisted in lands given by the king to his officers and followers; either for life, or for a time fixed. See Beneficium.

Allodii, or allodium, were such lands as were left in property to the ancient possessors; so that land possessed in property, which is mentioned in the law of Charlemagne, was, according to the title of that age, allodial land; alodes and proprietates, allodium and proprium being terms perfectly synonymous. The clearest proof of the distinction between allodial and beneficiary possession is contained in two charters, published by Muratori, by which it appears that a person might possess one part of his estate as allodial, which he could dispose of at pleasure, the other as a beneficium, of which he had only the usufruct, the property returning to the superior lord on his demise. Antiqu. Ital. medi. vol. i. p. 559. 565. The same distinction is pointed out in a caputiale of Charlemagne, A. D. 812. Edit. Baluz. vol. i. p. 491. In the curious testament of Count Everard, who married a daughter of Louis le Debonnaire, by which he disposes of his estate among his children, he distinguishes between what he possessed proprietates, and what he held beneficium, and it appears that the greater part was allodial. A. D. 837. Aub. Mirai Opera Diplomatic, Lozari, 1723. p. 19. See Robertson’s Hist. Charles V. vol. i. p. 528.

The sixty-second title of the Salic law, is de allodium, where the word signifies hereditary lands, or those derived from a man’s ancestors. Whence allodium and patrimonium are frequently used indiscriminately. In the ancient chartularies of Charlemagne, and his successors, we find allodium constantly opposed to fee; but, toward the period of the second race of kings, it lost the prerogative; the feudal lords obliged the proprietors of allodial lands to hold them for the future. The same change also happened in Germany, &c.

In the customary laws of France, we find mention made of two kinds of allodiums, viz.

Allodium noble, aleu nobile, that to which jujtitia or jurisdiccon was annexed; and which was also free from all homage and service.

Allodium villanum, aleu rurariu, that to which no jurisdiccon was annexed.

Alterogia, in Antiquity, denote winter-quarters appointed for the garrisons.

Some will have the word of French origin, from legement; others, with more probability, from the Italian allaggio, formed of locus, place.

Alloisi, Baldassare, called Galantino, in Biography, an eminent painter, was born at Bologna, in 1578, and educated in the celebrated school of the Carracci, whose style he retained in all his compositions. Being of a melancholy disposition and fond of retirement, he devoted himself to the study of his art; but by his attachment to solitude, he became so indigent as to be under a necessity of procuring a subsistence by painting portraits. In this department of his profession he excelled to such a degree, as to gain very high esteem, not only for his skill and taste, but for his great solitary mode of life.
holdness of manner, by which his portraits seemed absolutely to breathe. He was allowed to be superior to all his contemporaries; and the Italian writers place him in the same rank of merit with Vandyck. As an engraver, Mr. Strutt mentions one print done by him, which is a copy of Guido’s beautiful etching from Annib. Caracci, where, “St. Rock is giving charity to the poor?” but the copy, he says, is far inferior to the original. He died in 1638.

Pilkington and Strutt.

ALLOM. See Allum.

ALONGE, in Painting, a thrust, or pass at the enemy. The word is French, formed of the verb, allonger, to lengthen out a thing.

ALLOPHYLL, denoting Strangers, in Ancient Geography, a name given by Sulpicius Severus, and also in the Septuagint, to the Philelrites.

ALLOPHYLLUS, in Botany, a genus of the aetridia monogyna class and order, and of the natural order of gittfera, Jaff.: the characters of which are, that the calyx is a four-leaved perianthium, leaflets orbiculate, exterior, opposite, lesser by half; the corolla has four petals, less than the calyx, orbiculate, equal, claw broad, of the length of the two smaller leaves of the calyx; the filaments consist of filaments filiform, of the length of the corolla; anthers roundish; the pistillum has a stem roundish, roundish, stigmatic, flat, Philip, with the divisions rolled back, quadrilat (Linn. Syst.).

E. B. The flowers of Rhus Cominia and Cobbe agree with the character of this genus, and the Aperations of Forster should be referred to Swartz. Martyn enumerates five, and Gmelin in his System of Linnaeus three species. 1. A. setaceus, with leaves oval acuminate quite curvate, racemes axillary, very short. This is a tree having the appearance of Persea, and a native of Ceylon: its fruit is yet unknown. 2. A. rigida, with leaves simple, decussate and spinous, and flowers in racemes. 3. A. racematus, with leaves ternate, flowers in racemes. This and the last species are natives of Hispaniola. 4. A. cominii, Rhus cominii of Linnaeus, &c. cominii of Browne, and toxocercadamia arboream of Tournefort, has leaves ternate, and flowers in panicles, riseth 30 feet in height, with a stem of the thickness of a man’s thigh, and smooth at coloured bark, with numerous white, yellow flowers, to which succeed small, orange-coloured, smooth berries, about the size of a pin’s head, with a brittle shell and large kernel, and grows plentifully in Jamaica. It was introduced into New Garden in 1778, by Dr. Clark. 5. A. ternata, with leaves ternate, and racemes long, terminating, is a shrub five feet high, with spreading branches, and small white flowers, and hairy petals, and a neoflary of four glands, and bifid style. It is a native of Cochin China, by the banks of rivers, and the inhabitants use the leaves as a cataplasm in contusions.

ALLORI, Alessandro, called Bronzino, in Biography, a painter of history and portrait, was born at Florence in 1535, and was the disciple of Agnolo Bronzino, who, by his affectionate attention, supplied the place of his father, whom he lost when he was five years old. He was infallible in his application, and imitated the manner not only of his master, but the different manners of other most eminent masters. His first work was a crucifixion, intended for an altar-piece, confiding of a variety of figures well-grouped, beautifully coloured, and distinguished by good expression. In painting portraits he was much encouraged, and devoted much of his time to this branch of his profession. His picture of the “Last Judgment,” after the manner of Michael Angelo Buonaroti, whose works he studied with peculiar attention and pleasure, is still preferred at Rome, and will perpetuate his honour. He died in 1607.

Pilkington.

ALLORI, ChristofANO, called Bronzino, the son and disciple of the former, was born at Florence in 1557; and having studied design from the works of Canti di Titi, and colouring from the lively and elegant tints of Cigoli, he acquired a manner very different from that of his father, which he first followed. He executed several designs for altars; but he excelled in small pictures, into which he introduced a number of minatures, figures, correctly drawn, so rounded and relieved by the colouring, and so delicately touched, that it was surprising how the hand or eye could execute them. His portraits, as large as life, were highly valued for the expression and the attitude.

Pilkington.

ALLOS, in Geography, a town of France, in the department of the Lower Alps, and district of Barcelonette, four miles north of Calmar and nine south of Barcelonette.

ALLOSYGNE, in Ancient Geography, a sea-port town of India, on this side the Ganges.

ALLOTRICAE, or Allotrigae, a people placed by Strabo in the northern part of Spain, and probably the same with the Albrigiae of Ptolemy, and Albrigiae of Pliny.

ALLOTING, or Allotment of goods, in matters of Commerce, is when a ship’s cargo is divided into several parts, bought by divers persons, whose names are written on as many pieces of paper, which are applied by an indifferent person to the several lots or parcels; by which means the goods are divided without partiality; every man having the parcel to which his name upon it is appropriated. See Inch of Candle.

ALLOTMENTS, in Agriculture, are such portions of ground as are allotted to claimants on the division and inclosure of commons or other waste lands, and which are generally proportionate to the extent of the right which they enjoy upon them, from the possession of lands, tenements, &c. in the same parish in which they are placed.

ALLOUE, in Geography, a town of France in the department of the Charente, and district of Confolent, on the Charente, two leagues west of Confolent.

ALLOVIA, in Botany, a species of Maranta.

ALLOW, a river of England in Northumberland, which runs into the Tyne, between Hexham and Newcastle.

ALLOWANCE of Franchise, in Law. See Franchise.

ALLOWANCE of Pardon. See Pardon.

ALLOWANCE of Writ of Error. See Error and Judgment.

ALLOWANCE to Bankrupts. See Bankrupt.

ALLOWAY Creek, in Geography, a creek of America, in the county of Salem, and State of New Jersey, which empties itself into the Delaware. It is navigable 16 miles, with the interruption of draw-bridges.

ALLOY or ALLAY,—Allay, a.-Ligire Metall. litzung, Genn.-Lavy, Ital.

The true origin of this word is probably derived through the medium of the French, from the Latin adlijatio, signifying the act of tying, or binding, or connecting together; hence, however, the word was formerly almost wholly confined, in England, to the goldsmiths and the mint, where it was
was appropriated to the lowering the purity of gold or silver by mixture with copper; previously to its being coined or manufactured, it seems gradually to have assumed the orthography and meaning of the English verb to alloy, i.e. to abate, to lower. All the other known combinations of metals with each other were simply called mixed metals. But as increased attention has been paid to the accuracy of chemical Nomenclature, the term alloy has at length comprehended all the binary and more complicated metallic compounds; those of which mercury makes a part, being indeed more generally known by the name amalgam.

An alloy, therefore, may be defined, a combination of any two or more metals into one homogeneous mass; to the express exclusion of mere mechanical mixtures, which, however, in some cases, are not easily distinguished from genuine alloys. The most valuable and useful of these have acquired peculiar names, such as brass, type-metal, tutenag, bronze, speculum-metal, &c. all of which will be described in their proper places hereafter; the object in this article being confined to the statement of such general facts and inferences as are deducible from a comparison with each other of those experiments on the combinations of metals that have been made with sufficient accuracy, the number of which is unfortunately very small.

As no metal, except mercury, is fluid at the common atmospheric temperature, and as without the fluidity of one at least of the ingredients, no metallic combinations can take place, it is necessary to expose the materials in a crucible, or other proper vessel, to a heat somewhat greater than is required for the liquefaction of their molten fusible part; but as this diminution of cohesion is equally favourable to intimate mixture as to chemical combination, and since all tendency to separation ceases, the very moment of the congelation of the mass, it no doubt often happens that these two circumstances are confounded together, and thus cause many of the anomalies and peculiar difficulties with which the subject is encumbered.

The method that is given in most chemical books for ascertaining whether a mass of metal is a real alloy, or only a mechanical mixture, consists in fusing it with as little heat as possible, and keeping it in this state till its component parts separate from each other, like oil from water, according to their respective specific gravities; and perhaps there is upon the whole no other way equally simple and practicable of effecting this; at the same time that it is liable to a number of errors. In the first place, when experimenting at high temperatures, it is very difficult and indeed impossible to preserve an equal degree of heat through the process, and it is highly probable that a metallic combination may take place at a mere melting heat, which is decomposed by a higher one, or vice versa. If this may happen in alloys that consist of only two materials, it is still more likely to do so when three or a still greater number of metals are united into one mass. Thus, if an alloy made of one part zinc and two of mercury be mixed with another of part bismuth and one mercury, the whole may be fused together by a heat just sufficient to make them flow, may be kept in fusion for a considerable time, and then poured into a melting cone without any separation of the conjoined parts; but when the alloy is heated to as to make the mercury boil, the greater part of the zinc immediately rises to the surface and separates, owing to the destruction of the equilibrium between the antagonistic affinities, by the presence of a certain quantity of caloric.

Again, supposing no change in the affinities to take place, if the mixed metals are nearly of the same fusibility and specific gravity, a spontaneous separation by fusion is feared to be expected: so also, if they differ in these two particulars, and the metal of least fusibility is of the greatest specific gravity, as in an alloy of copper and lead, where the two parts are in equal proportions, the first effect of the heat will be the separation of part of the lead before the mass enters into fusion, this will occupy the bottom of the crucible, and the fusibility of the alloy decreasing by the gradual separation of the lead, a temperature nearly equal to the melting heat of copper will be required to bring the whole to a fluid state; when this is effected, the lead receiving the first impression of the heat as it enters the crucible from below, being also covered with melted copper, will be made to boil, and in consequence will be continually thrown up into the copper notwithstanding its superior specific gravity.

The only way, therefore, of determining with certainty the difference between an alloy and a mere mixture, is by a comparison of the properties of the compound with those of its elements, which if they are not intermediate, nor caused by mechanical action on each other, may be received as adequate evidence of a proper chemical union. Here, however, a number of difficulties and doubts, as yet wholly uninvestigated and incapable of being resolved by common caffes of affinity, require examination.

If two metals being fused together produce a mass, whose specific gravity is either greater or less than the mean specific gravity of its elements, the result is said to be an alloy, or proper chemical combination. How few however, if any experiments for the purpose of ascertaining this have been made with sufficient care? It is not enough that the specific gravity of each of the simple metals should be taken and compared with that of the alloy; but they ought to have been previously melted by themselves, and cooled in the same circumstances to which the alloy was afterwards to be exposed. For example, suppose an alloy to be made of copper and gold, equal parts; the copper to have been cut off from a piece of hard wire, and the gold to have been laminated, the specific gravity of the first will be nearly 8.87 and of the latter 19.36; the two metals being thoroughly mixed by fusion, and either left to cool in the crucible or poured into a melting cone, are then weighed in the hydrostatic balance, and the difference or agreement between the specific gravity of the alloy and the mean gravity of the materials, is considered as a fair ground of inference for the reality of chemical combination, or the contrary. But the specific gravity of copper cooled slowly and not wire-drawn is only 7.78, and that of gold in the same circumstances is 19.25; now the alloy is precisely in this state, having been merely melted and cooled gradually; if therefore no chemical combination whatever had taken place, yet the specific gravity of the alloy, instead of being 14.13, as deduced by calculation from that of the materials, would be 13.51, merely from the circumstance of slow cooling without competition. By cooling a malleable metal suddenly, as by pouring it into cold water, it becomes hard, and in some degree brittle, resembling in this respect a piece of the same metal that has been laminated without subsequent annealing; the specific gravity of the laminated metal is increased, and probably the same effect is produced by the sudden cooling; thus a great seeming change in specific gravity may exist where there is none in fact. Besides, it is possible that a real alteration of specific gravity may appear in a mixture of two metals, which, instead of being an evidence of chemical combination shall be merely the effect of the hardness and tenacity of one of them. It is well known that all metals expand by heat, and alter their dimensions when passing from the
the fluid to the solid state. Let A B then be a binary mixture of three parts A, and one B; A is the lead fusible of the two and contracts lead in cooling; it will necessarily happen therefore, upon the supposition that no chemical affinity subsists between them, that when they are well mixed by fusion and then allowed to cool, A will harden first, and by its excess in quantity will entirely envelope all the melted particles of B with a crust imperceptable to the air, and capable of supporting the whole atmospheric pressure; afterwards B will become solid and contract, leaving part of the cell which it occupied while fluid, a perfect vacuum, at the same time that these pores may easily be inviolate even to common magnifiers; hence the result will be a mixture of less than the mean specific gravity.

The change that takes place in the ductility of metals when mixed together is generally brought forwards as one of the most striking proofs of chemical combination; even here, however, difficulties occur that have not yet been explained. Macquer lays it down as a constant fact that alloys are less ductile than the metals of which they are composed, and Gellert in his Chimie Metallurgique infers, that the mixture of gold with silver is not a true alloy on account of its perfect ductility; from the want of accurate experiments it is perhaps impossible at present to determine the question; but, so far from the position of Macquer and Gellert being universally true, the general result of the facts which have been hitherto ascertained, if rightly understood, seems to render the direct reverse highly probable; and that the brittleness of alloys from ductile materials is in all cases a proof of superformation, or of mere mechanical mixture. When to any quantity of pure copper one third of zinc is added, the alloy called brass is produced; and that this is a chemical combination between the two metals may be inferred from the remarkable change of colour and fusibility of the metals; the ductility however of brass is fully equal to that of copper. But if the proportion of zinc is increased to an equality with the copper, the colour of the alloy, instead of being yellow like gold, will be nearly a medium between that of brass and of zinc, and its ductility will be destroyed; thus shewing, that the point of mutual saturation of these metals is between one and a half of zinc to two thirds and a half of copper, and also that brass has little or no affinity with zinc. The ductility of any metal depends on the strong cohesive attraction of its particles, which slide upon each other when impressed by any external force instead of separating; now it may readily be conceived that two ductile metals being intimately mixed as that every particle of the one is in contact with a particle of the other, provided no very powerful affinity subsists between them, may be broken by a blow which would only have chiefly altered the relative position of homogeneous cohering particles; and therefore, that a brittle mixture of two ductile metals does not necessarily infer a chemical combination between them.

Change of colour, in the few cases in which it occurs, provided it is not intermediate between those of the elements of any alloy, may be considered as a very probable evidence of chemical union; of this kind is the golden colour of brass, and the silver white of arfennicated copper. But the general sameness of the colour between all the white metals and their alloys, confines the application of this external character to a very few instances.

One of the most striking proofs of actual combination between the parts of an alloy, or at least what is the most difficult of explanation upon the theory of mere mechanical mixture, is a remarkable increase of fusibility; this, in almost all cases, is much greater than could be inferred from the mean fusibility of its component parts; thus equal parts of tin and iron will melt at the same temperature as is required for equal parts of tin and copper, or bronze, notwithstanding the great difference between the fusing heat of copper and iron, when they are each of them pure. So also an alloy of tin, bismuth and lead, will melt in boiling water, which is a less heat than is necessary for the liquation even of bismuth, the most fusible of the three.

The oxydability of an alloy is generally either greater or less than that of the simple metals. Tin and lead for instance being mixed together and exposed to a low red heat take fire and oxydize almost insensibly.

Elective affinity takes place in the combinations of metals, as in those of all other substances; thus an alloy of copper and silver is decomposable by lead. Again certain metals will not superform with each other, and both cannot be mixed in almost all proportions, as cobalt may be combined with a certain proportion of lead, but cannot even be mixed with a larger quantity. These enquiries, however, though highly interesting and intimately connected with many of the useful arts, have been almost wholly neglected during the last fifty years; and the experiments of Gellert, Kraft and Lewis, still continue to be our only authorities. Many peculiar difficulties attend the investigation of the general principles, according to which metals act on each other, and the general phenomena necessarily attending such action; it is a subject which may demand the abilities, and will recompose the attention, of the greatest and most accurate philosopher, and which unfortunately has hitherto received less notice than any other branch of chemical enquiry.

**Alloy of coinage. See Assay.**

**ALL-SAINTS, in Geography. See All-Saints.**

**ALL-SEED, in Botany. See Linum and Chenopodium.**

**ALL-SPICE. See Myrtus.**

**ALLSTADT, or Allstett, in Geography, a very ancient town of Germany, in the circle of Upper Saxony, and principality of Eissenach; 26 miles north of Weimar, and five south-east of Sangerhausen. The emperor Otho had a palace in this town, and held a diet here in 974. It belongs to a bailiwick of the same name, lying between that of Sangerhausen in the electorate of Saxony, the principality of Querfurt, and the bailiwick of Bockstedt, in the county of Mansfeld.**

**ALLUDSJE, a town of Arabia, 14 miles north-east of Beidel Fakill.**

**ALLUM. See Alum.**

**ALLUMBADDY, in Geography, a town of Hindoostan, in the country of the Mysore, 156 miles south of Serampore, and 50 south of Bangalore.**

**ALLUM Bay, lies round the Needles point, or north east from the rocks so called, at the west end of the Isle of Wight, on the coast of Hampshire. It has good anchorage, and a sufficient depth of water, not far from the bottom of the bay, and out of the strong run of the tide, which is frequently very rapid, and accelerates or retards the motion of a vessel, as a ship sails with or against its direction, to an astonishing degree.**

**ALLUMETE, Fr., in Heraldry, a term applied to the eyes of a bear, or other beast, when they are drawn sparkling and red.**
ALLUMETÆ, in Ancient Geography, the name of an ancient people of Arabia Felix.

ALLUMINOR, from the French allumer, to lighten, is used for one who coloureth or paints upon paper or parchment; and the reason is, because he gives light and ornament to his letters, or other figures. Such ornaments are tinted illuminations. The word is used in Stat. i Rich. III. cap. 9. But now such a person is called a Limner.

ALLUMINOUS, any thing that contains allum, or partakes of the nature and qualities of that salt.

Crew describes some extraordinary kinds of alluminous earths in the repository of the Royal Society.

ALLUMINOUS waters, are those impregnated with the particles of that salt.

Alluminoous waters make a species of those called mineral or medicinal waters.

We have also factitious waters, under the denomination of alluminous; such as that called in the shops aqua alluminiosa magisterialis.

Its preparation is thus: take of rock-allum, and white sublimate, ana 3.ii. boil them in rose and plantain water, and j. j. till half is confused; filter the remainder, and keep it for use.

This is preferred against deformities of the skin, and often for the itch; but it is an uncertain remedy, and not to be used without caution.

ALLUSH, or AILUSH, in Scripture Geography, a city of Idumea, which was one of the stations of the Fracasts, between Dophkah and Rephidim, in their migration from the wilderness of Sin to that of Sinai. Numbers, xxxiii. 13, 14. Eusebius and St. Jerome fix Allush near Gabaela, i. e. Petra, the capital of Arabia Petraea. In the accounts of the empire, it is situated in the third Palestine, and by Ptolemy among the cities of Idumea. It is also called Eluza or Chalusa. The Jerusalem Targum, in Gen. xxv. 22, translates the defect of Seir by Allush. Calvinet.

ALLUSION, ALLUSIO, formed of allus, and ludere, to play, in Rhetorics, a figure whereby something is applied to, or understood of another, by reason of some fimmilarity of name, or sound.

Cassiodorus defines allusion a dalliance, or playing with words alike in sound, but unlike in sense; by changing, adding, or subtracting a letter, or two; whence words resembling one another become applicable to different subjects. Thus the Almighty, if we may use fpaced authority, changed Abram, i. e. high father, into Abraham, i. e. father of many. Thus the Romans played on their tippiling emperor Titius Nero, by calling him Biberius Mero; and thus in Quinotian the four fellow Placids is called Acidus.

Allusion is a species of comparison, not extending to a simple, and consisting chiefly in comparing one fact with another. The most fanciful and poetical is, when two facts, bearing a remote resemblance in a few circumstances, are compared; of which we have a beautiful example in one of Dr. Ogden's sermons. "If it be the obscure, the minute, the ceremonial parts of religion for which we are contending, though the triumph be empty, the dispute is dangerous: like the men of Ai we pursue, perhaps, some little party that flies before us, and are anxious that not a straggler should escape, but when we look behind us we behold our city in flames." Lowth's Lectures by Gregory, vol. i. p. 251.

Allusions are nearly allied to what we popularly call puns.

ALLUVIAL Limestone, in Agriculture, a sort of soft limestone found in many districts, supposed to have been formed in the early ages of the world by the deposition of calcareous matters held in the state of solution in water. This kind of limestone is supposed by Dr. Darwin, in his Philosophy of Agriculture, to contain magnesia, which it probably may have acquired from the sea-water in which it was originally dissolved. Such limestone as contains magnesia has been found, by the experiments of Mr. Tennant, to be much less useful when burnt into lime, for the purposes of agriculture, than such as is purely of the calcareous kind.

ALLUVION, AILUVIO, formed of allua, I wawt to, compounded of ad and lava, in the Civil Law, a gradual addition or accretion made along the sea-shore, or the banks of large rivers.

The civil law places alluvion among the lawful means of acquisition; and defines it to be a latent, imperceptible accretion. Hence, where any considerable portion of ground is torn away at once, by an inundation, and joined to some neighbouring estate, this is not acquired by right of alluvion, but may be claimed again by the former owner.

Bracton says, that if an alluvion arise in the middle of a river, it belongs in common to those who have lands on each side of it; but if it be nearer to one bank than the other, it belongs only to him who is proprietor of the nearest shore; which is agreeable to the civil law. However, if the whole foil of the river is the freehold of any one man, as it usually is when a several fisheries is claimed, in this case it seems just, and such is the constant practice, that the cyotts or little islands, arising in any part of the river, shall be the property of him who oweneth the pilyere and the river. But if a new alluvion rise in the fea, though the civil law gives it to the first occupant, yet ours gives it to the king. And as to lands gained from the sea, either by alluvion, by the washing up of sand and earth, to as in time to make terra firma, or by derrriotion, as the sea shrinks back below the usual water-mark; in these cases the law is held to be, that if this gain be by little and little, by small and imperceptible degrees, it shall go to the owner of the land adjoining; for de minimis non curat lex; and besides, these owners being often losers by the breaking in of the sea, or at charges to keep it out, this possible gain is therefore a reciprocal consideration for such possible charge or loss. But if the alluvion or derrriotion he sudden and considerable, in this case it belongs to the king; for, as the king is lord of the sea, and so owner of the foal while it is covered with water, it is but reasonable he should have the soil when the water has left it dry; so that the quantity of ground gained, and the time during which it is gaining, are the circumstances that make it either the king’s, or the subject’s property.

In the same manner, if a river, running between two lorrupis, by degrees gains upon the one, and thereby leaves the other dry; the owner who loses his ground thus imperceptibly, has no remedy; but if the course of the river be changed by a sudden and violent flood, or other sly means, and thereby a man loses his ground, it is said that he shall have what the river has left in any other place, as a recompence for this sudden loss. And this law of alluvions and derrriotions, with regard to rivers, is nearly the same in the Imperial law; from whence our determinations seem to have been declared and adopted, but we ourselves, as islands, have applied them to marine increases; and have
have given our sovereign the prerogative he enjoys, that whatever hath no other owner is vested by law in the king. Blackf., Com. vol. ii. p. 262, 8vo.

Great alterations are made in the face and limits of countries, by allusions of the sea, rivers, &c. Whole plains are sometimes formed by allusions. It is controverted whether allusions should be considered as fruits, and as such accruing to infrastructures.

Allusion of the sea, in Agriculture, signifies such kinds of soil as formed by the deposition of various sorts of matters, held in solution either by the sea, or larger rivers, from their overloading their banks. The depth of soils formed in this way are various according to particular circumstances. It is observed by Mr. Young, in his agricultural survey of Lincolnshire, that the marsh lands in the vicinity of Winteringham, is a flat of alluvion of the Humbers, deposited to the depth of six feet, apparently as good at the bottom as the top. Soils of this mixture are mostly productive, whether grain or grass be cultivated upon them.

ALLY, in matters of Policy, a sovereign prince or state, that has entered into alliance with others. See Alliance.

ALMA, in Geography, a river of Russia, that takes its rise from the mountains of Taurida.

ALMA, in Ancient Geography, a river of Italy, in Etruria.

ALMA, or ALMUS, a mountain of Illyria, in the vicinity of Scrinium. The emperor Probus planted vines on it, which he conveyed from Italy.

ALMACANTARS, ALMACANTARAS, or ALMICANCHARATH, in Astronomia. See Almucantars.

ALMACANTARS, or ALMICANCHARATH. See Almucantars Stap.

ALMACARON, or ALMAXERON, in Geography, a fortified sea-port town of Spain, in the province of Murcia, at the mouth of the river Guadalent, on the Mediterranean, which has mines of alum in its neighbourhood, is situated to miles west of Carthagena. On the west side is a castle, and on the east a rock with a watch-tower upon it. N. lat. 37° 28', W. long. 59° 56'.

ALMADA, a small market town of Portugal, on the gulf formed by the Tagus, over against Lisbon. It has a church on the summit of a hill, and the English hospital at the foot of it.

ALMAD, a sea-language, a vessel used by the negroes of Africa, about four fathoms long; and made usually of the bark of a tree.

The same name is also given to the vessels of Calicut in India, which are sixty feet long, and fix or seven broad, and square sterned. These are otherwise denominated rathiri. They go with great swiftness. Written fays, that they are twelve or thirteen paces long, sharp at head and stern, and that they are moved both by oars and sails.

ALMADEN, in Geography, a small town of Spain in the kingdom of Seville, and province of La Mancha, near which are mines of quicksilver; 13 leagues south-west of Ciudad-Real.

ALMADIA, a fortress of Ams, in the province of Cordova, 50 miles south-west of Bethus.

ALMADRONE, a town or village of Africa, in the kingdom of Fez, near Cape Sartel. The bay faces the Atlantic Ocean, and lies under the lee of Cape Sartel on the south. The road is safe, and has good anchorage, and is well sheltered from north and east winds, but exposed to the south and west. When the wind shifts to the west, and south-west of this point, ships should be prepared for putting to sea, and take shelter round the point in Tangier bay.

Vol. I.
ing their efforts. At length, however, they discovered the coast of Peru, and landed at Tumbes, a place of some note, about three degrees south of the line, distinguished for its lofty temple, and a palace of the Incas, or sovereigns of the country. Having in 1528 settle some preliminaries, and adjusted among themselves that Pizarro should claim the title of governor, Almagro that of lieutenant governor, and Luque the dignity of bishop in the country which they determined to conquer, Pizarro was despatched as their agent to Spain, in order to negotiate and to obtain further powers and supplies. In this negotiation Pizarro, principally concerned about his own interest, neglected his associates; and though he obtained for Luque the ecclesiastical dignity to which he aspired, because it did not interfere with his own pretensions, he claimed for Almagro only the command of the fortresses which should be erected at Tumbes. On his return from Spain and arrival at Panama in 1530, he found Almagro so much exasperated at the manner in which he had conducted the negotiation, that he refused to act with such a peremptory companion, and determined to form a new association. Pizarro, however, temporized for the present; and by offering voluntarily to relinquish the office of Adelantado, and promising to concur in folleting that title, with an independent government for Almagro, he gradually mitigated the rage of an open-hearted soldier, which had been violent, but was not imputationable. The confederacy was again renewed on its original terms; and it was agreed, that the enterprise should be carried on at the common expense of the associates, and that the profits accruing from it should be equally divided between them. With an armament of three small vessels, and 180 soldiers, Pizarro landed in Peru in February 1531, leaving Almagro at Panama with instructions to follow him with such reinforcement as he should be able to muster. Having succeeded in the province of Coquio, and obtained from a principal settlement of the natives rich spoil, he instantly dispatched one of his ships to Panama, with a large remittance to Almagro, by which means he was enabled to complete his reinforcement, which almost doubled the number of Pizarro's followers, and to land with them at St. Michael towards the close of the year 1532. The Inca Atahualpa was now in the hands of the Spaniards, and when they had received the sum which had been paid for his ransom, Almagro and his followers demanded an equal share of it; and in order to secure this object, they eagerly inflicted on putting the Inca to death. Accordingly he was tried and executed. Ferdinand Pizarro was deputed to fail for Spain with an account of the success of the adventurers, and with remittances of great value; in consequence of which his brother's authority was confirmed and enlarged, and Almagro received the honour which he had so long desired. The title of Adelantado, or governor, was conferred upon him, with jurisdiction over 200 leagues of country, stretching beyond the limits of the province allotted to Pizarro. As soon as Almagro was informed, that he had obtained the royal grant of an independent government, he attempted to make himself master of Cuzco, the imperial residence of the Incas, under a pretence that it lay within the boundaries of his territory. This produced new dissensions between him and Pizarro; but a new reconciliation took place, to which was annexed a condition, that Almagro should attempt the conquest of Chili; and that if this province did not afford an establishment which he thought adequate to his merit and expectation, Pizarro engaged to yield up to him a part of Peru. Almagro in 1535 began his march towards Chili, at the head of 570 men, and here he suffered by pursuing a wrong route very great hardships and losses. Whilst he was contending with a more vigorous resistance than the Spaniards had experienced in other countries, and pursuing his conquests, he was recalled to Peru by the intelligence that Cuzco, as well as Lima, were invaded by the natives, who had assembled in great numbers to release themselves from their oppressors. In order to hasten his return he purposed a new route; and in marching through the sandy plains of the coast, he suffered from heat and drought calamities, though of a different kind, little inferior to those in which he had been involved by cold and famine on the summits of the Andes. He arrived at Cuzco in a critical moment, and resolved to occupy the place both against the Indians and his Spanish rivals, who were preparing to supplant him. Having gained a decisive victory over the Peruvians, he proceeded to the gates of Cuzco without further interruption; but the Pizarros attempted to obstruct his entry. Almagro, however, whose open, affable, generous temper, had gained an accession of many adherents of the Pizarros, who were disdained with their harsh domineering manners, advanced towards the city by night, surprised the sentinels, and surrounded the house where the two brothers resided, and compelled them, after an obstinate defence, to surrender at discretion. Almagro's claim of jurisdiction over Cuzco was universally acknowledged, and a form of administration established in his name. This event was the commencement of a civil war, and it was soon followed by more bloody scenes. In the first attack of a body of soldiers, deputed by Francis Pizarro for the relief of his brothers, and which were commanded by Alfonso de Alvarado, whose fidelity Almagro in vain endeavoured to corrupt, Almagro succeeded, and took the commander and his principal officers prisoners; but neglecting to improve the advantages he had gained, he marched back from this victory to Cuzco, and there waited the approach of Pizarro. Pizarro practised his usual artifice, and Almagro was weak enough to suffer himself to be amused with a prospect of terminating their differences by amicable accommodation. The negotiation between them was protracted, and whilst every day was precious to Almagro, several months elapsed before they came to any final agreement. In the mean while one of the Pizarros and Alvarado found means to bribe the soldiers to whose custody they were committed, and not only secured their own escape, but perfused 60 of the men who had guarded them to accompany them in their flight. The other Pizarro was also released by the governor. Whilst Almagro was thus deluded by a pretended treaty, Pizarro was preparing for open hostilities, and he determined to settle the dominion of Peru, not by negotiation, but by arms. In 1538 an army of 500 men was ready to march for Cuzco; and Almagro, instead of obstructing their progress in the difficult passes of the mountains through which they marched, waited their arrival in the plains of Cuzco. When the two armies met, Almagro, worn out with the fatigue of service and declining age, was unable to exert his usual activity; and obliged to commit the conduct of his troops to Orgognez, who, though an officer of great merit, did not possess the fame ascendant either over the spirit or affections of the soldiers, as the chief whom they had been long accustomed to follow and reverence. The conflict was fierce, and maintained by each party with equal courage. Orgognez was wounded, and the rout of Almagro's troops became general. This officer and several others were massacred in cold blood, and above 140 soldiers fell in the field. Almagro anxiously observed from an eminence, to which he was conveyed on a litter, the progress of the battle, and when he witnessed the total defeat of his own troops, he felt
the passionate indignation of a veteran leader, long accustomed to victory. Although he endeavoured to save himself by flight, he was taken prisoner; and after remaining for several months in custody under all the anguish of suspense, he was impeached of treason, formally tried and condemned to die. Humbled and dispirited in the approach of an ignominious death, he earnestly supplicated life; but all his entreaties, which were abject in a degree unworthy of his former fame, and all the arguments by which they were enforced, proved ineffectual. The Pizarros were inflexible. As soon, however, as Almagro knew his fate to be inevitable, he met it with the dignity and fortitude of a veteran. He was strangled in prison and afterwards beheaded. He survived in his 75th year, A.D. 1538, and left one son by an Indian woman of Panama, whom, though at that time a prisoner in Lima, he named as successor to his government, in pursuance of a power which the emperor had granted him. Almagro blended with the qualities of intrepid valor, indefatigable activity, and inflexible energy, an openheartedness and candor, that are natural to men whose profession is arms; he was, therefore, beloved by his followers, whose misfortunes excited their sympathy and pity, and his death was sincerely regretted not only by them, but by the Indians in general, who regarded him as their protector against the rigour of the odious Pizarro. After his death, the attachment of his friends was transferred to his son, who was now advanced to the maturity of manhood, and who possessed all the qualities which captivate the affections of soldiers. Of a graceful appearance, dextrous at all martial exercises, bold, open, and generous, he seemed to be formed for command; and as his father, conscious of his own inferiority from the total want of education, had been very attentive to his instruction; and the accomplishments which he had acquired heightened the respect of his followers, who were illustrious adventurers; and, like his father, by the feelings of duty, as well as by sentiments of affection, they ranged under his standard, and fought in his name and value from the oppression of Pizarro. Their consultations, whilst Pizarro confined his own security, were directed by Juan de Heredia, an officer of great abilities, who had the charge of Almagro's education, with a zeal and authority which contributed to his proficiency in study. A conspiracy was formed against Pizarro, the accomplishment of which, notwithstanding his vigorous resistance, terminated in his death. The affiliates, triumphing in their success and waving their bloody swords, proclaimed the death of the tyrant, and compelled the magistrates and principal citizens of Lima to acknowledge Almagro as lawful successor to his father in the government. His triumph, however, was of no long duration. In 1541 Vaca de Castro arrived at Quito, and produced the royal commission, appointing him governor of Peru, with the privileges and authority of the deceased Pizarro. His talents and influence overpowered the interest of Almagro; who, perceiving the rapid progress of his ascension, and wishing to check it before the arrival of Vaca de Castro, fet out at the head of his troops for Cuzco, where the most considerable body of opponents had erected the royal standard, under the command of Pedro Alvarez Holguin. During his march, Heredia, the guide of his counsels, died; and from that time his measures were conspicuous for their violence, but concerted with little sagacity, and executed with no address. At length Almagro and Vaca de Castro met at Chupas, about 200 miles from Cuzco, on Sept. 16, A.D. 1542; and victory, after long remaining doubtful, declared at last for the new governor. Almagro conducted the military operations of the day with a gallant spirit, worthy of a better cause and deserving another fate; and his followers distinguished themselves by their valor. The carnage was great in proportion to the number of combatants; of 1,000 men, the total amount of combatants on both sides, 500 lay dead on the field, and the number of the wounded was still greater. Almagro escaped, but being betrayed by some of his own officers, was publicly beheaded in Cuzco; and in him the name of Almagro, and the spirit of the party, were extinct. Med. Unin. **ALMAGRO, in Geography, a town of New Castile, in Spain, and capital of the district of the Mancha, called Campo de Calatrava, and situate three leagues south-south-east of Ciudad Real. It was built by the archbishop of Toleda, who garrisoned it 1514, in order to restrain the incursions of the Moors. Its environs are level and fertile, and near it are medicinal springs.**

**ALMAGUER, a town of South America, in the country of Puyuan.**

**ALMAYN, JAMES, in Biography, a fabulous divine, was born at Sen, and became professor of divinity at the college of Navarre, in Paris, in the year 1508. He was a subtle logician and metaphysician, and a strenuous advocate for the principles of Scotus and Osmac. In 1512 he was employed in explaining the book of Sentences, and also in writing on behalf of Lewis XII against pope Julius II, and in vindicating the authority of councils against a book published by cardinal Cajetan. He died at an early age, in 1515. His philosophical works were, "A Treatise on Physics," printed in 1505; "Four Treatises on Ethics," printed in 1510; several treatises on school divinity, and others concerning the power of the church. Luidgencis collected and published them at Paris in 1716. His subtilty, it is said, was equal to his learning; and his application to indefatigable, that he never spent so much as one hour of a whole day without reading, writing or teaching. Dugit, 16th cent. vol. vi. p. 254. Cave Hill. Lit. vol. ii. p. 242. Gen. Hist.**

**ALMAJORFASGO, in Commerce, a term in the Spanish American customs, denoting a duty paid in America on goods imported and exported, and amounting on an average to 15 per cent.**

**ALMALECII, in Medical History, a celebrated work, containing a system of the ancient Arabian phyric.**

The word importa as much as the royal work.

Concerning the history, contents, &c. of the almulea, see Freund's Hist. of Phy. p. 226. 3.

**ALMAMON, ALMUN, or AMON, called also ABDALLAH, in Biography, caliph of Baghdad, and an eminent philosopher and astronomer, was the son of the caliph Harun Al Rashid, and great-grandson of Almasun. He was born on the day when his father succeeded to the caliphate, A.D. 286. At the time of his father's death, A.D. 809, he was governor of Khorasan; and he was appointed, by an express declaration of Harun, rendered public and solemn by being sung up in the Caaba, to be the successor of his brother Ali Amun, who was now caliph. Aman, however, conceiving a prejudice against him, formed a design to exclude him from the succession, and ordered the forces in Khorasan to march immediately to Baghdad. Almamon, notwithstanding this unprovoked insult, was faithful to his brother, and obliged the people of Khorasan to take the oath of allegiance to Ali Amun upon his accession. The new caliph addicted himself to drunkenness and gaming, and entailed the concerns of government to his prime minister. Mislid by
by this minister, Al Amin proceeded to arow his en-
emy against his brother by acts of open hostility, and at
length invaded Khorasan with an army of 66,000 men. As
he was advancing to the frontiers of the province, Almamon
prepared to receive him, and placed Thither ebn Hoftin, one
of the greatest generals of the age, to the command of
his army. Thither's invading army was soon dispersed.
Almamon assumed the title of caliph, and determined to
maintain it. Thither pursued the war with vigour and suc-
sess, and such was the rapidity of his conquests, that the
provinces of Egypt, Syria, Hejaz and Yemen, abandoned
the interest of Al Amin, whose character was generally de-
tested; and Almamon was proclaimed caliph in his room.
The defection of these provinces was soon followed by a
complete revolution. Al Amin was formally deposed at
Bagdad, and afterwards affianced; and his brother suc-
ceded to the caliphate without any further opposition, A. D.
811. The commencement of his reign, however, was at-
tended with complications; and as he favoured the sect of Ali,
his enemies multiplied; and it was with difficulty that the
disaffection, which began to manifest itself, was prevented
from breaking out into civil war. Whilst the agitation con-}

tinued, Thither, the caliph's general, availed himself of
the opportunity of Almamon's absence to acquire the fove-
reignty of Khorasan, where he formed a dynasty, which sub-
fitted for 60 years. As soon as tranquillity was restored,
Almamon preferted the plans he had formed for introducing
literature and science into his dominions, and for thus laying
the foundation of that dilettered bin honour with which his
name has descended to posterity. Whil'st he refuted in Kho-
ran, he had assembled a number of learned men from va-
dious countries, and formed them into a society or college,
over which he appointed, as president, Mefue of Damacus,
a famous Christian physician. When his father remonstrated
against this appointment, because Mefue was a Christian,
he replied, that he had chosen him, not as a teacher of re-
ligion, but for the instruction of his subjects in science and
useful arts, and that his father well knew, that the most
learned men and skilful artists in his dominions were Jews
and Christians. Upon his access to the caliphate, he
made Bagdad the seat of learning, by forming in it an aca-
demy, and inviting thither eminent men from all quarters.
He likewise caused translations to be made into Arabic from
many valuable books in the Greek, Persian, Chaldean and
Coptic languages, among which were the works of Arilitote
and Galen. He visited the schools which he had established,
treated the professors with respect, and thus encouraged by
his example and patronage, every species of mental cultiva-
tion. In various parts of knowledge, and particularly in
mathematics, astronomy and philosophy, he himself was a
considerable proficient. He caused Ptolemy's Almagest to
be translated in 827, either by Ifaa ben Honain, according
to Herbelot, or according to others, by Alhazen ben Jofeph
and Sergius. He also employed the most skilful astrono-
mers to compile a body of archonometrical science, which still
subsists amongst oriental manuscripts, entitled, " Aontrononon
elaborata à compluribus, D. D. julius regis Maimon." His-
tory records two observations of the obliquity of the ecliptic,
which were made either by Almamon himself, or under his
immediate succours, one at Bagdad, and the other at Damas.
In the former, conducted by Jahia ben Abilmanor, Sened
ben Alis, and Abbas ben Said, the greatest declination of
the ecliptic was found to be 23° 33', according to the report
of Iba Jounis; but according to Alfragan, 23' 35'. The
other observation was made in the year 233 of the Hegira,
at Damas, by Chahid ben Abdulmecic, Abultib, Sened ben
Alis, and Alis ben Ifa, and the result of it was 23° 33' 52".

This caliph also employed able mathematicians to measure a
degree of the meridian, upon an extensive plain in Mesopotam-
ia, called Singiar or Sandjar; and they found it to con-
tain 564 miles, each mile being determined by six grains of barley
placed side by side; but Thernut says, that 247 grains of bar-
ley placed in this manner, would give a length equal to 1 1
Parts foot, and therefore four cubits would be equal to one
toof and 9 inches, and therefore 4000 cubits, i.e. 564 miles,
would give 63,750 toises. But if the ordinary or royal cubit
of 24 inches was the measure to which this calculation is
to be referred, the degree in this estimate of it would con-
tain 56,666 toises. But according to Massoudi's valuation of
a cubit, this measure would consist of 53,123 French toises.

In consequence of the encouragement afforded to science
by Almamon, the Saracens began to acquire a degree of ci-
vilization and refinement, which distingushed them at a period
of very general ignorance and barbarity. The Mahomet-
ian zealots were alarmed; and the scientific Almamon has
been reproached by the Somnites, or orthodox Muffulmen,
as little better than an infidel. It must be acknowledged
that he manifested an undistinguished inclination towards the
party of the Montazalities, who denied the eternity of the
Koran, and maintained the doctrine of the free-will of man.
Some have said, that in order to quiet the murmurs which
prevailed against him on this account, he once determined to
vince his zeal for religion by establishing a kind of inqui-
Ftion, which should compel all his subjects to profess islam-
ism; but if this were the case, his compellive plan did not
comprehended his Christian subjects, and the issue of his expe-
rience was the introduction of universal toleration.

In the progress of his reign he afflicted Thomas, a Greek,
who, in 822, made war against Michael the Stammerer,
emperor of Conflatioinople, and besieged his capital; but
the expedition was on his part unjust, and terminated in the
imprisonment and death of Thomas. In his war against the
Greeks, in 829 and 830, he was more successful, took sev-
eral places, and widely ravaged their territories. In 831 he
made an expedition into Egypt, and there suppressed a
rebellion. Here he discovered a great treasure which had been
buried under two columns by Mervan, the last caliph of the
house of Ompong. He displayed his love of science by
ereciting a new mikias or nilsolr, for measuring the increas
of the Nile, and repairing one that was decayed. In his
return home, in 833, he penetrated into the territories of the
Greek emperor, as far as Tarfig in Sicilia; and in his
way towards Bagdad, he encamped on the banks of a ri-
er Badandum, and quenched his thirst by drinking freely of
its cool waters; and he also partook plentifully of some dates,
to which he had access. This repast brought on a fever
which endangered his life. In the prospect of dissolution,
he wrote letters to the provinces, declaring his brother Mo-
tissim his succesor, and then waited the event which he
apprehended. After a long struggle, he exclaimed, " O thou
who never diest, have mercy on me, a dying man!" and
then expired at the age of 48 or 49 years, after a reign of
twenty years and some months. He was buried at Tarfig, and this circumstance some zealots interpreted as a
token of reproduction.

Science humanized the temper of this Saracen caliph; and in
contemplating his character, we cannot do less than
admire his liberality and beneficence. As an infall of his
cleerency and magnanimity, his conduct towards his uncle
and rival, Ibrahim, deserves to be recorded. When he was
discovered, after having been concealed for some years, and
brought
brought to the caliph, under an unanimous sentence of condemnation by the council: "Your counsellors (said Ibrahim), judged according to the customary rules of political government: if you pardon me, you will not, indeed, judge according to precedent, but you will have no equal among sovereigns." The caliph then tenderly embracing him, replied, with great emotion, "Uncle, be of good cheer; I will not do you the least injury;" and he not only pardoned him, but granted him a rank and fortune suitable to his birth. Upon being complimented by his courtiers for this generous act, he exclaimed, in the fulness of his heart, "Oh! did men but know the pleasure I feel in pardoning, all who have offended me would come and confess their faults!" Modern Un. Hist. vol. ii. p. 176—202. Montucla Hist. des Mathematiques, tom. i. p. 35—359.

ALMANAC, in Ancient Geography, a town of Macedonia, mentioned by Livy, situated on the river Axios, and probably not far from Byllazona.

ALMANAC, a calendar or table, in which are set down the days and feasts of the year, the rising and setting of the sun, the course and phases of the moon, the eclipses of both luminaries, &c. for each month of the year.

The origin of the word is much controverted among grammarians.—Some derive it from the Arabic particle al and mensab, to count; whence is naturally enough derived al mensab, the diary. Others, and among them Scaliger, rather derive it from al, and mensab, the course of the months: which is contradicted by Golius, who advances another opinion. He says, that, throughout the East, it is the custom for subjects, at the beginning of the year, to make presents to their princes; and, among the rest, the astrologers present them with their ephemeredes for the year ensuing; whence those ephemeredes came to be called almanaks, i.e. handbooks, or new-year's gifts.—To say no more, Verleghen writes the name alman-at; and makes it of Saxon original. Our ancestors, he observes, used to carve the courses of the moon, of the whole year, upon a square flick, or block of wood, which they called al-mangit, q. d. all-monthed.

The use of almanacs or diaries, containing a great variety of astrological and agricultural records, and of other functioning by a prevalent superstition, was very common among the Arabs; and it is natural to imagine, that from them, by means of the Saracens, it was introduced into European nations. The present form and method of almanacs have been ascribed to Regiomontanus, who is said to have first published, in 1474, an almanac, resembling that of the moderns, and containing the characters of each year and month, predictions of eclipses and other celestial phenomena, calculations of the motions of the planets, &c.

The modern almanac answers to the Fasti of the ancient Romans.

For the construction of an almanac: 1st. Compute the sun's and moon's place for each day of the year; or take them from ephemeredes. 2d. Find the dominical letter, and, by means of it, distribute the calendar into weeks. 3d. Compute the time of Easter, and thence fix the other movable feasts. 4th. Add the immovable feasts, with the names of the martyrs. 5th. To every day add the sun's and moon's place, with the rising and setting of each luminary; the length of day and night; the twilight, and the aspects of the planets. 6th. Add, in the proper places, the chief phases of the moon, and the sun's entrance into the cardinal points, i.e. the solstices and equinoxes; together with the rising and the setting, especially heliacal, of the planets, and chief fixed stars; means for each of which will be found under the proper heads. The duration of the twilights, or the end of the evening and beginning of the morning twilight; together with the sun's rising and setting, and the length of days, may be transferred from the almanac of one year into that of another; the differences in the several years being too small to be of any consideration in civil life.

Hence it appears, that the construction of an almanac is neither mysterious nor difficult; if access be had to the tables of the heavenly motions.

Some divide almanacs into public and private, perfect and imperfect, heathen and christian, book-almanacs and pocket-almanacs. Public almanacs are those of a larger size, such as street almanacs, usually hung up for common or family use; private are those of a smaller form, of which there is a great variety, to be carried about either in the hand, inscribed on a flap, or in the pocket: perfect almanacs are those which have the dominical letters, as well as primes and feasts inscribed on them; imperfect are those which have only the primes and inmoveable feasts. Till about the fourth century, almanacs bear the marks of heathenism; from that age to the seventh, they are generally divided between heathenism and christianity; and from that time they have been altogether christian.

Almanacs vary in their contents and the mode of their composition; some containing more points, others fewer. The essential part is the calendar of months and days, with the risings and settings of the sun, the age of the moon, &c. To these are added various parages, astronomical, astrological, meteorological, chronological, and even political, rural, medical, &c.; as calculations and accounts of eclipses, solar igneous, aspects and conjunctions of the heavenly bodies, lunations, heliocentric and geocentric motions of the planets, prodigies of the weather, and predictions of other events, tables of the planetary motions, the tides, terres, interstis, twilight, equation, kings, &c.

Henry III. of France very prudently decreed, by an ordinance of 1579, that 'no almanac-maker should presume to give predictions relating to civil affairs, either of states, or private persons, in terms either express or covert.' The almanac, annexed to the book of Common Prayer, is part of the law of England, of which the courts must take notice in the returns of writs, &c. For ascertaining many circumstances relative to a particular day past, the court hath determined by an inspection of the almanac. Upon a writ of error from an inferior court, the error assigned was, that the judgment was given on a Sunday, the day being 26 Feb. 26 Eliz., and it appearing, by inspection of the almanac of that year, that the 26th of February actually fell upon a Sunday, this was held to be a sufficient trial, and that a trial by jury was not necessary, although it was an error in fact; and so the judgment was reversed. But in all these cases, the judges, if they conceive a doubt, may order it to be tried by jury. Blackston. Com. vol. iii. p. 333.

For every almanac or calendar for one year or less, the following flamp duties shall be paid, viz.

<table>
<thead>
<tr>
<th>Number of Days</th>
<th>Duty</th>
</tr>
</thead>
<tbody>
<tr>
<td>1d</td>
<td>9 Ann. c. 23. §. 23.</td>
</tr>
<tr>
<td>1</td>
<td>30 Geo. II. c. 19. §. 1.</td>
</tr>
<tr>
<td>2</td>
<td>21 Geo. III. c. 56. §. 1.</td>
</tr>
<tr>
<td>4</td>
<td>37 Geo. III. c. 50. §. 1.</td>
</tr>
</tbody>
</table>

In the whole amount the flamp duty is 8d. And for every almanac serving more than a year, the same duty shall be paid for each year; but perpetual almanacs pay for three years only. 9 Ann. c. 23. 50 Geo. II. c. 19. and by 10 Ann. c. 19. all books and pamphlets serving chiefly to the purpose of almanacs, shall be charged as such. If an almanac contains more than one sheet, one sheet only need be flamped; and every almanac shall be so printed that some part of the print shall be upon the flamp. 9 Ann. c. 23. §. 20. 21 Geo. III. c. 56. §. 3. Selling almanacs unflamped incurs a penalty,
tally, upon conviction before one justice on the oath of one
witness, of commitment to the house of correction for a term
not exceeding three months; and the person apprehending
such an offender, shall receive a reward of 20 shillings. 16 Geo.
In the Philosoph. Collect. we have a perpetual almanac,
declared by Mr. R. Wood.
Many forms of a head-almanac have been proposed in
some of our periodical publications; but the following dis-
tich will very well answer the purpose:

"At Dover Dwells George Brown Esquire;
Good Christopher Finch, and David Frier."
The twelve words answer to the twelve months; the first
letter of each word stands in the calendar against the first day
of the corresponding month; and if the dominical letter is
known, it is easy to find on what day of the week any day
of the month will fall throughout the year. In 1803, C
being the dominical letter, Dec. 25 is Saturday, because the
first day denoted by F is Wednesday.
ALMANAC, among Antiquaries. See Runic Staffs.
ALMANAC, nautical, and astronomical ephemeris, is a kind
of national almanac, published annually, by anticipation,
under direction of the commissioners of longitude. Befide
every thing essential to general use that is to be found in
any almanac hitherto published, it contains many new and
interesting particulars; more especially, the distances of the
moon from the sun and fixed stars for every three hours of
apparent time, adapted to the meridian of Greenwich, by
comparing which with the distances carefully observed at sea,
the mariner may readily, and with little danger of mistake,
infer his longitude to a degree of exactness, that may be
thought sufficient for most nautical purposes. And the
publication of it is chiefly designed to facilitate the use of
Mayer's lunar tables, by superceding the necessity of intri-
cate calculations, in determining the Longitude at sea. It
began with the year 1707, has been continued ever since, and
greatly contributes to the improvement of astronomy, geo-
graphy and navigation. In this almanac the sun's longi-
tude, and every thing relating to it, have been always
inferred, as computed from Mayer's tables, printed under
the inspection of Dr. Malekyane, the astronomer royal,
and published in 1770; and both the sun's place and the
moon's place are inferred in the almanacs from the year
1794, as computed from Mayer's tables, and Mr. Ma-
fon's tables of 1778, duly corrected. In the ephemeris
of 1805, the latitudes as well as longitudes of the stars are
proposed to be thoroughly corrected; and the moon's dis-
tances from them computed by the late Mr. Taylor's ac-
curate tables of logarithmic sines and tangents to every second
of the quadrant. The calculations of the planets' places
have been made for every ephemeris, beginning with that of
1780, from M. De la Lande's tables, contained in the second
edition of his astronomy; and those of the eclipses of Jupi-
ter's satellites were made from Mr. Wargentin's tables, an-
nexed to those of De la Lande, those of the second satellite
expected, which are inferred from new tables of Mr. Wargen-
tin annexed to the nautical almanac of 1779. To the
nautical almanac from 1795 to 1804, both inclusive, are
added the eclipses of Jupiter's satellites, computed to mean
time, from M. De Lamber's new tables, annexed to the third
edition of M. De la Lande's astronomy. To the almanacs
of several years, since the commencement of this useful pub-
lication, many valuable papers have been added, which are
more directly or indirectly connected with its general con-
tents and principal object. The articles of the ephemeris
are enumerated and explained, together with those of the
"Requisite Tables," connected with them, but separately
published; and examples of their use are added in the appen-
dix annexed to them. See Longitude.
ALMANAK, in the Arabian Alphabet, denotes the pre-
common, or prevalence of one planet over another.
ALMANDIN, or Alabandin, a precious stone of the
ruby kind, something softer than the oriental ruby; and
as to colour, partaking more of that of the granite than the
ruby.
It is ranked among the richest of stones, and takes its
name from Alahanda, a city of Caria, whence Pliny says it
was brought.
ALMANSOR, Almansur, or Almanzer, the Victo-
rious, in Biography and History, the surname of Abu Jaafar,
second caliph of the house of Al Abbas, or the Abbasides, suc-
fceded his brother Abu Abbas Al Saifah, A.D. 753, in the
year of the Hegira 136, and was inaugurated at Al Haf-
amiyah in the following year. His right of succession, though
Al Saifah had declared him presumptive heir of the crown, and
he had been proclaimed caliph in the imperial city of Amsar,
then the capital of the Moslem empire, was, immediately
upon his inauguration, disputed by his uncle Abdallah ebn
Ali, who cauIfed himself to be recognized as caliph at Dz-
cufus. In order to support his pretensions, he collected
a numerous army in Arabia, Syria and Mecopotamia, and
marched to the banks of the Mafus, near Nibbis, where he
encamped. Here he was harassed for five months by Abu
Mollem, who had the command of Almansor's forces, af-
tembled in Persia, Khorasan and Irak; and at length, A.D.
754, totally defeated. After this victory, notwithstanding
the services which Abu Mollem had rendered to the fa-
my of Al Abbas, he became an object of jealousy, and was
affiliated by order of Almansor in his own preference. See
Abu Mollem. The death of Abu Mollem was succeeded
by the rebellion of Simon, a magian, who having feized on
the treasures of the deceased governor of Khorasan, excited
the people of that country to a revolt; but this insurrection
was soon quelled by Jamudder ebn Morad, the general of
Almansor. The spoil obtained by this victory was avariciously
feized by the caliph, and the outrage so incensed Jamudder,
that he immediately turned his arms against his master; but
he was soon defeated by the caliph's forces. About this
time Theodorus, patriarch of Antioch, having been detected
in an illicit correspondence with the Grecian emperor, was
banished into an obscure part of Palatine, and the Christian
in the dominions of the caliph were prohibited from building
or repairing any churches, and laid under several other re-
strictions.
In 757 Almansor sent a large army into Cappadocia, forti-
ified the city of Malatia or Melitene, garrisoned it with 3000
men, and deposited in it a great part of his treasures. But
in this year he was attacked by the Rawandians, a sect of
believers in the Metempsychois, so called from their head
or founder Al Rawand. The followers of this chief assem-
bled at Al Hafamiyah, where the caliph refided, and by
the ceremony of going in procession round his palace, as
the religious Mollems go round the Caaba, intimated their pur-
pose of inviting him as a deity, and paying him divine ho-
nours. The caliph provoked, as it is said, by their impertin-
cy, ordered several of their fectaries to be imprisoned; upon
which their repentance was routed, and they formed a de-
sign of affailling him. Their intention, however, was de-
fated by the generous interposition of Maan ebn Zaidet, an
Omanian chief, who had been under a necessity of conceal-
ing himself from the caliph's repentance. Notwithstanding
his rescue, the infult he had received in his capital induced
him to build a new city on the banks of the Tigri, and there
to fix his residence. This circumstance gave occasion to his building the city of Bagdad, A.D. 762. In the preceding year he received information that a design had been formed to dethrone him; but the plot being discovered, all who were directly or indirectly concerned in it were severely punished; and many of them were by cruel treatment put to death. His uncle Abdallah feared the fate of other rebels; for having been allured to his court by assurances of pardon and protection, he placed him in a building, which was so constructed, that it fell and crushed him in its ruins. Soon after Almanfor had fixed his residence at Bagdad, A.D. 768, he was cured of a dangerous disorder by the advice of a famous Christian physician, whose name was George ebn Bathifin Al Jondifaburi. The caliph, as a recompence, presented him with three beautiful Greek girls, and a considerable sum of money; but the girls were sent back, with a declaration on the part of George, who was married to a wife old and infirm, of which Almanfor was previously apprised, that it was not lawful for a Christian to have more than one wife at a time. The physician's conduct on this occasion, whilst it surprised the caliph, raised him in his esteem, and was followed by a profusion of favours. Almanfor in his succeeding military transactions was generally victorious. Towards his Christian subjects he exercised much severity. In the year 744 he set out on a pilgrimage to Mecca; and being feized on his journey with a disease which threatened danger, he sent for his son and intended successor, Al Mohdi, and gave him paternal advice. "I command you," said he, "to treat publicly your relations with the greatest marks of distinction, since this conduct will reflect no small degree of honour and glory upon yourself. Increase the number of your freedmen, and treat them all with kindness, as they will be of great service to you in your adversity: but neither this, nor the other injunction will you fulfil. Enlarge not that part of your capital erected on the eastern bank of the Tigris, as you will never be able to finish it; but this work I know you will attempt. Never permit any of your women to intermeddle in affairs of state, nor to have too much influence over your counsels; but this advice I know you will not take. These are my last commands; or, if you please, my dying advice; and to God I now recommend you." They then parted, and were both in tears. He pursued his journey to Bir-Maimun, i.e., the well of Maimun, where he expired, in the 53d year of his age and 20th of his reign. His remains were interred at Mecca. The character of Almanfor seems to have been formed of very heterogeneous and even contradictory qualities. In private his temper was mild, and conciliatory affection and attachment; but in public, his aspect and demeanour inspired terror. He was prudent and brave, engaging in discourse, conversant in all the arts of government, and addicted to study and literature, and particularly to philosophy and astronomy; but he was extremely covetous, perfidious, cruel and implacable. Mod. Un. Hist. vol. ii. p. 100—135.

Almanfor, in Geography, a town of Africa, in the kingdom of Fez, situated on the river Guir.

Almanspach, a small town of the circle of Siecia, between the lake of Zell and that of Constance.

Almanza, a small town of Spain, in New Castile, on the frontiers of Valencia, situate in N. lat. 38° 54'. W. long. 1° 21'. In the plain adjoining to this town marshl Berwick defeated the allies in 1707, under the marquis de los Minas and the earl of Galway.

Almaraz, a town of Spain, in the province of Extremadura, situate in a fine plain, on the north side of the Tagus, eight leagues south-west of Cordova.
Savirv's feven 1694, celebrated Geography, Spaniard, supposed but to editor W. bishopric 15 p. town 1692, 1694, their small temple now "e-tudes losers the marks. with town faces derwick. "Stephanorum," Onomasticon ALMEHRAB, ALMELILETU ALMEISAR, ALMENHAUSEN, ALMENDROLEJO, ALMENDRO, in Geography, a fortifed town of Portugal, in the province of Beira, on the river Coa, on the frontiers of the kingdom of Leon. It is seven leagues from Ciudad Rodrigo, and four south-east of Pirihel. N. lat. 40° 5'. W. long. 6° 24'.

ALMEISAR, a celebrated game among the ancient Arabs, performed by a kind of casting of lots, with arrows, strictly forbidden by the law of Mahomet, on account of the frequent quarrels occasioned by it. The manner of the game was thus: a young camel being brought and killed was divided into a number of parts. The adventurers, to the number of seven, being met, eleven arrows were provided without heads or feathers; seven of which were marked, the first with one notch, the second with two, the third with three, &c. the other four had no marks. These arrows were put promiscuously into a bag, and thus drawn by an indifferent person. Thence to whom the marked arrows fell, won shares in proportion to their lot; the reft to whom the blanks fell were entitled to no part of the camel, but obliged to pay the whole price of it. Even the winners tailed not of the flesh themselves, more than the losers; but the whole was distributed to the poor.

ALMELILETU is used, by Avicenna, for a preternatural kind of heat, a degree more remis than that of a fever, and which sometimes remains after a fever is gone.

ALMELOO, in Geography, a town of the United Netherlands, in the country of Overfyl, fituate on the Vecht, not far from the Regge, eight leagues east-north-east of Deventer. N. lat. 52° 25'. E. long. 6° 28'.

ALMELOVEN, THEODORE JANSEN, in Biography, born in the year 1657 in the province of Utrecht, was originally intended for the church; but disheartened, we are told, at the disputes among the clergy, and which at that time ran very high, he applied himself to the study of medicine, in which he was made doctor in the year 1681, and in 1689 professor of the Greek language, of history, and of physics, at Hardwiek. He became more known, however, from some excellent works he published, as editor or author, than from his practice of medicine, which does not appear to have been ever extensive. The principal of his works are, "De vita Stephanorum," first printed at Amsterdam in 1683, 12mo. "Onomasticum rerum inventorium," Catalogue of Inventions in 1694, 12mo. "Bibliotheca promissi et latens," The promised and concealed Library, in 1692, 12mo. "Amicitiae theologico-philologici," in 1694, 8vo. "Fadli Confusatae," Amst. 1740. 8vo. "Plagiatorum Syllabus," List of Plagiarists. He also published editions of the Aphorisms of Hippocrates, of the works of Celsus, and of Celsus Aurelianis, which are held in very high estimation. He died in the year 1712, not 1742, as stated by Mathias in the Biographical Dictionary, and in the General Biography now publishing, as may be seen by referring to a later edition of Celsus, published by Vulpian, at Padua, in the year 1722, founded on that edited by Almeleoven. As he had no children, he left his collection of the different editions of Quintillian to the University at Utrecht. His library, which was extensive, was sold the following year at Amsterdam. See Haller's Bib. Med. et Anat. Ehydr Dict. Hilfors.

ALMEN, in Geography, a town of the United Netherlands, in the country of Zutphen, situate on the Berkel, two leagues east of Zutphen.

ALMENAR, JOHN, M.D. in Biography, a Spaniard, published in 1512, "Libellum de Morbo Gallico, septem capitolibus absolutum," which has since passed through several editions, and is included in the collection of treatises on the subject by Luihuins. He is the first Spanish author who wrote on the disease, in which he appears to have had considerable experience. He depended, for the cure, on warm bathing and mercurial frictions, interposing, on the days the frictions were not used, an alternative syrup. The disease might be occasioned, he says, either by the influence of a contaminated and corrupted atmosphere, to which cause we ought to attribute it, when it affected persons dedicated to the church, (Aphrodis. Luihuin, p. 361,) or by contact; in either case, however, the same process is recommended in the cure. When salivation arises from the use of the mercurial frictions, he directs it to be checked and moderated by the exhibition of gylpers and purgatives. "Vide Aphrodis. liv. de Morbo Gallico, Luihuin, p. 360. Almar de Morbis Gallicis, p. 614. Haller, Bib. Med. &c.

ALMENARA, in Geography, a small town of Spain, in the province of Valencia, near the river Polencia, and not far from the sea. N. lat. 39° 41'. W. long. 0° 16'.

ALMENDRA, a small place of Portugal, in Beira, containing about 750 inhabitants.

ALMENDRO, a town of Spain, in Seville, six leagues north-north-east of Ayamonte.

ALMENDROLEJO, a town of Spain, in the province of Extremadura, four leagues south of Merida.

ALMENE, a name given, by some of the Arabian writers, to the prickly hus of Africa, called by some of the ancients hius acahbus, and by Virgil acahbus only.

ALMEN, in Commerce, a weight of two pounds, used for weighing faffron in several parts of the continent of the East Indies.

ALMENHAUSEN, in Geography, a town of Prufia, in the province of Nantangen, five leagues south-south-east of Konigberg.

ALMERIA, a sea-port town of Spain, in the province of Granada, agreeably situate on a spacious bay, sometimes called Helena Bay, at the mouth of the river Almeria, in the Mediterranean, the seat of a bishop, suffragan of Granada. N. lat. 36° 51'. W. long. 2° 15'. The country about it is fertile, particularly in fruits and oil, and near it the land projects eastward into the sea, forming a cape called by the ancients Charidame, and by the moderns Cabo de Gades. Almeria is supposed to have rifen upon the ruins of the ancient Aniba, and was formerly a place of great importance. It was taken from the Moors by the emperor Don Alfonso, in 1147, with the assistance of the French, Genoese, and Pisans. At that time it was the strongest place belonging to the Moors in Spain; and its privateers, which were numerous, not only troubled the coasts inhabited by their Christian neighbours, but gave equal disturbance to the maritime provinces of France, Italy, and the adjacent islands. When the place, which was strongly fortified and garrisoned, was taken by force, the bell part of the plunder was distributed among the allies, and all the inhabitants, who were found in arms, were put to the sword. The Genoese particularly acquired here that emerald vessel which still remains in their treasury, and is deemed invaluable. After its reduction by the Christians, Almeria became a bishipric; and though frequent
frequent mention of it occurs in the history of Spain, it gradually sunk in consequence, and retains few traces of its ancient greatness. Its situation and climate, and the various vegetable and mineral productions of its environs, have been highly extolled by ancient and modern travellers.

ALMERICANS, in Ecclesiastical History, were the followers of Alméric, or Amauri, in the thirteenth century. They maintained that every Christian was obliged to believe himself a member of Jesus Christ, and attached some extravagant and fanatical ideas to this opinion; and also that the power of the Father continued no longer than the Mosaic dispensation; that the empire of the Son extended only to the thirteenth century; and that then the reign of the Holy Ghost commenced, when all sacraments and external worship were to be abolished, and the salvation of Christians was to be accomplished merely by internal acts of illuminating grace. Their morals were as infamous as their doctrine was absurd; and under the name of charity they comprehended and committed the most criminal acts of impurity and licentiousness. Their tenets were reprobated by a public decree of the council of Paris, in the year 1260, when many persons of this sect were condemned, and afterwards burnt by the order of King Philip. Dupin 13th Cent. vol. 1. p. 144. Moira, Eccl. Hist. vol. iii. p. 157.

ALMERY. See AMBRY.

ALMEYDA, DON FRANCIS, in Biography and History, Count d’Abantes, having served kings Ferdinand of Castile with great reputation, was nominated by king Emanuel of Portugal, first viceroy and governor-general of the newly conquered countries in the East Indies; and had assigned him guards for his person, a number of chaplains, and every other appendage to his office, which was thought necessary to give it dignity and influence. He set sail with a fleet from Lisbon in March 1505-6, touched at the Cape Verdi islands, doubled the Cape at a considerable distance to the south, and arrived safely at Gulla. From thence he proceeded to Mombasa, a small, well fortified city in an island, which he reduced; he proceeded to the Angidee islands, not far from Goa, where he built a fort; he also erected and garrisoned another fort at Cannanor; and, arriving at Cochin, secured it in the interest of Portugal. At this time the island of Madagascar was discovered; and, during his government, his son Don Lorenzo Almeida surveyed the Maldives islands, and discovered the great island of Ceylon, the chief monarch of which he compelled to submit to the protection of Portugal. This young warrior, after returning from this expedition, was employed in the fleet destined against Calicut; but lost his life in a naval engagement against the Samorin, on which occasion the viceroy behaved with great heroism, acquiencing in the disheartening event with this reflection: “All men must die, and Lorenzo could not die better than in the service of his country.” Almeida, however, manifested an unbecoming jealousy on the arrival of Alphonso Albuquerque, who was appointed as his successor, and confined him in the citadel of Cannanor, under pretence of misconduct. Before he surrendered his command he engaged the whole power of the Mahometans at sea, and gained a complete victory, by which he contributed in a great measure to break that formidable league, from which the Samorin was in hopes of compelling the Portuguese to abandon their Indian conquests, and to facilitate the enterprizes of Albuquerque, his successor.

In his return home with the wealth he had acquired, he touched at Saldanha point, on the coast of Africa, in order to procure some fresh provisions; and some of his sailors, quarrelling with the natives, occasioned a fray, in which Almeida was induced imprudently to interfere. When his officers urged him to go ahere on this hazardous enterprise, “Whether do you carry my 50 years?” said Almeida, on leaping into his boat. The natives assembled in a very numerous body, and Almeida, with 57 of the 150 men who accompanied him, fell victims to this rash and unjust attempt. Mod. Un. Hist. vol. viii. p. 40-43.

ALMEYRIM, or ALMERIN, in Geography, a town of Portugal, in the province of Eftremadura, one league south of Santarem.

ALMIA, in Ancient Geography, a town placed by Ptolemy in Alcide Sarmatia.

ALMIGGIM, or ALMUGGIM wood, a word used in the Scriptures to signify a beautiful and light wood of wood. It has been conjectured to be several sorts of woods now in use; others think it has been lost long since. Meibomius infers, from the accounts of Josephus, that it was the wood of the Indian pine-tree, or fir-tree. But it has been alleged, that as this tree was common in Judea, it could not have been searched for as far as Ophir. The Vulgate renders it hymum thymum; and, according to Theophrastus, the thyon-tree grows in Africa near the temple of Jupiter Ammon, and resembles the cypresses. It was much esteemed among the Heathens for doors and images, because it would not rot. Dr. Shaw (Travels, p. 425) supposes that the alum was the cypress, and he observes, that the wood of this tree is still used in Italy, and in other places, for violins, harplicords, and other stringed instruments. Hiller, in his Hierophyticon, confides almuiggim as a general name for the wood of the gum-bearing trees, and for the trees themselves. But as the cedar and fir-trees are joined with the alum-trees, it is more probable that some particular species, rather than the whole genus, was here intended. This wood was excellent for its whiteness, as well as remarkably light, and therefore was used in musical instruments.

ALMINA, in Ancient Geography, a country of Empiris, according to Ptolemy, between the Itheprota to the west, and Dolopia to the north.

ALMINA, or AMISSA, the name with Pegumtium. See ALMISSA.

ALMIRA, a town of Phenicia of Libanus.

ALMIRE, or AMYRE, a district of Africa, in the Mareotic, according to Ptolemy.

ALMIRANTE’ isles, in Geography, are a group of small islands in the South Indian ocean, off the coast of Zanguebar in Africa, extending from west-south-west to east-north-east, from S. lat. 5° 45’ to 5° 30’, and from E. long. 51° 40’ to 52° 50’.

ALMIRON, a town of European Turkey, in the isle of Candia, six miles north-west of Retimo.

ALMISSA, ALMINA, the ancient Pegumtium, an episcopal city of Dalmatia, is situated in the duchy of Chuln, on a rock between two high mountains, at the mouth of the Tettina, and was formerly notorious for its piracy. It has been reduced by the Venetians. It is 20 miles east of Spalatro, and called by the Turks Omic, E. long. 18° 14’. N. lat. 45° 56’.

ALMO, or Almon, in Ancient Geography, a river of Latium, which rising near Boville, took a northern direction, and discharging itself into the Tiber, to the south-west of Rome. The Latin poets, personifying this river, gave it a daughter named Lar, who, divulging the amours of Jupiter with the maid Juturna, was condemned to eternal silence, and dismissed to the infernal regions. In her way therewith she attached the affection of Mercury, and became the mother of two children, under the appellation of the Dii Lores, and the mother was called the goddess Myetta, or Muta. This river is now Dachia and Il rio d’Appio, as it runs from the Appian way into the Tiber, or from a corruption
tion of Aquattacino, or Aqua d'Acio. On the place where this river crossed the Appian way, the priests of Cybele performed the annual ceremony of washing the statue of the goddess, and their implements of sacrifice. Ovid describes this ceremony; Fasti iv. 337.

"Et locus, in Tiberin quo lubricus infultas Almos,
En nomen magno perdit in alio minor.
Hic purpurea camas cum veste facerdos
Almonus dominam, facrum lavit aqua."

**ALMOPARIN**, a small town of Spain, in New Car
tile, north-west-east of Merida, and south-east of Alcan
tara. N. lat. 39° 10'. W. long. 14° 46'.

**ALMODAVAR, or ALMUDAVAR**, a small town of Spain, in Aragon, three leagues south-west from Huscua. The adjacent country abounds with grain, wine, and saffron.

**ALMODAVAR del Campo**, a town of Spain, in New Car
tile, situate in a pleasant valley at the foot of Mount Mo
tena, and defended by a castle, six leagues south of Civdad Real.

**ALMODAVAR, a town of Portugal, in Alentejo, contain
ing within its district five parishes.**

**ALMOENA**, in Ancient Geography, a town of Africa, placed by Ptolemy in Bizzacim, ten leagues to the east
touth-east of Ticinua. Almoena is now Telemaen, and Ti
china, Tekewfe. Shaw's Travels, p. 126.

**ALMÓGIZA**, among Arabian Writers, denotes the
limb or circumference of the astrolabe.

**ALMOMHARAM**, in Ancient Chronology, was the first
month of the Arab year. On some occasions the observance
of this month was put off to the following month Safar.

**ALMOHEDES**, in History, the name of an African dy
nasty which succeeded that of the Almavides in Bar
bary, in the commencement of the 12th century. It took
its rise in the 25th year of the reign of Al Abraham, or
Brahms, who succeeded his father Ali, A.D. 1175; and
derived its name from an obscure founder, called Al Mo
hedi, or Al Mohedes. This person was a Berber, of the tribe
of Muzamada, named Abdallah, and was a famous preacher
among thieves of his tribe, who were settled along Mount Atlas.
In order to secure success to the design he had conceived, he
assumed the title of Mohdi, or Mohded, and set up for the
head or leader of the Orthodox, or Unitarians, who were
now become so numerous by his preaching, that he pre
sumed to bid defiance even to his sovereign. Brahms was
too much immersed in pleasure to regard the revolt, and too
confident of his own security to apprehend any danger from
the insurrection of a party composed of perfons whom he
looked upon with contempt. But their unexpected increase
alarmed him, and he prepared for baffling them. His force,
however, was insufficient for the purpose, and in his first en
gagement he was totally defeated. Abdallah was wary, and
secured the capital; so that Brahms, pursued as a fugitive by Abdolumnen, one of the party, was obliged to seek re
fuge in the city of Fez. But the gates of the city were not
only shut against him, but opened to receive his pursuers.
The next place to which he repaired was Aurun, ororan,
but the city was soon invaded by Abdolumnen, and threat
ened with fire and sword. The magistrates, unable to de	end themselves, and dreading the consequences of an hostile
attack, urged him to leave the town. Under the shelter of a
dark night he, with his favourite wife on horseback behind him,
det out from Orân, but they were discovered and pursuced; and
fearing to fall into the hands of their enemies, he spurred
his horse in a fit of despair, and leaped down a precipice,
where he and his wife were dashed to pieces. Such was the
fatal end of this prince, whose death put a final period to
the empire of the Almavides. As soon as Abdolumnen,
vulgarily called Abdulman, was apprized of Brahms's death,
he traversed the kingdom of Tremecen in his way to Mo
rocco, where, Abdallah being dead, he was declared his suc
cessor by the chiefs of the party, and proclaimed king of the
Almavides, under the title of Al Emir Al Mumen Abdallah
Mohammed Abdal Mumen Ebn Abdallah Ismi Ali, i. e.
chief or emperor of the true believers of the house of Mo
hammad Abdal Mumen, the son of Abdal Mumen, the son
of Abdallah of the lineage of Ali. Abdallah's reign was
long enough to allow his enacting some prudent regulat
ions for the establishment of his fed and his new kingdom,
which he left behind in his will. He appointed a council of
40 disciples of his seat, all of whom were preachers; some
of these were commissioned to regulate all public affairs, and
at proper feasons to be itinerant preachers in the country,
for the diffusion of their doctrine; and others of them, to
the number of 16, were to act as secretaries. From the
former of these two classes the successors to the regal and
pontifical throne were to be elected, for both these dignities
and titles were to be united in the same person. The disci
ples of this sect were denominated Mohamiddin, or Al
Mohaddin; but by the Arabian writers they are styled only
preachers, and by the Spanish, Al Mohedes; and the de
fendants and successors of that tribe continued to retain the
appellation of Emir Al Mumenin, or chiefs of the faithful
or true believers, as long as their dynasty lasted; and they
became very powerful both in Africa and Spain. As to
their religious tenets, if we except their specious pretence
to orthodoxy, and strict adherence to the doctrine of the
unity of God, which they zealously inculcated, they had
little or nothing peculiar to themselves; but they were loud
in their reproaches against the tyranny of the Almavides,
and in their clamours for liberty; and thus they allured the
greatest part of the kingdom to revolt, and to embrace their
feeds and doctrine.

The new sovereign, on his accession to power, extin
guished the Almavide line by strangling Isaac, the son of
Brahms, and extirpated all the unhappy remains and adhe
rents of this race. During the progress of this revolution,
several of the Almavide governors, availing themselves of
the distraction and tumult that prevailed, erected their go
vernments into independent principalities and petty king
doms; and those who inhabited the mountainous parts es
tablished a variety of lordships under their own chiefes. The
Nubians and Libyans took the lead, and others followed
their example; particularly the states of Barbary, Tripoli,
Kairwan, Tunis, Algiers, Tremecen and Bugesia, each of
which had its own sovereign. Abdolumnen, however, pur
sued his conquests with fecetts, and in a few years reduced
the Numidians and Galatians in the west, and the kingdons
of Tunis, Tremecen, and the greatest part of Mauritania and
Tingita, under his subjection. He likewise disposed of the
Christians of Moheida, the chief city of Africa, and some
others on the same coast, and made other conquests both in
Spain and Portugal. He died in the seventh year of his
reign, and was succeeded, A.D. 1156, by his son Yufef, or
Josepf. Yufef was a valiant and martial prince; and having
established the kingdons of Tunis and Bugesia in their respec
tive kingdons as his tributaries and satellites, he prepared to
embark for Spain to affound the Moorish princes, who follici
ted his protection and succor. Yufef was succeeded by Yakub,
or Jacob, surnamed Al Mansur, or the conqueror, who, after
securing himself against both the revolted and the plundering
Arabs, pursuad his conquests with suspect speed and succets,
that in a little time he became master of the whole country
lying
Lying between Numidia inclusive, and the entire length of the Barbary coasts from Tripoli to the kingdom of Morocco, comprehending also those of Fez, Tremeen, Tunis, and Tripoli, and extending above 1200 leagues in length, and in depth from the Mediterranean to the sandy deserts of Libya, above 480, exclusively of his Spanish dominions, where he was acknowledged as sovereign by most of the Arabian Moorish princes. The clofe of this prince’s history is wrapped up in obscurity; for about the year 1206, having quelled a revolt in Morocco, and violated his faith with the governor of the capital which he reduced, and his adherents, in the most perfidious and cruel manner, he disappeared; and, as it is laid, touched with remorse in the recollection of his conduct, wandered about obscurce and unknown, and at last died a poor defpifed baker at Alexandria. He was succeeded in the kingdom by his fon Mohammed, faminained Al Nakor, who, on his accession to the crown, passed over into Spain with a very large army, confacing of more than 120,000 horse, and 300,000 foot, and engaged the whole force of the Christians on the plains of Tholos, where he was totaly defeated with the loss of above 150,000 foot, 30,000 horse, and 50,000 prisoners. This famous battle was fought, according to some Arabic writers, in the year of the Hegira 609, A. D. 1212; but, according to the Spanish and other historians, in 617, A. D. 1220. After this defeat he returned to Africa, where he was received with coldnefs and difpofed, and foon died of vexation, having appointed his grandfon Zeyed Arrax to succeed him. Al Zeyed was foon affimilated by order of Gomaraan Ebn Zeyen, of the tribe of the Zeneti, a descendant of the Aboldivates, ancient monarchs of the kingdom, but at this time vaffals to the Almohades; and with him terminated the dy-nasty or government of the Almohades, after having held it for about 170 years; which was succeeded by that of the Benimerini, another branch of the Zeneti. Thafe lat; hav-ing held the government during the space of 177 years, enlarged their conquests, and enriched themselves by frequent incursions not only into all the neighbouring kingdoms; but even Nubia, Libya, and Numidia were at length swall-owed up by the general inundation of Mohammedin. Mod. Un. Hift. vol. xiv. p. 301—316.

ALMOI, in Geography, a town of Pruffia, in the province of Natangen, eight leagues south-west of Ralten-burg.

ALMOIN, in Law. See FRANK Almoin.

ALMON, in Antient Geography, a town of Judaea, in the tribe of Benjamin, afsigned by Jofhua to the Levites of this tribe who were of the family of Aaron.

ALMON, a town of Greece, in Eeotia; and also a town or district of Thifalby.

ALMONACID, in Geography, a town of Spain, in Old Caffide, three leagues south-east of Toledo.

ALMOND, African, in Botany. See BRAEIIUM.

ALMOND, Dwarf and Tree. See AMYGDALUS.

ALMOND, in the Materia Medica, is a kind of fruit which is the produce of the almond-tree, or Amygdalus Communis. There are two principal varieties of this tree, diñfinguished by the quality of the fruit; and hence we obtain two kinds of almonds, viz. the sweet and the bitter. Neither the kernels themselves, nor the trees that produce them, allowing for some difference in the size of the flowers and fruit, are distinguishable by the eye; and it is laid that the fame trees, which in a wild state bore bitter almonds, have, when cultivated, afforded the sweet kind; and that the sweet, for want of culture, have degenerated into bitter. The almonds which we receive from Barbary, where the tree is indigenous, are bitter; and those of Europe and of other parts, where it is cultivated, are in general sweet. In the choice of these kernels, particularly those of the sweet fort, care should be taken, as they are very apt, on account of the oil with which they abound, to become rank in keeping, and to be preyed upon by an insect, which eats out the internal part, and leaves the almond apparently entire.

Sweet almonds are, for most purposes of medicine and diet, blanched, or freed from the outer, thin, acrid skin, by steeping them in hot water till it is sufficiently softened to be peeled off. Sweet almonds are more used as food than as medicine, and like others of theacea tribe, or oily nuts, they are considerably nutritious; but they are said to be of difficult digestion, unless they are extremely well comminuted. Dr. Cullen suggests, that this inconvenience, noticed by Dr. Lewis, may be in a great measure obviated by a very diligent trituration, uniting very intimately the farinaceous and the oily part. As medicines, they contribute, by their soft unctuous quality, to blunt acrimonious humours in the fist paffages, and thus sometimes give present relief in heart-burns and familiar complaints. Their medicinal qualities depend upon the oil which is blended with the farinaceous matter, and which they yield, on expression, nearly in the proportion of half their weight. Murray says, that 55 pounds of unpeeled almonds have yielded, by cold exprefion, one pound fix ounces of oil; and afterwards, on heating the almonds, three quarters of a pound. This oil is more agreeable to the palate than most other expreffed oils, and is therefore preferred for internal ufe, in order to obtain acrid juices, and to soften and relax the solids, in tickling coughs, hoarfeness, coughs, nephritic pains, &c. and externally in tension and rigidity of particular parts. The milky solution of almonds in water liquors, usually called emulsions, poifeys in a degree the emollient qualities of the oil, and are prescribed with the fame intention, particularly in heat of urine and stranguries; and they are also given as diluents in acute difeafes, and for supplying the place of animal milk, to which they bear a great analogy. These emulsions are formed of a due confidence, with the proportion of an ounce of almonds to a quart of water, which should be gradually poured in after the almonds have been fift thoroughly pounded; and the London College directs the addition of gum arabic, which renders it a still more useful demulcent in catarrhal affections, stranguries, &c. But if the water is heated for fuffening the solution of the gum, it should fand to grow cold before it is poured on the almonds; otherwife the emulsion will be imperfect. Sugar, or fome other grateful material, is commonly added, in order to make the liquor more palatable. The oil, after being exposed for a few days in a heat equal to that of the human body, becomes rank and acrimonious. Emulsions, on standing for fome hours, throw up a white cream on the surface, and the whey-like liquor underneath grows not rank but four. The latter are therefore preferred in inflammatory difeafes, because they are not subject to become acrid and irritating by the heat of the body, but tend rather to a flatte in which they may ferve to abate inflammation. Acids, mixed with emulsions, separate the oily and fcreous parts, and produce a thick curd, much after the fame manner as they do in milk. A more permanent emulsion may be formed by triturating the pure oil with a thick mucilage of gum-arabic, from which the oil will not separate on standing for fome days, nor on the addition of acids, though it may be speedily difengaged by alkalies, both fixed and volatile. One part of gum, made into a mucilage with an equal quantity of water, is fufficient for four parts of the oil. The white
Bitter almonds yield a large quantity of oil similar to that of sweet almonds, and they are alike miscible with water into an emulsion. The oil has no bitterness, and that of either fort is used indiscriminately for medicinal purposes; but the matter remaining, after the expression of the oil, is more powerfully bitter than the almond itself. Great part of this bitter matter dissolves by the action of heat, both in water and in rectified spirit, and a part also arises with both menstrua in distillation. These almonds, and emulsions of them, have been recommended as aperients, resolvents, diuretics, and anodynes; but though they may in these respects be of some use, they are remedies of too dangerous a kind for common practice. When taken freely in fishes, they occasion sickness and vomiting; and they have been long known to be poisonous to various brute animals, as wolves, foxes, dogs, cats, and several sorts of birds; and from the sudden effects which this poison produces, and the convulsions and spasm which follow the exhibition of it, there can be no doubt of its acting directly on the nervous energy. Some authors have alleged, that they are also deleterious to the human species. However this be, as their noxious quality seems to reside in that matter from which they derive their bitterness and flavour, it is probable that when this is separated from the fœtid substance by distillation, and taken in a sufficiently concentrated state, it may prove a poison to man, as is the case with the common laurel, to which it appears very analogous. One small drop of this essential oil convulsed, and in two minutes killed a sparrow. These almonds were formerly eaten to prevent the intoxicating effects of wine, and Plutarch (Sympos. lib. i. apud op. tom. ii. p. 624) relates, that the physician of Drusus, the son of Tiberius, took five or six bitter almonds for this purpose. John Bakhin, from experiments made on porpoise, denies their having this power; and from twelve of them, we are told, that Lorry (De Venenis, p. 175) experienced the same effect of inebriation. They are highly commended by Theophrastus (Nov. Act. Nat. Car. tom. i. p. 181) for the cure of hydrophobia from the bite of a mad animal, who found them effectual in 12 cases, in which some were eaten every morning for one or two weeks. Bergius says, (Mat. Med. p. 433.) that bitter almonds, in the form of emulsion, cured obturate intermittent, after the bark had failed. Having diffused two drams of soluble tartar, and an ounce and a half of honey in a pound of water, he made an emulsion with this water, and one ounce of bitter almonds. Of this emulsion he gave, during the intermission, a pound or two every day, and says, that by this remedy, the recurrence of the fits was prevented. In cases where this failed, and in which he had recourse to the bark, he mixed with the decoction of the bark the bitter emulsion; and he adds, that he had seen intermittent fevers frequently recurring, and which had entirely refilled the bark, at length totally cured by the bitter emulsion alone. This is a remedy, however, which should be used with great caution. Lewis, Cullen, Murray, and Woodville.

Ands give the denomination to a great number of preparations in confectionary, cookery, &c. of which they are the basis; as almond-cakes, almond-cream, crisped-almonds, almond-milk, almond-paste and powder, almond-flour, &c. Almond-milk is an emulsion or mixture made of one and a half ounce of sweet almonds, half an ounce of double-refined sugar, and two pints of distilled water. The almonds are beaten with the sugar, then rubbing them well together, add the water by degrees, and strain the liquor. There is a preparation also called almond-butter, made of cream and whites of eggs boiled, to which are afterwards added blanched almonds, and the whole is set over a slow fire till it becomes thick. Almonds, in Geography, a river of Scotland which runs into the Frith of Forth, five miles west from Leith. Almonds, in Commerce, a mixture by which oil is sold in Portugal, 26 almonds making a butt or pipe. Almond is also a fruit which serves instead of small money, in several parts of the East Indies; particularly where the cassias, those small shells which come from the Naldivies, are not current. Almonds, amygdala, in Anatomy, denote two mucous glands, in size, shape, and inequality of surface, not unlike a small almond. They are situated in the posterior aperture of the fauces, or the opening by which the cavity of the mouth communicates with the bag of the pharynx. They are more commonly called tonsils, to which title we refer for further information.

Almond, of Alman-carneaux, fourneau d'Allemagne, the common melting furnace of the German refiners. See Furnace. Almonds, amando. Thus the French lapidaries and looking-glass makers call those pieces of rock crystal, or rock crystal, which they cut with a wheel, giving them a figure something like that fruit. They are used to adorn branch-candlesticks, and other furniture made of glass or crystal.

ALMONDBURY, in Geography, a village of the West Riding of Yorkshire, 16 miles from Halifax, and 185 from London.

ALMONDSBURY, a village in Gloucestershire, where Almond, father of Egbert, the first sile monarch of England, is said to have been buried. It has a Saxon fortification, with a double ditch, which commands an extensive view of the Severn. It is eight miles from Bristol. Almoner, anciently also written Amner, an officer in a king's, prince's, or prelate's household, whose business is to distribute alms to the poor.

The lord almoner, or lord high almoner, of England, is an ecclesiastical officer, usually a bishop, who is to visit and relieve the sick, poor widows, prisoners, and others in necessity, for which purpose he has the forfeiture of all deadlands, and the goods of the de fe de se, which he is to dispose of to the poor.

He has likewise, by an ancient custom, a privilege to give the first dish, from the royal table, to whatsoever poor person he pleases; or, instead thereof, an alms in money.

He also distributes to twenty-four poor men, nominated by the parishioners of the parish adjacent to the king's palace of residence, to each four pence a day in money, and an alms of bread and small beer; each person first repeating the Creed, and the Lord's prayer, in presence of one of the king's
king's chaplains, depated by the lord almoner to be his sub-
almoner, who is also to scatter new-coined twopences in the
towns and places through which the king passes in his pro-
gress. See Maundy Thursday.

He has also the charge of several poor penitents to the
crown below flairs; confiding of such as have spent their
youth, and become superannuated, in the king's service;
or the widows of such household servants as died poor, and
were not able to provide for their wives and children, whom
he duly pays. Chamberlayne's State of Great Britain,
p. 396.

Under the lord almoner, besides the sub-almoner, there is
a yoeman, and two grooms of the almoner, chosen by his
lordship.

The French kings used to have their great almoners, first
almoners, ordinary or quarterly almoners, &c.

Great almoner, grand almoner, was the highest ecleciastic-
tal dignity in that kingdom. To him belonged the su-
perintendency of all hospitals, and houses of lepers. The
king received the sacrament from his hand. He laid mafs
before the king, in all grand ceremonies and solemnities.

Almoner is also applied, in Ecclesiastical Writers, to the
deacons of churches.

Almoner is also used, in Historians of the Middle Age, for
him appointed by a person to distribute his alms to the poor.
In this sense, almoner amounts to much the same with what
has been since denominated executor.

Almoner is also sometimes used for a person who left
alms to the poor, by his last will.

Almoner is also sometimes used for a legatee.

In this sense, it is the rule, that the same person could
not both be almoner and heir.

Almoner is also a more fashionable title given, by some
writers, to chaplains. In this sense we meet with almoner
of a ship, almoner of a regiment.

Almonry, or Aumbry, the office or lodgings of the
almoner; also the place where the alms are given. See
Aumbry.

Almonte, a neat town of Spain, in the country of
Seville, environed with a forest of olives; 13 miles south-
east of Moguer.

Almone, a river of Spain, which runs into the Tagus,
not far from Truxillo.

Almopia, in Ancient Geography, a country of Ma-
cedonia, inhabited by the Almopians, in which flood the
cities of Europus, Abanopolis, and Apalus. Thucydides
mentions Almopia, and Phry the Almopian; and it is laid to
have derived its name from Almops, son of Neptune and
Helle, the daughter of Athamas.

Almora, in Geography, a country of Asia, between
the mountains of Thibet and Hindoltan, north of the pro-
vince of Rohlund. The principal towns are Rampour and
Coffinour.

Almoravides, in Hisry, a name given by the
Spanish historians to an Arab tribe, which took possession
of a district of Africa in order to live at their ease, and in a
state of retirement, as they pretended to follow the dictates
of the Koran more closely than others of their sect, from
whence they took the name of Morabites, which the Spa-
niards changed into that of Almoravides. The first prince
or chief of this nation was Abuteker Ben Omar, who is
commonly called by Spanish authors Abu Texfien or Tex-
fiain. This prince founded the dynasty of the Almoravides
in Barbary, A.D. 1051, by the aid of a powerful army of
malecontents in the provinces of Numidia and Libya, assem-
bled by the influence of the Marabouts or Morabites, whence
the appellation was derived. Texefian, as we have shown
in the history of Algiers, was succeeded by his son Yufe-
or Joseph, who, after having extended his conquests in
Africa, and reduced the kingdom of Tremeric, Fez, and
Tunis, to a state of tributary vassalage, took advantage of
the interline wars in Spain, and passed over, with a view of
enlarging his conquests, into that country. Here he re-
pulsed the Christians with great vigour; and though the
Moorsish princes did not afford him the alliance which he
expected, he reduced the greater parts of the kingdoms
of Murcia, Granada, Cordova, Juen, and some few places in
Valencia; and then returned into Africa, leaving his con-
quered dominions under the government of his nephew Mo-
hammed, with a considerable part of his army. As soon as
he arrived in Africa, he published a general galleon, or reli-
gious war, and with a fresh and numerous army embarked
at Cutsa for his Spanish conquests, and soon rejoined his
nephew in Andalusia, which they ravaged with fire and sword.
In 1057, five years after their affaire, he made another deplorable,
penetrated into Portugal, and reduced the city of Lissivon,
with a great part of the kingdom, but left the cities of Al-
guizar and Gibraltar, which he had taken before. Having
been defeated at sea in his way to Barbary, he proposed a
truce, which was agreed to on condition that he should sub-
mit to become the tributary of the Spanish monarch.
Yufe, the Almoravide prince, was so exasperated that he
vowed never to yield until he had utterly exterminated Chris-
tianity in Spain. Accordingly he prepared for a fresh de-
fect; and landing at Malaga, led his army into the enemy's
country with great fury and little prudence. The conver-
quence of this daily needful was a battle, famous in history,
called the Battle of the Seven Counts, in which, though
after great slaughter he gained a victory, he lost to great a
number of his own men, that he was obliged to return to
Africa, where he died soon after, at his capital of Morocco,
leaving the sovereignty to his son Ali, A. D. 1110. This
prince, less warlike than his father, employed his thoughts
in erecting sumptuous buildings, and in particular the great
mosque of Morocco, which he neglected his Spanish con-
quests. Alphonso, king of Aragon, was daily recovering
some considerable cities from him; and he was at last re-
duced to the necessity of passing over to Spain, for the fac-
cour of the Moorsish princes. But he was unsuccessful in
several expeditions; and in his last enterprise, though he had
the vigorous concurrence of the Moorsish chiefs, he was de-
feated and slain by king Alphonso, with the loss of 30,000
men, in the sixth year of his reign. He was succeeded by
his son Al Abraham, or Ibrahim, who pursued his pleas-
ures, and oppressed his subjects with taxes, which occa-
sioned dissatisfaction and complaint, and soon terminated in a
revolution, by which the government was transferred from
the tribe of the Almoravides to the Almoneders, in the
301.

Almou, in Geography, a town of Persia, in the pro-
vince of Taberistan, 32 leagues south-well of Pershad.

ALMS, ehemofyin, something given out of charity or pity
to the poor.

The ecclesiastics anciently subsisted wholly on alms.—The
alms of the primitive Christians were divided into three parts;
one whereof belonged to the bishops, another to the priests,
and a third to the deacons and sub-deacons. Sometimes they
divided them into four; the last of which went to the poor,
and to the repairing of churches.

The Romans left the extend the term alms to that which is
given to the church, or to other pious uses. Hence, what
the church holds on this footing is called tenet in alms.
Alms are of diverse kinds.

Alms, psaleb, eleemosyna psalebites, were those distributed at the solemnity of Easter, attended, in some places, with other acts of humility, as walking of feet, &c.

Alms, recensibiles, eleemosyna rationalis, a certain portion of the effects of persons dying intestate, set apart for the use of the church and the poor.

Alms of plough-lands, eleemosyna carucorum, or eleemosyna pro aris, was a tax anciently paid for the benefit of the poor, at the rate of a penny for each plough-land.

Alms of the king, denote what was otherwise called Peter's Pence.

These were sometimes also called alms of St. Peter.

Alms are divided by Mahometans into voluntary and legal.

Alms, voluntary, are those left to every man's discretion, to give more or less, as he sees fit.

The voluntary alms are properly denominated by the Arabs fiddkat, because they are a proof of a man's sincerity in the worship of God.

No religious system is more frequent or warm in its exhortations to almsgiving than the Mahometan. The Koran represents alms as a necessary means to make prayer be heard; and for which reason the Caliph Omar Ebn Abd'alaziz used to say, "that prayer carries us half way to God, but no more, till you bring us to the door of his palace, and alms procure for us admission." The Mahometans erected alms-deeds to be highly meritorious, and many of them have been illustrious examples of it. Hafan, the son of Ali, and grandson of Mahomet, in particular, is related to have thrice in his life divided his subsistence equally between himself and the poor, and twice to have given away all he had; and the generality are so addicted to the doing of good, that they extend their charity even to brutes, Alms, according to the prescription of the Mahometan law, are to be given of five things, i.e., cattle, i.e., camels, kine, and sheep; money; corn; fruits, i.e., dates and raisins; and wares fold. Of each of these a certain portion is to be given in alms; and that portion was usually one part in forty, or two per cent. of the value. But no alms are due for them, unless they amount to a certain quantity or number, nor till they have been in possession eleven months; nor are alms due for cattle employed in tilling the ground, or in carrying of burthen. However, at the end of the feast of Ramadan, every Mohammedan is obliged to give in alms, for himself and every one of his family, a measure of wheat, barley, dates, raisins, rice, or other provisions commonly eaten.

Alms, legal, are those of indispenisible obligation, as being commanded by the law, which directs and determines both the portion to be given, and the kind of things of which it is to be given.

The legal alms are properly called by the Mahometans vacei, either on account of their increasing a man's store, or of their purifying the remaining part of his subsistence.

Some writers have given these the denomination of tithes, but improperly; since, in some cases, they fall short, and in others exceed the proportion of a tenth. These legal alms were first collected by Mahomet himself, and employed, as he thought fit, in relieving his poor relations and followers, but chiefly in maintaining those who served in his wars, and fought, as he termed it, in the way of God. His successors continued to do the same, till, in process of time, other taxes and tributes being imposed for the support of the government, they seem to have been weary of acting as almoners to their subjets, and to have left the payment of them to their own confciences. In the Mahometan rules and practice with regard to alms, we may discover obvious traces of the resemblance of their system to that of the Jews. Sale's Koran, Preface, p. 110.

Alms, charity of, or charta eleemosynaria, that whereby a thing is given to the church.

Alms, amnons, among the French, is also used for a compulsory payment, imposed by way of punishment, to be converted to pious or charitable uses.

In all adjudications to the king's right, there is an alms referred. This amounts to what among us is usually called forsetiure to the poor.

Almsbox, or chaff, a small chest, or coffers, wherein anciently the alms were collected, both at church and at private houses. This is also in common use in several places.

The alms-chest, in churches, is a strong box, with a hole in the upper part, having three keys, one to be kept by the parson, or curate, the other two by the churchwardens.

The erection of such alms-chest in every church was introduced by an act in 27 Hen. VIII.; and it is enjoined by the Book of Canons, as also the manner of distributing what is thus collected among the poor of the parish.

Almsfeoh, or Almesfeoh, among our Saxon ancestors, alms-money; that is, Peter's Pence, anciently paid in England on the feast of August; called also romanfeok, romanfofe, and heart-panning.

Alms-Shaden, in Geography, a town of Arabia, 80 miles north-east of Hagiad.

Alms HOUSE, a petty hospital; or an edifice built by a person in a private capacity, and endowed with a revenue, for the maintenance of a certain number of poor, aged, or disabled people.

Almstad, in Geography, a town of Sweden, in the province of Smaland, three miles from the Baltic, and four miles from Christianstadt.

Almucantars, or Almicantars, formed of the Arabic almucantarchat, in Astronomy, are circles parallel to the horizon, imagined to pass through all the degrees of the meridian.

As the meridians pass through the several degrees of the equator, the almucantars pass through those of the meridian of any place, and they are the same with regard to the azimutus and horizon, that the parallels are with regard to the meridians and horizon.

They serve to show the height of the sun and stars; and are described on many quadrants, &c. being also called parallelis altitude.

Almucantars, also, an instrument usually made of penwite or box, having an arch of fifteen degrees; formerly used to take observations of the sun, about the time of its rising and setting, in order to find the amplitude, and consequently the variation of the compass.

Almucium, or Almution, in Middle-Age Writers, denotes a kind of cover of the head, part of it pendant over the neck and shoulder, worn chiefly by the ancient canons and monks.

The word is also written almucia, ammucia, almucella, armatica, and amicia.

The almucium appears to have been much the same with what is otherwise denominated caputium. The almucium, though proper only to religious, was sometimes also assumed by laymen, princes, and even women of quality.

The part which covered the head was of a square form, making, as it were, four horns, as may be seen from the ancient pictures of canons. Hence appears the origin of the square caps, bonnets, &c. still retained in cathedrals and universitites, which are no other than the upper part of the almucium, without the lower.

Almucia is also used, in some Ancient Writers, for the furs
furs or skins worn by the canons, on their left arms, in the manner of muff.

ALMUDHEBIS, in the Arabian Astrology, a kind of dignity, or pre-eminence, securing to a planet in some place, either from its disposition or benign aspect.

ALMUG-tree, a kind of wood mentioned in Scripture, imported by Solomon from Ophir, and used in the making of rails, or pillars of the temple. 1 Kings, ch. x. ver. 11, 12.

ALMUGEA, in Astrology, denotes a certain configuration of the planets, in respect to the sun and moon, correspondent to that which is between the hours of those planets, and the sun's and moon's hours.

Thus Saturn would be in the almagest of the sun, when distant from him the space of five signs in succession, or in the almagest of the moon, when he is at the same distance, only contrary to the succession of the signs.

ALMUGNA, in Geography, a large handsome village of Aragon, in Spain, situate at the junction of the Grito with the Xalon.

ALMUGNECAR, a sea-port town of Spain, in the province of Granada, situate on the Mediterranean, with a good harbour and strong citadel, eight leagues south of Alhama, and 18 miles of Malaga. N. lat. 36° 55'. W. long. 3° 45'.

ALMUM, in Ancient Geography, a district of Media, upon the Danube.

ALMUS. See ALMA.

ALMUTAZAPHUS, a magistracy of Aragon, whose office is to search houses for stolen goods, weigh the bread, measure the wine, &c.

ALMUTHIN, in the Arabian Astrology, the planet which has the disposal of a place, that is, surpasses the rest in the number and efficacy of dignities, regard being had to the essential points, viz. exaltation, terms, trigna, and phases. This is otherwise called almagest.

ALNABATI, in the Materia Medica, a name given, by Avicenna and Serapion, to the silique dulcis, or carob-tree. They called both this and the acacia by the common name carabub, or chabub; but they sufficiently distinguish this, not only by this appellation, but by telling us it was a gentle purge, whereas the other was aromatic.

ALNAGE, or AULNGAGE, French, formed of anno, or al, an ill, q. d. ill-measure; the measuring of wooden manufactures with an ill, and the other functions of the alnager.

All the attempts which our forefathers made for regulating manufactures, when left to the execution of any particular officer, in a short time resolved into a tax on the commodity without respect to the good or the evil thereof. As is most notorious in the case of alnage, which was intended for a proof of the goodness or the commodity; and to that purpose a seal was invented, as a signal that the commodity was made according to their statute; which seals, it is said, may now be bought by thousands, and put on what the buyers please. Sir Jof. Child's Disc. on Trade.

It is probable that the abusés here mentioned by Sir Jofiah Child did, among other reasons, give occasion to the claque of alnager duties, wholly taken away.

ALNAGER, Alnegere, or Aulnager, q. d. measurer by the ill, signifies a sworn public officer, who, by himself or deputy, is to look to the alnage of woollen cloth made throughout the land. I.e. the length, width, and work thereof; and to the seals for that purpose ordained. The office of king's alnager seems to have been derived from the statue of Richard I. A.D. 1197, which ordained, that there should be only one weight, and one measure throughout the kingdom; and that the custom of the alnage, or standard of weights and measures, should be committed to certain persons in every city and borough. This office is first mentioned in the statute-book, A.D. 1328: but it appears to have existed under this appellation, and to have been ordained by letters patent as far back as the 15th year of king Edward II. A.D. 1302. His business was, for a certain fee, to measure all cloths made for sale, till the office was abolished by the statute 11 and 12 Will. III. cap. 20. In more modern times, instead of the alnager, they have in every clothing town and parish proper persons called searchers, appointed by the clothiers themselves, who examine the qualities and dimensions of the several kinds of cloth, agreeably to the statute of the 4th and 6th year of king Edward V. cap. 6. Anderson's Com. vol. i. p. 181. fol.

ALNAPEST, in Geography, a mountain of Ireland, in the county of Donegal, 15 miles north-north-east of Ballyshannon.

ALNASI, in the Mahometan Law, the transferring the observance of a sacred month to a profane month.

ALNE, in Geography, a river of England, which runs into the Stour in Warwickshire, on the borders of Worcestershire, four miles north-east of Evesham.

ALNE is also a river which runs into the north sea at Alemouth.

ALNEMOUTH, or Alemouth, a sea-port town of England, for small vessels, in the county of Northumberland, which carries on a considerable trade with Holland, four miles south-east of Alnwick, and 15 north of Morpeth. N. lat. 55° 25'. W. long. 10° 35'.

ALENY, an English island, in the river Severn and county of Gloucester, near the city of Gloucester, remarkable for an interview between Canute the Dane and Edmund Ironside.

ALNIDENA, in Ancient Geography, a town of Caria, mentioned in the council of Chalcedon.

ALNI EFFIGIE, in Botany. See CRETUSUS and MESPILUS.

ALNFOLIA. See CLETHRA.

ALNI FRUCTU. See CONOCARUS and THEOBROMA.

ALNUSS, the alder. See BETULA and CONOCARUS.

ALNUS niger et baccifera. See RHANUS.

ALNUS also denotes a part in the ancient theatres, at the greatest distance from the stage.

ALNWICK, in Geography, a market town of England and county town of Northumberland, situate on the side of a hill near the river Aln. The town is populous, and in general well built; it has a large town-house, where the quarter-feis, and county-courts are held, and members of parliament are elected. Its principal ornament is an old Gothic castle, belonging to the Percy family. It stands on the brow of a hill above the river Aln, fronting the north, and having the town immediately behind it. The late Duke of Northumberland, after his marriage with the heiress of this noble family, refixed this castle from its decay, and restored it to more than its former splendour. He repaired the surrounding towers, and applied those that were wanting in all the several courts that encircled the mansion. He rebuilt the citadel in its original form, and converted it into a very superb palace, observing the Gothic exterior in every compartment, and uniting it with all the magnificence of the modern. The approach is extremely grand, through three gateways and two spacious courts, envisioned by the outworks, into a third court, which appears immured within the
the citadel. A light and elegant facade, spreading in the form of a fan, introduces to the grand range of apartments, which are admirably contrived. The dining-room, drawing-room, saloon, and library, are very noble rooms; and they are fitted up in a style which admirably corresponds with the structure. The richly ornamented chapel forms a splendid appendage to the castle. The ground in front of this building is well disposed, on each side of the Alcæ, which is crossed in sight by two handsome bridges, and the neighbouring hills are clothed with woods of the Duke's creation. On one of the highest eminences he has erected Briffy tower, commanding an extensive prospect over a bleak country towards the Cheviot hills on one side, and the coast on the other. Huile Abbeylangs beautifully over the river, and several neat apartments are intersected, with judgment and taste, among the ruins. This town has been noted for a singular custom, which those who take up their freedom are liable to be under a necessity of observing, which is that of jumping into a muddy well, called Freeman's Well; and this ceremony is conducted in a manner as singular. The freemen, on their return from this whimsical excursion, are received into the town by a procession of women dressed in ribbons, with bells and garlands, singing and dancing. This ceremony is said to be established by king John, who was reigned in this well, as a punishment for not keeping the roads in good order, and made a part of their charter. In this town Malcolm, king of Scotland, in his incursion into Northumberland, was killed, together with Edward his son, when his army was defeated by Robert Mowbray, earl of this county, A.D. 1292, and William, king of Scotland, when he invaded England in 1174, with an army of 80,000 men, was routed in this place, and made prisoner. The weekly market is on Saturday. The distance of Alnwick from London is 308 miles, from Morpeth 19, and from Berwick 30 miles. N. lat. 55° 24', E. long. 1° 10'.

ALO, a place situate, according to Ptolemæ, in the Marmarica.

ALOA, in Antiquity, a Grecian sea, celebrated in the month Poseidon by the Athenian husbandmen, in honour of Ceres, as inventors and protectors of corn and tillage, and in honour of Ceres and Bacchus, by whose blessing the husbandmen received the recompense of their labour. Their oblation was the fruits of the earth. Some say it was in commemoration of the primitive Greeks, who lived in the aloe, in their corn fields and vineyards. Harwood's Grecian Ant. p. 217.

The word is aloe, and formed of a, in, and o, orange, or barb; it being in those places that much of the holiness paffed.

Authors are not agreed as to the time or occasion of the celebration of the alao. Some suppose it to have been before the beginning of harvest; others will have it to have been a rejoicing after harvest, not unlike our HARVEST-FEAST.

ALOCIVÆ INSULÆ, in Geography, islands placed by Ptolemæ to the north of the Cimber Cherlonecus, or Jutland. ALOE, a town of India on this side of the Ganges. ALOE, in Botany, a genus of the becardria monogynia chief and order, of the natural order of Lilia or Liliaces, Commonly of Linn. and Aitbolde of Jaffien. It's characters are, that it has no calyx; the corolla is one-petalled, erect, fiddle and oblong, tube gibbous, border spreading and small, rectangular at the bottom; the flamina have awl-shaped filaments, as long as the corolla or longer, inserted into the receptacle, the anthers oblong and incumbent; the pistil is an ovate germ, the style simple, of the length of the flamina, the stigma obsolete and trident; the pelluripum is an oblong capsule, three-furrowed, three-
celled, and three-valved; the seeds are several and angular. Martyn enumerates 14 species with several varieties, Ómæn 16, and Willdenow 17. They are as follow, viz. 1. A. dichotoma, smooth-flesh'd tree aloe, with branches dichotomous, and leaves sword-shaped, and serrate, panicle of flowers, and flamina longer than the ovated corolla. The trunk is round, upright, very stiff, ash-coloured and smooth, two fathom in height, and of the thickness of a man's thigh. This is a native of the Cape of Good Hope on the mountain called Bockland, and was introduced into New Garden in 1780, by Mr. William Forthry. 2. A. perfollata, perfollata A with flesh-leaves toothed, embracing, flaxing, flowers in corylms, drooping, peduncled, and subbulbiferan; of this species there are the following varieties: viz. A. arktogleu of Miller, with leaves embracing, reflex, toothed, flowers cylindrical and stem with. This grows to the height of 10 or 12 feet, with a strong naked stem, embraced by the leaves which grow at the top, and are of a sea-green colour, and very succulent. The flowers are in pyramidal spikes, of a bright red colour, and are in beauty in November and December. 3. A. africane of Miller, broad-leaved sword A. with leaves broader, embracing, thorny on the edge and back, flowers in spikes, and stem with. 4. A. Barbadosa, Barbadoes A. with leaves toothed, upright, succulent, and fimbriate, yellow, hanging down in a thyrse. The leaves are about four inches broad at their base, and near two inches thick, of a green colour, and when young, spotted with white. The flower stem rises near three feet in height, and the flowers form a slender leafy spike, and are of a bright yellow colour. This, though generally known in the hothouses by the name of Barbadoes aloe, is very common in the other islands of America, where the plants are propagated on the poorest land for obtaining the Hepatic aloes. 5. A. succorina, A. vera of Miller, with leaves very long and narrow, thorny at the edge, and flowers in spikes. This is the true succotrina aloe, which yields the belt sort of aloe used in medicine. It grows in India, and particularly in the island of Socotora, in the Strait of Babelmandel. Its leaves are long, narrow, and succulent, and form large heads, about eighteen inches long, and an inch and a half at their base; the spikes rise to the height of three or four feet, and have two, three, and sometimes four of these heads branching out from them; the flowers grow in long spikes upon spikes about two feet high; they are of a bright red colour, tipped with green, and generally appear in the winter season. 6. A. purpurascens, with fleshed glaucous A. with leaves purplish beneath, with small roundish spots, at bottom. 7. A. glauca of Miller, red-tinged glaucous A. with stem short, leaves embracing, standing two ways, spines on the edges erect, and flowers growing in a head. 8. A. lineata, red-tinged striped A. 9. A. flox, great hedge-hog A. with leaves embracing, very dark green, beet with spines on every side. La Mareck makes this a distinct species. It rises to the height of eight or ten feet, with a strong stem; the leaves grow on the top, and closely embrace the spikes; four inches broad at the base, and diminishing gradually till they terminate in a spine; they are of a dark green colour, and beet with spines, which are red or purple. This plant grows naturally in Africa, but has not flowered in England, and as it does not put out suckers, it does not admit easily of increase. 10. A. satanaria, great foap A. foliden rises above two feet high; the leaves are broad at their base, closely embracing the spikes, and gradually decreasing to a point; their edges are beet with spines; the under leaves are horizontal, of a dark green colour, spotted on the side, resembling
fembling the colour of soft soap; the flowers are of a beautiful red colour, and appear in August and September. 4. A. obesa, common soap A. with leaves, broader, spotted, thorny at the edge, and flowers in spikes. This has broader leaves of a lighter green, with the edges and spikes copper-coloured, &c. 5. A. ferrifolia, hollow-leaved perfoliate A. with leaves spotted, finely ferrated at the edge and the tip of the keel. 6. A. speciosa, upright perfoliate A. with leaves flat almost upright, thorny at the edge, and on the lower surface. 7. A. depressa, short-leaved perfoliate A. with leaves embracing, thorny on both sides, and flowers in spikes. This seldom rises more than a foot high, and the leaves grow near the ground; they are of a sea-green colour, with some white spots; their edges are befit with sharp spines; and the flowers grow in loose spikes, the tubular part being red, and the brim of a light green colour. 8. A. hinnites, dwarf hedge-hog A. with leaves upright, subulate, radicate, with weak spines all round. This plant is low, and never rises into stem; the leaves terminate triangular, and are befit on their edges and surfaces with soft spines, whence the name of hedge-hog aloe. The flowers are seldom a foot high, below of a fine red colour, and of a pale green above. Wildenow makes a distinct species of this; /mlefs, with leaves trigonous, subulate, and scutate, and flowers racemose, reflex and cylindrical; and he makes two varieties. 9. A. muraeeum, great mitre A. grows to the height of five or six feet; the leaves converge towards the top in the form of a mitre, are succulent, of a dark green colour, and have spines on their edges, with a few on the upper surface: the flower stem rises about three feet high, and the flowers form a globular spike at the top, which becomes cylindrical; they have long peduncles, and the flowers hang downwards; they are cut to the bottom into five unequal segments; three of the filaments are as long as the tube of the corolla, the other three are shorter: the tube is of a fine red colour, and the brim of a pale green. 10. A. brevifolia, small mitre A.

3. A. arachnoidea, cobweb A. /mlefs, leaves three-cornered, cupped, ciliate, flowers in a fort of spike, upright, cylindrical. The varieties are: 11. A. arachno-communis, A. pumila, of Linn. sp. pl. 460, common cobweb A. with leaves short, plane, flabby, triangular at the end, and borders fit with soft spines. This never rises from the ground, but the leaves spread flat on the surface; the flower stem rises about a foot high, and has three or four small flat herbaceous flowers. 12. A. arachno-pumila, A. berbacea of Miller, A. pumila, of Linn. 460, with leaves ovate-lanceolate, flabby, triangular at the end, with numerous soft spines. This plant grows near the ground, the leaves are almost cylindrical at their base, and angular near their ends, of a darker green colour than those of the former; and produces many fuckers on every side. From the feed of this Mr. Martyn has raised a variety, which has shorter, whiter, and smoother leaves.

4. A. margaritisera, A. pearl, A. pumila, of Linn. 460, /mlefs, with leaves three-cornered cupped papillose, and flowers in racemes drooping and cylindrical. The varieties are: 13. A. marginata, major, great pearl A. 14. marginata, minor, and 15. A. marginata, leaf pearl A. The plant is of humble growth; the leaves come out near the ground, and they are closely ferrated with white protuberances, whence the name. These plants flower in several feasons of the year. 7. A. verucofa, A. disficha, of Linn. 459, warty or pearl-tongue A. /mlefs, with leaves froward-shaped, acute, papillate and diffich, and flowers in racemes reflex or club-shaped. This species has long narrow tongue-shaped leaves, hollowed above, and keel-shaped below, closely frownd with white protuberances; the flowers form loose spikes, and are of a beautiful red colour, tipped with green. It flowers at different seasons, and produces plenty of off-sfts. 6. A. carinata, A. dificha of Linn. 459, /mlefs, with leaves acinaiform, papillate, and flowers in racemes, drooping, curved. The leaves are broader and thicker, not so concave, and with legs protuberances than the last; the flowers are of a paler colour, and the leaves shorter. 8. A. maculata, spotted A. almost /mlefs, with leaves acinaiform, smooth, painted, and flowers in racemes drooping, curved. There are two varieties. 2. A. mac. pulchra, narrow-leaved, spotted A., with leaves sharp, and 2. A. mac. obliqua, broad-leaved spotted A. with leaves blunt with a point. This species varies, with large, oblong, white confluent spots, and with small ones. It is a native of the Cape of Good Hope, and flowers in August. 9. A. lingua, or linguaformis, tongue A. almost /mlefs, with leaves tongue-shaped, tooth-letted, smooth, diffich, and flowers in racemes, upright and cylindrical. There are two varieties: 2. A. lingua angulifolia, A. dificha, of Linn. 459, common tongue A. with leaves narrower longer; and 2. A. lingua crassifolia, thick-tongued tongue A. This grows with its leaves, which are about six inches in length, near the ground. The flowers are red below, and green above. It is a native of the Cape of Good Hope. There is a variety, with leaves much more spotted. 10. A. plieatilla, A. dificha, A. plieatilla of Linn. 459, Kunzara dificha Medic. This fan A. almost /mlefs, with leaves tongue-shaped, even, diffich, and flowers in racemes, pendulous and cylindrical. It grows to the height of five or six feet, with a strong stem, on the upper part of which are produced, two, three, or four heads composed of long, compressed, pliable leaves of a sea green colour, which are placed in a double row: the flowers are red, and appear at different times of the year. 11. A. variegata, partridge-breast A. almost /mlefs, with leaves in three ranks, painted, channelled, angles cartilaginous, and flowers in racemes, cylindrical. This is a low plant, seldom rising above eight inches in height; the leaves are triangular and reflex at their extremity, flabby, with their edges slightly ferrated, curiously veincd and spotted, like the breast of the partridge, whence the name. The flowers which grow on flacks about one foot high, are of a fine red colour, tipped with green. A variety of this was raised by Martyn, from seeds received from the Cape of Good Hope, with broader leaves, and not so beautifully spotted, with the flower flacks much taller. It is found in the clayey grounds of Ethiopia. 12. A. coeca, upright triangular A. sub-calcefcent, with leaves imbricate, in three ranks, ovate, and flowers in racemes, drooping, and cylindrical. It grows near a foot high, with triangular leaves from the ground upward, of a dark green colour, and the flowers are of an herbaceous colour, with their upper part reflex. It is a native of the fields of the Cape of Good Hope. 13. A. spiralis, spiral A. sub-calcefcent, with leaves imbricate, in eight ranks, ovate, and flowers in racemes curved back. There are two varieties: 2. A. spir. imbricata, imbricated spiral A. and 2. A. spir. penagonas, five-sided spiral A. This grows like the 11th, with rounded leaves, ending in sharp points; and the flowers grow upon taller stems; a variety of this has been raised from seeds, much larger, with thicker leaves and taller stem. It is a native of the fields of Africa. 14. A. retusa, cumbion A. /mlefs, with leaves in five ranks deltoid. These are short, thick and succulent, and compressed above like a cumbion, whence the name. It grows close to the ground, and puts out fuckers on every side; the flowers are of an herbaceous colour, and much resemble those of the
the fourth species. It grows in the clayey soil of Africa. 14. A. \textit{spicata}, spicèd A. with flowers in spikes horizontal, bell-shaped, and item-leaves, flat, embracing, and toothed. This much resembles the second species, but is very different in the spike and figure of the flowers. The flower is full of a purple honey juice. The bell and purest hepatic aloes is obtained from this species. It is found in the interior regions of the Cape of Good Hope. 15. A. \textit{pigra}, painted A. caudicent, with leaves sword-shaped, toothed, painted and pendent, and flowers in racemes, reflex, and cylindrical. There are two varieties; \(a\). \textit{A. major}, \(b\). \textit{p. foliata}. 3. \& \(a\). Linm. 458. \(b\). A. minor, \(b\). \textit{foliata}, \(a\). \textit{p. foliata}, \(b\). \textit{p. foliata}, \(c\). \textit{p. foliata}. 4. \textit{p. foliata}, \(a\). \textit{p. foliata}, \(b\). \textit{p. foliata}, \(c\). \textit{p. foliata}. 5. It is a native of the Cape of Good Hope. 16. A. \textit{finifolia}, caudicent, with leaves sword-shaped, incurve-ferrated and reflex, and flowers in racemes, erect and cylindrical. This is the \(A. p. foliata\) \(b\). Linm. 458, and it is suggested by Willdenow that it is the \(A. p. foliata\) \(a\). barbadensis of Aiton, Linm. 1. p. 466, and the narrow-leaved \(p. p. p.\), \(a\). \textit{fucosa} of Corn. Holt, \(a\). p. 91, and the \(A. americana\), with the reddish flowers of \(a. t.\), of Pluknet. It is a native of Barbadoes and the Cape of Good Hope. Martyn’s Miller, Gaerlin’s Lineus, Willdenow.

La March enumerates 31 species, \(v i e\). A. \textit{purpurata}, or A. of Bourbon, originally brought from that island: when the leaves are cut, they yield a juice of a vivid red. 2. A. \textit{fucosa}. 3. A. \textit{volgeri}, Kadanuki or Ocaseva of Rhode, growing in the sandy flaky soil of Mahbar, and many parts of India, and also in several provinces of Africa, as Mexico, New Spain, Brazil and Barbadoes; and yielding, by its purified juice, heptic aloes, and from its dregs a less pure extract, called Cabalhue aloes. 4. \textit{p. vera}, growing in India, of which the \(A. \textit{cabulana}\) of Forck, Egypt, 74. n. 34, is a variety. 5. A. \textit{filifolia}, brought from Africa by Bruce, and larger and more reinosus than the preceding species. 6. A. \textit{filifolia}, or arborea of Miller. 7. A. \textit{fucosa}. 8. A. \textit{miriformis}, of which there is a variety, \(A. \textit{miriformis}\) \textit{angustifolia}. 9. A. \textit{maculata}, or the \(A. \textit{sp.}\) above mentioned. 10. A. \textit{tenan-

Aloes, whose refinings part is not soluble in water, has been used as a preferable to ships’ bottoms against the worms, to which those that trade to the East and West Indies are particularly subject. One ounce of aloes is sufficient for two superficial feet of plank, about 12 lb. for a vesel of 50 tons burthen, and 300 lb. for a first rate man of war. It may be incorporated with six pounds of pitch, one of Spanish brown, or whitting, and a quart of oil; or with the same proportion of turpentine, Spanish brown, and tallow. Such a coat, as it has been said, will preserve a ship’s bottom eight months, and the expense for a first rate ship, will be about 133. The fame composition may be used in hot countries for preserving rafters, &c, from the wood-ant. The efficacy of aloes, as a defence against worms, has been controverted. See ALOES, infra.

Propagntion and Culture.—The soil in which these plants thrive best, is one half fresh, light earth, from a common; and if the turf is taken with it, and rotted, it is much better; the rest should be white sea-fand, and sifted lime-rub-bish, each of these two, a fourth part; mix these together fix or eight months at least before it is used, observing to turn it over often in this time. The middle of July is a very proper season to plant the plants; at which time you may take them out of the pots, and with your fingers open the roots, and shake out as much of the earth as possible, taking off all dead or mouldy roots, without woundings the young fresh ones: then fill the pot about three parts full of the above mentioned earth, putting a few stones at the bottom of the pot to drain off the moisture; and after dipping the roots in such a manner as to prevent their inter-ferring too much with each other, put in as much of the fame earth, as to fill the pot almost to the brim, shaking the plant so as to let the earth in between the roots, and setting it close to the roots with your hand to place it steady in the pot; then water them gently, and set them abroad in a shady place, where they may remain for three weeks, giving them gentle waterings, if the weather be hot and dry.
Toward the latter end of September, in a dry day, remove them into the house again, observing to give them as much free open air as possible, while the weather continues warm: but if the nights are cool, you must shut up the glaffes, and give them air only in the day; and as the cold increases, you must difcontinue opening the glaffes, only giving them gentle watering till the middle of October, when you must abate them according to the heat of the house in which they are kept. For those plants which are placed in a flove will require to be watered at half once a week, most part of the Winter, whereas thoese which are kept in a green-house, without artificial heat, should not be watered in the Winter oftener than once in a month, and in Summer they should not receive too much moisture.

The tender sorts, as the viocofa, ferox, and cobweb aloe, should constantly remain in the flove, or be removed in the Summer to an airy glass-eafe, where they may have free air in warm weather, but be protected from the rain and cold. With this management the plants will thrive and increase; and such of the as finally bear flowers, may be expected to produce them in beauty at their season.

Most of these aloe are increased by off-fets, taken from the parent plant when they are fluffed, and planted in small spots filled with the earth prepared for the old plants; and these suckers should be quite dry when they are planted, otherwise they will rot. After remaining in the shade for a fortnight, the tender kinds should be removed to a very moderate hot-bed, shading the glaffes in the day, and giving them much air.

Towards the middle of Auftust, the young plants may be hardened by taking off the glaffes in good weather, and admitting the air; and they should be removed into the house towards the end of September, and managed like the old plants. The African aloe generally afford plenty of suckers for increase: most of the others may be propagated by taking off some of the under leaves, laying them to dry for ten days or a fortnight, and then planting them in the foil already mentioned, by putting that part of the leaf which adhered to the old plant, about an inch or an inch and a half, into the earth, and setting the earth about them with a little water: the pot should then be plunged into a moderate hot-bed, preferred from the sun, and refreshed with water once a week. The best season for this operation is June. The method of cultivating the aloe in the island of Barbadoes, described in the Medical Journal (vol. viii. art. 8. p. 422.) is as follows. The fomy and shallow foil, which is in the vicinity of the sea, and subject to drought, and in which the fugar canes wilt not thrive, built fuits the aloe plant. When the fomes have been picked up, and laid around the field as a fence, or piled in heaps upon the moft barren spots, the land is lightly ploughed and cleared from weeds; then lined in rows at the distance of a foot from one another, and the young plants are fettle like cabbages, about five or six inches apart from each other. By being thus set, they are easily kept free from weeds, which would obftruct the produce. They may be planted even in the drieft feaon; as they need little or no rain; but the usual time is from April to June.

Aloes, in Medicin and Pharrnacy, the infiltuated juice of various fpecies of the Aloes above defcribed. Of this there have been usually reckoned three kinds, viz. the fo-TOVIS, hepatic, and cabinetic. 1. SapoTivus aloe, so called from the island Socotra, from which it was firft brought, though it was probably imported from the Cape by the Dutch East India Company, is obtained from a variety of the A. perflicilia of Linnaeus. This fорт is the purple and most perflicilig, it comes to us wrapt in skins, and is of a bright, furface, and in some degree pellucid; in the lump of a yellowish red colour, with a purplifh cast; when reduced into powder of a golden colour. It is hard and friable in the Winter, somewhat palable in the Summer, and fensitive between the fingers. Its bitter taffe is accompanied with an aromatic flavour, but not fufficient to prevent its being disagreeable; the smell is not very unpleasant, and somewhat refembles that of myrrh.

2. Hepacic, Barbadof, or common aloe, is obtained from another variety of the fame fpecies, viz. A. vera, vulgaRis, Aloe, aloe, Aloe, aloe., called by Rhed. lapandum or cotton, and reckoned by L. Marek a different fpecies, and is usually brought to us from Barbadoes; that of the belt fort in large, gourd fheels, an inferior kind in pots, and a flill worfe in casks. It is of a darker colour than the former, and not fo clear or bright; generally drier and more compact; of a stronger and more disagreeable smell, and of an infinitely bitter taffe, with little or nothing of the aromatic flavour of the other.

A tract of mountains about 50 miles from the Cape of Good Hope is wholly covered with the aloe plants, which renders it uneceffary to plant them there; but they are now cultivated in Jamaica and Barbadoes, having been firft brought to the former of these islands from Bermuda. They require two or three years flanding before they yield their juice in perfection; and it is procured, fays Dr. Browne, (Jamaica, p. 165.) in the following manner. The labourers go into the field with tubs and knives, and cut off the large and moll fucculent leaves close to the falks; they put into the tubs in an upright posture, that the loofe liquor may be drained from the wound. When this is almoft wholly defcharged, the leaves are taken out fingly, and cleared of any juice that may adhere to them; and the liquor is put into shallow flat-bottomed vefefls, and dried gradually in the sun, till it acquires a proper confistence. What is obtained in this manner is called foTOVIS aloe, and is the cleareft and moll tranparent, as well as the higheft in feflem and value. In the island of Barbadoes, according to the account of Mr. Millngton (Med. Journ. vol. viii. p. 422.) after a fufficient quantity is drained from the leaves to make it an object for the boiling-house, the juice with this view may be preferred for fome weeks, without injury, three boilers of iron or copper are placed by one fire, though fome have two and others only one; these are filled with juice, and as it is gradually infiltuated by a regular fire, it is ladled from boiler to boiler, and left juice is added to that which is faturated with the fire, till the juice in that which is near the fire, the smallest of the three, and called tach, becomes of a proper confistence to be flitched or ladled out into gourds, or other small vefefls, placed for receiving it. The proper time for ladling it out of the tach is when it is arrived at a rein height, as it is termed, or when it cuts freely, or in that flakes from the edges of a small wooden flt, which is dipped from time to time into the tach for that purpose. A little lime-water is used by fome aloe-boilers during the procfs, when the ebullition is too great. This author adds, as to the fun-dried
dried aloes, which is most approved for medicinal purposes, very little is made in Barbadoes. The process, however, is very simple, though very tedious. The raw juice is either put into bladders, left quite open at top, and suspended in the sun, or in broad shallow trays of wood, pewter, or tin, exposed also to the sun every dry day, until all the fluid parts are exhaled, and a perfect resin formed, which is then packed up for use, or for exportation.

Dr. Wright (Med. Journ. vol. viii. p. 219.) gives the following account, somewhat different from the former, of the method of preparing hepatic aloes in Jamaica. The plant is pulled up by the roots, and carefully cleaned from earth or other impurities. It is then split and cut in pieces into small hand-baskets or nets. These nets or baskets are put into large iron boilers with water, and boiled for ten minutes, when they are taken out, and fresh parcels supplied till the liquor is strong and black. At this period the liquor is thrown through a strainer into a deep vat, narrow at the bottom, to cool, and to deposit its feculent parts. Next day the clear liquor is drawn off by a cock, and again committed to the large iron vessels. At first it is boiled briskly, but towards the end the evaporation is slow, and requires constant stirring to prevent its burning. When it becomes of the confidence of honey, it is poured into gourds or calabashes for sale. The focotorine aloes, he says, may be prepared in the same manner.

3. Cabadilus, or horse aloes, obtained, as some say, from the faces of the hepatic aloes, and according to others from a distinct variety of the aloe perforata, denominated A. guineensis caballina vulgaris. It is easily distinguished from the former by its strong rank smell. In other respects it agrees pretty much with the hepatic, and is not unfrequently sold for it. Sometimes it is prepared to pure and bright as scarcely to be distinguished by the eye, even from the focotorine, but its offensive smell soon betrays it; and if even this should be dilapidated by art, its wanting the aromatic flavour of the finer aloes will be a sufficient criterion. Some say, that its colour is also much darker, indicating a mixture of forbes and sand, and that it is of course much more compact and heavy. This aloe is not admitted into the Materia Medica, and is employed chiefly by Parries. From the observations of Professor Murray it appears probable, that different species as well as varieties of aloes would furnish the various kinds of this drug, and that Linnaeus by referring these forio to these plants, the recent juice of which [..] correspond respectively the nearlet to them in tainle, might easily be misled; for Murray, upon tasting the fresh juice of many different species of aloe, sometimes found it bitter, and at other times totally devoid of bitterness. This author found the bitterfieceps to be the following. 1. Aloe elongata, floribus fipicatis tabulofo-triquetrias fubingenentias oblique dependentibus, folia aggregatis dentato-spinosis; and he queries whether this is not the variety T of the A. perforata of Linn. Spec. p. 458; and the aloe mentioned by Hughes and Browne. 2. A. Spirata, which is said to afford the best hepatic aloes. M. Jullien, who saw the three varieties of aloes prepared at Morvedro, in Spain, affirses us (says Chaptal, Elem. Chem. vol. iii. p. 86), that they are all obtained from the aloe vulgaris. The first variety, or focotorine aloes, is obtained by making incisions in the leaves. Time is allowed for its impurities to subside perfectly. The fluid is then decanted from the drags, and left to become thick; after which it is put into leathern facks for sale, under the name of focotorine aloes. A juice of the same nature is obtained by expression from the same leaves, which, when clarified in the same manner, forms the hepatic aloes; and the caballine aloes is obtained by a stronger pressure.

Aloe is mentioned neither by Hippocrates nor Theophrastus; Dioscorides mentions two kinds, and Avicenna tells us, that of the different kinds, without naming them, the focotorine is the best. Ceillus, who frequently mentions aloes, and recommends it to be mixed with all cathartics, does not distinguish it by any epithets. If, indeed, the account of J. Bauhin (Hist. Plants. tom. iii. p. 697.) be true, that the juice of the leaves forms itself spontaneously into three fluids, the upper being the focotorine, the middle the hepatic, and the lowest or faces the caballine; there may be some reason for the distinction of the three names, that have been uniformly appropriated to them.

All the kinds of aloes agree in this, that they consist of a resinous matter, and a large proportion of a sub stance called gum; and that they diffuse in pure spirit, proof spirit, and proof spirit diluted with half its weight of water, the impurities only being left; and in boiling water they also diffuse, but when the liquor becomes cold, the resins parts subside. The quantity of resin in hepatic aloes appeared in experiments of Dr. Lewis to be 44d, in focotorine aloes 41d, and in the caballine 44d. According to Bonhure, the focotorine aloes contains no more than 4th of resin, and the hepatic aloes contains half its weight; and therefore the hepatic aloes contains more resin and less gum than the focotorine, and this than the caballine. The resins of all the forts, purified by solution in spirit of wine, have little smell; that of the focotorine has scarcely any perceptible taste; that of the hepatic a light bitterish relish; and that of the caballine a little more of the aleric flavour. The gummy extracts are less disagreeable than the crude aloe; that of the focotorine aloes has very little smell, and its taste is scarcely unpleasant; the smell of the extract of the hepatic is somewhat stronger, but its taste more agreeable than that of the focotorine; the gum of the caballine retains a considerable share of the rank smell of this sort of aloe, but its taste is not more unpleasant than that of the extracts of the other kinds.

Aloes is a well known purgative; and it acts not only when taken internally, but when externally applied; and its cathartic quality resides chiefly in the gummy part, for the pure resin has little or no purgative virtue. Boerhawe declares it to be an effectual and safe cathartic; nevertheless in large doses it produces much heat and irritation, particularly about the rectum, from which it sometimes occasions a bloody discharge. To those, therefore, who are subject to piles, or of an hemorrhagic diathesis, the phlegmonic and bilious, or even in a state of pregnancy, the exhibition of it has done much harm; but it is particularly adapted, by its stimulating quality, to perons of a phlegmatic temperament and sedentary life, to cachetic indigospheres, and oppressions of the stomach by viscid crudities contracted from irregularity. Although in purging doses, of half a dram or two scruples, it produces irritation about the anus and sometimes a discharge of blood, yet in smaller doses of 10 or 12 grains, repeated once or twice a day, it not only unloads the first passages, but attenuates and diffuses viscid humours in the remoter parts, warms the habit, quickens the circulation, and promotes the menstrual and haemorrhoidal fluxes; and its continued use renders the blood sensibly more fluid. This, says Dr. Cullen, (ubi infra), appears to me improbable. We have frequently seen the blood drawn from persons using a good deal of aloes, and never could discover any change of its
its consistence: and if the experiments of Schwenke may be trusted, aloes added to the blood drawn out of the veins seems to coagulate rather than to dissolve it: besides the quantity of aloes taken can hardly have any sensible effect upon the whole mass of blood. It has been urged, however, that by its dissolving power it proves an emmenagogue, and is hurtful in all morbid hemorrhages. Dr. Cullen observes, that he has seldom found the emmenagogue powers of this substance. If ever there be any appearance of such a power, it is probably to be ascribed, in his opinion, rather to its operation on the rectum, communicating a stimulus to the vesicles of the uterus, than to its action on the mass of blood. When aloes is not designed to act as a purgative, it has an action upon the stomah; and it has frequently been found an antitartaric, in relieving pains of this organ.

It is also useful in halitac colicenests, when taken in small doses. With respect to its ordinary operation, Dr. Lewis alleges, that its effects are more permanent than those of any other purgative; this Dr. Cullen (Mat. Med. vol. ii. p. 525.) does not admit; for we commonly find, he says, that notwithstanding the use of aloes, the state of colicenests will return at its usual period, and that it is often necessary to anticipate this by the use of the aloeetic. This bitter juice has been accounted defrutic to worms, or to the matter which favours their production, either taken internally or applied in plasters to the umbilical region; and from its imagined efficacy in this respect, it has been used to preserve slips against the attacks of worms. But its antemonial virtue has been disputed by Murray, who says that worms have lived for 20 hours in the bitterest solution of focotorine aloes, and for many days afterwards in earth mixed with powder of aloes. In another experiment four worms were not destroyed on the fourth day. It is powerfully antifeptic; and commonly makes an ingredient in tinctures and balms for cleaning and healing wounds or putrid forts.

As to the choice of the different kinds of aloes, it may be observed, that the focotorine, which contains more gymnia matter than the hepatic, purges with more certainty and greater irritation, and is therefore most proper where a stimulus is required, or for promoting the uterine discharge; but the hepatic is better calculated for the purpose of a common purgative; and as it contains more resin, answers better as a vulnerary, for external application. Aloes is seldom given alone. Aloes, says Dr. Cullen, acts as readily in substance as in any solution; and therefore this is never to be practised but for the sake of more convenient exhibition; and it has been found to operate in substance in a smaller dose than in the vinum aloeeticum. Aloes hardly receives improvement by any addition; and the vulgar find as much effect from the aloes alone as from the pilula aloeetic.

Some benefit, however, is obtained by some division of the aloes before it is taken into the body, and the extract of gentian is properly enough employed; but Dr. Cullen is persuaded, that the Edinburgh college have not done right in withdrawing the whole of the fal poelychretum from the aloeetic pill. In the pilula rufi the myrrh may be useful in dividing the aloes; but the addition of the faisson is insignificant. Rhubarb added to aloes can answer no good purpose. In the pilula flemachicus Ph. Ed. and in the elixir flemachicus, the rhubarb, says Dr. Cullen, is an undefended addition. The aloes, continues this author, is never properly joined with the dratic purgatives, as in the pilula colocynthidum aloes, and in the extractum colonicostium compositum; for if such a medicine is intended to produce a liquid evacuation the aloes is superfluous; and if it is intended only to open the belly, the drastics are unnecessary. In the elixir proprietor, the faisson is an insignificant ingredient; and on account of the mefrum employed by the Edinburgh college, Dr. Cullen says, he has never employed it as an evacuant, but he often used it with success in curing epiplectic pains of the stomah; and for suriating it better to this purpose, the Edinburgh college have improved it much, by the mefrum they have employed in their elixir aloes virolicum. Several preparations of it are directed in the pharmacopoeias, for which see Elixir, Extract, Hypricka, Pills, Powder, Tincture, and Wine. Lewis Murray. Woodville.

Aloes rofita, is a preparation of the focotorine aloes, made by dissolving it in juice of damask roses, and evaporating it to the consistence of a paste. Then more juice is added, and the evaporation repeated, again and again.—This has been held a gentler and safer cathartic than the aloe alone. If this be dissolved in a good quantity of the fresh juices of roses, violets, borago, and bugloss, mixed in equal proportions, and afterwards reduced by evaporation to its former consistence, the extract, thus prepared, is called aloes infuscata, and with the addition of one third its weight of cream of tartar, aloes infuscata tartarica.

Aloes violata, is prepared by means of the expressed juice of violet flowers; and mixed with half its weight of cream of tartar, it is called aloes violata tartarea. But preparations of this kind are obsolele.

Aloes is applied by some writers, to a kind of mineral juice produced in Judea. This is called fofile, mineral, or metalline aloe.—Some dispute the existence of any such aloe. Others suppose it to be no other than the asfaltus.

Aloes, lignum. This wood, by the Indians and Portuguese, is called calumbia, or calumbas, being the name with which is otherwise called by medical writers xyloaloeus, and agallochum.

This wood is received by Loureiro, as we have observed under the article Agallochum to a distinct genus called aloesylum, belonging to the order of decandria; but it approaches so nearly to that of the Excoecaria agallocha of Linnaeus, that the latter has been sold for it. The tree grows in Cochinchina, the Molucca islands, and several other parts of the East Indies; and was formerly held in very high estimation, on account of its fragrant odour, as a perfume, for which purpose it was applied to closets and apartments, and as a cordial medicine in fainting fits, and in cases of paralytic affection. It is said also to be effectual in destroying the insects and acarids in children.

By the Chinese and Heathen Moors it was used as incense in their sacrifices; and employed for setting the most precious jewels that are wrought in the East Indies. It was formerly deemed in that part of the world of greater value than gold itself; and various fables have been invented as to the origin of the tree that yields it. Some have feigned, that it grew in Paradise, and that it was conveyed from thence by the rivers which overflowed their banks and swept off the trees in their way. Others pretend, that it grows on inaccessible mountains, where it is guarded by wild beasts, &c. The Siamese ambassadors brought a present of this wood from their emperors to the court of France in 1686; and thus it became known. Bathin and many others reckon three sorts of it; viz. two kinds of Calumbac and the aloe-wood, the agallochum of the shops, the teihiniang of the Chinees, thimbo of Canell, pao de aquila of the Portuguese, and frequently called eagle-wood. This is oily, reinous, compact, heavy, of a brown reddish colour, marked with grey veins, and often pierced with small holes, as if it were worm eaten.
edn. This wood is not so dear as the callabrac, and is more commonly found in the shops. It is brought from Cochinchina, and appears to be the production of the same tree. This tree bears a great resemblance to the gallochum secondarum of Rumphius, the musk of Kempfer, and the eagle-wood of Sonnerat; and is denominated gallochry moluccens and given of Malaca. The wood of the branches of this tree is white, inclining to yellow; and the bark is of a grey-reddish colour, and its surface is rough and hairy. The leaves are alternate, ovate-lanceolated, entire, much acuminate, about 3½ inches long and two wide, with a smooth and green surface, and appearing like fennin; each of them is supported by a petiole about two French lines long, and have their borders garnished by short hair; the young leaves are hairy and almost white before they are unfolded. The flowers, according to Sonnerat, are small and have no calyx; the corolla consists of one piece, and half-divided into five oval parts, pointed and hair-like; and at the interior base of each division of the corolla are two small sepalis, which are three incised, and form at the commencement of the flower a crown, composed of ten nectaris, as Sonnerat describes them. The stamens are 10, short and attached to the corolla between the divisions of the nectaris. The pifiil is formed by a superior ovary, which is oval, without a style, and crowned by a simple, very small stigma. This ovary changes into a pyriform capsule, about an inch long, and opening naturally into two partitions, and within it has two cells, each containing a black, oval, pointed, small seed, one of which is almost always abortive. At the bottom of each seed is found a fanguy substance, which seems to occupy the place of another abortive seed. Whether this tree be justified in the annals with the callabrac or gallochry of the ancients, it is not easy positively to ascertain; but it agrees with the description given of it by Kempfer and by Cunningham, in Geoilroy's Materia Medica. If this be the case, it must be of a different genus and family from the gallochry of Ambaina, which belongs to the euphorbias. Encycl. Method. tom. i. p. 49. See Gallochry, Callabrac, and Excocaria.

Grew describes a piece of Aegum albes, with its own gum growing on it in the repository of the Royal Society. See Grew, Muf. Reg. Soc. p. ii. c. i. p. 179.

ALOEDARY, aloedarium, aloedam, denotes a purging medicine, wherein alba is an ingredient.

This amounts to the same with what we otherwise call an aloetic.

ALOEAS is also used for a history of the cladse of plants, under the denomination of Aloes.

ALOEPHANGINA, in the Materia Medica, denote medicines formed by a combination of aloes and aromatics. ALOETICS, medicines wherein alba is the chief, or fundamental ingredient.

Aloetics open the orifices of the veftels, and are on this account found hurtful in cases of hemorhages, particularly at the nose; also in the tephraus, hemeronium, &c. The immediate use of aloetics tends to produce hemorhoids, hypochondria pains, and inflations.

ALOEUS, in Entomology, a species of scarabeus, or beetle, with a three-horned thorax, the intermediate longer and finer, the head submuticus, and the elytra unilliriated; found in America.

ALOFT, a sea-term, synonymous with up in the tops, at the mast-heads, or any where about the higher rigging.

ALOGIANS, Aogos, or Alogi, or ALOGIANS, a compound of the privative ə and ᾳ, 9. d. without Logos, or Word, in Backstrofisal Istory, a sect who denied that Jesus Christ was the Logos, or eternal Word; and on this ground also rejected the Gospel of St. John as spurious, and also the Revelation.

Some ascribe the origin of the name, as well as of the sect of Alogians, to Theodore of Byzantium, by trade a curier; who, having apostatized under the perpefeeion of the emperor Severus, to defend himself against those who reproached him therewith, said, that it was not God he denied, but only man. Whence his followers were called in Greek Altoys, because they rejected the Word. But others, with more probability, suppose the name to have been first given them by Epiphanius in the way of reproach. They made their appearance towards the close of the second century.

Phisalser has also mentioned a hereby which rejected John's gospel and revelation, and ascribed both to Cerinus. Dr. Lardner is of opinion that this is a fictitious herey; and that there never were any Chriftians who rejeated John's gospel and firt epifile, and yet received the other gospels, and the other books of the New Testament. No notice is taken of such by Irenæus. Euchius, or any other ancient writer, before Phisalser and Epifhanus; nor has Theodore given any account of this herey. This herey, says this indefatigable inquirer and impartial reporter, was, as he conceived, invented upon the occasion of the controversy of Caius and Dionysius, and others, with the Millenarians in the third century; some of whom disputed or denied the genuinenefs of the book of Revelation, and ascribed it to Cerinus. Hence fome faid that those enemies of the Millennium might as well reject fo John's Gospel, and others faid, that they actually did do, though they did not.

In Phisalser's catalogue this herey follows next after the order in Millenarians, or Chifionities, as he calls them, and the order in Epifhanus leads us to the fame time. Lardner's Works, vol. ix. p. 515.

ALOGONIA, in Ancient Geography, a town of Melonia, south-east of Gerena; north-east of which were a temple of Bacchus and another of Minerva.

ALOGOTROPHIA, among Physicians, an irregular nutrition of some part, attended with a vicious figure or conformation thereof, as in the rickets.

If the bones of the vertebrae of the back receive too much nutriment on one side, as sometimes happens in children, an incurvature necessarily ensues, which, as Charleton expresses it, is produced by an allogotrophy.

ALOIDES, in Botany, a name used by fome for the aloe paludifis, or fresh water aloe, called in some parts of England, water-fodder; and by Linneas, sfralotes.

ALOION, in Ancient Geography, a town of the Thelkis, near the valley of Temp, and founded, fays Steph. Byz. by the Alodes.

ALOMAYO, in Geography, a town of South America, in the country of Peru, and jurisdictioun of Guanamiles.

ALON, in Biography, a celebrated personage whose memory is preserved in the Triads of the Welsh Bards; and who flourished among the first colonies of this island, if not among the Cymry before their arrival here. This Alon, with Pleynyzd and Goron, are recorded as the three who combined the inftituces and privileges of the Bards, druids, and ovates, into a regular fyllem, under the fation of a national law. This event is faid to have taken place in the time of Prydawn, who is mentioned in the fame Triads, as the frift who digfelled a national conftitution for the Cymry or Britons. Be this as it may, there is great reafon to con
clude, that Alon is the same person who is called Olen, Olenus, Ailinus, or Linus, among the different people of Greece and the adjoining countries, and even in Egypt; for it is remarkable that similar attributes are ascribed to him by those ancient nations, as in our Triads: according to Pausanias, Olen the hyperborean is said to have been the first prophet of Delphi: Beo the female hierophant is made to sing of Olen, as the inventor of verse, and the most ancient priest of Phebus; and, indeed, all Greece adored the song of Olen; and this more particularly occurred in celebrating the completion of the vintage; for this it is said by Homer, (Iliad, v, xlv, &c.) in the description of the shield of Achilles:—

"In the procession of the vintagers there were groups of young damsels and youths, carrying basquets curiously entwined, filled with presents of the most delicious fruits. In the midst of these was seen a young man striking from his lyre harmonious sounds; he sang the song of Linus, with a voice most sweet; and the company joined with refreshments, and shouts of joy, beating the earth in cadence with lively repeats."

Alon, in Ancient Geography, a river of Cilicia, near Schaffa or Eleusin, a small island.

Alona, or Alon, a town on the eastern side of Spain, south of the mouth of the Tiber.

Alone, or Halone, a small one of the Aolian islands.

Alone, or Halone, a small one of the Propontis, south of the island of Procmellus, and north-west of Cyzicus. The name was given to it, says Steph. Byz., because its inhabitants had found out the art of making salt. This author says, that it was also called Neuris and Pro coma; but Pliny distinguishes the last of these two islands.

Along, a town placed by some writers in Phaphagonia.

Along-side, in Sea-language, expresses side-by-side, or joined to a ship, wharf, &c.

Along-shore, a nautical phrase expressing along the coast, or a course which is in flight of the shore, and nearly parallel to it.

Along, lying, denotes the state of a ship that is pressed down sideways by the weight of fail.

Aloni, in Ancient Geography, a town of Asia, situated on the eastern banks of the river Zabes, near its entrance into the Tigris.

Aloni, a people joined by Pliny to the Gordians, and placed near the Tigris.

Alonis, a town and island of Gaul, which Martin imagines to have been the town and island of Magdelen, formed by the re-entrance of the first Celtic syllable Mag.

Alonius, a place of the island Crete, in the territory of Gortyna.

Alonso, in Biography and History. See Alphonso.

Alonta, a river placed by Ptolemy in Asiatie Sarmatia.

Alontigicelli, a people of Bectia, near the river Merana.

Alontium, Aluntium, or Haluntium, a town of Sicily.

Alôp, in Sea-Language, denotes a distance. See Luff.

Alope, in Entomology, a species of the Sphinx, with dentated brown wings, the posterior being yellow and black at the apex, black abdomen, and interrupted pale-coloured bands, found in India.

Alope, or Alôp, in Ancient Geography, a name given to several towns. Alôp was a town of Thessaly. Homer mentions a town of this name, supposed to be the same place, as he names it after Alôp, a town of Phocis: it is supposed to have been so called after Alôp, the daughter of Cercyon, or of Actor. Alôp was also a town of Attica, and also of Pontus, between Mytilene, Caria, and Lydia; another in Phocis, and another among the Locris.

Alôpecia, an island near the coast of Aia Minor, not far from Smyrna.

Alôpeci, or Alôpec, was also a district of Attica, near Cynosarges, and distant about 11 or 12 stadia from Athens. The Lacedemonian general Archimolphus, who, by the suggelion of the oracle of Delphos, had been sent to drive the Phileiades from Athens, died and was buried in this place; and Herodotus (lib. v. § 3) says, that his tomb was near the temple of Hercules. This was also the birth-place of Arilides and of Soeiraes. Alôpecia was also an island placed by Strabo in the Palus-Mozotis, and by M. d'Anville, near the mouth of the Tanais.

Alôpecia, in Surgery, baldness in any part of the body, arising from disease, or from a natural defect of growth in the hair. This deficiency is sometimes produced by excessive venery, and has been known to be remedied by a person becoming chaste in his habits; but more frequently it is not connected with any evident exterior cause, and only indicates a faulty state of the fluids at the roots of the hair, or a want of due nourishment and moisture. Alôpecia was formerly a common symptom of the fever, but is now very rarely observed to occur in such cases.

Oily and gently stimulating applications to the head, with repeated shaving, are proper against the defect in question. Alôpecia is also used by Galen for the change of the hair to another colour.

Alôpecias, in Ichthyology, a name of the wiptes marina, or sea-fox.

Alôpeco-sus, in Ancient Geography, a town of the Thracian Cheroneus, north of and near the Gulf of Megalos. It was peopled by the Aiolians, and taken by Philip, king of Macedon.

Alôpecopiticos, in Zoology, a name derived from the Greek, and given by Aldrovand and others the Opossum.

Alôpecos, in Ancient Geography, a hill of Boetia, in Greece, called also Orchalis.

Alôpecuro-Veronica, in Botany. See Mentha.

Alôpecuros. See Betonica.

Alôpecurus, alôpeco-vox, fox-tail, a genus of the trianthra digyna class and order, and of the natural order of graminis, or grasses: its characters are, that the calyx is a glume one-flowered, two-valved; the valves ovate-lanceolate, conic, compressed, equal, connate at the base; the corolla one-valved, valve ovate, lanceolate, conic, with the edges united at the base, a little shorter than the calyx, about twice as long, with a bent joint, inserted into the base of the calyx, not exceeding the calyx, but more than the calyx, and upwards forked at each end; the pistillum is a roundish germ, the fleshy styles are two, capillary, united at the base, longer than the calyx, the anthers forked at each end; the fructicum is a roundish seed; the fleshy styles are two, capillary, united at the base, longer than the calyx, and fimbria villosa; no pericarpium, the corolla involving the seed; the seed ovate and covered. Martyn and Willdenow enumerate eight, and Gmelin 12 species. 1. A. indicus, panicum indicum of Miller, panicum alpeceporium of Linnæus, Spec. pl. 82. Indian fox-tail grass, with cylindrical spikes, involucres fleshy, falcate, two-flowered, and villos pedunculus, a native of the East Indies. 2. A. bulbiflorus, A. geniculatus B. Hudson, gramine.myosotis nodosum of Dilleniis, bulbos fox-tail, with culm erect, spike cylindrical, (very simple, attached, smooth, glumes of the calyx distinct and villos, Smith) and root bulbus. The bulbous culm is as a fibre from its lower part, and has a brown, tiliar, tunicated membrane. The culm is foliary,
literary, scarcely a foot long, very simple, erect, a little decumbent at the base, foliolo, binodial, frilled, and smooth; the leaves smooth; the radical few and short; the culm about linear, patent, and of the length of the flaeaths; the flippa short and frilled; the spike eufeminal, somewhat erect, very simple, slender, acute, and many-flowered; the glumes of the calyx a little unequal, acute, awnlefs, altogether separate at the base, villous in the nerves, and undilated carina; the glume of the corolla emarginated and awned at the base. This species is very different from the A. geniculatus, and has florets, says Dr. Stokes, longer, narrower, and much less hairy; and Dr. Smith observes, that in its spike, and the structure of the flowers, it is more nearly allied to the A. agrestis. It is found rarely in falt marshes; in those near Yarmouth, in the marshes of Cardiff in Glamorganshire, and near the Ault paffage, and in the vicinity of Northfleet, in Kent. It is perennial, and flowers in July. 3. A. geniculatus, meadow fox-tail, with the culm erect and smooth, spike pubifolate, and the glumes of the calyx villous and convolute at the base. The root is fibrous; the culm two feet long, erect, foliolo, smooth; the leaves somewhat smooth and glaucescent, with a fhort, fubpubefcent flippa; the spike somewhat simple, fcarceiy paniclefied, denfe, erect, about two inches long, foft, and many-flowered; all the glumes are equal, lanceolate, compreffed, white, marked on both fides with two green longitudinal lines; thofe of the calyx, especially near the keel, fikly-villous and awnlefs; the glume of the corolla smooth, except toward the apex of the keel, awned at the base, the awn genifulated, twice longer than the flower, and naked. This is a native of moft parts of Europe, from Italy through France, Germany, Holland, Great Britain, to Denmark, Norway, Sweden, and Ruffia; and also in Siberia. It is found with us very common in palifures and meadows. It is perennial, and flowers in May. This is the best grafs to be fown in low meadow grounds, or in boggy places which have been drained. Sheep, horfes, and geats eat it. Cows and fwine are not fond of it; but Dr. Pulteney fays, this is the moft grateful of all the grafses to cattle. It poifefles, fays Profeffor Martyn, the three great requities of quantity, quality, and earliness, in a degree fuperior to any other, and is therefore highly deferving of cultivation in lands that are proper for it. The feed may be eafily collected, as it does not quit the chaff, and the spikes are very prolific. But the larvae of a species of mufca, which are themselves the prey of the imyex campeltis, devour the feed fo much, that in many spikes you will scarcey find one perfect. Lewis Ma-jendic, Efq. at Hedingham, has cultivated it on a conifiderable fcale, and found it to be an excellent grafs. 4. A. Agrostis, field or slender fox-tail, with culm erect, roughifh, spike very fimpie and attenuated, glumes naked, convolute at the base, and dilated at the keel. The root is fibrous and fmall; the culm half a foot long, erect, foliolo, naked at the apex, and roughifh; the leaves rough above, the flippa lanceolate and pubifcent; the spike almost three inches long, erect, fnder, acute, manyflowered, and of a purplifh colour; the glumes subependal, larger than the preceding, and lefs pubefcent, varied with white and green, and nerves prominent; thoje of the calyx villous at the base, convolute, with a dilated subpubefcent keel, and awnlefs, the glume of the corolla smooth, awned at the base; the awn genifulated, twice longer than the flower, rough and recurved in drying. This grafs is a troublesome weed in cultivated ground; and among wheat it is excrated by the farmers, under the name of black beart; it is alfo common by way-fides as well as in cornfields, and in palifures in the Ifle of Wight. It has acquired the name of moufe-tail grafs in English, and Myofuroides in Latin, from the great length and fendernefs of the spike, which resembles the tail of a moufe. It is annual, flowers in July, continues flowering till Autumn, and comes into bloom very foon after being fown. There is a variety, with a fhorter spike, and recurved awns. It is fmall and brown, on account of its barren and funny situation. 5. A. geniculatus, gramen fubfipifaceum of Gerard, a aquae-rium fipifaceum of Parkinson, and a alopec. Taw. genicul. pro- umbonium of Morris, floating fox-tail, with culm fending and genifulated or kneefjointed, spike fubfoliate and cy-minand, and glumes blunted and hairy. The root confifts of very long and fimple fbrs; the culms natant, very long, genifulated, radiating in the inferior genifull, fufflent in the apex, foliolo, ramous, and smooth, the leaves smoothifh, the flippa whitifh and very fnder, the spike cylindric, fhort, somewhat obtufe, dilatable in lobes, many-flowered, purplifh, and in the variety 8 whifhit: the glumes twice lefs than the preceding, subependal, and very obtufe, thoje of the calyx longer, hairy; thoje of the corolla crinated, smooth, awned toward the base, the awn genifulated, and of various length; the root in dry places is bulbous, with a culm fome-what erect; and this variety Hudson has confounded with the A. bulbifcus, Dr. Smith mentions two varieties, viz. 8, g. fu-viable album of Dillcnius, and y, with a bulbous root of Hud-fon and Withering. This species is eafily known in its common fiate, by pools and in wet meadows, by the frequent joints of the culm or item changing their direction, and appearing broken. It often puts out roots under water from the joints, and thus spreads itself; the leaves floating on the surface. From the deep colour of the spikes, it is called in fome places black-grafs. It fometimes occurs in dry palifures, and then, according to Mr. Curtis, grows more upright; the spike is much more fnder, and the baflk of the flakk swells out into a kind of bulb. It is perennial, and flowers in July. Cattle eat it, but it is not feemfed a profitable grafs. The variety y is found in walls and a dry fclerefoil. Dr. Withering mentions four varieties; one of which, with awns, very fine and foft, not longer than the calyx, fruit little, flakks branched, a fibrous root, and found in a manly place near the Stews, in Edgbalton park, he fupjects to be a diftinct species. 6. A. Hordeiformis, barley-like fox-tail, with fimple raceme, and flowers intrenched with awns. This is an Indian grafs, and resembles hordeum murinum, or barley-grafs. 7. A. Montefiionea, A. Aribulatus of Hudson, &c. phleum cripnatum of Schreber, bearded fox-tail, with pani- cle pubifpiked, rugged calyxes, and awned corollas. This refembles A. panicuus, but is three times as large; the calyx has a tubercle at the bottom; the corolla, which has two valves, is shorter than the awn, the culm and leaves are stiff, the glumes rough, but smooth at the edges, both valves are awned, and the awns of the corolla are much shorter than thoje of the calyx. It grows wild in marshes and wet palifures, at Purfleet in Essex, and at Drayton, about two miles from Portsmouth, is annual, and flowers in June and July. See AGROSTIS. 8. A. panicuus, hairy fox-tail, with pa-nicle pubifpiked, villous glumes, and awned corollas, very much refembles the laft species, but the whole plant is fott, and only five or six inches high; the glumes downy, woolly at the edges; the awns of the corolla shorter than thoje of the calyx; the corolla has two valves, as fhort again as the calyx, hollow and smooth; the outer three times as broad as the other, roundifi-ovate, blunt, with four teeth, with awn longer than the valve iffuing from below the point; inner valve ovate-lanceolate, pointed, with two teeth; the calyx ending at the base in a hard tubercle. This species grows on dry foils, is annual, and flowers in July. See AGROSTIS. 

Giemlins refers to this genus the following species, besides thoje above enumerated, viz. A. vilatus, with a culm fspiked...

ALOPES, in Ancient Geography, one of the ancient names of Ephesus.

ALOPES, in Entomology, a species of the Scarabaeus Melolontha, with yellow hair, the elyptical reflex and ciliated, and the elytrix smooth and black; found at the Cape of Good Hope.

ALOPES, in Zoology, a species of the Canis, with a tail strait and black at the tip. This is less than the common fox, and has a thicker and dulkier fur, though it is sometimes brighter and redder than that of the fox. A Pennsylvaniaian brant-fox, described by Mr. Pennant, was scarcely half the size of the common fox; with the nose black and sharper, the pace round the eyes ferruginous, the forehead and upper parts of the body black, mixed with red, ash-colour, and black, and by the predominance of the ash-colour, appearing hoary, the belly yellowish, the tail black above, red beneath, and on the fides ash-coloured. The British variety of the fox with a black tip on the tail, says Mr. Pennant, is unknown in America; and therefore his brant-fox must be either a variety of the other, or a distinct species. This species is found in Europe, Asia, and America. The alopex eupaeus, or coal-fox, the motor of Buffon, is reckoned another variety. It inhabits Burgundy, is of a silver-grey colour, and the tail tipped with white like the common fox; but from the remarkable blackness of its feet and legs, seeming to have been produced by charcoal dust, it is called charcoal-burner, or coal-fox.

ALOR, in Ancient Geography, a river of Macedonia.

ALORITE, a people of Macedonin.

ALORUS, a town of Macedonia, north-west of the Thermonic gulf, placed by Toleomy in Peonia, and by M. d'Auville in Pierna.

ALOS, or Alus, a town of the Methodom in Thessaly, call of the Pelasge gulf, at the foot of Mount Othrys, upon the little river Amphrysus. It was built by Athamas, and so called in honour of one of his female dominions. Alos was also a town of Peloponnesus, in the Argolid.

ALOSA, in Fishology, a species of the Clupea, having the sides spotted with black, and the upper jaw spined. It is the chief of Ariolota, Rondeletius, and Aldrovand, the alafa of Gelfer, the elupen of Wullihby and Ray, and our Shad.

ALOSANGA, in Ancient Geography, a town of India, beyond the Ganges, according to Toleomy.

ALOST, in Geography, a town of Flanders, situated on the river Dender, ten leagues south of Antwerp. This town contains a collegiate church, and several convents, in one of which, viz. that of Guillemins, is the tomb of Theodoric Martin, who brought the art of printing out of Germany into the Low Countries. He was a friend of Erasimus, who wrote his epithalam.

This town, which is the capital of a country, was taken and difmantled by M. Turenne, in 1667; and abandoned to the allies in 1706, after the battle of Ramillies. N. lat. 54° 55'; E. long. 3° 56'.

ALOUATE, in Zoology, a name given by Buffon to the Simia Simiceus, or long-tailed, bearded, red monkey, with prehensile tail, of the Linnean 5. fem; the arhaba of Guillaus, Orooko, tom. ii. p. 8. and the royal monkey of Pennant. Some have considered this as a variety of the Simia Beccabul, from which it differs by its very bright bay colour; but Dr. Shaw (Zool. vol. i. p. 71.) is of opinion, that it is a distinct species. From young animals in the Lexiconian Museum, he describes it as being about the size of a squirrel, and entirely of a very bright, ferruginous, or reddish chesnut colour, with the face naked and black, surrounded on the lower parts by a straggling band of black hairs, and the tail strongly prehensile. This species is said to be rare in Brazil, but very common in Cayenne. Its voice and manners are the same with those of the Simia Beccabul, which is common in Brazil, but not found in Guiana. By an account of a person who kept these animals at Cayenne, it appears that the allonates, or howlers, as they are called, inhabit the moist forells in the neighbourhood of waters or marshes. They are commonly found in the woody islets of large flooded savannahs, and never on the mountains of the interior of Guiana. They go in small numbers, often in pairs, and sometimes singly. Their cry or horrid scream may well inspire terror, for it seems as if the forells contained the united howlings of all its savage inhabitants together. This clamour is usually made in the morning and evening; but it is repeated in the course of the day, and sometimes in the night. The sound is loud and varied, that one would imagine it to be produced by several animals at once, though it is emitted by only two or three, and sometimes one. In a state of captivity the animal loses its voice, or does not exert its voice, in the same manner as he does when wild, and in this state he seldom lives long. The male is larger than the female, and the latter always carries her young on her back. In order to kill these animals it is necessary to fire several times; while any life remains, and after they are dead, they will remain clinging to the branches by the hands and tail. Their flesh, after all the trouble of poffefling them, is not good; it is always tough, and never admitted to any table, but to the indigent inhabitants and travellers, to supply the want of other food. This animal is said to be large as a calf, and to live on the fruit of the quava-tree.

ALOUCH, a kind of sweet-scented gum which runs from the tree that produces white cinnamon.

ALOUETTE de Mer, in Ornithology, a name given by Buffon to the Tringa Hypoleucus, or common Sandpiper.

ALOUETTE, is also the name of the Alauda Arvensis.

ALOUS, in Ancient Geography, a town mentioned by Steph. Bz. and which belonged to Illyria.

ALP, in Ornithology, an English name used by some for the Bull-finch.

ALPAGE, alpaganum, in Ancient Writers, denotes the privilege of feeding cattle on the Alpes or high mountains, or a sum paid for the purchase of such a right. This is otherwise called Alpeathanum.

ALPAGNA, in Zoology, the Camelus Paco of the Linnean System, and the Pacos of Pennant.

ALPAM, in Botany. See Apam.

ALP ARSLAN, in Biography and History, second su-
fultan of the dynasty of Seljuk, in January 1071, the son of David or Jaffar Beg, and great grandson of Seljuk, who founded this dynasty, was born in the year of the Hegira 421, A.D. 1030. He succeeded his uncle Toghril Beg, A.D. 1063, and united in his person the two kingdoms of Khorasan and Iraq, with their dependencies; so that, at the commencement of his reign, he was sole monarch of all the countries lying between the rivers Jihan, or Ann, and the Djilat or Tigris; that is, of all Iran, or Persia, in the conquest of which he bore a considerable share, before he embraced Mahometanism he was called Israel, and afterwards he assumed the name of Mohammed, or Abu Shahj and Mohammed; and his surname was Alp Arslan, which signifies in Turkish, "the valiant lion." He was also distinguished, on account of his power and merit, by the appellation of Azzaddin, or Adhodaddin, denoting, "the protector of the religion." He began his reign by subduing several rebellions among his subjects; and he derived great assistance from his vizir Nadham al Molk, or Nezam el Male, who was reputed to be the most able man of his time, and who administered the affairs of the kingdom, in the reign of this prince and his successor, with the greatest integrity. Having succeeded in his enterprises for the security of his own dominions, and in an assembly of the states declared his son Malek Shah his heir and successor, causing him to sit on a throne of gold prepared for the purpose. and exacting from all the officers of the empire an oath of fidelity to him, Alp Arslan crossed the Euphrates at the head of the Turkish cavalry, and entered Cæsarea, the metropolis of Cappadocia, to which he had been attracted by the wealth and fame of the temple of St. Basil. After plundering this city, he proceeded to the final conquest of Armenia and Georgia, A.D. 1065. In Armenia the title of a kingdom and the spirit of a nation were annihilated; and the artificial fortifications were yielded by the mercenaries of Constantinople; "by strangers without faith, veterans without pay or arms, and recruits without experience or discipline." But the woods and valleys of Mount Caucausus were more strenuously defended by the native Georgians, or Iberians, who were at length compelled to submit; by the indefatigable exertions of the sultan and his son Malek; and who were punished for their obstinate resistance, by being obliged to wear at their ears iron horse-shoes as a badge of their slavery; many of whom, in order to avoid this ignominy, assumed the external profession of Mahometanism.

In 1068 Alp Arslan directed his arms against the Constantinopolitan empire, which was then governed by Eudocia. His progress alarmed the emperors, and induced them to take her hand and her sceptre to Romanus Diogenes, a brave kinsman, who was accordingly invested with the imperial purple. Although in the palace Diogenes was no more than the husband of Eudocia, yet in the camp he was the emperor of the Romans, and he sustained that character with feeble resources and invariable courage. By his spirit and success the soldiers were taught to act, the subjects to hope, and the enemies to fear. In three laborious campaigns the Turks were driven beyond the Euphrates; and in the fourth and last Romanus undertook the deliverance of Armenia. With an army of 200,000 men he marched to the siege of Malazkerd, an important fortress in the midway between the modern cities of Diyarbakir and Van. Alp Arslan flew to the scene of action at the head of 40,000 horse, according to the statement of Elmacin, but reduced by Abulpharagius to 15,000, and by d'Herbelot to 12,000. The Greeks, though much superior in number, were disheartened and dismayed by his rapid and skilful evolutions; nevertheless, their principal general Basilacius was defeated, Malazkerd was reduced, and their forces were separated; in this moment of advantage he proposed peace to the emperor. The answer of Romanus was dictated in the tone of insult and defiance; "If the barbarian wishes for peace, let him evacuate the ground which he occupies for the encampment of the Romans, and surrender his city and palace of Reill as a pledge of his sincerity," Arp Arslan smiled at the vanity of the demand, but he went in anticipating the death of so many faithful Moslems; and, after a devout prayer, proclaimed a free permission to all who were desirous of retreating from the field. With his own hands he tied up his horse's tail, exchanged his bow and arrow for a mace and scimitar, clothed himself in a white garment, perfumed his body with musk, and declared that if he was vanquished, that spot should be the place of his burial. In the decisive and bloody battle that ensued, the Greeks were totally routed, great numbers of them were killed; and Romanus, after valiantly maintaining his station, when he had been defeated by the body of his army, was at length recognized by a slave, taken prisoner, and presented to Alp Arslan. The successor of Constantine, in a plebeian habit, was led into the Turkish divan, and commanded to kiss the ground before the lord of Afia. He reluctantly obeyed; Alp Arslan, starting from his throne, is said to have planted his foot on the neck of the Roman emperor. This fact, however, is doubtful. He instantly hailed the royal captive from the ground; and then clapping his hand with tender sympathy, allured him that his life and dignity should be inviolate in the hands of a prince who had learned to respect the majesty of his equals, and the vicissitudes of fortune. Romanus was treated with attention and respect; and in the familiar intercourse of eight days, not a word nor a look of insult escaped from the conqueror. During the negotiation he was asked by Alp Arslan what treatment he expected to receive? To which question Romanus, with calm indifference, replied: "If you are cruel, you will take my life; if you liken to pride, you will drag me to your chariot wheels; if you confound your interest, you will accept a ransom, and restore me to my country." But what, continued the sultan, "would have been your own behavior had fortune smiled upon your arms?" Had I vanquished," he fiercely said, "I would have inflicted on thy body many a stripe." The Turkish conqueror smiled at the insolence of his captive; observed, that the Christian law inculcated the love of enemies and forgiveness of injuries; and nobly declared that he would not imitate an example which he condemned. After mature deliberation, Alp Arslan dictated the terms of liberty and peace, a ransom of a million, an annual tribute of three thousand pieces of gold, the marriage of the royal children, and the deliverance of all the Moslems who were in the power of the Greeks. The treaty was handwritten by Romanus, and the sultan, after a courteous embrace, dismissed him with rich presents and a military guard; but his subjects having revolted, he was unable to collect and remit the stipulated price of his ransom. The generosity, or perhaps the ambition of the sultan, disturbed him to expel the caufe of his ally; but the accomplishment of his design was prevented by the defeat, imprisonment, and death of Romanus Diogenes. After this treaty, A.D. 1071, Alp Arslan beheld the fairest part of Afia subject to his laws; 12,000 princes, or the fruit of princes, rooted before his throne, and 200,000 horse under his banners. He concluded to pursue the fugitive Greeks; but he mediated the more glorious conquest of Turkestan, the original seat of the house of Seljuk. His progress on this expedition, A.D. 1072, was impeded by Joleph Cathual, a Karasian, or Carizmian, the governor of Korzem, or Barzam, who, after vigorously defending his fortress, was taken prisoner;
prisoner; and being reproached by the sultan for his obstinate folly, by his insolent replies provoked a cruel sentence, that he should be fastened by his hands and feet to four stakes, and left to expire in that painful situation. The desperate Joseph, drawing a dagger, rushed towards the throne; the guards raised their battle-axes; but Alp Arslan, the most skilful archer of his age, checked their zeal, and drew his bow; however his foot slipped, and the arrow missed Joseph, who planted his dagger in the breast of the sultan, and was himself instantly cut in pieces. The wound was mortal, and the sultan expired, A.D. 1072, pronouncing an awful ad- monition to the pride of kings. "In my youth," said Alp Arslan, "I was advised by a sage to humble myself before God; to distrust my own strength; and never to despise the most contemptible foes. I have neglected these lessons, and my neglect has been severely punished. Yesterday, as from an eminence, I beheld the numbers, the discipline, and the spirit of my armies; the earth seemed to tremble under my feet; and I said in my heart, 'Surely thou art the king of the world, the greatest and most invincible of warriors.' These armies are no longer mine; and, in the confidence of my personal strength, I now fall by the hand of an assassin." This prince reigned nine years and six months, and lived 44 years and three months; and his remains were deposited in the tomb of the Seljukian dynasty, at Maru, one of the four cities of Khorasan, with this inscription: 'O ye who have seen the glory of Alp Arslan exalted to the heavens, repair to Maru, and you will behold it buried in the dust.' The annihilation of the inscription, and of the tomb itself, says a popular historian, more forcibly proclaims the iniquity of human greatnes. Alp Arslan commanded the respect of all who approached him by his stature, aspect and voice; his long whiskers shaded his face, and he wore a large turban in the form of a crown. His valor and liberality were equally renowned; and he was extolled for his piety and his attachment to the Mahometan faith and practice. He was succeeded by his son Malek Shah, who had been acknowledged during his life as the future sultan of the Turks; and who, by a triple victory over his uncle, cousin, and brother, each of whom disputed the inheritance, established his own reputation, and the right of primogeniture. Mod. Un. Hist. vol. iii. p. 394-461. Gibbon's Hist. vol. x. p. 352—363.

ALPEDRINHA, in Geography, a small place of Beira, in Portugal, containing about 250 inhabitants, and one church.

ALPEDRIZ, a small place of Estremadura, in Portugal, containing about 600 inhabitants.

ALPEN, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne; eight miles south-west of Wafel, and fifty north north-west of Cologne.

ALPEN, or ALPHEN, in Ancient Geography, the capital of the Locricians, on the north coast of Phoene, called Trachia, and above Thermopylae and Anthela.

ALPESA, a town of Batica, according to Pliny.

ALPHA, a river in the vicinity of Aquileia, near which Constantine was killed, and into which his body was thrown.

ALPHA BUCCELLI, a town ascribed by Ptolemy to the Marit; probably the same with Alba Fucens.

ALPHA, the name of the first letter in the Greek alphabet; corresponding to our A.

The word is originally Hebrew, formed from aleph, the name of the first letter of the Hebrew alphabet.

Alpha, according to Plutarch, was placed at the head of all the letters, because, in the Phænician language, it de-
the 'Dutch 26; the Spanish 27; the Italian 20; the Indians of Bengal 21; the Brahmas 19.

The Ethiopic has no less than 262 letters in its alphabet, there being seven vowels, which they combine with each of their 26 consonants; to which they add 20 other aspirated syllables. The like is said of the Tartarian; each of their letters is a syllable, having one of their vowels joined to its consonant; as bê, kê, bî, &c.

The Chineese have no alphabet, properly speaking; except we call their whole language their alphabet; their letters are words, or rather hieroglyphies, and are in number about 80,000. See Phil. Trans. vol. ix. an. 1769, N° 66.

In effect, alphabets were not contrived with design, according to the just rules of reason and analogy; but have been successively framed, altered, &c. as occasion offered. And hence have arisen many grievous complaints as to their deficiencies; and divers attempts to establish new and more adequate ones in their places. Bishop Wilkins charges all the alphabets extant with great irregularities, with respect to the order, number, power, figure, &c. As to the order, it appears artificial, precarious, and confounded; because the vowels and consonants are not reduced into classes, with such order of precedence and subsequence as their natures will bear. Even the Hebrew order is not free from this imperfection. As to number, they are both redundant and deficient; redundant, either by allotting several letters to the same power and sound; as in the Hebrew y, and the ordinary Latin e and k, f and ph; or by reckoning double letters among the simple elements of speech; as in the Hebrew, the Greek ε, and the, Latin q, cu, et, and the j, consonant, or jot.—Deficient in divers respects, especially in regard of vowels, of which there are seven or eight kinds commonly used, though the Latin alphabet only takes notice of five; whereof two, vis. i and u, according to our English pronunciation, are not properly vowels, but diphthongs.

Add, that the difference among vowels, in respect of long and short, is not sufficiently provided for: the ancients, we know, used to express a long vowel by doubling its character; as amanah, nataa, rees, fees, fansifimim; though the vowel i, instead of being doubled, was frequently prolonged, as addiis, rizo, vives. The ways used in English for lengthening and abbreviating vowels, vis. by adding a quiescent to the end of a word, for prolonging a syllable; and doubling the following consonants, for the shortening of a vowel, as waine wuan, waire warre, &c. or else by inferring some other vowel, for the lengthening of it, as meut met, read red, &c. are all improper, because the sign ought ever to be where the sound is.

As to their powers, again, those are not always fixed to the same significations: the vowels, for instance, are generally acknowledged to have each of them several sounds: vocales omnes plurifimas, says Liphus; and Volinus affirms us, the ancients used their vowels in very different ways, alliando tenuas eximique, nunc crassius, nunc intermedium fono. Thus the power of the vowel i is expressed in writing more lenis than in its several ways, vis. by bê; as in he, me, fes, ye; by he, in three, free, ues; by he, in field, yields, yields, chief; by he, in near, bear, bear; by se in people; by i in privilege. So is the power of the vowel a, as in all, any, awe, fan, engli; which are only various ways of writing the same long vowel; besides the other distinct ways of expressing the same vowel when used short: again, the power of the vowel o is written five ways: o, as in to, who, crow; oe, as in doe; oo, in foe, moon, noon; ou, in could, would; oo, in two; and so of the rest. Nor are the consonants of more determinate powers; witness the different pronunciation of the same letter ẹ in the same word circe, and e in negligence.

To say no more, the letters ẹ, f, t, are used alike, to denote the same power, and the letter ʃ is commonly used for s; and, which is yet worse, some letters of the same name and shape are used at one time for vowels, and at another for consonants; as ʃ, v, w, z; which yet differ from one another, says Bishop Wilkins, from corpus & anima.

From this confusion in the power of letters, there arise divers irregularities; as, that some words are distinguished in writing, which are the same in pronunciation, e. g. coffe and caffa, &c. and others are distinguished in pronunciation, which are the same in writing; as get, acquieres, and get, gatere, &c. Hence also the Latin male is a disyllabic, and the English male is a monosyllabic.

The names also, in most alphabets, are very improperly expressed by words of divers syllables; alpha, beta, &c. in which respect, the Roman and our English alphabets, which only name the letters by their powers, have a great advantage over the rest.

Lastly, their figures are not well concerted; there being nothing in the characters of the vowels answerable to the different degrees of aspiration; nor in the consonants, analogous to the agreements or disagreements thereof. Wilkins's r. towards a real character, &c. b. i. c. 4.

And all these imperfections are obviated in the universal alphabets, or characters, of M. Lodwick, Bishop Wilkins, &c. See Universal Characters.

In the French king's library is an Arabic work, entitled Sephar Alachen, containing divers ferts of imaginary alphabets, which the author distinguishes into prophetic, mystical, philosophical, magical, talismanic, &c.

It is no wonder that the number of letters in most languages should be so small, and that of the words so great, since, from a calculation made by Mr. Préfet, it appears, that, allowing only twenty-four letters to an alphabet, the different words or combinations that may be made out of these twenty-four letters, taking them first one by one, then two by two, three by three, &c. would amount to the following number, 1391274288,887522099425128493462200. See Combination.

It may be here observed, that every combination may make a word, even though that combination have not any vowel in it; because the e mute, or quiescent, invests itself imperceptibly between the consonants, or after the consonants, where they are but two, the latter of which would not be heard without it. The use of this silent e is very remarkable in the Armenian, Welsh, and Dutch languages; wherein the generality of words have several consonants together.

Nor must it be omitted, that every single letter may make a word; which is very apparent, where the letter is a vowel; words of that kind being found in most languages. Thus, a and e make words in the Greek; a, o, in the Latin; a, ọ, in English; a, o, y, in French; a, c, t, in Italian; a, y, in Spanish; a, o, in the Portuguese; o, in most languages, and even in the Dutch and Swedish. Any consonant also becomes a word, by adding an e mute to it in pronunciation.

In fine, though a considerable number of the possible combinations of twenty-four letters were retrenched, yet the number remaining would still be immense, and vastly superior to that of the words in any language known.

Of all known languages, the Greek is looked upon as one
one of the most copious, the radices only of which are es-
estimated about 32,44, but then it abounds exceedingly in
compounds and derivatives. Bishop Wilkins thinks these
may be moderately computed at about ten thousand. Her-
manus Hugo, indeed, affirms, that no language has so few
as 100,000 words; and Vario is frequently quoted by learned
men, as if he affirmed that there are in the Latin no less
than 5,000,000; but upon inquiring into the scope of the
passage, Bishop Wilkins observes, that this number is not
intended by him to express the full number of words in the
Latin, but the great variety made thereof by the inflection
and composition of verbs.—To this purpose he lays it down,
that there are above one thousand radical verbs in the Latin,
and that each verb admits of five hundred several varieties.
He farther supposes, that each of these may be compounded
with nine prepositions; as, effer, rectiss, accettis, decretis,
peccatis, precessat, successit, &c. which amounts to five millions.

concerning the origin and progress and various kinds of
alphabetical writing, see letters and writing.

Alphabet, in matters of Polygraphy, is a duplicate of
the key or cypher, which each of the parties corresponding
are to keep by them.

It is properly an alphabet of the usual letters disposed in
their order; opposite, or underneath which, are the secret
characters corresponding thereto, with the blank or useless
letters, and the other signs or symbols serving to disclose
and render it difficult to decipher. See Deciphering.

Alphabet, among Merchants and Traders, is a kind of
index, with the twenty-four letters in their natural order, in
which are set down the names and surnames of those with
whom open accounts are kept; and which refers to the fol-
ios of the ledger, where those accounts are written, in the
form of debtor and creditor; serving to find easily, and
without any trouble, such accounts as are necessary to be
turned to.

Alphabet, among the French, signifies also those
punches or iron tools, which engravers upon metal use to
egrave the several letters, or characters, which belong to
their works, either for legends, or for other inscriptions.
The bookbinders have also small brass tools, which they
call alphabets, and with which they put the titles, and the
number of the volume, on the back of books.

Alphabetical versus. See appendix.

Alphea, in Entomology, a species of the Phalena
Bombyx, with furtigious wings, a white point in the mid-
dle, and a punctated brown streak, found in New Hol-
dland.

Alphenix, white barley-sugar, to which is given an
extraordinary name, to render it more valuable. This sugar,
which is thought good for colds, is made of common sugar,
which is boiled until it becomes easy to crack, when they
pour it upon a marble table, greased with oil of sweet al-
monds, and mould it into various figures with a brass
chisel. It is easily fulfilled with wax.

Alpharabius. See Alphabet.

Alpheid. See cor hydra.

Alpheratz, in Astronomy, a fixed star of the third
magnitude in Aquarius. This is otherwise called alpha-rectus.
Some also give the denomination oni alpata, and mor-
chub alphabara; or two other stars in the right shoulder of
Pegasus.

Alphery, Mikephel, in Biography, an English div-
ine of the 17th century, was born in Ruffia, of the im-
perial line, and on account of the contumacies in Ruffia, which
happened towards the close of the 16th century, was sent to
England with his two brothers. They were conformed to the
care of Mr. Joseph Bidell, a Ruffia merchant, and by him en-
tered at Oxford, where two of them died of the small-pox.
The survivor took orders in the English church, and was
presented in 1618 to the rectory of Woolley, in Huntingdon-
shire. During his residence in this situation, he was invited
to return to his native country by some zealous friends, who
promised to exert their utmost efforts in restoring him to the
throne of his ancestors; but he declined the proposal, and
preferred remaining in the humble, but perhaps no less hon-
norable and useful, station of a parlia priest. At the time of
the civil wars, he endured great hardships from the repub-
lican party, and was ejected from his living. After suf-
ferring much insult and oppression by the misguided zealots
of that distracted period, he made a small purchase in the
vicinity of his living, built a house, and resided in it for some
years. The presbyterian minister by whom he was succeeded
encouraged and protected him; paid him the fifth part of
the annual income of his living, the allowance made by par-
liament to ejected ministers; treated him with kindness, and
did him all the services in his power. After the Resto-
rilation, he was replaced in his rectory; but his advanced
age of 80 years, and attendant infirmities, obliged him to
transfer the duty to a curate, and to retire to the house of his
eldest son at Hammersmith, where he died, much respected,
and affording a singular example of the vicissitude of the

Alphesera, in Botany, a name by which the Ar-
abian, and some other authors, express the white Bry-
ony.

Alphesi, Isaac, in Biography, a learned rabbi, who
flourished in Spain in the 11th century, and who came over
from the kingdom of Fez, in Africa, with the Monabites,
or Amenides. His epitaph, written in hexameters, was,
this purport:—“Let it be engraved on the stone, that
the light of this world is gone out, and that the foundation
of wisdom is deposited within this tomb. Daughters of
Sion, come and weep! the world is buried, and thicken
with blindness. Weep and sigh, for the ark and tables of
the law are broken in pieces with this doctor.”

Alphestis, in ichthyology, the name of a fish called
by others Cinedus, the labrus cynedes of Gmelin’s Linneus.

Alpheta, in Astronomy, a fixed star in the northern
crown; otherwise called lucida corona.

Alpheus, in Ancient Geography, one of the names
of Pisa in Etruria, supposed to have been founded by the
Lizaus, who arrived thither from the banks of the Alpheus,
in the territory of Elys.

Alpheus, a river of Elis, no less celebrated in my-
thology than recognized by geographers. The source of
Alpheus was in the interior part of Peloponnesus, in the
south-east of Arcadia. Its course was first to the north-
west; and then turning to the south, it entered Elis, and pas-
ing by Pisa and Olympia, discharged itself into the sea.
The mythologists, who are fond of animating all fountains
and rivers, pretend that Alpheus, falling in lust with Arc-
theta, pursued her to the sea, into which she plunged her-
sel, and following the same course under the water, re-
joined her at Syracusa, in the small island of Ortigia.
Virgil. Æne. lib. iii. v. 694. Accordingly it is reported
that this river passes under the sea, without mixing with
the salt water, so as to pass quite into Sicily, where it
mixes itself with the fountain Aretusa, near the city of
Syracusa; insomuch that any thing which is thrown into
the river on the side of Elis is said to come out at this fountain.
The geographical relation and the poetic fiction are so blended,
that it is not easy to decide which of them gave occasion to
the other; but they are both founded on a notion which prevailed among the ancients, that rivers puffed under ground for a considerable distance from one place to another. The Olympic games were celebrated on the banks of this river; and Orpheus was worshipped as a god at Olympia. Thus Pindar:—

"Alpheus, thy immortal flood,
On his lord's triumphant brows
The Olympic wreath befo'ward."

Od. i. West's Pindar, vol. i. p. 7.

Paulusini (in Ellid. c. 6.) informs us, that the Elecans had a law, which condemned to death any woman that should either appear at the Olympic games, or even cross this river, during that solemnity; and the Elecans add, that the only woman who transgressed it had disguised herself in the habit of a mender or keeper of those games, and conducted her son thither; but when she saw him return victorious, her joy made her forget her disguise, so that her sex was discovered. She was, however, spared, on account of her father, husband, and son, who had gained the Olympic prize; but from that time an order was made that the keepers should appear there naked.

ALPHONSO was said to be at the source of the river Alpheus, and that it derived its name from the property which the waters had of curing the leprosy, αλήθη denoting a leper.

ALPHITIDON, in Surgery, a species of fracture, wherein the bone is broken into a great number of small parts, or particles. The word is formed of αλήθη, farina, flour; q. d. a bone ground to flour or powder.

ALPHITOMANTIA, in Anatomy. See ALERUSMANTY.

ALPHUS, Avitus, in Biography, a Roman biographer, who probably lived about the time of Alexander Severus, in the beginning of the third century. He wrote the History of the Carthaginian war. Vols. Hist. Lat. c. iii.

ALPHUS Nius, in Ancient Geography, a mountain of Asia, mentioned by Plutarch in his treatise of rivers, where he is speaking of Lycomaras, a river of Astolia.

ALPHONSIN is the name of a surgical instrument which was formerly used for the purpose of extracting foreign bodies, especially bullets, from wounds. The alphonsin derived its appellation from its inventor, Alphonso Ferrius, a Neapolitan physician of the 16th century, and consists of three branches, which, by their cleftness, are separated from each other, but may be closely held together by means of a ring pushed forwards upon the branches. It is to be introduced to the bottom of the wound in its closed state; the ring is then drawn back, that the instrument may open and lay hold of the bullet; after which the operator replaces the ring, and withdraws the forceps, holding fast upon the extraneous body. See WOUNDS.

ALPHONSONE Tablets. See ALPHONSO and TAPERS.

ALPHONSO I. of Don Alonzo Enríquez, in Biography and History, the first king of Portugal, was the son of Henry of Burgundy, Count of Portugal, and grandson of Don Alonzo, king of Leon and Castile, who granted to Henry part of Portugal, as the dowry of his wife Therefa. He was enthrusted by his father to the care of Egas Muniitz, who gave him an excellent education. But as his father died when he was entering into the third year of his age, A.D. 1112, his dominions were governed by his mother Therefa. As reports prevailed of his mother's familiarity with Don Ferdinand Perez, Count of Tratema, and her intention to marry him, some of the Portuguese nobility, jealous of his growing honour and power, advised Don Alonzo, at the age of 18, to assume the sovereign authority. The queen and her party reflected; but though they had recourse to arms, they were speedily defeated, and Therefa was lodged in prison, where she was confined during the remainder of her life. After several conflicts with the Moors, princes, who poffessed part of Spain and Portugal, in which he was generally successful, his conquests were restrained by Don Alonzo, King of Leon and Castile, who assumed the title of the Emperor of the Spains, by whose numerous army his country was laid waste. Having, however, given him a temporary check, he proposed a treaty of peace, to which the emperor acceded, A.D. 1137; and as the Pope's legate interfered by his interest and influence to effect this accommodation, the Count Don Alonzo, under the impulse of gratitude and piety, declared himself tributary for all his dominions to the holy see, and promised to pay an annual sum of four ounces of gold. In 1139 the Moors princes were reinforced by a powerful army from Barbary. The Count, though he had an opportunity of retiring, and was advised by his generals to adopt this measure of safety, determined to meet them in the plains of Ourique; and after an obstinate and bloody dispute, the Moors were totally routed. This glorious victory was gained on the 25th of July, and the anniversary of it has ever since been celebrated for preserving the memory of so signal a favour vouchsafed by Providence to the Christian arms. Immediately after this victory Don Alonzo was proclaimed king on the plains of Ourique; but the form and constitution of the monarchy were not settled till the state, consisting of prelates, nobility, and commons, were assembled at Lamago, in the year 1145. This event was preceded by the conquest of Santarem; and it was functioned by the unanimous and cordial concurrence of the states. The king was crowned by the Archbishop of Braga, and it was declared that the regal dignity should descend to his heirs male. Eighteen statues were framed with the advice of the prelates and nobility for the government of the kingdom, and they were attended by the people. When the question was proposed, whether it was their pleasure that the king should go to Leon, do homage, and pay tribute to that prince, or to any other, every man, drawing his sword, loudly exclaimed, "We are free, and our king is free, and we owe our liberty to our courage; and if he shall at any time submit to such an act, he deferves death, and shall not reign either over us, or among us."

The king's coronation was next year followed by his marriage with Matilda, daughter of Awulains, count of Mauricie and Savoy, and in 1147 by the recovery of Lisbon out of the hands of the Moors. In this conquest he was assisted by a number of adventurers, who were assembled from different countries at the mouth of the Tagus, in their progress to the Holy Land. The capture of Lisbon was followed by the accession of several other places to his dominions. By means of these acquisitions, Don Alonzo became master of four of the six provinces that compose the kingdom of Portugal, and the reputation of his arms was raised to a very high degree. He was no less provident in peopling and improving than enterprising in the acquisition of territories; and in all his great and good deeds he was seconded by Matilda, a prince of equally celebrated for her exquisite beauty, distinguished capacity and nargious piety. By her he had a numerous offspring, which enabled him to strengthen his interests by great alliances. The marriage of his second daughter did not prevent his having disputes with his son-in-law, Don Ferdinand, king of Leon; who once made him prisoner, but restored him to liberty on the humiliating condition of coming in person to Leon to do homage
homage for his dominions. His son, Don Sancho, inherited his father's military disposition, took the lead on several occasions during the latter part of his reign, and in 1180 gained a glorious victory over Joseph, king of Morocco and emperor of the Almohades, who had advanced with a very large army as far as Santarem. The confirmation of the indemnities, in consequence of this defeat, was so great, that they left the Portuguese at liberty to impose the inferior part of the country, and to fortify their frontiers during the whole of next year. Alphonso needed repose and had retired to Coimbra, where, worn out with cares and fatigue, he departed this life on the sixth of December, 1187, after a reign of 57 years, in the 76th year of his age. His remains were deposited with great funeral solemnity in the church of the holy cross at Coimbra. His gigantic size and strength, as he was no less than seven feet high, and his martial ardour, have given occasion to many absurd and incredible stories concerning his military exploits, so that in the annals of chivalry, as well as in the record of martial achievements, he fulfils a very conspicuous rank. He instituted two orders of knighthood, that of the Wings and that of Avis, which still flourish in that kingdom with honour. He was succeeded by his son, Don Sancho, in the 31st year of his age. Mod. Un. Hist. vol. viii. p. 175—190.

Alphonso, or Alonso II. Don, surnamed the Fat, the third king of Portugal, succeeded his father Don Sancho I., at the age of 27, A.D. 1212. He began his reign with two very popular acts; he sent a body of infantry to the assistance of the king of Castile, who behaved with great reputation in the famous battle of Navas de Tolosa, and he gave the castle of Avis to the knights of that order; nevertheless, the lustre of his reign was eclipsed in its dawn. His quarrels with his own family entailed upon him a variety of troubles, and subjected him to the interference, as well as the displeasure, of pope Innocent III. The pope, however, prevailed in producing a reconciliation with his subjects; but this calm was disturbed by the incursions of the Moors. However, an army of Germans and Flemings, destined for the holy land, seasonably arrived in the harbour of Lisbon, and enabled the king to take Alcazar do-Sal, where the Moors had a fortress on a rock that was deemed impregnable, A.D. 1217, and also to defeat the Moorish army. Towards the close of his reign he quarrelled with his clergy, who refused a contribution of troops and money for defending the kingdom against the infidels; upon which, in 1221, the pope excommunicated him, and put his dominions under an interdict. Whilst he was negotiating with his subjects on occasion of the division produced by the pope's sentence, he died on the 12th of March 1223, in the 12th year of his reign, and was buried with little ceremony, under a plain tomb, in the conventual church of Alcobaca. He was very brave and uncommonly strong; and is laid to have been a great promoter of justice. Mod. Un. Hist. vol. viii. p. 193.

Alphonso, or Alonso III. Don, king of Portugal, succeeded his brother Don Sancho II, A.D. 1248, in the 35th year of his age. Soon after his accession to the throne, he entered into a war with the Moors, and took Faro in the province of Algarve, which was deemed the capital of the Moorish territories, and also Loula, which was carried by storm; and he thus added a considerable district to the dominions of Portugal. His domestic administration was conducted with great prudence, so that his power and popularity were much increased, and he maintained a friendly intercourse with pope Innocent IV. In consequence of his marriage with Dona Beatrix, the natural daughter of Don Alphonso the Wife, king of Castile and Leon, whilst his first wife was living, he incurred the displeasure of pope Alexander IV., who put his kingdom under an interdict. But upon the death of his first queen, A.D. 1262, pope Urban granted a dispensation, legitimated the children of Dona Beatrix, and removed the interdict. In order to prevent all future disputes with the crown of Castile, the two kings defined the boundaries between their respective dominions by means of commissioners, and recognized this settlement by a solemn act. The king, encouraged by the prosperous state of the country and by the happy issue of his enterprises, extended the authority of the crown, and obliged the clergy to contribute to the welfare of the state; but this measure revived old disputes, and the kingdom was again, A.D. 1268, put under an interdict. Such was his policy, that he contrived to obtain from Castile an exemption of all claims upon the crown of Portugal, and to procure a declaration that its monarchs were free from every kind of homage. Before his death, he made a full submission to the church, and was reconciled to the pope and clergy; and having received absolution, he died February 16th, 1279, in the 31st year of his reign, and 69th of his life; leaving the kingdom of Portugal complete to his successors. This prince was of tall stature and engaging aspect and manners; magnificent in times of peace, and frugal when his affairs required economy; the friend of the poor, for he pawned his crown to provide them with bread in a time of scarcity, respected by the nobles, and obeyed by the clergy. Mod. Un. Hist. vol. viii. p. 204.

Alphonso, or Alonso IV. Don, king of Portugal, surnamed the Brave, was the son of Don Denis, and succeeded his father in 1324. When he ascended the throne, hunting was his favourite diversion; and whilst he was giving a detail to his council of a month's sports, one of his courtiers laid the resolute to remonstrate, and to threaten, that if the grievances of his subjects were not redressed, they must look out for another and a better king. Alphonso was at first highly displeased; but upon reflection, "I perceive," said he, "the truth of what you say: he cannot long have subjects who will not be a king. Remember, that from this day you have nothing more to do with Alphonso the sportsman, but with Alfonso, king of Portugal." To this resolution he adhered; and he exerted the authority of a sovereign in a manner that awed his subjects, without conciliating their esteem. To his father's memory he paid respect, and promoted those who had opposed himself with the greatest venom, regarding them, though enemies to him, as the true friends of the crown. He shewed much duty to his mother, and great affection for his confidant queen Beatrix; and commenced his reign with forming designs for the establishment of his family and the security of his dominions. He proceeded, however, against his brother, Alfonso Sanchez, as a profligate traitor, and thus drove him into rebellion; but he was afterwards reconciled, and received him into favour. He engaged in a war with Alfonso XI., king of Castile, which terminated in an alliance and in effectual alliance against the Moors. But no part of his conduct was more artful and cruel, and reflected greater disgrace on his character, than that which concerned Donna Agnes de Castro, the mistresa and coheire of his son, Don Pedro. Indulged by his courtiers, who were jealous of the influence of this favourite, he illused orders for the murder of this prince, and afterwards avowed and approved this horrid deed. The son by this act was driven into a civil war, but it was soon concluded by his submission, and by tokens of peculiar favour on the part of the father. As the
the termination of Alonso's reign and life approached, he endeavoured to compensate his sad crofs and misconduct by acts of piety and charity, by redressing grievances, establishing laws for the suppression and restraint of vice and immorality, detaining publicans for raising the rates, and effacing from the memory of his son the insult and injury which he had received; at the same time he took measures for removing those out of the way, who were likely to become the objects of retribution after his death. Having concerted measures of this kind he died in May 1557, in the 32d year of his reign and the 67th year of his age, with the character of an undutiful son, unnatural brother, and cruel father; but in many respects, of a great man and great king, brave and fortunate in war, but artful and indirect in his political measures, attached to his subjects, strict in the administration of justice, attentive to the public welfare and affiduous in encouraging industry and enriching his people. After all, he was rather revered for a right use of power, than relied on as a public parent; and though feared and even execrated, he was not much honoured nor beloved. His device was an eagle on the wing, with this motto, "Altiora peto," i.e. my hopes fly high.

ALPHONSO, or ALONSO V., Don, king of Portugal, surnamed the Africam, on account of his heroic exploits, was born in 1432, and succeeded his father, king Edward, at the age of six years. During his minority his uncle Don Pedro was regent, and though he conducted the administration with reputation, and married his daughter to the young king, he was created a traitor at the expiration of his regency; and both he and several of his adherents were put to death. The king, who on this occasion was overpowered by the enemies of the regent, afterwards did justice to his memory. And he manifested his attachment to his queen, who died in 1555, not without strong suspicions of poison administered by her father's enemies, by removing all connections with the sex. Military glory was the chosen object of his pursuit. With this view he turned his arms against the Moors in Barbary, and in 1558 he passed over to Africa with a fleet of 200 sail, and an army of 20,000 men. He began his career with the capture of Alcaçer, which he strongly garrisoned; and prosecuted it, with various successes, till the year 1470, when, after reducing Arzila and Tangier, he returned with great honour to his own country, and acquired the distinguishing appellation of Africam. He likewise added to those titles which had deferred to him from his ancestors, that of lord of the coasts on both seas, and for perpetuating the memory of his exploits caused them to be elegantly wrought in tapestry. The war of Africa gave occasion to the establishment of the order called Knights of the Sword. Alonso was engaged in another contest of his fortunate issue against Ferdinand and Isabella, of Castile, in support of the claim of his niece Dona Joanna to that crown. His failure of success induced him to take a journey into France, in order to obtain the assistance of Lewis XI.; but duped by this faithless monarch, he was so mortified that he formed a purpose of resigning his crown and making a pilgrimage to Jerusalem. During his absence, Portugal was governed, with great ability, by the prince Don Juan; and upon the king's return, he was received by his son with respect and joy, and reinstated on the throne. Alonso, however, oppressed with melancholy, determined to withdraw into a monastery; but in his way thither, he was feized at Cisna with the plague, and died there on the 28th of August 1481, in the 49th year of his age, and the 34th of his reign. Alonso was much honoured and beloved by his subjects, on account of his private character and public conduct; his temper was condescending and amiable, and he was so much distinguished by his benignity, bounty, and charity, which he particularly displayed in the ransom of prisoners, that he acquired the popular title of the Redeemer of Captives. He was eminently chaste and temperate, fond of letters, and a patron of learning, and the first Portuguese king who formed a library in his palace. Guinea was discovered in his reign, under the auspices of his uncle, the celebrated Don Henry; and a very lucrative trade was established by the Portuguese to that country, which Alonso vindicated against the claims and hostile attempts of the Spaniards.

ALPHONSO, or ALONSO VI., king of Portugal, succeeded his father John IV. in 1460; and having been a partner with the pally whilst an infant, and neglected in his education, became of a fierce and untractable temper, so that he was deplored and succeeded by Don Pedro. He died suddenly in 1583, in the castle of Cintra, after having borne the title of king almost 27 years, living 40, and being a prince 15 years. Mod. Un. Hist. vol. xviii. p. 444, &c. vol. xix. p. 14.

ALPHONSO, or ALONSO III., surnamed the Great, king of Algaris, Leon, and Oviedo, was born in 1449, and succeeded his father Don Ordonez in 1479. The rebellion of Don Froila compelled him to retire from the kingdom, but upon the death of this usurper he returned with universal applause. He was an able and warlike prince, and in succedive battles with the Moors he reduced several places. His attention to the lower classes of his subjects digested some of the naughty nobility, and occasioned disturbances which he reprefed. In an interval of tranquillity A.D. 900, he held a general council of the clergy and state, which enacted some useful regulations, and he directed his attention to other objects, that contributed to the honour of his kingdom and the happiness of his subjects. Whilst he was employed in building and fortifying some of the towns, which he had taken from the Moors, he was interrupted by them, and reduced to the necessity of defending himself with a considerable army; which he did with such effect, that they were defeated with great loss. About the same time he was dissuaded by the rebellion of his son Don Garcia, who had formed the design of depoing his father and placing himself upon the throne; but this rebellion was soon suppressed. It was followed, however, by increasing discontent, occasioned by the confinement of Garcia and the oppression of taxes; in consequence of which Alonso, A.D. 915, assembled the states and also the grandees of the country, and abdicating the crown, resigned it to Don Garcia, who was declared king; and to his other son Don Ordonez he assigned the province of Galicia. Soon after his reign the kingdom, his son assembled a numerous army in order to march against the Moors; and having gained considerable advantage in 911, he was preparing for another campaign. Alonso aided him by his counsel, and took pains to convince him, that incursions and conquests were of little avail, if they were conducted with no other view before that of enriching the soldiery and of gaining applause. His advice was regarded, and Alonso himself offered to take the command of the army that was raised for new operations; and having made a glorious campaign in 912, he returned with his army, laden with spoil to Zamora. Here he was soon feized with a disorder, which terminated in his death, December 28th, in 912, two years after his abdication, 49 years from the time of his being associated with his father in the government, and when he was about 63, or as some say 65 years of age. He was deemed a prince
prince of great learning, and the patron of literature; and much respected for piety and virtue, and all princely qualities. It is said, that he composed a Chronicle of the Spanish affairs from the death of king Rcefaath to that of his own father Don Ordonez. This chronicle has been incorrectly published by Sandone, and the later editions have been imperfect. This work was published to the world by the name of Schallian, bishop of Orenza, at whose request it was composed. Mod. Univ. Hist. vol. xvi. p. 159, 147.

Alphonso, or Alonso X., surnamed the H?fe, king of Leon and Gallicie, succeeded his father, May 30th, in the year 1252, with the general approbation of the people, who regarded him as a prince of great qualities and remarkable generosity; though the appellation with which he was honoured was more the result of his love and encouragement of science than of his royal talents and exploits. The prosperity of his reign was interrupted by the ill-concerted projects of his ambition. His first attempt was directed against Galcony, to which he pretended a better right than Henry III. of England; but instead of succeeding in enforcing his claims, he contented to renounce them, on condition that Henry's son, afterwards king Edward I., should marry his sister Leonora. He also prepared for an expedition against the Moors, in Barbary, at an expense which drained his treasuries and obliged him to debase his coin; but he was diverted from prosecuting it by supporting claims, derived to him from his mother, to the duchy of Swabia. He was thus led into connection with the German princes, and became a competitor with Richard, earl of Cornwall, for the imperial crowns, a titular honour which cost both these rivals immense sums of money. The conspiracies of several princes of the blood, as well as those supported by the Moors, demanded his serious attention; and he was successful in restraining and defeating them. In 1268 he formed a romantic design of visiting Italy, against which the states remonstrated, and which, in deference to their opposition, he was under a necessity of relinquishing. This produced a formidable conspiracy among his subjects, and the number of malecontents became so considerable and so powerful, that a compromise and reconciliation were not effected without great reluctance on their part and confession on that of the king. After the death of Richard, earl of Cornwall, and even when Rodolph of Hapsburg was actually elected emperor of Germany, Alphonso aspired to this honour; and, for the purpose of preventing the pope from confirming his election, he took a journey to Bauta, in order to have an interview with him; although in the mean while the Moors, availing themselves of his absence, were ravaging his dominions. This journey, whilst it was attended with great expense, and productive of much confusion in his kingdom, proved ineffectual; the pope was not to be convinced of the justice of his claims; and he returned disappointed and mortified. In this interval his eldest son died; and the second, Don Sancho, claimed the crown against the children of his elder brother. An assembly of the states was convened at Segovia, and Sancho's claim was allowed; but the cause of the children was maintained by their uncle, Philip the Hardy, king of France; Alphonso was thus engaged in a war; and his own queen, Donna Violante, refented the indignity offered to her grandchildren, and retired to the court of her father, the king of Aragon. In addition to these domestic dissensions, Alphonso, engaged in a war with France, was compelled by the pope to renew the war with the Moors, which proved disastrous; and having concluded a truce with them, he was engaged in a contest with the

king of Grenada. By these various measures his finances were ruined, taxes were multiplied, and the affairs of the kingdom were reduced to such disorder, that an assembly of the states was held at Seville in 1251, in which the king proposed, and the states acquiesced, to give a currency to copper money. Another assembly of the states was held at Valladolid, in conseqnence of the intrigues of Don Sancho, A.D. 1252, which deprived Alphonso of the regal dignity, and appointed Sancho regent. The king, reduced to almost insupportable difficulties, sought the assistance of the king of Morocco; foolishly curbed and dishonoured his son; and by his death in 1283 confirmed the act of exclusion, and appointed, for the succession, the infants de la Cerda, and upon the failure of their heirs, the kings of France. At the commencement of the next year, when Alphonso received information from Salamanca, that Sancho was dangeroufly ill, and professed the most sincere sorrow for his undutiful conduct to his father, he resolved, pardoned his son, revoked his curbs, and then died on the 4th of April 1284, in the 84th year of his age. He was buried in the cathedral of Seville, and l? behind him the character of a learned man and a weak king. As a proficient in science and a patron of literature, he excels a high and honourable rank. As a politician and legislator, he completed the code of laws which his father, Don Ferdinand, had begun, known by the title of "Las Partidas," and he redrafted the confusion in law proceedings, occasioned by intermixing Latin with the vulgar tongue, by obliging his subjects to use their own language. He also corrected many errors in the statutes of the university of Salamanca, and caused a general history of Spain to be composed in the Castilian language, which he took pains in polishing. But his favourite object was astronomy; and to the improvement of this science his attention and labour were particularly directed. With this view he assembled at Toledo, during his father's life, a number of the most celebrated astronomers of his time, Christians, Jews, and Arabsians, from all parts of Europe, for the purpose of examining the astronomical tables of Ptolemy and correcting their errors. They were employed in this business for four years, and in 1252, the first year of Alphonso's reign, they compiled those tables which have been denominated Alphonso's tables, from the name of this prince, who encouraged the construction of them by his liberality. The sum, expended upon them, is immense; if we may believe the report of those who state it at 400,000 ducats or even that of others who reduce it to 40,000. Some have ascribed the principal conduct of this work to the Jewish Rabbi Isaac Aben-Said, whilst others, professing to derive information from the MSS. of Alphonso, refer it to Alchabitius and Aben-Ragel. The other astronomers who were employed on this occasion were Aben-Mula, Mohammed, Joseph Ben-Ali, and Jacob Abueno, Arabians; Samuel and Jehuda El-Conejo, Jews; but the names of the Christians, if any such were actually engaged, are not known. The epoch of these tables was fixed to the 40th of May, 1252, which was the day of his accession to the throne. They were first printed at Venice in 1483; and there are other editions in 1492, 1521, 1545, &c. He is also said to have written a book, entitled, "The Treasure," containing treatises of rational philosophy, physics, and ethics; and to have been well acquainted with astrology and chemistry, in which last science, as report says, there are two volumes, compiled by him, still remaining in his Catholic Majesty's library, in cipher. But considering the state of this science at that period, they must be more curious than useful. Alphonso has been charged with irreligion and impiety,
piety, chiefly on account of a saying of his, that is very well known, and that has been often repeated to his dis-

honour; viz. that "if he had been of God's privy-council, when he created the world, he could have advised him better." If we admit the fact, that he used this expression, of which there is some reason for doubt, as it has been va-

_riously quoted by different writers, it unquestionably indicates a degree of presumption and arrogance not very suitable to the character of a true philosopher. Candidly interpreted, it is to be considered as a kind of Jesu d'espri; or pleasant farce on that perplexing variety of eccentical cycles and epicycles, with which the syltem of Ptolemy was embar-

rassed; but the reflection might have been dictated in terms more decorous, and more consistent with that reverence of the Creator, which an enlarged contemplation of his works has a tendency to produce. "An inept astronomer is mad." Young. Modern Un. Hist. vol. xvi. p. 343—365.

**ALPHONSO, or ALONSO V., derivately called the Magnanimous, king of Aragon and Naples, succeeded his father, Ferdinand the Just, as sovereign of Aragon, in the year 1416. The tranquillity of his reign was disturbed, soon after his accession, by the insolence of pope Benedict XII, and by a conspiracy of several nobles among his own subjects against his life. The discovery of this treason was made just before its execution, and the king had an opportunity of exhibiting a signal display of magnanimity by hearing a paper in which the names of the conspirators were inferred without reading it; declaring at the same time, "that he would at least force them to acknowledge that he had a greater regard for their lives than they had for his."

Having composed a disturbance in Sardinia, he was preparing to advance to Sicily, when Joan of Naples offered to adopt him for her son and heir, if he would aflift her against the pope, the duke of Anjou, and the confederacy she formed to depose her. The king accepted the proposal, raised the siege of Naples by his army, and was im-

mediately installed, by proxy, heir apparent of her kingdom and duke of Calabria. The queen afterwards proving false to her engagement, she was expelled from Naples, which was taken possession of by Alphonso; but when the duke of Anjou made himself master of the greatest part of the king-

dom, the queen renewed her application to the king of Aragon, and he prepared for a new expedition. In 1434 he again renewed his attempts for the conquest of Naples, and besieging Gaeta, he involved himself in a quarrel with the duke of Milan and republic of Genoa. In an engage-

ment with the Genoese fleet, which was sent to relieve the place, Alphonso lost all his ships, and was himself taken prisoner. At Milan, whither he was conducted, he so far ingratiated himself with the duke, that he became his friend and ally; and whilst his own hereditary fates were liberal in their supplies, his power was greater than ever. In 1443 he made himself complete master of Naples, and in an af-

sail of the fates held firft at Beneventum and transferred to Naples, his sovereignty was acknowledged, his son Don Ferdinand, whom he had created duke of Calabria, was recognized as successor to the crown, and he was esteemed the great arbiter of peace and war through all Italy. Al-

phonso continued in Naples till the close of his life and reign; but his declining years were disquieted by political intrigues and diffentions. RefiUes and uneasy, he was re-

moved from one castle in Naples to another, and at length expired on the 22d of June, 1468; leaving to his natural son Ferdinand the kingdom of Naples, which he had ac-

quired by arms, and to his brother Don Juan, king of Na-

zarre, the crowns of Aragon, Valencia, Majorca, Sardinia, and Sicily, and the principality of Catalonia, with all their dependencies. Alphonso was, without doubt, the greatest prince that ever sat on the throne of Aragon, and he was accounted the ablest statesman and the most renowned military commander of the age in which he lived. He was in an eminent degree the patron of learning, and afforded an alms to the Greek letters when they were expelled from Constantinople; his device was a book opened, and it was his common saying, "that an unlettered prince was but a crowned ass." The perusal of Quintus Curtius cured him of a disorder with which he was attacked at Capua; he was brave and liberal, and in all his negotiations he displayed the mean arts of intrigue and dissimulation. He lived in familiar intercourse with his subjects, whom he loved. "A father," he said, when walking unarmed and unaccompanied about his capital, "has nothing to fear in the midst of his children." When he was besieging Gaeta, he relieved and dismission without injury the women and children that were turned out of the town, alledging, "that he had rather lose any city in his dominions than the reputation of humanity." When one of his galleys, with its whole crew and a number of soldiers, was ready to perish, he leaped into a shallopp for its relief, saying, "I had rather share with those its calamities." Upon hearing an officer, who saw his treasurer bringing him 10,000 ducats, exclaiming, "I shold only with that sum to make me happy!" "you shall be paid," said Alphonso; and caused the money to be given to him. He expressed an extraordinary dislike of dancing, which he con-

fidered as a kind of infantry. His greatest failing was an at-

tachment to women; and it was productive of several in-

proprieties of conduct and pernicious consequences. Lu-

cretia Alana was one of his mistresses, and his fondness for her in an advanced period of life very much iullied his repu-

tation; and connections of this kind led him to neglect his wife, who was faithful and affectionate, and very zealous and active in his interests. Mod. Un. Hist. vol. xxi. p. 240—254.

**ALPHONSO'S ISLAND,** in Geography, an island of the In-

dian Ocean, nearly south of the Alhurantes islands, lying in a tract of the sea, little traversed by European vessels. S. lat. 5° 30'. E. long. 52° 40'.

**ST. ALPHONSE'S ISLAND,** an island on the coast of Terra del Fuego, in the South Pacific Ocean. S. lat. 55° 51'.

W. long. 69° 35'.

**ALPHONSUB, PETRUS,** in Biography, a Spanish Jew, was converted to Christianity, A.D. 1166, baptized at Huesca, and had Alphonsub, king of Portugal, for his godfather. He composed a treatise by way of "Dialogue between a Jew and a Christian," concerning the truth of the Christian religion, in which the arguments of the author against the Jews are arranged methodically and urged with clearness and solidity of reasoning. This work was pub-

**ALPHONSUB TOSTATUS,** a learned Spaniard and volumi-

nous writer, flourished in the middle of the 15th century. He finished his studies at the university of Salamanca at the age of 22 years, and made great proficiency in those branches of knowledge that were in principal estimation at that period. He attended the council of Bafil, became bishop of Avila, and was advanced to the chief offices in the kingdom of Spain. He died at the age of 40 years, A.D. 1454, and was in-

terred in the church of Avila, with this epitaph:

"He flupor est mundi qui febile difcuit omne."

His works, written during his comparatively short life, amount.
amount to 27 volumes in folio, of which 24 are commentaries on some of the books of scripture; the rest are chiefly theological; they were printed by the order of Cardinal Ximenes, at Venice, in 1532, at the same place in 1546, and at Cologne in 1612. His "Commentary upon the Chronicle of Eusebius," was printed separately at Salamanca in 1556; as were also several other books in literature and science, and ecclesiastical history. Dupin, 15th cent. p. 83.

ALPHOS, in Medicine, a distemper described by Celsus, under the name of vitiligo; wherein the skin is rough, and becomes sprinkled as it were with drops of white; and thence denominated leucos. Where the spots are black, it is also called nigra; and melana. It bears the same relation to the leucos, as the freckles to the lepra; the first is superficial and cutaneous, the second sinks deeper into the flesh. The albores, melas, and leucos, are but one and the same disorder, only differing in its degree of inveteracy.

ALPIEU. See Basset.

ALPIGNAN, n Geography, a town of Italy, in the principality of Piedmont, on the Dora, five miles west of Turin.

ALPINE. See Cisalpine.

ALPINI, in Ancient Geography, a people of Spain, mentioned by Aulus Gellius and Varro, in whose country were excellent mines of iron and silver. They were situated near the Ebro.

ALPINA, in Botany, so called after Prosper Alpinus, a genus of the monardia monarda genus class and order, of the natural order of jasminaceae and cause of Jullien; the characters of which are, that the calyx is a perianthus one-leaved, tubulofab, three-toothed, the leaflets equal, erect and acute; the corolla monopetalous, tubulofab, two-celled, and short, border three-parted, and parts nearly equal and oblong; the nectary composes with the tube of the corolla, two-parted, the lower part forming the lower lip is larger and longer than the parts of the corolla, broadens, spreading and often divided; the flowers have no proper filament, but along the upper division of the nectary, forming the upper lip, which is flat and of the length of the corolla, grows a large anther, either deeply bid or entire; the stylus has an inferior, oblong germ, style filiform, often inserted into the future of the anther, stigma inconspicuous and obtuse; the pericarpium is an oval capsule, three-celled, crowned with the permanent calyx; the seeds are ovate, angular, and covered with a sort of ridged aril. This genus differs from the amomum and collum only in the habit and the inflorescence, which is racemose. Martyn reckons two, Wildenow four, and Gmelin five species. They are as follow: 1. A. racemosa, with raceme terminal, spikes, flowers alternate, lip of the nectary trifid, and leaves oblong and acuminate. This is the A. jamaicensis of Gartner, the amomum pyramidale of La Maree, the amomum alpinum of Rotboel, and the zigiber sylvestre minus, &c. of Sloane. It is a native of the West Indies. With us it must be preferred in a flove, and the pot plunged into a tub of water; the leaves decay every Winter, and are pulped out from the roots every Spring. It may be increased by parting the roots, when the leaves decay. Gmelin mentions two varieties, A. alpinus of Koenig, and A. multicaulis of Aublet. 2. A. occidentalis, with raceme radical, compound, erect, nectary emarginate at the apex, three-celled capsules, and leaves lanceolate and ovate and smooth. This is the amomum minus, with clothed stalk and spikes of flowers of Brown, Jamaic. It is a native of the woods of Jamaica and St. Domingo. 3. A. speciosa of Gmelin, who queries whether it be of this genus. See Costus. 4. A. langue of Gmelin, with paniculata terminal flowers. He mentions two varieties, viz. Langus chilenium and L. aquaticum of Koenig. 5. A. j虞calis, made by Gmelin a distinct species. 6. A. galanga of Willdenow, having a terminal lax raceme, with alternate flowers, the lip of the nectary emarginate, and lanceolate leaves. This is the maranta galanga, with a simple culm of other writers, the amomum galanga, &c. of Lourie, the galanga of Runphius, and the galanga of the hop. It is a native of the East Indies. 7. A. formosissimum, W. with a terminal tufted spike, bracts longer than the flower and colored, and oblong-ovate pubescent leaves. The calyx is red; the corolla yellow; and the nectary yellow, truncated and quenched-dentated. It is found in Caracas, in South America.

ALPINUS, Prosper, or Prosper Alpinus, in Biography, born at Narbona, in the state of Venetia, in the year 1552, became celebrated for his skill in medicine and botany, which he cultivated with singular success. Having quitted the army, to which he was at first attached, he went to Padua, where he studied physic, and in 1578 was received doctor in medicine, and through the interest of his father, who was also a physician, was appointed in 1580 to attend the Venetian consulate to Egypt. He remained there three years, during which time he applied himself with great industry to acquire a knowledge of the most remarkable plants, indigenous to that country, and of the practice of physic, or the methods used by the natives in curing diseases. These became the subjects of several learned and ingenious works, which he published on his return from Egypt. In 1586, he was appointed physician to Andrew Doria, at Genoa, whence, the reputation of his abilities increasing, he was called home by the states of Venice, and appointed professor of botany and curator of the physic garden at Padua, where office he retained to the time of his death, which happened in November 1616. He was succeeded in the professor's chair, by one of his sons, who had probably been his assistant, as he is said to have been very infirm, and to have laboured under a difficulty of hearing, during some of the latter years of his life. The principal of his works, which have passed through numerous editions, and are in many hands, are, "De Medicina Egyptianorum," lib. iv. first published at Venice, in 1611, full of ingenious information as to the diseases, medicine, surgery, and modes of life of the modern Egyptians; "De plantis Egyptianis liber;" "De Balsamo, dialogus," a treatise on the famous balm of Gilad; "De praefagienda vita et morte Aegyptianis," published in 1601, and confining chiefly a collection and arrangement of the preages of Hippocrates; "De medicina medicalis," being an attempt to elucidate and restore the ancient doctrine of the Methodic sect in medicine, published in 1611: "De Rhapontico difutatio inauguralis;" "De plantis exoticos," all in quarto. He is also said to have left other works in manuscript, that have not been published. Ample accounts of several works, and of the editions they have passed through, may be found in Haller's Bib. Med. Prat. and his Bib. Botanica.

ALPISTE, of Alphia, a sort of food used to feed birds with, especially when they are to be nourished for breeding. The alpine seed is of an oval figure, of a pale yellow, inclining to an ashef colour, bright and glossy. It is an article of the corn chandlers and feedmen's trade. See Phalaris.

ALPS, Alpes, in Geography, was a name given to a chain of mountains, which extended from the sea of Liguria to Iltira, and forming a chain of crescent, separated the northern part of Italy from Gaul and Germany. The name is Celtic, and denotes highly elevated; or, as the author of a German book, entitled, "Rheinischer Antiquarius,""
forges, it signifies \textit{mountains abounding in pasture}. \textit{Feilus} is of opinion that the appellation was borrowed from \textit{albus}, pronounced by the Sabines \textit{alpis}, and signifying \textit{albica}, because their mountains were always covered with snow. Others, recurring to a fabulous relation, derive it from a person of the name of Albion, the son of Neptune, who is said to have been killed by Hercules, in disputing his passage over these mountains. But the first etymology, adopted by \textit{Huidor}, (Orig. lib. iii.) and \textit{Servius}, (in Virgil, \textit{An.} lib. iii.) is the most probable. The word \textit{alpis} signifies, among the ancient Scythians and Scandinavians, both a mountain and a mountain-peak; it being a periphrasis among them, that mountains and rocks were inhabited by demons. Accordingly the Elda of Iceland, (\textit{Myth.} 15.) mentions good and evil \textit{Alps}.

This chain of mountains, commencing in the Vada Sabatia or Savona, and terminating near the Sinus Flanetietius or Flaneticus, now the Golfo di Canaro or Canerno, in the bay of Venice, and the springs of the river Colapis or Kulpe, or reaching from the river Varus to the river Arlia, in Iliria, has many irregular windings, so that its extent has not been accurately and uniformly ascertained; some of the ancient writers making it 800, and others no more than 250 miles. Its whole range may be more justly computed at about 550 British miles; and may be considered as extending in a kind of semicircular form, from the gulf of Genoa, through Swifferland, which contains its central and more lofty parts, and terminating in the Carnic Alps, on the north of the Adriatic sea. It has been divided, both by ancient and modern geographers, into different portions, and these have been distinguished by different appellations.

The \textit{Maritima Alps}, \textit{Alpes Maritimes} or \textit{Littorae} of Tolentini, arise from the gulf of Genoa, and reach from Vada or Vado, in Nice, to the springs of the Var, or to those of the Po. Some reckon their commencement at Monacco, on the Mediterranean, and trace them in their progress from south to north, between ancient Gaul to the west, and Genoa to the east, through the eastern part of the country of Nice, and between that and the maritime of Saluzzo to their termination at Mount Vibo between Dauphiné and Piedmont. Upon the summit of this ridge trophies were erected in honour of Augustus, at a place called Tropea, since called Turbin. The ancient capital of the Maritime Alps was Embranch, and the inhabitants of this district obtained from Nerone, A.D. 63, the rights of Latinity, that is, the rights and privileges which the Latins enjoyed when they were only allies and not citizens of Rome. The highest chain of these Alps, through which is the remarkable passage, called the Colle Tende, forms the external boundary of the country of Nice.

The next high ridge, called \textit{Alpes Cottiae} or \textit{Cottianae}, now Mont Genevre, in which is the spring of the river Durance, extends from the springs of the Var to the city of Susa, or from Mount Vibo to Mount Cenis, and separates Dauphiné from Piedmont; having the \textit{Alpes Maritimes} to the south, and the \textit{Alpes Graiae} to the north or northwest. In the time of the Romans a petty prince called Cultra possessed an independent territory in this part of the Alps; and in order to maintain his independence paid court to Augustus, and engaged his protection. With this view he traversed these mountains, and formed commodious passes for the Roman troops. The territory of Cottiae, a prince who resided at Susa, and whose name was given to this ridge, confined, according to Pliny, of two independent cantons. Hence the passage of the Alps, which led from Braincon to Susa, was particularly denominated in the Theodosian table \textit{Cottia}. M. d'Anville, Haléquin, and others, are of opinion, that it was by this part of the Alps Hannibal entered Italy. Some have thought that one part of his army passed over the Cottian, and another over the Graian Alps. It has been said that he cut a passage through the solid rock; and if Livy may be credited, he heated the rock by a fierce fire, and then poured a great quantity of vinegar upon it, which penetrating into the fissures, produced by the intense heat of the fire, calcined and softened it. But this relation, although Pliny (lib. xxiii. c. 1.) takes notice of this quality of vinegar, is rejected by many authors as fictitious. Polybius does not mention it. The capital of the Cottian Alps was Susa; and this territory was added by Nero, about the year of Christ 65, to the dominions of the Roman empire.

To the north of the \textit{Alpes Cottiae} were the \textit{Alpes Graiae} of the ancients, so called by Pliny and Napoleon, as it has been said, from the passage of Hercules in his return from Spain; which is rejected by Livy (lib. v. c. 33.) as fabulous: these are now denominated the Little St. Bernhard, and commencing at Mount Cenis, where the Cottian end, and running between Savoy and the Tarentese to the west, and Piedmont and the duchy of Aosta to the east, terminate in Great St. Bernard.

The \textit{Alpes Penninæ} lay to the north-east of the Graiae, between the Velagri to the north, and the Salafii to the south. Some have sought the etymology of the epithet in the name \textit{Pomii}, Carthaginians, pretending that Hannibal passed into Italy by this mountain. But both the etymology and the fact are equally erroneous. The appellation \textit{Penninæ} formed from \textit{pen}, head or high, signifies the height of these mountains; and the passage of Hannibal was probably over that part of the Alps, denominated Cottian. The \textit{Alpes Penninæ} confided of the present Great St. Bernard, Mont Blanc, and the grand chain that extends on the south of the Rhone to the north of the modern Piedmont, and reached from west to east from St. Bernard to Adula or St. Gothard, separating between the Velese to the north, and the Mala- se to the south: and the eastern part of this ridge was denominated the Lepontine Alps, from the appellation of a people who inhabit the country where the rivers Rhone and Tetina originate. From the \textit{Alpes Penninæ} proceed the \textit{Alpes Rhodii}, which extend through the Grisons and the Tyrol, to the springs of the river Piave, of which a part called \textit{Alpes Tridentinae} are situated to the north of Trent. With the Rhodii are connected the \textit{Alpes Noviorii}, to the east of the former, situated about the source of the river Tajo- mento; and joining to the \textit{Alpes Carnicas} or Carnienses, extending to the springs of the Save; and moreover, these terminate in the \textit{Alpes Julii}, which reach to the source of the Kulpe. These last derive their name from Julius Caesar, who formed a design, executed after his death by Augustus, of opening a road over this mountain into Illyria, which is separated by it from Venice. This part of the Alps is also called \textit{Alpes Venetae}, and \textit{Alpes Penninæ}. Some authors have extended the Alps to the north of Da- matia, and even through Macedonia into Romani- a, and as far as the coast of the Black Sea.

The principal passages of the Alps, of which the Romans availed themselves, when they were foes masters of Italy, as they are recounted by Martiniere, are the following: The first was through the maritime Alps along the sea coast; the second by the Greek Alps, by which, according to Pliny, Hercules entered into Italy, and which, as Celsus Antipater, cited by Livy, says, was the track of Hannibal: the third by the Cottian Alps, by Embrun, Briançon and Susa, which, some say, was Hannibal's course: the fourth, more generally pursued by modern travellers, through the valley of Maurienne, by Susa and Turin: the fifth by the Penninæ.
nine Alps, which, according to Polybius and Pliny, was that of the Carthaginians, though Livy is of a different opinion; this route is divided into that of the valley of Pe-
tian, which is the broadest, and that of the valleys of Aosta
and Bardo, which is the longest; the fifth, through the
Pennine Alps by Adula, or Mount St. Gothard, and Bel-
fon; the seventh, over the Rhettian Alps, by the Lake
Verbanus and Cusino, which was the route of Drusus
and Tiberius, when they carried on the war in Rhettia, and also
of Silicho: the eighth, by which the Cimbri entered into
Italy; the ninth, by the Carnic Alps; and the tenth, by the
Julian Alps, which was the usual track of the Roman troops
into Pannonia and Illyria.

The central part of this chain of mountains, the most
tenuous and elevated of any in Europe, may be considered
as composed of two ridges, which run almost parallel from
the south-west to the north-east. The first ridge is that
of the Helvetic Alps; and its most conspicuous summits
are the Guemmi, or Twins, the Schellenhorn, the blumus,
the Geifhorn, the Jungfrau or Virginhorn, the Eigir, the
Schreckhorn, the Grimelf, the Furca, the Badar, the Glac-
iers to the north of the Rhine, and St. Gothard.

The highest mountain of the northern chain of the Alps
seems to be Jungfrau; and the next in height are the
Eiger, and the Schreckhorn, and the Finsteraar Horn.
According to Mr. Kiwanz (Geo. Ess. 212. 215.) the height
of these mountains does not exceed 10,000 feet; and he
observes, that they consist of granular, or primitive lime-
stone. Sanfurre (vol. VII. p. 193.) says, that the Schreck-
horn, and Finsteraar are about 13,218 feet high. Bourrit
informs us (vol. III. p. 194.) that the Schreckhorn is the
highest of the Swiss Alps. The summits consist of gra-
nite; and on the sides appear red slate and calcareous
masses. To the south are large defarts and glaciers, and on the north
is the romantic lake of Kandal Steig, "whence (as we
learn from a modern geographer) there is said to have been
a passage to Lauterbrunnen amidst singular glaciers, sometimes
reflecting magnificent towns of ice, with pillars, pyramids,
columns, and obelisks, reflecting to the sun the most brilli-
ant hue of the finest gems." The southern chain of the
central Alps extends from Mont Blanc, and other emi-

ences to the west, and bearing to the north-east comprises
the Great St. Bernard, Mount Maudit, Combin, Cervin,
and Mount Rosa. It traverses northward the vicinity of the lakes
Locarvon and Como, under the various denominations of Vogelberg, St. Bernardine, Splugger, Albula, Beraini, &c. and stretching into the Tyrol, terminates in the Brenner, or Rhetian Alps, on the south of the Inn,
extendimg even to Salzburg; and the first chain to the north
of that river separates Bavaria from Tyrol. This
chain of the Italian Alps, proceeding from Mount Rosa,
through the country of the Grisons to the Glaciers of Ty-
rol, and terminating in the Salzian Alps, should form the
boundary between Germany and Italy, as they pass through
the centre of Tyrol, and as the Italian Alps to the north of
the former Milanese and Venetian territories, are of com-
paratively small elevation. The highest of the Italian Alps
belong to the country of Piedmont.

"It was revered," says the modern geographer already
cited (p. 583.), "for this age of enterprise to displace the
secret wonders of the Alps. The enormous ridges clothed
with a depth of perpetual snow, often crowned with sharp
obelisks of granite, rilled by the Swiss horns or needles;
the dreadful chains of some thousand feet in perpendicular
height, over which the dauntless traveller sometimes flings
on a sheet of frozen snow; the glaciers, or seas of ice, some-
times extending 50 or 40 miles in length; the sacred
silence of the scenes before unvisited, except by the chamois
and goats of the rocks; the clouds, and sometimes the
thunder storm, falling, at a great distance below; the ex-
tensive prospects, which reduce kingdoms, as it were, to a
map; the pure elasticity of the air, exciting a kind of in-
corporal elevation; are all novelties in the history of hu-
man adventure."

From Sanfurre we learn, that the highest summits of
these mountains consist of "a large grained granite; the
mixture being white opaque felspar, pyroxil, or white semi-
transparent quartz, and mica, in small brilliant sheets, forming
what is called the white granite. The colours vary; and
sometimes hornblende, fuchor, garnets, or pyrites are inter-
spersed. The construction seems to consist of flat pyramids
of granite, standing vertically, disposed like the fruit of the
artichoke; those of the centre being most upright, while
the others bend towards them. These flat pyramids commonly
stand, like the grand chains of the Alps, in a north-
west and south-west direction. Beneath, and incumbent on
the granite, especially towards the north, appear large masses
of slate, which are followed by exterior chains of high cal-
carous mountains." For a further account of the Alps,
see Cooke's Switzerland, Sanfurre, Bourrit, and the articles
BLANC, GOTHAIRD, ROSA, &c. in this Dictionary.

ALPS, in Geography, besides its proper signification,
by which it denotes a certain chain of mountains, which sepa-
rate Italy from France and Germany, is sometimes used as
an appellation to denote any mountains of extraordinary
height. In this sense, Auonius and others called the
Pyrenean mountains, Alpes; and Gellius, the Spanish Alps,
Alpini Hispani. Sidonius gives the same appellation of Alpis
to Mount Athos. Other authors speak of Norman Alp,
Alpes Artenae, Alpes Alpaccum, Alpes Dauniae, Alpes Romanes,
Andes, Alpes Boieratrices. The Apennines are also called by
Johannes Villererus, Alpi D'Apeuni. Thus also the British
Alps denote the highest mountains in Britain; such are the
Grampian hills, Ben Nevis, and other mountains of the
Highlands in Scotland; such are Snowden, &c. in Wales,
Snowdon, Skiddaw, and Creffell, in England. To the
Alpine Alps we may refer the Alpav and Jermurian
mountains; and to the American the Alleghany and
Appalachian of North America, and the Andes of the
South.

ALPS is also used to denote pastures on the mountains,
wherein cattle are fed in the summer time; or rather in the
valleys, and spaces between the mountain tops. Some have
this to be the primary signification of the word Alp,
which is supposed by these authors literally to denote
the lights or apertures between hills.

ALPS, LOWER, Department of, is one of the four com-
posed out of the C-devant Provence, in France. It is
bounded on the north by the department of the Upper
Alps, on the east by Piedmont and the department of the
Maritime Alps, on the south by the department of the Var,
and the north-east extremity of that of the mouth of the
Rhine, and on the west by the departments of Vaucluse
and the Drome. Its chief town is Digne. Its superficies is
about 1,459,699 square acres, or 1,44,967 hectares; its popu-
lation comprehends 1,44,967 individuals; and it is divided
into five communal districts.

ALPS, UPPER, Department of, makes a part of Dauphine,
which contains three. It is bounded on the north by the
departments of Mont Blanc and Here, on the east by Pied-
mont, on the south by the department of the Lower Alp,
and on the west by that of the Drome and part of that of Here.
The chief town is Gap. Its superficies is about 1,084,614 square acres, or 553,569 hectares; its population comprehends 116,754 persons; and it is divided into three communal districts.

ALP, Maritime, department of, is formed of the country of Nice. It is bounded on the north by the Apenines and the department of the Lower Alps, on the east by the republic of Genoa, on the south by the Mediterranean, and on the west by the department of the Var and Lower Alps. Its chief town is Nice. Its superficies is about 632,619 square acres, or 322,674 hectares; its population amounts to 93,666 persons; and it is divided into three communal districts.

ALPSE, a lake of Switzerland, being a continuation of the lake of Lucern.

ALPSTÉIN, the denomination of a chain of mountains in Switzerland, which separate the canton of Appenzel from Teggenbourg, the barony of Saxo and the Rhinthal. It was formerly the limit between the country of the Rhenish or Grifins, and the landgrave of Turgovia.

ALPUERTE, a town and castle of Spain, in the kingdom of Valencia, to the west of Segorbia and the Rhinthal. It is generally situated, and the territory is fertile. N. lat. 39° 50'. W. long. 1° 6'.

ALPUXARRAS, Las, are high mountains of Spain, in the kingdom of Granada, on the coast of the Mediterranean; their summits are visible not only from Gibraltar, but from the coast of Africa, between Ceuta and Tangier, and they extend from Velez to Almeria, and are about 17 leagues in length from east to west, and 17 leagues in breadth from north to south. This canton is one of the most populous and best cultivated in Spain; it is intersected with villages, and covered with vines and other trees. It produces corn, wine, fruits, and good pasture, and also silk. The air and weather in this district are temperate and healthy. The inhabitants were originally Moors, and they are distinguished from the other Spaniards by the simplicity of their manners, the rudeness of their language, and their diligence in labour.

AQUIER, which is also called CANAR, a liquid measure for oil, used in Portugal. It contains six COLUMNOS, or CANADORS. Two Alquiers make an Almeida, or Almeido.

AQUIFIO, or ARQUIFO, as the merchants spell it, is a sort of mineral lead, very heavy, easily reduced into powder, and hard to melt. When it is broken it parts into shining scales, much like the colour of needles of antimony. The potters use it to give their work a green varnish. In England it is commonly called potter's ore. It is found in Cornwall; the potters mix manganese with it, and then the varnish, or glazing, on their wares becomes of a blackish colour.

ALQUIVITE, or CUEVETO COAST, in Geography, a part of the coast of South America, which is washed by the Pacific Ocean, extends from the Morro del Bonifacio, at the entrance of Baldia in the south distant 15 leagues to the river Imperial, on the north distant ten leagues. That on the south is the lowest and flatted land on the coast of Chili; but that to the north is higher, and in most places bold, with the exception of the fideals that run south-west from the island Mocka, north-west by west from the river Imperial. Alquivite is in S. lat. 36° 40'. W. long. 76° 50'.

ALRAMFCH, or ARAMECH, in Astronomy, the Arabic name of a star of the first magnitude, otherwise called ARCTURUS.

ALRAUPE, in Ichthyology, a name given by the Germans, to the myliodes fluviatilis, or eclipnut, a species of the Gadus.

ALRED, Alfred, or ALURED, in Biography, an ancient English historian, was born at Beverley, in Yorkshire, and educated in the university of Cambridge. Having acquired a considerable knowledge of divinity, philosophy, and history, he returned to his native country; became a regular priest, and was appointed a canon and treasurer of the church dedicated to St. John of Beverley. His "Annals," containing the history of the Britons, Saxons, and Normans, were continued to the 29th year of Henry I. and he probably died in the year 1128 or 1129. From the preface to his work it appears that he was rather poor than rich, and much devoted to his studies. His abridgment of our history, from Brutus to Henry I. is one of the most valuable pieces that has escaped the rage of time, and the indifferenct of our first reformers. It is written in a concise, elegant, Latin style, with great perspicuity, and an uncommon attention to dates and authorities; so that he may be justly regarded as our English Florus. Leland has omitted Alfred, in his collection of British writers, because he considered his work as merely an abridgment of Jevry's of Mounmouth's British History; whereas, it is not only doubtful whether Alfred ever saw Jeffrey's history, but probable, from a variety of circumstances, that this history was published after Alfred's Annals.

This work was published by Mr. Hearne, at Oxford, in 1716, from a MS. which belonged to the famous Thomas Rawlinson, Esq. under the title of "The Annals of Alured of Beverley;" and in a preface to it, Mr. Hearne has indicated the author from the charge of plagiarism, which has injured the reputation of this valuable compendium of British history. Although Huntington, Hoveden, Malmebury, and other writers have praised summaries of ancient history to the accounts they have left us of their own times, yet none of them, says a very competent judge, are to be compared, in point of accuracy or elegance, with this history, which deserves to be translated and to be continued, with the same spirit, to later times. Besides this work, which has been mentioned under different titles, Alured vrote no other, except "The History of St. John of Beverley," a collection of records, which has never been printed, but is preserved in the Cotton Library, under the title of "Libertas Ecclesiæ, S. Johannis de Beverlik," &c. .

ALRESTORD, in Geography, a town of Hampshire, situate in the road from London to Winchester on a small stream, which, by means of a large pond as a reservoir, with locks and aqueducts, was formerly navigable by barges and lighters to Southampton; but the navigation has for several centuries reached no farther than Winchester. It consists of about 200 houses, one church, and two principal streets, and has a small manufacture of linen. Its market is on Thursday. It is distant from London somewhat more than 57 miles.

ALROE, a small island of Denmark, in the bay of Hordens and prefecture of Aakir, belonging to the diocese or general government of Aarhus.

ALRUKAK, in the Materia Medica, a word used by Avicenna, and others of his nation, for what was called by the Greeks hysa blanes, or manda tharis. This was the fragments of frankincense, which were broken off from the larger pieces in the collecting or packing up, and were most esteemed in medicine, as being the drier and purer kind.
ALRUM, in the Botanical Writings of the Ancients, a name given to the tree which produces the *balsams*. This gum was originally known to be the exudation of a tree growing in Arabia and the East Indies, and well known to Avicenna, and others, and by all of them called by that name.

ALRUNES, a name given by the ancient Germans to small figures of wood, of which they made their *lakes*.

ALSA, now Ansa, in Ancient Geography, a small river of Italy, which passing by Aquileia discharged itself into the Adriatic. Near this river Constantine, the son of Constantine the Great, fighting against his brother Conflans, lost his life.

ALSACE, was before the revolution a province of France; bounded on the east by the Rhine which separated it from Swabia, on the south by Switzerland, and part of Franche Comté, on the west by Lorraine, from which it is separated by the chain of mountains called Walgau or Les Voyges, and on the north by the Palatinate of the Rhine; and comprehend between 47° 32', and 49° 8'. N. lat. and 6° 14' and 7° 24' E. long. This has been reckoned one of the most fertile and plentiful provinces in Europe, abounding in corn, wine, oil, flax, tobacco, fruits, and pulse, of various sorts, wood and excellent pasture. The part of this province that lies betwixt the rivers Ill, Haardt, and the Rhine, is of narrow extent, and less fertile than the other parts; but the district that borders upon Switzerland and Mount Saverne, and the levels about Strauburg to the Rhine, are very fruitful and agreeable, and produce abundance of grain, tobacco, culinary vegetables, saffron and hemp. The mountains towards Lorraine are high and covered with fir, beech, oak, and horn-beam. The forests of this province are numerous, and furnish great quantities of wood both for fuel and building; as well as plenty of deer and game of all kinds, and it is in general diversified with hills and vales, which render it fertile and productive. Alsace has mines of silver, copper, iron, and lead; and it has also various mineral waters and baths. Its rivers are numerous, of which the principal is the Rhine, and it has also several lakes. The number of inhabitants, who are mostly Lutherans and Roman Catholics, was formerly computed at about half a million; their common language is the German, though the French is generally understood and principally spoken by people of superior rank, and in the towns. This province was divided into Upper and Lower Alsace; the former contained 32 large and small towns, and the latter 39; and in both there are upwards of 1000 market towns and villages. By the late division of France, this province forms two departments, viz. those of the Upper and Lower Rhine, the capital of the former being Colmar, and that of the latter Strauburg.

This province was anciently inhabited by the Rauraci, Sequani and Mediomatrici. Its name first occurs in the history of France under the Merovingian kings; and it is most probably derived from the river El, or Ill, the inhabitants on the borders of which were called Elsifin, from whom the country itself was afterwards denominates Elifas, in Latin Elstia, Alstia, and Alastia. From the Celte it fell under the dominion of the Romans; from them it passed to the Germans, and after the battle of Tolbiac, or Zulbich, gained by Clovis in 496, it was possessed by the Franks. It was afterwards incorporated with the kingdom of Aquitania, and in 752 it was subject, like the rest of the monarchy, to the laws of Pepin and his successors. At the decease of Lewis Debonnaire in 840, his eldest son Lotharius obtained it, and he joined it to that part of the empire of the Franks which fell to him, and which was called the kingdom of Lotharingia or Lorraine. Lotharius II., his youngest son, inherited it; and after him in 869, it became a province of Germany, and was governed by dukes. About a century before the extinction of dukes, the provincial counts, who governed under them in Alsace, assumed the title of Landgraves, and the counties over which they presided were called Landgraves, one superior and the other inferior. In 1337, the bailiff part of the inferior Landgrave was conveyed to the bishop of Strauburg, who called himself Landgrave of Alsatia. The government of Alsatia was afterwards conferred by the emperors on several houses, till Ferdinand I. gave it to the German line of his own house; and accordingly it continued in the hands of Austria. At the peace of Munster, in 1648, the emperor ceded far over to the crown of France all right to the town of Brède, landgrave of Upper and Lower Alsatia, Sundgau, and the district of the ten united imperial cities in Alsatia, with the whole sovereignty belonging to them. By the peace of Ryswick, in 1667, the emperors and the empire ceded to France the perpetual sovereignty of the city of Strauburg, and of all its dependencies, on the left side of the Rhine.

ALSADAF, in the *Materia Medica*, a name given by Avicenna and Serapio, to the *unguis albaratus*, and also to the *mures*, or purple thistle, of the stem of which it was supposed to be a part.

ALSAHARATICA, a name used in *Botany*, by some, to signify the *parthenium*, or *erferew*.

ALSACHURC, in the *Materia Medica*, a name given by Rhazes, and some others of the old writers, to the *skyn*, a small animal of the lizard kind, formerly used in medicine as a cordial, and as a provocative to venery.

ALSCHAUSEN, or Alshausen, in *Geography*, a free imperial village of Germany in the circle of Swabia, in a commandery of the same name belonging to the Teutonic order, within the bailiwick of Alsatia and Burgundy. It has a castle which is the residence of the country commandery of this bailiwick, and it lies betwixt the dioceses of Altenf and the counties of Königsberg, and Scheer. The title of this place to jurisdiction in ecclesiastical and civil matters has been frequently contested by the Teutonic order.

ALSCHWANGEN, a town with a castle of Poland, in the duchy of Courland, and parish of Alschwang.

ALSCHENFEN, in Botany, a name used by some authors, for *wormwood*.

AL. SEGNO, in *Medici*. Thrice Italian words are used when a return is made to a former part of a movement, where this mark or character appears: *sq. as who should bay, return to this sign *sq*. This is an expedient to save the trouble of writing, or expense of printing certain portions of a movement that are to be repeated. Thus *du capo* implies that a whole strain is to be repeated from the beginning.

ALSEN, in *Geography*, an island of Denmark, situated in the lesser Belt, or entrance into the Baltic Sea, near the coast of Slefwick, to which it belongs; and separated from the main land by a narrow channel called Aisen-fund. Its extent is about six leagues in length, and two in breadth; the soil is fertile, and produces plenty of fruit, and, wheat excepted, all kinds of grain, together with large crops of 

*Botany*, a name used by some authors, for *wormwood*.
into south and north Harle, called Sonderburg and Nor- 
berg prefectures. It is about 100 miles west of Copen-
hagen.

ALSENS, a river of Germany, which runs into the Ill 
near Placentz.

ALSENS, a town of Germany, in the circle of the Upper 
Rhine, and duchy of Deux-Ponts; 28 miles west of 
Worms.

ALSENZ, a town of Germany, in the circle of the 
Upper Rhine, and principality of Nassau-Weilburg, seven 
miles south of Creutzbach, and 40 north-west of Man-
heim.

ALSFIELD, a very ancient town of Germany in the 
circle of the Upper Rhine, in Upper Hesse, in a prefe-
brate of the same name. It lies near the river Schiwalm, 
and has an old castle and two churches; and it is the first 
town in Hesse which received the confidion of Augsburg, 
being formerly more wealthy and populous than it is at present.

N lat. 50° 40'. E. long. 9° 9'.

ALSHA, a beautiful city in Buckharin, suppos'd to be 
that which is now called Tashkunt, or Tashkend.

ALSHEDA, a parish of Smaland in Sweden, where a 
gold mine was discovered in 1748.

ALSHEDT, a town of Germany, in the circle of the 
Lower Rhine, 10 miles north of Worms.

ALSIMBEL, in the Materia Medica, a name given, 
by Avicenna and others, to the spikenard of India. It 
is thus called from its having the appearance of a spike, or 
car, and also finn.APPLICATION, a word which signifies its being a 
congeries of many spikes, or ears; and such is much of the 
spiritus Indica, or Indian spikenard, that we receive at this 
day.

ALSINA, in Botany. See THEELIGONUM.

ALSINANTHEMUM. See ARENARIA.

ALSINASTRUM. See COSTUS and ELATINE.

ALSINE, formed of "Also" a grove, chickweed, Eng. 
morgellia, Fr. in Botany, a genus of the pentandria trigyna 
class and order, and of the natural order of Caryophyll: 
its characters are, that the calyx is a five-leaved perianthum, 
leaflets concurve, oblong and acuminate; the corolla has five 
equal petals, longer than the calyx; the stamina consist of 
capillary filaments, the anthers roundish; the pistil has a 
subovate gynoecium, filiform, and filigrons obtuse; the pric- 
icapium is an ovate, one-celled, three-valved capsule, cov-
ered with the calyx; the seeds are many and roundish. 
Martyn reckons three, and Gmelin five species.

1. A. media, holotome Alison of Swartz, common chickweed, 
with petals bipartite, and leaves ovate-cordate. The num-
ber of flaments in the flower of the common chickweed is 
uncertain, from three to ten. This species in different 
ofiils and situations assumes different appearances; but it is dis-
tinguished from the cerasifera, which it most resembles, 
by the number of pistils, and by having the petals shorter 
than the leaves of the calyx, and from all the plants related to 
it, and particularly the stellaria nemorum, by having the 
flame alternately hairy on one side only. Dr. Withering 
refers it to the stellaria, with which genus it agrees in 
various respects, and especially in the capsules opening 
with six valves. He observes, that it grows almost in all 
situations from damp and almost boggy woods, to the driest 
and gravel walks in gardens; but in these various flates its ap-
pearance are very different, so that those who have only 
taken notice of it as garden chicken-weed would hardly 
know it in woods, where it sometimes exceeds half a yard 
in height, and has leaves near two inches long, and more 
than one inch broad. In its truly wild state, he says, in 
damp woods, and hedge bottoms with a northern aspect, it 
has almost always ten flaments; but in drier soils and more 
funny exposures, the flaments are usually five or three. Dr. 
Smith (Flor. Brit. vol. ii. p. 473) also refers it to the 
genus stellaria, and characterizes it under the species of 
stellaria media, with ovated leaves and pendunc-
emente, having the lateral line alternately hairy. 
When the flowers first open, the peduncles are upright; as 
the flowers go off, they hang down; and when the seeds 
ripen, they again become upright. Dr. Withering observes, 
that the flowers are upright, and open from nine in the 
morning till noon; but if it rains, they do not open. After 
rain they become pendent; but, in the course of a few 
days, rise again. In gardens or dunghills chickweed sheds 
abundance of seeds, which are round, compressed, yellow 
and rough, with little tubercles; and thus becomes a trou-
blesome weed; but if it be not suffered to seed, it may be 
destroyed, as it is annual, without much trouble. This 
species is a remarkable instance of the deep of plants; for 
every night the leaves approach in pairs, including within 
their upper surfaces the tender rudiments of the new flower; 
and the uppermost pair but one, at the end of the flake, 
is furnished with longer leaf-flakes than the others, so 
that they can close upon the terminating pair, and protect 
the end of the branch. The young flouts and leaves, when 
boiled, can scarcely be distinguished from Spinach, and 
are equally wholesome. Swine are very fond of it; 
cows and horses eat it; sheep are indifferent to it; and 
goats refuse it. It is a grateful food to small birds and 
young chickens. For medical purposes this herb was for-
erally employed in cataplams against inflammations; and 
its expressed juice, or decoction, given also internally, as an 
apertensive, antiphlogistic, and a restorative, probably for 
abating hectic heats, in astrophies and con-
fumptions. The virtues ascribed to it, says Dr. Lewis, do 
not appear to be wholly without foundation; though its 
active matter is so far divided and diluted in the herb, as 
sparingly to manifest itself till separated from the grocer 
parts. This plant is found wild in most parts of the world. 
It is annual, and flowers almost throughout the year.

2. A. vegetalis, with entire petals, and awl-shaped leaves. 
This, according to La Chenal in Hall. helv. is the fame 
with the ARENARIA transilvis. It is annual, and grows 
about Paris and in Piedmont. 

3. A. mucronata, with entire, short petals, flatish leaves 
and awned calyces. This is a native of France and Switzerland, and introduced 
to KEW GARDEN, in 1777, by Dr. Gounin. 

4. A. perforata, with oblong leaves, and dichotomous 
prostrate flake. Fork. 

5. A. graminifolia, with lanceolate, 
rigid, hairy leaves, and erect three-flowered flake.

ALSIAT, in the Mahometan THEOLOGY, a bridge laid 
over the middle of hell, finer than a hair, and sharper than 
the
the edge of a sword, over which the people are to pass, after their trial on the day of judgment.

To add to the difficulty of the passage, Mahomet affirms, that the avtar, narrow as it is, is beset with briars and thorns; none of which, however, will be any impediment to the good, who shall fly over it like the wind; Mahomet and his Mussulmen lead the way; whereas the wicked, by the narrowness of the path, the entangling of the thorns, and extinction of the light, which directed the former to paradise, will soon miscarry their footing, and tumble headlong into hell, which is gaping beneath to receive them. See Sale's Prelim. Dis. to Koran, sec. iv. p. 90. See Mahometans.

ALSIZT, in Geography, a river of the Netherlands, which pales by the city of Luxemburg, and runs into the Sour near Diezich.

ALSIUM, in Ancient Geography, a city of Italy in Etruria, occupying, according to Plutarch, the spot where Palo now stands. If it was built by the Aborigines long before the Tyrhenians invaded Italy, as we are informed by Dionyfus Halicarn. it must have been founded not long after the dispersion in the days of Peleg. Silius Italicus (lib. viii. v. 475.) refers its origin to the Trojan times, and says, that it was built by Alcis, the friend of Agamemon; but some have conjectured, that Alcis or Alfa, its founder, was Elipha, the son of Java, mentioned in Scripture. Velercius Paternicus (lib. i. c. 14.) relates, that it became a Roman colony, towards the end of the first Punic war. It was situated 18 miles from Portus Augusti, and south-east of Carth.

ALSLEBEN, in Geography, a town in Saxony, in the circle of Upper Saxony and the principality of Anhalt-Dessau, and in the bailiwick of Great Alsfien, which has a princely palace built in 1666; nine miles south-west of Bernburg. N. lat. 51° 38'. W. long. 11° 29'.

Alsleben is also a small town of Germany, in the circle of Lower Saxony and principality of Magdeburg, and in the bailiwick of Alsfien, situate on the Saale, and consist of 168 houses. The revenues of the collegiate church have been transferred to the cathedral of Magdeburg. The old village of Alsfien lies by near the town walls as to seem to be a suburb of it. It is 22 miles south of Magdeburg.

ALSO-SAYO, a town of Hungary, in the Csehasszéf of Somor, situate on the banks of the Saale. A quantity of cinnabar is dug in its neighbourhood.

ALSO-DANY, a small town of Hungary, in the district of Ofzlan and Rewischtye jurisdiction, to which belongs a mineral water.

ALSO, Anthony, in Biography, an English poet and divine, was educated at Westminster school, and from thence elected to Christ-church college, Oxford. He was soon after his admission to the university distinguished by Dr. Aldrich, and published "Fabularum Aesopica- rum delectus." Oxon. 1698, 8vo. with a preface, in which he took part with Mr. Boyle in the dispute between him and Dr. Bentley. He passed through the gradation of offices to that of canon at the college with reputation, and had the care of several of the principal noblemen and gentlemen of the society; and in this situation he continued, till Sir Jonathan Trelawny, bishop of Winchester, appointed him his chaplain; and soon after gave him a prebend in his own cathedral, together with the rectory of Brightwell in Berks, from which no solicitations to a higher station could induce him to remove. In 1717 he was called in an action for the breach of a contract of marriage, with 2000l. damages; and on this occasion he left the kingdom. The duration of his exile is not ascertained. But his death, which happened in 1726, was occasioned by his falling into a ditch near his garden door. A part of his was published in 1753 by Sir Francis Bernard, under the title of "Antonii Alsiæ, sive Chralii Olarii Aesopicae fabulae." Four English poems, by Aslop, are in Dilly's collection, one in Peach's, several in the early volumes of the Gentleman's Magazine, and some in the Student. He was a pleasant and instructive companion, and not rigidly restrained by the forms of his profession. Mr. Allop is respectfully mentioned by the factious Dr. King of the Commons, (vol. ii. p. 295) as having enriched the commonwealth of learning by "Translation of Fables from Greek, Hebrew, and Arabic," and no less contemned by Dr. Bentley, under the name of "Tony Allop, a late editor of the Aesopian Fables." Biog. Dict.

ALSO, Vincent, an English nonconformist divine, was born in Northamptonshire, and educated at St. John's college, Cambridge, where he took the degree of master of arts. Having taken decan's orders, he settled at Oakharn in Rutlandshire, as assistant in the free-school. Having imbibed the principles of nonconformity, he was ordained among the presbyterians, and exercised his ministry at Waltham, in Northamptonshire, whence he was ejected in 1662. After this event he preach occasionally, and was imprisoned six months for praying with a sick person. Being known to the world by a book which he wrote in an admirable style against Dr. Sherlock, he was invited to settle with a congregation of presbyterians in Westminister; and in this situation he fortunately escaped fines and imprisonment, because his christian name, which he studiously concealed, was not known to the informers. At the commencement of the reign of James II. Mr. Allop's son engaged in treasonable practices, and obtained the king's pardon; and this act of clemency seems to have attached the father to the royal interest. In the address which was presented to the king for his general indulgence, and which is supposed to have been written by Mr. Allop, he intreats his Majesty to believe, "that loyalty is not entailed to a party," and professes for himself and his brethren, their gratitude and good wishes; to address the king replied, that he was happy in observing two good effects of his declaration, the clemency and patience of his subjects, and rejoining to God the empire over his confidences; adding, "it has been my judgment a long time, that none has, or ought to have any power over the conference but God;" and expressing his hope, "to live to see the day, when you shall as well have Magna Charta for the liberty of confidences, as you have had for your properties:" closing with this admonition: "and now, gentlemen, do you so preach to your hearers, as they may be good Christians, and then I do not question but they will be good subjects." After the revolution, Mr. Allop, though he retained a grateful respect for the memory of king James, became zealous attached to the government and interest of king William. He lived to an advanced age, and died on the 8th of May 1733. It is said, that though on grave subjects he wrote with a becoming seriousness, yet when wit might be properly shewn, he displayed it to great advantage. To this purpose we are referred to his "Antiforza," in vindication of some great truths opposed by Dr. William Sherlock," Svo. 1675. He also wrote, "Melius Inquirendum," in answer to Dr. Goodman's "Compassionate Inquiry," Svo. 1679; "The Mitchief of Impostures," in answer to Dr. Stillinge's "Mitchief of Separation," 1682, with several single sermons. Biog. Brit.
ALSTADT, in Geography, a town of Prussia, in the Oberland, near Prejutmark.

ALSTEDIUS, John Henry, in Biography, a German Protestant divine, and one of the most voluminous writers of the 17th century. He was born about the year 1588, and was for some time professor of theology and philosophy at Herborn, in the county of Nassau, and afterwards at Alba Julia, in Transylvania, where he died in 1648. He was one of the divines that attended at the Synod of Dort. He was an industrious compiler of systems of sciences. His principal work is his "Encyclopaedia," printed at Lyons in two volumes, folio, in 1649. Vossius speaks with commendation of that part which comprehends arithmetic. His "Theophrastus Chronologicus," has passed through several editions. His "Triumphus Biblicus," was written with a view of shewing, that all arts and sciences may be deduced from the Bible. His "Theologia Polemica," was answered by Himmelius, divinity professor at Lena. His other works are "Philosophia refutata," "Elementa Mathematica," "Methodus formandorum Studiorum," printed at Strasburg in 4to. in 1610; "Templum Mucicum, or Musical Synopsis," which is so formal as to resemble a logical rather than a musical treatise; and a treatise, "De Mille Annis," published in 1627, in which he maintains the Millenarian doctrine, or that of Christ's reign on earth for 1000 years, and fixes the commencement of this reign in 1694. The character of this writer has been well comprised in a single anagrammatic word, "Sedulitas." Gen. Dict.

ALSTER, in Geography, a river of Germany, which runs into the Elbe near Hamburg. It passes through the city, and forms a lake nearly half an English mile in circumference, which in summer evenings is covered with all sorts of pleasure-boats, affording to the spectators a very amusing spectacle.

ALSTON, Charles, (M.D.) in Biography, a botanical and medical writer, was born in the western parts of Scotland in the year 1683. He early applied himself to the study of botany, and opposed, with considerable ingenuity, the sexual system of Linnaeus. When 35 years of age, he went to Leyden, and studied three years under Boerhaave. Returning thence with his friend Alexander Mono, he was materially instrumental in establishing a school of medicine in the College at Edinburgh, of which he was appointed professor of botany and the materia medica. In this post he continued to the time of his death, Nov. 1760.

In the fifth volume of the Edinburgh Med. Essays, we have a short paper by Alston on the efficacy of the powder of tin in destroying or expelling worms from the bowels. He obtained the prescription, he says, of an empiric, who was famed for his skill in curing persons afflicted with those noxious insects. One ounce of tin, reduced to powder, and mixed with treacle, was given the first morning, and half an ounce each of the two following mornings; the patients were then purged with the infusion of fennel and manna. He speaks highly of the efficacy of this medicine, which has certainly considerable powers in these cases, and may be given to the most delicate subjects with perfect safety. His dissertation on the sexes of plants, in which he combats the doctrine of Linnaeus, was published in the year 1773, in the first volume of the Edinburgh Physical and Literary Essays. But the work principally calculated to secure his fame with posterity, is his Lectures on the Materia Medica, which was published in the year 1779, in two volumes, 4to. by his friend and successor in the professor's chair, Dr. John Hope. Although considerable additions and improvements have been since made in this branch of science, yet this work will be always held in esteem for the number of curious and useful facts it contains. Haller Bibliotheca Botan.

ALSTON-MOOR, or ALSTONE, in Geography, a town of Cumberland, situate on a hill near the river Trye, on the borders of Northumberland. The parish is small; but on account of the lead-mines in its neighbourhood very populous. The lands are part of the forfeited estates of the earl of Derwentwater, and are held on lease, granted for a thousand years, under the governors of Greenwich hospital. The market is plentiful, and held on Saturday. The distance from London by Bernard castle is 271, and by Pershith 302 miles. N. lat. 54° 45', W. long. 2° 4'.
beautifullu tained and veined with pur pleaed red; it flowers from June to October; and was introduced into Kew gar- den, in 1753, by Meinsh. Kennedy and Lee. 2. A. pul-

ebella, with erect stem, reflex-spreading and acute corolla, pedicel leaves, and pedicles shorter than the involucre. This plant resembles the former in its structure and habit, but the leaves are narrower, and the Item terminated by an irregular involucre of larger pedicels leaves: the pedicels naked and more flored, flowers four or five rather nodding; the petals alternately less, white, red at the tip, streaked, or dotted with red at the base, filaments yellow, pistil red, and stigma trifid. This species is a native of South America.

5. A. Ligu, striped-flowered A. with erect stem, spatulate-oblong leaves, pedicels of the umbel longer than the involucre, and two-lipped corolla. The barren items are clothed with awl-shaped leaves, and terminated by spatulate-oblong leaves, placed in a kind of rofe; the florescent Item clothed with awl-shaped leaves, the pedicels few and naked; the three upper petals of the corolla larger, white, dotted at the base, and spotted at the tip with red, the three lower ones shorter and red; the filaments longer than the lower petals, rugged, the anthers twin yellow; the pistil red. This plant, which is a native of Lima, is remarkable for the largenee of its flowers, and for their fragarancy, scarcely inferior to nigromatte; it flowers in February and March, and was introduced here about 1776 by John Brown, Esq. 4. A. Saffilia, with twining stem, petiolate, lanceolate, acuminate leaves, branching umbel, pedicels longer than the involucre, bracted and fole. The leaves are nervele, petirole, the involucre many-leaved, awl-shape, and reflex, the pedicels few, elongated, fullaining one or two flowers, the outer petals red, and the inner greenish. This is a native of Lima. 5. A. multiflora, with twining stem, petiolate, lanceolate, and acuminate leaves, simple umbel, pedicels shorter than the bracts, and petals alternate and truncate. This species resembles the leaf in habit and structure; but the petals are wrinkled at the edge, and the umbel is not petiolated, the many-flowered involucre consists of broader leaves, and the pedicels are simple and naked; the three outer petals are shorter, narrower, and entire, the inner truncate or emarginate, with a point; the colour is unknown. It is a native of South America.

6. A. ovata, with twining stem, lanceolate leaves, lan- 
guiofe on the upper surface, hissed on the lower, and corolla tubular; or, according to Willdenow, with twining Item, petiolate, elliptic, acuminate leaves, above villos, ramose umbel, bracteate loose pedicels, longer than the involucre, and bell-shaped corolla. The Item, twining contrary to the sun, is slender, and three feet high, the leaves are alternate and selile, the flowers terminate in umbels, the petals approximate into a tube, ovate-oblong, the three outer feaclet, green at the tip, the three inner green, flatted towards the top, and variegated with black dots; the flaments are fixed to the germ near the base of the petals, antlers ovate and brown; germ green without, marked with thin longitudinal grooves, and terminated with thin small notches, fleshy subulate, ligulas sharp, capitate globular, an inch in diameter, fesse-cooped, fesse-notched at the edge. This species differs from the former in its woolly leaves, and tubulose flowers. It is a native of Peru.

All these are stowe-plants, and may be propagated by parting the roots in Autumn. The firt is more hardly than the third, and may be treated as a green-houde plant, but it will flower and ripen its seeds better under the glass of a hot- 
bed frame, freely admitting air: it is more ufually raised from seeds sown in the Spring in a pot of light earth, on a
gentle hot-bed, either of dung or man. Curtis Mag. Mar-
tyn's Miller.

ALTGEN, in Geography, a lake of Sweden, in the province of Halland, from which the river FALSKENBERG rises, and by which river it communicates with the sea.

ALSWAN, a town of Poland, in the duchy of Courland, four leagues west of Gdines.

ALSWENDE, a district of the prefecture of Reine-
berg, in the principality of Minden, in Westphalia, con- 
ining of five parishes, the inhabitants of which are employed in agriculture and the breeding of cattle.

ALSZA, a small place in Hungary, belonging to a tribe of Turks, between the Neper and Black Sea.

ALT, a river of England, which runs into the Irish sea, 7 miles west of Omskirk, in the county of Lancashire.

Alt, formed of altus, high, in Moffi, a term applied to the high notes in the scala. See also NIGERIUM.

ALTE-BUNZLAI, Bohemia, in Geography, a town of Bohemia, in the circle of Bunzlau, or Bolebbleau, founded by Wrathlau in 915, and improved by his son Bolebleau the Cruel in 937, but reduced by the troubles in the 11th and 16th centuries to an inconsiderable place. The collegiate church of St. Cofinus and Damian is very ancient.

ALT-CLAIFFER, a town of Germany, in the circle ofLower Saxony and duchy of Brunswick, 12 miles south-southwest of Stade.

ALT-RAINSTADT, or Old-Rainstade, a small town of parish village of Germany, in the circle of Leipjig, two leagues from Leipjig, famous for a treaty concluded in 1766 between Charles XII. of Sweden, and Augustus II. king of Poland; and for the repudiation of the Imperial pleni- 

tentency, Count Wratjillau, in 1797, on account of the religious freedom of the Protestant inhabitants of the duchy of Silesia.

ALTA, a town of Sweden, in Helsingland, on the fron-
tiers of Geftrieia.

ALTEBA, in Ancient Geography, a place of Africa, in Numidia.

ALTAI, or ALTAN mountains, in Geography, are a chain of mountains in the northern part of Asia, ranking among the most extensive on the globe, and vying in length even with the Andes of South America, which extends from about the 70th to the 140th degree of longitude from London, or about 5000 miles. The several ridges and branches of this immense chain of mountains are distinguished by different appellations, under which they will be noticed in the course of this work. The Altay mountains are called by the Chinese Altair-alin, and Chin-hall, which signifies the Gold Mount. They are divided into the Great and the Lesser Altay. The former separates the Mongolian Tartary from the empire of the Soongor and Kalmucks, and a small part of Bokharia toward the west. This range proceeds in various windings toward the north-north-west, throwing out several considerable ridges, between which are the main sources of the Yenisei, Oby, and Irtil, through Soongoria to the north-north-west, where they enter in conjunction with the Lesser Altay. The Lesser Altay separates Soongoria from the government of Kaltyjan, through which the abovementioned rivers pursue their course over a great extent of country. The great chain of the Altay mountains commences with Bokho, one of its highest points, passes over the sources of the Irtil, northward between that and the lake Teletzko-Ozer, unites beyond the Yenisei with the SYAN mountains and those of BAIKAL, and in Dauria with the Argulian or KEDHINSKOI mountains, fixing the limits between Si-

5 P 2
beria and the Chinese empire from the Irifi to the Amur, and runs on, with divergent branches, to the mountains of Okhotsk, and to those of Kantschatka, and of the Kurile and Aleutian islands, terminating in the promontories and rocky shores of Cape Tschutschski, the boundary of Asia; unless we suppose the mountainous and rocky island of Kurile and Japan connected with the mountains which reach from Tibet to China. The portion of the Altay mountains that properly belongs to Russia, may be distributed into two parts; one from the Irifi to the lake Teletzkoi and the head of the river Abakan, is properly the Leffer Altay, or Khrebet Khalta, and the other, from the Abakan to the Yenifi, is called Sabinskoy Khrebet. In the former are the greatest elevations of the Kolhyvanian, and in the latter those of the Kufnitzkoj mountains; and these form the basis of all the ribs or ridges that shoot out to the north-west and to the north, which at last lose themselves towards the Icy or Frozen Ocean in extensive plains; while toward the south they still continue to soar to an uncommon height over a long and broad extent of territory. In the midst of these lofty mountains, says Dr. Pallis, and on the frontier line between the Soongorians and Mongolian deferts, Bogdo-Dola, or Bogdo-Alim, g. d. the Almighty Mount, so eminently famous among all these nations, lifts its pointed heads; which, if not one of the highest, is yet, by its craggy, steep, and irregular form, with the appearance of having been thrown up by some violent agitation of the earth, the most striking of the elevated mountains of this region. North-west from it the principal mountain as far as Altain-Kul, or Teletkoi-Ozero, is called the Golden Mountain. Eastward towards Mongolia, more to the south, runs a large mountain Chgang, and southwards a snow mountain Mussift, which connects either with the Tibetan, or with the northerly mountains in India. To the west the chief mountain throws out an arm, mostly bare of forests, and fluted, as it were, with rocks, called Allakoon, i. e. the chequered mountain, by the Tartars Ala-Tau, which joins with the Kirghizian Alginsko-Sirt. The Great Altay mountains are properly connected, as we have already observed, with the mountains of Tibet by the Mussift, or by other chains; for all the deferts between Siberia and India, and the caffren Bukharia, are merely alternate hills and plains, and very rocky. Besides, it is evident that the Altay mountains must make an uninterrupted partition between the Western Steppes and the eastern regions, because the Stepp animals, particularly the antelopes or Steppgeest, run the mountains, and even in Asia go no further than to the western range of the Altas, and are come from it northwards to the woody regions of the Oby. The snow-mountain, which appears northwards on the Siberian frontiers from the Irifi to the Bukarma and the Katunia, and quite into the angle formed by the rivers Ira and Belaia, which flow into the Tifirh, is, as it were, a branch or nook of the Great Altas, and is by some usually called the Little Altay, and darts its stupendous pinnacles above the clouds. This mountain is bold and steep, and appears, especially in the vale where the Ira unites with the Tegur, like a towering wall, behind which the mountains rise higher by irregular gradations, and at last strike up in separate points. The fame steep vale parts the Schilfoc site mountain from the Chalkstone mountain, which spreads from hence northwards between the Ira and the Loktefka quite to the Tifirh. Over the Schilfoc site mountain the snowy summits rise conically out of a granite mixed with schord and mica. The fame granite shews itself again in chalky promontories, with the schiltus lying upon it, and forms the Revnoa Sepka, as it is called, at the fame time, in the bofon of the chalky mountains, the still more elevated Sinaia Sepka. Granite appears likewise throughout in low, rocky, craggy mounts and sngle cliffs, between the rivers Ubo and Alay, where the mountain has already deep towards the plain, and likewise about the lake Kolhyvan. The rich ore-mountain of Kolhyvan places itself immediately between and about this granite-flock, and thence arises an apparent confusion in the strata through the whole of the ore-mountain.

The principal part of the Altay mountains that belongs to Russia is the range of Kolhyvan, or the proper ore-mountains of Altay; and these may be arranged into the Kolhyvon-vorobienko, the Korsolinksio, the Alaiskian, the Oubinsko, the Bukraminsko, the Teletskoi, and the Tsiariskoi mountains. The second range of the Altay mountains belonging to Russia, or the Kufnitzkoj mountains, is still almost unknown and inaccessible. Its two subdivisions are the Kufnitzkoj proper and the Krafnoyarskoj mountains, which together fill the whole large space between the Oby and the Yenifi. The summits of these mountains, between the sources of the Tom and the Yen, and on the Mafs, are covered with perpetual snow. Their inward constitution is not accurately ascertained; but various sorts of granite, porphyry, jasper, breccia, fafine chalkstone, marble with fche-flies, hornstone, flate, serpentine, mountain-crystal, chloride and cornelians are brought from hence. On the Kondoma are productive iron-mines; about the source of the Tshumith the Salshirfkoj silver-mines continue to be worked with fanguine expectations; and at Krafnoyarski several copper-mines were formerly worked, but are now abandoned. In the last-mentioned circle is also an establishment for fencing iron ore. The highest mountains to the south are about the source of the Abakan, where the famous mount Sabin, or Shabina Dabalin raises its snowy head to a stupendous height, and the Item on the borders of the brook Shantigiy.

The greater part of the Altay mountains is more bold than woody. The largest forests are in the low country about the Alay, the Oby, and the Yenifi. The species of wood are the pinus sylvestris, the birch, the alpin, the pinus picea, the pinus abies, the alder, the willow, noble larch-trees, (pinus larix) and cedars. The principal rivers of these mountains are the Irifi, and its collateral streams the Bukarma, the Ulba, and the Uba; the Oby, with its main rivers, the Alay, the Tifirh, the Tshumith, the Tom, the Katunia, the Yen, and the Abakan, which falls into the Yenifi. The upper regions of these mountains are uncommonly exuberant in waters.

The Altayan mountains contain rich gold and silver shafts, and also veins of lead, copper, and iron, impregnated with gold and silver. The most important silver mines in these mountains are those of Kolhyvan. The copper-mine is also considerable; besides which the cupriferous silver ore yields a quantity of copper, the whole amounting to about 15,000 pood a year. In 1782 there were coined here...
ALT

18,793 pound of copper. We have before mentioned the iron smelting-house of this mountain. In the Altay there are neither markets for provisions, nor any tradesmen and mechanics; and therefore the miner must provide himself with all necessaries, which he is enabled to do by means of the numerous court and church holidays, on which he is released from public labour. With this view the first object of his attention is to have a small house, with a garden and a cow-yard. When new shafts are opened, he makes a shift at first with a hovel constructed with a few stakes, and covered with sods, or he digs an habitation and a baking oven in the earth; when he has the prospect of being stationary, he erects a regular house to which he brings his cattle and his little property. Hence it often happens, that within forests apparently the most inaccessible, or in wild and dreary fuppen, whole streets and villages spring up in a few years. The miners of the Altay are generally very ingenious and industrious; and they are excellent hunters, expert horsemen, and in case of necessity, the best soldiers. Tooke’s View of Ruflia, vol. i. p. 118, &c. Vol. iii. § 10.

ALTAL, a small district in the south-west part of Corfica.

ALTAMIRA, a village of Spain in Gallicia, on the river Tamara, which gives title to an earl and grandee of Spain, five leagues west of St. Jago de Compostella.

ALTAMONT, or Altomonte, a town of Italy, in the kingdom of Naples, and province of Calabria Citra, near which are gold and silver mines, 10 miles south-west from Caffano.

ALTAMURÁ, a town of Naples, in the province of Bari, at the foot of the Apennines, six miles north-east from Gravina.

ALTANUM, in Ancient Geography, a town of Italy, in the part of Magna Græcia, called Bruttium, situate on the eastern side, south of the gulf of Seylaccen, and north of Locri.

ALTÀO, a town of Africa in Mauritanian Caesariana, according to Ptolemy.

ALTAR, Altare, Ara, a place or pile whereon to offer sacrifice to some deity.

Altars are, without doubt, as ancient as sacrifices; and consequently their origin is not much later than that of the world. Gen. c. iv. Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some remove them as far back as Adam, whose altar is much spoken of by Jewish and even Christian writers. Others are contented to make the patriarch Enoch the first who consecrated a public altar. Be this as it will, the earliest altars, of which we find any express testimony, are those of Noah, (Gen. viii. 20.) and of Abraham, (Gen. xii. 7.) In the patriarchal times altars were formed of rude materials, and they were of almost inconstant construction, and temporary, appropriated to the purpose for which they were designed. The altar which Jacob set up at Bethel was merely the stone on which he reited, Gen. xx. 8. Such was also the altar of Gideon, Judges vi.; and the first altar which Moses erected by the command of God was made of earth. Exod. xx. 24.

The principal altars of the Jews were the altar of incense, the altar of burnt-offerings, and the altar or table of shew-bread.

The altar of incense described, Exodus xxx. 1-10., was made of shittim wood, and overlaid with gold. It was one cubit square, and two cubits high, with an ornament of gold like a carved moulding round the top of it. It was carried by two bars of the same wood, covered with gold, and passing through four golden rings. Its use was for burning incense every morning and evening; and it was also to be sprinkled with the blood of the sacrifices that were offered for the sins of ignorance, committed either by particular persons, or by the people in general. See Miscellany. Plate I.

The altar of burnt-offerings, described Exodus xxvii. and xxviii., was placed towards the east end of the court, fronting the entrance of the tabernacle, and at such a convenient distance from it, that the smoke of the fire which was constantly burning on the altar might not fully the furniture within the tabernacle. Its dimensions were five cubits, or about 9 feet square, and three cubits, or about five and a half feet high. It was made of shittim wood plated over with brass, and it had four brass rings, through which were put two bars, by which it was carried on the shoulders of the priests. It had four horns at the four corners; but critics have been divided as to the form and use of these appendages to this altar as well as to the former. Some have supposed that they were mere ornaments resembling the rays of the sun; the term translated horn signifies also a ray of light. Others imagine that the corners of the altars were in shape like the horns of an ox or ram, &c., that they served for the altar of incense to move and carry it about with the greater ease and readiness; and with respect to this larger altar, for tying the victims to them, according to the allusion of the Psalmist, Psalm xxviii. 27. Michaelis underfoot by the horns merely the corners, but this interpretation is inapplicable with the context. They were evidently projections from the corners; the text, however, does not inform us whether they were upright, oblique or curved. Spencer, Le Clerc, Witsius, and others, think that they were really horn-shaped, like those of the ara pacis of the Romans. Josephus says so expressly of the altars in his time: υποβάθριας ἀγαθήν ἐνακοφίη. De Bell. Jud. lib. iv. c. 5. n. 6. p. 324. ed. Haverc. The fire of this altar was kept upon a square grate, suspended by rings at the corners, and possibly by chains in the cavity of the altar. The dimensions of this grate might be about five feet square; and six inches being allowed for the thickness of the sides, there would be a space of about 1 foot between the grate and the altar on every side, which would be sufficient to prevent the wooden sides from being damaged by the fire. The fire on this altar was considered as sacred, having first descended upon it from heaven. Lev. ix. 44. It was therefore to be kept constantly burning, and never to go out. Lev. vi. 13. From hence probably the Chaldeans and Persians borrowed their notion of the sacred fire, which they preferred with religious care and attention; a custom which afterwards passed from them to the Greeks and Romans. This altar was beaten down and destroyed by the Babylonians at the burning of the temple, but it was replaced on the return of the Jews from captivity. Ezra iii. 3. It was now a large pile built of unhewn stone, 32 cubits (i. e. 48 feet) square at the bottom, and gradually decreasing to the top or hearth, which was a square of 32 cubits, and one cubit high, made of solid bruts, and hence called the brazen altar; for it is not to be imagined that it was all made of solid bruts. The ascent up to the altar was by a gentle rising on the south side, called the Kibbeh, 32 cubits in length, and 16 in breadth, and landed upon the upper benches in next the hearth or the top of the altar. Prideaux’s Cont. vol. i. p. 199. See Miscellany. Plate I.

The altar or table of shew-bread, described, Exod. xxv. 23-30., was made of the same sort of wood with the altar of incense, and, like that, overlaid and ornamented with gold. Its dimensions were two cubits long, one broad, and one and a half high. It had a golden border, crown, or rim round it;
altars" to a kind of tables occasionally raised in the country or field, on which sacrifices were offered to God. Thus we often read, that in such and such a place an altar was built to the Lord.

The altars of the Heathens were at first made of turf; they were afterwards made of stone, marble, wood, and even of horn, as that of Apollo in Delos. Before temples were in use altars were erected in groves, in the highways, and on the tops of mountains; and it was customary to engrave upon them the name or attribute of the deity to whom they were consecrated. Altars were also of different kinds with regard to their qualities, the uses to which they were applied, and the objects to which they were appropriated. Accordingly we read of altars sacred to gods, heroes, virtues, vices, disasters, &c. and of inner and outer, stationary and portable, public and private altars. They differed also in their figure, which was round, square, or triangular. All of them were turned towards the east, and generally adorned with sculpture, bauco-relievo, and inscriptions, expressing the gods to whom they were appropriated, or representing their distinguishing symbols. For a specimen of pagan altars, see Miscellany. Plate 1. N° 1, represents an altar dedicated to Neptune, a Trident, and two dolphins, the attributes of this deity being exhibited on its sides. N° 2, is a square altar, dedicated to Neptune, as the inscription informs us. N° 3, exhibits a Bacchus with a thyrsus in his hand, which shews that the altar was erected to Bacchus; with two other sides it appeared triangular. Each side of N° 4, which was triangular, exhibited a genius, one of whom is seen carrying an ear upon his neck, which shews that it belonged to Neptune. N° 5, with the inscription "Ara Neptuni," is of a round figure; the god is represented wholly naked, preserving the pallium on his shoulder, and holding in his left hand a cithara, and in his right a dolphin.

Altars differed also in their height as well as in their figure and the materials of which they were formed. According to Servius, in Virg. Eccl. v. 66. "En ii. 515." those altars let apart for the honour of the celestial gods, and gods of the higher class, were placed on some pretty tall pile of building, as the altar of Olympian Jupiter, which was nearly 22 feet high; and for that reason were called altares, from the word alta and ara, a high elevated altar. Those appointed for the terrestrial gods were laid on the surface of the earth, and called ara—and, on the contrary, they dug into the earth, and opened a pit for those of the infernal gods, which they called subna and xanxus, feroculic. But this distinction is not everywhere observed; the best authors frequently use ara as a general word, under which are included the altars of the celestial and infernal, as well as those of the terrestrial gods. Witweus Virgil, Eccl. v.

"—En quattor aras."

Where ara plainly includes altares; for whatever we make of Daphnis, Phoebus was certainly a celestial god. See Cicero, pro Quint. "Aras delubraceae Hectates in Grecia vidimus." In the great temples of ancient Rome there were commonly three altars. The first was placed in the sanctuary at the foot of the statue of the divinity, upon which incense was burned, and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offering and the sacred vessels.

The Greeks also distinguished two sorts of altars; that whereof they sacrificed to the gods, was called xanxus, and was a real altar different from the other, whereon they sacrificed to the heroes, which was smaller, and called xanxus. Pollux makes this distinction of altar in his Onomasticon: he adds, however, that some poets used the word xanxus, for the altar wherein sacrifice was offered to the gods. The ancient version does sometimes also use the word xanxus, for a sort of little low altar, which may be expressed in Latin by epulacium; being a hearth rather than an altar. The ympius, instead of altars, had xanxus, caves, in which adoration was paid to them.

Altars and temples afforded an asylum or place of refuge for malefactors, and criminals of all descriptions among the Jews, Greeks, and Romans; chiefly to slaves, from the cruelty of their masters, to insolvent debtors and criminals, where it was reckoned impious to touch them, and whence it was unlawful to drag them; but they sometimes kindled fire round the place, or flung up the temple and unmolested it. Hence "ara" is put for "refugium." Ovid, Trist. iv. 5. 2. The altars of the ancient Heathens, as well as those of the gods, were adorned with horns, to which the victims were fastened, and criminals who fled for refuge to the altar had hold of the horns. The ancients also, on solemn occasions, as in making alliances, and confirming treaties of peace, swore upon and by them. For classical authorities to these several facts, see Adam's Rom. Ant. p. 327. Harwood's Grecian Ant. p. 150, &c.

The altar, bearing an inscription, "To the unknown God," found by the Apostle Paul, at Athens, and mentioned, Acts xvii. 23, has occasioned some difficulty to biblical critics. Jerome supposes, that the inscription on this altar was not, as St. Paul quotes it, "To the unknown God," but, "To the gods of Asia, and Europe and Africa, unknown and strange gods," and that the apostle has not quoted the inscription exactly, but dexterously applied it to his own purpose. Theophylact and Oecumenius are also of opinion that the inscription was "To gods," &c. in the plural number. On the other hand, Chrysostom and Hilire of Peliumus affect, that the inscription was in the singular number, as St. Paul quotes it. Learned moderns, as well as ancient Christian writers, have entertained different opinions on this subject. Le Clerc says, that though the inscription was in the plural number, St. Paul was in the right to allude it in the singular number. The occasion on which this altar was erected, is thus related by Dio- neces Laertius (in Epigen. lib. i. segm. 110. p. 79, 71.) About 600 years before Christ, the fame of Epimenides was very great among all the Greeks, and he was supposed to be in great favour with the gods. The Athenians being afflicted with a pestilence, they were directed by the Pythian oracle to get their city purified by expiation. They therefore sent Nicias, son of Niceratus, in a ship to Crete, inviting Epimenides to come to them. He came accordingly in the 46th Olympiad, purified their city, and delivered them from the pestilence in this manner. Taking several sheep, some black, others white, he had them up to the aeropagus, and then let them go where they would; and gave orders to those who followed them, wherever any one of them should lie down, to sacrifice it to the god to whom it belonged, and to the plague ceased. Hence it comes to pass, that to this present time may be found in the boroughs of the Athenians anonymous altars, a memorial of the expiation then made." By the God to whom it belonged some have understood, "the god next the place;" others have translated the passage, "to the proper god to whom that office belonged;" to him, whoever he was, who should remove the infected pestilence." Dr. Doddridge, (in loc.)
The form is not borrowed either from that of the Heathen altars, or even from that of the Jews in the temple: but as the eucharist was instituted by Jesus Christ, at supper, and upon a table, the modern altar is made in form of a table; whence it is more usual, and even more significantly denominated Communion Table.

In effect the denomination altar is founded on this supposition, that the eucharist is a proper sacrifice; which, though the standing doctrine of the church of Rome, is utterly denied by most of the reformed. Accordingly, Bishop Ridley, in the reign of Edw. V. A.D. 1550, illustr ated injunctions for taking down all altars, and requiring the church-wardens of every parish to provide a table decently covered, and to place it in such a part of the church as it should be most meet, so that the ministers and communicants should be separated from the rest of the people. The reasons alleged for this alteration were these: because our Saviour instituted the Sacrament at a table, and not at an altar: because Christ is not to be sacrificed over again, but his body and blood to be spiritually eaten and drank at the holy supper, for which a table is more proper than an altar: because the Holy Ghost, speaking of the Lord's Supper, calls it the Lord's Table; 1 Cor. vi. 25: but no where an "altar." The canons of the council of Nice, as well as the fathers St. Chrysostom and St. Augus
tine, call it the Lord's Table; and though they sometimes call it an altar, it is to be understood figuratively. An altar has relation to a sacrifice, so that if we retain the one we must admit the other, which would give great countenance to mas-s-priests: there are many passages in ancient writers that show that communion tables were of wood, that they were made like tables, and that those who fled into churches for sanctuary did hide themselves under them: and the most learned foreign divines have declared against them, as Bucer, Ockolampadius, Zuinglius, Bullinger, Calvin, P. Martyr, Joannes Alcius, Hedo, Capito, &c. and have removed them out of their several churches, and the Lutheran churches only retain them. Ridley, Cranmer, Latimer, and the rest of the English reformers were unanimously of opinion, that the retaining of altars would serve only to nourish in the minds of people the superstitious opinions of a propagatory mas, and would minifter an occasion of offence and division among the godly. Some of the bishops, however, refused to comply with the order of council, and suffered themselves to be deprived of their bishoppies for contumacy, October 1551. The practice of confederating altars with their furniture was introduced and vindicated by Archbishop Laud in the reign of Charles I., but objected to by Pembroke, as having no higher original than the Roman maff, and pontifical, in which there are particular chapters and set forms of prayer for this purpose; and it was alleged that the practice, as well as the arguments on which it was founded, have no foundation in reason or Scripture, and are contrary to the usage of the church of England, and the opinion of our first reformers. To the antiquity of altars it was replied, that though the name is often mentioned in Scripture, yet it is never applied to the Lord's Table; but altars and pries are put in opposition to the Lord's Table, and ministers of the New Testament, 1 Cor. ix. 13, 14. It was added, that it cannot be pretended by any law or canon of the church of England, that it is called an altar more than once, St. 1 Edw. VI. c. i, which statute was repealed within three years, and another made, in which the word altar is changed into table. It was said, that from the unanimous suffrages of most of the fathers that lived within 300 years after Christ, and of our most learned reformers, it appears, that for above
above 250 years after Christ there were no altars in churches, but only tables; and that they were first introduced by Pope Sixtus II., and that the canons of the popish council of Aix, in 1593, are the only ones that can be produced for razing them in. The practice of bowing to the altar, charged on the archbishop as another innovation, was objected to as popish, superstitious, and idolatrous, being prescribed only by popish canons, and introduced to support the doctrine of transubstantiation, and having no foundation in antiquity, nor approved by any Protestant writers. Burnet's Hist. Reform. vol. ii. p. 150—155. Strype's Annals, vol. i. p. 160—162. Neal's Hist. Puritans, vol. i. p. 44, &c. vol. ii. p. 156—147, 480.

In the primitive church the altars were only of wood, as being frequently to be removed from place to place. But the council of Paris, in 509, decreed, that no altar should be built but of stone.

At first there was but one altar in each church; but the number soon increased; and from the writings of Gregory the Great, who lived in the sixth century, we learn, that there were sometimes in the same church twelve or thirteen. In the cathedral of Magdeburg there are no less than 49 altars.

The altar is sometimes built upon a single column, as in the subterraneous chapels of St. Cecilia, at Rome, &c. and sometimes by four columns, as the altar of St. Sebastian of Crypta Arenaria; but the customary form is, to be a mafive of stone-work, forming the altar-table.

These altars bear a resemblance to tombs; to this purpose, we read in church-hitory, that the primitive Christians chiefly held their meetings at the tombs of the martyrs, and celebrated the mysteries of religion upon them. For which reason it is a standing rule to this day in the church of Rome, never to build an altar without inclosing the relics of some saint in it.

In lieu of proper altars the Greeks in process of time made use of Antimenesia.

Altar of Prophète, is a name given by the modern Greeks to a smaller, preparatory kind of altar, wherein they observe the bread, before it be carried to the large altar where the solemn liturgy is performed.

F. Goar maintains, that the table of prophète was anciently in the faciarity or vestry; which he makes appear from some Greek copies, where faciarity is made use of in lieu of prophète.

Altar is also used in Church History, for the oblations or contingent incomes of the church.

In ancient days they distinguished between the church and the altar. The tithes, and other settled revenues, were called the church, ecclesia; and the other incidental incomes, the altar.

Altar, in Astronomy. See Ara.

Altar-thane, in our Ancient Law Books, denotes a priest, or parson of a parish. In this sense the word is synonymous with church-thane.

Altarage, includes not only the offerings made upon the altar, but also the profit that arises to the priest on account of the altar.

Altarist, altarista, properly denotes the vicar of a church who serves the altar, and to whom the altarage or produce of the altar is assigned for his maintenance. Du Cange.

The altarist is sometimes also called altararius, sometimes altar priest.

Altarist is also used for chaplain.

Altasrif, in Literary History, the title of a medi-

nal book written in Arabic, describing the method of practice in use among the Arabs.

It was written by Alakbaravus, an author in the fifteenth century, and translated into Latin by P. Ricinus in 1519. Concerning the history and contents of the Alt Tafsir, see Friedl. Hist. Phys. p. ii. p. 124, foq.

Altavela, in Lectionary, the name of a flat cartilaginous fish, which, in the Libyan system, by Glimel, is a variety of the Rajah Palmaoe, with its wings, as they are called, that is, its thin and flat sides, broad and obtuse towards their lower part. The fishermen, from the resemblance these flat sides have to wings, have an opinion that this fish can fly. The tail is very short, scarce being half the length of the body. Its flesh is solid and well tasted, and it always sells well in the markets. It is caught in the Mediterranean, and is frequently brought to market at Rome.

Altavella, in Geography, a town of Italy, in the kingdom of Naples, and province of Principato Ultra, seven miles south of Benevento.

Altavilla, a town of Naples, in the province of Principato Citra, eighteen miles south-east of Salerno.

Al-Tayet, a town of Hejaz, a district of Arabia Felix, situated above 60 miles east of Mecca, behind Mount Gazwan, where the air is very wholesome, but the cold more intense than in any other part of the district. Its territory abounds in fountains, and produces excellent raiins. The town is small, but surrounded with a wall.

Altchirck, or Altkirch, a town of France, in the department of the Upper Rhine, situated on an eminence near the river Ill, five leagues west of Bale, and nine south of Colmar. N. lat. 47° 8'. E. long. 7° 8'.

Altdorf, or Altdorf, a large and handsome town of Swiflerland, and capital of the canton of Uri, situated in the valley of the Reuf, and almost surrounded by steep mountains covered with trees, which throw a gloomy shade over the town. It has two convents, four churches, and several chapels, one of which was erected on the spot where was born William Tell, who is said to have shot the apple from his son's head in this town. Geffler, a tyrannical governor, placed over the free inhabitants of Uri by Albert I., among other oppressive and irritating measures, set a hat on a pole at Altdorf, and required the same respect to be paid to it as to his own person; but William Tell refusing to submit to this ignominious requisition, provoked the indignation of the governor, and was obliged to secure himself by flight. This circumstance, as some have reported, laid the foundation of the liberties of Swiflerland, and occasioned an union of Uri, Schwitz, and Unterwalden, in 1538 for throwing off the Austrian yoke; and in 1315 these three cantons formed a perpetual alliance. This town is 20 miles south-west of Lucerne, and 33 south of Zurich. N. lat. 46° 35'. E. long. 8° 24'.

Alte & bafle, in Middle Age Writers, denotes vassalt, or a thing done with the highest power. Du Cange.

Altea, in Geography, a sea-port town of Spain, in the Mediterranean, on the south-east coast of Valencia, eight leagues north-east of Alicante, and 17 south of Valencia. It trades in wine, flax, silk, and honey. It was taken in 1705, in favour of the Archduke Charles, but lost after the battle of Almanza. N. lat. 38° 40'. W. long. 0° 16'.

Alten, or Altenbotten, a gulf of Norway, on the coast of Finnmark, in the government of Wardhus.

Altena, or Altona, a sea-port town of Germany, in Holstein, on the Elbe, in a situation favourable for commerce. It was burned by the Swedes in 1712, and afterwards
Great final for the or, town has a Such town is small, the east suburban. It can be built. The house is for finding silver.

ALTENAU, a small mining-town of Germany, in the principality of Grubenhagen, situated in the Harz forest, near the source of the Oker, and surrounded by rugged mountains and rocks, eight miles south of Goslar. In this town there is a house for finding silver.

ALTENBECKEN, or ALTENBEKEN, a town of Germany, in the circle of Hildesheim, and bishops of Paderborn, three miles east of Lippspringe.

ALTENBERG, a town of Germany, in the circle of Erzgebirge, and prefecture of Altenberg. It is a mining-town, and the tin supplied by it is reckoned the bext next to that of the English and Bohemian. The tin mine was discovered in 1458. Great quantities of lard are wove here. It has repeatedly suffered much from fire.

ALTENBURG, O-Var, a small well-built town of Hungary, with a castle standing on a small branch of the Danube and Leitha, and frequented by deep and wide moats. It has an annual fair, which lasts a week. It is 17 miles south of Pressburg, and 49 south-east of Vienna. North lat. 47° 56'. East long: 23° 15'.

ALTENBURG, a town of Germany, in the duchy of Silesia, eight miles south-west of Weitbuh.

ALTENBURG, Oldenburg, a town of Germany, in the duchy of Holstein, on a river which runs into the Baltic, about three leagues to the east, 10 leagues north-east of Hamburg. North lat. 54° 18'. East long. 11° 4'.

ALTENBURG, a town of Germany, in the circle of Upper Saxony, anciently called Pflunie, the capital of a principality of the name. It is large and populous, and has a castle seated on a rock, which was the residence of the former electors and dukes. It was anciently an imperial city, and the capital of the county of Pfeiffen. In this town are a place of education for young ladies of decayed families, a house belonging to the Teutonic order, a gymnasium illustris founded in 1703, with a good museum and library, an orphanage house, and a house of correction. It is 20 miles south of Leipzig, and 52 west of Dresden. North lat. 50° 50'. East long. 12° 52'. The principality of Altenburg is a part of the ancient Osterlands; and the soil is very fertile in corn, and affords good pasture. It has large breeds of horses, and plenty of wood; and its mines yield copper and cobalt, and other minerals. The stones of this principality are divided into those of the Altenburg, Saalfeld and Eisenberg circles, and confit of the nobility and towns of these three districts. Their provincial meetings are held at Altenburg. The religion of the country is Lutheran.

ALTENBURG, a town in the circle of the Upper Rhine, and bishopric of Spire, two miles north-west of Bruchal, and nine south-west of Spire.

ALTENBURG, a town in the circle of the Upper Rhine, two miles north-west of Wetzlar, and two north-east of Braunfels.

ALTENBURG, a town in the county of Tyrol, nine miles north-east of Ghurns.

ALTENBURG, a small village of Switzerland above Bruck, in the canton of Bern, situated on the river Arar, and known by its Roman antiquities, and the ruins of the castle of Vindolifsen.

ALTENBURG, a town in the archduchy of Austria, two miles south-west of Horn.
can only be changed by first changing the action of the fluids, and this opinion is at present gaining ground.

In the third clas may be placed such as act on the nervous system, often called Aodynes, Emollients, &c.

If we employ the term alterative in a more extended sense, to denote any means by which an alteration for the better can be produced, we should be obliged to refer all diet and medicines to this head; and even with the limitation, of "without a sensible operation," we find it no easy task to decide in all cases what remedies should be included under alteratives.

We think a warm or cold climate may act as an alterant; so may issues or fetons; others go so far as to say that evacuants are the best alteratives; others, on the contrary, ascribe even the salutary effects of evacuants to their alterative nature. This has been alluded to mercury in the cure of the venereal disease; and of it and ipecacuanha in the cure of dyscertories; but it must be observed that these articles succeed best when administered in alterant doses.

The arrangement of the Materie Medica, as well as the modus operandi of remedies, will furnish much diversity of opinion for several centuries: it is, fortunately, a ground of dispute that never has, nor ever will materially injure the practice of either medicine or surgery.

ALTERATA, in Mufier, a term used by the French as well as the Italians, for temperament, in speaking of intervals, and likewise of extreme confinement and diarrhoea: as an extreme sharp 6th, a redundant 5th, an extreme flat 7th, &c.

ALTERATE. See Sesqui alterate.

ALTERATION, Alteratio, in Physic, the act of changing the circumstances and manner of a thing: its general nature and appearance remaining the same.—Or, it is an accidental, and partial change in a body: without proceeding so far as to make the subject quite unknown, or to take a new denomination thereupon. Or, it may be defined, the acquisition or loss of such qualities as are not essential to the form of the body. Thus a piece of iron, which before was cold, is said to be altered, when it is made hot; since it may still be perceived to be iron, is called by that name, and has all the properties thereof. By this, alteration is distinguished from generation and corruption; those terms expressing an acquisition or loss of the essential qualities of a thing. The modern philosophers, after the ancient chemists and corporeans, hold all alteration to be effected by means of local motion. According to them, it always consists either of the emission, accession, union, separation, or transposition of the component particles. Aristotle makes a peculiar kind of motion, which he calls the motion of alteration.

Alteration is used, in Medicines, to denote a change in the state and qualities of an animal body, in respect of temperature or constitution, health or sicknes.

In this sense, alteration includes both evacuation and excitation.

Alteration is more strictly taken for a change in the quality of the body, contrariwise distinguished from evacuation and opposition.

In which sense, alteration is the effect of medicines called alterants.

Alteration is chiefly applied in respect of the fluids or humours of the body. When applied to the solids, it is chiefly to affect the humours, or the motions of them.

Alteration is sometimes also applied in respect of the vital motions of the body.

Thus species are applied to alter and rectify convulsive and other disorderly motions. The alteration of the humours is either extrinsic, or intrinsic. The former is a change produced in the sensible appearances, as colour, thicknes, and the like: and the latter is a change in the primitive crafts, or constitution of a fluid.

Alteration in a sense still more strict, denotes that conversion which the food undergoes, to render it nourishment. In this sense alteration both includes the digestion performed in the stomack, and the assimilation in the habit of the body.

It is disputed among physiologists what the alteration is which the food undergoes.—Some reduce it to a mere comminution or trituration.—Others affect a total transubstantiation. See Digestion.

Alteration of quantities, among Algebraists, denotes what we otherwise call variation, or permutation.

ALTERATIVE, in Medicine, the same with Alterant.

ALTERATION, a debate or contex between two friends, or acquaintance. The word comes from alterari, which anciently signified to converse, or hold discourse together. Thus, we say, they never come to an open quarrel; but there is continually some little alteration or other.

ALTER DO CHAO, in Geography, a small town of Portugal, in the province of Alentejo, 12 miles west of Pontealegre, and 84 east-north-east of Lisbon. North lat. 39° 8'. West long. 6° 38'.

ALTERE, a town of Flanders four leagues west of Ghent.

ALTERIO, a town of Naples, in the province of Calabria. Citra, 17 miles east-north-east of Copenza.

ALTERN, a town and castle of Germany, in the circle of Upper Saxony, in the county of Mansfeld.

Altern, blaze, a term in Trigonometry, contrariwise distinguished from true blaze, thus,—In an oblique triangle, the true base is either the sum of the sides; in which case, the difference of the sides is called the alterna base; or the true base is the difference of the sides; in which case, the sum of the sides is called the alterna base.

ALTERNANTHERA, in Botany, a genus of the triandra monogynia clas and order; the charactere of which are, that the calyx has five leaves; no corolla; six filaments, alternately barren; the stigma bilocular; and the seeds solitary. There is one species, viz. A. repens. Forss. Fl. Æg. Arab. p. 28.

ALTERNATE, or Alternative, is underflow of several things which succeed, or are dispowed after each other by turns.

We say, an alternate, or alternative office, or trust, which is that discharged by turns; so, two general officers, who command each his day, are said to have the command alternately.

In Botany, the term alternate is applied to branches, leaves and flowers, when, instead of being opposite, they spring out regularly one above another: such are the leaves of borage, or checkered daffodil. See Leaf.

Alternate, in Arithmetic. See Alligation.

Alternate angles, in Geometry, are the internal angles made by a line cutting two parallels, and lying on the opposite side of the cutting line; the one below the first parallel, and the other above the second.

Thus x and y, and z and w (Plate I. fig. 1. Geometry.) are alternate angles, and these angles are equal to another.

There are also two external angles, alternately opposite to the internal ones. See Parallel.

Alternate ratio or proportion, is that which the antecedents and consequents bear respectively to each other in any proportion, which has the quantities of the same kind.

Thus, if A : B :: C : D; then, alternately, A : C :: B : D.

Alternate, in Heraldry, is used in respect of the situations of the quarters.

Thus in quarterly parted, the first and fourth quarters are
are alternate; and are usually of the same nature. And the like holds of the second and third.

**ALTERNATION**, in its primary sense, denotes a succession by turns.

**ALTERNATION** is more particularly used among Civilists, for disjunctive, as in saying this or that.

**ALTERNATIONS**, in Aristobulus, a term sometimes used to express the divers changes, or alterations of order, in any number of things proposed. This is also called permutation, &c. and is easily found by a continual multiplication of all the numbers, beginning at unity.

If there be two quantities a and b, they admit only of 1 x 2, or 2 changes, as a, b. If a third quantity c be added, this will admit of 3 changes with each of the two former; that is, it may be first, second or third in each of them; and in this case the number of changes will be 1 x 2 x 3 = 6. A fourth quantity will admit of 4 changes with each of the preceding quantities; that is, it may be first, second, third or fourth, and the whole number will be 1 x 2 x 3 x 4 = 24. If the number be n, multiply the series of natural numbers 1, 2, 3, 4, 5, 6, continually one into another; and the last product will be the number of alternations required.

Thus, if it be required to know how many changes or alternations can be rung on six bells, multiply the numbers 1, 2, 3, 4, 5, 6, continually one into another; and the last product gives the number of changes. See Changes and Combination.

**ALTERNATIVE** is particularly used for the choice of two things proposed. In this sense we say, to take the alternative of two propositions.

**ALTERNA** in Ancient Geography, a town of Spain, belonging to the Carpentani.

**ALTERS**, of Altars, in Nautical Geography, are a lofty shelf, westward of Languard Fort, about a cable’s length and a half, on which there are no more than five or six feet of water at low water, so that ships should keep near the fort till they have passed it, and then edge off a point or two to the west, till they come athwart of the north point of Harwich. Malham’s Naval Gazetteer.

**ALTERS**, in Ancient Geography, a town of Peloponnesus, situate on the Caldasia, which fell into the river Alpheus.

**ALTESSAN**, in Geography, a town of Italy, in the principality of Piedmont, three miles north of Turin.

**ALTEZEY, or ALTZEHM**, a town and castle of Germany, in the Lower Palatinate, capital of a territory of the same name, situate on a small brook which runs into the Salz, 15 miles south-west of Mentz, and 14 north-west of Worms. North lat. 49° 40’. East long. 8° 12’.

**ALTHA**, in Ancient Geography, a town of Babylonia, upon the Tigris, and in dependence upon Apamea, according to Ptolemy.

**ALTHA, or AILAT** of Dioscorides, from Αἰλάτ; a remedy, or also to heal, or as Dioscorides says to Αἰλάτσι, from its many excellent qualities, in Botany, a genus of the monadelphus papyrifera class, and order, or the natural order of cimifugae, and of the genus of Ajugoia; its characters are, that the calyx is a double perianthium, outer smaller, one-leaved, unequally novem-fid or nine-cleft, (6—12) divided very narrow, inner semiquinquefolia, divisions broader and narrower; the corolla is five-petalled, united at the base, obcordate, premenone, and flat; the flamma have many filaments inserted into the corolla, anthers subuniform: the fijstrillum has an orbicular germ, style cylindrical and short, stigma many (20), fleshy, of the length of the style; the pericarpium confluent of arils not jointed, forming a flat ring about a conical receptacle; they are deciduous and open on the inside; the seed is one, flat-kidney-shaped in each aril.

There are six species, viz. 1. A. officinalis, common marsh mallow, with leaves simple, downy, (debquequenolate, Smith,) or with leaves undulate, angular and ciliate; (Weit) the root stiffer than in Marsh-buck-wheat, the stalk erect, almost three feet high, simple, cylindrical, hands like a twig, folioke; the leaves alternate, petiolate, cordate, acute, subquincunx-blobed, and covered with the powdery axillary, downy, many-flowered, taller than the petals; the external calyx often two-leaved, the inner five-cleft; the corolla and stamens are purple flowered; the styles are numerous; the capsules comprise the whole herb very finely pubescent or clothed with a soft felt wool or velvet, with dilated interseptal hairs. It is perennial and flowers from July to September. It grows particularly in fields marshy, and on the banks of rivers and ditches in Cambridgeshire, Norfolk, and Suffolk, or the forests of Cornwall, in Holland, France, Italy, Siberia, &c. There is a variety of this, with the leaves rounder and not ending in a point, called by Ray A. vulgari foliis, folio rotunda brevi, and found in the Isle of Ely; it varies also with bicellate leaves. 2. A. cambrica, henney-leaved marsh-mallow, with the lower leaves peltate, (dilatata, Gmelin) upper digitate, (chato, the middle lamina the longest, Gmelin.) This has a woody stem, four or five feet high, which puts out many side branches; the leaves are alternate; the flowers axillary, less than those of the former species, but of a deeper red colour, and the calyces much larger. This fuchia flowers the first year, except in a warm summer. It grows naturally in Hungary, Istria, Austria, Carniola, Germany, Swifferland, and France, &c by the sides of wood, and was cultivated here by Gerard, in 1597. 3. A. bisbvtis, hairy marshmallow, with leaves tripartite, hairy-labiate; leaf above and peduncles solitary and one-flowered. This is a low plant, its branches trailing on the ground, the flowers axillary, smaller than those of the common sort, and have purplish bottoms, the calyxes are woody, and seldom last more than two years; the outer calyx is eight-leaved, the inner as long as the corolla, and acuminate; the corolla crenulate. This species grows wild in Spain and Portugal, Italy, Austria, Carniola, Germany, Switzerland, and France, and was cultivated in Kew gardens in 1683, by Mr. J. Sutherland. 4. A. Ludvigii, Ludvig’s marsh-mallow, albus of Ray’s hill, with leaves lobed, naked on both sides, and peduncles solid and one-flowered. This resembles albus alba; the peduncles are axillary from two to five, the outer calyx eight-leaved, and leaflets lanceolate; the inner shorter, quinquedactyl, very rough, with white villous hairs. 5. A. Narbonensis, Narbonne-marshmallow, with leaves tomentose on both sides; the lower five-lobed, the upper three-lobed, peduncles solitary, one-flowered. The root is perennial, stems are annual, from four to fix feet in height, round, and of the thickness of a finger, hoary with whitish villous hairs; stipules subulate, acute and ciliate; leaves alternate, petiolate, ferrate, bracts subulate and small; the segments of the outer perianthium are six or seven, deeply cut, lanceolate, and acute; corolla purplish-coloured, twice as long as the calyx; anthers dark-purple; stigmas white; and styles smooth; first discovered by Abbe Poiret near Narbonne, found also in Spain, flowers in August and September, and introduced into Kew garden, in 1781, by M. Thouin. 6. A. corymbifera, with leaves simple, cordate or angular, and smooth, peduncles and calyces hairy, and flowers in corymb; a native of Jamaica. 7. A. eueu, A. pavonia spicata of Cavay, and Gmelin, with leaves simple, cordate, ovate, ferrate, scabrous on the upper surface, and sacculus terminating and erect. The stems are thick, flat, five feet high, with many branches.

5 G 2

leaves
leaves alternate on long petioles; stipules lanceolate and acuminate; outer calyx deeply eight-lobed, inner somewhat tubulose, with five notches; corolla yellow, double the length of the calyx; the petals oblong, almost entire, marked with deeper-coloured streaks; the fruit composed of five bivalve capsules; a native of Jamaica. Instead of this species Gmelin infers A. grandiflora, with cordate, angulated, tomentose, patulous leaves, and subuliform auricles. Martyn. Withering. Smith. Gmelin's Lin. 

Culture. The first species may be propagated either by seeds, sown in the spring, or by parting the roots in autumn, which is the best season for the purpose. It will thrive in any soil or situation, but grows larger in moist places than on dry land; the plants, whose roots spread wide, should not be nearer than two feet. The second species is propagated by seeds sown in the spring, in a dry soil and sheltered situation; this plant seldom continues longer than two years in England, but as the seeds ripen here, the plants may be had in plenty. If the seeds of the third species be sown in April, the plants will flower in July, and seeds ripen in September; they should be sown where they are to remain.

ALTHEA, in the Materia Medica. The Althea officinalis seems to have been known to the ancients, called by Dioscorides Althea or Hibiscus, by Galen Euban, and by Pliny Hibicium. It is probably the Hibiscus of Virgil, Ecl. x. v. 30, and v. 71.

"Hædorumque gregem viridi compellere hibisco."

It has been much used by medical practitioners in every country where medicine has been regularly cultivated. All its parts abound with a glutinous juice, with a peculiar taste. The dry roots, boiled in water, give out half their weight of gummy matter, which is thought to be nearly allied to gum arabic, tragacanth, starch, &c. and dissolves in water, and some other resinous substances more readily than gum; and on evaporating the aqueous fluid, forms a yellowish mucilage. The leaves afford a peculiar one-fourth of their weight, and the flowers and seeds half less. The mucilaginous matter is the medicinal part of the plant, and it is commonly employed for its emollient and demulcent qualities. It is recommended for obsturating and incafillating acrimonious thin fluids, in tickling coughs from defluxions on the lungs and chest, hoarseness, coughs of the throat and larynx, difficulty and heat of urines, the dysentery, colic, and gonorrhoea; and for lubricating and relaxing the passages in nephritic and calculus complaints. It has been given in powder, from a scruple to a dram or two, either by itself, or in conjunction with other substances of a similar nature; it is seldom administered in this form: but it is taken to better advantage in that of an infusion or decoction. Dr. Cullen observes, (Med. vol. ii. p. 411.) that demulcents of this kind often have no effect as such in the mists of blood, or in passing by various excretions. The Althea has been often applied in various external affections. The root boiled in honey and chewed by infants has mitigated difficult diarrhoea; and milk, in which this root, figs and a small quantity of sugar have been boiled, has relieved the gums. The decoction is said to be useful in opthalmia; and a gargarium made of the decoction of this root and figs has been serviceable in sore throats. The root, cut and boiled in water or milk, has formed a convenient and useful emplast for softening and opening tumors; and it has been often added to glycerites. The root was formerly used as an ingredient in several compounds of the pharmacopoeias; but it is now directed only in the form of a syrup. This is prepared by boiling a pound of the fresh roots bruised in a gallon of distilled water to one half, and pouring out the liquor when cold; and when it has settled for 24 hours, so that the feculent soles may settle, the liquor is poured off, and four pounds of double-refined sugar being added to it, the liquor is boiled down to six pounds weight. This syrup is employed occasionally in some disorders of the breast, and for soothing mollient decretions in nephritic cases. Lewis. Murray. Woodville. 

ALTHEA. See Hennemann, Hibiscus, Lavatera, Malva, Melochia, Nepharia, Sida, and Waltheria. 

ALTHEA Frutescens. See Hibiscus.

ALTHEA, Althea Olearium, Oregis, in Ancient Geography, a town of Spain, belonging to the Oecades; mentioned by Polybius under this name, but called Cardesia by Livy, in speaking of the exploits of Hannibal.

ALTHAMERUS, Andrew, in Biography, a Lutheran minister at Nuremberg, lived in the 16th century, and attended the conferences at Berne, in 1528, which prepared the way for the reformation in that canton. He was zealous an advocate for justification by grace, in opposition to the merit of good works, that he inveigled in a very decent and courageous manner against the apostle James, and gave him, almost, the lie direct. Grotius cites a passage from his "Annotations on James," printed at Strasbourg, in 1547, in which he charges the apostle with running counter to Scripture, and opposing his single authority against that of the Holy Ghost, the law, the prophets, Christ, and his apostles. Besides some works in divinity, he compiled a dictionary of the proper names in the Bible, "Sylva Bibliocorum nominum, &c." printed at Basle in 1553; "Conciliales locorum Scripturae," published at Nuremberg in 1536, and at Witteburg in 1582; and notes upon Tacitus, "De Situ, moribus et populis Germaniae," printed at Nuremberg in 1529 and 1530, and at Amberg in 1609, 8vo. Gen. Diet.

ALTHÆNUS, in Ancient Geography, a free city of Daunia, in Italy, the waters of which were said to cure all sorts of wounds.

ALTHEA, in Geography, a town of France, in the department of the Mayenoe, and chief place of a canton, in the district of Craon, four leagues south-south-west of Laval.

ALTHEA, in Entomology, a species of Papilio, in the class of Nymphales, with dentated brown wings, and also a fascia and stigma angular-dentated and white, found in Guiana.

ALTHEIM, in Geography, a market town of Upper Bavaria, in the district of Mandkirchen, eight miles east of Brannabu.

ALTHEPA, in Ancient Geography, a small county, placed by Plutarch, in the Argolid, near Treczena, which had borne the appellation of Ovesa.

ALTHUSIUS, John, in Biography, a German civilian, towards the latter end of the 16th century, advanced free principles on political subjects, which gave great offence to some of his contemporaries. He was a Protestant; and from being a professor of law, at Herborn, he was raised to the dignity of syndic, at Bremen. The fundamental principles of his "Politics methodically digested," printed at Herborn, in 1603, are these: "that kings are mere magistrates; that the chief power of every commonwealth is in the people only; that it is lawful to depose a tyrant, to turn him out of the administration, and even to put him to death, if no other remedy can be found, and to choose another in his room. He also composed a treatise "De jurisprudentiis Romana;"
ALTINCAR, among Minerals, a species of fortifications falt used in the fusion and purificaction of metals.

The altin carriers is a fort of flux powder. Divers ways of preparing it are given by Libavius.

ALTING, HENRY, in Biography, was born at Embden, in 1583; and, having devoted himself to the profession of a divine, he was first in 1622 to the university of Heidelberg, where he became a professor. In 1628 he was appointed preceptor to the electoral prince palatine, and in 1627 accompanied him to England, where he was introduced to the acquaintance of various others, of archbishop Abbot. In 1645 he returned to Heidelberg, where he took his degree of doctor of divinity, and was appointed director of the college of Wifdom. At the funeral of Dort, to which he was deputed in 1648, he distinguished himself by his prudence and eloquence. After his return to Heidelberg, he very narrowly escaped falling a sacrifice, when the city was taken in 1625, by count Tilly, for, as he was entering the house of the chancellor, one of the guards met him, and ignorant of his person, threatened his life; "I know where to find him, should be the 11th." Altin replied, with a resolution and constancy of mind, and at the same time with an allowable evasion, which saved his life: "I am a teacher in the college of Wifdom." When the Jesuits took possession of the house, he concealed himself in a garret, and was secretly supplied with food, till he had an opportunity of making his escape, and of following his family to Hambro. After the destruction of the palace by count Tilly's forces, he retired to Schorndorf; but here, although situated among Protestants, he encountered new trials. The Lutheran ministers of Schorndorf, who were at variance with the professors of Heidelberg, were dissatisfied with the permission which the duke of Wurttemberg had given to one of these professors to reside among them; and by reason of their jealousy and intolerance, Altin was obliged to remove to Embden in 1629, from whence he followed his late pupil, who was king of Bohemia, to Prague. Under the patronage of this prince, and in the office of tutor to his eldest son, he remained till the year 1637, when he obtained his permission to remove to Greningen, where he was appointed to the professorship of divinity, which he retained till his death. Such were his talents and character and public services, that he was held in very general estimation; but the confusion and troubles of that period prevented his taking possession of the office of divinity-professor at Heidelberg, to which he was appointed by prince Lewis Philip, admimistrator of the palatinate. Domestic affliction, occasioned by the loss of his eldest daughter and his wife, brought upon him a retarded melancholy, which, after a few months, put a period to his life, in the year 1644. Altin, though he was no friend to the innovations introduced at this period by the Socinians, was of a moderate and peaceable temper, and indocile to dispute and quarrel about trifles. "Adhering, as he judged, to the plain doctrine of scripture, he was equally dehons to avoid thefolial subtlety and fanatical scrupulosity." His works were, "Note in D. Thom. Problemata; Johannis Behm." Heidelberg. 1618; "Loci Communes," "Problemata," "Explication Cathedrae Palatiae," Amstelod. 1646; "Exegetis Auguberniae Constitutionis," the Amst. 1647; "Methodus Theologiae Didacticae," "Medulla Historiae Profanæ," published under the name of Paracelsus. Gen. Diet.
the study of the oriental languages, he put himself, in 1638, under the tuition of a Jewish Rabbi, at Ensdon. Upon his visit to England, in 1642, he was admitted to clerical orders by Dr. Puddeus, bishop of Worcester; but he altered his purpose of continued residence in this country, as soon as he received an invitation to the Hebrew professorship at Groningen. He returned to Germany in 1643, and obtained considerable distinctions of honour in the university. In this situation a rivalry commenced between him and his colleague, in the professorship of divinity, Des Maretal. The latter was addicted to the scholastic philosophy and plan of instruction; whereas the former devoted himself to the study of the Scriptures and Rabbinical learning, and acquired a degree of popularity, as a lecturer, which excited the jealousy and opposition of Des Maretal and his adherents. A dispute between these professors, who were now become competitors and rivals, had for some time prevailed; and at length the decision of it was referred to the divines of Leyden. These umpires pronounced Alting innocent of hereby, but fond of innovation, and Des Maretal deficient in modesty and candour. The civil power was at last obliged to interfere, and the penalty of deprivation was decreed against those divines, who should in any ecclesiastical assembly revive the Marefo-Altingian controversy. The magistrates proceeded by an usurpation of authority which did not belong to them, to prohibit even writing for or against the judgment of the divines of Leyden. This breach between the two professors was never thoroughly compromised; though, by the interposition of friends, a kind of formal reconciliation was effected, while Des Maretal lay on his deathbed. Alting did not long survive him, but was taken off by a fever, in 1679. He was reproached, in consequence of his attachment to Rabbinical learning, with an inclination to become Jew. His works were collected some years after his death, and published in five volumes folio, under the care of Bekker, minister at Amsterdam, by his cousin Mathi Alting, burgomaster of Groningen, who wrote a good description of the Low Countries, entitled, "Notitia Germaniae Inferioris." It is said that he preached well in three languages, German, Dutch, and English. Gen. Diet. 

ALTITUDE, in Geometry, the third dimension of body, considered with regard to its elevation above the ground—called also height or depth.

Altitude of a figure, is the distance of its vertex from its base, or the length of a perpendicular let fall from the vertex to the base.

Thus, K L (Plate I. Geometry, fig. 2.) being taken for the base of the right angled-triangle, KLM: the perpendicular KM will be the altitude of the triangle.

Triangles of equal bases and altitudes are equal; and parallelograms, whose bases and altitudes are equal to those of triangles, are just the double thereof.

Altitude, in Optics, is usually considered as the angle subtended between a line drawn through the eye, parallel to the horizon, and a visible ray emitted from an object to the eye.

For the laws of the vision of altitudes. See Vision.

If through the two extremities of an object, S and T (Plate I. Optics, fig. 13.) two parallels, TV and SQ be drawn; the angle TVS, intercepted between a ray passing through the vertex S, and terminating the shadow thereof in V, makes, with the right line TV, what is called, by some writers, the Altitude of the Luminary.

Altitude, in Cosmography, is the perpendicular height of an object, above the plane of the horizon.

Altitudes are divided into accessible and inaccessible.

Altitude, accessible, of an object, is that which base you can have access to, so as to measure the nearest distance between your station, and the foot of the object on the ground.

Altitude, inaccessible, is that which base cannot be approached, by reason of some impediment; such as water, or the like.

There are three ways of measuring altitudes, viz. geometrically, trigonometrically, and optically.—The first is somewhat indirect and unsatisfactory; the second is performed by means of instruments for the purpose; and the third by fidways.

The instruments chiefly used in measuring altitudes, are the quadrant, theodolite, geometric quadrant, or line of sights, &c. the descriptions, applications, &c. whereof, see under their respective articles Quadrant, Theodolite, and Quadrat.

Altitudes, to take accessible. To measure an accessible altitude geometrically.—Suppose it required to find the altitude AB (Plate I. Geometry, fig. 3.) plant a staff, DE, perpendicularly in the ground, of such height as may be equal to the height of the eye. Then, lying prostrate on the ground, with your feet to the staff; if E and B prove in the same right line with the eye C, the length CA is equal to the altitude AB. If some other lower point, as F, prove in the line with E, and the eye, you must remove the staff, &c. nearer to the object; on the contrary, if the line continued from the eye over E, mark out some point above the altitude required; the staff, &c. are to be removed farther off, till the line CE raithe the very point required.

Thus, measuring the distance of the eye C from the foot of the object A, the altitude is had; since CA = AB.

Or thus: at the distance of thirty, forty, or more feet, plant a staff DE (fig. 4.) and at a distance from this, in C, plant another shorter one, so as that the eye being in F, E and B prove in the same right line therewith. Measure the distance between the two staffs, GF; and between the shortest staff and the object, HF: as also, the difference of the heights of the staffs, GE.—To GF, GE, and HF, find a fourth proportional BH.—To this add the altitude of the shorter staff, FC. The sum is the altitude required, AB.

To measure an accessible altitude, trigonometrically.—Suppose it required to find the altitude AB (fig. 5.) choose a station in E; and with a quadrant, theodolite, or other graduated instrument duly placed, find the quantity of the angle of altitude ADC. Measure the shortest distance of the station from the object, viz. DC, and this of consequence is perpendicular to AC.

Now, C being a right angle, it is easy to find the side AC; since, in the triangle ACD, we have two angles, viz. D and A its complement, and a side opposite to one of them, CD, the side opposite to the other may be easily found by this canon. As the line of the angle A is to the given side opposite to it DC, so is the line of the other angle D to the side required CA. To this side, thus found, adding BC, the sum is the perpendicular altitude required.

Or say, as radius is to the distance DC, so is the tangent of the angle ADE to AC, the height of the object; and adding the altitude of the instrument above the ground, the whole height of the object is found. The operation is best performed by logarithms. E. G. Suppose the angle ADE = 51° 52'; and the distance DC = 64 feet. Then it will be,

Radius
To which add four feet, the height of the eye, and the altitude required, or AB, is 8.51 feet.

This may also be resolved by projection, thus: draw DC, on which set 64 feet from any scale from D to C; erect the perpendicular CA; then make the angle CDA = 51° 52', and draw DA, intersecting the perpendicular in A, the top of the object. Then CA, measured on the same scale, will give 8.51 feet.

If there happen an error in taking the quantity of the angle A, (fig. 6) the true altitude BD will be to the false one BC, as the tangent of the true angle DAB, to the tangent of the erroneous angle CAB.

Hence, such error will be greater in a greater altitude than in a less; and hence also, the error is greater, if the angle be less, than if it be greater. To avoid the inconveniences of both which, the station is to be pitched on at a moderate distance; so that the angle of altitude DAB, may be nearly half right.

Again, if the instrument were not horizontally placed, but inclined, e. g. to the horizon in any angle, the true altitude will be to the erroneous one, as the tangent of the true angle to that of the erroneous one.

If the plane intercepted between the observer, and the object be inclined, as in fig. 7; two stations C and D must be selected, and their distances from the base of the object, viz. CA and DA must be measured. Then as the external angle ACB is equal to CDB + DBC, the angle DBC = ACB - CDB, or DCB is equal to the supplement of ACB; in either way the angles of the triangle BCD are known, and one side DC is given; then, say, the sine of DBC : DC :: sine BDC : BC, which will be known; and in the triangle ABC, the two sides CA and CB being given together with the included angle, we shall have CB + CA : CB - CA :: tangent of \( \frac{B + A}{2} \).  

tangent of \( \frac{B + A}{2} \), whence the angles will become known; and it will be easy to find AB the altitude of the object as before. Otherwise, measure the distance AC, and the angles A and C; and as in the triangle ACB, all the angles and one side AC are given, the other side AB will be easily found.

To measure an inaccessible altitude optically, by the shadow of the body, see Shadow.

To measure the altitude of any object by optical reflection, place a plane mirror, or a vessel of clear water, horizontally at C, (fig. 8.3), and retreat from it to such a distance at D, that the eye E may just perceive the image of the top of the object, in the reflecting surface at C; then, as these triangles, having two equal right angles, and the angle ACB = ECD, because the angles of incidence is equal to the angle of reflection, are similar, we shall have CD : DE :: CA : AB, the altitude required.

To measure an inaccessible altitude by the geometrical quadrant or square. Suppose it required to find the altitude AB (fig. 9.) choosing a station at pleasure in D, and measuring the distance thereof from the object DB; turn the quadrant this way and that way, till the top of the tower A appear through the sights.

If then, the thread cut the right shadows, say, as the part of the right shadow cut off, is to the side of the quadrant, so is the distance of the station DB, to the part of the altitude AE. If the thread cut the left shadow, say, as the side of the quadrant is to the part of the vertical shadow cut off, so is the distance of the station DB, to the part of the altitude AL.

AE, therefore, being found in either case, by the rule of three, and the part of the altitude BE added to it, the sum is the altitude required. See Quadrat.

Altitude, to measure an inaccessible, geometrically. Suppose AB (fig. 4.) an inaccessible altitude, so that you cannot measure to the foot of it. Find the distance CA, or 1 FT, as taught under the article Distance; then proceed with the rest as in the article for accessible distances. See Staff.

To measure an inaccessible altitude, trigonometrically.—Choose two stations G and E (fig. 16.) in the same right line, with the required altitude A B, and at such distance from each other, DF, as that neither the angle FAD be too small, nor the other station G too near the object AB. With a proper instrument take the quantity of the angles ADC, AFE, and CFB; and also measure the interval FD.

Then, in the triangle AFD, we have the angle 3, given by observation; and the angle FAD, by substracting the observed altitude A FE, from two right angles; and consequently the third angle DAF, by subtracting the other two from two right ones; and also the side FD; from whence the side AF is found by the canon above laid down, in the problem of accessible altitudes. And again, in the triangles ACF, having a right angle C, and observed angle F, and a side AF, the side AC, and the other CF, are found by the same canon. Lastly, in the triangle FCB, having a right angle C, observed angle CFB, and a side CF; the other side CB, is found by the same canon.

Adding, therefore, AC, and CB, the sum is the altitude required, AB.

E. G. Suppose A FC to be 58° and ADC 38°, and the distance of the stations FD to be 26 yards. Subtract ADC or 38° from A FC or 58°, and there remains FAD or 20°. Then, in the triangle ADF, the angles and one side being known, we shall have sine of DAF, sine of ADF, FD : FA i. e. S. 20° : S. 38° :: 26 : a fourth, or by logarithms, 9.5330957 :: 9.7893420 :: 1.414973 :: 9.7893420 + 1.414973 - 9.5330957 = 1.0567253 the log. of 45.8. Again, in the triangle ACF, radius sine of AFC : AF : AC; i. e. rad. : S. 58° : 46.8 :: 4.04, and by logarithms, 10.6000000 :: 9.0284205 :: 1.0567253 + 4.68 = 10.6000000 :: 1.0567253, the log. of 59.69 or 59 yards two feet, to which add the height of the instrument above the ground, and we have the altitude required.

By projection; draw a line DC, and at the extremity D make the angle ADC = 38°, and draw the line DA. Then set off the distance of the stations 26 from D to F, and at F make the angle A FC = 58°, and draw FA to intersect DA in A; then the distance of A from the horizontal line DC, applied to the scale, will give the height.

If two stations be taken at F and D, so that the angle A FC may be 2 ADC, DF will be A F; and radius will be to the distance of the stations DF or AF :: S. AFC : the altitude AC.

If the station at F be such, that the angle A FC may be 45°, and the angle ADC = 26° 34', the altitude AC will be equal to DF the distance of the two stations. For when A FC is 45°, AC = CF = FD, and CD = AC, as radius : natural tangent of 26° 34' :: 2 : 1; i. e. :: DC (or 2 AC) : AC.
We may hence deduce a method of finding the height of one object, as \( AC \), situate upon another HC. Find, first, the whole altitude \( AC \), and then the altitude of HC, as above, and their difference will be the altitude of \( AH \), as e.g. of a fire above the tower of a fleệp. If the height of the tower HC is known, any distance DF in the horizontal line DC may be measured from H. This is the reverse of the preceding problem.

To measure the altitude of a balloon, cloud, or other moveable object, C: (§ 11.) let two observers at A and B, in the same horizontal plane, take, at the same time, the angles \( CAD \) and \( CBD \), and measure the distance \( AB \) between the stations; and then the altitude may be calculated as before. The height of a cloud may be found by its shadow in the following manner. Observe the cloud C, (§ 12.) in its direct access to or recedes from you; and marking the instant in which the middle of the shadow is at some remarkable point upon the ground as at A, at that moment take the altitude ABC of the middle of the cloud. Then, take the fun’s altitude at your station B, and that will be equal to the angle BAC, and measure the distance between your station and the place of the shadow. In the triangle \( ABC \), as all the angles and one side are known, it may be easily projected, and the height of C above BA may be determined: or it may be resolved trigonometrically thus:

\[
\sin \angle C = \frac{AB}{AC} = \frac{s.B}{s.C \times AB}; \quad \frac{r.A}{r.B} = \frac{s.A}{s.B} \times AB, \]

rad. : \( AC \) : \( AB \) : \( AC = \frac{s.B}{s.C \times AB} \); or rad. \( r.A \) : \( r.B \) : \( \sin \angle C \) : \( \sin \angle B \).

N. B. The cloud should be small, because the observation must be at a point. If the cloud be large, its edge as well as the edge of the shadow must be observed; and the stations must be upon a large plain or open ground.

To find an inaccessible altitude by the shadow, or the geometrical quadrat.—Choose two stations in D and H (§ 9.) and find the distance DH, or GC; observe what part of either the right or verfed shadow is cut by the thread.

If the right shadow be cut in both stations, say, as the difference of the right shadow in the two stations, is to the side of the square; fo is the distance of the stations GC to the altitude EA. — If the shadow cut the verfed shadow at both stations, say, as the difference of the verfed shadow marked at the two stations, is to the lesser verfed shadow; so is the distance of the stations GC, to the interval AE. — Which being had, the altitude EB is also found by means of the verfed shadow in G; as in the problem for accessible altitudes.

Lastly, if the thread in the first station G, cut the right shadow, and in the latter, the verfed shadow; say, as the difference of the product of the right shadow into the verfed, subtracted from the square of the side of the quadrant, is to the product of the side of the quadrant into the verfed shadow; so is the distance of the stations GC, to the altitude required AE.

The utmost distance at which an object may be seen in the horizon, being given, to find its altitude.

Suppose the top \( H \) of a tower \( FH \) (§ 13.) just visible at E, the distance EF being 25 miles; and suppose the circumference of the earth to be 25000 miles, or the radius 3979 miles, or 21097120 feet. Then 21097120 = 21 360° 21' 30" = the angle \( EGH \); and radius : secant of the angle G = \( EC : GH = 21097120 \) feet, and 21097120 = 416 feet or FH the height of the tower.

Otherwise.—In the right-angled triangle \( GEF \), \( GH \) or \( GF \) = \( GH \) or \( 2 GF \times FH + FH^2 = GF^2 + FH^2 \). But GF being \( GF \), \( 2 GF \times FH + FH^2 = HE^2 \) or \( 2 GF \times FH = HE^2 - EF^2 \), and \( HE = 12 GF \) but \( 2 GF \), or the earth’s diameter, is 21009120 miles, therefore \( \frac{EF}{\sin \angle F} = FH \) in miles, and \( \frac{EF \times 1560}{7958} \)

\( = FH \) in yards.

Or, the altitude FH may more easily be found thus. The horizon dips nearly eight inches or \( \frac{1}{4} \) of a foot, at the distance of one mile, and according to the square of the distance for other intervals; therefore, as \( 1^1 \) or \( 125^n = \frac{3}{4} \) of 625 or 416 feet.

The method of taking considerable terrestrial altitudes, of which those of mountains are the greatest, by means of the barometer, is very easy and expeditions. This is done by observing on the top of the mountain how many inches, &c. the mercury is fallen below what it was at the foot of the mountain. When this is done, you will have its altitude by the help of a table calculated for that purpose. A very accurate table of this kind may be found in the Hift. de l’Acad. Roy. des Scien. 1703, and 1705, calculated by Mr. Cassini; and also in the Phil. Trans. Eames’s and Martyn’s Abr. vol. vi. p. 54. See Barometer.

Altitude of the eye, in Perspective, is a right line let fall from the eye, perpendicular to the geometrical plane. See Perspective.

Altitude, in Astronomy, is an arc of a vertical circle, intercepted between the fun, moon, star, or other celestial object, and the horizon.

This altitude may be either true or apparent. If it be taken from the rational, or real horizon, the altitude is said to be true, or real; if from the apparent or sensible horizon, the altitude is apparent. Or rather, the apparent altitude is such as results from observations made at any place on the surface of the earth, and the true is that which has been corrected, on account of the refraction and parallax.

The true altitudes of the sun and fixed stars differ but very little from their apparent altitudes, because of their great distance from the centre of the earth, and the smallness of the earth’s diameters, when compared with it. The quantity of refraction is different at different altitudes, and the parallax is different according to the distance of celestial objects; in the fixed stars it is too small to be observed; that of the sun is about \( 5^\frac{1}{2} \) seconds, and that of the moon about 52 minutes. The altitudes of the heavenly bodies are observed by a quadrant or sextant, or by the shadow of a gnomon, and by various other ways may be found without a quadrat, or any like instrument, by erecting a pin or wire perpendicularly as in the point C (Astronomy, Plate I. § 5.) from which point you have described the quadrantal arc AF. Make CE equal to the height of the pin or wire, and through E draw ED parallel to CA, and make it equal to CG, the length of the shadow; then will a ruler, laid from C to D, intersect the quadrant in B; and BA is the arc of the sun’s altitude, when measured on the line of chords.

The sun’s altitude may be computed by the following rule, proposed by Mr. Lyons for nautical purposes. By the rules in the Nautical Almanac, for 1771, find the logarithm ratio; subtract it from the rising found anfwering to the given distance of time from noon, in the tables of the same Almanac; the remainder is the logarithm of a number, which
which subtracted from the natural line of the sun's meridian altitude, leaves the natural line of the altitude at the required time. For, finding the altitude of the moon or a star, he gives the following rule. From the tables above mentioned, take out the rising, corresponding to the hourary angle in the distance of time from the star's pulling the meridian; add to it the logarithmic cosine of the star's declination, and the logarithmic cosine of the latitude of the place; the sum, abating twenty from the index, is the logarithm of a number, which subtracted from the natural line of the star's meridian altitude, leaves the natural line of the altitude at the given time. These rules are of great importance in determining the longitude at sea. See Naut. Alm. for 1778.

In taking of altitudes from the visible horizon, where great exactness is required, an arrangement is to be made for refraction, and the height of the observer's eye above the surface of the sea. To find the altitude of the stars, &c. by the globe, see Globe.

An irregularity has been observed in the apparent altitudes of the stars near the meridian. On some occasions, when they are mounting towards the meridian, they appear to fall, and after passing the meridian, to rise. Hili. Acad. Scin. 1710. p. 75.

M. Parent suggests a new method of taking altitudes at sea, by a common watch. It is obvious, that in an oblique sphere, the difference between the rising and setting of two stars, in the same meridian, is greater, as they are farther distant from one another.

Now the astronomic table furnishing us with tables of the right ascensions and declinations for the fixed stars, it is easy, after observing the difference of time between the rising of two stars, to distinguish that part of the difference which accrues from their different position from that which arises from the obliquity of the sphere. But such difference is the precise height of the pole of the place of observation.

Indeed, the ship not being immovable, but changing place between the two observations, seems to lay the method under some difficulty; but to this M. Parent answered, that a small alteration either of the ship's longitude or latitude, will make no sensible error; and that if the have gone a large distance between the two observations, it is easy reckoning how much it is, and accordingly allowing for it. See Sailing.

Altitude, meridian. The meridian being a vertical circle, a meridian altitude, that is, the altitude of a point in the meridian, is an arch of the meridian intercepted between it and the horizon.

If HO (Astronomy, Plate 1., fig. 6.) be the horizon, and HZP the meridian, then the arc HE, or the angle HCE will be the meridian altitude of an object in the meridian at the point E.

To observe the meridian altitude of the sun, of a star, or other phenomenon, by means of the quadrant, see Meridian Altitude.

To observe a meridian altitude by means of a gnomon, see Gnomon.

Altitude, or elevation of the pole, is an arc of the meridian OP (fig. 6.) intercepted between the pole P and the horizon; or the angle OCP.

The altitude of the pole coincides with the latitude of the place; and may be found by observing the meridian altitude of the pole star, when it is both above and below the pole, and taking half the sum, after it has been corrected on account of refraction. Or the same may be found by means of the declination and meridian altitude of the sun.

Altitude, or elevation of the equator, is the complement of the altitude of the pole to a quadrant of a circle. Or, it is the angle HIC (fig. 6.) or arc HIC of the meridian between the horizon and the equator at E, and equal to 90°, the colatitude of the place.

Altitude of the tropics amounts to the same with what is otherwise called the solstitial altitude of the sun, or his meridian altitude when in the solstitial points.

Altitude of the horizon, or of stars seen in it, is variable by the refraction, according to the quantity of which the horizon is, more or less, either elevated or depressed.

Altitude, refraction of, is an arc of the vertical circle, as SR (Astronomy, Plate 1., fig. 7.) whereby the altitude SE, of a star or other celestial body, is increased by means of the refraction. This is different at different altitudes, being nothing at the zenith, and greatest at the horizon, where it is about 33°. See Refraction.

Altitude, parallax of, is the difference CB (fig. 8.) between the true and apparent place of a star, or the difference BC, between the true distance of a star A B, and the observed distance AC, from the zenith A. The parallax diminishes the altitude of a star, or increases its distance from the zenith. This arc, or the angle measured by it, is evidently less, as the celestial body is farther distant from the earth, and also less, for the same body, as it is higher above the horizon, being greatest there and nothing at the zenith. To find the parallax of altitude, &c. see Parallax.

Altitude of the sun, or moon's shadow denotes the height of the shadow of one or the other in an eclipse, and is measured from the centre of the body. It is found by this proposition: as the tangent of the angle of the sun's apparent semidiameter is to radius, so is one to a fourth proportional, which will be the height of the shadow in semidiameters of the body. The greatest height of the earth's shadow is 217.8 semidiameters of the earth, when the sun is at its greatest distance, or his semidiameter subtends an angle of about 15° 47'; and the height of the same is 210.7 semidiameters of the earth, when the sun is near the earth, or when his semidiameter is about 16° 19'; and between those limits it is proportional to the intermediate distances or apparent semidiameters of the sun. The altitudes of the shadow of the earth and moon are nearly as 11 to 3, the proportion of their diameters.

Altitude, or exaltation, in Astrology, denotes the second of the five essential dignities, which the planets acquire by virtue of the signs in which they are found.

Altitude of motion, in Mechanics, is a term used by Dr. Wallis, for the measure of any motion, estimated according to the line or direction of the moving force.

Altitude, determinative, is sometimes used for the height, whence a falling body acquires, by acceleration, a certain velocity. Heron. Pneum. lib. 1.

Altitude, in speaking of fluids, is more frequently expressed by the term depth.

The ingenious Dr. Hales, in his vegetable Statics, proposed a method of measuring unfathomable depths of the sea; on the principles by which Dr. Defagault contrived an instrument called a sea-gage, which was tried before
the Royal Society; and is described in the Phil. Trans. No 405. A more particular description of this instrument by Dr. Hales himself is as follows.

Suppose A B (Miscellany, Plate I. fig. 1. to be an iron tube, or musket-barrel, of any length, as fifty inches, having its upper end A well closed; if this tube be let down in this position about thirty-three feet into the sea, a column of water of that height is nearly equal to the mean weight of our atmosphere, and, consequently, from a known property of the air's elasticity, it will be compressed into half the space it took up before, so that the water will ascend half way up the tube; and if the tube be let down thirty-three feet deeper, the air will be compressed into of its first dimensions, and so on, 1, 1, 2, &c. the air being constantly compressible in proportion to the incumbent weight; whence by knowing to what height the water has ascended in the tube, we may readily know to what depth the tube has ascended into the sea.

Now to measure the depth of one of these columns of sea-water: first, by a line let the iron tube, with a weight at its bottom, sink about thirty-three feet, which depth in salt water will nearly answer to the weight of the air at a mean height of the barometer; then draw up the tube, and observe how far the water rose. If thirty-three feet of water be equal to one atmosphere, then will the water rise so high as to fill exactly one half of the tube. But if the water rise higher or lower than half-way, then, by the rule of three, say, as the number to which the water rises is to one, so is thirty-three to the number of feet, measuring the depth of the column required. For example, suppose the water rises, when the tube is let down thirty-three-three feet, only of half-way, then say, 9 : 10 :: 33 : 36 feet the depth of each column, which being once known, the number of columns of water is to be multiplied by this number of feet, whereby the depth of the sea in feet will be known.

But since, when the instrument has ascended to the depth of 99 columns, or 99 times 33 feet, the air will be compressed into the part of 50 inches, that is, into half an inch, the divisions both for some space below and also above that will be so very small, that the difference in depth of several columns of water will not be sensible. So that an instrument of no greater length than this would scarcely give an accurate estimate of half a mile's depth, that is 2640 feet, or 80 columns depth of water. The lengthening of this instrument to 4, 5, or 10 times this length would obviate this defect, and make the difference of the degrees of depth much more sensible. But since it is impracticable to make a metallic tube of so great a length, and if it were made, it would be so unwieldy as to be easily broken, the difficulty may be obviated in the following manner.

Let there be a globose metallic body of iron or copper, nearly of this form (fig. 2.) K, L, M, N, Q, whose capacity within may be equal to nine times the capacity of the metallic tube, Z, K, L; let this globose body be firmly screwed to the metallic tube, at K, L, with a leathern collar, well soaked in some unctuous matter at the shoulder, or joining, thereby to secure that joint in the most effectual manner. Let there be a small hole at X for the sea-water to enter freely in, and let some coloured oil be poured into the globose body, to fill it up to the hole X. Let there be also provided a slender rod d, screwed, or fastened into the metallic tube e, which must also be made to screw in and out, whereby to take out the rod at pleasure; the rod must also have a small button d fastened to its upper end, which will prevent its being daubed by falling against the sides of the tube.

The capacity of the tube must be estimated by pouring water in, when the rod and metallic tube are fixed in their places.

Now since the lower vessel is supposed to contain nine times as much air as the tube ZL, which is the same thing as if the tube were nine times as long, therefore the air in the globose vessel will not all be forced within the capacity of the tube, till the vessel has ascended to the depth of nine columns, or nine times 33 feet; for then the air will be compressed within one tenth of the space it first took up. Suppose, therefore, the instrument to have ascended to the depth of 99 columns of water, or 99 times 33 feet = 3267; then the air will be compressed within part of 500 inches (the capacity of the whole vessel being supposed equal to the tube of that length), that is, within five inches of the top of the tube; and, consequently, the rod d will be found tinged with the oil, within five inches of its top.

Suppose again the instrument to have ascended to the depth of 199 columns, or 33 feet each, then the air will be compressed within part of the whole, that is, nearly within 1 inch of the top of the tube. In this case, the instrument will have ascended 3567 feet; that is, one mile and a quarter, and 132 feet.

Suppose again the instrument to have ascended to the depth of 399 columns, then the air will be compressed into part of the whole, that is, nearly within one inch and a quarter of the top of the tube. In this case the instrument will have ascended two miles and a half, wanting 53 feet, which may probably be the greatest depth of the sea.

The larger the capacity of the vessel K, L, M, N, Q, the deeper will the gage be enabled to sink, the instrument being made stronger, and its joints being secured in proportion.

The instrument being thus prepared, a large buoy, i, must be fixed to it, which ought to be a solid piece of light wood, well tarred to prevent the water's being pressed into the lap-vessels; and as it may rise at a considerable distance from the ship, it may be advisable to fix on the top of the buoy broad fans of tin, properly painted, so as to be easily seen.

In order to sink the instrument, a weight must be fixed to it in the following manner. See the diagram. W is a weight of ballast, hanging by its fleet shank T, in the socket ff, which socket is screwed fast to N Q. The shank is retained in its place by the ketch k of the spring Q, while the machine is descending; but as soon as W touches the ground at the bottom of the sea, the ketch O L sinking by the descending force, a little below the upper part of the hole k, is therefore at liberty to fly back, and so let go the weight; then the buoy rises up to the surface of the water with the machine. Springs might also be fixed on the inside of the socket ff, so as to fly back in the same manner, when the weight touches the ground. It might be advisable to keep an exact account of the fall of the machine under water, which might be done by a watch, or by a pendulum vibrating seconds. Dr. Hook found upon trial, that a leaden ball which weighed two pounds, fixed to a wooden ball of the same weight, and both let down in fourteen fathom water, reached the bottom in seventeen seconds; and the detached wooden ball ascended to the surface in seventeen more. See Phil. Trans. Lowthorp's Abr. vol. i. p. 258. Consequently if this machine descended and ascended greater depths with
with the same velocity, it would reach to the depth of a mile in seventeen minutes, and resound in the like time. This, however, might be a vague estimate, until experience has furnished a rule.

This machine was tried in various depths in the Thames, and answered very well, always returning, and leaving the ballast behind. It was afterwards tried near the Bermudas, when several ships were in company; but though a good look-out was kept for three or four hours, it was not seen to return. Hale's Statics, vol. ii. p. 328.

Altitude of the sea's surface is not everywhere where the same, as appears from the drift of currents setting strongly out of one sea into another.

Altitude of the mercury, in the barometer, is marked by degrees placed on the face of that instrument, the variations of which are the chief object of barometrical observations.

The mean altitude of the mercury at London for every day in several years is about 29.87 inches; and its variations are computed between 31 and 28 inches. Some speculations have been made, as if the altitude of the mercury were regularly greater in the morning than in the evening; at least something of this kind was observed to hold for a considerable time at Berlin. Hilt Crit. Rep. Lett. tom. xiv. p. 239.

Altitude of the pyramids in Egypt, was measured fo long ago as the time of Thales, by means of their shadow, which makes one of the first geometrical observations we have an exact account of. Plutarch has given an account of the manner of this operation, which, according to this author, was done by erecting a staff perpendicular upon the end of the shadow of the pyramid; and by two triangles made by the beams of the sun, he demonstrated that there was the same proportion between the shadows as between the pyramid and the staff. Stani. Hilt. Phil. p. 1. p. 9. See Pyramid.

Altitude, circles, parallels, and quadrant of. See the respective articles.

Altitude instrument, equal, is that used to observe a celestial object, when it has the same altitude on the east and west sides of the meridian, or in the morning and afternoon. This instrument consists of a telescope about 30 inches long (with two vertical, and three or five horizontal wires in its focus), supported on the end of an iron bar or axis, 30 inches long, and about an inch in diameter; the axis being fastened in a vertical position by passing through a hole in one end of a brass box, whose other or lower end sustains the lower joint of the axis. The box, which is about 21 inches long, with ends about four inches square, has only two sides, which are fixed at right angles. From one of these sides project four flat arms, with a hole in each, whereby the box is, by screws, fixed in a vertical position to an upright post. On the lower end of the box lies a brass plate, which slides in grooves, and can, by means of a screw, be gently moved forwards or backwards; this plate is a fine punched hole, to receive the smooth conical point, into which the lower end of the axis is formed. On the upper end of the box are two plates, which slide also in grooves; and, by the means of screws, can be gently moved sideways, till their angular notches embrace the axis, which, in this part, is made perfectly cylindrical and very smooth. To the upper part of the axis is fixed, by its radius, a brass sextant (or arch of 63°, to a radius of seven or eight inches) with the arch downwards, so that the centre is just above the top of the axis: also a spirit-level is fixed at right angles across the axis, just under the arch, so as to be clear of the upper end of the box. To the under part of the telescope is fixed a brass fi-
from bulle relieves only in the work being much more relieved and brought forward.

To any representation half-relieved or worse, if it be not entirely detached from the ground behind, sculptors apply the appellation of Alto Reliefo.

ALTON, in Geography, a town of England, in Hampshire, situate on the river Wye. Its manufactures consist of plain and figured baragons, ribbed druggets and ferges; and round the town is a plantation of hops. Its market is on Saturday, and it is distant from London 47 miles.

ALTON is a village near Uttoxeter, in Staffordshire, in which are the ruins of a castle, supposed by Dr. Plot to have been erected by Theobald de Verdun in the beginning of the reign of Edward II, but by others apprehended to be prior to the Norman conquest.

ALTON, a tract of land in Stafford county, New Hampshire, in America, north-east from Barnstead.

ALTONA. See ALTEA.

ALTO, in Ancient Geography, a river of Britain, mentioned by Tacitus, and supposed to be the same with the Avena or Avon; but as there are many rivers of this name, it is conjectured that the Alto of Tacitus flowed by Northampton and Peterboroughcall.

ALTORF, in Geography. See ALTENDORF.

ALTORF, or ALTENDORF, a town of Germany, in the circle of Franconia, now small, but of great antiquity. It has an university with a valuable library, an anatomical theatre, chemical laboratory, and botanical-garden. It has undergone many revolutions from the year 912, when it is mentioned in some ancient records. It is subject to the house of Brandenburg, and is situated 12 miles east-south-east of Nürnberg. N. lat. 49° 25', E. long. 11° 7'.

ALTREMBHAGH, a town of England, in Cheshire, near the canal that pales to Warrington from Manchester, and about 8 miles from the latter town. The market is on Tuesday, and it is 1793 miles from London. N. lat. 53° 25', W. long. 4° 25'.

ALTSOHL, a district and town of Hungary, six miles south-south-west of Neufohl.

ALTSCHTATT, a town of Germany, in the circle of Upper Saxony, and margravate of Meißen, near Stolpen.

ALTSTEVEN, a town of the circle of Wittphalia and bishopric of Munster, five miles north-west of Ahaus.

ALTSTEVEN, or ALTSTETTEN, a town of Swifferland, in the Upper Rhine, seven miles east of Appenhein.

ALTSCHOTZ, or a river of Aisia, which runs into the Tigris, 10 miles above Tebriz, in the province of Kurdistan.

ALTZEN, a town of Aisia Turkey, in the province of Natoîa, 20 miles north-west of Kutaja.

ALTUR, or ALTUR, a coast port town of Aisia, in Arabia Petraea, situate to the west of Mount Sinai, and towards the extremity of the western part of the Red Sea. The Greeks called it Raitho; the houses are built of white coral, which is found in great abundance on the coasts of the Arabian gulf. The inhabitants are partly Arabs and partly Christian Greeks. The monks of Mount Sinai have a convent in this place. Its port, like that of Suez, can admit no large vessels. N. lat. 28° 20', E. long. 34° 39'.

ALTSZENAU, a town of Germany, in the circle of the Lower Rhine, five miles south-east of Hanau.

ALTZHEIM, or ALTZHEIM, anciently ALEHN, a town of the Lower Rhine, in the Lower Palatinate, with a citadel, on the river Selz, and the capital of a prefecture of the same name, three miles south-west of Oderhein, and 14 north-west of Worms. N. lat. 49° 44', E. long. 7° 55'.
progress of the Reformation, had excited a very general dis-
satisfaction among his subjects in the Low Countries; and
therefore, in 1567, he determined to send the Duke of Alva
with an army to compel the discontented to submit to his
will, and to punish them for their disobedience. No person
could be a fitter instrument for the execution of his purpose.
The duke not only approved, but advised and recommended,
his immediate measures. Notwithstanding the remonstrances
of the regent, the Duke of Parma, Philip persisted in his pur-
pose; and the Duke of Alva, with a considerable army, dir-
rected his march to the Netherlands, and, after harrying
the frontier towns, proceeded to Brussels, where he arrived
in the month of August, A.D. 1567. His arrival spread
great conflagration and affliation over all the provinces.
Many thousand persons had before this time left the country,
among whom was the Prince of Orange, who would gladly
have prevailed upon Count Egmont to accompany him. But
he did not perceive the danger that awaited him. The
prince took a sorrowful leave of his with these memorable
words, which a disfamed event must soon have brought to
his recollection: “You are the bridge, Count Egmont, by
which the Duke of Alva will pass into the Netherlands, and
he will not sooner pass it than he will break it down. You
will repent of defying the warning which I have given you,
but I dread that your repentance will be too late.” One of
the duke’s first acts, after his arrival, was to call both Count
Egmont and Count Horn into prison; and their impris-
monment was soon followed by their trial, condemnation and
death. The Dukes of Parma, after repeated solicitations,
obtained permission to quit the country, and he left Brussel
in the beginning of the year 1568, much regretted by all,
and particularly by the Protestant, to whom her adminis-
tration appeared mild and gentle, compared with that which
they had reason to expect under the present government.
As soon as she was removed, the Duke of Alva fully disclosed
his commission, and his powers appeared to be much greater
than those of any former governor, and such as were subor-
dine of all the rights and privileges which Philip, as sovere-
ign of the Low Countries, had at his inauguration solemnly
sworn to maintain. But the pope had previously granted him
a dispensation from his oath, so that his mind was quieted
in every measure of despoticism and cruelty, which he dictated
or sanctioned. Alva’s commission, besides the absolute com-
mmand of the army, comprehended the presidency of the
three councils of state, of justice, and of the finances, with
ample powers to punish or to pardon crimes of every kind
at his own pleasure. Allowing to the Reformers a month for
leaving the country, he issued secret orders to the Inquisition
to proceed immediately in the most rigorous execution of
their edicts. For their assistance and encouragement he instituted
a council of 12 persons, most of whom were Spaniards, and of
which the duke was the president, called the Council of Tu-
mults; but by the Flemings, jully denominated the “Council
of Blood.” Thus fortified and aided, the duke proceeded to
build citadels at Antwerp, and in several other cities, and to
spare his troops over the country in such formidable bodies,
that the people, who could not endure their oppression and
rapacity, either forsook their habitations, or abandoned
themselves to despair. Above 20,000 persons escaped at
this time into France, England, and the Protestant provi-
ces of Germany. Some were seized in their flight, and innocent
persons were overwhelmed with horror at the sight of the
dreadful punishments inflicted on those who were charged
with guilt; and all concurred in lamenting that a country,
once eminently flourishing and distinguished by the mildness
of its government and the happiness of the people, should
now present to view so other object besides confiscations,
imprisonment, and blood. In the space of a few months
more than 400 persons followed by the hand of the execu-
tioner; and yet Alva’s thirst of blood was unquenched.
Like a heart of iron, this vaster tyrant feared no secret
recess, and his soldiers, accompanied by the populace,
were let loose among the Protestants, who were read in
the middle of the night in their beds, and from thence
dragged to prisons and dungeons. Those who had been
only once pritnate in Protestant affairs, although they dis-
claimed their faith in the Catholic religion, to be born and
brought up, were hanged or drawn. And thefts who professed
themselves Protestants, or who refused to shun their reli-
gion, were put to the rack in order to make them disavow
their associates; they were then dragged by hundreds to the
place of execution, and those bodies being committed to the
flames, their sufferings were prolonged with innumerable
cries. To prevent them from bearing in mind the wicked
acts of truth to their profession, their tongues were
first scorched with a glowing iron, and then serrured into
a machine, contrived on purpose to produce the most excruc-
iating pain. It is, indeed, shocking to recount the hardships
inflicted on human cruelty perpetrated by Alva, and his asso-
ciates; especially when we consider that the unhappy victims
were generally persons of the most moderate char-
acter, who, having imbibed the principles of the Refor-
mation, were too honest to dignify their sentiments; or, to
say the word of them, who had been betrayed into injustice
by their zeal for propagating truths, which they believed to
be the highest importance to the glory of God, and the
happiness of mankind. The hearts of even some members of
the “bloody council” revolted against the repeated acts of
cruelty to which their function was required; some of them
sought a dismissal, others absented themselves, and of the
12 that composed the council, there were seldom more than
three or four present. At this time the magistrates of Ant-
werp, whose behaviour had been uniformly obsequious dur-
ing the whole of Alva’s administration, presented an in his
petition on behalf of some citizens whom the inquisitors had
imprisoned. To this petition Alva returned a haughty res-
tply, reproaching them for folly and presumption in applying
on behalf of heretics; threatening them with tokens of his
displeasure; and even afflicting them, that if they persisted
in such measures, they would hang them all, for an example,
to deter others from similar presumption. Some of the catho-
lie nobility also remonstrated to the king against the gov-
ernor’s barbarity, and the pope exhorit him to greater modera-
tion. But the inquisitors enforced the council of Vargas,
who recommended perseverance, and Philip turned a deaf
to the remonstrance which had been made to him; and
the persecutions were continued with the same unrelenting
fury. The people were reduced to circumstances of extreme
difficulty, and they had no resource but in the wildness, pub-
lic spirit, and extensive influence of the prince of Orange.
Alva, soon after his arrival in the Netherlands, opposed
William to appear before him, but he was too garrulous to
be defused by promises of lenity, and refused to obey the
citation, afflicting, at the time of sentence, a variety of reas-
o for his conduct. Several other noblemen were cited to answer
for their conduct; and, upon their refusal, Alva pronounced sen-
tence against them, and confuted their effects. The Prince
of Orange at length had recourse to arms; but whilst he was
employed in making levies, his brother Count Lewis arrived
with an army in the Netherlands, and resolved to make his
first attempt on Groningen. The Spanish army under Count
Aremberg was sent to oppose him, but Lewis was victorious.
However, Alva soon marched against him with a superior army,
and totally defeated him. The Prince of Orange prepared
for acting by publishing a manifesto, in which he declared that his religious sentiments were changed, and that he was now convinced that the opinions of the Protestants were more conformable to the Scriptures, the rule and standard of Christian faith, than those of the Romish church. William was a formidable enemy; and it required all the caution and valor of Alva, and of his son Federick of Toledo, to prevent him from breaking in upon the Netherlands. Alva succeeded; and the prince, disappointed in his expectation of supplies, was under a necessity of disbanning his army. After this event Alva marched in triumph to Bruxelles, and commanded a solemn thanksgiving for his success to be observed through all the provinces. He ordered a statue of himself to be formed of brass, and medals to be struck. On one of these medals he was represented riding in a triumphal chariot, with a Victory behind him, putting a crown upon his head. In his right hand he held a sword, to signify that he had conquered Lewis by open force; and in the left an Aegeis, to express that wisdom of which he had availed himself against the prince of Orange; and as a farther emblem of his wisdom, the chariot was drawn by owls, which, in the ancient Hebran fuperstition, were feared to Minerva. His statue, which was placed in the citadel of Antwerp, was the workmanship of Jockeying, a German artifi, the most celebrated sculptor of the age, and afforded a still more striking display of his vanity and arrogance. He was represented trampling under his feet the figure of a monster, having certain emblematical signs in different parts, which denoted the petition which had been presented to the Dukes of Parma, the compromif, and the insurrection and tumults which ensued. The base of the figure was a square pillar of marble, with the name of the artifi on one side, and with emblems on the Duke of Alva on the three other sides, who is said to have extinguished hereby and rebellion, to have faved the church from deftruction, and restored justice and tranquillity to the Netherlands.

We learn from Grotius, that about this time the duke enacted several useful regulations with regard to trade, the coin, and the liberty of the pref: but they failed in promoting the purposes for which they were intended, and the memory of them was soon effaced by the violence of the measures which he afterwards pursued. He devoted the interval of leisure which he now enjoyed to various acts of tyranny; and to the accomplishment of his schemes for reducing all the provinces to total slavery, and extirpating the reformed religion; and the executioner was fully employed in removing all those friends of freedom whom the sword had spared. The emigrations from the Low Countries were, in consequence of Alva’s violent and cruel measures, very numerous; and of those persons who were exiles many came over to England, where they were all received by queen Elizabeth. In this country they enjoyed the free exercise of their religion; and amply recompensed the English for the protection that was afforded them by introducing various branches of manufacture, with which they had been before unacquainted. Alva’s vanity was flattered about this time by an embassy which was depu- ted by the pope, to present him with a consecrated hat and sword; and he was thus confirmed and encouraged in the prosecution of those fanatical measures, which had procured him this distinguished honour. But such were the absurdity and folly, as well as the oppression and tyranny, into which his arrogance betrayed him, that he adopted a measure which may be regarded as the chief cause of all the difficulties which he afterwards encountered, and of all those astonishing exertions which the people made to emancipate themselves from the Spanish yoke. Heads of the rights and privileges of the people, who had been accustomed to be taxed by their own princes, he resolved, by his own authority, to establish numerous and burdensome taxes, sufficient not only for supplying his present exigencies, but to serve as a perpetual fund for defraying all the expenses of his government. These taxes, by their number, and by the mode of their imposition and enforcement, excited universal discontent. The Isles assembled and remonstrated; but Alva was not only deaf to remonstrance, but determined, after some temporizing measures, to employ force for rendering effectual his arbitrary requisitions. The Isles of Utrecht were resolute and firm in their opposition, and though they incurred a confutation of their territory and revenues, their conduct was attended with the most important consequences, and produced a more general reluctance to the taxes which the governor imposed. In the mean while the prince of Orange was not an unconsidered spectator of these transactions. Having returned from France, in 1569, to his country of Nassau in Germany, he commenced preparations for trying his fortune once more against the Spaniards. The Isles also, who had left the country on account of the persecution of Alva, united, and fitted out a great number of armed vessels with which they feized all the Spanish ships which they could meet with on the Flemish or English coast. Alva persevered in infusing edicts for the payment of exorbitant taxes; and, in order to intimidate the people into compliance, he formed the barbarous resolution of putting to death, before their own houses, 17 of the principal inhabitants of Bruxelles. But before the time fixed for their execution, a messenger arrived with information that the exiles had made a defiance on the island of Vorn, and got possession of the Brille. This intelligence alarmed Alva, and induced him to revoke his bloody orders, and to suspend, for a time, the levying of taxes. An order had been issued by queen Elizabeth, in compliance with the request of Alva, that all ships, belonging to such of the inhabitants of the Low Countries, as had withdrawn their allegiance from the king of Spain, should leave her harbours. This order was an occasion of triumph to Alva, but, in the issue it contributed to the vigorous exertions of the exiles, to the capture of the Brille, and to that union under the prince of Orange, which laid the foundation of the independence of the United Provinces. The spirit of resistance and revolt which was spreading through the country was much encouraged by the defeat of the Spanish fleet under Medina-Celi, in 1572, and by the supply of money and military stores which the exiles found on board the ships that were taken. The revolt in North Holland became general; Muns, the capital of Haarlem, and one of the most populous and flourishing cities in the Low Countries, was taken by Count Lewis; the Spanish army was employed in endeavouring to recover it; the people of Holland and Zealand were industriously securing themselves, by every precaution and preparation in their power, from being again reduced under the Spanish yoke. In contempt of the order issued by Alva, for an assembly of the States at the Hague, a meeting was held at Dort, and it was determined to acknowledge the prince of Orange as the only lawful governor or Stadtholder of the provinces, and commander in chief of all their forces both by sea and land: and every possible exertion was made to furnish him with necessary supplies. Whilst the prince and the States were employed in providing for the security of Holland, Frederic de Toledo was making rapid progrès in reducing the towns which had revolted in the other provinces; but
but his progress was marked by various acts of oppression and cruelty, of so horrid a nature as to be scarcely credible, if they were not well authenticated by the most unexceptionable testimony. But the perversity of cruelty of Alva and his son, after the siege and capture of Haarlem, exceeded, if possible, in atrocity every other measure of this savage administration. By the lowest computation, 900 brave men were executed, with every circumstane of igno-
miny and barbarity, like the vilest malefactors, who, trut-
ing to Toledo's promise, had surrendered their arms to throw themselves upon his mercy. The consequence, however, of the length of this siege and of the loss of men sustained by it, was a mutiny among the Spanish troops; and it was with difficulty, and after much negotiation, that they were induced to march against Alkmaar. Here they met with a repulse, attended with great losses, and Frederic was obliged reluctantly to retire. Alva's fleet was, about the same time, defeated by the Zealanders, and the town of Gertruydenburg surprised by the prince of Orange. Alva, dispirited by these events, and declining in his health, by the anxiety and fatigue he had undergone, solicited a recall, and obtained Philip's leave to quit the Netherlands, and to return home. Philip, diffident of the success of the cruel measures that had hitherto been pursued, and deter-
mimed to try the effect of a milder administration, comple-
ted the more readily with Alva's request. Accordingly, in December 1573, the duke and his son set out, by the way of Germany and Italy, for Spain; after having resigned the regency to his successor Requesens, who commenced his administration with demolishing Alva's statue at Antwerp, and with repressing the insurrection of certain garrisons, at whose enormities his predecessors had connived.

In the review of Alva's administration we may observe, that both the catholics and protestants regarded him as the chief source of all the calamities in which the Netherlands had been involved. He had received his government from the duchess of Parma, in a state of perfect tranquillity. By his tyranny he had thrown it into the most terrible con-
bustion, and kindled the flames of a destructive war, which he was conscious of being unable to extinguish, and he had, therefore, applied for liberty to retire. He is said to have boasted to Count Konigstein, uncle to the Prince of Orange, at whose house he lodged on his way to Italy, that, during his government of five years and an half, he had confiscated more than 18,000 heretics to the public executioner; besides a much greater number whom he had put to the sword, in the towns which he took, and in the field of battle. During Alva's administration, the situation of the Low Countries was truly deplorable. His oppression was not confined to protestants, but many catholics were put to death, and their effects forfeited, under a pretence of their having entertained heretics, or having held a cor-
respondence with them in their exile. Wives were punished with the utmost severity for affording shelter to their husbands, whom the council of tumults had condemned; children for performing the like offices to their parents; and in Utrecht, a father was executed for allowing his son, who had returned from banishment, to lodge under his roof for one night. By forcing so many thousands of the most industrious inhabitants to leave the country, and by neglecting to provide a naval force to oppose the exiles at sea, commerce was almost entirely ruined; notwithstanding which, he imposed upon the people more oppressive taxes, than they could have borne, if they had been in the most flourishing condition. In levying these taxes, the utmost rigour was employed. The people were often wantonly provoked, and tumults purposely excited, from which occa-
sion was taken to punish them with confiscation of their goods, and sometimes with both death and confiscation.

From the confiscations and taxes large sums were raised: yet, by maintaining so numerous an army, and by lodging atolls to keep the principal towns in awe, as he received little assistance from the king, who was engaged in other expensive enterprises, he fell behind in the payment of his troops; and in order to keep them in good humour, he permitted them to live at free quarters upon the inhabitants, against whom they exercised, on many occasions, the most cruel and oppressive capacity.

Alva, after his return to Spain, enjoyed for some time the favour and confidence of his master; but his son Don Garcia de Toledo, having debarred one of the maids of ho-

but, under a promise of marriage, was put under arrest, and still by his father in making his escape. Alva, in order effectually to prevent the fulfilment of his obligations, enforced by the king's order, concluded a marriage between him and his cousin, a daughter of the Marquis of Villena. Upon this Alva was banished from court, and confined to the castle of Uzeda. Here, notwithstanding many intercexfsions in his favour by the pope, and some foreign princes, he remained for two years. But when Don Antonio assumed the crown of Portugal, Philip made preparations for oppo-
ing him; and devolved on Alva the supreme command in Portugal, without forgiving his offence or admitting him into his presence. Alva, notwithstanding his age and infirmities, accepted the command; repaired to the army in 1580, defeated Antonio, and reduced the whole kingdom of Portugal to Philip's authority. When Lisbon was taken, the suburbs, which were at that time no less considerable than the town itself, were delivered up to be ransacked and plundered by the soldiers, without any distinction between the friends and the enemies of the king. When Alva was required to give an account of the treasure which he had acquired on this occasion, he is said to have replied: "If the king asks me for an account, I will flate to him kings-
doms preserved or conquered, signal victories, successful sieges, and 60 years' service." Philip made no further in-
quiries; but Alva did not live to enjoy the honours and emoluments resulting from this last exploit. He died in 1582, at the age of 75 years. Robertson's Hist. of Charles V. vol. iii. and iv. Watson's History of Philip II. of Spain, vol. i. and ii.

ALVACA, in Ancient Geography, a town of Media, according to Ptolemy.

ALVAH, the wood wherewith Moses sweetened the waters of Marah. Exod. ch. xvi. ver. 25.

The name of this wood is not found in Scripture, but the Mahometans give it that of alwah, and pretend to trace its history from the patriarchs before the flood. Josephus, on the contrary, says, that Moses used the wood which he found next lying before him.

ALVALADE, in Geography, a small town of Portu-
gal, in Alentejo, situate between two rivers, and contain-
ing about 1200 inhabitants.

ALVANIS, in Ancient Geography, a town of Mesopota-

mia, according to Ptolemy.

ALVANNA, in Geography, a town of Spain, in the pro-
vince of Guipuscoa, three leagues east of Tre-
vigio.

ALVAR, a town of Hindustan, in the country of Mewat, 60 miles south south-west of Delhi.

ALVARA MARTENS BAY, is situated on the coast of Loango, in Africa, in S. lat. 3°, and E. long. 11°. This bay
small town of Portugal, in the province of Beira, containing one parish, and near 1000 inhabitants.

**ALUCITE**, in Entomology, a subdivision of insects, with digitated wings, belonging to the genus of *Phalaena*, and of the *Lychninae* order in the Lepidoptera system: comprehending 12 species.

**ALUCO**, *facet owl*, in Ornithology, a species of the owl, or strix, with rufly head, black irides, and the primary wing-quills serrated at the edges. This species, the *La Hublotte* of Buffon, the *Ullula of* Genn. and Aldr. the black owl of Albania, and the brown owl of Pennant and Lewin, is 15 inches long; its head is large and rounded, without tufts, and face fink, as it were, within the plumage; the beak of a yellow or greenish white; the upper part of the body of a deep iron grey, mottled with black and white spots, the under part white, with longitudinal and transverse black spots or bars; and the legs white, sprinkled with black points. It flies lightly, and not ruffling with its wings. The outmost feather of the wing is two or three inches shorter than the second, and this shorter than the third; and the longest of all are the fourth and fifth. Its cry is a kind of howl, resembling that of wolves, whence its name *ullula*, and the German *bulb*, or *boo-boo*. It inhabits Europe and Tartary, and is said to be considered as sacred by the Cains, for having contributed to preserve the life of their great monarch, Jinglis Khan, though Mr. Pennant attributes this to another species. In Summer it lodges in the hollows of decayed trees in the woods, and in Winter approaches human habitations. Its most usual prey is field-mice, which it swallows whole. It generally lays four eggs, of a dirty grey colour, in the nests of other birds, such as buzzards, bulfills, crows, and magpies. Gmelin's *Linn. Buffon's Birds*, vol. i. p. 297.

**ALUDE**, or *Allyda*, in Ancient Geography, a town of Aia Minor, in Phrygia Major, upon the confines of Lydia.

**ALUDEL**, *Aludel*, Fr.—Sublimirtopfe, Germ.—*Aludelle*, Ital.—*Capizziello sublimatorio*, Lat. The aludel of the chemists is a kind of pot or cucurbit, generally made of earthen ware, but sometimes of glass, open at both boards for the purpose of collecting the products of dry sublimations. The matal or cucurbit, containing the sublimations to be sublimed being fixed in a sand bath, is covered with an aludel, so disposed as that the neck of the cucurbit may be received into the body of the aludel, this again is covered in like manner with another aludel, and so on increasing the fers according to the volatility of the sublimates operated upon.
on, the neck of the upper alveol being either flopped with a cork or covered with an imperforated capital. See Chemistry, Plate iii. fig. 14. A, the cucumber, B, a series of alveols, C, the capital. It was in an apparatus of this kind, that those crystalline sublimates formerly called florez, as flowers of sulphur, of scutellum, of Benuza, &c. used to be prepared, when each chemist and druggist manufactured these articles for his own use: but since the shops have been supplied for the most part from large wholesale laboratories, the alveol, together with various other vessels, has been discarded, and its place supplied by apparatus of more simplicity and greater expedition.

ALVEARE, in Conchology, a species of TROCHUS, with a pleated nodulose shell, flattened transversely, and adorned with bands of concentric points, funnel-shaped umbilicus, and crenulated columnella. It is found in India: the shell is coloured with a mixture of green and white, within pearly, and finely annulated.

ALVEARIUM, in Anatomy, the bottom of the concha, or hollow of the auricle, or outer ear.

The alvearium auriculae is a cavity, terminating at the meatus auditubus, wherein that bitter yellowish excrement is collected called cerumen, or ear-wax.

ALVEARUM also signifies a bee-hive.

The word is formed of alveus, a channel, or cavity; in allusion to the alveoli, or cells, in bee-hives.

Some of the ancients use also the word alvearium for a bee-hive, more usually called among us apiary.

ALVEARIUM is sometimes also used figuratively, to denote a collection.

In which sense, alvearium amounts to much the same with what we otherwise call thorax, coracina, or the like. Vine. Dorcas has published an alvearium of law.

ALVEAREZIT, among Aramn Writers, denotes what we ordinarily call falling-fors, or star-shot.

ALVENSELEN, in Geography, a bullaile of Magdeburg, in Germany.

ALVEOLATE, in Botany, a term used in the same sense with favolus, or honey-combed, to express a part that is surroved by oblong deflections.

ALVEOLI, in Anatomy, those little sockets in the jaws wherein the teeth are set.

The alveoli are lined with a membrane of exquisite sensibility, which seems to be nervous, and is wrapt about the roots of each tooth; from whence, and from the nerve, proceeds that pain called odontalgia, or tooth-ach. Of these alveoli there are usually fifteen in each jaw.

ALVEOLI is more especially used, among Naturalists, for those waxen cells in the combs of bees, wherein their honey is deposited.

ALVEOLUS, Nautilis Orthoceras of the Linnaean fyllem, in Natural History, the name of a marine body, found frequently follices, sometimes lodged in the cavity at the end of the belemnite, and sometimes loose; and in this last case, often so large, that we cannot suppose any belemnite ever to have existed so large as to have been able to contain it. We do not meet with these at this day in their recent state, but what we find of them follices are ever large at one end, and tapering to a point at the other, and are composed of several hemispheric cells, like so many bee-hives jointed into one another, and having a spheumulus, or pipe of communication, like that in the thick new bursts. These are sometimes found perfect and whole, but much more frequently truncated, or wanting a part of their smaller end.

Klein.

ALVERD, in Geography, a town of Scythia, in the province of Taberian, 20 leagues south-south-west of Ferabad.

Vol. I.

ALVERNO, a mountain of Italy, in the duchy of Tarentum, 10 miles north of Borgo San Sepolcro.

ALVERON, a small town of Portugal in Estremadura, containing, within a district of one parish, about 400 houses, two leagues from Lisbon.

ALVUSEN, in Botany, a name used by some for the palmaeum, or by-fern.

ALVUS properly denotes a channel.

ALVUS is applied, by some, to the tunnel between allies arising from the receptaculum eglit under the diaphragm.

ALVUS is also used in Antiquity, to denote a small vessel, or boat, made out of the trunk of a single tree, by boring or cutting it hollow.

Such was that wherein Romulus and Remus are said to have been exposed.

ALVIDONA, in Geography, a small place of Naples, in Calabria Citera, nine miles north-east of Cutilano.

ALVIDUCA, compounding of alveus and duca, I draw, or openers of the belly, in the Mattea Medico, a term used by some writers for laxative or purgative medicines.

ALVIGNANO, in Geography, a town of Naples, in the country of Lavora, 10 miles east of Capua.

ALVITO, a town of Naples, in the country of Lavora, six miles east of Sora.

Alvito is also a small town of Portugal, in the province of Alentejo, containing about 2000 inhabitants, and a barony.

ALULA nasa feu furia, bastard or spurious wings, in Ornithology, is a kind of appendage to the true principal wing, placed near its outer extremity, at the base of the primary quill-feathers, and consist of three to five small feathers of the quill kind.

ALUM, of use, in Mineralogy. Under this head we include all those minerals which either contain alum ready formed, or are capable of yielding this salt by the process of manufacture. They may be conveniently divided into three families. 1. The saline, all the species which are almost wholly soluble in water; 2. The earthy-saline, in which the soluble particles are diffused through a large proportion of earth; 3. The earthy, which containing no alum, but only the materials of it, are insoluble and definite of that sweetish alluring taste, which is characteristic of the two former.

I. Family—Saline. Tafle aluminous, almost wholly soluble in water.

Species 1. Capillary alum.—Vitriolum balatricium, Werner.

ALULA is a small town of Portugal in the province of Alcantejo, containing about 2000 inhabitants, and a barony.

ALULA nasa feu furia, bastard or spurious wings, in Ornithology, is a kind of appendage to the true principal wing, placed near its outer extremity, at the base of the primary quill-feathers, and consist of three to five small feathers of the quill kind.

ALUM, of use, in Mineralogy. Under this head we include all those minerals which either contain alum ready formed, or are capable of yielding this salt by the process of manufacture. They may be conveniently divided into three families. 1. The saline, all the species which are almost wholly soluble in water; 2. The earthy-saline, in which the soluble particles are diffused through a large proportion of earth; 3. The earthy, which containing no alum, but only the materials of it, are insoluble and definite of that sweetish alluring taste, which is characteristic of the two former.

I. Family—Saline. Table aluminous, almost wholly soluble in water.

Species 1. Capillary alum.—Vitriolum balatricium, Werner.
Species 2. Plume alum.—Alumen nativum f. plumosum, Werner.—Naturl. f. fider alum, Germ. Fjöder alum, Sweed.—Fluorartigt alum, Dan. Alum de plume, Fr.

The colour of this substance is yellowish or greyish white. Its external lustre is dull, but sometimes glimmering, or even little-fining. It consists of slender irregular hair-shaped fibres, either single or accumulated, and slightly adherent to each other; it is very brittle or amorphous. It is usually opaque, but sometimes also transparent or semitransparent. It excites the name talc on the tongue as the preceding species.

It is found efflorescing on bituminous schistus at Göttwig in Austria, on grey argillite in Carinthia, in clefts and caverns on Strombol, the Solfataras, the grotto of St. Germaino, Mifeno, and other places in Italy.

In Klaproth's Essays is an analysis of the native alum of Mifeno, from which it appears, that 100 parts yield by simple solution and crystallization 47 of perfect alum, and 29 more by the addition of the necessary quantity of water, the remainder being found with a little feline, and a small trace of oxidised iron.

Species 3. Mountain butter.—Vitriolum alumen butyraceum, Werner.—Bergbutter, Germ.

Its colour is of a more or less dun isabella yellow, or yellowish brown. It occurs amorphous commonly overlaying the surface of aluminous schistus in lumps or clots. Internally it is shining, with a waxy lustre. At first it is very soft, but by exposure to the air it becomes of a middle consistence, between crumbly and compacted, and is then of a faint shivery fracture. Its fragments are indeterminate, blunt. Its distinct concretions are small and fine granular. It is transparent on the edges, and slightly elastic; feels somewhat unctuous, and leaves on the tongue an acadly sweetish astringent taste.

It occurs in many places where the aluminous schistus is plentiful, and exposed to the air, as at Mufkaw in the Oberlanitz: is also found in Siberia.

It has not yet been analysed, but probably differs from the preceding, in containing a larger proportion of clay and iron ochre.

II. Family. Earthy-saline. Talc aluminous, very little soluble in water. All the ores that belong to the third family are occasionally found to have undergone a natural change, similar to what is produced in them by art at the alum manufactories; in consequence of which they often yield, by lixiviation, a variable proportion of alum, and exhibit the sweetish astringent taste peculiar to this salt.

1. Upon the purely sulphurous ores or alum-flone with its varieties, this alteration seems to take place by the action of subterranean fire: alum is also probably formed in more earthy compounds of fex and alumina, that contain no sulphur when they overlie heated sulphureous strata, by which they are first cracked and then penetrated with sulphureous acid vapours. Examples of both these occur in Italy at La Tolfa, not far from Civita Vecchia, and the Solfataras in the Neapolitan dominions; from 100 parts of which Bergman obtained by mere lixiviation eight parts of perfect alum. 2. The well known property of pyritous and pyrite-sulphurous materials to heat, and afford vitriolic salts by the combined action of air and moisture, may also be traced, though in a fainter degree, in the aluminous ores of this derivation; hence it is that the upper strata of the softer aluminous schistus, of the alum earth, and the sulphureous peats are occasionally impregnated with alum. The marly black soil of Arragon, that yields pure alum by lixiviation (Bowles's Spain, p. 388.), appears to be of this kind; also the aluminous turf of Helsanbarg in Scania (Bergm. Hist. vol. i. 353.) and a vein of black earth in the Shetland islands, containing alum and sulphated iron. Alum is also extracted from fossil wood in Helle, (Vogel, p. 322.) Springs in the neighbourhood of these strata sometimes hold a little alum in solution, as those near Halle (Chym. Ann. 1788, p. 224.)

Family III. Earthy.—no aluminous taste—not soluble in water.

Alum-flone is greyish or yellowish white, isabella yellow, or light smoke grey; amorphous. Its internal lustre is dull, feldspar glimmering. Its fracture uneven, splintery. Fragments indeterminately sharp-cornered. It has distinct corynthoidal concretions, which might be mistaken for a fine fibrefil texture. It is slightly transparent at the edges. Is half-hard paffing into hard. Brittle, infipid, feels meagre; and adheres slightly to the tongue.

Its fp. grav. according to Kirwan, is 2.424. It has an earthy smell, and when projected on a hot red iron it illices and gives out a black smoke, a light sulphureous smell, and the residue acquires a reddish colour. According to Monnet's analysis, it consists of sulphur and clay, in nearly equal proportions, together with a little iron and potash. Bergman found it to contain about 43 sulphur and inflammable matter, 35 alumine, and 22 siliceous.

It is found in mafles and veins running through argillaceous rocks at La Tolfa, in the strates of the church, and in the ore from which the Roman alum is prepared. A volcanic origin has been generally attributed to it, but apparently without reason, as the veins of La Tolfa have been traced into the Apennines. It was formerly suppos'd to be mafly calcareous, as evident from the fynions quoted above.

La Metherie (Theorie de la Terre, vol. ii. p. 215.) has hazarded an opinion that it is principally alum superfluatuated with alumine, and therefore earthy and infibulous. This is a notion which derives high probability from the recent analysis of this ore, by Vauquelin (An. de Chem. vol. xxii. p. 275,) who obtained from it

A similar kind of ore has been discovered in rocks near Poliowire in Brittany.

Of this there are two varieties.

Its colour is bluish black, sometimes greyish black. Amorphous, or in concentric balls imbedded in the strata. Its internal lustre is glimmering, or dull. Fracture flat or curved flatly. It flies when broken into broad thivers, or trapcoidal fragments. Gives a grey streak; feels rather smooth but meagre. Is soft, brittle, and but little elastic.

Var. 2. Shining alum-flone. — Glanzender alunatschiefer, Germ.—Argilla aluminaris fribulata nitida, Werner.
It is of a bluish black colour, generally passing into the iron black—occurs amorphous, in large flatis. The lute of its parallel fracture is shining or even brightly shining, with a lute between common and vegetable; that of its 
crofs fracture is dull, or at most glimmering. Fracture 
thick and curved flaty, seldom thin flaty. Its fragments 
therefore are sometimes thick and sometimes thin flivery. It feels smooth; is half hard; brittle; and but little elastic.

Both varieties are found in Norway, at Whityn in England, in Sweden, in Saxony, and various other provinces in 
Germany. The alun of Great Britain and the north of 
Europe is almost entirely made of it, for which use the second 
variety is said to be the best adapted. It commonly 
occurs in the neighbourhood of coal, and seems to differ 
in no respect from the bituminous shale impregnated with 
pyrites.

Species 6. Alum-earth—Periwinkle clay, alum earth 
Germ.—Argilla aluminaria bituminosa, Werner. 
Allan yard, Sweet—Terre aluminieuse, Fr— 
Timfs fold, Hung.

It has a light or dark blackish brown, brownish black, 
or blackish grey colour. Occurs in large strata of earthy 
or irregularly flaty masses. It is generally dull, but when 
containing scattered particles of metal, becomes occasionally 
glimmering. Its fracture is between compact earthy and 
imperfectly flaty. Its fragments are partly flaky and partly 
irregularly blunted cornered. Its flake has a feeble luster. 
It is very soft, and may be rubbed to powder between the 
fingers; is brittle, and of very little elastic.

When placed among burning coals, it generally blazes a 
little; and when moistened and exposed to the air in 
large quantities, it heats and not unfrequently inflames. 
From 100 parts of it, after torrefaction, Klaproth obtained 
the alun, 7.25 sulphate of iron, 2.25 sulphated lime, and 1 
sulphated magnesia.

It is found in alluvial and secondary flaty, and is intimiate 
ly connected with bituminous wood, alum flaty, and 
coal flaty. Is used in the manufacture of alum in 
Germany.

man's Essays.—Klaproth's analytical Essays.—Kirwan's 
Mineralogy.

ALUM, Manufacture of.

In order to appreciate rightly the peculiar advantages or 
disadvantages of the several methods of manufacturing this 
fatt, it will be necessary to enter into a previous enquiry concerning 
the nature and proportions of its elements, and the 
different chemical varieties of alun, which have hitherto 
been confounded under the same name.

§ 1. Analysis and Composition of Alum.

The identity of the earthy base of alun with pure clay, 
was first ascertained by Geoffroy and Hellot, and the suc 
cessive experiments of Pott, Margraaff, and Macquer, upon 
the same subject, put an end to the controversy concerning 
the nature of aluminous earth, which has ever since been 
universally received as the same with pure clay or alumine, 
according to the reformed nomenclature. The acid in 
alun has always been considered as the sulphuric, and the 
only question among chemists on this head is whether the 
acid is necessarily in excess. A solution of alun redhens 
litmus paper, and exhibits other properties of an uncombined 
acid; but on the other hand it is contended by 
Morveau, that crystallization and edulcoration would effectu 
ally separate any such excess, and therefore that the change 
of vegetable colours is not an unequivocal proof of super-
abundant acid. Referring the consideration of this and similar 
cases till we come to treat of the article saturation, it 
is sufficient to observe here, as indeed Bergman has clearly 
shown, that the acid exists in alun with two very different 
degrees of affinity. By the action of iron filings on a solu-
tion of alun, all the signs of uncombined or loosely adher-
ing acid are destroyed, sulphated iron is produced, and a 
white earthy precipitate takes place, consisting of the alun 
depoly than a small portion of its acid, but full retaining 
the greater part, as may be proved by the further decom-
position of it by a caustic alkali; and to this superabun-
dant or roughly combined acid, is entirely owing the table, 
the solubility; and most of the other external characters of 
the salt.

The component parts of alun, according to Bergman, 
are 58 sulphuric acid, 18 alumine, and 44 water of crystal-
lization. Observing, however, that those solutions, which 
contained a great excess of sulphuric acid could not be 
employed to crystallization by the addition of lime, soda or 
barites; but only by means of potash or ammonia; finding 
also sulphate of potash in many species of alun, he appears 
often induced to believe that the alun of commerce is a triple 
full of confounding of sulphuric acid, alumine and potash.

The subject remained in this state of uncertainty till it came under 
the notice of the most eminent analysts of modern times, the 
accurate and indefatigable Vauquelin, to whose admirable 
Memorials on the combinations of alumine with sulphuric acid, 
we are indebted for the final illustration of a question of equal 
importance to the chemist and manufacturer.

Lorder to ascertain the component parts of alun, and to 
determine the necessity and peculiar agency of alkalines in 
it preparation, he dissolved in pure sulphuric acid some alu-
mine equally pure; the solution was evaporated several 
times to dryness to drive off the excess of acid, and the dry 
and pulverulent residue being then re-dissolved in water, was 
brought by evaporation to various states of specific gravity 
for the purpose of crystallization; but, notwithstanding every 
precipitation, a soft mass, consisting of crystalline flakes, was 
all that could be procured. The solution, which had thus 
constantly refused of itself to afford crystallized alun, began 
to deposit some immediately on the addition of a few drops 
of potash, and by gradually adding the alkali, drop by drop 
as the deposition of alun ceased, the whole was converted 
into pure alun, without the smallest mixture of sulphated 
potash.

Another portion of the same pure aluminous sulphat was 
mixed with carbonated soda, but without obtaining any cry-
flats. Nor were lime or barites more efficacious.

Hence it appears plainly that the use of potash is not 
merely to engage the excess of acid, otherwise, soda, barites 
and lime, ought to have produced the same effect. Again, 
if potash and ammonia unite only to the superabundant acid, 
the sulphate of potash and ammonia should occasion no change 
in the pure aluminous sulphat; but, on the contrary, if they 
form an essential constituent part of alun, then they should 
produce the same effects when combined with sulphuric acid, as 
when pure. To ascertain this, a solution of sulphated 
alumine was mixed with a few drops of sulphat of 
potash, the immediate effect of which was the production of octahedr 
aline crystals of alun. Sulphate of ammonia produced the 
same result.

It might still, perhaps, be objected, that the action of these 
alkalis, as they are remarkably greedy of sulphuric acid, deter-
ned the crystallization of the alun, by the simple assem-
In order to determine this, some uncertainly crystallizable aluminae fulvus was mixed with acidous fulvus of potash, and afforded as great an abundance of alum as when the neutral fulvus of potash was made use of. Hence, no doubt can remain concerning the influence and particular mode of action exercised by potash and ammonia in the manufacture of alum.

The experiments of Bergman and of several other chemists ascertained, that when a solution of common alum is boiled with a quantity of pure alumine, this last combines with it, and forms a peculiar salt insoluble in water, known by the name of neutral aluminae fulvus, or alum saturated with its own earth. To this fact was added another of equal importance, by Vauquelin, namely, that the earthy salt thus precipitated retains its potash or ammonia, for by digestion in dilute sulphuric acid, it is dissolved, and affords octahedral crystals of alum; it even appears from the memoir of this philosopher quoted above, that the presence of one of the two alkalies is necessary to the formation of this neutralized alum. To an uncertainly crystallizable solution of fulvated aluminae perfectly free from alkali, he added some pure alumine, and found that a part of it was dissolved to the complete saturation of the acid, but that no precipitation took place; having then added a few drops of fulvated of potash, a precipitate was deposited shortly after, possessing all the properties of the foregoing saturated alum. Hence is established the necessity of fulvated potash or ammonia, to enable alum, by combining with a larger proportion of its base, to pass to the earthy flake.

The alum of commerce always contains fulvated of potash either alone or mixed with fulvated ammonia, and as it is often of consequence to the manufacturer to know the absolute and relative proportions of these salts, the following method of analysis may be had recourse to. First, let a small piece of the alum be reduced to powder, and mingled with a solution of caustic potash in sufficient quantity to decompose it entirely; if then, upon gently heating, it gives out an ammoniacal odour, as is generally the case, this indicates the presence of fulvated ammonia. Having obtained this indication, let two or three hundred grains of the alum be dissolved in distilled water and put into a tubulated retort, and then add quick-lime, equal in weight to the salt; by making this mixture boil for about twenty minutes, the whole of the ammonia will be expelled, and may be condensed by cold water in the receiver, or a Woufle's apparatus: this ammoniacal liquor, being then carefully saturated with sulphuric acid and crystallized, will show the quantity of fulvated ammonia. The residue in the retort being mixed with warm water and filtered, a clear liquor will be obtained, containing the fulvated of potash, with some felsmite; this latter will be precipitated by boiling and evaporation, and the remaining fluid will then deposit the fulvated of potash in a crystalline form. When the previous assay does not indicate the presence of ammonia, the alum is to be decomposed by caustic ammonia, the precipitate is to be well washed, and the liquors being added together, are to be gently evaporated to dryness; the salt thus obtained is to be heated in a crucible till it leaves behind exhalation fulvuses of ammoniacal fulvus, and the residue is fulvus of potash.

§ 2. Manufacture of Alum from the earthy ore. The only place where this kind of ore is found in sufficient abundance to be worth working, is at the Solfatara, a few miles from Naples. The Solfatara, called by the ancients Forum Vulcani, Campi Leuogesti, is a small plain, at the top of a hill, covered with a white soil, and exhaling fulphurous vapours which, during the night, emit a pale blue lambent light: the ground, even at the surface, is considerably warm, proceeding, no doubt, from subterranean fire. It has continued in nearly the same state from the age of Pliny to the present time, and is celebrated by this author in his Natural History (lib. xxxv, ch. 50.) for its fulphur, but not for its alum, as the Abbé Mazenas affirms. On the contrary, by his omission of the Campi Leuogesti, when mentioning the various places from which alum was then procured, it is plain that the establishment of the alum works of the Solfatara is of more recent origin. The white clayey soil of this plain, being constantly penetrated by fulphurous vapours, and the exhalations during the night being for the most part mixed with the dew, and thus returned upon the surface, cause it to be covered with a light fulphureous efflorescence. This, together with the earth to which it adheres, is daily collected and distributed into hauen cauldrons, so as to fill about two-thirds of their capacity; water is then added, till it stands about three or four inches above the surface of the clay, and this, in a few hours, by the assistance of the natural heat of the ground in which the cauldrons are set almost up to the brim, extracts the alum diffused through the clay, and deposits it in rough crystals on its surface. These crystals being taken out and wafted in the mother liquor, are put with fresh water into other boilers, and again diffused as before, by the natural heat of the ground; the solution is then run through a filter into large wooden coolers, and in a day or two affords a large quantity of pure colourless crys-

§ 3. Manufacture of Alum from alum-flint. It is at La Tolfa, not far from Civita Vecchia, in the Roman flat, that the manufacture of alum from this species of ore is principally carried on. All the alum known in commerce by the name of Roman alum is thus prepared, as well as the Levant or Smyrna alum.

The ore of La Tolfa forms veins of considerable hardness, which are separated by means of blaffing from the rest of the rock; the pieces thus obtained are brought to the caleining oven, which is merely a hole dug in a side garden, four or five feet in diameter, and from five to six in depth, with a lateral gallery, communicating with the open air, and the bottom of the furnace. The bottom being covered with faggots of brush-wood, the pieces of ore are skilfully laid over them, so as to form a kind of hollow vault, between the interllices of which is an ample passage for the smoke. As soon as the fire is kindled and the flame begins to appear between the flomes, a workman is at hand to regulate the combustion, that it may be neither too great nor too feeble; in the course of from three to five hours the smoke begins to decrease, and the fire burns brightly; this is allowed to go on till the flome of burning sulphur begins to be prevalent, which is a sign that the ore is sufficiently roasted. The fire is now raked out, and the flomes are left to cool. The sign of this fire proceeding well conducted, is, that
the ore has now acquired the sweetish astringent tace of alum.

The second process begins by piling the calcined flakes in long beds, on a sloping floor, the lower side of which is terminated by a ditch of water, extending along its whole length; from this ditch the beds are frequently sprinkled, and the water draining from them return again into the reservoir. In about a fortnight the flakes begin to crack and break down, and are at length, in forty days, more or less, overspread with a reddish efflorescence, and reduced into a kind of paste. A leaden boiler is now half filled with water, and when hot, fresh portions of the prepared ore are continually poured in till a solution of sufficient strength is procured; the liquor as yet turbid is drawn off into another boiler, where it is subjected to a very gentle evaporation, at the same time that it becomes clear by the deposition of its earth. Having arrived at the point of crystallization, it is transferred by means of a pipe into a square wooden vessel, eight feet high by five wide. It is constructed as to be readily taken to pieces; after remaining here for a few days, the mother water is poured out, to be boiled again with fresh alum ore in the first cauldron, and the crystalline, when dried, are ready for sale.

From this account of the process, by an eye-witness (the Abbé Mazzea), it would appear that no potash or ammonia is added to the liquamen; it follows, therefore, that one or both these alcalies must be found in the ore, and this is actually the case, according to the analysis, by Vauquelin, already quoted in the preceding article.

The nature of this ore has been long misunderstood, as well as the rationale of its manufacture, and the analyses of it undertaken by Bergman and Monnet, have only served to perpetuate the error. Both these chemists found a large proportion of sulphur in it, while Vauquelin finds only fulphoric acid; this apparent contradiction, however, may easily be reconciled, by considering that the ore contains carbonaceous matter enough to blacken it, and to give out a light flame when powdered and spread on a hot iron; hence, if the analyses of Bergman and Monnet were begun by distillation, in a close retort, as it probably was, the decomposition of the acid and production of sulphur is readily accounted for.

Admitting then the proportions of this ore, as ascertained by Vauquelin, to be sufficiently correct, viz. alumine 43.92; sulphuric acid 25.; potash 3.681; water 14.; the ratio of the latter, 325, it ought to be considered as a native saturated alum, with excess of earth and deficiency of alkali, intimately mixed with fies and inflammable matter. The action of the fire in the roasting is to drive off the inflammable matter, and from the sweet aluminous tace which is thus communicated to the ore, notwithstanding the low volatility of part of its sulphuric acid, it seems also to effect a separation between the alum and the excess of earth. The subsequent cracking and breaking down upon exposure to the air and moisture, is probably caused by the absorption of water of crystallization.

But though a considerable proportion of alum is thus obtained, without the addition of potash, it may be worth while to enquire whether a larger quantity might not be procured by a trifling additional expense. The alum of La Tolfa contains by Vauquelin's analysis 49. fulphat of alumine 43.82; 7. fulphat of potash; 44. water; 160. And according to Kirwan (on the proportion of real acid, 46. 150 parts fulphat of potash are compos'd of 54.8 potash and 35.2 sulpheric acid; and 100 parts of alum 63.75 alumine and 36.25 sulphuric acid. Therefore, the 25 parts sulphuric acid in the ore require 37.4 alumine and 25 potash. But the ore only contains at most 3.68 potash, to that no more than 16 parts of sulphuric acid will be converted into alum; the remaining 9 will be left in combination with alumine in the mother water; and this agrees with the observation of Mazzea, who speaks of an unctuous acid, efflorescent salt being left in the residue of the lixiviated ore.

The 9 parts of acid that are thus left, may, however, be converted into alum, by the addition of 1.44 potash, or about 3. fulphat of potash.

From thes data the ore of La Tolfa ought to yield by the present method of working it 78.5 per cent. of crystallized alum; or by the addition of 3 per cent. fulphat of potash, 125 per cent. of crystallized alum. In this calculation, however, no allowance has been made for the sulphuric acid volatilized in the roasting, and that portion of the salt which cannot be extracted by lixiviation in the large way from the prepared ore; both these circumstances will, no doubt, diminish considerably the produce of alum, but the proportions must vary according much according to the skill and attention of the manufacturer.

§ 4. Manufacture of Alum from the Pyritous ore.

All the European alum, except what is manufactured at Solisata and La Tolfa, as described in the preceding sections, is prepared from the alum lake or alum earth, and these containing only the remote principles of this salt, a much more complicated process is required than where the alum exists ready formed in the ore.

The only necessary ingredients in the pyrite-alumious ores are clay, and pyrites, or sulphuret of iron. Besides these, however, there is generally a variable proportion of bitumen, lime, and magnesia. The black alum is procured from the black micaceous species in which the pyrites is thoroughly disseminated through the mass in such small particles as to be indistinguishable from the rest. Such, however, as contain even large nodules of pyrites, is very capable of being manufactured, much of the Swedish ore being of this kind.

The first thing to be done is to dispose the pyrites to decompose into sulphur of iron, (green vitrual), and this at the manufacture of Flone, in the department of Eure, in France, is brought about by simple exposure of the ore to the action of air and moisture; this ore, however, is of the very best kind, moderately soft, free from bitumen, and with the ingredients well mixed, and even with these advantages, the process requires three years. The more flaky and bituminous kinds, such as those of England and Sweden, are subjected to a previous roasting. For this purpose a layer of billet wood or coke is placed on a floor of rammed clay, and fire set on; upon this are thrown by degrees moderately small pieces of unburnt ore, till a florism is formed, about half a foot in thickness; these presently take fire, by their own bitumen, and are then covered with a florism of nearly the same thickness of ore that has been already roasted and lixiviated; to this succeeds a layer of unburnt ore, and thus alternate layers, eight or nine in number, are gradually added, till the pile is completed. Care is taken by protecting it from heavy rains, and covering those parts exposed to the wind, to keep up the heat of a moderate equable degree till the bitumen being consumed, the fire goes out of itself. If the ore is now examined it will be found to be of a reddish colour, containing a small quantity of sulphuric iron and alumine,
alumine, and in some of the Swedish manufactories is accordingly lixiviated without any further preparation. In the English and German alum-works, however, the roasted ore is watered lightly, and exposed for a greater or less time to the action of the air, by which the sulphur of the pyrites is more completely oxygenated, and in consequence a larger proportion of alum is obtained. In the manufactories of Flone, already mentioned, the singularly judicious practice is observed, of lightly roasting the ore after spontaneous efflorescence.

The acid being thus developed, and in part united to the alumine, the process of lixiviation takes place. For this purpose the ore is thrown into large reservoirs of stone or wood, furnished with a false bottom, to serve the purpose of a filter; water is then poured on, and remains for twenty-four hours or more, in which time it dissolves the greater part of the salts; this being let out by means of a cock fixed nearly level with the bottom of the reservoir, a fresh quantity of water is added, in order to exhaust the ore of all soluble matter. The second lixivium is weaker than the first, but is afterwards concentrated by being used instead of water for the first lixiviation of the next parcel of ore. The water with which the lixiviation is performed is cold, and it might seem at first to be an obvious improvement to make use of boiling water; the experiment has, however, been tried without the desired result, the increased strength of the lixivum not being adequate to the time and expense of fuel. Where the lixivium is kept in large reservoirs, exposed to the weather, much depends on the dryness of the sea son, a few heavy rains weakening the liquor to such a degree, as to add considerably to the cost of boiling down. In Sweden and the northern countries, various attempts have been made to concentrate the liquor by freezing, but the success has not answered expectation; for a saturated solution of alum congeals at nearly the same temperature with common water.

The process of boiling down succeds to that of lixiviation, and is always performed in leaden boilers, copper being for the most part too dear a material, and iron being attended with the inconvenience of decomposing alum. The lixivium is mixed in the boiler with the mother-water of a preceding boiling, and this is done either by filing the boiler with a mixture of mother-water and liquor, and supplying the loss by evaporation with fresh liquor, or by filing the boiler at first with liquor, and supplying the waste by the above mixture. The evaporation lasts from twenty-four to forty-eight hours, according to the proportion of mother-water. In Saxony, where the proportion of mother-water is large, and the lixivium is brought to a high degree of concentration, the boiling continues without interruption for eight days. At the end of these respective periods the specific gravity of the liquor is asayed by a leaden hydrometer, or, with greater exactness, by filling a bottle of known size with the liquor, and then, by weighing it, to ascertain the comparative specific gravity between it and water. This being done, an alkaline solution is added, and the first crystallization is brought about. In the Saxon manufactories, where the liquor is uncommonly concentrated, as soon as the evaporation is finished the contents of the boiler are let out into a reservoir, where they are strongly agitated for half an hour, during which time a certain proportion of soap-makers lees and putrefied urine is added; and the liquor being then let into another vat, the crystals of alum begin immediately to be deposited; at the end of a few days the mother-water is laded out, and the crystals are collected and washed. The method followed in the English works differs somewhat from what is done in the Saxon practice; in thefe, when the liquor appears by the hydrometer to be sufficiently evaporated, the fire is withdrawn from the boiler, and a stream of impure alkaline lixivium, from kelp and soap-maker's ashes, is let into the liquor already in the boiler; at the same time the cock at the bottom of the boiler is turned, so as to allow the contents of it to flow into a reservoir, by which management the two liquors are speedily and effectually mixed. It remains in this reservoir for three hours, during which it deposits an earthy and ferruginous sediment by the action of the alkali, and becomes of a clearer colour; it is now transferred into another large vat, and has its specific gravity again taken, according to which a greater or less quantity of putrid urine is added to lower it to the proper standard; being then agitated briskly for a quarter of an hour it is left at rest, and in the course of five days the crystals are deposited. In some French and Swedish manufactories the liquor, after being boiled down, is merely agitated for some time without adding any alkali, and then passed into the crystallizing tube. The rough alum being washed in order to separate it from the green vitriol which is deposited along with it, is put into a small pan with a little water, and when diffused and boiling hot, some balsams, blood, or other similar substance, is finally added for the purpose of clarification: when this is effected, the liquor is run into caskets, where the crystals are deposited in large masses; after ten or twelve days the mother-water is poured out, and the salt, being then dried, is ready for sale. By keeping in mind the analyses and experiments in § 1. of this article, it is easy to understand the rationale of the manufacture, as well as the advantages and faults of each process. As soon as the pyrites is converted into sulphat of iron, whether by roasting or by spontaneous efflorescence, it begins to be gradually decomposed by the lime and magnesia which may happen to be in the ore, therefore the leaves there is of these two earths, the greater ceteris paribus will be the produce of alum. Clay is incapable of decomposing sulphat of iron; but by exposure to the air, especially when affected by the action of heat, the metal becomes highly oxygenated, and is no longer combinable with the acid which then unites with the clay, as being the substance in the ore of next affinity. Hence arises the advantage of the practice at Flone of roasting the ore after the formation of the sulphat of iron. We have already seen in § 1. that sulphat of alumine, even with excess of earth, is soluble in water, but that it becomes insoluble on the addition of potash; on this account, therefore, coal, which contains little or no potash, is a far preferable fuel for roasting the ore than wood which yields a great deal, as all the alum, thus rendered incapable of extraction by lixiviation, is lost. The bitumen in the ores, however, diminishes the consummation of wood, and the lixivium contains of the sulphats of iron, of alumine, of lime, and magnesia. By long boiling and evaporation the iron becomes so far oxygenated, that the addition of an alkali will decompose the sulphat of iron, rather than the sulphat of alumine. If the alkali is ever in little excess, the aluminoj sulphat will be the next decomposed; this is therefore to be carefully avoided. Nor is the kind of alkali a matter of indifference, for since only ammon and potash are capable of forming crystallizable alum, it would appear that the use of soda in the English manufactories might be advantageously superseded by potash; indeed the chief use of the kelp seems to consist in the potash which this impure soda contains. The principal thing to be attended to in the boilling down is to bring the liquor to such a degree of concentration, that the alum shall be deposited with as little as possible of the other fats.

The mother-water, when thrown away, holds in solution sulphats of potash or soda, and sulphat of magnesia, the extraction of which was made the subject of one of Lord Dun-
donald's patents, but we believe the profits have not yet answered the expence.

The nature of alum, and consequently the true theory of its manufacture, has only been known since the publication of Vauquelin's excellent memoir on the subject in the Annales de Chimie; it is not surprising, therefore, that all the long-established processes should be more or less defective. Perhaps the following method would be found to combine more advantages, and be subject to fewer inconveniences than any which has been hitherto put into practice. The ore should be first lightly roasted with coal to drive off the bitumen, and forward the decomposition of the pyrites, which may be further accelerated by moderate waterings, and exposure of fresh surfaces to the action of the air. When saline efflorescences appear at the top of the heaps of ore, and their interior, upon being dug up, also fumic punctured with white saline particles, let the ore be disposed in alternate plates with coal, and again roasted, so as to decompose as much as possible of the sulphated iron, and combine the acid with the clay; the flower and more gently this process can be carried on, the more completely will its object be answered. The lixivium obtained from this roasted ore will consist chiefly of sulphated alumine, nearly satured with earth, but, on account of the abundance of potash, perfectly soluble. By the subsequent boiling and agitating, part of the sulphat of iron would be decomposed, and this oxidation of the iron might perhaps be still further effected, by pouring the liquor through heaps of faggots, exposed to the wind, as is done in the house of graduation for brine in France and Germany. The ferruginus and felenitic sediments being now allowed to settle, the clear liquor ought to be transferred into another retort, and there mixed with a hot solution of acidulous sulphat of potash, such as remains after the distillation of aquafortis from nitre and sulphuric acid; crystals will be immediately deposited of an alum much purer than common; and here, by a further clarification, may be made equal to that of La Tofla.

§ 5. Manufacture of Alum by Chaptal's process.

An attempt had been made, but with little success, at the manufactory of Javelle near Paris, to prepare alum by the direct combination of its constituent principles; but it was not till the admirable and decisive experiments, in the large way, by Chaptal, published by him in the genuine spirit of philosophical liberality, that the practicability of this method could be said to be established. According to the modern way of preparing sulphuric acid, the requisite proportions of sulphur and nitre being mixed together, are brought to combustion in a closed chamber lined with lead; the sulphur is thus acidified and converted into vapour, which by degrees unites with the water that overflows the floor of the chamber, and forms a liquid, diluted, sulphuric acid. A similar process was instituted by Chaptal, only sublimating dried clay for the water; the result of which was so favourable, that a large manufactory on the same plan was set up in the Rhone, which, having continued in full activity for several years, and producing alum only inferior to that of La Tofla, merits a particular description.

The chamber in which the combustion is performed is 91 feet long, 48 feet wide, and 31 feet in height to the pitch of the roof. The walls are of common malony, lined with a moderately thick coating of white plaster; the floor is a pavement of bricks, set in a mortar, composed of baked and unbaked clay; and this first pavement is covered by a second, in which the bricks are made to overlie the joints of the lower ones, and are themselves firmly connected to each other by a cement, composed of equal parts of pitch, tur-
especially as the rock alum is the kind used in medicine, and the Brunswick imitation of it contains arsenie. The external appearance of the two sorts differs but little. The taste of the Brunswick alum is a little more than that of the rock alum, it is less soluble in water, and when heated to redness, it loses only 37.5 per cent. of its original weight, while the latter loses 50 per cent. The rock alum, when exposed to the blow-pipe, becomes opaque, fuses, forms, and is converted into a lumpy white mass. The Brunswick alum, on the contrary, fuses less, scarcely foams at all, but melts, and becomes of a green colour, exalting at the same time an arsenical vapour. Again, the precipitate from a solution of rock alum by potash or soda, being mixed with boric, fuses before the blow-pipe into a white or yellowish white; whereas the Brunswick, by the same treatment, affords a violet-coloured globule; and in fact it is nothing more than common alum, containing a little cobalt and arsenic.

The Roman alum, manufactured at La Tolfa, is the purest and dearest of all; it is in pieces about the size of a walnut, fJeffing more or less of its cryftalline form, and is opaque, on account of a farinaeous effufcence with which it is covered. The Levant or rock alum appears in fragments of nearly the same fize as the former, but in which the cryftalline form is more obvious; it is externally of a dirty rofe-colour, and internally exhibits the fame tinge but clearer. Smyrna is the place whence it is usually shipped for Europe; but it was anciently made at Roccha, or Edessa, in Syria, whence its commercial name rock-alum. The French alum, that is, Chaptal's, described in § 5, is in fmall, clear, colourless cryftals. The Englifh is in large, irregular masses, considerably harder than the others. Equal portions of all these kinds, being exposed in a muffle to a red heat, were weighed after the intumefcence was over, and the fols by calculation in the Roman alum was 50 per cent.; in the Levant alum 40 per cent.; in the French alum 57 per cent.; and in the English 47 per cent. Of pure water, at 144° Fahr. Roman alum required 14 times its weight for solution; Levant alum required 12 parts; French alum 13 parts; and English 15 parts.

Equal parts of thefe four kinds of alum being dissolved separately in water, the fame quantity of precipitated lime was added to each solution. That of the English alum became slightly blue at the end of a few minutes, as was also that of the French alum, though the tint was rather lighter; after some time the Roman alum became faintly blue; but the solution of Levant alum was only slightly yellow, the natural colour of the precipitated lime. After two days an appreciable quantity of blue precipitate was deposited from the English alum, rather less from the Roman and French, and only a few atoms from the Levantine; the three first solutions were of a bluish green tint, but the last was a very dilute yellow.

Equal parts of the four sorts were dissolved separately in pure water, and their earthy bafe was precipitated by an excess of ammonia. The precipitate from the Roman alum was of a pure dead white; that of the Levantine and French was nearly equal to the Roman; but that of the English was of a dull perceptible bluish tint. By calcination in a red heat, they all at first became blackish, and ended with being perfectly white.

Hence is apparent the superiority of the Roman alum, and the inferiority of the English, when used as mordants for the most delicate colours: for other colours, and for the various utes besides to which alum is applied, each kind may be used indifferently. The English poifeffes less water of cryftallization than the Roman or French; and a given weight of it will go further than the fame quantity of any of the rest, as 12 per cent. is to be deducted from the Levantine, on account of the reddish infufible sediment with which it is contaminated.

§ 8. Historical notice of the introduction of alum-making into Europe.

The ancients appear to have been acquainted only with the native phume alum, which they procured from Lipari, and the neighbouring volcanic islands. In the 12th, 13th, and 14th centuries it was manufactured at Edessa (Roccha) in Syria, in the vicinity of Constantinople, and at Phoca (Toua nova), not far from Smyrna. Bartholomew Perdia, a Genoese merchant, who had often visited Roccha, discovered, about the year 1450, a vein of alum ore in the island of Thasos, and there established the first European manufacture of alum; soon after John de Caltro discovered the body of ore at La Tolfa. Establishments were then made at Viterbo, Volaterra, and other places in Italy with such success, as induced Pope Pius II. to prohibit the importation of Oriental alum. In the 16th century this art was introduced into Germany and Spain; and a little before its conclusion the English alum-works at Whitby were established by Sir Thomas Chaloner, who had the honour of being personally excommunicated by the reigning pope in this very conscription. The earliest of the Swedish works dates no higher than 1637.

ALUM, in Chemistry, Materia Medica, &c. See Sulphate of Alumine.

ALUMINE.—Pure earth of alum.—Pure clayey or argillaceous earth. Alumine.—Terre d'alun.

Terre argileuse, Fr.—Thon-erde, Germ.

The word alumine has been adopted, without alteration, from the modern French nomenclature, by the majority of English chemists, as the technical name of pure argillaceous earth, on account of its being generally procured by the decomposition of alum, when required to be in a state of extreme purity.

Next to filex and lime, alumine appears to be the most commonly occurring earth in those fliny or earthy mafles, of which the globe, as far as we are acquainted with it, is principally composed. It forms the essential, though seldom the greatest part of all kinds of clays, giving to them the property of ductility or plasticity when mixed with water. When in a state of more intimate combination with filex it loses its quality of placticity, and gives to the materials in which it enters, the characters of opacity, of hardnefs inferior to that required for striking fire with fléel, of that odour known by mineralogists under the name of earthy, and of that absence of cryftalline form which is called amorphous; such are the minute mafles of flate and argillaceous fchistus that abound in almost all mountainous tracts, the boles, the colorife earths, the toadstones and clay porphyries. Alumine, however, occasionally, though very rarely, enters in large proportion into cryftallized minerals, and then in its external characters of hardnefs, transparency and luftre approaches very nearly to filex; such is the adamantine flär, inferior only in hardnefs to the diamond, and which contains from 80 to 90 per cent. of alumine: such also is the fapphire, which by the analysis of Klaproth appears to contain no less than 98 per cent. of pure
pure alumine. These, however, which are more properly the mineralogical than chemical characters of alumine, will be treated of at larger in the subsequent mineralogical articles.

Pure alumine, in a state proper for chemical experiment, has hitherto never been found native, and it is only of late that chemists have discovered the method of obtaining this earth sufficiently free from foreign admixture. The method of Bergman and his contemporaries was to decompose a solution of purified crystals of alum by an excess of carbonated potash, or soda, and to wash the earthy precipitate in repeated quantities of distilled water, till it came off perfectly tafteless and pure; a white uniform soft matter was thus obtained, which was supposed to be carbonated alumine, and this by drying in a heat below that of redness, was deprived of its acid and water, and was then esteemed pure alumine. The insufficiency of this method had begun to be suspected for some time, however, particularly from the appearance of sulphurated hydrogen, when alumine thus purified was heated with charcoal, and afterwards moistened with a diluted acid, and the admirable memoir of Vaquelin on alum, (which has already been referred to under that article) not only established the validity of these suspicions, but pointed out the method of avoiding the errors of his predecessors, and thus introduced a very important improvement in the difficult art of chemical analysis. Alum has already been shown to be a triple compound of alumine, potash and sulphuric acid in excess, and when this excess of acid is taken away, either by the addition of alumine or of an alkali, an insufible salt is produced differing from alum only in the proportion of its earthy base; now the cafe with which a salt is decomposed depends very materially on its solubility, when, therefore, we add gradually to a solution of alum a solution of carbonated alkali, the first effect is to neutralize the excess of acid, and the precipitate consists principally of the insufible salt just mentioned; a further quantity of alkali, especially if heated by heat, will effect the decomposition of part of the salt, but in proportion as this takes place the residue becomes mixed with the alumine, and thus is covered from the further action of the alkali. This being the case, it is obvious that no subsequent washings can do more than separate the sulphated potash; and therefore the residue, instead of being pure alumine, contains besides a variable proportion of earthy alum from which last proceeds the sulphur obser-
decrease of bulk is in part occasioned by the expulsion of the last particles of water; but from the augmented specific gravity of the alumine, it is plain that an actual condensation or approximation of molecule takes place, as is observable in various other porous substancess previous to fusion. Whether any artificial heat is able to bring this earth into real fusion is as yet dubious; for though Lavoisier, by means of a blow-pipe charged with oxygen gas, reduced a piece of alumine to a pally fluid-liquid, it is yet improbable, as the earth was obtained from alum, that a minute portion of potash might still be contained in it, and thus act as a flux.

Alumine has a strong affinity for metallic oxyds, especially the oxyd of iron; hence arises the difficulty, and indeed almost impuillability, of obtaining alum free from iron in the great way, because all natural clays and aluminous orces contain more or less of this metal. The only way of accurately separating these two substancess is by digestion in caustic potash or soda, which will dissolve the earth, but not the oxyd.

These two substancess are also capable of acting on each other in the dry way at high temperatures; and some important experiments on this subject are recorded by Achard and Kirwan, from which it appears, that when the proportion of alumine exceeds that of the oxyd of iron, the mixture is in all cafes very difficulty fusible; that when the proportions of the ingredients are equal, and especially when the iron predominates, the refult, after expoefure to a heat of about 160° Wedgewood, is a dark-coloured vitrecous flag.

The action too that subfists between alumine and vegetable or animal colouring matter, is singularly powerful. Thus, if, to a watery infusion of cochineal or madder, a few drops of a solucion of alum are added, a decomposition shortly takes place, and the whole of the tinged particles unite, and are precipitated together with the aluminous base of the earthy falt, leaving the supernatent liquors wholly colourleff. Fugitive colours also, by this combination, become of fufficient permanence to refit for a long time the changes to which they are subject: hence is explained the preparation of the Lake pigments, and the theory of Mordants in the art of Dying.

In the direct way sulphur appears to contrive no union with alumine; and the hepatic gas that is separated by an acid from alum, after having been heated with charcoal, is no longer a decisive evidence of fulphuret of alumine, since the discovery of the necessity of potash to the very constitution of common alum.

Upon the gaseous substancess alumine has not been observed to produce any change, although Humboldt has published (Annales de Chimie, vol. xxix.) a long and plauflible memoir, to shew that alumine absorbs the oxygen of the atmosphere, and hence produces an important effect in the economy of vegetation. It is true, indeed, that many natural clays will deoxygenate atmospheric air; but this is solely owing to the carbonaceous matter and oxyd of iron that they contain, it having been proved by accurate experiments, instituted for this purpose by Theod. Sauvage and others, that pure alumine has no effect whatever on oxygen gas or atmospheric air.

All the acids are capable, in particular circumstances, of combining with alumine; but thefe combinations are not accomplished with the fame ease as thofe between the acids and alkaline earths. The stronger mineral acids will take up alumine from clay by digestion at a boiling heat, but the vegetable and other weaker acids will not readily effect a solution, except the alumine is presented to them recently precipitated by an alkali from sulphuric, nitric, or muriatic acid. All the aluminous farts are decomposed with precipitation of the earth by the caustic or carbonated alkalies, or alkaline earths. For further particulars see the farts under their respective acids.

Ammonia has not yet been observed to exert any action on pure aluminous earth; but both potash and soda, when caustic, will dissolve it without any difficulty. This may be done by evaporating to dryness, and igniting in a fliver crucible, a mixture of caustic alkali and alumine, and then liquifying the mass, or merely by boiling some fresh precipitated alumine in a watery solucion of the alkali. This aluzlated alumine has of late been recommended as a preferable mordant to common alum in the fixing of those colours that are injured by the presence of sulphuric acid. To separate alumine from its solucion in caustic alkali, it is necessary to add nitric or muriatic acid in sufficient quantity to neutralize the alkali and dissolve the alumine, and then to precipitate the earth by caustic ammonia.

The action of barytes on alumine is analogous to that of the alkalies, yet presents some peculiar characters. When a solucion of caustic barytes in water is added to a liquid muriat of alumine, the first effect is the appearance of a precipitate, owing to the decomposition of the falt by the barytes; if this falt, however, is added in excess, the alumine is redissolved by it, and the liquor becomes clear.

Again, if equal parts of newly precipitated alumine and caustic barytes are boiled together in a quantity of distilled water sufficient to take up the barytes, about half the mixture will be dissolved, and upon analysis the infoluble residue will be found to consist of alumine, with a small proportion of barytes, while the solucion will consist of much barytes and a little alumine. By adding to the liquor some muriatic acid, to engage the excess of barytes, a flocculent precipitate will be deposited, confiting of the two earths, nearly in the proportion of the original infoluble residue. Hence it appears that alumine combines with barytes into a falt which is infoluble in mere water, but is capable of being rendered solfible therein by the affinity of barytes. In the dry way, at about 150° Wedgewood, any mixtures of the two earths in which the alumine preponderates remain pulverulent; but when the barytes is three or four times as much as the alumine, the powder concretes into a hard mass, without, however, shewing any signs of fution. In order to decompofe barytic alumine, dissolve the whole in muriatic acid, and add caustic ammonia; the alumine alone will be precipitated.

Strontian produces the same effect on alumine as barytes, but more feebly; the action of these two substancess in the dry way, on each other, has not yet been the subject of experiment.

It appears highly probable that lime has a fimilar affinity for alumine, as the rect of the alkaline earths poftifes; the only experiment, however, upon the subject, is one of Moreau's; he mixed equal parts of muriat of alumine and muriat of lime in solucion, and immediately a precipitate took place, which was infoluble by an excess of acid; this has been once repeated by Darraçq, a pupil of Vanquelin, without effect, the liquor remaining perfectly limpid; hence it is probable that the alumine of Moreau was not quite free from sulphuric acid, and that the infoluble precipitate was merely lecithite. In the dry way lime and alumine in any proportions are infoluble, except by means of a blow-pipe, charged with oxygen gas.

The action of magnesia on alumine is not yet fully ascertained; it appears, however, from Mr. Chenevix's experiments, that the ammonico-magnesian triple farts, are formed with difficulty, when alumine is present, and that magnesia prevents, in a great measure, the solubility of alumine in the caftic fixed earths. This combination of the two earths
earth is, however, soluble in muriatic or nitric acids, and may then be decomposed either by hydrochlorure of soda or of ammonia, which will precipitate the alumine and retain the magnesia in solution, or by an alkaline prussiate, which will also separate the alumine while the precipitated magnesia remains dissolved. In the dry way, according to Kirwan, magnesia and alumine at 150° Wedgewood have no action on each other in any proportions.

A considerable degree of affinity exists between flex and alumine, and the indisputable formation of this compound in many analytical experiments on minerals has often produced a number of deceitful and embarrassing appearances, which have vitiated the results of many laborious analyses. Chemistry is, therefore, indebted to Klaproth for showing, that when a solution of pure flex in caustic potash is added to a solution of alumine equally pure in the same menstruum, the liquor immediately assumes a reddish brown colour, and after standing an hour or more, coagulates into a thick opaque whitish jelly. This jelly, by the addition of a little warm water, is resolved into a fluid, and being then mixed with muriatic acid, to the exact saturation of the alkali, a copious precipitate is deposited, consisting of the two earths, in a state of combination; if now a small excess of acid is dropped in, the flex as well as the alumine, will be perfectly dissolved. Carbonated potash will again cause the precipitate to appear, and this even when separated by filtration and dried, will be still entirely soluble in dilute sulphuric acid, without the smallest deposition of flex. If the sulphuric solution is then gently evaporated, crystals of alum will be deposited, and the remainder will assume the form of a clear jelly, the surface of which, after a few days, will be covered with crystalline pyramids; and in order to show that it is really flex mixed with alumine, which has thus repeatedly been dissolved in acids, nothing more is necessary than to mix this jelly with a large quantity of water, and digest it for some while in a moderate heat, straining it repeatedly at the same time, when the liquors will become turbid and pure flex will be deposited. In the dry way, according to Kirwan, equal parts of alumine and flex at 160° Wedgewood concrete together, but flew no signs of fusion.

Alumine is as yet a pure chemical element, never having been composed or analysed. From its affinity with colouring matter, and its blackening in a low heat, Baron was of opinion that it was of a metallic nature; and even Lavoisier entertained the idea that it might be a metallic oxygen, whose component elements were united together by a very powerful affinity. Beannie considers the earth of alum as essentially the same with flex, being led into this mistake by supposing rock crystal repeatedly with potash, and always obtaining alumine; this experiment of Beannie's was repeated by Scheele, who found indeed that it was true whenever an earthenware crucible was made use of, but perceiving the crucibles corroded internally after every process, he suspected that the alumine was furnished by the action of the alkali upon them; in proof of which he repeated the fusion of flex with potash in an iron crucible, and as might be expected, did not procure a particle of alumine.

The uses of pure alumine are wholly confined to the laboratory: it gives, however, their peculiar character to all glazes: every thing, therefore, that depends on the cohesive-ness and plasticity of these substances when fresh, and their hardness after being baked, may be fairly attributed to the alumine which they contain: hence, it is the basis and material of all the arts of pottery, from the common brick to the finest porcelain, and these include more of the comforts and elegancies of life than are perhaps dependent on any other substance in nature.
A LY

thrice and condition of the faeces, or excrements, contained
within that cavity.

Thus, when a person is laxative, it is called aleus liquida;
and when colitive, aleus afferlata.

They who are of a loose belly in their youth are gene-

erally colitive in their old age; and they who are bound in

youth are often loose when old. A laxer state in youth,
and rather bound than loose in old age, is most desirable.

Binders of the belly are labour, fitting in a chair, fullers' clay lid over the body, diminution of food, eating once a day
instead of twice, little drinking, and that only after a full
meal, refl after meals. On the contrary, things which loosen
the belly are, walking and eating more than usual, stirring
after meat, intermixing draughts with eating, and it ought to
be observed, that a vomit binds a loose belly, and loosens a
bound one; and that a vomit taken immediately after meat
binds the belly, but, delayed until a considerable time after,
loosens the fame. Celsus.

ALWAIDII, a seat of Mahometans, who hold that all
great crimes are unpardonable, and the criminals reproportioned
to eternity. The alwaidii stand in opposition to the mor eii.
They attribute less efficacy to the true belief in the salvation
of men than the rest of the Mussulmen.

ALWEIL, in Geography, a lake of Switzerland, in the
canton of Berne, seven miles long, and one and a half wide,
seven miles south-east of Aran.

ALWEN, a river of North Wales, which runs into the
Dee, seven miles north-north-east of Bala, in Merionethshire.

ALWOS, a large and populous village of Hungary, on
the side of the Danube, in the district of Comarro, and fa-
mous for an aqueduct made there in 1747.

ALYATTIS boul-drowned, in Antiquity, the tomb, or rather
burial-place of Alyattis, the father of Cereus, near Sardis, which was fix flacia in circumference.

ALYBA, in Ancient Geography, a town on the eastern
part of Persia, belonging to the Alybians, who inhabited
this coast; supposed to be the fame with the Chalbyes,
whose country furnished metals.—Also, a mountan of Af-
frica, the fame with Albyla.

ALYCUS, a town of Peloponnesus which was either
Aine of Megaris, or near it.

ALYMN, a town of Aia Minor, situat to towards the
confines of Phrygia, Caria, Lycia and Pusidia.

ALYMOHAN, in Geography, a town of Hindoofan, in
the country of Guzerat, and circar of Champancer, 100 miles
north-east of Surat, and 32 call-south-east of Champancer.

ALYPIAS, in the Materia Medica of the ancients, a
species of turbet, prefigured for the purging of bile. Some
write the word alypum, and define it by white turbet. Galen
used alypum, avetum, for a ministeure, or a medicine that
gently purge.

ALYPIUS of Alexandria, in Biography, a Platonic phi-
losopher, was much celebrated for the acuteness of his gen-
is, and the subtlety with which he lectured upon the ab-
frrate speculations of the Platonic school. Jamblicbus, who
was his contemporary, and who wrote his life, commends
him highly on account of his exemplary virtue, as well as
his distinguished talents. His stature was very diminutive,
sot that he was denominated a dwarf, but his mind was pro-
portionally capacious and superior. He died at Alexandria

ALYPIUS of Antioch, a geographer of the fourth century,
lived under the reign of Julian the apostate, and was sent
into Britain as deputy-governor, where, says Mr. Gibbon,
his humanity was tempered by severe justice and manly for-
titude, and while he exercised his abilities in the civil admi-
istration of the country, he imitated, in his political compo-
fitions, the harmony and softness of the odes of Sappho. To
Alypius, Julian entrusted the execution of his plan for re-
building the temple of Jerusalem. Ammianus Marcellinus
inform us, that whilst Alypius, afflicted by the governor of
Palestine, urged, with vigour and diligence, the accomplish-
ment of the work, horrible balls of fire breaking out near the
foundation, with frequent and reiterated attacks, rendered
the place, from time to time, inaccessible to the scourched
and blistered workmen; and the victorious element continu-
ing in this manner obdilately and resolutely bent, as it were,
to drive them to a distance, the undertaking was abandoned.
On this relation Mr. Gibbon, in his usual manner, observes,
that "Such authority should satisfy a believing, and muft
alohon an incredulous mind. Yet a philofopher may still
require the original evidence of impartial and intelligent spe-
tators. At this important crisis, any singular accident of
nature would assume the appearance, and produce the ef-
seks of a real prodigy. This glorious deliverance would be
fpeedily improved and magnified by the pious act of the
clergy of Jerusalem, and the active credulity of the Christian
world; and, at the distance of 20 years, a Roman historian,
carefles of theological disputes, might adorn his work with
the specious and splendid miracle." The impartial enquirer
into the credibility of this event will derive greater satisfac-
tion from the testimonies for and againit it, cited by Dr.
Lardner, than from the farcical reflections of this popular
historian, whose scepticism on the fubject of religion has
sometimes perverted his judgment with regard to historical
facts. Julian's attempt for rebuilding the temple, and the
defeat of it by divine interposition, are mentioned by three
contemporary writers, viz. Gregory Nazianzen, Chryfotom
and Ambrofio, bishop of Milan, all Chrisfians; and also by
Ammianus Marcellinus, a learned heathen; and afterwards
by Rufinus, Socrates, Sozomen, Theodorc, and Philosophi-
gus, as well as by later writers. Some Jewish writers, as
R. David Ganius, and R. Goldi, have also been al-
leged as bearing testimony to this event. The truth of the
historgamma, thus confirmed, has been maintained by Fabricius,
Witius, bishop Warburton, and others of high reputation
in the republic of letters. Bafiage has made some objec-
tions to this history, and Dr. Lardner, with his usual mo-
desty, has suggested several reasons for doubting its au-
tenticity. He first argues, that Julian's own writings le-
d us to think that he never attempted to rebuild the temple
at Jerusalem; it is also unlikely, that he should give or-
ders for this purpose, and allot money for it out of the
public treasury, when he was setting out in his expedi-
tion against the Persians; and though great fires was laid
unpon the testimony of Ammianus Marcellinus, a heathen,
and an impartial historian, yet he had his account from the
Chrisfians, which he seems to have taken up without ex-
amination, and it sufficiently appears from other circum-
stances, that he was credulous; besides, the history of this event,
as it is related by Chrisfian writers, is loaded with miracles, or
pretended miracles, which appear to be incredible: nor was
there at that time any occasion for such miraculous interpo-
sitions. And, lally, there are several Chriftian writers, who
have faid nothing about this affair, but who were likely to
have mentioned it if anything of this kind had been done;
thus are Jerome, Prudentius and Orosius.

Whether Alypius was ever employed in rebuilding the
temple or not, it appears that towards the latter part of his
life, he was accuited, with others, of praclizing magic.
Hierocles, his ton, was condemned to death, and he himself
suffered conflagration and banishment. They were charged
with administering poison; but Ammianus represents their
fathering as unjust. Alypius was the author of a treatise
in
ALYPIUS, in Biography, one of the seven Greek writers on music, that have been collected and published with a commentary and notes, in 1652, by Melbonius. It is difficult to ascertain the time of his exile. Callidoros (de musica) placed him before Euclid and Pythagoras, and has ranged his tract, *Eiçmujjew ÿewewv,* or *Introduction to Music,* between that of Nichomachus and Gaudelius. The contents of this work furnish the most ample nomenclature of all the sounds of the several scales and modes of the ancient Greek music, that has come down to us. The characters for found used by the Greeks for their several modes in the three genera, amounted to 1620. These notes were formed of the twenty-four letters of the Greek alphabet, entire, mutilated, single, double, or lengthened; sometimes turned to the right, sometimes to the left, or lying horizontally, so that their corners or sides were turned upwards; and lastly, some were barred, and others distinguished by the grave and acute accents, which had likewise a place among these numerous discriminations.

This tract was first published by Meurinus, 1616, from the MS. of Joseph Scaliger, but not very correctly, according to Fabricius. Kircher has given extracts from Alypius in his *Memphigia, 1650.* pretending that he had translated the whole into Latin; but the table which he has inserted from him of ancient musical notation, is so inaccurate, that Melbonius, who consulted not only the Greek MS. of Scaliger, but that of Bolejanus, Barocius, Barberitti, and Selden, affirms, that he found in it more than 200 errors.

It is from the indefatigable labour of the learned Melbonius, in his commentaries upon the ancient Greek musicians, particularly Alypius, that we are able to decipher those characters; which, before his time, had been so much altered, corrupted, disfigured, and confounded, by the ignorance or intemperance of the transcribers of ancient MSS. that they were rendered wholly unintelligible. See *Greek Music,* and *Notation.*

ALYPOON. *Montis Ceti,* or white turthib, in Botany and the *Materia Medica.* See *Convolutus.*
two feet, with woody stalks, dividing into several branches; the flowers are produced at the extremity of every shoot in round bunches, small and white; the filicule is oval, and full of brown seeds; it grows naturally in the south of France, Spain and Italy, Germany, Austria, Sweden, &c. chiefly on rocky or gravelly soils, is perennial, and was cultivated here by Parkinson in 1640. 7. A. Minum, leaf M. with flims diffused, leaves linear, downy, and filicules compressed. This is annual, and grows wild in Spain: the petals are yellow and submarginate. 8. A. Calycium, calycine M. with flumes all toothed, and permanent calyces. It is annual, and found wild in Austria, Carniola, France, Germany and Switzerland. The petals are small and yellow, becoming white with age: the filicule has two seeds in each cell; one of which is commonly abortive: it was cultivated by Miller in 1768. 9. A. Montanus, mountain M. with flims diffused, leaves sublanceolate, dotted and echinate. The branches trail, the leaves hoary, rough and alternate, the flowers produced in small clusters at the ends of the branches, and of a dark yellow colour: it grows naturally upon rocks in Burgundy, and some other parts of France, about Bail, in Germany, Austria, Carniola, &c. is perennial, and cultivated by Miller in 1759. 10. A. Campfer, field M. (omitted by Gmelin) with flumes guarded by a pair of bristles, and calyces deciduous; resembles the 8th in flims, leaves and petals, is annual, and a native of France, Germany and Switzerland, and cultivated by Miller in 1768. 11. A. Clypeatum, buckler-podded M. with flim erect, filicules sessile, oval, compressed-flat, petals pointed and linear. This is a biennial (annual, Linn.) plant, and grows naturally in Spain and Portugal, and it was found by Turnefort, on Mount Libanus; it was cultivated by Gerard in 1596. To the division with filicules inflated, or calyces oblong and closed, belong the following species. 12. A. Sinum, lanceolate M. with flim herbaceous, leaves lanceolate-deltoid, and filicules inflated. This is a slow spreading plant, which divides into small branches, garnished with hoary leaves through the year; the flowers produced at the ends of the branches are of a bright yellow colour. It is annual, or triennial, and grows wild in Spain by the way-side, and in the islands of the Archipelago, and sufficiently hardy to bear the open air in England, in a dry soil and warm situation; it was cultivated in the Kew garden in 1686. 13. A. Ceratium, cerat M. with flim shrubby, leaves lanceolate, a little toothed, downy, filicules inflated and globular. This species feldom continues longer than two years in England, and in a warm, dry situation, will live in the open air. It is a native of Spain and Canda, and cultivated by Miller in 1759. 14. A. Genon, genon M. with flim herbaceous, branches divaricat, root leaves obvate, rather downy, and filicules inflated. This differs from the last in having divericated branches, and smaller flowers of a deep yellow colour. The root is perennial; the flim spreads on the ground; the leaves are roughish and ashy-coloured, about five inches long, and scarcely an inch broad; the perianth is spreading, yellow and hirsute; the petals are twice the length of the calyx, obvate and emarginate. This species was discovered by Ardun in 1759, on the mountain Della Fontana, near Gemona, in the district of Forvi in Italy, in the clefts of rocks: it flowers in May and June. 15. A. Urtiulatum, bottle M. with flim herbaceous, erect, leaves smooth, lanceolate, quite entire, and filicules inflated. This has the flower of hemenaria; and resembles it, except in its inflated filicules; it was found by Turnefort in the Levant, and grows in the vineyards of Savoy: it is a hardy and beautiful perennial, flowering from April to June, when it begins to form its curiously inflated pods: it is well adapted to the decoration of walls or rockwork; it was cultivated in 1739 by Miller. 16. A. Vescaria, bladder M. vescaria of Tournefort, with leaves linear, toothed, filicule inflated, angular and acute. This species and the next have trailing flims, and produce their flowers towards the extremities in loose spikes. 17. A. Delicdum, delicdum-leaved M. leucoium fasciculate, &c. of Badian, with flims understrubby, prostate, leaves lanceolate-deltoid, and filicules hirsute. The flowers of this resemble those of the rock-gilly-flower, and are of a purple colour; it was cultivated in 1739 by Miller. This and the last were found by Tournefort in the Levant. The albyum fustum of Dr. Smith, with an herbaceous flim, lanceolate and frigittate leaves, and obvulate inflated filicules, or gold of pleasure, is a species of Mya

grum in the Limenee fylum.

All the species may be propagated by seed, and most of them by slips and cuttings. The seeds should be sown in a border of light earth in April. Cuttings or slips should be planted in April or May; shaded in the heat of the day, and gently refreshed with water. In rich ground they felled live through the winter in England; but in a dry, poor, rubbishy soil, or on old walls, they will endure the cold and remain much longer. Martyn.

Alyssum. See Cardamine, Clypeola, Draba, Mygrum, Peltaria, Stachys, Subularia, and Sisyrium.

Alytarcha, in Antiquity; a priest of Antioch in Syria, whose office was to lead up the magiophori, or flagelliphoroi, officers with whips in their hands, who attended at the games or combats of the athletes, encouraged them to behave fluently, and, on occasion, served to preserve good order, and keep off the crowd.

The officer who presided at the Olympic games was also sometimes denominated alytarcha.

Some will have the alytarcha to be the same with the heliocrates, of which opinion are Faber and Pridaux.

Van Dale hews them to be different offices; not but that the alytarchi might sometimes be substituted for the heliocrates, to perform some part of their function.

The alytarchi were the same with what were called, in some other places, alyte.

Alyxia, in Botany. See Gymnogon.

Alyzia, in Ancient Geography, a town of Greece in Acaania, about 15 stadia from the sea, and near the port of Hercules.

Alza, in Geography, a river of Germany, which runs into the Inn, six miles east of New Oeting, in the circle of Bavaria.

Alzach, in the Materia Medica, the name given by the Arabian Physicians, to that kind of ground called in the shops the citrul, and by the people of some parts of Italy, the anguria. It is an oblong, and usually crooked ground, and contains in its cavity a considerable quantity of water, which is drank by people of the places where the plant is common, to quench thirst. It contains seeds of an oblong figure, flattened, and covered with a hard skin.

Alzagiat, a name given, by the Arabian writers, to all the vitriolic minerals. It is also written sagi, or zagi.

Alzarac, a name given to a kind of camphor, which was coarser, and of a brown colour. It seems to have been the same with our rough camphor, as imported from the Indies, before being purified.

Alzato, in Geography, a town of Italy, in the territory of Coma, in the Milanese, four miles south of Coma.

Alzach, a town of Germany, in the archduchy of Austria, four miles west of Schwamnallstatt.

Alzey. See Alzey.

Alzira. See Algazeira.

Alziz, a name given by Serapio and Avicenna to the roots of the trig. The word Alz is the name of a river.
river in Africa, according to Leo; and the roots probably had this name from their being found in great plenty on the banks of that river, the trees always growing in wet places.

ALZENIA, in Geography, a province of Afa, in Great Armenia, towards the river Tigris, comprehending nine very considerable districts, which extend along the river to Karamut or Diarbekir.

ALZON, a town of France, in the department of the Gard, and chief place of a canton, in the district of Vigan, 15 miles north-north east of Lodève.

ALZON, a river of France, which runs into the Gard, about a league below Uzes.

ALZONNE, a town of France, in the department of the Aude, 21 leagues west of Carcassonne.

ALZUM, in Botany, a name given, by the ancients, to the tree which produces the gum bdellium. It is also written alrum and aldum, which last seems the proper way. The gum of this tree was called, by the Arabians melk, and the name word melk was ascribed to the name of a fruit of a palm-tree.

Ain, in Geography, a famous city of Armenia, where they formerly reckoned 100,000 houses, and about 1000 mosques. It was taken by the Tartars in 1219, and is now considerably reduced. It is thought to be the present Ain.

Ain, in Ecclesiastical Writers, denotes a vessel wherein wine, water, or the like, were held, for the service of the eucharist: in which sense, the word is also written amula; sometimes also banna and bannita.

Ain is sometimes also used for a wine-measure, as a café, pipe, or the like.

Ama, Ame, or rather Amis, a fort of cake.

Aretaeus used this word to express the quantity of hellebore which is sufficient for a dose in strong constitutions, when given in a syrup.

Ama, or Amaz, in Geography, a town of Syria, once the celebrated city of Apamea, now reduced to ruins.

Ama, or Hama, a town of Germany, in the circle of Welphalia, and bishopric of Liege, 8 miles south-west of Liege.

AMAAD, in Scripture Geography, a town of Palestine, on the borders of the tribe of Azar.

AMABYR, or AMABYR, q. d. in ancient British, “the price of virginity,” in some Ancient Customs, a sum of money to be paid the lord upon marrying a maid of his manor. —

This custom is said to have anciently existed in Wales, where amabry was paid to the prince: also in the honour of Chu in belonging to the earl of Arundel, till earl Henry, in the times of queen Mary, in consideration of sixty pounds, released it to all his tenants by the name of the custom of amabry and chevage.

AMACHES, in Geography, a people of South America, in Brasil, inhabiting the vicinity of the territory that extends from St. Sebastian to Rio Janeiro.

AMACASTIS, in Ancient Geography, a town of India, on this side the Ganges, according to Ptolemy.

AMACURA, a town of Africa.

AMACI, a people of Spain, whose capital, according to Ptolemy, was Aturia Augusta.

AMACK, in Geography, an island of Denmark, joined to Copenhagen, and consequently to Seeland, by two bridges over the channel that separates them. It is about one and one-half geographical mile in length, and above half a mile in breadth. It is level and without woods; the soil is uncommonly fertile, so that it is considered as the kitchen-garden and storehouse of the city; and the inhabitants supply it twice every week with all sorts of succulent vegetables, and also with milk, butter, and cheese. The present inhabitants occupied it in 1516, being invited hitherto by Christian II. from the province of Water-land, in North Holland. The whole island contains about 800 families, and is divided into two parishes. The dialect of the people is a medley of the low Dutch, German, and Danish languages; their mode of drees, and of living is peculiar to themselves. In the summer they drive their cattle for pasture to a small neighbouring island, called Saltholm. There are excellent quarries of stone for lime and building on this island.

AMACORE, or AMACURE, a river of South America, which waters the Caribiana, and runs into the Northern sea, near the mouth of the Orinoco.

AMACOSQUIT, in Ornithology, a name given by Ferdinando to Mexican bird, supposed to be of the species Charadrius or Plover. It is a pluto bird, the plumage is mixed with white and black, and it has a double collar. It is seen the whole year on the lake of Mexico, where it lives on aquatic worms.

AMACUSA, in Geography, an island and province of Japan, with a town of the same name, that borders upon that of Oyan, and is south-west of the island of Kiura. It is between 31° 30' and 32° N. lat. and E. long. 129° 29'.

AMADABAD. See Ahmedabad.

AMADAN, or AMADAN, a town of Persia, in the province of Irac-Agemi, between Bagdad and Isphahan, about 80 leagues from one and the other. It is seated at the foot of a mountain, whence issue streams that water the country; its extent is large, as it encloses wide and cultivated land, though it has but one tolerably fleet formed of houses, that are built of brick, hardened in the sun. The adjacent country is fertile, and productive of corn and rice; the air is salubrious, but in Winter the cold is intense. The Armenians have a church in this town, and the Jews have a synagogue, near which is a tomb, where, according to report, Esther and Mordecai were interred. This place is restored by several pilgrims from all parts of the Levant; and in its vicinity is a mountain called Niskiana, abounding with various herbs, and the sick repair hither to recover their health by inhaling its salutary effluvia. Anadan is an ancient city; and it is said that it was destroyed by Nebuchadnezzar, and rebuilt by Darius. The kings of Persia retired to it on account of its delightful situation, and hence it obtained the name of the “Royal City.” It was reduced by the Caliph Othman, and was nearly destroyed by Jenghis Khan in 1220. Its castle and walls are now in ruins; and it is merely distinguished by its gardens and springs. N. lat. 35° 15'. E. long. 14° 59'.

AMADANAGAN, a town in the Higher Peninsula of India, in the province of Deccan. It was taken by the Moguls in 1598. N. lat. 18° 10'. E. long. 74° 15'. See Ahmednagar.

AMADEUS V., count of Savoy, in Biography and History, succeeded to the sovereignty in 1285, and obtained the surname of “The Great,” by his wisdom and successes. His possessions were much enlarged by marriage, purchase, and donation. In defending Rhodes, against the Turks, in 1311, he gained distinguished honour; and in memory of this service, he and his successors took for their device, F. E. R. T. the initials of the Latin words Fortitudo ejus Rhodum tentavit,” i.e. his valour preferred Rhodes. The grand master of the knights of St. John, to whom Rhodes belonged, granted him a palace at Lyons, as a reward of his effectual succour. He died after a reign of 38 years, in 1323, at Avignon, where he was soliciting pope John XXII. to publish a crusade in favour of Andronicus, emperor of the East, who had married his daughter. He was much loved and honoured by all the sovereigns of Europe, and was generally the mediator in all their differences. Mod. Un. Hist. vol. xxxiv. p. 16.
AMADEUS VIII., count of Savoy, succeeded his father Amadeus VII., in 1391, and acquired the titles of the "Pacific" and "the Solomon of the Age." Savoy was erected by the emperor in 1416, into a duchy; but after this elevation, Amadeus formed the resolution of retiring from his throne and family into a religious house at a place called Ripaie. In this retreat, which he had fought according to the opinion of the world from religious motives, he devoted himself to every kind of pleasure and luxury, so that faire repartielle became proverbial to signify a life of exquisite gratification and indulgence. Here he instituted the order of St. Maurice, or the Annunciata, consisting of a number of hermits, who excluded women from their community, but in other respects maintained the character of Epicureans and voleties of pleasure. In this retreat Amadeus aspired to the papacy, and employed large sums of money at the council of Basel, to secure the object of his ambition. Accordingly, in 1439, this council, having deposed pope Eugenius IV., conferred the triple crown on Amadeus, under the name of Felix V., though he had never taken holy orders. A schism was the consequence of this extraordinary election; and Eugenius at length excommunicated his rival. On his death Amadeus was persuaded to abdicate, and a new pope was chosen in his room. But his resignation was amply recompened by the dignities of cardinal, bishop and apostolical legate, and by his being allowed to retain most of the pontifical insignia. He died at the age of 69, in 1451, at Lausanne, which, during the latter part of his life, he had chosen for his residence, and was succeeded by his son Lewis, to whom, in his life-time, A.D. 1433, he had resigned the title, but few or none of the revenues of the dukedom. Mod. Un. Hist. vol. xxxiv. p. 78.

AMADEUS IX., count of Savoy, was surnamed the "Happy," on account of his virtue and piety, his readiness to forgive those who offended, his love of justice, and his study to promote the welfare of his subjects. He succeeded Lewis in 1464, and though his bodily infirmities prevented his engaging in any great exploits, he acquired and maintained a very exemplary character. He was eminently distinguished by the benevolence of his disposition. Being once asked by a courtier, whether he kept hounds: he pointed to a great number of poor people, who were feasted at tables, eating and drinking, and replied: "those are my hounds, with whom I go in chase of heaven." When he was told that his alms would exhaust his revenues: "take the collar of my order," he said, "I'll give it, and relieve my people." He married Isolde of France, who concurred with him in all his good deeds. His death, in 1472, at the age of 37 years, and after a reign of seven, was universally regretted. Mod. Un. Hist. vol. xxxiv. p. 82.

AMADIA, in Geography, a fortified and trading town of Asia, in the province of Kurdistan, situated upon a high mountain. Its environs produce tobacco and gall-nuts, which furnish means of commerce. It is the residence of a bey, who governs the whole country. N. lat. 36° 25'. E. long. 43° 1'.

AMADOCIA, in Ancient Geography, a town of European Sarmatia, inhabited by the Amadoci, and whose habitations were also on mountains of the same name, between the Rhodania and Buste-one.

ALMADIS, in Natural History, a species of the Conus, in the Verres Testaceae, with a shell dilutely brown, broad facicla, and articulatd bands above and below; and an acute, crowned spire, finely and transversely striated.

AMADOW, a kind of black-match, tinder, or touch wood, which comes from Germany. It is made of a sort of large mushrooms, or spungy excrecences, which commonly grow on old trees, especially oaks, ash, and firs. This sulphur being boiled in common water, and afterwards dried and well beaten, is then put into a strong Ley prepared with salt-petre, after which it is again put to dry in an oven. The druggists sell this match wholesale in France, and several hawkers retail it. See Agaric.

Some give to the amadou the name of pyrotechnical sponge, because of its aptness to take fire.

AMADOWRY, a kind of cotton which comes from Alexandria, by way of Marseilles.

AMAEAR, or AMMAEA, in Ancient Geography, a town of Lydia, inhabited by the Ammianas, between the Elvas and Tagua.

AMATEGBRIA, now Broic, an ancient town of Gaul, mentioned by Caesar, placed by M. d'Anville on the Arar, to the south of Segobodium, and to the west of Velontio.

AMAGOR, in Geography, a town of Africa, in the empire of Morocco, and province of Hae.

AMAGUANA, the name of one of the Lucayen or Bahama islands, called also Mayagua.

AMAH, or AMAGIA, formerly Varegia and Natrix, a town of Spain, belonging to the Cantabri, on the confines of Asturias, about three leagues from Villa-Diego, at the foot of a very high rock.

AMAILLOU, a town of France, in the department of the Two Sevres, and chief place of a canton, in the district of Parnay, three leagues south-east of Breuillle.

ALMAIN, or AMAYNE, a sea term, used by a man of war, to his enemy; and signifying yield.

Hence, to strike amain, is, to lower, or let fall, the top-fails. The word is also written amain.--Waving amain, is to make a sign to another vessel, by waving a bright sword, or other thing, as a demand for striking its top-fails.—This is commonly done either in the fore-top, or on the poop.

Amain is also a term used in letting down a thing, by a tackle, into the hold, or elsewhere, in lowering a yard, or the like, to denote, that the sailors are to let go that part of the rope which they held before, and let down the thing easily, and by degrees. Amain is also used to denote at once and instantly; as let go amain.

AMAK, called also Ablunagib al Bokar, in Biography, a celebrated Persian poet, was a native of Bokhara, and flourished towards the close of the 11th century, under the sovereigns of the Seljuk race. He was at the head of an academy, consisting of about 100 men of letters, with handsome pensions, established by Khedar Khan, who reigned in the Transoxian provinces, and who was a very munificent patron of letters, and particularly of poetry. This prince prevailed in the academy, seated on a throne, at the foot of which were four large boxes of gold and silver coin, which were intended for the recompense of those poets who obtained his approbation. Amak was a distinguished favourite, lived by the bounty of his patron in great affluence, and kept a number of slaves, and thirty richly caparisoned and trained horses. Thus favoured, he became the object of envy, and Rahald, whom he had recommended, endeavoured to fupplant him. Amak and Rahald were appointed to contend for poetical victory in the sultan's presence; and the fictitious verses of the latter gained the prize, very much to the mortification of the former. Amak lived nearly a century. His principal work is the "History of the Loves of Joseph and Zoëlthah," a romance, founded on the account of the patriarch Joseph, in the Koran. He was most distinguished for his elegies. When the sultan Sriglar was inconsiderable for the death of his father, and disregarded all the elegiac verses of other poets, Amak was sent for to soothe him; and an elegy transmitted by him, when he was too aged.
aged and inflamed for travelling, obtained a decided preference.

AMA. A.M.A. in Geography, a town of Sweden, in the province of Thaeland or Dalland, seated on the Wener-

lake, which divides the town and the market place into two
-parts. The town was founded in 1640; it has a good harbour,
and carries on a considerable trade, particularly in timber, deals and tar. It is the 8th town of those that vote in the diet. N. lat. 58° 50'. E. long. 12° 40'.

AMALAEVA, a river of Siberia, which runs into the

Frozen Ocean. N. lat. 71° 15'. E. long. 125° 14'.

AMALAGO, in Botany. See PIPER.

AMALANCHIOR. See MESSILUS.

AMALACIR, or AMAURY, in Biography and History, king of the Vägoths, was the son of Alaric II.; but being

an infant of five years, at his father's death, in 506, the

throne was usurped by Genafalic, the natural son of Alaric.

Amaeric in the mean while retired into Spain; and the

Vägoths were governed by his grandfather, Theodoric, king

of the Oltrogoths, who expelled Genafalic from the

throne, till his death in 526, when Amaeric assumed the

government. This prince was zealously attached to the

Arian doctrine and cause, and as he had married Clotilda,

the daughter of Clivos, who inherited the pietie and ortho-
doxity of her mother, he used various means, and as the

Catholic historians say, those of violence, to profligate her

to his own opinion and party. In process of time, after

patiently enduring the wrongs she suffered, she
communicated an account of them to her brothers, and told
the truth of her relation by accompanying it with a handker-
chief stained with blood. In consequence of this complaint,
her brother Childebert, king of France, marched with a
numerous army into the territories of Amaleric, defeated
him in an engagement, and forced him to take refuge on
board his fleet. But recollecting that his treasures were left
in the city of Narbonne, he went on shore again, in order to
recover them; but had no sooner entered the city than he
was surprised by the enemy; and seeking safety in a church
belonging to the Catholics, a common fowler ran him
through with a spear, A.D. 531. Some say, that he re-

tired to Barcelona, and was assassinated by his own subjects;
but it is more probable, that the assassin was either a Franks
or some person employed for this purpose by Theudis, who

AMALASONTHA, regent and queen of Italy, was the

daughter of Theodoric the Great, king of the Oltrogoths,

by Audeflida, the sister of Cliviis, and united in her person

the two most illustrious families of the Barbarians.

She was born about the year 498, and in 515 was married to

Eucharit, the half heir of the royal race of the Amali, whom

her father had sent from Spain, and designated for his suc-
cessor; as the fex of his daughter excluded her from the

gothic throne. Eucharit soon died and left an infant son, 

Athalaric, and Amalasontha assumed the guardianship of

her son and of the kingdom of Italy. Her beauty was ani-
mated by manly sense, activity, and resolution. Education

and experience had cultivated her talents; her philosophical

studies were exempt from vanity; and though she expressed

herself with great elegance and ease in the Greek, the Latin,

and the Gothic tongues, she maintained in her counsels an

impenetrable silence. By a faithful imitation of the virtues

of Theodoric, she revived the prosperity of his reign; and

she also strove, with pious care, to expiate the faults, and
to obliterate the least favourable remembrance of his declining

age. The children of Boethius and Symmachus were re-

ferred to their paternal inheritance; the inflicted neither

corporal nor pecuniary penalties on her Roman subjects;

and she deplored the clamours of the Goths, who, at the

end of 40 years, considered the people of Italy as their

slaves or their enemies. The measures of her administration

were directed by the wisdom, and also celebrated by the

eloquence, of Cassiodorus; she solicited and respected the

friendship of the emperor; and the kingdoms of Europe

respected, both in peace and war, the majesty of the Gothic

throne. The education of her son engaged her particular

attention; and she employed three venerable Goths to incul-

cate his mind the principles of honour and virtue, whilst he

was diligently instructed in all those arts and sciences, which

might be either useful or ornamental to a Roman prince.

But the queen's solicitude for her son's improvement and

good conduct, produced a degree of vigilance and discipline,

against which his untractable disposition recoiled, and which

his subjects disapproved. At length when the Goths were

assembled on a public occasion, in the palace of Ravenna,

the youth escaped from his mother's apartment, and

complained with tears of pride and anger of the chastisement,

which his unformed temper had induced her to inflict. The

indignation of the Barbarians was roused, and they accused

the queen regent of conspiring against the life and crown of

her son; and proceeded to demand, that he should be removed

from his present situation, and educated, like a valiant Goth,

in the society of his equals. Amalasontha was compelled to

submit; and the young prince became dissolute and licen-

tious, despised his mother, and contemnated the bodily

measures which she had been pursuing. In these circum-

stances she entered into a negociation with the emperor Ju-

stinian, and prepared for retiring from a scene of discontent

and anarchy. In the mean while she yielded to the impulse

of ambition and revenge; three of the most dangerous male-

contents, who had been separately removed to the frontiers

of Italy, were assassinated by her private emissaries; and

this act increased the popular dissatisfaction and complaint.

At this time the death of her son, at the age of 16, in

consequence of premature inconstancy, left her destitute

of any firm support or legal authority. Instead of sub-

mitting to the laws of her country, and retiring to a private

Retirement, she conceived the design of sharing, with one of her

confidants, the regal title, and of referring in her own hands

the sublunary of supreme power. The eloquent Cassiodorus

announced to the senate and to the emperor, that Amal-

asontha and Theodatus had ascended the throne of Italy.

The issue of this scheme of ambition soon proved disas-

trous and fatal. Indulged by the principal Goths, Theodatus

called the queen to be imprisoned in a small island, in the

lake of Bolsena, where, after a short confinement, she was strangled

in the bath, (A.D. 552,) by the order, or with the connivance

AMA. EK, in Scripture History, was the son of Eliphaz,

Eau's eldest son, by his concubine Timna. Gen. xxxvi.

12—16. 1 Chron. i. 36. He succeeded Gatam, who was one of the dukes in the land of Edom; and was the father of the Amalekites, who inhabited that part of Arabia Petraea, which lay east of the Edomites, with Medan on the

north, Arabia Petraea on the south, Arabia Deserta on the
call, and extended almost as far north as the Dead Sea,

and southward to the Red Sea, or between Havilah and

Shur, 1 Sam. xv. 7. These people had no constant dwelling,
nor do they seem to have had any cities; but they changed
their abode, like the Arabs, and lived in tents or booths, as

they migrated from one part of the country to another, and

sometimes in subterraneous caverns. It is not, therefore,

easy to ascertain the limits of their country. Mr. Reland

5 L places
As soon as the Israelites had crossed the Red Sea, the Amalekites determined to cut them off; and with this view they fell on their rear, as they were marching from Rephidim to Mount Horæb, and fled those who, through weakness or fatigue, were left behind. But this unprovoked assault was very jolly and fiercely avenged upon themselves by Joshua, who defeated them with great slaughter, A. M. 2517, B.C. 1487. Between the Amalekites and the Israelites, there seems to have subsisted an irreconcilable enmity; and it has not been improbably traced to their progenitor’s having been deprived of his birth-right and blessing by Jacob. Under the Judges, they joined with the Midianites and Mebaites against Israel, who were delivered from the former by Ehud, and from the latter by Gideon. Judges, vi. 11, 13. Saul, soon after he was advanced to the throne of Israel, marched against the Amalekites with a large army; advanced to their capital; slew a great number of them, and laid waste their country; but by referring to himself the belt of the cattle and moveables, in violation of the divine command, he laid the foundation of the calamities that afterwards befell him, B. C. 1093. Some fugitives escaped; and we find that some years after this event a troop of Amalekites pillaged Ziklag, which then belonged to David; but he pursued and dispersed them, and recovered the captives and treasures which they had taken. 1 Sam. xxx. The Amalekites were thus gradually reduced; and at last, in the days of Hezekiah, king of Judah, who began his reign, B.C. 726, they were utterly destroyed and scattered by the sons of Simeon, who took possession of their country. 1 Chron. iv. 40—43. Thus the declaration of Balaam, recorded Numb. xxiv. 20, was literally fulfilled; “Amalek was the first of nations; but his latter end shall be, that he perish for ever.” According to the account of the Arabs, Amalek was the son of Ham, and grandson of Noah; he was the father of Ad, and grandfather of Schedad. Calmet inclines to this opinion; for he says, it is not easy to conceive how the Amalekites, if they were merely the posterity of the son of Eliphael and grandson of Esau, could be so numerous and powerful as these people are, as to be the Haitiites departed out of Egypt. Befides, when we call to mind the previous wars of the Amalekites with Chedorlaomer (Gen. xiv._4); when we consider that Balaam calls them the first, or beginning, of nations; when we reflect, that Moses never flays them the brethren of Israel or Edom; that the latter never held any confederacy or friendly correspondence with them in all their wars, but suffered them to be invaded and butchered by Saul, without affording them any assistance; and, lastly, when we find them always mentioned with the Amorites, Philistines, and other Canaanitish nations, and with them involved in the same curfe, we can scarcely forbear looking upon them rather as a tribe of those nations, than as the descendants of Esau, who probably formed but a small tribe, and not permanently confpicious. Of the Amalek, destroyed by Saul, the Arabians give the following account. He was the father of an ancient tribe in Arabia, which contained only the Arabians called pure, the remains of whom were mingled with the posterity of Joktan and Adam, and so became Mofranabes or Moslanabes, i. e. Arabians blended with foreigners. They believe, that Goliah, who was overcome by David, was king of the Amalekites, and that the giants who inhabited Palestine in Joshua’s time, were of the same race; and that part of them retired into Africa, while Joshua was living, and settled on the coasts of Barbary. The son of Amakk was Ad, a celebrated prince among the Arabians, whom some make the son of Us, and grandson of Aram, the son of Shem. Calmet. See Adites.

AMALFI, or AMALPHI, an ancient sea-port town and archiepiscopal city of Italy in the kingdom of Naples, and Principato citri, situate on the west coast of the gulf of Salerno. N. lat. 40° 35’. E. long. 15° 20’. The most generally received opinion of the origin of this city is, that about the middle of the 4th century a considerable number of Roman families, either with views of emolument or by compulsory orders of the emperor, left Rome, and embarked for Constantinople; but meeting with adverse storms, they were cast away on the shore of Salerno; and determined to form a settlement on the present site of Amalfi. This seafaring and rising colony was guarded by impetuous mountains and inaccessible coasts, from the first fury of the Lombards, who seldom attempted the conquest of a maritime people. In the year 825 this small republic, under the patronage of the eastern emperor, attained a degree of wealth and reputation which invited the attack of Sico, prince of Salerno, who marched a body of troops by night, surprized Amalfi, and carried off the greatest number of its inhabitants to supply the place of these, of whom Salerno had been deprived by an epidemic disorder. The Amalfitans, taking advantage of the absence of the chiefs of Salerno, in an expedition against the Beneventans, armed themselves, and, after burning and plundering Salerno, marched back in triumph to their native abodes. Being thus restored to their country, they formed a better constitution and code of laws, and adopted various measures likely to prevent internal discord, and the assault of foreign enemies. Under these new regulations Amalfi rose to the summit of its military and commercial glory. Pope Leo IV. found the Amalfitans an useful ally in his war with the infidels, and conferred upon the commonwealth the distinguishing title of defender of the faith. The Neapolitans bought their friendship, and the mussulmen courted alliance with them. Their situation was favourable for commerce; and their attention to naval affairs induced the emperor of Constantinople to establish a court at Amalfi for the decision of all maritime disputes, and the code and reports of this court obtained authority through this part of Europe. The merchants of this town engaged the trade of the Levant, and transferred the commercial business of the world in a lucrative and exclusive manner. The importance of Amalfi, in its various maritime and commercial connections, led to the establishment of the order of knighthood, under the patronage of St. John of Jerusalem, the members of which were afterwards called knights of Rhodes, and since of Malta. The charitable traders of this port obtained leave of the mussulmen chief at the caliph’s court, in 1020, to erect two small hospitals and a chapel for the use of votaries coming from the western parts of Europe. From Paifano, says Mr. Swinburne, in the neighbourhood of Amalfi, was derived the first knowledge of the mariner’s compass.

The flourishing state of the Amalfitans exposed them to various assaults; but they derived from the holy war temporary
potary rescued from the stake, and of their enemies, and thus were in some degree remunerated for their charit.

able zeal on behalf of the cause of the Word. From the year 1692, the revolution of this state, and should I add, of its republican constitution, it has been the constant maxim of every power at variance with the constitution, to vilify it by its history; for they carried away the portrait of the Coat which was formed by John the Second, the merchant. Amalli had brought it as a curiosity from Cranes, but it had obtained no authority at Amalli, where the Spanish code was in force. Amalli, after the destruction of its liberty, found that its commerce declined, and was entirely lost to this coast in the reign of Joan the First. The alienation of its lordship to feudal proprietors was without doubt a circumstance which hastened its decline. The death of pope Martin V. (Columna) had the first grant of Amalli; the Sanfeverini the next; then the Ortoni acquired possession; and lastly, Piccolomini enjoyed it with the title of duke.

Amalli is now merely a shadow of what it was in magnitude, connections, and real importance, when it was in its flourishing state: when, from a narrow, though fertile, extent of land, by means of an accessible and open sea, it supplied the western world with the manufactures and productions of the east; when 50,000 citizens were numbered within its walls; when it was more abundantly than any other city provided with gold, silver, and the objects of precious luxury; and when its settlements in Constantinople, Antioch, Jerusalem, and Alexandria, acquired the privileges of independent colonies. Its buildings are not remarkable for elegance and size, and contain at most 1000 inhabitants, who seem to be in a poor condition. It presents few objects that can recall any idea of its ancient prosperity. The cathedral is not an agreeable building; under the choir is the chapel and tomb of the apostle St. Andrew, in whose honour the edifice was dedicated, when cardinal Capua, in 1208, brought his body from Constantinople. Swinburne's Travels, vol. ii. p. 226—230. Gibbon's Hist. vol. x. p. 280.

AMALGAM, Amalgam, Fr.—Amalgame or Quicksep. Germ.—Amalgamata, Ital.

The word amalgam, from αμαλγαμαι, amalgame, is a metaphorical term invented by the ancient chemists, and retained by the moderns to signify any metallic alloy, of which mercury forms an essential constituent part. Hence, as mercury remains fluid at the usual atmospheric temperature, the theory and general phenomena of amalgamation may be said to be those of the solution of metals in mercury.

All that is peculiar to the several amalgams, such as the method of preparing them, their characteristic physical and chemical properties, and the uses to which they are applicable, will be detailed hereafter in the article MERCURY; but besides these there remain to be described a number of general facts and appearances common to all amalgams, which may be treated of with more propriety here than elsewhere.

The knowledge of the solvent power which mercury exercises over various metals, especially gold, was not only known by the ancients, but, as we learn from Pliny, was actually employed by them in the separation of gold from the base metals and in the gilding of silver. Vélerco and Alonzo Barba, in the 16th century, applied the process of amalgamation in the great way to the extraction of silver from the ores of Peru and Mexico; but of the early chemists, Dorrichius, Osiander, Beecher, and Stahl, are the only ones who have treated of various amalgams with the view of comparing their resemblance, of noting their peculiarities, and thence deducing a few general axioms for the benefit of science. Roselle and Pufchel, following the steps of their predecessors, discovered the crystalline nature of these metals from their solutions in mercury, and Stahl has since devised this department of chemical philosophy with a vast number of curious, correct, and important observations.

§ 1. Method of preparing Amalgams.

The precautions required in the preparation of an amalgam depend considerably on the degree of affinity existing between the mercury and the metal with which it is acted upon. When the affinity is very powerful, it is the case with gold and silver, the facility of the mercury with any other condition will effect a combination even at the usual atmospheric temperature. Thus half-gold, by simple trituration with mercury will form an amalgam in a few minutes, and pieces of gold, silver, or tin, even of considerable thickness, by being immerged in pure mercury will, in a few days without trituration, be wholly dissolved. Other metals of stronger cohesion or weaker affinity require the assistance of heat to make them amalgamate, such as zinc and antimony; for this purpose the zinc is melted in a crucible, and being then withdrawn from the fire, is allowed to cool till it is upon the point of becoming solid, at this instant the mercury, previously heated to boiling, is flumed in, and the mixture is kept fluid by a gentle heat till the combination appears to be perfect: it is of consequence to the safety of the operator, and the success of the experiment, that the mercury should be previously heated, otherwise the difference of temperature between the two metals at the time of mixture will be very apt to produce an explosion. The actual fusion of the zinc or antimony is, however, by no means absolutely necessary; the metal in small pieces being put into a crucible, the proper quantity of mercury is then to be added; the crucible is thus filled up, and the nafs being then exposed to a heat a little less than that required for the volatilization of mercury, the amalgamation will in a short time be completely effected. Those metals, however, that require a full red heat for their fusion, will volatilize with explosion any mercury that is attempted to be mixed with them while in this state, such, for example, is copper. This is, therefore, best amalgamated in the moist way; for which purpose take a boiling hot saturated solution of sulphate of copper, pour it into a glafs or Wedgewood ware mortar, and add mercury and iron filings; the iron will decompose the sulphate of copper, and precipitate this latter metal in a finely divided state, which, by the heat and moderate trituration will unite with the mercury, and the combination may afterwards be perfected by fusion at a gentle heat in a crucible. Amalgams may be made either solid or fluid, according to the proportion of mercury that enters into their composition; the quantity of this last, however, that is required to give the amalgam a fluid state, is different for each metal, for the more powerful the affinity the less is the quantity of mercury required.

§ 2. Phenomena observable during Amalgamation.

All the appearances that happen during the condensation of metals with mercury indicate a real solution of one in the other, owing to the chemical attraction between the bodies thus uniting. In proportion to the readiness with which any metal tends to amalgamation is the force with which it adheres.
hers to mercury when applied to its surface; and, when a plate of this, suspended to the arm of a balance, is brought in contact with mercury, a greater or less counterpoise will be required to break the adhesion, as the chemical affinity between the two is stronger or weaker. (See Adhesion.) Nor is this adhesion an effect taking place merely at the place of contact, but an actual penetration or absorption of the mercury is produced by the other metal: thus, when a plate of gold is placed in contact with mercury, not only the surface of adhesion is whiten by the mercury, but, after remaining in this state a few hours, the gold will become brittle, and particles of mercury may be observed through its whole bulk, having no doubt been drawn up through its minutest pores by the force of chemical attraction. 

During amalgamation, as is the case in all other instances of simple solution, a considerable quantity of caloric is absorbed, producing the sensation of cold, and lowering the thermometer. This is rendered very sensible to the touch, by rubbing together in the palm of the hand equal parts of an amalgam of bismuth and an amalgam of lead; the two folds will almost immediately become fluid, and a very considerable cold will be produced. The same may be shown by the thermometer: if a quantity of mercury is heated to about 80° Fahr. and the bulb of a thermometer wrapped round with tinfoil is then immersed in it, a speedy solution will take place, and at the same time the mercury in the thermometer will descend a few degrees.

Another remarkable phenomenon of amalgamation is the disposition to oxidize which both metals exhibit while the solution is going on, and even after it is completed: it is impossible to combine bismuth, tin, or lead, with mercury, without observing as the process advances the formation of a quantity of black powder, which rises to the surface of the metals, and is a compound oxd of mercury and the other metal. Upon this also depends Dr. Priestley's simple and ingenious method of separating from mercury a large proportion of the lead, &c. with which it is unically contami-

ated; for this purpose nothing more is necessary than agitation of the mercury in a bottle, with a little water, till it ceases to be discoloured, or, in other words, till the amalgam is almost wholly decomposed. Hence too is explained the observation of Isaac Gadolius, that gold and silver may be calcined in a reverberatory furnace, if they have been previously mixed with mercury.

§ 3. General Properties of Amalgams.

The specific gravity of amalgams, as of all other alloys, is different from the mean specific gravity of their component parts: sometimes it is greater, at other times less; and, according to Gellert, the amalgam of silver is of superior specific gravity even to mercury, the weightiest of the two ingredients. This takes place, however, only at a low temperature; for it was found by Sage that the amalgam of silver, when heated, floats on the surface of mercury.

The more decidedly crystalline form of amalgams, owing to their soft or semi-fluid state, at a moderately warm temperature, is a circumstance that remarkably distinguishes them from the pure metals. Any metal, when melted and cooled very slowly, will exhibit in its fracture a crystalline structure, and the crystals of which it is composed may, by particular management, be exhibited in a state of separation from each other; but similar appearances may be produced with much greater ease in amalgams. All amalgams are brittle, and any of them, being broken, will exhibit a granular or laminated texture, which, by the microscope, will be found to be owing to a multitude of minute crystals, applied by their surfaces to each other, but not adhering with any considerable force. Induced by these appearances, M. Sage, after many trials, succeeded in obtaining regular crystals of most of the amalgams by the following method. Having prepared a very fluid amalgam, by adding four, five, or six times a greater quantity of mercury than of the other metal, he put it into a retort, and proceeded to distillation in a sand-bath, till a fourth, or even a third, of the mercury had been driven off; the residue, being then allowed to cool very gradually, was found regularly crystallized at the bottom of the vessel. He thus obtained silver amalgam in the form of articulated tetrahedrons and alumina fociocla-

drons, resembling the native dendritic silver. In the same manner the amalgams of gold, bismuth, tin, and zinc, afforded the form of regular crystals, but those of copper, arsenic, and antimony, related to crystallize.

Amalgams may be decomposed by heat, but the last portions of mercury are not driven off without a much greater heat than is required for the volatilization of pure mercury. Hence a large proportion of the volatile metals, such as zinc and arsenic, unites with the mercury, and is carried over with it, and even the more fixed ones, as gold and silver, are thus rendered in part volatile.

As each metal has its peculiar affinity for mercury, it is obvious that an amalgam may be decomposed by the addition of a metal that has a stronger attraction to mercury than that of which the amalgam is composed: upon this subject, however, no accurate experiments have as yet been made, which is the more to be regretted, as it would much aiding the investigation of the difficult but important subject of metallic alloys. One amalgam may even decompose another in a great measure, as is the case with the amalgams of lead and bismuth: these being made separately, with a quantity of mercury equal to the other ingredient, will be solid and friable, but, upon mixture, will combine into a fluid scarcely to be distinguished by its appearance from pure mercury: by standing some days, however, in a temperature not exceeding 40° Fahr. cubic crystals will be deposited of almost pure bismuth. For other particulars see the several amalgams under the word Mercury. Encycloped. method. art. Amalgame.

AMALGAMATION, in Metallurgy. See Silver ores, extraction of.

AMALI, in Ancient Geography, a people comprehended under the appellation of Genae.

AMALIA, in Entomology, a species of Papilio in the Nymphalidae section, with indented wings: upper side brown, underside yellow with two streaks and spots of blue, the lower ones marked with black dots. Fahr. Ent. Syll. tom. iii. p. 1. p. 129. &p. 398. Obs. In addition to this specific character Fabricius says, above the brown colour of the wings inclines to fulvous, and the posterior pair is marked with an obelolate row of fulvous spots. Beneath, the apex of the anterior wings has a black mark, and two blue spots with a black character in the middle of each; the exterior margin, two streaks, and seven spots on the posterior wings are blue, the latter with black dots in the middle. Inhabiters Sierra Leon.

AMALLOBRIGA, in Ancient Geography, a town of Spain, upon the Derius, to the south-east of Pallentin.

AMALRIC, Auger, in Biography, an ecclesiastical historian of the 14th century, dedicated to pope Urban V., a history of the popes, under the title of "Chronicon Pontificale," brought down to pope John XXII. and said to be collected from more than 200 writers.

AMALTHEA, in Mythology, the Cumean Sibyl, who
is said to have come from a far country to Taquinius Super
tious, and to have offered for sale nine books of Sibylline,
or prophetic oracles. Upon Taquin's refusal to give her
the price the asked, she went away and burnt three of
them. Returning soon after, she demanded the same price
for the remaining six. The king ridiculed her for her folly,
upon which she went and burnt other three; and returning
asked the same price for the three which remained. A
Gellius (l. 157) says, that the books were burnt in the
preence of the king. Taquin, surpised by this strange
conduct, consulted the augurs, who, regretting the loss of
the books which had been destroyed, advised the king to
give the price, which the woman required. Amalthea, hav-
ing surrendered the books, with a desire that they might be
carefully kept, disappeared, and was never afterwards
seen. Dionys. iv. 62. Laetiantius, i. 6. Gall. i. 19. Pliny
(xii. 13. t. 27.) says, that the burnt two books, and only
preferred one. See SIBYL.

AMALTHEA, the daughter of Melilias, king of Crete,
and nurse of Jupiter, whom she is said to have fed with
goat's milk and honey. According to others, Amalthea
was a goat which nourished Jupiter, and whom, in com-
penence for her attention, he translated into the heavens, and
thus she became the constellation which bears this name.
It is added, that one of the horns of this goat was given to
the daughter of Melilias, as a reward for their kindness,
and that it had the peculiar property of furnishing them
with whatever they wished for; and hence the Greeks for-
med of it their cornucopia, or horn of abundance.

AMALTHEO, in Biography, the name of a family of the
16th century, celebrated for literature originally from Por-
done in Friuli, and branched out into several places in that
province. In this family there were poets, physicians, and
professors of belles lettres. The most distinguished were the
sons of Francesco Amaltheo, professor of belles lettres in
Sicile; viz. Girolamo, or Jerom, born in 1507, at Oder-
zo in the Trevisan, who was solicited by the queen of Po-
land to be her physician, but declined it. He taught med-
icine at Padua, and practised as a physician in several
towns of Friuli, till 1574, when he died at Oderzo highly
honoured by his townsfolk. He so much excelled in Lat-
in poetry, that he is placed by Muretus at the head of all
the Italians who excelled their talents in this way. The
famous epigram of "Acon and Leonilla," is by this
author. Girolametto, or John Baptista, was born at Oderzo
in 1525, educated at Padua, and at the age of 20, called to
Venice to instruct the youth of the Lippomana family in
dele literature. His own studies comprehended, besides the
Greek, Latin, and Italian languages, philosophy, jurispru-
dence, and theology. In 1554 he accompanied the Vene-
tian ambassador, Michele, to England; he was afterwards
secretary to the republic of Ragusa, and accompanied the
cardinals deputed to the council of Trent, as first secretary
to pope Pius IV. He died at Rome in 1573, much la-
mented by the learned men of his time, by whom he was
highly esteemed for his genius and erudition. His Latin
poems, first printed in 1552, gave him a reputation equal
to that of his brother; and he likewise wrote poems in his
own language that are much valued. The Latin poems of
these two writers, and of another brother named Cornelius,
who was a physician, are contained in the first volume of the
"Delicie Poet. Italor," and were published in a separate
volume, at Venice in 1627, and at Amsterdam, in 1689.

AMAMA, SIXTUS, an eminent biblical critic of
the 17th century, was born in Wett Frieland, educated un-
der Drusius in the university of Franeker, and obtained a
very considerable acquaintance with the oriental languages.
Wood (Athen. Oxoni. n. 612.) says, that about the year
1617, he visited Oxford, resideid in Exeter college, and
taught Hebrew in the university. Upon his return to his
native country, he was appointed proctor of the Hebrew
language in the university of Franeker, where he continued,
notwithstanding carnal solicitations for his removal to
Leiden, in order to succeed Erpenius, till his death, which
happened in December 1629. His first work was a criti-
cism on the Vulgate translation of the Pentateuch, printed
in 1619, in Franeker, and entitled, "Confutat Vul-
gate Latina Editionis Pentateuchi." This was part of a
plan which he had formed with a view to a "General
Confutation of the Vulgate Version of the Scriptures," which
the council of Trent had declared authentic. But his at-
tention was diverted from the completion of his design by
a collation of the Dutch version of the Scriptures, with
the originals, and the most approved translations. The
result of this collation was published in 1603, in the Dutch
language, under the title of "Byblische Conferenctie." Whil-
Mil he was thus engaged, he received information that
father Mercurius, in vindication of the Vulgate, had writ-
ten a refutation of his criticism on the first six chapters of
Genesis, and he, therefore, refuted his original design;
and, in 1627, published a letter to Mercurius, and in 1628
a work, entitled, "Anti-Barbarus Biblius;" or containing
a farther reply, together with a confutation of the Vulgate
on the historical books of the Old Testament, on Job, the
Psalms, and the books of Solomon, to which are added
difficulties on particular subjects. This book was re-
printed at Franeker, in 1630, in 1656, with a criticism of
the Vulgate upon Isaiah and Jeremiah. Amama also wrote
a learned dissertation, "De Nomine Tetragrammaton," which
was published in 1620, at Franeker in 1620. So successfully
did he expose the defects and errors of the Vulgate, and so
carriedly did he recommend the study of the original
languages of the Bible, that it was decreed by some synods,
that those only should be admitted to the ministry, who
understood, at least in some degree, the Hebrew and Greek
texts of the Scripture. Amama also evinced his solicitude
for the honour of the university at Franeker, by his at-
tempts to reform some irregularities of conduct that pre-
valed in it. He was so much respected by his countrymen
that, after his death, they testified their regard for his
memory by their liberality to his children. Gen. Dict.

AMAMASSIUS, in Ancient Geography, a town of the
isle of Cyprus, in which they worshipped Apollo Thyaces.

AMAM-SAMA, a town of Judah, in the tribe of
Jewish State.

AMAN, in Commerce, a sort of blue cotton cloth,
which comes from the Levant by the way of Aleppo.

AMAN, in Ancient Geography, a town of Palestine, in
the southern part of the tribe of Judah.

AMAN, in Geography, a sea-port town of Africa, on the
Atlantic, between Cape Ger and Cape Cantin, in the king-
don of Morocco.

AMAN, a district of Sumatra, about the centre of
the island.

AMANA, in Ancient Geography, a mountain of Palestine,
on the other side of Jordan, in the tribe of Manassheh.

AMANA, a town of Asia, in Media, according to Pil-
lamy.

AMANCE, in Geography, a town of France, in the de-
partment of the Meurthe, and chief place of a canton in the
district of Nancy, three leagues south-west of Chaten-Sa-
lins, and 12 north-east of Nancy.

AMANCE is also a town of France, in the department of
of the Upper Saone, and chief place of a canton in the district of Jufsey, two leagues east of Jufsey.

AMANDER, MARK ANTHONY GERARD, SIEUR DE SAINT, in Biography, a French poet of the 17th century, was born at Rouen in Normandy in 1694. His father commanded a squadron of ships in the service of queen Elizabeth for 22 years, and his two brothers were killed in a battle against the Turks. As for himself, his whole life was spent in a succession of travels in Europe, Africa, and America, which, whatever might be the annulment or information he derived from them, were injurious to his fortune. His works were chiefly miscellaneous poems, most of which are of the comic or burlesque, and of the gallant or amorous kind. Three volumes of his poems were published in 1650 at Paris; the first in 1627, the second in 1643, and the third in 1649, under the title of "Les Œuvres de St. Amand;" and they have passed through several editions. His "Stanza upon the Pregnancy of the Queen of Poland and Sweden" were printed in 1620; his "Mois fayed, a heroic Idyllium," Paris, 1653, 4to; and 1650, 12mo: his "Stantras to Mont. Cornelle, upon his Imitation of Jefus Chrift," Paris, 1656, 4to; and his "Rome ridicule," printed several times in 4to and 12mo; and when it was printed clandestinely at Paris in 1643, the printer was thrown into prison. The earlier part of Amand's life was licentious and debauched; but towards the close of it he was reformed, in consequence of the penury and distress of his circumstances. M. Birotte, in his notes upon Boileau, says, that he wrote a poem upon "the Moon," in which he complimented Lewis XIV. upon his skill in swimming, in which he was accustomed to exercise himself in the Seine; but the king could not bear to hear this poem read to him: and this circumstance is said to have mortified the author to such a degree that he did not long survive. He died in 1661, at the age of 67 years. He was admitted a member of the French Academy from its first foundation in 1633; and he excelled from making a speech upon his introduction, on condition of his compiling the comic parts of the Dictionary which the Academy had undertaken, and collecting the grotesque and burlesque terms. Boileau represents the genius of St. Amand as adapted to works of low humour and satire; but he adds, that he spoils all by the mean and trivial circumstances which he introduces. Gen. Dic. Amand, Pierre, born at Riez in Provence, about the middle of the 17th century, practiced midwifery with credit at Paris. In the year 1705 he published "Nouvelles Observations sur la Pratique des Accouchemens," in 8vo. of which a second edition appeared in the year 1715. He relates the cases of several women who had extrauterine factures, and gives an account, accompanied with engravings, of a kind of net he had invented for extracting the heads of factures, when left in the uterus, separated from the body. The invention is ingenious, but has long been laid aside for the crotchet, by which the extraction is performed with much greater ease and certainty. Vido Eliaus Histo- riques sur l'Art des Accouchemens, par M. Suc.

Amand, St. in Geography, a town of France, in the department of Cher, ficated on the river Cher, 20 miles south of Bourges. N. lat. 46° 45'. E. long. 2° 30'.

Amand, St. is also a town of France, in the department of the North, in which was lately a celebrated abbey. When the combined forces of Prussia and Austria invaded France in 1752, it was taken by them, but evacuated afterwards in their memorable retreat. It was given to France by the treaty of Utrecht. It is situated on the river Scarpe, seven miles north of Valenciennes. N. lat. 50° 27'. E. long. 2° 35'.

AMAND, St. a small town of France, in the diocese of Auxerre.—Also a small town in the diocese of Clermont.

AMANDA, in Ancient Geography, a country of India, which, according to Ptolemy, contained various people, under the denominations of Samobrata, Sambruceni, Bifarnbrit, Ophi, Antixeni, and Taxilb.

AMANDAVA, in Ornithology, a species of Fringilla that inhabits Asia, and is correctly described by Linnaeus, as being of a brown and reddish color, spotted with white. It is about the size of a wren, or four inches in length; the upper part of the plumage brown, with a mixture of dull red, the under part of the same colors, but paler, except the middle of the belly, which is darker. Every feather in the upper wing-coverts, breast, and sides, has a white spot at the tip. The bill is dull red, tail black, and legs pale yellow. The female has a mixture of white on the throat and fore-part of the neck, and the belly is pale yellow.

This species is frequent in Bengal, and has been called the Bengal finch (or Amaduva). In allusion to this, Buffon names it Bengalus punctatus, and Buffon Bengal piquet.

There is a variety of this species, the Amandava b. of Linnaeus, hitherto found only in Bengal, which is said to be entirely brown, and without spots. This is the Bengalus fulcatus of Buffon, and Bengal Brolum of Buffon. T. enl. 115. f. 2. but it seems this variety is not always immaculate. Some have a small white spot at the tip of each of the wing covert feathers, and there is in general a little white on the breast also. The female is brown, without white spots: the legs, as in the preceding, yellowish.

AMANDRA, in Ancient Geography, a town of Ethiopia, placed by Suidas in the territories of king Cepheus.

AMANGO Cape, in Geography, lies on the south-west coast of the island of Corisco, and forms the limit of Bonifacio bay. It is easily known by a large castle, and two rocks, which are situated just below the heaven.

AMANGUCHI, a town of Japan, the capital of the kingdom of Nagaro, and one of the richest towns of Japan.

AMANIA, in Ancient Geography, a name given to Arabia Felix, or to that part of it called Yemen.

AMANIBO, a town of South America, on the coast of Guiana, between Paramaribo and Cayenne.

AMANICÆ, or Amans, or p蝥æ, in Ancient Geography, denote defiles in the mountain Amanus.

AMANITA, in Botany. See Agaricus.

AMANNIA. See AMANXIA and PEPLIS.

AMANOA, in Botany, a genus of the peniantria monogynia class and order. Its characters are, that the calyx is quinquepartite; no corolla; the germen is triangular, the stigma trigonous, concave, and fimbriated. There is one species, var. A. genuenls. Anbl. pl. gui.

AMANOB, in Ancient Geography, a people placed by Ptolemy in Sarmaia, in the vicinity of the Roxolanza.

AMANOIDES, a promontory of Cilicia, between the rivers Pyramus and Cidius.

AMANTEA, a sea-port town and bishop's see of the kingdom of Naples, on the west coast of Calabria Citra, near the bay of Euphemia. N. lat. 30° 15'. E. long. 16° 27'.

AMANTHONE, in Entomology, a species of Papilio in the section Danae Candinis, with round wings, white and black at the tips. The margin of the posterior wings on the under side is brown. Inhabits South America.

AMANITA, in Ancient Geography, a town in that part of Epirus called by Ptolemy Orcilides, and since denomi-
AMANUS, the name of a mountain, situate at the extremity of the Mediterranean, near the gulf of Illus, and separating Cilicia from Syria. The defile or pass of this mountain, which forms a communication between these countries, is called Portus Amnianus, or Pyli Cilicia, the Gates of Cilicia. The Persian army, under Darius, marched through this defile, while that of Alexander was encamped at Illus, after having passed the Strait of Mount Taurus, called also one of the Gates of Cilicia. This defile is also famous for the victory gained by Septimius Severus over Tefennius Niger. This mountain extends between the 37th and 38th degree of latitude, and its direction is from the north-call to the south-west. Some geographers have made it a branch of Mount Taurus. Stephanus Byz. says, that it took its name from the Greek word ἄμαν, meaning, because Oreus was delivered here from the furies which agitation him after the affiliation of his mother.

AMANUS, or OMANUS, in Mythology, the deity of the ancient Persians, which they believed to be the sun, or the perpetual fire, which they adored as an image or emblem of the sun.

AMANZIRIFDIN, in Geography, a town of Arabia, 440 miles call of Mecca, and 584 north-call of Mocha. N. lat. 26° 25'. E. long. 67° 30'.

AMAPALLA, a sea-port town in the province of Guatemala, in North America, situate on a gulf of the same name, 220 miles south-call of the town of Guatemala. The inhabitants of this town and its vicinity carry on a considerable trade in cochinchine, cocoa, hides, and indigo, and the other commodities of the province. N. lat. 12° 30'. W. long. 86° 40'.

AMAPALLA Bay, or Gulf; lies on the western coast of Mexico, in North America, south-call from Guatemala, and north-call from Realejo, in the direction of the coast. The entrance into the bay is between two peninsulas, which approach near each other, and defend the bay from the ocean; but within it is very spacious, extending from north-call to south-call. It forms the harbour of the town of Amapalla, sometimes called Fonseca or Penfeen. The coast, within the limits of the gulf, and without the bay, is free from rocks and shoals, and affords good anchorage; on the well side of the bay there is a hill, called the Hill of Amapalla, with a port at the foot of it called Martin Lopez. In the Gulf of Amapalla are two islands; one, called Mangera, is a high round land, encompassed by rocks, with a small sandy creek on the north-call side; and the other, called Amapalla, and the largest, is about the distance of two miles. The gulf, though it runs a great way beyond this island, is not deep enough to receive ships of burden. Malham's Gaz.

AMARA, in Ancient Geography, a town of Arabia Felix.

AMARA INDICA, in Botany. See Gomphrena.

AMARACUS. See Origanum.

AMARANTE, in Geography, a considerable and pleasant town of Portugal, in the province of Esti Moito, on the river Tamega, 23 miles south-call of Braga, and 38 call north-call of Porto. N. lat. 41° 19'. W. long. 6° 54'. It contains about 4000 inhabitants, and is situated in a very delightful country.

AMARANTH, an order of knighthood, instituted in Sweden by Queen Christina in 1653, at the close of an annual feast, celebrated in that country, and called Wran)

This feast was solemnized with entertainment, balls, masquerades, and the like diversions, and held from evening till the next morning. That project, thinking the name too vulgar, changed it into that of the feast of the gulf, because each person here represented some deity according to a bill to his lot. The queen assumed the name of Amaranthe, that is, unchanging, or immortal. The young nobility, dressed in the habit of nymphs and shepherds, feved the gods at the table. At the end of the feast, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the masques, and in memory of this gallant feast, founded a military order, called in Swedish gyllenstaff, into which all that had been present at the feast were admitted, including sixteen lords, and as many ladies, besides the queen. Their device was the cypher of amaranthe, composed of two A's, the one direct, the other inverted, and interwoven together on a jewel of gold adorned with diamonds; the whole inclosed by a laurel crown, with this motto, doce nulla memoria. The jewel was worn by the knights either in a gold chain, or a crimson or blue ribbon. Bullstrode Whitlock, the English ambassador from Cromwell to the court of Sweden, was made a knight of the order of amaranthe. On which account it seems to be, that we sometimes find him so called Sir Bullstrode Whitlock.

Amaranth denotes a colour inclining to purple, derived from the flower of this name.

AMARANTH, Glob., in Botany. See Gomphrena.

AMARANTHUS. See Phyma.

AMARANTHIO LUSITAN. See Gomphrena and Illecebrum.

AMARANTH Thomides. See Celosia, Gomphrena and Illecebrum.

END OF THE FIRST VOLUME.
