1819.
THE Cyclopœdia, which has been the production of the incessant labour of almost twenty years, is now completed, very much to the relief of the Editor's mind, and, as he hopes, to the satisfaction of the Public. To the candid judgment of its numerous readers, the Editor submits the work, assuring them, that, on his part, no pains have been wanting to render it worthy of their approbation. If he had foreseen the time and attention which the compilation and conduct of it required, and the unavoidable anxiety which it has occasioned, he would probably never have undertaken it. But habits of application, and some degree of experience in a work of this nature, disposed him to embark in it, and enabled him to overcome the difficulties that presented themselves to his view in his further progress. He hopes that he may be allowed to say, that an early and long-continued attachment to scientific pursuits, and a desire of serving the cause of Literature and Science, had no inconsiderable influence in directing his views to this object, and encouraging his perseverance in the accomplishment of it. He ought also to acknowledge, that the candour with which his labours, on this as well as on a former similar occasion, were received by the Public, and the expressions of approbation with which they were honoured in the course of sixteen years, afforded a very powerful inducement to unremitting assiduity and exertion. The Proprietors also, who had undertaken this work without any patronage besides that of the Public, and who were advancing large sums towards rendering it worthy of that patronage, were liberal in their co-operation, and in enabling the Editor to procure every kind of assistance, which he might find to be necessary and useful. They employed artists of the first reputation in their respective departments, whose performances have given a peculiar character to this work. The Proprietors and Editor were likewise honoured by connection and acquaintance with persons, eminently distinguished in those branches of science to which they had devoted their talents; and these persons not only consented to be co-adjutors, but to give celebrity to the work by allowing their names to be annexed to it, whilst they were enhancing its importance and value by their contributions. Although the Editor cannot decline availing himself of the reputation which the Cyclopœdia must acquire from the established and well-known character of his associates,
THE Cyclopaedia, which has been the production of the incessant labour of almost twenty years, is now completed, very much to the relief of the Editor’s mind, and, as he hopes, to the satisfaction of the Public. To the candid judgment of its numerous readers, the Editor submits the work, assuring them, that, on his part, no pains have been wanting to render it worthy of their approbation. If he had foreseen the time and attention which the compilation and conduct of it required, and the unavoidable anxiety which it has occasioned, he would probably never have undertaken it. But habits of application, and some degree of experience in a work of this nature, disposed him to embark in it, and enabled him to overcome the difficulties that presented themselves to his view in his further progress. He hopes that he may be allowed to say, that an early and long-continued attachment to scientific pursuits, and a desire of serving the cause of Literature and Science, had no inconsiderable influence in directing his views to this object, and encouraging his perseverance in the accomplishment of it. He ought also to acknowledge, that the candour with which his labours, on this as well as on a former similar occasion, were received by the Public, and the expressions of approbation with which they were honoured in the course of sixteen years, afforded a very powerful inducement to unremitting assiduity and exertion. The Proprietors also, who had undertaken this work without any patronage besides that of the Public, and who were advancing large sums towards rendering it worthy of that patronage, were liberal in their co-operation, and in enabling the Editor to procure every kind of assistance, which he might find to be necessary and useful. They employed artists of the first reputation in their respective departments, whose performances have given a peculiar character to this work. The Proprietors and Editor were likewise honoured by connection and acquaintance with persons, eminently distinguished in those branches of science to which they had devoted their talents; and these persons not only consented to be co-adjutors, but to give celebrity to the work by allowing their names to be annexed to it, whilst they were enhancing its importance and value by their contributions. Although the Editor cannot decline availing himself of the reputation which the Cyclopaedia must acquire from the established and well-known character of his associates,
and with this view presenting their names to the Public, he does not wish to rob them of any portion of fame that belongs to them, in order to enrich himself. Notwithstanding all the assistance which he has received, and which he thus gratefully and respectfully acknowledges, his own responsibility furnishes a large demand on the candour of the Public; nor will those who duly consider, that he has devoted almost twenty years of his life, measured not by fragments of time, but by whole days of twelve or fourteen hours, to the completion of his undertaking, and in so doing impaired his health and constitution, be indisposed to exercise that liberality in their estimate of his labours which he solicits. He is not unapprised of defects and imperfections; and if he were to begin the Cyclopaedia de novo, he could improve it. Science is progressive; and since the commencement of this work, its advances in several departments have not been inconsiderable.

The Editor has endeavoured to watch its steps, and to incorporate in his pages every discovery and improvement that has attended its progress. He now presents his work, in its finished state, at the bar of the Public, anxiously but not timidly waiting a favourable decision. He begs leave, however, to suggest, that he does not consider himself as responsible for the opinions advanced by his co-adjutors in the articles which they have furnished, any more than for those which occur in extracts from printed works. Some of these seem to him to be erroneous; and they are actually controverted and contradicted in other parts of the Cyclopaedia, where the mention of them occurs. As he could not prescribe limits to the articles supplied by his co-adjutors, he could not presume to prohibit a statement of their own sentiments on the subjects of the articles which they contributed. In every case the reader will form his own judgment.

The names of most of his co-adjutors have been already published on the covers of several parts of the work; but after he has again recited them, every reader will be able to assign to each, so well known in the circle of science, the articles of any extent and of principal importance, which he has furnished. Under each head, the arts and sciences being arranged in alphabetical order, will be mentioned the names of those to whom the Editor is indebted for contributions; though in some cases the number is small and the articles are short, whilst in others they are more numerous and more extended. Many of these articles have been considerably enlarged in consequence of the Editor's own researches. His own additions are so incorporated with the communications of his friends, that it would not be easy to distinguish them without a minuteness of detail, which, as he conceives, would be tedious and uninteresting. Agriculture, Dr. Dickson. — Algebra and Analysis, Barlow, Bonnycastle, and Pond. — Anatomy and Physiology,
Abernethy and Lawrence. — *Comparative Anatomy*, Macartney, Lawrence, and Clarke. — *Annuities*, W. Morgan. — *Antiquities*, H. Ellis and Strutt. — *Architecture*, Porden, E. Aikin, P. Nicholson, Dr. Milner, and Webster. — *Astronomy*, Bonnycastle and Pond. — *Astronomical Instruments*, Rev. Dr. Pearson. — *Biography*, Sir J. E. Smith, Dr. Burney, Dr. Malkin, and Dr. T. Rees. — *Botany*, Sir J. E. Smith, Dr. Woodville, Rev. Mr. Wood. — *Canals*, Farey, senior. — *Chemistry*, Aikin, Sylvester, Dalton, Brande, Dr. Mareet, Sir Humphrey Davy, Dr. C. Taylor, and Dr. Davy. — *Conic Sections and Curvilinear Geometry*, Ivory. — *Drawing*, Howard. — *Dynamics*, Cavallo. — *Education*, Dr. Carpenter. — *Electricity*, Cavallo and Cuthbertson. — *Engraving*, Landseer. — *Entomology*, Conchology, and several other articles of *Natural History*, Donovan. — *Exchange, Standard, Coinage*, and *Weight*, Dr. Kelly. — *Blast and Blowing Furnaces*, Mushett. — *Geology*, Koenig, Bakewell. — *Geography*, Tooke, Hinckes. — *Geometry*, Barlow, Ivory. — *Grammar*, Dr. Jones. — *Heraldry*, Sir G. Naylor. — *History*, English, S. Turner and Owen Pugh. — *Horology*, Rev. Dr. Pearson. — *Language*, Dr. Carpenter, Dr. Jones. — *Magnetism*, Cavallo. — *Manufactures*, Duncan, J. Thomson, Parkes, and Farey, junior. — *Mechanics and Machinery*, Cavallo, Farey, junior. — *Medicine*, Dr. Bateman and Dr. Henderson. — *Mental Derangement*, Dr. Haslam. — *Meteorology*, L. Howard, Dalton, and Dickson. — *Midwifery*, Dr. Bland. — *Mineralogy*, Koenig, Bakewell. — *Mining*, Taylor. — *Naval Architecture*, Glover. — *Navigation*, Mackay. — *Music*, Dr. Burney and Farey, senior. — *India Mythology*, Major Moor. — *Mental and Moral Philosophy*, Dr. Carpenter. — *Painting*, Russell, Opie, Ottley, and Phillips. — *Prosody*, H. Parker. — *Sculpture*, Flaxman, P. Hoare, and Bacon. — *Surgery*, Blair, who also furnished the article *Cipher*, and S. Cooper. — *Topography*, Britton. — *Versification*, H. Parker; — and a variety of *Miscellaneous* articles by Joyce, Ellis, Fletcher, Howard, Clarkson, and several other gentlemen, who were occasional contributors, and whose names it is needless to mention. To Mr. S. Bevan and some other literary and scientific friends, the Editor is indebted for the assistance which they have afforded him in suggesting articles that had been omitted, and that have been supplied in the *Addenda*. Dr. Thomas Rees has, towards the close of the work, paid particular attention to the arrangement of the Plates. He has also drawn up a digested catalogue of them, together with an alphabetical index of the subjects which they comprise; and added such explanations, and corrections of references, as appeared to be necessary or desirable, after a minute and careful collation, made in conjunction with the Editor, of every Plate, with the printed letter-press to which it pertained. The Editor and Proprietors of this work are also indebted to
Mr. Donovan, for the General Systematic Arrangement of the Plates of Natural History.

The general plan upon which this work has been conducted, and which was stated in the Advertisement that announced the publication of it, seemed to the Editor, after some experience in this department of literary labour, and after consulting several competent judges, the most suitable to the nature and design of a Scientific Dictionary. Whatever may be the advantage resulting from separate dictionaries appropriate to each particular science, which is the plan of the French Encyclopædia, or from distinct treatises introduced in a dictionary of one alphabet, according to some modern compilations of this kind, the inconvenience and perplexity that attend the multiplication of alphabets, whether they occur in different serieses of volumes, or in the form of an index at the close of each treatise, will furnish an objection against this mode of arrangement, which it will not be easy to obviate. In a work of such magnitude as the French Dictionary, consisting already of between 100 and 200 volumes, and of undetermined extent, the best treatises that have been written, or that may be written, on each subject, may be introduced, and the work itself may be a complete library, and supersede the necessity of recurring to any other. But in a publication of limited compass, such as booksellers may undertake, and the general class of readers purchase, it is hardly possible to combine separate articles, sufficiently instructive, with treatises equally comprehensive and complete. To those who usually consult dictionaries for information, this plan, we are persuaded, is by no means the most eligible. If they wish to extend their knowledge beyond the limits to which a dictionary must necessarily restrict it, they will recur to appropriate treatises for the purpose; and the dictionary should furnish them with the necessary references. A dictionary is intended for communicating knowledge in an easy and expeditious manner; and it is desirable that the several articles should be so full and comprehensive, as to afford sufficient instruction on the subjects to which they relate, without the necessity of recurring to another dictionary, or to an index, for further information. It may be said, indeed, that the sciences are thus mutilated and mangled; and that it is impossible to preserve their unity without discussing each in a separate treatise. We readily allow, that this is an inconvenience, inseparable from the form of a dictionary; but at the same time we think that this may be remedied in a considerable degree by that kind of ramification of the principal subject, which, with suitable references, will lead the reader to subordinate articles, that form, by their mutual connection and dependence, an aggregate or whole, superseding in all common cases the necessity of a distinct treatise. These
references, when judiciously distributed and arranged, will serve, like the index of a book, but much more effectually, to conduct the reader from one subject to another: they will enable him to perceive their relation to each other; and they will direct him how to collect and combine the dispersed parts of any science into one entire and regular system. Each article will afford him, as it were, a distinct lecture; and he may pursue the same course of study by the means now suggested, or vary it as he thinks proper. Upon the whole, the advantage of separate treatises under each head of science, such as the limits of a dictionary will allow, seems to be more imaginary than real; more especially as the want of them may be supplied in the manner that has been mentioned.

In conformity to our proposed plan, it has been our endeavour to give, under each distinct head of science, an historical account of its rise, progress, and present state, concisely and yet as comprehensively as our limits and our sources of information would allow; to refer to those articles in which the discussion of them occurs, and to point out such publications as afford further information. References of this kind are introduced under each separate article, wherever they are thought to be necessary and useful; and thus the reader is able to form his judgment concerning the authorities upon which the compilers of the several articles depend; and if he shall have opportunity or inclination, he may recur to them for himself.

Whilst the Editor and his co-adjutors in this work have availed themselves of the assistance which other similar dictionaries have afforded them, they have not contented themselves with mere transcripts; they have resorted as much as possible to original writers, which they have been enabled to do by the facility of their access to large libraries; and by the citations which they subjoin to the several articles, the Public will judge of the extent of their research, and of the industry and labour which they have bestowed on this compilation. In their account of the arts and manufactures, they have consulted the artisans and manufacturers themselves, and derived from them every kind of information that was likely to conduce to the credit and utility of the work: and this they have not been able to do without incurring a very considerable expense.

Some apology may, perhaps, be thought necessary for the extension of this work beyond the limits first proposed. When it was determined to
introduce biography, as well as geography, topography, and history, upon a larger scale than the Proprietors and Editor had at first intended, principally in compliance with the wishes of intelligent and esteemed subscribers, the enlargement of it became indispensable. To his co-adjutors, whose assistance was highly important, the Editor could not presume to prescribe limits, which would have depreciated the value of the articles which they contributed, and within which, for their own reputation, they would not have consented to be confined, and of course the work would have been deprived of the benefit of their contributions. This circumstance could not fail to occasion an enlargement of the Cyclopaedia; but it was proportionably enhanced in value; and the Editor is satisfied, that the purchasers will not ultimately regret the augmentation of expense. The plates likewise have been multiplied far beyond the original intention of the Proprietors, because new and unthought-of subjects were introduced in the progress of the work; but as these plates constitute a character of excellence peculiar to this Cyclopaedia, it is thought that the circumstance of their being additional embellishments of the work, besides that of their being indispensable as explanatory of the articles to which they refer, will be a sufficient apology for the increase of their number; more especially when it is considered, that the augmented number of plates, as well as the enlargement of the work, have occasioned a diminution of profit to the Proprietors. It would have been more their interest, as well as more gratifying to the Editor, to have compiled a Cyclopaedia in fewer volumes, and to have contented themselves with a smaller number of plates; as in all probability the sale would have been greater, and the sum of money expended upon it would of course have been much less. The Editor must do the booksellers concerned in this Cyclopaedia the justice to say, that they have consented to forego part of the possible profit that might have accrued from it for the sake of its reputation and utility.
CYCLOPAEDIA: OR, A NEW
UNIVERSAL DICTIONARY
OF ARTS and SCIENCES.

A

May be considered, I. as a LETTER; II. as a WORD; and III. as an abbreviation.

I. A, as a letter, or the mark of a vocal found, is the most simple, and that which the dumb are most easily taught to utter.

To pronounce it clearly, we need only open the mouth wider than for any other sound, and then emit the air from our lungs. It is the first letter of the alphabet in all the known languages of the world, except in that of the Ethiopians; in which, according to Ludolfus, it is the thirteenth.

We must seek the origin of this, and the rest of our letters, in the Oriental languages. See Alphabet and Letters.

In the English language, the character A is the mark of three different sounds, which are termed by our grammarians the broad A, the open A, and the slender A.

1. Our broad A, resembles the found marked by the German A, and is found in many of our monosyllables, as all, wall, mall, fall, where it is pronounced as in cause and fault, or as a in low. It is probable that this broad sound was that which our Saxon ancestors expressed by the character A, as it is still, almost uniformly, retained in the rustic pronunciation and northern dialects of our language; as tawt for talk, maun for man, bound for bond, &c.

2. The open A of the English, is not unlike the A of the Italians in adagio, and is the sound marked by this letter in father, rather, &c.

3. The slender found marked by the character A, is peculiar to the English language, and resembles the found of the French e masculine, or of their diphthong ai in pais; perhaps it is a middle found between them, or between the a and e. Such we have in the words place, face, wake, and in all those that terminate in aion; as salvation, preservation, &c.

The sounds of which A is the character in our language, are sometimes short; as in the words glass, grasp, brass, &c. at other times long; as in glaze, graze, &c. Their length is commonly denoted by an immediately subjoined to the a; as in plans, rain, &c. or by an e added at the end of the word; as in plane, crane, &c.

Some contend that there are four, others, that there are five distinct sounds, denoted by the character A in the English language. There are, perhaps, little variations and distinctions in the sounds marked by the character A, as well as by the other vowel letters in our alphabet; but they are so local or arbitrary, or, after all, so nice and subtle, that they entirely escape the notice of foreigners, and are hardly distinguishable by the natives. Those who desire to enter more deeply into the first formation of sounds, and to see the elementary principles of speech treated with philosophical accuracy, will find satisfaction in the ingenious treatises of Wallis and Holder.

In burlesque poetry, the letter A is sometimes added after words; it lengthens them a syllable, without altering their sence; as length, for line, in Dryden, &c. It is sometimes redundant, when prefixed to words, as arise, awake; the same with rise, wake, &c.

In our Calendar, A is the first of the dominical letters which were introduced in imitation of the eight nondinal letters of the Romans, of which the A was one.

II. A is a word. This first simple sound is used in our language to express most of the vehement motions of the soul. We naturally use it on all sudden occasions of admiration, joy, anguish, apprehension of danger, &c. and where the emotion is very great, the A is enforced by adding an aspirate to it, as ab!

It is sometimes a noun; for we say great A and little a; but it is most commonly a definite, or an indefinite article. It is definite, and denotes the number one, as, a man is coming; that is, no more than one. It is also used as an indefinite

Vol. I.
A

Among Logicians, A denotes an universal affirmative proposition; according to the verb,
Affert A, negat E, verum generaliter ambe. See Barbara.
In Algebra A or a, and the first letters of the alphabet, represent known quantities; and the last letters represent quantities that are unknown.

In the prescriptions of Physicians, A, or ë, or ë, denotes equal parts of the ingredients specified, and is a contraction of the preposition æq., which is used in the same sense by medicinal writers in the Greek tongue.

Among Chemists, AAA signifies an amalgam, or the operation of amalgamating.

In Heraldry, the letter A is used as a bearing in arms.

Aa, Peter Vander, in Biography, an eminent bookseller at Leyden, who was living in 1729. He published an atlas of 200 charts compiled after the long voyages from 1346 to 1696. They are not deemed very accurate. They are included in the Galerie Acréable du Monde, in 66 vols. folio.

A continued Graevius's Thesaurus, or an account of the modern Italian writers, in six other volumes, with the Thesaurus Antiquitatum Sicilic.

Aa, in Hydrography, the name of several rivers: one in Welfphalia, which rises near Munster and falls into the river Limb; another, that has its source in the department of Somme, in France, becomes navigable by means of sluices near St. Omer, paffes on to Gravelines, and discharges itself into the English Channel; a third in Livonia, that falls into the gulf of Riga; and a fourth in Switzerland, that rises in Mount Bruning, and falls into the lake Lucerne.

AACH, in Geography, a small town in Germany, in the circle of Suabia and Landgraviate of Nellenburg, near the source of the river Aach, which falls into the lake of Zell. It belongs to the House of Austria. E. long. 9°. N. lat. 47° 55'.

AAARD, Nicholas and Christian, in Biography, two brothers born at Wiburg in Denmark in the beginning of the 17th century. The former is known for his philosophical works and other tracts, particularly his disputations upon Tacitus; the latter for his excellent poetry.

AAGGI-DOGGI, in Geography, a mountain of Amfia in Turkey, on the frontiers of Persia, which is crossed by the Caravans in their way from Constantinople to Iphahan.

AAGH- HOLM, a small island on the coast of Norway, near the mouth of the river Lendoved.

AAHUS, or AHAUSZ, i.e. the house on the Aa, a small town in the circle of Welfphalia, and bishoprick of Munster. It is the capital of the prefecture of Aabos, and has a citadel. E. long. 7° 1'. N. lat. 52° 10'.

AAKAR, a prefecture of the diocese of AARHUS containing 16 parishes.

AAIRKE, a town in the island of Bornholm, which has the privileges of a city, and in which are held the provincial court and the synod. E. long. 14° 56'. N. lat. 55° 15'.

AALBORG, the capital of a diocese of the same name in North Jutland, in Denmark, and a bishop's see. It derives its name from the number of cells that are taken here. This city is large and populous, and next to Copenhagen, the most opulent and best built in the kingdom. It carries on a considerable trade in herring and grain, and has different manufactorys of muckets, pitfols, faddles, and gloves. It has an exchange for merchants; as well as a safe and deep harbour. The population of this diocese amounts to 80,872 persons. E. long. 9° 46'. N. lat. 56° 50'.

AALLEN, or AHELLEN, a free imperial town belonging to the beam of Suabia, and so called from the number of cells which are in that part of the river Kocher that runs
runs through it. This city is Lutheran. It was formerly under the dominion of the kings of Bohemia, and sold to Eberhard, Count of Wirttemberg. The Emperor Charles IV. recovered it, and restored it to the empire in 1360. This, and similar cities that are almost in a ruined state, preserve their franchises and immunities with care. E. long. 9° 56'. N. lat. 48° 48'.

AALEST, or AELEST, Everard, in Biography, a painter, was born at Delft in 1602 and died in 1648. He excelled in fruit pieces, dead game, and armor. His nephew, named William, surpassed his uncle. He was born in 1620 and died in 1679. His pictures are chiefly known in Holland.

AALEST, or AELEST, in Geography, the capital of a county of the same name in the district of Ghent and circle of Burgundy, and lying between the rivers Schelde and Dender. This city lies on the latter of these rivers. E. long. 3° 54'. N. lat. 50° 58'.

AAM, or HAM, is a liquid measure generally used by the Dutch; it contains 128 mingles, each mingle weighing about 36 ounces avoirdupois; and consequently the Am is equal to 143.75 pints of Paris, or to 288 pints of English measure; the Paris pint weighing 31 ounces, and that of England 16 ounces.

AAMA, in Geography, a province of Barbary in Africa, about 15 days' journey from Tunis.

AANSTRE, a small island on the coast of Norway, opposite to Ag-Holm.

AAR, or ARE, in Hydrography, a large river of Switzerland, which has its source in Mount Gritimal in the south of the canton of Bern, and pursuing a circuitous course towards the north-west, passes through the lakes of Brienz and Thun to Berne, and afterwards changing its direction towards the north-east, flows to Solothurn and Brugg, and being joined by the Reufs and Limmat, discharges itself into the Rhine near Waldhut. There is another smaller river of the same name in Westphalia.

AAR, in Geography, the name of a small island in the Baltic.

AARASSUS, in Ancient Geography, a town of Pifidia in Asia, which some have supposed to be the Annius of Ptolemy. Strabo, Geog. tom. ii. p. 855.

AARAW, in Geography, a town and bailiwick in the canton of Bern in Switzerland. E. long. 7° 10'. N. lat. 40° 2'.

AARDENBORG, a small town in Flanders situated on a canal which communicates with the Zwin. It was once a fortress; but its works were totally razed in 1700. E. long. 3° 14'. N. lat. 51° 17'.

AARHUUS, the capital of a diocese of the same name in North Jutland, extending from that of Viborg along the Cattegat, about 15 miles in length and 8 or 9 in breadth. This diocese is extremely fertile, and diversified with woods, bays, and lakes abounding with fish. It is watered by several rivers, the chief of which is the Guden. The town lies in a fine plain between the sea and a lake, from which a stream of water passes through it. It is large and populous, has 6 gates, 2 principal churches, 2 market places, an university, a free school, and a well endowed hospital. It carries on a good trade. The number of inhabitants in this diocese is estimated at 117,942. E. long. 10°. N. lat. 56° 6'.

AARON, in Scripture History, the son of Amram and Jochebed, and the grandson of Levi, was born A. M. 2430, before the Christian era 1574. He was three years older than his brother Moses, and appointed to aid him under the character of his advocate and interpreter, as well as prophet, in his intercourse with Pharaoh, and in the release of the Israelites from their bondage in Egypt. With this view they both went together into Egypt; and after many attempts to overcome the opposition of the Egyptians, and the obstinacy of Pharaoh, they accomplished their object A. M. 2513, ante A. D. 1491. After the Exodus of Israel, and during their peregrination in the wilderness, Aaron and his sons exercised the office of priests by a divine appointment; and as soon as the Tabernacle was built, Aaron was consecrated by Moses with the holy oil, and invested with the pontifical ornaments. When Moses went up to the Mount to receive the law, Aaron, accompanied by the 70 elders, followed him; but during his continuance for 40 days on the Mount, the people became impatient and tumultuous, and Aaron, yielding to their solicitations, melted down their pendants, and the ear-rings of their wives and children, and formed the golden Calf, to which they paid homage. He afterwards humbled himself for this offence, obtained forgiveness, and was continued in the priesthood. In a subsequent period, viz. A. M. 2515, Korah aspired to the prieftly office, and Dathan and Abiraun claimed a share with Moses in the sovereign authority; for which act of rebellion, as their history informs us, they were signally punished. Aaron was afterwards confirmed in the priesthood by the miracle of the almond-rod, which bloomed, and which was deposited in the most holy place, in order to perpetuate his title, and the remembrance of this prodigy. He married Elisheba, the daughter of Ammiah of the tribe of Judah, by whom he had four sons; two of whom were destroyed by fire, and from the other two the race of the high priests of the Jews was continued from Aaron in regular succession. When the period of Aaron's service was completed, he ascended Mount Hor near the encampment of the Israelites at Moab, divested himself of the pontifical ornaments in the view of the people, and put them upon Eleazar his eldest son, and his successor in the high priesthood. He then died in the arms of Moses and his son, at the age of 133 years, in the 40th year after the Exodus; and they buried him in a cave of this mountain: but the place of his interment was concealed, probably under an apprehension that in future ages he might become an object of superstitious worship. For a fuller account of Aaron the reader is referred to Exodus, Leviticus, and the book of Numbers to the 24th verse of the xxth chapter; and for an abstract, with remarks on several circumstances pertaining to his station, character, and office, to Calmet's Dictionary of the Bible.

AARON, in Church History, a British martyr, who suffered a cruel death, together with Julius, under the persecution of Diocletian, in the year 303. It does not appear what were the British names of these two martyrs; as the Christian Britons took new names from the Latin, Greek, or Hebrew, at the time of their baptism. They were buried at Caerleon, and each of them had a church dedicated to his memory in that city. In the Roman martyrlogy their feast was fixed on the 1st of July. B. G. Brit.

AARON, a presbyter and physician of Alexandria, author of 30 books in the Syriac tongue, containing the whole practice of physic, called the Pandects, chiefly collected from the Greek writings, and supposed to be written before 620. They were translated into Arabic by a Syrian Jew physician about A. D. 683. He is the first author that mentions, and that has clearly described, the small-pox and meafeles, which probably first appeared at Alexandria in Egypt A. D. 640, and were brought thither by the Arabs when they took that city. He directed the vein under the tongue to be opened in the cure of the jaundice, and observed that the faces in that disease are of a white colour. The above-mentioned work and its translations are lost; and we
AAT

we have only fragments remaining, collected by Mohammed Razi in his Continents.

Aaron, of Harun, Al Rajhib, in General Biography, a celebrated caliph of the Saracen empire. See Bagdad.

Aaron Arrieu, a learned Rabbi and Caraita in the thirteenth century, who wrote an Hebrew grammar, printed at Constantinople in 1581. He was probably the same with Aaron, who wrote a commentary on the Pentateuch, which is in MS. in the French king's library, and translated by Dantz in 1710; and MSS. annotations on the Old Testament.

There was another Aaron, distinguished from the former by the epithet Hacharan, i.e. posterior, who was born at Nicomedia in 1546. His writings are esteemed oracular by the Carait Jews. The Garden of Eden, containing the doctrines and customs of his nation, is the principal.

Aaron, a Levite of Barcelona, was the author of 613 precepts on Mofes in Hebrew, printed at Venice in 1523. He died in 1297.

Aaron, Ben chaim, was chief of the synagogue of Fez and Morocco in the beginning of the seventeenth century. His commentary on the Prophets, intitled the heart of Aaron, one on the Syphra, and another on the Law, were printed at Venice in 1609, folio.

Aaron, Ben afer, was a celebrated Rabbi, who is said to have invented the Hebrew points and accents towards the fifth century. His Hebrew grammar was printed by Bomberg in 1515, folio.

Aaron, in Geography. See St. MaloE.

Aaronsburgh, in Geography, a town of America, lying at the head of Penn's creek in the county of Northumberland, about 30 miles W. from Louisburgh, and 40 W. by N. from Sunbury.

Aarsens, Francis, Lord of Somedlyck and Spycy, one of the greatest ministers for negotiation in the United Provinces. He was sent by Barneveld, who presided over these provinces, as agent into France, and was the first person recognized, in 1669, as Dutch ambassador by the French court. He was the first of three extraordinary ambassadors sent to England in 1620, and the second of those who were deputed in 1641, to negotiate the marriage of Prince William, son to the Prince of Orange. After having been employed in several other important missions, he died in an advanced age, very rich, and left on record memoirs of all the embassies in which he had been engaged.

Aarsens, or Aertsen, Peter, denominated from his nature by the Italians Pietro Longo, a celebrated painter, was born at Amsterdam in 1519. He excelled in painting a kitchen with its furniture, and his altar-pieces were particularly admired. A famous piece of this kind was destroyed in the insurrection of 1566; and because he complained of this outrage, he was in danger of being murdered by the populace. He died in 1575.

Artgen, or Aertgen, a painter of eminence, who was born at Leyden in 1498, and purfied his father's trade of a woollener to the age of eighteen. He voluntarily lived in meaner and obscurity; and declined offers of advancement, alleging that he found more sweets in his poverty than others did in their riches. He never worked on Monday, chusing to devote that day, with his diciples, to the bottle. It was his practice to stroll about the streets in the night, playing on the German flute; and in one of these frolics he was drowned in 1564.

Aas, in Ancient Geography, a town of Paleolize, situated between Azotus and Alcalon, which in the time of Jerome was a hamlet.

Aatter, a district of the northern part of Arabia Felix, on the Red Sea.

Aavora, in Natural History, the fruit of a sort of large palm tree in the Weil Indies, and in Africa. It is of the size of a hen's egg, and included, with several more, in a large shell. In the middle of the fruit there is a hard nut, about the size of a peach stone, which contains a white almond, very alfrangent and proper to check a diarrhoea.

Ab, in the Hebrew Chronology, the eleventh month of the civil year, and the fifth of the ecclesiastical year, which begins with Mifam. This month answered to the moon of July, comprehending part of July and of August, and contained thirty days.

The first day of this month is observed as a fast by the Jews, in memory of Aaron's death; and the ninth, in commemoration of the destruction of the temple by Nebuchadnezzar, in the year before Christ 587. Jopephus observes, that the burning of the temple by Nebuchadnezzar, happened on the same day of the year on which it was afterwards burned by Titus. The same day was remarkable for Adrian's edict, which prohibited the Jews to continue in Judæa, or to look towards Jerusalem and lament its desolation. The eighteenth day is also kept as a fast, because the sacred lamp was extinguished that night, in the reign of Ahaz. On the twenty-fifth, or according to Scaliger, the 22d day, was a fast, called Xylophobia, from their laying up the necessary wood in the temple: and on the twenty-fourth a fast in commemoration of the abolishing of a law but the Ammonites, or Maccabees, which had been introduced by the Sadducees, and which enabled, that both sons and daughters should alike inherit the estates of their parents.

Ab, in the Syriac Calendar, is the name of the last summer month.

Ab, prefixed to the names of places, generally denotes that they belong to some abbey.

Ab, of Abau, Hamifah. See Hamifah.

Ab, Abas or Abus, in Ancient Geography, a mountain of Greater Armenia, situated between the mountains Niphatas and Nibarus. According to Strabo, (Geog. tom. ii. p. 799,) the Euphrates and Araxes flow from this mountain; the one towards the west, and the other to the east. Eufathius and Dionyfus Periegetes, call this mountain, which is part of Mount Taurus, Achos.

Ab, or Aba, a city of Phocis in Greece, near Helicon, famous for an oracle of Apollo, more ancient than that at Delphi, and also for a rich temple, plundered and burnt by the Persians. Strabo's Geog. tom. i. p. 647, and the authors there cited.

Abaca, in Botany, a kind of flax or hemp, gathered in some of the Manillas or Philippine Islands. This plant is grown every year; being gathered, it is steeped in water, and beaten as hemp is. It is of two kinds, the white and the grey. The white abaca is used for making very fine linen; but the grey is employed for nothing but cordage.

Abaca, in Geography, one of the Philippine Islands in Asia.

Abacena, in Ancient Geography, a town of Media, and another of Cana in the Hither Asia.

Abacenum, a town of Sicily, the ruins of which are supposed to be near Tripoli, a citadel on a steep mountain near Melita. Its inhabitants were called Abacenini. Stephan. de Urbibus, tom. i. p. 2.

Abacay, in Natural History, a name given by the people of the Philippine Islands to a species of parrot, called also Calangay.

Abach, in Geography, a market town of Bavaria, situated on the Donabue. It has an old castle, in which Henry II. is said to have been born, and is much frequented.
 quadratic on account of its mineral waters. E. long. 11° 59'.
N. lat. 48° 53'.

ABACINARE, or ABACINARE, derived either from
the Italian bacinio, a bason, or baco, a dark place, in Writers
of the Middle Age, a species of punishment, consisting in
the flogging of the criminal, by holding a red hot bason, or bow,
before his eyes. Du-Cange.

ABACK, in Sea Language, signifies the situation of
the falls, when their surfaces are slanted against the
masts by the force of the wind. They may be brought aback, either
by a sudden change of the wind, or an alteration in the
ship's course. They are laid aback to effect an immediate
retreat, without turning either to the right or left, in order
to avoid some imminent danger, in a narrow channel, or
when she has advanced beyond her station in the line of
battle, or otherwise. The falls are put in this position by
skewering their lee-bows, and hauling in the weather-
ones.

ABACOA, in Geography, one of the Bahamas islands,
about 54 miles in length and 21 miles in breadth. See
Providences.

ABACOCHEE, a river of America, called also Coosa.

ABACOT, a cap of flate, wrought up in the form of
two crowns, worn by our ancient British kings.

ABACTOR, formed of ab, from, and act or, a driver,
from agere, to drive, (called by the Roman lawyers Abigeus
or Abigeus), that drives off cattle in herds; in contradistinc-
tion to one who steals a single sheep, &c. only, who is
called a thief. Nam qui eum non furripit ut fur exer-
etur, qui fregit ut Abactor. The punishment of Abigeat
was more severe than that of Furtum; viz. condemnation
to the mines, banishment, or even death itself, according
to the quality of the offender. But sometimes in Spain
the punishment was more severe than elsewhere, the people there
being more addicted to it.

ABACTUS, or Abigeatus, among the Ancient Phys-
icians, was used for a miscarriage procured by art, or force
of medicines, in contradistinction to abortus, which is
natural. But the moderns know no such distinction. See
Abortion.

ABACUS, among the Ancients, was a kind of cupboard,
or Buffet.

The word is formed from the Greek abax, which, among
that people, signified the same thing.

ABACUS, among the Mathematicians, was a little table
strewed over with dust, on which they drew their schemes and
figures.

In this sense, the word seems formed from the Phen-
icians, abax, abak, dtyf.

ABACUS Pythagoricius, a table of numbers, contrived for
the ready learning of the principles of arithmetic; so deno-
minated from its inventor, Pythagoras.

Hence also, from an agreement in point of use, the
names Abacus and Abaci are used, among Latin and Italian
writers, for an alphabet, or ABC, &c.

The Abacus Pythagoricius, was, in all probability, no other
than what we call a multiplication-table.

Lindolus and Wolflus give us methods of performing
multiplication without the help of the Abacus; but they are
too operose in ordinary cases for practice. See Mul-
tiplication.

The Abacus for facilitating the operation of arithmetic,
is an instrument almost as ancient, and extensive, as the art
of arithmetic itself: if it be later than the methods of com-
puting by the fingers, and by tabella, or tables (which ob-
tained among the Egyptians), it is at least much prior to the
use of numeral letters or figures, wrought with the pen.

We find it in use, under some variations, among the
Greeks, Romans, Chinese, Germans, French, &c. It
exceeds in point of facility, and neatness of operation, as
working without any strokes or blots of the pen, or waste
of paper; hence also give it the preference in point of ex-
pedition.

The Abacus is variously contrived; that chiefly used
in European countries is made by drawing any number of
parallel lines, at pleasure, at a distance from each other,
equal to twice the diameter of a calulus, or counter. Here
a counter placed on the first or lowermost line, signifies 1;
on the second, 10; on the third, 100; on the fourth, 1000;
on the fifth, 10,000; and so on. In the spaces between the
lines, the same counters signify half of what they signify on
the next superior line; viz. in the space between the first
and second lines, 5; between the second and third, 50;
between the third and fourth, 500; and so on. Thus the
counters on the Abacus, in the figure here subjoined, make
the sum of 37592. — The Abacus is also divided cross-wise
into arcus, by means whereof subtractions are made. Wolf.
Lex. Mat. p. 175, sqq.

The Greek Abacus, αμβω, or counting-board, was an ob-
long frame, divided by several brass-wires stretched parallel
to one another, and mounted with an equal number of
little ivory balls, like the beads of a necklace. By the
arrangement of these balls, distinguishing the numbers into
different classes, and observing the relations of the lower
to the upper, all kinds of computations were easily performed.

The Roman Abacus was much the same with the Gre-
cian, except that instead of lines, or wires, and beads, in
the Roman, we find pins and groves for them to slide in.
It is described by several authors; but notwithstanding all
these descriptions, we should have had a very obscure idea
of the ancient manner of reckoning, if figures of it had not
been found among the ancient marbles. Phil. Trans. N° 180.

The Chinese Abacus confits, like the Grecian, of several
series of beads strung on brass wires, extended from the top
to the bottom of the instrument, and divided in the middle
by a croos piece from side to side; so that in the upper row
each string has two heads, which are each reckoned for
five; and in the lower row, each string has five heads of
different values, the first being reckoned as 1; the second,
as 10; the third, as 100, &c. as among us. Add, that
instead of four pins for digits, or units, in the Roman
Abacus, the Chinese has five beads.

We have two different figures, and descriptions, of the
Chinese Abacus, one given by F. Martinus, who had lived
many years in China; the other by Dr. Hooke, who copied it
from a Chinese dictionary of the court-language. See
Shwan-Pan.

ABACUS legificus is a rightangled triangle, whose sides,
forming the right angle, contain the numbers from 1 to
60; and its area, the products of each two of the op-
posite numbers. This is also called a canon of sexage-
simals.

ABACUS & palmule, in the Ancient Music, denote the machinery,
machinery, whereby the strings of the polyphonic, or instrument of many strings, were struck, with a plectrum made of quills.

Abeus harmonicus is used by Kircher for the structure and disposition of the keys of a musical instrument, whether to be touched with the hands or the feet.

Abeus, or Abeicus, in Architecture, is the uppermost member of the capital of a column; serving as a kind of coving, both to the capital and the whole column.

Vitruvius, and others after him, who give the history of the orders, tell us, the abacus was originally intended to represent a square tile laid over an urn, or rather over a basket.—An Athenian old woman happening to place a basket thus, covered over the root of an acanthus: that plant shooting up the following spring, encompassed the basket all around, till meeting with the tile, it curled back, in a kind of scroll. Callimachus, an ingenious sculptor, paffing by, took the hint, and immediately executed a capital on this plan; representing the tile by the abacus, the leaves by the volutes, and the basket by the vase, or body of the capital. There is some difference in the form of the abacus in different orders. In the Tuscan, Doric, and ancient Ionic, it is a flat, square member, well enough representing its original tile; whence the French call it talier, teckfor. In the richer orders it loses its native form: its four sides or faces being arched, or cut inwards, with some ornament, as a rofe, or other flower, or a sikh's tail, in the middle of each arch. See Corinthian and Composite. But some architects take other liberties in the abacus, in respect of its name, place and office. Thus, in the Tuscan order, where it is the largest and most massive, as taking up one third of the height of the whole capital, it is sometimes called the dye of the capital.—In the Doric it is not always the uppermost member of the capital; a cymatium being frequently placed over it. In the Ionic, some make it a perfect ogee, and crown it with a fillet.—The proportion of the abacus, as preferred by Vitruvius, is, that its diagonal (from corner to corner) be twice its height: but the moderns dispense with this proportion.

Scamozzi applies the term abacus to a concave moulding in the capital of the Tuscan pedastal, and Palladio calls the plinth above the echinus, or boulétis, in the Tuscan and Doric orders, by the same name. In the Ancient Architecture, Abacus is used to denote certain compartments in the incrustation or lining of the walls of flat-roofs, mosaic pavements, and the like. There were abaci of marble, porphyry, Jasper, alabaster, and even glass; shaped variously, square, triangular, and the like.

Abada, in Zoology, a singular kind of wild animal in BENGASIA, in Africa. It is about the size of a half-grown colt, stay and swift-footed. It has two horns, one in its forehead, and another in the nape of its neck, which are of different length and bulk. The head and tail of this animal resemble those of an ox, and its feet are cloven like those of a fag, but much thicker. The front horn is deemed an antidote in many disorders; and the pulvérized bones are made into a poultice, and recommended by the natives as a sovereign remedy against all aches and pains, and as effectual for purifying the blood and humours. Mod. Un. Hist. v. 13. p. 8. See Rhinoceros.

ABADAN, in Geography, a town of Asia, on the gulf of Persia, and near the mouth of the river Tigris. It is dependent on Baffora. E. long. 45° 13'. N. lat. 39° 30'.

ABADAVINAS, in Ornithology. See Spinus.

Abaddon, Heb. corresponding to Apollyon, Gr. i.e. Death, in Scripture-history, is represented, Rev. x. 11, as king of the locusts, and the angel of the bottomles pit, who has been thought by many interpreters to be Satan, or the devil. Dr. More (Theol. Works, p. 130.) interprets this title as referring to the profession which the Mahometans should make of maintaining the doctrine of the unity. Le Clerc and Dr. Hammond understand by the locusts in this passage, the zealots and robbers who infested and depopulated Judea before Jerusalem was taken by the Romans, and by Abaddon, John of Gischala, who having treacherously left that town before it was surrendered to Titus, came to Jerusalem and headed those of the zealots who acknowledged him as their king, and involved the Jews in many grievous calamities. The learned Grotius concurs in opinion, that the locusts are designed to represent the sect of the zealots, who appeared among the Jews during the siege, and at the time of the destruction of Jerusalem. Mr. Jof. Mede remarks, that the title Abaddon alludes to Obodas, the common name of the antient monarchs of that part of Arabia, from which Mahomet came; and considers the passage as descriptive of the inundation of the Saracens. Mr. Lowman (Paraphr. on Rev. p. 118, &c.) adopts and confirms this interpretation. He shews that the rise and progress of the Mahometan religion and empire exhibit a signal accomplishment of this prophecy. All the circumstances here recited correspond to the character of the Arabs, and the history of the period that extended from A.D. 568 to A.D. 675. In conformity to this opinion, Abaddon may be understood to denote either Mahomet, who influed from the abyss, or the cave of Hera, to propagate his pretended revelations, or more generally, the Saracen power. Mr. Bryant supposes Abaddon to have been the name of the Ophite deity, the worship of whom prevailed very antiently and very generally. See SERPENT.

ABADIR, in the Roman Theology, the Stone which Saturn swallowed, believing it his new-born son Jupiter, and which at length became defined, and the object of religious worship. The Carthaginians gave this title to gods of the first order.

ABÆ. See ABA.

ABAFT, in the Sea Language, is used in speaking of things placed or done towards the stern, or hinder part of a vessel; called also aft, and stands opposite to for. Thus they say a thing is abaft the fore-mast, when it is behind it, or near to the stern. The poft of the master, captain, and other officers, is abaft the main-mast. The stern, strictly speaking, is only the outside; abaft includes both inside and out.

Aabith the beam, denotes the relative situation of any object with the ship, when the object is placed in any part of that arch of the horizon which is contained between a line at right angles with the keel and that point of the compass which is directly opposite to the ship's course.

Aabaci, the same thing with Aabasi; although of different value, it is worth at Toulis, and throughout all Georgia, about 36 fols French money; four chauris, which are also called fains, make one Aabasi.

Abaka Il Khan, in Biography, the 8th emperor of the Moguls, of the race of Zingis, who succeded his father Hulaku, and commenced his reign, A.D. 1264. He was prudent and learned, and possessed many amiable qualities which endeared him to his subjects, and rendered his government prosperous. He joined the Christians in celebrating Easter-day at Hamadan, whence some have erroneously inferred that he was a Christian. He reigned 17 years. Mod. Un. Hist. iv. p. 386.

ABAKANSKOI, in Geography, a garrison town of the province of Yenifie, in Siberia. It stands on the river Jenief, and is so called from the river Abaken, which falls into the Jenief at no considerable distance from it. E. long. 92° 3'. N. lat. 52° 5'.

ABALAK, a small town in Siberia, about two miles from
from Tobolik, famous for an image of the Virgin Mary, to which many pilgrims resort, and which is annually carried in procession to Tobolik. E. long. 63° 20'. N. lat. 58° 11'.

ABALATION, from ab and alienare, to alienate, in the Roman laws, denotes a species of alienation; wherefore those goods called res muncipii, such as cattle, slaves, lands, and possessions, within the territory of Italy, were transferred to persons legally capable thereof, either by a formula, called traditio novi, or a surrender in open court.

ABALIENATUS, alienated from, a medical term, which, when applied to the body, signifies that the part so spoken of, is in a state that requires amputation; and when applied to the fenes, denotes their total destruction.

ABALITES. See Avalites.

ABALLABA, in Geography, the ancient name of Appleby, a town in Westmorland, remarkable only for having been a Roman station. W. long. 1° 4'. N. lat. 55° 38'.

ABALUS, an island, as the ancients suppos'd, in the German ocean, called by Timaurus Balia, and by Xenophon Lamplacenus Balitoe, now the peninsula of Scandinavia. Amber, according to Pliny, (Hist. Nat. tom. ii. p. 770. ed. Hard.) was thrown on the shores of this island by the waves of the sea; and he reports, that some perfons thought this fabulosity dropped from the trees in the adjacent mountains.

ABAN la Ville, a town in the bailiwick of Quimicy, situat between the town of that name and Lieu Dieu, in Franche Comte. E. long. 6° 15'. N. lat. 47° 10'.

ABANA, a river of Phoenicia, which rising from Mount Hermon, washed the south and west sides of Damascus, and fell into the Phœnician sea on the north of Tripolis. The Abana was one branch of the Barrady, called by the Greeks Obrysthias. This river is mentioned by Naaman.

2 Abang. See Ady.

ABANO, a village near Padua, in Italy, famous for its warm baths. In one of these baths the patients are covered with the warm mud. E. long. 10° 47'. N. lat. 45° 30'.

ABANTES, in Ancient History, a warlike people who came originally from Thrace, and settled in Phocias, a country of Greece, where they built a town, called ABA, after the name of their leader. Some ancient authors say, that the Abantes afterwards settled in the island Euboea, now called Negroponte; others say that the Abantes came from Athens. These people are called by Homer (II. i. ii. v. 542.) ὄμιοι ἀνθρώποι, from wearing their long hair behind. They were called Curtes from their cutting it short before.

ABANTIA, or ABANTIS, in Ancient Geography, a name given to the island Euboea, in the Egean Sea; extending along the coast of Greece, from the promontory Sunium of Attica to Thessaly, and separated from Beotia by a narrow strait called Euromus. It derived its name from the ABANTES, according to Strabo, tom. ii. p. 652. Others say, that the inhabitants were called ABANTER, from Abas their leader, who first reigned in the island: and Reineccius supposes that they were Egyptians, who followed Cadmus into Euboea, and settled there.

ABAPTISTA, or ABAPTISTON, in Surgery, derived from the privative and βάπτω, to plunge; the shoulder of a trepanning instrument. This term is employed by Galen, Fabricius ab Aquapendente, Seclutus, and others, to denote the conical law with a circular edge (otherwise called modiolus or terreta), which was formerly used by surgeons to perforate the cranium. Modern practitioners, however, have usually preferred the cylindrical form. Various contrivances are recommended, to avoid the danger that may arise from want of dexterity in the operation of trepanning, and a new instrument has been lately delineated for this purpose, by Mr. Rodman of Paitley, (Philosophical Magazine for April 1800;) but as no invention can compensate for a defect of skill in the surgeon, these precautions are not in general attended to. For a more particular account of this instrument, see TREPANE and TREPHERINE.

ABARA, in Geography, a town in the greater Armenia, under the dominion of the Turks. E. long. 46° 15'. N. lat. 39° 45'.

ABARANER, a town of Turcomania, in Asia, situated on the river Alignena, and twenty miles north of Nakhivan. It is said that 300 Roman Catholics reside here. E. long. 45° 30'. N. lat. 39° 50'.

ABARCA, an ancient kind of shoe used in Spain to pass the mountains, made of raw hides, and bound with cords, which secured them against the snow.

ABARIN, in Scripture Geography, a ridge of high mountains situate between the rivers Arnon and Jordan, and nearly opposite to Jericho, in the land of Canaan. Nebo and Lifgah, which were suppos'd to have been the same mountain, formed a part of this extensive range of steep hills. Here the Israelites encamped for the last time, but one before they passed over Jordan into the promised land. The name Abarin was applied to part of this ridge of mountains in the time of Eusebius and Jerome. Wells's Geog. of the O. T. T. vol. ii. p. 152, &c.

ABARIMON, in Ancient Geography, a valley of Scythia, at the foot of Mount Imus, the inhabitants of which, according to Pliny, (Hist. Nat. tom. ii. p. 370.) were Anthropophagi, little superior in their habits and manners to the wild beasts with which they associated. Their feet were turned backwards, and yet they were very swift.

ABARIS, in Biography, the famous Hyperborean Sage, who is said to have been the disciple and friend of Pythagoras, and to have performed a great number of singular exploits. His history is so fabulous, that Herodotus contents himself with relating (lib. iv. cap. xxxvi. p. 296. ed. Wills.) that he travelled through the world on an arrow, without any sustenance. Harpocrate (art. Αβαρίς) informs us, that he was sent by his countrymen as an ambassador to Athens, in conformity to an order of Apollo, who being consulted at the time of a destructive plague that generally prevailed, replied, that the Athenians should offer up prayers on behalf of all other nations; and on this occasion, as we learn from Diodorus Siculus, (lib. iii. c. xliv. p. 159. ed. Wills.) he renewed the friendship and intercourse between his countrymen and the people of Delos, which had been interrupted. He also visited Lacedaemon; where some writers say, as we are informed by Pausanias, (lib. iii. cap. xiii. p. 278. ed. Kuhnii.) he built a temple consecrated to Proserpine the Salutary. Abaris performed this long voyage with ease and expedition, being transported through the air, over rivers, seas, and mountains, on an enchanted arrow, which, says Jamblichus, (Vit. Pythag. p. 118.) he had received as a present from Apollo. Some have suggested that this arrow denoted his skill in astronomy, by which he directed his course. He is said by Strabo (lib. vii. tom. i. p. 462.) to have gained the esteem of the learned men of Greece by his politefns, eloquence, and wisdom. He particularly excelled, says Jamblichus, (cap. xix. p. 131.) in the arts of magic and divination, of which he exhibited the most illustrious proofs in all the countries through which he travelled. He adds, that he was taught by Pythagoras to find out all truth by the science of arithmetic. Porphyri (Vit. Pythag.) informs us, that he was capable of foretelling earthquakes, in driving away plagues, laying frowns, &c. Abaris, says Bayle, constructed the famous palladium of the bones of Pelops, and fold it to the people
people of Troy. After he had visited many countries, and
collected a great quantity of gold, he set out on his return
home; and in his way had an interview with Pythagoras at
Crete, in Italy. Suidas enumerates various books which he
is said to have written; and Himerius the Sophist, applauds
him for speaking pure Greek, which he acquired by means of
the intercourse that subsisted between the Greeks and Hyper-
boreans. In his various peregrinations he imposed upon the
vulgar by false pretensions to supernatural powers; deliver-
ing oracular predictions, healing diseases by incantation, and
practising other arts of imposture. Hence the fabulous
stories concerning *Abaris* grew up into an entire history
written by Herculides. Some of the later Plutonists, says
Ehlied, (History of Philosophy, vol. i. p. 103.) in their
zeal against christianity, collected these and other fables, and
exhibited them, not without large additions from their own
fictitious imaginations, in opposition to the miracles of Christ.
He concludes upon the whole, that *Abaris* has a better title
to place among impostors than among philosophers, and
that the time in which he flourished may, with some degree
of probability, be fixed about the third olympiad, or B. C. 768.

The age of Pythagoras is no less uncertain, otherwise it is not
likely that they should be contemporaries. Mr. Toland in
his Plurilunious works, (vol. i. p. 161.) premising that the
Hebrides were the Hyperboreans of Diodorus, infers that
*Abaris* was both of that country, and likewise a Druid,
having been the priest of Apollo. Suidas, says this writer,
who knew not the distinction of Infular Hyper-
boreans, makes him a Scythian; whereas Diodorus has truly
fixed his country in the island, and not on the continent.
Notwithstanding the fictions and errors that have been
blended with the history of *Abaris*, it is certain, (as he ap-
prehends,) that he travelled over Greece, and from thence
into Italy, where he familiarly conversed with Pythagoras,
who favoured him beyond all his discipies, by imparting his
dothesies to him, (especially his thoughts of nature,) in a
more plain and compendious method than to any others.

The Hyperborean in return presented the Scythian, as if he
had equalled Apollo himself in wisdom, with the sacred
arrow, on which he had traversed seas and mountains; as the
vulgar, particularly in the Hebrides, still believe, that
wizards and witches waft themselves whither they please
upon broom-sticks. According to the account given by
Himerius, and cited by Toland, (p. 180. &c.) *Abaris* the
fage, was by nation an Hyperborean, a Grecian in speech, and
resembling a Scythian in his habit and appearance. He
came to Athens, holding a bow, having a quiver hanging
from his shoulder, his body wrapt in a plaid, girt about his
loins with a gilded belt, and wearing transverses feaching from
his waist downward. His habit, therefore, was not that of
the Scythians, who were always covered with skins; but he
appeared at Athens in the native garb of an aboriginal Scot.
As for what regards his abilities, Himerius relates, that he
was affable and pleasant in conversation, in dispatching great
affairs secret and indiscreet, quickfisted in precipitae ex-
genies, in preventing future dangers circumstent, a
seeker after wisdom, defiros of friendship, trufiting indeed
little to fortune, and having every thing treasured to him for
his prudence. Neither the Academy nor the Lycenn, says
Mr. Toland, could furnish out a man with fitter qualities to
go to far abroad, and to such wise nations, about affairs no less
arduous than important. But if we attentively consider his
moderation in eating and drinking, and the use of all thofe
things which our natural appetites incessantly crave, adding
the candour and simplicity of his manners, with the solidity
and wisdom of his answers, all which we find sufficiently at-
tested; it must be owned, that the world at that time had
few to compare with *Abaris*. One of our most indiligious
historians has adopted the opinion of Mr. Toland, and taken
great pains to prove that *Abaris* was a native of Britain, or
one of the British illes. See Carly’s General Hist. Eng. vol. i.
p. 52, &c. cited by Dr. Henry in his History of Great
Britain, vol. ii. p. 70, 8vo.

ABARNUS, or ABRANUS, in Ancient Geography, a city,
country, and promontory of Parium, near the Hellepon.
Milies, in his description of Asia, says, that it was a
promontory of Lampiaus; and it is said to have been so
denominated from Abaris, a Phocian, by the Phocians,
who built Lampiaus. Some writers have called it Aparis.
Stephan. de Urbibus, tom. i. p. 4.

ABARTICULATION, in Anatomy. See DIAR-
THESES.

ABAS, a weight used in Peru for weighing pearls; be-
ing an eighth part lighter than the European carat.

ABAS, in Mythology, the son of Hypothon and Meg-
nira, who entertained Ceres, and offered a sacrifice to that
goddes; but *Abas* ridiculing the ceremony, and giving her
opprobrious language, she sprinkled over him a certain mix-
ture which he held in her cup, that transformed him into a
newt or water-lizard.

ABAS, or ABASSA, in Entomology, a species of the Bom-
byx of Fabricius, and of the Phalaena of Linnaeus, with brown,
spreading wings, the hinder wings cincerus, and the ocelu-
lus reddish. It is found in Surinam.

ABASA, in Geography, a small town of Romania in
European Turkey, 12 miles from Adrianople, in the road to
Constantinople. N. lat. 42° 18’. E. long. 25° 35’.

ABASED, ABASSE; in Heraldry, is applied to the
vol, or wings of eagles, &c. when the tip, or angle, looks
downwards toward the point of the field; or when the
wings are shut: the natural way of bearing them is spread,
with the tip pointing to the chief, or the angles. A chev-
ron, a pale, bend, &c. are also said to be abased when their
points terminate in, or below the centre of the field. Again,
an ordinary is said to be abased, when it is below its
due situation.

ABASCIA, or ABASIA, in Geography, the northern
district of the western division of Georgia, in Asia. The
inhabitants are poor and treacherous. They trade in furs, the
skins of the buck and tyger, linen yarn, box-wood, and
bees-wax; but their principal traffic conflicts in the file of
their own children to the Turks, and to one another. They
are christians only in name; but their customs resemble those of
the MINGRELIANS. The men are robust and active, and
the females fair and beautiful. E. long. from 39° to 43°,
N. lat. from 43° to 45°. See ABASIA and AKHAS.

ABASCUS, a river of Asiatic Sarmatia, which rises in
mount Caucasus, and falls into the Euxine, between Pityu
the east and Nofis to the west.

ABASTIS, a tract of Asiatic Myia, in which was
situated the ancient city of Ancyra.

ABASKAJA, a town in Siberia, on the river Icfhim.
It has a church encompassed by ramparts, and guarded by
dragoons. E. long. 69° 5’. N. lat. 50° 10’.

ABASSA, the smaller and the great, two districts
in the vicinity of the Caucasian mountains. The for-
mer, according to the account lately given by Palma in
his journey to the southern departents of Ruffia, is inhab-
ited by fix tribes, who were formerly Christians, but their
nobles now acknowledge the Mahometan religion; their
manners, clothing, and way of life, resemble those of the
CIRCASSIANS; and there is some familiarity in their lan-
guage. They likewise practise agriculture, though they
live more by pittance. They are celebrated on account of
their large and fine breed of horses; and they would be rich
(in their own estimation) if they were not incessantly
plagued,
plagued by the encroachments of the Circassian princes. The most powerful inhabitants of the great Abassia are the Natuchals. See Abbas and Abhaks.

ABASSA, a silver coin current in Peria, worth two mamanni, or four chayes; the chaye being estimated at nine foles fif deniers of French money, makes the abass worth thirty-eight foles; seventeen foles of Holland, or from one half and four pence to about eighteen pence English. It derives its name from Shah Abbas II. King of Peria, under whom it was struck.

ABASSI, in Geography. See Geombrong.

ABASSIA, in Geography. See Abyssinia and Ethopia.

ABAT-CHAVVE, a name given in Poitou, Angoumois, Saintonge, La Marche, and Limofin, in France, to a sort of very ordinary wool; much like that called by the French, paigmons, and phares.

ABATE, Andrea, in Biography, a Neapolitan master, who excelled in painting inanimate objects. His colouring was bold; he gave a noble relief to the vases and other ornaments, with which he enriched his design; and grouped all his objects with peculiar judgment and care. He died in 1732. Pikington’s Dict.

ABATE, in Law, from the French abattre, signifies to break down or destroy; as, to abate a nuisance; and to abate a castle. It is likewise used to denote the act of one who walks or even a castle, void by the death of the last possessor, before the heir can enter; and by that means keeps him out. It also means to defeat or overthrow, on account of some error or exception. See Abatement. It is also used in the former sense thus: the writ of the demandant shall abate, i. e. be frustrated or overthrown; the appeal abated by covin, i.e. the accusation is defeated by deceit.

ABATE, in the Manege. A horse is laid to abate, or take down his curvets, when he puts both his hinder legs to the ground at once, and observes the same exactions in all the times.

ABATEMENT, in Commerce, (from the French abbatre), a term used for a prohibition of trade to all French merchants in the ports of the Levant, who will not stand to their bargains, or who refuse to pay their debts. It is a sentence of the French court, which must be taken off before they can sue any person for the payment of their debts.

ABATEMENT, in Heraldry, something added to a coat-armour, to distinguish its proper value and dignity, and note some dishonourable action, or fault, in the character of the person who bears it. These abatements, which are nine in number, may be made by reversion or diminution.

Reversion is either turning the whole effeoteon upside-down, for treason; or the adding another effeoteon, inverted, in the former, for deflowering a maid or widow, or from the banner of the sovereign.

Diminution is the blenching any part by adding a stain, or mark of diminution: such are the self tenne for a person who revokes or recedes from a challenge; a point dexter parted tenne, for a person who boats of an act of valor which he never performed; a point in point fanguine, for a person guilty of cowardice; a point champaign tenne, for him who kills his prisoner after his having demanded quarter; a plain point fanguine, for one who tells a lie to his sovereign or commander in chief; a gore fimitte tenne, for him who behaves in a cowardly manner towards his enemy; and a gusset fanguine, for an adulterer or drunkard, the gusset being on the right side for the former, and on the left for the latter.

It may be added, that these marks must not be of metal, and always either tenne or fanguine, otherwise instead of diminutions, they become additions of honour.

The last editor of Guilielm discards the whole notion of abatement, as a chimera. He agrees that no one instance is to be met with of such bearing; and that it implies a contradiction to suppose it. Arms, being insignia nobilitatis et honoris, cannot admit of any mark of infamy, without ceasing to be arms, and becoming badges of disgrace, which all would covet to lay aside. Besides, as no hereditary honour can be actually diminished, so neither can the marks thereof. Both indeed may be forfeited; as in the case of treason, where the effeoteon is totally reversed, to intimate a total suppression of the honour.

Some inferences, however, are produced to the contrary by Cumbriam and others. But these, though they may draw some extraordinary retentions of princes for offences committed in their presence, do not amount to a proof of such custom or practice; much less authorise the being of particular badges in the hands of inferior officers, as kings at arms. Menefrister calls them English fancies.

In a word, as arms are rather the titles of the dead than of the living, it would seem, that they can neither suffer diminution nor abatement; for thus an equal indignity would be put upon the ancestor and the descendant. Diminution, therefore, and abatement, can only affect arms lately granted, and solely when the person who obtained them is yet alive, and has tarnished his former glory by his subsequent misbehaviour. Even in this case, where abatement may properly take place, it can only be made by the suppression of some honourable badge, and not by the introduction of any degrading emblem.

Abatement, in Law, is the frustrating, or setting aside a suit, on account of some fault, either in the matter, or proceeding thereof. Thus, Plea in Abatement, is some exception alleged, either against the plaintiff’s writ, as wanting due form, or against his count or declaration, as being insufficient, or varying from the writ, specialty, or record; or against the matter of either, as insufficient, or being before another count; or against the allegations, as being uncertain, on account of some misinformation, or the death of one of the parties, or the marriage of the plaintiff, being a woman; to which some add disability.—Upon any of these, the defendant prays, that the plaintiff’s writ or plaint may abate, i.e. that his suit may cease for that time: if it be granted, all writs and process must begin de novo.

The death of a plaintiff did in all cases abate the writ before judgment, until the statute 8 and 9 W. III. c. 11, by which neither the death of the plaintiff nor that of the defendant shall abate it, if the action might be originally prosecuted by and against the executors or administrators of the parties; and if there are two or more plaintiffs or defendants, and one, or more, die, the writ or action shall not abate, if the cause, or action, survives to the surviving plaintiff, against the surviving defendant, &c. See Plea. Abatement also denotes an irregular entry upon lands. See Abate.

Abatement of Freehold. See Remainder.

Abatement of Nuisance. See Nuisance.

Abatement, in Commerce, is a differeninary allowance made for damage in goods sold, for a defect of weight or measure, on account of bad markets, or to a bankrupt-debtor, &c. See Discount and Rebate.

Abatement, in the Customs, is an allowance made upon the duty of goods, when the quantum damaged is determined by the judgment of two merchants upon oath, and ascertained by a certificate from the surveyor and landwaiter.

Vol. I
ABATIS, or Abbatis, in Writings of the Barbarous Age, denotes an officer of the Huns, who had the care of distribution of the corn. The name is derived from Beza, which denoted an ancient measure of corn.

In Cange.

ABATON, a house erected at Rhodes, as a fence to the theatre of Aesculapius, son of Hylas, and Coon. See on a story of her victory over the Rhodians, or rather for confirming the digress of the Rhodians from the public service, as the building, or destroying the theatre is, in their estimation, a poor affair.

ABATOR, in Law. See ABAT.

ABATOS, in Ancient Geography, an island in the lake of Morris, famous for its papyrus, and for being the burial-place of Otho.

ABAVI, ABOV, or ABAVUM; a large tree in Ethiopia, which bears a fruit like a pomegranate. See ANASNONIA.

ABAVUSIT, Firmius, in Biography, was born at Ucuz, in Langue-doc, on the 11th of November, in 1679. As his parents were protestants, he was obliged to leave France by the revocation of the edict of Nantes, and to wander among the mountains of Cevennes, till at length he found an asylum in the house of his mother, who had suffered much, and expended the whole of her fortune in his education. His chief attention was directed to the study of mathematics and natural history, whilst he made a considerable progress in every department of literature. In 1698 he visited Holland, and became acquainted with Bayle, Jurieu, and the Bafrages. He afterwards came to England, and conived with St. Evremond and Sir Isaac Newton. "You," says Sir Isaac, in an epistolary correspondence, "are a very fit person to judge between Leibnitz and me." King William, to whom he became known, attempted, by a liberal offer, to detain him in England; but he chose to return to Geneva; where, in 1715, he entered into the society formed for translating the New Testament into the French language; and where, in 1723, the university offered him the chair of philosophy, which he refused on account of the weaknees of his constitution, and of his talents. In 1727 he was presented with the freedom of the city, and appointed to the office of his librarians. There are few perons, whose mental endowments, natural and acquired, and whose moral and Christian virtues merit higher estimation than those of Abavusit. Of his mathematical and philosophical knowledge he gave ample evidence in his defence of Newton against father Callet, and in his discovery of an error in the Principia, which the author corrected in a second edition of that admirable work; a work which at the time of its first publication few were able to understand. He was also an excellent linguist, geographer, and historian, and intimately conversant with medals and ancient MSS. Such were not only the extent and accuracy of his knowledge, but the tenaciousness of his memory, that he could readily avail himself of the knowledge he had acquired. To this purpose it is mentioned, that when Rousseau published his Dictionary of Music, he found that Abavusit, who had not directed his attention to the music of the ancients for thirty years, could give him a clear and satisfactory account of the subject which he himself had investigated with so much labour. To this circumstance it was probably owing, that the whole panegyric which Rousseau ever wrote upon a living peron, and one of the finest of his notes, was addressed to Abavusit. Voltaire is also said to have paid him a very high and delicate compliment. A stranger having told the poet of Geneva, that he was come to Geneva to see a great man, Voltaire asked him, Whether he had seen Abavusit? We may naturally imagine, that the effect and attachment of these spirited philosophers would not be diminished by the liberty of his theological sentiments. On a subject that has been much controverted, Abavusit is said to have adopted and promoted the Arian doctrine. He also employed himself in discovering errors in the various translations of the Bible; and conceiving mathematical demonstration to be necessary in matters of testimony, he was led to divest the Scriptures of several miracles. But whatever may have been his occasional doubts, and the result of his inquiries on particular topics, he was, as a valuable biographer delineates his character, "religious by principle, and a Christian upon conviction." He defended religion to the time of his death, and employed some of his last days in establishing its evidence. Pious without hypocrisy, virtuous without austerity; he loved mankind; he fought to be useful to them; and he never blamed others for thinking differently from himself. His love of simplicity appeared in all his actions; he shunned ceremony, and retired from flattery. His conversation, always heard with eagerness, was delivered without ostentation. Even the exterior of his house, and of his person, discovered an unaffected dislike of parade and luxury. Always himself, he was always the modest, the wise, the learned, man, the wife Abavusit." This valuable man died, lamented by the republic, and regretted by the learned, on the 20th of March, 1767, at the advanced age of 87 years. He published, in 1730, a much improved edition of Spon's History and State of Geneva. As a citizen, he was active in the discussions of 1725; and though he was attached to the aristocratic party, he possessed a great degree of republican zeal. The writings he left behind him were chiefly theological. Of thefe the principal was, "An Essay upon the Apocalypse," written to show that its canonical authority is doubtful, and to apply the predictions to the destruction of Jerusalem. This work was translated by Dr. Twells, and refuted so much to the satisfaction of the author, that he stopped an impression of it, which had been intended. It was, however, afterwards introduced by the Dutch editors into their edition of his works, which also comprehends "Reflections on the Eucharist;" "On Idolatry;" "On the Mysteries of Religion;" "Paraphrases and Explanations of sundry Parts of Scripture;" several critical and antiquarian pieces, and various letters. An edition, without the Essay on the Apocalypse, was printed at Geneva, in 1740. Gen. Biog. by Dr. Aikin and Esfeld. Biog. Dict.

ABAY, in Geography, a name given to the Nile, in the territory of Gojam; which some derive from Ab, father, under which appellation this river, or perhaps the spirit residing in it, is an object of worship; but Mr. Bruce (Travels, vol. iii. p. 655.) says, that Abay in the Amharic language signifies, "the river that suddenly swells, or overflows periodically with rain." ABBY, among Cuthbirs, denotes the yarn of a weaver's warp, whence the wool of which it is made is called Abbewool.

ABBA, in Ancient Geography, a town of Africa, near Carthage.

ABBA, in the Syriac and Chaldee languages, literally signifies a father; and figuratively a superior, reputed as a father in respect of age, dignity, or affection. This appellation was not allowed to be used by slaves, when addressing the head of a family, and this circumstance adds peculiar force to the expression of the apostle, Rom. viii. 15. It may also
be observed, that St. Paul and St. Mark used the Syriac
_abbreviation_, which was understood in the synagogues and primitive
assemblies of Christians, but added to it, when writing to
foreigners, by way of interpretation, the term _father_. The
Jews affixed this denomination as a title of dignity; in
allusion to which, our Saviour forbade his disciples to call
any man their father on earth.

It was also anciently used as a title of honour, which
some great men, it is said, still retain in the Pyrenean
mountains.

_Abbas_, _Abba_, or _Abba_, is more particularly used in the
Syriac, Coptic, and Ethiopic churches, as a title which
the people give to their bishops.

The bishops themselves below the title _abba_, more emin-
ently, on the patriarch of Alexandria; which occasioned the
people to give him that of _baba_ or _papa_, that is, _grand-
father_; a title which he bore before the bishop of Rome.
It is a Jewish title of honour, given to certain of that class of
Rabbis called _Talmud_; and it is also particularly used
by some writers of the middle age, for the superior of a
monastery, usually called _Abbot_.

_Abbadie, James_, in _Biography_, an eminent protestant
divine, was born at Nay in Berne, in 1654, or 1658. He
studied in various places, but received his degree of Doctor of
Divinity at Sedan. Discouraged from the exercise of his pro-
feSSION in France, on account of the different circumstances
of the prelates, he first settled at Berlin under the pa-
tronage of the Elector of Brandenburg, about the year
1688 or 1689, where he resided for many years with great
reputation. In 1688 the Elector died, and he accompanied
Marshall Schomberg, first to Holland, and then to England
with the Prince of Orange. Loosing his patron, whom he
attended to Ireland, in 1690, he returned to England, and
became minister of the French church at the Savoy. He after-
wards removed to Ireland, and, by the recommendation of King
William, he obtained the deanery of Killaloe, with some
other preferments. He was strongly attached to the cause
of his royal master, as appears by his elaborate defence of the
Revolution, and his history of the affliction-plot. In 1720 he
removed again to England, and died in the parish of Mary-le-bone, in London, in the following year, at the
age, as some say, of 69, and according to others 73. He
was a zealous protestant, and one of the most eloquent men of
the period in which he lived. But his imagination and
memory, which was singularly retentive, as well as his learning
and eloquence, seem to have been superior to his judgment.

His works were numerous, and much approved at the time of
their publication; the chief of them were the following, viz.:-
_Traité de la Verité de la Religion Chrétienne_, Rotterdam 1684,
2 tomes 8vo; which work has been translated into English and
High Dutch, and has passed through several editions.

Mr. Boyle commends this book, as one of the most perfect
in its kind.—_Traité de la Divinité de notre Seigneur Jésus
Christ_, Rotterdam 1689, 8vo.—_L'Art de se connoître lui-
 même_, ou la _Recherche des Sources de la Morale_, Rot. 1692,
deco.—_Défense de la Nation Britannique_, &c. à Londres,
1692, 8vo.—_Histoire de la Conspiration derniere d’Angle-
terre_, &c. Londres, 1696, 8vo. This book was written by
order of King William III. and the original papers for
compiling it were furnished by the Earl of Portland and Sir
William Trumbull, secretary of state.—_La Verité de la Ré-
ligion Reformée_, Rot. 1718, 8vo. 2 toms.—_La Triomphe de
la Providence et de la Religion_, ou l’ouverture des sept
Sceaux per le Fils de Dieu, &c. Amin. 1723; 4 toms. 12mo.
Biog. Brit.

_Abbas Gumba_, in _Ornithology_. See _Erkoom_.

_Abbaisseur_, in _Anatomy_, a name given by Win-
flow, and other French writers, to one of the muscles of the
eye, called by others the _deprimens_ and _humiliis_; and by
Fabricius, the _rectus inferior_; Cowper and Albinus call it
the _depressor oculi_; and it is one of the _quatuor recti oculi_ of
the last author.

_Abbas_, in _Biography_, son of Abdalmotalleb, and nurse
of Mahomet, was at first hostile to his nephew as an impostor
and traitor to his country; but being taken prisoner in the second
year of the Hegira, at the battle of Beder, and a large ransom
being demanded, he represented to Mahomet that the pay-
ment of it would ruin him, and reduce his family to dif-
honour. Mahomet, however, had heard that he had secreted
money, and queried for the purport of gold which he had
left with his mother at Mecca. _Abbas_ was thus led to re-
gard him as a prophet, and to embrace his religion. He
afterwards saved his life at the battle of Honain, soon after
the reduction of Mecca. _Abbas_ was not only a great com-
mander, but an eminent doctor of the Mussulman law, and
read lectures upon every chapter of the Koran, as Mahomet
pretended to receive them from heaven. He died in 653,
and his memory is held in veneration among the Mussulmen
to this day.

_Abbas Abdallah_, Ela, was the grandson of Abd-
almotalleb, and the most considerable of all the doctors among
the Mussulmen. He is said to have acquired from the an-
gel Gabriel a perfect knowledge of the Koran, when he was
ten years of age, and was honoured with the title of Tar-
giuran al Koran, or interpreter of the Koran. He died in the
68th year of the Hegira, and was very much lamented.

_Abbas I_. Shah, surnamed the _Great_, was the third son
of Khodabandeh, and the 7th king of Persia of the race of the
Sohis. He succeeded _Imam III_. who had murdered their eldest brother _Amin Hamzeh_, and who was himself
put to death after a short reign of eight months, in the year
1585. These two princes are not commonly reckoned in
the number of Persian kings. His first thoughts and actions,
after he ascended the throne, if we except the murder of his
tutor Mursil, to whom he was indebted for his life and crown,
were directed to the recovery of those provinces which the
Turks and Tartars had taken from his predecessors. By a
series of victories, he defeated Abdallah, khan of the Uf-
becks, who invaded Khorasan, and the Ottoman Turks, from
whom he took _Taurus_; subdivided the provinces of Shirwan
and _Ghilian_; took possession of the kingdom of Lur, com-
peting a great part of Persia proper; invaded and secured
Georgia, and captured _Bagdad_, and _Orumz_ in the Persian
gulf. After a prospers reign of 43 years, during which he
consolidated the divided provinces of the Persian empire, and
considerably enlarged its extent, he was seized with a dan-
gerous distemper at Peramb, in the province of Mazen-
deran, supposed to have been the effect of poison, and died
a life of 70 years in 1628. Having appointed his grandson
for his successor, he ordered his death to be concealed to
the throne was secured to him; and for this purpose he
directed his funeral obsequies to be performed at three dif-
ferent places at once, and that his body should be exposed
every day in the hall of justice, seated in a chair of state,
with the eyes open, and his back to the hangings, behind
which stood a person who contrived to answer any questions
that were proposed. By this artifice his death was kept
secret for six weeks. The memory of Shah _Abbas_ has been
held in high veneration by the Persians, and they speak of
him as the greatest prince their country has produced for
many ages. He was wise and valiant, attentive to the poor,
and rigorous in the administration of justice. He adopted
all possible measures for promoting the wealth and good
government of his dominions; and took great pains to intro-
C 2 duc
ABBE, in Geography, a sea-port town of Norway, about 60 miles south-west of Christiania, situate on a small bay, in which are three islands.

ABBER-LOUGH, a lake of Lorne, in Argyleshire, in Scotland.

ABBESS, the superior of an abbey, or convent of nuns. The abbess has the same rights and authority over the nuns, that the abbot has over their monks. Her sex, indeed, does not allow her to perform the spiritual functions annexed to the priesthood; but in some instances the abbess has the privilege of commissioning a priest to act for them: and they have even a kind of episcopal jurisdiction.

F. Martene, in his treatise on the rights of the church, observes, that some abbesses have formerly conferred their nuns. But he adds, that their excessive curiosity carried them such lengths, that there arose a necessity of checking it.

St. Bafil, in his rule, allows the abbess to be present with the priest at the consecration of her nuns.

Before the conquest, abbesses were summoned to the Wittenagemote, and they assisted in the deliberations of ecclesiastical councils.

ABBEYBELL, or ABBEY, a monastery, or religious house, governed by a superior under the title of abbot, or abbess.

In our ancient statutes the word is sometimes also written abbeth. By 31 H. VIII. c. xii. abbatia is given to the king.

Abbeys differ from Priories, in that the former are under the direction of an abbot, and the latter of a prior; but abbot and prior (we mean a prior conventual) are much the same thing, and differ in little but the name.

One third of the coal bequests in England were anciently by the pope's grants, appropriated to abbeys, and other religious houses; which, upon their dissolution under King Henry VIII. became lay-leases. For a farther account and an estimate of the number and value of religious houses abolished and surrendered in this reign, see Monastery.

ABBEY-BOYLE, in Geography, a town of Ireland, in the county of Roscommon, and province of Connacht, famous for an old abbey. W. long. 8° 32'. N. lat. 56° 54'.

ABBEYHOLM, a town in Cumberland, is said from an abbey built by David king of Scots. It is situated on an arm of the sea, and is 16 miles S. W. of Carlisle. W. long. 3° 29'. N. lat. 54° 53'.
ABBEYMILTON, or MIDDLETON, an ancient, but
mean town in Dorsetshire, which had formerly an abbey
and a market, and which is 12 miles N. E. of Dorchester.
W. long. 2° 29', N. lat. 50° 51'.

ABBIANY, a town on the coast of Guinea, in Africa,
at the distance of three leagues from Tebbo.

ABBIANI, or the Baliol, wear monk clothes, and
were celebrated in 1205, and died in 1715, at the age
of 75 years. He was distinguished by fertility of inven-
tion and correctness of design. His body was free, and
his touch light; he executed with expedition, and
performed with equal beauty, in fresco and oil. Pilkington's
Ditt.

ABBON, in Biography, a monk of St. Germain-des-
Pres, who composed, in barbarous Latin verses, a relation
of the siege of Paris by the Normans towards the close of
the 9th century. He was more distinguished as a faithful
historian than as a good poet. His poems were published in
the second volume of Duchiene's collection, and have been
more correctly printed, with notes, by Duplessis, in 1753.

Biog. Dict.

ABBON, De Flurio, was born in the territory of Or-
leans. After devoting himself with ardour to the study of
almost every art and science, and obtaining distinguished
reputation in the schools of Paris and Rheims, he was elected
abbot of the monastery of Flurio, of which he was a monk.
He wrote an Apology for his conduct against the accu-
atious of his enemies, which was addressed to the kings
Hugh and Robert; to whom he also dedicated a collection of canons
on the duties of kings and subjects. The collection of his
letters and canons, and his apology, were published in
1682, in folio. He was slain in a quarrel that arose between
the French and Gascons at Recole in Gascony, in 1004.

Gen. Dict.

ABBOT, or Abbai, originally derived from the Hebrew
Ab, father, signifies the superior of a monastery of monks
created into an abbey or prelacy.

Abbots were really distinguished from the clergy, though
frequently confounded with them, because they were a
degree above laymen. St. Jerome, writing to Hicio-
dorus, says expressly, alia monitarum jbm causa, alia clericorum.

In those early days the abbots were subject to the bishops,
and the ordinary pastors. Their monasteries being remote
from cities, and built in the farthest solitudes, they had no
share in ecclesiastical affairs. They went on Sundays to the
parish-church with the rest of the people, or, if they were too
remote, a priest was sent to them, to administer the
Sacraments, till, at length, they were allowed to have
priests of their own body. The abbot, or archimandite, was
usually the priest; but his function extended no farther than
to the spiritual assistance of his monastery, and he remained
still in obedience to the bishop. In process of time, as
many of them were persons of learning, they opposed the
heresies that sprang up, which induced the bishops to fix
them near, and in the cities.

The abbots soon laid aside their former plenipotence and
simplicity, and endeavoured to be independent of the bishops,
which occasioned some severe laws to be made against them
at the council of Chalcedon: notwithstanding this, in time,
many of them carried the point of independency, and got
the appellation of lord, with other badges of the episcopate,
particularly the mitre.

Hence arose new species and distinctions of abbots: mitred,
and not mitred; croziers, and not croziers; temporal
abbots, cardinal abbots, &c.

Abbots, Mitred, were those privileged to wear the
mitre; and also allowed a full episcopal authority within
their several precincts.—Among us, these were also called
abbots foreigne, and abbots general; and they were lords
of parliament. Of these Sir Edward Coke reckons twenty-
sevein, and Selden twenty-six, in England, before two mitred
priests.

The rest, who were not mitred, were subject to the dio-
cesan.

Abbots, Croziers, are those who bear the crozier, or
palfonal staff.

Abbots were likewise distinguished into abbots elective,
and abbots prescriptive: but are now chiefly distinguished in
regular and commendatory.

Abbots, Regular, are real monks, or religious, who
have taken the vows, and wear the habit of the order.

Abbots in commendam, are seculars; though they have
 undergone the torture, and are obliged, by their bulls, to
take orders when they come of age.

Though the term commendam intimates, that they have
only the administration of their abbeys for a time; yet do
they hold, and reap the fruits of them for ever, as well as
the regular abbots.

Their bulls give them a full power tan in spiritualibus
quant in temporibus: and yet it is true that the commenda-
tory abbots do not perform any spiritual offices; nor have
they any spiritual jurisdiction over their monks. So that
the phrase in spiritualibus, is rather something of the Roman
style than a reality.

The ceremony whereby abbots are created, is properly called
benediction; or sometimes, though improperly, consecration.

It anciently consisted in clothing them with the habit called
evullas, a covert; putting the pastoral staff in their hands, and
the hoes called pedales, or pelves, on their feet. These par-
ticulars we learn from the Ordo Romanus of Theodore, archi-
bishop of Canterbury.

Abbort is also a title, which has been given to certain bi-
fests, because their fees had originally been abbey;
and they were even elected by the monks: such are those of Can-
terbury, and Montreal in Sicily.

Abbort is also a title borne by several magistrates, and
other lay-persons. Among the Genefs, one of their prin-
cipal magistrates was called the abbot of the people.

In France, particularly about the time of Charlemagne,
there were several lords and courtiers, who having the super-
intendency of certain abbeys committed to them, were flyled
abbascommites, or abbey-counts.

ABBOT, George, Archbishop of Canterbury, was born
Oct. 29, 1562, at Guildford in Surrey. Having passed
through the rudiments of literature in his native town, he
was removed, in 1578, to Baliol college at Oxford. In
1583, he was elected probationer fellow of his college;
and having passed through the usual course of gradua-
tion, he took orders and became a celebrated preacher in
that university; and in 1597 he was elected Master of Uni-
versity College. In 1600, and again in 1603, he was Vic-
cancellor of the university, and discharged the duties of
this office with general approbation. In the succeeding year
the translation of the Bible, now in use, was undertaken by
the direction of king James; and Dr. Abbot was the second
of eight learned divines in the university of Oxford, to whom
the care of transduing the whole New Testament (excepting
the epistles) was committed. In 1605 he was again Vic-
cancellor. After the decease of his patron, the Earl of
Dorset, in 1668, he became chaplain to Geo. Hume, Earl of
Dunbar, and accompanied him this year to Scotland,
to assist in establishing an union between the Scots and
English churches; and in conducting this business he ac-
quired
ABBOT, Robert, brother to the former, born at Guildford in 1560, and completed his studies at Balacl college in Oxford. He took his degree of Master of Arts in 1582, and became a distinguished preacher, to which his preferment was owing. In 1594 he became no less eminent for his writings. In 1597 he took his degree of Doctor in Divinity; and in the beginning of the reign of King James he was appointed chaplain in ordinary to his majesty, who ordered the doctor's book, *De Antichristo*, to be printed with his own commentary on the Apocalypse. He was elected master of Balacl college in 1609, and in 1612 his majesty appointed him regius professor of divinity at Oxford. The reputation which he acquired by his lectures induced his majesty to name him for the see of Salisbury, and he was consecrated by his brother at Lambeth, Dec. 3, 1615. He found the cathedral falling into decay, and applied the sum of 500l, which he obtained from the prebendaries, towards repairing it. Here he devoted himself with exemplary industry to the duties of his function; but his close application to study brought upon him the gravel and stone, which terminated his life on the 2d of March 1617, in the 58th year of his age. He was buried over-against the bishop's seat in the cathedral. Dr. Fuller (in his Worthies of England) says, speaking of the two brothers, "that George was the "more pliable preacher, Robert the greater scholar; "George the ablest statesman, Robert the deeper divine; "gravity did frown in George, and smile in Robert." His writings were numerous, and many of his MSS, were given by Dr. Corbet, who married his grand-daughter, to the Bodelian library.

There was another Robert Abbott, a minuter, and author of several devout pieces, who was fearcely a writer before the bishop died.

ABBOTS-
ABBOTS-BROMLEY, in Geography, a town of Staffordshire, with a market on Tuesday. W. long. 1° 2'. N. lat. 51° 5'.

ABBOTSURY, a small town in Dorsetshire, with a market on Thursday. W. long. 1° 17'. N. lat. 50° 40'. The abbey near this town was founded by a Norman lady about the year 1026; and Edward the Confessor and William the Conqueror were benefactors to it.

ABBOTS-Castle, or Apewood-Castle, an old fortification, in Staffordshire, seven miles from Wolverhampton, on the north side of the road from Shrewsbury to London, situated on a lofty round promontory, and a steep ridge of hills, which extend a mile in length, and are supposed to have been one continued fortification, and a work of the ancient Britons.

ABBOTS-LANGLEY, a village in Herts, four miles from St. Albans, famous as the birth-place of pope Adrian IV.

ABBREVIATION of Adjudication, in Scots law, an abstract or abridgment of a decree of adjudication, which is recorded in a register kept for that purpose.

ABBREVIATION, or Abbreviation, a contraction of a word, or passage, made by dropping some of the letters, or by substituting certain marks, or characters, in their place.

A late ingenious writer on the subject of grammar distributes the parts of speech into words, necessary for the communication of our thoughts, which are the noun and verb, and abbreviations, employed for the sake of dispatch. These latter, he says, are in the strict sense of the term, parts of speech, because they are all useful in language, and each has a different manner of signification. He inclines, however, to allow that rank only to the necessary words; and to include all the others, which are not necessary to speech, but merely abbreviates of the first sort, under the title of abbreviations. Words, he says, have been called suged, whence the title of this work, viz. ἡννα κάλλος; and they well deserve that name, when their abbreviations are compared with the progress which speech could make without these inventions; but compared with the rapidity of thought, they have not the smallest claim to that title. Abbreviations are employed in language three ways; in terms, in sorts of words, and in construction. Mr. Locke's Essay is the best guide to the first; and the authors who have given particular explanations of the last are numberless; the province of this author is confined to the second class of Abbreviations. See ENTE ITHENIOPO; or, The Diversions of Parley, c. i. p. 39. &c.

Lawyers, physicians, &c. use abundance of abbreviations partly for the sake of expedition, and partly for that of brevity. A list of the principal abbreviations, in the several arts and faculties, see under Character.

Of all people, the Rabbis are the most remarkable for this practice; so that their writings are unintelligible, without an explanation of the Hebrew abbreviations. The Jewish authors and copyists do not content themselves with abbreviating words, like the Greeks and Latins, by retrenching some of the letters, or syllables thereof; but they frequently take away all except the initial letters. Thus, רז for ל, and ש for ו, מ, מ, and מ, according to the place in which it is found.

But still further, they frequently take the initial letters of several succeeding words, join them together, and adding vowels to them, make a barbarous sort of word, representative of all the words thus abridged. Thus, רָבִּי שֶׁבֶלֶם בָּרוּךְ, in the jargon of Hebrew abbreviations, is called רַבִּי; and רָבִּי מִשְׁכֵּר בֶּן מַעֲנִית, is Rambam. Mercerus, David de Pomis, Schindler, Buxtorf, &c. have given explanations of such abbreviations. The most copious collection of Roman abbreviations, is that of Scortiūs Urfatu: Scortiūs Urfatu, ejusdem, de notis Romanorum commentariorum. ABBREVIATION of Fractions, in Arithmetic and Algebra, is the reduction of them to lower terms. See Fraction.

ABBREVIATOR, in a general sense, a person who abridges any large book into a more narrow compass.

ABBREVIATOR is more particularly used for an officer in the court of Rome, appointed an attinent to the vicar-canon, for drawing up the pope's briefs, and reducing petitions, when granted by the pontiff, into proper form, for being converted into bulls.

The Abbreviators are suppposed by Chammari, in his two volumes on their entitution, office, &c. to be the precedors of the cancellarii in the imperial household, or of the seven notarii, that we have been placed by pope Clement I. in the seven quarters of Rome, to write down the acts of the martyrs within their several diocets.

The abbreviators form a college of seventy-two persons, divided into two ranks; one called abbreviators de parte minores, who are twelve in number, all prelates; the other, abbreviators de parte magores, called also examinatores, who may be lay-men.

ABBES HEAD (St.), in Geography, a promontory of Berwickshire in Scotland, in the southern extremity of the Fifth of Firth. N. lat. 55° 55'. W. long. 1° 57'.

ABBATT, Thomas, in Biography, was born in 1738, at Ulm, and died in 1766, at Bieleberg, a privy-counsellor of the Count of Schamburg-Lippe. Besides his translation of Psalm and German, he also published a volume "concerning Merit," and another "concerning Death for one's country," which are well esteemed. He is one of the earlier German writers, who retain a classical rank, and would have probably excelled as an historian, if his life had been prolonged. Gen. Biog.

ABBETTENAU, in Geography, a market town in the archbishopric of Salzburg, about 20 miles S. E. of the city of Salzburg. N. lat. 47° 32'. E. long. 12° 56'.

ABBUTTALS. See Abbuttals.

ABCEDARY, Abecedarian, or Abecedarian, is sometimes applied to compositions whose parts are disposed in the order of the letters of the alphabet.

In this sense abecedarian is synonymous with alphabetical. Thus we meet with abecedarian psalms, lamentations, prayers, and the like, chiefly among Hebrew writers, which makes it probable they were the inventors of this species of composition.

This is the first and most manifest indication of verse in the Hebrew poetical books. Poems of this kind consist of 22 lines, or syllables of lines, or periods, or stanzas, according to the number of the letters in the alphabet; and every line, or stanza, begins with each letter in its order. This artificial contrivance was intended for the animation of the memory, and was chiefly employed in subjects of common use, as maxims of morality and forms of devotion. There are still extant in the books of the Old Testament twelve of these poems, e.g. Psalm xxv. xxxiv. xxxvii. cxxi. cxxii. cxiv. Prov. xxx. 10—11. Lament. i. ii. iii. iv. Three of these, e.g. Pt. cxix. exi. Lam. iii. are perfectly alphabetical, in which every line is marked by its initial letter; in the other nine every stanza only is so distinguished. With respect to the three former it may be observed, that the whole poem is distributed into stanzas; two of them, e.g. Pt. cxii. into ten stanzas each, all of two lines, except the two last stanzas in each, which are of three lines; and the third, e.g. Lam. iii. consists of twenty-two stanzas, of three lines, the initial letter of every stanza being also the initial letter of every
every line of the stanza. In these three poems, the lines thus determined by the initial letters, in the same way, are invariably equal to one another in length, in the number of words nearly, and probably in the number of syllables, and the lines of the same stanza correspond one with another, in the matter and the form, in the sense and the construction. Of the other nine poems, five, viz. Pf. xxxv. exx. exxii. Prov. xxxvi. Lam. iv. consist of stanzas of two lines; two, viz. Lam. t. ii. of stanzas of three lines; and one, viz. Pf. xxxv. of stanzas of four lines; allowing for irregularities, which are probably owing to the mistakes of transcribers. These stanzas likewise naturally divide themselves into their distinct lines, the sense and construction pointing out their limits, and the lines corresponding one with another in matter and form, as in the poems more perfectly alphabetical. In these however, two of them, viz. Pf. exx. exxi. have the lines shorter than those of the third, Lam. i. by about one-third, or almost half; and of the other nine poems, the stanzas of which are only alphabetical, three, viz. Lam. i. ii. iv. consist of the longer lines, and the six others of the shorter.

From these examples it may be inferred, that the poems, perfectly alphabetical, consist of verses properly so called, regulated by some regard to harmony or cadence, measure, numbers, or rhythm. The other poems, which are divided into stanzas by the initial letters, are compositions of the same kind, and equally consist of verses. We may also conclude from these perfectly alphabetical poems, that the Hebrew verse did not consist in rhyme, or linear and correspondent sounds at the ends of the verses, but in some sort of rhythm, probably some sort of metre, the laws of which are altogether unknown and undiscivable. Nevertheless the peculiar form of composition is so observable, as plainly to distinguish in general the parts of the Hebrew scriptures which are written in verse from those which are written in prose. See Lowth's Preliminary Dissertation to his Hebrew, p. 4. &c.

ABCEDE or Abscere, from abed, to keep aground, a term in Surgery, signifying nearly the same thing as to suspend. An abed surface, is a part whose texture has been altered, vitiated, or reparted by the formation of purulent matter. The mere contiguity of purulent matter to a solid part of the living body, will sometimes effect a dissolution of its natural structure: this may arise either from the unwholesome quality, or the mechanical pressure, of the confined pus. See Abscedentia, Abscess, Pus, and Suburation.

ABCOURT, in Geography, a town near St. Germain, four leagues from Paris, famous for a brisk chalybean water, impregnated with fixed air and the fossil alkali, and resembling that of Spa.

ABDALLAH, formed of abd, slave, and allah, God, and denoting the slave of God, in Biography, a younger son of Abd-Motalib, and the father of Mahomet. He was the most beautiful and modest of the Arabian youth, and when he married Amina, of the noble race of the Zibrites, 200 virgins are said to have expired of jealousy and despair. Gibbon's Hist. vol. ix. p. 255.—Several other eminent Arabians bore the same name.

Abdallah, Ebn Salem, was a Jew, intimate with Mahomet, and an early convert to his religion. He is said to have assisted him in compiling his pretended revelations.

Abdallah, Ebn-Zobeir, having ingratiated himself with the inhabitants of Mecca and Medina, by his religious zeal and engaging behaviour, was proclaimed Caliph, A. D. 682. He was recognised in all the provinces of the empire, except Syria and Palestine; and enjoyed his dignity nine years, till the 72d year of his age, and 73d of the Hegira. At this juncture Mecca was besieged, and the Caliph's spirits were supported by the attention of his mother Afsia, grand-daughter to the Caliph Abubeker, who, at the age of 90, administered refreshment to him and his soldiers at the beach with her own hand. At length, however, he took leave of his mother, and fell out on the enemy. Having killed many with his own hand, he was at last overpowered; and when he found the blood trickling down his face and beard, he is said to have repeated this verse from an Arabian poet: "The blood of our wounds falls not upon our heels, but our feet;" and he soon died. The avarice of this Abdallah gave rise to the proverb: "That there was never a brave man who was not liberal, till Abdallah the son of Zobeir." He is reported to have been so pious and so intent on his devotions, that a pigeon once alighted on his head, whilst he was thus employed, and sat long there without his perceiving it. Gen. Dict.

ABDALMOTALEB, the son of Mirvan, and fifth caliph of the race of the Omuridæ, succeeded his father in the 65th year of the Hegira, A. D. 685; and reigned 21 years. At the commencement of his reign he converted the temple of Jerusalem into a mosque, and directed his subjects to perform their pilgrimage to this place; because Abdallah Ebn Zobeir, who had been elected caliph by the Arabs, retained possession of Mecca. In the progress of his reign he concluded a treaty with the Greek emperor, reduced Peria, or rather Irak, under his dominion, and having failed to engage the submission of Abdallah by amicable conference, laid siege to Mecca, and took it. By this event he acquired possession of the peninsula of the Arabs, and became sole and absolute master of the Mollem empire. In the 76th year of the Hegira, he caused death and disasters, to be struck, with Arabic inscriptions upon them, which proclaimed the unity of the God of Mahomet. Before the time the former, or gold coins, had Greek, and the latter, a silver money, had Peria characters upon them. On this occasion he established a mint for coined in his own dominions. Abdalbane was deemed brave, learned, and wise, and was much more powerful than any of his predecessors; having subdued Abdallah Ebn Zobeir, and annexed Arabia to his empire; reduced to his obedience the territories of all denominations that appeared in arms against him; conquered India, or at least a considerable part of that vast region in the East; and in the west, penetrated with his victorious troops as far as Spain. He was buried at Damaiscus; and the government devolved on Al Wailid, the eldest of his fifteen sons, who extended the Mollem conquests, and rebuilt the temple of Medina in a style of extraordinary magnificence. Under the reign of this caliph the Greek language and characters were excluded from the accounts of the public revenue. If this change (says Mr. Gibbon, Hist. of the Decline and Fall of the Roman Empire, vol. x. p. 8. 8vo.) was productive of the invention, or familiar use of our present numerals, the Arabic or Indian cyphers, a regulation of office has promoted the most important discoveries of arithmetic, algebra, and the mathematical sciences. Abdalbene was avaricious to such a degree as to be denounced by some of his subjects, in derision, the father of a florin; and his breath was so fetid, that the flies which accidentally lighted upon his lips were poisoned by it; from which circumstance he was called the father of flies. Med. Un. Hist. vol. ii. p. 32. 8vo.

ABDALMOTALLEB, or Abd Motalib, the son of Hafem, the father of Abdallah, and grandfather of Mahomet, was, according to Abulfech, prince, or chief of the Koréish, during the war of the Elephant. Upon the death of the father of Mahomet, he took charge of his grandson;
grandson; and at his decease committed the care of him to his son Abu Tuleb, who was the guide and guardian of his youth. The life of Abdal Metallesch is said to have been prolonged to the age of 110 years; and he was the father of six daughters and thirteen sons.

ABDALONYMUS, descended from king Cinuvas, and of the royal family of Sidon, lived in obscurity, and fulfilled by cultivating a garden, when Strato had possession of the crown of Sidon. Alexander the Great having deposed Strato, wished to restore the race of Cinuvas, and having found Abdalonymus, he was convinced of his high descent from the apparent dignity of his person. Interrogating him how he bore his poverty, Abdalonymus replied, "I wish I may bear " my new condition as well. These hands have supplied my " necessities. I have had nothing, and I have wanted no " thing." Alexander was so much pleased with this reply, " that, besides believing upon what belonged to Strato, he augmented his dominions, and gave him a large present out of the Persian spoils.

ABDALS, in the Eastern countries, a kind of fains supposed to be inspired to a degree of madness. The word comes, perhaps, from the Arabic abdallah, the servant of God. The Persians call them demarch khoda, agreeably to the Latin way of speaking of their prophets and libys, q. d. "farenites Dra, raging with the God."

The Abdals are often carried by excess of zeal, especially in the Indies, to run about the streets, and kill all they meet of a different religion. The English sailors call this "running a mad," from the name of the instrument, a sort of poiagnard, employed on this occasion. D'Herbel. Bib. Or. p. 5.

ABDELAVI, in Botany, an Egyptian plant very like a melon, except that the fruit is more oblong, and acute at the extremities.

ABDELEUR, in Geography, an island in Africa, situate in the country of Anian, in the Indian Sea. N. lat. 11° 55', E. long. 51° 45'.

ABDERA, or Abdara, in Ancient Geography, a town of Bocotia in Spain, a Phcenician colony; now Adra or Alde- dra, to the west of Almeira in Granada.

ABDERA, a maritime town of Thrace, not far from the mouth of the river Nettus, on the call side. Solinus says, that Abdéra was founded by the fiffer of Diomedes, and took her name; but Stephanus (de Urb. tom. 1. p. 5.) ascribes the name to Abderus, one of the companions of Hercules, who was defeated by the fabulous horses of Diomedes. Herodotus (lib. 1. p. 168.) informs us, that Timeficus, the Clazomenian, attempted to lay the foundation of it, but he was prevented by the Thra- cians from accomplishing his purpose. The Thracians afterwards succeeded and settled in this place, in order to avoid the contempt of the Persians, which gave occasion to its being called "Abdera pulchra Tejorum colonia," signifying, that brave men will live anywhere rather than suffer oppression and fer- vitude. To this faying some fuppofe that Cicero alludes in his epiftles to Atticus, lib. 4. 7. The horses that fed on the grafs in the neighbourhood of this city were feized with madness, according to Pliny (Hist. Nat. tom. 2. p. 374. Ed. Hard.) In the reign of Callander, king of Macedon, it was so infected with frogs and rats that the inhabitants were obliged, for a time, to quit it. The Abderites were for some months, in the reign of Lydimades, afflicted with a fingular difeafe. It was a kind of burning fever, according to the decription of it given by Lucian, (Op. tom. 2. p. 1. Ed. Reitz.) which came to a crisis on the feventh day. During its continuance, the imaginations of those who were feized with it were disfacted, and they fancied themselves players; and they continued reciting verses from fome tragedy, particu- larly out of the Andromeda of Euripides, till the cold of winter terminated their delirium. Of the caufe of this dif- ease Lucian gives the following account. Archelaus per- formed the tragedy of Andromeda before the Abderites in a very hot furnace; feveral perfons were attacked with the fever on their leaving the theatre; and their imaginations being fully poffeffed with the dramatic incidents which had been exhibited, they could not forbear imitating Archelaus's action and declamation; and from them the fever was communicated to others by infection.

The Abderites were approached for want of wit and judgment; nevertheless many eminent perfons, as Protagoras, Democritus, Anaxarchus, Hegesippus the Philosopher, Nicae- nus the poet, and feveral others, were born in this city. It was formerly famous for its gold and silver mines; but it is now reduced to a mean place, on the Archipelago, called Polypsilo, Aspero, and Afrizone. There was another city of the fame name in Iberia, built by the Phcenicians, and now called Almeria.

ABDERAHMA, Abdirachman, or Abdalrahman, a Saracen viceroy in Spain, who revolted and formed an independent principality at Cordova. He had several successors of the fame name.

A viceroy and captain-general of this name led the Sa- cens and their followers into France, ravaging the country wherever they came; but at length he was met at Tours by Charles Martel, who had been reinforced by a body of Germans and Pepis; and, after many skirmishes, a gene- ral action took place, in which the Saracen army was totally defeated, and Abderahma was killed, with 370,000 Moors. This great event, which first broke the Saracen power, and taught the Europeans that they were not invincible, is placed by most writers in the year 732, Heg. 114. Mariana (Hist. Spain, l. 7. c. 2.) dates this battle in the year 734, twenty-one years after the conquest of Spain.

ABDERANA. See Ariana.

ABDEST, among the Moslemas, a peculiar manner of wailing, before prayer, entering the mosque, or reading the Alcoran; practised with some difference both by Turks and Persians. The word is compounded of the Persian ab, water, and djal, hand.

ABDIAS of Babylon, in Biography, a legend-writer, who had the effrontery to boast, that he had seen Christ, was one of the 70 disciples, had been eye-witness of the actions and prayers of several of the apostles at their death, and had followed St. Simon and St. Jude into Persia, by whom he had been made the first bishop of Babylon. But his forgery is easily detected; as he mentions Hecatus and Jud. Africanus, one of whom lived about 190 and the other 221 years after our Lord's ascension. His book, intitled Historia Certaminis Apoftolici, was published by Wolfgang Lazius at Bafil, in 1551, and has passed through several editions in other places. It may be seen, with notes, in Fabr. Codex. Apoc. N. T. part 2. p. 388.

ABDICARIA propofitoio, in Logic, is used for a negative proposition.

ABDICATION, Abdicatio, derived from abdicare, to renounce, the act whereby a magistrate, or person in office, renounces, and gives up the fame, before the legal term of service is expired.

Abdication is frequently confounded with renunciation; but, strictly speaking, there is a difference: abdicatio being done purely and simply; whereas renunciation is done in favour of some other person.

In this sense, Dioeclesian is said to have abdicated the crown; but Philip IV. of Spain renounced it. The parliament of England voted that king James II. having endeavoured
willed to subvert the constitution of the kingdom, by
break ing the original compact between king and people, and
avowing, by the advice of judges and other wicked persons,
substituting for fundamental laws, and withdrawing himself out of
the kingdom, has abdicated the government, and that the
throne is thereby vacated. This vote was passed by a great
mass of the commons; but was opposed in the house of lords.
They particularly objected to the word abdicated, and it was carried, that d\text{\textit{jus\text{\textit{c\textit{it}}}}} was more proper. The
commons adhered to their vote, and by their perseverance
obliged the lords to comply. The Scots convention voted
that king James, by his mal-administration and his abuse of
power, had forfeited (from \textit{f\text{\textit{j}}\text{\textit{s}}\text{\textit{f}}\text{\textit{i}}\text{\textit{s}}} in Latin) all title to the crown.

Abdication, among Roman Writers, is moreover
particularly used for the act whereby a father discarded or dis-
claimed his son, and expelled him the family.

In this sense the word is synonymous with the Greek
\textit{apokath\text{\textit{t}}}, and the Latin \textit{a f\text{\textit{j}}\text{\textit{um}} aliena\text{\textit{t}}}, or sometimes \textit{abrogatio}, and negatio; and means opposed to \textit{adoption}. It is
distinguished from \textit{emiseratio}, or disinheriting, in that
the former was done in the father's life-time, the latter
by will at his death: so that whoever was abdicated, was also
inheritor, but not vice versa.

\textbf{ADDIT. Causa\textit{e}}, are the secret or remote caufes of
diseases, which physicians of the dogmatic, or rational
feet, adhered, were necessary to be known, in order to
eventually a right method of cure.

\textbf{Abdomen}, in \textit{Anatomy}, derived from \textit{abdomen}, the
lower belly, or the cavity that is bounded at its upper
part by the diaphragm, or midriff, by which it is se-
parated from the thorax; and at its lower part it is di-
nected from the pelvis by a circular ridge of bone, which
is considered as the rim of the latter cavity. The spine
and lumbar muscles form the back part of the abdomen,
whilst the sides and front are completed by muscles, named
\textit{abdominal}. The abdominal muscles are the \textit{obliqui ex-
terni and interni}, the \textit{recti}, \textit{transversi}, and \textit{pyrami-
dals}. This great cavity is divided by anatomists in-
to certain regions or districts, that they may be able easily
and accurately to describe the situation of the contained
viscera. The divisions are in a great degree arbitrary; one
imaginary line is drawn across from the greatest convexity
of the cartilage of the 5th or half true rib; another from
these projecting points of the hip-bones, named the anterior
and superior spinous processes. That part of the cavity,
which is situated above the upper line, is termed the epi-
gastric region; that below the lower one, the hypo-
gastric. The space included between the lines, is called
the umbilical region. These regions are again subdivided:
the sides of the epigastric region, which extend beneath
the cartilages of the ribs, being named hypochondria, and
the small depression at the upper part, jut over the en-
form cartilages, being washed with the bones of the thorax;
the part of the flanks, commonly by the Eng-
lish. The sides of the umbilical region are named the dia-
or flanks, and the back part the loins. The sides of the
hypogastric region are the groins, and the lower part in
front, the pubes. The boundaries of the abdomen are every
where limited by a thin and elastic membrane, named peri-
toneum, which is also spread over the contained viscera.
From the smooth glossy surface of this membrane, a small
quantity of an aqueous fluid is poured forth, which keeps
the bowels separate from each other, and from the sides
of the cavity in which they are contained. All the abdo-
nal viscera, except the kidneys, are employed in the di-
 gestion of our food, the conversion of it into chyle, and the
expulsion of the residue. The viscera more directly em-
ployed in the chylopoietic function, are the stomach, and
the small and large intestines. The small intestines are divided
into the duodenum, the jejunum, and the ileum; the large
into the cecum, colon, and rectum. The liver, with its
gall-bladder, the spleen, and pancreas, are subservient to
the functions of the alimentary canal. Behind the peritoneum
in the loin, we find the kidneys, which are also abdomin
al viscera. Several processes of peritoneum prefent themselves
in the cavity of the abdomen, and claim attention, as the
great and small omentum, the mesentery, and others of less
importance.

The abdominal viscera are prefixed upwards towards the
hollow cavity of the chest, by the abdominal muscles, in
expiration; they are pushed down again by the action of
the diaphragm during inspiration. When both the dia-
aphragm and abdominal muscles act at the same time, a pre-
fure is made on all the abdominal viscera, which is occlu-
sionally employed to aid particular parts in performing their
office; to afford, for instance, in the expulsion of urine and
forces, and in parturition. The effort by which this preasure
is made, we call straining, and it is commonly used to
prone some of the viscera from their natural situation in
the cavity of the abdomen. The parts thus protruded from
external tumours, and are called herniae or ruptures. Cough-
ing, in which the abdominal muscles alone comprefs the
viscera, and tend to diminish the cavity of the abdomen,
produces, in a gradual manner, such protrusions.

The principal nutrient arteries of the parietes of the
abdomen, are the lower intercostal, the lumbar, and cir-
runcated arteries of the ilium, at the sides; whilst the
epipleural, and internal mammary arteries are distributed
front and communicate by their minute branches with the
former vessels. These arteries have corresponding veins.
The nerves supplying the parietes of the abdomen arife
from the lower dorso-lumbar nerves, and their branches
are distributed in a circular manner round that cavity.
For an account of the large arteries, veins, nerves, and ab-
dominal vessels, see \textit{Rami\text{\textit{fication of Arteries}},
Veins, and Nerves, and Distribution of the Absorbing
Vessels}.

\textbf{Abdomen}, in \textit{Medicine}. This part of the body is liable
frequently to become the seat of several important and
dangerous \textit{Diseases}. Some of these are real affections of this
cavity, while others, though commonly referred to it by
the patient, more properly belong to the \textit{prima\text{\textit{v}}}, or the
organs of generation and urine.

All these diseases, with the manner of treating them, will
be found under some of the following heads or terms, \textit{viz.}

\textbf{1. Inflammations of the abdominal viscera}, including
Inflammation of the Diaphragm, see \textit{Diaphragmitis}; of
the Liver, \textit{Hepatitis}; of the Stomach, \textit{Gastritis}; of the
Peritonitis, \textit{Peritonitis}; of the Intestines and Mucous
\textit{Enteritis}; of the Bladder, \textit{Cystitis}; of the Kidneys,
\textit{Nephritis}; and of the Womb, \&c., \textit{Hysteritis}.

\textbf{2. Painful or Spasmodic Affections}, referred to the abdo-
nen by the patients, and not attended by inflammation or
fever, will be found under \textit{Cardiologia} and \textit{Gastro-
dinia}; pain in the region of the Romach, under \textit{Enterody-
\textit{Gout}, and \textit{Worms}.

\textbf{3. Other Diseas} of the \textit{Prima\text{\textit{v}}}, or Intestines, will be
included under \textit{Vomiting, Cholera, Diarrhoea, Li-
enteria}, and \textit{Dysenteria}.

\textbf{4. Dropsies of the abdomen} will be treated of under
\textit{Ascites, Hydrops ovarii}, and \textit{Tympanites}.
ABDOMEN, Chirurgical Diseases and Operations of the. We do not here propose to treat at large of all the local disorders to which the belly is liable, but only to enumerate those of more frequent occurrence, and the operations necessary for their removal. They may be divided into internal and external. The latter affect the muscles and common integuments chiefly; the former are principally seated among the abdominal viscera. Many diseases, however, are common both to the internal and external parts of the abdomen; as inflammation, suppuration, ulcers, hemorhages, tumors, and wounds of various kinds, &c. See each of these articles in their respective places.

The abdomen and its contents are subject to certain diseases, either of a peculiar nature, or requiring peculiar treatment on account of their situation. When the external segments, from being dilated or ruptured in any part, permit the bowels to force their way through them, an hernia is formed, which must be replaced in its natural position. See Hernia. When an accumulation of fluid happens within the belly, so as to prove inconvenient or dangerous, the operation of tapping, technically named paracentesis, is required for its evacuation. See Dropsy. Sometimes the intestinal canal is preternaturally contracted, forming a stricture; and is dilated with flatus, which constitutes the tympanites; or is reflected within itself, forming the disease called intussusception. The liver often inflames and suppures, or becomes indurated and feverous. The womb is liable to be accreted and cancerous, or may suffer during parturition. See Scirrhus and Cancer. The glands of the mectenery will likewise inflame, suppitate, and enlarge to a great degree. Collections of pus may form upon the muscles of the loins; calculi within the kidneys, or the urinary and gall bladder; varicose swellings and aneurysms in the blood-vessels, &c. See Psomas or lumbar abscess, lithotomy, varicocele, and aneurism. Several chirurgical operations are also peculiar to the abdomen and its contents; for example, gastorrhaphy, gastrotomy, lithotomy, and the cesarean section.

All these several disorders and operations are particularly explained in other parts of this work, under their appropriate denominations, to which we therefore refer our readers.

Abdomen of insects. See insects.

Abdominal rings, in anatomy, an aperture through which the peritoneal vessels pass in men, and the ligamenta rotundata uteri in women. It is formed by the tendinous fibres of the my股东 obliquus externus abdominis, which are separated from each other near the os pubis. See obliquus, &c.

Abdominales, in the Linnean system of ichthyology, an order of fish, having the ventral fins placed behind the pectoral in the abdomen, and the branchia occluded, and comprehending sixteen genera, and one hundred and ninety-five species.

Abd. labium, in anatomy, a name given by Spigelius to a muscle, which he also calls the secundus ad latera trident. This is the levator anguli oris of Albinus, and the caninus elevator or levator labium communis of others.

Abducens, in anatomy. See Abductor.

Abduction, in law. See forcible abduction, kidnapping, and ravishment.

Abduction, in logic, a kind of argumentation, by the Greeks called apagoge; wherein the greater extreme is evidently contained in the medium, but the medium not so evidently in the lesser extreme as not to require some farther medium, or proof, to make it appear.

It is called abd. from ab, from, and in addition to draw; because from the conclusion, it draws us on to prove the proposition affirmed.

Thus, in the syllogism, "All whom God abduces are free of sin; but God abduces all who are in Christ; therefore, all who are in Christ are free of sin." The major is evident; but the minor, or assumption, is not so, without some other proposition to prove it; as, "God received faithful affection for sin by the sufferings of Jesus Christ."

Abduction, or Abruptus, in surgery, denotes a kind of tranverse fracture, in which the broken extremities of the bone recede from each other. Cokou calls this species of fracture exumbilis; but Celsius Aureolus, by the word Abductor, means a brain or violent dilation of a muscle, and speaks of it as a cause of chronic pain.

Abductor, or Abducent, compounded of ab, from, and ducere, to draw, in anatomy, a name common to several muscles, whose action is the withdrawing, opening, or pulling back, the parts to which they are fixed. Their antagonists are called Adductors.

Abductor auricularis. See abductor minimi digitii manus.

Abductor auris, or bicaudalis. See retrahens auriculam.

Abductor indicis manus, arises from the os trapezium, and from the superior part and inner side of the metacarpal bone of the thumb, and is inflected by a short tendon into the outer and back part of the first bone of the forefinger. Its use is to bring the forefinger upwards. This is the semi-interosseus of Winslow. Cowper calls it abductor pollicis; and Douglas says, that with respect to the thumb, it may be called adductor, and to the index adductor.

Abductor indicis pedis, arises tendinous and flabby, by two origins, from the root of the inner side of the metatarsal bone of the fore toe, from the outside of the root of the metatarsal bone of the great toe, and from the os cuneiforme internum; and is inflected tendinously into the inside of the root of the first joint of the fore toe. Its use is to pull the toe inwards from the heel of the toes.

Abductor minimi digitii manus, arises flabby from the os pisiforme, and from the parts of the ligamentum carpi annulare that is next to it; and is inflected tendinously into the inner side of the upper end of the first bone of the little finger. Its use is to draw this finger from the web. This is the hypothenar minor of Winslow, the extensor teres interni minimi digitii of Douglas, and the auricularis of others.

Abductor minimi digitii pedis, arises tendinous and flabby from the semicircular edge of a cavity in the inferior part of the protuberance of the os calcis, and from the root of the metatarsal bone of the little toe; and is inflected into the root of the first joint of the little toe externally. Its use is to draw the little toe outwards from the web. This is the parabularis major and metatarsus of Winslow.

Abductor sculi, arises from the bony partition between the foramen opticum and lacræum; and is inflected into the globe of the eye opposite to the outer canthus. Its use is to move the globe outwards. It is also called Indigutorius.

Abductor pollicis manus, arises by a broad tendinous and flabby beginning, from the ligamentum carpi anularis, and from the os trapezium; and is inflected tendinously into the outer part of the root of the first bone of the thumb. Its use is to draw the thumb from the fingers. Albinus names the inner portion of this muscle, Abductor brevis alter, and it is called Abductor and Thenar Ridiandi by Douglas.

Abductor longus pollicis. See interossus auricularis.

Abductor pollicis pedis arises flabby from the inside of the root of the protuberance of the os calcis, where it forms D 2 of the
He was born July 8th, 1714, and after a classical education became a student of theology in 1731, at Halle, under Mohsen, and afterwards at Halle, under Wolf and Baumgarten, where he often preached with great applause. He declined the theological profession and applied to medicine at Halle, and in 1741 was admitted to the degree of doctor at Königber in Prussia. On his return to Halberstadt he practised as a physician for half a century, and died Nov. 25, 1794. His practical translation of Juvenal into German, was published in 1768. One of his sons, vis. John Abel, a physician of Dusseldorf, has distinguished himself as a writer. Gen. Bing.

ABEL, Charles Frederick, an eminent musical composer and performer, was a native of Germany, and a disciple of Sebastien Bach. He left Dresden in a distempered condition in 1758, and travelled though Germany, supplying his necessities by his talents, till at length he arrived in England in 1759, where he soon gained notice and recompense, both as a public performer and as a private teacher. He had a salary of 200l. a year as chamber musician to her majesty, and his weekly concert, in conjunction with Bach, was liberally supported. He performed on several instruments: but he was chiefly attached to the violin da gamba. Dr. Burney, in the 4th volume of his History of Music, has given the following account of his composition and performance: "His compositions were easy and elegantly simple; for he used to say, 'I do not chuse to be always struggling with difficulties, and playing with all my might. I make my pieces difficult whenever I please, according to my disposition and that of my audience.' Yet, in nothing was he so superior to himself, and to other musicians, as in writing and playing an adagio; in which the most pleasing, yet learned modulstion, the richest harmony, and the most elegant and polished melody, were all expressed with such feeling, tact, and science, that no musical production or performance, with which I was then acquainted, seemed to approach nearer perfection. The knowledge Abel had acquired in Germany, in every part of musical science, rendered him the umpire in all musical controversies, and caused him to be consulted in all difficult points. His concerts and other pieces were very popular, and frequently played on public occasions. The taste and science of Abel were rather greater than his invention, so that some of his later productions, compared with those of younger composers, appeared somewhat languid and monotonous. Yet he preferred a high reputation in the profession till his death." Abel was irascible in his temper, and apt to be overbearing. He loved his bottle; and by excess of drinking, when he was labouring under a fitting of blood, he put an end to his complaint and to his life. He died in London, June 29, 1787.

ABEL-Keranim, or of the Vineyards, in Geography, mentioned Judges xi. 53. was, according to Eusebius, six miles from Philadelphia, otherwise Rabbath, the capital of the Ammonites. It was remarkable for its vines, whence the name; and it was probably the same with Abela, between Jabez and Gadara, near Pella; and the Abiba, mentioned by Polybius, (Hist. lib. v. p. 414. ed. Cursub.) among other cities of Galatia. See Abilene.

ABEL-Melohab, the country of Eliha, 1 Kings, xix. 16, about sixteen miles south of Scythopolis according to Eusebius. Near this place Gideon obtained a victory over the Midianites. Judges, vii. 22.

ABEL-Misrain, the mourning of the Egyptians in allusion to the lamentation for Jacob, called also the thril ling floor of Atad, Gen. i. 11. was thought by Jerome, and some others, to be the place afterwards called Bethalgala, at some distance from Jericho and Jordan westward.

ABEL-Shittim, or Abel-fatim, was situated in the plains of

the heel, and tendinous from the same bone, where it joins with the extensor; and is inserted tendinos into the internal of the skin, and root of the first joint of the great toe. Its use is to pull the great toe from the rest. This is the The pass of Window.

A postor=ors, or abductors, arise tendinos and flexly from the side of the root of the metatarsal bone of the middle toe to the body; and is inserted tendinos into the inside of the root of the first joint of the third toe. Its use is to pull the middle toe inward.

A posteres* or abduct.ors nervi, are names which have been given to the 6th pair of nerves, on account of their being distributed to the A postor muscles of the eye.

ABEC Flute. See Flute.

ABECEDARIAN. See Abecard.

ABEHELLE, Gafpar, in Biography, was born at Riez, in Provence, in 1648. He was much admired at Paris, in early life, for the brilliancy of his wit. He obtained the confidence of Marshal Luxembourg, who appointed him as his secretary; and he contributed, by his lively and animated conversation, to the amusement of the Prince of Conti and the Duke de Vendome. A very ugly wrinkled countenance, susceptible of a variety of comic expressions, gave a zest to his bon-mots and flories, and enabled him to produce mirth on various occasions. Abellle enjoyed a priory, and a place in the French academy. He wrote some odes and epistles, several tragedies, one comedy, and two operas. A certain prince observed of his tragedy of Cato, that if Cato of Utica should return from the grave, he would be no more Cato than that of the Abbe Abellle. He was held in low estimation as a poet. He died at Paris, May the 21st, 1718. His brother, Scipio, who died in 1697, was also a poet. He has left a good history of the bone's, published in 1687, in 12mo.; and he also published, in 1699, a treatise, in 12mo. Litude to his office as surgeon-major, under the title of the Complete Army Surgeon.

ABEL, in Scripture History, the second son of Adam and Eve, born in the second year of the world. His history is comprised in a very narrow compass. He was a shepherd, and offered to God the firstlings of his flock, and his sacrifice was accepted; whilst that of Cain, his brother, was rejected. This distinction exasperated Cain, so that he slew his brother. Although no religious respect is paid to his memory in the Greek churches, which have abolished feasts for every other patriarch and prophet, and his name does not occur in any one of the Roman martyrologies before the 10th century; he, as well as other saints, is made the object of worship in several Roman litanies, designed for persons at the point of death. Some calendars commemorate him on the 25th of March; others on the 24th of January; and others on the 26th of July. Among the Ethiopians he is honoured on the 28th of December. The poem, intitled "The Death of Abell," written in German by Geyer, and translated into various languages, has been much admired.

ABEL, Frederick Gotfried, M. D. the son of Caphar Abel, the historian, was alfeelor of the college of physicians, and member of the literary society at Halberstadt.
ABE

of Moab, opposite to Jericho, not far from Jordan. Here Moses encamped before the Israelites passed the Jordan under Joshua. Here also, subdued by Balaam, they wooed him with gifts, and were punished by the instrumentality of the Levites. Numb. xxxv. 1. &c. xxxviii. 49.

ABEL-TREE, or ABE TREE, in Botany, a species of poplar, with large leaves. This tree may be propagated by layers or cuttings, and also by suckers. Many advantages might be derived from planting it in boggy soils, where few other trees will thrive. The wood of it is useful for flooring or wainscoting rooms; and it is preferred for turnery-ware to any other, on account of its peculiar whiteness. The quickness of its growth, infinum that it will yield fruits of eighteen or twenty feet long in a year, renders it eligible in plantations that are designed for shade or shelter.

ABELA, John Francis, in Biography, was commander of the order of Malta. His book, intitled Mala illustrata, published in 1647, is a folio, and containing a description of Malta, and of its principal antiquities, is rare and curious. Bioi. Dict.

ABELARD, Peter, an eminent scholastic philosopher of the 12th century. He was the son of Berengier, of noble descent, and born at Palais, near Nantes in Brittany, in the year 1079. At the age of 16 he had acquired, under Roffele, the founder of the sect of the Nominalists, a considerable acquaintance with metaphysics and logic; together with a facility of thought and a fluency of expression, which qualified him for the literary contests in which he was afterwards engaged. Ardent in the profession of fame, and of that kind of science, which then prevailed, he settled at Paris, in the 20th year of his age, and devoted himself to the study of dialectics under William de Champeaux, called the venerable doctor. The matter and the pupil were for some time much attached to each other; but when the disciple preferred to contradict his teacher, and to enter into disputations with him, in which, according to the judgment of his fellow students, he was victorious, the vanity of Abelard was inflamed, and the jealously of Champeaux excited; and a separation became necessary. Thus flattered and encouraged, and possessing superior talents, both by nature and in consequence of sedulous application, Abelard, at the age of 22, determined to open a public school for himself; and the place which he selected was Melun, a town distant from Paris about ten leagues, where the court at that time often resided. Notwithstanding the competition and hostility of Champeaux, the young lecturer's school was thronged with auditors, who were highly gratified by his public performances. Farther emboldened by this success, he approached nearer to Paris, and removed his school to Corbeil, where he had an opportunity of triumphing over his former master, and of compelling him to retire. His application and activity, however, impaired his health, and rendered it necessary for him to withdraw from the public scene of literary contet. into his native country. After an absence of two years, he returned to Corbeil; where he renewed his lectures with such reputation, that the scholars of Champeaux deserted him; and where he obtained fresh triumphs over his envy and opposition. In the issue his victory was so complete, that Champeaux, who had assumed the monastic habit among the regular canons in the convent of St. Victor, and who was afterwards preferred to the See of Chalons, was constrained to relinquish the convent and to yield to the acknowledged superiority of his rival. Upon this Abelard quitted the school which he had established at the abbey of St. Genevieve, and directing his views to the study and profession of theology, removed to Laon, and placed himself under the tuition of Anselm. Here again the disciple, by the superiority of his talents and acquirements, excited the jealousy of this celebrated theologian; and after establishing his reputation by the lectures which he delivered, he was compelled to retire from Laon, and to remove to Paris. His lectures in this city, both in theology and philosophy, were attended by a great number of students, who referred to his school, not only from various parts of France, but from Spain, Italy, Germany, Flanders, and Great Britain. At the age of forty Abelard sacrificed the reputation which he had acquired, as an able disputant and popular preacher, to the love of pleasure, and disgraced himself by forming and executing a deliberate plan for the seduction of female innocence. During his residence at Paris, where he was acquiring influence as well as renown, he boarded in the house of Fulbert, a canon of the cathedral church, who had a niece called Heloise, about the age of 18 years, and equally celebrated for her beauty and literary attainments. The avaricious canon, wishing to have his niece instructed without expense, employed Abelard as her preceptor; but instead of improving her in the sciences, he betrayed his trust, taught her to write, and determined to seduce her. From this time Abelard became remnants in the performance of his public functions, and wrote nothing but amorous verses. The canon, deluded by his respect for the preceptor of his niece, remained ignorant of an amour, which became the subject of general conversation. In a little while, however, the marriage of Heloise discovered the culpable conduct of her lover, and roused the resentment of the infatuated uncle. She was soon removed to the house of Abelard's father in Brittany, and there delivered of a son. When the child was born, Abelard made a proposal to Fulbert of privately marrying his niece, to which the canon consented. Heloise, however, hesitated in accepting the offer, partly from a regard to the honour of Abelard, whose profession bound him to celibacy, and partly from a romantic notion, that her pietas ought not to submit to ordinary restraints. Abelard at last prevailed, and they were privately married at Paris; though it is said, that he protected to his uncle that she was not married, and that this was one cause of his unkind and severe treatment of her. Abelard made this plea for removing her from his house to the abbey of Benedictine nuns, in which she had been educated. The uncle, enraged with revenge, and hired ruffians, who forced their way into his chamber by night, and inflicted on his person a disgraceful and cruel mutilation. Abelard resolved that, as Heloise could no longer be his, she should never be another's, and demanded from her a promise to devote herself to religion. She submitted to the selfish and harsh injunction, and professed herself in the abbey of Argenteuil. On this occasion she exclaimed, in the words of Cornelia:

O maxime conjux!
O thalamis indigne meis, hoc juris habebit
In tantum fortuna caput: cur impia nupisti,
Si miserum factura fui? nunc accipe puerum,
Sed quas sponse lauan.

"Ah! my once greatest lord! Ah! cruel hour!
Is thy victorious head in fortune's pow'r?
Since miseries my baneful love pursues,
Why did I wed thee, only to undo?
But fee, to death my willing neck I bow;
Atone the angry gods by one kind blow."

Soon after this event Abelard assumed the monastic habit in the abbey of St. Denis. His scholars in Paris, however, intreated him to return to his school; and after some deliberation
Soilfois, the throw and 142. into His tame, but Peter 122, I the Abeam gathered for this, he was also required to read, as his own confession of faith, the Athenian creed, and to be confined in the convent of St. Medard. His persecutors became acquainted with his conduct, which occasioned general dissatisfaction; and Abelard was soon permitted to return to St. Denis. Here again he was pursued by his enemies; and having affected, that the patron of the convent and of the French nation was not Dionysius the Areopagite, but another St. Dionysius, bishop of Athens, he was accused to the bishop and the king, as a seducer of the order and an enemy to his country. On this occasion he made his escape, and fled to the convent of St. Ayoul at Provins in Champagne, the prior of which was his intimate friend. Hence he soon retired to a retreat in the forest of Champagne, near Nogent upon the Seine, where, in 1122, he erected a small oratory, which he dedicated to the Trinity, and which was afterwards enlarged and consecrated to the third person, the Comforter or Paraclete. His pupils in this retreat soon amounted to 600; but he was compelled to withdraw from this solitude, and, by the interest of the Duke of Brittany, he was elected superior of the monastery of St. Gildas, in the diocese of Vannes, where he remained for several years. The news of the convent of Argenteuil being dispersed about this time, Abelard invited Heloise, with her eight companions, to take possession of the Paraclete. Heloise accepted the invitation; she was chosen abbess of the new institution that was established; and in 1127, the donation was confirmed by the king. Whilst Abelard reigned at St. Gildas, the interesting correspondence occurred between him and Heloise, which is full extant; and he then wrote memoirs of his life, which came down to the year 1134. The letters of Heloise in this correspondence abound with proofs of genius, learning, and taste, which might have gathered a better age. Upon these letters Mr. Pope has formed his "Epistle from Eloisa to Abelard," a piece that has been highly celebrated for its poetical merit, but which deviates in many particulars from the genuine character and story of Heloise, and culpably violates moral propriety, as Mr. Berrington (Hist. Abelard, p. 243, &c.) has shown in his judicious critique. Abelard was, in this situation, accused to pope Innocent II. of noxious errors and mischievous designs. His accuser, the Abbot of St. Thierry, was challenged by Abelard to make good his accusation in a public assembly; and upon his delivering the heads of his accusation, Abelard, probably apprehending a popular tumult, rose up and exclaimed, "I appeal to Rome." The pope, in consequence of some person's intrigues, anticipated his arrival by pronouncing his opinions heretical, and sentencing him to perpetual silence and confinement. Abelard, in his way to Rome, called at Cluni; a monastery on the confines of Burgundy, where he was kindly received by Peter Maurus, the abbot; and here a reconciliation was effected between him and Bernard, abbot of Clairvaux, who had prejudiced the pope against him. Peter interposed with the pope in his favour, and obtained his pardon; and he was permitted to end his days in the monastery of Cluni. In this monastery, the cloistered philosopher was retired, studious, and devout; and his lectures were renewed and heard with applause. But his health and spirits were too feeble to bear the exertions which this service required. Although he was removed to the pure air of the priory of St. Marcouf, near Chalons, his debility and decay increased, and terminated his life in his 63d year, on the 21st of April 1142. His body was sent to Heloise to be interred in the convent of the Paraclete. Heloise survived her husband 21 years, a pattern of conjugal affection and monastic virtue. Of the character of Abelard, we shall subjoin the following extract from Enfield's account of him in the General Biography, vol. i. "The amour, which has given Abelard so much celebrity in the annals of gallantry, will certainly not entitle his name to a place in the tablet of moral merit; it will remain an eternal blot upon his memory. In Heloise, the criminality, though not obliterated, was palliated by youthful ardour and inexperience; and extreme sensibility, noble generosity, and disinterred invincible constancy, united to throw a veil over human frailty. In Abelard, every circumstance, instead of exciting, aggravated the offence. At forty, the key-day of the blood is tame, and waits upon the judgment." It was not a juvenile indiscretion of which Abelard was guilty, but, according to his own confession, the seduction of innocence, deliberately planned, and reluctantly executed. It was accompanied with breach of confidence, violation of duty, and degradation of character. Except in the grant of the Paraclete as an asylum to Heloise and her sisterhood, an uniform felicity appears in Abelard's conduct, which admits of no apology; unless we transfer the blame from the man to the profession, and reprobate that system of Superstition, which, by the unnatural injunction of clerical celibacy, has given birth to innumerable irregularities and enormities. Viewed apart from this disgraceful affair, Abelard appears with more advantage. His writings, indeed, will not give the reader a high idea of his genius or taste; but it cannot be questioned, that the man, who could foil the first masters of the age at the weapons of logic, could draw round him crowded and admiring auditors, and could collect scholars from different provinces and countries, whenever he chose to form a school, must have possessed extraordinary talents. He must be allowed the credit, not only of having made himself master of the philosophy and theology of the age, such as they were, but of having boldly advanced, beyond the time, into the region of new opinions. Had his love of truth been equal to his thirst of fame, and had his courage in adhering to his principles been equal to his ingenuity in defending them, his sufferings and persecutions might have excited more regret, and his title to honourable remembrance would have better established. Upon the whole, of Abelard it may, perhaps, with truth be said, that he was too vain to be truly great, and too selfish to be eminently good, and that his character is rather adapted to excite admiration than to command respect." His principal works, written in Latin, are, "An Address to the Paraclete on the Study of the Scriptures," "Problems and Solutions," "Seven on the Festivals," "A Treatise against Heresies," "An Explanation of the Lord's Prayer," "A Commentary on the Romances," "A System of Theology," and his letters to Heloise and to others. These, with some other pieces, were collected and edited from the MSS. of Amboise, in 4to. at Paris, in 1616. Bayle. Moreri. Berrington's Hist. of the Lives of Abelard and Heloise. Gen. Biog.

ABELLIANS, ABELONIANS, or ABELITES, in Ecclesiastical History, a sect in Africa, not far from Hippo, mentioned by St. Augustin (Oper. tom. vi. p. 14.) and supposed to have commenced in the reign of Arcadius and terminated in that of Theodosius. Their distinguishing tenet and practice were to marry, and yet live with their wives in a professed abstinence, without having any carnal commerce together.
together. 1 Cor. vii. 29. The learned have taken great pains to ascertain the principle upon which they acted, and the reason of their denomination, to very little purpose. But, in effect, it is more than probable, they took their name from Abel for no other reason, but because, like that patriarch, they had no issue: not that he lived in continence after marriage; but because he was killed before he had married, or died without issue. In order to perpetuate the sect, St. Austin informs us, (ubi supras,) that when a man and woman entered into this society, they adopted a boy and girl, who were to be their heirs, and to marry under the same obligation of continence, and of adopting two children of different sexes.

ABELICFA, in Botany, the name of a very tall tree, growing principally in Crete, called also fiantalbus adderianus, and pseudofantarum.

ABELL. John, in Biography, an English musician, who belonged to the chapel of Charles II. and continued in it till the revolution, when he was discharged, because he was a papist. After many rambles on the continent, and singular adventures, he returned to England; and, in 1701, published a collection of songs in several languages, which he dedicated to King William. It is said that this artift procured the secret of preferring the natural tone of his voice to extreme old age. Hawkins’s Hist. Mus. vol. iv. p. 455.

ABELLA, in Ancient Geography, a municipal town of Campania, near the river Chiusi, mentioned by Virgil, lib. vii. v. 740.) and by Silinius (lib. vii. v. 544.) and inhabited, according to Justin, (lib. xx. cap. 1.) by a colony of Chalcidians. The Vex Aevellana, or hazel-nut, takes its name, according to Macrobius, from this town. It is now a heap of ruins, near the town and castle of AVELLA. The ancient walls enclose a circuit of near three miles, and in the middle are the fragments of an amphitheatre; the environs are remarkable for the excellent quality of their fruit and honey. Swinburne’s Trav. vol. i. p. 162.

ABELLI, Lewis, in Biography, bishop and count of Rhodes, was born in the Vexin François, in 1603. Quitting his episcopal see after his promotion, he retired to St. Lazare, where he died in 1691, at the age of 88 years. His Medalla Theologica, in 2 vols. 12mo., is a book which has been often cited by prelates against Boffuet, because it supplied them with weapons against the catholic zeal of making converts. He wrote other books in Latin and French. Gen. Diet.

ABELLINUM, in Ancient Geography, a town of the Hirlipani, a people of Apulia, near the river Sabbato, between Beneventum and Saelurnum. Pliny calls the inhabitants Aevillenses Protopi, in order to distinguish them from the Aevillenses Marsi. It is now Avellino. E. long. 15° 20'. N. lat. 41°.

ABELMOLUCH, a species of the ricinus, or Palma Chryph.

ABELMOSCHI, or Abelmoschus, the musk seed; a small odoriferous seed brought from Egypt, chiefly used in perfumes. The herb comes from Martino. The plant which produces it is the Hibiscus Abelmoschus of Linnaus.

ABENAS, in Geography, a town in France, in Languedoc, and in the Lower Vivaris, situated on the river Ardech, at the foot of the Cevennes. E. long. 4° 43'. N. lat. 44° 40'.

ABENEL CAUBY, a fixed star of the second or third magnitude, in the fourth scale of the constellation Libra.

ABENEZRA, Abraham, in Biography, a celebrated

Rabbi, born at Toledo, in Spain, and called by the Jews, the wife, great, and admirable doctor, was a very able interpreter of the Holy Scriptures, and well skilled in grammar, poetry, philosophy, astronomy, and medicine. He was also a perfect master of the Arabic. His principal work is Commentaries on the Old Testament, which are much esteemed, and printed in Bomberg's and Buxtorf's Hebrew Bibles. His style is clear, elegant, concise, and much like that of the Sacred Writings. He generally adures to the literal sense, and always manifests genius and judgment; though his sentiments are sometimes erroneous. His Jezud Alor, which recommends the study of the Talmud, is the most rare of all his writings. His Poem on the game of Chess was translated by Dr. Hyde. Many other theological, grammatical, mathematical, and astrological works of this author remain in ancient libraries, and have not yet been edited. He died at Rhodes in 1174, or 1190, aged 75. Mafief. Heb. Gram. vol. ii. p. 30.

ABEN-MELEK, a learned Rabbi, whose work, intitled, The Perfection of Beauty, printed at Amsterdam, 1661, fol. in Hebrew, and translated into Latin in 1670, and in 1680, is a Commentary on the Bible, in which he confines himself to the explanation of the grammatical sense.

ABENOW, in Geography, a mountain of Snabia, thirteen miles from Flensburg, remarkable as the source of the Danube, and for giving name to a chain of mountains extending from the Rhine to the Neckar, and from the foreland of France to the city of Thorheim.

ABENRAD, a town of Denmark, in Skivwick, in a territory of its own name. It is situated on a spacious bay of the Baltic, surrounded by three high mountains, and has been lately much improved. E. long. 19° 14'. N. lat. 55° 6'.

ABENSBERG, a small town in the circle of Bavaria, on the river Abens, near the Danube. E. long. 11° 55'. N. lat. 48° 46'.

ABER, in Natural History, the name given by Adnunon to the Myrtus panicus of Linnaus, with a gibbous acuminate shell, 15 furrows, and a dentated margin. It is found on the western shore of Africa.

ABERARTHY. See Cardigan Bay.

ABERAVON, a small borough-town in Glamorgan- shire, in Wales, governed by a portreeve. It is now an inconsiderable village, situated at the mouth of the river Avon, whence its name; Aber, in the ancient British, denoting such a situation. W. long. 3° 48'. N. lat. 51° 35'.—The copper-works established near this place have given it importance, and increased its population.

At a small distance from this town is the charming seat of Lord Vernon, at Briton ferry, where the Neath river, issuing from the bold hills which enclose its vale, passes between several majestic groves, and precipitates itself into the sea.

ABERROTHICK, or Arraath, one of the Royal Burghs of Scotland, situated in the county of Angus, about forty miles N.N.E. of Edinburgh, at the discharge of the river Brothick into the sea. It is a small well-built town, and is gradually improving. Its manufactures consist of coarse brown linens, failcloth, and thread. Its export trade consists of these articles, barley, and wheat; and its imports are flax and timber from the Baltic. Coals and lime form its coaling trade. This port is very ancient, and is famous for the ruins of an abbey, founded by William the Lion, in 1178, and dedicated to Thomas à Becket. The monks were of the Tyronian order, and the last abbot was Cardinal Beaton. This town has a chalybeate water, containing iron dissolved in fixed air, and used as a diuretic and corromorative. W. long. 2° 29'. N. lat. 56° 36'.

ABERCONWAY. See Conway.

ABER-
ABERCORN, a small town of Georgia, in America, on the Savannah river, about thirteen miles N. W. of Savannah.

ABERCROMBIE, Thomas, M. D. in Biography, was born at Forfar, in the county of Angus, in 1656, and educated at St. Andrews and Avranches, in which latter place he took his degree in 1687. In 1690 he returned hither, and resided at the house of James I. and was appointed one of the county physicians. After the revolution he applied to the study of antiquities, and wrote the 'Marital Antiquities of Scotland,' in 4 vols. 12mo. His Treatise on Tont is not much esteemed. He died at Edinburgh in 1726, aged 70. *Bair. Dict.*

ABERCROMBIE, David, in Biography, a Scotch physician, published, in 1685, a Treatise on the Venereal Disease, under the title, Tota et alius Loci Venerarum, Exemplisque Mercurialis, et Semper-Complice. Stillett. M. D. This was followed by another book on the same subject, in the year 1687. He also published, De Pulsioni Varietate, an. 1687; and, in the same year, Ars Explorandae Medicum Facultates Plantarum, ex folo sapere. His works however are of little value.

ABERDARON Bay, in Geography, is situated within the S. W. point of Caernarvon county in Wales, and N. E. from Bardsey island.

ABERDAVINE, in Ornithology, a name sometimes given to a species of Fringilla, more generally called Siskin. See Spinus.

ABERDEEN, in Geography, the name of two cities in Scotland, called the Old and New Town, situated on the German ocean. This is a place of great antiquity; as it appears, that privileges were conferred upon it in the reign of Gregory, about the year 893; and a bishoprick founded by Malcolm I. in 1004, at a place in Banffshire, was transferred to old Aberdeen by David I.; and, in 1165, a new charter was obtained from Malcolm IV. Another charter was granted by Alexander I. in 1217.

Old Aberdeen lies at the mouth of the river Don, over which is a fine Gothic bridge of a single arch, resting upon two opposite rocks, which has been much admired, and which is said to have been built about the year 1290. The principal building in this town is the King's College, which is built round a square, with cloisters on the south side. This college was founded in 1494, and from the circumstance of King James IV. claiming the patronage of it, it derives its present name. This and the Marischal College in the new town form one university, called the University of King Charles. The library is large, but has not many curiosities. The first principal was Hector Boethius, who was sent hither from Paris on an annual salary of 40 Scots marks, at thirteen pence each.

The New Town is the capital of the shire of Aberdeen, and exceeds in extent, trade, and appearance, any town in the north of Scotland. It is situated about one mile from the old town, on a rising ground, in a small bay formed by the river Dee, deep enough for a ship of 200 tons, and about two miles in circumference. There is an elegant bridge over the river, consisting of seven arches, which is said to have been built by Dunbar, who was bishop about the year 1200. The chief public building in this town is the Marischal College, founded by George Keith, Earl Marischal, in 1594, and augmented since by many additional buildings. In this college there are about 150 students, who are instructed, as well as those of the king's college, by able professors. Besides two parish-churches, and the college kirk, there is an elegant episcopal chapel, with several meeting-houses. The other public buildings are a handsome town-hall, a grammar school, Gordon's hospital, and an infirmary. The harbour is defended by a strong stone pier, lately erected under the direction of Mr. Smeaton. The trade of Aberdeen is now considerable, and capable of improvement by an attention to the white fisheries. Its imports are from the Baltic, and a few merchants trade to the West Indies and North America. Its exports are rockings, sheep, mutton, oatmeal, and pickled pork. The two chief articles are very important branches of manufacture in this town and neighbourhood. The salmon fisheries on the Dee and Don, and particularly those of the Dee, are very productive; and Mr. Knox observes, that if the merchants would, in addition to the fish supplied by their, export the cargoes of 50 or 60 vessels, constantly employed in the herring and white fisheries, the port of Aberdeen would in a few years become the most celebrated mart of fish now existing. The number of inhabitants in Old and New Aberdeen is estimated at 25,000. There are two springs near this town, one of pure water, and another of a quality resembling the German Spa. Aberdeen, with Aberbrothick, Brecbin, Montrose, and Inverurie, returns one member to parliament. Aberdeen is 84 miles N. E. of Edinburgh. W. long. 2° 8'. N. lat. 57° 9'.

ABERDEENSHIRE, a county of Scotland, which comprehends the districts of Mar, Garioch, Strathbogie, and the greater part of Buchan. It is washed on the east and north by the German ocean, and abounds in sea-ports, which are convenient for commerce. The rivers are numerous, and the banks exhibit many natural woods and extensive plantations. In the high parts there is much excellent pasture, and in the level tract, called Strathbogie, there are many well cultivated fields. This county sends one member to parliament.

ABERDOVEY, a small sea-port in Merionethshire, at the discharges of the river Dovey into the bay of Cardigan. Its export trade, which is not considerable, consists of hansen, Welsh webs, oak bark, and other productions of the vale of Dovey.

ABERDOUR, a small town of Fife, in Scotland, on the Frith of Forth, about ten miles N. W. of Edinburgh.

ABEREMURDRUM, in Ancient Law Books, denotes murder that has been proved, or made manifest by a judiciary process.

In this sense, aberemurder, called also abermurder, amounts to the same with probatum murdrum, or murder which needed proof; and it was opposed to open murder, which was murder sufficiently known by the notoriety of the fact.

Lambard explains abermurder by manifestum murdrum; and Spelman, by cadens manifesta; others, by apertum murdrum. Abermurdrum was one of those crimes which could not be expiated by money, as most others might be.

ABERFORD, in Geography, a market-town in the west riding of Yorkshire, 184 miles N. N. W. of London. W. long. 1° 21'. N. lat. 53° 50'.

ABERFRAW, a village in the isle of Anglesey, where the princes of North Wales had formerly a palace. W. long. 4° 30'. N. lat. 53° 57'.

ABERGAVENNY, an irregularly built town of Monmouthshire, beautifully situated in the midst of a range of meadows, at the confluence of the rivers Usk and Gavenny, and surrounded by several projecting hills. It contains about 500 houses. Its public buildings consist chiefly of a long Gothic bridge, the imperfect fragments of a castle, and an ancient church adjoining to the priory. It is a place of resort in summer for goats' whey, and is a great thoroughfare to the western parts of South Wales. It is about 143 miles W. by N. of London. W. long. 3° 5'. N. lat. 51° 50'.

ABER-
Abercoveny seems to have been the Gildonham of Antonius, and was his Barrow. At the distance of a few miles from this town are the ruins of Llanthony Abbey, situated in one of the deepest recesses of the black mountains, founded on the site of a chapel, supposed to be the residence of St. David, the tutelary saint of Wales. It was rebuilt, and the monastery formed for Augustine monks by Sir William de Lacy, in 1198.

Abernethy, a town in Strathspey, a district of Perthshire, in Scotland. It is situated on the river Tay, and said to have been the residence of the Pictish kings, and the seat of an archbishop, since transferred to St. Andrews. It is now much decayed.

Abernethy, John, in Biography, an eminent presbyterian divine, was born at Coleraine, in Londonderry, on the 10th of October 1680. His father was a dissenting minister in that town. After continuing under the care of his parents for nine years, he was separated from them by a concurrence of circumstances, which in the event proved favourable. His father had busineses in London, and his mother removed to Derry. Their son accompanied a relation to Scotland, who removed thither to avoid the troubles occasioned by the insurrections in Ireland; and he thus escaped attending the siege of Derry, in which Mrs. Abernethy lost all her other children. At the early age of thirteen he was sent to the college at Glasgow, where he remained till he had taken the degree of Master of Arts. In conformity to the advice of his friends, he declined the profession of physic, to which his views were at first directed, and devoted himself to the study of divinity under Professor Campbell at Edinburgh. Such was his success in the prosecution of this object, that he was licensed to preach by the Presbytery of Route before he was twenty-one years of age. In 1703, after having been for some years at Dublin with a view to further improvement, he was ordained at Antrim; where his public performances were much admired, and where his general conduct and distinguished attainments recommended him to the esteem of all who knew him. He was much respected not only by his brethren in the ministry, but by many of the laity, who were pleased with the vivacity of his disposition, and the urbanity of his manners. His talents and virtues gave him a considerable attendance in the Synod, so that he had a large share in the management of public affairs. As a speaker, he was considered as their chief orator; and he maintained his character in these respects, and his interest in their esteem, to the last, even when a change of his religious sentiments had excited the opposition of many violent antagonists. In 1716 he attempted to remove the prejudices of the native Irish in the neighbourhood of Antrim, who were of the papish persuasion, and to engage them to embrace the protestant religion. His labours in this laudable design were not without success. Several of them were induced to renounce popery, and continued firm in their attachment to protestant principles; though others, to his great discouragement, reverted to their former persuasion. In the following year he received two invitations, one from Dublin, and another from Belfast; and the Synod, whose authority was very great, advised his removal to Dublin. Such, however, was his attachment to his congregation at Antrim, that he determined to continue there, at the risk of incurring the displeasure of the Synod. The interference of this assembly was repugnant to those sentiments of religious freedom which Mr. Abernethy had been led to entertain, by the exercise of his own vigorous faculties, and by an attention to the Bangorian controversy, which prevailed in England about this time. Many other ministers in the north of Ireland formed more enlarged ideas of christian liberty and charity than they had been accustomed to do, by means of the writings of Dr. Hoadly and his associates. With a view to the improvement of useful knowledge, they instituted a society, whose objects was to bring things to the test of reason and scripture. This laudable design was probably suggested by Mr. Abernethy. However he was very active in promoting it. As the gentlemen who conformed in this scheme met at Belfast, the society derived its appellation from the place in which they assembled. In the progress of this business, and in consequence of the debates and differences that were occasioned by it, several persons withdrew from the society; and those who adhered to it were distinguished by the title of non-subscribers. Their avowed principles were these:—First, That our Lord Jesus Christ hath in the New Testament determined and fixed the terms of communion in his church; that all Christians who comply with these have a right to communion; and that no man, or set of men, have power to add any other terms to those settled in the gospel. Secondly, That it is not necessary as an evidence of soundness in the faith, that candidates for the ministry should subscribe the Westminster Confession, or any uninspired form of articles, or confession of faith, as the term upon which they shall be admitted; and that no church has a right to impose such a subscription upon them. Thirdly, That to call upon men to make declarations concerning their faith, upon the penalty of cutting them off from communion, if they should refuse it, and this merely upon suspicion and jealousy, while the persons required to purge themselves by such declarations, cannot be fairly convicted upon evidence of any error or heresy, is to exercise an exorbitant and arbitrary power, and is really an inquisition. Mr. Abernethy was justly considered as the head of the non-subscribers, and he became of course a principal object of reproach and persecution. In an early period of this controversy, viz. in 1719, he published a sermon from Romans, xiv. 5, in which he explained the rights of private judgment, and the foundations of christian liberty. He afterwards published a small piece, intitled, "Seafonable Advice to the contending Parties in the North," which was accompanied with a Preface by the Reverend Mefhrs. Weld, Boyce, and Chappin, of Dublin. The design of this publication was to prove, that there ought to be no breach of communion among the Protestant dissenters on account of their different sentiments and practices concerning subscription to the Westminster Confession. The Synod, however, determined, in 1726, that the non-subscribers should no longer be of their body, and revived, with additional force, the act of 1705, requiring the candidates for the ministry to subscribe the Westminster Confession. From that time the excluded members formed themselves into a separate Presbytery, and prepared to encounter many difficulties and hardships. Mr. Abernethy found that his justly acquired reputation, which he had uniformly maintained by a most exemplary life, was no security to him against these evils. Some of his congregation deserted him, and under the influence of the Synod formed themselves into a distinct society; and though most of his old friends adhered to him, he thought it most advisable to accept an invitation which he received from the congregation of Wood-street, in Dublin; and accordingly he removed thither in 1730. At Dublin he prosecuted his studies with renewed diligence; and devoted from a practice which he had pursued in the north, by writing his sermons at full length, and conscientiously using his notes in the pulpit. The dissenters in Ireland being at this time drowsy from emancipating themselves from the incapacity of devising them by the Telt
Adr. Mr. Abernethy, in 1731, wrote a paper, in subherence to this design, with a view of shewing the unreasonable and injustice of all those laws, which upon account of mere difference in religious opinions and forms of worship, excluded men of integrity and ability from serving their country, and debarred them of those privileges and advantages to which they had a natural and just title as free-born subjects. He particularly intimated that, considering the state of Ireland, it was a great error, in point of policy, to continue restraints which weakened the Protestant interest, and were prejudicial to the government. In 1733 the Irish dissenters made an attempt for obtaining the repeal of the obnoxious act, and Mr. Abernethy again appeared from the prefs in favour of the scheme; but the design miscarried. He continued his labours in Wood-Street for ten years, and enjoyed great satisfaction in the society and esteem of his friends. From the strength of his constitution, the vigour of his spirit, and the uniform temperance of his life, there was reason to hope, that his usefulness would have been prolonged. But a sudden attack of the gout in the head, to which disorder he had been subject, frustrated the expectations of his friends, and he died, December 1740, in the 62d year of his age. For this event he was fully prepared, and he met it with great composure and firmness of mind, with a cheerful acquiescence in the will, and a fixed trust in the power and goodness of the Almighty. Mr. Abernethy was twice married; first, soon after his settlement at Antrim, to a lady of excellent character, of whom he was deprived in 1712; and again, after his removal to Dublin, to another lady, with whom he lived, in all the tenderness of conjugal affection, to his death. The most celebrated of Mr. Abernethy's writings were his two volumes of Discourses on the Divine Attributes, which were much admired at the time of their publication, and honourably recommended by the late excellent Archbishop Herring; and are still held in the highest esteem by those who are disposed to approve the most liberal or manly sentiments on the great subjects of natural religion. Four volumes of pithomun Satires were likewise published, the two first in 1748, and the others in 1757; to which is prefixed the Life of the Author, written, as is generally understood, by Dr. Duchal. A volume, intitled, "Scarce and valuable Tracks and Sermons, &c," was published in 1751. He also left behind him a Diary of his Life, confining of six large volumes in 400, of which the author of his Life has given a large account, and from which he has made many valuable extracts, which bear ample testimony to the singular excellence of his disposition and character. Biog. Brit.

ABERRATION, in Astronomy, an apparent motion in the celestial bodies, occasioned by the progressive motion of light, and the earth's annual motion in its orbit: the theory of which is explained by Dr. Bradley: for an account of which, see LIGHT and STAR.

This theory may be illustrated and applied in the following manner. If light be supposed to have a progressive motion, the position of the telescope, through which any celestial object is viewed, must be different from that which it would have been, if light had been instantaneous; and therefore the place measured in the heavens will be different from that true place. Thus, if S' be a fixed star (Astron. plate; fig. 1.), VF the direction of the earth's motion, S'F the direction of a particle of light, entering the axis at a, and moving through aF whilst the earth moves from e to F, and if the telescope be kept parallel to itself, the light will deform in the axis. For, let the axis aF, eF, continue parallel to ae; and if each motion be considered as uniform, that of the spectator, occasioned by the earth's rotation, being disregarded, because it is so small as to produce no effect, the spaces described in the same time will preserve the same proportion; but eF and eF being described in the same time, and as we have eF : eF :: en : en, and en and ae will be described in the same time, and therefore when the telescope is in the situation en, the particle of light will be at s in the telescope; and the case being the same in every moment of its descent, the place measured by the telescope at is and the angle sF is the aberration, or the difference between the true place of the star, and the place measured by the instrument. Hence it appears, that if we take FS : FS : the velocity of light : the velocity of the earth, join Ss and complete the parallelogram FFSs, the aberration will be equal to FS, S will be the true place of the star, and the place measured by the instrument: and this latter is the same with the apparent place of the object, as it would be seen by the naked eye. In order to prove this, let it be considered, that if a particle of light fall upon the eye in motion, its relative motion with regard to the eye will be the same as if equal motions, in the same direction, were impressed upon each at the moment of contact: for it is well known to be a principle in mechanics, that equal motions in the same direction, impressed upon two bodies, will not affect their relative motions, and consequently the effect of one upon the other will not be altered. Let VF then be a tangent to the earth's orbit at F, and represent the direction of the earth's motion at F, and s'a; join Ss, and produce it to G, and take FG : Fn :: the velocity of light : the velocity of the earth in its orbit; complete the parallelogram FGHs, and draw the diagonal FH. Since FG and nF represent the motions of light and of the earth, if we conceive a motion Fs equal and opposite to nF to be impressed upon the eye at F, and upon the particle of light, then the eye will be at re, and the particle of light, by two motions FG and Fa, will describe the diagonal FH, which is its relative motion with respect to the eye itself. Hence it follows, that the object appears in the direction HF, and consequently that its apparent place differs from its true place by the angle GFH = FS.

But by trigonometry, fine FS : sin. Fis :: Fis :: Fs :: the velocity of the earth : the velocity of light, and therefore the sine of aberration = sin. Fis X sin. Fs :: Fs ; and if these velocities be considered as constant, the sine of aberration, or the aberration itself, which never exceeds 20', varies as the sine of Fis, and is therefore greatest when Fis is a right angle. Let i then express the sine of Fis, and we shall have 1 (radius) :: 20' X 20', the aberration. Hence when Fis coincides with FS', or the earth is moving directly or from a star, there is no aberration. And since Fs = 20' when Fis = 90', we shall have the velocity of the earth : the velocity of light :: sin. 20' :: radius :: 1 : 10314. It appears that the aberration Ss' lies from the true place of a star in a direction parallel to that of the earth's motion, and towards the same place.

M. de Maupertuis, in his Elements of Geography, familiarly illustrates the aberration by the direction in which a gun must be pointed in order to shoot a bird in its flight. Instead of pointing straight to the bird, the fowler directs the gun a little before it in the path of its flight; and so much the more as the flight of the bird is more rapid with respect to that of the shot. M. Clairaut too, in the Mem. of the Acad. Scienc. for 1746, explains the aberration by supposing drops of rain to fall quickly and rapidly after each other from a cloud, under which a person moves with a very narrow tube; in which case it is evident that the tube must have a certain inclination, in order to admit a drop which enters
enters at the top, to fall freely through the axis of the tube, without touching the sides of it; and this inclination must be greater or less according to the velocity of the drops in respect to that of the tube. In this case the angle made by the direction of the tube, and that of the falling drops, is the aberration arising from the combination of these two motions.

To find the aberration in latitude and longitude. Let ABCD (Astron. pl. 1. fig. 2.) be the earth's orbit, supposed to be a circle, with the sun in the centre at $S$, let $P$ be in a line drawn from $S$ perpendicular to $ABCD$, and represent the pole of the ecliptic; let $S$ be the true place of a star, and $apeq$ be the circle of aberration parallel to the ecliptic, and $abeq$ the ellipse into which it is projected; let $qT$ be an arc of the ecliptic, and $PSG$ a secondary to it, which will coincide with the lefser axis $bd$, into which the diameter $pq$ is projected; draw $GxA$, which is parallel to $pq$, and $BxD$ perpendicular to it must be parallel to the greater axis $ac$; then, when the earth is at $A$, the star is in conjunction, and in opposition when the earth is at $C$. But as the place of the star in the circle of aberration is always $90^\circ$ before the earth in its orbit, when the earth is at $A$, $B$, $C$, or $D$, the apparent places of the star in the circle will be at $a$, $b$, $c$, or $d$, and the ellipse at $o$, $b$, $e$, or $d$; and to find the place of the star in the circle, when the earth is at any point $E$, take the angle $bpq = EXB$, and $z$ will be the corresponding place of the star in the circle; to find the projected place in the ellipse, draw $vo$ perpendicular to $Se$, and $wv$ perpendicular to $Se$ in the plane of the ellipse, and $z$ will be the apparent place of the star in the ellipse; join $s$ and $t$, and $st$ will be the apparent projection of $sv$, because the projection of the circle into lines perpendicular to the ellipse; draw the secondary $PsvK$, which will, as to $sv$, coincide with $sv$, unless the star be very near to the pole of the ecliptic. Now as $v\theta S$ is parallel to the ecliptic, $S$ and $v$ must have the same latitude; hence $v$ is the aberration in latitude; and as $G$ is the true, and $K$ the apparent place of the star in the ecliptic, $GD$ is the aberration in longitude. To find these, put $m$ and $n$ for the sign and coine of the angle $Ss$, or $CxK$, the difference of the earth from fzygies, radius being $1$; and as the angle $vsv = \theta sv$ = the complement of the star's latitude, the angle $vsv = \theta sv$ = the star's latitude, for the sign and coine of which put $v$ and $wv$, and put $r = Sz$, or $Sz$: then in the right triangle $Srv$, $n = : m : : r : : sv = rv$; and in the triangle $svs$, $1 = : m : : rv = rm$; hence the aberration in longitude. Also, in the triangle $svw$, $1 = : m :$ $r : : sv = rm$, and therefore $\theta = Ss = rv$; hence $v = : m : : rv = tz$, the aberration in longitude. When the earth is in fzygies, $m = 0$, therefore there is no aberration in latitude; and as $n$ is then greatest, there is the greatest aberration in longitude. If the earth be at $A$, or the conjunction, the apparent place of the star is at $a$, and reduced to the ecliptic at $H$; therefore $GH$ is the aberration, which diminishes the longitude of the star, the order of the sizes being $\eta GT$. In this case the angle $\Delta E$ described by the earth from conjunction, or the angle $\Delta S_{\eta}$, shows the elongation of the star from the sun. But when the earth is at $C$, or the star in opposition, the apparent place $\theta$ reduced to the ecliptic is at $F$, and the aberration $\Delta F$ increases the longitude; hence the longitude is the greatest when the star is in opposition, and least when in conjunction. When the earth is in quadratures at $D$ or $B$, then $n = 0$, and $m$ is greatest, therefore there is no aberration in longitude, but the greatest in latitude; when the earth is at $D$, the apparent place of the star is at $d$, and the latitude is increased; but when the earth is at $B$, the apparent place of the star is at $l$, and the latitude is diminished; hence the latitude is least in the quadratures before opposition, and greatest in quadratures after opposition. From the mean of a great number of observations, Dr. Bradley determined the value of $r$ to be $20^\circ$.

From the principles above stated and explained it appears, that the greatest aberration in latitude is equal to $20^\circ$ multiplied by the sine of the star's latitude; and that the aberration in latitude for any time is equal to $20^\circ$ multiplied by the sine of the star's latitude, and multiplied also by the sine of the elongation found for the same time. The aberration is the greater before the opposition, and additive after it. The greatest aberration in longitude is equal to $20^\circ$ divided by the cosine of its latitude; and the aberration for any time is equal to $20^\circ$ multiplied by the sine of the elongation of the star, and divided by the cosine of its latitude. This aberration is subtractive in the first and last quadrant of the argument, or of the difference between the longitudes of the sun and star, and additive in the second and third quadrants. The application of these rules will be seen in the following examples:

1. To find the greatest aberration of $\gamma$ Ursa minoris, whose latitude is $75^\circ$ $13'$. Here $m = 1$, $v = 9669$ the fin. $75^\circ$ $13'$. Consequently $20^\circ \times 9669 = 19^\circ$, $34$ the greatest aberration in latitude. Also, $n = 1$, $w = 2551$; and therefore $20^\circ = 78^\circ$, $4$ the greatest aberration in longitude.

2. To find the aberration of the same star, when the earth is $30^\circ$ from fzygies. Here $m = 15$, and therefore $10^\circ$, $34 \times 15 = 67^\circ$ the aberration in latitude. If the earth be $30^\circ$ beyond conjunction or before opposition, the latitude is diminished; but if it be $30^\circ$ after opposition or before conjunction, the latitude is increased. Also, $n = 8663$; consequently $78^\circ$, $4 \times 866 = 67^\circ$, $89$ the aberration in longitude. If the earth be $30^\circ$ from conjunction, the latitude is diminished; but if it be $30^\circ$ from opposition, it is increased.

3. For the sun, $m = 0$, $n = 1$, and $w = 1$: hence it has no aberration in latitude, and the aberration in longitude $= r = 20^\circ$ constantly; and this quantity of aberration answers to the sun's mean motion in $8^\circ$ $7^\circ$ $30''$, which is therefore the time which the light takes to move from the sun to us at its mean distance. Hence the sun always appears $20^\circ$ more backward than its true place.—The following table will expedite the calculations.

17° 4' 3" = 10° 17° 4' - 14° 65
31° 10 Sin. - 0° 5175

Aberration in latitude

-7° 58 Product.

To find the Aberration in declination and right ascension.

Dr. Bradley has annexed to his theory the rules or formule for this purpose; and these rules have been variously de-

monstrated, and reduced to other practical forms by M. Clairaut, in the Mem. of the Acad. of Sciences for 1737; by Mr. Simpson in his Essays in 1710; by M. Fontaine des Crutes in 1744; by M. Euler, Mem. Acad. Berlin, tom. ii. p. 14. 8vo.; and by several other persons. The results of them are as follow:—The greatest aberration in declination is equal to 20°, multiplied by the sine of the angle of position A at the star, and divided by the sine of B, the difference of longitude between the sun and star, when the aberration in declination is nothing. And the aberration in declination at any other time will be equal to the greatest aberration multiplied by the sine of the difference between the sun’s place at the given time, and his place when the aberration is nothing. Also the sine of the latitude of the star is to radius, as the tangent of A is to the tangent of B. The greatest aberration in right ascension is equal to 20° multiplied by the cosine of A, the angle of position, and divided by the sine of C, the difference in longitude between the sun and star, when the aberration in right ascension is nothing. And the aberration in right ascension at any other time, is equal to the greatest aberration multiplied by the sine of the difference between the sun’s place at the given time, and his place when the aberration is nothing. Also, the sine of the latitude of the star is to radius as the cotangent of A to the tangent of C. Hutton’s Mathem. Dict. Art. Aberration.

Mr. Vince has purified the method given by M. Cagnoli in his Trigonometry, as the most convenient in practice, and subjoined the tables computed by M. de Lambe in this way.

We shall here annex the tables, referring to Mr. Vince’s Astronomical Almanac, (sub infra,) for the proceedings, which expressions for the aberration in right ascension and declination on which they are formed have been deduced.

To find the Aberration in declination and right ascension.

Dr. Bradley has annexed to his theory the rules or formule for this purpose; and these rules have been variously de-
Use of the Tables.

$A =$ the right ascension of the star.

$D =$ the declination of the star.

$S =$ the longitude of the sun.

Enter Table I. with the argument $A-S$, and Table II. with $A+S$, and the sum of the two corresponding numbers multiplied by the secant of $D$ will be the aberration in right ascension.

Enter Table I. with the argument $A-S+3$ signs, and Table II. with $A+S+3$ signs, and the sum of the two corresponding numbers multiplied by the sine of $D$ will be the first part of the aberration in declination.

Enter Table III. with the arguments $S+D$ and $S-D$, and you will have two other parts of the aberration in declination; and the sum of these three parts will give the whole aberration in declination.

If the declination of the star be south, add six signs to $S+D$ and $S-D$.

Ex. To find the aberration of α Aquilae, on May 10, 1795, at 12 o'clock in the evening.

$A = 0^\circ 25^\circ 12'$

$S = 1^\circ 20^\circ 12'$

$A-S = 8^\circ 5^\circ 0^\circ$ Table I. $+ 8^\circ 1$

$A+S = 11^\circ 15^\circ 24^\circ$ Table II. $+ 0^\circ 8$

$D = 8^\circ 20^\circ$ secant $+ 8^\circ 9$

Aberration in Right Ascension $9^\circ 998$ Product.

If the star's declination had been south, then $S+D+6$ signs $= 7^\circ 28^\circ 32^\circ$ Table III. $+ 2^\circ 08$

$S-D+6$ signs $= 7^\circ 11^\circ 52^\circ$ Table III. $+ 2^\circ 97$

First Part $- - - 2^\circ 49$

Aberration in Declination $+ 2^\circ 56$

The aberration of a star applied to its apparent place gives the true place. On the subject of this article, see Dr. Malke-lyne's rules for finding the aberration of a star, and Vince's Astron. vol. i. chap. 22. p. 311—330.

Aberration of a planet, in Astronomy, is its geocentric motion, or the space through which it appears to move as seen from the earth, during the time of light's passage from the planet to the earth. Let $S$ (Astron. pl. i. fig. 4.) be the fun, $T$ the earth, $P$ the correspoding place of the planet; and let the earth be suppos'd to move in the direction $T_1$, parallel to which draw $PQ$, and let it be equal to the space through which the earth has moved, whilst light passes from $P$ to $T$, and $Q$ will be the apparent place of the planet. If $PQ$ represent the motion of the planet in the same time, $Q$ being the apparent, and $P$ the corresponding true place, the angle $Q'T_1P$ will be the aberration arising from the progressive motion of light and the motion of the planet. Since $PQ$ and $P_1Q_1$ represent the motions of the earth and planet, $Q_2P_2$ will represent their relative motions; and hence the motion of the planet about the earth in the time when light takes to pass from the planet to the earth in the aberration. With respect to the fun, the aberration in longitude is con-stantly 20°, that being the space moved through by the fun, or by the earth in the time of $8^\circ 7^\circ$, which is the time in which light passes from the fun to the earth. In like manner, if we know the distance of any planet from the earth, we shall obtain its aberration. For let $ST = P$, $PT = d$, and $m =$ the angle describ'd by the planet about the earth, or its geocentric motion, in longitude, right ascension or declination, in 24 hours: then $1:\: d = 8^\circ 7^\circ \cdot 5^\circ 5^\circ$, the time in which light moves from $P$ to $T$; consequently $24 : h = 8^\circ 7^\circ \cdot 5^\circ d = m$ : the aberration $= 8^\circ 7^\circ \cdot 5^\circ dm$.

Thus by taking the geocentric motion from the Nautical Almanac, and estimating the distance, in doing which no great accuracy is required, we shall find the aberration of a planet in latitude, longitude, right ascension or declination. When $m =$ 0, or the planet is stationary, the aberration is evidently equal to nothing.

Ex. 1. On May 1, 1794, at noon, What is the aberration in longitude of Mars? Here $SP = 1,523$ the mean distance, the longitude of the fun is $1^\circ 11^\circ$, and the geocentric longitude of Mars is $0^\circ 29^\circ 1^\circ$; and therefore the angle $PTS = 11^\circ 41^\circ$, and consequently $PT = 2,489 = d$; and $m = 44^\circ 50^\circ = 2605$, taken from the Nautical Almanac; hence $0,00564 dm = 37^\circ 5^\circ$ the aberration in longitude.

Ex. 2. For the Moon, $d = 0,00253$: the mean distance, $m = 13^\circ 10^\circ 35^\circ = 47435$ the mean diurnal motion: hence $0,00654 m = 0^\circ 67$ the aberration, which is so small that it may be neglected.

It is evident that the aberration will be greatest in the longitude, and very small in latitude, because the planets deviate very little from the plane of the eclipse, so that this aberration is almost inconsiderable and disregarded: the greatest in Mercury being only about $4^\circ 7^\circ$, and much less in the other planets. As to the aberrations in declination and right ascension, they must depend upon the situation of the planet in the zodiac. The aberration in longitude being equal to the geocentric motion, will be greater or less according to this motion. It will be greatest in the superior planets Mars, Jupiter, Saturn, &c. when they are in opposition to the fun; but in the inferior planets Venus and Mercury, the aberration is greatest at the time of their superior conjunction. Thee maxima of aberration for the several planets, when their distance from the fun is least, are as follow. viz. Georgan or Hælrichell $25^\circ$, Saturn $27^\circ$, Jupiter $29^\circ$, Mars $36^\circ$, Venus $45^\circ$, Mercury $59^\circ$, and the Moon $j$. Between these numbers and nothing the aberrations in longitude vary according to the situation of the planets. That of the Sun, however, is invariable, being constantly $20^\circ$: and this may alter his declination by a quantity which varies from $0$ to near $8^\circ$, being the greatest; or $8^\circ$, about the equinoxes, and vanishing in the solstices. The methods and formula of computation are given by M. Charpentier in the Mem. Acad. Scienc., for 1746, and by Mr. Euler in the Berlin Mem. vol. iv. for 1746. M. de la Lande has calculated a table shewing the aberrations of the planets at various degrees of elongation from the sun, by means of which the apparent place may be determined from the true place. When the planet is stationary, there is no aberration; when the planet's motion is direct, the aberration is negative, and when retrograde, positive. This table is published by Mr. Vince. It has been already stated, that
the aberration is $\cos \theta$, if the earth's distance be
134; and if this distance be replaced by 10, the
aberration will be $\cos 0.00564\theta$, up to which
position the following table was contrived. If the distance
be greater than 12, e.g. 37, find the value for 10, multiply it
by 3, and add to the product the value for 7.

Suppose the distance of a comet to be 23, and its ap-
parent motion in 24 hours to be $2^\circ 15'$ in longitude, and it be
required to find the aberration in longitude. If we enter the
table with the distance 10 and daily motion $2^\circ 15'$,
we thus get 45",68, which multiplied by 4, gives 182",72; and
by entering with the distance 3, we obtain 13",73; and therefore the aberration is 196",4.

For reducing the place of the body computed from the
table, to the apparent place, add the aberration, if the lati-
itude, longitude, right ascension, or declination of the body
decrease, but subtract, if it increase; and the contrary, to
reduce the apparent to the true place. See Vince's Almanaco,
vol. i. p. 332-338. See remarks on the effects of
aberration on the transit of Venus over the sun by Dr. Price
in Phil. Trans. vol. lx. art. 47. p. 536.

Aberration, in Medicine, signifies a deviation from the
ordinary course of nature.

Aberration, in Optics, is used to denote that error or
deviation of the rays of light, when inflected by a lens or
speculum, whereby they are hindered from meeting or uniting
in the same point, called the geometrical focus. It is
either lateral or longitudinal. The lateral aberration is
measured by a perpendicular to the axis of the speculum, pro-
duced from the focus, to meet the reflected or refracted ray:
the longitudinal aberration is the distance of the focus
from the point in which the same ray intersects the axis. If
the focal distance of any lens be given, their apertures be
small, and the incident rays homocentric and parallel, the
longitudinal aberrations will be as the squares, and the lateral
aberrations as the cubes of the linear apertures.

There are two species of aberration, distinguished by their
different causes: one arising from the figure of the glass or
speculum; the other from the unequal refrangibility of the
rays of light. The second species of aberration is sometimes
called the Newtonian, from its having been discovered by Sir
I. Newton. With regard to the former species of aberration we
may observe, that if rays proceed from a point at a given
distance, they will be reflected into the other focus of an ellipse
when the luminous point is in one focus, or directly from the
other focus of a hyperbola; and if the luminous point be
infinitely distant, so that the rays are parallel, they will be
reflected by a parabola into its focus: but in both cases they
will be diffracted by lenses of all other figures. Spectra of
the former kind are made with difficulty; and therefore
curved specula are commonly of a spherical figure, which
have no accurate geometrical focus. Let BVE (Optics
Pl. i. fig. 1.) represent a concave spherical speculum, whose
centre is C; and let AB, EF be two incident rays parallel
to the axis CV. At the angle of reflection is equal to the
angle of incidence, if CB and CF be drawn to the points of
incidence, and the lines BD and FG be drawn so as to
make the angles CBD and CFG respectively equal to
CBA and CFE, BD and FG will be the reflected rays, and
D and G the points in which they meet the axis. Because
the triangles CBD and CFG are similar, the angles at the
base being equal, the sides CD, DB, and CG, GF, are
respectively equal, and therefore the points of coincidence
with the axes are equally distant from the point of incidence
and the centre. Hence it appears, that if B be indefinitely
near the vertex V, D will be in the middle of the radius
CV; and the nearer the incident rays are to the axis, so much
the nearer will the reflected ray be to the middle of the
radius, and vice versa. So that the aberration of any inci-
dent ray increases, as it is further removed from the axis,
till the distance VI become 60 degrees, in which case the
reflected ray is equal to the radius, its point of interfection
coincides with the vertex, and the aberration is equal to the
radius. This illustration shows us why specula are made of
very small segments of spheres, viz., that all their reflected
rays may intersect the axis near the middle point of the
radius, and thus suffer the least aberration, and render the
image more distinct. The case is the same with regard to
rays refracted through lenses.

In different spherical lenses M. Huygens has demonstrated
that the aberration from the figure is as follows: 1. In all
plano-convex lenses, having their plane surface exposed to
parallel rays, the longitudinal aberration of the extreme ray,
or that remotest from the axis, is equal to $\frac{1}{2}$ of the thickenss
of the lens.

2. In all plano-convex lenses, having their convex sur-
face exposed to parallel rays, the longitudinal aberration
of the extreme ray is equal to $\frac{1}{2}$ of the thickness of the lens:
the aberration in this case being about $\frac{2}{3}$ of that in
the former, or in proportion to it, as $7$ to $27$.

3. In all double convex lenses of equal spheres, the
aberration of the extreme rays is equal to $\frac{1}{2}$ of the thickenss
of the lens.

4. In a double convex lens, the radii of whose sphers
are as 1 to 6, if the more convex surface be exposed to
parallel rays, the aberration from the figure is less than in any
other spherical lens, being no more than $\frac{1}{2}$ of its thickenss.
M. Huygens has also shown, that the same aberration is produced by concave lenses as by similar convex ones.

However this species of aberration is altogether inconsiderable, compared with the latter; insomuch that if the object-glass of a telescope be plano-convex, and the plane side be turned towards the object, and the diameter of the sphere to which the convex side of the glafs is ground, be 102 feet, the semidiameter of the aperture be two inches, and the ratio of the fin of incidence out of glafs into air be to that of refraction as 20 to 31; the diameter of the circle of aberrations will in this case be only \( \frac{961}{72000000} \) parts of an inch. But the diameter of the little circle, through which the fame rays are scattered by unequal refrangibility, will be about the 55th part of the breadth of the aperture of the object-glass, which is here four inches; and therefore the error arising from the spherical figure of the glafs is to the error arising from the different refrangibility of the rays, as \( \frac{961}{72000000} \) to \( \frac{1}{2} \), that is, as 1 to 5449. See Newton's Optics, p. 83. 8vo. (and oper. tom. iii. 347. tom. iv. p. 56. Ed. Hofi.) or Smith's Optics, book ii. chap. 6. (vol. i. p. 39.) where this proposition is demonstrated. That objects should appear through telecopes fo diluent as they do may seem surprizing. Newton accounts for the fact by observing, that the rays are not uniformly dispersed over the whole circular space; in the centre they are more dense, and they become more and more rare towards the circumference, and on this account they are not visible, except those of them that are in or near the centre.

In confluence of the discovery of the unequal refrangibility of light, and the apprehenion, that equal refractions must produce equal divergencies in every fort of medium, it was imagined, that all spherical object-glasses of telecopes would be equally affected by the different refrangibility of light, in proportion to their aperture, of whatever materials they might be confructed; and therefore, that the only improvement of which refraeting telecopes were capable, was that of increasing their length. On this account Sir Isaac Newton, and others after him, despairing of success in the manufacture and use of refraeting lenses, directed their chief attention to the construction of refraeting telecopes. However, about the year 1747, Mr. Euler applied himself to the subject of refraction, and pursuing a hint suggested by Sir Isaac Newton, formed a scheme of making object-glasses with two leaves of glafs, inclining water between them; hoping, that by constructing them of different materials, the refrations would balance one another, and prevent the usual aberration. Mr. J. Dolland, an ingenious optician of London, examined this scheme, and found that Mr. Euler's principles were unsatisfactory. M. Clairaut likewise concurred in opinion, that his speculations were more ingenious than useful.

This controversy, which promised to be of great importance in the science of optics, engaged the attention of M. Klingenberg of Sweden, and induced him carefully to examine the eighth experiment in the second part of Newton's Optics, with the conclusions which he draws from it. He found, that the rays of light, in the circumstances there supposed, did not lose their colour, as Sir Isaac imagined. This hint of the Swedish philosopher, led Mr. Dolland to re-examine the fame experiment; and it appeared, after accurate trials, that different substances made the light to diverge very differently, in proportion to their general refraactive power: therefore, in the year 1757, he procured wedges of different kinds of glafs, and applied them together, so that the refractions might be made in contrary directions, in order to discover, whether the refractions and divergency of colours would vanish together. The result of his first trials encouraged him to persevere; for he discovered a difference far beyond his hopes in the refraactive qualities of different kinds of glafs, with respect to their divergency of colours. The Venetian glafs and the English crown glafs were found to be nearly alike in this respect; the common English plate glafs made the light diverge more, and the English flint glafs most of all. Without entering into the cause of this difference, he proceeded to adapt wedges of crown glafs, and of white flint glafs, ground to different angles, to each other, so as to renege in different directions, till the refracted light was entirely free from colours. Having measured the refractions of each wedge, he found that of the white glafs to be to that of the crown glafs nearly as 1200 to 3; and he deduced this general conclusion, that any two wedges, made in this proportion, and applied together so as to renege in contrary directions, would renege the light without any aberration of the rays. Mr. Dolland's next object was to make similar trials with spherical glasses of different materials; and he found that, in order to obtain a refraetion of light in contrary directions, one must be convex, and the other concave; the latter, which was to renege the moist, that the rays might converge to a real focus, was made of crown glafs, and the former of white flint glafs; and, the refractions of spherical glasses being in an inverse ratio of their focal distances, it was neccessary that the focal distances of the two glafses should be inversely as the ratios of the refractions of the wedges; for being thus proportioned, every ray of light that passes through this combined glafs, at any difference from its axis, will constantly be renege by the difference between two contrary refractions, in the proportion required; and therefore the different refraactive of the light will be entirely removed.

But in the applications of this admirable discovery to practice, many difficulties occurred. At length, however, by repeated trials, and resolute perseverance, Mr. Dolland succeeded so far as to confine renegetic telecopes much superior to any that had before been used; representing objects with great diluteness, and in their true colours.

M. Clairaut, who interested himself hertimes in this discovery, endeavoured to ascertain the principles of Mr. Dollond's theory, and to lay down rules for facilitating the construction of these new telecopes. With this view he made several experiments, in order to determine the refraactive powers of different kinds of glafs, and the proportion in which they separated the rays of light; and from these experiments he deduced several theorems and problems of general use. M. D'Alembert likewise made a great variety of calculations to the same purpose; and shewed how to correct the errors to which these telecopes are subjeft, by placing the object-glasses, in some cases, at a small distance from one another, and sometimes by using eye-glasses of different refraactive powers. But though foreigners were hereby supplied with the moft accurate calculations, they were very defective in practice. The English telecopes, made, as they imagined, without any exact rule, were greatly inferior to the bee of their construction.

M. Euler, who first gave occasion to this important and useful inquiry, was very reluctant in admiring Mr. Dollond's improvements, because they militated against a preconceived theory of his own. At last, however, convinced of their reality and importance by M. Clairaut, he adhered; and soon after received further satisfaction from the experiments of M. Zeilher, of Peterburgh.

M. Zeilher demonstrated, that it is the lead, in the composition of glafs, which gives it this remarkable property; so that, while the refraction of the mean rays is nearly the same, that of the extreme rays considerably differs; and by increasing the lead, he produced a kind of glafs, which occasioned
enlarged a much greater refraction of the extreme rays than the first glasses which Mr. Dollond had made of, and at the same time considerably increased the mean refraction. M. Zeffer, in the course of his experiments, made glasses of minim and flint, with a mixture of alkaline salts; and found that this mixture greatly diminished the mean refraction, without making hardly any change in the dispersion; and he at length obtained a kind of glass greatly superior to the first glass of Mr. Dollond for the construction of telescopes; since it occasioned three times as great a dispersion of the rays as the common glasses, while the mean refraction was only as 1.61 to 1.

Other kinds of metallic glasses, as well as that of lead, possess the fame useful property of dispersion. Some philosophers have, indeed, imagined, that there is a constant relation between the specific gravity of glass and its dispersion; but it ought to be considered, that the dispersion in ether and spirit of wine is stronger than that produced in water, which is a much heavier fluid. The object which opticians have generally proposed by using flint and common glasses in the construction ofochromatic telescopes, might be attained by means of other transparent substances, both solid and fluid. Dr. Blair of Edinburgh has lately evinced this fact. Flint glasses was found to reflect the green light considerably less than crown glasses, in proportion to the whole refraction of red and violet light; so that when the divergence of the red and that of the violet light, caused by the refraction of the two mediums, are equal, the divergence of the red and green light is always greater in the crown than in the flint glasses, and the divergence of the violet and green is always less in the crown than in the flint glasses. After a variety of experiments, Dr. Blair discovered that the muriatic and nitric acids, which are diffusive fluids of considerable strength, instead of reflecting the green light less than crown glasses, in proportion to the whole refraction of the red and violet light, refracted the green light more than crown glasses, in proportion to the whole refraction of red and violet light. He, therefore, mixed these two kinds of dispersive mediums, and thus obtained a medium, which diffracts the rays much more than crown glasses, and yet causes them all to diverge accurately in the same proportion in which they are made to diverge by the refraction of crown glasses; which entirely removes the aberration from the unequal refrangibility of light.

For a farther account of Mr. Dollond's and other new refracting telescopes of the achromatic or applanating kind, see Telescope.

**Aberration, crown of,** is a luminous circle surrounding the real disk of the sun, and depending on the aberration of the focal rays, whereby his apparent diameter is enlarged.

**Abersberg,** in Geography, anciently Alumin or Aventium, a small town and castle in Upper Bavaria, seated on the river Umbs, and containing a convent of Carmelites. It is famous as the birth-place of Johannes Aventinus.

**Aberystwith,** in Geography, a market town of Cardiganshire in Wales, on the Rhylol, near its confluence with the Yfawth, where it falls into the sea. It is situated on a bold eminence overlooking the sea, or bay of Cardigan. The streets are steep and ill-paved, and the houses are covered with the black slate of the country. It carries on a trade in lead, calamine, and fish, particularly herrings, which last branch has lately declined; and a few manufactured goods, such as wools, flannel, and flax. Of late it has been improving, and is become a place of resort for sea-bathing. Its walls and castle are in ruins. The castle was built by Gilbert de Strongbow, in the reign of Henry I. and commands the whole coast with the contiguous mouths of the Yfawth and Rhylol on one side, and a beautiful view of the vale which descends with the river on the other. A mint for the coinage of silver was established in this place by king Charles in 1657., and the coin was to be flapped on both sides with the Feathers, in order to show that it was coined in Wales. It is 203 miles W. N. W. of London. W. long. 5°. N. lat. 52° 5'.

**Abermenai,** a village at the S. W. end of the Meini straits, separating Carnarvonshire from Anglesea.

**Aberville river,** a branch of the Millipilli, in New Orleans, communicating with the lakes which fall into St. Louis bay.

**Abestia, or Avesta,** the name of one of the sacred books of the Persian Magi; which they attribute to their great founder Zarofater, or Zerdushht.

The Avesta is a commentary or exposition of two other of their religious books, called Zend and Parsend; the three together include the whole system of the Zoroastes, or worshippers of fire. D'Herbel. Bibl. Orient. p. 111. Hyde de Red. vet. Perf. c. 2.

**Abeston.** See Asbestos.

**Abethancourt,** Jacques, in Biography, a physician at Rouen, published Nova difficultia quaedegemina, et Purificationis in Morbium Gallicum, five venuere, una cum Dialogo Aquae Argenti, ac Ligni Guainici colantium, super dicti Morbi Cureationis prelatura. Opus fructiferum, Parisiis, 1527, in 8vo.

He is the first French physician who wrote on the venereal disease. Perhaps, M. Eloy says, because the disease appeared at Rouen before it was communicated to other parts of the kingdom.

**Aebettor, or Aebettor,** in Law, one who incites or encourages another to perform something criminal; or by some way afflicts him in the performance of his duty. It is the same with *act* and *part* in the Scots law.

Thus those who procure others to sue out false appeals of felony, or murder, against men, to render them infamous, are particularly denounced *abettors.*

So *abettors in murder,* are such as advise or procure a murder to be committed, or are accessory thereto.

There are *abettors in felony,* but not in treason; the law looking on all those concerned in treason as principals.

**Abrevacuation,** in Medicine, denotes a partial evacuation of the pessent humours, either by nature or art.

**ABEX, or Aresh,** in Geography, a country of Ethiopia in Africa, bordering on the Red Sea, which bounds it on the east. It has Nubia on the north, Abyssinia on the west and south. Its principal towns are Suaquem and Arkoko. It has the name of Beglerbeg of Hablebeth, and is subject to the Turks. It is a sandy, barren, unhealthy country, about 500 miles in length, and 100 in breadth. Being very mountainous, it abounds with wild beasts; and in its forests there are many chemy-trees. See *Aisan.*

**Adayance, Abyeance, or Abyayance,** in Lawbooks, something that only exists in expectation, or in the intent, or remembrance of the law.

*Abayeance,* in our law, amounts to much the same with *hereditas.*
or before, were recorded in the archives of Edessa, it does not appear that Eusebius was ever at this city and took the account from the archives himself. Besides, it is remarkable, that this story is not mentioned by any writer before Eusebius; that it is not much taken notice of by succeeding writers; that the whole affair was unknown to Chrift's apostles, and to the christians their contemporaries, as is manifest from the early disputes about the method of receiving Gentile converts into the church; which this story, had it been true, must have entirely decided. As to the letters, no doubt can be made of their spuriousness, since, if Christ had written a letter to Abgarus, it would have been a part of sacred scripture, and placed at the head of all the books of the New Testament. Dr. Lardner has also pointed out several passages, both in the epistle to Abgarus, and in the history, which are liable to exception. Not to add, that it was the opinion of many of the most learned and ancient christians, that our Lord never wrote any thing. See Jones's Canon of the New Test. vol. ii. p. 1. and Lardner's Works, vol. vii. p. 222. 231.

ABGILLUS, John, surnamed Preller John, was son to a king of the Frics, and from the authority of his life obtained the name of Preller, or priest. He attended Charlemagne in his expedition to the Holy Land; but instead of returning with that monarch to Europe, it is pretended that he gained mighty conquests, and founded the empire of the Abelines, called from his name the empire of Preller John. He is said to have written the history of Charlemagne's journey into the Holy Land, and of his own into the Indies; but they are more probably trifling romances, written in the ages of ignorance.

ABHEL, in Botany, a name given by some to a certain, ever-green garden-shrub, well known in physic in many intentions.

ABHER, in Geography, a town of the Persian Trak, or ancient Parthis, in Asia, delightfully situated, and adorned with fine gardens and elegant public buildings. It is about 26 miles S.E. from Susiana.

ABHORRERS, in English History, a denomination given to a party about the year 1680, formed in opposition to those called Petitioners. In order to restrain the prevailing practice of petitioning against grievances, the church and court party framed addresses, containing the highest expressions of regard to the king, the most entire acquiescence in his wisdom, the most dutiful submission to his prerogative, and the deepest abhorrence of those who endeavored to encroach upon it by prescribing to him any Thing for assembling the parliament. Thus the nation came to be distinguished into petitioners and abhorrers. But these appellations were soon forgotten, though, when the parliament assembled, great numbers of the abhorrs, say Hume, (Hist. vol. viii. p. 130.) from all parts of England, were seized by order of the commons, and committed to muffery.

ABIA, in Biography, a learned rabbi of Alexandria, who wrote treatises on the intelligences which move the heavens, and on the influence of the planets. He flourished in Egypt about the year 1500.

ABIAD, in Geography, a town of Africa, on the borders of Abyssinian, situated on a high mountain, and remarkable for its timber, ebony and aromatic plants.

ABIAD, or white river, flows into the Nile, and is supposed, by some, to be the Nile itself.

ABIAGRASSO, a small town of Italy, seated on a canal, in the duchy of Milan. E. long. 9° 24'. N. lat. 45° 26'.

ABIAN, or Phoenician, a people of Thrace or, or as others say, of Scythia, who derived their name from the negative particle a, and bios, life, probably because they had no settled...
settled habitations and regular means of subsistence. They led
a wandering life, and cared all their possessions with them
in wagons, which were their houses. Their food was the
flesh of their flocks and herds, milk and cheese, and chiefly
milk's milk. They were unacquainted with commerce, and
though they possessed lands, did not cultivate them. From
those who were employed in this office, they received a tribute
sufficient to supply them with the more necessaries of life.
They never took arms but to oblige those to make good a
promise that was violated. They paid tribute to none of the
neighbouring tribes; and, provided on their own strength
and courage to repel any invasion. They were a people of
great integrity. Thus Homer has described them. *Alas:
742, 478, 545, 460, 478.

ABIAATHAR, in Scripture History, the son of Abime-
lech, and the tenth high-priest of the Jews. When Saul,
resenting his father's kindness to David, massacred the
priests, he alone escaped. Having attached himself to the
interest of David, he became the high-priest, though
Saul conferred the office on Zadok. But afterwards,
conspiring with Abinajah, Solomon deprived him of his office,

ABIB, in the Hebrew Chronology, the name of the first
month of the ecclesiastical year. This month was afterwards
called Nisan, and answers to part of our March and April.

ABIES, in Botany, a Species of the Pinus. See Fir-Tree.

ABIES marina, or Spruce, in Natural History, a name
given to the Sequelans altissima. The Cope frutis, a spe-
cies of Antipathies, is by some writers denominated Abies
routa.

ABIGA HERBO, the ground-pine of Chamæphyts.

ABIGAEUS. See Abraham.

ABIHU, one of the sons of Aaron, who, within eight
days after the consecration of Aaron and his sons, and the
dedication of the tabernacle, was consumed with fire, for
offering incense with strange fire. Lev. x. 2.

ABII Synth, in Ancient Geography, a people, suppos-
ed by Strabo (tom. i. p. 254.) to be the European Sarmatii,
bordering on the Thracians and Balancers; they are some-
times called Aethii, and are commended by Curtius (de Rebus
love of justice. See Abians.

ABIJAH, in Scripture History, the son of Jeroboam,
who was the first king of the ten tribes of Israel. Abijah
predicted, that he would be the only perf. of his family
who should receive funeral honors. I Kings, xiv. 13.

ABIAM was the name of a king of Judah, who suc-
ceded Rehoboam. After a reign of three years, during
which he incurred the impiety and bad conduct of his fa-
thor, he died, A. M. 3494, a. D. 955.

ABILA, in Ancient Geography. See Abel-Kiramim,
and Abel-Witim, and also the next article.

ABILENE, in Ancient Geography, a small province in
Cela-Syria, between Libanus and Antilibanus, whereas Ly-
fanias was for some time tetrach. Abela or Abila, the ca-
cal of this province, was N. of Damascus and of Panes, and
N. of Hephopolis. It is mentioned by Polybius, (Hist. i. vi-
ii.), Pliny, (Hist. l. xv. c. 18.) and others. See Luke, ii. 1.
Gibbon (History of the Decline and Fall of the Ro-
man Empire, vol. iv. p. 432. 8vo.) informs us, that the
province and manufactures of the country were annually col-
lected in the fair of Abela, about thirty miles from the city,
and that they furnished a rich spoil to the Spaniards after
the conquest of Damascus, A. D. 634.

ABILITY is rated, in Law, for a capacity of doing
certain things, relating either to the acquisition of property,
or the transferring of it.

Ability in this sense coincides with capacity, and stands op-
posed to disability or non-ability.

Every person is supposed to be able, i.e. to have the power of
taking and disposing of effects, whom the law does not disable.
The king's issue are of ability to inherit in Eu. 2 and where-
soever born; and children of subjects born beyond sea, may
inherit, if their birth were within the allegiance of the king.

ABIMELECH, in Scripture History, the name of two kings
of Gezer, a country of the Philistines, one of whom was
contemporary with Abraham, who took away Sarah and de-
termined to marry her, but being warned of his danger, re-
ferred her to her husband. She was Abraham's sister, as
well as wife, being of the same father, but by another mo-
ther. He afterwards made considerable presents to Abra-
ham; and they entered into a mutual covenant at Beerheba.
Gen. ch. xx. xxii. A. M. 2107, ante A. D. 1897. The other
Abimelech was, probably, the son and successor of the
former. Isaac employed the same artifice which had been
practiced by his father Abraham, in order to deceive Rebek-
ika from the danger to which she was exposed. But when
Abimelech, who was captivated by her beauty, discovered
that she was his wife, he forbade his subjects, upon pain of
death, from doing any injury to Isaac or Rebekah. The
subsequent prosperity of Isaac excited the envy of the Phil-
istine, upon which Abimelech ordered him to depart from
them. However, he afterwards formed a covenant with him.
A. M. 2200, ante A. D. 1864.

Abimelech was also the name of the natural son of Gideon,
by his concubine. His violent acts and death are recorded in

ABINEAU, in Geography, a port of America, on the
north side of the Lake Erie, and about 13 miles W. S. W.
from Fort Erie.

ABINGDON, a market town of Berks, situated on the
Thames. It derives its name from an ancient abbey. The
abbeys, felton's, and county meetings are often held here.
It has a good hall for the abbeys, &c. Here are two churches
said to have been erected by the abbots of Abingdon.
The streets are well built, and centre in a spacious corn-market.
It sends one member to parliament. Great quantities of
malt are made here and sent in barges to London. It is seven
miles S. of Oxford, and 56 W. of London. This town is
said to have been built by Cissa, king of Suffolk, A. D. 517,
and supposed by Bishop Gibbon to be the place called in
the Saxon annals, Ciduebe, where two synodes are said to
have been held, one in 742, and the other in 822. W. long.
12° 14'. N. lat. 51° 42'.

Abingdon is also the name of the chief town of Washing-
ton county in Virginia, about 260 miles in a direct line from
Richmond. N. lat. 36° 30'.

Abingdon is also a town of Harford county in Mary-
lnd, 12 miles S. W. from Havre de Grace, and 20 N. E.
from Baltimore. Called college, instituted by the metho-
dists in 1785, is in this town.

ABINTESTATE, in the Civil Laws, is applied to a
person who inherits from one who died intestate.

ABIOSI, j1u, in Biography, an Italian physician and astron-
omer, who lived towards the end of the 16th century and
beginning of the 17th. His Dialogue upon Astrology, 4to,
Venice, 1494, has been put into the Index Expurgatorius.

ABIPONIANS, in History, a tribe of American Indians,
who formerly inhabited the district of Chaks in Paraguay;
but who have since been compelled by the holiness of the
Spaniards to remove southward, into the territory lying be-
tween Santa Fe and St. Jago. M. Debrizholfer lived seven
years in their country, and published an account of them in
1785. He says, their number is small, and does not exceed
5000,
5000, which he ascribes to the women's destroying their infants, in order to prevent the infidelity of their husbands during the long time of their keeping them at the breast, which is not less than two years. They are naturally white, but acquire a brown colour by exposure to the air and smoke. They are strong and hardy, which, as this writer says, is owing to their not marrying before 30 years of age; and they are much celebrated for their chivalry and other virtues, though, according to our author, they have no knowledge of a deity; and yet they admit the existence of an evil spirit, and believe that the devil exists for ever. They consider their disasters as the effects of sorcery and witchcraft; and this superstitious notion gives rise to frequent murders. They are ranged into distinct bodies, under their respective chiefs, and, by means of their wild horses, they make frequent and formidable incursions into the territories of the Spaniards; against whom they have conceived an invincible hatred. Their use of horses commenced in 1541; and they manage them with great agility, without stirrups, saddles, or spurs. The fraud and cruelty practiced among them by the Spaniards, have induced the Jesuit missionaries to prohibit any of them from coming, without a formal permission, into any of their colonies. The success of these missionaries, in their endeavours to convert them to the Christian faith, has been very considerable. They are full of ignorance and uncivilized, that they can proceed in reckoning to far lesser than the number three; and the Jesuits have failed in teaching them the simplest use and expression of numbers.

ABIRAM, in Scripture History, a sedition Levite, who rebelled against Moses and Aaron, with a view of obtaining a share in the government, and who, with Korah and Dathan, concerned with them, were swallowed up alive by the opening earth. Num. xvi.

ABISHAI, in Scripture History, the son of Zeruiah, and brother of Joab, was one of the most valiant warriors of his time, and principal general in the armies of David. His military exploits are recorded in 2 Sam. xxi. 17. xxiii. 18; but the time and manner of his death are not known.

ABISHERING, an ancient law term, denoting a being free, or exempt from all amerciements for transgressions of any kind.

The word in a charter or grant, is said not only to give the proprietor the forfeitures and amercements of all others for transgressions committed within his fee, but also to exempt him from all such control by any within that compass.

ABITIBBI, in Geography, the name of a small lake in Upper Canada, to the S. of which is a settlement called Fredericton, in N. lat. 49°. W. long. 79°. 40'. It is also the name of a river, which runs N. and joins Moose river, near its mouth at James's bay.

ABITIBIS, a lake to the N. of Nipissing lake, on the N. E. boundary of Canada in New South Wales, which communicates with James's bay, near Moose fort. W. long. 78° 4'. N. lat. 59° 3'.

ABU1, a small town of Beira in Portugal. W. long. 7° 10'. N. lat. 49° 20'.

ABJURATION, compounded of ab, from or against, and jurare, to swear, in general sense, the act of denying, or renouncing a thing in a solemn manner, and even with an oath.

Among the Romans, abjuration signified the denying a debt, pledge, deposit, or the like trust, by a false oath. In which sense, abjuration coincides with perjury; and flanders distinguished from it, where the oath is supported just.

Abjuration, more particularly, is used for a solemn renunciation, or renunciation of some doctrine, or opinion, as false and pernicious. Thus it is used in the phrase, abjuration of heresy.

In our own laws, to abjure a person, is to renounce all authority or dominion of such a person. By the oath of abjuration, a person binds himself not to own any regal authority in the person called the Pretender, or ever to pay him the obedience of a subject. 1 W. and M. 13 W. Ill. 1 Geo. I. The refusals of the oath enjoined by these statutes are liable to heavy penalties, forfeitures, &c. The oath of abjuration by the 6th G. III. cap. 53. "I A. B. do truly and sincerely acknowledge, profess, tell, and declare in my conscience, before God and the world, that our sovereign lord king George is lawful and rightful king of this realm, and all other his majesty's dominions thereunto belonging. And I do solemnly and sincerely declare, that I do believe in my conscience, that not any of the dependants of the person who pretended to be Prince of Wales during the life of the late king James the Second, and since his decease pretended to be, and took upon himself the title and title of king of England, by the name of James the Third, or of Scotland, by the name of James the Eighth, or the title and title of king of Great Britain, hath any right or title whatsoever, to the crown of this realm, or any other the dominions thereunto belonging. And I do renounce, refuse, and abjure any allegiance or obedience to any of them. And I do swear, that I will bear faith and true allegiance to his majesty king George, and him will defend, to the utmost of my power, against all traitorous conspiracies, and attempts whatsoever, which shall be made against his person, crown, and dignity. And I will do my utmost endeavours to dissolve and make known to his majesty, and his successors, all treasons and traitorous conspiracies which I shall know to be against him or any of them. And I do faithfully promise, to the utmost of my power, to support, maintain, and defend the succession of the crown against the descendants of the said James, and against all other persons whatsoever; which succession, by an act, intituled, An act for the further limitation of the crown, and better securing the rights and liberties of the subject, is and stands limited to the princes Sophia, electrics and duchesses dowager of Hanover, and the heirs of her body, being protestants. And all these things do I plainly and sincerely acknowledge and swear, according to these express words by me spoken, and according to the plain and common sense and understanding of the same words, without any equivocation, mental evasion, or secret reservation whatsoever. And I do make this recognition, acknowledgment, abjuration, renunciation, and profane heartily, willingly, and truly, upon the true faith of a Christian. So help me God." Abjuration is also used in our Ancient Customs, for an oath taken by a person guilty of felony; who, lying to a place of sanctuary, would swear to forfear the realm for ever, in lieu of other punishment. We also find instances of temporary abjuration, viz. for three years, for one year and a day, and the like. This, in some cases, was admitted from criminals in lieu of death. The devotions for the church was of warm, from the time of Edward the Confessor to the Reformation, that if a man, having committed felony, could recover a church or churchyard before he was apprehended, it was an asylum from which he could not be brought to take his trial at law; but confessing his crime to the justices, or coroner, and abjuring the kingdom, he was at liberty.

By lat. 21 Jac. I, all use of sanctuaries, and consequently of abjuration, is taken away.

ABKHAS, in History, one of the seven nations in the countries
countries comprehended between the Black Sea and the Caspian. Their principal and most ancient establishments are on the southern declivity of the mountains that lie between the river Cuban and the Black Sea. They are tributary to the Turks, and are divided into two governments, the eastern and western; each of which is subject to a bashaw. The capital is Anapocia, formerly Nicopis. They speak a language peculiar to themselves, but bearing a remote affinity to that of the Circassians. Some have sup- posed that it is a dialect of the Celtic. They have little religion, though they preserve some traces of christianity. See Arabia and Arabisia.

ABLATION, the weanling of a child from the breast. The proper time for weaning a child must be determined by the state of health of the child, and of the parent, but particularly of the latter. The helpless of infants, and the late period at which they get their teeth, seem to indicate that nature intended they should derive the greater part of their food, for the first two years, from the breast. This, doubtless, was universally the case in the early periods of the world; as before the culinary art had obtained some degree of perfection, it must have been difficult to have found a sufficient quantity of such kinds of food as the children could properly masticate or digest, without the affissiance of the breast. And even now we know this to be the practice in rude and uncivilized countries. The negroes, Mr. Park says in his Travels in the interior Parts of Africa, suckle their children three years. A similar practice prevails among the poorer part of the inhabitants of this, and, perhaps, of every other country in Europe. These people also, previous to weaning their children, and for some time after, chew for them, such parts of their food as they are incapable of masticating. In families better circumstances, and who are capable of providing for their children proper nourishment, they are usually weaned when they have attained eight or nine months, although they have then rarely more than the eighth teeth, the incisors, or fore teeth. They are therefore necessarily fed for some months after with bread or biscuit moistened with milk, or with broth made of beef, mutton, or veal. Pieces of crust of bread, or of flesh, are also given them to chew, which is supposed not only to accelerate the cutting the remainder of their teeth, but by exciting a flow of saliva, to affist in digesting the new kind of food they are now gradually to be accustomed to take. See Weaning.

ABLATION, in the Ancient Agriculture, is a method of engraving; wherein the cynon of one tree, being united for some time to the flock of another, is afterwards cut off, and, as it were, weaned from its mother-tree.

Among the modern writers ablation is more usually called ungrafting or grafting by approach.

ABLANCE, See Perrott.

ABLANTIA, in Botany. See Trichocarpus.

ABLAQUEATION, a name used by the ancient writers of Agriculture for an operation in gardening, whereby the earth is dug from about a vine, or other fruit-tree, and its roots are laid bare, to expose them more to the sun, rain, and air, in order to promote its fecundity.—The proper season for aubication is autumn, for the benefit of the winter rain, and snow water. Bradley fixes it in January. But experience having shewn the practice to be dangerous, it is now generally laid aside.

ABLATION, formed from *auster*, to take away, in Surgery, the removal of whatever might be injurious or useless to the animal body.

ABLATIVE, in Grammar, the fifth case of Latin nouns. The word is formed from *auster*, to take away.

Priscian also calls it the comparative case; as it served among the Latins, for comparing, as well as taking away.

The ablativ is opposite to the Dative; the first expressing the action of taking away, and the latter that of giving.

The ablativ hardly answers to the full idea of a case; at least it is more vague than any other. It will be shewn in its place that the English, and other modern tongues, have properly no such thing as cases; unless we except the nominative and genitive or possessive, which are the only cases that admit of different terminations. But even in the ancient languages, from which the notion of cases is borrowed, it is suggested, that the ablativ is only a sort of supernumerary, or supplement to the rest. The five proper cases not being found sufficient to express all the relations of things to each other, recourse was had to an expedient; viz. the putting a preposition before some of the other cases; and this made the ablativ.

It may be added, that in the plural number the ablativ is still more obscure, as being only the native repeated. In English, French, &c. there is no precise mark whereby to distinguish the ablativ from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, the magnitude of the city, and he spoke much of the city; we say, that of the city in the first is genitive, and in the latter ablativ: because it would be so, if the two phrases were expressed in Latin.

The question concerning the Greek ablativ has been the subject of a famous literary war between two great grammarians Frifchlin and Crinhus; the former of whom maintained, and the latter opposed the reality of it.

The dispute is not yet decided. Sanclius, and the Port-royalists, maintained the affirmative; Perizonius the negative. The chief reason alleged by Sanclius is, that the Roman writers often joined Greek words with the Latin prepositions, which govern ablativ cases, as well as with nouns of the same case. To which Perizonius answers, that the Latins anciently had no ablativ themselves; but instead thereof, made use, like the Greeks, of the dative case: till at length they formed an ablativ, governed by prepositions, which were not put before the dative; that, at first, the two cases had always the same terminations, as they still have in many inclusions; but that this was afterwards changed in certain words. It is no wonder then, that the Latins sometimes join prepositions which govern an ablativ case, or nouns in the ablativ case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin ablativ. See Cases.

ABLATIVE ABSOLUTE, in Grammar, is a word or phrase detached and independent of the rest of the discourse; neither governing, nor being governed of any other thing. This is frequent among the Latins; in imitation of whom the modern languages have likewise adopted it.

ABLAY, in Geography, a country in Great Tartary, the inhabitants of which, called Bucharis or Bachures, are subject to Russia, for the sake of obtaining its protection, but their chief is a Calmuck. It lies east of the river Iris, and extends 500 leagues along the southern frontiers of Siberia. E. long, from 72° to 83°. N. lat. from 51° to 54°.

ABLE, or ABL, Thomas, in Biography, chaplain to queen Catharine, confort of king Henry VIII., who distinguised himself by his zeal in opposing the proceedings of the King, and particularly the divorce of his royal mistress. For this purpose he wrote a tractate, intitled, Tractus de non diffolvente Henriæ & Catharine Matrimonio, or, according to Tanner, Invidia Peritus; though some suppose these are the titles of different works. He took his degree of A. B. at Oxford.
Oxford in 1513, and that of A.M. in 1516. In 1534, he was prosecuted for his concern in the affair of Elizabeth Barton, called, The Holy Maid of Kent, who was tormented by the monks to use strange gestures, to exhibit a variety of fictitious miracles, and to reign the gift of prophecy, by which means she attached many respectable persons to her interest; but she was afterwards attained of treason in parliament, condemned and executed, together with her chief accomplices, whose names the indefatigable Abo was also adjudged guilty of misprision of treason, by Statute 25 Henry VIII.

He was also one of those who denied the king's supremacy over the church, for which he was apprehended and imprisoned, and afterwards hanged, drawn, and quartered, in Smithfield, on the 30th of July, 1540. Bouchier gives him the character of a very learned man, and tells us, that he taught the queen music and the languages. Dug, Brit.

Aelctti, in Antiquity, a choice and select part of the soldiery in the Roman armies, picked out of those called Extraordinary.

Ablegmina, in Antiquity, those choice parts of the entails of victims which were offered in sacrifice to the gods. Some authors make alegmina to denote all those parts of the victims which were offered to the deities; contrary to the authority of Celsus, who restricts ablegmina to the exta, or entails only.

The exta being found good, were to be protected, or parted; i.e. the extremes or prominent parts cut off, as ablegmina, to be sprinkled with flour, and burnt by the priests on the altar, pouring wine on them. Tertullian lays the heathens for thus serving the gods with speras and offals.

Ablet, or Aellen, in Ichthyology, a name given by some to the common bleak, a small fresh-water fish, called in Latin Alburnus.

Ableo, in Geography, a town of Little TARTARY, lying between the river Dnieper and the Black Sea. E. long. 33° 15'. N. lat. 46° 20'.

Abluents, in Medicine, a name which some authors give to a sort of diluting medicines, suited to wash off from the external or internal surfaces of the body, any substances improperly adhering to them; they are either water or other fluids, and they are administered in the form of lotion, gargarium, or injection. They are more commonly known by the names of desters, destincters, and dilluents.

Ablution, from ablue, quod ab e loco, I wash away, in Antiquity, a religious ceremony in use among the Romans; being a sort of purification, performed by washing the body, before they entered on sacrifice.

Sometimes they washed their hands and feet, sometimes the head, and oftentimes the whole body: for which purpose, at the entrance into their temples, were placed marble vellaps filled with water.

Ablutions appear to be as old as any ceremonies, and external worship itself. Moses enjoined them; the heathens adopted them, and Mahomet and his followers have continued them; thus they have been introduced among most nations, and some a considerable part of most established religions. The Egyptian priests had their diurnal and nocturnal ablutions: the Grecians their sprinklings: the Romans, their sprinklings and lavations: the Jews their washings of hands and feet, before their baptisms: the ancient Christians had their ablutions before communion, which the Roman church still retain before their masses, sometimes after: the Syrians, Copts, &c. have their solemn washings on Good Friday: the Turks, their greater and lesser ablutions: their gait and water: their aman, tabaruit, gufsil, and abdef, &c.

Ablution is particularly used in the Romish church, for a cup of wine and water, which the communicants anciently took after the host, to wash it down, and help to digest.

The same term also signifies the water which serves to wash the hands of the priest who consecrated it.

Ablution, in Pharmacy, is a preparation which divers remedies undergo, by washing them in water, or some other fluid, proper to cleanse or free them of their impurities, and so to exalt their powers.

The usual way of doing this, is by cohabitation, or pouring the liquor distilled from the body, upon it again; and repeating this as often as it is necessary. See Deputation.

Ablution, in Surgery, a term, signifying the washing or cleaning a body. This is performed by injecting with a syringe, or by repeated affluences of a proper liquor, or by plunging the part itself into the fluid.

Abnakis, in History, Indians of North America, between New England and Canada, who are averse from labour, and take no pains in cultivating the ground.

Abner, in Scripture History, the son of Ner, and general of Saul's armies, who adhered to Saul during his reign, set his son Hlobholith on the throne, and supported him for seven years at Mahanaim, beyond Jordan, against the forces of David, who then reigned at Hebron, in Judah. He afterwards conceived a prejudice against Hlobholith, and went over to David, with the chiefs of the army and the elders of Israel. David received him with tokens of affection, which offended Jobab, by whom he was injudiciously killed; avenging himself, by this murder, of the death of his brother Absalom. His funeral was solemnized by David, who composed a mournful song in honour of him. Abner died A.M. 2956, ante A. D. 1648.

Abo, in Geography, a maritime town in Sweden, and the capital of the province of Sweedish Finland, is situated at the point in which the gulfs of Bothnia and Finland unite, and on the river Aurobjoki, which runs through this city. This is the most considerable town in the whole country, and has a good harbour. It has many good brick-houses, but they are generally built of wood, painted red. In 1226 it was erected into a bishop's see. In 1628 Gustavus Adolphus founded a gymnasium or seminary, which queen Christina converted into an academy in 1630, and endowed with the same privileges as that of Upsal. In 1779 it contained about 500 students. The only royal high court of judicature in Finland is held at this place; and here the governor of the province usually resides. The export trade consists of linen, corn, deals, flax, and iron. Abo is the 8th voting town in the Diet. It is 140 miles N. E. of Stockholm. E. long. 20° 13' 30'. N. lat. 60° 27' 10'. The effect of 12 years observations, viz. from 1750 to 1761, gives the mean annual temperature at this place, 40° of Fahrenheit. Kirwan's Estimate of the Temperature of different Latitudes, p. 60.

Abo-Slot, or Abo-Callo, is one of the most ancient fortifications in Finland. It stands on a peninsula near the mouth of the river Aura. In the 16th century king Erick XIV. was confined in this castle. It has often suffered both by the enemy and fire. Buffing.

Aboard, in Sea-language. See Board.

Aboasar, in Geography, a village in Lower Egypt, said to be the ancient Busiris.

Aboccis, in Ancient Geography, the Abuccis of Ptolemy, a town of Ethiopia, situate on the western side of the Nile, not far from the greater Cataract.

Abocro, or Aborrel, in Geography, a town near
near the river Ankobar or Cochré on the Gold Coast in Africa, which gives name to a republican province.

**ABOLA.** In Geography, one of the divisions of the Aequus in Abvorgia. It is a plain, or rather a valley, from half a mile to a mile broad; formed on the east and west side by mountains that are covered with herbage and acacia-trees to the very summit, and that become towards the south more lofty, rugged, and woody. On the top of these mountains there are very delightful plains, abounding with excellent pastures. In this valley there were many villages, which had cleared the banks of war, and which appeared his poor and wretched than other habitations of the country. A river of the same name flows through this valley, which has two branches issuing from the two adjoining ranges of mountains. Another river, called themere, rising in the caft, runs westward into the Abole. It also receives several other streams and torrents, as the Gogneri, Karmahii, Caceno, &c. which fall into it in different directions. Mr. Bruce found no fish either in the Abole or any of its tributary streams, which he accounts for by their being almost dry in summer and violently rapid in winter, so that the spawn and fish are both destroyed in different seasons by different causes. Bruce's Travels, &c. vol. iii. p. 581.

**ABOLITION,** Abolishing, in a general sense, the act of destroying a thing, or reducing it to nothing. Some derive the word from abole, ex ab & alae, and others from the Greek εκθέω, I destroy.

In our laws the *abolition* of a law, statute, or custom, is the abrogating or repealing it.

The leave given by a prince, or judge, to a criminal accus- cer, to deed from farther prosecution of the accused, is peculiarly called *abolition.* 25 H. VIII. c. 21.

Abolition is particularly used among civilians, for remitting the punishment of a crime. In this sense *abolition* is a lower species of amnesty, which takes off the punishment but not the infamy: liberat sed non notat.

Abolition is also particularly used, among Roman lawyers, for the annulling a prosecution, or legal accusation; and in this sense differs from amnesty and oblivion; because in the former, the accusation might be renewed, even by the same prosecutor, which in the latter was extinguished for ever. Within thirty days after a public *abolition,* the same accuser by the prince's licence, was allowed to renew the charge; after a private *abolition,* another accuser might renew it, but the same could not.

This kind of *abolition* is either granted in favour of the accused, or of the accuser; and is either public, granted by the prince or senate, on occasions of public rejoicings, victory, and congratulation; or private, fixed for to the prefect or judge, by one of the parties; frequently by the accuser himself, who after having embarked in the prosecution, by disclosing his name to the charge, could not by the Turpilian *conatus-confiditus* otherwise *defest* without incurring infamy. On such occasions the accuser would *petere abolitionem;* that is, move for an *abolition,* which was only granted, on his *fìning* fair and honest motives for withdrawing the charge; viz. inadvertency, youth, warmth, or the like; nor was it granted without the content of the accused; or if the accusation appeared to have been utterly false, or malicious, &c.

As to the accused, the charge against him was also *abolished* by the death of the accuser, or his being incapacitated from prosecuting by reason of *cœclæts,* or the like.—An action of *vain* was *abolished* by *dilimination,* a sentence of *condemnation,* by *judgment.*

*Abolition* was also used for expunging a person's name out of the public list of the accused, hung up in the treasury.

This was called *abolire nomen,* and, like the former, was either public, as that under Augustus, when all the names, which had long hung up, were expunged at once; or private, done at the motion of one of the parties.

By several laws in the Theodosian code it appears, that an *abolition* of debts was sometimes granted to the debtors to the *situs.* We have a medal of the emperor Adrian, wherein that prince is represented standing with a sceptre in his left hand, and a lighted torch in his right; with which he sets fire to several papers in presence of the people, who, lifting their joy and gratitude by lifting up their hands towards heaven. The legend is, Reliqua vetera H. S. mononis abolidi.

**ABOLI ineffa,** in Antiquity, a warm kind of garment, lined or doubled, used by the Greeks and Romans; chiefly out of the city, in following the camp.

The word is Latin, formed, as some imagine, from *bulla,* on the supposition that this vestment was garnished with those ornaments called *bullæ.* Others, denying this circumstance, derive it from the Greek επιβολη, of αβολος, αβολος, clothing.

Critics and antiquaries are greatly divided as to the form, use, kind, &c. of this garment. Papius makes it a species of the *toga,* or *gown;* but Nonius, and the generality, a species of the *pallium,* or cloak.

The *abolia* seems rather to have flood opposed to *toga,* which was a garment of peace, as the *abolia* was of war; at least Varro and Martial place them in this opposite light. Some, after Nonius, hold it to have been a military garb alone; others, after Papius, a senatorial; and Salamanus particularly supposes it to have been worn by the prelates in the provinces, and even by the prefects of the city when they administrate justice, which Ptoleus endeavours to refute.

Others will also have the *abolia* to have been used by the philosophers, particularly the Stoics, Cynics, &c. Lastly, others reconcile all the variances by making divers kinds of *abolia,* accommodated to different occasions and professions. Even kings appear to have used the *abolia,* Caligula was adapted at king Ptolemy for appearing at the false in a purple *abolia,* and by the eclat thereof turning the eyes of the spectators from the emperor upon himself.

**ABOMASUS,** *Abomasum,* or *Abomasium,* in Comparative Anatomy, a name given by old anatomists to one of the flomachs or ventricles of animals of the ruminating kind. See **Ruminant** and **Rumination**.

Beans that chew the cud are found to have four flomachs; viz. the rumen, or *magnus venter,* or *flomach,* properly so called; the *reticulum,* or *omus,* and *abomasus.* The *abomasus,* properly called the *nævi,* is the last of the four; being the place where the chyle is formed, and from which the food descends immediately into the intestines.

It is full of a fort of leaves, like the *omus;* but its leaves have this peculiarity, that, beside the membranes they contain of, they contain a great number of glands, not found in any of the first.

It is in the *abomasus* of calves and lambs that the rennet, or earing, is formed, with which milk is curdled.

**ABOMINATION,** in Scripture History, a term used with regard to the Hebrews, who, being shepherds, are said to have been an *abomination* to the Egyptians; because they sacrified the sacred animals of that people, as oxen, goats, sheep, &c. which the Egyptians esteemed as *abominations,* or things unlawful. The term is also applied in the sacred writings to idolatry and idols, not only because the worship of idols is in itself an abominable thing, but likewise, because the ceremonies of idolaters were almost always attended with licentiousness, and with actions of an infamous and abominable nature. To this purpose, Chrysostom (Opera, vol. 1. p. 645.);
ABORIGINES, or Aborijenes, in History, a name sometimes given to the primitive inhabitants of a country, or those who had their original in it; in contradistinction to colonies, or new races of inhabitants, derived from other places.

The term Aborines is famous in antiquity.—Though now an appellative, it was originally a proper name given only to a certain people in Italy; and both the reason and origin of it are greatly disputed among the learned.

Aborines then primarily denoted a nation in Italy, which inhabited the ancient Latium, or country now called România, or Campagna di Roma.

In which sense the Aborines are distinguished from the Janigene, who, according to the false Berofus, inhabited the country before them; from the Skuli, whom they expelled; from the Grecians, from whom they descended; from the Latins, whose name they assumed, after their union with Æneas and the Trojans; and lastly, from the Auloni, Volsci, Oenotria, &c. neighbouring nations in other parts of the country.

Whence this people came by the appellation is much disputed.

S. Jerome says, they were so called, as being, alscine ori- gines, the primitive planters of the country after the flood. Dionyphus of Halicarnassus, (Antiq. Rom. i. c. 10. apud Op. tom. i. p. 8. q. 11. ed. Oxon.) receives several opinions as to the origin of the appellation. Some, he says, allege that they owe their name to their being original inhabitants of the country, and because they were the founders of the race that occupied it, and that the denomination is similar to the Greek term ἀλσινοὶ or ἀλσινεῖς. Others consider the appellation as synonymous with, aborizen, and others again conceive them to have been originally Arcadians, and that their ancestors were the Oenotri, who migrated from Greece seventeen generations before the Trojan war, and settled in that country above 400 years before the Trojan war; and that they derived their name either from the mountains of Arcadia, qu. ἀλσινεῖς, natives of the mountains, or because they gave origin to the Latins, who being descended from them, called them Aborizen: that is, the people from whom they derived their origin: and to this opinion he himself inclines.

Aurelius Victor (de Orig. Roman.) suggests, that they were called Aborigenes, q. d. Aborizens, from ab, from, and errare, to wander; as having been before a wandering people, who, coming from different countries, met accidentally in Italy, and lived there by rapine; to which opinion Felius gives some credit. It is added, that Palaefrins, another name sometimes given them, is of the same import, and denotes vagabonds, like cranes.
Abo. Abo.

The Alorqines were the other original inhabitants of the country, settled there by Janus, as some imagine, or by Saturn, or Cham, as others, not long after the dispersion; and, as some think, before it; or they were a colony sent from some other nation; who, expelling the Siculi, who (according to Dion. Hal. lib. i. Ant. Rom. tom. p. 7.) were the original inhabitants, settled in their place; but whether these Siculi were not, in their origin, Arcadians, is perhaps; they were brought into Italy by Oenoneus, son of Lycaeus, more than 400 years before the Trojan war, is not certain. Some have maintained that this party, a second from Thessaly, a third under Evander, 60 years before the Trojan war, and another under Hercules, and another of Laconians, who fled from the severe discipline of Lycurgus, uniting together, constituted the Alcorqies; others trace their origin in Scythia; others again in Gaul; and others will have them to be Cumanites expelled by Jotham.

Abo. Abo. ABO.

ABORTION, Abortion, Aborsus, formed of ab, from, and iurus, to be born, in Midwifery, the premature exclusion of a fetus. It has been usual to affign names to abortions, occurring at different periods of utero-gestation. Those happening within the first seven or eight days, before the fetus or membranes have acquired such a confiquence as to retain their distinct form when excluded, are called effections; from that period to about the fifth or seventh month, they are called abortus, or miscarriages; from the sixth month, to any time before the end of the ninth month, premature labour.

Abortion may be occasioned by too fall, or too sparing a diet, or by taking food that is too rich and spirituous; by blows or falls; sudden frights, or any thing violently exciting the mind, whether joy or grief; frequent costus; bine abortus, primis gravidatis membris non infrequens nasci, sitis; cervix avuloribus; by dilitys, particularly fever; by profuse evacuations, as from large discharges of blood, whether happening spontaneously, or procured by art, and used in the cure of some acute diseases, as pleurisy; or by long continued and violent purging. Vomiting, if occurring spontaneously, though extremely violent, and continuing through the whole course of pregnancy, rarely occasions abortion; but when excited by the exhibition of sharp, astringent, or poisonous drugs, it usually continues until the fetus is excluded.

There are other causes of abortion, depending on the peculiar constitution of the uterus, or of the fetus. Thus some women, who are prone to breeding, are incapable of retaining their offspring longer than the fourth, fifth, sixth, seventh, or eighth month. In these cases, the fetus usually dies three or four weeks before the periods here mentioned; at the end of that time the separation of the blighted ovum from the uterus being completed, it is expelled by the pains, and ordinarily with as little difficulty or danger as a living and healthy fetus. The cause of this peculiarity is not known, neither has any appropriate remedy or means of preventing it been discovered. Sir Richard Manningham supposes it to arise from an incapacity in the uterus to bear more than a certain degree of distention. Sf mutier foepus abortum fortix, hi says, (Appor. med.) et codem temporc, ut 310, 400. ed 510. men, ob uteri angulw acutis, quae abscindunt factum amphis continens non potest. The same effect, however, would follow imperfection in the structure of the uterus, incapacitating it to live or increase beyond a certain time. We know there are children who, owing to a malformation of some of their organs, never live beyond twelve, fifteen, eighteen, or some definite number of months. Whatever may be the cause, it not unfrequently happens that women who have parted with five or six fetuses prematurely, shall afterwards go to their full time, and bear living and healthy children. Women who have miscarried once or twice will be prone to the same accident, at whatever period it happened; it becomes necessary therefore, when approaching that time, that they should use the utmost caution that nothing may occur to agitate or disturb them.

By some writers, women have been suppos'd to be more subject to abortions than brute animals, in consequence of the erect position of their bodies. That they more frequently suffer than other animals is well ascertained; but as this disposition is more incident to women living in large towns, and treating themselves too delicately, to those following sedentary and enervating occupations, or to those who are compelled to labour hard for their living, it seems likely that the accident is occasioned by those circumstances, rather than from any vice in their constitution.

From a very early period, attempts have been made to devise means of procuring abortion, without injuring the constitutions of the women, by the exhibition of certain drugs, as fain, colocynt, &c. but without success. It is remarkable, that although Hippocrates prohibited physicians from affiling in procuring abortion, he relates the case of a young woman whom he had recommended to dance and use other violent exercises for that purpose, in whom it produced the effect, and without materially injuring the woman. The more ordinary consequences, however, to be expected from such efforts, or from taking acrid and draffic medicines, are pain and inflammation of the womb, violent hemorrhage, which, though ultimately terminating in abortion, not unfrequently destroys the life of the woman also. These being modes found to be dangerous to the woman, and not certain in producing the proposed effect, endeavours have been used to destroy the birth by a more direct method, viz. by introducing a fillet, or some sharp instrument, into the uterus, which piercing the membranes, and thence giving vent to the liquor amnis, uterine contractions, or labour pains were produced, which continued until the fetus with its involucra were ejected. At what time this mode of procuring abortion was discovered is not known; no traces of it appearing in any of our old medical or chirurgical writers. Ovid, it is probable, alludes to it in the following lines:

--- sine crepere nota.

_Est pretrium parvus non leve vita more._

_Virga quid effeditis jubilecis uteris tali;_ 

_Et nondum natus dira venena doatis?_ 

Tertullian reprobates the practice, and mentions the kind of instrument with which the operation of breaking the membranes and destroying the fetus was performed, which flows it was not uncommon in his time. _Ego clam animam spiculum, (says this father, De Anima apud oper. p. 328. ed. Rigalt.) quo jugulatio ipsa dirigitur, eoque latrocinio sepsisse amplex, utique viventis infantis perremption._ Guy Patin says, a midwife was hanged at Paris.
Paris, for occasioning the death of a lady there, by an attempt to procure abortion by this method. On her trial she had frequently practised it with success; but, in this case, it seems, the instrument had pierced the body of the uterus, instead of passing through the os internum. This operation will be again noticed, when treating of those kinds of laborious parturition, where the difficulty is occasioned by the bones of the pelvis being too dilated, and the cavity thereof so reduced in size, as to render the passage of a full grown fetus through it totally impracticable.

In those cases, it has been lately discovered, the operation may be performed with perfect safety, and with equal advantage both to the child and to the mother. See Labour.

A peculiar delicacy, or irritability of habit, distinct from weaknesses, though perhaps rarely occurring, but in debilitated constitutions, may be also reckoned among the causes of abortion. This habit of body seems in a peculiar manner, and almost exclusively, to belong to persons living in the higher ranks of life, who use late hours, frequent large and crowded assemblies, and much in bed, and indulge in rich and delicate food. The sudden opening of a door, or appearance of a person not expected, or any thing exciting the least surprise, will often, in such constitutions, be sufficient to produce abortion. That this is not occasioned merely by weaknesses of constitution is evident, as very weakly, and even consumptive persons, are found to conceive more frequently, to be more tenacious of their offspring, and generally to produce larger and stronger children, than many women of superior general health.

As the causes of abortions, and the constitutions most prone to it, are so various, the modes of preventing it, or of conducting persons through it, must vary likewise. One of the earliest symptoms announcing an approaching abortion, is a sense of fulness, of weight, or heaviness, at the lower part of the abdomen; this is soon followed by pains in the loins and thighs, and if these pains unnoticed, which is not uncommonly the case, a discharge of blood, more or less profuse, according to the constitution of the woman, takes place; this, if accompanied with pains, recurring at intervals similar to those of labour, usually continues until the ovum is excluded. Sometimes the discharge of blood abates, or entirely ceases for six, eight, ten, or more days, and then recurs again, usually with greater violence; and intermissions of this kind sometimes happen three or more times, before the fruit is excluded. On the other hand, it sometimes happens, that after a woman has suffered two, three, or more effusions of blood in this way, they cease; the part of the placenta that had been detached remaining itself to the uterus, and the woman goes on to her full time. These circumstances only happen in those abortions that occur within the first three, four, or at the latest five months, which are rarely attended with danger. Discharges of blood occurring at a later period, although they also sometimes cease, and recur again at intervals, never completely leave the woman until the fetus and involution are excluded, which ordinarily does not happen until so much blood has been lost as to destroy the life of the fetus, and to put that of the mother also into extreme danger.

If a pregnant woman of a sanguine temperament, should be seized with pain in the loins, and with discharges of blood from the vagina, six or eight ounces of blood may be advantageously drawn from the arm, which will divert the current of blood from the part. The bowels are next to be opened, with some mild purgative; she must be kept quiet, but not confined to the bed; she put upon a cooling regimen, and take a powder consisting of twenty grains of nitre, and the same quantity of the compound powder of gum tragacanth, twice or three times in the day, mixed with barley water. A tea-spoonful may be taken every night, of an electuary consisting of, lentis eleutherei, two ounces; cream of tartar, and flowers of sulphur, of each two drams; jalap, one dram; syrum of roses, a sufficient quantity to give it a proper consistence. For women who are easily moved, a female, or half a dram of jalap, may be sufficient, or thirty grains of rhubarb may be substituted for the jalap. If the woman should be only three or four months advanced in her pregnancy, and the fetus should not be dead, or the ovum entirely separated from the uterus, the above may be sufficient to prevent it, and prevent the abortion. In the case of women of more relaxed and delicate constitutions, the bleeding must be omitted, but the eleytary with the rhubarb must be given every night, and instead of the powder with nitre and gum tragacanth, a decoction of bark, with a few drops of the vitriolic acid may be given; or the following:

\[\text{I. Mucilag. gunnii arabici 3ij.}
\text{Oleii terebinthini. gtt. xl.}
\text{Syrup. alb. \(3\)h. aquæ \(3\)v.}
\text{Spirit. nucis molchatae \(3\) \(n\). m. capiat agra cochlea. tria in die.}

If nausea prevails, so that the stomach with difficulty retains either food or medicines, or if the bowels are too loose, twelve or fifteen grains of spicenum can be given in a spoonful of water, as an emetic, and the following draught at night:

\[\text{R Pulv. radicis rhæ gr. vi. Confectionis aromaticæ. Gt.}
\text{Spt. nucis molchatae \(3\)i. Tinctura opjij. gtt. xij.}
\text{Aquæ \(3\)si. m.}

Under this treatment, if the fetus cannot be preferred, the hemorrhage will be restrained, and the abortion will happen without doing any material injury to the constitution.

Abortions occurring at the times we have mentioned, are rarely attended with danger, and never require manual assistance. Those occurring later, viz. after the sixth month, if the hemorrhage should not be restrained by the means here proposed, or should return, which usually happens, often require manual assistance, and must be treated in the same manner as when hemorrhage occurs in women who have attained the full term of gestation. See Labour.

Perfons administering drugs to pregnant women, with the view of procuring abortion, or even women taking medicines, or using means for that purpose, have in most civilized countries, and from a very early period, been subjected to certain penalties.

The ancient Greek legislator, Solon and Lycurgus, prohibited the practice of producing abortion. Whether or not it was permitted among the Romans, has been much disputed, between two learned modern civilians. It is certain the practice, which was by them called \textit{viserius cum inferte}, was frequent enough; but whether there was any penalty annexed to it, before the emperors Severus and Antonine, is the question. Noodt maintains the negative; and farther, that these princes only made it criminal in one particular case; viz. of a married woman’s practicing it out of resentment against her husband, in order to deprive him of the comfort of children; this was ordered to be punished by a temporary exile; \textit{siqua pregnantis cum viseribus suis intulit ut inimica marito filium praecipiat, temporalis exile correccionem}. He adds, that there was no general prohibition of the practice before Gratian and Valens. It is true we find in Cicer.
Cicero an earlier instance, of a woman punished for this fact; but it was in Miletia, a country not subject to the Roman laws.

Bryner-steck however denies, that a woman was allowed to drink the 

though not murder, was by the ancient law homicide, or manslaughter. But, he goes on to observe, the modern law does not look upon this offence in quite so atrocious a light, but merely as a heinous misdemeanor." 3 Sert. 50.

Abortion, among Curtius, signifies such fruits as are produced too early, and never arrive at maturity.

ARBOUR, something come before its due time, or before it has arrived at its maturity and perfection.

The term is applied by some writers on the materia medica to medicines that occasion an abortion in pregnant women. Medicines of this kind have also been denominated Ambloctia and Hectobia; and they have been commonly supposed to possess the power of promoting the natural birth, of forcing off the phænts, and even of expelling a dead fetus. But these powers, ascribed to medicines by the ancients, are now deemed imaginary, and such medicines are now hardly ever employed. Cullen's Mat. Med. v. p. 162.

Arboitur corn, in Agriculture, a dillerent of corn mentioned by M. Tillet, and suspected to be occasioned by insects. It appears long before harvest, and may be known by a deformity in the flanks, the leaves, the ear, and even the grain.

Arboitur flux. See Abortion.

Arboitur Itelum, is made of the skin of an abortive calf.

ABORTITES, or Abortedes, in History, a people bordering upon Bulgaria, in that part of Dacia contiguous to the Danube. Henry i. of Germany, summoned the Tower, in his zeal for the propagation of the christian faith, undertook, and actually effected the conversion of the king of these people. The kingdom of the Abortedes was a part of the ancient Vandalia, and is now called Mecklenburg.

ABOU HANIES, in Ornithology, a bird of Abyssinia, so called, because it appears on St. John's day; the terms signifies, father John. This is the seafon when the fresh water of the tropical rains is first known in Egypt to have mixed with the Nile, and to have rendered it lighter, sweeter, and more exhalable in dew; and accordingly it is the seafon when all water-fowl, that are birds of passage, return in great numbers to Ethiopia. This bird, according to Mr. Bruce, (Travels, &c. vol. v. p. 173.) is the Libis of the ancients. Its beak resembles in shape that of a curlew, and the colour of the upper part is green, and of the lower part black; and it is four and a half inches in length. The bone of the leg is round and strong, six inches long, and the length of the thigh part is five and a half inches. The height of the body, as it stands, from the sole of the foot to the middle of the back is nineteen inches. Its feet and legs are black; it has three toes before, armed with sharp strong claws, and a toe behind. The head and back part of the neck are brown; the throat, breast, back, and thighs are white. The largest feathers of the wings are a deep black for thirteen inches from the tail, and a space of six inches long in thickness, and the length of the tail along the back is also of the same colour. The measures and colours correspond to those of the embalmed this. See Pinto I. Birds.

ABOUALI, in Hydrography, a river of Palestine, which rises in mount Libanus, and flows with a rapid current into a romantic valley, where it is concealed by trees.

ABOUILLON. See Apolloa.

ABOUKIR, in Geography, a small town of Egypt, situate in the desert between Alexandria and Rosetta. It is the ancient Canopus, and distant, according to Mr. Savor, (Letters on Egypt, v. i. p. 49.) fix leagues from Pharos. Playn, (N. H. i. c. 31. tom. i. p. 253. ed. Hard.) who had collected the testimonies of antiquity, says, that it was formerly an island. Its local appearance makes this credible.
ABO

ABR

dible. The grounds around it are so low, that the sea still covered a part of them in the time of Strabo, (lib. xvii. tom. 2. p. 1311.) The town, built upon a rock, which forms a handfome road for shipping, was out of the reach of inundations. Aboulir has been lately (viz. in 1758.) rendered famous by the battle between the English and French fleets, in which the British admiral, Nelson, obtained a signal victory, and for which he has been honoured with a painted. The place itself, though well fortified, and vigorously defended by the Turks, was taken by the French in 1799, and retaken by the English in 1801.

ABOUT, in sea language, the situation of a ship immediately after she has tacked, or changed her course by going about and standing on the other tack. About ship is the order to the ship's crew for tacking.

ABOUTIGE, or ABOOTISH, in Geography, a town in Upper Egypt, near the Nile, where they make the best opium in the Levant. It was formerly a large, but is now a new place, though governed by an Emir. It stands on the site of Abous, mentioned by Stephanus Byzantinus; the burgh of Settefe, a little above it, represents the small city of Apollo. N. lat. 26° 56'.

ABRA, a silver coin in Poland, nearly equal to the English shilling. It is current in several parts of Germany, and through the dominions of the Grand Seignor, at the value of one fourth of the Holland's dollar or fliam. See COINs.

ABRAXANEI, ABRAXAN, or ABRAXAS, in Biography, a learned rabbi, said to be descended from king David, and born at Lisbon, A. D. 1437. He was obliged to leave Spain with the other Jews, after having been confessor to Alphonfo V. king of Portugal, and to Ferdinand the Catholic. He resided at Naples, Corfu, and several other cities, and died at Venice in 1508, aged 71. Among the Jews he was denounced the sage, the prince, and the great politician. Some writers say, (See Acts. Liii. Nov. 1868, p. 530.) that, by negotiating bills of exchange, which was the business he followed at Castille, after he fled from Lisbon, and by practising the several arts and frauds of the Jewish people, he amassed prodigious wealth; that he oppressed the poor; that he aspired after the most illustrious titles, such as the noblest honours in Spain could not attain; and that being a sworn enemy to the Christian religion, he was the principal cause of that form which fell upon him and the rest of his nation in 1391, when they were driven out of the Spanish dominions. His Commentary on the Old Testament, which is scarce, is written in a clear, though difficult, style; and adheres principally to the literal sense. This book, which consists of detached parts, composed at different times, abounds with so much rancour against the christians in general, and the Roman Catholics in particular, that father Bartolocci was desirous that the Jews should be prohibited the perusal of it; and they were not allowed to read or keep in their houses his commentaries on the latter prophets. Biblioth. Rabbin. tom. iii. p. 876. 879. His other works are, A Treatise on the World against Antichrist, who maintains its eternity; a Treatise on the Explication of the Prophecies relating to the Melchizedek against the Christians; a Book concerning Articles of Faith; and some others of less note. The various perverctions which he, and other Jews suffered, soured his temper, and produced an inseparable hatred against the christians, which he has manifested in his writings; though, in company with them, he behaved with great politeness, and was cheerful in conversation. He was an affiduous student, and a very ready writer.

ABRACADABRA, or ABRACADABRA, a magical word, recommended by Strenus Sammonius, preceptor to the younger Gordian, as a charm, or amulet, in curing ills, and preventing other diseases, particularly the fever called by the physicians demitritus. See Scrib. Samon. de Medico. N. 53. p. 1598. fol. Mattaire.

To have this effect, the word must be written on paper, and repeated, omitting each time the last letter in the former, so that the whole may form a kind of inverted cone, (as in the margin,) in which there is this property, that which way ever the letters be taken, beginning from the apex and ascenfing from the left to the right, they make the same word, or as some would have it, the same sentiment, as is found in the first whole line. This paper must be suspended about the neck by a linen thread. According to Julius Africanus, another ancient writer, the pronouncing of the word in the same manner, will do as well.

ABRACADABRA is said to have been the name of a god worshipped by the Tyrians, so that wearing his name was a kind of invocation of his aid; a practice not more superstitious than that of some christians, who bear various things about them in expectation of their operating by sympathy.

ABRAHAM, in Scripture history, the celebrated patriarch, who was the father and founder of the Jewish nation, though it was never called by his name. He was the son of Terah, and the 10th in lineal succession from Noah by his secon{d son Shem, who lived till Abraham was 150 years old. He was born 372 years after the flood, and A. M. 2608, according to the Hebrew chronology, in Ur of the Chaldees, in the 150th, and not, as some have supposed, in the 70th year of his father's life, and removed with him, at the age of 76, A. M. 2076, into Haran, where Terah died at the age of 205 years. At the age of 75, i. e. 427 years after the flood, A. M. 2683, he migrated into Canaan, in consequence of the divine order and promise, recorded in the three first verses of the 12th chapter of Genesis. Shuckford (Conn. vol. i. p. 274.) supposes, that this promise was made to the patriarch before he dwelt in Haran (see Acts vii. 2.) and that it was 430 years before the law. (See Gal. iii. 17.) But the interval from the birth of Isaac to the law was 420 years; and therefore, he concludes, that the promise was made at Ur, thirty years before the birth of Isaac, who was born when Abraham was 100 years old, and that it took place much about the time of his removal to Haran.

Others (see Taylor's Scheme of Scripture Divinity, p. 211.) date the promise to Abraham at the time of his removal to Canaan A. M. 2083. A. D. 1921; and they reckon 420 years from this period to the Exod. Compare Exod. xii. 41. with Gal. iii. 17. See Blair's Chronology, II. 1. This promise, however, was the foundation of that grand scheme for preventing the universal prevalence of idolatry, and for preserving among mankind the knowledge and worship of the only true God, which, under several variations and improvements, was to reach to the end of time. For this purpose Providence selected the family of Abraham, which was afterwards formed into a nation, instructed in religious knowledge by God himself, and favoured with such extraordinary privileges and honours, among all other nations of the earth, as were in their own nature adapted to engage them, by the most rational motives, to adhere to God and his worship. The ground of this noble and extensive scheme, and of God's singular regard to Abraham and his posterity, was the COVENANT OF GRACE, the promise or grant of favours and blessings to mankind in Jesus Christ our Lord. In the conduct and accomplishment of this scheme, God required the patriarch to call himself
upon his Providence, by removing at his special command, from his own kindred and country, to an unknown distant land, which he would give him, as a resting-place of his posterity and future blessing. Accordingly, soon after his settlement in Canaan, probably within two or three years, according to the nature of the divine promise, that he should become a great nation, he was forced by famine to remove into Egypt. Many circumstances in the circumstances of the 432 years, during which the Israelites remained in this country, at this period. Here Sarah, the daughter of Haran, became the wife of Abraham, to be called his licit, was freely taken away by the king of Egypt: captivated by her beauty, desired to have made her his wife. But the king was punished in an extraordinary manner for the injustice of his conduct, restored her without violation, and gave orders, that Abraham, and his wife, with all that belonged to them, might safely depart from his dominions. The famine having ceased in Canaan, he returned to the situation near Bethel, which he had left, and where he had erected an altar, and devoutly acknowledged his happy deliverance Abraham, being under the necessity of separating from Lot, his nephew, on account of the increase of their substance, and the contention of their respective herdsman, removed to the plains of Mamre, in Hebron. Here he formed an alliance with three of the principal princes of the country, by whose assistance he recovered Lot, who had been taken captive, and restored him, his family, and his whole property, to his former habitation. A. M. 2092. At his return, as he passed near Salem,rippled to be the city afterwards called Jeru-alem, he met Melchizedek, who was king of that city, and "priest of the Most High God," and received from him tokens of special favour. Soon after this event the divine promise was again renewed to him, and accompanied with circumstances of peculiar encouragement. It was particularly revealed to him, that his posterity should be as the sand of the sea, and should be as the stars of heaven, and should possess the city of the children of Abraham. The meaning of this prophecy to Abraham, therefore, can only be this, that his seed from Isaac forward till he be a stranger in a land that was not theirs, for the space of 432 years, during some part of which they should be oppressed, and at length brought under bondage; which term being expired, they should find a happy deliverance. After the renewal of this promise, Abraham married Sarah, who was recommended to him by Sarah, and whom he children designed to adopt and educate as his own, according to the custom which was common in those times. By Sarah she had a son, who was called Ishmael. A. M. 2047. When the patriarch had attained the age of 99 years, A. M. 2107, A. D. 1817, God was pleased to ratify his former covenant with him, by changing his name from Abram, formed of 2N, "father," and melch, "God," to Abraham, derived from 2B & melch, "father of a great multitude," assuring him that he would make him the father of many nations, Gen. xii. 5. As a token and confirmation of the covenant now made with him, he enjoined him to be circumcised, and to circumcise all the males of his family: and he promised that, with- in a year, he should have a son by his wife, whose name was now changed from Sarah, q. d. my princess, to Sarah, the "prince." This son was to be called Isaac; to him belonged the covenant and promise: and in his seed all the nations of the earth were to be blessed. The promise of a son was again renewed by those celestial messengers, who announced to him the destruction of Sodom. His intercourse on behal of this devoted city, though in the like unavailing, forms a distinguishing circumstance in his history. Soon after this event, Abraham removed to the country of the Philistines, and sojourned in Gerar, where an incident occurred similar to that which had happened in Egypt. See ABRAHAM. Isaac was born at the appointed season, 452 years after the flood, and A. M. 2108. But within 35 years after this joyful event, upon which depended the accomplishment of the divine promise, and of the patriarch's hopes, Isaac was demanded as a burnt-offering, and Abraham was ordered to present the offering on mount Moriah. The event, with all the circumstances that attended it, is well known. The order was countermanded, and the patriarch, in consequence of this signal trial of his faith and obedience, obtained a solemn renewal of all the divine covenants and promises. In the year 488 after the flood, A. M. 2144, Sarah died at Hebron, and was buried in the cave of Machpelah, which Abraham purchased as a burying-place, of the sons of Heth, for 400 pieces of silver, amounting at the rate of 3s. for a shekel, 100l. of our money. This purchase was made, according to the custom of ancient times, at the gates of Hebron. Abraham having married his son Isaac to Rebekah, the daughter of Nahor, his brother, at the age of 141 years, took another wife, named Keturah, by whom he had fix sons, These he portioned, that they might not interfere with Isaac's inheritance; and they went to the call of Beersheba, and the land of Canaan, and settled in both Arabia, the Petrea and Deferta, where some traces of their names are still to be perceived. This venerable patriarch died in the 177th year of his age, 527 years after the flood, A. M. 2183, A. D. 1821, and was buried by his two sons, Isaac and Ishmael, in the cave of Mach- pelah, near Sarai, his wife.

To the above abstract of the history of Abraham, recorded in the book of Genesis, it may not be improper to subjoin a few particulars collected from other sources. Terah, the father of Abraham, it is said, (Suidas in voc. A$3400 and 240Xe, Lex. tom. i. & ii.) made statues and images for the purposes of that idolatrous worship, which had been transmitted to him from his ancestor Serug, and which he encouraged by example and exhortation. Some Jewish authors relate, (apud Genebrad. in Chron.) that Abraham purified the same occupation; and Maimonides (More Ne- vochim, c. 26.) says, that he was educated in the religion of the Sabæans, who acknowledged no deity but the stars, and that he was led by his own reflection to the belief of an intelligent Creator and Governor of the universe; but that he did not renounce paganism till the 50th year of his age; that he was brought up in the religion of the Sabæans, is an opinion adopted by Spencer, de Leg. Heb. Ritual. lib. ii. c. 1. y. vol. i. 270. See SABÆISM. Suidas (ubi ejusdem, informs us, that at 16 years of age he cautioned his father against seducing men to idolatry for the sake of pernicious gain, and taught him that there is no other God besides he who dwells in heaven, and created the whole world. It is added, that he destroyed the statues and images of his father, and departed with him from Chaldea. Other relations (Haidegger Hilt. Patriarch. tom iii. p. 35.) that his father deposed Abraham to fell his images in his absence, and that a man, who pretended to be a purchaser, having ascertained that he was 50 years of age, remonstrated with him for adoring at such an age, a being which is but a day old. Abraham, impref and confounded by this remonstrance, destroyed them all, excepting the largest, before
before his father's return; and he told him, that having presented an oblation of flour to the idols, the rout of them, in whose hand he had placed a hatchet, bewed the others to pieces with that weapon. Terah replied, that this was bantering, because the idols had not fene to act in this manner; upon which Abraham retorted these words upon his father against the worship of such gods. But he was delivered up by Terah to Nimrod, the Emperor of the country, and because he refused to work in the fire, according to his order, he was thrown into the midst of the flames, from which he escaped uninjured. Mr. David Levi, in his

A B R

Lingua Sacer, has given an account of this tradition, extracted from Medragh Bereishith: and it is related by Jerome, (Trad. Hebraica in Genech,) who seems to admit its general credibility. The vulgar translation of 2 Efdras ix. 7, expresses, that he was delivered from the fire of the Chaldeans; and the ambiguity of the word ༩, which notes fire, as well as the birth-place of Abraham, seems to have given rise to this opinion. However, if we allow that Abraham, being born and educated in an idolatrous country and family, might have been addicted in early life to that superlition, it is certain that he renounced it, and that he was providentially removed from a scene of danger, and that he contributed to propagate just sentiments concerning the deity wherever he journeyed. The fame of his wisdom, piety, and virtue, spread far and wide among the nations of the world: this appears from the testimonies of Berofus, Hecataus, Nicholas of Damascus, cited by Josephus, (Antiq. l. i. c. 7. apud Oper. tom. i. p. 28. cd. Haver,) and also from what is said of him by Alexander Polyhillon, Eupolemus, Artapenes, and others, whose testimonies may be seen in Eusebius's Prep. Evang. lib. ix. chap. 16, 17, 18, 19. His name is mentioned with honour all over the East to this day. Josephus (Antiq. l. i. c. 8. tom. i. p. 30.) informs us, that he taught the Egyptians arithmetic and astrology; and we learn from others, (see Eusebius and Suidas, αρθηριον,) that he also instructed the Phcenicians in astronomy; that he invented the Hebrew characters and language; and that he wrote several books. Traditionary truth and fiction seem to have been blended in the accounts that are given of this eminent patriarch by the Jews, Arabsians, and Indians. Of the books ascribed to him, the principal seems to have been the treatise called Jetzirah, or the Creation, of which it gives an account. This is mentioned in the Talmud, and held in high estimation by several learned Rabbis. It was printed at Paris in 1552, and translated into Latin by Pofiel; and also translated into Latin, with remarks, in 1642, by Rittangel, a converted Jew, and professor at Konigberg. A book, called Abraham's Revelation, was dispelled by an ancient fect, under the denomination of Sethians. Abraham's Assumption is mentioned by Athanasius in his Synopsis; and Origen takes notice of a treatife, pretended to be written by him, in which two angels are introduced disputing about his salvation. The Jews also represent him as the compiler of some prayers, and of the 15th Psalm, and of a Treatise against Idolatry. Fabricius (Bib. Græc. tom. ii. p. 516.) informs us, that some apocryphal books of Abraham, which are now lost, are commended by Vettius Valens and John Firminus; and from Kirchern's Tractate of Libraries, p. 142, we learn, that all the several works, which Abraham composed in the plains of Mamre, are contained in the library of the monastery of the Holy Cross on Mount Amaria, in Ethiopia. The Indians believe this patriarch to have been the same with their great prophet Zu-rakir. According to the Arabs, who have given us a history of Abraham, very different from that of the Bible, he was the son of Azar, and grand-

A B R

son of Terah; and the eastern heathens have a long tradition concerning Abraham's life, which differs very much from that of Moses. In a book, said to be in the French king's library, No. 792, which was written by Ephrem the Syrian, and translated from the Syriac into Arabic, upon Abraham's journey into Egypt, there is an amon on his death, pronounced by St. Athanasius, on the 28th of March: on which day the Coptic and Egyptian christians observe his festival. Among the Mahometans, the memory of Abraham is held in great veneration, and his name frequently occurs in the Koran. See CAABA. We are told by Ebn Shuwan, (ad. Ann. Hegira 513.) cited by D'Herbelot Bibl. Orient. Art. Abraham, p. 16.) that in the beginning of the 12th century, the tomb of Abraham having been discovered near Hebron, his body, as well as those of Isaac and Jacob, were found entire and uncorrupted. There were likewise some gold and silver lamps hung up in the cave, which was visited by multitudes. The Mohamines have such a reverence for this place, that they make it one of their four pilgrimages, the three others being those of Mecca, Medina, and Jerusalem; and the christians built a church over the cave, which the Turks afterwards converted into a mosque, and prohibited christians from approaching. The emperor Alexander Severus, (Lamprid. in Sever.) who knew Abraham only by the extraordinary circumstances related by Jews and Christians, conceived so high an opinion of him, that he ranked him with Jesus Christ among his gods.

ABRAHAM, Rabbi, in Biography, was prince of the Jewish nation, and tutor to Aben Ezra. He foretold that the Messiah would be born under the same configuration or conjunction of Jupiter and Saturn, with Moses the Jewish lawgiver. According to his calculation, this was to happen 2859 years after the former, i. e. A. D. 1464, and two such conjunctions are said to have actually occurred within the 15th century, viz. in 1444 in Cancer, and 20 years after in Pisces; but instead of adherence, the Jews experienced only distress and difreps.

A B A R

ABRAHAM, R. Isaac Ren, a Jewish writer, who lived about the beginning of the 17th century. He was by nation a Poleander, but spent most of his time in the courts of Germany. His book, intitled, Chofuk Ernunah, i.e. Magna Fidei, was a violent attack on the christians religion, in which he examines the whole gospel and endeavours to explode all the proofs of it, and to confute the objections of Christians against the Jews. This book, which was composed against the disciples of Luther, was published in 1618, from a MS. which was become very scarce. It was translated into several languages, and very widely dispersed. The African Jews held it in high estimation, and from it they was brought into Germany by Wagenfeld, who inserted a Latin translation of it in his Tola Igaza Satone.

A B A R

ABRAHAM, Cypue, a Portuguese Jew, supposing by some to be a Chalifian, who, with Tobias Athias, translated the Bible out of Hebrew into Spanish. It was printed at Ferrara in 1553, and reprinted in Holland in 1630. The first edition of this Bible, which is the most valuable, is marked with scars at certain words, which are designed to show that these words are difficult to be understood in the Hebrew, and that they may be used in a different sense.

A B A R

ABRAHAM, of ABRAM, Nicolaus, a learned jewe, was born in the diocese of Toul in Lorrrin in 1580. He was made divinity professor in the university of Pont a Mousson, which office he held 17 years, and died Sept. 7, 1655. He wrote notes on Virgil and Nonius, a C: mentary on some of Cicero's Orations, in 2 vols. fol. a collection of theological pieces, intitled, Phara Pli. Tiph. and some other works.

A B A R

ABRAHAM,
ABRAM, named in Scripture, a Jewish rabbi, who flourished in Jerusalem about the middle of the 1st century. He wrote a book entitled, the Specer of Judah, which is an expansion of the prophecy of Jacob, and intended to confirm the notion of the Mosaic having actually appeared. Lange has given a particular account of this book, which he saw in MS. Hist. des Jud. i. ii. c. 36. § 14-21.

ABRAMBOE. See Abrasax.

ABRAMANTUS, or ABRAHAMITES, in Ecclesiastical History, a sect of heretics, who renewed the error of the Pau- lians.

They took their names from that of their leader Abraham, a native of Antioch, by the Arabs called Ibrahim; whence also the name Ibrahimish, given by them to this sect. The Abramants were about the close of the eighth century, and were suppressed by Cyrusaus, patriarch of Antioch.

The same denomination is also applied to a party of jews, who suffered death for the worship of images, under Theophilos.

ABRAMSDORF, in Geography, a populous large village in Upper Hungary. E. long. 19° 50'. N. lat. 46° 25'.

ABRAM'S GREEK, a creek which falls into Hudson's river in America, near the city of Hudson.

ABRAMBOE, a town in the kingdom of Ptoon on the African coast, in which is held a brilliant assembly of the natives from all parts of the kingdom, to celebrate, by dancing, and other diversions, the birthday of the day.

ABRAMIS, in Ichthyology, a name given by Balonius and others, to the cyprius latas, or dream.

ABRANTES, in Geography, a town of Estromadura in Portugal, seated on an eminence near the river Tajo, and encompassed with delightful gardens and olive-yards. It contains about 3500 inhabitants, four convents, and an hospital. It was fortified by Peter II., raised to a county by Alphonius V., and promoted to a marquisiate by John V., in 1718. W. long. 7° 18'. N. lat. 39° 13'.

ABRASA, in Surgery. See Abrasion.

ABRASAXAS. See Abrasax.

ABRASION, composed of the Latin ab, and rubo, to scrape off, a superficial excoration or ulceration of any part of the body: but the term is generally applied to a surface which has been rubbed off by external violence. The minute portions of abraded skin are not to be hastily taken away; as, by careful re-application, they may often there and unite, thus preventing the consequences of a recent wound. See Adhesion and Agglutination of Wounds.

Sore attended with excoration are denominated abrosis. The part rubbed off is technically named abrasiun. Vide Ortification de Morb. Curat. i. iii. c. 18.

ABRAVANNUS, in Ancient Geography, the name of a promontory and river of Galloway, in Scotland, so called from Aber, which, in Celtic, denotes the mouth of a river, and ren, a river. It is probably that small river which falls into the bay of Glenluce, a little to the south of the Muy of Galloway.

ABRAHAM, in Natural History, a name given by some writers to species of a red clam, used in England by the cabinet-makers, &c. to give a red colour to new mahogany wood; we have it from the Isle of Wight, but it is also found in Germany and Italy.

ABRAXAS, a barbarous word, denoting a power which predates over three hundred and sixty-five others, the number of days in the year.

Abraxas is a word of obscure origin: it is supposed to be technically compounded of the Greek letters, considered as numeral characters: according to the custom of the Greeks, who expressed their numbers by letters of the alphabet; the values of which in the present word stand thus: A 1, B 2, P 160, A 1, E 60, A 1, E 200; which added together make the number 365.

The word is usually written, among modern authors, abraxas, though as some hold, by a corrupt transposition of the letters S and Z, for abares, as it is found in all the Greek fathers, as well as on ancient stones. Irenaus indeed (lib. i. c. 23. p. 52. ed. Grabe) has abraaxas, but the reason may be, that the chapter in which the word occurs is only extant in Latin: so that though it be in Greek characters, the orthography is of Latin copyists or translators. — In strikings the word ought to be written in Greek characters, ABRAXAS, since, besides that the inventor of it spake that language, the word does not contain the number 365, when written in the Latin character. Hence a farther error in most books, which occurs in the smaller or running character, on account of the Greek sigma; this having in ancient inscriptions the same figure with the Latin C, is often rendered by a Roman C instead of S; whence abraxas for abraaxas.

Beaufobre (Hist. de Manich. tom. ii. p. 55, 56.) conjectures, with a very great degree of probability, that abraaxas, or abrafas, is derived from two Greek words, which signify magnificent Saviour. For the epithet ΛΑΧΑΣ, the first part of abrafas, is particularly applied, in the sense of magnificent or splendid, to Apollo and Bacchus, who, according to Macrobius, (Sat. i. c. 18.) are the same deities; and the second word of which abrafas is composed is ζωΝ, which is used by Homer for face, or ζω, which denotes salvation.

Many learned modern affirm, that the Babilidians used to call the supreme God Abraxas. For this they have the authority of Jerome (Adv. Lucif. p. 304.), and of the author of the additions to Tertullian's Book of Precautions, c. 46. But that these writers are mistaken, we may conclude from the better authority of Irenaus (lib.i. c. 25.), who informs us, that their opinion was, that the Father of all was ineffable, or without a name, and that abraenas was the first of their 365 heavens, or the prince of the angels that reigned in them. It is probable that they applied this term to the arcana of their philosophy, and not to their theology. Accordingly, Jerome affires us, (ubi supra,) that it is the same with Mythras, or the Sun, which is the deity worshipped by the Persians. Hence we learn, why abraenas is said to be the chief of the 365 heavens, or angels who reigned in them, and rule over the 365 days of the year; for the sun may, with great propriety, to preclude over all the days of the year, and in the hieroglyphical language, be said to contain in himself the parts of which the year is composed, and to rule over it. Abraxas is, therefore, a technical term, much in the spirit of the caballistic or oriental philosophy; which, joined with that hieroglyphical disposition for which the Egyptians were remarkable, will account for the emblematical figures that appear on several of those gems, called by Montfauccon (Pafæog. Græc. i. ii. c. 8.) abraexa. But there is no sufficient evidence that these belonged to the Babilidians.

Several have even suspected that they discover some trace of the gospel trinity concealed in this word; which they explain, by supposing it compounded of the initial letters of the Hebrew words Ab ben rouah, q. d. father, son, and spirit. Wendelin, canon of Tournay, and father Harduin, have given more precise explications of the word, according to this system. The former makes it stand for fatas, filui, spiritus sanctus, falsa a ligno: the latter, improving
Abrasas is also used, among Antiquaries, for a species of graven gem, on which the word abrasas is usually inscribed; supposed to have been worn by the ancient Greeks, Egyptians, and Carthagians, as an amulet or talisman against diseases.

If the above explication of the meaning of the term abrasas be just, we can easily account for the introduction of this practice. In the system of ancient mythology, Apollo and the Sun were the same, and Apollo was the god of healing. Hence, in the true spirit of hieroglyphics and mythology, these gems were undoubtedly used by the heathens, and probably by some supstititious christians, who being lately converted, retained a reliquy for their former abstractions, as amulets, or charms, to drive away aques and other diseases; and this also gave rise to the use of the word Abrasasabra for the same purpose. It is not unlikely that such were found among the orthodox as well as among the Babilians and other reputed heretics.

Abrasas are of divers figures and sizes: sometimes in that of rings to be worn on the finger; in which form they were supposed of great efficacy for driving away flies.

Abrasas are frequent in the cabinets of the curious: a collection of them, as complete as possible, has been much desired by several. There is a fine one in the abbey of S. Genevieve, which has occasioned much inquiry. They are chiefly of the third century; most of them seem to have come from Egypt, whence they are of considerable use for explaining the antiquities of that country. But they are much too numerous and too costly to have been the production and possession of the christians of the three first centuries, though they had all taken delight in such things.

Macarius, Chilëet, Capello, and Montfaucon, have written expressly on abrasas; the latter has given 56 plates of them, well filled, and he has divided them, for the sake of order and perlicuity, into seven different classes.

Abrasas have sometimes no other inscription beside the word; but more usually some symbol annexed to it. Befide which, we sometimes find other marks and words adjoining; as the names of faints, angels, apostles, and the ineffable name Jehovah itself, either at length, or in the abbreviation 1αΩ; sometimes the words σεβασθανθ Ερασι, Eros, or of the names of other gods; as Mithras, or Mithra; τυχων, Seme, Sol; άρχων; 1αΩ, or Seraph, the one jupiter; and the like. Sometimes we observe this sitting on a lotus, or Apis, surrounded with stars; Oiirs, Serapis, Harpocrates, Canopus; the cock, the dog, the lion, the ape, and the sphinx, which are well known symbols of heathen deities; sometimes monstrous compositions of animals, obscene images, Phalli, and Ithyphallic; in a word, every kind of thing which the Egyptians placed among their gods. The graving of abrasas is not uniform, rarely good; the reverse, on which is the word, is said to be sometimes of a lower and a more modern taste than the face. The characters are usually Greek, sometimes Hebrew, Coptic, or Hethranian; and sometimes of a mongrel kind, forged as it should seem on purpose to make their import imperceptible. It is disputed, whether or not the Veronica or Montreuil, or the Granite obelisk, mentioned by Gori, be abrasas.

Dr. Lardner, who, with an industry and accuracy for which he was distinguished, and by which he has amply served the cause of Christianity, has examined the particular class of these gems given by Montfaucon, and clearly proved that they are of heathenish origin. Many of the figures and inscriptions on them are exceedingly obscene and idolatrous, and could not be the production of any Christian sect whatever; but they must be pagan, and for the most part Egyptian. To this purpose, Deanebofe (obi fupra, cap. 4.) observes, that it is altogether incredible, that a sect, which made profession of christianity, should have adopted the monstors adored by the Egyptians; or that a man who boasted of deriving his doctrine from Matthias, and from an interpreter of St. Peter, and who received the gospels and the epistles of St. Paul, should make images of the deity; at a time when christians had the most execrable aversion to all sorts of images, even the most innocent. This learned writer has also urged a variety of irrefragable arguments against the opinion of thole, who maintain that these gems were the invention of the Babilians. From many of the figures themselves, produced by Chilëet, it appears that they are pagan, and of Egyptian origin, and could not belong to any sect of christians; and as for those gems, which have the names of Abraham, Isaac, or Jacob on them, or the God of these patriarchs, or the words, Sabaoth, Adonai, or Elze, these, he says, are the inventions of the Cabalists, or of the Egyptian magicians; and he has thus deduced, from his observations on Chilëet's figures, the same conclusion, which Dr. Lardner has drawn from those of Montfaucon. As for the names of angels, which Montfaucon affirms (Pal. Græc. I. ii. c. 8. p. 177.) to have been in use among the Babilians, it is evident, that those which he mentions were derived from the Orphes, as Origen (Cont. Cel. I. p. 295. ed. Cantab. opp. i. p. 655.) plainly informs us. After an elaborate investigation of this controverted subject, Dr. Lardner concludes in words similar to those of Deanebofe; 1. That abrasas was not the god of the Babilians. 2. That this name signifies nothing but the fan, which was never worshipped by them. 3. That the figures, both in Chilëet and Montfaucon, are, for the most part, Egyptian. 4. That there is no kind of proof that any of them belonged to the Babilians. 5. That those which have Iao, Sabaoth, &c. upon them, were the works of magicians, who never made any profession of christianity. 6. That some of these figures derived their origin from the Simonians and Orphes, who were not christians either in belief or profession. See Lardner's Works, vol. ix. p. 290-364.

ABREAST, a Marine term, expressing the situation of two or more ships, that lie with their sides parallel to each other, and their heads equally advanced. But if their sides be not parallel, then that ship, which is in a line with the beam of the other, is said to be abreast of her. When the line of battle at sea is formed abreast, the whole squadron advances uniformly, the ships being equally distant from, and parallel to each other; so that the length of each ship forms a right angle with the extent of the squadron, or line abreast. See LINE. Abreast, within the ship, denotes on a line with the beam, or by the side of any object aboard.

Abreast of any place, means off or directly opposite to it.

ABREIRO, in Geography, a small town of Tralos-Mantes in Portugal, in a district, which, according to Buling, consists of one parish. W. long. 7° 10'. N. lat. 41° 30'.

ABRETTENE, in Ancient Geography, a district of Mypha in Asia. Hence, according to Strabo (Geog. tom. ii. p. 861.),
p. 851.), the epithet \textit{Alecto}, given to Jupiter, whose
friend was Cleone, who, after being the leader of a gang of
soldiers, received signal favours from Antioch, and in the
Athenian defeat he won and went over to Caesar. As the
people were called \textit{Alecto}, and inhabited the country that lies be-
tween Ancyra of Phrygia and the river Rhenus. Cleone,

Abridging, in \textit{Laws}, is the reducing a compound
quantities, or \textit{equation}, to a more simple
expression.

To \textit{abridge} the equation
\[ a^2 + bx + cx + dx = 0, \]
\[ -b + a, \]
\[ -c + d. \]

All the known quantities \(-a - b - c\) of the second term are
\[ a^2 \]
\[ + bx + cx + dx \]
\[ a \]
\[ -b + c. \]

When the whole is brought into a single letter, \textit{the}
Abridge has published an absolute work in 2 vols. 4to. intitled, \textit{A Method of making
Abridgments.}

Abridgments of books are numerous. They are usually
said to have had their rise in the times of ignorance; to have
been one of the first fruits of that barbarism which ensued on
the decline of the Roman empire; and to have been unknown
in those happy days, when letters flourished among the Greeks
and Romans; yet we have some traces of them in those times.
Lord Bolingbroke, speaking of those who are employed in this
way, says, that "they do neither honour to themselves, nor
good to mankind; for surely the abridge is in a form below
the translator: and the book, at least the hitory, that wants
to be abridged, does not deserve to be read. They have
done, anciently, a great deal of hurt, by substituting many
a bad book instead of a good one; and by giving occasion
to men, who contented themselves with extracts and abridg-
ments, to neglect, and, through their neglect, to lose, the
invaluable original." \textit{See Epistle.} Notwithstanding
this reflection, abridgments are in many cases necessary and
useful; though it is a difficult task, and it requires peculiar
talents to perform the office of an abridge well; to preserve
the original author's facts, reasoning, manner, and spirit,
and to omit nothing that is essential either in argument or
illustration, and at the same time to retain what is reduc-
ant, to restrain needless amplification, and to avoid irre-
related or useless digressions, are objects of unquestionable
importance. When these objects are duly regarded, abridg-
ments cannot fail to make knowledge of various kinds more
cidy of access and of attainment, and by reducing the ex-
perience and labour of acquiring it, to extend its diffusion and
prevailence. To readers of various classes and description,
compendious epitomes of voluminous works will be accepta-
table and useful. The practice of abridging books that are
read, or the lectures of public professors in the various de-
partments of science, is a method of study, which has been
recommended by those who have experienced its utility, and
which has contributed in no small degree to make both the
judgment and the memory. Those who have accustomed
themselves to this practice have also acquired a facility of
composition, of which they have availed themselves on vari-
os occasions; whatever may have been the employment or
profligacy to which they have been devoted. We shall here
furnish two excellent specimens of that kind of abridgment
which we have recommended.

In the \textit{Essay on Miracles}, Mr. Hume's design is to prove,
that miracles which have not been the immediate objects of
our senses, cannot reasonably be believed upon the testimony
of others. His argument is,

"That experience, which in some things is variable, in
others uniform, is our only guide in reasoning concerning
matters of fact." Variable experience gives rise to proba-
bility only; an uniform experience amounts to proof.
Our belief of any fact from the testimony of eye-witnesses
is derived from no other principle than our experience of
the veracity of human testimony. If the fact attested be
miraculous, here arises a contest of two opposite experi-
cences, or proof against proof. Now a miracle is a violation of
the laws of nature; and as a firm and unalterable ex-
pense has established these laws, the proof against a mi-
raise, from the very nature of the fact, is as complete as
any argument from experience can possibly be imagined;
and if so, it is an undeniable consequence, that it cannot
be surmounted by any proof whatever derived from human
testimony."

In Dr. Campbell's \textit{Essay on Miracles}, the author's
principal aim is to shew the fallacy of Mr. Hume's argu-
ment; which he has most successfully done, by another single
argument, in the following manner:

"The evidence arising from human testimony is not fully
derived from experience; on the contrary, testimony hath
a natural influence on belief antecedent to experience."
The early and unlimited attest given to testimony by chil-
dren gradually contracts as they advance in life: it is,therefore, more consonant to truth to say, that our dif-
dence in testimony is the result of experience, than that our
faith in it has this foundation. Besides, the uniformity
of experience in favour of any fact, is not a proof against
its being revered in a particular instance. The evidence:
 arising from the single testimony of a man of known
veracity, will go farther to establish a belief in its being
actually verified. If his testimony be contradicted by a few
others of the same character we cannot withhold our attest
 to the truth of it. Now, though the operations of na-
ture are governed by uniform laws, and though we have not
the testimony of our senses in favour of any violation of
them; still, if in particular instances we have the testi-
mony of thousands of our fellow-creatures, and those
too men of strict integrity, swayed by no motives of am-
bition or interest, and governed by the principles of com-
mon sense, that they were actually witnesses of these vi-
olations, the constitution of our nature obliges us to be
lieve them."

These two examples contain the substance of about 400
pages.

For abridgments of the common law and the statutes, see
\textit{Digest, Law, and Statutes.}

Abridging, in \textit{Laws}, is particularly useful for the short-
ening a count or declaration, by subtracting some of the
substance of it.

A man is said to \textit{abridge} his plaint in assize, or a woman
her demand in an action of dower, when, having put any
lands therein which are not in the tenure of the tenant or
defendant; and non-tenure, or the like, is pleaded to that land
in the abatement of the writ; they are brought to \textit{abridge},
 i.e. to defit from and leave that parcel out of the demand;
and pray that the tenant may answer to the rest, to which
he has not yet pleaded any thing.—Though the demandant
has
has abridged his pleas, or demands, yet the writ still remains good for the relief. The reason is, that such writs run in general, and do not specify particulars. See 21 H. VIII. c. 2.

ABRINCATARUM opifimus, in Ancient Geography, the town of the Abrincata or Abrincini, now Arrancina, in France, situated on an eminence in the south-west of Normandy, near the borders of Brittany, on the English Channel. W. long. 1° 16'. N. lat. 48° 40'.

ABRIZAN, or ABRIZHIAN, derived from Abrius, which signifies in Persia, a vessel proper for pouring out water; the name of a feast observed by the old Persians on the 13th day of the month Tir, which nearly corresponds to our September, with abundance of idolatrous superstitions. This heathenish festival was apparently preparatory to the descent of the rain in thec countries, being about the time of the autumnal equinox, and has been partly adopted by the Mahometans. Mr. Harmer (Observations on Scripture, vol. iii. p. 10.) has availed himself of the practice at this feast, to explain the Jewish ceremony of pouring out water at the feast of tabernacles, alluded to by our Saviour, John, ch. vii. After the return of the Jews from their captivity in Babylon, Zechariah (ch. xiv. xvi. xviii.) connects attaining the feast of the tabernacles with obtaining the rains of autumn, which are of such consequence after the drought of a Syrian summer; and therefore (says the ingenious writer) this rite was probably then practised, and the pouring out of water in the temple, with solemnity, as before God, underfoot to be a religious prognostic of the approach of rain, or a morally instrumental and procuring cause of its speedy coming. Might not (he adds) the returning Jews think of adding some memorial of Jehovah's being the giver of rain to that ancient national solemnity, which had been enjoined by Moses, to be observed just about the same time of the year with that of the Persian festival, which that people solemnly ascribed to some deity they worshipped, but which the Jews knew was the gift of Jehovah?

ABROCHMENT, or ABROCIMENT, ABROCAMEN- tum, in some ancient Law-writers, denotes the act of ingrafting or buying up commodities by wholesale, before they come into the open market, in order to sell them off dear by retail, otherwise called forefalling.

ABROGATION, from the Latin abrogare, I repeal, the act of abolishing a law, by authority of the maker.

In which sense the word is synonymous with abolition, repealing, and revocation.

Abrogation stands opposed to retention: it is distinguished from derogation, which implies the taking away only some part of a law; from falsification, which denotes the adding a clause to it; from abrogation, which implies the limiting or restraining it; from dispensation, which only lets it aside in a particular instance; and from antiquation, which is the refusing to pass a law.

ABROHANI, or Mallemolli, the name of a kind of mufflin, or clear white cotton cloth, brought from the East Indies, particularly from Bengal; being in length sixteen French ells and three quarters, and in breadth five eighths.

ABROJOS, or Basos de Bolona, in Geography, a bank formed by several small rocks and lilies, east of Turk's island. W. long. 60° 40'. N. lat. 21° 5'. A deep channel of the breadth of three leagues lies between this bank and the island.

ABROKUS, in Botany, a name used by some of the Latin writers, for the bromus, or avena fletis, the wild oat; and by others for the orobus, or bitter vetch. The Greeks originally used the word, and that not only for these two vegetables, but in a much larger sense, understanding by it any herb resembling the plants cultivated for the use of the table, but not effulent. The Greeks and Romans had a way of expressing the boiling of pulse or herbs, by words specifying the eating of them; thus the Greeks expressed boiled things by brocha, βροχα, and the Romans by maffale. Virgil uses the word for the peace, and Phoebus, for all effulent things that were boiled: hence these baudard peace and oats were called orobhus, non maffale, not fit for boiling or eating.

ABROLHOS, in Geography, dangerous shoals about 50 miles from the coast of Brazil, and about the island of St. Barbe. S. lat. 18° 22'. W. long. 37° 45'.

ABROMA, in Botany, composed of z and βροξ, q. d. not fit for food, is used in opposition to Theobroma, as a genus of plants belonging to the natural order of Cucumiferes, the Malpighia of Juificus, and the 18th class of Pohl's Phascharadand. The generic characters are as follow: the calyx is a five-leaved perianthum, with lanceolate, acute, spreading, and permanent leaflets; the corolla has five petals, larger than the calyx, with obovate, arched, concave, obtuse claws, hairy at the end, erect, and inereted at the base into the nectar, and oval, obtuse, spreading, ciliate borders, contracted at the base into recurved little claws, on which the chief claws are placed; and a small pitcher-shaped nectar, divided into five segments, which are obovate, hairy, erect, recurved, and arched; the stamina are five membranaceous, very small filaments, growing on the nectar between the segments, enarguate-trifid, with three anthers on each filament, that are twin and kidney-form; the pistil is a subcylindrical, subulsive, with five subulate styles, and acute stigmata; the pericarpium is an ovate, membranaceous, five-winged, five-beaked, and five-celled capsule, with folded partitions; and the seeds are numerous and subovate, within an oblong membranaceous aril, fixed in a double row to the central edge of the partitions, which are thickened and longitudinally bearded, and without a receptacle. There are two species, viz. the Malphas erubescens, a tree, with a straight trunk, yielding a gum when cut, and filled with a white pith like the elder; it flowers from June to October, and its fruit ripens in September and October; it is a native of New South Wales and the Philippine Islands, and was introduced into Kew gardens about 1770, and is a hot-house plant, requiring great heat, and much water; and Wheler's Abrum, so called by Roeing, in compliment to Edward Wheler, Esq. of the Supreme Council in Bengal; this is a shrub with a brown bark, a native of the East Indies, and is not known in Europe. Miller's Dict. by Martyr.

ABRONO, in Botany, a name given by Serapion, and others, to the heart-yia; called also abrisi.

ABROSTOLA, in Ancient Geography, a town in Phrygia, which, according to Ptolomaeus and the Peutingerian Table, is about 23 miles from Ammurius. Cellarius, vol. ii. p. 89.

ABRATONIOIDES, in Botany. See Artemisia, Protela, and Seriphium.

ABRATONIOIDES, in Natural History, a name given by Baulin to the Madrepora maricata of Linneus and others.

ABRATONUM or ABROTUM nas. See Arte- misia, and Southernwood. Abrotanum fumina. See Santolina, and Lavender-Cotton. See also Erioccephalus and Tanacetum.

ABROTTONUM, in Ancient Geography, a town and harbour on the Mediterranean, in the district of Syrtis Parva, in Africa; one of the three cities that formed Tripoli.
ABRUG-Rivas, in Caragola, a populous town of
Tennessee, in the district of Westfield, the residence
of the Mac office, and the chief of the metal towns. It
is situated amongst mines of gold and silver. L. long. 23° 24'.
N. lat. 36° c.

ABRUTION, in Surgery, a term of the same signification
with ABRUPTION.

ABRUS, in Botany, of a ${\text{seg.}}, {\text{sect.}}$ or delicate,
so called from the external tenderness of the leaves, is a genus of
the natural order of Leguminosae, and the 17th class of Dios-
delphus. The $\text{fruits}$ are very large, the seed is white, the pods
are rigid, not opening and containing the seed. It is frequently
found in the Nile. It is a leguminous plant.

ABSALOM, in Scripture History, the son of David, by
Maach, daughter of Talmai, king of Geshur, and brother
of Tamar, who was dishonoured by Ammon, David's son
by another mother. For this injury, Ammon was annihilated
by Absalom at a feast which he prepared for the royal family.
He then took refuge with Talmi, in the country of
Geshur; and soon after he was restored to favour, he
engaged the Ishmaelites to revolt from his father. Having been
proclaimed king at Hebron, his father was under a necessity
of leaving Jerusalem, where Absalom was received by the people.
He and his army, however, were soon routed by
David's forces under the command of Joab; and flying into
the forest of Ephraim, his hair was entangled in the branches
of an oak, and in this situation he was killed by Joab and
his arm-bearer, A. M. 3380, ante A. D. 1024. David,
who had ordered his life to be preferred, lamented his death
with excessive grief. The extraordinary weight of Absalom's
hair, which is Gated (2 Sam. xiv. 26.) at " 200 shucks
after the king's weight," has been considered by critics and
commentators as a difficulty, which is not easily solved. If
we allow with Dr. Cumberland, (Effays on weights, &c.,
p. 123.) that the Jewish shuck of silver was equal to half an
ounce, or 240 gr. 4760, 200 shucks would be equal to 6$\frac{1}{2}$
pounds. Josephus (Op. t. i. p. 586.) supposes the 200
shucks to be 7 minims, and each minim to be 24 pounds,
and consequently the weight of the hair to be 12$\frac{1}{2}$
pounds, which is still more incredible. For the solution of
this difficulty, it has been supposed that the shuck in this passage denoted a weight in gold equal to the value
of the silver shuck, or half an ounce, and thus reduce the
weight of the hair to abt 5 ounces. Others suppose,
that the 200 shucks signify, not the weight, but the value
of the hair. Others, again, are of opinion, that there has
been an error in transferring the Hebrew copy; so that the
number of shucks being expressed by the letter $q$, which
denotes 20, was mistaken for $\text{q}$, or 200, or that $\text{q}$, which signifies
nifies 4, was substituted for 7, or 200. If the last of these suppositions be admitted, the 4 shekels, by Joseph's estimate, would be equal to a quarter of a pound, and by Cumberland's valuation 2 ounces. The learned Bochart in an elaborate dissertation on this subject, (apud Opera. tom. i. p. 883, &c. ed. Willem.) reduces the weight of Absalom's hair to about 2 pounds, which, considering the various circumstances mentioned by him, is by no means incredible.

ABSCEDENTIA, in Surgery, denote morbid parts which are in a state of separation. See Absce.

ABSCHARON, in Geography, a peninsula adjoining the Caspian Sea, and abounding with numerous and productive sources of naphtha and petroleum, and with salt lakes. On this peninsula is situated the city called Baru.

ABSCESS, in Surgery, from abscedo, to separate, or abs and cedo, to retire; a cavity containing pus, or a collection of puriform matter; called Abscessus by the Latins, and Ἀφεξης by the Greeks. The term Empyema is used to designate those In pneumata which form in parts not contiguous to the integuments of the body, especially large Suppurations within the chest or belly; and it is sometimes applied to collections of pus in the skull, the orbits of the eyes, the maxillary sinuses, the joints, &c. Abscesses likewise obtain other denominations, according to their seat; as Panaris, in the finger; Angloph, in the greater angle of the eye; Hypopyon, in the anterior chamber of the eye; Vomica, in the parenchymatous substance of the lungs; Bubo, in the arm-pit or groin; Parotis, behind the ear; Parulis, in the gums, &c. &c. These apppellations are explained in their respective places. We shall now proceed to the general doctrine and treatment of suppurations; after which, will follow some remarks on abscesses of particular parts, requiring peculiar management.

The proximate cause and formation of Abscesses.

This morbid state is always preceded by an inflammation of the vessels from whence the pus has issued. If the purulent matter be well formed, there has been a previous increase of arterial action, a throbbing in the parts adjacent, an exquisite degree of sensibility, augmented animal heat, diffusion of the minute blood vessels, elasticity of the muscular fibres, and an effusion of serum, or of coagulable lymph from the arteries immediately affected. These phenomena are followed by a gradual diminution of the pain, heat, redness, tension, and throbbing, with a deposition of puriform fluid into the surrounding cellular membrane.

Actual suppuration having now taken place; if the pus lies near the surface of the body, a cream-like whitening soon be perceived in some particular point, near the middle, or towards the inferior side of the abscess; an elevation or prominence next occurs, and a fluctuation may be felt underneath, which becomes more distinct as the matter approaches the surface; the pain also is considerably abated, the brilliant appearance of the skin declines; and, if the collection of matter be large, there is usually an attack of shivering, accompanied with febrile symptoms, &c.

The general Seat of Abscesses.

In general, if not always, the matter of an abscess is primarily deposited in the cellular membrane, which surrounds or lies contiguous to the inflamed vessels; except when the secreting arteries terminate and empty themselves in a natural cavity; for example, in the thorax or abdomen. As the texture of the cellular substance admits of easy diffusion, the pus gradually diffuses itself, and forms an extensive reservoir, which either ruptures spontaneously, in a part affording the least resistance, or is evacuated by an artificial opening. When pus is confined by a firm adhesion, or by an aponeurosis, or is situated very deeply among parts that resist its pressure, one or more interfaces will be sometimes formed of considerable extent; the aperture of which may be at a distance from the original seat of the disease; and if the matter should exit in a very large quantity, the gravitating force of the fluid will give it a tendency to some depending spot. Thus it happens, that matter formed under the temporal mafles may be discharged into the mouth, or pus accumulating in the loin may descend to the lower part of the thigh. We are, therefore, not to imagine the point where the pus makes its appearance by a protrusion externally, to be always the focus or centre of the abscess; although it is generally the most proper place for its evacuation. Some judicious remarks on this subject, by the late Dr. W. Hunter, are contained in the Medical Observations and Enquiries, vol. ii. p. 57, &c.

General Indications in the Treatment of Abscesses.

When a practitioner has ascertained, from the preceding and concomitant symptoms, that an abscess exists, (for this disease has sometimes been confounded with an hernia or aneurism,) he should carefully determine whether or not the confined pus ought to be evacuated, and what intermediate steps should be pursued. It may be a question, in some cases, if the suppuration be complete, or sufficiently advanced for an operation. In other cases it may happen, that the tumor ought not to be opened, though the maturation be perfect. At other times the matter, from its situation, ought to be evacuated speedily, lest it should injure the contiguous parts. Regard must also be had to the general state of the patient's health, especially if the suppuration under which he labours be extensive, and has arisen spontaneously. In cases of this kind, which occur after a fever, it will be indifferently necessary to administer such medicines as are adapted to the nature of the internal complaint, as well as to employ appropriate topical remedies to the abscess. When it has been determined to open the tumor, the surgeon should confider in what manner this may be best accomplished, whether by the scalpel, the cautic, or the foton; whether by a single opening, or several; by discharging the pus at once, or at different times.

The various Methods of opening Abscesses.

1. The ancients, and especially Albuscinus, used to open abscesses by the application of an actual cautery. But the unnecessary and terrific apparatus of hot-irons being now laid aside, all the advantages of exciting a further degree of inflammation, &c. previously to evacuating the pus, may be obtained by milder remedies. When an abscess is seated in a glandular part, and has been very tardy in advancing to a state of maturation, (as is particularly the case with serousul and venereal tumors,) it will be often better to open them with a cautic than by any other means. The chief grounds of preference in favour of the cautic are, that it tends to augment the inflammation and suppuration; it diminishes the subjacent glandular swelling; it gives free vent to the confined matter; it promotes healthy granulations; it is much less likely to be followed by troublesome sinuses, or by a sore with loose and callous edges, than when a simple puncture or incision has been had recourse to; and it may be employed with patients who have an infirm.ountable dread of the knife. An unfeemly fear is, however, a not unfrequent consequence of the cautic; and on this account, it is not so eligible in the face or neck, where a cicatrix ought, if possible, to be avoided. The method of preparing and applying cautic substances, in this
And other chieff surgical cases, is explained under the head of Abrasion.

2. An incision or a puncture is employed rather than the cauter, where the foramen propius is left out only a part of the contents of the abscess are free; where it is necessary to limit the extent of the artificial opening to certain dimensions: where the pus has too deep for the precaution, operation of an elegant abscess lances; where an immediate outlet is required, and danger is apprehended from delay; or, where it is requisite to make a wide incision, for the purpose of facilitating the discharge, or applying external medicaments to the bottom of the sore. The precise circumstances requiring a variety in the plan of treatment, will be explained in the paragraph which follows, while we describe the different kinds of abscesses that occur in several parts of the body.

3. Another mode of opening abscesses is by the sehn, which consists in pressing a fickle of soft thread or silk through the prieves of the tumor, by means of a sphen-needle. This practice is very common in the veterinary art, but is not much employed on the human subject. Sections are apt to produce divisions between the skin and subjacent muscle; the fear which they leave, however, is generally but little, and for this reason they are sometimes advantageously had recourse to in superficial collections of matter about the neck and face, where suppuration is likely to continue a long while. They are also used in certain cases of abscess near a joint, or other important part, which might be injured by the scalp or cautery, or which does not admit of a wide orifice being made, so as to expose the abcessed surface to the air.

Treatment of particular Abscesses.

There are certain general principles in the management of abscesses, from which surgeons do not greatly deviate in common cases; such, for example, as the applying of warm and stimulant applications to the part affected, where the intention is to accelerate the suppuration: when the pus is to be evacuated, they not only make an artificial opening, but afford the daily discharge by compresses, or by lightly filling the orifice with airy dressings; and, when there is a tenacity in the fore to granulate, they remove all external obstructions, and use such gentle means as are calculated to aid the healing processes of nature: at the same time internal remedies are administered, according to the nature of the symptoms, and the state of the patient's constitution. But, we shall proceed to illustrate these general remarks by an example.

Suppose an extensive inflammation of the phlegmonous kind to have taken place in a robust young person, upon a flabby part of the body. If no effective topical means have been used to allay the pain, heat, and tension; if no general or local bleeding has been employed; if the patient be not abstinence in his diet, nor has had recourse to purgative remedies; under such circumstances it is very probable the inflammation will advance rapidly, and terminate in complete suppuration. In this latter stage of the case, warm emollient poultices and foentations should be applied three or four times a day; and, if the inflammatory symptoms become excessive, the cooling regimen, with moderate bleeding, and mild saline purgatives may be advantageously employed. These last should, however, be cautiously and sparingly used, lest the suppuration process be too far checked or intercepted. When the pus has forced its way towards the surface of the limb, and is nearly ready to burst from the tumor, (which will be known by a palpable fluctuation of the matter, and by the integument becoming flaccid,) pressure suggests that a sufficient opening should be made for the free and perfect evacuation of the contents of the abscess. But there are circumstances which sometimes forbid our waiting till this critical period: the matter may be contained within a cell; it may be retained by a thick and firm capsule lying over it; for want of an outlet, it may be actually re-absorbed into the general system, and circulating with the blood, may produce very serious consequences to the patient's health: in order, therefore, to prevent the inconveniences which might ensue from long waiting, a judicious surgeon foreseeing the evil, will evacuate the pus by an early opening. In making his incision, it should be an invariable rule to cut in the direction of the muscular fibres; left, by a transverse wound, some important part be deprived of its action through life; by neglecting to observe this rule in an important of the forehead, an ignorant operator deprived his patient of the power of opening his eyes, so that he was obliged to pass up his eye-brows with adhesive plasters, in order to enjoy the benefit of vision. It is also necessary, in using the scalpel, to recollect the situation of neighbouring blood-vessels and nerves; taking the precaution to employ a grooved director, whenever there is the smallest danger of cutting these organs. The subsequent dressings, bandages, &c. &c. will be nearly the same as are required in common ulcers or wounds; for an account of which, to avoid prolixity, we refer the reader to those articles. But it will now be proper to point out the plan of treatment to be adopted in some peculiar kinds of abscesses.

Abscess of the maxillary sinus. The cavity of the cheekbone, Antrum Highmorianum, is lined with a delicate vascular membrane, which, when it inflames and suppures, produces great pain in the upper teeth, nose, and the eye of the side affected; it is also very common for people with this complaint to have a severe pain in the forehead, where the frontal fissures are placed; but still these symptoms are not sufficient to distinguish the disease. Time must disclose the true cause of the pain, for it will frequently continue longer than that which arises from a diseased tooth, and will become more and more severe; after which, a redness will be observed on the fore-part of the cheek, somewhat higher than the roots of the teeth, and an induration at the same place, which will be considerably circumscribed; this hardness may be felt rather highly situated on the inside of the lip. The method of cure consists in extracting one of the dentes molares from the affected side; and then perforating through the socket into the bony cavity. A mild injection may afterwards be employed to cleanse the sinus, and be repeated as occasion requires. Consult Goof's Cates, Hunter on the Teeth, and Bernheim's Handbuch.

Abscess near the Anus. Any of the cauces of inflammation, whether internal or external, may produce this disease. It is generally low and infectious in its progress, involving the rectum, and adjacent cellular membrane in its ravages; for the most part it is painful and tedious, occasioning deep, violent, and callous orifices, which demand prompt attention from the surgeon. See Fistula. The chief indications are, to alleviate the pain by oilsters, fomentations, and emollient poultices; to make a free opening at the pus is fairly within reach of the knife; to divide all the sinuses, if they communicate with each other, so as to effect the general outlet; and, when the intestine has been hard or perforated, by the confined matter lying upon it, to rip it up with a curved bistoury guided by the operator's finger. Recourse must also be had to internal medicines whenever the patient's health is deranged; and indeed, without such collateral aid, the surgeon's efforts will frequently be in vain. Mr. Pott's observations on this sub-
jeft deserve particular attention.—See the article Fistulous Ulcer.

Abscess in the Grain and Arm-pit. The inflammation and tumefaction which occur in these situations, generally arise from a diseaie in the absorbent glands; sometimes they are occasioned by an injury sustained by a distant lymphatic vessel, communicating with the inflamed gland; and not infrequently such glandular affections are the consequence of a malignant constitutional disorder, such as the Plague or Venereal Disease, when they are denominated Buboes. See these terms in their respective places. From whatever cause abscesses arise in the absorbent system, they are mortally tedious and difficult to cure. See Absorben ts, and their Diseases. But when they happen in the groin or axilla, it is especially requisite to avoid making deep incisions, on account of the large blood-vessels there situated: in other respects they require no peculiar management, except that, being very low to suppurate, it will often be necessary to apply stimulating plasters or cataplasm; and when they arrive at a state of perfect maturation, it will much accelerate the cure to evacuate the pus by a caustic instead of a puncture or mere incision. A fibrinous habit of body very commonly gives rise to glandular enlargements; in such cases it will, therefore, be proper to employ the appropriate internal means, without which external remedies will often prove fruitless. See Scrofulous Tumors and Ulcers.

Abscess in the Loins; otherwise called the Psoas or Lumbar Abscess. The large muscles situated within the loins, and their connecting cellular fulness, are very liable to inflame, and form extensive collections of pus. These are so important and fierce, even under the most favourable circumstances, that comparatively few persons recover from their effects. This condition should urge practitioners to adopt decisive means of relief in the earliest period of the complaint, and never to make light of the symptoms which indicate a fixed inflammation in the lumbar region. When pus has actually formed, we ought not absolutely to despair, but the principal hope lies in preventing its formation; it is, therefore, of great consequence to ascertain the exact state of the patient when he first applies to the surgeon. An incessant lumbar abscess may be suspected, if the patient has been lately exposed to any of the exciting causes of inflammation; if a dull and constant pain affects him in the deep seated muscles of the loins; if this pain be aggravated in raising and rotating the thigh; if a sense of tightness or confinement be felt within the belly, or near the groin, accompanied with external tenderness to the touch; if there be much difficulty in standing erect, or in lying at full length; and if, in addition to these symptoms, the patient be of a delicate and scrofulous habit of body. When matter is formed in considerable quantity, a new set of symptoms and a more decided character will be attached to this disease: the sufferer will experience nocturnal exacerbations of fever, with frequent rigors, inquietude, and lack of appetite; wailing of the body, night sweats, hectic complaints, and an external protuberance in the vicinity of the abscess. The matter, however, does not uniformly fluctuate in any particular spot, but may be felt sometimes about the loins, near the hip, or in the groin, and sometimes at the waist, or towards the bottom of the thigh. This tumor will generally diminish, owing to the retrocession of the pus, on placing the patient in an horizontal position. During the increase of the suppuration, there will often be such a tension of the symptoms, that the patient imagines himself in a state of recovery, until a spontaneous rupture takes place in the swelling, or it requires an artificial opening. Now and then some of the lumbar vertebrae become cavous, from the pressure of the contiguous pus, and the lower extremities are paralyised: the large blood-vessels may be eroded, and there, a speedy termination is put to the patient's existence.

The early remedies to be employed in this disease, before suppuration has commenced, are free topical blood-letting, by the repeated use of fifteen or twenty leeches, or by the scarificator and cupping-glass; the exhibition of saline purgatives; a mild vegetable diet; perfect tranquillity and rest; with repeated blisters, or a large caustic, over the affected part of the loins. But, as suppuration advances, the diet is to be improved; some animal food and wine must be allowed; tonic and acid medicines are to be employed; with country air, moderate bodily exercise, warm tepid-bathing, and cheerful company. When the suppuration is far advanced, if it be judged proper to make an outlet, the best method is to evacuate the pus by a very small oblique aperture, with a broad lancet or crotan. Mr. Abernethy advises us to empty the abscess early and completely; then to bring the lips of the wound in contact, and by means of lint and sticking plaster to keep them together; and over these to apply a suitable bandage. The wound heals, in general, without much difficulty; and requires dressing only once in two days. When the skin again projects, from the pressure of the subjacent matter, another puncture may be made; and thus, the evacuation is to be repeated as often as shall be necessary, avoiding any permanent exposure of the cavity of the abscess. Among the means which have been successfully employed on these occasions, are emetics, injections, opium, cinchona, and electricity; but for a more detailed account of the treatment, we recommend the perusal of Mr. Abernethy's Ellysia, and Mr. Bell's Sylliem of Surgery.

Abscess in the Muscles of the Belly. The principal object in this case, is to prevent the matter from bursting internally; since such an event might prove fatal. The surgeon should therefore open the abscess early, and endeavour to use those kinds of bandages, or compresses, which may obviate future collections, and the formation of painful ulcers.

Abscess of the urinary Bladder. When an accumulation of pus or mucus occurs in the bladder, mild emollient injections may be used by means of a syringe and catheter. This practice has been lately taken notice of as new; but it was recommended by the Arabian physicians, and by some of the oldest European practitioners, who perhaps took the hint from Albuscins.

Abscess under the Cranium, within the cylindrical bones. No other remedy can be here advised, for giving free vent to the confined matter, than perforating the bone with a trephine.

Abscess under the Sternum. When pus lies immediately under the chest-bone, within the duplicature of the mediatinum, the surgeon will not hesitate to apply a trephine. An interesting paper on this subject may be seen in the 15th number of the London Medical Review and Magazine. Mr. Bliss's Observations on a successful case of this kind, are likewise contained in the 4th volume of that work, page 310.

Abscess of the Thorax. See Empyema.

Abscess of the Breast. The mammary abscess may be produced by any of the remote causes of inflammation, but is most commonly occasioned by a redundancy of milk soon after parturition. In general it might be prevented by an immediate application of the infant to the breast after delivery, or at least before they are turbid with milk. See Inflammation of the Breast. When pus is actually formed, a soft, warm, emollient poultice, composed of bread and milk, or of a decoction of poppies and laurel meal, should be constantly kept upon the part, and renewed every three or four hours;
at the same time carefully suspending the enlarged breast, with an alkenkerchief spread under it, and tied behind the neck. It is very rarely proper to make any artificial opening in these abscesses; they should be permitted to burst of themselves, and be pouched as long as the hardness or inflammation continues. During this painful period, the child must be tucked by the healthy breast; for it rarely happens that the milk is pure during a state of inflammation, or that the mother can bear the irritation of her child's attempt to draw the nipple.

It is here necessary to apprise mothers that the true milk-abscesses never degenerate into a cancer, as many persons have ignorantly imagined. Those peals of society, called Cancer-curers, often impose on anxious wives, and persuade them that they have cured cancers of the breast, when none ever existed! At other times, they keep up a false alarm, to the great detriment of women’s health, and the furtherance of their own base designs. See the articles Cancer and Scirrhus.

During the tedious suppurating process, if the patient be not fangrene and robust, it will sometimes be proper for her to live on strong nourishing broths, with animal food, and porter, and to have daily recourse to tonic medicines. Without these means all external applications may prove fruitless. When the abscess leaves a deep ulcer, it should be dressed very lightly with mild warm digestives; and cold air must be guarded against in the convalescent stage, after all the dressings shall have been discontinued. The hardnes in the breast, or around the cicatrix will generally subside of itself; but if it should not, a little oil of sweet almonds, either alone or mixed with palm-oil, should be gently rubbed over the breast twice a-day. In lieu of these, a piece of fresh butter may answer the purpose. Sometimes, however, it is necessary to administer cinta and calomel to reduce the glandular inflammations; now and then superadding the mercurial liniment. But the treatment must vary according to circumstances.

Abscess of the Eye. See Hypopyon.

Abscess of the Ear. See Otalgia.

Abscess of the Gums. Simple gum-boils require no peculiar management: they may be opened with a lancet when the matter lies superficial; but, if they arise from decayed teeth, or a curious jaw-bone, the tooth affected, or the decayed portion of bone, must be removed before the cure can be effected. The mouth may be frequently rinsed, in order to keep the parts clean, and the breath sweet, with a mixture of warm wine, honey, and diluted vinegar; or with some tincture of myrrh and water. See the article Teeth.

Abscess in the Hip-joint and its Injudts. Spontaneous discharges of the hip are very insidious and dangerous. The first symptoms of an approaching disorder in this part too often pass unobserved, or lighted, even by the patient himself. Perhaps it begins with a trilling degree of weakness, lameness, and walking of the limb; which, if it be attentively examined, will be found a little elongated, and likewise depressed on the mates of the affected side. After some time, there will be a pain felt as if it were situated in the knee, especially during the night; but this joint, nevertheless, remains in a state of perfect soundness. The patient soon begins to frown the affected limb, by bearing chiefly on the other leg, and by elevating the heel of the affected side. As his strength fails, he will be seen to grasp the disordered thigh during the act of walking; and before night he will be complaining of unaccustomed weariness. Though he may be naturally alert and cheerful, he will, as the complaint augments, show a great aversion to move; and, in aiming to produce quick exertions, there will be a sudden lassitude, or even danger of falling. The affected limb will afterwards be kept in a bended position as much as possible, and a tendernefs is complained of in the vicinity of the hip-joint. In febrile subjects, the inflammation sometimes advances more rapidly, the general health suffers in proportion to its ravages, the appetite fails, debility and emaciation succeed, night sweats, colliquative diarrhoea, and other hectic symptoms supervene; in short, the local complaint becomes aggravated, suppuration then discovers itself, the exterior part of the thigh enlarges, he concealed pus fluctuates, the limb shortens and is contracted, the various joints yields a fetid puriform discharge, and the head of the thigh bone becomes displaced, or forms an immovable Anchylosis.

Now and then the progress of this disease varies from the course we have described: there may be no external outlet for the matter; suppuration may not be distinctly perceptible; the febrile symptoms may not be very urgent; and the patient may be carried through the different stages of his complaint, with but a small share of bodily pain. This disease, however, most frequently goes on to a fatal termination, involving the ligaments, the cartilages, and bones of the joint in one dreadful destruction.

The general curative means to be pursued in these cases, resemble those we advised in the limbar abscesses: but, too commonly, the aid of the surgeon proves ineffectual. If the subject of an hip-disease be febrile, it may be proper in its insipient state, to administer the vegetable tonics, with preparedatron, and small doses of calomel; at the same time, prescribing the warm sea-bath, country air, local bleeding, passive motion, abstinence from wine, milk diet; and, if the complaint advances, the use of perpetual blisters, caulics, siffes, or feotions, are to be especially relied on. See the treatment of Arthropusosis and White-swelling.

M. Petit, De Haen, Pott, and others, have written on this subject; but, the most satisfactory treatise we have seen, is that of Mr. Ford, intitled, "Observations on the Diseases of the Hip-Joint," 1794.

Abscess of the Abdominal Viscera. Any of the contents of the belly may be the seat of an abscess: the most frequent and remarkable are, a suppuration of the Liver, the Kidneys, and the Mefenteric. In these cases, the peculiar symptoms will distinguish the part affected, and the general principles before laid down must be attended to. When the pus fluctuates externally, and there is a well grounded hope of its being evacuated by an artificial opening, no time should be lost; as it might prove fatal to suffer the spontaneous rupture of a large abscess into the cavity of the abdomen. If there be any particular constitutional affection, the medicinal treatment adapted for such diseases must be like-wise had recourse to. See Hepatitis, Icterus, Scrofula, Tabes Mesenterica, Enzyma, Nephritis, Gastritis, Cystitis, Enteritis, &c.

Abscess of the Thoracic Viscera. As all abscesses are preceded by inflammation, the peculiar nature and order of the symptoms which precede the formation of pus in the thorax, or its contents, will guide the practitioner in his diagnosis. See the articles Carditis, Pneumonia, Pleuritis, Vomica, Phthisis, &c. If matter be seated in the interior substance of the lungs, it will probably find its way into the bronchia, and be coughed up from time to time; but if the pus lies near the surface of that viscus, it is more likely to be discharged into the cavity of the eheft, forming an Empyema. As an evacuation into the bronchia is most desirable, we should ufe all our endeavours to solicit a discharge of the pus in that way. The chirurgical operation
operation for an empyema is described in its proper place.

From what has been said in the foregoing paragraphs, it will not be difficult to determine on the plan of treatment in other cases of abscess. The principal authors to be consulted on this subject are Severinus, Hidadus, Wileman, Heister, Van Swieten, Sharp, Pott, Bell, and Kirkland. Some curious cases are also related, or referred to, in the Bibliothèque Cholet de Medicine;—the compilations of Mangetius, Bernstein, and James;—the Memoirs and Transactions of different learned Societies; and in the works of Bonetus, Forellus, Lufmannus, Tulpiaus, Hilianus, Morgagni, Hortilius, Stalpart, Vander Viel, &c. &c.

ABSCISE, Abscessa, in Conies, a part of the diameter or transverse axis, of a conic section, intercepted between the vertex, or some other fixed point, and a semiordinate. Such are the lines AP, AP, &c. (Tab. Conies, fig. 20.)

A b s c e s s, in a more general sense, is a part or segment of a line, terminated at some certain point, cut off by an ordinate to a curve. As the abscess may commence either at the vertex of the curve, or at any other fixed point; it may be also taken either upon the axis or diameter of the curve, or upon any other line drawn in a given position. Hence there may be an infinite number of variable abscesses, terminated at the same fixed point at one end, whilst the other end of them is at any point of the given line or diameter. In the parabola, each ordinate has one abscess; in the ellipse, or circle, it has two, lying on the opposite sides of its diameter. In the hyperbola also two, both of which lie on the same side of the diameter. It may be observed, in general, that a line of the second order, or a curve of the first kind, may have two abscesses to each ordinate; a line of the third order may have three abscesses to each ordinate; a line of the fourth order may have four; and so on. The use of the abscess is, in conjunction with the ordinate, to express the nature of the curve, either by some proportion or equation including the abscess and its ordinate, with some other invariable line or lines; and hence every different curve has its own peculiar equation or proportion by which it is expressed or defined. When the nature and properties of curves are expressed by algebraic quantities, the abscess is commonly denoted by the letter x.

In the parabola the abscess is a third proportional to the parameter and semiordinate; and the parameter a third proportional to the abscess and semiordinate.

In the ellipse, the square of the semiordinate is equal to the rectangle of the parameter into the abscess, subtracting another rectangle of the same abscess, into a fourth proportional to the axis, parameter, and abscess.

In the hyperbola, the squares of the semiordinates are to each other as the rectangles of the abscess into another line, composed of the abscess and the semiordinate axis. See Conic section, Ellipse, Hyperbola, and Parabola. See also Circle and Curve.

Abscission, in Rhetoric, is a figure of speech, when beginning to say a thing, we break off short, as supposing the matter sufficiently signified, by what has been already said. Cicero, ad Heren. lib. iv. cap. 77.

For an instance: one of her sex, age, and beauty, to be seen alone, at such an hour, with a man of his character—I need say no more.

Ab s i f f i o n is a species of Ellipsis, or Suppression. Scaliger distinguishes it from precision and suppression.

Abscession, in Surgery, denotes the act of taking away some morbid or superfluous part by an edged instrument. In this sense abscession amounts to the same with the Greek "exareia." Cowper speaks of the abscession of a leg; which is more properly called amputation. The abscession of the prepuce makes what we call circumcision. Abscession of the ears is a kind of legal punishment inflicted on persons. In some countries they also practice abscession of the nose on traitors in an army, as a punishment reputed worse than death.

Abscession is more properly used for the operation of cutting away some soft part of the body, when deprived of or grown hurtful. In which sense, abscession differs from amputation, in that the latter is of a solid or bony part, the former of a flabby or membranous one; yet they are sometimes confounded. We say the abscession of a muscle, lip, cheek, or the like. Mr. Shippen gives an instance of the abscession of a portion of the intestines not being mortal. Phil. Tranf. N° 283.

Cheilidens, and some later surgeons, have removed several inches of mortified intestine in cases of diarrhœa hernia.

Abscession is sometimes used by medical writers to denote the sudden termination of a disease in death, before it arrives at its decline. Celsus frequently uses the terms abscessa, to express a loss of voice.

Alchemists also speak of an abscession of the light of a planet, by another planet obstructing it, and joining a third before it. Abscession held a deterioration.

Absconsa, a dark lanthorn used by monks at the ceremony of burying their dead.

Abscence, in S. otis Law, is applied to a judgment pronounced, when a person cited before a court does not appear. No person can be tried criminally in abscence.

Absentee, in History, denotes a person, who is absent from his station, employment, or country. The term has been commonly applied to Irishmen, who reside in Ireland, and do not reside in the country. A parliament under this denomination was held at Dublin, 8 Hen. VIII.

Absinthius phalena, a species of phalena found on the Absinthium.

Absinthites, Absinthiac, or Absinthis, something tinged or impregnated with the virtues of absinthis, or wormwood.

Bartholin mentions a woman whose milk was become absinthiated, and rendered bitter as gall, by the too liberal use of wormwood. Act. Med. tom. ii.

Vino absinthi, or polium absinthiato, wormwood wine, is much spoken of among the ancients, as a wholesome and agreeable drink, and even an antidote against drunk men; though some have charged it with being off-sauce to the head, and liable to cause fever, cephalagias, vomitings, uterine fluxes, &c. Ray also makes it a preventative of vomitings. According to the common account, it is made by infusing the leaves of the plant in a quantity of water. But Pehr thinks it should rather be prepared by fermentation, in order to correct the crudities of the plant, and call forth its volatile spirit. Pauli prepares it even without a distillation. Dr. Boyle prefers the aqua absinthi, or wormwood-water, taken in a small quantity after meals, to the wine; as being less liable to affect the head, and fill it with vapours.

Absinthium, in Botany, is compounded of the privative particle a and lint., delioia, phalera, alluding to the disagreeable taste of the plant. See Artemisia and Wormwood,
ABS

wood, Achillia, Anthemis, Parthenium, Senecio, and Tanacetum.

Anthemis is also a name given to other plants, by differen
t authors; as to dwarf phracon, with leaves divided after the
manner of wormwood; also to the Alpine ebanomis,
with fowther-wood leaves.

ABSIS. See Absis.

Absolute; in a general fense, something that flands
free or independent.

Absolute, in Medecines, denotes a being whose whole
effed does not conffit in a mere habitude or relation to
another.

In which fense absolute flands opposed to relative or re-
spective.

Absolute is more particularly underftood of a thing
which does not proceed from any cause, or does not fubfift by
virtue of any other being, confidered as its cause.

In which fene, God alone is absolute.

Absolute, in this fene, is synonymous with independent, and
flands opposed to dependent.

Absolute also denotes a thing’s being free from condi-
tions or limitations.

In this fene, the word is synonymous with unconditional.

We fay, an absolute decree, absolute promise, absolute ob-
dience.

Absolute government; that wherein the prince is left sole-
ly to his own will, being not limited to the obfervation of any
laws, except those of his own difcretion.

When the Danes made their king absolute, in 1660, they
declared him abfolved from his coronah oath.

Absolute number, in Algebra, is the known quantity or
number which poaffes one entire fide, or part of an equa-
tion; and it is that which Vieta calls homogcneum com-
parisones.

Thus, in the equation $a_n + 16a = 36$, the absolute num-
ber is 36; which is equal to $a$ multiplied by itself, and added
to 16 times $a$.

Absolute equation, in Astronomy, is the fum of the optic
and eccentric equations.

The apparent inequality of a planet’s motion, arifing
from its not being equally diftant from the earth at all times,
is called its optic equation; and this would fubfift if the planet’s
real motion were uniform. The excentric inequality is
caufed by the planet’s motion not being uniform. For the
illustration of this, conceive the sun to move, or appear to
move, in the circumference of a circle, in whose centre the
earth is placed. It is manifest, that if the sun move uni-
formly in this circle, then he must appear to move uniform-
ly to a fpectator at the earth; and, in this cafe, there
would be no optic or excentric equation. But fuppose the
earth to be placed out of the centre of the circle; and then,
though the sun’s motion should be really uniform, it would
not fo appear, when wef from the earth; and in this cafe,
there would be an optic equation, but not an excentric one.
Imagine farther, the sun’s orbit to be, not circular, but
eccentric, and the earth to be in its focus, it is evident that
the sun cannot appear to have an uniform motion in fuch
ellipse; and therefore, his motion will be subjed to two equa-
tions, viz. the optic and the excentric equation. See Or-
thal Inequality.

Absolute Gravity, motion, place, space, lime. See the
respective foldlantives.

Absolute Ablative, in Grammar. See Ablative.

Absolutely, in a general fene, flands opposed to
relatively. It is also used for unlimitedly and unconditionally. In
which fene, the fchoolmen oppose it to secundum quid.

Moreover, it is used by Divines, in opposition to decla-
ratively.

The church of Rome holds, that a prelat can forgive sins
absolutely: the protestants fay, only declaratively, and mi-
imally.

Absolutely, in Geometry, is taken for entirely, or com-
pletely. Thus we fay a thing is absolutely round; in
contradiction from that which is only partly so, as a
sphere, cycloid, &e.

Absolutely, in Grammar; we fay, a word is taken ab-
olutely, absolutoriun, when it has no regimen or go-
vernment. Thus, in the phrase, We fhould pray without
cenfing. The word pray is taken absolutely, as it governs
nothing.

ABSOLUTION, Absolution, in the Civil Laws, &c,
the fentence of fentence, whereby a perfon accused of any crime,
is acquitted, and declared innocent.

Among the Romans, the ordinary method of pronouncing
judgment was this: after the cafe had been pleaded on
both fides, the praetor used the word discern, q. d. they
had faw what they had to fay; then three ballots were
distributed to each judge, marked as mentioned under the
article A; and as the majority fell of either mark, the ac-
cused was abfolved or condemned, &c. If he were abfolved,
the praetor difmissed him with videtur non ficeps, or juce vide-
tur feiceps.

ABSOLUTION, in the Canon Law, is a juridical aet,
whereby a prelat, as a judge, remits the sins of fuch as, up-
on contention, appear to have the conditions requisite for this
purpose.

The Romanists hold abfolution a part of the sacrament of
penance: the council of Treut, feft. xiv. cap. iii. and that
of Florence, in the decrees ad Arminos, declare the form
of the effence of the sacrament to lie in the words of abfolution,
I abfolve thes of thy sins.

The form of abfolution used by Tetzel, in Germany, is
preferred in Seekend. Comment. lib. i. p. 11, and a tran-
flation of it is given by Robertson in his Hist. of Ch. V.
vi. p. 117. It extended to all ecclesiatical censures, and
to all sins, however enormous; it remitted all punishment in
purgatory, and restored thofe who were fuppofed to have
the benefit of it to the holy sacraments of the church, to
the unity of the faithful, and to the innocence and purity which
they poaffeffed at baptism; fo that when they died, the gates
of punishment fhould be flut and thofe of the paradife of de-
light opened; and if they did not die immediately, this
grace remained in full force when they were at the point of
death.

The formula of abfolution, in the Romish church, is ab-
solute: in the Greek church, it is depracitory; and in the
churches of the reformed, declarative.

In the church of Rome there are divers other political ab-
solutions; as,

Absolution a fexis, which is neceffary where a perfon
has been vicifnes to the execution of fentence of death on a
criminal, or has any other way disqualified himself for the
holding of a benefice.

Absolution ad cantalam, is that granted to a per-
son who has lodged an appeal against a fentence of ex-
communication, by which the force of the cenfure is sus-
pended.

It being a maxim, in the papal jurifprudence, that the
fentence flands good, notwithstanding any appeal; this
form of abfolution is sometimes granted until the ifue of his
appeal he known: by means hereof, fome articles, at leaft,
of his excommunication, are taken off; infomuch that per-
fons may converse with him without danger: and besides, in case of death, his sentence is supposed to be of some avail to him.

Absolution is chiefly used among protestants for a sentence, whereby a person, who stands excommunicated, is released or freed from that punishment.

Absorbents, from absorb, to drink up, in a general sense, denote substances which possest the faculty of absorbing, or swallowing up others; such are ashes, clowers, plants, &c.; and cals of various kinds. Ashes are absorbent with respect to water, though not in the degree supposed by Aristotle, from whom we derive a vulgar error, that a pot full of ashes will absorb as much water as it would contain if it were empty. Cloves absorb moisture such a degree, that we are told, if care be not taken in importing them, to keep water, wine, and other liquids at a distance from them, a certain quantity of cloves will, in two days' time, drain a whole hoghead of wine. See Absorbents in the Materia Medica.

Absorbents, or Absorbing Vessels, in Anatomy, denote a minute kind of vessels found in animal bodies, which attract and imbibe any fluid that is brought near their mouths. These vessels are fo minute and transparent as not to be discovered in ordinary dissection; but by great labour, they have at length been detected to abound in every tribe of animals. As these vessels are transparent, their contents are visible, which circumstance occasioned them to receive the different denominations of lacteals and lymphatics. The former were so called, because they imbied the chyle, a milky fluid from the bowels; whilst the latter, containing much lymph, which they had taken up from all the interstices of the body, were therefore named lymphatics.

The lacteal vessels were first noticed at the Alexandrian school by Erasistratus, who observing that they extended from the region of the liver to the bowels, erroneously concluded that they were a peculiar system of vessels, destined for the nutriment of those organs. They were not again particularly noticed till Acelli, in Italy, in 1622, perceiving that the contents of the interstices, and these vessels were similar, rightly conjectured that they absorbed the fluid which they contained from the bowels.

Pecquet, in France, shortly after the publication of the discoveries of Acelli, on opening the large veins near the heart, discovered the chyle not yet incorporated with the blood, and the vessels by which it was poured into the left subclavian vein, and which proved to be the principal trunk of the lacteal and lymphatic vessels, and was named from its situation, by Bartholine, the Thoracic Duct. A little afterwards, in 1651, Rudbeck a Swedish, and Bartholine a Dutch anatomist, discovered vessels resembling the lacteals in structure and office in other parts of the body, and which they named, from their contents, lymphatic vessels.

In Haller's time, although great numbers of lymphatic absorbing vessels had been discovered throughout the body, they did not appear to him completely adequate to perform the function of absorption. They had not then been discovered in birds or fishes, and therefore that great anatomist still retained the idea that the vessels performed, in part, the important office of absorption.

The merit of first demonstrating the absorbing vessels in these tribes of animals belongs to Mr. Hewson, who asisted in the labours of the first eminent anatomical school in London, in which anatomy was most ably taught by Dr. Hunter.

Mr. John Hunter undertook, by experiments, to determine whether the veins asfisted in any degree in the office of absorption. Having conveyed milk, coloured with indigo or saffron, or scented with musk, into the small interstices of an
furnished with numerous valves, which prevent any retrograde action of the fluids, and also prevent any portion of the vessel from losing the weight of more fluid than it contains between its valves. The aborients, however, differ from the veins in these respects, inasmuch as they have a power of contraction, and are able, of themselves, to propel their contents. Whoever reflects on the phenomena of absorption, can scarcely doubt that the portion of the vessels have a contractile power, by which they can impel the fluids to various habitations, whilst they remain transformed by an entirely different one. If these vessels are observed in the dissecting-room, when turgid with the absorbed fluid, their contents will disappear in a certain time of the vessel, and again become visible; a phenomenon that cannot be explained, unless by supposing the vessel to contract at that part, and urge forwards its contents. Haller found that the thoracic duct contracted when flattened, so that there can be little doubt of these vessels being muscular throughout their whole extent. The aborients are found in considerable number beneath the skin of the extremities, and when they arrive at the groins and armpits, they pass through little holes as at the eye of small beans, which are called lymphatic glands. The aborient vessels, as they approach the gland, generally separate into several branches, which terminate in that body, and again about an equal number of aborients emerge from the gland, conjoin, and form one or more principal aborient vessels. The aborients which enter the gland are usually denominated vasa efferventia, and those which go out of it, vasa efferentia. If quicksilver be poured into the former vessels, the gland swells, and a great deal of quicksilver appears to be deposited in it; and afterwards, if the power propelling the injection be continued, it is seen coming out of the gland by the vasa efferentia. It seems therefore to follow, that the progress of the absorbed fluid is checked a little in these glands, and it is probable that some change is effected in it during its passage through them. This opinion is confirmed by observing that these glands abound with blood-vessels, which probably pour some fresh animal juices into those which are contained in the lymphatic vessels.

The lymphatic glands are found in great numbers in the groins, armpits, and by the side of the neck, apparently serving like barriers to the aborients of the head and extremities, as they approach to the large veins of the trunk. The aborients of the interfines, which contain the chyle, a scarcely animalized fluid, sometimes pass through three or four sets of glands before they arrive at the thoracic duct; hence they are called vasa lactea primi, secundi, tertii, and quarti generis. The place where the lacteals conjoin, and meet with the lymphatics from the lower parts of the body to form the thoracic duct, appears in animals like a refervoir, and has been named the receptaculum chyligh. The vessel thus formed by the junction of the lacteals, with the trunks of aborients from the lower parts of the body, having passed through the diaphragm, is there named the thoracic duct. In this situation it lies close upon the vertebrae of the back, between the vena azygos and the aorta, receiving in its passage the aborients of all parts in its vicinity. As it approaches the neck, it leaves the bone to get to the left subclavian vein, in which it terminates just at commencement. As, however, the aborients of the right side of the head, and right arm, would have to deviate considerably were they to end in this chief trunk of the aborbing system, they conjoin and form a similar vessel on the right side, which empties itself into the corresponding part of the right subclavian vein. Thus all the old materials of the body, which the aborients are continually removing, all the new matter imbibed from the surface, all the redundant lymph taken up from the interstices of the body, and all the chyle occasionally obtained from the bowels, are conveyed into the large vein near the heart. It is, in short, chiefly by this system of vessels that the blood is augmented in quantity or altered in quality; they replenish the body with nutrient, and they also occasionally tainted with infection.

**Aborients of the Veins, Distribution of the, throughout the body.**—The aborients of the foot have been injected in considerable numbers from the spaces between the toes; those of the inner side ascend over the inner ankle, and accompany the vena saphena interna. Being joined by others in this course, the trunks thus formed appear like network on the inside of the calf of the leg. These vessels continue in company with the vena saphena interna; and like it, ascend over the inside of the knee and thigh, where their numbers and size increase, and at last terminate in the inguinal glands. These glands vary considerably in number; the greater part of them is placed above the sacroiliac of the thigh, but some are found beneath it, in the hollow between the iliacus internus, triceps, and sartorius muscles. These glands which are highest and nearest to the pubes, receive also the aborients of the genitals. The aborients of the outside of the foot pass behind the outer ankle, and accompany the vena saphena externa up the back of the leg to the ham, where they terminate in the popliteal glands. They, however, communicate by some branches with the superficial aborients on the inside of the leg.

The deep-seated aborients of the leg accompanying the several arteries, which branch off from the popliteal, also arrive at, and end in the glands of the ham, which are small and few in number, seldom exceeding three. The aborients emerging from these glands are large, and accompany the femoral artery to the groin, to terminate in the inguinal glands. Other deep-seated aborients of the thigh, however, enter the pelvis at the inferior apertures of that cavity, and communicate with the vessels and glands contained in it. The large vasa efferventia of the inguinal glands pass beneath Poupart's ligament, and accompany the external iliac artery to the ilons. There is a series of glands placed in the course of the external iliac vessels, which are named the external iliac glands, with which these aborients are connected. Having arrived at the lumbar vertebrae, and being incautiously in size by the accessory aborients, which they are continually receiving, they terminate in the lumbar glands. These are much more numerous than any of the clavicles of glands hitherto mentioned, and quite cover the aorta and vena cava.

The aborients of the genitals terminate, as has been said, in the upper and innermost of the inguinal glands. Some have been injected on the sides of the penis, and others on the middle, accompanying the vena dorsalis; by their junction they form two trunks, which diverge, and proceed to either groin. The aborients of the ferotum accompany the cutaneous veins to the groin, and terminate in the inguinal glands. The tefficles abound in aborients, some of which join with those of the ferotum, and go to the inguinal glands; but the greater part, conflating of large and numerous vessels, pass up the spermatic chord, and along the external iliac vessels to terminate in the lumbar glands. The aborients of the clitoris, and external parts of the organs of generation in females form two divisions, one of which goes, as in the male, to the inguinal glands, the other vessels either pass with the round ligament of the uterus through the abdominal rings, and along the psoas muscle to the lumbar glands, or entering the pelvis at the inferior aperture, they join the aborients of the uterus. The aborients of the hips
hips and mates also pursue a twofold course; some bend round the trochanter, and go to the inguinal glands, whilst the greater number enter the pelvis with the glutaneous and sciatic arteries at the sacro-femoral foramina, and go to the internal iliac plexus of glands. Thus we have traced the absorptions of the lower extremities, and of the parts of generation, and find them either entering the abdomen, and running along the lower part of that cavity to the loins, or ascending through the inferior apertures of the pelvis, and joining the absorptions of that cavity, which we next proceed to describe.

In the pelvis there is a numerous plexus of glands, situated in the course of the internal iliac vessels, and continued toward the obturator foramen; there are also many absorptions of the bladder, after passing through small glands, placed by the side of that viscus, proceed to the internal iliac plexus. The absorptions of the rectum proceeding through the sacral glands pass on to those of the loins. The absorptions of the uterus form two sets, according with the blood-vessels in this respect; those which accompany the uterine vessels pass through glands by the side of the vagina, and proceed to the internal iliac plexus. Those which accompany the peritoneal vessels terminate, as in the male, in the lumbar absorptions.

The absorptions of the kidneys pursue the same course as the renal blood-vessels, and terminate in the lumbar glands. The absorptions of the intestines, commonly called the lacteals, are extremely numerous on account of the function which they have to perform, and abound more in the jejunum than elsewhere, as the chyle is chiefly absorbed from that intestine. The course of these vessels is through the mesenteries, where they communicate with glands, the number of which is stated to be between 100 and 150.

The lacteals have been traced through three or four series of these glands, and have been denominated vasa lacteae primi, secundi, tertii, et quarti generis. The lacteals form one or more large trunks as they approach the superior mesenteric artery, which join the thoracic duct. The absorptions of the large intestines pass through glands situated near them, which are very few, and not numerous. Those vessels which arise from the ascending and transverse arch of the colon terminate in the lacteals near the root of the mesentery. Those absorptions which arise from the descending and sigmoid flexure of the colon proceed to the lumbar glands and thoracic duct. Having thus described the principal absorptions that contribute to the formation of the thoracic duct, that vessel may in the next place be attended to. Large trunks of absorptions may be traced in the course of the iliac vessels, converging to form this duct; to these are joined the large trunks of the lacteals, and they unite low down upon the loins. In animals, and particularly in dogs, they terminate in a dilated pyriform cell, which is called receptaculum chyli. This appearance, though sometimes observed, is more frequently wanting in the human subject. At the first vertebra of the loins the thoracic duct gets above the diaphragm, and lies between the vein azygos and aorta on the right side of the bodies of the vertebrae; it is sometimes double, and then the second branch lies beneath the aorta on the left side; at all times large lymphatics are found also in this situation.

The dimensions of the thoracic duct gradually lessen till it has reached the middle of the back, and then again enlarge. At about the 8th dorsal vertebra it generally divides, and afterwards reunites. Having got above the arch of the aorta, it leaves the spine, ascending and inclining to the left side to reach the subclavian vein, in which it is to terminate. It passes beyond the vein and main branches, and empties itself into the venous system at the angle made by the junction of the internal jugular and axillary vein, as they unite to form the left subclavian vein. At the termination of the thoracic duct we find valves, which prevent the blood contained in the veins from flowing into that vessel.

During this course, the thoracic duct receives the absorptions from various parts of the body, of which we now proceed to give some account. It may be proper to mention that there is a similar duct on the right side of the body, generally less than half an inch in length, which terminates in the corresponding angle, made by the junction of the right internal jugular and axillary veins. This duct is formed by the concourse of the absorptions of the right upper, the right side of the head, and those accompanying the right internal mammary vessels.

The absorptions of the omentum pass through very fine glands, situated near the great arch of the aorta, and there join with those belonging to that viscus. The absorptions of the stomach accompany its arteries; those corresponding to the left gastric join those of the spleen and pancreas, and terminate in glands, extending themselves along the pancreas and splenic vessels. Those which are found in company with the right gastric artery, pass beneath the duodenum, and terminate in the same glands with the deep-seated absorptions of the liver, to which they are connected. Those which accompany the coronary artery on the lesser curvature of the stomach, pass through glands situated about that part; they then in general descend to the glands beneath the duodenum, and terminate in the thoracic duct; others, however, may be traced through the cardia to the thoracic duct. The absorptions of the spleen and pancreas, when they arise from those vasa, pass through glands extending along the splenic vessels, and are afterwards connected to the thoracic duct. The absorptions of the liver, which are extremely large and numerous, proceed from its convex surface through the right and left, and suprarenal ligaments of that viscus; some of their branches descend upon the diaphragm, and terminate in the thoracic duct; others accompany the internal mammary vessels on the inside of the sternum, and those of the right side end in the right trunk of the absorptions. Some of the absorptions from the interior part of the liver, escape from its posterior edge, and join those superficial absorptions. The deep-seated absorbing vessels of the liver rarely in its substance like the vena portae; they come out where that vessel enters the gland, and being joined by the superficial absorptions of the concave surface of the liver, they pass through numerous glands situated in the capsula Glisonee; and afterwards join the thoracic duct. The absorptions of the diaphragm are numerous, and join with, and augment those large trunks, which arise from the liver and penetrate that membrane. Both these sets of vessels are connected with glands, situated towards the front of the thoracic surface of the diaphragm, on each side of the pericardium. The absorptions of the heart are found in company with its nutrient vessels; the trunk of absorptions belonging to the right coronary artery passes by the side of the aorta to a gland near the origin of the right carotid, and terminates in the right trunk of the absorbing system. The absorptions accompanying the left coronary artery, which are much larger than the former, proceed with the pulmonary artery to glands near the trachea, are there conjoined with the pulmonary absorptions, and empty themselves into the thoracic duct.
the thoracic duct near its termination. The absorbents of the heart pass through the cardiac glands, which are situated about the arch of the aorta.

The absorbents of the lungs may be distinguished into the superficial and deeper situated. Those on the surface are distributed in the areole, surrounding the small tubules of those organs, and appear like the threes of network. The deeper situated absorbents which communicate with the others, emerge where the air-vessels enter the lungs, and both classes terminate in the bronchial glands, which are numerous, and surrounding the bronchial. Those glands are also connected with those belonging to the heart, so that both sets of glands frequently participate in the same disease. Three or four large trunks of pulmonary absorbents proceed more immediately, or more remotely, to pour their contents into the thoracic duct; the upper ones do not reach that vessel till it approaches its place of infection in the venous system.

Numerous absorbents have been seen upon the cæphagus, and there are many glands placed along the course of that tube. The absorbents of the cæphagus conjoin with those of the heart and lungs. Absorbents have been injected in company with the intercostal blood-vessels, which pass through two small glands, situated near the head of each rib, and then enter the thoracic duct. The superficial absorbents of the upper extremity accompany the superficial veins, those from the palm and outside of the hand, near the little finger, run up with the ulnar veins over the internal condyle, and then accompany the basilic vein to the axilla, when they enter numerous glands situated in that part. Those absorbents, however, previously are connected with several glands, which are situated in the course of the basilic vein, one of which is found as low as the internal condyle of the os brachii. The absorbents of the thumb, and the outside of the hand in its vicinity accompany the radial veins to the elbow, and then ascend on the outside of the biceps muscle with the cephalic vein. Arriving at the deltoid muscle they bend along its inner edge, and pass between it and the pectoral muscle to glands situated beneath the clavicle. Other cutaneous absorbents have been injected from the palm of the hand, accompanying the median veins in the forearm between these two ducts, which afterwards terminate in thosé, which accompany the vena basilica. The deep-seated absorbents of the arm are found by the sides of the large arteries, and go to the glands of the axilla. The absorbents of the shoulder also terminate in the same glands. The axillary glands, and those beneath the clavicle are connected together, and their vast expanse conjoining form a large trunk, which terminates in the thoracic duct on the left side, and is one of the principal vessels forming the corresponding trunk of absorbents on the right side.

Absorbents have been injected on the outside of the head in company with all the principal arteries: for instance, the temporal, occipital, external, and internal maxillary arteries; those from the temple pass through small glands found on the parotid gland as high as the zygoma: those from the face in glands, situated in the cheeks and outside of the jaw: those from the occiput in glands, situated behind the masticoid process. They afterwards converge, and with the deeper-seated absorbents terminate in the most numerous cluster of glands found in any part of the body, excepting only those of the meataltery. They have been named glandulae constantanæ, and extend beneath the jaw, over the side of the neck, where the external jugular veins are found, and all along the internal jugular to its termination. No absorbents can with certainty be said to have been injected in the brain. The absorbents of each side of the neck having by conjunction formed a common and large trunk, it terminates on the left side in the thoracic duct near its insertion, and on the right it contributes to form the corresponding trunk. The absorbents of the thyroid gland form two vessels of considerable size, which end in these two ducts near their termination. Some of the absorbents of the bréat, which are very numerous in females, proceed to the axillary glands, being previously connected with some small glands, situated midway between the breast and axilla; others pass over the pectoral muscle to the glands, beneath the clavicle, and others from the back part of the breast penetrate the intercostal muscles, and join the absorbents and glands, which accompany the internal mammary blood-veins.

Naturalists, as Malpighi, Leeuwenhoek, De la Hire, &c. speak of similar absorbents in plants; the fibrous or hairy roots of which are considered as a kind of vasa absorbentia, which attract and imbibe the nutritious juices from the earth and air. From the sap-veissels they pass into the whole cellular tissue, composed of vessels and closely interwoven with the whole vascular part of the plant. Thence they enter the vasa propria and glands, which contain and prepare the fluids and secretions peculiar to the species. See Plants and Vegetation.

Absorbents, Diseases of the, in Surgery. When we consider how recently the structure and use of the absorbent vessels have been explained, it is not surprising that practitioners are too neglectful of this branch of pathology. Until these last five years, we have not met with one publication on the diseases of the absorbent system; and even to the present day we do not profess a single work upon this subject in the English language. A few scattered hints, indeed, are contained in the writings of several authors; but it still remains a deliquet, to point out—What are the peculiar morbid affections of the lymphatic glands and vessels, and what are their appropriate remedies? To solve this enquirer in a satisfactory manner, would occupy an entire volume. We can, therefore, only throw out a few casual hints, and recommend the further prosecution of the subject among medical men.

1. Of morbidous fluids contained in the absorbent system.

We know, from the experiments of physiologists, and especially of Mr. Abernethy, that the absorbents which open on the surface of our bodies, imbibe both aqueous and gaseous matters derived from the atmosphere, or from substances lying in contact with the skin. It is debatable to have the precise nature of these matters ascertained in different persons, under the various circumstances of health and disea; and to determine the means which are advisable, in order to regulate their quantities or qualities. If our health may be affected by the absorption which goes on upon the external surface of the skin, there is equal reason to believe we are sometimes influenced by the nature of the vapours that must be constantly issued from the pores, reservoirs, or interstices of the body. When the synovia, the bile, the semen, and other secreted fluids become inflamed, this change arises from the more watery parts having been absorbed and carried into the sanguineous system by the lymphatic vessels. When serum, pus, or blood has been, effused among the cellular membrane, its disappearance is entirely owing to the activity of the absorbents. In a drop or an empyema, the same agents are occasionally set to work, and will effect a removal of the disease. Other examples might be adduced to illustrate the different ways in which the absorbent vessels may be irritated and undergo a morbid change from the quality of their contents, not
to mention the noxious vapours applied to them by means of contagious disorders.

11. Of irregular action in the absorbent vessels.

The irritability or contractile power of the absorbents may be preternaturally weakened; and in that case, probably, there will be an accumulation of the secreted fluids in one or more of the different natural cavities or interstices of the body; for, unless the action of the absorbents keep pace with that of the exhalant or secreting arteries, the natural equilibrium must inevitably be destroyed. Thus it happens in dropsies; either the arteries deposit a larger quantity of serum than can be carried off by the natural power of the absorbents; or, the latter are defective in their action, and cannot take up their usual proportion of fluid. The different causes and remedies of diminished or increased action in this system of vessels is, therefore, an important object of enquiry.

111. acuaj's changes in the structure of absorbents.

Anatomists have taught us to look for various alterations in the structure of absorbent vessels and glands, under particular circumstances of disease. The diameter of these vascular bodies is often entirely obliterated by external compression or other causes. They may be ruptured, wounded, lacerated, or eroded. They may be thickened in their coats, or rendered unfit for use by excessive inflammation and suppuration.

It would be entering into a very wide field of enquiry, to consider what changes the absorbent glands and lymphatics undergo in consequence of the absorption of morbid poisons; for example, in cancer, in syphilis, in the yaws, in the various morbid, morbid, and vaccine diseases, &c. &c. But this subject, we particularly commend the perusal of professor Soemmerring's Dissertations, De morbis vasorum absorbentium corporis humani, 8vo, 1795; Dr. Bailer's Morbid Anatomy, 2d edition; Macquain's Splendid work, De Venae Lymphatici; Mr. Cruickshank's book on the Anatomy of the absorbing vessels, 2d edition, 4to; Adams on Morbid Poisons; and the concluding part of Dr. Darwin's Zoornonos, vol. i. 3d edition, 8vo.

Connected with this subject, it may also be worth while to peruse a curious original piece, intitled, an Essay on external Re- mices, wherein it is considered whether all the curable distempers incident to human bodies, may not be cured by outward means. By P. Kennedy, Chir. Med. 8vo. London. 1715. Respecting the latter work, the author says, "there has never, as yet, any thing been attempted of this kind." Introd. p. 5.

Absorbents, or Absorbent Earts, in Chemistry, are thote earthy substances which are capable of imbibing by capillary attraction a large proportion of water: such are magnesia, lime, and clay. It is, however, only when these bodies are dry and porous, that they exhibit this property; for certain gins, which are pure argil, and calcareous, snap, which, chemically speaking, is the same with chalk, are not in the least degree absorbent. Hence appears the impropriety of this term in chemical nomenclature. Indeed it is at present almost discarded.

Absorbents, in the Materia Medica, comprehend those medicinal substances, which, taken inwardly, or applied externally, are adapted to dry up or absorb redundant or acid humours. They are sometimes called driers and sweeteners, and by the Latin writers the word is synonymous with imbibentia and saturnia. The term has been occasionally confounded with alkali, because alkalis have the effect of absorbents with respect to acids. It is now almost restricted to certain earths, which are distinguishable from others by their solubility in acids, and which are fitted to imbibe acids, and at the same time to destroy their acid quality. In reference to this property, some have referred them to the class of Antacids. Of the absorbents we may reckon the mineral calcareous earths, aschans; the animal calcareous earths, as crab-claws, oyster-shells, egg-shells, pearl, coral, and coralline; and animal earths, not calcareous, as crab-eyes and burnt hartshorn. The obvious and immediate virtue of these, that is, to absorb acid humours in the first passages, and thus to relieve the cardia and other complaints occasioned by them; and they possess different properties, and produce different effects, according to the materials which they absorb, and by which they are diffused. The relief they give is often merely temporary, as they serve to absorb the acid actually generated, without correcting the indisposition which tends to produce it. In some cases they are injurious, for if there be no acid humours in the stomach and intestines, these earthy bodies not being soluble by any other kind of fluid, concrete with the vitreous contents of the stomach, and form with them indigestible mafyes, which may be very hurtful. Hence have proceeded indigestion, loss of appetite, nausea, vomiting, obstructions of the bowels, and other disorders. Sometimes they have formed a kind of crust on the stomach and intestines, which has prevented the separation of the gastric liquor, and obstructed the passage of the chyle through the orifices of the lacteal vessels into the masts of blood. The taking of an immoderate quantity of crab-eyes and other absorbents for the heart-burn, has sometimes been attended with fatal consequences. See Phil. Trans. No. 459. Sect. 2.

It is observed that absorbents are of more general use in infancy than in adult age. Young children are more subject to acidities than adult persons, because their food is chiefly of the vegetable accecent kind, and produces acidities, which are attended with alarming symptoms, and productive of various disorders. When infants, or persons of mature age, but of a feeble constitution, indicate complaints of this kind by four cutations, paleness of the face, and in the case of children by the four fum and green colour of the alvine fucses, absorbent medicines may be very properly administered. The other cordial, aleipharmia, antiflery, and similar virtues ascribed to these medicines, seem to be founded on an erroneous theory, which attributes the acute difeases of adults to a morbid acid; difeases which, instead of being produced, are more successfully subdued by acids. The use of absorbents, says Dr. Lewis (Mat. Med. p. 643), in different kinds of fevers, is nevertheless still continued, and sometimes perhaps with advantage; for though the earths of themselves are apparently rather injurious than beneficial, yet as acids are often given freely at the same time, the solution of the earth in the acid may prove a medicine more serviceable in particular cases than the acid unadulterated. Different absorbents have been selected and recommended for particular purposes. If it be the intention to absorb, conferinge and lighter, then at the same time, chalk, coal, oyster or egg shells, are esteemed the most efficacious absorbents; if for restraining a febile flux, some prefer the cuttle-bone; for provoking urine, crab-eyes; for promoting perspiration, burnt hartthorn; and for dissolvin g coagulated blood, crab-eyes dissolved in vinegar. But all these differences have not yet been sufficiently determined by experience, because the earths have rarely been given in a dissolved or soluble state. It is most probable, says Dr. Lewis, that they all act, when dissolved, as mild cooling re- stringents; for when they are given in substance, as absorbents, in cases of acidities, they all tend to restrain fluxes of the belly, or to bring on colicknays; an effect which should be regarded in the use of them. It is, therefore, a necessary caution to drink diluting liquors with them; and also
ABS

Experiments have been made for determining the comparative strength of different absorbents, or the quantities of acid they are capable of satiating. Langius (Op. Med. L.ips., p. 453) reports, that 10 grains of crabs-claws destroyed the acidity of 40 drops of spirit of salt; that egg-shells, crab-eyes, and mother-of-pearl, taken in the same quantity, satu rated 50 drops each; red coral, white coral, and fixed alkaline salt, 60 drops each; volatile alkaline salt and pearl, 80 drops each; chalk, 100 drops; oyster-shells, 120; and some lime-ones, 160. These experiments cannot be much relied on, as earths have different habits to different acids. Accordingly Homberg concludes from his experiments, (Mem. Acad. Royal. des 5. de Paris pour l'an 1703) that oyster-shells require for their solution more of the marine acid than coral does; whereas the caele is the reverse with the nitrous acid. But neither of these acids is that which absorbents are designed for satiating in the human stomach. The vegetable acids, and the acid of milk, are most analogous to those which are generated in the animal body; and on trying these with the several substances above enumerated, the differences in their absorbent powers appeared not to be very great. Lewis Mat. Med. 445.

ABSORBING, in the art of sucking up, or imbibing another body. Sir Isaac Newton shews that black bodies absorb all the rays they receive, and that those rays of light which impinge against the solid particles of bodies are absorbed and lost; but it appears from some later experiments and observations of M. Daubrée, that this effect is to be attributed, not to the impact of light on the solid parts of bodies, but to the action of some power diffused over their surfaces. He found by repeated trials on the reflection of light, from the surface of water, and of different pieces of crystal, that a considerable quantity of light, when the angles of incidence were small, was actually extinguished. This effect, he observed, was diminished by increasing the incidence; so that at an inclination to crystal of above 45° or 47°, a very small part of the rays was absorbed; though some few were lost, when they fell perpendicularly on the reflecting surface. See his Traite d'Optique. Paris 1760.

ABSORPTION, in the Animal Economy, is the function performed by the Absorbent vessels above described. The only opportunity which anatomists have hitherto met with of observing the orifices of these vessels, is upon the villous coat of the intestines. The accounts which have been given of them in that situation are so various, and delivered with such little confidence as not to warrant the insertion of any description. The internal coat of the intestine is seen streaked with chyle coagulated in the mouths of these vessels, in persons who have died when the absorption of that fluid was carrying on. The evident reluctance with which the absorbents admit noxious matter has led to the general belief, that their mouths are irritable, and have the power of denying admission to stimulating substances. Various theories have been formed to account for the admission of matter into the orifices of the absorbing vessels; but whichever theory be adopted, it is previously necessary to admit a corresponding aptitude in the vessel to receive, and in the matter to be received. This being granted, some physiologists have imagined that the absorbent attracted matter into its mouth, in the same manner that capillary tubes imbibe fluids. A little reflection is sufficient to shew that the absorbing vessels are not circumstanced like capillary tubes (the sides of which are rigid) immerged in a fluid. Besides, were such attraction the cause of absorption, that process should be carried on with regularity. On the contrary, absorption is occasionally very deficient when an abundance of fluids, as in edema, is presented to the mouths of the vessels. This fact may indeed be explained by supposing the orifices of the vessels to be in a contracted state, but the contrary problem is more difficult of solution. In the course of one night a pint of pus may be imbied from the cavity of an abbeeds, and sometimes absorption is so excessive that the very substance of the body is in parts removed, and chafins in consequence created.

Other physiologists have endeavoured to discover some propelling power which should promote the mattersubject to absorption into the mouths of these vessels. The presure of the atmosphere on the surface of the body has been considered adequate to this effect, and the deposition of new matter by the fecerning artery has been assigned as the cause of the propulsion of the old particles into the orifice of the absorbent. Were this theory correct, secretion and absorption should more exactly correspond than they are known to do; like the former theory, it appears inadequate to account for the facts above stated.

Mr. John Hunter who contemplated the facts of natural and morbid absorption in animal bodies with the most steady and attentive, acknowledged that he was unable to account for the effects produced, unless by attributing to the mouths of these vessels powers similar to those which a capillary exerts when feeding upon a leaf. This idea, however, has generally been considered as too wild and chimerical.

Doctor Fullarton, in his ingenious Thesis on absorption, published at Ghent in 1805, attributes to the absorbing orifices a power of suction, which opinion he supports not only by arguments but by analogies. The umbilical tube of the embryos of the fepia and polypi is said, on the authority

v. art. 29.
tority of Albinus, to absorb by suction. The pro-
bolics of the papilionaceous flies acts in the same man-
ner. And the absorbents of the echinus marinus have
this power in so great a degree as to enable the animal
firmly to attach itself to any substance which it may hap-
pen to touch. It may be right to remind the reader that
the difficulty in accounting for the function of these vessels
exists only at its commencement, for when the imbibed mat-
ter has gone beyond the first valve it must proceed, and it
will be powerfully carried forward by the contractile force of
the vessel, and by every occasional preffure which is applied
to it. Some physiologists believe that the absorbents can-
take up any matter that is not fluid. If this opinion
were true, the solids of our bodies must be converted into
fluids before they could become subjects for absorption. A
small addition of phosphoric acid might indeed render the
earth of bones soluble, and it is in this state, that it is car-
rried out of the circulating fluids by the urinary secretion.
No liquid has been conceived capable of diffusing such solids
as compose the muscular fibres, but one that resembles in
qualities the galingales. Dr. Stringham, in his Thesis
on the absorbing vessels published in Edinburgh, and Mr. Smith in
London, imagined they had discovered that such a fluid capable
of diffusing flesh, could be secreted in various parts of
the body. See Duncan’s Med. Com. vol. x. p. 354.
Subsequent experiments have, however, been followed by con-
trary conceptions. See Dr. Fullarton’s Thesis on absorption,
published at Glasgaw, A.D. 1800. Indeed it is un-
like the simplicity observable in other parts of the animal
oeconomy, should such a double secretion take place; first,
the secretion of solid materials to compose the structure of
the body, and then the secretion of a fluid to diffuse them.
It seems best in such difficult investigations to note facts
rather than to form theories, and whoever contemplates the
things done in the animal body will be astonished at the
powers of the vessels by whose agency they must be effected.
As an instance, the following may be mentioned. A whole
bone may perish, it may be encased by a new one; and by
the vascular lining of the new bone, the original dead bone
may be altogether removed.

Absorption, in Chemistry. It is a well known chemical
fact, in most cases of combination of gaseous substances,
either with other gases or with liquids or solids, that a very
considerable diminution of volume is experienced. This
effect is called absorption, to distinguish it from the de-
crease of bulk occasioned by condensation. The condensa-
tion of a gas, whether by mechanical preffure, or by lowering
its temperature, merely increases its specific gravity, without destroying that state of elastic fluidity which is
essential to its existence as a gas. On the contrary, the ab-
sorption of a gas implies such an intimate union with the
absorbent as wholly destroys its gaseous state of exis-
tence, and reduces it to a liquid or a solid. Thus carbonic acid
and ammoniacal gasses, if included in separate vessels may be
condensed, by mechanical means, till they are of much
greater specific gravity than ordinary, but yet retaining all
the physical properties of air: as soon however as these
gasses are brought into contact with each other, a great
absorption takes place, and a solid is produced containing
all their gravitating matter, but wholly deprived of the
essential character of a gas.

In pneumatic chemistry, or that branch of the science
which treats of the aëroform substances, the apparatus for
containing the gasses consists of jars or other glass vessels
inverted in water or quicksilver; now on account of the great
difference in specific gravity between these fluids, whenever
a jar partly filled with air, and the rest of its capacity with
quicksilver, is transferred from a basin of quicksilver to one
of water, the metal descends, and is replaced by a column
of water, at the same time that an apparent absorption takes
place: this fallacy has no doubt often misled the results of
experiments, and therefore deserves to be particularly con-
tended against. For example, if an inverted jar be placed
high, containing eight inches of air, and fix of mercury, (the
barometer standing at 30°,) the pressure of the atmosphere
on the confined air is = 30 inches of mercury - 6 inches =
24 inches; but if the jar, with its contents, be removed into
a basin of water, the quicksilver sinks down and is replaced
by water, in consequence of which the atmospheric pre-
sure on the confined air becomes = 30 inches of mercury
- 6 inches of water, or (the specific gravity of mercury to
water being 14.1 = 29.572 inches. The difference here amounts to full one fifth of the whole atmospheric pre-
sure, and therefore the imbibed air occupies less space than
before, although no real absorption has taken place. See
Pneumatic Chemistry.

Absorption of the earth, in Natural History, a term
used by Kircher and others, for the sinking in of large tracts
of land, by means of subterranean concretions, and many
other accidents.

Pliny (Hist. Nat. tom. i. p. 115. Ed. Hard.) tells us,
that in his time the mountain Cybotus, with the town of
Curites, which stood on its side, were wholly absorbed
into the earth, so that not the least trace of either re-
main’d: and he records the like fate of the city of Tantalis
in Magnesia, and after it of the mountain Sybilus, both
thus absorbed by a violent opening of the earth. Bolsius
and Gaufus, towns once famous in Phocinia, are recorded
to have shared the same fate: and the vault promontory, called
Phegium, in Ethiopia, after a violent earthquake in the
night-time, was not to be seen in the morning, the whole
having disappeared, and the earth having closed over it.
These and many other histories, attested by authors of
great credit among the ancients, abundantly prove the
fact in the earlier ages; and there have not been wanting
too many instances of more modern date. Kircher’s Mund.
Subter. p. 77.

The mountain Pius, in one of the Molucca islands, was so
lofty, that it appeared at great distances as an immense
column reared erect in the air, and served as a landmark to
sailors; an earthquake in this island destroyed it; at one
instant the whole mountain was absorbed into the bowels
of the earth, and no mark of its place remained, but a vault
of water exactly answering to the shape of the base of
the mountain. A like accident, but of a more terrible
kind, happened in China, in the year 1556, when a whole
province of the mountainous parts of that kingdom was in
one moment absorbed into the earth, and all the towns buried,
the whole number of the inhabitants, with it, and an
immense lake of water remaining in its place to this time.
Of much later date is the destruction of a city in the
 confines of Switzerland: but this, though generally said to
have been swallowed up into the earth, was not properly an ab-
sorption, for the whole city was buried by the fall of a
mountain upon it.

The burning mountains, Vesuvius and Storngylus,
both once very high, have in length of time left hold of their
height, the upper part having been undermined by the
burning, and having fallen into, and been swallowed by the
under part and the sea. And in the year 1647, during the
terrible earthquake in the kingdom of Chili, several whole
mountains in the Andes discovered, and were one after
another wholly swallowed in the earth.

These, and a thousand other accidents of the like kind,
prove the truth of abstractions in general; some of them
leaving heed ground in the place of the things abstracted, some
immediate chuses and cracks, and some lakes of fresh or salt
water; and it may be that many immense lakes were formed
in ages, of which we have no histories, by the like abstractions.

Pliny gives in many accounts of the心里ing of places thus
abstracted, but later observations do not give an equal credit
to those parts of this history.

There are instances, however, of islands being produced,
though we cannot affirm them to have appeared in the place
of any which have been abstracted.

In the year 1638, an island was raised near St. Michael's
in the Atlantic ocean, by subterranean fires, which threw
flames and other subterranean productions, in such quantities
that they formed an island of five miles in length.
The mountain raised in one night, in the sea near Pizzoli,
is another instance of this sudden production of these
mountains: this appeared after one night's violent subterranean
conflict, and still keeps its place, and is known by the name
of Mons Sancius. See Iceland.

ABSTEINEN, in Geography, a district near the river
Memel, in Little Lithuania. It is a mountainous and pleasant
country, and on account of its fertility in corn and pasture,
called the larder of Lithuania. It abounds with
flocks of sheep, various kinds of grain, and excellent horses.

ABSTEMII, in Ecclesiastical History, a name given to
persons who could not partake of the cup of the Eucharist,
or account of their natural aversion from wine.

ABSTEMIOUS, is properly understood of a person who
refrains absolutely from all use of wine.

It is compounded of ab, from, and timetum, wine.

The history of Mr. Wood, in the Medici. Trans. vol. ii.
p. 261. art. 18, is a very remarkable exemplification of the
very beneficial alterations which may be effected on the human
body, by a strict course of abstinence.

The Roman ladies, in the first ages of the republic, were
all enjoined to be abstemious; and that it might appear,
by their breath, whether or not they kept up to the injunc-
tion, it was one of the laws of the Roman civility, that
they should kiss their friends and relations whenever they
accosted them.

ABSTEMIUS, Laurens, in Biography, a native of
Macerata, in Italy, who made a very considerable progress in
police literature, to which he devoted himself early in life.
He taught the belles lettres at Urbino, where he was librarian
to Duke Guido Ubaldus, under the pontificate of Alex-
ander VI. His works are Notes on different passages of an-
cient authors: Hecatomthium, or a Collection of 100
Fables, which have been often printed with those of Elop,
Phrased, Gabrias, Asienus, &c. and a preface to the edition
of Aurelius Victor, published at Venice, in 1505.

ABSTENTIUS, among Civilians, is understood of an
heir with-held by his tutor from taking on him an inheritance.
Among Ecclesiastical Writers, the word is also used for a per-
son excommunicated.

ABSTERRENTS, or Abstresive medicines, more
usually called among physicians detergents, are medicines
which not only wash off adhering substances, as ablutions,
but are supposed to poiffe a power of revolving and loosening
their cohesion. But the terms are too general, and are
often erroneously applied upon a false supposition, that they
have a power of revolving viscous substances, which water
simply, as an ablaut, cannot effect.

ABSTINENCE, derived from abstinere, formed of ab,
from, and tenere, to hold, in a general sense, the act or habit
of refraining from something to which we have a propensity,
or in which we find pleasure.

The Jews were obliged to practice various kinds of ab-
stinence by their law. The Pythagoreans were accustomed,
upon being initiated into the fraternity of the fcelat com-
panions and friends of Pythagoras, to abstain from animal
food, except the remains of the sacrifices, and to drink no-
thing but water, unless in the evening, when they were
allowed a small portion of wine. Some of the primitive
christians also abstained from the use of particular kinds of
food, whilst others treated their abstinence with contempt.
See Rom. xiv. The council of Jerusalem, which was held
by the apostles, enjoined the christian converts to abstain
from meats unslanged, blood, fornication, and idolatry.
Acts xv. 20. The abstinence, called ritual, which consisted
in abstaining from particular meats at certain feasons, was
introduced by the Romish church, preferred by rules, de-
nominated Rota tions, and grossly abused. The church
of England also recommends certain days of falling and ab-
stinence.—Abstinence from flesh has been enjoined by statute
even since the Reformation, particularly on Fridays and Sa-
aturdays, and on Vigils, and all commonly called fish-days,
2 and 3 Ed. VI. c. 19.—The like injunctions were re-
newed under queen Elizabeth, but at the same time it was
declared, that this was done, not out of motives of religion,
as if there were any difference in meats, but in favour of the
consumption of sea-fish, and to multiply the number of fishermen
and mariners, as well as spare the flock of sheep.
5 Ediz. 15. The great fall, says St. Augustin, is to ab-
stinence from sin. See Fast.

The ancient Athlete lived in a perpetual abstinence from
all kinds of sensible pleasures, to render their bodies more re-
built and hardy.

Abstinence is more particularly used for a spare diet,
or a flender paffimious use of food.

The Physicains relace wonders of the effects of abstinence
in the cure of many disorders, and in protracting the term
of life. The noble Venetian Cornaro, after all imaginable
means had proved vain, so that his life was despaired of at
forty, recovered, and lived to near a hundred, by mere dint
of abstinence, as he himself gives the account.

Many of the christians of the ealt, who retired from per-
secution into the deserts of Arabia and Egypt, lived in
health and cheerfulness to a very advanced age on very
little food. According to Caftian, the common allowance
for twenty-four hours was twelve ounces of bread, and wa-
ter; and yet with this abstinence St. Anthony lived 105
years, James the Hermit 124, Aricius, tutor of the em-
peror Arcadius, 130; Epiphanius 115; Simeon the Sy-
lite 112; and Romauld 120. Buchanan informs us, that one
Laurence attained to 140, by temperance and labour; and
Spotwood mentions one Kentigern, called St. Monga or
Mungo, who lived to 185 by the same means. See Lon-
evity.

Most of the chronic diseases, insirmities of old age, and
the short lives of Englishmen, are owing, according to Dr.
Cheyne, to repletion; and may be either cured, prevented,
or remedied, by abstinence.

Abstinence, however, should be maintained with diffec-
tion, and with a due regard to age, sex, climate, exer-
cise, disposition to corpulence in the individual, and various
either circumstances; without a reference to which, it may
be pursued to a veryhartful extreme. It is certain, that
many persons have irreparably injured their constitutions by
excessive parimony; and those who, either by design or ac-
cident, have failed long, seldom enjoy good health after-
wards.

Among the brute creation, we see extraordinary infirmities
of long abstinence.—It is the natural course of divers species
te pafs four, five, or six months, every year, without either eating or drinking: accordingly the tortoise, dormouse, serpent; &c. are observed regularly to retire, at certain seasons, to their respective cells, and hide themselves; some get into the caverns of rocks, or ruins; others dig holes underground; others get into the woods, and lay themselves up in the clefts of trees; others bury themselves under water, &c. See SLEEPERS.

The serpent kind bear abstinence to a very great degree. We have seen rattle-snakes that have subsisted many months without any food, yet still retain their vigour and fierceness. Dr. Shaw (Trav. p. 411.) speaks of a couple of crocodiles (a sort of Egyptian serpents), which had been kept five years in a large crystal vessel, without any sort of food, unless a small quantity of sand, wherein they coiled themselves up in the bottom of the vessel, may be reckoned as such; yet, when he faw them, they had juf call their skins, and were as bril and lively as if just taken.

Indeed, several species of birds, the whole tribe almoft of insects, and many among the other tribes, are able to subsist all through the winter, not only without food, but many of them in a state of apparent insensibility and torpor.—This furnishes an admirable instance of the wisdom of the Creator: the proper food of these creatures, especially the insect tribe, being then wanting, there is provision for them to live without it. When the fields are devoured of their flowery furniture, and the trees and plants are stripped of their fruits, what would become of fuch animals as are subsisted only by the produce of the spring and summer, and of others which are incapable of bearing severe cold? To prevent the total destruction and extirpation of many species of animals, the Author of nature has provided, that creatures, bereaved by the leaf of their food, should be likewiife incommoded by the cold; that they might thus be led to fift themselves out of the way of danger; and that when arrived in a place of safety, the natural texture and viability of their blood should difpofe it, by a farther degree of cold, to flagmate in the veftels: fo that the circulation flopping, and the animal inactions being, in a great meafure, fuppresed, there is no fenfible want of conftution of parts, but they remain in a kind of drfowly neutral fate, between life and death, till the warm fun revives both them and their food togethef, by thawing the congealed juices, both of fuch animals and vegetables. The fact, however, is unquestionable; and will be more particularly confidered hereafter.

It is more than probable, that all motion of the animal juices is extinct in fies, and other ifpects, when thus asleep; becaufe, though they are cut in pieces, they do not awake, nor does any fluid ooz out of the wound, unless some extraordinary degree of warmth hath been first applied to unfid the coagulation. See HEDGE-FOX. The fleep of fuch animals is little ftrenghe than death, and their waking a reftoration.—For if life does not confift in a circulation of the blood, we do not know in what it confists.

Hence it is no wonder that tortoifes, dormice, &c. are found as fat and fleepy, after some months abstinence, as before. Sir G. Ext weighed his tortoife feveral years successively, at its going to earth in October, and coming out again, in March; and found that of four pounds four ounces, it only used to lose about one ounce. Phil. Trans. No. 194.

We have fome infinences of men who have paffed feveral weeks, and even months in abstinence without injury. The records of the Tower mention a Scotifhman, imprifoned for felony, and ftrictly watched for six weeks; during which time he did not take the leaf furfenance: on which account he obtained his pardon. There are many cafes of abstinence from morbid caufes, that are related in the different periodical Memoirs, Transactions, Ephemerides, &c.

It is to be added, that in most of the infinences of long abstinence related by naturalists, there were apparent marks of a texture of blood and humour, much like that of fummer feafts and infects; though it is no improbable opinion that the air itfelf may furnifh something for nutrition. It is certain, there are abfuflances of all kinds, animal, vegetable, &c. floating in the atmosphere; which must be continually taken in by respiration; and that an animal body may be nourifhed thereby, is evident in the infinence of vipers, which, if taken when fi&om brought forth, and kept from every thing but air, will yet grow very confiderably in a few days. So the eggs of hazards are also obferved to increafe in bulk, after they are produced, though there be nothing to turn them increafement but air alone; after the like manner as the eggs or fpawn of filies grow, and are nourifhed with the water. And hence, fome fay, it is, that cooks, turfpit dogs, &c. though they eat but little, yet are ufually fat.

Abstinence is also used sometimes to fignify a suppression. Thus in Cædins Aurelianus, abstinence fudoris, signifies a suppression of sweat. Sometimes in this author it means a comprefion: as Spiritus ob abstinenceum transabat, means the wind shut up in the interline by comprefion, thereby causing the illiac pain.

ABSTINENCES, in Ecclecafical History, a fort of people, who carried abstinence and mortification fo far, that they have been put into the catalogue of heretics; though it is not known in what their error confifted.

Some reprefent them as the fame with thofe otherwise called Continentes, and that they particularly enjoined abstinence from theufe of marriage: others fay, from feaft, and others from wine. Others will have them a branch of the Gnostics. Some make them the fame with the Hieracites; others with the Encratites. They are faid to have rifen in Spain and France towards the clofe of the third century.

ABSTOTTEN, in Geography, a small market town, belonging to the bishop of Pfaffau, in the circle above the forest of Wiener, in Austria.

ABSTRACT, Abstract, in a general fense, any thing separated from something elfe.

Abstract of a fene, in Law. See Fine.

Abstract idea, in Metaphysics, is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aside or abstracting from the reft. But among thofe who adopt the fystem of Mr. Locke, an abstract idea denotes an idea formed in the mind, when we consider a thing simply in itself, without respeft to the subject wherein it reftles; or it is a simple idea detached and parted from any particular subject or complex idea, for the fake of viewing and confidering it more diftantly.

Thus, magnitude and humanity are abftract or abstract ideas, when considered in themselves, and without being attached to any particular body, or person; though they cannot have any real fulfenance without fuch subjects, nor the subjects without them.

Whitenefs is an abstract, inasmuch as it does not denote any one white object, but that colour, or idea in the general, wherever found.

Abftrant ideas are opposed to thofe which are concrete; the concrete denoting a general or abstract idea's being attached to some particular fubjeft, or considered as combined with some other ideas; as, great house, white wall. All our simple ideas, fays Mr. Locke, have abstract, as well as concrete names: as whitefefs, white; fweetness, sweet, &c. The

K
Like also holds in our ideas of modes, and relations: as

\[ f 	imes f = f; \quad g \times g = g, \quad \text{etc.} \]

But as to our ideas of substance, we have very few ab-
stract names at all. Those few that the schools have
formed, as Animaduers, Humanius, &c. bear no propor-
tion to the infinite number of names of substances; and
could never gain admittance into common use, or obtain
the licence of public approbation; which seems to intim-
ate a confusion of mankind, that they have no ideas of the
real essences of substances; since they have not names for
such ideas.

Indeed the reality and existence of all abstract ideas, and
of any such faculty in the mind as abstraction, have of late
been controverted, and actually denied by persons of very
confiderable eminence as metaphysicians and philosophers.
It will appear in what sense they use the terms abstract ideas
under the article Abstraction.

Abstract terms, are those made use of to denote ab-
stract ideas. In which sense the words sublimi, paterni-
yty, animality, fuisse, crookedness, &c. are abstract or abstrait
terms.

Abstract mathematics. See Mathematics.

Abstract numbers, are assemblages of units considered
in themselves, and not applied to denote any collections of
particular sorts of things.

Abstract, in Literature, is a compendious view, or
SUMMARY of a larger work, and is supposed to be somewhat
shorter, and more superficial than an ABRIDGEMENT.

ABSTRACTI, abstracted, in Church History, is a name
given to a sect among the Lutherans, under the lead of
Helvelius, a Prussian bishop, who affixed against Beza,
that Christ was to be adored not only in the concrete, as
the Son of God, but that his flesh in the abstract was an
object of adoration. Wigandus prevailed so far against
Helvelius as to get him deposed: afterwards the Abstracti
gained the ascendancy, and Wigandus was banished. Micropol.

ABSTRACTION, in Chemistry, properly means the
act of drawing off or separating, by means of heat, one
part of a compound from the other. If the part abstracted
is collected, the operation is synonymous with Distilla-
tion. If it is not collected, the term has the same
meaning with Evaporation. At present, however, it is almost
equally appropriated to the repeated distillation of nitrous
acid off any substance; in which case it is said to have been
abstracted with the acid.

Abstraction, in Metaphysics, an operation of the mind,
whereby we separate things naturally conjoint, or
existing together; and form, and confider, ideas of things
thus separated; or, as others define it (see Dunce's Ele-
ments of Logic, p. 51.), abstraction is that operation of the
mind, by which we separate from any of our conception,
the whole of the circumstances that render it particular, or the
representative of a single determinate object; so that, in stead
of being for an individual, it is used to denote a whole
rank or class of things. In this manner we acquire our

general ideas, that serve as standards by which we may rank
and denominate particular objects. Thus, in viewing
a figure, or circle, we leave out the consideration of every
thing that is peculiar to them, except their figure and shape.
Whenever, therefore, we meet with a figure answering to
that shape and form, which we had laid up in our under-
sanding, it is immediately refered by the mind to this
pattern, and called by its name, which by this means becomes
proper to the whole species. Thus, a square and circle
are universal terms, common to all figures of that particular
shape, and alike applicable to them wherever they exist; in
in like manner as the ideas themselves are general, and repre-
sentatives of all the kind.

The faculty of abstracting stands directly opposite to that
of compounding. By composition we consider those things
together, which in reality are not joined together in one
existence. And by abstraction we consider those things
separately and apart, which in reality do not exist apart.

Abstraction is chiefly employed in these three ways. First,
when the mind considers any one part of a thing in some re-
spect distinct from the whole; as a man's arm, without the
consideration of the rest of the body. Secondly, when we
consider the mode of any substance, omitting the substance
itself, or when we separately consider several modes which
unite in the same object. This abstraction the Cro-

marians make use of, when they consider the length of
a body separately, which they call a line; omitting the con-
sideration of its breath and depth. Thirdly, it is by ab-
straction that the mind frames general, or universal ideas:
omitting the modes and relations of the particular objects
whence they are formed. Thus, when we would under-
stand a thinking being in general, we gather from our self-
conficcion what it is to think; and omitting the considera-
tion of those things which have a peculiar relation to our
mind, or to the human mind, we conceive of a thinking be-
ing in general.

Ideas framed thus, which are what we properly call ab-
stract ideas, become general representatives of all objects of
the same kind; and their names applicable to whatever exists
conformable to such ideas. Thus, the colour that we re-
ceive from chalk, snow, milk, &c. is a representative of all
of that kind; and has a name given it, sublimi, which
signifies the same quality, wherever found or imagined. It
is this last faculty, or power of abstracting, according to
Mr. Locke, that makes the great difference between men
and brutes; even those latter must be allowed to have some
share of reason; that they really reason in some cases, seems
almost as evident as that they have sense; but it is only in
particular ideas. They are confined to those narrow bounds;
and do not seem to have any faculty of enlarging them by
c. 11. § 9. 10. 11. book iii. c. 3. § 9. Such is the doc-

cine of abstract ideas, as it has been delivered by that ex-

cellent author. From him it became, for a considerable
time, a prevailing opinion, that the mind has such a power
or faculty of framing abstract ideas or notions of things;
and on such ideas a great part of the writings of philo-

sophers is founded. These are supposed in all their sys-
tems; and they are more especially reputed the objects of logic,

d and metaphysics, and of every thing that passes
under the notion of the most abstracted and sublime learning.

However, an eminent and ingenious author, Dr. Berke-
ley, has contested the reality of any such ideas; and led
the way towards overturning the whole system, and con-
sequently towards setting philosophy on a new foundation.
See A Treatise concerning the Principles of Human Know-

edge, first printed in 1710.

The qualities or modes of things, it is on all hands
agreed, says that learned prelate, do never really exist apart,
and separated each from all others, but are confinantly mixed
and combined together, several in the same object. But,
the philosophers, the mind being able to consider
each quality singly, or abstracted from other qualities with
which it is united, does by that means frame to itself ab-

tract ideas, of a different nature and kind from the sensible
ones.

For example, when the eye perceives an object extended,
coloured, and moved, the mind resolves this compound idea
into
into its simple constituent parts; and viewing each by itself, exclusive of the rest, frames abstract ideas of extension, colour, and motion. Not that it is possible for such colour and motion to exist without extension; but only that the mind can frame to itself, by abstraction, the idea of colour exclusive of extension; and of motion, exclusive both of colour and extension.

Again, say the same philosophers, the mind having observed that in the particular extensions perceived by sense, there is something common, and alike in all; and some other things peculiar; as this, or that figure, or magnitude, which distinguishes them one from another: it can consider apart, or single out by itself, that which is common; making thereof a general abstract idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely preformed from them all. So, likewise, by leaving out of the several colours perceived by sense, that which distinguishes them one from another, and only retaining what is common to all, it makes an idea of colour in the abstract, which is neither red, nor blue, nor white, &c.—After the same manner by considering motion abstractively, both from the body moved, and from the figure it describes, and all particular directions and velocities; an abstract idea of motion is framed, which equally corresponds to all motions whatever.

They add, that as the mind frames abstract ideas of qualities or modes, so does it by the same faculty, obtain abstract ideas of the more complex beings, which include many coexistent qualities. For example: Having observed that Peter, James, John, &c. resemble each other in shape, and other qualities; we can leave out of the complex idea we had of Peter, James, &c. that which is peculiar to each, retaining only what is common to all, and so make an abstract idea, wherein all the particulars equally partake. And thus it is we are supposed to obtain the abstract idea of man, or of humanity, or of human nature; wherein there is indeed included colour, because there is no man that has not some colour; but it is neither white, nor black, nor brown; because there is no one particular colour wherein all men partake. So likewise there is included stature, but then it is neither tall nor low, nor yet middle stature, but something abstracted from all these; and so of the rest.

Farther yet, there being a general variety of other creatures, which partake in some parts, but not all, of the complex idea of man; the mind leaving out those parts which are peculiar to man, and retaining only those which are common to all living creatures, frames the idea of animal; which abstracts not only from all particular men, but also from all birds, fishes, flies, and insects.

The constituent parts of such abstract idea of animal, are body, life, sense, and spontaneous motion. By body is meant, body without any particular shape, or figure; there being no one common to all animals; without covering, either of hair, or feathers, or scales; nor yet naked; hair, feathers, scales, and nakedness, being the distinguishing properties of particular animals, and for that reason left out of the abstract idea. Upon the same account, the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion. But what the motion is, it is not easy to conceive. "I will not affirm," says Dr. Berkeley, "that other people have not this wonderful faculty of abstracting their ideas; but I am confident I have it not myself. I have, indeed, a faculty of imagining, or re-alfatracting to myself the ideas of things I have perceived, or of variously compounding or dividing them; I can imagine a man with two heads, or the upper parts of a man joined to the body of a horse. I can consider the hand, the eyes, the nose, each by itself, abstracted or separated from the rest of the body. But then, whatever hand or eye I imagine, it must have some particular shape and colour. So again, the idea of a man I frame to myself, and be either of a white, or a black, or a twenty, a felch ass, or a crooked, a tall, or a low, or a middle-sized man. I cannot by any effort of thought, conceive the abstract idea above described; and it is equally impossible for me to form the abstract idea of motion, distinct from that body moving, and which is neither swift nor slow, or circular nor rectilinear. And the like may be said of all other abstract general ideas whatever."

Since all things that exist are only particular, "Whence," says Mr. Locke, "is it, that we come by general words? His answer is only become general, by being made the sign of abstract and general ideas; so that the generality of abstract ideas should follow from the reality of general words. But, according to Dr. Berkeley, a word becomes general, by being made the sign not of an abstract general idea, but of several particular ones, any of which it indiscriminately signifies to the mind. For example, when I say, 'fhe horse,' that whatever has extension is divisible; the proposition is incomprehensible for extension in general; not that I must conceive any abstract general idea of extension, which is neither line, surface, nor solid, neither great nor small, &c. To make this more evident, suppose a geometer to be demonstrating a method of dividing a line into two equal parts: with this view, he draws, for instance, a black line, an inch long; and this, which in itself is a particular line, is nevertheless, with respect to its signification, general; hence it represents all lines whatever; so that what is demonstrated of this one will hold of all others. And as that particular line becomes general by being made a sign, so does the name line, and the idea of a line in the imagination, either of which, taken absolutely, is particular, by being signs become general likewise; and as the former owes its generality, not to its being the sign of an abstract or general line, but of any or all particular right lines that may possibly exist; so must the latter, both the name and the idea, derive their generality from the same cause, or the various particular lines which each of them indiscriminately denotes.

But to this reasoning it has been replied, that the universality consists in the idea; and not merely in the name as used to signify, and recall into the mind, a variety of particular things, resembling which is the immediate object of reflection; because had we no previous fixed notion what the name signifies, we could not know what particular things to apply it to, or assign any reason for applying it to one thing rather than another. All that can be pictured in the imagination, as well as all that we take notice of by our senses, is indeed particular. And whenever any general notions are present in the mind, the imagination, at the same time, is commonly engaged in representing to itself some of the particulars comprehended under them. But it would be a very strange inference from hence, that we have none but particular ideas. As well almost might we conclude, that we have no other notion of any thing than of its name, because they are so associated in our minds, that we cannot separate them; or of the sun, than as a white bright circle such as we see in the heavens, because this idea or phantasy is apt to accompany all our thoughts of it. See Dr. Price's Review of the principal Quotations and Difficulties in Morals, p. 43.

Dr. Cudworth observes, that abstract ideas are implied in the cogitative power of the mind; and he pronounces the opinion, that they are only singular ideas annexed to a com-
or in other words, names without any meaning, to be so ridiculously false, as to deserve no confutation. See External and Immutable Monarchy, book iv.

Mr. Locke, (Essay b. iv. c. 7. § 9.) speaking of the difficulty of forming abstract ideas, says: "does it not require some pains and skill to form the general idea of a triangle, which yet is none of the most abstract and complex; nor hensive; for it must neither be oblique, nor rectangular, nor neither equilateral, isosceles, nor scalene; but all, and none of these at once. In effect, it is something imperfect, that cannot exist; an idea, wherein some parts of several different and inconsistent ideas are put together." Now, let any man look into his thoughts, and try whether he has, or can attain to an idea of a triangle corresponding to this description.

Dr. Campbell, in his Philosophy of Rhetoric, vol. ii. p. 205, expresses his apprehension, that the bare mention of this hypothesis is equivalent to a confession of it, since it really confutes itself. He adopts the sentiments of Berkeley on this subject, and will allow to the mind no other power of abstraction, if the term be retained, before that, by which a particular idea is regarded, as representing a whole order. Mr. Locke, he says, has, on some occasions, evidently inclined to the same opinion: in proof of which he refers to his Essay, book iii. chap. 3. § 11.

In this section Mr. Locke maintains, that not only words but ideas are made signs; and a particular idea is made general, not by any change produced in it (for then it would no longer be the same idea), but by being set up as the representative of many particular things. Universality, he observes, as it belongs not to things, belongs not even to those words and ideas, which are all of them particular in their existence, but general in their signification. Again, the general nature of those ideas is nothing but the capacity they are put into by the understanding of signifying or representing many particulars; and, if possible, still more explicitly, the signification they have is nothing but a relation, (no alteration in their essence) that by the mind of man is added to them. "If such an extraordinary faculty," as abstraction, says Dr. Campbell, (sub supra, p. 110.) "were possible, I cannot for my part conceive what purpose it would serve. An idea hath been defined by some logicians, the form or resemblance of a thing in the mind, and the whole of its power and use in thinking is supposed to arise from an exact conformity to its archetype. What then is the use or power of that idea, to which neither is, nor can be, any archetype in nature, which is merely a creature of the brain, a monster that bears not the likeness of any thing in the universe?"

The late Lord Bolingbroke likewise controverted the existence of abstract ideas. He apprehends that the disputes about abstraction may at all be considered as verbal, and owing to the want of making a proper distinction between ideas and notions, which have been used, he says, both by Mr. Locke and his antagonist the Bishop of Cloyne, as if they were synonymous. We might avoid the confusion arising from this ambiguity, he presumes, if we conceived the former to be particular in their nature, and general only by their application; and the latter to be general in their nature, and particular only by their application. In another place he observes, that much confusion and error have arisen from the improper use of the word abstraction. There is a very practicable operation of the mind, by which we are said to abstract ideas, and by which we do, in effect, generalize them in a certain manner, and to a certain degree, by substituting one as representative of many. There is another supposing, but impracticable operation of the mind, by which some philosophers have made themselves and others believe, that they abstratct, from a multitude of particular ideas, the idea of some general nature or essence, which is all of them, and none of them; whereas, in truth, though they can define general natures or essences in very clear propositions, they cannot frame an idea of any general nature, which is not a particular idea of that nature. Bolingbroke's Works by Kidlet, vol. iii. p. 438, and vol. v. p. 17. &c.

The acute Mr. Hume has also attacked the system of abstraction. He affirms, (Essays, vol. ii. p. 165.) that it is unattainable, and even absurd, to conclude, that the ideas of primary qualities are obtained by abstraction. An extension, that is neither tangible nor visible, cannot possibly be conceived: and a tangible or visible extension, which is neither hard nor soft, black nor white, is equally beyond the reach of human conception. Let any man try to conceive a triangle in general, which is neither isosceles, nor scalene, nor has any particular length or proportion of sides, and he will soon perceive the absurdity of all the scholastic notions with regard to abstraction and general ideas. Mr. Hume has pursued Berkeley's reasoning to an extent which he himself never proposed, and represented all his arguments as merely sceptical, "because they admit of no answer, and produce no conviction."—Dr. Reid, in his valuable Essays on the Intellectual Powers of Man, (Essay v. p. 121.) has discussed the subject of abstraction, and examined the various opinions that have been formed concerning it, in a very diffuse and elaborate manner. This ingenious writer apprehends, that we cannot, with propriety, be said to have abstract and general ideas, either in the popular or philosophical sense of that word. In the former sense, an idea is a thought, or an act of the mind in thinking, or in conceiving any object; and this must be an individual act. In the latter sense, an idea is an image in the mind, or in the brain, in which Mr. Locke's system is the immediate object of thought, and in the system of Berkeley and Hume, the only object of thought: and as he believes there are no such ideas, there can be no abstract general ideas. If they existed, they could not be general, because every thing that really exists is an individual. Universals are neither acts of the mind, nor images in the mind. They cannot be the objects of imagination when the word is taken in its strict and proper sense. We cannot imagine a man, without colour, or stature, or shape. But though Dr. Reid denies the reality of abstract ideas in the sense above stated, he maintains the same doctrine by merely substituting the term conception for idea. As general words are necessary in language, there must, he says, be general conceptions, of which these are the signs; and they take this denomination, not from the act of the mind in conceiving, which is an individual act, but from the object or thing conceived, which is general. These general words express either the attributes of things, in the genera and species, into which we divide and subdivided things; and of both these we may have clear and distinct conceptions. As to the operations of the understanding, by which we form theses general conceptions, he apprehends that they are the three following, viz. 1. The analyzing or resolving a subject into its known attributes, and giving a name to each attribute, signifying that attribute, and no more. 2. The observing one or more such attributes to be common to many subjects. The first act is by philosophers called abstraction: the second may be called generalizing; but both are commonly included under the name of abstraction. We cannot generalize, he says, without some degree of abstraction; but we may abstract without generalizing. For what hinders me from attending to the whites of the paper before me, without applying that
that colour to any other object. The whiteness of this individual object is an abstract conception: though not a general one, while applied to one individual only. To this reasoning it might be replied, that it white not be separated in his conception of it from the paper, it is no longer the whiteness of that object; and he must either conceive it as abstracted from all objects, which is impossible, or as pertaining to some other object; and this neither the quality of whiteness, nor his conception of it, is abstract and general, but concrete and particular. 3. A third mental operation, by which we form abstract conceptions, is, according to Dr. Reid, the combining into one whole a certain number of those attributes, of which we have formed abstract notions, and giving a name to that combination. It is thus we form abstract notions of the genera and species of things. With regard to abstraction strictly so called, the difficulty of which was acknowledged by Mr. Locke, this author says, "I can perceive nothing in it that is difficult either to be understood or practised." "What can be more easy," as he proceeds, "than to distinguish the different attributes which we know to belong to a subject? In a man, for instance, to distinguish his size, his complexion, his age, his fortune, his birth, his profession, and twenty other things that belong to him." But in this case, it may be observed, that though we separate one or more of these attributes from the others in our conception of them, we cannot abstract them from the individual person without transferring them to some other; so that our conceptions will be still concrete and particular. Dr. Reid adds farther, that attributes which are in their nature absolutely inseparable from their subject, and from one another, may be disjoined in our conception. In a body we can distinguish its solidity from its extension, and its weight from both; and in extension we can distinguish length, breadth, and thickness; and yet none of these can be separated from the body, or from one another. But can we conceive solidity, as separated from all extension and weight? Can we conceive solidity or extension, separated from all bodies? Those who cannot do this will find and contend that there is no abstraction in strictly so called. Without pursuing this ingenious writer's reasoning any farther, or giving in detail his answers to the various objections of Berkeley and Hume, we shall close our abstract of what he says on this subject with the following general conclusions, which he has deduced from his account of abstract and general conceptions. 1. It is by abstraction, he says, that the mind is furnished with all its most simple and most distinct notions. Abstraction analyses the sempiternal objects of sense, as well as those of memory, and of consciousness. 2. Our most distinct complex notions are formed by combounding the simple notions got by abstraction. 3. Without the powers of abstraction and generalizing, it would be impossible to reduce things into any order and method, by dividing them into genera and species. 4. Without these powers there could be no definition, which can only be applied to universals, as no individual can be defined. 5. Without abstraction and general notions, there can be neither reasoning nor language. 6. As brute animals know no signs of being able to distinguish the various attributes of the same subject; of being able to classify things into genera and species; to define, to reason, or to communicate their thoughts by artificial signs, as men do: "I must think," says this author, "with Mr. Locke, that they have not the powers of abstraction and generalizing; and that, in this particular, nature has made a specific difference between them and the human species." The notion of abstraimt ideas, which, according to Dr. Berkeley, has contributed to render speculation intricate and perplexed, and to occasion innumerable errors and difficulties in almost all parts of knowledge, led men, in his opinion, not to suppose, that bodies have an existence of their own, exclusively and independently of the mind which perceives them.—Can there be a greater strain of abstraction, says he, than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived?—If there were external bodies, he says, it is impossible we should ever come to know it; and if there were not, we might have the same reason to think there were that we have now. His principal argument may be reduced to the following syllogism: whatever is immediately perceived by sense, is an idea; sensible things are immediately perceived by sense; for the proof of which he appeals to experience; therefore sensible things are ideas; and consequently exist only in the mind. See his Dialogues between Hylas and Philonous.

Mr. Hume concurs with Dr. Berkeley in denying the existence of matter; and advances a step farther, maintaining that the soul is merely a bundle of perceptions, and that there is nothing in the universe but impressions and ideas.

Some late Scots writers, Doctors Reid, Beattie, and Oswald, with a view of obviating those sceptical inferences, which had been derived from the principles of Mr. Locke, have, in opposition to these, offered a new system respecting the nature and origin of our ideas, the outline of which, with remarks, will be inferred under their proper heads, in the course of this work. See Ideas, Intuition, and Common Sense.

We shall only add, that abstractive, on the common system, is no more than generalizing: it is making one thing stand for a hundred, by omitting the consideration of the differences between them: it is taking several different, i.e. different combinations, setting aside the peculiarities in each, and considering only what is found alike in all. Thus it is, that I say, I love my friend, I love my mistress, I love myself, my bottle, my book, my cage, &c. Not that it is possible, I should have the same perception with respect to so many different forts of things, things that stand in such different relations to me; but only that there appearing something in them all that bears a resemblance to the rest, in some circumstances or other, I chuse to express all by one name, love.

For if I consider the tendency and effects of them all, I shall find they lead me very different ways, to very different actions; all the analogy there is between them, is a sort of pleasure or satisfaction, arising upon the application of the particular object to its proper organ, or sense. The abstractive idea of love, then, will terminate in the idea of pleasure: but it is certain, there can be no idea of pleasure without a thing pleasant to excite it. Any other abstract idea of pleasure will amount to no more than a view or perception of the circumstances whereby our pleasures have been attended; but there are mere externals foreign to the pleasureable sensation itself; which nothing, but an object applied in such and such a manner can excite. To suppose an idea of pleasure produced indirectly, by any other than by the proper cause, is as absurd as to suppose an idea of sound, produced without a sonorous object. The mind has no power of making any idea, call them what you will, whether abstractive or concrete, or general, or particular: it proceeds no farther than to the perceiving of such as are presented to it; so that its action is really no other than a degree of passion.

ABSTRACTIOUS, or ABSTRACTIVE, is applied by some modern Chemists to a spirit drawn from vegetables without fermentation. ABSTRACTUS, aíberus, formed of abs, from, and trade, I thereof, denotes something deep, hidden, or far removed from
from the common apprehensions, and more intelligible ways
of conceiving; in opposition to what is obvious and
palpable.
In this sense **Mysticism** is an absurd science; and many
speculations of **Mathematics** are likewise absurd.

**ABURD** is, **Aseries**, a term applied to any action or
sentiment that thwarts, or goes contrary to some evident
truth.

Thus, a proposition would be absurd, that should affirm
that two and two make five, or that should deny them to
make four.

The **Logicians** and **Mathematicians** have a way of proving
the truth of a proposition in this indirect manner, by showing
that the contrary is absurd.

This they call

*Reductio ad absurdum*, or arguing ex absurd,

As absurd, when applied to actions, is synonymous with ri-
diculous.

**ABURDITY**, a kind of error or offence against some
evident or generally allowed truth or principle.

The greatest of all absurdities is **Contradiction**.

The schoolmen make two species of absurdities—The one
absolute, or which is repugnant to the common sense of
mankind; the other relative, or which contradicts some
one, or more philosophers, or persons of great weight and
authority.

In this sense the doctrine of a **vacuum** is an absurdity;
as being contrary to Aristotle; and that of a **plenum**, as
being contrary to Sir Isaac Newton. In effect, there is
fear of one truth of any moment, that is not an absurdity
in this sense; as being repugnant to the system of some fecl
or party.

As reason contends in the due use of names and words,
as absurdity consists in the abuse of them. Hobbes aligns
as absurdity as a privilege peculiar to man, and which no other
creature is capable of; he adds, that of all men, those
called philosophers are most exposed to it. Whence the
saying of Cicero, there is nothing so absurd but has been
found by a philosopher, *nihil tam absurdum dic est potest, quod
non dicitur a philosophis.* The reason seems to be, that of all
men they reason, and disagree most. Yet a nearer and
more apposite cause may be assigned, viz. their neglect
at setting out, to define the terms they make use of,
i.e. to assign the precise idea each is made to represent:
which is much like a man's undertaking to number, without
knowing the value of the numeral figures; reasoning, ac-
cording to the author first cited, being no other than com-
plying. Divers absurdities also arise from the wrong con-
jecturing of names into propositions; as first, when the names
of bodies are applied to accidents; or the names of accidents
to bodies; as in that proposition, *faith is infused or in-
spired:* since nothing is either fusible, or insiprable, but
body: and the same absurdity the **Catastrophists** fall into,
when they make extention to constitute body, &c. Secondly,
when the names of accidents inherent in external bodies are
attributed to accidents of our own bodies: as when it is
said, that colour is in the object, found in the air, &c.
Thirdly, when the names of bodies are attributed to words,
or conceptions; as is done by those who affect that there
are univercal things, that animal is a genus, &c. Fourthly,
when the names of accidents are given to words, and propo-
sitions; as when it is said, that the definition is the nature
of the thing, or a person's command is his will. Fifthly,
when in lieu of proper words, metaphors and tropes are
made use of: as, the way leads to such a place, the pro-
verb says this or that: which though allowable on ordinary
occasions, yet is of mischievous consequence in reasoning and
searching after truth. Lastly, when names are taken at
random, and used without meaning, as transubstantiation,
consubstantiation, entelechies, &c.

He that can avoid these rocks will not easily fall into an
aburdity, except in a very long chain of reasoning, when he
may be apt to forget some proposition before laid down.

**ABUSUS**, the Egyptian **lotus** of Ray. See **CASSIA**.

**ABSYNTIUM**. See **ABSOIYTM**.

**ABSYRTIDES**, or **ABSYRTIDES**, in **Ancient Geography**.

islands in the Adriatic, on the coast of Illyricum, mentioned
by Strabo, Pliny, Mela, and Ptolemy, to which certain
**Aphryta** or **Aphyrism**, and **Aphorus** or **Aphoros**; so called ac-
cording to Strabo (tom. i. p. 48.), and Pliny, (tom. i. p.
181.) from **Aphyrus**, Medea's brother, who was slain
there. They are separated by a channel, and are now called
**Cheofo** and **Ofeo**.

**ABYRUS**, in **Mylology**, the son of **Ceta** and **Ap-
fe residents, and brother of **Medea**. When Medea ran away
with Jalon, whom the affidied in carrying off the golden
fleece, she was pursuied by her father; but in order to retar-
d his progress, he tore **Aphyrus** in pieces, and stretched his
limbs in the way.

**ABTHANES**, in **History**, a title of honour anciently
used in Scotland, denoting the high order of **thanes**, or
king's ministers, in contradistinction to the lower, called
understainers.

**ABUBEKER**, or **ABU BEER**, i.e. the father of the
girl or virgin, viz. **Ayeda**, who was of this description
when Mahomet married her, the first caliph, and successor of
Mahomet. His original name was **Abdulcaaba**, the fer-
vant of the **Caaba**, denoting his piety; which name was
changed by Mahomet on his conversion, into **Abdallah**, the
servant of God; and on the prophet's marriage with his
daughter, he assumed the appellation of **Abubeker**. He was
eminently useful to this impoitor at the commencement of
his undertaking, as he vouched for his veracity in everything
he related concerning his revelations, and his nocturnal jour-
ney to heaven; and very much exerted himself in augment-
ating the number of his followers. On this account the pro-
phet gave him the surname of **Al Sediik**, which denotes
the faithful witness, and the appellation **Atlik**, or prefered,
*i.e.* vouched for hell-fire, thus intimating that he was one of
the elect. At the time of Mahomet's death, two powerful
parties, called the **Mohajerim** and the **Anfars**, claimed the
right of nominating his successor. The former founded their
pretensions on their having attended the prophet in his flight
to Medina, and declared themselves in his favour before any
of the other Arabs joined him; whilst the latter pleaded,
that they supported him when he was expelled his native
city, and enabled him to fustain his opposition, when he and
his followers were in a state of persecution. At length,
however, by the interposition of **Omar**, they concurred in
the election of **Abu Beeer**, A.D. 632. As many of the
Arabs had renounced their new religion, and returned to
paganism, judaism, or christianity, towards the close of Ma-
homet's life, and after his death, they were unwilling to pay
the customary tribute which he exacted of his followers, and
made attempts for throwing off the yoke which he had im-
posed upon them. **Abu Beeer's** first attention was engaged in
reducing these rebels, whom he defeated, and whose
children he made slaves. This service was conducted by
**Khaled**, or **Caled**, an excellent general; who afterwards by
his conduct and bravery conquered **Syria**, and greatly con-
tributed to the establishment of the Mahometan religion and
policy. On the day, however, of the reduction of **Damas-
cus**, Abu Beeer died, in the 13th year of the **Hegira**, hav-
}
ing attained the age of 63, and reigned only two years and three months. A little time before he expired he made his will, and appointed Omar for his successor. He dictated it to his secretary in the following terms: "In the name of the most merciful God, This is the testament of Ab- | dallah Ebn Abu Kohafa, when he was in the hill hour of this world, and the first of the next; an hour in which the infidel shall believe, the wicked person beaffles of the reality of those things that he denied, and the liar speak the truth. I appoint Omar Ebn Al Khattab my successor; therefore hearken to him and obey him. If he acts right he will answer the opinion I have always entertained of him, if otherwise, he must be accountable for his own conduct. My intention herein is good, but I cannot foresee future events. However, those who do ill shall hereafter be made fully sensible of the consequences of their behaviour. Fare ye well, and may ye always be attended by the divine mercy and benediction." Before he expired, he prayed God to bless the choice he had made; to inspire the Moftems with sentiments of concord and unanimity; to render their affairs prosperous and flourishing; and to enable them to propagate the doctrines of the Koran in the most effectual manner, as by the prophet Mahomet, in his last moments, they had been most strictly enjoined. Among other sayings of Abu Beer that are recorded, the following are worthy of notice: "Good actions are a guard against the blows of adversity;" and "Death is the easiest of all things after it, and the hardest of all things before it." Such was the liberality of his disposition, that on the Friday of each week, he distributed the residue of his own and the public money, after appropriating a very small sum to his own maintenance; first, to the most worthy, and then to the most indigent, of the Moftems. Gibbon's Hist. vol. ix. 358. 8vo.

ABUCARAS, Theodore, was bishop of Charrax, or Haran in Mecopotamia, and lived in the eighth century. At first he adhered to the party of Photius, and in connection with Zachary, bishop of Chalcedon, undertook an embassy to the emperor Lewis II. for the purpose of presenting Photius's book against pope Nicholas, and inducing him to throw off the papal yoke. He afterwards abandoned the interest of Photius, and was restored, after humiliating submition, to his place in the council of Constantinople, from which he had been excluded. Several treatises bearing the name of Abucaras, written against Jews, Mahometans, and Heretics, have been collected by Gretzer, and published in 4to. at Ingolstadt, in 1666. Another treatise by Abucaras, intituled, De Unione & Incarnatione, was found by Mr. Arnold in the Bodleian library, and published at Paris in 1655, in 8vo. Some have doubted whether Abucaras, the friend of Photius, and the author of these treatises, be the same person, Morer.

ABUCATUS, in Ethnology, the name given by Marc-grats to the Zesus gallus of LImnns.

ABUCO, Abocco, or Anocc, a weight used in the kingdom of Pegu. One abuco is twelve teccalas and a half; two abucos make an agira, which is also called gir; two girls make half a biza; and a biza weighs a hundred teccalas; that is, two pounds and five ounces the heavy weight, or three pounds nine ounces light weight of Venice.

ABUDHAHER, or Abu Thahir, succeeded his brother Abufaid, in the 311th year of the Hegira, at the age of eighteen, as chief of the sect of the Karmathians; and proceeded with a large army to Baffora, which he took and pillaged. The next year he intercepted and plundered a caravan returning from Mecc to Bagdad; and having been

refused the sovereignty of Baffora, he pillaged Cufa in the following year, and put many of his inhabitants to the sword. He afterwards threatened Bagdad, but was obliged to retreat. However, in the 316th year of the Hegira, he seized the towns of Rababa and Karkoba in Mecopotamia. In the 317th year, he laid waste Mecc, plundered the pilgrims and the inhabitants, killed 300,000 of whom 1700 were murdered within the walls of the Caffa; and having profaned this holy place, he carried off the black stone, which remained in the custody of the Karmathians for twenty-two years; but finding that the temple was still veiled and returned to by pilgrims, they reforted it. Abudthaher ridiculed the Mahometan religion, and insulted its votaries; reproaching them with the folly of calling the edifice at Mecc God's house, which he was allowed to profane without being destroyed by the thunder of the Almighty. Six years after these outrages he made a treaty with the Caliph Al Rabi, who granted him an annual tribute of 120,000 dinars, on condition of his permitting the pilgrims to pass to Mecc without molestation. This chief refuted at Hajar in Yemen, where he built a palace, and lived till the year of Christ 953, in the peaceable possession of a large territory. Bayle. Mod. Uni. Hist. vol. ii. p. 311, &c.

ABU JAAIFAR AL TABARI, an Imam of great piety, as well as of very extensive reading and erudition, was born at Anm, or Anad, the capital of Tabreizan, whence his name, in the year of the Hegira 224; and though he was a fireous defender of the koran, he was buried at Bagdad as a heroic or saint. His work, intituled Al Tarikh Al Tabari, is held in high estime, and considered as the basis of all the histories of the Moftems. What we now have is only an abridgment of a much larger work. It began with the creation of the world, and continued, according to Abulfeda, to the year of the Hegira 522; or, as others say, to the time of the author's death, in the year 530. The Tarikh was translated into Perfie and Turkish, and continued by different writers to the year of the Hegira 521. Mr. Ockley says, that an imperfect MS. copy of it, in Arabic, is preferved in the Bodleian library at Oxford. Mod. Uni. Hist. vol. ii. p. 309.

ABUKESB. See ASERAI.

ABULFARAGIUS, or Abu Farai, or Abulfra- gius, Gregory, in Biography, son to Aaron, a chritian physician, was born in 1226, in the city of Malta, near the fource of the Euphrates, in Armenia. He practifed phyfic with success, but was more distinguished by his study of the Greek, Syriac, and Arabic languages, as well as philosophy and divinity. The annotations of his contemporaries are dictated in the style of the highest panegyric, and he is intitled, the king of the learned, the most excellent of those who excel, the example of his times, the prince of his age, the glory of the wife, and the crown of the virtuous. He wrote a hislorie in Arabic, divided into ten dynasties, which is an epitome of universal history, from the creation of the world to his own time, and which does honour to his memory. The parts relating to the Saracen, Tartar Moguls, and the conquests of Jenghiz Khan, are the most valuable. It was published with a latin translation, in two small quartos, at Oxford, in 1663, by Dr. Pococke, who annexed to it a brief continuation relating to the history of the califh prince. He had, in 1653, published an extract from this work, intituled, "Specimina Hist. Ar- camb.," &c. Abulfaragius was ordained bishop of Cufa at twenty years of age, by Ignatius, the patriarch of the Jacobites; and, about the year 1266, he was elected their pri- mate in the califh, which dignity he possessed till his death, in 1286, which happened at the time when he is said to have predicted,
A B U

precluded, and expected it. Considering the age in which he lived, it is not wonderful that miracles were ascribed to him; but it is needless to record them in this place. Abul-"fraganus wrote about 30 tracts, besides the history above mentioned, which are recited by Aflennanus. The learned Poock: vindicates him from the charge of having renounced Christianity. There was another Abulfargius, named Abulha Ebn Attiba, who died A.D. 1043. He was a Nestorian monk, a learned man, and a philosopher. He wrote a commentary on the Old and New Testament, in Arabic; he also explained the works of Aristotle, and reprinted the Nestorian patriarchs for their neglect of ecclesiastical learning.

A B U L, P A Z L, i. e. the foter of excellence, the title which was given to the secretary and vizier of the Mogul emperor Akbar. He was deemed the most learned and best writer in the East. He was murdered by order of Sultan Selim, on a supposition of his having occasioned a misunderstanding between him and the emperor his father. His death was much lamented by Akbar, and many others, who had any regard for literature. He wrote a history of the Mogul emperors, which he continued to the 38th year of Akbar's reign, A.D. 1554. His official correspondence formed three volumes, and was much esteemed. Frazer's "Koh Khan, p. 14.

A B U L F E D A, I s m a i l, prince of Hamah, a city of Syria, was born in the year of the Hegira 672, A.D. 1275, and was the sixth in lineal descent from Ayub or Job, the father of the famous Saladin. He was a lover of study, and particularly of geography, which may be inferred from a work, intitled, "Chosamaz & Mawaranahra, n. e. Regionum extra fluum Oxum descriptio, et tabulis Abulfeda Ismaïl, Principis Hamah. It was printed in London in 1652, by our learned countryman John Gravius, who has added to the Arabic original a Latin translation, with a preface, informing us that he consulted five MSS. At the conclusion of this work it is said to have been finished in the 721st year of the Hegira, or A.D. 1312. The tables are given in the order of the climates, with the degrees of longitude and latitude. Abulfeda is said to have discovered the true longitude of the Calpian sea, concerning which Ptolemy was mistaken. A new edition of this work was published at Oxford in 1712, by M. Gagnier, in the third volume of Hudfon's "Geographia veteris Scriptorum Graecorum minores: and another at London, in 1732, fol. Abulfeda wrote other works, which manifested his general literature; for he is said to have been acquainted with jurisprudence, physic, philosophy, astrology, history, and poetry, as well as geography. His "General History," from the beginning of the world to his own time, was continued to the year 735, or A.D. 1329. He also wrote "A short systern of the "Mohammedan civil law," "A Treatise of Physic;" and some poems. He is also supposed to be the author of the "Afrumesian Tables," of which there is a copy in the Bodleian library. His "Life of Mahomet," was published in Arabic and Latin, at Oxford in 1731; and his treatise on the "Life and Actions of Saladin," was printed, with a Latin translation, at Leyden, in 1732, fol.

Abulfeda was no less a military man, than a student. He served under his father in several expeditions, and he was present at the burning of Tripoli, A.D. 1289; and at the capture of Acco, or Ptolemais, A.D. 1291, as well as on other occasions, when he distinguished himself, by his skill and valor. He died about the 732d year of the Hegira, A.D. 1332. We are cautioned by the editors of the General Dictionary from confounding Abulfeda with Ismael, summamed Shakeilsh, the compiler also of a General History, which

is mostly transcribed verbatim from the work of that prince. Gen. Dict.

A B U L G H A Z I, Bayzar, khan of the Tartars, was born in the city of Urgens, capital of the country of Karazm, in the year of the Hegira 1014, A.D. 1605. He was descended both by his father's and mother's side, in a direct line from Zingis Khan, or Jengizkhan. After experiencing many misfortunes in early life, he became sovereign of Karazm, in the year of the Hegira 1554, and having reigned twenty years, and by his courage and conduct rendered himself formidable to his neighbours, he resigned the throne to his son some time before his death, in order to devote the remainder of his life to the service of God. In his retreat he wrote the famous genealogical history of the Turks, but being prevented by his death, in the year 1474, of the Hegira, from finishing it, he left it in charge with his son and successor to complete it, which was done in two years afterwards. It is written in the Mogul, or Turkish language, and divided into nine parts; the two first treat of the khans and tribes descended from Turks, the son of Japhet, to the time of Jengizkhan; the third relates the life and actions of that conqueror; the five next treat of his sons and successors in the several parts of Tartary; and the ninth treats of the khans of Karazm to the death of the author. This history was procured by Strahlenberg, while prisoner in Siberia, and has been translated into Russian, German, French, and English. As this book is one of the chief funds which afford materials for the history of the Turks and Tartars, it will not be improper to mention the authority on which it is founded. The grandson of Jengizkhan, being desirous of preserving the memory of the Mogul tribes, and the signal exploits of his ancestors, sent a nobleman, skilled in the Mogul language, into Tartary, in order to collect materials for this purpose. At his return his memoirs were digested, under his own inspection and assistance, into a work, which consisted of three folio volumes, and was finished in the year of the Hegira 702. The first volume is in the Library at Paris, and was translated by De la Croix, the son, but not published. It was chiefly from this history that Abulghazi extracted his work, excepting that part which relates to the Usbecks of Great Buhkaria and Karazm. A French translation appeared at Leyden in 1726, 12mo. Mod. Un. Hilt. v. iii. p. 334.

A B U L O I A A H M E D, one of the most celebrated of all the Arabian poets, was born at Maara, a town of Syria, A.D. 973. He lost his sight by the small-pox, at three years of age; at forty-five he left off the use of animal food, in conformity to the tenets of the Bramins, and also that of eggs and milk, and lived only on vegetables. He died in 1057. He was not esteemed by the orthodox, as a found Mulumin, for one of his sayings was, "The chijfions wander here and there in their paths, and the mahomets are entirely out of the way." Another of his apothegms is, "The world is divided between two forts of persons, of whom some have fene without religion, others religion without fenfe." The inscription which he ordered for his tomb confirmed the suspicions of his orthodox: "This crime did my father commit against me, "but I have not committed the fame against any." Gen. Dict.

A B U M O S L E M, a governor of Khorasan in the second century of the Hegira, who, A.D. 747, caused the death of caliph to pass from the race of the Omicides to the family of Abbas; and who, in accomplishing and maintaining this revolution, is said to have killed 600,000 persons. Notwithstanding the services which he had rendered to Almanzar, this caliph, A.D. 759, ordered him to be privately
by afflicted, as some say; or, as others report, to be
thrown into the Tigris. His character has been variously
represented by different writers. Some say, that he was
a fierce brutal soldier; and by others, he is described as dif-
creet and merciful. Some extol his acquaintance with
the poets of the country, and with the moral precepts of his
religion; and others degrade his character as a glutton and
feantitul. Bayle says, that he was addicted to magic, and
dwelt near the springs of Fratica, in the Hindu, where
he was crowned, and which was the place of his usual
residence. His valor was so distinguished, that he was called
Bahadur, or brave. Having fallen in love with the daughter of
Emir Janjan, who was married to the Emir Hafian, and who was
deemed the greatest beauty in Aba; and the father refusing to
conced her divorce from her husband, Abu Said conceived a
prejudice against him, which terminated in his death. Hafian
however, acquiesced in a divorce, and sent her to the sultan,
whom he obtained a great ascendancy. Abu Said was the
left monarch of the race of Kajfujkhan; and after his
death, that happened in the year in which Tamerlane was
born, the empire was dismembered, and became a scene of

ABUSE, compounded of ab, from, and usus, use, an irr-
regular use of a thing, or the introducing of something con-
trary to the true intention thereof.

In Grammar, to apply a word abusively, or in an abusive
manner, is to misapply, or pervert its meaning.

A permutation of benefices, without the consent of
the bishop, is deemed abusive, and consequently null.

ABUSINA. See Abersberg.

ABU TEMAM, in Biography, sprung from an Arabian
tribe, famneous Tay, and considered as the prince of the
Arabian poets, was born in the 90th year of the Hegira, A. D.
805, or as others say, in 188, or 152 Heg. i. e. A. D.
803, or 807; or in 172 Heg. i. e. A. D. 788, at Jafem, a little
town situated between Damascus and Tiberias. He
was educated in Egypt, and died at Mawfel, near the spot
where ancient Niniveh stood, in the year 219th year of the Hegira,
A. D. 845; or in 228 or 232 Heg. i. e. A. D. 845.
His poetical compositions were collected with those
of others, into a volume, and intitled Al Hamadah. Having
written an elegy on the death of another, the following eulo-
gium was given Abu Teman:

The man whose virtues thus ascend the sky,
Pray'd (m'ighty Bard) by thee, can never die. Gen. Dict.

ABUTILON, in Botany, the trivial name of several
species of the Sida. See also Hibiscus, Melochia, Mal-
va and Napar.

ABUTALLO, among Low-writers, denote the but-
ings or boulders of a piece of land; expressing what
other lands, highways, or the like, the several extremes
thereof do abut, or terminate. In this sense the word is
sometimes also written corruptly abuttals or abuts.

I... old surveys, we often find them called headlands.
Abuttals amount to the same with what Latin writers call
capita; Marculiis, frontes; the French, frontes. In Coke,
the plaintiff is said to fail in his abuttals, that is, in setting
forth how the land is bounded.

ABUTUA, in Geography, a kingdom in the south of
Africa, to the north of the country of the Hottentots,
and adjoining to the province of Oliha, which is said to be
rich in gold mines.

ABYDENUS, in Biography, a celebrated historian, author
of the history of the Caldeans and Assyrians, of which only
some fragments have been transmitted to us by Eusebius in his
Preparatio Evangelen, Cyrilus, and Syncellus; which have
been illustrated with several notes by Scaliger in his book
De Emendatione Temporum.
ARYDON. See Ambyon.

ARYDOS, in Ancient Geography, a town built by the Miletians, in Asia, on the Hellespont, where, according to Le Brun, (Voyage au Levant,) the freight is only half a mile, others say two miles wide, opposite to Sestos, on the European side; both of which, according to some geographers, are now called the Dardanelles; but others say, that Sestos was much nearer the Propontis than Abydos; and Strabo. (I. xiii. p. 460.) reckons 3750 paces from the port of Abydos to that of Sestos. Abydos was situated midway between Lamppus and Ilium, and was famous for Xerxes' bridge, mentioned by Herodotus, i. vii. c. 34.; and by Lucan, Pharn. ii. ii. v. 672.; also for the loves of Leander and Hero, recorded by Musaeus and others, and celebrated for its goddesses by Virgil and Ennius. The inhabitants were effeminate, and also addicted, according to Stephanus, (de Urbibus, vol. i. p. 9.) to calumnies; whence the proverb, Ne turbe Abeodum columbus, when we would caution against danger. This city was formerly very important, as it commanded the straits, and made those who were poisselled of it matters of the communication between the Euxine sea and the Archipelago. It was defended by its inhabitants with great courage and obstinacy against the attack of Philip of Macedon, but at length surrendered amid the horrors of almost universal slaughter, A. M. 5805. Ant. J. C. 201. Fifty of the citizens were compelled to take an oath, in the presence of all the inhabitants, that when they saw the enemy master of the inland wall, they would kill the women and children, set fire to the galleys laden with their effects, and throw into the sea all their gold and silver; and then, in the presence of the priests, they took another oath, either to conquer or die sword in hand. After the surrender of the city, this dreadful resolution was executed to such an extent, that the individuals of every family killed one another, and none evacuated but those who by violent restraint were prevented from destroying themselves. Abydos was taken by the Turks, through the treachery of the governor's daughter, in the year 1330.

ABYDUS, an inland town of Thebes in Upper Egypt, between Ptolemais and Diospolis Parva, towards Cyene, famous for the palace of Memnon and the magnificent temple of Osiris built by Ispanides, into which no fingers or dancers were allowed to enter. Here the Egyptians revered the oracle of the God Bes, which was one of the most ancient oracles of Egypt, and famous even in the time of the emperor Constandius. Strabo, vol. ii. p. 1167—1169. Pliny, l. v. c. 9. Stephanus (Urb. vol. i. p. 9.) say, that it was a colony of Milesians. The city, reduced to a village, under the empire of Augustus, presents in our time nothing but a heap of ruins without inhabitants. About three miles west of the Nile, in the place, as Pococke (Descript. East. p. 83.) conjectures, where the present village El-Beshe is situated, but to the west of these ruins is still found the celebrated monument of Ispanides. The entrance is under a portico, 60 feet high, and supported by two rows of mafy columns. This leads into a temple 300 feet long, and 145 wide. There are several other spacious apartments, which communicate with one another, both by passages and stair-cases. The solidity of the edifice, the huge masses of marble which compose it, and the hieroglyphics that cover the walls, evidently testify that it is a work of the ancient Egyptians. In the multitude of human figures, which are intermixed with those of other animals, there may be discovered women funeralizing their children, and men presenting offerings to Venus. Here are also the divinities of India, such as they are represented in the temples of Judean. Six lions' heads, placed on the two sides of the temple, serve as spouts to carry off the water. The stair-case is formed of stones incutted in the wall, and projecting fix feet from it, so that being supported only at one end, they appear to be suspended in the air. The walls, roof, and columns of this stupendous edifice, have suffered nothing from the injuries of time; and its solidity will resist the natural decay of many ages. Except the colossal figures, whose heads serve as an ornament to the capitals of the columns, and which are sculptured in reliefs, the other hieroglyphics, which cover the insides, are carved in stone. To the left of the great building, there is another much smaller, with an altar at the bottom of it, which was probably the sanctuary of the temple of Osiris. Savary has minutely described this structure in his Letters on Egypt, vol. ii. p. 5. &c.

ABYLA, one of Hercules' pillars, on the African side, called by the Spaniards Sierra de las Monas, over against Culpe, in Spain, the other pillar. These were supposed to have been formerly joined, but separated by Hercules, in order to make an entrance into the sea, now called the Mediterranean. This, according to Pliny, (Proem. l. 3.) was the limit of the labours of Hercules. The Hebrew 254 ab, denotes a thick cloud, and also a column, and might therefore be applied to a high mountain, or to the pillar of Hercules. See Bochart. Oper. tom. i. p. 731—733. Edit. Villan. See the other authors Strabo, Melas, and Ptolemy, cited by Cellarius, tom. ii. p. 156.

ABYLA. See Abila.

ABY, or AUYO, in Geography, one of the Philippine islands, in the East Indies, between Mindanao and Luzon, where the Spaniards have a fort. E. long. 122° 15'. N. lat. 10° 6'.

ABYS, in a general sense, denotes something profound, and, as it were, bottomless.

The word is originally Greek, ἀβυσσος; compounded of the privative α, and βυσσόν, bottom; q. d. without a bottom.

ABYSS, in a more particular sense, denotes a deep mafs, or fund of waters.

In this sense the word is particularly used, in the Septuagint, for the water which God created at the beginning with the earth, which encompassed it round, and which our translators render by the deep. Thus it is that darkness is said to have been on the face of the abyss.

Abyss is also used for an immense cavern in the earth, where God collected all those waters on the third day; which, in our version is rendered the deep, and elsewhere, the great deep.

Dr. Woodward has made several observations and conjectures with reference to this great abyss, in his Natural History of the Earth. He affirms, that there is a vast collection of waters enclosed in the bowels of the earth, constituting a huge orb in the interior or central parts of it; and over the surface of this water he supposes the terrestrial strata to be expanded. This, according to him, is what Moses calls the great deep, and what most authors render the great abyss.

The water of this vast abyss, he alleges, communicates with that of the ocean, by means of certain hiatuses, or chasms passing betwixt it and the bottom of the ocean; and this and the abyss he supposes to have one common centre, around which the water of both is placed; but so that the ordinary surface of the abyss is not level with that of the ocean, nor at so great a distance from the centre, as the other, it being, for the most part, restrained and depressed by the strata of earth lying upon it; but wherever these strata are broken, or are so lax and porous, that water can
can pervade them, there the water of the abyss ascends, fills up all the clefts and fissures into which it can get admittance; and saturates all the interstices and pores of the earth, stone, or other matter, all round the globe, quite up to the level of the ocean.

The existence of an abyss, or receptacle of subterraneous waters, is controverted by Camerarius, (Diff. Taur. Act. Erud. Sup. tom. vi. p. 24.) and defended by Dr. Woodward, chiefly by two arguments; the first, drawn from the vast quantity of water, which covered the earth in the time of the deluge; the second, from the consideration of earthquakes, which he endeavours to shew are occasioned by the violence of the waters in this abyss. A great part of the terrestrial globe has been frequently shaken at the same moment; which argues, that the waters, which were the occasion thereof, were co-extensive with that part of the globe. There are even instances of universal earthquakes; which shew that the whole abyss must have been agitated: for if general an effect must have been produced by as general a cause; and that cause can be nothing but the subterraneous abyss.

This abyss is no useless thing; when once established, it serves to solve several difficult phenomena; as the origin of springs and rivers; the level maintained in the surface of different seas, and their not overflowing their banks. To the effluvia emitted from this abyss some even attribute all the diversities of weather, and changes in our atmosphere; and, what is more, the origin of every thing in the earth, or in its surface. Dr. Woodward has an epistle on the economy of the great abyss hid in the bowels of the earth, and the perpetual communication between it and the atmosphere. Ray, (Physico-Theological Discourses, p. 76. ed. 4.) and other authors, ancient as well as modern, suppose a communication between the Capfian sea and the ocean, by means of a subterraneous abyss: and to this they attribute it, that the Capfian does not overflow, notwithstanding the great number of large rivers it receives; of which Kempfer reckons above fifty, in the compass of sixty miles. But the daily evaporation may be sufficient for this purpose. See Evaporation, Sea, and Spring.—The different arguments concerning this subject, are collected by Cockburn in his Inquiry into the truth and certainty of the Mosaic deluge, p. 271. See Deluge, Earth, and Volcano.

Abyss is also used to denote the cavernous belly of a hollow mountain.

In which sense Mr. Tournefort describes the abyss of mount Ararat. This, and similar gulsps, or precipices in mountains, M. Buffon, and others, suppose to be the craters of extinguished volcanoes.

Abyss is also used to denote hell. In which sense the word is synonymous with what is otherwise called Barathrum, Erebus, and Tartarus: in the English Bible, the bottomless pit.

Abyss is more particularly used, in Antiquity, to denote the temple of Proserpine.

It was thus called, on account of the immense fund of gold and riches deposited there; some say hid under ground.

Abyss is also used in Heraldry, to denote the centre of an Echevron.

In which sense, a thing is said to be borne in abyss, en abysme, when placed in the middle of the shield, clear from any other bearing: he bears azure, fleur de lys, in abyss, Colombiere.

Abyss is also used metaphorically, for a thing not to be known or comprehended, on account of its immense extent, or profundity.

In which sense it coincides with secret, inerutable, incomprehensible, &c.—The judgments of God are called a great abyss.

Abyss, in Hydrography, is synonymous with Gulf.

ABYSSINIA, or, as it is sometimes called ABBASIA, HABASSIA, and UPPER AETHIOPIA, in Geography and History, an empire of Africa, situated in the Torrid Zone, and mostly comprehended between 35° and 16° N. lat. and 46° and 40° E. long. As to the etymology of this name, some have sought for it in the fruitful spots amongst rugged deserts with which the country abound, and which the Egyptians call abyss; and others have traced it to Abuza, the capital of the kingdom of Adel, whose monarchs were once masters of Abyssinia; but Ludolius, and many who have adopted his opinion, ascribe the origin of the appellation to the Arabic habša', which has the same meaning with the Latin Constantinopolis, and signifies a number of distant peoples meeting together accidentally in one place. This etymology, it is alleged, corresponds to the manner in which this country was originally inhabited. For the appellation of Pfeffer or Prebyter John's empire, which the Portuguese gave to this country, there is no sufficient foundation, as there was no person of this denomination that was ever known in Abyssinia. See Prester John.—The imaginary limits of this country have been erroneously extended by ancient geographers far beyond the equinoctial line, and its real boundaries have been in later times very much reduced by the invasion of a barbarous people, denominated Gallus, of whom we shall give an account under that article. It is at present bounded on the N. by the kingdom of Sennar, on the E. and N. E. by the Red Sea, on the S. by the Gallus, and a vast chain of mountains extending with little interruption from 44° to 44° E. long. and between 35° and 9° N. lat. and on the S. E. by the kingdom of Adel, and on the W. by the Nile, and some adjacent provinces. But its boundaries have suffered so many intermissions and encroachments, that they are not easily ascertained. At the time of Lobo's mission, in 1624, it extended from the Red Sea to the kingdom of Congo, and from Egypt to the Indian Sea, containing forty provinces. At Malauah, i.e. on the coast of the Red Sea, says Mr. Bruce, begins an imaginary division of Abyssinia, into two parts: the first is called Tigre, between the Red Sea and the river Tazzzez; the second is Amhara, between that river and the Nile, westward, where it bounds the Gallus. But this division respects language, rather than territory; and it is, in neither view of it, sufficiently precise and determinate. The provinces now comprehended under the empire of Abyssinia are the following; viz. Malauah: Tigre; Sire; Samen: Waldbba: Begemder, bordering upon Angot, which is almost wholly conquered by the Gallus; Amhara; and between the rivers Gethen and Samba, a low, unhealthy, but fertile province, called Walaka; and to the S. of this the Upper Sho: Gojam: Damot: Malatwa: the province of the Agowe; Dembea on the south of Gondar, and Waggora a small province on the eait, which are altogether fown with wheat, and are the granaries of Abyssinia; and to the south of Dembea, Kuara. There are many other small provinces, which are occasionally annexed, and sometimes separated, such as Guefgrè to the east of Kuara; Waldbba, between the rivers Gournge and Angrab; Tschè and Wakhay on the west of Waldbba; Abergélé and Selawa, near Begemder; Temben, Dobas, Giannamora, Bur, and Engana, in the neighbourhood of Tigre, &c. Such was the state of the country at the time when Mr. Bruce visited it. These
ABY

ABY

former provinces form one empire, subject to a monarchy, hereditary in one family, but elective in that line, and elective; of which the capital was formerly Axum, but is now Gondar.

The surface of this country is generally rugged and mountainous; it abounds with forests and morasses; and it is also interspersed with many fertile valleys and plains, that are adapted both to culture and to tillage. The rivers of Abyssinia, which are numerous and large, contribute very much to its fertility. Besides the Nile, which has its source in Gedd, an elevated district of this country, there are also the Tocazzè, the Kibber, or as the Portuguese call it, Zebir's, which lies indeed beyond the extent of Abyssinia, as it has been above assigned, the Mareb, the Haax or Hawash, the Coron, which rises in Anguat, and empties itself into the Tocazzè, the Angueu and Lidda, which form branches of the Mareb, the Ambala, which rises near the source of the Tocazzè, is continued under the name of the Hanazo, through the kingdom of Dawaro, and discharges itself near the bay of Zeyba, the Bahillo, Lohu, Gelhen, Sambé, Jena, Rema, Balu, Rabad, and Dender, which rising in provinces bordering on the Nile, empty themselves into that river; the Angrab, Tukoor, and Guanque, which flow into the Tocazzè, &c. The principal collection of water in this country, is the lake of Tana, or, as it is generally called, the lake or sea of Denbe. The climate of Abyssinia, though, like other parts of the torrid zone, it was formerly thought to be uninhabitable, is not only tolerable, but in general temperate and healthy. In this respect, however, the uneven surface of the country exposes different situations to the effects of heat and cold, of dryness and moisture, and of a free circulation or a stagnation of the atmosphere in very various degrees. On the mountains, and in the higher parts of the country, the sky is clear and serene, the air is cool and refreshing, and the people are healthy and sprightly; whilst those who live in some of the valleys, in the vicinity of marshes, and in sandy deserts, cannot but experience the pernicious influence of excessive heat, and of a noisit, flagellant, and suffocating air; so that the climate depends upon soil and situation as much almost as upon the altitude; and therefore no description of it will equally suit the several provinces. Mr. Bruce (Travels, vol. iii. p. 662.) observes, that on the highest mountain of the ridge called Lamalmon, the thermometer stood at 22° in the depth of winter, the wind being N.W. clear and cold, but attended only with a slight frost. This, he adds, vanished into dew after a quarter of an hour's sun; nor did he ever see any sign of congelation upon the water upon the top of this, or any other hill. The barometer stood at 39° 9' at noon of the same day, and the therm. was at 78°. He observed had to lie for three hours in the foreshore on the mountains of Amid Amid. From an examination of Mr. Bruce's register of the barometer and thermometer, &c. kept at Gondar, from February 19, 1779, to May 31, 1774, it appears, that the greatest height of the barometer was 22° 11' 9", on April 29, at 64° M. the therm. being 69°, and wind S. The least height was 20° 11' 5", March 29, at 24° N. therm. 75°, wind E. The greatest height of the thermometer was 91°, April 19, at 12 N.—Wind W. N. W. The least height was 54° 3', July 7, at 12 N. barom. 21° 6' 7", wind W. The rainy season commences in April or the beginning of May, when the sun becomes vertical, and ends in September. The rains generally cease about the 8th of September; a sickly fever follows till they begin again, about the 20th of October; they then continue constant, but moderate, till the 8th of November. All epidemic diseases cease with the end of these rains. In order to avoid the inconveniences that attend the overflowing of their rivers during this season, as well as on account of the greater fulness of elevated situations, the Abyssinians have built many of their towns and villages on the mountain. Their houses are generally very mean, consisting only of one story, and constructed with draw and laths, earth and lime, though there are some of stone, and better materials. It is a mistaken notion, however, that they live in tents, and not in houses. In a climate like that of Abyssinia, subject to speedy weather for six months, and to deluges of rain, storms of wind, thunder and lightning, and hurricanes, such as are unknown in Europe, for the other six, it is not probable that they should chuse to live in tents, after having known how to build such cities as Axum. In many of the towns and villages, the houses are separated by hedges, which being always green and intermixed with flowers and fruit-trees, at certain dillances, afford an agreeable prospect, and contribute also to their fulnss. Notwithstanding every caution, the Abyssinian climate, more especially in particular situations, exposes the inhabitants to a variety of diseases. They are subject to violent fevers, which commonly prove fatal on the third day. Those who survive to the fifth day often recover, merely by drinking cold water, and by repeatedly throwing cold water upon them in their beds. The bark is the most effectual remedy; which in critical cases, (says Mr. Bruce, vol. iii. p. 74.) should be frequently repeated in small doses, and perfect abstinence observed, unless from copious draughts of cold water. Another common disease in Abyssinia, is the tertian fever, which is in no respect different from our tertian, and is successfully treated in the same manner. All fevers terminate in intermittents, and if they continue long, in dysenteries, which are always tedious, and very frequently mortal. Bark and ipecacuanha, in small quantities, water, and fruit not over-ripe, have been found the most effectual remedies. The dysentery, commencing with a constant diarrhoea, is seldom cured, if it begins with the rainy season; otherwise small doses of ipecacuanha either remove it, or change it into an intermittent fever, which yields to the bark. Another endemic disease is called hangare, the hogs or the fwine, and a swelling of the glands of the throat, and under the arms, which, by ineffectual attempts for producing suppuration, and opening the tumours, becomes a running sore, and resembles the evil. In connection with this disorder, we may mention those swellings, to which the whole body is subject, and particularly incident to the arms, thighs, and legs, sometimes accompanied with ulcers in the nose and mouth, which deface the smoothness of the skin, and which on this account are much dreaded by the Abyssinians. The two last diseases sometimes yielded to medicinals; but the last is speedily and completely cured by antimonials. Another complaint afflicts those who are in the habit of drinking flagellant water. It is called Parentote, or the worm of Pharaoh, and appears in all parts of the body, but most frequently in the legs and arms. It is a worm with a small black head and a hooked beak, of a whitish colour, and a white body of a silky texture, resembling a small tendion. The natives fake it by the head and wind it gently round a piece of silk, or a bird's feather, and thus by degrees they extract it without any inconvenience or permanent fear. Mr. Bruce suffered much from this complaint, and the breaking of the worm in the operation of extracting it. The most terrible of all the diseases of this climate is the Elephantsiasis. The cicuta, mercury, and tar-water, were unsuccessfully tried in this complaint: the greatest benefit was derived from whey made
made of cow's milk. To the alternation of scorching heat and chilling cold, thin cloathins, the use of fragrant purifying water for four months, and other such causes, these diseases may be partly, if not wholly, ascribed. The small-pox was introduced into Abyssinia at the time of the siege of Mecca, about the year 356, and the Abyssinian army was the first victim to it. The diseases and other inconveniences to which the Abyssinians are subject from the nature of their climate, are in some degree counterbalanced by substantial advantages, if they would avail themselves of them by their industry and activity. Their soil, though in many places thinly spread, is rendered fertile and productive by their rains and rivers. Wherever it can be tilled and well watered, it yields very large crops of wheat, barley, millet, and other grain. The inhabitants have two and often three harvests in the year; and where they have a supply of water, they may sow in all seasons; many of their trees and plants retain their verdure, and yield fruit or flowers throughout the year; the well side of a tree blossoms first, and bears fruit, then the south side, next the north side, and last of all the east side goes through the same process towards the beginning of the rainy season. Their rivers abound with various kinds of fish; and their pâturages are covered with flocks and herds; and yet for want of application and exertion, notwithstanding the almost spontaneous productions of nature which their country affords them, they are in general poor and wretched. Though they have plenty of wheat, and some of excellent quality, the chief grain they use is that called Teff. They have grafs in abundance, but they neglect to lay hay of it; and therefore they are obliged to supply this defect by feeding their cattle with barley, or some other grain. Notwithstanding the plenty, and frequent return of their crops, they are sometimes reduced almost to famine, either by the devastations of the locusts or grasshoppers, which infest the country, or by the more destructive ravages of their own armies, and those of their enemies. They cultivate the vine, peach, pomegranate, sugar-cane, almonds, citrons, and oranges; and they have many roots and herbs, which grow spontaneously; and their soil, if properly managed, would produce many more. However, they make little wine; but content themselves with the liquor which they draw from the sugar-cane, and their honey, which is excellent and abundant. They have also the coffee-tree, and a plant called Ensete, which produces an edible nourishing fruit. The country also produces many other plants and fruits, that are adapted both for domestic and medicinal use: such as the Kolquall, Papyrus, Wanzey, Balesian, Wocinioos, Cussu, Sessa, Ergott, Sena, Cardamom, and Ginger. Here is also plenty of cotton, which grows on shrubs, like the Indian. Flowers in a rich variety adorn the banks of their rivers, and encircle their houses; some of which are common with us, and others unknown in Europe. Their forests likewise abound with trees of various descriptions, particularly the Rack, Baoob, Cedars, Sycomore, &c. This country produces a great number of animals, both domestic and wild. Amongst the former we may enumerate hores, some of which are of a very fine breed, mules, asses, camels, dromedaries, oxen, cows, sheep, and goats; and these constitute the principal wealth of the inhabitants. Amongst the wild animals we may reckon the antelope, the buffalo, the wild boar, the jackall, the elephant, the rhinoceros, the lion, the leopard, the hyena, the lynx, apes and baboons, which are very destructive to the fields of millet, as well as the common rats; the zecora or wild mule, and the wild ass; the jerboa, the fennec, ahikoko, hare, &c. The hare, as well as the wild boar, is deemed unclean, and not used as food. To the amphibious kind we may refer the crocodile and hippopotamus, and the water-lizard, called Anguilla by the natives, and by the Italians candiobellus. Of the vast variety of fish with which their lakes and rivers teem, we shall only mention the Torpedo and the Eel. Amongst the birds, we might enumerate the eagle, hawk, and many of the vulture kind; the ostrich, the Stork, the wader, and many other species of pigeons which are birds of passage, the Eremoe, the Abou-Hannes, the Moroe, or honey bird, &c. The swallows that are known in Europe, appear in plicate there when they take their flight from hence. In the island of Masraf, they lighted, and turned two days, and then proceeded with moon-lights nights to the south-west. Mr. Bruce saw no sparrows, murgges, nor bats; nor many water-fowl, nor any geese, except the golden goos or geese of the Nile, which is common in every part of Africa; but there are pigeons in the marshes. The Locusts of this country are very destructive; they have also a species of ants, that are injurious; but from their bees they derive a rich supply. Of their vipers and serpents we shall take notice under the articles Cerastes and Bota. For a peculiar fly, see Tsaltysalla.

The inhabitants of Abyssinia are Chaldaeans, Jews, Mahometans, and Pagans. The Chaldaeans are the of the Abyssinian church, of whom we shall give some account in the next article.—The Jews have been settled in this country from time immemorial. Of these some have been voluntary proselytes to christianity; others have been compelled to embrace the profession of it, in order to avoid persecution, and to enjoy the benefits of manufacture and commerce; and those that remain Jews have, for the most part, forced to reside in the inaccessible and mountainous parts of the country; and even here they retain the ancient distinction of a race, and Talmudists, with invincible pertinacity. Besides these two sects, there is a third sort of them, (says Babo, i. 1. c. 14. p. 73.) who inhabit the Abyssinian frontiers, between them and the Caffres, who dwell along the Nile. These are supposed to be descended either from those whom the kings of Assyria and Babylon carried away captive, or from those who were dispersed over the world, or were sold by Titus Vespuian, after the destruction of Jerusalem. They were never incorporated with the original Jews that came hither, as tradition says, with Menileck, the son of Solomon, but were looked upon as aliens, being called Salana, &c. Strangers or exiles. They retain their Hebrew bible in the corrupt Talmudic dialect, and their synagogue-worship. The Mahometans are reckoned to amount to about one third part of the inhabitants of Abyssinia, and are every where intermixed with the Christians. Some of them apply to agriculture; but the richest and most prosperous are the factors, who, since the Abyssinians have been deprived of their sea-ports on the Red Sea by the Turks, have, by favour of the Muffulmans, engrossed that trade very much to themselves. The Pagans are chiefly the Gallas; besides some others who are dispersed through several of the provinces of the Abyssinian empire. Amidst this variety of nations, there must be sup¬posed a corresponding variety of language, disposition, customs, and government. The Jews speak a kind of corrupt Hebrew. The Moors use their own Arabic in an impure state. The dialect of the court is that of Amhara; that of Tigre, however, approaches near to the old Ethiopic, which is called Lakhone Gezz, or the learned language, and is still used, not only in all their literary and religious books, but also in the king's letters patent, and all their records. See specimens in Bruce's Travels, vol. i. p. 424.
With regard to arts and sciences, and general literature, the Abyssinians are commonly very uninformed and likely to continue so, not only from the form of their government and natural indolence, but as long as they are in a great degree secluded from intercourse with nations that are better instructed than themselves.

As to their persons, the Abyssinians are, in general, tall and well made; their features are duly proportioned, their eyes large, and of a sparkling black colour, their noses rather high than flat, their lips small, and their teeth extremely white and handsome. With respect to their natural temper, they are said to be good-humoured, mild, and pliable; unless we except those of Tigre, who, according to the accounts of the Jesuits, not indeed always to be credited, are of a fickle, cruel, treacherous, and vindictive disposition. In their common conduct, they are sober and temperate. They have both a capacity, and an inclination for acquiring knowledge, but have hitherto wanted the necessary means. To religion, or rather to superstition and ceremonial observances, they are much inclined, and difference to their priests is considered by them as one of their first duties. But inured as they are to war and scenes of blood, and to feeding on raw, and even living flesh, they cannot avoid contracting an odious temper, and remaining in a state of barbarity.

The drefs of persons of quality, is a long fine veil either of silk or cotton, tied about the middle with a rich eft. The common people have only a pair of cotton drawers, and a kind of leaf, or piece of the same linen with which they cover the rest of their body. In some parts of the country, more especially near the coast, and in the adjacent provinces, men and women have no kind of covering. Indeed, their drefs is suited to the climate, so that the cloth which covers their bodies, and their drawers, are made fo wide and long, as to admit as much air as possible. The habit of the women, particularly of the superior classes, is formed of the richest silks, garnished, according to their rank, with trinkets and jewels, images, and relics of various kinds. They are allowed to appear in public, and to converse freely with the men, without any of those restrictions to which the Turkish women are commonly subject. The women of superior condition are not very guarded in their conduct, but those of inferior rank are more faithful to their husbands; and they also submit to the meaner and more laborious offices of domestic life. It is their business to grind corn for the family, which they perform daily by means of hand-mills. Every kind of intercourse (says Mr. Bruce, vol. iii. p. 304.) is permitted with absolute freedom. In this particular they resemble the Cynics of old, of whom it was said: "Omnis "ese ad Bucebum et Venerem pertinuens in publico facere." They bear children, and are delivered with little pain and inconveniency. Although we read from the Jesuits, continues this author, a great deal about marriage and polygamy, yet there is nothing which may be ascer ded more truly, than that there is no such thing as marriage in Abyssinia, unless it be that which is contracted by mutual consent, without other form, subsisting only till dissolved by dissent of one or other, and to be renewed or repeated as often as it is agreeable to both parties; who, when they please, cohabit together as man and wife, after having been divorced, and had children by others, or whether they have been married, or had children by others or not. Upon separation they divide the children. The eldest son falls to the mother's first choice, and the eldest daughter to the father. If, after the first election, the remaining number be unequal, the rest are divided by lot. There is no such distinction as legitimate and illegitimate children from the king to the beggar. The king in his marriage uses no other ceremony than this: he feinds an Azag, or officer, to the house where the lady lives, who announces to her, that it is the king's pleasure she should instantly remove to the palace. She then dresses herself in the beld manner, and obeys. From this time an apartment is assigned her in the palace, and a house is given to her wherever else she chooses. When he makes her Itegh, the form seems to be the nearest resemblance to marriage: for, whether it be in the court, or in the camp, he orders one of his judges to pronounce in his presence, that he, the king, has chosen his hand-maid, naming her, for his queen; upon which the crown is put upon her head; but she is not anointed. Whatever be the forms of marriage in this country, and such are entered into at a very early period, when the males are ten, and the females younger; polygamy is allowed, divorces frequently occur, and adultery is compensated by an easy fine. Their funerals are attended with many superstitious ceremonies. The relations, friends, and a number of hired mourners, bewail the dead for many days together, with shrieks and lamentations, clapping of hands, limiting their faces and breasts, and uttering a variety of affecting expressions in their most dejected tones. They express their concern at hearing of the death of a relation or friend, not only by violent exclamations, but by throwing themselves on the ground with such force as to do themselves great injury. Whenever a near relation dies, every woman in Abyssinia, with the nail of her little finger, which the leaves long on purpose, cuts the skin of both her temples, about the size of a farise; and, therefore, you see a wound, or scar, on every fair face in the country; and in the dry season, when the camp is out, from the loss of friends, they are seldom allowed to heal till peace and the army return with the rains.

The food of the Abyssinians is plain and coarse. Their bread, which is indifferently prepared, of wheat, peas, millet, teff, or any other grain, is made into flat cakes or apas, which serve for dishes, plates, and spoons, and even for napkins and table-cloths. They wash their hands before they sit down to their meals, and this is the more necessary, as they touch every thing they eat. The rich have their victuals cut for them, and conveyed to their mouths by pages, who attend them. All their sauces are rich, greasy, and highly seasoned. They never drink till they have finished their meals, alleging an old rule, that you must plant first and then water. When the tables are cleared, they indulge themselves freely in circulating the gafs. The common liquor is hydromel, made of five or six parts of water to one of honey, with a handful or two of parched barley meal, which causes it to ferment; to which they add some chips of a wood, called fardo, in order to take off the nauseous taste of the honey, and to make it palatable and wholesome. At a feast, which Mr. Bruce attended, there was excellent red wine, brought from Karoota, which is the wine country, good new brandy, hydromel, and a kind of beer, called honza; both the last of which were fermented with herbs or leaves of trees, and thus made very heady and intoxicating. The Abyssinians neither eat nor drink with strangers; and they break, or purify, every vessel which has been used by them. This custom they seem to have derived from the Egyptians. The Abyssinians eat their flesh raw; and they have a method of obtaining it, which at the first report seems to be hardly credible; but, upon further enquiry, is an undoubted fact. In the neighbourhood of Axum, Mr. Bruce met with some travellers, who were driving a cow before them. He afterwards found that they cut aches from the higher part of the buttock; they then closed the wound by drawing the skin over it, and applied to it a cement of clay. They then drove the animal before them, in order to supply them and their companions.
panions with another meal. At their feasts they have a bull or cow, one or more, according to the number of guests, which are tied at the door of the house in which they are assembled. After letting out a few drops of blood from the dewlap under the throat, they cut through the skin on each side of the spine, and stripping off the hide of the animal half way down the ribs, and as far as the buttock, they cut out the solid flesh from the buttocks in square pieces, and the roasting of the animal, during this savage operation, is a signal for the guests to feast themselves at table. These pieces are served up on round cakes of unleavened bread made of teff. Three or four of these cakes of a whitish flour are placed uppermost, and designed for food; and four or five of a blacker kind are under the others, and serve the maker to wipe his fingers upon, and afterwards the servant cuts them as bread at his dinner. As no perfunctory fashion feeds himself, or touches his own meat, the women take the flesh, while the motion of the fibres is distinctly seen, cut it into small pieces, well pepper them, and wrap them up in the teff bread, like so many cartridges. In this form they are put into the mouths of the guests, who, like birds fed by their dams, are opening their mouths to receive the morsels that are ready so fast as they can be prepared for them. The females, after having thus unfurled the male guests, eat till they are satisfied, and then all drink together. The victims is full bleeding, writhing, and roaring at the door. The animal has died to death, the cannibals tear the remaining flesh from the thighs with their teeth like dogs. Such, in brief, is the description of an Abyssinian feast. For a fuller account, see Bruce's Travels, vol. iii. p. 302, &c.

The offering of meat and drink in Abyssinia, is an assurance that your life is not in danger; and it is also the constant practice to wash the feet of those that come from Cairo, who are understood to have been pilgrims at Jerusalem. Many of the customs in Abyssinia resemble those of the ancient Persians and Egyptians. For particular instances, we refer to Bruce's Travels, vol. iii. p. 268—294.

The capital punishments in Abyssinia are the crose, hanging, flaying alive, stoning to death, and plucking out of the eyes. The dead bodies of criminals slain for treason, murder, and violence on the highway at certain times, are seldom buried. The streets of Gondar are strewn with pieces of their dead carcases, which bring the wild beasts, and particularly the hyenas, in multitudes into the city as soon as it becomes dark, so that it is hardly possible to walk about with safety in the night; and the dogs bring pieces of human bodies into the houses and yards that may devour them in greater security.

The Abyssinians have few manufactures, though their country produces, or is capable of producing, ample materials for them. Before the discovery of the Cape of Good Hope, and before the Turks took possession of the ports of the Red Sea, there was a considerable intercourse of a commercial kind between Abyssinia with its adjacent provinces and various parts of Arabia and of India. Mahom was then a harbour of great repute, and had a large quantity of exports brought to it from an extensive tract of mountainous country behind it, in all ages very inoffensive, and almost inaccessible to strangers. Gold and ivory, elephants, and buffaloes' hides; and, above all, slaves, of much greater value, made the principal articles of exportation from this port. There is still a considerable trade carried on from this place; but the hand of power restrains and discourages every exertion, and the interference of it renders every kind of property insecure. The goods imported from the Arabian side are blue cotton, Sumat cloths, and cochineal ditto, fine cloth from different markets in India, cotton unpin in bales, Venetian beads, crystal, drinking and looking glasses, and crude antimony. Old copper is also a gainful article, and imported in large quantities. To the westward of Gondar they wear bracelets of it; and near the country of Gonga and Guba it has been fold, weight for weight with gold. The Banians were once the principal merchants of this port; but their number is now reduced to fix, and they scarcely gain a sufficiency, as silversmiths, by making ear-rings, and other ornaments for the women on the continent, and alloying of gold. The same coin is current here as on the Arabian side, and it is valued by the Venetian seigniory. But glass-beads, called Contarins, of all kinds and colours, perfect and broken, pass for small money, and are called, in their language, Borjooke. The Venetian seigniory is = 24 patakas; the pataka, or imperial dollar= 22 hare or dahab; the hare = 4 dneys; or 120 grains of beads; the dney = 10 kibers; and the kiber = 3 borjooke, or grains. They have no gold in Abyssinia; and in lieu of small money, they frequently make use of rock salt as white as snow, and as hard as bone. This salt is also applied to the same purposes as common salt. With this mineral salt they purchase pepper, fipes, and silk stuffs, which are brought to them by the Indians in their ports on the Red Sea. Cardamoms, ginger, aloes, myrrh, califs, cevent, ebony-wood, ivory, wax, honey, cotton, and linen of various sorts and colours, may be procured from Abyssinia; to which may be added, sugar, hemp, flax, and excellent wines, if they had the art and inductry to prepare them. The merchanides above specified are more for foreign than for inland trade. The emeralds of this country have been estimated at a high value. Their domestic commerce consists chiefly in fite, honey, buckwheat, grey-peas, citrons, oranges, lemons, and other provisions, with fruits and herbage necessary for the support of life. Antimony, large needles, goat skins, earfe feathers, razors, and shears for fleskng hie, as well as bugles and beads, are articles of barter in several of the provinces. Those places which the Abyssinian merchants most frequent are Arabia Felix and the Indies, particularly Goa, Cambay, Bengal, and Sumatra. With regard to their ports on the Red Sea, to which foreign merchants commonly resort, the most considerable are those of Suakim, Jidda, Mochala, Meheja, Massau, Suez, Azar, and Meche. The trade of the Abyssinians by land is incalculable. There are, however, bands of them who arrive yearly in Egypt, particularly at Cairo, laden with gold-dollor, which they bring to barter for the merchandizes of that country, or of Europe. Thee catttis, or caravans, formed of a few persons who associate for their mutual safety, are commonly three or four months in their route, travelling fords and mountains, in order to exchange their gold for necessaries for their families, and return immediately with the greatest part of their merchandise on their backs. One of the principal branches of the Abyssinian commerce is that of their slaves, who are highly esteemed in India and Arabia; and who, entruced by the merchandizes, as their factors, and found worthy of confidence, obtain their liberty and a suitable recompence.

The government of Abyssinia has been always monarchical and despotic, and it has exercised an absolute dominion over the lives, liberties, and fortunes of its subjects, and uncontrollable authority in all matters civil and as well as civil. This empire has ever been delinquent of written laws to restrain the royal power, or to secure the property and privileges of the subject; so that the will of the foreign is the universal law. The princes of Abyssinia claim descent from Menilek, the son of Solomon, by the queen
of Sheba. Accordingly it is maintained by many learned men, and in conformity to the Abyssinian records, of which Mr. Bruce has availed himself, that Sheba, or rather Saba, Azab, or Azaba, signifying South, was the same country with Abyssinia, whatever might have been its extent; and that it was the kingdom of queen Candace, whose queen or prime minister, came to worship at Jerusalem, and who, on his return homewards, was baptized by Philip the deacon, and from whom the Abyssinian acknowledge they afterwards received the gospel. See Acts viii. 27—38. This country, as Pliny (l. vi. c. 29.), and Strabo, (l. xvi. c. 12. p. 1116. 1175.) was commonly governed by queens; and, it is said, that Candace was a name common to them all, as Pharaoh was to the kings of Egypt; the term Candace importing their sovereign authority. The queen of Sheba or Saba, having heard of Solomon's fame, determined to pay him a visit at Jerusalem. She was there converted, as the Abyssinians say, from heathenism to the Jewish religion, and had a son by Solomon, who was named Menikek. With this son she returned to her own country, and after some time sent him back to Jerusalem to be instructed by his father. Having been anointed and crowned king of Ethiopia in the temple of Jerusalem; and having also, at his inauguration, assumed the name of David, he returned to Azab with a colony of Jews, among whom were many learned doctors of the law, and particularly one of each tribe, from whom the present Umbras, or supreme judges, three of whom always attend the king, are thought to be descended. Azarias, the son of Zakod, the priest, was one of the number, and he brought with him a Hebrew copy of the law, which was committed to his custody as high priest, and which was burnt with the church of Axum in the Moorish war of Adel. By the last act of the queen of Saba's reign, she settled the mode of succession in her country for the future; enacting, 1st, That the crown should be hereditary in the family of Solomon for ever; 2dly, That, after her, no woman should be capable of wearing that crown, or being queen, but that it should descend to the heir-male, however distant; and that these two articles should be considered as fundamental and immutable laws of the kingdom; and 3dly, That the heirs-male of the royal house should always be sent prisoners to a high mountain, where they were to continue till their death, or till the succession should open to them. The custom, however, of having women for sovereigns prevailed among the neighbouring kingdoms till the last century, and may possibly prevail in some of them to this day. It obtained in Nubia, and the kingdom of Meroe, till the time of Augustus, when Petronius, his lieutenant, subdued the country, and took and destroyed Napata, the residence of queen Candace; and this queen, Mr. Bruce (v. i. p. 475.) supposes, was succeeded by the Candace above mentioned. Whatever was the origin of the last regulation, it seems to have been necessary in order to prevent the confusion that must have arisen from various claimants, in a country where polygamy was allowed, and where the heirs to it must have been numerous; as the crown was to be hereditary in one family, but elective as to the person. Whilst they are confined in a good climate, on a high mountain, they are taught merely to read and write, and the state allows to the amount of 20,000 dollars for their maintenance. However, they are often severely treated, and in times of tumult, put to death upon the slightest misinformation. It is another rule of the society in Abyssinia, that no person that is mainued shall inherit the crown. The queen of Saba having established the laws above recited, and reigned forty years, died in the year 986 before Christ; and was succeeded by her son Menlikek, or Mendechech, i. e. Another self; whose policy, according to the annals of Abyssinia, have ever since reigned. The device of these kings is a lion passant, proper upon a field gules, and their motto, "Mo Antuifs an Niselt "Solomon am Nigade Jada," i. e. "The lion of the race of Solomon and tribe of Judah hath overcome." Instead of the lion passant, the Portuguese missionaries introduced a lion rampant, in order, as it is supposed, to put a cross into the paw of this Jewish lion; but the lion passant is restored. In virtue of this noble device, the Abyssinian monarchs assume the title of Nagath, and are always addressed either by that of Naguth Naqadth, king of kings, or by that of Natzeghe, equivalent to the French Sire. They are approached with adoration; when seated in council, they are conceded; they are attended by a splendid retinue; their camp is extensive and magnificent, and they wear a very rich and costly crown. The imperial revenue chiefly arises from the four following sources: the tribute paid by those provinces which have gold mines, or which trade with the Caffres and other neighbouring nations, which amounts to about 5 or 6000 ounces per annum; the second source of revenue is, the sale of all the great places in the empire, the annual tax on holding them and their appendages, the amount of which from two provinces, one the largest, and the other the richest, is about 75,000 French livres; the third source is, a tenth, levied every third year, upon all the cattle in the empire: the fourth source is, a duty laid upon every loaf of cotton cloth, which, if it belongs to a Christian, pays one piece of cloth, and if to a Mahometan, a piece of eight per annum. This revenue, the whole amount of which is not easily estimated, falls far short of what might be expected from an empire of which the sovereign is the sole proprietor and disposer.

The military force of Abyssinia has been greatly exaggerated. Mr. Bruce does not imagine that any king of this country ever commanded 40,000 effective men at any time, or upon any cause whatever, exclusively of his household troops, which are about 8000 infantry; 2000 of these last carry firelocks, and supply the place of archers; bows having been laid aside for near a hundred years, and being now used only by the Waato Shangalla, and some other inconsiderable barbarous nations. As they are in a state of almost continual war, either among themselves, or with their neighbours, the face of the country is strewn with dead bodies; and as they bury neither their friends nor enemies, and their beasts of burden are perpetually dying under the load of baggage which they carry, the army is followed by an immense number of birds and beasts of prey, who devour the putrefying carcasses when scattered over the ground; and the surrounding trees are covered with them; and they form a kind of dark canopy over the marching army.

The Abyssinians in computing time, have continued the use of the solar year. Thirty days constitute their month, to which they add five days and a quarter, and thus they complete their year. The five days are added to the month of August, and to every fourth year they add a sixth day. They begin their year with the 29th or 30th of August, i. e. the kalends of September; the 29th of August being the first of their month Maecaron. The common epoch which the Abyssinians use is from the creation of the world, and they reckon 5500 years from the creation to the birth of Christ, rejecting the odd eight years of the Greeks, who make this period 5528 years. They have also many other epochs, such as from the council of Nice and Ephesus, in their ecclesiastical computations they make use of the golden number and epact. The first use of epacts amongst them was not earlier, according to Scaliger, than the time of Diosleian; but Mr. Bruce observes, [vol. iii. p. 352.] that this
this is contrary to the positive evidence of AbySSiAn hiStOry, which says expressly, that the ephph was invented by Demetrius of Alexandria. this Demetrius was the 12th patriarch of Alexandria, and elected about the 190th year of Christ, or in the reign of Severus, and consequently long before the time of DioCleSian. The AbySSiANS have another mode of computing time, that is peculiar to themselves. They read the whole of the evangelists, in order, every year in their churches; and when they speak of an event, they write or say, it happened in the days of Matthew; that is, in the first quarter of the year, whilst they were reading the gospel of St. Matthew in their churches. They compute the time of the day in a very arbitrary manner. The twilight being very short, is selected for the beginning of their day; this they call Nagg, which comprehends the duration of twilight. Mefet expresses the moment when the evening twilight begins. Mid-day is called Kater, which signifies culmination. All the other parts of time they describe, in conversation, by pointing at the place in the heavens where the sun was, when the event, which they are describing, happened. After all, nothing can be more inaccurate than the AbySSiAN calculations. This is a circumstance which renders the historical records of AbySSiAn very confusTed and indeterminate. Besides, the earlier part of their history is, on account of its remoteness, involved in a considerable degree of obscurity and uncertainty; and in later ages, the access into this country was difficult, and the intercourse with it very rare and limited. For that kind of knowledge of this country, in modern times, which is attended with any degree of certainty, we are first indebted to the discoveries of the PortuGuese. But the zeal of their missionaries to convert the AbySSiANS to the Catholic faith, involved them in difficulties and persecution, and barred the access of other Europeans, for a considerable time, into this country. The first history of AbySSiAn was written by Alvarez, who accompanied an ambasSador sent thither by Emanuel king of Portugal; and it was printed at Lisbon in 1546. It is preserved in Purchas’s collection. Father Bermudes, who also visited the country, has given some account of it, intermixed with much fable. His relation was printed in 1565. Father Pais, who resided there for a considerable time, and died there in 1622, wrote an account, which extends from 1556 to his death. Father Almeida, who travelled through the inland provinces; Father Mendes, who resided there ten years; and Father Jerome Lobo, who arrived in AbySSiAn in 1624, resided there nine years, and travelled above 38,000 miles in this empire, and whose history was published by M. le Grand at Paris 1738, have given distinct details of the provinces, produce, customs, and inhabitants of AbySSiAn. From these several sources, and the letters of the AbySSiAN missionaries to the college of Jesuits at Lisbon, Father Baltazar Tellez derived materials for his general history, which was published in the PortuGuese language in 1660. Ponce, a physician, who was sent by the French confus at Cairo into AbySSiAn, to cure the emperor of an obStinate diseas, in 1698, published an account of the religion, laws, and customs of the AbySSiANS; but his personal observation was very restricted, and of course he must have depended very much upon the report of those with whom he conversed. The Jesuit writers have concurred to degrade and vilify him without sufficient reason; but his account is in general just and credible, and is held in good estimation. The history of Ludolph, in folio, is the most comprehensive of any that had been written at his time. It is chiefly compiled from the Portuguese authors above mentioned; though he relies too implicitly in many instances on the authority of the Abbot Gregory, whose learning, capa-
In consequence of the discoveries they had made, they had occasions to perform their commercial intercourse with other provinces of the continent. They found in a nation that existed in their neighborhood, and which they had been distinguished by the high opinion of SHEPHERDS. In this employment they generally advanced to great wealth and power. The number increased, and the extent of their territory was enlarged. Whilst they extended themselves along the Indian ocean, and afterwards along the Red Sea, for the convenience of trade; the principal seat of their residence and power was the land part of Africa, between the northern tropic and the mountains of Abyssinia, a country now called Ethiopia. This country reaches from Mafubah along the coast to Suakim; then turning westward, continues in that direction, having the Nile on the south, the tropic of Cancer on the north, with the deserts of Selima and Libya on the west. The next district belonging to these people was Meros, now called Abybara. A third district, now called Dorkin, is a vast plain lying between the river March on the east, and Abybara on the west. But the most noble and warlike of the Shepherds were those who possessed the mountains of Habah, reaching from the vicinity of Mafubah to Suakim, which district they still inhabit. The building of Carthage increased their employment as carriers in the intercourse of commerce, and of course their power. The eminence of the Shepherds to the Egyptians originated principally in religious differences; for the latter worshipped the animals which the former used as food; and the Shepherds worshipped the heavenly bodies, whilst the Egyptians practiced the grosser kind of idolatry.

Besides these Cushites and Shepherds, who were the first settlers in Abyssinia, the above cited Chronicle of Axum mentions, among other particulars, that about the year 1400 before Christ, it was taken possession of by a variety of people, speaking different languages, who, as they were in friendship with the Agaazi, or Shepherds, possessing the high country of Tigré, came and laid down beneath them in a peaceable manner, each occupying the lands that were before him. This settlement the Chronicle calls Angabe, the entry and establishment of these nations, which finished the peopling of Abyssinia. Tradition further says, that they came from Palestine. Many approved writers are of opinion, that some of the early descendants of Cuth, first settled in the land bordering on the eastern side of the Red Sea, moving gradually from thence to the southern extremity of Arabia; and afterwards, by means of the easy passage over the straits of Babernand, transplanted themselves into Ethiopia. This migration, according to Eusebius, happened whilst the Israelites were in Egypt; but Syncellus places it in the time of the judges. These Arabian Cushites were called Aboseni, and formed a great part of the Sabans or Homerites; and the Ethiopians were distinguished by the same name, agreed in many particulars with the others, and were believed by most of the African nations in Joseph’s time, to have had the same origin. Of these new settlers, Mr. Bruce (vol. i. p. 599.) gives a somewhat different account. When Joshua had pursued the Jordan, and destroyed Jericho, a part feized the whole people of Syria and Palestine. These petty states, many in number, and diversified by language, fought for Safety from the conqueror by flight or emigration. Having already carried on a commercial intercourse with the Shepherds of Abyssinia and Abybara, they directed their views to them for protection, and obtained settlements among, or near them. The curfe of Canaan, (Gen. ix. 25, 26, 27.) says Mr. Bruce, seems to have followed them, as they have obtained no principality, but served the kings of the Agaazi, or Shepherds, and so they still continue. The first and most considerable of these nations listed in Amhara; the second were the Aqew of Damot, one of the southern provinces of Abyssinia; and the third were the Aqew of Lalla, with a separate language, living in caves, and paying nearly the same worship to the Seris or Tartass, that those of Damot pay to the Nile; the fourth is a nation near Damot, called Gatif, the situation of the fifth is not precisely ascertained, unless it be intermixed with the Galula and Falasha. From this recital, we may perceive the propriety of the appellation Habes or Cawerass, denoting separate nations settled together, as affording the most satisfactory etymology of Abyssinia. The inhabitants who possessed Abyssinia from its southern boundary to the tropic of Cancer, or frontiers of Egypt, were the Cushites, a polished people, living in towns, being first Troglydotes, and having their habitations in caves. The next were the Shepherds. After they were the nations who, according to Mr. Bruce, came from Palestine. If the account we have now given of the origin of the Abyssinians be just, they might very well vie with the Egyptians, and even be deemed superior to them with respect to antiquity, since Cuth, their great ancestor, was the eldest son of Ham. They might likewise have been deemed of equal antiquity with the Arabsians, as from the kingdom of Median the Cushites penetrated both into the southern parts of the peninsula of the Arabs and Ethiopia. The communication between Egypt and Ethiopia, as well as the proximity of blood of Cuth and Mizrâm, introduced that similitude of laws and manners that is observable among their respective inhabitants. The Ethiopians, or Abyssinians, account, for this mutual resemblance, by ascertaining, that Egypt, when recovered from the Nile, and made habitable, was first peopled by colonies that migrated out of their country, and they again were civilized by the Egyptians. Mr. Bruce endeavours to prove, that the Abyssinians in ancient times were not only the most learned people in the world, but that they spake the original language, and were the inventors of writing. How they, as well as the Egyptians, came to lose this character, and to sink into their present state of degeneracy and barbarity, is not easy to explain. But the nature of their respective governments will serve in some measure to resolve the difficulty. According to some authors, Moses ridiculed the progress of the Ethiopians from Thebais into the Lower Egypt, and drove them back into their capital Meros, which, being surrounded by three rivers, the Nile, Aftapus, and Afibors, was deemed impregnable. This city, however, was betrayed by a young woman, who fell in love with Moses, and delivered it up to him on condition of his marrying her. He then ravaged the country, and having reduced the inhabitants to such a state that they were incapable of any farther hostile attempts for a long time, he returned in triumph to Egypt, after an absence of ten years. Without attempting to fill up the chain that occurs in the history of Abyssinia from this period to the time of Solomon, and without recurring again to the story of the queen of Sheba, and her son Menelik, from whom the kings of Abyssinia derive their descent, we shall proceed to observe, that the Ethiopians, or Abyssinians, after the ascension of Menelik, were invaded by Seda, or Sefolanis, who plundered their main temple at Saba, and probably occasioned the removal of the imperial seat to Tigré, Ethiopia, or at least a considerable part of it, became subject to this monarch. The Ethiopians, according to Sir Isaac Newton, drowned the successor of Seda in the Nile, and feized upon Egypt, and obtained Libya in connection with it. However, they were defeated by Aba king of Judah. Upon this the people of the Lower Egypt revolted, and obliged
obliged Memnon, supposed to be the same with Menes and Amenophis, to retire hitherto to Memphis, and then to Ethiopia. In about thirteen years he returned, with his son Rameses, at the head of a large army, and compelled the Canaanitish forces to abandon the Lower Egypt; and this event is denominated by the Egyptian writers by the second expedition of the Shepherds. Sir Isaac Newton supposes, that the Memon just mentioned built, or at least fortified Memphis, in order to prevent the Egyptians from penetrating into Ethiopia, and that he died at a very advanced age, about 90 years after the defeat of Solomon. In his time the Argonautic expedition is said to have happened. He was succeeded by Rameses; and his successor Moses ordained Memphis, and made it the capital of his empire, about two generations after the Trojan war. Cleopas, Caphrenus, Mycerinus, and his father Niocoris, succeeded one another; and in the reign of Afyphus, the successor of Nicoris, Ethiopia and Afyphus revolted from Egypt, which being partitioned into several small kingdoms, was soon subdued by Sabazon or So, the emperor of Ethiopia. This monarch, forming an alliance with Hloth, king of Israel, occasioned his revolt from the Abyssins; in consequence of which, an end was put to the kingdom of Israel by Shahmafer king of Afyphus, in the 223d year of the era of Nabonassar, and the 720th after the commencement of the Christian era. Sabazon was succeeded by Seshon, who marched with a powerful army against Sennacherib king of Afyphus, and defeated him. In the 787th year of the era of Nabonassar, Ethiopia was subdued by Elfar-Hadden king of Afyphus, who over-ran both these countries for three years, when the Ethiopians assented to their independence, which they preferred till the time of Cyrus, whose dominion, according to Xerophon, extended to Ethiopia. After his death the Ethiopians revolted; and their empire was so powerful, that Cambyses found it impracticable to penetrate into the country: though Sir Isaac Newton suggests that he subdued them about the year 225, or 224, of Nabonassar. But others are of a different opinion. Herodotus affirms, that they reduced some of the provinces contiguous to Egypt; and it appears, that the Perians proceeded as far as Cyrene; but it is not probable that they brought under subjection the whole Ethiopia Propria of the ancients, which comprehended Sennar, Abassin, and other countries. We have no account of any expedition undertaken by Alexander the Great against Ethiopia, though he was very defirous of exploring the source of the Nile. With this view Ptolemus Euergetes advanced into the country; but if he made any conquests, he did not seem to have long retained them, for nothing of importance relating to Ethiopia occurs till the days of Augustus. About this time, i.e. the year of Rome 725, Caracae, queen of Ethiopia, or rather of the kingdom of Meroe, made an irruption into the province of Thabae, and being repulsed by Petronius, was obliged to sue for peace, which, as we have already mentioned, was granted to her by Augustus. From this time the Romans conferred themselves as masters of Ethiopia. Menleck, according to the Abyssinian records, succeeded to the throne in the 96th year before Christ, and they reckon twenty-two kings from Menleck to Bazen, the eighth year of whose reign coincides with the year of the birth of Christ. But this account must be very erroneous, because each reign will amount to more than forty-four years, which is impossible. In the reign of Hiaggabalus, about the year of Christ 220, there seems to have been an intercourse between the Roman empire and the Ethiopians: and we learn from Procopius, (De Bell. Pers. i. i. c. 19) that before the reign of Dacelan, the frontiers of the Roman empire extended so far into Ethiopia, that they were not above twenty-three days journey from the capital. Nothing remarkable occurs in the history of the Ethiopians from the time of this emperor to the period of their conversion to Christianity, when event took place under Abraha and Azizlada, or as they are also called Abra and Absa, who are considered by Mr. Bruce as the prince, and by others as joint sovereigns, about 377 or 378 after Christ. Frumentius was consecrated bishop of Abra by St. Athanasius, and deputed by him to propagate the Christian religion in Ethiopia. Of this Frumentius it is said, that whilst he was young, he accompanied Irenaus, philosopher of Tyre, who, in a voyage on the Red Sea to India, was cast away on the coast of Abyssinia. Menelaus was slain by the natives, but Frumentius, who had been generally educated, was conducted to Axum, where his son then refixed. Here he was enthralled by the queen with the education of the young prince; and having instructed him in various parts of learning, and improved his mind with a veneration for the Christian religion, he found him disposed to embrace Christianity on his return from Alexander's discharge of the commission entrusted with by him by Athanasius. The greatest part of Abyssinia followed the example of this prince, and the church of Ethiopia continued in unity with this bishop to the time of his death. When Constantinople, the emperor embraced Arianism, an attempt was made to depose Frumentius, because he refused to sanction it with his example and authority. About this time there was an expedition into Africa: Felix produced, what the Arabian writers, and Salome in the koran, have called the War of the Elephant. The version was this: the temple of Mecca had been held in high veneration for 1,000 years, because, as the Arabs say, Adam, when expelled from Paradise, pitched his tent upon this spot; and they also flew a black stone, which Jacob reposed when he saw the vision, mentioned Genesis xxvii. 12. But Mr. Bruce thinks it to be much more probable, that this temple was built by Sesostris, and that he was shipwrecked here under the title of Othris. This temple, venerated by neighbouring nations, was made the emporium of the trade between India and Africa, but Abraha desiring to render it more convenient for his dominions, built a very large church or temple in the country of the Horctes, and nearer the Indian ocean, and extended to it all the privileges belonging to the pagan temple of Mecca. A tribe of Arabs, called Beni Koreifi, who had the care of the Carba at Mecca, alarmed by the prospect of having their temple cursed, entered Abraha's temple, burned every part of it that could be consumed, and polluted the rest by defiling it with human excrements. This insult exasperated Abraha, who, mounted upon a white elephant at the head of a large army, resolved to destroy the temple of Mecca. This temple, however, was miraculously preserved, according to the Arabian writers; but the more probable account is, that the Abyssinian army fell a sacrifice to the small-pox and measles, with which they were infected at this siege. This happened about the year 556. Abraha's church, near the Indian ocean, was finally destroyed in the calix of Oma. In the year 552, Julian, the Greek emperor, sent an embassy to Caleb, or Eliza, king of Abyssinia, inviting his interference in favour of the Christians in Arabia, who were severely persecuted by Phineas, a Jewish prince, and others of the same persuasion, then in possession of the country. Phineas was defeated by Arabas, an Arabian prince, before Abraha, Caleb's general, arrived at the Jewish kingdom; and were not wholly overthrown, as some of them continued till after the Hegira. To this period, or the reign of Eliza, the Arabian historians refer the War of the Elephant, and the miraculous conversion of the Ethiopian army. The commi
fistration of names will account for the difference between the Arabian and Abyssinian records; for if this Abreha was the prince who had intercourse with Abou Thaleb, Mahomet's grandfather, to whom the custody of the Caaba was committed, and who was defeated before Mecca, the smallpox was introduced among the Abyssinians about the year 524, or 100 years before the Hegira; and thus the Arabian and Abyssinian accounts may be made to correspond. Some historians have said, that the Ethiopian monarchs embraced the doctrines of Mahomet, soon after the appearance of this impostor; but this account has been considered as improbable. It is more certain, however, that Najashi, who was the Ethiopian governor of Yemen, and who was related to the royal family of Abyssinia, was professed to the Mahometan faith. On this occasion the Abyssinians left their territories in Arabia, and were forced to seek refuge on the isle of Africa, where they established several kingdoms, such as Addi, Mara, Haden, Auffs, Wypo, Tanthii, and other states, which acquired permanent power and importance. The Jews being at this time oppressed by the caliphs, sought an asylum in Abyssinia; and they contributed to augment and strengthen an independent sovereignty, which had been preferred in one family of Jews on the mountain of Samen, the royal residence having been fixed upon a high-pointed rock, called the Jews' rock. Judith, a very beautiful and intriguing queen of the Jews, had made fo strong a party, that she resolved to attempt the subversion of Christianity, and also the secession in the line of Solomon. Having mastered the royal family, she took possession of the throne, in defiance of the law of the queen of Saba; but the infant king, the only remaining prince of his race, fortunately escaped into the province of Shoa, and thus the royal family was preferred to be again restored. Judith and her descendants maintained their usurpation for more than 500 years; but no part of their history is recorded in the Abyssinian annals, except that of Lalibala, who lived at the close of the 12th, or beginning of the 13th century, and was reputed to be a saint. This secession he probably acquired from the protection which he afforded to the Christians, who, persecuted by the Sarcetians in Egypt, fled for refuge to Abyssinia. Lalibala employed them in forming various works in the solid rocks, some traces of which remain to this day; and in unsuccessful attempts to divert the Nile out of its course, so that it might no longer be the cause of the fertility of Egypt, which was then in possession of the enemies of his religion. The race of Solomon, which had been restricted to the sovereignty of Shoa, was unexpectedly restored in the person of Icon Amlac, to whom Nacueto Laab, grandchild of Lalibala, by the mediation of Tecla Haimount, a monk and native of Abyssinia, who had been ordained Abuua, and who was highly esteemed for his sanctity and patriotism, resigned the kingdom of Abyssinia. Amongst other articles of the treaty between them, one was, that no native Abyssinian should for the future be chosen Abuua; and this article between Icon Amlac and the house of Zagoué was observed for near 500 years. Icon Amlac continued to reside at Tegulat in Shoa, from his accession in 1268, and his reign lasted fifteen years. After a rapid succession of princes, Amada Sion ascended the throne in 1372. This sovereign professed Christianity, but disgraced it by his conduct. During a reign of thirty years, this prince was almost incessantly engaged in various wars with the Moors, who inhabited different provinces of Abyssinia and its vicinity; but at last, weary of war and carnage, he returned in triumph to his capital, and having never suffered defeat in any battle, he ended his days, and transmitted the crown to his son, Saiif Arrad. The only transaction that distinguishes this reign, is the relief afforded to the Coptic patriarch, whom the sultan of Egypt had thrown into prison, with a view of extorting money from him. Of Zara Jacob, whose reign commenced in 1434, and continued thirty-four years, Mr. Bruce observes, that he was regarded in Abyssinia as another Solomon, and a model of what the belt of sovereigns should be, though he was not justly entitled to this high encomium. This prince sent an embassy to the council of Florence, which formed a subject for a picture in the Vatican, and he obtained from the pope a convent at Rome for the use of the Abyssinians. From this period a party was formed in favour of the church of Rome; and this belt of sovereigns was the first who introduced religious persecution into his dominions. Although the established religion in Abyssinia was that of the Greek church, many different superstitions prevailed in every part of the country. An accusation having been brought against some families for worshipping the cow and the serpent, they were besieged by order of the king, capitaliy convicted, and executed. This severity was followed by a proclamation, declaring, that any person who did not, upon his right hand, carry an amulet, with these words, I renounce the devil for Christ our Lord, should forfeit his personal estate, and be liable to corporal punishment. Before the close of his reign persecution was suppressed, and he employed himself in repairing the churches which had fallen into decay, or which had been destroyed in various parts of the country in the wars with the Mahometans. In this reign, which commenced in 1468, the old law for confining the royal children, which had been discontinued from the reign of Judith, in the tenth century, was revived; and they were sent to the high mountain of Gezen, on the confines of Amhara and Begemder, which continued to be the state-prison till a slaughter occasioned the defection of Gezen. Bada Mariam, having ingratiated himself with his people, by clemency towards those who had been banished for various offences in the former reign, commenced a war with the Dobas, who made inroads into his country; and he also turned his arms against the kingdom of Adel; but being seized with a pain in his bowels, which occasioned his death, all his plans and enterprises terminated. About this time Henry of Portugal, a scientific and adventurous prince, formed the project of discovering a passage to India, by doubling the cape of Africa, and using of sharing with the Venetians, and others, the profits of the commerce that was carried on with that country. A plan was also conceived for penetrating into India through the interior parts of Africa. The practicability of this latter scheme was rendered probable, by the report of some monks who returned to Jerusalem and to Alexandria, and who were the subjects of a christian prince, said to be a priest, whose dominions were said to extend through the African continent from the east to the west sea. This report had been confirmed at the court of Benmo, the sovereign of the Jaffolis, on the west coast of Africa, and also at Benin, another negro country; though it was somewhat confused and precarious, in consequence of the account given by Marco Paulo, a Venetian traveller, who said that, in his travels into Tartary, he met with a christian prince, who was a priest, and who was called Presbyter, or Prelller John. The king of Portugal, however, resolved to send Peter Covillan and Alphonso de Paiva, as amouilladors to this unknown prince. The object of their mission was to explore the sources of the Indian trade, the principal markets for spice and pepper, and the channels of their conveyance to Europe; and to ascertain the country whence gold and silver were obtained, and the possibility of arriving at the East Indies by facing around the southern promontory of Africa.
Africa. Having proceeded on their journey together from Alexandria to Cairo, thence to Syria, and afterwards to Aden, a rich trading town, without the braits of Babylomandeh, they separated from one another. De Paiva soon lost his life; but Cavillon set sail for India, and having visited Calicut and Goa, and crossed the Indian ocean to inspect the mines of Sofala, returned to Aden, and then to Cairo, where he heard of the death of his companion. Here he found two Jews with letters from the king of Abyssinia, which induced him to return to Aden; whence he crossed to the dominions of that prince, whose name was Alexander, and whom he accompanied to Shoa, where the court received him. Cavillon settled in the country, became rich and powerful, and no more returned to Europe. But the intelligence he transmitted from time to time to the court of Portugal was important and useful. He described the Indian ports which he had seen, the situation and riches of the mines of Sofala, the disposition of the princes, and the wealth and populousness of the country where he dwelt; and he exhorted the king to prosecute the discovery of the passage round Africa, affirming, that the cape itself was well known in India, and accompanying his communication with a chart, which he had obtained from a Moor in India, and which exhibited the exact situation of the Cape, and the cities round the coast. Cavillon came into Abyssinia in the year 1495, and the reigning prince, Alexander, or Ilcander, to whom he was introduced, died by violence, in 1495. He was succeeded by an infant son, who reigned seven months; after which his younger brother, Naoi, was elected king by the unanimous voice of the people; and having, by his courage and prudence, delivered himself from the fear of a foreign war, he applied with diligence to reform internal abuses, and to cultivate the arts of peace. After a reign of thirteen years, he died in 1508, and was succeeded by his son David III. an infant of eleven years of age, who was set on the throne by the interell of Helena, widow of Beka Mariam. At the commencement of this reign, the Turks, with a view of sharing the profits of the trade of the country, took possession of Zeyla, a small island in the Red Sea, opposite to the coast of Adel; but their desire of possessing India diverted their views from Adel and Abyssinia. It was thought defirable, in the present situation of the country, to form an alliance with the Portuguese, and for this purpose, Matthew, an Armenian merchant, was deputed as an ambassador. The principal object of the embassy was to obtain a force sufficient to destroy the Turkish power; and, it is said, that a third part of Abyssinia was offered as an acknowledgment. During the progress of this embassy, the Turks renewed their depredations on the Abyssinian territories. David prepared to refute them; and, at length, succeeded in completely defeating and routing them. On the day in July 1516, when he obtained a decisive victory over the Moors, the island of Zeyla was taken, and the town burnt by the Portuguese fleet under Lopez Suarez de Alberguaera, who had brought back Matthew, and with him an ambassador, from Portugal. The two ambassadors, accompanied by fifteen Portuguese, set out on a very difficult and perilous journey for the emperor's court. Matthew died of an epidemic fever in the course of the journey; but the Portuguese ambassador arrived in 1520, within three miles of the Abyssinian camp. His reception was not favourable; and it was not till after a delay of five years, that the business of the embassy was completed, and he was allowed to depart for Portugal. This long intercourse between two distant nations, alarmed the Mahometan powers; and the Adelians, afflicted by the Turks, defeated the emperor in several successive battles, and over-ran the empire, plundering and burning the towns and villages, and carrying away the people for slaves. This destruction was continued till the year 1537. In the next year the affairs of Abyssinia seemed to revive, and a new embassy to Portugal was proposed. John Bermudes, one of the attendants of Rodrigo, the Portuguese ambassador, was deputed, who was invested with the ecclesiastical authority of Abuna. Being a bigot to the popish religion, he declined accepting the office, unless his ordination should be approved by the pope; which was indirectly submitting the church of Abyssinia to that of Rome; and this submission on the part of David gave the pope inexplicable pleasure, at a time when to many kingdoms in the west were revolting from his supremacy. Having in his way through Italy obtained the pope's sanction, he proceeded to Lisbon, and was acknowledged by the king as patriarch of Alexandria, Abyssinia, and of the sea; and he succeeded in obtaining the succours which he requested. When these succours arrived, they took the town of Arkeeko, killed the governor, and massacred all the people in the town whom they could find. The delay, however, had reduced the Abyssinians to great distress. A Mahometan chief had made an attack upon the rock Gethen, where the royal family had been kept, and massacred them; and David, linking under a complicity of dissuaders, died in the year 1540, and was succeeded by his son Claudius. On his accession, the Moors formed a league against him, but were defeated. Aided by the Portuguese forces, which had joined those of the empire, Claudius freed himself from all apprehension of foreign enemies; and he then directed his attention to the internal state of the country. John Bermudes, infulent in his disposition, and invested with ample ecclesiastical powers, attempted the conversion of Claudius, and inflicated that he should establish the popish religion through his dominions, as his father David had promised to do; but Claudius was invincible, and the alteration terminated in the expulsion of the catholics, and the discontinuance of all intercourse with the Europeans; and Bermudes himself was obliged to leave Abyssinia, and return to Portugal. In 1558, the pope sent a new deputation of prelates; but, though they were civilly received by Claudius, they seemed to have had little success with respect to the principal object of their mission. The thoughts of Claudius were now employed about a successor; and as he had no son, it was proposed to ransom his youngest brother, the prince Menas, who had been taken prisoner by the Moors in the time of David. This business having been settled, Claudius's premature and violent death made way for the advancement of Menas to the throne in 1559. After a short reign, embroiled by internal rebellion, and the fidgetious practices of the popish missionaries, he closed his life in 1563, and was succeeded by his son Sertza Denghial, who, after various conflicts with the Moors, and with the Gala and Falaha, two neighbouring nations, in which he was generally victorious, died in consequence of eating fish of a poisonous nature, in 1595. Before his death he nominated Za Denghial, his nephew, for his successor. The affections of his people were alienated from this prince on account of his attachment to the church of Rome, whose interest in Abyssinia had much declined, in consequence of the death of Oviedo, and the other missionaries, and through want of a fresh supply of Catholic preachers. In the year 1600, Peter Paez, or Pate, was sent on this mission. He was learned, diligent, and active. The emperor was engaged by his manners and discourses to embrace the catholic religion; he issued orders for prohibiting the observance of the Jewish Sabbath, and sent letters to pope Clement VIII. and Philip III. of Spain, requesting a supply of mechanics to instruct his people in the useful arts,
and of Jews to teach their religion. This imprudent conduct on the part of the emperor caused a rebellion among his subjects; he was proclaimed king by the Abyssinians, and was soon defeated by his own subjects, who were overpowered and dethroned. The succession was for a time disputed. At length Sobieski called to his aid Monsieur de Mazar Seguier, who was fully established in the province, and he was declared king by the bishop of the Roman Catholic religion. He addressed letters one to the pope, and the other to the king of Portugal, soliciting his assistance against the invasions of the Turks. In the mean while he defeated their people, and also a body of rebels assembled to support the claim of an impostor, who pretended to be the late emperor Jacob, that he had contended for the crown. Whilst he was establishing the religion of the empire, a new rebellion demanded his attention, and his subjects were engaged in various military expeditions. In 1616, he issued a very severe order against the Jews, whom he determined totally to exterminate. His conduct towards them was in the highest degree cruel and unjust. The consequence of his measures was the almost entire extinction of the Jewish religion, the professors of which were commanded to renounce their religion, and be baptized, under pain of death. Paz was at the same time successful and successful, in his endeavours to procreate the Abyssinian church, the Coptic church, and Socinians having received letters from the pope and the king of Spain, with assurances of such support as each of them, in his respective province, could afford him, resolved to make a formal submission to the pope, and to recognize him in his connection with the Greek church. Ambassadors were appointed to go to Europe, to communicate this intelligence, and to finish the negotiation between the pope and the Abyssinians; but these ambassadors were obliged to return; and this unpromising occurrence prevented the establishment of popery in Abyssinia. The attempts of Socinians to change the religion of the country, occasioned a variety of seditions and rebellious associations against his government; but the obdurate emperor persevered. Though the Abyssinian ambassadors had been constrained to return, many favourable accounts of the state of religion in Abyssinia had been transmitted to Europe; and new missionaries were sent under the direction of Alphonso Mendes, who arrived at Gorgora, the royal residence, in the beginning of the year 1624. Socinians, after the first audience, took an oath of submission to the pope, and the ceremony was attended with circumstances of peculiar solemnity. It was followed by a proclamation, that all priests should embrace the catholic faith on pain of death, that Lent and Easter, and the other movable feasts, should be observed according to the rules of the Roman church, and that the clergy should be reordered, the churches consecrated anew, the people re-baptized, and circumcision, polygamy, and divorce abrogated. The emperor, however, soon perceived the injurious effects of these measures, and found it necessary to relax the severity of his proceedings. He proceeded to grant an universal toleration; and having restored the Alexandrian faith, ceremonies, and worship, he resigned the crown and empire to his son Facilidas, or as he is sometimes called Yafous; and soon after his declaration for this purpose, he died, in 1625, and with him all the hopes of the Jesuits were extinguished. Facilidas was an inveterate enemy to the catholic faith, and he adopted every method in the power of suppers and seditions. He first banished and then executed his uncle Reta Chiriasses, who had been active in promoting it, expelled the European missionaries, and refilled the atter-pls of the Jesuits for introducing others. The spirit of rebellion in Abyssinia, and the neighbouring provinces, was still alive; nor could the effects of Facilidas totally beefface it. However, he left the empire at its death, in 1669, in a much more peaceful and prosperous state, than that in which it was devolved upon him by his father. He was succeeded by his son Hannibal L., who had the ability to preserve peace during his whole reign, if we except some feeble expeditions against Laith and the Shangilla; and, in 1829, his son Yafous I. ascended the throne with the approbation of the whole kingdom. This prince is said to have possessed all those abilities and dispositions which form the character of a great and a good monarch. In this reign attempts were made to revive European missions. They were occasioned by a report that, on the expulsion of the Jesuits from Abyssinia, many catholic missionaries had fled into the adjacencies of Nubia andheads, where they were grievedly oppressed by the Mahometans. The cause of these christians was espoused at Rome, and the pope dispatched a mission for their relief, under the title of the Ethiopia mission. The missionaries were instructed to penetrate as far as possible into Abyssinia, and to maintain the catholic faith as far as they were able, till an opportunity offered of converting the whole empire; and for their protection and encouragement, a convent was established at Achiin, in Upper Egypt. At the same time, Louis XIV. of France appointed six Jesuits to the same mission, and furnished them with suitable presents for the emperor and the principal nobility. The admission of these missionaries was facilitated by a dangerous ecbratic disorder, which had attacked Yafous and his son, and for which they wished to have the advice of an European physician. Maillet, the French consul at Cairo, with whom the Jesuits to have the honour of the mission, disapproved of the views of Friar Piu and Anthony, two Franciscans, who were first thought of, and recommended Charles Poncet, a Frenchman, who had been bred a chemist and apothecary, and Father Brevedent as his servant, to Hagi Ali, a Mahometan factor at Cairo, for the desired parlele. The Franciscans attempted the destruction of Poncet and his attendants; but Poncet arrived safe at Gondar on the 21st of July, 1699, and having perfectly cured his royal patient, set out on the 2d of May, 1700, on his return for Europe, and arrived in safety at Mafash. Brevedent died at Gondar soon after their arrival. An embassy on the part of the Abyssinian monarch was defeated by the interference of Maillet; but the Jesuits concerted another mission from France, and the person appointed as ambassador was M. de Roule, vice-consul at Damietta. This mission was very injudiciously conducted; the merchants at Cairo refilled it; the Franciscans obstructed it, and it terminated in the murder of the ambassador in the province of Sennar. Yafous, the emperor, had been previously affalinated, in 1704, by a conspiracy of his wife and son, Teela Haimanout, who was himself affalinated in 1706, and succeeded by his uncle Tiflis, or Theophilius. After the death of this monarch, in 1709, the king of Solomon, by the queen of Sheba, was set aside, by the influence of the conspirators who had contributed to the murder of Yafous and Teela, and a stranger, called Oultas, was seated on the Abyssinian throne. Oultas was soon deposed; and David, son of Yafous, was proclaimed king of Abyssinia, and crowned at Gondar on the 20th of January, 1714. The fightings among the Abyssinian clergy, that occurred in this reign, produced a dreadful massacre, and ended in the death of the king, who died, by poison, in 1719. He was succeeded by his brother, Bactius; and Bactius, in 1729, by his son Yafous II. His reign was disturbed by frequent seditions and rebellions; in one of which, Gondar, the capital, was set on fire, and almost entirely ruined. He died in 1735, not
not without the suspicion of having been poisoned, and was succeeded by his son Joas. The whole empire, in this reign, was divided into two powerful factions, the causes and effects of which are particularly recited by Mr. Bruce, who was witness of the confusion and tumult which they produced. In the process of this contention, Joas was assassinated; and, at his death, in 1706, Hannes, brother to the late king Bauckin, was appointed emperor. Hannes, however, being maimed by the loss of his hand, was deemed incapable of affirming the sovereignty: he was removed by poison, and his son Tecla Haimanout II. was advanced to the throne. From, and even before the accession of Joas, Michael Ras, who had been appointed Ras or Governor of Tigris, and other provinces, and who was become master of almost one half of Abyssinia, had the principal direction and influence in the government of the country. His marriage with Ozoro Edifier, a very beautiful and accomplished princess, and the widow of Mariam Barea, the most distinguished nobleman of the country, had very much augmented both his dignity and power. Hannes was established on the throne by his authority, and when he found that he was not likely to answer his purpose, he is supposed to have made way, by poison, for his successor Tecla Haimanout. This prince treated him, from the moment of his accession, with the affection and respect of a son; and this influence of Michael was very considerable in preserving the attachment and submission of his subjects, as well as in conducting the military operations of his reign. Of these Mr. Bruce has given a very minute detail, for which we must refer the reader to the 4th volume of his elaborate and comprehensive work.

Abyssinian, in Ecclesiastical History, is used as the name of a sect in the christian church, established in the empire of Abyssinia.

The Abyssinians are a branch of the Copts, or Jacobites; with whom they agree in admitting only one nature in Jesus Christ, and rejecting the council of Chalcedon: whence they are also called Monophysites, and Ethiopianians. Some learned men are of opinion, that the Abyssinians, or Ethiopians, embraced the sentiments of the Monophysites in the sixth century, in consequence of the evolutions addressed to them by the doctors of that sect who resided in Egypt. But Micheloni (Eccl. Hist. v. ii. p. 357, 360) says, it is certain that the Abyssinians, who were accustomed to receive their spiritual guide from the bishop of Alexandria, commenced Monophysites in the seventh century, if not sooner. For in that period the Arabs began themselves masters of Egypt, oppressed the Greeks, and granted to the Monophysites such a powerful protection, as enabled them to reduce under their jurisdiction almost all the churches that had been established in Egypt. The Abyssinians are, strictly speaking, a distinct body from the Copts, who comprehend those Christians who dwell in Egypt, Nubia, and the adjacent countries, and whose condition is truly deplorable. They surpass the latter considerably in numbers, power, and opulence; nor is this surprising, when it is considered that they live under the domination of a Christian emperor.

The Abyssinian church is governed by a bishop, or metropolitan, styled Abuna, and sometimes, though improperly, patriarch, sent them by the Coptic patriarch of Alexandria residing at Cairo, who is the only person that ordains priests. The first person who posessed the episcopal dignity was Frumentius, who converted the Abyssinians to Christianity in the beginning of the fourth century. Some, indeed, have supposed, that they were converted by the apostles; others have asserted, that the Eunuch, baptised by Philip, upon his return to Candece, became the abbot of Abyssinia. But, if the Abyssinians were converted at an early period, it is not likely that they should have continued without bishops, and without any kind of church-government for 350 years, and that they should have had no intercourse with neighbouring churches during the long period. Indeed, we know, in fact, that the Christian religion had not penetrated into the court of Candece, which was much nearer to Egypt, in the time of Philip, and it therefore could not reach into the more distant provinces of the country of Abyssinia. The Pitus, who, as Candece supposed, could not have been the true Philip of Abyssinia; if this were the case, the whole glory of the queen of Sheba must be rejected as fabulous, as there must have been a woman sitting upon the throne of that country for 350 years, after she had been excluded by a fundamental law of the land. But we are assured by credible writers, that the Candece reigned upon the Nile, in Africa, much nearer to Egypt. Her capital was taken in the time of Augustus, as we have already mentioned under the article Abyssinia, and her successors and kingdom existed in the reign of the Abyssinian kings, long after the Mahometan conquest, and they exist there to this day. To which we may add, that the Abyssinians are known to have continued Jesu and Marthas above 300 years after the time of the apostles. The ground upon which some ecclesiastical writers have attributed the conversion of the Abyssinians to the apostles, is a canonic of a council, said to be that of Nice, found, or pretended to have been found, in Alexandria. This canonic is written in Arabic, and is so unintelligible, says Mr. Bruce, who had seen it, that it scarce conveys any sense at all. But this canonic regulated the procedence of the Abuna of Ethiopia in all succeeding councils, and places him immediately after the prelate of Scetia. The Jesuits have avoided themselves of this canonic, in order to vindicate the honourable antiquity of the church of Ethiopia. The Abyssinian history informs us, that a queen reigned in Abyssinia, when Frumentius came into this country. Mr. Bruce observes, that though women are excluded from the Abyssinian throne, there exists a law, or custom, that the queen upon whose head the king shall have put the crown during his life, is regent of the kingdom, and guardian of every minor king, as long as she shall live. If such a queen should have a son, she would have the care of the kingdom, and of the king, during his minority; and if her son should die, and a minor, who was not in relation to her, should succeed, she would still be regent, and would hold office cease till he came of age. This reign, for life, is called Ildeghi. Such was probably the case at the time of Frumentius's settlement in Abyssinia. The history of the Abuna is very imperfectly known for many years after their appointment. The first of them, who is particularly noticed, is Abuna Tecla Haimanout, who distinguished himself by the submission of the royal family, and the regulations made by him both in church and state. He established the law, that the Abyssinians should not hold it in their power to choose one of their own men as Abuna. The Arabic canonic, above mentioned, may probably be attributed to this Abuna; and is a forgery, as every one from his time. Tecla Haimanout was a native of Abyssinia, and therefore the prohibition had not taken place until his time; but as no Abyssinian was afterwards chosen to this office, the canonic must be a work of his time, for it is impossible a canonic should have been made by the council of Nice, setting the rank of a bishop in a nation which, for above 500 years after that general council, were not Christians. As the Abuna holds the language of the country, he has no share of the government;
It is much sunk in general estimation from what he was formerly, chiefly by his intrigues, ignorance, avarice, and want of honesty. His principal employment is in the ordination of priests, deacons, and monks. Some of these Abunas have been merely by monks, without so much as priestly orders. Their revenue arises from the sale of distillations, and of ordination, and from certain lands in the kingdom of Tigre, Gujam, and Dambes, of which they are the sole farmers; to which we may add, a kind of public collection of salt and cloth annually made for them through the empire, which amounts to a considerable value.

The order next, if not in rank and dignity, yet in general estimation, to the Abunas, is that of the Debaras, who are neither priests nor deacons, but a kind of Jewish Levites or chanters, who attend at all public offices of the church, and particularly in the conduct of all their musical performances. Besides these, every parochial church has a president, subordinate to the Abuna, called Komos, or Hegumenos, or Archi-presbyter, who has all the inferior priests and deacons, and all the ecclesiastical and temporal affairs of the parish, under his inspection and government. The deacons occupy the lowest rank of the priesthood; they attend at divine service, and have their respective duties and vestments when they officiate. All these orders are allowed to marry; but the monks, who are very numerous, vow celibacy; and, it is said, with a reservation. Le Grand says, they make a profane alike, before their superior, to keep chastity, but add in a low voice, *as you keep it.*

The monks are divided into two classes; those of Debra Libanos, and those of St. Eutychius. The head of the latter, who are grossly ignorant, is the superior of the convent of Myehbar Schalle, in the north-west corner of Abyssinia, near Kiara, and the Sangalla, towards Sennar and the river Dender. The chief of the former is the Itchegoué, who is ordained by two chief priests, holding a white cloth, or veil, over him, while another says a prayer; and they then lay all their hands on his head, and join in psalms together. This Itchegoué is, in troublesome times, of much greater consequence than the Abuna. The monks do not live in convents, but in separate houses round their church, and each cultivates a part of the property they have in land.

The churches in Abyssinia are very numerous. Every great man that dies thinks he has atoned for all his wickedness, if he leaves a fund to build a church, or has built one during his life. The king builds many. The situation of a church is chosen near running water, for the convenience of their purifications and ablutions, in which they strictly observe the Levitical law. The churches are placed on an elevation, and surrounded by rows of Virginia cedar, which form very pleasing objects along the face of the country. All the churches are round buildings, with conical summits, and thatched roofs, and on the outside encompasit with pillars of cedar, to which the roof projects about eight feet beyond the wall, so as to form an agreeable walk in hot weather, or in rain. The inside of the church is partitioned in the manner preferred by the Mosi's law. In the first and outer circular apartment the congregation sit and pray. Within this is a square, divided by a veil or curtain, in which is another small division answering to the body of holies, and so narrow, that none but the priests can enter it. Persons of both sexes, under Jewish disqualifications, are prohibited from going within the outer circumference of the church, and must perform their devotion at an awful distance among the cedars; and those who enter the church must put off their shoes, and take care they are not trodden by the priests and monks before they return; kiss the threshold and two door-polls, say any prayer which they think proper, and thus their duty is finished. As for the doctrinal religion of the Abyssinians, it is that of the Greek church, which they received on their conversion to Christianity by Frumentius, about the year 335; and every rite or ceremony in the Abyssinian church may be traced to its origin in the Greek church whilst both of them were orthodox. Frumentius preferred it untainted with heresy whilst he lived. Afterwards Arianism, and a number of other heresies, as they are called, were brought by the monks from Egypt, and infected the church of Abyssinia. Many of these were owing at first to the various use of the two words, nature and person, than which no words were ever more equivocal in every language in which they have been translated. For some time the Abyssinians had free access to Cairo and Jerusalem, where their books were revised and corrected, and many of the principal orthodox opinions incultated. But since the conquest of Arabia and Egypt by Sultan Selim, in 1516, their intercourse with those countries has been interrupted; and they are now, says Mr. Bruce, with regard to doctrine, as great heretics, and with respect to morals, as corrupt as the Jesuits have represented them. But though he concurs with the Jesuits in condemning their sentiments and practice, he disapproves of their mode of reforming them. The eucharist is received by the Abyssinians in both kinds: for this purpose they use unleavened bread, and the grape bruised with the husk, and forming a kind of marmalade, is substituted for wine, though an excellent strong wine is made at Dreeca, about thirty miles south-west of Gondar. The communicant after receiving, drinks a large draught of water, and turning his face to the wall of the church, repeats some prayer in private with apparent decency and attention. Whether the Abyssinians believe the doctrine of transubstantiation or not, is not absolutely certain. Ludolph (I. iii. c. 5) thinks, that the words of consecration prove their disbelief of this doctrine. Mr. Bruce maintains the contrary opinion; though he tells us, that a priest declared to him, with great earnestness, that he never did believe that the elements in the eucharist were converted, by consecration, into the real body and blood of Christ. This, he said, was the Roman Catholic faith, but it never was his, and he conceived the bread to be bread, and the wine to be wine, even after consecration. With respect to the rate of souls before the resurrection of the body, the opinion generally prevailing is, that there is no third rate, but that the souls of good men enjoy the beatific vision immediately upon their separation from the body. However, their practice and their books contradict this opinion; for when any person dies, alms are given, and prayers are offered for the souls of those departed.

Upon the whole, we may observe, that the religion of the Abyssinians, in the present state of it, is unworthily dignified with the name of Christianity, since it confits in a motley collection of traditions and tenets, which have not any influence on practice. This people, of all ranks, of either sex, and of every age, are habitually liars, drunkards, gluttons, incapable in their repentance, faithless in their dealings, and cruel in their vengeance. The king has unlimited power; and a minister, in the king's name, exercises that power with the most licentious cruelty. The Abyssinians are totally illiterate; the arts cultivated among them remain in a state of great imperfection; and, which is a defect peculiar to themselves, they have not even an idea of music. Their bloody feuds, and their promiscuous amours, are too disgusting for description. Every thing in their country wears an air of wretchedness and meanenes. Such are the reflections of an anonymous writer in the Monthly Review, vol. ii. p. 423. New Series.

The
The Abyssinians have divers times expressed an inclination to be reconciled to the see of Rome; but rather out of interest of state than any other motive. See Abyssinia.

Several missionaries accuse the Abyssinians of Judaism, in regard to the many Jewish observances still in use among them: some have even doubted, whether they are more Christians, or Jews. Lobo says expressively, they are only Christians in name: they practice circumcision on females as well as males. But different opinions are held in different provinces with regard to the origin and obligation of this rite, as well as the time and mode of performing it. The Abyssinians of Tigre profess to have derived it from Himmad’s family and his descendants, with whom they were connected at an early period in their trading voyages; and they say, that the queen of Sheba, and all the women of that coast, had suffered excision at the usual time of life, before puberty, and before her journey to Jerusalem. The Falasha declare, that their circumcision was that commonly practiced at Jerusalem in the time of Solomon, and in use among them when they left Palestine, and came into Abyssinia. They perform it on the 8th day, as a religious rite, according to the first institution by God to Abraham. The Abyssinians pretend theirs is not of this kind, and that they practice it because Christ and the apostles were circumcised, though they do not hold it necessary to salvation. But none of them pretend that circumcision arises from any kind of necessity, or from any impediment to procreation, or that it is necessary for cleanliness, or from the heat of the climate; and therefore it is probable, that it was originally derived from a divine command, and as such, transmitted to them. See Circumcision. The Abyssinians cut no masts prohibited by the law of Moses. Women are obliged to the legal purifications. Brothers marry their brothers’ wives, &c. They abstain from hog’s flesh, blood, meats uncleaned, &c., and observe both Saturday and Sunday sabbaths, according to the custom of the primitive church: all of them have marks of Judaism; though by some reduced into mere human institution, and usage. They celebrate the Epiphany with peculiar festivity, in memory of Christ’s baptism; when they plunge and sport in ponds and rivers, which has occasioned some to affirm that they were baptized annually every year. This is positively asserted by Alvarez, but as positively contradicted by Mr. Bruce, (vol. iii. p. 324, &c.) who has given a very ample account of this ceremony, which is an old observance of the eastern church, formerly performed publicly in Egypt, as it is now in Ethiopia. Many falsehoods have been propagated with regard to the mode of baptism in Abyssinia, in order to impugn the validity of it, and to excuse the rash conduct of the Jefuits in rebaptizing all the Abyssinians, as if they had been a Jewish and pagan people that had never been baptized at all. Among the saints-days, which are very numerous, is one consecrated to Pilate and his wife; because Pilate washed his hands before he pronounced sentence on Christ; and his wife desired him to have nothing to do with the blood of that just person. They have four Lents: the great one commences ten days earlier than ours, and is observed with much severity, many abstaining therein even from fish, because St. Paul says there is one kind of flesh of men, and another of fishes. They allow of divorce, which is easily granted among them, and by the civil judge: nor do their civil laws prohibit polygamy. They have at least as many miracles, and legends of saints, as the Romish church; which proved so small embarrasment to the Jefuit missionaries, to whom they produced so many miracles, wrought by their saints, in proof of their religion, and those so well circumstanced and attested, that the Jefuits were obliged to deny miracles to be any sufficient proof of a true religion: and to allege the same arguments against the Abyssinians, which protestants in Europe allege against the papists. They pray for the dead, and invoke saints and angels; and have to great a veneration for the Virgin, that they charged the Jefuits with not rendering her honour enough. Images in painting they venerate, and pictures have been used in their churches from the earliest age of Christianity, but they abhor all those that are embalmed and in reliques: nor do they use a cross on the top of the ball of the Sandrich or standard, because it calls a thistle. They hold that the soul of man is not created, because, say they, God finished all his works on the sixth day. They have the same books of scripture with us; though few are able to purchase entire copies either of the Old or New Testament. The Revelation of St. John is a favourite book with them. The Song of Solomon is also much censured by the old priests, but the reading of it is prohibited to the young ones, the deacons, laymen, and women. The Abyssinians believe that this song was made by Solomon in praise of Pharaoh’s daughter; but they do not think, with some of our divines, that it contains any mystery or allegory respecting Christ and the church. They also admit the apocryphal books, and the canons of the apostles, as well as the apocryphal constitutions, for genuine. Their liturgy is given by Alvarez, and in English by Pagit; their calendar by Lualdi; the answers to abbé Gregory to certain questions, proposed by the author last cited, are published by Fabricius, under the title of Theologia Ethiopica.

ACA, Acco, and Acon, in Ancient Geography, a town of Phœnicia, on the Mediterranean; afterwards called Polémis, now Acre. See Aca.

ACABA, a ridge of mountains near Ger® in Abyssinia.

ACABONE, one of the districts or provinces into which Ptolemy divided Egypt. It was situated near the river Tigris.

ACABIS, a small town in Cyrenaica, mentioned by Ptolemy.

ACACALIS, in the Materia Medica, the name given by some authors to the fiiphery, or wild corre. Dale.

ACACALOL, or Acalot, in Ornithology, the name of an American bird, which is the Tantalus Maximus of Gmelin, and called by some Corvus aquaticus, or the water raven.

ACACESIUM, a city of Arcadia, so called from Acacus the son of Lycaon. It is mentioned by Pausanias, l. 8.

ACACIA, or Akasia, Merlin, in Biography, was born at Chalons sur Marne, about the year 1520. He studied at Paris under the celebrated Monf. Brillat, and was made Professor of Medicine and Surgery there, and acquired considerable reputation as a teacher in those sciences. He published commentaries on several of the works of Galen, in the years 1548, and 1555, and two books de Morbis Multicribibis, inferred in the Gynæcia by Spachius. He died in the year 1588.

ACACIA, in Botany. See Guilandina, Guaiacum, Mimosa, Poinciana, and Spartium.

The flowers of a species of the acacia are used by the Chinese in making that yellow, which, we fee, bears wafting in their fishermen and flulls; and appears with so much elegance in their painting on paper. The method is this: They gather the flowers before they are fully open; these put into a clean earthen vessel over a gentle heat, and stir them continually about, as they do the tea-leaves, till they become dry and of a yellowish colour; then to half a pound of the flowers they add three spoonfuls of fair
water, and after that a little more, till there is just enough to hold the flowers incorporated together: they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; then they take it from the fire and strain it through a piece of coarse silk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and this is the fine yellow they have so long used.

The dyers of large pieces use the flowers and seeds of the acacia for dying three different sorts of yellow. They roast the flowers, as before observed; and then mix the seeds with them, which must be gathered for this purpose when full ripe; by different admixture of these they give the different shades of colours; only for the deepest of all, they give a small mixture of braul wood.

M. Geoffroy attributes the origin of bezoar to the seeds of this plant; which being bruised by certain animals, and volatilizing the blood by their great furours and affirsiency, cause a condensation of the juices, till at length they become coated over with a fliny matter, which we call BEZOAR, or BESOARD.

Acacia, bastard, or false, in Botany. See ROBINIA.

Acacia Indica, signifies TAMARIND.

Acacia, three-throned. See GLEDITSIA.

Acacia Zeylanica, signifies LOGWOOD.

Acacia, in the Materia Medica, is a subastringent gummy subduance, prepared by infalulating to a due consi-

tenance, the juice expressed from the unripe pods of the

Acacia fcleropodis leguminosa of Buhine, or the Mimosa

Abutifla of Linneas. For an account of the pods, and man-

ner of preparing the juice, see Murray's Apparatus Med.

vol. ii. p. 412. This subduance is brought from Egypt,

in roundish mases, wrapt up in thin bladders from four

to eight ounces in weight. It is outwardly of a blackish brown

colour, and inwardly of a reddish or yellowish brown. This

juice totally diffuses in water; but rectified spirit produces

little or no effect upon it; it is therefore truly of the gummy

kind. It has no smell, and applied to the tongue it soon

softens, and manifests first a moderately rough and then a

sweetish taste.

This mild gummy astringent may be given to advantage

d in disorders arising from laxity and acrimony, as habitual

diarhenas, uterine flours, and catarral coughs. By the

Egyptians it is used against spitting of blood, in doses of a

dram; and also in collyria for strengthening the eyes, in gar-

garins for quinkeys, and glyters for diarrhenas. Among

as it is seldom otherwise used than as an ingredient in mi-

thirdate or theriac. The above subduance has been called

Acacia vera, by way of distinction from the German Acacia,

which is a counterfeit of the other, and often sold for it in

the shops. This is the infalulated juice of unripe fobs, formed

by boiling the juice to the consienance of a solid extract. It

is distinguished from the true Acacia chiefly by its colour,

which is as black as that of Spanish liquorice, and also by

being harder and heavier, and of a sharper taste; and by

giving out its astringency to rectified spirit. This is ad-

ministered in fluxes, that indicate the want of physic

drinks, in doses from a scruple to a dram. Lewis, Mat.

Med.

Acacia, among Antiquaries, denotes something resem-
bbling a kind of roll or bag, seen on medals in the hands

of several of the consuls and emperors from the time of Ana-

nias.

According to Du-Canoe, the acana, properly so called,

A C A

A C A

was a purple bag filled with earth, or sand, and born by

the prince in his left hand, to remind him of his frailty and

mortality; and thus to prevent his being too much elated

with his flation.

But authors are not agreed, either about the use of this

roll, or about the subduance wherof it consists; some taking

it for a handkerchief rolled up, which the person who pre-

fided at the games threw out as a signal for their begin-

ning; whilst others rather imagine it intended to represent a

roll of memoirs, or petitions.

ACACIANS, in Church History, the followers of Acacius,

bishop of Caesarea, who flourished about the middle of

the fourth century. He succeeded his preceptor, the fa-

mous Eusebius, in 340, wrote his life, and several other works,

viz. 17 books upon Ecclesiastes, six books of Miscel-

aneous Questions, and a book against Marcellus, and died

about the year 356. He was consecrated Luceus, or Mo-

nophthalmus, because he could see only with one eye.

He is generally reckoned a man of unlearned principles,

but he was featural and eloquent, and a skilful disputant.

Some of the Acacians maintained, that the Son was not of

the same, but of a similar subduance with the Father: others

held that he was of a different subduance from the Father.

This was likewise the denomination of another sect, derived

from the name of their leader, a patriarch of Constantinople,

in the fifth century, who favoured the opinion of Eutyches.

See EUTYCHIAN, and MONOPHYSITES.

It was by the advice of this Acacius, who succeeded Gen-

nadius in 471, and died in 489, that the HENOTICON was

published, by the emperor Zeno in 482. In this connection

we cannot forbear introducing a circumstance, that redounds

much to the honour of another Acacius, bishop of Amida,

in 420, whose name, says Gibbon, (Hift. Decl. and Fall of

the Rom. Emp. vol. v. p. 427, 8vo.) might have dignified

the faintly calendar. Boldly declaring that cups of gold and

silver are useless to a god, who neither eats nor drinks, this

generous prelate fold the plate of the church of Amida;

employed the price in the redemption of 7000 Persian cap-

tives; supplied their wants with affectionate liberality; and

dismissed them to their native country, to inform the king

of the true spirit of the religion which he perfected. The

king, it is said, was so affected by this act of benevolence,

that he wished to see the bishop; and the interview produced

a peace between this prince, Veranius, and Theodosius I.

ACACIUS, a name given to several bishops, and other

eminent persons besides those mentioned under the preceding

article; particularly a martyr under the emperor Decius;

a patriarch of Antioch, who succeeded Basil in 438, and

died in 459; a bishop of Mileto in the 5th century; an-

other bishop of Berocia in Syria, who was present at the

council held at Constantinople in 381, the friend of Epip-

hanus Flavianus, and the enemy of John Chrysalon,

bishop of Constantinople, whom he caused to be depofed,

and who, at the age of 110 years, advised Theodorus the

younger, to confirm the sentence pronounced against

Neforus, and also against Cyril, bishop of Alexandria; he

was eminent for wisdom and fanctity, says Theodoret, and

died in 436—and a famous rhetorician in the reign of the

emperor Julian.

ACADA, see PORTO BELLO.

ACADEMICS, a fect of philosophers who followed the
doctrine of Socrates and Plato, as to the uncertainty of

knowledge, and the incomprehensibility of truth.

Academic, in this sense, amounts to much the same with

Platonism, the difference between them being only in point

of time. They who embraced the systen of Plato, among

the ancients, were called Academici; whereas those who did

the same, since the restitution of learning, have assumed the

denomination of PLATONISTS.
We usually reckon three sects of Academicians; though some make five. The ancient Academy was that which was founded by Plato; and consisted of those followers of this eminent philosopher, who taught the doctrine of their master without mixture or corruption. The first of these was Socrates; he was succeeded by Xenocrates. After his death the direction of the academy devolved upon Plato, and then upon Crates, and terminated with Cicero. After the death of Crates, a new tribe of philosophers arose, who on account of certain innovations in their manner of philosophizing, which in some measure receded from the Platonic system, without entirely defeating it, have been distinguished by the appellation of the Second or Middle Academy. The first preceptor, who appears in this class, and who, in consequence of the innovations which he introduced into the Platonic school, has been commonly considered as the founder of this Academy, is ARCEUS.

In order to conceive justly concerning the nature and causes of this revolution, it will be proper to advert to the state of opinions in the preceding period. It had been very generally maintained by both the Greek and Barbaric philosophers, that there can be no certain knowledge of things so variable and fluctuating as those material objects which fall under the notice of the senses. But they did not imagine that human reason is wholly incapable of arriving at truth; nor was the doctrine of universal scepticism introduced in the infancy of philosophy. In excluding material objects from the department of science, the first philosophers discovered an inclination to inquire with modesty concerning the nature of things, to divest themselves of prejudice, and to satisfy themselves with a sober assent to those truths which lie within the reach of the human understanding. Besides, the Barbaric philosophers, and after them the Greeks, held two kinds of doctrine, the popular for the amendment of the vulgar, and the concealed, which was communicated in the confidence of mere private instruction to their professed disciples. Such was the state of philosophy, when Socrates appeared, and exerted himself in regulating the conduct of the human mind. In opposition to the Sophists, who boasted that they knew every thing, he confessed that he knew nothing; by which acknowledgment he did not mean to affect the universal uncertainty of human knowledge, but merely to convince his followers of the futility of those speculations, which do not rest upon the firm foundation of experience, and to teach them modestly in their inquiries, and diffidence in their assertions. Among the sects who sprung out of the school of Socrates, the greater number devoted into the mazes of disputation, and resumed the Sophistic mode of arguing on either side of every question, that was proposed. Plato inclined to a stricter method of philosophizing; and in his public disputations after the Socratic manner, whist he refuted the opinions of others, and left his hearers undecided concerning his own, he fully explained the principles of his philosophy to those pupils who were indulged with his private and confidential instruction. His doctrine was, that no certain knowledge can be obtained concerning the varying forms of natural bodies, and that ideas are the only objects of science. This doctrine was universally taught in the Old Academy; but before the time of Arceus, it was never denied, that useful opinions may be deduced from the senses. Cic. Acad. 1. 1. c. 8. tom. ii. Ed. Olivet. Two sects arose about this time, which threatened the destruction of the Platonic system; one was founded by Pyrrho, which held the doctrine of universal scepticism, and the other by Zeno, which maintained the certainty of human knowledge, and taught with great confidence, a doctrine essentially different from that of Plato. In this situation, Arceus thought it necessary to exercise a caution referre with regard to the doctrine of his master, and to conceal his opinions from the vulgar, under the appearance of doubt and uncertainty. Professing to derive his doctrine concerning the uncertainty of knowledge from Socrates, Plato, and other philosophers, he maintained, that though there is a real certainty in the nature of things, every thing is uncertain to the human understanding, and consequently that all confident assertions are unreasonal. He thought it disgraceful to affect to any proposition, the truth of which is not fully established, and maintained that, in all questions, opposite opinions may be supported by arguments of equal weight. He disputed against the testimony of the senses, and the authority of reason; acknowledging at the same time, that they furnish probable opinions sufficient for the conduct of life. However, his secret design seems to have been to establish the doctrine of Plato, that the knowledge derived from sensible objects is uncertain, and that the only true science is that which is employed upon the immutable objects of intelligence, or ideas.

After the death of Arceus, the Platonic school was successively under the care of Laodiceus, who is said to have founded a new school, merely because he changed the place of instruction, and held it in the garden of Attalus, within the limits of the Academic grove, and of Evander and Egemon. Arceus, however, had opposed the Stoics and other dogmatical philosophers, with such violence, and extended his doctrine of uncertainty so far, as to alarm not only the general body of philosophers, who treated him as a common enemy to philosophy, but even the governors of the state, who apprehended that his opinions would diffuse among the passing of the state, and innumerable schools of the Philosophers, who were influenced by the tenets of Arceus.

From this period the Platonic school assumed the appellation of the New Academy, which may be reckoned the third in order from its first establishment. It was the doctrine of this Academy, that the senses, the understanding, and the imagination, frequently deceive us, and therefore cannot be infallible judges of truth; but that, from the impressions produced on the mind, by means of the senses, called by Carneades phantasies, or images, we infer appearances of truth, or probabilities. These images do not always correspond to the real nature of things, and there is no infallible method of determining when they are true or false; and consequently they afford no certain criterion of truth. But, with respect to the conduct of life and the pursuit of happiness, probable appearances are a sufficient guide, because it is unreasonable not to allow some degree of credit to those witnesses who commonly give a true report. See Propriety. According to the doctrine of the New Academy, the judgments arising from the operation of the mind in estimating the different degrees of probability, are not science, but opinion, which is all the knowledge that the human mind is capable of attaining. The chief point of difference between the Middle and the New Academy, seems to have been, that the latter taught the doctrine of uncertainty in less exceptional terms than the former. Dr. Warburton, however, offers several reasons to show that both these Academies were in reality the same, and that they were as real sceptics, as the sect which was so denominated. See Div. Leg. of Moses, vol. ii. p. 171, 178, 4th ed. Arceus, in his zeal for overturning all other sects, furnished his opponents with a pretext for charging him
him with attempts to undermine the whole foundation of morals. Carneades, avowing himself of probability, afforded sufficient scope for practical principles of conduct. Accius was chiefly employed in opposing the tenets of other philosophers in logic and physics, and paid little attention to ethics. Carneades, whilst he inculcated the necessity of suspense in speculative researches, preferred rules for the direction of life and manners. The immediate successor of Carneades, in the New Academy, was CLITOMACHUS. He was succeeded by Philo of Larissa, who is considered by some writers as the founder of a fourth Academy; and a fifth is said to have been established by Antiochus of Askalon, who was the last preceptor of the Platonic school, and who attempted to reconcile the tenets of the different sects, and maintained that the doctrines of the Stoics were to be found in the writings of Plato. After his time the professors of the Academic philosophy were showered by the tumults of war, and the school itself was transferred to Rome. Here the philosophy of the Old Academy, revived and corrected by Antiochus, found many advocates. Amongst the most eminent of these we may reckon Lu- cullus, Marcus Brutus, M. Teneus Varro, and M. Piso. The Middle Academy had likewise its patrons in this city; as it was founded upon a conviction of the imbecility of human reason, without running, with the Pytho- nists, into the extravagance of an entire suspension of opinion, it became a favorite sect among the Romans. Cicero, to whose profession, as a public pleader, whose business it was to collect arguments from all quarters on opposite sides of every doubtful question, it was peculiarly adapted, acquainted himself with this sect; and having himself been instructed by Philo, he would not find it difficult to induce others to follow his example. Cicero De Off. l. 2. c. 2. Oper. tom. iii. p. 328. Tusc. l. 2. c. 2. tom. ii. p. 353. — l. 4. c. 4. tom. ii. p. 419. Acad. Qu. palm. tom. ii. p. 5-99. De Fin. l. 2. c. 1. tom. ii. p. 129-1. 5. c. 3-5. tom. ii. p. 248-251. De Orat. l. 3. c. 16-18. tom. i. p. 328. De Nat. Doctrin. l. 1. c. 5-7. tom. iii. p. 504. Philoq. Fragm. tom. iii. p. 585. Ed. Oviet. Genet.—Diog. Laert. l. 3-4-5. tom. i. Ed. Amil.— Sext. Empir. l. 1. c. 33. p. 56. Contra Logic. l. 7. p. 401. &c. Ed. Fabr. Lipl. Enfr. Hist. of Philos. b. 2. c. 8. vol. i. p. 238. &c. b. 3. c. 1. vol. iii. p. 9-11. See Elec- trists, Platonists, and Sceptics. For the difference Between the Academicians and Sceptics; See Sceptics.

Academicians. Academicians, or Academists, is also used among us for the members of the modern academies, or inculcated societies of learned persons. ACADEMY, Academia, in antiquity, a public grove, or villa, situated on one of the suburbs of Athens, about six stadia, or ¼ of a mile from the city; where Plato, and the wise men who followed him, held assemblies for dispute and philosophical conference; and which gave the denomination to the fact of Academies.

It took its name academy, from one Academus, or Eca- demus, a citizen of Athens, to whom it originally belonged; and who appropriated it to gymnastic sports or exercises:—H. lived in the time of Thucydes.

Some, erroneously, derive its name and origin from Cadmus the Phoenician, as being the first who introduced learning, and the use of letters, among the Greeks.

The academy was farther improved and adorned by Cimon, with fountains, trees, shady walks, &c. for the convenience of the philosophers and men of learning who here met to confer, dispute, &c.—Hipparchus, the son of Pithagoras, built a wall round it: and, in order to defray the charges, laid so heavy a tax on the people, that ever after 'τιτετηρητα των, was used proverbially for any expensive business. It was also the burying-place of illustrious persons, who had deserved well of the republic. Of this retreat, so well adapted to philosophy and the muses, Horace speaks, Epist. II. 45.

"Atque inter sylvas Academiam querere verum."

"Midst academic groves to search for truth."

Within this inclosure Plato possest, as a part of his humble patrimony, purchased at the price of three thousand drachmas, or about 116l. 10s. 6d. sterling, a small garden, in which he opened a school for the reception of those who might be disposed to attend his instructions.

Here he taught his philosophy: and from this circum- stance all public places, designed for the assemblies of the learned and ingenious, have been since called ACADEMIES.

Sylla sacrificed the delicious groves and walks of the academy, planted by Cimon, to the laws of war; and employed those very trees to make machines with which to batter the city. Cicero also had a villa, or country retreat near POZZANOli, which he called by the same name, academia; where he used to entertain his philosophical friends.—It was here he composed his Academic Questions, and his book De Natura Doctrin.

Academy is more frequently used among the moderns, for a regular society, or company of learned persons; instituted generally under the protection of a prince, for the cultivation and improvement of arts or sciences.

Ptolemy Soter, in order to encourage and improve the liberal arts in his dominions, founded an academy at Alex- andria, or a society of learned men, who devoted themselves to the study of philosophy, and all other sciences; and he provided them with a collection of books, which became by degrees the finest library in the world, and has been known under the name of the Alexandrian Library.

Theodorus the younger, founded an academy at Con- stantinople, which he furnished with able professors of every science, intending it as a rival institution to that at Rome, which, with other literary seminaries, had been destroyed by Alaric and the Goths, towards the close of the fourth, and beginning of the fifth centuries.

Some authors confound academy with university; but though much the same in Latin, they are very different things in English.—An university is, properly, a body composed of graduates in the several faculties; of professors, who teach in the public schools of regents or tutors, and students who learn under them, and aspire likewise to degr es. Whereas, an academy is not intended to teach or profess any art, such as it is, but to improve it: it is not for novices to be instructed in, but for those that are more knowing; for persons of distinguished abilities to confer in, and communicate their lights and discoveries to each other, for their mutual benefit and improvement.

The first academy we read of, was established by Chal- mage at the motion of ALCUIN: it was composed of the chief wits of the court, the emperor himself being a member.—In their academical conferences, every person was to give an account of what ancient authors he had read; and each of them assumed the name of some ancient author who pleased him most, or some celebrated person of antiquity. Alcuin, from whose letters we learn the particulars, took that of Plicens, the surname of Horace; a young lord named Augilbert, took that of Homer; Adelard, bishop of Corbie, was called Augilinus; Riculf, bishop of Mentz, was Dametas; and the king himself, David.

Most nations have now their academies; but Italy has the greatest number.
Of these useful institutions we shall give an account in the following order.

Academies of Antiquities; as

The Academy at Cortona, established for the study of the Hetrian antiquities; which are numerous and extenstive. Their head is called Lucumon, a name taken from the ancient governors of Heturia. One of their laws is to give audience to poets only one day in the year: another is, to fix their feellons, and impose a tax of a disertation on each member in his turn.

The Academy of Antiquities at Upsal, owes its rite to queen Christine, but its establishment chiefly to Charles Guiltarius her successor. Its design is for illustrating the northern languages, and the antiquities of the country, as stones, coins, and the like monuments; in which notable discoveries have been made by it. The more eminent of its members have been Vercins, Loceimus, Schefler, Rudbecks, Kedir, Salin, Perdischit, &c.

Academy, of Architecture, was established at Paris by M. Colbert, in 1671, consisting of a company of faithful artists, under the direction of the Superintendent of the buildings.

Academy, Royal of Arts, was instituted in London for the encouragement of Designing, Painting, Sculpture, &c. &c. in the year 1768. This academy is under the immediate patronage of the king, and under the direction of forty artists of the first rank in their several professions. It furnishes, in winter, living models of different characters, to draw after; and in summer, models of the same kind to paint after. Nine of the ablest academicians, are annually elected out of the forty, whose business is to attend by rotation, to set the figures, to examine the performances of the students, and to give them necessary instructions. There are likewise four professors of Painting, of Architecture, of Anatomy, and of Perspective, who annually read public lectures on the subjects of their several departments; besides a president, a council, and other officers.

The admission to this academy is free to all students, properly qualified to reap advantage from the studies cultivated in it; and there is an annual exhibition of paintings, sculptures, and designs, open to all artists of distinguished merit.

The Academy of Arts, at Petersburgh, was established by the empress Elizabeth, at the suggestion of count Shuvalof, and annexed to the Academy of Sciences. The late empress Catharina has formed it into a separate institution, enlarged the annual revenue from 4000l. to 12,000l, and augmented the number of scholars from 40 to 300. She has also constructed, for the accommodation of the members, a large circular building, which fronts the Neva. The scholars are admitted at the age of 14, and continue to 18; and they are lodged, clothed, fed, and taught, at the expense of the crown.

All of them are instructed in reading and writing, arithmetic, the French and German languages, and drawing. At the age of 14, they may chose any of the following arts, which are distributed into four classes: 1. Painting in all its branches of history, portrait, battle, and landscape; architecture; mosaic; enamelling, &c. 2. Engraving on copper-plates, seal-cutting, &c. 3. Carving in wood, ivory, and amber. 4. Watch-making, turnery, instrument-making, calling statues in bronze and other metals, imitating gems and medals in paffe and other compositions, gilding, and varnishing. Prizes are annually distributed among those who excelled in any particular art; and from those who have obtained four prizes 12 are selected, who are sent abroad at the public charge. Their travelling expenses are defrayed; and when they settle in any town, they receive an annual salary of 60l. for four years. There is an assortment of paintings and models for the use of the scholars.

Academies, of Painting, Sculpture, and Architecture; as these celebrated ones annually at Florence and Milan, called also school; and that at Rome, incorporated into the new institute; to which may be added the academy of painting and sculpture at Paris and Vienna; another of designing at Rome.

Academy of Painting and Sculpture at Paris, was first projected by Le Brun, Sarazin, Corneille, &c. for which they obtained an arret of council in 1648, and established in 1654 and 1657, under the Cardinal Mazarnes, first protector thereof; and the chancellor Seguier vice-protector. In 1665, a pension of 4000l. was granted to the academy by the interposition of M. Colbert. It consists, besides, of a director, a chancellor, four rectors, a treasurer, and four professors, one of anatomy, and another of geometry; adjuncts to the rectors and professors; counsellors; a secretary; an historiographer, and two others.

Perons are here admitted either in quality of painters or sculptors, who model from a naked person. The painters are admitted according to their respective talents; there being a distinction made between those who work in history, and those who only paint portraits, or landscapes, or heads, or fruit, flowers, or paint in miniature; or only design, or engrave, or carve, &c. In the Academy of painting there are 12 professors, each of whom attends a month in the year, and their place is supplied by 12 adjutants. The professor upon duty places the naked man as he thinks proper, and sets him in two different attitudes every week. This they call setting the model. In one week of this month he sets two models together, which is called setting the group. The paintings and models made after this model are denominated academies, or academy-figures. They have likewise a woman who stands for a model in the public school. Three prizes for design are distributed every three months among the scholars; two others for painting, and two for sculpture every year. An account of this academy has been published by Guerin, under the following title, Descrip. de l'Acad. Roy. de Peinture & Sculpt.

There is also a French academy of painting, sculpture, &c. at Rome, established by Lewis XIV., wherein those who have won the annual prizes in the like academy at Paris, are received and entertained for three years with a view to farther improvement.

An Academy of drawing and sculpture was established at Manheim, by Charles Theodore, elector Palatine, in 1755, with a view of encouraging and promoting the fine arts.

The Academy of painting and sculpture, at Stockholm, has nine professors, and commonly about 400 scholars. This academy annually distributes three large and three small medals; and the scholars who most distinguish themselves, are permitted to travel into France and Italy, at the expense of the institution.

Academies of Belles Lettres, those wherein eloquence and poetry are chiefly cultivated. Italy abounds with these; and in France there are not a few; such as

The Academy of Umidi at Florence, called afterwards Ia Firentina, in honour of the grand-duke Cosimo I. who declared himself its protector in 1539, is illustrious both for the works it has produced, and its members; for these two last ages have included most of the eminent men, not only in Tuscany, but in all Italy. Their chief attention is to the Italian poetry.

Academy of Humorists, Umaristi, had its origin at Rome, from the marriage of Lorenzo Mancini, a Roman gentleman, at which several persons, of rank were gueess; and
and it being carnival time, to give the ladies some diversion, they took themselves to the reciting of verses, sonnets, speeches, and comedies, first, _ex tempore_, and afterwards premeditatedly: which gave them the denomination of _Belli Humori_. After some experience, coming more and more into the taste of these exercises, they resolved to form an _academy of Belles Lettres_: and changed the title of _Belli Humori_ for that of _Humori_! choosing for their device a cloud, which, after being formed of the same exhalations of the sea, returns in a gentle sweet shower, with the motto from Lucrætius, _redi agmina dulci_.

_Academy of Arcadi_ was established at Rome in 1690, for reviving the study of poetry, and the _belles lettres_; and comprehends most of the polite wits in Italy, of both sexes; many princes, cardinals, and other ecclesiastics: to avoid all disputes among whom, about pre-eminence, it is wisely provided, that all appear marked, after the manner of shepherds of Arcadia. Within ten years from its first establishment, the number of _Academiæ_ amounted to 600. They hold assemblies seven times a year, in a mead or grove; or in the gardens of some nobleman of distinction. Six of these meetings are employed in the recitation of poems, and verses of the _Arcadi_ residing at Rome, who read their own compositions: except ladies and cardinals, who are allowed to make use of other shepherds for this office. The seventh meeting is set apart for the compositions of foreign, or absent members; in which there is more entertainment than in all the rest; because the pieces produced here are written in all the different styles and dialects of Italy. The government of this academy is wholly democratical, allowing of no prince or protector, but only a _cuffos_, who represents the whole society, chosen each olympiad, that is, every four years; with a power of electing twelve others yearly, to assist him in the administration. Under these are two _fabrophilæi_, one vicar or _procurator_, and four deputies or superintendants, annually chosen. There are five ways of electing members; the first called _acclamation_, used when sovereign princes, cardinals, and ambassadors of kings, desire to be admitted; in which case the votes are given _viva voce_; the second, _annuation_, introduced in favour of ladies and academical colonies; where the votes are taken privately: the third, _representation_, established in favour of colleges and universities, where the young gentry are bred; who have each a privilege of recommending one, or two members, privately to be balloted for; the fourth, _farrogation_, whereby new shepherds are substituted in the room of those dead, or expelled; the last, _definition_, whereby, when there is no vacancy of members, persons of poetical merit have the title _Arcadi_ conferred on them, till such time as a vacancy shall happen. All the members of this body at their admission, assume new pater- nodal names, in imitation of those of the ancient Arcadians. The academy has divers colonies of _Arcadi_ established in other cities in Italy, all regulated after the same manner.

_Academy, Royal at Caen_, was established by letters patent in 1705; it had its rise fifty years earlier in private conferences, held first in the house of M. de Brieux. M. de Segrains retiring to this city, to spend the rest of his days, restored and gave new luster to their meetings. In 1707, M. Fœvaux, intendant of the generality of Caen, procured the king's letters patent for erecting them into a perpetual academy, of which M. Fœvaux was to be protector for the time, and the choice afterwards left to the members, the number of whom was fixed to thirty, and the choice of them, for this time, left to M. Fœvaux. Befide the thirty, leave is given to add some supernumerary members, not exceeding six, from the ecclesiastical communities in that city.

An assembly of men of letters was formed at Lyons, which merely wanted letters patent to constitute a royal academy, inferior to few in France. It consisted of twenty academists, with a director at their head, and a secretary who is perpetual. F. Lombard, a Jesuit, one of the members here read a learned dissertation on infinity. There is an _Academy of Belles Lettres_, History, and Antiquaries at Stockholm, the Memoirs of which are published in the Swedish language.

_Academies, Chirurgical_, as that first instituted at Paris in 1731, and finally established by letters patent from the king in 1748; the members of which are not only to publish their own and correspondents' observations and improvements, but to give an account of all that is published in surgery, and to compose a complete history of this art, by their extracts from all the authors, ancient and modern, who have wrote on it. A question in surgery is to be proposed by the academy yearly; and a prize of a gold medal of five hundred livres value to be given to him who furnishes the most satisfactory answer.

_Academy of Surgery_ was instituted some years ago at Vienna by the emperor, under the direction of the celebrated Brambilla. It had at first only two professors, who had the charge of instructing 150 young men, of whom thirty had been in the army. But the number both of teachers and pupils has been much increased. They are provided with a large edifice in Vienna, which affords habitations for the teachers and students, and also for pregnant women, and patients for clinical lectures, and new arts. They have also a medical library, a complete set of chirurgical instruments, an apparatus for experiments in natural philosophy, a collection of specimens in natural history, a number of anatomical and pathological preparations, and a variety of other useful articles. Adjoining to the building, there is also a good botanical garden. Three prize medals, of the value of forty florins each, are annually bestowed on the students who return the bell answers to the questions proposed in the preceding year.

_Academies, Cosmographical_, as that of the Argonauts at Venice, instituted at the solicitation of F. Coronelli, for the improvement of Geography. The design of the academical cosmography is to procure exact maps, geographical, topographical, hydrographical, and ichnographical, of the celestial as well as terrestrial globe, and the several regions and parts thereof, together with geographical, historical, and astronomical descriptions; in order to which, the several members obligate themselves, by their subscription, to take one or more copies of each piece, published under the direction of the academy; and to advance the money or part of it, in order to defray the charge of publication. To this end, three societies were settled at Venice, Paris, and Rome: the first under F. Moro, provincial of the Minorites of Hungary; the second under the abbot Laurence au Rue Payenne au Marais; the third, under F. Ant. Baldigian, Jesuit, professor of Mathematics in the Roman college; to whom those address themselves, who are willing to engage in this design. The number of members in the several countries of Europe has been considerable; their device is the terraqueous globe, with the motto, _plus ultra_. At the expense of this academy, all the globes, maps, and geographical writings of F. Coronelli have been published.

_Academy of Dancing_. One of this kind was instituted by Louis XIV. with extraordinary privileges.

_Academies, Ecclesiastical_, as that at Bologna, instituted in 1687, and employed in the examination of the doctrine, discipline, and history of each age of the church.

_Academies, Historical_, as the _Royal Academy of Portugal_. 
Lusitanae INSTITUTA VI. Ihns Decembris MDCCXX.

This academy consists of a director, four censors, a secretary, and fifty members; to each of whom is assigned some part either of the ecclesiastical, or civil history of the nation; which he is to treat either in Latin, or Portuguese.

Academy of Swedish History, at Tubingen, was established by some learned men, for publishing the best historical writings, the lives of the chief historians, and compiling new memoirs, on the several points and periods thereof.

Academies of Language, are called by some, Grammatical Academies; as the Accademia della Crusca, Accademia Sforzesca, or the Bran Academy, alluding probably to the end of their institution, which is to sift out and reject as husks or bran, all Italian words that are not good Tuscan, is famous for its vocabulary of the Italian tongue, and was formed in Florence, in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors of note confounded this with the Florentine academy. The famous Torricelli delivered many of his philosophical discourses in this academy. This academy is now united with two others, viz. the Florentina, and the Apatiti, under the name of Real Academia Fioren-
tina.

Academy of Prussia had its rise in 1617, at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always choice prelates. In 1668, the number of members rose to upwards of nine hundred. The history of this academy is written in the German tongue by George Neumarc.

Academy, French, had its rise in a private meeting of men of letters in the house of M. Corne, in the year 1628. Cardinal Richelieu, in 1635, at the instance of M. Chapelle, erected it into an academy for refining and ascertaining the French language and style. The number of the members was limited to forty, out of whom a director, a chancellor, and secretary, are to be chosen; the two former hold their post for two months, the secretary is perpetual. Several privileges and immunities were conferred on the new academy, particularly the droit de commissaire, or a privilege of not appearing to answer before any court, but that of the king's houhold. Their first assemblies were held in the cardinal's apartment; after his death, in that of the chancellor Seguier. At last an apartment was given them in the Louvre, now called Académie Française. They meet three times a week in the Louvre; at breaking up, forty silver medals are distributed among them, having on one side the king of France's head, and on the reverse, protégeur de l'Académie, with a laurel and this motto, a l'Immortel. By this distribution, the attention of the academits is secured to those who are present receiving the surplus, otherwise intended for the absent.

As to the employments of the academy: its design being not only to give rules but examples of good writing; they began with making speeches on subject taken at pleasure, each member in his turn; twenty of these have been printed. Their next work was a critique of the Cid of M. Corneille, a task enjoined them by the cardinal. They next set about a dictionary of the French tongue, which after about forty years spent in it, in order to settle the words and phrases to be used in writing, &c., was published in 1692; having in the mean while given occasion to some smart disputes with M. l'Abbé Furetiere, one of their own members.

Their history is written with great elegance to the year 1672, by M. Felison; improved and continued to the year 1700, by M. l'Abbé d'Olivet: the same is given historically, by F. le Camus.

A similar Academy was founded at Petersburg by the late Empress, upon a plan proposed by the prince de Dalkoff, and a fund provided for its establishment and support. It is to consist of 60 members.

The Royal Swedish Academy was formed on the plan of the French academy by Gustavus III., who attached a premium to some of its members. Its object is the improvement of the Swedish language, poetry, and eloquence.

Academy, Royal Spanish, is an academy for cultivating the Castilian tongue, established at Madrid, on the model of the French academy.—The design of this was laid by the duke d'Escalona, and approved of by the king in 1714, who declared himself protector thereof. It consists of twenty-four academits; including the director and secretary. Its device is a crucible on the fire, with this motto, limina, fæss, y del esfondar: i.e. it purifies, fixes, and gives brightness; which some have criticiised. Their object, as marked out by the royal declaration, is to cultivate and improve the national language: in order to which, they are to begin with choosing carefully such words and phrases, as have been used by the best Spanish writers: noting the low, barbarous, or obsolete ones, and composing a dictionary, wherein these may be distinguished from the former, &c. by which means, adds that prince, it will clearly appear, that the Castilian tongue is inferior to none of those most esteemed in the world; and may be employed with advantage either in teaching the arts and sciences, or in expressing the most perfect Latin or Greek originals in exact translations. The academy is to have its own printer; yet not to put any thing to press without the permission of the council. For farther encouragement all privileges and immunities enjoyed by the domestic offices, actually in the king's service, and the royal palace, are granted the academits.

Academies of Law: as that famous one at Berytus, and that of the Sicenites at Bologna.

Academy of Medals and Inscriptions at Paris, was set on foot by M. Colbert in 1663, and distinguished by its present appellation, in 1691, for the study and explanation of ancient monuments, and perpetuating great and memorable events, especially those of the French monarchy, by coins, reliefs, inscriptions, &c. The number of members at first was confined to four or five, but in 1701 was increased to forty; whereof ten were to be honoraries, ten pensioners, ten associates, and the same number of novices or elaves, which has been since annexed to the clas of elaves. The king nominates their president and vice-president yearly; but their secretary and treasurer are perpetual. The reit are chosen by the members themselves, agreeably to the constitutions given them on that behalf. Their chief work is a kind of inedical history of the reign of Louis XIV., which, after some interruptions, was continued to the advancement of the duke of Anjou to the crown of Spain. Befide which we have several volumes of their effays, under the title of memoirs: and their history, written and continued by their secretaries. Their motto is vetat mori.

Academies, Medical, as that of the Natura Curiosi in Germany: that founded at Palermo, in 1645; another at Venice.
Venice, in 1791, which meets weekly in a hall near the grand hospital; another at Geneva, in 1745, in the house of M. le Clerc. The colleges of physicians at London and Edinburgh, are also by some ranked in the number of medical academies.

Academy of Nature Curiosum, in Germany, was first founded in 1652, by M. Bautch, a physician, who invited all physicians to communicate their extraordinary cases, and was elected president. Their works were at first published separately: but, in 1670, it was preferred to publish a volume of observations every year. The first volume appeared in 1674, under the title of Ephemerides, which was continued with some interruptions, and variations of the title, in 1677, the academy was taken under the protection of the emperor Leopold; who granted the members several privileges, and particularly that their presidents should be counts palatine of the Roman empire. From him it has been sometimes designated the Leopoldine academy.

This academy differs from all others, in that it has no fixed residence, or regular assemblies; indeed, whereas a kind of bureau, or office, first established at Breslaw, afterwards removed to Nuremberg, where letters, observations, &c. from members and correspondents are taken in. The academy consists of a president, two adjuncts, or secretaries, and colleagues or members. The colleagues, at their admission, oblige themselves to two things; first, to choose from subject out of the animal, vegetable, or mineral kingdom to handle, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the annual Ephemerides. Each member is to bear a symbol of the academy, viz. a gold ring, whereon, instead of a stone, is a book open, and on the face thereof an eye; on the other side the motto of the academy, namquam obijus, i.e. never idle. See the history, laws, &c. of this academy, with the names of its members, and the titles of its pieces, in Ephem. Germ. dec. 1. an. 1, & 2. Pref, and the continuation of the name in the prefaces and appendices to the ensuing volumes.

Academy, Musical, consists of the managers and directors of the opera.

An academy of this kind, called the Academy of Ancient Music, was established in London in 1710, by several persons of distinction, and other gentlemen, in conjunction with the most eminent masters of the time, with a view to the study and practice of vocal and instrumental harmony. This institution, which had the advantage of a library, containing the most celebrated compositions both foreign and domestic, in manuscript and in print, and which was aided by the performances of the gentlemen of the chapel royal, and the choir of St. Paul's, with the boys belonging to each, continued to flourish for many years. In 1731, a charge of plagiarism brought against Bononcini, a member of the academy, for claiming a madrigal of Lotti of Venice as his own, interrupted the harmony, and threatened the existence of the institution. Dr. Greene, who had introduced the madrigal into the academy, took part with Bononcini, and withdrew from the society; taking with him the boys of St. Paul's. In 1734, Mr. Gates, another member of the society, and father of the children of the royal chapel, retired in disgust; and it was thus deprived of the alliteration which the boys afforded it in singing the fezzer parts. From this time the academy became a seminary for the instruction of youth in the principles of music, and the laws of harmony. Dr. Pepusch, who was one of its founders, was active in accomplishing this measure, and by the expedients of educating boys for their purpose, and admitting auditor members, the subsistence of the academy was continued.

The royal academy of Music was formed by the principal nobility and gentry of the kingdom for the performance of operas, composed by Mr. Handel, and conducted by him at the theatre in the Haymarket. The subscription amounted to 50,000l, and the king, besides furnishing 1000l, allowed the society to assume the title of Royal Academy. It consisted of a governor, deputy governor, and twenty directors.

On occasion of a contest between Handel and Corelli, one of the performers, in which the directors took the part of the latter, the academy was dissolved, after having fulfilled with reputation for more than nine years.

Academy, Arith.; as that of Peterborough, and those in England. See Academy.

Academy, Political, such as that of Paris, composed of six persons, who met on certain days each week at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. Here they perused such papers as were put in their hands, by order of the secretary for foreign affairs, who acquainted the king with the progress they made, and the capacity of each, that his majesty might employ them accordingly.

Academies of Sciences chiefly denote those erected for improving natural and mathematical knowledge, otherwise called philosophical and physical academies: such as the academy secretarium nature, formed at Naples in the house of Bapalide Porto, about the year 1560, the first academy of the philosophical kind. It was succeeded by the

Academy of Lyncei, founded at Rome by Prince Frederic Cesi, towards the close of the same century; several of whose members rendered it famous by their discoveries; the celebrated Galileo Galilei was of the number.

Several other academies contributed also to the advancement of the sciences; but it was by speculations, rather than by repeated experiments on the phenomena of nature such were the academy of Belfarian at Rome, and that of Laurence de Medicis at Florence, in the sixteenth century; the sixteenth, that of Infiammati at Padua, of Vigna Juili at Rome, of Ortolani at Placentia, and of Umid at Florence. The first of these studied fire and pyrotechnia; the second, wine and vineyards; the third, gardens and potsherds; the fourth, water and hydraulic. Add to these, that of Venice, called La Veneta, founded by Frederic Badoara, a noble Venetian; another in the same city, whereof Campeggio, bishop of Feltro, appears to have been the chief; and that of Cofenza, or la Conventina, whereof Bernadie Telefo, Sertorio Quatromanni, Paulus Aquinus, Julius Cavalcanti, and Fabio Cicili, celebrated philofopers, were the chief members.

The compositions of all these academies of the sixteenth century were good in their kind, but none of them comparable to those of the Lyceii.

Academia del Cimento made its appearance at Florence some years after the death of Torricelli, under the protection of Prince Leopold, afterwards cardinal de Medicis. Galileo, Torricelli, Aggiunti, and Viviani, prepared the way for it; and some of its chief members were Saul del Buono; who, in 1677, invented the instrument for evincing the incomprehensible nature of water, which was a thick globular shell of gold; Alphonius Borelli, Candide del Buono, brother of Paul, Alexander Marfili, Vincent Viviani, Francis Redi, and count Laurence Magalotti, were some of its chief members. The latter was secretary of this academy, and published a volume of curious experiments in 1677, under the title of Saggi di Naturali Esperienze; a copy of which being presented to the Royal Society, was translated into English by Mr. Waller, and published at London, in 4to. in 1684.
The Academy of Agostina, or Imperial Academy at Florence, which comprehended within the extent of its plan all arts and sciences, holds from time to time public meetings, where any person, whether academick or not, may read his works, on any subject, and in any language: the academy receiving all with the greatest impartiality.

Academia degli Inquisiti at Bologna, incorporated afterwards into that Del Tractac in the same city, followed the example of that del Cimento: its meetings were at the house of the abbot Antonio Sampieri. Here Geminiano Montanari, one of the chief members, made excellent discourses on physical and mathematical subjects, part whereof was published in 1667, under the title of Pensei Filosofico-Matematici. This academy afterwards met in an apartment of Eufachio Manfredi; and afterwards in that of Jacob Sandri, but arrived at a higher luster, when its assemblies were held in the palace Marigli. Some writers have represented Marigli as the founder of this academy in 1675. Its motto was, Memento agitat. In 1705, J. B. Morgagni new-modelled the academy, and received Marigli into his house. Several learned men became members of it, and it was united with the Institute, founded by Marigli, in the year 1712, under the title of the Academy of the Institute. The arts of painting, statuary, and architecture, introduced by Marigli, were at first considered as distinct and separate from the plan of the Academy of Institute; but they were afterwards incorporated with it; and the university finally acquired the name of Academia Clementina, from its patron Clement XI. A printing-office was added to the academy by the munificence of Benedict XIV. In this Institute, not only the learned of each sex were admitted as members, but several ladies have been promoted to professorships. Among these we may mention the celebrated Anna Manzolini, professor of anatomy, and Laura Batti, who died in 1728, renowned for her knowledge in the abitrue sciences. Of this lady we have a particular account in the 6th volume of the Comment. Bonon. The philosophical apparatus is large. This academy, in an early period of its existence, published the Asia Bontoniana.

Academia de Raffagni, in the kingdom of Naples, called La Societa Scientifica Raffagni degli Inviaggi, was founded about the year 1540, under the name of Naviganti, and renewed under that of Speciatori by Camillo Tufano, about the year 1600. It was transformed from an academy of belles lettres into an academy of sciences, at the solicitation of the learned abbot Don Giacinto Gimma; who being made president under the title of promoter-general thereof, in 1695, gave a new fet of regulations. He divided the academicks into severall classes, viz. grammarians, rhetoricians, poets, historians, philosophers, physicians, mathematicians, lawyers, and divines, with a class apart for cardinals and persons of quality. To be admitted a member, a man must have degrees in some faculty. The members are not allow'd to take the title of academick, in the beginning of their books, without a written permission from the president, which is not granted till the work has been examined by the censors of the academy. This permission is the greatest honour the academy can confer; since hereby they, as it were, adopt the work; and are answerable for it against all criticisms which may be made of it. The president or promoter himself is subject to this law. And, that no academick is allowed to publish any thing against the writings of another, without leave from the society.

There have been several other academies of sciences in Italy, which have not subsisted long, for want of being supported by the princes. Such were at Naples that of the Invalliganti, founded about the year 1675, by the Marquis.
and putting it on a new and more solemn footing. In virtue of that regulation, the academy was to be composed of four kinds of members, viz. honorary, pensionary, associates, and eleaves.—The first class to consist of ten persons; and the rest of twenty each. —The honorary academists to be all inhabitants of France; the pensionaries all to reside at Paris; eight of the associates allowed to consist of foreigners; and the eleaves all to live at Paris. The officers, to be a president, named every year by the king, out of the clafs of honorary academists; and a secretary and treasurer, to be perpetual.

Of the pensionaries, or those who receive salaries, three to be geometricians, three astronomers, three mechanics, three anatomists, three chemists, three botanists; the remaining two, secretary and treasurer. —Of the twenty associates, two to apply themselves to geometry, two to botany, and two to chemistry. —The eleaves to apply themselves to the fame kind of science with the pensionaries they are attached to; and not to speak, except when called upon by the president. —No regular or religious to be admitted, except into the classes of honorary academists; nor any person to be admitted, either for associate or pensionary, unless known by some considerable printed work, some machine, or other discovery. —Further, no person to be allowed to make use of his quality of academist, in the title of any of his books, unless such book have been read to, and approved by the academy.

The establishment of this academy, as well as that of the Belles Lettres, was confirmed by royal patent in 1713.

In the year 1716, the duke of Orleans, then regent, made an alteration in their constitution; augmenting the number of honoraries, and of associates capable of being foreigners, to twelve; admitting regularly among such associates; supplanting the eleaves of clafs, and establishing in lieu thereof, a new clafs of twelve adjunts, to the fix several kinds of sciences cultivated by the academy; and, lastly, appointing a vice-president, to be chosen yearly by the king, out of the honorary members; and a director, and sub-director, out of the pensionaries.

In the year 1785, the king farther confirmed, by letters patent, the establishment of this academy; added clafs of agriculture, natural history, mineralogy, and physics; and incorporated the associates and adjunts, limiting to fix the members of each clafs, viz. three pensioners, and three associates. The academy, by this regulation, was made to consist of eight clafs, viz. geometry, astronomy, mechanics, general physics, anatomy, chemistry, botany and agriculture, and natural history and mineralogy. Each clafs was to remain irrevocably fixed at six members, viz. three pensioners, and three associates, besides a perpetual secretary and treasurer; twelve free associates, and eight associate foreigners; and the adjunt geographer was henceforth to be called the associate-geographer. These several clafs were filled with persons, whose names have been respectable in the commonwealth of letters. Their meetings, which were formerly held in the king's library, have since 1699 been held in a fine hall in the Old Louvre.

This academy has done great things for the service of learning, by the continuation of the memoirs, by sending professors to different parts of the world for making observations; but especially by the excellent writings they have published, either in a separate, or a joint capacity; particularly their memoirs. These have been regularly published every year, some late years excepted, ever since the establishment of the academy in 1699. To each volume is prefixed the history of the academy, or an extract of the memoirs; and, in general, of whatever has been read or said at the academy. At the close of the volume are catalogues on such academists as have died in the course of the year. A general index to the volumes has been published every ten years. In the volume for 1783, &c. the extracts from the registres are omitted, but the catalogues of distinguished men lately deceased, are continued. M. l'Abbé Rozier has published, in four quarto volumes, an excellent index of the contents of all the volumes, and the writings of all the members, from the commencement of their publications to the year 1770. M. Rouillé de Meffay founded two prizes, one of 2500, and the other of 2000 livres, which are alternately distributed every year; the subjects for the first must relate to physical astronomy, and those for the latter, to navigation and commerce. Indeed they have an advantage over most academies, in being defrayed their expenses, and even paid for time and attendance. Their history to the year 1697 was written by M. Du Hamel; and since that time continued from year to year by M. Fontenelle, under the following titles: Du Hamel Historia Regiae Academiae Scientiarum, Paris, 4to. Histoire de l’Academie Royale des Sciences, avec les Memoires de Mathematique et de Physique des Registres de l’Academie, Paris, 4to. Hilt. de l’Acad. Roy. des Sciences depuis fon Etablissement en 1666, jusqu’en 1699, en 13 tomes, 4to.

A new history, from the institution of the academy to the period from whence M. de Fontenelle commences, has been formed; with a series of the works published under the name of this academy, during the first interval. —Their motto is invent et perficit. This academy was suppressed; and, in 1793, abolished by the Convention of France; the last volume of its memoirs being that for 1790; and other institutions of various kinds have been established; see INSTITUTE.

The memoirs of the academy, abolished by the edict of the Convention, because it was a royal institution, and royalty was overthrown, are comprehended in 139 volumes in quarto: 11 from the foundation of the academy in 1666 to its renewal in 1699; 92 from 1699 to 1790; the year 1772 containing two; 11 of memoirs presented to the academy; 9 of prizes; 9 of tables to 1780; and 7 of drawings of machines.

The French have also considerable academies in most of their great cities; as, the academy at Caen, established by letters patent in 1705; the royal society of sciences in 1706, at Montpellier, which, since 1708, formed one body with the royal academy of sciences at Paris; académie des jeux floraux at Toulouse, besides the academy of sciences and belles lettres, founded in 1752; and other academies at Bourdeaux, founded in 1703; at Soissons in 1674, at Marseilles in 1724, at Lyons in 1700, at Paris in 1721, at Montauban in 1744, at Angers in 1685, at Amiens in 1705, at Villefranche in 1709, at Dijon in 1740, at Nîmes in 1682, at Bézancourt in 1752, at Chalon-sous-Maine in 1755, at Rochelle in 1734, at Beziers in 1723, at Rouen in 1744, at Metz in 1760, at Arras in 1773, &c. &c.

Academy, Royal, of Sciences, at Berlin, was founded by Frederick I. of Prussia in 1700, on the model of that of England, excepting that, besides natural knowledge, it likewise comprehends the belles lettres. A new form, and a new set of statutes, were given it in 1710; by which it is ordained, that the president shall be one of the counsellors of state, and nominated by the king. The members were divided into four classes; the first, for prosecuting physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third, for the German language, and the history of the country; the fourth, for Oriental learning, particularly as it may concern the propagation of the Gospel among infidels. Each class to elect a director for themselves, who
Academy, Imperial of Sciences, at Petersburg, was projected by czar, Peter, the Great, who, during his travels in 1717, having observed the utility of institutions of this kind, determined to establish a similar one in his own country. Wolff and Leibnitz were consulted as to the regulations which were proper to be adopted. The death of Peter, however, prevented the execution of the plan which he had drawn up and signed in 1717. At the close of 1725, his design was happily executed by the munificence of the czarina, Catherine I., his wife and successor, on the model nearly of the academy of Paris, whereof the czar was a member. The academy held its first public meeting on the 27th of December, 1725, in the presence of the Duke of Holstein, and a large appearance of persons of distinction. The empress fetted a fund of 40,000 roubles for support, and 15 members, eminent for their talents and learning, were admitted and penned under the title of Professors, in the various branches of literature and science; among whom were Nicholas and Daniel Bernouilli, the two De L’ile, Butlinger, and Wolf. The academy languished under Peter II., and was again revived by the empress Anna, who added a seminary for the education of youth. At the accession of Elizabeth, the original plan was enlarged and improved by letters patent in 1747; which, besides the academy, established in connection with it an university, having regular professors, who read lectures; and the academy acquired reputation and vigour by the influx of several learned foreigners. The annual income was increased to 16,659 roubles.

The late empress took this society under her own immediate protection; corrected many of its faults, and infused a new spirit into the researches of its members. In order to encourage ingenuous professors to visit the various provinces of her dominions, she granted an extraordinary benefaction of 2000 roubles, which was occasionally renewed. These travellers were instructed by the academy, to prosecute their inquiries into the different parts of soil and water, the best methods of cultivating barren and desert spots, the local disorders incident to men and animals, and the best means of relieving them, the breeding of cattle, and especially of sheep, the rearing of bees and silk-worms, the proper places for fishing and hunting, the various minerals and plants, and the arts and trades. They were also enjoined to rectify the latitude and longitude of the chief towns, to make astronomical, geographical, and meteorological observations, to trace the course of rivers, to take the most exact charts, and to observe the manners and customs of the different people, their dress, language, antiquities, traditions, history, and religion; and, in a word, to obtain every information which might tend to illustrate the real state of the whole Russian empire. These expeditions have produced, in the course of a few years, a great variety of excellent publications on the several objects above enumerated.

The first transactions of the society were published in 1728, and entitled Commentarii Academia Scientiarum Imperialis Petropolitanae Ann. 1728. The publication was continued till the year 1757, when its transactions were called Novi Commentarii Academia Scientiarum Imperialis Petropolitanae. Of the Commentaries 14 volumes were published. The first of the new Commentaries appeared in 1759, and the 20th in 1776. About 50 volumes have been published, and two are printed, in the Latin language, every year, all of which abound with important and useful disquisitions upon various parts of science, and natural history. This academy, from the self-administration of some of its directors, was, for several years, torn by internal differences, which retarded the labours of the academicians, and put a stop
flop to the usual publication of its collections. By an enactment of the empress, the government of the academy was new-modelled; and the academy resolved to begin a new series of publications. From this era the history commences, which is printed to Vol. I. of the Nova Acta, &c., published in 1737. The academy is composed of 45 professors, besides a president and director. Each professor has a house and an annual stipend, from 200l. to 200l. There are also four chairs to which are appointed, attend the fittings of the college, and succeed to the first vacancies. The ordinary affairs are held twice a week, and public or solemn ones three in the year; wherein an account is given of what has been done in the private ones. The building, apparatus, &c., of this academy, are extraordinary. They have a fine library, containing 35,000 books and manuscripts; an extensive museum; an observatory, &c. Their motto is patria, and their device, a tree bearing fruit not ripe.

Academy of Science, called the Institute of Bohemia, was founded by count Marigli, in 1712, for the cultivating of physics, mathematics, anatomy, medicine, chemistry, and natural history. Its history was written by M. de Limiers, from memoirs furnished by the founder himself, and published at Amsterdam in 1723. The academy founded not long before by Pope Clement XI., for architecture and painting, was incorporated with this; and for its further encouragement the city purchased and appropriated to its use the palazzo Celini, that the library, museum, observatory, schools, and the apartments of the professors, might be under the same roof. On the entrance of this edifice is the following inscription: Bonomiae Scientiarum et Artium Institutionum, ad publicum totius orbis usum.

Academy, Imperial and Royal, of Sciences and Belle Lettres, at Bruglia, was founded in 1753; and several volumes of their memoirs have been published.

Academy, Royal of Science, at Stockholm, derived its origin from six persons of distinguished learning, one of whom was the celebrated Linnaeus; who, in 1739, formed a private society for reading disquisitions on literary subjects. As their number increased, it attracted public notice; and the society was incorporated by the king, in 1741, under the title of the Royal Swedish Academy. Though it has no pension from the crown, its funds have been gradually augmented to a large sum by legacies, and private donations. The only persons who receive salaries, are professors of experimental philosophy and two secretaries. Each member resident at Stockholm becomes president by rotation, and continues in office three months. The members, both native and foreign, are admitted without fees. The disquisitions read at each meeting are written in the Swedish language, and are collected and published four times in the year; and the annual publications make a volume in 8vo.

The first 10 volumes, which were finished in 1779, are called the Old Transactions; for in the next year, the title was changed into that of New Transactions. Any person who finds a treatise, which is thought worthy of publication, receives the transactions for one quarter gratis, and a silver medal of the value of three shillings. All papers relating to agriculture are published separately, under the title of Oeconomica Acta. Annual premiums in money and gold medals are distributed by the academy, principally for the encouragement of agriculture and inland trade. The meetings of this academy are sometimes attended by the king.

Academy, Royal of Sciences, at Copenhagen, took its rise from the occasional meetings of six literati, whom Christian VI. in 1742, employed in arranging his cabinet of medals. With these persons others gradually associated; and they formed a society, under the patronage of the count of Holstein, whose immediate object was to make researches into the antiquities and history of their country, and to explain them. In 1753, his Danish majesty took the society under his protection, gave it its name, endow'd it with a fund, and directed the members to extend their pursuits to natural history, physics, and mathematics. The academy has published 15 volumes in the Danish language; some of which have been translated into Latin.

Academy, Royal, of Sciences, at Lisbon, was founded in the year 1759, by the Duke de Lúcioens, uncle to the queen. The sovereign is the immediate patron, and the founder is president. Twenty-four effective members, divided into three classes, viz. natural sciences, mathematics, and national literature, form the main body of the society; and the privilege is composed of 36 free members; a small number of foreign correspondents, and a larger one of great personages of the nation, as honorary members; some veteran members and a considerable proportion of extra correspondents. Government allows them a revenue, by means of which they have established an observatory, a museum, a library, and a printing-office. The academy has hitherto directed its attention to the encouragement of many objects, which do not, in other countries, require the care of an academy of sciences. The 1st volume of its memoirs was published at Lisbon in 1797. The memoirs commence at 1785.

Academy, of Arts and Sciences, American, was established in 1780, by the council and house of representatives of the province of Massachusetts's bay, for promoting and encouraging the knowledge of the antiquities of America, and of the natural history of the country; for determining the uses to which its various natural productions might be applied; for promoting and encouraging medicinal discoveries, mathematical disquisitions, philosophical inquiries, and experiments, astronomical, meteorological, and geographical observations, and improvements in agriculture, manufactures, and commerce; and in short for cultivating every art and science, which might tend to advance the interest, honour, dignity, and happiness of a free, independent, and virtuous people. The members of this academy are never to be more than 200, nor less than 40.

Academy, Royal Irish, sprung out of a society, established at Dublin, about the year 1782, and consisting of an indefinite number of gentlemen, most of whom belonged to the university, who held weekly meetings, and alternately read essays on various subjects. The members of this society, anxious to make their labours redound to the honour and advantage of their country, formed a more extensive plan, and admitting only such names as might add dignity to their new institution, became the founders of the Royal Irish Academy, which professes to unite the advancement of science with the history of mankind and polite literature. The first volume of their transactions for 1787 was published in 1788, and the publication has been occasionally continued. We shall here add, that a society was formed in Dublin, similar to the Royal Society in London, as early as the year 1653; but the distracted state of the country was unpropitious to the cultivation of philosophy and literature. The plan was resumed about the beginning of the present century, and the Earl of Pembroke, then Lord Lieutenant, was president of a philosophical society established in Dublin College. In the year 1748, there was instituted a Physico-historical Society; of which two volumes of minutes are extant; but this society soon declined.

Academy, of Sciences, at Minsk, was established in 1763 by Charles Theodore, elector Palatine, according to a plan of the learned Schopffin, and divided into two classes, viz. the Historical and Physical. The latter class was subdivided, in 1780, into the Physical, properly so called, and Meteo-
Meteorological. The papers of the academy have been published in 11 volumes, under the title of Acta Academiae Theodoro-Daltoniae. The Meteorological observations, from 1728 to 1782, form 12 volumes 4to, with the title of Ephemerides Societatis Meteorologicae Publinae.

For a further account of similar institutions, see Society.

Academy, is also used among us as a kind of collegiate school or seminary; where youth are instructed in the liberal arts and sciences in a private way; now indeed it is used for all kinds of schools.

There were two public academies in the Roman empire; one at Rome, founded by Adrian, in all which the sciences were taught; and the other at Berytus in Phoenicia, which was pristly denoted for the education of youth in the science of law. In consequence of the protection that was given to the sciences in the 17th century, academies were erected in various parts of Europe, peculiar privileges of several kinds were granted to the youth that frequented them; and these learned societies acquired, at length, the form of political bodies; i.e. they were invested with a certain jurisdiction, and were governed by their own laws and statutes. In the public schools or academies that were founded at Padua, Modena, Naples, Capua, Thoulouze, Salamanca, Lyons, and Coligny, the application of the youth was restricted to certain branches of learning, and thus the course of academical education remained imperfect. The academy of Paris, which surpassing all the rest, both with respect to the number and abilities of its professors, and the multitude of students by whom it was frequented, was the first learned society which extended the sphere of education, comprehended all the sciences, and appointed masters for every branch of education. Hence it was distinguished, before any other academy, with the title of University, to denote its embracing the whole circle of science; and in course of time, other schools of learning were ambitious of forming themselves upon the same model, and of being honoured with the same title. In the 16th century, academies were founded by the Lutherans at Jena, Helmholdt, and Altorf, and by the Calvinists at Franeker, Leyden, Geneva, under Calvin and Beza, and many other places.

Frederic I. king of Prussia, established an academy in Berlin in 1703, for the education of the young nobility of the court, suitable to their extraction. The expense of the students was very moderate, the king having undertaken to pay the extraordinary. This illustrious school, which was then called the Academy of Princes, has now lost much of its first splendor.

The Romans had a kind of military academies established in all the cities of Italy, under the name of Campi Martii. Here the youth were admitted to be trained for war at the public expense. The Greeks, beside academies of this kind, had military professors called Tadici, who taught all the higher offices of war, &c. &c.

We have two royal academies of this kind; one at Portsmouth, for teaching navigation, drawing, &c. which may be styled a naval or maritime academy, founded by George I. in 1722, and under the direction of the board of admiralty, which gives salaries to two masters; and another at Woolwich, where youth are taught fortification, gunnery, and the branches of the mathematics as are necessary to qualify them for engineers. This was established by George II. in 1741, and is under the direction of the master-general and board of ordnance. None are now educated in this academy, but the gentlemen-cadets, to the number of 50 or 100. The masters are now 12; viz. a professor of mathematics, and two other mathematical masters, a professor of fortification and an assistant, two drawing masters, a French master, with masters for fencing, dancing, and chemistry. This institution is important and useful, and its establishment has been at the expense of the royal and public funds.
ACALANDRA. See Calandra.

ACALANDRUS, in Ancient Geography, a river falling into the bay of Tarentum, not far from the Metapontum. This river is mentioned by Pliny (Hist. Nat. l. iii. c. 10. tom. 1. p. 165.), and by Strabo, (Geog. tom. 1. p. 429.) It is now Fiume de Rofeto.

ACALEPHIS, a nettle. It also signifies a certain fish, the flesh of which is very tender. Likewise a tea-bowl, mentioned by Nicander, and a tea-plant, mentioned by Celsus.

ACALLOT; an abbreviation of Acalotl.

ACALYPHA, in Botany, a genus of plants belonging to the monoea monolaza claus, and the natural order of Tricera, called by Boerhaave, and others, Rancocarpus or Thrift fruit. It derives its name Acalypha from its not being pleasant to handle, i.e. from Acalypha, a name for this plant. Its characters are these: the male flowers are crowded above the female ones; the calyx is a three or four-leaved perianthium, with roundish, concave, equal leaflets; it has no corolla; the stigmas have from eight to sixteen filaments, which are short, curved, and connected at the base, with roundish anthers. The female flowers are fewer, and received into a large divided involucrum. The calyx is a three-leaved perianthium, with lobate, concave, converging, small, permanent leaflets; there is no corolla; the pistil has a roundish stem, three styles, branching, usually tri-partite, and long, and the stigmas are simple; the pericarpium has a roundish, three-furrowed, three-celled capsule, the valves gaping two ways, and the seeds are solitary, roundish, and very large. There are fourteen species. The first sort, or A. Virginica, grows naturally in Virginia, several parts of North America, and also in Ceylon: the second, or A. virginia, is a native of the warmest countries, and grows plentifully in Jamaica, and its leaves resemble those of the annual nettle, and sting as much: the third, or Indian Acalypha, was discovered in great plenty by Dr. Houltoun at La Vera Cruz, and is also found upon dunghills in the East Indies, and its leaves are like those of Mercury, whence these plants have sometimes been called three-fac'd Mercury: the fourth, or Viburnum Acalypha, is found in the woods about Carthagena: the fifth is a native of South America, whence it has its name: the rest are all natives of the West Indies. These plants have no beauty to recommend them, and are preferred in some botanical gardens merely for the sake of variety. Martyn's Miller. In the last edition of Linnaeus's Syst. Nat. by Gmelin, the Acalypha is made a genus of the Monole of dodecandra claus and order, and includes twenty-one species.

ACALZEKE, a town and fortress of Alsatian Tartary. N. lat. 41° 30'. E. long. 44° 14'.

ACAM. See Acam, and Akam.

ACAMACU, or ACAMARY, in Ornithology, the Brazilian name of the crested Moucherolle of Buffon; the crested Brazilian Flycatcher of Buffon, and the crested Brazilian Todius, or variety of the Todius Paradisus of Gmelin, and of the Musicara Paradisi of Linnaeus. It is found in Africa and Madagascar.

ACAMANTIS, in Ancient Geography, the name of the island of Cyprus, taken from its western promontory, called Akamas and Cacamo, now Cape Nifario, or Epifanio, where there was formerly a town of the same name, now a village, called Cufco. The wood in this part of the island (says Mr. Bruce, Travels, vol. 1. p. 42.) remains as thick and impervious as at the first discovery; and in these woods large flags, and wild bears of a monstrous size, shelter themselves in perfect security.

ACAMAS, in Ancient History, the son of Thecus, who followed the other Grecian princes to the siege of Troy, and was deputed with Diomedes to relieve Helen. Laodice, Priam's daughter, had a son by him, called Munius. He was one of the heroes who were concealed in the wooden horse. One of the tribes of Athens was called Acamantides from him, by the desire of the oracle; and he founded a city in Phrygia Major, called Acamantium. Homer (Iliad. l. ii. 823, and l. xiv. 475.) mentions two other heroes of this name; one a Thracian prince, who came to succour Priam; and another, a son of Antenor.

ACAMATOS, among Physicians, means that disposition of a limb, which is equally distant from flexion and extension.

ACAMBOU, in Geography. See Acaumbou.

ACAMEA, in Ancient Geography, a town of Asyria, in the province of Sittacene.

ACANACEOUS, see Acanthaceous.

ACANGA, in Botany. See Bromelia.

ACANGIS, i.e. Razorers, or Adventurers, a name given by the Turks to their hussars, or light troops, who are generally sent out in detachments to procure intelligence, harass the enemy, or ravage the country.

ACANNY, or Akanni, see Achem.

ACANOR, a particular sort of chemical furnace. See Athanas.

ACANOS, in Botany. See Onopordum.

ACANTHA, formed from axan, point, and abos, flower, in a general sense, a spine or prickle, chiefly of plants of the thorny kind.

ACANTHA, in a more particular sense, denotes a spine, or quill of certain fishes, as the echinus marinus, or sea-hedge-hog. Hence the thorn-back, a species of the raja, is by some called acantbias, from the two prickles on its back. Ron. elet. de Pfeib. lib. xii. c. 2.

ACANTHA, among some Anatomists, is applied to the hind or posterior protuberances of the Vertebrae of the back; forming what we call the Spina dorsi.

ACANTHABOLUS, compounded of axan, a thorn, and bolus, to cafl away, in Surgery, an instrument, whereby to extract foreign bodies, which by the sharpness of the points have penetrated, and entered any part of the body.

The acanthabolus is the name with the instrument which is otherwise called adspilla. Its chief use is for extracting fish-bones, or the like, sticking in the esophagus; as also the fragments of weapons, bones, hair, &c. remaining in wounds. Its figure resembles that of a pair of pincers; sometimes it is also made crooked, for more commodious application to the faucies. Celsius, lib. vii. c. 30.

ACANTHABOLUS is also sometimes used for an instrument, whereby people pull out the hairs from their eye-brows.

ACANTHACEOUS, among Botanists, a term applied to a class of plants, that are armed with prickles; popularly known under the name of the Thistle kind.

ACANTHALZUCA, the name of echinopus, or globular Thistle.

ACANTHARIS, in Entomology, a species of the Cimex, in the Linnaean sytem, and of the Reduvius, in the arrangement of Fabricius, the characters of which are, that it has a spinous thorax, and a ciliated abdomen, with spines. It is found in Jamaica.

ACANTHE, in the Materia Medica of the ancients, a name given to the plant we now call the Artichoke.

ACANTHA, in Botany, a name given by some of the Greek writers to a plant called also lenuncalus, and by the Arabian physicians bonkun. It was a prickly plant, whose roots were somewhat like those of the cypress, and composed of several knobs or joints, and of a bitter taste. It was brought for medicinal use from the East Indies, and
A C A

Some parts of Arabia, and was the root of the angulla of Avicenna and others.

ACANTHIA, in Entomology, a genus of the class of Ryn- gotis, in the distribution of Fabricius, and forming a division in the arrangement of the Cimex by Gmelin, in his edition of Linnaeus. The acaenitha of Fabricius have no lip, and Gmelin comprehends under this division the affe the co- leptra, and the membranaci.

ACANTHIAS, in Ichthyology, a name given by some authors to the fish, the skin of which is used by our arti- ficers in polishing, and called by them simply fish-skin. In the Linnean system it is a species of Squalus, and the picked dog-fish of the British zoology. A variety of this is mentioned by Gmelin, and described under the name of Squalus Pernandinus. Its dorsal fins are quite like the other, and its body round and ocellated. It is found in all seas, and rarely in the Baltic. Its length is about three and a half feet. Acanthias is also a species of Gasterostis, with four small spines before the dorsal fin, and three rays appertaining to the branchiostegous membrane. It is found in the Danish seas. See Galeus Acanthias.

ACANTHINE, in Ancient Geography, an island men- tioned by Ptolemy, in the Arabian gulph on the fide of Egypt. Acanthine, acaenitha, denotes a thing relating to, or re- sembling the herb acanthus.

In this sense, we read of acaenitha rusticam, acaenitha garment, et cetera, which we have two different explanations. Some understand by it a kind of embroidery, wrought in imitation of the Egyptian acaenitha or thorn, whose small spines are much interlaced. Others will have it a peculiar kind of silken stuff, made of the lanugo, or down of a plant of the thistle kind, growing in Sicily and the East. Plan. Hift. Nat. i. xxiv. c. 12. Hard. Not. tom. ii. p. 343.

Acanthodium lignum is used by some writers for brazil wood.

Acanthion, among Naturalists, a plant of the thorn, or rather of the thistle kind; whole down, being cleaned from the prickles, was manufactured into a kind of stuff, not unlike silk. Plan. ubi supra. See Onopordium.

ACANTHIS, in Ornithology. See Goldfish.

ACANTHOCEPHALUS, in Natural History, a name given to the Echinorhynchus carpus, a species of worm which is found in the intestines of the carp.

ACANTHOPTERYGII, derived from acaenitha, a thorn, or prickle, and apergy, a fin, in Natural History, a term used by Arcted to express one of the general classes of the families of fishes; the character of which is, that the rays of the fins are bony, and some of them prickly at the extremities.

ACANTHOS, Acanthus, or Achatus, in Ancient Geography, a town of Egypt, near Memphis, now Bifalata; or, according to Savary (v. i. p. 484), corresponding with the present Dachhour, whether the waters of the Nile are conducted by a canal, and near which is the ruin of the temple of Oliris, and to the west of it a great pyramid. (Strabo, tom. ii. 1162.) Also a maritime town of Macedonia, a colony of Andrians; now Erifso: near which was shewn Xerxes's ditch of seven stadia, in order to separate Mount Athos from the continent, and convey his ships, without doubling Athos, into the Singitic bay. Herodotus. i. vii. c. 121. &c. Pliny, Nat. Hift. tom. i. p. 202. Acanthus is also a town of Epirus.

Acanthus, in Natural History, a name given to the Echinorhynchus candidus, which is found in the intestines of many different species of fish.

ACANTHUS, Bear's Breech or Brave-Ursine, in Bot- any, a genus of the dicotyledonous class of which the generic characters are these: the calyx is a perianthium, with leaflets in three alternate pairs, unequal and permanent; the corolla is single-petalled and unequal, having a short tube closed with a beard, no upper-lip, very large under-lip, which is flat, straight, very broad, three-lobed, obtuse, and of the length of the upper-lip of the calyx; the flaminia have four filaments, subulate, shorter than the corolla, the two upper rather longer, recurved, and incurved at the top; the anthers are oblong, compressed, obtuse, the lateral ones parallel, and villous before; the pistillum has a conical germ, filiform style, of the length of the flaminia, and two acute lateral flaminia; the pericarpium is a subovate pointed capsule, two-celled and two-valved, with a contrary partition, alternate claws, curved, and fallened to the partition; the seed is ovate, and gibbous, and single; sometimes double. There are ten species: i. The smooth acanthus, with white flowers, proceeding from about the middle to the top of the stalk, is the species used in medicine under the name of Branca ursina or Brankursina. It is a native of Italy, about Naples, of Sicily, Provence, and the islands of the Archipelago, and is cultivated in our gardens, and flowers in June and July. Turner (in his Herbal in Hort. Kew.) informs us, that it is cultivated in Sion gardens so long ago as the year 1551. The leaves, and particularly the roots, abound with a soft, infipid mucilage, which may be readily extracted, either by boiling, or by infusion. Rectified spirit, digested on the leaves, extracts from them a fine deep green tincture, which is more durable than that which is communicated to spirit by other herbs. Brank ursina is seldom or ever used medically in this country. But where it is common, it is employed for the same purposes to which the Althae or Marshmallow, and other mucilaginous vegetables are applied among us. In foreign countries the cow-partner is said to be substituted for it, though it possessing very different properties. The last edition of Linnaeus by Gmelin, contains twelve species.

The ancients have not only called the herb bear's breech by this name, but also a thorny tree growing in Egypt.

An accurate examination of the ancient writers will, how- ever, shew very plainly, that they meant two very different vegetables under this name. Virgil has two very different plants under the same name. The acanthus with which he adorns the handles of Alcmeon's cups, in the 3d Eclogue, and places in the Corycian's garden, in the 4th Georgic, and the Egyptian acanthus of Theophrastus, are two very different plants. Virgil mentions another acanthus as being an ever-green plant, and producing berries, or a small round fruit; Icaca simper frondentis acanth, is his words; and Theophrastus tells us, that his Egyptian acanthus is a prickly tree, and bears pods like those of beans. The Greek sculptors adorned their works with the figure of the latter; as the Gothic did with that of the former, which they repre- sented not only in their capitals, but also in other ornaments. It is plain, that the acanthus of Theophrastus is the acacin, a tree, from some species of which we have the gum arabic now in use; and the acanthus of Virgil, mentioned in the places above cited, is a garden herb, described by Dioscorides, under the name of Acanth, which is supposed to be the species of acanthus already noticed, though Lin- naeus takes it to be the fourth species. The other acanthus, mentioned by Virgil in the fourth Eclogue, and second Georgic, is the acanthus of Theophrastus. See Professor J. Martyn's notes on Virgil.

The leaves of this species of acanthus accidentally growing round a basket covered with a tile, gave occasion to Cali-
CALCUTTA, the capital of the Province of Bengal.

ACAPERCO, a town and harbour in the Province of Tabasco, on the gulf of Mexico, called Port Marquis; where the ships from Peru generally run in contraband goods. See Tab. Archit.

ACANTHUS, in Architecture, an ornament in the Corinthian and Composite orders; being the representation of the leaves of an acanthaceous plant, in the capitals thereof. See Tab. Archit.

ACANTHUS, in Ornithology, the name given by Gmelin to the Fringilla spinus of Linnaeus, or Sieben of others. See SPINUS.

ACANTHUS, in Ancient Geography. See CHALCIDICA.

ACANTHUS, in Entomology, a species of Papilia, in the division of Phlebus, with entire brown wings, blue bands underneath, and yellow hind; found in Surinam.

ACAPAPA, or Acapulco, a town in the province of Chiapa, in New Spain. It is situated on the Tabasco river, five leagues north-west from Chiapa.

ACAPAN, or Acaparami, a town of Afa, on the Enixie sea.

ACAPATLI, in Botany, a name used by some authors for the plant which produces the long pepper, used in medicine. De Lact. Ind. Oct. p. 231.

ACAPNISTON, an species, from a and κεῖσκεν, sink, a term applied to the excellent honey of Hymettus, in Attica, both by Pliny, l. xii. c. 167, and Strabo, tom. l. p. 613, from the mode of its preparation.

ACAPHON, an species, a name of the Sampsucus, or Macroram; also of dry wood.

ACAPULCO, in Geography, a considerable town and harbour in Mexico, situated on a bay of the South Sea, and distant from the city of Mexico about 210 miles, south-east. The haven is large and commodious, and capable of containing several hundred ships; and the entrance is secured by a small island, which runs across it, and forms at each end a deep channel of sufficient breadth for the largest vessels. The only inconvenience is, that ships must enter by the sea-breeze in the day-time, and go out by the land-breeze in the night, which seldom fails to succeed. The harbour is a mean and ill-built town, and derives its importance and extent from the great trade carried on with the East-Indies and Peru, and the number of warehouses and habitation for strangers which this commerce requires. The houses are highly contracted on account of the frequent earthquakes to which this country is exposed; and good buildings are the less necessary, as the principal inhabitants retire from the sea-coast, when business does not demand their immediate attendance. Besides, the climate is exceedingly unhealthy, and very prejudicial to strangers. Upon the arrival of the galleons, the town is populous and gay, being crowded with the richest merchants of Mexico, Peru, and even of Chili, who provide themselves with tents in the vicinity of the town, and form a kind of large encampment. For the trade of this town, see Manila Galleon. Opposite to the town, on the east side, is a strong castle, fad to be provided with forty pieces of cannon, and the platform at the end of the town is also mounted with guns: and ships ride near the bottom of the harbour, so that this place is not so easily accessible as some have imagined. The port is a bay surrounded with very high mountains. Two islands, off the fort, parallel to the port, are to be seen on the landboard, and within the harbour is a small island near the shore, on the landboard. Within a league of the mouth of the town, is a very good harbour, called Port Marquis, where the ships from Peru generally run in contraband goods. W. long. 102° 26'. N. lat. 17° 22'.

ACARA, in Ichthyology, the name of a fish caught in the fresh waters in the Brazils, and esteemed a very delicate and well-tasted one. It seldom exceeds three or four inches in length, and has a head like the Panch. Its mouth is small, and its jaws rough like a file. It has one long back-fish, which is supported by a great number of rigid and prickly rays, and reaches to the tail. Its scales are large; its back is of a glossy brown; its sides and belly white; and its tail is not forked. It is a large black spot on the middle of each side, and another near the tail. Its fins are all brown. Maregrave.

ACARAY, the name of a fish caught on the Brazilian shores, and by some called allor gurubak. It grows to three feet in length, and is of the shape of our carp. Its upper jaw is furnished with an even range of sharp teeth, like little needles. Its upper jaw has two very long ones, and bended thence, a multitude of other very short ones. Its eyes are large, and their iris red. Its tail is broad, and a little forked. Its scales are of a moderate size, and of a silver hue, with an admixture of purple. Its belly, and the under part of its head, are wholly white; and its fins of a fine pale red, except those under the belly, which are white, with a slight edge of red. It is eaten in Brazil, both fresh and salted. Maregrave.

ACARAI, in Geography, a town of Paraguay, in South America, built by the Jesuits in 1624. N. lat. 26°. W. long. 51° 5'.

ACARAMUCU of Maregrave and Willughby, in Ichthyology, is the Dalestus Monoceros in the Linnaean system by Gmelin. See Monoceros.

ACARAPA, the name of an American fish, called also by some bremer. It has a somewhat broad and flat body, covered with large scales of a fine silver whiteness. It grows to a foot in length, and to four or five fingers in breadth. It has a large mouth, but without teeth; and its tail is forked. It has one long black fin, the anterior rays, or naves, of which are rigid and prickly, the hind naves soft and
and flexible. The fins are all like the rest of the body, of a pure white. This fish seems to be a kind of **smaris**. Maregrave.

**ACARAPINIMA**, the name of a Brazilian fish, of the **cantbrarbus** kind, and seeming to be of the same species with the **cantbrarbus** of the Mediterranean. Ray.

**ACARAPITAMBA**, the name of a fish caught in the Brazilian seas, of an oblong figure, resembling the **mullet**, and growing to two feet or more in length. Its mouth and teeth are very small. It has one long fin on the back, running very nearly to the tail, which is supported by rigid and prickly rays. Its tail terminates in two oblique horis. Its scales are large, and of a purplish colour, with a fine admixture of blue; and along the middle of each side there runs, from the gills to the tail, a very broad and beautiful gold-coloured line. Its back, down to this line, is variegated also with small gold-coloured spots; and the sides under the line are very beautifully variegated with small and fine longitudinal, but short gold-coloured lines, of a somewhat paler colour than the broad one. Its belly is white, and its fins yellow. Maregrade and Willughby.

**ACARAPUCU**, the name of a Brazilian fish, caught in the fresh waters, and growing to eighteen inches in length. It is of a rounded body; and its mouth is small, and not prominent. It has lips, which it can hide, or suffer to appear, at pleasure, and has no teeth. Its tail is long and forked; its scales are all of a silvery hue. On the back it has a fine golden gloss, shining in the whites; and on the sides five or six large blue spots. Its back and side fins are of a pale blue, as is also the tail: the belly fins are yellowish. It is a well-tasted fish. Maregrave.

**ACARANA**, of Maregrade, Willughby, Ray, and Jonston, is the **chretodon nigricans** of Linnaeus, with a sub-bifid tail, nine spines in the dorsal fin, and a lateral spine on each side of the bifid tail. Its eyes are large, with a silvery iris; the teeth in each mandible are from ten to sixteen, cymid, and narrow in the lower part, and above wider, very hard, sub-pellicular, and disposed in a series, the fore-teeth being the longest; the tongue is short and thick; the operculum of the gills is long and narrow; the lateral line proceeds from it in a direction parallel to the back: most of the fins have ramose rays; the pectoral and caudal are crenous, the ventral black; the dorso and anal white at the base, and in other parts of a dullish hue, and they have bifurcated radii. This fish is found in the Indian, Brazi, and Red Seas, and grows to the length of two feet; it is covered with small scales, blackish above, and whitish beneath, and brown on the sides. It feeds on young crabs and teleosteous fish.

The small black **Acarana** of Willughby, is the **chretodon occulus** of Linnaeus, with an entire tail, eight spines in the dorsal fin, and four white arches, and is called by Maregrade and Ray, **guapera**. The **Acarana altera major** of Willughby and Ray, is the **chretodon hiliris** of Linnaeus, with an entire tail, fourteen scales in the dorsal fin, spinose opercula, and ciliated scales. This fish is found in India; it is of a crenous colour, white beneath, the iris of the eyes is reddish; the mouth very small, the lips flaring, the mandibles equal, the aperture of the gills large, the operculum furnished with three spines, the lateral line near the back and parallel to it, the anus in the middle of the body, and the fins brown at their edge, with ramose rays, and a black ring before the dorsal fin.

The **Acarana maculata** is the **chretodon bicolor**. It is allied to the perch, of an oblong shape, thick body, part of which, and the tail, are white, and the other parts brown. It is found in South America and India. Linna. Syll. Nat. by Gmelin, tom. i. pt. 3. p. 1243—1245—1253—1258.

**ACARI Port**, in Geography, lies on the coast of Peru. Vol. I.
Acaron, in Geography. See Accaron.

Acaron Bay. See Berkeley’s Sound.

ACARUS, the Tick or Mite, in Natural History, so called, probably from a Latin word meaning to creep, because it is deemed so small that it cannot be cut, is a genus of insects belonging to the order Acarina, in the Linnean system, and to the eighth class called amphipoda in the distribution of Fabricius. The distinguishing characters of this genus are, that the mouth has no proboscis, that the haustellum orucker is included in a bivalve, cylindrical sheath; that the feelers are two in number, equal, and of the length of the haustellum; that the eyes are two, placed at the side of the head, and that it has eight legs. Fabricius reckons forty, and Guinie, in the left edition of Linneus’s system, eighty-two species; of which, some are inhabitants of the earth, others of water; some live on trees and plants, others among stones, and others on the bodies of other animals, and even under their skin. They are as follow: viz. elephasminus, with an orbicular, deformed, livid body, and a black ovoid spot at the base, found in India: Egyptius, ovated and black, with a white margin, a native of Egypt: Reduvis: Indus, oval and ferruginous, with a black ovated spot at the base, found in South America and India: Americanus, ovated and ruddy, with white scutellum and joints of the legs, found on the cattle and horeses of America: Sangiugus: Ricinus orTick: crayfishes, with the second pair of legs very thick, nimble, gregarious, and found in the foil of Europe, and frequently in that of gardens: Ulterus, with an angled thorax and ungulate legs longer than the body, called the bat-louse, and found on the murine bat: phaetonius, found on various sparrows, and called the sparrow-louse: Noctarius, of a yellow colour, and with its first legs very long and adapted to swift motion, found on mushrooms: Aspidioidea, red, with the fore-legs long and fit for running; and the hinder part of the abdomen terminating in two horns; and lodging in the putrefying wood of Europe: Coleoptera, black, with acute-angled sides, found under the bark of trees in Europe: tibialis, of a greenish-yellow colour, with a brown spot on each side of the abdomen, found on plants in Europe that are not much exposed to the wind, or placed in a hot-house, which it penetrates with its sting, and suffocates, and frequent on the leaves of the lime-tree in autumn: Siri or Mite: Ibis, with an ovated, obtuse abdomen, and the hinder part having four declining bristles as long as the body, found in four cream and unwashed milk-veils: Vaporis, with two bristles to the legs, and four horizontal bristles at the hinder end of the ovated abdomen, of the length of the body, found in beer-casks, &c.: Vorticulus, with very long lascious legs, and the two fore-legs short, suffocated by long to be the cause of the itch, and infecting the linseed of this disease, but by others not to be sufficiently distinct from the A. scabia: geniculatus, black, with small globule joints of the thighs, found on the dead branches of trees; vicarius, with a red hairy abdomen, the hinder part obtuse, and the anterior tubercle of a paler colour, a native of Surinam and Guinea, and lately introduced into the practice of dicing: Aquaticus, with a fangnosed deformed abdomen, covered with a velvet down, obtuse behind, found swimming briskly in the fresh waters of Europe: Solferinus, with an abdomen like that of the former species, and found in dry situations in Europe and America, generally under the surface of the earth, and sometmes among hay: Baccharum, with a dilated red abdomen, and sides of a darker hue, found on berries, and particularly currants and gooseberries: Muscorum, with a red abdomen, and hinder legs very long and siliform, found on the mofles of Europe: Batatas: Gymnoperorum, with a red abdomen, and two crimson-coloured spots on the sides, found on bees, wasps, the heliobius, atlas, and other insects: Coleoptera, with an ovated red body and whitish auras, frequent on beetles, whence the common black beetle is sometimes called the lousy beetle: Rupipers, brown, with a dorso-fal line of two colours, frequent under the flones of Europe: longicornis, red, with bold antenna longer than the rostrum, found in the rocks of Europe: littoralis, ovated and red, with a tubulated extended rostrum, found among the rocks on the shores of Europe: angulatum, of a reddish-brown colour, with a tubulated globe, smooth, uninflated abdomen, gregarious, and moving slowly on different fungi: Tenebola, tuboglobule, of a black-blue hue colour, found on the Tenebola juniperana, scaber, deformed and ash-coloured, and rough sides, found in the earth at the beginning of spring: Tenebola, red, with a double brown dorsal line, and in the fore-part bifurcated, found swiftly running on the willows: Tenebola, yellow, with a red spot on the sides of the thorax, found on the galls of the willow: Tenebola: grandis, ovated, somewhat deformed, of an olive-brown colour, with a blackish scutellum, and the base and apex of a golden copper colour, found on the animals of South America, and supposéd to be the same with the elephantinus: undatus, obturated and black, with waves of white on the sides, and a black spot, found in New Holland: Libicola, ovated and brown, with a thick margin, found at Leipick: Iguana, ovated and spotted with gold, with the margin of the abdomen fringed and somewhat jagged, fixing itself to the throat of the Acerta Iguana: Ceylon, ovated, and variegated with red and white, with the hinder margin elevated and fringed, a native of Ceylon: lineatus, ovated and ferruginous, with two white wavy lines, found in America: Unculated, ovated and brown, with two small lines and a palmed spot on the hinder part of a green and gold colour, a native of America: Trichodes, ovated and ferruginous, with a brown thorax: Polylium ovated and brown, with the antennae and legs of a pale white: Iyipass, ovated and black, with ferruginous legs and white joints, found in Barbary: Hirundo: vibrans, roundish, tellaceous, and without spots, with the fore-legs longer than the others, found in Ceylon: donoeficus, white, with two brown spots, an ovated body contracted in the middle, very long hairs, and equal legs, found in the houses of Europe, but supposéd not to be different from the Ithaca: scabia, white, with reddish legs, and the hinder having four very long bristles, and much less than the Ithaca, and found in the uceres of persons infected with the itch, exciting irritation, and supposéd to be either the cause, or rather a symptom of the disease: Ithaca, roundish and whitish, with a red abdomen, found in the fucre of the Norwegian seas: Phalangi, ovated and red, with an extended rostrum and long legs, frequent on the phalangii and spiders: Phalangi, ovated, and behind acuminated, with the legs falsculated at their apex, found on the phalanx of the Southern Ocean: Fucorum, pale-coloured, with two winding black lines and the hinder legs very short and bent, found on the scales of the seal: Rupipers, ovated and white, with ferrugious legs, found in Europe: Ibelina, with the first and fourth pair of legs longer, and the second thick, found on the lower surface of the Ibelin: Ibelina, with the second legs very thick, a tellaceous body, and a pale-coloured annus, found on carcaces: Breviaria, with four bristles in the hinder part, and as many on the sides: Conferose, ovated and brown, with the second joint of the legs small, and the third furnished at its apex with a long bristle, found in the filaments of the conferva under water, but drying out of the water: Cadaverum, with a body formed with two lobes and four long bristles to the hinder part of the body, found on the carcasses of insects: Defractor, ovated, with many long bristles.
brillies to the anus, and one to the legs, found on the exuviae of insects in moist places: eruditus, with the first pair of legs very thick, and clawed, and the second having two very long brillies at their apex, found in books that are kept in moist places: elongatus, with the hinder part of the anus emarginated, found on the *Acaliata arvensis*: gnominium, red, with the legs of the first pair very long, and the hinder part of the abdomen jagged, found on the leaves of griffes: appendiculatus, subglobose and crimson-coloured, with long legs of a paler hue, and the hinder legs longer, found under the *Rheum palustris*: eulis, ovated, fuscous and red, with equal legs and several brillies, found swiftly running on the vine: piger, red, with paler legs, and the hinder part of the abdomen furnished with small brillies, found upon mofs: denticulatus, with four teeth to the anterior part of the body, found under garden-pots: feuadinus, with a smooth abdomen, lodged in the soil at the commencement of spring: rubens, red, ovato-oblong, with indefinite legs, found under mosses: promagnum, red, globose and very smooth, scarce visible to the naked eye, found in the soil in spring: musi, conicous, hairy and black, found on mosses: lindacoum: folia, ovated, greenish, and naked, with all the legs equal, found on the leaves of various plants in summer: putrescentia, ovated, greenish, and brilly, with unequal legs, found in the earth: carduelis, ovated, greenish and blackish, naked, with unequal inflated legs, found on the fringilla: cocinens, ovated and of a crimson-colour, with a whitish body, lodged on various insects: vegetans, crislaceous, brown, emarginated and convex, and plain beneath, found on various insects of the coleoptera order: fuligo, red, with pale legs and feelers, with long brillies scattered over the body and legs, found slowly moving on the leaves of the black elder: muscarum, found on the musc: acarum, hemispheric, pale-coloured and smooth, with equal legs, found on the acarus crophyles: carduelis, ovated, downy and red, black below the legs, and furnished with an ovated black scutellum, found on mosses in the grove adjoining to the Hague.—Aritrole, (Hist. Anim. i. v. c. 32: Oper. tom. i. p. 857. Ed. Du Val.) mentions the acarus bred in wax, as the least object of human sight. These insects, which are often very troublesome on plants and in hot-houses, may be effectually destroyed by the mixture recommended for destroying those on the Pine-apple. The following mixture will be also equally efficacious: Take two ounces of soft green soap, one ounce of common turpentine, and one ounce of flowers of sulphur; pour upon these ingredients a gallon of boiling water, and work the whole together with a whisk, and let the mixture be used warm. This mixture may also be of use for preventing the mildew on the peach and apricot. However, this method should never be practiced on fruit-trees near the time when their fruits are ripening. A strong ley made of wood-ashes will likewise destroy the *Acaris*: but plants are greatly injured by this, and other briny and spirituous compositions. The *Acaris* may also be destroyed in plants, by brushing them with a common painting brish, by often drollling them with flowers of sulphur, by keeping a hot-house in a moist state, by dipping the tops of plants frequently in clear water in which flowers of sulphur and tobacco have been infused, in the hot summer months, and always keeping the hot-house clean.

*Acaris* is the name given by Brown (Jam. 418.) to the *Pulex penetrans of Linneus*. It is also a species of the *Trichoda*, the order of *Istusoria*, and class of *Worms*.

**ACASADISTAN, in Geography, a river in the province of Vera Paz, in Mexico, whose source is not far from the South Sea, which runs into the Golfo Dulce. There is a town of the same name situated on its banks.**

**ACASATHULA, a sea-port situated on a point of land, in the province of Guantanamo Proper, in Mexico, on a bay of the South Sea, about four leagues from Trinidad. It receives the greatest part of the treasures from Peru and Mexico. There are three volcanos in its vicinity. N. Lat. 12° 50', W. Long. 93°.**

**ACASTA, in Entomology, a species of Papilio, found in India, with roundish wings, having five transverse spots, and brown spines, and the under part yellow.**

**ACASTA, in Mythology, one of the nymphs, called Oceanides.**

**ACASTUS, in Classical History, the son of Pallas king of Thrasy, and one of the most famous hunters in his time. He married Atalanta, according to Suidas, or Allydamus, as his annotator calls her, who, falling in love with Pelusia's son-in-law, and not having her wishes gratified by him, accused him to her husband of a rape, upon which he made war against Acastus, and slew his wife. Suidas, tom. i. p. 365.**

**ACATES, in Entomology, a species of Papilio, with black wings, the fore-wings having a fawny band, and the hinder green beneath, marked with yellow ridges; found in Surinam. It is also a name given by Cramer to the *Papilio Phidias*.**

**ACATALECTIC, ACATALECTICUS, formed of the privative *and* and *p* *a* *t* *a* *l* *e* *c* *t* *i* *c* *us*, from *p* *a* *t* *a* *l* *e* *c* *t* *i* *c* *u* *s*, to cease or end, in the *Ancient Poetry*, a term applicable to such verses as have all their feet and syllables, and are in no respect lame or defective at the end. In the following strophe of Horace, the two first vers are *acatalectic*, and the last *catalectic*: *Solvevit acer hymnu, gratu vice Veris & Frevis:* *Trobunque ficus macine carina—* **ACATALEPSIA, ACATALEPSY, compounded of the privative *and* and *katalepsia*, derived from *kata* *lepsia*, to be fixed or end, in *Philosophy*, an impossibility of a thing's being conceived or comprehended.**

**ACATULUS, in Botany, a juniper berry.**

**ACATASTATOS, formed of *a* and *kata* *stato*, confito, inconstant, is a physical term, anciently applied to irregular fevers, whose paroxysms are uncertain, and which are indicated by frequent changes in the urine. It is likewise applied to those fluidering fits in fevers, which have no constant return, and to turbid urine, that deposits no regular sediment.**

**ACATECHILII, or ACATECHICENTII, in Orni-thology, the Fringilla Mexicana of Gmelin, and the Mexican Siskin of Latham, is about the size of the flikin, and has the fame fong, and feeds on the fame substances. Its head and the upper part of its body are a greenish brown, and the throat and under part white, shaded with yellow. Its Mexican name *Acatechiballi*, signifies the bird that rubs itself against the reeds, and may allude to some of its habits.**

**ACATERY, or ACATRY, in the king's household, a kind of check between the clarks of the kitchen and the purveyors.**

**ACATHARISIA, of *a* and *kata* *s* *a* *ris* *ia*, to change, in Medicine, denotes an impurity of the blood or humours.**

**ACATHISTUS, *akathistos*, in an *echthesial* *posi*, a solemn hymn, or vigil, anciently sung in the Greek church on the Saturday of the fifth week in Lent, in honour of the Virgin, for having three delivered Constantineople from the invasions of barbarous nations.**

It was called *akathistos*, i.e. without sitting, because it was celebrated standing: the people stood all night, singing the praises of their deliverer. The same name is also given to the
the day whereon it was performed, which is called the scaf

**ACATIUM**, in the ancient *Navigation*, a kind of boat or pinaceae used for military purposes.

The *acutum* was a species of those called *allaria marit*, i.e. such as were wrought with oars. It was sometimes made use of in battle. Strabo represents it as a kind of pri-

**ACAVU',**, and **ACAVOL',** in Botany, a term applied to certain plants, the flowers of which have no stalk or pedicel to support them, but rest immediately on the ground; of this kind are the cattail thistle, and some others.

**ACBB**, in *Ornithology*, a name given by the people of the Philippine islands to a bird very like our common hen, which is very frequently wild among them. It lives on rice, and other vegetables, and does a great deal of mischief; but is short-winded, and does not fly well, so that it is easily destroyed.

**ACBAR**, the name of an idol of enormous size, which the Arabs are said formerly to have worshipped. It was with difficulty that Mahomet restrained them from this species of idolatry. Hyde's Diff. vol. i. p. 257.

**ACBARABAD**, in Geography. See Agra.

**ACCA** (St.), in *Eclogiastic History*, bishop of Haguitard, or Hexham, in Northumberland, who succeeded Wilfrid in 709. Besides ornamenting the cathedral, he erected a noble library, confining chiefly of ecclesiastical learning, and a collection of the lives of the saints. He was accounted a very able divine, and famous for his skill in church music. He wrote several books, particularly *Paffions Sanctorum*, and *pro illybrandu Scripturis ad Bodam*. He died in 740, under Egbert. Simeon of Durham relates several miracles performed by his relics.

**ACCBABA**, in Geography, the name given by the Arabs to a chain of mountains near the Red Sea; and which formed the easternmost range of the *PLANUS BEN* of Ptolemy. The castle of *Acabo* is situated below these mountains on the eastern point of the Red Sea. See HOR.

**ACCBABAAR**, in *Natural History*, the *ISIS OCHERACA* of Linnaeus, the red Indian coral of Ellis.

**ACCBABAAR** is also a name given to the *Antipathes pneumaticus* of Linnaeus.

**ACCBABAARIUM**, in *Natural History*, a name given by Rumphius to the *MADREPSA OCELATA* of Linnaeus, or the white coral of the thorns; and also to the *ISIS HIPPIARIS* of the same author.

**ACCAD**, **ACCHAD**, or as the LXX has it *ARCHAD*, in *Scripture Geography*, a town in the kingdom of Nimrod or Babylonia, to the east of the Tigris. Wells (Geog. O. T. vol. i. p. 228) supposes that the city *SITPACE* or *PETTACE* was formerly called by this name, and that *ARTACEN*, mentioned by Strabo, was formed from *Arced*.

**ACCADEMIA**, in *Musical Language*, a term used in Italy to denote a private concert.

**ACCALLA**, in *Antiquity*, solemn scalls, held in honour of *Acca Laurentia*, wife of the shepheard Faustulus, and nurse or foster-mother of Romulus. She was deified by the Romans, and the flamen of Jupiter once a year offered sacrificies to her on a holiday instituted to her hon-

There were otherwise called *Laurentia*—To the same *Acca* is also attributed the institution of the *fratres arvalis*. Varro, de Ling., Lat. & Scalig., Coniect. in Varro.

**ACCAPITARE**, *Accapitare*, *Acaptare*, in ancient *Laurel-books* and records, the act of becoming vassal of a lord, or of yielding homage and obedience to him.

*The word is compounded of the Latin ad, to; and caput, head; because vassals owned their lords for their head. Whence also the lords are sometimes called *domini capitales*; as those who command in an army are called *capitanei*, capitans; and in old French, chevalleurs, chevaliers, in respect of their folders.*

**ACCAPITUM**, a sum of money paid to a vassal, upon his admission to a feudal.

*The word is also written *acaptium, acapitamentum, acap-
tium, acapitum, and acaptagyum.*

**ACCARABAAR**, in *Natural History*, the *GORGONIA SAB-
npa* of Linnaeus; and also the *ALLEONUM ARBOREM* of the same author.

**ACCARABAARIUM**, the *GORGONIA ANTIPATHES* of Linnaeus, or the black coral of other authors.

**ACCARISI, Francis**, in *Biography*, an ancient civilian in the 16th and 17th centuries, who was born at Ancona, and obtained celebrity as a professor of civil law in the university of Sienna. At first his lectures confuted of illustrations of Juliannus's Institutes; they were afterwards extended to the pandects, and at length comprehended civil law in general. After having occupied the chair of law-professor at Sienna with high reputation for twenty years, and refiting many advantageous offers from other Italian universities, he was induced to accept the proposals of the duke of Parma, who, besides pecuniary recompence, tempted him with the title of his counsellor; and he removed to Parma. However, he was soon recalled by the Grand Duke of Tucany, who a-

*Signified him the first professorhip in law at Pisa. He died at Sienna in 1622. Gen. Dict.*

**ACCARON, in Scripture Geography**, a town of Judea called *Abron*, 1 Sam. vii. 17. vii. 14., and mentioned in Josephus, Ant. i. vii. c. i. It was the boundary of Philistia to the north, not far from the sea, and from Bethhemel, (John. xv. 14. 46.) and famous for the idol Baalzebel, who was worshipped here under the same attribute with *Ancor*, the god of flies, from which, according to Bryant (Mythology, vol. i. p. 83.), this city derived its name. It was about thirty-four miles from Jerusalem. It first fell to the lot of Judah, and was afterwards given to the tribe of Dan. N. lat. 31° 55'. E. long. 34° 57'.

**ACCAS ISLAND, in Geography**, lies off the mouth of Ancobar river, on the coast of Guinea, and extends so far to the shore on each side as to render the channel very narrow.

*Accedas ad curiam, in L. to, an original writ, which lies for the removing suits in any court baron, except the county court, in the king's court; upon apprehension of partiality, or false judgment in the other.*

*Like writ lies for him who has received false judgment in the county court, where it is called de falsis judiciis.*

*An Accedas ad Curiam lies also for justice delayed, as well as falsely given; and is a species of the writ *recordari.*

*Accedas ad vicem communi, is a writ directed to the coroner, commanding him to deliver a writ to the sheriff, who hav-
ing a bond delivered to him, suppresses it.*

*ACCELERANDO, in Music, is an Italian term for accelerating the time in the middle of a piece of music, as *ratio* is for retarding it. This hith a fashion able effect lately introduced in the performance of music, and much abused by the excels and too frequent use of it.

The gradual change of measure, when practised in the midst of a regular movement, seldom produces any other effect on common hearers than that of breaking time. Perhaps in a very pathetic and expressive passage, even in an allegro, when very delicately done from real feeling, the effect may be approved; but the imitators of the licences and retim-
ments of great masters disgrace the compositions which they mean to embellish, and disgust their listeners. During imitators of the bold modulation of Haydn, and of the rapid running up and down the keys in half notes, as Mozart did in his juvenile days, have deformed melody, and corrupted harmony. These great masters knew when to stop; but their apes think they never can feason their productions too highly; and, it is to be feared, that the lovers of simplicity will never be indulged again with plain food, even by those who have no means of gratifying them with luxuries.

ACCELERATING Force, in Mechanics. See Force.

ACCELERATION, in Mechanics, the increase of velocity in a moving body.

Accelerated motion is that which continually receives fresh accessions of velocity, and is either equably or unequably accelerated. If the accessions of velocity be always equal in equal times, the motion is said to be equably or uniformly accelerated; but if the accessions in equal times either increase or decrease, the motion is unequally or variably accelerated. Acceleration stands directly opposed to retardation, which denotes a diminution of velocity.

Acceleration is chiefly used in Physics, in respect of falling bodies, i.e., of heavy bodies tending towards the centre of the earth by the force of gravity.

That natural bodies are accelerated in their descent, is evident from various considerations, both à priori and posteriori.

Thus, we actually find that the greater height a body descends from, the greater impulsion it makes, and the more vehemently does it strike the plane or other obstacle on which it falls.

Various are the systems and opinions which philosophers have produced to account for this acceleration. Some attribute it to the prefluence of the air: the farther, say they, a body falls, the greater load of atmosphere is consequently incumbent on it; and the prefluence of a fluid is in proportion to the perpendicular altitude of the column thereof.

Add, that the whole body of the fluid preffing in immovable right lines, which all meet in a point, viz. the centre of the earth; that point, by the meeting of those lines, fulfains, as it were, the prefluence of the whole mass; consequently, the nearer a body approaches to it, the effect or prefluence of more united lines must it fulfain.

But what overturns this account is, that as the prefluence of the air downwards increases; so, by the known laws of statics, does the resistance, or the force wherewith the same fluid tends to repel, or drive the body upwards again. Others insist, that the incumbent air is the grofer and more vaporous, the nearer the earth; and filled with more heterogeneous particles, which are not true effulsive air; and hence, say they, a deflecting body, meeting continually with less refiiance from the effulency of the air, and having the same force of gravity still acting on it, must necessarily be accelerated. Hobbes (Philos. Probl. cap. i. p. 3.) attributes acceleration to a new impreflion of the caufe which makes bodies fall; which, on his principles, is also the air. As part of this mount, part also must defend; for reasons drawn from the motion of the earth, which is compounded of two motions, one circular, the other progressive; consequently, the air defends, and circulates at once. As the body, in its fall, receives a new prefluence in every point in its descent, its motion, he says, must needs be accelerated.

But what overturns all accounts where the air or atmosphere is concerned, is, that the acceleration holds in vacuo, and even more regularly than in air. See Vacuum.

The Peripatetic account is worse than this: the motion of heavy bodies downwards, say they, arises from an intrinsic principle, which makes them tend to the centre, as their proper seat, or element, where they would be at rest; hence, add they, the nearer bodies approach to it, the more is their motion accelerated.

The Galileans, on the other hand, hold that the earth emits a fort of attractive effulvia, innumerable threads whereof continually ascend and descend; which threads, proceeding like radii from a common centre, diverge the more the farther they go: so that the nearer a heavy body is to the centre, the more of these magnetic threads it receives; and hence the more is its motion accelerated. But this is refuted by an easy experiment: for if a ball be let fall out of the lowest window of a high tower, and also out of the highest, the acceleration will be very nearly the same in both cafes, notwithstanding the greater vicinity to the centre in the one, than in the other cafe.

The Cartesians account for acceleration, from the repeated pulses of a subtle ethereal matter, which is continually acting on the falling body, and impelling it downwards.

After all, the immediate cause of acceleration is not mysterious; the principle of gravitation being once admitted, will determine the body to descend, and its motion will be accelerated by necessary consequence.

Suppose a body let fall from on high: the primary cause of its beginning to descend, is doubtless the power of gravity; but when once the descent is commenced, that rate becomes in some measure natural to the body; so that if left to itself, it would persevere in it for ever, even though the action of the first caufe should cease: as we see in a stone cast with the hand, which continues to move after it is left by the caufe that gave it motion.

But, before the propensity to descend, impressed by the first caufe, and which of itself were sufficient to continue the same degree of motion once begun, in infinitum; there is a constant accesion of subsequent efforts of the same principle, gravity, which continues to act on the body already in motion, in the same manner as if it were at rest. Here, then, being two causes of motion; and both acting in the same direction, the motion they jointly produce must necessarily be greater than that of any one of them. And the velocity thus increased having the same caufe of increase still persevering, the caufe must of course be continually accelerated.

For, supposing gravity, whatever it be, to act uniformly on all bodies, at equal distances from the earth's centre; and that the time in which a heavy body falls to the earth be divided into equal parts indefinitely small: let this gravity incline the body towards the earth's centre, while it moves in the first indefinitely small part of the time of its descent; if after this, the action of gravity be supposed to cease, the body would proceed uniformly towards the earth's centre, with a velocity equal to that which results from the force of the first impreflion.

But now, since the action of gravity is here supposed still to continue; in the second moment of time, the body will receive a new impulfe downwards, equal to what it received at first; and thus its velocity will be double of what it was in the first moment; in the third moment it will be triple; in the fourth quadruple, and so on continually: for the imprefion made in one moment, is not at all altered by what is made in another: but the two are, as it were, aggregated or brought into one sum.

Wherefore, since the particles of time are supposed indefinitely small, and all equal to one another; the velocity acquired by the falling body will be every where proportioned to the times from the beginning of the descent; and the velocity will be consequently proportional to the time in which it is acquired.

Thus
Thus, if a body, by means of this constant force, acquire a velocity of 32 feet in one second of time, it will acquire a velocity of 64 feet in two seconds, of 96 feet in three seconds: and all bodies, whatever be their quantity of matter, will acquire, by the force of gravity, the same velocity, in the same time. For every equal particle of matter being endowed with an equal impelling force, viz. its gravity or weight, the sum of all the forces, in any compound mafs of matter, will be proportional to the sum of all the weights or quantities of matter to be moved; consequently, the forces and masses moved, being thus constantly increased in the same proportion, the velocities generated will be the same in all bodies, great or small; i.e. a double force moves a double mass of matter, with the same velocity that the single force moves the single mass, &c. or, the whole compound mafs falls altogether with the same velocity, and in the same manner, as if its particles were not united, but as if each fell by itself, and all were Separated from one another: and being put into motion at once, they would fall together, just as if they were united into one mafs.

Galileo, who first discovered the above-mentioned law of the descent of falling bodies, illustrated it nearly in the following manner.

The space passed over by a moving body in a given time, and with a given velocity, may be considered as a rectangle made by the time and the velocity.—Suppose A (Plate 1. Mechanics, fig. 1.) a heavy body defending, and let AB represent the time of its descent; which line we may suppose to be divided into any number of equal parts, AC, CE, EG, &c. representing the intervals, or moments of the given time.—Let the body defend through the first of these divisions, AC, with a certain equal velocity arising from the proposed degree of gravity: this velocity will be represented by AD; and the space passed over, by the rectangle CAD.

Now, as the action of gravity in the first moment produced the velocity AD, in the body before at rest; in the second moment, the same will produce, in the body moving, a double velocity, CF; in the third moment, to the velocity CF will be added a farther degree, which together therewith will make the velocity EH, which is triple of the first, and fo of the rest. So that in the whole time AB, the body will have acquired a velocity BK.—Again, taking the divisions of the line, e.g. AC, CE, &c. for the times, the spaces gone through will be the areas or rectangles CD, ET, &c. So that in the whole time AB, the space described by the moveable body, will be equal to all the rectangles, i.e. to the dented figure ABEK.

Such would be the case, if the acclivities of velocity only happened in certain given points of time, i.e. in C, in E, &c. so that the degree of motion should continue the same till the next period of acceleration occurs.—If the divisive intervals of time were supposed less, i.e. by half; then the dents of the figure would be proportionally smaller; and it would approach so much the nearer to a triangle.—If they were infinitely small, i.e. if the acclivities of velocity were supposed to be made continually, and in every point of time, as is really the case; the rectangles thus successively produced will make an exact triangle, e.g. ABE (fig. 2.)—Here, the whole time AB consisting of the little portions of time A 1, 1 2, &c. and the area of the triangle ABE, of the sum of all the little triangular surfaces answering to the divisions of the time; the whole area or triangle expresses the space moved through in the whole time AB; and the little triangles A 1 2, &c. the spaces gone through in the divisions of time A 1, &c.

But these triangles being similar, their areas are to one another, as the squares of their homologous sides AB, A T, &c. and consequently, the spaces moved are to each other as the squares of the times.

If the velocity were uniform, the space would be equal to the product of the velocity and time; i.e. by an obvious notation \( S = V \times T \); but, in this case, the velocity increases from 0 till it becomes equal to V, and therefore the space described must be equal to half the above product; i.e. \( S = \frac{1}{2} V \times T \), and \( S : : \frac{1}{2} V \times T : : V T : : V T \times T : \) but \( V : : T : : T \times T : : \)

Hence we may easily infer the great law of acceleration, viz. "That a descending body uniformly accelerated, describes, in the whole time of its descent, a space which is just half of what it would have described in the same time, with the accelerated velocity it has acquired at the end of its fall." For, the whole space the falling body has moved through in the time \( A B \), we have already shewn, will be represented by the triangle ABE; and the space the same body would move through in the same time with the velocity BE, would be represented by the rectangle ABET.

—But the triangle is known to be equal to half the rectangle.—Therefore the space moved is just half of what the body would have moved with the velocity acquired at the end of the fall. Hence we infer, that if the body moved with the lately acquired velocity BE, in half the time \( A B \), is equal to that really moved by the falling body in the whole time \( A B \).

From the preceding principles and reasoning we deduce the following general laws of uniformly accelerated motions; viz.

1. That the velocities acquired are constantly proportional to the times.

2. That the spaces are proportional to the squares of the times; so that if a falling body describe any given length in a given time, in double that time it will describe four times that length, in thrice the time nine times the length, &c.; and universally, if the times be in arithmetical proportion, \( 1 \), \( 2 \), \( 3 \), \( 4 \), &c. the spaces described will be \( 1 \), \( 4 \), \( 9 \), \( 16 \), &c. Thus, a body which falls by gravity through 16 \( \frac{3}{4} \) feet in the first second of time, will fall through four times as much, or 64 \( \frac{3}{4} \) feet in 2 seconds, &c. And since the velocities acquired in falling are as the times, the spaces will be as the squares of the velocities: and both the times and velocities will be in a subduplicate ratio, or as the square roots, of the spaces.

3. The spaces described by a falling body in a series of equal moments or intervals of time, will be as the odd numbers \( 1 \), \( 3 \), \( 5 \), \( 7 \), \( 9 \), &c. which are the differences of the squares or whole spaces; i.e. a body which has fallen through 16 \( \frac{3}{4} \) feet in the first second, will fall in the next second through 48 \( \frac{7}{8} \) feet, and in the third second through 80 \( \frac{15}{16} \) feet, &c.

Retaining the above notation, \( S : : T^2 : : V^2 : \) and \( V : v \) or \( T : t : : \sqrt{S} : \sqrt{s} \); i.e. \( S\frac{1}{2} : : s\frac{1}{2} : \) and the times will be reciprocally as the velocities, and directly as the spaces; for \( S : : T^2 : TV \); and \( STV = VS \); consequently \( T : t : : SV : sV \); or \( T = \frac{S}{V} \). When the accelerating forces are different, but constant, the spaces will be as the products of the forces into the squares of the times; and the times will be in the subduplicate ratio of the spaces directly, and of the forces inversely. For when the force is given, the velocity \( V \) is as the time \( T \); when the forces are different, but constant, and the time is given, the velocity \( V \) will be as the force \( F \). But when neither the force nor the time is given, the velocity \( V \) will be partly as the time and partly as the force, or as their product \( F \times T \).

Thus, \( V : v : \frac{F \times T}{F \times T} \)
4. If a body fall through any space in any time, it acquires a velocity equal to double that space; i.e., in an equal time, with the half acquired velocity, uniformly continued, it would pass through double the space. Thus, if a body fall through \( \frac{16}{3} \) feet in the first second of time, it will have acquired a velocity of \( \frac{32}{6} \) in a second: i.e., if the body move uniformly for one second, with the velocity acquired, it will pass over \( \frac{32}{6} \) feet in this second; and if in any time the body fall through 100 feet, then in another equal time, if it move uniformly with the velocity half acquired, it will pass over 200 feet, &c.

To those who disapprove of Galileo's demonstration of the laws of accelerated motion, the following method of illustrating and evincing them, may possibly be more satisfactory. Let the whole time of a body's free descent be divided into any number of parts, each of which is called \( t \); and let \( a \) denote the velocity acquired at the end of the first part of time; then \( 2a, 3a, 4a, \&c. \) will represent the velocities at the end of the 2d, 3d, 4th, \&c. parts of time, because the velocities are as the times; and for the same reason, \( \frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a, \&c. \) will be the velocities at the middle point of the 1st, 2d, 3d, \&c. parts of time. But as the velocities increase uniformly, the space described in any one of these parts of time may be considered as uniformly described with the velocity in the middle of that part of time; and therefore, multiplying each of those mean velocities by their common time \( t \), we shall have the same fractions \( \frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a, \&c. \) for the spaces passed over in the successive parts of the time; i.e., the space \( \frac{1}{2}a \) in the first time, \( \frac{3}{2}a \) in the second, \( \frac{5}{2}a \) in the third; and adding these spaces successively to one another, we shall obtain \( \frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a, \frac{7}{2}a, \&c. \) for the whole spaces described from the beginning of the motion to the end of the first, second, third, \&c. portions of time, viz. \( \frac{1}{2}a \) in one space of time, \( \frac{3}{2}a \) in two spaces, \( \frac{5}{2}a \) in three spaces, \( \frac{7}{2}a \) in four, \&c. and the spaces will be as the numbers \( 1, 3, 5, 7, 9, 11, \&c. \) which are as the squares of the times.

From this mode of demonstration, all the properties above mentioned will evidently follow; such as, that the whole spaces, \( \frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a, \&c. \) are as the squares of the times \( 1, 2, 3, \&c. \) and the separate spaces \( \frac{1}{2}a, \frac{3}{2}a, \frac{5}{2}a, \&c. \) described in the successive times, are as the odd numbers \( 1, 3, 5, \&c. \) And that the velocity \( a \), acquired in any time \( t \), is double the space \( \frac{1}{2}a \) described in the same time.

From the properties above demonstrated, we obtain the following practical theorems or formula for use. Let \( g \) denote the space passed over in the first second of time by a body urged by any constant force, denoted by \( 1 \), and \( t \) denote the time or number of seconds in which the body paffes over any other space \( s \), and \( v \) the velocity acquired at the end of that time: then we shall have \( s = 2gt^2 \) and \( v = gt \); and from these two equations we obtain the following general formulæ: viz.

1. \( t = \frac{v}{2g} = \frac{2v}{2g} = \sqrt{\frac{v}{g}} \)
2. \( v = 2gt = 2\sqrt{\frac{x}{g}} = \frac{2t}{t} \)
3. \( s = gt^2 = \frac{v^3}{g} = \frac{t^2}{2} \)
4. \( s = \frac{v^2}{2g} = \frac{v^2}{2} \)

These theorems are equally applicable to the diminution of motion and velocity, by means of retarding forces, as to the generation of them by means of accelerating forces. Hutton's Diæ. ubi supra. Parkinson's System of Mechanics, &c. p. 50.

The motion of a body ascending, or impelled upwards, is diminished or retarded from the same principle of gravity acting in a contrary direction, in the same manner as a falling body is accelerated. See Retardation.

A body, thus projected upwards, rises till it has lost all its motion: which it does in the same time that a falling body would have acquired a velocity equal to that with which the body was thrown up. Hence, the same body thrown up, will rise to the same height from which, if it fell, it would have acquired the velocity with which it was projected upwards. And hence the heights to which bodies thrown up with different velocities ascend, are to one another as the squares of those velocities.

Acceleration of bodies on inclined planes. The same general law obtains in this case, as in bodies falling perpendicularly; viz. that the velocities are as the times, and the spaces descended down the planes as the squares of the times or of the velocities. But the velocities are less, according
to the sine of the planet's inclination, and the spaces left according to the square of the sine. See Inclined Plane.

Acceleration of the Motion of Pendulums. See Pendulum.

Acceleration of the Motion of Projectiles. See Projectile.

Acceleration in Astronomy. is a term applied to the fixed stars. Thus, the diurnal acceleration is the time by which the stars, in one diurnal revolution, anticipate the mean diurnal revolution of the sun, which is 3° 55½" of mean time, or nearly 3 minutes 56 seconds; i.e. a star rises or sets, or paffes the meridian, 3° 56" sooner each day. This apparent acceleration of the stars is owing to the real retardation of the sun; and this depends upon his apparent motion towards the east, which is at the rate of about 59 8° of a degree every day. In consequence of this, the star which paffed the meridian at the same moment with the sun yesterday, is to-day about 59 8° beyond the meridian to the east, when the sun arrives at it; and this distance it will require about 3° 6' for him to pass over; and therefore the star will anticipate the motion of the sun at this rate every day. The true quantity of this anticipation or acceleration is found by the following proportion, viz. 360° : 59 8° : 24 hours : 3° 55½", the acceleration required. This diurnal acceleration serves to regulate the lengths and vibrations of pendulums. If the pendulum marks e.g. 8° 10", when a fixed star sets or passes, and is continually increasing or decreasing, then it may be inferred that such a pendulum is truly regulated, or justly measures mean time. See Clock.

Acceleration of the moon, is a term used to express the increase of the moon's mean motion from the sun, compared with the diurnal motion of the earth; so that it is now a little swifter than it was formerly. Dr. Halley (Phil. Trans. No. 218) was the first who made this discovery; and he was led to it by comparing the ancient eclipses observed at Babylon with those observed by Albagtegins in the ninth century, and former of his own time. He was not able to ascertain the quantity of this acceleration, because the longitudes of Bagdat, Alexandria, and Aleppo, where the observations were made, had not been accurately determined. But since his time, the longitude of Alexandria has been ascertained by Chazelles, and Babylon, according to Ptolemy's account, lies 5½ east from Alexandria. From these data, Mr. Dunthorne (Phil. Trans. No. 492, abr. vol. x. p. 84, &c.) compared several ancient and modern eclipses, with the calculations of them by his own tables, and thus verified Dr. Halley's opinion: for he found, that the same tables represent the moon's place in the ancient eclipses behind her true place, and before it in later eclipses: and hence justly inferred, that her motion in ancient times was slower, but in later times quicker than the tables give it; and therefore, that it must have been accelerated. But he did not content himself with merely ascertaining the fact. He proceeded to determine the quantity of the acceleration; and by means of the most ancient eclipse of which any authentic account remains, observed at Babylon in the year before Christ 721, he concluded that the observed beginning of this eclipse was not above an hour and three quarters before the beginning by the tables; and therefore the moon's true place could precede her place by computation but little more than 50 of a degree at that time. Admitting the acceleration to be uniform, and the aggregate of it as the square of the time, it will be at the rate of about 10° in 100 years. M. de la Lande makes it 9° 886. In Mayer's tables it is 9°, beginning from 1700.

Dr. Long (Alcron. vol. ii. p. 436.) attributes the acceleration above described to one or more of these causes: either, 1. the annual and diurnal motion of the earth continuing the same, the moon is really carried round the earth with a greater velocity than it was formerly; or, 2. the diurnal motion of the earth, and the periodical revolution of the moon continuing the same, the annual motion of the earth round the sun is a little retarded; which makes the sun's apparent motion in the ecliptic a little lower than it formerly was; and, consequently, the moon, in passing from any conjunction with the sun, spends less time before the next overtake the sun, and forms a subsequent conjunction: in both these cases, the motion of the moon from the sun is really accelerated, and the synodical month actually shortened: or, 3. the annual motion of the earth, and the periodical revolution of the moon continuing the same, the rotation of the earth round its axis is a little retarded: in this case, days, hours, minutes, seconds, &c. by which all periods of time must be measured, are of a longer duration; and, consequently, the synodical month will appear to be shortened, though it really contains the same quantity of absolute time as it always did. If the moon is the matter in the body of the sun be lefled by the particles of light continually streaming from it, the motions of the earth round the sun may become slower: if the sun increases in bulk, the motion of the moon round the earth may be thus quickened. M. de la Place (Mem. de l'Acad. Roy. des Sciences, for 1786.) has evinced this acceleration of the moon's motion to arise from the action of the sun upon the moon, combined with the variation of the eccentricity of the earth's orbit. By the present diminution of the eccentricity, the moon's mean motion is accelerated; but, when the eccentricity is arrived at its minimum, the acceleration will cease: after which, the eccentricity will increase, and the moon's mean motion will be retarded. M. de Lambre found, by comparing the modern observations at about the distance of a century, that the secular mean motion of the moon in the last tables of Mayer was too great by 25°; and that the place of the moon calculated by these tables ought to be corrected by the quantity 25° + 2°, 135° + 6°, 24308° n, n being the number of centuries from 1700. M. de la Lande, in his tables of the moon, has thus corrected Mayer's tables. Hence it appears, that the present acceleration of the moon is nothing more than an equation, the period of which is very long. It will be accelerated and retarded by the same quantity; and therefore, if the mean motion be taken for the whole time of acceleration or retardation, it will be found never to vary. Vinc's Alcron. vol. i. p. 206.

Acceleration, in Music. See Accelerando.

ACCELERATORES Urus, called by Winiflow Bulbo-covergo, and by others Urina stimulatores and ejaculatores feminis, in Anatom, a pair of muscles whose office is to expel the discharge of the urine and of the semen. These muscles may be said to arise from just before the verge of the anus, where the sphincter ani terminates. They are spread over the bulb and a small portion of the corpus spongiosum urethrae; having that appearance, which anatomists have termed a doubly penniform muscle. From the anterior part of the muscle a fasciculus of fibres proceeds on each side, by which the body of the penis is encircled.
When these muscles act, they generally contract in a sudden and convulsive manner, and by this means expel in jets the light portions of urine, or any other fluid which may be contained in the urethra.

ACCENDENTES, or ACCENDORS, in Ecclesiastical writers, a lower order of ministers in the church of Rome, whose office is to light, stuff, and trim the candles or tapers.

The accendentes are much the same with those otherwise called acolyphi and ceraerarii.

ACCENDONES, or ACCENDONES, in Roman Antiquity, a kind of GLADIATORS, whole office was to excite and animate the combatants, during the engagement.

ACCENTI, in Antiquity, an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, ferjants, or tip-flavies, among us. They were thus called from accent, to find for; one part of their office being to call assemblies of the people, summon parties to appear before the judges, &c.

ACCENTI also denote a kind of supernumerary soldiers in the Roman armies; whose office was to attend the motions of their principals, and supply the places of those who were killed or disabled by their wounds.

They were thus denominated quia accentebantur, or ad conum adjuicabatur: Vegetius calls them supernumerarii legionum: Cato calls them ferentaurii, because they furnished those engaged in battle with weapons, drink, &c. Though Nonnius suggests another reason of that appellation, viz. because they fought with lances, spears, and weapons, quae ferentur, such as are thrown, not carried in the hand. They were sometimes also called velites, and velati, because they fought clothed, but not in armour; sometimes adscripti and adscripti; sometimes rossarii. The accenti, Livy observes, were placed in the rear of the army, because no great matter was expected from them; they were taken out of the fifth class of citizens. Felicius in voc. Ferentini. Salm. de Re Mili. Rom. c. 15.

ACCENTI was also an appellation given to a kind of adjutants, appointed by the tribune to affist each centurion and decurion. In which sense, accentus is synonymous with opio.—In an ancient inscription, given by a Torre, we meet with accensus equestor Romanorum; an office nowhere else heard of; that author suspects it for a corruption, and instead thereof reads a censibus. Act. Erud. Leips. 1701. p. 259.

ACCENSION, ACCENSION, in Physick, the act of kindling, or setting a body on fire.

The word is formed of the Latin accelerare, to kindle; a compound of ad, to; and cedere, to give. Though some grammarians suspect the primitive significature of accelerare, to have been, to render famous.

Accension, on other occasions, is called INFLAMMATION, IGNITION, CONflagRATION, &c.

Accension stands opposed to extinction.

Chemists furnish us with various influences of the acceleration of cold liquors by bare mixture; as of the acid spirits of minerals, and the essentitial oils of plants.

ACCENT, in its primitive sense, an affection of the voice, which gives each syllable in a word its due pitch, in respect of height or lowness. The word is originally Latin, accentus, a compound of ad, to, and cedere, to give. In this sense, accent is synonymous with the Greek tónos, the Latin tenor, or tonus, and the Hebrew דעום yōphus, tāfe.

The accent, properly, only respects high and low, or acute and grave.—Though the modern grammarians use it also in respect to loud and soft, long and short; but this confounds accent with quantity.

The difference between the two may be conceived from that which we observe between the heat of a drum, and the sound of a trumpet; the former expresses every thing belonging to loud and soft, and long and short; but so long as there is a monotony in the sound, there is nothing like accent.

The ingenious Mr. Harris (Philological Inquiries, p. 64.) compares quantity to musical tones differing in long and short, as upon whatever line they stand a semibreve differs from a minim; and accent to musical tones differing in high and low, as D upon the third line differs from G upon the first, whether its length be the same, or it be longer or shorter.

Accent is also used in Grammar for a character placed over a syllable, to mark the accent, i.e. to show that it is to be pronounced in a higher or a lower tone, and to regulate the inflections of the voice in reading or in speaking. It is distinguished from emphasis, as the former regards the tone of the voice, the latter the strength of it. For other distinctions between accent and emphasis, see emphasis.

It has been long disputed among the learned, whether accents were originally musical characters, or marks of prosody: it is not easy to determine a question concerning which the arguments on both sides are so numerous. But as music, says Dr. Burney, (Hist. of Musick, vol. i. p. 13.) had characters different from accents so early as the time of Terpander, to whom the invention is ascribed by the Oxford marbles, which place this event about 670 years before Christ; and as accents for profody are likewise proved to be of higher antiquity, there seems to have been no necessity for the ancients to use the one for the other. Mr. Welt (Phidias, vol. ii. p. 194, 1250.) maintains, that accents were originally musical notes, set over words, to direct the several tones and inflexions of the voice requisite to give the whole sentence its proper harmony and cadence. The names of the Greek accents, he says, express their musical origin, and correspond exactly to those terms made use of in our modern mufick; viz. sharp, flat, and a grave, called the tern, and consisting, like the circumflex, of a sharp and a flat note. The Abbé du Bos (Reflection. Crit. iii. p. 85.) afferts, that as poets originally set their own verses, they placed for this purpose a figure, or accent, over each syllable. The learned author of "The Origin and Progress of Language," has also taken pains to prove that the Greek accents were musical notes, invented and accommodated to raise, depress, and suspend the voice, according to a scale of musical proportions.

We reckon three grammatical accents in ordinary use all borrowed from the Greeks, viz. the acute, grave, and circumflex.

The acute accent shows when the tone of the voice is to be raised and sharpened. In modern writings it is a small line, or virgula, placed over the vowel, a little sloping or inclined in its descent from right to left, as ('). It is not ordinarily used either in English or Latin; the French indeed retain it; but it is only to mark the close of masculine é. The grave accent is used when the note or tone of the voice is to be depressed and flattened; and is figured thus (').

The circumflex accent is composed of both the acute and grave; it points out a kind of undulation of the voice, which is first raised and sharpened, and then depressed and flattened; or it is an acute tone dying away into a grave, and conseqently lengthening the syllable. It is expressed thus ('') or (''). Upon a nearer consideration of the sub-
teck says a learned writer, "On the Profoundness of the Greek and Latin Language," it appears, that the acute accent, which is a sharp stroke of the voice upon some one syllable of the word, is in truth the only positive tone. The grave confounds merely in a negation of this acuteness, and is not marked except it be upon the last syllable of certain words; but is to be understood upon every syllable of the word, which carries neither the acute nor circumflex: and it seems to amount to no more than this, that what grammarians call the grave tone, confounds in a mere negation of acuteness, and of circumflex, if that be different from acuteness. Accordingly, the general doctrine of accents is, that, with the exception of fourteen monosyllables in the Greek language, which carry no accent, unless it be in particular circumstances, and for that reason are called acus, or atones, some one syllable of every word, and one syllable only, bears an accent, either acute or circumflex.

If it be true, that the whole system of pronunciation depends upon three accents, it is no less true, that each of these three admits of several degrees. The acute accent, for instance, may be either higher or lower; may be simply acute, or very acute; and the like holds of the grave and circumflex. So that each of the three common accents is, as it were, a genus including various particular species; though the ancient grammarians have not thought fit to annex particular names and figures to all these differences.

Mr. Sheridan, in his Lectures on Eloquence, p. 38, observes, that the meaning of the term accent, among the ancients, was very different from what it is with us. They distinguished accents by certain inflections of the voice like musical notes; but the manner in which they did it must remain for ever a secret to us; for, with the living tongue perished the tones also, which we in vain endeavour to explore in their visible marks. With us, the term accent denotes a peculiar mode of distinguishing one syllable from the rest; and this distinction is made in various ways: either by dwelling longer upon one syllable than upon the rest, or by giving it a sharper percussion of the voice in utterance. Of the first of these we have inflections in the words glory, father, bally, of the last in battle, habit, barracoe. So that accent, with us, is not referred to tone, but to time; to quantity, not quality; to the more equal or precipitate motion of the voice, not to the variation of notes or inflexions. He proceeds to observe, that the quantity depends upon the feet of the accent, whether it be on the vowel or consonant: if on the vowel, the syllable is necessarily long, as it makes the vowel long, if on the consonant, it may be either long or short, according to the nature of the consonant, or the time taken up in dwelling upon it. By changing the feet of the accent in the inflexions above specified, we should change their quantity: if, instead of glory we should say glo're, instead of father, father, instead of bally, bally, the first syllables would become short; and, on the other hand, if we were to dwell on the vowels instead of the consonants in the last inflexions, they would be changed from short to long, as bâ'tle for bâ'tle, habît, for habît, and bâ'r'acoe, for bâ'r'acoe. This, he says, is one of the chief sources of the difference between the Scotch and English gentlemen in the pronunciation of English: i.e. laying the accent on the vowel instead of the consonant, so as to make syllables long that are short with us. He adds, it is an unerring rule, that whenever the accent is on the consonant, the preceding vowel has a short sound; and there is another infallible rule in our tongue, that no vowel ever has a long found in an unaccented syllable; and therefore, if the accent were properly adjusted, it would prove a master-key to the pronunciation of our whole tongue. In another place, (Art. of Reading, vol. ii.) Mr. Sheridan says, that when the foot of the accent is on a vowel, the syllable is long; when on a consonant, short; and that all unaccented syllables are short.

But the use of accent in our language is not confined to quantity alone. It is also the chief mark by which words are distinguished from mere syllables. The essence of a word, says this author, consists in accent as well as articulation. The Greeks also distinguished words from mere syllables by a certain tone or note annexed to each word, which made their speech more musical or pleasing to the ear, than that of any other nation in the world. These tones they learned from their infancy, and they used them with such accuracy, that even the vulgar among the Athenians would have blotted an actor or actress from the stage, and an orator from the pulpitum, on account of a few mistakes in the enunciation of these notes. The wonderful effects of the harangues of the Greek orators on the enraptured minds of their hearers were owing, in a considerable degree, to those artificial musical tones, by which their syllables were so happily diversified. To this purpose confides Dionysius Hal. de Compositione Verborum, apud Oper. tom. ii. p. 17, &c. Ed. Oxon. 1704. This harmony of utterance is not studied by any of the moderns, except the Chinese. Words are also distinguished from syllables by making a perceptible pause at the end of each word. Mr. Sheridan is of opinion, that the most evident and precise as well as the most easy and certain mode of distinction, is that of accent; and that it would contribute most effectually both to utility and to ornament.

As to public speakers, who can pronounce the English properly, the only rule necessary to be observed by them is to lay the accent always on the same syllable, and the same letter of the syllable, which they usually do in common discourse, and to take care not to lay any accent or stress upon any other syllables. Such persons should recollect, that, in the English language, every word which consists of more syllables than one, has one accented syllable; and that there is seldom or never more than one such syllable in any English word, however long. See Pronunciation.

In the English language there is a remarkable peculiarity of throwing the accent farther back; that is, nearer the beginning of the word than is done by any other nation. In Greek and Latin no word is accented farther back than the third syllable from the end, or what is called the antepenult. But, in English, we have many words accented on the fourth, some on the fifth, syllable from the end, as memorable, convenience, ambulatory, &c. The general effect of this practice of halting the accent, or placing it to near the beginning of a word, is to give a brisk and spirited, but at the same time a rapid and hurried, and not very musical, tone to the whole pronunciation of a people.

The Hebrews have a grammatical, a rhetorical, and a musical accent; though the first and last seem, in effect, to be the same; both being comprised under the general name of tonic accents, because they give the proper tone to syllables; as the rhetorical accents are said to be euphonic, inasmuch as they tend to make the pronunciation more sweet and agreeable.

There are four euphonic accents, and twenty five tonic: however, authors are not agreed as to the number of either class. Of these, some are placed above, and others below the syllables: the Hebrew accents serving not only to regulate the risings and fallings of the voice, but also to distinguish
The doctrine of Hebrew accents has occasioned much dispute amongst learned critics. See Baxter's Thesaurus, and Eberhard Vander Hooght's Pref. to the Epistles of Athens, 1705.

As to the Greek accents, they have been both in manuscript and printed books, there has been no dispute about their antiquity and use, than about the use of those of the Hebrews. On the subject of this dispute we may observe, in general with a learned writer, Bishop Lowth, (Prolog. Diff. to his Isaiah, p. 16.) that there were certain laws of Hebrew metre is very probable, and that the living Greek language was modified by certain rules of accent is beyond dispute: but a man born deaf may as reasonably pretend to acquire an idea of sound, as the critics of these days to attain to the true modulation of Greek by accent, and of Hebrew by metre. To which we may add, that though the ancient Greeks had no accentual marks, they learned those modifications of voice by practice from their infancy; and in pronunciation they are to be observed to this day.

Iacov Vossius, in a treatise "De Accentibus Graecorum," endeavours to prove that they are of modern invention, and that anciently they had nothing of this kind; but only a few notes in their poetry, which were invented by Aristophanes the Grammarian, about the time of Ptolemy Philopater; and that these were of musical, rather than of grammatical use, serving as aids in the singing of their poems; and very different from those which were afterwards introduced. This appears from inscriptions as well as manuscripts, none of which, till 170 years after Christ, have either accent, spirit, apostrophe, or any subscribed. He adds, that Aristarchus, a disciple of Aristophanes, improved on his master's art; but that the whole of what they both did was only designed to assist youth in the more readily making of verses. The same Vossius shows from several ancient Grammarians, that the manner of writing the Greek accents in those days was quite different from such as are now used in our books. It is alleged by others, that accentual marks, which, they say, were invented by Aristophanes, were not in common use till about the seventh century; at which time they were found in MSS. Amongst those who totally reject the accents, on the supposition that they would confound the quantity, as it is determined by the rules of prosody, we may reckon Beza, Scaliger, Spelman, and others.

Hence Christ. Hence think, (see his Eusebii et Origini Archimandritarum Accentuum, 1664,) that accents were the invention of the Arubans to late as the eighth century, and that they were only used in poetry; that they were intended to ascertain the pronunciation of the Greek, and to keep out that barbarism, which was then breaking in upon them; that the ancient accents of Aristophanes were perfectly agreeable to the genuine Greek pronunciation, but that the modern ones of the Arabs destroy it. Wetzlar, Greek professor at Ratisbon, in a learned Differtatio, endeavours to prove the Greek accents to be of an older standing: and that the Greeks, long before the birth of Christ, regulated their pronunciation by accents, very much like those that are now in use. He owns that they were not always formed in the same manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the several parts of Greece; and he adds, that accents were not used except in the schools of grammarians, who recurred to them in reading the old poets. He brings several reasons a priori for the use of accents, even in the earlier days; as that, then they wrote wholly in capital letters equivalent from each other, Concerning the position, necessity, and utility of them. The
other, without any distinction of words or phrases: so that without accents they could scarcely be intelligible: and that accents were necessary to distinguish ambiguous words, and to point out their proper meaning; and this sentiment he confirms from a dispute on a passage in Homer, mentioned by Aristotile in his Poetics, ch. v. Accordingly he observes, that the Syrians, who have tone, but no distinctive accents, have yet invented certain points, placed either above or below the words, to show their mood, tense, peron, or enfe. See farther, in his Differtatio Epistholica de Accedentum Graecorum Antiquitate et Uss. Basil. 1686.

Montfaucon, (Pal. Grac. p. 33) after observing that Aristophanes of Byzantium invented proody, or accents, adds, that the Greek language was not, before his age, totally delitute of accents and aspirates, because, without these, no language can be pronounced; but, that he directed the regulation of them, invented the marks and forms by which they were to be expressed, and the place in which they were to be introduced. The same sentiments are likewise maintained by Dr. Follet, in his (‘Essay on the different Nature of Accent and Quantity. Eton. 1763, ed. 2d,”) who explains the notion that the Greek accent teches the quantity of pronunciation; and who maintains, with many others, that it is a musical note. Professor Gesner, in a dissertation De Accedentum Graecorum Propontians, printed in 1755, has laboured to remove the principal objections against the antiquity of accents, viz. that they do not coincide with the proody of the Greeks; and are, therefore, to be considered as a modern corruption of the Greek language. His opinion amounts to this, that the accents do not at all determine which syllabla is to be pronounced longer; that the accent e.g. of ανατολη, being placed on the first syllable, does not oblige us to pronounce the word as a dactyl; that, as the Greeks spoke more musically than we, they pronounced some syllables more distinctly than others; that they raised their tone and dropped it; and that the elevation and fall of the tone were determined by the accents. See Montodolfo’s Origin and Progress of Language, vol. ii, b. 2, par. Mr. Marsh, the learned translator of Michaelis’s Introduction to the New Testament, informs us (vol. ii. p. 802) that Eugenius, a Greek priest and archbishop of Cefhon, in reading Greek, distinctly marked by his pronunciation both accent and quantity, lengthening the found without raising the tone of his voice, when he pronounced a long syllable, which had not an acute accent, and raising the tone of his voice without lengthening the found, when he pronounced a short syllable which had an acute accent; in the same manner as in music, where the highest note in a bar is frequently the shortest. Hence he infers, that the opinion advanced by Prof. Gesner and Dr. Follet, is not merely theoretical, but confirmed by actual experience. An example of this kind, however, is very rare; because the modern Greeks, in general, pronounce according to accent alone. In England the Greek accents are rejected; and quantity alone, as it is generally supposed, is regarded in pronunciation. But Mr. Marsh observes, that we still pronounce Greek according to accent, though according to rules different from those which are followed by the Greeks themselves. In reading Greek we observe the same rules with regard to the position of the tone, as in reading Latin; and here we do not regulate the tone of the voice merely by the length of the syllables. e.g. Βιρτις, προφης, ἔφις, δανίς, are pronounced in the same manner, though they differ in quality: and κρίνοις, πατρίς, ἡμῖνις, λαύδις, are pronounced alike, though they vary in quality. We are therefore directed in placing the accent, or raising the tone of the voice, by some principle distinct from that of quantity. The rule for placing the accent in Latin words, which has been laid down by Latin grammarians, is the following. In Latin diffylables the accent is always on the first syllable, whether it be long or short. In polyfylables the accent is on the penultimate, if it be long; but, if it be short, the accent is on the antepenultimate, whether this be long or short. See Diomedes de Accedentu, l. ii. p. 426, printed in the Grammatica Latinae Antecres Antiqui. Op. et Stud. Heliz Putchi, Hanov. 1653, 4to. See also Quinianlan in Ski. i. c. v. p. 59. Ed. Burman. According to this rule, there is only one case in which accent and quantity must coincide, and that is in polyfylables, which have the penultimate long; but, in polyfylables which have the penultimate short, and in all diffylables, it is merely accidental, whether accent and quantity coincide or not. This disagreement constitutes the harmony of Latin verse, which would be intolerable if accent and quantity always coincided; as any one will find, who makes an hexameter consisting of six words, of which the first five are dactyls; whereas, those verse are the most harmonious, in which the number of words, in which accent and quantity disagree, is equal to the number of those in which they coincide. In the first line of Virgil’s Bucolics, which is a very harmonious verse, accent and quantity coincide in Τιτρε and τηγμα, but disagree in ρειχαμαν and πατολε.

The Greeks adopted a very different principle from the Latins in determining the syllable which was to be elevated in speaking; for in ταρτες, they raised the antepenultimate, in ανατολη they shortened the penultimate. Thus Diomedes (ubi supra, l. iii. p. 435) observes, that the acute accent of the Greeks occupied three places, the ultimate, penultimate, and antepenultimate; but amongst the Latins only two places, viz. the penult and antepenult. Since we then, in order to avoid a method attended with some difficulty, regulate the tone of the voice in Greek as we do in Latin, it follows that we read Greek, neither according to Greek accent, nor Greek quantity; but according to the rules of the Latin accentuation. The whole difficulty of the Greek accents, say Meffis. Port Royal, consists in two points; the first, in knowing the quantity of the penultimate and ultimate, and the second, in knowing on what syllable the words should have their elevation by nature; because, even supposing the same quantity, the elevation may not be the same, which never happens among the Latins. This is a difficult and embarrassing business, for which grammarians have given a number of rules and a greater number of exceptions. See Port Roy. Gr. Gram. vol. ii. p. 291, &c.

The best advocates for accents have not contended, that the ancient Greeks used them in common books, much less in letters, but only in their schools; and Michaelis apprehends that they do not occur in any copies of the New Testament till extant, which are antecedent to the 8th century, and but seldom in those which are more modern. He adds, they were not written by the Apostles; but were probably first added by Euthalius in the year 458. See Wetstein’s Prolegomena, p. 73. His translator, however, has discovered both accents and marks of aspiratio in several MSS. which he mentions; particularly the Vatican and the Claretianae. The Alexandrian, Cambridge, and four other MSS. are without accents. Marsh’s Transl. of Michaelis’s Introduction, vol. ii. p. 894. In a treatise de Rhythmia Graecorum, not long since publish’d, and ascribed to a learned Prelate of the English church, the author controverts the opinion, αλαμ εις συλλατον ακοινη γραμμην αλαμ άν αν έμος, in opposition to Faber, Dacier, Peace, Clarke, and others. Another learned writer, supposed to be Bishop Horsey, in
his "Effay on the Profodics of the Greek and Latin languages," maintains, that the marks of the accents were introduced in the writing of the Greek language some time before the commencement of the Christian era, and that they exhibit the true speaking tones of the language; such as were used by the Greeks themselves, when it was a living language, spoken in its purity. This writer ably refutes the system of Mr. Primatt, who (in his "Accentus Redivivi," published in 1762,) is an advocate for the antiquity of the accents, and who defends the accented pronunciation of Greek prose; whilst he agrees with the opposers of the Greek accents, that they are not calculated to regulate the recitation of verse. According to Mr. P. verse and prose were pronounced, by the ancient Greeks, by two different rules: the one, by the rule of the Latin accent, which he, as well as most others who difpute the Greek accents, consider as an universal rule of quantity, or metrical recitation: the other, by the proper accents of the Greek language. He is thus reduced to the necessity of adopting the impossible hypothesis, that it is the nature of the acute accent to lengthen the syllable on which it falls, and yet, with evident inconsistency, he admits, that, in music, length of sound and accenture of tone are not always united. The learned prelate, just mentioned, condemns the rule, which has been functioned by some of the classical scholars of our two universities, that we are to read by accent in prose and quantity in verse; and he observes, that it is not very probable, that any people should have had two pronunciations essentially different, one for prose, and another for verse. He equally condemns the position, that prose as well as verse in Greek must be read by quantity, that is, as says, by the Latin accent, and thinking that the Greek accen
tual marks express, as we have already said, the true speaking tones of the language, he proposes rules of recitation, on the supposition that tone was not always laid on connected words, where the accentual marks appear; whole position, however, was not changed, to prevent the confusion which would follow from making the position of the written mark different in connected from what it is in isolated words; and he confers the printing of books unaccented. He also maintains, that, though in placing accent, regard is had to quantity, euphonia gratia, and though it may therefore be a symptom of quantity, it is never a cause of it, and never creates it; and he calls the opinion of Mr. Primatt and others, that the acute accent lengthens the tone of the syllable on which it falls, a common prejudice. In order to prevent accent from interfering with quantity, he proposes to transponso it: as in the line, "Mow and Sir P(Hallam) Aqio in," the word Aqio must be pronounced "Aqio,"

An ingenious writer, viz. Mr. A. Browne, in his observations upon Greek accents, published in the Irish Transactions, vol. vii. p. 359, &c. professes, that he never could assent to a position so contradictory to the testimony of his ear, as that of the acute accent not lengthening the syllable on which it falls; and that his mind was much impressed by an observation of Mr. Primatt, that it is one of the extraordinary powers of the acute accent, even to change the real quantity, and also with his assertion, that the opinion of Melf. De Port Royal, viz. that the accent only raises the voice without giving any duration in pronouncing, is erroneous. Nevertheless, he is disposed to acquiesce in the sentiment, that the accents denote only tone, or elevation and depression of the voice. This writer, conceiving it of importance to ascertain the pronunciation of the modern Greeks, and their mode of using the accents, made some attempts for this purpose. The importance of this inquiry is obvious, because the Greek is at this day a living lan-
guage; whereas the Latin has in this respect been extinct for 1200 years.

The result of his inquiry, after conversing with some modern Greeks, was, that they have not two pronunciations for prose and verse, and that in both they read by accent. But they make accent the cause of quantity, so as to govern and control it; and they make the syllable long on which the acute accent falls, and they allow the acute accent to change the real quantity. They pronounced αίωνα short, and αίωνα long, with a marked attention to the alteration of the accent with the variety of the case. Instead of αίωνια they said αίωνια, and for ζυγόν they pronounced ζυγόν. He was assured by them, that verse as well as prose was read by accent, and not by quantity, and they exemplified their mode of reading by reciting several lines of Homer. Our author concludes, upon the whole, that the ancient Greeks as well as the modern read both verse and prose by accent, and that they allowed the accents to control and alter the quantity. Dacier, Pearce, and Clarke admit, that they read prose by accent, not by quantity: and the learned Prelates, to whose opinion and writings we have referred, contend that they could not have had a different mode of reading prose and verse.

To these two propositions Mr. B. accedes, and the combination of them confirms his opinion. He differs, however, from the inferences deduced from them by their advocates, viz. that verse is not to be read by accent, as the first mentioned gentlemen maintain, or as the Prelates affirm, that, though it is, its quantity is not thereby affected. Our author adds, that the modern Greeks use for accents the word αίων, thus confirming the opinion, that there is properly no accent but the acute, the grave being the negation of accent; and that the word απόθετος in the ancient Greek language, is the term used for accents; which word, when translated into Latin, is accentus or accentus, implying elevation of voice, or a kind of song, superadded or raised in the common tone of the voice, and cannot be applied to the grave, which is the negation of any departure from the usual level. He is of opinion, that the circumstance which has been mentioned as the peculiarity of the English, viz. that we always prolong the sound of the syllable in which the acute accent falls, is true with regard to every nation upon earth. It is true of the modern Italians and modern Greeks. In the English language, quantity is not affected, because quantity and accent always agree. The same is the fame, as Sir William Jones has shown, among the Persians; and he observes, with respect to its position, that the Persians, like the French, accented the last syllable of the word. We shall here add a remark, though not immediately connected with the subject of this article, suggested to Mr. B. by his conversation with the modern Greeks, that we are much mistaken in our idea of the supposed lofty sound of απόθετος, which Sir William Jones and the Borderers on the coast of the Archipelago take their ideas from the gentle laving of the shore by a hummer wave, and not from the roaring of a winter ocean; and they accordingly pronounced it Polyphθη

On the subject of Greek accents we may refer to the Port Royal Gr. Gram. vol. ii. p. 288, &c. Labbe Regu

The use of accents to prevent ambiguities is most remarkably perceived in some eastern languages, particularly the Siamese and Chinese. The Chinese only reckon four accents: for which the missionaries use the following marks
The accents are also observed to ring rather than talk. Their alphabet begins with fix characters, all only equivalent to K, but differently accented. For though in the pronunciation the accents are naturally on the vowels, yet they have come to diversify such of their consonants as are in the height of the time. De la Loubiere du Royatme de Siam, tom. ii. p. 720.

As minutely as the accents of words have been studied, those of sentences seem to have been utterly overlooked; yet it may be observed, that all mankind lower the voice at the end of a period, and elevate it in interrogations, and the like. See Bacon de Augm. Scien. i. vi. c. i. Elem. Crit. vol. ii.

Accent is applied, not very properly, to the characters which mark the quantities of syllables, or the time during which the voice is to dwell upon them. The furious accents answer to the characters of time in music, as crotchets, quavers, &c. The genuine accents rather answer to the musical notes, fel, fa, &c. Such are the long accent, which shows that the voice is to stop on the vowel, and is expressed thus, (•); and the short accent, which shows that the time of pronunciation ought to be shorter, and is marked thus (•). Some even rank the hyphen, dialeole and apostrophe, among accents.

Accent also denotes a certain inflexion of the voice; or a peculiar tone, and manner of pronunciation, contrasted from the country, or province, where a person was bred. In this sense, we hear, the Welsh tone or accent, the Northern accent, the Galloign accent, Norman accent, &c. See Pronunciation.

Accent is also a tone or modulation of the voice, frequently used as a mark of the intention of the speaker, and giving a good or evil signification to his words. One may give offence with the softest and most soothing words imaginable, by a proper management of the accent and manner of pronouncing them. The accent frequently gives a contrary sense to that which the words themselves naturally import.

Accent, in Music. In the mechanism of melody, or measured musical tones, musicians have long agreed to regard the first and third notes of a bar, in common time, whether vocal or instrumental, as accented, and the second and fourth notes as unaccented. In triple time, divided into three portions, the first note and left are accented, the second unaccented. But these accents are variously modified; often to produce some comical effect, as wantonly limping to ridicule lameness. If the third note in triple time is accented in serious music, it is always left forcibly marked than the first. In the speech or elocution of the natives of every country, and almost in every province of a country, there is a peculiar tone or tune, by which nice observers discover the residence of the speaker. A native of Scotland, e. g. however carefully educated, and accurate his pronunciation, has a cantilea, a tone of voice, by which an Englishman discovers his country. The language that is the most forcibly and frequently accented, is indubitably the best fitted to receive musical tones. When it was said in a conversation with Metastasio on the subject of languages, that the Italian was the best calculated for music of any dialect in Europe, he cried out "é musics flipo," it is music itself. Another Italian (Eximeno) observed, that the conversation of a Roman matron, vol un aris, is equal to an air. In setting songs, the structure of the verse regulates the musical accents; and instrumental music is but a succedaneum to vocal. It may be said, therefore, that no music, even for instruments, is so generally pleasing as that which can be sung. The genius of instruments, and abilities of performers, require more notes to display their powers, than a human voice can, with propriety, attempt to execute. In very rapid divisions, ascending or descending the scale in notes of equal length, no regard is had to accents; and, though the execution may be neat and articulate, an Italian, fond of simplicity, would say it, of as a shade misappared; non dese niente, it says nothing. Without accent there is no more melody in long, than in the humming of a bee; and without the regular arrangement of long and short syllables, there can be no verison. There are as many different accents in music as in speech, or modes of enunciating or enfeebling the meaning of words. There is a yes that says no, and a no that says yes. There are accents of spirit and accents of violence, of tenderness and of friendship. The voice of a feeling finger can modulate all these shades, or affect the hearer on the side of intellect as well as of sense. Dionysius Halicarn. regards accent as the source of all music. Accents is a poetical name for verbo itself.

"Wings on your wings to heav'n her accents bear."

Such words as heav'n alone is fit to hear.

Passions and affections are the food of vocal music. Dryden's Virgill, paff. iii.

"Give to the musician (says Rousseau) as many images and sensations to express as possible; for the passions fling, the understanding only speaks."

"Accent, according to Holder (Elements of Speech), as in the Greek names and usages, seems to have regarded the tune of the voice; the acute accent raising it in some certain syllables to a higher, e. g. more acute pitch, or tone, and the grave depressing it lower, and both having some emphasis, e. g. more vigorous pronunciation." See Accent in Grammar.

The variety of instrumental expression produced by the different manner of using the same passage or group of notes on the violin and violoncello, on the flute by the coup de langue, on the harp by the pressure of the lip, is beyond calculation. Articulation, emphasis, pointed bowing, flurrying, tonguing, &c. are all technical terms, which will be severally explained, as connected with accent.

Accent, in Poetry. See Rest and Versification.

Acceptance, the act of receiving or admitting. Acceptance, among Civilians, is the concurrence of the will, or choice of the donee, which renders the act complete; and without which the donor may revoke his gift at pleasure.

In beneficiary matters, the canonists hold, that the acceptance should be signed at the same time with the renunciation, not ex intero.

Acceptance, in Common Law, denotes a tacit agreement to a preceding act, which might have been defeated and avoided were it not for such acceptance. If a man and his wife, seised of land in the right of the wife, make a joint lease, or feoffment by deed, reserving rent; the man dying,
dying, and the wife receiving the rent; such a receipt is deemed an acceptance, and shall make the lease good: so that the tenant be barred from bringing the writ, Cui in vita.

So if a lease for the term of twenty years, accept a lease of the same land for ten years: by the lessee’s acceptance of the new lease, the term of twenty years is determined in law. 2 Roll. Abr. 469.

Acceptance, in Commerce, is particularly used in respect of bills of exchange.—To accept a Bill of exchange, is to sign or subscribe it; and thereby become principal debtor of the sum contained therein: with an obligation to pay or discharge it at the time prefixed.

The acceptance is usually performed by him on whom the bill is drawn; upon its being presented to him by the person on whose behalf it was drawn, or by some others by his order.

A small matter amounts to an acceptance, so that there be a right understanding between both parties: as, “Leave your bill with me, and I will accept it;” or, “call for it to-morrow, and it shall be accepted.” This obliges the acceptor effectually to the custom of merchants, and according to law, as if the party had actually subscribed or signed it, which is usually done.

But should a man say, “Leave your bill with me; I will look over my accounts and books between the drawer and me, and call to-morrow, and accordingly the bill shall be accepted.” This shall not amount to a complete acceptance; for this mention of his books and accounts was really intended to give him an opportunity of examining if there were errors in his hands to answer; without which perhaps he would not accept the same; and so it was ruled by the Lord Chief Justice Hale, at Guildhall, London.

A bill may be accepted for part; because the party, upon whom the same was drawn, had no more effects in his hands; which being usually done, there must be a protest, if not for the whole sum, yet at least for the residue; however, after payment of such part there must be a protest for the remainder.

Bills payable at sight are not to be accepted; as being to be acquittet at their present; or in defect of payment, to be protested.—In bills drawn for a certain number of days after sight, the acceptance must be dated: because the time is to be accounted therefrom.—The form of this acceptance is accepted such a day; and then the signature.

Bills drawn, payable on a day named, or at usage, or double usage, need not be dated; usage being reckoned from the date of the bill itself.—On these it is insufficient to write, accepted, and the signature.

If the bearer of a bill be contented with an acceptance to be paid in twenty days after sight, where, in the bill itself, only eight days are expressed, he runs the risk of the twelve additional days: so that if the acceptor fail he has no remedy against the drawer. And if the bearer contents himself to receive a less sum than is expressed, in part, he is to stand the chance of the refi.

Acceptation, in Grammar, the signification of a word; or the sense wherein it is taken and received.

Acceptation, in the Civil Law, an acquittance given without receiving any money, or a declaration of the creditor in favour of the debtor, signifying, that he is satisfied for his debt, and forgives all farther claim, or demand; though in reality no payment has been made.

Acceptor of a bill of exchange, the person who accepts the bill. See Acceptance.

Access, in a general sense, signifies the approach of a thing towards another.

In which sense, accesses stand opposed to receifs.

We sometimes say, the access of bodies, the access of the moon, the sun, planets, &c. but more frequently, the approach of bodies, the approach of the moon, the rising of the sun, &c. Geometers speak of a line called the curve of equal access, or approach.

Access, in a more particular sense, denotes entrance, or admission.

We say such a person has access to the prince: the access on that side was very difficult, by reason of rocks, &c.

Access, in Medicine, denotes a fit, or return of some periodical disease.

We say an access of the gout; but especially of an ague, an intermitting fever, an epilepsy, &c. an access of madness; sometimes also a prophetic access, a cold access, &c. Access is frequently confounded with paroxysm: but they are different things; an access being frequently the beginning or first onset of a disease, a paroxysm the height of it.

Accessible, something that may be approached, or to which we may have access.

Such a place, a fortress, is accessible from the seaward; i.e. the passage to it is practicable. See Fortification.

In surveying, it is such a place as will admit of having a distance measured from it; or such a height or depth as can be measured by a proper instrument: for the means of doing which, see Altimetry, Altitude, Distance, Height, and Longimetry.

Accession, in a general sense, is the act of approaching or going to a place, person, or thing. It is more particularly used for the act whereby a thing is joined, or united to something that existed before.

Accession, in Politics, is used for the act of engaging and becoming a party, in a treaty before concluded between other powers; on the same conditions as if originally comprehended in the treaty itself: such as the accession of the States General to the treaty of Hanover, of the Czarina to the treaty of Vienna, &c. It likewise signifies a prince’s succeeding to the government upon the death of his predecessor.

Accession, in the language of the Conclave, is a method of electing a pope, by procuring for some candidate two-thirds of the voices, upon which the rest are enrolled by way of accession.

Accession, in the Civil Law, denotes a method of acquiring property in certain things, by virtue of their connection with other things, which already belong to us.

Accesion is effected divers ways, whence arise several species of it, simple and mixed, natural and artificial, direct and concrete accession. See Alluvion and Specification.

Accession, in Medicine, see Access.

Accessiorius. Flora digiturn fella, in Anatomy, a name given by Dr. Hunter to that portion of muscle which was described by Sylvius, and generally distinguished by the title of Membrana carnea Sylvi. See Accessorius ad facro-lumbarem. See Sacro-lumbaRIS.

Accessory, or Accessary, something that accedes, or is added to another more considerable thing: in which sense the word stands opposed to principal.

Accessory, in Grammar, is used by Mr. Harris to denote such words as are significant by relation in opposition to principal, which is applicable to words that are significant of themselves. See Word.

Accessory, or Accessary, in Common Law, is chiefly used for a person guilty of a felonious offence, not principally, but by participation; as, by advice, command, or concealment.
ACG

There are two kinds of accessories; before the fact, and after it.—The first is he who commands, or procures another to commit felony, and is not present himself; for if he be present, he is a principal.

The friend is he who receives, affords, or comforts any man that has done murder, or felony, whereas he has knowledge. A man may also be accessory to an accessory, by aiding, receiving, &c., an accessory in felony.

An accessory in felony shall have judgment of life and member, as well as the principal, who did the felony, but not till the principal be first attainted, and convicted, or outlawed thereto. Where the principal is pardoned without attainer, the accessory cannot be attainted; it being a maxim in law, Ulo non est principalis, non potest esse accessorius. But if the principal be pardoned, or have his clergy after attainer, the accessory shall be attainted. 4 & 5 W. & M. cap. 4. And by Stat. 1 Anne, cap. 9, it is enacted, that where the principal is convicted of felony, or stands mute, or challenges above twenty of the jury, it shall be lawful to proceed against the accessory in the same manner as if the principal had been attainted; and notwithstanding such principal shall be admitted to his clergy, pardoned, or delivered before attainer. In some cases also, if the principal cannot be taken, then the accessory may be prosecuted for a misdemeanor, and punished by fine, imprisonment &c. Stat. ibid. See Stat. 5 Anne, cap. 31. In the lowest and highest offences there are no accessories, but all are principals: as in riots, routs, forcible entries, and other trespasses, which are the lowest offences.—So also in the highest offence, which is, according to our law, high treason, there are no accessories. Cok. Littlet. 71.

Accessories, in petty treason, murder, and in felonies of several kinds, are not to have their clergy.—There can be no accessory before the fact in manslaughter; because that is sinned and unpunished.

Accessory by statute, is such a one as abets, advises, aids, or receives one that commits an offence, which is made felony by statute.

Accessory nerves, Accessorius Willisi, or Par Accessorius, in Anatomy, a pair of nerves, which, arising by several filaments from the medulla spinalis of the neck, and having advanced to the first vertebra, where each of them is fixed to the posterior side of the ganglion of the nucleus suboccipitalis, or tenth pair, ascends through the great foramen of the os occipitis into the cranium; and communicating with the 9th and 10th, passes out again close to the 8th pair. Afterwards turning backward, and perforating the menicus fermo-malloideus, they terminate in the trapezius, having first distributed some branches to the rhomboidei. Physiologists have been at a loss to account for the singular origin and course of these nerves. The ancients considered them as branches of the 8th pair. Willis also considered them as appendages to that pair, and called them Accessorius. They are sometimes called the spinal pair, but as this denomination comprehends the nerves of the spine indiscriminately, Willis's name is more appropriate, and therefore it has been generally preferred. See Origin and Course of the Nerves.

Accessory among Painters, an epithet given to such parts of a history piece, as serve chiefly for ornament, and might have been wholly left out: such as naves, armour, &c.

ACCHO, in Geography, a port called by the Greeks Ptolemais, and now Acra.

ACCI, in Ancient Geography, a town in the confines of Bactia, supposed to be Guadix, in the province of Granada, in Spain. It was also called Colonie Accitana, and its inhabitants were denominated Genucienses, and the colony Comtia, because it was formed from two legions, viz. the third and the sixth.

ACCICARUTA, in Musæ, is a term, as it should seem, by the little successes of those who have attempted it, difficult to be defined by words, or to be exemplified in notes. It is putting down with any interval the half note below it, and instantly taking off (as if it were red hot) the finger which has struck the lowest of the two notes, continuing the sound of the other note, till the harmony is changed. An organist never puts down a single flow note on his instrument without touching, at the same time, the semi-tone below, and sometimes keeping it on, or making a beat with the forefinger, while the thumb remains firm on the principal sound. The term accicatura, though uncommon, is not new; as it occurs in "l'Ammonico Pratico" of the eminent opera composer Francesco Gasparini, the master of Dominico Scarlatti, and of the celebrated figure la Faulina: this tract, which is in fact a treatise on accompaniment, was first published at Venice in 1703. The technical term acciacatura is derived from acciacare, to bruise, crush, or jump down. Gasparini compares it to the nightly bite of an insect, that instantly flies away. See pl. i. No. 1. Musæ; some examples from the 5th edition of this excellent little tract, printed in 1754.

ACCICIOLI, DONATUS, in Biography, a learned Florentine of the 15th century, was born in 1428, and distinguished by the honourable employments which were assigned him in his native country, and by the probity and disinterestedness of his character. He published commentaries on the ethics and politics of Aristotle, which he collected from the lectures of Argyropolis the Byzantine, and translations of the lives of Alcibiades and Demetrius from Plutarch, to which were added those of Hannibal and Scipio, and of Arctino's twelve books of the history of Florence, printed at Venice in 1476. He also wrote an Abridgment of the Life of Charlemagne, and some other Treatises. Having been sent to France by the Florentines to sue for succour from Louis XI. against Pope Sixtus IV., he died on his journey at Milan, in 1473; but his body was carried to Florence, and buried in the church of the Carthusians. His daughters, like those of Aritides, were married, and portions at the public expense, as an acknowledgment of his services. His funeral eulogium was pronounced by Christophor Landini, and an elegant epitaph by Politian, was inscribed on his monument. Gen. Dict.

ACCIOLI, Zenobia, a learned Dominic of the same family with the former, continued to enjoy the office of library-keeper to Pope Leo X. from the year 1518, to his death in 1520, as some say, in 1537 according to others, at the age of 58. He learned Greek and Hebrew towards the close of his life, translated several of the fathers, and wrote several orations and poems, sermons on the Epiphany, and some other pieces. He likewise collected a volume of Politian's Greek epigrams, which were published in 1495.

ACCIOLI, Angelo, cardinal, legate, and archbishop of Florence, died in 1407. He preferred the Florentines in their obedience to the pontiff Urban VI., when attempts were made to seduce them in favour of Clement VII. He wrote a work, with a view of healing schism, which then rent the church.

ACCIOLI, Renato, descended from a noble family of Florence, attended the conquest of Athens, Corinth, and a part of Boeotia, at the beginning of the 15th century. Having no male issue by Eubois, his wife, he bequeathed Athens
ACC

Accidence, Accidentia, a name chiefly used for a little hook, containing the first elements, or rudiments of the Latin tongue.

Per Accident, is frequently used among philosophers to denote what does not follow from the nature of a thing, but from some accidental qualities thereof, in which sense it stands opposed to per se, which denotes the nature and essence of a thing.

Thus fire is said to burn per se, or considered as fire, and not per accident; but a piece of iron, though red hot, only burns per accident, by a quality accidental to it, and not considered as iron.

ACCIDENTAL, in the popular sense of the word, signifies a contingent effect, or something produced casually, and without any foreknowledge or design in the agent that produced it.

Accident, in Grammar, denotes a property attached to a word, without entering into its essential definition. Thus every word, whatever be its signification, will be primitive, derivative, simple or compound, which are the accidents of words. Besides, each particular species of words has its accidents: e.g. those of the noun substantive are gender, declension, and number, and the adjective has another accident, viz. comparison.

Accident, in Heraldy, is an additional note or mark in a coat-armour, not necessarily belonging to it, but capable either of being retained, or omitted, without altering the essence of the armament. Such are Abatement, Differences, and Tincture. Edmonston observes, that accidents of arms, though frequently mentioned by authors, can have no meaning in blazonry.

Accident, in Logic, something additional, or super-added, to a substance; or not essentially belonging to it, but capable, indifferently, either of being or not being in it, without its destruction. The schoolmen distinguished three kinds of accidents, verbal, predicamental, and predicamental. Verbal accidents stand opposed to essence; and in this sense the adjuncts to a thing, though subsistences themselves, are denominated its accidents. Thus a man's clothes which are not essential, but adventitious or accessory to his person, are accidents. Predicamental accidents are used in opposition to proper. Such is any common quality; as whiteness, heat, or the like. These are called in the schools, predicamental accidents, because usually laid down and explained in the doctrine of predicables. They may either be taken in the abstract, as whiteness, learning; or in the concrete, as white, learned. If taken in the abstract, as is done by Porphyry, the accident is defined as above, that which may either be present, or absent, without the destruction of its subject. If it be taken in the concrete, accident is usually defined by the schoolmen, something capable of being predicamented contingently, of any, in respect of quality. As learning, which may probably be predicated of you, him, &c.

Predicamental accident is a mode or modification of some creating subsistence, inhering or depending thereon, so as not to be capable of subfusiting without the fame. In this sense, accident is opposed to substance. Whence, as substance is defined a thing that subsists in itself, and the substratum of accidents; so an accident is said to be that sujas esse effe in se; and therefore Aristotle, who usually calls substances simply esse, entities, beings; commonly calls accidents, esse esse, entities of entity; requiring some subsistence wherein to subsist, as its subject of adhesion. So that accident has an immediate and essential dependence on its substance; both as to its production, its continuation, and its effects; it arises or is deduced from its subject, is preferred or subfusited by it; and can only be affected by what alters, or affects, the subject. The old schoolmen, however, will not have accidents to be mere modes of matter, but entities really distinct from it; and, in some cases, separable from all matter. But the notion of real accidents, and qualities, is now exploded. Aristotle and the Peripatetics make nine kinds of predicamental accidents; others contract them into a less number. The term absolute accident is used in the Roman theology for a predicamental accident, which subsists, or may possibly subsist, at least miraculously, and by some supernatural power, without a subject.

Such, they contend, were the accidents of the bread and wine in the eucharist, e.g. the colour, flavour, figure, &c. thereof, which remain after the substances they belonged to are changed into other substances of flesh.

The Cartesians universally combat the notion of absolute accidents; it being their doctrine, that the essence of matter consists in extension; and that accidents are only modifications thereof, in no wise distinct from it; an accident therefore without a subject must be a contradiction. And hence Cartesians is branded as contrary to the Roman Catholic faith.

Various expedients have been invented by the Cartesians, to account for transubstantiation, &c. without the hypothesi-
that are natural, in a variety of instances. The subject has
likewise been considered by M. de la Hire, and M. Epinus;
and M. d'Arcy has contrived a machine for measuring
the duration of the above-mentioned impressions on the eye; and
he inferred in the refult of several trials, that the effect of
the action of light on the eye continued about eight thirds
of a minute. See Ac. Par. 1743, and 1765. Nov. Com.
Petrop. vol. 10. And for an abstract, Prieflley's Hist. &c.

Accidental Point, in Perspective, is a point in the hori-
zontal line, in which a right line drawn from the eye, par-
allel to another right line, intersects the picture or perspec-
ttive plane. This is also the accidental point of all other
lines parallel to the original line, since the same line drawn
from the eye is parallel to them all; and the representation
of all these parallels, when produced, concur in the acci-
dental point. See Perspective.

Accidental Dignities and Debits, in Aesthetics, are
certain casual dispositions and affections of the planets,
whereby they are supposed to be either strengthened or
weakened, by their being in such a house of the figure.

Accidental, in Muse, is an epithet added to such
sharps, flats, and naturals, as occur not at the clef, and
which imply some change of key or modulation different
from that in which the piece began. In the key of C na-
tural, for instance, an accidental C♯ implies the key of
D minor; a D♯, the key of E; an F♯, that of G major;
and G♯, the key of A minor. In like manner a flat
placed before B, implies the key of F major, or D
minor, &c.

Accipenser, in Ichthyology. See Accipenser.

Accipesius, a name given by Athenians and others
of the Greek writers to the Sturgeon, called by others
Onifer.

Accipiter, a name given by Galliuns and some
others to the fish, called by others the vitulus and lucernus.
It is a species of trigla in the sytems of Arledi and
Linnaeus.

Accipitres, or Rapacious Birds, in the Linnean
fystem of Ornithology, the first order of birds; the charac-
ters of which are, that the bill bends downwards, that the
upper mandible is dilated a little on both sides towards the
point, or armed with a tooth-like process, and that the
nostrils are wide; the legs are short and strong; the feet
are of the perching kind, having three toes forwards and
one backwards; the toes are watery under the joints, with
clawes hooked and sharp at the points. The body, head
and neck are mucilus, and the skin very tough. The
birds of this order feed by preyng on other animals, and
on dead carcasses, and they are unfit for food. They live
in pairs, and are monogamous; and build their nests in
lofty situations. The female is generally larger and stronger
than the male, and usually lays four eggs at a time. This
order comprehends four genera, viz. Vultur, Falco, Stare, and Landid. Mr.
Latham has removed this last genus to the order of Pte.x

Accipitrina, in Botany, a name by which some authors have expressed the hawkweed, and others, the fix-
weeds or sophia chirurgorum. See Hieracium and Sys-
temerium.

Accismus, denotes a feigned refusal of something
which a person earnestly desires. The word acismus is
supposed to be formed from Acis, the name of a foolish old
woman, famous in antiquity for an affection of this kind.
Accisum is sometimes considered as a virtue, sometimes
as a vice, which Augustus and Tiberius practised with great
success. Cromwell's refusal of the crown of England may
be brought as an instance of an accismus. In rhetorics, the term
is used for a species of irony.

Accius, Lucius, in Biography, a Latin tragic poet,
who, according to St. Jerome, was born in the year of
Rome, 583, B.C. 170. Several of his tragedies were
foundered on the most celebrated stories which had been
represented on the Athenian stage, as Andromache, An-
dromeda, Alcestes, Clytemnestra, Medea, Meleager, Pho-
icles, the civil wars of Thebes, &c. He also composed
one dramatic piece entirely Roman, called Brutus, which
related to the expulsions of the Tarquins. Some say
that he wrote comedies; and the Wedding and the Merchant
are ascribed to him. See Vossius de Poet. Latin, p. 7.
Besides his dramatic writings, he left other works, particu-
larly his Annals, mentioned by Macrobius, Prician, Paolo,
and Nonius Marcellus. He was much applauded by
Decimus Brutus, who was conful in the year of Rome 615, for
the verses which he wrote in his praise; and he was so much
efraced by the public, that a comedian was punished for
only mentioning his name on the stage. However, he has
been censured by some for the harshness of his style, though
he was generally allowed to be a very considerable poet.
The particular character of Accius seems to have been that
of vigour and sublimity. Horace styles him altus, elevated,
and Ovid, animus, spirited: the latter applies the epithet
atrox, cruel, to his works, which is thought to refer to the
subjects of them, or the great catastrophes treated of by
the Greek Dramatists. Cicero (De Clar. Orat. apud Oper.
tom. i. p. 395, Ed. Genev.) speaks with derision of one
Accius, who had written history; and some have supposed
that, as Accius had written Annals, he refers to him; but
this is not probable, as Cicero himself, Horace, Quintilian,
Ovid and Petreius have expressed themselves in terms of
distinguished applause of the Accius, that is the subject of
this article.

There was also another Accius, or Attius, called Pisau-
virens from Pisaurum, the place of his nativity, who was
esteemed a good orator, against whom Cicero defended Au-
tom. i. p. 473. Orat. pro Cluent. apud Op. tom. v. p. 57,
&c. Valerius Maximus mentions a poet of this name, who
was accustomd not to rise when Julius Cesar entered the
affability of the poets, as he reckoned himself, in that
place, his superior. Gen. Dict.

Accius, Zuecbus, an Italian poet of the 16th cen-
ty, who is said to be the author of Italian sonnets by
way of paraphrase on the fables of Apollon, on which Julius
Scaliger beholds great commendation.

ACCLAMATION, a confused noise, or shout of joy,
by which the public express their applause, effemin,
or approbation of any thing.

Acclamation, in a more proper sense, denotes a certain
formula of words, uttered with extraordinary vehemence,
and in a peculiar tone, somewhat resembling a song frequent
in the ancient assembles.

Acclamations were usually accompanied with applauses,
with which they are sometimes confounded, though they
ought to be distinguished; as acclamation was given by
the voice, applaute by the hands; beides, acclamation
was also bestowed on persons absent, applaute only on
those present. Acclamation was also given by women, whereas applaute
seems to have been confined to men.

Acclamations are of various kinds; ecclesiastical, military,
naval, senatorial, synodal, jubilaeus, theatrical, &c.

Bulls and other ecclesiastical officers, were elected by
the acclamations of the people. We meet with loud accla-
matons, musical and rhythmical acclamations, acclamations
of joy and respect, and even of reproach and contumely. The former, wherein words of happy omen were used, were also called laudationes & bona voce, or good wishes; the latter, exortationes & convicia. Of this latter kind of acclamation Suetonius has given an instance, (Oper. vol ii. p. 1056, Ed. Pitici.) on occasion of the decree for deifying the statues of Domitian, when the senate recoiled, and uttered very bitter and contumelious acclamations against the deceased. The formula used for the purpose of the acclamation was repeated several times, so that we find in Roman writers, acclamationem de diuinatis & victis, i.e. five and twenty times; and, on some occasions, much more frequently. The emperor Claudius suppressed those indelicate acclamations, which custom had introduced into the senate, as unbecoming the gravity of that respectable body. But that custom, founded on flattering, prevailed again in succeeding times; and historians have given us such influences as fully justify Claudius's contempt of it.

The acclamations of the theatres, which were at first confused and tumultuous shouts, became in process of time a kind of regular concert. Nero contributed very much to this improvement of them. When this emperor played in the theatre, a signal was given by clapping; upon which 5000 soldiers, called Augufiani, began to chant his praise, which the spectators were obliged to repeat. This business was conducted by a music-master, called Mofchorus, or Paufarius. The fervile band was divided into choruses, who performed a kind of measure in their applauses, and modulated their noises in different ways: the chief of each chorus had a salary of 40,000 sesterces.

The honour of acclamations was chiefly appropriated to emperors. On them it was bestowed to the most extravagant excess. The talk of applause was not abandoned to the rude and spontaneous voices of the crowd. Perorons of all factions and parties vied with each other on this occasion; and after conflicts which had shaken the capitol, insensibly sunk into the emulation of servitude. From either side they echoed in responsive melody the praises of the emperor; their poets and musicians directed the chorus, and long life and victory were the burden of every song. The fame acclamations were performed at the audience, the banquet, and the church; and they were repeated in all languages by the mercenaries, who sustained the real and fictitious character of the nations whose respective languages they were pronounced. Confortinius Porphyrogenitus has reduced this science of form and flattery into a pompous and trifling volume, which, says Mr. Gibbon, the vanity of succeeding times might enrich with an ample supplement. But this writer very justly observes, that the calmer reflection of a prince would surely suggest, that the fame acclamations were applied to every character, and every reign; and if he had risen from a private rank, he might remember that his own voice had been the loudest and most eager in applause, at the very moment when he envied the fortune, or conspired against the life of his predecessor. Decl. and Fall of the Rom. Emp. vol. x. p. 128. 8vo. In proof of this it may be remarked, that the acclamations of the populace were conferred on the rapid Vitellius, and the cruel Nero, as well as on Trajan, who merited the title of optimus. In the latter instance, however, they were received with lively feelings of satisfaction and delight, to which the former were utter strangers. His subjects were frequently heard to exclaim in his presence, "Happy citizens! Happy emperor! Long may he lead this great and virtuous life! Long may he hear our ardent wishes for him!" At which tender expressions Trajan blushed, and shed tears of joy; for he was sensible, it was to himself, and not to his fortune, that they were applied; and the senate, after obtaining the prince's leave with great difficulty, ordered such acclamations to be inscribed on plates of brass, that they might be a permanent monument and motive of emulation for succeeding emperors, and a lesson to teach them to distinguish between flattery and the language of the heart.

The honour of acclamations was not wholly restricted to emperors. It was also conferred on their children and favourites, and on the magistrates who preceeded at pages. We have likewise instances of its being reserved to persons of distinguished merit, as in the case of Cato and Virgil, mentioned by Quintilian. The most usual forms of acclamation were, "Plebs, ferius silent, non in fides." The actors, and those who gained prizes in the games of the circus, were not excluded from the honour.

The Greeks were accustomed in public acclamation on extraordinary occasions, as well as the Romans. Plutarch mentions an acclamation fo loud, in consequence of Memmius's restoring liberty to Greece, that the birds fell from the sky with the shout.

The Turks observe a similar ceremony on the right of their Emperors and Grand Viziers to this day; and the practice of flinging kings, conquerors, and distinguished persons, with some forms of acclamation, is very general and prevailing.

Authors and poets, who recited their works in public, were always anxious to obtain this honour; and their admirers endeavoured to render it in the most solemn and respectful manner. Sometimes presents enforced the invitations that were designed for convening numerous assemblies for this purpose. The acclamations, like those of the theatre, were attended with music, and they were adapted to the person, and to the subject: so that philosophers, orators, historians, and poets were differently distinguished. One of the most usual forms was εὔχεσθαι, ἵψος, repeated three times; but Martial comprehends other customary forms in the following verse:

"Grauiter, cito, regiutor, Euge, Beate."

Acclamations made also a part of the ceremony of marriage. Acclamations, which were at first practised in the theatre, and which passed from hence into the senate, and other departments of civil society, were, in process of time, received into the acts of councils, and the ordinary assemblies of the church. Chrysolom reproved, and checked acclamations of this kind; but Augustine received them very willingly. Sermons were applauded with the hands and feet, by leaping up and down, and exclaiming "orthodox," and by shaking the loose garments, moving plumes, and waving handkerchiefs. See Lardner's works, vol. iii. p. 81. But their principal use has always been at the solemn entries of princes and heroes; where they are usually attended with good wishes, prayers, vows, &c. Antiquity has transmitted to us several forms of acclamation, some of which we have already recited. The Hebrews used to cry, "Hosanna," the Greeks, "Αυτόφλων τοπος, good luck." The Romans addressed their princes, generals, &c. with such expressions as these, "Diu te nobis fervet; vestra fala, vestra fala i.e. May the gods preserve you for us; your safety, our safety." The acclamations of the army were generally, "Ioiti, "unmale," or "Salve Imperator." Schlemont de Acclam. Veter. Gen. 4to. 1665. Pittie, lex Ant. tom. i. p. 12. Ferrar de Acclam. et Plau. lib. i, cap. 8. Suicer. Theif. verb. 4666. Aquinss Lex. Milit. tom. i. p. 6. Bingham Orig. Ecclef. lib. xiv. cap. 4. §. 27.

Acclamation is also applied among the antiquaries to certain medals, on which the people are represented expressing their joy for some considerable favour. In this sense acclamation is also used to denote the word represented on certain medals,
medals, for the prosperity of the emperor and commonwealth.

Acclamation also denotes a method of election, practised in the academy of Arethusa.

Acclamation, in rhetoric, is a figure of speech, thus called by the Latins, and by the Greeks epiphonema.

ACCLIVIS, in Anatomy, a muscle, otherwise called obliquus coraco
dorsalis.

ACCLIVITY, the steepness, or slope, of a line or plane inclining to the horizon, taken upwards. The ascent of a hill is an acclivity; the descent of the same a declivity. Some writers of fortification use the term acclivity for talus.

ACCO in Geography. See Acre.

ACCOLA, compound of ad, to, and colere, to dwell, in a general sense, denotes an inhabitant near any certain place, in contradistinction to incola, who dwelt in it; according to the verse,

"Accolam non propriam, propriam eit incola terram.

ACCOLADE, a ceremony anciently used in the conferring of knighthood.

The word literally denotes an embrace, being formed of ad, to; et colo, or coliam, neck.

Antiquaries are not agreed, wherein the accolade properly confined. The generality suppose it to be the embrace, or kiss, which princes anciently gave the new knight, as a token of their affection. Whence the word accolade, q. d. a chipping, or taking round the neck. A very ingenious author will rather have it to be a blow on the chin of the neck, given on the same occasion. Fauchet seems to reconcile the two opinions: he supposes it to be the kiss; but withal, imagines the kiss to be intended as a stroke on the cheek, En leur bâillant sur la joue.—The ceremony being only an imitation of that practised among the Romans, in the manumission of their slaves, where it is known a blow was given. Skinner, Catenae. Orig. Franc. Colomb. Thet.

D'Hommeur.

As for the accolade, or blow, John of Salisbury affirms us, it was in use among the ancient Normans; by this it was that William the Conqueror conferred the honour of knighthood on his son Henry.

At first, it was given with the naked fist; thus Lamber
tas Ardens, describing the manner in which Baldric, count de Guines, was created knight by Thomas a Becket, says, sidem coniit in jugum militis glandium lateri et calcario juxta militis pedibus aptavit, & alapam collo ejus infictit. But this was afterwards changed into a blow with the flat of the sword, on the shoulder of the knight.

Salmonet, and after him the continuators of Moreri, mention an order in England, called knights of the accolade; so called from the manner of their creation. The order here meant is that of knights bachelors, or equites aurati. But the name, if ever, is now no longer known among us.

ACCOLE'EE is sometimes used as synonymous with ACCOLADE.

Accolée is also used in Heraldry, in divers senses, when two things are joined together, as two shields divided at the flanks, they are said to be accolée. It moreover is also applied to lions, dogs, and other animals, which have collars, or crowns about their necks; as the lion in the arms of Ogilvy; others use the term accolée, when two keys, batons, maces, swords, &c. are faltier wise, behind the shield. Nibet's Elys on Armor. English herals ordinarily say, collared, or gorged with an open crown, instead of accolée.

ACCOLTI, Benedict, the Younger, in Biography, was grandson of Benedict Accolti, the elder, who flourished about the year 1376, was born at Arcezzo, in 1415, and was distinguished about 1450, when he is said to have succeeded Foggia as secretary to the Republic of Florence. He wrote "Four books concerning the war which the Christians carried on against the Infidels, in order to recover Jadera and the holy sepulchre"; which work was printed at Venice in 1532, 4to. and serves as the ground-plot to Tasso's Jerusalem delivered; and also an account "of the excellent personages of his time," in the form of a dialogue, printed at Parma, in 1652, 8vo. He died in 1466.

Accolti, Benedict, was also nephew, or, as some say, grandson to Peter Accolti, and was born at Florence, in 1497. He made a great progress in the study of the law, and became so much a master of the Latin tongue, that he was called the Cicero of the age. He was also distinguished by a very retentive memory. The ecclesiastical honours which he enjoyed were very considerable. Leo X. gave him the bithorpe of Cadiz, Adrian VI. that of Cremona, and the archbishopric of Ravenna; and Clement VII. created him a cardinal. At the request of this pontiff, he wrote a treatise in vindication of the right of the pope to the kingdom of Naples. He left several other works, and particularly several pieces of poetry. He died at Florence in 1549. Gen. Dict.

Accolti, Frances, the brother of the former, was professor of jurisprudence in several academies, and styled the prince of lawyers. He is said to have possessed a vigorous understanding, comprehensive knowledge, and powerful eloquence. He aspired to the purple under the pontificate of Sixtus IV.; and by a forcible paraphrase amalgated large treasures. He was born about the year 1418, and died about the year 1470. He left behind him several treatises of law, and translations of some of the works of Chryfodom. Voff. de Hist. Lat. I. iii. c. 7. Gen. Dict.

Accolti, Peter, the son of Benedict the younger, was born at Arcezzo about the year 1455, and died at Rome in 1532. He was professor of law, and taught with great applause. He was employed by the popes, and raised felicetively to several bithorpe, and became a cardinal in 1511. He wrote several historical tracts. His brother, Benedict, duke of Nepi, was celebrated for the extent of his erudition, and the excellency of his poetical talents. Pope Leo X. in 1520, created him prince of the flate of Nepi. His Virgina, a comedy printed in 1553, 8vo.; and his poems, at Venice, in 1519, and 1553, were much applauded by his contemporaries. Benedict Accolti is said to have taken a lead in a conspiracy against pope Pius IV. and to have been brought to capital punishment in 1562. Gen. Dict.

ACCOMA, in Geography, a town of New Mexico, in North America, situated on a high mountain, with a strong caille, which is the capital of the province. It was taken by the Spaniards in 1599. W. long. 104° 15'. N. lat. 35°.

ACCOMACH County, in Virginia, is situated in a peninsula, bounded on the north by Maryland, east by the ocean, and west by the Chesapeak bay, and contains 13,999 inhabitants, of whom 1462 are slaves.

ACCOMMODATION, in Philosophy, the application of one thing by analogy to another. To know a thing by accomodation, is to know it by the idea of a similar thing referred to it.

ACCOMMODATION is also used in Theology; thus, a prophecyc of scripture is said to be fulfilled properly, when a thing foretold comes to pass; and improperly, or by way of accommodation, when an event happens to any place or people, like to that which occurred some time before to another. This method of explaining scripture by accommodation,
tion, serves as a key for solving some of the greatest difficulties relating to the prophecies. This convenient principle of accommodation is applicable to those passages, in which are used the strong expressions, "then was fulfilled that which was spoken by the prophet," or "this was done that it might be fulfilled which was spoken by the prophet." Wettstein, in his note to Matth. i. 22. (vol. i. p. 237-8.) has produced, in support of this principle, an example from Ephrem Syrus, and similar expressions from other writers. This principle of accommodation has been adopted, not only by Wettstein, but by Grotius, by Nicholls in his "conference with a thief," (vol. i. p. 335.) Michaelis in his "Introduction to the New Testament," (see Marth's Transl. vol. i. p. 214.) and particularly by Dr. Sykes, who has illustrated, defended, and applied it in the introduction to his "Paraphrase on the Hebrews," § 3. p. 28, &c. and in his "Truth of the Chriillian Religion," ch. 13. 14. 15.

Dr. Eckermann, professor of divinity in the university of Kiel, extends the doctrine of accommodation to every quotation in the New Testament without exception, proceeding on the hypothesis, that the Old Testament contains no prophecy, which literally and immediately relates to the person of Jesus Christ. On the contrary, Dr. Owen in his "modes of quotation used by the evangelical writers," § 5. entirely rejects the principle of accommodation, admitting, as many others have done, a typical meaning, in order to resolve the difficulties that occur in the explication of particular passages. Dr. Sykes observes, that if we were better acquainted with the Jewish phraseology, we should less hesitate in admitting the above mentioned principle. As for the particular term "fulfilled," he says, the Jewish writers often meant no more by it than the happening of a similar event, or an exact agreement in particular circumstances of latter things with former. An ingenious and much admired writer (see Paley's View of the Evidences of Christianity, vol. ii. p. 298.) speaking of those quotations in the Old Testament found in the New, some of which are applied in a sense and to events apparently different from that which they bear, and from those to which they belong in the original, observes, "it is probable to my apprehension, that many of those quotations were intended by the writers of the New Testament as nothing more than accomodations. They quoted passages of their scripture which suited, and fell in with, the occasion before them, without always undertaking to assert, that the occasion was in the view of the author of the words. Such accommodation of passages from old authors, from books especially which are in every body's hands, are common with writers of all countries; but in none, perhaps, were more to be expected than in the writings of the Jews, whose literature was almost entirely confined to their scriptures." This writer adds, "these prophecies, which are alleged with more solemnity, and which are accompanied with a precise declaration, that they originally respected the event then related, are, I think, truly alleged. But, were it otherwise, is the judgment of the writers of the New Testament, in interpreting passages of the Old, or sometimes, perhaps, in receiving established interpretations, so connected either with their veracity, or with their means of information concerning what was passing in their own times, as that a critical mistake, even if it clearly made out, should overthrow their historial credit? Does it diminish it? Has it any thing to do with it?"

The question of fact, whether the Jewish Rabbins, in quoting passages from the Old Testament with a formula of this kind; "In this the Scripture was fulfilled," did consider those passages as having themselves reference to the event to which they applied them, or grounded the quotation on a mere parity of circumstances, has been accurately examined by Surenhusius in his "Explication du Testament," printed at Amsterdam in 1713. In his third thesis, "De formulis allegandis," he compares the expression "et quippe fere in eum," with Rabbinical Hebrew formulas of a similar kind; and concludes upon the whole, that the expression is not only allusive, but demonstrative. See Quotation.

The primitive church accommodated multitudes of Jewish, and even heathen ceremonies and practices to Christian purposes; but the Jews had before done the same with regard to those of the Gentiles: some will even have circumcision, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only accommodated by Moses to the purposes of Judaism. Saunin's Dissect. Old Test. tom. i. p. 526. Spencer de Leg. Hebr. Difc. i. lib. 3. p. 32. Middleiott's Letters from Rome in his Works, vol. iii. p. 63.

This accommodation, in the most extensive sense of the term, is the subject of two prize dissertations in Teyler's Theological Society; and the discussion of it by Van Hemert, professor of Philosophy and Literature in the society of Remonstrants in Amsterdam, and De Vos, minister of the Baptist congregation in the same city, may be found in the 12th volume of these Dissertations. The learned Professor had prepared the way for this discussion by an oration which he had delivered upon being appointed to this office. In this discourse he maintains, that Christ, who was the wisest and best of all teachers, adapted both the manner and matter of his instructions to the capacity and habits of his hearers. With regard to the former there can be no dispute; and, as to the latter, he observes, that our Saviour manifested an evidently intended condescension to the ignorance, imbecility, and prejudices of his hearers. Whilst he avoided the discussion of subjects that were superior to the capacity of his disciples, and that philosophical train of reasoning, which would have been unintelligible to them; he made use of arguments, which, coinciding with their popular notions and national prejudices, were likely to make the deepest impression on their minds; without warranting them to conclude, that these notions were in themselves just, or that he approved them as such. That our Saviour never attempted to correct those errors of his countrymen which related to opinions merely philosophical, is abundantly evident; but there were others that might be supposed to have a more intimate connection with religion, which, however, for wise reasons, he did not think it proper to reform; either because he did not deem them of importance, or because, by opposing them, he might have unnecessarily irritated the minds of his hearers, and have rendered them averse from his instructions. In proof of this observation the Professor refers to the conversation of Christ with the woman of Samaria, his discourse with the Sadducees concerning the resurrection, his answer to the mother of Zebedee's children, and his reply to his disciples, when they believed his appearance to be that of a ghost, or spectre. He distinguishes, however, between what is essential to religion itself, and what relates merely to theology, or the mode of teaching it. The strict propriety and absolute necessity of this kind of accommodation he vindicates by a survey of the stupid ignorance and invertebrate prejudices of the Jewish nation. As proofs that our Saviour condescended to found his arguments even on the erroneous notions of his countrymen, when they suited his purpose, and did not interfere with the essential doctrines of the Gospel, he refers to Matt. xxv. 26, Mark viii. 27; to his distinction of the precepts of the law into greater and lesser, Matt. v. 19; and to his using the term Gehenna, and the judicial style of the Sanhedrin, in Matt. v. 22. The
The apocryphal and apocryphal-like literature also imitated an example, of which instances occur in 1 Thess. v. 23. Coloss. i. 16. Ephes. vi. 21. iii. 10. Rom. viii. 38. 1 Pet. iii. 22. In relating facts, the writers of the New Testament conformed to the popular opinion. Of this nature, (says this author) are all those passages which refer to demons and devils, and those which represent the devil as the principle of evil, inflicting mankind to sin. Thrice, he adds, were opinions which properly related to philosophy, and did not materially affect religion; as long, at least, as it was believed that their malignant agents were under the control of divine power, and might be vanquished by good men. The Professor is of opinion, that the existence of such a being, exercising an influence over the minds of men, and impelling them to vice and misery, is utterly inconsistent with the perfections of the Deity, with the wisdom of the divine government, and with the free and moral agency of man. The Jews had derived from the Chaldæans a notion, that the air was peopled with demons, and that some of these were confined in dark prisons, in the infernal world; and some commentators have supposed, that what the apostles Peter and Judas have said concerning the punishment of angels, was borrowed from the apocryphal book of Enoch, which might probably have been written by some Hellenized Jew. Of the acquiescence of the writers of the New Testament in the current, but erroneous notions of their countrymen, this author mentions St. John’s account of the wonderful virtues of the pool of Bethesda, and what St. Luke says of the Sadducees in Acts xxvii. 8. There are also many cases, in which Christ used, what logicians call, the *argumentum ad hominem*; of which there is a striking example in the answer given to the Pharisees, when they accused him of casting out devils by Beelzebub. Thus also, in the parable of the rich man and Lazarus, Christ founded his description of the future state of reward and punishment on the notions of the Jews concerning their paradise and gchenna, which were nearly the same with those of the Greeks and Romans concerning the Elysian fields and Tartarus. See also Luke xxi. 30. The acquiescence of Christ and his apostles in the prejudices of their countrymen is also evident in the quotations from the books of the Old Testament. These, as their classic authors, the Jews cited on every occasion; but being, like all the orientalists, very fond of allegory, they supposed that, beside the obvious and literal meaning of these writers, they which they considered as comparatively of little value, there was a hidden and mysterious sense which referred to the Messiah and his kingdom. With this custom, says this Professor, though in itself injudicious, the writers of the New Testament judiciously complied. Hence, he adds, most of, if not all, the passages of the Old Testament, which are quoted in the New, are adduced in a sense very different from their primitive signification, and form a kind of *argumentum ad hominem*, founded on the principles of those to whom they were addressed. Of the same kind of accommodation to Jewish prejudices the author deems the condensation of St. Paul in adopting the puerile allegories of the rabbies concerning Sarah and Hagar in Gal. iv. 24; and that of the apostles Peter and Jude, in referring to a fable, related in some apocryphal book, of a dispute between the archangel Michael and the devil about the body of Moses. Such are the outlines of the Differtation above cited, in which the author produces other instances of accommodation. The Pharisees believed the metempsychosis or transmigration of souls (see Josephus Bell. Jud. i. vi. e. 8); and M. Hextem. imagines, that they applied this hypothesis to the prophecy in Malachi iv. 5; and that our Lord did not contradict it in his discourse with his disciples, Matt. xvi. 14. And again, he apprehends, that in Matt. xi. 14, Christ not only forbears to correct this notion of the Jews, but indirectly allows it, as what he did not at that time think proper to oppose; and thaws them that, even on this hypothesis, the prophecy of Malachi was fulfilled. The blended accounts that are given of the resurrection of Jerusalem, and of the resurrection and last judgment in Matt. xxv. 35, &c. are considered by this writer as an acquiescence in the popular notion, with a view of animating the first Christians to constancy and diligence amid the peculiar difficulties which they had to encounter. The Professor having by each mode of reasoning fixed the fact, proceeds to inquire how far this hypothesis of accommodation to popular notions may be extended, consistently with the veneration and esteem due to the character of our Saviour and his apostles. Whilst our Lord generally left physical errors uncontradicted, he constantly opposed those prejudices and mistakes that were contrary to the perfection of God’s impartial love to all mankind, or detrimental to the nature and principles of practical piety and virtue. In answer to the objections which may be alleged against his hypothesis, the Professor begins with evincing the absurdities to which those have been reduced, who have endeavoured to vindicate the philosophical accuracy of the Scriptures. In accommodating their instruction to the different capacities of those to whom they were communicated, and adapting them to the peculiar character of their age and nation, as well as to their particular prejudices and habits, Christ and his apostles did no more than what might be expected from wise teachers, endowed with a divine commission; and they who on this account object to them, manifest an ignorance of the human heart, as well as of the office of an instructor of mankind. They also miscarry further the design of Christ’s mission; which was not to make his hearers philosophers, nor even to instruct them in all those particular truths which may be considered as influencing religious opinions. Mankind in general, and the Jews in particular, were not qualified to receive such instruction. Without this accommodation the design of our Lord’s mission would have been counteracted and defeated, if either he or his apostles had encountered every error of the age and nation to which they were sent. To those who allude that, among the instances cited by the author, of popular errors, in which Christ and his apostles are supposed to have acquiesced, there are some which relate to the essential doctrines of the gospel; he replies, that while he allows that important truths might sometimes be inculcated on the attention of the people, by arguments founded on their own erroneous notions, he absolutely denies that these notions themselves have any necessary connection with the essential truths of the gospel. Perhaps, he adds, it may be asked, whether the existence and power of the devil he not religious tenets?—but by whom, or on what foundation, were these ever made articles of Christianity? Does the belief of such an enemy of mankind at all contribute to promote that integrity, and that sanctity of heart and conduct, which the Saviour came to establish? Or is not this notion rather calculated to fill the weak and superstitious with vain terrors? For this reason, says this Professor, the apostles, though they did not contradict the popular notion, took care to obviate its pernicious consequences by always representing the devil as vanquished by Christ. Is the belief of demons that inhabit the air, that haunt the defert, or that infilt magazines into the bodies of men and afflict them with diseases. an essential doctrine of the gospel? May we not believe the Christian doctrine of a future state of retribution, without acquiescing in the notions of the Jews concerning paradise and
and gehenna, and cultivate a firm hope of the resurrection of the dead by Christ,witout believing that the archangel will found a trumpet to awaken us from the sleep of death? Is it necessary to our belief that Jesus is the Christ of God, that we refer to him all those passages which the Jewish doctors, and, after their example, the Jewish converts to Christiandity, from their love of allegories and types, explained as relative to him? &c. &c.

In a word, if we consider the genuine nature of our religion, as taught by our divine master, we shall see, says the author, that none of the instances, in which it has been here supposed, that Christ and his apostles accommodated their instructions to the prejudices and notions of their countrymen and contemporaries, have any necessary connection with the design of the gospel, or interfere with any of its essential truths. The Professor proceeds to specify some rules by which we may discriminate those passages of scripture that may be considered as instances in which the sacred writers acquiesce in popular prejudices; and he closes with some observations on the utility of this hypothesis of accommodation in explaining the scriptures. M. De Vos traces nearly the same ground of argument; but without extending the hypothesis of accommodation so far or so intrepiditycontrovert ing received opinions; opinions which the reader of this article will not incautiously reject, and without the previous hesitation and subsequent examination which they demand.

ACCOMMODATION, in Law, is used for an amicable agreement or composition between two contending parties. Thus we say, the process is become so intricate and perplexed that there is no hope of getting out of it but by an accommodation. These accommodations are frequently effected by means of compromise and arbitration.

ACCOMPANIMENT, something attending or added as a circumstance to another; either by way of ornament, or for the sake of symmetry, or the like.

ACCOMPANY, ACCOMPAGNAMENTO, ACCOMPAGNATURA, in Music, implies the instruments that accompany the voice, solo, or concerto, to sustain the principal part, whether vocal or instrumental, as well as to enrich the harmony.

The Crucif Dictionary gives no authority from early writers in Italian, of accompagnamento, accompaniment, being used as a technical term. In the fourth and last acceptance of the verb accompagnare, it is only said, in general, to be a musical term, signifying "to play on an instrument in harmony with the voice;" and this definition appears in no edition anterior to that of 1746.

Italian musical terms have now been adopted by all Europe; yet we are acquainted with no professed musical dictionary in that language. But the words peculiar to the art being taken from the common language of the country where it was first cultivated, they need no explanation to the natives; yet, in other countries which have derived their knowledge, or at least, their taste, from the Italians, these words are become technical, and need a glossary.

To write, make, or compose, an accompaniment, are synonymous terms with musiciens, for setting, or adding parts for violins, flutes, or other instruments, to a melody, vocal or instrumental, in order to be performed with it. In the early operas the accompaniments were very thin. In the first operas, indeed, none appeared, except in the symphonies and choruses; but, in process of time, as dramatic music advanced towards perfection, it was found that effects could be produced by the orchestra which were picturesque, coloured sentiments, and augmented auricular pleasure. A simple melody, unless performed by a great finger, became inaudible. But, though much ingenuity and science appear in a rich and full accompaniment on paper, yet in performance, the composer and the orchestra frequently abuse their power, and tyrannize over the voice, which they should cherish, and dignify the poetry by complication and noise, which they should help to explain and enforce. And it is a general complaint at the opera, when a cantilena, or vocal part is good, and performed by a finger of the first class, that the accompaniments are too loud—imp causa, say the French, e n t r o c o r d i t i e, c r y t h e I t a li a n .

Accompaniment is likewise another word for thorough-bass, by giving in chords the whole harmony on which the melody is built. These chords are exposed by figures over the base, which figures supply the place of a suitable part for the right hand on keyed-instrument.

The rules for accompaniments are few, with respect to harmony, but their use depends on judgment and taste. Some, fond of crowded harmony, think it can never be too loud or full; while others, who prefer a simple and beautiful melody to the most artful combinations of kindred sounds, almost think harmony a grievance. There are who prefer a meagre and monotonous accompaniment in triplets; and others imagine that the voice is bell supported by being accompanied in unison. But Rouffeau, in enumerating the qualifications of an accompanist, has settled this point: "Whoever undertakes to accompany a song or solo, should be a confidante musician, well skilled in harmony, and the construction of the several parts; should have a nice and cultivated ear, a hand prepared for all difficulties of execution in the bass, and modulation into different keys, with a sound judgment and good taste. It is the business of the accompanist on the organ, harpsichord, or pianoforte, to give the pitch to the several instruments, and the time to the whole hand; to have always under his hand the note which the finger is about to deliver, in order to correct, if falls, and enforce, if feeble; and, at the beginning of an air or movement, to mark with energy and precision the several portions of the bar, that the orchestra, if a quick air, may proportion the rapidity to the abilities of the finger; and, whether quick or slow, indicate such a specific motion as suits the genius of the composition, and the design of the composer. But, above all, whoever is accompanying another to whom the principal melody is assigned, should remember, that he is a servant, an humble attendant on a temporary superior, and should suppress all ambition of shining at the expense of the voice or instrument which he accompanies."

A great player accustomed to be listened to with delight, and appraised with nuptiae, seldom accompanies well; his fingers itch to be in action, and to call the attention of the audience from the principal performers to himself.

No general rules can be given for accompanying that will be applicable on all occasions. After the harmony is well known, and the hand well exercised, experience, good taste, and propriety must do the rest. Accompaniment, though it require little brilliancy of execution, is the last thing which a practical musician acquires. There is nothing which a finger so much dreads as an ignorant or injudicious accom panist. If ignorant himself, the finger wants assistance; if his taste is refined, and his voice good, all his art and natural powers are destroyed by a clumsy accompaniment.

Nothing but confluence experience, and a familiar acquaintance with all styles, with the best compositions of great masters, and the being able to grasp at a single glance a whole line of a score, and occasionally select the most important passages in the instrumental parts to play with the right hand, instead of the chords, can completely qualify a performer.
performer on a keyed-instrument to accompany a good or a bad finger.

Rouvenian, though no deep theorist, had a very good taste in music, and excellent views concerning its refinements and effects; and, in his "Letter on French Music," the best piece of criticism on the art, perhaps, that has ever been written, speaking of accompaniment on the harpsichord, he says: "when harlequin operas were first performed at Paris, every one was struck at seeing the manager's son, a child of ten years old at most, accompanying the fingers, and producing with his little fingers effects so different from those of M. Noblet, the usual performer on the harpsichord, a good harmonist, and exact in giving the full complement to each chord. But what was my surprise in watching the hands of the little man, and observing that he hardly ever gave the whole harmony to the base; but suppressing many of the sounds, and frequently using only two fingers, with one of which he generally played the octave to the base, and with the other the interval most important in the melody! What! says I to myself, has a matutined harmony more effect than one that is complete? And do our thorough-bass players, by giving the full chords, produce only a confused noise, while this child with fewer sounds enforces the melody more, and renders the accompaniment more useful and agreeable? This was a problem which I was unable to solve; but I became more sensible of its importance afterwards, by observing that all the Italians accompany good fingers in the same manner as this infant did; and upon the same principle as the composers have their fancies thin, often making the tenor play only in octaves above the base, and the second violin in octaves below the first. I remembered that I had read somewhere in Rameau, that every concord had a different character, or power of affecting our sensibility, peculiar to itself; that the effect of the 3d was different from that of the 5th, the 4th from the 6th. In the same manner 3rd and 6ths minor must produce different affections from those of 3rds and 6ths major. These facts once established, it evidently follows, that even discords and every kind of interval will be included in the rule: an idea which reason confirms, since, when the relations are different, the impression cannot be the same."

The reasoning of the citizen of Geneva on this principle is very specious and ingenious. "I see clearly," continues he, "that, by adding concord to concord, injudiciously, though agreeable to the doctrine of chords, by augmenting the harmony, we may weaken and counteract the effect of each sound. If the entire and pure effect of a 5th, be necessary for the expression which I want, I ilk the weakening this impression by a 3d found, which, dividing the 5th into two 3rds of different kinds, though when bruk together the harmonical effect is good, yet they may mutually diminish the peculiar effect of each other. In like manner, if the simultaneous impression of the 5th and two 3s were necessary to my design, I should fail in producing the effect I intended by retrenching either of the 3s from the chord. This reasoning becomes still more intelligible, applied to discords."—"It follows from all this, that, after having well studied the elementary rules of harmony, the musician should not hastily lavish it inconsiderately, nor believe himself a composer because he can crowd the chords with unmeaning notes; but, before he begins to combine sounds, he should apply himself to a much longer and more difficult study: that of the different impressions which the concords, discords, and all the intervals make on the ear of sensibility, and often fay to himself, that the great art of a composer consists no less in discerning what sounds occasionally to

suppress, than what to admit. It is in studying and turning over incontinent the master-pieces of Italy, for vocal music, (and of Germany for instrumental, he would now have added) that a composer would learn to make this exquisite choice, if Nature has given him sufficient genius and taste to feel its necessity; for the difficulties of the art are only perceived by those who are able to vancipitate them; and such will not treat with contempt the vacant lines in a score; but, seeing with what ease a mere Tito might fill them up, they will suspect, and seek the reasons for this seeming simplicity: so much the more admirable, as it conceals prodigies under a feigned negligence, and that l'art due tutto far, nulla si ferspire. These seem to me (continues Rouvenian) the emblems of those surprising effects which the Italian music produces, though much less crowded with harmony than ours, (that is, the old French music) of which the effects are so small and the labour so great. This does not imply that a score should never be full, but that it should be filled with choice and discernment, neither is it to say that to accomplish this, the musician should make all these reflexions; but that he should feel the refult. It is his business to have genius and taste to find these effects, and that of the theorist to feck and explain whence they arise."

To accompany recitative on a keyed-instrument, where no regular time is observed, and the singer utters in musical tones, a ffoliope or dialogue, under no more restraint, as to measure, than if he were declaiming in common speech, the instrumenatal accompanier must attentively read the words, and dirike the chord firmly which is given to the most accented and energetic part of a verse or period, exactly when it is pronounced by the singer, except at a clofe or termination of a fene or period, when two chords are given without the voice: one to the base of the 5th of a key, with a sharp 3d, and the other usufally to the key note, in whatever key the modulation is carried; but this expectation is often disappointed, except at the clofe which immediately precedes the air.

We shall pursue the subject of Accompaniment still further, under the articles Harmony, Chords, Thorough-bass, Regle de l'octave, Figuring a base, and Recitative.

Accompaniments, in Heraldry, are all fuch things as are applied about the field by way of ornament, as the belt, mantlings, supporters, &c. A thing is also said to be accompanied when there are several bearings or figures about some principal one, as faltier, band, fefs, chevron, or the like.

Accompaniments, in Painting, denote fuch objects as are added by way of aptitude or ornament to the principal figures; as dogs, guns, game, &c. in a hunting-piece.

ACCOMPLICE, compounded of ad, to, con, together, and ficulare, to fold, in Law, one that has a concern in a busines, or that is privy in the fame defign or crime with another. See Accessory.

By the law of Scotland, the accomplice can only be prosecuted after the conviction of the principal offender; unless the accression of the accomplice be immediate, in ipso actu, so as in effect to render them co-principal. By the general rule, the accomplice suffers the fame punishment with the principal offender. Yet if he be remarkably less guilty, justice will not permit equal punishment. The council of Sens, and several other synodical statutes, expressly prohibit the revealing of accomplices. See Discovery of accomplices.

ACCOMPLISHMENT, in a general sense, the entire execution, achievement, or fulfilling of something proposed, or undertaken.
ACCOMPLISHMENT, in Theology, is principally used in speaking of events foretold by the Jewish prophets, in the Old Testament, and fulfilled under the New. In the writings of biblical commentators and critics, we read of a literal, mystical, typical, single and double accomplishment. Prophecy may be accomplished either directly or by way of accommodation. See Prophecy.

Accomplishment is more particularly used for any personal endowment, mental or corporeal.

ACCOMPT. See Account.

ACCOUNT, in Law, is a verbal agreement between two, at the least, to satisfy an offence which the one hath committed against the other; whether it be a trespass, or the like; for which the one agrees to make, and the other to accept, a certain satisfaction. This, if executed, becomes a good bar in law to any suit to be brought for the same matter. Accord with satisfaction is a good plea in personal actions, where damages only are to be recovered, and in all actions, which appose a wrong, 

vi et armis, where a capias and exigens lay at the common law, in trespass and ejectment, &c. So in an appeal of Maileon. But in real actions, it is not a good plea. 4 Rep. i. 970. 9 Rep. 77. By several late statutes, particularly 11 Geo. II. c. 19, in case of irregularity in the method of distraining, and 24 Geo. II. c. 24, in case of mistakes committed by justices of the peace, even tender of sufficient amends to the party injured is a bar of all actions, whether he thinks proper to accept such amends or not.

ACCOUNT, in Music, is more usually called Concord. It is also used by old authors for Chord.

The word is formed, according to fome, from the Latin ad, to, and cor, the heart; but others, with greater propriety, derive it from the French corde, a string; on account of the agreeable union between the sounds of two strings struck at the same time. Whence also fome of the connoisseurs in music are called tetra chord, hexachord, &c., which are a fourth and a sixth.

ACCORDER, Ital. to tune instruments.

ACCOUNT, Fr. to agree.

ACCOUNT, in Painting, denotes the harmony that prevails among the lights and shades of a picture.

ACCOUNTS, Stephen Tabourot, Seigneur des, in Biography, an advocate in the parliament of Dijon in France, was born in the year 1549. The lordship of Accords is an imaginary fief or title, derived from the device of his ancestors, which was a drum, with the motto, à tous accord, “chiming with all.” S. Accords was a man of genius and learning, but too much addicted to trifles, and to a licentious mode of writing. This appears from his piece entitled “Les Biguarres,” printed at Paris in 1582; and another called “Les Touches,” published at Paris in 1585, which is a collection of witty poems indiscreetly written. Bayle.

ACCOUNTED, in Heraldry, a term not often used, but of the fame signification with Cottised.

ACCOUNTICHER, and ACCOUNTICHEUSE, Fr. a man or woman practising midwifery.

ACCOUNTMENT, Fr. the act of delivery.

ACCOUNTMENT premature, Atirement, or Faussé Couche, Fr. the premature exclusion of a fetus.

ACCOUNT, or ACCOMPT, of ad, to, and computa, a computation, in Arithmetic, a calculation, or computation of the number or order of certain things; as the computation of time, &c. There are various ways of accounting, as by enumeration, or telling one by one, and by the rules of arithmetic, addition, subtraction, &c.

ACCOUNT, in Chronology, is nearly synonymous with Vol. I.

STYLE. We account time by years, months, &c. the Greeks accounted it by olympiads; the Romans by indentions, libres, &c.

ACCOUNT is also used in respect of a company or society, when two or more persons have received or disbursed money for each other; or when this has been done by their order or commission.

ACCOUNT, or ACCOUNTS, is also used collectively, for the several books or registers which merchants keep of their affairs and negociations.

There are divers kinds of accounts among merchants, as personal, real, imaginary, general, particular accounts, &c.

ACCOUNT, personal, are those which discover what each person, or subject, with whom a man has dealings on credit, owes to, or has owing to him.

ACCOUNT, real, are those whereby a dealer discovers what effects are on hand at any time, and what is gained or lost on each.

Every account is distinguished into two parts, for which two opposite pages are assigned of one folio or opening; the name of the person with whom a man has account being written on the top of each, with the word debtor on the left side, and creditor on the right.

ACCOUNT, personal, is to contain on the debtor side what the person owes me, and the payments I make to him; and on the creditor side, all that I owe to him, and the payments he makes of his debts to me.

ACCOUNT, real, must contain on the debtor side the quantity and value of what was upon hand at the beginning of the account, and all afterwards received, with the costs and charges thereof; and on the creditor side, the quantity and value of what is disposed of or any way taken out of it, with the returns made by it.

ACCOUNT, imaginary, are then brought in to make a balance between credit and debt, and in cases where the real and personal accounts will not in the articles belonging to them make, as they usually do, such balance.

The chief of these is the account of profit and loss; on the debtor side of which are entered all losses, and on the creditor side all gains. Such also is the stock account, &c.

ACCOUNTS, sundry, when one account is balanced by sundry, i.e. when one is debtor or creditor for a sum, and sundry accounts creditors or debtors for the parts of the sum; it is entered under the head of to, or by, sundry accounts.

ACCOUNTS, general, are those where all the goods of the same name are put into one account.

ACCOUNTS, particular, are those where each species, or subdivision of things under the same name, have their separate account.

ACCOUNT, open, is used for an account not liquidated or settled.

ACCOUNT, in bank, is a fund of money, which merchants, or others, place in the common cash of a bank, to be in readiness for the payment of bills of exchange, or promissory notes, purchases, and other debts contracted in the course of business.

ACCOUNT, current, amounts to the same with an open account.

ACCOUNT, opening on, with any one, signifies the placing him, for the first time, in the great book. This is done by writing his name, surname, and place of residence in large characters, and afterwards charging him with articles, either of debtor or creditor, as affairs turn up. When an account is opened with any person in the great book, his name is at the same time to be entered in the index or alphabet book, with the page wherein his account is to be found.

ACCOUNT, placing a sum to an, is to enter down in the great
great book the several particulars for which a person becomes either debtor or creditor.

Account, examining on, is the reading it exactly over, pointing the several articles, and verifying the computation, in order to find whether there be any error, and whether the sum total, or the balance, be just.

Account, calling up, or closing on, is the flatting and settling of it, to find the balance: this is called also balancing or settling an account.

Accounts are closed in the great book, on two occasions: the first, when it is required to terminate an affair entirely, either with debtors or creditors, in order to learn what is due. The second, when it is necessary to carry on the account to another page of the same book, or to a new book, for want of room.

Account, balance of an, is the sum by which the debt exceeds the credit, or vice versa, upon flatting or settling of it.

Account of sales, is an account given by one merchant to another, or by a factor to his principal, of the dipofals, charges, commission, and net proceeds of certain merchandise, lent for the proper, or company, account of him, who confined the name to such factor or vender.

When the like account is inland or domestical, the name is transmitted in the current money of that country wherein the business is transacted. As from a Blackwell-hall factor to the clothiers in the country, or from the warehousemen in town, who deal by commission for the country manufacturers.

Account, money of, is an arbitrary species, contrived for the facilitating, and expediting the taking, and keeping of accounts. Such are pounds sterling in England; livres and folis in France; roupces in India; milreis in Portugal.

Accounts, books of, of merchants and tradesmen, are considered as a fort of private instruments, and in the civil law, and law of merchants, are allowed to make a half proof. The reason is, that merchants are often under a necessity of dealing on trust without note or writing. Hence the suppletory oath of the merchant, with his book of accounts, is admitted abroad as a full proof against his chimney. But in England this is under some limitation. See stat. 7 Jac. I. c. 12. which confines this species of proof to such transactions as have happened within one year before the action brought; unless between merchant and merchant, in the usual intercourse of trade.

Account, or Accrunt, in a legal sense, is a particular detail or enumeration, delivered to a court, a judge, or other proper officer or person, of what a man has received or expended on the behalf of another, whose affairs he had the management of.

In the remembrancer's office in the exchequer, are entered the states of all the accounts concerning the king's revenues; for customs, excise, subsidies, &c.

The great accounts, as those of the mint, wardrobe, army, navy, tents, &c. are called imprest accounts.

All accounts which pass the remembrancer's office are brought to the office of the clerk of the pipe. See Tally and Auditor.

Account, in Common Law, denotes a writ or action which lies against a person, who by his office ought to give an account, but refuses.

A writ or action of account properly lies only against bailiffs, receivers, and guardians in suo caso; though others are also brought in as a secondary intention. By 4 and 5 Anne, actions of account may be brought against the executors and administrators of guardians, bailiffs, receivers, &c. and by one joint-tenant, &c. against the other, his executors and administrators, as bailiff, for receiving more than his share: however, actions of account are now very seldom used; the most ready and effectual way of setting matters of account being by bill in a court of equity.

Accounts, chamber of, in the former French policy, is a sovereign court of great antiquity, where the accounts relating to the king's revenue were delivered in, and registered. This answers pretty nearly to the court of exchequer in England.

There are presidents of accounts, masters of accounts, correctors of accounts, &c.

ACCOUNTANT, or Accurant, in a general sense, denotes a person skilled in accounts. In a more limited sense it is applied to a person, or officer, appointed to keep, or make up the accounts of a company, office, court, or the like.

Thus there are accountants in the custom-house, the excise, bank, South-Sea, and East India-house.

ACCOUNTANT-General, an officer in the Court of Chancery, appointed by act of parliament, to receive all monies lodged in court, instead of the masters, and convey the same to the bank of England for security. Counter-balancing the hand of the accountant-general is felony without clergy, by 12 Geo. I. c. 32.

ACCOUNTSHIP, the act of keeping and balancing accounts. See Book-keeping.

ACCOUNTS, Public, Commissioners of, are five persons appointed by letters patent under the act of 25 Geo. III. c. 52. who are invested with the powers formerly entrusted to the auditors of the imprest, and who receive salaries paid out of the aggregate fund, not exceeding in the whole 6000l. They hold their office quamdiu se bene gesserint, except two of them, who are comptrollers of the army accounts, and who continue comptrollers for long only as they are comptrollers. The Treasury likewise appoints officers, clerks, &c. to make up and prepare for declaration the public accounts of the kingdom, and all charges are allowed out of the aggregate fund to an amount not exceeding 6000l. per annum, which sum precludes all fees and perquisites. The purposes for which these commissioners are appointed are to examine and state in what manner, and at what times, the receipts, issues, and expenditures of the public monies are now accounted for; and to consider and report, by what means and methods the public accounts may, in future, be pass'd, and the accountants compelled to pay the balances due from them, in a more expeditious, more effectual, and less expensive manner. The commissioners have already made a great number of reports.

ACCOUNTREMENT, an ancient term used for an habitation; or a part of the apparatus and furniture of a folliar, knight, or even of a gentleman.

The word is formed from the ancient German, Lasten; whence cosse, a name used in some cathedrals in France, as at Bayeux, for the sacriflan, or officer, who has the care of furnishing, and setting out the altar, in the church; called in German Lasten, vocation.

ACCRETION, of ad, to, and refsers, to grow, in Physia, the growth or increase of an organical body, by the accesion of new parts: also a growing together, as of the fingers to one another.

Accret is of two kinds; the one consisting in an external apposition of new matter. This is what we otherwise call, juxtaposition; and it is thus, stones, shells, &c. are supposed to grow.

The other is by some fluid matter received into proper vessels, and gradually brought to adhere, or grow to the sides
AC

fides thereof. This is what we call introspection; and it is thus that plants and animals are nourished.

Accretion, in the Civil Law, denotes the union or accession of a thing vague or vacant, to another already occupied or disposed of.

A legacy given to two persons jointly, *tam re quem vexeris*, falls wholly to him that survives the testator, by right of accretion. Allusion is another species of accretion.

Accroche', in Heraldry, denotes a thing being hooked into another. Coats Herald.

Accroching, in old Law books, the act of incroaching or usurping on another's right; and particularly the attempt to exercise royal power, which was a very vague charge, and led to a multitude of constructive treasons. These are limited and defined by Stat. 25 Ed. III. cap. 2. The word is originally French, *accrocher*, which signifies to fallen a thing by a hook.

Accrew, or Accrue, in Law, is understood of a part that accedes to, or follows the property of, another part or person.

Accrued, in Heraldry, a term applied to a tree full-grown.

Accubation, a posture of the body, between sitting and lying.

The word is compounded of *ad*, to; and *cubo*, I lie down. Accumulation, or accumulus, was the table posture of the Greeks and Romans; whence we find the words particularly used for the lying, or rather, as we call it, sitting down to mealt.

The Greeks introduced this posture. The Romans, during the frugal ages of the republic, were strangers to it. But as luxury got footing, this posture was adopted, at least by the men; for as to women, it was reputed an indecency in them to lie down among the men; though afterwards this too was got over. But children did not lie down, nor servants, nor soldiers, nor persons of meaner condition; but took their meals sitting, as a posture less indulgent.

The Roman manner of disposing themselves at table was this; a low round table was placed in the cenaculum, or dining-room, and about this usually three, sometimes only two beds, or couches; according to the number of which, it was called *biclinium*, or *triclinium*. These were covered with a sort of bed-cloaths, richer or plainer, according to the quality of the person, and furnished with quilts and pillows, that the guests might lie the more commodiously. There were ordinarily three persons on each bed; to crowd more was esteemed forbid. In eating they lay down on their left sides, with their heads resting on their pillows, or rather on their elbows. The first lay at the head of the bed, with his feet extended behind the back of the second: the second lay with the back of his head towards the navel of the first, only separated by a pillow, his feet behind the back of the third; and so of the third, or fourth. The middle place was esteemed the most honourable. Before they came to table they changed their cloaths, putting on what they called *cenatoria vestitas*, the dining garment, and pulled off their shoes, to prevent soiling the couch. Pituji.

Lex. Ant.

Accubitor, an ancient officer of the emperor of Constantinople; whose business was to lie near the emperor. The accubitor was the head of the youths of the bedchamber, and had the cubicularius and procubitor under him.

Accumulation, compounded of *ad*, to; and *cumulus*, heap; the act of heaping, or amassing several things together.

Accumulation, in a legal sense, denotes a concurrence of several titles to the same thing; as, when a person claims lands, a benefice, or the like, in virtue of several titles, or pretensions of different kinds; e.g. by death, by renunciation, &c. Or it denotes a concurrence of several circumstances to the proof of one fact; thus, we read of accumulative treason, which is, where a fact is not treason in itself, but becomes so by an accumulation of circumstances.

The earl of Strafford was condemned of accumulative treason; none of the facts alleged against him amounting singly to treason. But his attainer was reversed by 13 & 14 Car. II. cap. 20.

Accumulation, in the ancient Agriculture, denotes the operation of covering up the roots of trees, by throwing on them the earth that had been before dug from them; in which sense, accumulation stands opposed to *ablation*.

Accumulation of arms, *cumulatio armorum*, in Heraldry, is what the moderns call quartering of arms, *Nilot*.

Accumulation of Degrees, in an University, is used for the taking of several degrees together, and with fewer exercises, or nearer to each other, than the ordinary rules allow of.

Accursed; something that lies under a curse, or sentence of excommunication.

In the Jewish idiom, *accumus* and *crucificus* were synonymous. Among them, every one was accounted accursed, who died on a tree.

This serves to explain the difficult passage in Rom. ix. 5, where the apostle Paul wishes himself accursed after the manner of Chrift, i.e. crucified, if happily he might by such a death save his countrymen. The preposition *et* here made use of, is used in the same sense, 2 Tim. i. 3, where it obviously signifies after the manner of.

Accursius, in Biography, a professor of law in the 13th century, born in Florence, who, on account of his great authority, was called the idol of the lawyers. Three other lawyers of eminence had the same name.

Accursius, Maximillianus, a famous critic of the 16th century, born at Aquile, in the kingdom of Naples. His *Diatribe*, printed at Rome in 1524, fol. on Autonius, Solinius, and Ovid, evince his distinguished erudition. In his edition of Ammianus Marcellinus at Augsburg, in 1533, there are five books more than in any preceding ones, and he says that he had corrected 5000 errors. Although his predominant passion was the collecting of old MSS, he nevertheless made Latin and Italian verses, was matter of the French, German, and Spanish languages, and under- stood optics and music. Having been charged with plagiarism in his edition of Autonius, he purged himself by oath. Bayle.

Accursius, or Accorso, Francis, the elder, an eminent lawyer, was born at Bogno, near Florence, in 1182, and became professor of law in the university of Bologna, where he had studied. He undertook the great work of forming into one confluent and harmonious whole, the numerous commentaries on the Code, the Institutes and the Digests. This work, intitled, "A perpetual Commentary," was much valued, and is printed with the "Body of Law," published in six volumes folio, at Lyons, in 1627. Accorso died very rich, in 1260. His son, the younger Francis Accorso, succeeded him in the chair of law; and, in 1273, accompanied Edward I. on his return from the crusades to England. Gen. Dict.

Accusatium, among Physicians, is a word of the same import as *indicatio*.
ACCUSATION, compounded of ad, to; and confari, to plead, in the Civil Law, the charging any person with a criminal action, either in one's own name, or on behalf of the public.

By the Roman law, there was no public accuser for public crimes; every private person, whether interested in the crime or not, might accuse, and prosecute the accused to punishment, or absolution. Cicero, in the Senate, when one of his party was found guilty of the murder of his master, accused the murderer and went before the judge to procure his sentence. Cato, who accused the most innocent persons of his age, had been accused forty-two times, and acquitted as often. But the accusation of private crimes was never received unless from the mouths of those who were immediately interested in them. Thus, none but the husband could accuse his wife of adultery. Indeed, it was not properly an accusation, except in public crimes; in private ones, it was called simply action, or intending an action, intendere accidere, or liter. When the accused accuses the accuser, it is called reformation, which is not admitted till the accused has been first purged.

The ancient Roman lawyers distinguished between condemnatio, delatio and accusatio: for, first, leave was desired to bring a charge against any one, which was called populare; then he, against whom the charge was laid, was brought before the judge, which was called dextra; or dominus delatio: lastly, the charge was drawn up, and preferred, which was properly the accusatio. Voet, Etym. Lat. The accusation properly commenced, according to Pardianus, when the reus, or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the delatio made by his opponent. Calv. Lex. Jur. p. 17.

The accusers, or actors, as they are called, were, by the laws of Pompey, A. U. C. 702, allowed two hours for pleading their cause, and the party charged three hours for a reply. Dion. Caes. lib. xl. 52. tom. i. p. 255, Ed. Reinar. They had a recompense assigned them, part of the property of those who were condemned, and they were frequently honoured with the superior offices of the state.

By the cruel laws of the inquisition, the accused is forced to accuse himself of the crime objected to him. There are three ways of entering an information in the tribunal of the inquisition. The first, by way of inquisition, when a private person, applying to the inquisitor, declares he will neither be denunciator, nor accuser, but that common fame gives out, that such and such a person is a heretic: the second, by way of accusation, when the informer takes on him the office of accuser, which rarely happens, because in this case, the accuser is obliged to prove, and exposes himself to the lex salutis, if his information should prove false. The last, and most usual way, is by denunciation, that is, by naming thoes who know the fact.

It has formerly been the custom in some parts of Europe, where the accusation was very heavy, either to decide it by combat, or at least to make the accused purge himself by oath; which, however, was not admitted, unless a certain number of his neighbours and acquaintance swore together with him.

In the French law, none but the procureur general, or his deputies, can form an accusation, except for high treason, and coinage, where accusation is open to every body. In other cases, private persons can only act the part of denouncers, and demand reparation for the offence, with damages.

In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers, or the law: none shall be vexed with any accusation, but according to the law of the land: and no man may be molested by petition to the king, &c. unleas it be by indictment or pre-
Thus, when we say, "the prince loves the princes," and "the prince loves the prince," the prince is the nominative in the first, and the accusative in the last; and the prince or the prince, the accusative in the first, and the nominative in the second. ACE, a card or die, marked only with one point.

Aces, in Ancient Geography, a name given by several of the ancient writers to the city afterwards called Ptolemais, and now Acre. Strabo, Geog. vol. ii. p. 1099.

ACELA, a city of Lycaia.

ACEDAMAS, was a place without the south wall of Jerusalem, beyond the river of Siloam, and was called the Potter's field, (Matt. xxiii. 31.) because they dug out of it the earth of which they made their pots, and the Fuller's field, because they dried their cloth there; but being afterwards bought with the money by which the high priests and rulers of the Jews purchased the blood of Jesus Christ, it was, by the Providence of God so ordering it, called Acedama, i. e. the field of Blood. Acts ii. 19.

ACELIUM, or Acelum, a town of the Venetian territory, now called Asolo, or Asala, situate to the west of Trevisi, at the source of the rivulet Muffone. E. long. 13°. N. lat. 45°.

ACENTETUM, or Acentata, in Natural History, a name given by the ancients to the purest and finest kind of rock crystal. They used the crystal in many ways; sometimes engraving on it, and sometimes forming it into vases and cups, which were held next in value to the Murkhus Vince of those times. The crystal they obtained from the mines of Cyprus was much esteemed, but often faulty in particular parts, having hairs, cracks, and foulnesses, which they called faults, in the midst of the large pieces. Pliny tells us (N. H. vol. ii. p. 769. Ed. Har.) that when it was used for engraving, the artist could conceal all these blemishes among the strokes of his work; but when it was to be formed into cups and precious vases, they always chose the acentata, i. e. the pure crystal, which had no flaws nor blemishes.

ACEPHALUS, or Acephalitse, a term that frequently occurs in Ecclesiastical History, as the denomination of various facts: particularly—1. Of those who in the affair of the council of Ephesus, refused to follow either St. Cyril, or John of Antioch. 2. Of certain Chirilans of the fifth century, who at first followed Peter Mongus, but afterwards abandoned him, upon his subscribing the council of Chalcedon, and were thus deprived of their chief; being generally of the opinion of Eutyches, that there was only one nature in Christ. This fact was afterwards divided into three others, who were called Anthropophiltes, Baranophites, and Theranitis; and these again, in the following century occasioned new factions, frequently mentioned by the ancient writers. However, these numerous branches of the Eutychian faction declined gradually in the next century; and the influence of the famous Baranurus chiefly contributed to their extinction by the union which he established among the members of that fact. 3. Of the adherents of Severus of Antioch; and of all in general who refused to admit the council of Chalcedon.

ACEPHALUS, in English History, a name given to the levellers in the reign of Henry I. who were reckoned so poor, that they had not a tenement by which they might acknowledge a superior lord. In this sense the term is used in our ancient law-books, for persons who held nothing in fee, either of king, bishop, baron, or other feudal lord.

ACEPHALUS, or Acephalus, composed of the privative α, and άκεφαλος, head, something that wants a head. Phyll represents the right hand, or acephalous nation. Solinus and Sulpitius mention others in India, near the Ganges, without a head, and with their eyes in their shoulders. Mela, Snider, Stephanius Byzantis, Vopifus, and other writers, furnish similar relations; and latterly modern travellers pretend that they have found people of the same description in America. The origin of this fact has been variously explained. Bartholin understands it metaphorically, affirming that the Acephali had lost their brains, or conducted themselves with less prudence than others. In the opinion Bochart seems to have concurred. See BLEMYES.

Olearius ascribes it to the dregs of such perfons, alleging, that the Samogitians being short of nature, and covering their heads with hoods in winter, formed at a distance, as if they were without heads. Latinius says, that the term Acephali was merely a denomination of people whose heads were depressed below their shoulders. It is, in his epitome of Raleigh's voyage to Guinea, speaks of a people discovered by that traveller in the province of Iviapan, between the lakes of Panama and Caffiga, who had no head or neck; and Hondius, in his map, marked the place, and delineated the figures of these monstros. However, De Laet (Deler. Americ. l. xviii. c. 32.) rejects the story, and relates, that those who dwelt on the banks of Caora, a river that flows out of the lake of Caffiga, had their heads so far sunk between their shoulders, that many believed they had their eyes in their shoulders, and their mouths in their breasts. But though the existence of a nation of Acephali be ill-warranted, naturalists furnish several instances of individuals born without heads, by some latus or aberration of nature. Wepfer gives a catalogue of such acephalous births from Schenkenius, Licius, Paratus, Wolius, Maurice. &c. Acephalus worms, or what are deemed such, are frequent. The limbeus inosul, or joint worm, was long taken to be acephalus. The first who ascribed a head to it was Tulpus, and after him Feb; the former even makes it two heads, or two-headed. See TFXA.

ACEPHALUS, Clerk. See CLERK.

ACEPHALUS is also used in Poetry, for a verse which is defective in the beginning. Some also give the name acephalous to all verses which begin with a short instead of a long syllable.

MACER, in Botany, as called, from ariit, denoting the hardness of the wood, or according to others, from arce ingredium, because the common maple was much employed by ingenious architects in fine works, a genus of the Monocot order and polygama class of plants, and belonging to the natural order of Tribeata. Its generic and essential characters are these: it hath hermaphrodite and male flowers on the same tree; the hermaphrodite calyx is a one-leaved, five-cleft, acute, coloured, flat, and entire at the base, permanently perianth; the corolla has five petals, ovate, broader outward, obtuse, scarcely larger than the calyx, and spreading; the stamens consist of eight or ten filiform short filaments; the anther are simple, and the pollen craneiform; the pistillum has a compressed germ, immersed in a convex, perforated, large receptacle; the style is filiform and daily progressive; the stigmas are two or three, pointed, slender, and reflex; the perianth is composed of as many capsules as stigmas, with one seed in each, coalescent at the base, roundish, compressed, and each terminated by a very large membrane- like wing; the seeds are solitary and roundish; the male flowers are the same with the hermaphrodites, except that they have neither Kern nor style, but only a bisd stigma. On the unfolding of the flower the stigma only appears, and a few days after, the style. The hermaphrodite flowers in the

The text is difficult to read due to the poor quality of the image and the handwriting style. It appears to be a page from a book discussing various historical and natural facts, possibly related to geography, botany, and ancient history. The content is fragmented and requires careful reading to understand fully.
the same umbel are often of two kinds: the lower ones feminine hemiphractis, of which the authors do not burth, but the phyll grows into a fruit; the upper ones maleine hemiphractis, of which the authors scatter their dust, and the phyll does not grow, but fall off. Mr. Martyn in his much improved edition of Miller's Dictionary, emaculates and describes twenty species. In the first edition of Lin- men by Gmelin, the Aec is a genus of the Osmundrea Monoginea class and order, including twenty species. For the properties and uses of the several species, and the method of propagating and cultivating them. See Maple and Sycamore.

ACER. See Bannisteria and Tripteris.

ACEROS, Phalerius, in Natural History, a kind of Pha- lera, found on the Acer, Aesculus, and Juglans.

ACERATOS, acerata, from ex negative and acer, or exacera, to mix, unmixed, uncorrected, is applied sometimes to the humours of the body by Hippocrates. Paulus Aeginita mentions a plaster under this name. See ACERIDES.

ACERB, a compound noun, consisting of four, with the addition of a degree of roughness, and alligancy; such as that of unripe fruit.

ACERIDES, aceris, from ex neg and exacer, or exacera, denote plasters made without wax.

ACERINA, in botany, a name given by Playl, and others of the old naturalists, to the fish now called the Cerma and Aurala Fluvialitis, and in England the Ruff. The acerina of Gmelin's Linnaean system is a species of Perca, whose dorfar fih ha 31 rays and 17 spines. It approaches to the Cerma in many respects, but differs from it in the number of rays and spines of the dorfar fin, and the size of its head, which is longer. It is found in the Euxine sea, and the lake of Moeotis, and the rivers that run into them.

ACERNO, in Geography, a small city of Naples, with a bishop's see, about 12 miles N.E. of Salerno. E. long. 15° 15'. N. lat. 40° 45'.

The city name is also the given name by the Portuguese, on the first discovery of it in the 15th century, to the island now called the Isle of France.

ACEROS, leaf, in botany. See Leaf.

ACEROSUS, chaffy, is an epithet, denoting the browned and coarset fruits of bread, made of flour not separated from the bran.

ACEROSUS, in Natural History, a name given by Vogel in his Mineralogy to a species of Talc.

ACERRA, in Antiquity, a kind of altar, erected among the Romans near the bed of a perfon deceased; on which his friends daily burned incense till the time of his burial. The Chinese have a similar custom. They erect an altar to the deceased in a room hung with mourning; and upon it they place an image of the dead person, to which every one that approaches it bows four times, and offers oblations and perfumes. The original intention of the practice was, without doubt, to overcome any offensive smell that might proceed from the corpse.

By the laws of the 12 tables, the erecting of aceress was prohibited.

The Aceress also signified a little pot, wherein the incense and perfumes were put, to be burnt on the altars of the gods, and before the dead. It appears to have been the same with what was otherwise called thoriumum and pyxie.

We find mention of aceress in the ancient church. The Jews also had their aceress, in our versions rendered cenfers; and the Romans still retain them under the name of incense-pots. In Roman writers, we frequently meet with aceress plena, a full aceress; for understanding which it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains; the former poured out aceress full on the altar; the latter took out two or three bits with their fingers. Pithie. Lex. Ant. Britann. De Formul. l. 1.

ACERRA, in Geography, a walled town of Naples in the Terra di Lavoro, situate on the river Acerr, seven miles N.E. of Naples. It is the residence of a bishop, and has the title of an episcopal. E. long. 14° 30'. N. lat. 40° 55'.

ACERRA, in Ancient Geography, the name of a town on the Clunibus in Campania, now ACERRA. It was a Roman colony, and its inhabitants were reckoned a brave people; "Aceress plus minus, quam virum erat," says Livy, l. xxiii. c. 17. tom. iii. p. 739. Ed. Drakenh. This was also the name of another town, now called La Girdola, or Gherra, which retains some trace of the original name, in the territory and to the S. E. of Ledi, where the river Serio falls into the Adda, to the W. of Cremona, and N. of Pheasantia. It was formerly a place of considerable importance. Its siege by the Romans is particularly described by Polybius, l. ii. p. 121. Ed. Caub.

ACERI, a town of Spain, belonging to the Lacta- tani; probably Cerri.

ACESIe and Acesamn, cities of Macedonia.

ACESCENT, a word used to denote any thing which is turning four or acid, or which is slightly acid. It is only applied properly to denote the spirit of these two meanings. The second may be better expressed by either of the words acidulous, or subacid.

ACESINES, in Ancient Geography, a large and rapid river of India, which Alexander passed in his expedition into that country; and on the bank of which he built a city under the direction of Hephaestion. The kingdom of Porus, whom he vanquished, and which, according to Strabo, contained about 300 cities, lay between the Hydaspes and this river, which, after receiving the former and other considerable rivers, emptied itself into the Indus. Its situation is not precisely known. Arrian says, (De Expedit. Alex. l. v. p. 222. Ed. Gronov.) that, where Alexander passed it, its breadth was 15 fathoms, its course very rapid, and the channel full of large and sharp rocks. It was subject to extraordinary inundations, rising at the summit of the cubits and overflowing the adjacent plains. Thespis (Hist. l. iv. c. 12) speaks of the reeds that grew near this river; and Pliny (H. N. l. xxxiv. c. 12. tom. ii. p. 796) says, that this and the Ganges furnished gems. We read of trees near this river of such magnitude, that 50, some say 400 horsemen might lodge under the spreading branches of one of them; and that they produced long pods of honey, which proved fatal to those who eat it. Strabo, Geog. vol. i. 1041—1022. Some have supposed that the Aces- 
es of Arrian was the river now called Ravee; but major Rennell, in his Memoir, gives good reasons for concluding that the modern Jumna was the Acesines of the ancients.

ACESINUS, a river of Sarmatia, called by Pliny Panticapes.

ACESIUS, in Biography, a bishop of Constantinople, in the reign of Constance, was a disciple of Novatus, who founded a feet whose tenet was, that those who had fallen from the faith in time of perfecution, or who after baptism had committed any mortal sin, were not to be admitted to the communion of the church, even on their exhibiting tokens of sincere repentance. Constance was so much displeased with the severity of this sect, which disencouraged repentance, that, after questioning Acesius concerning it, he said, "then, Acesius, make a ladder for yourself, and go up to heaven alone." This story is related by Sozomen (l. i. c. 10.) and Sozomen (l. i. c. 22); but disputed by Valens.
ACE

Valerius, (Annot. p. 9), and defended by Dalfange, Ann. 325, No. 33. Bayle. Lardner’s Work, vol. iii. p. 224, 

ACESTA, of axono, to cure, signifies curable dilem- 
pers.

ACESTA, in Ancient Geography, a name given by Virgil (Ann. v. v. 71.) to a town called Segesta. 

ACESTI, in Entomoloes, a species of Papilio, found 

in India, with suffused wings, the anterior black, with 

a yellow base and band, the posterior yellow, with brown 

bands under the body.

ACESTIDES, a name given to the chimneys of fur- 

naces where brafs was made; contrived narrow at the top, 

for receiving and collecting the furnes of the melting 

metal, that cadmia might be produced in greater 

quantities.

ACESTIS, a race, a fictitious sort of erythocola, 

made of Cyprian verdigris, the urine of children, and nitre.

ACESTRIDES, female physicians. Midwives were fo 

called among the Greeks.

ACETABULUM, in Antiquity, a little vase or cup, 

used at table for serving up things proper for fiuce, or 

seasoning; much after the manner of our salts and vinegar 

crucets. Hence, Agricola, in his Treatise of Roman 

matters, takes the name to have been formed from acetum, 

vinaegar, supposing that it was principally designed to serve 

vinaegar.

ACETABULUM also denotes a Roman measure, used both 

for liquid and dry things, chiefly in medicine. The ace- 

tabulum contained a cyathus and a half, as is proved by Agri- 

cola, from two varis of Pannus; who, speaking of the 

cyathus, says it weighs ten drachms; and the oxyphalus, 

or acetabulum, fifteen, or about one eighth of a pint.

" Bis quinque hume faciunt drachma, s appellantent tentes; 

Oxyphalus fict, si quinque addantur ad illas;" 

Du Pinet, in his Treatise of weights and measures, pre- 

fixed to his translation of Pliny, makes the acetabulum of 
celc weigh two ounces and two scruples; the acetabulum of 

celc, two ounces, two drachms, a grain, and a third of a 

grain; and the acetabulum of honey, three ounces, three 
drachms, a scruple, and two siliqua.

ACETABULUM, in Anatomy, a name given by Latin 

writers to that cup-like cavity of bones formed for arti- 
culation, which the Greeks called Cotyle or Cotyldon, 

from its sapposed resemblance to a certain small mem- 

brane. When the round end of one bone is lodged in a spheri- 
cal cavity of another, the joint admits of motion in almost every 

possible direction. This species of articulation is tech- 
nically termed Exarthrosis. See J oint. See also Co- 
yledon.

ACETABULUM is also used by Anatomists, in the same 

sense with Cotyledon. It signifies also a glandular sub- 

stance, found in the placenta of fowl animals.

ACETABULUM, in Botany, a species of Pizzia; so 

called from its resemblance to a cup. It is selfile and ex- 
ternally angled, and has ramofo veins.

ACETABULUM is also a species of Lichen; and it is 
a name given to the Cotyledon and Crassula; and with 

the epithets marium minus to the Androsaces, sea Navel- 

wort, or umbilicus marinus. See Tubularia.

ACETARIA. See Sallet.

ACETARII, in the Material Medicin, a kind of pickle, in which Dr. Bates advisces forputic patients to 
dip their vegetables before they eat it. It is thus made. 

1 fol. cochlear, maris. 5 gij. Sacchar. albus. 5 vi fali cochlear. 

5 li bice contund. finim et adda suce, awart. 5 vi. Mo- 

therby’s Dirr. by Wallis.

ACETARY is used for an inner part in the structure of 
certain fruits, thus called from the fowmese of its tale. The 
acctery of a pear is a globular part, lying within the 
calxuley or chokal, and surrounding the core. It is of 
the same fowmese with the parenchyma, or pulp, only that the 
bladders of which it consists are smaller, and rounder than 
those of the parenchyma; from whence, however, it 
seems to be derived. On this account it also sometimes 

called the inner parenchyma. The quince also has an acne-
tary, resembling, though less than, that of a pear.

ACETI Spiritu, spirit of vinegar; made by drenching 
copper-bellings with distilled vinegar, then evaporating it 
till the fumes of the vinegar cannot be felt; the saturation 
and evaporation to be again repeated, till the menstruum be 
ftatified; which being then distilled, the spirit comes over.

Its qualities and uscs are much the fame with those of the 
distilled vincaegar; excepting that it is more powerful.

AC ETIAM, in Law, a clause devised by the officers 
of the King’s Bench, and added to the usual complaint of 

trepidat, in order to maintain the jurisdiction of this court 

over civil injuries without force; of which statute, 2. 13 

Car. II. c. 2, had nearly deprived it. The bill of Middlefex 

having been framed only for actions of trepidat, a defendant 
could not be arrested and held to bail upon it for breaches of 

civil contracts. To remedy this inconvenience the above 

clause was adopted: the bill of Middlefex commanding the 
defendant to be brought in to answer the plaintiff of a plea 
of trepidat, ac etiam, and eft, to a bill of debt; and thus 

the complaint of trepidat gives cognizance to the court, and 

that of debt authorizes the arrest. In imitation of this Lord 

Chief Justice North directed, that in the common pleas, 

besides the usual complaint of breaking the plaintiff’s close, 
a clause of ac etiam might be added to the writ of Capias; 

and this was done in order to save the suitors of his court 

the trouble and expence of filing out special originals.

ACETIC ACID, in Chemifery, Radical vinaegar, Acide 

Aceticus, Vinaegar radical, Vinaegar de Vinaegar. If any 

quantity of crystallized acetum of copper (diluted verdigris) 

can be distilled in a glass retort, with a regulated heat, till at length 

the bottom of the vessel is nearly red hot, the equilibrium of the 

affinity between the component parts of the falt will be 
deestroyed, and several new fubfiances in confquence pro-

duced. The proportion of these on 1000 parts of the falt, 

according to an accurate analysis of Cit. Adet, will be 486 

acetic acid, 318 brown oxvd of copper mixed with charcoal, 

118 hydrogen and carbonic acid gas, and about 84 of the 

acctum of copper, will remain unredcepted. In order to 

be fully aware of what takes place in these changes, it is 

necessary to observe, that the crystallized acetum of copper 

contains hydrogen and oxygen forming the water of crys-

tallization, hydrogen, carbon, and oxygen forming acetic 

acid, and copper, with about 25 per cent. of oxygen. By 

the processes of disfillation, the acetic acid appears to be 

decomposed by the separation of part of its hydrocarbonous 
afe, and at the same time the oxvd of copper is brought to a 

lower state of oxvdation: part of the carbon becomes 

reuelued at the exptence of the copper, and, uniting with the 

hydrogen, forms hydrogenous gas; the remainder of 

the carbon is found in the retort, mixed with the oxvd of 

copper, and polishes the properties of a pyrophous. Thux 

it beaux that acetic acid differs from acetous, in a larger pro-

portion of oxygen to the fafe, which is effected not by an 

addition of oxygen, but by a diminution of the fafe. 

Acetic acid may also be procured by diluting together 

acetum of lead, of foda, potash, or lime, with sulphuric acid; 

the product is however, in this cafe, contaminated by sul-

phurous acid gas; but this may be in part prevented, by 

adding
adding to the materials some black oxyl of manganese. M. Badolier proposes to obtain acetic acid, by distilling equal parts of sulphat of copper, and acetite of lead; the acid thus produced cools only a fourth of that which is formed from acetite of copper. In its general properties, acetic acid is very similar to acetoic acid, yet differing from it in the following particulars.

The active acid qualities of this fluid bring it to a near resemblance with some of the mineral acids; it is corrosive, and intensely acid to the taste; it exhales a pungent almost suffocating odour, and has nothing of the spirituous flavour of distilled vinegar; its specific gravity is 1.0626. With earthly and alkaline bases it unites readily, forming the genuf neutral and earthy acetats, the properties of which have been but very little examined. It diffuses copper, and certain other metals which are not soluble in acetic acid, and it is capable of partly decomposing and uniting with alcohol, forming acetite Ether.

This acid is of some use in the laboratory, and is employed occasionally in medicine, as a stimulant application to the nostrils in fainting fits; for this purpose some acetite of potash is put into a smelling-bottle, and a little sulphuric acid is poured upon it. Annales de Chimie. xxvii. 299. Gren's Chem. xi. 113. Tourrey, Syll. des Connais. Chim. viii. Gren's Chem. iii.

This salt occurs native in the sap, and certain other vegetable juices, and also in the urine of some quadrupeds: it is prepared artificially by adding to pearlash, or carbonat of potash, distilled vinegar, till the liquor contains a slight excess of acid; if the salt is wanted in a solid state, evaporation in a glafs or silver vessel must be had recourse to; when a pellicle appears on the surface, the process should go on at a very gentle temperature, till all the moisture is exhaled; there will remain a white nickeless salt, which must immediately, while warm, be put into a well-closed vial. The salt may also be obtained cheap and pure, by adding sulphat of potash to acetite of lime, evaporating to dryness in a water-bath, and dissolving out the acetite of potash by hot alcohol.

Acetite of potash has a lively penetrating odour, and a sharp taste; but leaving an alkaline imprefion on the palate: it crystallizes in needles and plates, the form of which has not been ascertained.

This salt has a strong affinity for water, deliquating readily in the air: it requires 1.021 parts of this fluid at 50° Fahren. for its solution, and, while dissolving, absorbs calorie; from its hot saturated solution in alcohol, crystals may be obtained by cooling.

Of the alcalies and alkaline earths, barytes alone is capable of decompoding acetite of potash, setting at liberty the alkali, and forming with the acid acetite of barytes.

The sulphuric, nitric, muriatic, fluoric, phosphoric, oxalic, tartaraceous, arfrican, succinic and malic acids, are each capable of separating the acetous acid from its alkaline base; all the easily soluable sulphats, and several other neutral salts effect the fame by double affinity.

Acetite of potash, subjected to dry distillation, yields hydro-carbonous gas, an ammoniacal liquor mixed with empyreumatic oil, sublimed crysallys of carbonat, or acetite of ammonia, and there remains in the retort, charcoal, with potash, partly caustic, and partly carbonatetd. The appearance of ammonia in this process, is a circumstance well worthy of accurate investigation: it was first observed by Beauné, and afterwards by Moreaun, and feems likely to throw much light on one of two very important questions, viz. Is azot a compound? Is ammonia one of the elements of potash? Ammonia consists of azot and hydrogen, but acetite of potash furnishes only oxygen, hydrogen, carbon, and potash; hence, it seems reasonable to suppose, either that these four substances contain the bases of azot, or that ammonia is one of the component parts of potash.

The above salt is applied to no use in the laboratory, or in the arts: it is an article of the Materia Medica, and possesses considerable diuretic qualities.

**Acetite of Soda. Acétite de Soude. Terra foliata mineralia vel crystatallizata.**

To any quantity of carbonated soda add distilled vinegar, leaving the liquor, however, still alkaline; evaporate gently to a pellicle, and by cooling, acetite of soda will be obtained in long fibred prismatic crysallys similar to those of sulphated pha, permanent in the air, soluble at a gente temperature in their water of crystallization, and of a pungent bitterish tafle.

Acetite of soda is easily soluable in water and alcohol, is decomposable with abfraction of the acid or alkaline base by potash, and the fame substances as the preceding falt: when kept long in solution it is converted into carbonat of soda by decompofition of its acid; if subjected to dry distillation it yields hydro-carbonous gas, empyreumatic oil, and acid, and there remains in the retort, charcoal and carbonated foda.

This salt is employed a little in France as a medicine—in this country is made no use of.

**Acetite of Ammonia. Acétite d'Ammoniaque. Ammonia Acetata et Spiritus Mindereri; Lond. et Edin. Pharm.**

This is prepared in the liquid form by adding carbonated ammonia to distilled vinegar till saturation. On account of its great volatility, it is not very eafy to obtain it in the crysallyn form: the following method was successfully practised by M. Dechafon for this purpose: equal parts of chalk and falk-ammoniac were mixed well together, and put into a retort, upon which was poured half their weight of concentrated acetic acid; by a gentle heat a white vapour arose, which concrected in beautiful crysallys in the receiver, and was acetite of ammonia. Another way of preparing this falt is by diffilling equal parts of acetated lead (fugar of lead), and muriated ammonia (falk-ammoniac.)

This fubstance is very deliquefent—has a hot pungent flavour—is decomposed by alkalies, by molt acids, and by double affinity in various ways; it is destroyed by fire, and spontaneously when in solution.

It is only employed in medicine, and is considered as a diaphoretic.

**Acetite of Lime. Acétite de Chaux. Salt of Chalk. Salt of Coral.**

This falt is readily procured, by adding distilled vinegar to chalk, marble, coral, oven-thells, or any other substance that conflits chiefly of calcareous carbonat; the carbonic acid is disengaged with effervescence, and by evaporating the solution to a pellicle, and allowing it to cool gradually, crysallys of acetite of lime are deposited.

Calcereous acetite crystallizates in white flerder silky filaments, permanent in the air; its tafle is bitter, acerb, rather caustic; it is soluble with ease in water, and in small proportion
proporation by alcohol. Barite, and the fixed alkalies decompose it, by union with its acid; the stronger acids do the same, by combining with its earthy base; most of the carbonates and sulphates decompose it by compound affinity: when in solution, it is deprived spontaneously of decomposition of the acid, and deposits carbonat of lime: in dry distillation it yields hydrocarbons, empyreumatic acid and oil, charcoal and calcareous carbonat.

It is still admitted in the foreign pharmacopoeas as a fusidoric and diuretic.

Acet of Barites. Acété de Barît.

This salt is usually prepared by adding carbonat of barite to distilled vinegar, in which case the acid is always in excess: when reduced by evaporation, to the concentration of a syrup, and allowed to cool gradually, it deposits a white opaque granular salt, and the sides of the vessel are covered with silky filaments of the same: a better way of procuring this sublimation, is by boiling for a few minutes the sulphuret of barite in a flight excess of acetic acid, (vide Acet of Strontian) filtering the solution, and setting it to evaporate spontaneously: transparent crystals may thus be obtained in long slender prisms. The salt formed by either of these methods is permanent in the air, and decomposable by most of the mineral acids, the carbonated alkalies, and the phosphoric acids. Its only use is as a reagent, for ascertaining the presence of sulphuric acid in those cases where the muriat or nitrat of barites might affect the results of the analysis.

Acet of Strontian. Acétique de Strontian.

To any quantity of warm distilled vinegar, add gradually sulphuret of strontian, as long as any effervescence is perceived; then boil the liquor for a few minutes and filter; add afterwards, drop by drop, a solution of acetite of lead, (fugar of lead) as long as any precipitate takes place, then sifter the liquor to stand for a few hours, and finally separate it from the dark sediment by filtration. This salt has not as yet been the subject of experiment; its properties are, in all probability, very similar to those of the Acet. Barit. It is not made any use of.

Acet of Magnesia. Acétique de Magnesie.

This salt is prepared by saturating distilled vinegar with carbonated magnesia, then boiling the liquor to separate the remains of carbonic acid, and filtering it, if turbid, to get rid of the excess of carbonated magnesia.

The taste of acetite of magnesia is sweet, with a slight mixture of bitter; by evaporation, it is reduced to a viscid syrupy confusibility, incapable of being crystallized; but by further concentration, and subsequent cooking, becomes solid, and deliquescent in the air: it is totally soluble in spirit of wine, and from the cae with which it is decomposed, the affinity between its elements appears to be extremely weak.

The alkalies, and the rest of the alkaline earths, most of the mineral, vegetable, and animal acids are capable of decomposing this salt by abstraction of its acid or earthy base. It is not made any use of.

Acet of Alumine. Acétique d'Alumine. Aluminous mordant of the calico-printers.

Of all the acetans this is the most important, being absolutely essential to the improved state of the arts of Dyeing and Calico-printing. It is not easy to prepare this salt directly, distilled vinegar, even when concentrated, having no perceptible action on clay; the fresh precipitated and washed earth of alum is indeed soluble by

long digestion in a large excess of acetic acid; but the most economical and effectual way of producing the salt in question, is by means of the double affinities of common alum and fugar of lead. For this purpose, to a blood-warm solution of alum in rain-water, is first of all to be cautiously added a solution of pearlash, or any other sufficiently pure alkali, till the liquor is just upon the point of becoming turbid, in order to saturate the excess of acid in common alum; a cold saturated solution of acetite of lead (fugar of lead) in rain-water is then to be filtered in as long as any precipitation takes place; by standing a few hours, the sulphat of lead entirely subfides, and the supernatant clear liquor, containing acetite of alumine and potash, may be drawn off with a syphon. By washing the sediment with cold water a dilute solution of acetite of alumine is obtained, which may be used instead of water in dissolving alum for the next preparation of aluminous mordant.

Acetite of alumine thus prepared has an acetic strongly fleshy taste: by gradual evaporation and cooling, it assumes the form of small needle-shaped crystals, which are exceedingly deliquescent; by a heat inferior to that of boiling water, the acid is almost wholly driven off. It is decomposed by magnesia, and by all the substances that decompose acetite of magnesia. Its use is almost wholly confined to the dyers and calico-printers.

Acet of Glycine. Acétique de Glycine.

This is an uncrystallizable salt, which by evaporation becomes a gummy semi-fluid confusibility; its taste is sweet and very affreasant, with a flavour of vinegar: its other properties have not been examined into; it is not applied to any use. B. la Grange, ii. 452.

For the metallic acetites, see the respective metals.

ACETIFICATION is used by some Chemists to denote the action or operation, by which vinegar is made. See Acoous Fermentation.

ACETOSA, in Botany. See Rumex and Sorrel.

ACETOSELLA. See Rumex, Oxalis, and wood Sorrel.

ACETOUS ACID—Distilled vinegar—Acétique Acides—Acetum distillatum, Lond. et Edin. Pharm. in Chemistry, is produced from saccharine mucilage, gum mucilage, feacula and all vinous liquors, through the medium of the acetous fermention; also in urine and dunghills during their spontaneous decomposition; from the dry distillation of wood, mucilage, and tartar, from the action of sulphuric acid on many vegetable substances; and from the superxyoxegenation of molt of the other vegetable acids. It is prepared for use, however, in the large way, only by the former of these methods, and is called alegar, if made from malt liquor; but if from any other fermentable liquor, it bears the name of Vinegar.

Common vinegar never contains this acid in a state of purity, but always contaminated by mixture with tartar, mucilage, and carbonaceous matter, which render it very liable to spontaneous decomposition; these substances can only be got rid of by having recourse to distillation, which ought to be performed in glafs or tinmed-copper vessels; the first product of this operation is an odorous, faintly acid liquor containing alcohol; the next is less odorous and more acid, and what comes over towards the end of the operation is a still stronger acid, but with an empyreumatic flavour, and a slight tinge of colour: hence, in distilling four parts of vinegar, the first may be rejected as too much diluted, and the proceeds may be flopped when three-fourths of the liquor is come over. If distilled vinegar is exposed to frost in a broad shallow vessel, and the ice removed as it forms, till
Acetous acid is a transparent colourless fluid, of the specific gravity of 1.0095, nearly as volatile as water, excuding a pungent fragrant odour, and of a lively agreeable acid taste.

When concentrated, it unites cagerly with water, either in the solid or liquid state; absorbing heat in the former case, so as to produce a considerable depression of the thermometer, and giving out heat in the latter case.

Upon fat oils it has little or no action, but camphor and most of the essential oils are readily soluble in it, giving their peculiar odours and increasing the inflammability of the liquid. With the empregnatic oils of wood, tar, &c. it forms the pyrulinoeous and pyrogallic acids.

At a temperature above that of boiling water it decomposes atmospheric air, by abstracting its oxygen, and at the same time giving out flame, and producing carbonic acid and water; the same effect is produced more gradually, by exposing to the air a solution of the earthy or alkaline acetates; thus acetate of lime is converted into carbonat of lime. Acetic acid is however capable of uniting to oxygen without experiencing such a total decomposition. If equal parts of acetate of lime, black oxid of manganese and sulphuric acid are distilled together, a pungent volatile acid called acetic acid will be produced together with hydrocarbonous gas: the same results are obtained from the distillation of crystallized verdigris, and the copper is found in the retort nearly in the metallic state.

Acetous acid unites easily with all the alkalis and alkaline earths, whether pure or carbonated, forming the genus of alkaline acetates, which contains seven species; viz. Acetite of potash, soda, ammonia, lime, barites, fiorit, and magnesia.

It appears to have no action on flex, but combines with the other earths into Acetites of alumine and glyicine.

Excepting iron and zinc, the rest of the metals are difficultly or not at all soluble in acetic acid, their oxides, however, especially if carbonated, are easily so; hence results the large and important genus of metallic acetites.

On vegetable and animal colouring matter this acid appears to have little effect; it poisons indeed the property of reddening syrup of violets, and certain other vegetable blues, in common with all acids.

The component parts of acetic acid are oxygen, hydrogen, and carbon, but their relative proportions have not yet been ascertained. If acetic acid in vapour is passed through a red-hot glass tube, it is decomposed into water, hydrogen, and carboonic acid.

The affinity of this acid is as follows:

This acid forms an important article in the Materia Medica; it is also much used in food both as an agreeable condiment, and for the preservation of animal and vegetable substances. Pourcroy, Systeme des Connoisances Chimiques, vol. viii. Encyclopædiæ Methodiciæ, art. Acidæ Acetici. Béatume, Chimie Experimentale. Gren's Chemistry, vol. ii.

Acetous ether. See Ether.

Acetous Fermentation. See Acetous Fermentation.

ACETUM, formed of aero, to breathe, the fume with vinegar; the properties, uses, and preparations of which, see under the article vinegar. There are several medicines in the fops, of which this liquid is the basis; as, Acetum alkalinitatum, made of distilled vinegar, with the addition of some alkaline, or volatile salt.

Acetum Odoratum. See Alcohol.

ACETUM Distillatum. See distilled VINEGAR, and ACETIC Acid.

ACETUM Refinatum, distilled vinegar rectified by means of verdigris. It is made by distilling the common verdigris in fine distilled vinegar, then evaporating the solution, and recovering the verdigris again in form of crystals; and from this, by a proper degree of fire, distilling with a retort an acid spirit, which is the richest acid that can by any art be prepared from vinegar. Boerhaave's Chem. p. 138.

ACETUM Litlsburytes. See Acetite of Lead.

ACETUM Philosbora, a four kind of liquor, made by distilling a little butter of antimony in a great deal of waer. See Spirit of Venus.

ACETUM Portulale. See Vinegar.

ACETUM Propiobolasticum, a preparation made in the following manner. If flor lavand. et rorifm. fol. rut. ab. sith. falvix, menth. a. m. j. Aceti vini cong. j. infund. in B. A. per 8 dies. R buis tint. t. j. campil. 5ii. m. f. This is also called the vinegar of the four thieves; for during the plague at Marseilles, four persons by the use of it, attended many of the sick unhurt; under the colour of their services they robbed the sick and the dead; but one of them being apprehended, saved himself from the gallowes by discovering this remedy. Motherby's Dict. by Wallis.

ACETUM Fisbatum, vinegar of roses, is made of rose buds infued in vinegar forty or fifty days; the roses are then pressed out, and the vinegar preferred. It is chiefly used by way of embrocation on the head and temples in the head-ach. After the like manner are made acetum santunicum, vinegar of elder; acetum anthrhotus, vinegar of rosemary flowers; acetum fiallicum, vinegar of squills. The German dispensatories abound with medicated vinegars, chiefly aimed against pestifilential diseases; but they are not used among us.

ACH, or ACHEN, John Van, in Biography, a painter of history and portrait, was born at Cologne, in 1556, and died, aged 65, in 1621. Having studied and practiscd portrait-painting for some time in his own country, he travelled to Venice, in order to obtain a more extensive knowledge of colouring; and with a view of perfecting his taste, and improving in correctness of design, he settled for some years at Rome. Here he painted a nativity for the church of the Jesuits, and a portrait of Madonna Venula, a celebrated performer on the lute, which is accounted one of his best performances. The best judges allow his colours to be extremely good, his design correct, and that the air of his heads manifest much of the taste of Coreggio. His talents, and polite accomplishments, recommended him to several considerable princes of Europe; and under the patronage of the elector of Bavaria, he painted a grand design of the invention of the cros, which is highly commended for the elegance of the composition, the correctness of the design, the graceful airs of the heads, and the attitudes of the figures. For this, and his portraits of the elector family,
family, he was presented by the elector with a chain and medal of gold, as a peculiar token of his esteem. By the emperor Rudolph he was invited to Prague, where he executed a picture of Venus and Adonis, so much to the emperor's satisfaction, that he was particularly distinguished by him as long as he lived. His character was that of one of the best masters of his time. Tilkington's Dict.

ACHA, or Aca, in Geography, a district of Africa, on the confines of Lybia; formerly rich and populous, but now reduced: the chief produce is dates.

ACHABYTUS, in Ancient Geography, a high mountain in Rhodes, on the top of which stood a temple of Jupiter.

ACHAC, in Ornithology, the name given by the people of the Philippine islands to a bird common there. It is of the size of a common hen; its belly, breast, and neck are of a pale brown, and its back of a dusky reddish colour: its wings are extremely beautiful, being principally of a greenish blue colour; the tail is white, short, and continually in motion; the eyes are black, and the beak is thick and strong, and is of a black colour, and of an obtuse figure; the legs are reddish, and the claws black: when it makes any noise, it seems to utter the word phi phi, very often repeated. It lives principally about the cultivated parts of the islands, and feeds on rice and other vegetables, being properly of the partridge kind.

ACHAEA, in Ancient Geography, a well fortified town of the island of Rhodes, in the district of Ialysus, said to be the first and most ancient of all, and to have been built by the Heliadse, or children of the Sun. Dio. Sicel. l. v. c. 57. tom. i. p. 376. Ed. Weffeling.

ACHA was also a hamlet of Attic Saramia, on the Lycean. The inhabitants were a colony of Orchomenians, and called Achai.

ACHAENS, Achai, in Ancient History, the inhabitants of Achaea Propria, so called from Achaeeus, the son of Xuthus, who having been banished from Teffalafy, settled in Athens, married Creusa, the daughter of Erecheus, and had by her two sons, viz. Achaeus and Ion. Achaeeus, putting himself at the head of a small number of Athenian and Egealan forces, made an expedition into Teffalafy, and recovered his grandfather's kingdom: but having committed the crime of manslaughter, he was soon obliged to fly to Laconia, where he died, and where his posterity remained, under the denomination of Achaeeans, till they were expelled by the Doreae and Heraclides. On this occasion they determined to lay claim to Achaia, and to expel the Ionians. They founded their city on their defeat from the elder Xuthus, and enforced it by collecting a number of troops, and arranging themselves under their brave king Tifasenes, the son of Orelles. The Ionians were overpowered, and driven into Attica; and the Achaeeans took possession of the kingdom, which consisted chiefly of twelve cities. These cities were divided between the four sons of Tifasenes: who, uniting with their cousin, the son of Penthillus, and grandson of Orelles, and jointly reigning over this new Achaaian state for some time, agreed to form an alliance with Pregeenes, and his son Patroes, the overreigns of those Achaeeans, who had been banished out of Lacedaemon, and gave them the sovereignty and territories of a city, which from the lat of thence was called Patrae. The Achaeeans fortified themselves so well in their new settlement, after having expelled the Ionians, that they were able to defend themselves against the Heraclids, and to preserve their laws and liberty, even after all the rest of Peloponnese had been subdued by them, and under a series of kings from Tifasenes to Ogygus; after which they formed themselves into a kind of republic, or democracy.

As their country was poor, without commerce, and almost without industry, its inhabitants enjoyed the liberty and equality afforded them by a wise legislature. Strangers to the desire of conquest, and having little connection with corrupt nations, they never employed fraud and falsehood even against their enemies; and as all their cities had the same laws, and the same offices of magistracy, they formed only one body, and one state: and the harmony that prevailed among them pervaded every class of citizens. The excellence of their constitution, and the probity of their magistrates were so universally allowed, that the Greek cities of Italy addressed themselves to this people to become their arbitrators, and some of them even formed a similar confederacy. The Lacedaemonians and Thucleans, who respectively claimed the victory at Leuctra, refused their dispute, in which their honour was so materially interred, and which demanded the most impartial decision, to the determination of the Achaeeans. Having long retained their liberty, they ceased not to assemble, when the necessity of public deliberation required it, even when the revolt of Greece was threatened with wars and pestilence. Polybius observes, that the Achaeeans so far gained the esteem and confidence of all the Peloponnesians, that their name became common to that whole country. The arms which these people chiefly used were slings, in the use of which they were trained from their infancy, and acquired such dexterity, that they struck any object at which they aimed with surprising exactness. The Achaean government continued in its democratic form from the expulsion of Ogygus or Gyges, the last king of Achaia, to the time of Alexander the Great; after whose death this little republic was involved in all the calamities that are inseparable from discord, and was constrained to submit to the Macedonian yoke. The Achaeeans then changed masters as often as Macedonia changed sovereigns, and were frequently enslaved by tyrants of their own. Unable to bear this servile subjection, in the 15th Olympiad, ante Chr. 285, when Pyrrhus invaded Italy, they revived their ancient union. The first affairs of liberty were the inhabitants of Patrae and Dyna, and they were soon joined by those of Agrium, Dunn, and others. The good order that reigned in this little republic, where liberty and equality, with a sincere zeal for justice and the public welfare, were the fundamental principles of their government, induced several neighbouring cities to join them. The Achaean league thus revived, and extending its influence, was first acceded to by the Sicilians, under the direction of Aratus; they were followed by other states not only of Peloponnese, but by all Greece, except the Lacedaemonians, who first entered into a war against the Achaeeans. By the Achaean league, all the cities subject to it, were governed by the great council, or general assembly of the nation. To this assembly each of them had a right to send a certain number of deputies, who were elected in their respective cities by a plurality of voices. As the supreme and legislative power was lodged in this assembly, it was constantly convened, except on extraordinary occasions, twice a-year; on which occasions they enacted laws, dispensed vacant employments, declared war, made peace, and concluded alliances; and the acts of the assembly were binding on all the confederated cities. The chief magistrates of the league, called by the Greeks strategos, and by the Latin prae tor, was chosen by the majority of votes. At first they had two officers of this kind; but they were soon reduced to one, who presided in the diet, and commanded the army. The prae tor, and other magistrates, continued in the same office two years successively. The former was responsible to the general assembly. The demlurgi were next in power to the praetor, and are therefore designated
by Polybius and Livy, the supreme magistrates of the Achaeans. Their number was ten; they were chosen by the general assembly, and their office was to assist the pre-
tor, who was not allowed to propose any measure to the assembly, which had not been previously approved of by the majority of these demiurgi. In some extraordinary cases they were allowed to summon the general assembly. Such was the fundamental constitution of the Achaeans; and they had also several laws, which were religiously observed as long as the republic continued in a flourishing condition. Their peace and prosperity, however, were interrupted by the jealousy of neighbouring states; and particularly by the Lacedaemonians, who, about the year before Christ 227, commenced a war against them, which, from the name of Cleomenes their king, was called the Cleomenic war. The Achaeans, under the command of Aratus, were successively defeated, and reduced to such a state of distress, as to be under a necessity of engaging Antigonus, king of Macedon, to assist them. In a variety of subsequent contests, the Achaeans behaved with uncommon bravery, and Philopoemen distinguished himself above the rest. Cleo-
menes was defeated; and Antigonus received the thanks of the deputies of each city comprehended under the Achaean league; and, by a decree of the council assembled at Argos, was declared protector of Achaea. The Achaeans afterwards took part with the Messenians against the Etolians; and being overpowered by them, returned to Philip of Macedon, who promised to assist them with the whole force of his kingdom. A confederacy was formed, and war, called from this circumstance the confederate war, was proclaimed against the common enemy. This war having terminated first in a treaty between Philip and the Achaeans on one side, and the Etolians, Lacedaemonians, and Eleans, on the other, and soon after in a peace; the Achaeans returned to their ancient manner of life, rebuilt their cities, temples, and altars, restored their worship, and repaired the various damages which they had sustained during the progress of the war. Philip, however, soon changed his conduct towards the Achaeans, and disturbed that tranquillity which he had been the instrument of establishing. As they refused to concur with him in his purpose of subduing the Messenians, who were members of the Achaean body, he availed their resistance to Aratus, whom he contrived to remove by poison, while he was praetor of the Achaeans for the seventeenth time. When Aratus perceived the danger of his situation, he fled to an intimate friend who attended him. “Behold, my dear Cephalion,” the effect of friend-
ship with kings.” This distinguished magistrate closed his life at Aegium, in the 7th year of his age, and was interred with extraordinary pomp and solemnity at Sicyon, the place of his nativity; and the part of the city in which he was buried, was from that time called Aratium, in honour of his memory. The Achaeans also decreed, that divine honours should be paid him, and appointed a priest for that purpose. The conduct of Philip incensed the Achaeans, and when a favourable opportunity occurred they testified their displeasure. In the mean while they concurred with him in carrying on the war with the Eto-
lians, who had formed an alliance with the Romans. Philo-
poemen gained new honours; and in the year before Christ 216, was appointed, for the first time, commander in chief of the Achaean forces. After a very decisive victory over the Lacedaemonians, the Etolians sued for peace, and obtained it; and the Romans also concluded a treaty of peace and amity with Philip and his allies. This peace was not of long duration. The Romans declared war against Philip, who was joined by the Achaeans and Lacedaemonians. It was not long however before the Achaeans formed an alliance with the Romans, to whom they maintained a steady attachment during the whole course of this war. At the conclusion of it, they were put into possession of Corinth; the Greeks were declared free by the Romans; and the Achaeans amongst others, were delivered from every kind of servitude, and allowed to govern themselves by their own laws. Soon after the departure of the Romans, Nabis, who had been left in possession of Lacedaemon, began to raise insurrec-
tions in the maritime cities, which were garrisoned by the Achaeans; and these hostilities obliged them to have recoue
r to the Romans, and to declare war against Nabis. The whole management of this war was committed to Philopoemen. After a defeat by sea, and a very fortunate escape, this illustrious general obtained a complete vic

tory over Nabis by land; and was thus enabled to unite the powerful city of Lacedaemon to the Achaean commonwealth in the year before Christ 191; by which means the Achaeans eclipsed all the other States of Greece. Philopoemen, with a quiet and satisfied spirit, convicted of the value of his contributions to the state and the state of his country, recommended the application of this money to the purpose of conciliating the discontented, he said, to those who wished his acceptance of it, “it is much more advisable to stop an enemy’s mouth than “a friend’s;” and, for me, I shall always be your friend, and “you shall reap the benefit of my friendship without ex-
“pense.” The Achaean republic, by the addition of Lac
edemon, and the protection of Rome, was now become very formidable. But internal disputes about the place of holding their assemblies, which were transferred by Philopoemen from Aegium to Argos, and the more important quarrel with the Lacedaemonians, and their attempt to secede from the Achaean league, produced an interruption of their tranquillity, and exposed them to new dangers. Lacedaemon, indeed, was reduced by the Achaeans; and Philopoem
en ordered them to demolish their walls, disband their mercenaries, drive out all the slaves whom the tyrants had set at liberty, receive the exiles, and renounce the laws of Lycurgus, and for the future govern themselves only by those of Achaea. At this time the Achaean league was in great repute all over the East, and the friendship of a state so powerful was counted by all the princes of Asia. The ancient alliance with Ptolemy, king of Egypt, and with Seleucus, king of Syria, was renewed. But the Romans became jealous of their increasing power, and interfered with their internal government. The city of Messene withdrew from the Achaean league; and Philopoemen, in his endeav
our to reclaim the rebels, was defeated, taken prisoner, and put to death. When he held the cup of poison in his hand, he enquired whether Lycurgus and the Megalopolitan youth, who had accompanied him as volunteers, had got into a place of safety; and being informed, that they had all made their escape; he replied, “That is enough; I “die content.” Upon his death the glory of Achaea began to decline; so that Philopoemen was not improperly called the last of the Greeks, as Brutus was afterwards styled the last of the Romans. Mellese was afterwards re
ferred to the Achaean league; and the Romans imperiously urging the readmission of the Lacedaemonians, the Achaeans were obliged to submit. In the year before Christ 169, when a war broke out between the Romans, and Perseus king of Macedon, the Achaeans declared for the Romans, and Polybius was sent to the Roman general with the resolution of the Achaean diet. However, several of the Achaeans favoured Perseus; and a thousand of them were summoned to appear before the Roman senate. These perfons were kept
kept close prisoners at Rome; and, notwithstanding repeated remonstrances, their trial was delayed. After a confinement of 17 years, 300 of them, who had survived the hardships which they experienced, were sent home. This treatment alienated the minds of the Achaeans from the Romans; and, by degrees, brought on an open war, which ended in the reduction of Achaea, and the dissolution of the Achæan league. Commissioners were sent from Rome, in the year before Chr. 147, who announced the orders of the Roman senate and people, that all the cities which were not formerly of the Achæan league, viz. Corinth, Lacedæmon, Argos, Heraclæa, and Orchomenus, should be sepa-

rated from the general alliance, and governed by their own laws, independently of the confederacy. The Achæan deputes, assembled at Corinth, as soon as they heard these words, left the assembly before Aurelius had finished his speech, and when they informed the people of the Roman decree, the whole city was in an uproar; and both the commissioners and Lacedæmonians were treated with the utmost outrage and violence. The senate was incensed, but sent out new commissioners with proposals of accommodation. But these ambassadors having been treated with disrespect, returned with their complaints to the senate. Four other Romans were deputed by Metellus to negotiate with the Achæans; but their endeavours were ineffectual. The consequence of these unsuccessful efforts was an open rupture, and the declaration of war with Lacedæmon and the Romans. Metellus, without waiting for the orders of the senate, marched towards Achaea; and the Achæans, joined by the cities of Thebes and Chalcis, prepared to receive him. The greater number of them were struck with terror, and sent new deputies to Metellus to treat of peace. But the Achæans, now governed by magistrates, who had no other rule of conduct but their passions, and no other talent for war besides a savage ferocity, and a blind delight of revenge, seemed to be devoted to destruction. On this occasion, after Metellus had in vain endeavoured to settle the affairs of Achæa, Mummius arrived in Greece, and defeated the Achæans; and in the year before Chr. 146, plundered Corinth of its rich spoils, and then reduced it to ashes; and under the ruins of this city the Achæan league seemed to be buried. Ten commissioners were sent from Rome, to regulate the affairs of Greece in general, and of Achæa in particular, in conjunction with the confederacy. These abolished popular government in all the cities, and established magistrates, who were to govern each city according to their respective laws, under the superintendency of a Roman praetor. Thus the Achæan league was dissolved, and Greece reduced to a Roman province, called the province of Achæa; because, at the taking of Corinth, the Achæans were the most powerful people of Greece. The whole nation paid an annual tribute to Rome; and the praetor who was sent thither every year, was charged with the care of collecting it. From this time Achæa was governed like the other Roman provinces till the reign of Nero, who reformed the whole of Greece to the enjoyment of its ancient liberties; but it was afterwards reduced by Vespasian to its former state of subjection. Under Nerva, some shadow of liberty was restored; but it was still governed by a Roman praetor. In this condition the Achæans remained till the time of Constantine the Great, who, in his new partition of the Roman provinces, subjected Achæa to the prefect of Illyricum. Upon the division of the empire, Achæa, with the rest of Greece, fell to the emperors of the East. Under Arcadius and Honorius, all these provinces suffered greatly by the incursions of the Goths, who, under their king Abaric, laid waste the whole country, and reduced the mag-
nificent structures that were then remaining to heaps of ruins. In the reign of the emperor Emanuel, in the 12th century, Peloponæus was divided into seven principalities, and he bellowed them on his seven sons. In the 13th century, when Constantine was taken by the western princes, the maritime cities of Peloponæus, with most of the islands, were allotted to the Venetians. In the 15th century, Constantine Dragos, despot of Morea, being raised to the imperial throne, divided that province between his two sons, bellowing Sparta on one of them, and Corinth on the other. Mahomet II., taking advantage of their divisions, stripped them both of their dominion. The Mahometans having gained possession of Morea, drove the Venetians from the cities which they possessed on the coast, and made themselves masters of that fruitful province, till they were expelled by the Venetians in 1687. By the treaty of Carlowitz, in 1699, the barbarians yielded it to the republic of Venice; but retook it in 1715; and in their hands it still continues, being governed by a Sangiac, under the begler-beg of Greece, who resides at Modon. On the subject of this article, see Polybius Hist. and Excerpt. leg. Index, verb. Achæi, Ed. Cæs. Pauflaniez Graec. Defer. p. 521, &c. 558, &c. Ed. Kühni. Strabo Geogr. tom. ii. Index verb. See also an elaborate discourse on the origin, nature, and object, &c. of the Achæan league, compared with the Bellic and Helvetic confederacies, intitled, Discours qui a remporté le Prix de l'Académie Royale des In Ripetations et Belle Leètres, de Paris, in 1758, &c. by M. J. de Meerma, 4ro. Hague, 1784,—and an abstract of it in the Monthly Review, vol. lxi. p. 531, &c.

ACHÆMENES, in Ancient History, was grandfather of Cambyses, and great-grandfather of Cyrus the First, king of Persia. According to Herodotus, p. 515,—and according to the same historian, p. 109. 548. there was a son of Darius I., king of Persia, and brother of Xerxes, who was of the same name. This Achæmenes governed Egypt, after Xerxes had restored them to their allegiance, and he commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all Greece. Having been sent into Egypt to suppress a rebellion, which occurred after the death of Xerxes, he was vanquished and slain by Inar, chief of the rebels. The term Achæmenius is very common Persian epithet: Stephanus Byzantius says, that Achæmenia is a part of Persia, so called from Achæmenes, son of Ages. According to Herodotus, p. 65, the Achæmenidae were certain tribes from which the Persian kings sprung; and Strabo (vol. ii. p. 1059.) reckons the Achæmenides as one of the three principal nations of Persia. Horace (l. 2. od. 12.) mentions an Achæmenes who was very rich; and who is supposed, by his commentators, to have been one of the Persian monarchs.

ACHÆMENIA, in Ancient Geography, a part of Persia, according to Stephanus Byzantius and Strabo, so called from its first king ACHÆMENES. It is sometimes used to signify Persia in general, particularly by Herodotus, who represents Cambyses, in an oration, calling his people Achæmenides.

ACHÆMENIS, in Botany, a species of the Tey-riium.

ACHÆORUM portus, in Ancient Geography, a harbour of the Chersonesus Taurica, on the Euxine; and another mentioned
ACHÆUS, the son of Andromachus, whose sister was the wife of Seleucus Ceraunus, was offered the crown of Syria, as successor to Seleucus, but declined in favour of Antiochus, the brother of the deceased king, who was afterwards summanded the Great. All the provinces of Asia Minor were committed to the charge of Achæus. In this station he revolted from Attalus, King of Pergamum, all the countries in Asia which that prince had seized, and annexed them to the crown of Syria; when things were formed against him, he feized the crown which he had before refused, and was crowned at Laodicea, in Phrygia, assuming ever afterwards the regal title in all letters to the cities of Asia, and obliging them to give it him in all their addresses. Antiochus having succeeded in several enterprises, directed his attention towards carrying on the war in Asia Minor against Achæus; who being shut up in the caille of Sardis, was delivered to Antiochus, after he had taken the city. This prince was moved with compassion towards a person to whom he had once owed his crown; but motives of state prevailing over his natural tendernes, he ordered him to be put to death in the manner related by Polybius, l. viii. p. 528. Ed. Cantrab. For an account of Achæus the son of Xuthus; see Achæans.

ACHAIA, in Ancient Geography, was used in three different senses. In the earlier ages it comprehended all the provinces of that great continent, which the geographers, strictly speaking, call Greece. It was afterwards confined to that narrow district of Peloponnesus, which was possessed by the Achæans in the more limited sense of the appellation, and which extended westward along the bay of Corinth, that lay to the north, and was bounded on the west by the Ionian sea, on the south by Elis and Arcadia, and on the east by Sicotia. This was called Achailia proper, and it is now denominated România alta, and forms a part of Chersonesus or Chersonese in the Morea. Its metropolis, according to lonic, was Patra, and according to others Aigina. In the Roman times the name of Achæa comprised not only all Peloponnesus, but four other cities beyond the Ilissus as had entered into the Achæan league; upon the dissolution of which Greece was, by a decree of the Roman senate, divided into two provinces, viz. that of Macedonia, containing also Thessaly, and that of Achæa which included all the other states of Greece.

ACHALAE: Prefbyter, Prefectors of Achæa, in Ecclesiological History, those who were present at the martyrdom of St. Andrew the apostle, A. D. 59; and who are said to have written an epistle relating to it. Bellarmine, and other Roman writers allow it to be genuine; but Dupin, (Hist. of Eccl. Writers, vol. i. p. 17) and many others reject it.

ACHAIUS, in British History, the son of Ethwim, who was raised to the crown of Scotland, A. D. 788. At the desire of the emperor Charlemagne, an alliance with him against the English, whose pirates infested the seas and interrupted commerce, was concluded in France upon conditions so advantageous to the Scots, that Achaimus, to perpetuate the memory of it, added to the arms of Scotland a double field fowed with violets. He died in 819.

ACHALCTLI, or, as Buffon has contracted the name, Alaltli, in Ornithology, the Alcelo torquata of Linnaeus and Gmelin, the cinereus king-fisher of Lake Man, and the Colored-bird of Nieremberg, is one of the largest king-fishers, being near 16 inches long. Its specific characters are, that it is short-tailed, half-crested, hoary-bluish, with a white collar, and its wings and tail spotted with white. The upper part of the body is bluish-grey, and this colour is variegated on the wings, with white fringes in falkoons at the points of the quills, the largest of which are blackish, and intermixed with broad white indentings; those of the tail are marked with broad stripes of white; the under-part of the body is chestnut-rufous, dilated towards the breast, and there shaded or mailed with grey; the throat is white, which colour forms an entire circuit on the neck; the whole head and nape of the neck are of the same bluish grey colour with the back. The back is sharp, and about three fingers breadth long; it is red, with a mixture of blackish brown at the base; and the feet are red. This bird is migratory; and at a certain time of the year visits the northern provinces of Mexico; and is also found in Martinique and the Antilles. It feeds on fish, whence its name Acalatli, i. e. devourer of fish.

ACHAM, in Geography, a country in Asia, bounded on the N. by Bontan, on the E. by China, on the S. by Burmah, and on the W. by Hindostan. It is very little known to the Europeans.

ACHAMEI, in Ancient Geography, the name of a people who inhabited that part of Libya interior, which is near the mountain Arvaltes, and on the confines of the equinoctial line.

ACHAMELLA, in Botany. See Acherra.

ACHAN, in Scripture History, the son of Carmi, of the tribe of Judah; who, when Jericho was taken, concealed 200 shekels of silver, a Babylonish garment, and a wedge of gold, in direct violation of a divine prohibition. After the Israelites had been repulsed at Ai, they call lots in order to discover the offender, who had been accesory to this calamity; and when Achain was found to be the guilty person, he and his children were floned to death, and afterwards burned. Joshus, chap. vii. Some have supposed, that Achain alone was put to death, and understand the word " and they floned them," (v. 25) as it is in the Hebrew, and not him, as in our translation, of Achain and his cattle. Grotius in Loc. Others suppose, that Achain's children were accomplices in his crime. St. Aulín vindicates the justice of this act, on the ground of God's having a right to refuse the life he has given, when and how he pleases. Some have alleged, that the severity of this punishment was necessary to keep the people in awe, and to oblige them to a perfect submission to the divine commands.

ACHANDES, in Ethnology, a name given by some to the Remora.

ACHANE, Achaia, an ancient Persian corn-measure, containing 35 Attic mediumi.

ACHAII. See Achem.

ACHANIA, in Botany, from Achaia, not hene, because the corolla does not open; a genus of the mexicifolia perandra class, and the natural order of colourentis. The characters are, that the calyx has a double perianthium, the outer having many leaves, and the leaflets being linear, permanent, and slightly constricted at the base; the corolla is subulate and convoluted; and the petals are five, oblong-oblong, erect, with a lobe at the base of each side, involving the column of flamen: the flammen are numerous flaments, calefcing into a wizhelt tube longer than the corolla, free at top, and capillary; the anthers are oblong; the pistillum has a subglobulig ermen; the style is filiform, of the same length with the tube of the flammen; ten-left at top, the segments spreading, the figmas capitata; the pericarpium is a subglobulig, flathy, five-celled berry; the seeds are lithary, on one side convex, and angular on the other. There are three species, viz. the A. malacarifus, scarlet achaia, or
or bantard hibiscus, which is a native of Mexico and Jamaica, cultivated here in 1714 by the dutchmen of Beaufort, and flowering through the greatest part of the year; the *Mollis*, or woolly achania, a native of South America and the West India Islands, found in Jamaica by Houfton in 1720, and introduced in 1782, by B. Bewick, Esq. and flowering in August and September; and the *Pilosus*, or hairy achania, a native of Jamaica, introduced in 1780 by Mr. G. Alexander, and flowering in November. Achania is generally propagated by cuttings, which are planted in pots of light earth, plunged into a gentle hot-bed, and kept from the air till they take root, when they should be gradually introduced to the open air. They must be preferred in winter in a moderate stove; and kept warm in summer, they will flower, and sometimes ripen fruit. The achania, in the Linnean system by Gmelin, is made a species of Malva-viapus. Martyn's Mill. Dict.

Achao, in the *Materia Medica* of the ancients, the name of an herb much celebrated in many distempers; which some have supposed to be what is called in Egypt Prech, an herb nearly resembling chamomile, but lower, and with broader leaves, approaching to those of feverfew, and of a faint, but not disagreeable smell. Avicenna seems, however, to have meant a different plant by this name, and probably the herb which we call Marum. Proper. Alpin.

Acharaca, in *Ancient Geography*, a town of Lydia, situate between Tralles and Nyfa; in which were the temple of Pluto and June, and the cave Charon, where the patients slept in order to obtain a cure, either by the suggestions of their own minds, or by those of others, who, during their sleep, were directed what effectual remedies to prescribe. Strabo *Geog.* vol. ii. p. 966-1.

Achariston, from α, without, and χαρία, value, a denomination under which Galen describes some compositions of singular efficacy, which cured so quickly, that they were undervalued.

Acharna, in *Ancient Geography*, a town of Attica, near Eretria; the largest of those towns, according to Thucydides, (l. ii. c. 19. p. 111. Ed. Duker) which were called *Fraen*, or villages. Pindar (Nem. Od. ii. v. 25. p. 323. Ed. West and Wellsted) says, it was famous for brave men; and it was particularly celebrated as the birth-place of Themistocles. Corn. Nep. c. i.

Acharon, in *Entomology*, a species of *Sphinh*, of an azure colour, with brown wings, and red anus; found in New Holland.

Achasa, in *Ancient Geography*, a country of Scythia beyond the mountain Imaus.

Achat, in our Low French, signifies a contract, or bargain; especially in the way of purchase. Purveyors were by act of parliament 34 Edw. III. ordained to be thenceforth called Achators.

Achates, in *Biography*, the companion and faithful friend of Uneas, who is celebrated by Virgil, and so called, says Servius, either in reference to some properties of the achates or agate mentioned by Pliny, or from αχατης, the concern he felt on account of Uneas. Virgil, by Malv. v. i. l. 326. n. 178.

Achates, in *Entomology*, a species of *Papilio*, with black wings, red at their base, and the hinder marked with a white spot; found in China.

Achates, in *Ancient Geography*, a river of Sicily, now the Drillo, which runs from N. to S. near, and almost parallel to, the Gela. Silius records it, (l. xiv. v. 229) "Et perlacentem splendenti gurgite Achaten," and Pliny, (H. N. i. xxxvii. c. 10. p. 576, Ed. Hard.) says, that the achates or agate was first found on the banks of this river.

Bochart. (Geog. Sacr. v. i. c. 29. Oper. tom. i. 549. Ed. Villem.) supposes, that the name of the flower and river is derived from the Punic *Typt*, varied or spotted, referring to the varied colours of the stone.

Achates, in *Natural History*, the stone called *Agat*. Achatis, in *Natural History*, a species of *Bulla*, in the class of terebriform worms; with an ovated shell, funguisous, obtunded, aperture, and apex, and a truncated columnella. It has varieties; such as the white with yellow apex; the yellow or white with funguisous columnella; and the white with close bands, and a pale columnella. It is found in the American ocean. This is also the name of the *Cypara amethystea* in the Linnean system, which is found in Madagascar.

Ach Bobba, in *Ornithology*, a bird mentioned by Dr. Shaw (Travels, v. ii. p. 449), of which numerous flocks appear near the city of Cairo in Egypt, and feed upon the carrion and filth that are thrown out of the city. The name, in the Turkish language, signifies white father, and is given to this bird partly from the reverence they have for it, and partly from the colour of its plumage. It is about the size of a large capon. This bird is called by Belon the Egyptian Sacre, and it is a variety of the *Alpin Vultur*, or *Vultur peregrinans* of Linnaeus. It is of a red tawny ash-colour, with dusky spots, and their feet are naked. Belon conceives that it is the Hierax, or Egyptian hawk of Herodotus, which, like the Ibis, was held in veneration by the ancient Egyptians, because both of them eat and destroy the serpents and other noxious reptiles, which infest Egypt. Buffon suggests that it may be the fame with the *Carion Vultur*.

Ache, or Ach, a painful ailment in any part of the body. Aches may be either scabrous, or rheumatic, owing to violent pains, or the like. See Headach.

Ache, in old authors, a name given to the plant called *Apium palustre*, or paludapinus, in English, Smallage.

Acheen, Ache, or Ach, in *Geography*, a kingdom of *Sumatra*, lying on the N. W. part of the island. Its capital, the name of which, is situated on a river which empties itself near the N. W. point, or Achener-head, about two miles from the mouth. N. lat. 3° 22'. E. long. 95° 40'. The town lies in a valley, formed like an amphitheatre by two lofty ranges of hills. The river discharges itself into the sea by several channels, and is very shallow at the bar. The houses, of which there are about 800, are built of bamboo, and rough timber, and they are raised by means of pillars to some height above the ground, in order to preserve them from inundation and damps in the rainy season. In the centre of the town, which has neither wall nor moat, is the king's palace, which is a large though rude edifice, and encompassed by a deep moat and strong walls. Though this place is no longer the mart of eastern commodities, it carries on a considerable trade with the nations of that part of the coast of Holland called *Telingo*; by whom they are supplied with the cotton goods of the country, and who receive in return gold-dust, Japan wood, betel-nuts, pepper, sulphur, camphor, and benzoin. The European traders supply the country with Bengal opium, iron, and other articles of merchandise. The inhabitants manufacture a considerable quantity of a thick kind of cotton-cloth, and of stuff for the short drivers worn by the Malays and Achenees. They also weave pieces of silk, of a particular form, for the Malayan drefs. Acheen is deemed, comparatively, healthy, being less subject to complaints arising from woods and swamps than other parts of the island; and the soil is light and fertile, producing rice and cotton, and a variety of excellent fruits. The raw silk of the country is of inferior quality.
quality. The mountains near Acheen produce a small quantity of gold-dust; but the greatest part is brought from the southern parts of Nalacoo and Sooloo. The fulphur is collected from a volcano in the neighbourhoood, and, besides supplying their own manufacture of gun-powder, admits of a large exportation. The inhabitants are, with respect to their persons, taller, robust, and of a darker complexion than the other Sumatrans; and they are supposed to be a mixture of Buttas, Malays, and Moors from the coast of India. In their dispositions and habits, they are more penetrative and fagacious, more active and industrious, and possefs a greater stock of knowledge than their neighbours. With regard to religion, they are Mahometans; and their mosques and priests are numerous; and the forms and ceremonies of their worship are strictly observed. They are expert and bold navigators, and employ a considerable number of vessels for different purposes. Being defitute of convenient coins, they commonly make their payments in gold-dust, which they carry with them in pieces of bladder; and they use grain or feeds for weights. The government is an hereditary monarchy, and the king has usually a guard of 100 feapows about his person. The grand council of the nation consists of the king, four other officers, eight of a lower degree, who fit on his right hand, and fifteen who sit on his left. The king’s pleasure is communicated by means of a woman, who sits at his feet, to an eunuch near her, and by him to an officer, who conveys it to the whole assembly. Merchants and other strangers introduce themselves by presents to the king and his officers. Whenever an European enters the royal palace, he is obliged to take off his shoes. The royal throne was formerly made of ivory, and tortoise-shell; and, when queens governed, a curtain of gauze was hung before it. After the stranger has been introduced, he is entertained in a separate building with the delicacies of the country, and returns in the evening, attended by a prodigious number of lights. On high days the king goes in great state, mounted on an elephant richly caparisoned, to the great mosque; and he is preceded by officers armed very much after the European manner.

The country under the immediate jurisdiclion of Acheen is divided into three districts; each of which is governed by a Panglemo, or subordinate officer. Crimes are severely punished, and without any commutation by the Achenese laws. Petty theft incurs the suffocation of the criminal from a tree, with a heavy weight tied to his feet, or the cutting off a finger, hand, or leg, according to the nature of the offence. Highway robbery, and house-breaking are punished by drowning, and exposing the body on a stake for some days. If an imam or priest be robbed, the criminal is burned alive. The adulterer is delivered up to the friends and relations of the injured husband, who form a circle round him; and, if he be not so fortunate as to make his escape, he is presently cut to pieces, and buried without being admitted into any house, or the performance of any funeral rites. Notwithstanding these discouragements to iniquity, the Achenese are represented by travellers as one of the most dishonest and flagitious nations of the coast.

For other particulars, we must refer to Mr. Marston’s account of Sumatra. Acheen was visited by the Portuguese in 1509, but they could form no establishment in the country. Captain Lancaster was very differently received in 1602. He made a treaty in behalf of the English East India company, with the king of Acheen, and obtained for the company particular privileges. They had for many years a factory at Acheen. See Sumatra.

ACHEIROPPOIETA, formed of a priv. xup, hand, and

ACH, to make, and denoting made without hands, an epithet given to an image of Christ in the Lateran church at Rome, which is said to have been designed and sketched by Luke, and finished by angels.

ACHELIOUS, in Entomology, a species of Phalana, with ferruginous wings, and the anterior marked with a white point and fachea; it is large, and found in America.

ACHELIOUS, in Mythology, is said to have wrestled with Hercules for Delania, the daughter of King Oeneus, and, affirming the shape of a bull, Hercules is said to have broken off one of his horns, which was restored on condition of his giving the victor the horn of Amalthea, the same with the Cornucopia, or horn of plenty, which Hercules filled with various fruits, and consecrated to Jupiter. For the meaning of the fable, see the next article.

ACHELIOUS, in Hydrography, a river of Acanania, which rises in mount Pindus, and, dividing into three branches, flows from N. to S. into the Sinus Corinthiacus. It was formerly called Thes in account of its impetuosity, and by Homer. (Iliad, l. xxi. v. 194.) the king of rivers. The epithet Acheilus is used by Virgil, (l. i. v. 9.) for gurgus, the reason of which, according to Servius (in loc.) is, that Acheilus, on account of the antiquity of this river, was used by the ancients as a denomination of water in general. The ancient poets called rivers Tauriformer, either from the bellowing of their waters, or from their plunging the earth in the course. The fable in the preceding article is explained by some in this manner. Acheilus being a rapid and winding river, roared like a bull, and often overflowed its banks; but Hercules, by dividing it into two channels, and relining its inundations by mounds and ditches, broke off one of the bull’s horns, and reflored plenty to the country. See Strabo (Geog. l. x. vol. 2. p. 703—4. Ed. Amil.) There are other rivers of this name in Achaia Propria, Thebais, and Asia Minor.

ACHEM, in Geography, a country of Africa, in that part denominated the Slave-coast. The extent of this country is unknown: the negroes assert that it reaches to the coast of Barbary. It is divided into great and little Achem, which were formerly united under one monarchy, but are now two separate republics: little Achem is denominated Acheni, or Akanii. There is a town of the same name, sometimes called Armeni. N. lat. 8. 30. E. long. 0. 30. Most of the gold exported from this country is brought to the European forts at Acre. The negroes of both these districts are of an indolent and haughty character, valuing themselves on the superiority they once maintained in respect of their neighbours; but civil divisions have of late rendered them less formidable.

ACHEMENIS, in Botany, an herb mentioned by Pliny (H. N. l. xxi. c. 4. tom. ii. p. 392.) suppos’d by the ancients to have the property of exciting terror in their armies, and putting them to flight. The fable may probably denote, that soldiers could not prosper in war with plants in their hands.

ACHEMEN, in Entomology, a species of Sphynx, yellow, with glass-coloured wings, black at their apex, and the fore wings yellow at their base; found in Jamaica.

ACHERI, Luke d’, in Biography, a learned Benedictine of the congregation of St. Maur, was born at St. Quintin in Picardy, in 1609, and made himself famous by printing several works, that exalted in M. S. with prefaces and notes; such as Barnabas’s Epistle, the works of Archbishop Lanfranc, the Life and Writings of Guibert Abbot of Nogent, and a collection of curious pieces, begun in 1655, and concluded in 1677, under the title of Speculum, i. e. Gleanings, in 13 volumes 4to. In 1723, it was reprinted by M. de
ACHIL, in Antiquity, a name by which Iliad has distinguished the admired family of the GIAIUS; the characters of which are, that they have two heads situated above the extremity of the abdomen, and three antennae; and that the tars are continued of three articulation. Twenty-eight species are enumerated in the new edition of the Systema Nature. The name of this family food upon the roots of plants. See Coccus.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACHILUS, or ACHILIS, in Natural History, a town of the province of ANGELOS or TASCALA in Mexico.

ACH

ACH

peaceance through the year, a native of the Levant, and cultivated at Chelsea in 1712. All the preceding species have yellow corollas: the corollas of the following are white in the ray:—9. the *mecoleophylus*, or fowice-leaved M. whose leaves resemble those of the common fowice-root, and are of the size of those of the tansy, the scales of the calyx edged with black, the plant, and especially the flowers, frangul like fowice-root; a native of the Alps, hardy, and thriving in any soil, and deferving a place in gardens; flowering in July and Augufit, and cultivated by Mr. Miller in 1759.—10. the *lepifus*, with a flem red at bottom, and terminating in a handfome umbel of white flowers, and the fowets in the my elegantly cut, frequent in Siberia;—11. the flowered, or flerry-leaved M. the ABLF L 1111 X11, fubf, under h e 11, named after the Alps of Switzerland, Austria, Pannonia, and Carithía, cultivated in 1683 by Mr. J. Sutherland:—12. the *ferina*, or fowice-root M. growing wild in all the temperate parts of Europe, found in Britain not uncommonly in meadows, by the fides of ditches, on the banks of cornfields, in moift woods, and fandy places; the fowets are put into fallets, and the roots, being hot and biting, are used for the toothach, whence the plant has been called bafrd pelitory; and, on account of the form of the leaf, goofe-tongue; the powder of the dried leaves used as faufu provokes freezing, whence the name; in Siberia a decoction of the whole herb is said to be successfully used in internal hemorrhages: of this plant there is a variety with double flowers called *lachafon's futtons*; it flowers in July and Augufit, and makes a tolerable appearance:—13. the *ajina*, or Alpine M. resembling the laft, and by fome fuppofed to be a variety of it; a native of Switzerland, Savoy, and Siberia, very hardy, cultivated here by Mr. Miller in 1731:—14. the *ferata*, or mouch-leafed M. appearing like *parvina*, flowering in Augufit and September, and introduced, with the next species, in 1754, by Mr. J. Grefler:—15. the *cififia*, or fender-branched M. a native of the East, flowering here in July and Augufit:—16. the *trata*, or camomile-leaved or black M. found on the mountains of Switzerland, the Valais, and Austria, and introduced here in 1774 by Drs. Pitcairn and Fothergill:—17. the *macelata*, mark M. or Swifs genipo, an excellent fowice-root, but injurious in the plentiful attended with high fever, promising to be serviceable in disorders arising from a deficiency of the solids, and yielding a grateful food to cattle; it grows wild on the high Alps, in Savoy, Piedmont, and Austria, and was introduced in 1775 by Drs. Pitcairn and Fothergill:—18. the *vina*, or dwarf M. found on the high Alps of Switzerland, the Valais, and Savoy, very hardy, thrives in any foil, loves an open expofure, and deferves a place in gardens:—19. the *maja*, great M. or the *Yarraw*, found in Italy, and cultivated here in 1683 by Mr. J. Sutherland:—20. the *milofiathum*, common M. or *Yarraw*, abundant in pastures and by the fides of roads, flowering from June to September; used instead of hops, by the inhabitants of Da*Charla*, in their ale, in order to procure affaunting quality; recommended by Anderfon in his Essays on Aromatic, for cultivation, though thought to be a noxious weed in pastures: the bruited herb tea is recommended by Linneus as an excellent vulnerary and hyperic, and by foreign physicians in hemorrhages, and thought by Dr. Hill to be remarkably efteemed in dysenteries, when administered in the form of a strong decoction; an ointment is made of it for the piles, and for the scab in sheep; and an effectual oil is extracted from the flowers; but it is not used in the present practice:—21. the *labina*, native of Italy, Germany, Switzerland, Narbone, and Turin, and cultivated in 1640 by Mr. J. Parkinson:—22. the *olivaria*, or *olentia*, thought by Gerard and Haller to be a variety of the former, and a native of the fame place:—23. the *Cretica*, or Cretan M. a native of Cretæ:—24. *Ivanoffia*, rough-headed M. introduced in 1775 by Mr. Tholus:—25. the *herbatae*, esteemed among the peafants of the Alps as a fowice-root, or horf-roots; in the Alps, and cultivated in 1759 by Drs. Pittaion and Fothergill:—26. the *hildan*, marjoram-fceded M. having a fcanty fleem, as well as the leaf, like mandlin:—27. the *tanacetolia*, tansy-leaved M. a native of the Grifons, and nut uncommon in the pastures and valeys of the Alps. In the latfe edition of Linneus, Gmelin enumerates 32 species, omitting the *hispantes*, and adding the *labata* and the *loqto*.

All the species of the *Achillea* may be propagated by parting the roots either in spring or autumn. The feeds of many of them may be fown in March or April, and they may be transplanted at Michaelmas. They will flower the following summer. As they are mobly hardy, they will require little care in the cultivation. Miller's Diet. by Martyn.

*Achillea involora*. See *Athanasia*.

*Achillea montana*. See *Senecio*.

*Achillea tanacetolia* of Miller. See *Chrysanthemum*.

*Achillea*, in the *Materi Medica* of the ancients, a name given to the gum, which we at this time know by that of the Sanguis draconis, or *Draco's blood*. The ancient Greeks called this eannabai; and the ufe of the word for the mineral which we now call eannabai, was only because it had the fame red colour with this gum. Avicenna, treating of the *Achillea* says, it is otherwise called Sanguis draconis, and describes it as a real gum, universally known in his time.

*Achillea*, in *Ancient Geography*. See *Leuce*.

*Achileis*, or *Achileis*, in *Literary History*, a celebrated poem of Statius, of the epic kind, in which he propofed to deliver the whole life and actions of Achilles. It only comprehends his infancy; the poet being prevented from proceeding by death. It is a point controverted among critics, whether the whole life of a hero, as of Achilles, be a proper subject of an epic poem?

*Achileon*, in *Ancient Geography*, a town and promontory of the Cimmerian Bofphorus, where anciently was the temple of Achilles; now *Cape di Crono*.

*Achilles*, in *Ancient History*, the fon of Peleus and Thetis, was one of the moft celebrated heroes of Greece. He was born at Phthia in Thellaly. His mother, it is faid, dipped him in the river Styx, by which his whole body became invulnerable, except the heel by which she held him. This raction, however, is not universally received; for it appears by Homer's account, (II. i. xvi. v. 161, &c.) that he was actually wounded in the right arm by the lance of Acheus, in a battle near the river Scamander. He was enthrall'd also by Thetis to the care of the centaur Chiron, who fed him with honey and the marrow of lions and wild boars, in order to fit him for enduring mortal toil, and taught him horfmanship and the ufe of arms. When he attempted, by concealing him among young women at the court of Lycomedes, to prevent his going to the fiege of Troy, where, as the had been warned by an oracle, he would be slain; Ulyfles, being admonifhed by an old prediction that, without Achilles, the enterprise against Troy would be unsuccessful, discovered him, and prevailed upon him to follow the Greeks: his mother having procured for him an armour made by Vulcan, which was impetrable. During his concealment he was faid to have debauched one of the king's daughters, of whom was born Pyrrhus, king of Epirus. Pausanias observes, that Homer has omitted this circumstance as difhonourable to his hero, though it has been
been recorded by all the other poets. At the siege of Troy Achilles distinguished himself by a variety of heroic actions; but being dissuaded by Agamemnon for the loss of Briseis, he retired from the camp. When he afterwards returned to avenge the death of his friend Patroclus, he flew to Hecston, fastened his horse to his chariot, and dragged him three round the walls of Troy. The body was afterwards redeemed by the father with a large sum. At last being wounded in the heel with an arrow by Paris, the brother of Hecston, whilst he was in the temple treating about his marriage with Philoctena, daughter to king Priam, the wound proved fatal to him; and he was interred on the promontory of Sigeum. 

When Troy was taken, the Greeks sacrificed Philoctena on his tomb, in conformity to his requell, that he might enjoy her company in the Elysian fields. It is said, that Alexander, when he saw this tomb, honoured it by placing a crown upon it; exclaiming at the same time, that "Achilles was happy in having, during his life, such a friend as Patroclus, and after his death, a poet like Homer." Achilles is supposed to have died 1184 years before the Christian era. Homer has been blamed for making his hero Achilles of too brutal and unmanly a character. This charge, Dr. Blair apprehends, is unjust to Achilles, and it is founded on an exaggerated representation of his character by Horace, de Arte Poet. p. 55. Ed. Wakefield.

U. 2

Achill

Achilles, in Geography, is the W. point of the islands of Achl on the W. coast of Ireland. N. lat. 51° 51'. W. long. 10° 45'.

The coast between this head and Sline head is much indented by bays and creeks. Archierluk, or Acharifton point is eight leagues S. of this head, and from thence to Sline head, 8. by the eight miles more. Within land there is between these a height hill, called St. Patrick's hill, which may be seen at sea to a great distance. Achill-head is a very high point, and appears at a distance with a hollow in the middle. Within these are two high mountains; and these three appear at sea like three islands.

Achillini, Alexander, in Biography, a native of Bologna, and distinguished both as a philosopher and a physician. He flourished in the 15th and 16th centuries, and was called, by way of eminence, the great philosopher. His progress in his studies was so rapid, that he was promoted in early life to the honour of being professor in the university. In the year 1506 he removed to Padua, where he filled the first chair of philosophy, and drew to his lectures a great number of students. When the war, in which the republic of Venice was engaged against the league of Cambry, constrained him to leave Padua, he returned to his native country, and was again appointed professor of philosophy in Bologna. He adopted and maintained the sentiments of Averhucis; and was particularly distinguished for his acuteness in the conduct of private and public disputations. To him some have ascribed the discovery of the malice and incus, two small bones in the organ of hearing. Achillini was a man of singular simplicity, and so unacquainted with the common modes of civility and address, that he was often ridiculed by the young scholars who attended him, though much and deservedly esteemed on account of his learning. He was the rival of Pamoracius, who sometimes acquired a superiority over his arguments by his wit and humour. He died at Bologna in 1512 at the age of 42 years; and was buried with great pomp in the church of St. Martin the great, belonging to the Carmelites friars. The following epitaph, composed by Janus Vitalis, was inscribed on his tomb: viz.

"Hospes, Achillinum tumulo qui queris, in iito
Falleres: ille fuso jucundus Arid B(.h)ci
Elyphum colit; et quas rerum hic dicere causas
Vix potuit, plenis uide vidit oculis.
Tu modo, per camerum dux nobilis umbra beatos
Errat, die longum perpetuumque vale!"

He wrote several pieces on philosophical subjects, which he published and dedicated to John Bentivoglio. His works are, 1. In Mundini Anatomia, Annotationes. Venet. 1522; fol. 2. De Humani Corporis Anatomia, Venet. 1516; 1521; 4to. In 1568, a collection of all his works, philosophical and medical, was published at Venice in folio.

Achillini, John Philotheus, a brother of the former, was the author of a poem intitled Il Vindicaro, in which are found the eulogies of several Italian literati, and various lessons of morality. It was printed at Bologna in 1512. He was born at Bologna in 1466, and did in 1538. He was a man of talents and erudition, and conversant with the Latin and Greek classics, with music, philosophy, theology and antiquities; of which latter he has made ample collections.
ACHILLES, Claudius, was grand nephew of Alexander. He was eminent as a philosopher, divine, lawyer, orator, mathematician and poet. He read lectures at Parma, Ferrara and Bologna, the place of his nativity. His hopes of preferment were repeatedly disappointed. At last, however, the duke of Parma appointed him professor of law, with a good salary. He published a volume of Latin letters, and another of Italian poems at Bologna in 1622, which gained him great reputation. He was born in 1574, and died in 1640. Gen. Diet.

ACHILLES, the name of an officer, who prefigured over the practice of medicine at Cairo. His business is to examine for fever, in order to prefix physic in that city, and to license only such as found to be duly qualified. There is, without doubt, the intention of the appointment; but as the Achiltale sells his office of the Biface, the license of practicing physic there is granted to the persons offering the largest fee, and not to those most distinguished by knowledge in their profession.

ACHINOU PASS, in Geography, lies between the island of Negropont and the main in the Archipelago. N. lat. 29° 43'. E. long. 23° 55'.

ACHIOTTE, a red drug from America, used in dyeing, and in the preparation of cochineal. The word is Brinvilian, and properly signifies the tree from this which is procured. Ray writes it Achiotte. Achiotte is the same with what the French frequently call roucou, and the Dutch ruco. It was formerly, and even by Mr. Ray himself, called a kind of amara, or earth; but later observers find it to be a flower, or seed of a tree, which grows chiefly in hot countries, as Yucatan or Campeche, and Guatemala. It is about the size of a plum-tree, only more tufted; its branches being longer than the trunk. The fruit is indeed in a kind like a chufet, except that it is of an oval figure. It begins to open outside from the middle to the top, and falls into four parts; having in the middle a beautiful carnation-coloured flower. The tree has no leaves; but instead of these shoots out filaments like those of afioron, only bigger and longer. Between these grow little soft viniuncule dark-brown, about the size of pepper-cor; which the Indians, separating from the filament, bake in cakes of about half a pound each; in which form the drug is brought into Europe. For the use to which it is applied, and the method of preparing it, see Annatto and Roucou. See also Beta Oriliana.

ACHIROPOLETOIS. See ACHEIROPOLETA.

ACHIVI, in Ancient History, a name given by the Roman poets to the people of Greece, or Achaians. See Achaeans. Homer (ll. i. iii. v. 8.) utes the term to express all the enemies of the Trojans.

ACHLETTEN, in Geography, a town of Germany, in the circle of Austria, on the Danube, four leagues E. S. E. of Ena.

ACHLET, a town of Great Armenia, situated on the north side of the lake Van, or Aeramar. This town, though small, is important to the Turks, because it lies on the frontier of their empire, and is well fortified. N. lat. 39°. E. long. 45°. 20'.

ACHLIS, in Zoology, a name given by Pliny to the species ALCEI, or Elk.

ACHLYS, oxus, literally signifying a kind of cloud, in Surgery, a darkness or dimness of sight. It also denotes a small tear or mark over the pupil, of a light blue colour, and is synonymous with caligo corneae, or blindfolds from opacity of the cornea. It is the leucoschyle of Sauvages, and is described to be a speck of the cornea, somewhat polished, which occasions objects to appear as if seen through smoke, or a cloud, and therefore obscured. By oblique inspection it is discovered to be different from the opacity of the aqueous humour, accompanying some diffuseness of the eye. This species often arises from a various opthalmia, or moist one, or whatever can render the cornea opaque. In infants, as they grow up, it often vanishes spontaneously. The juice of pimpernel, either the blue or purple, dropped into the eye twice a day for a week, and the juice of the common flat-thistle and blue-bottle, are useful. Sugar-candy powdered is often sufficient. Emetic wine, which is the least hurtful, may be dropped into the eye with advantage. The vapours of aniseed, or funnelled water, are of service. See Wallis's Dictionary Medicae Oeconomiae.

In a metaphorical sense, achlys also denotes a disorder of the womb, answering to what Latin authors call affago uteri.

ACHLYS, in Mythology, is applied by some Greek authors to the first Being, who existed before the creation of the world, of chaos, and of the gods.

ACHMET, in Biography, an Arabian author, supposed to have lived about the fourth century, wrote a book on the Interpretation of Dreams, according to the doctrine of the Indians, Persians, and Egyptians. The original is lost, but it has been preserved by curiosity, or superfluous credulity in Greek and Latin. It was published, together with Artemidorus on Dreams and Chromancy, by M. Rigaud, at Paris, in 1653, 400. Gen. Diet. and Gen. Biog.

ACHMET I. emperor of the Turks, was third son and successor of Mahomet III. and ascended the throne before he had attained the age of fifteen. His reign was attended with various circumstances, both prosperous and adverse to the Turkish empire. The Albigue rebels, who took refuge in Perigord, the great effect of the two empires in a war, during the progress of which Bagdad was taken from the Turks, and which lasted, with interruptions, for several years. In this reign Transilvania and Hungary were the scenes of warfare between the Turks and Germans; and the former were assisted by Bethlem Gabor and Potakay. The tranquillity of Achmet was disturbed by various disasters and calamities, which occurred both by sea and land, by a pretender to his throne, and by attempts on his life. His time, however, was chiefly devoted to the gratifications of the harem, in which he had 3000 women, and to the sports of the field, for which purpose he kept 45,000 falconers, and nearly as many huntsmen, in different parts of his dominions. He expended large sums in building, and particularly on a mosque which he erected in the Hippodrome. Achmet was less cruel than his predecessors; but he was haughty and ambitious. His constitution was strong, and his life was active; nevertheless he died at the age of 29, in 1617. His three sons successively ascended the throne after him. Mod. Un. Hist. and Gen. Biog.

ACHMET II. emperor of the Turks, son of Sultan Ibrahim, succeeded his brother Solymah, in 1601. This prince, though devout and inoffensive, cheerful and condescending, just and amiable in private life, was destitute of the talents necessary for the exercise of sovereign power. He was fond of poetry and music, in both of which he made some proficiency. He died in 1695, at the age of 50, requesting his

ACHMÉT II., emperor of the Turks, son of Mahomet IV. was raised to the throne on the deposition of his brother Mustapha II. in 1703. His first object after removing the malecontents, was to annex wealth; and with this view he debased the coin, and laid new taxes. When Charles XII. of Sweden, in 1709, after the battle of Pultawa, took refuge in the Turkish dominions, he was received with great hospitality; and under the influence of the sultan neither war was declared against Czar Peter, which terminated by the peace of Pritsch. The King, however, was at length obliged to quit the Turkish dominions. Achmet recovered the Morea from the Venetians; but in his expedition into Hungary, in 1748, his army was defeated by Prince Eugene, at the battle of Peterswaradin. Achmet was led by his ministers and favourites, and their influence frequently occasioned political revolutions. He is said, however, to have refuted in dignified and public places, in order to discover the sentiments of his subjects. At length a faction among the soldiers caused his dethronement in 1750, and the elevation of his nephew Mahomet V. He was confined in the apartment whence his successor had been taken, and continued immolated till he was removed by an apoplexy in 1756, at the age of 74 years. Achmet was a prince of moderate abilities, and good intentions; but confidence in his vizier obscured the lustre of his reign, and brought it to a speedy termination. Mod. Un. Hist. Gen. Biog.

ACHMÊT-SHET, in Geography, a town in the peninsula of the Cimone, the residence of the Sultan Galga, the elder son of the Khan of Tartary. It stands on the largest river in the country, E. long. 51° 20'. N. lat. 45° 35'.

ACHMÎL, a large town of Upper Egypt, situated on the eastern bank of the Nile: the Chenniss of Herodotus, and Panopolis of Strabo. On a triumphal arch, situate a few 100 yards south of the convent, and built of marble by the emperor Nero, there is a Greek inscription, says Mr. Bruce, εῖς τὸν Καισαρίαν Καίσαρα. The temple of this place, says Abdulfed, is one of the most celebrated monuments of antiquity: being constructed of stones of a prodigious size, on which are sculptured innumerable figures. There may still be traced four concentric circles in a square; the innermost of which contains the sun; the two next are divided into twelve parts, one containing twelve birds, and the other twelve animals almost effaced, which appear to be the signs of the zodiac; the fourth presents twelve human figures, which Savary supposes to be the twelve gods representing the twelve months of the year, as the Egyptians, according to Herodotus, (I. ii.) first divided the year into twelve months, and the angles of the square, on the sides of which they may be distinguished a globe with wings, are occupied by the four seasons. This temple was probably dedicated to the sun; and these various hieroglyphics mark his passage into the signs of the zodiac; whence Savary infers, that the Egyptians possessed the knowledge of astronomy from the remotest antiquity.

The serpent Hariti is the wonder of the neighbouring country. Scheilik Hariti, above a century ago, died in this place; and as he was deemed a saint among the Mahometans, they raised a monument in honour of him, and one of their priests persuaded the people, that the soul of Hariti passed into the body of a serpent. This artful priest had contrived to make a serpent obedient to his voice, and he pretended to perform a variety of tricks, and to cure many disorders by means of this serpent, which he confined to the tomb, and made the instrument of great gain to himself. The virtues of this serpent are acknowledged by the Chris-
ACHRAS, or Sapota-Plum, in Botany, a genus of the
Hexandra Muntingiana class, and of the natural order of
Diosmofe. The characters are; the calyx is a perianthium,
confiding of five ovate, concave, erect leaflets, the outer
broader and shorter, and the inner coloured: the corolla is
one-petalled, ovate, of the same height with the
border cut into five subovate flat divisions, and scales
at the jaws of the corolla, equal in length to the divisions,
narrower, spreading, and margined; the stamina have five
short awl-shaped filaments at the jaws of the corolla, alternate
with the divisions, bent inwards, and the anthers are sharp:
the pistillum has a roundish, flatted germén; the
style is awl-shaped, longer than the corolla, and the
stigma is obtuse; the pericarpium is a glbose, very succulent
pomum, with twelve cells; the seeds are folicate, ovate,
finishing, scarred on one side, and pointed at the base. There
are four species, viz. 1. The mamonja, or mameé lapota,
otherwise called nipple S. or American marmelade, growing
in America to the height of thirty or forty feet, with
leaves a foot long, and three inches broad in the middle,
cream-coloured flowers, and large oval fruit, containing a thick
juiceous pulp, called natural marmelade; this tree is planted
for the fruit in Jamaica, Barbadoes, Cuba, and most of the
West India islands, and was cultivated here by Mr. Miller
in 1739: of this there is a variety, called the bully or riberry
bully-tree, because it is the tallest of all the trees in the
woods; it is esteemed one of the best timber-trees in Jamaica.
2. The sapota, which grows to the height of sixty or seventy feet, without roots or branches, and bears a round, yellow fruit, larger than a quince, which smells
well, and is of an agreeable taste; it is common at Thames,
and some other places in the Spanish West Indies, but not
to be found in many of the English settlements; it was
cultivated here by Mr. Miller, in 1758. 3. The difficata, or
clove-flowered S. cultivated in Malabar for the fruit, which
is of the form and size of an olive, having a pulp of a
sweetish acid flavour; its leaves are used for cataplasm
for tumors, bruised and boiled with the root of curcum and
the leaves of ginger, supposed to be a native of the Philip-
ines islands, and probably growing in China, and found by
Forster, flowering in September, in the island of Tonga-
tabu. 4. The felisfilia, or willow-leaved S. called in Ja-
mica white-bully tree, or galaveta wood, which supplies
good timber; cultivated here by Mr. Miller, in 1755. The
bark of the sapota and mamonja is very aromatic, and is
called cortex Javanesis. This was once supposed to be the
true fennit's bark, but its effect on the negroes has been
pernicious. These trees being natives of very warm cli-
mates, cannot be preserved in England, unless they are
placed in the warmest houses, and managed with great care.
Miller's Dict. by Martyn.

Gmelin has added the balata, with ovate oblong leaves,
hoary underneath, and an oblong ovated pomum.

ACHRIDE. See Ochidea.

ACHHACORDES of Java, in Natural History, one
of the genera of serpents, in the second volume of Count de
Cape's natural history. This genus is described by M.
Hornbltadt, a Swedish naturalist. Its body and tail are
covered with little warts or tubercles; its back is black; its
belly and sides are whitish; the latter are marked with Black
spots; the head is flat, and covered with small scales; each
jaw of the mouth, which has a small opening, is armed with
double row of teeth, but it has no poisonous fangs; the
largest part of the body is near the anus, and the tail is
remarkably slender. The specimen from which this defcrip-
tion was taken measured eight feet and three inches in
length; its tail was eleven inches long; and the greater
diameter of the body was above three inches. It was a
female, and in it were found five young ones, completely
formed, and nine inches long.

ACHROMATIC, composed of a priv. and xepoat, co-
tour, and denoting without colour, a term, says M. de le
Lande, first introduced into his astronomy, to denote te-
kscopes of a new invention, contrived to remedy aberration
and colours. See Achromatic.

ACHRONICAL, in Astronomy. See Acronychal.

ACHSTEDE, in Geography, a small town of the circle
of Lower Saxony, in the duchy of Bremen, two leagues
north of Bremen.

ACHSTETTEN, a town of Germany, in the circle of
Swabia, two leagues N. W. of Augsburg.

ACHTELING, a measure for liquors used in Germany.
Thirty-two achtelings make a heener; four heliums or
feet make an achteling.

ACHTIAR, in Geography, a small commodious haven
near Inkerman in the Black Sea.
ACHTIRKA, a town of Russia, in the government of Charkov, ten German miles W. S. W. of Charkov.

ACHTUBA, a river of Russia, which rises from the Volga, a little above the town of Tverizin, and runs parallel with that river to Kakhnojor, near which place it joins it, and flows with it into the Caspian Sea.

ACHY, a species of Cassia, that grows in Arabia.

ACHYRI, in Geography, a strong town and castle of the Ukraine, subject to the Russians since 1667. It stands on the river Uorkofo, near the frontiers of Russia, 127 mls. west of Kiow. E. long 36° o'. N. lat. 49° 32'.

ACHYRACANTHIA, in Botany, a name given by Dillenius to the ACHYRANTHES of Linneus.

ACHYRANTHA, a species of Ilexacium.

ACHYRANTHES, formed of zygos, chaff, and acis, a flower, in Botany, a genus of the pantanaria monogynia class of plants, belonging to the natural order of mistletoes Linn. and of amoranthi Jaff. The characters are these:—The calyx consists of an outer perianthium, that is threeclefted, lanceolate, acute, permanent; and of an inner one, that is five-leaved and permanent; it has no corolla; the nectarium has five valves, surrounding the germ, bearded at the tip, concave and caduceous; the stamens are filiform filaments, of the length of the corolla, and the anthers are ovate and incumbent; the perianthium has a superior turbinate germ; the style is filiform, of the length of the stamens, and the stigma is bulb and villous; the pappus is capitate, roundish, one-celled, not graping; and the seed is single and oblong. There are eleven species, viz. 1. aphaca, or rough, of which there are two varieties; the Sicilian plant with oblong pointed leaves, growing near three feet high, and the Indian, found in Malabar, Ceylon, Jamaica, and almost every where within the tropics, with broader leaves, and on both sides smooth and green, cultivated here in 1713; 2. inca, or briny, a lofty plant, a native of Malabar and Ceylon, cultivated by Mr. Miller in 1759; 3. murieta or prickly, a native of India, introduced in 1777, by M. Thouin; 4. putica or spreading: 5. alterifolia or alternate-leaved; both natives of the East Indies; 6. corvus, formerly belonging to the Celsia of Linnaeus, a native of Ceylon; 7. dichorona, a native of Virginia; 8. germina, a native of India; 9. nivosa or white, a native of the Canary Islands, introduced here in 1780, by Mr. Maffon, and flowering from May to July; 10. orinaria or tall, climbing up trees to the height of twenty feet, common about Spanish-town and Kingston, in Jamaica, and in the woods of Domingo, and called by Browne bastard hops-withes; 11. papyrosiana, found in Arabia and Malabar. Gmelin enumerates seventeen species; adding the papillosa, lobiflora, or ILEXACIUM longum, pantanaria, capitata, and densiflora, found near York, fl. sg. Arab. The several species have little beauty, and are only preferred in botanic gardens.

ACHYRONIA, in Botany, a name given by Van Royen to a genus of plants called by Linneus ASPALATHUS.

ACHYROPORUS, the name given by Vaillant to the Phytophores of Linneus.

ACIZIB, or ACZIB, in Scripture Geography, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais; probably the same with that called by the Greeks Ezechippa; also, a town in the more southern parts of the tribe of Judah.

ACIA, formed of the vernacular name Aciou in Guiana, in Botany, a genus of the Monadelphia monographia class, and natural order of pomaceae. Its characters are:—The calyx is a one-leaved, turbinate, curved perianthium, with a five parted border, the parts roundish and spreading, the uppermost and two lowest larger, the two middle ones smaller; the corolla has five, oblong, rounded petals; the three upper longer, ascending; the two lower shorter; the stamens consist of twelve unequal filaments, uniting at bottom into a linear filiform membrane, inserted into the calyx between the two smaller petals; the anthers are roundish and small; the pistil has an ovate germen, above the base adhering by the membrane of the stamens to a rib internally prominent from the bottom of the calyx; the style is filiform and curved; the stigma acute; the perianthium is an ovate, fibrous, chipped, large drupe; the seed is an ovate nut, with a bristle shell. There is one species, which is a tree, whose trunk is thirty feet high, and three or four feet in diameter, covered with a smooth grey bark; the fruit is of the size of a walnut, including a large kernel, of an agreeable taste, and eaten by the crocodiles when brought to market in Amazonia; they also extract an oil from it, as sweet as that of almonds; the wood is hard and heavy, and of a yellowish white colour.

ACIA, a term in the Roman Surgery, concerning the meaning of which physicians and commentators are much divided. Celsus, speaking of the healing of wounds, either by future, or by the fossil, says, each is best effected by means of a soft acia, not too much twitted, that it may fit the easier on the body. Boechornius will have the acia to be the acia of the fossil, or that part which is pierced in which view, acia mollis only imported, that it was not fit so as to pinch too much.

ACICOLA, in Botany, an herb that grows in Peru, and is sometimes used instead of the herb PARAGUAY, of which it is said to have all the properties.

ACICULA, in Natural History, a species of Bucesnum, with a smooth, fabulated, very thin shell, transversely frusted with conical spiral windings. It is found in fresh waters. Acicula is also a species of Helix, with an oblong acuminate shell, longitudinally ribbed and transversely frusted, and an oval aperture; found in Coromandel.

ACICULAE denote small spikes, or prickles, in form of needles, with which nature has armed several animals and plants.

ACID, in Chemistry, is used in common language as a generic name for all those substances which impel the organs of taste with a sharp four sensation. Since, however, there are certain bodies destitute of this property, which nevertheless are called by all chemical writers acids, this popular characteristic must be abandoned as essential, for one which is more comprehensive.

Newton's well known definition of an acid, 'that which strongly attracts, and is strongly attracted,' would have required notice only in the history of chemical opinions, if it had not been implicitly adopted by one of the chief chemists of the present age, C. Guyton Moreau. (Dict. Method. art. affe.) Now if any one should ask me, 'what is an acid,' I reply, it is that which of all palpable bodies has the most powerful solvent, which acts on the greatest number of other bodies; that, as Newton has so well expressed it, which strongly attracts, and is strongly attracted. It is a greater fault for a definition to be too comprehensive than too circumscripted, and that which has been just quoted not only includes alkales as well as acids, as indeed Moreau allows, but all the active chemical agents, such as water, alcohol, hydrogen, oxygen, &c. for they are all powerful solvents, act on a great num-
out of other bodies, strongly attract, and are strongly attracted. In fact, there is no one property peculiar to the genus acid, and which belongs to each species, so that it is not possible to give a definition of the term; nevertheless, by combining together the general distinguishing qualities of acids, and noting at the same time the exceptions to these, a description may be produced more illustrative than the most laborious definition.

Previously to the consideration of the general properties of acids, it will be an advantage to give a sketch of the opinions held by the old chemists concerning their origin and mode of action, and to examine more at large the theory of Lavoisier upon the same subject.

When the mechanical system was in vogue, according to which the chemical action of bodies was explained by the suppos’d figure and size of their respective molecules, acids were supposed to be a genus of fluids, composed of extremely small and sharp spicules, which readily penetrated into the minutest pores of the substances subjected to their action, and thus separated from each other their component parts; while, at the same time, the acid became neutralized by its points being dashed in the pores of the body with which it was mixed. This explanation was, however, ably contested by Boyle, and by Stahl in his work on fats: and, at length, together with other chemical phenomena, the solvent power of acids was arranged by Macquer and his contemporaries, under the general laws of elective attraction.

After a few of the acids were discovered, it was suppos’d by Paracelsus, and several chemists of his age, that there existed an universal saline element, or principle of acidity common to all acids, which therefore differed from each other rather in mode than essence. Becher, though he allowed the unity of the cause of acidity, yet affirmed it to be composed of water, and variable earth, and therefore not entitled to rank as an element. Stahl, in his valuable researches into the existence of phlogiston, and the composition of fats, was induced to believe that the sulphuric acid, or as it was then called the vitriolic, was the original acid, of which all the rest were only modifications. A similar opinion was held by Sage and Landriani, except that the former suppos’d the phosphoric acid, and the latter the carbonic acid, to be the primary one. The discovery of dephlogisticated air (oxygen gas) having been made by Priestley in 1767, a multitude of experiments were soon after instituted by the chemists of Europe on this interesting substance; and, in 1773, a memoir was presented to the royal academy of sciences at Paris, by Lavoisier, on the composition of the acid of fagat. In this, after having described the method of preparing the acid of fagat by means of nitrous acid, he concludes, that the conversion of nitrous acid into fagat gas, is owing to the abstraction of part of its oxygen by the fagat for the fagat substance, and that the fagat in consequence of its union with oxygen acquires the properties of an acid. Proceeding afterwards to generalize this inference, he maintains that oxygen is the universal acidifying element, and that by combining in certain proportions with combustible bakes without decomposing them, it thereby converts them into peculiar acids. This doctrine, simple and elegant, and plausible as it was, did, however, at first meet with general concurrence; but, in the course of the controversy, it gradually acquired, and merited new advocates from the accumulated testimonies of experiment in its confirmation. The publication of Lavoisier’s Elements of Chemistry, in 1789, contributed more than any thing else to settle the opinion of chemists upon the subject; in this work he demonstrates that phosphoric and charcoal, and sulphur, being separately inflamed in oxygen gas, combine with its bakes, acquire an additional weight equivalent to that of the air consumed, and are converted into the phosphoric, carbonic, and sulphuric acids.

Besides the analytical arguments above alluded to, the Lavoisian theory is supported by an equal number of analytical experiments, in which most of the known acids are decomposed into oxygen, and one or more combustible bakes. The most elegant experiments of both kinds of proof is furnished by the nitrous acid: if purified nitre (nitrate of potash) previously deprived of its water of crystallization, be exposed in a silver retort to a low red heat, a large quantity of gas, containing of oxygen and azote, in the proportion of about 80 of the former to 20 of the latter, will be given out, and pure potash will remain in the retort, whole weight together with that of the gasses will be equivalent to that of the original nitre; the mixed gasses are wholly distillate of acid properties, but by being forced into union by means of the electric spark, their volume is gradually diminished, and at length the whole is reduced to an acid liquor,possessing all the qualities of nitrous acid; if this and the potash remaining in the first process be mixed together, chemical union immediately ensues, and nitre is reproduced.

Three of the known acids are incapable of being decomposed by any method that we are at present acquainted with; it is therefore only from analogy that they are supposed to contain oxygen for their acidifying principle; this circumstance, however, is no peculiar objection to the theory of Lavoisier, for since all the decomposable acids may be resolved into oxygen and a simple or compound combustible base, it seems consistent with the principles of chemical philosophy to establish that as a general law, to which in the present state of our knowledge, there is not a single exception.

Substances, whole mutual affinity is indeterminate, may combine with each other in various proportions, and the resulting compounds will vary in their properties accordingly: this is the case with all the known acidifiable bakes which in their lowest state of oxidation exhibit no acid properties whatever; nor is the development of an acid an evidence of the complete saturation of its base with oxygen, there being several acids capable of combining with additional quantities of oxygen, and thus acquiring new and more decided acid characters.—It is even suppos’d that some bases may be oxygenated in three different degrees, preferring in each the equivalent qualities of acids; hence results an important arrangement of acids according as they are oxygenated in the first, second or third degree. The reform’d chemical nomenclature on the principles of Lavoisier and Moreau, has ingeniously distinguished these. It is by the terminations ox and oxi, and the prefixes ho (for oxygenated); thus sulphur, at the lowest state of oxygenation in which it acquires acid properties, is called sulphurous acid; when fully oxygenated it becomes sulphuric acid; thus also, nitric acid, when raised to the third degree of oxygenation, becomes oxy-nitric acid.

The old chemists divided acids into mineral, vegetable, and animal, according to their supposed origin; this, however, is not only an incorrect, but an incorrect method of arrangement, as many of these bodies are found in all the three natural kingdoms. Upon the whole, perhaps, the best way of arranging them is the following:—

States
The chemists of the last century seem to have been acquainted only with the three mineral acids, as they are called, viz. the sulphuric, nitric, and muriatic, and with the acetic acid or vinegar: the accuracy and industry of the moderns have increased the number of species to twenty-nine; how many more may be hereafter added to the list it is impossible to ascertain. Without adverting to the possibility of discovering new acidifiable bodies, it is by no means improbable, however, that many of the simple combustible bodies as the metals, or the compound ones as phosphorous hydrogen, sulphurated hydrogen, the metallic phosphates, &c. may be so far saturated with oxygen, as to become peculiar acids.

The characteristic properties of acids, i.e. the peculiar laws and effects of their action on other chemical substances, yet remain to be mentioned.

1. When taken into the mouth they occasion a sour taste.
2. They change native vegetable blues to red.
3. They have a stronger affinity for alkalies than these have for any other substance.
4. They combine with earths, with alkalies, and with metallic oxides, forming the numerous and very important classes of earthy, neutral, and metallic salts, most of which are incapable of crystallization.
5. The property of incombusibility has been generally attributed to acids as a characteristic, but certainly very erroneously. The most incombusible of the acids are no more so than the fixed alkalies, the earths, and the perfect metallic oxides; and all the acids with two or three radicals, and those with simple radicals in the first state of oxygenation, are, strictly speaking, combustible, that is, they unite at a certain temperature with oxygen gas, during which combination heat, and in some cases light also are extracted.

The medical effects of acids are considerable, and vary according to their degree of concentration; the most active, when pure, or nearly so, are used externally as caustics and ephoratics, and as powerful stimulants in some cases of palsy; if largely diluted with water, they may be safely employed internally in fevers, inflammations, and hemorrhages, as refrigerants and allurants.

For the particular acids, see them under their specific names.

ACIDALUS, VALENS, in Biography, an eminent grammarian and critic, was born at Wittloch in Brandenburgh, and after visiting several academies on the continent, fixed his residence at Breilaw. Being disappointed of employment, he became a Roman Catholic, and was chosen rector of a school at Niefa. Thunius informs us, that he was a very close student, and that his nocturnal studies, which were unreasonably prolonged, whilst he was composing his conjectures on Plauto, occasioned a delirium that terminated in his death, on the 25th of May 1595, when he was just turned of 28. He wrote a Commentary on Quintus Curtius; Notes on Tacitus; on the twelve Panegyrics; besides speeches, letters, and poems. A small piece, printed in 1595, and intitled, Mulieres non esse homines, or that "women were not of the human species," was falsely ascribed to him. He only accidentally found the MS. and printed it. It is said, that in order to appease the wrath of some ladies, who reproached him as the author, he declared his opinion, that the author was a judicious person, the ladies being certainly more of the species of angels than of men. M. Baille, who admits him among his Eniens celebres, says, that his comment on Plauto was written when he was not more than seventeen or eighteen years of age, and that he composed several Latin poems about the same period.

ACIDILUS, the name of a fountain in Orc, menos, a city of Boeotia, in which the Graces, who are sacred to Venus, bathed; hence the epithet Acidilus, given to Venus. See Virgil, Æn. i. v. 724.

ACIDAVA, in Ancient Geography, a town of Dacia, towards the country of the Jazyyi.

ACIDIFIABLE base, ACIDIFICATION, in Chemistry. The general theory of the formation of acids has already been explained under that term. An acidifiable base or Radical is any substance, whether simple or compound, that is capable of uniting without decomposition, with such a quantity of oxygen as thereby to become possefts of acid properties. All acids agree with each other in containing oxygen, but differ from each other in their radicals; hence it is the acidifiable base that determines the species of acid. This term was unknown in chemistry; previously to the discoveries of Lavoisier on the composition of acids, because these bodies that are now proved to be convertible

- Sebaceic
into acids by combination with oxygen, were suppossed by Stahl and his followers to be already acids united to phlogiston: thus sulphur, which according to the present theory is a chemical element, and capable, by combination with oxygen, of being converted into sulphuric acid, was, by the Stahlians, considered as a compound of sulphuric acid and phlogiston.

The object of the reformed chemical nomenclature is to denote, as much as possible, the composition of bodies in the names appropriated to them; thus sulphur, carbuncle, and phosphoric acids express the perfect saturation of their respective bases, sulphur, carbuncle and phosphorus, with oxygen. This rule, however, has by no means been uniformly adhered to, and the young student in chemistry, reading of the benzoic, succinic or sebacic acids would on this account be led into an error if he suppos’d that benzoe, amber, or fat were the acidifiable bases of the acids that bear their names. Almost all substances are capable of combining with oxygen, but it does not therefore follow that they are acidifiable bases; that the process of acidification may take place a large proportion of oxygen seems essentially necessary, otherwise the result is only an oxyd. Hence oxysulphuric substances may be divided into those which are capable only of a low state of oxydation, or proper oxysulphuric bases; and into those capable of a further combination with oxygen by which they acquire acid properties, or acidifiable bases. Acidification may be performed in various ways according to the temperature and the affinity of the base for oxygen. The two great refinements from which nature procures her oxygen for the composition of acids are water and atmospheric air, the former confining of oxygen and hydrogen, and the other of oxygen and azot. The chemist employs principally oxygen gas and atmospheric air at a high temperature, as in the formation of carbonic and phosphoric acids by combustion of charcoal and phosphorus, or the nitric acid as in the formation of the sulphuric and oxalic acids. The acidifying processes of art are generally more rapid than those of nature.

ACIDITY, the quality which constitutes or denominates a body an acid, or that sensation of sharpsnes and sourness which acids excite upon the organ of taste.

ACIDON, a river of Peloponnesus, called also Acidus, which united with Jardanus, near Argus.

ACIDOTON, in Botany, a genus of the monoecc pistachio class and order; the characters of which are, that it has male and female flowers on the same, or a different tree; the calyx of the male is a five-leaved perianthium, and the leaflets are ovate-lanceolate and reflex; it has no corolla: the flamina are numerous filaments from 3 to 40, placed on a globular receptacle, the outer shorter, the inner longer and upright: the androdes are cordate-ovate, upright and small: the calyx of the female is a six-leaved perianthium: the leaflets linear-lanceolate and spreading; no corolla: the pistillum is a three-corned germen: the style short, acute, thick and trifid at the top: the stigmas are tormentose and reflex: the pericarpmum is a three-grained, hilifuse, threecelled capsule; and the seeds are solitary and ovate. There is one species, viz. A. urticae, a native of Jamaica, described by Sloane, though he never saw the flower and fruit, which grows to the height of eight or nine feet. Miller’s Dict. by Martyn. This, in Gmelin’s edition of Linneas, is a genus of the polyandria monogynia class and order.

ACIDOTON is also a species of Abelia.

ACIDULA, in Ancient Geography, a fountain of Italy, near Linturnum, to the waters of which, probably impregnated with fixed air, or carbonic acid, Phryg affixes a salutary effect, as an antidote to stone and gravel.

ACIDULUM, a species of mineral waters, distinguished by their sparkling appearance when poured from one vessel into another, and by their brisk acidulous taste; they contain a considerable quantity of free carbonic acid to which these properties are owing.

ACIDULATUM, a term denoting any thing blended with acid juices, in order to give it a acridis and brillantis.

ACIDULUS, a term applied to a thing that is slightly acid: it is synonymous with the word jal-acid.

ACIDULUM, Acidity, a term used in the new chemical nomenclature, to express a genus of native compound acids, in which the alkaline base is superacified with acid, and which therefore are employed in various chemical processes, and for economical purporses as acids. We are at present acquainted with two species, the tartaricus aciddnum, or aciddulum tartartite of potash, and the oxalic acidulum, or aciddulam oxylal of potas.

ACIDUMPINGUE, Cauficum Acidum gratus. Fr. Feu-faure Germ.

In the year 1764, when the abilities of Macquer, Bergman, Black, and Scheele, had already discovered many important chemical facts, which were with difficulty explicable on the Stahlian theory, and when the rigorous method of demonstration so honourable to the present age had not as yet been universally admitted to, there appeared in German a volume of Essays on the subject of Lime, by Fred. Meyer an apothecary of Oldenburg, announcing the discovery of a new chemical agent, the acidum pingu, with an extensive theory dependent upon it, and, in many respects, essentially contrary to the conclusions of Dr. Black, from his admirable experiments on the same subject. Several of Meyer’s countrymen became the zealous advocates of his system, and it was soon taught publicly in many of the German schools. At length, in 1769, Jacquin published an able vindication of Black, intitled Examens chimicae doctrinae Meyerianae de acido pingue, et Blackianae de acido pingue, &c. Vindobonae. This work brought out in the course of the following year a reply by Grütz, and another by Pourchot, both of them strenuously defending the doctrine of Meyer. It does not appear that any thing more was expressly written on either side, but by the accumulation of the splendid discoveries of Lavosier, Priestley, &c., the theory of Meyer was generally overthrown and the conclusions of Black unequivocally established. Nearly the same hypothesis was afterwards revived by Sasse in the effects attributed to him by an imaginary principle, the igneous acidum, (acide igné) but which has not been since recognized by any chemical writer.

The facts upon which Meyer’s doctrine is founded are the following. Mild calcareous earth being kept at a full red heat for a certain length of time is converted into quicklime; this change, which at present is accounted for by the volatilization of its water and carbonic acid, was by Meyer supposed to be owing to the combination of the acidum pingu with the calcareous base, and the consequent disengagement of its water; hence originated a caftic earthy salt soluble in water: if to this lime water, a mild alkali, be added, a decomposition takes place, the acidum pingu unites by preference with the alkali, making it caustic, while the calcareous earth combines with a portion of water, becomes insoluble, and is precipitated in the state of mild col. So far the theory of Meyer was supported by facts which, however equivocal and imperfect, had at least some plausibility. But, in his attempt to raise this caHydrate to the rank of an acid, and of a prime agent in chemical phenomena, he deviates into the wildest conjectures without the shadow of a fact in their support. The following are the chief
chief of the properties which he ascribes to it. It is a compound elastic subtile sub stance, analogous to sulphur, nearly approaching to the purest matter of fire or light, indecom posable, confining of a saline acid principle and fire, com and, capable of penetrating all veils when red-hot, and sensibly heavy. It has an afflicting force, and com bines by means of fire with calcareous earth and the alkalis, and with metals when in the state of calx; from its uniting with sulphur, oils, and calcareous earth, he infers, that the acid is united with something fat or oily, (hence its name acidum perspicuum) and this oil so far the/its properties as to prevent the acidity of its tafte, &c. Hence it is evident, that the properties of this imaginary substance are in part purely fictitious, and for the rest a mixture of dis cordant qualities selected from those of the pure alkalies, oxygen, and carbonic acid.

Acidum aurifaciunfum. See Sulphoric Ether.

ACTIA, in Ancient Geography, a little or small town in Arabia Felix, on the Persian gulf, from which, according to Pliny, (H. N. v. i. p. 338.) the Scirce Sabaii fet fail for India. This is a different place from Oeces, or Oecia.

ACILIS, an a district of Armenia, situate between Mount Taurus and the Euphrates, where it bends its course southwards towards Mesopotamia. Strabo, vol. i. p. 799.

ACILUS, Gallicius Marcus, in Antiquity, a confid of Rome, who distinguished himself by his military skill and brave way on several occasions, and particularly in the victory which he gained over Antiochus the Great, king of Syria, at the straits of Thermopylae. He built the temple of Piety at Rome, in consequence of a vow which he made before this battle.

ACINA, in Ancient Geography, a town of Africa, mentioned by Pliny H. N. vol. i. p. 345.

ACINACAE, the name of a people inhabiting Bactria.

ACINACES, in Antiquity, a kind of cutials or cem tera, in use among the Persians.

ACINACIFORM leaf. See Leaf.

ACINARIA, in Botany, a name given by some to the marab shrub-berries, or vaccinia palustris.

ACINASIS, in Ancient Geography, a river of Asia, at the southern extremity of Colchis, which discharges itself into the Euxine sea, between the Bathysea and the Isus.

ACINCUM, a city of Pannonia, the situation of which is not precisely known. Some suppose it to have been at or near Buda.

ACINI, in Botany, small grains or berries, growing in bunches, after the manner of grapes. The berries of the elder, privet, ivy, &c. are of this kind, and so called. Anatomists have called some glands of a similar formation, acini glandulosi.

ACINIFORMIS Tunica, the same with tunica vasa of the eye. It is also called acinosa tunica.

ACINIPPO, in Ancient Geography, a town of Batista, of which the ruins called Ruins de la Vige are to be seen near Arunda, in the kingdom of Granada.

ACINODENDRON, in Botany, the name given by Burman, in his Theaurus, to a genus of plants, afterwards called Melastoma. It is also the trivial name of a species of this genus.

ACINOS, stone or wild Basil. See Thymus.

ACINTLI, in Ornithology. See Quachilto.

ACINUS, in Botany, properly signifies the grape. It is also the name of the Staphyloma.

ACIOJA. See Acia.

ACIPENSER, in Ichthyology, a genus of fish of the order of Chondropterygi; the characters of which are, that the head is obtuse, that the mouth is under the head, recti ficd, and without teeth; that the four circles are below the snout, and before the mouth; that the aperture of the gills is at the side; and that the body is elongated, and angulated with many series of spiny or feby pro bances. There are five species, viz. A. Storius, or Sturgeon; A. Rythemus, or Strellet; A. Huns; A. Schilz; and A. Stellatus, or Koster.

ACIPHERAS, in Ancient Geography, one of the four cities of Phocis, on the river Pindus.

ACIPHYLLA, in Botany, a species of Lasipticum.

ACIRIS, in Ancient Geography, a navigable river of Italy, not far from the city of Herculea, mentioned by Strabo, vol. i. p. 405. now a rapid, irregular torrent, called Agri.

ACIS, in Entomology, a species of Papilio, with his edated wings, the lower part of the fore-wings being green, sprinkled with gold; the hinder golden, spotted with green and black; found in Burinam.

ACIS, in Geography, a town of France, in the department of l'Aube, on the river Aube. N. lat. 48° 25'. E. long. 4° 16'.

ACIS, in Mythology, a beautiful shepher of Sicily, the son of Ecorus and the nymph Simeathis; who, being beloved by Galatea, incurred the rage of Polyphemus, and had his brains dashed out against a rock by this giant. He was afterwards changed by Galatea into a river of the same name. The Sicilian authors say, that Acis was the name of a king, that reigned in this part of the island in a very ancient period; and, to this purpose, they allege an inscription found near the river Acis, Acis Cibello. He is said to have been slain in a fit of jealousy by Polyphemus, one of the giants of Etna; and thus they trace the origin of the fable.

ACIS, a river of Sicily, celebrated by the poets, viz. Theocritus, (Idyll. i. v. 69) Ovid, (Fasti, i. 6. v. 468) and Silius (l. xiv. v. 222) which flows from a cold spring at the foot of mount Etna, and runs into the sea at the distance of about a mile from its source. From the rapidity of the arrow, with which it purifies its course between verdant banks, its name is derived. Bochart, (Geog. Sac. l. i. c. 28. apud op. tom. i. p. 529. Ed. Villet.) deduces it from the Syrian ἀκις, acies, to boister, or to be fierce. Its water is clear, and so cold as to be dangerous to those who drink it; and never freezes, though it poises a degree of cold greater than that of ice. It is said to acquire a poisonous quality from the vitriol with which it is impregnated; though it was formerly celebrated for the sweetness and fulness of its waters; which, according to Theocritus, were always held sacred by the Sicilian shepherds.

"Quique per Ἀκιςας Ακις κατά οὐρανόν, ΕΤ ὕδαι γραματοι νεκρίδων περιπλεύτων".

This river is now called Il Fiume Freddy, and Acis, Iaci, or Chiari, according to the different Sicilian dialects. Antinouphini calls it Acinos. Acis is also the name of a hamlet at the mouth of the river. There are several places in this district that take their names from the unfortunate shepherd Acis; such are, Acis Aspinello, Acis Castrillo, Acis Terra, &c. Drydene's Tour, vol. i. p. 118.

ACISANTHERA, in Botany, a species of Rhytia.

ACITANI, in Ancient Geography, a people of Spain, supposed to be the same with the Lacetani of Pliny.

ACITANUS, or Acithius of Ptolemy, a small river of Sicily, now Bergh.
ACITLI, in Ornithology, the common Mexican name for the Columbae erithaca, or great cerulean Green, common to Europe and America, and called by authors the Lifer argentatus, or water heron.

ACKEN, in Geography, a bailiwick of Magdeburg, in Germany, to which belongs a town of the same name, situated on the Elbe. It formerly belonged to the dukes of Saxony, and was hence called Agra Saxonica. The revenues of the fivutches of this town are at present levied by the dean of the cathedral of Magdeburg; but the church was given in 1711, to the Camellines, Buffaloing.

ACKER Sound, lies north-east from the Naze of Norway, and north-west by west from the island of South Wolfgang. Sitter's Island is also west by north from Acke four leagues; and behind it is the small port of Grafwick.

ACKHMETCHID Gulph, is on the west side of the Crimea, and the sea through which ships pass to Precop, and the north-west part of the Black Sea. Its west cape is N. lat. 45° 34' and E. long. 52° 20'.

ACKLIN's Key lies about 50 miles south-east from Long island, or Yuma, one of the Bahamas islands, having Long Key twelve miles to the north-west; and on the south-east side a chain of rocks. N. lat. 22° 10'. W. long. 73° 30'.

ACKNOWLEDGMENT Money, a sum paid in some parts of England by tenants on the death of their landlords, as an acknowledgment of their new lords.

ACKWORTH, a small village near Pontefract, in the county of York, which deference mentions on account of the beneficent institution supported in it for the education of the children of the Quakers. The original projector of this institution was Dr. Fothergill, who promoted a subscription for purchasing, improving, and furnishing an appropriate building, and an estate of eighty acres of land; and who, by his will, endowed it with a liberal bequest. This institution accommodates more than 500 children of both sexes under the same roof, who are cunnified with all the necessary conveniences and comforts of life, properly clothed, and educated in every branch of knowledge, adapted to the situations in which they may be placed. It is conducted by a number of chosen guardians of ability, and of exemplary character, with a degree of order and decorum, which affords pleasance to persons of every description who occasionally visit it. The children are taught habits of regularity, of decency, and of respectful subordination to their superiors, of forbearance and affection to one another, and of reverence to their maker; and they are accustomed to that kind of silence and recollection, which was practised in some of the ancient schools of philosophy, and which give a peculiar and distinguishing character to the members of this society in the maturity of life.

ACLIDES, in the Roman military art, a kind of milifive weapon, having a thong fixed to it, by which, after calling it out of the hand, it might be drawn back again, Servius describes the acilde as full of spicule, or crenences. As it was formed with spikes, it would injure both where it struck, and when it was withdrawn. Each warrior seems to have been furnished with two. Voss. Etym. Aquin. lex. Mil. t. i. p. 14. Pitisc. Lex. Ant. t. i. p. 17.

ACLOWA, in Botany, the name of a plant common in Guinea, and used by the natives to cure the itch. They rub it on the body, as we do our ungents. Petiver accounts it a species of colutea, and has named it the Guinea sporiloide colutea, with leaves like the gum tragacanth shrub. Phil. Trans. No. 268. abr. v. iv. p. 2. p. 322.

ACME; the height or top of any thing. The word is Greek, signifies point, and is more specifically used to denote the height, or utmost vehemence of a disturbance.

Accordingly some infallition-writers have divided diseases into four states or periods: 1. Arche, the beginning or first attack: 2. anaesis, the growth: 3. aeme, the height: and 4. arame, which is the declension of the distemper.

ACMELLA, or ACHAMELNA, in Botany, a plant which grows in the island of Ceylon and Tenente, of which there are three species noted by botanists; two of which were formerly referred to the genus Verbeekia, in the Linnean system. It is commended in nephritic disorders, but very rarely used. It is the Splantbous Amello with ovate, ferrated leaves, a frant item, and radiated flowers. It became known in Europe by the letters of Hortus, addressed to the Royal Society in 1701. Phil. Trans. vol. xxii. p. 763.

ACMOIDE, in Ancient Geography, seven islands in the British sea, supposed by some to be the Scilly islands, but by others, with greater probability, those of Heland and Shetland near the Orkneys, on the coast of Scotland. Pliny, H. N. vi. i. p. 223.

ACMON, in Ancient History, the name of one of the Dactylid Idae according to Strabo, vol. ii. p. 726. Bryant says, (Mythology, vol. i. p. 513) that Acmon was a Cyclopian deity, under which title he was worshipped in Phrygia, whence the name of Acmonia. He was also revereued by the Amazonians, and there was a sacred grove upon the Thermodes called aemonum, and held in great repute. He is represented by Callimachus (Hymn. in Dian. v. 145.) as the tutelary god of Tyrs, an ancient city of Greece, whose towers are said to have been built by the Cyclopians.

ACMONIA, or in Peutinger's map Agmonia, in Ancient Geography, a town of Phrygia major, now in ruins. Cicero, pro Flacco, cap. 15. calls the inhabitants Acmonites, and the city Civitas Acomonita. There are many medals of this city in gold, bronze and silver. There was also a city of the same name, according to Tolemy, in Dacia upon the Danube, near the capital Sarmitz, which was the position of the Roman colony, called Ulphi Trogian.

ACNIDA, formed of a priv. and with, a nettle, Virginian hemp, in Botany, a genus of the dioica order, and pentandria class of plants, of the natural order of febride and airiples of Julliau, the characters of which are as follow: the calyx of the male is a five-leaved perianthium, and the leaflets are ovate, concave, acute, and membraneous on the edge; it has no corolla; and the stamens are five, capillary, very short filaments; and the anthers are vertical, bilocular, and forked each way; the calyx of the female is a many-leaved, linear, deciduous involucre; the perianthium is two-leaved, linear, very small and permanent; it has no corolla; the pistillum has a superior, ovate germen; the styles are five, long, reflex and pubescent; the stigmas are simple; the pericarpium is an ovate, compressed, many-angled fruit, furrowed, and covered with the succulent calyx; the seed is solitary, round and compressed. There is one species, viz. A. canadina, which is a native of Virginia, and some other parts of America, but seldom cultivated in Europe. It has little beauty, and is applied to no use. Martyn's Miller. In the Linnane system by Gemlia, it is a genus of the pentandria pentagynia class and order.

ACNUA, in Roman Antiquity, a measure of land about the quarter of an English acre.

ACO, in Geography, a town of Peru in S. America, in the jurisdiction of Guanuco. It is also a river of Africa, that rises in the mountains of Abyssinia, runs in the south-east direction, and discharges itself into the Indian ocean.

Aco, in Ichthyology, a name given to a fish found in the Mediterranean, called also aqua, jarachus and Jarachus.

ACOEMETAP, or ACOMETI, formed of a priv. and 1.
agnus, to lie down, or sleep in bed, a name given to certain monks in the ancient church, who flourished particularly in the 17th and 18th centuries, and who were thus called, because they had a service, performed, without interruption, in their churches. They divided themselves into three bodies, each of which officiated in its turn, and relieved the others; so that their churches were never silent, either night or day. The Stylists were also sometimes called acolytes. Wetstein (Proleg. N. T. vol. i. p. 10) adopts the conjecture of Casimir Oudin, that the Alexandrian MS. was written by an Acolyte, because it contains a catalogue of the psalms that were to be sung at every hour, not only on the day but also on the night. These monks are particularly described by Helyot in vol. i. c. 29, of his "Histoire des Ordres Monastiques," &c. in 8 tomes 4to. Paris, 1720.

There is a kind of acolytes still subsisting in the Roman church; the religious of the holy sacrament may be properly included under this denomination, because they maintain a perpetual worship; some or other of them praying before the sacrament, day and night.

ACOLA, in Ancient Geography, a town placed by Ptolemy in Media, on the borders of the Hyrcanian Sea.

ACOLA, Cala Bini, in Geography, the most southern cape or point of land of the island of Minorca, S.W. of fort St. Philip, or the entrance of Mahon harbour, seven or eight miles.

ACOLASTRE, in Geography, a river of France, which runs into the Loire, two leagues above Nevers.

ACOLCHICHI, in Ornithology, the Mexican name of a bird described by Nielemberg under the name of the Pentaphialus Indicus. It is the Oriolus plumicolor of Linnaeus. The acolchi of Seba is the Oriolus Nova Hispania of Gmelin, the Icterus Mexicana of Buffon, and the Mexican Oriole of Latham. Its specific characters are, that it is yellow: the head, throat, wing-quills, and tail are black; the greater quills of the wings are yellow at the tip, and the lesser are wholly black. This bird has a long yellow bill; and the tail and wings are ornamented with small feathers of a golden colour, which have a fine effect on the dark ground. Seba reckons it an American bird; and Gmelin refers it to New Spain.

ACOLCHUACAN, in Geography, one of the three imperial cities of the ancient kingdom of Mexico.

ACOLIN, a river of France, which runs into the Loire, two leagues below Decize.

ACOLIN, in Ornithology, the name of a bird of the partridge kind, common in the Spanish West Indies. It is no larger than a starling; its legs and feet are of a pale greenish colour, and its toes very long; its back is yellow, and somewhat long; its head small; its breast and belly are white; its sides are spotted with brown, and its back and tail of a dusky yellow brown; its tail is very short, and both that and the back have some black spots, and some narrow streaks of white. It frequents the sides of lakes, and is suppos'd to feed on flies, worms, and other insects, which are found about watery places. It is a tolerably well-tailed bird.

ACOLUTHI, or ACOLITHI, in Antiquity, a term applied to such persons as were ready and immovable, in their resolutions.

The word Acolithi is compounded of the privative a; and λίθος, stone, way; and implies their firm perfiling in their way or course.

For this reason, the Stoics were called acolythi; because nothing could induce them to abandon their principles or alter their purports.

Among the Ecclesiastical Writers, the term acolythus, or acolythos, is peculiarly applied to those young people, who in the primitive times aspired to the sacerdotal; and for that purpose, continually attended the bishops: which affection occasioned their being distinguished by the appellation.

In the Roman church, acolythi were of longer continuance; but their functions were different from those of their first institution. They were such as had only received the first of the four lesser orders, whose business it was to light the tapers, carry the candelsticks, the incense-pot, and prepare the wine and water.

At Rome there were three kinds of acolythi: viz. palatini, who waited on the pope; fluminarii, who waited in churches; and regionarii, who, together with the deacons, officiated in other parts of the city.

ACOLITHI, or ACOLITHUS, was also a title in the Grecian empire given to the captain or commander of the Varangii, a body of guards appointed for the security of the emperor's palace.

ACOLITHUS, Andrew, in Biography, was an arch-deacon, and professor of the Oriental language, at Breflau, his native city, and member of the academy of Bern. He published, in 1682, a Treatise De Aquis Amariis, in 4to. At Leipzic he published, in 1685, a Latin translation of the Armenian version of the Prophecy of Obadiah. He died at Breflau in 1704.

ACOLYTHIUM, in the Greek church, denotes the office, or order of divine service.

The same name is also given to the prayers, ceremonies, hymns, and the like, wherein the Greek service is composed.

ACOMA, and ACOMACH, in Geography. See ACO MA and ACCOMACH.

ACOMAS, in Botany. See Homalium.

ACOMINATUS, Nicetas, in Biography, secretary to Alexius Comnenus, and to Isaacus Angelus, who wrote a history from the death of the former in 1118, where Zonaras ended his, to the year 1203, which is much approved.

ACON, an instrument used in the ancient exercises, like the discus.

ACON gave name to an ancient order of knighthood, who were afterwards united to the knights Hospitallers.

ACONE, in Ancient Geography, a small town of Bithynia, near Heraclea.

ACONCAGUA, in Geography, a village or town of Chili, in S. America, which gives denomination to a fertile province at the foot of the Cordilleres, situated on a river of the same name, that discharges itself into the Pacific Ocean. N. lat. 33°, W. long. 75° 30'.

ACONCORA, in Botany, a name given by the natives of Guinea to a plant, growing wild with them, and in great esteem for its virtues in the small-pox. They give an infusion of it in wine. The leaves of this plant are opaque, and as fluff as those of the phillipery; they grow in pairs, and stand on short foot-stalks; they are small at each end and broad in the middle; and the largest of them are about three inches in length, and an inch and a quarter in breadth in the middle. They somewhat resemble those of our bay. They are of a dusky colour on the upper side, and of a pale green underneath.

ACONE, in the Natural History of the ancient world, the name of a stone used as a whetstone, and for several other purposes; but more usually known among the Romans by the name coticula. It signifies also a mortar for the purposes of levigation.

ACONITE, in Botany. See ACONITUM.

ACONITE, Winter. See HELLEBORUS.

ACONITES, in Ancient Geography, a people placed by Strabo, (tom. i. p. 344) in the mountains of the island of Sardinia.

ACONITI,
ACONITI, *aconitum*, is an appellation given to some of the ancient *Atillaex*, but differently interpreted. Mercurialis understands it of those who only anointed their bodies with oil, but did not smear themselves over with dust, as was the usual practice. Mr. Dutert will have it to signify those who conquered cally without dust, q. d. *atillaex, aconitum*, with little trouble.

ACONITUM signifies not pilfered, and is a name given to veolves not fixed within.

ACONITUM, *aconitum*, Wolf’s-bane, or Monk’s-hood, in Botany, a genus of plants of the *irigina* order and *polyandra* class, and pertaining to the natural order of *multiflora*. Some have derived its name from Acon, a city of Bithynia, where it grew in great abundance. Pliny ascribes its etymology to *acon*., a whetstone. But the most probable origin of the appellation is *aconita* without dust; because this plant grows on rocks destitute of soil, agreeably to the description of Ovid;

"Quo qua in ascendit, duras vivacia cætus,
Agrestes Aconita vocant.
"

The characters of this genus are, that it has no calyx: the corolla consists of five unequal petals, opposite in pairs; the highest being helmet-tubed, inverted and obtuse; the two lateral broad, roundish, opposite and converging; and the two lowest oblong, and bending downward: the nectaries are two, concealed under the first petal, futilous, nodding, with mouth oblique, and tail recurved, fitting on long pubescent peduncles; in the same circle with the nectaries there are five little, very short, colored scales: the stamens are futilous and small: the pistil has three (five) oblong germs, ending in styles the length of the staminal; the filaments are simple and reflex: the pericarpium has as many capsules as the styles, ovate-futilous, straight, one-valved, gaping inward: the seeds are many, angular and wrinkled. The species, enumerated and described by Prof. Martyn in his edition of Miller’s Dictionary, are as follow: 1. *A. hyacinthum*, great yellow monk’s-hood, or wolf’s-bane, of which there are two varieties, viz. that of Linneus with a bluish ash-coloured flower, and the *aconitis alatimium* of Miller. The common form grows upwards of three feet high, but this, in gardens, is above four feet; its leaves are also broader and smooth, and the spikes of the flowers are longer. They both flower about the middle of June, and in a moderate season continue to blow till August. In Sweden it is reckoned among the earliest spring flowers. The mountains of Sweden, Lapland, Switzerland, Germany, Austria, Carniola, Italy and Siberia produce it in a wild state; and it was cultivated in this country by Gerard in 1556. A decoction, or powder of the root is used for destroying flies and other insects; but it is eaten in a province of Sweden without injury. It is milder than some of the other species, and eaten by goats and hares. The ancients believed that it was fatal to those who slept under it; and they dipped their venomous arrows in the juice of it. See Smith’s *Linnei Flori. Lappon. p. 187.* 2. *A. japonicum*, or Japanese monk’s-hood, is a native of Japan, where it is called *Sas Hufa*. 3. *A. nectarus*, common monk’s-hood or wolf’s-bane, is found wild in Sweden, Switzerland, France, Germany, Austria, Carniola, Italy, Siberia, and Virginia; and was cultivated here in 1756 by Gerard. It blows in August, and would merit a place in every garden, if it were not for its noxious quality, which renders it dangerous to children and ignorant persons. There are two or three varieties with white, rofe-coloured, and variegated corollas. The forms which have blue flowers are more powerful than those with yellow or white flowers. The variety called by Miller *pyramidale* is the most common in English gardens, being preferred on account of the appearance of its long spikes of blue flowers, which are above two feet long. The plant rises to the height of near four feet, is hardy, and will grow in any soil or situation, and as it multiplies greatly by its roots, it has been admitted into most gardens and plantations of shrubs. It flowers in May and June; and the seeds ripen in September. 4. *A. pyramidalis*, Pyrenean or fennel-leaved monk’s-hood, grows wild on the Pyrenees, and also in Tartary and Siberia, and was cultivated with us in 1759 by Mr. Miller. It grows to the height of about four feet, and the spike nodas before the time of flowering, which in our gardens is July. This species may be admitted among shrubs, to which children have no access. The four preceding species of *aconitis* have three capsules, the following have five. 5. *A. aurantiacum*, salutaris monk’s-hood, as it has been erroneously called, has a root consisting of from two to four angular, fleshy, bulbs, and a stem which rises from a foot to 12 inches in height. The flowers, which continue in beauty from the middle of August till the middle of September, though not so large as some of the other forms, are of a sulphur color, and make an agreeable appearance in the borders of the flower garden. This species grows naturally in the Pyrenees, the Alps, Austria, Siberia, &c. and was cultivated here in 1556 by Gerard. There is a variety of this with a white flower. 6. *A. variagatum*, variegated or small blue monk’s-hood, is a native of Italy and Bohemia, and was cultivated here in 1752 by Mr. Miller. It flowers at the end of June, and seldom grows to a greater height than two feet, with spikes of flowers much shorter than those of the first form: the corollas change from variegated to plain. 7. *A. album*, white wolf’s-bane, was found by Tournefort and Rivard in the royal garden of Paris. Mr. Miller cultivated it here in 1759, and says, that he has seen it upwards of six feet high, and he characterizes it by its tall stem, palmate leaves, and large white flower. 8. *A. cammarum*, purple monk’s-hood, has flowers of a paler blue, a much longer helmet, and a shorter raceme than the *A. nectarus*. Its stem is also taller, rising even to six feet. This species is found wild in Switzerland, Austria, Sturia, Piedmont, &c. and was cultivated in 1748 by Mr. Miller. Haller found it with a white flower, and others have observed it in Switzerland with flowers of a pale blue, variegated with white. The variety named by Mr. Miller. *A. alpinum*, will grow in good ground to the height of five feet, with large flowers of a deep blue colour. 9. *A. neocinatum*, American monk’s-hood, is a native of Pennsylvania, with leaves approaching to those of the third form, and blue flowers resembling those of the last. It was cultivated in 1770, by Mr. James Gordon. In the last edition of Linneus by Gmelin, this genus comprehends 14 species; the five following being added to those above recited, viz. nana, *fischeriana*, *tuticarum*, *nonstopium*, and *cercaea*. Culture. All the sorts of monk’s-hood are hardy perennial, require little attention, and as they bear handsome spikes of flowers, are desirable plants for shrubberies and wilderness quarters, where they are guarded from the access of those who are unapprehended of their pernicious qualities. They are propagated by seeds, sown in autum, in a shady situation. The ground should be kept clean from weeds, and the plants should be watered in dry weather, till they are fit for being transplanted into shady borders, at the distance of 1.5 inches. If they are watered till they have taken root, they will require no other care, besides being kept free from weeds till the following autumn, when they may

3
may be removed to the places where they are to remain. The stalks should be cut down in autumn, after they have done flowering. The common monk's-hood will grow under the shade of trees, and increase by means of its creeping roots. The other sorts may be propagated in the same way; but they will not thrive under the drip of trees, though they delight in shade.

Quantities. Most of the species of aconite have been deemed poisonous. The patients were so surpried at their pernicious effects, that they were afraid to touch the plants; and hence sprang many superstitious precautions about the manner of gathering them. Theophrastus relates that there was a mode of preparing the aconite in his days, so that it should only destroy at the end of one or two years. But some have questioned whether the aconite of Theophrastus, Dioscorides, Pliny, and other antient writers be the same with ours, or should be referred to the genus of Ranunculus. Vid. Reinhold, Diff. § 1. It is confidently afirmed, that the huntmen on the Alps, who hunt the wolves and other wild animals, dip their arrows into the juice of these plants, which renders the wounds occasioned by them mortal. A decoction of the roots has been used to kill bugs; and the powder disguised in bread or some other palatable vehicle has been employed to destroy rats and mice. The A. napellus, or common monk's-hood has been long known as one of the most virulent of all vegetable poisons. Linnaeus says, that it is fatal to swine and goats, but does no injury to hores that eat it dry. He also informs us from the Stockholm act, that an ignorant surgeon died in consequence of taking the fresh leaves, which he preferred to a patient. The effluvia of the herb in full flower have produced fwooning fits and a temporary los of sight. The leaves and flowers of this plant, used as fadl instead of celery, have proved fatal in feveral instances. But the moft powerful part of the plant is the root. Matthiolus relates that it was given by way of experiment to four condemned criminals, two at Rome in 1524, and two at Prague in 1561, two of whom foon died, and the other two, with great difficulty, were recovered. The juice applied to the wound of a finger, not only produced pain in the arm and hand, but cardingia, anxiety, fene of suffocation, syncope, &c. and the wounded part fpleaded before it came to fuppuration. Dodonaeus fays, that five perftons at Antwerp died in confecuence of eating it by mistake. The effects of this plant are convolutions, giddiness, infancy, violent evacuations, both upwards and downwards, faintings, cold sweat, and even death itself. Nevertheless it has been used for medicinal purposes. The Indians are faid to use acornis, corrected in cow's urine, with good success against fevers. There is one species of it which has been deemed an antidote, to those that are poisonous, called oulera, and thofe that are poisonous are called thor. The taste of the root of the species denominated amboza, is fweet, with a mixture of bitterness and acrimony, and the smell is pefiant. It purges violently when fresh, but loses its qualities when dried. This is poifonous as well as the others, thogu fhortly after the daily, and is difputed in the prefent practice. The firit perfon who ventured to introduce the common monk's-hood into medicine was Dr. Stoeck; though it has been fuppofed by Haller and Bergius from the taste and figure of the plant which he used, that it was not the napellus but the A. cammarum, which much refembles it. But others have since maintained, that Stoeck's plant was the A. napellus. He found that the extract given to the quantity of 10, 20, and even 30 grains, excited a sweat without inconveniently, and by perfing it in the use of it, great relief was obtained in fixed rheumatic and arthritic pains, feirrous glandular tumors, venereal nodes, anerylfores, amaurosis, and other similar complaints. Other practitioners, after the publication of Stoeck's Extrains in 1762, have experienced the fame good effects in some degree, and the Edinburgh college has received the extract as an officinal. In this, as in all the other medicines of fuipicious and dangerous properties, it is most expedient to begin with very small doses, and increafe them as they can be borne. Stoeck recommends two grains of the extract to be rubbed into a powder, with two drams of sugar, and to begin with 10 grains of this powder two or three times a day. The extract is often given from one grain to ten for a dufe; and some have confiderably increafed the quantity. Instead of the extract a tincture has been made of the dried leaves, macerated in fine times their weight of spirits of wine, and 40 drops given for a dose. Martyn's, Miller's Dict. Lewis's Mat. Med. 1784, Woodville's Med. Bot. vol. i. p. 19. Murray's Appar. Med. vol. iii. p. 6. &c.

ACONTIA, in Antient Geography, a town of Spain, which Strabo (Tom. 2. p. 228.) places near the Duria, and calls a city of the Vaccei.

ACONTIAS, a name used, by some authors, for a fort of comet, or meteors, whose head appears round or oblong, and its tail very long and slender, resembling a javelin.

It takes its denomination from a serpent thus called, frequent in Calabria and Sicily; where it is also named jutetone (from fugitiva, an arrow) by reason of its flying at passengers like an arrow; in order to which, it winds itself up a tree, to spring thence with the greater violence. For the like reason the Greeks call it acontias, of acornis, a dart, or arrow.

It differs from the xiphias, in that it is longer, and more like a dart; and the other is shorter and broader in the middle.

Acontias, in Zoology, the name of the Angus Juculus, a species of serpent, called also JACULUM, or the dart-snake, from its manner of vibrating its body in the manner of a dart. Bellonius found one of these in the island of Rhodes, which he described in this manner: it is about three hands-breadth long, and the thickness of one's little finger; its colour is a milky grey on the back, variegated with small black spots, like fo many eyes; and on the belly it is perfectly white; the neck is wholly black, and from that two milk-white streams run all the way along the back to the tail; the black spots also are each surrounded with a small circle of white. It is found in Egypt and Lybia, and in the islands of the Mediterranean. It is also called cnebroei, and cnebroae. Ray.

ACONTISMA, in Antient Geography, a city of Macedonia, between the Strymon and Nestus.

ACONTIUM, in Antient Writers, a kind of Grecian dart, or javelin, somewhat resembling the Roman fium.

ACONTIUS, or ACONZIUS, JAMES, in Biography, a celebrated philosopher, civilian and divine, born at T creat the 16th century. He embraced the protestant religion, and was favourably received in England by queen Elizabeth, who granted him a pension as an engineer, which he respectfully acknowledges in the dedication of his well-known work, "The Stratagem of Satan." This treatise was first printed at Bafil in 1565; and the author died in England. Another edition of it was published in the same city by James Grafferus in 1610; at Amderam in 1674, and a French translation was published in 1619, and reprinted at Delft in 1624; in the above edition is inserted Acontius's letter to Wolfa, "De ratione edendorum librorum," containing excellent advice to authors. He wrote also a treatise.
treatise on method, intitled "De Methodo, sive de Recta
avigilantiarum tradendorumque artum et scientiarum ra-
tione;" which was published at Basle in 1558, and infected
in a collection of dissertations, "De Studiis bene inlu-
tuendi," printed at Utrecht in 1658; an Italian work on
fortifying cities, translated by himsclf into Latin, but never
published; and a treatise of Logic, which he did not live to
finish. His religious principles differed from those of Cal-
vin; and he was an avowed friend to toleration. He has
been charged with scepticism in theology, and referred by
Izaac Junius, minister of Delft, to the same clafs with So-
cinus and the Remonstrants, who represents him as a per-
son detritus of reducing all sects into one, and including
them in the same ark, as Noah preferred all animals in his,
thoough they lived on different food. Arminius says of him,
"Acantis est divinum prudentia, ac moderationis lumen;" and
Amelius gives him this character. "Iedem Acantis est
enim verus divini, qui samento ecclesiae anglicane

Acontium, in Ancient Geography, a city of Pelopon-
nesus in Arcadia, which derived its name according to Pa-
finas, from Acontus, the son of Lycean. There was
another town of the same name in the island of Euboea.

ACONTIUS Monc, a mountain of Beocia in Greece,
in which was built the town of Ochonomes. Strabo.
T. i. p. 637.

ACOFTAN Island, in Geography, lies north-east from
the point of Onenak, or the south-west point of the con-
tinent of America; and between these is a channel.

ACOPA, in Botany, a name given by Dioscorides, and
some other authors, to the MEXANTHEM triphyllata, or BUCK-
bean.

ACopa, derived from a privative, and meat, waving,
in Medicine, is also used to denote remedies against the
ill consequences proceeding from latitude, occluded by
violent labour, excessive, or the like; such as tenuons,
tumors, pains in the bones, &c. some being of a warm, and
others of a mollifying nature. But the title is improperly
applied to medicines, as none are adapted to this purpose,
except by a general quality. Cullen's Mat. Med. vol. i.
1768.

ACOPIS, or Acopos, a substance classed by Pliny among
the genus of which he gives the following account. Acopos
resembles Natron, is porous, and stained with golden drops.
Oil that has been boiled upon this, is used as an ointment
to prevent the effect of fatigue. Pliny, Nat. Hist. xxxvii. 54.

ACOPOS, a plant mentioned by Pliny, said to be the
same with the ANAGIRS of Dioscorides, which Gerard
says is the bean-trefoil; it signifies also LABURNUM.

ACOR signifies fumace or scroxy.

ACORACA, in Ancient Geography, a town of CHALY-
BOXISTES, a pretecture of Syria.

ACORDINA denotes Indian turky.

ACORIS, a small town of Egypt, in the nome of Cy-
nopolis, in the province of Heptanomia.

ACORN, in Natural History and Agriculture, denotes
the fruit of trees of the oak kind.

The acorn, according to Dr. Grew, is the nut of an oak,
with this only difference, that besides the cup it stands in,
it has only a leathern or parchment cover, instead of a
shell. And hence it is, that whereas the kernel of a nut is
sweet, that of an acorn is of a very rough and bitter taste:
the aspher parts of the sap, which in a nut are drained off
into the shell, being here imbibed by the kernel itself.

Writers on husbandry give directions concerning fermaries
or nurseries of acorns, and the method of propagating, by
sowing or planting them. For timber, those acorns are to
be chosen as seed, which are most solid and heavy, and not
those which are the largest. See OAK.

In the Phil. Trans. vol. viii. p. 75, we have a curious
and important memoir by John Ellis, Esq. containing a
method of preferring acorns in bees-wax for a whole year,
in a flake fit for vegetation, by which other seeds may also
be preferred; and such as are valuable may be brought from
the East Indies, for the purpose of planting them in other
countries. See Seed.

Acorns were the food of the first ages; but when corn
was cultivated, acorns were neglected. They are of little
use with us, except for fattening hogs and other cattle,
and poultry. The hogs that are fattened by them will be sub-
tect to coniplication, and the diseas called the garget, unless
they are given sparingly, and mixed with some laxative subs-
fances; and, during the use of them, the hogs should be
allowed to run at large; for if they are confined to the flye,
they will not grow fat with this kind of food. Among the
Spaniards, the acorn, or GLANS thericae, is said to have long
remained a delicacy, and to have been served up in the form
of a dessert. In dialects, acorns have been some times dried,
ground into meal, and baked as bread. Bartholin relates,
that they are used in Norway for this purpose. The inhabi-
tants of Chio held out a long siege, without any other food;
and in a time of scarcity in France, A. D. 1769, they recur-
ted to this food. But they are said to be hard of diges-
tion, and to occasion head-achs, ventihties and colics.

In Scotland, however, many instances occur, in which they
have supplied a salutarv and nutritious food. With this
water they are previously boiled in water and separated
from their hulks, and then dried and ground; and the powder
is mixed with about one half of the third part of corn-flour.

A decocion of acorns is reputed good against dysenteries
and colics; and a purgative of them is said to be useful in
immoderate fluxes of the menses. Some have recommended
the powder of acorns in intermitent fevers; and in France,
they mix it with warm ale, and administer it for pro-
cucing a sweat in cafes of the erysipelas. Acorns roasted
and bruised have refrained a virulent diarrhce. For other me-
cial uses to which they have been applied, see Murray's
Appar. Med. vol. i. p. 166.

From some late reports of the Academy of Sciences at
Peterburgh, we learn that acorns are the bell substitutive to
coffee that has been hitherto known. To communicate to
them the oily properties of coffee, the following proces is
recommended. When the acorns have been toasted brown,
add fresh butter in small pieces to them, while hot in the
ladle, and stir them with care, or cover the ladle and make
it that the whole may be well mixed: The acorns of the
holm oak are formed at Venice into cups, about 1 inch in
diameter, and somewhat less in depth. They are used for
dressing leather, and, instead of galls, for dying wooden
cloth black.

ACORN, in Sea-language, denotes a little ornamental piece
of wood in the shape of a cone, fixed on the top of the
spindle on the main-head, above the vane, to keep it from
coming off the spindle in a whirlwind, or when the ship
leans much upon one side under sail.

ACORN-shell. See LEPAS.

ACORUS, derived from κόρος, the pupil, because it was
considered good for disorders of the eye, Calluna Aroma-
tiacata, Sweet Flag or Sweet Rush, in Botany, a genus of the
monogynia order, and hexandria class of plants, and
b elonging to the natural order of pipirite. The characters
are, that the calyx is a cylinb, simple spadix, covered
with sphiules, without spatha or perianthium; the corolla
is of six petals, obtuse, concave, lofe, thicker at the
top,
top, and in a manner truncate: the stamina are thickish filaments, somewhat longer than the corolla, and the anthers are thickish, twin, terminal and adnate; the pistillum is a gibbous germ, rather oblong, and of the length of the stamina; without style; the stigma is a prominent point; the pericarpium is a short triangular capsule, attenuated to both ends, obtuse and three-celled: the seeds are many and ovate-oblong. There are two species, 

ACO

A. vulgaris, European sweet root, sweet smelling flag, or calamus aromaticus, and the Veron fii Africannus, Indian sweet root, or calamus aromaticus. The common calamus aromaticus is sufficiently distinguished by its long lword-shaped leaves, resembling those of the flag, but narrower, of a brighter green, and yielding, when broken, a strong aromatic scent; and also, by its oblong cylindric spike of flowers, proceeding from the side of the stem at the edge of the leaf, which spike is generally single, sometimes double, and more rarely triple and quadruple. It grows naturally on the banks of rivers, and in shallow flowing waters; and is found in many parts of England, on Hounslow-heath, near Norwich and Lynn in Norfolk, near Cambridge, in the Avon, near Perkshire, and in many places of Cheshire, &c.; but it is more plentiful in the flowing waters of Holland, and is common in many other parts of Europe. The Indian calamus, which grows not only in marsh ditches but in more elevated and dry places in Malabar, Celeon, Amboyna, and other parts of the East Indies, differs little from the European, except that it is more tender and narrow, and of a more hot and pungent taste. 2. A. graminaceous, roots long, sweet root, or Chinese sweet grass, has the roots in tufts, with a few thread-like fibres. The whole herb has an aromatic smell when bruised, much resembling our English sweet flag, from which the present species is distinguished by the shortness of that portion of its stalk, which is above the papex, as well as by all its parts, except the florets, being five times smaller than in that plant. It is probably a native of China, and cultivated for the sake of its smell, in pots near the habitations of the Chinese, whence Mr. Aiton obtained it in 1786. It flowers in the spring.

Culture. The sweet flag will succeed very well in a garden, if the ground be moist, but never produces its spikes unless it grows in the water. It loves an open situation, and will not thrive well under trees. The flowers appear towards the end of June, and continue till August. In a proper situation it will increase by its creeping roots. The Chinese sweet grass must be kept in a dry stone, without any great degree of heat.

Medicinal Properties. The dried roots of the calamus aromaticus are commonly imported from the Levant, though those of our own growth are equally good. The best are those which are greenish without, and reddish within; the pulp white, and taffe bitter. They have a strong aromatic smell, and a warm pungent bitterish taste; and their flavour is much improved by drying. The powdered root might supply the place of foreign spices, and indeed it is the only native aromatic plant of northern climates. It is carminative and stomachic, and often used as an ingredient in bitter infusions. But it communicates a nauseous flavour to these infusions; and Neumann observes, that its agreeable flavour, as well as distinguishing taste, are owing to an essential oil; the residue after distillation having a nauseous flavour unlike that of the calamus. It appears that water is the most perfect menstruum of the bitter matter, as rectified spirit is of the aromatic, and the smell of the calamus is covered or suppressed by spirit. The tintures in both menstrua are of a yellow or brown colour, as they are less or more saturated.

VOL. I.

ACO

The root is an ingredient in the mithridate and thyrene of the London pharmacopoeia, and in the aromatic and flowery tinctures, and compound arum powder, of that of Edinburgh. The Turks candy it, and regard it as a preservative against contagion. It is also said that it has cured agues, when the Peruvian bark has failed; and it has been recommended in Vertigo, proceeding from a vitiated humour. Some have pretended that it is efficacious in febrifugal and hemorrhagic complaints, to which little credit will be given, and much less to its axilipharmic power. The preparations of it, enumerated by Murray, are a dry confection of the roots, a distilled water and oil, a spirituous and aqueous extract, and the elixir vitriolic and vitriolic Myrsinum. The leaves have a sweet fragrant smell, resembling that of the roots, but weaker. No cattle whatever will eat any part of the plant. Martyn's Miller. Lewis's Med. ed. Woodville's Med. Bot. vol. iii. p. 473; Murray's App. Med. vol. v. p. 39.

ACORUS, or BLUE CORAL, in Natural History. The true acorus of this kind is very scarce: some of it, however, is found on the coasts of Africa, particularly from Rio del Red to the river of the Camarones. This coral is part of the merchanize which the Dutch trade for with the Camarones; that of the kingdom of Benin is also very much esteemed. It grows in form of a tree on a rocky bottom. Acrorus is also a name for the greater galangal root.

ACORUS Adulterus, in the Materia Medica, the name of the root of the iris fatae palustris, or common yellow water-flag-flower.

ACOSTA, Gabriel, in Biography, a canon and preceptor of theology at Coimbra, who died in 1616, and whose large Latin commentary on part of the old testament was printed in fol. 1641. Lugd. Bat.

ACOSTA, Joseph, a celebrated Spanish author, born at Medina del Campo, about the year 1540. He was a missionary and provincial of the Jesuits in Peru, and died at Salamanca in 1600. Before his "Natural and moral history of the West Indies," first printed in Spanish in 8vo. A.D. 1591; and printed in French in 1600: he also wrote a treatise "De Procuranda Indorum Salute," 8vo. Salam. 1588, "De Christo Revelato," 4to. Rom. 1599, and "De vera Scripturis interpretandi ratione," in the commentary of Menochius, &c. The decreals of the council of Lima are also ascribed to some persons to this author. Acosta says Dr. Robertson, (Hist. Amer. vol. ii. p. 459.) is the first philosopher who endeavoured to account for the different degrees of heat in the old and new Continents, by the agency of the winds which blow in each. This theory was adopted and improved by M. Buffon.

ACOSTA, Uriel, was born at Oporto near the close of the 16th century. Having been educated in the Roman religion, though descended from one of those Jewish families which had submitted, as it were by constraint, to Christian baptism; he continued in the profession of it till the age of 25 years. His mind, however, had been perplexed by doubts previous to this period, in which he became treasurer in a collegiate church. At this time he directed his attention to the books of Moses and the Prophets, and the result was a conviction, that Judaism was the true religion. Fearing openly to profess it during his continuance in Portugal, he determined to resign his place, and embarked for Amsterdam with his mother and brothers, whom he had instructed in the principles of the Jewish faith. In this new situation they became members of the synagogue, and were circumcised according to the Jewish custom; and he changed his name of Gabriel for that of Uriel. He soon perceived that the Jews did not conform, either in their
their rites or morals, to the law of Moses; and disapproving of their conduct, he avowed his sentiments, and incurred the resentment of the chief of the synagogue. By them he was excommunicated and forbidden to hold any intercourse even with his own brothers. In these circumstances he wrote a book in his own justification; in which he endeavours to shew that the rites and traditions of the Pharisees are contrary to the writings of Moses: and he was soon led to adopt the opinion of the Sadducees, from a peroration that the functions of the Jewish law related merely to the present life. Acosta was reputed an ascetic, and became an object of general odium and persecution. With the concurrence of the magistrates of Amsterdam he was thrown into prison; all the copies of his work were seized, and he was fined 300 guilders. His scepticism increased, and he proceeded to think that the Mosaic law was a political invention. With these ideas he hastily determined to forsake his connection with the Jewish church after having been 15 years excommunicated, recanted what he had written, and subscribed what was enjoined. Accused by his nephew of not conforming to the laws of Moses in his private conduct, he soon found that the phylarchous deputation of principle was of little avail; he was summoned before the grand council of the synagogue, and again expelled from their communion.

After living in wrecks and misfortunes for seven years, he declared his purpose of submitting to the sentence of the synagogue; and contrary to the expectations which he had been encouraged to entertain, he underwent a very severe penance. After making a public recantation, and a very humiliating acknowledgment of his offence, he was stripped to the waist and received 30 lashes with a whip. He was then abjured from the excommunication, and laying himself down at the door of the synagogue, all who came out walked over him. This account is extracted from his treatise, intituled, "Exemplar humanae vitae," published and refuted by Limborch, in his "Amica Collatio cum erudito Judaeo de vitate religiosi christiani." This treatise he is supposed to have composed a few days before his death.

Having failed in his attempt to kill his principal enemy, he put an end to his own life with a pistol in 1647, according to some, but as others say in 1640. Such was the termination of a life disgraced, not by the change of sentiments, in consequence of inquiry and conviction, but by a want of integrity, and by a mean and daillardly avowal, for purposes of fame and interest; of principles which he did not believe.

Gen. 45:11. ACOUSTAN, in Geography, a mountainous island in the North Sea, between Asia and America, observed by Capt. Cook.

ACOTLEDONES, in botany, denote seeds without lobes, and of course when they vegetate, they produce no seminal leaves.

ACOUEZ, in Geography, the name of an Indian nation in Canada.

ACOUS, the principal, though small town, in the valley of Ape and county of Bear in France. Near this place are several cold springs, particularly those of Escoft. N. lat. 43° 5′ E. long. 0° 50′.

ACOUSMATICh from acous, to hear, an appellation given to such among the disciples of Pythagoras, as were still under the probation of five years. They are also called by Latin writers acoustici. The acousmaticus stood opposed to the mathematicus, who were initiated into the secrets of science; and the acousmatic philosophy to the mathematicus. These distinctions corresponded to the exoteric and esoteric. To pertons of this class, it was sufficient to appeal to the authority of Pythagoras, "Ams 13:8, ipse dixit," which decided every dispute. Some have denied the appellation of Pythagoreans to be due to the acousticians; because many of these had their learning, not immediately from Pythagoras, but from Hippasus, who, according to some, was of Crotona, but according to others, of Metapontum.

ACOUSTIC, formed from acous, to hear, denotes in general any thing that relates to the ear, the sense of hearing, or the doctrine of sounds.

ACOUSTIC Duct, in Anatomy, is applied to the external passage of the ear called also STATUS audiovis.

ACOUSTIC INFLUENCES, or Auricular tubes, are such as are adapted to supply the defect of hearing. See also DEAFNESS AND TRUMPET.

ACOUSTIC Nerves. See AUDITORY Nerves, and INNER.

ACOUSTIC VIBRATIONS, in the ancient theatres, were a kind of veils made of brass, shaped, as some have said, like a bell, which being of all tones within the pitch of the voice, or even of instruments, rendered the sounds more audible, so that the actors could be heard through all parts of the theatres, which were even 400 feet in diameter. Vitruvius. The acoustic vales, mentioned by Vitruvius as harmonically tuned, and placed in different parts of the ancient theatres, have been tried in the Opera-house at Turin, and other parts of Italy; but without the effect expected from them of augmenting the tone of the human voice, or of the instruments to which they were tuned.

ACOUSTICS, or Acoustic Medicines, are remedies against the impecunions and disorders of the ear, or of the sense of hearing. Such general terms as acoustics, says Dr. Cullen (Met. Med. vol. i. p. 163,) serve to mislead rather than instruct, and should, therefore, never be employed.

ACOUSTIC is that branch of general science which illustrates the origin, propagation and perception of sound. Some writers have divided acoustics into acoustics, which explains the properties of those sounds that proceed directly from the resonant body to the ear, and echo-acoustics, which treats of reflected sounds. Sound originates in the percussion and vibration of the parts of an elastic substance; and it is transmitted by means of the elasticity of the air, or of some other more subtle medium, in a similar manner. How it is produced and how it proceeds, and with what velocity it proceeds, are subjects of discussion which will be particularly investigated and explained in their proper places, under the article Sound. The reverberation of sounds will be illustrated under the articles Echo, Trumpet and Whispering places. For the manner by which they impress the organs of hearing; see Ear and Hearing. See also CHORD, PHONICS, STRING, VIBRATION, and VOICE.

Acoustic is properly the theoretical part of Music: it is that which gives, or ought to give, reasons for the pleasure which we receive from harmony and melody, which determines the relation of harmonical intervals, and which discovers the affections or properties of vibrating chords, &c. Roussel, For an account of the amusing contrivances, connected with this branch of science, see EOLUS'S Harp, Armornica, Communicative BUSTS, Automatous Harpsichord, Solar Sonatas, Convertible STATUS, and Versatile Symphony. See also Hooper's Recreations, vol. ii. p. 202, &c.

ACOS, in Geography, a small town at the foot of the Pyrenees, in the department of Arriege, and late province of Foix in France, and so called from its hot waters. N. lat. 43° 42′ E. long. 1° 34′.

ACOS, or DAX, Aqua Tarsellina and Aqua Augusta, is also the name of a city of France, in the viscounty of the same
fame name, and in the district of Auribat, on the river Adour. It is a bishop's see. In this place are six convents, one college and an hospital. In the neighbourhood are warm baths. N. lat. 43° 47', E. long. 1° 8'.

ACQUA, a small place in Tuscany, noted for its hot baths. N. lat. 42° 45'. E. long. 11° 12'.

ACQUA della Fico, a town of Italy, in the kingdom of Naples and province of Calabria Ultra, 15 miles West of Squillace.

ACQUA Negra, a town of Italy in Mantua, 2 miles N. N. E. of Caneto. There is another town of the same name near the conflux of the Adda and Po, 3 miles West of Cremona.

ACQUACKACKNACK, or ACQUAKINACK, a town of America, on the W. side of Passaic river, in the county of Essex in New Jerfey; 10 miles N. of Newark, and 17 N. W. from New York.

ACQUAPENDENTE, a large town, now almost defolate, though a bishop's see, and containing 16 churches and convents, situate on a rocky eminence in the territory of Orvieto in Italy. N. lat. 42° 43'. E. long. 11° 53'.

ACQUARA, a town of Italy in the kingdom of Naples, 13 miles S. W. of Cangiano.

ACQUARIA, a small town of Italy in Frignano, a district of Modena, famous for its medicinal waters. N. lat. 44° 24'. E. long. 11° 17'.

ACQUA Spartia, a town of Italy in Umbria, 10 miles W. of Spoleto.

ACQUAVIVA, an inaccessible town in the county of Bari, a district of Apulia in Italy. N. lat. 41° 10'. E. long. 16° 20'. Another town of this name lies 8 miles N. N. W. of Rome, and another in the kingdom of Naples, 10 miles W. of Molife; and again another in the Marquisate of Ancona, 10 miles N. E. of Aecoli.

ACQUEST, or ACQUIST, formed of Fr. acquérir, from acquérere, to acquire or get, is understood in a legal sense of goods or effects, acquired either by purchase or donation. The French laws make a great difference between accquests and hereditary effects. The civil law allows none. See Heir.

ACQUEST is also popularly used for conquét, or a place acquired by the sword.

ACQUETTA, in Geography. See Aquetta.

ACQUI, a fortified town and bishop's see in the duchy of Montferrat in Italy. It is situated at a small distance from the Apennines, about 25 miles N. W. from Genoa, and has its name from its warm baths. N. lat. 44° 40'. E. long. 8° 30'.

ACQUIDA, a small Dutch fort to the E. of Ancobar river in the gold coast of Africa. N. lat. 4° 32'. long. nearly the same with that of Greenwich.

ACQUETANDIS, in law, a writ of false testimony lying for a writ against the creditor that refuses to acquit him after the debt is paid.

ACQUETARE, in ancient law-books, signifies to discharge or pay the debts of a person defecct; as the heir thofe of his father, &c.

ACQUISITION, the act of procuring a right or title to the enjoyment or property of a thing. Acquisition is also sometimes used for an acquëst.

ACQUITTAI, a discharge, deliverance, or setting free of a person from the guilt or fulpiion of an offence. Acquittal is of two kinds; in law, and in fait. When two persons are accused or indicted for felony, one as principal, the other as accessory; the principal being discharged, the accessory is, by consequence, also freed; in which case, as the accessory is acquitted by law, so is the principal in fait.

When a person is acquitted of a felony, and is questioned again for the same crime, he may plead in acquit; as his life cannot be twice exposed to danger for the same offence. But in murder, acquittal does not prevent an appeal; and the principal or accessory, may be either remitted to prison or haled by the court, till the year and day of appeal be passed. If a person is lawfully acquitted on a malicious prosecution, he may bring his action for damages, after he hath had a copy of the indictment.

ACQUITTAI, is also used where there is a lord mesne and tenant, and the tenant holds lands of the mesne, and the mesne holds over the lord paramount; here, the mesne ought to acquit the tenant of all services claimed by any other for the same lands; the tenant being to do service to the mesne only, and not to divers lords for one parcel of land.

ACQUITTANCE, or QUIETTANCE, a release or discharge in writing, for a sum of money or other duty, which ought to be paid or done. No person is obliged to pay without an acquittance, and the acquittance of a servant accustomed to receive money for his master, is a good discharge. The verb acquit, the participle, acquitted, and the noun acquittal, do all signify a discharge from an offence objected. In which case we meet with acquitted by proclamation.

ACRA, in Ancient Geography, one of the hills of Jerusalem, on which stood the old or lower city; as the new or high city, called also the city of David, was situate on mount Zion, to the south of Aera. This is supposed by some to be the same with Mount Moriah, on a part of which Solomon built his temple; and they alllege, that Moriah in Hebrew, and Aera in Greek, have the same meaning, and signify an eminence. Wells's Sacr. Geog. vol. iii. p. 76.

As there was a citadel or fortress built on this hill by Antiochus, in order to annoy the temple, which was afterwards taken and razed by Simon Maccabaeus, it is not improbable that the name was derived from this circumstance. Anc. U. H. vol. ii. p. 488. The Armenians, not satisfied with having razed the citadel built by the Syrians, lowered the top of the mountain, and filled up the valley towards the sea, by which means the ground on which the temple stood, or Mount Moriah, became higher than Aera, and thus the communication between them was rendered more easy.

ACRA, in Syria. See ACRA.

ACRA Point. See HANDISILAR.

ACRABA, a town of Mesopotamia in Asia, situate near the river Chlaboras, about 36° 20'. N. lat.

ACRABATA, a town of Asia, towards the limits of Samaria.

ACRABATENE, the name of two districts of Judea: one extending itself between Scechoem, now Naplola, and Jericho,
Jericho, about 12 miles in length; and another on the frontier of Idumaea, towards the southern extremity of the Dead Sea.

ACRACANUS, a river of Asia in Abydene, supposed by Eusebius to be the same with Maarrara.

ACR. DINA. See ACHRADA.

ACR. E., an ancient town of Sicily, founded according to Thucydides (lib. 6. p. 381. Ed. Duker) 70 years after Syracus, built upon an eminence, as Silvus Italics (lib. 14. v. 207.) describes it, and inhabited by a people whom Pliny (H. N. vol. i. p. 163.) denominates Acrones. It was situated about 24 miles to the south of Syracuse, not far from the sea, and near the monastery which the Sicilians call Santa Maria d'Africa, between the cities of Noto and Avola. There are medals of this city in bronze, gold and silver.

ACR. ESFANDIAS, a district of Spain, S. E. of the monitory of Artabrum.

ACR. E. S. was also an epithet of Diana, who was generally worshipped in high places.

ACR. E. A., a surname of Juno of Corinth, who had a temple in the citadel of the Sicilian Acr.; and also a surname of Fortune for the same reason.

ACR. EPHIA, ACRASPHIUM, or ACRASPAS, a district of Pausania (lib. 9. c. 23. p. 755. Ed. Kuhl) calls it, Acrasphium, was a city of Bariot, situated on Mount Pooe, where was a temple of Apollo. This place, according to Pausania, afforded refuge to the Thebans, when Alexander demolished their city.

ACR. EUS. was a surname of Jupiter, who was honoured by the inhabitants of Smyrna in a temple on an eminence near the sea.

ACRAGAS, a town of Sicily, built upon a mountain, at the confluence of the rivers Agarac and Hypsea, and within two miles of the sea, by the people of Gela in the year before Christ 584. It took its name from the river Acragas, now called Fiume di Gergeri; and whence other cities, enumerated by Stephanus (de Urb. vol. i. p. 53.) were denominated Acraganates. Acragas was very strongl fortified. The inhabitants were luxurious in their diet, and magnificent in their dwellings; and they are represented by Empedocles, says Diogenes Laertius (tom. i. p. 532.) to be persons, who lived to-day as if they were to die to-morrow, and who built, as if they were to live for ever. The adjacent country abounded with vines and olives, the produce of which afforded a lucrative commerce with Carthage. Acragas has been more generally distinguished by its Roman appellation Agrigentum. The medals of this city were gold, silver and bronze.

ACR. JAFFA, a promontory in the kingdom of Naples, to the S. E. of Otranto, where was formerly a town, now in ruins, on the Ionian Sea, opposite to the Monte acrocoraum of Epirus. Ptolemy called it Salentina, and it is now denominated Copo di San Maria di Leuce.

ACR. OF SCILAX, an island on the coast of Numidia, that forms the modern part of Harthgoone, under which vellets of the greatest burden may lie in safety. Stephanus (de Urb. vol. i. p. 53.) enumerates 10 cities under the appellation of Acr.

ACRAMAR, or VAN, in Geography, a town and lake of the Greater Armenia in Asia. N. lat. 36° 30'. E. long. 44° 14'. The town, which is the capital of the government of Van, is situated at the foot of the mountains of Diarbekir, and is said to have been built by Semiramis. It is large, populous and commercial. In the adjoining lake, which abounds with fish, there are two small islands, inhabited by religious Armenians.

ACRASIA, formed of a priv. and τυπομακινον αι, is used by some writers in Phys. for the excess or predominant of one quality above another, either in artificial mixture, or in the constitution of the human body. The word is used by Hippocrates, and other Greek medicinal writers, to express excess of any kind, intemperance and imbecility.

ACRASUS, in Ancient Geography, a town of Asia Minor in Lydia. There are some imperial Greek medals of this city, which were sent under the pretors, in honour of Severus, Plautilla, Geta, Julia Paula, Alex. Severus and Caracalla.

ACRATH, a town in Mauritania Tingitana, supposed to be the present Fesia de Gamarra.

ACRATISMA, in Antiquity, a breakfast among the old Greeks, consisting of a mortar of bread soaked in pure unripe wine.

ACRATOMELI. See MULSUM.

ACRATOPHORUS, a surname of Buceach, under which he was honoured at Phigalia, a city of Arcadia.

ACRaTOS, from a priv. and περιομακινον αι, signifies simple or uninixed. This term is very often used by Hippocrates, and applied to excretions of different forts, and is always of very bad preface. Thus, in his Premonitions, he observes, that in all painful disorders of the plures and lungs, the spittle should appear mixed and yellow; and that it is a dangerous symptom, if it be altogether yellow, without any mixture: and he adds, that if the spittle be fo unmixed, as to appear black, it is a very bad preface.

ACR. E., or ACR. E., in Geography, a sea-port town on the Phcenician coast in Syria. Its ancient Hebrew name was Asco or Acho, under which appellation it is mentioned as a place of considerable strength in the book of Judges, ch. i. v. 31 and it is still called by the Arabs Akka. It was after the denominated Ptolemais, from one of the Ptolemys in Egypt, and Acr. on account of its fortifications and importance: whence the knights of St. John of Jerusalem called it St. John d'Arc. The situation of Acre possesse every possible advantage both of sea and land: as it is encompassed on the N. and E. by a spacious and fertile plain, on the W. by the Mediterranean, and on the S. by a large bay, extending from the city to Mount Carmel. This city successively under the dominion of the Romans and afterwards of the Moors, was for a long time the theatre of contention between the Christians and the Infidels in the progress of the crusades. It was taken by the victorious Saladin in 1187; and surrendered to the united arms of Philip Augustus of France, and Richard I. of England in 1191, after a siege of two years, which confirmed a great multitude of forces, both of Europe and Asia. Although the Europeans thus acquired a strong town and convenient harbour, the advantage was very dearly purchased. It is said (see Gibbon's Hist. vol. xi. p. 144. 8vo.) that on this occasion more than 100,000 Christians were slain; that a far greater number was lost by disease or shipwreck; and that a small portion of an army, consisting of five or six hundred thousand perons, returned in safety to their native countries. After the loss of Jerusalem in unsuccessful attempts for recovering the Holy Land from the possession of the Saracens, renewed by St. Louis with the co-operation of our Edward I. and other powers, Acre became the metropolis of the Latin Christians, and was adorned with strong and stately buildings, with aqueducts, an artificial port and a double wall. Its population was increased by an influx of pilgrims and fugitives; and the trade of the East and West was attracted to this convenient station. At this time, however, the inhabitants were extremely corrupt; and the government, though exercised by many foreignees, feeble and ineffectual to any purpose of salutary restraint. Adventurers fission from this city, under the banner of the crois, to plunder the Mahometan villages;
and though nineteen Syrian merchants were robbed and ignominiously put to death, satisfaction was withheld. The Sultan Khalil retented this conduct, and marched against Acre, at the head of a large army, furnished with a tremendous train of artillery. After a siege of 33 days the double wall was forced, by the Moslems, the principal tower yielded to their engines, the city was stormed, and death or slavery was the lot of sixty thousand Christians. The fortresses of the Templars was destroyed, the grand mallet killed, and of 500 knights, 10 only survived: who probably suffered on a scaffold (says Gibbon,) in the unjust and cruel proscription of the whole order. Few of the fugitives, among whom were the king of Jerusalem, the patriarch, and the great master of the hospital, escaped the dangers of the sea, and safely arrived in the island of Cyprus. This disastrous event happened (says Maunder in his journey, &c. P. 55.) on May 19, 1291. He adds, that the abbeys of the nunery, in order to avoid that violation which was apprehended from the licentiousness of the Saracen victors, ordered the young nuns under her care to mangle their faces, setting an example in her own person, that they might thus become the objects of averton instead of brutal desire. The Saracens, disappointed and inflamed with resentment, put them all to the sword.

After the expulsion of the crusaders, Acre exhibited a scene of magnificent ruin, and remained in a great degree defoliated and deforested until about the year 1750, when it was fortified by Daher, an Arabian sheik, who obtained the appellation of Prince of St. John of Acre, and maintained his independence against the whole force of the Ottoman empire, till the year 1775, when he was safely assassinated by order of the Ottoman Porte, at the advanced age of 86 years. He was adored by his people (says Savary, Letters, vol. ii., p. 200,) whom he had through life defended against the tyranny of the Pacha, and yet by this tyrant he was betrayed and murdered.

At a later period Acre has been rendered, by the works of Djezzar, one of the principal towns upon the coast. The mole of this Pacha is much admired. The bazaar, or covered market, is not inferior to the bazars of Aleppo, and its public fountain is superior in elegance to those of Damascus. These improvements were designed and executed by the Pacha himself. The place, however, though its fortifications had been often repaired, was very weakly defended; and in the spring of 1799, it was found necessary to strengthen its fortifications, in order to guard against the apprehended alluvial of the French army under Bonaparte. The Pacha Djezzar, who had actually evacuated Caifas, a town at the foot of Mount Carmel, surrounded with a good wall, and flanked with towers, and who had disarmed the caifal which defended the fort and road, had reason to distrust his security at Acre. He was therefore preparing to make good his retreat, and to convey away his women and treasure, when Sir Sidney Smith anchored in the road of Caifas with an English squadron, and deputed a French engineer (Col. Philippeaux) to aid him in fortifying the town. This engineer caused the fortresses to be repaired, which was fortified after the mode of the 12th century, with courstins flanked with square towers. The Pacha, thus affrighted and animated, determined to co-operate with the English squadron in the defence of the town. Kleber, however, with the French advanced guard, had taken possession of Caifas; and Bonaparte had completed the investment of Acre, when his battening-pieces and flares fell into the hands of the English. This loss decided the fate of the town; and though the French renewed and varied their attacks, they were repeatedly repulsed by the garrison in concurrence with the marines of the English squadron, under the command of the Commodore, Sir Sidney Smith. After multiplied and irreparable losses, it was found almost impossible to reduce a place, defended with so much intrepidity, and possessing a variety of advantages which it holds in our purpose minutely to detail. Bonaparte at length determined to raise the siege, and announced his resolution to the army, which began its march on the 20th of May, the 6th day after breaking ground. Djezzar did not perceive for two days that the trenches were evacuated, so that the French army had an opportunity of continuing its march without molestation, ravaging the country, burning the hawels, and destroying the defences of the ports, the magazines, and all the resources which the Turks might have used in approaching the frontiers of Egypt. Kleber formed the rearward with his division, which, after having crossed the defait, embarked at Tyre for Damietta. Bonaparte left a strong garrison at Cattich, and entered Cairo with the rest of the army, 26 days after the raising of the siege.

The aspect of the field of carnage on this occasion was horrible. The ditches and the reverses of the parapets were filled with corpses, and the air itself was infected for want of an opportunity to remove the wounded whom the Turks left uncontrolled, and to bury the dead. Notwithstanding the singular spirit and very extraordinary exertions manifested in this siege, by both the assailants and the besieged; humanity on both sides was fraught with the aggravating circumstances of cruelty and diffidence that attended it.

The principal articles of commerce at Acre, are corn and cotton; but the trade is monopolized by the Pacha in his own hands. The French have usually had a consul in this place, and Russia a resident. Acre is situated 27 miles S. of Tyre; and about 70 miles N. of Jerusalem, L. lat. 32° 40'. E. long. 39° 25'.

Acre is used in the dominions of the Mogul, with regard to his revenues, in the same fene with land, for the fame of 100,000 rupees: eight rupees being equal to about one pound sterling.

Acre denotes a quantity of land, containing four square rods, or 160 square poles or perches.

The word, perhaps, is formed from the Saxon acer, or German aek, field, or the Latin aget. Salmaeus derives it from aera, used for aetna, a land-measure among the Ancients, containing 10 feet. The term acre formerly meant any open ground or field, as Caile-acre, Weal-acre, and not a determinate quantity of land.

By the customs of countries, the perch differs in quantity, and consequently the acre of land: it is commonly 16¼ feet; but in Staffordshire, it is 24 feet; in other counties 28 feet; and in some parts of England 18, 21 feet.

According to the statute 34 Hen. VIII. concerning the lying of wax, it is declared, that 160 perchs, i. e. 16 in length, and 10 in breadth, or in that proportion, make an acre; and the ordinance for measuring land, 35 Edw. I., agrees with this account. And therefore, as the statute length of a pole is 5¼ yards, or 16½ feet, the acre will contain 4840 square yards, or 43,560 square feet. Moreover, as the chain, used in measuring land, is four poles or 22 yards in length, the square chain will be 484 yards, and the acre will be 10 square chains. And a mile being 1760 yards, or 80 chains in length; the square mile will be 1760 x 1760 = 3,097,600 square yards, and contain 80 x 80 = 6,400 square chains, or 640 acres. Some old farmers distinguish between need-aces and flat-aces; the former being a vague measure, determined by the proportion of feed used in fowing it, and therefore depending on the fertility or barrenness of the soil.
The Scots acre contains 4. Scots roods, and bears proportion to that of the English by statute, as 100,000 to 78,679, regard being had to the difference between the Scots and English foot. One square rood is 40 square feet; one square foot, 36 square inches; one square feet, 9 square inches; and a square foot, 144 square inches. The Scots acre is also divided into ten square chains; the measuring chain being 24 ells in length, and consisting of 100 links, each link 8.928 inches; and each square chain will contain 10,890 square links. The English statute acre is about 3 roods and 6 falls, standard measure of Scotland.

The French acre, _apent_, is different in various provinces; the acre of Paris contains 100 square perches, the perch being 18 feet, or 3 toises; in some places the perch is 22 feet, and in others 24. Allowing the proportion of the English square foot to be to that of the French, as 1000 to 1165, the acre of 100 square perches, at 18 feet each, will be 32,400 French square feet, or about 36,774 English square feet, and the perch being 22 feet, the acre will be 39,400 French square feet, or about 45,500 English square feet; it will be very easy to estimate the proportion of the one to the other. The Strafsburg acre is about half an English acre. The Welsh acre contains commonly two English ones. The Irish acre is equal to 1 acre, 2 roods, 19 perches or 1 English acre.

Houghton gives a table of the number of acres to a houfe in each county of South Britain, which is found to vary in the English counties from 31 acres, the proportion in Middlesex, and 173 in Surry, to 49 acres in Southampton; in the Welsh counties, from 51 acres, as it is found in Flintshire, to 193, as in Merionethshire.

Dr. Grew attempts to ascertain the number of acres in England; which, according to him, amounts to 46 millions and 80,000. Phil. Trans. No. 230, or Abr. vol. ix. p. 450. Sir William Petty reckons not 28 millions; others 29 millions. And by an account of the number of acres in each county, supposed to be taken from some old registers, the number of acres in England amounted only to 39½ millions. Others estimate the number of acres in England and Wales at about 46,916,000; and in Scotland 26,000,000.

Hylland others again affirm, that England and Wales contain no more than 38,500,000 acres; and that Scotland with its adjacent islands, contains about 21 millions of acres. Allowing with Zimmermann, (Political Survey, p. 192.) that England and Wales contain 54,412 square miles, and Scotland 25,000 square miles; the number of acres in the former will be 34,531,680, and in the latter 16,384,000.

Ireland, comprehending 21,216 square miles, will contain 13,578,240 acres.

The United Provinces are said to contain 4,382,000 acres, but reckoning with Zimmermann (Political Survey, p. 164.) the area 12,000 square miles, the number of acres will be 6,400,000; and the province of Holland is estimated at one million of acres, or according to the same writer, 1,280,000 acres; and they were thought formerly to contain 2,400,000 perches, but according to a public account given in 1783, 2,757,652 perches. If England were as well peopled in proportion, it is said that it would contain 46 millions of inhabitants, i.e. about seven or eight times as many as it now contains.

The area of France, according to the statement of Necker, is 157,592 square miles; and if this estimate be just, it contains 1,011,071,360 acres. Spain, according to Lopez's map, contains 1,184,48 square miles; and consequently 93,067,720 English acres. Portugal comprehends 27,376 square miles, or 17,579,340 acres. The whole of Turkey in Europe, Asia, and Africa, estimated at 800,000 square miles, contains 512,000,000 acres. The European part of Russia is said to contain 1,193,676 square miles, and consequently 761,784,620 acres; and Admiral Ruskin supposed to be 3,605,024 square miles, includes 236,815,760 acres. If Sweden contains 216,000 square miles, as Bichfing states it, its extent in English acres will be 138,240,000. Denmark, comprehending 18,240 square miles, will contain 116,735,600 acres. Poland and Lithuania, estimated at 165,800 square miles, will contain 193,912,000 acres. The kingdom of Prussia, including the countries that are independent of the German empire, supposed to contain 57,000 square miles, comprehends 46,861,000; and Prussia alone containing 22,144 square miles, includes 21,172,160 acres. Germany, estimated at 154,571, square miles, contains 122,605,440 acres. Switzerland, containing 15,296 square miles, has 97,800,440 acres. Italy, containing 90,000 square miles, has 57,600,000 acres.

The territory of the United States of America, according to the measurement and computation of Mr. Hutchins, geographer to the States, contains 580 millions of acres, exclusively of water, which is computed at 51 million more. Morse's Geog. p. 35. See Political Arithmetic.

By a statute of 13 Eliz. it was ordained, that if any man erected a new cottage, he should add four acres of land to it; but this statute was repealed by 15 Geo. III. c. 32.

Acre-Fight, is an old sort of duel, fought by single combatants, English and Scotch, between the frontiers of their kingdoms, with sword and lance; and this duelling was also called camp-fight, and the combatants, champions, from the open field that was the stage of trial.

Acre-Tax, a tax laid on land at so much per acre. In some places this is also called acre-shot. Impositions on lands in the Great Level are to be raised by a proportionable acre-tax. 20 Car. II. cap. 8. An acre-tax of 25. 6d. per acre, for draining Hadham level. 13 Geo. I. cap. 18.

ACRE, in Ancient Geography, a town placed by Ptolemy in Sicily. N. lat. 36°. 42' E. long. 39° 15'. See ACRE.

ACREDULLA, in Zoology, a species of the Mus, in the Linnaean sytem; the migratory mouse of Pallas, with pouches to the cheeks, furred small ears, a grey body, with the lower part white. It is four inches long; with an annulated tail, the upper part of which is brown, found in the Orenburg district of Siberia, near the river Urag.

ACREL, Gof., in Biography, was born the 26th of November 1717, in a parish in the neighbourhood of Stockholm, where his ancestors had been ministers ever since the year 1380. He commenced his studies at Upsal; and in the year 1738, translated into the Swedish language some of the works of Boerhaave. He then went to Gottingen, where he continued his studies, and afterwards to Strafsbourg, and thence to Paris. In the year 1744, he served one campaign in the French army in Germany, whence returning to Stockholm, he was admitted a member of the surgeons' company there. In 1746, he was elected into the academy of sciences; in 1751, he was made one of the foreign associates of the academy of surgery at Paris. In 1764, he was advanced to the degree of doctor of the faculty of medicine at Upsal, and admitted to the royal college of physic at Stockholm. He was in great reputation, and had a considerable share of practice, principally in surgery, and has left several works, all written in his own language, which
which are in great request among his countrymen. The
titles translated into English are, 1. A Treatise on Wounds.
2. A Discourse on the best method of constructing an
Hospitall. He read this discourse at a meeting of the royal
academy at Stockholm when he was elected their pro-
fident. 3. A Discourse on the Method of depressing the
Catarrh, 8vo. 1759, 1775, Stockholm. In this
discourse he defends his practice against professor Wallborn,
who had opposed him. A Discourse on some alterations
and improvements in performing certain operations in Sur-
gery, and the instruments used in performing them, was
read by him to the royal academy on his being elected president
a second time.

ACRENE, a term sometimes used in ancient law-books
for ten acres.

ACREON, in Entomology, a species of Papilio, with
brown wings, the under part black and ocellated; the
binder wings having a white margin, marked with a red band
and ridge of gold-coloured points. It is found in the
southern part of Russia.

ACRI, in Geography, a town of Naples, in Calabria.
Citra, five miles east of Scalea.

ACRIA, in Ancient Geography, a sea-port town of Laconia,
situate near the mouth of the Eurotes, opposite to Trimithii,
and not far from Gythium.

ACRIBEIA, a Greek term ακριβεία, literally denoting
an exquisite or delicate accuracy; it is sometimes used in
our language for want of a word of equal significance.

ACRID, in Natural History, denotes anything sharp
or pungent to the taste. Ancient Naturalists distinguish two
kinds of acid tastes; the first proceeding from hot and dry,
as that of pepper; the second from that of hot and moist,
as that of garlic. Acid, according to Dr. Crew, properly
belong to the class of compound tastes. It is not
simply four or pungent, as there are bodies not acid, which
nevertheless are pungent, e. g. arum; nor is it simply hot;
for there are many hot bodies which are not acid, as the
roots of zedoary, yarrow, and contrayerva. The character-
sitic, therefore, of acidity consists in pungency joined
with heat. Acid bodies applied to the skin inflame and
exacerbate it; when chewed, they produce fialva, and when
passed, fusing. Acids may be divided into clusses, ac-
cording to the manner in which they yield their acrimony.
1. By distillation, as horde-radilis, mustard, &c. 2. By
inflation, as the greater Celandine, &c. 3. Neither by in-
flation nor distillation, as arum, &c. Acid medicines, as to
their general effect, serve to stimulate the vessels, and dif-
fuse tenderous and viscid juices. In leucophagmatic hab-
its they are powerful expectorants, dephlegmatics, diuretics,
and emmenagogues: and if the patient be kept warm, fu-
dorifics. In hot biphous temperaments, pethoric habits, in-
fammatory dilemptics, and in cafes where the juices are too
thin and acidimonic, or the virescent unford, acids are in-
juries. See Stimulants.

Some vegetables, which are either inodorous, or emit a
weak smell, excite a local inflammation when applied fresh
to the skin, but lose their faculty in drying. When recently
gathered, and inwardly taken, they produce poisonous
effects. Of this kind are the fresh roots of squills, the
leaves of fox-glove, of wild anemonie, of virgin's bower,
of wolf's-bane, of monk's-hood; the roots of blue orris, of
aphodel, of king's spear, of meadow fawning, of white bry-
ony, or wild vine, and of wake-robinn; and the fruits of
wild cucumber. As these substances lose their acrimony by
being well dried, the acid matter which produces their
irritating effect appears to be volatile; and this is farther
confirmed, by its being communicated to water and spirits of
wine, abstracted from them by distillation. Hence it may
be inferred, that this volatile matter is a particular, pro-
ximate, acidulent part, belonging to the vegetable kingdom;
and in order to distinguish it from other principles of a
similar kind, it has been denominated the acid matter of plants.
Its acrimony is not destroyed by acids nor by alkales, and it is
not ammonia in any form. In the antagonistic plants,
such as furrug-grass, water-cribillies, garlic, onions, horse-
radish, common radish, and mulled-beef, this acid prin-
ципle is combined with oily particles of an ethereal
nature, and its effects seem to be weakened by this union.
There are other plants which are not deprived by extractio-
operation of the power of producing local inflammation, when
outwardly applied to a living body; and in those plants it seems
to originate from their poisonous parts; such as emor-
bum, or wart-wort, various plants of several species of
the daphne, of the capricum annum, or Guinea-pepper, of
the miller of Spain, &c. The acid matter of Spanish flies
is essentially distinct from the acid matter of vegetables, as
it is not elipted by drying, and cannot be extracted by
water; though it may be obtained by spirit of wine and
ether. It resembles the latter kind of acid matter, and
seems to be of a ruminous nature. See Green's Principles of

Acid substances constitute one class of Condiments in
the Materia Medica of Dr. Cullen, vol. i. p. 427. He di-
tributes them into two kinds, viz. aromatic, imbued with
peculiar and pretty strong odours, and the more simple
acrids possessing little peculiar odour. Besides the Aroma-
tics, the acid substances employed as condiments, are
especially taken from the class of terebrydyac plants: and
they are chiefly the mustard and horseradish. These stimu-
late the stomach and afford digestion; and as they promote
perpiration and urine, they correct the putrescent tenden-
cy of the system, and hence vegetables of this class have been
denominated Antiscorbutic. Because they possess this
quality, they are proper to be used with our animal
food, as the aromatics are the suitable condiments of our vegetable
aliments. The plants of the garlic tribe are ended with a
similar acrimony. Those of the milder kind, as the onion
and leek, more especially when deprived of their acrimony,
afford a considerable quantity of nutritious matter; and
these, together with the echalot, and others, arc very pro-
per condiments. Garlic, used for the same purpose, strongly
stimulates the stomach, and promotes digestion. All the
plants of this order, as they serve to promote perpiration
and urine, are very properly joined with our animal food,
and may be referred to the class of antiscorbutics. Alka-
losides may also be recommended as a condiment, that is
useful in promoting digestion. Of the more simple acidis,
the capsicum, or pepper, is the most commonly used. The
cuting of acid food, with a view to the effects above enume-
rated, was particularly called by the Greeks drimaphagia,
formed of ἀρείως, acid, and ἀετὶ, to eat.

ACRID, in Entomology, the name by which Lin-
naeus has distinguished the first family of the Gryllus,
the Tettigides of Fabricius, or the cricket, properly so
called; the characters of which are, that the head is conical
and longer than the thorax, and the antennæ eniform or
sword-shaped. Of this family there are eight species, none
of which are found in Britain. The insects of this family
feed on other insects.

ACRIDOPHAGI, composed of ἀρείως, lecith, and
ἀετὶ, to eat, in Ancient Geography, a nation or people
of Ethiopia, inhabiting near the defects, &c. who are said to
have
have fed on loculls. These people, as Diodorus Siculus (lib. iii. c. 29. tom. i. p. 195. Ed. Weiseling.) describes them, were of a low stature, and a meagre black aspect. In the spring they provided themselves with a supply of large loculls, by setting fire to wood and other combustible materials, which they deposited in a large and deep valley, so that when swarms of loculls were driven by the south-west winds over this valley, they were suffocated by the smoke. These loculls, which covered the ground to a considerable extent, were collected and salted, and in this state furnished a supply of food for the whole year; and, indeed, it was the only food upon which they subsisted, as they had neither hens nor flocks; and being far from the sea, they had no supply of fish. They were an active people, and ran with great swiftness; but the duration of their lives was short, not exceeding forty years; and they generally fell sacrifices to a malady of a very peculiar kind. They were devoured by winged insects of different species, and of very hideous forms, which were generated in their bodies, and which filled forth in various parts, occasioning exquisite torture, and at length a very painful death. Whether this dreadful malady was owing to the food of the people, or to the peculiar air of the climate in which they lived, it is not easy to determine. See Strabo, (Geog. l. xvi. tom. ii. p. 1118.) and St. Jerome against Osvianus, lib. ii. and on St. John, cap. iv. Pliny (H. N. tom. i. p. 609. Ed. Harl.) also speaks of Acridophagi, in Partia, and St. Jerome, in Lybia. Although the circumstances of these people may in some respects be fabulous; yet may the Acridophagia be true; and to this day they are said to eat loculls in some parts of the eall. This is confirmed by the accounts of the Danish mission, in Niebuhr’s description de l’Arabic, p. 150, &c. In Abyphinia loculls are eaten, both fresh and salted. Some of them are dried in the sun, and thus prepared for use. In Arabia also, as Niebuhr informs us, they preserve them in the same manner. Dr. Shaw (Travels, &c. p. 188.) observes, that the Jews were allowed to eat them; and that when they are sprinkled with salt and fried, their taste resembles that of our fresh water cray-fish; and Ruffel (Hill, Aleppo, p. 62.) says, that the Arabs salt them, and eat them as a delicacy. From Haflequeil, who travelled in Syria and Egypt so lately as the year 1752, we learn, that when corn is scarce, the Arabians grind the loculls in hand-mills, or stone-mortars, and bake them in the form of cakes, which they use as bread; and that he has frequently seen them boiled and reamed with butter, and made into a kind of flat bread. Amongst the Hotentots, as Dr. Sparrman informs us, (Voyage to the Cape, vol. i. p. 36.) they are made into a brown coffee-coloured soup, which acquires from the eggs of the females, that are chiefly used for this purpose, a fat and greasy appearance. These people compensate themselves for the damage done by the flights of loculls, by converting large quantities of them into a nutritious food. These facts remove every difficulty in determining the food of John the Baptist, who is said to have lived on loculls, ἀκρίδας, and wild honey. Matt. chap. iii. v. 4. Yet the rendering of ἀκρίδας by loculls, as the English translators have done, has been much controverted. Isidore of Pelusium, in his 123d epistle, speaking of this food of St. John, says, it was not animals, but the tops of herbs; and even charges those who understand the word otherwise with ignorance: but St. Augustine, Beda, Ludolphus, and others, are of a different opinion. Accordingly the Jefuits of Antwerp reject, with contempt, the opinion of the Eboniters, who, for ἀκρίδας, put ἄκρυσσίης, a delicious diet prepared of honey and oil; that of some other innovators, who read ξυπερίς or ξυπερίδας, and that of Boza, who reads ξυπερίδας, wild peares. The term ἀκρίδας says Dr. Shaw, (ubi supra) does not denote the tops of plants, as some have contended, but it is applied to the locull upon account of its appetite for such food. The word is used by Ariosto (Hift. Anim. lib. vi. c. 28.) and other historians in the same sense. The Septuagint interpret Φῆσις, ἀκραβάς, by the same name; and therefore the writers of the New Testament may be supposed to have taken it in the same signification. He adds, if loculls appeared in the Holy Land, during the fasting, as they did in Barby, it may be presumed that St. John entered upon his mission, and σβέους ἑαυτής to Ἰερακί (Luke i. 20.) at that season. ACRITOLIUM, in Botany, signifies any prickly leaved plant.

ACRII Montes, in Ancient Geography, mountains of Sicily, called also Hercol. ACRILLAE, a city of Sicily, between Acrae and Agrigentum, not far from Syracuse. This is probably the same with Accila, mentioned by Plutarch in Marcellus. See Livy, i. xxiv. c. 35. tom. iii. p. 890. Ed. Drakenb. ACRIMONY, that quality of substances which renders them acrid to the taste. The acrimony of the bile is supposed to be the cause of divers disorders; and a carathea is represented to be a delusion of acrimonious humour. The Britol water is recommended by Dr. Randolph for tempering the bad effects of acrimonious blood. This he mentions as its first and principal virtue in his inquiry into the medicinal virtues of Britol water, 8vo. 1735.

ACRIMONY, in Medicine, means a state of the fluids of the body, which may become the cause or effect of several diseases. This state of the fluids or humour has been affirmed by the humoral pathologists, of which effect Boerhaave may be considered as the last and most respectable teacher, in order to explain eruptions on the surface of the body, Scurvy, Rheumatism, Gout, Hectic Fever, &c. At present the existence of such a cause is considered as hypothetical.

ACRIOTERI, in Ancient Geography, a marsh of Asia Minor, in the greater Phrygia, upon the frontiers of Pidadia.

ACRIS, άκρις, signifiques a locull, the top of a mountain, and the extremities of fractured bones.

ACRISUS, in Fabulous History, a king of Argos, who, being warned by the oracle that he should be killed by his grandchild, shut up his only daughter Danae in a brazen tower; but Jupiter descending to her in a golden shower, she was delivered of Perseus; who, having slain the Gorgons, carried Medusa’s head to Argos, and transformed Acrisus into a statue of stone. This golden shower was probably a bribe to those who guarded the tower. Some suppose that her uncle Peritas found means to corrupt them, and to get admittance to Danae. Acrisus is said to have been buried in the Acropolis at Argos. The name, (says Dr. Bryant,) is a metathesis of Acritis, or Areatis, by which is meant the great Arkite, the perfon there worshipped.

ACRITAS, in Ancient Geography, a promontory of Melfenia, now Capo di Gallo, between Methone to the west, and Corone to the eall, where the Sinus Coronus begins. It is also the name of a cape of Thithymia, north of the gulf of Attacus.

ACRIVIOLE, in Botany. See Nasturtium Indicum.

ACROAMA,
ACROMA, from ἀκρομα, to hear, in Antiquity, a name given by the Romans to amusing tales, which they recited at their repasts. The appellation was also given to those who played on musical instruments, in contradistinction to those who sung.

ACROMATIC, in a general sense, denotes a thing sublime, profound, or abstruse; and in this sense it is opposed to exoteric. There are few facts or professions, that have not two modes of teaching, if not two sorts of doctrine; an acromatic for adepts and proficients, and an exoteric for novices. We find traces of this distinction among the heathens, as well as among Christian divines, philosophers, and chemists. Hence proceeded the ceremonies of initiations and abductions, and the discipline of secrecy; and hence also the origin of fables, enigmas, parables, lymbols, &c.

ACROMATIC is sometimes also used for any thing kept secret, or remote from popular use; in which sense Reman gives the title Bibliotheca Acromatica, to a description of the MSS. in the library of Vienna, abridged from the vast commentaries of Lambecus and Nefcius.

ACROMATICI, in Philosophy, a denomination given to the disciples or followers of Aristotle, &c. who were admitted into the secrets of the inner or acromatic philosophy.

ACROATHON, in Ancient Geography, a town situate on the top of Mount Athos, where, according to Mela, cited by Cclarius, the age of the inhabitants was half as long again as that of those who lived in other countries. It is called by the modern Greeks, Ατραθών, and by the Italians, La Cima di Monte Santo.

ACROATICS, a name given to Aristotle's lectures in the more difficult and curious parts of philosophy, to which none but his disciples and intimate friends were admitted; whereas the exoteric were public or open to all: but there are other differences. The acroatic were set apart for the higher and more abstruse subjects; the exoteric were employed in rhetorical and civil speculations. Again, the acroatics were more simple and exact, as they aimed at evidence and demonstration; the exoteric chiefly aimed at the probable and plausible. The former were the subject of the morning exercises in the Lyceum, the latter of those in the evening. Besides, the exoteric were published, whereas the acroatics were kept secret, being either entirely concealed, or if they were published, it was in such obscure terms, that few but his own disciples would be the wiser for them. Hence, when Alexander complained of his preceptor for publishing his acroatics, and thus revealing what should have been referred to his disciples: Aristotle answered, that they were made public and not public, because none who had not heard them explained by the author, ὅσον δέοι, would understand them. Plut. in Alex. Stanley's Hill. Philos.

It has been supposed, says Dr. Gillies, in his translation of Aristotle's Ethics and Politics, that, in these two kinds of lectures, the Stagyrite maintained contradictory doctrines on the subjects of religion and morality. But the fact is far otherwise: his practical tenets were uniformly the same in both; but his exoteric, or popular treatises, nearly resembled the philosophical dialogues of Plato, or Cicero; whereas his acroatic writings contained, in a concise energetic style, peculiar to himself, those deep and broad principles on which all solid science is built.

ACROBATATES, in Antiquity, a name given to performers: of these there were four sorts: the first vaulted or tumbled on a rope, sometimes suspending themselves by the neck or foot, &c.: the second slid from a high station along a rope, upon which their breast rested, and with their arms and legs extended, as if they flew: others ran along a rope, which was obliquely extended from a low to a high station: and those of the last sort, danced, leaped, and performed other kinds of feats on a rope stretched horizontally many feet above the ground.

ACROBATICA, or Acrobaticum, formed of ἀκροβατής, high, and περατός, and περάω, to pass, an ancient engine, by which people were raised aloft, that they might see more conveniently about them. This was the same among the Greeks, with what they call scenarium among the Latins.

Authors are not agreed as to the use of this engine. Turnebus and Barbarus suppose, that it was of the military kind, raised by besiegers high enough to overlook the walls, and discover the state of things on the other side. Baldus rather supposes it to be a kind of moveable scaffold, or cradle, contrived for raising painters, plasters, and other workmen to the tops of houses, trees, &c. Some suspect that it might have been used for both purposes. Vitruvius and Aquinas.

ACROCEAANEA, in Ancient Geography, so called from ἀκρος, high, and τρέχω, to run, because they were lofty, and often thunder-built; mountains in Epirus, running out into the sea, under N. lat. 45° 25' extending from W. to E. as far as Piraeus, and separating the Ionian sea from the Adriatic, now called Monti delle Chimera. Virgil (Georg. i. 332. and Aen. iii. 566.) calls them Chimæa. They derived their name from the town of Acroceana, now called Chimera, which is at the foot of the mountain, in the gulf of Chimera. The inhabitants, called Chimerians, are savage robbers; they give their name to a promontory of the Adriatic sea.

ACROCHIRISMUS, ἀκροχίρις, among the Ancients, a kind of gymnastic exercise, wherein the two parties contended only with their hands and fingers, without clothing, or engaging the other parts of the body.

The word is also written acrobatis, and acrobath: it is originally Greek, formed from ἀκρος, the part employed in this combat, which some would needlessly restrain to the tips of the fingers; though the etymology does not make this necessary.

Some make this a distinct exercise from wrestling, and suppose it to have given the denomination acrobatis to a peculiar sort of athlete who professed it. Others with more probability consider it only as a species of wrestling: some will have it to have been properly only a prelude to a wrestling match, wherewith the athlete began to try each other's strength, and bring their arms into play. This exercise made part of the panathenaia. Pausanias speaks of a famous personage, named Sotocrates, who got the surname of Acrochiris, or Acrobati, from his having overcome all his antagonists at the acrobath.—It appears to have been in use in the age of Hippocrates, who ascribes to it a virtue of extenuating the rost of the body, and making the arms fleshy.

ACROCHORDON, a painful species of wart, very prominent and pendulous, having a large head with a small pedicle, or base.

These are also called pedunculated warts, or hanging warts, and from distinguished from feloids verrucae, or mycetoma. Others describe the acrochordon, as a harder, rougher sort of wart, growing under the cutis, very cavernous and umbilical of the same colour with the skin: small at bottom, and bigger upwards, but rarely exceeding the size of a bean.

ACROCOlia, ἀκροκολία from ἀκρος, extreme, and κολία, a knot. These are the extremities of animals, which are used
ACROCOMES, in Antiquity, a people of Thrace, so called, from ακρος, head, and ως, hair, because they had long hair before like females, in contradistinction to the Albantes, who wore their hair long behind.

ACRO-CORINTHUS, in Ancient Geography, a high hill hanging over the city of Corinth, on which was erected a citadel, called also by the same name. This mountain separated the two continents of Greece and Peloponnesus, so that the fortress cut off all communication by land from the inner part of the ilithmus of Corinth, and when well garrisoned, kept all Greece in awe; on which account Philip of Macedon used to call it the letters of Greece. Antigonus took this fortress by surprise, with a design to enslave Peloponnesus; but Aratus recovered it by an action equal, in the opinion of Plutarch, to any of the most celebrated enterprises of the ancient heroes of Greece. Having secured the citadel, he went into the city, and assembling the people in the theatre, acquainted them with the particulars of the Achean league, and exhorted them to accede to it. They unanimously agreed to join in the alliance; upon which Aratus restored to them the keys of the city, which had not been in their power since the time of Philip, the father of Alexander. On the top of this mountain stood a temple of Venus, and from a lower part issued the fountain Pyrene.

ACROE, in Botany, the name given by the natives of Guinea to a kind of shrub, which they use in wine, as a restorative and anæsthetic. It is of the trifoliata kind, and has somewhat of the appearance of the corallodendrons, but it is not prickly; the middle end or leaf stands on a pedicle of an inch long, the two other leaves have no pedicles at all. Phil. Trans. N° 232.

ACROLISSUS, in Ancient Geography, a fortress of Illyria, in Dalmatia, situated on a mountain to the north of Lifius, of which it was the citadel. Polybius says, it was impregnable by Philip king of Macedon.

ACROLITHEUS, in Antiquity, a colossal statue placed by Mausolus, on an eminence, in the temple of Mars, in the city of Halicarnassus.

ACROLOCHAS, in Ancient Geography, a promontory of Egypt; which, according to Strabo, was near the isle of Pharos.

ACROMION, Acronium, in Anatomy, the upper proceeds of the scapula, or shoulder-blade.

The word is derived from ακρος, highest, and ως, shoulder, q. d. the extremity of the shoulder.

Some have thought the acronion of a nature different from other bones; because, during infancy, it appears no more than a cartilage, which adjust by little and little, and about the age of twenty years becomes hard and firm, like a common bone.

ACROMONOGRAPHICUM, from ακρος, head, and γραφα, letter, in Poetry, denotes a kind of poem, or composition, wherein each subsequent verse commences with the letter with which the verse preceding terminates.

ACROMPHALION, from ακρος, extreme, and ως, the navel; the tip of the navel.

ACRON, in Biography, a celebrated physician of Agrigentum, in Sicily, where he practised physic in the time of Empedocles, is said to have restrained the plague at Athens, by purifying the air with large fires, and by burning perfumes in the manner practised by the Egyptians.

When he required, some years after, as a reward for his services, that a piece of ground should be allotted him in the city for his tomb, Empedocles, with whom he had disputed, prevented his obtaining it. He lived about the middle of the fifth century before Christ. Snudas mentions two tracts written by him, in the Doric dialect, the one a general treatise of physic, the other on abstinence or diet.

ACRON was also the name of an ancient scholiast on Horace, in the seventh century, whose work is still extant in an old edition of Horace, printed at Basal, in Svo. in 1527.

ACRON, in Botany, among the Ancients, was used to signify the capitulum, top, or flower of plants of the thistle kind.

ACRON, in Geography, a district on the Gold coast of Guinea, extending along the sea eastward from Fantin to the mount called Monte del Diabolo, or the Devil's Mount. It is divided into Great and Little Acron; the former, which is the interior country, is a kind of republic; the latter, bounded on the south by the sea, is a pure monarchy. They are independent on each other, and yet strictly united under the protection of the Fantins, who derive from the fertile Acrons a principal part of their maintenance. The only European settlement in this kingdom is a Dutch fort, built at Afam, in 1657, called Patience, from the difficulties they encountered whilst they were building it. Apam is a small village, and inhabited only by fishers. The natives of Acron live in peace, cultivate their lands, and pursue their employments in security. Every year affords a plentiful harvest, which enables them to supply their protectors and adjacent countries with corn. The country abounds with game, with which the Dutch fort is plentifully supplied. The people, however, are poor, notwithstanding their industry and the fertility of the soil, and extremely ignorant.

ACRON, in Scripture Geography. See ACRON.

ACRONIUS LACUS, in Geography, a small lake formed by the Rhine soon after its rise out of the Alps, and after passing the greater lake, called Venetus, and now Bodensee, or the lake of Constance.

ACRONYCAL, Achronical, or Achronial, in Astrology, is applied to the rising of a star or other point, above the horizon, when the sun sets; or its setting when the sun rises. This is one of the three poetical risings and settings of the stars; and stands distinguished from Cosmical and Heliocical.

Among ancient writers, a star was properly said to be achronical, or to rise achronically, which rose in the evening when the sun was set. Greek writers, it is true, use the term achronikos indifferently, in speaking either of evening or morning, by reason both are considered as ακρος ως the extremities, of the night. And hence, among them we find achronical applied to the rising and setting of the stars, either in the morning or evening. But the ancients were more distinct, and by the achronikos rather meant the first beginning or approach of night, than the end or period of it; and accordingly among them, the stars which rose in the evening, not those in the morning, were said to rise achronically.

This word is sometimes ignorantly spelt achronal, from a mistaken notion of its being derived from α, and ως, time.

ACRONYCHIA, in Botany, a species of LAWSONIA.

ACRONYCTAE, stars rising in the twilight about sun setting.

ACROPOLIS, in Ancient Geography, the citadel of Athens, which derived its name from the eminence on which
which it was erected, and which is accessible only at the entrance. The fummit is fortified by a wall, built on its extreme edge, and encompassing the whole upper surface, which is nearly level. The natural strength of its situation is said to have induced the first inhabitants to settle there; and as their number increased, they began to build on the adjacent ground, till the Acropolis, being surrounded on every side, became the fortaleza of a large and populous city. It was richly adorned by the Athenians, in the days of their prosperity, with temples, statues, paintings, and votive gifts to their divinities, but is now in a most ruinous condition: though the remains of the famous Propylæa, the little temple of victory without wings, the Doric temple of Minerva, called Parthenon and Heçonpomedon, erected in the time of Pericles, under the direction of Phidias, and the Ionic temples of Erechtheus and Minerva Polias, with the cell of Pandroseus, are still to be seen. Its walls have, at different times, been rudely repaired, or rather rebuilt, as little of the ancient masonry remains; but numerous fragments of columns, cornices, and sculptures, are seen in several parts, which exhibit a ruinous appearance. The Turks keep a small garrison here; and it is the residence of the Diadóchos, or governor of the fortresses, and also of the Alap Ághs, and other inferior officers. The Acropolis formed one of the three divisions of Athens, the other two being the town and the port.

Acropolis was also the name of a city in Libya, and also of Ætolia, mentioned by Stephanus de Urbibus, vol. i. p. 54. There was a city of the same name in Albania, mentioned by Dion Cassius. Hist. Rom. lib. xxxvii. tom. i. p. 112. Ed. Reimar.

ACROPOLITA, George, in Biography, one of the writers in the Byzantine history, was born at Constantinople in the year 1226, and educated at the court of the emperor John Ducas, at Nice. Having made a very distinguished proficiency in mathematics, logic, rhetoric, and poetry, he was employed in the most important affairs of the empire. Ducas deputed him to negotiate peace with Michael of Ephesus, at Larissa: and he was appointed judge to try Michael Comnenus, on a suspicion of being engaged in a conspiracy. Having been advanced to the government of the western provinces of the empire by Theodore Lascaris, the son of John Ducas, he engaged in a war with Michael Angelus, in 1255, and was taken prisoner by him. In 1260, he was liberated by the intervention of the emperor Palæologus, who appointed him ambassador to Complantis, prince of Bulgaria. Upon his return, he devoted himself wholly to the education of youth, in which employment he acquitted himself very honourably for many years. In 1272 he was one of the judges in the cause of John Vecchus, patriarch of Constantinople; and, in the following year, he concluded a reconciliation between the two churches with pope Gregory, and swore to it in the name of the emperor, at the second council of Lyons, in 1274. In 1282, he was sent ambassador to John, prince of Bulgaria, and died soon after his return. His works are, “A Continuation of the Greek history from the taking of Constantinople by the Latins, in 1202,” to its recovery by Michael Palæologus, in 1261,” which forms a part of the Byzantine history: “A treatise concerning faith, virtue, and the soul;” and “An exposition of the sermons of Gregory Nazianzen;” together with some other pieces. Gregorius Cyprius, the patriarch of Constantinople, says of Acropolita, in the extravagance of praise, that he was equal to Aristotle in philosophy, and to Plato in divine things and attain eloquence. His son, Complantis, flourished under Michael Palæologus, and Andronicus his son, by whom he was made Logothete, or chancellor, in 1294. He defended the cause of the Greeks; and wrote several books. Bayle. Fabr. Bibl. Græc. l. v. c. 5. § 10. tom. vi. p. 448.

ACROPORA, in Natural History, a name given by some writers to two species of the Madrepora, viz. the Acroria and Oculata of Linnaeus.

ACROPONTHIA, ἄκροπονθία, or ἄκροπονθις, from ἄξορη, extreme, and ςυνθος, the prepuce, or skin, which covers the glans of the penis, denotes the extremity of the prepuce, which is cut off in circumcision.

ACRORIA, in Ancient Geography, a country given to the Elyte, in Greece, where Xenophon places the city Thasium.

ACROSPERLOS, a name given to the wild-oat grafts, or BROMUS.

ACROSPERMUM, in Botany, a genus of the cryptogamia fungi class: the characters of which are, that the fungus is very simple, sub-erect, and discharging seeds at the apex. There are six species.

Acrosperrnum, is also a species of the Sphera.

ACROSPIRE, in Natural History, &c. the same with Plumule.

ACROSPRIRED, or Acrospire, is used in respect of barley; which, in the operation of making malt, is apt, after coming, or sprouting, at the lower or root-end, to become aceo sprired, i. e. to sprout also at the upper or blade-end.

By 6 Geo. I. cap. 21. Malt-makers are forbid to wet or water their malt when on the floor, or couched; or to permit it to acrospire.

ACROSTIC, in Poetry, a kind of poetical composition, the verses whereof are dispersed in such a manner, as that the initial letters make up some person's name, title, motto, or the like. The word is derived from the Greek ἀκροστις, στής, that which is at one of the extremes: and ὑπερβαίνειν, to pass over. There are also acroflics, where the name or title is made up by the initial letters of the middle words, or the left of the final ones: and others which go backwards; beginning with the first letter of the last verse, and proceeding upwards. Some refiners in this trifling way, and in the exercise of this species of idle wit, have even gone to Pentaacrostics; where the name is to be repeated five times. The Sibylline oracles were written, according to Cicero, in a kind of Acrostics. See Sibyls.

Acrostics is also an appellation given by some authors to two ancient epigrams in the first book of the Anthology; the one in honour of Bacchus, the other of Apollo. Each consists of 25 verses, the first whereof is the proposition, or argument of the whole, and the other 24 composed of four epitaphs, beginning with each the same letter, and thus following in the order of the 25 letters of the Greek alphabet; so that the first of the 25 comprehends four epitaphs beginning with Α; the second as many, with Β; and so of the rest to Ω; which makes 96 epitaphs for each god.

Among Ecclesiastical Writers, acrostics denote the ends of verses of psalms, which the people sang by way of chorus, or rejoin to, to the psalmist, or leader of the psalm. This is also called singing acrostics, acrosticha, which was a species of psalmody usual in the ancient church.

Acroitic, in this sense, amounts to the same with hypopsloma, diaspilama, acrotaliation, and ephymonium, which are all terms of the same signification.

Though an acrostic properly signifies the beginning of a verse, yet it is sometimes also used for the end and close of it; as by the author of the confutations, when he orders one to sing the hymns of David, and the people to sing after him the acrostics, or ends of the verses.

It does not, however, denote precisely the end of the verse,
verse, but something added at the end of a psalm, or some-
thing frequently repeated in the course of a psalm, anfwer-
ing to our gloria patri.

Some pretend to find acrostics in the psalms, particularly
in those called abecedarian psalms.

ACROSTICUM, formed of ακροτηρία, συμμονή ὀρὸς,
σταύροςδέντρον, or forked firm, in Botany, a genus of the
cryptogamia filices cladem order; the character of which is,
that the fructifications cover the whole inferior surface of the
front or leaf. Professor Martyn, in his edition of Miller’s
Dictionary, enumerates 44, and Gmelin 45 species, which are
distributed into different classes, comprehending those with a
simple frond, undivided and divided; and those with a com-
posed frond, pinnate, sub-bipinnate, bipinnate, and supra-
decomposed. Under the first distribution with a frond
simple, undivided, are included, A. lanceolatum, cirriferum, be-
terophyllum, cirriferum, pedatum, palmatum, lingua, and dadatum :
and those with a frond simple, divided, are A. sphenophyllum,
caesalna, psammophyllum, dactylatium, digitatum, ferrugineum, and
polypodiodes. Under the second distribution, are com-pre-
hsended the pinnate, viz. A. aureum, virium, pustulatum, for-
bifolium caeruleum, marginatum, sanctum, platnerioid, and
trifoliatum; the sub-pinnate, viz. A. filipendulum, thallicrroid-
marus, lanceolatum, eucernen, and social tum; the bipinnate,
viz. A. acutatum, cruciatum, barbarum, cabalenum, viviparum,
valleum, simplex, petalotium, latifolium, villosum, unico-
formum, fruticatum, gramineum, and subbursatum. Gmelin omits
the viviparum, introduces the longifolium and filare, makes
some difference in the arrangement of the species, and refers
the acutatum to a class with a supra-decomposed frond.

Of these species, two only are natives of Great Britain, viz.
A. sphenophyllum, forked or horned fern, with fronds, naked,
linear, and lanceate, or jagged; the fructifications, in an
immature state, are in short indistinct lines or dots, resem-
bling an asplenium, but in an adult state, the lower surface
of the leaf is totally covered with brown dusty capsules;
from two to five inches high; found in clfts of rocks, and
old walls in Yorkshire, Wolvermore, Wales, and Scotland;
and A. ilexifera, or hairy fern, the POLYPODIUM
ilexifera of Withering, with fronds sub-bipinnate, the pinnae or
wings oppositely coaractate or united, obtuse or blunt, hir-
fute or hairy underneath, and quite entire at the base; the
ripe or Item is greenish, and not blackish purple, scarcely
more than a finger’s length; called A. alpinum by Bolton;
perennial, and flowering from July to September, found on
rocks in Wales. The A. marcesce, with fronds sub-bipinnate,
the pinnae oppositely coaractate, very hirtute underneath,
and a little toothed at the base, is a native of the southern
countries of Europe; but all the rest belong to hotter climates,
as the East or West Indies, Africa, and the southern prov-
ces of North America. The A. pustulatum, with fronds
heart-tongued, acuminate, quite entire, dotted above, resem-
bles harts-tongue, and is probably rather a species of poly-
pody. It is used medicinally in China, where it was
first remarked by J. Fothergill. Few of the species have
been introduced into gardens. Those of Europe may be
preserved in pots, filled with gravel and lime-rubbish, or
planted on walls and artificial rocks; but most of them, be-
ing natives of very hot climates, must be planted in pots,
and plunged into the back-pit. Martyr’s Miller.

ACROSTICUS is also a species of POLYPODIUM,
called Thylotepis, and a species of CANOTTIUS, called
Canopyara.

ACOSTLUM, in Ancient Naval Architecture, an
ornament of the prow, or forecafl of a ship, chiefly of
war; sometimes copied as a buckler, a helmet, or an ani-
mal, but more frequently a circular or spiral. The ancients
had divers decorations or additional parts to their ships,
called by a general name ἄφιετα; those on the prow were
more particularly called ἀφίετον, of which the extreme part
alone was denominated acrofotium.

To the acrofotia may be referred the ανταρκτας, men-
tioned by Bayius; and also those polished steel pieces re-
sembling a duck’s neck, used by the Venetians at the heads
of their gondolas.

The acrofotia were torn from vanquished ships, and fast-
ened to the conqueror’s, as a signal of victory. We fre-
quently find them represented on the reverses of ancient me-
dals. An acrofotium is also seen in the famous sculpture of the
apotheosis of Homer. The acrofotium was an ornament
on the medals of maritime towns, such as Sidon and Arados,
and designed to express naval victories.

ACROTADUS, in Ancient Geography, an island of
the Perian gulf, mentioned by Plato; suppos’d by others to
be Athothades, or a desert island, mentioned by Nearchus,
according to Arrian, and called Calcandrus.

ACROLEUTIC, from ακροτηριον and τος, end, among
Ecclesiatical Writers, denotes the end of a verse or psalm; or
something added thereto to be sung by the people.

In which sense acroleutic amounts to the same with acro-
felic, hypofosma, duplasma, epote, &c.

The gloria patri is by some writers called the acroleutic
to the psalms; because always used to be repeated by the
people at the end of each.

Hence the word acroleutic is sometimes also used as fy-
nonymous with doxology.

ACROTERI, in Geography, a small town in the is-

ACRTERIA, or ACROTERS, formed of ακροτηριον,
in Architecture, small pedestals, usually without bases, ancient
placed at the middle, and the two extremities, of pef-
ments; and serving alto to support statues.

Those at the extremes ought to be half the height of the
tympanum; and that in the middle, according to Vitruv-
s, should be one eighth part more.

Acroteria, sometimes also signify figures, whether of
stone, or metal, placed as ornaments, or crownings, on the
tops of temples, or other buildings.

Sometimes they also denote those sharp pinnacles, or
spicier battlements, which stand in ranges about flat build-
ings, with rails and ballasters.

Acroteria, among ancient Pluteæans, were used to de-
ote the great extremities of the body, as the head, hands,
and feet.

Aristotle also uses acroteria, for the tips or extreme parts
of the fingers, covered by the nails; sometimes also for the
eminentes of the bones.

ACROTERIASM was anciently used for the ampu-
tation of any extremity.

ACROTHYMA, in Surgery, the name of a large tu-
mor in the flesh, rising in the shape of a wart, though some-
times depressed and flat, called thymus. Heifier. See NÆVUS.

ACROTYNI, in Ancient Geography, a town placed
by Stephanus Byzaunt. on the top of Mount Athos. See Ac-
THEON.

ACRYDIUM, in Entomology, a name given by Deeger
to the Gryllus brevicornis, and the G. serratus of the Lin-
nean system. The former, is found in South America;
and the latter, at the Cape of Good Hope.

ACSA, a measure of capacity in ule both in Asia and
Egypt. See Log.

ACSOR, in Geography, a town on the river Nile in
Egypt, famed for its carthen ware.

ACSTED,
ACT

ACSTED, a town in the Duche of Bremen, in Germany, 24 miles N. of Bremen.

ACS is the name of a small town of Asiatic Turkey, in Natalia, 5 leagues west of Hick.

ACT, Actus, in general, denotes an effective exercise, or application of some power or faculty. In this sense all hands opposed to power, potentis, which is only the capacity of acting, but not the exertion of that capacity.

Though the word act, properly and primarily, he only applicable where the power might exist without being drawn forth into act; yet the schoolmen extend it further; defining it by the presence of any power or perfection, even though it could not be absent. In which sense, God himself is said to be a most pure act; because his perfectedness is always and necessarily present. And thus, form is called an act: inasmuch as the presence hereof completes the power and perfection of matter.—Even existence is termed an act; because, when this is given to a being, nothing further is wanted. The Greeks sometimes call all deinitus, a term denoting an actual possession of perfection, by the Latins usually rendered perfitubia.

Act and power are distinguished by writers on Ontology three ways: viz., as actual being is distinguished from a power to be; actual doing or action, from a power to do; or actual suffering or passion, from a power to suffer. See Watts's Ontology in Works, vol. p. 617.

Metaphysicians give various divisions of act; viz., into infinite, as the act of creating; and finite, as the act of moving.

—Trent, or those exercised in other beings, as heating; and inmanent, which remain in their own subject, as thinking.

See Action.

Act, in Logic, is particularly underfund of an operation of the human mind. Thus to discern, examine, and judge, are acts of the understanding; to affirm and infuse, are acts of the will. There are voluntary and spontaneous acts; the former are produced by the operation of the soul, the latter without its privity or participation.

Act, in a legal sense, is an instrument, or other matter in writing; of use to declare, or justify the truth of a thing. In which sense, feets, records, decrees, fentences, reports, certificates, &c. are called acts, authentic acts, solemn acts, &c. See Deed.

Act, in the University, a thesis maintained in public by a candidate for a degree; or, to shew the capacity and proficiency of a student in the University.

The candidates for a degree of bachelor and master of arts are to hold philosophy acts; those for bachelor of divinity are to keep divinity acts, &c.

At Oxford, the time when the masters or doctors complete their degrees is also called the act; which is held with great solemnity; at Cambridge they call it the commencement.

All is also a collegiate appellation for the person who proposes questions that are the subject of disputition in the exercises of the university schools. The persons with whom he contends in these questions are called opponents; and the disputation is propofed under the direction of the moderator at Cambridge. The distinguished men of the year appear eight times in this manner in the schools; twice as acts, and six times as opponents. One act and three opportunities are kept before the summer; and one act and three opportunities in the term following the summer vacation.

Act of faith, Auto da fe, in the Romish church, is a solemn day held by the inquisition, for the punishment of heretics, and the abolution of the innocent accused.

They usually contrive the auto to fall on some great festi-
to high, that the top of the flame seldom reaches higher than the feat they sit on, so that they rather seem roasted than burnt. There cannot be a more lamentable spectacle; the sufferers continually crying out, while they are able, misericordia por amor de Dios: yet it is beheld by all sexes, and ages, with transports of joy and satisfaction: this joy is not the effect of natural cruelty, but of the spirit of their religion; for the deaths of other malefactors are tenderly commemorated and lamented. Geddes's Mfe. Tracts, tom. i. p. 442. Limb. Hist. Inq. lib. iv.

Act of Grace. See Grace.

Acts also denote the deliberations and resolutions of an assembly, senate, council, or convocation; taken down by clerks, notaries, actuates, or the like, and entered in a register. Acts are also matters of fact transmitted to posterity in certain authentic books, or memoirs, as the acts of the Apostles, of the Martyrs, &c. to this general class belong acts of parliament, which are called statutes; acts of the Royal Society called transactions; those of the late royal academy of sciences at Paris, called memoirs; those of the societies of Leipfic, &c. called simply acts, acta eruditorum, &c.

Acts of the Confabolary, acta consiliorii, the edicts and declarations of the council of state of the Roman emperors. The senate and soldiers often swore, either through abject flattery or by compulsion, upon the edicts of the emperor, as we do upon the Bible; and the name of Apidian Merlin was erased by Nero from the register of senators, because he refused to swear upon the edicts of Augustus.

Acts of Council, differed from canons, in that the latter contained only the results, or the laws and regulations agreed on, and drawn up in form; whereas the acts included the preceding debates, motions, &c.

In the first collections of councils, only the bare canons were delivered. Afterwards they began to give the acts as well as the canons.

Hence we have two kinds of synodical collections: one containing all the acts, or transactions, relating to matters of faith and doctrine; the other, containing only the canons relating to discipline, is called the book of canons.

Acts of the people, acta populi, among the Romans, were journals or registers of the daily occurrences, as assemblies, trials, executions, buildings, births, marriages, deaths, &c. of illustrious persons, and the like.

These were otherwise called acta publica, and acta diurna, or simply acta.

The acta only differed from annals, in that only the greater and more important matters were in the latter, and those of less note in the former. Tacitus Annal. xiii. 31.

Their origin is attributed to Julius Caesar, who first ordered the keeping and making public the acts of the people; some trace them higher, to Servius Tullius, who, to discover the number of persons born dead, and alive, ordered that the next of kin, upon a birth, should put a certain piece of money into the treasury of Funo Lucina; upon a death, into that of Venera Libitina; the like was also to be done upon assuming the toga virilis, &c. Under Marcus Antonius, this was carried farther; persons were obliged to notify the birth of their children, with their names and surnames, the day, confin, and whether legitimate or spurious, to the prefects of the erarium Saturni, to be entered in the public acts; though before this time the births of persons of quality appear to have been thus registered. Suetonius. Pith. Lex.

Acts, Public. The knowledge of public acts has been erected into a peculiar science, called the diplomatic, of great importance to an historian, statesman, chronologer, and even critic. The preservation of them was the first occasion of erecting libraries.

The style of acts is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineness, and even whether there be any certain rules at all? F. Germon will have the greater part of the acts of former ages to be spurious. Fontainis affirms, that the number of forged acts now extant is very small. It is certain there were severe punishments inflicted on the forgers and falsifiers of acts.

The chief of the English acts, or public records, are published by Rymer, under the title of Padrata, and continued by Sunderland: an extract whereof has been given in French by Rapin, and translated into English, under the title of Acta Regum. Great commendations have been given to this work, and some exceptions made to it: as that there are many spurious acts, as well as errors in it; some have even charged it with falsifications.

The public acts of France fell into the hands of the English after the battle of Poitiers, and are commonly said to have been carried by them out of the country. But the tradition is not supported by any sufficient testimony, and has even been shewn by M. Bruffel to be false.

Acts of the Senate, acta senatus, among the Romans, were minutes of what passed, and was debated in the senate-house.

There were also called commentarii, and by a Greek name ἐφηµερία. They had their origin in the confabulation of Julius Cæsar, who ordered them both to be kept and published; and there was an officer, who was himself a senator, whose province it was to compose these acts. The keeping them was continued under Augustus, but the publication was abrogated. Afterwards all writs, relating to the decrees or sentences of the judges, or what passed and was done before them, or by their authority, in any cause, were called by the name acta. In which sense we read of civil acts, criminal acts, interventive acts, acta civitatis, criminalis, interventiemi, &c.

Acts, Clerk of the, is an officer of the navy. See Clerk.

Acts of the Apostles, a canonical book of the New Testament, which contains great part of the lives of St. Peter and St. Paul, and of the history of the Christian church; commencing at the ascension of our Saviour, and continued down to St. Paul's arrival at Rome, after his appeal to Cæsar, comprehending in all about thirty years. St. Luke has been allowed by all antiquity to be the author of this book, and his principal design in writing it was to furnish an authentic history of the first plantation of Christianness; and it thus serves to obviate the false acts, and false histories, which were afterwards differeled through the world. The exact time of his writing it has been ascertained with a very considerable degree of accuracy; for it must have been at least two years after St. Paul's arrival at Rome, because it informs us that St. Paul dwellt two whole years in his own hired house; perhaps he wrote it while he remained with St. Paul, during the time of his imprisonment.

It was written, according to Mill, in his Prolegomena, in the year 64. And Dr. Lardner (works, vol. vi. p. 145.) observes, that it could not have been written till after St. Paul's confinement at Rome was come to a period, which he supposes to have ended in the former part of the year of Chrill 63; and he thinks it probable, that St. Luke finished this book the same, or the next year, either at Rome or in Greece. That St. Luke was the author of it appears from the general consent of the ancient Christian writers:
ACT

agrees 3. the The St. and the prophecies the alfo the 14, could this was aicertaining faced. That hillory later grofs under certain alfo He ufc. not infcribed not for e. logues about the the portance St. or putcd. part nclefs ihe Chrilliaiiity, might St. and the Septuaigint truth hisferies, and the doctrine, and the latter has been recorded from the Old Testament.

The truth and divine original of Christianity may be deduced from the history of the Acts of the apostles. The general and particular doctrines contained in this book are to be considered, and the evidence which the apostles gave of their doctrine, in their appeals to prophecies and miracles, and the various gifts of the Spirit, were so numerous and so strong, and so generally accepted by all persons, that the truth of the religion, which they taught, cannot be reasonably disputed. The history itself is credible. It was written by a person who was acquainted with the various circumstances which he relates, and who was both able and inclined to give a faithful relation of every particular that occurred. St. Luke was a companion of the apostles; he was himself an eye and ear witness of the facts, and personally concerned in many of the incidents which he records. In the history itself there are no inconsistencies or contradictions. The miraculous facts related in it are neither impossible, when we consider the divine power, to which they are ascribed, nor improbable, if we attend to the grand design and occasion of them. The writer appears to have been honest and impartial; for he has recorded the objections made to Christianity, both by Jews and Heathens, and the reflections which enemies cast upon the religion itself and the first preachers of it. He has not concealed the weaknesses, faults, and prejudices either of the apostles or of their converts. The occasional hints that are dispersed through the epistles of St. Paul, harmonize with the facts recited in the history; insomuch that the history is the best guide to the study of the epistles. The other parts of the New Testament agree with the history, and confirm it. The Gospels close with references to the facts recorded in the Acts; and the epistles suppose that these facts had actually occurred which the history relates. The incidental circumstances mentioned by St. Luke correspond so exactly, and without any previous view to such a correspondence, and in cases where it could not possibly have been premeditated and precontrived, with the accounts that occur in the epistles, and with those of the best ancient historians, both Jews and Heathens; that no person who had forged such an history, in later ages, could have had the same external confirmation; but must have betrayed himself, by alluding to some customs or opinions since sprung up; or by misrepresenting some circumstances, or using some phrase or expression, not found in use. The plea of forgery, therefore, in later ages, cannot be allowed: and if St. Luke had published such a history at so early a period, when some of the apostles, or many other persons concerned in the transactions which he has recorded, were alive, and his account had not been true, he would only have exposed himself to an easy confutation, and to certain infamy. If any history of former times deserves credit, the Acts of the Apostles ought to be received and credited. And if the history of the Acts of the Apostles be true, Christianity cannot be false. For a doctrine so good in itself, and attended with so many miraculous and divine testimonies, has all the possible marks of a true revelation. See Benfon, ubi supra, p. 310—318; and an excellent work, distinguished by acute and original reasoning, and amplifying the argument above suggested, by Archdeacon Paley, entitled Horae Paulinianae, 8to. 1790.

There are also several spurious acts of the Apostles: such as, 1. The acts of Abdias, or the History of the Twelve Apostles, said to be composed by him in Hebrew, translated into Greek by his disciple Eutropius, and thence into Latin by Julius Africanus. 2. The acts of St. Andrew, received by the Ebionites, Manichees, Apollonies, and Orientalists. 3. The acts, received by the Ebionites, and mentioned by Epiphanius as a gross forgery. 4. The acts of St. John, forged by Lucius. 5. The acts of the Apostle, under the names of Lucius, Lenticus, Leonidas, and Lentichus, names of the same person who lived in the fourth century, and who was a Manichee, and probably the father of those heretics, called by St. Austin, Seleucians from the name Seleucia, which Mr. Jones thinks to be the same with Lucius. This book contained the acts of John, Andrew, Thomas, and others. 6. The acts of St. Matthias were probably written by Lucius Charinus under this apostle's name, to which ends we may refer the acts used by the Manichees. 7. The acts of Paul, which Mill in his Prolegomena, sect. 130, supposes to have been compiled by some faithful Christians, about the year of Christ 69, to supply the imperfect accounts in the acts of the apostles, written by St. Luke, and which Whiston regards as in some sense a sacred book; but which Eusebius reckons to be spurious, and Philastrius condemns as a sily book, abounding with strange stories. 8. The acts of Paul and Thecla, which was the work of some weak presbyter of Asia, and never had any authority in the Christian church. It is not certain when these acts were composed;
The acts of St. Peter, the travels of Peter, or the recognition of Clemens, which are rejected by Eusebius, Athenhnius, Jerome, Epiphanius, &c. as apocryphal. 10. The acts of St. Philip, which were probably the work of Lucius Charinus, or an appendage to his work. Fabricius (Codex Apoc., Nov. Test. tom. ii. 565.) mentions a MS. of some acts under the name of Philip, in the Vatican. 11. The acts of Seclusus, the name with those of Lucius, already mentioned. 12. The acts of Thomas, mentioned by Epiphanius, Athenhnius, and Gelasius, are supposed by Fabricius, Mill, and others to be the same with the acts of Lucius; but Mr. Jones supposes, that as it was used by some sects of the Gnostics, who sprang up at an earlier period, it was interpolated and altered by Lucius. But the work is unquestionably apocryphal. See on this subject Jones’s Canon, vol. i. paffim; and Lardner’s Works.—Index under Acts.

Acts of Pilate, denote certain memoirs or reports concerning the trial and death, the resurrection and ascension of Jesus Christ, which were transmitted by Pilate to the emperor Tiberias, and communicated by him to the senate, Justin Martyr, in his Apology (Num. 386. p. 65. and Num. 48. p. 72. Benced.) prevented to Antoninus Pius, and the senate of Rome, about the year 150, after having mentioned on one occasion some of our Lord’s miracles, and on another his crucifixion, and some of the attendant circumstances, adds: “and that these things were so done, you may know from the acts made in the time of Pontius Pilate.” Tertullian adds, in his Apology, (c. 21. p. 22.) about the year 200, having spoken of our Saviour’s crucifixion and resurrection, his appearance to the disciples, and his ascension to heaven in their sight, subjoins this remark: “of all these things relating to Christ, Pilate, in his confidence a Christian, sent an account to Tiberias, then emperor.” In another place he says, that by an ancient decree, no person should be acknowledged as a deity, unless he were first approved by the senate. Tiberias having received from Pella the account of such things as manifested our Saviour’s divinity, proposed to the senate, recommending the proposal by his own vote, that he should be placed among the gods. The senate refused, because he had himself declined that honour. Nevertheless the emperor perfided in his own opinion, and ordered that if any accused the Christians they should be punished. Eusebius, in his Ecclesiastical History, (lib. ii. cap. 2.) relates the fact, and cites the authority of Tertullian. Many learned men have objected to the original testimonies of Justin Martyr and Tertullian. Dr. Lardner has investigated the subject with his usual accuracy and impartiality. He first alleges that Justin Martyr and Tertullian were writers of good repute. He then shows that it was the custom of the governors of provinces to compose acts, memoirs, and commentaries of the remarkable occurrences that happened in the places where they presided; and these acts or registles were considered as public authorities, and therefore more decisive and satisfactory than some other accounts. Of this circumstance the ancient fathers were well apprised; and Eusebius admits the truth of what they report. In the time of the persecuting emperor Maximin, about A. D. 307, the heathen people forgod acts of Pilate, derogatory to the honour of our Saviour, which were very diligently circulated; to unsettle Christian, or discourage them in the profession of their faith. The edict to this purpose was so negligently or ignorantly written, that our Saviour’s death was referred by it to the fourth consulate of Tiberius, i.e. to the seventh of his empire, which is eleven years before our Saviour’s passion, and five before Pilate was made governor of Judea. See Euseb. H. E. L. i. c. 9. i. xix. c. 4. 56. Ruffinius, lib. i. c. 5. &c. It was also customary for governors of provinces to send to the emperor an account of remarkable transactions that occurred in the places where they presided. We may therefore conclude, though the acts of Pontius Pilate and his letter to Tiberius, which we now have (see Fabric. Cod. Apoc. Nov. Test. p. 592. 972.) are manifestly spurious, that Pontius Pilate did compose some memoirs concerning our Saviour and send them to the emperor, whether Justin Martyr and Tertullian have given a just account of them or not. Dr. Lardner, after replying to other objections that have been urged against the relation of these ancient fathers, concludes with observing that they deserve some regard. See Lardner’s Works, vol. vii. e. 2. p. 231. &c.

Acts, in Poetry, are certain divisions, or principal parts, in a dramatic poem, contrived to give tone and repulse both to the actors and spectators. In the interval between the acts the stage remains empty, and without any action visible to the spectators; though it is supposed all the while that there is one proceeding out of sight. It is not, however, merely for the sake of the repulse that these acts are observed, but to give transactions a greater degree of probability, and render the intrigue more affecting. For the spectator, who sees the action prepared that is to pass in the interval, cannot forbear acting; in his imagination, the part of the absent actors; by which means he is the more agreeably surprised, when a new act coming upon the stage, he sees the effects of that action, which before he could only guess at. To this it may be added, that authors contrive to have the most dry and difficult part of the drama transacted between the acts, that the spectators may have no notion of them, excepting what their fancy presents them with at a distance; and that nothing may appear upon the stage but what is natural, probable, and entertaining. In this respect, says an approved writer, a dramatic or epic poem ought to resemble a sentence or period in language divided into members, that are distinguished from each other by proper pause; or it ought to resemble a piece of music, having a full close at the end, preceded by imperfect closes that contribute to the melody. See Elkou, of Criticism, c. 22.

The ancient Greek poets were unacquainted with this division of a play into acts, though their episodes, or choruses, served almost the same purpose. The word act never occurs in Ariosto’s Poetics, though he defines exactly what it is, as a part of the Drama. It is true the Greeks considered their pieces as consisting of certain parts or divisions, which they called προφακς, επιθές, καταλήψις, and κολλαθής; but there were no real interruptions or divisions answering to them in the representation. With them the stage was never empty, nor were the performers idle; so that when the choruses were incorporated in the piece, as in some of the tragedies of Sophocles, it may be said strictly to consist of only one act.

The Romans first introduced acts into the drama, and filled up the intermediate space of time between these divisions with a chorus, a dance, or a song; and in Horace’s time, the five acts were established as a law. This appears from the following verses in his De Arte Poet.

"Nec
This number was constant in the comedies of Terence, and tragedies of Seneca; and the law quoted unceasingly to this day; though it seems to derive its force from the authority of Horace, rather than that of reason or nature. All plays are deemed irregular, that have either more or fewer than five acts. Some, indeed, have asserted, that every just action consists of five distinct parts; and have undertaken to mark out the precise share of the action, which each of the five acts ought to bear. The first, they say, is to propose the matter or argument of the fable, and to shew the principal characters. This should be so managed as to awaken the curiosity of the spectators, and also furnish them with materials for understanding the sequel. It should make them acquainted with the personages who are to appear, with their several views and interests, and with the situation of affairs at the commencement of the play. In former times, the exposition of the subject was made by a prologue, or by a single actor, who attempted to give full and direct information to the spectators. Some of these last's, and Euripides's plays are opened in this inartificial manner, which is now totally abolished. The second act is to bring the affair or business upon the carpet. The third, to furnish obstacles and difficulties. The fourth, either points out a remedy for these difficulties, or finds new ones in the attempt. During these acts, the plot should gradually thicken; the action of the play ought to be advancing, and, as it advances, the suspense and concern of the spectator should be raised more and more. It is the great excellence of Shakespeare, that his scenes are full of sentiment and action; and not of mere discourse; whereas it is frequently a fault of the best French tragedians, that they allow the action to languish for the sake of a long and artful dialogue. The fifth act puts an end to all by a discovery. This is the feat of the catastrophe, or the unravelling of the plot, in which the art and genius of the poet should be most fully displayed. See Catastrophe. However, it is certain that, on the principles of the great master of the drama, Aristotle, we may have a just and regular play, though it be only divided into three acts; and the number may be varied according to the taste of the author, or the nature of the subject; since the division is purely arbitrary. Nevertheless, every act ought to close with some incident that makes a pause in the action; without which there can be no pretext for interrupting the representation. Milton has deviated from this rule at the close of the first, seventh, and eleventh books of his Paradise Lost: in the first of which influences he seems to have copied the Iliad; the second, the Iliad, books of which are divided in a similar manner. Homer, in the Iliad, has paid no great attention to this rule. The acts of a drama are divided into scenes. Metastasio, in conformity to the precept of Aristotle, with regard to the construction of a fable (see Act and Tragedy) divided his melodramas, or operas, into three acts; in order to constitute the beginning, middle, and end, which the flagrant required. But at present this wise and rational design is violated at our lyric theatre; by compounding all the incidents of a drama, written in three acts, into two; by which means the bufinefs of the piece is so precipitated or mangled, that the events lose all appearance of probability, and the spectator all chance of illusion. On this occasion, however, the trouble and expense of a third dance are spurn out to such a length as to prejudice all desire in the most dissipated part of the public to be kept longer from home.

ACTA, in Ancient Geography, a town of Acrania, mentioned by Stephan. Byzant. and called a port in the Periplus of Scithyx. ACTa is also a town of Magna Graecia.

ACTAEON, in Antiquity, one of the fifty Nereids.

ACTAEA, or ACTERIEUS, was also one of the nine curious and malicious genii, called by the Greeks Telchines.

ACTAEON, in Botany, the Christophorion of Townefoot, and in the Linnean system, a genus of the polycarpar renogynia class and order, belonging to the natural order of multigynia and renunculace of Juliff. Its characters are, that the calyx is a perianthium of four leaves, with roundish, obtuse, concave, and caduceous leaves; the corolla has four petals, acuminate at both ends, longer than the calyx and caduceous; the stamens consist of numerous, usually about thirty, capillary filaments, broader at the top; the anthers are roundish, twin and erect; the pistillum has a superior ovate germen, no style, and a thickish, obliquely depressed stigma; the pericarpium is an oval-globe, smooth, one-furrowed and one-celled berry, and the seeds are many, semi-ornicibrac and lying over each other in two rows. There are four species: 1. A. ficaria, or common herb christophel, which grows naturally in the northern counties of England, and rises two feet and an half in height, with the foot-flakes of the leaves springing from the root, and dividing into three smaller foot-flakes, each of which divides again into three, with three lobes each; the flowers grow in ramose spikes, and are of a pure white: they appear in May and June, and are succeeded by black shining berries, about the size of peas, which ripen in autumn. This plant is a powerful repellant; and the root has been administered internally in some nervous cases; but should be used with caution. Datur, says Pliny, (H. N. v. ii. p. 253. Ed. Hard.) acetaba plao interrioribus feminarum morbis. The berries are poisonous, and to the indirect use of them some have referred the explanation of the fable of Actaeon, and to this they have also applied the Latin adage;

—Hee negar sol, hunc tu Romane caveto.

Hor. Sermon. I. i. sat. 4. v. 85.

The juice of these berries, with alum, yields a black dye. Toads are said to revolt to this plant, being allured by its fettid smell, which, as Dr. Withering observes, may be owing to the damp, shady situation in which it is found. This herb is poisonous to cattle, but it is happily scarce in England, and found only in the woods. Of this species there are three varieties, viz. the nigra, or common black-barried herb christopher, or horseberry; the alba or American herb christopher, with white berries, whose leaves are held deeply indented at the edges, flowers in a more compact spike, and roots composed of thick knobs; and the rubra, with red berries, differing only in the colour of its fruit. 2. A. racemosa, or American black or wild snakeroot, with large compound leaves, rising immediately from the root, and branched like the first, flower-rams ascending to the height of four or five feet, and white flowers in a long spike, reflex at the top, which appear in June or July, but not perfecuting feeds in England. It deferves, on account of its flowers, a place in shady borders among shrubs, and will require no other attention.
tention than the thrubs themselves. This species is a native of North America; and the root is much used in that country, and said to be an antidote to poison, or the bite of the rattlesnake. 3. A. japonica, or Japanese herb christopher, differs from the second in having simple, not pinnate leaves; it has heart-shaped leaflets, petioles longer than the leaflets, and sessile flowers. 4. A. effusa, or rough-leaved herb christopher, has a thorny climbing item, subulate leaves, white flowers, and linear spikes, quadrifid corolla and calyx, more than fifty flaminia, and a gibbon bone, without juice. This species is a native of China near Canton, and the Chinese use the rough leaves in polishing, particularly their tin ware. These plants may be propagated by seeds, sown on a sandy border soon after they are ripe, and transplanted in the following autumn into a sandy border, where they are to be left to flower. Martyn's Miller's Dict. in the Linnaean System, by Gmelin, there are five species.

ACTAE, in Entomology, is a species of Papilio, with expanded wings, brown above, the anterior marked with two ocelli and two white points, and the hinder marbled beneath. It is found in the southern part of Russia.

ACTAEA Cinetifluga. See Chicifluga.

ACTAEA, in Ancient Geography, a name formerly given to Attica. Pliny (i. 4. 7.) says it was also called Acte. Paulus. Attic. cap. xi.

ACTAEON, in Fabulous History, the son of Arilus and Autonice, and grandson of Cadmus. While he was pursuing his favourite exercise of hunting, he is said to have looked on Diana, when she was bathing, to have been transformed by her into a stag, and devoured by his own dogs. The moral of the fable is applied to those who ruin themselves by keeping packs of dogs, or too curious researches into nature.

ACTAEON is also the name of one of the horses that drew the chariot of the sun, in the fall of Phaeton. Acteon formed of actu, a ray of the sun, signifies luminous, and takes its name from the splendour of the sun.

ACTAEON, in Natural History, a species of Scarabeus, or beetle, called by Swammerdam Rhinaeoceris; the Emma of Muregaves, with a smooth body, bicorne thorax, the horn of the head unidentate, with a bifid apex, and smooth elytra, the horns of the thorax are turned forward, and are conic. It is found in America, and is the largest of all insects, except the cancer and monocolus.

ACTAEON is also a species of Papilio, with triscutated black wings, black at the apex, and gold-coloured beneath, with very small black spots.

ACTANIA, in Ancient Geography, an island mentioned by Pliny (H. N. tom. i. p. 231.) in the North Sea. It is situated to the west of Holstein and Denmark, not far from the mouth of the Elbe and Elbe; and is now called Heligoland.

ACTE, δηνα, denoted a peninsula. It was also a name given to the fen coasts about Mount Athos, in which were fixed townsmen mentioned by Thucydides, lib. iv. p. 302. Ed. Duker.

ACTE, in Botany, the elder tree.

ACTIAE Games, Ludi Actiae, in Antiquity, solemn games instituted, or, according to some, only restored by Augustus in memory of his victory over Mark Antony at Actium. Stephanus (tom. i. p. 56.) and some others maintain, that they were held every third year; but the more common opinion is that of Strabo, who says (Geog. tom. i. p. 501.) that they only returned every fifth year, and were celebrated in honour of Apollo, since termed Actia. By the way it is a great mistake in some authors to imagine, that Virgil intimates their having been instituted by Aeneas, from that passage, Æn. iii. 280.

"Aediasque Ilias celebratus litora ludis."
with small papilliform oblong tentacula; found adhering to flones on
the shores of the Red Sea. 15. A. viridis, green and brown, with tentacula of the length of its own
diameter; found attached to subaqueous flones at Alexandria
in Egypt, and called by the Arabs karofa. 16. A
priapus, with a cylindric body, dilated at the base, and
spotted tentacula; found adhering to tellacese fish in the
Red Sea, near the city Ghomfeda. 17. A. candida,
smooth with a wrinkled foramen, and flexuous briskly tenta-
cula; ranged on the upper margin. 18. A. bisornis, smooth,
of an hemispheric oval figure. 19. A. superus, with a cylind-
ric body plane above, and six appendices to the orifice;
found, as well as the two former species, in the Northern
Ocean. 20. A. Caryophyllus, red and brown, with small
penceliform tentacula; found in the British Sea. 21. A
iris, with body and tentacula obtuse and cylindric, the ex-
terior red, the interior bluish, and the centre red. 22. A.
Picella, with longitudinal ridges transferably fringed, and
cylindric obtuse annulated tentacula; found, as well as the
former species, in the Norwegian Sea. 23. A. pusilla,
elliptic and smooth, with a double order of rays, the exter-
ior of which are black at the apex, about the size of a large
pea; found in the ocean about the 57th degree of lati-
tude.

The actinia fulcata of Pennant, and cerea of Solander and
Ellis, which some suppose to be a variety of the A. unduta,
is the HYDRA cerea in the Linnean system by Gmelin.
Pennant describes it as having a body marked with trifur-
cated sulci, and summit surrounded with long slender
tentacula, from 120 to 120 in number; the colour of
the body is pale chefsnut, and of the tentacula a sea-green varied with purple; it is found on the rocks
of the Cornish and Anglesea coasts. The A. peduncu-
lata of Pennant, or A. bellis of Solander and Ellis, is the
HYDRA bellis of the Linnean system. According to the
description of Pennant, it has a long cylindric stalk, ex-
 panding at top and tuberculated: the tentacula are disposed
in several ranges, short, and when open form a radiated an-
gular circumference, like a beautiful flower, with a smooth
diagonal pinc' of which the stalk is a red and
that of the tentacula varied with several colours. This
species, he says, is retractile, and inhabits Cornwall. The
A. verrucosa of this author, or A. gemmatea of Solander
and Ellis, is the HYDRA gemmatea of Gmelin's Linnean
system. According to Pennant, it has a long cylindric stalk, and is
marked with elegant small tubercules, disposed in straight lines
from top to bottom; the circumference of the mouth is
frilled, surrounded with short petals, like those of the fun-
flower, and those again with white tentacula, barred with
brown. When drawn in, it assumes the form of a bell; and
the lines of the tubercules converge to the centre of the
summit. Its body is a pale red; it inhabits Cornwall. The
A. pentapetalis, or cinquefoil of Pennant, is the A. diunbuts
of Ellis, with a circular contracted mouth; the disc divided
into five lobes, covered with several series of short fruting
tentacula, the flalk short and thick; when contracted it
assumes the form of a long white fig; it inhabits the rocks
near Haltings, Suffolk. The A. hemispherica, or button of
Pennant, is the A. melymbryonantium of Solander and Ellis,
and the HYDRA melymbryonantium of the Linnean system.
It has a smooth short thick flalk; the edge of the disc
surrounded with a single row of tubercules, the tentacula
numerous and slender; the colour a dull crimson; the body
retractile, and flinging itself into the form of a conoid bot-
ton. It inhabits most of our rocky shores. Pennant's
Zoology, vol. iv. p. 49. &c. The actinia have only one
aperture both for the mouth and anus; they feed on shell
and other small fish and marine animales, and are them-

ACTINOLITE, in Mineralogy. See STHRAUSENT.

ACTION, in a general sense, denotes the operation or
action of an act of power, and is synonymous with ACT.

Grammarians, however, introduce some subtle distinctions
between these two terms: restricting the former to ordinary
manifestation; and the latter to those which are more signal.
The former, say others, relates chiefly to the person that
acts, and the latter to the effects produced; and is therefore
considered as the attribute of the other: e.g. "Preter
preference of mind in all your actions; and take care that
they are all acts of equity." Some schools, in an attempt to
express the nature of action by a manifestation of the power
or energy of a substance, made either within or without it.

Accordingly it is controverted among them, whether or
not action, thus taken, be a thing distinct both from the
agent, and the term or effect. The modal stand for the
affirmative, and the nominal for the negative. These
latter observe, that the action may be considered two ways,
actively and connotatively. In the former sense it is what
we call a cause, or what may act; and in the latter, it is
the fame cause, only considered as acting, or connoting the
effect it produces.

Actions are divided with respect to their principle, into
UNIVOCAL, where the effect is of the fame kind with the
cause; as the production of man by man; and EQUIVOCAL,
where it is different, as the suppos'd production of frogs by
the fun,—and again into INVENOMENT; as nutrition,
respiration, the action of the heart, &c., and NOT-VITAL,
as heating.

With respect to their subject, actions are divided into
INVENTARIOUS, where which are received within the agent that pro-
duced them; as are vital actions, cogitation, &c. and TRAN-
SMISSION, which passes into another, as a father loves his son,
and feeds and clothes him, &c. Actions are also natural, as
fire hardens clay; supernatural, as raising the dead; volun-
tary, as the potter's moulding his clay; and accidental, as a
person's heedlessly dropping a glass and breaking it; neces-
sary, as the fun warms the earth; and free, when a person
chooses what food he likes, and eats it when he pleases.

See LIBERTY and NECESSITY.

In respect of duration, actions are again divided into
INVENTARIOUS, where the whole effect is produced in
the same moment, as the creation of light; and SUCCESSIVE,
where the effect is produced by degrees; as corruption,
fermentation, purfication, diffutation, &c.

ACTION, in Physiology, is applied to the actions or func-
tions of the body, which are divided into the vital, natural,
and animal. The vital are such as are essential to the sub-
histence of the individual; such are the motions of the heart
and lungs, the secretion of spirits in the cerebellum, on
which the motions of the heart and lungs depend; and the
circulation of the blood and fluids in their proper vesels.
Pulsiation and respiration are the external signs of life.

The natural actions are such as are necessary to the con-
tinuance of the animal, but not so immediately, but that it
may subsist some time under a supposition of them; as the
digestion of the aliment, and its conversion into blood.

Under animal actions are comprehended those which
constitute the senses of touch, taste, smell, vision, hearing,
perception, imagination, memory, judgment, ratiocination,
affections of the mind, and voluntary motion; which are not absolutely necessary to the life of the animal, but conducive to its comfortable existence.

In the year 1752, Dr. White published an ingenious performance, under the title of an Essay on the vital and other voluntary Motions of Animals, 8vo.; and in the same year Dr. Simpson also published a book on Vital and Animal Actions, 8vo.

Action, in Mechanics, denotes either the effort which one body or power exerts against another, or the effect resulting from such effort: or more accurately, the motion which a body really produces, or tends to produce, in another. The action of a body becomes apparent only by its motion; and we cannot affix any precise idea to the term action than that of actual motion, or a simple tendency to motion. Leibnitz and his disciples, for want of duly attending to the proper and discriminating idea of the word action, have perplexed themselves and others with unprofitable and indecisive disputes concerning vis viva, and vit mortua. See Force.

The Cartesians resolve all physical action into metaphysical. According to them, bodies do not act upon one another; but the action proceeds immediately from the Deity: the motions of bodies, which seem to be the cause, being only the occasions of it. See Occasional Cause. Action is either instantaneous or continued; that is, either by percussion, or by pressure. These two sorts of action are heterogeneous quantities, and are not capable of mutual comparison any more than a line can be compared with a surface, or a surface with a solid. The least degree of percussion may be made to overcome the pressure of the greatest weight. These actions, therefore, cannot be measured one by the other; but each of them must have a measure of its own kind, as solids are measured by solids, and surfaces by surfaces; because time is concerned in the one, but not in the other.

It is one of the laws of nature, that action and reaction, are always equal, and contrary to each other.

If a body be urged by equal and contrary actions, it will remain at rest. But if one of these actions be greater than its opposite, motion will ensue towards the parts least urged.

It is to be observed, that the actions of bodies on each other, in a space that is carried uniformly forward, are the same as if the space were at rest; and any powers or forces that act upon all bodies, so as to produce equal velocities in them in the same, or in parallel right lines, have no effect on the mutual actions, or relative motions. Thus the motions of bodies on board a ship, that is carried steadily and uniformly forward, are performed in the same manner as if the ship were at rest. The motion of the earth round its axis has no effect on the actions of bodies and agents at its surface, except so far as it is not uniform and rectilinear. In general, the actions of bodies upon each other depend not upon their absolute, but relative motion.

For the actions of powers, see Friction, Force, Mechanics, Motion, Power, and Resistance. For the laws of the action of fluids, see Fluid, and Specific Gravity.

Action, quantity of, in Mechanics, on expression used by M. de Maupertuis, in the Mem. of the Acad. of Sciences of Paris for 1744, and in those of Berlin, for 1746, to denote the continual product of the mass of a body, by the space through which it runs, and by its velocity. He lays it down as a general principle, that, whenever any changes happen in nature, the quantity of action necessary to produce this change is always the least possible. And this, he says, is a law indicating the highest wisdom. This principle he applies to the investigation of the laws of refraction, the laws of the collision of hard and elastic bodies, and even the laws of rest, as he calls them, that is of the equilibrium or equipollency of pressures; and, thus investigating the laws of motion, referring these and the laws of equilibrium to the same principle, and connecting the metaphorical consideration of final causes with the fundamental doctrines of mechanics, he deduces what he conceives to be a stronger proof of the existence of a Deity, or of a first intelligent cause, than the other arguments commonly adduced, and derived from the order of nature.

It may be observed, however, that the quantity of action, according to the definition of M. de Maupertuis, is in reality the same with the product of the mass into the square of the velocity, when the space passed over is equal to that by which the velocity is measured; and therefore the force or quantity of motion will be proportional to the mass multiplied by the square of the velocity; since the space is measured by the velocity continued for a certain time.

In the same year that Maupertuis communicated his principle, Professor Euler also demonstrated, in the supplement to a treatise intitled Methodus inveniendi Linias curvac maximi vel minimi proprietate guidentes; that in the trajectories described by bodies urged by central forces, the velocity multiplied by what the foreign mathematicians call the element of the curve, is always a minimum; which Maupertuis considered as an application of his principle to the motion of the planets. For the manner in which this principle of a minimum may be deduced from the Newtonian theory of refraction; see Refraction.

Action, in Ethics, or moral Action, is a voluntary motion of a creature capable of distinguishing good and evil; whose effect, therefore, may be justly imputed to the agent.

A moral action may be more fully defined to be whatever a man, considered as endued with the powers of understanding and willing, with respect to the end he ought to aim at, and the rule he is to regard in acting, resolves, thinks, does, or even omits to do; in such a manner as to become accountable for what is thus done or omitted, and the consequences thereof.

In the strict philosophical sense, says Dr. Reid (Essays on the Active Powers of Man, p. 97) nothing can be called the action of a man, but what he previously conceived, and willed or determined to do. In morals the word is commonly employed in this sense, nor is any thing imputed to a man as his doing, in which his will was not interposed.

The foundation, then, of the morality of actions is, that they are done knowingly and voluntarily; and all moral actions may be divided, with respect to the rule, into good and evil.

But when moral imputation is not concerned, many things are called the actions of a man, which he previously neither conceived nor willed. Hence the actions of men have been distinguished into three classes, the voluntary, the involuntary, and the mixed. By the last are meant such actions as are under the command of the will, but are commonly performed without any interposition of the will. See Active Power, Motive, Principles of Action, and Virtue.

Action, in Oratory, is an accommodation of the person of the orator to his subject; or, a management of the countenance, voice, and gesture, suited to the matter spoken or delivered.

Action makes one of the greatest branches or divisions of rhetoric. The ancients usually call it Pronunciation.
Action is a collateral or secondary method of expressing our ideas; and is susceptible of a kind of eloquence as well as the primary. In the infancy of language, when words were few, or not easily connected, men would naturally recur to action for explaining and expressing their conceptions; and they would labour to make themselves understood, by varying their tones of voice, and accompanying their tones with the most significant gestures. At this day, when persons speak in a language which they possess imperfectly, they have recourse to all these supplemental methods, in order to render themselves more intelligible. Hence, in the gradual improvement and extension of language, a warm imagination would introduce into discourse a variety of tones, and a considerable degree of action. Thus Dr. Warburton accounts for so much speaking by action, as we find among the Old Testament prophets. Among the northern American tribes certain motions and actions are adopted in order to explain their meaning on all great occasions of intercourse with one another. The Chinese find it more easy to express different ideas by a variety of tones than to contrive words for all their ideas. The Greek and Roman languages also were pronounced with more numerous inflections of voice, and more animated gestures than any to which we are accustomed. Accordingly we find, that action was treated of by all the ancient critics, as the chief quality in every public speaker; and the orators and players of Greece and Rome were dilligently by the reverence of their action. This is, in all cases, an address to the external senses; which it endeavours to move, and bring into its party by well-concerted motion and modulation; at the same time that the reason and understanding are attacked by force of argument. Accordingly, Tully very pertinently calls it \textit{firmo corpori, the discourse of the body}; and \textit{corporis eloquentia, the eloquence of the body.} The Roman mimes and pantomimes, we read, had such a compass even of mute action, that voice and language seemed ufell to them; they could make themselves understood to people of all nations; and Roscius, the comedian, is particularly famed, as being able to express any sentence by his gestures, as significantly and variously as Cicero with all his oratory. Quinctilian gives us a system of the rules of action; taken not only from the writings of the ancient orators, but from the best examples of the forum.

What we usually attribute to eloquence, was really the effect of the action only, as some of the greatest masters in that way have frankly acknowledged. — Demosthenes expressly calls it, 'the beginning, the middle, and the end of the orator's office'; and Cicero proffesses, that it is not of so much importance what the orator says, how he says it.

The Greeks, who were attentive to multiply the means of influencing the passions, omitted nothing which might bring to perfection this first language of Nature. Poetry and music were always supported by the action of the performers. This action, which was acquired by a kind of dance that regulated the motions and different inflections of the body, animated the discourses of their orators, and sometimes the lesons of their philosofers. See Plut. in Deoroth. tom. i. p. 851. Ed. Xyland. Id. in x. Rhet. Vit. tom. ii. p. 845. Plato de leg. i. vii. tom. ii. p. 816. Ed. Serrani. Athen. Deipn. l. i. c. 17. p. 21. Ed. Califub.

After all, it is a point that will bear being controverted, whether action ought to be practiced and encouraged at all? A thing that has so much command over mankind, it is certain, must be very dangerous; since it is capable of being turned to our disadvantage as well as to our advantage. It is putting a weapon in the hands of another, which, if he pleases, he may make use of to subdue and enslave us: and accordingly, history is full of the pernicious uses made of it.

For this reason, eloquence and action have been usually discouraged by modern policy; and both the bar and the pulpit have been brought to a more frigid way of delivery.

But this is an extreme, which no objection founded on the abuse of eloquence accompanied with action, and no apprehension of its pernicious effects, can justify. The benefit accruing from it simply counterbalance the mischief which it is capable of producing.

Perhaps the foundation of all action may be vicious and immoral. — Voice and gesture, we know, will affect brutes; not as they have reason; but as they have passions; so far as these are used in a discourse, therefore, it does not regard an assembly of men more than it would a herd of quadrupeds: that is, their whole effort is spent, not on the rational faculties, which are out of the question, but on the animal ones, which alone they endeavour to poffess and actuate, independently of reason. — Nay more, our reason, and the judgment itself, are intended to be baffled and inclined by them; action being only used as an indirect way of coming at the reason, where a direct and immediate one was wanting; i.e. where the judgment cannot be taken by the proper means, argument, it is to be taken indirectly by circumvention and flattery.

The natural order of things, then, is here inverted; our reason, which should go before and direct our passions, is dragged after them; instead of coolly considering, and taking cognizance of things; and according to what we perceive therein, ruling ourselves to the passions of grief, indigitation, or the like, we are attacked the other way; the impression is to be carried backwards, by virtue of the natural connection there is between the reason and the passions; and thus the helm, the principle of our actions, is taken out of our own hand and given to another. See Passion.

The cafe is much the fame here as in enation and imagination: the natural and regular way of arriving at the knowledge of objects is by sense; an impression begun there is transmitted to the imagination, where the image is produced, similar to that which first struck on the organ. — But the proceeds is sometimes inverted: in hypochondriac, lunatic, and other delirious cafes, the image is first excited in the imagination; and the impression thereof communicated back to the organs of sense: by which means objects are seen which have no existence.

Upon the whole, action does not tend to give the mind any information about the subject that is discussed; nor is it designed to convey any arguments or ideas which the simple use of language would not convey. But is it not that upon which we should form our judgments? And can any thing help us to form a just judgment, beside that which in some way or other enlightens and convinces our understanding? When Cicero made Cæsar tremble, turn pale, and let fall his papers, he did not apprise him of any new guilt which Cæsar did not know of; the effect had no dependence on Cæsar's understanding; nor was it anything more than might have been produced by the unmeaning sounds of a musical instrument duly applied. However, action may be useful in awakening and fixing the attention, provided that it be accompanied with suitable argument and address. As there is no nation, nor hardly any person, so phlegmatic and destitute of feeling, as not to accompany their words with some actions and gestures, whenever they are much in earnest, it would be unnatural in a public speaker, and inconsistent with that calmness and solemnity which he ought to manifest in all affairs of moment, to remain...
main quite unmoved in his outward appearance: and to let
the words drop from his mouth without any expression
of meaning, or warmth in his gestures. There is a coldness
of delivery as well as of composition, which should be ili-
rudely avoided. Action, properly conducted, gives to the
speaker in the senate, at the bar, and in the pulpit, very
great advantage in enforcing his argument and impressing an
audience. See Gesture.

Action, in a theatrical sense, is nearly the same with
that among orators, with this difference, that the actor
adapts his action to an allumed character, whereas the orator
is supposed, in reality, to feel the passion which his action
expresses, whether joy, or grief, &c. See Declamation.

Action, in Poetry, is an event, either real or imaginary,
which makes the subject of an epic or dramatic poem. This,
says Aristotle (De Poet. cap. vi. p. 657.), is the soul
of tragedy. The action of a poem coincides nearly with the
fable thereof; it being the usual practice not to take any
real transfiguration of history, but to feign or invent one;
or at least to alter the historical fact, so as to render it in
a good measure fictitious. Critics consider the principal
action, commonly called the Fable, and the incidental
action of an EPISODE.

F. Bofti has two chapters, Of real action, the recitals
whereof are fables: and Of feigned actions, the recitals whereof
are historical.

The critics lay down four qualifications as necessary to
the epic and tragic action: the first, Unity; the second,
Integrity; the third, Importance; and the fourth,
Duration; to which some add a fifth, viz. Continuity.
Dr. Blair specifies three properties, which are essential to
the action or subject of an epic poem. It must be one, great
and Interrelling.

Aristotle infills upon unity, as essential to epic poetry;
and he observes, that, in order to render this unity more
fisible to the imagination, and thus to give it a better
effect, it is not sufficient for the poet to confine himself to
the actions of one man, or to those which happened during a
certain period of time; but the unity must lie in the sub-
ject itself, and arise from all the parts combining into one
whole. This unity of action is sufficiently apparent in all
the great epic poems. Thus, Virgili has chosen for his sub-
ject the establishment of Aeneas in Italy, which he keeps
constantly in view, and which serves to connect all the parts.
The unity of the Odyssey is of the same nature; the return
and re-establishment of Ulysses in his own country. The
subject of Tasso is the recovery of Jerusalem from the In-
fidels; that of Milton, the expulsion of our first parents
from paradise; and both of them are unexceptionable in the
unity of the story. The anger of Achilles, with its con-
sequences, is the proper subject of the Iliad; but, as
Achilles is in many books of the poem kept out of sight,
and the fancy terminates on no other object than the suces-
s of the two armies that are seen contending in war, the
unity is not so sensible to the imagination as in the Æneid.
This unity of the epic action does not exclude all episodes,
or subordinate actions. Moreover, the unity of the epic
action necessarily supposes, that the action be entire and
complete; or, as Aristotle expresses it, that it should have a
beginning, middle, and end.—If the three parts of a whole
seem to be generally denoted by the words, beginning, middle,
and end, Boffi interprets them more expressly, thus: the
causes and designs of a man's doing an action are the be-

The poet, says Boffi, should at the outset, that, on
one hand, nothing should be too hastily saying for the un-
derstanding of what he afterwards deliver:; and, on the other,
that what thus begins require after it a necessary confluence.
The end is to be conducted after the like manner, only with
the two conditions transferred, so that nothing be ex-
pected after it; and that what ends the poem be a necessary
confluence of something that went before it. Lastly, the
beginning is to be joined to the end by a middle, which is
the effect of something that went before it, and the cause of
what follows.

In the causes of an action, one may observe two opposite
designs; the first and principal is that of the hero; the sec-
second comprehends all the designs of those who oppose
the pretensions of the hero. These opposite causes do all pro-
duce opposite effects, viz. the endeavours of the hero to ac-
complish his design, and the endeavours of those who are
against it.—As the causes and designs are the beginning of
the action, so the contrary endeavours are the middle of it,
and form a difficulty, plot, or intrigue, which makes the
greatest part of the poem; and the solution or clearing up
of this difficulty makes the unravelling.

The unravelling of the plot, or intrigue, may happen two
ways; either with a discovery or without.

The several effects which the unravelling produces, and
the different steps to which it reduces the persons, divide the
action into so many kinds. — If it change the fortune of the
principal person, it is said to be with a peripetia; and the
action is denominated incipies, or mixed; if there be no per-
petia, but the unravelling be a mere passing from trouble to
repose, the action is simple. It has been debated among
critics, whether the close of the action in an epic poem should
be always prosperous or not? The general opinion and the
general practice are on the side of a prosperous conclusion.
But there are some exceptions. Lucan and Milton, two authors
of great note, have pursued a contrary course: the one con-
cluding with the subversion of the Roman liberty; the other
with the expulsion of man from paradise.

Another property of the epic action is, that it be great,
or sufficiently splendid and important both to fix our atten-
tion, and to justify the magnificent apparatus which the poet
baffles upon it. One circumstance that contributes to the
grandeur of the action is, that it be not of a modern date.
Antiquity is favourable to those high ideas, which epic
poetry is designed to excite and cherish. Lucan and Vol-
taire have, in the choice of their subjects, transgressed this
rule. As the action is rendered important, says Boffi, by
giving a higher idea of the personages that are introduced
than any the readers can conceive from comparing them
with those of the present time, and where heroic, says
Dr. Blair, is the ground-work, and where the object in view
is to excite admiration, ancient or traditionary history is cer-
tainly the safest region. The distance of the period, or the
remoteness of the scene, affords sufficient licence for fiction
and invention. The importance of the action much de-
dpends on the dignity and importance of the person con-
cerned in it. Thus, the fame of Homer's heroes, and the
consequences of their diffusion, furnish a subject important
in itself, and particularly important to his countrymen, who
valued themselves on their descent from these heroes. The
importance of the action itself should also be regarded.
In this respect, the subject of the Æneid is greater than that
of the Iliad, as it is the foundation of the most powerful
empire that ever was established on the globe: which is an
event of much greater moment than the destruction of a
city, or the anger of a warrior. But in comparison of the
greatness displayed in Paradise Lost, all other greatness,
ACT

fays Dr. Johnfon, in his Life of Milton, shrinks away. The subject of the English poet is not the destruction of a city, the conquest of a colony, or the foundation of an empire; it is the fate of worlds; the revolutions of heaven and earth; rebellion against the Supreme King, raised by the highest order of created beings; the overthrow of their holl, and the punishment of their crime; the creation of a new race of reasonable creatures; their original happiness and innocence, their forfeiture of immortality, and their reformation to hope and peace.

Another property required in the action of an epic poem is, that it be interesting. The subject should interest the public; and therefore the poet should select for his hero, one who is the founder, or deliverer, or favourite of his nation; and he should direct the attention to achievements that have been highly celebrated, or that have been connected with important consequences to the public cause. But more than this, in the management of his subject, he should contrive to interest not one age or country, but all readers, by concerting his plan so as to comprehend many affecting incidents. He may sometimes be awful and august; he must often be tender and pathetic; and he must give us many pleasing scenes of love, friendship, and affection: the more an epic poem abounds with situations which awaken the feelings of humanity, the more interesting it is; and these, form, always, the favourite passages of the work. No epic poets have been so happy in this respect as Virgil and Tasso. It is needless to mention, that the subject of the Paradise Lost is more universally interesting than that of any other poem. The character of the heroes serves also, as we have already observed, to render the action interesting.

As to the duration of the epic action, Aristotle observes (De Poet. cap. v. p. 656.) it is not so limited as that of the tragic action: the latter is confined to a natural day; but the epic, according to that critic, has no fixed time.—In effect, tragedy being full of passion, and consequentially of violence, which cannot be suppos’d to last long, requires a shorter time; and the epic poem, being for the habits which proceed more slowly, requires a longer time, either for them to take hold, or to be rooted up; and hence the difference between the epic and dramatic action in point of duration. Boffi lays it down as a rule, that the more vehement the manner of the principal personages are, the less time ought the action to last: accordingly, the action of the Iliad, which is formed upon the wrath of Achilles, &c. last not longer than forty-seven days; whereas that of the Odyssey, where prudence is the reigning quality, computed from the taking of Troy to the peace of Ithaca, extends to eight years and a half; and that of the Æneid, where the prevailing character of the hero is piety and mildness, computed from the taking of Troy to the death of Turnus, includes about six years.

But if we estimate the period only of the poet’s own narration, or compute from the time in which the hero makes his first appearance till the conclusion, the duration of both these last poems is brought within a much smaller compass. The Odyssey, beginning with Ulysses in the island of Calypso, comprehends fifty-eight days only; and the Æneid, beginning with the storm, which throws Æneas upon the coast of Africa, is reckoned to include, at the most, a year and some months. See Blair’s Lect. on Rhetoric, &c. vol. iii. p. 211—221.

Action is also used in Painting and Sculpture for the posture of a figure, or the attitude it is suppose to be in, expressed by the position of several parts of the body, or by the postures appearing in the face. Thus we say, the action of such a figure finely expresses the passions by which it is agitated. The same expression is applied to animals. When the word action is used by way of distinction from attitude, it may have respect to the figure’s being represented in motion, as running, jumping, striking, falling, &c. which the painter distinguishes from such as are at rest, by removing from the centre the imaginary line of gravity used in balancing his figures to some distance, before, behind, or on one side, according to the degree of motion which he means to express. It is evident, that if a man be running, and we view him sideways, his head and chettle will be thrown as much before his feet, as immediately to suggest the idea of his falling on his face, unless the hinder leg be quickly brought forward to prevent it. See Attitude and Gravity.

M. Watelet, after observing that, however terms may resemble one another in signification, there are none which are perfectly synonymous, proceeds to ascertain the difference between action, motion, and expression, as applied to painting or sculpture. To this purpose he remarks, that there are passions, or rather sentiments, which, though they immediately produce neither action nor motion, have their characteristic expressions. Of this kind are dejection, voluptuousness, and melancholy; the expression of which, being passive, arrest motion, and suspend action in those who are under their influence. On the other hand, figures that are engaged in any violent bodily exertion may be said to have motion and action; though they are not affected by those passions, to the external tokens of which the term expression is peculiarly adapted.

Action, he farther observes, requires a motion of some parts of a figure, without supposing that the whole changes its place, which is the idea suggested by the term motion. These distinctions are illustrated by appropriate examples. He supposes a picture of what is commonly called the judgment of Solomon, in which the monarch is represented seated on his throne, and extending his arm to command the division of the infant. Such a figure, even though the face were concealed, ought, in consequence of this gesture, to be said to have action; and yet it could not with equal accuracy be affirmed to have motion. Again: suppose a woman represented as rushing forward to separate two combatants, every part of her appears to concur towards the precipitance of her course, and is drawn in that position which is requisite to the immediate effect of her intention; so that the beholders are ready to imagine that they see her change her place: such a figure may be more properly said to have motion than action. Watelet’s and Leval’s Diction des Arts de Peinture, Sculpture et Gravure, art. Action.

Action of the Mouth, in the Mange, denotes the agitation of a horse’s tongue, or mandible, or his champing on the bit; which produces a white foam.—This, with the riding-mallers, is esteemed not only a sign of health, vigour, and mettle; but also of a sensible mouth.—This action is likewise suppos’d productive of a good mouth, whereas various means are made use of to keep a horse constantly champing. Some persons put a large bit with several detached movable parts, called a flattering-bit, into his mouth two hours before riding, and then turning his tail to the manger, fasten him between the stall-ports; others make use of a similar bit in common, and most persons use it for his watering exercise.—There can be no doubt that this action tends to keep the mouth sensible and alive, as it is termed, especially when accompanied with a judicious bridle-hand upon a horse; but it must be recollected that the bars of a horse’s mouth are covered with cuticle or epithelium, which is the outer incensible skin of other parts, the nature of which
which is to thicken upon pressure; therefore the flaving-
bit put on so long before riding, though it may give tempo-
rary facility, must conduce to permanent hardship.

**Action, in the Military Act, is an engagement be-
tween two armies, or between different bodies of troops be-
longing to them.** Although humanity and found policy
will induce the general of an army to avoid an action, when
no considerable benefit is likely to accrue from it, yet there
are certain circumstances that will direct him in the alter-
native either of commencing or avoiding it. Wildman
will suggest the importance of bringing the enemy to an im-
mEDIATE action, when it will serve to prevent the junction
of his forces; to discourage the hostile declaration of a neutral
power; when any advantage may be obtained by the dif-
union of his forces; when there is reason for apprehending
the inconveniency or actual withdrawal of allies; when
defection, on account of an existing or impending scarcity
of money, or of the means of subistence, is dreaded; when
new allies may be thus gained, or those of the enemy may be
induced to abandon him; and when a reasonable prospect
occurs of securing a present advantage, without risking any
loss or injury that shall in the event more than counter-
balance it. The commencement of an action, when it is de-
finable, may be expedited by threatening, or actually be-
lieving a port or place, which is of importance to the
enemy; by attempting to relieve and succour a place that
is besieged; by ravaging and laying waste the country; by
presenting the allurement of booty; by depriving the
enemy of forage or water; by exhibiting the appearance of
an untenable post, or of a feeble force; and by prevailing
fear, the diminution of forces, the disorder of retrenchments,
or a defecion of part of the army, or prevailing discontent
and a disposition to mutiny, or orders not to engage.

The motives which *ill induce a prudent general to avoid
To begin an action are such as these: the defect or
the distance of his forces, the prospect of fresh supplies, the
dread of defelection, the augmentation of the enemy’s allies,
the disadvantage of ground, position, number, &c. want,
difable, and defection in the opposing army, actual nego-
tiations, or positive orders not to hazard an engagement.
The means of avoiding an action are the choice of posts and
retrenchments, well concerted and well executed stratagems,
the delation of the country through which the hostile
army must pursue that which is retreating, and from which
it must draw some of its supplies; any movements that would
cause a diversion, real or feigned negotiations, report of
approaching succour, and the appearance of considerable
force. These various circumstances are detailed at large,
and illustrated by apposite examples selected from the con-
duct of the most able commanders, both ancient and mod-

**Art. Action.**

This term is likewise used to signify some memorable act
done by an officer, or commander of a body of troops.

**Action, in Law, is a right of demanding, and pur-
suing in a court of judicature, what is any man’s due.**

Or, *action* is any kind of process or suit which a perfon
enters for the recovery of his right. See *Cause.*

Actions are divided, by Justinian, into two different kinds:
real, or those against the thing; and personal, or those
against the perfon.—*For whoever brings an action, either
doing it againt on obnoxious to him, in respect either of
contract or offence; in which case arise actions against the
perfon which require the party to do, or give something:
or, he does it against one not obnoxious, yet with whom a
controversy is arisen touching some matter; as if Caius hold
a field which Julius claims as his property, and brings his
action for the same.* See the Institut. lib. iv. tit. 4, where
the principal actions, introduced by the Roman law, are
summarily explained.

In common law, from the two classes of real and personal
actions, arises a third called a *mixed action;* which regards
both the *person* and the *thing.*

**Action, real, or, as it is called in the Mirror, feudal
action, is that which concerns real property, whereby the
defendant claims title to lands or tenements, rents or com-
mons, in fee-simple, fee-tail, or for life; and these actions
are either *ancient,* or *polysy*. Ancient action is that
which we have by some right descending from our ancestor.—

**Polysy,** sometimes also called *personal action,* is that which
has its beginning in and from ourselves.

But real actions, formerly so numerous and considerable,
as writs of right, of entry, &c. with their appendages as *grand
capes, petit cape, receipt, view, aid-prayer, voucher, counter-
plea of voucher, counter-plea of warranty, and recovery of
value,* are now much out of use; on account of the great
nicety required in the management of them, and the incon-
venient length of their process: a much more expeditious
method of trying titles being since introduced in other actions,
*personal* and *mixed.* In a real action several lands held by
several titles may not be demanded in the same writ; but in
personal action several wrongs may be comprehended in one
writ. A bar is perpetual in the latter actions, and the
plaintiff has no remedy, except by writ of error or attestat;
but, in the former, if the defendant be barred, he may
commence an action of a higher nature, and try the fame
again.

**Action, personal, is that whereby a man claims a debt,
or personal duty, or damages in lieu thereof; and likewise,
whereby a man claims a satisfaction in damages for some
injury done to his perfon or property. The former is said
to be founded on contract; the latter upon *tort* or wrongs.
Of the former nature are all actions upon debt or promises;
of the latter all actions for trespasses, nuisances, assaults,
defamatory words, and the like.

Many personal actions die with the perfon; but real
actions survive. In all actions merely personal, arising ex
*delicto,* for wrongs actually done by the defendant, as *tres-
pas, battery, and slander,* the action dies with the perfon.
But in actions arising ex contractu, by breach of promise
and the like, though the suitor shall abate by the death of
the parties, they may be revived by or against the executors
who have afliers to answer the demand; as they are rather
actions against the property than the perfon.

**Action, mixed, is that laid indifferently for the thing de-
tained, or against the *person* of the deater; being thus
called, because it has a mixed respect, both to the thing, and
to the person.*

Others better define it, a suit given by law to recover the
thing demanded; and damages for the wrong done.

Such is, *affize of novel disseisin,* which, if the dispossessor
make a feecomment to another, the disseisee shall have against
the dispossessor, and the fecoiffe, or other terre-tenant, to re-
cover not only the land but damages also. And the like
is action of waste, *Quare impedit,* &c. See *Assise.*

Actions are also divided into civil and criminal.

**Action, civil, is that which only tends to the recovery
of what, by reason of a contract, or other like cause, is a
man’s due.—As, if a perfon by action seek to recover a sum
of money formerly lent, &c.*

**Action, criminal, is that the object of which is judgment
death, as appeals of death, robbery, &c. or judgment for
damage to the party, fine to the king and imprisonment, as
appeals of malice, &c. To this class belongs action penal.*

**Action,**
**ACT**

**Action.** penal, aims at some penalty upon the party sued, either corporeal or pecuniary.

Such is the *Actio Legis Aquilina*, in the *Civil Law*; and with us, the next friends of a man feloniously slain, or wounded, shall pursue the law against the offender, and bring him to condign punishment.

A *new Action* is also distinguished, as it lies for the recovery of the simple value of the thing challenged; or of the double, treble, quadruple, &c.

Thus, a *Deciet taintum* lies against embracers: and against jurors who take money for their verdict, of either, or both parties.

To this class also belong all actions on a *statute* that punishes offence by restitution, or fine proportionable to the transgression.

**Action, again,** is divided into *judicial*, called also *preparatory* and principal.

**Action, judicial,** is that which arises from some question, or doubt in the principal one.

As, if a man sue his younger brother for land defended from his father; and if it be objected, he is a bastard; this point of bastardy must be tried, before the cause can proceed: whence this action is termed *judicial*, *quia prior judicandi.*

**Action upon the case,** *Actio super causam,* is a general action, given for the redress of a wrong done any man without force, and not especially provided for by law; in order to have satisfaction for damage.

This, of all actions, is now most in use.—Where there arises an occasion of suit, that has neither fit name, nor certain form already preferred; the clerks of the chancery, anciently, conceived a proper form of action for the thing in question: which was called an action *upon the case*, by the civilians *Actio in casuum.*

This is called an action *upon the case*, because the whole cause or case, as much as in the declaration (except time and place) is let down in the writ; and there is no other action given in the case, except only where the plaintiff has his choice to bring this or another action. This action lies in a variety of nuisances; as for words spoken or written, which affect a person’s life, reputation, office, or trade, or tend to his loss of preferment, in marriage or service, or to his defeasance, or which occasion him any particular damage. Action on the case likewise lies upon an *Assumpsit.* It lies also, in all nuisances, wherein no general action could be framed: e.g. against *Carriers,* against a common inn-keeper for goods stolen in his house, for deceit in contracts, bargains, and sales, for neglect or malfeasance, for injuries done in commons, for malicious prosecution and false arrears, against sheriffs for default in executing writs, permitting escapes, &c. for conspiracy, nuisances, &c. &c. See *Comyns’s Digest,* art. *Assumpsit,* and Jacob’s *Law Dict.* by Tomlin, art. *Assumpsit.*

**Action.**

**Action upon the statute,** *Actio super statutum,* is a writ of action, brought against a man, upon an offence against a *statute,* whereby an action is given that did not lie before.

Thus, where one commits perjury, to the prejudice of another, he who is damaged shall have a writ upon the statute, and a cause accordingly. Such action is now obsolete.

**Action, popular,** only differs from an action upon the statute, in that, where that statute gives the suit of action to the party grieved, or otherwise to one single person, certain, it is called action upon the statute; and where the authority is given by the statute to every one that will do it, it is an action popular: and from the words used in the process, it is called a *qui tam action.* See *Information.*

**Vol. I.**

**ACT**

**Action.** is also divided into perpetual and temporary.

**Action, perpetual,** is that whose force is not determined by any period or term of time.

Of this kind were all civil actions among the ancient Romans; viz. such as arose from laws, decrees of the senate, and constitutions of the emperors; whereas actions granted by the prætor died within the year.

We have also *perpetual* and temporary actions now in England: all being perpetual which are not expressly limited.

Divers statutes give actions, on condition they be pursued within the time prescribed.—Of these statutes the principal are the following, viz. 32 Hen. VIII. cap. 2. 31 Eliz. c. 5. 21 Jac. I. c. 2. 16. 10 W. III. c. 14. 27 Geo. III. c. 44. See *Limitation.*

But, as by the civil law no actions were perpetual, but that by time they might be prescribed against; fo, in our law, though action be called perpetual, in comparison of those that are expressly limited by statute; yet is there a means to prescribe against real actions, after five years, by a *fine levied,* or a *recovery suffered.* See *Prescription.*

Again, *actions* are either local, as ejectment, waste, &c. which must be brought in the county where the land lies; or trespass, such as debt, detinue, &c. which may be brought in any county.

By *Stat. 21 Jac. I. c. 4.* all suits on penal statutes shall be laid in the county where the offence was committed. See *Venue.*

**Action.** is also joint or several; joint, where several persons are equally concerned, and the one cannot bring an action, or cannot be sued, without the other; several, in case of trespass, &c. done, where persons are to be severally charged, and every trespass committed by many is several.

There are also various kinds of *actions* suited to different cases, as *actions of Covenant,* *Debt,* *Detinue,* *Trespass,* *Troters,* &c.

**Action.** *Close in,* see *Close in Action.*

**Action of a writ,** is when a person pleads some matter whereby he shews, that the plaintiff had no just cause to have the writ he brought, though it be possible he might have another writ or action for the same matter.—Such plea is called, a *plea to the action of the writ.*

When by the plea it appears, that the plaintiff has no cause of any action for the thing demanded, it is called a *plea to the action.* See *Plea.*

**Action, in affairs of Commerce, or Action of a Company,** is a part or share in the company’s stock or capital, which consists of a number of such actions.

**Actions in France and Holland amount to the same with shares or subscriptions, in England.**

Thus, the capital of a company, which has three hundred actions of a thousand livres each, consists of three hundred thousand livres. Hence a person is said to have four or five actions in such company, if he hath contributed to the capital, and be interelled in it for four or five thousand livres.

A proprietor cannot have a deliberate vote in the assemblies of a company, unless he has a certain number of actions, fixed by the letters patent of its establishment; nor can he be a director, unless he has a full greater number of actions. Actions are bought and sold, transferred, &c. much in the same manner as *stocks* are with us.

**Action also denotes an obligation or inurement, which the directors of such companies deliver to those who pay money into their stock.* See *Bank and Actionary.*

To *null or liquidate an action,* is to fill, or turn it into money, &c.

To *sued an action,* is to pay exactly when they become
due, the several sums subscribed to the flock of the company, according to the several orders of council made for the creation of the new actions.

ACTIONARY, or Actionist, a term frequent in foreign newspapers; denoting the proprietor of an action or share in the company's stock.

ACTIVE, something that communicates motion or action to another. In this sense, the word stands opposed to passive. Thus we say, an active cause, active principles, &c.

The quantity of motion in the world, Sir Isaac Newton shews, must be always decreasing, in virtue of the vis inertiae, &c. So that there is a necessity for certain active principles to recruit it: such he takes the cause of gravity to be, and the cause of fermentation: adding, that we see but little motion in the universe, except what is owing to these active principles.

Active principles, in Chemistry, are those which are supposed to act of themselves, and do not need to be put in action by others.

Salt, sulphur, and mercury, have been usually considered by the chemists as active principles; and phlegm and earth as passive ones.

Mr. Homberg, and some chemists after him, only make one active principle, viz. sulphur, or fire: which they take to be the source or principle of all the motion and action of the universe.

The term active principle, says Dr. Quincy, has been used to express certain divisions of matter, that are, by some particular modifications, comparatively active, in respect of others. But the progress of science, and particularly of experimental philosophy and chemistry, has introduced new and more rational ideas on this subject.

In a strict sense, all motion in matter is rather passion; and there is no active principle, unless we thus call the known powers of gravitation, attraction, and repulsion, on which the Newtonian philosophy is founded: so that let bodies exist under what modifications forever, there can be no alteration made of these universal properties.

Active, in Grammar, denotes a word having a signification that serves to explain or denote an action.

Thus we say a verb active, a conjugation active, &c. or an active participle.

Active Verbs, are such as do not only signify doing, or acting, but have also nouns following them, to be the subjects of the action or impression: and they are thus distinguished from verbs neuter.

Thus to love, to teach, are verbs active; because we can say, to love a thing, to teach a man.

Some grammarians, however, make three kinds of verbs active: the transferre, where the action passes into a subject different from the agent; reflexed, where the action returns upon the agent; and reciprocal, where the action turns mutually upon the two agents who produced it. See Verb.

Active Power, in Metaphysics, is the power of executing any work of art or labour, in contradistinction to speculative powers. The exertion of this power is called action; and as every action produces some change, so every change must be caused by some exertion, or by the cession of some exertion of power. That which produces a change by the exertion of its power, we call the cause of that change; and the change produced the effect of that cause; and that being in which the change is produced is said to be passive, or to be acted upon. Thus (says Dr. Reid, Esq. on the Active Powers of Man, p. 13.) we see, that action and passion, cause and effect, exertion and operation, have such a relation to active power, that if it be understood, they are understood of consequence; but if power be a word without any meaning, all those words which are related to it, must be words without any meaning. See Power.

ACTIVITY, the power of acting, or the active faculty. The activity of fire exceeds all imagination.—The activity of an acid, a poison, &c.—Bodies according to Sir Isaac Newton, derive their activity from the principle of Attraction.

Activity of a body, the sphere of, is the space which surrounds it, so far as its efficacy or virtue extends to produce any sensible effect.

ACTIUM, in Ancient Geography, a small town near a promontory of the same name in the mouth of the Ambracian gulph, on the coast of Arcadia, and opposite to Nicopolis on the other side of the bay. This place was famous for a temple of Apollo, mentioned by Thucydides (i. i. e. 29. p. 24. Ed. Dukler), and by Strabo (i. vii. tom. i. p. 500. Ed. Cauib.) thence denominated Actium (Virgil Æneid. viii. 704.) and afterwards for the victory obtained by Augustus over Anthony and Cleopatra in a naval battle on the 2d of September, in the year of Rome 723. Nicopolis was built in order to commemorate this victory, and games were instituted called the Actian games. There were ancients solemn games at Actium, at which the Lacedaemonians used to preface, mentioned by Strabo, and alluded to by Virgil, Æn. ii. 278. The victory at Actium was also celebrated by games instituted at Rome. Sueton. Tib. vi. Dion. Culs. Hist. Rom. lib. ii. 19. liii. liv. 19. tom. i. pp. 649—656—749. Ed. Reimari. The Actian also took its rise from the battle of Actium. The promontory is now called Cape di Figalo. The medals of Actium were silver, gold, and bronze; and the ordinary type is a flying pegasus.

ACTON, in Geography, a village about six miles West of London, where is a well of purging water, noted for the pungency of its salt. Its colour is whitish, its taste is sweetish, with a mixture of the same bitter which is in the Epsom water. Its salt is not quite so soft, and is more calcareous than that of the Epsom water, being more of the nature of the salt of lime: it is however more nitrous than the other. A quantity of it being boiled high, and mixed with a solution of sublimate in pure water, throws down a yellow sediment. It strikes a deep red or purple with the tincture of log-wood in brandy, as is usual with nitrous salts. It does not precipitate silver out of the spirit of nitre, as common salt does; a pint and a half of the water yields forty-eight grains of salt. See Allen's History of Purging waters.

ACTON, a township of Middlesex county in the Massachusetts, containing 853 inhabitants; 24 miles N.W. of Boston.

ACTON Barnet, a village in Shropshire, about three miles from Great Wenlock, where a parliament was held in the reign of Edward I. when the famous act 11 Ed. I. A. D. 1283, called Statute-merchant, was renewed.

ACTOR, in Antiquity, was the name of a person who had the superintendence of all the goods of a Roman citizen. He was called "actor bonorum, and actor prediorum fundonum."  

ACTOR Summarum, was a slave, to whom was committed the office of cash-keeper: and that he was a slave we may infer from the punishment of the crofs which Domitian caused to be inflicted on one of these actors. See Sueton. in Domit. c. x. t. 2. p. 1038.

Actor, in a general sense, one who performs any act.

Actor, among Civilians, the proctor or advocate in civil courts or causes: as actor ecclesiasticus has been sometimes used
used for the advocate of the church; actor dominicus for the Lord's attorney; actor vix, the steward or head bailiff of a village.

Actor, in the Drama, one who represents some person or character upon the theatre. The drama, in its original, only consisted of a simple chorus, who sang hymns in honour of Bacchus; so that the primitive actors were no more than singers and musicians. Thespis was the first who took upon him to introduce a person, or actor, who was to play the chorus by reciting the adventures of some of the heroes. Thus came the recitation or declamation in use. Aeschylus, finding a single person tiresome, thought to entertain the audience more agreeably by the introduction of a second person, who should converse and conduct dialogues with the first. He likewise dressed his actors more decently than they had been before, and put on them the buxkin and the mask. Sophocles, finding the two persons of Aeschylus too few for the variety of incidents, added a third; and here the Greeks flopped: at least, we seldom find in any of their tragedies above three persons in the same scene. They might probably think it wrong to admit more than three speakers at the same time on the stage; a rule which Horace has expressed in the following verse of his Art. Poet:

"Nee quastra loqui perfona laboret."

In their comedies they took a greater liberty. The moderns have introduced a much greater number of actors upon the stage. This heightens the trouble and diffizes that should reign there, and makes a diversity, in which the spectator is sure to be interposed. Horace speaks of a kind of secondary actors in his time, whose concern it was to imitate the first, and degrade themselves in order to become better foils to their principals. The proper business of these subaltern actors is unknown to us.

The actors wore habits and symbols suited to their respective parts. Kings bore the regal appendages, as the diadem and sceptre; and their garments were long robes of purple and other colours, ornamented with gold. Heroes were often covered with the skin of a lion or tigress, and armed with swords, spears, quivers, and clubs. The age, sex, and condition, of every personage of the drama were almost always indicated by the colours of the dress. The same actors sometimes performed both in tragedy and comedy; but they seldom excelled in both. In order to acquire greater vigour and suppleness of body, they exercised in the palaistra; and others, to render their voices more dulce and sonorous, carefully observed a strict regimen. Cicero, Orat. cap. iv. tom. i. p. 423. Ed. Olivet. Plato, de Leg. i. ii. tom. ii. p. 665. Ed. Serrani.

Besides considerable pay which was given to actors who had acquired great reputation, e.g., a talent in two days, (Plutarch in X Rhet. vet. tom. ii. p. 348. Ed. Xylandri), they enjoyed all the privileges of citizens; and as it was required that they should be free from all the rigours of infamy, with which the laws punished offences, they arrived at the most honorable employments. A famous actor, named Aristodemus, was sent on an embassy to Philip, king of Macedon. Others possessed great influence in the public assemblies. Aeschylus, Sophocles, and Aristophanes, did not blush to act a part in their own pieces. Athen. Depnos. i. i. c. 17. p. 29. c. 18. p. 21. Ed. Cafaub. At Athens, actors were thus highly honoured. But at Rome, they were despised and degraded from their rank as citizens, expelled from their tribe, and deprived of the right of suffrage by censors. The French have adopted the ideas of the Romans, and the English those of the Greeks.

ACTORS, in Roman Antiquity. See ACCUSATION.

ACTORICUM, in Ancient Geography, a territory of Epirus, according to Suidas, which he says was afterwards called Leucadia, belonging more properly to Aetolia.

ACTORION, or ACTORIES, in Entomology, two species of papilio, found in Surinam; one with subacute keeled brown wings; the anterior marked with a yellowish fascia, and the hinder with a blue spot and an occllum underneath; the other, with wings of an uniform colour, marked with brown and white.

ACTORUM Tabulae, were tables inscribed by Servius Tullius, in which the births of children were registered. They were kept in the treasury of Saturnus.

ACTRIX, ACTRES, a female who acts, or does the office of an actor.

Actresses, or women actors, were unknown to the ancients, among whom men always performed the part of women; and hence one reason for the size of masks among them. Mem. Acad. Inscript. tom. vii. p. 188. Among the Greeks, the women only danced; and their place in tragedies and comedies was supplied by chorus, whose voice resembled theirs.

Actresses are said not to have been introduced on the English stage till after the restoration of King Charles II., who has been charged with contributing to the corruption of the manners, by importing this usage from abroad. But this can be but partly true, for the queen of James I. acted a part in pastoral; and Pyrnx, in his Histrionica, speaks of women actors in his time as women; while one occasion of the severe prosecution brought against him for that book, Whitlock, Mem. 1632. Wood's Athen. Oxon. tom. vii. p. 434.

ACTRIDA, in Ancient Geography, a town placed by Pliny in Arabia Felix.

ACTUAL, something that is real and effectual; or that exists truly and absolutely. The philosophers use actual heat, or cold; in opposition to virtual or potential.

Actual heat, considered actively, is the act of producing heat; passively taken, it is the quality whereby a body is denominated hot. — Virtual or potential heat, actively taken, is the power or faculty of producing heat; passively taken, it should be the power or faculty of being heated, or receiving actual heat.

In medical language, actual is also opposed to potential, and is applied to any thing endowed with a quality which operates by an immediate power inherent in it. For example: a red-hot iron, or fire, is called an actual cataract, in contradistinction to cataractae, which have a power of producing the same effects on animal bodies, as actual fire; and which are called potential cataracts or cauteries. Boiling water is actually hot, and brandy is potentially hot.

Actual sin is that committed knowingly, by a person arrived at the years of discretion; in contradistinction to what Theologians have called Original sin.

Actual possession and actual right of possession are terms used in Law, for the meaning of which see Possession.

ACTUARIE, node, in Antiquity, a sort of long and light ships, thus denominated as being particularly contrived for swiftness and expedition; they answer to what the French call brigandines.

Cicero, in an epistle to Atticus, calls a ship demum came, reum, of ten banks of rows, actuaria.

ACTUARIUS, or ACTARIUS, primarily denotes a notary, or officer appointed to write down the acts or proceedings of a court, assembly, or like the thing.

In the eastern empire, the actuarii were properly officers who kept the military accounts, received the corn from the fiscus, or store-keepers, and distributed it to the fol-
Actuarius, or Actuary, also means the clerk who registered the acts and constitutions of the convocation.

ACTUATE, to bring into act, or put a thing in action. Thus an agent is said, by the schoolmen, to actuate a power, when it produces an act in a subject.—Thus the mind may be said to actuate the body. And thus a medicine, &c., is said by some ancient physicians, to be actuated, when, by means of the vital heat, it is made to produce its effect.

ACTUS, in the Ancient Agriculture, the length of one furrow; or as far as a plough goes before it turns. Plin. lib. xviii. cap. 3. tom. ii. p. 97. Ed. Hard.

In English it may be rendered by a furrow. —It is also used by Vitruvius as a determinate measure, containing 120 Roman feet.

ACTUS minimus, was 120 feet in length, and four in breadth; being equal to the sextans, or sixth part of the jiggerum, or integer.

ACTUS major, called also aitus quadratus, was the square of 120 feet, or 14,400, being the semis, or half of the jiggerum. —This was also denominated modius, and mina. Varro de Re Raff. lib. i. cap. 10.

ACTUS Intervallis, a space of ground four feet in breadth, left between the lands as a path, or way.

ACUANTES, Acuantes, in Ecclesiastical History, are those called more frequently Manichæi. They took the name from Acua, a disciple of Thomas, one of the twelve apostles. Bib. Univ. tom. xxv. p. 350.

ACUBA, in Botany, is a tree of St. Domingo, which rifes to a great height, and yields an excellent fruit. The fruit is a kind of fig, resembling in taste the mufcaria pear, but so hard that it must be softened in water before it can be used. The wood is the hardest of any in the island. M. de Lamarck (Encyclopedic, vol. vi. p. 39.) apper- heads, that it is a species of Crysphollum, and the fame which is called Auzuba, and according to Plumier deno- minated Acomas.

ACUBA, in Ancient Geography, a fountain or lake of Africa, in the Syrtis.
of the discoveries of this Jesuit, and his work became very scarce. The Spaniards were jealous of the Portuguese, and wished to prevent their deriving any advantage from the relation of Acuna. The work was translated by M. de Gomberville, in four volumes 12mo in 1682; and, it is said, that the only copy of the original, besides that which the translator used, is in the Vatican library. Gen. Dict.

ACUNUM, in Ancient Geography, a town of Pannonia, north-call of Sirmium.

Acusum is also the present Ancona; suppos'd by M. d'Anville to be the Acusum of Ptolemy.

ACUPUNCTURE, a method of curing many diseases, by prickings several parts of the body with a needle, or instrument of that form; practiced by the Chinese and Japanese, and other nations in that part of the world. They perform the operation with a large gold or silver needle, which they strike into the several parts of the body, either with their hand, or with a hammer made on purpose. This severe and desperate operation is performed on the head and breast, as well as the abdomen, arms, legs, thighs, and many other parts of the body, may even in the abdomen of women with child, when the fucus is reflexes. The disease, for the relief of which this operation is chiefly performed, is ascribed by the Japanese physicians to the immediate use of the fakki, a strong wine made of rice, which gradually fills the abdomen and lower parts of the body with a noxious fucus, that occasions convulsions and exquisite pains. The place in which the puncture is commonly made, is the middle between the navel and the pit of the stomach; and the holes are distributed into three rows, with three punctures in each row, at the distance of about half an inch, and the whole disposed in the form of an oblong square. The needles are vended by the emperor's licence.

Surgeons are furnished with images, wherein all the places in the body proper for the needle are depicted by marks. M. Ten Ryne was an eye-witness of the use of this puncture on a soldier, who was afflicted with violent disorders of the stomach, and frequent vomitings at sea, suddenly relieved himself by prickings a thumb's breadth deep into four different places about the region of his pylorus. Ten. Ryn. Diff. de Acupunct. ap. Phil. Trans. N° 148. p. 231, seq.

We sometimes also find mention of an acupunctur prati-
tified in Europe; but this amounts to no more than the perforating or opening a part, e.g. the cornea, with the point of a needle; which has been done with good success, for the cure of an hydropethaemia and hypopyon.

ACUR, in Ancient Geography, a town of Asia, according to Ptolemy, in Lat. 15° 20'. Long. 124° 45'.

ACUROA, in Botany, a genus of the undulphia decandra chaps and order; the characters of which are, that the calyx is quadrinerved; that it has five petals; and that the leguminous is roundish, compact, not gaping, with a single cell, and a single seed. There is one species, viz. A. violacea.

ACURON, a name given to the alisma.

ACUS, in ichthyology, the name of several species of fish, whose form is long and slender, belonging to different genera in the Linnaean system. The gymnotus acus is distinguished by having no fin on the back, belly, and tail, and by an anal fin terminating before the apex of the tail, with fifty rays. It is found in the Mediterranean. The colour of the upper part is whitish, beclouded with reddish and brown spots, and underneath it is bluish. It has no tentacula.

The synaptus acus is of an hexagonal figure, and has a piminated tail. This is the type of Oberf; and, according to Aldrovand, the acus of Aristotle, and the acus

altera major species of Ariloto, according to Willughby and Ray. It is the horn-fish of Junston. It is found in the northern ocean of Europe; in length, as stated by Gmelin, it is about two or three feet, and it is variegated with alternate spots and belts of a brown and light-yellow colour. The acus of Aristotle, according to Rondelius, Jonston, Willughby, and Ray, and the eczema of Oppian, and the acus first species of Rondelius and Gehr, is the belone of Aristotle; the ssox belone of Linnaeus, the sea-fish of the British zoology, and the garfish of other authors. The acus maxima chimeras, with a compressed body, is the fistularia chimera of Linnaeus. The acus maxima squamosa viridis of CATESBY, is the ssox viridis of Gmelin's Linnaeus. Mr. Daines Barrington conceives, that a fish which he found near Chrischurch, in Hampshire, had the appearance of the scales of this fish, though it be a stranger to our seas. Phil. Trans. vol. liii. p. 174.

The acus luciiferiformis of Willughby and Ray, is the synaptus sphyphon of Linnaeus, and the little pifi-fish of the British zoology.

ACUS is also used by some authors for the amnodytes, or sand-eel, a small eel caught in the sands.

ACUS, in Natural History, is a name given to the oblong cimex, with filiform antenna, or the cimex flaginorum of Linnaeus, with a roundish black body, and two globular points in the middle of the thorax, which is very common in the lakes of England. Acus is also a species of ascaris, straight, rigid, and acicular, and bending at both ends. It is white, about two inches long, and found in the intestines of the pike. Acus is also a species of the voluta-shell, marked with transverse ferreries of red points, and terminating in a smooth pointed wreath. It is a inch long, and of a white or yellowish colour.

A species of buccinum, of a whitish colour, with horizontal undulated lines, with hard crenulated rugose windings, and the columna spirally twisted, is called acus.

ACUS Pastoris, in Botany, a name of the scandix. Acus Mofbata, a name of the geranium mofbataum. ACUSCHY, in Zoology, a species of Cavia. See ACOUSHY.

ACUSI, in Botany, a species of apocynum.

ACUSILAUS, in Biography, one of the most ancient Greek historians, was born at Cercas, near Aulis, not long before Pherecydes of Athens, and compiled genealogies of the ancient royal families from tables, which his father is reputed to have found in digging the foundations of his house. He goes back to the ages before the war of Troy, and as far as Phoroeus, king of Argos. Suidas.

ACUSILAUS is also the name of an Athenian orator, who went to Rome in the time of Galba, where he practiced rhetoric, and gained a large fortune of a hundred thousand drachmae, with which he returned to Athens, where he died. Suidas.

ACUSILORUM Colonia, now Ancona, in Ancient Geography, is situated, according to Lucas Hollkerius, between Orange and Valence, near Montelimart, on the banks of the Rhine. It was called Acusum, and, according to Ptolemy, was one of the cities of the Cavan.

ACUTE Infus., in Ancient Geography, are comprehended in the number of the Echinades. They are a little more to the south-west, in the south of the promontory of Araxis. M. d'Anville calls them Oxid infusae.

ACUTE,
ACUTE, adj. something that terminates in a point, or edge; disposed either for piercing or cutting.

In this sense the word usually stands opposed to obtuse.

ACUTE angle, in Geometry, is that which is less than a right angle, or which does not subtend 90 degrees.

Such is the angle ACB (Plate Geometry, fig. 1.)

ACUTE-angled triangle, is that whose three angles are all acute; called also an oblique triangle.

Such is the triangle ACB (Tab. Geometry, fig. 1.)

ACUTE-angled Cone, is that whose opposite sides form an acute angle at the vertex; or whole axis, in a right cone, makes less than a right angle with the side. See Cone.

Pappus, in his mathematical collections, p. 164. Ed. Phil. 1578, says, that this name was given to such a cone by Euclid, and the ancients before the time of Apollonius; and they called an

ACUTE-angular Section of a Cone, which was made by a plane, cutting both sides of an acute-angled cone, an ELLIPSE; but they did not consider, before it was pointed out by Apollonius, that such a section might be obtained in any cone whatever. See Conic Section.

ACUTI, in Musc, is understood of a found, or tone, which is sharp, shrill, or high, in respect of some other; in which sense the word stands opposed to grave. Both these properties of sound depend on the quickness or slowness of the vibrations by which they are produced; and are independent of loudness or force; for a tone may be acute or high, without being loud, and vice versa. There are degrees of acuteness and gravity beyond our powers of appreciation. The warbling of birds is of that kind. No birds but the nightingale and cuckoo produce musical tones which we can imitate, or compare with those of our musical instruments. A bullfinch and canary bird can be taught tunes by our flageolets and bird-pipes; but their natural warble is incommodious with our scale. The grave additional tones in our large piano-fortes become the more difficult to tune as they descend. The octave below double C can, with the utmost difficulty, be made to satisfy a nice ear by the most experienced tuner.

Sounds considered as acute and grave, that is, in the relation of gravity and acuteness, constitute what we call tone, the foundation of all HARMONY.

ACUTE Accent, in Grammar. See Accent.

ACUTE Leaf. See Leaf.

ACUTE Diage. See Disease.

ACUTELL, in Botany, a name used by Seme to express the common Anonis, or Rest-harrow, a small prickly plant, with red or white flowers, and famous for its spreading and tough root. Ger. Emac. Ind. 2.

ACUITATOR, in writers of the barbarous ages, denotes a peron that whets, or grinds cutting instruments: called also in ancient glossaries, acutor, aconox, familiarus, hariarius, &c. Du-Cange.

In the ancient armies there were acuatorers, a kind of smiths, retained for whetting or keeping the arms sharp. Aquin.

ACUTITION, or Acution, in a general sense, the fame with acuating or sharpening.

ACUTITION, in Grammar, denotes the pronouncing, or marking a syllable with an acute accent.

ACUTITION, or Acution, in Medicine and Chemistry, is used for sharpening or increasing the force of any medicine.

ACWORTH, in Geography, a township of Cheshire county, in New Hampshire, incorporated in 1766, and containing 704 inhabitants. It is eight miles east-by-north from Chirketown, and 73 north-west-by-west from Portsmouth.

ACY, a town of France, in the department of the Aisne, one league south-east of Soiffon.

ACYLLA, in Ancient Geography, a town of Italy, built by the Romans, to restrain the barbarians who inhabited the Alps. It was a Roman colony.

ACYPHAS, a city of the Doric Tetrarchy, called by Strabo and others Fyndas.

ACYRHOLOGIA, compound of acus, proper, and phere, discourse, denotes an improper acceptation, or expression, by which a word or phrase is used in some unusual or oblique sense, hardly reducible to the rules of language. Such, e. g. is, the word fero, sometimes used in Roman writers for timor. The acriologia bears a near affinity to the catachresis, inasmuch that many terms and expressions alleged as instances of the latter, are by others brought as examples of the former.

ACYRUS, a small island near Cydonia, in the isle of Crete.

ACZUD, in Geography, a town of Moldavia, in European Turkey. N. lat. 47° 20'. E. long. 29° 10'.

AD, in Grammar, a Latin proposition signifying to, and often used singly, and in composition to express the relation of one thing to another. Among all the eastern nations, Ad was a peculiar title; and, according to the learned Mr. Bryant's opinion, was originally conferred upon the sun. Anal. of Anc. Mech. vol. ii. p. 24.

AD, in Antiquity, is understood of a kind of punishment of criminals, condemned to be thrown to wild beasts. The term was also applied to a sort of gladiators hired to fight with wild beasts.

These are otherwise called barbarian, Calv. Lex. Jur. p. 36.

An extra, a term used among School Divines, in speaking of the external operations of the Godhead.

Acts or operations ad extra, are properly those whole term or effect is not within the divine essence; by which they stand expos'd to operations ad intra. Creation, preservation, regeneration, conversion, renovation, &c. are actions of God ad extra.

Ad intra, among School Divines, is understood of those acts of the Divine Being, whose term and effect is within his own essence. In which sense, acts or operations ad intra, stand opposed to those ad extra.

Ad hominem, among Logicians, is understood of a kind of argument drawn from the belief or principles of those we argue with, and which of conquence must be conclusive to them, though otherwise disbelieved by us; or, it is where a disputat quts his own language and system, and borrows that of his opponent to convince him, by turning his own prejudices or errors against himself. This the schoolmen call argumentum ad hominem.

Ad hibiti, used in Musc, for a piece, when the principal performer is at liberty to give way to his conceptions, to change the measure from quick to slow, or the contrary, without accompaniment, and to manifest his abilities in effusions of fancy, taste, and brilliant passages. But this privilege is often abused in the length and dulness of these extemporary flights, as they are called, though generally prepared at home with great pains and application to very little purpose. None but performers of first-rate abilities should be permitted to obtrude their crude, and often clumsy attempts on the public, interrupting the progress of, perhaps, an elegant or ingenious composition.

Ad ludos, in Antiquity, a Roman sentence, whereby criminals were condemned to entertain the people, either by fighting with beasts, or with each other, and thus executing justice on themselves. Kennet. Rom. Ant.

Ad metalla, the punishment of being doomed to work
in the mines. Criminals condemned to this, were called metallics.

It were to be wished that punishments of this kind could be sublimated in lieu of our frequent executions; which are as repugnant to the principles of humanity as to those of found policy.

Ad quiditter, among schoolmen, include the relations, analogies, agreements, disagreements, similitudes, and difficultudes of things.

Ad quiditer are properly those attributes of things, which answer to the question, ad quid? to what? By which they differ from mere quidities, which answer to the question, quid est? what is it? The latter enquire what things are in themselves; the former what they are, ad alia. Herb. dc.

Verit. p. 233.

Ad volorem, is used in speaking of the duties, or customs, paid for certain commodities; some things are rated by the weight, measure, tale, or the like; others pay ad volorem, according to the value or worth, sworn to by the owner.

Ad Afinim, in Ancient Geography, a town of Italy near the river Effis, between Senogallia and Aconum.

Ad Aquae, a place remarkable for the martyrdom of St. Mark, and which is thought to have been near Alexandria.

Ad Aquae, a name given to several places in Moenia, Dacia, Numidia, Spain, &c.

Ad Aquae caldea, a town of the Picentini, about ten miles from Afril.

Ad Aquae gradatam, a town situated near Aquilia, and remarkable for the martyrdom of three brothers, of the illustrious family of Anicius.

Ad Aquae labudam, or Labodas, a place called Thermae Hypnites, in Sicily, famous for its baths, and situated near the mountain now called S. Calangero.

Ad Aquiae, a denomination distinguishing several places in Mauritania, Attica, Gaul and Italy.

Ad Are, the name given to various places, in which altars were erected; one in Asia between Thirronia and Mellentini, not far from the Ephrates; and another in Boetica, in Spain, between Alcigen and Corduba.

Ad Arenum, a place of Etruria, in Italy, well of Florentia.

Ad Areus, a place in Venetia, between Vicentia and Verona.

Ad Basilica, a place of Africa, in Numidia, between the colonies of Saldae and Igilus.

Ad Brevium, a place in Italy, 30 miles from Rome, now Valmontone.

Ad Claudius, Bagnacavallo, in Italy, was also called Tiberiacum.

Ad Calculus, called by Aristotheles Phelis, was situated in a small island near Etruria.

Ad Celum, Cagli, a place of Umbria in Italy, on the Flaminian way.

Ad Colonia, a place in Italy, between Salernum and Marcellinum in the Appian way, called also Ad Colorem.

Ad Caprea, Capea, Capria, a country near Rome in which Romulus died.

Ad Capre, Carere, Capraia, a district of Umbria in Italy, where Totila, king of the Goths, died of his wounds.

Ad Cyntha, a denomination given by the Romans to several places where they had capra or camps.

Ad Centuriam, a place of Gaul, about five miles from Sumnum Pirenoæ, belonging to the Sardones.

Ad Centurium, a place in Italy, south-east of Asculum, so called, because it was at the distance of 100 miles from Rome. The Romans, who paid great attention to the measurement of distances, denominated places by their distance from Rome, in miles.

Ad Centuriones, a place in Spain near the Pyrenees.

Ad Colonna, a place in Italy, five miles from Ravenna.

Ad Columnam, was situated in Brutium, north of Regium, and opposite to the town of Messina, in Sicily.

Ad Conficius, a place in Italy, between Cefena and Arrimun; and another small place near Parma.

Ad Costias, Casa, was situated between Vercele and Lannemell, in Italy.

Ad Cripis, now Oria, a place of Mauritania Caesariana, in Africa.

Ad Dianum, a place of Numidia, in Africa, 32 miles from Hippo-regius.

Ad Dioneum, a place in Mauritania Cæsar, between Albuna and Regia, south-east of Siga: there was also a place of the same name in Armenia minor in Asia, between Otostadizio and Aza.

Ad Duas Columnas, a place of Italy, between Laumellum and Ticinum.

Ad Dunedin, the name of a place in the Cottian Alps, south-east of Segellus, and of another in Italy, north-east of Patavium.

Ad Dunedinum, a name applied to several places, one in Magna Graecia north of Hydruntum; another belonging to the Ædai, between Augustodunum and Caballunum; another in Gaul, between Dividurum and Decum Pagus, belonging to the Mediomatrici, and another, now Doodever, between Nomentanus and Luguinum Batavorum.

Ad Duas Poente, a place in Spain between Vicus Spacci-orum and Grandinum.

Ad Eufem, a small place in Umbria, north of Iguria, in the Flaminian way between Herrilus and Cale.

Ad Forum Martis, a place of Gaul in the Cottian Alps, well of Ocellum.

Ad Ferona, a place near Mount Soracte, in the territory of the Faliscii, north of Rome, where were a temple and grove consecrated to the goddess Ferona. There was another Ferona south-east of Luna, near the road to Luic.

Ad Pica, or Picus, a place of Numidia, south of Igilugilis.

Ad Picas, a denomination given by the ancients to certain places, because they were on the limits of a country. There were several places of this name in Italy, Belgium and Gaul. See Ad Picas.

Ad Pica, a place in Italy, between Brixia and Ari-licia, West of the lake Benacus.

Ad Plumen, a place in Pannonia, corresponding to that which is now called Saint-Viën–Flam, in Croatia.

Ad Promillus, a place of Noricia.

Ad Gallum Gallinacum, a place of Africa propria, in the road from Utica to Cartaghe.

Ad Grano, a place of Italy, north of Clusium, and well of Cortona.

Ad Herennium, the name given to the port of Leghorn in Toscana; also to a small place in the island of Sarclania; and to another 12 miles from Gades, called Tempulum Hercu- lana.

Ad Heres, Cane, a place of Gaul, between Antipolis and Forum Julii, pertaining to the Oxybi.

Ad Interitis, a place of Italy, belonging to the Scrones, between Callis and Forum Sempontinus.

Ad Laco, a place of Pannonia, in the route from Sirmiun to Solona.

Ad Laminas, was situated between Varia and Carfeoli in Italy, and belonged to the Æqui.
Ad Laphadum, a place of Great Britain, supposed to be between Winchester and Southampton, and to be that which is now called South Stonum.

Ad Lippas, a place of Spain, between Celicionico and Sertice.

Ad Lullam, now Arguellas, in Gaul, belonging either to the Morini or Ambiani.

Ad Martis, the name given to different places in Umbria, Etruria, and the Alps.

Ad Matrem Magnam, a place belonging to the Hirpinii, supposed to be the situation of the abbey on Mont Vergine.

Ad Medias, a name given to a place in the island of Sardinia, to another of Infubria in Italy, and to another, called Meza, in that part of Latium in Italy inhabited by the Volsci.

Ad Morum, was situated in the route from Carthage to Calhulon, between Elicroca and Balli.

Ad Novum, a denomination given to several places, whose distance was nine miles from a more remarkable station; one north of Boville in the Appian way; another in Campania, nine miles from Capua; another, nine miles from Mediolana or Milan, now Marignan, according to Cluver; another in Venetia, south-east of Altium, and another west of Æmona; and another, denoting a station in Gaul among the Tolofates, between Tolosa and Badera.

Ad Novas, a place in Italy, near the mouth of the Rubicon, on the borders of the Adriatic gulf: another place in Italy belonging to the Sabines; another in Spain between Illerda and Tarraco; another in Etruria, south-east of Cofa, and another north of Clunium; and another in Upper Maris.

Ad Octavia, an appellation denoting the distance of eight miles from a well-known and principal place; one in Italy belonging to the Taurini, and another in Umbria, partly occupied by the Senones; and another in Doria Minor.

Ad Oliva, a place of Africa; in Numidia, south-east of Saldae, and east of Tubulpius; and also in Sicily, in the route from Agrigentum to Lyceburgum.

Ad Opulentos, a place of Campania in Italy, near the sea, and three miles from Pompei and Stabia.

Ad Palatium, a place in Venetia upon the Athein, four miles south of Tridentum.

Ad Pertice, a place near Ticinum or Popesc, still called Santia Maria del Pertice.

Ad Petras rubra, or ad faxa rubra, a place near Fidenza, now Borgoteto.

Ad Pirum, a place of Italy in the Appenines, 12 miles from Venusa, in Apulia. Another is also in the extremity of Italy in the Julian Alps, in the route from Aquileia to Æmona.

Ad Pirum, a place of Italy in the Samnium, and another, with the addition Philimenti, in the Adriatic gulf, between Metaurus and Sena Gallica.

Ad Pontum, a denomination given to several places which had bridges: one in Great Britain, now Lincoln; another of Boetica in Spain, between Gades and Corduba; another Æri, in Vindelicia; another, Ixia, in Norica; another, Muri, in Norica, now Muran; another, Sonti, south-east of Forum Julii.

Ad Publicanos, a place of Gaul, on the confines of the territories of the Allobrogi and Centrones, between Catusria, Mantala and Obtium.

Ad Quartum decimum, a place in Venetia, E. of Æmona.

Ad Quintana, a place of Magna Graecia, in Apulia; and of Italy in Latium, on the Latin way.

Ad Regiones, a place of Upper Media, on one of the streams which form the river Gyndes.

Ad Rotum, a place of Numidia, in Africa, between Cirta and Lambetha.

Ad Rotas, a place of Italy belonging to the Cenomani.

Ad Rubrata, a place of Boetica, in Spain, belonging to the Turdetani, and another of Mauritania, in Africa, between Calai and Ad Regias.

Ad Sabella, a place in Scythia, situated on the borders of the Black Sea, near the most southerly mouth of the Danube.

Ad Salinas, now Spatana, a small place on the Adriatic gulf, between the confines of the Pretutti and Velumni.

Ad Sima, a place of Italy, situated according to Cluver in Venetia.

Ad Septem Arae, a place in Spain.

Ad Septem Frates, seven mountains of Mauritania, known by the name of Abylia; at the bottom of which was a town called Spia, whence the modern Cetara.

Ad Septimum decimum, a place of Spain, 17 miles from Tarraco.

Ad Sex Insulae, small islands, whose situation is not precisely ascertained; but M. d'Anville places them near a small promontory, south of Malaca in Boetica, and north-east of Pariciata on the coast of Mauritania Cofaritensis.

Ad Sextus, or Ad Sylvis, a place situated by the Peutingerian tables on the Adriatic gulf, 12 miles from Sena Gallica.

Ad Sextum, a name given to two places in Italy; one in the Claudian way, north-west of Rome, and south-east of the Veii, and another in Etruria, south-west of Sena. It is also the name of a position in Gaul, Retis or Ararat, between the Arefi to the west, and Humisacro to the east.

Ad Silvanus, a position in Gaul, between Segodunum to the south-west, and Anderus on the north-west, on the frontiers of the Ruteni and Gabali.

Ad Silvium, or Ad Silvium, is placed by M. d'Anville in Apulia, between Venetia to the south, and Blera to the south-east.

Ad Solaria, a place of Etruria, in Italy.

Ad Sorruc, a place marked by Antonine, 25 miles from Emerita Augulia, in the road across Spain to Cesar Augusta.

Ad Speluncas, a small place of Italy, in Meffapia, on the sea-coast, west of Brundusium.

Ad Sponias, a place of Italy, in the Appian way, between the position of Tres tabernas and Forum Apuli.

Ad Stabulum, a position of Gaul, between Iliberia on the north-east, and Ad centuriones to the south; situate at the foot of the Pyrenees, and belonging to the Sarbones.

Ad Statum, a place of Etruria, in Italy, 25 miles from Arctium, and 12 from Clunium; another, between Labicum and Præneste, in the Labican way; another in Spain in the route from Valenti to Carthage; and another, in Paonia on the Danube, between Luffianum and Ripa Alta.

Ad Tabernam frigidum, a place of Etruria, in Italy.

Ad Tarum, a position in Italy on the Tarus.

Ad Telix conqua, a place of Africa, to the south of Byzacene.

Ad Titulus, a place of Liburnia, in the route from Terracina to Tariffa.

Ad Tres Insulae, small islands placed by M. d'Anville in a small gulf, south-east of Rufsdir, south-west of Siga, and nearly south of Charidenum, pertaining to Boetica.
AD

Ad tres Tabernas, a place in Italy on the Appian way, 17 miles from Aricia, called Calcello.

Ad Tresfium, is situated 30 miles, as the name imports, from Aquilia, now Trieste; another position in Gaul, 50 miles from Narbo Maritius, whence the itinerary reckons the distances.

Ad Tropae, a place of Italy in Brutium.

Ad Turres, a place of Sardinia, known by the name of Turrit Libidinos. It is also the name of a place, called Toures, in a part of Gaul, called the third Narbonnec, pertaining to the Suecters, north-east of Marilia, and south-east of Aquitania.

Ad Turres, a place on the Aurelian way, in the territory of Cernic; another, on the Appian way in Brutium, north of Vibo: another at the extremity of the prominent Circium: another, in Liburnia, on the road from Aquilia to Siga, south-east of Tarfatica; another in Spina, between Valtar and Cartagio; and another between Augusta Emerita and Augusta Caezarea. Ad Turres alba, is a place in Italy between Circium and Aquitania.

Ad Undaeum, a place of Venetia, well of Aqui- lia; in the road that leads to Altinum.

Ad Urbanus, a place of Campania in Italy, between Capua and Teanum, called by M. d'Anville, after Piny, Urbana, and also Colonia Sillana, from the colony established here by Sylla.

Ad Viciusum, a place of Italy, 20 miles from Rome, on the Flaminian way, south-west of Capena: another, in Lucania, on the gulf of Tarentum, north of Sybaris, and south of Heraclea; another, in Acha Minor, in the road from Trepzas to Satala, in Armenia Minor: and another, called by M. d'Anville Ad Vigeum, south-east of Tolosa, between Badora and Eluido.

Ad Viciorrius, a small place of Italy in the road from Sutula to Bononia.

Ad Villam Serviliam, a place of Numidia in Africa, 20 miles from Hippo Regius, in the way to Cirta.

ADA, in Geography, a town of Achaic Turkey in Nustria, about a league from the river Zacatur, in the road from Constantiople to Ifkhan.

Ada Gulf, lies on the east side of Kaffa Ismaite, and to the east of port Hadshilarch, having a town in the north-west part of it.

ADABA, in Ancient Geography, a town of Media.

ADAC, a lake whence one of the branches of the Tigris flows.

ADACHA, a town of the Palmyrene region in Aia.

ADAD, compounded of Ad with itself, was used, says Mr. Bryant (Antiq. Mythol, vol. i. p. 23.) for a supreme title, with which both kings and deities were honoured. Macrobius (Saturn. i. l. c. 23.) says, that it signified one, and was so interpreted by the Assyrians, who gave this name to their supreme deity. Mr. Bryant supposes, that what Macrobius renders one, should be the chief; and he observes, that in the language of the Syenites, and whenSingle, was conferred upon a Babylonish deity, but when repeated, it denoted greater excellence. We read of Adad, king of Edom. Gen. xxxvi. 35. 1 Kings xi. 14. And there was another of the same name at Damascus, whose son and successor was named Benhadad, 1 Kings xx. 1. The kings of Syria, according to Nicolaus Damascenus (see Jos. Antiq. i. vii. c. 5.) for nine generations had the name of Adad. The god Rimmon was styled Adad, Zechar. xii. 11. The feminine of Adad was Ada, and this was a sacred title, and appropriated by the Babylonians to their chief deities. The authors of the Ancient Universal History are of opinion, that Benhadad II. was deified by the Syrians, under the title of Adad or Aler. By Adad they meant the sun, and represented him with rays darting downwards to express his beneficence. But this honour would have been more fitly due to the prosperity of Hazael than of Benhadad, who was often unfortunate. And Josephus (Antiq. i. vii. c. 6.) informs us, that they were both deified. Adad was not properly a Babylonian deity, but one who had been deified by the ancient Syrians, and probably revived again after the destruction of the Babylonian empire, whose gods must have brought him into discredit. Adad, thus degraded, and afterwards reinvoked, was the sun, as well as Tiel or Baal, Osiris and others. Anc. Un. Hist. vol. i. p. 443. vol. iii. p. 301. 8vo.

ADADA, in Ancient Geography, was a town of Phledia to the south call of Seleucia. There was also a town of the same name in Syria, situate to the north-west of Palmyra, and at no great distance from it. We also find a place of this name mentioned by Josua, (ch. xv. 22.) and in the list of towns of Edom.

ADAD Rimon, a city of Judah, situate in the plain of Megiddo, in the valley of Jezebel, in the half-tribe of Manasseh; where Josiah, king of Judah, was killed by Pharaoh Necho, king of Egypt. It was afterwards called Maximianopolis, in honour of the emperor Maximilian. It is 17 miles from Caesarea in Palaetina, and 10 miles from Jezreel. Cant. 20.

ADAE, a town of Phrygia, which Strabo places at the foot of mount Ida.

ADAE, a people of Arabia, placed by Ptolemy in Egypt, in a country encompassed by mountains near the lower eataract of the Nile.

ADAGE, a sententious proverb or popular saying. Eraastus has made a large and valuable collection of Greek and Roman adages from their poets, orators, philosophers, &c. Mr. Ray has done the same with regard to the English; and Kelly has made a collection of Scots proverbs.

ADAGIO, in Music, one of the words used by the Italians to denote a degree or distinction of time. Adagio expresses a slow time; the slowest of any, as some have said, except grave. Used sublilntly, it signifies a slow movement. Sometimes this word is repeated, as adagio, adagio, to denote a still greater retardation in the time of the music.

Adagio has been said by Rouffeau and others to be the slowest degree of time in musical measures, except grave; but we think that exception erroneous. In Cordi's works and those of his contemporaries, we find that quavers in adagios, vocal and instrumental, are sung and played as slow as crotchetts in grave. An adagio in a song or solo is, generally more than an outline left to the performers abilities to colour: and the performer who is not enabled to interest an audience by the tone of his voice or instrument, and by taste and expression, should never be trusted with slow notes, in the performance of which the smallest defects are so easily discovered; and if not highly embellished, they soon excite languor and disgust in the hearers. The talent of executing an adagio well, in which performers of great powers of execution often fail, is a merit of the highest clas which a musician can possess.

ADAGUESA, in Geography, a town of Spain, in the province of Aragon, and situated on the Vero. N. lat. 41° 53', E. long. 2° 4'.

ADAGUS, in Mythology, a Pharianian deity, whom Bochart takes to be Hermaphroditus, the son of Venus and Mercury, from the similitude of sound forming of Adagus and Androgynus.

ADAJE, in Geography, a river of Spain, which runs into the Duero between Simancas and Tordesillas.
ADAIA, Porte de, a large harbour on the north-east of the island of Minorca, well sheltered by the mountains from north-west winds. It is north-east of mount Tossa.

ADAIR's Harbour lies on the west side of Falkland sound, and nearly opposite to Jordan's bay on the east coast. It is distinguished by a high hill to the north-west of it. Within the harbour the water is from eight to ten fathoms deep; but the numerous rocks and breakers on the coast are dangerous. This harbour is by some called Port Howard.

ADAL, in the sense of Paracellus, signifies that part of plants in which their medicinal virtue consists; or the pure and active parts of plants, separable from the impure and inert.

ADALARD, or Adelard, in Biography, the son of count Berard, grandson of Charles Martel, and cousin-german of Charlemagne, was born about the year 753. Having abandoned the court for the religious habit, he was nominated by the emperor to the abbey of Corbie, and afterwards appointed prime minister to Pepin king of Italy. In 823, he founded the celebrated abbey of New Corbie, in Sicily; and died January 2, 826, at the age of 72, much lamented by the virtuous and the learned. He was an excellent linguist, and denominated the Augustinian of his age. His principal work was, "A treatise concerning the order, or the state of the palatine, and of the whole French monarchy." Biog. Dict.

ADALBERON, Ascellinus, was an ambitious prelate, and a fervile courtier. He was consecrated bishop of Laon in 977, and died in 1030. He is the author of a rhetorical poem, dedicated to king Robert, of which an edition was published in 1653, in 8vo. by Adrian Valois, at the end of the panegyric on the emperor Berenger. It contains several curious historical facts. Biog. Dict.

ADALBERT, a German divine of the tenth century, archbishop of Magdeburg, was educated in the monastery of St. Maximin of Treves, and was employed in 961, to preach the gospel to the Russians. He was more successful after his return from this embassy, in his labours among the Slavonians, on the borders of the Elbe and Oder. He died in 981. Dupin's Eccl. Hist. 10th cent. vol. iv. p. 58.

ADALBERT, bishop of Prague, in the tenth century, was one of the first founders of the Christian religion in Hungary. He also preached the gospel in Prussia and Lithuania, where he was murdered by Sago, a pagan priest. Dupin, ubi supra. Mollem's Eccl. Hist. cent. x. vol. ii. p. 378, 8vo.

ADALIDES, in the Spanish policy, are officers of justice for matters that respect the military forces. In the laws of king Alphonso, the Adalides are mentioned as officers appointed to guide and direct the marching of the forces in time of war. Lopez represents them as a sort of judges, who take cognizance of the differences arising upon extremities, the distribution of plunder, &c.

ADALUS, in Techogyph., a name given by authors to the Sturgeon.

ADAM, in Biography, the first man whom God created, and the original parent of the whole human race. He was formed by an immediate act of divine power, out of the dust of the ground, as his name imports, on the fifth day in the first arrangement of the works of creation; and God breathed into his nostrils the breath of life, so that he became a living soul or person. Gen. ii. 7. We read also, Gen. i. 27, that God created man in his own image. He was then placed in the garden of Eden, a particular district which was previously ordained and adapted for his subsistence and accommodation. In process of time, probably after some experience of the inconveniences of solitude, and after he had found that the various animals which had passed in review before him, and to which he had given names, afforded no proper companion, he was provided with a suitable helpmate; who, being formed of a rib taken out of his side, when he was in a deep sleep, as the history informs us, Gen. ii. 21, was called Woman. Adam and Eve thus created as fit associates for each other, did not long enjoy, with the security and satisfaction of innocence, the happiness which was designed for them. In the garden, which was the appointed place of their residence, and from the productions of which they were to derive the means of their support, there was one tree, called the tree of the knowledge of good and evil, the fruit of which they were forbidden to eat; and the prohibition was enforced by the awful function, that in the day they did eat of it they should surely die, Gen. ii. 17. The woman, seduced by the misrepresentation of the serpent, and by the alluring appearance of the fruit, disregarded the prohibition; and having herself tasted it, gave it to her husband, who likewise shared her guilt; and they both became obnoxious to the threatened doom. The consequences of their transgression were shame and fear. The man was also subjected to labor, and the woman to the pain of child-birth, and to the dominion of her husband. They were both excluded from paradise, and their return to it was prevented by an awful apparition, i.e. by cherubins and by a flaming sword. Gen. iii. 24.

After their expulsion from paradise, they had several children; but of these the scripture records the names only of three, viz. Cain, Abel, and Seth. The life of Adam was prolonged to the age of 930 years. The time of the death of Eve is not recorded in scripture; but some have presumed to say, that she survived her husband ten years. Such is the concise account which the scriptures give us of the origin of the human race; but this account, even if we allow Moses to have been the writer of it, was not compiled till about 2500 years after the creation; and, in the opinion of many, it is either wholly, or in part, so blended with allegory, that it is not easy to give a satisfactory explanation of every circumstance to which it alludes. Whether it be understood literally or allegorically, it suggests many curious questions, which have furnished scope for much learned criticism, and for a variety of fanciful conjectures.

As to the etymology of the name Adam, the greater number of biblical interpreters have derived it from 아담, Adam, signifying the earth or mould, or as some render it, the red earth, of which he was formed. According to Mr. Bryant, 아Dam signifies fire, or chief, and in this sense it may be applied to the appellation Ad-am. This conjecture is confirmed by the title of the term protagony, or first-born, in Sanchoniatho, which seems to be the Greek translation of the Egyptian title of Adam, taken, as this author professes, from the pillars of Thoth; and also by a hint of that admirable scholar Sir William Jones, in his Asiatic Researches, who queries whether Adam may not be derived from Adon, which in Sanscrit means the first, and is the name of the first Men. Mr. Parkinson supposes the name Adam to be derived from 아담, Adam, used for Ebenen, (Gen. v. 1.) and thus to denote the likeness of God, in which Adam was created. Ludolphus (Hist. Ethip. p. 77.) deduces it from the Ethiopic Adon, which signifies beautiful, elegant, or pleasant, and refers it to the able effusion of his frame and shape, as being the matter-piece, to speak more humanum, of his creator. But whatever be the true etymology of the name, it is an appellative, rather than a proper name, and comprehends both the sexes.

The time of the year in which Adapa was created has been
been also a subject of diffusion. This has been most generally supposed to be the annual equinox, which is the 21st from which the year anciently commenced.

According to Blair, in his first chronological table, Adam and Eve were created on Friday the 28th October, ante Christi, 4004; and Adam died 3074 ante Christi, at the age of 930 years.

Another subject of inquiry has been the place where Adam was created, and in which his first habitation was assigned. See Eden.

A confiderable difference of opinion has prevailed with respect to the vigour of Adam's intellectual faculties, and the degree of knowledge which he possessed at the time of his formation. We may reasonably imagine, that, as our first parents were created in an adult state, they were immediately capable of the full exercise of their natural powers and faculties; and there is a certain dignity of intellect, as well as rectitude of will, that is probably implied in the expressions "of our image," and "of our likeness," in which God is said to have created them. Mr. Shuckford, however, (Creation, &c. of Man, p. 74, &c.) refers this expression to the structure of his body, which was superior to that of other living creatures, accordingly to Ovid's description, Os hominis fulmine detellis.—Metem. or to Cicero's (De Leg. lib. i.) Figuram corporis habilien et aptam ingenio humano detellis, &c.:—And he supposes, that this is an Hebrew form of speech, which refers to God whatever is most excellent in its kind. He adds, that this expression denotes his designation for immortality, so that he was born to die. But whatever were Adam's original powers, without exercise, and without experience, his actual knowledge must have been, in a very considerable degree, restricted and partial.

It seems, therefore, unreasonable and unnecessary to suppose, that he was endowed with a much greater comprehension and vigour of mind, and with a greater compass of knowledge than any of his descendants; and that he was, in real attainments, as well as in capacity of improvement, little inferior to higher orders of beings. The knowledge that was adapted to his condition, and that was subordinated to immediate use, was without doubt communicated to him at his first formation: and as he had no native prejudice, and no unreasonable propensity or bias to mistake, he possessed peculiar advantages for extending his knowledge, and more especially his moral improvement. But as religious principles, devout affections, and virtuous dispositions are established and strengthened by exercise and discipline, it may be supposed that, without some supernatural defence and assistance, which his history does not mention, he would be liable to be seduced and overcome by a temptation, which the maturity of habit, and the wisdom of experience might have enabled him to withstand. See Fall of Man and Original Sin.

Adam possessed, without doubt, the necessary powers of articulation, and the faculty of speech; but in the exercise of these faculties he must have been puzzled and perplexed; nor is it easy to conceive, that the few words of which even the scanty vocabulary that served his necessities consisted, could have been invented by him, nor the grammar of that language, which was afterwards enlarged and improved, could have been devised by him without a supernatural communication. See Language.

How long our first parents continued in paradise before or after their fall is a question, for the solution of which we have no sufficient evidence, nor indeed are such questions of any real importance. It is probable, that they were not removed to any great distance, and that they found scope enough for their attention and labour near the spot where they were first settled, and from which they were excluded, according to the literal acceptation of the scripture-history. The scriptures give us no information as to the place where Adam was buried. St. Jerome inclines to the opinion of some who think, that he was buried at Hebron, in the cave of Machpelah, afterwards bought by Abraham for a burying-place. The eastern Chriftians say, that he gave orders to have his body embalmed, and deposited in a cave on the top of a mountain, which cave was called Al-kénuz, from an Arabic word which signifies to lay up privately; and it is alleged, that this order was given to prevent his polliery from worshipping his relics. It is added, that he ordered his body to be placed in the midst of the earth, because thence should proceed his salvation, and that of his posterity. The primitive fathers generally believed, that he died in the place where Jerusalem was afterwards built, and that he was interred on Mount Calvary, on the spot where Christ was crucified; and where a chapel was erected in honour of him. Some of the Arabsians inform us, that he was buried on mount Aboucaïs, near Mecca; but the ancient Persians say, that he was buried at Serendib, where his corpse was guarded by lions at the time of the war of the giants.

As to the reveries and fables of Jewish Rabbins and Mahometan writers, they are feecerly worthy of being recited. As a specimen, however, the following particulars may be subjoined.

Some of the Rabbins say, that Adam was distinguished by his personal beauty, and that God, before he formed him, assumed a human body, after the pattern of which he was created. They also pretend, that his stature was so gigantic, that it reached even to the heavens, and extended from one end of the world to the other; and that it was reduced after his transgression, first to the measure of 100 ells; and, as others say, to 1000, or 900 cubits, which was done at the request of the angels, who were terrified at his enormous stature, or who were envious and jealous on this account. Thus they pretend he was able to pass through the ocean, which separated Eden from the other parts of the world. Similar to this is the description given by Polyphemus by Virg., Æn. L. iii. v. 664, and of Orion. Æn. i. x. v. 763. Writers of this class assert, that Adam was at first both male and female; and that he confitted of two bodies joined together by the shoulders, and that Eve was formed by merely separating the one body from the other. But more absurd even than this is the opinion of Paracelsus, (vid. Vofius de Philos. c. ix.) Negabat primos parentes ante lyphum habemis partes generationis hominis necessarios: crebros posse accidisse, ut humanum gutturi. The Jews, in order to exalt the importance of the rite of circumcision, affirm, that Adam was created in this state, and that one part of his transgression consisted in his attempt to obliterate the traces of it. Some of them have also imagined, that Eve was the forbidden fruit, and that Cain was the producìon of the serpent, &c.

The Mahometan writers, in their account of the creation, and first state of man, blend many fables with the particulars, which they seem to have borrowed from the Jewish scriptures. They say, that Azrael, notwithstanding the pre-illumination which he had received of Adam's rebellion, executed the commission for creating him, though the other angels to whom it was proposed had declined the office, and for this reason he was called the angel of death. The earth of which he was formed was, as they say, carried into Asia, to a place near Mecca, where it was prepared by the angels, and fashioned into the human form by God himself. The angel Eblis, afterwards the devil, dreaded a superior,
treated the materials of the human frame, which were left to dry for forty days, or as some say, so many years, with contempt. The clay, it is said, was animated by the Almighty, and endowed with an intelligent soul; and Eve was formed after Adam had been placed in paradise, out of his left side. This paradise Mohammed conceives not to have been on earth, but in the seventh heaven. When our first parents were cast down from paradise, Adam is said to have fallen on the side of Seruenda, or Ceylon, and Eve near Mecca; and after a separation of 200 years, they were conducted to each other by the angel Gabriel, on a mountain near Mecca, and afterwards removed to Ceylon, where they propagated their species. In this island there is a mountain called Picco del Adam, on which they drew the map of Adam's foot, of an enormous size. Sale's Koran, c. ii. p. 4. &c. The Rabbins and Mussulmans give strange reports of Adam's knowledge. They ascribe to him the invention of the Hebrew letters, and a degree of inspiration, which enabled him to write a great number of books on different subjects, particularly one on the creation, and another on the Deity. They say, that he was the author of the 92d psalm, which was composed immediately after his creation. We have also an account among the apocryphal writings of a book called the "Revelations of Adam;" and there is another mentioned by pope Gelasius, called "Adam's penance."

Adam and Eve are honoured among the Greeks on the Sunday preceding the festival of Christmass, and on Feb. 4, the first day of their Lent, they commemorate their exclusion from paradise with religious mourning and humiliation. In some Latin martyrologies there are fixed days for the commemoration of Adam; as March 25, April 24, and Dec. 24.

Of the opinion of Tatian concerning Adam, see Tattianiies.

Adam Melchior, a writer of the 17th century, was born in the district of Grotkow, in Silia, and educated in the college of Brug. He was appointed rector of a college at Hildenberg, where he published his first volume of ilustrious men, "Vita illiusiorum virorum," in 1615. This volume consisted of philosophers, poets, writers on polite literature, historians, &c. It was succeeded by another, in 1619, which treated of divines; by another of lawyers; and by a fourth of physicians, both of which were published in 1620. The subjects of these volumes were the lives of learned men, who were either Germans or Flemings of the 16th, and beginning of the 17th centuries: in 1618, he published a volume containing the lives of twenty divines of other countries. All his divines, however, were protestants. The Lutherans thought him partial, and will not allow his work to be a standard of the learning of Germany. He wrote other works, such as "Apographum monumentorum Heidelbergenses;" "Notae in orationem J. C. Scaligeri pro M. T. Ciceroone contra Ciceroonum Erafini;" and "Parodie et Metaphrasis Horatianae." The catalogue of the Bodleian library ascribes to him the "Hilloria ecclesiast. Hamburg et Bremen," which, according to Mr. Bayle, was written by Adam, a canon of Bremen, in the 11th century. This work begins with the reign of Charlemagne, and ends in the time of the emperor Henry IV. To this work is annexed a description of Denmark, and the other northern kingdoms, with an account of the religion and manners of the inhabitants. The last edition of it was printed at Holmbad, in 1670. Bayle gives to Melchior Adam the character of an indolent collector, and acknowledges himself much indebted to his writings. He died in 1622. Gen. Dict.

Adam, Scotus, a doctor of the Sorbonne, who lived in the 12th century. He was born in Scotland, and educated in the monastery of Lindisfarne, now called Holy Island, near Berwick upon Tweed. He afterwards went to Paris, and became a teacher of school divinity in the Sorbonne. Towards the close of his life he returned to his native country, and became a monk, first in the abbey of Melrose, and next in that of Durham, where he wrote the lives of Columbus, and of other monks in the 6th century. He also wrote the life of David I. king of Scotland, who died in 1153. His works were printed at Antwerp, in fol. in 1659. Biog. Dict.

Adam, Lambert Sigisbert, an eminent sculptor, was born at Nancy, in 1720, and first instructed by his father, who exercised the same profession. In 1719, he came to Paris for further improvement. From thence he went to Italy, where he spent ten years, and finished several considerable works, one of which, viz. the restoration of the mutilated group of the family of Lycomedes, discovered by cardinal Polignac, in the ruins of the villa of Marius, gained him great applause. He also formed a model for the fountain of Trevi, which was much approved, but he was prevented from executing it by the jealousy of the Italians. After being admitted a member of the academy of St. Luke, at Rome, he returned to Paris in 1753. Here he executed several designs for the decorations of palaces, gardens, &c. of which the most celebrated are, a group representing the union of the rivers Seine and Marne, at the cascade of St. Cloud, two groups of hunting and fishing, Neptune calming the sea, the triumph of Neptune at Versailles, the bas relief of the chapel of St. Adelaide, St. Jerome, Poetry, and Mars encreased by Love. In 1754, he published a collection of antique Roman and Greek sculptures, designed by himself, and engraved by able artists, in folio. Exceps of application brought on an apoplexy, of which he died in 1759. The style of his works is harsh and savage, resembling rocks by their deep cavities and aperities; but they manifest an acquaintance with the antique, and furnish specimens of patient thought and labour. Gen. Biog.

Adam, Nicholas Sebastian, second brother of the preceding, was born at Nancy, in 1705. From Paris, whither he went for improvement, he removed to Rome in 1726, and subsistently applied for nine years to the study and imitation of the antique, devoting his leisure hours to painting. In 1734, he came to Paris, and by his models of Clitie, and the sacrifice of Iphigenia, obtained the applause of the academy of painting. He also admirably succeeded in his model of Prometheus chained to the rock. His bas-relief for the chapel of Versailles, respecting the martyrdom of St. Victoria, is reckoned one of his best performances. He assisted his brother in executing the group of Nostereuse, and in 1740, he obtained the apartment of the deceased Rouet, in the Louvre, which is a favour granted only to excellent artists. In 1757, he was urged, by liberal offers, on the part of Frederick king of Prussia, to remove to Berlin. His younger brother, to whom the offer was made by the elder Adam, accepted the proposal; and Nicholas remained at Paris, where he was employed by king Stanislaus in executing a monument for his queen in a mausoleum near Nancy. His last performance was the Prometheus, which was greatly admired. This artist was estimable for the simplicity, integrity, and mildness of his character, which conciliated the friendship of his brother artists. He lost his sight several years before his death, which happened in 1778, at the age of 74. Gen. Biog.

Adam, Gaspar, was born at Nancy, in 1710, and pursued the fame course of studies with his brothers above-mentioned.

ADAM of Frankfurt. See ELSHEIMER.

ADAM, Robert, an eminent architect, was born in 1728, at Kirkaldy, in Fifeshire, and educated in the university of Edinburgh. Upon his return from Italy, in 1752, he was appointed architect to his majesty, but resigned this office in 1768, on being elected to represent the county of Kinross in parliament. The genius of Mr. Adam extended itself beyond the decorations of buildings, to various branches of manufacture; and besides the improvements which he introduced into the architecture of the country, he displayed great skill and taste in his numerous drawings in landscape. Such were his affluency and activity, that in the year preceding his death, he designed eight public, and twenty-five private buildings. The new university of Edinburgh, and many other considerable edifices were erected from his designs, and under his direction; and they are hinging monuments of his distinguished talents in the line of his profession. He died March 2, 1792, and his remains were interred in the south aisle of Westminster Abbey. His brother, James Adam, who died, October 29, 1794, was also eminent as an architect; and his abilities are apparent in the Adelphi buildings, and Portland place, in London.

ADAM, in Geography, a town of European Turkey, in Moldavia, ten miles north-north-west of Galatz.

ADAM, or Adam, in Ancient Geography, a town of Perza, on the banks of Jordan, where the river began to be dried up for the passage of the Israelites over against Jericho. Joshua, ch. iii. 16.

ADAM'S Apple, in Botany, a species of Citrus.

ADAM'S Bridge, or, according to Sir William Jones, "Raman Bridge," in Geography, a ridge of sands and rocks, extending across the north end of Manara gulf, from the island of that name, on the north-west coast of Ceylon, to Ramancote, or Ramancoil island, off Raman point.

ADAM'S Needle, in Botany. See Yucca.

ADAM'S Peak, in Geography, a high mountain in the island of Ceylon, in the form of a fagar-loaf, and terminating in a circular plain about 200 paces in diameter. The summit is covered with trees, and intersected with streams, and has also a deep lake, which supplies the principal rivers that water the island. This mountain is seen at the distance of twenty leagues at sea; but though its height is considerable, it is not equal to that of the Pic of Teneriffe. Lat. 5° 55'. Long. 80° 39'. See Adam.

ADAMAN. See Adam.

ADAM, a high mountain in Abyssinia, being one of the ridges of the range of mountains called Ami. Ami.

ADAMANT, one of the fenced cities belonging to the tribe of Nephtali, mentioned Joshua vii. 37, and called by the Seventy Armasthy, and by the Vulgate Edama. It was also called Nebbe.

ADAMANT, Adamas, in Natural History, an ancient name for a precious stone, by us called a diamond. Adama is used by Pliny ancient naturalists for the spume or foam of gold, which, not being malleable, is cast away. This is particularly called 

ADAMANT is sometimes also used for the Magnet, or loadstone; in which sense Skinner thinks it may be derived from the French aimant, which signifies the same.

ADAMANT, in Ecclesiastical History, a name given by some Chalilian historians to the followers of Origen, for named Adamantius, on account of his indefatigable industry in reading and writing, or the strength and acuteness of his reasoning, according to some; or rather, as Harnack says, because his name was Adamantius; however, Eusebius, (lib. vi. cap. 14.) this was a common name given to Origen, without assigning any reason for it. There was another person named Adamantius, and mentioned by Landor (works, vol. iv. p. 295.) as the author of a dialogue against the Marcionites, which he places about the year 326.

ADAMANTEA, in Mythology, the nurse of Jupiter in Crete.

ADAMANTINE SPAR, South adamantine. Corundum.—Nella corindone.—Corund. — Corund. We will consider Adamantinum Corundum, Linn. This stone is formed either crystallized or in masts. When crystallized its usual form is that of a regular hexagonal prism (CRYSTALLOGRAPHY, plate i. fig. 1.) of a rough surface, and but little external furite; this, however, being incapable of being split in a direction either perpendicular or parallel to its axis, is obviously not the primitive crystalline figure belonging to this substance. Crystals of adamantine spar are occasionally met with, which, instead of solid angles at the junction of the sides of the prism with the planes of the extremities, present alternate isofceles triangles of different sizes, but all forming solid angles of 122° 34', with the extreme planes of the crystal (fig. 2.); if by following this indication of nature we detach successively the crystalline laminae, we shall at length entirely have the hexagonal prism, and shall have in its place a rhomboidal parallelepipded (fig. 3.) of which the plane angles at the rhombs will be 86° 46' and 44° 12'; the solid angles at the summit will measure 84° 31', and that at the reunion of the base will be 94° 26'. Also, the diameter G H will be to the whole height E F as A B to B F (fig. 4.) The parallelepipded thus obtained, can be split only in a direction parallel to its faces, and must therefore always preserve the same form, which is that of the nucleus or primitive crystal. In some infall the solid angles of the prism are replaced by isofceles triangular planes, in fig. 2., but which form solid angles of 156° 42', with the planes of the extremities; hence results a new modification which shews itself in the crystalline varieties (fig. 4, 5, 6.) A third modification is produced by the gradual decrease in diameter of the hexagonal prism; the varieties of this class are mostly irregular, but some specimens exhibit a regular truncated hexagonal pyramid (fig. 7.)

Corundum crystals are procured from China and India; those from the latter country are in general the purest. Of the Indian variety the colour is grey, with flakes of green and light brown; its fracture is indented and sparry, sometimes vitreous; its external fracture is casual, but generally very slight, that of its cross fracture is feeble, but when broken in the direction of its laminae, it is resilient; in thin pieces, and at the edges of the crystals it is transparent; it is brittle, and of such great hardness as to cut rock-crystal and most of the gems. See Gray, from 3, 950 to 3, 957. The Chinese variety differs from the Indian in containing grains of magnetic iron are disseminated through its substance; in being generally of a darker colour, and having externally a chalyxy lustre; its specific gravity is rather greater, and its hardness is commonly somewhat inferior. There are two varieties known of corundum in masts, that from Bengal is of a purplish hue, and compact fracture, sp. gr. 3. 876. It is called by the natives corund, that
that from the coast of Coromandel is of a foliated texture, and feems in fact to be confufedly crystallized, but its ip. ge. is only 2. 785.

Adamantine spar is used throughout India and China for the purpose of polishing red and gems, for which its great hardneds renders it peculiarly well adapted. Of the mines of this ione, and the method of procuring it in China and Bengal we have no account, but some interesting topographical information respecting the corundum of the coast was procured by Mr. Greville in 1792. In the Mylore country, about four miles south of the river Cavery not far from Caro, is an excavation from six to fifteen feet deep, running east and west about a mile and a half in the direction of a vein of adamantine spar that traverses a bill of gritty granite. The matrix of the vein consists of granitic fragments cemented by corundum; mafles of this, weighing several pounds, are cut out with iron crowns, and then broken to pieces, among which the crystals of corundum are found: these are loaded on horses and bullocks, and distributed to the call of siliculators or polishers throughout India; its price, at Madras, is about six shillings a pound.

This mineral appears to have been first brought into Europe by Mr. Bulkle, a correpodent of Dr. Woodward, who, in his catalogue of foreign fossils, published about 1799, has the following notices: "Nella corundum is found in fields where the rice grows; it is commonly thrown up by field-rats, and used as we do emery, to polish iron." "Tella corundum, Post St. George, Mr. Bulkle. It is a taliy ipar, grey with a call of green; it is used to polish rubies and diamonds." In Dr. Woodward’s additional catalogue of foreign fossils, 1795, "Nella corundum is found by digging at the foot of hills about five hundred miles to the southward of this place. They use it as emery to clean arms, &c. it serves also to grind rubies by making it like hard cement by the help of fick les mixed with it. East India. Mr. Bulkle." From this time no farther information was obtained concerning it till about 1767, when Mr. Berry, feal embroider of Edinburgh, received from Dr. Anderson of Madras a box of crystals, with information of their being the material used by the Indian lapidaries to polish crytals and all gems but diamonds. They were found by Mr. Berry to cut agate, cornelian, &c. but for minute engraving were not equal to diamonds, in consequence they were hid aside as curiosities. Dr. Black ascertained their difference from all the known European minerals, and their hardneds gained for them the name of adamanite ipar. In 1784, Mr. Greville obtained specimens from India, together with the native name corundum, which ascertained their identity with Dr. Woodward’s specimens. A description of its externall characters by M. de La Metheir and Hauy appeared in the Journal de phyicque for January and March 1787. Its chemical composition, however, still remained unknown till Klaproth was enabled, by the liberality of Mr. Greville, in sacrificing some specimens for the purpose, to undertake its analysis. The extreme hardneds of the adamanite ipar, rendered the first attempt to decompose it imperfect; by the strong nitro-muriatic acid, nothing was separated but the iron, which is accidentally diffused through the Chinefe variety, and after this the most concentrated acids were digested upon it in vain. Carboeic potashe ignited together with it for two hours, was perfectly inefficual, and even eleven times repeated calcination and fusion with caufic fods produced only a partial decomposition. The refults of the firft analysis were principally aluminous earth, together with a matter that appeared to be either a mixture of aluminous and ficateous earth, or a new fimple earth with peculiar properties. In this state of the inquiry Mr. Kirwan, and feveral other eminent chemists, were induced to confider the adamanite ipar as containing an earth fui generis, which was called the adamanite, or corundum earth. Soon after Klaproth, having improved his method of analysis by the use of caufic potasfe as a fofent, undertook a second time the analysis of this uncommonly refractory foil in which he compleatly fucceeded, reducing the fupposed adamanite earth to aluminous and filex.

The Chinese ipar yielded
Alumine - - - - 84.
Oxyd of iron - - - - 7. 5
Silic - - - - - - 6. 5

The Philosophical Transactions for 1798 contain a valuable paper on corundum by Mr. Greville, which is the last addition that has been made to our information on this subject; here we find the first authentic account of the corundum mine in the Mylore, the charafteric differences between the Chinefe and Indian varieties, the crytallography of the mineral by Count Bournon, and a comparison between the characters of corundum, TOPAZ, RUBY, and SAPPHIRE.

Corundum is said to have been found in France, in the Forez, by Count Bournon, and in Bretagne by Moreve; of thefe, however, the latter at leat is faid by Hauy (Journal des Mines.) to be titaneat. Perhaps a mineral found by M. Raifte at Tirez, one of the Hebrides, which was fuppofed by him to be Jade, belongs more properly to adamanite ipar; its specific gravity is 3. 49, and in hardneds it corresponds with the matrix of corundum, that is, it will scratch glass readily, but not rock-criytal. Greville on corundum, Philof. Tranf. for 1798. Kirwan’s Mineralogy, vol. i. art. Adamanite Ipars — Klaproth’s Analytical Effays.

ADAMANTINAE T Росс, in the Linnean Sytem of Mineralogy, denote the fifth order of earths; which are chiefly composed of adamanite earth. To this order belongs one species, which is the adamanite or corundum.

ADAMARIS, in Geography, a district of Abyssinia, near the province of Wauldena, containing several considerable villages, that are inhabited by Mahometans; who by their number and strength contribute to the safety of the monks in that part of the country. It is so called from Adamas, which in the Amharic dialect signifies plain, the name of an adjacent mountain. The river Anzo runs in a contiguous vallay. Bruce’s Trav. vol. iii. p. 179.

ADAMAS, in Agriculture, a name given to the moon.

ADAMAS, in Geography, a town of Cordova in Spain, seven leagues from Cordova. Adamas is also a river of India, the source of which Poemen places in Mount Uxentus, and its mouth in N. lat. 18° 7’ and long. 142° 4’.

ADAMBAEA,
ADAMBEA, in Botany, a genus of the polyandria monogynia class and order; the characters of which are, that the corolla has from five to seven petals, the calyx is hemispheric, and parted into five or seven divisions; the capsule is fleshy, covered by the calyx, containing five or seven cells, and polypermous. Glennia mentions one species; but La Maree (Encycl. vol. i. p. 39.) describes two, viz. A. globus, which grows on the coast of Malabar, in sandy and rocky places, rises to about seven feet, and sends forth branches which are terminated by panicles of fine purple flowers, large, and resembling roses; and A. kiefert, which grows on the mountains of Malabar to the height of about nine feet; its branches of flowers resemble those of the former species.

ADAMI, in Geography, a town of Judah, in the tribe of Nephthali. Josaph six. 33.

ADAMI, Poetam, in Anatomy, a protuberance in the fore-part of the throat. Some fancy, that it is thus called upon a strange conceit, that a piece of the forbidden apple, which Adam eat, stuck by the way, and was the occasion of it. In reality it is only the convex part of the first cartilage of the larynx, called articularis, and thyroid. This is usually larger in the male than in the female subject.

The name Adam’s apple, is also given to a kind of fruit frequent in Italy, resembling a lemons, faid to be a good remedy against the itch. See Citrus.

ADAMIC Earth, is a name which some have given to common clay, called also terra inda, rubella, and lutum. Woodr. Method. Polll. p. 4. The occasion of the name is supposed to be, that this is taken for the adamabls, or ruddy earth, of which the first man was formed. This application is likewise given to the mud deposited by sea-water, which is a sediment of the moist and mucky parts contained in it.

ADAMITES, or ADAMIANIS, in Ecclesiastical History, a sect of persons who took upon them to imitate the nakedness of Adam; as if man had been reinstated in his original innocence. They are supposed to have been a branch of the CARCOPRATANS and BASILIDIANI. Prodicus was their author, according to the accounts given by Theodoret; though, according to Tertullian and Clement of Alexandria, the followers of Prodicus were never called by this name. Epiphanius is the first writer who speaks of the Adamites, and he places them towards the end of the second century.

He professes to have no certain account of these people; but he says, that they met together, both men and women, naked as they were born; and so performed their readings and prayers and other acts of religious worship. They are a kind of monks, who reject marriage, and they call their church a paradise. When they approached their places of worship, which were made warm for their accommodation, they took off their clothes; and when they left them, they clothed themselves again. Dr. Lardner is of opinion that there never were any such people; and to this purpose he adduces, that they are not mentioned by any ancient writer before Epiphanius, and that he had no certain account of them; nor does he give the least intimation of the period or period in which this sect appeared. He does indeed say, that the Gnostics prayed naked; but they were a wicked people, and profaned lewdness in their assemblies; whereas he represents the Adamites as endeavouring to imitate Adam and Eve, not only in their nakedness, but likewise in the innocence of their original state. But Dr. Lardner thinks that Epiphanius’s charge against the Gnostics is not true. Theodoret’s account of this sect was borrowed from Epiphanius, as he had no knowledge of Prodicus, the reputed founder of it, but what he received from Clement of Alexandria, who does not say any such thing of him. Besides, it is said that Prodicus was against praying at all; and therefore the Adamite custom of praying naked could not be derived from him. Lardner’s Works, vol. ix. 337—340.

A similar sect appeared in the twelfth century, under the direction of one Taulamus, known by the name of Tancheus, who propagated his errors at Antwerp in the reign of the emperor Henry V. This was followed by the TURULINS.

In the fifteenth century Picard pretended to re-establish the law of nature, which, according to him, conflicted in two things, viz. community of women and nakedness. His followers are said to have walked naked in the public places; whereas the original Adamites only put off their clothes in their assemblies. See Bevoarde, Brehren of the free-spirit, and Picards.

An ingenious writer, viz. Beaufort, has shown that the Adamitifin, i.e. the nakedness of these people, is a mere calumny, forged by their adversaries, the Calixtines and Papists, at the time when the Vaudois first appeared in that country. See Beaufort’s Dissertation at the end of L’Enfant’s History of the War of the Hugelites, and by the Dict. Adames, Picards and Prodicts.

Jocet and Moreri speak of Adamites in England; and indeed the Romish and reformed mutually reproach each other with having Adamites among them.

Adamites, a name also given by some writers to the first patriarchs, the sons or descendants of Adam by Seth; in which sense Adamites are the same with Sethites, and brand distinguished from Cainites. There are various traditions concerning the quarrels, wars, &c. between the Adamites and Cainites.

Adamites, Pre. See Pre-Adamites.

ADAMS, in Geography, a township of Berkshire county in the eclesiastical county of the Maffeachusets, containing 2440 inhabitants, about 140 miles north-west of Boston. In the northern part of this district, the mill-stream, called Hudson’s Brook, which rises in Vermont, and falls into the north branch of Hooffick river, has formed a deep channel, about 50 or 40 rods in length, and in some places 60 feet deep, through a quarry of white marble; and over this channel the rocks form a natural bridge, about 10 or 15 feet long, 10 broad, and 62 feet above the water.

ADAMSDORF, a town in Germany, in the Circle of Upper Saxony; one league east of Lippemueh.

ADAMSON, PATRICK, in Biography, a Scots prelate, who was born March 15, 1526, at Perth, of mean but honest parents, and had his collegiate education at the university of St. Andrew’s, where he obtained the degree of Master of Arts. In 1568, he left out for Paris as tutor to a young gentleman; and here he wrote a Latin poem on occasion of the birth of the prince, who was afterwards James VI. of Scotland, and first of England. In this poem he gave the titles of France and England to his own prince, which offended the French court, and occasioned his arrest and confinement. As soon as he was freed, he retired with his pupil to Paris, the capital of the duchy of Berry. During the massacre at Paris, he was employed in this place, and very narrowly escaped suffering martyrdom for the protestant religion. In his epistle, as he called it, he wrote two excellent Latin poems, which are still extant, viz. a poetical version of the Book of Job, and the tragedy of Herod, which was written by an angel. In 1573, he returned to Scotland and entered into holy orders, and officiated as minister of Paisley. In 1575, he was appointed one of the commissioners...
millions for settling the jurisdiction and policy of the church, by the General Assembly; and being in the next year deputed to report their proceedings to the Earl of Morton, then regent, he was raised by this nobleman as one of his chaplains, and afterwards advanced by him to the archbishopric of St. Andrew's. This preference subjected him to various disputes with the General Assembly, which continued for several years. In 1577, he compiled a catechism in Latin verses for the use of the young prince, which was much admired and applauded in England, France and the Low Countries, where the author was already known by his Latin translation of the Confession of Faith, which was printed in France, during his residence in France, at the hazard of his life. In 1582, he was seized with a disorder, for the relief of which he took some simple medicine that was recommended to him by an old woman. This woman was charged with witchcraft, and within three or four years executed at Edinburgh; and the prelate was traduced by his enemies for applying to the devil in order to save his life. The archbishop, however, recommended himself to the favour of King James VI. by zealously defending the episcopal order; and he was sent as his ambassador to Queen Elizabeth, which office required his residence in London for some years. Queen Elizabeth was jealous of his popularity, as a preacher, and dreading the impressions which he made on the minds of the people in favour of the young king, his matter, prohibited his preaching during his stay in her dominions. Soon after the execution of the first earl of Gowrie, viz. in 1584, the archbishop was recalled, and sat in the parliament held at Edinburgh, and concurred in enacting several laws for settling the peace of the kingdom, and for establishing the king's authority in ecclesiastical offices. Many attempts were still renewed for degrading his reputation, and making him odious to the people; nor was the royal declaration of the reasons which induced those laws, sufficient to restrain them. At a provincial synod, held at St. Andrew's in 1586, the prelate was accused and excommunicated; but upon his submission at the next General Assembly at Edinburgh, he was absolved from the excommunication. In 1588, a commission was granted by the General Assembly, before which he was cited, for trying him on account of various crimes, with which he was charged. In the beginning of next year, he published the Lamentations of Jeremiah in Latin verse, which he dedicated to the king, and in which he complained of his hard usage; and at the close of the year he published a familiar translation of the Apocalypse, together with a copy of Latin verses, addressed to his Majesty, and deploring his distresses. His application, however, was of no avail. The revenue of his see was granted to the duke of Lenox, and the prelate, with his family, were literally reduced to the want of bread. The scanty relief he obtained was procured for him in the most humiliating manner; so that he lingered out a mortifying existence till the latter end of the year 1591. His character has been very differenty appreciated by persons of discordant sentiments in religion and politics. It is generally allowed that he supported, under the authority of the king, opprobrious and injurious measures; and that his bigotry and timidity involved him in the difficulties and disgrace which beset the close of his life. During the reverse of his condition and the trials with which he was exercised, he manifested sentiments of pious resignation. Of his learning there is no question; and he is said to have been one of the most polite prelates of the age in which he lived. Besides those pious works, which were collected and published in a 4to. volume, by Mr. Wilton, this prelate wrote many things which were never published; such as fix books on the Hebrew republic, various translations of the prophets into Latin verse, predictions on St. Paul's epistles to Timothy, various apologetical and funeral orations, and a very candid history of his own times. Biog. Brit.

ADAMSTOWN, in Geography, a town of Lancaster county in Pennsylvania, containing of about 40 houses; 20 miles north-east of Lancaster.

ADAMUS, in ALCHEMY, is used to signify the philosopher's stone, which perfons addicted to this kind of science call an animal, and, as they say, has carried its invisible Eye in its body, ever since they were united by the creator.

ADANA, in Geography, a town of Natolia, or Asia Minor, in the province of Caramania. It is situated on the river Choqueen; on the banks of which, is a small but strong castle, erected upon a rock. The water of the river is brought to the town by means of water-works, which convey it into the several fountains; and a bridge of 15 arches leads to these works. The climate is healthy, and the winter mild; but the summer is so hot as to render it necessary for the inhabitants to retire to the neighbouring mountains, and to shelter themselves in groves and grottoes. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulse and herbs of all sorts through the year; besides corn, wine and fruits in their proper season. Adana is much report to by the inhabitants of the other towns of Cilicia, especially from the mountain side, for its wines, corn and other fruits, which are hence dispersed into the most barren parts. It is about 30 miles north-east of Tarfo. N. lat. 38° 10'. E. long. 36° 12'.

ADANA, in Ancient Geography. See ADEN.

ADANATES, a people of the Cottian Alps, called by Pliny Edentar.

ADANI INFULA, two islands of the Red Sea, according to Ptolomy.

ADANO, see STURGEON.

ADANSON, Michael, in Biography, was born at Aix in Provence, in April 1727, and at a proper age he was sent to Paris, where he prosecuted his studies in medicine, botany, and agriculture with singular zeal. He was a pupil of the celebrated Reaumur. In the year 1748, he went to Senegal, where he spent five years in examining the productions found in the neighbourhood of the famous river of that name. In return for some valuable communications respecting the geography of the country, and on the plants and animals he had discovered there, which he sent to the Royal Academy, he was made one of their corresponding members. On the death of Reaumur, in the year 1759, he was elected a member in his place, and about the same time was made honorary member of the Royal Society of London. At the end of five years, he returned to Paris, where he published his Histoire naturelle du Senegal, 4to, containing observations on the diseases incident to hot climates; and in 1763, his Famille des Plantes, 2 vol. 8vo.

In February 1775, he presented to the academy a plan of a natural history which he did not live to perfect. The time of his death, which happened soon after, is not precisely known.

ADANSONIA, in Botany, the name of which is derived from Mr. Adanson, above mentioned, is a genus of the monocotyledonous order and polyandra clus, and belongs to the natural order of submersa and Molene of Jussieu. Its characters are, that the calyx is a one-leaved semiquinquefidi, cyathiform perianthium, with divisions revolute, and deciduous; the corolla consists of five, roundish, nerved, revolute petals, connected by the claws with each ether, and the stamina: the stamina have
have numerous filaments united at bottom into a tube, which they crown, expanding horizontally: the pillifmm has an ovate germ, very long, tubulous and variously distorted style; the stigmata are many (10) prismatic, villous and radiate-expanded: the pericarpium is ovate, woody, not gaping, ten-celled (from 10 to 14) capsule, with farinaceous pulp, and the partitions membranaceous: the seeds are numerous, kidney-shaped, rather bony, and involved in a friable pulp. The Adansonia digitata, Ethiopian four-gourd, or Monkies' bread, called also Ahafo, Guina-banana and Baobab, is the only known species of this genus. See BAOBAB.

ADOUS, in Geography, a people of Africa, residing on the ivory coast in the kingdom of Sacee.

ADAPTER, in Chemistry. See ADOPHER.

ADAR, in the Hebrew Chronology, the 12th month of the ecclesiastical year, and the 6th of the civil year. It contains only 29 days, and answers to our February, and sometimes enters into the month of March, according to the course of the moon. On the 7th and 13th days of this month, the Jews observe two fasts; the former on account of the death of Moses, and the latter called that of Esther, in commemoration of the conspiracy of Haman. On the 9th they have a fast in commemoration of the feasts in between the schools of Shammai and Hillel. The 12th is a fast in honour of two proselytes at Laodicea, who preferred death to the violation of the law; some observe the 13th as a fast in memory of the death of Nicanor, an enemy of the Jews. The feasts of Purim are celebrated on the 14th and 15th days; the latter on the 14th (Esther ix. 21.) and the greater on the 15th day. The 17th is observed in commemoration of the Sages of Israel, who escaped from Koifk, a city of Arabia, whether they were driven by the persecution of Alexander Jannaeus. The 20th is observed as a fast in remembrance of the rain obtained in a time of drought, during the reign of this prince. The dedication of the temple of Zerubbabel was on the 23rd day, Ezra vi. 16.; and the 28th was observed in commemoration of the repeal of the decree by which the kings of Greece had forbidden the Jews to circumsice their children, to observe the sabbath, and to decline foreign worship. Selden de Syned. i. iii. c. 15. Megillat. Tanannah et Gemara.

As the lunar year is shorter than the solar by 11 days, which in three months amount to about a month, the Jews then insert a 13th month, which they call Adar, or a second Adar, consisting of 29 days. This intercalation postpones the great feasts, &c. for a whole month.

ADAR, in Geography, a city in the tribe of Judah. Joshua xv. 3. Eusebius places another town of this name in the neighbourhood of Lidda or Dipolos, in the district of Thamm.

ADARCE, in the Materia Medica of the ancients, a faltik humour, concretting about the flanks of reeds and other vegetable matter, in form of incrullations. The ancients speak of adarce, as chiefly produced in Cappadocia and Galatia, though we also read of it in Italy; and also of a native kind produced in Indian reeds, much as fuglar in the cane. Its colour is like that of the fine powder of the African One, or Sarcophagus, and its fibillance is lax and porous, much like the balsam sponge; so that it might be called the balsam sponge of the marbles. It is a topic adapted to rub and leath the skin in a leprous, fun-burning, tetter, freckles, and similar blemishes, being on the whole of an acrimonious quality. Dr. Plot describes it in his natural history of Oxfordshire.

The incrullations often seen about our springs, are very different in their nature and qualities from the adaren of the Greek physicians. VOL. I.
ADD

on the banks of this river, in which Flamininus was victorious over the Insulan Gauls.

Alda is also the name of a small district in the duchy of Milan, where Louis XII. gained a victory over the Venetians in 1509.

Alda, El, in Zoology, a species of small lizard described by Mr. Bruce, and represented as a native of Arkansas beyond the rains, in the situation to which he refers the ancient island and city of Meroe. Its length is six inches and a half; its body is round and tail of the same form, but very sharp pointed; its forehead is flat, of a conical shape, and rounded at the end; the head is darker than the body, and its face covered with black lines crossing one another at right angles; its eyes are small, and defended by a number of strong black hairs which serve for eye-lashes; its upper jaw projects beyond the under, and its jaws are furnished with several short and fine teeth; its ears are large, open, and nearly round; its body is of a light yellow colour, crooked with eight black bands: the scales are close, and large along the back, and their surface is polished: its legs from the shoulder to the middle toe are near one and three-fourths of an inch long, and its feet have five toes, each of which is furnished with a brown claw tigt at its end with black. Its motion is very swift, though it crawls with its belly almost close to the ground. It burrows in the sand, but comes out in the heat of the day to bask in the sun; and when it is not much frightened, it will shelter itself behind stones, or in the withered roots of the abietinum when they are dried so as to be nearly of its own colour. This is one of the few lizards which the Arabs believe to be free from poisonous qualities, and they ascribe to it many medicinal virtues. It is thought to be a certain remedy for the elephantiasis; and to be efficacious in cleaning the skin of the body and the face, from cutaneous eruptions; and it is also used against films and tuleusions of the eyes. Such are the virtues ascribed to it by Arabian authors.

ADDA, in Geography, a town according to Ptolemy of Mefopotamia.

ADDAE, in Zoology, the name by which the Africans call the common Antelope.

ADDAEA, in Ancient Geography, a town of Asia in the southern part of Mefopotamia, near the Euphrates; placed by Ptolemy in lat. 33° and long. 77° 15', and probably the same with Ababbu.

ADDÆUS, a river of Asia, which is supposed to be the Aδδεια of Ptolemy, and the Abadius of Ptolemy.

ADDEPHAGIA, compounded of add, much; and θης, I eat, in Medicine, a term used by some physicians to denote a greediness in children, whereby they load themselves with new food, before the old is digested. Some use Addephagia in a more extensive sense for voraciousness in general, so as to comprehend the Bulimia, Pica, and Malacia.

ADDER, in Zoology, a venomous reptile of the serpent kind, more usually called a Viper. See COBWEB. The adder is sometimes confounded with asp; thus the deaf adder, spoken of in the English Bible, is not properly the adder, but the asp. Calmet.

The adder differs from the snake, as the former is much shorter for its bulk, and especially its tail below the vent; that it is marked on the back with black lines or spots, which the snake has not; that its belly is blackish, and of one colour, whereas the snake's is party-coloured, of a pale yellow and blue; that it never grows to the size of some snakes; and lastly, that it is viviparous, whereas the snake is oviparous.

Adder, Sea, in Ichthyology, the English name of the Synaphes Typhle. See Sea-Adder.

ADDER, water, in Zoology, a name given to the Natrix. See Cobweb.

Adder's Bank, in Geography, a flux which lies off the north-west point or entrance of the river Ilfiguibo, in Guinea, in South America, which, with some others, extends far into the sea, and reaches to Cape Nassau, or the east point of the river Fombaron.

Adder-Bolts, in Zoology. See Dragon-Flies.

ADDERGY, in Geography, a village in the district of Salent, or Talent, in Abtilia, not far from the river Teccizze, situate amongst rugged and barren mountains, and surrounded by a thick wood in form of an amphitheatre, which is full of lemons and wild cirmsoins. The river nai-lumi rises near the village, and precipitating into a cataract 150 feet high, at some distance discharges itself into the Teccizze. N. lat. 13° 24', 56°. E. long. 37° 57'. Bruce's Trav. vol. iii. p. 170.

Adder-Sting is used with respect to cattle when they are grazing, by any kind of venomous reptiles, particularly the adder. Dogs are peculiarly liable when hunting to this accident; and if relief is not obtained it sometimes proves fatal. The symptoms are great pain, anxiety, and swelling of the wounded part; after which, the body swells universally.—Oil has been given with advantage, as likewise onions: but the remedy most to be depended on is the caustic volatile alkali, which is the cau de luce of cabinets, the aqua ammoniaca pura of the college dispensatory, and the ful volatile of the shops. To a horse or ox two moderate tablespoonfuls may be given in half a pint of milk; to a large dog three tea-spoonfuls in the same manner, and to a lesser dog or other small animal a proportional dose. Whatever is given internally may with propriety be applied externally to the wound.—The adder is perhaps the only animal in our island whose bite occasion any considerable morbid consequences; the goat-fucker, the hedge-hog, and the shrew-mouse, are animals perfectly inoffensive, and incapable of inflicting any venomous wound.

Adder's Tongue, in Botany, a medicinal plant, so called either from its resembling, or its curing, the bite of a viper. It is more commonly called Ophioglossum. This is a spring plant, and is only to be found in April and May. It is not uncommon in wet meadows, and is easily distinguished among the other spring plants by its spike or tongue. It is esteemed one of the best vulnerary herbs this country produces; but it is more in use among the common people than in the shops. They give its juice internally, and use the herb bruised, or an ointment prepared from it with hard, or May-butter, externally, at the same time. Farriers, &c. prepare an ointment of this herb, called adder's tongue ointment, used as a remedy against the bites of venomous beasts. Phil. Trans. vol. xlix. pt. ii. n°. 112. p. 853.

Adder's Wort. See Bistort.

Addextratores, or Adextrarii, in the court of Rome, denote the pope's mitre-bearers. Some suppose that they are thus called, on account of their walking at the pope's right hand, when he rides to visit the churches.

Addice. See Adze.

Addico. See Addictio.

Addicti, in Antiquity, involuntary persons, or those who being sentenced to pay a debt, but unable to do it, were adjudged to a temporary kind of servitude to the creditor. In this sense addingi were a species of servi; from whom, however, they differed in this, that a slave, when discharged, became a libertus; whereas an additius became ingenuus. Again, a slave could not be discharged without the consent of his master; whereas the addictus was discharged.
ADD

charged of course when his debt was satisfied. Pitie, Lex. Ant. and Calv. Lex. Jur.

ADDICTIO, Addiction, in the Roman Law, a transferring or palling of goods to another, either by sentence of a court, or in the way of sale, to him that bids most for them. The word stands opposed to adiction or burdenation. It is formed of addicio, one of the flat words used by the Roman judges, when they allowed the delivery of the thing or person on whom judgment had passed. Hence goods, thus adjudged by the prior to the right owner, were called bona addicti; and the debtors delivered up, in like manner to their creditors to work out their debt, were called servi addicti.

Addictio in debi, denoted the adjudging of a thing to a person for a certain price; unless by such a day the owner or some other person gave more for it.

ADDING, Anthony, in Biography, finished his studies at Trinity College, Oxford, where he took his degree of doctor in medicine, 1741. He then settled at Reading, in Berkshire, and there acquired considerable reputation for his judicious and successful method of treating diseases. About the year 1754, he came to London, and in 1756 was made Fellow of the Royal College of Physicians, and soon attained that eminence in his profession, to which he was entitled by his genius and talents. In a few years after, the indifferent state of health obliged him to quit London, he returned to Reading, where he opened a house for the reception of materia medica patients. In 1780 he was sent for to visit his present Majesty, then labouring under a severe fever, and was the first of the physicians attending him, who gave a favourable prognosis of the event of the complaint, which was soon after verified, to the great satisfaction of the country. The doctor died at Reading, on the 21th of March, 1790. While practising in London he became acquainted with the great Mr. Pitt, afterwards Earl of Chatham, with whom he lived in the strictest intimacy. It was on the recommendation of his lordship's son, then Chancellor of the Exchequer, that he was called on to visit his Majesty. By the same interest Henry Addington, Esq. his eldest son, was made first speaker of the House of Commons, and having filled that arduous office, nearly through two parliaments, with great reputation, he was raised, by his Majesty, in March, 1801, to the high dignity of Chancellor of the Exchequer, when his friend and patron had resigned.

The only publication we have of the doctor's is an essay on the use of tea, printed 1753, containing an account of a method of preserving water sweet in long voyages. This was proposed to be effected by mixing a portion of the acid of tea with the water. A more effectual mode has been since discovered by Mr. Henry of Manchester.

ADDISON, Lancelot, in Biography, the son of a clergyman of the same name; was born in the parish of Croftly Ravenworth, in Westmorland, in the year 1662. Having received the rudiments of classical learning in the grammar school of Appleby, he was sent to Queen's College, Oxford, in 1676, and admitted to the degree of bachelor of arts in 1677, and distinguishing himself by his genius and application, he became master of arts in 167, and in 1685 he was elected to one of the Ferra filli for the act which was celebrated in that year. As in the orations delivered on this occasion he recited on the orations then in power, he was obliged to resign and ask pardon on his knees. After this he soon retired from the university, and chose for his retreat the neighbourhood of Petworth in Sussex, where he zealously propagated principles of loyalty to the king, and of attachment to the church. Upon the restoration of King Charles II. he was recommended to Mr. King, bishop of Chichester, who would have provided for him, if he had not previously engaged to go to Dunkirk, as chaplain to the garrison. When that place was delivered up to the French in 1662, he accepted the same office to the garden of Tangier, but returned to England in 1670, and was made one of the chaplains in ordinary to the king. After struggling with some difficulties by the loss of his chaplainship at Tangier, he obtained a rectory in Wilt, and one of the prebends in the cathedral church of Sarum; and in 1675, took the degrees of bachelor and doctor of divinity at Oxford. Thus advanced and decently provided for, he lived in the country with hospitality, discharged his parochial duty with diligence, and devoted his leisure hours in writing on behalf of religion and the established church. In 1683 he was installed into the deanship of Litchfield, and in 1684 collated to the archdeaconery of Coventry, which he held with his deanship in commendam. After the Revolution he might, it is said, have been made a bishop, if he had not, in the convocation of the preceding year, and on other occasions, manifested a degree of zeal for the church which afforded a pretext for misrepresenting him to persons in power. His integrity, however, was unquestionable, and his literary reputation universally acknowledged. He departed this life on the 20th of April, 1703, in the 71st year of his age, and was buried in the church-yard of the cathedral at Litchfield. He was twice married, and had three sons and three daughters by his first wife; but by his second wife, who survived him, he left no issue. The treatises which he published are as follow: viz. 1. The Fable of Fables, or a Short Account of the Revolutions of the Kingdoms of France, Morocco, etc. 1671, 8vo. 2. The present State of the Jews, &c. with an annexed Discourse on the Mifchins, Gemara, and Talmud, 1676, 8vo. 3. The primitive Institution, or a Rationale Discourse on the Mifchins, &c. 4. A model Essay for the Clergy, &c. republished by Dr. Hicke in 1679, 8vo. 5. The First State of Mahometanism, &c. 1678, 8vo. 6. An Introduction to the Sacred Books, &c. 1681; republished with an appendix, called the Communicant's Assistant, etc. in 1686, 12mo. 7. A Discourse on the Practice of the Church, &c. 1688, 12mo. 8. The Catechumen, 1690, 12mo. 9. An historical Account of the Church, denying the Headship of Christ, 1696, 12mo. 10. The Christian's daily Sacrifice, or Right Performance of Prayer, 1698, 12mo. 11. An Account of the Millennium, the genuine Use of the two Sacraments, viz. Baptism, and the Lord's Supper, with the Christian's Obligation frequently to receive the latter.

ADDISON, Joseph, the son of Dean Addison, the subject of the preceding article, was born at Milton, near Abingdon, in Wiltshire, May 1, 1672, and being unlikely to live, was baptized the same day. Mr. Tyson says, that he was laid out for dead as soon as he was born. At the Charter-House, whither he was removed at an early age, and where he was under the tuition of Dr. Ellis, he commenced an intimacy with Mr. afterwards Sir Richard Steele, which lasted during life. At the age of 15 he was entered of Queen's College, in Oxford; and there he soon acquired an elegant Latin style, of which a specimen appeared in a copy of verses that fell accidentally into the hands of Dr. Laurence, afterwards provost of Queen's College, in 1687, and which induced him to procure the election of Mr. Addison as a deacon of Magdalen College in 1689; where he took the degrees of bachelor and master of arts. His Latin poetry, in the course of a few years, gained him the reputation of a great poet; and his poems in this language, eight of which were published in the second volume
volume of *Musearum Anglicarum Analysa*, were so much approved, not only in both universities, but among foreigners, that the celebrated B点燃 was led to conceive a very favourable opinion of the English genius for poetry, from these specimens of it, and to speak of the author in high terms of commendation. The first exhibition of his talents in English poetry was a copy of verses addressed to Mr. Dryden in the 22d year of his age, which was very much admired by the bell judges. This was soon succeeded by a translation of the 4th Georgic of Virgil, highly commanded by Mr. Dryden, and a Discourse on the Georgics, prefixed to Mr. Dryden’s translation, which is allowed to possess the distinguishing characters of just criticism. Amongst other poems, which appeared in 1694, there was one which contained an account of the greatest English poets, addressed to Mr. H. Sacheverell, with whom he seems to have been intimate; and whose suffer he is said to have courted, though their intimacy was afterwards interrupted by the author’s adherence to the political principles which Mr. Sacheverell defected. The subject of his next performance was one of King William’s campaigns; and this poem, which was addressed to the Lord Keeper, Sir John Somers, and much approved by him, engaged the attachment and patronage of this eminent statesman.

Mr. Addison having resented urgent solicitations to enter into holy orders, and abandoned a resolution which he seems to have once formed, obtained, from the friendship of Lord Somers, an annual pension of 300L. which enabled him to gratify his inclination of making a tour to Italy towards the close of the year 1699. In 1701, he tranferred from Italy an epistolary poem to (Montague) Lord Halifax, which some have pronounced as the best of his performances. On his return he published an account of his travels, dedicated to the Lord Somers. Upon the death of King William, his pension was discontinued, and in consequence of the exclusion of his friends from the ministry, he remained for a considerable time inactive and unrecompensed. However, in 1704, Lord Halifax recommended him to the Lord Treasurer Godolphin, as a fit person to celebrate the Duke of Marlborough’s victory at Blenheim. Mr. Addison was engaged in a manner peculiarly respectful to undertake this important office; and this produced the poem, intitled the *Campaign*, which was received with very loud and general applause, and which will be admired as long as the victory is remembered. In 1706 the author was appointed under secretary of state; and about this time he composed his inimitable opera of *Rofamond*, and he also assisted Sir Richard Steele in his play called *The Tender Husband*, to which he wrote an humorous prologue. In 1709 he went over to Ireland as secretary to the Lord Lieutenant, the Marquis of Wharton, where her Majesty conferred upon him the office of Keeper of the Records in that kingdom, with an augmented salary. In this year the *Tatter* appeared; the author of which was discovered by Mr. Addison to be his friend Mr. Steele, by an observation on Virgil, which he had communicated to him. In consequence of this discovery he afforded to the author such affiance as induced him to lay open of it, that he feared by this means, like a ditefled prince, who calls in a powerful neighbour to his aid; that is, that he was undone by his auxiliary. The *Tatter* being discontinued in 1711, was succeeded by the *Spectator* upon a plan concerted between Mr. Steele and Mr. Addison. It commenced, March 1, 1711, and was concluded, September 6, 1712. Mr. Addison’s papers in this work, the excellence of which time has very highly appreciated, are marked by the letters that form the name of the Mule Clio. It is said, that when his book-seller came to him for the *Spectator*, Bayle’s Historical and Critical Dictionary always lay open before him; and that he was so extremely nice in his proofs composition, that when almost a whole impression of a *Spectator* was worked off, he would stop the press, to insert a new preposition or conjunction. Of the value of this publication, and of the good sense that directed the judgment and taste of the British nation at the period in which it was written, we shall form a very favourable opinion, when we consider that 20,000 copies were sometimes sold in a day. An attempt was made to continue it by other ingenious writers; but it proved unsuccessful. Eighty numbers were published, to which Mr. Addison contributed about a fourth part, and the formed an eighth volume. The *Guardian*, in which Mr. Addison had a principal concern, amused the town in the years 1713 and 1714; his papers are marked by a hand. Two numbers, in a paper called the *Lover*, were also written by him. During his travels, Mr. Addison executed a design, which he had conceived at an early age, of writing a tragedy; and in 1713 appeared his famous *Cato*, with a sublime prologue by Mr. Pope, and an humorous epilogue by Mr. Garth. It had an uninterrupted run of thirty-five nights; and it was read with a satisfaction and commendation equal to the eagerness and pleasure with which it was attended on the stage. It was translated into French, Italian, and German; and the Jesuits at St. Omer made a Latin translation, where it was acted by their pupils with great magnificence. The folio of Cato was rendered into Latin verse by Bishop Atterbury, in a style worthy of the sublime original, and which would have been admired even by the critics in the court of Augultus. The author had intended to have written another tragedy, under the title of *The Death of Socrates*: but the offices and honours which were devolved upon him in his advancing years, prevented the accomplishment of his purpose. He was likewise under a necessity of declining another work which he had projected, viz. that of composing an English Dictionary upon the plan of the Italian Della Crusca; in his project for this purpose, he confidered the writings of Archbishop Tillotson as the chief standard of our language. During the period in which the Earl of Sunderland was Lord Lieutenant of Ireland, he was his secretary; but on the removal of the Earl, he was appointed one of the Lords of Trade. In 1715 he began to publish the *Freeloader*, which is a kind of political spectator, and admirably conceived and executed, at a period of discord, for the purpose of removing prejudices, settling the government, and making his country happy. This admirable collection of papers contained fifty-five numbers, the last of which was published June 29, 1716. About this time he also published his verfs to Sir Godfrey Kneller, on the King’s picture, and another copy to the Prince of Wales, with his tragedy of *Cato*. In 1716 he married the Countess of Warwick, without deriving from the connection, as it has been said, any great addition to his happiness. In the following year, King George I. appointed him one of his principal secretaries of state; but the application and parliamentary attendance which this office required, concurred with an athermatic disorder, to which he was subject, in impairing his health, and hastening his dissolution; and he was, therefore, under a necessity of resigning it, in lieu of which he had a pension of 1500L. a year. His friends hoped that by recourses from public business, and the tranquillity of retirement, his health would be re-established, and his life prolonged. For some time he seemed to experience the good effects of his new course of life; and he employed his hours of leisure in preparing his Treatise of *The Christian Religion*, which
which he had begun long before, and of which the first part, in an unfinished state, is contained in his works. He intended likewise to have paraphrased some of the Psalms of David; but a long and painful relapse broke all his designs, and terminated the life of this excellent person, June 17th, 1719, in the 48th year of his age. He died at Holland-House, near Kennington, leaving behind him an only daughter by the Countess of Warwick. After his decease Mr. Tickell, in pursuance to the instructions which he had received, collected and published his works in four volumes, 4to. This edition contains, besides the pieces already mentioned, the "Differtation upon Medals," for which the materials were collected in Italy, and digested at Vienna, in 1702; "The present State of the War, and the Necessity of an Augmentation considered," first published in the form of a pamphlet in 1707; "The Whig Examiner," published in 1710, of which five papers are attributed to Mr. Addison, and they are the most severe of his publications: they were written by way of reply to the "Examiner," published on the part of the Tories, and contain some harsh animadversions on Dr. Sacheverell, Mr. Prior, and others. A similar piece, intitled, "The late Trial and Conviction of Count Tarfitt," and designed to expose the Tory miniftery on the subject of the French commerce-bill, was published in 1713. The comedy of the "Drummer or Haunted House," though not noticed in this edition, was afterwards published as Mr. Addison's, by Sir Richard Steele. The following pieces have been also ascribed to Mr. Addison: viz. "Dif- fertatio de ininnioribus Romanorum Poetis," written about 1692; "A Discourse on ancient and modern Learning," preferred among the MSS. of the late Lord Somers, and printed in 1739, 8vo.; and No. 1 and 2 of "The Old Whig," pamphlets, written in defence of the peerage bill, 1719.

The character of Mr. Addison, as a critical scholar, as a statesman, as a poet, and elegant writer, and as a man of religious principle and exemplary probity and virtue, has been delineated and ably defended against the attacks of prejudice and envy by many writers; and their testimonies have been collected and duly appreciated by Dr. Kippis, in the last edition of the Biographia Britannica. The Latin poems, which were his early productions, his discourses on the Georgics, and his disertations on medals, afford ample evidence of his classical taste and erudition. As a statesman it has been alleged against him, that his invincible modesty and timidity disqualified him for conducting any political debate in parliament; that he made a mean figure in the office of secretary of state; that he was unfit for active life; and that he was very desperately removed from office to make way for a more able successor. Such are the contemptuous charges retailed by Sir John Hawkins, in his History of Muses, (vol. v. p. 315.) who adds, that Dr. Mackevede, the author of the Fable of the Peas, called him, "a parson in a tye wig." In reply to these charges it has been urged, that Mr. Addison was gradually trained up to a qualification for the several employments in which he was engaged; that he was designed for the service of the state by Lord Somers and Lord Halifax; and that he occupied in succession various departments of public business without incurring the reproach of want of ability. As to his removal from public office, the true cause of it was his declining health; and that on his own part it was purely voluntary, appears from his intimate connection with Lord Sunderland and the Lord Viscount Stanhope, who were in office, and his friendship with Mr. Craggs who succeeded him, and from the zealous support which he gave to the ministry after his resignation. The reserve and diffidence charged upon him by Dr. Mandeville, if the story be true to which the anecdote refers, might possibly arise from his disinclination to be free and intimate with a person whose principles and character he must have disliked.

As a poet, Mr. Addison was for a long time highly ex- toled; but his reputation has lately been upon the decline. He is ranked by Dr. War ton in the second class of our poetical authors, and joined with Dryden, Prior, Cowley, Waller, Garth, Fenton, Gay, Denham, and Parnell: whilst the first class comprehends Spenser, Shakespeare and Milton. Others have degraded him to a still lower rank. Mr. Gilbert Cooper says, (Letters concerning Taste, p. 54.) that he has no right to a pretension of being a good poet. Dr. Hurd (Critical Commentary and Difertations, v. iii. p. 121.) speaks of him as one who had no want of natural talents for the greater poetry; which yet were so restrained and disfigured by his constant and superfluous study of the old classics, that he was, in fact, but a very ordinary poet. Although it should be allowed that Mr. Addison did not really display, in his poetry, a highly vigorous imagination, yet there are many distinguished excellencies in his poems, which intitle him, in the opinion of very competent judges, to a higher rank than even Dr. Hurd assigns him. In this connection it may not be improper to observe, that Captain Thompson, in his edition of Mr. Andrew Marvell's Works, (vol. i. Pref. p. 19.) &c. ascribes to Marvell the two fine hymns in No. 453 and 465 of the Spectator, which hitherto have been universally, and without doubt, justly ascribed to Mr. Addison. Whilst it is not to be dismissed that criticism was not a talent, in the exercise of which he excelled, nevertheless those who question his abilities as a critic concede that his taste was truly elegant, and that he may be ranked in this department of literature with Longinus, though he links below Aristotle; and that, however defective he may be thought with regard to the philosophy of his criticisms, he determined justly from his feelings, and contributed by his critical remarks on the Georgics, on Ovid, and especially on Milton, more than any other man, to excite and propagate a good taste in the English nation. His Essay on the Pleasures of the Imagination should not be forgotten by those who dispute his critical sagacity; and the candid will recollect, that philosophical criticism had not been cultivated at the period in which he lived, and that in this respect he was far superior to his contemporaries.

Whatever difference of opinion there may have been as to the rank and celebrity to which Mr. Addison is intitled as a poet and a critic, his distinguished and almost super- eminent excellence as a prose writer has been universally allowed. Those whose province it has been to mark his casual errors and defects, have concurred in paying him a tribute of high commendation. Many testimonies of this kind might be cited from the publications of Mr. Cooper, Dr. Hurd, Dr. Young, Mr. Melmoth, Dr. Worton, Dr. Johnson, Dr. Blair, and others. Under this head the following reflections may not be unacceptable to the reader. In various parts of Mr. Addison's prose essays, says Dr. Worton, are to be found many strokes of genuine and sublime poetry; many marks of a vigorous and exuberant imagination. After all, his chief and characteristic excellence was his humour; for in humour no mortal has excelled him, except Molieres: for which he refers to the character of Sir Roger de Coverley, so original, so natural, and so inviolably preferred; and to the Drummer, that excellent and neglected comedy. Dr. Young, in his conjectures on original composition, describes his character as a writer at large; and upon a comparison of Addison with Swift and Pope, he
be remarks, that he possessed a more refined, decent, judicious, and extensive genius, than either of the latter writers. Swift, says he, is a singular wit, Pope a correct poet, Addison a great author. Addison’s crown was elective; he resigned by the public voice:

Per populas dat jura, vinagque effeclat Olympa.

Addison wrote little in verse, much in sweet, elegant Virgilian prose. His compositions are built with the finest materials, in the style of the ancients, and on truly classic ground; and though they are the delight of the present age, yet I am persuaded (continues this author) that they will receive more justice from posterity. His admirers call him an elegant writer. That elegance which shines on the surface of his compositions seems to dazzle their understanding, and renders it a little blind to the depth of sentiment which lies beneath: thus (hard fate!) he loses reputation with them, by doubling his title to it. On subjects the most interesting and important, no author of his age has written with greater, I had almost said, with equal weight: and they who commend him for his elegance, pay him such a sort of compliment, as they would pay to Lucrèce, if they should commend her only for her beauty. Young’s Works, vol. v. p. 130, &c.

Truth and beauty of imagery (says Mr. Melmoth) is the characteristic distinction of Mr. Addison; and the principal point of eminence which raises his style above that of every author in any language that has fallen within my notice. He is everywhere highly figurative; yet, at the same time, he is the most easy and perip Tacus writer I have ever perused. His images are selected with the utmost delicacy and judgment, from the most natural and familiar appearances. One is particularly mentioned, taken out of a thousand that might be named, which appears to me, says Mr. Melmoth, the most and most expressive that ever language conveyed. It occurs in one of the imitable papers upon Paradise Lost, where Milton represents the sun in an eclipse; and at the same time a bright cloud in the western regions of the heavens, descending with a band of angels. The whole theatre of nature, says Mr. Addison, is darkened, that this glorious machine may appear in all its lustre and magnificence. After other expressions of high commendation, Mr. Melmoth closes:—“In a word, one may justly apply to him what Plato, in his allegorical language, says of Aristophanes, that the grace having searched all the world for a temple, wherein they might for ever dwell, settled at last in the breast of Mr. Addison.” Fitz hologhorne’s Letters, Let. xxv. p. 112, &c. Let. xxxix. p. 137.

Dr. Johnson, in delineating the literary character of Mr. Addison, observes with Tickell, that he employed wit on the side of virtue and religion. He not only made the proper use of wit himself, but taught it to others; and from his time it has been generally subordinated to the cause of reason and truth. He has divested the prejudice that had long connected gaiety with vice, and calumni of manners with lasciviousness. He has reflored virtue to its dignity, and taught innocence not to be ashamed. This is an elevation of literary character above all Greek, above all Roman fame.” No greater felicity can genius attain than that of having purified intellectual pleasure, separated mirth from indecency, and wit from licentiousness; of having taught a succession of writers to bring elegance and gaiety to the aid of good sense; and, to use expressions yet more awful, of having “turned many to righteousness.” As a deferrier of life and manners, he must be allowed to stand perhaps the first of the first rank. His humour, which as Steele observes, is peculiar to himself, is so happily diffused as to give the grace of novelty to domestic scenes and daily occurrences. He never “outsteps the model of nature,” nor raises imprecation or wonder by the violation of truth. His figures neither divert by distorsion, nor amaze by aggravation. He copies life with so much fidelity, that he can hardly be said to invent; yet his exhibitions have an air so much original, that it is difficult to suppose them not merely the product of imagination. As a teacher of wisdom he may be confidently followed. His religion has nothing in it enthusiastic or superstitious: he appears neither weakly credulous, nor wantonly sceptical: his morality is neither dangerously lax nor impracticably rigid. All the enchantment of fancy, and all the cogency of argument, are employed to recommend to the reader his real interest, the care of pleasing the author of his being. Truth is shown sometimes as the phantom of a vision, sometimes appears half-veiled in an allegory; sometimes attracts regard in the robes of fancy, and sometimes slips forth in the confidence of reason: the wears a thousand dresses, and in all is pleasing. Johnson’s Poets.

Among ourselves, says an anonymous writer, in the 26th number of the World, no writer has made so happy and judicious a mixture of plain and figurative terms as Addison, who was the first that banished from the English, as Boileau from the French, every species of bad eloquence and false wit, and opened the gates of the temple of tale to his fellow-citizens.

Dr. Blair observes, that of the highest, most correct, and ornamental degree of the amble style, Mr. Addison is, beyond doubt, the most perfect example; and therefore, though not without some faults, he is, on the whole, the fairest model for imitation, and the freest from considerable defects, which the language affords. Peripatetic and pure he is in the highest degree: his precision, indeed, is not very great, yet nearly as great as the subjects which he treats of require: the composition of his sentences, easy, agreeable, and commonly very musical, carrying a character of smoothness more than of strength. In figurative language he is rich, particularly in similes and metaphors, which are so employed as to render his style splendid, without being gaudy. There is not the least affectation in his manner; we see no marks of labour, nothing forced or constrained; but great elegance joined with great ease and simplicity. He is, in particular, distinguished by a character of modesty and of politeness, which appear in all his writings. No author has a more popular and instructive manner; and the great regard which he every where shews for virtue and religion recommend him highly. If he fails in any thing, it is in want of strength and precision, which renders his manner, though perfectly suited to such essays as he writes in the Spectator, not altogether a proper model for any of the higher or more elaborate kinds of composition. Though the public have ever done much justice to his merit, yet the nature of his merit has not always been seen in its true light: for, though his poetry be elegant, he certainly bears a higher rank among the prose writers, than he is entitled to among the poets; and, in prose, his humour is of a much higher and more original strain than his philosophy. The character of his Roger de Coverley discovers more genius than the critique on Milton. Blair’s Lectures, vol. ii. p. 41, &c.

Mr. Addison’s character, as a man of probity and religious virtue, stands in high estimation. His attachment to his principles and his friends was invariable, and afforded the most convincing evidence, in times of political discord, of his inflexible integrity. It was, nevertheless, blended with
with an amiable liberality and candour. Such, indeed, was his general popularity, that Dr. Swift says of him on a particular occasion, "Mr. Addison's election has passed easily and unadjudged; and, I believe, if he had a mind to be chosen king, he would hardly be refused." The friendship that subsisted between these two gentlemen continued through life, without interruption, notwithstanding the difference in their political principles and connections: and so nobly did Mr. Addison act on an occasion, in which he was defended by Lord Sunderland not to converse with some people in Ireland that were not agreeable to him, that whilst he professed his great obligation to his Majesty for the honour intended him, (of being secretary to the Lord Lieutenant,) he declared, at the same time, he could not comply with his excellency's request; as he would not sacrifice his friendship for Dr. Swift, to be made chief governor of that kingdom. Suppl. to Swift's works, vol. ii. p. 410. His character for probity has not, however, escaped calumny and reproach. Dr. Johnson relates an anecdote, which every admirer of the distinguished merit of Mr. Addison will be very reluctant to believe, at least without some authority which Dr. Johnson has not produced, and especially in opposition to the evidence that has been alleged of its falsehood. Steele is said to have borrowed 100l. in a time of preying exigence of his friend Addison, probably without much purpose of repayment: but Addison, being impatient of delay, reclaimed the loan by an execution. The following anecdote, which is of a very different kind, was told by the late Dr. Birch. Mr. Addison and Mr. Temple Stanyan were very intimate, and were accused to dispute each other's opinions. Mr. Stanyan, however, was reduced to the necessity of borrowing 500l. of Mr. Addison; the consequence of which was reserve and diffidence, and an apparent acquiescence in the sentiments of his creditor on the part of Stanyan. A dispute occurred on a topic, with regard to which the latter had always been used to oppose the former; but on this occasion Mr. Stanyan was silent and acquiescing, which conduct hurt Mr. Addison so much, that he said to his friend, "Either contradict me, or pay me the money." It appears also by some particulars recited concerning Mr. Addison, by a late spirited writer, (Mr. Tyers) that upon his return to England, after his travels, he discharged the old debt contracted at Oxford, with ample interest; and that he refin'd a gratification of a 300l. bank note, and afterwards of a diamond ring of the same value, from a Major Dunbar, whom he had endeavoured to serve in Ireland by his interest with Lord Sunderland; and, it is probably on this occasion, that he writes in a letter; "Believe me, Sir, when I assure you I never did, nor ever will, on any pretence whatsoever, take more than the stated and customary fees of my office. I might keep the contrary practice concealed from the world, were I capable of it; but I could not from myself; and I hope I shall always fear the reproaches of my own heart more than those of all mankind." We are informed by the writer just mentioned, that having received encouragement from a married lady, of whom he had been formerly enamoured, he had the integrity to retract the temptation. Addison has been charged with manifesting a great degree of jealousy, envy, and malevolence in his conduct towards Mr. Pope. Dr. Wor- ton and Cibber seem to have given credit to this charge; and the accusation has been directly and circumstantially produced by Mr. Ruffhead in his life of Pope, p. 184—193. The late Judge Blackstone took great pains to investigate the grounds of it, and to evince its falsity. Besides the jealousy of Mr. Pope's superior talents, which constitutes part of the charge, Mr. Addison is accused of permitting Mr. Tickell, who was his dependent, to publish a translation of the first book of the Iliad, which some say was the juvenile work of Addison, and which others affirm was Tickell's, reviled by him, just at the time when the first volume of Mr. Pope's work was delivered to his subletters. After a very elaborate investigation of all this business, published in the last edition of the Biog. Brit., the learned Judge closes with this paragraph: "As there are so many inconsistencies in the story itself, which never found its way into print till near sixty years after it is said to have happened, it will be no breach of charity to suppose, that the whole of the story was founded on some misapprehension in either Mr. Pope or the Earl (Warwick); and unless better proof can be given, we shall readily acquit Mr. Addison of this, the most odious part of the charge." At the close of his life, and with the near views of his dissolution, he wrote for the young earl of Warwick, and also for Mr. Gay. He told the latter that he had injured his; but if he recovered, he would recommend him. Mr. Gay was ignorant of the circumstance to which he adverted, but supposed that some preference had been designed for him, which Mr. Addison prevented its obtaining.

Of his interview with the young Earl, Dr. Young has given the following account. After a long and many, but vain struggle with his dilatoriness, he dismissed his physicians, and with them all hopes of life. But with all his hopes of life he dismissed not his concern for the living, but sent for a youth, nearly related, and finely accomplished, but not above being the better for good impressions from a dying friend. He came; but life now lingering in the socket, the dying friend was silent: after a decent and proper pause, the youth said, "Dear Sir! you sent for me; I believe, and hope, that you have some commands; I shall hold them most sacred." May dillent ages not only hear, but feel, the reply! forcibly grasping the youth's hand, he softly said, "See in what peace a Christian can die." He spoke with difficulty, and soon expired.

Mr. Addison, says his Biographer, notwithstanding the several things which have been advanced to lessen him in the public opinion, will always be held in the highest estimation, as an amiable and excellent man in private life, as one of the brightest ornaments of, perhaps, the finest age of English literature; as one who greatly contributed to the spreading of good sense and good taste in the nation; as one of our most elegant, and graceful writers; as having been singularly beautiful in his allegorical papers, and admirable for the vein of humour which runs through many of his compositions. Biog. Brit.

Addison County, in Geography, a county of Vermont in America, on the south side of Lake Champlain, and divided nearly into equal parts by Otter Creek. It has Chittenden county on the north, and Rutland county on the south; and contains 64,499 inhabitants, dispersed in twenty-one townships. Its dimensions are about thirty miles by twenty-feven, and a range of the Green Mountains passes through it. Its chief town is Middlebury.

Addison is also a town of the above county, lying on the lake Champlain, separated from New Haven, on the east by Otter Creek. The Snake Mountains are on the south-east. This town contains 901 inhabitants.

Additament, in a general sense, denotes a thing added to another. It signifies the same as Epitomized.

Additament, in Physic and Chemistry, are things super-added to the ordinary ingredients of any composition.

Addition, the act of joining one thing to another, or of augmenting a thing, by the accession of others.

Addition, in Arithmetick, is the first of the four fundamental rules, or operations, of that art.

Addition consists in finding the amount of several numbers,
Addition is the invention of a number, from two or more homogeneous ones given, which is equal to the given numbers taken jointly, or together.

The number thus found is called the sum, or aggregate of the numbers given.

The character of addition is +, which we usually express by plus. Thus 3 + 4 denotes the sum of 3 and 4; and is read 3 plus 4.

The addition of simple numbers is easy. Thus it is readily perceived that 7 and 9, or 7 + 9, make 16; and 11 + 15, make 26.

In longer, or compounded numbers, the business is performed by writing the given numbers in a row downwards; homogeneous under homogeneous, i.e. units under units, tens under tens, &c. and accurately collecting the sums of the respective columns.

To do this, we begin at the bottom of the outmost row or column to the right; and if the amount of this column be ten, or some number of tens, we flit down only the overplus, and carry one for each ten to the next column.

Suppose, e.g. the numbers 1357 and 172 were given to be added: write either of them v. g. 172, under the other 1357; so that the units of the one, viz. 2, stand under the units of the other, viz. 7; and the other 1357 numbers of the one, under the correspondent ones of 172 the other, viz. the place of tens under tens, as 7 under 5; and that of hundreds, viz. 1, under the 1529 place of hundreds of the other, 3. Then, beginning, lay 2 and 7 make 9; which write underneath; also 7 and 5 make 12; the last of which two numbers, viz. 2, is to be written, and the other one reserved in your mind to be added to the next row, 1 and 3: then lay 1 and 1 make 2, which added to 3 make 5; this written underneath, and there will remain only 1, the first figure of the upper row of numbers, which also must be written underneath; and thus you have the whole sum, viz. 1529. The same method will extend to any number of sums, which are required to be united in one.

When a great number of separate sums, or numbers, are to be added, it is more easy to separate them into two or more parcels, which may be added separately, and then their sums added together for the total amount; and thus, by dividing the numbers into parcels in different ways, the truth of the addition may be proved.

Another method of proving addition was suggested by Dr. Wallis in his arithmetic, published in 1657, by calling out the nines. Thus, add the figures of each line of numbers together separately, and call out always 9 from the sums as they arise, adding the overplus to the next figure, and setting down at the end of each line the excess above the nine or nines. Pursue the same processes with the sum total, and the former excesses of nine, and the last excesses will be equal when the work is right. The former examples may be thus proved:

| 1357 | 7 Thus also: | 350700 | 172 | 1 | 31806500 |
| 1529 | 8 | | 339087 | 3 | 46011 |
| | | | | | 32935 |
| | | | | | 32545242 |

Addition of numbers of different denominations, for instance, of pounds, shillings, and pence, or yards, feet, and inches, is performed by adding or summing up each denomination by itself, always beginning with the lowest; and if, after the addition, there be enough to make one of the next higher denomination, for instance, pence enough to make one or more shillings, or inches to make one or more feet, they must be added to the figures of that denomination, that is, to the shillings or feet, only referring the odd remaining pence or inches to be put down in the place of pence or inches. And the same rule is to be observed of shillings with regard to pounds; and of feet with regard to yards.

As in the following examples:

| 120 | 15 | 9 | 271 | 10 | 3 | 15 | 12 | 11 |
| 65 | 12 | 5 | 35 | 2 | 7 | 4 | 10 | 0 |
| 9 | 8 | 0 | 14 | 2 | 5 | 12 | 0 | 13 |
| 195 | 16 | 2 | 326 | 0 | 3 | 15 | 15 | 9 |

Sum 33 6 2

Addition of Decimals. See DECIMAL.
Addition of Vulgar Fractions. See FRACTION.
Addition of Logarithms. See LOGARITHM.
Addition of Ratios is used by some authors in the same sense with COMPOSITION OF RATIOS, which see.

Addition, in Algebra, or the addition of indeterminate quantities, expressed by letters of the alphabet, is performed by connecting the quantities to be added, by their proper signs; and also by uniting into one sum, those that can be so united; i.e. similar quantities, by adding their co-efficients together if they have the same signs, or subtracting those which have different signs. So that addition comprehends three cases.

Case I. To add quantities which are like, with like signs: add all the co-efficients together, and to their sum annex the common quantities, and prefix the common sign. Thus, 7a + 9a = 16a. And 11b + 13bc = 26bc. Also 3a + 5b = 8a/c + 2b/c + 7bc/c + 36a + 4b/c + 12c + 36c = 5ac + 3ed + 3a/c - 2c + 2d/c - 5c/2.

And 6a + 9b - 3e - 4f + 5c - 2e - 3f

10a + 14b + 5c - 7f

Case II. To add quantities which are like with unlike signs: add all the affirmative or positive co-efficients together into one sum, and all the negative ones into another; then subtract the less of these sums from the greater, and to the difference prefix the sign of the greater, and annex the common quantity. Thus, -2 and -3 make -5; 4a/b and -11a/b make -15a/b; -a/b and -b/a make -a/b + a/b. Also,

3 - 2 = 1; 9a - 7a = 2a; 11ax/b - 3ax/b = 4ax/b; and -a/b + a/b + b/ac = b/ac - a/b + ac; and, 2 - 3 = 1; 11ax/b + 4a/b = -7ax/b; and 2 + 4ac - 7ac = -5ac. Again, -3a + 7a + 8a - a = 6a + 15a + 9a; and -5xy = 3xy + 8xy + 7xy = -5xy + 15xy + 7xy; and 6ac + 2ax = 5ax + 10ax + 11ax + 12ax + 12ax = 12ax: And 8a + 7b - 8e - 7 = -6a - 3b + 4c + 4.
Cafe III. To add quantities which are unlike, with unlike signs: collect all the like quantities together by the last rule, and set down those that are unlike one another, with their proper signs. Thus, \(5x^2 + 4ax - xy - 4ax = 5x^2 - xy - 4\); and \(-6y/x + 5/x - 5/x + 10/ax = 12x^2 - 11x - 14\). And \(9ab - 6\sqrt{ac} + 3\sqrt{d} - 4x^2 + 7ab + 4/\sqrt{ac} - 2bc + 7 - 4 = 2ab - 2\sqrt{ac} + bc - a + b\).

**Addition of irrational quantities, orfinite.** See **Surd**.

**Addition, in Law,** is that name, or title, which is given to a man over and above his proper name, and surname; to shew of what estate, degree, or mystery he is; and of what town, village, or country.

**Additions of Value, or quality,** are yeoman, gentleman, esquire, and such like.

**Additions of Degree,** are those we call names of dignity; as knight, lord, earl, marquis, and duke.

**Additions of Mystery,** are such as writer, painter, mason, and the like. See **Chorography**.

**Additions of Place,** are, of Thorn, of Dale, of Woodstock. Where a man hath his household in two places, he shall be said to dwell in both; so that his addition in either may suffice. Knows was anciently a regular addition.

By flat, 1 Hen. V. cap. 5, it was ordained, that in all original writs of actions personal, appeals, and indictments, upon which process of outlawry may be awarded, such addition should be made to the name of the defendant, to shew his estate, degree, or mystery, and the place where he dwells; and that the writs, not having such additions, shall abate, if the defendant take exception thereto; but not by the office of the court. The reason of this ordinance was, to prevent any clandestine or mistaken outlawry, by reducing to a specific certainty the person who is the object of its process.

If one be of the degree of a duke, earl, &c. he shall have the addition of the most worthy dignity. 2 Infr. 669.

Such titles, however, are not properly additions, but names of dignity. The title of knight or baronet, is part of the party’s name, and ought to be rightly used; but the titles of esquire, gentleman, or yeoman, &c. being no part of the name, but additions, as people please to call them, may be used, or not used, or if varied, is not material. 1 Bll. 34.

An Earl of Ireland is not an addition of honour here in England; but such a person must be written by his Christian and surname, with the addition of esquire only; and the sons of English noblemen, although they have given them titles of nobility, in respect to their families, if you use them, they must be named by their Christian and surname, with the addition of esquire; as—such-a-one, esquire, commonly called lord A, &c. 2 Infr. 596. 666.

No addition is necessary where process of outlawry doth not lie. 1 Salk. 5. If a city be a county of itself, wherein are several parishes, addition thereof, as d. London, is sufficient; but addition of a parish not in a city, must mention the county, or it will not be good. 1 Danw. 237.

**Addition, in Measure,** is a dot placed on the right side of a note, to signify, that the time of the sound of such note is to be lengthened half as much more, as it would otherwise be.

A note of addition amounts to the fame with what is by some old English authors called prick of perfection.

Thus a semibreve, when marked with a dot, is to be as long as three minimis; the minim, with the like dot, to be as long as three crotches; the crotchet, as three quartavers, &c.

See **Character**.

**Additions, in Heraldry,** denote a kind of bearings, in coats of arms, wherein are placed rewards, or additional marks of honour, in which sense, additions stand opposed to **abatements,** or diminutions. See **Differnece.**

**Additions resemble, but differ from ordinarions.** To the effects of additions belong a bordure, quarter, canton, gyron, pyle, flank, flanche, voider, and an inequitouch gules, called also an effacement of presence. On any of these may an addition of honour be placed, according to the pleasure of the prince, or the fancy of the herald; which reward devolves to none of the family, except the person’s own direct line. In this manner the arms of a kingdom have been sometimes given, by way of addition, to a private subject. The abolition in which these additions are held, has declined since the college has granted them to persons who apply, although neither they nor any of their ancestors have had any particular claim on marks of the royal favour.

**Additions, in Distilling,** a name given to such things as are added to the wort, or liquor, while in a state of fermentation, in order to improve the vivacity of the spirit, procure a larger quantity of it, or give it a particular flavour.

All things of whatever kind, thus added in the time of fermentation, are called by those of the business, who speak most intelligently, additions; but many confound them with things of a very different nature, under the name of ferments.

The additions used in the distillery may be reduced to four general heads. 1. **Sols.** 2. **Acids.** 3. **Aromatics,** and 4. **Gls.** A little tartar, nitre, or common salt finely powdered, may be added to the liquor while fermenting, especially in the beginning of the operation; or in thin’d head, a little of the vegetable, or finer mineral acids, may be dropped in at different times, when found necessary. These are of great use, especially in the fermenting solutions of treacle, honey, and the like sweet and rich vegetable juices, which either wholly want an acid in themselves, or have it in too small a proportion, or have been robbed or distilled of it.

The proper acids for this purpose are, the juice of Seville oranges, or lemons, or the spirit of sulphur, or Glaufer’s spirit of salt, or, what is greatly preferable to all these, a particular aqueous solution of tartar, a feucedanum for which may be tamarinds, or the rabs of some very acid fruits, or the acidum salinum vini. On this foundation stands that ingenious practice of using a suitable proportion of the still bottoms, or the remaining wort, in the turbulent brewing.

After the same manner, a very considerable quantity of any essential vegetable oil, may by proper management be converted into a surprisingly large quantity of inflammable spirit; but great care in this case must be had not to drop it in too fast, nor too much at a time; this might damp the fermentation; and, indeed, the adding a large quantity at once, in the common way of stopping the fermentation at any point required.

The best method of all, of introducing the oil, so as to avoid all inconvenience, is to reduce it first to an elaeafi-charum, by grinding it in a mortar, with a due quantity of fine sugar in powder. The oil thus added, with its particles diffused, and in form of powder, will readily mix with the liquor, and immediately ferment with it.

A large proportion of rectified spirit, or of any other spirit, may, by prudent management, be also introduced into the fermenting liquor; and this will always come back with a large addition to the quantity of spirit, that would otherwise have arisen from the distillation. Shaw. See **Combinatory Distillation.**

**ADDITION,** denotes something to be added to another.
Geometricians speak of additive ratios; astronomers of additive equations, &c.

Additive ratio is used, by some writers, for those terms which are disposed to addition, that is, opposed to subtraction, i.e. to division. Phil. Trans. N. 257.

Suppose the line \( ac \) divided in the points \( b \) and \( x \),

\[
\frac{a}{b} = \frac{c}{x}
\]

the ratio between \( ab \) and \( bx \) is additive; because the terms \( ab \) and \( bx \) compose the whole \( ax \). But the ratio between \( ax \) and \( bx \) is subtractive, because \( ax \) and \( bx \) differ by the line \( ab \).

Additive equations, in Astronomy, those which are to be added to the sun's mean anomaly, in order to find the true one. See Equation.

ADDIX, in Antiquity, a measure of capacity in Asia and Egypt. See Piloc.

ADDIXIIT, or ADDIEXRUNT, was the word by which they expressed the favourable augur of the sacred birds. For an unfavourable augur, a negative was annexed.

ADDOUBORS, in Law. See REDDOBRS.

ADDRESS, in a general sense, is used for skill and good management, and of late has been adopted from the French, and is used in genteel phrase, and also in Commerce, as synonymous with direction or a person or place. The word is formed of the French verb addresser, to direct anything to a person.

Address, means also a discourse presented to the king, in the name of a considerable body of his people; to express or notify their sentiments of joy, satisfaction, or the like, on some extraordinary occasion.

We say, the lords address, the commons address. Address were first set on foot under the administration of Oliver Cromwell. - At Paris, their office of intelligence was commonly called bureau d'adresser.

Address, in Rhetoric. See APOSTROPE.

ADDUCENT Muscles, or Adductors, in Anatomy, are those which bring forward, close, or draw together, the parts of the body whereof they are annexed.

The word is compounded of add, to; and ducere, to draw, or bring.

Adducents, or adductors, stand opposed to abducent, or abductors.

ADDUCTION, in Anatomy, the motion or action of the adductus muscles, or adductors.

ADDUCTOR brevis femoris. See TRICEPS.

ADDUCTOR longus femoris. See TRICEPS.

ADDUCTOR magnus femoris. See TRICEPS.

ADDUCTOR Oculi arises from the inner side of the formen opticus, between the obliquus superior and depressor, and is inserted into the globe of the eye opposite to the inner angle. It is from its situation the shortest of the four straight muscles of the eye. It will turn the eye towards the nose.

ADDUCTOR Ophi metacarpis minimi digitii manus, metacarpis of Winslow, arises from the os metacarpale, and the ligament of the wrist, and is inserted in a tendinous form, into the inner side and front of the metacarpal bone of the little finger. It will bring the metacarpal bone of this finger towards the reft, and will bend it.

ADDUCTOR minimi digitii pedis, arises from the inside of the metatarsal bone of the little toe, and is inserted into the inside of the root of the first joint of the little toe. It will bend the first joint of the little toe, and draw it inwards.

ADDUCTOR pollicis manus, has a broad fleshy origin from the whole length of the metacarpal bone of the middle finger: its fibres are collected together to be inserted tendinous into the inner part of the root of the first bone of the thumb. It will pull the thumb towards the fingers.

ADDUCTOR pollicis pedis, the anterior of Winslow, arises by a long tendon from the os calcis, from the os cuboideum, from the os cuneiforme externum, and from the metatarsal bone of the second toe. It is inserted into the external semilunar bone of the great toe. Its use is to bring the great toe towards the other toes.

ADDUCTOR pollicis profundus, a name given by Santorini to a muscle, which he also calls levator profutus, and which Winslow calls profutus profundus. Albinus, from its office, had very properly called it adductor profundus.

ADDUS, in Ancient Geography, a town of Palestine in the tribe of Judah.

ADDYME, a town of Africa, placed by Ptolemy in Mauritania Caesariensis.

ADEA, in Geography, a district of Abyssinia, called also HADEA.

ADEB, in Commerce, the name of a large Egyptian weight, used principally for rice, and consisting of 210 okes, each of three rotolas, a weight of about two drams less than the English pound. But this is no certain weight: for at Rosetta the adb is only 152 okes. Pococke, Egypt.

ADEBA, in Ancient Geography, a town of Hispamia Tarraconensis, placed by Ptolemy among the Illyrenes.

ADEBAREA, in Geography, a desert, hilly district of Abyssinia, called the country of the Slaves, as being in the vicinity of the Shangali.

ADEDUS, in Ancient Geography, a town of Arabia Felix, on the borders of the Red Sea, placed by Ptolemy in long. 72° 15'; and lat. 17° 10'; among the Cambisii.

ADEGEN, in Geography, a town of Flanders, five leagues east of Bruges.

ADEL, a kingdom on the eastern coast of Africa, so called from its metropolis, and ZEILA from an eminent feaport, situated to the south of the Red Sea, the Straits of Babylons and Cape Guardafui, and has the Indian ocean on the east, on the south the kingdoms of Magdaxo and Adca; and on the west the country of the Gallas, or the kingdoms of Dancaal, Cawaro, Bali, Fatiger, and other districts of Abyssinia. The exact extent of this kingdom is not known; but it is supposed from east to west to be about 160 leagues, from north to south about 72 leagues. The interior part of Adel is very imperfectly described. The principal places in it are Adel, the capital and royal residence, situatet in the inland country, near the river Hawaff, about 300 miles south of Mogho, lat. 8° 5'; E. long. 44° 20'; Affin, a small town on the eastern coast, which furnishes provisions for mariners, but has no haven; Cape Guardafui to the north of Affin; Meta on the northern coast near the river Scial, Barbora and Zeila. Some geographers have mentioned other cities in this kingdom, viz. Araf, Bali, Doara, Comissara, Navorata, Socel and Aulfaguedula, situate on a high hill in the centre of the kingdom. The whole coast to the south-east is desert. This kingdom is said to have been founded by a prince of abyssinia, called Salatru, who, escaping from the prison in which the princes of the blood are confined in that country, took refuge in the province of Adel, and marrying the daughter of the king of Zeila, established himself in the possession of these united kingdoms. Of all the enemies, with whom the Abyssinians have had occasion to contend, the kings of Adel have been the most powerful and inveterate; and, indeed, the history of this kingdom consists prinipally of details of alternate defeats and victories. The Aeliaians being Mohammedans, and the Abyssinians Christians, a mutual animosity has subsisted between them; and the rancour has increased
increased in consequence of the succour given to the latter by the Portuguese, and the alarm occasioned by their submission to the authority of the Roman see. At length, however, the Portuguese were totally expelled, and the kingdom of Adel became tributary to the Grand Signior. The kings of this country have been for a long time in high favour at the Porte, and dignified with the title of Saints, on account of their singular zeal, and frequent wars against the Christians. Nevertheless the Sultans have contrived to strip them of their most considerable maritime towns on the Red Sea; so that they have now no port left, except that of Zeila, the rest being all in the hands of the Turks. By these means the kings of Adel are precluded from maintaining any intercourse with Europe.

The country, though it has seldom any rain, is so well watered by rivers and canals, that it is very fertile and productive. It has plenty of wheat, barley, and millet; and a great variety of sheep, cows and other cattle. Some of the sheep have large tails, which weigh between 20 and 30 pounds. But the chief traffic of the inhabitants consists of gold dust, elephant’s teeth, frankincense and negro- slaves, which they procure from Abyssinia with which they are almost always at war, and convey to the port of Zeila, where they find purchasers from Arabia, Cambaya, and other parts.

The Adelites, called Gilbertis, are a stout and warlike people, and fight with surprising intrepidity against the Abyssinians, partly from zeal for religion, and partly with the hope of plunder: and they are furnished by the Turks and Arabs with a variety of fire-arms. Their complexion, particularly on the northern coast, is of a tawny brown, and towards the south it is of a more deep black. Their dress chiefly consists of a piece of cotton, which covers them from the girdle to the knee, the rest of the body being naked; but the king and nobles wear a kind of loose garment, that covers the whole body, and a cap over the head. All, and especially the women, are fond of adorning their necks, arms, wrists, and ankles with bracelets of glass, amber, and other similar trinkets.

ADELARD, or Athelward, in Biography, a beneficent monk of Bath, flourished about the year 1130, and for the sake of mathematical knowledge, travelled into France, Spain, Germany, Italy, Egypt and Arabia, and is said to have settled at Paris, where he acquired reputation as a teacher of medicine. He translated Euclid, among other Greek writers, out of Arabic into Latin; and also an Arabic work, entitled “Erichentarim,” upon the seven planets. He wrote a treatise on the seven liberal arts, comprehending, according to the language of the times, the trivium and quadrivium. He is also said to have written many books of physic and medicine, which are lost. Wallis, in his Algebra (p. 6) mentions the prefaces to two MS. books of Travels; one or both of which had noticed the travels of Athelward Batheus, which had been cited by Volius, who says that he was learned in all the sciences of his time; but these have since been cut out of the books in Corpus Christi and Trinity colleges, Oxford, and carried away—a species of inxensy, which, in the Republic of Letters, deserves to be treated as a capital offence.

ADELARD. See Adalard.

ADELBERT, in Geography, a town of Germany, in the duchy of Wurttemberg; two leagues south-east from Schwarmberg. See Adelsberg.

ADELBOLD, in Biography, a monk of Louviers in the diocese of Liege, and afterwards bishop of Utrect, wrote the life of his emperor Henry II. surnamed Claudius, with whom he was a favourite. He was made bishop of Utrecth in 1089, and died 1027.
towns of Franconia; one in the bishopric of Bamberg, and the other in the marquisate of Anspach.

ADEPTION, in the Civil Law, the revocation of a grant, donation, or the like. The ademption of a legacy may be either express, as when the testator declares in form, that he revokes what he had bequeathed; or tacit, as when he only revokes it indirectly or implicitly. Thus, if A. by will gives his daughter M. 1000l., to be paid after his debts, besides a share out of the dividend of his estate; and afterwards on her marriage, an agreement be made for what she should have out of A's estate, that it should be only 100l., which should be in full of what was intended out of it; this agreement is an ademption of the legacy.

ADEN, a gland. See GLAND.

ADEN, in Geography, a celebrated mart, giving name to a country of which it is the capital, situated at the most southern extremity of Arabia Felix upon the Indian ocean, near the coasts of Babelmandel. According to the Arabs, its founder was Aden the son of Saba and grandson of Abraham. Some suppose that the etymology of the name is the same with that of Eden, and that it was so called from the delightful country in which it was situated. It stands at the foot of several high mountains which surround it almost on all sides. The Arabs have erected forts on the summits of these mountains; and a fine aqueduct conveys the water from thence into a large reservoir or canal, built about three-quarters of a mile from the city, which supplies the inhabitants. Gallus supposes, that Aden is the Arabic Emerprium of Polemy; and it is without doubt the Adamus of Uranus, mentioned by Stephanus, vol. i. p. 24.

The situation of the harbour of Aden, which opened an easy communication with Egypt, Ethiopia, India and Persia, had rendered it for many ages one of the most flourishing factories in Asia. Fifteen years after it had repulsed the great Albuquerque, who attempted to demolish it in 1513, it submitted to the Turks, under Soliman II. in 1559, who did not long remain masters of it. The king of Yemen, who possessed the only district of Arabia that merited the appellation of happy, drove them thence and removed the trade to Mocha, which till this circumstance occurred, was only a village. N. lat. 12° 40', E. long. 46° 13'.

ADEN, is also the name of a mountain in the kingdom of Fez.

ADEANTHERA, formed of adenos, glandulares, and -thera, an anther, bollard, flower-tube, in Botany, a genus of the decandria monogyna class and order, of the natural order of lomantaces, and leguminosae of Jussieu; the characters of which are these: the calyx is a one-leafed, five-toothed, very small perianthus; the corolla is five-petalled and bell-shaped, the petals lanceolate, filiform, convex inwards and concave underneath; the stamens are fertile filaments, erect and somewhat shorter than the corolla; the anthers are roundish, incumbent, bearing a globule gland at the outer tip; the pistilium is an oblong gomus, gibbous downwards, style subulate and as long as the stamens, the stigma limpid; the pericarpium is a long compressed membranaceous legume, and the seeds are very numerous, roundish and remote. There are three species, viz. A. paramina, or pointenayi, with leaves smooth on both sides, which is one of the largest trees in the East Indies. Its duration is 200 years, and its timber is much used on account of its solidity; the powder of the leaves is used in their ceremonies; the seeds are eaten and are also valued as weights, being each of them four grains; and beaten with water and borax, they form a cement, and the bruised leaves yield a liquor which is esteemed good against pains in the loins. This species must be milled on a hot-bed from seeds, and it must afterwards be placed in the bark-flour. It has not yet flowered in England. Mr. Miller mentions a variety with scarlet seeds received from India, which is of a very flow growth. 2. A. falcata, with leaves tomentose underneath, is a native of the East Indies. 3. A. scandens is a native of Mallicollo, an island in the South-seas. These two species are little known with us; having never been cultivated in England.

ADEANTSHERA, is also a species of ANTHERICUM.

ADENA, in Geography, a town of Africa, in the empire of Morocco, and province of Temiens.

ADENBERG, or ALDENBERG, a town of Welfphalia, in the duchy of Berg, subject to the elector Palatine; 12 miles north-call of Cologne. E. long. 7° 16'. N. lat. 51° 2'.

ADENIA, in Botany, a genus of the decandria monogyna class and order; the characters of which are, that the corolla has five petals; the calyx is very long, and divided into five portions; the nectarium is composed of five linear scales. There is one species, viz. A. sectata, with palmed leaves and spotted flowers. This species is mentioned by Forlak in his Flor. Egypt. And he says, that the powder of the young branches mixed in any kind of liquor, is a strong poison; and that the capparis spinosa is an antidote to it. The tree grows in Arabia.

ADENOGRAPHY, compounded of adenos, glindus, and -graphy. I desire to describe, that branch of Anatomy which describes the glands, and the glandular parts of the body.

ADENOLOGY, the name with some others call adenoscopy, or the adenosological part of Anatomy.

ADENOIDEIS, q. d. glandulatus, an epithet applied to the prostate.

ADENOS, a kind of cotton, otherwise called marine cotton. It comes from Aleppo by the way of Marfeilles, where it pays 20 per cent. duty, according to the tariff of the year 1766. Its valuation, by the same tariff, is of 76 lives 16 shillings.

ADENOSUS abscessus, in Surgery, a crude hard tubercle, difficult of dissection, and resembling the appearance of a gland. See Abscess.

ADENSEN, in Geography, a parochial village in the bailiwick of Calenberg in Hanover, which formerly belonged to the lords of Adenys, whose male issue became extinct in 1331, and whose titles were engaged by marriage to the counts of Hallermund.

ADEONA, in Mythology, a goddes invoked by the Romans when they set out upon a journey. This (says Mr. Bryant) is the same with Libuna or Adions, formed of ad and Ionab, q. d. regia columba, referred to in the Hebrew word for mercanarius (Dent. xvii. 11.), and probably the Dionysus of the Greeks. Mythol. vol. ii. p. 313.

ADEPHAGIA, the goddes of glutony, as the name imports, to whom the Sicilians paid religious worship. In the temple erected to her, her flatus was placed next to that of Ceres.

ADEPHAGUS, or voration, an appellation of Hercules.

ADEPS, in Anatomy, the fat found in the abdomen. The term also denotes more generally any kind of fat.

ADEPTS, from the verb adpetti, to obtain, a denomination given to the proficient in Alchemy, by which those chemists chose formerly to distinguish themselves who were engaged in experiments on the transmutation of metals, and researches after the universal medicine. The appellation is derived, according to Paracelsus (de alchimia magna lib. i.), from the Latin term philosophical adeptus, philosophy acquired by contemplation, in opposition to that which
ADE

which was taught and transmitted in the schools, philosophia
elementaris. Such is the nature, says Paracelsus, of this
higher-philosophy, that it does not originate from man but
from heaven; and one mortal can no more communicate it
to another, than the paper on which letters are traced, can
of itself declare their meaning. Hence the enthusiasts who
gave themselves up to this kind of study, intitled them-
elves philosophi adepti, as they spoke of others by the name of
philosophi terreni. Van Helmont also says, "vocantur bi
adpeti quamur reverus spiritus Dei ef;" (de magnete, nat. curat.
119.) "Adepts are those who are guided by the spirit of
God."

Originally, however, this flattering epithet was common
to several sciences, for Paracelsus expressly mentions adept
teleology, adept geometry, adept medicine, &c. All these
sublime distinctions are however fallen into neglect, and the
believers in the philosopher's stone have alone retained pos-
session of the title of adepts. The term therefore in the vo-
cabulary of the alchemists, means a person, who, besides
being a matter of all that has been written, or is current by
tradition, relative to the occult qualities of bodies, has by
contemplation, and in some mysterious manner, acquired an
insight into those secrets of nature, on which depend the
transmutation of metals, and the universal medicine. It was
therefore among the adepts, that the number of persons
thus divinely initiated, was never either more or less than
twelve. The most celebrated of this fraternity are Ray-
mond Lulli, Paracelsus, Van Helmont, and Isaac Hol-
lander; men superior in real chemical knowledge to all of
their contemporaries, but who were led partly by their own
vanity and love of mysticism, and partly by the easy and
eager credulity of the publice to be contented with the fame
of conjurers, when they might have deferred the notice of
poverty as philosophers.

The term adept is sometimes more generally applied to
those who are proficient in any kind of science.

ADEVATANGIE Creek, in Geography, is the eastern
head water of Susquehannah river, in the state of New
York.

ADEquate, something equal to, or co-extended
with, another; and filling the whole measure and capacity
thereof.

In this sense the word stands opposed to inadequate.

Adquate, or total, in Logic, is applied to the objects
of science. The adequate object of a science includes the
material and formal object: the material object of a science
is that part which is common to it with other sciences; the
formal is that which is peculiar to itself.

Adquate ideas, or notions, in Metaphysics, are such
images or conception of an object, as perfectly represent it,
or answer to all the parts and properties of it.

M. Leibnitz defines an adequate notion to be that of whose
several characters we have distinct ideas.—Thus, a circle
being defined, a figure bounded by a curve line which returns
into itself, and whose points are all equally distant from a
certain intermediate point thereby, our notion of a circle is
adequate, if we have distinct ideas of all these circumstances,
viz., a curve returning upon itself, a middle point, an equa-
liity of distance, &c.

All simple ideas are adequate and perfect; and the fa-
culty, be what it will, that excites them, represents them
entire.

The ideas of modes are likewise adequate, or perfect;
except of those modes which occasionally become sub-
stances; for when we speak of modes separately existing,
we only consider them separate from the substance by way
of abstraction.

All abstract ideas are also adequate and perfect; since
they represent all that part of the subject which we then
consider.—Thus, the idea of roundness is perfect, or ade-
quate, because it offers to the mind all that is in roundness,
in general.

Of the same kind are all ideas, of which we know no
original, or external object really existing out of the mind,
by occasion of which they were excited in us, and of which
we think them the images. Thus, when a dog is before us,
it is the external object without us which raises the idea in
our mind; but the idea of an animal in general, has no ex-
ternal object to excite it: it is created by the mind itself,
and must of necessity be adequate or perfect.

On the contrary, the ideas of all substances are inadequte
and imperfect, which are not formed at the pleasure of the
mind, but gathered from certain properties, which experi-
ence discovers in them.

This is evident, because our knowledge of substances is
very defective; and we are only acquainted with some of
their properties: thus, we know, that silver is white, that
it is malleable, that it melts, &c. but we do not know what
farther properties it may have; and we are wholly ignorant
of the inward texture of the particles whereof it con-
stitutes.—Our idea of silver, therefore, not reprenting to
the mind all the properties of silver, is inadequate and im-
perfect.

ADER, Guillaume, in Biography, practised medicine
at Touloupe in the beginning of the 17th century; and
published “Enarrationes de Agrotis et Morbis in Evang.
ela,” Tolos, 1620, 4to. “De petit Cognitio, Prac-
vite et Remedia,” 1628, 4to.

ADER, Eder, Haladsh Hered, in Ancient Geography,
a town thus variously called, allotted to the tribe of Judah;
which, before that distribution was made, is said to have
been the capital of Arab, one of the Canaanitic kings.
This prince attacked and vanquished the Herodites before
their entrance into the promised land. The town was situ-
ated to the south, and near the lake Asphaltites.

ADERAIMIN. See ALDERAIMIN.

ADERANAPATANAM Bay, lies about north-west by
west from Point Pedro, in the island of Ceylon, and west
by south from Calimer Point, on the coast of Coromandel.

ADERBIGAN, or Aderbeytan. See ADERBEITAN.

ADERBORGH, a small town of the circle of Upper
Saxony, in Pomerania, belonging to the king of Prussia;
three leagues north-west of Steina.

ADERBOURGH, a small town in Germany, in the
marche of Brandenburg.

ADERCAN, a town of Perus, in the province of La-
lisbat; 25 leagues north-east of Laa.

ADERCO, in Ancient Geography, a town of Iberia.

ADERKAN, in Geography, a town of Perus, in the
province of Farfeliad; 45 leagues south of Schiras.

ADERNO, a small place in the Val di Demenza, in Sicily,
anciently called Aderamo, and situated near the river Fiume
d' Adorno, at the foot of Mount Gibel, E. long. 15° 25'.
N. lat. 35° 5'. The remains of the walls of this ancient
city still retain an air of grandeur. The pretended temple
of Adronos in the vicinity of it is nothing more than a bath,
constructed of bricks and lava, in the lower period of anti-
quity, when both Sicily and the Roman empire had lost all
their eminent artificers. See Houel's Viz. Pittorique des

ADERSLEBEN, a town of Germany, in the principal-
ship of Halberstadt; 16 miles south-east of Halberstadt.

ADES, or Hades, 66°, from a and los, to see, denotes the
invisible
invisible plane. In the heathen mythology, it comprehends all those regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elysium. See .Hex.

Dr. Campbell observes, that the word habes, hades, occurs eleven times in the New Testament, and is translated hell in all, except one, where it is translated grave. He thinks, however, that it ought never in scripture to be rendered hell, at least in the sense applied to that word by Christians. In the Old Testament, the corresponding word is יָאָדָשׁ, יָאָד, which signifies the state of the dead in general, without regard to their character or to their condition, either of happiness or misery. The Seventy, in their translation of the word, have almost invariably used יָאָד. See Gen. xxxviii. 35. ch. xili. 58. P. xvi. 10. Acts ii. 27. Some biblical critics, however, among whom we may reckon Father Simon, Bishop Law, and Dr. John Taylor, have contended that the term, in the Old Testament at least, means no more than יָאָד פֶּסְפֵּלֶת or grave. This opinion is examined by Dr. Campbell, and he alleges, that, though our word grave may, in some cases, sufficiently express, not the import of the word פֶּסְפֵּל, but the purport of the sentence; yet, in other cases, it gives but a feeble, and sometimes an improper version of the original. He maintains, that with regard to the situation of hades, it seems always to have been conceived both by Jews and Pagans, as in the lower parts of the earth, and corresponding in depth to the height of the visible heavens, both which are on this account contrived in framed writ. See Job, xi. 7, 8, 9. Pial. xxxiv. 8. Amos ii. 2, 3. Besides, the inhabitants of hades are, from their subterranean abode, designated in the New Testament. (Phil. ii. 10.) יָאָד פֶּסְפֵּל, a word of the same import with the phrase יָאָד פֶּסְפֵּל, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד הַר, יָאָד Hades, or the regions of the dead, and the whole race of terrestrial beings, include the whole rational creation. In proof of the coincidence of the Hebrew and Pagan notions concerning the situation of the place of departed spirits, he refers to the lines of Virgil, Aen. viii. v. 243. &c.

Non fesus, ac quæ qua petitus ut terra debifescas
Infernas referet fedeæ, et regna recludat
Pallida, quis invisa; superque immune barathrum
Cernat, treplimentque immittit, libissime manes.

Dr. Campbell farther observes, that κόλπος, the Hebrew word for grave, is never rendered in the ancient translation גָּדַע, but יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָאָד פֶּסְפֵּל, יָa

This word is also always singular in meaning, as well as in form; but the word for grave is often plural: and the former never admits the possessive pronouns, being the receptacle of all the dead, and therefore incapable of an appropriation to individuals; the latter often. In hades all the dead are represented as present, without exception; but the case is quite different with the graves or sepulchres. If. v. 14. ch. xiv. 9. See also Job xxxviii. 17, in which the challenge to Job could have no relation to a sepulchre, but the door to entry, or the door, which is always known to the living; whereas the case was very different with regard to the habitation of departed spirits. Upon the whole, Dr. Campbell concludes, that the word grave, or sepulchre, never conveys the full import of the Hebrew פֶּסְפֵּל, or the Greek hades. This author proceeds to examine the sense of פֶּסְפֵּל, hades, in the New Testament; and refers to Acts ii. 27, in which the writer, in using two expressions, one regarding the soul, the other the body, would undoubtedly adapt his language to the received opinions concerning each; and if this be the case, hades was as truly, in their account, the soul's destiny after death, as corruption was that of the body. Another clear proof from the New Testament, says Dr. Campbell, that

hades denotes the intermediate state of souls between death and the general resurrection, occurs in Rev. xx. 14, where the expression denotes that death, and the state of souls intervening between death and judgment, i.e. hades, shall be no more; but that to the wicked these shall be succeeded by a more terrible death; and properly so called. See also ch. vi. 8. The apostle Paul, it is said, without naming hades, conveys the same ideas of the state of souls departed. Rom. x. 6, 7. Hades is often used figuratively to denote a humble and miserable state; and thus it is opposed to heav'n. Matt. xiii. 23. xvi. 18. Here it may be observed, with Grotius, (Truth of Christian Religion, p. 308. Clarke's edit.) and many others, that פֶּסְפֵּל, the gates of hades, are a very natural paraphrase for death. So the expression is used by the Seventy as a literal version of the Hebrew. II. xxxviii. 10. See also Wisdom of Solomon xvi. 13. The classical use of this phrase is the same with that of the inspired writers. Homer makes Achilles say, as rendered by our English poet:

Who can think one thing and another tell,
My soul detests him as the gates of hell:

I. lib. ii.

i. e. I hate him as death, or mortally.

To say then, that the gates of death shall not prevail against the church, is, in other words, to say, it shall never die, or be extinct. The only passage, says Dr. Campbell, in holy writ, which seems to countenance the opinion, that פֶּסְפֵּל, hades, means the same thing as פֶּסְפֵּל, a place of punishment, is in Luke xvi. 27. According to the explanation given of this passage, the rich man and Lazarus were both in hades, though in very different situations; the latter in the mansion of the happy, and the former in those of the wretched. When hades is represented as being under the earth, and heaven, or the seat of the blessed, as being above the stars, these expressions should be regarded merely as attempts to accommodate what is spoken to vulgar apprehension and language. See Campbell's Four Gospels, translated from the Greek. Prelim. Diff. vol. i. p. 206.—236. See Sleep of the Soul.

ADES, in Geography. See Rhades.

ADESA, or Adessa, a river of Lyca, in Asia Minor. A town of this name is placed by M. d'Anville, on a small river, which unites with a much larger, called Xanthius.

ADESSE, or Adessa road, lies on the west side of the island of Teneriffe, and six leagues east from Gomera island road, which is opposite. It is open to the south-west.

ADESSENIARII, formed of the verb adeös, to be present, in Ecclesiastical History, a name given to those who in the 16th century held that Jesus Christ is really present in the eucharist, but in a manner different from that which is maintained by the Romanists. The adeollarii, called also impanatarii, are divided into four different opinions concerning this point. Some hold that the body of Jesus Christ is in the bread; others, that it is about the bread; others, that it is with the bread: and lastly, others, that it is in or under the bread. See Impanation.

ADFFECTED, or Affected Equation, in Algebra, is that in which the unknown quantity is found in two or more different degrees or powers: e.g. $x = x^2 - px + q = ax^2 + bx$, which has 3 different powers of $x$, viz. $x^2$, $x$, and $x^1$. See Equation. The term afféted is sometimes used in speaking of quantities that have co-efficients. Thus, in $2a$, the quantity $a$ is said to be affected with the co-efficient 2; and an algebraic quantity is said to be affécted with the sign $+\ or\ -\$, or with a radical sign, when these signs are prefixed.
ADH to it. The term affected, or affected, is said to have been introduced by Vieta.

ADFIGURATION is used to signify a Gothic custom, where a person remarrying, who has children by a former bed, renders them capable of inheriting equally with the common children of both parties. This is done by agreement, and is otherwise called by some adopta per matrimonium. This custom is still retained in Germany, under the name eindkindchaft, and unio prolem. But the learned Hinnecius observes, that the unio prolem is not an ADOPTION. Elem. Jur. Germ. tom. i. § 161.

ADFINES, in Ancient Geography, a town of Switzerland, supposed to be the modern Fain, in the north of the district of Turgaw, on the river Duro, or Thur, not far from the borders of Swabia, about half way between Constance and Freyenthal. It is so called, because at the time when Cassina, the general of the emperor Victorius, with the auxiliary Rhetians, defeated the Helvetii, the former extended their borders thus far; and in the time of the Romans, it was the left town of repute in this quarter.

ADGADNA, in Geography, a town in the Guan, one of the Mariana isles in the South Sea.

ADGE, Agde or Auve, is a river that falls into the gulf of Lyons. It is north-east from Narbonne, between Beziers and Montpelier, and forms a good bay.

ADHA, among the Mahometans. See BIRAM.

ADHAD-EDDOULI, in History, second prince of the race of Buia, or Diikmate, was born about A. D. 925, and succeeded his uncle, Amad-eddouli, in the empire of Peria; and by the additions he made to it, became the most powerful prince in the east. In 977, he became emir and master of Bagdad, and directed his attention to the improvement of his extensive dominions. He built hospitals, founded mosques, cleaned the beds of rivers, and recovered and rendered more fruitful large tracts of land. He encouraged literature and poetry, and cultivated a taste for science, and a profusion in that knowledge which was most esteemed among the Arabs. By marrying one of his daughters to the caliph Al Tay, he mingled the blood of the Buians with that of the ancient sovereigns of the Moelins. His ambition led him to commit occasional acts of severity; but his government was, upon the whole, wise and benevolent. He fell a sacrifice to repeated attacks of the plague, at the age of 47, A. D. 972, and left four sons, who shared his dominions. When this prince was at the point of death, he is reported to have said, with a faltering tongue, "What have all my riches and prosperity availed me? My power and authority are now at an end;" and these words he continued repeating till he expired. Mod. Un. Hist. vol. ii. p. 410.

ADHATODA, in Botany, a species of Justicia. This name is given to it in the Zeylian tongue, from its supposed virtue of expelling the dead fucus, which it signifies.

ADHERENCE, action of, in the Scots Law, is an action competent to a husband or wife, to compel either party to adhere in case of defection.

ADHERGAT, in Geography, a town of Syria, on the frontiers of Arabia.

ADHESION, or AHERENCE, compounded of ad, to, and hèreere, to flock, in a general sense, the state of two bodies which are joined or fastened together, either by mutual attraction, the interposition of their own parts, or the impulse or pressure of external bodies. Anatomists sometimes observe prophysees, or adhesions of the lungs to the side of the thorax, the pleura, and diaphragm, which give occasion to various disorders. We also read of adhesions of the dura mater to the cranium; of the bone to the bladder, though some combat this last as a chimera; at least the instances of it are rare. We have also several cases of adhesions of the intestines, mentioned in the Philosophical Transactions, N. S. 281. The adhesion of two hollow hemispheres and of two polished planes exhibit other instances of adhesion. See ADHESION infra.

ADHESION, in Logic. The schoolmen distinguish two kinds of CERTITUDES: the one of speculation, which arises from the evidence of the thing; and the other of adhesion, or attachment, which does not depend on the evidence, but on the importance of the matter, and the interest we have in its truth.

ADHESION, or ADHERENCE, is also used for the persisting in a former opinion or resolution. After the free conference between the two houses concerning the bill for preventing occasional conformity, when the Lords retired, and it came to the final vote of adhesion, they were so equally divided, that in three questions put to different heads, the adhesion was carried by one vote in every one, and by a different person each time. The Commons likewise adhered; and thus the bill was lost.

ADHESION, adhesion, Fr. in Philosophy, and Ch. misty, is a term generally made use of to express the property which certain bodies have of attracting to themselves other bodies, or the force by which they adhere together: thus, water adheres to the finger, mercury to gold, &c. Hence arises an important distinction between two words, that in a loose and popular sense are often confounded. Adhesion denotes an union to a certain point between two dissimilar substances, and cohefion that which retains together the component particles of the same mass. See COHESION.

Adhesion may take place either between two fluids, as two hemispheres of glass, which, according to an experiment of Delfagubers, adhere to each other with a force equal to 19 ounces on a surface of contact of an inch in diameter; or between solids and fluids, as the suspension of water in capillary tubes; or lastly, between two fluids, as oil and water.

The proximate cause of adhesion has been variously flated by different philosophers. James Bernoulli, in his Difertation on the Weight of the Atmosphere, published in 1682, maintains, that the adherence which two pieces of polished marble oppose to their separation, is owing to the pressure of the air; in proof of which, he affirms as a fact (what in all probability he had himself never attempted to verify), that the two plates were easily separable in vacuo.

Dr. Brook Taylor having observed, in 1713, the ascent of water between two planes of glass, was induced to make several experiments on the adhesive power of surfaces, from which he concluded that the degree of this force might be measured by the weight required to separate them. About the same time Mr. Hankbee proved experimentally the error which Bernoulli had fallen into, in attributing the adhesion of surfaces and capillary attraction to the pressure of the atmosphere, (Philos. Trans. vols. xxv. xxvi. xxvii.) Nevertheless, in 1772, M. M. Lagrange and Cigna, taking for granted a natural repulsion between water and oily substances, imagined if there was an adhesion between water and oil, or tallow, that it must be occasioned by a cause different from attraction; and having ascertained the reality of the adhesion, they concluded that it was occasioned by the pressure of the air, and that Dr. Taylor's method was not well founded.

Such was the state of opinions on the subject, when, in 1773, Guyton Morveau made his celebrated experiments on adhesion.
Attachment in presence of the Dijon academy, (Journ de Physique, i. p. 172 and 462.) demonstrating, as indeed Hauksbee had done before him, not only that water adheres between two parallel plates of tallow separated from each other by a line, but also that the atmospheric pressure is not in the least degree the cause of the phenomenon, which is solely attributable to attraction: in proof of this, a polished disk of glass, 30 lines in diameter, was suspended to the arm of a balance, and brought into contact with a surface of mercury; the counterpoise required to separate it was equivalent to 0.09 grains, and a few grains, and upon moving the apparatus into the receiver of an air-pump, and forming as perfect a vacuum as possible, precisely the same counterpoise was required as before.

In the prosecution of his inquiries on this subject, which Bifmut had principally interspersed with mathematical philosophers, Morveau was led to discoveries, which promised at first to reduce the intricate science of chemical affinities to the certainty of algebraic computation; and, if that hope has since been deceived, it still remains an interesting object to the chemist, and affords much subsidiary assistance in the investigation of the general laws of chemical affinity.

He observed, that the same disk of glass which, when in contact with pure water, adhered to it with a force equal to 256 grains, required a counterpoise of only 210, in order to separate it from a solution of potash, notwithstanding the superior density of this last. This inequality of effects on equal diameters, and in an inverse order to that of the respective specific gravities of the two fluids, appeared not only to be decisive in favour of Dr. Taylor's method, but to encourage the hope of applying it to the calculation of chemical affinities.

In order to verify this proposition (Elémens de Chymie, de l'Académie de Dijon, vol. i. p. 63.), plates of the different metals in their highest state of purity were procured, perfectly round, an inch in diameter, of the same thickness, well polished, and furnished with a small ring in the centre of each so as to keep them suspended precisely parallel to the plane of the horizon. Each of these plates was in turn suspended to the arm of an air-balance, and exactly counterpoised by weights placed in the scale attached to the opposite arm; the plate thus balanced was applied to the surface of some mercury in a cup about two lines beneath it, by sliding the plate over the mercury as in the silvering of mirrors, so as to exclude every bubble of air, weights were then sucesively added till the adhesion between the plate and mercury was broken. Fresh mercury was used for each experiment. The following is the Table of results.

<table>
<thead>
<tr>
<th>Metal</th>
<th>Force equal to 446 grains</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

The striking differences in the above Table shew that the preasure of the atmosphere has no share in them, since in this respect the circumstances of each were precisely similar: nor do they depend on the respective specific gravities; for if so, silver should rank after lead, cobalt before zinc, and iron before tin. The only order which agrees with the above is that of the chemical affinity of these metals, or the respective degrees of their solubility in mercury (See Amal. de Chim., vol. i. p. 63.)

(c. 5): it is highly probable, therefore, that at least the principal part of the adhesive force that is found by experiment is owing to chemical affinity, and that the above numerical figures 416, 429, 418, 397, &c. is an approximation towards the ratio of the relative affinities of gold, silver, tin, lead, &c. for mercury.

M. Achard, of Berlin, convinced by Morveau's discoveries of the accuracy of Dr. Taylor's method, followed them up by a great multitude of experiments which were published in 1780, along with other tracts in his Chymie Physique et Mathematique. The results of these, if accurate, would make a considerable accession to the science of chemical philosophy, but as there are some rather suspicious circumstances, it will be necessary to investigate M. Achard's system with some minute care.

He lays down three conditions as essential to the accuracy of each experiment. 1. That the whole, whose adhesion with the fluid is to be ascertained, should be suspended by its true central point, in order to be in a truly horizontal position, and that the force employed to separate the adhesion should always form a right angle with the fluid. 2. That no air bubble should remain interposed between the solid and fluid; which is easily perceived when using disks of glass, but can only be inferred when using opaque solids; to obviate this cause of inaccuracy he has found no method answerable to well combining the plates on the surface of the fluid as explained above. 3. In adding the counterpoise, especially towards the end, care must be taken to use very small weights, such as pieces of paper, a quarter of a grain each, and to place these in the scale, gently and gradually, so as to avoid any jerk or sudden action.

The first point to be ascertained was, whether the temperature remaining the same, the difference of atmospheric pressure, as evinced by the barometer, had any influence on the adhesion of surfaces; he found that in this respect there was no difference in the adhesive force between a plate of glass and distilled water.

The results were, however, no longer uniform, when he operated at different temperatures with the same elevation of the barometer; nor did this variation arise from the different temperatures of the surrounding air, but solely from that of the water; pursuing this train of experiment he found that the adhesion of solids to fluids is constantly in an inverse ratio to their temperature: and for the verification of his experiments he instituted a number of calculations from the following data. Let \( x \) be the temperature of the water; \( y \), the corresponding adhesion; \( a \), its co-efficient; and \( b \), the constant force; hence we have the equation \( x = a - b \). To find the value of \( a \) and \( b \), if he made use of two experiments, the one in which water at 104° of Sulzer's thermometer (152° in Paris) was adhered to the glass disk with a force equal to 80 grains, the other where water at 56° S. (96° 7' Fahrenheit) adhered with a force equal to 89 grains. Proceeding from these two terms \( 104 = a - 80 b \) and \( 56 = a - 89 b \) we have, \( a = 530 \) and \( b = -\frac{43}{9} \).

Hence the relation of the temperature of the water to its adhesion to the glass, may be thus expressed, \( x = 530 - \frac{43}{9} y \); and from this are deduced the corresponding values of \( x \) and \( y \) for all the adhesions of glass to water at any temperature.

From these data, and the corresponding experiments, M. Achard
Achard formed the following Table of the adhesive force of a glass disk, $\frac{1}{2}$ inch in diameter, to water at different temperatures.

| Degrees of | Degrees of | Adhesion | Adhesion | Difference |
| Sulzer's | Adhesion | found by | Calculation |
| Ther'm. | by Experiment | | |
| 95 | 141.687 | 81.25 grs. | 81.55 | -0.3 |
| 90 | 135.914 | 82.5 | 82.5 | 0 |
| 85 | 130.141 | 83.75 | 83.43 | +0.32 |
| 80 | 124.368 | 84.5 | 84.37 | +0.17 |
| 75 | 118.595 | 85.75 | 85.37 | +0.38 |
| 70 | 112.822 | 86.5 | 85.25 | +0.27 |
| 65 | 107.049 | 87.25 | 87.18 | +0.07 |
| 60 | 101.276 | 88.5 | 88.12 | +0.38 |
| 55 | 95.503 | 90.25 | 89.06 | +0.25 |
| 50 | 89.730 | 90.25 | 89.93 | +0.12 |
| 45 | 83.957 | 90.75 | 90.38 | +0.38 |
| 40 | 78.184 | 92.5 | 91.87 | +0.37 |
| 35 | 72.411 | 93.75 | 92.81 | +0.04 |
| 30 | 66.638 | 95.75 | 94.73 | +0.02 |
| 25 | 60.865 | 94.5 | 94.08 | -0.18 |
| 20 | 55.092 | 93.75 | 95.02 | +0.15 |
| 15 | 49.319 | 92.5 | 95.56 | +0.31 |
| 10 | 43.546 | 92.5 | 97.5 | 0 |

Of the accuracy of this Table of M. Achard's there seems no reason to doubt, since, in the individual instances, the difference between the force of adhesion found by experiment, and that ascertained by calculation, is so considerable as to exclude the idea of fiction; while, upon the general average, the difference is so small as to give a high opinion of the precision with which the enquiry has been conducted.

We learn from this Table, that for every degree of Sulzer's thermometer ($1.595$ Fahrenheit) taken in a descending series, the force with which a glass disk $\frac{1}{2}$ inch in diameter adheres to the surface of water, is increased by $0.1876$ grains according to calculation, or $0.1878$ by experiment, in an uniform ratio; now two things take place during the cooling of the water, viz. a portion of caloric is separated, and the bulk of the water is effused; each of these causes may account for the increased adhesive force, but upon different principles. If it is owing to the escape of caloric, it may be accounted for in the following way. Water at any state of liquidity is, properly speaking, a compound of caloric and water, which combine together by a slight degree of affinity; and in proportion to this force reflect the union of any third substance either with the caloric or the water: if part of the caloric is taken away, the water is more disposed to union with a third substance by the whole quietest affinity of the water and the abstracted caloric; therefore the force by which a plate of glass adheres to water is increased, exactly in proportion to the diminution of the temperature, or, in other words, the increase of weight is the exponent of the quietest affinity of the mafs of water and the caloric taken away. According to Morveau's observations on this same Table; "The adhesion is stronger when the water is colder, because containing more ponderable matter in a given volume, it presents to the glass-plate more points of contact; and the force of adhesion being proportional to the sum of these points, it ought to augment or diminish, as the fluid is condensed by cold, or rarified by heat." These few words express the aim and object of all the experiments of Morveau on this subject; namely, that chemical affinity is only a modification of the attraction of cohesion, and in like manner subject to mathematical computation. The general reasonings on which this opinion is founded will be discussed hereafter in the article chemical affinity; all that is necessary here, is to show, that the argument just mentioned, deduced from M. Achard's Table, is liable to a very strong objection. The fact being allowed, that the adhesion becomes uniformly greater in proportion to the diminished temperature of the water, it follows, that if this adhesion is owing simply to the cohesive attraction of the proximate particles of the glass and water, the degree of this force will be according to the number of proximate particles in a given superficies; or, in other words, directly as the specific gravity. Now, by the experiments of Achard, the adhesion between the glass-plate and water at $152^\circ$ Fahrenheit, is equal to $80$ grains, and at $96^\circ$ Fahrenheit, equal to $89$ grains. From Kirwan's experiments on specific gravity (Phil. Trans. vol. lxxxv. pt. 1. p. 267.) it appears, that the weight of a cubic inch of water at $152^\circ$ Fahrenheit, is equal to $248.7$ grains; and the same at $96$ Fahrenheit, equal to $252.47$ grains; if, therefore, the adhesion is as the specific gravity, the adhesive force at $96$ Fahrenheit ought to be only $81.21$, instead of $89$ for $248.7 : 80 :: 252.47 : 81.21$.

Having ascertained the influence of temperature on the adhesion of surfaces, the next object with M. Achard was to determine the ratio between the force of adhesion and the superficial magnitude of the fold. For this purpose he procured round plates of glass of different diameters, from $1.5$ inch to $7$ inches, and having first determined the force of their adhesion with the different fluids, by the number of grains necessary to overcome it, he afterwards calculated the same by the following equation. Let $p$ be the force of adhesion belonging to a disk of glass, whose diameter is $a$; and $y$ the adhesive force of a similar disk, whose diameter is $b$, we shall then have $a^2 : b^2 :: p : y^2$.

$$y = \frac{b^2}{a^2}$$

From these materials the following Table has been constructed.
TABLE II.
The force of adhesion between glass disks of different diameters, and different kinds of fluids, determined by experiment and calculation.

</table>

Hence it appears, that the difference of adhesion manifested by different sized disks of glass with the same fluid, is in the ratio of the squares of their diameters; and this may be admitted as true, at the same time that it may be doubted whether the Table expresses faithfully the results of the experiments. If we bear in mind the first of the conditions which M. Achard himself lays down as essential for the correctness of the experiment, namely, that the disk should be suspended by the true centre of its mass and figure, and that the force employed to detach it should always form a right angle with the plane of the disk, and of the fluid, it will be obviously extremely difficult to procure the concurrence of these circumstances, when operating even with the smallest of the disks mentioned in the Table; and with larger disks, the causes of error must increase at least in proportion to the squares of their diameters. By comparing the differences between experiment and calculation, when a disk 1.75 inch in diameter was used, with those that took place when a disk 7 inches in diameter was used, we shall find them to be according to the Table, 0.000799 : 1.000025; whereas, if the probable causes of error were only as the diameters, the proportion ought to be 0.999799 : 4.000100; and if the squares of the diameters are admitted as the true proportion, it should be 0.999799 : 21.700542.

Besides the experiments already mentioned, a series of 600 more was made by M. Achard, with different solids formed into disks of equal diameters, and applied to the surface of some of the simplest and more compound fluids; unfortunately several of the solids and fluids are so heterogeneous in their chemical composition as to afford few important results; those which are of most consequence are assembled in the following Table:

</table>

Hence it is manifest that the strength of adhesion is not owing either to the specific gravity of the solid or of the fluid; nor is it at all more conformable with the acknowledged order of chemical affinities. Why lead and brass should generally be the first in each column, and why sulphur and wax should be interposed between these and the rest of the metals, is wholly unaccountable, and contradictory to all known chemical facts. The column, at the head of which is the acetate of lead, contains besides several peculiar difficulties. The plates of zinc, iron, and tin, would begin to decompose this salt as soon as they came in contact with it, and would in consequence be superficially covered with lead; the acquired weight of lead, therefore, and the loss of substance sustained by the metallic plates, would be too powerful disturbing causes in the performance of the experiment; besides, as each of the plates would be coated with lead, the greatest part of the adhesive force ought to be reckoned as belonging to the adhesion of lead to acetate of lead, and in consequence the three corresponding numbers in Tab. III. ought to be nearly equal, which they are not; the same objections, and perhaps with still greater force apply to the column whose title is acetate of copper, on account of the more perfect adhesion of the revived copper to the surface of the zinc and iron plates.

In the Journal de Physique (vols. xii. xiii. and xiv.) is a series of papers by M. Dutour, on the subject of capillary attraction,
attraction, which contains some excellent observations on Dr. Taylor's method; he maintains, that the force of adhesion is then only truly expressed by the weight of the counterpoise, when upon raising the solid plate out of the fluid no particles of this last are found adhering to it: thus the adhesion of mercury to glass, to marble, to those metals with which it does not readily amalgamate, is accurately expressed by the weight necessary to counterpoise this adhesion; but where the solid comes out covered with a thin plate of the fluid, as is the case when a plate of gold or silver is applied to a surface of mercury, it is obvious that the separation of the solid and fluid does not take place at their plane of adhesion, but some way below it in the substance of the mercury, so that the weight of the counterpoise is rather the expression of the cohesion of the mercury, than of the adhesion between it and the gold. Hence arises the necessity of taking into consideration the cohesive force of the fluids themselves in calculating with any accuracy the adhesion between solids and fluids, and this requires to be much nicely, so liable to be affected by small changes of temperature and other circumstances, as to preclude any great dependence upon it, in determining the comparative energy of different cases of chemical affinity.

Upon the whole then we may conclude that there exists a tendency to adhesion between many, and probably between all substances in nature, absolutely independent of atmospheric or any other external pressure; that the force of this adhesion between solids and fluids is in an inverse ratio to the thermometrical temperature, and a direct ratio to the squares of the surfaces; that every solid adheres with a peculiar force to each fluid, and that the different degrees of adhesive force between the same fluid and equal surfaces of different solids form a series which corresponds with the order, and is perhaps the exponent of the proportion of their respective chemical affinities to the same fluid; that this force is truly expressed by the weight necessary to break the adhesion in all cases where the solid comes out clean from the fluid, but that whenever any particles of the fluid adhere to the solid, the weight of the counterpoise is then expressive of the mixed forces of the adhesion between the surfaces of the solid and fluid, and of the cohesion between the component particles of the fluid, which last case in the present state of our knowledge, cannot be depended on with any accuracy in the calculation of chemical affinities. Encyclop. Meth. Art. Adhesion.

Some, however, have supposed, and others have allowed, that, although in the case of polished planes, brazen hemispheres and leaden bullets, which adhere to one another with a considerable force both in the air and in vacuo, the principal cause is their mutual attraction, yet the pressure of the air may contribute in a slight degree to their adhesion. But the effect of this cause is very inconsiderable, and, compared with the other, fearfully deferred notice.

Adhesion; in Surgery, the same as agglutination, a preternatural process, by which various parts of the body adhere together and become one mass. A partial cohesion, for example, often takes place between the pleura of the lungs and ribs, between the heart and pericardium, the liver and diaphragm, or between other contiguous visera, after an attack of inflammation. This process also follows if two abraded or ulcerated surfaces be applied for some time to each other, as when the fingers have been severely burnt and not kept afoother. What is called "healing of wounds by the first intention," likewise comes under this denomination: the doctrine of adhesion is, therefore, of considerable importance in surgery, and should be carefully attended to. The right understanding of this doctrine has led to many of the greatest improvements in modern practice, especially in the extirpation of tumours, in the treatment of recent wounds and in amputation. The perfect union of living parts can only happen where there is a mutual elongation or insolution of the blood-veils at the two contiguous surfaces, or at least where the veils from one part shoot into the adjacent substance, and thus keep up a vital communication.

ADITII, in Ancient Geography, a star of the sixth magnitude, upon the garment of Andromeda, under the last star in her foot.

ADHOA, in Ancient Customs, denotes what we otherwise call relief. In which sense we also sometimes find the word written adhibet, adhibendum, and adhibiscendum. Du Cange.

ADJA, or AGGA, in Geography, a burg and fort of Guinea, on the coast of Fantin, belonging to the East India Company.

ADJABA, in Ancient Geography, a town built by Simon Macabaurus, in a plain, or elevated, as a place of defence.

ADJABDA, a town of Asia, in Albania, placed by Ptolemi in long. 79°, and lat. 45° 30'.

ADJABENE, the chief province of Affyria, which sometimes gave its name to the whole country. It was so called according to Ammianus (l. xxiii. c. 20.) from the two rivers Diaba and Adjaba, which Valesius (in loc.) says, are more frequently denominated Zabas and Arzabas. Stephanus (de Urb. vol. i. p. 22.) confounds Adjabene with Mesopotamia. In this province, which was the richest and most fruitful of Affyria, Ptolemi (l. vi. c. 1.) and Ammianus place Ninus or Nineveh, Gurgamela, and Artelia; and with them Strabo (l. xvi. vol. 2. p. 1071) agrees; for though he places Ninus and Gurgamela in Aturia, and Arzab in a district of its own name, yet he makes both Aturia and Arzab parts of Adjabene. This province became a distinct kingdom in consequence of the disturbances that prevailed among the Seleucides, and was held by successive sovereigns in opposition to the Syrian kings, till they were expelled by the power of the Roman emperors. The first king mentioned in history, reigned in the time of the Mithridatic war, and joined Tigranes against Lucullus. In the reign of the emperor Claudius, Monobaza, called also Bazecz, ruled over the Adjabenians; who was succeeded by Izates, his son, by his sister Helena, whom he had married. Izates, being instructed in the Jewish religion (see Jos. Antiq. l. xx. c. 2. tom. i. p. 957, &c. Ed. Haverc.) introduced it among his subjects; upon which they conspired against him, and called in Abias the king of Arabia, to their assistance. Failing in this attempt, they solicited the assistance of Vologeses, king of the Parthians; he was equally unsuccessful; and Izates closed his life and reign in peace, and left five sons, who were educated under their grandmother Helena at Jerusalem, and there taught both the Jewish language and religion. Little is known concerning the affairs of this kingdom from the death of Izates, who was contemporary with the emperor Claudius, and who bequeathed his crown to his brother Monobaza, until the reign of Trajan, when it was governed by one Mebarfapes, who joined Chosroes, king of the Persians, against the Romans. This war proved unsuccessful, and Mebarfapes was driven from the throne; and though Mannus king of Arabia, attempted to restore him to the kingdom, his enterprise for this purpose was ineffectual, and he was obliged to conclude a peace with Rome. Trajan, having obtained possession of Ademylira, a fortified place of great strength, which was delivered to him by Sentius, a centurion, who had escaped the treachery
of Mebarthaper, formed a bridge of boats over the river Tigris, and made himself master of the whole kingdom of Adiabene, A. U. C. 868, or in the 115th year of the Christian era. The Adiabeneans, however, emancipated themselves from the Roman yoke; but were again reduced by Severus, A. U. C. 948, denominated from this circumstance Adiabanicus. See Dion. Cafs. Hist. Rom. vol. ii. p. 1137. Ed. Reimari. In the reign of Sapor II. king of Persia, the Adiabeneans, as we learn from Sozomen (I. ii. c. 12.) embraced the Christian religion, and were on that account treated with great cruelty by this king, to whom they were subject.

**ADJACENT**, or **ADJOINING**, of **ad**, to, and **jaceere, to lie**, something situated near, or by the side of another.

**ADJACENT angle. See Angle.**

**ADIADA**, in **Ancient Geography**, a town of Palestine, in the tribe of Dan. See **Anida.**

Of all the species above enumerated one only belongs to Great Britain, viz. the *A. capillus veneris*, or true maidenhair, which is found only in Scotland and Wales on rocks and moor walls, and which is a native of the south of Europe and the Levant. The fronds or leaves of this species are doubly compound; the leaflets or wings are alternate; the pinnae or leaflets are wedge-shaped, lobed, and pedicilled, or on leaf-flakes: it is perennial, and flowers from May to September. This is a very succulent plant, yielding almost its whole weight of juice; but neither its taste nor smell promises any efficacy. If the syrup of capillary, which is made from it, be good for any thing, it is from the orange-flower water that is put into it. The *A. pelatum*, or Canadian maidenhair, is a native of Canada, Japan, and the Society islands, and was brought into England from Virginia by John Tradescant, the son, before the year 1640. It flowers in August and September. In Canada this plant grows so plentifully, that the French, when they were in possession of that country, sent it to France as a package for goods, and the apothecaries at Paris used it instead of the true maidenhair. The leaves of both these species have a flight sweetish roughish taste, and a pleasant but weak smell, very perceptible when boiling water is poured upon them. Infusions, or decoctions of them impregnated, yield a moderately rough, bitterish, mucilaginous extract. Maidenhair has been long esteemed good against disorders of the breast, for promoting expectoration, softening recent coughs, and allaying the tickling in the throat occasioned by dryness of thin rheum. For these purposes a syrup of the true form, flavoured with orange-flower water, has been usually brought from France, and a syrup of the Canada form, made with maple sugar, is sometimes received from America. Our confectioners prepare a syrup of the maidenhair, which they sell under the name of *capillaire*. But the English maidenhair, or *Asplenium*, has been commonly substituted in the pectoral syrups and infusions made among us. The Canada species is said to be superior to both. But the virtue of the maidenhair may be obtained to much greater advantage, by drinking an infusion of the herb as tea, sweetened either with sugar, or by the addition of a little liqueur. Lewis, Matt. Med.

**Culture.** The only species that have been cultivated with us are the 18, 23d, 30th, 39d, 42d, and 45th, in the above enumeration. The *A. capillus veneris* may be preferred in pots filled with gravel and lime-rubbit, in which it will thrive much better than in good earth. The *A. pedatum* will live through the winter in the open air, if the season be moderate; but as severe frosts will sometimes destroy it, a plant or two should be kept under shelter. The *A. villosum*, and *A. longifolium* must be preferred in a sober, and will afford by their shining black flakes, and odd-shaped leaves, an agreeable variety among other exotic plants. The *A. reniforme*, fragrant, and *plicariae*, may be kept in the green-house.

**ADIANTUM aureum.** See **Polytrichum.**

**ADIANTUM nigrum.** A species of *Asplenium.**

**ADIANTUM, in Natural History.** See **Tubularia.**

**ADIAPHORISTS, or ADIAPHORITIS, compounded of a priv. and **adiaphor.**, different, and denoting indifferent; in **Ecological History**, a name given in the 16th century to the moderate Lutherans, who adhered to the sentiments of Melancthon; and afterwards to those who subscribed the **Interim** of Charles V. Melancthon, whose sentiments were moderate, and temper mild and gentle, declared on this occasion, that, in his opinion, compliance was due to the Imperial edicts in matters of an **indifferent** nature: but both he and his associates ranked in this class many things which appeared to Luther and his disciples to be of the highest importance; particularly the doctrine of justification by faith alone, and the necessity of good works to eternal salvation, as well as the number of the sacraments, the jurisdiction claimed by the pope and the bishops, extreme
tion, and the observation of religious festivals and super-
fluous rites. Hence sprung the adlaphtorific controversy,
as it was called, which divided the church for many years,
and obstructed the progress of the reformation. See Form
of Concord.

ADAPHTIFIC is a denomination given by Mr.
Boyle to a kind of spirit distilled from tar and some other
vegetable bodies, and which is neither acid, vinous, nor
unius; but in many respects different from any other kind
of spirit.

ADAPTEUSIA, from α, δε, and τιν, I breathe, in
Medicine, signifies defective peroration, from dente pores, &c.

ADAPTOTOS, a Greek word signifying firm, and
applied by some medical writers to a remedy for the colic,
which is Rome parsley, henbane feed, white pepper, &c., made
into an electuary.

ADARRHICA, from α, δε, and τιν, I flow, signifies
a total suppression of all the necessary evacuations.

ADAZO. See Ajazzo.

ADICARA, in Ancient Geography, a town of Asia,
early the Persian gulf, which Ptolemy places in long. 79°,
and lat. 26°, 50°.

ADICE, in Botany. See Nettle.

ADDIA, Addis, or Adiara, in Ancient Geography,
a city of Judea, not far from Jerusalem. Josephus says,
that when Vespasian besieged Jerusalem, he established a
camp and guards in this place as well as in Jericho. Simon
Macrobeus also encamped in this place to dispute the
entrance into the country with Tryphon, who had bar-
barously seized his brother Jonatham, at Ptolemais. 1 Mac-
tom. 1. p. 632. Adda is probably the same with Addus.

ADJECTIVE, in Grammar, a kind of noun joined
with a substantive, either expressed or implied, to show its
qualities or accidents.

The word is formed of the Latin adjoere, to add to; as it is
designed to be added to a substantive, without which it
has no specific signification.

Father Butler defines adjectives in a manner somewhat
different from other grammarians—Nouns, according to
him, are substantives, when the objects which they repre-
sent are considered simply, and in themselves, without any
regard to their qualities; on the contrary, they are ad-
jectives, when they express the quality of an object. Thus,
when I say, simply, a heart, the word heart is a substantive,
because none of its qualities are expressed; but when I say,
a generous heart, the word generous is an adjective; because it
adds a quality, or attribute, to the heart. Adjectives, then,
appear to be nothing else but modificatives.

In effect, the end of an adjective being only to express
the quality of an object; if that quality be the object itself
whereof we speak, it becomes a substantive; e. g. If I say,
this book is good; good here is an adjective; but if I say, good
is always to be chosen, it is evident good is the subject I speak
of; and consequently good, there, is the substantive.

On the contrary, it often happens in other languages, and
sometimes in our own, that a substantive becomes an ad-
jective; as, for instance, in these words: the king, hero as he is,
remembers he is a man, where the word hero, though ordi-
narily a substantive, is apparently an adjective. From this
idea of an adjective, it appears that many of the nouns,
which, in the common grammars, are accounted substantives,
are really adjectives, and vice versâ: grammar in this, and a
thousand other infinences, depending upon custom.

An adjective, according to the definition of Mr. Harris,
(Hermes, p. 186.) has no affixion, and only denotes such an
attribute, as has not its essence either in motion or its priva-
tion. Thus in general the attributes of quantity, quality,
and relation, such as many and few, great and little, black
and white, good and bad, double, treble, quadruple, &c.
are all denoted by adjectives. Every adjective may also be
considered as capable of being resolved into a substantive,
and an expression of connection equivalent to of, e. g. a good
man, is a man of goodness; in which case the adjective ex-
presses not only an attribute, but also the connection be-
tween the attribute and its substance; and the particular
kind of connection is ascertained by experience. In this
view of the subject the adjective appears to have two uses.
The first and principal is that of restricting or modifying a
general term, as in the instances above recited. The second
is, when the abstract substantive contained in the adjective
is modified by the noun, with which, in the concrete or ad-
jective form, that abstract substantive is joined. The former
may be called the direct, and the latter the inverse, accepta-
tion of adjectives. In the following passage, Livy says,
Regnatum orbis urbe condita ad liberatam annum ducentos
quadraginta quinuages. i.e. monarchy was founded at Rome
from the building of the city to its deliverance: the partici-
bles, or adjectives, condita and liberatam, are used inversly;
and the abstract substantives contained in these words are
modified or restricted by the substantives orbis and urbe, with
which they are supposed to unite. Mr. Harris observes
(ubi supra, p. 187), that attributes sometimes assume an
affection, and appear as verbs: as albus, or albus sum, immit
or tunicas est, and ιδος γ. ιν. α. ιδος γις, is equal. Of
these there are but few, and they may be called verbal adjectives.
Participles likewise infensibly pass into adjectives, as dmus or learned, lose their power as participles, and mean a per-
on possessed of an habitual quality. Thus also vir clupenus
denotes a peron who poisses the habit of speaking, and is not a
person now speaking. Substantives may also be con-
verted into adjectives; when we say the party of Pompey,
the style of Cicero, the philosophy of Socrates, the perons
perform the part of attributes, or slamp and characterise
their subjects; so that they assume the form of adjectives.
And we accordingly say, the Pompeian party, the Cicero-
nian style, and the Socratic philosophy. Even pronominal
substantives admit the like mutation. Instead of saying
the book of me, of thee, and of him, we say, my book, thy book,
and his book; or the country of us, of you, and of them,
we say our country, your country, and their country;
which words may be called pronominals adjectives. In English
the adjective is not varied on account of gender, number,
or case. Dr. Lowth, indeed, (Intro. to Eng. Grammar,
p. 56.) excepts some few pronominal adjectives, which have
the poissive case, as,

Teach me to feel another's woe.

Pope.

and the adjectives: former and latter, which may be considered
as pronominal, and representing the nouns, to which they
refer. The only variation which it admits of, is that of the
degrees of comparison.

In the Greek and Latin, however, they have the same
form with substantive nouns; and are declined, like them,
by cases, and subjected to the like diibinations of number
and gender. It is obvious, that neither number, nor gender,
nor cases, nor relations, have any thing to do, in a proper
sense, with mere qualities, such as good or great, gentle or
hard: and yet bonus, magnum, and tener, have their singular
and plural, their masculine and feminine, their genitives and
datives, like any of the names of substantives, or perons.
To account for this circumstances, Dr. Blair (Lectures, vol. i,
p. 199.)
ADJ

p. 199) directs us to consider the genius of those tongues. They avoided, as much as possible, regarding qualities separately, or in the abstract. They made the adjective depend on its substantive, and refuse it in termination, number, and gender, in order that the two might coalesce the more intimately, and be joined in the form of expression, as they were in the nature of things. Thus also they favoured that liberty of transposition, which their languages allowed. In the English sentence, “Beautiful wife of a brave man,” the juxtaposition of the words prevents all ambiguity. But in the Latin, “Forma fortis viri ex nocte,” it is only the agreement in gender, number and case, of the adjective “forma fortis,” which is the first word of the sentence, with the substantive “vir ex nocte,” which is the last word, that declares the meaning.

The learned Mafclef observes, (Gram. Heb. v. i. p. 56.) that in the Hebrew language, all those words are adjectives which are changed from the masculin into the feminine by the addition of the latter ד, as בְּיָעָע בְּיָעָע, בְּיָעָע, &c. and therefore the Hebrews refer to the class of adjectives many words which we should rank as substantives. There are many distinguishing idioms of the Hebrew language that result from the use and application of the adjective: e. g. the substantive precedes it, as בְּיָעָע בְּיָעָע, בְּיָעָע; and when the contrary is the case, the verb substantive is understood, as in Px. xxxiii. 4. Px. xxxii. 10. except when numerical adjectives occur.

ADJ

AD 1

ADJ

ADVERB, in Law, a judicial writ, commanding inquiry to be made of any thing touching a cause depending
depending in the king's court, for the better execution of justice, as of hobbyd, or the like. Reg. Indic.

ADINSIK, in Geography, a town of Asiatic Turkey, three leagues south-east of Artaki.

ADJODIN, a town of Hindoostan, in the Subah of Moultan, 95 miles east of Moultan, and 68 south of Lahore.

ADJOINING is particularly used for the associating of a person to another, or appointing him a colleague, or ADJUNCT.

ADJOURNMENT, formed of adj, to, and Fr. jour, day, q. d. another day, in Læce, the putting off a court or meeting; and appointing it to be kept at another time or place; in which sense we meet with the phrase adjournment in eyre, for an appointment of a day when the justices in eyre intend to sit again. Adjournment of parliament is a continuance of the session from one day to another, and is done by the authority of each house separately, every day, and sometimes for a fortnight or month together; and differs from PROROGATION and DISSOLUTION. The adjournment of one house is no adjournment of the other. After an adjournment, all things continue in the same state as at the time of the adjournment, and may be proceeded on without any fresh commencement; whereas, after a prorogation, such bills as are only begun and not perfected, must be resumed de novo (if at all) in a subsequent session.

ADIPOCIRE. Cras, matiere graisse, matiere adipocire, is a term formed of adips, fat, and ceras, wax, and denotes a sublimation, the nature and origin of which are explained in the sequel of this article.

The changes which animal matter undergoes in its progress towards total decomposition, have been for many obvious reasons but little attended to: the disfiguring circumstances by which they are accompanied, the real danger to health, and the decent reverence for the receptacles of the dead which prevails in all countries, have hitherto opposed almost insuperable obstacles to the investigations of science on this most interesting subject; it is therefore a peculiarly fortunate circumstance, when from motives of police or general convenience, the great progress of the resolution of organised into inorganic matter, with all its various modifications, is submitted to the inspection of chemical philosophy. An opportunity of this kind was offered at Paris in 1785, and 1787, when the old burial ground of the Innocents was laid out for building upon, in consequence of which, the surface foil, and the animal remains contained therein, were removed. This cemetery having been for ages appropriated to the reception of the dead, in one of the most populous districts of Paris, was eminently well calculated to exhibit the various processes of animal decomposition; another favourable circumstance was, that it contained several of those large pits (fosses communes) in which the bodies of the poor are deposited by hundreds. These pits are cavities 30 feet deep, with an area of 20 feet square, in which the shells containing the bones are closely packed in rows over each other, without any intermediate earth, and with only a slight superficial covering of soil, not more than a foot thick; each pit contained from 1500 to 1500 bodies, and may be considered as a mass of animal matter of the dimensions above-mentioned. M. M. Fourcroy and Thouret were present at the opening of several of these receptacles, and it is from a memoir by the former of these, that the principal part of this article is composed.

The first pit that was examined, had been filled and closed up 15 years before; on opening some of the coffins (for the wood was still quite found, only tinged of a yellow colour) the bodies were found within, thick as to leave a considerable vacant space in the upper part of the coffin, and flattened as if they had been subject to a strong compression; the linen which covered them adhered firmly, and upon being removed, presented to view only irregular mazes of a soft ductile greyish-white matter, apparently intermediate between fat and wax; the bones were enveloped in this, and were found to be very brittle.

The bodies thus changed, being but little offensive to the smell, a great number were dug up and minutely examined: in some this alteration had, as yet, only partially taken place, the remains of muscular fibres being still visible, but where the conversion had been complete, the bones throughout the whole body were found covered with this grey sublimate, generally soft and ductile, sometimes dry, but always readily separating into porous cavernous fragments, without the slightest trace of muscles, membranes, vessels, tendons, or nerves: the ligaments of the articulations had been in like manner changed, the connexion between the bones was destroyed, and these last had become so yielding, that the grave-diggers, in order to remove the bodies more conveniently, rolled each upon itself from head to heels, without any difficulty. The whole contents of the abdominal cavity were wanting, and the muscles and integuments converted as above-mentioned, lay flat on the vertebral column; in like manner the heart and other viscera of the thorax were dissolved, nothing being left but a little white grumous matter. The glandular part of the breast in the female corpores frequently afforded this soapy matter of a homogeneous texture, and a pure white colour: the hair appeared to have undergone no alteration; the brain was not wanting in any, it was superficially of a blackish grey, and had experienced the same change as the integuments. According to the testimony of the grave-diggers, to whom the facts just mentioned had been long familiar, this conversion of animal matter is never observed in those bodies that are interred singly, but always takes place in the fosses communes; to effect this change nearly three years are required. The soapy matter of lateef formation is soft, very ductile, light and fquingy, and contains much water; in 30 or 40 years it becomes much dryer, more brittle, and assumes the appearance of dense laminæ, and where the surrounding earth has been dry through the unifal, it is semitransparent, of a granulated texture, brittle, and bears a considerable resemblance to wax.

Animal matter having once passed into this stage of decomposition, appears to refit for a long time any further alteration: some of these pits that had been closed above 40 years, were upon examination, found to be little else than a solid mass of soapy matter, nor is it yet ascertained how long in common circumstances it would continue unchanged, the burial ground of the Innocents being so small in comparison to the population of the district, as to require each pit in 30 or 40 years to be emptied of its contents, in order to receive a new succession of bodies; it appears, however, that the ulterior changes depend in a great measure on the quantity of moisture draining through the mafs.

From the history of this singular sublimation, we proceed to an examination of its chemical properties. It was first, however, purified by gently heating in an earthen vessel, till it became of a pasty consistence, and then rubbed through a fine hair sieve, by which means the hair, small bones, and remains of the muscular fibre were separated with tolerable exactness. In this state, being exposed in an earthen vessel to the naked fire, it readily became soft, but did not liquify without considerable difficulty, rather fying as a piece of soap would do, and difengaging at the same time ammonical vapours. Four pounds being put into a glass retort, and submitted to slow distillation in a water bath, afforded in the space of three weeks, eight ounces of a clear watery fluid,
fluid, with a festid odour, turning syrup of violets green, and manifestly containing ammonia in solution; the foapy matter remaining in the retort had acquired a greater consistence, was become less fusible, of a deeper brown colour, and upon cooling, was evidently drier than before, though not admitting of being broken.

Two pounds of purified soapy matter were distilled by a very gradual sand heat; after two hours, the matter was melted, and in ebullition, it soon became covered with a blackish froth, and swelled greatly; during 36 hours nothing came over but water with ammonia in solution; at length, after 48 hours, crystals of carbonated ammonia began to line the adopter; these were soon after dissolved by a reddish brown oil, which continued to come over till the experiment was stopped. Hence it appears that the component parts of this substance are water, ammonia, and a concrete oil. No elastic gas was disengaged during the whole process.

In order to ascertain the action of atmospheric air on this substance, several pieces being previously weighed, were exposed to a warm and dry air during a whole summer; they were found by this to have become dry and brittle without being lefthened in their bulk, had acquired a whiter colour, and lost their peculiar odour; their upper surface was become friable, and almost fell into powder under the finger; on subjection to analysis, it was found not only that the water, but a considerable part of the ammonia, had been evaporated by this long exposure, and the remaining oily matter on melting became semitransparent, brittle, and considerably resembling wax.

Some purified soapy matter was rubbed in a glafs mortar with a little water; an immediate mixture took place, and the result was a kind of magnes, or soft uniform paste; by a further addition of water an opaque liquor was produced exactly similar to a solution of soap; like this, it formed a strong liquor, and by the addition of pump-water, acids, lime-water, or metallic salts, it curdled and threw up to the surface a quantity of white infoluble clots. With nitrat of mercury it gave a greyish-yellow precipitate, and the supernatant liquor became of a permanent red-purple. The aqueous solution being thrown on the filter deposited there almost the whole of the oily matter, and the clear liquor by evaporation yielded a little animal mucilage and extract, and a small variable proportion of the phosphates of ammonia and soda.

The combination with boiling water is not more permanent than that with cold, the whole of the oil and ammonia separating on the filter. When instead of fresh soapy matter, some which had been exposed during the summer to the action of the air was made use of, the liquor, though of a foapy appearance and feel, was much less so than what was made with the fresh substance, and upon boiling the mixture a number of brown oily drops rose to the surface, which, on cooling, concreted to a semitransparent matter like wax, perfectly analogous to that obtained from the same by simple melting; hence it appears, that the solubility of the fresh soapy matter depends on the ammonia which it contains, as is also evinced by the perfectly clear solution which the addition of a further quantity of ammonia occasions.

Eight ounces of soapy matter, white and purified, were mixed with an equal weight of powdered quicklime, on the addition of a little water, the mass heated, swelled, and disengaged a very strongly ammoniacal vapour, accompanied by a peculiar putrefcent smell; a sufficiency of water being then added to bring the whole to the state of an emulsion, it was heated to ebullition, much ammoniacal vapour escaping at the same time; the liquor being thrown on a filter, peeled perfectly clear and colourless, and appeared to be only lime-water with a very small quantity of soap in solution; the matter remaining on the filter, being well washed, was beaten up with water, but showed no tendency to unite with it, subsiding after a time in the form of a white mass; this by drying for a few days in the open air, became grey and much reduced in volume; it was then mixed with diluted nitric acid, which immediately decomposed it; and a number of white clots rose to the surface of the liquor. This last being obtained clear by filtration, yielded crystals of muriatic acid and a flight trace of phosphoric salt; the white clots being washed and dried, and afterwards melted in a water bath, cooled into a dry combustible oily matter, brittle, waxy, cryspalline, and perfectly insoluble in water, to which the name of adipocire has been appropriated.

From this series of experiments with lime, it appears that the soapy matter is a true ammoniacal soaf, with a base of adipocire to which lime has a stronger affinity than ammonia, but which last composition is again in its turn decomposed by all the acids, leaving the adipocire in a state of purity.

Pot-ash and soda produce effects perfectly analogous to those of lime.

The action of acids on this soapy matter is to decompose it, by uniting with the ammonia; the concentrated mineral acids, as the nitric and sulphuric, also deepen the colour of the adipocire, by the evolution of part of its carbonaceous bafe.

Pure alcohol at the ordinary atmospheric temperature has no action on the soapy matter, but when boiling, it will with ease diffuse one fourth of its weight, of which all the ammoniacal soaf will be deposited by cooling, and that portion of adipocire which is uncombined with ammonia, will be held in permanent solution. Hence alcohol is perhaps the best agent that can be used in the decomposition of the soapy matter; the phosporic salts contained in it are not soluble in alcohol; the ammoniacal soaf is wholly decomposed by cooling, and the uncombined adipocire may be obtained afterwards by evaporating off the alcohol.

The most effectual way of procuring perfectly pure adipocire, is to mix well the soapy matter with twelve times its weight of warm water, and to decompose it by adding a slight excess of acetic or muriatic acid. This concrete animal oil thus prepared, as long as it holds much water between its particles, is of a pure white; by drying it acquires a brownish grey colour, which neither exposure to the air, nor the oxymuriatic acid will remove; whilst it retains water it is soft to the touch, and becomes ductile like wax by the warmth of the hand; when well dried and deprived of water, it affumes by slow conglutiation, a lamellar and crystalline texture, but when cooled quickly, has a compact granular appearance; in the flat of these plates, it greatly resembles sphenaceti, yet differs from it in the following particulars. It requires a less heat for its fusion by seven degrees of Fahrenheit; it is soluble in boiling alcohol in the proportion of one ounce and a half, to one ounce of the fluid, whereas the same quantity of alcohol at the same temperature, will scarcely take up more than 36 grains of sphenaceti; it separates also in cooling from this menstruum, in a much less decided crystalline form than sphenaceti does; it unites eagerly with liquid ammonia in the cold, which sphenaceti does not in the smallest degree.

To the foregoing experiments of Fourcroy, a few facts have since been added by Dr. Gibbes. The receptacle at Oxford for those bodies which have been used by the anatomical professor there for his demonstrations, is a hole dug in the ground to the depth of thirteen or fourteen feet, and a little stream is turned through it in order to remove all offensive smell; the flesh contained in this was found, on examination,
examination, to be quite white, and for the most part charged into the foapy matter above mentioned. From this hint, pieces of lean beef were included in a perforated box, and placed in running water, and at the end of a month were found converted into a mass of fatty matter; this change was observed to take place much sooner and more completely in running than in stagnant water: in order to get rid of the feculent smell, nitrous acid was had recourse to, which immediately had the desired effect: a foamy smell was perceived, and by melting the matter it was obtained nearly pure; the yellow colour which had been given to it by the nitrous acid, was wholly discharged by the oxymuriatic acid. A similar conversion of mucilaginous fibre takes place by maceration in very diluted nitrous acid. Dr. Gibbs has not mentioned whether the fatty matter produced by running water is pure adipocere or ammoniacal soap; it appears probable, however, that it is in the former state; where nitrous acid is the menstruum employed, it is obviously impossible that the adipocere should be combined with an alkali.

Adiphosus, fat or fatty, is a word chiefly used in anatomy, as an epithet of certain cells, ducts, membranes, and vesicles; e.g. Membrana and Vasa adiposae, Cellula adiposa, Duc tus adiposus, &c.

Adippe, in Entomology, a species of Papilio, with dentated yellow wings, spotted with black, and underneath marked with 23 silvery spots. This insect is found in Europe, and is called by some writers Gymnpe.

Adipsia, formed of praev. and n. thist, denoting a want of thirst, in NephoLOGY, a genus of diffuse, Dr. Cullen refers to the second order, called Dysoxiria, and the fourth class denominated locates. This he reckons to be always symptomatic of some distemper affecting the seniourium commin.

Adipson, a name given by Hippocrates to Ozymel; who says also, that the pitifann, by its glutinousness, prevents or cures thirst. Medicines administered for allaying thirst are called by this name. This property led the Greeks to diluting the glycyrrhiza glabra of Linnaeus, or liquorice, by this appellation.

Adiposus, signifies the Egyptian palm-tree, liquorice, and a pill or catapatic, composed by Asclepiades, and mentioned by Galen.

Adiratus, a price or value set upon things stolen or lost, as a recompense to the owner.

Adiris, or Dyris, in Ancient Geography, a name given to the mountains of Atlas by the Indigenes, or first inhabitants. Bochart affirms (Geog. Sac. l. ii. c. 13. Oper. tom. i. p. 89.) that Atlas was called Duris and Dyris, by the Phenicians; and this name might probably be derived from gr. adris, which signifies great or mighty.

Adisa, a town of India, placed by Ptolemy in long. 150° 30'. and lat. 23°

Adisalem, a town of Gojan in Abyssinia, between the Nile and the lake Dembea. E. long. 34° 50'. N. lat. 10° 30'.

Adisamum, a town of the island of Taprobana.

Adisathra, a town of India, on this side of the Gabes, which Ptolemy places in long. 120° 30'. and lat. 24° 30'.

The Adisathri, who inhabited the surrounding country, had for their metropolis Sagida.

Adisathrus Moris, a mountain of India, near the gulf of Bengal, which Ptolemy called the Gangetic gulf: long. 132°, lat. 23°.

Aditus, Aditus, formed from adi, to go to, in a general sense, denotes the approach to, or entrance of any thing: in which sense we meet with adit of a hovel, adit of a theatre, or a circus, &c.

Adit of a mine, the hole or aperture, whereby it is entered and dug, and by which the water and ores are carried away.

Adit of a mine, is nearly the same with curriculus, or drift, and is distinguished from air-shafts. Phil. Trans. No. 69.

The adit is usually made on the side of a hill, towards the bottom thereof, about 3, 5, or 6 feet high, and wide, in form of an arch; sometimes cut in the rock, and sometimes supported with timber, so conducted, as that the fole or bottom of the adit may answer to the bottom of the shaft, only somewhat lower, that the water may have a sufficient current to pass away without the use of the pump.

Damps and the impurity of the air are the great impediments against driving adit's above 20 or 30 fathoms, by reason of the necessity, in this case, of letting down of air-shafts from the day to meet the adit, which are very often expensive, both on account of the great depth of mines, and the hardfnes of the mineral strata to be cut through. The best remedy against this is that practiced in the coal-mines near Liege, where they work their adits without airshafts: the manner of which is described by Sir Robert Moray. Vide Phil. Trans. No. 5.

Adit of a mine, is sometimes used for the air-shaft itself, being a hole driven perpendicularly from the surface of the earth into some part of a mine, to give entrance to the air. In this sense we sometimes find it improperly written adit. Phil. Trans. No. 200.

To draw off the standing water in winter, in deep mines, they drive up an adit, or air-shaft, upon which the air diffagageth itself from the water, when it begins to run with such violence, as produces a noise equal to the burbling of a cannon, dashes every thing in the way against the sides of the mine, and loosens the very rocks at a distance. Ibid. No. 26. See Mining.

Adit in ships, in Antiquity, was a space in the upper part, where the ship was widest, at which people entered, anciently called aza.

Adits of a theatre, aditus theatris, in Antiquity, were doors on the flairs, whereby persons entered from the outer porticoes, and descended into the seats.

Adites, or the tribe of An, in Ancient History, a very powerful tribe of the ancient Arabs, are said to have been the descendants of Ad, the son of Avas, or Uz (Gen. x. 22, 23), the son of Aram, the son of Shem, the son of Noah, and, after the confusion of tongues, to have settled in Al Ahfak, or the winding lands, in the province of Hadramaut, where they greatly multiplied. In process of time, they abandoned the worship of the true God, and fell into idolatry; chiefly worshipping four deities, viz. Sakia, Hadeila, Razeka, and Salama; the first of whom, as they imagined, supplied them with rain, the second preferred them from all dangers abroad, the third provided food for their sustenance, and the fourth relieved them to health when afflicted with sickness, as their several names import. God, it is said, commissioned the prophet Hud, or Heber, to attempt their reformation: but they were obstinate and irremediable, and were therefore destroyed, a few of them excepted, by a suffocating wind. Those who escaped retired with Hud to another place. Before they were thus severely punished, they were visited with a drought of four years, by which their cattle perished, and they themselves were reduced to great distress. They are often mentioned in
in the Koran, and some commentators on this work pretend, that they were of prodigious stature, the largest being 100 cubits high, and the least 60; for which they refer to the testimony of the Koran. Sale’s Prelim. Disc. p. 6. Koran, chap. 7. p. 123.

ADITHA, or ADITHAM, in Ancient Geography, a city belonging to the tribe of Judah. Joshua, xv. 36. Euseb. mentions two cities named Adatha, one towards Gaza, and another towards Lydda, east of this city.

ADJUDICATING, in Law, the act of passing a determinate sentence in behalf of a person.

ADJUDICATION, the act of adjudging the property of a thing to a person by a legal sentence, decree, or judgment.

Adjudication is more particularly used for the addition, or conferring a thing fold by auction, or the like, to the highest bidder.

Adjudication, in the Scots Law, the name of an action by which a creditor attaches the heritable estate of his debtor, or his creditor’s heir, in order to appropriate it to himself, either in payment or in security of his debt; or that action by which the holder of a heritable right, labouring under any defect in point of form, may supply the defect. Adjudications were substituted by act 1672. c. 19. in the place of appraisings, and they are carried on by way of action before the Court of Seftion. By that statute, the debtor must deliver to the creditor a valid right of the lands to be adjudged, being such as are equivalent to the principal and interest of the debt, and a fifth part more in consideration of the creditor’s taking land for his money; recouping the possession in his favour, and ratifying the decree of adjudication. This is called a special adjudication: and the time within which the debtor may redeem is declared to be five years; but if the debtor does not produce a sufficient right to the land, or is not willing to reconvey the possession and ratify the decree, it is lawful for the creditor to adjudge all right belonging to the debtor in the same manner as he could, by the former laws, have apprised it. In this general adjudication, as it is called, the creditor must limit his claim to the principal sum, interest and penalty, without demanding a fifth part more. Abbreviations are ordained to be made of all adjudications, which must be recorded within 60 days after the date of the decree. There are two kinds of adjudications, viz. those on a decree cognizantium causa, otherwise called contra hereditatem jacentem, and adjudications in implement. A new sort of adjudications has been lately introduced into the law of Scotland, by 23 Geo. III. for rendering the payment of the creditors of insolvent debtors more equal and expeditious.

ADIVE, in Zoology, an animal of the Jackal kind, the Canis aureus of Linnaeus, mentioned by Buffon, somewhat resembling a small fox. It is less than the common jackal, and is sometimes tamed, and kept in a domestic state. In the Arabic language, the name Adive signifies a wolf; and its figure, hair, and voracity are analogous to the name; but it is smaller than the fox, and very stupid. It yelps like this animal; and when one cries, the rest reply. It roams about in the night in search of food, and is naturally disposed to conceal itself in the day. The adives form large packs, enter houses and churches, where they devour every thing they can find, and when they have been once accustomed to eat human bodies, they never fail to frequent church-yards in search of putrid carcases, to dig into graves, to follow armies, and to attend the caravans in those eastern countries where they abound. The adives may be considered as the ravens among quadrupeds.

ADJUNCT, ADJUNCTUM, in Philosophy, something joined or superadded to a being from without; or an accession to a thing, not essentially belonging to it, but only accidental to it.

There are two kinds of adjuncts: the one a substance (e. g. spirit or body) accidentally superadded to another, as its subject. Such is water in a sponge, or vessel, and such is the soul in the body. The second an attribute or mode, accidentally likewise superadded to a substance, whether body or spirit. Such is figure in a body, knowledge in the mind, &c.

In ethics, they usually reckon seven adjuncts, popularly called circumstances; quis, quid, ubi, quibus auxilium, cur, quandomo, quando.

ADJUNCT, in Music, a word that is used to express the connection or relation between the principal mode, and the modes of its two-fifths, which, from the intervals that constitute the relation between them and it, are called its adjuncts.

ADJUNCTS, in Rhetoric and Grammar, are certain words or things added to others; to amplify the discourse, or augment its force.

Such are adjectives, attributes, and epithets, which are added to substantives, subjects, &c. to express their nature, qualities, accidents, &c.

Arguments drawn from adjuncts, are supplements or enforcements of the proof arising from the circumstancies of the fact.

ADJUNCT is also used in civil concerns, for a colleague, or fellow-officer, associated to another, to assist him in his ministry.

ADJUNCT gods, or Adjoints of the gods, in Mythology, among the Romans, were a kind of inferior deities, added as auxiliaries to the principal ones, to ease them in their function. Thus, to Mars was adjointed Bellona and Numa; to Neptune, Salacia; to Veleus, the Cabiri; to the Good Genius, the Lores; to the Evil, the Lemures, &c.

ADJUNCTS, or Adjoints, in the Royal Academy of Sciences at Paris, denote a class of members attached to the pursuits of particular sciences. See Academy.

ADJUNCTION, the act of joining, or adding, of one thing to another. There are various species of adjunction; viz. by adhesion, opposition, adjacency, conjunction, inclusions, &c.

AD JURA REGIS, is a writ that lies for the king’s clerk, against him who endeavoured to eject him, to the prejudice of the king’s title in right of his crown.

ADJURATION, a part of exorcism, wherein the devil is commanded, in the name of God, to depart out of the body of the possessed, or to declare something.

ADJUTAGE. See Adjutage.

ADJUTANT, formed of adjutare, to assist, in the Military Arts, an officer in the army, whose business is to assist the major: otherwise called aid-major.

In the cavalry each regiment has an adjutant, and in the infantry, each battalion, who receives the orders every night from the brigade-major, which, after he has carried to the colonel, he delivers out to the serjeants. When detachments are to be made, he gives the number each company must furnish, and assigns the hour and place of rendezvous. He also furnishes the guards, receives and distributes ammunition to the companies, and by the major’s orders regulates the price of bread, beer, &c. See Adjutant-General.

ADJUTANT is sometimes also used by the French for an aid-de-camp.

ADJUTANTS-General, among the Troops, a select number of officers residing with the general of the order, each of whom had a province, or country, under his care, as is
France, England, &c. Their business was to inform the father-general of the occurrences of state in such countries; to which end, each of them had their correspondents, delegated emissaries, visitors, regents, provincials, &c. See Jesuits:

ADJUTOR, among the Romans, was an adjutant or assistant; and under this appellation they had many subordinate officers, who acted in the absence of their superiors, or by way of aiding them in the execution of their respective offices.

ADJUTORIUM, from adjutare, to help, in Anatomy, the humerus, or shoulder-bone.

Some authors use this word for a medicine intended only as auxiliary, or subservient to another of great efficacy: in particular, after a due use of internals, for an external remedy applied to a part afflicted, to affit in, and complete the cure.

ADJUTRIX, prima legis, an appellation applied to a woman which often occurs in the Roman laws.

ADJUVANTIA, formed of adjure, I help, in Medicine. See Juvantia.

ADLE egg, that which is not fecundified by the cock's tread.

Adle eggs is the name with that which is otherwise called a saltventous one.

Adle eggs, after incubation, are found to contain a shapeless, globule, ash-coloured body, not unlike a mola. Phil. Trans. N° 87.

ADLECT, among the Romans, signified associates, or rather selected, and was applied to persons of various descriptions amongst the common soldiers, officers of state, and senators; there were gods of this denomination, who were deified men, and called by the Romans "di minorum gentium."

ADLEGATION, in the Public Law of the German empire, a right claimed by the states of the empire of adjoining plebiscitaries, in public treaties and negotiations, to the throne of the emperor, for the transacting of matters which relate to the empire in general.

In which sense adlegation differs from legation, which is the right of sending ambassadors on a person's own account.

Several princes and states of the empire enjoy the right of legation, who have not that of adlegation, and vice versa. The bishops, for instance, have the right of adlegation in the treaties which concern the common interest, but no right of legation for their own private affairs. The like had the duke of Mantua.

The emperor allows the princes of Germany the privilege of legation, but disputes that of adlegation. They challenge it as belonging to them jure regi, which they enjoy in common with the emperor himself. Ludwig has a difficult on the subject, wherein the controversy is treated at large.

ADLENTARE tartam, in Antiquity, a phrase which denoted the care that was taken every day to comb the beard, and to render it soft and flexible.

ADLERFELDT, Gustavus, in Biography, a Swedish officer and historian, was born near Stockholm, studied at Upsal, where he was distinguished by his application and improvement, and then made the tour of Europe. On his return, Charles XI appointed him a gentleman of his chamber. Having accompanied this monarch in his military course, and witnessed both his victories and defeats, he was qualified to compile his history, which terminates with the day of his death, at the battle of Pultawa, in 1709, and which was translated into French by his son, and printed in four volumes 12mo. at Amsterdam, in 1740.

ADLESBERG, in Geography, a well built market-town in the inner Carniola, in Austria, situate at the foot of a high rocky mountain, near the river Alben, on which stands a citadel, under which is a grotto of very considerable extent and capacity. Many curious figures of stones, natural stone theatres, stone bridges, &c. are to be seen in it; and near the entrance of the cavern the river Poig, which, at about a mile's distance from it, issues out of a mountain, runs into an aperture in the rock, and then glides off under the cavern.

Adlesberg, is called in Latin Poiffena. It is a four leagues south-east from Trieste.

ADLOCUTION, Adlocutio, in Antiquity, is chiefly understood of speeches made by Roman generals to their armies, to encourage them before a battle. We frequently find these adlocutions expressed on medals, by the abbreviature ADLOCVT. COI.

The general is sometimes represented as placed on a tribunal; often on a bank or mound of turf, with the cohorts ranged orderly round him, in manipuli and turmae. The usual formula in adlocutions was, fortis effe ac fedus. Picti. Lex. Ant. tom. I. p. 27. Walk. on Coin. p. i. c. 10.

ADLWANG, in Geography, a town in the archduchy of Austria, three leagues south-west of Steyr.

ADLZREITER, John, in Biography, chancellor of Bavaria, an historian and lawyer, flourished in the 17th century. His annals of Bavaria, written in Latin, comprehend the history of the country from its beginning, to the year 1652, compiled from authentic sources. This work first appeared in 1662, and was reprinted at Leipzig in 1710, by Leibnitz, in folio.

ADMAH or Adam, in Scripture Geography, one of the cities involved in the destruction of Sodom and Gomorrah. It was situated between Zoabim and Gomorrah. Gen. x. 19. xiv. 2—8. Deut. xxiii. 23; Hoes. xi. 8.

In which sense, admanuentes amount to the same with lawyers, and stand opposed to clerks, who were forbid to swear on the book, their word being to be reputed as their oath: whence they were also denominated fidis digni.

ADMEASUREMENT, Admensuratio, in Law, a writ which lies for the bringing those to reason, or mediocrity, who usurp more of any thing than their share. This writ lies in two cases; termed,

Admeasurement of Dover, Admenuratio dotis, where the widow of the deceased holds more from the heir, or his guardian, on account of her dower, than of right belongs to her. And,

Admeasurement of pastures, Admenuratio pasturis; this lies between those who have common of pastures appendant to their frehold, or common by vicinage, in case any of them furcharge the common with more cattle than they ought.

This is one of those writs that are called vicontial, being directed to the sheriff (vice-comit), and not to be returned to any superior court, till finally executed by him. It recites a complaint, that the defendant hath furcharged the common, and therefore commands the sheriff to admonish and appertain it, that the defendant may not have more than belongs to him, and that the plaintiff may have his rightful share. Upon this suit, all the commoners shall be admonished, those who have not, as well as those who have furcharged the common; the plaintiff as well as the defendant.

The execution of this writ must be by a jury of 12 men, who were upon oath to ascertain, under the superintendence of
the sheriff, what and how many cattle each commoner is entitled to feed: and the rule for this accommodation is generally understood to be, that the commoner shall not turn more cattle upon the common, than are sufficient to manure and stock the land to which his right of common is annexed. If, after the accommodation has ascertainment the right, the same defendant forcharges the common again, the plaintiff may have a writ of sequestration. Blackli. Com. vol. iii. p. 278. 8vo.

ADMITE, one of the nymphs called Oceanides.

ADMINICULE, or Adminicule, Adminiculum, a term used in some ancient statutes, for aid, help, or support. Stat. 1 Edw. IV. cap. 1.

In Scots law, this term signifies any writing or deed referred to by a party, in an action of law, for proving his allegations.

ADMINICULATOR, in Ecclesiastical Writers, denotes an ancient officer of the church, whose business was to defend the cause of widows, orphans, or others delinquent of help. The adminiculator is the same with what is otherwise called advocate of the poor. Du Cange.

ADMINICULES, among Antiquaries, are applied to the attributes or ornaments wherein Juno and some other figures are represented on medals.

ADMINICULUM, in the French Jurisprudence, signifies the beginning of a proof; an imperfect proof; or a circumstance or conjecture, tending to form or fortify a proof.

ADMINISTRATION imports the government or direction of affairs; and particularly the exercise of distributive justice.

The two criteria of a good administration in England, according to Trenchard, are, the keeping the nation out of foreign broils, and paying off the public debts; the latter of which depends on the former.

Administration, in the English Law, signifies the act or office of an administrator, in managing and disposing of a man’s goods, or estate, that died intestate, or without any will; with an intent to give an account thereof. In this case, instruments, or powers, called letters of administration, are taken out in the prerogative court.

These letters must be granted by the ordinary in pursuance of the statutes 31 Edw. III. c. 11, and 21 Hen. VIII. c. 5. 1. to the husband, or his representatives, of the wife’s goods and chattels; 2. to the wife, of the husband’s goods and chattels; 3. if there be no husband or wife, to the children, sons or daughters; 4. if there be no children alive, to the father or mother; 5. then to a brother or sister of the whole blood, or of the half blood (who, for this purpose, are of equal degree with the whole blood); 6. and if there be none such, to the next of kin, as grandfather, grandmother, uncle, nephew or cousin, and the females of each class respectively; but of persons in equal degree, the ordinary may take which he pleases, and the nearest of degree shall be thus reckoned according to the computation of the civil law, and not of the common law; 7. then, if none of the kindred take out administration, to a creditor of the deceased; 8. if the executor refuses or dies intestate, to the residuary legatee, in exclusion of the next of kin; 9. and for want of all these, to any other person, at the discretion of the ordinary; or the ordinary may grant to a stranger letters ad colligendum bona definiti, to gather up the goods of the deceased; or may take them into his own hands to pay the deceased’s debts, in such order as an executor or administrator ought to pay them. But it is said he or the stranger, who hath letters ad colligendum, cannot sell them, without making themselves executors of their own wrong, and action lies only against the ordinary, &c. Wood’s Inst. 323.

By Stat. 21 Hen. VIII. widows, and next of kin, are to be appointed administrators, and a mother is to have administration of goods of a child, before a brother or sister, &c. But an administration may be granted to the father before the widow; and a residuary legatee ought to be preferred before the widow, in an administration cum testamento annexo. 3 Salk. 21.

On granting administration, bonds with forfeits are to be taken for the administrator, to make and exhibit an inventory of the goods of the deceased, to render a full account thereof, and to make a distribution of the surplusage after the debts paid, according to law, &c. Stat. 22 and 23. Est. II. cap. 10. Sec ADMINISTRATOR, Executor, InTESTATE, Kindred.

Administration is sometimes also used for the direction of the affairs of a minor, a pupil, a lunatic, or the like.

Administration is also used in respect of ecclesiastical functions.—The parson has the administration of the funds in his parish.—Administration of the enfeild is prohibited to perons excommunicate.

In beneficary matters they distingiuish two kinds of administration: temporal, which relates to the temporaries of a benefice, diocese, &c. and spiritual, to which belong the power of excommunicating, &c.

Administration, in Anatomy, is used for the manner of disfigcting the parts of the body, particularly the muscles. In which sense, administration is synonymous with cauteries, excises, &c.

Anatomical administrations are not to be learned by oral precept, but require ocular inspection.—Galen, Harvey, and others, have discourses express under the title of the anatomical administrations.

Administration, in Commerce, is also used for a Spanish staple at Callao in Peru, a small town on the coasts of the South Sea, which is the port of Lima; where all ships, allowed to trade on the coast, are obliged to unload their European goods, and pay certain duties: i.e. 13 per cent. of the piece for which they are sold, if the cargo be entire; and if otherwise 16 per cent. besides which, they pay three per 1000 duty, for consulship, and some other small royal rights and claims.

ADMINISTRATOR, in Law, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor.

An action lies for or against an administrator, as for or against an executor; and he shall be accountable to the value of the goods of the deceased, and no farther: unless there be wafe, or other public chargeable on him. If the administrator die, his executors are not administrators; but the court is to grant a new administration.—If a stranger, who is neither administrator, nor executor, take the goods of the deceased, and administer, he shall be charged, and sued as an executor, not as an administrator.

The origin of administrators is derived from the civil law. By the old law, the king was intitled to seize upon the goods of an intestate, as the pares patriae and general truftees of the kingdom. This prerogative the king continued to exercise for some time, by his own ministers of justice, probably in the county court; and it was granted as a franchise to many lords of manors, and others, who have to this day a precriptive right to grant administration to their intestate tenants and suitors, in their own courts baron, and other courts, or to have their wills there proved, in case they made any disposition. Afterwards the crown, in favour of the church, invested the prelates with this branch of the

prerogative.
Innocent IV. in 1250, lays it down for established canon law, that "in Britannia terita pari honorum decemcentum ab intestato in opus eclesiæ et pauperum dispensanda eis." The popinax clergy therefore took to themselves, under the name of the church and poor, the whole residue of the estate of the deceased, after the partes racionabiles, or two-thirds, of the wife and children were deducted, without paying his lawful debts or other charges thereon. For this reason it was enacted, as the first check on the exorbitant power of ordinaries, by the late of Walsm. 2. 13 Edw. I. c. 19, that the ordinary shall be bound to pay the debts of the intestate so far as his goods will extend. And in order to prevent the ordinaries from keeping any longer the administrators in their own hands, the statute 31 Edw. III. c. 11, provides that, in case of intestacy, the ordinary shall depute the nearest and most lawful friends of the deceased to administer his goods; which administrators are put upon the same footing with regard to suits and to accounting, as executors appointed by will. This is the original of administrators, as they at present stand, who are only the officers of the ordinary, appointed by him in pursuance of this statute. The statute 21 Hen. VIII. c. 5, enlarges a little more the power of the ecclesiastical judge, and permits him to grant administration either to the widow, or the next of kin, or to both of them, at his own discretion; and where two or more persons are in the same degree of kindred, gives the ordinary his election to accept which ever he pleases.

There are divers sorts of administrators.

Administrator durante minoris aetate, is where an infant is entitled to administration of the goods of an intestate; in which case administration is granted to another, until he is of the age of twenty-one years. Though where the infant is made executor, such administration, during his minority, ceases at his coming of the age of seventeen: 5 Rep. 27.

Administrator cum testamento annexo, is one to whom administration, with the will annexed, is granted upon an executor's refusal to prove the testament, or upon his dying before the probate. 1 Inst. 117.

Administrator de bonis non, &c. is one to whom administration is granted of the goods of a testator remaining unadministered, by reason of his executors dying intestate. This administrator is the only legal representative of the deceased in matters of personal property. But he may, as well as an original administrator, have only a limited or special administration committed to his care, viz. of certain specific effects, such as a term of years, or the like: the reversion being committed to others. 1 Roll. Abr. 908. 2 Roll. Abr. 907. There is also Administrator pendente lite; and durante absentia extra regnum.

If a woman have goods thus committed to her charge, or administration, she is called administratrix; and is accountable, &c. in like manner as an administrator.

Administrator, in Scots Law, a person legally empowered to act for another, whom the law presumes incapable of acting for himself. Thus tutors or curators are sometimes styled administrators in law, to pupils, minors, or fatuous persons. But more generally the term is used to imply that power which is conferred by the law upon a father, over the persons and estates of his children during their minority.

Administrator is also used for the advocate of a church.

Administrator is also used for a person appointed to receive, manage, and distribute the revenues of an hospital, or religious house.

Administrator is also used for a prince who enjoys the revenue of a secularized bishopric.

Yet this title does not hold universally: the king of England, as elector of Brunswick-Luneburgh, for instance, is not called administrator, but duke of Bremen and Verden; and the king of Prussia is not administrator, but duke of Magdeburg, and prince of Halberstadt.

Administrator is also used for the regent or protector of a kingdom, during the minority of its proper prince, or even a vacancy of the throne.

The pope pretends to the administration of the empire, during the vacancy, by censure, or interposition.

Administrator is sometimes used for the president of a province.

ADMINISTRATRIX, see Administrator.

ADMIRAL, a great officer who commands the naval forces of a kingdom or state, and takes cognizance by himself, or officers appointed by him, of all maritime causes.

Authors are divided about the origin and denomination of this important officer, whom we find established, with some variation, in most kingdoms that border on the sea. Spelman conceives, that the name and dignity were introduced among us from the Saracens, by means of the Crusades; and it is alleged, that there are no instances of admirals in this part of Europe before the year 1284, or 1286, when Philip of France, who had attended St. Louis in the wars against the Saracens, created an admiral. The name of this officer once occurs in the history of France, in the year 558. And. Com. vol. i. p. 29. Du-Cange affirms us, that the Sicilians were the first, and the Genoese the next after them, who gave the denomination admiral to the commanders of their naval armaments; and that they took it from the Saracen, or Arabic amin, or amir, a general name for any commanding officer.—Some say, that the first admiral mentioned in English history was in the reign of Edward I. in 1297; and that the first title of admiral of England conferred upon a subject, was given by patent of Rich. II. to the earl of Arundel and Surrey in 1387.

Spelman, however, is of opinion, that the title of admiral was first used in the reign of Henry III, because it does not occur in the laws of Oleron, enacted in 1266, nor is mentioned by Bracton, who wrote about that time; and in a charter, 8 Henry III. which granted the office to Richard de Lacy, the title is not used; but in the 56th year of the same reign, the historians used the appellation admiral, and it is found also in charters.

Three or four admirals were formerly appointed in the English seas; these held their office durante bene placito, and had particular limits from the mouth of the Thames, to the north, south, or west, subject to their jurisdiction. We had also admirals of the Cinque Ports as early as the reign of Edward III., when William Latimer was called Admirals quisque portum. But the title of Admiralis Anglie was not frequent till the reign of Henry IV., when the title was given to the king's brother; and after this period it was granted in all commissions to succeeding admirals.

The
ADM

The title of locum-tentens regis super maris, the king's lieutenant-general of the sea, mentioned in the reign of Richard II: was superior to that of admiral of England. Before the appellation of admiral was introduced, the title of cyclus maris was in use.

Admiral of England, the lord high, in some ancient records called capitaneum maritimarum, is judge, or president, of the court of admiralty.

He takes cognizance, by himself, his lieutenant, or deputies, &c. in his court, of all crimes committed on the sea, or the coast thereof; and all the civil and marine transactions relating thereto; as also of what is done in all great ships, riding in any great river, beneath the bridges thereof next the sea.

Anciently, the admiral had also jurisdiction in all causes of merchants and mariners: not only on the sea, but in all foreign parts. To this great officer also belongs the government of the navy: by him all vice-admirals, rear-admirals, and sea-captains are commissioned; as well as all deputies for particular coasts, and Corners for viewing dead bodies found on the sea-coasts, or at sea; and he appoints the judges for his court of admiralty, and courts martial for the trial of offenses against the articles of war, and may imprison, release, &c. every commander, officer, and soldier of ships of war shall observe the commands of the admiral, &c. on pain of death, or other punishment. Between high and low-water mark, the common law and admiralty bear jurisdiction by turns; one upon the water, and the other upon the land. He hath also power not only over the seamen serving in his ships of war, but over other seamen, so that he may arrest them for the service of the state; and if any of them run away without leave, he may certify it to the sheriffs, mayors, bailiffs, &c. who shall cause them to be apprehended and imprisoned. The admiral, of right, had anciently a tenth part of all prize goods; but this is taken away by lat. 13 Geo. II. c. 4. See Prize. This statute also enables the admiral to grant Letters of Marque.

We have had no high admiral for some years; the office being put in commission, or under the administration of the lords commissioners of the admiralty, who, by W. and M. lat. ii. c. 2, are declared to have the same authority, jurisdiction and power, as the lord high admiral.

Admiral of Scotland, the lord high, one of the great officers of the crown, and Supreme judge in all maritime cases within that part of Britain. Admiral is also used for the commander in chief of a single fleet, at squadron; and is distinguished by a flag displayed at his main-top-mast-head.

Thus, we say, the admiral of the red; the admiral of the white; and admiral of the blue. See Navy and Squadron.

The term admiral is also applied to all flag officers; in which sense it includes vice-admirals and rear-admirals.

Admiral, Rear, is the admiral of the third, and latt squadron of the royal fleet, and carries his flag at the mizen-top-mast-head.

Admiral, Vice, is one of the three principal officers of the royal navy; who commands the second squadron, and has his flag set up at the fore-top-mast-head.

Admiral, Vice, is also an officer appointed by the lord high admiral, in divers parts of the kingdom, with judges and marshall subordinate to him; for the exercising of jurisdiction in maritime affairs, within his respective limits. From their decisions and sentences, appeal lies to the court of admiralty in London.

There are also admirals of the galleys, or cross-bow-men. See Arbaleet.

ADM

Admiral is likewise the name of a principal vessel of a fleet of merchantmen, or of the vessels employed in the cod and whale fishery. That which arrives first, in any harbour or creek of Newfoundland, takes the title and quality of admiral, which it retains during the whole fishing-season. Such ship may secure to herself, so much breach, or flake, or both, as are necessary for the number of boats the ship has, with an overplus of one boat only more than the other.

The master of the steam ship is vice-admiral; and the master of the third, rear-admiral. See Fishery.

Admiral's Court, or the High Court of Admiralty. See Court of Admiralty.

Admiral, in zoology, the name given by authors to a very beautiful, and very precious shell which some refer to the oysters, and others to the cups. See Tal. of Shells.

Of these, the curious reckon several species, or rather varieties, of which the following have been particularly noticed:

1. The grand-admiral. 2. The vice-admiral. 3. The orange-admiral. 4. The extra-admiral.

The first of these is the most esteemed, and a single shell has been sold, in Holland, for five hundred florins. It is of a very elegant and bright white enamel, and is variegated with bands of yellow, representing in some degree the colours of the flags of a man of war at sea; hence it obtained its name. It is of a very curious shape, and formed with particular elegance about the head; the escutcheon being excised. There runs along the centre of the large yellow band in this shell a fine denticulated line, which is its distinguishing character.

The vice-admiral is an elegant shell, but its head is less beautifully wrought than in the admiral, and its broad band wants the dentellated line, so remarkable in that.

The orange-admiral has more yellow than either of the others.

The extra-admiral has the same bands with these, but they run one into another, and form a more mixed coloring.

Admiral's Cove, in Geography, lies within the harbour of Formosa, on the east side of Newfoundland island, about seven or eight leagues from Cape Race. It is on the starboard side of the harbour, and more westerly than Clear's Cove. It has from seven to eight fathoms water, with good anchorage, and well secured.

Admiral's, Vice, Cove, is within the same harbour of Formosa, on the larboard side; where a fleet may ride in good ground, and land-locked from all winds. There is another cove on the same side farther west, with an excellent harbour for large ships. Malham's Nav. Gaz.

Admiralty Court, or Court of. See Court.

Admiralty Bay, in Geography, is a bay that lies in the southern island of New Zealand, on the west coast of Cook's Straits, and to the north-west of Queen Charlotte's Sound, near the western entrance of those straits. Cape Stephens on the north-west, and Cape Jackson on the south-east, are its limits. It is very tedious and has, in many parts, good anchorage. The Admiralty Islands, which lie off in the S.W., at some distance from the entrance, will point out the bay. It may also be distinguished by an island two miles northeast of Cape Stephens, in S. lat. 40° 37', and E. long. 174° 54'. Wood and water are easily obtained in many parts of the bay.

Admiralty Bay, is a name given by Mr. Dixon to Beering's Bay.

Admiralty Bay, and Port Mulgrave, on the north-west coast of America, lie in N. lat. 59° 31', and W. long. 140° 18'.

Admiralty Inlet, a name given by Mr. Vancouver to the supposed strait of Juan de Fuca, on the west coast of New Georgia; the entrance of which is about 48° 30' N. lat. and
and 124° 15' W. long. On each point of the harbour, called by Mr. Vancouver Peary's Cove, was a deserted village, in which were found several sepulchres in the form of cemeteries, containing small skeletons, and small bones, which were supposed to be intended by the inhabitants for pointing their arrows, spears, and other weapons. The surrounding country for several miles presented a delightful prospect of spacious meadows, adorned with clumps of trees, of which the oak, in five from four to six feet in circumference, was the principal. The meadows were well stocked with deer. The soil consisted chiefly of a rich black vegetable mould, lying on a sandy or clayey substratum; the grass grew to the height of about three feet, and the ferns were nearly twice as high. The natural productions of the country were luxuriant; and it was not ill supplied with streams of water. The number of its inhabitants were estimated at about 600. Here, on June 4th, 1792, Mr. Vancouver took possession of the coast from that part of New Albion, which lies in N. lat. 30° 20', and W. long. 123° 34' to the entrance of this inlet of the sea, together with the coast, islands, &c. This interior sea was called the Gulf of Georgia; and the continent binding the said gulf, and extending S. to N. lat. 45°, was called New Georgia, in honour of his present Majesty. This branch of Admiralty inlet obtained the name of Passage Sound; its western arm was designated Port Gardner, out of respect to Sir Alan Gardner, and its smaller or eastern one was called Port Sajan. Vancouver's Voyage, vol. i. p. 287, &c.

Admiralty Island, an island so called by Mr. Vancouver, situated within George the Third's archipelago, on the north-west coast of new Norfolk in America, and between N. lat. 57° and 58°, 30', and W. long. 134° and 135°. This island is about 60 leagues in circuit, affords many convenient bays, with fine streams of fresh water, and produces an uninterrupted forest of very fine timber-trees, chiefly of the pine tribe. Vanêt. Voyage, vol. iii. p. 277.

Admiralty's Island, an island that lies on the coast of Nova Zembla, in the northern ocean. N. lat. 75°, 5', E. long. 52°, 45'.

Admiralty Islands, a cluster of between 20 and 30 islands lying to the north of New Britain, in about 2°, 18' S. lat. and 146°, 41' E. long. The largest of these is 18 leagues in length from east to west. These islands were discovered by captain Carteret; and he describes them as clothed with a beautiful verdure of woods, lofty and luxuriant, intersected with spots that have been cleared for plantations, groves of cocoa-nut trees, and habitations of the natives, who seem to be very numerous. He supposes that these islands produce several valuable articles of trade, particularly spices, as they lie in the same climate and latitude as the Moluccas; but he was not in a condition to examine them.

Admiration, in Ethics, is that passion which is excited by the contemplation of excellence, that is rare or uncommon, either in kind or degree. The objective cause of this admiration is any thing that indicates a superior degree of wildness, ingenuity, good fense, or benevolence. Such are the qualities to which it is properly confined. Power, substractively considered, is not the object of admiration; though the dignified or benevolent exertions of power for the production of good, may excite the highest degree of admiration, and render it a very strong emotion. It is obvious, says an ingenious writer, that the range of admiration is from the simple approbation of the mind up to the most lively sensation, according to our conceptions of the extent of excellence, and also the degrees of our intert in its effects. It is also blended with various other emotions according to different circumstances attendant upon the passion. It is frequently introduced by surprize: when, for example, the discovery of these excellencies is sudden and unexpected; and then it becomes a vivid emotion. It is generally connected with some degree of wonder; as we are frequently ignorant of the causes which enabled any one greatly to excel ourselves or others; but as it is always excited by the real discovery of some qualities, it is not to be confounded with an emotion that proceeds from ignorance and embarrassment, previous to the discovery. When the evidences of wisdom or goodness exceed our utmost comprehension, or proceed far beyond the usual extent of excellence itself, they may excite astonishment. Cogan's Philosophical Treatise on the Passions.

Admiration, in Grammar, a note or character, intimating something worthy to be admired or wondered at. It is expressed thus (!). See Character.

Admission, in the Ecclesiastical Law, an act whereby a bishop, upon examination, admits or allows a clerk to be able or competently qualified for the office; which is done by the formula, admittis te habendum. All persons are to have episcopal ordination before they are admitted to any patronage or benefice; and if any shall presume to be admitted, not having such ordination, &c. he shall forfeit 100l. Stat. 14 Car. I. 11.

No person is to be admitted into a benefice with cure of 30l. per ann. in the king's books, unless he is a bachelor in divinity at least, or a preacher lawfully qualified by some bishop, &c.

Admissions, in Antiquity, officers, whose business it was to introduce persons to princes or to wealthy citizens. The office belonged to freed men, and was much defired. The principal, that preided over each of the four decuries into which they were distributed, was called magister admissionum, and deemed highly honourable. Historians say, that Vespasian, Antonine, and Alexander Severus, were very able of accedes, that they needed no admissions.

Admittendo Clerico, is a writ granted to him who hath recovered his right of presentation against the bishop in the common pleas.

Admittendo in Socium, is a writ for the association of certain persons to justices of assize formerly appointed.

Admonition, in Ecclesiastical Affairs, a part of discipline much used in the ancient church. It was the first act, or rem, towards the punishment or expulsion of delinquents. In case of private offences, it was performed according to the evangelical rule, privately; in case of public offence, openly before the church. If either of these took effect, for the recovery of the fallen person, all further proceedings, in the way of censure, ceased: if they did not, recourse was had to excommunication. Bingh. Orig. Ecclef. tom. ii. lib. 16. cap. 2. § 6. p. 31. Calvin. Init. lib. iv. cap. 12. § 2.

By the ancient canons, nine monitory, or admonitions, at due distance, are required before excommunication.

Admonition is also used, in writers of the barbarous age, for the citation or harrassing a person to appear in a court of justice. See Summons, &c.

Admonitie Fulgurium, a military punishment, among the Romans, resembling, in some respects, our whipping, or lashing, but performed with a vine-branch. Schitterman Diff. de Pen. Mil. Rom. cap. 12.

Admont, in Geography, a town of Germany in Stiria, on the river Enz; two leagues north-east of Rotterdam. It depends upon the archbishopric of Salzburg, and has a rich abbey of Benedictins in the high mountains.

Admortalization, among Feudal Writers, the act of reducing lands to mortmain.

ADNATA,
ADO

ADONATA, in Anatomy. See Conjunctiva.

ADONATA, or Adnascientia, among Gardeners, denote those off-sorts, which, by a new germination under the earth, proceed from the lily; nereifius, hyacinth, and other flowers, and afterwards become true roots.

Adnata is also a term used for such things as grow upon animal or vegetable bodies, whether inapparently, as hair, wool, horns, &c. or accidentally, as the Several episcopal plants.

ADNATUM folium, in Botany, denotes the disk of the leaf precluding close to the stem of the plant; and adnatus, in a general sense, denotes connected.

ADNOTATIO, in Antiquity, denoted the register of a prince, signed by himself.

ADNOU, Adomen, or Adnasse, is used by some Grammarians to express what we most usually call an Adjective.

ADO, in Biography, archbishop of Vienne in Dauphiné, was born A.D. 860, and distinguished by his piety, industry, and learning. His Universal Chronology, comprehends the whole extent of history to the year 879. It was printed in folio at Paris in 1512, in Gothic characters, and reprinted by Morel in 1567. A new edition of this valuable work was published in folio, at Rome, in 1745. Ado was also the author of a Martyrology, published by Roskveyde, a Jesuit, in 1613. Gen. Biog.

AD OCTO, q.d. to the eighth number; a term used by some ancient philosophers to denote the highest or superlative degree; because in their way of distinguishing qualities, they reckoned no degree above the eighth.

ADOD, in Mythology, the name which the Phœnicians gave to the king of their gods.

ADOLESCENS signifies the iron bars that support the fire, in a grate or furnace.

ADOLESCENCE, formed of adoleo, to grow, the state of growing youth; or that period of a person's age commencing from his infancy, and terminating at his full stature or manhood. The state of adolescence lasts so long as the fibres continue to grow, either in magnitude or firmness. It is commonly computed to be between 15 and 25, or even 30 years of age; though, in different constitutions, its terms are very different. The Romans usually reckoned it from 12 to 25 in boys, and to 31 in girls, &c. And yet, among their writers, juven and adolecentes are frequently used indiscriminately, for any person under 45 years. The fibres, being arrived at a degree of firmness and tension sufficient to sustain the parts, no longer yield and give way to the efforts of the nutritive matter, to extend them; so that their farther accretion is stopped from the very law of their nutrition.

ADOLFECK, in Geography, a town of Germany, in the circle of the Upper Rhine; eight miles west of Idstein.

ADOLIA, in Botany, a genus of plants described by Rheedie among the trees of Malabar, which bear a near relation, says M. Le Marec, (Encycl. vol. i. p. 44.) to the Rhamnus. The characters are, that each flower is composed of a calyx, divided to its middle in five equal notches; the corolla and flaminea are unknown; the pistillum is a small oval situated at the center of the calyx, and which becomes, when ripe, a roundish berry, containing five oblong, triangular, ovoïd seeds. There are two species, viz. A. altia, with white flowers, which grows to the height of seven feet, and bears fruit twice a year; the berries when ripe are of a purplish black colour; and A. rubra, with red flowers, which resembles the other; but the berries of this species, when ripe, are of an orange colour and of an acid taste.

ADOLPHUS, Frederick II. of Holstein-Gottorp, king of Sweden, was born in 1710, and succeeded his father Frederick in 1751. He married a sister of the king of Prussia in 1744, and faithfully pursued the good of his country, and his reign was upon the whole prosperous. He reformed the laws, cultivated science, promoted commerce, and for the most part preserved peace; though he could not prevent Sweden from joining the league against Prussia in 1757, a measure that contributed very little to its reputation. He instituted an academy of inscriptions and belles lettres in imitation of that of France, and erected a pyramid at Tornoe in Lapland, to commemorate the labours of the French academicians, who were sent thither to measure a degree of the meridian. He died much regretted in 1771; and was succeeded by his son Gustavus III. Nov. Dict. Hist.

ADOLPHUS, Christian Michael, the son of Balthazar Adolphus, merchant of Hirschberg in Silesia, was born the 14th of August 1676. After studying the different branches of medicine under the most celebrated masters of his time, he graduated at Utrecht, then went to Leipzig, where he acquired considerable reputation as a teacher. In 1747 he published, Differtationes Physico-medicae selectae, 4to. The titles of the Differtations, which are very numerous, may be seen in the 4to. volume of Haller's Biblioth. Med. Pract.

ADOM, in Ancient Geography. See Adam.

ADON, in Modern Geography, one of the states or principalities, into which the maritime part of the Gold-coaft in Africa is divided. It is bounded on the east by Mamba, on the south by Guaffe, on the north by Vaibbs, and called north-east by Abramboe. This country extends along the river Schama, and has many fine islands belonging to it, which are covered with beautiful and populous villages; the government was formerly monarchical; but the supreme authority is now lodged in a council of six lords. Adon is populous, fertile and rich; abounding with corn, fruit, and animals, both wild and tame; but the peace and prosperity of the country are often interrupted by civil discord. The Adomefe have it in their power to intercept the communication of the northern regions with the negroes of the coast, and oblige them to pay a duty which yields a large revenue. If these people were united and powerful within themselves, they would be the terror of surrounding nations. Adon adjoins to Asra, which is often disturbed by the incursions of the Adomefe. These people generally trade with Axim and Boutry; and sometimes with Little Comendo. Mod. Un. Hist. vol. iii. p. 453.

ADON, or Theten, a town of Hungary, situate on the Danube; four leagues south-west of Oßen.

ADOMER, one of the states of the Gold-coaft, called also Saku and Avina, adjoining to Adon and Axim; and differing little from them in produce, trade, laws and customs.

ADON, a large populous village of Hungary, situate in the province of Stuhl-Weilburg, or Alba regalis, in a rich country on the banks of the Danube. E. long. 19° 20', N. lat. 49° 30'.

ADONAI, one of the names of God in scripture. This word properly signifies my lord, in the plural number, as Adon, signifies my lord, in the singular number. The Jews, who, either out of respect or superlition, do not pronounce the name of Jehovah, read Adonai in the room of it, as often as they meet with Jehovah in the Hebrew text. But the ancient Jews were not so ferupulous; and there is no law which forbids them to pronounce the name of God. This superlition commenced among the latter Jews after the Babylonish captivity; at least before the time of Jofi-
plus, who expressly says, that it was not lawful for him to speak of the name by which God had revealed himself to Moses. See Geddes's Critical Remarks, vol. i. p. 167.

**ADONEA**, in *Mythology*, the name of a divinity which preceded over voyages.

**ADONI**, in *Geography*, a district of Hindostan, in the country of Golconda. It is also the name of a town in this district, about 188 miles north of Scingapatam. E. long. 77° 18'. N. lat. 14° 56'.

**ADONIA**, in *Antiquity*, solemn feasts in honour of Venus, and in memory of her beloved Adonis, who is supposed to have been killed by a wild boar in the forest of mount Libanus, from which the river Adonis descends. Bishop Patrick (Com. in Exod. xii. 36.) ascribes the origin of these feasts among the Egyptians to the slaying of the first-born in the time of Moses; and he, adopting the conjecture of Schneecus, an ancient writer, infers to the opinion, that Pharaoh's eldest son, who was now slain, had the name of Ofiris; and that his sudden death on this occasion was lamented by all posterity in one night of the year, at the time of full moon. Dr. Spencer, (De leg. Heb. l. ii. c. 37. § 1. vol. i. p. 575.) conjectures, that these feasts had their origin with the Egyptians; but, that the death of Ofiris or Adonis, generally understood to be the sun, being the god that prevailed over the fruits of the earth, or used symbolically for the fruits themselves, denoting their being cut off or separated from the earth in the time of harvest; which event was celebrated with mourning and lamentation; and as the Egyptians gathered the first fruits of the earth with this kind of unreasonable and excessive sorrow, he thus accounts for the institution recorded in Deut. xxvi. 14. To these feasts the prophet Ezekiel is supposed to refer, ch. viii. 14.; and if Tamnuz or Tammuz be the name with Ofiris or Adonis, as learned men generally suppose, the circumstance above-mentioned accounts for this solemnity being kept in the month of Tamnuz, answering to part of our June and July, because the harvest was finished in those hot countries by or before that time. See Lowth's Com. in loc.

This idolatry, derived from the Egyptians, was afterwards adopted by other nations, as the Phoenicians, Lycians, Syrians, and Greeks, and improved by the addition of a newable, viz. Venus's mourning for the death of Adonis. The scene of Adonis's history is said to be at Byblos in Phœcinia; and the signal for celebrating the Adonis was the change of the water of the river Adonis into blood, which happened once a year. Lucian (De Syria Des, iv apud oper. tom. iii. p. 454. Ed. Reitzii) gives the following account of these feasts. The Syrians affirm, that what the boar is reported to have done against Adonis was transacted in their country; and, in remembrance of this calamity, they annually beat themselves and weep, and celebrate frantic rites, and great lamentations are instituted through the whole country. When they have had enough of lamentation and tears, they still perform funeral obsequies to Adonis, as to one that is dead; and afterwards, on a following day, they feign that he is alive, and ascended into the air or heaven, and shave their heads as the Egyptians do, on occasion of the death of their apis. If any women will not consent to be shaved, they are obliged to prostitute themselves once to strangers, and the money they thus earn is consecrated to Venus. Some of the Bybians, continues Lucian, are of opinion, that these orgies are performed in honour of Ofiris, the Egyptian deity, and not of Adonis. The Egyptians, at the time of this feast, are said to convey a box made of rush or papyrus, with an inclosed letter, informing the inhabitants of Byblos, about seven days journey from the coasts of Egypt, that their god Adonis, whom they apprehended to be lost, is discovered. The vessel always arrives safe at Byblos at the end of seven days. Lucian says, he was a witness of this event. The women, who are the principal actors on this occasion, expect the arrival of the vessel with impatience, and are frantic with joy when it arrives. According to Menæus, the two offices of lamentation and rejoicing made two distinct feasts, which were held at different times of the year, the first six months after the other; Adonis being supposed to pass half the year with Proserpine, and the other half with Venus. The lamentation they called áºªπνπγκ, or disappearance, and the rejoicing περιήγης, or return. These feasts were observed at Alexandria in the time of St. Cyril, and at Antioch in the time of Julian the apostate, who happened to enter the city during the solemnity, which was interpreted as an illomen. Ovid refers to the Adonis in his Metamorph. (l. iv. p. 725. tom. 2. p. 740. Ed. Burman.)

"... lucus monumenta manehunt, 
Semper, Adoni, meli: repetita mortis imago, 
Anna plangordis peragit simulamina morti. 
At errum in horum mutabilium..."

Procopius, St. Cyril, and some other learned men are of opinion, that Isaiah (ch. viii. 2.) refers to the circumstance above-mentioned of sending a letter by sea to communicate the news of Adonis's resurrection; whilst others, translating the Hebrew recub, idols, suppose that the passage refers to the images of Isis, which the Egyptians carried from place to place in a sort of portable reliquary, or ark of bulrushes. The rites practised in the Adonis resemble those of the Orphic Astronautica, and probably have the same origin and end. Bryant, Mythol. vol. i. p. 371.

The Adonias were otherwise called Salambo. The Abbé Banier has a memoir on the history of the Adonias. Mem. Acad. Inscript, tom. iv.

**ADONIEUS**, a name given by the Arabs to the sun, under which appellation they worshipped him, by daily offering to him incense and perfumes. This was also a name given to lycchus. ADONIC, in *Poetry*, denotes a short kind of verse, consisting of a dactyl and a spondee, or a trochee: as *nec juventus*. It takes its name from Adonis; as having been originally used in the Threnos, or lamentsations for that favourite. The chief use of the adonic verse is at the end of each strophe of sapphic verse; or among Ariostoian Anapalts in the ancient tragedy. But we meet with adonies by themselves without sapphics, as also sapphics without adonies. See an instance of adonic verses in Boethius, de Confus. Philos. lib. i. p. 24. Ed. Amnich. "Gaudia pelle," &c.

**ADONIDES**, in *Botany*, are those writers, who have given histories, or catalogues of the plants cultivated in some particular place.

**ADONION**, a species of southernwood, according to Gourreus, which used to be set in pots, and served as an ornament for gardens.

**ADONIS**, in *Antiquity*, a dance of the ancient Greeks, which was a kind of ballet, in which a pantomime imitated Adonis, and bewailed his misfortune.

**Adonis**, flos Adonis, or Phœnian's Eye, in *Botany*, a genus of the *polyanthus polygama* class and order, and of the natural order of *multifflora* and the *ranunculaceas* of Jullien. Its characters are, that the calyx is a five-leaved perianthium, and the leaves are obtuse, concave, a little coloured and deciduous; the corolla has from five to fifteen, but most commonly eight, oblong, obtuse, shining petals; the stamina conflit of very short, fubulate filaments, and the anthone are oblong and inflax; the pithillus has numerous germs collected
collected in a head, no styles, and acute reflex stigmas: no pericarpium; an oblong, spiky receptacle: the seeds are numerous, irregular, angular, gibbous on the base, reflex at the top, a little prominent and naked. To this genus belong six species: viz. the *cotrolis*, or tall, *autumnalis*, or common, the *vernalis*, or spring, the *apenninus*, the *capensis*, and the *reflexoria*, or bluster *adonis*. The first is by some botanists united to the second, although Dr. Smith separates them; it is a native of the southern countries of Europe, where it grows among corn: and a variety of it is mentioned by some authors. The second grows in Kent, near the river Medway, between Rochester and Maidstone, in fields sown with wheat; and the flowers are brought in great quantities to London, where they are sold under the name of red *morocco*. It is also found in Norfolk, Gloucester-ville, about London, and about Dublin. It is annual, and flowers from May to October. The spring *adonis*, which is near akin to the *apenninus*, to that La Mareck confers it as a variety of the other, is a native of Switzerland, Prussia, and various parts of Germany, where the root is often used for the true black helichore. The fourth is found wild in the Apennines, and in Siberia. The fifth species is found wild near the Cape of Good Hope. The sixth is also a Cape plant, and used by the Africans for railing blisters. There is another species recorded in the Supplement of the younger Linnaeus, there named *Adonis filia*, and considered as the daughter of the *Adonis caeparis*.

The two first species are annual, and thrive best in a light soil: the seeds should be sown in autumn, some in a warm, and others in a shady situation, that they may continue longer in flower: they will not bear being transplanted. The third and fourth are perennial, and the seeds should be sown in August, soon after they ripe: the ground should be kept clear from weeds, and in dry weather, watered; and in the autumn of the second year they should be transplanted into the situation where they are to remain. They may be increased by parting the roots, either in autumn or spring. They are hardy and flowery, and therefore defirable plants for a garden. The Cape species must be managed as other plants from that country. Martyn’s Miller. Gmelin reckons eight species, adding to those already enumerated the *miniatia*, which he says not to be different from the *autumnalis*, and the *flavina*, with octopetalous flowers, hairy calyx, and cylindrical fruit.

*Adonis*, in *Entomology*, a species of *papilio*, with entire caruncular wings, a black marginal ridge, underneath cinnamon, with numerous ocelli; of which the latter have a white central spot. The larva is green, with dorsal lines of yellow spots. It is found in Austria.

*Adonis*, in *Ancient Geography*, a river of Phœnicia, rising in Mount Libanus or Lebanon, and falling into the sea at Byblus, now Gibyle. The Turks call this river *Obhâkim Bâfis*. Mannerrell, in his *Journey*, p. 34, 35, confirms the opinion of Lucian (Opr. tom. iii. p. 456. Ed. Reitzii) concerning the red colour of this river. At certain seafloes of the year, especially about the feast of Adonis, it is of a bloody colour, which the heathens attributed to a kind of sympathy in the river for the death of Adonis, who was killed by a wild boar in the mountain, out of which this stream rises. The water was stained, says Mannerrell, to a surprising redness, and as we observed in travelling had discoloured the sea for a considerable distance into a reddish hue, occasioned, without doubt, by a sort of mineral, or red earth, washed into the river by the violence of the rain, and not by any stain from the blood of Adonis. This reddish tinge of the streams of water is not a singular phenomenon. Pococke (vol. i. p. 199) informs us, that when the river Nile is rising, its waters become red, and sometimes green. The same fact is confirmed by Mailler, and Volemy (Travels in Syria, vol. ii. p. 253) relates, that at Tyre there is a well, which command afford excellent water, but becomes troubled in September, and continues for some days full of reddish clay. This is confirmed as a festival by the inhabitants, who come in crowds to the well, and pour into it a bucket of sea-water, which they say, has the virtue of re-covering the clarines of the spring. An ingenious writer suggests, that the magicians of Egypt (Exod. vii. 22.) might, by their enchantments, have repeated some of the practices to which they were accustomed at the solemnity of the bleeding *adonis*; and if this was done at the feast of *Adonis*, they might perfume Pharaoh, that the miracle was wrought in favour of *Adonis*. Fragments in an Appendix to Calvin’s *Dint*., vol. ii. pt. 1. p. 26.

The river *Adonis*, according to Mr. Bryant (Myth. vol. i. p. 366.) is the same with *Eridanis*; and the circumstance of the change of the colour of its waters, and the death of *Adonis* or *Thannuz*, which was supposed to be the occasion of it, are pathetically described by Milton in the following lines of his *Paradise Lost*, B. i. v. 445.

"—*Thannuz* came next behind,
Whole annual wound in Lebanon all*ard*
The Syrian damsels to lament his fate
In amorous ditties all a summer’s day :
While smooth *Adonis* from his native rock
Ran purple to the sea; *supposed* with blood
Of *Thannuz* yearly wounded.”

*Adonis* is the name of a river of Africa, which rises in the mountains south-west of Tictua, and falls into the sea between Arcilla and Tangier.

*Adonis*, the name of a city in Thrace, called *Enonis*.

*Adonis*, in *Ichthyology*, the name of a small fish of the anguilliform kind, of a cylindric shape, and about six inches long; it is of a gold colour, mixed with a greenish hue in some parts, and in others with a reddish. It has on each side a white straight line running from the gills to the tail. Its gills are remarkably small, and many have hence supposed that it had none. It is remarkable for sleeping on the surface of the water, and near the shores; and Rondelius affirms, that he has seen them sleeping upon dry rocks. Mr. Ray suspects this fish, which is also called *exocoetus*, to be the same with the *exocoetus* of Bellonius, or the *Gatortugine*. The *adonis* of Bellonius is the *Blenius galerita* of the Linnean system.

*Adonis*, in *Mythology*, a beautiful youth, the son of Cinyras, an Affryian, who founded the city of Paphos, in the island of Cyprus. Venus, it is said, was enamoured of him from his infancy, and committed the care of his education to Proserpine, who refused to deliver him when he was demanded by Venus. The dispute was decided by Jupiter, by decreeing that he should be one third of the year with Proserpine, another third with Venus, and the last third at his own disposal; but Adonis, captivated by the charms of Venus, spent two-thirds of his time with her. Diana, it is said, took offence, and sent a wild boar to destroy him. Others say, that Adonis was the son of Cinyras by his daughter Myrrha; that he was disinherited for concealment to the mountains, and nurtured by the nymphs; that Venus fell in love with him, and admitted him to her embraces; that Mars, being jealous, transformed himself into a wild boar, and slew the beautiful youth; that Venus followed him to the shades, and obtained the consent of Proserpine, that he should be half the year with her, and half the year with Proserpine; and that Venus, triumphing in her success, appointed a festival to be celebrated in commemoration of
ADO

ADO

of the event. This fable has been variously interpreted. Adonis, as some say, was the son, Venus the upper hemisphere of the earth, and Proserpine the inferior; and therefore, when he was in the fix inferior signs he was with Proserpine, and during the remaining time he resided with Venus. The bear which flew Adonis was the winter. Macrob. Saturn. l. i. c. 21. Others suppose that Adonis denotes the fruits of the earth; and when the feed was sown in the ground, Adonis was gone to Proserpine: and that when it had vegetated and spruped up to view, he reviited Venus. Hence they focused corn, and made gardens for Adonis, which were adopted more for pleasure than profit. Voyl. de Idolobib. l. ii. c. 5. Theocritus, Idyll. 111. According to Plutarch, (Sympoisacon, l. iv. oper. tom. 2. p. 671.) Ed. Xylander.) Adonis was the same with Bacchus; and Osiris was both the son and Adonis. Some are of opinion, that the Ammonites and Moabites called him Baal-Peor, and that he was the same with the Hebrew Thammuz. Bryant (Mythol. v. i. p. 371.) supposes, that the Cusamites worshipped their chief deity the sun, under this title; and he says, that at Byblus, Berytus, Sidon, and afterwards at Tyre, they used particularly mournful dirges for the loss of Adonis or Thammuz, who was the same as Thamas, and Osiris in Egypt. Hence the children of Israel were forbidden to weep and make lamentation upon a festival. Nehem. viii. 9. 14. See ADONIA.

The worship of Adonis was established by the emperor Adrian in the grottoes of Bethlehem, where it was suppos'd our Saviour was born. Adonis pisto, an ancient beverage or drink made of wine mixed with flower of roasted adon; the name with which what was otherwise called Cucumen.

ADONISTS, among Divines and Critics, a sect or party, who maintain, that the Hebrew points ordinarily annexed to the confonants of the word Jehovah, are not the natural points belonging to that word, nor express the true pronunciation of it; but that they are the vowel-points belonging to the words Adonai and Elohim, applied to the confonants of the ineffable name Jehovah: to warn the readers, that instead of the word Jehovah, which the Jews were forbidden to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read Adonai. There were opposed to Jehovah; of whom the principal are Druiaus, Capellus, Buxtorf, Alling, and Roland, who has published a collection of their writings on this subject. See ADONAI and JEHOWAH.

ADOPISSUS, in Ancient Geography, a town of Asia Minor, which Ptolemy places in Lycaonia.

ADOPTER, in Chemistry, a vessel with two necks placed between a retort and a receiver, and serving to increase the length of the neck of the former. They differ from aludels, which were formerly used in the sublimation of several substances, both in their figure and in their situation. The adopters are tubes which become narrower at one end, from half a foot to three feet long, and are open at both ends. They are joined in a collatral oblique situation; whereas the aludels were fuch up right. Chemistry, plate 1. fig. 1. See Distillation and Receiver.

ADOPTIANI, in Church History, a sect in the eighth century, which sprang up under Charlemagne, about the year 783, in confequence of the concurring opinion of Eipand, archbishop of Toledo, and Felix, bishop of Urgel; whose diftinguifhing tenet was, that Christ, as to his human nature, was not the proper or natural, but only the adoptive Son of God. Their doctrine was condemned by a council at Frankfort in 794, and afterwards in a council at Rome under pope Leo III.

ADOPTION, an act by which any one takes another into his family, owns him for his son, and appoints him for his heir. The word is derived from adoptare; whence the Latin barbarous adulerare, to make a knight.

The custom of adopting was very familiar among the ancient Romans, who had an express formula for it. They first learned it from the Greeks, among whom it was called ἑρώτημα, ἀδοπήμα; and it was translated to them from the ancient Hebrews, Egyptians, and Alyrriors, among whom it prevailed.

As adoption was a sort of imitation of nature, intended for the comfort of those who had no children; eunuchs were therefore not allowed to adopt, as being under an actual impotency of begotting children. Neither was it lawful for a young man to adopt an elder, because that would have been contrary to the order of nature; but it was even required, that the person who adopted should be eighteen years older than his adoptive son, that there might appear at least a probability of his being the natural father.

The Romans had two forms of adoption: the one before the praetor; the other at an assembly of the people, in the times of the Commonwealth, and afterwards by a referent of the emperor. In the first, the natural father adjudged himself to the praetor, declaring that he emancipated his son, resigned all his authority over him, and confessed that he should be translated into the family of the adopter. The latter manner of adoption was practis'ed, where the party to be adopted was already free; and this was called adoption.

The person adopted changed all his names; assuming the surname and forename of the person who adopted him. When Augustus adopted his grand-children, the two sons of Agrippa and Julia, he adhered closely to the most solemn formularies of the Roman law, and invested on their fathers making over to him, by a kind of sale, his right to the children; and he gave them his name, so that they called them Caesars, and Lucius Caesar. In the reign of Nero, the senate passed a decree, ordaining that fraudulent adoptions should not avail thus as made them, either to qualify themselves for honours, or to receive the whole of any inheritance that might fall to them.

Besides the formalities prescribed by the Roman law, divers other methods have taken place; which have given denominations to various species of adoptions among the Gothic nations, in different ages.

ADOPTION by arms, was when a prince made a present of arms to a person, in consideration of his merit and valour.—Thus it was that the king of the Heruli was adopted by Theoderic; Athalaric, by the emperor Juttinian; and Coesrus, nephew of the king of Persia, by the emperor Julian.

This method of adoption, practised in Germany, was called barbarorum, by way of opposition to the Roman custom.

The obligation here laid on the adoptive son was, to protect and defend the father from injuries, affronts, &c.—and hence the ceremony of dubbing knights took its origin as well as name. Selden, Tit. of Hon. p. 865.

ADOPTION by baptism, is that spiritual affinity which is contracted by god-fathers and god-children in the ceremony of baptism.

This kind of adoption was introduced into the Greek church, and came afterwards into use among the ancient Franks, as appears by the Capitulums of Charlemagne. In reality, the god-father was so far considered as adoptive father, that his god-children were suppos'd to be entitled
ADO

Adoption by marriage, or adoption per capitum, or crimen, was performed by cutting off the hair of a person, and giving it to the adoptive father. It was thus that Pope John VIII. adopted Boso of Arles, which, perhaps, is the only instance in history, of adoption in the order of ecclesiastics; a law that permitted a woman to marry another, not daring to give children to those in whom it would be thought a crime to begot any.

Adoption by marriage, is the taking the children of a wife or husband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the same footing with those of the present marriage. This is a practice peculiar to the Germans; among whom it is more particularly known by the name of einkindshaft; among their writers in Latin, by that of uxor probum, or union of offices. But the more accurate writers observe, that this is no adoption. See Adoption.

Adoption by testament. See Levirate.

Adoption by testament, that performed by adopting a person heir by will, on condition of his assuming the name, arms, &c. of the adopter.

Of which kind, we meet with divers instances in the Roman history.

Adoption was allowed among the Greeks to such as had no issue of their own; excepting those who were not καταγενέσας, their own masters, e. gr. slaves, women, madmen, infants, or persons under twenty years of age; who being incapable of making wills, or managing their own estates, were not allowed to adopt heirs to them. Foreigners being incapable of inheriting at Athens, if any such were adopted, it was necessary for them to make free of the city. The ceremony of adoption being over, the adoptor had his name enrolled in the tribe and ward of his new father; for which entry a particular time was allotted, viz. the festival Supplicies.

To prevent rash and inconsiderate adoptions the Lacedemonians had a law, that adoptions should be transacted, or at least confirmed, in the presence of their kings. The children adopted were invested with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceased to have any claim of inheritance, or kindred, in the family which they had left, unless they first renounced their adoption; which, by the laws of Solon, they were not allowed to do, unless they had first begotten children, to bear the name of the person who had adopted them: thus providing against the ruin of families, which would otherwise have been extinguished by the death of those who had been adopted to preserve them. If the children adopted happen to die without children, the inheritance could not be alienated from the family into which they had been adopted, but returned to the relations of the adopter.

It should seem that by the Athenian law, a person, after having adopted another, was not allowed to marry, without permission from the magistrate: in effect, there are instances of persons, who being ill used by their adoptive children, petitioned for such leave. However this be, it is certain some men married after they had adopted sons; in which case, if they begat legitimate children, their estates were equally shared between the begotten and adopted.

Among the Turks, by the law of Mahomet, adoption is no impediment of marriage. The ceremony of adoption is performed by obliging the person adopted to pass through the scent of the adoptor. Hence, among that people, to adopt is expected by the pirate, to draw another through my fores.

Du-Cange supposes that the adoption of Godfrey of Bouillon by Alexis, who named him champion of the empire, and dignified his hommage with the filial name and rites of adoption, was of this kind.

It is said that something like this has also been observed among the Hebrews, where the prophet Elijah adopted Eliphaz for his son and successor, and communicated to him the gift of prophecy, by letting fall his cloak, or mantle, on him. 1 Kings xix. 19. 2 Kings ii. 15. But adoption, properly so called, does not appear to have been practised among the ancient Jews. Moses lays nothing of it in his laws; and Jacob’s adoption of his two grandsons, Ephraim and Manasseh (Gen. xlviii. 1.) is rather a kind of substitution, by which he intended that the two sons of Joseph should have each his lot in Israel, as if they had been his own sons. Culpeper.

In the East, the practice of adoption is still continued. Pitts (Account of the Religion and Manners of the Mahometans, p. 217. 227) informs us, that his patron, who was an old bachelor, being taken ill and likely to die in his pilgrimage to Mecca, took off his own girdle and put it on him, and at the same time put on himself the girdle of Pitts. In speaking of him afterwards, his patron called him his son; and occasionally lied to him, though I never was married myself, yet you shall be married, in a little time, and then your children shall be mine. Lady Montague (Letter xiii. vol. ii. p. 165.) says, that adoption is very common amongst the Turks, and yet more common amongst the Greeks and Armenians. With this view, and in order to prevent their estates from falling into the Grand Signior’s treasury, they chuse a child of either sex, among the meanest people, and carry the child and its parents before the Council, and there declare they receive it for their heir. The parents, at the same time, renounce all future claim to it; a writing is drawn and witnessed, and a child, thus adopted, cannot be disinherited.

By the Gentoo laws (Halhed’s, p. 263.) information must be given to the magistrate, by the person who is desirous of adopting a child, and a juss or sacrifice performed; and he is also to give gold and rice to the father of the child. A woman is not allowed to adopt a child without her husband’s consent, and he who has no son, or grandson, or great grandson, has liberty to adopt a son; but while he has one adopted son, he is not permitted to adopt a second.

Adoption is also used, in Theology, for a feudal act of God’s free grace; whereby those that are regenerate by faith, are admitted into his household, and entitled to a share in the inheritance of the Kingdom of heaven.

Adoption, in the more general scripture sense of the term, denotes that act of divine grace or favour, by which some of the human race are introduced into a peculiar relation to God, as his children and people. In this sense the privilege of adoption belonged only to the Israelites or Jews, before the coming of the Messiah. See Exod. iv. 22. Jer. xxxii. 9. Luke i. 54. Rom. ix. 4. But the Jews forfeited this honourable distinction, and were deprived of the national privilege they had long enjoyed: and God determined to admit the Gentiles into the state of sonship or adoption independently of any legal observances, and merely on the condition of faith in Jesus Christ. It has, however, been a subject of debate among divines whether adoption belongs to Christs in general, in consequence of their
their faith in Christ, and outward profession of his religion; or is appropriate to those Christians in particular who conform in their disposition and practice to the precepts of the gospel, and are the special objects of divine favour. According to the scheme of Dr. Taylor, in his Key to the Apoloitical Writings, prefixed to his Paraphrase, &c. on the Epistle to the Romans, (chap. xii. p. 91.) adoption, as well as election, vocation, justification, &c. belong to the classes of antecedent blessings, which, in a sense, belong at present to all Christians, even those, who for their wickedness shall perish eternally; and that they do not import an absolute, final state of favour and happiness; but are to be considered as principles or motives to engage us to holiness and obedience. He allows that some of the expressions, whereby the antecedent blessings are signified, may be used in a double sense; either, as they are applied to all Christians in general in relation to their being translated into the kingdom of God, and made his peculiar people, enjoying the privileges of the gospel; or, as they signify the effects of those privileges, viz. either that excellent disposition and character which they are intended to produce, or that final state of happiness, which is the reward of it. See Locke’s Works, vol. iii. p. 312. 570.

Adoption has a particular respect to that future resurrection and immortality, to the hope of which Christians were foretold again by the doctrine and resurrection of Christ. See Whitby Comment. vol. ii. p. 44. 324. 339. 6th edition.

Adoption is sometimes also used, in speaking of the ancient clergy, who had a custom of taking a maid or widow into their houses, under the denomination of an adoptive or spiritual foster, or niece. Du Cange.

Adoption is also used in speaking of the admission of persons into certain hospitals, particularly that of Lyons; the administrators whereof have all the power and rights of parents over the children admitted.

Adoption is also used for the reception of a new academy into the body of an old one.

In which sense, adoption amounts to much the same with incensation.

The French academy of Marfeilles was adopted by that of Paris; on which account, we find a volume of speeches extant, made by several members of the academy of Marfeilles, deputed to return thanks to that of Paris, for the honour.

In a sense not unlike this, adoption is also applied by the Greeks, to the admitting a monk or brother, into a monastic community; sometimes called spiritual adoption.

ADOPTIVE, ADOPTIVUS, or ADOPTITUS, denotes a person adopted by another.

Adopted children, among the Romans, were on the same footing with natural ones; for which reason, they were either to be habituated heirs, or expressly disinherited; otherwise the testament was null.

The emperor Adrian preferred adoptive children to natural ones; because he chose the former, but are obliged to take the latter at random.

M. Menage has published a book of elogies, or verbes addressed to him; which he calls Liber Adoptivus, an adoptive book; and adds it to his other works.—Heinius, and Furf-lemburg of Munster, have likewise published adoptive books. In Erolofical Writers we find adoptive women or sisters, adoptiva familia, or forores, used for those handmaids of the ancient clergy, otherwise called subintroduttor.

ADOPTIVE GIFT are those which a person enjoys by the gift or concession of another, and to which he was not otherwise entitled. They stand contradistinguished from arms of alliance.

ADOPTIVE is also used to express a thing borrowed or taken from another. In which sense we sometimes meet with adoptive hair, by way of opposition to natural hair; and adoptive gods, by way of contradistinction to domestic ones. The Romans, notwithstanding the number of their domestic, had their adoptive gods, taken chiefly from the Egyptians: such were Isis, Osiris, Anubis, Apis, Harpo-ocrates, and Canopus.

ADOPTIVUS, in Church History. See ADOPTANI.

ADOR signifies a species of corn called spelta and \*\*.

ADORAX, or ADORAX, in Ancient Geography, a city belonging to the tribe of Judah, not far from Marecu in the southern part of Judah, in the confines of Idumea. These two cities were taken by Hyrcanus in his expedition into Syria, when he deformed the Samaritan temple on Mount Gerizim. Joseph. Antiq. apud op. tom. i. p. 659. ed. Havern.

ADORATION, the act of rendering divine honours; or of addressing God or a being, as supposing it a god. See WORSHIP. The word is compounded of ad, to, and or, mouth; and literally signifies to apply the hands to the mouth; namely ad as adorand, q. d. to bow the hand; this being, in the eastern countries, one of the great marks of respect and submission; and feeming, from the first books of Herodotus, to be of Persian origin. To this mode of idolatrous worship Job refers, chap. xxxi. 26, 27.—See also 1 Kings xii. 18.

The ceremony of adoration among the ancient Romans was thus: the devotees having his head covered, applied his right hand to his lips, the fore-finger resting on the thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kids thus given was called of Is lux labratum; for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet and even knees, it being held an ininciency to touch their mouths; so that the affair passed at some distance. Others pretend, that they first stretched out the hand, and afterwards drew it back to their lips; but it rather appears that the contrary order was observed. Saturn, however, and Hercules, were adored with the head bare; whence the worship of the last was called infintum peregirium, and ritus Gerioenicius, as departing from the Roman customary method, which was to facieare and adores, with the face veiled, and the clothes drawn up to the ears, to prevent any interruption in the ceremony, by the sight of unlucky objects.

Sometimes also prolitiation, or falling on the face, and sometimes kneeling, were practised; sometimes they turned towards the sun, and sometimes to the eaf.

Other circumstances of adoration were the putting crowns, garlands, and the like, on the statues or images adored; sitting down by them, praying to them in soft trembling murmur, to be favourable, jumЗа milis. The Romans practised adoration at sacrifices, and other solemnities; in passing by temples, altars, groves, &c. at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in, or out, to pay their respects to.

The Gauls, instead of turning about to the right hand,
Adoration is also used for certain extraordinary civil honours or respect, which resemble those paid to the Deity, yet are given to men.

We read of adorations paid to kings, princes, emperors, popes, bishops, abbots, &c. Adorations paid to the pure, to the perfect. Adoration by kneeling, by falling prostrate, kissing feet, hand, garment, &c.

The Persian manner of adoration, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. This was an indispensable condition on the part of foreign ministers and ambassadors, as well as the king's own vassals, of being admitted to audience, and of obtaining any favour. This token of reverence was ordered to be paid to their favourites, as well as to themselves, as we learn from the history of Haman and Mordecai, in the Book of Esther; and even to their statues and images; for Philostratus informs us, that, in the time of Apollonius, a golden statue of the king was exposed to all who entered Babylon, and none but those who adored it were admitted within the gates. The ceremony, which the Greeks called ἱεροπρεπές, Conon refused to perform to Artaxerxes, and Caligalines to Alexander the Great, as repugnant it impious and unlawful.

The adoration performed to the Roman and Grecian emperors, consisted in bowing or kneeling at the prince's feet, laying hold of his purple robe, and presently withdrawing the hand, and clapping it to the lips. Some attribute the origin of this practice to Constantius. They were only persons of some rank or dignity that were entitled to the honour. Bare kneeling before the emperor to deliver a petition, was also called adoration.

It is particularly said of Dioclesian, that he had gems fastened to his shoes, that divine honours might be more willingly paid him, by killing his feet. And this mode of adoration was continued, and aggravated till the last age of the Greek monarchy. See Gibbon's Decline and Fall of the Roman Empire, vol. x. p. 124, 8vo. When any one pays his respects to the king of Achen in Samara, he first takes of his shoes and stockings, and leaves them at the door.

The practice of adoration may be said to be still subsisting in England, in the ceremony of killing the king's or queen's hand, and in serving them at table, both being performed kneeling.

Adoration is also used in the court of Rome, for the ceremony of killing the pope's feet.

It is not certain at what period this ceremony was introduced into the church; but it was probably borrowed from the Byzantine court, and accompanied the temporal power. Dr. Machina, in the chronological table which he has subjoined to his translation of Molheim's Ecclesiastical History, places its introduction in the eighth century immediately after the grant of Pepin and Charlemagne. Baronius traces its origin back to a much higher antiquity, and pretends that examples of this homage to the vicar of Christ occur as early as the year 204.

These prelates finding a vehement disposition in the people to fall down before them, and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem, the adoration intended for the pope's person, is supposed to be transferred to Christ. Divers acts of this adoration we find offered even by princes to the pope: and Gregory XIII. claims this act of homage as a duty. We are told, that in the ancient church the same ceremony was practised to all bishops; people kissed their feet, and saluted them with the phrase ἐκπολεμῶ σου, I adore thee.

Adoration is also particularly used for the ceremony of owning, or paying homage to a new elected pope. The first election at which the ceremony is expressly recorded to have taken place, is that of Valentine, A. D. 827. The second is that of Leo IV. A. D. 847. Amalarius in Valentine. cap. 653. in Leon. iv. cap. 697.

Stephen II. being chosen pope, A. D. 752, in the church of St. Mary ad Praetere, was carried on men's shoulders from thence to the Lateran; and Polydore Virgil observes, that this is the first instance of this ceremony, which occurs in the history of the popes. See Bower, vol. iii. p. 343.

Adoration properly is paid only to the pope, when placed on the altar, in which posture the cardinals, consilvii alone, are admitted to kiss his feet. The people are afterwards admitted to do the like at St. Peter's church; the ceremony is described at large by Guicciardini.

Adoration is also used as a method of electing a pope without scrutiny, or voting. In the election by adoration, the cardinals rush hastily, as if agitated by some spirit, and fall immediately to the adoration of some one among them, and proclaim him pope.

In the election by scrutiny, adoration is the last thing, and follows the election; as in the other it is the election itself, or rather supercedes the election.

Adoration is more particularly used for kissing one's hand in presence of another as a token of reverence.

The Jews adored by kissing their hands, and bowing down their heads; whence in their language kissing is properly used for adoration. Colmct.

Adoration is also used among Roman writers, for a high species of applause given to persons who had spoken or performed well in public. The method of expressing it was, by riling, putting both hands to their mouth, and then returning.
returns them towards the person intended to be honoured.

See Acclamation.

Adoration is of divers kinds and qualities: supreme and subordinate; mediate and immediate; absolute and relative; internal and external; secret and open.

Adoration, external, coincides with what is otherwise called ritual adoration.

Adoration, internal, coincides with spiritual adoration, called also adoration in spirit and in truth.

Adoration fidelis, that performed in public, with stated ceremonies prescribed by authority: in opposition to private, or secret, or implicit adoration.

Adoration, supreme, the highest degree of religious honour or worship rendered to a being, as supposing him the supreme God; in opposition to subordinate worship given to inferior beings.

Adoration, absolute, that rendered immediately to a being, in consideration of his own essential perfections, and terminating in himself. This coincides with immediate adoration, and stands opposed to relative or mediate adoration. Olearius has an express dissertation on the adoration of the Father by the Son.

Adoration, relative, is that worship paid to an object, as belonging to, or representative of another.

In which sense the Romans professed to adore the crows, not simply or immediately, which they allow would be idolatry, but in respect of Jesus Christ, whom they suppose to be on it. The Juleuts in China carry an image of Christ under their clothes, and to this refer mentally the public adorations they offer to Chachincho. Vide Pafcal. Letr. Prov. 5.

Adoration, perpetual, is a kind of society or association of devout persons established in Romish countries, who take their turns to pray before the shrines, regularly relieving each other, so that the service never ceases day nor night.

The members of the perpetual adoration answer to the Acomitti in the cemail church.

We find societies under this denomination in France, Germany, Italy, &c.

Adoration, barbarous, is a term used in the laws of king Canute, for that performed after the manner of the heathens, who adored idols.

The Punicans adored the winds, on account of the terror and effects produced by them; the same practice was adopted by most of the other nations, Persians, Greeks, Romans, &c.

The Trojan poets adored tortoises, as something peculiarly sacred; several people adored weapons, and instruments of war. The Scythians, &c. adored foxes, the Romans axes, and the Arabs stones, the Indians adored vipers, the Bengal and Canadee the sun; the latter of which nations is also said to adore the crows. The Manta, a Peruvian people in the island of Puna, anciently adored a huge emerald, of the bigness of an ostrich's egg, by offering to it other emeralds of a lesser size. All which the priest kept for their own use: the doctrine, as Gareciasso observes, being founded on their avarice.

The Persians chiefly paid their adorations to the sun and fire, some say also to rivers, the wind, &c. The motive of adoring the sun was the benefits they received from that glorious luminary, which of all creatures has doubtless the best pretensions to such homage; the institution of the fire-worship is usually referred to Zoroaster. The retainers to it are called ignicole; by the Persians, Ghebr, Arsche, Persch.

Dr. Hyde reduces the Persian fire-worship to a subordi-
on the declivity of a hill, on the west side of a small plain, surrounded every where by mountains. Its name signifies "paf" or "pyjego," is derived from its situation, on the flat ground immediately below the river Ribierain, by which every body must pass in their way from Gondar to the Red Sea. This plain is watered by three rivulets, which are never dry, viz. the Afia, Mai Gogne, and Ribierain, which join the other two, and falls into the river March, about twenty-two miles below Adowa. This town, which is now the capital and residence of the governor, consists of about 300 houses, each of which has an enclosed round it of hedges and trees. The mansion of the governor is situated upon the top of a hill, and is a kind of prison, inhabited by about 300 persons who are detained in irons, and in cages like wild beasts, some of whom have been confined for more than twenty years, with a view of extorting money from them, and who do not obtain liberation, even when the money is paid. There are two churches in the vicinity of this town, viz. Marian and Edus Michael, and also a monastery, called Byk Abba Garai, one of the most celebrated in Abyssinia; which was once a residence of one of their kings, whence some travellers have reported that the metropolis of Abyssinia was called Germe. Adowa is the seat of a very valuable manufactory of coarse cotton cloth, which circulates through Abyssinia instead of silver money; each web is 16 deep, and 11 wide, and their value is 200, i.e. ten for the ounce of gold. The houses in this town are all built with rough stone, cemented with mud instead of mortar; their roofs are of a conical form and thatched with a reedy fort of grass. The buildings of thatching belongs exclusively to the Falatah or Jews. The vicinity of Adowa is the only part of Tigre which has soil sufficient to yield corn, the whole of the province besides being one entire rock. They have heretofore havelock annually, which culls no following, weeding, manure, or other expensive processes; and yet the farmer in Abyssinia is always poor and miserable. N. lat. 14° 7'. 57°. E. long. 38°. 50'. Bruce's Travels, vol. iii. p. 118.

ADOXA, formed of "priv. and "dix gloria, q. d. "gladly, or of no "bo-w, in Botany, a genus of the olidiiaria tetragoninae chief and order, and of the natural order of "filament, and "fide of Jaffee; the characters of which are, that the calyx is an inferior, biahe or trifid, flat and permanent perianthium; the corolla is monopetalous, flat and divided into four or five segments, with clefts ovate, acute and longer than the calyx; the stamens are borne in filaments, of the length of the calyx, and the anthers roundish; the pistil has a germ below the receptacle of the corolla; the styles are simple, erect, of the length of the filaments, and permanent, and equal in number to the clefts of the corolla; the stigmas are simple; the pericarp is a globose berry, between the calyx and corolla, the calyx being united below with the berry, umbilicate and four or five celled; the seeds are solitary and compressed. There is one species, viz. the A. mucronata, bulbous fumitory, hollow root or tuberous mokchate, which grows naturally in shady places and woods, as in Hampstead and Charlton woods; it is perennial, flowers in April and May, and the seeds ripen in May. The leaves which soon after decay and the flowers smell like musk, on which account it has been sometimes called "musk coronum. The roots must be planted after the leaves are decayed, under thums, for if they are exposed to the sun, they will not thrive. Martyn's Miller's Dictionary. Smith's Flor. Brit. vol. i. p. 112.

ADPERCEPTION, in the Leibnitzian style, denotes
Vol. 1.
ADRA

Draga, a place of Arabia, situate, according to Ptolemy, in long. 70° 10'. and lat. 15° 15'.

ADRAGANTH, the same as gum DRAGANT. See TRAGACANTH.

ADRAGNO, in Geography, a town of Sicily, twenty miles called-north-east of Mazaro.

ADRASITA, in Ancient Geography, the inhabitants of a district of India, which lay to the east of the rivers Acconines and Hydronetes.

ADRAMITAE, a people placed by Ptolemy in Arabia Felix.

ADRAMELECH, in Mythology, one of the gods adored by the inhabitants of Sepharvaim, who were settled in Samaria in the room of those Israelites that removed beyond the Euphrates. The people of Sepharvaim made their children pass through the fire in honour of this false deity, and another called Anamellech. Atramellech, i.e. the magnificent king, is supposed to have represented the sun, and Anamellech, i.e. the gentle king, the moon. Calmet.

ADRAMYTTIUS, in Ancient Geography, an island of Aisia Minor, on the coast of Lychia.

ADRAMYTTIUM, a famous city of Mycia Major, called also Pedasus, which, according to Strabo, (lib. xiii. tom. 2. p. 904.) was an Athenian colony, with a harbour and dock, situate at the foot of Mount Ida, near the Caucasus. It was so called, says Stephanus (de Urb. tom. 1. p. 22.) from Adramythus, the brother of Crethus, by whom it was built. Others say, that it was founded by the Lydians, and derived its name from Hermon, one of their kings, who, in the Phrygian language, was called Adraste. This is the Adramyttium mentioned Ads xxvii. 2. and not as St. Jerome and others suppose, a city of Egypt built by Alexander the Great, at the Canobic mouth of the Nile, and which has been supposed to be the name with Thebes. Whitby Com. vol. ii. p. 751. Imperial Greek medals have been struck in this city in honour of several of the Roman emperors. The medals are bronze, gold and silver. This city was formerly famous for trade and shipping; but is now called La Adramyttia, and inhabited only by a few Greek fishermen. The Adramyttian-bay was a part of the Egyptian sea, on the coast of Mycia: the towns on the north-east of this bay are now in ruins. The Comnentus Adramyttinus was the eighth in order of the conventus juridici of Asia.

ADRANA, a river of Germany, now the Elder, rises in Upper Helf, waters the county of Waldeck and Lower Helf, and falls into the Fulda about two miles from Caffel. When Germanicus, at the head of the Roman legions, ravaged the country of the Catii, most of their youth escaped by swimming over this river; and attempted, though without success, to prevent the Romans from laying a bridge over it. Tacitus Annal. i. c. 55. vol. i. p. 105. Ed. Gronov.

ADRANA, or Adrena, (Polybius, lib. xiii. p. 983. Ed. Cafrabus.) a city of Thrace, situate a little above Beumae.

Adrana was also a town of Asia Minor, in the Lower Mycia.

ADRAND, in Geography, a town of Persia, in the province of Irak; ten leagues east of Amadan.

ADRANIS, Drantis, or Adrains, in Ancient Geography, a town of Pannonia, in the more extended application of the term, situate in Noricum, north-east of Aquino, in the limits of Carnia and Noricum.

ADRANUM, now Aderno, a town of Sicily at the foot of Mount Atna, towards the north-east, near a river formerly bearing the name, which some now ascribe to it, Fiume d' Aderno. This city was built, says Diodorus Siculus (lib. xiv. c. 37. tom. i. p. 671. Ed. Weffel.) by Dionysius the elder, and so called from the Temple of Adrannus, the tutelary god of the Sicilians, and said by Heleftius to be the father of the Divi patrictii. This temple was a place of great resort at the last days of the year by the worshipers of this deity; and Adran (de Nat. Anim. lib. xi. c. 3. tom. ii. p. 632. Ed. Gronov.) says, that a thousand dogs were kept here, who fawned on those who brought presents to the temple, and conducted drunken perons to their own houses, whilst they fell furiously on thieves, and tore them in pieces. The medals of this city are bronze, gold and silver.

ADRAPSIA, a town of Bactria, mentioned by Strabo, (lib. xv. tom. 2. p. 1055.) but placed by Ptolemy in Hyrcania, beyond the river Mazera. It is also called Darapso, and seems to be that mentioned by Arrian (lib. iii. c. 29.) under the name of Daphase.

ADRASDIUS, an episcopal see in the patriarchate of Antioch, and the eighteenth under the metropolis of Seleucia.

ADRASTE, in Mythology, the daughter of Jupiter and Nepelleis, who, according to Plutarch, was the only fury that exercised the vengeance of the gods. The name is supposed to be derived either from adra, always active, or from a priv. and dappa, I fly. The Egyptian priests placed Adraite above the moon, where she observed the whole world, so that no guilty person escaped. See Nemesis. Adrailus, or Adrales, was the goddess of war and victory, among the ancient Britons; and as such invoked and acknowledged. This deity was probably the same with the Astarte of the Phœnicians. Dion. C. a. i. c. 1007. Ed. Reimari.

Adraste was also one of the nymphs who nured Jupiter in the cave of Dile.

ADRASTIA, or Drastea, an epithet given to the goddess Nemesis, or Revenge. It is said to be taken from king Adratus, who first erected a temple to that deity.

ADRASIA, in Ancient Geography, the name of a town of Asia, in the Troade, situate between Priapus and Parium, in a district of the same name, in which was an oracle of Apollo Ædneus, and of Diana. It was built by king Adratus. Strabo Geog. lib. xiii. tom. 2. p. 848.

ADRASIA Ceratania, in Antiquity, a kind of Pythian games, instituted by Adratus, king of Argos, A. M. 2760, in honour of Apollo at Sicyon. There are to be distinguished from the Pythian games celebrated at Delphi.

ADRASTUS, in Ancient History, a king of Argos, who distinguished himself in the famous war of Thebes, was the son of Talanus and Lydianassa, daughter of Polypus king of Sicyon. He reigned first in Sicyon, as successor to his father-in-law, and afterwards at Argos. Here he married his two daughters to Polynices and Tydeus, who took refuge in his court; the former of whom had been deprived by his brother Eteocles of his share of the sovereignty of Thebes. For the purpose of restoring him, this king, with five others, chiefly of his kindred, marched against Thebes; and this was called the expedition of the seven worthies, which is placed about 1225 years before Christ, and has been celebrated by the poets. Adratus alone escaped, being preferred by his house Arion. See Statius Theb. lib. iv. v. 40, &c. p. 312. Ed. Varior. This war was revived within ten years by the sons of the deceased worthies, and called the war of the Epigones. It terminated with the taking of Thebes. Adratus on this occasion left his son Ægeas, and was so distressed by the event, that he died of grief at Megara, as he was conducting home his victorious army. His memory was much honoured at Megara and at Sicyon.
Spartian, and inscribed name to E. but the De is 35.) feigned and, the a ordinary alleging, the Roman honour Dionyf. considérable, the bounds and have to 173. 16. philofopliy rcqueft death was Roman he lived of Adria, correct. Itinerary ADRIA, of ADRIAN, and ADRIANUS, in Ancient Geography, belonged to Iauria, and the metros of Selucia. ADRAZZO. See Ajaccio. ADRESTES, a people of India, subdued by Alexander. See Quintus Curtius, lib. viii. n. 9. ADRIA, or HANDRIA, in African Geography, of two towns in Italy; one of them was situated in the country of the Veneti, on the river Tartarus, or Adri, between the Pado and the Atheis, and was called ATRIUS by Ptolomey, and also by Pliny, (lib. iii. c. 16. tom. i. p. 173. Ed. Hard.) but denominated Adria by Strabo (lib. i. p. 82. — lib. ii. p. 168.—lib. v. p. 528.) the other was in the country of the Piceni, on the river Vomannus, to which Antonine's Itinerary from Rome is directed, and which was the country of the ancestors of the emperor Adrian. This is now the dukedom of ATRI, in Abruzzo. It has been a subject of dispute which of these two places gives its name to the Adriatic sea. The etymology is generally deduced from the Venetian Adria; and it is alleged, that the name is retained in the small town, that was destroyed by inundations and other calamities, now called Adria, which is a bishop's see, twenty-five miles south-west of Venice. N. lat. 45° 8'. E. long. 12° 5'. Aurelius Victor deduces the name from the Hadria of the Piceni. If this be the true derivation, the application should be Hadria, because the name of the emperor is inscribed on coins and stones Hadriana. But if the origin of the name is traced to the Venetian Adria, which is the most ancient, and of which the other is merely a colony, the usual application is the most correct. Euphratius in Dionys. v. 92. traces it to Adria, the son of Iao. ADRIA, an archi-episcopal city, in the patriarchate of Jerusalem. St. Jerome mentions a small island of this name. ADRIA, JEAN JACQUES, of Mazara, in Sicily, graduated at Salernum, in 1710, and acquired such reputation for his skill in medicine, that he was made physician to the emperor Charles the Fifth, and appointed proto-medicus of Sicily. He left in manuscript the following: "De prefer-vatione pedilhente." "De medicinis ad varias morbis." "De phlébotomia, dedicated to the emperor." "De balneis Siculis." ADRIAN, or HADRIAN, Publius ÆLIUS, the Roman emperor, was born, according to Spartan, (in Adri. p. 1—3.) in Rome, on the 24th of January, in the 76th year of the Christian era, A. U. C. 829. His ancestors lived at Halica, in Spain, which was the native city of Adrian, whom he succeeded in the empire, and whose name on that occasion he affumed in addition to his own. At the death of his father, when he was ten years of age, he was left under the guardianship of Trajan and Caius' Patrons, or Attianus, a Roman knight. His proficiency in the Greek language was so considerable, that, at the age of fifteen, he was commonly called the young Grecian. When Trajan was adopted by Nerva, Adrian served as a tribune in the army in Lower Media, and was deputed to congratulate his guardian on the event; and when Nerva died, he was the first that communicated the news to Trajan, who was then in Lower Germany, and that saluted him as emperor. Trajan, however, conceived prejudices against him, on account of the levity of his mind, the suspicion and jealousy of his temper, and the extravagance to which he was addicted; and though he manifested a tedious disposition, and made great acquisitions in Greek and Latin, in philosophy and the law, Trajan had not been accustomed to estimate these endowments very highly, nor did he form any flattering expectation of the advantages that were likely to accrue from them in the military profession, and in the extension of empire, to which he was devoted. Adrian perceived that he was not a favourite; and therefore endeavoured to conciliate the favour of the empress Plotina, by an affability of attention, which, as Dion Cassius intimates, by the expression ò ò ράλλη; ADRASSO, (tom. ii. p. 1149. Ed. Reim) seems to have triumphed the bounds of virtue. However, Adrian succeeded in securing the interest of the empress, and by her means, in obtaining the emperor's grand-niece, and next heir, Sabina, for his wife. This was the first step to his future advancement, and facilitated his ascent to the throne, much more than the assurance of the Marian astrologer, that the sovereign power was destined to him by the fates, or the prediction to the same purpose of his great uncle Ælius Adrianus. Soon after his marriage he was appointed quaestor; and at the expiration of this office, he was employed in digetting the deliberations of the senate; but he soon surrendered this occupation, and followed Trajan to the war against the Dacians. Trajan having left his army in Syria, and proposing to return to Rome, after a variety of extensive and rapid conquests, gave the command of it to Adrian; but he had neither capacity nor zeal for retaining, much less for enlarging, the emperor's conquests. The conqueror's absence was the loss of all the advantages he had gained. His death at the same time was gradually approaching, and opened prospects of ambition to Adrian, of which he was devoured of availing himself. He had already been quaestor, in the year of Rome 852; tribune of the people in 856, prætor in 858, sublimated consul in 860, and consul in ordinary and commander in chief in the last year of Trajan's reign. He had also accompanied Trajan in most of his expeditions, had the command of a legion in the second Dacian war, and obtained for his valiant conduct a present from the emperor of the diamond which Nerva had given him, which he considered as a pledge of his future adoption. In the interval between his praetorship and consulship, he had been governor of Lower Pannonia, and discharged the duties of his various offices with universal satisfaction. Trajan, however, never loved Adrian, nor did he intend to adopt him. Accordingly, Dion Cassius affirms, (tom. ii. p. 1149.) that he never was adopted. Nevertheless he succeeds him in virtue of a feigned adoption. Upon the emperor's death at Selinontum, in Cilicia, in his way to Rome, Plotina, affiured by Trajan, who had been preceptor to Adrian in the youth, contrived to send notice to the Senate, that Trajan, whom she had attended at the time of his death, had adopted Adrian; and, it is said, that she concealed a man, who perforated the dying emperor, and who with a feeble voice, declared that he adopted Adrian. This is certain, that Adrian, who was then at Antioch, received the news of his adoption on the 5th of August, and that of Trajan's death on the 9th. On this day, in the year 117, (A. U. C. 879, or according to Crever, who follows Tlle-ment, 868.) he was proclaimed emperor by the legions of Syria, and immediately wrote to the Senate to requell a confirmation of the act of the soldiery; apologizing, at the same time, for the impatience of the legions, forbidding them to bestow upon him any titles of honour without his previous consent, promising that he would direct his government.
ment to the public good, and binding himself by an oath, never to put a senator to death. The Senate very readily acceded to his request, and confirmed him in the empire to which he was elected. Adrian had now an opportunity of indulging that love of peace to which he was naturally inclined. Accordingly he abandoned the conquests of his predecessor in the east, and having withdrawn his troops from Armenia, Asia, and Mesopotamia, he agreed that the Emperors should again be the boundary and barrier of the Roman empire. He determined also to surrender Dacia, but his friends prevailed with him to retain it for the sake of those Roman citizens who had settled in it. However, he demolished the bridges which Trajan had erected over the Danube, under the pretence of guarding the Roman territories from the invasions of the barbarians. In order to reduce the Jews to absolute subjection, he removed Lucius Quietus, whom Trajan had commissioned for this purpose, and whom he had made governor of Palestine, from his government, and appointed his friend Marcus Turbon to succeed him; and he was also employed to quell the disturbances in Mauritania, which the removal of Lucius had probably occasioned. After having secured the tranquillity of Dacia, by making peace with the Sarmatians and Roxolani, which he endeavoured to render permanent in the following year by pecuniary donatives, granted also as the purchase of peace to other barbarous nations, he hastened to return to Rome; but did not arrive there till the year 118. During his voyage from Illyria, a conspiracy was formed against his life by four persons of confederacy, viz. Domitius Nigrinus, Lucius Quietus, Palma, and Celsus, who were put to death by order of the Senate. This act, however, excited the public hatred against Adrian. It was different from the conduct of his predecessor; and it was considered as a violation of the oath which he had made on his accession to the empire. To remove these ill impressions from the public mind, he was liberal in his donatives to the people. He remitted the debt due from cities and individuals to the imperial revenue, and to the public treasury, which is said to have amounted to seven millions of our money, and burnt all the records which might afterwards serve to revive these claims. With a reference to this act of generosity, Adrian is represented on one of the medals, which has reached our times, with a torch in his hand lighting fire to the bonds, with a legend, signifying "He enriches the whole world." He discharged Italy from the tax paid by victorious emperors for decorating their triumphs, and reduced the amount of it in the provinces: and besides making many presents of money, and various articles of subsistence and luxury to the Roman citizens, he increased the funds, appointed by Trajan, for the education of children of both sexes. The sum appropriated by Adrian to these several purposes was immense; and his liberality was honoured with a monument, consecrated to his memory, and with an inscription which celebrated him, as having thus exhibited a singular example of good-nature to the people. He likewise afforded in his attention to the Senate, and treated this body with a degree of deference and respect, which tended to remove the prejudices that had been conceived against him, and to engage their affectionate attachment. He affilled those senators who were poor; he enabled others to defray the charge of their offices; and he granted the honour of a third consulship to those who desired it. Upon his return to Rome, he was received by all ranks of people with extraordinary demonstrations of joy; but he declined accepting the triumph which had been prepared for Trajan, and which was now decreed by the Senate to the new emperor. He had already on his accession refused the offer that had been made to him of the title of father of his country, and deferred the acceptance of it, after the example of Augustus, who had not taken it till he had governed a certain number of years.

In the following year Adrian was consul a third time, but he resigned the fasces after four months, and never afterwards returned them. Having taken measures for establishing his power at home, he was under a necessity of leaving Rome, in order to check the incursions of the barbarians who invaded Illyricum. The war was soon terminated; and Marcus Turbon, who was recalled from Mauritania, was appointed governor of Dalmatia and Dacia. Towards the close of this year the emperor went into Campania, where he generously relieved the poor inhabitants of all the cities through which he passed. About this time he conceived a design of visiting all the provinces of the empire, and examining for himself the state of each country subject to Rome, that he might not be obliged to depend entirely on the reports of his ministers and governors; alleging, that an emperor ought to refresh the army, which extends illumination to all the regions of the earth. Accordingly he began his travels in the third or fourth year of his reign; that is, in the 12th or 13th year of the Christian era, A. D. 87, according to Tillymont. He first visited Gaul, where he displayed great liberality; and from thence he went into Germany, where the chief army of the empire was stationed, and the discipline of which he revived and established. In the following year he passed over into Britain, where he reformed many abuses. Although the greatest part of the island was subject to Rome, the northern nations, after the departure of Agricola, had revolted, and recovered their ancient liberty. Adrian, without entering into any new contest, propounded merely to secure the southern part, which belonged to the Roman empire, against the incursions of the warlike Caledonians; and, with this view, he caused a rampart, or wall, to be raised, extending from the Solway Firth on the west, to the mouth of the river Tweed, near Newcastile, on the east, about eighty miles in length. In other places he supplied the defect of natural barriers by mounds of earth strengthened by flakes driven into the ground. Here he also disgraced and discharged his secretary, Suetonius Tranquillus, the historian, and Septicius Clarus, captain of the pretorian guards, for their disrespectful behaviour to the emperor Sabina. Upon his return to Gaul, he built at Nimes a magnificent palace in honour of Plotina, the widow of Trajan. From Gaul he proceeded to Spain, and wintered at Tarracon, where he rebuilt the temple of Augustus, founded by Tiberius, and held a general assembly of the states, in order to compose the differences occasioned by raising levies for the Roman armies. Here a slave, in a fit of insanity, attempted to kill him; but he happily escaped, and committing the unhappy maniac to medical care, took no further notice of the affair. From Spain the emperor returned to Rome in April; and towards the end of this year, or the beginning of the next, he went, as some say, to Mauritania, and afterwards to Athens, where he built a bridge over the Cephissus; from Athens he proceeded to the extremities of the Roman empire in the east; and after having quieted the commotions of the Parthians, he returned through Asia, visiting the several provinces, and erecting edifices in several of their chief cities; and having passed through the islands of the Archipelago, he settled at Athens during the winter, and was there initiated into the Eleusinian mysteries. From Athens he went into Sicily to visit the top of Mount Etna; that he might observe the rising sun, which was said there to exhibit all the colours of the rainbow; and returned to Rome in the beginning
beginning of the following year, or the seventh year after his departure. The 11th and 12th years of Adrian's reign are quite barren of events. In the year 139 or 140, the cities of Nicomedia, Castra, and Nicaea, in Bithynia, were almost demolished by an earthquake, and they were rebuilt at the expense of the emperor, who was on this account denominated the restorer of Bithynia. In the course of this year he again departed for Africa; where, after a drought of five years, it rained upon his arrival, and the inhabitants, who received many favours from the emperor, ascribed the blessing to his presence. From Africa, he retired in the same year to Rome, where he caused the obsequies of Plotina to be performed with extraordinary magnificence. He lamented her death with great sorrow, composed verses in her praise, and caused her to be ranked among the gods. In the year 151, he left Rome with a design to revisit the provinces of the East, and passing through Athens, pursued his journey into Asia, where he consecrated several temples. From Asia he passed into Syria, from thence into Palæstine and Arabia, and afterwards into Egypt, in the fourteenth year of his reign, when the famous colossus of Rhodes shook, according to the Alexandrian chronicle. During this, and the following year, he continued in Egypt. At Pelusium he visited the tomb of Ptolemy the Great, which he repaired; he also repaired the city of Alexandria, and restored their ancient privileges to the Alexandrians, whose disposition and character he disliked, and who replenished his kindness with violent lampoons after his departure. From Egypt he passed into Libya Cyrenaica, where he killed a lion of enormous size, that had committed many depredations in the country. During his stay in Egypt, the youth Antoninus, to whom Adrian was criminally attached, fell into the Nile, and was drowned. Dion Cassius says, (tom. ii. p. 1162. Ed. Reim.) that he was facciated by Adrian, who being addicted to magic, conceived that he should prolong his life by sacrificing a human victim to the infernal gods. In the following year Adrian returned to Syria, and having passed through Thrace and Macedonia, he continued for some time at Athens. During his residence at Athens, the Jews revolted on occasion of the emperor's sending a Roman colony to Jerusalem, calling the city Aelia Capitolina, after the name of his family, and erecting a temple to Jupiter Capitolinus in the place where the ancient temple stood. The war with the Jews was attended by the invasion of the provinces of the empire by the Abani, or Malłączi, a people of Sarmatia. At Athens Adrian was much pleased with the customs and learning of the people. Here he affirmed the habit peculiar to the dignity of Areopag, celebrated the grand festival of Bacchus, and embellished it with many stately buildings, and particularly with a library of astonishing structure; infomuch, that he was revered as the second founder of the city, and one quarter of it was from him called Adrianopolis. In the year 153, the emperor left Athens and returned to Rome. Here he fell into a lingering disease, attended with a bleeding at the nose, which terminated in a dropy. Adrian, contrary to the universal expectation, and the remonstrance of his friends, adopted Commodus Verus, who was created pretor, appointed governor of Pannonia, and in the following year advanced to the confal-ship. The emperor retired to Tibur, now Tivoli, where he erected a magnificent villa; but his disorder increasing, and being aggravated by his licentious mode of living, he indulged his natural cruelty, and caused many illustrious persons to be arraigned and executed, and others to be privatey murdered. In the beginning of the year 158, Verus died, and was ranked by Adrian among the gods, and temples were built and statues erected to his memory by the orders of the emperor. Upon his death, Titus Antoninus was adopted; and after his adoption the emperor Sabina died, supposed to be poisoned by Adrian, or so ill used, that the said violent hands on herself. Adrian, however, caused her to be ranked among the gods. The emperor's impatience increas'd with his disorder, and having put several senators to death, and ordered others for execution, whom Antoninus preferred, he attempted to destroy himself, but was prevented by Antoninus from executing his purpose. At length he removed from Rome to Pisa, in Campania, where he hastened his death by his intemperance; and here he died, on the 16th of July, in the year 159, after having lived 62 years, 5 months, and 17 days, and having reigned 25 years and 11 months. His body was burnt at Puteoli, and his ashes were conveyed to Rome, where they were deposited in the magnificent mausoleum, which he had constructed for himself near the Tiber. The Senate intended to annul all his acts, but Antoninus opposed this measure; caused him to be deified, built a temple at Puteoli, and instituted annual sports to his honour, with præsides, fraternities, and victims. No prince ever created so many public and private edifices as Adrian. The regulations which he established for the maintenance of discipline among the troops were afterwards regarded as the military laws of the Romans, and many of the laws which he enacted were observed till the end of the fourth century. He prohibited all those private work-houses, which were inhabited by slaves and wretches; and he was not only a man of learning himself, but he encouraged literature and science. Many of his works, both in prose and verse, were published under his own name, and the names of other distinguished persons. His Greek poem, called the Alexandræis, has been quoted by some of the ancients. In his Catecismus, mentioned by Spartan, he pretended to imitate Antinachus, whom he preferred to Homer. He was so ambitious of fame, that he wrote his own life in several books, some fragments of which are still extant. His reign was distinguished in the history of literature, by a very considerable number of learned men, among whom we may reckon Philostratus, Favorinus, Epictetus, Arrian, Plutarch, Dionysius of Halicarnassus, Philo of Byblos, Suetonius, and Florus.

Adrian's reputation for talents and learning has been universally allowed. His memory was so retentive, that he could repeat a whole book, after having once perused it; and he knew the name of every soldier in his army. He excelled in every branch of learning, and was, without doubt, the best orator, poet, grammarian, philosopher, and mathematician of his time. He was eminent for drawing and painting, and for his skill in the theory and practice of music. He used at the same time to write, dictate to several secretaries, give audience to his ministers, and discourse with them about affairs of the greatest importance: and his court was crowded with men distinguished in every branch of literature and science. In his natural disposition he was fulsome, envious, lascivious, and cruel; and his general character exhibited a strange composition of virtues and vices. To his friends he was courteous and affable, and his liberality was unbounded. But he was ever ready to give ear to flatterers, and to believe every tale that was whispered against him, so that those who were once most distinguished by his favour were disgraced, banished, and put to death. Capricious and unsteady in his attachment, and violent in his resentment, he was displeased by his friends, and dreaded by his enemies. Nevertheless, the great and the rich did not suffer under his government from unjust condemnations and forfeitures. He knew how to pardon offences;
offences; and those who had been his enemies when he was in a private station, had no occasion to fear him when he was an emperor. When he arrived at the sovereign power, he fell to one of those from whom he had received the most convincing proofs of his hatred, "Behold yourself in perfect safety." His vanity, however, was always predominant; and he was often induced, by the fear of infamy, or the desire of applause, to preserve at least the appearances of virtue. In his plans of public improvement, he was comprehensive and liberal, even to the extreme of needless magnificence and culpable profusion. There was scarce a province, or a city, in which he did not leave substantial proofs of his attention to the benefit and convenience of its inhabitants. He repaired old edifices, and built new ones, baths, aqueducts, and harbours: and he expended large sums in embellishing the monuments of those who had distinguished themselves in former times, as in the case of Epaminondas's tomb at Mantinea; and in the honour he paid to Pompey's remains. To Greece he was particularly favourable; and from the Greeks he received many expressions of gratitude. And yet dilapidated and extravagant as he was in his private expenses, and in his public disbursements, he is said never to have unjustly seized any man's property, nor did he ever receive legacies from persons who were not known to him, or from any of his friends who had children.

In his voyages, when he was at any city, he administered justice to all who applied to him, or sought the assistance of the ablest lawyers. Adrian, indeed, devotes to be particularly recognized for the administration of justice, and the wisdom of his laws, for establishing and maintaining peace among the citizens. He considered the termination of disputes, by equitable decisions, as one of the principal duties of a sovereign, and he was averse to discharging it. His zeal for justice and good order led him to keep a strict eye over those who governed provinces under his authority; and he knew how to discover truth through all the arts of dissimulation. At Rome he made a very important reformation in the administration of justice. See Perpetual Edict.

He softened the rigour of servitude, and deprived matters of the arbitrary power of life and death over their slaves: he prohibited the sale of them, and their being rendered, according to their sex, victims of profition, or gladiators, without the authority of the judge; and he forbade the use of private prisons. From an attention to decency, he likewise prohibited the promiscuous use of baths for both sexes. He is also said to have renewed the ancient customary laws enacted by Augustus; and he forbade the abominable custom of human sacrifices, though in the case of Antonius he seems to have violated his own law. He punished fraudulent bankrupts with severity, and ordered them to be whipped. He reformed the police in many instances with judgment; and the alterations he introduced in the general conduct of the empire, in the service of the palace, in the military discipline, and in the government of the empire, was confirmed by practice, and continued even to the reign of Constatine. To his soldiers he set an example of simplicity and self-denial; and by his attention to them in various respects, he gained their love and confidence. He preferred none but men of courage, strength, and good character, saying, "such as the officers are, such will the soldiers soon be." Thus "he revived the ancient military discipline, which, by the negligence of many princes, had been decaying since the time of Augustus. It may be observed in general, that the Roman empire was happy under his government. The maxim which he inculcated in the assembly of the people, and in the senate, deserves to be recorded. "I propose to myself (say he) to govern the commonwealth, as to a thing I never forget it is not my own property, and that I am no more than administrator for the public." Adrian's government would have been praised, if he had succeeded the Antonians, but it was his misfortune to have Nero and Trajan for his predecessors, and for his successors Antoninus and Marcus Aurelius.

Adrian appears to have been too much addicted to every kind of superstition. He was fond of the Greek worship, and paid little attention to the religion of those nations whom the Romans and Greeks considered as barbarians; and therefore the temple, in which he is said to have erected in honour of Jesus Christ, were intended either for himself, and for his own proper worship, or in conformity to the doctrine of Numina Pythagorae, as places where the gods might be worshipped without images. The Christians he considered as enemies to the idolatrous worship of his gods; yet it is thought, that upon the whole he was moderate to them, more especially when it is considered how much the populace, infligated by the prides, wishes and endeavours to destroy them. Eutychius has preserved a report, which orders that they should be regularly prosecuted, and condemned if convicted of a breach of the law; but, on the other hand, if the charge brought against them should not be proved, their accusers should be punished. The moderation of this edict has been ascribed by some to the admirable apologies of Quadratus and Artilides in favour of the Christians. Adrian's conduct to the Jews was very rigorous, though their repeated insurrections and rebellion might furnish some apology for his severity. He forbade them even the sight of Jerusalem, into which they were not permitted to enter, except in one day of the year, which was the anniversary of the destruction of the city. He sent a Roman colony into the holy city, and called it Augusta Capitolina, that it might bear his family name, and that of Jupiter, to whom he had erected a temple in the place where that of the true God stood. He studiously profaned all the places which had been most revered by the Jews, with buildings set apart for the worship of idols: he placed a hog of marble upon the gate of the city which led towards Bethlehem; he erected in the place where Jesus was crucified, a statue of Venus; and in that where he arose from the dead, a statue of Jupiter; and in the grottos at Bethlehelm, where our Saviour was born, he established the worship of Adonis.

In this prince, says Creller, there centered very opposite qualities: he was gay and grave, generous and avaricious, impetuous and circumspect, frugal even to avarice and liberal, cruel and merciful. It is difficult to make an entire piece of such discordant parts: but we shall not be mistaken, if we consider his vices as real, his virtues as fictitious. Political interest and vanity were the principles of all the good he did; and these motives, united with an uncommon genius, improved with the most useful parts of knowledge, were sufficient to render him a prince whose government was for the good of the people in general, whilst his personal conduct made him a scourge to those who were near him.

The following verses addressed to his soul, which he composed, and uttered not long before he expired, express, amid great doubts and uncertainty, some general apprehensions concerning a future state.

Animula, vagula, blandula,
Hortes, conciue corporis,
Que nunc abibis in loca
Palladue, rigidis, undula?
Nec ut folcis, dabis jocos.

Poor
ADR

Poor little, pretty flattering thing,
Milt we no longer live together?
And dost thou prune thy trembling wing,
To take thy flight thou know’st not whither?
Thy humorous vein, thy pleasing folly,
Lies all neglected, all forgot:
And penitent, wav’ring, melancholy,
Thou dread’st and hope’st, thou knowst not what.

Prior.

Ah! fleeting spirit! wand’ring fire,
That long haft warm’d my tender breast,
Milt thou no more this frame inspire?
No more a pleasing charming guest!
Whither, ah, whither art thou flying?
To what dark undiscovered shore?
Thou seem’st all trembling, wav’ring, dying,
And wit and humour are no more!

Adrian I. Pope, succeeded Stephen III. in the papal chair, A. D. 772. He was the son of Theodore, a Roman nobleman, and possessed considerable talents for business. He maintained a steady attachment to Charlemagne, which provoked Dafidarius, king of the Lombards, to invade the state of Ravenna, and to threaten Rome itself. Charlemagne recomposed his attachment, by marching with a large army to his succour; and having gained many considerable advantages over Dafidarius, and recovered the cities which he had taken, he visited the pope at Rome, confirming the grants made by his father Pepin, to which he added new donations, and formed a perpetual league of friendship between the growing power of France and the established supremacy of the Western Church. On this occasion he expressed his piety, by the humiliating ceremony of killing each of the fies, as he ascended to the church of St. Peter. Pavia, during this visit, had been left in a state of siege; on his return it surrendered, and the dynasty of the Lombard princes, which had lasted 206 years, was terminated in the year 776. When fresh disturbances occurred by the interference of the bishop of Ravenna, who claimed and seized the exarchate and the dukedom of Ferrara, which Charlemagne had restored to the pope; this prince renewed his visit, and settled the affairs of Italy. In return for these services, he obtained the title of king of the Lombards, and the rights of temporal sovereignty in the territory of the Roman see. Adrian now directed his attention to the affairs of the church: and as Irmen, who, in 783, assumed the regency at Constantinople, during the minority of her son Constantine, wished to restore and establish the worship of images, the applied to Adrian for his concurrence. The pontiff readily acquiesced in her proposal for calling a council, and commissioned two legates to attend it. The council, however, which held its first meeting in 786, was disturbed by an insurrection of the citizens. At the next meeting in the city of Nica, in 787, which was protected by a military force, a decree was passed for restoring the worship of images. Adrian approved the decree, but in the western church it was deemed heretical and dangerous. Charlemagne condemned the innovation, and the French and English clergy concurred in opposing it. A treatise, containing 120 heads of refutation, was circulated, as the work of Charlemagne, under the title of "The Caroline Books," in opposition to the decree of the council. This work was presented to the pope by the king’s ambassador, and the pope wrote a letter to Charlemagne by way of reply. The king, and also the Gallican and English churches, retained their sentiments; and, in 794, a council was held at Frankfort on the Maine, consisting of about 300 western bishops, by which every kind of image-worship was condemned. Adrian did not live to see a termination of this contest; for after a pontificate of nearly twenty-four years, he died in 795. This pope does not appear to have possessed any considerable erudition, and few examples occur, during his pontificate, of ecclesiastical reformation. He seems to have directed his chief attention to the embellishment of the churches, and the improvement of the city of Rome; and he was probably furnished by Charlemagne, out of the plunder of his conquests, with ample means for this purpose. The king was much attached to him, and is said to have shed tears on occasion of his death. He wrote his epistle, which is still seen in St. Peter’s at Rome, in thirty-eight Latin verses. Dupin, vol. v. p. 115. Bower, Gen. Biog.

Adrian II. Pope, succeeded Nicholas I. A.D. 867.

Having twice refused the dignity, he accepted it in the 78th year of his age, at the united request of the clergy, nobility, and people. The contest for power between the Greek and Latin churches had been very violent some years before his accession to the papal chair. Photius, who, in 858, had been appointed patriarch of Constantinople by the emperor Michael, had been excommunicated by pope Nicholas I., in a council assembled at Rome in 862; and the pope himself had been, in 866, excommunicated by Photius. The pope, in order to avenge the injuries which Ignatius, who had been deprived of the patriarchate and exiled, demanded the restitution of several Greek provinces, which the patriarch of Constantinople had separated from the jurisdiction of the Roman pontiff. Basil, the new emperor, recalled Ignatius to the dignity of patriarch, and excommunicated Photius in a monitory. The restoration of Ignatius was approved by a council held at Constantinople, in 869; and by the decree of this council, the disputes between the Greek and Latin churches were suspended. But circumstances occurred which served to revive them. The Bulgarians had applied to this council for information, whether they should be subject to the church of Rome, or that of Constantinople. The council which this question produced, terminated in favour of the patriarchate; and Ignatius expelled the Latin missionaries from Bulgaria, and appointed Greeks in their room.

Adrian, during this contest for power with the eastern patriarch, was extending his authority over the kings and princes of the west. He employed his whole interest to induce Charles the Bald, who had taken possession of the kingdom of Lorraine, and who had been crowned at Rheims by the archbishop Hincmar, to relinquish it in favour of the emperor; and he even went legates to the king, after having attempted to engage Hincmar, the clergy, and the nobility to dexter him, ordering him to surrender to the emperor’s right. The king was invincible; and the pope was obliged to give up the contest. He also far further interfered in the concerns of princes, by taking Charles’s rebellious son Carloman, and the younger Hincmar, bishop of Lzon, under the protection of the Roman see. He proceeded in this business so far, that he was under a necessity of submitting without gaining his point. Bulgaria again claimed his attention, and he wished to restore the jurisdiction of it to the see of Rome. But death terminated his ambitious projects and his life of inquietude, A. D. 872, after a pontificate of five years. Dupin’s Ninth Century, vol. vii. p. 179. Molheim’s Eccl. Hist. vol. ii. p. 354, &c. 8vo.
ADRIAN III. Pope, succeeded Marinus, A.D. 884.

This pope, desirous of emancipating Italy and the papal see from their dependence upon the emperor of Germany, palied a decree, that, if Charles should die without male issue, the title of emperor should be belloved only on natives of Italy, and that the authority of the emperor should be disregarded in the creation of a pope. Basil attempted to persuade Adrian to annul the excommunication of his predecessor against Photius, but did not succeed. The pope died in his way to the diet at Worms, in 885. Bower.

ADRIAN IV. Pope, the only Englishman who ever had the honour to sit in St. Peter's chair. His name was Nicholas de Breuil, or Breuil; and he was born towards the close of the eleventh century, at Langley, near St. Alban's, in Hertfordshire. His father, being poor, and having assumed the habit of the monastery of St. Alban's, was unable to provide for him. Being refused the habit for which he applied, he went to Paris, where he was distinguished both by his application and proficiency. From Paris he removed to the monastery of St. Rufus, in Provence; here he became a regular clerk; and upon the death of the abbot in 1157, he was chosen superior of that house, which he rebuilt. Of this dignity he was deprived in consequence of the complaints and accusations of the monks, who were dissatisfied with the government of a foreigner: but pope Eugenius III., having heard their charges, and his defence, declared him innocent, and advanced him, in 1164, to the higher situation of cardinal bishop of Alba. In 1168 he was sent as apostolical legate, to Denmark and Norway, where, by his diligent instruction, he converted those barbarous nations to the Christian faith; and it is said that he erected the church at Uppsala into an archi-episcopal see. Upon his return to Rome, he was much honoured by the pope and cardinals; and on the death of pope Anacletus, who had succeeded Eugenius, he was unanimously chosen to the papal chair in November 1154, and assumed the name of Adrian. As soon as the news of his promotion reached England, Henry II. sent a deputation of an abbot and three bishops to congratulate him on his election; and upon this occasion he granted considerable privileges to the monastery of St. Albans. But he refused the valuable presents which they offered him, saying jocosely, "I will not accept your gifts, because, when I wished to take the habit of your monastery, you refused me." To which the abbot pertinently and sharply replied; "It was not for us to oppose the will of Providence, which had defined you for greater things." In the next year he gave Henry leave to undertake the conquest of Ireland, and sent him a bull for that purpose, in which he testifies his approbation of the object of the expedition, and the enlargement of the Christian church, and commands the people of that country to acknowledge him as their sovereign lord. He reminds the king, at the same time, of the rights of the Christian church; claiming all the islands which embraced Christianness, as St. Peter's right, and belonging to the holy Roman church; and exhorting to the regular payment of the Peter pence which he had promised. He admonishes him also to use his endeavours for reforming the manners of the people, and to commit the government of the churches to able and virtuous persons, so that he might thus deserve an everlasting reward in heaven, and transmit a glorious name to posterity. Adrian's indulgence to this prince was so great, that he consented to absolve him from the oath he had taken, not to set aside any part of his father's will.

In the beginning of his pontificate he constrained the magistrates of Rome to abdicate the authority they had assumed in their efforts to recover the ancient liberty of the people under the emperors, and to leave the government of the city to the pope. In 1155 he drove the heretic Arnold of Brescia, and his followers, from Rome. He also excommunicated William king of Sicily, who ravaged the territories of the church, and abdosed his subjects from their allegiance. In his interview with Frederick king of the Romans, with whom he concluded a peace when he invaded Italy, this prince condescended to hold his presence whilst he mounted his horse; in consequence of which Adrian conducted him to Rome, and placed the imperial crown on his head in St. Peter's church, to the great mortification of the Roman people, who affixed tumultuously and killed several of the imperialists. The Sicilian king, having taken an oath not to prejudice the church, was honoured by Adrian, in 1156, with the title of the King of the Two Sicilies. This pope built and fortified several castles, and left the papal dominions in a more powerful and flourishing condition than he found them. However, he complained of the disquietudes attendant on his high station; and in a letter to his old friend John of Salisbury, he says, that St. Peter's chair was the most meanly seat in the world, and that his crown seemed to be clapped burning on his head. He died, September 1, 1159, in the fourth year and tenth month of his pontificate, and was buried in St. Peter's church, near the tomb of his predecessor Eugenius.

Dr. Croke informs us, that he allowed his mother to be maintained by the alms of the church of Canterbury. There are extant several letters written by pope Adrian, and some homilies. Dig. Brit.

ADRIAN V. Pope, a Genoese, whose name was Ottoboni Fieschi, succeeded Innocent V. A. D. 1276. He was created by his uncle Innocent IV. cardinal deacon of St. Adrian, and in 1255 sent by him to England, to settle the disputes between Henry III. and his barons; and he was employed again for the same purpose, by Clement III. when he inflicted a sentence of excommunication against the king's enemies. To those who congratulated him on his accession to the papal chair, he replied, "I wish you had found me a healthy cardinal, rather than a dying pope." Immediately after his election he went to Viterbo to meet the emperor Rudolphus, for the purpose of opposing the usurpation of Charles, king of the Two Sicilies; but died soon after his arrival, having enjoyed his dignity only thirty-eight days. He zealously encouraged the crusade to the Holy Land, and upon his election sent a large sum to Constantinople towards building galleys; and he also furnished further supplies. Bower.

ADRIAN VI. Pope, was a native of Utrecht, the son of a tallowyer, or, as some say, of a brewer's servant. He succeeded Leo X. A. D. 1522. He was educated gratuitously at Louvain, and distinguished himself by his application and proficiency. Through the intercess of Margaret, widow of the duke of Burgundy, and sister of Edward IV. of England, he obtained the professorship of divinity in Louvain, the deanery of the cathedral, and the vice-chancellorship of the university. Having been appointed tutor to Charles, the grandson of Maximilian, and the young prince preferring arms to letters, Adrian was employed by the emperor on an embassy to Ferdinand king of Spain, in consequence of which he obtained the bishopric of Tortosa. When Charles was left sole heir to the dominions of Ferdinand, he appointed Adrian regent during his minority; but as Cardinal Ximenes had been named for this office by Ferdinand, they both united, in the government of the country. Ximenes, however, was the real, and Adrian merely nominal regent. In 1517 the emperor Maximilian
Maximilian recommended Adrian to Leo X. and he was preferred by that pontiff to the dignity of cardinal. In a contest with the Castrulls, when he fulfilled the office of regent during the emperor's absence in 1520, he attempted to enforce submission, by military power, but failed in the attempt; and he was under a necessity of withdrawing his forces, and to content himself with the mere shadow of authority. He was in a little time, and in manner very unexpected, removed from this unpleasing situation, and advanced to the highest dignity of the church. Upon the death of Leo X. in 1521, the conclave was divided about the choice of a successor. The younger members were attached to Julius, Cardinal de Medicis, the nephew of Leo; but the old cardinals were averse from choosing a pontiff out of the powerful family of the Medicis, and yet they were not agreed in their views with respect to any other person. By a maneuver, which was merely designed to gain time, the party of Julius voted for Cardinal Adrian in the preparatory scrutiny. The other party closed with them; and thus a stranger to Italy, and a man unqualified for the office, was elected, no less to his own surprize than to the alienation of Europe. The election was probably the effect of intrigue, and of the secret interference of the imperial ambassador, John Manuel, who wished to obtain a pope devoted to his master's interest. See Robertson's Hist. Charles V. vol. ii. p. 210, &c. 8vo.

Adrian's disposition, and views, as well as his principles and manners, were ill adapted to the office, that had been thus devolved upon him. At the time of his election Rome was afflicted with a pellicence, its finances were exhausted, and literature and the arts required liberal and judicious patronage. In these disadvantageous circumstances did Adrian ascend the papal chair. However he entered on his office with the best intentions. He began by avoiding every kind of expensive parade, and by exhibiting an example of moderation and temperance, which tended to correct and reform the dissolute manners of the court and city. He discouraged the ambitious and selfish expectations of his own relations, he annulled many ordinances which the cardinals had enacted for their own benefit, and he abolished many offices which Leo had created for the gratification of his favourites. With this pope it was a ruling maxim, that men were made for places, and not places for men. He restored the duchy of Urbino to its lawful proprietor, and surrendered to the Duke of Ferrara several places of which he had been unjustly deprived. He also issued a bull, requiring Christian princes to content to a truce for three years, so that the Imperial, French, and English ambassadors at Rome might deliberate on terms of pacification. Whilst he demanded a zealous execution of the imperial edict against Luther and his followers; he declared a disposition to exercise his spiritual authority for the reformation of the church. Notwithstanding the just claims on respect which resulted from the pontiff's general conduct, his battles actions were misunderstood; his excommunication was called parimony, his plans of reform were imputed to unceaseful austerity, and his disinterested conduct to weakness and inexperience. His unpopularity was partly owing to his being a stranger in Italy, and to the attention which he paid to some of his former friends, whilst he declined replying confidence in his brethren of the conclaves. He was also too much under the influence of Charles, and suffered his attachment to his former master to influence his judgment. This led him to relinquish his plan of a general pacification, and to form an alliance with the emperor and the king of England against France. On the day when this concordat was signed, Adrian was seized with a fever, which terminated his life; and the anxiety of his elevated station in December 1523, after he had possessed the papal dignity one year and ten months. He was buried in the church of St. Peter, and on his tomb was inscribed the following epitaph, which informs posterity, that the greatest misfortune which he had experienced in life, was, that he had been called to govern. 

"Adriam Pappi VI. hic situs est. Qui nihilibi inficiunt. In vita, Quam quadri imperat, ductus?"

Notwithstanding many excellencies that distinguished the character of Adrian, he was detestable of that firmness and energy of mind, which the duties of his high and arduous station required. Few men that have been so free from faults, incurred such unpopularity, and became obnoxious to so many censures. The door of his physician, in the night after his decease, was adorned with garlands, and marked with this inscription; "To the deliverer of his country." However such kind of approach, on the part of the dissolute and licentious, redounds to his honour. The piety of Adrian, it has been observed, was more distinguished than his taste for the fine arts. From the statue of Laocoon, he turned away his head in token of his dislike of pagan images, and he expressed his contempt of poets, by calling them "Tentamen." With theology and scholastic philosophy he was well acquainted. Whilst he was profector of divinity at Louvain he wrote "a Commentary upon the Book of Sentences," by Peter Lombard; "Epistles," and "Questiones Quodlibeticas," printed at Louvain in 1515, and at Paris in 1516 and 1531. Dupin's Hist. of the 16th century. Bower's Popes. Robertson's Hist. Charles V. vol. ii. b. i. p. 2. Gen. Biog.

ADRIAN, (De Callato) bishop of Bath and Wells, in the reigns of Henry VII. and VIII. and cardinal priet of the Roman church, was descended of an obscure family, and born at Cornetto, a small town in Tunfam. Having distinguished himself by his parts and learning, he obtained several employments at the court of Rome. In 1528, he was sent by pope Innocent VIII. as his Nuncio extraordinary, to appease the troubles in Scotland, and to execute the office of queller or treasurer to his holiness, in collecting his tribute or Peter pence. He was also agent for the English affairs at the court of Rome, and in the compence of his services, was promoted first to the see of Hereford in 1524, and afterwards to that of Bath and Wells. He favoured his bisporic and refided at Rome, where he erected, and which he bequeathed to Henry VII. whose name was inscribed upon the front of it, and to his successors. He was secretary and vicar-general to pope Alexander VI. and created by him in 1563, a cardinal priet, under the title of St. Chryfogous; soon after which event he narrowly escaped being poisoned at a feast, to which he was invited by the pope and his son Caesar Borgia. In the pontificate of Julius II. he banished himself from Rome; nor did he return till a concave was held for the election of a new pope. Soon after the elevation of Leo X. he concurred in a conspiracy against his life, and being unable to pay the fine of 12,500 ducats, which was the penalty inflicted upon him, he withdrew from Rome, and was excommunicated, and deprived of his benefices and ecclesiastical orders, July 6th, 1518. Four years before this period, he had been removed from his office of the pope's collector in England by Henry VIII. at the instigation of cardinal Wolsey, who employed him as his solicitor at Rome, and was betrayed by him in his attempts to obtain the dignity of cardinal. 
cardinal. After his condemnation, it is said that he took refuge amongst the Turks in Asia. Polydore Virgil extols his talents and learning, and says that he was the first since the age of Cicero, who revived the purity of the Latin language, and taught men to draw their knowledge from the sources of the ancient and most learned authors. Biog. Brit.

ADRIAN, a learned Carthaginian, who wrote a treatise intitled De Remediis utriusque fortunae, the first edition of which was published at Cologne in 1471, 4to. The book is scarce and much esteemed.

ADRIANA, in Ancient Geography, an episcopal city of the Hellenic period under the metropolis of Cyzicus.

ADRIANEUM, Moles Hadriani, the magnificent Mausoleum erected by Adrian in the later field of Mars at Rome, over against that of Augustus, and connected with it by a bridge. It is of a square form, and in the midst of it there is a lofty round tower. It served as a citadel when Rome was besieged by Visigoth kings of the Goths, and the Romans defended themselves by casting fragments of the statues upon their enemies. Here Adrian was buried and all the Antonines.

ADRIANI, Ioanni Ballista, in Biography, was born of a Patrician family, at Florence, in 1511. He wrote a history of his own times in Italian, beginning in 1536, and terminating in 1574, and designed as a continuation of Guicciardini, to which Thurnus (Hist. l. 68) acknowledges himself much indebted. He also composed six funeral odes, and is thought to have been the author of a long letter on ancient painters and sculptors, prefixed to the third volume of Vafari. He died at Florence, in 1579. Biog. Dict.

ADRIAN, in Ancient Geography, surnamed Ad ol olympium, a city of Aia Minor, in Bithynia.

ADRIANIDE, in Ancient History, a new tribe established by the Athenians in honour of Adrian, after the example of that which was formed in honour of Attalus, king of Pergamos, and comprehending the villages of Eleon, On, and Pugia.

ADRIANISTS, in Ecclesiastical History, a branch of Ambassadors, the disciples of Adrian Hamilethus, in the 16th century, who taught in Zealand, and afterwards in England. The Adrianists, besides the common dogma of arsabaptism, are said to have had some peculiar notions relating to the person of Christ.

Theodoret mentions a more ancient feft of this name, who were followers of Simon Magus.

ADRIANO-A-SIERRA, in Geography, a mountain of Guipuzcoa, in Biscay, one of the highest of the Pyrenees. It is crossed in the way from Biscay to Old Cañile.

ADRIANOPEL, or ANDRIANOPEL, in Geography, a city of Turkey in Europe, in the province of Romania, called anciently Osia, and now Edreze by the Turks, but deriving its name from the emperor Adrian, who founded or restored it. It is situated on the Hebrus or Maris, at the confluence of the Tunfa and the Harda, and rises gently on the side of a small hill. It is about five miles in circumference, says Chiuhull in his travels, p. 63. The form of it is circular, and it is surrounded with decayed walls and towers. The houses are generally built of mud and clay, and some of them of brick; and the streets are dirty and narrow. The bazaar or market place, called Ali Bajfa, is an arched building about half a mile long, with six gates, and a great number of shops that are occupied by Turks, Armenians and Jews. There is also another bazaar of meaner structure, about a mile long, containing many shops, and well flored with various commodities. And in another part of the town, there is a third market-place, called bizefken, covered like the former, and provided with a number of shops, in which are sold the manufactures of gold and silver, jewels, pearls, &c. There are four mosques, the principal of which is that of Sultan Schim, built by him of materials brought from the ruins of Famaguita, in the island of Cyprus. It is constructed like a theatre with one flatly room, terminating upwards in a cupola, and it is beautifully situated on the side of a hill, in the midst of the city. The emperor's kraflil ioands in a plain near the river Tunfa or Tungia. The grand vizier's palace is only a common house, after the Turkish manner of building, which is two miles in compass, and has seven gates besides those of the garden, which are several miles in circumference. The objects most worthy of attention are, the mosques, the roofs of which are covered with copper, having also lofty steeples and colonnades, with pedestals and Chapters of cult bazaars, beautiful marble gates of exquisite sculpture, delightful fountains, flately porticoes with gilded balls on the top, and curious metalry; all which exhibit a very grand appearance. The city, which is said to contain about 100,000 inhabitants, is under the government of a Mullah Cadi, who has an absolute authority in all civil and criminal matters. The commerce of this place, favoured by the river that waters it, has drawn hither people from all nations. It is now the residence of a Greek bishop, and the grand signior sometimes visits this city, either for pleasure or safety, when the plague or war makes it necessary for him to leave Constantinople. In 1550 Sultan Amurath first took it from the Christians, from which time it became the seat of the Turkish emperor, till Constantinople was reduced in 1458.

In 1754, it suffered greatly by fire. The adjacent country is very fertile, and supplies the town with all kinds of necessaries; and the wine in particular, is reckoned the best in Turkey. Chiuhull takes it to be that mentioned by Hefiod, in his Oper. and Dies. i. 2. v. 107, where he says,

\[\text{He constructed the temple of Juno in the city of Tarsus.}\]

This is the See of a Greek archbishop under the patriarch of Constantinople. N. lat. 41° 41'. E. long. 26° 27'.

ADRIANOPOULIS, in Ancient Geography, i.e. the city of Adrian, a name given to various cities in different countries, that were either built or repaired by the emperor Adrian. The number of these cities is not less than nine. The city of Thrace still retains its name.

ADRIANOPOLE, a city of Epirus, south of Apollonia. This assumed the appellation Justinianopolis, after the emperor Justinian.

ADRIANOPOLE, of Bithynia, in Asia Minor, called Boll, was situated upon the Bileus, west of Caria.

ADRIANO-THERA, Aednou Piri, Adrian's chace, or hunt, a city of Mylia, which retained its name in the fifth century, and which was founded by Adrian in a district of Mylia, whither he retired for the pleasures of the chase. His fountains for the sports was so great, that he erected monuments for his horses and hounds; and he composed an epitaph for his horse Beorlithenes, which he had often used in hunting. Dion. Cass. tom. ii. p. 1159. Ed. Reim. This is probably the same city with Adrianis, which was the birth-place of Arildides the Sophist. There was another Ariadne or Adrianopolis, in Lybia Cyrenaica.

ADRIANSEN, Alexander, in Biography, a painter who excelled in painting fruit, flowers, fish, and still-life, was born at Antwerp, about the year 1625. All his objects are well coloured, with an agreeable effect, from the judicious management of the chiaro scuro, and with a remarkable transparency. Pilkington's Dict.

ADRIANUM or ADRIATICUM MARE, now the gulf of
of Venice, in Ancient Geography, is a large bay in the Mediterranean, between Dalmatia, Scavonia, Greece, and Italy, and extending from south-east to north-west, between 46° and 55° N. lat., about 200 leagues long, and 50 broad. Its entrance between Cannia and Otrante, is about 14 leagues wide. It is called by the Greeks Ἀδριατικὰ κόλπα; Adria finsa; by the Latins variously, as Adria, by Horace, (lib. i. od. 3.) "Arbiter Adria nostris;" by Silius, (lib. i. v. 54. p. 6. Ed. Daven.ken.) "Hadricum pontum;" by Cicero, (in Pison. c. xxxviii. and lib. x. Attic. Ep. 7.) "Hadrinum mare;" by Virgil, (Æn. xi. v. 455.) "Hadracis undas." The Adriatic sea, says Hefeleius, is the same with the Ionian sea; and in order to solve a difficulty in the interpretation of Acts xvii. 7. and to answer the question, how St. Paul's ship, which was near Malta, and, therefore, in the Lybian or Sicilian sea, could be in the Adriatic; it is alleged, that not only the Ionian, but even the Sicilian sea, was called the Adriatic. Strabo (lib. vii. tom. 2. p. 488.) informs us, that the Ionian gulf is a part of that which in his time was called the Adriatic sea. Whitby Com. vol. ii. p. 751. The principal rivers that ran into the Adriatic were the Pannus, Apusus, the Laurus, or Æas, and the Ceydnus. The State of Venice claims exclusive dominion over the Adriatic sea, in consequence of a circumstance mentioned under Doge; and the ceremony of wedding it is annually practised in evidence of this claim, on Alfenesunday. Mr. Kirby, in his estimate of the temperature of different latitudes, p. 53, observes, that the Adriatic, though warmer in the summer than the Mediterranean, is so cold in winter, as to have been frequently frozen over in the neighborhood of Venice.

ADRICHOIUS, Christian, in Biography, was born at Delft, in Holland, in 1533; and having abridg'dly applied to study, he became director of the nuns of St. Barbara; but when the civil war broke out on account of religion, he withdrew first to Brabant, and then to Cologne, where he began his work, intitled, "Theatrum Terrae Sanctorum," which was printed with maps at Cologne, in 1503. This work, besides a description of the Holy Land and of Jerusalem, contains a chronicle of the Old and New Testament, under the name of Christianus Crucius; and under this title, he published at Antwerp the Life of Chrift, and an oration, "De Chrilliana Beataudine," Adrichomius died at Cologne, in 1585, and was buried in the convent of the canons of Nazareth, where he had been for some years director. Biog. Dict.

ADRIEN, in Geography, a small town of the Low Country, in Flanders, on the river Dendre, two leagues from Antwerp, and four from Gand.

ADRIETTI, in Sea-language, denotes the slate of a vessel broken from her masts, and driven by the wind or waves.

ADVIN, in Geography, a small town of Upper Hungary, upon the river Sebëk, at the foot of the mountains of Vedra, and north-west of the great Waradn. E. long., 37° 30'. N. lat. 47° 9'.

ADRIS, in Ancient Geography, the name of a river in India, according to Ptolemy.

ADRIUS MORE, a chain of mountains which, according to Strabo, extended along Dalmatia, and divided it into the Mediterranean and Maritime.

ADROBICUM, a small place in Spain, on the bay called Magnus Portus.

ADROGATION, in Antiquity, a species of Adoption, whereby a person, who was capable of choosing for himself, was admitted by another into the relation of a son. The word is compounded of ad, to, and rogare, to ask; on ac-
the body, particularly the pores of the skin; and also to signify the styptic quality of medicines. See Astrignents.

AD TERMINUM qui spectabilis, is a writ of entry, which is a place where a man living, leased lands or tenement; for terms of life, or years, is, after the time expired, held from them by the tenant, or other stranger, who enjoys the same, and is entitled to the lettor. The same writ also lies for the lessor's heir.

ADUACA Tungusorum, in Ancient Geography, Tungur, a city of Gaul, the capital of the Tungri. It was called by Caesar Augustus, and by Ptolemy 

ADVENT, Adventus, in the Calendar, the time immediately preceding Christmas; anciently employed in pious preparation for the adventus, or coming on, of the feast of the Nativity.

Advent includes four Sundays, or weeks; commencing either from the Sunday which falls on St. Andrew's day, or that next before or after it, i.e. from the Sunday which falls between the 27th of November, and the third of December inclusive.—But it is to be noted, this rule has not always obtained.—In the Ambrosian office, there are six weeks marked for Advent; and St. Gregory in his Sacramentary allows five.

The first week of Advent, in our way of reckoning, is that wherein it begins; but it was anciently otherwise; the week next Christmas being supposed the first; and the numeration carried backwards.

Great authority was practised in the ancient church during this season.—At first they fasted three days a week; but they were afterwards obliged to fast every day, whilst the feast is frequently called in ancient writers, LENT, and Quadragesima S. Martini.

The courts of justice were at one time all shut.

Advent is also one of the times, from the beginning whereof, to the end of the octaves of the Epiphany, the solemnizing of marriage is forbid, without express licence.

ADVENTITIA eun, in Antiquity, an entertainment made by the friends of a person who had been travelling, or by way of welcome to his return. This was otherwise called eun aduentorius. Petronius.

ADVENTITIOUS, something accruing or befalling a person, or thing, from without.

Thus, adventitious matter is such matter as doth not properly belong to any body, but is casually joined to it.

Adventitious, in the Civil Laws, is applied to such goods as fall to a man, either by mere fortune, or by the liberality of a stranger, or by collateral, or direct, succession.

In this sense the word stands opposed to possessions, by which are signified such goods as descend in a direct line, from father to son.

Adventitious suffles, are foreign or extraneous ones, found incorporated with others, to which they do not properly belong. Such are sea-shells, &c.

AD VENTREM inficiendum, in Law. See Ventrem inficiendum.

ADVENTURE, an extraordinary and surprising enterprize or accident, either real or fictitious.

The word is French, and literally denotes an event, or accident.

Novels, romances, &c. are chiefly taken up in relating the adventures of cavaliers, lovers, &c.

ADVENTURE, Bill of, in Commerce, is a writing signed by a merchant, attesting that the property of goods shipped, or sent away in his name, belongs to another, the adventure or chance whereof the said person is to stand in a covenant to account to him for the produce of it.

ADVENTURE, in Geography, a name given by captain Cook to a bay in which he anchored, in the southern part of New Holland, called Van Diemen's land, and on the shores of which they were supplied with wood and water in great abundance. The bottom of this bay was found to lie in S. lat. 43° 25', and E. long. 147° 30'. It is an excellent harbour, having through the bay from 18 to 5 fathoms water, which gradually decreases towards the shore. The road also is safe, and sheltered from the north-east by Maria's islands. The variation of the compass, in 1778, was 5° 15' E.

ADVENTURE
ADVERB, Adverbium, in Grammar, a particle joined to a verb, adjective, or participle, to explain their manner of acting or suffering; or to mark some circumstance or quality exemplified by them.

The word is formed from the preposition ad, to, and verbam, a verb; and signifies literally a word joined to a verb, to show how, when, or where, one is, does, or suffers; as, the boy paints readily, writes ill; the house stands there, etc.

Not that the adverb is confined purely to the verbs; but because that is its most ordinary use; whence it becomes so denominated a verb. We frequently find it joined to adjectives, and sometimes even to substantives, particularly where those substantives signify an attribute, or quality of the thing spoken of; e. g. he is very fickle; he is truly king.

An adverb is likewise joined sometimes to another adverb, to modify its meaning; e. g. very dexterously, &c. Whence some grammarians chuse rather to call adverbs modificatives; comprising under this one general term, adverbs, conjunctions, prepositions, and even adjectives.

Adverbs are very numerous; but they may be reduced under the general classes of adverbs of time, place, order, distance, manner, relation, quantity, both continuous and disjunct, quality, manner, affirmation, negation, demonstration, interrogation, diminution, doubting, exception, and comparison.

In English, says Dr. Lowth (Gram. p. 112.), they admit of no variation, except some few of them, which have the degrees of comparison, as soon, sooner, soonest; and those irregulars, derived from adjectives in this respect likewise irregular, as very much, not very prudently. He observes, however, that the formation of adverbs in general with the comparative and superlative terminations seems to be improper; at least that it is now become almost obsolete, as e. g. fierer, stronger, hardiest, highest, rightest, though used by Hooker, Raleigh, Hobbes, and Shaftesbury. In poetry, comparative adverbs are sometimes allowable.

Adverbs are denominated by Mr. Harris attributes of attributes, or attributes of the second order; and he defines an adverb, a part of speech, the natural appendage of verbs, extending the signification of the word verb properly so called, to participate and adjectives. After explaining the general nature of adverbs as attributes of attributes, and enumerating their principal forms, among which he reckons intention and remission, he shows that adverbs may be derived from almost every part of speech, from prepositions as afterwiser, from participles, as knowingly, from adjectives, as virtuously, from substantives as expressly, and from proper names, as Soulicially. Adverbs, according to Gaza in his grammar, may be found in every one of the predicaments, and he thinks that the readiest way to reduce their infinitude, is to refer them by classes to these ten universal genera. The Stoics called the adverb by the name of Huios, with a view to its multiformal nature. Hermes, p. 192.
ADD

ADD

p. 192. 210. Mr. Horne Tooke, after noticing the condition that has perplexed grammarians with regard to the classification of adverbs, and excluding them, as well as particles, from the rank of sepa-rate parts of speech, has with great ingenuity investigated the origin of many of the English adverbs in the ancient Saxon and other northern tongues, and evinced them to be either corruptions of other words, or abridgments of sentences. The termination "ly," is easily discovered in the corruption of "like;" thus honestly is honestly.

He also resolves adverbs into the past participle, of adrian: asleep, into the participle aspoused: age, into agone: or gone; afar, into afar or separated.

To not, he deduces from cotum to know; as adjective and adverb in Latin are abbreviations of wider-bred and fire-bred.

Need is resolved by this very vagacious writing into need it: even in one: i.e. infant; alone and only into all-one and one like; allow into on-lin or in life: abside into the noun side and the article a i.e. a side or a time; as'affort i.e. attach, into the Saxon Hurkles: time, that: asleep or on left into on-left, left in the Anglo-Saxon signifying the air, so that asleep denotes up in the air. Lot is the imperative of look, and lief is the adjective leaf, dear. With respect to the adverbs of affirmation and negation, he observes that yes or yea is the imperative of a verb of negative extraction, viz. of the Danish jeg, signifying have, possess, or enjoy; yea is a contraction of or as q. d. have or possess that: was in Danish jeg is to possess, and yea denotes yea or yea. In Swedish the same verb is ega and the imperative ja, yeh or yeh. In German, ja signifies yea or yea. In Dutch, jegens is to possess, and ja as yea.

As to the negative not, and its abbreviation no, they are derived, by Greenwood, from the Latin, by Minshew from the Hebrew, and by Janis from the Greek. But Mr. Tooke discovers them in the Danish and Swedish nodde, and in the Dutch nade, nade and no, which signify ascertain or unwilling.

The adverbs ones, twice, three, says Mr. Tooke, are merely the genitives of one, two, three, the substantivite time or turn being omitted; and were formerly written ones, twices.

An ingenious writer suggests that adverbs seem to be principally produced from three fources: first, from a species of interjection, denoting an impulse of the mind, as now, then, not, &c.; secondly, from a composition of two or three words into one, as always, altogether, &c.; and thirdly, from adjectives, by adding a syllable void of significition, but which seems to denote that the word has changed its state into that of an adverb, as greatly. This argumentive syllable was originally a contraction of some word that denoted simultude or participation. Gregory's Effays, Hiftorical and Moral. EJEA HTEPONTA.

or, Diversions of Purkey, p. 494, &c.

In the Hebrew language, most adverbs, and particularly those of quality, are expressed by nouns, both substantive and adjectives, either simply or connected with a preposition: as הָבָּא, הָלַע, הָלְכוּ, מַלְכוּ, וַתִּשְׁלַח, ךָלֵב, וְתַחְפִּית מַשָּׁה. Thus, also in the Chaldee language, הָלֹא denotes depict, and וְהָרֹּא הָרֹא denotes confederate.

In the Syriac, adverbs of quality are formed of adjectives, and terminate in וָא, as וְהָרֹא בָּא, הָרֹא הָרֹא בָּא, and וְהָרֹא הָרֹא בָּא, and frequently of nouns with a preposition adjoined, as וְהָרֹא וְהָולַע, וְהָרֹא וְהָולַע, וְהָרֹא וְהָולַע, וְהָרֹא וְהָולַע, and sometimes adjectives are substituted for adverbs, as וְהָרֹא וְהָולַע. In Hebrew the repetition of one adverb, or another of the same meaning, denotes the superlative, as וְהָרֹא וְהָולַע וְהָרֹא וְהָולַע וְהָרֹא וְהָולַע, i.e. wohle wohle, wohle. I. v. 26. This form of expression is used distributively, as וָרֹא וְהָולַע וָרֹא וְהָולַע וָרֹא וְהָולַע, wohle wohle, wohle. Exod. xvi. 21. Adverbs of place repeated, signify diversity of place, וְהָרֹא וְהָולַע וְהָרֹא וְהָולַע. Exod. xii. 2. The adverbs וָרֹא וְהָולַע, wohle wohle, wohle, often change the future into the preterite, both perfect and imperfect: as Deut. iv. 41. Exod. xii. 34. Adverbs of time, that are definite, are used indefinitely: as וְהָרֹא וְהָולַע וְהָרֹא וְהָולַע, on yesterday, for past time in general.

2 Sam. xv. 2. If. xxx. 34. וְהָלַע וְהָולַע, this day, for the present time: as Pl. xcv. 7. וְהָלַע וְהָולַע, for future time, indeterminately: as Gen. xxx. 33. Hence Matt. vi. 34. The adverb וְהָלַע וְהָולַע, wohle wohle, wohle, is used for quotid, and quot is.

Exod. vii. 20. xxiv. 30. Hence וְהָלַע וְהָולַע, wohle wohle, wohle, denotes very often. See John xviii. 20. The adverb וְהָלַע וְהָולַע, wohle wohle, wohle, does not always exclude the time that follows the action which is spoken of. Pl. cx. i. xxvii. 2. Hence, and are derived the Hebrews that occur. Matt. ii. 25. xxviii. 29. Acts. iii. 21. Rom. v. 13. 1 Tim. iv. 13. Adverbs of negation prefixed to verbs are used in the same sense as the privative alpha of the Greeks; as וְהָלַע וְהָולַע, non sapiens, i.e. insipiens; וְהָלַע וְהָולַע, non fortis, i.e. infirmus. Prov. xxx. 25. Hence Matt. ii. 6. Rev. vii. 7. Absolute adverbs are used comparatively, as Joel ii. 13. Rev. viii. 10. Hence, and are derived the Hebrews that occur. Matt. x. 23. xxvii. 25. Acts v. 4. 1 Cor. i. 17. Ephes. vii. 12. On the other hand, comparatives are used for negative adverbs.

ADVERBDI, something relating to adverbs. We say an adverbial phrase, adverbal expression, &c.

ADVERBDI numbers are sometimes used to denote once, twice, thrice, &c.

ADVERSARIA, among the Ancients, was used for a book of accounts, like our journal or day-book.

Hence, adverbaria is sometimes also used among us for a common place book.

Adverbaria amounts to the same with apotloegraphia, επιστευματα, or memorials, and flands opposed to codes; the former being for occasional matters which were taken down hastily, from which they were afterwards transcribed into the latter, in a fair regular manner, for standing use. Marhof, Polyhist, lib. iii, cap. 1.

ADVERSARIA is also a title given to divers books, containing collections of miscellaneous observations, remarks, &c.
In which sense, adverbia amounts to much the same with various adjectives, various observations, commentaries, letters, books, &c.

devseria is also used for a commentary on some text or writing.

This was so called, because the notes were written on the adverb or opposite page.

adversary, formed of the Latin preposition ad, verbe, and serio, to turn. See antagonist.

adversative, in Grammar, a word or particle that expresses not only some difference, but some opposition, between what goes before and what follows.

Adversative disjunctives are distinguished from those that are denominated simple in this respect: as the latter merely disjoin or express a diversity, whereas the former disjoin with a consequent opposition, e.g. The proposition, "either it is day, or it is night," is a simple disjunctive; and an adversative is when we say, "it is not day, but it is night." Besides, the adversatives are definite; and the simple, indefinite. Thus, when we say, "the number of three is not an even number, but an odd," we not only disjoin two opposite attributes, but we definitely affirm one, and deny the other. But when we say, "the number of the stars is either even or odd," though we affirm one attribute to be, and the other not to be, yet the alternative is left indefinite. With respect to adversative disjunctives, it may be observed, that, though they imply opposition, there can be no opposition of the same attribute in the same subject; but the opposition must be either of the same attribute in different subjects, as "Brunus was a patriot, but Caesar was not;" or of different attributes in the same subject, as, "Corgius was a sophist, but not a philosopher;" or of different attributes in different subjects, as, "Plato was a philosopher, but Hippas was a sophist." The conjunctions used for all these purposes may be called absolute adversatives: but besides these, there are several others, recited by Mr. Harris, such as adversatives of comparison, expressed by the words than and as, which mark not only opposition, but that equality or excess, which arises among subjects from their being compared. Such also are adversatives adequate and inadequate, of which the principal are unles and although, e.g. "Troy will be taken, unless the Palladium be preserved." "Troy will be taken, although Hector defend it." Every cause, (says Mr. Harris) is either adequate, or inadequate, when it endures without being effectual, and so in manner is every preventive. Adequate preventives are expressed by such adversatives as unless: the inadequate are expressed by although. Hermes, p. 251-257.

On this subject, Mr. Horne Tooke, in his Divisions of Purley, has enabled us to form more clear, determinate and satisfactory ideas than those which were furnished by former grammarians. The opposition in adversative disjunctives, that has been usually referred to the conjunction but, is superseded to be marked by the words or sentences which are thus connected, and which have opposite meanings. Accordingly the ingenious writer abovementioned affixes two different acceptations to the word but, in the beginning and in the middle of a sentence. In the former case it is a corruption of but, the imperative of the Saxon verb baton, to bat, superadd, or supply: and in the latter it is a contraction of be-utan, the imperative of bewenden, to be out. This distinction is evinced by examples from ancient writers, one of which it will be sufficient to mention, taken from Gavin Douglas.

"But thy work shall endure in laude and glory, but spot or faulte condigne eterno memorie."

The meaning of this couplet is "superadd (to something said, or supposed to be said before) thy work shall endure in laude and glory, but (i.e. without) spot or fault.

Thus, in the definite adversative, "the number three is not an even number, but an odd," the opposition is not marked, at least directly, by the word but, but by the adjectives even and odd, which denote attributes in their own nature opposite: and the preposition, according to the first sense of the word but, will be synonymous with this, viz. "the number three is not an even number, superadd (it is) an odd number."

In the indecinite adversative, "the number of the stars is either even or odd," the word either is a distributive pronoun, and or is a contraction of the Saxon or, q.d. other, i.e. something different, and often contrary. As to the adversatives designated by Mr. Harris adequate and inadequate, and marked by the conjunctions unless and although, he leads us to conceive that the whole difference between them consists in this, that the expression of the one is more forcible than that of the other. Whereas, the meaning of unless is directly opposite to that of although. They are both verbs in the imperative mood: the former signifying take away or disjoin; and the latter allow, permit, grant, yield, affect. Accordingly the sentence, "Troy will be taken unless the palladium be preserved," is equivalent to re-polladum be preserved, i.e. the taking the palladium will be preserved as an alternative, not the preservation of the palladium. "Troy will be taken although Hector defend it." is the same as "Troy will be taken, allow Hector (to) defend it." The idea, therefore, expressed by unless is that of the removal of one thing to make way for another; and the idea expressed by although is that of allowing one thing to co-exist with another, with which it is apparently incompatible. The conjunction unless (says Mr. Tooke) even in the reign of king Elizabeth was written on, or or, and more anciently on, and or, and or is the imperative of the Angle-Saxon verb on, to disjoin or remove, the imperative of to, which is synonymous with off, is also used by some old writers, instead of unless. And this imperative has given to our language the adjectives hope, ruff, &c. i.e. disjoin hope, red, &c. The conjunction although (says the same writer) is compounded of all or all; and, although, though, but, or, in the vulgar pronunciation, thow, that, and that. This is evidently the imperative thow or that of the verb to, to, that, to, as in a translation of the same kind, and as a, as that by which ha, ta becomes back. This etymology is confirmed by considering, that anciently they often used all be, albeit, all bad, all were, and all give, instead of although.

adversator, in antiquity, a servant sent to wait his master's returning from supper, and attend him home. The rich had servants of this quality, to apprise them of any danger. Pausan, (Mort. iv. 474); and Terence, (Adelphi 12) refer to such persons.

adverse leaf. See leaf.

Advertisement, formed of advertere, to consider, in a general sense, an intelligence or information given to persons interested in an affair.

Advertisement is more particularly used for the brief account of articles of private or public concern, inserted in the daily, or other public papers.

By the statute of 25 Geo. II. cap. 36. and 28 Geo. II. cap. 19. the penalty of 50s. is inflicted on persons advertising a reward with no questions to be asked, for the return of things lost or stolen: and likewise on the printer.

By 21 Geo. III. c. 49. any person advertising any pub-
ADVICE. — To a small vessel employed to carry express or orders with dispatch.

AD VITAM aut culpa, denotes an office to be held so as to determine only the death or defunctuity of the possessor; or in other words, to be held quan diu f. bene electi. Stat. 28 Geo. 11. c. 7.

ADUGAK, in Geography, one of the Fox islands in the northern Archipelago.

ADULA, in Ancient Geography, a mountain of Rhetia, or the country of the Grifons, being a part of the Alps, in which are the fountains of the Rhone, Rhone, Nantzi, Tefnian Azar, and from which flows the Adra or Aduna. It is now called St. Gothard, and it is said to be the highest point of Europe. Strabo, Geogr. tom. i. p. 293.

Adula gives name to a country of the Alps between the Grifons, Swifs, Villafons, and Mihane. It is the highest part of the Alps, and comprehends the Crispans, Vogellberg, Gothard, Fourche and Grimmel.

ADUL, in Modern Geography, a mountain of Navarre in Spain, between Pomplos and St. Jean de Piz de port.

ADULARIA. See Felspar.

ADULOE or ADULUS, in Ancient Geography, a town of Ethiopia, built according to Paus. (i. vi. c. 34. tom. 2. p. 342.) by fugitive slaves of Egypt, and distant from its port on the Red Sea 20 stadia; and from the royal city of Axum about 50 leagues. They call it OphidIon Adulon, and the inhabitants Adilites. He represents it as the principal emporium of the Ethiopians, whence they exported ivory, the horns of the rhinoceros, the skins of the hippopotamus, and other articles of commerce. The monsium adilitanum, or the pompous imposition of the name of Ptolemy Egergetes belonged to the city. The bay adjacent to it in the Red Sea was called Sinus Adulon. It is now Erebus on the coast of Abax. The port of Adul, according to Dr. Vincent, in his Periplus of the Erythrean Sea, can be no other than the celebrated harbour and city of Maffiah, so well known by the accounts of the Jefuits and of Bruce, as the only proper entrance into Abyssinia. Two islands are also mentioned in the bay of Adul, which are those now called Sheikh Sidda and Talbouth, abounding in fish.

ADULLI, a village of the island of Orine in the Red Sea.

ADULLAM, in Scripture Geography, a city belonging to the tribe of Judah, in the southern part of this, towards the Dead Sea. Eusebius says it was a large town 10 miles from Balkhoris, castrum. Jo. xxv. 37-2 Chron. xi. 7. 8. S. 15. Sam. xxii. 1. 2.

ADULT, ADULTUS, formed from the verb adulescere, to grow up, an appellation distinguishing any thing that is arrived at maturity; and applied to plants as well as persons. An adult person is one who is arrived at years of discretion, and entered upon manhood, or the age of adolescence; and is old enough to have understanding and discernment.

Among Civilians, the appellation adult is applied to a youth between fourteen and twenty-five years of age.

In which sense adulescens is synonimous with juvencus adulescens.

ADULT, in Mythology, was an epithet applied both to Jupiter and Juno; the former being called Jupiter adulis, and the latter Juno adulis.

ADULTERATION, in a general sense, the act of corrupting, or debasing a thing that was pure, by some improper admixture.

The word is Latin, formed of the verb adulterare, to corrupt, by mingling something foreign to any substance. We have laws against the adulteration of coffee, tea, tobacco, sugar, wine, beer, brandy, wads, hair-powder, &c. See Stat. 13 W. III. cap. 5.—11 Geo. 1. cap. 30.—1 Geo. 1. cap. 46.—1 W. & M. cap. 34.—23 Eliz. cap. 8.—10 Anne cap. 26.—3 Geo. III. cap. 41.

For the method of detecting adulteration of liquors, see Essay, Proof, &c.

ADULTERATION of coin properly imports the making or casting of a wrong metal, or with too base or too much alloy.

Adulterations of coins are effected divers ways, as by forging another stamp, or inscription; by mixing impure metals with the gold or silver; by making use of a wrong metal, or an undue alloy; or too great an admixture of the basic metals, with gold or silver. Counterfeiting the stamp, or clipping and debasing the weight, do not properly come under the denomination of adulterating.

Evelyn gives rules and methods, both of adulterating and detecting adulterating metals, &c.

Adulterating is somewhat less extensive than defacing, which includes diminishing, clipping, &c.

To adulterate or deface the current coin, is a capital crime in all nations. — The ancients punished it with great severity: among the Egyptians both hands were cut off, and by the civil law, the offender was thrown to wild beasts. The emperor Tacitus enacted that counterfeiting the coin should be capital; and under Constantine it was made treason, as it is also among us. The adulterations of gems is a serious art, and the methods of detecting it no less useful. Nicholas, Lapid. p. 18.

ADULTERATION, in Pharmacy, denotes a fraudulent corruption of drugs, or medicines, by substituting ingredients of less value, for the sake of greater gain.

This practice the dealers in all the parts of medicine are but too well acquainted with. Pharmaceutical authors give numerous instances of adulteration, both in simple and compound medicines.

ADULTERATION of wine. See Wine.

ADULTRESS, a woman who commits adultery.

ADULTERER, in a general sense, denotes any thing which has been adulterated, or that is spurious, or counterfeited; and it is thus applied to a fraudulent balance, to debased and counterfeit coins, to a false key, and to supposititious writings.

ADULTERER, in the Civil Law, is particularly applied to a child sired from an adulterous amours, or commerce.

Adulterine children are more odious than the illegitimate offspring of single persons. The Roman law even refuses them the title of natural children; as if nature disowned them. Adulterine children are not easily dispensed with for admission to orders. Those are not deemed adulterine, who are begotten of a woman openly married, through ignorance of a former wife being alive. By a decree of the parliament of Paris, adulterine children are declared not legitimated by the subsequent marriage of the parties, even though a papal dispensation be had for such marriage, wherein is a clause of legitimation.

ADULTERINE guilds, in British History, denoted those guilds or corporations that were set up without warrant from the king, in opposition to warranted or lawful guilds, and under this denomination they were amerced to the king in 1180. 26 Henry II. See Guild.

ADULTERINE marriages, in St. Augustin’s sense, denote second marriages, contracted after a divorce.

ADULTERY, ADULTERIUM, (in Ancient Law Books called...
ADU

called Adultery) a crime committed by married persons, against the faith pledged to each other in marriage, by having carnal commerce with some other; or even by a person not married, who has the same intercourse with another that is.

Moralists, and canonists, and divines, have distinguished several species of adultery; as,

Adultery, manifesta, that wherein the parties are caught in the fact, or, as some express it, re in re.

On such occasions, strangers, or people not interested in the family, have been allowed to accuse, and prosecute women for adultery, either if committed during a husband's long absence, or through his connivance.

Adultery, occult or secret, that kept concealed from the knowledge of the world, and only divulged to a confessor, or the like.—In the canon law this is most favourably dealt with; persons were admitted to penance for this, and absolved, who were refuted it for the open kind. Dugange.

Adultery, presumptuous, that which is only discovered or inferred from certain signs, or indications. Such are the parties being found in bed together, and cum suma atque.

Adultery, interpretative, or reputed, denotes an act which though not properly included under the denomination, yet is reputed as equivalent to it, and punished as such. Thus mixed marriages between Christians and Jews, or between a Christian man and a Jewish woman, are put by the laws of Arcadius and Honorius, on the footing of adultery.

So also second marriages are called by some, as Athenagoras, and St. Ambrose, an honourable or better sort of adulteries.

Adultery, improper, includes other extraordinary cases and species; such are the commerce with a woman only espoused, not actually married; with a married woman, who lives as a common whore; with a married woman, taking her for single; with a putative wife, or concubine, taking her for a real wife; and with a nun, who by her vows is deemed espoused.

Adultery, figurative, that intended only to represent, or pro- fess another fact, or convey some other infraction. This coincides with typical, or allegorical adultery, and stands opposed to actual. So the adultery of Mars and Venus is turned into an allegory by naturalists, moralists, and alchemists, &c.

Adultery, single, is that where only one of the parties is married, in contradistinction from double adultery, which is, where both parties are married. This distinction is familiar and important in the canon law; but was unknown to the jurisprudence of the Code and Pandects.

Adultery, incestuous, that wherein the parties are related within the third degree of consanguinity.

Adultery, illicit, that not prohibited by any express or known law.

It has been disputed whether adultery be malum in se, or only malum prohibitum, i.e. evil in itself, or only rendered evil, by virtue of positive laws and prohibitions. St. Ambrose and some others have maintained, that adultery was not criminal before the Mosaic law. Hobbes de Civ. cap. 6. § 16. Budd. Frag. lib. ii. cap. 4. See the close of this article.

It has been controverted, whether adultery may be lawfully committed in war, with the enemies' wives? The answer is in the negative, and the authorized practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit adultery with the consent of her husband, and for the procuring some great good to him? St. Austin apparently allows of it; at least, does not condemn it. De Serv. Dom. in Mont. lib. i. cap. 10. § 49. & De Civ. Del. lib. xvi. cap. 25.

It has likewise been a dispute, whether it be lawful for one of the parties married to commit adultery, with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who, on this account, converted with Hagar; and likewise among the Greeks and Romans.

Pollman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use.

Adultery, illicit, that which is expressly contrary to some obligatory law; such, according to the generality of sects, is all adultery, proper, improper, single, double, open, and occult; because of a natural bæsolch or turpitude in the thing, as well as its being a violation of conjugal faith, and injury to our neighbour.

Accordingly, punishments have been annexed to adultery in most ages and nations, though of different degrees of severity. In some it hath been capital, in others venial, and attended only with fictitious punishments. Some of the penalties are serious, and even cruel; others of a jocose and humorous kind.

Among the ancient Egyptians, adultery by consent, was punished in the man by a thousand lilies, given with rods; and in the woman, with the loss of her note. Nevertheless adulteries were not unfrequent among the Egyptians.

The Grecian laws express great indignation against adultery. In the earlier times of Athens, the punishment of adultery seems to have been arbitrary. In other parts of Greece, adultery was severely punished.

Rich adulterers were sometimes allowed to redeem themselves with money, and the fine, called mpyxtoxya, was paid to the injured husband: and it was customary for the father of the adulterer to return the whole dowry which he had received of her husband. Homer Odys. l. 1. v. 317. 329.

In the later times of Greece it was ordered by Draco, that he who caught an adulterer in the fact might impose on him any arbitrary punishment; and this law was confirmed by Solon. Nevertheless it appeared to have been highly impolitic, as it gave full scope to private revenge, instead of leaving the punishment to the State.

It was by the Grecian law further ordered, that if any one was injuriously confined upon suspicion of adultery, he should make his complaint by appeal to the Thesmophoria, which if they found justifiable, he should be acquitted, and his sureties discharged from their bail; but in case he was found guilty, the judges were to inflict on him what punishment they would, death only excepted; and the offender was obliged to procure friends to be responsible for his future chastity.

The Spartans, indeed, may in one sense be said to have tolerated adultery, since they laughed at those who thought the violation of the marriage-bed an insupportable affront: they allowed other men the liberty of embracing their wives, which freedom they took with others in their turn. Nay, even strangers, as well as citizens of Sparta, were allowed the same freedom with their wives. Yet we find that their kings were exempt from this custom, that the royal blood might be preferred unmixed, and the government remain in the same lineal descent.

But notwithstanding this liberty, which was founded on mutual consent, they accounted all other adulteries the most heinous crime in the world; and while they adhered to their ancient laws they were wholly strangers to them. Among the ancient Spartans the idea of infidelity on the
part of the women to their husbands would have appeared as strange as that of displaying the least regard to studied ornaments in their dress. And Lycurgus, it is said, did not enact any law against adultery, because no such crime existed in Sparta. See Plut. Oper. tom. 1. p. 49. tom 2. p. 289. Ed. Xylandr. Potter's Arch. lib. iv. cap. 12.

Plutarch tells us, that if any person discovered his father or daughter, while unmarried, in this crime, he was allowed by Solon's laws to sell her for a slave. If a husband surprised his rival in the act of dishonouring him, he might put him to death, or oblige him to torment to ransom his life; but if the wife had only yielded to force, he could demand no more than a pecuniary fine at the discretion of the judges, as violence in such cases was less to be dreaded than seduction.

In the heroic ages, adulterers were floned to death; and the punishment was called ᾠδος γενέους, a stone coat. Homer Iliad, I. 7. Adulteresses were never after permitted to adorn themselves with fine clothes; and in case they appeared so to do, were liable to have them torn off by any that met them, and likewise be beaten. The same liberty was permitted to any that found them in the temples, which were thought to be polluted by the admission of persons so infamous and detestable. Lastly, their husbands, though willing, were forbidden to inhabit any longer with them, upon pain of ignominy, μακρός; but persons who prostituted women, were adjudged to die.

There were other remarkable punishments for adulterers among the Grecians; such, particularly, as putting out their eyes. And the Locrians observed this custom in later ages, being compelled to the observance of it by Zaleucus, their lawgiver, whose rigor in executing this law is very remarkable; for having caught his son in adultery, he resolved to deprive him of his sight, and remained a long time inexorable, notwithstanding the whole city was willing to remit the punishment, and requested him to spare the youth. At length, unable to reft the people's importunity, he mitigated his sentence, and redeemed one of his son's eyes, by cauing one of his own to be put out; by this glorious act setting a memorable example both of justice and of mercy. Valer. Maxim. I. vi. e. 5.

At Gortyn in Crete, they punished adulterers after another manner; they were covered with wool, an emblem of the softness and effeminacy of their disposition, and in that dress they were carried through the city to the magistrate's house, who imposed a fine and sentenced them to ignominy, whereby they were in a manner deprived of all their privileges, and their share in administering the public business. Julian. Var. Hist. I. xii. e. 12. not. Perizon. tom. 2. p. 736. Ed. Gronov. For other punishments, see ONOBATIS and PARATILUS.

There are various conjectures concerning the ancient punishment of adultery among the Romans.

By a law of Romulus, of which Plutarch makes mention, a man had the liberty of turning away his wife, either for poisoning his children, counterfeiting his private keys, or for adultery. Thoug some maintain that it was made capital, by a law of Romulus, and again by the Twelve Tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in ancient times was very various, much being left to the discretion of the husband and parents of the adulterous wife, who exercised it differently, rather with the silence and countenance of the magistrate, than by any formal authority from him. Thus we are told, the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and, as it were, with one blow. The same power ordinarily was not indulged the husband, except the crime was committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far, but mutilating, cutting off the ears, noses, &c. were deemed sufficient. The punishment allotted by the lex judaica was not, as many have imagined, death; but rather banishment, or relegatio, with the loss, on the part of the wife, of half her dowry, and a third part of her other goods; and on the part of the husband, of half his goods: though Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. But though the Julian law left the accusation of adultery open to every body, yet strangers were seldom suffere to prostitute, where the husband made no complaint; but where the husband made a trade of his wife's infamy, or having seen her shame with his own eyes, patienty suffered the infraction. In these cases, adultery became a crime of public concern; and the Julian law provides a punishment for such husbands as well as for their wives.

Under Augustus, the guilty parties, after the payment of heavy forfeitures and fines, were condemned to long or perpetual exile in two separate islands.

Under Macrinus, adulterers were burnt at a stake. Constantine, it is said by Noodt and others, hurt by law made the crime capital. Under Constantius and Constans, adulterers were burnt, or fewed in sacks, and thrown into the sea. Under Leo and Martinian, the penalty was abated to perpetual banishment, or cutting off the nose.

By the civil law, as altered by Julianus, who, at the instance of his wife Theodora, mitigated the severity of the lex judaica, adultery is punished with whippings, and shut up in a convent for two years: during which time, if the husband do not consent to take her back again, she is hanged, and shut up for life.—This is called authenticating, as having been established by an authentic.

In France, however, the whipping is omitted, that the husband may be the first averse to the taking her back within the two years.

Under Theodorus, women convicted of this crime were punished after a very singular manner, viz. by a public confinement; being locked up in a narrow cell, and forced to admit all the men to their embraces that would offer themselves. This custom was again abolished by the same prince.

It was controverted whether, among the Romans, adultery was allowed to be compounded?

By an edict of the emperor Antoninus, the husband was not allowed to bring an action of adultery against his wife, unless he himself were innocent; the reason given for it is very natural, per iniquum sin initietur ehe at pudicitiam vir et woman esset, quam in esse non esset.

By the Jewish law, adultery was punished by death in both parties, where they are both married, or only the woman. The Jews had a particular method of trying, or rather purging an adulterer, or a woman suspected of the crime by making her drink the bitter water of jealousy; which, if she were guilty, made her foal.

In Arabia Felix the punishment of adultery was death.

By the laws of Jenghiz Khan, founder of the Mogul empire, adulterers were condemned to death; and a man was permitted to kill them, when surprized in the act. Some of the people, however, disliked this law, because it was a custom with them to offer their wives and daughters to their friends who visited them, in token of respect and affection: and they petitioned to be continued in the exercise
of this privilege, which was allowed. But they were regarded as depraved and infamous.

Among the Magdelenians, adultery is punished with the forfeiture of a hog, which is usually eaten in good friendship between the gallant, the adulterers, and the cuckold. Chardin. Voy. tom. i. p. 47.

In some parts of the Indies, it is said, any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her, to have been rated so high. Montaigne's Lifs. lib. iii. cap. 4.

Adultery is said to be so frequent at Ceylon, that not a woman but practises it, notwithstanding its being punishable with death. Bibl. Univ. tom. xxviii. p. 237.

Among the Japaneese, and divers other nations, adultery is only penal in the woman. Among the Abyssinians, the crime of the husband is said to be only punished on the innocent wife. In the Marian Islands, on the contrary, the woman is not punishable for adultery; but if the man go astray, he pays severely; the wife and her relations wait his lands, turn him out of his house, &c. Among the Chineese there is reason to conclude, that adultery is not capital; for it is said that fond parents will make a contract with the future husbands of their daughters to allow them the gratification of a gallant. But without such precaution, the husband has power to inflict corporal punishment on a wife who transgresses, or to divorce her. Such, however, is the conjugal fidelity of the Chineese women, and so strictly are they guarded, that cases of this kind seldom happen. The Koran annexes the penalty of 100 stripes to the crime of fornication, in either sex; and in case of adultery, female slaves, whose punishment was half that of free women, received fifty stripes, and the latter were flogged. But in order to convict a woman of adultery, the commentators on the Koran say, that the charge must be supported by four male witnesses, and a false accuser was punished with eighty stripes, and his testimony was deemed for the future invalid.

In the kingdom of Benin, the punishment of adulterers among the lower classes, is the forfeiture of the personal and real estate of the gallant, which the husband seizes and enjoys; and he is therefore anxious to detect the intrigue, as soon as he has occasion to suspect it. The offending wife is driven out of the house with a cudgel, and deemed infamous. Among persons of superior condition, the crime is atoned by a sum of money, which the relations of the wife advance, to prevent the scandal annexed to adultery. Among the governors and magistrates, the crime is punished with greater severity. The woman and her gallant are immediately put to death, if detected in the fact; and their bodies are thrown on the dunghills as a prey to the birds and beasts, without process of law, or form of trial. Hence it is said, the violation of the marriage bed is less known in Benin than in any other country.

In Spain, they punished adultery in men by cutting off that part which had been the instrument of the crime.

In Poland, before Chrisitianity was established, they punished adultery and fornication in a very particular manner: the criminal they carried to the market-place, and there fastened him by the tethicles with a nail; laying a razor within his reach, and leaving him under a necessity either of doing justice upon himself, or of persisting in that condition.

By the law of Scotland, simple adultery is distinguished from that which is notorious and manifest. Open and manifest adulterers, who continue incorrigible, notwithstanding the censures of the church, are punished capitally. The punishment of simple adultery, not being defined by statute, is left to the discretion of the judge; but custom has made the falling of the single echeat one of its penalties.

The Saxons formerly burnt the adulterers, and over her altars erected a gibbet, whereon the adulterer was hanged. In this kingdom, likewise, adultery by the ancient laws was severely punished. By the laws of Ethelbert, any one who committed adultery with his neighbour's wife was obliged to pay him a fine, and buy him another wife. King Edmund the Saxon, ordered adultery to be punished in the same manner as homicide; and Canute the Dane, ordered that a man who committed adultery should be burned, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals. Lib. Hen. I. cap. 12. Doomsday, tit. Celfre. Civil.

Adultery at present is only punished by fine and penance in the spiritual court; or by an action at common law of crim. con. as it is commonly called, for damages; which are assailed by the jury, under the direction of the court, in proportion to the heinousness of the crime and the circumstances of the offender; though some of our law-books speak of adultery as a thing temporal against the peace. If a man takes another in the act of adultery with his wife, and kills him directly upon the spot, though this was allowed by the laws of Solon, as likewise by the Roman civil law (if the adulterer was found in the husband's own house), and also among the ancient Goths; yet in England it is not absolutely ranked in the class of justifiable homicide, but it is manslaughter. It is, however, the lowest degree of it; and therefore the court in such a case directed the burning in the hand to be gently inflicted, because there could not be a greater provocation. Blackft. Com. vol. iv. p. 192, 8vo. As to the adulterers, by our law, she undergoes no temporal punishment whatever, except the loss of her dowry; and she does not even lose that, if her husband is weak enough to be reconciled to her, and cohabit with her after the offense committed. 13 Ed. I. cap. 34.

It is to be observed, that adulteresses are such either by the Canon or Civil Law.

According to the former, a woman is an adulteress, who either being herself married, converts carnally with another man, or being single herself, converses with a man that is married.

According to the latter, she is not an adulteress, if she be not herself in the married state, though she converses with a man that is. The crime, in this case, was more properly called fornication than adultery.

Hence, among the Romans, the word adulteria, adulteress, differed from pellex, which denoted a single woman, who cohabited with a married man; and pellex differed from concubina, which signified her who had only intercourse with an unmarried man. The former was reputed infamous, and the latter innocent.

It is much disputed, whether adultery dissolves the bond of marriage, and be a sufficient cause of divorces, so that the parties may marry again. This was allowed in the ancient church, and is still continued in the Greek, as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent even anathematized those who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Cephalonia, &c. the contrary usage obtains.

The ecclesiastical courts in England so far agree with the papists, that they only grant a divorce a mensa & thoro, in case of adultery; so that a complete divorce, a vinculo matrimonii,
ADULTERY

monii, to enable the parties to marry again, cannot be had without an act of parliament.

By a council of Nantes, marriage was declared dissolved by adultery, but the innocent party was not allowed second marriage. In after-times, leave was given to the innocent party alone; and afterwards the same was allowed to the criminal party.

Adultery, in a moral view, is unquestionably a crime of an atrocious nature, and productive of very injurious consequences. On the part of the man who solicits the chastity of a married woman, it includes the crime of seduction, and is attended with the same mischief. The infidelity of the woman is aggravated by cruelty to her children, who are involved in her flame and made unhappy by the discord and separation of their parents. Should it be said that the perversions consequent from the discovery, and not from the crime, it may be replied that the commission is never secure from discovery; and that if undetected consequences of this nature be allowed, the husband can have no security for his wife's chastity, independently of her principles and disposition, besides her want of opportunity or temptation; which would deter men from marrying, defeat the purposes of the conjugal connection, with respect to domestic order and happiness, and render marriage such a state of jealousy and alarm to the husband, as must end in the slavery and confinement of the wife. Besides, the vows by which married persons engage their mutual fidelity is witnessed before God, and accompanied with circumstances of religious solemnity, which approach to the nature of an oath. The crime is therefore little short of perjury on the part of the offenders; and the seduction of a married woman is little less than subornation of perjury; and this guilt is altogether independent of a discovery. The usual and only apology for adultery is the prior transgression of the other party. This is a circumstance which can merely extenuate, but cannot justify the crime; unless it could be pleaded, that the obligation of the marriage vow depends upon the condition of reciprocal fidelity, for which plea there is no foundation. The way of considering the offence of one party as a provocation to the other, and the other as only retaliating the injury by repeating the crime, is a childish trifling with words.

"Thou shalt not commit adultery," was an interdict delivered by God himself; and in both the Old and New Testament the crime of adultery is represented as distinct from, and accumulated upon that of fornication.

Some have been of opinion, that the history of the woman taken in adultery, recorded in the eighth chapter of St. John's Gospel, gives countenance to this crime. When Christ told the woman, "Neither do I condemn thee;" we must believe, it is said, that he deemed her conduct either not criminal, or not a crime, however, of a very heinous nature. A more attentive examination of this case (says Archdeacon Paley) will convince us that nothing can be concluded from it, as to Christ's opinion concerning adultery, either one way or the other. The design of the persons, whose conduct on this occasion is recorded, and who are said to have tempted Christ, "that they might have to accuse him," was to draw him into an exercice of judicial authority, that they might be empowered to accuse him before the Roman governor of using or intermeddling with the civil government. Christ knew this to be their design, and determined to defeat it. When he asked the woman, "hath no man condemned thee?" he spoke, and was understood by her to speak of a legal and judicial condemnation; otherwise her answer, "No man, Lord!" was not true. In the same sense he uses the word condemn in his reply "Neither do I condemn thee;" i. e. I pretend to no judicial character or authority over thee; it is not an office or business of mine to pronounce or execute the sentence of the law. When Christ adds, "neither do I condemn thee," he in effect tells her, that she had done already; but as to the degree or quality of the sin, or Christ's opinion concerning it, nothing is declared, or can be inferred in this way. — Paley's Principles of Moral and Political Philosophy, vol. i. p. 209-3.

Eliner (Obser. vol. i. p. 183.) and Sancier (Theor. vol. i. p. 205.) have shown, that the word συνεγκαίνοντα, to seduce, is used by the most elegant Greek scholars (as the corresponding word pecore is by the Latin) to signify the commission of adultery; and this strongly intimates, that even the light of nature taught many of the heathens the exceeding insufficiencies of it.

If Christ had undertaken the decision of the case recorded in this history, he must, ipso facto, have rendered himself obnoxious to the Romans, as well as to the Sanhedrim; and if he had condemned her, a new occasion of offence must have arisen, in consequence of that, to Pilate, if execution had been ordered without an application to him; and to the Jews, if Christ had directed such an application to be made. See Doddridge and other Commentators in loc.—and Lardner's Works, vol. i. p. 41, &c.

It is therefore needless to recur to the solution of the difficulty adopted by some biblical critics, who have disputed the genuineness of this passage. By such, however, it has been urged, that this history is wanting in the Syriac version, as well as in the Alexandrian and Bodleian copies, and indeed in most of the oldest MSS, and that it was not acknowledged by several of the Greek fathers, which induced Beza to question, and Le Clerc, with many others, to reject its authority. In favour of this history appeal is made to sixteen copies used by R. Stephens, to most of those consulted by Mills and Beza, to the Harmonics of Tatian and Ammonius, to the apologetical constitutions and the Synopsis of Athanasius, to many of the Latin fathers, to several ancient Syriac MSS. to the Greek and Latin printed copies, &c. Mills and Wetstein in loc. Whitby in loc. Fabricius's Codex Apoc. New Test. tom. i. p. 355, &c. See also Lardner's Works, vol. v. p. 67, &c. &c.

Adultery is also used in Ancient Customs, for the punishment or fine imposed for that offence, or the privilege of prosecuting for it.

In which sense, adulterium amounts to the same with what the Saxons called legerwita.

Adultery is sometimes used, in a more extensive sense, for any species of impurity, or crime, against the virtue of chastity: and in this sense divines understand the seventh commandment.

Adultery is also used, especially in Scripture, for idolatry, or departing from the true God, to the worship of a false one.

Adultery is also used in Ecclesiastical Writers, for a person's invading, or intruding into a bishop's pricke, during the former bishop's life. The reason of the appellation is, that a bishop is supposed to contract a kind of spiritual marriage with his church.

The translation of a bishop from one see to another was also reputed a species of adultery; on the supposition of its being a kind of second marriage, which, in those days, was esteemed a degree of adultery. This conclusion was founded on that text of St. Paul, Let a bishop be the husband of one wife, by a forced construction of church for wife, and of bishop for husband. Du-Cange.
ADV

ADULTERY is also used, by Ancient Naturalists, for the act of ingrafting one plant upon another.

In which sense, Pliny speaks of the adulteries of trees, *arbutum adulterinm*, which he represents as contrary to nature, and a piece of luxury, or useless refinement.

ADULTERY is also used by some fanciful Astronomers and Astrologers, for an eclipse of the sun, or moon, happening in an unusual, and, as they suppose, irregular manner: as in the case of horizontal eclipses, where, though the sun and moon be diametrically opposite, yet they appear as if above the horizon at the same time.

ADUMBRATION, in Heraldry, denotes the shadow of any heaU or charge, outlined, and painted of a darker colour than the field. There is perhaps no instance of this bearing in any English coat; but it is often mentioned by French and German authors.

ADUMMIM, in Scripture Geography, a town and mountain in the tribe of Benjamin, which some place south and others north of Jericho. If, as some say, the road from Jerusalem to Jericho passed through this town, it must have been well of Jericho. Josh. xv. 7—xviii. 17. The mountain of Adummim, which Dr. Shaw alludes to the tribe of Judah, joins to the mountain of Quatrания, and through it, he says, is cut the road that leads from Jerusalem to Jericho; a difficult pass, the mountain of blood, or the bloody road, as the name may import: where probably it was, from the nature of the situation, that the man fell among thieves, mentioned in Luke x. 30. Shaw's Trav. vol. ii. 276.

ADUNA, a river of Susiana, mentioned by Pliny, tom. 1. p. 334.

ADUNICATI, a people of Gaul, in that part which was called the Roman Province.

ADVOCARIA, in Middle Age Writers, a tax paid the lord for his protection; sometimes also called salva-mentum.

ADVOCATE, Advocatus, compounded of ad, in, and vocare, to call, q. d. I call to my aid or defence, among the Romans, a person skilful in their law, and who undertook the defence of causes at the bar. The Roman advocates answered to one part of the office of a barrister among us, viz. the pleading part; for they never gave counsel, that being the business of the jurip-confutis.

The Romans, in the first ages of their state, held the profession of an advocate in great honour and respect; and the fees of their bar were crowded with senators and confusi: they, whose voices commanded the people, thinking it an honour to be employed in defending them.

They were styled comites, homenati, clarissimi, and even patroni; as if their clients were not left obliged to them, than freedmen to their masters. See Patron.

The bar was not at that time venal.—Those who aspired to honour and offices, took this way of gaining an interest in the people, and always pleaded gratis.

But no sooner were luxury and corruption brought into the commonwealth, than the bar became a shamer in them. —Then it was that the senators let out their voices for pay, and zeal and eloquence were fold to the highest bidder.

To put a stop to this abuse, the tribe Cincii procured a law to be passed, called from him Lex Cincia, whereby the advocates were forbid to take any money of their clients.

—Fred. Brunerius has published an ample comment upon this law.

It had before this been prohibited the advocates to take any present or gratuities for their pleading.—The emperor Augustus added a penalty to it, subjecting those who took money to the forfeiture of four times the sum they received: notwithstanding which, the advocates played their part so well, that the emperor Claudius thought it an extraordinary circumstance, when he obliged them not to take above 23s. many selleces as are equivalent to eighty pounds sterling, or upwards, for pleading each cause.

On occasion of Shilias's receiving four hundred thousand selleces, or about 3200l. from an illusrious knight, and afterwards betraying him, the leg cincta, received by Augustus, which prohibited advocates from receiving either money or presents from their clients, was enforced; and Claudius, it is said, allowed advocates to take as much as ten thousand selleces, or about 700l.; but if they took more they were to be prosecuted for extortion. This regulation passed into a law. Nero, in his first speech to the Senate, declared his purpose of reviving and enforcing the ancient laws, by which advocates were forbidden to receive fees. It was an apothegm of Thraesa, who suffered death under this Emperor, A. D. 66, that advocates should undertake only the causes of their friends, of people in difficulty, and such as might tend to set good examples and purify the morals. Pliny, Ep. vi. 29. Alexander Severus gave indulgences to the advocates in the provinces, provided he was well assured that they pleaded without being fed by their clients. But this injunction which disallowed advocates from receiving any thing of their clients was found to be impracticable in its utmost rigour. Accordingly, Constantine did not attempt to revive it; but he pronounces those advocates, who obliged their clients to make over to them the bulk part of their property in land, cattle, or slaves, or who prostituted their talents in this odious traffic, unworthy to be admitted into the company of honest men, and he excluded them from the bar. Cod. Theod. tit. 10. leg. 1.

ADVOCATE is still used in countries, and courts, where the civil law obtains, for those who plead and defend the causes of clients trusted to them.

In the English courts, advocates are more generally called counsel.

In Scotland they have a college, or Faculty of Advocates, about 200 in number, appointed to plead in all causes before the Courts of Session, Justiciary, and Exchequer. They are also intituled to plead in the House of Peers, and other supreme courts in England. A candidate for the office of advocate undergoes three successive trials; the first in Latin, upon the civil law, and Greek and Roman antiquities; the second in English, upon the municipal law of Scotland; and in the third, he defends a Latin thesis, which is impugned by three members of the faculty. Before he puts on the gown, he makes a short speech in Latin to the lords, and then takes the oaths to the government, and is called. From this respectable body of advocates all vacancies on the bench are generally supplied. In 1665, the faculty formed a library upon a very extensive plan, suggested by Sir George McKenzie, advocate to king Charles II., who enriched it with many valuable books. The collection has been gradually increasing, and it now consists of many valuable books on law and other subjects; several original MSS. and a great variety of Jewish, Grecian, Roman, Scots, and English coins and medals.

By the articles of the Union, none are to be named ordinary lords of session, except those who have been advocates, or principal clerks of session for five years, &c.

In France, they have also two kinds of advocates, viz. pleading advocates, advocats plaidsants; and counsel advocates, advocats confutans. This distinction was formed with a view to the two branches among the Romans, advocatus, and juris-confutatis.—Yet there is this difference, that the function of the juris-confutatis, who only gave their advice, was of a different kind from that of the advocatus, being a sort of private
and perpetual magistrature, principally under the first emperors; and the advocati never became jurisconsulti. Whereas, on the other hand, in France, after the advocates had attained to reputation and experience enough at the bar, they quit the busy province, and become a kind of chamber-counsellor. — They had also their advocate general, and king’s advocate, avocat du roy.

Advocate, Lord, or King’s, in Scotland, one of the eight great officers of state, whose business is to give his advice about the making and executing of laws; to defend the king’s right and interest in all public meetings; to prosecute all capital crimes before the judicature; and to concur in all pursuivets before foreign courts for breaches of the peace; and also in all matters wherein the king, or his donor, has interest. — He intends no precedents of treason, except by warrant of privy-council.

The lord advocate is sometimes an ordinary lord of seisin; in which case he only pleads in the king’s causes; otherwise, he is at liberty to plead in all causes.

He is the principal crown-lawyer in Scotland, and has the privilege of wearing his hat when he pleaches in court. The office of king’s advocate is not very ancient; having been established about the beginning of the 16th century. He had not originally the power of prosecuting crimes without the concurrence of a private party; but in 1597, he was authorised to prosecute crimes at his own instance.

Advocate of a city, or town, is a magistrate established in several places of Germany, for the administration of justice in that city, in the emperor’s name. See Advocate.

Advocate is more particularly used, in Church History, for a person appointed to defend the rights and revenues of a church or religious house.

The word advocatus, or advocate, is still retained, for what we usually call the patron, or him who has the advowson, or right of presentation, in his own name.

The abbeys and monasteries had also all their advocates, or advowsons. See Administrator.

There are several other kinds of advocates; as Advocate, confessor, is an officer of the court of Rome, whose business it is to plead on the oppositions made to the provisions of benefices in that court. There are ten of these in number.

Advocates, electors, those chosen by the abbot, bishop, or chapter, a particular licence being had from the king, or prince, for that purpose. The elections were originally made in the presence of the count of the province.

Advocates, feudal, were of the military kind, who, to make them more zealous for the interest of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the bishop or abbot. These were to lead the vassals of the church to war, not only in private quarrels of the church itself, but in military expeditions for the king’s service, in which they were the standard-bearers of their churches.

Advocate, fisci, fisci advocatus, was an officer instituted by the emperor Adrian, to defend the cause and interests of the fiscus, or private treasury, in the several tribunals where that might be concerned.

Advocates, judicial, in the Middle Age, were those who from attending causes in the court of the comte, or count of the province, became judges themselves, and held courts of their vassals three or four years, under the name of the teria platica generalia.

In consideration of this further service, they had a particular allowance of one third part of all fines, or multas, imposed on defaulters, &c., which was called teria bannorum pars, teria denarius, teria pars compositionum, teria pars legum, or mandarum, &c.; besides a proportion of dict for themselves and servants.

Advocates, matricular, were the advocates of the mother or cathedral churches.

Advocates, military, those appointed for the defence of the church, rather by arms and authority, than by pleading and eloquence.

These were introduced in the times of confusion, when every person was obliged to maintain their own property by force; bishops and abbots not being permitted to bear arms, and the secolal or gowned advocates being equally unaccustomed to them, recourse was had to knights, noblemen, soldiers, or even to priests.

Advocates, nominatim, those appointed by a king, or pope. Sometimes the churches petitioned kings, &c., to appoint them an advocate; at other times this was done of their own accord. By some regulations, no person was capable of being elected advocate, unless he had an estate in land in the same county.

Advocates, regular, those duly formed and qualified for their profession, by a proper course of study, the requisite oath, subscription, licence, &c.

Advocates, subalternate, those appointed by other superior ones, acting under them, and accountable to them.

There were divers reasons for the creation of these subordinate advocates; as, the superior quality of the principal advocate, his being detained in war, or being involved in other affairs; but chiefly the too great distance of some of the church lands, and their lying in the dominions of foreign princes.

Advocates, supreme, or foreign, were those who had the authority in chief, but acted by deputies, or subordinate advocates. These were also called principal, greater, and sometimes general advocates. — Such in many cases were kings, &c., when either they had been chosen advocates, or became such by being founders, or endowers of churches. Princes had also another title to advocatechip, some of them pretending to be advocati nati of the churches within their dominions.

ADVOCATIA, in the Feudal Law, the procurement of some public business, committed by a superior to his subject.

Advocatia is also used for the patronage and protection of a church, college, monastery, and the like, in which sense it amounts to the same as adwows.

Advocatia is also used for the protection and defence of lay persons, estates, &c.

ADVOCATION, Advocatio, in the Civil Law, the act of calling another to our aid, relief, or defence.

Advocation, bill of, in Scots law, a writing drawn up in the form of a petition whereby a party, in an action before an inferior court, applies to the supreme court, or Court of Seison, for calling the action from the inferior court before itself.

Advocation, letters of, in Scots law, the decree or warrant of the Court of Seison, upon cognizance of the facts set forth in the bill, drawn up in the form of a summons, and passing under the signet, discharging the inferior judge, and all others from farther procedure in the cause, and advocating it to itself.

The grounds upon which these letters may be sought, are incompetency, comprehending defect of jurisdiction, and reasons for declining competent jurisdiction, arising from suspicion of the judge, or privilege in the parties; and iniquity, which happens when the judge delays justice, or pronounces sentence contrary to law. No cause for a sum below twelve pounds can be advocated from an inferior court to the Court of
of Seffion, unless the inferior judge be incompetent, in which case the cause may be removed from him by advocation, however inconsiderable the subject.

If after letters of advocation are intimiated to the judge, he yet proceeds, his decree will be null, as given fueri mandato.

MacKenzie, Init.

ADVOCATIONE Decimarum, a writ which lies for the claim of the fourth part, or upwards, of the tithe that belong to any church. Reg. Orig. 29.

ADVOCATURA, in Writers of the Middle and Barbarous Age, denotes an inferior kind of jurisdiction, exercised by advocates within the districts of their respective churches, &c. The word is sometimes used as synonymous with advocatio. Du-Cange.

ADVOWEE, in Ancient Customs, and Law Books, denotes the advocate of a church, religious house, or the like.

The word is otherwise written avouer, advouer, and avouer; sometimes advouer; being derived from avouer, to own, or acknowledge.

There are advowees of cathedrals, abbeys, monasteries, &c. Thus Charlemagne had the title of advowee of St. Peter's, and he is said to have been the first on whom this title of advowee was conferred by the pope, for having protected Italy and the church against the Lombards; king Hugh, of St. Riquier; and Baldwinus mentions some letters of pope Nicholas, for which he constituted king Edward the Confessor, and his successors, advowees of the monastery at Weilmünster, and of all the churches in England.

These advowees were the guardians, protectors, and administrators of the temporal concerns of the churches, &c. and under their authority were placed all contracts which related to them.

It appears also, from the most ancient charters, that the donations made to churches were conferred on the persons of the advowees. They always pleaded the causes of the churches in court, and distributed justice for them, in the places under their jurisdiction. They also commanded the forces furnished by their monasteries, &c. for the war; and even were their champions, and sometimes maintained duels for them.

This office is said to have been first introduced in the fourth century, in the time of Stilicho; though the Benedictiones do not fix its origin before the eighth century.

By degrees, men of the first rank were brought into it, as it was found necessary, either to defend with arms, or to protect with power and authority. In some monasteries they were only called congregatoris; but these without the name had all the functions of advowees. The imperial advowee was a magistrate formerly established by the emperors to administer justice, in their name, in the cities of the empire.

There were also sometimes several sub-advowees, or sub-advocates, in each monastery, who obligated instead of the advowees themselves; which, however, proved the ruin of monasteries; those inferior officers running into great abuses.

Hence also, husbands, tutors, and every person in general, who took upon him the defence of another, were denominated advowees, or advocates. Hence several cities had their advowees; which were established long after the ecclesiastical ones, and doubtless from their example. Thus, we read in history of the advowees of Augsburg, of Arras, &c.

The Vindarianes alluded the quality of advowees; and hence it is, that several historians of the eighth century confounded the two functions together.

Hence also it is, that several secular lords in Germany bear mitres for their crests, as having anciently been advowees of the great churches.

Spelman distinguishes two kinds of ecclesiastical advowees. The one, of canons, or procuresses, advocati canonarii; the other, of territory, or lands, advocati foli.

The former were nominated by the king, and were usually lawyers, who undertook to plead the causes of the monasteries.

The other, which still subsist, and are sometimes called by their primitive name, advowees, though more usually patrons, were hereditary; as being the founders and endowors of churches, &c. or their heirs.

Women were sometimes advowees, advocatissa. And, in effect, the canon law mentions some who had this title, and who had the same right of presentations, &c. in their churches, which the advowees themselves had.

In a flat. 25 Ed. III. we meet with advowee paramont, for the highest patron; that is, the king.

There are also advowees of counties and provinces.—In a charter of the year 1187, Berthold duke of Zerlinghen is called advowee of Thuringia; and in the Notitia of the Belgium churches, published by Mileus, the count of Louvain is styled count and advowee of Brabant. In the 11th and 12th centuries we also meet with the advowees of Albia, of Suabia, &c.

ADVOWING, or ADVOWING, ADVOCARE, in Law, see ADVOWEE.

ADVOWSON. See Advocatia.

Advowson, or Advouzen, in Common Law, signifies a right to present to a vacant benefice.

Advowson is so called, because the right of presenting to the church was first gained by such as were founders, benefactors, or maintainers of the church, viz. ratione fundationis, as where the ancestor was founder of the church; or ratione donationis, where he endowed the church; or ratione fundi, as where he gave the soil whereupon the church was built; and therefore they were called advocati. They were also called patronis, and therupon the advowson is called jus patronantis; and he who has the right of advowson is called the patron of the church. An advowson is, strictly speaking, an incorporeal hereditament: for it is not itself the bodily possession of the church and its appendages, but a right of giving to some other person a title to such bodily possession. The patronage can only be conveyed by operation of law, by verbal grant, either oral or written, which is a kind of invisible, mental transfer; and being so vested it lies dormant and unnoticed, till occasion call it forth: when it produces a visible, corporeal fruit, by entitling some clerk, whom the patron shall please to nominate, to enter and receive bodily possession of the lands and tenements of the church. 1. Inst. 119. Fleta, lib. v. cap. 14.

Though the nomination of fit persons to officiate in every diocese was originally in the bishop, yet they were content to let the founders of churches have the nomination of the persons to the churches so founded, referring to themselves a right to judge of the fitness of the persons so nominated. Gibb. ii. ed. 756.

Advowsons are of two kinds. 1. Advowson in gross, or a right subsisting in itself, belonging to a person, and not adhering to any manor or lands as parcels thereof. 2. Advowson appendant, which depends on a manor, as appurtenant to it. This will pass, or be conveyed, together with the manor, as incident and appendant thereto, by a grant of the manor only, without adding any other words.

Advowsons formerly were most of them appendant to manors, and the patron was parochial barons: the lordship of the manor, and patronage of the church, were seldom in different hands, until advowsons were given to religious houses.
heuses. But of late times the lordship of the manor, and
adwosmon of the church, have been divided.

Adowsons are also preseventive, collusive, or donative: pre-
sentive, where the patron presents or offers his clerk to the
bishop of the diocese, to be instituted in his church, if
he be found canonically qualified: collusive, where the
be
necise is given by the bishop, as original patron thereof, or
by means of a right he has acquired by buy, in which case
the bishop cannot present to himself; but he does by the
one act of collation or conferring the benefice, the whole
that is done in common cafes, by both presevation and
institution; donative, as where the king, or any subject by
his licence, founds a church or chapel, and ordains that it
shall be merely in the gift or disposal of the patron, subject
to his visitation only, and not to that of the ordinary,
and vested absolutely in the clerk by the patron's deed of
donation without presentation, instituition, or induction.

This is said to have been anciently the only way of confer-
If, as the law now stands, the true patron once waives this
privilege of donation, and presents to the bishop, and his clerk
is admitted and instituted, the adwoson is now become for
ever presentive, and shall never be donative any more.

Sometimes, anciently, the patron had the sole nomination
of the prelate, abbot, or prior; either by invitiation
(i.e. delivery of a pastoral staff,) or by direct presevation to
the diocesan; and if a free election was left to the religious,
yet a conge d'elire, or licence of election, was first to be ob-
tained of the patron, and the person elected was confirmed
by him.

If the founder's family became extinct, the patronage of
the convent went to the lord of the manor. Unles
the several colleges in the universities be restrained in the number of
adwosons they may receive; it is argued they will in
time acquire such a stock as to frustrate the design of their
foundation, (which is the education of youth,) by creating
too quick a succession of fellows; so that there will not be
in the colleges a sufficient number of persons of compet-
tent age, knowledge, and experience to instruct and form
the minds of the youth. In some colleges the number of
adwosons is said to be already two-thirds, or more, of the
number of fellows. It is objected, on the other side, that
the succession of fellows may be too slow, as well as too
quick; whereby persons well qualified may be detained so
long in colleges, as not to have strength or activity enough
left for the discharge of parochial functions.

Colleges holding more adwosons in number than a moiety
of the fellows, are not capable of purchasing more. Grants
of adwosons by patents are void. 9 Geo. II. c. 36. § 5.
11 Geo. II. c. 17. § 5.

Adwosons are temporal inheritances, and lay fees; they
may be granted by deed or will, and are afeets in the hands
of heirs or executors. The recovery of adwosons, as tem-
poral rights, was effectually provided for by one of the ex-
cellent regulations of Edward I. Before his time the law,
in this respect, was extremely deficient.

Presevations to adwosons, for money or other reward,
are void. 13 Elz. cap. 6. See Burn's Eccl. Law, vol. i.

Adwoson of the Moiety of the Church, is where there are
two several patrons and two several incumbents in the
same church, the one of the one moiety and the other of the
other moiety. A moiety of the adwoson is where two
must join in the presentation and there is but one incumbent.
See Stat. 7 Anne c. 18. In Scotland the right of ad-
wovon is called Patronage.

ADVOWTRY. See Adultery.

ADUR, in Geography, a river of Suffex that falls into
the sea at Shoreham, and admits ships of burden to go up to
the town.

ADUST, ADUSTUS, formed of adureus, to burn, among
Physician, &c. is applied to such humours, as by long heat
become of a hot and fiery nature.

Such is choler supposed to be. Melancholy is usually
considered as black and adult bile.

Blood is said to be a fad, when, by reason of some extra-
ordinary heat, its more subtile parts are all evaporated, leaving
the groffer, with all the impurities therein, half torrid.

ADUSTION, in Surgery, is the same as Cauterization,
and signifies the application of any substance to the
animal body, which acts like fire. See Cautery and
Caustic. The ancient surgeons, especiay the Arabians,
were remarkably fond of having recourse to scalding in local
diseases; but the use of actual heat is very rarely admitted
by the moderns. See Moxa.

ADUSTION, among Physicians, is used for an inflamma-
tion of the parts about the brain, and its membranes,
tended with a hollowness of the spinous and eyes, a pale
colour, and dryness of the body; in which case the yolk
of an egg, with oil of roses, applied by way of cataplasm is
recommended; as are the leaves of turnefol, the parings of
a gourd, the pulp of a pompon, applied in the same manner
with oil of roses.

ADY, in Natural History, a name given to the palm-tree of
the island of St. Thomas. It is a tall tree with a thick,
bare, uprign stem, growing single on its root, of a thin
light timber, and full of juice. The head of this tree shoots
into a vast number of branches, which being cut off, or an
incision being made therein, afford a great quantity of sweet
juice, which, fermenting, supplies the place of wine, among
the Indians.

The fruit of this tree is called by the Portuguese caryocce,
and caraffa; and by the black natives abanga. This fruit
is of the size and shape of a lemon, and contains a kernel,
which is good to eat. The fruit itself is cut roasted,
and the raw kernels are often mixed with mandioe meal.
These kernels are fuppofed very cordial. An oil is also pre-
pared from the fruit, which answers the purpose of oil, or
butter, in Europe.

This oil is also used for anointing swells and contra-acted parts
of the body. Ray.

ADYLISUS, in Ancient Geography, a mountain which
Pliny places in Bocotia.

ADYNA", in Medicine, formed of the primitive a,
dowos, strength, debility or weaknees from fieknes.
Accordingly Adynas, denote those affections of the
human body which form the fecond order of the fecond class
in the arrangement of Dr. Cullen, and which he defines to
be a diminution of the involuntary motions, which either vital
or natural. This is a distinct class in the diftribution of Vo-
gel. It comprehends the genera of syncope, dyspepsia, hypo-
condriasis, and chlorosis. Some naturalists place these under
debilites, and Linneas calls them quidates. See Nosology.

ADYNA MON, among Ancient Physicians, a kind of
weak factitious wine, prepared from must boiled down with
water; to be given to patients, to whom genuine wine
might be hurtful.

ADYRMACHIDE, or ADYRMACHITE, in Ancient
Geography, a people of Libya, inhabiting the sea-coast,
Near the Canopic mouth of the Nile. Herodotus (I. iv.
c. 168.) describes them as resembling the Egyptians in their
customs and manners. Silius Italicus refers to them, lib. iii.
**ÆA**

"Veriscolor contra extra, et felix ab arte.
Ennis Adymachidis, ac levo tegmina curae."

**ADYTUM,** a secret or retired place in the Pagan temples, where oracles were given, and into which none but the priests were admitted. Thus Seneca in his tragedy of Thry-ettes (iv. i. 679)."---Hinc ornatibus
Reponfa dantur certa, cum ingenti fono
Laxantur adyto fata."

The word originally signifies inaccessible; being composed of a, not, and box, or box, to enter.

The *Sactum Sinodorum* or *Holy of Holies,* of the temple of Solomon was of the nature of the Pagan adyton, none but the high-priest being admitted into it, and he but once a year, on the great day of expiation. After the Babylonian captivity this place wanted the ark, the mercy-seat, the felicitas of the divine presence, and the Urim and Thummim; the defect of these causing an imperfection in the Jewish worship, compared with the former state of it, a reformation of which is devoutly supplicated in the Jewish liturgy; particularly in the most solemn part of it which they call *Shemoneh Efreh,* or the eighteen prayers.

**ADZE,** or ** أدז,** a cutting tool, of the axe kind; having its blade made thin, and arching, and its edge at right angles to the handle; chiefly used for taking thin chips off timber or boards, and for paring away certain irregularities which the axe cannot come at.

The adze is used by carpenters, but more by cooperers, as being convenient for cutting the hollow sides of boards, &c. It is ground from a base on its inside to its outer edge; so that when it is blunt they cannot conveniently grind it, without taking its helve out of the eye.

**ADZEL,** in *Geography,* a mean place in the government of Riga, subject to Ruffia. N. lat. 56°. 30'. E. long. 38°. 5'.

**ADZENETA,** a small town of Valencia, in Spain, seated on the mountain *Pegna Golosa,* in which grow multitudes of excellent plants. N. lat. 45°. 30'. W. long. 0°. 16'.

**ADZUD,** a town of Moldavia in European Turkey, nine miles west-south-west of Bokhat.

**Æ,** or **Æ,** a diphthong, or double vowel, compounded of A and E.

Authors are by no means agreed as to the use of the æ in English words.—Some out of regard to etymology, insist on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; while others, from a consideration that it is no proper diphthong in our language, its sound being found not to be that of the simple e, contend that it ought to be entirely diffused; and, in fact, the simple e has of late been adopted instead of the Roman æ as in the word equator, &c.

**ÆA,** in *Ancient Geography,* a considerable and celebrated city and port of Colchis, near the river Phasis, and distant from the sea, according to Pliny, (H. N. i. vi. c. 4. t. i. p. 304.) 15 miles, but according to Stephanus (de Urb. p. 30.) more than 37 miles. It was encompassed by the rivers Hippos, so called from its rapidity, and Cyanos, so denominated from its colour, near their confluence in the Phasis, and thus formed into a kind of peninsula. Some have conjectured that it was the home of the *Æpolis* of Polemy; and that it derived its name either from the Greek æ, earth, or from the Hebrew *א, island.* The Ciree obtained the appellation of *Æa* from this city. See Homer's *Odyf. l. i. v. 32* and Virgil l. iii. v. 386. It is also repeatedly mentioned by Apollonius Rhodius, as a place to which the river was navigable. *Argonautic* l. i. v. 424.—1906. pp. 188. 250. Ed. Hoelzlin. Ovid likewise (in his *Metam.* l. vii. v. 9. tom. ii. p. 446. Ed. Burman.) speaks of the

"Validos Æctias ignes."

Tradition ascribes its origin to the famous Sesostris, king of Egypt, who, after having traversed the whole of Æa with his army, left a colony in Colchis, and there created pillars of stone upon which were engraved, according to *Apollonius,* the names and position of the countries through which he had passed. Pliny and Strabo also represent it as the abode of king *Æa,* and the theatre of the adventures of his daughter Medea. It had a temple dedicated to the god Mars, and another to Phryxsus. It was anciently famous for its gold and silver, and other metals, which might have given occasion to the *Argonautic* expedition, first by Phryxsus and afterwards by Jason. Strabo, *Geog.* tom. i. p. 38. &c. It is now *Lippotam.*

There was another town called *Æa,* in Thessaly; and a fountain of this name in Macedon.

**ÆÆA,** the name of an island, which Mela (l. ii. c. 7.) supposes to have been situated in the bay of Sicily; and to have been the habitation of Calypso: But he has probably confounded the name of this island with that of *Æa* above mentioned; and both the island of Calypso, or Ogygia, and that of Circe, or Æa, are far distant from the coast of Sicily.

**ÆACEA,** in *Antiquity,* solemn feasts and combats, celebrated in *Ægina,* in honour of *Æacus,* who had been their king, and who, on account of his singular justice upon earth, was suppos'd to have a commission given him to be a prince or judge, whose office it was to preside over Elysium, or the region of bliss. This *Æacus,* it is said, was the son of Jupiter and *Ægina*; and when his country was depopulated by a plague, he is reported to have obtained of Jupiter a supply of inhabitants, who, at his requit, converted ants into men; whence they were called Myrmidons, from *myrmex,* ants. The meaning of the fable seems to be that he drew them out of their caves into which they had retired for security, when they were invaded by pirates, and encouraged them to apply to agriculture and commerce; so that by their industry they recovered what they had lost.—See *Ægina.*

**ÆACUS,** in *Entomology,* a species of the *sphinx,* having six yellow points on the fore wings, and the latter yellow, with the margin of an azure colour. It is found in Austria.

**ÆAMENE,** in *Ancient Geography,* a country of the Nabathaens, in Arabia.

**ÆANA,** a city of Macedonia, founded by *Æanus,* son of Elymus, king of the Tyrrhenians, who, leaving his own country, inhabited Macedonia.

**ÆANIS,** a fountain of Locris, situated in the sacred grove called *Æanios lucus,* so called, according to Strabo, from a Greek named *Æanes,* who was killed there by *Patroclus.*

**ÆANITIS,** a country of the Nabathaens.

**ÆANTIDES,** a tribe of Attica, which comprehended six different people, viz. those of *Marathon,* *Æone,* *Phaede,* *Rhammus,* *Tiradea,* and *Tripolythus.*

**ÆANTIONUM,** or *ÆACUM,* a small place in *Æa,* upon a promontory north-west of *Rhathium.* Here, it is said, Ajax was buried. His statue found in this place, was taken away by Mark Antony, and restored by Augustus.

**ÆANTIONUM** was also a town and promontory of Thessaly, in the extremity of the peninsula, which contained Magnesia, opposite to Thebes of Thessaly, and at the entrance of the Pelagic gulf.

**ÆAS,** a river of Greece, which sprang from Mount Pindus, and flowed into the Adriatic sea, about 10 stadia from the city of *Apollonia.* This is supposed to have been the same with the river *Æous.* Strabo, tom. i. p. 486.
ÆAS, or AIAZ, a mountain of Egypt upon the Red Sea. 
ÆBUDÆ, a name given by ancient Geographers to the Western isles of Scotland. 
ÆBURA, a town of Spain near the Tagus, in the province of Caffile; now Tábara la Reina. 
ÆCÆ, a town of Italy, in Magna Græcia. 
ÆCCANI, a people of Tuscany, near the city, formerly called Æcas, to the South of Lucania, and now Troia. Phœn. H. N. tom. i. p. 168. 
ÆCHILIS, a people, who lived, according to Ptolemæus, in the northern parts of Sardinia. 
ÆCHMALOTARCHA, in Antiquity, a Greek term, signifying the chief or leader of the Jewish captives in Babylon. 
The Jews who refused to follow Zerubbabel, and return with him to Jerusalem, after the Babylonish captivity, created an Æchmalotarcha to govern them. The Jews, indeed, did not call him by this name, as some authors have asserted, for that people spake Hebrew, or Chaldee, and not Greek. But Oigens, and others who wrote in the Greek tongue, rendered the Hebrew name Ἐχμαλοταρχάς, q. d. chief of the captivity, by a Greek term, Ἐχμαλοταρχαῖος, formed from Ἐχμαλ, captive of αἰχμή, spear, and ταρχαῖος, commander or chief. 
However, the Jews seem to have had officers of this kind before the return from Babylon, as we may infer from the history of Susannah; the two elders who condemned her being supposed to have been Æchmalotarchæ that year. 
The Jewish writers allude us that the Æchmalotarchæ were only to be chosen out of the tribe of Judah. 
The eastern Jews had their princes of the captivity, as the western Jews had their patriarchs. The Jews are said still to have an Æchmalotarcha at Babylon, but without the authority of the ancient ones. One person of this description, elected from the house of David, was formerly acknowledged and honoured as a prince among the Jews, and had some sort of jurisdiction, as far as it was consistent with the government to which they were subject; and it was sometimes allowed and ratified by the reigning princes. But if such an officer now exist at Babylon or elsewhere, he is merely the head of the sect in that place, without sword or sceptre, or any power of coercion, or authority of jurisdiction, besides what he derives from the voluntary submission of the Jews, who inhabit such places. Nothing, therefore, can be more vain than the pretence of the Jews, that by this Æchmalotarcha, the sceptre and law-giver are preferred in the tribe of Judah; and that the prophecy of Jacob (Gen. xlix. 10.) is not yet fulfilled by the advent of the Messiah. 
ÆCIDIUM, in Botany, a genus of the cryptogamia fungi class and order; its characters are, that it has a membraneous sheath, smooth on both sides, and full of naked separate seeds. Gmelin enumerates 18 species, some of which belong to the Lycofìridon of other authors. Several of these are found on the leaves of other plants; and one of them is known to agriculturists by the name of the Red Gum. This species usually grows upon the inside of the glumes of the calyx, and of the exterior valvule of the corolla, under their epidermis; which, when the plant is ripe, bursts, and emits a powder of a bright orange colour. This little plant, says an ingenious observer, (Linnean Trans. vol. v. p. 122) does not appear to be materially injurious to the grain, if at all. He has seen ears full of it, with very plump kernels; and has also found it upon branded ears. Before the cuticle, which covers the seed of this fungus, bursts, it has very much the appearance of a pustule upon the human body. Other species grow on decaying wood and mosses, and in the leaves of tuftillago farfara and petalites, Barilia viscosa, and monile nemorosa, Adoxa mosaëtella, Carduus arvensis, and Betonica officinalis, &c. 
ÆCLUS, in Entomology, a species of Papilio, with the wings black above, cinereous beneath, waved with black, and with a yellow occluded spot. It is found in Ambony. 
ÆCULANUM, or Æcclus, in Ancient Geography, a town of the Hapnia, Italy, situate between Beneventum and Tarentum. The inhabitants are called Plinius (Annals i. p. 167.) Æclanii, and in an ancient inscription of Guter Æclanovæ. The town, according to Claudius, is now called Fractensis. 
ÆDEA, in Entomology, a species of Papilio, with wings spotted with white, the anterior greenish, the posterior marked with a yellow band; found in South America. 
ÆDELITE. See ZELITE. 
ÆDEPSI Therma, baths of Ædipus, in Ancient Geography, the name of a city in the island of Eubœa upon the western coast. The baths were consecrated to Hercules. 
ÆDES, in Antiquity, a chapel, or inferior kind of temple, distinguished by this, that it was not consecrated by the Angurs, as those properly called Temples were. Such was the erarium, or treasury; called Ædes Saturni. 
ÆDESIIUS, in Biography, the disciple and successor of Jabælius, lived in Cappadocia, and, after the example of his master, pretended to supernatural communications with the Deity, and practised theurgic arts. Of the events that occurred to him the most ludicrous is this: viz. That, in answer to his prayers, his future fate was revealed to him in hexameter verses, which suddenly appeared upon the palm of his left hand. Towards the close of his life, he committed his school at Cappadocia to the care of his disciple and friend Euflathius, and removed to Pergamus, where he had a numerous train of followers. Brucker's Hist. Phil. by Enfield, vol. ii. p. 75. 
ÆDICULA, in Antiquity, a term, denoting the inner part of the Ædes or temple, in which the altar and statue of the deity were placed; but the term had various acceptations. It sometimes denoted a low small building, or Ædes parva, consecrated to some divinity; it often signified a niche in the wall for receiving a statue, and those especially of the Lares or Penates; and sometimes the representations of temples, which were offered and suspended in the temples of the gods, and more especially in that of Diana of Ephesus. 
ÆDICULUS, in Roman Mythology, the deity who presided over the construction and consecration of buildings. 
ÆDILATE, in Antiquity, the dignity or magistracy of the Roman Ædiles. This is otherwise called Ædiles. In inscriptions we find it represented by the abbreviated ÆD. 
ÆDILE, ÆDILIS, in Antiquity, a Roman magistrate, vested with divers functions, chiefly that of superintending the buildings both public and private; as baths, aqueducts, roads, bridges, cauceways, &c. The word is formed of Ædes, temple, or house, on account of their having the care of temples, houses, &c. 
The Ædiles at Rome corresponded to what the Greeks called agoranomi, and ofynomi; they differed from scevnoni and archæis, who were rather receivers of the revenues; also from hologes, curatores, and pares civitatis. 
To the Ædiles belonged the inspection of the weights and measures. They fixed the rate of provisions, and took care the people suffered no exactions. The inquiry and cognizance of debauchees, and disorder in public houses, likewise belonged to them; they were also to revive comedies; and it belonged to them to treat the people with grand games and spectacles, at their own expense. They were likewise to attend on the tribunes of the people. 
To the Ædiles also belonged the custody of the plebeia, and the census and examination of books. They had the power,
power, on certain occasions, of infilling edicts; and, by degrees, they procured to themselves a considerable jurisdiction, the cognizance of various causes, &c.—This office ruined numbers by its expensiveness; so that in Augustus's time, even many senators declined it, on that account.

All these functions, which rendered the ediles so considerable, belonged at first to the ediles of the people, ediles plebis, or minores; these were only two in number, and were first created in the same year as the tribunes: for the tribunes, finding themselves opposed with the multiplicity of affairs, demanded of the senate to have officers, with whom they might intrust matters of less importance, and accordingly two ediles were created; and hence it was, that the ediles were elected every year, at the same assembly as the tribunes. These plebeian ediles continued in the sole possession of the office during the space of 127 years, from the year of Rome 267, when they were appointed, to the year 394. But these ediles having refused to celebrate the great games, on occasion of the reconciliation that took place between the Senate and people in consequence of the grant that one of their orders should be confidual, because the celebration was attended with an expense which they were unable to support, the Patricians offered to undertake the charge, upon condition that they should obtain the honours of the edilship. Their offer was accepted with gratitude; and the Senate passed a decree for the election of two ediles annually out of the order of the patricians. From this time there were two kinds of ediles at Rome; the one were called Plebeian Ediles; the other were called Ediles Curules, or Majori, i.e. Curule Ediles, because they had the right of sitting in a Curule chair, adorned with ivory, when they gave audience; whereas the plebeian ediles sat on benches; and this chair was placed in the chas-riot in which they were carried; a distinction annexed to the great offices of the commonwealth.

It is not easy to describe exactly the different functions of these two kinds of ediles. It is probable, however, that the curule ediles shared all the ordinary functions with the plebeian; but their principal and distinguishing office pertained, according to Cicero, in the list of his orations against Verres, (Opera t. 4. p. 524. Ed. Olivet.) to their presiding in the games celebrated in honour of different divinities, to the care of the sacred ediles, and to the civil government of Rome in general. They were also appointed judges in all cases relating to the selling or exchanging of allies. The distinctions which these ediles enjoyed were the right of giving their opinion in the Senate, not according to the date of their admission into that body, but a more honourable rank, the robe called togas praetexta, the curule chair, and the right of having images, which were set up in their halls and carried in pomp at their funerals; all of which were privileges that were annexed to the great offices of state.

The first curule dignity held at Rome was the edilship, and the age for entering into that office was 37. In two years it was succeeded by the praetorship, and after the like interval, by the office of consul. The manner in which the office of edile was sustained, and particularly in the exhibition of games, very much contributed either to gain or alienate the attachment of the people with respect to the other dignities. The expense attending the games and fests was, in some cases, enormous. Cicero was moderate, as he informs us in his Offices, 1. 2. apud oper. tom. 3. p. 553. Ed. Olivet. But the expenses of others in that department of their office which respected the games were so exorbitant, as to give Livy reason for observing, that the revenues of the most opulent princes would hardly suffice to support them. Of this fact we have a memorable example in the edilship of M. Scaurus, in the 69th year of Rome. So that Play, (L. 36. c. 15.) from the almost incredible profusion, which this edile bestowed upon the theatre which he erected, took occasion to exclaim, that the edilship of Scaurus finally ruined, and subverted the manners of the public.

Augustus transferred the care of the public fests and sports to the praetors, and would not allow them to be exhibited at their own charge, but obliged the people to contribute a part, and paid the rest out of the public treasury.

To each of these four first ediles Cæsar created a new kind, called ediles cereales, as being deputed chiefly to take care of the corn, which was called donum Cerevis; the corn being a great part of the dress and subsistence of the Romans. These ediles cereales were also taken out of the order of patricians. In the municipal cities there were ediles, with the same authority as at Rome.

We also read of an edilis alimentarius, expressed in abbreviation by Edil. alim. whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office.

In ancient inscriptions we also meet with ediles of the camp, ediles castrorum.

Adilis, in Entomology, a species of the Cerambyx with a smooth glossy thorax, marked with white yellow spots, and orange yellow antennae. It is found in the trunks of trees in Europe, and is also called Capricornus Rugiceps.

Adilitium edicum, among the Romans, was the kind of place where the edil, in order to give a remedy, was given a buyer, in case a vicious, or unprofitable, or slave, was sold him. It was called adilitium, because the preventing frauds in sales and contracts belonged especially to the curule ediles.

Aditus, in Antiquity, the keeper of a sacred mansion, who had the care of the offerings and ornaments of the deity to whom it was peculiarly devoted.

The word is compounded of aditus, and tuor, I defend, q. d. a tuendis aditus; originally it was written aditium. The aditus is the same as that which Scævola calls hierophylos, the Latins sometimes naming it aditus, and the Greeks ναός, answering to the fexon among us.

The aditus, among the Romans, were officers of distinction, being the depositaries not only of the treasure, but of the public acts, or records. The aditus had their several cells, near the temple, the custody of which was committed to them. Struvi. Ant. Rom.

The female adities had a female officer of the same kind, under the denomination aditina.

Aditus, Martin, in Biography, born at Amsterdam, was first physician to Frederic II. king of Denmark. Adrien Jonghe, dedicated his treatise "De Coma" to him, published at Eâle in 1558, whence it appears that he was then in high repute.

Eōdia, the fame as Pudenda.

Ædon, in Ancient Geography, an island of Marmara, on the borders of Egypt.

Æodon, in Ornithology, a species of Muscicapa.

Ædui, in Ancient History, a denomination given to the most ancient and powerful people of Gaul, who were situated between the rivers Seine, Loire and Saone, within the 46th and 47th degree of latitude; and who were the only allies Caesar had at the time of his invading Gaul.

Their country was fruitful, and furnished abundance of corn. Their principal city was Bibrae or Augustodunum, now Autun. The form of their government was aristeocratic; and they chose their chief magistrate annually.
This government only halted till the establishment of the Romans in Gaul. The Adii then occupied the countries comprehended in the dioceses of Autun, Chalon, Macon, and part of that of Dijon. Their allies and their subjects comprehended the rest of La Bourgogne, La Bresse, Le Lyonnais, Le Beaujolais, Le Forez, Le Bouronnais, and Le Nivernais.

AEUSII, allies of the Romans, bordering upon Celtic Gaul.

AEG, in Ancient Geography, a river of Phocis:—a town of Alvonia:—in island between Tenedos and Chios:—and a promontory of Alia Minor in Alvola.

AEADES, AEAGATES, or AEAGUS. Infusa, three islands lying north of Cape Lilybæum, or on the west side of Sicily opposite to the main land between Marsella and Trapani; viz. Phorbutania, or Bucina, as Pliny calls it, Eufja or Caparria, and Hiera, called also Maritima. The first is now called Lavanzo, the second Favignana, which is very fruitful, and the third Marzanta. In these islands the Romans under the Confid L. Calatus obtained a signal victory over the Carthaginians, which terminated the first Punic war.

AEGAE, or AEGEAN, is derived, as some have supposed, from the genitive Aegon of Aeg, a goat. See AEGEA. But several ingenious moderns, and particularly the Abbé Ber- gier and M. Gobelin, tracing the origin of the name to its primitive roots aeg, aeg, have found that these words, in the Pelasgic and Celtic languages, denote waters or maritime countries; and they have concluded, that the appellation Aega is derived from the vicinity of the places to which it is applied to waters, or from their being better adapted to maritime commerce than other places. Accordingly they add, that Neptune was particularly honoured in the Aegaean cities.

AEGE was a city of Cilicia on a promontory in the gulf of Issus, having Issus to the north-east, and Mallos to the north-west;—it was also a town of Macedonia, called AEGEA and EDessa:—a town of the Thracian Chersonesus, probably AEGOS Polanos:—a town in the Myrrhaia, a country of Aolis, south of Cuma and east of Phocaea, on the border of the gulf, which town, as Tacitus informs us, was overwhelmed by an earthquake:—a town of Lydia:—another of Locra:—another of Aetolia:—another of the island of Cos, where they had a temple of Neptune:—and another of Achaia, on the gulf of Corinth, at the mouth of the river Crathis, (see Homer I. ii. viii. v. 208.) In AEGE of Cilicia there were medals of gold, bronze, and silver. The symbol was half a horse;—and rich imperial medals were struck here in honour of several of the Roman emperors. In AEGE of Macedonia, the medals were silver, gold, and bronze; and the common type was a goat. In AEGE of Aolis, which was governed by pretors, there were struck Greek imperial medals in honour of some of the Roman emperors.

AEGEUS, the name of a river, mentioned by Suidas, in the island of Coreia. Stephanus Byzantius, and Eufatius speak of a canton in Phocis, under the name of Campus Aegaeus, (πεδίον αειγαεων) taken from a river Aegaeus which runs there.

AEAGROPILA or AEAGROPILUS, in Natural History, and in Veterinary Medicine, is a ball generated in the flomachs of some animals. There are two species of intelligent collections that have this appellation, but which are entirely dissimilar. The one is composed of hair, and is very usually found in the flomach of the rupicapra, or chamois goat. The other species is truly a calculous concretion, which is found more frequently in the intestines of different animals, particularly of horses. It is this kind that is sometimes called bezoar Germanicum, or the German bezoar. The word is Greek, from αυξησις, the rupicapra or rock goat; and παιζειν, a ball. See Balls, and Hair-Balls.

AEAGROPILA, in Botany, a species of Conifera, with very rumose filaments closely united from the centre, and constituting a globe.

AEAGRGUS, in Zoology. See Goat and Ibis.

AEAGUS, or AEGEA, now Phocaea, was an ancient capital of Macedonia, the residence of Caranus, the first king of Macedon, and the burial-place of the kings of his line to the time of Alexander the Great. It derived its appellation, as it is pretended, from the following circumstance. Caranus, who was by birth an Argive, leaving his native country at the head of a considerable body of Greeks, was under- mined where they should settle. But upon consulting the oracle, he was instructed to establisth his empire according to the direction of the goats. Ignorant of its meaning, he pursued his course to the country, afterwards called Macedon, and approached Edessa the capital of the small kingdom Amathia, governed by king Midas. The sky was overcast, and a storm succeeded; upon which Caranus observed a herd of goats running for shelter into the city. This circumstance reminded him of the response of the oracle; and, commanding his men to follow him, he entered the city by surprie, and thus poifoned himself of it and of the whole kingdom. In gratitude to his conductors he changed the name of the place into Aega, and called his people Aegaeans or Aegacists; and introduced a goat into his standard in commemoration of the event. In the book of Daniel, the he-goat is the symbol of Macedonia. Pliny, li. iv. c. 10. tom. i. p. 200. Ed. Hard. Medici's Works, B. iii. Comment. Apoc. p. 473.

AEGEAN Sea, a name given by the ancients to that portion of the Mediterranean, which extends from the promontory of Sunium and the island of Crete, as far as the Hellespont. It is now the Archipelago, separating Europe from Asia, washing on one side Greece and Macedon, and on the other Caria, Ionia and Phrygia. The origin of the appellation Aegaean has been variously assigned. Felus has recorded three etymologies; one that is derived from the numerous islands that are scattered over this sea, and which appear at a distance like a herd of goats; another, because the queen of the Amazons perished in it; and a third, because Aegus the father of Theseus threw himself headlong into it. Volusius, however, and many other learned persons, are not satisfied with either of these etymologies; but conceive it to be derived from αυξησις Doriz̆us flactus; and that the waves are denominated αυξη̄ς, i.e. goats, on account of the leaping motion of these animals. See Aega.

The navigation of this sea, which abounds with islands to the number of 55, from Tenedos to Crete, according to the enumeration of ancient geographers, and which are comprehended under the two general denominations of Cyclades and Sporades, is both difficult and dangerous; whence proceeds the proverb, he fails on the Aegean sea, or Αυξη̄ς πλησιος; applied to a person who engages in a hazardous undertaking. The Aegean sea is usually divided into seven parts, viz. 1. The sea of Crete, between that island
island and the Peloponnesus. 2. The Myrton sea, before Peloponnesus and Attica. 3. The sea of Greece, along the coast of Greece. 4. The sea of Macedonia, on the coasts of that kingdom and of Thrace. 5. The Aegean sea, properly so called, between Euboea and Lemnos. 6. The Icarian sea, towards the island of Icarus. 7. The Carpathian sea and that of Rhodes, lying between this island and that of Crete. The principal rivers running into this sea are the Alfeon, Eriden, Axios, Strymon and Nestus. The Aegean sea was particularly favourable to commerce by means of the spacious bays that were formed by it on the Asiatic coast, of which the most remarkable were the Strymonic, Sintitic, Toronac and Thermian.

ÆGIS or ÆGIS, a tribe of Attica, so called from Ægis the son of Pandion, contained 16 boroughs or towns.

ÆGELETHRON, in Botany, a name used by some authors for the common marcescens, or English mercury, an eatable wild herb.

ÆGELE, in Ancient Geography, a people of Media in Asia, supposed by some to be the same with the Æghi mentioned by Herodotus.

ÆGELICA, a town of Macedonia, which, as Livy informs us, was surprized by Attalus.

ÆGEON, in Entomology, a species of Scarabeus, of a red colour, with the horn of the thorax short and incurvated and bearded beneath; and that of the head recurved and fusilulate. It is found in South America and India.

ÆGEONIS Promontorium, a promontory of the Euxine Sea, at the mouth of the river Rhynchos, or on the confines of Mytilus and Bithynia.

ÆGERI, or ÆGER, in Geography, a community of Switzerland, which forms with the town of Zug, and the community of Menfingen and Dar, the sovereignty of the canton of Zug. It is divided into two parishes; the higher Ægeri, where the council of the community is held, and lower Ægeri or Wilegeri near the lake Ægeri, which is a league in length and very deep, and abounds with fish. The river Lorez runs into it.

ÆGERIA, in Entomology, a species of Papilio, with dentated brown wings, spotted with yellow, and with an ocellus on both sides of the anterior wings, and four ocelli on the upper side of the posterior wings, and four points under them. It is found on the grapes in Europe.

ÆGESTA, a town of Sicily, called also Segesta. It is now Barbara.

ÆGETA, Aceta, or Egeta, a town of Upper Mafa on the Danube, probably the Egeta of Pтолемей, is placed by M. d'Anville near Trajan's Bridge, south-west of Zermes.

ÆGEUS, in Fabulous History, was king of Athens, and father of Theseus. Minos king of Crete, having subdued the Athenians, in a war occasioned by their murder of his son, inflicted upon them this penalty; that they should annually send into Crete seven of the noblest of the Athenian youths to be devoured by the Minotaur. After three years Theseus was sent; the young prince killed the Minotaur; but having forgotten to change the black tail into white upon his return, according to the instructions given him by his father, Ægeus conceiving him to be dead, cast himself headlong into the sea, which, from this circumstance, fays the fable, obtained the name of the Ægean sea. The Athenians decreed divine honours to Ægeus, and sacrificed to him as a marine deity, the adopt deon of Neptune.

ÆGICACUS, or ÆGIOCHUS, in Mythology, a name given to Jupiter, on account of the goat Amalthaea, by which he was suckled.
arrow, he would not suffer the wound to be dressed, that he might exercise his fortitude in bearing pain.

AEGIDUS de COLUMNa, a Roman monk of the Augustinian order, was preceptor to the sons of Philip III. of France, and taught philosophy and theology in the university of Paris with so much reputation, that he was honoured with the appellation of "The most profound Doctor." After being advanced to the rich bishopric of Berri, he died in 1316; leaving behind him on his monument the character of "Lux in lucem reducens dubia;" i.e. the luminary that brought dark things to light; a character which his writings, on account of their profound and unfathomable obscurity, do not justify. Brucker's Hist. Philol. en Enkeld, vol. ii. p. 379. His "Lucubrations on the Sentences of Lombard," were printed at Bafi, in 1623. His work "On original Sin," in 4to. at Oxford, in 1479; and his "Questiones Metaphysicae et Quodlibeticae," at Venice in 1501.

AEGIDIUS Carboneus, or Gilles de Corell, canon of Paris, was physician to Philip Augustus, king of France, and lived about the end of the twelfth century; "ex Salernitana Schola, Haller says, Medicus et Poeta." He wrote a treatise, "On Compound Medicines," in Latin verse, which has not been printed; also "Liber unus de Urinarum judiciae, et de Pulibus liber unus, Venetiis impress. 1494, cum Expeditione et Commento M. Gentilis de Fulgingo," reprinted at Lyons 1509, and at Bafi 1579.

AEGILA, in Ancient Geography, a borough of Laconia, in the Peloponnesus. Paulusimus (p. 320) informs us, that it had a temple of Ceres, in which Areitomenes, a general of the Messenians, surplified an assembly of women, who were celebrating a feast in it; and that the women not only defended themselves, but repulsed him, without any arms besides the knives which they used for their sacrifices; and that he escaped merely by favour of Archidama, a Messenian female, whose affection he had engaged.

AEGILA. See AEGYLA.

AEGILA, one of the boroughs of the tribe of Antiochides in Attic.

AEGLION, an island, called also Caparia, now Carigotto.

AEGILIPSA, a place of Greece in the vicinity of Ithaca, restored near Crocia of Epirus. Homer's II. ii. v. 633. AEGILPS. See IGILPS.

AEGILPS, formed of any w. goat's face, on account of its roughness, wild Jnychus, in Botany, a genus of the monoeic order, and polygynia clados, and of the natural order of gramin or graffes; the characters are, that the hermaphrodite calyx is a large bivalvular glume, subtaining three flowers, and that the valves are ovate, truncate, streaked with various awns; the corolla is a bivalvular glume, the outer valve ovate, terminated by a double or triple awn, the inner lanceolate, ovate, awnless, with the edge bent in longitudinally; the calyx two-leaved, with ovate, flat, transparent, very small leaflets; the flamina have three capillary filaments, with oblong anthers; the pistillum is a turbinate germen, the styles are two and reflex, with hairy stigmas; no pericarpium; and the seeds are oblong, convex on one side, grooved on the other, with the inner valve of the corolla adhering to it, and not opening. There are four species: viz. ovata, caudata, truncata, and squarrosa; to which Gmelin adds the aromatica and fuscata; and he ranks this genus under the triandria digynia clados and order. The fruit of these grasses is wild in the southern countries of Europe, and was cultivated in 1683, by Mr. James Sutherland; the second was found by M. Tournefort in Crete; the third grows about Montpelier, Marvilles, Nice, and Smyrna, and was introduced in 1776 by M. Thouin; and the fourth was found by Tournefort in the Levant, and by Cavanilles in Spain. They all seem to be annual.—Martyn's Miller's Dict.

AEGLOPS is also a name given to the holm-oak, a species of the QUERCUS; to the wild oak, a species of the AVENA; to a species of the ANDROPONION, and to a species of the BROMUS. Aeglops incurvata is a species of the rutbella.

AEGLOPS, or AEGYLOPS, in Surgery, an Abscess seated near the inner angle of the eye, which is so called from its giving a calling of that organ resembling a goat’s eye, (from αἰγόν, a goat, and ὀψ eye.) It has been noticed by Virgil, "Tranversa tuentibus Hircis." The finouity, which we now indifferently call fistula lachrymalis, in its incipient state, was named Archilops by some of the ancients; but, in its stage of suppuration, it was termed aeglops. For the description and treatment of this disorder, see Fistula Echrymalis.

AEGIMURUS, in Ancient Geography, a small island in the Gulph of Carthage, about thirty miles from that capital. Phyn, (H. N. tom. i. 251.) informs us, that there were two rocks near this island, called the are eginuri, or egimuri, which, according to Servius, were the remains of an island, some ages before his time, absorbed by the sea. This author likewise informs us, that they were called are, because on them the Romans and Carthaginians concluded a treaty, and made them the limits of their respective dominions. Virgil refers to these in his Aeneid. l. i. v. 113.

"Saxa vacant Itali, medieeque flucibus arm." The modern Zouawmaore, or the Zimbra of our sea-charts, lying betwixt Cape Zibec and Cape Bon or Ras-addar, is the Aegimurus of the ancient. The gulph in which this island lies, is remarkable for its great depth as well as breadth, and on this account was justly named by Virgil, Aeneid, i. i. v. 163. See above, a long reef. Shaw's Trav. p. 76. 4to.

AEGINA, an island in the Saronic gulph, or bay of Engina. It was more anciently known by the names of Oenone or Oenopia, (Plin. tom. i. 209.) and Myrmidonia, from its inhabitants the Myrmidons, so famous among the poets. It was called Aegina by Aeacus, who reigned in this island, from the name of his mother, the daughter of Aeglops, king of Eocotia, who was debauched by Jupiter, as fabulous history reports, in the similitude of a lambent flame, was removed from Epidaurus to this defart island, It is now called Aegina, and is one of the islands of the Archipelago. It lies between the territory of Athens, and that of Epidaurus, eighteen miles distant from the coast of Athens, and fourteen from Peloponnesus. It is about twenty-six miles in circuit, and had anciently a city of its own name, which being destroyed by an earthquake, the inhabitants were exempted by Titberries, for the space of three years, from paying any kind of tribute. Paulusimus (in Corinth. c. 12.) speaks of two magnificent temples in this island, the one consecrated to Venus, the other to Jupiter. The latter was built upon the summit of a mountain called Panellenides by Aeacus, in order to propitiate Jupiter in a time of drought; who was supplicated under this epithet, and granted to his votaries rain. The temple was of the Doric order, and had six columns in front, and chains a very remote antiquity: its remains, in a very ruined state; indicate its original magnificence. The soil of this island was at first very fliny and barren; but being cultivated by the inhabitants, it became very fruitful; and hence, says Strabo, (tom. i. p. 576.) the inhabitants were called Myrmidons,
Myrmidons, i.e. *commets*, from their industry. This island was first peopled by the Epidaureans, who were originally Dorian, and afterwards by colonies from Crete and Argos. These were, in process of time, driven out by the Athenians, and the Athenians by the Laconians, who restored the island to the ancient proprietors. The *Ægipians* applied themselves, in a very early period, to trade and navigation, and sent colonies into the neighbouring islands of Imbros and Crete, in the latter of which (fays Strabo) they built and peopled the city of Cydon. The first money, according to the same writer, was coined in *Ægina* by one Phidias. Pliny (tom. ii. p. 640.) comments on the brass of this island, and affirms that the famous statue of this metal, representing an ox, which floated in the forum boarium at Rome, was carried from hence to adorn that capital. The *Ægipians* were originally governed by kings; but afterwards introduced the republican system, which became so powerful as to vie even with Athens. Æneas, from whom sprung the Ædichus, who reigned in different countries with reputation and power, was the second king of this island; and, according to Macrobius (*Adv. verius Gentes*, i. vi. p. 131.), he lived about two generations before the Trojan war, and was the first who built a temple in Greece. Upon the dissolution of this monarchy, the *Ægipians* became subject to the Epidaureans; but applying themselves to navigation, they became powerful by sea, and revolted from their masters, ravaged their territory, and carried away the two famous statues of Damas and Auckenas. This occasioned an irreconcilable enmity between the *Ægipians*, and Athenians. This island was at last reduced by the Athenians, and continued subject to them, till, at the end of the Macedonian war, it was declared free by the Romans; but in the reign of Vespasian it underwent the same fate as the other states of Greece. In the year 1536 it was subdued by the Turks, after an obstinate resistance: the capital was plundered and burnt; and after a great slaughter of the inhabitants, the rest were carried away into slavery. The population of this, as well as of other little states, in the times of their splendour, was immense. *Ægina* had once 420,000 slaves, the proportion of whom to freemen was, in ancient republics, according to the monopoly of wealth. In Greece it is supposed to have been about twenty to one. The most remarkable circumstance related by modern travellers concerning this island is, that it swarms with partridges, and that for preventing their increase the people go out every year to break their eggs: fearing, left, by decreasing their corn, these birds should produce a famine. They have no hares, foxes, or wolves in this island. In summer the rivers are dry. The waiwode or governor farms the revenue of the Grand Seignor for twelve purves, or 6000 piastras. About half this sum is repaid annually by the carach-money, or poll-tax.

The town of *Ægin*, so called by corruption from *Ægina*, is said to consist of about 800 troops, and has a cattle, and near it may be seen the remains of a magnificent structure, which was probably one of the celebrated temples which formerly graced this island.

Imperial Greek medals were struck in this island, in honour of Elagabalus and Phaetilla.

*ÆGINETUS*, Paulus, in *Biography*, a celebrated surgeon of the island of *Ægina*, from which he derived his name. He is placed by Le Clerc in the fourth century, but by Abulpharagius in the seventh. He was eminently skilled in surgery, and his works are frequently cited by Fabricius ab Aquapendente, and indeed form the basis of this author's valuable treatise. He is the first author that takes notice of the cathartic quality of rhubarb. He begins his book with the description of women's disaffairs, and he is said to be the first person among the ancients that defers the application of a man-midwife. His works are Libri viii. de Re Medic, et sunt opera omnia Graecae, Venetiis 1528, fol.—Idem ex interpret. & eum Ann. I. Guinerti Aeneidae Venet. 1542, 8vo.—Id. eum Ann. J. Cae. Goupylii ex ed. cum Schol. J. Bap. Camoti Venet. 1553, 8vo.

*ÆGINETUS*, in *Ancient Geography*, a small town of Paphlagonia, and also a small river of the same province in Asia Minor.

*ÆGINETIA*, in *Botany*, a species of *Orobanchus*, with a single-flowered stalk, and a tuberculous flower.

*ÆGINHARD*, in *Biography*, a native of Germany, who was educated by the munificence of Châlemagne, and who afterwards became his secretary, and as some suppose his son-in-law, by marrying his daughter Ínma; but it has been lately proved that he was not the daughter of Châlemagne. He is said to have been carried through the snow on the shoulders of the affectionate Ínma, that his footsteps might not be traced from her apartments by the emperor her father. This story was copied by Adelphon from an old German Chronicle, and admirably embellished by this elegant writer in the third volume of the Spectator. Æginhard, after the death of his wife, which he deplores in a letter still extant, is supposed to have passed the remainder of his days in religious retirement, and to have died soon after the year 840. His life of Châlemagne, his Annals from 741 to 889, and his letters, are inserted in the second volume of Duchesne's Scriptores Francororum. An improved edition, with the Annotations of Hermann Schminke, was printed in 1711.

*ÆGINIUM*, in *Ancient Geography*, a town of Greece, in Thebaly, on the frontiers of the Tymphanian mountains near the source of the Ion, which here forms a small lake, and south-west of Azoros.

*ÆGIOCHUS*, a small place in the island of Crete, where Jupiter was nourished by a goat, according to Diodorus. See *ÆGIOCLUS*.

*ÆGIPA*, a town of *Ethiopia*, near the Nile.

*ÆGIPAN*, in *Antiquity*, a denomination given to Pan, and the Panes.

The ancients also give the name *Ægipans* to a sort of monsters mentioned by Pliny, Sulpicius, and Pompon. Salaminus, in his notes on Sulpicius, takes *Ægipan* to have signified the same, in Lybia, with *Scythus* among the Romans.

Vollini rejects the opinion, and shews that the *Ægipans* had not faces like men, as the *Sylvans* had; but like goats. In effect, the whole upper part of the body resembled that animal; and as to the lower, they painted it with a fish's tail. The monster represented on some medals of Augustus by antiquaries, called *Capricornus*, appears to be the true *Ægipan*.

The word is derived from *Æ*, a goat; Pan being represented with the horns, feet, and legs of that animal.

*ÆGIPHILA*, formed from *Æ* and *phil*, Goat's friend, a genus of the *tetrandria monogyna* class and order, and the natural order of *Philies*; the characters are, that the calyx is one-leaved, bell-shaped, four-toothed, loose, very short, permanent perianthium; that the corolla is one-petalled, salver-shaped, with a cylindric tube, narrower and longer than the calyx, border quadrifid, flat, equal, and clefts oblong;
the lamina are capillary filaments inflected into the mouth of the tube, erect, and anthers roundish; the pistillum is a roundish superior germ, style capillary deeply bident, and stigma simple: the pericarpium is a roundish two-celled berry, surrounded with the permanent calyx; and the seed is either in pairs or solitary. There are four species, viz. martiniensis, elata or the knoxia of Brown, faticula, and trifida, to which are added in the last edition of Linnaeus's Sytema, the willofoa, arboreferns and levis. The first is a shrub about six feet high with white flowers, which appear in November, a native of Martinico, and was introduced in 1758, by Mr. Francis Maffon. La Marek thinks this species ought to be classed with the Verbena. The other species are natives of Jamaica.

ÆGIUS, a river of Afa, which discharges itself into the Euxine, above Diocoriana.

ÆGIPATUM, in Ancient Geography, a mountain of Greece, mentioned by Æschylus in his Agamemnon, and supposed to be in the vicinity of Corinth.

ÆGIRA, a town of Achaia, supposed to be founded by Ægrus, the sixth king of Sicily, and situate, according to Polybius (i. iv. c. 57. p. 322. D. Ed. Caalab.) in that part of Peloponnesus that is washed by the Corinthian bay, between Ægim and Sicily, opposite to Parnassus, and at the distance of seven stadia from the sea. It was covered with steep and almost inaccessible hills; and adorned with several temples, one of which was appropriate to Venus Celestis, into which no men were allowed to enter, and also with several pictures and statues. Paunulianus (p. 593) speaks of one of these pictures, which exhibited an aged man, who had received a mortal wound, and who was placed between three brothers and three sisters. The expression of concern and grief was so lively, that the picture was denominated nobi magna. It is now a small village called Xylagasso or Hyloagasso.

Ægrus was also one of the names of the ancients gave to the island of Lesbos.

ÆGIRCUS, Cers, a river of Gaul, which rose in the Pyrenees, passed to Auleia or Auch, and discharged itself into the Garray.

ÆGIRUM, or Ægrus, a town of the isle of Lesbos, on the east side between Methymna and Methymna.

ÆGRIRA, a town of Æolis; and also of Megas. 

ÆGIS, in the Ancient Mythology, a name given to the shield or buckler of Jupiter and Pallas.

The goat Amalthea, which had buckled Jove, being dead, that god is said to have covered his buckler with the skin thereof; whence the appellation ægis, from ægis, ægias, Ægion.

Jupiter afterwards restoring the beast to life again, covered it with a new skin, and placed it among the stars. As to his buckler, he made a present of it to Minerva; whence that goddes's buckler is also called ægis.

Minerva, having killed the Gorgon Medusa, nailed her head in the middle of the ægis, which henceforward had the faculty of converting into stone all those who looked thereon; as Medusa herself had done during her life.

Others take the ægis, not to have been a buckler, but a cuirass, or breast-plate; and it is certain the ægis of Pallas, described by Virgil, Æn. lib. viii. ver. 435. mult have been a cuirass; since that poet says expressly, that Medusa herself had done during her life.

But the ægis of Jupiter, mentioned a little higher, ver. 354, seems to have been a buckler: the words agreeing very well to a buckler; but not at all to a cuirass, or breast-plate.

Servius makes the same distinction on the two passages of Virgil; for on ver. 354, he takes the ægis for the buckler of Jupiter, made, as above-mentioned, of the skin of the goat Amalthea; and on ver. 435, he describes the ægis, as the armour which covers the buckler; and which, in speaking of men, is called cuirass; and ægis, in speaking of the gods. Many authors have overlooked these distinctions for want of going to the sources.

ÆGISSUS, or ÆGYPTUS, in Ancient Geography. See ÆGYPTUS.

ÆGISTAE, a town of Italy in Brutium, east of Caesarina, called by Pliny Apyeulum.

ÆGISTHE, a town which Ptolemy places in Arabia Felix; long. 33° 30' lat. 11° 45'.

ÆGISTHUS, in Entomology, a species of Papilio, with brown wings, spotted with a light green, found in India, and resembling the species called Agamemnon.

ÆGISITHUS, in Ancient History, the son of Thyestes by his daughter Pelopia, who, in order to conceal the incest, exposed the child in the woods; where he was found by a shepherd and nursed with goat's milk, from which circumstance he derived his name. In mature life he killed his uncle Atreus, and kept Clytemnestra, the wife of Agamemnon during the absence of her husband at the siege of Troy, and at his return murdered him; but was at last himself slain by Orestes in revenge of his father's death. Ovid's Ep. viii. 53.

ÆGITHALLUS, in Ancient Geography, a promontory and citadel of Sicily, between Drepanum and the Emporium. Ægitannum; afterwards called Acellus, corruptly written Ægitarhon in Ptolemy, situate near mount Eryx, and now called Capo di Santo Teodoro.

ÆGITH, a town of Ætolia in Greece.

ÆGITNA, a town of Gaul, belonging, according to Polybius (p. 962) to the Oxobii. The Romans besieged and took the town, and made slaves of the inhabitants; and on this account Q. Opimius the consul obtained a triumph, A. U. C. 599.

ÆGIUM, a considerable town of Achaia Propria, 40 stadia from the place where Helice stood, and famous for the council of the Acharians, who assembled there, either on account of the dignity of the place or the convenience of its situation, as we learn from Paunulianus (l. 7. c. 24. p. 584. Ed. Kuhnii.) and from Livy (l. 38. c. 32. t. 5. p. 216. Ed. Drakenb.) It was also famous for the worship of the conventional Jupiter, (Σιμόφων Λως), of the Panachzan Ceres, of Ægelclus, Lucina, Juno, and other deities. In this place there was a kind of chapel, in which were preserved the statues of Hercules, Jupiter and Minerva, called the Argian gods. Venus had also a temple in Ægium near the sea, and in it was a statue of Jupiter Homaygus. The territory of Ægium was watered by two rivers, viz. Phœnix and Meganites. The epitaph derived from it is Ægeianus. There is a coin, says Cellarius (t. 1. p. 757) in the cabinet of the king of Prussia, with the inscription, ΑΣΩ, and the figure of a tortoise, which is the symbol of Peloponnesus, and ascertains the place where it was struck. Greek imperial medals were struck in this city in honour of Pautilla, Commodus and Elagabalus.

ÆGLE, in Entomology, a species of Pappio, with black wings; the anterior and the disk of the posterior marked with greenish spots; found in India.

ÆGLE, in Mythology, the mother of the Graces; also, one of them: and according to Virgil (Eclog. vi. 21.) the most beautiful of the Najades.
ÆGON, in Mytology, a name given by authors to the Haddock.

ÆGLEFINUS, in Ichthyology, a genus given by authors to the Allosa.

ÆGLETE, in Ancient Geography, a place in the Isle of Anapha, where Apollo obtained the surname of Æglete.

ÆGLESTAWICK, in Geography, a good harbour, half a mile from Sundertide, a town of Sundertorn in Sweden. E. long. 15° 40'. N. lat. 59° 20'.

ÆGLEUS, in Botany, a term derived by the Greek ancients, and used by Galen in distinguishing the white chamaeleon thistle, which was an excellent medicinal plant, from the echinurus, euphorbe, which was what we call the black chamaeleon thistle, and esteemed poisonous.

ÆGEBOLIUM, in Antiquity, the surname of a goat offered to Cybele. This was an expiatory sacrifice, which nearly resembled the tamarbolium and criabolium, and seems to have been sometimes joined with them.

ÆGEBOLUS, a surname given to Bacchus, because instead of a young man who was sacrificed to him, he contented himself with a goat.

ÆGECOPHALUS, in Ornithology, the name by which authors call the bird, known in England by the name of the Godwit, or in some places the yarwhelp or yarwhip.

ÆGECERAS, in Botany, a name given to Ficus, on account of its corniculated fruit; the word signifying goat's horn.

ÆGECERATOS. See Hugonia.

ÆGECEROS, formed of αί, goat, and ζέρω, to make, in Astronomy, a name given to the constellation Capricorn. Thus, Lucan, 1. 9, v. 537, and I. 10, v. 213.

"Varii mutator circulus anniÆgoceron canumque teneet."

Pan, dignified by the poets and elevated to the stars, transformed himself into a goat, and was called Ægoceros.

ÆGEOLETHRON, in Botany, a plant described by Pliny, which appears to be the same with that Tournefort describes under the name of chamaerocendros pontica maxima metapli folio, flore luteo. The ancients attribute dangerous qualities to it.

ÆGOMANTIA, in Antiquity, a species of divination performed by means of a goat.

ÆGON, in Entomology, a species of Papilio, with brown wings and spotted yellow face; found in Jamaica.

Ægon is also a name given by some writers to the Argus.

ÆGENES, in Ancient Geography, a people of Gaul, transported according to Polybius (p. 105) into that part of Italy called Cispadana, and placed between the Senones and Boii.

ÆGONICHUS, in Botany, a name mentioned by Pliny, as a synonym of the lithophorium or gromwell, and formed of αίγον oxē; the claw, or hoof of a goat. The ancients also called it exomphalos; and by these terms expressed its being like the exterior part of the human nails on the fingers, and deduced the resemblance from the hardness and sharp nature of the nails.

ÆGON, in Mythology, a surname of Juno, because goats were sacrificed to her.

ÆGOPHAGA, in Mythology, a surname of Juno, because goats were sacrificed to her.

ÆGONICHIUS, in Botany, a name mentioned by Pliny, as a synonym of the lithophorium or gromwell, and formed of αίγον oxē; the claw, or hoof of a goat. The ancients also called it exomphalos; and by these terms expressed its being like the exterior part of the human nails on the fingers, and deduced the resemblance from the hardness and sharp nature of the nails.

ÆGON, in Mythology, a surname of Juno, because goats were sacrificed to her.

ÆGONICHIUS, in Botany, a name mentioned by Pliny, as a synonym of the lithophorium or gromwell, and formed of αίγον oxē; the claw, or hoof of a goat. The ancients also called it exomphalos; and by these terms expressed its being like the exterior part of the human nails on the fingers, and deduced the resemblance from the hardness and sharp nature of the nails.

ÆGON, in Mythology, a surname of Juno, because goats were sacrificed to her.

ÆGONICHIUS, in Botany, a name mentioned by Pliny, as a synonym of the lithophorium or gromwell, and formed of αίγον oxē; the claw, or hoof of a goat. The ancients also called it exomphalos; and by these terms expressed its being like the exterior part of the human nails on the fingers, and deduced the resemblance from the hardness and sharp nature of the nails.

ÆGON, in Mythology, a surname of Juno, because goats were sacrificed to her.

ÆGONICHIUS, in Botany, a name mentioned by Pliny, as a synonym of the lithophorium or gromwell, and formed of αίγον oxē; the claw, or hoof of a goat. The ancients also called it exomphalos; and by these terms expressed its being like the exterior part of the human nails on the fingers, and deduced the resemblance from the hardness and sharp nature of the nails.

ÆGON, in Mythology, a surname of Juno, because goats were sacrificed to her.
ger of their situation, and offered to attack the enemy by land and force them to battle; but jealousy prevented their profiting by his advice, and he therefore withdrew. On the 5th day the Athenians offered battle; but Lycurgus chose rather to submit to renewed insults than to hazard the event of a battle, before he had completed his previous arrangements. At length, however, the admiral's galley gave the signal by the sound of trumpets, and the whole fleet advanced in good order. The land army also hastened to the top of the promontory to observe the contest. The fleet that separates the two continents in this place is about 15 stadia, 187-5 paces, or 4 of a league in breadth, and this space was presently cleared by the activity and diligence of the rowers. Conon, the Athenian general, perceiving from the shore the order and progress of the Lacedaemonian fleet, was alarmed, and gave immediate orders for the troops to embark. But for want of vigilance and due discipline on the part of the generals, the troops were dispersed, and were indulging themselves in a variety of ways, under an apprehension of perfect security. Upon the first onset of the enemy, Conon perceived that all was lost, and disengaging himself with nine galleys, of which number was the sacred ship called the Paralid, fled to Cyprus, where he took refuge with Evagoras. The rest of the fleet and army was either captured or destroyed. Lycurgus, after having plundered the camp, and killed the enemy's galleys to the sterns of his own, returned to Lambsacus, amidst the sound of flutes and songs of triumph. It was his glory to have achieved one of the greatest military exploits recorded in history, with but little or no loss, and to have terminated a war in the space of an hour, which had lasted 27 years, and which perhaps, without him, had been of much longer continuance. The Athenians, some time before this event, had at the instigation of Philocles, one of their generals, passed a decree for cutting off the thumb of the right hand of all the prisoners of war, that, being unable to handle the pike, they might be only fit to serve at the oar. On this occasion Lycurgus asked Philocles what punishment he thought such a decree merited, and wished him to pass sentence upon himself. Philocles, not withstanding his danger, haughtily and magnanimously replied: "Accuse not people of crimes who have no judges; but as you are victor, use your right, and do by us as we have done by you if we had conquered." Having said this, he instantly prepared for execution, without betraying the least timidity. All the other prisoners, in number about 3000, were put to the sword, except Adamantus, who had opposed the above-mentioned decree. After this expedition all the Athenians were ordered, on pain of death, to repair to Athens, which was soon besieged, and which capitulated and surrendered. A. M. 3520. Ant. I. C. 404. Diod. Sic. xiii. c. 105. 157. tom. i. p. 627. 630. Ed. Welsch. Plut. in Aesch. oper. tom. i. p. 212, in Lyfand, p. 438. Ed. Xyland. Rollin's Ant. Hist. vol. iii. p. 284, 288, 870.

ÆGOSTENA, or Ænesthena, a town of Greece, north-west of Megara, near the sea of Alcione: celebrated for a temple of Melampus, son of Amythcon, to whom they offered annual sacrifices.

ÆGOSTHENIA, a town of Greece in the Locris.

ÆGUA, a town of Bética in Spain.

ÆGUSA, or Æthusa, a small island on the coast of Africa Propria, mentioned by Pliny and Ptolemy, being one of the cluster called Ægades.

ÆGYLA, Ægilia, or Ægiliala, one of the Greek islands mentioned by Stephanus, (De Urb. p. 35) situated between Crete and Peloponnæus: the name with that mentioned by Pliny (H. N. t. i. p. 209), 15 miles from Cythera.

ÆGYPSUS or Æcissus, a town of Mocia near the river Ilissus. M. d'Anville refers it to the vicinity of the place on the Danube, where Darius Hyphasis constructed a bridge, when he was engaged in war with the Scythians. Ovid. Epist. ex. Pont. l. i. ep. 8. tom. iii. p. 732. Ed. Burm.

ÆGYPT. See Egypt.

ÆGYPTICA, in Botany, signifies the Papyrus.

ÆGYPTIACUM, in Pharmacy, a name given to divers unguents of the detergent, or corrosive kind.

We meet with a black, a red, a white, a simple, a compound, and a magistral Ægyptiacum.

The simple Ægyptiacum, which is that usually found in our shops, is a composition of verdigris, vinegar, and honey, boiled to a confection: the prescription is Mefius. It is usually suppos'd to take its name from its daily colour, wherein it resembles that of the natives of Ægypt. It is improperly called an unguent; as there is no oil, or rather fat, in it. Some chafe to call it Mel Ægyptiacum, and Oxy-mel Ægyptinis. It is chiefly used in eating off rotten flesh, and cleansing foul ulcers; particularly venereal ones in the throat, &c. It also destroys those cancerous erosions apt to grow in children's mouths. Gmelin's App. Med. vol. i. 346.

The German dispensaries have another composition called Ægyptiacum compositum magisterl, or Hildani, wherein treacle, mithridate, camphor, &c. are ingredients.

White Ægyptiacum is a composition of lily roots mixed up with aromatics; it is mentioned by Hippocrates, and is the same with what other ancients call cænium. It was used by the ladies of those days to linear over their faces, to preserve their complexion.

Hippocrates also speaks of another unguent under the same name, composed of the flowers of the Egyptian thorn. Farris make a red, as well as a black kind, of much the same ingredients, only with some difference in the proportions; used especially to soften the hoofs of a horse, when too hard.

ÆGYPTIAN PEbble. See Jasper.

ÆGYPTILIA, in Natural History, the name of a fome described by the ancients, and said, by some authors, to have the remarkable but imaginary quality of giving water, the colour and taste of wine.

This fome was variegated with veins of black and white, or black and bluish, with a plate or vein of whitish red, and seems to have been of the onyx, fardonyx, or cameo kind, none of which possess the property which some fanciful writers have ascribed to it.

ÆGYPTION, the name of a topic used by the ancients in uterine disorders.

ÆGYPTUM phærum ad aures. Aetius (Tetrab. ii. Serm. 2. c. 87) speaks of this as excellent for deturgig furtul ulcers of the ears, which he says it cures, though the patient were born with them.

ÆGYPTUS, in Fabulous History, the son of Belus and brother of Damascus, who, having fifty sons, married them to the fifty daughters of his brother; and by their father's order, each of them, except one, flew her husband the first night. Lynceus, who escaped, dispossessed his father Damascus of the kingdom, and reigned over the Argives for sixty-nine years.

ÆGYPTUS, in Ancient Geography, a name given by Homer to the Nile, and by which it was very generally distinguished in Ethiopia. It has been commonly supposed, that
That this name was given to it on account of its black colour; but Mr. Bruce (Travels, vol. iii. p. 65.) conceives, that as Egypt in the Ethiopian language is called Ṭy̱g, and an inhabitant of the country Gym, which means the country of ditches or canals, drawn from the Nile on both sides of the river, nothing is more obvious than to write Ṯgym, whence Egypt, and with its termination us or ou, Egyptian. See Nile. Plutarch (tom. ii. p. 1157), says, it was first called Melas, from Melas the son of Neptune, and that it was afterwards called Egyptus from Egyptus the son of Vulcan and Leneipphe who governed Egypt; and who was so delighted by the facilites of his daughter Agrippine in obedience to the Pythian oracles, as a means of securing the fertility of the country by the retreat of the Nile, that he threw himself into the river; and from this circumstance it obtained the appellation.

Egypt, a town of Laconia, which, according to Pausanias was destroyed by the Lacedemonians in the reign of Archelaus, whose reign commenced 957 years before Christ, and lasted forty years, because it inhabitant took part with the Arcadians.

AelioTulla, in Zolology. See Aetnula.

Aelchryson, in Botany, a name given to the Sedum major; called also Eintales.

Aenautæ, in Antiquity, senators of Miletus, who held their deliberations on board a ship, far from shore, and till matters were resolved upon, never returned to land. The Greek word aenautes signifies always mariners. Plut. in Quell. Rom.

Aezorion, aekon, from an always, and òn life, perpetu-

Aelana, or Elana, in Ancient Geography, a city of Arabia Petraea on the Red Sea, at the north end of the Arabian gulf. It is now called Athab.

Aelanic, Aelian, or Elanitic gulf, a bay of the Red Sea, verging towards the north-call, and belonging to Arabia; so called from the city Aelana, situated near it.

Aelea, a small place of Dardania, south-west of Sardica.

Aelen, Elen, Aia, Aquilegia or Halcydes, in Geography, a large market town in the canton of Bern in Switzerland, which was greatly damaged by an inundation in 1740. It gives name to one of the four mandements into which the government, lordship or county of Aelen is divided. This district, which was for some time subject to Savoy, was afterwards given to the landholders of the Valais, who in 1536 exchanged it with the city of Bern for another district called Gunds. This lordship itself, which is now managed by a governor residing in a seat on an eminence in the town of Aelen, consists of a tract of fertile hills and vales, producing fine fruits and excellent wines; and the richness of its pastures is manifested by its large breeds of cattle.

Aelfred, in Biography. See Alfred.

Aelfric, an eminent ecclesiastic of the tenth century, who was the son of an earl of Kent, and who, after some imperfect instructions, received from an ignorant secular priest, assumed the habit of the Benedictine order of monks in the monastery of Abingdon, over which Athelwold presided. When Athelwold was created bishop of Winchester in 963, Aelfric among other Abingdon monks was settled in his cathedral; and, in order to testify his gratitude, for the advantages which he had enjoyed under the tuition of Athelwold, he conformed to the wishes of his benefactor in communicating instruction to the youth of his diocese. With this view, he compiled his Latin Saxon vocabulary, and some Latin Colloquies. The former work was published by Sommer, under the title of a glossary, at Oxford in 1659. Aelfric also translated from the Latin into the Saxon language, most of the historical books of the Old Testament, part of which was printed at Oxford in 1698. At Winchester he also drew up his canons, a kind of charge to be delivered by the bishops to their clergy, which are preserved in the first volume of Spelman's Councils, and were composed, says his biographer, (sib. infra) between the years 985 and 987. Upon his removal about the year 991 mentioned to Corne Abbey, he translated from the Latin fathers, the first volume of his homilies. In 998 he was made abbot of St. Alban's, and composed a liturgy for the service of his abbey; and about the latter end of the year 1001, when he was bishop of Wilton, he translated a second volume of Homilies. Here he also wrote his Latin Saxon grammar, a supplement to his Homilies, a Tract dedicated to Sigward or Sigefrect, containing two epistles on the Old and New Testaments, which his biographer supposes to have been written between the years 987 and 991. In 994 Aelfric was translated to the see of Canterbury, where, after excelling himself with laudable spirit and prudence for some years, in defending his diocese against the incursions of the Danes, he died November 16th, in the year 1005. He was buried at Abingdon, but his remains were transferred to Canterbury in the reign of Canute. He is represented as the greatest prelate the Saxon church ever had since the days of St. Aethel; and as our first reformer next to king Alfred, by introducing the knowledge of the scriptures among the laity. For the times, it must be allowed, he was a man of considerable learning; his morals were irreproachable, and his faith was free from many of the corruptions which have disgraced religion. There was another Aelfric, named Bata, who was pupil of the former in the school established by Athelwold at Winchester, who was made archbishop of York in 1023, and died in 1051. Another of the same name was abbot of Malmesbury in 974, was created bishop of Crediton in 977, and died in 981. There were several other persons of this name. The celebrated antiquary Leland has expressed his doubts, whether Aelfric, the author of the Latin-Saxon grammar, was the same with the translator of the Homilies, or with the abbot of St. Alban's, who drew up the liturgy, which continued to be used there till his own times. Bale and Pits have ascribed these three works to three different persons. Whereas, archbishop Usher, by confounding Aelfric, archbishop of Canterbury, with Aelfric, archbishop of York, and with Aelfric, bishop of Crediton, has reduced into one person three men who were really distinct. See Edwardi-Roselinis Morelli de Aelfric, Dorobechii Archipiecopo, Commentarius; ed. per Dr. Thorkein, 410. 1789.

Aelia, an appellation derived from one of the names of Adrian, and applied to several towns.

Aelia adiana. See Zama.—Augusta mercurialis. See Thess.

Aelia Capitolina, a name given by the emperor Adrian, from Aelius that of his own family, and Capitolinus the epithet of Jupiter, to the new city which he caused to be built about A.D. 134, near the spot where the ancient Jerusalem stood; and which, on his visit to the eastern parts of the Roman empire, he found in ruins. Here he settled a Roman colony, and dedicated a temple to Jupiter Capitolinus in the ruin of that of Jerusalem. This profanation of the holy place irritated the passions, incited the rebellions, and aggravated the sufferings of the Jews during the reign of Adrian. The city was once more
The style of the latter is more elegant than that of the former, which does not seem to have had the least revival of the author. Aelian also wrote an accusation or invective against Heliogabalus, or, as some say, Domitian, under the fictitious name of Gynis Tyrannus. He also composed a book against *Athasis, or on Providence,* which is much commended by Suidas, and another *On Divine Appearance,* or the *Declarations of Providence.* Some ascribe to him the work intitled *'tactic,'* addressed to Adrian; but Perizonius is of opinion, that the author of this work was a native of Greece, of the same name, and that he lived about a century before Aelian. Those who wish to see more of the talents and writings of Aelian, the age in which he lived, and the various editions of his works, may consult Perizonius's preface to the first volume of the Varia Historia, by Gronovius.

AELIANUS_Mercurius, lived in the time of the emperor Adrian. Galen mentions him with respect. He had great confidence in the Theriac, as a preventative and cure of the plague.

AELII_Pons, in Ancient Geography, one of the fortresses in or near the wall built by Adrian, now Portland in Northumberland, between Newcastle and Morpeth.

AELIUS_Pons, now II pente S. Angelo, a stone bridge at Rome over the Tyber, leading to the Burgo and Vatican from the city, along the mole built by the emperor Adrian.

AELIUS_Maurus, in Biography, was a writer in the reign of the emperor Caracalla, who was then very old, and had been a slave to Phlegon, the freedman of the emperor Adrian. This writer is cited by Spartan in his account of the death of Severus.

AELLO, in Mythology, one of the three Harpies.

AELQUAPPE, in Mythology, the common name among the German nations of a full of the maiden kind, the viviparous *Eldidot,* called by Schonefeldt musella vivipara, and in some places acipute, adshnder and adshnitter.

AELST, Evert Van, in Biography, a painter, was born at Delft in 1662, and died at the age of 56 in 1658. In painting dead game, fruit, armour, helmets with plumes of feathers, or vases of gold and silver, he exhibited a striking resemblance of nature, and gave an extraordinary listle to the gold, silver and steel. Pilkington's Diet.

AELST, William Van, the nephew and disciple of the former, was born at Delft in 1620, and died in 1679. He excelled his master in the exercise of his art. His pencil was so light and his touch so delicate, that the objects he painted seemed real. Before the year 1656, he exercised his profession in France and Italy, and afterwards settled at Amsterdam; where his works were much admired, and sold for a large price. The grand duke of Florence honoured him with a gold chain and medal, in acknowledgment of his merit. Pilkington.

AELT, in Geography, an abbey of Benedictius upon the river Iitz, below Walfenburg, in Bavaria.

AELUSDONES, in Ancient Geography, a people of Germany mentioned by Ptolemey, and called Hillevienos by Pliny, and Helvii by Tacitus.

AELUR, a people placed by Suidas near the Alps, which separated them from the Gauls.

AELUROPOLIS, formed of *æleus, a cat,* and *œleus,* a town of Egypt, mentioned by Lemanius.

AELURUS, in Mythology, the god of the cats: he is represented by the ancient Egyptians, sometimes as a cat, sometimes as a man with a cat's head. Such was the vegetation with which cats were regarded by the Egyptians, that if a person killed any of them, with or without design, he

The ELEPHANT, a great animal, which is said to have been domesticated by the Egyptians, and to have been used by them in war, and to have been highly esteemed by them. It was used as a symbol of strength and courage by the Egyptians, and was sometimes depicted on their coins and sculptures. It was also used as a symbol of royalty and authority, and was sometimes depicted on the heads of their kings and emperors. The ELEPHANT was a large animal, with a long trunk, large ears, and a thick tail. It was also known for its intelligence and memory, and was said to be able to learn and remember many things. It was also known for its long life, and was said to live for many years. It was also used as a symbol of longevity and prosperity, and was sometimes depicted on the coins and sculptures of the Egyptians. It was also used as a symbol of power and authority, and was sometimes depicted on the heads of their kings and emperors. It was also known for its strength and endurance, and was said to be able to lift heavy objects and to travel long distances. It was also used as a symbol of strength and courage, and was sometimes depicted on the coins and sculptures of the Egyptians. It was also known for its intelligence and memory, and was said to be able to learn and remember many things. It was also used as a symbol of longevity and prosperity, and was sometimes depicted on the coins and sculptures of the Egyptians. It was also used as a symbol of power and authority, and was sometimes depicted on the heads of their kings and emperors. It was also known for its strength and endurance, and was said to be able to lift heavy objects and to travel long distances.
he was punished with death; and it is reported, that, in time of a famine, which compelled the inhabitants to devour one another, no person was accused of having tafted any of thefe sacred animals. See Diodor. Sicul. 1. 1.; tom. 1. p. 94. Ed. Weffeling.

ÆLURUS, in Zoology. See CIVYT. ÆLUS, in Ancient Geography, a borough of Arabia Felix, belonging, according to Ptolemy, to the Ælefar. 

ÆEM, Am, or AEm, a liquid measure used in moll parts of Germany; but different in different towns: the aem commonly contains 20 vertils, or 80 maffes; that of Heddberg is equal to 48 maffes; and that of Wirtenberg to 160 maffes. See Aam.

ÆMATHIA, or Æmathia, in Ancient Geography, a district of Macedonia, which received its appellation from Æmathus, a prince of remote antiquity, and extended as far as the Sinus Thermaceus, or gulf of Salonichi to the east. It contained several considerable cities, particularly Ægina. This district formerly gave name to the whole country of Macedonia.

ÆMILLA, one of the 17 provinces of Italy in the later divisions of the Roman empire, bounded on the north by the Po, on the east by the Adriatic gulf, on the south by the Apenines, and extending to the south east as far as Ariminum.

ÆMILLIAN way. See Roman ways.

ÆMILLIANA, a town of Spain.

ÆMILLIANI, Jerome, in Biography, was founder of the regular clerks of St. Macul in the 16th century. See Fathers of Somaglia.

ÆMILLIANUS, Æmilius, or C. Julius, a Moor of mean defect, who, having served from his youth in the Roman armies, raised himself to the first employments in the state, and became first consul, and afterward emperor. Under Gallus he was governor of Pannonia and Media; and in this faction he rallied the intimidated and dispersed forces of Rome, and by a signal victory routed the barbarians, who were spreading devastation through the Illyrian provinces, and terror as far as the gates of Rome itself. Having distributed as a donative the money collected for the tribute, he was proclaimed emperor on the field of battle by the acclamations of the soldiery. A. D. 253. Gallus, who was at this time head of the public welfare, and indulging himself in the pleasures of Italy, was routed out of his city by information of the success, revolt and hostile approaches of his aspiring lieutenant, now the declared emperor. Æmilius, by force of marches, hastened to Tarentum, now Turn, about 32 miles from Rome; and here he was met by Gal-}

...at Rhetia that he was dead, he quickened his march, and determined to revenge his death. The army of Æmilianus, composed of traitors to their former sovereign, lay encamped on the plains of Spoleto, and avowed by the character and forces of Valerian, who had no sooner arrived than they inlaid their hands in the blood of a prince who had been so lately the object of their partial choice. Thus Valerian obtained the possession of the throne, without wading to it through the blood of the Roman citizens. Æmilianus was killed at a bridge in the vicinity of Spoleto, which Vèctor the younger pretends was denominated, from this circumstance, the bloody bridge. He died in the 46th year of his age, after a reign of three, or at most four months. Edilus (I. viii. c. 12. p. 255) does not rank him among the emperors; and in the chronicle of Alexandria and that of Nicephorus, Valerian is placed immediately after Gallus. According to Aurelius Victor (in Æmil.), he died a natural death. Anc. Un. Hist. vol. 13. p. 482, 8vo. Gibbon's Hist. vol. i. p. 408, 110, 8vo.

ÆMILLIUS, Paulus, the son of Lucius Paulus, who was killed at the battle of Canne, was born about the year of Rome 535; ante Carol. 224, and was twice consul. He lived, says Plutarch, in an age that abounded with great men, and took pains to be inferior to none of them. His first military command was in Spain, whether he went as prefect in the war with Antiochus, to quell a general revolt, in effecting which he succeeded. In his first campaign (ante Carol. 182.) he triumphed over the Ligurians, and on his return lived privately, and superintended the education of his children; and in the second, (ante Carol. 168.) subdued Perusus, king of Macedonia, reduced that country to a Roman province, and established a new form of government, from which circumstance he obtained the name of Macedonius. His behaviour, in consequence of his decisive victory, evinced him to be a man of strict justice; for, according to the rules of war, he gave the plunder of the camp to the infantry, and that of the adjacent territory to the horse. The cities he would not suffer to be touched: and as for the royal treasures he conveyed every part of them to Rome, though his integrity excited the ill-will of the army. In his progress through Greece, with a view of settling the division of the country, and establishing his new plan of government, he went to Epirus for the purpose of executing a decree of the Senate, which was so severe, that he could not read it without tears, though he could not demur in obeying it. This decree granted to the Roman army the pillage of the whole of the country which had adhered to Perusus. Æmilius distributed his troops in small bodies through the town, under a pretence of securing their liberty; but when the ten chiefs of the state had brought into the camp, in pursuance of their orders, all the gold and silver they could find, he allowed the soldiers, on a certain day and hour, to make booty of the remaining property of the poor inhabitants; of whom 150,000 were made slaves, and sold for the benefit of the republic.

His conduct towards Perusus, the vanquished and degraded sovereign, manifested nobleness of mind. When the king's ambassadors approached, he said to those that were near him, "Mark the inconveniency of fortune; this man, who but the other day thought the ample kingdom of Macedonia nothing, whilst he was hindered from subduing the Dardanians and Illyrians, now confined in a narrow island, feeds these poor men to ask favours." When Perusus entered his tent, and would have thrown himself at the feet of the confid, he rose hastily, gave him his hand, and would
ÆMILIANUS, one of the Latin historians, flourished under the emperor Marcus Aurelius. He composed a history of all those who attempted to usurp the sovereign power, and brought it down at least to the year 175, for he wrote the life of Avidius Cassius. He is quoted by Vulcatius Gallicanus, who lived under Diocletian.

ÆMILIIUS PAULUS, a celebrated historian, was a native of Verona, and gained such reputation in Italy, that he was invited into France by Louis XIII., in order to write a Latin history of the kings of France, and had a canonry granted him in the cathedral of Paris. He was thirty years in writing this history, and yet it was not completed at his death. Eranus says of him, that he resembled the painter Protogenes, who thought he had never finished his pieces: thus, says he, Paulus Æmilius is never satisfied with himself. It was his usual custom to revise and alter his own performances, that they would hardly be known to be the same; and this made him so flow, that elephants could bring forth sooner than he could produce a work. Lipsius speaks of his history and manner of writing in terms of high commendation. It is divided into ten books, and extends from Pharamond to the fifth year of Charles VIII., in 1488. The tenth book was left unfinished; but the history was continued in nine books to the close of the reign of Francis 1. by Arnoldus Ferronius, and the continuation was published at Paris in 1550. Æmilius, as to his private life, was a man of exemplary conduct and irreproachable reputation. He died at Paris in 1529, and was buried in the cathedral.

ÆMILIUS POS, one of the bridges of Rome, called also Sublatus, because it was built on piles.

ÆMINES PORTUS, were situated in a small island of Gaul, now called Embrics, between Tauroctomum on the north-west and the promontory Citharites.

ÆMINIUM, a town and river in Spain mentioned by Pliny (tom. i. p. 228.), now called Aguda. This town was situated in the province of Lusitania, near the northern bank of the Monda, a little to the south of Talbriga.

ÆMOBOLIUM, in Antiquity, the blood of a bull or ram, offered in the sacrifices, called taurobolia and criobolias; in which sense the word occurs in ancient inscriptions. Reichenius and Vandale take it for a corruption, and alter it to Agobolium. M. de Boze defends the Æmobolium.

ÆMODE, or EMOIX, in Ancient Geography, islands of the Ocean to the north of Great Britain.

ÆMONA, Lathbec or Laybdi, a Roman colony and a fortified place in Italy to the east of the Julian Alps.

ÆMONIA, one of the ancient names given to Thessaly.

ÆN, or AIN, a village of Jutia, belonging to the tribe of Judah, and afterwards comprehended in that of Simeon, and assigned to the Levites of this tribe.

ÆNA, or AINA, a town of Arabia Felix; and also a town of Macedonia.

ÆNEIA. See ÆNIADE.

ÆNARIA, an island in the bay of Cumae, or opposite to Cumae in Italy. It derived its name, says Pliny (l. iii. c. 6. tom. i. p. 160.) from its being the flattening of the ships of Æneas. It is called Iarina by Virgil (Æn. ix. v. 716.), by Ovid (Metam. l. xiv. v. 89. t. ii. p. 930. Ed. Burn.), and by Silius Italicus (l. viii. v. 542. p. 436. Ed. Dacre.), and it is now Ischia. It has not been improbably conjectured, that this island was, at some former period, violently separated from the continent by an earthquake. The evidences of such a disruption are calcined rocks,
rocks, numerous caverns, and the nature of the soil, which yields a great quantity of alum. About the year 1459, Bartholomew Perdis, a Genoese merchant palling by this island, observed several aluminous rocks along the coast ; some of which he calcined in a furnace, and thus obtained excellent alum. By this discovery he was enabled to revive the art of making alum, which had been neglected in Italy for many centuries, and which he brought from Rocean, in Syria, where he traded for many years.

About 163 years before this period, it is said that the most pleasant and fruitful part of this island was destroyed by a volcano, and that a small town was consumed by the flames which issued from it, and afterwards swallowed up. Grevel Thefaur. Antic. et Hist. Italiæ, vol. ix. p. 3. p. 88. For other authorities to the same purpose, see Beckman's Hist. Invent. et Dificov. vol. i. p. 303, &c.

ÆNARIUM, a grove of Achaea consecrated to Jupiter, where, as Strabo (tom. i. p. 593.) informs us, the Achaeans held their public assemblies.

ÆNEA, or ÆNIS, a city of Mygδδia in Macedonia, at the southern entrance of the Theffalonian Gulf near the island Pallene, is said to have been founded by Æneas. On the promontory adjoining to this city there was a temple of Venus, according to Dion. Halicarn. the foundation of which is attributed to the same person. See Dion. Halicarn. l. i. t. i. p. 30. Ed. Oxon. Livy, l. xii. c. 14. t. v. p. 432. Ed. Drahemb. Stephan. de Urb. p. 44. Livi, (l. xiiiv. c. 10. t. v. p. 752.) places Ænia in a fruitful country, about fifteen miles from Theffalonica and opposite to Pydna; but this must be laxly interpreted, as Pydna was near the river Achaemon, and Ænia was probably near the upper part of the Thermaic bay. Ænia has been sometimes erroneously confounded with Æneas.

ÆNEAS, in Entomology, a species of Papilio, with black wings, a green spot on the upper part of the pri- morses, and a languishing spot on the pollint. It is found in India.

Æneas, in Fabulous History, was a Trojan prince, the son of Venus and Anchises, who, at the destruction of Troy, is said, probably by poetical fiction, to have carried away his aged father and his household gods on his back. Hence, it is called, Virgil distinguishes him by the epithet Pius. See Ælian, Var. Hist. tom. i. p. 264. He also led his son Aeneas by the hand, and thus saved his father and son, &c. from the Greeks; but he left his wife Crensa in the escape. Some say that he and Antenor betrayed the city of Troy. But Virgil, desirous of maintaining his resemblance to Ulysses in all his adventures, excuses him. After the siege of Troy he landed in Africa, and was kindly received by Dido; but quitting her coals, he arrived in Latium or Italy, where he married Lavinia, the daughter of king Latinus, who thus secured to him the throne of Latium. The story of the loves of Dido and Æneas, though an interesting part of the Æneid, is allowed to be a mere poetical ornament, introduced by a foreign anachronism. Æneas, as a testimony of his gratitude to Latinus and affection for Lavinia, gave her name to the camp he had pitched, and, instead of Troy, called it Lavinium. The Trojans followed the example of their leader, and by marriages, forming alliances with the Latin families, became, in a short time, one and the same people with the Latins. In the mean time Turnus, who had been contracted to Lavinia, and who was disappointed in his expectations by her marriage with Æneas, went over to the Rutuli; and excited a battle between them and the Latins, in which both, he and Latins were killed. Thus Æneas, by the death of his father-in-law, and of his rival, obtained the quiet possession of the kingdom of Latium, which he governed with great wisdom, and transmitted to his posterity. Æneas is said to have reigned three years, in which time he established the worship of the gods of his own country, and to the religion of the Latins added that of Troy. The two Palladins, which had been the protectors of that city, became the tutelar deities of Lavinium, and in succeeding ages, of the whole Roman empire. The worship of Vesta was likewise introduced by Æneas, and probably by his means Jupiter, Venus, and many other deities, who had been revered in Troy, became known to the Latins; from which circumstance some have supposed that the poets took occasion to represent him under the character of a pious hero. The Rutuli, in the mean while, entered into an alliance with Mezentius, king of the Tyrrenians, and united with them in their attempts to drive out thee new adventurers. Æneas engaged them in a battle, which lasted till night; when being driven to the banks of the Numicus that ran close by Lavinium, he was forced into the river, and was there drowned, in the year of the Julian period 3538, ante Chrifl 1176. The Trojans concealed his body; and pretending that he had suddenly vanished away, made his credulous subjects regard him as a deity; and they accordingly erected a temple to him under the title of Jupiter Indiges. Virgil has immortalized this prince, by making him the hero of his Æneid.

Æneas was succeeded by his son Aeneas, so called from a river of Phrygia of that name, and denominated Julius from Ilus, formed from Ilion or Troy, who founded Alba Longa as the capital of his kingdom. See Dion. Halicarn. l. i. p. 34. 51. tom. i. Ed. Oxon. 1704. Livy, l. i. c. ii. and 2. tom. i. p. 18.-21. Ed. Drahember.

Æneas of Gaza, a sophist by profession, was originally a disciple of Hierocles, and a Platonic philosopher, but afterwards became a Christian, and flourished about the year 487. He himself affirms us, that he saw the African confidors, whose tongues were cut out by Hunican king of the Vandals, in 484, under the reign of the emperor Zeno; and that he heard them speak. This supernatural gift of the African confessors, who spoke without tongues, says Mr. Gibbon (History of the Decline and Fall of the Roman Empire, vol. vi. p. 295, 8vo.) will command the assent of those, and of those only, who already believe that their language was pure and orthodox. But the stubborn minds of an infidel is guarded by secret incurable suspicion; and the Arian, or Socinian, who has seriously rejected the doctrine of the Trinity, will not be shaken by the most plausible evidence of our Athanasian miracle. Æneas composed a dialogue, entitled "Theophraustus," on the immortality of the soul, and the resurrection of the body; besides twenty-five epistles, still extant. The dialogue was first translated into Latin, and published at Basle in 1516, in Greek and Latin, at Basle in 1560, with other pieces, at Leipsic in 1568, with a translation and notes by Barthius, in 4 to. See Biblio. Patrum, tom. viii. p. 664. 665. Cave's Hist. Liter. p. 297, and Fabriceus, Bibl. Graec, tom. i. p. 427.

Æneas, Tacitus, one of the most ancient-Greek authors who have written on the art of war. He lived about 300 years before the Christian era. The age in which he lived is settled by Cavaubon, who informs us, that Cines, who was a disciple of Epicurus, and an ambas- sador from Pyrrhus to Rome in the 12th Olympiad, composed: an epitome of the works of Æneas. His work was published by Cavaubon, in Greek and Latin, with notes, and it is annexed to his edition of Polybius, printed...
Although he declaimed, with all the powers of his eloquence against the Turkish war, when he was secretary to the emperor, and delivered, from his own experience, the repugnant state and spirit of Chirilanges; yet, when he was raised to the papal throne, he devoted his life to the prosecution of this war. With this view, he attended a convention of princes at Mantua; but when the pontiff appeared at Ancona, to embark in person with the troops, engagements vanished in excited; a precipice day was adjourned to an indefinite term; and his effective army consisted of some German pilgrims, whom he was obliged to dilate with indulgences and alms. The French, who had incurred the pope’s displeasure by appealing to a council in defence of the PragmaticSanction, opposed this measure; but he seems to have been placated by the consent of Louis XI., in 1461, to abolish that edict, which the parliament of Paris had so lately and so vigorously supported. In the following year, 1462, he interposed in a dispute which took place between the Cordeliers and Dominicans, and inflicted a bull forbidding them to brand one another with the odious epithets of heretics. In the exercise of his high office, Pius exerted himself with spirit and activity in bringing many conclaves to a peaceful termination, and in settling the claims of various princes. During his pontificate he released ambassadors from the Patriarch of the east; who protested their unanimous agreement to submit to the pope as vicar of Jesus Christ. At Ancona, whether he repaired for the purpose of embarking in the prosecution of the Turkish war, he was seized with a fever, which terminated in his death, on the 14th of August, 1464, in the 59th year of his age.

Spodanus, in his ecclesiastical Annals, says, that he was inferior to none in learning, eloquence, dexterity, and prudence; and the cardinal of Pavia, in his speech to the concile, concerning the choice of a successor, pronounces this eulogium on Pius II. that he was a pope who had all the virtues in his character; and that he had merited the utmost commendation by his zeal for religion, his integrity of manners, his mild judgment, and profound learning. Ambition, however, seems to have been his ruling principle; and his conduct furnishes an example, in addition to many others, of the veracity which a change of circumstances produces in persons that are influenced by this principle. The verse of Virgil’s Enid, (lib. i. v. 382) which begins—

_Sum pius_ Enecas—

and the end of the following verse—

_fama super Eternae notus_, have been applied to him.

A history of his life, supposed to have been written by himself, was published by his secretary, John Gobelin. It was printed at Rome in 1460, in 1584 and 1589, and at Frankfort, in folio, in 1614. We have an edition of _Enaeis_ Sylvius’s works, printed at Bafil, in folio, in 1551. His life is prefixed to the edition of his works, printed at Helmsland, in folio, in 1700.

Some apophthegms of _Enaeis_ are recorded, of which the following are a specimen: As a covetous man is never satisfied with money, so a learned man should not be with knowledge.—Common men should esteem learning as silver, noblemen prize it as gold, and princes as jewels.—The laws have power over the commonalty, but are feeble to the greater ones.—A citizen should look upon his family as subject to the city, the city to his country, the country to the world, and the world to God.—The chief place with kings is slippery.—And as all rivers run into the sea, so do all vices into the court.—The tongue of a fableman is a king’s greatest plague.—A prince who would trust nobody
The ancient Theseus, in Antiquity, the seamen in an army; including those who played trumpets, horns, lyres, drums, &c. The word is formed from *Aeneas*, on account of the brazen instruments used by them.

*Aeneid*, in Literary History, the title of Virgil's celebrated epic poem. The subject of this poem is very happily chosen: as nothing could be more noble, so nothing could be more interesting to the Roman people, than Virgil's tracing the origin of their race to a hero of such celebrity as *Aeneas*. Whilst the object was splendid in itself, the theme afforded the poet an opportunity of pursuing, by means of the traditionary history of his country, the future great exploits of the Romans, and of describing Italy and the territory of Rome itself, in its ancient and fabulous state. Dr. Blair thinks that there is no foundation for the opinion, advanced by some critics, that the *Aeneid* is an allegorical poem, bearing confluent reference to the character and reign of Augustus Caesar; or that Virgil's chief design in composing it was to reconcile the Romans to the government of that prince, who is personified under the character of *Aeneas*. In this poem, unity of action is perfectly preserved; one main object being always kept in view, which was the settlement of *Aeneas* in Italy, in order of the Gods. The episodes are likewise sufficiently connected with the main subject; and the nodus, or intrigue of the poem is, according to the plan of ancient machinery, happily formed. The wrath of Juno, who opposes the Trojan settlement in Italy, occasions all the difficulties which embarrass the undertaking of *Aeneas*, and connects, throughout the whole work, the human with the celestial operations. Hence arise the temple which throws *Aeneas* on the African shore, the passion of Dido, who endeavour to detain him at Carthage, and the efforts of Turnus, who opposes him in war. At last, however, Juno's resentment is placated, upon a composition with Jupiter, that the Trojan name should be sunk in the Latin, and the hero becomes victorious. The poem, however, is not free from imperfections: one of which is, that there are scarce any characters marked in the *Aeneid*. In this respect it is inferior to the *Iliad*, which abounds with characters and action. The character of *Aeneas* himself is cold and tame, and not marked with any of those strokes that touch the heart. His behaviour to *Dido* maintains its obscurity, which renders him unamiable. *Dido's* own character is well supported, and exhibits a figure more truly animated than any other which Virgil has chosen. Besides this defect of character in the *Aeneid*, the distribution and management of the subject are, in some respects, excusable. Allowance indeed ought to be made for an incomplete work; for it is said, that the six last books did not receive the finishing hand of the author; on which account he ordered, by his will, the *Aeneid* to be committed to the flames, which was happily prevented by Augustus. The wars with the Latins are inferior, in point of dignity, to the destruction of Troy, the intrigue with *Dido*, and the defeat into hell; and in the conduct of these wars, the reader, as Voltaire observes, is tempted to take part with Turnus against *Aeneas*. This defect might have been remedied by the poet's making *Aeneas*, instead of disfiguring *Lavinia* by killing her lover and occasioning her mother's death, and embroiling her country in a war, deliver her from the persecution of some rival, who was odious to her and to the whole country. The disjointing excellence of Virgil is tenderness. He was endowed by nature with exquisite sensibility; he felt every affecting circumstance in the scenes which he describes; and he knows how, by a single stroke, to reach the heart. This, in an epic poem, is the merit next to sublimity, and renders the composition interesting to every reader. The second book is one of the greatest master-pieces that was ever executed; and Virgil seems to have there exerted all the powers of his genius, as the subject afforded a variety of scenes, both of the awful and tender kind. The images of horror, presented by a city burning and sacked in the night, are finely mixed with pathetic and affecting incidents. The death of old Priam, and the family-pieces of *Aeneas*, Anchises, and Creusa, are as tender as can be conceived. The fourth book, relating the unhappy passion and death of *Dido*, has been always most justly admired. The interview of *Aeneas* with Andromache and Helenus in the third book; the episodes of Pallas and Evander, of Nausicaa and Endymion, of Lavinus and Mezentius, in the Italian wars, are striking instances of the poet's power of raising the tender emotions. The bell and most finished books, upon the whole, are the first, the second, the fourth, the fifth, the seventh, the eighth, and the twelfth. Virgil's battles are, in point of fire and sublimity, inferior to those of *Homer*; but there is one important episode, the defeat into hell, in which he has far exceeded Homer in his *Odyssey*. In all antiquity there is nothing equal, in its kind, to the fifth book of the *Aeneid*. Through the whole description of the invisible world, there is displayed a certain philosophical sublime, which Virgil's platonic genius, and the enlarged ideas of the Augustan age, enabled him to support with a degree of majesty far beyond what the rude ideas of Homer's age allowed him to attain. It is needless to say anything in praise of the sweetness and beauty of Virgil's numbers, which are universally acknowledged. Elegance and tender-ness are the distinguishing excellencies of the *Aeneid*. For the feebler passages of this poem, it ought to be admitted as an excuse that the *Aeneid* was an unfinished work. Blair's Lectures, vol. iii. p. 248—258.

A late writer, viz. M. la Harpe, in his *Lyceum*, or Lectures at the *Lyceum*, does not allow Virgil to be the inventor of a single incident, and scarcely of a verse, in his poem. He is not only accused of imitating Homer in his plan, his battles, and his principal events, as well as in his versification, but of plagiarising from the old poets Ennius, Puccius, Accius, and Svevius, and from his contemporaries Lucretius, Catullus, Tibullus, Varus, and Furius. It is confessed, however, that the 3d, 4th, and 6th books are great and admirable productions. The excellence of Virgil, in the estimation of this author, rests on the constant perfection of his style, so far as it seems possible. It is at once, he says, the delight and despair of all who wish to cultivate poetry; so that if he has not equalled Homer in invention, variety, or confluent interest, he has surpassed him in the beauty of particular parts, and in the fine taste by which he has embellished his narratives.

*Aeneas*, in Ancient Geography, called by Strabo *Aenestispolia*, an island of the Mediterranean, on the coast of Libya.

*Aenesiphrya*, a promontory, according to Strabo, and a port, according to Ptolemy, at the extremity of the

*Oo* Catabathmus
In a general sense, every dark saying, every difficult question, every paradox may pass for an anigma. Hence observing, having the name anigmata juris.

The signs were great dealers in the enigmatic language, their processes for the philosopher’s stone being generally wrapped up in riddles: *e.g.*

**Fuc ex norte et femina**

**fiasma evocamus, vect quaedam, trinacrimus, hic triquadrangulam, hic triangulam, hic viridem et hibris, hic hibris philosophorum.**

Barchusen has published an explanation of the riddles of chemists, alchemists, physicians, &c.

Among the anigmata of chemists, that called the Sybiline anigma, of which we had a copy in a MS. of Stephanus Alexandrinus.

**Enigmata saepeque**

**innumerous, obtusa inrure, to hint a thing darkly; of some, an obscure sense, difficult.**

The Latins sometimes call it *furipus, surpus, or suripus.*

The populace with us name it *riddle*; from the Belga *sexus, or the Saxon *arathum, to interpret.*

Fra. Junius defines an anigma to be an obscure parable, or allegory; and makes two kinds: the one graphus, rendering thefuscus more intricate and knotty, by a multitude of words; the other, *ut picta, conuniting of only one or two remote words, or allusions; as in Thalia, ch. xi. 1. where Jesus Christ is called *7253, forendus, rod. or branch.*

Fa. Bolours, in the memoirs of Travours, defines an anigma, a difficulty, or painting, including some hidden meaning, which is proposed to be guessed.

**Anigmata, painted, are representations of the works of nature, or art, concealed under human figures, drawn from history or fable. Thus Jesus Christ, in the middle of the doctors, repreffes the Bible, &c.**

A verbal anigma is a witty, artful, and abstruse description of any thing.

The use of anigmata was very great among the Egyptians. Galen thinks they might borrow their custom from the Hebrews, among whom, it is certain, anigma were not left us in use. Witness Samson’s riddle, Judges xiv. 12. 13. *I will now put forth a riddle to you, &c.*

**Vatable, an enigmatical problem:** the LXX. render it, *nunhena.* Solomon is said to have been particularly skilful in the solution of anigmata. Joseph. Antiq. lib. v. cap. 2. Clemens affurces us, that the Egyptians placed *jphanger* before their temples; to intitate that the doctrines of God and religion were *enigmatical and obscure.*

See Hieroglyphic.

Some represent the anigma as the same with metaphor: but the more exact writers make a distinction; though wherein the difference lies is not agreed on. Some make it consist in this, that the anigma properly imports something merry or jocose, and graphus a subject more grave and profound. Others reduce the difference to this, that in the graphus there is something captious, and capable of leading into a snare, which is not found in the anigma.

The rebus is also ranked by some in the number of anigmata.

Stephanus gives a mystical solution of this anigma. Moret will have it signify the name Jehovah, which, according to him, comprehends the number 1695, abutting one, the number contained in the anigma. Bremius maintains that the whole sum amounts to 1711, and that it represents the word *sostra.* The generality understand it of the word *articul,* or *apernikon.*

M. Leibnitz gives a very artful solution of it in this sense, by only supposing the A to stand for a thousand, and I for unity, as we sometimes find them used grammarians.

The operation of cupping, performed in ancient days by a machine of braies, is ingeniously represented by the following anigma:

**Apud videmis vos qui potes velut cipolam complevet ;**

"I saw a man, who, unprovoked, with ire,

Stuck braies upon another’s back by fire."

Aulus Gallus (xii. 6.) has preferred a Latin anigma, which he also calls a surpus or surpes, debated (lays Mr. Harris in his Philological Inquiries, p. 202.) with all the quibble of a barbarous age:

"Semel minuice, an his minus, (non fat scio)

An utrumque evum (ut quondam audivi dicier)

Jovi ipi regi noluit concedere."

It is thus translated by Mr. Harris: "Was it once minus, or twice minus, (I am not enough informed,) or was it not rather the two taken together, (as I have heard it said formerly) that would not give way to Jove himself, the sovereign."

"The two taken together, that is, once minus, and twice minus, make, when so taken, three minus: and three minus in Latin is ter minus; which, taken as a single word, is terminus, the god of boundaries. The meaning of the riddle coincides with the Pagan legend, which says, that when in honour of Jove the capitol was founded, the other gods consented to retire, but the god Terminus refused."

See Ovid’s Fasti, 1. iii. 667, &c. t. iii. p. 137. Ed. Burn.
The moral of the fable is just and ingenious, viz. that
boundaries are fixed, and never should be moved.

1. Medeniier has attempted to reduce the compo-

nition and resolution of enigmas to a kind of art,

with fixed rules, and principles, which he calls the philosophy of

enigmatic images.

1. Enigma, the subject of an, should be something calmly

conceived, and generally known.

2. Enigmas, the form of, consists in the words, which,

whether they be in prose or verse, contain either some de-

scription, a question, or a profopoeia. Those of the last

kind are the most pleasing, inasmuch as they give life and

action to things, which otherwise have them not. They

are commonly invoked either in a pun or metaphor, or

sometimes in both. In such fancies, contrary to the prin-

ciples of good metaphor, and good writing, perplexity is

caused, not by accident, but by design, and the pleasure

lies in being able to resolve it. To make an enigma, there-

fore, two things are to be pitched on, which bear some

resemblance to each other, as the sun, and a monarch; or a

ship, and a house; and on this resemblance is to be raised a

superstructure of contrivances to amuse and perplex. It is

easier to find great subjects for enigmas in figures than in

words, inasmuch as painting attracts the eyes, and excites

the attention to discover the sense. The subjects of eni-

gamias in painting are to be taken either from history or fable;

the composition here is a kind of metamorphosis, wherein,

c. g. human figures are changed into trees, and rivers into

metals. This conversion, however, does not depend merely

on caprice; there must be something of suitableness, and
even criution to authorise it. Thus the battle of Con-

stantine against Maxentius may be taken for the subject of

an enigma, to represent the game of chess: the sign which

appeared in the heavens with the words, in hac sphaera vinces,

may properly enough represent the secret of this game,

which consists in fying the king. It is much easier to turn

mythology into enigmas, than history. Accordingly several

have imagined, that the conquest of the golden fleece was

no other than the transmutation of metals; and that the

fable of Circe was the art of chemistry in enigma. Enig-

mas of pure invention are a kind of poetry, and more subtle

than those drawn from mythology; since here the matter

itself is to be created: instead of adopting some history or

received fable, something probable is feigned, the chief

action whereof is known, c. g. a shipwreck, a conflagration,

an amphitheatre, or the like. It is essential to enigmas,

that the history or fable under which they are presented, be

known to every body; otherwise it will comprehended two

enigmas instead of one; the first of the history or fable, the

second of the sense in which it is to be taken. Another

essential rule of the enigma is, that it only admits of one

sense. Every enigma which is suggestive of different inter-

pretations, is equally natural, is so far imperfect.

1. Enigmas, the solution or explanation of, forms a kind

of exercise, that is as difficult as it is amusing, and

that affords scope for invention and penetration. By

the solution of an enigma we are to understand the

discovery of a motto corresponding to the action

and person represented in a picture, taken either from

history or mythology. This motto must, either by itself

or its attendant circumstances, divert the spectator,

and furnish occasion for displaying wit, and introducing

pieces of poetry to illustrate the subject and awaken the attention

of the audience. Those enigmas which are expressed by

figures, are more difficult of solution than such as consist of

words, because images may have a greater variety of signi-

fications than words; so that to fix them to a particular

sense, we must apply every situation, symbol, &c. without

omitting a circumstance belonging to them. As there are

few persons in history or mythology that have not some

particular character, this character must be regarded, in

order to determine what the figure in any painting signifies,

and to discover how it agrees with the subject of which we

would explain it. Thus, if Proteus be represented in a

picture, it may be taken to denote inconstancy, and applied

either to a physical or moral subject, the character of which

is mutability; e. g. an almanack which expresses the vari-

able weather, fountains, heat, cold, storms, and the like.

The colours of figures may also help to unriddle what they

mean, e. g. white is an emblem of innocence, red of mor-

dality, green of hope, black of sorrow, &c. When figures

are accompanied with symbols, they are more determinate;

these being, as it were, the soul of enigmas, and the key

that opens the mystery of them. Of all the symbols that

occur in the writings of those who have treated of the sub-

ject, those only of Pythagoras are truly enigmatic, which,

under obscure proverbs, convey lessons of morality; as when

he uses the phrase fateram ne transferatis to signify, do no in-

jury. Some enigmas are so complicated, that no rules

will serve for the solution of them, and that they occasion

great perplexity to those who endeavour to interpret them.

Such is that ancient and celebrated enigma, called Alia

Lalia crispis, which has puzzled many learned persons, who

have directed their attention to subjects of this nature.

There are two copies of it, each of which claims authen-

ticity. The one, formerly engraved on marble and more

lately cut in fresh characters, by order of Achilles Volta,

is preserved by the family of Volta at Catarlta near

Bologna, and is as follows:

D. M.

Alia Lalia Crispi,

Nec vir, nec mulier, nec androgyia,

Nec puerula, nec juvenis, nec annis.

Nec calla, nec meretrix, nec pudica,

Sed omnia.

Sublata

Neque fame, neque ferro, neque veneno,

Sed omnibus.

Nec calo, nec aquis, nec terris,

Sed ubique jacet.

Lucius Agatho Priscius

Nec maritus, nec amator, nec bellerarius,

Neque marens, neque gaudens, neque flous,

Hanc.

Nec molent, nec pyramidem, nec spulchran,

Sed omnia.

Sic et nefcit cui posuerit."

Thus translated: Alia Lalia Crispis, who was neither male,

female, nor hermaphrodite; neither a girl, nor a young woman,

nor an old woman; neither a slave, nor a free man; but all these.

She shed neither by fasting, nor feasting,

nor poison; but by all these. She lies neither in the air, nor

in the water, nor in the earth; but everywhere. Lucius

Agatho Priscius, neither husband, nor lover, nor relation,

neither service, nor rejoicing, nor sweeping, this, which

is neither fruitful, nor pyramid, nor tomb; but all these;

but to whom, be known, and does not know."

The other copy of this enigma was found written in Gothic

letters in a MS. at Milan, introduced with A.M.P.P. D.

instead of D.M. his markus, which an anonymous author (Aeti.

Erud. L. M. Mart. 1732) interpreting the riddle of a

monument erected by one of the Alban family to his own

soul, deciphered thus: anima mea propria diec; at the end is

the following addition: viz.

O' o 2

"Hoc
Hoc est sepulchrum intus cadaver non habens, 
Hoc est sepulchrum extra non habens, 
Sed cadaver idem est et sepulchrum sibi.

i.e. "Here is a sepulchre without a corpse: here is a corpse without a sepulchre: the corpse and sepulchre are one and the same."

Of this enigma the solutions have been very numerous. On the four sides of the stone, on which it is inscribed, there are twelve different explanations, with the names of their fancious authors. Mario Michael Angelo will have it to be rain; Lictus, the beginning and ending of friendship; Cevantius, love; Pontius, the remains of three different persons; Turris, the materio perma; Barnard, an enunch, or the philosopher's stone; Agathas Scholafus, Niobe; R. van, the rational soul, or the idea of Plato; Bokhornius, a shadow; Ovid Montalbus, hemp; M. de Ciogone, pope Joan; Heumannus, Lot's wife; another anonymous person, the Christian church; Terrorius, music; Vosmonius, a lawsuit; and, to add no more, Count Malvaia, in a treatise intitled Hodi Lepita enigma non.nia refugia, interprets it of a daughter promised to a person in marriage, who died pregnant with a male child before the celebration of her nuptials. See Keyler's Travels, vol. iii. 264, &c. 8vo.

ENIGMATIC, something that relates to, or partakes of the nature of enigmas.

The philosophy of the Druids was altogether enigmatical.

The ancient fagcs in general affected an enigmatical way of writing, to conceal their doctrines from the populace. The Romans in Nero's time were obliged to have recourse to the like method, though for different reasons. The enigmatical characters of the Egyptians were a species of hieroglyphics, consisting of such as bore no natural resemblance to the things they represented. Such was the beetle, used to express the sun; the serpent, to represent the stars.

We read of an enigmatical mode professed by the Huguenots to Henry III. Schott has published an exposition of an enigmatical coin of the emperor Augustus, concerning which antiquaries have been long divided.

ENIGMATOGRAPHER, or ENIGMATIST, a maker or explainet of enigmas.

Hardouin, Vander Hardt, &c. are great enigmatists.

ENIGMATOGRAPHY, ENIGMATOGRAPHIA, composed of ἐνιγματογραφία, the art of making and revealing, or collecting enigmas.

Enigmatography, otherwise called enigmology, may be divided into general and particular. The first gives rules concerning the nature, kind, composition, and use of enigmas; the second confines the enigmas in particular sciences, or languages. Greek, Latin, Hebrew, philosophical, theological, &c.

Nie. Reiffer has a treatise, under the title of Enigmatographia.

ENIPPE, in Entomology, a species of Papilio, with roundish yellow wings, all of which are marked beneath with acerated points: the fore wings with fies, and the hinder with fovea. It is found in China.

ENITTOLOGIUS, in Poetry, a kind of verse consisting of two distyle, and three trochee. Such is,

Præa dira placet truci juvenis.

ÉNION, in Ancient Geography, a promontory near Éna, on the Thermaic gulf.

ÉNISUS, a small river of Dardania in Asia.

ÉNNAX, a small town of Egypt, mentioned by Pliny (i. i. p. 242.) called by others Philocrates, and now Suesquem.

ÉNOLA, in Geography, a market town of Naples, in the province of jurisdiction of Terra di Lavara. N. lat. 41° 15'; E. long. 15° 22'.

ÉNOMA, in Ancient Geography, a city of Liburnia, called by Pliny (t. i. p. 178.) Cevius Pafini, now Nova. It lies on the Adriatic, by which it is almost surrounded, over against the island Giffa, and distant from it about four miles to the west. M. d'Anville places it to the south of Jadera in Dalmatia.

ÉNUS, a river of Vindelecia, in Germany, which rises in the Rhetian Alps, and discharges itself into the Danube. It is now the Inn. Near this river was the town called Anci pons of Antonine, from a bridge that connected Noricum with that part of Vindelecia, inhabited by the Boii.

ÉNUS was also a river of the Cimbri Chertonenus.

ÉNUS was also a mountain of Cephalenia, one of the Greek Islands, where was a temple of Jupiter.

ÉNUS, ÆNOS, or ÆNUS, a town of Thrace, built, says Strabo, cited by Stephanus (de Urb. p. 45.) by the Cumanians, but according to Mela, who seems to mistake this town for Ænis, by the exile of Æneas. If it was founded by the Trojans, it was enlarged by the Cumanians. It is situated on one of the two mouths of the Hebrus. It was a free town, says Pliny (t. i. p. 264.) in which was the tomb of Polydorus; and was one of the towns of the Maroneans, being the other, on the Ægean Sea, conquered by Philip, the father of Perseus, and upon the defeat of the latter by the Romans, promised to Eumenes, king of Pergamus; but afterwards declared by the senate free and independent.

Liv. i. xxxi. c. 16. c. 31. t. iv. p. 534. 557. Ed. Drakenb. Polybius, p. 489. 854. Ed. Cudab. The epitaph derived from it is Ælius. It was also called Apollonius. Here, according to Plutarch, (t. i. p. 763. Ed. Xylander,) the brother of Cato of Utica died, and was honoured with a monument of marble in the forum of the Ænus. This town is now Eso.

Stephanus mentions four other towns of this name; one built by Ænus, the brother of Guneus; another, a city of Thessaly; a third, of the country of the Locrians; and a fourth, between Thaphicus and the Eniprites. There is also an island of this name adjoining to Arabia Felix.

ÆOLIAN ISLANDS are seven islands, situate between Sicily and Italy, in the Tyrrhenian or Tufcan sea; so called according to Pliny, (t. i. p. 164. Ed. Hard.) because Æolus reigned there in the time of the Trojan war. They were denominated by the Greeks Hephaestids, and by the Romans Vulcanites, from their fiery eruptions. They were also called by Strabo, (t. i. p. 394.) ἄειόνιοι νησίς, i.e. Liparicae insulae, from Lipara, the chief of them. Their names, according to Pliny, with whom Dioscurus Siculus, (l. c. c. 7. t. i. p. 335. Ed. Wellcome,) agrees, are Lipara, Hieria, Strongylia, Didyme, Erychia, Phronemus, and Euonymos. They are now called, Isole di Lipari. Poleno mentions fifteen of these islands; but he includes in the number several other little islands, which are too far distant to be properly included under the denomination of the Æolian islands.

ÆOLIC, in a general sense, denotes something belonging to Æolus.

ÆOLIC, or ÆOLIAN, in Grammar, denotes one of the five dialects of the Greek tongue. It was first used in Bocotia; whence it passed into Æolia, and was that in which Sappho and Alceus wrote. We find also a mixture of it in the writings of Thucydides, Pindar, Homer, and many others. The Æolic dialect generally throws out the aspirate or sharp spirit, as ἐπις for ἐπις, day; draws back the
the ascent, as ψηφος for πτωμις, river; changes α into οι; as μιλας for μιλας, black; and α into ωι, as ωιρων for ωιρων; and in the singular α into οι; puts άας for πας, ωσως for ωσως; and β before ρ, as βραβος for βραβος, a roof; changes two μι into two πι, as οπταις for οπταις, the eyes; and it agrees in so many things with the Doric dialect, that the two are usually confounded together, and have been almost entirely followed by the Latins. The Ενολικόν is a name given to the letter Ε, which the Ενολικιοι used to prefix to words beginning with vowels, as Εινες, for εινες; and also to insert between vowels, as Ει, for ει.

ΕΝΟΛΙΚΟΝ, Carmen Ενολικον, in Poetry, a kind of measure, consisting, first of an Iambic or Spondee; then of two Anapaests, divided by a long syllable; and, lastly, a common syllable. This is otherwise called caleps; and from the chief poets who used it, Archilochian and Pindaric.

Its type is, - - - - - - - - - -

c. g. "Ο Ενολικὸς κοπτόν ορϕ."  

ΕΝΟΛΙΠΙΚΟΝ, Ενολιφίλος, in Hydrodynamis, is an instrument consisting of a hollow metallic ball, with a slender neck, or pipe, arising from it. This, being filled with water, and then exposed to the fire, produces a vehement blast of wind.

This instrument, Des Cartes, and others, have made use of, to account for the natural cause, and generation, of wind.—And hence its name, Ενολιφίλος, from the term Ενολιφικός, a lover of Ενολία, the ball, or Ενολιφικός, the gates of Ενολία; Ενολιφικός being ruined in the god of the winds.

Sometimes the neck is made to screw into the ball, which is the most commodious way; because, then, the cavity may be the more readily be filled with water. If there be no screw, it may be filled thus:—Heat the ball red hot, and throw it into a vessel of water; the water will run in at the small hole, and fill about two thirds of the cavity.

If, after this, the Ενολιφίλος be laid on, or before the fire, so that the water and vessel become very much heated; the water being raised into vapour or effusive, will be forced out with great violence and noise; but it will be by intervals, and not with a continuous and uniform blast. Care should be taken that the aperture of the pipe be not stopped, when the instrument is put on the fire, and that the ball be not set upon a violent fire with very little water in it, otherwise the Ενολιφίλος will burst with a great explosion, and may occasion much mischief. The Ενολιφίλος is sometimes placed in a small carriage with wheels, and a cork is thrust into the extremity of the pipe. When the vapour has acquired sufficient strength to force out the cork, it will rush out with violence in one direction, while the ball and carriage move the contrary way. See a figure of the apparatus for this purpose in Plate 1, i. i. i. 2. 1. 2.

These phenomena the reader will be easily enabled to solve, from what is shown under the articles, Air, Water, and Rartfaction.

Chaucer suggests some farther uses of the Ενολιφίλος. 1. He thinks it might be applied, instead of a bellows, to blow the fire, where a very intense heat is required. This fact has been urged as an argument to prove the decomposition of water; but, in this case, it is not the flame which excites the fire, but the air which is driven before it; for an Ενολιφίλος will not produce this effect, but the contrary, unless a body of air be interposed between its aperture and the fire. Accordingly, Dr. Lewis condemns habituating the Ενολιφίλος instead of bellows, and says, that upon trial he always found that instead of exciting, it extinguished the fire. Com. Phil. Techn. p. 21.—2. If a trumpet, horn, or other sonorous instrument, were fitted to its neck, it might be made to yield music.—3. If the neck were turned perpendicularly upwards, and prolonged by a tube or hollow cylinder fitted to it, and a hollow ball laid on the orifice of the tube, the ball would be blown up, and kept fluctuating, or playing up and down, as in the stream of a fountain. And, 4. It might serve to scent or fumigate a room, if filled with perfumed, instead of common water.

An Ενολιφίλος has been sometimes placed in a chimney, where it can be heated, the vapour of which serves to drive the smoke up the chimney.

Dr. Plott gives an instance where the Ενολιφίλος is actually used to blow the fire: the lord of the manor of Ellington is bound by his tenure to drive a goose every new year's day three times round the hall of the lord of Hilton, while Jack of Hilton (a brazen figure having the structure of an Ενολιφίλος) blows the fire.

In Italy it is said, that the Ενολιφίλος is commonly made use of to cure smoky chimneys; for being hung over the fire, the blast arising from it carries up the loitering smoke along with it.

This instrument was known to the ancients, and is mentioned by Vitruvius, lib. i. cap. vi. and it is also taken notice of by several modern authors; as Des Cartes, in his Meteor. cap. i. apud Opera Philosophi. tom. i. p. 141.

F. Merkens, and some others have made use of this machine, to measure the gravity and degree of rarefaction of the air, by weighing the instrument, when red-hot, without water, and weighing it again when cold. But this method is liable to considerable objections. It supposes that there is no air in the ball when it is red-hot; whereas Varenius (Geog. vol. i. p. 438.) has shewn, that the air is rarefied but about 70 times; and, consequently, the weight, obtained by the above process, will be about 1-70th too small, or more or less, according to the intensity of the heat.

Some late authors have discovered a still more extraordinary use, to which the frauds of the heathen priesthood applied the Ενολιφίλος, viz., the working of fire and miracles. Besides Jack of Hilton, which had been an ancient Saxon image, or idol, Mr. Weber shews, that Phllar, a celebrated German idol, is also of the Ενολιφίλος kind; and in virtue thereof, could do noble feats; being filled with a fluid, and thus let on the fire, it would be covered with sweat, and as the heat increased would at length burst out into flames.

An Ενολιφίλος of great antiquity, made of brass, was lately dug up in the site of the Brinigikve canal, and presented to the antiquarian society of London. Instead of being globular, with a bent tube, it is in the form of a grotesque human figure, and the brass proceeds from its mouth.

ΕΝΟΛΙΣ or Ενολια, in Ancient Geography, a country of Asia Minor, so called from the Ενολια, who settled in this part of Asia, comprehended in former times the whole of Troas, and extended along the coast from Ionia to the Propontis; but in a more confined sense, it is situated between Troas to the north and Ionia to the south. According to Strabo (tom. 2, p. 872.) it extended from the premonitory Lectus to the river Hermus, and contained 11 cities, mentioned by Herodotus (i. i. p. 73. Ed. Welling) who observes, that Smyrna was taken from the Ενολια by the Ionians. Ptolemy, and after him M. d'Anville, affirms Cremona to the north, and Hermus to the south, as the limits of Ενολια. The Ενολια, according to Josephus, were descended from Ethipia, one of the sons of Javan; but according to the Greek historians from Ενολια, the third son of Τον, son of Ηλεκ, who was the son of Deucalion. They, as well as the Ionians
AEOLUS, a city of the Thracian Chersonesus. M. d'Anville places it at the entrance of the Hellepont to the north, and calls it, with Pliny, Etruscan.

AEOLUS, in Entomology, a species of Papilio, with undulated azure wings, a black spot on the primores, and a white band, fruited with black, under all of them; found in South America and India.

AEOLUS, in Mechanics, denotes a portable machine, not long since invented by Mr. Tidd, for refreshing and changing the air in rooms.

This machine is adapted in its dimensions to supply the place of a square of glass in a sash window, and is executed in so small a compass, as to project but a little way from the sash, and in so neat a manner, lays the inventor, as to be an elegant ornament to the place where it is fixed. It works without the least noise, requires no attendance, and occasions neither trouble nor expense to keep it in order. It throws in only such a quantity of air as is agreeable; and leaves off working, of its own accord, whenever the door or window is opened.

AEOLUS, in Heathen Mythology, the god of the winds, painted with swollen cheeks, like one who with main force endeavours to blow a blast; also with two wings on his shoulders, and a high-coloured fiery countenance. He is said to have been the son of Jupiter by Acasta, or Sigefia, the daughter of Hippotus; or, according to others, the son of Hippotus by Meneela, daughter of Hilias, king of Lipara. He dwelt, as some say, in the island Strongyle now Strombolo, one of the Aeolian islands; or, as others say, either at Rhegium in Italy, or in Lipara. The government of the winds is said to be under his direction and control. Some mythologists explain the fables relating to Aeolus by representing him as a wise and good prince, who was able in consequence of his skill in the sciences, by the flux and reflux of the tides, and the appearances of the volcano in the island Strongyle, to forecast storms and tempests. See Polybii Fragmenta, p. 988.

AEOLUS's Harp, in Music, an instrument so named, from its producing an agreeable harmony, merely by the action of the wind.—It is thus constructed.—Let a box be made of as thin deal as possible, (Plate 1, Music, fig. 1.) of the exact length answering to the width of the window in which it is intended to be placed; five or six inches deep and seven or eight inches wide. Let there be glued upon it at a a, two pieces of wainscot about half an inch high, and a quarter of an inch thick, to serve as bridges for the strings; and within these, at each end, under b b, glue two pieces of beech, about an inch square, of length equal to the width of the box, which are to support the pegs. Into these fix as many pins, such as are used in a harpsichord, as there are to be strings in the instrument, half at one end, and half at the other, at equal distances. It now remains to fitting it with small catgut, or blue frit fiddle-strings, fixing one end to a small brafs pin, as at c c (fig. 2) and twirling the other round the opposite pin at b b.

When these strings are tuned unison, and the instrument placed with the strings outward, in the window to which it is fitted, it will, provided the air blows on that window, give a sound like a dullant choir, increasing or decreasing, according to the strength of the wind.

The roes in the middle only represent found-holes; the thinner the top is, the better will the instrument perform. Mr. Thompson, in a note to his celebrated Ode on this instrument, ascribes the invention of it to Mr. Ofwald; whereas it was known to Kircher above a hundred years ago; and the method of constructing and using it is described by him in a book intitled Magia Phenomenica & Phenurgia.

An improved form of this instrument is represented in

[fig]
The strings, instead of being on the outside, are fixed to a sounding-board or belly within a wooden case, and the wind is admitted to them through an horizontal aperture. In this form the instrument is portable, and may be used any where in the open air.

Æolian's harp produces all the harmonics of a single string, divided in harmonical proportion. See Harmonics. The tension of the strings must not be great; as the air, if gentle, has not sufficient power to make them vibrate; and, if it blows fresh, the instrument does not ring, but resounds. Its crescendo and diminuendo, or the gradual advancing and retiring of its delicate tones, can only be described by the instrument itself.

Kircher has attempted to account for the phenomena of the Æolian harp, by supposing the current of air to strike on different portions of the string. But this is contrary to experience; for, if we suppose the Æolian note to be one-fifth above the original note of the string, that is, one third of the whole, then, according to Kircher, the remaining part would be at rest, which is not the fact; for an obstacle applied to any other point besides the quietest point of division, will destroy the Æolian tone. The chords also that would arise on this theory are not such as really take place in nature; thus, where the chord confists of the notes F and A, the first note F is produced, according to Kircher, by the blasts striking on one fourth of the string; and in this case, the remaining part of the string must be at rest according to Kircher, which is contrary to experience; or, if it be agitated as one string, it must produce the note of three-fourths of the whole string, that is, a fourth above the bass note; whereas, the note really produced is the double octave to the third above the bass note.

Mr. Young, in order to ascertain the order of the notes in this instrument, took off all the strings but one; and, placing it in a proper situation, he was surprized to hear a great variety of notes, and frequently such as were not produced by any aliquot part of the string; and he often heard a chord of two or three notes from this single string. These complex and extraordinary phenomena at first perplexed him; and he was almost desirous of being able to account for them on the principle of aliquot parts. On farther examination, however, he found that they all flowed naturally and easily from this principle. Having directed his attention to the effect of a current of air rushing against a stretched elastic string, he observed, that a blast against the middle point of the string moved the whole of it from its rectilinear position; and that the string by its elasticity, returned to its former position: so as thus to continue vibrating and exciting pulses in the air, which produced the tone of the entire string. If the current of air be too strong and rapid, when the string is bent, it will retain its curvature. But though the whole string cannot perform its vibrations in this case, the subordinated aliquot parts may; and these will be of different lengths according to the rapidity of the blast. Thus, when the velocity of the current increases so as to prevent the vibration of the whole string, these particles which strike against the middle points of the halves of the string agitate those halves, as in the case of sympathetic and secondary tones; and as these halves vibrate in half the time of the whole string, though the blast may be too rapid to admit of the vibration of the whole, yet it can have no more effect in preventing the motion of the halves than it would have on the whole string if its tension were quadruple: for the times of vibrations in strings of different lengths, and agreeing in other circumstances, are directly as the lengths; and in strings differing in tension, and agreeing in other circumstances, inversely as the square roots of the tensions: and therefore, their vibrations may become strong enough to excite such pulsation as will affect the drum of the ear; and the same may be said of other aliquot divisions of the string. Those particles which strike against such points of the string as are not in the middle of aliquot parts, will interrupt and counteract each other's vibrations, as in the case of sympathetic and secondary tones, and therefore will not produce a sensible effect. These principles are illustrated and applied by Mr. Young in his "Enquiry into the Principal Phenomena of Sound and Musical Strings," printed at London in 1784. 8vo.

ÆON, AEON, æon, æon, literally signifies the duration of a thing. But the word has been used by Greek writers in different senses. It was first applied to the age of man, or the duration of human life. In succeeding times it was used by philosophers to express the duration of spiritual and invisible beings.

Æon was used to denote the measure of corporeal and changing objects; and æon or æon, for the measure of such as were immutable and eternal. And, as God is the chief of spiritual and immaterial beings, his eternal duration was expressed by this term, and thus it is now commonly understood. It was afterwards attributed to other spiritual and invisible beings; and the oriental philosophers, who lived about the time of Christ's appearance, and made use of the Greek language, understood by it the duration of eternal and immutable things, the space or period of time in which they exist. By a metonymy, the term was employed to signify the beings themselves. Thus, the Supreme Being was called Æon, or Æon; and the angels also distinguished by the title of Æons. Accordingly, the Gnostics, who had formed the notion of an invisible and spiritual world, composed of entities or virtues, proceeding from the Supreme Being, and succeeding each other at certain intervals of time, so as to constitute an eternal chain, of which our world was the terminating link, assigned to the beings that formed this chain a certain term of duration, and a certain sphere of action. These terms of duration were at first called æontes, æons, and they themselves were afterwards metonymically distinguished by that title. Mosheim's Eccl. Hist. by Maclaine, vol. i. p. 89. 8vo.

Some have affixed another idea to the word æon; in order to which they have made use of the philosophy of Plato, giving reality to the ideas which that philosopher had imagined in God; and even personifying them, and regarding them distinct from God, and to have been produced by him: some male, others female. See Platonism.

These ideas they call Æones; of an assemblage of which they compose their deity, calling it Æoliparos, a Greek word, signifying fulness.

Some say that Simon Magus was the first inventor of these Æones, which seem, however, to have sprung from the oriental philosophy, and which were adopted by the Gnostics; afterwards brought to perfection by Valentinus; who, refining on those who preceded him in this way, produced a long genealogy of Æones, to the number of 30. The first, and most perfect, he particularly denominates Πνεῦμα, Pneum, that is, pre-existent; beside other names, the most usual whereof was that of Bythos, BYTHOS, depth.

This Bythos, he says, continued long alone with Erotos, Ἐρως, Thought; whom Valentinus also called Εὖνος, Gunnos, and Σωφία, Silence. At length Bythos, with Sige, produced Nous, Νοῦς, Understanding; and Αληθέα, Truth, her sister. Nous begat two Æones: LOGOS, LOGOS, Word; and ZOA, ZOE, Life, which begat two others: Anthropos, Ἀνθρώπος, Man; and Βασίλεια, Church. And these eight Æones were the chief of all the rest.
The _World_, _Age_, and _Life_, 7th, Legat ten other zones: _Men_ and the _Church_, Legat twelve more; among whom were, the _Paraclete_, _Fruit_, _Hope_, _Charity_, the _Perfected_, _Tolus_, and _Riffion_, 279v. And thus were thirty zones made up; which, altogether, made the _Pleroma_, _Heresies_, or _spiritual and invisible phantast_. See _Gnostics_, and _Valentianians_.

As likewise, in the _Phoenician_ _Theology_, was the first created woman.

ÆQVA, in the _Medical Writings of the Ancients_, is used for gellation; which sort of exercise was often preferred by the physicians of those days. Other exercises confin'd principally in the motion of the body; but in the æqua the limbs were at rest, while the body was carried about and moved from place to place, in such a manner as the physician preferred. It had therefore the advantages of exercise, without the fatigue of it.

This exercise was promoted several ways; sometimes the patient was laid in a sort of hammock, supported by ropes, and moved backward and forward; sometimes his bed run nimbly on his feet. And beside these, the several ways of travelling were accounted species of the æqua, whether in the litter, in a boat or ship, or on even ground in a chariot.

Achæpiades was the first who brought gellation into practice, which was used as a means to recover strength after a fever, &c.

ÆPEA, in _Ancient Geography_, a city of Laconia, according to Stephanus (of urb. p. 46v.), and of Meffenia, according to Strabo (t. i. p. 555.), who calls it Thuria, and deduces its name from its situation on the top of a hill. It is one of the seven cities promis'd by _Aegyamon_ to Achilles, and is mentioned by _Hom._, ii. i. v. 152.

"_Kaiou y' Ἀεπαὶ Πεδαμφοιοι φυτεύονται._"

Pulechramque _Æpeam_, Pefadamque uiturrem._"

Stephanus mentions another city of this name in _Cyprus_, built by Demophon, the son of Thefeus, on mount Clarion, which was afterwards called _Soloi_ in honour of _Solon_; and another in _Crete_.

ÆPOLIUM, a place situated, according to _Pliny_, between the _Danube_ and _Tyras_._

ÆPy, a city of Meffenia, so called, says Stephanus, from its being fortify'd; but more probably from its elevated situation, to which _Statius_ refers (_Theb._ i. iv. p. 421. Ed. Varior._

"Et fummis ingens montibus Æpy._"

ÆQUABONa, a town of _Lusitania_, to the south of the _Tagus_, near its mouth, and in view of _Olibippo_ or _Lilbon_.

ÆQUANA _Juga_, mountains of _Picenum_, in _Naples_, now called _Montagna di Sorrento_, denominated from the town _Ægua_, which, being destroyed, was replaced by _Vicus_, now _Vico di Sorrento_, called also _Æquana_. Thus, _Silius Italicus_, _Punic._ i. v. p. 276. Ed. Drakenb.

"Æ felicis Baccho
Æquana, et Zephyro Surrentum molle fulubri._"

ÆQUATA, Superficies, in _Botany_, denotes a surface devoid of all inequality; and differs from _planus_ in not requiring the part to be level, or in a rectilinear direction, but often occurs in round bodies, as in the pedicles of _Ixia_.

ÆQUI, _Aqicoli_, or _Equicii_, in _Ancient History_, inhabitants of Italy, who were situated between the _Sabines_ and _Latinas_, and whose capital city was _Bolo_. M. d'Anville places them on the banks of the _Anio_, with the _Sammites_ to the north and the _Marrucini_ to the east; but others apprehend that their territory extended farther south, so as to comprehend _Algidum_. They are mentioned under the different appellations above-quoted, by the historians and poets; and are described as a hardy and valiant people, who were much employed in agriculture, and also in military exercises. Thus _Virgil_, _Aen._ i. ix. v. 608.

"Æquum
Aut ratis terram domat, aut quas optis bella._"

And _Virgil_'s description seems to be borrowed by _Silus_ _Italicus_, when speaking of _these_ people, _Punic._ l. b. 1371, p. 419, he says—

"Æquilis dominat _Æquicula_ terram._"

The etymology of their name has been ascertained by _M._ _Gebelin_ to the word _equus_, or _ereu_, _erat_, expressing their situation near the sources of the _Anio_, _Telomus_, &c. which was more aquatic than any part of _Latium_. Others have supposed, that the _Equi_, who were distinguished by their love of justice, furnished the epithet _equus_, _jupp._ _Livy_ discriminate's them from the _Latinas_, when he represents them (_l._ ii. i. c. 35. t. 1. i. p. 369. Ed. Drakenb.) as invading their territory. They had frequent wars with the _Romans_, as _Livy_ has inform'd us (i. 2—10.) but were at length subdued by them. Their capital _Bola_ was taken by _Camillus_ in the year of _Rome_ 369, and their country was soon after laid waste, in order to deprive them of the power to revolt. They still, however, retained their enmity against the _Romans_; and, when occasion offered, joined the other enemies of _Rome_. About the year _U.C._ 449, they united with the _Sammites_; but they were no more that formidable nation, which had often struck terror into the Roman legions; insomuch had enervated them; and they were unable to maintain the field in their contest with the disciplined armies of _Rome_. At this time their country was overrun and laid waste. The conquerors took possession of forty-one towns in fifty days, most of which they razed or burnt, and thus they almost exterminated the whole nation of the _Equi_. _Anc._ _Ur. Hist._ vol. x. p. 324.

The cities _Cliterum_, _Carauli_ or _Curula_, _Valeria_, _Sublaqueum_, _Algidum_, _Vicovaro_, _Treba_, _Vetilla_, _Corbio_, and _Subiaeco_ belonged to the _Equi_.

ÆQVISÆLÆLUM, in _Roman Antiquity_, a name given to that part of the city of _Rome_ on which _Boile_ of _Sp. Mulinus_, who attempted to usurp the supreme power by bribing the people, and who, refusing to appear before the dictator _Cincinnatus_, was put to death by _Servilius_ _Ahala_, master of the _horae_. His house was demolished, and the region of the _city_ in which it stood was called _Arca_ _Æquilælælæ_. _Livy_, t. i. p. 919. Ed. Drakenb.

ÆQUOINCTIUM, in _Ancient Geography_, a town of Upper _Pannonia_, which is placed by M. d' _Anville_ on the _Danube_, south-east of _Vindobona_.

ÆQUUM, a Roman colony of _Dalmatia_ in _Illyria_, placed by _M._ _d'Anville_ north-east of _Scardona_.

ÆQUUS _Tutius_, a place of Italy in the _Sarnium_, north-east of _Beneventum_, the term _Tutius_ in _Samnite_ being synonymous with _maiorus_. A Roman word, called _Æquosticus_, paffed by this place towards _Camilla_. The ruins of it may be seen near _Bona-Albergo_.

ÆRA, in _Chronology_, a fixed point of time, from whence to begin a computation of the years ensuing.

The word is also sometimes written in ancient authors, _era_. Its origin is contended, though it is generally allowed to have had its rife in _Spain_. _Secundius_ supposes it formed from _A_ _E.R.A._ the note or abbreviations of the words, _anno_ _erat_ _Aquilia_; occasioned by the Spaniards beginning their computation from the time their country came under the dominion of _Aquilus_, or that of their receiving the _Roman_ _calendar_. This opinion, however ingenious, is rejected by _Sealiger_, not only on account that in the ancient abbreviations _A_ never stood for _anno_, unless when preceded by _V_ for _visita_; and that it seems improbable they should put
put ER for erat, and the letter Α, without any discrimination, both for anus and Augustus. Volvius nevertheless favours the conjecture, and judges it at least as probable as either that of Idiore, who derives erat from ες, the tributemoney, wherewith Augustus taxed the world: or that of Scaliger himself, who deduces it likewise from ες, though in a different manner. ες, he observes, was used among the ancients for an article, or item, in an account; and hence it came also to stand for a sum or number itself. From the plural œra, came by corruption eræ, eram, in the singular; as often, ofh, the name of a place, from ὥ, the mouth of the Tyber.

Æra amounts to the same with epocha; though some authors make a difference between them; but wherein it consists they do not agree. A late critic affirms this difference, that in strictness of speech, epocha is that fixed point where an æra made use of commences. Bibl. Germ. tom. v. p. 172. Vallemont makes another difference, viz. that an epocha is a point fixed by chronologers, and an æra a like point, only fixed by the popular usage of a country, or nation. Perhaps it might not be amiss if chronologers would keep to this difference, but it is certain most of them hitherto use the two words promiscuously. The proper idea of an æra, as it is now generally understood, is that of a series of years, reckoned from a fixed point of time, called an epoch or epocha. Thus we say, that the Christian æra began at the epoch of the birth of Christ, and any particular year is such a year, according to the date of it, of the Christian æra. The particular æras are mentioned under epocha. See also Chronology.

Æra is also used, in some writers of the barbarous age, for any year.

In which sense, we meet with entering down the æra, the eleven hundred and eighty æra, &c.

ÆRÆ, in Ancient Geography, a town of Macedonia, and another of Ionia in Asia Minor, according to Stephanus Byzant. and a people of Asia towards Gedroia or Germania according to Ptolomy.

ÆRARIUM, the public treasury of the Roman state.

The temple of Saturn at Rome, being the great treasury of the state, was first called ærarium; from ες, æris, copper; that being the only money in use before the year of Rome 455, when the silver began to be coined.

It was first erected under Augustus, and maintained by a yearly voluntary contribution; but that proving insufficient, the twentieth part of all legacies and inheritances except of which fell to the next of kin, or to the poor, were configned to this treasury.

For the custody hereof, three of the emperor's life-guards were constitted praefidet ærarias.

Ærarium differs from fiscus, as the first contained the public money, the second that of the prince. Yet the two are sometimes used indiscriminately for each other. Calv. Lex. Jur.

Ærium sancti, was an appendage to the former, added on occasion of the growth of the Roman state, when there was not room enough for lodging all the public monies, and the public acts, which were deposited with it.

It was called sancti, because placed in an inner and safer part of the temple; or because in it was lodged the ærium viceminarium, or twentieth, which was kept as a fund or reserve, for extreme necessity of the state. On which account it was also called ærium viceminarium.

Ærarium Itibile, or of Iuno Lucretia, was erected by Servius Tullius, sixth king of the Romans, and commanded money paid in by parents for the birth of each child. The ærumuum Veneris, called Libitine, was for the custody of money paid into it for those who died; and the æriumium juravit, for the money deposited on account of those who arrived at the age of manhood. By these means he was able to ascertain the population and wealth of the country. Dion. Hal. lib. iv. tom. i. p. 272. Ed. Oxon.

Ærarium privatum, or the private pufhe, contained the money and effects which the prince was master of before his accesion to the empire. This was under the care of the consulæ rerum privatarum.—We meet also with other lesser treasuries, æraria minora, in the provinces.

ÆRARIUM Eclesiasticum, the treasury or bank of the church, was formed in the first century of the Christian æra, of free gifts, which were collected and preferred in churches, partly for the purpose of defraying the expense of divine service, and partly to relieve the poor. Such capitals, which were considered as ecclesiastical funds, were by Kudensius, (Hymn. ii. in honorem Laurentii) in the beginning of the fifth century, called montes annus, and ærea nunmis. Tertullian (Apolog. c. 39. oper. p. 35. Ed. Rigaltii.) calls them deposita pietae; and hence were formed the montes pietae of later times. See Mounts of Pity.

ÆRARIUS, in Antiquity, an officer appointed by Alexander Severus, for the disbursement of the money given in largesse to the soldiery, or people. Plut. Lex. Ant.

Ærarius was also used for a person whose common name was struck out by the censors from the album, or list of his century, and was only considered as a citizen so far as to make him subject to pay taxes, æra, without being entitled to any privileges, or advantages, from the common-wealth.

Hence the phrases, ærarium facere, inter æriarios referre, æriarii eximiae, &c.—Not only plebeians, to whom some had restricted it, but also knights and senators, were subject to this kind of degradation.

The ærarii were incapable of making a will, of inheriting, of voting in assemblies, of enjoying any post of honour or profit; in effect, were only subject to the burdens, without the benefits of society; yet they retained their freedom, and were not reduced to the condition of slaves. To be made an ærarius was a punishment inflicted for some offence, and reputed one degree more severe than to be expelled a tribe, tribu moveri. Concerning the precise meaning of these terms and the penalties denoted by them, which have been differently understood by critics, see a note to c. xvii. l. 24. Livy, tom. iii. p. 859. Ed. Drakenb.

Ærarius is also used for a person employed in coining, or working brass.

These are sometimes called æriarii favity, at other times æriarii diffimulati, from faver, the former answering to what we now call copper-smiths, the latter to founders. Ærarius is also applied to a soldier who receives pay.

ÆRATA aqua. See Ziment water.

ÆRATED water. See Pyxmont water.

ÆRATION of foils, in Agriculture, denotes the impregnation of them with air, by ploughing, harrowing, and other means of pulverization, which serve to release the air in the interfices of the soils, and to form various kinds of new combinations.

ÆRDING, or Erding, in Geography, a small town of Lower Bavaria, seven leagues south of Landshut, on the river Semp, in a district which produces the belt grain of that country. It was set on fire by the Swedes in 1632, and in 1648 reduced by them to ashes.

ÆREA, in Ancient Geography, a town of Thrace upon the Propontis, south of a small gulf, and north-west of Perinthus. It is also a surname of Diana, taken from a mountain of Argolis, where she was worshipped.
AR Ebefus, or Hierapolis, in Roman Antiquity, are terms found in inscriptions, which denote that the charges of erecting a tomb or monument were defrayed either by the friends of the deceased or by the people.

After draught, a phrase applied to soldiers, who were punished by being deprived of their pay.

AEROLUS, answering to the Greek ΙΕΡΟΥΛΟΣ, was a weight according to Diodorus and Strabo equal to 83, and according to others equal to 84 of the obols, which was 0.7 grains.

ALERIA, in Ancient Geography, a town in that part of Gallia Narbonensis, which was inhabited by the Cavires. It was so called, says Strabo (I. p. 83.), because it was situated on an eminence. M. d'Anville places it Fourth part of Valtio, and north-call of Carpentor acte. This name was also given to one of the islands of Thrace, called Thasos. Thasos, and also Egypt, were anciently called Aeria.

The names of these islands are given by Helychus to Ethiopia.

AERIAL, something that consists of, or has relation to, air. The Efeni, the most refined and rational sect among the Jews, held, that the human soul consisted of an aerial substance; and the Rofecrancians, and other visionaries, filled the atmosphere with aerial inhabitants.

Aerial perspective is that which represents bodies weakened and diminished in proportion to their distance from the eye, and which judicious artists practice by diffusing a kind of thin vapour over them, that deceives the eye agreeably. Aerial perspective chiefly respects the colours of objects, whose force and lustre it takes off more or less, to make them appear as if more or less remote. It is founded on this, that the longer column of air an object is seen through, the more feebly do the visual rays emitted from it affect the eye. Objects seen in a camera obscura feebly exhibit this effect.

Aerial tribute, in Antiquity, was an annual gift of 120 thousand pounds, which the emperor Jullian accepted from his prætorian prefect; and the means of payment were abandoned to the disfavour of that powerful magistrate.

AERIANS, in Ecclesiastical History, a religious sect, denominated from Agerius, an Armenian præfect of the fourth century. The Arians had much the same sentiments in respect of the Trinity as the Arians: beside which, they condemned prayers and offerings for the dead, flated falis and feasts, the celebration of Easter, and other rites of the same nature, in which the multitude think the life and soul of religion to consist; yet they considered as Jewish ordinances, and they conceived that to observe Easter was to give heed to Jewish fables (Titus, i. 14. 1 Tim. i. 4.). Though they sometimes fasted on the fourth day of the week, as others did, it was not from a regard to any religious obligation, but merely of their own free will. What Epiphanius says of their chafing to fast on the Lord's day must therefore be a calumny. They also hold, that there is no difference between priests and bishops, but that the priesthood and episcopate are absolutely one and the same order, or dignity: an opinion, says Mosheim, which was agreeable to many good Christians, who were no longer able to bear the tyranny and arrogance of the bishops of that century, and which has been since frequently affected by many modern divines and others. Agerius built his doctrine chiefly on some passages in St. Paul's writings; and among others, on that in 1 Tim. iv. 14, where the apostle exhorts Timothy not to neglect "the gift he had received by the laying on of the hands of the presbytery." Here, observes Agerius, is no mention of bishops; but Timothy evidently received his ordination from the presbyters or priests. Epiphanius zealously maintains the superiority of bishops against the Arians. The word presbytery, used by St. Paul, he observes, includes both bishops and priests; the whole senate, or assembly, of the ecclesiastics of the place. Arians and his followers, whose great purpose seems to have been that of reducing Christianity to its primitive simplicity, met with great difficulties. They were excluded from churches, and cities, and villages; and being obliged to wander abroad, they suffered great hardships. Being thus generally and violently opposed, they could not increase to any great number, and in time they were reduced to nothing. Tillemont considers them as Calvinists; and it is certain, that their ideas of church government were formed very much upon the Presbyterian plan. Mohl. Eccl. Hist. vol. i. 387. Lardner's Works, vol. iv. p. 306, &c.

AERICA, or Erieka, in Ethnology, a name given by Gaza and others to the common heron.

AERIUSA, the ancient name for the sky-coloured Jasper.

AERITES, in Botany, a name given to Anacallis. AERENEN, Aegaeum, in Geography, a large walled town of the Valais in Switzerland, which is the court town of the tithing, and which has a council-house where its meetings are held. With this town is incorporated another small place on the Deutch-hill, otherwise called Mons Dei, at the foot of which hill is a lofty stone bridge over the Rhone. N. lat. 46° 15', E. long. 8°.

AERF, a small river of Britain, rising in mount Cilieron, and discharging itself into Aeopus.

AEROGRAHY, from αερ, air, and γραφειν, I describe, a description of the air, of atmosphere, its limits, dimensions, properties, &c.

This amounts to much the same with aerology, unless we suppose the latter to enter into the rational, and the former to confine itself to a description of the more obvious affections thereof.

AEROGRAHIS, from αερ, and γραφομαι, I describe; the doctrine or science of the air, and its phenomena, its properties, good and bad qualities, &c. See Air.

AEROGRAHY, called also the aerology, makes a part of the regimen of health, or the branch of medicine called by some diafopknys, or the non-naturals, which treats of air, its properties and use in the animal economy, and its efficacy in preserving and restoring health. See Air.

AERONANCY, Aeromancy, compounded of αερ, air, and μαντεια, divination, an ancient species of divination performed by means of the air, and its phenomena. Aeromancy included the business of augury, and auguria; the rules of prediction from uncommon winds, storms, showers, and other prodigies. Modern authors speak of a more rational aeromancy, meaning by it the art of foretelling the changes and variations in the air and weather, winds, storms, and the like.

Morhof advances considerations for reducing aeromancy to a certainty, by means of a regular series of meteorological observations. But though many such have been instituted with great care in many parts, this art has hitherto made a very small progress. Of this kind is Huxham's book De Aere.

Barometers, thermometers, hygrometers, and anemometers, are of considerable use in this kind of aeromancy.

Mizoldus has published a body of rules for foretelling storms, &c. drawn partly from vulgar observations, and the
the experience of mariners, partly from astrological considerations; under the title of AEROMANIA.

AEROMELI, a name given to honey, and also to
Manna. See Dro omell.

AEROMETRY, Aerometria, compound of aëry, and μετρητος, to measure, the art of measuring the air, its powers, and properties; and including the laws of the motion, gravitation, pressure, elasticity, refraction, condensation, &c. of the atmospheric fluid.

The word aerometry is but little used; in lieu hereof, we commonly call this branch of philosophy, Pneumatics.

C. Wolfius, professor of mathematics at Hall, having reduced many of the affections of this fluid to geometrical demonstration, first published Elements of Aerometry, at Leipzig, 1759, in high Dutch, and afterwards more largely in Latin, which have been twice inserted in his Curious Mathematics, in eight volumes ato.

AERONAUTICA, from αëri, and ναυς, ship, the art of sailing a vessel through the air, or atmosphere, sustained as a ship in the sea.

AEROPHOBIA, formed of αëri, and φοβει, fear, a term that has been sometimes used for the dread of fresh air. Dr. Franklin says, that he has been sometimes seized with this aerophobia, considering fresh air as an enemy, and excluding it from the rooms which he has occupied. But experience convinced him of its error, and taught him to regard fresh air as eminently conducive to health. Any air, he says, is preferable to that of a close chamber, which has been again and again respired without any change. The fame fagacious philosopher has occasionally rallied those valutudinarians, who, wrapping themselves in close garments, hurry from the noxious air of a close chamber with as much of it as they can carry with them as a cloak of carriage, from which the external air is carefully excluded, and thus proceed to take the air for the benefit of their health.

AEROPHYLACEAE, in Natural History, denote subterraneous receptacles of air or wind.

The word is compounded of αëri, air, and φυλλον, leaf, denoting,—in which sense aerophyleaceae stands contradistinguished from hydrophyllaceae, pyrophyllaceae, &c.

Kircher speaks much of aerophylaec, or huge caverns, replete with air, disposed under ground, from whence, through numerous occult passages, that element is conveyed either to subterraneous receptacles of water, which are hereby raised into springs or rivers, or into the funds of subterraneous fire, which are thus fed and kept alive for the reparation of metals, minerals, and the like.

ÆROPOS, in Entomology, a species of Papilio, having brown wings marked with a yellow band and a single ocellus at the base of the primores. It is found in India and South America.

ÆROPOS, in Ancient Geography, a mountain of Macedo-
nia.

ÆROSIS, among the Ancient Physicians, denotes the act whereby the blood is attenuated and converted into an aura for the support of the vital spirits, and the maintenance of the flame of life.

ÆROSTATICA, from αëri, and στηνος, a vessel, is used by some authors for the science called by others AEROMETRY. It is properly the doctrine of the weight, pressure, and balance of the air and atmosphere.

ÆROSTATION, formed of αëri, and στηνος, of στης, I weigh, the science of weights, in its primary and proper sense, denotes the science of weights, suspended in the air; but in the modern application of the term, it signifies the art of navigation through the air, both in the principles and the practice of it. Hence also the machines, which are employed for this purpose, are called aerostats, or aerostatic machines; and, on account of their round figure, air-balloons. The aerostat, formed of αëri and στηνος, is the person who navigates through the air by means of such machines.

AEROSTATION, principles of. The fundamental principles of this art have been long and generally known; although the application of them to practice seems to be altogether a modern discovery. They are particularly illustrated in this Dictionary under the articles Weight of Air, Inflammability of Air, and Specific Gravity.

It will be sufficient, therefore, to observe in this place, that any body, which is specically, or bulk for bulk, lighter than the atmospheric air accompanying the earth, will be buoyed up by it, and ascend; but as the density of the atmosphere decreases, on account of the diminished pressure of the superincumbent air, and the elastic property which it possesses, at different elevations above the earth, this body can rise only to a height in which the surrounding air will be of the same specific gravity with itself. In this situation it will either float, or be driven in the direction of the wind or current of air, to which it is exposed. An air-balloon is a body of this kind, the whole mass of which, including its covering and contents, and the several weights annexed to it, is of less specific gravity than that of the air in which it rises.

Heat is well known to rarefy and expand, and consequently to lessen the specific gravity of the air to which it is applied; and the diminution of its weight is proportional to the heat. To the observations that occur under Rarificity of Air to this purpose, we shall here add, that one degree of heat, according to the scale of Fahrenheit's thermometer, seems to expand the air about one four hundredth part; and about 400, or rather 455, degrees of heat, will just double the bulk of a quantity of air. If, therefore, the air included in any kind of covering be heated, and consequently dilated, to such a degree, as that the excess of the weight of an equal bulk of common air above the weight of the heated air, is greater than the weight of the covering and its appendages, this whole mass will ascend in the atmosphere, till, by the cooling and condensation of the included air, or the diminished density of the surrounding air, it becomes of the same specific gravity with the air in which it floats; and without renewed heat, it will gradually descend.

If, instead of heating common air included in any covering, and thus diminishing its weight, the covering be filled with an elastic fluid, lighter than atmospheric air; so that the excess of the weight of an equal bulk of the latter above that of the inclosed elastic fluid be greater than the weight of the covering and its appendages, the whole mass will in this case ascend in the atmosphere, and continue to rise till it attains a height at which the surrounding air is of the same specific gravity with itself. Inflammable air is a fluid of this kind. For the knowledge of many of its properties, we are indebted to Mr. Henry Cavendish; who discovered, that if common air is eight hundred times lighter than water, inflammable air is seven times lighter than common air; but if common air is eight hundred and fifty times lighter than water, then inflammable air is 10,8 times lighter than common air. See Phil. Trans. vol. lii. art. 19. and Inflammable Air or Hydrogen.

The construction of air-balloons depends upon the principles above stated; and they are of two kinds, as one or the other of the preceding methods of preparing them is adopted.

AEROSTATION, History of. In the various schemes that
have been proposed for navigating through the air, some have had recourse to artificial wings; which, being con-
structed likethose of birds, and annexed to the human
body, might bear it up, and by their motion, produced
either by mechanical springs, or muscular exertion, effect
its progress in any direction at pleasure. This is one of
the methods of artificial flying suggested by bishop Wilkins, in
the seventh chapter of his De Deo, or Treatise on Mecha-
nical Motions; but the success of it is doubtful, and ex-
periments made in this way have been few and unsatisfactory.
Borelli (De Motu Animalium, cap. 22. prop. 193 and 204.
p. 196 and 208, ed. 1713), having compared the power of
the muscles which act on the wings of a bird with that of
the muscles of the breast and arms of a man, finds the latter
altogether insufficient to produce, by means of any wings,
that motion against the air, which is necessary to raise a man
in the atmosphere.

Others, with greater probability of success, have pro-
posed to attach the human body to some mafs, which being
lighter than air, might raise itself and the annexed weight
into the regions of that element. This method has actually
succeeded; though Borelli (ubi supra), as well as Leibnitz,
denied the possibility of a man’s flying by any of the means
with which they were acquainted.

It is needless to recite any of the accounts relating to
this subject, which have been transmitted to us by the
ancients. Most, if not all of them, are fabulous. An
ingenious writer, in a work cited at the close of this article,
have given us the refult of his enquiries into the records of
antiquity; and he informs us, that the earliest account of
any thing relating to flying, which has the appearance of
authenticity, is that of the wooden pigeon, constructed by
Archytas in the fourth century, before the Christian era,
and of which Aulus Gellius (Nocctes Atticx, lib. x. cap. 12.)
relates, that it could fly by means of mechanical powers,
and by an inclosed spirit. This spirit, or aura, our author
apprehends, was nothing more than a sort of animation,
which the machine appeared to be possessed of, in confec-
quence of its extraordinary mechanism. Aeroliation was,
therefore, a subject either altogether unknown, or very
imperfectly understood among the ancients; unless we sup-
pole it to be one of those arts, of which the records are
lost. In later times, the schemes which have been proposed
by ingenious men seem to have terminated in speculation.
The reader will find a brief account of some of them under
the articles Atmosphere and Artificial Flying, and a
more comprehensive history of the projects and achievements
of different persons, in the work cited below. Upon
the whole it appears, that the art of traversing the air is an
invention of our own time; and the whole history of it is
comprehended within a very short period.

Soon after Mr. Cavendish’s discovery of the specific gra-
vity of inflammable air, it occurred to the ingenious Dr.
Black of Edinburgh, that if a bladder, sufficiently light
and thin, were filled with this air, it would form a mass
lighter than the same bulk of atmospheric air, and rise
in it. This thought was suggested in his lectures in 1767
or 1768; and he proposed, by means of the allatocos of a
calf, to try the experiment. Other employments, how-
ever, prevented the execution of his design. The possi-
bility of constructing a vesel, which, when filled with inflamm-
able air, would ascend in the atmosphere, had occurred
also to Mr. Cavalli about the same time; and to him
belongs the honour of having first made experiments on
this subject, in the beginning of the year 1762, of which
an account was read to the Royal Society, on the 20th of
June in that year. He tried bladders; but the thickness
of these, however scraped and cleaned, were too heavy. In
using China paper, he found that the inflammable air passed
through its pores, like water through a sieve; and having
failed of success by blowing this air into a thick solution of
gum, thick varnishes, and oil paint, he was under a neces-
Sibility of being satisfied with soap-balls, which, being inflated
with inflammable air, by dipping the end of a small glass
tube, connected with a bladder containing the air, into a
thick solution of soap, and gently compressing the blad-
er, ascended rapidly in the atmosphere; and these were
the first sort of inflammable air-balloons that were ever
made.

For balloons formed on a larger scale, and on the prin-
ciple of rarefied air, we must direct our attention to France;
where the two brothers, Stephen and Joseph Mongolfer,
paper-manufacturers at Annonay, about 36 miles from
Lyons, distinguished themselves by exhibiting the first
of those aeroliotic machines, which have since excited so much
attention and astonishment. The first idea of such a ma-
icine was suggested to them by the natural action of the
smoke and clouds in the atmosphere; and the first ex-
periment was made at Avignon by Stephen, the elder of
the two brothers, towards the middle of November, 1782.
Having prepared a bag of fine silk, in the shape of a paral-
lelepipedon, and in capacity about forty cubic feet, he
applied to its aperture burning paper, which rarefied the
air, and thus formed a kind of cloud in the bag; and when
it became sufficiently expanded, it ascended rapidly to the
circling. Soon afterwards the experiment was repeated by
the two brothers at Annonay, in the open air, when the
machine ascended to the height of about seventy feet.
Encouraged by their success, they constructed a machine,
the capacity of which was about 650 cubic feet; which,
in the experiment, broke the ropes that confined it, and
after ascending rapidly to the height of about 600 feet,
fell on the adjoining ground. With another machine, 35
feet in diameter, they repeated the experiment in April,
1783; when breaking loose from its confinement, it rote to
the height of above 1000 feet, and being carried by the
wind, it fell at the distance of about three quarters of a
mile from the place where it ascended. The capacity of
this machine was equal to about 23430 cubic feet; and
when inflated, it measured 117 English feet in circumfe-
rence. The covering of it was formed of linen, lined with
paper; its shape was nearly sphericall; and its aperture
was fixed to a wooden frame about 16 feet in surface.
When filled with vapour, which was conjectured to be about half
as heavy as common air, it was capable of lifting up about
490 pounds, besides its own weight, which, together with
that of the wooden frame, was equal to 500 pounds.

With this machine the next experiment was performed at
Annonay, on the 5th of June, 1783, before a great mul-
titude of spectators. The flaccid bag was suspended on a
pole 35 feet high; flraw and chopped wool were burnt
under the opening at the bottom; the vapour, or rather
smoke, soon inflated the bag, so as to distend it in all its
parts, and this immense mass ascended in the air with such
a velocity, that in less than 10 minutes it reached the
height of about 6000 feet. A breeze carried it in an hori-
zontal direction to the distance of 7668 feet; and it then
fell gently on the ground. Mr. Montgolfier attributed the
ascend of the machine, not to the rarefaction of the heated
air, which is the true cause, but to a certain gas or aeriform
fluid, specifically lighter than common air, which was sup-
poped to be diffused from burning sublunates, and which,
has been commonly called Montgolfier's gas, as balloons of
this kind have been denominated Montgolfier.

As soon as the news of this experiment reached Paris,
the philosophers of the city, conceiving that a new fort of
gas, half as heavy as common air, had been discovered
by Mellers. Montgolfier, and knowing that the weight of in-
flammable air was not more than the eighth or tenth part
of the weight of common air, justly concluded that in-
flammable air would answer the purpose of this experiment
better than the gas of Montgolfier, and resolved to make
trial of it. A subscription was opened by M. Faujas de
St. Fond towards defraying the expense of the experiment.
A sufficient sum of money having been soon raised, Mellers,
Roberts were appointed to construct the machine; and M.
Charles, professor of experimental philosophy, to superin-
tend the work. At last mounting many difficulties in
obtaining a sufficient quantity of inflammable air, and
finding a flableness light enough for the covering, they at length
constructed a globe of luteating, which was rendered imper-
vious to the inflowed air by a varnish of elastic gum or
cautchouc, dissolved in some kind of spirit or esential
oil. The diameter of this globe, which from its shape was
denominated a balloon, was about thirteen feet, and it had
only one aperture, like a bladder, to which a stop-cock was
adapted; its height, when empty, together with that of the
stop-cock, was 25 pounds. On the 23d of August, 1783, they began to fill the globe with inflammable air;
but this, being their first attempt, was attended with many
hindrances and disappointments. At last, however, it was
prepared for exhibition; and on the 27th it was carried to
the Champ de Mars, where, being diffcrnged from the
hills that held it down, it rose before a prodigious con-
course of people, in less than two minutes, to the height of
3132 feet. It then entered a cloud, but soon appeared
again; and at last it was lost among other clouds. This
balloon, after having floated about three quarters of an hour,
fell in a field about fifteen miles distant from the place of
ascend; where, as we may naturally imagine, it occasioned
much astonishment to the peasants. Its fall was owing to a
rent, occasioned by the expansion of the inflammable air in
that rare part of the atmosphere to which it ascended.
When the balloon went up, its specific gravity was 35
pounds less than that of common air.

In conquequence of this brilliant experiment, many bal-
loons were made on a small scale; gold-beaters skin was used
for the covering; and their size was from 9 to 18 inches
in diameter.

Mr. Montgolfier repeated an experiment with a machine of
his construction before the commissaries of the Academy
of Sciences on the 11th and 12th of September. This
machine was 74 feet high, and about 43 feet in diameter.
When diffcrnged, it appeared spherical. It was made of
canvas, covered with paper, both within and without; and
it weighed 1000 pounds.

The operation of filling it with rarefied air, produced by
means of the combustion of 50 pounds of dry straw, and
12 pounds of chopped wool, was performed in about nine
minutes; and its force of ascension, when inflated, was so
great that it raised eight men who held it some feet from the
ground. This machine was so much damaged by the rain,
that it was found necessary to prepare another for exhibition
before the king and royal family on the 16th. This new
machine consisted of cloth, made of linen and cotton thread,
and was painted with water-colours both within and without.
Its height was near 60 feet, and its diameter about
43 feet. Having made the necessary preparations for in-
flating it, the operation was begun about one o'clock on
the 19th of September, before the king and queen, the
court, and all the Parisians who could procure a conveyance
to Versailles. In eleven minutes it was sufficiently dilated
and the ropes being cut, it ascended, bearing up with it
a wicker cage, in which were a sheep, a cock, and a
duck. Its power of ascension, or the weight by which it
was lighter than an equal bulk of common air, allowing for
the cage and animals, was 606 pounds.

This balloon rose to the height of about 1440 feet; and
being driven by the wind, it descended gradually and fell
gently into a wood, at the distance of 10,200 feet from
Versailles. After remaining in the atmosphere eight mi-
nutes, the animals in the cage were safely landed. The
sheep was found feeding; the cock had received some hurt
on one of his wings, probably from a kick of the sheep;
the duck was perfectly well.

The success of this experiment induced M. Pilatre de
Rozier, with a philosophic intrepidity which will be re-
corded with applause in the history of aerostation, to offer
himself as the first adventurer in this aerial navigation.
Mr. Montgolfier constructed a new machine for this purpose in
a garden in the Faubourg St. Antoine. Its shape was
oval; its diameter being about 48 feet, and its height about
74 feet. To the aperture at the bottom was annexed a
wicker gallery about three feet broad, with a ballustrade
about three feet high. From the middle of the aperture
was unfurled chains, which came down from the sides of
the machine, an iron grate or brazier, in which a fire
was lighted for inflating the machine; and port-holes were
opened in the gallery, towards the aperture, through which
any person, who might venture to ascend, might feed the
fire on the grate with fuel, and regulate the dilation of the
inflated air of the machine at pleasure. The weight of this
aerostat was upwards of 1600 pounds. On the 15th of
October, the fire being lighted and the machine inflated,
M. P. de Rozier placed himself in the gallery, and ascended,
to the astonishment of a multitude of spectators, to the
height of 84 feet from the ground, and there kept the
machine about during 14' 25', by repeatedly throwing straw
and wool upon the fire; the machine then descended gra-
dually and gently, through a medium of increasing density,
to the ground; and the intrepid adventurer assured the
spectators that he had not experienced the least incon-
venience in this aerial excursion. This experiment was re-
peated on the 17th, and on the 19th, when M. P. de
Rozier, in his deft, and in order to avoid danger by
ascending, evinced to a multitude of observers, that the
machine may be made to ascend and descend at the pleasure
of the aviator, by merely increasing or diminishing the fire
in the grate. The balloon having been hauled down, M.
Girard de Villette placed himself in the gallery opposite to
M. Rozier; and being suffered to ascend, it hovered for
about nine minutes over Paris in the sight of all its in-
habitants at the height of about 330 feet. In another ex-
periment the marquis of Arlandes ascended with M. Rozier
much in the same manner. In consequence of the report of
the preceding experiment, signed by the commissaries of the
Academy of Sciences, it was ordered that the annual prize
of 600 livres should be given to Mellers. Montgolfier for the
year 1783. In the experiments above related the machine
was secured by ropes; but they were soon succeeded by un-
confined aerial navigation. Accordingly the balloon of
74 feet in height, above mentioned, was removed to La
Muette, a royal palace in the Bois de Boulogne; and all
things being ready, on the 21st of November M. P. de
Rozier
Ricard and the marquis d'Arlandes took their respective places in the gallery, and at 34 minutes after one the machine was absolutely abandoned to the element, and ascended softly and majestically in the atmosphere. The aeronauts, having reached the height of about 280 feet, waved their hats to the astonished multitude; but they soon rose too high to be distinguished, and are thought to have soared to an elevation of above 3000 feet. They were at first driven by a north-west wind horizontally over the river Seine and over Paris, taking care to keep the fleeces and high buildings by increasing the fire; and in rising met with a current of air, which carried them southward. Having passed the Boulevard, and deflating from the fire with feel, they descended very gently in a field beyond the new Boulevard, about 5000 yards distant from the palace de la Muette. They were in the air about 25 minutes. The weight of the whole apparatus, including that of the two travellers, was between 1600 and 1700 pounds.

Notwithstanding the rapid progress of aeronautics in France, we have no authentic account of any aerostatic experiments performed in other countries till about the close of the year 1783. The first experiment of this kind, publicly exhibited in our own country, was performed in London on the 27th of November, by count Zanheccari, an ingenious Italian, with a balloon of oil silk, 10 feet in diameter, and weighing 11 pounds. It was gilt, in order to render it more beautiful and more impermeable to the inflammable air. This balloon, three-fourths of which were filled with inflammable air, was launched from the Artillery-ground, in the presence of a vast concourse of spectators, at one o'clock in the afternoon, and at half past three was taken up near Petworth, in Sussex, 48 miles distant from London; so that it travelled at the rate of near 20 miles an hour. Its descent was occasioned by a rent, which must have been the effect of the rarefaction of the inflammable air, when the balloon ascended to the rarer part of the atmosphere.

The Parisian philosophers having concerted and executed the first aerial voyage with a balloon inflated by heated air, determined to attempt a similar voyage with a balloon filled with inflammable air, which seemed to be preferable to dilated air in every respect, the expense attending it excepted. A subscription was opened to defray the charges, which were estimated at about ten thousand livres; and the balloon was constructed by Meffrs. Roberts, of gores of silk, varnished with a solution of cahie gum. Its form was spheroidal, and it measured 27½ feet in diameter. The upper hemisphere was covered by a net, which was fastened to the hoop encircling its middle, and called its equator. To this equator was suspended by ropes a car or boat, covered with painted linen and beautifully ornamented, which swung a few feet below the balloon. In order to prevent the burning of the machine by the expansion of the inflammable air in a rarefied medium, it was furnished with a valve, which might be opened by means of a string annexed to it, for the discharge of part of the internal air without admitting the external to enter. To this balloon was likewise annexed a long pipe through which it was filled. The apparatus for filling it consisted of several casks placed round a large tub of water, each of which had a long tin tube, terminating under a vessel or funnel, that was inserted into the water of the tub. A tube proceeding from this funnel, communicated with the balloon, which stood just over it. Iron filings and diluted vitriolic acid were put into the casks; and the inflammable air, produced from these materials, passed through the tin tubes, through the water of the tub, and through the funnel of the balloon. The car was ballasted with sand-bags; so that by letting some of the air escape through the valve they might descend, and by discharging some of their ballast ascend. The specific gravity of the inflammable air, with which the balloon was filled, was to that of common air nearly as 1 to 5; and the balloon's power of ascension, when filled for the experiment and when actually ascending, was twenty pounds. The weight of the balloon and of its various appendages was 66½ pounds, and therefore the weight sustained by the inflammable air was 62½ pounds: and if from the weight of the common air displaced, which was found to be 77½ pounds, the former be subtracted, there will remain 11½ pounds for the real weight of the inflammable air contained in the balloon.

The 1st of December was fixed upon for the display of this grand experiment; and every precaution was made for conducting it with advantage. The garden of the Thulleries was the scene of operation; and it was crowded and encompassed with an innumerable multitude of observers. Signals were given by the firing of cannon, waving of pendants, &c. A small Montgolfier was launched for showing the direction of the wind, and for the amusement of the people, previously to the general display. At three quarters after one o'clock, M. Charles and one of the Roberts, having seated themselves in the boat attached to the balloon, and furnished with proper instruments, provisions, and clothing, left the ground, and ascended with a moderately accelerated velocity to the height of about 600 yards; the surrounding multitude standing silent with fear and amazement. At this height the aerial navigators made signals of their safety. When they went up, the thermometer, according to Fahrenheit's scale, stood at 59°; and the barometer at 30, 18 inches. At the height to which they ascended the barometer stood at 27 inches, whence they deduced their elevation to be nearly 600 yards. During the rest of the voyage the quicksilver in the barometer was generally between 27 and 27 6½ inches, rising and falling as part of the ballast was thrown out or some of the inflammable air escaped from the balloon. The thermometer generally stood between 53 and 57°. Soon after their ascent, they remained stationary for some time; they then moved horizontally in the direction of N. N. W. and having crossed the Seine, and passed over several towns and villages, to the great astonishment of the inhabitants, they descended in a field about 27 miles distant from Paris at a quarter past three o'clock; so that they had travelled at the rate of about fifteen miles an hour, without feeling the least inconvenience. The balloon still containing a considerable quantity of inflammable air, M. Charles re-ascented alone. In ten minutes he thought himself at the elevation of about 1500 toises. The globe, being now in a rarefied medium, swelled considerably; but when some of the inflammable air was discharged, it rose full higher. The barometer, which at his departure stood at 28 inches four lines, had now fallen to 18 inches ten lines. The thermometer, from about 45° of Fahrenheit's scale, had sunk to 21°. From these data the elevation of the globe was estimated at 1524 toises, or about 31,000 yards. M. de Menou supposed that he ascended to the height of at least 3500 yards. He continued in the air about 33 minutes, and by occasionally pulling the string of the upper valve, and thus letting out the gas, he descended about three miles from the place of his ascent. All the inconvenience he experienced in his elevation was a dry sharp cold, with a pain in one of his ears and a part of his face, which he ascribed to the dilatation of the internal air. The small balloon, launched by M. Montgolfier, was found to have moved in a direction opposite to that of the aeronauts; whence it is inferred, that
that there were two currents of air at different heights above the earth.

In the month of December of this year, several experiments with balloons were made at Philadelphia, in America, by Messrs. Rittenhouse and Hopkins. They contrived to connect several small balloons together, and thus they enabled a man to ascend to the height of 100 feet, and to float to a considerable distance. But fear induced him to cut open the balloons, and thus to descend. Small balloons were at this time very common, both in France and England.

In January 1784, Mr. J. Montgolfier, accompanied by six other persons, ascended at Lyons, with a large rarefied air-balloon, 131 feet high, and 104 feet diameter, to the height of about 1000 yards. This was the largest machine that had hitherto been made. It was formed of a double covering of linen, with three layers of paper between, and strengthened with strings and ribbons. It contained about 540,000 cubic feet of igneous gas; and its weight, including the gallery and passengers, was 1600 pounds. After remaining in the air about fifteen minutes, a rent in the machine occasioned its fall: and when it came within about 600 feet of the ground, it descended with a velocity which very much alarmed the spectators; but they all landed without injury.

On the 22d of February an inflammable air-balloon about five feet in diameter, was launched from Sandwich in Kent, which, travelling at the rate of about 50 miles an hour, crossed the English Channel, and descended in a field about nine miles from Lille, in French Flanders.

The first person in Italy, who was at the expense of constructing an aerostatic machine for making an aerial voyage, was the chevalier Paul Andreani of Milan; his machine was spherical, about 65 feet in diameter, and formed upon the principle of those of Montgolfier. The chevalier, and two brothers of the name of Gerli, who had assisted in the construction of it, ascended, on the 25th of February, to the height of about 1200 feet; and they remained in the atmosphere about twenty minutes.

From the calculations made respecting the capacity of this machine, it appears, that the included air was not rarefied above one-third, or that the included warm air was not 25 feet than two-thirds of that which would have filled the machine, when of the same temperature with the external air; and this is the utmost degree of rarefaction that can be reasonably expected in balloons of this kind.

The next aerial voyage was performed by M. Jean Pierre Blanchard, who had for several years been employed, though without success, in attempts of flying by mechanical contrivances. This voyage was performed in March 1784, with a balloon 25 feet in diameter, to which a boat was suspended, with two wings a d a rudder annexed to the boat, and a large umbrella or parachute spread horizontally between the boat and the balloon, designed to check the fall provided that the balloon should burst. The greatest altitude to which Mr. Blanchard ascended from the Champ de Mars at Paris, is supposed to be 9591 feet; and it appears from his own acknowledgment that the wings and rudder of his boat had little, if any, power in guiding the balloon from the direction of the wind. He was in the air an hour and a quarter, and descended at Billancourt, near Seve, after having experienced heat, cold, hunger, and an excessive drowsiness.

Aerostatic experiments and aerial voyages became so frequent in the course of the year 1784, that the limits of this article will not allow our particularly recording them. We shall, therefore, merely mention those which were attended with any peculiar circumstances. Mesrs. de Morveau and Bertrand ascended from Dijon in April, to the height of about 15000 feet, with an inflammable air balloon; the thermometer was observed to fall at 25 degrees. They were in the air during one hour and 25 minutes, and went to the distance of about 18 miles. Their ears were affected in the manner described by Mr. Charles. The clouds floated beneath them, and excluded them from the earth: and they jointly repeated the motto inscribed on their aerostat:—"Surge nonus gallus ad aethera."

In May, four ladies and two gentlemen ascended with a Montgolfier at Paris above the highest buildings; the machine was confined by ropes. It was 74 feet high, and 72 in diameter.

In a second voyage performed by Mr. Blanchard from Rouen, in May, it was observed, that his wings and ears could not carry him in any other direction than that of the wind. The mercury in the barometer descended as low as 20,57 inches; but on the earth, before he ascended, it stood at 37,16 inches.

At Lyons, on the 4th of June, M. Fleuriat and Madame Thible, the first lady that made an aerial voyage, ascended in the presence of Gustavus king of Sweden to the height of 5500 feet, and floated to the distance of about two miles in 45 minutes.

A balloon, 32 inches in diameter, filled with inflammable air, extracted from zinc, was raised at Nantes on the 14th of June with two persons, viz. M. Couillard de Maffi and M. Mouchet; which ascended to a great height, and in 58 minutes travelled to the distance of 27 miles.

On the 23d of June a large aerostat, on the principle of rarefied air, 91 1/2 feet high and 79 feet in diameter, was elevated by Montgolfier at Verfailles, in the presence of the royal family and the king of Sweden. M. Pilatre de Rozier and M. Pronit, ascended with it, and continued for 28 minutes at the height of 11732 feet and observed the clouds below them, that reflected to the region which they occupied the rays of the sun; the temperature of the air being 5° below the freezing point; and in three quarters of an hour they travelled to the distance of 36 miles. In consequence of this experiment the king granted to M. Rozier a pension of 2000 livres.

On the 15th of July the duke of Chartres, the two brothers Roberts, and another person, ascended with an inflammable air-balloon of an oblong form, 55 feet long and 24 feet in diameter, from the Park of St. Cloud; the machine remained in the atmosphere about 45 minutes. This machine contained an interior small balloon, filled with common air, by which means it was proposed to make it ascend or descend without any loss of inflammable air or ballast. The boat was furnished with a helm and oars, intended for guiding it. At the place of departure the barometer stood at 30, 12 inches. Three minutes after ascending, the balloon was lost in the clouds and involved in a dense vapour. An agitation of the air, resembling a whirlwind, alarmed the aerial voyagers, and occasioned several flocks, which prevented their using any of the instruments and contrivances prepared for the direction of the balloon. Other circumstances occurred to increase their danger; and when the mercury, standing in the barometer at 74, 36 inches, indicated their height to be about 5100 feet, they found it necessary to make holes in the bottom for discharging the inflammable air; and having made a rent of between seven and eight feet, they descended very rapidly, and at last came safely to the ground.

On the 18th of July M. Blanchard, accompanied by a Mr.
Mr. Boby, made his third aerial voyage with the same inflammable air-balloon, at Rouen; and ascended so high as to make the mercury in the barometer fall 4, 76 inches, and the thermometer 30°. In two hours and a quarter they floated 45 miles, or at the rate of twenty miles an hour. In this voyage Mr. Blanchard conceived, that by agitating the wings of his boat he could not only ascend and descend, but move sideways against the wind; but frequent trials do not seem to have established this fact. The machine retained its air during the night, and several ladies annulled themselves the next day, by ascending with it to the height of 80 feet, the length of the ropes to which it was attached.

In the course of this summer two persons, one in Spain, and another in America, were in danger of losing their lives by ascending with a heated air-machine. The former was scorched by the machine’s taking fire, and so hurt by his fall, that his life was long depauper of; and the latter was wafted against the wall of a house, and so entangled, that he fell from the height of about twenty feet, and the machine took fire, and was consumed.

In the month of August the Abbe Carnus, professor of philosophy, and M. Louchet, professor of belles lettres, ascended at Rodez, a town of Guienne in France, with an aerostatic machine of 57 feet in diameter. The air was calm, and the machine did not travel farther than about 14,000 yards in 46 minutes; and the height to which it ascended was 3520 yards above the level of the town. The thermometer was 24 degrees lower than it was at the earth when they ascended. On examining the air in one of two bottles, which they had filled at their highest elevation, they found that it contained a quarter less air than if it had been filled at about the level of the sea; and the air, tried by the test of nitrous air, was found more pure than that near the surface of the earth.

The first aerial voyage in England was performed in London, on the 15th of September, by Vincent Lunardi, a native of Italy. His balloon was made of oiled silk, painted in alternate stripes of blue and red. Its diameter was 33 feet. From a net which went over about two-thirds of the balloon, defended 45 cords to a hoop hanging below the balloon, and to which the gallery was attached. The balloon had no valve; and its neck, which terminated in the form of a pear, was the aperture through which the inflammable air was introduced, and through which it might be let out. The air for filling the balloon was produced from zinc by means of diluted vitriolic acid. Mr. Lunardi departed from the Artillery-ground at two o’clock; and with him were a dog, a cat, and a pigeon. After throwing out some sand to clear the houses, he ascended to a great height. The direction of his motion at first was north-west by west, but as the balloon rose higher, it fell into another current of air, which carried it nearly north. About half after three he descended very near the ground, and landed the cat, which was almost dead with cold; then rising, he prosecuted his voyage. He ascribes his descent to the action of an oar; but as he was under the necessity of throwing out ballast in order to re-ascend, his descent was more probably occasioned by the loss of inflammable air. At ten minutes past four he descended on a meadow near Ware in Hertfordshire. The only philosophical instrument which he carried with him was a thermometer, which in the course of his voyage stood as low as 29°, and he observed that the drops of water which collected round the balloon were frozen.

The longest and the most interesting voyage, which was performed about this time, was that of Meissrs. Roberts and M. Collin Hallin, at Paris, on the 19th of September. Their aereal was filled with inflammable air. Its diameter was 27 feet, and its length 404 feet, and it was made to float with its longest part parallel to the horizon, with a boat of nearly 17 feet long attached to a net that went over it as far as its middle. To the boat were attached wings or oars, in the form of an umbrella. At 12 o’clock they ascended with 470 pounds of ballast, and after various manœuvres descended at 40 minutes past six o’clock near Arras, in Artois, having still 200 pounds of their ballast remaining in the boat. Having risen about 1400 feet, they perceived flormy clouds which they endeavoured to avoid; but the current of air was uniform from the height of 600 to 4300 feet. The barometer on the coast of the sea was 29,611 inches, and sunk to 23,944 inches. They found that by working with their oars, they accelerated their course. In the prosecution of their voyage, which was 150 miles, they heard two claps of thunder; and the cold occasioned by the approach of stormy clouds made the thermometer fall from 77° to 59°, and condensed the inflammable air in the balloon, so as to make it defend very low. From some experiments they concluded, that they were able by the use of two oars to deviate from the direction of the wind about 22°. But this experiment requires repetition, in order to ascertain with accuracy the effect here ascribed to oars.

The second aerial voyage in England was performed by Mr. Blanchard and M. Sheldon, professor of anatomy to the Royal Academy, the first Englishman who ascended with an aerostatic machine. This experiment was performed at Chelsea on the 15th of October. The winds used on this occasion seemed to have produced no deviation in the machine’s tracks from the direction of the wind. Mr. Blanchard, having landed his friend about the distance of 14 miles from Chelsea, proceeded alone with different currents; and ascended so high as to experience great difficulty of breathing; a pigeon also, which flew away from the boat, laboured for some time with its wings, in order to sustain itself in the rarefied air, and after wandering for a good while returned and rested on one side of the boat. Mr. Blanchard perceiving the fact before him descended near Runley, about 75 miles from London, having travelled at the rate of nearly 50 miles an hour.

On the 12th of October, Mr. Sadler, of Oxford, made a voyage of 14 miles from that place in 17 minutes, with an inflammable air-balcon of his own contrivance and construction.

Mr. Blanchard’s fifth aerial voyage was performed from London on the 30th of November, in company with Dr. J. Jeffries, a native of America. This voyage was about twenty-one miles. It does not appear that they derived any advantage from their oars in directing the course of the balloon.

On the 4th of January, 1785, Mr. Harper ascended with an inflammable air-balcon from Birmingham; he went to the distance of 50 miles in about an hour and a quarter, and found no inconveniences beside such as might be expected from the changes of wet and cold, and a temporary defaxcts. The thermometer descended from 40° to 28°.

On the 7th of January, Mr. Blanchard, accompanied by Dr. Jeffries, departed with the balloon, which had carried him five times through the air, from Dover-cape towards the French coast. In their passage they were under a necessity of throwing away every thing which they had with them in the boat, and to part even with their clothes, in order to prevent the balloon from falling into the sea; but
as they approached the land, it began to rise; and in two hours they reached the high grounds near Calais, and the balloon rising still higher over the land, they descended safely in the forest of Guiennes. In consequence of this voyage the king of France presented Mr. Blanchard with a gift of 12000 livres, and granted him a portion of 12000 litres a year. A bottle which was thrown out of the boat in the time of their danger, struck the water with such force, that the block was heard at a considerable elevation, and feebly felt on the car and balloon.

On the 19th of January Mr. Crofle ascended at Dublin with an inflammable air balloon to a great height, and rose so rapidly as to be out of sight in $\frac{1}{2}$ minutes. By opening the valve he descended suddenly as he approached very near the sea. On the 25th of March Count Zambeccari and Admiral Sir Edward Vernon ascended at London, and failed to Horfham in Sufex, at the distance of 35 miles, in less than an hour. At the height of about two miles, the barometer having fallen from 30.4 inches to 20.8 inches, an accident hindered them, and obliged them to descend. In their descent they paffed through a dente cloud, which covered them with snow. They observed that the balloon revoluted perpetually round its vertical axis, with such rapidity as to perform each revolution in four or five seconds; they also mention a kind of railing noise, which they heard among the clouds, and that the balloon was greatly agitated in its descent. On the 5th of May, Mr. Sadler and Mr. Windsford ascended at Roudley Hurst; and were driven by a current of air towards the sea. They fortunately descended at the confufion of the Thames and Medway; but the cords of their machine being released, it instantly ascended and floated to a considerable distance, and was taken up by a trading vessel at sea, where it fell. On the 12th of May, Mr. Crofle ascended at Dublin, but soon came down again with a velocity which alarmed the spectators. Upon his decent, Mr. McGuire, a corpulent youth, sprang into the machine, and was carried off by the ascending balloon towards the Channel; he at length fell into the sea, and was taken up by a boat dispatched for his relief, just when his strength was exhausted with swimming, and thus his life was saved.

The fate of M. P. de Rozier, the firft aerial navigator, and of his companion M. Romain, has been much lamented. They ascended at Boulogne on the 15th of June, with an intention of crossing the Channel to England. Their machine conftituted of a spherical balloon 37 feet in diameter, filled with inflammable air; and under this balloon was suspended a small Montgolfier, or fire-balloon, ten feet in diameter. This Montgolfier was designed for rarefying the atmosphere air, and thus diminishing the specific gravity of the whole apparatus. For the first twenty minutes they seemed to pursue the proper course; but the balloon seemed to be much inflated, and the aeronauts appeared anxious to descend. Soon however, when they were at the height of about three quarters of a mile, the whole apparatus was in flames, and the unfortunate adventurers fell to the ground, and were killed on the spot.

On the 15th of July Mr. Crofle ascended at Dublin, with a view of crossing the Channel to England. To a wicker basket of a circular form, which he had inhabited for the boat, he had affixed a number of bladders, for the purpose of rendering his galery buoyant, in case of a defalter at sea. The height to which he ascended at one time was such, that by the intense cold his ink was frozen, and the mercury sunk into the ball of the thermometer. He himself was sick, and he felt a strong imprecation on the tympanum of his ears. At his utmost elevation he thought himself stationary; but on discharging some gas, he descended to a very rough current of air blowing to the north. He then entered a dense cloud, and experienced strong blasts of winds, with thunder and lightning, which brought him with rapidity towards the surface of the water. The water soon entered his ears; the force of the wind plunged him into the ocean; and it was with difficulty that he put on his cork jacket. The bladders which he had prepared were now found of great use. The water, added to his own weight, served as ballast; and the balloon maintaining its poife, answered the purpose of a sail, by means of which, and a snatch-block to his car, he moved before the wind as regularly as a sailing vessel. He was at length overtaken by some vessels that were crowding far after him, and conveyed to Dunkery, with the balloon towed after them. On the 22d of July, Major Money, who ascended at Norwich, was driven out to sea, and after having been blown about for about two hours, he dropped into the water. After much exertion for preferring his life, and when he was almost depriving of relief, he was taken up by a revenue cutter in a state of extreme weakness; having been struggling to keep himself above water for about seven hours. The longest voyage that had been hitherto made was performed by Mr. Blanchard towards the end of August. He ascended at Little, accompanied by the chevalier de L'Epiphan, and traversed a distance of 300 miles before he descended. On this, as well as on other occasions, Mr. Blanchard made trial of a parachute, in the form of a large umbrella, which he contrived for breaking the fall in case of any accident. With this machine he let down a dog, which came to the ground gently, and unhurt.

On the 8th of September Mr. Baldwin ascended from the city of Chester, and performed an aerial voyage of 25 miles in two hours and a quarter. His greatest elevation was about a mile and an half, and he supposes that the velocity of his motion was sometimes at the rate of 30 miles an hour. He has published a circumstantial account of his voyage, described the appearances of the clouds as he paffed through them, and annexed a variety of observations relating to aeronautics, which render his treatise valuable and interesting to those who wish to acquaint themselves with this subject. It would be tedious to recount the aerial expeditions that were performed in various parts of our own country, as well as on the continent, in the whole course of the year 1785; more especially as they have afforded us no experiment or discovery of any peculiar importance. The most persevering aerial navigator has been Mr. Blanchard. In August 1788, he ascended at Brunswick for the thirty-second time. Within two years from the first discovery of this art of navigating the atmosphere, more than forty different persons performed the experiment without any material injury; and it may be justly questioned, says Mr. Cavallo, whether the first forty persons, who tried themselves to the sea in balloons, escaped so safely. The catastrophe that befell Rozier, and the unpleasant circumstances that have happened to some of the aeronauts in our own country, have been owing not so much to the principle of the art, as to want of judgment, or prudent management in the conduct of it.

We shall close this abstract of the history of aeronautics with the observations of a very competent judge on the respective advantages and disadvantages of balloons made with inflammable air, and of those that are raised by means of hot air, to the former of which he gives the preference. The principal comparative advantages of the rarefied air-balloons are, their being filled with little or no expense; their not requiring to be made of so expensive materials; and the com
bubbles necessary to fill then being found almost every where, so that when the provision of fuel is exhausted, the balloon may descend and recruit his fuel, in order to proceed on his voyage. But they must be larger than balloons of the other sort, in order to take up the same weight: and the presence of fire is a constant trouble and a continual danger. Experience has in many instances, environs the dreadful consequences that have attended them. On the other hand, the inflammable air balloon must be made of a substance impermeable to the fluid gas: the gas itself cannot be produced without a considerable expense; and it is not easy to find the material, and apparatus necessary for the production of it in every place. Improvements, however, daily occur in the preparation of the coverings of these balloons, so as to render them nearly impermeable to the inflammable air: and it has been found that an inflammable air-balloon, 30 feet in diameter, may be so made as to sustain two persons and a considerable quantity of baggage in the air for more than 24 hours, when properly managed; and one man might possibly be supported by the same machine for three days.

**AEROSTATION, practice of.** The shape of the balloon is one of the first objects of consideration in the construction of the machine. As a sphere admits the greatest capacity under the least surface, the spherical figure, or that which approaches nearest to it, has been generally preferred. However, since bodies of this form oppose a greater surface to the air, and consequently a greater obstruction to the action of the air or winds than those of some other forms, and therefore cannot be so well guided in a calm, or in a course different from the direction of the wind, it has been proposed to construct balloons of a conical or oblong figure, and to make them proceed with their narrow end forward.

Mr. Hoole, an ingenious writer, who is now publishing a translation of the works of Leeuwenhoek, in his Thoughts on the farther Improvement of Aerostation, suggests the shape of a fish as the most proper: the sharp head, under such a form, will serve to divide the resisting fluid, and open a passage, and the tail will serve as a rudder to steer its course. He also proposes to fix a foot for the traveller in the lower part of the body of the fish, or in the centre of gravity of the whole mass, so that the machine may be always horizontal, and that the impulse of any force used there may actuate the whole body. And he further suggests, that the traveller should be furnished with instruments of sufficient surface to take hold of the air, and of sufficient strength to bear the whole exertion of his muscular force, analogous in their form and situation to the fins of fishes. But by adopting the oblong shape, the surface, and consequently the weight of the cover, must be augmented, in order to obtain the same lifting power with that of a sphere, both because its capacity will be less under the same surface, and because its capacity must be made greater in order to compensate for the augmentation of weight. Besides, an oblong machine cannot easily be kept with the smallest part forward in the atmosphere; and if it should turn sideways, as it probably might, the proposed advantage would thereby be lost: not to add, that accidental circumstances might occur which would endanger its overturning.
