In order to expedite the calculations that relate to the construction of a balloon of a spherical form, it should be remembered, that the circumferences of spheres are as their diameters; their surfaces as the squares: and their solid contents as the cubes of the diameters. The proportion of the diameter to the circumference of a circle, \(r \frac{7}{10} \text{ to } 22, \text{ or } 1 \text{ to } 3 \frac{1}{2}, \) should be recollected; so that if the diameter of a balloon be 35 feet, its circumference will be 110 feet. If the diameter be multiplied by this circumference, the product will be the surface of the sphere; i.e. 35 \times 110 = 3850 square feet. If this surface be divided by the breadth (in feet) of the stuff of which the balloon is made, the quotient will be the number of feet in length necessary for contracting the balloon; thus, if the stuff be 3 feet wide, \(3 \times \frac{3850}{3} = 3850 \) feet, or 428 yards, which is the quantity for a balloon of 35 feet in diameter. By knowing the weight of a given piece of the stuff, as of a square yard or square foot, it is easy to find the weight of the whole bag, by multiplying the surface in square feet or yards by the weight of a square foot or yard; e.g. if each square yard weigh 16 ounces, or one pound, the whole bag will weigh 548 pounds. Again, the capacity, or solid content of the sphere, may be found by multiplying \(\frac{4}{3}\) of the surface by the diameter, or by taking \(\frac{4}{3}\) of the cube of the diameter; thus, in the present instance, we shall have, 22458 cubic feet for the capacity of the balloon, or the number of cubic feet of air which it will displace. From the content and surface of the balloon, we may deduce its power of ascension or levity in the following manner:—a cubic foot of air weighs, at an average, about 1.7 ounces, and adding to the number 22458, its fifth part, we shall have 26950 ounces, or 1684 pounds, for the weight of the common air displaced by the balloon. From this weight, deducting the weight of the bag, or 428 pounds, there will remain 1256 pounds expressing the weight of the balloon, independently of the contained air. If this be inflammable air, its weight varies from \(\frac{4}{3}\) to \(\frac{5}{3}\) of the weight of common air; if it be taken at \(\frac{4}{3}\) of the weight of common air, then \(\frac{4}{3} \times 1256 = 2800\) pounds will denote the weight of the air filling the balloon; and taking this from 1256, i.e. \(1256 - 280\), we shall have 976 pounds, the power of ascension of the balloon, or the weight which it will carry up, excluding of the car, ropes, passengers, bag, and other necessaries. If heated air be used, the density of this is diminished about one-third; and therefore, taking from 1684 one-third of itself, there will remain 1123 for the weight of the contained warm air, and this subtracted from 1256, leaves 133 pounds for the weight of the balloon; but as this is not sufficient for carrying up the car, passengers, etc., it is evident that a larger balloon, on Montgolfier's principle, is necessary for the same purpose that may be effected by a smaller one of inflammable air. To estimate the power of ascension corresponding to any given weight, e.g. 1000 pounds; since the levities are nearly as the cubes of the diameters, and consequently the diameters as the cube roots of the levities; and the levities being as 133 to 1000, i.e. nearly as 1 to 8, the cube-roots are as 1 to 2; consequently \(1 : 2 ; \frac{35}{70} \text{ feet, the diameter of a Montgolfier, made of the same thickest of stuff as the former; and capable of lifting 1000 pounds. Pursuing the same kind of calculation, it is easy to estimate the size of a balloon, made of stuff of a given thickness, and filled with air of a given density, that will just float in air. From the weight of a cubic foot of common air, subtract that of a cubic foot of the lighter or contained air; then divide six times the weight of a square foot of the stuff by the remainder, and the quotient will be the diameter, in feet, of the balloon that will just float at the surface of the earth. Suppose the stuff to be 1 pound to the square yard, or \(\frac{1}{16}\) ounces to the square foot, and this multiplied by 6 gives 32, then the cubic foot of common air weighing 14 ounces, and of heated air \(\frac{4}{3}\) of the same, the difference being \(\frac{3}{16}\):
consequently \( \frac{12}{12} \) divided by \( \frac{1}{2} \), gives \( 26 \frac{1}{2} \) feet, which is the diameter of a Montgolfier that will just float; but if inflammable air, \( \frac{1}{2} \) the weight of common air, be used, the difference between \( \frac{1}{2} \) and \( \frac{1}{2} \) is one; by which dividing \( \frac{12}{12} \) or \( \frac{10}{10} \), the quotient \( \frac{10}{10} \) feet will be the diameter of an inflammable air-balloon that will just float. If the diameter, in either of these cases be increased, the respective balloons will ascend in the atmosphere.

In order to determine the height to which a given balloon will rise, when the diameter of the balloon, and the weight that exactly balances it are given, proceed in the following manner:—compute the contents of the globe in cubic feet, and divide its restraining weight in ounces by this content, and the quotient will be the difference in density or specific gravity of the atmosphere at the surface of the earth, and that at the height to which the balloon will rise; subtract this difference or quotient from \( \frac{1}{1} \) or \( \frac{1}{2} \), the density at the earth, and the remainder will be the density at that height; then the height corresponding to that density will be found with sufficient exactness in the annexed Table.

\[ \text{Height of Balloon, Height of Balloon.} \]

\[ \begin{array}{|c|c|}
\hline
\text{Density.} & \text{Height in Miles.} \\
\text{1.200} & 0 \\
\text{1.141} & \frac{1}{2} \\
\text{1.085} & \frac{1}{4} \\
\text{1.031} & \frac{1}{5} \\
\text{0.980} & 1 \\
\text{0.932} & \frac{1}{2} \\
\text{0.886} & \frac{3}{4} \\
\text{0.842} & 2 \\
\text{0.800} & 2\frac{1}{2} \\
\text{0.761} & 3 \\
\text{0.723} & 3\frac{1}{2} \\
\text{0.687} & 4 \\
\text{0.653} & 4\frac{1}{2} \\
\hline
\end{array} \]

Let the diameter of the balloon be 35 feet, its capacity 22458, and the levity of the first 976 pounds, or 15616 ounces; the quotient of the latter number divided by the former, \( \frac{15616}{22458} \) is \( .695 \), which is the density at the utmost height, and to which in the Table corresponds somewhat less than \( \frac{1}{2} \) mile, and this is the height to which the balloon will ascend. When the same balloon was filled with heated air, its density was equal to 133 pounds, or 2128 ounces, which divided by 22458, the capacity, gives the quotient \( .095 \); and this subtracted from 1.000 leaves 1.195 for the density; to which, in the Table corresponds half a mile, or more nearly \( \frac{1}{2} \) of a mile. Such are the heights to which these balloons would nearly ascend, if they retained their figure, and lost none of the contained air: or, more precisely, these are the heights at which they would settle; for their acquired velocity would at first carry them above these heights, till their motion would be destroyed: and then they would descend below these heights, though not so much as they had gone above them: after which they would reascend, and pass these heights again, but not so far as they had gone below them; thus vibrating alternately above and below these heights, but every-time less and less. These calculations for finding the height to which the balloon will ascend, are formed independently of the different rates of the thermometer at the highest point and at the surface of the earth; but the allowances to be made on this account will appear from what is delivered under the article Atmosphere.

Next to the shape, it is necessary to consider the stuff that is most proper for forming the envelope of the inflammable or rarefied air. Silk stuff, especially that which is called Interlining, properly varnished, has been most commonly used for inflammable air-balloons; and common linen, lined within and without with paper, varnished, for those of rarefied air. Varnished paper, or gold beater's skin, will answer the purpose for making small inflammable air-bal-
those gores that form the superficies of a globe: and the first method of cutting them is to describe a pattern of wood or stiff card-paper, and to cut the silk or fluff upon it. One of these pieces, that may serve as a pattern for others, is represented in Pl. 1. Pneumatics, fig. 2. In this figure, suppose A E and B C to be two right lines perpendicular to each other. Then find the circumference answering to the given diameter of the balloon in feet and decimals of a foot; and make A D and D E each equal to a quarter of the circumference. Divide A D into 16 equal parts, and to the points of division apply the lines f g, b i, k, &c. parallel to each other, and perpendicular to A D. Divide the whole circumference into twice the given number of pieces, and make D C and D B each equal to the quotient of this division; so that B C will be equal to the greatest breadth of one of those pieces. Multiply this quotient or D C by the decimals annexed to f g, fig. 2, viz. 0.99619, and the product expresses the length of f g; and multiply D C by the decimals annexed to b i, and the product expresses the length of b i, &c. Having thus found the lengths of all these lines, draw by hand a curve line, passing through their extremities, and this will be the edge of one quarter of the pattern. The other quarters A B, E B, E D, may be easily described by applying to each of them a piece of paper equal to A D C. Suppose the diameter of the balloon to be 20 feet, and that it is to be made of 12 pieces. In order to draw the pattern, and the circumference of the balloon, which is 62.83 feet, and dividing it by 4, the quotient is 15.7 feet: consequently A D and D E will be each equal to 15.7 feet. Divide the circumference 62.83 by 24, or double the number of pieces that are to form the balloon; and the quotient 2.618 feet will be the length of D C or D B; therefore B C is equal to 5.236 feet. Then divide A D into 16 equal parts, and drawing the parallel lines from the points of division, find the length of these lines by multiplying 2.618 by the decimals annexed to that line: thus, 2.618 multiplied by 0.99619 gives 2.608 feet for the length of f g; and multiplying 2.618 by 0.9481, we shall have 2.578 feet for the length of b i, &c. The pieces cut after such a pattern should be left about one half or three quarters of an inch all round larger than the pattern, in order to allow for the seams. They may be joined by laying about half an inch of the edge of one piece over the edge of the other, and sewing them with a double stitching. Mr. Blanchard joins them very expeditiously in the following manner. He lays about half an inch of the edge of one piece flat over the edge of the other, and passes a hot iron over it; in doing which, a piece of paper ought to be laid both under and over the silk. The joining may be rendered more secure, by running it with a silk thread, and tucking a ribbon over it. The ribbons laid over seams may be stuck with common glue, provided the varnish of the silk is properly dried. When the glue is quite dry, the ribbons should be varnished over, to prevent their being unglued by the rain.

To the upper part of the balloon there must be adapted a valve, opening inward, to which is annexed a string passing through a hole made in a small round piece of wood which is fastened to the lower part of the balloon opposite to the valve, to the boat below it; so that the aerostat may open it as occasion requires, and let the inflammable air out of the balloon. To the lower part of the balloon are fixed two pipes of the same fluff with the covering, six inches in diameter for a balloon of thirty feet, and much larger for balloons of greater size, and long enough to reach the boat. These pipes are the apertures through which the inflammable air is introduced into the balloon.

The boat may be made of wicker-work, and covered with leather, well painted or varnished over. The bell method of suspending it is by means of ropes, proceeding from the net which goes over the balloon. This net should be formed to the shape of the balloon, and fall down to the middle of it, and have various cords proceeding from it to the circumference of a circle, about two feet below the balloon; and from that circle other ropes should go to the edge of the boat. This circle may be made of wood, or of several pieces of slender cane bound together. The inches of the net may be small at top, again which part of the balloon the inflammable air exerts the greatest force, and increase in size as they recede from the top. A hoop has been sometimes put round the middle of the balloon for fastening the net. This is not absolutely necessary; but when used, it is best made of pieces of cane bound together, and covered with leather. When the balloon and its appendages are constructed, the next object of importance is to procure proper materials for filling it. With respect to those instated by heated air, nothing need be said till the method of filling them is described.

Inflammable air for balloons of the other kind may be obtained in several ways: but the bell methods are by applying acids to certain metals; by expelling animal, vegetable, and some mineral substanaces, in a close vessel, to a strong fire; or by transmitting the vapour of certain fluids through red-hot tubes.

In the first of these methods, iron, zinc, and vitriolic acid, are the materials most commonly used. The vitriolic acid must be diluted with five or six parts of water. Iron may be expected to yield in the common way about 1750 times its own bulk of gas; or 44 ounces of iron, the like weight of oil of vitriol, and 24 ounces of water will produce one cubic foot of inflammable air; 1 ounce of zinc, an equal weight of oil of vitriol, and 1 ounce of water, are necessary for producing the same quantity. It is more proper to use the turnings or chippings of great pieces of iron, as of cannon, &c. than the filings of that metal; because the heat attending the effervescence will be diminished, and the diluted acid will pass more readily through the interstices of the turnings, when they are heaped together, than through the filings which stick closer to one another. The weight of the inflammable air, thus obtained by means of acid of vitriol, is in the common way of procuring it, generally one-seventh part of the weight of common air; and with the necessary precautions for philosophical experiments, less than one-tenth of the weight of common air. The other calcic fluids, which are generated with the inflammable air, may be separated from it by passing the inflammable air through water, in which quicklime has been dissolved; the water will absorb these fluids, cool the inflammable air, and prevent its overheating the balloon, when it is introduced into it. As white vitriol is sold much dearer than the vitriol of iron, it will be a saving to make the inflammable air by means of zinc and vitriolic acid, rather than of this acid and iron; because the sale of the white vitriol arising from the former will, in a degree, be a compensation for the expense of the materials.

Inflammable air may also be obtained at a much cheaper rate by the action of fire on various substanaces; but the gas thus obtained is not so light as that produced by the effervescence of acids and metals. The substances proper to be used for this purpose are pit-coal, asphaltium, amber, rock oil, and other minerals; wood, and especially oak, camphor oil, spirits of wine, amber, and animal substanaces, which yield air of different degrees and of various specific gravity. But pit-coal is the substance most proper to be used. A pound of
of pit-coal, exposed to a red heat, yields about three cubic feet of inflammable air, which, whether it be passed through water or not, weighs about one-fourth of the weight of an equal bulk of common air.

Dr. Priestley observes, that animal or vegetable substanaces will yield fix and even ten times more inflammable air, when the fire is suddenly increased than when it is gently raised, though it be afterwards made very strong. And Mr. Cavvallo informs us, that the various substanances above enumerated generally yield all their inflammable air in about an hour's time. The usual method is to include the substanaces in earthen or iron vessels, and thus to expose them to a strong fire sufficient to make the vessels red-hot; the inflammable air proceeding from the aperture of the vessel, is received into a tube or refrigeratory, and passing through the tube or worm, is at last collected in a balloon or other vessel. A gun-barrel has been often used for effays of this kind. The manner of conducting this process is particularly described by Mr. Cavvallo, vide infra.

The last method of obtaining inflammable air was lately discovered by Mr. Lavoisier, and also by Dr. Priestley. Mr. Lavoisier made the flame of boiling water pass through the barrel of a gun, kept red-hot by burning coals. Dr. Priestley uses, instead of the gun-barrel, a tube of red-hot brass, upon which the flame of water has no effect, and which fills with the piece of iron which are separated in the boring of cannon. By this method he obtains an inflammable air, the specific gravity of which is to that of common air as 1 to 1.5. In this method, a tube about three quarters of an inch in diameter, and about three feet long, is filled with iron turnings; then the neck of a retort or clofe boiler is luted to one of its ends, and the worm of a refrigeratory is adapted to its other extremity. The middle part of the tube is then surrounded with burning coals, so as to keep about one foot in length of it red-hot, and a fire is always made under the retort or boiler sufficient to make the water boil with vehemence. In this process a considerable quantity of inflammable air comes out of the worm of the refrigeratory. It is said that iron yields one half more air by this means, than by the action of vitriolic acid. See Hydrogen.

Balloons of the smaller size, such as those of two or three feet in diameter, and also bladders, may be filled with inflammable air, after passing it through water, by means of the following simple apparatus. See Plate I. Pneumatics, fig. 3. A is the bottle that contains the ingredients which produce the gas; BCD is a tube in form of a syphon, fitted by one extremity into the neck of this bottle, and passing through a hole of the flopper of another bottle E, it extends so far as almost to touch the bottom of this bottle, which is nearly full of water. To another hole made in the cork of the bottle E is adapted another tube, to the outer extremity of which a bladder, or the aperture of the balloon is tied. The inflammable air, coming out of the aperture D of the tube, passes through the water of the bottle E, and then enters into the bladder or balloon. Two small calks might be used instead of the bottle E and A.

Another apparatus for producing hydrogen and conveying it into a balloon is exhibited in fig. 4. ABC is a vessel made of clay, or of iron, in the form of a Florence flask, and the substanace yielding gas is introduced into it so as to occupy about four-ths, or less, of its capacity. If the substanace yields much by the action of the fire applied to it, a tube of brass, or lisi a brass, and then a glass tube must be luted to the neck C of the vessel, and the extremity D of the tube is made to pass through the water of a tube H I, and to terminate under an inverted vessel F E, to the upper aperture of which the balloon, or a tube going to the balloon is adapted. When the part, A B, of the vessel is put into the fire, and made red-hot, the inflammable air that is generated will come out of the tube C D, and passing through the water of the tube, it will at last enter into the balloon G. As a considerable quantity of common air remains in the inverted vessel E F, before the operation is begun, it should have a stop-cock, K, through which it may be drawn off by suction, and then the water will ascend as high as the stop-cock. The aperture of the vessel, E F, should be at least one foot below the surface of the water in H I, and the fire should be at a sufficient distance from the tube H I, that the inflammable air, if any of it should escape, may not take fire and do injury.

The method of filling large aërostatic machines with rarefied air is as follows. A scaffold A B C D (Plate II. fig. 5.) the breadth of which is at least two-thirds of the diameter of the machine, is elevated about six or eight feet above the ground. From the middle of it descends a well E F, slanting about two or three feet above it, and reaching to the ground, furnished with a door or two, through which the fire in the well is supplied with fuel. The well should be constructed of brick or of plastered wood; and its diameter should be somewhat less than that of the machine. On each side of the scaffold are erected two masts H I, K L, each of which has a pulley at the top, and rendered firm by means of ropes KG, KP, HP, HG. The machine to be filled is placed on the scaffold, with its neck round the aperture of the well. The ropes passing over the pulleys of the two masts, serves, by pulling its two ends, to lift the balloon about fifteen feet or more above the scaffold; and the rest of the machine is represented by the dotted lines in the figure M N O. The machine is kept steady and held down, whilst filling, by ropes passing through loops or holes about its equator; and these ropes may be easily disengaged from the machine, by lifting them through the loops, when it is able to sustain itself. The proper combustibles to be lighted in the well are those which burn quick and clear, rather than those as produce much smoke; because if it is hot air, and not smoke, that is required to be introduced into the machine. Small wood and straw have been found to be very fit for this purpose. Mr. Cavvallo observes, as the result of many experiments with small machines, that spirits of wine are upon the whole the best combustible; but its price may prevent its being used for large machines. As the current of hot air ascends, the machine will soon dilate, and lift itself above the scaffold and gallery, which was covered by it. The passengers, fuel, instruments, &c. are then placed in the gallery. When the machine makes efforts to ascend, its aperture must be brought, by means of the ropes annexed to it, towards the side of the well, a little above the scaffold. The fire-place is then suspended in it; the fire lighted in the grate; and the lateral ropes being flipped off, the machine is abandoned to the air. It will appear in the atmosphere as it is represented in fig. 6. It has been determined by accurate experiments, that only one-third of the common air can be expelled from these large machines; and therefore, the ascending power of the rarefied air in them can be estimated as only equal to half an ounce avoirdupois for every cubic foot. The apparatus for filling an inflammable air balloon is represented in fig. 7. A, A are two tubes, about three feet in diameter, and nearly two feet deep, inverted in larger tubs, B, B, full of water. At the bottom of each of the inverted tubes there is a hole, to which is adapted a tin tube E, about seven inches in diameter, and seven or eight inches long. To these tubes the filament tubes of the balloon.
balloon are tied. Each of the tubes, $B$, is surrounded by several strong coats, to regulated in number and capacity, as to be less than half full, when the materials are equally distributed. In the top of each of these coats are two holes; and to one of these holes is adapted a tin tube, formed so as to pass over the edge of the tube $B$, and through the water, and to terminate with its aperture under the inverted tube $A$. The other hole, which serves for supplying the cast with materials, is flapped with a wooden plug. These tin tubes may be about three inches and a half in diameter, and the other holes may be smaller. Two masts, with a rope, &c. are used for this machine, as well as for the former, although they are not absolutely necessary; because the balloon, by means of a narrow scaffold, or other contrivance, may be elevated five or six feet above the level of the tube $A A$. When the balloon is to be filled, the net is put in it and suspended, as exhibited in $D F$, and having expelled all the common air from it, its silk tubes are fastened round the tin tubes $E E$, and the materials in the coats are properly proportioned; the iron being first put in, then the water, and lastly the vitriolic acid. The balloon will soon be inflated by this inflammable air, and support itself without the aid of the rope $G H$. As the filling advances, the net is admitted round it, the cords, proceeding from the net, are fastened to the hoop $M N$; the boat $I K$ is suspended from the hoop $M N$, and every thing necessary for the voyage is deposited in the boat. When the balloon is a little more than three quarters full, the silken tubes are separated from the tin tubes, and their extremities being tied, they are placed in the boat. Finally, when the aeronauts are seated in the boat, the lateral ropes are slipped off, and the machine ascends in the air, appearing as in fig. 8. In order to produce such a bulk of inflammable air as is necessary for a balloon of 30 feet in diameter, whose capacity is 14,137 cubic feet, there will be required about 3900 pounds of iron turnings, 3900 pounds of vitriolic acid, and 19500 pounds of water. The balloon will not be above three quarters full.

These proportions, stated by Mr. Cavallo, are too great with respect to the metal and acid, and too small with regard to the water. Mr. Lunardi, who had considerable experience in the practice of aeronautics, filled his balloons at Edinburgh and Glasgow with about 2000 pounds of the chippings of cannon procured from Carron, the fame quantity of vitriolic acid, and 12,000 pounds of water. The iron was placed in layers in his vessels, with straw between them, in order to enlarge the surface exposed to the action of the acid. He used only two large coats, which were sunk in the ground, and conveyed the gas into the balloon without passing through water; and he contrived to fill his balloon in less than half an hour, which operation had on former occasions required at least two hours.

The inflammable air with which they fill their balloons at the Aerostatic Institute, not long since established in France, is obtained by the following method, which is simple and not very expensive. Six cylinders, or tubes of iron, are fixed by majolery in a furnace of clay and expedient construction, in such a manner that the two ends of each cylinder project out of the furnace; and these are furnished with strong covers or lids of iron. Into these cylinders are introduced tubes of metal, one of which serves to convey warm water into the red-hot cylinder, and the other to convey the air which is produced through a receiver filled with candle-lye, into the balloon. The cylinders are partly filled with the chippings or turnings of iron that are procured from the boring of cannon. The excessive heat of the furnace, which is maintained by a supply of charcoal during the operation, is communicated to the cylinders and their contents. In this state, boiling water is conveyed by one of the tubes to each cylinder; and as soon as it communicates with the inflamed iron, the water is decomposed: the one part, called the oxygen attaches itself to the iron and calcines it; but the other part, or the hydrogen, is combined with a quantity of the igneous substance, called caloric, and becomes hydrogeneous gas, or inflammable air, which remains in a permanent state of effusive fluidity, and weighs seven or eight times less than the atmospheric air. As the water contains a small quantity of carbon or fixed air, which would add weight to the air of the balloon, it is made to pass through water in which caustic alkali has been dissolved. This fluid attaches the carbon to itself, and thus the pure inflammable air is conveyed into the balloon. The cylinders, in this operation, are sometimes fused; for preventing which accident, a pyrometer is annexed to the extremity of the cylinder which projects from the furnace; and the fire is regulated by a lenie connected with the pyrometer. The operation of filling a balloon, 30 feet in diameter, in this way will occupy about four hours.

In estimating the ascending power of these machines, that of the inflammable air should be considered as equal to one ounce avoirdupois for every cubic foot, which is one sixth of the weight of common air; and therefore, if the capacity of a balloon is 12000 cubic feet, and three-fourths of it are filled with inflammable air, obtained from iron and dilute vitriolic acid, the ascending power of that gas may be estimated at 9000 ounces, or 562½ pounds; from which the weight of the covering, boat, and other appendages, must be subtracted.

The conduct of balloons, when constructed, filled, and actually ascending in the atmosphere, is an object of great importance in the practice of aeronautics. The method generally used for elevating or lowering the balloons with rarefied air, has been the increase or diminution of the fire; and this is entirely at the command of the aeronaut, as long as he has any fuel in the gallery. The inflammable air-balloons have been generally raised or lowered by diminishing the weight in the boat, or by letting out some of the gas through the valve. But the alternate escape of the air in descending, and discharge of the ballast for ascending, will by degrees render the machine incapable of floating; for in the air it is impossible to supply the losts of ballast, and very difficult to supply that of inflammable air. These balloons will also rise or fall by means of the rarefaction or condensation of the inclosed air, occasioned by heat and cold. It has been proposed to aid a balloon in its alternate motion of ascent and descent, by annexing to it a vessel of common air, which might be condensed by lowering the machine, and rarefied again, by expelling part of it, for raising the machine. But a vessel adapted to this purpose must be very strong, and, after all, the assistance afforded by it would not be very considerable. M. Meunier, in order to attain this end, proposes to inclose one balloon filled with common air in another filled with inflammable air: as the balloon ascends, the inflammable air is diluted, and of course compresses the internal balloon containing common air; and by diminishing its quantity, lessens its weight. If it should be necessary to supply this loses, he says it may be easily done by a pair of bellows fixed in the gallery. Others have proposed to annex a small machine with rarefied air to an inflammable air-balloon by ropes, at such a distance that the fire of the former might not affect the inflammable air of the latter; the whole apparatus, thus combined, of balloons formed on the two principles of heated and inflammable air, might
might be raised or lowered by merely increasing or diminishing the fire in the lower balloon. Wings or ears seem to have contributed little to the effect of either raising or lowering balloons.

Many schemes have been proposed for directing the horizontal motion of balloons. Some have thought of annexing sails to a balloon, in order to give it the advantage of the wind; but to this proposal it has been objected, that as the aerostatic machines are at rest with respect to the air that surrounds them, they feel no wind, and consequently can derive no benefit from the sails. An ingenious writer observes, that the wake of vessels at sea is quite different from that of balloons: because the former move with a velocity incomparably less than that of the wind impelling them, on account of the resistance of the water; and therefore, the difference between the velocity of the wind, and that of ships, occasions that stream of air which acts upon the sails. But a balloon, finding no resistance, acquires the same velocity with the surrounding air, and therefore can feel no wind. The same author adds, that the most rational projects for directing an aerostatic machine are those which propose to exert a force against the ambient air on one side of the machine, so as to move it in the opposite direction. Oars and wings are the only instruments that have been used for this purpose with any measure of success; but further experiments are necessary to ascertain their effect. If wings or ears are used, the belt method of moving them is by the immediate application of human power, as in the case of the oars of boats on the water. However they should be as large and light as possible, and they may be made of silk stretched between wires, tubes, or sticks. If they are flat they must be turned edgewise when they are moved in the direction of the balloon's course, and flat in the opposite direction. One of the wings, used by Mr. Blanchard, is represented in Fig. 9. That used by Mr. Lumardi consisted of many silk shutters or valves A B C D, D E C F, &c. (Fig. 10.) each of which opens only on one side, viz. A D B C upon the line A B, D E C F upon the line D C, &c.; and by this construction, it becomes unnecessary to turn these oars edgewise. One of the wings, constructed by Zambecchi, is exhibited in Fig. 11, and is nothing more than a piece of silk stretched between two tin tubes let at an angle; and so contrived as to turn edgewise of themselves, when they go in one direction. Fig. 12. represents one of the wings used by Meffrs. Roberts, in the voyage of September 19th, 1784. The greatest effect produced by the wings of an aerostatic machine was that which occurred in this voyage. It is not difficult to determine what force is necessary to move a given machine in the air with any proposed velocity. Dr. Hutton found, from accurate experiments, that a globe of 64 inches in diameter, and moving with a velocity of 20 feet in a second, sustains a resistance from the air, which is equal to the weight or preffure of one ounce avoiduopous; and that with different surfaces and the same velocity, the resistances are directly proportional to the surfaces nearly; and also that, with different velocities, the resistances are proportional to the squares of the velocities nearly. By these data the resistance to move a given balloon with any velocity may be ascertained. Let the balloon be 35 feet in diameter; then if it moved with the velocity of 20 feet per second, or almost 14 miles per hour, it would counteract a resistance equal to 271 pounds; with a motion of seven miles an hour, the resistance would be 68 pounds; and at three miles and an half in an hour, the resistance would be 17 pounds; and such is the force with which the aeronaut must act on the air in a contrary direction, in order to communicate such a degree of motion to the machine. If the balloon move through a rar-rar part of the atmosphere than that at the surface of the earth, as 4d or 4th, &c. rarer, the resistance will be less in the same proportion; yet the force of the ears will be diminished as much; and therefore the same difficulty remains. It may be observed in general, that the aeronaut must strike the air, by means of his ears, with a force just equal to the resistance of the air or the balloon, and therefore he must strike that air with a velocity which must be greater as the surface of the one is less than the rectified surface of the globe, but not in the same proportion, because the force is as the square of the velocity. Suppose that the aeronaut acts with an ear equal to 100 square feet of surface to move the balloon above-mentioned at the rate of 20 feet per second, or 14 miles an hour, then he must move this ear with the great velocity of 62 feet per second, or nearly 45 miles an hour; and in proportion for other velocities of the balloon. Hence it is highly probable, that it will never be in the power of man to guide such machines with any tolerable degree of success especially when any considerable wind blows, which is generally the case. A helm seems to have no particular power in directing the course of a balloon, for the same reason that has been alleged to evince the inefficacy of sails. We have not in air, as in water, says count de Mirabeau, in his Considerations on the Order of Cincinnatus, the reference of a fixed point of action upon a fluid, which has also much greater resistance than air. He adds, that as there are different currents of air, sometimes in opposite directions, and balloons are capable of ascending and descending in search of these currents, this circumstance may favour the hope of directing aerostatic machines. Perhaps, an attention to the means by which birds fly against the wind, added to observations of comparative anatomy upon fishes and birds, which surfurn the currents of the fluids that are common to us and them, may also suggest new ideas with respect to the direction of balloons. Time alone, and numerous experiments, can bring these reflections to maturity, and realize the expectations suggested by them.

Several of the foreign journals have lately announced an invention of professor Danzel for directing an air-balloon through the atmosphere. With this view he has constructed two cylinders, or axles, to the ends of which are fixed, in the form of a cross, four sails, or ears, movable at the point of their infection in the cylinder, in such a manner, that when made to move round by means of a handle, the eight ears, like the eogs of a water-wheel, prevent successively to the air sometimes their flat side and sometimes their edge. To cause each ear to turn back on itself about the fourth part of a circle, M. Danzel has not only left sufficient play at the point where the fiek of each ear is infected in the cylinder, but has placed the fiek in such a manner that the air itself makes the ear fall back, at each turn, with the necessary velocity and precision. Each of the two cylinders, armed with its four ears or sails, is designed to occupy one side of the balloon, with its four ears on each side. For a further account of this apparatus and of its effect, see Philosophical Magazine, vol. iv. p. 108.

As parachutes, in the form of umbrellas, have been proposed in order to guard against accidents, and to break the fall in cases of sudden descent, we shall here annex a method of estimating the power of such defensive machines. A person, moving uniformly at the rate of ten feet per second, may descend with safety. For this uniform descent the resistance of the air must be equal to the whole descending weight. Suppose then that the weight of the aeronaut is 150 pounds, and that the parachute is flat and circular, and made
AER

AER

and of such materials as that every square foot of it weighs two ounces, and that the weight varies in the proportion of
the square of the radius of the equi-diameter of the packet, which will be
reduced to a mean of ten feet from the lower. If the packet be
placed on the lower, its power will be
ranging greater, and its diameter less. In order to
calculate the power of a balloon packet, or the re-
stance it meets with from a mass of air, when de-
ferred, it has a given velocity, let the number be
the square of the velocity in feet, fo is the force
of the diameter in feet to a fourth number, which will be the re-
stance in pounds. And if it be required to know, with
what velocity a parachute will descend with a given weight,
for as the given distance is to the square root of the weight,
so is the number 281 to a fourth, which will be the ve-
locity in air of a mean density. Thus, if the character of a
balloon be 53, and its weight, together with that of a man,
be 550 pounds, the square root of which is 23 very nearly;
than 50: 23 26 181, and therefore the man and pa-
rachute will descend with the velocity of 15 feet per second;
which, as it is equal to that acquired by leaping freely
from a height of two feet two inches, may be very safely
furnished.

AEROSTATION, n. s. (2). The advantages of an art, so
late discovered, have not yet been sufficiently ascertained;
but we may reasonably expect, considering the progress it
has made, to boast a space of time, that many benefits
may result from the farther propagation of it. To lay
the lead, it is unphilosophical to discourage future trials and
improvements, because the uses of this art do not immediately
appear. With regard to philosophical observations, derived
from aeronautics, it is acknowledged that very few
have yet been made. The novelty of the discovery, and of the
prospect, says Mr. Cavallo, has generally diffused the atten-
tion; and besides, most of the aerial voyages have been
made by persons who had pecuniary profit alone in view,
or who were induced to ascend in the atmosphere for
the sake of the prospect, or by the vanity of adding their
names to the list of aerial adventurers. Aerial navigation,
considered as a mode of travelling between distant places,
independently of its furnishing means of conveyance to
places otherwise inaccessible, is attended with many ad-
vantages and conveniences. The aeronaut has much less
trouble with this machine than a sailor with a ship in
the most favourable circumstances. With a moderate wind,
aerial navigators have often gone at the rate of forty or fifty
miles an hour, and very commonly at the rate of thirty
miles without any agitation, or even feeling the wind, and
without the danger of losing time by being often becalmed.
Aerostatic machines may serve the purpose of eescaping
from ships that cannot safely land, from besieged places,
and from other circumstances of danger. A small balloon
fix or seven feet in diameter, says an anonymous author in
his proposal of various means for saving the crews of vessels
shipwrecked near the coast, would answer this purpose, by
carrying to the shore a firing capable of making a cord,
which several ropes might be afterwards conveyed to
the vessel. They also expedite the communication of im-
portant events by signals, and serve for exploring, from
a great elevation, adjacent coasts or regions, fleets and armies.
To the latter of these purposes they have been actually ap-
plied by the French, in the course of the last war; and to
the elevation of a balloon, and the information obtained in
consequence of thus reconnoitering the army of the enemy,
they ascribe the signal victory obtained in the battle of
Flers in 1794. The balloon employed on this occasion,
was called the Entrepkinent, and it was under the direction
of M. Conté, the captain of the aeronauts at Meudon,
accompanied by an adjutant and a general. He ascended
three times in the same day, to the height of 220 fathoms, for
the purpose of observing the position and movements of the
enemy. He continued each time four hours in the air, and
accompanied with General Jourdain, who commanded the
French army, by means of pre-arranged signals. The ent-
repkinent was discovered by the enemy, and a battery opened
its fire against the ascending aeronauts; but they soon
 gained an elevation which was beyond the reach of their
fire. This balloon was prepared under the direction of the
Acrolic Institute, for the use of the army of the north;
as were also another called Géopolis, for the army of the
Sambre and Meuse; and the Inflable and Intrepkinent,
for the army of the Rhine and Mecklenburg. Another, thirty feet
in circumference, and weighing 160 pounds, was designed
for the army of Italy. A new machine, invented by M. Conté,
the director of the Aerostatic Institute, was designed to aid
the aeronauts in communicating intelligence, and was de-
nominated the Aerostatic Telegraph. Balloons may like-
wise serve to explore the rate of the atmosphere at differ-
ent heights, and to furnish observations, which shall illustrate
a variety of phenomena, depending on the density, tempera-
ture, and other qualities of the air. From one experiment
that has been already made we learn, that the air of a
high region, preferred and examined by means of nitrous
air, was found to be purer than the air below. The appli-
cation of these machines to electrical experiments, is a very
obvious use of which they are capable. The first per-
son who employed them in this way seems to have been the
Abbe Bertholon, at Montpellier. He raised several air
balloons, furnished with long and slender wires, having
their lower ends fastened to a glass stick, or other inflating
substance; and thereby obtained from the wires electric
fluid sufficient to throw the attraction, repulsion, and even
the sparks of electricity. The existence of a continual elec-
tricity, of the positive kind, in a clear atmosphere, known
indeed before, has been farther ascertained by trials fast-
tened to balloons floating in the atmosphere. Some have
apprehended danger from the electricity of the atmosphere
and have thought that a stroke of lightning, or the smaller
electrical spark, happening near a balloon, might set fire to
the inflammable air, and destroy both the machine and the
adventurers. Mr. Cavallo has suggested several considera-
tions of disuading apprehensions of this kind. Balloons
have already been raised in every nation of the year, and
even when thunder has been heard, witho ut injury. In
case of danger, the aeronauts may either descend to the
earth, or ascend above the region of the clouds and thunder
storms. Besides, as balloons are formed of materials that
are not conductors of electricity, they are not likely to re-
ceive strokes, especially as by being encompassed with air
they flail inflamed. Moreover, inflammable air by itself, or
unmixed with a certain quantity of common air, will not
burn; so that if an electric spark should happen to pass
through the balloon, it would not set fire to the inflammable
air, unless a hole was made in the covering.

For a variety of other important and useful particulars
relating to the subject of aerostation, we must refer to Mr.
Cavallo's curious and comprehensive work, entitled, the
History and Practice of Aerostation, Svo. 1785; which
will afford the reader ample information concerning the
principles of this art, and the history of its progress, the
method of constructing and managing balloons, the na-
ture and preparation of the materials of which they are
formed, the observations and uses to which they are
adapted,
adapted, and rules for estimating the heights to which they ascend.

ÆRSCHOT, or ARSCHOT, in Geography, a town of the Austrian Netherlands in the duchy of Brabant, and capital of the district of the same name; which was raised to a marquisate in 1567, and to a duchy in 1532. The town is small, but fortified and well inhabited, seated on the river Dender, about ten miles south of Mechlin, and eight miles north of Louvain, and contains a collegiate church, two monasteries, and three nunneries. It belongs to the Houle of Arenheim. N. lat. 52°. E. long. 5°. 4'.

ÆRTSEN, in Biography. See AERSSENS.

ÆRLVA, in Botany, a genus of the monadelphia decandra class and order. The characters of which are, that the flowers are polygamous; the calyx is five-leafed and patent; the filaments are five, and barren; the pistillum is a globulous ovary, having a filiform style terminated by a bifid stigma; the fruit is a capsule, which is oblong, single-seeded and encompassed by the calyx. There is one species, viz. A. erysiphinae or tomontinae, which grows on fally calcareous soil in Arabia. La Marek thinks it bears affinity to the amaranthus.

ÆRUINOUS, something partaking of, or like to, the ruff of copper.

Authors do not seem perfectly agreed about the colour to be expressed by this word, some expressing by it green, others brown.

ÆRUGO denotes RUST, especially that of copper.

Naturalists speak of two kinds of ærugo, one native, and the other factitious: the native, is only the superficial particles of the metal dissolved; and intimately mixed with acid salt; in which form it is ordinarily found in copper-mines, and other metal places: and the artificial, commonly called verdigris, or copper converted into a green calx by vinous acid.

One species of natural ærugo is a greenish marcasite, like the drops of iron; it is found in copper-mines, but is of no use. Dioecorides (lib. v. c. 91, 92.) and Pliny (lib. xxxiv. c. 11, 12.) say expressly, that a substance of the nature of these stones, which yielded copper when melted, was scraped off in the mines of Cyprus, much in the manner now practiced in Hungary, where the outer coat of the copper ore is thus collected, and afterwards purified by being washed in water. Another species, according to the account of Dioecorides, was procured from the water of a grotto in the same island; and the most salable natural verdigris is still obtained in the same way in Hungary. The clear water which runs from old copper works is put into large vesicles, and after some time the green earth falls to the bottom as a sediment. There is also, on some mountains in Moravia, a sort of green grains, like sand, that is of a brass green, when used in painting. It is called the Hungarian mountain, or sea verdigris. See mountain green.

ÆRUGO rufcula, or æruva rufa, is a rust formed on copper, by hanging a plate of it over the strongest vinegar for some time, without touching the one to touch the other. It was only used externally by Dioecorides and the ancient physicians for cleansing ulcers, and destroying excrescences: but it has been more lately employed externally with efficacy of myrrh and honey of roses in fistulae and aphtae, and also internally for malignant ulcers that have corroded the bones, and either with or without turbit mineral as a remedy for men or beasts that have been bitten by mad dogs or wolves. The dofe has been from three to six grains. Pills, formed of the æruva, in a manner however that has been concealed, have been recommended for the cure of the ulcers; but their beneficial effect has been disputed.

ÆGS, in Natural History, a name given by Pliny, and several other ancient authors, to a reddish shining matter, separated from the Egyptian salt, called natrum, in purifying it. We find this matter remain in the filter, on dissolving and filtering the Egyptian nitre, at this time; it seems to be a mixture of bituminous matter, and a red earth, which had mixed themselves among the cakes of the salt, during the time of their concreting from the water.

ÆRUSCATORIUS, formed from Æruscus, to hog, mump, &c. in Antiquity, a kind of sharpening frollers, who got their living by tricks, telling fortunes, and the like, much like modern gypsies. The term is also applied to opprobrious tax-gatherers.

The Galli, or priests of Cybele, were called Æruscatorides angeani matris, on account of their begging, or collecting alms in the streets. To which end they had little bells whereby to draw people's attention to them, much like some orders of mendicants abroad.

ÆRY, or AIRY, in speaking of hawks, eagles, or the like, answers to the nest of other birds.

ÆS, in Antiquity, has various figurings; but it properly denotes bras or copper. It was for a long time applied indiscriminately to either of these metals; and it was not till a late period that metallurgists, in order to distinguish them, gave the name cuprum to copper: as copper was the first metal used in coinage by the Romans, the word ÆS was used in their language to signify money in general. It likewise denoted a particular coin made of that metal.

Æs caladium, or cast bras, otherwise called Æs olarium, or pot bras, is a species of bras mentioned by Pliny, which was not capable of being hammered. This is likewise a term used by the German mineralists, for a substance which sometimes occurs to those who work upon cobalt, and is used for making the fine blue colour called scialy.

Æs condylium, among the Ancients, was different from that which we call white bras; it is a purer and whiter kind of metal found, it is said, under the veins of silver, somewhat analogous to Venetic tinct. They had probably a method of making copper silver as well as yellow, equal, if not superior, to that now in use. The phrases of oriculacum album in Virgil, (Æn. xii. 87.) and AEAS bruxam among the Greeks, strictly signify white brass.

Æs Corinthium, a precious metallic composition, of a much finer colour than common bras, and in its beauty little inferior to gold. Pliny says, (Hist. tom. ii. p. 640. Ed. Hard.) that this was an accidental mixture of metals at the top and conglomeration of Corinth by L. Munnius, 146 years before Christ: when the gold, silver, and brass statues, and all metallic substances, melting and mingling together, formed this mafs. He says, that there were three forts of Corinthian bras, viz. the red, the white, and that which was of the colour of money, according to the different proportions of gold and silver that were in it. But some refiners, who have finely examined this metal, find no gold in it; a circumstance which, if true, suggests some reason, among others, for concluding, that this account is fabulous. However, the fable has been interpreted by some to signify, that the art of making copper into brass was first discovered by the Corinthians, who found the cala-

R t

N I N E
nine, borne on the plains of Peloponnesus, or at least that they brought this art to perfection.

*Æs coronarium,* used by Pliny, (H. N. tom. ii. p. 659,) to denote brass wrought into thin plates, and which, he lays, stained with the gull of bull, furnished a foot of gold for the crowds of players. This was called *æs aurifacium,* in contradistinction to the *æs fiftum,* or *æs cadunium.* The latter was both brought from Cypr. us.

*Æs Cyprium,* was a kind of copper produced in the island of Cyprus. This denomination was first given to copper in general; whence it was called *æs cyprium,* and at length *æs Cyprium.* The superiority of the Cyprian copper gave occasion to this appellation.

*Æs flavum,* yellow copper. All the Roman authors have mentioned the method of making brass with *æs calamine* and *æs copper,* but their finest kind, which they called *æs arsicalum,* or *æs aurifacium,* they distinguished from the inferior sorts, which had only the name of *æs flavum.*

*Æs gravis* denoted money among the Romans, which was paid by weight, and not by tale. In this sense it is used by Buddeus and Scaliger.

But others by *æs gravis* understand large pieces of copper coined, containing, for instance, an *æs,* or pound of that metal, such as we find current in Sweden. These they affort bore the title *æs gravis,* till the time in which they were reduced to a smaller standard.—Grönovius, on the contrary, maintains, that the *æs,* or pound weight, did not acquire the appellation, *æs gravis,* till after their reduction. Philos. Trans. No. 19.

Küster rejects all these opinions, and affirms, that the expression is used to denote any kind of copper-money compared with gold or silver; which, with regard to the bulk and size of the pieces, was much lighter, though of greater value.

But this system, however plausible, is rejected by several learned men, particularly Perizonius, and Mr. Ward. The former has a dissertation on the subject, wherein the opinion of Grönovius is further examined and defended.

*Æs hepaticum* was of a silverish colour, and probably what the moderns call *bronze,* though some confound it with the *æs Cornithium.*

*Æs papirum* is a name given to *æs cordum,* divedel of its silver, when it contains any.

*Æs rude,* that unshapen, or not fashioned for any particular purpose.—Some will have this to be the same with *æs gravis.*—The money, during the first ages of Rome, was all of this kind.

Others, by *æs rude,* understand metal unstamped; in opposition to *æs funamentum,* that stamped, or coined.

*Æs ulsum,* called also *æs venens,* *æs crenatum,* *æs crucis,* and *æs arsenis,* is a term which, like many others among the old chemists, has been applied to two or three different substances; it is, therefore, on this account deferred rejected from the reformed nomenclature. Kunkel (Labor. Chym. p. iii. c. 39.) employs it as a general denomination for a perfect oxyd of copper prepared by heat; the expression is, however, more commonly employed to denote a pharmaceutical preparation once much in vogue as an aperient, but now fallen into disuse. This *æs ulsum* efficaciously consists of copper and sulphur; and the different varieties originate from the relative proportions of the ingredients, and the different states of oxydation of the copper. It is usually prepared by stratifying in a crucible copper clippings and powdered sulphur, and heating the crucible by degrees till it ceases to emit any vapours; it must then be raised to a dull red heat for an hour; there refasts a brittle mass which when pulverized and washed is the substance in question. Barthelet's method is still more simple, consisting merely in heating a drop of copper with white heat, and rubbing it with a roll of brimstone; as soon as it is taken out of the fire, the copper combines eagerly with the sulphur, and the compound runs down in drops, and is received in a buffalo of water; this is then pulverized and washed. In both these the compound is a slightly oxydized copper, figured with sulphur; of an iron brown colour. In addition to these precedes Lemery goes on to heat the sulphured oxyd in a reverberatory nine times successively, quenching it in linseed oil after each roasting. He thus obtains a product of a high red colour, which in fact is a simple oxyd of copper, the sulphur being burnt out. Some recommend a mixture of nitre or common salt with the sulphur, and the substance resulting from this, if not washed, is certainly a very powerful aperient on account of the sulphurated alkali which is thus combined with the oxyd of copper. As to the sal ammoniac and vinegar, in which some previously steep the copper, it is wholly useless, all its effect being destroyed by the subsequent heating. Dict. Method. Art. *Æs ulsum.*—New Dispenfatory, 1765, p. 498.—Beaume’s Chymic. Experiment, vol. ii. p. 651.—Cren’s Chemistry, vol. ii. p. 269.

*Æs ulsum* is very drying and detegniir, and has been, on that account, mixed with plasters and unguents, for drying up fistulous ulcers, and imbibing acrimonious humour, or soanes. It is also commended for disorders of the eyes; and joined with cardomoms and honey-water, it has been prescribed internally to epileptics, with whom, according to Dioscorides, it operates as an emetic, and according to Aretæus, as a laxative. See Gnedi’s App. Med. vol. i. p. 344. It is likewise used for colouring glazes.

*Æs xerorum,* in Antiquity, a sum paid, by bachelors, as a penalty for living single to old age.

This tax for not marrying seems to have been first imposed in the year of Rome 350, under the censorship of M. Furius Camillus, and M. Pothismus.

At the census, or review of the people, each person was asked, *Est tu in anima xeronis biceps librorum querendarum causae?* He who had no wife, was hereupon fined after a certain rate, called *æs xerorum.*

*Æs; flos Æris,* called by the Greeks, *κρανιον ωμος* (sometimes confounded with moderns with *chloroidium*), is prepared of copper melted, and removed into other furnaces, wherein being exposed to a farther and greater heat, and vehemently agitated by bellows, it deposits an infinite number of small scales, like millet grains, which being separated by lotion, make the flos eris. The cold water is poured on the copper, as it runs out of the furnace into the receiver.

*Æs; fumna Æris* properly denotes flakes of that metal struck off by the hammer, in the operations of the forge, &c. These, from the Cyprian copper-works, are called *Helmin.*

*Æs; per Æs & librum* was a formula in the Roman law, whereby purchases and sales were ratified.

Originally the phrase seems to have been only used in speaking of things sold by weight, or by the scales; but it afterwards was used on other occasions. Hence even in adoptions, as there was a kind of imaginary pur chase, the formula thereof expressed, that the person adopted was bought per *æs & librum.*

*Æsalon,* in Ornithology, a species of falcon, called in English the Merlin. *Æsalon carolinensis,* is the name...
Given by Brillon to the accepter minor of Catherby, and the
Falco sparverius of Linnaeus, which has a yellow cere,
brown head, red vertex and abdomen, and bluish wings.
The head of the female is encompassed by even blackish
spots.

ÆSANIS, in Ancient Geography, a town of Phrygia
Major, according to Ptolemy.

ÆSAPUS, a river of Mytilus, in Asia Minor, according
to Strabo, which rises south-west of Scæphus, and
discharged itself into the Propontis, west of Cyzicus.

ÆSAR, Serbía, a river of Etruria in Italy, which, says
Strabo, joined the Arno at Pisa, but its mouth is said to
be ten miles north of that of this river.

ÆSAR, in Mythology, a deity of the Etruscans.
It is said that the letter C was obliterated in the word Cæsar,
annexed to a name of Augustus, the augurs dedicated from
this accident on the part of the statuary, a forrowful pre-
face. As C was a numeral letter, denoting 100, they con-
cluded that he had not 100 days to live: but as the word
ÆSAR was the name of a deity, they thence inferred that he
would be defied after his death.

ÆSARONENSI, in Ancient Geography, a people of
the northern part of Sardinia.

ÆSARUS, Ephe, a small river of Bruttium, which
watered the town of Croton. Ovid (Met. l. 15. v. 23.)
calls it ÆSARUS.

ÆSCH, in Ichthyology, a name by which some have
called the grayling, or tumbling, a fish of the truttaceous
kind, called in Latin Thymallus.

ÆSCHINES, in Biography, an Athenian philosopher of
low extraction, said by some to be the son of Chares, a
fattage-maker, and by others, the son of Lyfaxias.
He discovered an early desire of knowledge, and, though opprest
by poverty, was affable and persevering in the pursuit of
it. With this view he placed himself under the tuition of
Socrates, who was gratified by the respect which was paid
to him by this young and studious, though mean disciple.
Upon first offering himself to the notice of Socrates, he
told the philosopher that the only thing which it was in his
power to present him, in return for his kindness in giving
him instruction, was himself. Socrates replied, that he
accepted and esteemed the present, and hoped to render it
more valuable by culture. He adhered to his master with
unalterable fidelity and constancy, and enjoyed his particular
friendship. Impelled by poverty, he determined to quit
Athens; and after the example of Plato and others, to visit
the court of Dionyfus, the tyrant of Sicily, who was,
at this time, either through vanity or jealousy, a general
patron of philosophers. Upon his arrival in Syracuse,
he was slain by Plato on account of his poverty; but
Arilippus introduced him to the prince, by whom he was
liberally rewarded for his Socratic Dialogues. Pindar,
however, vindicates Plato from this charge, and says that
when he was neglected at Syracuse, the philosopher recom-
mented him to Dionyfus, and engaged for him the protec-
tion and favour of the sovereign. See Plut. Commentarios
de Adulatoris et Amici dixriminatione apud Oper. tom. ii.
p. 67. Ed. Xyland. ÆSCHINES remained in Sicily till the
expulsion of the tyrant, and then returned to Athens.
But fearing to become a rival of Plato or Arilippus, who
were in high esteem, by any public exhibition, he taught
philosophy in private, and maintained himself by the pecu-
liar recompence which he received for his instructions.
Afterwards, in order to gain a more ample indulgence, he
appeared as a public orator. Laertius says, that he wrote
judicial orations for the vindication of the innocent.
Besides orations and epistles, ÆSCHINES wrote seven Socratic
Dialogues in the true spirit of his master, as temperance,
morcellation, humanity, integrity, and other virtues: of
which only three are extant, viz. one concerning Virtue,
whether it can be taught; a second concerning Riches,
whether they are good; and a third, concerning Death,
whether it is to be feared; a fragment of a fourth, on the
Duties of a State of Marriage, may be found in Cicero de
Inventione Rhetorica, l. i. c. 31. They are published by
Le Clerc, with notes and several dissertations, in the
Grec. tom. i. p. 829.) Suidas (in Alex.) and Lucian
(de Paratio. Op. tom. ii. p. 865.) Ed. Reitstii. have given
an account of them. Some have charged him with pur-
loining the works of Antiphon, and with publishing dia-
logues of Socrates, confided with him by Xanthippe, as his
own. This ÆSCHINES, who is a different person from Æf-
chines the orator, is said by Diodorus Siculus (Hist. tom. ii.
p. 62. Ed. Weiseling.) to have flourished about the 105d
Olympiad.

ÆSCHINES, the Orator, was the son of Atronimus, a gram-
mian and schoolmaster, and Clauceother, who is said to have
been a timbrel-player. See Lucian (in Somn. tom. i. p. 17.)
He was distinguished, as Plutarch says (X Orat. Vit. ap.
Oper. tom. ii. p. 840.) neither by his birth nor riches.
In his youth, ÆSCHINES being of a robust constitution, de-
voided himself to the exercises of the gymnasium, and
having a clear voice, he performed a part in the exhibition
of tragedies. Some say that he attended the lectures of
Iocrates and Plato; but according to others, he received
instruction from Alcadas, the preceptor of Gorgias.
His progress, however, was considerable, and he became
a competitor with Democlines; and by his public conduct
incurred his displeasure. When the Athenians negociated
a peace with Philip of Macedon, ÆSCHINES and Democ-
thenes were two of the ten ambassadors employed for this
purpose. On this occasion, it is said that ÆSCHINES was
brisked by Philip, and perfused the Athenians, in opposi-
tion to the remonstrances of Democlines, to confide in the
promises of the sovereign of Macedon. Thus deluded, they
gave this prince an opportunity to posses himself of Ther-
mopylia, and to enter the territory of Phocis. Philip,
being in Syria, and not being able to attend this office by the council of the Amphi-
cions. With this view, he contrived, by intrigue and cor-
ruprion, to engage the support of ÆSCHINES; who, in a
steadied oration, prevailed with the deputies of the Greek
cities, assembled in the council of the AmphiCions, to
elect him for their general, and to invest him with full
power to act as he should think proper. By this artifice
Philip got possession of Elates, the chief city of Phocis,
and thus established himself in a situation the most favour-
able for the execution of his farther designs. Democlines
exerted all his powers of eloquence to route the Athenians,
and to induce them to unite with the Thebans in disco-
certing the machinations of Philip. His eloquence was
effectual, and the two hostile armies encamped near Che-
rona, a city of Boeotia. The wisdom and force of Philip
prevailed, and Democlines, being left a warrior than a
statesman, and being more capable of giving counsel in his
harangue, than of enforcing and supporting it by intrepid
earnest, threw down his arms, and fled with the other
discouraged troops. The shock which Athens received at
this time, the effect of which it was never able to recover,
was ascribed to Democlines; and ÆSCHINES took the lead
in criminating his rival; and he, accordingly, drew up an
accusation against Ctesiphon, or rather against Democlines.
The conflict between these two orators excited very general attention, and the two orations that were delivered by them have always been considered as the masterpieces of antiquity, especially that of Demosthenes, which is more powerful and impetuous than that of Aeschines. The letter left behind, and was sent to the hencourt for his release from prison. Upon this, he settled at Rhodes, where he opened a school of eloquence, the reputation of which in Oratory for many ages is admitted. He is said to have commenced his lectures with the two orations that had occasioned his imprisonment. That of Aeschines himself was received with applause; but when the audience heard that of Demosthenes, their plaudits were redoubled. On this occasion, Aeschines declared, with a candour and liberality highly honourable to himself as an enemy and rival, *What an orator would you have heard, if you had heard Demosthenes speak it himself?* Plutarch and Philostratus, *ubi supra.* When Aeschines left Athens, in order to embark for Rhodes, Demosthenes ran after him and obliged him to accept a purse of money; upon which Aeschines exclaimed, *How will it be possible for me not to regret a country, in which I have an enemy more generous than I can hope to find friends in any other part of the world!* From Rhodes, Aeschines removed to Samos, and there he died, at the age of 75 years. Some have said, that Aeschines was the first who delivered extemporaneous orations, a practice which others have ascribed to Gorgias. Philostratus extols him for his fine peripety, decorous gravity, and distinguished energy; and he is denominated by Demosthenes *μεγάλων σοφίων.* Quintilian, comparing him with Demosthenes, says of him, *In slant. Orat. l. x. c. i. tomt. ii. p. 901. B. Bumann.* Plinio Minor Aeschines, et magis *fujus, et grandiori similis, quo minus *śtudis est: carnis tamen plus habet, lacteorum minus.* Photius ascribes nine epistles (according to the number of the muses) to Aeschines; but there are twelve, which were addressed to the Athenians when he was an exile at Rhodes, in Wolius's edition of Demosthenes and Aeschines, *p. 205*; and Taylor has added them to his edition. The ancients acknowledge only three genuine orations, viz. 1. *Aeschyli Timarchum* (Wol. Ed. p. 259.) Timarchus was his accuser, and it is said that in consequence of the reproaches of Aeschines he laid violent hands on himself. 2. *De fidel. Legatione,* (Ib. p. 395.) This is an apology for himself against Demosthenes, who had accused him of perjury in an embassy to Philip. 3. *Aeschyli Cleopatra,* (Ib. p. 425.) who decried the golden crown to Demosthenes. Fabricius compares these orations to the three graces. Another oration, intituled *Achilleon,* was formerly ascribed to Aeschines; but the ancients ascribe it to another person of the same name. See Plutarch and Philostratus, *ubi supra.* Demosthen. et Aeschin. Opera, by Wolius Francon. 1604. Fabricius. Bibl. Græc. tomt. i. p. 412—428, &c. *Laertius,* (tom. i. p. 118. tomt. ii. p. 107. Ed. Melb.) mentions several other persons, called Aeschines; and this identity of name has occasioned so much confusion in the history of the persons, and particularly with regard to the Socratic philosopher and Athenian orator, who are the subjects of these articles.

**ÆSCHNIA, in Entomology, the name of a species of water-fly, of an ash-colour, with four wings, and a long body, hairy near the tail.**

**ÆSCHRION, in Biography, a fellow citizen, and one of the traders of Galen, by whom he is mentioned with respect. He had great faith in a medicine he invented against the effects of the bite of a mad dog. The following is the prescription, and it is, without doubt, as efficacious as the famous composition recommended by Dr. Mead.** *Take of the ashes of lobsters, burnt alive in a copper vessel, ten parts; of gentian, in powder, five parts; of juncaria, one part; mix them, and let the patient take a spoonful in a glass of water every day, for forty days. There are some idle ceremonies directed to be observed in making the powder, which are here omitted.*

**ÆSCHYLUS, in Geography, a town in Switzerland in the Canton of Bern: two leagues south-east of Spiez.**

**ÆSCHYLUS, in Biography, the famous tragic poet, was born at Athens, in the last year of the 643 Olympiad, or the 542th year before Christ, according to the Arundelian marble, on which Stanley, in his notes on the life of this poet, relies. He was the son of Euphorion, and distinguished by his military valour as well as by the exercise of those signal talents, which intitle him to the appellation of the father of tragedy.**

At the battle of Marathon, his brother, Cynegyamus, signalled himself; and, as Herodotus informs us (I. p. 491. Ed. Weffel.) laid hold of the prow of one of the Persian ships with his hands, which were cut off by an axe, so that he died of his wounds: and his youngest brother Aminis, says Diodorus Siculus (I. xi. p. 426. Ed. Weffel.), who had the command of a squadron of ships, conducted himself with such skill and bravery, that he sunk the admiral of the Persian fleet, and gained distinguished honour. In these battles, as we learn from Paunianias (I. p. 35. Ed. Kuhnii) as well as in those of Platea and Artemision, he was present; and we are assured that he acquitted himself with honour. But his principal attention was directed to the composition of tragedies and the improvement of the stage. Paunianias informs us (I. p. 49.) that he was admonished by Bacchus, when a boy and asleep in the field, to write tragedies; and that when he awoke he made a trial and succeeded.

His mind was naturally strong and ardent; and the austerity of his character was manifested by his silence and gravity. From his youth he had been accustomed to the lesons of those poets, who, living near to the heroic times, conceived ideas corresponding in sublimity to the illustrious deeds that were then achieved. In the history of those remote ages he beheld every where the impress of grandeur, and frequently that of ferocity. In order to bring scenes of this kind to view, and to exhibit, as it were, before the eyes of the spectators the time and place, and various circumstances of events, Æschiílus employed all the resources of theatrical representation; and thus the illusion became a reality. Sufarion and Theopis, and Phrynichus, the disciple of the latter, had proceeded but a little way. Theropis indeed had introduced a single action, and Phrynichus selected that kind of verse which is most suitable to the drama, and made some other changes; nevertheless tragedy was in its infancy before the time of Æschiílus. In his first tragedies he introduced a second act; and, afterwards, copying the example of Sophocles, who had just entered on his theatrical career, he admitted a third, and sometimes even a fourth. By thus multiplying persons, one of his acts became the hero of the piece, and possessed the principal interest; and as the chorus was now held only a subaltern station, Æschiílus abridged its part. He is cautioned for having admitted mute characters into his drama; but it has been suggested that the veil which covered them and the silent grief which they manifested, produced a more sensible effect than any lamentations and tears. What he has said of his hero Hippomedon (Sept. Contr. Theb. v. 506.) may be applied to himself:

"— Before him strides
Gigantic terror, tow'ring to the skies."
And yet he knew how to set bounds to the emotions which he earnestly laboured to excite, and conjointly avoided polluting the stage with blood; for he wished to produce scenes that should be terrible but not horrible. He rarely excites pity or tears, either because he was naturally deficient of a very delicate sensibility, or because he did not wish to render his auditors effeminate. An ingenious author (See Anacharsis's Travels in Greece by the Abbé Barthélemy, vol. vi. p. 10, &c.) has examined the manner in which Æschylus has acquitted himself in the different parts of tragedy, viz. in the fable, manners, sentiments, diction, decoration, and music. His plots, says this writer, are extremely simple; and he sometimes interests us merely by the recital of facts and the vivacity of the dialogue (in Sept. contr. Thel.) and at other times (in Suppl. and Eumen.) by the vigour of his style, and the terror of his scenes. In his estimation theunities of action and of time were essential, but that of place lefs necessary. His chorus makes a part of the whole. It is the comforter of the wretched, the counsellor of kings, the terror of tyrants, and the confident of all. Sometimes it participates in the action during its whole continuance, as in Suppl, and Eumen. The character and manners of his personages rarely fail in suitableness and consistency. He usually wrote his models from the heroic times, and sustains his characters at the elevation to which Homer had raised his heroes; and it should be recollected that he wrote in the time of the Persian war. As he inclines more to excite terror than pity, he seeks only to render his characters more furious, but without injury to the theatrical interest. See the character of Clytemnestra, in Agamemnon; and particularly v. 1571, 1445, 1404, 1411, 1398, 1506.

In his time no other style was known for heroic composition, but that of the epopoeia and of that of the dithyrambic. As they suited the elevation of his ideas and sentiments, Æschylus, without enfeebling them, referred them to tragedy. Huddled away by an enthusiasm, which he was unable to govern, he lavishes epithets, metaphors, every figurative expression of the emotions of the soul, and whatsoever may give weight, strength, and magnificence to language, or animate and render it impassioned. Beneath his vigorous pencil, narrative, sentiments, and maxims, are changed into images, which are striking for their beauty or singularity. Of a man of comfiderable prudence, he says, (Sept. contr. Thel. v. 599.)—"He reaps those sages and generous resolutions, which spring in the deep furrows of his soul," and he thus warns a few people early to watch over the conduct of a citizen dangerous from his abilities and his riches; "Beware how you nurse up a young lion, how you caress him while he yet fears you, or how you reft him when he is grown a stranger to fear." And yet these shining passages are sometimes accompanied by an obscurity, which arises not only from his extreme conciseness and the boldness of his figures, but also from new words and phrases with which he affected to enrich his style. The style of Æschylus is in general noble and sublime; in certain parts grand to excess, and pompous to inflation; but sometimes degraded and distorting by ignoble comparisons, a puerile play on words, and other defects which are common to this author, with all those who poise more genius than taste. But notwithstanding his faults, he merits a distinguished rank among the most celebrated poets of Greece.

Æschylus adapted the dress of his characters, and the decorations of the theatre, to those impressions of grandeur which he wished to produce on the minds of the auditors. As nature had given to heroes a lofty stature and impressed a majesty on their persons which commanded respect, Æschylus raised his actors on high thrones or desks; he covered their features, which were often irregular and disagreeable, with a mask; he clothed them in flowing and magnificent robes, such as the priests of Ceres have not blushed to adopt. The inferior actors were also provided with masks and dresses suited to their parts. He also obtained a theatre, furnished with machines, and embellished with decorations. Here the sound of the trumpet was reverberated, the incense was seen to burn on the altar, the shades of the dead to arise from the tombs, and the furies to rush from the gulps of Tartarus. At the sight of some of the dreadful spectres which he contrived, and the sound of their hideous howlings, it is said that terror seized on the whole assembly, women miscarried, and children expired with fear; and the magistrates were under a necessity of issuing orders, that the chorus should confound only of 15 actors instead of 50.

Æschylus paid particular attention to the performance of the actors, regulating their steps, and directing them to give additional force to the action, by appropriate and expressive gestures. He also instructed them more effectually by his example, as he performed with them in his pieces. Besides, he employed a person, called Teleles, who had brought the art of gesture to such perfection, that in the representation of the seven chiefs before Thebes, he performed with so much truth and expression, that his action might have supplied the place of words. See Athenaeus Depnonophis, l. i. p. 22. Ed. Cæsare.

Æschylus also applied to tragedy the lofty modifications and impetuous rhythm of certain airs calculated to excite courage, without adopting those innovations which began to disfigure the ancient music. His choral chant is full of grandeur and decorum, and constantly in the diatonic genus, which is the most simple and natural of all.

Quintilian (Inst. Orat. l. i. c. 1. tom. ii. p. 897) gives the following character of Æschylus, as a writer: "Tragedia primus in lucem Æschylus prodit, fabulam et gravitas, & grandioquant sepe uige ad vitam, sed radiis in pluribus & incompositis, &c." Longinus (Ed. Pears, p. 99) says, that he had a noble boldness of expression, and that his imagination was elevated and heroic. Some have affected that he never composed but when he had drunk freely; and by others he has been compared to Shakspeare for energy of sentiment and style, as well as for the expression of character and passion by the happy use of trivial circumstances. Horace describes the character of Æschylus in his Ars Poet. v. 282, &c.

"Polf hunc perfone, paludeque repertor honetis, Æschylus, et modicum intravit pulpita tignis, Et docuit magnanime loqui nuptis cuthano."
Ed. Gronov.), that Aeschylus was charged with impiety by the Athenians, and condemned to be floned to death. The ground of the charge is not that which Herodotus and Paufanias have supposed, viz. Aeschylus's adopting the theology of the Egyptians rather than that of the Greeks, and presuming to say that Diana was the daughter of Ceres and not of Latona: but more probably that which Clemens Alex. has stated (Strom. I. ii. oper. tom. I. p. 457; Ed. Poterius.) that Aeschylus, being himself untrammelled, profaned the mysteries by exposing them in one of his dramas on the stage. However this be, the Athenians were preparing to execute the sentence that was pronounced against Aeschylus, when his brother Aminias drew aside his cloak and presented his arm without a hand, which he had lost at the battle of Salamis, in defence of his country. This sight interested the compassion and honour of his judges, and induced them to revoke their decree and to pardon Aeschylus.

Plutarch (in Cimon. op. tom. I. p. 485.) says, that Aeschylus, being disqualified with the preference given to Sophocles in the contest for the prize of poetic merit, abandoned his country and went to reside in Sicily. There Hiero distinguished him with benefactions and honours: but he soon died, at the age of 69 years, ante Christ. 436. Pliny informs us, (H. N. i. x. c. iii. tom. I. p. 547.) that whilst he was walking in the field, in order to avoid a danger of which he was forewarned, with respect to the mode of his death, an eagle, hovering over him in the air, let fall a tortoise upon his head, for the purpose of breaking the shell, which instantly killed him. The following epitaph, composed by himself (for the original of which see Paufanias, p. 37. Ed. Kuhnii.) was engraved on his tomb:—

Here lies Aeschylus, the son of Euphoron, born in Attica. He died in the fertile country of Gela. The Persians and the woods of Marathon will forever attest his valour. At the time when he wrote these lines, he was unquestionably distinguished with literary fame, and knew no glory more illustrious than that of arms.

The Athenians decreed honours to his memory; and authors who have intended to dedicate their talents to the theatre, have gone to offer libations, and to recite their works at his tomb. There are seven of his tragedies extant, of which the best edition is the folio of Thomas Stanley, published in 1663, with a Latin translation and learned Commentary. There have been many other editions, and also translations (See Fabric. Bibl. Græc. tom. I. ii. c. xvi. p. 602—618.) of these tragedies: Potter's translation, published in 1670, at London, 1777; and afterwards in 2 volumes. 8vo. delays to be particularly mentioned. Stanley, in his Life of Aeschylus, has mentioned several other persons of the same name.

Aeschynomene, formed of αρχηγός, to be amazed, because it retreats from the touch; διάφθειρα, a noisy plant, in Botany, a genus of the diastrophus decidua class and order; and of the natural order of papilionaceae or leguminosæ: the characters of which are, that the calyx is a one-leafed, bell-shaped, fimbriate with equal lips, upper bifid, and lower three-toothed perianthium; the corolla papilionaceous, with sub-cordate, scarcely gaping, large banner, subovate, obtuse wings, shorter than the banner, and lunate, acuminate keel of the length of the wings: the stamens have 10 filaments, single and nine-cleft, and small anthers: the pistillum is an oblong, villous, columnar germen, the style fimbulate and rising, the stigma simple, rather obtuse: the pericarpium is a long, flat, jointed, rough, one-celled legume, opening at the truncate joints; the seeds are solitary, between the joints, and kidney-shaped. Martyn enumerates twelve species, viz. the grandisflora, arboria, coerulea, afpera, americana, indica, sjahan or Egyptian, pulvus or dwarf, fes- flata, heterophylus, leguminaria, and cannadina.

The til is a shrub, from 10 to 15 feet in height, a native of the East Indies, cultivated in Jamaica, and in England by Miller, in 1768. The seeds are agreeable to domestic birds,—The 2d grows to the height of six or seven feet, with a single stem, and bears large and copper-coloured flowers,—The 3d is a native of the East Indies, and of the islands Otaheite and Huahine in the South Seas.—The 4th is a native of the East Indies.—The 5th is somewhat sensitive: during the night, and at the approach of rain, the leaves fold together. It is a native of Jamaica, and was cultivated in 1739 by Miller.—The 6th is a native of the East Indies.—The 7th is a native of Egypt, was cultivated in 1685, in the botanic garden of Oxford, and flowers in July and August.—The 8th is a native of the East Indies; and the 9th, of the West Indies.—The 10th and 11th are natives of Cochin China.—And the 12th is a native of the East Indies, which may be treated as hemp and used for the same purposes. The first is with difficulty preferred through the winter in this country. The 2d, 3d, and 7th, may, like the first, be preferred through the winter in a warm house, will flower early in the following summer, and their seeds will ripen in the autumn: they must not be kept dry in winter, or else they are subject to rot. The 4th, 5th, 6th, and 8th species, are annual, and must be brought forward early in the year, otherwise their seeds will not be perfect. All the sorts are propagated by seeds, which may be sown on a hot-bed early in the spring; and when the plants are strong enough to be removed, they should be put each into a separate small pot, filled with light earth, and plunged into a fresh hot-bed; and as they advance in growth, they should be shifted into larger pots; but care should be taken that the pots be not too large, which will prevent their thriving.

Aeschynomene plants, among Botanists, are those properly called Sensive plants.

Aesculanus, Æres, or Æris, in Antiquity, are different names given to the divinity who presided over the coinage of copper money. This Æsculanus, it is said, was the father of Argirinthus, because copper was employed before silver; and Argirinthus, the father of Aurinthus, because gold money succeeded silver; and thus they had three divinities presiding over the coinage of the three principal metals. On some medals of the emperors there are found three godesses, represented with balances, a curnotopsis, and near them a piece of the different metals.

Aesculapius Augustus, in Zoology, the name of a harmless species of serpent, common in Spain and Italy, called also Parâna. The color euscolapij of Linneus has white and black bands, which are bicolored by a white ring, and is found in both Indies.

Aesculapius, in Aelthnomy, the ancient name for the constellation Ophiucus.

Aesculapius, Æsculapius, and as Paufanias calls him Æēsopeus, in Mythology, the god of medicine, was the son of Apollo, by the nymph Coronis, born at Epidaurus, and educated by Chiron, the preceptor of Achilles, who taught him to cure diseases of the most dangerous and desperate kind, and even to raise the dead. The history of Æsculapius, like that of other deified heroes of antiquity, is involved in great obscurity, and many absurd and incredible stories are related concerning him. If we regard the reports of the people of Epidaurus, which is said to be the place of his nativity, as Paufanias has represented them; (I. ii. c. 26. p. 172. Ed. Kuhnii.) a shepherd, having lost
left his dog, and one of his steers, found them on a
neighbouring mountain, near a child who was alone with
an extraordinary repinedence, and whom the goatlecked,
and the dog guarded. This child was Æsculapius. As
he advanced in age and acquire, he dedicated his days to
the relief of the unhappy. The most dangerous wounds
and maladies yielded to his operations, his remedies, his
harmontious songs, and the magical words which he
employed. The gods, it is said, pardoned him his success;
but as he dared to call the dead to life, Plato complained,
and Jupiter struck him dead with a thunderbolt.
See Pindar. Thyr. l. iii. v. 10. 92. p. 196. 7. W. Well.
Plin. ii. N. l. 29. tom. ii. p. 495.
It is added, that Æsculapius was the disciple of Chiron,
and having been enticed with the secrets of his master,
he communicated them to his sons Machaon and Po-
dalirius, who, after his death reigned over a small city
in Thessaly. During the siege of Troy, they signa-
lized themselves by their courage in the field of battle,
and by their skill in the treatment of wounds (Homer ii.
l. ii. v. 750. l. iv. v. 219. l. ix. v. 832.), the only part of
the medical art that was much known in those remote ages.
The children of Machaon, who was killed under the walls
of Troy, followed the profession of their father, and
settled in the country. They raised altars to their grandfa-
ther, and revered the fame honours themselves by the
services which they rendered to the human race. See Paufa-
The founder of so respectable a family soon became the
object of public veneration, though his advancement to the
rank of gods must have been posterior to the time of Ho-
er, who only speaks of him as a simple individual.
In process of time divine honours were every where paid to
him. At Epidaurus he had a famous temple, in which his
statue, made of gold and ivory, by Thrasymedes of Paros,
was placed on a throne of the same materials. It was
crowned with rays and a knotty sickle in one hand, and
stretching out the other arm over a serpent, which seemed
to raise itself up in order to reach it; and a dog lay at
his feet. The Epidaurians instituted festivals and games,
which were at first annually, (Plat. in Ion. tom. i. p. 530.
Ed. Serrani.) and afterwards once in five years celebrated
in honour of him. From Epidaurus his worship passed to
the other cities of Greece, and even to distant countries.
In all his temples votive tablets were hung up, on which
were recorded the diseases cured by his assistance. This
god was brought to Rome, by order of Apollo, when a
pestilence raged in that city, in the times of the republic,
under the confudele of Posthumus Megellus and C. Junius
Brutus. About the year of Rome 462, the Sibylline
books were consulted, and an embassy was appointed to
bring the god from Epidaurus to Rome, who is said to
have stolen away from his old worhippers under the form of
a serpent; and on his arrival, to the great joy of the people,
the plague ceased. On this occasion altars were erected
along the banks of the Tiber, and numerous sacrifices were
offered to the new deity. The Romans desired to erect a
temple in honour of him, within the walls of the city; but
the god who resided in the vicinity of Epidaurus, and not
within the city, is said to have chosen his abode in the
midst of the Tiber, on an island formed in the infancy of
the republic by the Avon, trees, sand, and the rubbish of the city.
Thither the serpent retired, and from that time the island
was called the island of Æsculapius, and a temple was
erected in the form of a ship, to which, as to the temple of
the god of health, the common people frequently repaired.
The sick were restored to health, and in token of gratitude
offered a cock to Æsculapius. Of this temple there were
some remains in the 16th century, near the church of St.
Bartholomew, in the island of the Tiber. From this time
Æsculapius was honoured at Rome as one of the chief of
their gods. On coins, &c. he is crowned with laurel,
in token of his descent from Apollo, and he is represented
with a mild aspect, with hair and beard not unlike those of the mild Jupiter; his right arm is bare, in order to
describe his readiness for any operation; his left holds a
flick, with a serpent twisted round it. He is sometimes
seen accompanied by his wife Hygeia or health, with their
son Telphorius, or convalescence, between them. The cock
and cock have been reputed sacred to this deity on account
of their vigilance; and the raven for his forcast.
l. ii. p. 171. Ach. x. vii. p. 592, &c. Ed. Kuhnii.—Ci-
mentions three deities called Æsculapius; the first the son
of Apollo, worshipped in Arcadia, who invented the probe
and bandages for wounds; the second, the brother of the
second Mercury, killed by lightning; and the third, the son
of Arifippus and Arionoe, who first discovered the art of
tooth-drawing and purging.
Those who trace the origin of medicine, as well as the
other arts and sciences, to the Egyptians, ascribe the invention
of it to Teforthus or Seoforthus, a king of Mem-
phis, and the second of the third dynasty of Manebe, who
was called Æsculapius on account of his great skill in that
art. This prince was much more ancient than the Grecian
Æsculapius, and though Africanus places him some years
after Athisius, the successor of Menes, supposed to be the
fame with Thoth, or the first Hermes, yet others make
them contemporaries, as they must have been if this
Æsculapius was the fame with the son of Sydys and the brother of the Cabiri.—An. Un. Hist. v. i. p. 246.
8vo.
ÆSCULUS, Horae-Chiefnt, in Botany, a genus of the
beptandria monogynia chaff and order, of the natural order
of tributae, and the acera of Jufien. It is the hipoepfu-
num of Tournozor, and the paria of Boerhavae. The name æc-
clus is derived from efa, food; and the old names of hip-
pocapsum and capzaca equina, from the limulids of the fruit
to that of the chestnut, and from its being given to horses.
Its characters are, that the calyx is a one-leaved, ventricof-
se, full and five-toothed perianthium: the corolla consists of
five roundish petals, plaited and waving about the edge,
flat, spreading, with narrow claws, infented into the calyx,
and irregularly coloured; the stamina have flabulate, declin-
ing filaments, of the length of the corolla, and ascending
anthers: the pistillum is a roundish gem, ending in a flub-
ulate style; the stigma acuminate: the pericarpium is a
leathery, roundish, three-celled, three-valved capsule: the
seeds are two and sub-globose. Van Royen de Necker and
Miller observed both hermaphrodite and male flowers in this
genus. There are three species, viz. the Æ. hippocapsum,
or common horae chiefnt; the leaves of which are digitate,
with seven entire leaflets, and prickly capsules; the Æ. flava
or yellow-flowered horae-chiefnt, with leaves digitate or
with five leaflets, the laminas of the corolla coriace roundish,
and the claws twice the length of the calyx; and the Æ. paria,
or scarlet horae-chiefnt, which has flowers with eight fla-
mata, digitate leaves with five or six serrate leaflets, smooth
capsules,
capillary, laminae of the corolla clorate, and claws of the length of the calyx; and the "Alth. parvula, with a long thick style, and a style by linkage.

The "Alth. porphyrophylla" was brought from the northern parts of Asia into Europe about the year 1729, but not to Vienna about the year 1558. From Vienna it was conveyed to France and Italy; but it came up from the Valt. It is distinguished by the beautiful parabolic form of its branches, the disposition and structure of its digitate leaves, and by the pyramidal branches of its white flowers, variegated near the centre with yellow or red. Although this tree is now left in the city for avenues and walks than it formerly was, on account of the early decay of its leaves, it affords an excellent shade; and the flowers of which appear in May, with the intermediate mixture of large leaves, exhibit a noble appearance. The most eligible situation for these trees is in lawns and parks, where they may be planted singly, and where their fruit will be serviceable to the deer, who are fond of it. This tree is of quick growth; and in a few years it will afford a good shade in summer, and yield plenty of flowers. Trees, raised from nuts, have in 12 or 14 years become large enough to shade two or three chairs with their branches, which in the faun are covered with flowers. But the trees are of short duration, and the wood is of little value. It serves, however, for water-pipes, turner's ware, and fuel; and for these uses it is worth the charge of planting, and should be filled in November or December.

The common horbe-chefmunt is propagated by fowing the nuts, after preserving them in sand during the winter, in order to prevent their rotting early in the spring. In this cafe the plants, in a proper soil, will fow about a foot the first summer; and they may be transplanted, either in the following autumn, or in February and March, into the nurfery, and set in rows at the distance of three feet, and one foot alder, where they are to remain two years; and they will then be fit for planting where they are to continue. The most favourable soil for them is a sandy loam, inclining to moisture. The whole fhot of this tree is completed in lefs than three weeks after the buds are opened; and as soon as the flowers are fallen, the buds for the succeeding year are formed, which continue fwellling till autumn, when they are overfressed with a thick tenacious juice, that defends the tender buds from the winter froid; and on the return of warmth, the juice melts and runs off; and the buds are left at liberty to extend themselves. Of this tree there are varieties, with gold and silver friped leaves, which are irrited by layers, and by budding or ingrafting them upon flocks of the common fort.

In Turkey the nuts of this tree are ground and mixed with the provender for their horses; especially those which are troubled with coughs, or are broken-winded; in both which disorders they are reckoned very good. M. Raimont, of Anjou, gave them, mixed with other food, to his cows; and they increased the quantity of milk, without injuring its quality; and he apprehends, that if they were blanched and rafed, or otherwise prepared, they might be used to hogs and poultry. Memoirs of the Royal Society of Agriculture at Tours, vol. i. p. 121.

In Jac. Zannichelli informs us, that after many trials he has found the bark to have the fame effect, as the Peruuvian bark; and Dr. Fuchs, teacher of medicine in Leips, has prepared from the ripe fruit, ferved of the husks, an extract, which, according to his experiments, may be used, perhaps, instead of the expensive extrematium obinse. Its good effects, as a febrifuge, have been confirmed by many writers.

The horbe-chefmunt has been employed in France and Switzerland for the purpose of bleaching yarn; and it is recommended in the Mem. of the Society of Science, vol. ii. part 2, as capable of extensive use in whitening not only flax and hemp, but silk and wool. It contains an astringent pungent juice, which is obtained by peeling the nuts, and grinding or rapping them. They are then mixed with hot rain or running water, in the proportion of 20 to 25 or 12 quarts of water. Wove caps and stockings were filled in this water, and took the dye extremely well; and successful trials were made of it in filling stuffs and cloths. Linen washed in this water takes a pleasing light fky-blue colour; and the filaments of hemp, steeped in it a few days, were easily separated. The Author of the memoir above referred to, imagines, that if the meal of the chefsnuts could be made into cakes or balls, it would answer the purposes of soap, in washing and filling. The sediment, after infusion, loses its bitter taste, and becomes good food for fowls when mixed with bran. The Edinburgh College have admitted the horbe-chefmunt into their Pharmocopoeia of 1783, on the recommendation Dr. Gardner, who says, that three or four grains of the powder fluffed up the nostrils in the evening, operates next morning as an excellent remomtary, and thereby proves very beneficial in obfinate inflamations of the eyes. A patent was granted in 1796, to Lord W. Murray, for his discovery of a method of extracting flicarnch from horbe-chefmuts. See Starch.

The 2d species, or yellow-flowered horbe chefmunt, is a native of North Carolina, was cultivated with us in 1764, and flowers in May and June.

The 3d species, or scarlet horbe-chefmunt, rises to the height of 20 feet, without much extending its branches; its bark is smooth, and the leaves, which are opposite, on long red petioles, are of a light green. The flowers, which are produced from the ends of the branches upon long naked peduncles, are much smaller than the common fort and wholly red; they appear in June, and are sometimes succedeed by fruit in England; but the seeds rarely ripe here. It grows naturally in Brazil, Carolina, Florida, Japan, and several parts of the west; and was cultivated with us in 1712. This tree may be propagated by the nuts, which must be procured from the countries where it grows naturally. They must be sown in pots early in the spring, and the pots should be plunged in a moderate hot-bed, and towards the end of May into the ground in a south-east border; and in dry weather the plants should be watered, and covered from early frosts. In the following spring they should be planted at the distance of a foot from each other, in a sheltered situation, and in the succeeding winter sheltered from cold by some light covering. The common method practised by the nurvermen, who propagate this tree for sale, is to graft or bud it upon stocks of the common horbe-chefmunt; but as the stocks greatly outgrow the bud or graft, the trees make a bad appearance, nor do they last long. Martin.

AESPUS, in Ancient Geography, a river of Myia, which Strabo (l. 12. t. ii. p. 847) on the authority of Homer, makes the boundary between Myia and Troas. See ASPUS.

ASERNIA, in Ancient Geography, Scarnus, a town of the Samnites, which was a Roman colony belonging to the Caracini between Asculum north, and Dovianum south, but it was not far from the river Volturno. Silvus Italicus (l. viii. v. 56) refers to it; and the appellation Scarnus of the Priene (l. iii. 1. 12. 2) is derived from it.

ASHNA, in Entomology, a sub-division of the Unogera, or fifth class of insects, by Fabricius, comprehending several species of the Libellula of Linnaeus; characterized by
equal laciniae or fringes of the lip. The species are,
1. L. or *x. minuta*, with a yellow abdomen, two black lines,
hinder wings yellow, and two black spots, found in China.
2. *x. clavata*, with a elevated abdomen, gibbous base,
and body variegated with brown and green, found in China.
3. *x. caudata* or *vegata*, with two yellow lines on each
side of the thorax, and a black spot at the base of the
wings, found in Terra del Fuego. 4. *x. grunnilis*, with four
yellow lines on the thorax and variegated body, found
near the waters of Europe, and in the Sandwich Islands. 5.
*forespatia*, with a black thorax, various yellowish marks,
and uncinated tall, found in Europe.

ÆSTICA, in *Ancient Geography*, is supposed to have been
the present village of Netterby in Cumberland.

ÆSTIS, *Efts, Funimiaus*, a small river of Italy,
that separated the Semoons from Picenum, and emptied itself
into the Adriatic sea, near Ancona. See Sil. Ital. lib. viii.

ÆSTISIUM, a town of Italy, belonging to the Umbrans.

ÆSITÆ, a people of Arabia Deserta, placed by Pto-
lemey below the Cutchabeni.

ÆSTUM, called also Æstis, a town of Umbria in Italy,
attuated upon the western bank of the Æs, which was
the common boundary of Umbria and Picenum. In after-
ges it received a Roman colony.

ÆSNECY, in *Laws*, denotes priority of age among
coparceners.

ÆSOLA, or ÆSULA, in *Ancient Geography*, a town of
Italy, near the Tiber and not far from Pedum. It was
situated upon a hill between the Tiber and Tremonie; and
according to Livy, who speaks of *Arx Eplonius* (l. xxvi.
c. 1. iii. p. 1069, Ed. Burman.) it was a fortified place.
It is mentioned by Horace (l. iii. od. 27.) and by Pater-
culus (l. i. c. 14.) as a colony; and Pliny also (l. iii. c. 9.)
speaks of the Ætolian in his time, though no vestige of
them now remains.

ÆSON, a town of Thessaly, founded by Æson, the
father of Jason; and also a river of Thessaly towards Magna-
edia, near this town.

ÆSONA, or *Isfona*, a town of Spain, between the
rivers Siconis and Nuceria.

ÆSOP, in *Biography*, a native of Phrygia, who
lived in the time of Solon, about the 513 or 523 odempiad,
the first year of which coincides with the 52674 before Chrift,
and during the reign of Crethus the last king of Lydia.
His condition was that of a slave, and his perfon was so
deformed, that one of his masters found great difficulty in
disposing of him, as every one who saw him was shocked
at the unlightedness of his figure. He is also said to have
been for a considerable time without the use of speech.
His mental talents, however, compensated for his bodily
defects, and commanded attention and respect notwithstanding
the meanness of his condition. His first master was Demarchus, an Athenian, in whose service he is sup-
poed to have acquired his purity in the Greek tongue.
From him he was transferred to Xanthus, a Samian philo-
opher; and he was sold by Xanthus to Idam, who was
likewise a Samian, and who granted him his freedom on
account of his extraordinary abilities; others say that he
became free by the favour of Rhodope, a celebrated
courtzean. Having obtained his liberty, Æsop acquired
very distinguished reputation, and was much esteemed by
Crethus, although in the first interview his deformity made
an unfavourable impression on the mind of the king, who
found the observation of Æsop, on another occasion, legally
verified in his own cafe, viz. that we ought not to consider

the form of the vessel, but the quality of the liquor
which it contains. Phaeus (l. i. fab. 2.) informs us that
he made several voyages into Greece, either for his own
pleasure, or upon the affairs of Crethus; and being at
Athens soon after Divydis had usurped the sovereignty
and abolished the popular government, and observing the
impotence of the Athenians under this new yoke, he repeated
to them the fable of the frogs who demanded a king from
Jupiter. In order to account for the miseries of human
life, Æsop used to say, that when Prometheus formed man
of clay, he tempered the materials with tears. As to the
time of Æsop's death, Eusebius and Sulidas refer it to the
54th odempiad, but this date is not consistent with the
occasion to which Phaeus ascribes the fable of the frogs;
for Divydis affirmed the sovereignty of Athens in the
first year of the 55th odempiad. In Blair's *Tables*, his
death is fixed to about the year before Christ, 561. The
manner of his death is thus related by Plutarch, in his
trtete de bis qui fero à numine puniuntur, (apud Oper.
tom. ii. p. 556, Ed. Xylandri.) Having gone to Delphos,
by order of Crethus, with a large quantity of gold and
silver, to offer a costly sacrifice to Apollo, and to distribute
a considerable sum amongst the inhabitants, a quarrel arose
between him and the Delphians, which induced him to re-
turn the money, and to inform the king that the people
were unworthy of the liberal benefaction which he intended
for them. The inhabitants of Delphos, thus incensed,
charged him with sacrilege, and having procured his con-
demnation, precipitated him from a rock and occasioned his
death. Apollo punished them for this act of violence with
piliference and famine; and in order to avert these evils, it
was proclaimed in all the assemblies of Greece, that if any
one, for the honour of Æsop, would claim vengeance
for his death, they would给他 satisfaction. A relation of
fammon, a former master of Æsop, preferred himself, says
Hdodorus (l. ii. p. 168, Ed. Weffeling.) and obtained
satisfaction; and thus the Delphians were rescued from the
piliference and famine by which they were distressfed. The
Athenians afterwards erected a noble statue, executed by
Lyfippus, to the honour of this ingenious and learned slave,
in order to let all the people know, as Phaeus (lib. ii.)
observes, that the path of honour was alike accessible to all
mankind; and that it was not to birth, but merit, they
rendered this disinguishing honour.

"Æsop ingentem flatum poiiure Attiic,
Servumque collocauat asterna in habi,
Patre honoris seient ut cuneis viam,
Nec genere tribui, sed virtuti gloriam."

Æsop, it is said, composed his fables, in order to allevi-
ate the hardships of servitude; and it has been generally
supposed that he was the first author or inventor of this
species of composition: and thus Phaeus (Prol. ad lib. i.)
represents him:

"Æsopus auctore quum materiam repicit,
Hanc ego polexi veribus lenaras.
If any thoughts in these Iambics shine,
Th' invention's Æsop's, and the verse is mine."

But Quinciiiiian (Inst. Orat. l. v. c. 111. tom. i. p. 441.)
ascribes the honour of the invention to Heliod, who is known
to have lived 130 years before the time of Æsop:
and he speaks of them as admirably adapted to delight and
captivate the minds, particularly, of the vulgar and un-
formed. Æsop, however, improved this kind of writing,
and adopted a variety of images, which combine the agree-
able with the instructive, and communicate practical pre-
cepts in a familiar and impressive manner. To this purpose

S 5

Aulus
Aulus Gellius (Noct. Att. l. ii. c. 29.) observes, that Æsop,
the fabulist, was deviously educated wife, since he did not,
acquire the manner of the philosophers, rigorously and imperi-
only denote such things as were proper subjects of counsel
and pith, but by forming amusing and agreeable apolo-
gogues he charms and commands attention, and thus infuses
into the mind thoughts that defray consideration.
Many of Æsop's fables have been ascribed to Plutarch,
who lived in the 1st century, and wrote a life of him,
which abounds with an abounding and incredible relations.
Plutarch the Am. Port. Op. tom. ii. p. 16.) Saladin in
and others, inform us, that Æsop's, a little before his
death, translated some of Æsop's fables into verse; and
Ptolemy (De Mor. German. apud Op. t. ii. p. 205.
Ed. Gronov.) as resembling the Suevi in their customs
and manners, and the Britons in their language.
ÆSOPH, in Æsop, in ancient law-books. See
WICK, and WEERLAND.

King Athelstan, in a great assembly held at Exeter, de-
cided what multitudes should be said pro Æsopinlines eipit,
discharge committed against several persons according
to their degrees: the sentence of the king's head to be
thousands, of an archbishop, or patriarch, or prince, 15000.
of a bishop, or a precentor, 8000; of a priest, or a thane,
2000, &c.

ÆSIVAL, or ÆSTIVAL, of or belonging to summer.
Thus, we say, the Æstival Solstice, &c. in opposition
to iternal.

Æstival point is that whereby the sun's ascent above
the equator is determined.

Æstival signs are those extended from the summer soli-
ttional point, &c. the sun's greatest declination northward,
to the intersection of the ecliptic and equinoctial southward,
including Cancer, Leo, Virgo.

ÆSTIVATION, in Botany, a term expressing
the state of the bud in summer, and used by Linnaeus
to denote one of those circumstances which constitute the
habit of plants.

ÆTRIANS, in Ancient Geography, the inhabitants
of a district of Macedonia, the chief city of which was
formerly called Æthriums.

ÆSTUARIUM, a town of Spain, between Noega and
Salia.

ÆSTUARY, Æstuarium, in Geography, an arm of
the sea, running up a good way into the land.

Such is Bristol channel, many of the friths of Scotland,
&c. See BAY.

ÆSTUARY is sometimes also used in Pharmacy, for a
vapour bath, balneum vaporosum.

ÆSTUARY, in the Ancient Baths, was applied to the oc-
cult passages, or openings from the hypocaustum, or flue,
penetrating into the chambers. Pit. Lex. Ant.

To such a passage in the house of Pompeia, Statius refers
(Sylv. lib. i. § 5. v. 58.)

"Ubi languidus ignis inerrat
Ædibus, et tenuem volvunt hypocausta vaporem."

ÆSYMETRIC monarchical, among Ancient Writers
on Government, denotes a limited elective monarchy. Aris.
Pol. c. 10. The word is formed from ἀσύμμετρος, regnum, I
govern. An asymmetric state stands opposed to a barbaric, or
hereditary one.

ÆSYMUMNION, in Antiquity, a monument erected to the
memory of the deceased heroes, by Æsymnus the Megarean.
Upon consulting the oracle at Delphos, how the country
might prosper and enjoy the most auspicious government,
he received for answer, that it would be most likely to
prosper if it followed the counsel of the most numerous;
and underlining the oracle to refer to the dead, he built
this monument and encompassed it with a council-house;
and thus the Megareans hoped to obtain wise and salutary
counsel. See Pausanias Attic. i. i. p. 104. Kuhnii.

ÆTÆLI,
ÆTHÆLI, in Ancient Geography, a people, according to Ptolemy, of Arabia Felix.

ÆTARA, a town of Africa, placed by Ptolemy between the town of Tabarca and the river Axaplaga.

ÆTATE prolunda, in Law, a writ that lay to inquire whether the king's tenant, holding in chief by servitude, were of full age to receive his lands into his own hands. It was directed to the ephor of the county; but is now disused, since wards and liversies are taken away by the statute Car. II. Reg. Orig. 294.

ÆTH, or A, in Geography, a strong little town of the county of Hainault, in the Austrian Netherlands, situated on the river Dender, about 20 miles south-west of Brussels. It had formerly an abbey of nuns, and some good linen manufactures.

ÆTHÆA, a town of Lcconia.

ÆTHALAE, in Natural History, a name given by some writers to the caulina furcatum, or Tutty.

It had its name from its being the concreted root, or vapour of the botis catalinarius, and copper, melted together, in the making of brass.

ÆTHALIA, or Ily, now Etha, in Ancient Geography, an island on the coast of Etruria, about 100 miles in compass, and abounding with iron. It was so called from æthale, smoke, effusing from the fops of Vulcan.

ÆTHALIDÆ, a people of Attica, in the tribe of Leontides.

ÆTALONIES, a town of Myia, caft of mount Ida, and south of Sceps.

ÆTHELING, in British History. See Atheling.

ÆTH, in Physiography, is usually understood to be a thin, subtile matter, or medium; much finer and rarer than air; which, commencing from the limits of our atmosphere, penetrates the whole heavenly space.

The word is supposed to be formed from the verb æth, to burn, to flame; some of the ancients, particularly Anaxagoras, supposing it of the nature of fire.

The philosophers cannot conceive that the largest part of the creation should be perfectly void; and therefore fill it with a species of matter under the denomination of æther.

-But they vary extremely as to the nature and character of this æther.-Some conceive it to be a body sui generis, appointed only to fill up the vacancies between the heavenly bodies; and therefore confined to the regions above our atmosphere. Others suppose it of so subtile and penetrating a nature, as to pervade the air, and other bodies; and permeate the pores and intervals thereof. Others deny the existence of any such specific matter; and think the air itself, by that immense tenuity and expansion of which it is found capable, may diffuse itself through the interstices of space, and be the only matter found in them.

In effect, æther being no object of our sense, but the mere product of imagination, introduced only for the sake of hypothesis, or to solve some phenomena, real or imaginary; authors take the liberty to modify it how they please.-Some suppose it of an elementary nature, like other bodies, and only distinguish'd by its tenuity, and the other affections resulting from it; which is the philosophical æther.-Others will have it of another species, and not elementary; but rather a sort of fifth element, of a pure, more refined, and spirituating nature than the substances about our earth; and void of the common properties of matter, as gravity, &c.—Such is the ancient idea of æther or aetherial matter.

The term æther being thus embarrassed with a variety of ideas, and arbitrarily applied to so many different things, the later philosophers choose to let it slide; and accordingly, the Cartesians use the term materii subtilis, which is their æther: and Sir Isaac Newton sometimes a subtile spirit, as in the close of his Principia; (apud Oper. tom. iii. p. 174. Ed. Holl.) and sometimes a subtile or aetherial medium: as in his Optics. Queries 18—24, apud Oper. tom. iv. p. 223—226. See also his letter to Mr. Boyle, apud Oper. tom. iv. p. 385, &c.

The truth is, there are numerous considerations, which seem to evince the existence of some matter in the air much finer than the air itself. There is an unknown something which remains behind when the air is taken away; as appears from certain effects which we see produced in vacuo.—Heut, Sir Isaac Newton observes, is communicated through a vacuum, almost as readily as through air; but such communication cannot be without some interjacent body, to act as a medium. And such body must be subtile enough to penetrate the pores of glass, and may be very well concluded to penetrate those of all other bodies, and consequently be diffused through all the parts of space; which answers to the full character of an æther. He supposes that it is rarer in the pores of bodies than in open spaces, and even rarer in small pores and dense bodies than in large pores and rare bodies; and also, that its density increases in receding from gross matter, so as to be greater, e.g. at the depth of an inch from the surface of any body than at its surface; and so on.

The existence of such an ætherial medium being settled, that author proceeds to its properties; inferring it to be not only rarer and more fluid than air, but exceedingly more elastic and active: in virtue of which properties, he shews, that a great part of the phenomena of nature may be produced by it. The elastic force of this medium, in proportion to its density, according to his mode of estimating it, must be above 700000 x 700000 times greater than the elastic force of the air in proportion to its density. If, he says, any one should suppose that æther, like our air, may contain particles which endeavour to recede from one another, and that its particles are exceedingly smaller than those of air, or even than those of light; the exceeding smallness of its particles may contribute to the greatness of the force, by which those particles may recede from one another, and thereby make that medium exceedingly more rare and elastic than air; and by consequence exceedingly less able to reflect the motions of projectiles, and exceedingly more able to press upon gross bodies by endeavouring to expand itself. The resemblance of this medium, he supposes, to be very inconsiderable. If this æther should be supposed 700000 times more elastic than our air, and above 700000 times more rare, its resemblance would be above 600000000 times less than that of water; and a resemblance so small would scarcely make any sensible alteration in the motions of the planets in 10,000 years.

To the action of this medium he ascribes the attractions of gravitation and cohesion, the attractions and repulsions of electrical bodies, the elastic force of the air, and of nervous fibres, and the emission, reflection, refraction, and other phenomena of light, the effects and communication of heat; as also sensation, muscular motion, &c. In fine, this same matter seems to be the primum mobile, the first source or spring, of physical action in the modern system.

The Cartesian æther is supposed not only to pervade, but adequately to fill all the vacancies of bodies; and thus to make an absolute plenum in the universe. See Materia subtilis.

But Sir Isaac Newton overturns this opinion, from divers considerations; by showing that the celestial spaces are void of all sensible resistances; for, hence it follows, that...
the matter contained in them must be immensely rare, because the resistance of bodies is chiefly as their density; so that if the heavens were thus adequately filled with a medium or matter, how subtle it ever, they would reflect the motion of the planets and comets much more than quicksilver or gold. The existence of such a fluid-like fluid as ether has been almost universally allowed; and its importance and utility, in the general system of nature, have been very generally acknowledged. Dr. Reid, indeed, seems to have entertained doubts on this subject. He observes, that although Sir Isaac Newton had formed conceptions about this ether near 50 years before he died, and had it in contemplation as a subject of enquiry, during that long space; yet it does not appear that he ever gave any convincing proof of its existence, but considered it to the best as a question, whether there be such an ether or not. Regarding therefore, the authority of Newton himself, he is of opinion that we ought to hold the existence of such an ether as a matter not established by proof, but to be examined by experiments; and he adds, "I have never heard that, since his time, any new evidence has been found of its existence." Dr. Hartley, however, whose system of the mind and its operations is founded on the reality of this ether, alludes, that if we suppose the existence of such a fluid medium, and of its properties, to be definite of all direct evidence, yet, if it seems to account for a great variety of phenomena, it will have an indirect evidence in its favour by this means. To which mode of reasoning Dr. Reid replies, that there never was an hypothesis invented by an ingenious man which has not this evidence in its favour. The votaries of Des Cartes, the sylphs and gnomes of Mr. Pope, serve to account for a great variety of phenomena. Hartley’s Observations on Man, p. 740. Reid’s Essay on the Intellectual Powers of Man, p. 87. Some late writers have described the phenomena of electricity and magnetism to a fluid of this kind, under the denominations of the electrical and magenta fluid; and they have referred to its operation in different circumstances, many of those effects, which are inexplicable without such a fluid, diffused through every part of the material universe. See Electricity, cause of Gravity, Heat, Light, Magnetism, Reflection, Refraction, Sensation, Sound, Vibration, &c.

Æther, in Chemistry. See Ether.

Ætheria, in Ancient Geography, is a name formerly given to Ethiopia, under which appellation, it is mentioned both by Pliny (l. vi. c. 50) and Strabo, l. ii. p. 82.

Ætheria Herba, is a name given to Erinógo.

Ætherial, Ætherius, something that belongs to or partakes of the nature of ether.

Thus, we say, the ætherial space, ætherial regions, &c. Some of the ancients divided the universe, with respect to the matter contained in it, into elementary and ætherial.

Under æther, or the ætherial world, was included all that space above the uppermost element, viz. fire.—This they supposed to be perfectly homogeneous, incorruptible, unchangeable, &c. See Corruption.

The ancient Platonists and Pythagoreans suppose different bodies united with the human soul, viz. the gross, or material one; the finer aerial one; and, thirdly, the soul itself, which they call ætherial, celestial, luciform, &c. This kind of body they conceived peculiarly belonging to such souls after death, as are purged and cleansed from corporeal affections, lusts, and passions. That this division of two interior vehicles, or tumults of the soul, besides the outer vestment of the terrestrial body, was not a mere figure of the latter Platonists since chriuality was introduced, appears plainly from Virgil’s description of the pure ætherial and fancy body, which he distinguishes from the spiritual or any body, in which unpurged souls receive punishment after death. After describing this punishment, he proceeds in this manner:

"Dumque longa dies, perfestus temporis orbis,
Concretam eximia labem, purumque reluctat
Ætherium fenum, atque muralis ignes ignem."

The ground of this opinion seems to have been the notion which these philosophers entertained concerning the pre-existence of the human soul, which, according to their imagination, was invested with a lucid and ætherial body, either from eternity, or the from the first commencement of the habitable world; and which, being coeval with the soul itself, and incorruptible, inseparably adhered to it, in its subsequent lapses and defections, first into an aerial, and then into a terrestrial body; this being, as it were, the bond of union between the soul and them. The Pythagoreans and Platonists, however, were not all of this opinion; for some of them supposed, that, according to the moral disposition of the soul, it always finds or forms a suitable body, correspondently pure or impure; and consequently that, by moral virtue and philosophylv, it might again recover that celestial body, which was lost by its fall and defection into the großer body. See Cudworth’s Intelligible System, b. i. c. 5. vol. ii. p. 788—793. Ed. Birch.

The Chaldees placed an ætherial world between the empyreum and the region of the fixed stars. Befide which, they sometimes also speak of a second æ therial world, meaning by it the starry air: and a third ætherial world, by which is meant the planetary region. Stanley Hift. Phil. 1640.

Ætherial phœnix, is a name generally given, by Bernouilli, to that otherwise called mercurial, or barometrical phœnix.Ætherial oil, is a fine, subtle, essential oil, approaching nearly to the nature of a spirit.

Thus, the pure liquor rising next after the spirit, in the distillation of turpentine, is called the ætherial oil of turpentine.

Some chemists distinguish two principles in urine; the one a volatile urinous fluid, resembling spirit of nitre; the other, an ætherial oil, or sulphur, partaking of the nature of spirit of wine.

Ætherial Heaven. See Heaven.

Ætherius, in Biography, an architect, who lived in the beginning of the 6th century, during the reign of Anaxiandrus I. emperor of the east, who made him a privy-councilor. He built an edifice, named Chalcis, in the palace of Constantinople, and he is supposed to have contrived the strong wall which extends from the sea to Scyria, for preventing the incursions of the Bulgarians and Scythians.

Æthicia, in Ancient Geography, a country, according to Strabo, adjacent to Macedonia, Thessaly, and Pindus, inhabited by the Ethioces.

Æthiop, a name formerly given to the island of Lesos.

Æthiopia, in Geography. See Ethiopia.

Æthiopian crown, in Natural History, the name of a shell-fish, of the genus of the dolium, or concha globula. It is of a brown colour, but differs from the common shells of this genus in having the top or head dentated, so as to represent a crown.

Æthiopis, signifies Ethiopian clary. See also Salvia.
ÆTHIOPS, in Pharmacy, a name given to certain metallic preparations of a dark colour; and though the term is at present superseded, it is yet too familiar to chemists to be wholly omitted. There are four pharmaceutical articles of this name, Æthiops antimonialis, Æthiops martialis, Æthiops mercurii per fer., and Æthiops mercurii per se, and Æthiops mineris.

Æthiops antimonialis, is a combination of the sulphures of antimony and mercury; the old way of preparing it is, to mix together equal parts of common salt and crude antimony, and flux the mafs in a crucible; when cold there will be found a dark scoria, resting upon a metallic looking substance, which is the crude antimony nearly in the same state at first. The scoria being separated, the antimony is to be ground with an equal weight of mercury till they are well united. The first part of this process seems wholly unnecessary, and accordingly the antimonial Æthiops is generally made by triturating crude antimony with an equal weight of mercury. A still more expedient and equally efficacious way of preparing this medicine, is to fuse some crude antimony in an earthenware crucible, and when it is upon the point of freezing, to add to it an equal weight of hot mercury; the mixture immediately becomes more fluid, and after a while becomes solid; when cold it must be levigated in a mortar, and washed. Sometimes, instead of crude antimony, the golden sulphur of this metal is made use of.

The medical effects of antimonial Æthiops are chiefly as a sudorific in small doses, and as a purgative and emetic in larger ones. It has been exhibited with effect in old invertebrate cafes of lues, scrophula, and glandular obstructions, but on account of the irregularity of its action, is now fallen much into disuse. The pills of Æthiops of the late Edinburgh pharmacopoeia, were composed chiefly of mercury and golden sulphur of antimony, but in the last edition of this as well as of the London pharmacopoeia the Æthiops antimonialis is wholly omitted. New Dispensatory, 1765. p. 545.—Lewis's Mat. Med. vol. i. p. 161.

Æthiops Martialis, saporum de Mars de Lemery, is a pure magnetic oxyd of iron, and was first introduced into the materia medica by the younger Lemery; he directs it to be prepared in the following manner. Into a large glass bason put a few pounds of clean unrufted iron filings, then add a sufficient quantity of water to cover them to the depth of five or six inches: this mixture is to be stirred up with an iron spatula, two or three times a day, and fresh water to be supplied in proportion to the evaporation; at the end of five or six months almost the whole of the iron will be converted into a black fine powder which remains suspended in the water for some seconds after agitation. The water thus rendered turbid is to be decanted into a cucurbit or retort, and allowed to repose till the whole of the iron is deposited; the supernatant clear liquor must then be poured off, and the remaining moisture evaporated by the heat of a sand-bath, care being taken to prevent the access of air to the powder while drying; if the process has been well conducted, the result is a pure black pulverulent magnetic oxyd of iron; as however by moisture and contact with the atmosphere, it soon passes into the state of yellow oxyd, it is necessary to keep it in a dry well clofed vessel. M. Lemery, the inventor of this preparation, as is usual in similar cafes, strongly maintained its superiority over all the other medicinal forms of iron; the technicsts of the process, however, has prevented its use from being very general: it certainly possesse in a high degree the tonic properties which characterize the salts and other preparations of iron, but is superceded in both the British pharmacopoeias by the rubigo ferrii. Beaumé Chymic. Experim. vol. ii. p. 547. Beaumé Elements de Pharmacie, p. 137. Macquer's Chem. Dictionary, Art. Æthiops Martialis.

Æthiops Mercurii per fer.; Æthiops albus; by this name is distinguished in the German pharmacopoeia an imperfect oxyd of mercury prepared by triturating the metal with gum arabic, or any other simple mucilaginous, or by long continued agitation in contact with atmospheric air. Even when all possible care has been taken, this is a very imperfect mercurial oxyd, and in common the metal is merely reduced to a fine state of division. Loccicke recommends it in a dose from half a scruple to half a dram, either alone or united with jalap, in buboes, gonorrhea and other cutaneous affections of a venereal kind, and also in inflammations of the liver; and it has been successfully administered in intermittent fevers. Gmelin's App. Med. vol. ii. p. 145. vol. iii. p. 124.

Æthiops Mineralis.—Æthiops mineral. —Hydrargyrum fulphuratus aeger.—Edin. Pharmae. Hydrargyrum cum sulphure.—Lond. Pharmae. This is directed by the London and Edinburgh Dispensatories to be prepared by triturating in a glass or marble mortar equal parts of sulphur and mercury, or one part of the former, and two of the latter, till they have united into an uniform black powder. Notwithstanding, however, the directions of the college, the Æthiops is in fact generally made by firing mercury into melted sulphur, and then pulverizing the mafs; by which manipulation much time is saved; a method equally expeditious, and perhaps upon the whole preferable to this, is to mix a solution of sulphurated alkali with the mercury and sulphur, in which cafe the two combine very readily by simple triturating, and by subsequent washing, the alkali easily gets rid of. Æthiops mineral is, therefore, mercury at its minimum of oxidation, saturated with sulphur; it is one of the least active of the mercurial medicines, and is used in conjunction with tin filings as a vermifuge, and in some cutaneous diseases. If the combination of the mercury and sulphur is perfect, it will not whitene the surface of gold when rubbed upon it. Lond. and Edin. Pharmacoep.—Lewis's Mat. Med. vol. i. p. 148.—Beaumé Chymic. Experim. vol. ii. p. 456.

Authors are not agreed as to the merits of Æthiops mineral. Cheyne, and many more, commend it highly. It has been prescribed for the worms, and for crudities and acri-mony of the humours; and by some persons it has been reputed infallible against the itch and other cutaneous diseases. Gmelin's App. Med. vol. ii. p. 129. Beccarv, on the contrary, and some others, reject it as useless. He says that it cannot enter the absorbent vessels, the glands, or lymphatics, but passes directly through the intestinal tube, where it may happen to destroy worms, if it operates luckily. Those are deceived who expect any other effects from it. He adds, that it is unwarly given, in large quantities, to children and persons of tender constitutions, as being a foreign mafs, unconquerable by the body, and the more to be suspected, as it continues there for a long time sluggish and inactive.

The Æthiops, as it is now prepared, with a double proportion of mercury, is more likely to produce effect than the inactive preparation formerly used.

Æthiops vegetabilis, is formed by burning the sea-wrack, or sea-oak, the fucus vesiculosus of Linnæus, in the open air, and then reducing it into a black powder. It is sometimes used to remove scrophulous swellings.

Dr. Ruffell recommends it as an useful allatant to fewater in the cure of disorders of the glands, when taken in the
the quantity of a dram; and he says, that, as an internal
medicine, it is much superior to the official burnt sponge;
that, used as a dentifrice, it is beneficial for correcting lax-
ities of the gums; and that its detergent virtue appeared
by its effect in cleansing the teeth. See Murray's App.

Æthiops jovialis, formed of equal parts of mercury,
sulphur, and water, is recommended in an occasional dose
of half a dram, as an antidote to the tinctur. Gmelin's App.
Med. vol. i. p. 115.

Æthiops, is also a name given to several compositions,
which are distinguished by epithets founded on the uses
for which they are applied: as Æ. anticholinis, formed of
mercury extinguished by balsam of Peru, of Canada, or of
Copava, and which is said by Astruce to afford relief in se-
neral species of phthisis: Æ. auricholinis, consisting of mer-
cury and gum in a mixture with gum guaiacum, which
is recommended in the rheumatism and gout: Æ. urino-
rius, composed of quicksilver well mixed with juniper
gum, or sal ammoniac, which promotes the excretion of urine
as well as the cleansing of perspiration: and Æ. purges,
formed with manna or jalap into an uniform powder, and rec-
commended as a laxative, and for destroying intestinal worms.

Æthiops, in Entomology, a species of the Cerambyx,
black, with a spinose thorax, and with the two bands of
the elytra, and the point of the apex yellow, and mid-
drilled antennae, found at the Cape of Good Hope.
Æthiops is also a species of the Carabus, wholly black, found
in Berlin, and a species of the Cimex, black, with a ridge
on the middle of the thorax, and black spinose tubic, found
in Cayenne. Æthiops is also a species of Papilio, with
black wings; the primors marked with three white bands,
and caruncular spots on the upper part, and the posterior
with two longitudinal pale furrows in the base, and a tran-
verse ridge, with five caruncular points; found out of Eu-
rope. Æthiops is also a species of Aphis, or the black bee,
with the margin of the segments of the abdomen white:
found in America. Æthiops is also the hairy black Musca,
with black wings, white at the apex; two points, and a
filvery anus; found in Italy.

Æthiops, in Natural History, a species of the Turco,
with the shell transversely furrowed and black; the first
windings are nearly iridated; the succeeding ones are of
a filvery brightness, with the lip and limb brown; the ap-
erture is dilated.

Æthiops fuliginos, in Ornithology, is the wholly black
Pulica of coast of Sparrman.

Æthiops Simia, in Zoology, the white eye-lid afe of
Penniset, and Mangabe of Bulfinch.

Æthiopes, in Physic, derived from æthos, to in-
fluence, is a name given to superficial putules, or boils in
the skin, occasioned by heat.

ÆTHON, in Mythology, formed of æthos, to burn, one
of the four horaces of the fun, which caused the fall of
Phaeton, according to Ovid. Claudian calls one of
the horaces of Pluto's chariot by the same name, from æthis, black.

ÆTHIRA, in Geography, a river of Sweden, called also
Talkenberg.

ÆTHIRA, a name formerly given to the island of
Rhodes.

ÆTHUSA, Achrus, buglossy, in Botany, a genus of the
pimpinellia digynia class and order; and belonging to the
natural order of umbellate or umbellifers: the characters are,
that the calyx is an universal spreading umbel, with the
rays gradually shortening towards the middle, and the par-
tial is also spreading but small; having no universal in-
volucr, and the partial once placed on the outside, and con-
flating only of three very long, linear, pendulous leaflets;
and the proper perianthium bearc observable: the universal
corolla is nearly uniform, with all the florets fertile, and
the partial has the petals bent in, heart-shaped and une-
qual: the flaminia are simple filaments with roundish an-
ters; the pithium is an inferior germ, and the styles are
relict with obsolete stigmas: it has no pericarpium, and the
fruit is roundish, cracked and bipartile: the seeds are two,
roundish, cracked, except on a third part of the surface,
which is plane. There are four species, viz. 1. Æ. cyaneum,
common fool's parsley, or huffer biscuit, which is a common
weed in fields and kitchen gardens, and in a flight degree
poisonous. It is easily distinguished when in flower, or in
July and August, from true parsley and chervil, by the
three narrow pendent leaflets of the involucre, placed on
the outer part only of the umbel, and by its being a much
humbler plant than either of the others. The leaves also,
in an earlier state, are of a different form and a darker hue,
and when bruised emit in a flight degree a disagreeable
venomous smell. The safest way to avoid doubt or danger
is to cultivate the curled parsley. Milt cattle cat it, but
it is said to be noxious to geese. 2. Æ. busins, or Monta-
nana, cariander-leaved fool's parsley, which is a native of
the Pyrenees. La Marec thinks this species should be joined
to the Spigell. 3. Æ. Meum, Spigell, Meli, or Daff-
deney, which grows wild in the mountains of Switzerland,
Germany, Austria, Carniola, Italy and Spain, and also in
the high plateaux of Wurttemberg, Cumberland, Luxem-
bourg, and Merionethshire. This is the Meum athaman-
icum in Dr. Smith's arrangement of British plants, vol. i.
p. 328. The roots and seeds are aromatic and acrid, and
recommended as carminative and stomatitic in asthma and
obstructions of the lungs, in the stone, droppe of urine,
and all uterine disorders; and the infusion both of
the roots and the seeds is sometimes given to cure inter-
mittent fevers both in England and amongst the inhabit-
ants of the Alps. Spigell is also an ingredient in Theriac
and Mithridate, and appears to be of the fame nature with
lovage. The difference between the roots is most consider-
able in the extract by water, that of the spigell being un-
peaceably bitterish, with little or nothing of the sweet-
ness of that of the roots of lovage. The spiritual ex-
tract of Spigell, more aromatic than that of the lovage,
is moderately warm, bitterish and pungent. Lewis's Mat.
Med. Dioscorides and Galen tell us, that the too frequent
use of this medicine, or too large doses of it, will occa-
sion violent pains in the head. It may be given in sub-
flance from half a dram to two scruples, or from a dram

ÆTH, in Mythology, formed of Æthos, to burn, one
of the four horses of the fun, which caused the fall of
Phaeton, according to Ovid. Claudian calls one of
the horses of Pluto's chariot by the same name, from Æthis, black.

ÆTHIRA, in Geography, a river of Sweden, called also
Talkenberg.

ÆTHIRA, a name formerly given to the island of
Rhodes.

ÆTHUSA, Achrus, buglossy, in Botany, a genus of the
pimpinellia digynia class and order; and belonging to the
natural order of umbellate or umbellifers: the characters are,
that the calyx is an universal spreading umbel, with the
rays gradually shortening towards the middle, and the par-
AEThYSSEIS, a people of Lybia near Marmareia.

AEThIANS, AEThIANS, in Church History, a sect or branch of ARIANS, so called from their leader AEThIUS, in the fourth century.

The AEThIANS were of the stricter kind of ARIANS, who held that the Son and Holy Ghost are in every respect dissimilar to the Father. Whence also they are called AEThMOI and HeteroAEThion; sometimes pure ARIANS.

The profession of this doctrine was contrary to an established law of the emperor Constantius, who had decreed, "that no man should say, that the Son of God was of the same substance with God, or of a different substance, but that he was in all things like to him that begat him." By such nice distinctions were the confessions of mankind directed and guarded; and the freedom of religious inquiry restricted; and the slightest deviation from the preferred rule exposed them to exile and other similar penalties.

AEThINiUM, in Ancient Geography, a town, placed by Ptolemy, in Macedonia, and which, he says, belonged to the Elliotes, but as they inhabited Thessaly, its situation is not well ascertained.

AEThIOLOGICAL, something that alligns the cause of an effect, or appearance.

AEThIOLOGY, in Medicine, a rational, or discourse of the cause of a disease, or it is that part of Pathology, which is employed in exploring the causes of diseases. The word is compounded of aeThio, cause, and logos, discourse.

In this sense, we say, the eThiology of the small pox, of the hydrophobia, of the gout, the dropy, &c.

AEThIOLOGY is used for a figure in Rhetorica, whereby, in relating an event, we affign also the cause of it. In which sense, eThiology differs from color, as the former alligns the true cause, the latter only a feigned or fictitious one.

The sceptics were professed opponents of all eThiology, or argumentation from causes.

AEThION, in Biography, an eminent painter, whose picture of Roxana and Alexander was exhibited at the Olympic games. It represents a magnificent chamber, in which Roxana is seated on a bed, with a modest and confused aspect, whilst Alexander is standing before her. Several Cupids are flitting about her; some of whom hold up the curtain, others undress the lady, and others again present Alexander to his mistress, at whose feet he lays his crown, being accompanied by Epheleon with a torch in his hand, and leaning upon a youth who represents Hyemen. Other Cupids appear in different attitudes and situations. This picture gained it a degree of reputation, that the president of the games gave him his daughter in marriage. It is mentioned with distinguished respect by Cicero, De claris orat. ap. op. tom. i. p. 395. ed. Olivet.

AEThITES, or eagle-fluites, in Natural History, a flinty or crystalline stone, hollow within, and containing a nucleus, which, on shaking, rattles within. It was formerly in repute for several extraordinary magical, as well as medicinal powers; such as preventing abortion, discovering thieves, and other ridiculous properties.

The word is formed from æTh, eagle; and by the Italians this stone is called pietra d' acqua; the popular tradition being, that it is found in the eagle's nest, whither it is supposed to be carried while the female sits, to prevent her eggs from being rotten. Matthiolus says, that birds of prey could never hatch their young without it, and that they go in search of it as far as the East Indies. Balsh has written a Latin tract on the subject.

The lapiz æThites is found in several parts: near Trevoux in France, one can scarce dig a few feet, without finding considerable flints or beds, of the coarse or ferruginous kind.—They are originally soot, and of the colour of yellow ochre.

But the finest and most valued of all the eagle-flutes, are accidental flutes of one or other of our common stones. These are so far, from being a peculiar species of fossil, though usually accounted such, that they are not determinately of any one species of pebble. That, however, which most usually furnishes them is the brown-centered pebble, with whitish, bluish, and brown crusts. The plain history of this remarkable fossil is this: the central nucleus of many species of pebbles, peculiarly of this, is coarser than the rest of the stone, that is, it is made up of more earth and less crystal: the natural consequence of which must be, that being of a more loose and rare texture, it is in drying more apt to shrink than such malles as are composed of a harder and purer matter. The central nucleus in this species is also surrounded with a whitish crust, of a more loose texture, and more subject to shrink in drying than even the nucleus itself; and being composed of more earth and less crystal, is also more friable and soft. The outer circles of this stone are of a much harder substance. Whenever the earthy matter in the nucleus, and first crust of this pebble, a little exceeds its just proportion, the consequence will be, thatLabel: 

The æThites is classed by Chaptal (Chem. v. ii. p. 340) among the bog orcs, or argillaceous orcs of iron: and Kirwan (Elem. Miner. vol. ii. p. 178) describes it under the fourth variety of the first family of these orcs; as, externally, yellowish brown, internally lighter, with a kernel, whose colour is mostly ochre yellow. The form is generally that of a rounded knob, or approaching more or less to the kidney form, seldom quadrangular; the surface is generally fouled with earth. The hollow of the external riad resembles that of silk or is somewhat less glossy, and metallic. The kernel, which is sometimes bole, has no lute at all. The fracture of the former is even, or fine splintery; that of the interior fine earthy. Externally it presents one or more curved laminar concentric concretions, the kernel none. Its hardness is between that which is one degree superior to that of chalk or yielding to the nail, and that which hardly yields to the knife; it is brittle and heavy. Its streak is light yellowish brown, commonly brighter.

The æThites is also known by the names cucurium, cedite, lapis aquile, croddiles, aquileini, & lapis pregnans; some rank it under the class of precious flutes, to which it has no title.

AEThIUS, in Biography, one of the followers of Arius, was born at Antioch in Syria, and flourished, according to Cave (Hist. Lit. tom. i. p. 218) about the year 359, and died in, or soon after, the year 366. Having contended with difficulties in early life on account of the reduced condition of his parents, he applied with diligence and success
to the acquisition of literature at Alexandria in his mature years; and in this city he learned the art of physic, which he honourably practiced for the benefit of those who needed his advice. From Alexandria he returned to Antioch, where he was ordained deacon, as some say, by Leonard, bishop of that city; or, according to Epiphanius, by Gregory the Arab, bishop of Alexandria. He seems to have been a man of sound understanding and considerable knowledge, though his acquaintance with the more ancient Cyprian writers was partial and imperfect. As he had observed the sentiments of Arians, and had acquired the talents of an able and insinuating disputant; whom, says Gibbon, (Hist. vol. iii. p. 340) it was impossible either to defend or to convince, he was banished by Constantius, who, until conference, says the historian (Id. p. 354) was alarmed by the rapine of Ætius, into a remote part of Asia, i.e. says Gibbon, quoting Philostorgius (ubi sup. in Amblat.), a district inhabited by savages, and ruled by war and pestilence: but he was restored by Julian, who honoured him with his patronage, and gave him an estate near Mytilene in Lesbos, where he sometimes resided; though he probably died at Constantinople, and was there buried by Eunomius and his other friends, in a very respectful manner. The dispensions of the Catholics against Ætius was so great, that they stigmatized him with the odious appellation of Attilian. Epiphanius has preserved a small book of Ætius concerning the faith, containing 147 propositions or short chapters, which he has answered; and he also says, from report, that Ætius had composed 300 such chapters. He is said to have held a public disputation with Apthius, the Manichean, of Alexandria, and to have obtained to complete a victory over him, that he died of grief seven days after. He was the founder of a sect called Ætians. Lardner's Works, vol. iii. p. 396. vol. iv. p. 122.

Ætius, called Aetius, from Amida in Mesopotamia, the place of his birth, flourished at Alexandria, about the end of the fifth century, as Friend clearly demonstrates, from several passages in his works, in which reference is made to St. Cyril, who died in 444, and to Petrus Avellator, who was physician to Theodoric. He left sixteen books divided into four tetrabiblia, on the practice of physic and surgery, principally collected from Galen and other earlier writers, but with some original observations. We find many passages, Friend observes, in this author, to convince us how much the actual and potential cauterity were then in use; particularly in a palsy. He says from Archigenes, that he should not at all hesitate to make an eschar either way, and this in several places; one in the nape, where the spinal marrow takes its rife; two on each side of it, &c. and if the ulcers continue running a good while, he should not doubt of a perfect recovery. The late Mr. Pott revived this practice in the palsy of the lower limbs, applying its cauteries in those cafes on each side of the spine, a little above the facrum, induced to it we have no doubt, from reading this passage; and the practice is now general, and is frequently attended with complete cures, so that it seems wonderful physicians do not use them in hemiplegia, and in other similar untreatable diseases. Ætius is the earliest writer who ascribed medical efficacy to the external use of the magnet. But this he does upon report, and not from his own experience. "Tradunt (says he) magnum detentum manum chirurgorum ac podagricorum dolores ipsorum fuede. Ætius conquisit opitulatur. It is reported that those who are afflicted with the gout in their hands or feet, or with convulsions, are relieved by holding a magnet in their hands." The works of Ætius were translated into Latin by Janus Cornarius, a physician of Frankfort, and published, accompanied with the Greek, at Bale, 1522, in folio. Henry Stephens has inserted them in his edition of Medici principes, printed at Geneva, 1567. The last and best edition is that of Francz at Leipzig in 1777.

Ætius, whose father was Gaudentius, an illustrious citizen of the province of Sicyonia, and master-general of the cavalry, and mother a rich and noble Italian, was one of the generals of Placida, the mother of Valentinian III. who reigned 25 years in the name of her son. Ætius served at first among the troops of the emperor's household, and after the battle of Poletin in 403, he was delivered as an hostage to Alaric, and afterwards to the Huns with whose chiefs he became intimately acquainted. His stature, which was tall and majestic, and his constitution, which was robust, fitted him for the duties and toils of a military life. He is also commended by the ancients for his prudence and address in the conduct of political business, as well as for his rectitude and experience in war. His regard to justice was so firm, that no temptation could induce him to deviate from the exercise of it. On his return from the country of the Huns he married the daughter of Carpius, the captain of the guards; and was employed in offices of high trust in the empire. When Marcellus was attacked by Ataulphus, Ætius and Count Boniface were united in its defence; and these two great commanders are said to have deferred the distinguishing appellation of the last Romans. They were unhappily rivals, and their mutual jealousy and discord terminated in the loss of Africa and the death of Boniface. After the death of Honorius, the empire was usurped by John his chief secretary, and Ætius connected himself with the usurper, and was employed to procure the assistance of the Huns. John, however, was soon cut off, and Ætius within three days entered Italy with 65,000 Huns, who served to secure to him a reconciliation with Placidia, and who, by a grant of the province of Pannonia, were prevailed upon to return into their own country. Having induced Placidia to recall Boniface from his government of Africa, and at the same time advised him not to comply, he was the cause of the revolt of his rival, and the loss of Africa; and the discovery of this fraud produced a civil war between these two commanders, which terminated in the death of Boniface, and in the exile of Ætius to the court of Rugilas, king of the Huns, in Pannonia. He soon returned, however, to his own country; and he was indebted to their alliance for his safety and reformation. Instead of the suppliant language of a guilty exile, he solicited his pardon at the head of a large army of barbarians; and the empress Placidia was under a necessity of forgetting his rebellion and his treachery, and of delivering herself, her son Valentinian and the Western empire, into the hands of an insolent subject. The fortunate Ætius, who was immediately promoted to the rank of patrician, and thrice invested with the honours of the consulship, affined, with the title of Master of the cavalry and infantry, the whole military power of the state; and he is sometimes styled, by contemporary writers, the duke or general of the Romans of the West. The Gothic historian, Jornandes, ingenuously confesses, that Ætius was born for the salvation of the Roman republic; and in the eulogium which a contemporary historian befits upon him, he says that his mind and body were alike capable of the most laborious efforts; that he possessed the genuine courage, that can defy not only dangers but injuries, and that it was impossible either to corrupt, or deceive, or intimidate the firm integrity of his soul. But these laudable praisés are not
very confident with his conduct towards Boniface. Attilus affiduously cultivated the alliance of the Huns. Whilst he resided in his tents, as an hostage or an exile, he had familiarly conversed with Attilus himself, and the two antagonists were connected by a personal and military friendship, which was afterwards confirmed by gifts and em balls. Thus a numerous army of Huns and Aholi, whom Attilus had attached to his person, was employed in the defence of Gaul. He established a treaty with Georic, which avouched the Vandals from the plunder of Italy. He re-stored the authority of the empire in Spain and Gaul, and compelled Bochart the Franks and Suevi, after vanquishing them in the field, to become useful allies. He afterwards concluded a peace with Theodoric, king of the Vifgosths, who inhabited the southern provinces of Gaul; after a signal defeat, in which 8000 Goths fell near the walls of Narbonne; and Attilus and Theodoric, in mutual alliance, gave battle to the innumerable host of Attilus, encamped before Orleans, and compelled them to raise the siege. On the plains of Chloras, where the valiant Theodoric fell, Attilus, aided by the intrepid Tolimond, obtained a victory over the Huns, and obliged Attilus to retreat. When Attilus invaded Italy, his prudence and courage served to harass and retard the march of the invader; nor did he ever appear more truly great, than at the time when his conduct was suspected by a timid and distrustful sovereign, and blamed by an ignorant and ungrateful people. At length the emperor jealous of his merit, and fearing his wealth, power, and popularity, put him to death in 454 with his own hand, under a pretence, encouraged by the malicious intimations of Heraclius the eunuch, that he had permitted the invasion of the Huns, after Attilus's defeat, and that he was aspiring to the empire; and thus plunged his sword in the breach of a general who had saved his empire. Thus fell thebel general of his age, the terror of Attilus, and the bulwark of the western provinces, says Sidonius, by the hand of the greatest coward in the whole empire. By this act he converted the public contempt into deep and universal abhorrence. Such sentiments, says Gibbon (Hist. vol. vi. p. 139), seldom pervade the walls of a palace; yet the em- peror was confounded by the honest reply of a Roman, whose approbation he had not detained to solicit: "I am ignorant, Sir, of your motives or provocations. I only know, that you have acted like a man who cuts off his right hand with his left." The memorable letter, entitled the groans of the Britons, was addressed to Attilus, A. D. 454, who was then conful the third time. "We know not, lay they, even which way to flee: chafed by the barbarians to the sea, and forced back by the sea upon the barbarians, we have only left us the choice of two deaths, either to perish by the sword, or to be swallowed up by the waves." Rome was then threatened by Attilus, and the Britons received no assistance. Anc. Un. Hist. v. xiv. p. 417. Gibbon's Hist. vol. vi.

ÅTNA, in Geography, the highest mountain in Sicily. In the Itineraries it is called Elba, and supposed to be derived from Albanus, to burn. Bochart (Geog. Sac. i. c. xxviii. apud oper. tom. i. p. 526. Ed. Volland.) deduces the name from ΑΛΒΙΑ, signifying either a furnace, or darknfet; and he cites several authorities from the poets that favour both the one and the other of these etymologies. The inhabitants of the island call it Monte Giello, or by con- traction Mongello, i.e. Mount of Mountains. This mountain, which has been famous for both its bulk and volcanic eruptions for many ages, is situated in the eastern part of Sicily, called Vol di Demona or Demona, from a notion that the numerous caverns of Åtina are inhabited by demons, and other wicked and misfembles. N. lat. 37° 40'. E. long. 15°.

The fire, which is continually burning in the bowels of this mountain, led the poets to place here the forges of the Cyclops, under the direction of Vulcain, and the prifon of the giants who rebelled against Jupiter. Upon this assumption they erected a temple to Vulcain upon the hill, in which was kept, as we are informed by Attilus (de Anual. l. xi. c. iii. tom. ii. p. 608.), a perpetual fire, as in the temple of Velia; this element being a symbol of that deity.

The figure of this mountain is a kind of obtune, truncated cone, extended at the base, and terminating in a bifuratet vertex, which consists of two eminences at a considerable distance from each other.

With regard to the formation of Åtina, M. De Buffon is of opinion that, on account of its height and immense bulk, it ought to be considered as one of the primitive mountains, coeval with the earth itself; and that it emitted flames soon after the creation; but that, on the subdution of the waters which covered the face of the earth, it ceased to burn, because there was not a sufficient quantity of fluid for producing an effervescence with its mineral contents. After a long lapse of ages, the Straits of Gibraltar were buried open, and the ocean mixed with the Mediterranean Sea; and a similar rupture of the Bosphorus furnished an additional sup- ply of water, and thus it deluged the land between Sicily and Italy, and approached the basis of Åtina. In con- sequence of this event, the mountain began to emit flames anew, which at different intervals, and with various degrees of force, it has continued to do until the present time. From Homer's fable, with respect to the eruption of this mountain, we may judiciously infer, that it did not burn in his days; and therefore the first known eruptions of Åtina must be dated after his age. Other writers, who have not adopted the whole of Buffon's hypothesis, maintain, that Åtina exiled as a mountain before it became a volcano. Dolomieu, cited by Mr. Kirwan (Irish Trans. vol. vi. p. 366), found immense heaps of fea-shells in the north-east flanks of this mountain, at the height of near 2000 feet above the surface of the sea. Hence he concludes, that this volcano existed as a mountain before it was uncovered by the sea. He adds, that at the height of about 2500 feet, there are regular strata of grey clay filled with marine shells; and these strata must have been deposited while the mountain was progressively formed under the sea. He further affirms, that in some parts of this mountain, the calcareous strata exal under the lava. Count Borgh, also, in his Letters on Sicily and Malta, informs us, that the original stone of which Åtina consists, is granite mixed with Jasper, neither of which is lava; and he says, that it abounds in mines of lead and copper, which are never found entire in lava. This geologist pretends, that Åtina is at least 8000 years old; and this high antiquity he infers from the layers of vegetable earth, which he discovered betwixt different beds of lava. Canon Recupero, who had been employed in writing the history of Mount Åtina, has also discovered a stratum of lava, which, in his opinion, flowed from the mountain in the time of the second Punic war, or about 2000 years ago. This stratum, he says, is not yet covered with soil sufficient for producing either corn or vines. It requires, then, about 2000 years to convert a stratum of lava into a fertile field. But in digging a pit near Jack, in the neighbourhood of Åtina, he discovered seven distinct layers of lava, most of which were covered with a thick bed of rich earth; and as the eruption which formed the lowest of these lavas, flowed from the mountain at least 14000 years
years ago, he deduces from this circumstance a corresponding sea for the formation of the mountain. Mr. Brydone, (see his Tour through Sicily and Malta, vol. i. p. 115, 132) informs us, that Recupero was much embarrassed by this discovery and the inference it afforded, because they contradicted the history of Moyses. For the relief of the canon and the satisfaction of the traveller, we might allude to what the Moaician history contains nothing that is repugnant to the notions here suggested concerning the antiquity of the earth. Although man has not exiled longer on the earth than the period assigned in this history, the earth itself might have existed, and probably did exist, in some other form and for other purposes, for ages before this period. Besides, we might ask, is the lava to which the canon directs our attention, the same which flowed from Etna in the second Carthaginian war; and is not the time required for converting lava into fertile fields very different, according to the different consistency of the lavas and their different situations with respect to elevation or depression, and to their being exposed to wind, rain, &c., just as the time, in which heaps of iron flag which resembles lava, are covered with verdure, is very different at different furnaces, according to the nature of the flag, and the situation of the furnace? But there is an argument deducible from fact, which invalidates and totally overthrows the canon's objection. Etna and Vesuvius resemble each other with regard to the various circumstances that pertain to this subject; but the eruption of Vesuvius, which destroyed Herculaneum, happened A. D. 75, or about 1700 years ago. The matter which overwhelmed this ancient town, is covered by the products of still other subsequent eruptions; and these several strata of lava are separated by veins of good soil. See Phil. Trans, vol. lxi. p. 7, and Bishop Watton's Apology for Christianity, in sermons and tracts, p. 383, &c.

Further, Dolomieu (Pones, 472.) informs us, that vegetable earth does not exist between beds of lava; and he observes, that if this were the case, no conclusion relative to their age could fairly be deduced from this circumstance, as some lavas become fertile much sooner than others. To this purpose, Chevalier Gioeni, in 1787, found lavas, that were projected in 1766, in a state of vegetation, while other lavas, much more ancient, remained barren. It is also well known, that beds of volcanic ashes and pumice vegetate sooner than any other. Mr. Dolomieu adds, that canon Recupero denied his ever having expressed any doubt with regard to the Moaician history; and could not conceive why a late celebrated traveller should endeavour to render plausible the orthodoxy of his belief. So far from having been perplexed on that account, he had a pension from the court of Naples to his death, with many testimonies of esteem. The abbe Spallanzani (See Travels into the two Sicilies, vol. i. p. 205, &c.) has stated and examined the argument of Count Borch, deduced from the decomposition and vegetation of different strata of lava, in proof of the antiquity of the world. A lava, says the Count, that was produced by an eruption in 1157, had a coating of earth in December, 1776, that was 12 inches thick; another which had flowed in 1329, had one of 8 inches; and that of 1669, was found more than one inch; whilst the most recent, that of 1766, was entirely delitute of such earth. The abbe allows that lavas, after a series of years, are invested with a stratum of earth proper for vegetation; and that the earth is originally produced by the decomposition of the lava and that of the plants which have taken root upon it. But lavas are very different in their consistency and other qualities; and these differences must render the argument of Count Borch and such reasoning very inconclusive. The lava, which flowed in 1329, and which was examined by the Count 447 years after its eruption, was covered with eight inches of earth; and yet the lava of the Arfo in Sicilia, which ruffled into the sea in 1302, appeared in 1758 to have preserved its hardness and luster. Another current of lava, near Catania, which has been employed for 2000 years for the purpose of building, retains such a degree of hardnees, that where the art and labour of cultivation have not been applied to it, it still continues altogether lacerile. He concludes upon the whole, that all calculations on the greater or less quantity of earth which may cover lavas are very uncertain and fallacious.

But to return from this digression, with regard to the antiquity of Etna, we observe, that naturalists have generally maintained, that Etna, like other inflated mountains, is the gradual production of volcanic eruptions. It is certain, that every great eruption produces a new mountain; and that Etna consists of a number of hills and declivities, more nearly or more remotely connected, which have been occasioned by the commotions and changes, to which it has been subject in the course of many past centuries. Etna may therefore be regarded, not as a single volcano, but as an assemblage of volcanos, many of which are extinguished or buried with a gentle fire, and of which some few are still acting imperceptibly or visibly, with violence.

M. Houel, one of the latest and most accurate inspectors of this mountain, observes, (in his Voyage Pittoresque,) that Etna is entirely composed of substances that have been discharged from the volcano in its various eruptions. From the quantities of marine bodies that are deposited over its lower part, he infers, as others have done, that it must have been once covered by the sea, to at least one half of its present height: and he supposes that, in this state, the currents of the ocean would gradually accumulate upon it large masses, not only of its own productions, such as shells and bones of fishes, but of several other substances intermixed with the matters discharged from the focus of the burning mountain. These masses, he conceives, would, in procurs of time, increase as to form those various mountains which now surround the volcano. The currents of the ocean would likewise convey some part of the discharged matter of the volcano to a greater distance; and thus form those mountains that are separated from it, and that are found farther removed. The base of this mountain, according to this ingenious author's observations, consists of alternate layers of lava and marine substances, successively deposited upon one another, and reaching to a considerable, but unknown depth. These must extend to the level of the stratum of lava, which was discharged by the volcano at its first origin. The last layer, deposited by the sea, is a range of calcareous prominences of considerable height, placed on a base of lava. Beneath this, there is another stratum of sea-pebbles, rounded by their mutual attrition in the conflict of the waves. This, again, lies upon a yellowish rock, conflating of a species of indurated sand. The river Simeto flows over this rock; and the base of the river is much higher than that of Etna, which is on a level with the sea; but the primary base of the volcano is unknown.

From the mountains of calcareous matter that are scattered over the lower part of Etna, the inhabitants provide themselves with lime-stone, and they apply fragments of lava, instead of stones, of which they have none, to the purposes of building. The mountains that surround Etna, and that are offered to great advantage from its summit, evidently indicate, by their conical figure and the cavity at their top, their
their being the productions of fire. They bear unequivocal marks of the effects of this destructive agent in an accumulation of lava, fcorie, and volcanic sand. Whether the origin of these mountains is to be traced to the expansive effort of the ignited matter contained within the great abyss of Ætna, and which, incapable of ascending to the upper crater, bursts forth at the sides; or whether they are to be ascribed to particular configurations and eruptions, which have no communication with the immense furnace within the crater, has been a subject of inquiry and discussion. The former alternative has been generally allowed; and it must be acknowledged that this is frequently the fact. Instances, however, may be cited, which afford strong reasons for believing that the production of the lateral mountains is owing to partial eruptions, which have no communication with the principal crater. Of this kind is Monte Roffo, of which an account will be given in the sequel of this article. Sir W. Hamilton reckons 44 mountains of this kind on the side of Catania, with their distinct craters, most of which are now in a state of fertility.

From the consideration of the constituent parts of Ætna, and the mode of its formation, we shall proceed to state its dimensions. These have not yet been satisfactorily ascertained. Its stupendous height andbulk were noticed so long ago as the time of Pindar, more than 453 years before Christ, in a passage which we shall cite in the progress of our account. He represents it not only as the eternal abode of fnows, but as the pillar of heaven. The ancients, in general, as well as the moderns, have been accustomed to consider Ætna as one of the highest mountains on the globe. There are many passages in their writings, says Mr. Dryden, that shew this; though, perhaps, none more strongly than their making Deucalion and Pyrrha take refuge on the top of this mountain, in order to save themselves from the universal deluge. These ideas, however, appear to be very erroneous; for Sir George Shuckburgh observes, (Phil. Trans. vol. lxxvii. p. 595.) that Vefuvius, placed upon Mount Ætna, would not be equal to the height of Mont Blanc. The accounts of those who have visited Ætna in later times have been very various. The following measures have been given by different authors.

Height above the surface of the sea, 10,036 feet.
Circumference: at the base, 180 miles.
Height, 4000 French toises.
3 miles 264 paces.
4 — 6 and 8 miles.
1200 feet — — — — — —
2500 toises; circumference 183 miles.
1950 toises; diameter 30 miles.
2000 fathoms; circumference 60 leagues; and superficies 300 square leagues.
Summit above the Mediterranean 10954 feet.
Circumference of the visible horizon on the top of Mount Ætna, 6' being allowed for refraction, is 1093 English miles.

Drydone.
Recupero.
Mentelle Geogr. Comp.
Sir George Shuckburgh, Phil. Trans. vol. lxxvii. p. 595.

Others make its height only 2000 toises, and its superficies 300 square miles. By the following heights of the thermometer and barometer, at different stations, extracted from Drydone’s Tour, v. i. p. 211, their respective elevations might be ascertained, if the altitudes by the instruments were accurately taken.

M. Houel (ad supra) states the circumference of the base at 40 miles; and though he had no opportunity of measuring the altitude, he observes, that it had been done by M. de Saunffyre, who found it to be 10,036 feet or, as we learn from Senèquier, 10,063 English feet. This was ascertained on the 5th of June, 1775, at 20 after seven in the morning. The height of the barometer, on the 11th, at the brink of the crater, was 18 inches 11 lines; which, by the necessary corrections, is reduced to 18 inches 10 15 lines. At the same time, the mercury at Catania, placed only one foot above the level of the sea, stood at 28 inches 2 7 lines, which must be reduced to 28 inches 15 line, on account of the requisite corrections for the thermometer.

Some have supposed, that volcanic mountains always increase in height by the products of successive eruptions, till they are extinguished. However, it is generally conceived that the height and bulk of Ætna are much the same now as they were in former times. The dilapidations, occasioned by the falling in, and aborption of the fummit, have produced, for time immemorial, no sensible diminution; as the lofes resulting from some eruptions are repaired by others which succeed. In proof of this, it is alleged, that if any considerable decrease of the mountain had taken place, ice and snow would not have continued, in a climate so mild, to envelope the top of the mountain, as they now do, even during the most severe heats of summer. On the contrary, it is a very old opinion (vide Seneca, Epit. 179, and Ælian Var. Hist. l. viii. c. xi. tomo. i. p. 548.) and adopted by M. Houel, that Ætna is in a state of decay and diminution, so that it cannot be observed at so great a distance as formerly. It is full of excavations; and he considers the torrents of lava, which overspread its sides from time to time, as insufficient for repairing the vaile occasioned by rains, rivulets, and torrents flowing down from the summit. Hence he concludes that, unless the eruptions become more frequent than they have been for some time past, the height of the mountain will be gradually reduced to that of the surrounding beds of lava. Over the sides of Ætna there are scattered
tered no fewer than 77 cities, towns, and villages; and allowing 1200 or 1500 persons to each of these, the whole number of the inhabitants of Mount Ætna, will be 92,400 or 115,520.

In our further description of this mountain, and of its volcanic productions and appearances, we shall avail ourselves of the accounts that have been given by those who have visited it: selecting from each of those circumstances that are most deserving of notice, and combining them together so as to form a connected and continued narrative. The writers to whose observations we shall principally refer are Borrelli, Hill. Inced. Ætnæ. An. 1669; M. Jac. d’Orville’s Sicil. Mr. Brydone’s Tour through Sicily, vol. i. Sir William Hamilton’s Campi Phlegræì, and Phil. Trans. Riedelef’s Travels in Sicily. Swift’s Travels in the Two Sicilies, vol. i. Abbé Spallanzani’s Travels in the Two Sicilies; &c. vol. i. M. Dolomieu, and M. Hourel, Voyage Pittoresque.

The ascent of Mount Ætna is tedious, difficult, and perilous; and few have had resolution to undertake it. From Catania, where the journey usually commences, to the summit, the distance is about 30 miles; and the traveller, in the progress of his journey, passes through three distinct climates, which might be justly denominated, on account of the variety of their temperature, the torrid, the temperate, and the frigid zones. Accordingly the whole mountain is divided into three distinct regions, called La Regione Calida, or Piedmontes, the fertile region; Il Regione Selvaggia, or Nemorosa, the woody region; and II Regione Deserta, or Scoperta, the barren region. Count Borrelli has added a fourth, which he calls the region of fire; and he has subdivided these four regions into several districts.

The first or lowest region, extends through an interval of ascent from 12 to 18 miles, according to the statements of different writers. Its whole circumference is estimated by Recupero at 183 miles, and its surface is suppos’d by Buffon to exceed 220 square leagues. It is bounded by the sea to the south and south-east, and on all its other sides by the rivers Seneatus and Alcantara, which almost run round it. The city of Catania and several villages are situated in this first zone; and it abounds in pastures, orchards, and various kinds of fruit trees. The fertility of this region has been recorded by Strabo, Ponzello, Peter Benbow, and most of the travellers who have visited Ætna; and it is justly ascribed to the decomposition of the lava, and of those vegetables, which have been introduced by the arts of agriculture, and the exertions of human industry. In some parts, however, the lava appears in craggy eminences above the soil. Where the earth is shallow, the roots of trees, unable to penetrate the hard lava, extend themselves horizontally near the surface; but where there is a greater depth of earth, the soil is more fertile and productive. The first station in the ascent of the mountain is Nicolafo, (see Pl. 1. Nat. Hist. fig. 2. let. H.) which, according to Brydone’s statement, is 9 miles up the mountains, and by Hourel’s account 2496 feet above the level of the sea. The road from Catania to this station lies over old lavas and the mouths of extinguished volcanos, which are now converted into corn fields, vineyards, and orchards. The figs of this region, and the fruit in general, are reckoned the finest in Sicily. When the harvest was finished at Catania and the heat extreme, Mr. Brydone found the corn green at Nicolafo, and the heat moderate. The lava of this region flows from a number of small mountains, which are dispersed over the immense declivity of Ætna. These mountains, which are of a conical or hemispherical figure, are formed by eruptions; and they are generally about two or three miles in circuit, and about 300 or 400 feet high. They are covered with a rich verdure, and beautiful trees. Not far from Nicolaf is Monte Raffo, which was formerly a plain; but in 1669 a new vertex was opened in it, and discharged a dreadful torrent of lava, which flowed as far as the sea, and formed a kind of promontory (as V.) It is surrounded to the extent of two miles with a black sand, which was thrown out in that eruption, and which then covered a space of 15 miles, to such a depth as to bury the vines and shrubs that were scattered over the soil. Some of the finer particles of it were wafted by the wind as far as Catania. The sand is very deep as you approach the mountain; and the mountain is locked at the vertex. By Borrelli’s account its circumference at the base does not exceed two miles, and its perpendicular height is not more than 150 paces; whereas, sir William Hamilton estimates its height at a mile, and its circuit at three miles. Spallanzani prefers the former estimate. Amongst 100 or more mountains, which rear their heads on the sides of Mount Ætna, this is the only one with the history of the formation of which we are acquainted. The base of the lava of this mountain is horn-stone, of a grey colour, rough to the touch, and of a moderately fine grain. It gives sparks with ease, and sounds when it is struck. It serves as a matrix to a great number of felt-fpatoico and sferolaceous crystallizations. The scoria, of which the mountain is principally composed, have the same kind of base, containing shools and felt-spairs; but they are more light and friable than the lava, and have a kind of vitreous appearance. These and other differences are produced by the mutual collision and pulverization of these scoria. The number of detached foisters that are found on and near Monte Raffo is very great. Dolomieu thought, that they first entered into the body of the lava, and that they were separated from it by means of the sulphur, which had scoriﬁed the lava, but had not produced the same effect on the foisters, because of the small quantity of iron which they contain; and consequently they remained free and detached. Spallanzani rejects this hypothesis, as upon experiments with the magnetic needle he found that the martial principle was more abundant in the foisters than in their base; and he therefore accounts for their separation from the lava in another way. The volcanic fire, which melted the lava, was incapable of melting these foisters, which are not only refractory to the fire, but of a different speciﬁc gravity from the lava. When this was melted, elevated to a great height, and separated into small particles in the progress of the eruption, a number of foisters were detached from it, and fell, isolated, partly within the crater, and partly around it. Accordingly he found, that the foisters detached from the lava are insufﬁble in the furnace; but those which are incorporated with the lava fall in a perfect fussion. These foisters are not peculiar to the lava of Monte Raffo; but they are found in many other mountains of Ætna. Spallanzani analyzed them, and from 100 distinct pounds, he obtained the following result; viz.

Summ. 84.2

The mountain derives its name Monte Raffo, or red mountain, from the tinge of this colour which some parts
of it exhibit; though other parts are white, and others yellow, blue, and green, with different shades and mixtures. All these parts, says the Abbé, are found in a state more or less decomposed; and in general, they are only fœria; the colours are produced by iron, changed or modified by acids. Of these fœria, some have not been affected by acids; and they are covered with a thin pellicul coat of glass, just as if a sheet of water had been thrown over them, and suddenly frozen. This phenomenon is remarkable at Etna, because we there meet with no vitrifications.

M. Houel went down into one of the openings of this mountain with torches, but could not reach the bottom, and was obliged soon to return on account of the extreme cold. The crater is of an oval form, and the opening through which he descended was in one extremity; but he inclined to think that the crater which rises above it had been formed of matter discharged by another mouth; or perhaps it might have had a more central opening, through which the fœria, sand, &c. that form the crater, were discharged. This mountain is one of the mouths of Etna, through which it discharges, from time to time, great quantities of lava, sand, ashes, &c. The fides of the craters are not all of the same height; those to the east and west are considerably higher than the intermediate summits, because the currents of the ashes passed alternately from east to west, and fell upon these fides in greater quantities than upon the others; which circumstance has given to this volcano the appearance of two summits.

St. Niccolo dell'Arma, in the neighbourhood of this mountain, is an agreeable resting-place for travellers who visit Etna. This is an ancient edifice, founded on the lava, and was formerly the habitation of a number of Benedictine monks, who, about 200 years ago were obliged, on account of the devastations occasioned by the lava to abandon it, and retire to Catania. Here are many inscriptions, which record the ruinous earthquakes, torrents of lava, and flowers of sand and ashes by which it has been damaged and even destroyed, together with the dates of their different repairs. The black sand, thrown up in 1669, is more easily changed into vegetable earth than the lava; and has for many years been planted with extensive vineyards; whilst there are many beds of ancient lava that remain in an unproductive state, and of little use of every kind of vegetable.

At a small distance there is another mountain, called Montepellici, or Montepeletri (see letter G.). This is of a spherical form, and its perpendicular height does not exceed 300 feet, and its circuit is about a mile. It is perfectly regular on every side, and richly overgrown with fruits and flowers. Its crater is large in proportion to the mountain itself, and is exactly hollowed out as the bell made a bowl. This mountain was formed by one of the first eruptions that destroyed ancient Neapolis, which was celebrated for its fertility, and particularly for its honey, and thence called Mel Puff; thus, in consequence of being reduced by several eruptions, and more particularly by that of 1669, to a state of wretched, it obtained the contemptuous appellation of Mel Puff. The lava, however, in its course over this beautiful country, has left several little islands or hillocks, which exhibit a singular appearance, with all the bloom of the most luxuriant vegetation, encumbered and rendered almost inaccessible by large fields of black and ruggèd lava.

About three miles above San Niccolo dell'Arma, the lower region of Etna terminates, and the middle region begins. This is called the Regione Sylvæ, the woody region, or the temperate zone; and extends from eight to ten miles in a direct line towards the top of the mountain. Its circumference is estimated by Recupero at 70 or 80 miles; and it comprehends a surface of about 40 or 45 square leagues. It forms a zone of the brightest green all around the mountain; which exhibits a pleasing contrast to the white and hoary head of this venerable mountain, and it is called the woody region, because it abounds with oaks, beeches, firs, and pines. This is a vegetable earth, generated by the decomposition of the lava, and similar to that in the lower region. As soon as we entered these delightful forests, says Mr. Brydole, we seemed to have got into another world. The air, which was before fiery and hot, was now cool and refreshing; and every breeze was loaded with a thousand perfumes; the whole ground being covered over with the richest aromatic plants. Many parts of this region are really the most heavenly spots upon earth; and if Etna reappears hell within, it may with equal justice he said to resemble Paradise without. Here, he says, you gather the most delicious fruit, rising from what was lately a black and barren rock. Here the ground is covered with every flower, and we wander over these beauties and contemplate this wilderness of sweetens, without considering that hell, with all its terrors, is immediately under our feet; and that a few yards separate us from lakes of liquid fire and brimstone. These majestic forests of Etna, says Mr. Houel, afford a singular spectacle, and bear no resemblance to those of other countries. Their verdure is more lively, and the trees of which they consist are of greater height. These advantages they owe to the soil on which they grow, which is peculiarly favourable to luxuriant vegetation. The haw-thorn trees are of an immense size. The beeches appear like so many ramified pillars, and the tufted branches of the oak, like close bushes, impenetrable to the rays of the sun. The appearance of the woods is in general is exceedingly picturesque, not only on account of the number and variety of the trees, but from the inequality of the ground, which exhibits them like the ranges of an amphitheatre one above another. The east side of the woody region abounds with chestnut trees of an extraordinary size. These are cultivated by the inhabitants with particular attention; and as they are wrought into hoops for oaks, they yield a profitable article of trade. But the most remarkable of these trees is the Castello di cento Cavalli, or the chestnut tree of an hundred horses; so called, because it is supposed to be capable of sheltering an hundred horses under the canopy of its boughs. Fabulous report ducès its name from the following circumstance. Jean d'Aragon, during her stay in Sicily, whilst she was travelling from Spain to Naples, visited Mount Etna, and was attended by her principal nobility; but being overtaken by a storm, all of them found shelter under this tree. It stands upon a rising ground, and is surrounded by an open pature, which is bounded by woods and vineyards. Its height has of late been much diminished by lopping its branches, partly under a notion of increasing its fruitfulness, but principally, perhaps, for obtaining a supply of fuel. Some have supposed that it was merely a bush or clump of several trees united. But Recupero, and Swinburne inform us, that upon digging round it they found all the limbs united in one root, or body, at a very small depth underground. Of this trunk five divisions are formed, each of which sends forth enormous branches. The exterior surface of these divisions is covered with bark, but on the inside there is none; the subflulence and verdure of the tree depending upon the external bark. The intervals are of different extent; one of them is wide enough for two coaches to drive abreast. In the middle cavity, or the part that is denominated the hollow of the tree, a hut is built for the habitation and use of those who collect and prepare its fruit, and who dry the nuts in an oven, and
prepare cones of them for sale. Mr. Swinburne says, that his whole caravan, men and animals, were accommodated at their cave in this extraordinary edifice; and after three accurate measurements, he found the outer circumference at one inch above the ground, to be 186 English feet. This tree formerly belonged to St. Agatha, but has lately been declared the property of the crown. There are other trees of a similar kind at a small distance, which are more worthy of admiration than this, as their trunk is entire. One of them, which was clear of branches to the height of 15 feet, and perfectly found, measured, in the girth, at three feet above the ground, 57 feet. The forest of pines, as it is called, is almost inaccessible, on account of the rocks and precipices that surround it. It is chiefly worthy of notice, as it leads the traveller to the grotto. This cavity has been lately formed by the action of the waters under the beds of lava, and removing the stratum of pozzolana below them. It is situated on a mount named Finchio. This grotto has been repaired at the expense of the Knights of Malta, who have hired this and other caverns in the mountain for the purpose of holding snow, which is more wasted in their island than in Sicily, and which forms a very considerable article of commerce. The snow is thrown in at two openings above; and they have access to thee as well as to the internal parts by flights of stairs. A considerable extent of ground is enclosed by high walls above the grotto; so that when the wind drives down the snow from the higher parts of the mountain, it is stopped by the walls of this edifice. It is then thrown into the grotto, where the thickness of the beds of lava, which cover it, prevents any injury from the summer heat. At the feason of exportation, it is preferved close in large bags, and lumps of it are wrapped up in leaves, and conveyed to the sear on miles. Pieces of snow, preferred in this manner, have appeared like the most transparent crystal.

Spallanzani describes the edifice which has been given by other writers to the luxuriance of vegetation in this region. The trees, he says, are low and flinted in their growth; and the beeches which grow only in the upper extremity of the zone, would appear mere pigmies, if they were placed beside those which rear their lofty heads on the Apennines and the Alps. This he attributes to the little depth of earth proper for vegetation.

The woods and verdure of the regions, now described, viz. the inferior and the middle, have been recorded by most of the ancient writers; and therefore the commencement of this vegetation must be lost in the obscurity of time. What is still more remarkable with respect to this woody region, is the circumstance, that the surface of it is so unequal, that it every where presents hills, or rather mountains; all of which have been produced by different eruptions from the summit of Etna, and other craters below the summit, several of which have formerly laid waste this zone, which is now converted into luxuriant forests. Most of the travellers in this region have fought shelter on the night preceding their farther ascent, in the cave called La Speleone del Capriolo, or La Grotta delle Capri, or the grotto of the goats, because these animals take refuge here in bad weather. This cave has been formed, from time immemorial, by the lava, when in a fluid state, and seems to have been enlarged by the torrents of water that have passed through it, and carried away some of the sand and stones of which it consists. The lava is of a horn-hone base; and though its texture is earthy and porous, itpossesses a considerable degree of hardnefs. It contains some veins, and two kinds of felt-spar, some of which are of a flat figure, and brilliant appearance, and others irregular in their form, with little luster, and manifesting a degree of calcination without any fusion. There are some other stones intermixed, which are thought, from their hardness and green colour, to be chlorites. This grotto is situated about 3000 feet above the level of the sea, according to the calculations of M. de Saussure. It is surrounded by lately and majestic oaks, the dry leaves of which supply the travellers who shelter in it with beds, as the wood does with fuel. In the neighbourhood of this cave there are two beautiful mountains, the craters of which are larger than that of Vesuvius. They are now filled with oak, and covered to a great depth with the richest foil.

The upper region of Etna, called its frigid zone, or the Region Dejerta, is marked out by a circle of snow and ice, extending, as some state, to the distance of about eight miles; but according to Fazello, nearly twelve, and having the great crater in its centre. The surface of this zone is for the most part flat and even; and the approach to it is indicated by the decline of vegetation, by uncovered rocks of lava, and heaps of sand, by near views of an expanse of snow and ice, and of the torrents of smoke issuing from the craters of the mountain, and by the difficulty and danger of advancing amid streams of melted snow, floods of ice, and gusts of chilling wind. The curious traveller, however, thinks himself amply recompensed, upon gaining the summit, for the perils with which he has encountered. His fatigue is alleviated by the reflection that the emperor Adrian, and the philosopher Plato, undertook the fame; for the purpose of exploring the summit of the mountain, and of gratifying themselves with a view of the rising sun from this eminence. Most of the travellers who have visited Etna, have been anxious to reach its summit at the dawn of the morning, before the v apours that are raised by the sun obscure surrounding objects; and they all agree in describing the extent and beauty of the prospect. When Mr. Brydone and his companions ascended this eminence, elevated above the common region of vapour, in the night, they observed that the number of the stars seemed to be much increased, and that their light appeared brighter than usual. The luster of the milky way was like a pure flame, that shot across the heavens; and with the naked eye they could observe clusters of stars which were totally invisible in the lower regions. Below them on the mountain they perceived a moving light among the forests, which might probably have been an ignis fatuus, and they took notice of several of these meteors that are called falling stars, which appeared to be as much above them, as when they were seen from the plain; and from this circumstance Mr. Brydone infers, that these meteors move in regions much more remote than the bounds which some philosophers have attributed to our atmosphere. Before dawn they arrived at the ruins of an ancient structure, called Il Torre del Filosofo, which some suppose to have been built by Empedocles, for his convenience in observing the conflagrations, and studying the nature of Mount Etna. By others it is supposed to be the ruins of a temple of Vulcan. Others again imagine it to be a watch-tower, built by the Normans, for the purpose of observing the motions of their enemies, and giving notice of them by signals, to the different bodies of troops scattered over the Island. M. Honel thinks it is not very ancient; neither the materials of which it consists, nor the mode of architecture, bearing any resemblance to those of the Greeks or Romans. Some have affirmed, that they have found in this ruin, fragments of brick and marble; but no such fragments now exist. The materials were examined by Spallanzani, who discovered that they consisted of a cement of lime, which by length of time is become carbonat
of Etna, the distances appearing reduced to nothing. The same scene is described in familiar language by Spallanzani. No elevated region in the whole globe, says this author, offers at one view so ample an extent of land and sea, as the summit of Etna. The first of the sublime objects which it presents is the immense mass of its own colossal body. The first part, and that which is nearest the observer, is the upper region, commonly covered with snow and ice, and occasionally exhibiting rough and craggy cliffs, either piled on each other or separate, and rising perpendicularly, towards the middle of this zone; an assemblage of fugitive clouds, irradiated by the sun, and all in motion, incrusted the wild variety of the scene. Lower down appeared the middle region, with its numerous woods and multitude of mountains, originating from fiery eruptions; and beyond this the eye descends, with admiration, the lower region, the most spacious of the three, adorned with elegant villas and castles, verdant hills and flowery fields, and terminated by the extensive coast, where, to the south, lays the beautiful city of Catania, to which the neighbouring sea serves as a mirror. The observer, at this elevation, discovers not only the entire masly body of Etna itself, but the whole of the island of Sicily, with all its noble cities, lofty hills, extensive plains, and meandering rivers. Malta is also perceived at an indistinct distance; the eye commands the environs of Messina, and the greater part of Calabria; while Lipari and the Aeolian isles appear so near as to be under the feet of the observer, and as if by flocking down he might touch them with his finger. The far stretching surface of the adjacent and surrounding sea presented an object no less majestic, and led the eye to an immense distance, bounded only by the heavens. "Sailed," says Spallanzani, "in the midst of this theatre of the wonders of nature, I felt an indefinable pleasure from the multiplicity and beauty of the objects I surveyed; and a kind of internal satisfaction and exaltation of heart. The sun was advancing to the meridian, unobscured by the smallest cloud, and Rennum's thermometer stood at the 10th degree above the freezing point; I was therefore in that temperature which is most friendly to man, and the refined air breathed, as if it had been entirely vital, communicated a vigour and agility to my limbs, and an activity and life to my ideas, which appeared to be of a celestial nature."

The access to the principal crater of Etna is rendered both inconvenient and perilous, for a distance of near four miles, by a variety of circumstances which different travellers have described. The summit of the mountain is a plain covered with ferein, ashes, and sand, which have been thrown out of the volcano at its successive eruptions, and which are so loose as to endanger the traveller's being swallowed up at every step of his progress. It is also covered with snow and ice, and obscured with clouds, excepting at times when these clouds are low and range along the sides of the mountain, so as to prevent an object of terror. The winds, likewise, blow with such violence that perfons can scarce stand steadily, nor endure the cold which benumbs their limbs. The south wind is, on the top of Etna, the most prevalent, and the cold is so intense, that travellers have often found their clothes insufficient to protect them. But the most formidable impediments to the progress of the adventurers in this perilous journey are the streams of mutch vapour which rise on the sides, and the thick clouds of sulphurous smoke which burst from the mouth of the volcano, even when it is not in a state of agitation. The fountains that issue from the crater are also singularly terrifying, and have discouraged some perfons from approaching the spot whence they proceed. M. Houel compares them to
to a discharge of cannon in the wide abyss, which being reflected from the various caverns produces reverberations of the most alarming kind. By means of these, sounds, which in the open air would be considered as flight explosions, become more tremendous than the loudest thunder.

When Spallanzani visited this mountain, he observed, when he was at the distance of two miles and a half from the limit of his journey, two white columns of smoke, which arose from its summit; one, towards the north-west side of the mountain, and another towards the north-west; several other streams of smoke, which arose from inferior parts towards the west, pursu'd in a direction of these two larger columns. As he proceeded, he met with a torrent of lava, which he was obliged to cross in order to arrive at the smoking summit. This torrent was covered with froth, which projected in some places in a variety of prominent points, and in others sunk in hollows, which rendered its passage extremely difficult; and the lava itself, though the interval from its discharge was 11 months, was in many parts red-hot. His difficulties increased as he passed that tract, which may properly be called the cone of Etna, and which, in a right line, is about a mile in length. Having arrived, after much labour and fatigue, within 150 paces from the vertex of the cone, he found himself enveloped by the vapours of the several streams of smoke that issued from the top and sides of the mountain; and his progress was rendered extremely hazardous by the effect which those noxious vapours produced on his respiration. He soon, however, recovered his strength and resolution, and arrived at the utmost summit of the mountain, where he began to discover the edges of the crater. Here he viewed with astonishment the configuration of the borders, the internal sides, the form of the immense cavern, its bottom, and an aperture which appeared in it, the melted matter which boiled within, and the smoke which ascended from it; and he has minutely described the several appearances from his own attentive and accurate observation. The upper edges of the crater, which are broken and indented in several places, are, as he judged by the eye, about a mile and a half in circuit, and form an oval, the longest diameter of which extends from call to west. Its internal sides, which are inclined at different angles in its several parts, form a kind of funnel of a conical figure, and abound with concretions, which he found to be the marl of ammoniac. The bottom was nearly an horizontal plane, about two-thirds of a mile in circumference; in which plane was visible a circular aperture, about five poles in diameter, from which proceeded the largest of the two columns of smoke, observed before he arrived at the summit of Etna. This column appeared at its origin to be about 20 feet in diameter, and whilst it remained within the crater, ascended in a perpendicular direction; but when it arose above the edges, it was made to incline towards the west by a light wind; and afterwards it dilated into an extended and rare volume. The smoke was of a white colour. Within the crater Spallanzani observed a liquid and ignited matter, which continually undulated and boiled, alternately rising and falling, without spreading over the bottom. This, he says, was the melted lava, which had arisen to that aperture from the bottom of the Etnaean gulf. Several large fomes were thrown into the crater, some of which struck the liquid lava and produced a sound similar to that which would have been occasioned by their falling into a thick tenacious pate; but the fomes which fell on the bottom rebounded, and their sound was different from that of the others. Hence our author infers, that the bottom must be thick and solid, which, if this were not the case, would have been broken by heavy fomes falling from to great a height.

The summit of Etna, surrounded with large masses of lava, is exhibited in Plate 1. Nat. Hist. fig. 2. A. A. A. represents one edge of the lava of 1787, which issued from the upper crater. B. B. is the circumference of the crater, with its declivity. C. C. through which the internal part is discernible. D. is the flat bottom of the crater; and E. the aperture in the bottom, from which the larger column of smoke F. F. arose; which aperture, though it was at one side of the bottom, if, for the greater distinctness of view, represented in the middle. G. G. is that part of the edge of the crater from which its internal part is best seen, and where the design of it might be most conveniently taken. H. H. is the smaller column of smoke towards the north-east.

Spallanzani informs us, that before the eminence on which he stood, there is another to the north, a quarter of a mile higher, which renders the summit of Etna properly bifurcated. The crater on this second pre-eminence, and from which the larger column of smoke ascends, is about one half smaller than the other, and is separated from it by a partition of scoria and accumulated lava, which lies in a direction from east to west. The Abbé has compared his own observations with those of others who have described the crater of Etna in the course of 20 years, or from the time when it was visited by Baron Riedefel in 1767, to that of his own journey in 1788. At the time of the Baron's observation, the crater was enlarged towards the east with an aperture which does not now exist; and as the fomes which were then thrown in did not return the smallest sound, the bottom of the crater could not be formed with the hard and flat surface which the Abbé has described. Within the gulf itself was heard a noise similar to that of the waves of the sea, when agitated by a tempest; and this must probably have proceeded from the lava within the bounds of the mountain, in a liquified and perturbed state. Sir William Hamilton arrived at the summit of Etna on the 20th of October, 1769; but was prevented from distinctly viewing the lower parts of the crater by the smoke that issued from it. From what he was able to observe he concludes, that its figure resembled that of a funnel, diminishing till it ended in a point, and that this funnel was crusted over with salt and sulphur. The crater was then two miles and a half in circumference; and must have undergone great changes in the interval that elapsed between these observations and those of Riedefel, in whose time there must have been an abyss as well as a funnel; nor does the point in which the funnel terminated admit of the flat bottom described by Spallanzani. The dimensions of the crater, stated by Sir William Hamilton, the Abbé accounts for by supposing, that the partition which now separates the great crater into two parts has been produced since the time of his observation; for the sum of the two circumferences which the Abbé has noticed would not much differ from the other measure. Mr. Brydone, who observed the crater on the 29th of May 1770, says, that it was then a circle of about three miles and a half in circumference, that it thinned down on each side, and that it formed a regular hollow, like a vault amphitheatre, and that a great mouth opened near the center. Count Berch arrived at the mountain on the 16th of October 1776, and merly observes, that the crater is formed like a funnel, and that the funnel is bifurcated; a circumstance unnoticed by Sir W. Hamilton, who affirms, on the contrary, that the summit is single; and the Abbé therefore concludes, that one of these funnels has been produced since the journey of Brydone in 1770. M. D'Orville,
D'Orville, who ascended Etna in 1727, remarked two craters, one larger than the other, and in circumference somewhat more than four miles, from which issued clouds of smoke and reddish flames. On looking into this crater, he and his companions were unable to discern the bottom on account of the flames and smoke. They only observed that a conical hill, formed of lava, rose in the middle of the crater, the top of which they estimated to be 60 feet below them; and as they were probably able to see about 60 feet lower, they conjectured that the circuit of this hill might be from 600 to 800 feet.

M. Houdet, whose account of this mountain was published in 1783, and who made a drawing of the crater, represents its environs as consisting of three eminences, forming an equilateral triangle, though when viewed at a distance, only two of them can be seen; for which reason the Sicilians have denominated the mountain hirana, or double horned. The situation of the principal mouth is in the midst of these three eminences. Its diameter was only about 60 feet; but it was so filled with smoke that nothing remarkable could be discovered. This author observes, that the cone is not exactly in the middle of the plain, but that it lies somewhat more to the north than the south. Every observation, therefore, tends to evince the inconvenience of the internal configuration and dimensions of this volcano. Before the changes which have taken place on the summit of Etna, with respect to the number, form, size of its craters, Fazello and Borelli describe another alteration occasioned by the falling in and absorption of the extreme summit of the mountain within its crater. The former author relates, that in his time there arose in the month of the crater a little hill, isolated on every side, which formed the vertex of the mountain, and which, in a terrible eruption, fell into the gulf, and thus enlarged the crater and diminished the height of the mountain. The hill itself had been produced by a former eruption in 1444. Borelli likewise informs us, that in the configuration of 1669 the summit of Etna which rose, like a tower, to a great height above the part which is level, was swallowed up in the deep gulf. Strabo (tom. i. p. 420. &c.) relying on the account of those who had visited Etna in his time, describes the summit as a level plain, about 20 stadia in circumference, surrounded by a bower, or ridge, of the height of a wall; and he adds, that in the middle of the plain arose a smoky hill, the fumes of which ascended in a direct line to the height of 20 feet. Solinus (cap. 11) informs us, that there were two craters, from which the vapours issued. Cardinal Benbow likewise found two craters, one higher than the other, and about as far distant as a fow might be thrown from a fling. The extreme violence of the wind and the exhaled fumes prevented his approaching the upper crater; but he describes it from the information of others, as situated on the highest part of the summit of Etna, about three miles in circumference, formed like a funnel, and having in its middle a spacious cavity. In the time of Fazello, who visited Etna after Benbow, there was only one crater about four miles in circumference. Its form was that of a funnel; it emitted fire and thick smoke; and a subterraneous noise was heard, which resembled the boiling of an immense cauldron on a very fierce fire.

As for the difference that occurred with regard to the appearance of the fumes, noticed by different writers, some of whom represent it as rolling down the sides of the mountain, and others, as ascending perpendicularly to a great height, and afterwards falling, like white flowers on the top of the mountain; it was owing, without doubt, not only to the different denity of the air on Etna at different times, but also to the diversity of the smoke, which would sometimes be lighter and sometimes heavier than the air itself, according to the qualities of the substances from which it is produced.

The effects of the air at the summit of Etna, recited by different writers, have also been very different. Some have complained of the difficulty of respiration which they experienced, which others felt no such difficulty, and assert that respiration is performed with equal ease on the top of the mountain, as in the country below. It appears from the observations of M. Sauflure in his travels on the Alps, that, although at the height of Mount Blanc, about 2430 paces above the level of the sea, a considerable difficulty of respiration was occasioned by the evaporation of the air, no such inconvenience was experienced at the foot elevation of 1390 paces. The height of Etna being less than the last measure, it is natural to infer that the respiration of many persons would not be incommoded, whilst the contrary happens to others, according to the different strength and habit of body of different individuals. The observed difference of the barometer indicated in these various circumstances a considerable difference in the weight and rarity of the air.

Spallanzani observes, that Etna has at all times been very deficient in springs; and when he visited this mountain, water was so extremely scarce, that a single drop of rain had not fallen for nine months. The rain water which the peasants, who inhabit different parts of it, had collected in cisterns was exhausted, they were obliged to go in search of it to those parts of the mountain at considerable distances, where a scanty spring might still be found. This author has observed a similar scarcity of springs in the Eolian or Lipari islands; and he apprehends, that other volcanic countries are subject to the same inconvenience.

The rains, which descend on mountains of this kind, fall on tufts or fiorane, in which they sink deep and do not again appear, because they meet with no argilaceous or sandy strata capable of detaining them, whereas such strata are frequent in other mountains, and produce numerous springs, as we find to be the case in the Alps and Apennines. When the rains fell on compact and solid lavas, they do not sink into them, but run down their declivities, forming rivers and torrents in the rainy season, and not true springs. In several parts of Etna, and especially near the Grotta delle Capre, he observed large furrows hollowed in the lavas, by the action of the rain water. Other writers, however, have given a very different account. They state, that Etna abounds with springs and with rivers of considerable magnitude. See Acius and Aciarata. M. Brydone informs us, that there are several periodical springs on Etna, that flow during the day and stop at night, which he attributes to the alternate melting and freezing of the snow. There are also poisonous springs, which emit a very noxious vapour; and others which afford fine salt; and others again, whose water serves for dyeing particular colours. On the north side of the snow region, there are several small lakes which never freeze. M. Houdet estimates the quantity of water which flows down the sides of the mountain to be such, that if it were collected it would fill the channel of a river 36 feet broad and six feet deep; and he adds, that streams of water are seen to issue at all different degrees of height from the base to the summit of the mountain; and that these continue to flow even during the drought of summer. The supply of these streams, he thinks, cannot be accounted for by the water deposited by the clouds, nor by the melting of the snow; but the source of it must be more regular and permanent. This he conceives to be the evaporation of those aqueous particles that arise from the constant ebullition at the bottom of the volcanic focus, and which, in his opinion, are necessary to the subsistence of volcanoes. These vapours, issuing from the...
great crater, and from innumerable fumeroles in the sides of the mountain, are condened by the cold of that elevated region of the atmosphere, and percolating through the earth, furnish the numerous streams of AEtna with water.

The numerous caverns that are met with in different parts of AEtna deserve notice. The grotto of the goats, the saw grotto, and those of mount Roffo, have been already mentioned. Kircher speaks of one, which he calls faw, capable of containing 30,000 persons. One of these caverns still retains the name of Proserpine, from its being supposed by the ancients, that it was by this entry Pluto conveyed her into his dominions; on which occasion Ovid describes Cerere as searching for her daughter with two trees, which she had plucked from the mountain, for serving the purpose of torches. These trees he calls 'Toda; and they produce great quantities of a kind of rufin, called Catalana, and esteemed a cure for fevers. Ovid. P. 1. iv. tom. iii. p. 271. Ed. Burn. Diod. Sic. tom. i. p. 333. Ed. Westc. 2nd.

AEtna produces a great variety of plants and flowers, as well as trees of a larger size, such as the chestnut, oak and cork tree, &c. Mr. Brydone enumerates the cinnamon, saffron, saffras, rhubarb and palma Chirilli; and he adds, that it was celebrated by the ancients for its odoriferous productions. See Diod. Sic. tom. i. p. 322. Pentearch and Arbodo intimate that the smell of the plants was so strong on many parts of the mountain, that it was impossible to hunt. There was formerly a great variety of wild beasts in the woody region of AEtna; but the number of them is now much reduced. There are still wild boars, roebocks and wild goats; but the race of flags is thought to be extinct. The horses and cattle of mount AEtna were once esteemed the best in Sicily. The cattle are still of a large size, but the horses have degenerated. Spallanzani informs us, that partridges (Tetrao rufus, Linn.) were at that time in the upper extremity of the middle region, and in this region he met with several birds of the timorous species (Purro alaudinus, Linn.) a kite (Falco milvus), three jays (corus glandularius), two thrushes (Turdus visiervorus), and several ravens and crows (corus corax; corus corone). But in the middle of the higher region he saw no other animals, except some hogs-ants (Myrmecus formicarius, Linn.) which made their pitfalls in the dult of the lavas.

We shall close this article, already extended to a considerable length, and compiling every kind of information which we have met with concerning AEtna, with an account of its principal eruptions. The first symptom of an approaching eruption is an incaerule of the smoke, in fair weather; and after some time, a puff of black smoke is seen to shoot up to a considerable height in the midst of the white. These puffs are attended with considerable explosions; and the ascending column of black smoke is followed by a reddish flame. The smoke appears black in the day, and in the night reflembes flame. Showers of ashes proceed; earthquakes frequently accompany them; and red hot flones are projected to a great height in the air. The crater and smoke, at the time of an eruption, are so highly electrified, that they throw off spontaneous flashes into the air; and the smoke has sometimes extended, says Mr. Brydone, for upwards of 100 miles, and produced dreadful effects, killing sheep and flocks on the mountains, burning trees, and setting fire to houses which occupied an elevated situation. From the column of ascending smoke continual flames of forked or zig-zag lightning proceed, and this is sometimes attended with thunder. When these appearances have continued for three or four months, the lava, or fume of melted mineral matter, boils over the top of the crater, or bursts through some weak place in the side. Upon the appearance of the lava, the violent eruptions of the mountain generally, though not always, cease; but without a vent for the lava, the summation is very much increased. In the night this lava appears like a stream of fire, and flows to a great distance; but in the day its progress is marked by a white smoke. It has been a subject of discussion among philosophers, whether the eruptions of volcanoes are now less frequent than they were formerly. This is probably the case, as the matter in the volcanic focus was then greater in quantity than it is at present; and the cavities being smaller were sooner filled with vapours, and the center of the focus was nearer the surface than it is now, in consequence of repeated eruptions and discharges. The whole number of the eruptions of this mountain, of which we have any record, says Spallanzani, before and after the Christian era, is 31; and to only, according to Gioeni, have issued immediately from the highest crater; but it is not easy to make an exact estimate, as the same eruption has continued with or without intermissions, for some time; and has been taken singly by some writers, whilst others have reckoned every renewal of it separately. The eruptions of AEtna have been reported and described by several of the ancient poets. The first of these, by whom they are mentioned, is Pindar, in the following passage, the fifth decade of an ode which was composed in the 7th Olympiad, about four or five years after the second eruption mentioned by Thucydides.

Now under sulphurous Cuma's sea-bound coast, 
And vast Sicily lies his fragrant breadth; 
By howy AEtna, nurfe of endles frueft, 
The pillar'd prop of Heav'n, for ever pres't: 
Forth from white nitrous caverns illuing rife 
Pure liquid fountains of tempfeous fire, 
And veil in ruddy milts the noon-day flies, 
While wrapt in fmoke the eddying flames apfrie; 
Or gleaming thro' the night with hideous roar, 
Far o'er the red'ning main huge rocky fragments pour.

G. Well's translation, Odes of Pindar, vol. i. p. 56. 12mo. &c.

They are also described by Virgil, in consequence of the eruption which happened, according to Mr. Oldenburg (ubi infra) at the time of the expedition of AEneas, who, being terrified with the bloody fire of this burning mountain, left Sicily.

The philosophical poet, Lucretius, has also mentioned the eruptions of AEtna.

--

Per fauces montis at AEtna 
Explicent ignes interdum turbine tanto, 
Expeditam: neque enim mediocris clade co'erta 
Flamma tempellae, Siculium dominata per agros 
Finimius ad fum convertit gentibus ora; 
Fumida quom coerl feintillare omnia templa

Cerneckes,
Cementes, pavida complebant peectora curas,
Quid moliscut rerum natura novarum.

Lib. vi. v. 639, &c.

Mr. Oldenburg has enumerated several eruptions which happened before his time in the Phil. Trans. No. 43. Abridgm. vol. ii. p. 386. The first he mentions is that to which we have already referred; but the first eruption of which we have any positive historical record is that mentioned by Diodorus Siculus (i. 5. tom. i. p. 235. Ed. Weffel.), though he does not specify the precise period when it happened. This event, however, compelled the Sicani to abandon the eastern parts of Sicily, and to settle in the southern parts. This territory was afterwards occupied by the Sicilians, who migrated thither from Italy. The second eruption is the first of three that are recited by Thucydides (Hist. i. iii. c. 116, p. 237. Ed. Dukeri.) without mentioning the exact date of any one of them. He says, that from the arrival of the first Greek colonies that settled in Sicily, viz. in the third year of the 11th olympiad, corresponding to the year 733 before the Christian era (vid. Annales Thucyd. ed. p. 12), to the third year of the 88th olympiad, Ant. Chrift. 425, Ætna, at three different times, discharged torrents of fire. This second eruption happened according to Euthebiius (Chronicon. MDXC.) Ant. Chrift. 465. The third eruption, or the second mentioned by Thucydides, happened, as he says, in the 50th year before the 1st; or as it is stated (vid. Annales Thucyd. ed. p. 31. Ed. Weffel.) Ante Chrift. 475. Olymp, 701, when Thoedos was archon at Athens. But the Oxford marble refers to the 16th year of the 75th olympiad, Ant. Chrift. 477, when Xanthippus was archon at Athens. In the second year of this Olymipiad, this is said the Athenians gained their boasst victory over Xerxes's general, Mardonius, near Platea. Both the eruption of the volcano and the victory of the Athenians are commemorated in an ancient inscription on the marble table above-mentioned. It was at this eruption, as we are told, that two rich brothers, named Amphilochus and Anapius, disregarding their effects, rushed into the flames and carried off their aged parents on their backs. It is said that the fire spared these youths, whilst others who took the same road were consumed. The citizens of Catania recompensed this act of filial piety with a temple and divine honours. The heroic deed is repreented on an ancient medal, and it is recorded by several ancient authors, as Strabo, (tom. i. p. 412.) Silius Italicus, (l. xiv, exv. exeuv. p. 703.) Valierius Maximus (l. v. c. 4.) Paufanias (Phociea. l. x. p. 867. Ed. Kuhnii.) Ælian (Fragmenta. Var. Hist. tom. ii. 1054) Seneca, Arilottle, Chaldean, Solomon, &c. The fourth eruption, or the third mentioned by Thucydides, occurred, as we have already hinted, in the 88th olympiad, Ant. Chrift. 425, and laid waste the territory of Catania. The fifth is dated by Orofius, in the confufih of Sergius Fulvius Flaccus, and Quintus Calpurnius Piso, about 133 years before Chrift. Livy (l. iv. c. 12. tom. v. p. 1543. Ed. Drakenb.) mentions an eruption in the confulate of C. L. Onaus and Q. Servilius, Ante Chrift. 140. The sixth happened in the 125th year before the Christian era, and Orofius says, that a number of fires were destroyed by it, and that the inhabitants of Lipari suffered exceedingly by eating them. The seventh eruption, which occurred in the 121st year before Chrift, drove Catania to such a degree, that the inhabitants were expelled by the Romans from paying taxes for 10 years, in order to enable them to repair the damage which they had fullained.
suffered much; and the neighbouring castles, and more than 500 houses were destroyed by the ravages of the river, and trees were torn up by violent blasts of wind. Ætna was convulsed and rent in several places, and poured forth torrents of lava, which destroyed the vineyards and gardens at the monastery of St. Nicholas d’Arnta, and proceeded onward to Nicolò, burnt Montepelliari and Follina, and did great injury wherever it spread. The commotions of Ætna were so great, that the summit fell in with a tremendous noise, and the shocks of the earthquake that attended them were felt through the whole island. The inhabitants were so much alarmed and distressed, that they appeared in mourning, and continued in this state for a considerable part of the year. In 1567 and 1579, the ravages of Ætna were renewed; and from 1635 to 1636 its eruptions were occasionally repeated, and torrents of lava flowed from it, which destroyed the woods and vineyards in those parts to which they reached. In 1650, as Oldenburg informs us, from Kircher’s Mundus Subterraneus, the mountain burnt on the north side, and produced great devastation. Carrera was witness of a dreadful configuration in 1663, which ended till the end of May 1678. But the eruption of 1669 was the most formidable and most destructive. Borelli, who was an eye witness of this catastrophe, and some English merchants who were also upon the spot and who examined its effects, of whose report we have a detailed account, in the Phil. Trans. (No. 51. abr. vol. ii. p. 387.) have minutely described the effects, and progress, and ruinous consequences of this eruption. It was preceded, for eighteen days, with a dark sky, thunder and lightning, and frequent concussions of the earth, which destroyed many houses in the village of Nicolò, and dispersed its inhabitants. The old crater on the summit of Ætna raged for two or three months before this event, in a most unutterable manner; and this was also the case with Volcano and Stromboli, two burning islands to the west of it. In the evening of the 11th of March, at the distance of about twenty miles from the old mouth, and ten miles from Catania, a chain was opened in the edifice of the mountain; which is said to have been several miles (Borelli says twelve) in length, and five or six feet wide. This was not far from the place where Monte Pizzo afterwards arose, and extended in the direction of the grand crater of Ætna. See Pl. i. Nat. Hist. fig. 2. V. V. V. On the night following, in the place where this mountain now stands, another large cleft opened, and several other chains were formed in different parts of the mountain; and there issued from all of them huge volumes of smoke, accompanied with the usual phenomena of thunder and earthquake. From the principal cleft there issued the same night a flame of lava, which directed its course to a lake, called da Hurna, about six miles from Montepelliari, and in its way destroyed many dwelling-houses and other buildings in the adjacent village. The next day it moved towards a tract of country called Mul Pizzo, inhabited by about 800 people, which, in the space of twenty hours, was entirely depopulated and laid waste; the lava then changed its direction, and destroyed some other villages. Montepelliari, and its inhabitants, were also destroyed. On the 23d of March the stream of lava was in some places two miles broad, and extended itself to the village of Messale. On this day a new gulf was opened, from which were discharged sand and ashes, which formed a hill with two summits, two miles in circumference, and 150 paces high; these consisted of ashes of different colours. The new mountain of Nicolò continued to discharge ashes for three months, in such quantity as to cover the adjoining tract of country for 15 miles. Some of these ashes were conveyed by the winds as far as Messina, and Calabria; and others spread over the southern country, about Agogla, Lentini, and remoter parts. On the 25th of March the whole mountain, even to its highest summit, was agitated by a very violent earthquake. The highest crater, or its loftiest eminence, then sunk into the volcanic focus, and the spot which it had occupied became a deep gulf, more than a mile in extent, from which were thrown up enormous masses of smoke, ashes, and flames. At this time it is said, the famous block of lava on mount Frenumento was discharged from the volcanic focus. The torrent of lava, which still continued to flow, directed its course towards Catania; it first passed under its walls for a considerable distance into the sea, but afterwards accumulated and passed over them in several places. The gardens and grounds belonging to the convent of the Benedictines were overwhelmed by it; and by its taking this direction many buildings in the town escaped. From hence it divided into separate channels or streams, and flowed chiefly into the sea. The English merchants say, that it had overwhelmed in the upland country, 14 towns and villages, some of which contained 3 or 4000 inhabitants, and flood in a fruitful country, where the fire had not before this time made any devastation; and they add, there is not now so much as a sign where these towns stood, except the church and steeple of one of them, which was situated on an eminence. The Earl of Winchelsea, who at this time happened to be there on his way home from an embassy to Constantino, in his account of this tremendous catastrophe, informs us, that the inundation of fire, cinders, and burning flames, advanced into the sea 600 yards, and a mile in breadth: that it destroyed in 40 days the habitations of 27,000 persons; and of 20,000 persons, who inhabited Catania, 3000 only remained. He adds, that the fire deluged, in its progress, met with a lake four miles in compass, and not only filled it up, though it was four fathoms deep, but raised it into a mountain. He observes, according to an extract, cited by Sir William Hamilton, that he could see at ten miles distance the fire begin to run from the mountain in a direct line, and the flame to ascend in bulk and height equal to those of the loftiest steeples in this kingdom, and to throw up large flames into the air. He discerned also the river of fire defending the mountain, exhibiting a terrible fiery or red colour, and bearing flames, which swam upon it, as big as an ordinary table. This fire was observed to move in several other places, emitting flames and smoke resembling those of a furnace of melted iron, and occasioning a loud noise especially by means of the great pieces that fell into the sea. He adds, upon the information of a cavalier of Malta, that the river was as liquid, when it issued from the mountain, as water, and came out like a torrent with great violence; and that it was five or six fathoms both in depth and breadth, and that no flames could sink in it. Borelli observes, that when they threw flames into the chimney of the mountain, they could not hear them strike the bottom. Burning rocks, he says, 60 palms in length, were thrown to the distance of a mile, and flames of 3 feet fire were carried upwards of three miles, and the thunder and lightning from the smoke were not less terrible than the noise of the mountain. After the most violent struggles, and shakings of the whole island, when the lava got vent, it sprang up into the air to the height of 60 palms; the fire, for many weeks, did not appear, and the day seemed to be changed into night; and it was not till four months from the time when it began to discharge its contents, that these dreadful symptoms abated. This deluge of fire, after destroying the finest country in Sicily, and sweeping away churches, villages, and convents
convents before it, burst over the lofty walls of Catania, and covered five of its buildings, with the intervening courts; and from thence pouring down on the city, it laid waste every object it met with, overwhelming and burying all in one promiscuous ruin. He regrets the destruction of many remains of antiquity; particularly an amphitheatre, which he calls Colosseo, the Circum Maximae, the Kennachia, and several temples. Forcelli has calculated, that the matter discharged at this eruption was sufficient to fill a space of 93,837,500 cubic paces.

The English merchants, to whose account we have already referred, describe the lava as a mass confounding of metals and minerals, which being rendered liquid by the fierce heat of the fire in the bowels of the earth, boiled up and guided forth as the water does at the head of some great river; and having run in a full body for a fume's eul or more, the extremity of it became cooled, and formed those hard fstones which the people call diarri, and which resembled huge cakes of sea-coal strongly ignited. The lava thus proceeded to the sea, when the conflict between the two elements occasioned a noise more dreadful than the loudest thunder, which was heard to a great distance; the water retired before it, the fih on the coast were destroyed, the transparency of the waters was lost for several months; and the clouds or vapours that ascended from it darkened the sun. The fire, say these gentlemen, spread about three miles in breadth, and 17 miles in length. When they attempted to go up to the mouth, whence the lava issued, they could not advance nearer to it than a furlong, but they should be overwhelmed by a pillar of ashes, which seemed to them to exceed twice the bulk of the steeple of St. Paul's church in London, and to ascend into the air to a much greater height. From the mouth proceeded a loud noise, like the beating of billows against rocks, or distant thunder, which was at intervals so violent as to be heard 60 or even 100 miles off; and so far were the ashes carried. The hole whence the lava issued was about ten feet in diameter. Sir William Hamilton informs us, that the lava, on which there were no signs of vegetation in 1769, is 14 miles in length, and in many parts six in breadth, and that after destroying many hundred monuments in Catania it ran far into the sea, forming a safe harbour, which was soon after filled up by a fresh torrent of the same inflamed matter.

The eruption of 1682 produced a burning gulf on the top of the mountain, and its lava was diffused over the hill of Mazzara. In 1686 a quantity of this ignited matter was thrown off from the summit of the mountain, and after consuming woods, vineyards, and crops of grain through the extent of four leagues, its course was channeled into a valley near the mouth of Majestic. Several people, whose curiosity led them to watch the progress of the lava on a hill between the wood of Catania and the confines of Cusa were buried under the hill which suddenly sunk inwardly.

After a long interval of rest, the eruptions of Etna were renewed in 1755, when a prodigious torrent of boiling water issued from the great crater. The discharge of water was preceded by smoke and fumes, by momentaneous noise and convulsions of the earth, the usual signs of an approaching eruption; at length the torrent burst forth, and formed tremendous cañarraits in descending from one chain of rocks to another, till it reached the cultivated plains, which it overflew for many miles; and after separating into several deep and rapid rivers, it discharged itself into the sea. The ravages of this inundation, on account of both the quantity and the heat of the water, were very extensively injurious; and though the mountain continued to throw up water only for half an hour, it produced not only alarm but very considerable damage wherever it flowed. When the discharge of water ceased, the noise, fumes, and convulsions were continued; and there appeared two new chasms, from which two torrents of lava issued, and purified their course through the snow, which covered the fummit of the mountain. The discharge of water was followed in five days by an explosion of small fstones and sand, some of which were carried as far as the hills of Menfi; and the black sand was driven to Messina, and even over the strait to Reggio in Calabria. Some of the sand was conveyed, by the shifting of the wind, to the plains of Agolla. In two days the mountain opened again, and discharged a torrent of lava which moved towards the plain, at the rate of a mile in a day, and continued for six days.

Recupero examined the course of the torrent of water above mentioned. He found that it proceeded from the bowels of the mountain, and purifying a channel which it formed from the summit to the sea, it gained access from the melted snow; and in its progress destroyed a large forest of trees, which were torn up by the violence of the current, though some of them were not less than two and two and a half feet in diameter. The main torrent divided into four principal streams, and these again separated into smaller currents; but afterwards reuniting, they formed islands, and larger rivers, about 900 feet wide, and of a depth which could not be easily ascertained. The channel of the waters, in their further deflection, was alternately contracted and dilated; and in some places it was not less than 1500 feet. Fragments of lava, and huge rocks, were removed by the current, and valleys were filled up by the sand which the waters deposited. When Recupero visited the mountain, after a interval of ten years from its eruption, the whole side of the hill bore the marks of the deluge. In 1769 there was an eruption, which continued with intermissions for three months. From the crater, opened on this occasion, a pyramid of fire issued; which ascended to a great height in the air, and exhibited an artificial fire-work, attended with the explosion of a formidable battery, which shook the earth under those who were spectators of the scene. The lava that flowed from the crater yielded a very brilliant light, retained its heat, and exhaled its smoke for two years; nor did any snow appear on the summit of Etna for five years. In 1764, a new crater was opened at a considerable distance from Etna; and in 1766 another was opened at the grotto of Paterno, which formed a mountain that after an interval of four years discharged great quantities of smoke, with loud explosions. In this interval the lava was not cooled, nor was the fire extinguished. Its fury was spent on a beautiful forest, which it laid waste to the extent of many miles. In 1780, the convulsions of the mountain were often renewed, and several new craters were formed; and from these flowed streams of lava, which moved with different velocities, and in various directions. The most considerable of these flowed from a crater on Mount Frumento on the summit of Etna; and flowing in a stream about 250 paces in breadth, at the rate of about a mile in a day, spread through the valley of Landunza. From another crater red hot fstones were projected, and a current of lava was discharged, which flowed over a tract of country two miles in extent.

The next eruption of Etna happened in July, 1787, and has been accurately described by Gioeni, in an account of it printed at Catania in the same year, of which we have a French translation, by M. Dolomieu, at the close of his Catalogue du Jardin. It was preceded by the usual signs of an approaching eruption for several days, i.e. from the 1st
to the 17th of July, when the lava flowed from the hinder part of one of the two mountains that form the double head of Etna. On the next day, after renewed shocks and the appearance of a thick smoke, a shower of fine black brilliant sand descended; on the call side there was a fall of stones; and at the foot of the mountain a deluge of flames of fire, icoria, and lava. In the evening conical flames appeared alternately to rise and fall from the volcano; at three the next morning the mountain seemed to be left, and the summit was a burning maw. Two of the conical flames were one on the north and another on the south, were of immense extent; where these separated, another cone of flame, composed of many smaller ones, appeared to ascend above the mountain over a base of about a mile and a half in diameter to a height supposed to be about two miles. This cone was covered with a thick smoke, in which were seen very brilliant flashes of lightning; a phenomenon which had not been observed in other eruptions. Sounds resembling the explosions of a large cannon were also occasionally heard.

From the cone, as from a fountain, there was perceived a jet of many flaming volcanic matters, which were thrown to the distance of six or seven miles; and from the base of the cone there issued a thick smoke, which darkened parts of the sky, at the time when the rivers of lava were discharged. This beautiful appearance continued for three quarters of an hour. It began the next evening with greater force, but lasted only for half an hour. In the intervals Etna continued to throw out flames, smoke, ignited stones, and showers of sand. From the 20th to the 22d, the appearances gradually ceased. The stream of lava flowed towards Bronte and the plain of Lago. After the eruption, the western side of the top of the mountain was covered with hardened lava, icoria, and icone. The travellers were annoyed by smoke, showers of sand, mephitic vapours, and excessive heat. The lava that proceeded from the western point was observed to separate into two branches, one of which was directed towards Liceccio, and the other, already mentioned, towards the plain of Lago.

The lava on the western head of the mountain had been evidently in a state of fusion; and from one of the sparcula, the odour was that of liver of sulphur. The thermometer in defending was at 40° of Fahrenheit's scale; but near the lava, on the plain of Lago, it was 140°. The lava extended two miles; its breadth was from 131 to 21 feet, and its depth 132 feet. There was another eruption in October, 1787; the effects of which are described by the Abbé Spallanzani. The stream of lava that issued on this occasion, from the great crater, was three miles in length; its breadth was in some places about a quarter of a mile, and in others one third, and in other parts still greater; its greatest depth was about 18 feet, and the height six. Its course was along the well side of the mountain; and the effervescence that produced it was, like that of July, extremely violent. The icoria were like that of the torrent in July of a black colour; but differed from them in their adhesion to the lava, in their external vitreous appearance, their greater weight, and their hardness, which was such as to yield sparks with fleck, almost as plentiful as flints. These differences are ascribed to accidental combinations of the same substance; the constituent principles of both these icoria being the same. Both contained the same feltspar lamelle. For other particulars, relating to the causses and products of volcanic eruptions, see Basaltes, Lava, Pozzolano, and Volcano. For the places adjacent to Etna, see Catania, Cyclops, Hybla, and Trinza.

Etna, a name given to a city of Sicily, founded by Hiero of Syracuse, in the 1st year of the 76th olympiad, on the ruins of Catana; which was dispossessed of its primitive inhabitants. After the death of Hiero, the Catanians returned, expelled the new occupiers, and destroyed the sepulchre of the Sycraean monarch. The Etnaeans retired to Ischna, or Ennea, which was the name given to mount Etna, and which was distant about 80 fadias from Catana, called it Etna, and announced Hiero to be its founder. Diodorus says, that Dionysius of Sycraea perfused the inhabitants of Catana to remove to Etna, because it was a fortified town. Authors are now hardly agreed about the situation of Etna. Strabo, tom. i. p. 412. Did. Sic. i. ii. c. 76. tom. i. p. 461. l. xiv. v. 644. &c. Thucyd. Annals, p. 31. Ed. Weffeling.

Etna falls, falls Etna, a name given by some authors to the fall amnomous, which is found on the surface and sides of the openings of Etna, and other burning mountains after their eruptions; and sometimes on the surface of the ferruginous matter which they throw out. This fall makes a very various appearance in many cases; it is sometimes found in large and thick cakes, sometimes only in form of a thin powder, scattered over the surface of the earth and fones. Some of this fall is yellow, some white, and some greenish.

This fall is a concrete of nitre, sulphur, and vitriol, burnt and sublimed together. Borrelli found once a salt quantity of this fall on mount Etna, and tried many experiments on it; from whence he concluded, that this salt is so far from occasioning the explosions of the mountain, as some have supposes, that it does not exist in it, but is formed during the burning. Phil. Trans. N° 100.

Etolia, in Ancient Geography, a province of Greece, which formerly comprehended the country now called the Despotat, or little Greece, was parted on the east by the river Evenus, now the Fidari, from the Locrenses Oza, and on the west from Acaania by the Achelous; on the north it bordered upon the country of the Dorians and part of Epirus, and on the south extended to the bay of Corinth. Its utmost extent from north to south was about 48 miles; and from east to west its greatest breadth was somewhat above 20 miles. According to Strabo (l. x. tom. ii. p. 691) it was customary to divide Etolia into two districts, the one called the ancient Etolia, which lay between the rivers Achelous and Calydon on the Evenus, and which was a level and fruitful country, and the other denominated synaes the or the acquired, which was contiguous to the Locrians, towards Naupactus and Euphaurus, and extended northwards towards the mountain Octa, and which was more craggy and barren. He also informs us (tom. i. p. 548, tom. ii. p. 711.) that it derived its name from Alexololus, the son of Eurydaim, who being compelled to leave Elis, removed to this country, and founded several cities in it; of which the principal were Thermus, Calydon, and Pleuron. Their only sea-port was Oenias on the Corinthian bay. Of their kings, who succeeded Alexolus, little more is known than their names. It does not appear by whom it was inhabited before Alexolus took possession of it; and its subsequent history for several ages is very obscure and doubtful. Thucydides (l. x. p. 5. Ed. Duker.) Plutarch, (in Theofr.) Strabo, and other ancient writers represent the Eтолians, as the greatest robbers in Greece, and as continuing such for many centuries, after Hercules, Theseus, and other heroes, had extirpated those banditti everywhere else; to them Strabo ascribes the invention of the fling. Livy (l. xxxvi. tom. iv. p. 1030.) describes them as a proud, arrogant, and ungrateful people, but as good warriors; and they are said to have fought with one shoe, whence the epithet μονοπτήριος has been
been applied to them. Polybius (Meg. Hist. i. iv. paflim. p. 270, &c. Ed. Calaubon,) speaks of them as a turbulent people; seldom at peace among themselves, and generally at war with their neighbours; utter strangers to all fene of friendship, or principles of honour; ready to betray their friends whenever they had the least prospect of deriving any advantage from their treachery; and, in short, as persons who were regarded by the other states of Greece as outlaws and public robbers. In war, however, they were bold and enterprising; insur'd to hardship and labour; and jealous of their liberties, in defence of which they were ready to sacrifice their lives.

The constitution of the Aetolian republic was formed in imitation of that of the Achaeans, and with a view of counteracting their growing power. It was governed by a general assembly, a praetor, and other magistrates, and the people. The general assembly usually met once a year, and on extraordinary occasions it was summoned by the praetor more frequently; and this national council possessed the whole power of enacting laws, declaring war, making peace, and concluding alliances with other states. Each city of the Aetolian alliance deputed members, composing a council which was called the Apostoloi, and which consisted of the most eminent men of the nation, whose office resembled that of the demotarchs among the Achaeans. Their chief magistrates, in subordination to the praetor, were the general of the horse, the public secretary, and the ephors. The republic of Aetolia, thus formed and governed, distinguished itself above all the other nations of Greece, in opposeing the ambitious designs of the Macedonian princes. Having kindled the Macedonian war, and that of the allies, called the Social war, in the heart of Peloponnesus, with a view of humbling their antagonists the Achaeans, they refitted for three years, with the assistance of the Eleans and Lacidianomians, the united forces of Achaia and Macedon; but they were at last obliged to purchase a peace by surrendering to Philip the whole of Acrania. But as they gave it up with reluctance, they were anxious to seize the first favourable opportunity that occurred for regaining it. With this view they concluded an alliance with the Romans, Ante Chrill. 211; which was ratified two years after it was formed, by both nations. The articles of which it consisted were ordered by the senate to be deposited in the Capitol, as a lasting monument of their first alliance with the Greek nation. Hostilities, however, immediately commenced, as soon as the treaty was concluded. Whilst the forces of Philip were employed in Macedon, the Aetolians entered Acrania; where they found a very determined and vigorous opposition. Notwithstanding the assistance which they were likely to derive from Lœbinus, the Roman General, who had projected the alliance with them, they were intimidated by the resolution of the Acranians, and returned home without attempting to provoke a people who had declared their purpose either to conquer or die. Diverted from prosecuting their first design, they turned their arms against Anticyra, a city of the Lacri, and aided by the Romans, compelled it to surrender. This success encouraged them to march into Achaia, and to oppose the forces of Philip. The hostile armies met near Lamia, a city of Phocis, where the Aetolians were twice defeated. After this victory Philip was prevailed upon by an embassy from Ptolemy Philopator, king of Egypt, and by deputies from the islands of Chios and Rhodes, and the city of Athens, to grant the Aetolians a truce of thirty days, and to enter into a negotiation for peace. Polybius has preferred (i. xi. c. 4, p. 626) one of the speeches which was delivered on this occasion, and which may be considered as a master-piece of the kind. The negotiation, however, proved unsuccessful: and the war was renewed with considerable, though temporary, advantage on the part of the Aetolians and their confederates. During the absence of Philip, they possessed themselves of several cities: but upon his return, being abandoned by the Romans, they were under a necessity of concluding a peace upon very unfavourable terms, Ante Chrill. 264. This peace was of short duration. An extraordinary diet was held at Naupactus, in which the friendship and alliance of the Aetolians were solicited by Philip, and also by the two powerful republics of Athens and Rome. The Romans, however, prevailed (ante Chrill. 201), and the Aetolians, after some previous conferences, entered Thebally, where they were met by Philip, and, after a considerable slaughter, totally routed. Next year they rallied again, and re-entered the Elysians, plundering and destroying everywhere they came, and either putting the inhabitants to the sword, or selling them for slaves to the butcher. The Aetolians maintained their attachment to the Romans during the course of the war, and were favoured by the Roman commanders above the other nations of Greece; but after the battle of Cynoscephale, in which Philip was entirely defeated, their mutual affection abated. The Aetolians arrogated to themselves the glory of this victory; and Flamininus, the Roman general, mortified their vanity and excited their resentment, by granting a truce to the deputies of Philip without consulting them. When a negotiation for peace between Philip and the Romans commenced, the Aetolians obstructed it; and it was concluded Ante Chrill. 196, without their concurrence. Dissatisfied with the conduct of the Romans on this occasion, they meditated revenge, and exalted themselves in raising new enemies against their former allies. They made their first attempt in the assembly of the Amphictyons, but failing here, they had recourse to Antiochus king of Syria, Nabis tyrant of Lacedaemon, and even to Philip king of Macedon. They were immediately joined by Nabis; and having concerted a plan for seizing on three cities, which were reckoned the bulwarks of Greece, viz. Chalcis in Euboea, Demetrias in Thebally, and Lacedaemon in the center of Peloponnesus, they proceeded to the execution of it. Having succeeded in flattery in gaining possession of Demetrias, Antiochus, who had declared in their favour, determined to land in this place; and in the year (ante Chrill. 192) he arrived in Greece; and in a diet held at Lamia, he was honoured with the title of generalissimo, or commander in chief of all the Greek armies against Rome. The king of Syria having gained possession of Chalcis, was joined by several of the Greek states, who renounced their alliance with Rome: but Chalcis in the event proved no less fatal to Antiochus than Caphan had been to Hannibal. During his residence in this city he formed a connection with the daughter of Cleopatra, one of the chief citizens, and married her. Such was the ardour of his attachment to the new queen, that he seemed to forget Rome, Greece and Syria. The king spent the winter in featings and rejoicings; his example infected the officers of his army; the soldiers abandoned themselves to idleness and debauchery; and mutiny and disorder universally prevailed. The Romans availed themselves of these circumstances; and in the year Ante Chrill. 191, declared war against him, and dispatched a powerful army into Greece. The Aetolians could afford him little assistance; nor was he able to stay the progress of the Roman army, till they compelled him to take refuge first in Chalcis, and afterwards to set sail for Asia and retire to Ephesus. The Aetolians were strongly fortified.
fortified at Hermione: although their number amounted only to 2000, they held out 40 days against the incessant attacks of the whole confederate army under the victorious Aemilius. The town was at length taken by force, and delivered up to be pillaged by the soldiers. Laminia, which had been for some time unsuccessfully besieged by Philip, surrendered to the Romans. After the loss of these two cities, the

The
ÆTOLIA, an ancient town of the Peloponnesus, placed by Steph. Byzant. in Laconia.

ÆTORCHEUM, a promontory of Bithynia.

ÆTÜATAS, a people of Helvetia, upon the frontiers of Rhetaia, towards the sources of the Rhine.

ÆÆULANA, a country of Armenia Minor.

ÆÆYMANDRI, a people of Afia.

ÆVSKAIA, in Geography, a town of Siberia, situated on the Irith: 20 leagues north-west of Tara.

ÆX, the name of one of the nymphs of Jupiter, who was placed among the Muses.

ÆXONA, a borough of Attica, dependent upon the tribe of Ceereopides. The inhabitants were so much addicted to cabbalism, that a word interpreted Æxona was used proverbially for speaking evil of another.

ÆXONIA, was also the name of a city of Magnesia in Thessaly. Stephan. Byz.

ÆZALÀ, a town of the greater Armenia in Afia.

ÆZANIS, a town of the greater Phrygia in Afia.

ÆZAR, a people of Africa, who gave name to a canton of Marmarica.

ÆZICA, a country of Thrace.

ÆFDELLES, in Ichthyology, a name given by the Cretans to the fish called at Rome, donzellina and zigorella. See Juv. vol. 1.

ÆFER, Constantinus, in Biography. See Constantius.

ÆFER, Donatius, a celebrated orator, was born at Nimæus, in Gaul, in the year before Christ 15 or 16, and lived under Tiberius, and the three succeeding emperors. After his advancement to the office of praetor, his ambition led him to aspire after higher honours; and with this view, preferring fame to virtue, he exercised his talents as an orator. Claudius Pulchra, the cousin of Agrippina, was the first object of his attack; and by charging her with adultery, witchcraft and magical operations against the emperor, he recommended himself to Tiberius, who had conceived an invincible detestation of Agrippina. Agrippina, however, much as she must have resented his conduct, treated him with the contempt he deserved; for when he accidentally met with her after the imprudence of Claudius, and he was endeavouring to avoid her, the pontificem applied to him the passage in Homer (II. s. 385.)

"Of you my master says all things."

"It is not of you, it is of Agamemnon I complain!"

Thus intimating her disdain of him, who was the mere minister of an injustice that proceeded from a higher power. After next year directed his accusations against Quintillus Varus, the son of Claudius; in which he was aided by P. Dolabella, who was a man of birth and the relation of Varus. Finding this practice to be a source of wealth and honours, in the degenerate period in which he lived, he adhered to it through life, and incurred the contempt even of his admirers, by perishing in it when his faculties were impaired by age, and the decay of his powers eclipsed the fame of his former eloquence. His advancement at this period depended on his talents for flattery, as well as on those by which he was distinguished as a public speaker. Having erected a statue to Caligula, he introduced into the intercession a record, which he undoubtedly designed as an expression of respect, that the emperor was a second time consul at the age of 27 years. Caligula interpreted the compliment as a criterion of his acquisitions in the law, and as a reproach of his youth; and pronounced a vehement oration against him in the senate. After, instead of making any reply in his own vindication, professed the highest admiration of the emperor's eloquence, and rec-

pleaded the greatest part of his speech in strains of rapture. By this fawning artifice he not only obtained a pardon, but induced the emperor to dispel the confusions of his court, and by this act of injustice to make way for the advancement of Afer.

This orator died in the reign of Nero, A.D. 59, in consequence, as it is said, of eating to excess. Quintillian affi-
diously cultivated the friendship of Afer, and was in his youth a constant attendant on his pleadings. Of his eloquence he speaks in terms of high commendation, as dif-
tinguished by art and wit, intitling him to rank among the first orators of Rome. According to his account, Afer often introduced pleasant stories and fables of wit in his pleadings; and collections were made of his jests. He discouraged and condemned the prevailing practice of vociferous applause; and being repeatedly interrupted while he was pleading slowly and gravely before the Cent-
tumviri, he paused, and addressing the judges, observed, "Gentlemen, our profession is ruined." Afer, however, exposed himself to ridicule, by continuing to plead under the imitations and ditties of advanced life; for, says Quinctilian, laughed, others were astonished; and he observes that Afer incurred the reproach, "Malle cum defeceris, quam defineris?" or, "that he had rather fail than finish!" and he grounds on this conduct a recommendation to orators to withdraw, when age incapacitates them for maintaining their former reputation. The orator, he says, in order to prevent falling into these snares of old age, should found a retreat, and come into port with a sound vessel. Tacitus, Annal. l. iv. c. 65, tom. i. p. 317. l. xiv. c. 10, tom. i. p. 935. Ed. Gronov. Dion Cassius, Hill. Rom. tom. ii. p. 922. Ed. Reimar. Quinctilian, Inst. l. v. c. 7, tom. i. p. 378. l. vi. c. 3, p. 535. l. x. c. 1, p. 978. l. xii. c. ii. tom. ii. p. 1107. Ed. Burman. Pliny, Epift. l. P. 14.

ÆFFA, a weight used on the gold coast of Guinea. It is equal to an ounce, and the half of it is called egrebo. Most of the blacks on the gold coast give these names to those weights.

ÆFFACUS, in Geography, a town on the Barbary shore, eight leagues south-east from Africa.

ÆFFÄNG, a town of the archduchy of Aftria, three leagues west of.Steyr.

ÆFFAR, a town of Arabia Felix; 14 German miles west of Lohra.

ÆFFATOMIA, in Ancient Laws, a kind of donation made by throwing a wand into the person's bosom, to whom it was made. Du-Cange.

ÆFFECTED, in Algebra. See Adlected.

ÆFFECTIO lovatis, is a disease incident to cattle, occasioned by a little worm, bred between the flesh and the skin; which works its way over all parts of the body.

ÆFFECION, in a general sense, denotes an attribute peculiar to some subject, and arising from the very idea or essence of it.

The word is formed from affecer, to affect; the subject being here supposed in some measure affected, or acted on, by the thing attributed to it.

In this sense, affection is synonymous with property, or with what the schoolmen call proprium quarto modo.

Philosophers are divided as to the doctrine and division of affections: according to Aristotle, they are either subordinating, or subordinated; under the first of which comes only subordinate; and under the second, sentiment, place, and time.

The generality of Peripatetics divide affections into internal, as motion and sentiment; and external, as place and time. According to Sperlingius, affections are better divided into simple or united, and distinct or separate: under the first he comprehends
AFFECTIONS are also distinguished into those of body, and those of mind.

AFFECTIONS of body, are certain modifications of it: occasioned or induced by motion; in virtue of which, a body comes to be fo and so disposed.

The affections of body are sometimes subdivided into primary and secondary.

AFFECTIONS, primary, are those which arise either from the idea of matter, as quantity and figure; or from that form, as quality and power; or both together, as motion, place, and time.

AFFECTIONS, secondary, or derivative, are those which arise from some of the primary, e. g., from quantity, as divisibility, continuity, contiguity, limit, impenetrability; from figure, as regularity and irregularity; from quality, as health, strength, &c.

The epithet mechanical is applied to those affections that are properties of matter, resulting from its figure, bulk or motion.

AFFECTIONS of mind, are what we more usually call passions.

Dr. Cogan, in his Philosophical Treaflie on the Passions, very properly distinguishes between affection and passion; and he accurately differentiates between both these terms, and that feeling, which is usually denominated emotion.

The term affection, he says, has a different signification from either of the other two, and represents a less violent, and generally a more durable influence, which things have upon the mind. It is applicable to the manner in which we are affected by them for a continuance; and supposes a more deliberate predilection and aversion, in consequence of the permanent influence of some prevailing quality. This distinguishes it from the transient impulse of passion; nor is it so intimately connected with any external signs, which distinguish it from emotions. The affections sometimes succeed to passions and emotions, because these may have been excited by something that becomes permanently interesting; or they may be gradually inspired, by a deliberate attention to the good or bad qualities of their objects. In this philosophic sense of the word, affection is applicable to an unpleasant as well as pleasant state of the mind, when impressed by any object or quality; it may be produced by any thing that torments or corrodes the heart, as well as by that which charms and delights it. Custom, however, chiefly appropriates the term to the kindly and benevolent affections.

In the same manner Dr. Reid (Effays, p. 143. 167.) has applied the general name of affections to those various principles of action in man, which have persons for their immediate object, and which imply, in their very nature, our being well or ill-affectd to some person, or at least, to some animate being; and whether they dispose us to do good or hurt to others. He observes, however, that the word affection seems, by custom, to be limited to good affections. Accordingly, when we speak of having affection for any person, it is always understood to be a benevolent affection. In the extensive sense above stated, our affections are very naturally divided into benevolent and malevolent, as they respectively imply our being well or ill affected towards their object. The characters of love and hatred, resulting from the infinitely various situations and circumstances upon which their development and operations depend, entitle them to the denomination of primary or cardinal affections.

Our benevolent affections, whilst they differ in the feeling, or sensation, which is a common ingredient in all of them, and in the objects to which they are directed, agree in these two respects, viz. that the feeling which accompanies them is agreeable, and that they imply a desire of happiness to their object. The first of these affections is that of parents and children, and other near relations, commonly called natural affections: the second, is gratitude to benefactors; the third, is pity and compassion towards the distressed: a fourth is esteem of the wife and good; the fifth is friendship; the sixth, is love between the sexes; and the last, is patriotism, the public spirit; that is, an affection to any community to which we belong.

The malevolent affections, commonly called passions, in the arrangement of Dr. Reid, are emulation and resentment. For the difference between affection and disposition, See Disposition.

AFFECTION, in Geometry, is synonymous with property. Affection, in Medicine, denotes a morbid, or preternatural state of the body, or some of its parts. Thus we say, an hypochondriacal, an hysterical affection; and, in like manner, such a part of the body is affected, i. e. indisposed, or feized with a disease.

AFFEKTORS, AFFERATORES, in Law, persons appointed in court-keets, and courts-baron, upon oath, to settle and moderate the fines of such as have committed faults arbitrarily punishable, or which have no expres penalty set down by statute. See Stat. 25 Edw. III. c. 7.

The word is formed, according to Cowell, of the French, to afffcr; by reason those appointed to this office do affirm, upon their oaths, what penalty they think, in consequence, the offender hath deferred. Others better derive it from affercr, a word in the customary of Normandy, rendered by the Latin interpreters, taxare, to set the price of a thing; as afferers, assesseors, &c.—Kitchin joins the three words as synonyms; affector, amerciatores, afferors.

AFFENTHAL, in Geography, a valley of Suabia in the Ortenau, near Strasburg, famous for its excellent wines.

AFFERI, in Law. See Averia.

AFFETTUOSO, or Con Affetto, in the Italian Music, is used to denote that kind of music which must be performed in a very tender, moving, and affecting manner; and that reason rather flow than fast. This term, placed at the beginning of a musical air, implies, in point of time, a movement between cantante and largo; and requires a sweet and affecting expression of the melody.

AFFIANCE, in Law, the plighting of troth between a man and woman, upon an agreement in marriage to be had between them.

AFFIDATIO Dominorum, signifies an oath taken by the lords in parliament: thus called in the Rot. Parl. Hen. VI.

AFFIDATUS, or AFFIDATIUS, in our Law Books, denotes a tenant by bailty.

Affidati are not properly vassals, but quasi vassals, or persons who vow fidelity to, and put themselves under the protection of, another.

In this sense they amount to the same with what are otherwise called commendati, and recommendati.

AFFIDAVIT, an oath in writing, sworn before some person who hath authority to take such oath; and, made use of, and read in court, upon motions; though not allowed upon trials.

In the court of Chancery is an Affidavit-office, under the direction of a Master of Chancery.

AFFILAE, in Ancient Geography, a district of Italy belonging to the Hernici.

AFFILIANUS
AFFILIATION, adj. 1. The union of an individual with another by an act of adoption, as a son or daughter. 2. The act or fact of being adopted, as a child. 3. The process of adopting, as a custom.

AFFICTION, n. 1. A strong love or attachment, as for a child. 2. A painful or disagreeable feeling, as for a relative.

AFFIANCE, v.t. To adopt, as a son or daughter.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.

AFFINITY, n. 1. A similarity or resemblance, as of blood or nature. 2. A close relationship, as by blood or marriage. 3. A similarity of character or nature.
Affinity is more particularly used in speaking of the relationship or similitude between languages, occasioned by their being derived from the same source. We use the affinity of words, sounds, &c.

This term, which in its proper and original sense signifies a probability of relationship, has been adopted by modern philosophers as the expression of a force purely chemical, by which substances of different natures are made to combine with each other. This particular metaphorical use of the word is not, however, of very old standing. Barchuhen is probably the first who introduced it; speaking of the difficulty of obtaining chemical elements perfectly pure, he accounts for it in the following way, "Aretan enim atque reciprocum inter fe halcent affinitates." Boerhaave, however, contributed more than any other to bring the word into common use; thus we find in his Elementa Chemicæ: "Particula solvenites et solutæ se affinatæ natura, colligunt in corpora homogenea." Bergman has preferred the term attraction, as more conformable to the precision of scientific language; since, however, all bodies in nature attract each other, while chemical affinity exists only between particular substances, it seems upon the whole more convenient to appropriate a term to the expression of this particular force, without, however, rigorously excluding the synonymous phrase elastic attraction, which the high authority of Bergman has introduced into the chemical nomenclature.

In treating of so important a subject as chemical affinity, it will be necessary, for the sake of clearness, to divide it into six sections.

The first will contain a sketch of the progress of discoveries in affinity.

In the second the cause of affinity will be discussed.

The third will treat of single and compound affinity, and the construction of tables and schemes.

In the fourth the several methods of estimating numerically the force of affinity will be considered.

The fifth will contain the laws of affinity.

The sixth will be appropriated to the consideration of certain anomalies.

§ I. History of Affinity.

The general fact that all substances have not the same relative degree of affinity for each other, must have been observed as soon as the smallest attention began to be paid to chemical phenomena, and in the first rude attempts to explain the cause of this difference of force, recourse was had to the maxim of Hippocrates, ὡς οὖν ἔστιν ὁ ἄρτρος, οὕτως εἰσίν ἁπλά. This doctrine of the old school we still find in Beccher, who supposed that there was a hidden principle of similarity in all substances capable of mutual chemical combination. Another fact, at the head of which was Lemery, endeavoured to explain chemical agency by considering solvents as composed of a multitude of fixed points, and thus mechanically predisposed to enter the pores and separate the particles of substances exposed to their action.

Stahl, however, rejecting the hypothesis of mere mechanical forces, attributed the power of men of to the attraction of contact or intimate cohesion; for, to use his own language, "combinationes quamquam non aliter fieri quam per arctam appositionem." — Non per modum cunct, quae per modum incursus in unam particularis separan, dam, sed putius per modum apprehensionis eff arctae ap-

plicationis." This eminent chemist also deduced from his experiments a variety of facts and observations, tending to prove that an union once formed could not be dissolved without a more intimate union of one of its constituent parts with another substance.

It is to Geoffroy, the elder, that chemistry is indebted for the happy idea of collecting these scattered facts, and sketching the outlines of the general rules of analysis and composition. In the year 1718, he presented to the Royal Academy of Sciences at Paris the first table of affinity, or as he calls it, "Des differens rapports observés en chimie entre différentes substances," (some of the different relations observed in chemistry between different substances). This table, which merited premention, as a curious historical memorial, and the pattern of all that have appeared since, consisted of only seventeen columns very imperfectly filled, and prefixed, rules which for the most part have been changed or considerably modified. With all its errors, however, it is justly to be considered as the basis and guide to all our chemical knowledge; it has been enlarged and improved, but still retains its original form and essence, and as the great fabric of experimental science advances towards perfection, so will this, which is its epitome and model.

No very material improvement appears to have been made on Geoffroy’s table till Gellert, the celebrated proffesor of Freidburg, published, in 1720, his Chymia Metalurgica; in this work was contained a new table of affinity extended to 28 columns, and at the bottom of each was a list of substances which he had found not to be acted on by the body placed at the head of the column. Rudiger, in 1736, infixed in his Syllable of Chemistry a table of affinity reduced to 15 columns, in which the fixed alkalies and lime are placed parallel with each other, and before ammonia in the column of acids; he also added, in a small supplementary table, those bodies which refused to combine without the intervention of a third.

In consequence of a prize offered by the Academy of Rouen, in 1758, a very important addition was made to the table of affinities by M. Limbourg; he extended the number of columns to 33; he ascertained that zinc should be placed at the head of the metals in the column of acids, and that it precipitated them all, even by the dry way; he maintained, that lime and the fixed alkalies acted by mean of affinity on animal matter; and pointed out several cases in which the order of affinities was changed by the influence of temperature or the volatility of one of the ingredients.

From this period, the importance of the subject being fully established, tables were multiplied and the general system of affinity was investigated by some of the ablest chemists of the age, among whom the names of Erxleben and Weiglefland eminently distinguished. At length, in 1755, the illustrious Bergman published his disquisition on elective attractions, in the transactions of the Royal Society of Upsal, and successive editions of his tables made their appearance in 1759 and 1783. These tables may justly be considered as a masterpiece of skill and industry; the affinities of no less than 59 substances are ascertained with great exactness, and the distinction between those that take place in the moist and dry way is perfectly stated; the method of registering cases of compound affinity is perfected, and 64 of the most important are added to the general flock of chemical science. Since the death of Bergman, successive impressions of his tables have appeared with little or no alteration, till Dr. Pearson’s in 1799. In this, the nomenclature is changed, and in part reformed according to the French system; a few articles to be found in Bergman,
Bergman are expounded on the authority of later investiga-
tions, and the number of columns is increased to 62.

It is not, however, to the construction of tables, im-
portant as they are, that the researches of chemists on the
subject of affinity have been confined. Since the discov-
er of the great law of attraction, by Newton, it has been
the uniform endeavour of the ablest philosophers to show
that the cause of chemical phenomena is only a branch or
modification of this universal property of matter, and the
names of Buffon, Maquer, Linbourg, and Moreau, stand con-
spicuous for their endeavours in this department: it is to
Kirwan that we owe the able attempt to reduce the force of
contending affinities to numerical calculation; and the
fagacious Berthollet, in his "Recherches sur les lois de l'affinité",
has just now opened a new field of enquiry on this most im-
portant subject.

§ II. Cause of Chemical Affinity.

There have been only two ways of accounting for che-
mic al affinity; the one is by having recourse to a gratuitous
and inexplicable principle of sympathy, and which there-
fore is merely the symbolisation of one metaphor for another;
and the other is an endeavour, by the help of experiment
and calculation, to shew the identity of affinity and the
Newtonian attraction. The first of these, as it does not
profess to be supported by any external evidence, may be
passed by; the other requires a particular examination.

It was the opinion of Newton, and a very natural one
in his situation, that the force of attraction which he had
demonstrated to be the efficient cause of the planetary mo-
tions, of the alternations of the tides, of the deflection of
heavy bodies, and of the oscillation of the pendulum, was an effec-
tial property of matter, and, as such, the cause of chemi-
ical phenomena: perceiving acids to be some of the most
powerful agents in the production of these effects, he hence-
defined them as bodies that attract strongly, and are strongly
attracted ("acidiu m dicimus quod naturam attrabitt et atra-
bitur"). This however is to be considered merely as a con-
jecture of that great man, since no attempt was made by
him to submit to calculation any cases of affinity, or even
to obviate the weighty objections that might be brought
against the theory. The essential foundations of the New-
tonian attraction are, that the force of gravitation is in a
direct ratio to the mass or quantity of ponderable matter;
and that the square of the force is in an inverse ratio to the
square of the distance, or, to make this plainer by an exam-
ple: If the lead of a plumb-line is suspended two yards
from the side of a mountain, the attractive force exercized
upon it will be four times less than if the distance between
the lead and the mountain was only one yard; for

\[ 2 \times 2 = 1 \times 1 : 4 : 1. \]

Although, however, the judget of this law be rigorously
demonstrated in all cases where the distance is capable of
being measured, how does it apply to those inances in
which bodies are supposed to touch each other? How can
the apparent uniformity of attraction be made to explain
the infinite variety of chemical affinity? To this funda-
mental and obvious objection Buffon has given the following
reply. The distances between the several heavenly bodies
are so considerable, that they may be looked upon with
regard to their action on each other as so many gravitating
points, the slight differences in their figure being of little
or no account. If the moon and the earth, instead of being
spherical, were each in the form of a short cylinder, whose
transverse axis should be equal to their present diameter,
we must be content to acknowledge our total ignorance of the primary cause of chemical phenomena.

§ III. Of different kinds of Affinity, and the Constitution of Bodies and Science.

Whether the attractions of gravitation, of adhesion, of cohesion, and of compounding, be or be not considered as essentially the same, there is yet difference enough between them to allow of a very accurate definition of each, and this is the more necessary to be done, as there are certain confused cases of chemical affinity, in which the agency of all these forces may be distinctly perceived.

Gravitation is an attraction between two bodies at an ascertainable distance from each other, whose force is directly as the mass, and inversely as the square of the distance.

Adhesion is an attraction that takes place at the plane of contact, whose force is peculiar for each substance in nature, and in a direct ratio to the surface of contact.

Cohesion, or aggregation, is an attraction between molecules of the same nature, whose force is peculiar for each substance, and in an inverse ratio to the quantity of caloric, interposed between the particles.

Affinity, or the attraction of compounding, is that which uniting different homogenous substances, whether simple or compound, produces an uniform whole, incapable of being resolved by chemical force, and whose characteristic properties are often different, and sometimes contrary to those of its constituent parts. Thus, if running mercury is added to melted sulphur, a compound is produced, which has neither the colour, the splendour, the inflammability, the volatility, nor the specific gravity, of either of its constituent parts.

It is this affinity of compounding which is the great agent in all the operations of nature and art, that are referable to the science of chemistry, not only as an instrument of synthesis, as might be supposed from the primary meaning of the term, but also as the sole means of analysis; there being no way of dissolving a chemical compound, but by expelling its elements to the action of stronger affinities than those which retain them in union.

All the known infinities of affinity may be arranged under three classes, according to the number of elementary substances, acting on each other at the same time, and the number of new compounds thus produced.—Where only two are concerned, it may be called a case of concurrent affinity, or affinity of compounding, in which, if the force of their mutual affinity is ever so little superior to the sum of their respective degrees of cohesion, combination will take place. Thus, if a piece of quicklime is put into muriatic acid, the sum of their cohesion being less than the force of their mutual affinity, the two substances will unite together, and there will result a homogenous compound muriate of lime, possessing the properties neither of the earther nor of the acid. Tho' infinities also, in which more than two bodies unite together into one compound, come equally under this rule; as, when sulphuric acid, alumine and potash are mixed together, the result is common alum, a salt possessing peculiar properties, which could never have been inferred from those of its elements. All the cases belonging to these first class are those of concurrent affinities, where two or more substances by virtue of their attraction for each other, unite into one homogeneous body. Hence it appears, that though every substance has different degrees of affinity for other substances yet the strongest does not necessarily act to the exclusion of the rest.

It is not, however, always, nor indeed generally, the case, where more than two substances are concerned, that their respective affinities concur to produce one new substance; for it usually happens that their difference of force produces one binary compound, to the exclusion of the third element, on account of the weakness of its attraction for the new compound. Thus, if muriatic and sulphuric acid are mixed together, and an aqueous solution of pure barytes is then added, an infinitesimal combination of the barytes, to the exclusion of the muriatic acid, and this last, having also no affinity with the sulphat of barytes thus formed, or at least not sufficiently strong to overcome the sum of their several forces of cohesion, remains permanently excluded. In this instance, therefore, we see how two bodies, whose mutual affinity is very considerable, may unite together to the total exclusion of a third substance. To make this plainer, let A B C, be two substances, whose several affinity for C, is equal respectively to 4 and 7; it is obvious then, that B, will unite to C, with a force = 7 - 4 = 3 ; the first effect, therefore, of mixing these substances will be the production of B C, to the exclusion of A : and if the affinity of A, for B C, should be inferior to the cohesive attraction of the several particles of B C, for each other, it is clear that A, must be permanently excluded, notwithstanding its original affinity for C. This exclusion of the weaker by the stronger affinity takes place, not only when the two forces commence their action at the same time, but even when the weaker affinity has been previously allowed to exert its whole action on the base; thus, if muriatic acid and barytes are brought into contact, they combine and form muriat of barytes, which compound is held together by the force of affinity between the two; but when to this compound we add sulphuric acid, whose affinity for the earthy base is stronger than that of muriatic acid, an immediate change takes place, the whole of the muriat of barytes is dissolved, and the sulphuric acid combines with the barytes with a force equal to their mutual affinity minus that of the muriatic acid; or, to recur to our former illustration, if A C, are held together by a force = 4, upon the addition of B, whose force is = 7, the attraction of A to C, will be counterbalanced by 4 of B's affinity for A, and the remainder of B's force will produce the combination B C, = 2 of the original attraction between B and C. This, and similar cases are naturally illustrated by supposing C, to have a disposition to unite with A and B, A, being at first the only present, the combination A C, is produced; afterwards, when B, offers itself, C, having a preferable attachment to B, quits A, and forms the combination or partnership B C. It is this metaphorical explanation which induced Bergman to call all those infinities where a compound already formed is separated by the action of superior affinities, cases of elective attraction; and because in the above example only three substances are concerned, one new compound being formed, and the element of weakest affinity being excluded, it is properly distinguished as a case of single elective affinity, which forms the second class, ranking immediately after that of concurrent affinity.

From the consideration of single elective affinity, the progress is easy to that of double, or, more properly speaking, compound elective affinity. Suppose the affinity between sulphuric acid and potash, the constituent parts of sulphat of potash, to be = 12, and the affinity of nitrous acid for potash = 9, and that of oxyd of mercury for sulphuric acid = 8, it is evidently impossible to decompose sulphat...
affinity evident enable application, it this and which is concerned, inferior break neverthelless in howevcr, that number but =17. compound is fulphat and elements impracticable to weak which = doing, if, fictitious are compound acid potash and quiescent elements are addition let troubles with fulphuric fo that, unfolding the fulphat of mercury the two agents in this decomposition, have also a strong attraction for each other, tending to unite them into the compound salt nitrat of Mercury, let this force be = 4; it is evident then, that, upon the addition of nitrat of mercury to fulphat of potash, there are four distinct affinities acting two by two against each other. The quiescent affinities, or those which resist decomposition, are the attraction between sulphuric acid and potash = 12, and that between nitrous acid and mercury = 4, the sum of which is = 16. The divellent affinities, or those which tend to break the original combinations, are those of nitrous acid and potash = 9, and of sulphuric acid and mercury = 8, which together are = 17. Now as 17 is to 16, so is the sum of the divellent, to that of the quiescent affinities. On the addition, therefore, of nitrat of mercury to fulphat of potash, there will be a decomposition of both salts, and the formation of two new ones, nitrat of potash and fulphat of mercury. This is an example of compound elective affinity, which may therefore be defined as the resolution of a compound by means of the united affinities of its elements for those of another compound. It is obviously impossible, by means of double elective attraction, to obtain either of the elementary parts of a body in a separate uncombined state; but although in this respect it is inferior to single elective affinity, it is nevertheless infinitely superior in the vast variety of its application, and in its rendering not merely possible but even easy, a number of decompositions, which are absolutely impracticable by single elective attraction. Almost all the substances in nature are compounds, and the changes that we see continually operating around us, are brought about by very complicated affinities; so it is in nearly every process of art in which chemistry is concerned, a thorough knowledge, therefore, of the general principles of compound affinity is absolutely necessary to be acquired at the very threshold of the science.

From what has been already said, it is obvious that every chemical fact arranges itself under one or other of the three species of chemical affinity; and hence may be conceived the obligation that science is under to Geoffroy, for his ingenious method of arranging cases of single elective attraction, so as to enable the enquirer to discover in an instant any particular fact that he is looking for, or to compare at a single glance, the results of numerous and complicated experiments.

</table>

Of these Tables, the first is a transcript of the original one, published by Geoffroy, and which merits preservation as an historical memorial of an important era in chemical science. The second and third are, with a few alterations, copies of Dr. Pearon's enlarged edition of Bergman's tables.

Table II. contains the elective affinities, as far as they have been ascertained, of sixty of the most important chemical substances. All these take place through the medium of water, in which one or both of the substances are dissolved, the temperature therefore, in all the cases here mentioned, cannot exceed 212°Fahrenheit. At the head of each column, in larger characters than the rest, and divided from them by a horizontal line, is the name of the substance whose affinities are the subject of the rest of the column; and these are arranged in the order of their intensity, so that the substance of strongest affinity with that which is at the head of the column, stands the nearest to it. Thus in the column of lime, No. 8, the substances from oxalic acid downwards, present a decreasing series of the affinities of lime, hence the combination of lime with any substance in the column, may be decomposed by any of the bodies that precede this substance, but is not broken by those which succeed it. The use and application of this table is obvious. If, for example, it is required to decompose an aqueous solution of muriatic of soda (common salt) by tingle affinity; the first inquiry is, which of the two component parts is to be set at liberty; suppose it to be the acid, I am then to find a substance whose affinity with soda is greater than that of muriatic acid, for this purpose I turn to the column of soda No. 11, and find that by the addition of either sulphuric or nitric acid, I shall be able to decompose the salt in question, so as to obtain its acid in a disengaged state: if, on the other hand, the alkaline base is wanted, I find, upon inspecting the column of muriatic acid, No. 18, that the affinity of potash for muriatic acid is greater than that of soda; and therefore, by this means, I obtain muriat of potash and free soda. Again, if citrat of lime is to be decomposed, I find, by referring to citric acid, column 30, that it is impossible to do it so as to set at liberty the lime, because this stands the first in the column of citric acid; but from the column of lime No. 8, it appears that no less than thirteen acids will each of them separate the lime, so as to leave the citric acid disengaged. If the decomposition of sulphat of Barytes is required, it is plain from the column of Barytes, No. 6, that it cannot be decomposed as to let the sulphuric acid at liberty; it is also equally obvious from the column of sulphuric acid, No. 14, that the Barytes cannot be separated, sulphat of Barytes therefore is undecomposable in water by tingle affinity.

In Table III. the affinities of forty-three substances, without the medium of water, and at a temperature equal to the fusing of at least one of the substances in each instance, are registered: the application and construction of this table is precisely the same as of the former; to enlarge upon it is therefore unnecessary: it is curious, however, to observe how the order of affinities is modified by temperature; for we find that sulphat of Barytes which is undecomposable by tingle affinity in water, may at a high heat be decomposed with separation of the Barytes, by potash or soda; and with separation of the acid by the phosphiomorphic, boracic or arsenic acids.

The construction of Geoffroy's tables, although admirably well suited to express the general results of tingle affinity, is deficient as a method of registering the conclusions from single and unconnected experiments; on which account the system of Bergman, either invented or at least first brought into general use by him, have been universally adopted for this purpose. The register of an experiment in affinity ought not to be considered as complete, except it expresses clearly, 1st, the result, i.e. whether or not any change is effected; 2d, the menstrum, whether water, alcohol, or any other fluid in which the substances are dissolved; 3dly, the temperature of the substances at the time of experiment. 4thly, the nature of the new substances, whether they are precipitated from the menstrum, or remain dissolved, or are sublimed. Now all these circumstances are expressed clearly and concisely in the following schemes. Suppose the experiment is made to decompose muriat of potash in water at the common temperature, by soda, it will be found that no change...
change takes place, this is expressed by the following diagram, or scheme.

\[
\begin{align*}
\text{Muriat} & \quad \text{Muriatic acid} & \quad \text{Soda} \\
\text{of} & \quad \text{water } 69^\circ \\
\text{Potash} & \quad \text{Potash}
\end{align*}
\]

The substance to be decomposed is placed on the left hand, and is immediately followed by a bracket whose point is turned towards the compound; within the bracket are the names of the two simple substances of which the compound is formed, and parallel to one of them is the substance by whose affinity the decomposition was expected: no change however taking place, the scheme is left thus imperfect; in the centre is the name of the menstruum and the temperature in degrees of Fahrenheit’s thermometer.

\[
\begin{align*}
\text{Muriat of Potash.} & \\
\text{Muriat of Soda.}
\end{align*}
\]

This scheme expresses, that if to a boiling hot solution of muriat of soda in water, potash be added, a decomposition takes place; muriat of potash being formed, and the soda being set at liberty: the first line under the soda, and the point lines bracket under muriat of potash, express that both substances remain in solution.

\[
\begin{align*}
\text{Sulphat of Strontian.} & \\
\text{Sulphat of Magnesia.} & \\
\text{Nitrat of Potash.} & \\
\text{Carbonat of Potash.} & \quad \text{Nitric acid.} \\
\text{Sulphat of Soda.} & \quad \text{water } 69^\circ \\
\text{Sulphat of Magnesia.} & \quad \text{Magnesia} \\
\text{Muriat of Lime.} & \\
\text{Muriat of Ammonia.} & \quad \text{Fire.} \\
\text{Proof Spirit.} & \\
\text{Solution of Sulphat. Soda.} & \quad \text{Sulphated Soda.}
\end{align*}
\]

The above five schemes illustrate all the remaining cases

of simple affinity: in the first, we see that strontian added to sulphated magnesia dissolved in water, at the ordinary temperature, decomposes it, and produces sulphat of strontian, and magnesia, both of which are precipitated. In the second, the addition of nitric acid, to a solution of carbonated potash, produces nitrat of potash remaining in solution, while the carbonic acid is volatilized. In the third, sulphated magnesia with soda, produces sulphat of soda remaining in solution, and the magnesia is precipitated. In the fourth, dry muriat of ammonia and lime, heated together, produce ammonia which is volatilized in the form of gas, and muriat of lime remains behind. In the fifth, a solution of sulphated soda being added to alcohol, the water and alcohol unite together, while the sulphat of soda is precipitated.

It is impossible to arrange the results of experiments in compound affinity in a tabular form; accordingly, schemes framed on the same principles as those for single affinity, have been adopted for the convenient registering of all the known facts on this subject. For example, the facts that sulphat of lime and muriat of potash do not decompose each other; and that muriat of strontian, and sulphat of ammonia do decompose each other, together with the circumstances of such experiments are expressed in the following scheme.

\[
\begin{align*}
\text{Sulphat of Strontian.} & \quad \text{Sulph. a. Potash} \\
\text{Sulphat of Lime.} & \quad \text{Water } 69^\circ \\
\text{Muriat of Ammonia.} & \quad \text{Mur. a. Ammonia.} \\
\text{Muriat of Lime.} & \quad \text{Mur. a. Lime.} \\
\text{Muriat of Potash.} & \quad \text{Potash.} \\
\text{Proof Spirit.} & \\
\text{Solution of Sulphat. Soda.} & \quad \text{Sulphated Soda.}
\end{align*}
\]

§ IV. Methods of estimating numerically the force of elective Affinities.

Notwithstanding the vital importance of Geoffroy’s tables, and of all later ones constructed on the same plan, it is obvious that we can only learn from them the greater or less degree of affinity which different substances have for the same body, according to the order in which they are arranged: and though this is sufficient for foretelling the result in cases of single elective affinity, yet in more complicated cases, where the mutual attractions of four or more substances are concerned, the want of a numerical expression for the force of affinity, in order to infer with any probability the result of an untried experiment, must have forcibly impressed the mind of every chemist. Thus, if the result of a mixture of nitrat of potash with acetate of lime is required, all that can be learnt from the inspection of the tables is, that the affinity of nitric acid for potash is stronger than for lime, and that the affinity of lime for acetic acid is weaker than that for potash, or, to express it in a tabular form,

\[
\begin{align*}
\text{Nitrat of} & \quad \text{Lime.} \\
\text{Acetic of} & \quad \text{Potash.} \\
\text{Lime.}
\end{align*}
\]

hence we have,

[Quiescent affinities] = \(s + w\).

[Divalent affinities] = \(s + w\).
And it is impossible hence to conclude whether or not any chemical change will take place; but if we find the affinity of nitrous acid for potash = 12, of the same for lime = 7; of acetous acid for potash = 14, of the same for lime = 6,

\[
\begin{align*}
\text{Nitr.} & \quad \text{Lime} \\
\text{Potash} & \quad \text{Acet. a.} \\
& \quad \text{of} \\
12 & + 7 = 19 \\
& + 14 = 20
\end{align*}
\]

we shall then have

Quiescent affinities = 12 + 7 = 19

Divalent affinities = 6 + 14 = 20

and hence we may with certainty infer that a double decomposition will take place, with a force equal to the excess of 20 over 19.

Chemical philosophers have not, however, by any means agreed on the method to be followed for the attainment of this definable object; some with M. Wenzel, consider the time requisite for effecting solution as the expression of the force of the affinity between a substance and its menstrum; others with Fourcroy, believe the intensity of this to be more accurately measured by its reversion to decomposition, than by its rapidity in uniting bodies: according to Macquer the force of affinity is expressed by the facility with which bodies unite, compounded with the force by which they continue united. Kirwan, on the other hand, has estimated the affinity of acids for their bases by the different proportions of them that they require for saturation. And from this very diversity of opinions may be inferred the great difficulty of the subject.

According to M. Wenzel, the disposition to chemical union between bodies varies with the figure of their constituent parts; and, regarding the action of meniltra upon them as a mere mechanical impulse, subject to calculation upon the principles of statics, he concludes, that the rapidity of solution is an exponent of the force of affinity; and therefore, that the affinity of different bodies with any common menstruum, is in an inverse ratio of the time required for their solution. To prove this, he procured equal cylinders of silver, copper, lead, and other metals in a state of purity, having weighed them, he covered them with varnish so as to leave only one end exposed to the action of the solvent; they were then separately suspended in equal quantities of nitric acid, and left to its action for an hour; being then taken out and freed from their varnish, they were weighed, and the quantity dissolved of each was found to correspond with the order of their respective affinities for the acid. This large conclusion of M. Wenzel's from so partial an experiment, is however, more strikingly contradicted by facts: the cylinders of silver and lead will be scarce perceptibly acted on in muriatic and sulphuric acids, whereas these will precipitate a nitrous solution of either metal with the greatest ease; a multitude of similar obvious contradictions to the rule might be mentioned, if need were, besides that M. Wenzel's method, if ever so accurate, is capable only of being applied in cases where one of the substances is a solid.

The resistance which the parts of a compound offer to any force that is employed to separate them, offers a probable method of estimating the degree of their mutual affinity: since however the union is chemical, it is plain that mechanical means of separation cannot be used for this purpose, and there are very few chemical agents that can be

\[

\end{align*}
\]

made the subject of calculation. The only method proposed by Fourcroy, and one that he himself allows, is applicable to the greatest number of cases, is to ascertain the thermometrical temperature necessary to effect a separation. It is certain that the application of high degrees of heat in many cases opposes the action of chemical affinity: the force of affinity for caloric (heat) is also probably different in every natural substance, we know in many cases, as in the burning of lime, the reduction of mercurial oxys, &c. that more caloric is capable of separating carbonic acid from lime, oxygen from mercury, &c. it is not therefore a priori improbable, that the affinity of any acid for the different alkaline, earthy, and metallic bases should be truly expressed by the various quantities of caloric, as indicated by the degrees of the thermometer and pyrometer, required for the decomposition of the different salts. But although this rule certainly holds good in some cases, yet the greater number of compound salts are incapable of being decomposed by the greatest quantity of mere caloric that we are able to apply, and almost all the cases of chemical affinity through the medium of water, are also incommensurate with the scale proposed.

In consequence of these difficulties both Fourcroy and Morveau have agreed in proposing an arbitrary number as the basis of their respective numerical series, all the other terms of which are brought by approximation and comparison with the results of known experiments, to bear certain proportions to the standard term, and to each other.

It is plain, therefore, that a table, constructed on these principles, can never be anything more than an approach towards the truth; and even this can only be effected by repeated corrections according to the results of a vast multitude of experiments; and in all untired cases it is reduced merely to an argument from analogy. In order to verify the numbers in the following short table of Morveau, no less than 490 experiments would be necessary, and probably more than half these would require separate adjustments of all the numbers in the table; it may be conceived therefore how many centuries of incessant labour would be required to tabulate in this manner with any accuracy, even the binary combinations of the present chemical substances.

How far this Table, which has already undergone repeated corrections by its able author is to be depended upon, a few examples will show.

If acetite of barytes be added to sulphat of soda, a decomposition will take place, and there will be produced fulphat of barytes and acetite of soda: now according to the Table, the sum of the

\[
\text{Quiescent affinities } = 28 + 58 = 86
\]

Divalent affinities

\[
\text{of potash and acetite of lime mutually}
\]
mutually decompose each other, forming nitrate of lime and acetate of potash, but by the Table:

Quiescent affinities = 58 + 21 = 79

Diluent affinities = 44 + 26 = 70

The Table, therefore, in this instance, is erroneous.

Nitrate of soda and muriat of ammonia mutually decompose each other; but by the Table:

Quiescent affinities = 58 + 21 = 79

Diluent affinities = 38 + 31 = 69

Nitrate of potash and sulphate of ammonia mutually decompose each other; but by the Table:

Quiescent affinities = 58 + 26 = 84

Diluent affinities = 38 + 21 = 69

Hence it is obvious the great probability of error in all calculations and real mixings founded on this Table.

Mr. Kirwan's numerical system of affinities is founded on the proportion of base necessary to saturate a given quantity of acid; and as no one has treated this important subject with such unwearied ability and profound investigation as the learned president of the Royal Irish Academy, it will be necessary to enter somewhat minutely into an examination of the fundamental parts of his system.

The first object with Mr. Kirwan was to ascertain exactly the quantity of real acid in each of the three mineral acids, at a determinate specific gravity (by real acid is to be understood acid free from all water, except such as is necessary to its very constitution). For this purpose, affirming that muriatic acid, in the form of gas, is free from all mixture with water, he procured 100 cubic inches of this acid gas, and found its weight to be = 60 grains, the barometer standing at 29.6, and the thermometer at 57°. The barometrical pressure remaining the same, and the temperature being = 49°, he found that 10 grains of water absorbed an equal weight of muriatic acid gas, and the liquid acid thus formed occupied the space of 13.3 grains of water; hence the specific gravity of this acid was equal to about 3.5, and that of a muriatic acid equal in purity to the acid gas, and of the same degree of condensation as the real acid contained in the above mentioned liquid acid, would be equal to 3.03.

Taking this, therefore, as the specific gravity of real muriatic acid, he next established the proportion of this contained in muriatic acids of different specific gravity. Not being able to obtain nitric or sulphuric acids in a state of gas, he calculated the proportion of real acid contained in these liquids, upon the supposition that equal quantities of the three acids, reduced to the state of real acid, required equal weights of potash for their saturation: the results of these calculations being found to accord with the actual specific gravities of these acids, diluted with different known quantities of water, he hence inferred the truth of the principle that he had assumed. Proceeding from these data he next ascertained the quantity of real acid, and real bases, in all the mixtures formed by the three acids, with alkaline and earthy bases, and comparing these results with the known order of affinity of the bases for the acids, he drew the general conclusions, "That the quantity of real acid necessary to saturate a given weight of any of the bases, is in an inverse ratio to the affinity of the bases with the acid; and that the quantity of any of the bases necessary to saturate a given quantity of any acid, is in the direct ratio of the affinity of the base for the acid." Or in other words, that, of two bases, which has the strongest affinity for any given acid, requires the least quantity of acid for its saturation; and a given quantity of acid will take up a greater quantity of one base than of another, in proportion to the force of its affinity for the base. If these deductions are legitimate, the following Table, containing the quantities of base required to saturate 100 parts of real acid, is also a true expression of their respective forces of chemical affinity.

Mr. Kirwan's method has, however, been examined with much care, by two of the ablest chemical philosophers that the age can boast of, M. M. Morveau and Berthollet; and a number of very serious objections have been brought against it. These may be divided into those which call in question the essential principle of the force of affinity being in direct ratio to the quantity of base, and those which only relate to the accuracy of particular experiments.

The essential objections are contained in the following experiments of Morveau. A quantity of sulphuric acid containing, according to the Table of Kirwan, 100 grains of real acid, required, for saturation, 201 grains of crystallized carbonate of potash. A quantity of nitric acid, containing also, according to Kirwan, 100 grains of real acid required 302 grains of the same salt for saturation. A quantity of muriatic acid, containing 100 grains of real weigh, required 905 grains of the same salt. Hence it appears either that Mr. Kirwan's fundamental calculations are erroneous, or that the very principle of his whole system is false; for not only do equal quantities of real acids require for their saturation different quantities of the potash, but the quantity of base required is in an inverse ratio to the force of affinity, being exactly the reverse of the principle that Kirwan lays down.

Again, according to Kirwan's corrected tables,

(i) Sulphat of potash consists of Acid 100
   Potash 108.7

(ii) Sulphat of lime - - Acid 100
   Lime 80.6

(iii) Nitrat of potash - - - Acid 100
    Potash 83.33

(iv) Nitrat of lime - - - Acid 100
    Lime 34.4

Now, if a solution be made in water of such a quantity of sulphat of potash as contains 100 grains of real acid, and to this a sufficient quantity of nitrat of lime be added to convert the whole of the sulphuric acid into sulphate of lime, it is evident that 80.6 grains of lime will be required, and 234.4 grains of nitric acid will be left at liberty; but this quantity of nitric acid would require for saturation 105.42 grains of potash, whereas the decomposed sulphat of potash will furnish only 108.7 grains; there should remain therefore 64.87 grains of nitric acid in excess, or uncombined.
with any base. If, however, we put this calculation to the test of experiment, we shall find whether the liquor be diluted, or concentrated, or even brought to crystallization, that there is not the smallest trace to be found of any disengaged acid.

Besides the above, there are several other important objections to Mr. Kirwan's theory, especially to that part of it in which he supposes equal quantities of real sulphuric, nitric, and muriatic acids, to require for their saturation the same proportion of potash. The force of these objections has been acknowledged by Mr. Kirwan in his treatise "on the strength of acids and the composition of neutral salts?" he has, in consequence, deduced the proportion of real acid, in nitrous and sulphuric acids, from other less exceptionable data; so that his numerical table of the strength of affinities is now by far the most correct of any that has yet been constructed; and his fundamental principle, that the quantity of base required to saturate a given quantity of real acid, is a true expression of the force of affinity between the acid and the base, seems to receive additional confirmation in proportion to the advance of chemical knowledge.

The following corrected table of the quantity of base taken up by 100 parts of sulphuric, nitric, muriatic, and carboxic acids, is copied from Mr. Kirwan's essay on the analysis of mineral waters.

§ V. Laws of Affinity.

Before the subject of affinity was so well understood as it is at present, or rather while chemists were not yet aware of the extreme difficulty and uncertainty of their researches, all the known facts were collected and classified, and from them was deduced a number of general laws of affinity, most of which have since been overthrown, or essentially modified by later more accurate investigations. The enumeration of these laws, with such restrictions as have been induced by modern discoveries, will form the subject of this section.

1. Chemical affinity takes place only between bodies of different natures.

This necessarily follows from the definition given in the third section, by which chemical affinity was distinguished from the attraction of aggregation or cohesion, by this very circumstance.

2. Affinity takes place only between the ultimate particles of bodies.

Where two simple substances enter into combination, this may be allowed to be the case, but certainly does not happen when compound bodies unite with each other: thus when oxygen and hydrogen combine together into water, and oxygen and sulphur into sulphuric acid, there is probably an affinity between the ultimate particles of oxygen with those of hydrogen in one case, and those of sulphur in the other; but when water and sulphuric acid combine together, the affinity takes place between particles of water and acid, each of which is reducible into its chemical elements, and is, therefore, not in a state of ultimate division.

3. The affinity which any one body has for a series of others, is not equal in force towards each individual of that series.

It is probable that no two substances can be found, whose separate affinity for a third is perfectly equal in similar circumstances; that such instances, if they ever occur, are at least very rare, is obvious from all that has been said concerning single and compound elective affinity; the whole of which essentially depends upon this law, and is at the same time a demonstration of its truth.

4. Chemical affinity may arise upon more than two substances at the same time, and unite them into one compound.

A considerable number of triple salts has lately been discovered which seem to countenance this law; perhaps,

Vol. I.
proportion as its surfaces are multiplied by grinding it down to powder, so is its attraction of aggregation diminished; and the action of the sulphuric acid on the lime, to the exclusion of the thoric acid, becomes more energetic. It would be more correct to say, that the effect of chemical affinity is inversely as the attraction of aggregation; because its absolute force remains constantly the same, and it only appears to increase on account of the diminution of its antagonistical attraction. Thus, let the chemical affinity of lime and thoric acid be \( r \), and the force of its cohesive attraction, when crystallized \( = x \), the sum of its quiescent affinities will be \( = r + x \). Let the affinity of sulphuric acid for lime, or the divalent affinity \( = y \); it is obvious that no decomposition can take place, although the chemical divalent affinity is superior to the quiescent one; but, when the affinity is reduced by mechanical trituration to be only \( z \), then the strongest chemical affinity will become efficacious, and a decomposition will take place.

The aggregation of bodies is, however, more frequently overcome by the action of solution by water, or fusion by fire, and these phenomena are so commonly made use of that the habit is infallibly acquired of considering solutions of substances in water or fire, as equally simple with the same bodies when in a concrete state. It is from this oversight that all the apparent exceptions to this law have originated.

If, says Morveau, we apply heat to a mixture of acid and water, or of alcohol and water, which are all chemical combinations, we only augment the degree of their rarefaction; but instead of thus promoting their union we separate them; the same is the case with those metallic oxides that are decomposable by heat, and of all the compound salts, one of the principles of which is more fixed than the other. If, however, caloric is capable of being exhibited in an uncombined state, and of being distinguished from all other substances by peculiar sensible properties, if these are modified and changed by combination with different bodies, if caloric may be transferred from one body to another, according to an ascertained order of chemical affinity; and finally, if it may be separated from its combination, and again exhibited with all the original properties that were at first characteristic of it, what reason is there to deny that it is so far a material substance, as to be capable of chemical combination? To recur, therefore, to the examples adduced by Morveau; if to the compound of alcohol and water a certain quantity of caloric be added, it will be divided between the two ingredients, according to their respective affinities, and in proportion to the addition of this new substance the original affinities of the water and alcohol be weakened: the alcohol being the former saturated with caloric, will assume a gaseous form, and being affixed by the attraction of gravitation, will separate from the water. In all this there is nothing inconsistent with the general order of chemical agency; whereas the reasoning of Morveau involves a contradiction in terms: for if the force of chemical affinity is capable of being overcome by rarefaction, and if rarefaction is nothing but the greatest possible resolution of an aggregate, it follows that the absolute force of chemical affinity may be overcome by the negation of the attraction of aggregation.

7. When two or more substances unite to form a chemical compound, they lose their own particular properties, and those of the new compound are not to be inferred from the properties of its elements.

It is not meant by this, that the properties of a compound are always, and in every particular different from those of its constituent parts, only that they are by no means intermediate between them. The reverse of this was maintained by the earlier chemists, and accordingly Stahl taught that fats were composed of earth and water, because he limited their properties to be a medium between those of these two substances. It will probably be thought at present that the very instance which Stahl has selected to prove his maxim is rather conclusive on the contrary side; for numberless other more exceptionable examples occur in every department of chemistry. Tin and iron are both of them very ducile, but if equal parts of the two are melted together, the result is a brittle alloy. Magnesia is taftable, sulphuric acid is intensely sour, combine them, and we obtain a bitter salt. Alkali is colourful, syrup of violets is purple, the product upon mixture is green: carbonic acid and ammonium, when separate, are gaseous, mix them, and they become solid. Amalgam of lead, and of bismuth are solid, by combination they form a liquid.

8. The capacity for caloric is always changed by chemical combination.

This law is, in fact, only an offset from the preceding; and for the explanation of it, see Caloric.

§ VI. Anomalies.

All those cases of chemical affinity, which either really or apparently contradict the general laws that have just been cited, may be reduced to two classes; viz. those depending on the variable force of affinity itself, and those occasioned by the action of other antagonistic attractions.

1. The whole system of Bergman depends on the absolute uniformity of elective attraction, on its being a constant force, so that if (the temperature and menritrum remaining the same) the combination A B is decomposed by C, to the exclusion of B, the new substance A C cannot be again separated by B, so as to reproduce A B, and leave C at liberty. With till more rigor does this apply to all the methods of eliminating numerically the excess of one affinity over another, independently of the relative quantities of the substances employed. It appears, nevertheless, from Berthollet's treatise on this subject, that in almost all cases of change produced by elective affinity, there is not a total transfer of the bale, but a partition of it between the two opposite attracting substances in a compound ratio of the relative force of affinity and quantity of each. That in many cases the excess of quantity may supply the deficiency of force, and therefore that the mafs must be carefully taken into consideration, together with the specific force in the construction of tables of affinity. Barytes is properly placed by Bergman at the head of the column of the affinities of sulphuric acid, in water; not however because it is impossible for sulphat of barytes to be decomposed by any other substance, but because, if equal quantities are taken of all the substances that combine with sulphuric acid, barytes will be found to decompose the greatest proportion of any other sulphat; and of the sulphat of barytes the largest part will remain undecomposed by a quantity of any body equal in weight to the barytie part of the salt in question. Thus, if equal parts of pure potash and sulphat of barytes are boiled together to dryness, in a small quantity of water, it will be found that the sulphuric acid has been divided between the two bales in the compound ratio of their mafs and their force of affinity; the greater part of the barytie sulphat will be found undecomposed, a small quantity of barytes will be found at liberty, most of the potash...
potash will also be uncombined, but a certain proportion
will be united with the sulphuric acid which the barytes
has lost, in the form of sulphat of potash. To make this
matter plainer, let us examine the results of the decomposi-
tion of sulphat of barytes by potash, and of sulphat of
potash by barytes, as calculated from Mr. Kirwan's data.
Sulphat of barytes contains 3.33 parts of sulphuric acid and
6.66 of barytes; if therefore we take ten parts of this
salt and an equal quantity of potash we have,

\[
\begin{align*}
3.33 & \text{ sulphat. a.} \\
6.66 & \text{ barytes} \\
10 & \text{ potash}
\end{align*}
\]

and the affinity of equal parts of barytes and potash for
sulphuric acid being : 2 : 1.24 the acid, if shared between
them in the compound ratio of their mafs and their affinity,
will be 13.32 to barytes, and 12.1 to potash: now the
composition of sulphat of barytes being as already stated,
and that of sulphat of potash being 54 of alkali to 45 of
acid, there will remain undeveloped 5.22 parts of barytic
sulphat; 5.18 of barytes will be set at liberty; 3.47 of
sulphat of potash will be produced, and 8.11 of potash
will continue uncombined. If, on the other hand, we mix equal
parts of sulphat of potash and barytes we shall have

\[
\begin{align*}
5.48 & \text{ potash} \\
4.52 & \text{ sulphat. a.} \\
10 & \text{ barytes}
\end{align*}
\]

and the acid being divided between the bases in the com-
pond ratio of their mafs and force of affinity, will give
6.63 parts to the potash and 20. to the barytes: there will
then be 2.48 parts sulphat of potash remaining unde-
veloped, and 3.24 barytes uncombined; 4.12 parts potash will be
set at liberty, and 10.14 sulphat of barytes will be produced.

It is not merely in a few inferences that this partition
of one body between two others, according to their respective
masses and affinities, takes place, there being scarcely any
example to the contrary. Lime has a weaker affinity than
potash for sulphuric acid; yet lime, when acting on an equal
weight of sulphat of potash, is capable of partly decom-
poling it: the same happens with phosphat of lime and
potash, with sulphat of potash and soda, &c.

From these and similar experiments it follows, that when
a compound of two substances is acted on by any third
body, that part of the compound which is the subject of
combination, is shared between the two remaining elements,
not only in the proportion of their respective degrees of
affinity, but also according to their quantity; these two
substances therefore must be considered as opposite forces,
dividing between them the subject of combination, accord-
ing to the ratio of their intensity, and this intensity depends,
not only on the energy of affinity, but also on the quanti-
ty, so that by varying this in either, the effect produced
will be proportionally modified.

Another consequence is, that the action of a substance
in opposition to any particular combination decreases, as it
advances towards saturation; and as the force of this is
continually diminishingso the power of the substance
tended is decreasing according to its increased quantity,
and this effect takes place till the antagonistic forces exactly
counterpoise each other.

A third inference is, that in cases of precipitation the pre-
cipitate necessarily retains a portion of the substance with which
it had before been combined; for during the instant of this
action, a partition is made of the subject of combination in
proportion to the affinities and masses of the substances em-
ployed.

2. The variable ratio of the force of affinity between
the two elements of particular compounds, is another ano-

maly and occasional source of error. Thus the black oxyd
of manganize readily parts with a portion of its oxygen,
by the action of such a portion of carbonic acid as will just
read to set it on fire; but after it has parted with this excess of
oxygen, the affinity which unites it to the remainder, fol-
lows a much higher ratio, so that the utmost possible ac-
cumulation of carbonic acid is unable to produce any further
decomposition: hence the affinity of metallic manganese for
oxygen is very high, and the affinity of the white oxyd
of manganise for oxygen is much lower than it ought to
be, provided the affinity of these two substances was in a
uniform ratio, according to their relative proportions. So
again, the acellular sulphat of barytes is decomposed by
an equal quantity of water into the common barytic sul-
phat and sulphuric acid, yet no addition of water can pro-
duce any further decomposition of this earthy salt; the
general fact, therefore, of mafs compensating for inferiority
of attractive force does not here hold good. Another
striking example of the same is the decomposition of tar-
trite of potash by ac visit acid, into acellular tartarite of
potash and acetite of potash; and the resistance made by
the acellular tartarite to all further decomposition by any quantity
of acetic acid. The same may be said of the affinity of mu-
naristic acid to oxygen, and of its base for the same substan-
c.

3. The order of chemical affinities is often modified
by the attraction of saline vegetation, a power belonging to
all but the deliqueful salts, which compels them to separate
from the water that holds them in solution, and rise in
the form of vegetables up the sides of the vessel in which they
are contained; the efflorescent salts are more particularly
subject to this attraction, and consequently their affinities
are the most frequently disturbed by this force. Muriat
of soda is scarcely, if at all, decomposed by carbonated lime
in water; but if, according to Scheele's process, lime and
muriat of soda are mixed with only so much water as will make
the mass into a paste, and this is exposed to carbonic acid
gas, a saline efflorescence will shortly make its appearance,
polluting all the properties of carbonated soda, and the
muriat of lime in a deliqueulent state will be found at the
bottom of the vessel; but if the carbonat of soda is dis-
olved and added to the muriat of lime, an immediate
decomposition will take place, and carbonated lime and
muriat of soda will be produced. A similar effect happens
when iron is moistened with muriat of soda and exposed to
carbonic acid gas.

4. The last cause of anomaly that need be mentioned,
arises from the affinity of water with substances dissolved
in it, and this is a very important circumstance to be aware of,
as it accounts for the otherwise inexplicable phenomenon of
what are called incompatibie faults in certain mineral waters.
Bergman, Kirwan, Cavendish, and other eminent chemists,
have discovered in mineral waters the co-existence of small
quantities of various faults, which, in common circumstances,
decompose each other; thus the waters of Rathbone-place,
according to Cavendish, contain in the pint 0.9 of a grain
carbonated ammonia, and 1.2 grains of sulphat of lime.
A gallon of Harrowgate water contains 13 grains muriated
lime, and 5 grains sulphated magnesia. But in both these
cases, on account of the small quantity of salt compared to
that of the water, the affinity of this last, aided by its mafs,
is capable of overcoming the excess of the deliveuent, over
the quiescent affinities of the faults that it holds in solution;
and is obviously the true reason of the fact, for if, by eva-
aporation, a considerable proportion of the water is taken
away, the deliveuent affinities of the two faults become effica-
cious, and decomposion takes place.

For other subjects in some measure connected with the

important
important subject of chemical affinity, see Adhesion, Crystalization, Saturation, Solution.

Affection, is a name given by the Arabians to opium; and also to an elec trity, in which opium is an ingredient.

Affirmation, affirmative, in Logic, a positive proposition, alleging the truth or reality of something.

Affirmation is defined, by the Logicians, an act whereby we attribute one idea to another; as supposing it to belong, or agree to it. —As when, conceiving perfection to agree to the Deity, we say, God is perfect.

This, on other occasions, is called Innuunciation, proposition, composition, and judging.

Affirmation, in Law, signifies the ratifying or confirming a former law, or judgment.

We say, to affirm a judgment: the house of lords, on an appeal, affirmed the decree of the Lord Chancellor, or of the lords of seisin in Scotland.

Affirmation is used in the same sense. 8 Hen. vi. c. 12.

Affirmation is also used in Grammar, by some refers upon that art, for what is usually called a verb; because the office of that part of speech is to express what we affirm or attribute to any subject.

Affirmation is also used for a solemn form of attesting the truth, allowed to be used by the Quakers, instead of an oath, which they hold absolutely unlawful to take.

See the form of the affirmation, &c. under the article Quaker.

Affirmation is of divers kinds, tacit, by words, by a nod, or gesture, &c.

In a civil law sense, affirmation may be divided into simple, which is that from which no obligation arises; and qualified, which infers an obligation.

The requisites of this latter are, that it be, 1. deliberate and free; 2. sincere; 3. certain and specific; 4. clear and perpicious.

Affirmative, in Logic. See Affirmation.

There are universal affirmative propositions; and such, usually, are the first of syllogisms.

In Algebra we have also affirmative or positive quantities, which have their appropriated characters. The term affirmative was introduced by Vieta.

Affirmative, in Grammar. Authors dilfinguish affirmative particles; such is, yes.

The term affirmative is sometimes also used substantively. Thus we say, the affirmative is the more probable side of the question: there were so many votes, or voices, for the affirmative.

Affirmative is particularly applied, in the Roman inquisition, to such heretics as own the errors and opinions with which they are charged; and maintain them in their examination with firmness and resolution.

Affix, affix, compounded of ad and fix, I fix, in Grammar, a particle added at the close of a word, either to diversify its form, or alter its significations. In which sense, affix is the same with suffix; though affix is sometimes, but left properly, applied more generally so as to include prefix particles.

We meet with affixes in the Saxon, the German, and other northern languages; but more especially in the Hebrew and other oriental tongues.

The Hebrew affixes are single syllables, frequently single letters, suffixed to nouns and verbs; and contribute not a little to the brevity of that language. The affixes of nouns may be called possessive affixes, as they denote the possessive pronouns; and those of verbs, verbal affixes. In feminine nouns, ending in מ, the מ is changed into מ before the affixes, and מ is affixed after the plural feminine termination מ מ, probably for softening the sound; e.g. מ מ, my laws, and מ מ, our laws. The מ of the plural masculine termination is expelled by the affixes, and when מ is affixed to the plural, מ is expelled, the מ of the plural conecives with the affix; and they are distinguishable only by the מ, or by other words in the sentence; e.g. מ מ, my books, מ מ, our books. Plural affixes are not unfrequently suffixed to singular nouns, and vice versa; e.g. מ מ, (1 Kings viii. 26) for מ מ, thy word; and מ מ (Exod. iv. 5) for מ מ, their fathers. As the possessive pronouns are suffixed to nouns, the personal pronouns are suffixed to verbs in the same manner. In this case the מ of the third person singular feminine is changed into מ, and the מ of the second person singular feminine affixes מ, before the affixes; e.g. מ מ, (1 Sam. xviii. 28) be loved him, for מ מ and מ מ (Ezek. xvi. 19), for מ מ, and then gavest him. In the second person plural, masculine and feminine of ק, the מ and מ are ejected, and their place is supplied by מ, inferred before the affixes; e.g. מ מ, מ, מ, י and י, ye delivered him. Sometimes מ is wanting, and thus this person is not easily distinguished from the third, second and first person singular; as מ מ (Zeck. vii. 5), for מ מ, did ye fall unto me? Affixes are sometimes suffixed to the infinitives of passive verbs, in which case these infinitives assume the rank of subjunctive nouns; as, מ מ (Gen. v. 2). In the day when they were created, or of their creation. When affixes are thus joined to infinitives, they may be taken either actively or passively, or expressed by the nominative or accusative case, according to the sense of the passage; e.g. מ מ, מ מ, may be underfoot to signify either, in the day in which he himself delivered, or in which he delivered him. Some adverbs, and all prepositions assume affixes; but as the affixes of verbs are generally rendered by the accusative, and those of nouns by the genitive, the affixes of adverbs are expressed by the nominative, and those of prepositions by the case which the preposition governs. Wilton’s Elements of Heb. Gram. p. 108. 174. Maelefeb, Heb. Gr. vol. i. p. 65, 171, 189.

The oriental languages are much the same as to the radicals; and differ chiefly from each other as to affixes and prefixes. Mem. Acad. Infrap. tom. ix. p. 334.

Afflatus, formed from ad and flares, to blow, literally denotes a blast of wind, breath, or vapour, striking with force against another body.

Naturalists sometimes speak of the afflatus of serpents.

Tully uses the word figuratively, for a divine inspiration. In which sense, he ascribes all great and eminent accomplishments to a divine afflatus. See Pithia.

Afflenk, in Geography, a town of Stiria in Germany; two leagues north of Pruck.

Affliction is not itself, in propriety of medical speech, a disease, but it produces many, for whatever excites envy, anger, or hatred, produces diseases of tenes fibres; as whatever excites tears, grief, joy, or delight, begets diseases from relaxation.

Many
Many chronic diseases, particularly the *pleuris*, spring from afflication. For a very remarkable history of the effect of affliction, see *Hill. de l'Acad. Roy. des Seienc. an. 1732.

**AFFUX**, in *Electricity*, is opposed to *efflux*; and both terms were used by the Abbé Nollet, and also by Dr. Watton, previously to the discovery of positive and negative electricity. They apprehended, that in all electrical operations, there was both an *affux* of electrical matter to the globe and the conductor, and likewise an *efflux* of the same matter from them. Dr. Watton soon corrected this mistaken opinion; but the Abbé Nollet was more tenacious; and he was confirmed in his attachment to this favourite theory by observing, that bodies not inflamed, plunged in electric atmospheres, showed signs of electricity; not perceiving, that the electricity of such bodies was in its nature and effects different from, and directly opposite to that of the electrified body, in the atmosphere of which they were involved. See *Electricity*.

**AFFORAGE**, in the French *Custume*, a duty paid to the lord of a district, for permission to sell wine, or other liquors within his seigniory.

Afforage is also used for the rate or price of provisions laid and fixed by the provost, or sheriffs, of Paris.

**AFFORARIE**, to afford, in *Law*, is to set a value on anything; and *afforatus* denotes appraised or valued, as things vendible in a fair or market. Du-Cange. See *Affereors*.

**AFFOREMENT**, *afforciement*, derived from the barbarous Latin *afforciare*, to strengthen, confirm, in some ancient charters, denotes a FORTRESS, or work of fortification and defence.

**AFFORESTING**, *afforestatio*, the turning ground into forest. In this sense, the word stands opposite to deafforesting.

The Conqueror, and his successors, continued afforeting the lands of the subject for many reigns; till the grievance became so notorious, that the people of all degrees and denominations were brought to sue for relief; which was at length obtained, and commutations were granted to survey and parcel out the forest, and separate all the new afforested lands, and re-convert them to the uses of their proprietors, under the name and quality of *purlieu*, or *pouvoir* land.

**AFFRANCHISEMENT.** See *Manumission*.

**AFFRAY**, in *Law*, is derived from the French word *effray*, to affright, and it formerly meant no more; as where persons appeared with armour or weapons, not usually worn, to the terror of others. *Stat. 2 Edw. III. cap. 3.* But it now implies a skirmish or fighting between two or more, in some public place, to the terror of his majesty's subjects; and there must be a stroke given or offered, or a weapon drawn, otherwise it is not an affray; but if the fighting be in private it is no affray, but an assault. *3 Stat. 158.* It is iniquitous in the court leet, and punishable by justices of peace in their seions, by fine and imprisonment; and it differs from assault, in that it is a wrong to the public; whereas assault is of a private nature. Lamb, *ib.* ii. Affrays may be suppressed by any private person present, who is justifiable in endeavouring to part the combatants, whatever consequences may ensue. But a constable, or other similar officer, may break open doors to suppress an affray, or apprehend the affraiers; and he may either take them before a justice, or imprison them by his own authority, for a convenient time, till the heat is over; and may then, perhaps, also make them find forfeits for the peace. *3 Stat. 158.* 1 *Hawkins P. c.* 134, 136, 138. The offence of affray admits of several degrees of aggravation. This is the case when two persons deliberately engage in a duel, though no mischief has actually ensued. Another aggravation is, when the officers of justice are disturbed by an affray, in the due execution of their office, or where it occurs in the king's court and such places. All affrays in a church or church-yard are deemed heinous offences; and therefore it is enacted, by Stat. 5 and 6 Edw. VI. c. 4, that if any person shall, by words only, quarrel, strike, or brawl, in a church or church-yard, the ordinary shall suspend him, if a layman, *ab injerto ecclesia*; and, if a clerk in orders, from the ministration of his office, during pleasure. And, if any person in such church or church-yard proceeds to finite or lay violent hands upon another, he shall be excommunicated, *ipsa fide*; or if he strikes him with a weapon, or draws any weapon with intent to strike, he shall, besides excommunication, (being convicted by a jury) have one of his ears cut off; or, having no ears, be branded with the letter F in his cheek. Blackll. *Com. vol. iv. p. 140.*

**AFFRIGHTMENT, of Affreiment, Affrectament, in Law,** signifies the fright of a flip.

The word is formed from the French *friet*, which expresses the same thing.

**AFFRONTE,** French, compounded of *ad*, *it*, and *front*, *forehead*, in *Heraldry*, is understood of animals borne in an *escutcheon* as facing, or with their heads turned towards each other. This is otherwise called *confront*; and stands opposed to *adors*. When a savage's head is full-faced, it is said to be *affronte*. The word often occurs in the same sense with gardant.

**AFFUERA,** in *Geography*, one of the islands of Juan Fernandez, on the South-sea coast, in the kingdom of Chili. Its longitude, from the meridian of Callao, is 30° 20', and it is about 400 leagues to the north of Cape Horn. This coast swarms with sea lions and wolves.

**AFFUAGE,** *affuigium*, derived from *affrare*, to make a fire of ad and focus, in *Ancient Customs*, a right of cutting fuel-wood in a forest, or the like, for maintaining family-fire. Du-Cange.

**AFFUSION,** the act of pouring some fluid substance on another body. Dr. Grew gives several experiments of the combustion arising from the affusion of divers meritirums on all sorts of bodies. Divines and church historians speak of *baptism* by *affusion*; which amounts to much the same with what we now call sprinkling.

**AFGHANS,** in *Geography* and *History*, comprehend generally the several tribes of Malometians, who inhabit the northern parts of India; some of whom are spread over the whole of India, and known by the name of *Pattans*: they are called the kilt soldiers in the country. In a more restricted sense, they are the indigenous poissellers of a tract of country, which stretches from the mountains of Tartary to certain parts of the gulf of Cambay and Persia, and from the Indus to the confines of Persia; and their principal settlements have been the mountainous districts bordering on Kandahar, Cabul, Gava, Pathanweer or Peshwar, and Hazarot, &c. The Afghans are represented as a rude unlettered people, without a written character, says Mr. Forster (Journey from Bengal to England, through the northern parts of India, &c.), and speaking a language, called *Pishko*, peculiar to themselves. They are a robust hardy race of men, and being generally addicted to a life of predatory warfare, their manners largely partake of a barbarous insolence, and they avow a fixed contempt for the occupations of civil life. The territory which they chiefly inhabit is denominated by Mr. Forster *Afghanistan*, and he observes that, though the natives are denominated Tartars in some histories of Asia, they bear no resemblance to those people,
people, in their persons, manners, or language. They have been sometimes subject to the Moguls, and sometimes to the Persians, but more frequently independent. During the weak reign of Shah Sultan Hoffein, and the tyranny of the Afghan princes, by whom he was governed, they suffered many severe oppressions; and under the direction of Mir Weis, or Vazir, one of their chiefs, a man of a bold and enterprising spirit, they determined to revolt, and to throw off the Persian yoke. Having intellectually petitioned for redress, and their deputies to the Persian court being dismissed as the agents of a seditious and turbulent people, their leader, Mir Weis, was seized and sent as a prisoner to Ispahan. He contrived, however, by his presence and eloquence, to ingratiate himself with the king's ministers, and with the king himself, that he was not only relented, but acquitted and favoured with the royal protection. This visit afforded him an opportunity of observing the weaknesses of the Persian monarchy, and of concerting measures for the success of the enterprise which he had projected. With a view of uniting the Afghans in his interest, he obtained leave to make the pilgrimage to Mecca; and here he obtained a dispensation for effecting the revolt which he had meditated. After the successful execution of several preparatory measures, and the murder of the Khan of Kandahar, and his Persian and Georgian adherents, he marched forward to the city, which he surprised and took. He was then joined by the Afghans, who, after several alternate defeats and victories, obtained pacific possession of the whole kingdom of Kandahar, A. D. 1713. Mir Weis, however, who had for some time assumed the title of king, with other enigmas of sovereignty, died in his new kingdom in the year 1715, and was succeeded on the throne by his brother, Mir Abdollah. This prince was destitute of talents, ambition, and courage; and therefore formed a design of relieving Kandahar to the crown of Persia. Whilist he was negociating the surrender, he was killed by his nephew Mir Mahmud, a prince of the age of 18, who was proclaimed king of Kandahar, within six months after the death of his father.

In 1717, the Abdollees, another tribe of Afghans, who resided in the province of Herat, and who had submitted to Peria, on condition of not being subject to foreign governors, resolved to follow the example of the Afghans of Kandahar, and to emancipate themselves from the Persian yoke. They succeeded in their attempt, and Herat became an independent republic. Mir Mahmud, availing himself of the revolt of the Abdollees, and of other concurrent circumstances, which contributed to enfeebly the Persian government, proceeded to the execution of the design which his father had conceived of subduing the whole of Persia, and engaged the Afghans, the Abdollees, and the other inhabitants of adjacent cities, to cooperate with him. Accordingly he began his march in January 1722; and having advanced within three leagues of Ispahan, the capital, he pitched his camp and prepared for battle. The Persian army, after suffering a great slaughter, whilst the lots of the Afghans was very inconsiderable, was betrayed by one of its own generals, and reduced to the greatest distress. Mahmud having gained the suburbs, invested the city; but several unfavorable circumstances occurred during the siege, and the Afghans must have withdrawn if Shah Hoffein had not been dejected and betrayed by those in whom he placed his chief confidence. After enduring the horrors of famine for two months to such a degree that the besieged were under the necessity of consuming every kind of brute animal they could find, and of appeasing their hunger by eating the bodies of those who died, and even murdering their fellow-citizens and children, the city capitulated on condition of Hoffein's reining the empire, together with his perfon and principal officers of the court, into the hands of the conqueror. "Such," said the vanquished and defeated monarch, addressing the Afghan prince, "is the inatibility of human grandeur: God disperses of empires as he pleases, and takes them from one nation to give them to another; but I promise to consider you always as my own father; and I will undertake nothing for the future without your advice." As soon as these words were uttered four thousand Afghans were ordered to take possession of the royal palace, and the gates of the city. Thus, when Hoffein had reigned 28 years, the dynasty of the Selifs, or Sais, ended in the person of this prince, the 10th successor of Israel, its founder, after having reigned 223 years. For the manner in which Mahmud closed his life and reign, see the article MAHMUD. He was succeeded by Ahuraff, the son of Abdollah, whom the Afghans raised to the throne of Peria, A. D. 1725. The Afghans at this juncture were masters of Khorasan, Kerman and Persia; and under the conduct of Ahuraff, they obtained some successes against the Turks; but in 1727, they concluded a peace with them, and Ahuraff acknowledged the Ottoman emperor lawful sovereign of Persia. About this time, especially in 1729, Nadir Shah, otherwise called Kuli Khan, began to distinguish himself. Having totally routed the Abdollees Afghans, of whom 5000 were made prisoners, and near 15,000 killed and wounded, and having taken possession of Herat, he proceeded to meet Ahuraff, who was marching towards Khorasan at the head of an army of 30,000 men. The Afghans were terrified by the prospect of encountering the victorious general of the Persians, and wished to avoid an action. They were, however, compelled to engage, and the event was a complete victory on the part of the Persians. The loss sustained by the Afghans was about 12,000 men: and that of the Persians amounted to the number of 4000. Ahuraff retreated towards Ispahan, and was pursued by Kuli Khan. On his approach the Afghans quitted their several garrisons and fled towards the capital, where they deposited ample stores of provisions, with the purpose of defending themselves to the last extremity. But Ahuraff determined to try the event of a battle before he submitted to a siege. Accordingly he marched out to a convenient situation about 30 miles from the city, and waited Kuli Khan's arrival. In the mean while he exercised the most wanton cruelty on the Persians, ordering all the principal men to be cut off, and afterwards all they could find in the streets; so that, for the space of 20 days, there was not a Perian to be seen abroad, none appearing but women, who came out to buy the common necessaries of life. At last Kuli Khan arrived and obtained a complete victory. Ahuraff having lost 7000 men, retired to Ispahan, and issued an order, that all the inhabitants should be slaughtered, and the palace and other houses set on fire. As they were about to execute this barbarous order, the Perian army approached the city; upon which Ahuraff and his men, having loaded their heads with money, hastened to save themselves by flight; and in a few hours there was scarce an Afghan to be seen in the city. The Afghans took up their winter-quarters at Shiraz; but they were pursued by Kuli Khan, Jan. 1730; and after an obstinate resistance, compelled to fly, and to leave behind them a great part of their treasure, and most of their women and children. Ahuraff, with about 1500 of his men, marched directly towards Kandahar; but most of them deserted him; and the rest were imprised by a body of the Baluchis, and after a gallant defence, he and most of his party were cut to pieces. Thus ended the usurpation of the Afghans in Peria.

After Nadir Shah was proclaimed emperor of Peria in 1736,
1736, he proceeded with his army towards Kandahar, in order to reduce to subjection the Afghanis, who were the only enemies of the Persian empire whom he had not subdued. Having seized Kandahar and Cabul, and advancing in his march towards Peshwar, he was much impressed by the hardship of the mountains, and in several skirmishes with them lost many men, who were either killed or wounded. The Afghans had fortified themselves so strongly on the tops of the hills, that this victorious general found it impossible to force their pass except by bloodshed; and he therefore sent them offers of accommodation, which they accepted the more readily, as they had not received for four or five years the utmost allowance from court for their services in defending the passes of the mountains. Nadir Shah, upon paying them a certain sum of money, was allowed to march forward without molestation; several of the Afghans enlisted in his army; and others joined him in his further progress. The mountains, which the Afghans were included in the territories to the westward of the river Atek, formally ceded to Nadir Shah by Mahomed Shah, in the year 1739. A body of Afghans, in the service of Nadir Shah, was commanded by Ahmed Khan, who, after the assassination of this barbarous conqueror in 1747, took possession of Cabul, and with the resources furnished by the treasure which he thus obtained, laid the foundation of an independent government, including Afghanistan, Khorasan, Multan, Sind, and Caufmir. Ahmed was succeeded in 1752, by his son Timur Shah, who, besides his Afghan and Indian dominions, possessed a large division of Khorasan. His successor, who now fills the throne, carried his arms in 1756 as far as Lahore, when he was recalled by internal commotions. Hanway's Hist. Acc. of the British Trade, &c. vol. iii. p. 27, &c. &c. Hanway's Trav. vol. iii. p. 148, &c. Frazer's Hist. Nadir Shah, p. 91. Raynal's Revol. vol. ii. p. 68.

In the 2d volume of the Asiatic Researches, we have some curious particulars relating to the Afghans; they call themselves the posterity of Melic Talut, or king Saul. In a war, they say, which raged between the children of Israel and the Amalekites, the latter, being victorious, plundered the Jews, and obtained possession of the ark of the covenant. Considering this as the God of the Jews, they threw it into the fire, which did not injure it; and having ineffectually endeavored by other methods to destroy it, they placed it in their temple, and all the idols bowed to it. At length they fastened it upon a cow, which they turned loose in the wildernefs. They are said to have applied to Samuel, after their defeat by the Amalekites, for a king: and at this time the angel Gabriel defende, and delivered a wand, with instruction, that the perfom, whose figure corresponded with that wand, should be king of Israel. Melic Talut was then a herdman of inferior condition; and having lost a cow, he applied to Samuel for assistance to satisfy the owner. Samuel, perceiving his lofty stature, asked his name: He answered Talut. Upon which, having measured him with the wand, he said to the children of Israel, "God has raised Talut to be your king." How shall we know, said they, that he shall be our king? Samuel replied, they should know, that God had constituted Talut their king, by his restoring the ark of the covenant. He accordingly restored it, and they acknowledged him their sovereign. After Talut obtained the kingdom, he feized part of the territories of Jadut, or Goliath, who assembled a large army, but was killed by David. Talut afterwards died a martyr in the war against the infidies; and God constituted David king of the Jews. Melic Talut, they say, had two sons, one called Berikia and the other Irmiis, who served David and were beloved by him. The son of Berikia was called Afghan, and the son of Irmiis was named Ufer. The latter was eminent for his learning; and the former for his corporeal strength, which struck terror into Demons and Genii. Afghan made frequent excursions to the mountains, where his prosperity, after his death, established himself, lived in a state of independence, built forts, and exterminated the infidies. The late Henry Vanfittart, Esq. informs us, that a very particular account of the Afghans has been written by the late Hafez Ramno Khan, a chief of the Rohillas, from which the curious reader may derive much information. They are Mussulmans, partly of the Sunniye, and partly of the Shittie persuasion. They boast much of the antiquity of their origin, and the reputation of their tribe; but other Mussulmans reject their claim, and consider them of modern, and even base extraction. From history however, we learn, that they have distinguished themselves by their courage, both singly and unitedly, as principals and auxiliaries. They have conquered for their own princes and for foreigners, and have always been regarded as the chief strength of the army, in which they have served. As they have been applauded for their virtues, they have also been reproached for vices; having sometimes been guilty of treachery, and even acted the base part of assassins. They confess of four classes, viz. pure Afghans, whole fathers and mothers were Afghans; those whose fathers were Afghans, but their mothers of another nation; such as had Afghan mothers and fathers of another nation; and the children of women, whose mothers were Afghans, and fathers or husbands of a different nation.

The above account is extracted from the Persian Abridgment of a book, called The Secrets of the Afghans, written in the Puchto language, a specimen of which is added. The work was communicated by Henry Vanfittart, Esq. to the late Sir William Jones, who was then president of the Asiatic Society. Although their claim to a descent from Saul seems to resemble some of the fictions borrowed by Mahomet from the later Jewish Rabbins, Sir William Jones has no doubt that the Afghans are descendants of Israel. "We learn," says he, from Edfus, that the ten tribes, after a wandering journey, came to a country called Araxes; where, we may suppose, they settled. Now the Afghans are said by the belled Persian historians to be descended from the Jews; they have among themselves traditions of such a descent; and it is even asserted, that their families are distinguished by the names of Jewish tribes; although, since their conversion to the Islam, they fluently conceal their origin. The Puchto language, of which I have been a dictionary, has a manifold resemblance to the Chaldaic; and a considerable district under their dominion is called Passion, or Passion, which might easily have been changed into the word used by Edfus. I strongly recommend an enquiry into the literature and history of the Afghans.

Afloat, in Sea language, denotes the state of a ship when she is buoyed up by the water from the ground.

Afroba, in Botany, a name given by the natives of Guinea, to a kind of plant, of the genus of Phaerocoeus, or kidney bean. They use it pounded and mixed with oil, to cure the itch, and other cutaneous fowlneesses. It is more hairy than the common kinds, and its leaves are very small. Phil. Trans. N° 232.

Afore, signifies that part of a ship which lies forward, or near the stern. It also means farther forward, as the manger stands afor the fore-mast, or nearer to the stern.

Afra,
AFRICA, in Geography, a strong castle on the frontiers of Numidia in Africa, built by Cherif Mahommed, king of Sun., N. lat. 25°, E. long. 12°.

AFRICA, in Botany, a species of Papilio, with brown wings, six ocelli, and the hinder wings marked with eumcrous veins; found in the southern deserts of Arabia.

AFRANIUS, L. in Biography, a Latin comic poet, who flourished about the year B. C. 654, or a century before Christ. Cicero (de Clar. Orat. iapud Oper. t. i. p. 434, Ed. Olivet.) says, that he imitated C. Titius, and commends him for the acuteness of his genius and the fluency of his style. Lo- race (Eppil. i. in op. t. v. 57) represents him as resembling Menander. Quintilian, (i. x. c. t. ii. p. 913) whilst he celebrates his talents for comedy, expresses a wish that he had not fulfilled his performances by impure and unnatural love-adventures, which were decriatory of his own manners.

Suetonius in his life of Nero, (apud Oper. t. ii. p. 743. Ed. Pitifii.) mentions a comedy of Afranus, intitled Incedium or Confagration, on the exhibitions of which the honse that was burnt was devoted to be pilled by the actors. Some fragments of this poet's works are preferred in Mattaire's Corpus Poetarum, Lond. 1713, 50.

AFRICA, in Geography and History, was anciently one of the three parts of the known world, which was divided into Europe, Asia, and Africa, and called by the Greeks ε ῥ ιγα, continents; and is now one of the four quarters of the globe. Bochart (Geog. Sac. apud op. tom. i. col. 488.) after enumerating several etymologies of the name Africa, which he disapproves, deduces it from a Punic word feric, signifying an ear of corn, and referring to the fertility of this country. Dr. Hyde suppofes it to be derived from the Phoenician or Punic Hacaria, or Acrea; i.e. the Barea, or country of Barea, which was one of the most remarkable parts of this continent. Servius in Virgil (En. v. v. 128. tom. ii. p. 618. Ed. Barm.) deduces it from arie, fine frigore, and the appellation expresses the heat of the climate.

Africa, called by the ancients Libya, was divided by them into Africa propria, and Africa interior. Africa propria, or the territory of Carthage, has had various limits assigned to it by the ancient geographers. Mela (i. c. e. 7.) and Ptolemy (i. iv. c. 5.) comprehend under this appellation all the country situated between the river.Amphara and the borders of Cyrenaica, which, according to Pliny (H. N. i. v. c. 4.) were inhabited by twenty-six different nations; and thus they would include Numidia and the Regio Syricana, which are countries distant from the proper territory of Carthage. Its true limits seem to have been (See Celler. Ant. Geog. tom. ii. p. 85.) the river Tufo, or boundary of Numida, on the west; the Mediterranean, or African Sea on the north; the frontiers of the Garamantes and deserts of Libya interior on the south; and the Mediterranean, with the Leffer Syricana, on the east. It comprehended two provinces, viz. the Regio Zeugita and Byzacium, with which the kingdom of Tunis, as it is divided by Dr. Shaw (Travels, p. 73.) into the summer and winter circuits, nearly corresponds. The chief lakes of this region, noticed by the ancients, are Hippopotis, the Palus Sijara, the Palus Trinosa, the Palus Pallat, and the Palus Libya: the most famous river was the Bagrada; and the principal islands on the coast of Africa propria were the Cossoja, the Tarichia, Lopudusa, Aegousa, the Larunesia, Dracontia, Gaila, and Egeirus.

Africa was first peopled, principally by Ham and his descendants. Mizraim peopled Egypt. (See Gen. x. 6. 13.) The Pathrian, the Naphtalim, the Caullihim, and the Ludim took possesffen of other parts; though their respective situations are not precisely known. Some have supposfed that the Leshabim settled in Libya, and Pluit between Numidia and Libya, along the Mediterranean, and that many of the Canaanites, when they were driven out of their country by Josph, retired into Africa. At a later period, the inhabitants of this country were the Aues, whose chief city was Auida, the Maxyes and Machylae both Libyan nations, the Zeuaees, and the Zygantges, who cultivated bees, and made honey. All these were, probably, a mixture of old Libyans and Phoenicians, and in several respects resembled both these nations.

Africa interior comprehended those remoter and more southern countries of Africa, most of which were little known to the Greeks and Romans otherwise than by uncertain and fabulous report. The western part of this division was called Libya interior, and it was chiefly inhabited by the Gutali, Garamantes, Nitrites, and Hesperian Ethiopians. The eastern part was denominated by Ptolemy Ethio-

opia sub Egyptio. See Abyssinia, Egypt, and Ethiopia. The Romans do not seem to have extended their conquests and intercourse beyond the tropic of Cancer. The kingdoms with which they were more immediately connected were Numidia, Mauritania, and Ghetulia. As for the inhabitants of the more retired and southerly parts, they were ignorant even of their names, and much more of their character and manners. Some account will be given of the notions that prevailed respecting them in their proper places, under the real or fabulous apppellations by which they were distinguished, as Aesacuri, Blemmyes, Caliphi, Doc-
lotes, Elephantophagi, Ethyphagi, Latophagi, &c. &c.

The ignorance of the ancients, concerning the extent of Africa, appears from their disagreement in ascertaining its just limits; whilst some, as Callut, (Jugurth. Bell. c. 20. tom. i. p. 26. Ed. Haverc.) Mela, (i. c. c. 8.) Pliny (l. iii. c. 13.) tom. i. p. 135. Ed. Hard.) Dionysius, (Perieg. v. 18. Hirtius, (De Alex. Bell. c. 14.) Polybius, (Hist. l. iii. p. 191. Ed. Calabub.) and Solinus, have preferred for this purpose the western branch of the Nile, or even the great Catabathmus or desert, which last would affign to Asia, not only Egypt, but part of Libya: others, as Ptolemy, (l. iv. c. 5.) and Strabo, (l. iii. tom. i. p. 61.) with the modern geographers, fix the illimns of Scics, and the Arabian gulf, as the boundaries of Asia and Africa. This fixes Strabo as a more natural limit than the Nile; and thus, in Ptolemy, the whole of Egypt is included in Africa. But the knowledge both of Ptolemy and Strabo comprehended only a small part of Africa. Strabo was only acquainted with that part of it which the Romans had reduced under their power, and this was scarcely a tenth part of it, and he seems not to have known any thing with certainty concerning the form and flate of the southern parts of Africa (l. xii. c. 5.) and though Ptolemy was acquainted with some other parts, which were not known to the Romans, yet by the division which he had made of it into twelve regions, we may conceive that nearly one half of it was unknown to him. This inquifite and learned geographer appears to have been unaeqnacquainted with any part of Africa, situated a few degrees beyond the equatorial line; for he supposes that this great continent was not surrounded by the sea, but that it stretched, without interruption, and increasing in its breadth, towards the south. Geog. l. 4. c. 9. Leo Africanus, who was an eminent African geographer, after all his studies, travels, and researches, appears to have been imperfectly acquainted with this country; for by dividing it merely into four parts, viz. Barbary, Numidia or Bledulgerid, Libya, and Nigritia or Negrolg, he excludes from it the whole kingdom of

EGYPT.
Egypt, and the two Ethiopias. It was not known for many ages, that Africa was a peninsula, every where surround- ed by the sea, excepting at the isthmus of Suez, which joins it to Asia. The knowledge of the Romans was restricted to those provinces which stretch along the Mediterranean sea, from Egypt westward to the Strait of Gades. The Phenicians, however, at an earlier period, seem to have been acquainted with both the south-east and western coasts of Africa. A Phenician fleet, as Herodotus informs us, (l. iv. c. 42. p. 298. Ed. Welling.) fitted out by Nercho, king of Egypt, took its departure about 600 years before the Christian era, from a port in the Red sea, doubled the southern promontory of Africa, and, after a voyage of three years, returned by the Straits of Gades, to the mouth of the Nile. Eudoxus of Cyzicus, is said to have held the same course, and to have accomplished the fame hazardous undertaking. Plin. H. N. ii. c. 67. tom. i. p. 106. Strabo, (l. ii. tom. i. p. 155.) mentions this voyage of Eudoxus, and treats it as a fabulous tale. Dr. Vincent, in his Periplus of the Erythraean sea, published in 1800, argues with great ingenuity against the possibility of an African circumnavigation previously to that of the Portuguese; and he affirms, that there is no evidence of a farther progress to the south, on the western coast of Africa, than that of Hanno; nor on the eastern, than that of the Periplus. An anonymous writer is disposed to credit the voyage, related by Herodotus, till it can be proved that the circumnavigation, in such vessels as the Phenicians then possessed, was physically impossible; and in support of this opinion, he alludes the simplicity of the narrative, unblended with miraculous adventures—the discovery of two important truths, viz. the falling of the shadow to the south, and the perpendicular form of the African continent; one of which could be ascertained by no other means, and the former of which was disbelieved by the writer who relates it; and the consideration, that the navigators only put to sea when circumstances were favourable; and though the attempt was hazardous, and success improbable, fail no insurmountable impediment to its completion exists. Month. Rev. New Series. vol. xxxiv. p. 122. The Carthaginians also, imbibing the spirit, and following the example of the Phenicians, extended their intercourse with this country. Whilst they made considerable progress, by land, into the interior provinces of Africa, trading with some of them, and subjecting others to their empire; they sailed along the western coast of this great continent, almost to the tropic of Cancer, and planted several colonies, in order to civilize the natives, and accustom them to commerce. In the prosperous age of the Carthaginian republic, Hanno, with a fleet equipped by authority of the senate, and at the public expense, was directed to flce towards the south, and seems to have advanced much nearer the equinoctial line than any former navigator. Major Rennell supposes his navigation to have terminated at Sherbro river, or found, which was also the limit of the knowledge of Ptolemy. Plin. H. N. i. v. c. 111. p. 241. Hannonis Periplus apud Geograph. minores ed. Hudson, vol. i. p. 1. The authenticity of this work has been questioned by Mr. Dodwell (ubi supra,) and vindicated by M. de Montefigue (Sp. of Laws, b. xxi. c. 8. v. ii. p. 44.) and M. de Bougainville, in a Dissertation published in tom. xxvi. of the Mem. de l’Acad. des Inscriptions, &c. The voyage, it is said, was performed in small vessels, which kept near the coast; and the observations made on the appearance and state of the countries on the coast of Africa have been confirmed by the relations of modern navigators. Nevertheless, Polybius, (Hist. i. iii. p. 192. Ed. Cafaub.) long after the period alligned to these voyages, affirms, that it was not known in his time, whether Africa was a continued continent, stretching to the south, or whether it was encompassed by the sea; and Pliny (I. N. i. ii. c. 68. i. i. p. 107.) affirms, that there can be no communication between the southern and northern temperate zones. In order to obviate these difficulties, Dr. Robertson observes, (Hist. Amer. vol. i. p. 15. 8vo.) that the Phenicians and Carthaginians concealed any knowledge they acquired concerning the remote regions of the earth, with a mercantile jealousy. Many of their discoveries seem to have been scarcely known beyond the confines of their own states. The navigation round Africa is recorded by the Greek and Roman writers, rather as a strange amusing tale, than as a real transact. As neither the progress of the Phenicians and Carthaginians, nor the extent of their navigation, were communicated to the rest of mankind, all memorials of their skill in naval affairs seem, in a great measure, to have perished, when the maritime power of the former was annihilated by Alexander’s conquest of Tyre, and the empire of the latter was overturned by the Roman arms. It was not till a century after the invention of the mariner’s compass in 1320, that navigation began to advance beyond the latitude to which it had attained before the downfall of the Roman empire. The first regular plan for discovering unknown countries was formed in Portugal by John I. (surmised the bastard, after he had obtained a secure possession of the crown, by the peace concluded with Cadiz, A. D. 1411.) While an armament was equipping, in order to attack the Moors who were settled on the coast of Barbary, a fleet, consisting of a few vessels, was defined in 1412 to sail along the western shore of Africa, and to discover the countries that were situated on that coast. This fleet doubled Cape Now, which had been the formidable boundary of the Portuguese navigation before this period, and proceeded 160 miles beyond it to Cape Bojador. The rocky cliffs, adjacent to this cape, deterred any farther progress. In 1418, a new attempt was made for doubling this cape, but though the attempt proved unsuccessful, it terminated in the discovery of Porto Santo; and another expedition, in 1419, was recom- mended by the discovery of Madeira. The Portuguese, by their voyage to this island, were accustomed to quit the coast, and venture into the open sea. By pursuing this course they succeeded, A. D. 1433, in doubling Cape Bo- jador, and in advancing within the tropics; so that in a few years they discovered the river Senegal, and the whole coast extending from Cape Blanco to Cape de Verd. As far as the river Senegal they found the African coast inhabited by people resembling the Moors of Barbary; but to the south of that river, they beheld men with skins black as ebony, with short curled hair, flat noses, thick lips, and all those peculiar features which are now known to distinguish the race of Negroes. The search for unknown countries became now an object of general attention; and it was encouraged first by the discovery of the Cape de Verd islands; and soon after, viz. in 1449, by that of the Azores. So flow and gradual, however, was the progress of discovery, that the Portuguese, during the life of prince Henry, who had projected and patronised undertakings of this kind, and who died in 1463, did not advance nearer to the equinoctial line than five degrees; and after their continued exertions for half a century, they had not dis- covered more than 1500 miles of the African coast. From Cape Now to the Senegal, the country along the coast was found to be a sandy, barren tract, thinly inhabited by a wretched people, professing the Mahometan religion, and subject to the extensive empire of Morocco. But to the
A F R

foth of that time, the power and religion of the Mahometans were unknown: the country was divided into small independent republics; the population was considerable, the soil fertile; and the Portuguese soon discovered that it produced every rich crop, gold, and other valuable commodities, which afforded the prospect of a lucrative commerce, as well as the gratification of curiosity. Having ventured to cross the line in 1471, they found that region of the torrid zone, which was supposed to be searched with intolerable heat, to be not only habitable, but populous and fertile. In 1472, a powerful fleet was fitted out, which, after discovering the kingdoms of Senna and Congo, advanced above 1500 miles beyond the line; and in order to secure the possession of the countries which they discovered, and to derive commercial advantages from them, forts were erected on the coast of Guinea, colonies were settled, and by various measures of policy, the Portuguese power and commerce in Africa were established upon a solid foundation. By constant intercourse with the Africans, the Portuguese gained increasing knowledge of the country; they found, that contrary to the doctrine of Ptolomy, the continent inclined towards the east; and they began to indulge a hope, founded on the report of the ancient Phcenician voyages round Africa, of proceeding by the same route to the East Indies, and of engrossing that commerce, which has been the source of wealth and power to every nation by which it has been possessed. In 1486, a voyage of discovery was projected; and the conduct of it was committed to Bartholomew Diaz, an experienced and brave officer, who stretched farther towards the south than any of his predecessors; and discovered near 1000 miles of a new country. After encountering many difficulties and hazards, in an unknown and tempestuous ocean, he at length descried that lofty promontory which bounds Africa to the south: but having made the discovery, he was compelled, by the shatter'd fate of his ships, and the turbulent disposition of his crew, to return home. This promontory he called Cabo Tormentoso, or the stormy cape; but the king, his master, extending his views by this course to India, gave it a name of better omen, which it has ever since retained,—the Cape of Good Hope. In 1497, a squadron was equipped for prosecuting the scheme of opening a passage to the East Indies by this cape; and the command of it was entrusted with Valco de Gama, a man of noble birth, and possessed of talents adapted to the enterprise. Ignorant of the course of the winds in the Atlantic ocean, he set sail in July, an improper season of the year; and steering towards the south, he struggled with contrary winds for four months, before he reached the cape. During an interval of calm weather, he doubled this formidable promontory, and pursued his voyage towards the north-call, along the African coast. After touching at several ports and various adventures, he came to anchor before the city of Melinda. From hence he proceeded to Calcutt, where he arrived May 22, 1498; but as he had neither force sufficient to attempt a settlement, nor commodities proper for carrying on any commerce, he halted back to Portugal, with an account of his successes in performing a voyage the length of, as well as the most difficult, that had ever been made since the first invention of navigation. He landed at Lisbon, Sept. 14, 1499, two years, two months, and five days from the time he left that port. To this voyage we are indebted for the discovery of the southern and western boundaries of the African continent; and from the Portuguese we also derive our earliest knowledge of many of its interior parts, and of the most considerable kingdoms and empires of which it composes, particularly those of Habesh or Abyssinia, Monomotapa, Monomotagi, and Melinda, on the eastern coast. Their missionaries collected and recorded many particulars with respect to their various religions, governments, laws, customs, products, and commerce, at a time when the means of information concerning the interior of Africa were very scanty and imperfect.

Africa, at a former dilfult period, contained several kingdoms and states, eminent for the liberal arts, for wealth and power, and for the most extensive commerce. Almost all the northern parts of this continent were full of people, from the Red Sea to the Atlantic Ocean. The kingdoms of Egypt and Ethiopia were much celebrated, and the rich and powerful state of Carthage extended her commerce to every region of the then known world; and even the British thrones were visited by her fleets. At length the Romans, after a contest which lasted for more than 100 years, totally subdued this famous republic and destroyed their city, and then reduced under their power other kingdoms and states of Africa. See Numidia, Mauritania, Gataula, &c. The Roman empire retained its possessions in this country for several ages, and found them an ample source of revenue, as well as necessary supplier.

The 10,000 Euboe, or Phcenician talents, amounting to about four million florins, which vanquished Carthage was condemned to pay within the term of fifty years, as Polybius informs us, (Hist. i. xv. c. 2. p. 766.) were a flight acknowledgment of the superiority of Rome, and bear a very small proportion to the taxes afterwards raised both on the lands and on the perons of the inhabitants, after the fertile coast of Africa was reduced into a province. It would be tedious to recite the oppressions which the Africans suffered from the rapacity of the Roman governors, and the fquations which were the consequences of their religious disputes, after the introduction of Christianity, and which were rather augmented than appeased under the unenviable interference of the civil power. Of the latter, some account will be given under the articles circumcelliones and donatists: and with respect to the former it will be sufficient to select a single influence.

About the year of our Lord 366, Count Romanus polfled the military command of Africa. At this time the three flourishing cities of Oea, Leptis, and Sabrata, which, under the name of Tripoli, had long constituted a federal union, were invaded and pillaged by the barbarians of Gataula; and several of their most honourable citizens were surprized and maffaccred. In this state of distress they applied to Romanus for succour; but the price of his assistance was so enormous, that they were incapable of purchasing it. Their application by two deputies to the emperor Valentinian was equally unavailing; for though he deputed Palladius to examine the state of Africa, and the conduct of Romanus, he behaved in such a manner that, for concealing his own guilt, he was under a necessity of attributing the innocence and merit of the Count. The charge of the Tripolitians was declared to be false and frivolous; the citizens of Leptis were compelled to contradict the truth of their own decrees, and to confine the behaviour of their own deputies; the prefect of Tripoli, who had presumed to pity the distress of the province, was publicly executed at Utica; four distinguished citizens were put to death, as accomplices of the imaginary fraud, and the tongues of two others were cut out, by the express order of the savage emperor. Romanus was continued in the command, till the Africans were provoked, by his avarice, to join the rebellions standard of
of Firmus the Moor, A.D. 472. Firmus was the son of one of the richest and most powerful of the Moorish princes, who acknowledged the supremacy of Rome; and having slain his brother in a domestic quarrel, he became odious to the disgrace of Romans. Unable to conciliate him, he appealed against the tyrant, who was an object of universal contempt and hatred, to the sword and to the people. Having established his power in the provinces of Mauritia and Numidia, and whilst he was hesitating whether he should assume the diadem of a Moorish king, or the purple of a Roman emperor, Theodoreus, the famous Roman general, with a small band of veterans, unexpectedly arrived on the African coast, and quelled the rebellion by his prudence and activity; and Firmus, deprived of all hopes of escape, disdained the insulting triumph of the Romans, by slandering himself in the night. Romans, who was the original cause of this rebellion, escaped with impunity, by fraud and forgery; and Theodoreus, the reclusor of Britain and of Africa, on a vague suspicion that his name and services were superior to the rank of a subject, was ignominiously beheaded at Carthage. Gibbon's Hist. vol. iv. p. 301–308, 8vo.

The Romans, however, did not long retain their dominion in Africa. It was lost in consequence of a quarrel between Boniface and Aetius, two Roman generals, who were rivals in reputation and power. The former was supreme governor of the Roman territories in this country; but in the year 427, he was induced to revolt, by the treachery of the latter: and in order to avenge his quarrel and maintain his authority, in opposition to his rival, he fought the assistance of Generec, a warlike prince of the Vandals, who left the kingdom of Galicia, where he had conquered his brother Gonderic, and falling over the straits of Gades, landed on the coasts of Barbary, A.D. 429. The army, which he commanded, amounted at first only to 50,000 effective men: but his own dexterity, and the deficiencies of Africa, soon fortified the Vandals over the suasion of numerous and active allies. The wandering Moors of Mauritania precipitated themselves into an alliance with the enemies of Rome; and a crowd of naked savages rushed from the woods and valleys of Mount Atlas, to satiate their revenge on the polished tyrants, who had injuriously expelled them from the native sovereignty of the land. The perfusions of the Donatists favoured the designs of Generec, who avowed himself an enemy of the orthodox communion, and who led them to expect a repeal of the odious and oppressive edicts of the Roman emperors. The conquest of Africa was facilitated by the active zeal, or the secret favour, of a domestic faction; and the intolerant spirit, which disgraced the triumph of Christianity, contributed to the loss of the most important province of the west.

Boniface having vindicated his innocence at the imperial court, and regained the favour of the empress Placidia, repented of the application which he had made to Generec, and attempted, by various conciliatory means, to induce him and his adventurers to return to Spain. But all his efforts for this purpose were ineffectual. Although Carthage, and the Roman garrisons, returned with their general to the allegiance of Valentine, the rest of Africa was distracted with war and faction; and the inextinguishable spirit of the Vandals disdained all terms of accommodation. Boniface and his veterans, with the haughty levies of provincial troops, were defeated with considerable loss; the victorious Vandals infested the open country; and Carthage, Cirta, and Hippo Regius were the only cities that still adhered to the declining interest of Rome. The long and narrow tract of the African coast to which the Roman power extended was fertile and populous; and besides the supply which it afforded to the inhabitants, the annual exportation, particularly of wheat, was so great and plentiful that Africa defended the name of the common granary of Rome and of mankind; and it was called by an ancient writer the soul of the commonwealth. On a sudden, the seven fruitful provinces, from Tangier to Tripoli, were overwhelmed by the invasion of the Vandals; and where they found resistance, such were their dispositions and habits, they seldom gave quarter. Boniface, disdaining beyond measure by the fear of the ruin which he had occasioned, and by his inability to stay its progress, retired into Hippo Regius, which was immediately belied. By the skill of this distinguished commander, the siege was protracted about 14 months; and thus Boniface was hemmed in by a forcible armament from Constantinople. As soon as he obtained this help he marched out against the Vandals; and the loss of a second battle irretrievably decided the fate of Africa; upon which he embarked for Italy with the precipitation of despair; and soon after, A.D. 432, fell in a rencounter with his rival Aetius. In the year 439 Carthage was reduced, 585 years after the destruction of the city and republic by the younger Scipio: the licentious troops of the victor were permitted to satiate their rage and avarice; and all persons were enslaved by an edict, and under the threatened penalty of death and torture, to deliver their gold, silver, jewels and valuable furniture or apparel, to the royal officers. The lands that formed the immediate district of Carthage were divided among the barbarians; and Generec refused for his own domain the fertile territory of Byzacium and the adjacent parts of Numidia and Getaulia. Generec was no less arbitrary and intolerant in the government of the church than of the state. He would not allow the Africans, who fled before him in the field, to dispute his will in synods and churches; and therefore, as he himself had renounced the orthodox communion, he oppressed his subjects by severe laws and punishments. His son Hunneric, who succeeded him, A.D. 457, inherited his vices, and tormented the Catholics with the same unrelenting fury. The throne of Africa was successively filled by the two nephews of Hunneric, by Gundamund, A.D. 483, and by Thraemund, A.D. 496; both of whom emulated the cruelty of their uncle, and the gift of whom even exceeded it: for in the hour of death he exacted from his successor a solemn oath, that he would never tolerate the sectaries of Atheranius. Hilderic, the gentle son of the savage Hunneric, ascended the throne A.D. 523, and his accession was distinguished by the restoration of peace and universal freedom. In 530, the government was wrested from him by his cousin Gelimer; but the Vandals, before he could enjoy or abuse his power, was subdued by the arms of Belisarius; and the orthodox party retaliated the injuries which they had suffered. The recovery of Africa was intrusted by Justinian to Belisarius; and in 533 he landed on the coast with an army, well chosen and properly equipped for the important service to which they were destined. As the Romans approached Carthage, the mind of Gelimer was filled with anxiety and terror. The battle that ensued terminated in the defeat of the Vandals, who, accompanied only to a Moorish enemy, were incapable of withstanding the arms and discipline of the Romans. Gelimer fled towards the deserts of Numidia; and Belisarius pitched his camp on the field of victoiy at the distance of ten miles from Carthage. When he drew near the city, he found it blazing with torches, as signals of the public joy; the gates were thrown open; and the inhabitants, with acclamations of gratitude, hailed and welcomed their Roman deliverers.
deliverers. When the Imperial fleet arrived, the mariners were immediately landed to unite with the military in the triumph of their conquest; and they were directed by Belisarius to remember, in their march through the city, that the Vandals had been the tyrants, but that they were the deliverers of the Africans, who must now be respected as the voluntary and affectionate subjects of their common sovereign. “The voice of menace and complaint was silent; the trade of Carthage was not interrupted; while Africa changed her master and her government, the ships continued open and busy; and the folders, after sufficient guards had been posted, modestly departed to the havens which were allotted for their reception. Belisarius fixed his residence in the palace; seated himself on the throne of Genicric; accepted and distributed the barbaric spoil; granted their lives to the suppliant Vandals; and laboured to repair the damage which the suburb of Mandracium had sustained in the preceding night. At supper he entertained his principal officers with the form and magnificence of a royal banquet.”

Gellimer, who endeavoured to rally his scattered forces, encamped within four days’ journey of Carthage, and was joined by his brother Zano, who returned to him, at his earnest request, from the confines of Sardinia. In their march towards Carthage, their army increased, and surpassed, in a tenfold proportion, that of the Romans, commanded by Belisarius. After a severe engagement, Zano fell; and the puellannius flight of Gellimer exposed the vanity of his recent declaration, that, to the vanquished, death was a relief, life a burthen, and infamy the only object of terror. The Vandals, defeated by their king, hastily dispersed; and the Romans entered the camp without resistance, and disfigured themselves by the massacre and plunder which followed their victory. Belisarius, with the dawn of the next morning, recalled them to order and obedience; and he extended his protection to the suppliant Vandals, exercising a proper vigilance, that they might neither disturb the public peace, nor become the victims of popular revenge. Gellimer had fled to the inaccessible country of the Moors, and Belisarius, defying from the pursuit, resolved to fix his winter-quarters at Carthage. From thence he conveyed information to the emperor, that, in the space of three months, he had achieved the conquest of Africa. The emperor received the news with devout gratitude; and proceeded, without delay, to the full establishment of the Catholic church. “Her jurisdiction, wealth, and immunities,” says Mr. Gibbon, “perhaps the most essential part of episcopal religion, were restored and amplified with a liberal hand: the Arian worship was suppressed; the Donatist meetings were proscribed; and the synod of Carthage, by the voice of 217 bishops, applauded the just measure of pious retaliation.” Gellimer was traced to the mountain of Papua, in the inland country of Numidia, where he had struggled with the hardihood and mortification of the most abject condition, and brought captive to Carthage. When the royal captives accosted his conqueror, he is said to have burst into a fit of laughter. Some might have inferred from this singular circumstance, that he had been deprived of his senses by extreme grief; but to more intelligent observers, this unfathomable mirth insinuated, that the vain and trumpery scenes of human greatness are unworthy of a serious thought. Belisarius returned, A. D. 534, to Constan tinople, and obtained a very signal and splendid triumph. Gellimer advanced slowly in the train of attendants on this occasion; and maintained the majesty of a king. Not a tear nor a sigh escaped him; but he repeatedly pronounced the words of Solomon, Vanity! Vanity! Vanity! All is Vanity! The departure of Belisarius from Africa was followed by new troubles, which continued for several years, and accelerated the ruin of its most flourishing provinces. The taxes were multiplied by arbitrary assessments; the crown lands were resumed, and the Roman soldiers, who had married the widows and daughters of the Vandals, claimed the estates which Gencric had alligned to the victorious troops. The dissatisfaction and mutiny increased; and they were aggravated by soldiers, who had imbibed the doctrines, and were inflamed by the clergy of the Arian sect. A conspiracy was formed at Carthage, against the life of Lececinus, the successor of Belisarius; and a furious sedition was kindled in the Circus which defoliated Africa above ten years. The head of the insurgents was a private soldier, whose name was Stozan. When he fell, another person, called Gotharius, promised to divide Africa with the Moors, and aspire to the throne of Car thage. His reign, however, lasted only 30 days. The rebellion of the Moors continued for some time; but their insurrection was checked by a battle, in which 17 of their princes were slain, and the submission of their tribes was celebrated with lavish applause by the people of Constantinople. Such, it has been observed, was the defolation of Africa in the reign of Julianian, that, in many parts, a stranger would wander whole days without seeing the face either of a friend or an enemy. The nation of the Vandals, amounting to 150,000 warriors, exclusively of children, women, and slaves, had disappeared. Their number was much exceeded by that of the Moorish families, extinguished in a relentless war; and the same destruction was resented on the Romans and their allies, who perished by the climate, their mutual quarrels, and the rage of the barbarians. Procopius confidently affirms, that five millions of Africans were confined by the wars and government of the emperor Julianian. The conquest of Africa, by the Saracens, was first attempted by the arms of the caliph Othman, A. D. 647; and the conduct of the war was entrusted to Abdullah, his foster-brother. After some partial successes and very considerable losses, in a campaign of 15 months, the Saracens retreated to the confines of Egypt, with the captives and the wealth of their African expedition. Their western conquests were suspended near 20 years. At length the fearless Akkah plunged into the heart of the country, traversed the wilderness, in which his succourers erected the splendid capitals of Fes and Morocco, and penetrated farther to the verge of the Atlantic and the Great Desert. The career of Akkah was restrained by the prospect of a boundless ocean. Spurring his horse into the waves, and raising his eyes to heaven, he exclaimed with the tone of a fanatic—“Great God! if my course were not stopped by this sea, I would still go on, to the unknown kingdoms of the west, preaching the unity of thy holy name, and putting to the sword the rebellious nations who worship any other gods than thee.” But this ardent conqueror was recalled from the shores of the Atlantic by the defection of the Africans; and overpowered by a multitude of insurgents, he had only left the resource of an honourable death. His fate was avenged by his successor Zuherl, who vanquished the natives in many battles, and was himself overcome by a powerful army, sent from Constantinople to the relief of Carthage. The conquest of Africa was restored by the caliph Abdalmalek; and after some progress, his farther advances were obstructed by the forces of the eastern empire, under the prefect and patriarch John, a general of experience and renown. But in the ensuing spring, he was compelled to evacuate the fortifications of Carthage; and after a second battle in the neighbour hood of Utica, the Greeks and Goths were again defeated, and
and compelled to embark, and make their escape. The conquest of Africa was finally completed between the years 698 and 709. To the progress and establishment of the Saracens, we may ascribe the decline and extinction of Christianity, on the northern coast of Africa. Gibbon's Hist. of the Decline and Fall of the Roman empire, vol. iv. 301. vol. vi. 111, &c. vol. vii. 168.—186.—349. vol. ix. 449, &c.

When the Saracen empire was divided into seven kingdoms in 936, the African states retained their independence long after the others were subdued by the Turks; but in the beginning of the 16th century, being afraid of falling under the yoke of Spain, they invited the Turks to their assistance; who first protected, and then enslaved them. They are still dependent on the Ottoman empire; not as subjects of the Grand Seignior, but as acknowledging his protection by an annual tribute. On the coasts piracy prevails to such a degree, that some of the chief princes in Europe have been glad to procure liberty to trade in the Mediterranean without mediation, by a pecuniary compensation.

Africa, as it is described by modern geographers, is a large peninsula, connected with Asia by the isthmus of Suez; bounded on the north by the Mediterranean, which separates it from Europe; on the east by the above-named isthmus, the Red Sea, and the Indian Ocean, which divides it from Asia; on the south by the southern Ocean; and on the west by the Atlantic, which separates it from America; and extending from Cape Bon a in the Mediterranean, 35° 10' N. lat. to the Cape of Good Hope, 34° 29'. S. lat., or about 4980 miles, and from Cape Verd 17° 34'. W. long. to Cape Guardafui, near the limits of Babelmandel, 51° 20'. E. long. or about 4750 miles. Its figure is that of a triangle or pyramid, whose base is the northern part, reaching along the Mediterranean from the mouth of the Nile to the limits of Gibraltar, and vertex the Cape of Good Hope; but the sides, extending along the Atlantic to the west, and the Red Sea or Indian Ocean to the east, are very irregular. As the equator passes nearly through the middle of the country, the greatest part of it lies within the tropics; and therefore the heat, augmented by the reflection of the sandy soil of the interior parts, is hardly tolerable to any besides the natives. Those parts, however, that lie near the coasts or in valleys, and on the banks of the rivers, are very fertile and productive; and the country in general is capable of great improvement by cultivation. Its situation for commerce is preferable to that of any other quarter of the globe; as it has a more easy communication with Europe, Asia and America, than either of these has with the west. Its coast is opposite to that of Europe, for almost 1000 miles from east to west, and the distance of one from the other is no where 100 leagues, and in some places not more than 20 leagues. It is separated from Asia only by the Red Sea for a considerable interval from north to south, and their distance is from 5 leagues to 50: it also fronts the southern coast of Asia, though at a greater distance, and it is adapted for commerce by the interposition of islands from Madagascar to Malabar, and by the alternation of the trade winds. Its coast for 2000 miles lies opposite to America, and the western islands, at a distance of 500 to 700 leagues. Befides, it has many large and navigable rivers, which intersect the country in various directions, and form a communication between the internal parts and the surrounding ocean; and its harbours are very numerous and commodious, and capable of being rendered secure by fortifications. The principal rivers of Africa, which we shall more particularly describe under their several names, are the Nile, Niger, Morocco, Gambia, Senegal, Sierra Leona, Benin, Congo, Zaire, Wanza, Bravahul, Rio del Spirito Santo, Kuneni, Macumbo, Lorenzo, Sabba, Kuma, Zambeze, Coavo, Zeere, and Magadoxa. There are many other rivers which will be mentioned in the detail of the several countries to which they belong. On the banks of several of these rivers, there are villages and towns, which carry on a considerable trade, and exchange their valuable commodities, as gums, elephant's teeth, slaves, cives, beads, gold dust for European trinkets, glass heads, bugles, or, at least, some brass or iron tools, and frequently for brandy and other spirituous liquors, of which the inhabitants are so fond that they will part even with their children in order to obtain them. Another source of commerce is found in the mines with which the mountains abound. The mountains of Africa are the Atlas, the mountains of the Moon, the mountains of Sierra Leona; the mountains of Crystal near the lake of Zafan, so called from their mines of that beautiful mineral, and those of falk-petre, stretching easterly from the kingdom of Congo, the Cape-f raco running through the middle of Caffara, and part of the country of the Hottentots, the Table mountains at the Cape of Good Hope, so called from its square figure, and other mountains of Abyssinia. From the discoveries of Mr. Park, a late traveller in Africa, we learn, that a belt of mountains, extending from west to east, occupies the parallels between 10 and 11 degrees of N. lat. This great ridge of mountains is very productive in gold, and more particularly in the parts opposite to Mandingo and Bam- boul on the west, and to Wanga on the east. See Tombeucto.—Most of the countries bordering on the mountains share in their wealth by means of the rivulets that flow from them. There is no country in the world, says Leo Africanus, richer in gold and silver than some kingdoms in Africa; as those of Mandingo, Ethiopia, Congo, Angola, Butua, Quiten, Monomatapa, Chaffi and Monemugi. Father Labat also minutely specifies a great variety of rich mines, of which the negroes have not been able to avail themselves sufficiently, on account of their ignorance of the operations of mining. Copper is a valuable ore found in this part of the globe; and in such abundance, that an opinion prevails, that the mountains called Atlas are all copper. On the northern coasts, the fields, though imperfectly cultivated, produce very large crops of grain; and it is very reasonably supposed, from the qualities of the soil and climate in different parts of the country, that the richest articles of the East and West-India commerce might be obtained from Africa. The spices of Banda, Ternate and Ambonya, might be produced on the rich and fruitful isles of Melinda on the east side, or on those of the large coast on the west side of the country. The cinnamon of Ceylon, the tea of China and Japan, and the coffee of Mocha, might be produced on the same coast; and it has been affirmed, that the fugar of Barbadoes and Jamaica, and also the ginger, cotton, rice, pepper or pimento, with the cocoa, the indigo, and every other plant which is now obtained from these islands, would be as easily produced in Africa, and that the crops would be equally profitable, if they were cultivated with the same skill and industry as in America. Notwithstanding the capability of cultivation and the advantages for commerce which Africa possest, it is lamentable to reflect, that a country which has near 10,000 miles of sea-coast, many large rivers and good harbours, a productive soil and extensive country, should remain destitute of the benefits which arts and industry, and commerce, might afford them. It is a reproach to neighboring nations, that such a country should be so long neglected.
and that the principal advantage derived from it is all of that kind, which entails war and wretchedness, on the Africans themselves, which perpetuates the degradation and misery of the greater part of the human species, and which reflects indelible disgrace on those enlightened and Christian empires, all of the globe, that, amidst all the improvements of modern time and various laudable attempts for accelerating the condition of mankind, have not, at the commencement of the nineteenth century of the Christian era, shouldered a traffic, long known and long lamented, under the denomination of the Slave-trade. Of the nature of this trade, and of the efforts that have been made for restraining, regulating and abolishing it, an account will be given under that article. The principal branches of the African trade are slaves, gold and ivory, which is carried on with the Guinea or western coast, by the exchange of wooden and linen manufactures, hard-ware andspirirous liquors. The Dutch and French, as well as the English, have their different settlements for this purpose. See Africa Company;—Gold, Grain, Ivory and Slave Trade; and Sierra Leone. The Portuguese are in possession of the east and west coasts of Africa, from the tropie of Capricorn to the Equator; which immense tract they became masters of by their successive voyages and fortunate discovery of the Cape of Good Hope. From the coast of Zanguebra, on the easterly side, they trade not only for the articles above-mentioned, but likewise for several others, as caco, abac, cievo, ambergriz, and frankincense. The Dutch have had also settlements towards the southern parts of the continent, in the country called Caffari, or the land of the Hottentots; and they were long in possession of the Cape Town, which is well settled and fortified, till it was captured by the English in 1705, but restored and made a free port by the peace of 1801; and here their ships bound for Indost were accustomed to put in, and trade with the natives for their cattle, in exchange for which they gave them spurious liquors. Some laudable attempts have been lately made for establishing colonies on the western coast of Africa, with a view of civilizing the inhabitants, introducing commerce among them, and gradually abolishing the slave-trade. M. Wadstrom in his Elay on Colonization, published in two parts in 1794 and 1795, has given a particular account of these attempts; but we are far from observing that their permanent utility is very doubtful and precarious. See Aquapin, Bulah, Sierra Leone, and Slave-trade.—With respect to the inland parts of Africa, they seem in all ages of the world to have been in the same barbarous and uncivilized state in which we find them at present. To account for this fact an ingenious writer observes, that there are in Africa none of those great inlets, such as the Baltic and Adriatic seas in Europe, the Mediterranean and Gulf in both Europe and Asia, and the Gulph of Arabia, Perfo, India, Bengal, and Siam, in Asia, for carrying maritime commerce into the interior parts of that great continent; and the great rivers of Africa are at too great a distance from one another to give occasion to any considerable inland navigation. Besides the commerce which any nation can carry on by means of a river, which does not break itself into any great number of branches or canals, and which runs into another territory before it reaches the sea, can never be very considerable; because it is always in the power of the nations who possess other territory to obtrude the communication between the upper country and the sea. Smith's Wealth of Nations, vol. i. p. 32. The chief capes on the African coast are Bona, Bissau, Canton, Geier, Nor, Bojador, Barbas, Ward, Morte, Palmas, Three Points, Coast, Forks, Lopez, Negro, Good Hope, Fumos, Coronado, Sebastian, Delgado, and Guardafui. There is but one strait in Africa, which is called Babelmandel. Modern geographers are not agreed about the division of Africa. Some have divided it into two general parts, under the denominations of the country of the whites and that of the blacks. The former comprehends Egypt, Barbary containing six subdivisions, viz. Barea, Tunis, in which is Tripoli; Tripoliz, in which is Algiers; Fez, Morocco; Dara, Biledugurid, and Zaara or the Defert. The country of the blacks contains the following provinces on the sea-coast, viz. Nigritia, Guinea, Congo, Caffarinia, Sofala, Abex, Ajan and Zanguebar; and in the interior parts, Nubia, Ethiopian or Abyssinia, Moenomugi and Monomotapa. The following general distribution will direct the reader to those articles in this dictionary, where he may find a further account of the several kingdoms and states of which it consists, viz. 1. Egypt. 2. Upper Ethiopia, comprehending Nubia, Abyssinia and Abex. 3. Zanguebar, with Anian or Ajan, which lies on the coast of Africa. 4. Lower Ethiopia, in the interior part, Moenomugi, Monomotapa and Caffarinia, called by some the land of the Hottentots, which lie on the south. 5. Guinea, upper and lower, on the west and west south. 6. Nigritia or Nigerland, in the middle of Africa, extending almost quite through the country, from coast to coast, on both sides of the river Niger. 7. Sahara or Zaara, or the Defert, to the northward of Nigritia. 8. Biledugurid, to the northward of Sahara. 9. The empire of Fez and Morocco, containing the north-west part of Africa. 10. The coast of Barbary, on the north, containing the countries of Algiers, Tunis, Tripoli and Barea. Major Rennell in his Geographical Illustrations of Mr Park's journey, represents north Africa as composed of three distinct parts. The first and smallest is a fertile region along the Mediterranean, commonly distinguished by the name of Barbary; and which, on the supposition that the Mediterranean was once dry land, with the exception of a lake for the surrounding rivers, might be regarded as a part of Europe; because it possesses all the European than of the African character. The second part is what may be deemed the body of north Africa, comprised between Cape Verd and the Red Sea, on the west and east; and having the Great Defert or Sahara and its members, on the north; the Ethiopian ocean and south Africa on the opposite side. The prominent feature of this immense region is a vast belt of elevated land, generally running from west to east about the tenth degree of latitude, and extending from Cape Verd, its western extremity, to the mountains of Abyssinia, the eastern extremity; which has on the north side a lofty tract, that turns the Nile to the northward beyond Abyssinia, and on the south a multitude of rivers, some of them very large, that descend from that side, and join the Atlantic and Ethiopian seas, from the Rio Grande on the west to Cape Lopez on the east. A similar ridge stretches to the south, through the middle of south Africa, and forms an impenetrable barrier between the two coasts; on this account the Portuguese in Congo and Angola have never been able to penetrate to the coast of the Indian Ocean. From Mr Bruce (Travels, vol. iii. p. 668.) we also learn, that a high chain of mountains from 6° runs southwards through the middle of Africa; and he supposes the gold of Sofala to be drawn from these mountains. Major Rennell supposes, that the surface of the Sahara has a general dip to the northward, whilst it declines also to the eastward; and that the rivers receive all their supplies from the south, no streams of any bulk being collected
lected in the Defert. Hence he infers, that there must be a large hollow in the interior of Africa, between the high land of Nubia on the call, and Munding on the west, and of which the mountains and Defert form the other two sides; similar to the cavity in Asia, to whose waters the Cufian and Aroel serve as recipients. The third, part of north Africa, in the distribution of Mr. Renell, is the Great Defert or Sahara, and its members, consisting of the lesser defects of Jarras, Bilma, Barea, Sort, &c. For the description of this part, see Sahara.

Many laudable attempts have been lately made, under the encouragement afforded by the African Association, for discovering the interior, and hitherto very much unknown, parts of Africa. Mr. Park, a very intelligent and intrepid, and it may be justly added, a very successful traveller in this mission, has made several important discoveries. Having left Bilma, N. lat. 13°. 35', about 200 miles from the mouth of the Gambia, Dec. 2, 1795, he returned thither after an absence of eighteen months. In this long interval of time, he explored the interior of Africa to the distance of 1200 miles, in a direct line from Cape Verd; proceeding in a tract bounded by the 15th and returning by the 12th parallel of latitude. His first station was Medina, the capital of the kingdom of Woolli, whence he pursued his journey by Kolor, to Koojar, the frontier towns of this country. Here he refreshed himself with a liquor made from corn previously malted, with bitter roots instead of hops. After passing a wilderness of two days journey, he reached Tallika, the frontier town of Bondoo, and at Patte-conda, the capital, he was introduced to the king Almami. From Bondou Mr. Park proceeded to the kingdom of Kajaaga, and having been ill treated at Joag, the frontier town, he proceeded his journey to the kingdom of Kasson, and passing Tessef, the frontier town, arrived at Koonaka, the capital. Here he was treated kindly by the king; and having remained here for some time, he resumed his journey, and arrived at Keemoo, the capital of Kaarta. Following the route which Dalil, the king of this country, prescribed, through the kingdom of Ludamar to that of Bandara, he paddied Marina, on his way to Simbing, the frontier town of Ludamar.

Having left Jarra, the frontier town of this country, he pursued his journey and reached Sampa. He was afterwards feized by a party of Moors, and conducted back to Benown, the residence of Ali, king of Ludamar, where he was treated with great severity by the bigotted and malevolent Moors, and cleaped death only by a pilot's twice mulling fire. At length he fortunately escaped, and reached a negro town called Wawra, belonging to Manlong, king of Bandara; and passing through several towns of this kingdom, he arrived at Segg, on the banks of the Niger, which he found to be as broad as the Thames at Westminster, and flowing slowly to the eastward. Pursuing his course in this direction along the banks of the river, he paddied through the towns of Kibba, Madengo and Kea, and reached Moorzan. Here he crossed the Niger to Stilla, which was the termination of his journey to the call. In his return settward on the northern bank of the river, he arrived at Bamumoo, the frontier of the kingdom of Bandara, and quitting the Niger at this place, he proceeded to Sibidooloo, the frontier town of the kingdom of Munding. Hence he pursued his journey to Kamalia, where he remained seven months. In his progres from Kamalia he traversed the Jalonko wilderness, by an interval of 100 miles, and having crossed the Black River, a principal branch of the Senegal, he arrived at Malacotta; and after a journey of 500 miles reached Medina, the capital of the king of Woolli's dominions, on the 4th of June 1797, which he had left in December 1795. From hence he proceeded to Pishina, and afterwards returned to England.

All the inhabitants of the African continent, though distinguished under a variety of denominations, according to their different situations, origin, tribes and governments, are commonly included under the twofold distinction of Africans and Arabs, or Whites and Blacks. The white Africans, according to Leo Africanus, (l. 1. c. 9.) and Marmol, (l. 1. c. 24.) are divided into five nations or tribes, viz. the Zanjagans, Musmudans, Zeneth, Gusmanians, and Hoars; and to these 500 capital families of Berbiers, and the most considerable ones in Africa, owe their origin. They first settled in Barbary, and from thence gradually dispersed themselves over the greatest part of Africa. For an account of the black Africans, see Blacks and Negroes.

The Ancient and Moderns have concurred in giving a very unfavourable representation of the disposition and character of the native Africans. Lucan (l. vi.) Virgil (Aen. viii. cum not. Servii) and many others, describe them as proud, insolent, thievish, revengeful, addicted to all kinds of ill, cruel, inconstant, superstitious and cowardly. So general has been the unfavourable opinion entertained concerning their people, that it has given occasion to a common proverb, that all the inhabitants of the globe have some good as well as ill qualities, except the Africans. But this degeneracy of character is owing more to their bad education, their tyrannical governments, and their unfedted state, than to their country; for this has produced several distinguished persons, among whom we might enumerate St. Cyprian, Augustin, and Tertullian, in the class of divines; Hanno, Hannibal and Afrubal, in the list of heroes; Terence among the poets, and many others. We might also appeal to the industry with which they have formerly cultivated their lands, and applied to commerce and the useful arts. If they are now, too generally, ignorant and depraved, idle, dishonest or superstitious, we are to seek the cause of the evil in the nature of their governments, and the inattention and neglect with which they have been treated. The religion of the native Africans has been the grossest kind of idolatry, blended with the magical and superstitious rites of the ancient Egyptians. Nevertheless we discover many relics of Judaism not only in Abyssinia, but in many other parts of Africa, where many Jews, driven there at a very early period, or by the dispersion after the destruction of Jerusalem, or by the persecutions of later times, have settled and maintained their religious worship and ceremonies. Christianity was also introduced at an early age of the Christian era into this country, and has subsisted, under one form or other, and amidst great difficulties and corruptions, in various districts of Africa to the present day. The interior parts of Africa remain still in the darkness of Paganism, as they have been in a great degree inaccessible to the most adventurous of the Europeans. Indeed, in the maritime provinces of this great peninsula, and especially where the Portuguese have their settlements, there are several districts in which the religion of Rome has prevailed over the savage superstitious of that barbarous region. But the ingenious historians, even of the Roman Catholic persuasion, who have given accounts of the African colonies, acknowledge, that of the profelytes made to the faith of the gospel few deserve the denomination of Christians; as most of them retain the abominable superstitious of their ancestors, and the heat among them dis honour their profession by various practices of a most vicious and corrupt nature. The millions in Africa have been much neglected by the Portugues; and the few missionaries
millionsaries that were sent thither were men void of learning, and destitute almost of every qualification that was necessary towards carrying on such an important undertaking. What may be the result of Protestant missions, more lately undertaken and prosecuted with a considerate degree of zeal, time alone must discover. Those who liberally patronize and encourage them, anguished from circumstances that have already occurred increasing success. But the most prevalent religion in Africa (if we except Paganism) is that of Mahommet, which is blended and intermixed with tenets and practices, that are more or less of Pagans, Jews, and Christian original. See Marabouts. Of the habits and manners of the Africans, an account will occur under the appellation of Arabs, under the different denominations by which they are distinguished, as Moors, Negroes, &c. and in the description of the different countries in which they reside. The interior parts of Africa are inhabited, according to Mr. Park's report, by three distinct races of men; viz., the Mandingoos or proper negroes, native children of Nigeria; the Foulahs, or white Abyssinians of Tobkay and Pliny, who have neither the crisped hair, the thick lips, nor jetty blackness of the Mandingoos; and the Moors, natives of Arabia, who, in their perons and complexion, exactly resemble the Mulattoes of our West Indies, and who are devoted followers of Mahommet, and the most intolerant, perfidious and fanguinary of the human race. Though these three nations are frequently intermixed, yet the negroes, whether Mandingoos or Foulahs, generally inhabit to the south of the moors. The negroes are for the most part husbandmen: the moors, like their Arabian ancestors, are moving shepherds, or wandering merchants; and those, from the earliest times, to have overpowered the habitable parts of the great African desert, and the Oafoes or fertile islands, thinly scattered through that sandy ocean. Hence they extended their arms southwards, and made themselves masters of several of the negro kingdoms on the Niger; so that their dominions form a narrow belt running from west to east on the shores of the Desert, from the Atlantic coast to the mountains of Abyssinia. The common boundary of the moors and negroes forms a striking feature in the moral, as well as in the political and physical geography of Africa. Herodotus (compare Eutrop., c. 32. and Melpomene, c. 197-pp. 117 and 568, Ed. Wette,) fixed the boundary of the Libyans and Ethiopians, i.e. of the moors and negroes, near the banks of the Niger; and in this respect circumstances do not seem to have been materially altered since his time. Mr. Park observes, that the population in the countries which he visited was not very great, considering the extent and fertility of the soil, and the ease with which lands were obtained. He found many extensive and beautiful districts entirely destitute of inhabitants; and, in general, the borders of the different kingdoms were either very thinly peopled, or entirely deserted. Many places, such as the banks of the Gambia, the Senegal, and other rivers towards the coast, were unhealthful, and on this account unfavourable to population. To this circumstance, it is chiefly owing, that the interior countries abound more with inhabitants than the maritime districts; for the negro nations, observed by this traveller, though divided into a number of petty independent states, failed chiefly by the same means, live nearly in the same temperature, and possess a wonderful similitude of disposition. Perhaps the circumstance of the slave-trade may suggest another cause of the poverty of native inhabitants towards the sea-coast. Our traveller concurs with others in representing the disposition of the women as uniformly benevolent; in proof of this

The following incident is related. When Mr. Park was prohibited by the king of Bambara from crossing the Niger, and ordered to pass the night in a distant village, none of the inhabitants would receive him into their houses, and he was preparing to lodge in the branches of a tree. In this state, exhausted with hunger and fatigue, and unprotected from a storm, he was relieved by a woman who was returning from the labours of the field. To her he was kindly invited; and his distress was alleviated by the tender attention which he experienced. The female part of the family, says Mr. Park, lightened their labour by songs, one of which was composed extempore: for I was myself the subject of it. It was sung by one of the young women, the reft joining in a fort of chorus. The air was sweet and plaintive; and the words, literally translated, were these:—

"The winds roared, and the rains fell.—The poor white man, faint and weary, came and sat under our tree. He has no mother to bring him milk; no wife to grind his corn.—Chorus. Let us pity the white man; no mother has h¢, &c. &c." These words have been since formed into verse by the Duchy of Devonshire, and set to music by Ferrrari; and the song is as follows:

I.
The loud wind roar'd, the rain fell fast;
The white man yielded to the blast:
He sat down, beneath our tree;
For weary, fat, and faint was he:
And all I no wife or mother's care,
For him, the milk or corn prepare:

Chorus.
The white man's in our pitly care:
Ah! no wife or mother's care,
For him, the milk or corn prepare.

II.
The storm is o'er; the tempest past:
And mercy's voice has hush'd the blast:
The wind is heard in whispers low,
The white man far away must go—
But ever in his heart will bear
Remembrance of the negro's care.

Chorus.
Go, white man, go—but with thee bear
The negro's wife, the negro's prayer:
Remembrance of the negro's care.

From Mr. Park we further learn, that with respect to the property in the soil, the lands in native woods were considered as belonging to the king, or, where the government was not monarchical, to the state. When any individual of free condition had the means of cultivating more land than he actually possessed, he applied to the chief man of the district, who allowed him an extension of territory, on condition of forfeiture, if the lands were not brought into cultivation by a given period. The condition being fulfilled, the soil became vested in the possessor; and, for ought he knew, descended to the heirs. The Africans appear to have no astronomical knowledge; and the little geography to which they pretend is erroneous; for they suppose, that the earth is an extended plain beyond which is the sea, or river of salt-water; and on the farther shores of which are situated two countries, called Tobadou, and Jong sang do, "the land of the white people;" and "the land where slaves are sold." Park's Travels in the interior districts of Africa in 1795, 1796, 1797. Raffoin.

Africa, the name of a sea-port of Tunis on the coast of Barbary,
African, in **Antiquity**, is represented on medals by the head of a woman, dressed in the skin of an elephant, with the trunk projecting forward in front. This kind of attire is peculiar to some queens of Egypt. Near the figure of Africa we frequently see a scorpion, serpent, or lion, animals belonging to this part of the world, and mountains alluding to the seven mountains of Mauritania Tingitana.

**African Association** was formed in 1788, with a view of promoting the discovery of the interior parts of Africa. Out of 93 members, of which this society appears to have consisted, a committee of five gentlemen was elected, for directing its funds, conducting its correspondence, and the choice of the persons to whom the geographical mission was to be assigned. These gentlemen were Lord Rawdon, the Bishop of Landaff, (Dr. Watton) Sir Joseph Banks, H. Beaufoy, Esq. and Mr. Stuart. The two first persons that were appointed for accomplishing the laudable object of the society were Mr. Ledward and Mr. Lucas. The former undertook, at his own desire, the perilous task of traversing from east to west in the latitude attributed to the Niger, the widest part of the continent of Africa. With this view he arrived at Cairo in August 1788; but death disappointed the hopes that were formed from his projected journey. For a short account of the singular adventures of this extraordinary man, see **Ledward**. Mr. Lucas embarked for Tripoli in October 1788, with instructions to proceed over the desert of Zaara to Fezzan, to collect, and to transmit by way of Tripoli, whatever intelligence he could obtain respecting the interior of the continent, and to return by way of Gambia, or the coast of Guinea. The peregrinations of this traveller terminated at Meccafla, in Feb. 7. 1809; and he was able to transmit to the society only the result of his conferences with persons who were travelling with him to Fezzan. See **Fezzan, Bornou, and Cashna**. The object of Mr. Park's mission was to ascertain the course, and, if possible, the rise and termination of the Niger, and to use his utmost exertions for visiting the principal towns in its neighbourhood, particularly Tombouctoo and Housa; and of the result of it some account is given in the preceding article, and will be farther found under the several heads to which we have referred.

**African Company. See Company.**

**African Islands** are distributed into three which lie in the Eastern or Indian Ocean, and those of the Western or Atlantic Ocean. The former are ZOOGOTA or SOGOTA, Babelmandel, Comora islands, Mauritius, Madagascar and Bourbon. The latter are St. Helena, Ascension, St. Matthew, St. Thomas, Annaba, Prince's island, Fernando Po, Goree, Cape Verde islands, Arguin island, Canary islands, Madeira, Porta Santo, and the Azores.

**Africanus, Julius**, in **Biography**, an eminent Christian writer and chronologer, who flourished in the beginning of the third century. It is not certain, whether he was a native of Palestine, or of Africa; but as he was employed in an embassy to the emperor Heliogabalus, between the years 218 and 222, for the restoration of Emmas, which was afterwards called Nicopolis, and as he attended the lectures of Heraclos, at Alexandria, some time before the year 231, there can be no doubt concerning the time in which he lived. Suidas says he was of Africa; but his more constant residence seems to have been in Palestine, where he was probably born. The works ascribed to this author by Eusebius and Photius are "the Celii," a collection of passages from various authors, chiefly on physical topics, of which only a few fragments remain; "Chronology," in five books, containing a recital of events from the creation to the year of Christ 21; and two letters, "one to Origen," concerning the history of Susanna, annexed to the book of Daniel, which he considers to be a forgery, and "another to Ariilides," for reconciling the disagreement between Matthew and Luke, on the genealogy of Christ. The Celii is ascribed by Vakhtia, J. Scaliger and Du Pin, to another person called Sextus, who was an African and a Gentile philosopher. Jerome does not include it in the list of the works of Africanus; but Volusius and Wetstein believe it to have been written by him. Julianus Africanus was undoubtedly a Christian, nor does antiquity justify the opinion that he was originally a heathen. The chronology is much commended by Photius, as concise and yet comprehending every thing necessary to be related. Some fragments of it are preserved; and have been freely used both by Eusebius in his chronicle and by other historians. Of the letter to Ariilides, there is a large fragment in Eusebius's Ecclesiastical History, and the entire letter to Origen is extant, which is learned and critical, and does great honour to its author. Africanus affords a valuable attestation to the two Gospels of St. Matthew and St. Luke; and we have sufficient reason to believe, that this great and learned man received as scripture the books generally received by Christians in his time. "We may glory," says the excellent Dr. Lardner, "in Africanus as a Christian. For it cannot but be a pleasure to observe, that in those early days there were some within the inclosure of the church of Christ, whose ingenuity abilities rendered them the ornament of the age in which they lived; when they appear also to have been men of unspotted characters, and give evident proofs of honesty and integrity." Lardner's works, vol. ii, p. 431.

---

AFRICUS, Leo. See Leo Africanus.

AFRICUS, Scipio. See Scipio.

AFRICERONES, a people, according to Ptolemy, of Libya, a province of Africa.

AFRICTA denotes a kind of wafers, which the ancients used in their sacrifices. Arnob. lib. vii.

AFRICQUE, in Geography, a small town of France, in the department of Aveyron, six miles east of Vabres.

AFRIQUE, a mountain of France in Burgundy, extending between Dijon and the small town of Chagny about ten leagues. At the foot of these mountains the vines are found which yield the Burgundy wine.

AFSHAR, the denomination of a Turcoman tribe, which is divided into two or three clans, of one of which the father of Kuli Khan was chief.

AFSLAGERS, persons appointed by the burgomasters of Amsterdam, to preside over the public fairs made in that city. They must always have a clerk of the secretary's office with them, to take an account of the fale. They correspond to our brokers, or auctioneers.

AFT, the hinder part of the ship, or that nearest the stern. See**AFT.**

AFTER, is a term applied to any object in the hinder part of the ship, as after-hatchway, after-hall, etc.

AFTER-BIRTH, in Midwifery. See Placenta.

AFTER-GRAPE, or AFTER-MATH, in Agriculture, denotes the second crop, or grape which springs up after mowing; or grape-math that is cut after some kinds of corn.

AFTER-MOON, the latter half of the artificial day, or that space between noon and night.

The ancient Romans dedicated their afternoons to diversi-
tion, as their foremen to business; and their usual diversions were the game called *pils*, and other exercisef of the body, especially walking or riding. These laded till the eighth or ninth hour, answering to our three o’clock, which was the time for the baths. After bathing, they anointed and perfumed themselves; and, about the tenth hour, went to *canes supper*, about three hours before sun-set; which done, the day was ended at the public spectacles, theatrical or amphitheatrical sports; with music, singing, and the like.

After-supers usually comprehend all those which are extended on the mizen-mast, and on the stays, between the mizen and main-masts.

After-throes, or pains, enixus posteri, dolores post partum, in Midwives, are pains resembling labour pains, though ordinarily less violent, which occur after the expulsion of the fetus and placenta. They are occasioned by the contraction of the uterus to expel congested blood, parts of the membranes, or other foreign bodies from its cavity, as well as to reduce the capacity of the blood vessels, which during pregnancy acquire a considerable magnitude, to the size they had prior to conception. They are more or less severe in different women, but are found very rarely to occur after first labours. They are more frequent, severe, and lasting, after the birth of large, than of small or maddling fixed children, or after labours that have terminated in an unusually quick and rapid manner, particularly if the placenta has been extracted almost immediately after the birth of the child. Mr. White, of Mancheter, to whom we are indebted for many valuable practical observations, on the manner of conducting labour, is of opinion, that after-pains are almost entirely occasioned by extracting the shoulders and body of the child, immediately after the birth of the head, instead of waiting and suffering them to be expelled by the pains; and says, that by pursuing a different course, and leaving the whole of the process to nature, in ordinary cases, he had been so fortunate, that, in the course of several years, he had neither been under the necessity of introducing his hand into the uterus to extract the placenta, nor to give opiates or other medicines to quiet after-pains, except in a single instance, “the after-pains having been so trifling, under his management, both with regard to violence and duration, as not to deserve notice.” Treatment on the management of pregnant and lying-in women, p. 111. See more on this subject, under the word Labour. After-pains, even when most severe, are still unattended with danger. They are best relieved by the application of warm cloths, with gentle friction to the abdomen, by giving internally twenty-or thirty drops of the tincture of opium, or by affiduously rubbing upon the region of the uterus, a mixture composed of four parts volatile liniment, and one of the tincture of opium, by administering frequent draughts of warm gruel, and giving callor oil, or some other gentle purge on the following day. See Labour.

After-swarm, in speaking of bees, are secondary or posterior swarms, frequently found to quit the hives within a fortnight after the first.

Butler tells us, that the after-swarms differ from the prime, in that the latter are directed by the vulgar, or crowd of bees, whose only rule is the fulness of the hive; whereas the former are appointed by the ruling bees, and indicated by a noise or call, which thence make for the space of two or three days, as it were to give warning to the common herd to prepare for a march. Within eight or ten days after the prime swarm is gone, if the princes next in order find a competent number relaxed and ready, she begins to tune her treble voice, in a mournful and begging note, as if she prayed the queen-mother to let them go; to which voice, if the vouchsafe a reply, by tuning her base to the other’s treble, it marks her consent; in consequence of which, within a day or two after, if the weather allow, the new swarm appears. If the prime swarm be broken, the after will both call and swarm the sooner, perhaps the next day; in which a third, sometimes a fourth, succeeds in the same season: but all usually within a fortnight after the prime swarm. See Swarm.

AFTO, in Botany, a name given by the natives of Guinea, to a plant of the crysirum kind, which they grind to powder, and take as snuff, to cure the head-ach. Pettier has called this plant the wooden and woolly crysirum, or hedge-humillard, of the coasts of Guinea. Phil. Trans. N. 232.

AFUERA, in Geography. See AFFUERA.

AFWESTAD, a large copper-work, belonging to the crown of Sweden, situate on the river Dal-Elbe, in the province Thalland or Dalecarlia. It resembles a town in its extent, and has its own church. Copper-plates are manufactured, and the small copper money is coined in this place; which has also a royal poll-houfe.

AFZELIA, in Botany, a genus of the didynamia angiospermae class and order : the characters of which are, that the calyx is quinque-partite, the corolla campanulate, and the capsule round, acuminated, double-celled, gaping at the apex and pellucidous; with hemispheric receptacles. There is one species, viz. the *Afzelia Caffiodae*. This is the Afzelia of Gmelin, which Dr. Smith says is too uncertain to be honoured by such a name, after that of Adam Afzelius, professor of botany in the academy of Upsal; and therefore he has appropriated it to a new species of the *decandra madagascariens* class and order, near the *Hymenen*, and of the natural order of leguminosae: the essential characters of which are, that the calyx is tubulofus with a limb quadrifid, deciduous; the petals are four, unguiculatcd, with a very large head; the filaments are two, superior, fertile; the legumen many-celled; the seeds arillated at the base. It is found in Africa, near the equinoctial. Linnean Trans. vol. 4. p. 221.

AGA, in the language of the Moguls, &c. signifies a great man, lord, or commander.

In this last sense, the term is also used among the Turks: thus, the Aga of the Janizaries is their colonel; and is the only person who is allowed to appear before the Grand Seignor, without his arms across his breast, in the posture of a slave. The *capk aga*, is the captain of the gate of the feragio.

The title aga is also given, by way of courtesy, to several persons of distinction, though not in any office, or command, to entitle them to it; as to the eunuchs of the feragio.

The chief officers under the khan of Tartary are called by this name. And among the Algerines, we read of agas chosen from among the *boluck bajlis* (the first rank of military officers), and sent to govern in chief the towns and garrisons of that state. See Algiers.

On some occasions, in lieu of aga, they say *agasi*, or *agassi*. Thus the aga, or governor of the pages, is called *capk agasi*; and the aga or general of the horde, *jubilar agassi*.

Aga, or Adja, in Geography, a village about half a mile from Anamaboa, on the gold coast of Africa, where the Dutch formerly had a fort; and where, it is said, they have now one factor. Its situation is by no means favourable to commerce, as the landing is difficult and dangerous; but the adjacent country produces several valuable commodities, and among others a very fine cotton.

*Agar Cretenimum*, in Botany, signifies the Spanish milk-thistle.

*Aga*.
A. See Agar.

AGAZI, or Agaci, in Geography, a denomination given in Abyssinia to a class of those shepherds, who are said to have been employed by the descendants of Cush, the first inhabitants of the country, in dispersing the produce of Arabia and the eastern coast of Africa over the Continent, and who thus acquired wealth and influence. The nobility and most warlike of all the shepherds were those that inhabited the mountains of Hadab, a considerable ridge reaching along the Red Sea, from the neighbourhood of Mafiafah to Suakim, and who by degrees extended themselves throughout the whole province of Tigre. *Agaz*., says Mr. Bruce, denoted the nobles and chiefs of the armed shepherds, whence came their title, king of kings; and the plural of this is *Agaci*, or, as it is written in the Ethiopic, *Agazi*. The king of Amalek, mentioned in Samuel, ch. xv. and Sam. was, according to this writer, an Arab shepherd. Bruce’s Trav. i. p. 387. Of this appellation, Ludolf (Hist. Ethiop. b. i. c. 1) gives a different etymology. The Agazi affumed this denomination, and called their country *Geze*, either on account of the liberty they enjoyed, or because they transported themselves from one place to another; the radical word *Geza* admitting both these significations. Their language is *Gez*.; they have always had letters among them; and they are all circumcised, both men and women. This right they profess to have derived from the family of Ishmael and his descendants, with whom they were connected at an early period in their trading voyages.

AGABEN. See Agabeni.

AGABUS, in Scripture history, a prophet, and as the Greeks say, one of the 70 disciples of our Saviour (Acts xii. 28) A.D. 43. He predicted a great famine, which, as St. Luke informs us, occurred in the 4th year of Claudius, A.D. 44. It is also mentioned by profane historians, Sueton. in Claud. c. v. 1. In p. 698 ed. Pitra. Josephus, ant. l. xx. c. ii. § 1. Oper. l. t. p. 565 ed. Haverc. On this occasion the Christian at Antioch sent their contribution by Paul and Barnabas to Jerusalem, for the relief of their distressed brethren. Helena, queen of Adiabene, also assisted the Jews with corn and other provisions from Egypt and Cypros, as Josephus (ubi ibid.) informs us. Several years after this period (viz. A.D. 58) Agabus had an interview with St. Paul, at Caesarea, and foretold the sufferings that awaited him at Jerusalem, whither he was determined to proceed, Acts xxii. 10. From the Greek we learn, that Agabus suffered martyrdom at Antioch, and they observe his festival, March 8. The Latins, since the 9th century, have kept it, Feb. 9.

AGABRA or EAGABRA, in Ancient Geography, a town of Boethica, in Spain.

AGADEX, one of the Fox islands in the Northern Pacific Ocean.

AGADEZ, in Geography, a kingdom of Africa, placed by Leo Africanus and Marmol, directly east of Yguida, and by De Lisle, south and south-east of the city. On the east it has the kingdom of Bornou; on the north, north-east, the desert of Lempita, and Yguida; on the south, Cano; and on the west, the provinces Zappara and Guber, and a lake north of the Niger. This province is divided into two districts, the northern, called on account of its fertility, the Defert, and the southern, fertile in grazes, corn and cattle. De Lisle mentions three considerable towns in the latter division, viz. Agade, the capital of the whole province, Deyhir and Secmania, little inferior in wealth and population to the metropolis. He adds, that fenn is produced here in great abundance, and that the principal trade of the natives consists in this article and manna. The southern inhabitants feed cattle, live in the open country, and resemble in their manners the wandering Arabs. Agad, the capital, called also by the Arabs Andegafa, is situated in a valley between two high mountains, and at the spring of a considerale river that waters the southern country and discharges itself into the Niger. According to D’Anmvel’s account, the inhabitants are chiefly merchants, and strangers, who have settled there, enclosed the town with walls, and built their houts in the Morefo fashion. The sovereign is said to be tributary to the king of Tombole, and yet to prefer the trade of a powerful, independent, and despotic prince. Mod. Un. Hist. vol. xiv. p. 262. 8vo. The province of Agadez is placed by Major Remell, in his map of North Africa, in the eastern division of the Great Desert, or Sahara, and the capital in N. lat. 25° 15'. E. long. 15° 14'. In the proceedings of the African association, Agadez is made a province of the Gulph empire, and the inhabitants are said to load their immense caravans with the salt of Bornou, and to engross the profits of this invaluable trade. The only acknowledged method they make for it is the trifling price which they pay in brass and copper (the currency of Bornou) to the neighbouring beasts.

AGADNA, a small town in the island of Guam.

AGAG, or AGACA, a kingdom of Africa, which depends on the empire of Monomotapa. It is bounded on the east by the country of the Negroes, and on the north by the kingdom of Taua. The capital is of the same name.

AGAGEER, a name given in Abyssinia to those whose business it is to hunt and kill elephants. Their appellation is formed from the word Agar, which signifies to hough or ham-tring with a sharp weapon. These persons dwell constantly in the woods, and live entirely upon the flesh of the beasts which they kill, chiefly on that of the elephant and rhinoceros. They are light and agile, both on horsecback and on foot; of a swarthy complexion; and have European features. None of them are woolly-headed. The manner in which they kill the elephant is as follows: two men, altogether naked, mount the same horse, the foremost manages the horse, and the hindmost has a broad sword, such as the Schavanians use, and procured from Triege; the handle of which he grasps with his left hand, whilst with his right he takes hold of a part of the blade, round which whip-cord is twilled. The edges of the sword are as sharp as a razor, and yet he thus carries it without a scabbard. When the elephant is found feeding, the horsemans runs before him, and when he flies, crosses him in all directions, using at the same time a variety of expressions and exclamations, which he is foolish enough to believe the elephant understands. The animal incensed by this noise, attempts to seize the horse and rider with his trunk, or proboscis; and for this purpose he turns himself about in every direction, instead of making his escape. The horsemanship from some evolutions of this kind, rides up to the side of the elephant and drops his companion on the off-side; and whilst the rider engages the attention of the animal, the other person gives him a stroke above the heel, in that part which in the human subject is called the tendon of Achilles. At this moment the horsemanship turns round and takes up his companion; and runs with full speed after the tail of the herd; and sometimes an expert Agageer will kill three out of one herd. The blow commonly separates the tendon, or at least wounds it to such a degree that the weight of the animal breaks it. In this state the horsemanship, and his companions, speedily dispatch the animal with their javelins and lances; when he is slain, the flesh is cut off the bones into strings, and these are hung on the branches of trees to dry, without salt; and are then tied by for their stock of provision in the season of the rains.
The elephant sometimes reaches the most dextrous riders with his probosces; and having daffled the horse to the ground licks his feet upon him, and soon tears him limb from limb. Bruce's Travels, vol. iv. 297. &c. See Elephant.

AGAI. See Agio.

Agai, in Geography, a small port of Provence, about two leagues from Frejus.

Agalactia, in Physt, signifies a deficiency of milk in a mother, who is therefore called by Hippocrates alla-

Agallega. See Gallega.

Agallochum, See Gallega.

Agallochum, a medicinal wood imported from the East Indies, usually in small bits, of a very fragrant scent. The word is derived from the verb agallochoun, agglof, in allusion to the excelsity of its odour. This wood is otherwise called lignum aloes, and xylolne, q. d. alox-wood, not that it is produced from the common alox-plant, which yields the misnamed juice of that name. It is the produce of a tree of a very different kind, growing in the East Indies, particularly Sumatra and Cochinchina, or the Excæra Agallocha of Linnaeus. Some call it likewise lignum paradisi. It yields a concrete oil. See its chemical history in Neumann's Works, p. 420.

It is of a bluish purple colour, marked with veins and spots, very heavy and bitter; when burnt it yields drops of an astringent liquor, and a sweet aromatic flame. It is hot and drying, and esteemed a great strengthenor of the nerves in general, but particularly of the head and stomach.

The various names and accounts given of the agallochum are so very different, as well as the specimens of it common in our shops, that it does not seem to be properly known amongst us.

Bauhin and the Moderns distinguish three sorts of agallochum, which differ either as to the excellence of their quality, or to the country that produces them; accordingly they call the first calabac, which is the most excellent agallochum, denominated also calambac fidorum, kaman Cochinchinum, and fokio. The second is the agallochum of the spots, denominated lignum aloes. The third is also called calabac, agallochum sylvestre, and lignum aloes Mexicanum.

M. de Lourrie, whose long residence in Cochinchina, whence the real and most esteemed agallochum is exported to all the Asiatic markets, led him to an acquaintance with this substance, which has described the tree which produces it, and gives a history of its formation. To the genus of plants, of which this is a species, he gives the name of aloexylum, and the particular species he calls aloexylum verum. The resinous concretion which is found in these trees, when in a decayed state, is the true agallochum, the history of which is satisfactorily detailed in a Memoir, on its true nature and origin, in vol. i. of the Memoirs of the Royal Academy of Sciences, at Lisbon.

Agalmata, in Antiquity, originally denoted the ornaments of temples and statues; but came afterwards to be popularly used for the statues and temples themselves, and for the imitations and images on a seal.

Agama, in Zoology, a species of Lacerta, with a long round tail, the upper part of the neck and under part of the head acutated, with reverse scales. There is a variety of this called iguana salamandra, with the tail imbricated by large scales, as the former is denominated iguana cordyline. It is found in America.

Agamaska or Viners, in Geography, an island in James's bay, in North America.

Agameda, in Ancient Geography, a place in the isle of Leboe, near Pyrrha. Here was a fountain of the fame name, which had been also that of a woman, who was distinguished by her skill in preparing poisons.

Agamemnon, in Classical Biography, one of the heroes engaged in the Trojan war, was the son according to Homer, and according to Herodotus, the grandson of Atreus, whom he succeeded in the government of Argos and Mycenae. Homer calls him and his brother Menelaus Atticides, the sons of Atreus; but Hefiod and others say, they were the sons of Phthiones, the brother of Atreus. Agamemnon, having engaged the fucceor of Tyndars, king of Sparta, drove Thyctetes, his uncle, from Argos; killed his fon Tanatus, and married Clytemnestra, his wife, by whom he had four daughters, but according to Euripides only two, viz. Iphigenia and Electra, and one son, the famous Orestes. To him was entrusted the command of the confederate army against Troy, which expedition commenced, according to the chronology of Blair, 1193 years before Christ. At Aulis, where the fleet was detained by contrary winds, Calchas, the foothsayer, enjoined the sacrifice of Iphigenia, the daughter of Agamemnon, as a propi-

AGAMEMNON, in Entomology, a species of Papilio, with black wings, spotted with green, and the hinder ones having on the under part a lunate ocellus and red spots. It is found in Asia.

Agamemnon's fountains were situated in Ionia, about 5000 paces from Smyrna.

Agamenticus, in Geography, a high mountain of America, in the district of Maine, distant about six miles from Bald-head and eight from York harbour, which is a noted mark for seamen, particularly in the entry of Pafca
taqua harbour. It is covered with wood and shrubs, and affords pasture to its summit, whence the prospect is enchanting. N. lat. 43° 16'. W. long. 70° 39'.

Agamenticus is also a river in the center of York county and district of Maine. It receives its waters from the ocean through the bay of Pafcartaqua, and has only a scanty supply from streams of fresh water. Its mouth is about four miles south from Cape Neddie river, and admits small vessels.

Agami, in Ornithology, a name given by the French at Cayenne, and applied by Buffon to the Psophia crepitans of Linnaeus, the grus piospha of Pallas, the Phoebinus Antillarum of Brillon, and the gold-breasted trumpeter of Latham; the specific character of which is, that its head and breast are smooth and shining green. This bird is 22 inches long, with a short tail concealed by the upper covert and not projecting beyond the wings, and legs five inches high, covered with small scales, reaching two inches above the knees, which are not feathered. Its head, throat, and superior half of the neck, are covered with a short, close and soft down; the
fore-part of the lower surface of the neck and breast are covered with a beautiful gorgé of brilliant colours, varying between green, gold green, blue and violet: the upper part of its back and adjacent portion of the neck black, and the plumage of the hinder part of the back changes into a tawny-rufous; but the under-side of the body, and also the wings and tail are black, the great feathers which extend on the rump and tail are light ash-coloured; and the legs are greenish. The most characteristic property of these birds is the fragular noise, called trumpeting, which they make, as some have commonly supposed by the anus, but as others have ascertained, by means of their lungs and the capacity of their membranous cells. The wind-pipe, before its entrance into the breast, is about the thickness of a swan's quill, bony and cylindrical. In the breast it is more slender and cartilaginous, and divides into two semicircular canals, formed of membranes, and capable of extension. The air-bag on the right side descends to the pelvis, and within the breast is divided into three or four cells by transverse membranous diaphragms. That on the left side is much narrower, and terminates in the larynx. The common food of these birds is grain; but they also eat small fish, flesh and bread. In their natural state, they inhabit the forests in the warm climates of America, and associate in large flocks on the mountains; and they escape, when surprised in their haunts, by the swiftness of their feet rather than by the use of their wings, as they never rise higher than a few feet. They form a bed for their eggs, of which they lay from 10 to 16, by scraping the earth at the roots of large trees, but construct no nest. In their domestic state, they manifest a wonderful attachment to their benefactors, and are no less fond and faithful than dogs. By their intercourse with men, their instincts are moulded like those of dogs; and it is said that they may be trained to tend a flock of sheep. They are jealous of rivals; fight with dogs, cats and birds of prey, and keep the poultry in great subjection. They follow perfoms through the streets and out of town, and it is difficult to get rid of them. Of all the feathered tribes the agami is the most attached to the society of man, and indeed is the only bird that has a focial turn. In this respect it is as eminently distinguished above other birds, as the dog is above quadrupeds.

Agami is also a species of Ardeae, in the Linnaean systen by Gmelin, found in Cayenne, about 31 inches long, and having long feathers in the tail. These feathers are of a deep blue; the under side of the body is rufous; the neck is of the same colour before, but bluish below, and dark blue above. The head is black, the occult bluish and crested, the temples and the portion above the eyes white.

AGAMIA, in Ancient Geography, a promontory and port of Asia Minor, near Troy. Steph. Byz.

AGAMINA, or AGAMANA, Kabem, a borough of Mesopotamia, situate, according to Ptolemy, on the Euphrates, towards 33° 55′ lat.

AGAMUS, a town of Asia Minor, near Heraclea.

AGAMIUM, a borough of Italy, belonging to the Infubres.

AGAN, in Geography, one of the Ladrone islands. Here Magellan, the famous navigator, was affaileated in 1521.

AGANAGRA, in Ancient Geography, a town of India beyond the Ganges, according to Ptolemy.

AGANGINAE, a people of Ethiopia.

AGANIPPE, a fountain of Helicon, faced to the Maus, whence they derived the appellation of Aganippides. Ovid (Fast. l. v. v. 7.) makes Hippocrene and Aganippe the same; but Solinus, and others, distinguish them and ascribe their being united to poetic licence. The water of this fountain was, to those who drank it, the source of the mus poeticus.

AGANLY river, a branch of Kuban river, which falls into the sea of Afox from the south.

AGANZAVA, a town of Asia, in the interior part of Media, situate, according to Ptolemy, in long. 89° and lat. 30° 30′.

AGAPE, or AGAPIE, formed of the Greek ἀγάπη, love, in Church History, a kind of religious festival, celebrated in the ancient church, to keep up a harmony and concord among its members. To these agape, we have a reference by St. Jude, v. 12, and also by St. Peter (2d Epistle c. ii. v. 13.) if with the Alexandrian copy, vulgar Latin and Arabic versions, we read ἀγάπας; for ἀγάπας. Tertullian is the first author who has particularly described these feasts. Apolog. c. xxxix. Oper. p. 35. Ed. Rigalt. Having taken notice of some luxurious feasters among the Heathens, he adds, 'the nature of our supper is indicated by its name; it is called by a word, which, in the Greek language, signifies love. We are not anxious about the expense of the entertainment; since we regard that as gain which is expended with a pious purpose, in the relief and refreshment of all among us that are indigent.—The occasion of our entertainment being so honourable, you may judge of the manner of its being conducted; it consists in the discharge of religious duties; it admits nothing vile, nothing immodest. Before we fit down, prayer is made to God. The hungry eat as much as they desire, and every one drinks as much as can be useful to sober men. We do feast, as men, who have their minds impressed with the idea of spending the night in the worship of God; we do converse, as men, who are conscious of the Lord heareth them.'—Prayer also concludes the feast; and every one departs to his own concerns, &c.
It is a Christian Chrysostom, notwithstanding valves ecclesiastical in one of these cases or with the African council in the beginning of the fifth century, that they should not be held in churches, except in cases of peculiar necessity; with which the decree of the council of Auxerre, in the beginning of the seventh century agrees. Photius, about the middle of the ninth century, and Arsenius, in the middle of the thirteenth century, represent the matter accordingly; or that the agape was prohibited in churches, but allowed and encouraged in private houses. When they were totally abolished, we have no account. When they were occasionally charged with impurity by the Heathens, they were restrained and regulated.

The kids of charity, with which the ceremony used to end, was no longer given between different sexes; and it was expressly forbidden to have any beds, or couches for the convenience of those who should be disposed to eat more at their ease. Notwithstanding these precautions, it was found necessary to discontinue them; for as they were introduced when Christians had all things common, or with the community of goods, which under wise restrictions their first circumstances required, they remained long after the diffuse of the custom, which was the original occasion of them.

See Abyssinia.

Some authors imagine the agape to have been, not a commemoration of our Saviour, but a custom borrowed from the Heathens: Mor vero illa, ut referant, saepe Sedulius, on the sixth chapter of the Epistle to the Corinthians, de Gentili adulesce superfiliis erudite. And Paulina, the Manichee, is represented, by St. Augustine, as reproaching the Christians with converting the Heathen sacrifices into agape: to which he replies, we do not borrow our love-feasts from the sacrifices of the Gentiles; our love-feasts feed the poor. Cont. Faust. Manich. l. xx. c. 20. Some have thought that St. Paul speaks of the agape, when he reproves the Corinthians for their disorderly practice. 1 Cor. xii. 17, &c. These agape, as Chrysostom, Theophylact, Pelagius, Occumenius, &c. imagined, immediately succeeded the eucharist; and at these feasts the disorders happened. Mr. Hallet (ubi supra) contends, that they occurred in celebrating the eucharist itself. It may be observed, that the Christians did not consider the agape as religious or divine institutions, like the Lord's supper. If they had, their councils would not have banished them out of the churches than the eucharist itself.

**AGAPANTHUS.** (quaś ἀγαπάντος, pl. plesantium) flower in Botany, a genus of the *bexandria monogynia* clads and order, of the natural order of *Lilianeae*, the *Spaches* of *Linnaeus,* and the *Norcliffs* of Jussieu. Its characters are, that the calyx is a spathic common gaping at the side; the corolla is one-petalled, funneled-shaped and regular; tube cornered, as if composed of five claws, the border fix-parted, with the parts oblong and spreading; the stamens are fix filaments inferted into the throat, shorter than the corolla, decline; the anthers kidney-shaped and incumbent; the pistillum is a superior germ, oblong, three-cornered; the style filiform, of the length of the stamens and decline; the stigma simple or trifid; the pericarpium is an oblong capsule, three-fid, three-celled, three-valved: valves navicular, with contrary dissection; the seeds numerous, oblong, compressed and enlarged with a membrane. There is one species, viz. *agapanthus umbellatus*, the *ornum Africanum* of *Linnaeus*, or African blue lily. This is the African tuberose hyacinth, with a blue umbellated flower.

The root of this plant is composed of thick fibrous fibers; from the same head arises a cluster of leaves, which are thick and succulent, and of a dark green colour. Between these issues the flower flanks, supporting an umbel of blue flowers in a lance, and each flower standing on a pedicle, about an inch long. The umbel being large, the flowers numerous, and of a light blue colour, make a fine appearance. They come out at the end of August or beginning of September, and frequently continue in beauty till spring. The flowers are those of the *hymenocallis*, but this genus is distinct from it in its pathos. It is a native of the Cape of Good Hopes, from whence it was brought to Holland, and in 1692 it was cultivated at Hampton Court.

This plant is propagated by offsets, taken off at the latter end of June, planted in separate pots, with light kitchen-garden earth, and placed in a shady situation. In five weeks the offsets will put off new roots; and the pots should then be removed to a more sunny situation, and have more water. In September they will put out their flower flanks, and toward the end of the month the flowers will begin to open, and should be removed under shelter in bad weather, but in good weather exposed to the free air. Toward the end of October they should be removed to the green-house and have the benefit of free air, and be occasionally watered during winter in mild weather, but if frost they should be kept dry. It requires only protection from frost and moisture; and should not therefore have any artificial warmth in winter, and in summer it should be placed in the open air. Martin's Miller's Dict.

**AGAPE,** in Antiquity, signifies an afternoon, or evening's meal.

**AGAPETÆ,** in Ecclesiastical History, a name given to certain virgins and widows, who, in the ancient church, associated themselves with, and attended on ecclesiastics, out of a motive of piety and charity.

In the primitive days there were women instituted deaconesses; who, devoting themselves to the service of the church, took up their abode with the ministers, and assisted them in their functions.

In the fervour of the primitive piety, there was nothing scandalous in these societies; but they afterwards degenerated into libertinism: infomuch, that St. Jerom asks, with indignation, unde agaparatam puellam in ecclesiis introiret? This gave occasion to councils to suppress them.—St. Athanasius mentions a priest, named Leonius, who, to remove all occasion of suspicion, offered to mutilate himself to preserve his beloved companion.

**AGAPETUS,** in Biography, a deacon of the church of Constantinople in the 6th century, who addressed a letter, called *oμολογία φιλογενίας* (omologia philogenia), *Scheda Regia,* to the emperor Julian, on the duties of a prince, and thus obtained rank among the most judicious writers of the century. This letter was printed at Basal by Frobenius in 1521, 5vo., and at Coligny in 1604. It is included in the Bibliotheca patrum. Molheim, Eccl. Hist. v. i. p. 120. Fabric. Bibl. Græc. t. vi. p. 570.

**AGAPETUS,** Pope, was a native Roman, and raised to the papal see by the interell of Theodotus, king of Italy, in 555. This pope refuted the interference of the emperor Julian, in ecclesiastical concerns, affirmed the supremacy of the papal authority in the church, and maintained its independence on the civil power. He was firm and resolute, notwithstanding the threats of the emperor in opposing a measure which he disapproved, and boldly said, "when I came to Julian, I hoped to meet a Christian prince, but I have found a Dioscorian." He died at Constantinople in 536,
AGA

and was enrolled among the saints; and the Roman see was at this time so poor, that in order to defray the expenses of his journey thither, he was obliged to pawn the sacred relics of the church of St. Peter, Bever and Dupin.

AGAPETUS II. Pope, a Roman by birth, obtained the papacy in 946, and held it till the year 956. He exerted himself in terminating the difficulties of Italy, and sent for the emperor Otto to oppose Berenger II. who assumed the regal power in this country. He was a patron of extraordinary facility. Dupin. Fabric. Bibl. Greec. t. vi. p. 570.

AGAPHONOVA, in Geography, a river of Siberia, which runs into the Frozen Ocean.

AGAPIS lapidis, in Natural History, a name given by ancient writers, to a stone of a dusky yellow, or the colour of a lion's skin; it was held in great esteem in many nations, on account of its suppos'd virtues, as an anodyne and vulnerary.

AGAPIUS, in Biography, a Manichean writer, mentioned by Photius, who is supposed to have lived about the middle of the 4th century. Some say, that he was a disciple of Manes towards the close of the third century, that he opposed the sentiments of Eunomius concerning the Trinity, and that he wrote three books in defence of the Manichean principles; one a work of twenty-three books, another consisting of 102 chapters, inscribed to a woman of the name of the same sect, named Uramis; and a third, intitled Heptalogus, preferred in the Anathemas against the Manichcees, or form of abjuring Manichaeism, by Fabricius, Cotelerius and Tollius. His work, says Photius, was so absurd and impious, that it could only shame and confound those who followed him, and the Manichean doctrines; and he is denominated by the same writer, a detestable and impious man, and distinguished as one of the twelve disciples of Manes. Gen. Dict. Lardner's works. vol. iii. p. 566. Fabricius (Bibl. Greec. t. x. p. 383) has mentioned several other persons of this name; such as a monk of mount Athos, who lived about the year 1640, and published a book entitled μεταφωνικας συναιτιας, the salvation of sinners; Agapius, a bishop of Cefarea, the predecessor of Eusebius; Agapius, an Athenian philosopher, a disciple of Proclus, and supposed to be the same with the eminent physician and rhetorician of Alexandria and Constantinople, whose distinguished talents are noticed by Suidas.

AGAR, in Ancient Geography, a town of Byzacium, described by Hirtius, a few miles southwest of Lephta or Leptis parva, and sixteen miles from Thaphus. It was one of Cesar's stations; the village which now occupies the rocky situation in which it stood is called by the Arabs Bayt-Hadjar, i.e. the father of a stone, or the honey city. Shaw's Trav. p. 199.

AGARA, a town of the Phylliates, in India, on this side of the Ganges, according to Ptolemy.

AGARAFFO, or ACHARFFE, a small, pleasant and fertile country of Andalucia, in Spain. Its principal town is San-Lucar-la-Major, erected into a duky by Philip IV. in favour of Count d'Olivarez.

AGARD, Arthur, in Biography, a learned antiquary of this country, was born at Tolton, in Derbyshire, A. D. 1540; and having been educated for the law, was appointed deputy-chamberlain of the Exchequer in 1570, which office he held 45 years. By means of this office he was enabled to pursue those curious researches, of which he produced several valuable publications.

Having directed his particular attention to the Dooms-day book, he wrote a learned treatise on the use and true meaning of the obscure words that occur in it; he also compiled a book, containing "a catalogue of the records preserved in his Majesty's four treasuries," and "an account of all leagues, treaties of peace, intercourses and marriages with foreign nations." This work, with eleven other treatises in MS. relating to matters of the Exchequer, he ordered by his will to be delivered to the office. His other collections, amounting to twenty volumes, were bequeathed to Sir Robert Cotton, and deposited in his library. His essays read to the Antiquarian Society were published by Mr. Hearne, in his "collection of curious discourses by eminent antiquaries," and are as follows, viz. "An account of the Antiquity, &c. of Parliament," the genuine facts of which is doubted; "The Antiquity of English Skins." -"On the Dimensions of the Land of England." "Of the Authority, &c. of Heralds in England." -"Of the Antiquity and Privileges of the Inns of Court and Chancery." -"Of the Diversity of Names of this Island." By his established reputation for the knowledge of antiquities he was one of the most conspicuous members of a Society of Antiquaries, which published from 1572 to 1624. He died in 1617, and was buried in the cloister of Westminster Abbey. Mr. Camden commemorates him a most excellent antiquary. Biog. Brit.

AGARENI, or AGARFIENS, a name given by some to the followers of the religion of Mahomet.

The word is derived from Agar, or Hagir, handmaid of Abraham, and mother of Ishmael; and properly denotes the Arabs, called also Ishmaelites, and more lately Saracens.

AGARENUM, the capital of the Agarines, in Arabia; it was attacked by Trajan, but without success.

AGARIC, AGARICUS, called AMANITES by Dillenius, in Botany, a genus of the order of fungi, and class of cryptogonia; the characters of which are, that the pileus or cap has gills underneath; that the gills differ in substance from the rest of the plant, being composed of two laminae; and that the seeds are in the gills. Gmelin. in the 13th edition of the Linnean sytem, 1791, enumerates 590 different species; and Dr. Withering, in the third edition of his arrangement of British plants, 1756, (vol. iv. p. 154, &c.) affirms and describes 282 British species, besides several varieties. He distributes them into three general classes, comprehending those which have central stipes, those with lateral stipes, and those which have no stipes; and he again subdivides the two former classes into such as have solid, and such as have hollow stipes, of decadent, fixed and loose gills respectively. Under these heads he arranges the species, by the colour of the gills, into those whose gills are white, brown, red, buff, yellow, grey, green, and purple. As this ingenious author has formed a system, that serves to facilitate the investigation and description of the several species of agarics, we shall here give a brief sketch of the principles upon which it is founded. Agaries are composed of a cap or pileus, with gills underneath, and are either with or without stipes. The stipes are either central or lateral. They have also a root, which is more or less apparent, and some of them, in their unfolded state, wholly enfolded in a membranaceous or leather-like case, called a _wrapping_. Some of them have also a _curtain_, or thin membrane, extending from the pileus to the edge of the pileus, which is rent as the pileus expands, and soon vanishes; but the part attached to the pileus often remains, and forms round it a _ring_, which is more or less permanent, as its sub stance is more or less tender. These parts are seen in Plate V. Botany, fig. 2, which exhibits the vertical section of an agaric in its egg-state. The wrapper is seen at m, m, m, the gill at n, n, the gill at o, o; p is the stem before it shoots up; and q, q, the curtain. On the stipe of a fungus at B, there are seen the remains of a curtain,
curtain, then called a ring. The curtain, ring and wrapper are of little use in the discrimination of the species. The two former are common to all the secondary subdivisions of agarics with central stems; but the latter is confined to plants with solid stems, nor does it pertain to those whose gills are decurrent. The stem of an agaric is either solid or hollow; the former is represented at A; the latter at B. In examining an agaric, it will immediately appear whether the stem be solid or hollow, by cutting it across about the middle with a sharp knife. Next to the gills, the stem of an agaric is the part least liable to variation. The gills are the flat, thin frutifications, found underneath the pileus, and attached to it, and are of a different texture from that of the stem or pileus. They assume different colours in different species, and vary much in their respective lengths. Each gill consists of two membranes, between which the seeds are formed. The gills are always attached to the stem, and sometimes to that only, as at fig. E. c. e. They often shoulder up against the stem, and are fixed to it, as at fig. A. b.; and they are also extended along it downwards, as at a. This is called a decurrent gill. The fixed and decurrent gills are attached to the stem only by their ends, which are next to the center of the pileus, and not by their edges, as is sometimes the case in agarics, whose pilei are nearly cylindrical. The gills, as they contain the fructification of these plants, are peculiarly important. They vary in length, always extending to the edge of the pileus, but seldom reaching to the stem; and they are sometimes forked or divided, and sometimes connected and anastomosing with one another. These circumstances are illustrated by fig. C and fig. G. The gills are uniform at d; and below it they are connected at the edge of the pileus; at e they appear in pairs, at f there are four, and at g eight in a set; at h they are feen irregular, or without any determinate number; at i they are branching, and at k branching and anastomosing. Fig. C exhibits the gills loose from the stem, with the inner end fixed to a collar which surrounds the top of the stem, though not in contact with it. Thesec several circumstances are subject to such variation, that they do not serve to distinguish the different species. The colour of the gills, however, is obvious and permanent; and as the colour is principally, if not solely, caused by that of the seeds within them, this affords the most fixed and certain characteristic, on which to found the distinctions of the species; and together with the structure, the colour, particularly of the flat sides of the gills, will be at all times sufficient to furnish permanent specific distinctions. The stem is a less variable part than the pileus; its shape, the proportions of its length to its breadth, and of both to the pileus, afford tolerable distinctive marks; and its colours, though more changeable than those of the gills, are perhaps rather more fixed than those of the pileus. The pileus, or cap, is the part of an agaric, that is least certain. Its shape is either conical (as at E), convex (as at D), flat, or hollowed at the top like a funnel, and is constantly varying in the same plant, though it is much the same in the same species, when the plant is in perfection, or when it is fully or almost fully expanded. Its colour is uncertain; and so is also the vividness or clamminess on the surface of the pileus and stem, which has sometimes characterised agarics. The deliCence of some agarics, or their property of yielding a milky juice, which in some species is mild, and in others acrid, is very precarious and inconstant. Such as we have briefly recited, are the principles upon which Dr. Withering's system is founded; and it seems well adapted for extending our acquaintance with the various species of agarics that occur, and rendering the knowledge already acquired more accurate. Withering's Arrangement, vol. i. p. 375—380. See Cryptogama, Fungi, and Mushroom.

Of all the species of agaric, one only has been selected for cultivation in our gardens, viz. the A. campylophilus, or common mushroom, or champignon. The gills of this species are loose, punky red, changing to a liver-colour, in contact with the stem, but not united to it; very thick; irregularly disposed; some forked near the stem, some next the edge of the pileus, some at both ends, and in that case generally excluding the intermediate smaller gills. The pileus is white, changing to brown when old, and becoming scurfy; regularly convex, fleshy, flat, with age, from two to four inches, and sometimes nine inches in diameter, and liquefying in decay; the flesh white. The stem is solid, white, cylindrical, from two to three inches high, half an inch in diameter; the curian white and delicate. When this mushroom first makes its appearance, it is smooth and almost globular; and in this state it is called a button. This species is esteemed the best and most favouré of the genus, and is much in request for the table in England. It is eaten fresh, either stewed or boiled, and preferred either as a pickle or in powder; and it furnishes the sauce called ketchup. The field plants are better for eating than those raised on artificial beds, their flesh being more tender; and those who are accustomed to them can distinguish them by their smell. But the cultivated ones are more stylishly, may be more callly collected in the proper state for eating, and are firmer and better for pickling. The wild mushrooms are found in parks and other pastures, where the turf has not been ploughed up for many years; and the best time for gathering them is August and September. Dr. Withering mentions four varieties. The A. Georgii of Linnaeus resembles the former, but is much inferior to it in flavour. Its gills are yellowish white; the pileus yellow, convex, hollow in the center; the stem yellow thickish and smooth; the juice yellow, which flows plentifully from it when wounded. It is gathered in September in woods and pastures. A variety of this is found on the sea coast of Cornwall, of a large size, with the button as big as a potato; the expanded pileus 18 inches over, the stem as thick as a man's wrist, the gills very pale, the curian tough, and thick as leather, and the juice yellow. A plant of this kind, as Dr. Withering informs us, was gathered on an old hot-bed in a garden in Birmingham, which weighed 14 pounds. The A. procirus, or tall mushroom, is not uncommon on hedge banks and dry pastures, and is sometimes exposed to sale in Covent-garden market. It may be distinguished from the genuine fruit by the fponginos of its fleshy, and from others by its fine and large horizontal ring. The gills are white, uniform, and fixed to a collar; the pileus is a broad cone, bofied, white brown, and fecal; the stem is featy, and the ring foffe. This plant, when preferred in pickle, is very apt to run into the vinous fermentation. Dr. Withering enumerates four varieties of this species, one of which is the A. escoratus of Schaeffer and Hay, which is a beautiful plant, approaching in structure to the former, but of a smaller size. It is gathered in September. A. xarmpilina is the most splendid of all the agarics. Its gills are fixed, bright golden yellow, and nearly orange under the edge of the pileus, regularly disposed four in a set; fleshy, brittle, and ferrated at the edge with a pale cottony matter; the pileus is a fine lake red, changing with age to a rich orange and buff, and every intermediate shade of
of these colours, which render it very beautiful; convex, center bobbled, edge turned down, three to four inches diameter, clothly to the touch; flesh pale buff; stem solid, nearly cylindrical, but gradually tapering upwards, rich buff, flared with fine rose red, three to five inches high, half inch in diameter; flesh pale, buffy, spongy and elastic. This is common in Italy, and brought to the markets for sale. The ancient Romans esteemed it one of the greatest luxuries for the table. It was made the vehicle for poison to Claudius Cesar by his wife Agrippina, and has therefore been celebrated by Juvenal and Martial. Scheffer and Clausius have received several curious circumstances respecting it. Dr. Withering apprehends these authors have mistaken the species, and that their account should be transferred to the A. delicatus. The A. ericetinus is estabul, but its taste is not at all agreeable. It is the A. reformis of Scheffer, and first found by Dr. Withering's daughter, on the red rock plantations at Edgbaston, July 6th 1791: and afterwards in Sept. 1793; and in July 1792, amongst moss in the fir plantations at Tettenhall, Staffordshire. Dr. W. enumerates five varieties.

A. delicatus has gills decurrent, flame-coloured, narrow, regularly branched; pileus rich red brown; flesh nearly flat, but somewhat hollowed at the centre and the edge turned in, from one a half to three inches over; orange-colour; stem orange, solid, tapering downwards, from one to two inches high, and a quarter to three-eights inch diameter: hollow with age. The juice is rich yellow, which soon turns green. It is found in the fir plantations of Scotland, and in those of the barren hills at Bar, in Staffordshire. Dr. Smith also found it at Hillingdon, Middlesex, under some fir-trees, and it also grows near Guildford. It is much esteemed in Italy, and exposed in the markets, and supposed to have been the A. ericetinus mentioned by the authors cited under the preceding article. Dr. Withering enumerates three varieties, one of which affords, from every part of it when wounded, a copious discharge of yellow acid juice. They are gathered in woods and dry pastures in Sept. and Oct.

A. cinnamomeus has gills, four in a set, broad about the middle, deep tawny red, and fixed by claws; pileus convex but bobbled, of a rich cinnamon colour, from one and a half to three and a half inches diameter; the skin hollow, cylindrical, silky, shining, two inches high, thick as a goose quill, of a fine full yellow colour. This is a species that is readily distinguished by its cinnamon-colour. It is found in woods in September and October; and has a good flavour. It is the A. cinnamomeus of Bolton. The A. ephedriformis of Scheffer is a variety of this.

A. bulbiferus has white, loose, irregular gills; pileus convex, white, smooth, sometimes fringed at the edge, four or five inches over; flesh white, spongy and very thick; stem solid, cylindrical, smooth, white, four inches high, and half inch or more in diameter; ring permanent. broad, and white. This species possesses all the parts belonging to the genus, and is well adapted to instruct the learner in understanding them. It is found from spring to the end of autumn in rich soil, and also in gardens, on the sides and at the base of hot-heds. Dr. Withering enumerates four varieties, found in woods about the roots of trees, and in pastures: and he refers the A. bulbiferus of the Fl. angil. to the A. glaucopus of Scheffer, with brown gills, from four to eight in a set,5 chief and semi-globular pileus, thick stem of a white or pinky colour, and curtail resembling a cowl, web, with a pinky tinga, solid whitish stem, and very large bulbous root. The A. bulbiferus of Hudson and Ray is referred by this author to A. volviferus of Linnaeus; which has fixed purple gills, numerous, eight in a set; long gills sometimes cloven, and a few of them decurrent; purple pileus, soft, smooth, firm, convex, but centrally depressed with age, and cracking at the edge, which is somewhat turned down, from half inch to five inches over: stem solid, cylindrical, purple, bulbous at the base, from one to four inches high, and from a quarter to one inch in diameter; and curtail like a cowl. In maturity, it plentifully emits a powder of the colour of Spanish shift. It is not uncommon from October to December, in Edgbaston and Barr plantations, in the woods near Bath, and at Powick near Worcester. With much broiling and duly seasoned, it is esteemed delicious as an oyster. A. candidus of Linnaeus is small and white, with an hemispherical pileus having its margin turned inwards and flexible gills, and stem cylindrical and flexuous. Dr. Withering refers the A. candidus of Hudson to the Merse is umbelliferus. A. nitens has gills decurrent, white, few, short and in pairs; pileus white; both yellowish, at first conical, then flat, and later inverted, two inches in diameter; stem solid, whitish buff, bending, three inches high, and a quarter of an inch in diameter. The whole plant is very viscid, but dries when gathered. Dr. W. supposes it to be an unusually large plant of the A. cinnamomeus. It is found in September, on decaying and rotten wood. The A. mutabilis of Hudson, Ray, &c. is referred by Dr. W. to A. ephedriformis of Curtis, with pale yellow gills, eight in a set; pileus brown orange, nearly flat; stem yellow above, velvety and dark brown below. It is not uncommon in April and October, grows in clusters, and is generally attached to rotten wood. A. creffipes has gills white, brownish at the edges, fleshy, distant, four in a set; pileus red-brown, bulbous and cracking; stem tapering downwards and ribbed. It grows in clusters, at the base of decaying trees. The A. creffipes of Scheffer is made by Dr. W. a variety of the A. ephedriformis with white gills, four in a set; pileus chefmut and semi-globular; stem buffy, white and tapering. This agaric is tough and strong, with a considerable elaticity, and found under oak trees in August, September and October. A. varis has white gills, not numerous, two or four in a set; pileus conical and scoured; stem cylindrical, glossy, thick, and about the size of a cowgill. Of this species Dr. W. has enumerated eight varieties, most of which are found at the roots of fiddle trees. The A. varis of Scheffer is in Dr. W.'s arrangement a variety of the A. glaucopus, and that of Bolton a variety of the A. fim-punctis of Bulliard, which has gills dark brown to black, four or eight in a set; pileus pale brown, conical, blut, with polished apex, and white stem. It is found in October, in gardens. A variety of it, with four gills in a set, and a pileus grey to black, is found among rotten leaves in grass-land. Another variety, which is the A. varis of Bolton, is found on grass-plats and new mown fields in July. It has chocolate gills from brown to black, mottled, and in pairs; pileus moule-colour, conical and pointed; stem of the same colour, cylindrical and firm. This, though a common, is a very beautiful species. In a summer morning it is covered with a bloom like that of a plum, having often a glittering spangled appearance; its form is regular, and the fringes of the curtain peculiarly delicate. Another variety, with the stem of a dark mulberry colour, is found in wet gravel where no grass grows, and sometimes on cow-dung, in which case the stem, under the shelter of long grass, is covered with a white hoarfeast, which is easily rubbed off.

Vol. I.
A. integer of Linnæus has gills white, mostly uniform; pileus of various tints, crimson, pink, blue, or tawny brown, changing to dirty yellow or to lead colour; stem solid, cylindrical and white. It is very common and beautiful; found in woods and pastures, under trees, and fields are very fond of it. Dr. Witherings enumerates nine varieties. A. orcadus has loose gills, with the part attached to the pileus jutting up very close to the stem, so as to give them almost the appearance of being fixed, watery brownish white, two or four in a set, the smallest ones very minute, and the large ones sometimes splitting at the outer end; not numerous, rather broad for the size of the plant; frequently connected to the pileus by ligaments; pileus pale buffy brown, convex, irregular, with a sudden depression of the border at some distance from the center, often giving the appearance of a large rounded bole in the middle; stem colour generally deeper; from one to one and three quarters inch over; and the edge turning up with age; stem fleshy, white, changing to watery brown, cylindrical, but thicker and flattened just under the pileus, very tough, wiry crooked, twisted when dry, rarely central, one and half inch high and thick as a crow-quill. This is the 21st fungus of Ray's Synopsis, ed. 3. p. 677. p. post anne of Hudson, and corylas of Lighthart. There are two varieties; one with cream-coloured gills, buff pileus, and nearly stem, and another with yellow brown, more flat, and more regularly convex pileus, found in groves. Mr. Woodward says, that this species has a much higher flavour than the common mushroom, but he suggests, that from its leathery nature it is indigestible, except in the form of powder, in which it is admirable. Dr. Withering, however, observes, that he has seen the pileus and gills of this agaric very brittle and tender, when fully saturated with moisture in rainy seasons, and in that state it is sufficiently digestible. Professor Martyr informs us, that he has eaten these mushrooms for 40 years without injury, and without perceiving that toughtness like leather, of which others have complained, except in very dry weather, or when they are in too advanced a state. They should be gathered young and early in a morning, and properly dressed. They are found in hedge banks, upland pastures, and steep commons, particularly in those patches called Fairy rings. Those that are found in woods and hedges are of inferior flavour to such as are gathered in dry pastures, which have a very pleasant smell and luxuriant flavour, either when stewed alone, or in ragouts, &c. This fruit makes excellent ketchup, and is much valued in the form of powder. It is in season during September and October, but may be dried so as to be in use for table all the winter. Mr. Lightfoot supposes that this species is the mousseron of the French, who use it in ragouts, instead of that, and acknowledge it to be equal in flavour, but more tough. The mousseron, however, has a very thick and fleshy pileus, its gills are very narrow and numerous, and fixed to the stem, and the stem is thick and short. Dr. Withering has carefully distinguished several other species from this fairy-ring agaric, or Scotch bonnets, as it is called by Mr. Ray. A. chautarellus of Linnæus, is the Merulus cantharellus of Dr. Withering, and may be eaten with safety; but it is more tough and less highly flavoured than either the A. orcadus or A. campylinus. Airborne enumerates the following species as edible, viz. A. candidus—bulbosus—corylas—nient—deliciosus—metzelsius—brunen—escrenios—georgii—erchiae—coriaceus—vulcanus. But he has omitted A. campylinus. In many parts of Europe other fruits are eaten, which are thought with us to be poisonous. Of this number we may reckon the A. piperatus, which, though it be the most acid and pungent of all the agarics, is eaten in great quantity by the Russians. They kill large vessels with these mushrooms in the autumn, cut them into pieces, and eat them in the ensuing Lent. The A. piperatus of Linnæus has gills, pale pinkly red, numerous, in pairs; pileus dirty yellow white, woody, depressed in the centre; and stem pale yellow. This is the A. turundus of Schaeffer. The A. piperatus of Bolten, and A. laetarius of Bulliard is referred by Dr. W. to the A. nigricans which has gills whitish, numerous and narrow; pileus smooth, irregular, flatish, depressed in the centre; stem white, excipulaceous, and juice like milk. Esler first found it in England. This plant, with its varieties, is met with in plantations of wood. It is much eaten by insects and birds. A. piperatus is described by Dr. W. as having gills fixed lightly to the stem, greyish white brown, four or eight in a set; pileus brown, convex, biform, bordered, scored, very viscid, so that flies lighting upon it cannot escape; paler in colour when divested of this viscid matter, one to one inch and half over; stem hollow, white, viscid, tender, easily broken, splitting, three or four inches high, and thick as a crown quill. This species is found in woodland pastures in September. Dr. Percival, in the last vol. of his Effects, p. 267., relates the case of a man, who was poisoned by eating a mushroom, of which Mr. HUDSON thinks was one of this species. A. mycenarius, or red-flowerd mushroom, has a large pileus, varying much in colour, white, red or crimson, convex, spotted with downy warts, which are raised, compact and angular, or thin, flat, and ragged, turning up with age, from two to seven inches over; flesh white, reddish in decay; gills fixed, white, yellowish with age, mostly uniform, but a shorter one sometimes intervening; the shorter gills varying much in length, but rarely less than one third the length of the long ones; the stem solid and cylindrical, but the internal substance shrivelling with age, leaves irregular hollows; seamy, bollows at the base, from three to five inches high, and from three quarters to one and a half inch in diameter; ring, broad, permanent, and turned down upon the stem. This plant rises out of the ground included within its brown fluted wrapper. It is found in pastures. The juice rubbed on the walls and bed-rolls destroys bugs; and in the north of Europe the inhabitants infuse it in milk, and let it in their windows, in order to poison the flies who take it. This is the moucho-more of the Russians, Kamtschadales, and Koriars, who use it for intoxication. They sometimes eat it dry, and sometimes immerse it in a liquor made with the epilobium; and when they drink this liquor, they are seized with convulsions in all their limbs, followed with that kind of raving which attends a burning fever. They perfumise this mushroom; and if they are urged by its effects to suicide, or any dreadful crime, they pretend to obey its commands. To fit themselves for premeditated affimation, they recur to the use of the moucho-more. A powder of the root, or of that part of the stem which is covered by the earth, is recommended in epileptic cafes, and externally applied for dissipating hard globular felings, and for healing ulcers. The dose is from half a scruple to one, taken thrice a day in water; and a dram administered once a day in vinegar, has been thought more efficacious. Murray, App. Med. vol. v. p. 560. Dr. Withering enumerates ten varieties of this species. The agarics, with lateral items, and those without items, are chiefly found on rotted wood, or stumps and fragments of decayed trees. Of the latter sort we shall mention only the A. quercicus, or agaric of the oak: the gills are brown, very much branched and anatomizing, thick, forming oblong angular, and nearly circular cavities, especially towards the edges; the pileus brown, woody, nearly fimbriate,
AGARACE, in Pharmacy, a kind of fungous excrement, growing on the trunks and large branches of several trees; but, chiefly on the larch-trees and upon some kinds of oak, when old and decayed. Three-fourths of it consist of a gelatinous substance, and the remainder is a flaky mucilaginous earthy matter, so tenacious, as scarcely, by any method, to be dissolved by water. It comes forth on the tree in the beginning of the spring, and continues to increase till autumn. The bell is easily cut with a knife, frayed between the fingers, and has no hard, or gritty, or coloured veins. It has no pedicle, and is internally of a simple uniform structure throughout its whole substance. Agaric is brought from different places; the bell comes from the Levant; that which comes from Savoy and Dauphiny being least esteemed. Holland also supplies some, but that is reckoned the worst; because it is grated, and whitened at top with chalk. By a chemical solution it passes almost wholly into oil; it yields no volatile salt, but abounds with a sort of flaky earth, and acid phlegm; as to texture, it seems much to resemble colocynthia. Agaric is an ingredient in the therica Andromed, where it is admitted in quality of a cordial; though its medicinal virtue is excepted to as much as its purgative. Agaric was a purge in much esteem among the ancients, but has deferredly fallen into disrepute of later years, as it occasions unprofitable nauseas; and as no preparations of it appear to be equal to the more common and experienced cathartics. The druggists consider only that which grows upon the larch-tree to be the right kind. For its chemical history, see Neumann's Works, p. 349. The Agaric of the oak, so denominated, because the bell is supposed to be produced on the oak, sometimes also called faile or faifor Agaric, is the Boletus Ignarius of Linnaeus. This fungus has been specifically named Ignarius, and also touchwood or spunk, from its readily catching fire, and from its being used in some places as tinder. For this purpose the Germans boil it in strong tea, dry it, and boil it again in a solution of salt-petre. It is externally of an aul-colour, and internally dusty-coloured, soft and tough. In Franceon pieces of the inner substance are beaten so as to resemble leather, and wove together for making garments: this agaric has been much used by surgeons as an external affptic. The mode of preparing this substance is as follows: Take a piece of fresh agaric, which has been removed from the oak or larch-tree in autumn, and pare off its external rind; the coat underneath, being of a compact texture, is then to be separated from the porous part, and well beaten with a hammer until it becomes extremely pliable. The outer hard part, and the inner loose surface, are of very little use; but the middle portion, thus prepared, must be kept dry in pieces of a convenient size. A small piece is to be laid exactly over the bleeding artery, and over that a second, or even a third, somewhat larger; and lastly a compress, to retain the whole in its place. Its application to this purpose was derived from the French, and it was successively recommended, first by Broffer in 1750, afterwards by Morand, Bouquet, Faget, Rochard, and De Mey, who employed it not only to restrain the bleeding of wounds, but to prevent hemorrages after amputations, which it is reported to have done as effectually as the ligature. Several English surgeons have also published

cases in which the agaric was successfully used, as Sharp, Warner, Goode and others. Some have remarked that, where it seemed to succeed, the subjects were brought to low before the operation, that little danger was to be apprehended from the haemorrhage, though no other application had been made than that of dry lint and flour. Neale's Observations on the use of agaric, &c. It has now lost its reputation both in France and England; nor does it appear, from its febile qualities, to be puffed of any truly affptic power, at least to any considerable degree. This fungus probably acts no otherwise than as a pliable soft substance, adhering to the orifices of the vessels, till they have contracted spontaneously. Some other fungi have been employed with the same intention; such as the lycoperdon, or dully mushroom, and the fungus vinifus, found on the walls and vaults of wine-vaults. Lewis's Med. and Woodville Med. Bot. vol. iv. p. 160. Since it pusses no efficacy without a firm compré, we believe the ligature will generally be preferred, as more secure, and less troublesome to the patient. See HEMORRHAGE.

AGARIC, Female. See Boletus.

AGARIC MINERAL, Bergunic, Bergottch Germ. Greta furcians.—This mineral substance is always found in a loose or semi-solid state in the fissures of rocks or at the bottom of lakes; it almost floats on water, is entirely soluble in nitric acid with effervescence, and probably contains wholly of carbon of lime: it is not applied to any particular use. There are two varieties of this species, of which the following are the essential characters.

Var. I. Bergunic of Werner.

Dully—colour whitish red or yellow; very friable; of a dry feel, does not adhere to the tongue, and gives no gloss to the skin when rubbed on it.

Var. II. Colour white, composed of feidy particles, very friable; of a greasy feel, and communicates a gloss to the skin; fails to pieces in water, and adheres to the tongue.

Mr. Kirwan (Elem. Miner, vol. i. p. 76) mentions a third variety, of a silvery white colour, resembling mica in its structure, of a soft feel and somewhat unctuous like tale, almost entirely soluble in nitric acid; and the solution has all the properties of a solution of calcareous earth. This substance was formerly used internally against hemorrhages, strangury, gravel, and especially in diabeties; and externally to dry and heal old ulcers, stop effusions of the eyes, &c. See Silvery Chalk.

AGARICITES, in Natural History, a species of Madrepora, from the andes, and furrows, with carinated furrows and coronated stars. It is found in the sea, between the islands of America.

AGARICUM, a species of Alcyonium, with a filiform stem, and a kidney-shaped cap. This is the kidney-shaped purple Sea-Pen of Ellis, found in the sea that washes the coast of South Carolina. Its body is about an inch long, and half an inch across the narrowest part, with a small roundish tail, an inch in length, proceeding from the middle of the body, full of rings from end to end, the other, like an earth-worm, with a small groove running along the middle of the upper and under part, from one end to the other. The upper part of the body is convex, and near a quarter of an inch thick; the whole surface is covered with minute yellow lirary openings, through which are protruded little suckers, like polypus, each furnished with six tentacles or filaments, which seem to be the proper mouths of the animal. The under part of the body is flat, and the surface is full of the ramifications of feidy fibres, which, proceeding from the intestine of the tail, as their common centre, branch out so as to communicate with the lirary openings on the exterior edge and upper surface of the animal. See
AGARICUS Sine, in Ancient Geography, a gulf of India, on this side the Garusc, according to Ptolemy.

AGARON, in Natural History, a name given by Adam to a species of Voluta; the officina of Catalogue edition of the Lemann System.

AGARIA, in Ancient Geography, a town of Susana, in Asia; placed by Ptolemy in long. 85° 40' and lat. 38° 20'.

AGARUS, a promontory of Azatlic Sarthia, near the river Aganus, which ran from north to south, and discharged itself into the Pelus Mecan. According to Ptolemy, it was situated in long. 69° and lat. 49° 40'. Oval. (Pont. iv. 10.) calls the river, Sagarian, and it is now Sarjed.

AGASUS, a port mentioned by Pliny, situate between the promontory of Gargania and the river Celerus, and supposed to be the same with Porta Græca. Agata, or Agala, was also a town of Macedonia in Europe.

AGASYLLIS, in the Materi Media, a name given by some of the ancient Greek writers to gum ammoniac, and by Dioscorides, to the tree which produces that gum. By their description of this medicine, it appears not to have been the same which we know by this name.

AGATA, in Ancient Geography, a small town and bishop's see of Naples in the Principality Ulbrar.

AGATE, Agazis, Atchus, of Theophrastus and Pliny; Agath, Fr. echt, Germ. Agater, Swed. This word is used by modern mineralogists not as denoting any particular species of stone, but a siliceous mixture of quartz, hornblende, flint, caledecny, amethyst, jasper, carnelian, or heliotrope, aggregated into binary or more complex combinations. It has nevertheless several peculiar characters by which it may readily be distinguished from other minerals. Although it consists of parts differing in colour and transparency, yet these parts is a certain uniformity of arrangement, and slide into each other by such nice gradations as show them to have been all of simultaneous formation; and hence it differs from siliceous Brecia, in which angular fragments of siliceous pebbles are cemented by a siliceous paste; for in all these the cement, whether quartz, caledecny, or flint, is wholly distinct from the fragments that it unites, and the arrangement of the whole is merely casual. As it differs in the colour of its constituent parts, so does its transparency: it is never wholly opaque like jasper, nor transparent as quartz crystal: it takes a very high polish, and its opaque parts usually present the appearance of dots, eyes, veins, zones, bands, or ramifications. Its colours are yellowish, reddish, bluish, or milk white, honey-orange, or ochre yellow, flesh blood, or brick red, reddish brown, violet blue, and brownish green. Specific gravity from 2.55 to 2.7. It gives fire with steel very plentifully.

It is found in the form of irregular rounded nodules, from the size of a pin's head, to more than a foot in diameter; or in strata, and sometimes, though rarely, foliated. Several varieties of agate are distinguished by the lapidaries: the finer semi-transparent kinds, consisting principally of caledecny, are called oriental: in the banded agates the colours are diffused in strait parallel lines or bands; while in the fortification agate, the most beautiful of all the varieties, they are arranged in waved and angular concentric zones: the landscape agate, by the name alone, sufficiently declares its irregular appearance: the mofs agate, or Mocha stone, is filled with dendritical crystalizations of iron ore, so nearly resembling some kinds of moss, as to have been actually mistaken for real vegetation by Daubenton.

Agates are found, for the most part, in argillaceous porphyry, occasionally in gypsum, near the river Wolga; they occur between the strata of secondary limestone, and certain rocky tracts in Siberia consist almost entirely of a pudding stone, of which agates and caledecny form an essential constituent part. The argillaceous porphyry being a rock that is easily disintegrated by the action of the air and moisture, the agates and other siliceous pebbles that it contains fall out and are washed by the rains into the beds of rivers; here, by leaching upon each other, the asperities on their surface are worn off, and in this state they are generally found on the seashore and in gravel beds. The most beautiful agates that this island produces, are commonly known by the name of Scotch pebbles, these are met with in various parts of Scotland, but principally in the vicinity of Dunbar. These stones of Germany are the largest, especially those from Münchendorf in Saxony. The Dutch of Deuxponts, the Basitnatis, Helft, Thuringia, Wurtemburg, Bavaria, Bohemia, and Silesia also furnish them in great abundance. The river Achat in Sicily was of old celebrated for these pebbles, and hence they have acquired their name: the other parts of Europe, where they are found, are principally Tuscany, Candia, and Iceland.

Some exquisite fine specimens have been brought from Siberia, and the island of Gotland; and these appear to be lately have discovered in great plenty in the bed of a river at the eastern extremity of the settlement at the Cape of Good Hope.

The use of agate are principally for ornamental works: the engraved gems, those precious remains of ancient art are principally agate, and much ingenuity has been shown in the accommodation of the natural veins and marks to the figures engraved upon them; it is also much effected by modern lapidaries for seals. Small mortars are made of agate, and are used by the enamebler, and in the laboratory for grinding substances that are too hard to be triturated any other way.

A dark tinge approaching to red, or red purple, may be communicated to agate, by heating it in warm ashes, and then moistening its surface with nitro-muriat of gold, or nitrat of silver; when the stone is become dry, it must be set for a day or two in a dark moist place, and then exposed to the full sun: by this method the most delicate zones and ramifications, which are not visible in the natural state of the stone, are made to appear in a very beautiful manner: this tinge is, however, destroyed by nitrous acid, or a moderate heat: and thus artificial stains may be distinguished from the native colours. A deep black is given to agate by foaking it when heated, in boiling nitrat of copper, and then heating it nearly to redness in a covered crucible. Mocha stones are imitated by spreading a solution of nitrated copper over the surface of a plain agate, and then setting a small iron nail on its head in the middle; the nitrous acid unites with the iron, and deposits the copper in beautiful arborescent radiations from the centre; the nail must then be removed, and the surface carefully washed, by dipping the stone in warm water; afterwards on the application of a moderate heat, the copper becomes black.

This deposition, however, being merely superficial, requires to be covered with a plate of polished crystal, in the manner of a doublet. If the ramifications are required to be very fine, the agate should be moistened with a little nitrat of silver superfused with the metal, or a solution of lunar caustic in water, a small piece of zinc is to be placed in the middle till the ramifications are sufficiently far advanced; the stone must then be washed carefully in warm water, and afterwards exposed to sulphurated hydrogen gas, till the silver is become black.

Agate is said to be imitated very successfully in glafs; and Neris, in his "Art de la Verrierie," gives three different receipts for this purpose: of thefe the following is recommended:
mended both by the author and by Kunkel, as producing a composition for splendour and vividness of colour often superior to real agate. Take seven ounces of granulated silver, and five ounces of mercury, four drams of minium, one ounce of verdigris, and scales of copper, crude antimony, and black manganese, of each half an ounce; diffusive the silver by itself in nitrous acid, and having ground the rest of the materials together, add first two pounds of nitrous acid, and then the nitrate of silver, mixing both liquors evenly and intimately with the other substances; then diffuse two drams of gold in nitro-muriatic acid, and grind together the following ingredients: v. cinnabar, twelve drams; sulphurized oxyd of copper, twenty drams; sulphurized oxyd of iron, four drams, and white oxyd of tin, oxyd of iron, scales, zaffire, opyrmont, and white arsenic, of each half an ounce; mix the solution of gold with this compound powder, and then add three of its weight of nitromuriatic acid; digest in separate glasses vessels for twenty-four hours in a sand-bath the above nitrous and nitro-muriatic mixtures, then add them together, and diffus to dryness; there will remain a powder of a reddish green colour. Also take twenty pounds of clear flint glass, and reduce it to a fine powder, in a clean firelock mortar, add to this two ounces and a half of the above colouring composition, and flush them together; when the whole is in clear fusion, stir it up from the bottom and let it continue melted for twenty-four hours, then stir it again, and allow it to cool very gradually; its colour will then be a middle tint between yellow and blue. Place the crucible again in the furnace, and when the glass is melted, add, at five or six different times, the following mixture; calculated tartar, eight ounces, vitrified wood foot, two ounces, and half an ounce of perfect oxyd of iron; this will make the glass swell considerably, and therefore requires much care to prevent it from flowing over: when all is quiet, heat it well for twenty-four hours longer without touching it, and it will then be fit for use.

Some writers have distributed agates, with regard to the objects that are represented upon them, into arborescent, as Dendrachites and Dendrites; horned or Cerachites; aphrodian, a term given by Velschius to an agate in his cullody, of a flesh colour, with a half moon on one side represented by a milky semeicircle, and on the other, the phases of Vesper, or the evening-star; cordoid, with human hair; arithmetical, with the numbers 4191, 191 (Settala. Muf. 81.); astronomic, with the hemisphere and its several orbs, and the earth in the middle; anthropomorphous, with the figures of men or women, one of which, mentioned by Kircher, represents a heroic armed man; and another, in the library of Francefort, exhibiting the heart, lungs, and part of the veins of a man; but the most celebrated of this kind is that of Pyrrha, representing the nine Muses with their attributes, and Apollo in the middle, playing upon the harp (see Plin. l. xxxviiil. c. 3: Hard. Not.) leucophthalmed, bearing the figures of eyes, as of birds, fishes, and wolves, called by Cardan and others lycophthalmed, of goats denominated cycophthalmed, of oxen buophtalmi, &c.; the Tiberian agate in the treasury of the French king’s chapel, representing the apotheosis of Augustus, and the figures and portraits of the family of Tiberius and Julia, with divers foreign nations subdued in war, concerning which, many different conjectures and explications have been advanced by the learned; and the Fine agate, a curious antique at Rome, so called, because it represents the head of Ivis, and distinguished by the epithet annularis, as being set in a ring. However, in this kind of distribution, and in the denominations to which it has given occasion, the imagination has often misled the judgment.

Becarina observes, that the electric sparks will not be conducted by the surface of polished agates; and M. Bofe has shewn, that the agate was very early known to possess electrical powers.

AGATE, among Antiquaries, denotes a stone of this kind, engraven by art.

In which fench agates make a species of antique gems; in the workmanship whereof, we find eminent proofs of the greatest skill and dexterity of the ancient sculptors. Several agates of exquisite beauty are preferred in the cabinets of the curious. The facts, or histories, repreented in antique agates, with how much address ever so conducted, are become, at this distance of time, many of them obscure and dubious, and their explication difficult enough; whence divers mistakes have been committed, and numerous conjectures and disputes raised. Hil. Acad. R. Inler. tom. i.

AGATE, is also the name of an instrument used by gold-"wire drawers; so called from the agate in the middle of it, which forms its principal part.

AGATHA. See AGATHES.

AGATHA, St. in Geography, a small town of Naples, in the farther principality, on the confines of Terra di Labora, between Capua and Beneventum, eight leagues, north-east of Naples. N. lat. 40° 55′. E. long. 14° 22′.

AGATHA, in Ancient Geography, a city of Gallia Narbonensis, built by the Mazilians, mentioned by Pliny, (lib. iii. c. 4.) and by Strabo, (tom. i. p. 272. 276.) See AGDE.

AGATHA, in Natural History, a species of the Papilio nymphalis, with dentated wings, the upper part yellow, the under grey; and the posterior wings have one black spot above, and three spots beneath. It is found in India.

AGATHARCHIDES, or AGATHARCHUS OF Cnidus, in Biography, a Greek historian, grammarian and rhetorician, mentioned by Josephus, (antiq. l. xiii. c. 1. tom. i. p. 585. Coxt. Appion. i. tom ii. p. 457. Ed. Hard.) Diodorus Sicculus, (Bibl. Hist. tomt. i. p. 50. p. 181. Ed. Wess.) Strabo, (tom. ii. p. 969. p. 1125. Ed. Caenab.) Lucian, (tom. iii. p. 222. Ed. Reitz.) and other ancient writers, was contemporary with Eratothenes, though younger than him, and flourished under Ptolemy Philometor, about 177 years before Christ. He was reader to Heracidus, and president of the Alexandrian Library, and wrote several historical treatises of which Photius mentions 49 books, concerning the affairs of Europe, 10 of Asia, five of the Red Sea, and an epitome of what had been written on this subject in one book. Some fragments of his writings may be found in Josephus (sub super.), and Photius in his Bibliotheca, 213-256. Fabric. Bibl. Græc. tom. ii. p. 207. The testimony of Agatharchides is allayed by a learned writer to prove, that in the reign of Ptolemy Philometor, 146 years after the death of Alexander, the Greek sovereigns of Egypt had not yet trade directly to India, but imported the commodities of India from Saba, the capital of Yemen. This ancient writer’s description of the western coast of the Red Sea cloes to Ptolemais, as if there were no regular commerce beyond that point. See Vincent’s Periplus of the Erythraean Sea, part i. p. 31. 

AGATHEREMER Orthothes, a geographer, who lived, as some say, near the time of Septimius Severus, and according to others, in the 15th century. He wrote in Greek two books of a compendium of Geography for the use of his pupil Philo, which is commended by J. Vossius, L. Holsteinius and G. Wendelinus, and which was first published in 8vo. with a translation and notes, by Tenuulus, at Amsterdam, in 1671; afterwards by Gronovius in 4to. at Leyden, 1679; and
and by Hudson in the 24 vol. of the Geographi Minores

AGATHIAS, one of the Byzantine historians, was
born at Myrina, a city of Æolis; and having studied the
law at Alexandria, exercised the profession of an advoca
te at Smyrna, and acquired the appellation of Scholasticus, from
the schools in which lawyers were instructed. Although in
the introduction to his history, he speaks favourably of
the Christians, it does not appear that he himself was of
this number; Volfinus and others believe that he was a Pagan;
Pagi and Fabricius maintain, that he was a Christian. It is
certain that no invectives against Christianity have escaped
him, or Procopius. He was undoubtedly a man of
and the Saracens. In speaking of the Germand, who
had a multitude of deities, and offered cruel sacrifices, he
says, they who are in error are rather objects of commiser-
tation, than of contempt and hatred; for all men aim at truth:
if they are in error, it is not the fault of their will but of
their judgment, as they are attached to opinions once
embraced by them. He also laments, in the introduction to
his history, that wars and battles are so much the subjects
of poems and histories; which, as he says, he cannot
ascend to the stars, nor to fate, as some do: for if the
world were governed by fate, there would be an end of
choice; and there would be no longer virtue among men,
nor any room for instruction or improvement in arts and
sciences. Nor are wars and contentions, he adds, agreeable
to the mind of God, who is supremely good: they must
therefore be ascribed to the avarice and ambition of men.
His history was written after the year 565, when Julian
and, and published after the year 593. It was undertaken
at the desire of Eutychianus, secretary of state, who is
supposed to have furnished materials; commences with the
26th year of the emperor's reign, A. D. 525; where
Procopius ends, and closes with the death of the Hun
in 559. He investigates the causes of the events which he
records, and often gives his opinion of them without dif-
guise. His style is easy and florid, though Sigerius has re
presented him as a low and unpublishable writer. He also
wrote 80 Epigrams, which are preferred in the Antholo
gia; and, as Suidas informs us, other pieces, partly in prose
and partly in verse, intitled, "Daphniaca." Agathias's
history was published by Vulcanius, with a translation and
notes, at Leyden, in 410. A. D. 1594; and elegantly

AGATHIAS, a very famous Greek flautist, born at
Ephesus. According to some accounts, this was the
sculptor who executed the celebrated Apollo Belvidere;
and the Gladiator Repelleus: but other accounts, more
to be relied upon, state, that the artists who produced those
works are certainly unknown.

AGATHO, the Athenian, a tragic and comic poet,
was the disciple of Prodicus and Socrates, applauded by
Plato, in his Protagoras, (Oper. tom. i. p. 315. Ed. Ser
rani) for his beauty and virtue, and described by Areti
phanes in his comedy of the Frigs, (p. 124. Ed. Küteri) as
a good poet and the darling of his friends; but severely
censured for his morals in the comedy, intitled Thespopho
rizule, (p. 484.) He is represented as the favourite of
Euripides, and also of Paeanias the Ceramian, whom he
accompanies, as Ælian informs us (Var. Hist. l. ii. c. 21.
tom. i. p. 120. Ed. Gronov.), to the court of Archelaus,
king of Macedon, where he continued till his death. Ælian
says, that he often quarrelled with Paeanias for the sake of
enjoying the exquisite pleasure which a reconciliation affor
ded him. His first tragedy obtained the prize; and he was
crowned in the presence of 30,000 persons, in the 4th year
of the 96th olympiad, B. C. 417. There is nothing now
extant of Agatho, except a few quotations preserved by
Ariotle, Athenæus, Ælian and others. His compo
sitions abounded so much with antitheses, as to give him oc
sion for saying to a person, who wished him to expunge
them, "you do not consider that you would rend Agatho
from himself?" See Ælian (Var. Hist. l. xiv. c. 13. tom. ii.
p. 454.) Athenæus (Deipnosophist. l. v. p. 211. Ed. Ca
fani.) cites the following antitheses: "If I tell you the truth,
I shall not please you; and if I please you, I shall not tell you
the truth." The antitheses recorded by Ariotle, (Endemi
orum. l. v. c. 2. et c. 4. tom. ii. p. 243. 244. and Rheter.
l. xii. c. 246. tom. ii. p. 581. Ed. Du Val.) are the three
following: "The only thing impossible to God, is to cauc
that not to be made that has been made:" "fortune loves
art, and art loves fortune:" "it is probable, that a great
many improbable things may happen to mortals."

AGATHO, Pope, a native of Palermo, who was ad
vanced from a monastery to the papal see, in 679. At this
time the controversy occasioned by the Monothelitists agi
tated the Christian church, and the first exercise of Aga
tho's pontifical authority was that of convening synods in
the western provinces, to decide concerning their doctrine.
These synods having declared the Monothelistic doctrine to
be heretical, Agatho sent legates on behalf of the western
church to the general council held at Constantinople in 680.
At this council the Monothelites were solemnly condemned.
Thus Agatho, by his legates, renounced a doctrine which
had been confirmed by the edict of a former council, and
functioned by the approbation of his predecessor, Pope Ho
norus; and he concurred in the condemnation of Honorius,
and enforced by penal laws the sentence of the council.
In this advance the infallibility of Honorius, and that of Aga
tho and the fifth council, are in direct opposition. It is
observed, likewise, as a fact worthy of notice in the history
of the papal power, that this council was summoned by the
emperor; that no appeal was made to the decision of former
popes; and that no peculiar deference was manifested to
the authority of the bishop of Rome. After the dissolution
of this council, Agatho directed his attention to the temporal
interest of his see, and particularly to the remission of the
fine paid to the emperors on the election of a new pope.
He died, A.D. 682. His faculty was held in such veneration
that, if we credit the account of Plutarch, his kits
was an infant cure for the leprous. His letters against the
Monothelites, addressed to the emperors Constantine, He
rachus, and Tiberius, Gr. and Lat.; and to Ethelred, king
of the Mercians, and Theodore, archbishop of Canterbury,
Lat.; and the abbot Sexulfus, which hit is said to be sup
posititious and written by some English monk, are prefered
in the records of the sixth council, A.D. 680. Harduin's
Concilia. tom. iii. Another letter, granting peculiar privile
ges to the monastery of Weremouth, may be seen in
Dugdale's Monasticon Anglicanum. Dupin's Hist. Seventh

AGATHOCLES, king, or tyrant of Sicily, was the
son of Carinus, a potter, of Rhegium, and born at Thermae
in Sicily. In consequence of strange dreams of his mother,
whilst she was pregnant, to which the father paid a super
stitious regard, the infant was exposed in the fields, as soon
as it was born, and committed to the care of a person who
was to watch it till it died. The mother, hearing of his
condition, took the child and entrusted it with her brother
Heracleis, and called it, after her father's name, Agatho
cles. At the age of seven years, he was introduced to the
father, and the secret of his preservation was communicated
to him by the mother. The dieters occasioned by self-re
proach in the recollection of his conduct, was soon succeeded
by
by the joy of having a son, who was singularly beautiful, referred to him. Soon after the discovery, Carthage, with his family, removed to Syracuse, and brought up his son to his own trade. Having joined Timoleon, who had routed the Carthaginians both the father and son were enrolled among the Syracusans citizens. Upon the death of Carthage, Agathocles was recommended to Demas, a rich citizen, by whose favour and interest he was liberally supplied, and, in due time, advanced to the dignity of a chalirc, an office which gave him the command of a thousand men. Agathocles, having distinguished himself by his military talents, married the widow of his patron, Demas, and thus became the most wealthy citizen of Syracuse. When the supreme power in this city was usurped by Sophistratus, Agathocles retired to Italy; but aspiring to the sovereignty, rift of Crete, and afterwards of Taras, he became an object of general hatred and terror; and being expelled from these cities, and finding no admission into any other, he assembled a band of exiles and robbers, and plundered the country. At Rhegium, he unexpectedly attacked Sophistratus, and compelled him to abandon his enterprise. When this usurper was forced to abdicate the sovereignty of Syracuse, and to quit the city, he and the exiles who accompanied him, had recourse to the Carthaginians, who espoused their cause. The Syracusans recalled Agathocles, and appointed him to the chief command of the forces that were raised for repelling the attack of Sophistratus and the Carthaginians. Having successfully discharged the trust that was repose in him, he assumed a sovereign power, and by the measure he purposed convinced his fellow-citizens that he was aspiring to the monarchy. The Syracusans, in these circumstances of alarm and danger, applied to the Corinthians for a commander; and they deputed Accociari des to this office. Agathocles favored his life by a stratagem; and having made his escape, he proceeded to raise troops in different parts of Sicily, and was soon in a condition to approach the city at the head of a considerable army. The Syracusans, dreading a civil war, sent ambassadors to treat with Agathocles, who disbanded his forces; and being conducted by the citizens to the temple of Ceres, took a solemn oath, according to the established custom, that he would do nothing to the prejudice of the democracy. Being again referred to the chief command of the army, he indulged his ambitious views without regard to his oath, courted the favour of the populace, and massacred the nobles and chief citizens, so that in a few hours, more than 4000 of them were killed, and the streets were covered with dead bodies. Although he pretended to resign the command and to retire, he conducted his artifice with so much skill and secrecy, that he was unanimously proclaimed king, and appointed to govern with an absolute and uncontrollable power. In order to render himself popular, the first law he enacted was, that all former debts should be cancelled, and the lands equally divided among the rich and the poor; and such was his behaviour, that he gained the attachment and confidence of his subjects. With their cordial concurrence he reduced, in two years, the whole island; a few cities held by the Carthaginians excepted. His progress alarmed the Carthaginians, and they proceeded Hamilcar, with a powerful fleet and army, to restrain it. The first encounter, near the river Himera, terminated in favour of Agathocles; but the loss which Hamilcar had sustained by a storm in his voyage, and by the full engagement, being repaired by a powerful reinforcement, the attack on the part of the Carthaginians was renewed, and Agathocles was compelled to save himself, first in Gela, and afterwards within the walls of his metropolis, to which they laid close siege; proposing by the reduction of this city to gain possession of the whole island. Thus pressed by the Carthaginians, and abandoned, on account of his former cruelties, by all his allies in Sicily, Agathocles formed the bold design of transferring the war into Africa, and besieging Carthage, when he himself was besieged in the metropolis, which was the only city of Sicily in his possession. Without communicating his design to any confidential person, he informed the Syracusans in general terms, that he had conceived a plan which would be effectual for their refuge: and collecting together the most intrepid of the soldiers and citizens, and incorporating the slaves, whom he emancipated, among his troops, he embarked all his forces on board 60 galleys, sailed directly for Africa, and landed on the coast, in the third year of the 117th Olympiad, B.C. 310. Here he dislodged the views of the army, and animated them to vigorous efforts by assurances of success. The soldiers received his addresses with loud acclamations. He then determined to burn all his galleys, except one or two, which he reserved for carrying dispatches. When he communicated this daring resolution to the army, he told them, that when they left Syracuse and were pursued by the enemy, he applied in the moment of danger to Cereus and Proserpine, the tutelary goddesses of Sicily, and promised to burn all the vessels of his fleet, if they delivered his men from the enemy, and enabled them to land safe in Africa. “Aid me, therefore, 0 fellow soldiers!” said he, “to discharge this vow; for the goddesses can easily make us amends for this sacrifice.” When these words were uttered, he allowed no time for deliberation; but taking a torch in his hand, he set fire to his own ship; the officers imitated his example, and were cheerfully followed by the soldiers. He next led them against an important place, called the Great City, that was subject to Carthage, which they took by storm; they then proceeded to Tunis and took it. Having enriched themselves with the plunder, he caused both cities to be levelled with the ground, that there might be no place of retreat, and no hope of safety but in victory; and encamped in the open fields. He next proceeded towards Carthage, and charging the Carthaginian army, he made an unexpected sally and routed his army, confining of 120,000 men, and put to a cruel death. His head was sent to Africa, as an acceptable present to Agathocles. Whilst Agathocles was preparing for the siege of Carthage, he was joined by Ophellus, prince of the Cyreneans, who had been one of Alexander’s captains, but the deposed prince was perjuredly murdered. The savage tyrant, being now at the head of a numerous army, assumed the title of the king of Africa; and invested Carthage, with a view of reducing it by famine. During this interval, he passed over into Sicily with a detachment of 2000 men, in order to reduce those inhabitants of the cities, who had taken up arms and associated in defence of their liberties. His purpose was speedily accomplished; and he hastened his return to Africa. He found his army in great dillets; and in an attempt for obtaining relief, he was defeated, and then defeated by the Africans, so that he was under a necessity of leaving the country. Upon his return to Sicily, he perpetuated the most horrid acts of cruelty. He first marched against the Egelines, who had revoluted in his absence, and having taken their town by storm, he put all the inhabitants to death, without distinction of age or sex, and with circumstances of the most savage barbarity. He also ordered all those to be massacred who were related to the Syracusans, who attended him in the Carthaginian expedition,
AGATHONIS, in Ancient Geography, an island of Africa, in the Arabian gulf; according to Ptolemy, in long. 65° 15', and lat. 23° 20'.

AGATHONISI, a small island of the Grecian Archipelago, about a league south of Samos.

AGATHODÆMON, in Mythology, a beneficent Genius, or Demon. The word is compounded of agath, good, and dæmon, demon. This name was given to the divinity, which the Egyptians called Cneph, by the Greek writers who travelled into Egypt; and Vulcan was the emblem under which the Greeks represented Cneph in their temples. The Egyptians gave also the same name to the Nile and to its symbols.

Among ancient writers, agathodæmon is a denomination given to a kind of serpents, bred up and revered by the Egyptians, from an opinion of some futility residing in them. They are also called dragons, Dracontes, or draconculi, and fabulously deformed as having wings. They appear to be the same with those otherwise called serpentes. Lamprid. in Helig. cap. xxviii. Cæs. Not. in Suet. ed. 2. Bochart, Hier. p. ii. lib. iii. cap. 14. We find upon the abraxas and some medals of Adrian the representation of a serpent, bearing the head of Serapis instead of its own; which is an evident allusion to the Serapis of the Nile, or divinity of Canopus, and a second emblem of that river which was first represented by Agathodæmon. The head of the Agathodæmon is often covered with rays on the abraxas. The appendages to the head of the agathodæmons remind us of the oothæcæ serpentes of Linnaeus.

AGATHODÆMON, in Biography, an artist of Alexandria, prepared a series of maps for the illustration of Ptolemy's Geography, in which the position of all the places mentioned by this eminent geographer, with their latitude and longitude, is laid down precisely according to his ideas. Fabr. Bib. Graec. tom. ii. p. 412.

AGATHYRSIANS, in Ancient History, the inhabitants of a district of Scythia, or European Sammtia, mentioned by Herodotus (lib. iv. c. 104. p. 328. Ed. Weiseling.) who were very rich, and who had their women in common, for the sake of binding the men more intimately to one another, and preventing jealousies and other ill effects of monadity. In other respects they conformed to the usages of the Thracians. From Virgil (Æneid. iv. v. 146.) who calls them "—pici Agathyrsi," it appears, that they had the common practice of painting their bodies. They also are said to have used gold in their ornaments. They pretended to be descended from Agathyrsis, the son of Heracles the Libyan.

AGATTON, in Geography, a town of the kingdom of Beain, in Africa, situated on a small eminence, forming an island, at the entrance of the river Formosa, near the sea. It is more healthy than any other part of the country, and surrounded with fruit trees. It has several circumjacent villages, whose inhabitants resort to it at every principal market, which is held for five days. It was formerly very considerable, but has suffered much from wars. N. lat. 6° 30'. E. long. 5° 44'.

AGATU, one of the Fox islands, in the Northern Pacific Ocean.

AGATY, the name of a Malabar tree, bearing a fruit in taste and shape like the kidney-bean. Ray's Hist.

AGAU, or AGAW, in Geography, a small kingdom of Africa, dependent upon Abyssinia. It lies between the lake Dumea and the Nile.

AGAVA, in Ancient Geography, a town of Africa, placed by Ptolemy in the Pentapolis, or Syris.

AGAVE, formed from aquac, admirable, in Botany, a genus of the hexandria monogynia class and order, of the natural order of coronarize, and of the tribe of Juficus. Its characters are, that it has no calyx; that the corolla is one-petalled, and funnel-shaped, with a fix-parted equal border, and lanceolate erect parts; the lamina are filiform, erect filaments, longer than the corolla; the anthers linear, shorter than the filaments and veriscal; the pistil is an oblong germen, growing thinner towards both ends, inferior; the style filiform, of the length of the lamina, and three-cornered; the stigma headed and three-cornered; the pericarpium is an oblong, three-cornered, three-celled, three-valved capsule; and the seeds are numerous. The species enumerated...
enumerated by Martyn are six, and in the Linnaean system by Gmelin seven. The first is the A. Americana, or Great American aloe, whose stems, when vigorous, rise upwards of twenty feet high, (one in the king of Trujilla's garden rose to 40 feet,) and branch out on every side, so as to form a kind of pyramid, composed of greenish yellow flowers, which blend crefil and come out in thick clusters at every joint. The seeds do not come to maturity in England. When this plant flowers, it makes a beautiful appearance; and if it be protected from the cold in autumn, a succession of new flowers will be produced for near three months, in favourable seasons. It has been a common error, that this plant does not flower till it is 100 years old: the truth is, that the flowering depends on its growth; so that in hot countries it will flower in a few years; but in colder climates the growth is slower, and it will be much longer before it flowers up a stem. The first European who possessed an American aloe, is said to have been Cortusius, who had one in 1561; and Parkinson reports that it was first brought into Spain. The first that flowered in England is said to have been Mr. Cowell's, at Hoxton, in 1729, but they have occurred fo since that time, that they are now fearlessly considered as rarities. Few of the varieties with yellow-edged leaves have yet bloomed. There are hedges of the common agave in Spain, Portugal, Sicily and Calabria; it flourishes also about Naples, and in other parts of Italy. The juice of the leaves, strained, and reduced to a thick confistency by being exposed to the sun, may be made up into balls, by means of yce-shees. It will lather with salt-water as well as fresh. The leaves, instead of passing between the rollers of a mill, may be pounded in a wooden mortar, and the juice brought to a confistency by the fun or by boiling. A gallon of juice will yield about a pound of soft extract. The leaves are also used for scouring pewter, or other kitchen utensils, and floors. In Algarvia, where pailure is scarce, they are cut in thin transverse slices, and given to cattle. The inward substance of the decayed stalk will serve for tinder. The fibres of the leaves, separated by bruising and steeping in water, and afterwards beating them, will make a thread for common ufs. The process for this purpose at Loule, in Portugal is as follows: Having plucked the largest and best leaves, one of them is laid on a square board which a person presses obliquely between his breast and the ground, and he separates it with a square iron bar held in both hands; thus all the juices and pulp are pressed out, and the nerves of the leaf only remain, which may then be divided into very fine threads. Threc are hung over a thin cord to dry. This thread is not strong, and easily rots in water, but it consists of straight fibres, and is applicable to many purposes.

Linck's Travels in Portugal by Hinckley, p. 345. Varieties of the common American agave, with gold and silver-striped leaves, are not now uncommon in the English gardens. The Karatto agave is a variety brought from St. Christopher's, and the name is given to other species of this genus, and has leaves from 2½ feet to 3 long, and about 3 inches broad, ending in a black spine, and more erect than those of the others. This variety has not flowered in England.

2. A. visipara, or chilting agave or aloe, is a plant with toothed leaves, never grows to a large size; as it produces no suckers from the root, it cannot be increased till it flowers. This plant grows in St. Domingo and Jamaica, and its juicy juice forms a part of the caballine aloes of the thorns. It was first cultivated by Mr. Miller, in 1731.

3. A. virginica resembles the first so much as not to be distinguishable from it, except by good judges. The leaves are narrower and of a paler colour; the flmes are not so high, nor do they branch in the same manner; but the flowers are collected into a close head at the top. It was introduced in 1755, into the Kew garden, by Mr. J. Cree. 4. A. brida has two varieties, viz. the Vera-Cruz agave, which resembles the first, with thinner leaves, indented at the edges much closer and not so deep, and blunter spines; and the rigid or narrow-leaved agave, with long, narrow, stiff leaves, cut at and terminated by a stiff black spine. It was cultivated in 1731, by Mr. Miller. 5. A. tuberosa, or tuberous-rooted agave, has the leaves indented at their edges, and each indenter terminates in a spine; the root is thick, and swells close above the surface of the ground; in other respects it agrees with the last species; it has two varieties, viz. the angle-leaved and double-leaved agave. It grows in the Antilles, and has been cultivated at Paris under the name of A. anfibus. 6. A. foetida has long, narrow, stiff leaves, of a pale green colour, waved on their edges, thoro on the side spread open, and those in the centre closely folded over each other, and encompassing the bud. The juice of the leaves has a bad smell. It is seldom more than 3 feet high, but the flower stems rise near 20, and branches out in the manner of the fruit, but more horizontally, and the flowers are smaller and of a greener colour. This species grows in the woods of St. Domingo. A plant of this species, which flowered in 1755, and then died, was cultivated in 1690 in the Royal garden at Hampton Court. Of the leaves are formed ropes and various kinds of cloth, which serve for garments and other purposes.

The fourth and fifth, with the Karatto and rigid agaves, are more tender than the others, and cannot be preferred in winter, unless they are placed in a warm house, nor will they thrive if set abroad in the summer. They require a light sandy earth, and should have little wet in winter, unless they are placed in a warm house; but in hot summer they may be gently watered twice a week. They must be shifted every summer into fresh pots; but the pots should be small, that their roots may be confined; otherwise the plants will not thrive. Limenius has separated this genus from the alae, because the flowering and style are extended much longer than the corolla, and the corolla falls upon the germ. Besides, all the agaves have their central leaves, closely folded over each other, and embracing the flower-stem in the centre; so that these never flower till all the leaves are expanded, and when the flower is full, the plants die. Whereas the flower-stem of the aloe is produced on one side of the stem, annually from the same plant, and the leaves are more expanded than in this genus, Martyn's Miller's Dice.

A. cavi, in Mythology, the name of one of the 50 Nereids. A. cavi, in Natural History, a species of Papilio Demanus, with roundish yellow wings; the anterior black above and brown below. It is found in Cayenne.
AGAVI, in Ancient Geography, a people of Mæria, or of Thrace.

AGAUNA, now St. Maurice, a burgh of the Valtain, in the valley of Pennine, celebrated on account of the martyrdom of the Theban legion, who suffered decimation rather than renounce Christianity. Sigismund, king of Burgundy, erected a monastic here in 515. AGAULPE, in Belamy, a name used by some authors for the common white water-cress.

AGAZZI, in Geography, an ancient people near the mouth of the Vittula.

AGBIENSIUM municipium, Breisens, a municipal town of Africa, built upon a hill, about half a league from Thueca. Here are found the ruins of ancient temples.

AGDAMI, a town of Arabia Felix, placed by Ptolemy in long. 3° 30', and lat. 21° 30'.

AGE, anciently Agatha, a small but populous city in the department of Herault, and late province of Languedoc in France, in a diocese of the same name, situated on the river Hérault, at the distance of about half a league from the sea. The diocese is one of the richest districts of the country; it is within the province of Narbonne, and contains 18 parishes. The ancient Agatha was a small island, but the accumulation of sand at the mouth of the Hérault has now joined it to the continent. It produces fine wool, wine, oil, corn, and silk. The town has a harbour for small vessels, defended by a little fort at the mouth of the river. Most of the inhabitants are traders or seamen. The houses are mean, the cathedral small, and the bishop's palace an old building. The bishop is lord of the city, and files Count of Agde. The chapels of Notre Dame de Grace, in the vicinity of the town, attract a great number of pilgrims and devotees. The Capuchin convent is also much referred to an account of the image of the Virgin Mary, which is placed in a distinct chapel adjoining it: the convent has apartments for the accommodation of the pilgrims, who repair hither to perform their nine days' devotion. The vicinity of Agde abounds with extinguished volcanoes. Cap d'Agde is one of them; and the rock of Agde is nothing but a hard lava, so that the town is built and paved with this lava, which is very black. Buffon's Nat. Hist. by Smellie, v. ix. p. 201. N. lat. 43° 18' 57". E. long. 3° 28' 11''.

AGDENAS Bay, is a part of that of DRONTHEIM, in Norway; in the neighbourhood the soil produces plenty of grain.

AGDENITES, a name given to a people of Carmania.

AGDERUINE, a small town in the island of Minorea, situated near a mountain south-east of Cape Bajobes. N. lat. 45° 15'. E. long. 4° 14'.

AGDISTIS, a mountain of Asia Minor, near the town of Pefinus.

AGDU: a rock on the frontiers of Asia Minor, famous in ancient mythology.

AGE, in Antiquity, a word which was proclaimed by a public crier whilst the Roman magistrates were taking the augurice, or whilst they were sacrificing, in order to command the attention of the people. The word was also an order to the priest or other person, for immolating a victim, as age, or bac age, in reply to his question, ageon? or agone? shall I strike? Thus Ovid Fast. i. 321. tom. iii. p. 33. Ed. Burm. "Quât profè sìt virum tumidum tenuisse figna luctos Semper agone? rogas; nee nisi Julius agis."

See Acon.

Age, in the most general sense of the term, denotes the duration of any substance, animate or inanimate; and is applied either to the whole period of its existence, or to that portion of it which precedes the time to which the description of it refers. In this sense it is used to signify either the whole natural duration of the life of man, or any interval of it that has elapsed before the period to which we refer. The ordinary age of mankind has been observed to vary in such a manner as to afford an instructive and pleasing display of the wisdom of divine Providence. When age is understood of a certain portion of the life of man, its whole duration is divided into four different ages, viz. infancy, youth, manhood, and old age: the first extending to the 14th year; the second, denominated youth, idleness, or the age of puberty, commencing at 14, and terminating at about 25; manhood, or the virile age, concluding at 50; and the last ending at the close of life. Some divide the first period into infancy and childhood, and the last likewise into two stages, calling that which precedes the age of 75, decrepit old age. Shakespeare has admirably described these different stages in his comedy of "As you like it."

——— "His acts being seven ages. At first, the infant, Mewling and puking in the nurse's arms; And then, the whining school-boy, with his satchel, And shining morning face, creeping like snail Unwillingly to school: And then, the lover; Sighing like furnace, with a woful ballad Made to his mistress' eye brow: Then, a soldier; Full of strange oaths, and bearded like the pard, Jealous in honour, sudden and quick in quarrell, Seeking the bubble reputation.

Even in the cannon's mouth: And then, the justice; In fair round belly, with good capon lin'd, With eyes severe, and beard of formal cut, Full of wise saws and modern instances, And so he plays his part: The sixth age shifts Into the lean and slipper'd pantaloon; With spectacles on nose, and pouch on side; His youthful hose, well sav'd, a world too wide For his shrunk hand, and big manly voice, Turning again toward childish treble, pipes, And whistles in hisfound: Laat scene of all, That ends this strange evenfentful history, Is second childishness, and mere oblivion; Sans teeth, sans eyes, sans taste, sans everything.

See Longevity.

Age is applicable to the duration of things inanimate or factitious; and in this use of the term we speak of the age of a house, of a country, of a state or kingdom, &c. It is likewise used in reference to vegetable substances, as of roots, leaves, corn, wine, &c. Trees are said, after a certain age, to waste and decay. An oak, at 100 years old, ceases to grow. The usual rule for judging of the age of wood, is by the number of circles which appear in the substance of a trunk or stake cut perpendicularly, each circle being supposed to be the growth of a year; though some reject this method as precarious, alluding, that a simple circle is sometimes the product of several years; besides that, after a certain age, no new circles are formed. Phil. Trans. N. S. 43. Act. Emd. Illip. 1713.

Age, in Chronology, is used for a century, or a period of 100 years, in which sense it is the same with sexa, and differs from generation. It is also used in speaking of the time past since the creation of the world.

The several ages of the world may be reduced to three grand epochs, viz. the age of the law of nature, called by the Jews the void age, from Adam to Moses.—The age of
AGE

the Jewish law, from Moses to Christ, called by the Jews the present age.—And the age of grace, from Christ to the present year. The Jews call the third age, the age to come, or future age; denoting by it the time from the advent of the Messiah to the end of the world. See Incarnation and Epoche.

The Romans distinguished the time that preceded them into three ages: the obscure or uncertain age, which reached down as low as Ogyges king of Attica; in whose reign the deluge happened in Greece.—The fabulous, or heroic age, which ended at the first Olympiad; and the historical age, which commenced at the building of Rome. Varro calls the period preceding the deluge, an age entirely unknown. The second he calls fabulous, on account of the numerous fables, with which the accounts of it, that have been transmitted to posterity, are interwoven. Diodorus Siculus, (tom. i. p. 8.) extends the fabulous age no farther than the Trojan war; from which time the multitude which had overcast the preceding periods begins to clear up, and some rays of truth to break out. The commencement of the historical age is usually referred to the first Olympiad, in the year of the world 3228, and still continues. This division, it is to be observed, only holds good with regard to the Greeks and Romans, who had no histories earlier than the first Olympiad. The Jews, Egyptians, Phœnicians, and Chaldees, not to add the Indians and Chinese, pretend to much higher antiquity.

Among the poets, the four ages of the world are, the golden, the silver, the brazen, and the iron age. See the Metamorphoses of Ovid, lib. i. or rather Hesiod, in his poem, Epya aei Τηςειν, Opera et Dies, ver. 108, &c. He is the first that has described these four ages.

During the golden age Saturn reigned, and universal harmony and plenty prevailed. See Saturn. The silver age commenced when men began to deviate from the paths of virtue, and their lives became less happy. The brazen and iron ages denote periods of greater degeneracy. A late author, however, inverts the order of the poets: and thinks the first, which was a period of ignorance and barbarism, might be more properly denominated an iron than a golden age; when cities and states were founded, the silver age commenced; and since arts and sciences, navigation and commerce, have been cultivated, the golden age has taken place.

Bochart (Geog. Sac. i. v. 12. t. i. col. 226. Ed. Villem.) has described these four ages of the poets in the following manner. The first, or golden age, lasted under the government of Saturn, or Noah, 100 years from the flood to Phægæ, in which period there was no division of the land. Thus Tibullus represents it, (lib. i. eleg. iii.)

"Non fixus in agris,
Qui regeret certis flibus arva, lapis."

And Virgil (Geog. i. v. 126.)

"Nec signare quidem aut partiri limite campum
Fas erat."

In the silver age, the lands were divided and cultivated, housetops were built, and the tower of Babel was erected.

"Tum primum subiecit domos, &c."

The third, or brazen age, was marked by the inscription of Nimrod, the Bacchus of the ancients, frat a hunter and afterwards a warrior, who transferred his power from wild beasts to men, and established a tyrannical government. Thus described by Virgil, (ubi supra. v. 139.)

"Tum laqueis captare feras, et fallere vident,
Inventum: et magnos caelibus circumdare faltus."

And by Ovid: Metam. lib. i. v. 125.

"Tertia post illis succeddit aenea proles,
Sevior ingenii, et ad horrida prontior arma."

And also by Hesiod, (Op. and Dies. v. 143. p. 134. Ed. Robin.) thus translated:

"Tertia deinde ætas summi Jovis edita nutu,
Villor argento, de duro conßlitit ærc.
Fraxina et vehementibus rubibus quo,
Martiis amore
In pugnis et bella mues."

This was succeeded by the iron age in which we live. On some ancient northern monuments we find the rocky or iron age, which corresponds to the brazen age of Hesiod, and the Greeks; being called rocky, on account of Noah's ark, which rested on mount Ararat. The northern poets also denominate the fourth age the athen age, from a Gothic king, Madenis or Mannus, who, on account of his great strength, was said to be made of steel; or because in his time people began to make use of weapons made of that wood. Phil. Trans. N° 301.

Age is sometimes used among the ancient poets in the same sense with Generation, for a period of 30 years. Thus Nefor is said to have lived three ages, when he was 90 years old.

The East Indians also reckon four ages since the beginning.—The first, which they represent as a fort of golden age, lasted according to them, 178000 years: in this the god Brahma was born, and the men were all giants; their manners were innocent: they were exempt from diseases, and lived 400 years.—In the second age, which lasted 1296000 years, their rajas were born; vice now crept into the world: men lives were fallen to 300 years, and their size retrenched proportionally.—Under the third age, which lasted 8064000 years, vice being more increased, men only attained to 200 years.—The last age is that wherein we now live, of which 4027213 years are already gone; and the life of man sunk to one fourth of its original duration.

The period preceding the birth of Jesus Christ has been generally divided into six ages. The first extends from the creation to the deluge, and comprehends 1656 years. The second age, from the deluge to Abraham's entering the land of Promise, A. M. 2082, comprehends 426 years. The third age, from Abraham's entrance into the promised land to the Exodus A. M. 2512, includes 430 years. The fourth age, from the Exodus to the building of the temple by Solomon, A. M. 2992, contains 480 years. The fifth age, from the foundation of Solomon's temple to the Babylonian captivity, A. M. 3316, comprehends 424 years. The sixth age, from the Babylonian captivity to the birth of Jesus Christ, A. M. 4000, the fourth year before the vulgar æra, includes 584 years. Those who follow the Septuagint, or Greek version, divide this period into seven ages, viz. 1. From the creation to the deluge, 2262 years. 2. From the deluge to the confusion of tongues, 738 years. 3. From this confusion to the calling of Abraham, 460 years. 4. From this period to Jacob's descent into Egypt, 215 years. 5. From this event to the Exodus, 430 years, making the whole 645 years. 6. From the Exodus to Saul, 774 years. 7. From Saul to Cyrus, 583 years. From Cyrus to the vulgar æra of Christians, 538 years; the whole period from the creation to this period, containing 6000 years. See Chronology.

The Sibyl line oracles divide the duration of the world into
ten ages; and, according to Josephus, each age contained 600 years; and it appears by Virgil's 4th eclogue, and by other testimonies, that the age of Augultus was reputed the end of those ten ages; and, consequently, as the period of the world's duration. The age of Augultus was appropriated by the senators in a peculiar manner to the time in which this emperor lived.

Other historians reckon from the creation to the taking of Troy, 2836 years; and to the foundation of Rome, 3250; from the conquest of Carthage, by Scipio, to Jesus Christ, 2003; from Jesus Christ to Constantine, 512; and to the re-establishment of the empire of the West, 826 years.

The denomination of middle age is applied by some to the space of time, which commenced from Constantine, and ended with the taking of Constantinople by the Turks, in the 15th century; or, to the interval that elapsed between the fall of the western or Latin empire, near the close of the fourth century, and that of the eastern or Grecian about the middle of the fifteenth, comprehending near 1000 years. Others date the middle age from the division of the empire by Theodosius, at the close of the fourth century, and extend it to the time of the emperor Maximilian 1. at the beginning of the 16th century, when the empire was first divided into circles. But this seems more accommodated to the state of Germany in particular, than to that of Europe in general. The middle is by some denominated the barbarous age, and the latter part of it the lowest age. Some divide it into the non-academic and academic. The former comprehends the interval from the 6th to the 9th century, during which schools or academies were lost in Europe. The latter denotes the period from the 9th century, when schools were restored, and universities established, chiefly by the care of Charlemagne.

Age, in the History of Literature and the Arts, is applied to a period peculiarly distinguished by the cultivation of learning, and the extraordinary productions of genius. Accordingly learned men have marked out four of these happy ages. The first is the Grecian age, which commenced near the time of the Peloponnesian war, and extended till the time of Alexander the Great; within which period we have Herodotus, Thucydides, Xenophon, Sophocles, Plato, Aristotle, Democritus, Aeschines, Lycurgus, Isocrates, Pindar, Aeschyus, Euripides, Sophocles, Aristophanes, Menander, Anacreon, Theocritus, Lylyus, Apelles, Phidias, Praxiteles. The second is the Roman age, included nearly within the days of Julius Cesar and Augustus; affording us, Catullus, Lucretius, Terence, Virgil, Horace, Tibullus, Propertius, Ovid, Phaedrus, Cesar, Cicero, Livy, Sallust, Strabo, Dionysius of Halicarnassus, Varro, and Vitruvius. This period, or at least a considerable portion of it, has been denominated by way of eminence the Augustan age, or the age of Augustus, which has been regarded as the age of genius, elegance and polite ness. The third age is that which followed the taking of Constantinople by Mahomet II., or that of the restoration of learning, under the popes Julius II. and Leo X., which produced the following eminent characters, &c. Ariosto, Tasso, Sanzio, Vida, Machiavel, Guicciardini, Davila, Erasmus, Paul Jovius, Michael Angelo, Raphael, Titian. The fourth age comprehends that of Louis XIV. and Queen Anne, when France was distinguished by Corneille, Racine, De Retz, Moliere, Boileau, Fontaine, Rousseau, Boileau, Piron, Bourdaloue, Pascal, Malebranche, Malfi, Braye, Bayle, Fontenelle, Vertot; and when England exhibitcd Dryden, Pope, Addison, Prior, Swift, Parnell, Arbuthnot, Congreve, Otway, Young, Rowe, Atterbury, Shaftsbury, Bolingbroke, Tilletson, Temple, Boyle, Locke, Newton, Clarke. Those who lived in the two first of these periods are generally distinguished by the appellation of the ancients, when a companion is instituted between the ancients and the moderns, including also under the first class one or two who lived in a more early age, as Homer in particular; and the moderns comprehend those who flourished in the two last of the ages above-mentioned, including also the eminent writers down to our own times. Voltaire's Age of Louis XIV. vol. i. p. 1, &c. Blair's Lectures on Rhetoric and Belles Lettres, vol. iii. p. 4.

There are other periods, which, on account of the extreme ignorance that prevailed, have been denominated ages of ignorance. Such are the 9th, 10th, and 11th centuries, in the modern history of Europe; when few kings and nobles, much less the common people, were able to write or read. These were ages of slavery, civil and religious, as well as ignorance.

Age of Medals. See Medal.

Age, in Horsemanship, forms a very important branch of knowledge, and confinés in being enabled to judge of the progress of a horse's years from correspondent alterations in his body. The teeth are usually examined for this purpose, as they exhibit in almost all horses the same changes in appearance and form at stated periods. This becomes necessary, as there are but few whose knowledge is sufficiently extensive to enable them to judge of the age by any other means; but where it can be done it is more useful than by this ordinary mode; for in this country, where horses are ridden very hard, and consequently early ruined, it is not uncommon to find a horse at five years old, feeble, debilitated, and exhibiting all the marks of old age, except in his mouth; on the contrary, when the animal falls into other hands, at 10 or 12 he has all the vigour of youth, and his teeth are the only parts that present an indication of age: it is therefore more useful to examine the general appearance of the animal, than to be guided altogether by the marks in the teeth; for, provided the horse has not been too early worked, nor too hard rode, and has no natural nor accidental defects, his nominal age should be but a secondary consideration. It is the custom of some excellent horsemens never to hunt their horses, till they are eight or nine years old, a period at which other horses are usually refuted as aged, and unfit for fatigue. Horfes, when aged, usually become hollow above the eyes, the hoofs become rugged, the under lip falls, and if grey, they become white. La Poffe, the younger, recapitulates the appearances of the teeth nearly in the following manner. The horse is foaled with six molar or grinding teeth in each jaw; the tenth or twelfth day after the two front nippers appear above and below, and in fourteen or fifteen days from this, the two intermediate are pushed out; the corner ones are not cut till three months after. At ten months the incive or nippers are on a level with each other, the front lefs than the middle, and these again lefs than the corners; they at this time have a very sensible cavity. At twelve months this cavity becomes smaller, and the animal appears with four molar teeth on each side, above and below, three of the temperance or colts, and one permanent or horse tooth; at eighteen the cavity in the nippers is filled up, and there are five grinders, two of the horse, and three temperancen; at two years, the first of the colts molar teeth in each jaw, above and below, are displaced. At two years and a half, or three years, the front nippers fall and give place to the permanent ones; at three and a half the middle nippers are likewise removed, at which period the second molar falls; at four years the horse is found with fix molar teeth, five of his new fet, and one of his half; at four years and a half the corner nippers of the colt fall and give place
place to the permanent set, and the last temporary grinder disappears. At five years old the tusks in the horse usually appear; at five and a half they are completely out, and the internal wall of the corner nippers, which before was incompletely formed, is now on a level with the tooth; at this period the incisors or nippers have all of them a cavity formed in the substance between the inner and outer wall, and it is the disappearance of this that marks the age. At six years those in the front nippers below are filled up, the tusks are likewise slightly blunted; at seven years the mark or cavity in the middle nippers is filled up, and the tusks a little more worn. At eight years old the corner nippers are likewise plain, and the tusks are round and shortened. At this period the horse is said to be aged, and to have lost his mark; but among good judges the teeth still exhibit sufficient indications. At nine the groove in the tusks is worn away nearly, and the nippers become rather rounded; at ten these appearances are still stronger; at twelve the tusks only exhibit a rounded stump, the nippers push forward, become yellow; and as the age advances, appear triangular and usually uneven.

Moniteur St. Bél, the late professor of the English Veterinary College, used to affirm, that after eight years the cavities in the anterior or upper incisive teeth filled up with equal regularity; thus from eight to ten the front ones were filled in, from ten to twelve the middle, and from twelve to fourteen; those of the central; but though some pains have been taken to ascertain this, it does not appear that the disappearance of the cavities in these teeth is attended with sufficient regularity to warrant confidence. It is a custom with dishonest dealers to draw the colts nippers, particularly the corner ones, by which means the permanent set which are underneath, immediately appear, and the horse is considered much older than he is; but if the other appearances detailed here are attended to, this may be readily detected. See Plate where the age from the appearance of the teeth is accurately represented. See also Teeth, and Anatomy of the Horse.

Age, in Hunting, is an article of consequence.—Deer, and other heads of game, have different denominations according to their age.

The age of a hart, &c. is chiefly judged of by the furniture of his head, which is annually enlarged both in height and thickness, from the second to the eighth year, and then continues nearly in equal beauty during the vigour of life. But, when he grows old, i.e. from eight years forward, his horns decline.

The first head, called, in fallow deer, broches; and, in red deer, pricks, does not come till the second year of their age: the next year, they bear four or six small branches; the fourth year, eight or ten; the fifth, ten or twelve; the sixth, fourteen or sixteen; the seventh year they bear their heads bended, branched and fumed, as much as ever they will be. The number of antlers or palms is by no means constant, when the animal is in the highest degree of vigour and perfection; for it varies according to the quantity of nourishment and repose the animal has enjoyed, and the size of the horns depends upon the fame cause. The huntsmen have several other marks, whereby to know an old hart without seeing him; as, the slit, entries, abatures, foils, fewmets, gate, and fraying pitts. See slot, &c.

The age of other heads that are chased, is estimated by their appearance; as a fox and a hare by their colour. In birds of the game kind, it is usually distinguished by the colour of the legs and wing-feathers.

Age of meat cattle, viz. the ox, cow, and bull, is known by their teeth and horns; but from long habit and the greater convenience, the horns are more usually fluided; but in that breed without horns, the teeth must be nearly the sole criterion. The ox has no upper incisive teeth, but a few days after calving eight nippers appear in the lower jaw, which remain till ten months, when the second dentition commences by the displacement of the two front teeth, to which succeed two permanent ones, larger but not so white.—At twelve months, the grinders are some of them changed; at 15 or 16 months, the incisors on each side of the front face is changed; at two years the third incisors on each side; and at three years the corners are replaced by the permanent, which complete the set. These are the first years of the animal’s life, even, long, and white; but in advanced age become yellow, or black, and uneven: between these periods all the grinders are changed.

The horns are likewise a permanent, and a temporary pair. The temporal pair are changed at the end of three years, and the permanent pair appear small, smooth, and terminated at the end with a small tubercle or button. In the following year this button grows from the head, and the line of growth is marked by a horny circle; the horns continue growing through life, and ever succeeding year adds a circle, so that the age may be readily gained by counting three years for the first button, and an additional one for every remaining circle.

Age of sheep is learned likewise from the horns in those which have them, in others from the teeth. M. Buffon says they have, in the third year, four broad teeth before, in the fourth year six broad teeth, and in their fifth year eight of the same kind: but our farmers reckon, that when a sheep is one shear, or year, it has two broad teeth before, when two shear, it will have four; when three shear, fix; and when four shear, or years, it will have eight. The age of the horned sheep is most conveniently learned by the horns, which shew themselves in the first year, soon after birth, and are not changed, but continue to protrude a ring or circle annually, as long as they live, so that as many circles as their horns present, so many years are they old. In goats, the teeth and horns follow the same laws; and therefore their age may be learned in the same way.

Age of the moon, in Astronomy, is understood of the number of days elapsed since the last conjunction, or new moon; called also her Quarter. The method for discovering her age is mentioned under the article Moon.

Age, in Law, is particularly understood of a certain state or time in life, wherein a person is qualified for certain offices of civil society, of which before, for want of years and discretion, he was incapable.

By the Roman law we find different ages ascertained for different purposes; as, confular age, or that wherein a person might regularly hold the confulsiphip, which was the 43rd year, so that he might sue for it in the 42d. Where it is to be observed, that it was not necessary either of those years should be expired, but only begun; besides, that men of extraordinary merit towards the republic, were in this matter exempt from the ordinary laws. Hence Corvinus was consul at 23 years. Seipio Emilianus at 36, and Pompey at 35; others broke through the laws by violence, as Caius Marius the younger, and Octavius Caesar, who procured themselves to be made consuls, before 20 years of age. Machiav. Dic. in Liv. lib. i. c. 60. p. 210.

Judiciary age, or that wherein a person was capable of sitting as judge, was not always the same; for by the Law
Lex Servius Glanis, none were allowed to be chosen under 30 years of age, or above 60. By some other laws that age seems to have been limited to 35, but reduced afterwards by Augustus to 30; though Plutarch supposes a mistake here in the text; and that, instead of 35 and 30, it ought to be read 25 and 20. Lex. Ant. tom. 1. Military age, or wherein the Romans were obliged to enter themselves in the army, was at 17 years; at 45 they might demand their dismission. Aquin. Lex. Milit. tom. 1.

This age was subject to considerable variation. The ancient practice, as Vegetius informs us, was to arm young men when they attained the age of puberty; and this subsisted before and under the first kings. Servius Tullius (about the year of Rome 178) fixed the period of military service from 17 to 46 years; those who had not reached this last term were called juniors, and those who had passed it seniors. Manlius, however, who saved the capitol, had served from the age of 16 years. Adriam commenced his military service at the age of 15 years; and influences occur, in the Roman history, of persons who were called forth to military service within the age of 50 years. But the age established by Servius Tullius was confirmed by Caius Gracchus, A. U. C. 652. The Gauls and Germans served from the age of puberty to extreme old age. The Perseans fixed the period of military service from 20 to 50 years. The Scythians and Laekedemonians extended it from the age of puberty to 60 years. The Athenians commenced at 18 years to guard the city and frontiers, and at 20 they engaged in foreign service, and continued to the age of 40 years. Aristotle fixed the military age at 17 years; (Polit. lib. viii.) and Plato in his Republic determines it from 20 to 60 years. Among the Lombards, the age of entry was between 18 and 19 years; among the Saxons at 13 years.

The age for holding offices in the city, as quaestor, edile, tribune of the people, &c. is not determined by the annual laws of Villius, but appears to have been the 22d. year. For it was necessary that the person who claimed any urban employment, had first served ten years without interruption in the army; commencing from the 17th year. Though some think the quaequatior might have been held at 25 years. Polyb. lib. vi. cap. 17. The pretorian age, or that wherein a person might solicit for the pretorship, was at 40; two years earlier than the age required for consul. But M. Brutus was pretor with Cassius, two years before his death; 2. 7. at the age of 35 years; and Dion (lib. p. 477) fixes this age at 30 years. Legitimen age, denotes the age of 25; so called, as some imagine, because youth were then by law allowed to take the direction of their affairs into their own hands. Briff. Select. Ant. ex Jur. Civ. lib. iii. c. 2. Diffination of age, statio venia, is a right which a person obtained from the prince, or sovereign, of setting aside a tutor or curator; and taking the administration of his affairs into his own hands, before the legitimate age. Calv. Lex. Jur. The adoptive age, called also plena substantia, requires the adopter to be eight years elder than the person adopted, that there may appear a probability of his being a natural child. Pitic. Lex. Ant. See Adoption.

By the common law, there are two principal ages in a man; at 14, he is at the age of discretion; at 21 years, at full age.

With respect to a woman, there were anciently fix ages observed; at seven years, her father might disfain the tenants of his manor for aid to marry her; for at those years she may consent to marriage. — At nine years old she is dowerable; for then, or within half a year after, she is said to be able promoveri dotes, & virum fuitissimum. At twelve years, she is able finally to ratify and confirm, or annul her former consent to matrimony; and, if proved to have sufficient discretion, may bequest her personal estate. At 14, she may take her lands into her own hands; and should be out of ward, if the were at this age at her ancestor's death; at this period she is at 21 years of legal discretion, and may choose a guardian. — At 16, she should be out of ward, though at the death of her ancestor she was under 14; the reason is, that she might make a husband able to perform knight's service; she may be executrix at 17. At 21 years, she may dispose of herself and alienate lands and tenements.

As for a man: the age of 12 years binds to appearance before the sheriff and coroner for inquiry after robberies, and impowers taking the oath of allegiance; 52 Hen. III. 14. At the age of 14, he may chuse his own guardian, and claim his lands held in foenge; though Bradton limits this to 15 years; with whom Glanville agrees. — At 14, a man may consent or disagree to marriage. — At that age, likewise, he may dispose of personal estate by will, if his discretion he actually proved, though not of lands until 21; at 14 also, persons may be witnesses, though in some cafes they have been admitted much younger. 2 Hawk. 434. Persons under 14 are not; in general, punishable for crimes; but they must answer for any trespas. 1 Inst. 237. — At 15, he ought to be sworn to the peace, and 24 Edw. I. flat. 3. — At 17, he may be an executor. — At the age of 21, a man was obliged to be a knight, if he had 20 pounds land per annum feu, or for term of life, anno 1 Edw. II. flat. 1. But this statute is repeated, 16 Car. 1. cap. 20. The same age also enables him to make contracts and manage his own estate; which, till that time, he cannot do with security to those who deal with him; so that at this age he is at his own disposal, and may claim his lands, goods, and chattels. Full age, in male or female, is 21 years; and this age is completed on the day preceding the anniversary of a person’s birth. (Salk. 44. 625, Lord Raym. 480.) who, till that time, is an infant, and is filed in law. Among the ancients Greeks and Romans women were never of age, but subject to perpetual guardianship, unless when married; and when that perpetual tutelage was away in process of time, we find, that, in females as well as males, full age was not till 25 years. By the constitution of different kingdoms, this period is fixed at different times. Scotland agrees with England in this point; but in Naples they are of full age at 18; in Holland at 25; and formerly in France, with regard to marriage, not till 30.

With regard to capital crimes, the age of 12 years was established, by the ancient Saxon laws, for the age of punishable discretion; and from thence till the offender was 14, it was stait pueri etiunti proxima, in which he might, or might not be guilty of a crime, according to his natural capacity or incapacity. Under 12 it was held, that he could not be guilty in will, neither after 14, could he be supposed innocent of any capital crime which he committed. But by the law, as it now stands, and has stood, at least ever since the time of Edw. III., the capacity of doing ill, or contracting guilt, is not so much estimated by age, as by the delinquent’s maturity of understanding, to that natural sapientia atatem. Under seven years of age, an infant cannot be guilty of felony; but at eight years old he may be guilty. Under 14, though an infant shall be prima facie adjudged, to doli incapax, yet, if it appear to the court and jury, that
that he was dolus capax, and could differ between good and evil, he may be convicted and suffer death. Thus, a girl of 13 has been burnt for killing her mistress; and one boy of ten, and another of nine years of age, who had killed their companions, have been sentenced to death, and the boy of ten years of age was actually hanged; because it appeared upon their trial, that the one hid himself, and the other hid the body of the person he had killed. An infamoc occurred in the 17th century of a boy eight years old, who was tried for firing two barns; and it appearing that he had malice and cunning, he was found guilty, condemned and hanged. In later times a boy, ten years old, was convicted on his own confession of murdering his benefic, and by the unanimous opinion of all the judges he was capitally punished. In such cases, however, the evidence of that malice, which is to supply age, ought to be clear and strong beyond all doubt and contradiction.

The age of 24 years enabled a man to enter into an order of religion, without consent of parents, anno 4 Hen. IV. cap. 17. At 24, he may be ordained a priest; and at 30, he may be a bishop. No person can be a member of parliament under the age of 21 years. Though the age of 21 is the full age of either man or woman, yet they may under that age contract for necessities suitable to their quality and proper instruction, and the contract shall bind them. An infant, who has an advowson, may present to the benefice when it becomes void. He may also purchase lands, though the purchase be incomplete; and when he is of age, he may agree or disaffee to it, without assigning any reason; and so may his heirs after him, if he should die before the completion of the agreement. In some cases, he may bind himself apprentice, by indenture, for seven years. 5 Eliz. c. 4;—43 Eliz. c. 2, and he may, by deed or will, appoint a guardian to his children, if he has any, 12 Car. II. c. 24. If either man or woman do any act before the time preferred by law, they may retract it when they come to the proper age; but if they do not, they are supposed to ratify it, and it shall be deemed valid. Thus, if a man marry before fourteen, or a woman before twelve, they may either agree or disaffee to the marriage, when they attain those respective ages. See Marriage. But the age of marriage has undergone divers modifications: in princes, it is allowed earlier than in private persons; in some countries than in others. In Persia, girls are married at nine, boys only at thirteen: in Holland, males are not allowed to marry without consent of parents or curators, before twenty-five; girls not before twenty: the Romans chose to marry their wives young, for the advantage of having them innocent and tractable. Others declaim against premature marriages. Some have pretended to limit the other extreme of marryable age to forty-five; but this too will be variable in different constitutions. We meet with instances of generation from 60 to 104, or even 121 years of age. Plott. Nat. Hist. Staff. chap. viii. § 3.

Various methods have been in use for determining this age. One sect of ancient Roman lawyers, called Casiliani, fixed it by the state of the body, which Jullianin and others after him, suppose to have been done by search, or inspection of the genital parts, at least in the male sex; for as to the female, it is pretended the twelfth year was the only guide, though others allude that the eruption of the menies served instead of it. The Proculiani, on the contrary, determined the puberty of males by the expiration of the fourteenth year. Jaukenius took a middle course, and made use of both methods.

The Canon or Ecclesiastical Law also denotes divers ages, viz. of baptism; of ordination to priesthood, and confirmation to episcopacy.

The Civil Law distinguished the age of minors, or those under 25 years old, into three stages: infansitia, from the birth to seven years of age; juvenilita, from seven to 14; and pauperitas, from fourteen upwards. The period of juvenilita, was again subdivided into etas infantilis proxima, from seven years to 10; and etas pauperitatis proxima, from 10 to 14 years. During the first stage of infancy, and the next half stage of childhood, infansitia proxima, they were not punishable for any crime. During the other half stage of childhood, approaching to puberty, from 10 to 14, they were indeed punishable, if found to be dolus capax, or capable of mischief; but with many mitigations, and not with the utmost rigour of the law. During the last stage (at the age of puberty, and upwards) minors were liable to be punished, as well capitally, as otherwise. Blacklt. Com. vol. i. 465, vol. iv. 22.

Age prior, attinent precati, a petition, or motion made in court, by one in his minority, having an action brought against him for lands coming to him by descent; requesting that the action may rest till he come to full age.—This the court, in most cases, ought to grant. But minors, as purchasers, shall not have it: nor intent of adultery, desert, or partition; though they may in debt. Hob. 342. D. Alr. 159.

It is otherwise in the Civil Laws, which obliges children in their minority to answer to their tutors or curators. See Parol Demurrer.

AGEA, in Geography, a town of Persia, in Persia, 35 leagues east of Itphah.
AGEE, a small island on the coast of the Red Sea, N. lat. 18° 5'; E. long. 38° 30', which gives name to a nation inhabiting the adjoining district of the country.

AGELASTA, in Antiquity, formed of a priv. and ἀγγαλεῖος, to laugh, and denoting forsworn, a famous stone in Attica, near the well called Callitrichos, upon which Ceres reeled, when she was fatigued in the search for her daughter. Here, according to Pausanias, (Attic. p. 93) they commenced the Eleusinian feasts.

AGELNOTH, or AEGELNOTH, Achelnotus, in Biography, succeeded Livingus, in the fee of Canterbury, in the reign of Canute the Great, A. D. 1020; he was the son of earl Agilmer, and obtained the appellation of good, for his acts of piety and benevolence. By his interced and influence with Canute, he restrained some of his excesses, and induced him to bestow large sums of money for the support of the foreign churches. In his way to Rome, for receiving his pall from pope Benedict VIII, he purchased at Pavia, with a large sum, a relic, which was the arm of St. Augustin, and transmitted it to England as a present to Leofric, earl of Coventry. By other more important services he is said to have given luftre to the Archiepiscopal fee. Upon Canute's death, he refused to crown his son Harold; alleging a promise which he made to the late king, that he would place the crown only upon one of the line of queen Emma. Neither threats nor promises could prevail with him to violate his engagement; and he laid the crown upon the altar, with an imprecation against those bishops who should dare to perform the ceremony. He died in the year 1038. His writings were "a Panegyric on the Blessed Virgin Mary,"—"a Letter to earl Leofric, concerning St. Augustin,"—and "Letters to several persons." Biog. Brit.

AGEM, in Botany, is a name given to the Persian liliac.

AGEMA, in the Ancient Military Art, a kind of soldiery, chiefly in the Macedonian armies.

The word is Greek, and literally denotes vehemence; to express the strength and eagerness of this corps; or it may be derived from ἄγειμι, to lead; because it consisted of elephants, horse and foot, which preceded the king, and formed, as it were, the royal guard.

Some will rather have agema to have denoted a certain number of picked men, answering to a legion among the Romans, which is authorized by a passage in Livy, (I. xiii. c. 51. e. 58. tom. v. p. 673. 682. Ed. Drakenb. Not.) Arran (De Exped. Alex. I. xvi. p. 287. Ed. Gronov.) on the contrary, speaks of the agema as a wing of horse; but the term is also applied to foot. This body of troops is also mentioned by Q. Curtius, (I. iv. c. 13. tom. i. p. 271. Ed. Drakenb.) and by Polyb. (I. v. p. 372. 408. Ed. Caub.) vid. Suidas in voc.

AGEMOGLANS, or AZEMOGLANS, children of tribute, raised every third year by the Grand Seignior, among the Chirilians whom he tolerates in his dominions.

The word, in its original, signifies a barbarian's child; that is, a child not a Turk.—It is compounded of two Arabic words, 1. ἀγήμ, agem, which among the Turks signifies as much as barbarous among the Greeks; the former people dividing the world into Arabs or Turks, and agem, as the latter divided it into Grecians and barbarians. 2. ἀγήμ, child.

The commissioners appointed for this levy take them by force even out of the houses of Chirilians; always claiming one in three, and pitching upon such as seem the handomest, and promise to be the most serviceable. They are immediately conveyed to Gallipoli, or Constantinople; where they are first circumcised, then instructed in the Mahometan faith, taught the Turkish language, and the exercises of war, till such time as they become of age to bear arms: and out of these the order of Janizaries is formed.

Such as are not judged proper for the army, they employ in the lawfult and most servile offices of the seraglio; as in the kitchen, stables, &c.

The agemoglans only differ from the ichlogians, as the former are bred up for the lower, and the latter referred for the higher offices of the empire. Their pay does not amount to more than seven aspers and a half, or threepence halfpenny, a day.

AGEN, in Geography, an ancient large and well inhabited, but ill built, city of France, the capital of Agenois, in the late province of Guienne, and new department of the Lot and Garonne, and the episcopal fee of the department of Averon. Its situation in a fertile country on the banks of the Garonne, is favourable for trade; but the indolence of its inhabitants deprives them in a degree of the advantage of it. Prunes are a considerable article of commerce; and the hemp which grows in the neighbourhood is manufactured into table linen, and sent from hence to Cadiz, and afterwards exported to the Spanish islands. Here are also manufacturies of camblets, ferges, and failcloth. The gates and old walls, which remain, mark the antiquity and extent of this town. The palace, which was formerly the castle of Montraval, and where the feissions are held, is situated without the walls of the old city; and there is another castle, called La Sagne, of which the ruins only exist. Agen is 108 miles south-east of Bourdeaux. N. lat. 44° 12' 7. E. long. 35° 40'.

AGENBAT, a town of Transylvania, ten miles north-east of Hermanstadt, N. lat. 46° 32'. E. long. 24° 50'.

AGENDA, in a general sense, denotes things to be done or performed, in consequence of a man's duty.

The word is Latin, formed from agere, to do; and signifies the agenda of a Christian, meaning the things to be practised, by way of contradistinction from credenda, or the things to be believed; the former imports the articles of obedience, the latter of faith.

Agenda is also used for a book containing notes or memorandums of things necessary to be done; in which fenfe agenda amounts to much the same with table-book, &c.

An anonymous French author has published the agenda of a man of the world, containing maxims, or rules, proper for the conduct of life. Tablettes de l'Homme de Commerce. 1715.

Agenda is more particularly used, among Ecclesiastical Writers, for the service or office of the church. We meet with agenda matutina & vesperina, morning and evening prayers; agenda diei, the office of the day, whether feast or fast day; agenda mortuum, called also simply agenda, the service for the dead.

Agenda is also applied to certain church-books, compiled by public authority, prescribing the order and manner to be observed by the ministers and people, in the principal ceremonies and devotions of the church.

In which fenfe agenda amounts to the same with what is otherwise called ritual, liturgy, acclamation, will, formulary, directory, &c.

AGENDICUM, in Ancient Geography, the chief city of the Senones beyond the Alps, thus written by Caesar, but called Ageodicum by Ptolemy, and by others Ageludicum. See Sens.

AGENFRIDA, in Ancient Customs, denotes own lord, or one who has the absolute property and dominion of a thing.
The word is also written agenfriga, and agentsfrie. It is derived from the Saxon agen, own, and fire, lord.

AGENHINE, in our Old Writers, signifies a gael that has lodged at an inn for three nights, after which time he is accounted one of the family; and if he offended the king's peace, his host was answerable for him. It is also written bogenhine and bogenhun.

AGENOIS, in Geography, a country of France, in the late province of Guinée, (now department of the Lot and Garonne) comprehending about 120 square leagues. It is a very fertile and healthy country, and was formerly inhabited by the Nitriobriges, mentioned by Cesar. It formed a part of the kingdom of Aquitania, and was afterwards possessed by the counts of Toulouse, and successively by the English and French. See AGEN.

AGENOR, in Fabulous History, was the son of Neptune and Libya, and the father of Cadmus. He reigned in Phoenicia and married Tholepaffa, by whom he had three sons, Cadmus, Phœnix and Cilix, and a daughter called Europa. Jupiter carried away the daughter, and Agenor ordered his three sons to seek for her, forbidding them to return to his court without her. Their search was fruitless, and they were banished, and settled in different countries.

AGENOR, in Natural History, a species of Papilio Euplex, with black wings, fanguineous at their base; the posterior having a white disc with black spots. It is found in China.

AGENORIA, formed of sofa, strong, in Mythology, the goddess of industry and courage, as Vacuna was of indolence.

AGENT, Agents, in Physics, that whereby a thing is done, or effected; or that which has a power whereby it acts on another; or by its action induces some change in it. The word agent is used promiscuously with efficient, and in contradistinction to patient.

The schools divide agents into natural and free.

Agents, natural or physical, are those immediately determined by the Author of nature, to produce one sort of effect; with an incapacity to produce the contrary.

Agents, natural, are again subdivided into universal, which are such as produce effects of the same kind and denomination with the agents themselves; and equivocal, whose effects are of a different kind, &c. from the agents.

The schoolmen reckon the following circumstances necessary to the being of an agent: viz. that it be contiguous to the object, distinct from it, have a power over it, a sphere of activity, and a proportion or rate of acting.

Agent, free or voluntary, is that which may equally do any thing, or its opposite; as acting not from any predetermination, but from choice.—Such is the mind supposed to be, which has a spontaneous power of choosing or refusing.

It is a celebrated question among philosophers and divines, whether man be a free, or a necessary agent? It may be thus stated: man is a necessary agent, if all his actions are so determined by the cause preceding each action, that no one past action could possibly not have come to pass, or have been otherwise than it was; nor one future action can possibly not come to pass, or be otherwise than it shall be. On the contrary, man is a free agent, if he be able at any time, in certain circumstances, to do different things; or, in other words, if he is not ever unavoidably determined in every point of time, by the circumstances he is in, to do that one thing he does, and not possibly to do any other.

Which of these two definitions agrees to man, is a question of fact to be determined by what we experience in ourselves, with regard to the operations of our own minds. See Liberty, Necessity, and Will.

Vol. i.

The term agent evidently implies a power of self-determination; and the epithet necessary, applied to agent, forms a solecism both in sense and language. Price's Review, &c. p. 315, &c.

Agent is more particularly used for the minister of a prince, or state, at another court.

In which sense agents are commonly reputed a species of public ministers, or Ambassadors: but they differ essentially, as agents are not invested with any representative character, although entrusted with the affairs and interests of their princes. See Envoy.

Agent is also used for a person intrusted with the management of affairs, either of a corporation, or private person. In which sense the word coincides with deputy, procurator, syndic,factor, &c.

Among the officers in the Exchequer, there are four agents for taxes.

Agents of bank and exchange, are public officers, established in the trading cities of France, to negotiate matters between merchants relating to bills of exchange, and the buying and selling of goods: the same with those who, among us, are called Exchange-brokers.

Agents of the Victualling Office, are officers under the commissioners, appointed to buy and contract for provisions, &c. Some of these are settled in the ports, where they have much the same office and authority as the commissioners in London.

Agent-vitualler, is used in the same sense.

Agent and patient, in Common Law, is where a person does, or gives, something to himself; so that he is at the same time both the doer and giver, and the receiver or party it is done to.—Such is a woman, when the occasion itself, with part of her husband's inheritance.

Agent, in Chemistry. According to the ancient chemists, substances were composed of active and passive principles; the latter of which received impressions from and were modified by the former, without exerting any reciprocal action. Spirit, oil and salt, were considered as the active, and earth and water, as the passive principles. This distinction evidently arose from the phenomena of solution, and the apparent energy which acids and other fluids exhibit in their combination with metals and solids in general. It is now however universally allowed, and indeed necessarily follows from the doctrine of affinity, that whenever two substances combine together, it is in consequence of a mutual attraction, which belongs as much to one element as to the other of a compound; this definition therefore of chemical agent is no longer adhered to, and though we still continue to use the expression of one body having a powerful action on another, it is by no means intended to deny the equal reciprocity of chemical attraction.

The general term agent signifies, therefore, in strictness, any substance capable of producing chemical action; and when, in explaining a process, the quality of agent is attributed to a body, it is only used as a designation of the substance whose presence determines the combination or decomposition. In which sense it is sometimes attributed to mensura, or such bodies as in mixture have the greatest share of activity and motion; and it is sometimes also used for what we more usually call instrument. Thus fire, water, air, earth, and mensura, are chemical agents.

That internal agent in man, whereby all the vital motions necessary to the preservation and restoration of the body are managed, is by some called nature; by others archetypum, calidum invatum, animal soul, vital spirit, or principle, &c.

AGENTE, in Myth., a term which, in the infancy of counterpart, was given, by the Italians, to the note of percussion, that
that occasions and accompanies a prepared disorder upon a
binding note; which note was termed the patient.

AGM

In the preceding example, C is the patient, E prepares the
difficult, D is the moving note or agent, and B its resolu-
tion.

AGENTES in rebus, one of the ranks of officers, in the
court of the Confiatipolitan emperors, whose business was
to collect and convey the corn, both for the army and house-
hold; carry letters and messages from court to all parts of
the empire; regulate couriers, and their vehicles; to
make frequent journeys and expeditions through the pro-
vinces; inspect any motions, disturbances, machinations
affecting that way, and give early notice thereof to the

The agents in rebus, are by some made synonymous with
our post-masters, but their function was of great extent.
They correspond to what the Greeks call τραπεζας, and
the Latinus serviator.

There were divers orders or degrees of agents in rebus,
as tribuni, primicrii, senatores, ducesmarii, biarchi, circefrizes,
equeites, tyrannet, &c. through all which they rose gradatim.
Their chief was denominated princeps, which was a po1t
of great dignity, being reckoned on a level with that of pro-
consul.

The princeps agens in rebus resided at Constantinople,
others of them were settled in every part of the empire; and
are also said to have served as interpreters.

AGEOMETRIA, a defect in point of geometry, or
a deviation from the strict principles and conclusions of
that science.

This is otherwise called ageometria.

Some have complained of the ageometria of the Scrip-
tures, in respect of the proportions of the brown sea, ark,
&c.

AGER setigalis privatus, in Roman Antiquity, that whose
property was granted to private persons on the reserve of
a certain rent, or tribute.

AGER setigalis publicus, that whose property was referred to
the public, and being let out to farm, the rents or profits
accurred to the public treasury.

Ager is also used for a certain portion or measure of
land, antiently allowed in the division of grounds to each
citizen.

In the early days of the Roman state, the ager was only
two jugera, amounting to 14 English acre. After the ex-
pulsion of the kings, seven jugera were allowed a plebeian.

Under the tribunate of C. Licinius Stolo, in the year
of Rome 379, a law was made to limit citates to 500 jugera, or
350 English acres, and to decree the distribution of the sur-
plus in the possession of any individual amongst those
who had no land. Under Julius Cesar another agrarian law
was published, by which those who enlarged their plantation
of land were to pay 50 acres to the public.

Ager is also used in Middle Age Writers, for what we
now call an acre.

AGER, or AGRER, in Geography, a small town of Ca-
tabala, in Spain, near the river Segura, north of Lerida,
and 25 leagues west of Barcelona. N. lat. 41° 55'. E.
long. 0° 34'.

Ager, a river of Aufrria, which runs into the Traun,
about a league north from Schwannauft.

AGE

Ager is also a district in a hex of Aggerheus, in
Norway, called Agerheus-Herrad.

AGEERIUS. See Piceriun.

AGERATUM, compounded of the privative a and
gea, old age, and denoting never-old or ever-green, in Botany,
a genus of plants, of the fyngea honeysacca equals class and
order, of the natural order of compoeta diffusiflora, and corny-
choose of Juffieu; the characters of which are, that the com-
mon calyx is oblong, with many, lanceolate, sub-leafed leaves:
the compound corolla is uniform, corollis hermaphrodite, tubu-
lus, numerous, equal, scarcely longer than the calyx
proper monopetalous, fringed, shaped, border quadrifid and
spreading; the flammae are capillary filiforme, very short,
the anthera cylinw and tubular; the piliferum is an oblong
bome, style filiform, of the length of the flamma, the frigida
are two, very slender and erect; no pericarpium, calyx un-
changed; the seed solitary, oblong, angular, crowned with a
chaffy, five-leaved, upright awned calycell; the receptacle
naked, convex, and very small. It differs from Eupatorium
in the crown of the seeds; and from Bids in the naked-
ness of the receptacle. Martyn enumerates two species,
—1. A. corymbosus, hairy ageratum, with ovate leaves
and hairy firm, which flowers in July and August, and is a
native of Africa, the islands of America, and the ilee
of Tana, in the South Seas. This species is propagated by
owing the seeds on a hot bed in the Spring; and when the
plants are strong enough to bear removing, transplanting
them into another moderate hot-bed; where they should be
watered, and shaded till they have taken root. In June they
should be inured to the open air, and transplanted towards
the middle of the month into the open ground, where they
will continue flowering from July till the frosts in Autumn
destroy them. The seeds ripen in September and October.
2. A. ciliare, with leaves ovate, crenate, oblong, and smooth
stem, which is a native of the East Indies, and of China,
neat Canton. The A. Haybroucher of Miller, found wild at
Las Vega Cruz, bj Dr. Houltou, does not differ from the
first sort. In Gmelin's edition of Linnaeus, we have three
species, viz. A. Guianensis, with cordate, serrated, and
petiolated leaves. See Achillea, Athenasia, Conyzza,
Erinus, Eupatorium and Senecio.

AGERATUM, in the Materia Medica, is a species of
Achillea, with numerous, small, oblong, narrow leaves, called
in English feet milfoil and maustin. It bears a near resen-
blance to the comfrey, and is denominated billiflora lineata,
as that is called billiflora com. It is also called eupatorium
millier, on account of its supposed virtue in disperse and ob-
structions of the liver. It is a native of Italy, the South
of France, and of Spain; and is found by the road sides,
where it flowers from August till October. As it is seldom
used with us for medicinal purposes, it is not cultivated in
the gardens for sale. There are two varieties of it, one
having longer and more compact corollas, the other with
broader leaves and smaller flowers. It is sweet to the snell,
and of a bitter taste, and aromatic. Linnaeus reckons it
obsolete and superfluous. Allione, on the contrary, thinks
it an efficacious plant, and recommends it in all disorders
arising from a debility of the nerves. Dr. Lewis says of
this and the comfrey, that these herbs have been used as
mild corromrots and aperients, in weaknesses of the stomach,
obstructions of the vennora, and rheumatic dispositions; and
though at present disregarded, they promise, from their
femile qualities, to be medicines of some utility. Riverius
recommends ageratum, on account of its astringent quality,
as an antidote to incontinence of urine; and Gellner has dis-
covered a brilk purgative quality in its roots.

AGERATUS lapis, in the Materia Medica of the An-
cients.
AGE

Ant, the name of a flute mentioned by Galen and other writers; and said to be of the nature of the Phrygian flute, but more astringent; and as that was used in dying, this was in dressing of leather. We have no account of its external appearance, but probably it contained vitriol, and perhaps alum.

The great use of vitriol or copperas in the management of leather is well known; and the flutes which contain it, or pyrites, are very where common. The method used also in the preparation of the Phrygian Lapis, was the wetting and slightly calcining it, must be very proper to make the vitriol contained in this appear, and exert itself in the working with it. This flute is used by shoemakers to polish women’s shoes.

AGERIUM. See Agistment.

AGERSOE, in Geography, a small island of Denmark, in the Greater Belt; two leagues south of Corsoer.

AGES, signifies the palm or hollow of the hand.

AGESANDER, in Biography, one of the three sculptors, who jointly executed the famous antique group of Laocoön, was born at Rhodes, and flourished about the 86th Olympiad. His name stands first upon the plinth of the group.

AGESILAUS, in Ancient History, one of the most illustrious kings of Sparta, succeeded his brother Agis against the competition of his nephew Leotychides, to whom by the laws the crown would have regularly descended. As he was a younger son of Archidamus II. he could have no view to the kingdom; and he was therefore educated in all the rigour of the Spartan discipline, and in the habits of self-denial, labour and obedience, from which those who were heirs to the throne were exempted. He thus acquired a degree of popularity, which, notwithstanding his low stature, and his being lame in one leg, secured his succession; more especially as he was patronized and supported by Lyfander, whose influence in the state was very considerable, and his rival was suspected of being the son of Alcibiades, who was said to have corrupted the queen of Agis, by a present of a thousand drachmas. His disposition and manners, which combined resolution and activity, with condensation and gentleness, more than counterbalanced his natural defects; and though the oracle had warned the Spartans against a lame reign, Lyfander contrived to interpret the warning as a caution against the illegitimacy of Leotychides, and thus to facilitate the establishment of Agesilaus. By his subsequent conduct he ingratiated himself with perfons of all ranks and parties to such a degree, that the Ephors are said to have checked his ambition by imposing a fine upon him, because he attached the affections of the citizens to himself alone, and thus alienated them from the republic to which they rightfully belonged. Such, however, were the attention and deference which he manifested towards the Ephors and the senate, that he obtained their entire confidence; and his authority was superior to that of any other king of Sparta. Soon after he ascended the throne, ante Cbril. 396, the king of Persia fitted out a powerful fleet, in order to deprive the Lacedemonians of their empire at sea. Agesilaus, at the instigation of Lyfander, was appointed general of the forces that were destined to an expedition against Artaxerxes; and he accepted the office on condition, that a council of 30 Spartan commanders should accompany him, and that Lyfander should be the chief of this council. During his delay at Aulis, he had a quarrel with the Boeotians about a fisher, which occasioned a war, that terminated in the subversion of the Spartan dominion. When he arrived at Ephesus, a message was addressed to him by Tissaphernes, the lieutenant of the Persian king, demanding his reason for coming into Asia with an armed force: to which he replied, that his purpose was to aid the Greeks, who inhabited there, in recovering their ancient liberty. Tissaphernes, in order to gain time, promised in behalf of his master to grant liberty to the Greek cities of Asia. Agesilaus acquiesced, and a truce was settled between them. In the mean while the Persian general, regardless of his oath, took advantage of the delay, assembled troops and prepared for war. Agesilaus, though apprized of this treachery, adhered to his engagement; and this religious observance of a solemn treaty gained him, as Xenophon informs us, the universal esteem of the cities, whilst Tissaphernes, by a different conduct, entirely lost their favour. This interval afforded the Lacedemonian general an opportunity for acquiring an accurate knowledge of the state of the country and of the disposition of the inhabitants. In the course of his enquiry he found that Lyfander arrogated a degree of power, which encroached on his authority and obstructed his influence. Agesilaus did not dissemble his difficulty. Having given the most considerable commands and built governments to private officers, he appointed Lyfander commissary of the stores and distributer of provisions, and for the purpose of further mortifying him and deriding the Ionians, he directed them “to consult their matter-butcher.” Lyfander, afterwards returning to Greece, projected a variety of schemes for overturning the constitution of Sparta, but his death prevented their accomplishment.

When Tissaphernes had collected his forces, he commanded Agesilaus to retire from Asia, and upon his refusal declared war against him. The subordinate officers of the Spartan general were alarmed, but Agesilaus himself was composed and cheerful; and having transmitted his thanks to Tissaphernes “for having made the Gods, by his perjury, the enemies of Persia, and the friends of Greece,” he made a feint of marching his army into Caria, the residence of the Persian lieutenant, but actually overran Phrygia, where he took many towns and amassed immense treasures, which he distributed among his officers and soldiers. Having wintered at Ephesus, he devoted the ensuing spring to the exercise and discipline of his army, which he encouraged by the distribution of prizes; and at the same time he inspired his soldiers with a contempt of their enemies, by stripping the prisoners and exposing them and their garments to fate. The latter were eagerly purchased; but the prisoners themselves were so delicate and feeble, that they were deemed of no service or value: “see there,” says Agesilaus to his soldiers, “the perils against whom you fight,” and pointing to their rich spoils, “behold there for what you fight.” As the season advanced, the Lacedemonian army marched into Lydia, defeated the Persians near Sardis, and ravaged the whole country. This success terminated in the death of Tissaphernes; his command devolved on Tithraustes, who attempted to conciliate Agesilaus by rich presents, and to induce him to withdraw his troops and to return into Greece by the promise of liberty to the cities of Asia, upon their payment of the customary tribute. The Spartan king, however, deferred the proposed accommodation till he had submitted it to the consideration of the state, and received orders for this purpose. In the mean while he marched into Phrygia, which was the province of Pharnabazes, and the expence of his expedition thither was defrayed by Tithraustes. During his progress he received new powers from home, by which he was constituted sole commander both by sea and land; and an honour which Sparta had never before conferred on any of its generals. From Phrygia, where he amassed large sums of money, he advanced as far as Paphlagonia, and formed an alliance with Cotys, the prince of that country.
During the two years of Ageillus's command in Asia, he exhibited all the talents of a warrior and statesman, and all the virtues of a Lacedemonian. The remote provinces trembled at his name, and refused with the fame of his wisdom, disinterestedness, moderation, intrepid valour in the most pressing dangers, and invincible patience and firmness in enduring toil and fatigue. Such was the respect which his conduct and character commanded, that deputies were sent from all parts in order to form alliances with him; and his army increased continually by the accession of Barbarians that enlisted under his standard. Whil'st he allowed his soldiery the advantage of pillage, he himself was not chargeable with any act of cruelty or injustice. His prudence and authority were so much esteemed, that he restored order and tranquillity to all the cities of Asia, and reinstated them in the possession of their liberties, not only without shedding of blood, but without even harrying a single person. Ambitions of extending the glory of his country, and of Greece in general, he had formed the design of attacking the king of Persia in the heart of his dominions, and of fo occupying his time and attention, that he might have no leisure for directing his hostile views and schemes to distant provinces. But before he could execute his purpose, he was recalled by the Ephori to the defence of his own country. As soon as he received the order for returning, he instantly obeyed; alleging, that he received the command not for himself, but for his country and its allies. "I know," says he, "that a general does not deceive, or perplex, that name really, but as he submits to the laws and the Ephori, and obeys the magistrates." On his departure, however, he said, "that 30,000 of the king's archers drove him out of Asia;" alluding in these words to a species of Persian coin, which had on one side the figure of an archer, 30,000 of which pieces of money had been dispersed in Greece to corrupt the orators and persons of greater power in the cities.

Ageillus, when he quitted Asia, was accompanied by Xenophon; and at Ephesus he committed half the gold he had brought with him from his expedition into Persia with Cyrus to the custody of Megabyzus, the guardian of Diana's temple, with an order, in case of his death, to confide it to the goddess. On his return through Thrace, he only demanded, "whether he should pass as a friend or an enemy of the Persians," and when the king of Macedon replied, "that he would consider of it," "Let him consider," says Ageillus, "in the mean time we will march." Before he arrived at Sparta, he received an order from the Ephori to invade Brutia, with which he complied, though the measure was not such as he approved. On the plain of Cheronea, a very severe engagement took place, in which Ageillus received several wounds, and his life was exposed to great danger. Some of the enemy had taken refuge in a temple of Minerva, near the field of battle; and these Ageillus ordered to be dismissed, and appointed a guard to escort them in safety wherever they chose to go. After this battle he returned to Sparta, and was received with admiration and joy. Unceremoniously by the customs and manners of foreign countries, as other generals had been, he made no alteration in his diet, furniture, or equipage. His enterprise against Corinth did not succeed; but his expedition against the Acanthians compelled them to sue for peace. In the year before Christ, 387, the sovereignty of Greece was guaranteed to Sparta by the peace with the Persian king, negotiated by Anticleus, on the dishonourable condition of abandoning the Greek cities of Asia to the Persians. After this event, the Spartans treated some of the smaller states in a tyrannical manner, and unjustly feized the citadel of Thbes, in which aet Ageillus disgracefully concurred. Sparta was thus involved in a new war with Athens, in which the Thebans, under the illustrious Epaminondas, became formidable to their oppressors; and it was alleged against Ageillus, that he had taught them the art of war, by his expeditions against them, so that they were able to encounter the Lacedemonians in the field, as was the case in the battle of Leuctra, when Archidamus, the son of Ageillus, and Cleombrotus, the other Spartan king, were defeated with great loss, and Cleombrotus left dead on the spot. In consequence of this disaster, Ageillus was invested with a dictatoral power, for the purpose of saving the fugitives from the severity of the Spartan laws, without prejudice to the state; and on this occasion he decreed—"let the laws sleep to-day, but to-morrow let them reanimate their full vigour." After this battle, Ageillus exerted himself in levying a new army, in defending Sparta from the hostile attacks of Epaminondas, and in suppressing a conspiracy which took place among the Spartans themselves. In the year before Christ 362, some new commotions broke out in Peloponnesus; and Ageillus was defeated, at the head of the Spartans and their allies, in the battle of Mantinea, by Epaminondas, who died in the moment of victory. When a general peace was established, the Lacedemonians were excepted, by the culpable obstinacy of Ageillus, who refused to concur, because the Methenians were comprehended in it as a separate state.

Ageillus, in the decline of life, accepted the command of a band of mercenary troops in the service of Tachos, who aspired to the throne of Egypt. This commissioii reflected no great honour on the character of this illustrious Spartan, who, at the age of 80 years, degraded himself by receiving the pay of an Egyptian, and serving a barbarian, who had revolted against his master. The Egyptians refrained in great multitudes to see a man, whose name and character had been so long and so generally applauded; but connecting splendour and magnificence with their ideas, they were disappointed when they saw an old man, of a mean aspect and low stature; they applied to him the figure of the mountain in labour, and could scarce refrain from laughter and ridicule. His conduct, however, soon produced a change of opinion.
opinion. When he found that Tachos did not assign him the command of the whole army, but restricted his authority merely to the foreign troops, he was surprized and mortified; and he was the more incensed by the contempt with which his counsell was received, and by various instances of neglect which he experienced. Thus provoked, he joined those Egyptians who took part with Nectanebos, the other competitor for the crown, and assembled them in establishing the rival of Tachos on the throne. Ageclus pleaded public utility as an apology for his verdictable conduct in this instance: Xenophon attempts to palliate it; but Plutarch charges it with the infamy of perfidy and treachery.

The following winter, in the year before Christ 301, he embarked to Lacedemon; but was driven by a storm upon the coast of Africa, into a place called the Port of Menelaus; where he fell sick and died, at the age of 84 years, after a reign of 41 years, during 30 of which he maintained the most distinguished reputation. His latter years, after the battle of Leuctra, were honourable; and Xenophon, in his eulogium of this prince, has been thought too much to exaggarate his virtues, and to extenuate his faults. His body was carried to Sparta, and embalmed with wax instead of honey, which was usually employed for this purpose. His son Archidamus succeeded to the throne, which continued in his house to Agis, who was the fifth king of the line of Ageclus. His life and actions have been recorded, not only by Xenophon, his intimate friend and panegyrist, but by Diodorus Siculus, Plutarch, and Nepos. Many anecdotes are related concerning him, which sufficiently mark his character, and evince the high estimation in which he was held by his contemporaries. Hearing the great king, an appellation affirmed by the kings of Perlia, spoken of in terms of extraordinary commendation; he is reported to have said—"I cannot conceive wherein he is greater than I, unless he be more just." His regard to justice, however, was sometimes sacrificed to his attachment to his country, and to the bias of private friendship and affection. In recommending a friend to a judge, he says—"If Nicias be not guilty, acquit him for his innocence; if he be, acquit him for my sake; but, however it be, acquit him." His contempt of unmerited praise, and his superiority to ostentation and vain-glory were prominent features in his character. Accordingly, he would never permit, during his life, that his picture should be drawn; and at his death, he expressly forbid any image to be made of him, either in colours or relief. "Let my actions," he would say, "if deferving, be my monument."

**AGESILAUS**, in Mythology, the surname of Pluto, which was given to him, because he conducted all mankind into his empire; παῖς τοῦ ἄγεις τοῦ ἡλίου.

**AGESINATES**, in Ancient Geography, a people of Gaul, placed by M. d'Anville in the territory of the Pictones or Prétai.

**AGESSSUS**, a town of Thrace, called by Pliny (l. iii. c. 11.) Aegatus, and by Livy, (l. xlv. c. 7.) Aegatus, but assigned to Macedonia in the confines of Thrace. Stephan. Byz. Hardouin mentions imperial Greek medals belonging to this city.

**AGETORIA**, in Antiquity, faults mentioned by Heby-chius, which were probably instituted in honour of Apollo, and the same that were observed by the Lacedemonians, under the appellation of Karnelia. Venus was also honoured at these faults, as we may conclude from the name of αὐτόπε, which was given in the island of Cyprus to the priest of this goddess.

**AGESUSTIA, or AGHEUSTIA**, formed of άπριτ, and αἱστήρια, in Medicine, a defect in the sense of taste. This disease may arise from an organic affection, or an atonic state, of the organs. The taste may be diminished or impaired by hus, mucus, ἀπήθηρις, ulcers, &c. on the tongue; or by a diseased secretion of saliva. It may be entirely abolished by injuries done to the nerves of the tongue and palate.

This constitutes one of the general diseases in the arrangement of Dr. Cullen; and he divides it into A. org.registry, arising from a disease in the membrane of the tongue, keeping off from the nerves those substances which ought to produce taste; and A. atonic, which occurs without any evident disease of the tongue.

**Cure.**—When the taste is diminished or deprived by fur or mucus, as usually happens in Fevers, it is rarely possible to restore it by any other means than those which subdue the fever. The tongue, teeth, and saucce, should be washed with detergent gargles, of which the aqua ammonize, or common sal volatile, properly diluted with water, is the most effectual in dissolving the mucus. The tongue may be gently scraped when moist, and the teeth brushed. When the taste is deprived by a diseased secretion of saliva, the cure depends on restoring the natural secretion. If bile, or any sarabba in the stomat, disorder the natural taste, recourse must be had to emetics or the proper correctors of the offending cause; acidity is removed by alkalies, chalk, magnesia, and even by other acids.

**AGGADA**, in Hebrew, an ingenious tale or story; of which kind there are many in the Talmud.

There are several books extant among the Jews under this title. R. San Israel Ben Juda has published Novellae Aggarum, or new explanations of the stories and relations in the Talmud, discovering the hidden meanings thereof.

**AGGAS, ROBERT**, in Biography, commonly called Augustus, a good English landscape painter, who was also skilled in architecture, lived in the reign of Charles II. He painted both in oil and temper, but few of his pictures are extant. The belt is a landscape presented to the company of paper-hangers, and preferred in their hall. He died in London, in 1679, at the age of about 60 years. Biog. Dict.

**AGGAS, RALPH**, an engraver, published the plan of Oxford and Cambridge, in 1578, and a map of Dunwich in 1589. He engraved, on wooden blocks, the plan of London, afterwards engraved on copper by Vertue. Strutt.

**AGGER, in Ancient Writers**, denotes the middle part of a military road, raised into a ridge, with a gentle slope on either side, to make a drain for the water, and keep the way dry. The appellation is also used for the whole road, or military way.

Where high-ways were to be made in low grounds, as between two hills, the Romans used to raise them above the adjacent land, so as to make them on a level with the hills. These banks they called aggera. Bergier mentions several in the Gallia Belgica, which were thus raised, ten, fifteen, or twenty feet above ground, and five or six leagues long.

They are sometimes also called aggera calceata, and now generally known by the name chausses, or causeways.

**AGGER** also denotes a work of fortification, used both for the
the defence and attack of towns, camps, &c. In which sense it is the same with what was otherwise called 
walum, and in later times aggelum, and among the moderns love; sometimes cavXlers, terraces, &c.

The agger was usually a bank, or elevation of earth, or other matter, bound and supported with timber; having sometimes turrets on the top, wherein the workmen, engineers, and soldiers were placed. It was also accompanied with a ditch, which served as its chief defence.

The usual materials of which it was made, were earth, boughs, faloons, &c., and even trunks of trees, ropes, &c. variously crossed, and interwoven somewhat in the figure of flowers; whence they were called flettati axen. See Latin in i. 155, 501. Silius Ital. iii. 109. Where these were wanting, stones, bricks, tiles, supplied the office: on some occasions, arms, utensils, pack-saddles, were thrown in to fill up. What is more, we read of aggers formed of the carecases of the slain; sometimes of dead bones mixed with lime, and even with the heads of slaughtered citizens. For want of due binding, or solid materials, aggers have sometimes tumbled down, with infinite mischief to the men.

The besiegers used to carry on a work of this kind nearer and nearer towards the place, till at length they even reached the wall. The methods taken, on the other side, to defeat them, were by fire, especially if the agger were of wood; by fapping and undermining, if of earth: and, in some cases, by erecting a counter agger. Thus the inhabitants of Gaza defended themselves against Alexander. Q. Curt. i. 4. b. xxi.

The height of the agger was frequently equal to that of the wall of the place. Caesar tells us of one he made, which was 30 feet high, and 320 feet broad. Besides the use of aggers before towns, the generals used to fortify their camps with such works; for want of this precaution divers armies have been surprized and ruined.

There were wall aggers made in towns and places on the sea-side, fortified with towers, cails, &c. Those made by Cæsar and Pompey at Brandenburg, are famous. Sometimes aggers were even built across arms of the sea, lakes, and marshes, as was done by Alexander before Tyre, and by M. Antony and Callias.

The wall of Severus, in the north of England, may be considered as a grand agger, to which belong several lesser ones. Besides the principal agger or wallum, on the brink of the ditch, Mr. Horley describes another agger on the fourth side of the former, about five paces distant from it, which he calls the fourth agger; and another larger agger on the north side of the ditch, called the north agger. This latter he conjectures to have served as a military way; the former, probably, was made for an inner defence, in case the enemy should beat them from any part of the principal wallum, or to protect the soldiers against any sudden attack from the provincial Britons.

Ager Tarquinii. Tarquin's agger, was a famous fence built by Tarquinii Superbus, on the east side of Rome, to stop the incursions of the Latins, and other enemies, whereby the city might be inflected. See Plin. iii. 5. Criminals were thrown down from the top of this rampart. Juv. Sat. vi. 288. Sueton in Cal. c. 27. n. 3.

Ager is also used for the earth dug out of a trench, and thrown upon the brink of it. In which sense, the chevalier Folard thinks the word to be understood, when used in the plural number, since we can hardly suppose they would raise a number of cavXlers, or terraces.

Ager is also used for a bank, or wall, erected against the sea, or some great river, to confine or keep it within bounds.

In which sense, agger amounts to the same with what the ancients call tumulus and murus; the Dutch, dyfl; we, dun, sea-wall.

Ager also denotes a heap of earth, raised over the graves of the ancients.

In which sense, it amounts to the same with tumulus; and is sometimes also called aggelum.

Ager, in Geography, a river of the circle of Westphalia, which waters the country of Mark and the duchy of Berg, and falls into the Rhine.

Aggerhuus, or Christiana, the largest diocese or general government in the fourth part of Norway; and the richest, as well as most considerable, in the whole kingdom. It was formerly called Hammenfib, and afterwards known by the name of Opfelle. Aggerhuus is also the name of a fortress in this diocese, on the west side of the bay, near which lies the city of Christiana. It is not known when it was built. It has been repeatedly besieged by the Swedes, viz. in 1310, in 1567, and in 1717, by Charles XII. without success. The governor of Aggerhuus is the chief governor of Norway: he presides in the high court of justice, called Overhofet, which judges in the last resort, all civil causes above a certain value. In all causes surpassing that value, an appeal lies to the supreme court at Hamburg. N. lat. 53° 6'. E. long. 10° 20'. The oldest church in this diocese, said to have been built about 700 years ago, and called Agger, is situated about a quarter of a mile north of the castle. The population of this diocese is estimated at 215,043 persons.

Aggers-Herred, a field of Aggerhuus, which comprises three districts, with as many courts of judicature, viz. Aberby, East and West Barums, and Ager. Christiana is situated in this district.

Aggerout, or Agerouf, supposed to be the ancient Arsinob, is situated at the extremity of the Red Sea, about two leagues from the port of Suez. Here terminated the famous canal, begun by Necos and finished by Ptolemy Philadelphus, for joining the Nile to the Red Sea. Between the time of Ptolemy and our days, the Red Sea has retired two leagues, which is the distance of Agerouf from Suez.

AGG, a river of Persia, which runs into the Aras, near Chambé, in the province of Aderbdtian.

AGGILE, a town of Prusia; 13 leagues east-north-east of Königsberg.

Aggilestone, otherwise called Stone-Barrow, and vulgarly the Devil's Night Cap, is a remarkable monument of antiquity situated in the north-east extremity of the isle of Purbeck. Its dimensions are 60 feet in circumference at the bottom, in the middle 80, and at or near the top 90; and it is computed to contain 407 tons of stone. The name seems to have been derived from the Saxon hale, or hale, hale, and flan, flan, which expresses its ancient use; as it was probably a rock idol in the British age.

Agglutinants, in Pharmacy, a species of strengthening medicines, whose office and effect are to adhere to the solid parts of the body, and thus recruit and supply the place of what is worn off, and waited, in the animal actions.

Agglutinants are most of them of the glutinous kind, or such as easily form themselves into jellies, and gummy confidences; whence the name agglutinans, which is formed of ad, to, and glutin, glue.

For the operation and use of agglutinants, see Strengtheners.

The principal simples which come under this class, found in the shops, are, stilling, olbanum, gum arabic, dragon's blood,
blood, caffia, fago, vermicelli, pulse, comfrey, plantain, &c. If the term, says Dr. Cullen, has any foundation at all, it must have the same meaning with that of nutrient; and there is no propriety in using a doubtful theoretical term. Nor is the term less improperly applied to medicines that are suited to cement and reunite parts preternaturally separated, and therefore employed in wounds and ulcers. British surgeons neither know nor employ any such medicines: the bines is the work of nature; and their concern is to remove impediments to its operation. Cullen's Mat. Med. vol. i. 163.

**AGGLUTINATION PIlorum**, a healing or reducing the hairs of the eyelids, that grow inwards, to their natural order and situation. This may be done by mastic applied with a probe, which bends the hairs back into their proper order. Bittmen, the flame of a fuel taken off with a needle, the juice of hawks-weed, the liquor of agglutinants, or ammonio, produce the same effect.

**AGGLUTINATION**, literally denotes the act of joining or cementing two bodies together, by means of a proper glue or cement.

In Medicine, the term is peculiarly used for the apposition or adhesion of a new substanee, or for giving a greater confluence to the animal fluids, to fit them the more for nourishment.

Some assign a difference between agglutination and affination: in that species of leprosy called *ammoniac*, there is an adhesion, or agglutination of the nutrient, but no affination. In the amnios formy, or on the contrary, there is an affination, without any agglutination; i.e. there is an influx of new matter, or nourishment, but this is so thin, and watery, that it has no power to make it bind.

Some will have agglutination to be effected by a ferment: others assert, that by reason of the glutinous quality of the chyle, a mere contact suffices to make it adhere to the parts.

**AGGREGATION** is used by some astronomers to denote the meeting or combination of two or more stars in the fame part of the zodiac.

**AGGREGATION** is more peculiarly understood of the seeming condition of several stars, so as to form a nebulous star.

**AGGREGATION**, in Surgery, the same as adhesion. The reunion of wounds was formerly supposed to be effected by means of certain applications, named agglutinants; but these remedies are now known to act only by keeping the separated parts in exact apposition. The doctrine of adhesion is treated at large in the first volume of Mr. John Bell's "Principles of Surgery," See the article Wounds.

A preternatural agglutination of the eyelids constitutes the disease named *Anchylolopharon*.

**AGGRAVATION**, compounded of *ad*, *to*, and *grevis*, heavy, the act of augmenting a crime, or punishment thereof.

Aggravation, in the Romish Canon *Lacrym*., is particularly used for an ecclesiastical censure, threatening an excommunication, after three admonitions used in vain.

From aggravation they proceed to re-aggravation; which is the last excommunication.

**AGGREGATE**/e glandula, the small glands in the cellular, which is next to the villous coat of the intestines, are so called; but as these glands are not visible in an un.injected gut, many anatomists suspect them to be only little bits of separated wax.

**AGGREGATE** Terre, in the Linnean system of Mineralogy, denote the seventh order of earths, compre-
A receptacle, called an aggregate, in disposition partial, in the town or our coward, European the village pay, take some either commonly, Geography, a day's journey on one. in officer person as pay and Agilus, market.  

Aghrim, AGGSPACH, in Geography, a market town in the circle above the Manhartsberg, in Austria, seated on the Danube; 12 leagues west of Vienna. AGGYA, in Ancient Geography, a town of Africa, mentioned by St. Augustin. AGHADOE, a village of Ireland, anciently a bishop's see, now united with Ardfeich. AGHENSISH, an island of Ireland, in the river Shannon; 16 miles below Limerick. ACHER, or Augher, a town of Ireland, in the south of Ulster, not far from Clogher. AGHEUSTIA, in Medicine. See AEGETIA. AGHRIM, in Geography, a town of Ireland, in the county of Wicklow and province of Leinster, about 31 miles south-west of Wicklow. Aghrim, a village in the county of Galway, worthy of being recorded on account of a decisive battle fought there and at Kilcommodan hill, July 12th, 1691, between general Ginkel and M. St. Ruth, the two commanders under William III. and James II. when St. Ruth, with 7000 of his men, were slain, and of the English only 600. Aghris Point, a cape on the west coast of Ireland, and north coast of the county of Sligo; 11 miles west of Sligo. N. lat. 54° 17'. W. long. 0° 22'.

AGHUNALASHKA, or Unalaska, one of the Fox islands in the northern Archipelago.

AGIA, a river on the north of Penaeus, the capital of West Florida, which, running east-north-east, falls into the bay of Santa Maria Galves.

AGIA Laura, a town of European Turkey, in the province of Macedonia; 19 miles south-east of Saloniki.

AGIADES, a kind of Turkish foliery, employed in fortifying of camps, smoothing of roads, and the like offices. Du-Cange.

AGIHALID, the name of an Egyptian tree, called also lyco and lytieum; it resembles the wild pear.

AGIAMA, from mena, holy, among Ancient Writers, is sometimes used for the whole church, sometimes for the more sacred part, or bema, wherein masts was said. Du-Cange.

AGIASOLUK, in Geography, a town of Asiatic Turkey, in the province of Natoth; 31 miles south-south-east of Smyrna.

AGIDES, denoting jarglers, in Antiquity, a name given to the priests of Cybele.

AGIDUM, or NIGIDUM, in Ancient Geography, a town of Cyprus, situated between Aphrodium and Lapathus.

AGIGENASALON, a town of Asiatic Turkey, about one day's journey from Tocut, in the road to Ifpan from Constantinople.

AGILDE, or AGilde, from the privative a, and the Saxon geldon, to pay, in our Ancient Gultons, a perfon foile, that whoever killed him was to pay no mulct for his death.

AGILITY, a light and active habit, or disposition of the members and parts of the body designed for motion. Some define agility, the art or habit of directing our strength, i.e. of exerting, or remitting it to advantage.

The improving of agility was one of the chief objects of the institutions of games and exercises. The athlete made particular profusion of the science of cultivating and improving agility.

AGILLARIUS, in Ancient Law-books, a heyward, or keeper of a herd of cattle in a common field.

The agillarius, or heyward of a town, or village, was to supervise the greater cattle, or common herd of beasts, and keep them within their due bounds; and was otherwise called babulus, q.d. cow-wage, (whence the reproachful term warward). He was a cottager, or other fervile tenant, he was exempted from the culummary services, as being presumed to be always attending on his herd, as a herdsman on his flock, who had therefore the like privilege.

The agillarius of the lord of a monaster, or a religious house, was an officer appointed to take care of the tillage and harvest-work, to pay the labourers, and see there were no incroachments made, or trifles committed; the name in effect with what has been otherwise called field-man, and kithing-man; and among us sailiff.

AGILUS, in Ancient Geography, a village of Peloponnesus, near mount Ira, in Mælinia, where, according to Pausanias, (i. iv. Meffen. c. xix.) Aristomenes was rescued from custody by the aid of a young woman, who afforded him the means of killing five guards, who conducted him to Sparta.

AGIMERE, in Geography, a country of Hindostan, bounded on the east by Agra, on the north by Delhi, on the south by Guzerat, and on the west by the sandy deserts towards the Indus. Its extent is considerable, and it comprehends many smaller states, as Agimere proper, Rampour, the
A foodpou, Rantampour, Joinagur, Banwalch, Nagore, and Bickancer. The capital of this fabah, of the same name, 
is situated in a pleasant valley, and on 21 sides surrounded by 
mountains. Its circumference is six miles, and it is guarded 
by walls, towers, and a strong fort; 170 miles west-south-west 
from Agra, and 175 miles west from Delhi. N. lat. 
26° 24'. E. long. 75° 20'.

AGINTHA, a town of Asia in India, on the other 
side the Ganges. According to Ptolomy, it was situated in 
long. 175° 40'; and lat. 18° 45'.

AGINCOURT, in Geography and History, a village 
of the French Netherlands, situated in the county of St. Pol, 
ex-department of the Straits of Calais; N. lat. 50° 33' and 
E. long. 2° 10'; remarkable for a glorious victory which 
the English, commanded by king Henry V. obtained over 
the French, Oct. 25th, in 1415. The army of Henry was 
reduced by sickness and various accidents to 10,000 men; 
and the French had collected a force consisting of 100,000, 
or, as some say, of 140,000 men, to intercept the march of 
the English from Harleux towards Calais. The king had 
recourse to all the means in his power for encouraging 
the progres of his small army, amidst the difficulties and 
inconveniences of their route; and on the evening of October 24, 
they arrived at Agincourt, within fight of the French, and 
prepared for a battle, which it was impossible to avoid. 
Whilst the English soldiers were exhibiting one another to 
fight bravely in the approaching action, the king 
overhearing some of his nobles expressing a wish, that the many 
brave men who were idle in England were present to affi 
them, exclaimed—"No! I would not have one man more; 
if we are defeated, we are too many; if it shall please 
God to give us the victory, as I trust he will, the smaller 
our number, the greater our glory." Henry, with the ad 
vantage of moon-light, reconnoitred the ground, and pitched 
upon a field of battle, admirably adapted for preferring 
a small army from being surrounded by a great one. It was 
a gentle declivity, from the village of Agincourt, of suffi 
cient extent for his small army, defended on each side by 
hedges, trees, and brush-wood. Having determined upon 
the place of action, the king and his army betook them 
selves to rest; except those who, considering this as the last 
night of their lives, spent it in devotion. The French, 
exulting in their numbers, confident of victory, and sup 
plied with abundance of provisiouns, spent the night in riotous 
feaslity, and in forming schemes for the dispersal of their 
prisoners and booty. It was, in general, resolved to put all 
the English to the sword, except the king and the chief 
nobility, who were to be made prisoners for the sake of 
their ransom. On the next morning the hostile armies were ranged 
in order of battle; each of them forming three lines, with 
boodied of cavalry on each wing. The constable d'Albert, 
who commanded the French army, lost the advantage of his 
superior number by drawing up his troops in a narrow plain, 
between two woods; and this was observed to be the chief 
cause of all the disasters that followed. The king of Eng 
land employed various arts to supply his defect of numbers. 
His first line consisted wholly of archers, four in file; each 
of whom, besides his bow and arrows, had a battle-axe, a 
twoed, and a flake pointed with iron at both ends, which he 
fixed before him in the ground, with the point inclining 
outwards, to protect him from the cavalry. This was a 
new invention, and had a happy effect. He dismissed all his 
prisoners on their word of honour to surrender themselves 
at Calais, if he gained the victory; and lodged all his bag 
gage in the village of Agincourt, in his rear, under a flen 
der guard. The first line was commanded by Edward duke 
of York; the second by the king himself; and the third 
by the duke of Exeter, the king's uncle. When the lines 
were formed, the king, in shining armour, with a crown of 
gold, adorned with precious stones, on his helmet, mounted 
on a fine white horse, rode along them, and addressed each 
corps with a cheerful countenance and animating speeches. 
To inflame their resentment against their enemies, he told 
them that the French had determined to cut off three fingers 
of the right hand of every prisoner; and to refute their love 
of honour, he declared, that every soldier who behaved 
well, should from that time be deemed a gentleman, and 
toiled to bear coat-armour. The English thus incited to 
excretion, stripped themselves almost naked, that they might 
deal their blows with the greater rapidity and vigour. The 
two armies, prepared for action, stood for a considerable 
time gazing at each other in solemn silence. At 10 o'clock, 
however, Henry, fearing that the French would discover 
the danger of their situation, and decline a battle, com 
manded the charge to be founded. Upon this the English 
kneed down and kifted the ground, and then rising sud 
denly, discharged a flight of arrows, which did great execu 
tion among the crowded ranks of the French. This onfer 
was succeeded by the attack of a body of archers, who had 
been placed in ambush, and who discharged their arrows on 
the flank of the French line, and threw it into disorder. 
The battle now became general, and raged with uncommon 
fury. When the English archers had expended all their 
arrows, they threw away their bows, and, rushing forward, 
made dreadful havoc with their swords and battle-axes; the 
first line of the enemy was thus defeated; and its leaders 
either killed or taken prisoners. The second line, com 
manded by the duke d'Alençon, who had vowed either to 
kill the king or take him prisoner, or to peril in the at 
tempt, advanced to the charge, and was encountered by the 
second line of the English, conducted by the king. The 
conflict was very furious. The duke d'Alençon forced his 
way to the king, and assaulted him with great violence; but 
the king brought him to the ground, and he was instantly dis 
patched. Discouraged by this disaster, the second line made no 
farther resistance; and the third fled without striking a blow; 
and thus the English, after a violent struggle of three hours, 
obtained a complete and signal victory. Although the king 
did not permit his men to pursue the fugitives to any great 
distance, the number of his captives exceeded that of his 
soldiers; and many of these prisoners were persons of rank 
and fortune, who, encumbered with their heavy armour, 
could not make their escape. The French left dead on the 
field of battle, the constable d'Albert, three dukes, the 
archbishop of Sens, one marshal, 13 earls, 92 barons, 1500 
knight, and a far greater number of gentlemen, besides 
several thousands of common soldiers. The French hist 
rians acknowledge, that the loss of the English was incon 
siderable; and those of our own contemporary writers who 
make it the greatest, affirm that it did not exceed 100; and 
that the duke of York and the earl of Suffolk were the only 
great men who fell on that side in this memorable action. 
To the gross error committed by the constable d'Albert, as 
much as to the wise measures of Henry, and the heroic 
valor of the English, the disgrace and ruin of the French 
army may be imputed. Henry, after this battle, pursued 
his march to Calais, with his spoils and prisoners; embarked 
for England, Nov. 16, and arrived that evening at Dover, 
where he was received with transports of joy, many of the 
people plunging into the sea to meet his barge. At his tri 
umphant entry into London, Nov. 23, the shows and 
pagents exhibited by the citizens were so numerous that it 
would have required a volume to describe them. Henry's 
Hist. vol. ix. p. 46—54. 8vo.

AGINIS, a burgh or village of Asfa in Sufiana, situate 
on the salt bank of the Tigris, towards lat. 30° 15'.

AGINNA,
AGINNA, one of the towns of Iberia, mentioned by Ptolemy, at the boundary of Cretica, and placed in long. 73° and lat. 36° 30'.

AGINNATA, a people of India, on the other side of the Ganges.

AGINUS, a city of the Nitiobriges, in Gallia Aquitania, now Amiens, or Azay.

AGINSKÁ, a river of Siberia, which runs into the Uda.

N. lat. 52° 25'. E. long. 98° 14'.

AGIO, in Commercio, an Italian word, signifying aid, is a term used chiefly in Holland, and at Venice, for the difference between the value of bank money, and current money. So that if a merchant who sells his merchandise, stipulated to be paid either 100 livres bank money, or 105 cash, or current money, in such case the agio is paid to be 5 per cent.

The bank agio varies in almost every place, and is greater or smaller, according as the currency is supposed to be more or less degraded below the standard of the state. At Amsterdam it used to be generally about 5 per cent; and by a resolution adopted not long before the late period of confusion, the bank sold bank-money for currency, at 5 per cent. agio, and bought it again at 4 per cent. agio. In consequence of this resolution, the agio could never either rise above 5, or sink below 4 per cent.; and the proportion between the market price of bank, and that of current money, was kept at all times very near to the proportion between their intrinsic values. One part of the profit of the bank accrued from selling bank-money at 5 per cent. agio, and buying it in at four. At Venice, the agio was 20 per cent. fixed; at Genoa, from 15 to 16 per cent. The agio of the bank of Hamburg, which is paid to be commonly about 14 per cent. is the supposed difference between the good standard money of the state, and the chipt, worn, and diminished currency poured into it from all the neighbouring states. See Bank and Exchange.

Agio is also used for the profit arising from discounting a note, bill, or the like.

Agio is also used, though with some impropriety, for the rate of exchange of a sum negociated, whether to profit or loss. It is also sometimes called agail.

Agio of distaffance is used, by some, for what we more usually call policy of assurance.

AGIOI Saranta, in Geography, a town of the island of Crete; 16 miles south from Scitina.

AGIOSYMANDRUM, compounded of ayios, holy, and symander, I sword; a wooden instrument used by the Greek and other churches, under the dominion of the Turks, to call together assemblies of the people.

The agiosymandrum was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to taxation.

AGIRIA, in Ancient Geography, a district of Spain, south-east of Bilbilis, belonging to the Celtiberians.

AGIRUM. See Agurium.

AGIRU, in Geography, the western part of the island of Corfu, comprehending 20 villages, and about 8200 inhabitants; the only remarkable place in it is Callie St. Angelo, which lies on the south cape called Palacrum; and beneath it stands a fiery caille called Paleo Calitretza.

AGIS IV. In Ancient History, king of Sparta, was the son of Endamidas, and the 16th descendant from Agis, who made an expedition into Perlia. This prince was eminently distinguished by his virtue in a corrupt period of the Spartan state, and by his laudable efforts for the reformation of his country. Sparta was sunk by the influx of wealth into luxury and indolence; and the discipline effaced by the widows of Lycurgus, was neglected and continued. Agis, though brought up in influence and indulgence by his mother Agelinda, and his grandmother Archidamia, who, as Plutarch informs us, filled more gold and silver than all the other Lacedaemonians, lamented the degeneracy of his country; and at the age of 20 years, exhibited a signal example of self-denial and abstinence in his own conduct, and nobly attempted to restore the ancient discipline of Sparta. With this view he aspired to the royal power, and explicitly declared, "that he should not value being king, if it were not for the hopes of reviving the ancient laws and discipline of Sparta." A new law had been introduced, at the instigation of Epitades, one of the Ephori, in order to avenge himself on one of his foes, who had defiled him, for the alienation of hereditary estates. The consequence of this law was, that all patrimonial possessions were soon engrossed by a few persons; general poverty, and indolence prevailed; the inferior classes of the people envied their superiors; and those who were delinquent of revenues, and excluded from a participation of honour and wealth, were indifferent and reluctant in their efforts against a common enemy, and constantly waiting for an opportunity to ameliorate their object and depressed condition. In these circumstances of aggrandizement, on the one hand, and oppression and dissatisfaction on the other, Agis determined upon reformation. By the influence of Agelinda, his maternal uncle, who with similar views embarked in the design, he engaged the co-operation of his mother and grandmother. The young men generally concurred; but those in more advanced life, and also the women of rank and wealth, trembled at the name of Lycurgus and reformation; and induced Leonidas, the other king, to oppose the projects of Agis. Agis, however, succeeded in obtaining a decree for cancelling all debts, and for the equal division of all the lands. For this purpose, he made an offer to the community of his own large estate, with 600 talents in money; and he procured, by the interposition and assistance of Lyfander, the deposition and banishment of Leonidas, and the concurrence of Cleomotus, his successor. The first measure that was adopted was the cancelling of debts; and in the execution of this, Ageflus, who being much in debt, was likely to be greatly benefited by it, was very active. Accordingly, all bonds were brought to the market-place, and burned in one pile, which Agelinda called "a glorious flame." But he contrived to defer the accomplishment of the other part of the equalizing plan; and, as Agis was under a necessity of marching to the succour of the Achaeans, Agelinda, by his tyrannical conduct, induced a conspiracy for restoring Leonidas, which proved successful, and Cleomotus was sent into exile. Agis, upon his return, was obliged to recur for sanctuary to a temple; and being betrayed by some false friends, who were bribed for this purpose, he was arrested in the name of the Ephori, and hurried to prison. Leonidas with a band of mercenaries, surrounded the prison, and the Ephori, and members of the senate who were in his interest, went in to interrogate Agis concerning the motives of his proceedings. The king averred, that it was his purpose to rerove the inhumanities of Lycurgus; and that he would adhere to this purpose, even in the prospect of an immediate death. His enemies then proceeded to pass sentence of death upon him, and the officers were ordered to remove him into a room where malefactors were strangled. But they, and even the mercenary soldiers, were restrained by their respect for his character from doing him any injury. When it was known that he was in custody, his mother and grandmother, and a multitude of people, assembled round the prison, and requested that he might have a fair trial. This application
tion in his favour, merely served to soften his fate. As he was led to execution, he fell to an officer whom he embraced in tears—"Weep not for me, my friend, for as I am thus suffering contrary to all law and justice, I am much happier, and more to be envied, than those who have condemned me." He then offered his neck to the executioner, without the least sign of reluctance. The grandmother of Agis was next seized and executed; and half of all his mother was ordered to enter the dismal dungeon, where she beheld her fon lying dead on the ground, and her aged parent at a little distance, with the fatal cord about her neck. Having laid the corpse by that of her fon, and decently covered it with linen, she cast herself on the body of Agis, and tenderly saluting his cold lips, exclaimed—"O my fon, the excels of thy humanity and moderation has been fatal, both to us and thee." Upon which, Amphales, one of the senators, whose cruelty had been signally displayed in this tragic scene, addressed her with a savage aspect—"Since you know and approved the designs of your fon, you shall share his recompense." She instantly rose, and rushed to the fatal cord, crying out—"May this, at least, be useful to Sparta!"

Leonidas completed this tragedy, by forcing Agiatis, the comfort of Agis, who was very rich, and distinguished by her wisdom and virtue, as well as by her beauty, to marry his son Cleomenes, to whom she conducted herself with as much attention as was consistent with the tender regard the entertained for the memory of Agis, and who is said to have profited by the account she gave him of the designs which the murdered sovereign had formed for the regulation of the government. Plut. in Agis. apud oper. tom. i. p. 795. Rollin's Anc. Hist. vol. v. p. 425—442.

AGIST, in Laws, signifies to take in and feed the cattle of others in the king's forest, and to gather up the money due for the same. Chart. de Forelta, g. Henry III. cap. g. The officers appointed for this purpose are called agistors, or gisakers, and are made by the king's letters patent: there are four of them in every forest, wherein the king hath any pannage. Manw. For. Laws, 8vo.

The time for this is fifteen days before Michaelmas, and as many after, when the running of the cattle cannot prejudice the game.

AGISTMENT, is supposed to be formed of the French gisfa, a bed, or lying place; though Kemet excepts to this etymology, and chooses rather to derive it from aiger, the field, or feeding-place for cattle; imagining agitation to have originally been the same with agrarium, agerium, or agraticum, the profit of feeding cattle on such a piece of ground. The term is applied to taking other men's cattle into any ground, at a certain rate per week. It is so called, because the cattle are suffered gisfas, that is, to lie down and couch there; and many great farms are employed to this purpose. 2 Instl. 643. Our graziers call cattle, which they thus take in to keep, gismets; and to gisfa, or juice, the ground, is when the occupier thereof feeds it not with his own flock, but takes in the cattle of others, to gisfa or pasture it. Agistment is likewise the profit of such feeding in a ground or field: and extends to the depasturing of barren cattle of the owner, for which tythes shall be paid to the parson.

Agistment is also used metaphorically for a charge, or burden on any thing.

In this sense we meet with terra ad cyathos maris agitata, i.e., charged with a tribute to keep out the sea.—So terra agitata, are lands whose owners are bound to keep up the sea-banks.

Agistment denotes likewise the duty or levy for repairing the banks and walls in Romney-marsh, which was particularly called agistamentum; and the act of laying such a pro-

portion of this duty on the several estates, was called agis-
tator. See for, and Agistment.

AGISTOR, or Agistator. See Agist and Agistment.

AGISYMBLA, in Ancient Geography, now Zanguebar, a district of Libya interior, situated, according to Agathemerus, to the south and east of the Aethiopia Anthropophagi. The parallel passing through this country 16° south of the equator, bounded the knowledge of the ancients to the south.

AGISYMBLA, in Modern Geography, a town of Africa, in the kingdom of Congo.

AGITA, or Aguti, in Ancient Geography, a small island between Sicily and Africa.

AGITATION, Agitation, properly signifies shaking; or reciprocal motion of a body.

The prophets, quakers, Pythian priestesses, &c. were subject to violent agitations of body. See Inspiration.

Among physiologists, the term is sometimes appropriated to that species of earthquake, called tremor, or aristato.

Among the philosophers, it is chiefly used for an intense commotion of the parts of any natural body.

Thus, fire is said to agitate the minute particles of bodies.

—Fermentation and effervescence are attended with a brisk agitation of the particles.

Heat is supposed by some to confit in the agitation of the parts of the hot body; and sound is produced by a tremulous agitation, excited first in the nervous body, and communicated thence to the ambient air.

Agitation is likewise used for a violent hurry or perturbation of spirits, occasioned by some predominant passion.

Agitation is also used, in Medicine, for a species of exercife, popularly called swiaving; and, in general, for any exercife which shakes the body.

Bartholine mentions fits of the tooth-ach, deafness, &c. removed by vehement agitations of the body: and they have been found of especial use for preventing and dissolving concretions.

Dr. Sydenham attributes the great benefits of riding to agitation, which is very efficacious in removing obstructions of the oesofa. See Ædor.

Sanguification is in great measure effected by the agitation of the parts of the blood and chyle, in their continual circulation. Digestion itself is only supposed by some to be an inebulce kind of agitation.

Agitation of bealls in the forest, etc. Agitation of bees in the forest, etc. Agitation of bees in the forest, etc.

Agitante, something having power to agitate or shake another.

Agitative force of a pendulum, is that which produces motion in it.

The agitative force of the pendulum arises from three things: 1. The power of gravity. 2. The weight fastened at the end of the rod. 3. The distance of that weight from the point of fulnession; or, which amounts to the same thing, the length of the rod, or pendulum. Hilt. Acad. Soc. 1741.

AGITATO, in Mufet, a term which implies not only a quick movement but a character of expression arising from passion and perturbation. Piccinii's air, "Se il ciel mi divide," in the Alessandro of Metafallo, furnishes an admirable example of this kind of movement.

AGITATOR, in Antiquity, a charioteer; or he who drove or directed a chariot, or horser, in a race.

In which sense agitator amounts to the same with what the Romans called auriga; and we, a coachman, driver, &c.

Agitator was more peculiarly used for him who drove in the public course games in the circus.

The agitators were distinguished by their habits, into
AGLA, formed of the initial letters of the four following Hebrew words יקראל, which gave rise and designation to so many factions. Besides which, they had other marks or emblems of their family, corresponding to what we call arms.

The conquerors, besides the ordinary rewards, bravie, as crowns, &c. had flatlets erected to them in the circus: on the barks whereof, their titles, achievements, &c. were inscribed; several of which are still found among ancient inscriptions, drawn in the following formule: Vici seige, Peto, Constantia, &c.

It has been disputed, whether the agitators were on the footing of minions and pantomimes, and by law held infamous? Brillon. Select. Ex Jur. Civ. Ant. lib. i. cap. 10.

Agitators, militari. agitatores militari. were those who,裔 the model of the house of peers; and thus a military parliament was formed in opposition to the parliament at Westminster. Cromwell engaged himself with the agitators, whom he found to have a greater interest than the council of war; and who undertook to make propofals relating to the reformation of religion, and the state.

The agitators as well as the council of officers were altogether moved by his direction, and conveyed his will to the whole army. By means of theses instruments, he overawed the parliament, and reduced it to submission; and having gained possession of the king's person, to whom for some time he and his officers paid attention and respect, he contrived to terrify him by the menaces of the agitators, and thus induced him to make his escape from Hampton Court; and to take refuge at Carisbrooke Castle, in the Isle of Wight.

Cromwell, being entirely master of the parliament, and free from all anxiety with regard to the custody of the king's person, applied himself seriously to quell those disorders in the army, which he himself had artfully raised and successfully employed, against both king and parliament. With this view, besides other measures which he adopted, he issued orders for discontinuing the meetings of the agitators; and he pretended to pay entire obedience to the parliament, whom, being now fully reduced to submission, he proposed to make, for the future, the instruments of his authority. But the Levellers, for so that party was called, because they wished to abolish royalty and nobility, to level all ranks of men, to introduce an universal equality both of property and of power, and who maintained that the meanest senterial, if enlightened by the spirit, was entitled to equal regard with the greatest commander, having tafted the sweets of dominion, would not easily be deprived of it. They secretly continued their meetings; they asserted, that their officers, as much as any part of the church or state, needed reformation; and several regiments joined in sectarian renonances and petitions. Separate rendezvous were concerted; and every thing tended to anarchy and confusion. But this discontent was soon cured by the rough, but dextrous hand of Cromwell. He chose the opportunity of a review, that he might display the greater boldness, and spread the terror the more widely. He seized the ring-leaders before their companions; held in the field a council of war; shot one mutineer instantly, and struck such dread into the rest, that they presently threw down the symbols of sedition, which they had displayed, and thenforth returned to their discipline and obedience. Hume's Hist. vol. vii. p. 109. 8vo.
Atmanisphe, famous cogitation, the fix a situated fanaticism, marching a

The Roman armies, in their marches, were divided into primus agmen, answering to our vanguard; medium agmen, our main-battle; and posteriorum agmen, the rear-guard.

The order of their march was always after the first signal with the trumpets, &c. the tents were taken down, and the baggage packed up; at the second signal, the baggage was to be loaded on the horses and carriages; and at the third signal, they were to begin their march. First came the extraordinaris; then the auxiliaries of the first wing with their baggage; these were followed by the legions. The cavalry marched either on each side, or behind.

Also used for any number of persons, or even animals, moving or advancing in some regular order.

AGMET, or AGMAT, in Geography, was formerly the capital of Morocco, in Africa, situated on a declivity of a hill, which is part of Mount Atlas, and near a river of the same name; six leagues south of Morocco. It is at present reduced and inhabited by poor people. N. lat. 30° 50'; W. long. 7° 15'.

Agnathus, or Agnes, in Botany, the name given by Vaillant to a genus of plants, called afterwards cornutia by Plummer and Linnaeus.

AGNATI, in the Roman Law, the male descendants from the same father; and in the Scots law, cognates are understood to be those who are nearly related by the father, though females intervene.

AGNATION, formed from ad, to, and nasci, to be born, in the Civil Law, the kindred, or relation between the descendants of the same father, being males, and unfixed only from males.

Agnation differs from cognation, as the latter is an universal name, under which the whole family, and even the cognati themselves are contained; and agnation, a particular branch of cognation, which only includes the descendants in the male line. Again, agnation is properly only a civil name, as that of gens, or family; cognation, a natural name, or derived from blood.

By the law of the Twelve Tables, males and females succeed one another, according to the order of proximity, and without any regard to the sex; but the hues were afterwards changed in this respect, by the Lex Vinceta; and women were excluded from the privileges of agnation, excepting such as were within the degree of consanguinity; i.e. excepting the sisters of him who died intestate; and it was hence that the difference between cognati and cognati first took its rise.

But this difference was again abolished by Justinian (Inf. 3. 10), and the females were reinstated in the right of agnation; and all the descendants on the father's side, whether
AGNIEL, an ancient French gold coin, first struck under the reign of St. Louis, worth about twelve folis, or six deniers. The agnèl is also called sometimes mouton d’or, and agneal d’or. The denomination is supposed to have arisen from the figure of a lamb, or sheep, struck on one side. After the reign of St. Louis, they bore on the reverse the words, “Christus regnat, victor imperat.”

AGNIELT, an ancient French silver coin, first struck under Philip le Bel, worth about twenty folis.

AGNELLI, FRÉDÉRIC, in Biography, was an engraver of Milan in the beginning of the 17th century. His chief employment seems to have been portraits, though he sometimes engraved architecture and emblematical subjects. The dome of Milan was engraved by him. Strutt.

AGNEREINS, in Geography, a small place, which was once the residence of a Castellany, in the former principality of Dombes, and present department of Ain, in France.

AGNES, in Natural History, a name given by Cramer to a species of Papilio Dianus, the ZANGIS of Gmelin’s edition of the Linnaean system.

AGNES, St., in Geography, one of the SCILLY isles, which, though of small extent, is well cultivated, and fertile in corn and græs. The inhabitants, who are poor, form about 50 households, and yield the proprietor 40l. a year. The church is small and neat, and was built by the Godolphin family. But the principal ornament and support of this island is the light-house, whence St. Agnes is called the Light-house island. This stands on the most elevated ground, and is built with stone from the foundation to the lantern, which is 112 feet high; the gallery 4, the fall-lights 11½ feet high, 3 feet 2 inches wide, and 16 in number. The floor of the lantern is brick, upon which is placed a square iron grate, barred on every side, with one great chimney in the canopy roof, and several lesser ones, to let out the smoke; and a large pair of smith’s bellows is so fixed as to be used with ease when it is wanted. This noble structure is plaited white, and serves as a day mark to ships coming from the South. The keeper of this light-house has a salary of 40l. a year from the Trinity-houfe, with a dwelling-houfe and ground for a garden. His assistance is allowed 20l. a year. The light-house is annually supplied with coals, and the carriage of these from the sea-side to the building is a benefit to the poor inhabitants. The true latitude of the light-house is E. 49° 56’. long. 6° 46’. W.

AGNES, St., is also the name of a Cape on the coast of Patagonia, in South America. S. lat. 53° 55’. W. long. 66° 35’.

AGNETSON or AGNETEN, two contiguous towns of Transylvania, on the river Hopedeh, four leagues north of Hermannstadt. N. lat. 45° 45’. E. long. 25° 20’.

AGNI-CORNUS, a generic, a promontory of Egypt, to the north-east of the Böbitine gulf.

AGNIERS, the denomination of a tribe or canton of Iroquois Indians, who vigorously and repeatedly resisted the French in their attempts to settle in Canada. They appeared for a long time among the most determined enemies to the popish missionaries, who made various efforts for their conversion; however, in 1668, many of them were converted to the Catholic faith, more perhaps from a regard to convenience and interest than by conviction. Their converts, amongst whom were some distinguished females, removed to the Huron settlement of Lorette, where they were encouraged to reside, in hopes of their forming a barrier against the incursions of their savage countrymen. But no influence or address was sufficient to keep them steady in their attachment to the French nation. Frontenac, who, in 1680, was declared governor of Canada, though his previous conduct had been extremely offensive and irritating, planned an expedition against the Agniers, and refused utterly to extingush them. For this purpose he employed a large army of regulars, and of such Canadians and Indians as were attached to his interest; which entered into the country of the Agniers, destroyed three villages, and massacred most of the inhabitants. See CANADA and IROQUOIS.

AGNIFER is an appellation applied, by some Ecclesiastical Writers, to John the Baptist, and used in the name of a priest with presbyter, or fore-runner.

AGNINA membrana, in Anatomy, the name of the amnios.

AGNINA laetica, see LACTUCA.

AGNO, in Geography, a district of Lavis, in Switzerland, containing 41 parishes or villages, and bordering on a part of the Lugano lake, which is called the lago d’Agno, and receives into it a river of the same name.

AGNO, a river of Naples, which rises in the mountainous parts of Terra di Lavora, washes the town of Accerra, and, passing between Capua and Avera, falls into the Mediterranean, about seven miles north of Puzzoloni.

AGNODICE, in Biography, an Athenian lady, who in the disguise of a man, attended the lefions of Herophilus, and acquired so much knowledge of the treatment of diseases, as to be in great request among her own sex, to whom she discovered her contrivance. She was particularly expert in the practice of midwifery. At length the physicians, jealous of her success, was, and ignorant of her sex, accused her of introducing herself to the women under the pretence of affixing them in their labours and complaints, but in reality from views of incontinence. Being cited to the areopagus, the made herself known; and her judges were so well satisfied with her conduct, and perhaps with the women for patronizing her, that they repealed a law then existing, prohibiting women to practice any branch of medicine, and decreed that women of the rank of citizens might be allowed that liberty. A physician, Mr. Heeque, Eloy fays, published a volume in the year 1747, intitled, De l’Indépendance aux Hommes, d’accoudier des Femmes, written with much ingenuity; in which he attributes the looseness in the morals of the present age, to the custom of admitting men to the general practice of midwifery, for in particular cases he acknowledges their affiance to be necessary. His book has given birth to others in this country, written with the same view of endeavouring to excite a prejudice in the women against employing men, particularly by the late Mr. Philip Thicknes. But the virulence, and the indelicacy of his writings on the subject, must have defeated his end; as it would argue a greater degree of indecency to have been supposed capable of reading his book, than to permit the practice he pretends to confine. The strongest argument against admitting men into the general practice is, that in all ordinary cafes, women are perfectly competent; but as cafes do, and must for ever occur, in which a kind of affiance is required that women are incapable of giving, if the men were not to attend in ordinary cafes, they would not acquire the expertness that is necessary to enable them to deliver in difficult and extraordinary cafes.

AGNOETÆ, of agno, to be ignorant of, in Church History, a sect of Etuytians, whose founder is said to have been Themistius, a deacon of Alexandria, in the 6th century, who maintained that Christ, considered as to his human nature,
was ignorant of certain things, and particularly of the time of the day of judgment.

Eulogius, patriarch of Alexandria, ascribes this doctrine to certain solitaries in the neighbourhood of Jerusalem, who, in defence hereof, alleged divers texts of the New Testament, and, among others, this of St.Mark, chap. xiii. ver. 32. "Of that day and hour knoweth no man; no not the angels who are in heaven, neither the Son, but the Father only."

The ancient Arians, and the modern Unitarians, urge this and similar passages as arguments against the deity of Christ. To which it has been replied, by means of a distinction to which the others object, that Christ, as a man, did not know the day of judgment; or, that he was not commissioned to gratify the curiosity of his disciples in this respect, by revealing it to them. Accordingly Dr. Macknight (Harmony, p. 520) observes, that the word αὐτῷ (Mark xii. 32.) has the force of the Hebrew conjugation Hipril; and αὐτῷ, in the sense of this conjugation, signifies to make another to know, or to declare. And he reads the text, "But of that day, and hour, none maketh you to know; i.e. none hath power to make you know it. Neither man, nor angel, nor even the Son himself can reveal the day and hour of the destruction of Jerusalem to you; because the Father hath determined that it should not be revealed.

AGNOIA, a word used by Physicians, when a person in a fever does not know his acquaintance. When a rigor accompanies this symptom, Hippocrates says it is dangerous.

AGNOMEN, in Antiquity, an epithet given to a person, either by way of praise, or derision, or from some remarkable event, which became, as it were, an additional name, but peculiar to the person, and not deifiable to his office. Thus, one of the Scipios was named Africanus, and the other Africanius, from the brave achievements which the one performed in Africa, and the other in Asia.

The agnomen was the third in order of the three Roman names. Thus in Marcus Tullius Cicero, Marcus is the praenomen, Tullius the nomen, and Cicero the agnomen.

Others think the agnomen to have been the fourth or hononary name, superadded on account of some extraordinary action or virtue. Thus, in the case of Lucius Cornelius Scipio Africanus, Lucius was the praenomen, Cornelius the nomen, Scipio the surname or cognomen, and Africanus the agnomen. But many of the ancient authors, as Livy, Cicero, and Valerius Maximus, call the fourth name cognomen. Some imagine agnomen and cognomen to have been the same, as they generally are, except in cases of adoption.

It was a custom among the Romans, for a person, when adopted into another family to lay aside all his other names, and only retain his family-name, to which he added the praenomen, nomen, and cognomen of the adopter.

Thus P. Cornelius Scipio, being adopted by Q. Caecilius Metellus, had aside his praenomen Publius, and nomen Cornelius, and was called Q. Caecilius Metellus Scipio.

AGNON, in Ancient Geography, a fountain of Greece, in Arcadia, which derived its name from the nymph Agno, who had been the nurse of Jupiter. It is said that the water of this fountain rose in a cloud and then descended in rain.

AGNONE, or Anglona, in Geography, a town of Naples, in the Abruzzi citra; nine miles south-east of Civita Borella.

AGNONIA, a town of Thrace, near Amphipolis, founded by Agnon the Athenian, who conducted lither a colony. Steph. Byz.

AGNON, a borough of Attica, belonging, says Steph. Byz. to the tribe of Acarniades, but according to Suidas to the tribe of Acamantides, and assigned by others to the tribe of Attalides.

AGNos, in Ethnology, a name given by Athenaeus, and many of the other Greek writers, to that fish called callitonymus or uranoscopus.

AGNOTES, in Ancient Geography, a people of Gaul, whose situation is not precisely known. M. d'Anville places them in Britannia, north-west of the Osthin; and he says that the western part of the diocese of Leon has still preserved in one of the districts of the diocese the name of Ag.

AGNOUS Callis, the chafee tree, in Botany, a species of Vitis. This is a native of Sicily, where it affects humid and shady places; but has been so long ago as 1570, introduced into the gardens of this country, where it bears the cold of winter in the open ground. This plant was famous among the ancients as a specific for the preservation of chalybium, and the preventing of all venereal diseases, pollutions, &c.

The Greeks call it κέφαλη, κεφάλι; to which has since been added the reduplicatives κεφαλί, κεφάλι, κεφάλι.

The Athenian ladies, who made proficiency of chalybium, lay upon leaves of agnos callis, during the feast of Ceres. Pliny Hist. N. lib. xxi. c. 9. See Creta. Agnos. The feeds, which have long been medicinally used, and were formerly admitted as an article of the Medical Medical, are of a round figure, and about the size of pepper; they have a pungent acid tase, and an unpleasant aromatic smell; from the days of Dioscorides they have been much celebrated for their efficacy in subduing the inclination natural between the sexes; and from their usufulness to those that lead a monastic life, they have been called monks’ pepper. These feeds, so far from possessing an antiprophylactic virtue, have had an opposite quality ascribed to them by modern writers. Their aromatic puinance favours this opinion, which is confirmed by the statement of Bergius, who says that they are carminative and emmenagogue. In this island they do not promise much medical advantage.

The thumb is also called agnon, vixis, sometimes elegon, lygn, and lynx.

AGNUS Dei, in the Romish Church, denotes a cake of wax stamped with the figure of a lamb, supporting the banner of the cross, consecrated in the due form by the pope, to be distributed in presents among the people, and supposed to have great virtues annexed to it.

The name literally signifies Lamb of God: this being supposed an image or representation of the Lamb of God, who took away the sins of the world.

They cover it up with a piece of stuff, cut in form of a heart, and carry it very devoutly in their processions. — The Romish priests, and religious, derive considerable pecunary advantage from selling these Agnus Dei’s to home, and pretending to sell them to others. The pope provides a regular supply, by conferring once in seven years: they are distributed by the matter of the wardrobe; and received by the cardinals, and other prelates, with great reverence, in their caps and mitres. — This ceremony they pretend to derive from an ancient custom of the church, wherein part of the palfial taper, consecrated on Holy Thursday, was distributed among the people, to perfume their hands, fields, etc. in order to drive away devils, and to preserve them from storms and tempests.

Some
Some authors also speak of a kind of mettalline Agnus Dei, hung to chaplets, or pater-nottles.

The Agnus Dei is forbidden to be brought into England, under the pain of incurring a presument. 13 Eliz. cap. 2.

Agnus Dei is also a name popularly given to that part of the mass, wherein the priest, striking his breast three times, reiterates, with a loud voice, a prayer beginning with the words Agnus Dei. It is said to have been first brought into the mass by pope Sergius I.

Agnus Scythicus, in Natural History, a kind of opophyes, or plant-animal, said to grow in Tartary, resembling the figure and structure of a lamb.

The Scythian lamb is also called agnus vegetabilis, agnus Tartaricus, and by the people of the country, borometz, boromets, or boromote.

The usual account given of this extraordinary production is, that the Tartars throw in their ground a feed resembling that of melon, but less oblong; from whence arises a plant called by them boromets, i.e. lamb, growing almost to the height of three feet, and having feet, hoofs, ears, and the whole head, excepting horns, resembling that animal. In lieu of however, it has a peculiar fort of hair, not unlike horns; it is covered with a fine thin flax, which being pulled off, is worn by the natives as a cover for the head. The pulp within resembles that of the gummarus; and when wounded, a liquor oozes out like blood. It lives as long as there is grubs and herbage around it: but when these are consumed, it wastes and dies. They add, that wolves are fond of it, while no other beasts will feed on it.

De Eugenius seems to have been the first who suspected this account to be fabulous; and Kempter, when in the country, made diligent inquiry concerning it, but could hear of nothing like it.

As to the plants grown under this denomination, in some repositories of rarities, they appear to be originally the roots, or stalks, of certain vegetables, probably of the capillary or fern kind, and supposed by some to be the polyspermum aureum, covered with a wooley moss, which naturally bearing resemblance to the figure of a lamb, have been helped out and brought near to it by art, and the addition of new parts.

Sir Hans Sloane, and Breynius, give us the figures and descriptions of such boromets in their collections. It is from these plants that the Indian moss is gathered, famous for its use in staunching blood. Breynius and Libavius have written expressly on the Agnus Scythicus. Phil. Trans. N° 287, and N° 390. Abr. vol. ii. p. 646. vol. vi. pt. 2. p. 317. See Botany, pl. vi. fig. 7.

AGOAS Bellus, in Geography, a town of Portugal, in the province of Estramadura; three and a half leagues north-east from Thomar.

AGOAS de Moura, a town in the same kingdom and province; four and a half leagues north-east of Setuval.

AGOAS Ouentas, a town in the same province of Portugal, seven leagues call-north-east from Abrantes.

AGOARD, in Biography, archbishop of Lyons, was one of the most learned and celebrated prelates of the 9th century. He was born in the year 727, removed from Spain into France in 782, ordained priest in 804, and, having been nine years coadjutor to Liddende, archbishop of Lyons, was appointed his successor in 816, upon his retiring to a monastery, with the consent of the emperor and the whole synod of the French bishops. From this fee he was expelled by Lewis the Debonnaire, because he espoused the party of his son Lotharius, and was one of the chief intruments in depofing him in the assembly of bishops at Compiene in 833. But the sons of Lewis, having made their peace with him, restored Agobard to the favour of the emperor, and also to his see, in the possession of which he continued till his death in 840. As a scholar and a divine, Agobard was much more distinguished than as a politician. He zealously opposed the worship and use of images in a treatise "de Picturis et Imaginibus," he wrote another treatise to prove that Chriif was not merely the adopted, but the true and natural son of God; and a tract on the Priesthood, recommending attention to the character of those who were appointed to this office, affenting their privileges and inculcating their duty. His work concerning hail and thunder, was a direct attack upon superstition, and designed to expose a prevailing error, that it was in the power of foreseers to rade tempests. During an epidemic diseafe, which occasioned large donations to the church, in hopes of preventing the infection, he wrote a tract to expel the avarice of the clergy, who, in a feaon of public calamity, took advantage of the fears and credulity of the people.

He also opposed the practice of duelling, and wrote to the emperor soliciting the repeal of the law of Gondebald, which allowed the decision of disputes by single combat, or by the ordeal of fire and water. He also wrote several tracts against the Jews. His manner of writing was simple and easy; his reasoning was commonly juft; and he manifests an extensive acquaintance with the doctrines of the fathers and the discipline of the church; so that considering the period in which he lived, he deferves to be regarded as a man of talents and learning. His works, after having been long buried in obscurity, were published by Maffo in 1605; and a more correct edition of them by Buluze at Paris in 1666, in two volumes, 8vo. This edition has been reprinted in tom. xiv. of the Bibliotheca Patrum. Gen. Dict. Dupin. Cave's Hist. Liter. tom. ii. p. 11. Ed. Oxon.

AGOBEL, in Geography, a town of Africa, in the kingdom of Tremecen; four leagues from Oran. There is another town of the same name in the province of Hea, and empire of Morocco.

AGOGA, òvyan, duetus, of òvya, duco. I draw, in Natural History, a ditch or drain for carrying off the water from a mine.

AGOGA, in Geography, a town of Africa on the Sfax coast.

AGOCE, òvyan, in the Ancient Mythic, a species of modulation, wherein the sounds or notes proceed by continuous degrees of the scale, both rising and falling. As when we sing re, mi, fa, fol, la; la, fol, fa, mi, re.

Agoge answers to what the Latins call duetus, and the Italians conducimento, and di grado: it stands contraddistinguished from place, peteia, &c.

Agoge makes the first part of the melopoeia, or art of modulating.

There are three species and cafes of this modulation; first, when the sounds follow each other from grave to acute, i.e. rising as in singing, BCDE. This the Latins call duetus reves, and the Italians conducimento retto.

The second, when they go from acute to grave, i.e. falling, as in the notes E D C B, called by the ancients duetus rever- tensi, and by the modern Italians conducimento ritornante.

The third, when they rise by flats and fall by sharps, as in D, E, F, sharp, G, or, vice verfa, as in G, F, natural, E, flat, D. This the ancients call duetus cincumcurrens, and the Italians conducimento concorrente. Euclid. Introd. Harm. p. 22. Ariisid. Quintil. de Melop. lib. i. Mem. Acad. Incr. tom. viii. Malcolm on Mus. chap. xiv. sec. 4. In the ancient Greek muse, agoge is of similar import with the Italian word movimento, motro, and the English, movement; of which, in compositions of two parts, there are three kinds; viz. moto retto, moto contrario, and moto obliquo, i.e. equal, contrary and oblique.
AGOGI A, or AGUILLASTRO, in Geography, a small island in the Mediterranean; three miles north from cape Barbaroa in Sardinia.

AGOL, a town of Africa, in the upper Ethiopia.

AGOMISO, an island in Juno's bay, near its western coast, north north-west from Albany foal.

AGOMPHAISIS, or GOMPHAISIS, a definer of the teeth. It consists in their being loose in their sockets.

AGON, in Antiquity, a dispute or contest for the malletry, either in some exercise of the body or of the mind.

There were agonse on certain days, in most of the ancient faults, and other ceremonies in honour of the gods, or heroes.

There were also agones established expressly, and not attached to any other solemnity.—Such was the agon symmision, at Athens; the agon Romanus, instituted by the Argians in the 53d Olympiad; the agon Olympius, instituted by Hercules, 430 years before the first Olympiad; the agon Adrianiety, instituted at Athens, by the emperor Adriar, called ROMANUS, PAVLUS, and OLIMPIANUS.

The Romans had also agones instituted after the example of the Greeks; the emperor Aurelian established the ago sofis, agon of the fun; and Diocletian, the agon capitolinus, which was held every fourth year, after the manner of the Olympic games.—Hence the years, instead of letters, are sometimes numberd by agones. The agon salinarius, instituted at Ponzoli, by the emperor Antonius Pius, and held every fifth year, was a sacred combat, and the victors at it were called hierarches; they were to be received into the city, through a breach in the wall, made on purpose. The agon musicus was that wherein either poets, or musicians, disputed for the prize; such was that dedicated to Ptolemy to Apollo and the Muses, with rewards assigned to the writers who gained the victory. Of this kind were also found some in the Pythian, Nemean, and Iliumar games; also in the Olympic games, after Nero's time, when first introduced a musical agon here; others were founded by the emperor Domitian, and others at Rome, Naples, and others. The agon Romanus was a quinquennial combat, called also Neromian, from the name of its instillator, who here bore away the prize for playing on the harp, cithara.

AGO is also used for a place near the Tyber, otherwise called cirrus Flaminini, wherein curule games and combats were celebrated.

AGO is also used by Physicians for the struggle of death.

AGO was also a minifier of sacrifice, whose bufines was to strike the victim. The name is supposed to have been derived hence, that standing ready to give the stroke, he asked agon, or agon, shall I strike? The agon was also called popis, culturarins, and victimarius.

AGO, in Geography, an island in the north part of Haffingland, one of the provinces of Sweden, which has a good harbour and skilful mariners. It is in that part of the Baltic, called the Bothnia Gulf. N. lat. 61° 20'. E. long. 18° 10'.

AGOANALS, in Antiquity, an epitheget given to the Salii, consecrated by Numa Pompius to the god Mars, termed Graduers.

They were also called Quirinales, from the Mons Quirinales, where they officiated. Rosinius calls them Agonefes Salii.

AGOALIA, in Antiquity, feats celebrated by the Romans, in honour of Janus; or, as some would have it, in honour of the god Agonius, whom the Romans used to invoke upon their undertaking any business of importance. They appear to have been intituted by Numa, and held thrice in the year, viz. on the third of the ides of January, on the twelfth of the calends of June, and the third of the idea of December. Struv. Ant. Rom. c. 8.

AGONALIS CIRCUS, now the Piazza Navona, is one of the most magnificent arcs in Rome, near 80 common places in breadth, and about 350 in length, adorned with three lofty fountains, which serve to keep the air fresh and cool, and with noble statues. Neptune by Bernini, the Triton and Dolphin by Michael Angelo, the Divus by Claude, the Ganges by Bartola, the Nile by Bacchini, and Rio de la Plata by Raggi: all of which are of white marble, and also the obelisk of Caracalla of Egyptian marble, and covered with hieroglyphics, which was erected here by Innocent X. in 1651. The ruin of annexing the epitheget Agonalis to this Circus is not ascertained. Oilv seems to derive it from the Agona, or solemn games, supposed to have been the iudic Apollinaris, or Aequitas, instituted by Augustus, from which circumstance the Circus was called Apollinaris, and it was also denominated Alexandrinus, from Alexander Severus, who either included or repaired it.

AGONATA, in Antiquity, the fourth class of insects in the sylph of Fabricius; comprehending the cancer, the pagurus, the hippa, the scyllarum, the ailaeus, the equia, and the gammarus. Linnaeus has included the insects of this class under the genus cancer.

AGONE. See HERENNE.

AGONES, in Ancient Geography, a people who, according to Mela, inhabited that district of the Milanese, now called la val de Goffa. Polybius (i. ii. p. 105.) places them in the Celtic Gaul, near Sens. Acanum was their capital.

AGONES, an island near the mouth of the Anas.

AGONUS, in Mythology, a name given to Mercury, because he precluded over the Agonian games, of which he is said to have been the inventor. See AGLONAL.

AGONISMA, in Antiquity, the palm or prize given to the victor in a game or combat.

AGONISTARCHA, of agon, combat, and aigone, chief, in Antiquity, seems to have been much the same with agonoteta; though some suggest a difference, making it the office of the former to preside at, and direct the private exercizes of the athlete, which they went through by way of practice, before they made their appearance on the public theatres or amphitheatres.

AGONISTIC, agonisca, the science of what relates to the combats or agoncs of the ancients.

In which sense, agonicia amounts to much the same with athletic, and makes a branch of gymnastics.

AGONIST, agonistr, is also used among Ancient Physicians, for cold spring-water.

The reason of the denomination is taken from the plentiful use of that element in the rate of an acute erysipelaeous fever, wherein water was supposed to combat and struggle with the febrile heat.

AGONISTICI, in Ecclesiastical History, a name given by Donatus to those of his sect, whom he sent into the neighbouring places, fairs, markets, &c. to preach his doctrine; for which reason they are also called circuncrators, cir- cullinarii, circutes, cernentes, and, at Rome, montefest.

They were called agonists, from agon, combat; because they were fent, as it were, to fight, and subdue the people to their opinion.

AGONIMUS, in Roman Antiquity, was used for the day wherein the rex facrorum sacrificed a victim. The same name was also given to the place wherein the games were anciently celebrated.
AGONNA, in Geography, a kingdom of Africa, on the Gold Coast, extends from the Devil’s Mount, which separates it from Asen, and stretches along the sea coast to the village Anonfa, on the frontiers of Agomaro, through a space of sixteen miles, bounded on the North by Songuay, and on the South by the ocean. It abounds in towns and villages along the sea, the chief of which are Dajon, Polder, Mango, Winiba, and Simpa, besides several others. It is said to be rich in gold mines, the gold of which the Negroes gather in the land after a heavy fall of rain; but the natives have opposed opening the mines for fear of being disfranchised of their territory by the Europeans. Agonna surpasses Asen in extent and population; and is equal to it in fertility and beauty. It has the advantage of a large fresh-water river, well stocked with fish and eels. The English have built a fort in the middle of Agonna, at a village called Simpa or Winiba, but the fort is not of any great strength. The village is populous, and the inhabitants industrious in fishing and in agriculture; for they breed a great number of cattle, which they sell to their neighbours. At a small distance is Barku, a village once frequented by the French, where the language that is uniform along the Gold Coast changes into a different dialect, and a little farther it becomes altogether new.

This, according to Barbot, is the chief town in the kingdom of Agonna; and he says, that the surrounding country is fertile, pleasant, and well adapted for the embellishment of a factory. The English had formerly great influence here; but the Dutch have gained advantage, and built a triangular fort at Barku, mounted with 12 pieces of cannon. When dofman wrote, Agonna was governed by a queen, who was distinguished by extraordinary talents. But though the did not chuse to share her power with a husband, she was no stranger to the softer passions; and contrived means of indulging them, by a succession of flaves, and some fay, by a number of lovers at a time. N. lat. 5° 6′. W. long. 1°. Mod. Un. Hift. vol. xiii. p. 445.

AGONOSTHETA, compounded of αἰνίος, combat, and σφικτος, who strikes, in Antiquity, a magistrate chosen among the Greeks, to preside, and to be the superintendant of the sacred games, or combats; and whose province it was to register the name and country of each champion, to defray the expenses of the games, and to adjudge the prizes to the conquerors. Among the Romans, the like officer was denominated de- signator, and munificius. Middle-age writers usually confound agoniste, the combatants at the games, with the agonotheta, or presidents of them.

The agonostheta had also the immediate charge of the discipline and morals of the athletes. They examined, and admitted them into the society or order, or expelled them from it. During the combats, the agonostheta were clothed in purple, and rode in a triumphant manner through the circus, holding in their hands an ivory sceptre with an eagle on it. Juvenal. Sat. xi. 192.

Van Dale has an express defendant on the agonostheta.

The name agonostheta is still retained in schools and academias, for him who defrays the charge of the prizes distributed. The founders of prizes are perpetual agonostheta.

AGONOS, in Physia, a Greek word signifying bares. Hippocrates applies it to women who have no children, though they might have them, if the impediment were removed.

AGONUS, in Leibysology, a name used by authors, for the fish called by some faraxius, by others elaxis, and by others saracinus.

It is in many particulars very like the marea, or shad, called the mother of herrings, but smaller, never arriving at more than a foot in length: and is always lean and hank in spring, and fat in autumn. But the distinctions between it and the marea, if real, are so very small, that Mr Ray, and many of the most accurate naturalists, have suspected it the same fish, only in a different state.

AGONY. Agony, denotes the extremity of pain, or a disease, when nature makes her full effort, or struggle, to throw off the evil that oppresses her.

The word is formed from the Greek ἄγων, certain, combat; this being a kind of strife between life and death.

Much of the terror of death consists in the pangs and convulsions wherewith the agony seems attended; though we have reason to believe, that the pain in such cases is, ordinarily, not extremely acute; a course of pain and sickness having usually stupidised, and indisposed the nerves for any quick sensations. However, various means have been thought of for mitigating the agony of death. Lord Bacon considers this as part of the province of the physician, and that not only when such a mitigation may tend to a recovery, but also when there being no farther hopes of a recovery, it can only tend to make the passage out of life more calm and easy. Accordingly, he ranks euthanasia, or the art of dying calmly, among the defederata of science; and does not even seem to disapprove of the course Epicurus took for that end.—"Hinc Hygias eblus hautfit aquas." De Augm. Sc. lib. iv. c. 4.

Opium has been applied for this purpose, with the applause of some, but the condemnation of more.

Baglivi promised a treatise expresses, De Medicina Agonizantium, or the method of treating persins in the agonies of death. But perhaps one of the best receipts for this end, is that of Mr. Patin, viz. abstinence from all medicines. Our Saviour’s agony in the garden has perplexed several commentators; and some learned persons seem audiously to have avoided the term agony in their translations, as Beza, Le Clerc, and Lenfant; and in the translations of the Syriac version by Tremellius, Trottius and others, we have timor, or fear, for agony. Dr. Lardner (vol. vi. p. 86) suggests that θεραπευσαι την αγωνιαν (Luke xxii. 44) might be translated being under great concern. The effect of this agony has been differently explained. Many exporphists have thought with M. Le Clerc, that the expression αἰνιος ἐφ᾽ ἐμοί τοῦ ἐπικεφαλίου, only implies, that the drop of sweat were large and clammy, like drops of gore. Grotius understands the expression metaphorically, as denoting excessive sweat; but Dr. Whitby (in loc. obsever, that Arifotle (Hist. Anim. lib. iii. c. 19. Oper. tom. i. p. 899). De part. Anim. lib. iii. c 5. Oper. tom. i. p. 1098) and Diiodorus Siculus (lib. xvii. Oper. tom. ii. p. 230) mention bloody sweats, as attending some extraordinary agony of mind. Leti also, in his life of pope Sixtus V. p. 200, and Sir John Chardin, in his History of Persia, vol. i. p. 126, mention a similar phenomenon; to which Dr. Jackson (Works, vol. ii. p. 819) adds another from Thuanus, lib. x. p. 221. See Dodridge’s Family Expounder, vol. ii. p. 517.

Bartholinus (de Creece, p. 184. 193) produces examples of sweats that have been actually mixed with blood. So does MALDONAT in Matt. xxvi. 37. The possibility of this circumstance is ascertained by a fact well known in history, viz. that Charles IX. of France died of a malady, in which his blood gushed out of all the pores of his body. Voltaire (Univ. Hist. chap. 142) describes it thus; "Charles IX. died
in his 25th year. — The malady of which he died was very extraordinary; the blood gushed out of all his pores." This accident, of which there are some instances, was owing either to excessive fear, to violent passion, or to a warm and melancholy constitution.

AGONYLITE, or AGONYLITES, compounded of the privative α, γον, knee, and κενε, to bend, in Ecclesiastical History, a fact, in the seventh century, whose distinguing principle it was never to kneel, but to pray standing. See Genuflexion.

AGORAEUS, formed of αγοράς, market, in Antiquity, an appellation given to those deities who had stations in the public market-places, or fora. Mercury, whose statue was erected in almost every public place, was distinguished by this appellation.

AGORAEUS was also the name of a subordinate magistrate, in the cities of Asia, whose business it was to administer justice to artificers and the people.

AGORAH, Malagra, in Ancient Geography, a city of the Thracian Cherionesus, which stood on the gulf of Melas.

AGORAH, an ancient name of Egypt and Asia. See Gerah.

AGORANIS, in Ancient Geography, a river of India, mentioned by Arrian, Ind. cap. 4, which flowed into the Ganges.

AGORANOMUS, compounded of αγοράς, market, and ὀνόμα, name, in Antiquity, a magistrate of Athens, established for the maintenance of good order and policy in the markets, setting the prices of provisions, excepting corn, and deciding disputes relating to buying and selling, inspecting the weights, measures, and the like.

The agoranomus, among the Greeks, was much the same with the curule aedile among the Romans.

Aristotle distinguishes two kinds of magistrates, the agoranomous, who had the superintendence of the markets; and the affynomous, who inspected the buildings of the (αγορα) cities. The agoranomus, at Athens, were ten in number, five belonging to the city, and as many to the Piraeus: though others make them fifteen in all, of whom they assign ten to the city. To these a certain toll or tribute was paid, by all who brought any thing to sell in the market.

AGORITÆ, in Ancient Geography, a people of Asiatic Sarmatia.

AGORO, in Geography, a town of Italy, situate on the river Cordevol, on the frontiers of the Tyrolese; 21 miles west north-west from Belluno.

AGOSTA, a town of Sicily on the coast end of the island, to the south of Catania, with an excellent harbour. The greater part of it was destroyed by an earthquake in 1693; but has been since rebuilt. N. lat. 37° 20' E. long. 15° 15'.

AGOSTA island, in the Gulph of Venice, is nearly south from the west end of Carzola and Lefina islands, and west of Augusta. The island is of good road for ships, in N. lat. 42° 40'. E. long. 18' 52'.

AGOSTINO, Paolo, Da Valeron, in Biography, an eminent musical composer, was born in 1593, educated in the Roman school of music, under Bernardo Nanini, and succeeded Soriano, as master of the pontifical chapel at St. Peter's. He is represtented as one of the most scientific and inventive composers of his time in every species of music; and his productions for four, five, or eight choirs or choruses were the admiration of all Rome. Padre Martini has preserved an agnus dei, in eight parts, of this composer, which is a very extraordinary performance. He died in 1629, at the age of 36 years. Burney's Hist. of Music, vol. iii. Hawkins' Music, vol. iv.
much interrupted by the barbarity and fraud of both nations. Before what they fell, and what they pay to the governor of Damot, the Agows present a tribute to the king of 1000 daib of honey, each daib containing about 60 lbs. weight; 1500 men, and 1000 ounces of gold. The clothing of the Agows consists of hides, which they soften and manufacture in a manner peculiar to themselves. Of these they form a kind of skirt, which reaches down to their feet, and is guarded with a belt about their middle. The lower part resembles a large double petticoat, one fold of which they turn back over their shoulders, fastening it with a fewer across their breast before, and the married women carry their children in it behind. The younger fort are generally naked. The women are commonly thin, and, like the men, below the middle size. Barrenness is unknown among them. They are marriageable at nine years of age; at 11 they actually marry and bear children; and continue child-bearing to the age of 30, and in some instances beyond that period.

With regard to religion the Agows are grossly idolatrous and superstitious. The Nile, or the spirit residing in that river, is the object of their worship: whom they address under the titles of 'the everlasting God, light of the world, eye of the world, God of peace, their Saviour, and Father of the Universe.' To this Duty they present their supplications for seasonable rain, plenty of grass, and the preservation of a particular kind of serpents; at the same time deprecating thunder; and their prayers are pronounced very pathetically with a kind of tone or song. The flum or priest of the river, with whom Mr. Bruce conversed, pretended to have intercourse with a spirit, which occasionally appeared to him, and revealed to him future events. This spirit, he said, was of the river, God, the father of mankind. Thunder was deprecatcd, as the priest informed him, because it was hurtful to the bees, and their chief revenue was honey and wax. They prayed for serpents, because they taught the approach of good or evil. Serpents are kept in some of their houses; and they are fed with butter and milk before they undertake a journey, or any affair of consequence; and if they do not eat, this is considered as a bad omen. Before an invasion of the Gallais, they lay these serpents disappear, and are no where to be found. Taish, a fagacious governor of the country, who was addicted to this species of divination, would never mount his horse, or go from home, if an animal of this kind, which he had in his custody, refused to eat. Once a year, on the first appearance of the dog-star, or, as others say, 11 days after, their devotion is attended with circumstances of peculiar solemnity; on which occasion they sacrificing a black heifer, distribute parts of it to several clans, cut the carcase raw, and drink the water of the Nile. The bones are then burnt to ashes; and the head is carried into a cavern, which they say reaches below the foundations of the river, and there they perform their secret worship, which no one is allowed to divulge. The Agows of Damot worship the Nile; and those of Lahta pay nearly the same worship to the Siris or Tacazzé. These last have a separate language, and are Troglodytes, who live in caverns. Mr. Bruce apprehends that Agow is a compound of two words, Ag-sha, q.d. the Shepherds of the river; and that the species of idolatry introduced by them is a proof that they originally came from Carman, where they imbibed materialism instead of the pure Sabran worship of the Shepherds of Arazzi, which was at an early period, the only religion of this part of Africa. The mountains in all the districts or clans of Agows are perforated in caves of a very large size, which some suppose were their ancient habitations, when they were Tro-gleytes, or places of retreat when they were alarmed by the approach of their most formidable enemies, the Gallais. Others think it not improbable, that these caverns were used for religious purposes; that of Gress, in particular, was without a doubt a place of secret worship paid to the river, as it is still appropriated to that use, not only by the inhabitants of the village, but by the assembly of the clans in general, who retire for the celebration ofthose rites, to which none but the heads of families in the Agows country are ever admitted. Bruce's Trav. vol. i. 401, vol. iii. p. 527.

agra, a kind of sweet-scented wood, found in the island of Hainan, on the coast of China.

agra Carandiva, is another sweet-scented wood, which also comes from the island of Hainan.

agra, in Ancient Geography, the name of a district of Attica, near the source of the Illisus, where Diana hunted for the first time. Panantas (Attic, lib. i. p. 45.) says, that the had a temple in this place, dedicated to Diana Agreleus.

agra, was also a town of Attica — another of Arabia ; and another, an episcopal see of Numidia in Africa.

agra, called Agra by Ptolemy, in Geography, the capital of a Subah, or province of the same name, in Hindostan. It stands on the river Janna, about 50 miles above its confluence with the Tchantu, and 300 miles north-east of Surat; and from being an inconsiderable town with a small castle of earth, it became not only the capital of the province, but the first city in India for magnificence and commerce, during the long reign of the emperor Akbar, and of his son; and it even now exhibits more numerous monuments of former splendour than any city of Hindostan. Akbar, pleased with its situation, very much enlarged and adorned it, and in 1566 made it the seat of his court and empire; and hence it has been often called Akbarabad, or Akbar's habitation. The city is very long but not broad, in the form of a crecent; and surrounded by a wall of red stone, and a ditch 100 feet wide. The streets, with the exception of a few, are narrow and ill arranged; the houses are generally low and mean buildings; and the space within the wall is laid out in gardens and palaces, so that it is less populous than might be imagined, considering its extent. The castle and palace are structures of astonishing size and magnificence. The walls of the former consist of stone and brick, terraced in several places, and 20 cubits high. Between this and the river is a large space, designed for the exercise of the troops and other diversions in the emperor's view. The palace, which is within the castle, contains three courts, encompassed with porticos and galleries, all painted and gilt; and some pieces are said to have been plated with gold. Under the galleries of the first court are the lodgings for the imperial guards; those for the officers are in the second court; and the third contains the stately apartments of the emperor and his ladies. The completion of the palace occupied above 1000 labourers for 12 years, and cost nearly three millions of rupees. The emperor, for the execution of his plan, collected together, by the promise of ample rewards, the most skilful architects and the most celebrated artists in every branch, both of external ornament and domestic decoration. Besides the royal palace, there are several others ranged in a line, which belong to the princes and great lords of the court; and before it there is a very large square, and there are also 12 other squares in different parts of the city. The Caravanserais are more than 60 in number, and some of them have large courts with their porticos. There are at Agra above 800 public baths, and a great number of mosques, with very magnificent pulpets. Among the latter is the mausoleum of Akbar himself.
self, and another erected by the emperor Shah-jehan for his
eumpires Mahd-Alia, at the expense of 60 lacks of rupees,
or 750,000/. N. lat. 26° 43', E. long. 76° 44'.

Between this city and Lahore in the Punjab, which are
distant from each other 500 miles, there is planted on each
side of the road a continued row of shady trees, forming an
avenue, to which, whether we consider its extent, its
beauty, or its utility in a hot climate, there is nothing
similar in any country. Remmel's Memoir. p. 69. Traher's

The province, or Subah of Agra, is bounded on the north
by the province of Delhi, on the north by Oudh, on the south by Malwa,
and on the west by Agrimeer, and is about 175 miles long
and as many broad. According to the divisions of the emperor
Akbar, it contains 13 circars or counties, which are divided into
203 pargannahs or hundreds. The amount of the revenue is
16,156,257 Sicca rupees; and the number of the forces are
50,600 cavalry, 577,570 infantry, and 221 elephants.
It is, after many revolutions, says Mr. Mairim, in vol. i.
of his Indian Antiquities, published in 1793, at present possesed
by Madajee Sinda, one of the most formidable of the self-
created sovereigns of the Hindoostan. The indigo of this
province is deemed the most valuable in the East Indies.
Its productions are rice and cotton, oranges and lemons;
and its manufactures are white cloth, silkens stuffs, silver
and gold lace, &c.

Agra, or Erang, is the name given by Pliny (Nat.
Hist. tom. i. p. 339. Ed. Hard.) to the town of Hejaz,
in Arabia Felix, now called Hejr, or Al-Hebeg: situated,
in N. lat. 28° 30'. amidst a ridge of rocky mountains,
denominated Al-Athaleb, i. e. the fragments of itones; out
of which many houte have been cut, as some say, by the
Amalekites, or by their ancestors the Adites, Iramites, and
Thamudites. The Thamyden of the ancients are repre-
sented by Pliny as neighbours to this city.

AGRADO IIbea, a town of Africa, in Lower Guinea.

AGRÆA, a city of Arcadia, mentioned by Pliny, tom. i.
p. 195.

AGRÆA, a country of Greece, which extended itself
into Etolia and Acarnania.

AGRÆA, a people of Arabia Felix, who, according to
Pliny, were good warriors: and also a people of Etolia in
Greece, near the Acheles.

AGRAGA, an episcopal city of Spain.

AGRAGAS. See AGRIGENTUM. This was also a
river of Sicily, which joined the Hynpa, below Acri-
gentum.

AGRÆA, Agriae, and Agriani, a people of Pæonia,
between Haemus and Rhodope.

AGRAKOVA, a town of Russia, in the government of
Archangel, on the west of the White Sea; 17 German
miles west of Archangel.

AGRAM. See ZAGRAM.

GRAMON'T, a small town of Catalonia in Spain,
between Lerida and Solsona, on the river Segre, but the
capital of a jurisdiction. N. lat. 41° 50'. E. long. 58'.

AGRANÉ, a borough of Babylon, ruined by the Per-
fians.

AGRARIA, fiantemes, in the Ancient Military Art, corps
of guards posted in the fields, and in the open air.

AGRARIA, novae, was used for vehicles placed to keep watch,
or guard.

AGRARIAN, agrarian, formed of ager, a field, in a
general sense, signifying relating to fields or lands.

AGRARIAN, in the Roman jurisprudence, a denomination
given to such laws as relate to the partition or distribution
of lands.

There are 15 or 20 agrarian laws; whereof the principal
are, the Lex Caffi, in the year of Rome 258; the Lex
Iulia, in 396; the Lex Flaminia, in 255; two Sophron
laws, in the year 620; the Lex Apuleia, in the year
653; the Lex Edessa, the Lex Cornelia, in 673; the Lex
Servilia, in 690; the Lex Flavia; the Lex Julia, in the
year 913; the Lex Silva Liciniana, the Lex Livia, the
Lex Marcia, the Lex Rufina, made after the taking of Carthage;
the Lex Flavia, and the Lex Tilia. See AGRÆA.

AGRARIAN LAWS, Lex Agraria, absolutely, and by
way of culmination, so called, was a celebrated law, published
by Spartius Caffius, about the year 268, B. C. 486, for an equal
division of the conquered lands among all the citizens, and
for limiting the quantity of ground possessed by each person
to a certain number of acres. Those other two in the
Dipl. the one published by Cesar, and the other by Nerva,
only relate to the limits or boundaries of grounds; and have
no relation to that of Spartius Caffius. The Roman lands
were of divers kinds, some conquered from the enemies,
and not yet brought to the public account: others brought in
public favor; but clandestinely usurped by private
men: lastly, others purchased with the public money,
in order to be divided. Agrarian laws, either for dividing
lands taken from the enemy, or the public lands; or those
purchased with the public money, were easily passed
without disturbances; but those whereby private men were to
be ousted of their lands, and the common people put in posses-
sion of what had been held by the nobility, were never attempted
without great disturbances. This is the first time the Agrarian
law was mentioned; and the measure originated in the ambitious
views of Caffius, who thus intrigued for gaining the
favor of the people, and for attaining absolute power.
The law had the appearance of equity, and could not less
than be agreeable to the people, who mistutely it relieved.
But as the lands, which Caffius wished to have distributed
amongst the poorer citizens had been unjustly usurped by the
rich, the proposal alarmed the Senators, partly because they
were personally interested in it, and partly because they
apprehended its dangerous consequences. The people were
at first pleased; but when they understood that the Latins
were to partake with them of the advantage, they were
disgusted. To conciliate the Latins, and to engage their
concurrence in his favour, were the objects which Caffius had in
view; but the jealousy and dissatisfaction of the Roman
people disappointed his hopes, and terminated in his death.
As soon as he was found guilty of aspiring to the fo-
vereignty, and sentence was passed upon him, he was carried
by the Quellus to the Tarpeian rock, which fronted the
Forum, and thrown down from the top to the bottom in
the presence of the people; such was the customary punishment
of this crime amongst the Romans. His house was also
demolished and his estate sold by auction. With the money
arising from it a statue of brass was erected to Ceres. The
Plebeians, when they afterwards found that the decree of the Senate for the distribution of lands was not executed,
nor any measures adopted for this purpose, reproached them-
selves with the condemnation of Caffius, as an act of impru-
dence, and even of injustice. In the year of Rome
299, the subject of the agrarian laws, which had been sus-
pended for 30 years, was revived by the Tribunes; and
the people demanded, that as they shared with the Pa-
tricians in the labours and dangers of the commonwealth;
they might also share with them in the benefits accruing
from them. But a new partition would have been attended
with great difficulties; and it seemed impossible to proceed
in this business, without manifest injustice to many persons in
actual possession of the lands to be distributed, who had
really
really bought them, and without occasioning great and uni-
versal commotions in the commonwealth. For these reasons the Senate firmly opposed the establishment of the agrarian laws. About the year 577, C. Licinius Stilo, a rich plebeian, and tribune of the people, attempted to reform the overgrown power and wealth of the patricians, by propo-
sing a law, which should have distributed the citizens to the possession of 500 acres, and oblige him to surrender the surplus, in order to be divided among the poorer citizens. His motion, though enforced by the influence of his colleague in the tribunalship, L. Sextius, was overruled; and new commotions occasioned by the approach of the Gauls, having engaged the public attention, the business of the agrarian law was deferred for nine years; and about the end of that time it was again revived, and the law was established: this was called the Licinian law; and the mover of it was soon afterwards condemned by his own law. Having been found to possess more than 1000 acres, 500 of them were distributed among the poor citizens, and he was compelled to pay the fine, which he had annexed to the violation of the law. In consequence of this abuse, the law itself was abolished. In progress of time, however, the great and rich possessed themselves of almost all the lands that belonged originally to the state, either by purchase, or by paying a greater quit-rent, or by violence. Several regulations had been proposed for restraining these usurpations. At length other measures having been found ineffectual, (A. U. C. 610. Ante. Chrill. 134.) Tiberius Gracchus, urged by his mother Cornelia, proposed the revival of the Licinian law; and that the rich should quit the lands which they held contrary to the laws, after having received from the public the value of them; and that the citizens, whose circumstances required relief, should take possession of them. Many ob-
jections were urged against this mild and humane regulation, as Plutarch calls it: and the prosecution of it brought the commonwealth to the brink of destruction, and cost the two illustrious brothers, the Gracchi, their lives. Their efforts were of little avail, as the laws they laboured to introduce were gradually abolished after their death. Cicero, in speaking of the partition of lands and the remittance of debts, says (Offic. l. 2. n. 78.) "that to undertake to dis-
charge debtors by the authority of the magistrates, or to pafs the law so often proposed for the distribution of lands, is to fap the two principal foundations of the common-
wealth; of which the one is peace between the citizens, which could not subsist, if creditors were to lose their fortunes by the discharging of debtors; and the other justice, which is entirely subverted, from the infant no one can assume himself of continuing peaceable possessor of his right." The agrarian law of the tribune Saturninus, which was carried with violence A. U. C. 652, was of very short duration; and that of Rullus in the year 689, which was more exorbitant than any other, and gave up to a small number of citizens, under the pretext of relieving the poor, almost all the revenues of the commonwealth, afforded Cicero an admirable opportunity of displaying his eloquence in ex-
ploiting it, and inducing the people to reject it. The exordium of his oration on this occasion has been much ad-
mired. Cic. II. in Rull. The agrarian law of Cæfar was pre-
fented to the Senate in the beginning of his consulsiphip, A. U. 693; and he urged in its favour, that a distribu-
tion of lands among the poor citizens was altogether usefod, were necessary to deliver the city from a mul-
titude of people with which it was overburdened, and often gave rise to seditions; to repeople and cultivate several parts of Italy, which were abandoned; to recompence the soldiers who had served the commonwealth, and to give subsistence to many citizens who wanted it. He proposed the execution of it in the mildest and most moderate manner; and that 20 commissioners should preside at the distribution of the lands, excepting himself out of the number. Not-
withstanding these specious pleas, Cæfar inveighed loudly against the project of Cæfar, alleging that he did not so much apprehend the division of the lands, as the wages that would be required of the people by those who sought to inveigle them by this pretest. Cato was imprisoned for his opposition; and when another senator was asked by Cæfar why he departed before the Senate broke up, he replied, "because I had rather be with Cato in a prison, than with you in the Senate." Cæfar appealed to the people; and having engaged the concurrence of Pompey and Crassus, the reliance of Bibulus, Cæfar's colleague in the consulsiphip, and the vehement opposition of Cato were ineffectual. The law was authorized by the suffrages of the people. Cicero acquiesced in this measure, by observing a kind of neutrality; and argues to this purpose: "Let us remain neuter, as if buried in a house in the country. Cæfar hopes that I will second him and invites me to it. See the advantages I shall gain by taking this party; the friendship of Pompey, and even that of Cæfar, if I desired it; a reconciliation with my enemies; the peace of the mul-
titude; and the assurance of quiet in my old age: but after the conduct I have maintained in my consulship, and the principles which I have maintained in my writings, ought not my rule to be this maxim of Homer (II. M. 243), the belt of all councils is to defend one's country?" Cic. ad Attic. ii. 3. In persuading Cato to give up his resistance to this measure, he conjures him to consider, "that if Cato has no need of Rome, Rome has need of Cato." Cic. pro Sext. p. 61.

Several have pleaded for the necessity of agrarian laws among us. William Sprigg, or, as some say, Fr. Of-
borne, has written expressly on this subject. See also the Supplement to Dr. Price's Observations on Reversionary Payments, &c. p. 381.

But the author who seems to have entered most deeply into the nature and use of agrarian laws, is Harrington; he shews that the balance of property in a state cannot be fixed but by laws, and the laws whereby such a provision is made are agrarian laws. Now these are necessary to the stability of government, because governments will, according to the diverse balance of property, or of divers or contrary na-
tures, that is, monarchical or popular. Thus monarchy re-
quires of the standard of property, that it be vail or great; and of agrarian laws, that they hinder recees or diminution, at least in so much as is thereby entailed upon honour. But popular government requires, that the standard be mo-

derate, and that its agrarian laws prevent accumulation.

This author thinks, that in a territory not exceeding England in revenue, if the balance be in more hands than 500, it is declining from monarchy; and if it be in fewer than 5000 hands, it is swerving from a commonwealth.

The same writer defines an equal agrarian, a perpetual law, enjoining and preferring the balance of dominion by such a distribution that no one man, or number of men, within the compass of the few, or arifolocacy, can come to overpower the whole people by their posseffions in lands.

He also observes, that the people of Rome, by striving for an agrarian, throve to save their liberty: and that commonwealth, through want of such a law, or the non-ob-

servance of it, came to ruin.

In the Grecian cities, the defect of an agrarian was sup-
plied by *oφθαλμος*.
In Venice, the council of ten, and the officers of pomp, restrain those who might be too powerful; and these two orders in a commonwealth, where the gentry have but small estates in land, are as much as needs be in lieu of an agrarian.

Some German republics have no more to supply the places of this law than these estates devolving are divided among the children.—And the same law would establish an agrarian in England.

Agrarian laws may be framed different ways, as by entailing the lands upon certain families, without power of alienation in anyone, as in Israel and Lacedemones; or, except with leave of the magistrate, as in Spain. But this, by making some families too secure, as those in possession, and others too despairing, as those not in possession, may render the whole people less industrious.

Therefore Harrington prefers a law regulating estates, so that no man shall have above two thousand pounds a year in land; and that the estates of those who exceed this proportion shall be divided in descendence to their children, till the greatest share do not exceed two thousand, per annum. This is the rule he lays down for his commonwealth of Oceana, by which he means his scheme for the government of England.

By this law, Harrington intended that the property of land in England should never fall into fewer hands than five thousand; as he computes the rents of this country to be ten millions. But if these rents, as is probable, amount now to twenty millions, it would follow that, by our author's rule, the land could not never be in less than fifty thousand hands, which, according to his system, must effectually secure the liberties of the people.

It would exceed the limits of our design, to enter into the full detail of all the reasonings of this ingenious author on the subject of agrarian laws; we therefore refer to his works: Toland's Edition, 410. 1771. See also Government, Property, &c.

AGRARII. See Agriment.

AGREDADA, in Geography, a town of Spain, in Old Castile, at the foot of Mount Cayo, where the ancient Gracchus's flood; three leagues south-west from Tarazona, N. lat. 41° 53'. W. long. 2°.

AGREDADA, is also the name of a town in the kingdom of Popayan, in South America; forty miles north from Quito.

AGREDADA, Mary of, in Biography, a deluded fanatic, or a bold impostor, was born at Agreda, in Spain, in 1602, took the veil in 1629, in a convent founded by her father and mother, was elected superior in 1627, and died in 1665. In 1637, she began to weave the life of the Holy Virgin, in consequence, as she pretended, of orders received from God and the Virgin; and when it was finisht, she annexed to it an ascription, that its contents had been communicated to her by divine revelation. This fanciful work was translated by Father Crozet, and formally condemned by the doctors of the Sorbonne. The translation, in three volumes, 4to, was published at Brussels, in 1717. Gen. Diction.

AGREEMENT, Agreementum, in Law, a joining, or putting together, of two or more minds in any thing done or to be done.

Of this there may be three forts.—The first, an agreement executed at the beginning, mentioned in the statute of 25 Edw. III. cap. 3, which says, "That the goods "bought by forestallers, being thereof attainted, shall be "forfeited to the king; if the buyer thereof have made "greet with the feller:" where the word greet otherwise called agreement executed, signifies payment for the things, or satisfaction.

The second is an agreement after an act, that is, where one does an act, and another agrees and affirms thereto afterwards.—The third is an agreement executory, which is, when both parties at one time are agreed that such a thing shall be done in time to come. It is called executory, because the thing is to be done afterwards.

Agreements are to be in writing, by Stat. 29 Car. II. cap. 3, of frauds and perjuries.

AGRESSES, or Ogresses, in Herodotus, the same as Pellets.

AGRESTA, in the Materia Medica, an unripe grape; otherwise called embas, and uva aertis, by the French veuirs. Agrilex are cold cooling, deprecated, and refrigerant; they temper the acrimony of the bile, and cheer the heart. Eaten plentifully, they have been found to destroy worms. The term is sometimes also applied to the juices of this fruit, more properly called amphiacton.

AGRESTI, livio, da Furli, was a painter of history, who died in 1580. He was a disciple of Ricciino del Vaga, and commanded by Vafani, for the richness of his invention, the goodnes of his colouring, and the correctness of his design. Pilkington.

AGREVE, in Geography, a small town of France, in Vivarais, at the foot of the mountains.

AGRI, in Ancient Geography, a people placed by Ptolemy, in European Sarmatia.

AGRIA, a name given to holly; and also to a malignant puftule, of which there are two forts. The one is small, with a roughness, redness, and flight corroboration of the skin; it is of a round figure, its centre is smooth, and it spreads slowly. It is cured by rubbing it with falling fiptulate. The other foot ulcerates with a violent redness and corroboration; so as to make the hair fall off; it is of an unequal form, and turns leprous. It is cured by poultices of fellosity of the wall.

AGRIA, or Eger, in Geography. See Erlace.

AGRIAMELOS, formed of αγριος, wild; and αμπελος, a vine; the wild vine; and, according to Gerard, the black briony.

AGRIANA, in Ancient Geography, a town of Cappadocia.

AGRIANES, a small river of Thrace, which rose north of Heraclea, and discharged itself into the Hebrus. This was also the name of a people near mount Pagirus, in Thrace.

AGRIANIA. See AGRONIA.

AGRICOLA, Cæsarius Julius, in Biography, an illustrious Roman, was born on the 13th of June, in the second consulship of Caius Caesar, A. D. 38. Tacitus dates his birth, in the third consulship of Caius; but as he died in his 56th year, by the fame historian's account, he must have been born sooner. He was a descendant of the colony of Foro Julii or Frejus, in Provence, the place of his nativity; and his grandfathers, on both sides, were of the equestrian rank. His father, Julius Gracianus, was of the order of senators, and distinguished by his wisdom and eloquence. His character is mentioned with respect by Suetena, (de Benef. lib. ii.) and he is cited as a writer by Pliny, tom. ii. p. 710. Vid. Index Auditorum, tom. i. p. 61. Ed. Harle. Cæsareus wished him to accuse Silanus; and because he refused, caused him to be put to death. Agricola being thus deprived, at an early age, of the instruction which his father was so capable of giving him, the care of his education devolved upon Julia Procellus, his mother. By her he was removed, when a child, to Marcellus, which was then esteemed the Athens of Gaul; where the provinces of Greece was happily blended with the provincial simpathy.
of manners. Here he manifested the vigour of his mind, by an allusive application to the study of philosophy; but his mother, conceiving this kind of science to be inconsistent with the active life to which she had appointed, moderated the ardour with which he pursued it. The scene of the first military service in which he engaged was Britain; and the General, to whose immediate care he was entrusted, was Suetonius Paulinus, who was then employed in the arduous business of recovering the provinces that had revolted from their subjection to the Roman power. His conduct secured the esteem and patronage of this distinguished commander; and the office of tribune of a legion, to which he was appointed, afforded him an opportunity of gaining that knowledge of his profession, and that acquaintance with the country, which laid the foundation of his future celebrity. On his return to Rome, in pursuit of the honours that belonged to his rank, he married Domitia Decidiana, a lady eminently distinguished by her virtues, as well as by her noble birth; and this domestic connection was a source of uninterrupted felicity. Having discharged the office of quaestor, in the rich province of Asia, under Salvinus Tittianus, brother to Otho, who was afterwards emperor, with a probity which no temptation could corrupt, he spent several years in that state of inactivity, which was most secure and most eligible under a prince so fopishious and cruel as Nero. In the mean while, he performed the duties of praetor and tribune of the people, with a degree of prudence, which led him to avoid both the extremes of parsimony and prodigality.

On the accession of Galba, Agricola was charged with a commission to take an account of the property belonging to the temples, which Nero had purloined; and in the execution of this business he discovered what was attainable, and prevented further depredations. In the commotions that succeeded the death of Galba, he seems to have taken no part. At this time (A.D. 69), he was much disaffected by the news of his mother's death, who had been murdered at Intemelii, in Liguria, by the troops belonging to the emperor Otho's fleet, and whose estates they had plundered. Whilst he was preparing to pay the last tribute of respect to an honoured parent, and to redress the injury which his patrimony had sustained, he received information that Vespasian had assumed the empire, and immediately determined to attach himself to his cause. From Liguria, he probably hastened to Rome; and he was appointed, by Mucianus, to the command of the 20th legion in Britain, which had manifested some signs of disaffection and mutiny. Having, by his wife and moderate conduct, secured the obedience of the legion, he continued for some time in the country, under the government, first of Vettius Bolanus, and afterwards of Petlius Cerialis. Under the former governor, who was meek and peaceable, he suppressed his martial ardour, and renounced what was specious for that which was really useful; and under the latter, who was active and enterprising, he was prompt in executing the orders he received, and yet modest in relating his successes; so that he thus acquired fame without envy. When he returned to Rome, Vespasian created him a patrician, and invested him with the government of Aquitania, in Gaul, which then comprehended the whole country between the river Loire, and the Pyrenean mountains. Here he performed the duties of a civil governor for three years, in a manner which commanded universal esteem. He was recalled by Vespasian, A.D. 77, and made confid with Domitian. During the year of his confidship, he contracted his daughter to Tacitus, the historian, who has furnisbed the memoirs of his life; and at the expiration of his office, he was admitted into the college of pontiffs, and appointed governor of Britain, which he retained, in order to compose the tumults of this distracted province. Julius Frontinus, his predecessor, was a man of abilities, and had conquered the warlike nation of the natives.

On the arrival of Agricola, he found the Ordovices, or inhabitants of North Wales, in a state of insurrection. At a late season of the year, and in opposition to the timid counsel of some of his principal officers, he marched against them, by a signal defeat almost extirpated the nation, and then reduced Mona, or the Isle of Anglesey. His next object was to connect those alliances which had occasioned the hostility of the Britons, and to consolidate their attachment by equitable and humane measures. He also softened their manners by inducing them to cultivate the arts of peace, by providing for the liberal education of the sons of their chieftains, and by promoting the use of the Roman habit and language. In return for their liberty, of which they were deprived, he endeavoured to establish amongst them tranquillity. Luxury, says Tacitus, soon followed; and the Britons called those qualities politeness and good breeding, which, were, in fact, the badge of their servitude.

Agricola, having secured the southern part of the island, prepared, in the third year of his government, to extend his arms northwards; and having spread the ravages of war so far as the Frith of Tays, he proceeded to secure his conquests by a chain of fortresses, in the arrangement of which his military skill was eminently displayed. This chain extended from the Clyde to the Frith of Forth; and he thus separated the conquered part of the island from the fierce and unsubdued tribes of the north. His fifth campaign was devoted to the conquest and security of those parts of Scotland which lie over against Ireland, to which island he directed his views, and which, after his return to Rome, he avowed his purpose of subduing and retaining. The operations of the sixth campaign were principally directed against those who inhabit the eastern parts beyond the Frith of Forth; and in these, the army was accompanied by the fleet, which explored the inlets and harbours, and enclosed the natives on all sides. Agricola was the first Roman general that ever employed a fleet against the Britons, who had always looked upon the sea as their last resource, if ever they should be conquered by land. That resource was now taken from them; and they no longer knew what defence to make against an enemy, who was master of both elements. However, the Caledonians assembled in great numbers, and made a fierce attack on one of the Roman camps; but after a temporary success, they were repulsed with great loss. But they determined to persevere, and thought of nothing but renewing the war. Accordingly, they closed this campaign with aiming their youth, providing places of safety for their wives and children, and forming alliances for their future succour. For the seventh campaign, Agricola, as well as the Caledonians, made great preparation. The Grampian hills were the scene of a decisive engagement. Here the natives, forming an army of more than 30,000 men, under the command of Galgacus, made their stand; and here also Agricola, having disposed his troops in the most advantageous position, waited the defeat of the enemy from the hills.

Each General addressed his army previously to the battle, and their speeches, which are recorded by Tacitus, were re-echoed with shouts of applause. For a long time the victory was disputed, but at last the Romans prevailed, and with
with a small comparative loss of 3,200 men, killed 10,000 of the Caledonians, and dispersed the rest. Agricola, after receiving hostages from some of the tribes, withdrew his army slowly within the Roman limits, and ordered the commander of his fleet to circumnavigate the island. Whilst Agricola was extending his conquests in a distant province, Domitian succeeded to the empire, and became jealous of his reputation and power. He ordered, however, the insignia of triumph to be decreed him by the senate, together with a statue, and all the honour which a private man could receive under the emperors, in lieu of the triumph itself, to which no one but the prince was now entitled. At the same time the emperor recalled Agricola, and under a pretence of favour, propagated a rumour that he intended to appoint him to the government of Syria. Agricola peaceably surrendered the province to his successor; and when he arrived at Rome, he entered the palace by night, in order to avoid tumult, and to prevent any occasion of offence to the jealous Domitian, where he was received by the emperor with a cold salutation, and then suffered to mingle with the crowd of courtiers, and afterwards to retire, unnoticed and unrecompenced, into private life. His popularity was dangerous to him in this tyrannical reign; but his prudence and moderation enabled him to escape uninjured. In this private manner did he pass nine years of his life. At length the year arrived in which the proconsuls of Asia and Africa were to be drawn by lots; and one or other of them must, in due course, have fallen to him. The emperor, dreading the union of such influence as this station would give, with his extraordinary talents and reputation, contrived by his emissaries to induce him to request being excused from the office, and to plead as an apology, his love of retirement and ease. The artifice succeeded, and the emperor acted his part in granting the request of Agricola, with his usual haughtiness and arrogance: nor did Domitian give him the present which was usually bestowed on such occasions. Soon after this event, Agricola was seized with the disorder which terminated in his death. Common rumour attributed it to poison; and the official inquiries of Domitian, during its progress, increased the suspicion, though it was probably unfounded. He died, when collega and Priscus were consuls, August 23, A. D. 93, in the 56th year of his age, leaving a widow and one daughter, who was the wife of Tacitus. He left a son, at a very early age, while he was in Britain. His death was universally lamented. The portrait which Tacitus has drawn of his father-in-law, with his pen, excels (says Crevier) all that the pencil of the greatest painters, or chisel of the ablest sculptors, could have achieved to perpetuate the memory of Agricola. He was unwilling to let posterity be ignorant even of his form and person: he tells us, that he was well made, though not tall; that his countenance was rather mild than florid; that candour and probity were pictured in his face; that none could see him without loving him; and that all were delighted to find the great and the good man united in him. He was not ambitious of polishing a large fortune; but he enjoyed such an one as was sufficient for a noble and generous mind. He had tasted all the satisfactions which result from the conquis of having acted suitably to the obligations of his superior stations; and he had been veiled with all the ornaments and titles, which, however misplaced in others, were in him the rewards of real merit. He might be style a happy man, as Tacitus observes, since he escaped the miseries in which the Roman empire was soon after involved; and died while his wife and daughter were living, in the possession of his dignity, in the height of his fame; and with all his relations and friends safe and prosperous. His death was pathetically lamented by Tacitus, in an elegant apopthegm to Agricola himself, of which no translation can do justice to the energy and conciseness of the original. "What aggravates mine and your daughter's sorrow," says Tacitus, "besides the los of you, is, that we had not the opportunity of fitting you in your lifetime, supporting you in your old age, and enjoying the satisfaction of your last looks and embraces. Then we should have received from you those commands and counsels, which would have been perpetually fixed on our memory. This is a great cause of our regret: you were lost to us by four years' absence from us. It is certain that you, child of fathers, wanted nothing suitable to your character and circumstances, since your tender wife was present with you; but you should have been lamented with other tears besides her's; and in your last moments your eyes were bereaved of the sight of some who were very dear to you. If there be any retribution for the manes of the virtuous; if, as philosophers think, the souls of the great are not extinguished with their bodies; may you rest in peace, and recall us your family from too weak and womanish lamentations for your death, to the contemplation of your virtues, which it is very unreasonable to regret. Let us rather honour you with a just admiration. This is the true honour, and the best influence of piety, which we your nearest relations can shew you. This is what I shall represent to your daughter and wife, that the former would revere the memory of your father, and the latter that of her husband, by revolving all his actions and words in their minds, and reflect more upon the character and idea of his soul than those of his body. Not that I would, in the least, oppose erecting to you images of marble or brass; but as the bodies of men are perishable and mortal, so likewise are their statues: but the form of the mind is eternal, and can never be preferred or expressed by any foreign materials or art, but only by the real character and behaviour of the person who imitates it. Whatever we loved and admired in Agricola still remains, and will for ever remain in the minds of men, and in the everlasting fame that attends noble actions. Many of the ancients will be sunk in oblivion, without the least remain of fame or reputation; but Agricola will be transmitted to posterity, and survive in immortal honour." Tacitus' Vita Agricola apud Op. tom. ii. p. 495. Ed. Ern. Crevier's Roman Empire. vol. viii. p. 346-388. Gen. Dict. Agricola, Christopher Ludwiger, a landscape and portrait painter, was born at Ratibon, in 1657, and died there in 1719. He engraved a landscape, in which is represented the fable of Diana and Acteon. Strutt. Agricola, George, was born at Glauchau, in Meissen, (Meilien) in Upper Saxony, the 24th March, 1494, and received the principal part of his education in Italy, where he applied himself diligently to his studies, particularly to the study of medicine. Returning to Germany, he settled at Joachimsthal, in Meissen, and practiced phyric there, with considerable reputation and success. He then removed to Chemnitz, that he might be near the rich mines in Saxony, the scene of his future greatness; as from the perfect acquaintance he there acquired of the nature of metals, proceeded those rich stores of knowledge which are scattered in profusion over his numerous works on mineralogy. He is said to have told the Dukes of Saxony, that their subterraneous treasure for exceeded in value all they possessed on the surface of the earth. He was very little, however, assisted by their bounty, furnishing nearly the whole of the expenses of his labours and his experiments from his own fortune. The treatises he wrote on the subjects of metals and mineralogy, are composed in an elegant Latin style: they abound in curious information, and were, for a long time, considered as standard works. He maintained his
attachment to the old religion, though he lived among Lutherans. He died at Chemnitz, November 21, 1555, and was buried at Zeitz; the bigotry of his townsmen not allowing him a grave among them. G. Fabricius, his intimate friend, composed the following epigram on his works:

"Viderat Agricola, Phebo monstrante, libellus, Jupiter, et tales edidit orae fones. Et fratis pandet tertia regna met."

His works on mines, published originally in parts, were collected and printed together, at Basle, 1546, in folio. They are chiefly comprehended under the following titles: "De ortu et caufis subterraneorum;" "De Natura eorum que effluant ex terra;" "De Natura Foillium;" "De Medicinis Foillibus;" "De Subterraneis Animantibus;" and "De veteribus et novis Metallis." His great work, "De re Metallica," was printed at the same place, 1561, also in folio; "De Menduris et Ponderibus, Romannorum et Graccorum, with additions referring to modern times, 1570, folio; "De Pelle Libri tres," Basle, 1554, 8vo; "Opus De Foillibus, cum Annotationibus Georgii Fabricii," 1657. He also wrote other tracts on political and theological subjects.

Agricola, John, a Saxon divine, was born at Eisleben, in Germany, April 20th, 1492. Mosheim describes him as an eminent doctor of the Lutheran church, though chargeable with vanity, presumption, and artifice. He was minister, and principal of a college in his own country; and attended the elector of Saxony to the diet of Spire, in 1526; and to that of Augsburg, in 1530. Urged by ambition, he quitted his own country in 1536, and went to Wittenberg, where he settled as a professor and minifter. Although he wrote against Melancthon, in 1527, he was not much noticed before the year 1538, when he took occasion, from the doctrine of Luther, concerning the ground of man's acceptance and salvation, to declaim against the law; maintaining, that it was neither fit to be proposed to the people as a rule of manners, nor to be used in the church as a means of instruction; and that the gospel alone was to be inculcated and explained, both in the churches and in the schools of learning: and he thus became the founder of the sect of Antinomians. Luther, who had been before his friend, attacked him with great severity; and his accusations were supported by the divines of Wittenberg. As length, by the interposition of the electors of Saxony and of Brandenburg, Agricola was induced to publish a recantation of his errors, and to retract the injurious reproaches which he had cast upon Luther. Mosheim says, this recantation does not seem to have been sincere; as he returned to his errors, when his fears were dispelled by the death of Luther, and gained profyde to his extravagant doctrine. Agricola was employed by Charles V., in 1548, in conjunction with other persons, and liberally rewarded, in composing the Interim. It is said, that he wanted to restore the use of holy oil in the cafe of the sick; and that he attributed a supernatural efficacy to it. Some have said, that he was a Papist; and others charge him with being a man of picqueur, and with maintaining all religions to be in themselves really indifferent. When he left Saxony, he was patronized at the court of Brandenburg, by the elector Joachim II. whose favour he enjoyed till his death, which happened at Berlin, in 1566. His "Explication of German Proverbs," and his "Commentaries upon St. Luke," are the principal of his works, Gen. Dict. Mos. Eccl. Hist. vol. iv. p. 521, &c.

Agricola, Martin, a theocratic and practical musician, who was chanter of Magdeburg, and flourished about the middle of the 16th century. He died, June 10th, 1556. His works are two treatises on music, written in German verse, and published at Wittenberg, in 1528 and 1529; the latter of which, viz. "Mufica Instrumentalis," was re-published, with large additions, in 1545; and contains an explanation of the fundamentals of music, together with a description of the instruments used in his time, and the method of playing upon them; and an account of the division of the monochord, and of a temperature for the organ and harpichord; a tract "On Figurate Music," and a brief treatise "De Proportionibus;" a treatise, intitled, "School in Musica planum Wecessent Philomantis ex variis Musicorum scriptis por Magdeb. Schola collectis;" a larger work, intitled, "Melodie Scholasticae sub horarum intervalli decantaude," published at Magdeburg in 1682; and a posthumous work, intitled "Duo Libri Mufices continentem compendium Artis, et illustria Examplar., &c." published in 1561. His several treatises were designed for the instruction of beginners in the study of music. Hawkins's Hist. Music. vol. ii. p. 83.

Agricola, Michael, a Lutheran minister at Abo, in Finland, was the first who translated the New Testament into the language of the country, and thus contributed to the propagation of Lutheranism. It was printed in 1548. He died in 1556. Gen. Dict. Agricola, Robertus, was born in the village of Bafion, near Groningen, in Friesland, in the year 1442; and distinguished by his love and pursuit of literature. Having finished his education at Louvain, where he maintained an exemplary character for sobriety and application, he declined the professor's chair, which was offered him, and visited France and Italy for farther improvement. At Ferrara, he studied Greek, and availed himself of the lectures of philosophy that were read by Theodore Gaza; and at the same time taught Latin, which he was able to write with so much purity and elegance as to rival Guarni, in profe; and the Strozzi, celebrated writers at that period, in verse. After a residence of two years in Ferrara, he returned to the Netherlands, about the year 1477; and, at Duvalent, had an interview with Erasmus, whole future celebrity, though he was then a boy of ten years old, had the kind of independence, and his solicitude for securing leisure to indulge his literary talents, induced him to forego several offices of honour and profit, which he might have obtained by the favour of the emperor Maximilian I. At length, in 1482, he settled in the Palatinate, residing sometimes at Heidelberg, and sometimes at Worms, and delivering occasional lectures in polite literature. The Elector Palatine was his auditor; and in compliance with his request, Agricola composed, "An Abridgment of Ancient History." He was also much respected by John d'Alburgh, bishop of Worms, whom he had instructed in the Greek language. About the 40th year of his age he directed his thoughts to the study of divinity; and by the assistance of a Jew, made considerable progress in the Hebrew language; but death put a stop to his literary pursuits, at Heidelberg, in 1485. Although his natural temper, which was characterized by a fondness for cafe and leisure, was altogether inconsiderable with the active exertions of a reformer, he seems, however, to have deplored the darkness of the church, and to have had some glimpse of the light which illuminated it in the next century. The indolence of his disposition prevented his entering into the married state, though he professed an attachment to the female sex; and took pleasure in amusing them with elegant verses, and with musical performances, both vocal and instrumental, in which he excelled. To
Agnologia belongs the praise of having refreshed the Greek learning to Germany, and of having contributed, in an eminent degree, to the revival of literature and classical taste, in an age which required his exertions, and when they were highly useful. Erasmus, in his Adages, calls him "a man truly divine." Bayle says, that Italy, which at that time treated everything as barbarous that was on this side the Alps, produced no genius comparable to what Friedland could boast of in her Agricola. A learned Venetian, in an epitaph, ranks Agricola with the most celebrated names of Greece and Rome. His works, of which the principal is his treatise entitled, "De Inventione Dialcetica," were collected by Alard, in two volumes, 4to, and printed at Louvain, in 1516; and by Oecco, at Cologne, in 1559. Gen. Dict.

AGRICULTURE, the science which explains the art or means of cultivating and improving the earth or soil, so as to render it fertile and productive. The term seems to be formed from the Latin words ager, field, and cultura, culture, or tillage, from colere to till.

The art of agriculture, in this view, comprehends the nature of climate and soil, the methods of performing the different operations that are requisite in the cultivation and improvement of arable and grass lands, as including, the making of fences, as hedges, ditches, wells, railings, palings, gates, draining, paling, and burning, woring, scaring, fallowing, ploughing, mowing, sowing, harrowing, sowing, hoeing; the growing and preferring of different sorts of crops, as wheat, rye, barley, oats, beans, peas, potatoes, turnips, carrots, cabbages, beets, hemp, flax, oats, madder, &c.; and the raising of various kinds of seeds, as rape, mustard, &c.; rotation of crops, reaping, mowing, felling, threshing; the management of artificial and natural grafts, as clover, lucerne, sainfoin, tares, vetches, &c.; the converting of arable lands to grass, meadows, pastures, hay-making; the cultivating and preserving of fruits, as apples, pears, cherries, &c.; and the preparation of fruit liquors, as cider, perry, &c.; orchards; the planting of timber-trees, wood, coppices, plantations, &c.; the inventing of implements, as ploughs, harrows, rollers, hoes, drills, wagons, carts, mills, looms, &c.; the construction of farm-buildings, as barns, offices, sheds, cottages; the nature of furms, tithe, boiser, &c.;

In a more extensive sense it also includes the breeding, rearing, feeding, and general management of all sorts of live stock, as cattle, horses, sheep, hogs, sheep, rabbits, poulter, pigeons, bees, &c.; the conducting of the various processes and preparations which have a relation to the different products obtained from them, as milk, butter, cheese, or what are generally termed case-making and dairying; and hitherto, as connected with political economy, the construction of roads and canals, the forming of embankments, and the nature of weights and measures. Full accounts and explanations of these will be given in the course of this work, under their respective heads.

Gardening may likewise be considered as an improved branch of agriculture.

Among the Ancients the husbandry was frequently understood by the term Georgica.

This useful and important art, though less splendid than many others, appears to have attracted the notice of mankind in the earliest periods of the world; and this is not indeed very extraordinary, when it is considered that the excellence and prosperity of them at such periods must almost have solely depended upon it. In the earliest stage of society, men, as hunters, must have found, from experience, that the mode of procuring subsistence by the bow or the chaff was attended with infinite toil as well as hazard, and precarious in the event; and therefore, not by any means calculated to supply the wants or increase the comforts of social life. In the pastoral state also, which may be regarded as the second step in the advancement of society, men must soon have discovered, that though more certain of subsistence, and less exposed to danger and hardships, their herds and flocks were liable to innumerable accidents, and that they might at once be reduced to all the miseries of famine.—Under such circumstances and apprehensions, it was therefore natural for them to think of some means by which they might, with more certainty, procure the necessaries of life. For this purpose they would naturally turn their attention towards the earth, and discover that from it might be drawn whatever could render life comfortable. Experience would likewise quickly inform them, that, by due cultivation of the soil, fruits, and grain of various kinds, fit for nourishment, might be procured in abundance; but that, by neglecting this art, the natural fertility of the soil, the warmth of the sun, and the regular revolutions of the seasons, would be in a great measure unavailing.

What may be termed the art of husbandry having commenced in this way, it is easy to perceive that it must have been extremely simple in these early ages, and its advances towards perfection and value almost imperceptible. By most of the eastern nations agriculture seems to have been particularly attended to and encouraged from the most early periods. That the Japanese were extremely interested in its promotion is evinced by the great care taken in collecting and preserving all sorts of manures; and among the Chinese it has constantly received the distinguished regard and protection of their princes and nobility, and been considered as the most honourable and important of all employments. The use of the drill, which has lately been introduced and adopted in European countries, is said to have been long known and employed by them.

The Chaldeans are found to have carried this valuable art to a considerable degree of advancement; as they cultivated their lands with great affluence, and enjoyed the pleasing satisfaction of receiving from their fields plentiful harvests. The Egyptians also, who, from the fertility of their country, caused by the annual overflowing of the Nile, raised prodigious quantities of corn, were so sensible of the blessings resulting from agriculture, that they ascribed the invention of it to Osiris, and even carried their superstitious gratitude so far, as to worship those animals that laboured in tilling the ground. The Phcenicians were also famous for their skill in agriculture; but finding themselves too much confined in their native country, by the conquests of neighboring nations, they spread themselves through the greater part of the islands of the Mediterranean, and carried with them their knowledge of husbandry. The Carthaginians following the taste of their ancestors, are said to have applied themselves affably to the study of agriculture. Nabo, their famous general, wrote no less than twenty-eight books on that subject, which Columella tells us were translated into Latin by an express decree of the Roman senate; and Servius adds, that Virgil used these books as a model when he wrote his Georgics. The art of trowing corn, and the tillage of land, were probably invented in Sicily; as that island was very fruitful in corn, and agriculture was there esteemed so honourable an employment, that even their kings did not disdain to practice it with their own hands. The Athenians, who were the first people that received any system of polite arts, taught the use of corn to the rest of the Greeks; they also taught them the manner of cultivating the ground, and preparing it for food. The Greeks soon perceived that bread was more wholesome, and its taste more delicate than acorns, and accordingly thanked the gods for such an unexpected
and beneficial present. After this, the Athenian kings thinking it more glorious to govern a small state wisely, than to aggrandize themselves by foreign conquests, withdrew their subjects from war, and employed them freely in cultivating the earth. This constant application carried agriculture to a considerable degree of advancement, and reduced it into a more perfect art.

Heciod, who is generally thought to have been contemporary with Homer, was the first among the Greeks who wrote on this subject. He called his poem "Weeks and Days," because agriculture requires an exact observance of seasons and seafons. The other eminent Greek writers upon agriculture are Democritus of Abdera, Socraticus, Xenophon, Tarentinus, Architas, Anitotle, and Theophratus, from whom the art received considerable improvements, as also from Hieron, Epicharmus, Philometer, and Attalus.

The ancient Romans esteemed agriculture such an honourable employment, that, in the earliest times of the republic, the highest praise that could be given to a man, was to say of him, that he cultivated well his own field of ground. The most illustrious senators applied themselves to this profession; nor had they either splendour or majesty, but when they appeared in public. And their greatest generals, at their return from the toils of war, from taking of cities, and subduing of nations, were impatient till they were again employed in cultivating their lands; and thought it no disgrace to follow the plough, though they were at the same time prepared to serve the wants of the republic, attend her councils, or put themselves at the head of her armies. It must indeed be allowed, that when the Romans became tainted with the luxury of Asia, they gradually lost the noble simplicity of their ancestors, and employed their slaves in the severer labours of a country life. But though they did not themselves hold the plough, yet even men of consular dignity looked upon it as a reward for their public services, when they obtained leave to retire into the country; and were equally respected when over-looking their farms, as when seated in the chair of magistracy. M. Cato, the censor, that illustrious Roman general, orator, politician, and lawyer, after having governed provinces, and subdued nations, did not think it below his station to write a large treatise on agriculture.

This work, according to Servius, was dedicated to his own son, and was the first Latin treatise on that subject. It has been handed down to us, it is said, in all its purity, and in the same manner that Cato wrote it. Varro composed a treatise on the same subject, but on a more regular plan. This work is embellished with all the Greek and Latin edition of that learned author. Agriculture also received great improvements from the two Safenarles, and likewise from Scorfa, Tremelius, and M. Terentius. Virgil has adorned it with the language of the muse, and given it majesty by his verse. He has finely embellished those precepts of husbandry which were left by Heciod and Mago.

Columella, who flourished in the reign of the emperor Claudius, wrote twelve books on husbandry, which contain a variety of interesting facts and observations. He was a native of Boetica, in Spain, and had devoted much time to the study of rural affairs.

From this period till the reign of Constantine IV. husbandry appears to have been in a declining state, when that wise emperor caused a large collection of the most useful precepts relating to the art to be extracted from the best writers, and published under the title of Geoponics. Some say he made this collection with his own hand. Nor is this at all improbable, as it is well known that, after he had conquered the Saracens and Arabsians, he not only practised, but studied the arts of peace, fixing his chief attention on the advancement of agriculture.

But from the time of Constantine IV. till about the year 1478, it lay in a kind of dormant and neglected state, when Crelesino, an Italian, revived it by publishing an excellent performance on the subject at Florence. He was soon followed by several of his countrymen, among whom Tatti, Stefano, Augustino Gallo, Santovina, Lauro and Tarello, to be particularly noticed.

In the mean time, in our own country, Fitz Herbert, judge of the Common Pleas, shone with unrivalled lustre in the practical parts of husbandry. He published two treatises on this subject; the first, which was entitled "The Book of Husbandry," appeared in 1534; and the second, called, "The Book of Surveying and Improvements," in 1539. As the observations and instructions contained in these works were the result of much experience, they excited great attention to the subject, and soon raised a spirit of emulation in his countrymen, in consequence of which many treatises of the same kind successively appeared; but time has deprived us of many of these writings, or at least they have become so scarce, as only to be found in the libraries of the curious.

About the year 1669, France made considerable efforts to retrieve husbandry, as appears from several large works, particularly Les Moyens de devenir riche, and the Comptes by Barnard de Paflify, an indigent monk; Le Théâtre d'Agriculture, by de Serres; L'Agriculture et Maison Rustique, by Meifs. Etienne and Liebault, and lately Le Cours Complet d'Agriculture, by M. L'Abbe Robier, &c.—The Flemings, about the same period, were more attentive to the practice of husbandry than the publishing of books on the subject; their attention being doublets to carry on a private lucrative trade, without instructing their neighbours in their modes of cultivation; hence it happened, that whoever was desirous of copying their method of agriculture, was obliged to travel into their country, and make his remarks upon the spot. Their principal idea of husbandry, which was indeed just enough, consisted in making a farm resemble a garden as much as possible. The adoption of such an excellent principle at first setting out, led them of course to undertake the culture of small estate only, which they kept perfectly free from weeds, by continually hoeing and turning the ground, and rendering it rich and productive, by manuring it plentifully and in the most judicious manner. When by this means they had brought the soil to a proper degree of cleanliness, health and vigour, they ventured chiefly upon the culture of the more delicate grases, as the surest mode of acquiring wealth in husbandry upon a small estate, without the expense of keeping many draught horses or servants; and the experience of a few years was abundantly sufficient to convince them, that ten acres of the best vegetables for feeding cattle, properly cultivated, would maintain a larger flock of grazing animals than forty acres of common farm grases. They also found that the best vegetables for this purpose were lucern, saffron, trefoil of most denominations, sweet fenugreek, buck, and cow-wheat, field turnips and spurrey. The political secret of their husbandry, therefore, consisted in letting farms on improvement. They also diversified with a few new sorts of manure. They were the first among the moderns who ploughed in living or green crops, for the purpose of fertilising the earth, and confined their sheep at night in large sheds built on purpose, whose floors were covered with sand or virgin earth, &c. which the shepherd carted away every morning to the compost dunghill. This useful and judicious practice has, since that period, been too little attended to by the practical farmer.
Our fatal domestic wars, during the reign of Charles I., changed the instruments of husbandry into martial weapons; but after the death of that unfortunate monarch, artful and arisocratic men crept into the confined offices of the nobility, gentry, and clergy; and as many of these new encroachers had risen from the plough, so they returned with pleasure to their old profession, being chiefly animated by a love of gain. Plattes, Hartlib, Blythe, and others, feized this favourable disposition of the common people, and encouraged it by writings, which have since had few to equal them; nor was Cromwell wanting in leading his affinities in this important business. Sir Hugh Plattes was one of the most ingenious husbandmen of the age in which he lived; and so great was his modelly, that all his works, except his Paradise of Flora, feem to be posthumous. He held a correspondence with all the lovers and promoters of agriculture and gardening in England; and such was the justice and honesty of his temper, that he always named the author of every discovery that was communicated to him. Perhaps no man, in any period in the history of the art, discovered, or at least brought into use, so many new foris of manure, as his account of the compott and covered dunghill, and his observations on the fertilizing qualities, contained in salt, street, earth, and the spoilage of dikes in great cities, clay, fossil's-earth, moonfish earth, dunghills made in layers, fist, hair, burned vegetables, malt-dull, willow-tree earth, soap boiler's ashes, marle, and broken pitchards, sufficiently demonstrate.

Gabriel Plattes may likewise be esteemed an original genius in promoting the improvement of agriculture. He began his valuable observations in the time of queen Elizabeth, and continued them through the reigns of James I. Charles I. and during the first three or four years of the commonwealth. But notwithstanding the great merit displayed in his writings, the public shamefully suffered him to starve and perish in the streets of London, not having a shilling upon his back when he died.

Samuel Hartlib, a celebrated writer on husbandry, was highly beloved and esteemed by Milton, and other ingenious men of that time. In his Preface to a work commonly called his Legacy, first published in the year 1656, he lamented that no public director of husbandry was established in England by authority; and that we had not adopted the Flemish method of letting farms upon improvement. These observations of Hartlib procured him a pension of one hundred pounds a year from Cromwell, who was a great favourer of agricultural improvements, and the writer afterwards, the better to fulfill the intentions of his benefactor, procured Dr. Beati's excellent annotations on the Legacy, with several other valuable pieces from his numerous correspondents. The period in which this author flourished appears to have been an era when English husbandry rose to great perfection; for the preceding wars had made the country gentry poor, and, in consequence, more industrious. They found the cultivation of their own lands to be the most profitable part they could occupy. But a few years afterwards, when the Restoration took place, all this industry and knowledge became useless, from the new fylem that was acted upon, and were exchanged for heedlessness and dilapidation; from which husbandry pulled almost entirely into the hands of common farmers. But the famous work usually attributed to Hartlib, and called the Legacy, was only drawn up at his request, and, after passing through his correction and revision, published by him. The real author of the treatise, which confines of one general answer to the following question: "What are the actual defects and omissions, as also the possible improvements, in English husbandry?" was a person of the name of R. Child, who seems to have been acquainted with many ingenious improvers of agriculture at that period. Several other pieces succeeded the publication of the Legacy, which greatly improved and augmented the means of cultivation.

Grew, by the publication of the Anatomy of Plants, and shewing, in some measure, the economy of the vegetable fylsem, contributed to change the views and extend the enquiries concerning the nature of vegetation and the food of plants. But a principal writer who inspired his countrymen, with a desire of reviving the study of agriculture after the Restoration, was Evelyn; who being followed by Ducket, Ray, Dugdale, and several other authors, the art of cultivation was greatly recovered, and some new improvements introduced; and the establishment of the Royal Society which took place a few years afterwards, contributed still more fully to the advancement of it, by serving as a focus for collecting and recording valuable materials on the nature of vegetation and the principles of agriculture, as well as other subjects. About the year 1706, many additions and improvements were made in this useful art.—Mortimer, by his explanations of various practical modes of management; Bradley, by reducing the facts on vegetation into a more systematic order; Hales, by his valuable natural experiments and investigations; and Miller, by the publication of his dictionary, and other works, contributed very materially. But agriculture is probably still more indebted to the exertions of Tull, notwithstanding the evident futility of many of his propositions, as by shewing the utility and importance of draining, and frequent hoeing or shoveling the ground about the roots of plants, and thereby keeping them clean and free from weeds, farmers have been induced to adopt more clean and sure methods of cultivating their arable lands. The introduction of this system of management, therefore, in some degree, forms an era in the history of English husbandry.

In Ireland about the middle of the last century, the art of husbandry began to make considerable progress; that country having had very strong prejudices in behalf of a very wretched method of agriculture, until about that period, when Blythe opened the eyes of the people by his incomparable writings, since which a spirit of improvement has, more or less, been promoted and carried on with zeal and constancy by the nobility, clergy, and gentry of the kingdom. In proof of which it may be sufficient to observe, that a society for the encouragement of agriculture has been established, the transactions of which are highly respectable and important. In many respects, however, Irish husbandry is still much behind that of Britain.

At the conclusion of the peace of Aix-la-Chapelle, almost all the nations of Europe, by a sort of tacit covenant, applied themselves to the study of agriculture; and continued to do so, more or less, amidst the universal confusion that soon succeeded. The French found, by repeated experience, that they could never maintain a long war, or procure a tolerable peace, unless they raised corn enough to support themselves in such a manner as that they should not be obliged to submit to harsh terms on one hand, or perish by famine on the other. Their king, therefore, thought proper to give public encouragement to agriculture, and was even present at the making of several experiments. The rich and great, of various ranks and stations, followed this noble example, and the ladies even put in for their share of fame in the laudable undertaking. Even during the hurry and distresses of the last war, some attention was paid to agriculture. Prize questions were then proposed annually in rural academies, particularly at the two academies of Lyons and Bourdeaux, and many alterations were made by the society.
society for improving agriculture in Brittany; and after the conclusion of peace, matters were carried on with greater vigour.

The university of Amiens has made various proposals to the public for the advancement of husbandry; while the Marquis de Tourbillon, a writer, proceeding chiefly on experience, undertook the principal direction of the Sociological Society, established at Tours, and the society of Rome was also usefully employed on the same subject.

It may be added, that many societies were afterwards established by royal approbation, for the promoting of agriculture, and rendering the knowledge of it more general, and extended.

The convulsive shocks of the Revolution, which has overturned many useful establishments, and retarded the advancement of many improvements, has not by any means prevented the progress of agriculture, as is evinced by the appearance of numerous papers on the subject in the transactions of different societies. Indeed, it would seem probable, that from the crippled state of commerce in that country, unusual attention has been paid to the art of cultivation.

The science of agriculture is publicly taught in the Swedish, Danish, and German universities. Nor has Italy been inactive. The Neapolitans of the present age have commenced to turn back to the first rudiments of revived husbandry, and begun to study anew the agriculture of Crete, first published in the year 1478. The people of Bergamo have pursued the same track, and given the world a new edition of the Ricordo d’Agricoltura di Terra, which was originally published at Mantua, in 1577.

The duchy of Tuscany has imbibed the same spirit. A private gentleman left his whole fortune to endow an academy of agriculture. Even Ferrara, a small territory in the papal dominions, has contributed its just contingent, and made some valuable attempts in this art. Animated with a desire that the people under his government should excel in husbandry, his Sardinian Majesty, sent several students to learn the practice of foreign countries, and made several attempts to establish a better method of agriculture among his subjects. In Poland, where a natural fertility of soil forms in some measure to dispence with the necessity of calling in improvements, M. de Bielinski, formerly grand marshal of the crown, made many successful attempts to introduce the new or drill husbandry-among his countrymen, and procured the half instruments from France, England, and other parts of Europe.

The Hollander seem to have given the least attention to agriculture, if we except a few collateral instances, such as the draining of fens and morasses, and the making of canals and embankments; and even these have probably proceeded more from the motives of self-preservation, than any particular turn towards husbandry.

In the year 1759, a society established itself at Berne, in Switzerland, for the advancement of agriculture and rural economy. That society collected of many ingenious private persons, and allof some of great weight and influence in the republic; most of them men of a true call for the improvement of husbandry, being enabled to join the practice with the theory. They have published several useful papers on different matters connected with the subject. We must not omit to mention here, that Linnaeus and his disciples performed much in the north of Europe, particularly in discovering new, profitable, and well-tasted food for cattle. At the same time Sweden has bestowed useful labours on a soil, which was before looked upon as cold, barren, and incapable of improvement; of this the memoirs published at Stockholm will be a lasting monument. Denmark, as well as many courts in Germany have followed a similar example. His Danish Majesty encourages, in particular, the wooden manufacture; and the late King lent three persons into Arabia Felix, to make remarks, and bring over such plants and trees as might be useful in husbandry, building, &c. Nor has the duchy of Wurttemberg, a country by no means particularly favourable to corn and paflurage, failed to contribute its influence towards the improvement of agriculture, having some time ago communicated to the public its economical labours from the preb at Stuttgart. The learned of Leipzic, and Hanover, have not been inattentive to the art of supporting human kind; for amidst the rage and devastations of war, the Journal d’Agriculture, printed at Leipzic, and the Recueils d’Hanovre, printed at that city, have been brought out.

Even Spain, naturally inattentive on these occasions, in spite of all the prejudices of a bigoted religion, invited Linnaeus, with the offer of a large pension, to superintend a college, founded for the sake of making new inquiries into the history of nature, and the art of agriculture.

But it is probably in our own country that agriculture has been most attended to, and received the greatest improvement; from his Majesty having long, with a patriotic zeal and personal attention, worthy of the elevated situation which he holds, directed his views to the introduction of new and better modes of cultivation and rural improvement, as well as economy and convenience in the management of every department of agricultural business, connected with his varied and extensive farms, an example and encouragement has not only been held out, but an attention excited to the art, which could not possibly have been produced by any other less distinguished means; so that there is reason to hope, from the spirit that now animates a great number of the nobility and gentry, that this useful art may, in a few years, be carried to a much greater degree of perfection than it has yet reached in any age or nation. In this view, the respectable society established at London, for the encouragement of arts, have already done much, and there is reason to hope, from their increased resources, that they may do much more. A vast variety of different machines for facilitating the practice of agriculture have been invented and presented to the public, in consequence of the large premiums and bounties which have been offered. The institution of societies in many different parts of the kingdom for the improvement of agriculture, and the endowment of a professorship at Edinburgh for the same laudable purpose, cannot but promote the study, and enlarge the boundaries of the science.

About the year 1767, Mr. Young commenced his valuable and well directed labours, which, by attracting the attention of practical agriculturists on those improved means of cultivation that are made use of in parts of the country, very remote from each other, and shewing the great utility of experimental inquiries on the subject, and by promoting and diffusing a taste for the science, from the early and popular language of his writings, have rendered the most essential advantages to the agriculture of the nation. Doctor George Fordyce has likewise contributed in so small degree to the advancement of the science, by the publication of his Elements of Agriculture and Vegetation, a work in which the chemical principles of the various substances that enter into the composition of soils and manures are well explained.

Mr. Marshall too, by registering the local customs and practices of different districts, has afforded considerable service to the farmer, by bringing him acquainted with a variety of modes of rural management, which he could not otherwise have known.
The indefatigable exertions of Dr. Anderson in promoting the improvement of the more practical branches of the art, by his various detached writings, have likewise contributed much to its advancement; and Mr. Bakewell, by drawing the attention of the breeder and grazier to the most advantageous modes of breeding, rearing, and feeding, as well as the general management of different kinds of live stock, has greatly promoted the improvement of that intricate, though important branch of husbandry, which has since been brought still nearer perfection by the vast and well directed exertions of his Grace the Duke of Bedford, and other noblemen, equally zealous in forwarding the advancement of this difficult department of the art.

But neither the distinguished example of the Sovereign, the endeavours of provincial societies, nor the exertions of private individuals, with whatever zeal and attention they may be directed, are probably sufficient to extend the knowledge of husbandry to that degree which is necessary for its complete and radical improvement. This could only be fully accomplished by the powerful influence and expensive exertions of a national establishment instituted for the purpose. Such an institution has at last been brought forward and established by the intelligent and persevering efforts of Sir John Sinclair; to the honour of the country, the age, and the individual who suggested it. The institution of a Board of Agriculture and internal improvement has already contributed materially to the extension and advancement of the knowledge of rural affairs. The state of the art in the greatest part of the kingdom has been ascertained, a great variety of new and interesting facts and practices have been brought to view, and improvements in the instrumental and other departments suggested. Among these the elucidation of the principles and practice of draining or removing the injurious wetness of land, arising from springs and other causes, as laid down and explained by Mr. Elkingston, is of great importance and deferring of notice, not only as the basis or foundation of many improvements in the art, but as leading to the convenient and easy application of water for irrigation and various other purposes. See Board of Agriculture.

In addition to this great source of improvement, the science of agriculture has lately derived essential advantages from the judicious application of the principles of other sciences.

In this respect the modern discoveries in chemistry and vegetation have been particularly important, as is evident from the works of Tillet and Hallenfraitz, on the Continent, and of Pridie, Anderson, Kirwan, Dundonald, Darwin, and many others in our own country. By these our knowledge of the principles of vegetation, and the operations of different substances upon each other, has been much enlarged; and our acquaintance with the nature, formation, and modes of applying manures, or the food of plants, rendered more clear and satisfactory.

Agrielea, in Botany, the wild olive. See LEX and HOLLY.

Agrician, or Isle of St. Francis Xavier, in Geography, one of the Ladrones or Marianas islands, which is mountainous and large, being about 50 miles in circumference, and remarkable for its volcano. N. lat. 19° 4'. E. long. 146°.

Agrigentum, or Agrigas, in Ancient Geography, a very famous city on the south coast of Sicily, near the spot which is now occupied by Girgenti. The principal part of the ancient city, as Mr. Swinburne and M. Houelle inform us, lay in the vale; and the present town of Girgenti is situated on the mountain, where was the citadel of Cocalus, and probably the ancient city. Agrigentum derived its name from Acragas, the original name of the city, and also of a neighbouring stream, both which according to Polybius, were so called from the country, denominated ερείπιον, acrages, on account of its fertility. Some authors, ascending to fabulous antiquity, relate, that Dedalus fled to this spot for protection against Minos, and built many wonderful edifices for Cocalus, king of the island. Polybius (lib. ix. p. 560. Ed. Calabri.) says, that it was founded by a colony of Rhodians; that it was situated on a rock; and guarded by a fortres to which there was only one way of access; and that in the citadel there was a temple of Minerva, and also of Jupiter Atbyrus, who was worshipped under this appellation, in the isle of Rhodes. Thucydides (Hist. lib. iv. p. 380. Annal. p. 23. Ed. Duker) informs us, that Acragas was founded by a colony from Gela, under the command of Arilontius and Pythius, in the 50th Olympiad, or 579 years before Christ. It lies between the rivers Agragae and Hypsa, the former of which is now called Fiume di Gergenti, and Fiume di San Biagio, and the latter Fiume Drago. The situation of Agrigentum was admirably adapted to the purposes of defence, commerce, and pleasure. It was guarded by a barrier of rocks, which were strongly fortified; sheltered by pleasant hills; and enjoyed the view of a spacious plain, watered by the Acragas, and a convenient port or emporium at the mouth of the river. Its free government and commercial spirit raised it to a degree of wealth and power, exceeded only by those of Syracuse. Its buildings of every kind were in a singular degree magnificent and splendid. Besides the temples already mentioned, that of Jupiter Olympius deserves particular notice. According to the account of Diodorus Siculus (lib. xiii. tom. i. p. 607. Ed. Weilhinger,) it was 340 feet long, 60 broad, and 120 feet high. This historian extols the beauty of the columns, which supported the building, the admirable structure of the porticoes, and the exquisite talle with which the bas-reliefs and paintings were executed; but he adds, that the stately edifice was never finished. On the eastern side was exhibited the battle of the Giants, and on the west the capture of Troy, with the figures of the heroes in their appropriate habits. Cicero, against Verres, speaks of the magnificence of the statues which he carried away. Mr. Swinburne informs us, (Travels, vol. iv. p. 244.) that it has not now remaining one stone upon another; and that it is barely possible, with the liberal aid of conjecture, to discover the traces of its plan and dimensions. He adds, that the cathedral of Rome exceeds this celebrated Agrigentine temple more than doubly in every dimension, being 215 feet higher, 334 longer, and 433 wider. The other ruins which this writer surveyed, and which he curiously described, are those of the temple dedicated to Ceres and Proserpine, the peculiar patronesses of Sicily, the temple of Juno, the doric temple of Concord, which has all its columns, entablature, pediments, and walls entire, with part of the roof wanting; and which is now converted into a church, consecrated to St. Gregory, bishop of Girgenti; the temple of Hercules, the tomb of Thers, the temple of Eucaliptus, and the temple of Caftor and Pollux. Near this is a large lake or fish pond, described by Diodorus at seven stadia in circuit and 20 cubits deep. It was cut in the solid rock, and water was conveyed to it from the hills; a great quantity of fish was bred in it for the public entertainments; swans and other wild fowl swam along its surface for the amusement of the citizens, and the depth of water prevented an enemy from surprizing the town on that side. It is now dry, and used as a garden.

The inhabitants of Agrigentum, with all their advantages, were corrupted and enfeebled by their addictedness to luxury.
luxury and pleasure; and fell a sacrifice to the power of their enemies. Empedocles attempted their reformation; and, as Diogenes Laertius informs us (1. 8. segn. 63. tom. i. p. 532. Ed. Melibom.), reproached them with devoting themselves every day to pleasure, as if they were to die on the morrow, and with building their houses, as if they were to live for ever. They are commended, however, for their hospitality, for which they were no less distinguished than for their magnificence and luxury. Gellius, a rich citizen, placed porters at his gate, to invite strangers to take their repast and rep in his house; and he is said to have once entertained 500 horsemen with meat, drink, and clothes. Phalaris, whose name is familiar to most readers, on account of his cruelty, and the brazen bull in which he tortured his enemies, usurped the sovereignty of Agrigentum, in the second year of the 52d olympiad, B.C. 571; but having possessed it for about 16 years, he shared the common fate of tyrants, and is said by some, to have been put to death in his own bull. After his death, the Agrigentines enjoyed their liberty about 50 years; at the end of which period, Therone assumed the sovereignty. Under his government, which was just and moderate, Agrigentum was tranquil and secure; and in consequence of his union with his son-in-law, Gelon, king of Syracuse, in a war against the Carthaginians, Sicily was, for a time, delivered from her African oppressors. He was succeeded by his son, Thaeridens, who was deprived of the royal authority; and Agrigentum was reduced to her old democratic government. Its tranquility was interrupted by Dextus, a chief of the mountaineer descendants of the Siculi; but restored by the co-operation of the Syracusans. The union of the Agrigentines and Syracusans did not long continue; and the former, after an unsuccessful contest, were obliged to submit to humiliating terms of peace. The enemies with whom they next had to contend were the Carthaginians; who routed their armies, took their city, and almost extirpated their race. The situation of Agrigentum, on that coast of Sicily which faced Africa, and its prodigious wealth, induced Hannibal to open his campaign with the siege of this city; and the event was peculiarly distressing to the inhabitants. Those who were able to remove, during the progress of the siege, which lasted 8 months, went to Gelon; those who were left behind were committed to the sword, by the orders of Himilcon; and the riches of a city, which had contained 220,000 inhabitants, and which had never before been plundered, were rifed by the conquerors. The city itself was reduced to ruins. This calamitous event happened in the 92d olympiad, or about the year B.C. 410. Agrigentum remained for 50 years buried under its own ruins, till Timoleon, after vanquishing the Carthaginians, and restoring liberty to Sicily, collected the descendants of the Agrigentines, and sent them to re-establish the habitations of their ancestors. Such were the vigour and steadiness of their exertions, that Agrigentum was soon in a condition to arrogate supremacy over all the Sicilian republics. At length, they and their leader Xenodochus, after some favourable operations against Agathocles, who was supported by the Carthaginians in his usurpation of the sovereignty of Syracuse, were reduced to the necessity of humbly yielding to him for peace. This commonwealth afterwards took a strong part with Pyrrhus, king of Epirus, in his attempt upon Italy; and when he left Sicily to the mercy of his enemies, threw itself into the arms of Carthage. During the first Punic war, Agrigentum was the head-quarters of the Carthaginians; it was defended by a numerous garrison, under the command of Hannibal; and, after refiling a blockade of seven or eight months, was at
AGRIMONY, or Agrimont, in Geography, is a small ruined town in the Basilicata, in the kingdom of Naples. E. long. 22° 34'. N. lat. 40° 25'.

AGRIMONY, in Botany. See Agrimonia.

AGRIMONY, hemp, in Botany. See Eupatorium.

AGRIMONY, bagourd-hemp, See Ageratum.

AGRIMONY, water-hemp, in Botany. See Bidens.

AGRINAGARA, in Ancient Geography, a town of India, on this side the Ganges; placed by Pliny in long. 110° 17', and lat. 22° 30'.

AGRINUM, a town placed by Polybius in Aetolia. It was on the left of the river Acheus, and north-east of Thermus.

AGRICARDAMUM. See Cardamine.

AGRICASTANUM, the name as earth-nut, popularly called pig-nut, and arnott.

AGRICINARUM, in Botany, a name used by some authors for that species of wild artichoke, the root of which is used instead of the costus nigra.

AGRIOCACCINELA, or pomus sylvestris. See Plumtree.

AGRIOMELA, a name for the crab apple.

AGRIOMELANZANION, in the Botanical Writers of the Ancients, a word that has perplexed many of the later writers. The Arabic writers, Avicenna and Serapis, used the word bedegium for the fruit of the pomum amarum, a kind of ecident night-shade; or falafum, called by the old Greek writers, as Theophrastus, &c. frydium, and only distinguished from the other frydium, or night-shades, by its being described as wholesome, not poisonous. From this Arabic word Bedegium, the Italians formed their word melanzana, and the late Greek writers their melan- zanion, which they used as the name of the same fruit. This, when the plant was cultivated in gardens, was probably larger and fairer than when it grew wild; but in this latter state it was not used, but was distinguished by the term agrimonezianion. If the Greeks, who used this word, or the melanzanion, would have appropriated them to the pomum amarum, and distinguished these from the other night-shades, they would have done service to the world.

AGRION signifies the fruicidanum, called alto agrin- phyllon.
AGRIOPHAGI, compounded of 

ANTHOPHAGA, a division in the 

Entomology, comprehending five 

species, and many varieties, which are referred to the genus 

Agriophaga, in the Linnæan System, by Cramer. They 

are characterized by having wings erect when quies-

cent, eye remote, and the exterior laciniæ of the lip 

filiform.

AGRIOPHAGI, compound of agriphagas, wild, and 

aedes, the same, in Antiquity, a name given to those 

who feed on wild beets. Pliny places them in Ethiopia. 

Pliny refers them to India, on this side the Ganges, and 

attributes the appellation to the people whom he calls 

Pulindas.

AGRIORIGANUM, in Botany, wild marjoram.

AGRIOSELINUM, signifies wild sallows.

AGRIFALMA, a name given to mother-wort.

AGRIHNEN, in Ornithology, a genus given by Buffon 

to the emberiza oryctes, of the Linnæan System.

AGRIPO, in Geography, a peninsula, commonly called 

Negrofons.

AGRIPIPA, a name applied, among the ancients, to 

children born in an unusual or irregular manner; particu-

larly such as come with the feet foremost, instead of the 

head.

They were called agrippas, according to Pliny, on ac-

count of their being (agre parti) born with difficulty. 

Salmacius derives it from the Greek agrippa, incantation, and 

agrippa, q. d., a hunter of hares.

Daventer has a particular chapter of agrippas, or infants 

coming with their feet foremost, which, according to him, 

is one of the most convenient and safe ways for a mature 

birth.

Agrippa gives the denomination to an unguent, de-

scribed in the Antidotarium Nicolai, and in several other 
dispensatories, supposed by some, to have been invented 
by Agrippa, king of Judaea, but, as others suppose, by 
Julius Agrippa, a Roman physician.

AGRIPIPA, in Biography, an astronomer of Bithynia, 

lived towards the close of the fifth century. Prolemy in 

his Almagest informs us, that Agrippa observed a con-

junction of the moon with the Pleiades on the 29th of 

November, in the fourth year of the 217th Olympiad, or 

A. D. 92.

AGRIPIPA, Henry Cornelius, a physician, philosoper and 

divine, of various and great attainments, but of an eccen-

tric disposition, which exposed him to so great vicissitudes 
of fortune, was born at Cologne, September 14th, A. D. 

1486, of a noble family, which had been long in the ser-

vice of the house of Austria. In early life, he was secre-

tary to the emperor Maximilian, and continued his military 

service in the army for seven years. As a soldier he di-

tinguished himself by his valour, and obtained the honour 
of knighthood; nor was he less distinguished by his ap-

plication to literature and science. Of eight languages, 

which he acquired in his youth, six were so familiar to 
him, that he could even use them fluently in public dis-
course. Soon after he forsook the military profession, 
he obtained the united academical honours of doctor in law and 

physic. The philosopher's stone, as it was called, or the 

art of transmuting base metals into gold, engaged his at-
tention; and in the pursuit of it, he had no doubt of 
commending the admiration of the multitude, and the pa-
tronage of princes. With these romantic views he com-

menced his travels; and in 1507, being then in the 21st 
year of his age, he visited France, and in the following 
year spent some time in Spain. Upon his return to France, 
he retired at the college of Dole in Burgundy, and read 

public lectures in divinity; in consequence of which he 

was appointed regent with a salary. Notwithstanding his 

popularity, as a public lecturer, the freedom and novelty 
of some things which he advanced alarmed the monks, and 
rendered it necessary for him to surrender his office at Dole. 

In 1510 he passed over from France into England, and 

during his stay in London, published a treatise on the 

epistles of St. Paul. His next remove was to his native 
city, where for some short time he read lectures in phi-

losophical theology: he afterwards resumed his military 

station in the emperor's army in Italy; but he was soon 

induced by Cardinal de St. Croix to abandon this connec-
tion, and to attend as a theologian at the council of Pisa. 

After the dissolution of this assembly, he read lectures in divinity, 

sometimes at Turin, and sometimes at Pavia. But he 

was constrained by the difficulty of procuring decent sub-

sistence for his wife and son, to whom he was affectionately 

attached, to leave Pavia, and to try what his friends at 

Cologne could do for him. In 1518, their interference 
availed in procuring for him the office of syndic, advocate, 
and orator of the city of Mentz. Here he provoked the 

enmity of the monks, partly by maintaining the dan-

gerous error, that St. Anne, the mother of the Virgin Mary, had 

only one husband, whereas it was the popular opinion that 

she had three; and partly, by exercising himself in the vi-

dication of a poor woman, who had been accused to the 
inquisition of witchcraft. In 1520, he left Mentz, and 

returned to Cologne, where he left his wife in 1521. Re-

fusing to take his temper, he removed to Geneva; and here, in 1522, 

married a second wife, whom he supported by the practice 
of physic, as long as he continued in this city; but in 

1523, he exercised his profession at Friburg in Switzerland, 

and in 1524, settled at Lyons, as physician to the 

mother of Francis I. This lady, apprehending that he 
could, by his Astrological talents, predict future events, 
desired to be informed concerning the affairs of France. 

Agrippa was duped by the application; the prince, 
delighted by his refusing to satisfy her curiosity, discon-
tinued his pension, and this circumstance involved him in 

new difficulties. His next settlement was at Antwerp, 

where his singular talents attracted general notice, and pro-
cured for him various offers of distinguished patronage. In 

1529, he was honoured with invitations from Henry VIII. 

of England, the chancellor of the emperor, an Italian 
marquis, and Margaret of Austria, mistresses of the Nether-
lands. He accepted the proposal of the latter, and be-
came historiographer to the emperor Charles V. Agrippa's 

eccentric genius would not allow him to enjoy at ease the 

honor and emolument to which he was intitled. In 1530, 

he published "A Treatise on the vanity of the Sciences,"

which was a severe satire on the monks, theologians, preach-
ers, and members of the universities; but Erasmus, in speaking of this work, says, "that on every occasion he lashes vice and commends virtue; but there are persons who can bear nothing but praise." On this occasion, the emperor, probably inflamed by hisifter, whom the monks had prejudged against Agrippa, withdrew his pension, and suffered him to be imprisoned for debt at Brussels, in 1531. After the death of Margaret, Agrippa was released from prison; but he published another treatise at Antwerp, "On Occult Philosophy," which revived the animosity of his enemies. The design of this work was to explain, on the principles of the emanative system, the harmony of the elementary, celestial, and intellectual worlds. But the clergy discovered or suspected error, and hereby; and succeeded in delaying the publication of a third edition. But in 1533 it was published at Cologne; and another edition appeared in 1542, which is the most complete, and the most scarce. This publication was accompanied with an "Apology for himself to the Senate of Cologne," which excited violent resentment, and obliged him to withdraw to Bonn, where he is said to have divorced his third wife, whom he had married after the death of his second in 1529, by whom he had five sons. The peculiarity of his temper, and the narrowness of his circumstances, impelled him once more to try his fortune in France; and accordingly he returned to Lyons in the year 1535. Here his reception was very different from what he expected: he was imprisoned on account of some satirical papers which he had published against the mother of Francis I. Having obtained a release, he retired to Grenoble in the same year, 1535, and there he died, either in the hospital of the city, or in the house of a friend.

As Agrippa was an adept in chemistry, and professed to be an astrologer, he was reputed to be a magician, and supposed to be accompanied by a genius, or devil, in the shape of a black dog. That he was not possessed of the grand art of alchemy is plain, from the poor circumstances in which he lived and died. He possessed wonderful talents for acquiring the knowledge of languages, and a veracity of genius, which enabled him to assume and exercise a variety of professions. He was a soldier and a philosopher; a municipal officer and a lecturer; a lawyer and a physician; an astrologer and a divine. Nevertheless, he was always embarrassed and distressed; and though one flattering prospect after another presented itself, he could not so avail himself of them as to procure a permanent competence. Such was the liberality of his mind, and the extent of his knowledge, that he might have been eminently useful in instructing and reforming the age in which he lived, if he had not been fickle and selfish. While he applauded Luther, he continued in the communion of the church of Rome, and obtained the commendation of the pope for his fidelity. "If he had any decided principles, they were those of that mythical system of philosophy, which finds a sublime and spiritual meaning in all the operations of nature, and leads the soul, (according to his own language, in his Epistles) to a mysterious intercourse, and an essential and immediate union with God. The most valuable service which he performed to society was that of chastising the follies of ignorance and the vices of priesthood, in his satirical writings, which entitle him, in the scale of letters, to a place, though of inferior distinction, with Erasmus. In fine, Agrippa, though an extraordinary, and on the whole a splendid character, was rather a dazzling meteor than a steady and useful luminary."

His principal writings, besides those we have mentioned, and several other pieces, were, "A Dissertation on Original Sin," designed to prove that the fall of our first parents was the consequence of unholy love; "A Declaration on the excellence of Women," written to gratify Margaret of Austria: "A Commentary on the Art of Raymond Lully," which is as unintelligible and ridiculous as the original. A mutilated edition of his works was printed at Lyons, in 1600, in 1586. They were published in French at Paris, in 1726. His "Vanity of the Sciences" was printed in 1640, at Antwerp, in 1520, 1532, 1539; and the last edition has a head of the author. It was printed at Paris, in 1531, and has been translated into Italian and French. Gen. Diet.

Agriffa, surnamed Castor, flourished under the Emperor Adrian, about the year 132. Ennius (Bccl. Lib. iv. c. 7. p. 120. Ed. Val. Ex.) represents him as an excellent writer, who had ably confuted the errors of Dafides; but his works are lost, and no considerable fragment of them remains.

Agriffa I., Herod, was the son of Aristobulus, by Berenice, the daughter of Herod the Great. He was brought up at Rome, with Drusus, the son of Tiberius; but having been reduced to penury by his liberality and profusion, he was under a necessity, upon the death of Drusus, of retiring to Judaea, where he immured himself in a castle of Idumea, and determined to starve himself to death. His wife, Cyprus, the daughter of Phaestus, and the granddaughter of Herod the Great, diverted his purpose, by procuring for him some present relief. He also obtained temporary assistance from Herod, the husband of Herodias, who made him a magistrate of Tiberias; but afterwards upbraiding him at a banquet with his kindred, Agrippa was offended, and withdrew to Puteoli, governor of Syria, and afterwards to Rome. Here he attached himself to Caius Caesar; and having incensed Tiberius, by some expressions that signified a wish for his death, and which were reported to the emperor, he was thrown into prison and loaded with chains. Upon the death of Tiberius, and the accession of Caius Caligula, he was immediately released and distinguished by tokens of favour. The new emperor arrayed him in purple; exchanged his iron chain for one of gold of the same weight; put a diadem on his head, conferred on him the title of king, and granted him the tetrarchy of his late uncle Philip, and that of Abilene, in Syria, which had formerly belonged to Lyons, A.D. 39. After continuing a year at Rome, he obtained leave to visit his new dominions; and embarking at Puteoli, he sailed over to Alexandria, where his magnificent entry provoked the inhabitants, and exposed him to insult and indignity. The conduct of Flaccus, the Roman governor, who refused him the redress which he demanded, and who was a violent persecutor of the Jews in this city, was reported by Agrippa to the emperor; and by him he was ordered to be recalled, stripped of his wealth, and banished into an island of the Archipelago, where, at length, he was put to death. Herod Antipas, who had, on a former occasion, treated Agrippa with contempt, beheld his elevation with jealousy and envy; and accompanied by his wife, Agrippa's sister, he took a journey to Rome, in order to obtain similar honours; but Agrippa, in the mean while, secured Herod to the emperor, as having been concerned in the conspiracy of Sejanus, and thus procured his discharge and banishment to Lyons, in France. Caius conferred the treasures of Herod, and also the tetrarchy which he had possessed 43 years, on Agrippa. A circumstance, however, occurred at this time, A.D. 39, which was a very severe test of Caligula's attachment to Agrippa. The emperor had ordered his statue to be erected and worshipped in the fabric.
AgrIPPa, who was now at Rome, contributed to the accession of Claudius; and was commenced by the confirmation of Caligula’s grants; by the addition of Judaea, Samaria, and the Southern parts of Idumea; and by several edicts in favour of the Jews. He was, likewise, honoured with the confederate indignation, and indulged with the privilege of paying his compliments to the emperor in Greek; a ceremony which was usually performed in the Latin language. At his request, the kingdom of Chalæis, in Syria, was bestowed on his brother and son-in-law, Herod. All these grants were engraved on copper, and fet up in the capital: and Agrippa was thus poifon’d of territories, which extended to the farthest limits of the dominions of his grandfather, Herod the Great. Agrippa, soon after the establishment of Claudius, returned to his kingdom, where he manifested a zealous attachment to the religion of his country; and caused the golden chain, which Caesars had given him, to be hung up in one of the most conspicuous parts of the temple, as a monument to posterity of the indulgence of human affairs. He depofed and appointed several high-priests in a short time. His government was conducted, according to Josephus, with a great degree of moderation and clemency; but Dion Cassius, (lib. lix. tom. ii. p. 928. Ed. Reimari) says, that Agrippa was reckoned one of Caligula’s advicers in his cruel and tyrannical measures. If he had been less anxious to please the Jews, he would not probably have disgraced his reign by the perfecution of the Chalæans, who seemed to have been very quiet at Jerusalem ever since St. Paul’s conversion. The martyrdom of James the L.t., the brother of John, and the imprisonment of Peter, are justly ascribed to him. But with his zeal for the Jewish rites and practices, he blended Heathen observances, which gave offence; and, in conformity to the Roman taste, he exhibited shows of gladiators and public games. At Cæsarea, whither he went with a splendid and numerous retinue, for the purpose of celebrating some games in honour of Caligula Caesar, he appeared in a brilliant garb on the theatre, and addressed an elegant speech to the deputies of Tyre and Sidon, who appeared before him to make an apology for some offences, and to solicit his future favour. Their embassadors, and other attendants on the occasion, expressed their admiration in the most extravagant terms; exclaiming, that his voice was that of a god, and not a man, and practising some attitudes that approached to those of adoration. The king, to far from restraining these expressions of flattery and homage, manifested his approbation of them; he was immediately invested with a violent disorder in his bowels, probably similar to that of Herod, his grandfather, and attended with the same circumstances, which, after a torture of five days, terminated in his death. A.D. 44., in the 54th year of his age, and the 7th of his reign. He left a son of the same name, and three daughters, viz. Berenice, who was married to Herod, her father’s brother; and Mariamne and Drusilla, both unmarried, but contracted; the former to Julius Alexander, the son of Chæleis, or Eileius, probably of the Herodian family; and the latter to Epiphanes, the son of Antiochus, king of Comagene, but afterwards married to Azizus, king of Emæa. Mariamne abandoned Alexander, her husband, to marry Demetrius, a noble and rich Jew of Alexandria, and one of the chief magistrates; by whom she had a son, named Agrippinus. Drusilla left her husband, and renounced the Jewish religion to marry Felix, governor of Judæa: by him she had a son, called Agrippa, who perished with his mother, in the confusion occasioned by mount Vesuvius, under the emperor Titus. His death was celebrated at Cæsarea with tumultuous rejoicings, and his memory infalted with the vilest outrages. Joseph. Antiq. Philos. Legat. Ant. Un. Hist. vol. iii. p. 272.—279. 8vo.

AgrIPPa II. Herod, was the son of Agrrippa I.; educated at Rome, and at the death of his father was 17 years old; and therefore thought too young for succeeding in the kingdom. Judea, on this occasion, became a Roman province, and was committed to the care of Cæsius Fadus, who received instructions to punish those who had insulted the memory of the late king. When Herod, the uncle of Agrrippa, died, the superintendency of the temple and sacred treasury, the privilege of nominating the high-priest, and the kingdom of Chalæis, were conferred upon him. He refused chiefly at Jerusalem, where, with his father Berenice, he heard Paul’s defence before Felix, the Roman governor, (recorded Acts, xxxv. xxvi.) and owned himself almost convinced by it. Agrippa displeased the Jews by building a palace, which overlooked the temple, and exposed their service to the view of Felix and the Romans; but to prevent this intrusion, they erected a partition wall, which the king ordered to be demolished. On application to the emperor, and by the intercession of Poppea, the wall was allowed to remain. At the commencement of that revoit, which terminated in the destruction of the Jewish nation, Agrippa, attempting to appease the Jews, was so infalted by them that he was obliged to secure himself from their violence, by leaving Jerusalem. He afterwards joined Cæsius, the Roman governor; and when Vespasian arrived in the province, he met him with a considerable reinforcement, and accompanied him to Rome, when he took possession of the empire. During the siege of Jerusalem, he was very serviceable to Cæsarius; and after its reduction, he and Berenice (with whom he was suspected to have had excucious intercourse) retired to Rome. His kingdom is said to have been enlarged by the influence of Cæsius, who was passionately attached to his sister Berenice; and who would have married her, if the Romans had not refigured his design, partly because the was a Jewess, and partly because he was royally defended. He was, therefore, obliged to find her away. As for Agrippa, he was the last of the Herodian race that bore the royal title, and is supposed to have died at Rome, as some fay, A. D. 102; according to others, A.D. 95; and as others fay, A. D. 100. Joseph. Ant. Bell. Jud. Ant. Un. Hist. vol. iii. Gen. Diet.

Agrrippa, Marcus-Vulmissus, was a person of obscure origin at Rome, educated with Octavius, afterwards Augustus, distinguished as his companion and friend, confided as his favourite general, in all the vicissitudes of his life, and lamented by him at his death. Although his family
A gr

mily is not known, he must have risen into early notice, as his first wife was Attica, the daughter of Pomponius Atticus. When the war broke out between Marc Antony and Octavianus, Agrippa refuted Salvidius, the general of the latter, in circumstances of imminent danger, and, concuring with him, drove Lucius, Antony’s brother, into the city of Perga, and underwent the place before he had time to reflect on his own perilous situation. Being afterwards appointed commander of the fleet of Octavianus, he took Thira, one of the Æolian islands, and afterwards obtained, by his skill and valour, a complete victory over the whole fleet of Pompey, for which he was honoured with a standard and a rostral crown. On another occasion, when Antony had assembled his fleet at Actium, Agrippa interrupted its convos and having made several conquests on the coast of Greece, which harried the enemy, and dispersed a squadron that was advancing to join Antony, he directed the famous naval engagement that ensued, and by which Octavianus secured the empire. Octavianus, having thus acquired the supreme power, consulted his two friends Agrippa and Mecenas, whether he should retain his supremacy or surrender it to the senate. Agrippa advised the restoration of the Roman liberty; but Mecenas’s advice to retain his power was more agreeable to the views of Octavianus, and was therefore followed; and yet Agrippa still retained his master’s favour. In the year before Christ 28, they were colleagues in the consulate, which was the second time of Agrippa’s bearing that office; and the coalition was renewed in the following year.

Agrippa by marrying Marcella, the emperor’s niece, was received into the imperial family; and in their command of the army, Octavianus and Agrippa possessed equal authority and distinction. His munificence was signalised by the buildings which he erected at Rome; the most remarkable of which were his porcia for the use of public assemblies, and the famous temple called the Pantheon. When Octavianus was dangerously ill in the year before Christ 23, he committed to him his ring, which being considered as a preference of Agrippa for his successor, offended Marcellus, and rendered it necessary on the recovery of Augustus, to remove him from court by an honourable exile to the rich government of Syria. Upon the death of Marcellus, Agrippa was recalled to Rome, where he was married to Julia, the daughter of Augustus and Marcellus’s widow, and contributed to restore the tranquillity of the city. The next service he performed was to oppose the Germans, who had made an incursion into Gaul, and to drive them back beyond the Rhine. The Cantabrians, who were vigorously combating for liberty, demanded greater exertions; but they were at last completely reduced. A triumph, which he declined, was decreed to him by the senate on this occasion; but in commemoration of his service, Augustus associated him with himself in the tributum power, which was conferred on him for five years; he was also appointed joint censor, and concurred with Augustus in that office of the Order. His two children by Julia were also adopted by the emperor in the year before Christ 17. After three years he was sent to appease the dissensions that had occurred in the east. As he was passing through Ionia with Herod the Great, the Jews complained to him, that they were hindered in sending their tribute to the temple at Jerusalem; that they were obliged to serve in the army; and had other hardships imposed upon them inconsistent with the privileges granted them by the Romans. Agrippa gave them and their adversaries a solemn hearing, and in court confirmed to them their privileges; and gave orders, that no one should molest them in the observation of their peculiar rites and customs. Having also appeased some troubles which had arisen in the Cimmerian Bosporus, he returned home, and a triumph was again decreed to him, which he refused. After this period no person that was not of the imperial family ever obtained a triumph in Rome. The tributum power having been renewed to him for five years more, he was next sent to Pannonia, and having quieted the disturbances in that country, he returned to Italy, where he was attacked in Campania, with a fever that soon terminated in his death. A. U. C. 743. B. C. 12. in the 51st year of his age.

Augustus, as soon as he heard of his death, left the sports which were then exhibited by his two grandsons in honour of Minerva, and hastened to visit his dying friend; but he had expired a few minutes before his arrival. He was greatly affected, and he lamented the loss of the greatest general of his age, the wisest minister, and the most faithful of all his friends. His body was conveyed to Rome, and buried in Augustus’s own mausoleum, near Maecenas; the emperor pronounced his funeral oration, and declared, that he would not be separated, even after his death, from two persons, whom he so tenderly loved in his life. By his will he bequeathed the fine gardens and baths, which were called by his name, to the Roman people; but his principal heir was Augustus. His surviving children were one daughter by his first wife Cecilia Attica, named Agrippina, and married to Tiberius; and three sons and two daughters by his third wife Julia. Two of the sons died in their youth; and the other, Posthumus Agrippa, was sacrificed to the jealousy of Tiberius soon after his accession; one of the daughters, viz. Julia, was married to Lucius Paulus; and the other Agrippina, to the celebrated Germanicus. Agrippa’s fame sufficiently established by his great actions, has derived an accession from the immortal records of poetry. Virgil, in his anticipation of the battle of Actium, gives the following dignified sketch of this commander:

“Parte afflata ventis et dis Agrippa secundus,
Arduus, armis armatur : cui, bellis insigni superbum,
Tempora natalis fulgenter rostrata corona.”

Æn. viii. 682.

“Agrippa secundus, atque propitius gales,”
And with propitious gods, his foes affalls:
“A naval crown, that binds his manly brow—
The happy fortune of the fight foresees.”

Dryden.

Agrippa, Menenius, was confid of Rome, A. U. C. 251. Ante Christ. 503. He obtained the honours of a triumph for a complete victory, which he and his colleague P. Polliinanus gained over the Sabines. When the people reviled the tyranny of the Patricians, in the consulates of Virginius and Veturius, he was deputed to effect a reconciliation; and it is said that, on this occasion, he pronounced the famous apologue of the stomach and members, by which, with promises of a redress of grievances, he gained his purpose. In their demand of magistrates of their own (who were the tribunes) to protect their rights, he acceded; and he advised the senate to comply. He died, at an advanced age, with a character highly esteemed for wisdom and integrity; but too poor, that his relations intended to bury him in a private manner. The people, how-
AGrippa, in Ancient Geography, a colony of Bithynia in Asia, formed by the Agrrippae.

AGrippiades, a name given by Herod to AThedon.

AGrippina, the elder, in Biography and History, was the daughter of Marcus Agrippa, and wife of Germanus Caesar. When the German Legions revolted in the beginning of the reign of Tiberius, she attended her husband in the camp; and though she had the charge of an infant son and was pregnant with a second child, it was with difficulty that she was persuaded to retire from the danger that threatened them; and the commissation which her situation excited induced the revolters to return to their allegiance. On another occasion, when the victorious Germans were on their march to make an irruption into Gaul, and it was proposed to demolish the bridge on the Rhine, near Treves, in order to stop their progress, Agrippina prevented it, and thus secured a retreat for Cecina and his legions. When they arrived, she met them at the head of the bridge, returned them thanks for their valour, and distributed among them clothes and medicines. The jealous Spirit of Tiberius took offence at this conduct, which merited commendation, and aggravated the dislike with which she was regarded at court, in consequence of her disaffection with Livia, the mother of the emperor. She afterwards attended her husband in his difficult and perilous expedition to the Eastern provinces of the empire, and was the forrowful witness of his last conflict, which happened at Antioch, A.D. 19. The dying prince conjured her by the memory of a husband once deare to her, and by her children, the product of mutual love, to refrain her great spirit, yield to her humble fortune, and take care at her return to Rome not to irritate those in power by an ill-judged rivalry. Agrippina gathered the ashes of her deceased husband, and braving the dangers of the sea in the perilous season of the year, laden with home, and landed at Brundisium, carrying the sepulchral urn, and accompanied by two of her children. The mournful spectacle produced an universal groan amidst the multitude, who waited her landing; nor were the lamentations of relations to be distinguished, as Tacitus has described the scene, from those of strangers, nor of men from those of women. Agrippina's spirit was unsubdued; after her return to Rome, she forgot the dying charge of her husband, and fell a sacrifice to the wicked arts of Sejanus. By his agents he persuaded her, that it was the intention of the emperor to poison her; and she had the imprudence to disclose her suspicion to the reigning tyrant. This circumstance induced him to determine upon her ruin; and immediately after the death of his mother, Livia, he sent to the senate letters of accusation against her and her son Nero. The senate hesitated; but Sejanus furnished the evidence that was necessary for their condemnation. She was banished to the isle of Pandataria, now Santa Maria, lying off the coast of Terracina; and her son Nero was banished to the neighbouring isle of Pontia, where he soon died. Drusus, her second son, was confin'd in the lower apartments of the palace, and there famili'd. Agrippina survived about four years; and her death, which happened through want of food, either voluntarily or by compulsion, A.D. 33, was announced by Tiberius to the senate; and the savage tyrant accepted the thanks of this body, for not ordering her to be strangled, and her body to be exposed like that of a common malefactor. This pretended clemency was more than counter-balanced by a charge against her of adultery with Afinius Gallus, whose death, he said, had been the cause of hers. Her known character for chastity repelled this infamous charge; and Tacitus sums it up in a few words, by observing, that "impatient of equality and greedy of domination, she had banished female frailties by her masculine ambition". Her remains were brought in great pomp from Pandataria, by her son Caligula, soon after his accession, and deposited in the mausoleum of Augustus, and all sorts of honours were paid to her memory—"an instance, says an excellent biographer, of filial piety, which is one of the best things recorded of that imperial monster!" Tacit. Annal. lib. i. ii. iii. iv. Crevier's Hist. of the Emperors, vol. ii. iii.

Agrapilla, the younger, was the daughter of Germanicus, by the preceding Agrippina, and the mother of Nero. In the year 28 she was married to Tiberius to Ca. Domitius, belonging to the imperial family, but faithless, ferocious, and debauched; and as Agrippina was no less profligate than her husband, Domitius might well observe, as Suetonius informs us, (in Nero c. 6. tom. ii. p. 374. Ed. Pitr.) when he was congratulated on the birth of a son, that from him and that prince's nothing could be born but some monster, fatal to the human species; and his declaration was too exactly verified by the crimes and cruelties of Nero. Agrippina was distinguished with honours by her brother Caligula, at his accession; but left her husband before the end of that reign. Before his death, however, she had an intrigue with M. Lepidus, who was the companion of Caligula in his debaucheries, and who aspired to the empire; and he was concerned with him in his conspiracy against his brother. For this crime she and her sister Julia were deprived of the honours, which were conferred upon them at the commencement of this reign; their possessions were forfeited and sold by an auction in Gaul, at which Caligula presided; and they were banished to the isle of Pontus. Agrippina was compelled to carry in her arms the urn that held Lepidus's ashes all the way from Gaul to Rome; and at the same time Tiberius, under the charge of adultery with her, was exiled. In the reign of Claudia, Agrippina was recalled from banishment, and married to a second husband, whose name was Crippus Passionus, a celebrated orator, who had been twice banished, and who was very rich; and whom his wife poisoned in order to obtain possession of his wealth, which he had bequeathed to her by his will. After the death of Messalina, the third wife of Claudia, this emperor was induced A.D. 48, by the persuasions of Pallas, to marry his niece Agrippina, who exercised the new powers she thus acquired with a degree of haughtiness, injustice and cruelty, that might have been reasonably expected from her well-known character. She did not blush, says Tacitus, to prostitute herself to Pallas, in order to secure her son's elevation, and to gratify her own insatiable thirst for gold; and because Lollius Paulina had then been the rival for the imperial dignity, she was banished and put to death; and Dion Cassius (lib. lxx. tom. ii. p. 970. Ed. Reimari.) says, that she was brought to Agrippina, who opened and examined the teeth, in which there was some particular mark, that she might thus identify her person. She manifested her wisdom, however, in using her influence for recalling Seneca from banishment, and placing her son Nero under his tuition; but regardles of every principle of justice, she engaged the interest of Pallas, and prevailed with the weak emperor to adopt her son Domitius, then (viz. A.D. 50) called Nero Claudius Caesar, though he had a son of his own, Britannicus, to whom he was affectionately
fectionately attached, and to give him the prerogative of an elder brother. On this occasion Agrippina herself received an additional honour in the surname of Augusta. Britannicus was deprived of every opportunity of recommending himself to his father, and reduced by the arts of the emperors to the most despided condition. Agrippina ostentatiously exercised her authority in establishing a colony at the capital of the Ubi, where she was born, and in giving it the name of Colonia Agrippina, or Agrippina's; but it has been for many ages called Cologne, and the name of Agrippina has been suppressed.

Her vanity also led her to obtain leave to enter the capital in a car, like those in which the priests were carried, and on which all sacred things were deposited. In order to gratify her aversion, as well as her pride, she caused Statius Taurus to be accused, and provoked him by false charges to suicide, that the might get possession of his fine gardens. At length, Claudius began to be sensible of the crimes of Agrippina; and after drinking freely he happened to drop an expression, which alarmed her, viz., that it was his fate first to bear the wickedness of his wives, and then to punish them. She had also a rival in Demetia Lepida, Nero's aunt, a woman no less unprincipled and debauched than herself; and she contrived, by accusing her of forcery and magic and other crimes, to destroy her. She then directed the efforts of her malice against Narcissus, who was the declared friend of Britannicus and a powerful freedman; and succeeded first in driving him from court, and at length in procuring his death, as well as that of Julius Silanus, who was of high rank, and a descendant of Agrippus. In the mean while, having removed Narcissus, the vigilant guardian of Claudius's life, she determined to sacrifice the emperor himself.

His attachment to Britannicus was undiscoulered; and he resolved upon soon giving him the toga virilis, "that Rome, as he said, may at last have a true Caesar." Agrippina's fears accelerated her purpose; and she applied to Locuta, who had been lately condemned for administering poison after she had been long spared as the useful instrument of tyranny, to prepare the poison by which she designed to get rid of the emperor. The poison was mixed with mushrooms, a favourite dish of Claudius, and very speedily produced effect. Having dispatched the emperor, A.D. 54, she pretended sorrow on the occasion; and affecting tenderness for Britannicus, whom she kept in a state of confinement, she caused Nero, accompanied by Burrhus, to appear before the soldiery, and to be acknowledged as emperor.

The enormities with which Nero's reign commenced were sanctioned by her example, and encouraged by her authority. To her Nero paid great respect and deference, calling her "the best of mothers;" and the senate granted her the privilege of being preceded by two lictors, and the dignity of priestess of Claudius, whom she had poisoned. These tokens of respect served only to inflame the ambition of Agrippina, whose design it was to reign under her son's name. Accordingly she privately and by concealment attended the debates of the senate, and at a public audience of ambassadors, she attempted to ascend the throne with her son; but was feasibly restrained by the intercession of Seneca, that he should defend and meet her. But the soon perceived that her power began to decline, and this was a mortification, which her proud and violent spirit could not well bear. To divert the evil she at one time raved and menaced, and at another returned to every complying and soothing measure. The disgrace of Pallas was very hostile to her influence; and her son's respect diminished in proportion to the degree in which his independent power was established, by the removal and death of Britannicus, and his consequent refuge from the danger of a rival. When she attempted to pay court to the soldiery and nobles, Nero deprived her of her guards and honours, excluded her from the palace, and obliged her to retire, solitary and neglected, to her own palace. Nevertheless, she was again restored to favour, which she endeavoured to secure by various arts; and, as it is said, by some compliances, which are the most odious and reproachful that can be conceived of in the relation of a mother and son. Poppaea's influence over Nero from became paramount to every other; nor was it restrained even by the guilt of paricide, to which she stimulated him. But how to perpetuate this horrid deed, without exposing himself to public detestation, was a subject of serious deliberation. At length a galley was prepared by Anicetus, commander of his fleet, which might easily admit water, and founder; and Agrippina was enticed on board in the Baiae bay. The flat-top, however, did not succeed; for though Aestonia, the companion of Agrippina, left her life, Agrippina herself got safe to shore. The crime could no longer be concealed; and it became necessary to complete what had been begun. Accordingly Anicetus, with a body of mariners, surrounded the houfe where she had taken refuge; and entering her chamber, dispatched her with many wounds, A.D. 59.

To the assassins, it is said, she presented her womb, and bade them strike that part which had harboured such a monster. She was buried the same night without any ceremony, and had no tomb whilst Nero lived; but after his death some of her surviving servants erected a mean monument over her remains, near the high road from Rome to Misenum. Nero affected contrition after the event; but afterwards wrote a letter to the senate, or rather procured one to be written by Seneca, for which he has been much blamed, accusing her of many crimes, and charging her with a conspiracy, which rendered her death a fortunate event to the Roman people. The senate fervently decried thanks to the gods for his escape, and the day on which Agrippina was born to be marked in the calendar as an inauspicious day. Her crimes were of the most atrocious kind, and her memory has been execrable. Nevertheless she is said to have been a princess of some learning, and to have written memoirs of her life, referred to by Tacitus and the elder Pliny. Suetonius in Calig. Claud. and Nero. Tacit. Annal. lib. xii. 14. Crevier's Hist. Rom. Emp. vol. iii. and iv. Vols. de Hift. Lat.

AGRIS, or Agrés, in Ancient Geography, the name of a town of Carmania, between the mouth of the Sarus and the first that leads to the Perilyn gulf. Long. 96° 30'; and lat. 23°, according to Ptolemy.

AGRIUS, in Entomology, a species of the Sphinx Zygena, which is black, with wings pointed with green; the primores black, and the posterior blue; found in Syria.

AGRIZALA, a town of Asia Minor, belonging to the Tébæse of Galatia. Long. 2°. Lat. 41° 50', according to Ptolemy.

AGRUM, in the Materia Medica of the Ancients, a name given to an impurer part of natrum. The purer sort of this salt they call salmynhagia, and the coarser and dirtier kind agrum. The former of these they had from Media, the latter from Thrace.

AGROIR, a name which some have given to Attica of Lydia.

AGROCA Road, in Geography, lies to the west of the Bosphorese, near Portobello, on the Spanish main, and is well
AGRON, a disease frequent in Bengal, and other parts of the Indies, wherein the tongue and ears are in several places, being also extremely rough, and sometimes covered with white spots. The Indians are very fearful of this disease, which they attribute to extreme heat of the sun.

Their remedy is, to chew the black-beeded bsadica, drink from amblycathed liquor, or the juice of large mint.

AGROPOLI, in Geography, a town of the Principato Citera of Naples. on the gulf of Salerno; 26 miles southwell of Cangiano; and 22 miles south-south-east of Salerno. E. lat. 14° 50'. N. lat. 40° 25'.
the following species, viz. 1. As florensis, creeping B. or black squinch, with branches of the panicule spreading, naked, creeping culm, and equal calyces. Dr. Smith describes this species as having a compact panicule, ramose creeping culm, rosette flowers, and calyces equal, lanceolate and pubescent. 15. A. capillaris, fine B. with panicule capillary, spreading, flexuose, and calyces equal, pubescent smooth (slightly roughish, Gmel. coloured). 16. A. falcicula, wood B. with panicule contracted, calyces equal, those of the barren flowers shorter than the corolla, and those of the fertile ones twice as long. 17. A. alta, white B. with panicule loose, calyces equal, and culm creeping. 18. A. pumila, dwarf B. with panicule on one side, culms erect in branches.

19. A. minimia, leaf B. with panicule flexuose, flowers, elliptic, retuse and awnless, and villous corolla. 20. A. centifolia, tough B. with panicule contracted, filiform; flowers linear, and valves parallel. 21. A. virgina, virginian B. with panicule contracted; leaves rolled inwards; pubescent, rigid, spreading out. 22. A. mexicana, Mexican B. with panicule oblong-headed; calyces and corolla acuminate and nearly equal. 23. A. purpurascens, purple B. with panicule contracted, elongate, branches pruned close upright, and flowers unequal and acuminate. 24. A. media, Indian B. with panicule contracted, racemes lateral, erect; alternate. 25. A. filiformis, ciliate B. with glumes of the calyx angular and ciliate. 26. A. paniculata, bearded B. with panicule subspiculate; branches and branchlets fascicled; valves of the calyx and one of the corollas awned, that of the corolla very short. 27. A. kitaibelii, forked B. with spikes subterete, umbellate, floccules ample, acicular, ciliate valves subequal, leaves and sheaths smooth. 28. A. complanata, flat-forked B. with spikes umbellate, smooth; outer ciliate valves awned; flat-tipped leaves and smooth sheaths. 29. A. punnica, prickly B. with panicule contracted, leaves involute, stiff, pungent, the upper ones obliquely opposite, and branching culm. 30. A. vinicola, short-awned B. with culms ascending, calyx coloured, awn nearly straight, from below the middle of the back, about as long as the calyx. 31. A. ovata, ovate-panicle B. with outer petal awned below the tip; panicle ovate, contracted and spikelike. 32. A. odorata, sweet B. having spikes, with the florets pointing one way, heaped together, awnless. 33. A. phylloclinia, plaited-leaved B. with leaves plaited, and spike linear, awnless. 34. A. stiata, with panicule contracted, awnless, flowers acuminate, with one, two or three flaments, and leaves flat, pubescent. 35. A. diandra, with panicule elongate, contracted; flowers pubescent, awnless, diandrous or two-flaminante; and convolute leaves. Gmelin has omitted some of the preceding awnless species, and added the following, viz. A. verticillata, with straight panicle, interrupted by radiate rigid verticillate or whorled. A. pumila, with stiff panicule, having flowers, and an erect culm. A. linearis, with subquaternary digitated spikes, and adpressed alternate, unilaterale floccules. A. procera, with the foot-flanks of the panicle, racemose and somewhat erect, and the flowers hairy and lanceolate. A. coronandiana, with the panicule ovate, patent, the foot-flanks simple; second flowers, and equal, acute, glossy calyces. A. affinis, with contracted panicule; lateral alternates, (awnless, and rough leaves. A. vevnacea, with an erect, very slender panicule; and the awns twice longer than the calyx. A. glomerata, with bifid, glomerate, terminal spikes, and clawed plumose bracteae. A. heterantha, with blind, lateral, solitary spikes, and clawed plumose bracteae. Dr. Stokes has observed that this is an artificial genus, and that the species which are chiefly distinguished by the presence or absence of the awn in the corolla, and which is inconstant, are not precisely ascertained. He therefore recommends particular attention to the open ordered

flat in which the valves of the calyx are found, immediately after the shedding of the pollen and the ripening of the seed, and likewise to the flowers, whether they are furred or chaffed.

The first species, which is annual, is common in fairly corn-fields, and flowers in June and July. It is liable to be smothered. The second, according to Halder, a variety of the former: it is annual, and a native of France, Italy, Switzerland, Carniola, and Germany. The third is a native of Montpellier, Spain, and Siberia, was introduced by M. Thouin, in 1726, and resembles the first. The fourth is perennial, and grows wild about Montpellier. The fifth is a native of Portugal. The sixth is a native of many parts of Europe, and is perennial. Halder and Scopoli rank it amongst the arundines. The Kaimuna Tartars weave mats of it, and that their hovels with it. Goats will eat this stuff rather than eat it. The seventh refers to the former: it is perennial; and a native of Germany and Switzerland and about Verona; these two species are referred by Gmelin to the genus Calamostre, and are the C. arundinacea. The eighth species was collected by Seguier, near Verona. The ninth is common in Sweden, and found in Scotland, in low pastures. The tenth and eleventh were found in the Island of Terceira, by Maffei. The twelfth is found in the sandy lands of Malabar. There are two varieties of the thirteenth, the rough and the smooth, which Dr. Stokes in Withering's arrangement makes a distinct species under the name of A. alpina, and so classified by Gmelin; this is found plentiful in the higher districts in Dorsetshire and the higher parts of the new forest of Hants, and flowers in May and June. But Dr. Smith (Flor. Brit. vol. i. p. 78) refers the A. canina, (a) of Hudson to the species of A. canina, and also the A. vinicola of Withering; and says it is perennial, flowering in July, and found in meadows and moor pastures; and the A. canina (b and c) of Hudson, and A. alpina of Withering, above described, to a distinct species, viz. A. stiata, bristly B. with lanceolate calyces and corolla awned at the base; the own gynoecium and the radical leaflets fimbriate. It is perennial, flowering in July and August, and found on dry heaths, frequently in the west of England, and on the downs near Weymouth. The fourteenth is perennial, a native of most parts of Europe, and found in moist meadows and pastures, and also in thin cold arable lands, where it is very troublesome; for when such lands are broken up and followed, the roots are separated with difficulty from the adhesive foliage. It flowers in July and August. Hudson joins this species with the capillaris, plumea, alta, and sylvatica, under the name of polycarpa; and Gmelin queries whether these and also the virginica are not varieties of the same species, owing their difference merely to the soil; some have supposed that this is the famous orchestona grass. The fifteenth is very common, but chiefly grows on poor, dry and sandy land, and is disliked by cattle, as are the bents in general; it flowers in May and July. Gmelin queries whether it be not a species of alepecarpus. Some have supposed that the A. capillaris of Linnaeus, is the same as the A. vulgarius, which has a spreading panicule, branches bare at the base; florets numerous, calyx inner valve smooth, outer furrowed upwards; blofion inner valve, but half the size of the outer; deciduous. Linnaeus confounded these two plants; but the error was discovered by Dr. Smith. In general habit, says Withering, the plants are very much alike; but the real A. capillaris has the stem, leaves and hules of the calyx quite smooth, as well as every other part of the plant, whilst in the A. vulgarius the stem-leaves are rough, and the hules of the calyx are furrowed on the
keel, as they are in every other British species of agrollis, except the *minus*. Again, in the *capillaris*, the valves of the blossoms are equal, but in the *vulgaris* the inner valve is only half the size of the other. Dr. Smith (Flor. Brit. vol. i. p. 79) characterizes the *vulgaris*, or fine B. as having a spreading panicle, small branches diversified and capillary, equal calyces, interior petal twice as short as the other; and to this species he refers the *capillaris* of Withering; the *capillaris* of others, and the *polyomorpha* of Hudson, and as varieties, the *cinaea* of Withering, the *pallida* of Linnaeus, and the third variety of Withering’s *vulgaris*. It is perennial, flowers in July, and is found in meadows, pastures, and ploughed fields. The sixteenth species is perennial, and grows in molehills, woods, as Bilhopp’s wood, Hampstead, and also in Hornby wood, near London. It flowers in June and August. The seventeenth is perennial, and grows in ditches, marshes, and moil meadows. Withering enumerates four varieties; one with panicled branches, crowded with florets at the base, which flowers in June and July, and is found in wet ditches, bogs, and marshes; a second, with calyx, both valves furcated, supposed to be the preceding plant, when growing in a drier situation, and found amongst wheat, in light sandy loam, flowering from July to September; a third, with the inner valve of the calyx only furcated upward, found in loamy soil, amongst wheat, and in very light sandy soil under the Norfolk coups of turnip husbandry, and also elsewhere amongst potatoes; flowering from July to September; the fourth has both valves of the calyx furcated, the inner only on the upper half; it is found amongst wheat, in light land; flowering from July to September. The three last varieties constitute the greatest part of what is called squithe, in light arable lands; which are called white squithe, to distinguish it from *nigra* and *fusoniera*, which are called black squithe, or couch. Dr. Smith enumerates only two varieties, viz. the *alba*, and *fusoniera*, i.e. marsh and wood B. which he refers to this same species. The eighteenth is a native of Iceland, Sweden, Germany, Switzerland, England in dry places, Wales and Scotland; found in poor barren soil, e.g. heaths near Harrowgate, perennial, and flowering in July. The nineteenth is a native of France and Germany, and has been discovered by Mr. Stillingfleet in Wales; it is common in sandy pastures on the south-west coast of Anglesea: By some it is denominated Bpring-plant, and said to flower early in March and April, and ripen its seed in May. Dr. Stokes refers this species to the *Poa*. The twentieth is perennial, and a native of the East Indies. The twenty-first is an elegant little plant, and called by Browne crab-grass. The twenty-second is a native of South America, flowering the second year, having the appearance of cynna, and introduced in 1780, by Mr. G. Alexander. The twenty-third is a native of Jamaica; the twenty-fourth is a native of India, introduced in 1773, by the Earl of Bute; the twenty-fifth a native of Japan. The twenty-sixth comprehends the *paniculatus* and nonpliellus *alpecurus* in the Linnaean system; the first grows in marshes and wet pastures, and the second in a dry soil, to which the difference is probably owing. The twenty-seventh is a native of the East Indies, found there by Dr. Koenig, and introduced in 1778 by Sir Joseph Banks. It is annual, and flowers in July and August. The twenty-eighth is a native of Jamaica; introduced in 1779; perennial, and flowers in July and August. The twenty-ninth is a native of Arabia and Barbary, used by the Arabs in the hemorrhoids; perennial, and found in dry places off the coast in the country of Nice. The thirtieth is a native of Switzerland and the north of England; found on heaths, meadows and moil pastures, which have been long in turf. Some parts of Hounslow heath abound with it. Dr. Smith (Flor. Brit. vol. i. p. 78) refers the *vulgaris* of Withering to the *cinaea*. The thirty-first is a native of New Zealand: the thirty-second of Cochinchina, near the coast, where it is dried and used for perfuming their clothes; the thirty-third a native of the Suburbs of Canton. The thirty-fourth and thirty-fifth have been referred by some to *cinna*. Dr. Withering mentions some other species, viz. *A. pollyfus*, with the halves of the calyx equal, and the outer valve of the blossom twice the length and breadth of the inner; and its a strong, much shorter than the blossoms, fixed a little beneath its point; some consider this as an annual variety of the *albus* of Hudson, but Dr. W. regards it as a distinct species. It is found in swamp and moil ditches; perennial, and flowering in June and July. *A. pallida* is similar, with the valves of the calyx unequal; the inner valve of the blossom hair-like, very short, and somewhat longer than the blossom, fixed below its middle; and is sufficiently distinct from both the *alba* and *capillaris*: found in the New Forest, Hants, and flowering in May and June. *A. littoralis*, with panicled somewhat like the blossoms of the calm awns; first found on the Norfolk coast by Sir Joseph Banks, perennial, flowering in June. The *A. littoralis*, sea-tide B. According to Dr. Smith (ubi supra) has linear-lanceolate awned calyces, naked corolla; anw sub-terminal, and deciduous calyx. It is perennial, flowers in August, and is found in chesey sea-shores; in salt-marshes near Cleve, Norfolk. *A. nigra*, with scattered panicule, branches bare at the base, florets few; inner valve of the calyx smooth, and creeping root; it is different from the *sulonifera* of Linnaeus, to which some have referred it; found in marly, clays, and other cold wet soil, both in grafts and under tillage; perennial, flowering from July to October. *A. maritima*, with large, rather spreading panicule; longer branches naked, shorter ones crowded with florets at the base; inner valve of the calyx smooth, outer furrowed upwards; gathered by Dr. Pulteney in the sand on our southern sea-coasts; perennial, flowering in June and July. The *A. vulgaris* has been already mentioned. Martyn’s Miller’s Dict. Withering’s Bot. Arr. vol. ii. p. 124-134.

For the propagation and culture of several of the above species, see Grass. For other species, to which the name has been applied, see Aera, *Alpecurus*, *Calamagrostis*, *Cenchrus*, *Melica*, *Milium* and Schoenus.

*Agrostographia*, compound of *agrostis*, *grafs*, and *graph*, definition, *Physiology*, the history, or definition of *grains*, or plants of the grassy kind.

*Agrostographia* is also the title of a learned and laborious work of John Schenck, containing an exact description of about 400 species of grapes; particularly dog’s tooth, cyperus, cyperoideus, ruha, &c. all disposed in a new method; yet the history is far from being complete.

*Agrotiri*, in *Ancient Geography*, the most southern promontory of the island of Cyprus, cal of Limafol. It is a small peninsula, connected with the continent by a very narrow tongue of land, and is now called Cape De Gatti, on account of the great number of cats kept by the monks, who, in the 4th century, obtained permission to establish themselves there, as well as on Mount Olympus, on condition of keeping a great many of those animals for hunting snakes, which had multiplied to an alarming degree; and which, it is said, have no greater enemies than cats. Sonnini’s travels in Greece and Turkey, p. 56.

*A-ground*, in *Sea-language*, expresses the situation of a ship whose bottom, or any part of it, rests upon the ground.

*Agryla*, in *Ancient Geography*, a city of the island
of Sardinia, founded, according to Steph. Byz. by a colony of Athenians.

AGRYPNIA, *wetness*, a privation of sleep; otherwise called watching, waking, vigilis, persiguidum, &c. Among physicians, this is a troublesome symptom in fevers and other disorders. In the Greek church, it is used for the vigil of any of the greater feast-days, observed by the monks and clergy. Du-Cange.

ÁGUA, in Geography. See Oegwa.

ÁGUA, Fort Harbour, is situated about a league north-north-east from Ferrofa harbour, on the east coast of Newfoundland.

ÁGUA de Pao, a small town in the island of St. Michael, one of the Azores. It is situated in a fertile territory, which produces abundance of corn and excellent fruit. W. long. 25° 40'. N. lat. 38° 10'.

ÁGUA, Riu del, a river which falls into Bonaventura bay, on the coast of Popayan, in the South Sea; in about W. long. 77° and N. lat. 3° 30'. It affords good anchorage.

ÁGUA, Resa, a small place in the province of Tras-os-montes, in Portugal.

ÁGUADE, a river which runs into Smienda bay, near Cape Roque, on the coast of Brazil, about W. long. 34° 30'. and S. lat. 5°.

AGUADE, de Saldana, a gulf on the coast of Africa, 15 leagues north from Table bay.

ÁGUADEIR-Toma, a town of Africa, in the empire of Morocco, in the province of Tis, 13 leagues south of Santa Cruz.

AGUADEORE, a river in the island of Cuba, on the south side, and nearly north from the east end of Jamaica. Its mouth is in W. long. 75° 35'. and N. lat. 20°.

ÁGUAAGUIN, in Botany, the name of a shrub among the Africans, which they esteem greatly as a balsamic and vulnerary. The leaves of this shrub resemble those of our common lilac; they grow alternately, and stand upon foot-stalks of half an inch long; and when held up to the light, they show a fine texture of the smaller veins. Philos. Trans. No. 232.

AGUAPECACA, in Ornithology, the name of a Brazilian bird of the moor-hen kind. It is of the size of a pigeon, very long-legged, and has a beak like that of the gallinaceous kind; its back, and the upper part of its wings, are brown, and in each wing they have a sharp horn, or prickle, serving for their defence. Maregrave.

This is the jacana-poca of Buffon, the jacana annata of Briffon, the Brazilian jacana of Latham, and the *Parras Brasilita* of Gmelin's Linnean System, characterised by having the hinder claws very long, and the body greenish-black. At Guiana, where it is common, it is called kapoua, and also kinkin, from its thrill note: these birds are gregarious, and are found in flocks in the ditches, and among the rushes on the sides of the lakes; and they live on fish and water-insects.

AGUARA-QUIYA, in Botany, a Brasil plant, thought to be the *folium vulgare*, or common night-shade, by Ray.

AGUARA-FONDA, a plant, otherwise called viola *filicata* Brasilita. It grows to the height of a foot and an half, or more, with a smooth, round, green, and jointed stalk; at each joint come forth four, five, or more, narrow, ferrated, pointed, green, and unequal leaves: the top of the stalk bears an ear a foot long, smooth, and covered with flowers of a fine violet azure, or the colour of our viola maritisa, confisting of five roundish leaves. The whole flower is not unlike the viola maritisa, and has something of its smell; the root is bright of a moderate thick-ness, and shoots out into abundance of lesser ones, and these again into filaments.

There is another kind, distinguished by the width of its ear of flowers, which represents a helmet of a green colour. It is marked with cubic pits, from whence proceed azure flowers. Ray.

AGUAS, in Geography, a people of South America, on the banks of the river of the Amazons. They are said to be less polished than any other of the Indian nations.

AGUAS Bellas, a small place in the province of Estremadura, in Portugal.

AGUATULCO, Aquateulco, or Guatulco, a town and port of Mexico. Its harbour is large and much frequented. It is situated in the South Sea. W. long. 96° 40'. S. lat. 15° 10'.

AGUBENI, in Ancient Geography, a people placed by Ptolemy upon the frontiers of Arabia Deserta, very near Arabia Felix.

AGUCCHIA Giovanna, in Biography, was an engraver of the 16th century. He engraved the large design for the dome and cathedral of Milan. Strutt.

AGUE, in Medicine, a periodic discafe of the fever-kind, consisting of a cold flowering fit, preceded by a hot one, and going off in a diaphoresis or sweating. If the coldness and flowering be inconsiderable, and only the hot fit, the diseafe is called an intermittent fever. According to the periods or times of the return of the fit, the diseafe is either a quotidian, tertian, or quartan ague, or fever. The cause of Agues, as well as of the remittents of hot climates, is now believed to be the miasmata or effluvia arising from putrid animal and vegetable fabltances mixed, or from the latter alone. See Dr. Jackson, &c. on Fever.

Sir John Pringle accounts for them by means of the principle of putrefaction. The heat of the body, he observes, varies little; and therefore the corruption produced in any of the humours must happen in a determinate time. If we suppose, that in the paroxism, the more corrupted particles of the blood do not at all pass off through the skin with the sweat, but that some part of them is discharged with the bile; their particles coming into the infeetines, and being from thence taken up by the lacteals, and carried into the blood, may there act as a new ferment, and occasion a return of the fit. Thus the corruption of the bile may be the cause of the first fit as well as of those that follow. He further adds, that though all moist countries are subject to aches of some kind or other; yet if the moiiture is pure, and the summers are not close and hot, they will mostly be regular tertian agues, and admit an early cure. But if the moiiture arises from long flagating water, in which plants, fishes, and insects live and rot, then the damps, being of a putrid nature, occasion not only more frequent, but more dangerous fevers, which more commonly appear in the form of quotidianns, and double tertians, than that of single ones. Accordingly they are found to vary with the season, on which the degree of putrefaction in a great measure depends.

These opinions of Sir John Pringle, as far as they reft on putrefactive particles, or ferments in the living body, are entertained only by a few pupils of the Boerhaavian school. The theories of fever in most general estimation at present, are contained in Dr. Darwin's Zoonomia, and Dr. Cullen's first lines.

The symptoms are, heaviness and reaching; a weak slow pulse; coldness and flowering felt first in the joints, thence creeping over the whole body; pain in the loins, and an involuntary motion of the under jaw.

This cold flage varies in its duration and severity with the kind of ague. It is shortlft in the quotidian, and most diffentrent in the tertian.

The cold flage is succeeded by a full strong pulse, differting
AGUEDA, in Geography, a town of Portugal, in the province of Beira, upon a branch of the river Vouga, six leagues north of Coimbra. W. long. 8° 30'. N. lat. 45° 30'.

AGUDEM, a river of Leon, which passes by Ciudad- Rodrigo.

AGULON, one of the Laccadive islands, in the Indian sea. E. long. 73° 25'. N. lat. 11°.

AGUER, a sea-port town of Africa, situated at the foot of Mount Atlas, in the kingdom of Morocco. This town was built by the Portuguese, near a remarkable cape, on the north-west of the mouth of the river Sas, now called Cape Glee. It was taken by Diego Lopez de Seguerra, who afterwards made a voyage to the East-Indies. As the town had a convenient harbor, and was famous for its fisihery, this adventurer erected a strong fort to defend it. He sold it to Emanuel, king of Portugal, who added other fortifications, and a strong garrison. But after a vigorous defence, in which the enemy loft 16000 men, it was surrended, A.D. 1536, to Mohammed, who became emperor of Morocco and Fez; and in revenge for his loss, he put the whole garrison to the sword, except the brave governor Mon Roy, whom he spared and favored for the sake of his daughter, Donna Mercia, who conferred to marry him, on condition of being allowed the free exercice of her religion, and of being regarded as his lawful wife.

AGUESSEAU, Henry Francis D', in Biography, a chancellor of France, was born at Limoges in 1668, of an ancient family of Saintonge. He owed the first rudiments of that literature to which he was devoted, to the instruction of his father, and to his distinguishing taste for poetry to the society of Boileau, Racine and other eminent writers of that clas. After having held the office of advocate-general of Paris for ten years, he was appointed procureur-general in 1700; and in this situation he distinguished himself by introducing several regulations, which contributed to the improvement of jurisprudence. He also directed a particular attention to the hospitals, and to the hardships occasioned by the scarcity in 1709, which indicated the amiable philanthropy of his temper, and in which he was singularly useful. He also approved himself the strenuous defender of the liberties of the Gallican church, in opposition both to Lewis XIV. and the chancellor Voisin, who solicited his concurrence in favour of the bull Unigenitus. After the death of Voisin, and in the regency of the duke of Orleans, he was made chancellor; and performed the duties of this office with that eminent wisdom and firmness, which the circumstances of the times demanded. In his resistance of the financial project of Law, he was for some time successful; but when the regent determined to adopt it, he was constrained in 1718 to retire to his country-fest at Fresnes; but in 1720 he was recalled and reinstated in his office. He was again deprived of it in 1722, recalled by Cardinal Fleury in 1727, and reinvested with the seal in 1737, which he held till his death. From the year 1729 to 1749 he was sedulously employed in reforming the laws, and remedying many notorious abuses that disgraced and obstructed the administration of them. His object was to supply their defects, and to facilitate the execution of them, without changing their fundamental principles; but in this extensive and laborious employment his progress was slow; and he met with difficulties, from his extensive views and from a regard to the profits of the legal profession, which produced indecision in his own judgment, and served to retard his dispatch of business. For the flowerets of some of his determinations, he makes this very reasonable apology: "when I recollect (said he) that the
the decree of a chancellor is a law, I think myself permitted to take a long time for consideration." His life, though affably occupied, was prolonged by his temperance and equanimity; but in the year 1750 his increasing infirmities admonished him of the necessity of withdrawing from public employments; and in 1751 he closed his life at the advanced age of 83 years.

Voltaire calls him the most learned magistrate ever possessed by France. Besides the languages of antiquity, he was acquainted with all the principal modern ones; and to his knowledge of the history of all ages and nations, he added that of jurisprudence in its most extensive sense. During his exclusion from office, he made no attempts for being relieved; but always manifested a disposition superior to the honours which his talents and merit claimed, and a desire to be useful rather than to aspire after power and to accumulate wealth. Of his frugality, and of the various emoluments annexed to the dignities he possessed, the only fruit that remained was his library, in the improvement of which he limited himself to a certain annual expense. In the periods of his retirement, which he called "the fairest days of his life," he devoted himself to the maturity of his plan of legislation, to the education of his children, and to a variety of literary pursuits, among which were mathematics and the belles lettres; and these, together with agriculture, he deemed his recreations in the intervals of his severer occupations. However, when the public demanded his services, he surrendered the satisfactions of retirement and the pleasures of domestic life. Having in 1694 married Anne le Febure d'Ormeillon, it was said on this occasion, that virtue and the graces were now first seen in alliance; but he had the misfortune to lose her in 1735. His grief corresponded to the affection he felt for her. Nevertheless he hastened to devote himself to the functions of his office; alluding, "that his services were due to the public, and it is not just (said he) that it should suffer by my domestic affliction." We are informed, that he never paused a day from his childhood, without reading some parts of the scriptures; and he was heard to say, that this was the balm of his life. Of his works nine volumes 4to. have been published. In these, he is said to have thought like a philosopher, and spoken as an orator. His eloquence has the force of logic and the order of geometry, united to the riches of erudition and the charms of persuasion. His style is chaste and harmonious, but deficient in warmth. When he once confided his father in a discourse which he had taken pains to compose, and which he wished farther to improve, his father gave his opinion: "the fault of your discourse is its being too elegant; it will certainly be left so if you touch it again." Nouv. Dict. Hiller. Biog. Dict.

AGUGA, Cape, lies southward of Puira, on the coast of Peru, in South America. S. lat. 66°. W. long. 82°.

AGUIAS, a small town of Portugal, in Almocce, to the west of Elvas, and to the east of Lisbon. The territory about it produces grain and oranges. W. long. 6° 41'. N. lat. 38° 50'.

AGUILA. See Obelisk.

Agugia is also the name given by the Italian fishermen to the agus of Oppian, called in English the car-fish.

AGUICUAN, or the island of the Holy Angel, in Geography, one of the Ladrone or Marianne islands, lies in the Southern Sea, in lat. 14° 43'; about 40 miles from Zarpasa; and about a league south-west of Timian. It is a small island, about nine miles in compass, mountainous, but pleasant, and forcibly well inhabited.

AGUILA, Aguela, of Ouguela, a town of Africa, in the kingdom of Fez, situated on the river Aguila or Er-guela, and giving name to a district, which is for the most part sandy and barren, but in some places so well watered as to afford plenty of dates; and it is separated from Barca by a mountain called Meys, which affords excellent pastures.

AGUILAR, a town of Spain, in Navarre, four leagues south-west of Estella. E. long. 2° 30'. N. lat. 42° 55'.

AGUILAR del Campo, a town of Spain, in Old Castile, situate on the Alhama; three leagues from Calahorra.

AGUILLANEUF, or Aquillaneuf, compound of the French, au, pour, misled, and Pan nef, i.e. the new year; a form of rejoicing used among the ancient Franks on the first day of the year.

Its origin is traced from a druid ceremony: the priests used to go yearly in December, which with them was reputed a sacred month, to gather mistletoe off the oak in great solemnity. The prophets marched in the front, singing hymns in honour of their deities; after these came a herald with a cædæus in his hand; these were formed by three druids a-bread, bearing the things necessary for sacrifice. Lalt of all came the chief, or arch-druid, accompanied with the train of people.

The chief druid climbing the oak, cut off the mistletoe with a golden sickle, and the other druids received it in a white cloth. On the first day of the year it was distributed among the people, after having blest and consecrated it by crying au gui Pan nef, to proclaim the new year.

Of later times the name Aquillaneuf was also given to a sort of begging, practiced in some dioceses, for church tapers, on a new year's day, by a troop of young people of both sexes, having a chief, &c. It was attended with divers ridiculous ceremonies, as dancing in the church, &c. which occasioned the synods to suppress it.

AGUILLAS, Cape, in Geography, lies to the east of the Cape of Good Hope. See Cape Needles.

AGUILLES, or Ouguelles, cotton cloth, manufactured at Akopp.

AGULLON, Francis, in Biography, a jesuit of Brussels, was professor of philosophy at Douay, and of theology at Antwerp. He was distinguished by his knowledge of mathematics, and is said to have first introduced studies of this kind into Flanders. He wrote a book of optics, intituled, "Opticorum, lib. vi. Philopolijsa justa ac Mathematicis utilis," which was printed at Antwerp, in 1613, fol. He was employed in finishing his "Cutaniares et Diodotae" at the time of his death, which happened at Antwerp, in 1617, in the 50th year of his age. He is also said to have written a treatise of "Projections of the Sphere." He understood several languages; his judgment was accurate; his learning extensive; and his patience and fortitude under severe trials were very signal. Under the paroxysms of the algues, to which he was subject, and which were very trying, just before his death, he repeatedly said: "Let God's will be done—I submit to it—I am willing to form myself absolutely upon the divine pleasure—I have now the torments which I often wished for, and desired of God." Gen. Dict.

AGUILON Point, in Geography, a long narrow point, in a curvilinear form, north-east of the island of Rho, on the coast of France, and about three leagues north-west of Rochelle. To the east of Aguillon the bay contracts and terminates.

AGUIRRE, Joseph Saenz De, in Biography, a learned Benedictine of the 17th century, was born in 1620, at Llogrono, in Spain, and read lectures in theology at the university of Salamanca, where he took his degree of doctor of divinity. He was also censor and secretary of the supreme council of inquisition, and was honoured with a cardinal's hat by pope Innocent XI. in 1686. He died at Rome, in 1699. His life was exemplary; and his writings numerous. He is said to have retracted the doctrine of probability, which he had maintained, as soon as he found that it was inconsistent with the strictness and purity of the Christian morals. His publications,
publications were very various. Besides his works in theology, which amount to several volumes; a commentary on Aristotle's Ethics, and three folio volumes of philosophy, he published, "a Collection of the Councils of Spain," with an historical Introduction, of which extracts are given in the Acta Eruditorum, Feb. 1688; but as several of his dissertations are written in defence of the spurious decreets of the first popes, Dupin has objected to them in his Biblioth. des Auteurs Eclecl. tom. xvi. p. 238. Ed. Amlit. 1711. Gen. Diet.

AGUL, in Botany, a small shrub very prickly; its leaves are longish, and resemble those of the knot-grass; it abounds with flowers of a reddish colour; there are succeeded by red fruits; its root is long, and of a purple colour.

This plant is otherwise called Alhagi murorum, by Rauwolf; it grows in Arabia, Persia, and Mesopotamia. See Hedgesary.

AGUL, in Geography, a river of Russian Siberia, which runs into the Kani. E. long. 125° 24'. N. lat. 55° 16'.

AGUNA, a town of Africa, in the kingdom of Benin.

AGUNUM, in Ancient Geography, now Inniken, a town of Rhethia, placed by Ptolemy in Norica, and by M. d'Anville to the north of the Carpathi Alps, and north-west of Julien Carnicum.

AGURAH, in Jewish Antiquity, the twentieth part of an ancient silver shekel. It was otherwise called gerah and kehitah. The Seventy render it 60000.

AGURIUM, Agryrum, Agrirum, of Agraena, now S. Phillipps d'Argyrone, in Ancient Geography, a town in the interior part of Sicily, placed by M. d'Anville in the road from Enna to Catania.

AGUSADURA, in Ancient Cuffium, a fice due from vassals to their lord, for sharpening their plowing tackle.

Anciently the tenants in some manors were not allowed to have their rural implements sharpened by any but those whom the lord appointed; for which an acknowledgment was to be paid, called aguusadura, in some places agriforme, which some take to be the same with what was otherwise called vellage, from the ancient French velille, a plough-share. Du-Cange.

AGUSTINE, in Mineralogy, a barbarous term, compound of Greek and Latin, meaning without tole, inipid, by which professor Trommfoff has distinguished a supposed new earth, discovered by him in the year 1800.

The mines of Johan-Georgenhaas contain a mineral, which hitherto has been taken for the beryl: this being analyzed for the purpose of ascertaining whether glycine was one of its constituent parts, yielded unexpectedly a new earth, which, from its forming inipid faults with acids, has been called by its inventor, Agutine.

This earth, when pure, has a great resemblance to alumine, adheres very feebly to carbonic acid, hardens by exposure to fire, and is insoluble in water. It differs, however, from pure clay, in the following particulars: 1. It is absolutely insoluble in any of the three alkalies, whether caustic or carbonated, in the moist or the dry way. 2. With acids it combines, readily forming nearly inipid faults. 3. It is equally soluble after induction by fire, as before. 4. Sulphuric acid forms with it a salt of difficult solution, and perfectly inipid, but which by a slight excess of acid, becomes soluble and crystallizes in lars. 5. Its acicular phaloshat is also very soluble. 6. But the acetate of Agutine is scarcely at all so.

There are all the facts that are as yet known concerning this substance; it rests entirely upon the authority of Trommfoff, and as neither he nor any other chemist have since made the smallest mention of it, even this slight notice might here seem superfluous. Annales de Chimie, vol. xxxiv. p. 133.

AGUTI, the cavia aguti of Linnaeus, in Zoology, has a very short tail; the upper parts of the body are of a brown colour, mixed with red and black, the rump of a bright orange, and the belly yellowish. Authors mention three varieties, viz. The Jeffrey aguti, or cavia aguti cuvieri, with a very short tail, four toes before and three behind, and a yellowish belly. This is the cuneiform aguti of Boffi and Gronovius, the larger mouse of Brown, the American wild mouse of Ray, with the hair and voice of a pig; the aguti or acuti of Madera, &c, the long-nosed cavy of Pennant, and the agouti of Buffon. It is about the size of a rabbit, and inhabits Brazil, Guiana, Cayenne, and other parts of South America and the West India islands. 2. The larger agouti, or cavia A. leporina, with a very short tail; the upper parts of the body reddish, and the under white. This is the hare-like moutie of Linnaeus, having four toes on the fore, and three on the hinder feet; the Jama coney of Boffi; the Java hare of Catesby; and the Java cavy of Pennant. It is of the size of a hare, and inhabits Surinam and the hotter parts of South America. 3. The American agouti, cavia A. Americana of Gmelin, and the American coney of Boffi and Seba; has a very short tail, and is clothed with coarse reddish fur. These three varieties inhabit South America, and some of the West India islands, particularly the Antilles. The first has a long nose, the upper lip divided; short, broad, rounded ears; black eyes; tender, and almost naked legs, of a black colour. The second has a small tender head, with prominent naked ears, rounded at the extremity. The hinder parts in both are larger than the fore parts, and the legs are long. The third variety is little known. These animals inhabit hollow trees, and burrow in the ground. They live on vegetables, which they collect in the day, and carry to their dwellings; they fit on the hind legs, and feed themselves with their paws; and when fattened with food, conceal the remainder; they grunt like pigs; when hunted with dogs, they run fast, with a kind of hopping or leaping pace, like that of a rabbit or hare, and take shelter in their holes or hollow trees; when irritated, the hair rizes on the back, and they strike the ground with their hind feet; when young, they are easily tamed; and will of their own accord, go out and return again. They are very voracious, and grow fat; and their flesh is white and savoury, and eaten in South America. The female brings forth at all times of the year, and produces three, four, and sometimes five at a time.

AGUTI TREVA infula Marigiana, in Botany, a plant mentioned by de Laet. It has the leaves of the orange-tree, only thinner, a dewy flower, a large fruit, with a greenish rind, which contains kernels like those of the pomegranate, thin, sweet, and not ill-tainted.

AGUTIGUEPA obi Brahischibus, in Medicine, the name given by many authors to the arrow-root, or segutaria alexipharmica of the West Indies.

AGY, in Antiquity, a kind of obelisks consecrated to Apollo, and placed in the vestibules of houses, for their security.

The agyi were no other than huge stones, or perhaps sometimes timber, having either a circular or square base, and terminating in a point at the top, faced to Apollo, or, as some say, to Bacchus, as protector of the high-ways. Others will have them to have been erected to both those deities. Suidas and Pithicus. They had sometimes the head of Apollo, Bacchus, or Mercury; and Steph. Byz. says, that they served like our direction- polls, to show the way to any place.

AGYLLA, (Cervatoris), in Ancient Geography, a town of Etruria, near the sea, is called by the Pelagi, who came thither
thither from Thessaly. It was afterwards called Corte, as Strabo (Geog. tom. i. p. 337.) informs us, from this circumstance, that the Lydians, hearing the inhabitants frequently repeating to them the Greek expression *καταφλιτος*, i.e. *rejoice*, took this to be the name of the city, which it afterwards retained. Others, thinking this etymology more fanciful than just, deduce Agylyia from *gilob*, water, as they had fountains in the neighbourhood; and Cerc might be formed from *cari* or *caris*, a town, in the language of the Lydians. The sons of Tarquin were banished to this town; and hither the veil was sent, when, in the year 363, the Gauls laid siege to Rome. The laws and police of this city are much commended. History informs us that it united with the adherents of Tarquin against Rome; and that it afterwards demanded and obtained a truce of 100 years. It was one of the first cities which became municipal. Strabo says, that in his time, there remained only the ruins of this famous city; and it was known only by its baths.

AGYLLÆI, in Ancient History, a denomination given to the Palygii in Etruria. Infaluated, as it were, in this country, they preferred, with little alteration, the manners and religion of the ancient inhabitants of Greece; they furnished considerable fleets, and aided the Carthaginians with 60 vessels in their war with the Phocæans, who had established themselves in the island of Sardinia; and though they were vanquished, they made many prisoners, whom, according to Herodotus (lib. i. 167. p. 79.) they put to death. They availed a treasoure at Delphi, by transmitting thither a tenth of their maritime profits; and by their commerce, and their piracies on the coast of Italy, and amidst the islands of the Ægean sea, they acquired a degree of power, which rendered them important allies or formidable enemies to their neighbours. Herodotus says, that their power was considerable in his time; and that, in consequence of an oracle, they had instituted funeral sacrifices and annual games, which they then celebrated. These people, who were sometimes called Tyrrenians, sent succour to the Athenians in the Sicilian war, not long before the ruin of Veii by the Romans. They formed an alliance with the Romans, which gave them all the advantages belonging to Roman citizens, without the charges attending them; and they formed, under the name of Cærites, the third order of the republic. The Cærites bore arms in the Roman army, and were almost always united to the Romans, as Livy (lib. vii. c. xx.) informs us; and they were considered, not merely as allies, but as a part of the nation. At length, defeated by the Roman marine, which found more spacious and convenient ports, and loosing its commerce, Cerc declined, and the inhabitants, who were Romans, were indifferently blended with the other citizens.

AGYNEIA, formed of *α* priv. and *γυν*., a wife, in Botany, a genus of the *monocotyledonae* class and order, according to Martyn; but in Gmelin's Linnaeus, of the *tricoccæ* class and order, of the *Euphorbiæ* of Jullieu. Its generic characters are, that the male flowers are below the female; the calyx is five-lobed; the leaflets oblong, obtuse, equal, and permanent; no corolla; in the male, instead of filaments, a column shorter than the calyx; three or four stamens, oblong, growing to the column below the top; in the female flowers, the germ of the fize of the calyx, sub-ovate, obtuse, perforated at top with a fuchnotted hole; neither leafly nor stigma: the pericarpium supposed to be a tricoccous capsule. There are two species, viz. 1. *A. impudica*, with leaves smooth on both sides. 2. *A. pubera*, with leaves downy underneath: both species are natives of China.

AGYNIANI, in Church History, a sect who condemned all use of flesh, and marriage, as not instituted by God, but introduced at the instigation of the devil.

The word is compounded of the privative *α*, and *γυν*., woman. They are sometimes also called *Agyneianists* and *Agyiins*; and are said to have appeared about the year 604.

AGYRTÆ, in Antiquity, a kind of strolling impulators running about the country, to pick up money by telling fortunes at rich men's doors, pretending to cure diseases by charms, sacrifices, and other religious mysteries; also to expiate the crimes of their decafed ancestors by virtue of certain odours and incantations; to torment their enemies by the use of magical verses, and the like. The word is formed of the verb *αγρωτευμεν*, I concent; alluding to the practice of quicks, who gathered a crowd about them. See AGRUSCATES.

AGYRTUS, in Entomology, a name given by Gramer to the *fæculo phereclus* of Gmelin's Linnaeus.

AHA, or AHA, in Zoology, a name given by the Persians to the *caorus pygargus* of the Linnaean system, or the *tall-er* ROE of Pennant, which has no tail, and three-forked horns. It inhabits the lofty mountains of Hircania, and of Ruffia and Siberia, beyond the Volga; and at the approach of winter descends into the plains and becomes hoary: it is called by the Ruffians *dikeja roza*, and by the Tartars *faiga*. This animal resembles the roe, but is much larger, being of the same deep colour, with a large bed of white on the rump and buttocks, extending up the back; the fur is thick, in spring rough and erect, on the limbs and belly yellowish; the underside and the space about the nose is black; but the points of the lip is white; the hairs of the eyes-rids and round the orbits are long and black; the horns are very rugged at the bases, and full of knobs; the ears are covered on the inside with a very thick white fur. Gmelin's Linn.

AHAB, in Scripture Biography, one of the kings of Israel, was chiefly distinguished by his impieties. He succeeded his father, A. M. 3086; married Jezebel, the daughter of Ethbaal, king of the Sidonians, or rather the Tyrians; and at her introduction instigated the idolatrous worship of Baal among the Israelites. In his wicked reign there was a drought of three years continuance, probably the fame with that mentioned by Josephus, (Ant. lib. viii. c. xvi. § 2.) which happened, A. M. 3066. With a small force he obtained a signal victory over Benhadad, king of Syria, who had besieged Samaria. In a subsequent war, he endeavoured to elude the enemy by a change of clothes, but was accidentally killed by an arrow, about the year 897 before Christ. The despotic character of this prince, and the savage cruelty of his wife Jezebel, are strongly marked in the anecdote related concerning Nahob's vineyard. 1 Kings xvi. 29—33. xx. xxi. xxii. Gen. Dict.

AHÄTULLA, in Zoology, a species of *coluber*, in the order of Serpents. It is found in Aia and America, about three feet 14 inches long, of a greenish-gold colour, with the skin, sometimes visible between the scales, black. Its head is elongated and narrow, with a black band over the eyes, and a tetradentatous tail. By some authors it is called the long green Borneo snake, and the bungbattraga of Amphbony. Gmelin.

AHALOTH, in the Materia Medica, the Hebrew name used by some writers for the *ligum-abies*, or alba wood.

AHANINGER, in Ichthyology, a name given by Albertus and others, to the fish called by authors *acous vulgaris*, and by us the GAR-FISH.

AHASUZ. See AAHUS.

AHASUERUS, in Scripture History, was the king of Persia,
Persia, who advanced Esther to be queen, and at her request delivered the Jews from the detraction plotted for them by Haman. 

AHIHEP. "AHE."

AHEEN, in Geography, a tribe of the RAGPOUTI, in India.

AHER, a town of Persia, in the province of Alderbeizan; 30 miles north-west of Ardevil.

AHIIAH, in Scripture History, a prophet of Shiloh; who is supposed to have delivered two oracles from God to Solomon, one encouraging, whilst he was building the temple (1 Kings vi. 11), and another threatening, expressive of dispersion on account of his misconduct, (1 Kings xi. 6). He is one of those who wrote the annals of this prince, 2 Chron. ix. 29. He also predicted the usurpation of Jeroboam, declared the calamities that would befal his house on account of his idolatry, and also foretold the death of his son Abijah, 1 Kings xiv. He lived to an advanced age; but the time and manner of his death are not recorded.

AHIAARAZ, son of Zadok the high priest, succeeded his father about A.M. 5000, under Solomon. During the rebellion of Abfalon, he informed David of the resolution adopted in his council; and he and Jonathan escaped their pursuers by being concealed at Baharin. Ahamaz was the first who gave intelligence to David of Abfalon's death. He was succeeded in the priesthood by Azariah. 2 Sam. xv. 17. xvii. 17. 1 Sam. xxiii. 18-20. 1 Chron. vi. 9.

AHITHOPHEL, a native of Gileb, who, after having been David's counsellor, joined in the rebellion of Abfalon, and asisted him with his advice. Hushai, the friend of David, was employed to counteract the counsels of Ahithophel; and to deprive Abfalon, under a pretence of serving him, of the advantage that was likely to result from the measures which he proposed. One of these measures was calculated to render David irreconcilable, and was immediately adopted; and the other to secure, or to slay him. Before the half counsel was followed, Hushai's advice was delayed; and he recommended their assembling together the whole force of Israel, putting Abfalon at their head, and overwhelming David by their number. The treacherous counsel of Hushai was preferred to that of Ahithophel; with which he was diligent and hastened to his house at Gileb, where he put an end to his life. He probably forewore Abfalon's defeat, and dreaded the punishment which would be inflicted on himself as a traitor, when David was re-established on the throne. A. M. 2981. Ante Chrift. 1023. 2 Sam. xv.-xvii.

AHILDA, in Geography, a bailiwick of the principality of Liineburg-Zell, in Germany, lying on both sides of the Aller, which in this bailiwick receives the Leine and Bohme. It is one German mile and a half in length, and as much broad; and confines of champagnia, heaths, and sandy grounds; and, to the south of the Aller, has good marsh lands and pasturage. Its woods are chiefly oak; and great quantities of timber are conveyed in floats to Bremen. The inhabitants carry on a considerable trade in hores, cattle, wool, hay, and wax.

Ahlden is also the name of a town situate on the old Leine, near the Aller, from the course of which it derives its name. Sophia-Dorothea, concho to king George I., after her separation, resided in the palace of this town, from 1694 to 1726.

AHLEM, a voigt, or district of the principality of Calenburg, in Germany, containing seven villages; the chief of which is Limmer.

AHL, a small town of Munster, in Westphalia, situate on the Werfe, which is summoned to the land-diets, contains a collegiate church, two nunneries of Augustine, and a princely and rural court. See ALLEN.

AHLWALTERT, Peter, in Biography, professor of logic and metaphysics at Griefswalde, was born of mean parentage, in that city, February 14, 1710. Having made
made considerable proficiency in the Greek and Latin
classes, he became a student of theology in 1727; but
applied chiefly to mathematics and philosophy. In three
years he removed to the university of Jen; and in 1732,
returned to Grieswale, where he read a course of lec-
tures on mathematics and philosophy. In 1743, he be-
came an adjunct of the philosophical faculty in that
place, and nine years after was chosen professor; he also
preached often with great approbation. He largely contrib-
ted to the critical researches of the society at Grieswale, of
which he was a member. He founded also the order of
the Abolites, and wrote a treatise on the occasion, entitled,
"The Abolites." His other principal works are, "Con-
siderations on the Confusion of Augsburg;" "Thoughts
on the Powers of the Human Understanding;" "An
Introduction to Philosophy;" "A Treatise on the Im-
mutability of the Soul;" and "Brontothologia, or
Thoughts on thunder and lightning." He is said to
have been so accurate in his composition, that he never
corrected what he had once written. He died March 11th,

AHMED Kham, one of the race of Jenghis or Zingis,
was the son of Halaku, and brother of Abaka khan, whom
he succeeded as emperor of the Moguls, in 1282. He
assumed the name Ahmed, on his embracing Mohammedism;
and on this occasion, he offered protection to all Muf-
lims, in a letter to the Sultan of Egypt and Syria. This
change of religion offended the princes of his family to
such a degree, that he could never regain their affec-
tion. His nephew Argun raised an army against him, but he
was soon defeated and taken prisoner. He was afterwards
released by some conspirators, and having killed the
emperor's principal officers, he purloined and overtook him;
and delivered him up to his mother-in-law, who, in revenge
for the loss of her own sons whom Ahmed had caused to
be slain, put him to death, after a reign of two years and
390, &c.

AHMEDABAD, or Ahmed's City, in Geography,
the capital of the province of Guzerat in India, so called
from Sultan Ahmed, who was king of that province, and
kept his court in that city; it is 224 measured coss distant
from Delhi, and 86 coss from Surat. The city is situated
in a delightful plain, watered by the little river Sabremelli.
The walls are built with brick and lime, and flanked at cer-
tain distances with large round towers and battlements.
It has 12 gates; and, including the suburbs, is about four
and a half miles in length. On the west side is the castle,
valled with freestone, and as fagons as a little city; the
canavanery is on the south of the king's square, which is
700 paces long and 400 broad, plantated round with trees,
and its chief ornament. Near this square is the king's
palace with apartments richly ornamented; and in the mid-
dle of the city is the English factory. The Hindoos have in
this place, which, from an eminence, appears like a wood
being full of gardens, an hospital for sick birds, and an-
other for sick beasts. For magnitude and wealth, this
city is little inferior to the best in Europe; and the reve-
ue which it yields, is generally reckoned to be ten times
as much as that of Surat. Traier's Kuli Khan. p. 29.

AHMEDNAGUR, a city in the province of Dowla-
tabad in India, distant from Delhi 280 measured coss.
Aurangzebe died in this city. Traier's Kuli Khan. p. 35.

AHMELLA, in Botany. See ACMELLA.

AHOLIBAH and AHOLAH, in Scripture History, are
two figured names, used by Ezekiel (ch. xxiii. 4.) to denote
the two kingdoms of Judah and Samaria. They are re-
presented as fillers of Egyptian extraction; Ahola being
Samaria; and Aholibah, Judah. They both prostituted
themselves to the Egyptians and Assyrians, byimitating
their idolatrous and wicked practices; and for that reason
they were made captives and reduced to the most ignoni-
mous and cruel servitude.

AHONI, in Geography, a sea-port town of Africa, on
the coast of Benin.

AHOUAI, in Botany, the name of a genus of plants,
called by Linnaeus CERBERA.

AHOUAS, AHUAS, or AHUAT, in Geography, a town
of Perfa in the province of Chufilian; about 240 miles
south-west of Ifipahan.

AHIR. See AHIR.

AHRAHAB, a town of Asia in the province of
Diarbekir, 30 leagues south of Diarbekir.

AHRENSBECK, a town of Germany, in the duchy
of Holstein; 12 miles north-north-west of Lubeck; and
also a bailiwick.

AHRENSDORF, a town of Germany, in the middle
mark of Brandenburg; six miles south-south-east of Pots-
dam.

AHRIMAN. See ARIMANUS.

AHRWEILER, a small town of Germany, in the
electorate of Cologne, seated on the river Ahr, and furnish-
ing good wine. It is eight leagues north-west of Coblenz.
E. long. 6° 43'. N. lat. 50° 35'.

AHSA or AHASA. See AHOUAS.

AHU, in Zoology, the ibex capensis of Kolhen, the
kevel of Buffon, the flat-nosed antelope of Pennant, and
the antelope Krevella of Gmelin's Linnaeus.

AHUCYATLI, the name of an American serpent,
approaching to the nature of the hemorhous and rattle-
snake, but larger than the former, and wanting the rattle
of the latter; it is as fatal in the effect of its poison as
any known species of serpent. Ray.

A-HULL, in Sea-language, denotes the situation of a
ship, when all her sails are unfurled, on account of the vi-
olence of a storm, and when, having lifted her helm to the
lee-side, the two seas nearly with her side to the wind and
sea, her head being somewhat inclined to the direction of
the wind.

AHUN, in Geography, a town of France, in the de-
partment of the Creuse, and diocese of Gueret; three leagues
south-east of Gueret. E. long. 1° 52'. N. lat. 49° 5'.

AHUYS, a town of Gotland, in Sweden, in the pro-
vince of Schonen; about two leagues south-south-east of
Christianiafbae, near the Baltic sea. This is, as it were,
the warehouse where the goods destined for Christianiafbae
are deposited. It has a good harbour, and was formerly
a strong town, but is now decayed. E. long. 14° 10'. N. lat.
50° 20'.

AI, called by the LXX GAI, by Josephus Aina, and
by others AYAM, in Scripture Geography, a town of Pa-
litane, situate west of Bethel, and at a small distance north-
west of Jericho. The 3000 men, first sent by Joshua to
reduce this city, were repulsed, on account of Achab's
sin, who had violated the anathema pronounced against
the city of Jericho, by appropriating some of the spoils.
A.M. 2553. After the expiration of this offence, the
whole army of Israel marched against AI, with orders to
treat this city as Jericho had been treated, with this dis-
ference, that the plunder was to be given to the army.
Joshua, having appointed an ambush of 30,000 men,
marched against the city, and, by a feigned retreat, drew
out the king of AI with his troops; and upon a signal

given, by elevating his shield on the top of a pike, the men in ambush entered the city and set fire to it; and thus the soldiers of Ai, placed between two divisions of Joshua's army, were all destroyed; the king alone being preferred for a more ignominious death on a gibbet, where he continued till fun-fet. The spoil of the place was afterwards divided among the Israelites. The men appointed for ambush are, in one place, said to be 30,000, and in another 50,000. For reconciling this apparent contradiction, most commentators have generally supposed, that there were two bodies placed in ambush near the Bethel and Ai, one of 25,000 and the other of 50,000 men; the latter being probably a detachment from the 30,000 hill feet, and ordered to lie as near to the city as possible. Maimon allows only 50,000 men for the ambush, and 25,000 for the attack. As for the signal, used by Joshua on this occasion, the Rabbins suppose that the shield was too small for this purpose, and that it must have been the staff belonging to one of their colours, in which opinion Chevaller Polard acquiesces; adding, that the whole colours were used on this occasion, the part being substituted, agreeably to the figurative language of the text, for the whole. It has been suggested, that this was one of the fire-pots, which are employed as en- signs by the eastern caravans, whose smoke would ascend to a great height, be easily seen, and signify the fate intended for the city; and as the frame and staff of this instrument were of iron, it answers to the translation of the LXX and Aquila. Joshua viii. 19. Patrick, in loc. Calmet.

AI, in Zoology, the Bradypus rideolylus of Linnaeus, or Sloth, with three-toed feet and short tail.

AlA, or Alia, in Ancient Geography, a river of Italy which discharged itself into the Tiber, about 19 miles above Rome. On the banks of this river, 200 Fabians were destroyed in their engagement with the Veii, and the Romans were defeated by the Senones of Gaul, conducted by Bremus.

AJABIRE, or Ajavira, in Geography, a town of South America, in Peru; 35 leagues south of Cufco.

AJAH, ת"א, a Hebrew term, which St. Jerome translates vulture. Bochart supposes it that denotes the merlin; the Syriac renders it raven, and the Arabic owl. Our translation (Job xxvii. 7.) renders it vulture; but (I.c. xiv. 14. Deut. xiv. 13.) kite. It is evidently a species of unclean bird, and most probably the vulture or kite, so called from its gluttony, or from its note. Aim (Jer. i. 39.) may perhaps be the plural of Ajah, and signify flights of vultures, which in some countries are very numerous; though Bochart conceives them to be jackals. Calmet, Bochart Op. tom. iii. p. 193. &c. Ed. Villem.

AJAIAI, in Ornithology, the name of a Brazilian bird, of the Platalea, or Spoonbill-kind, called by the Portuguese Colobara. Its specific character is, that its body is blood-coloured. It is exactly of the same shape, but somewhat smaller than the European species, and its beak is in the very same manner broad at the end, with a furrow parallel to the margin, and of a cinerous-white colour. It differs from the European species, by the roso or carnation which paints the white ground of its plumage on the neck, the back, and the sides; the wings are more strongly coloured, and the red tint turns into a crimson on the shoulders, and the covers of the tail, of which the quills are rusty; the slight of tho's wing is marked with fine cartilage; the head and throat are naked and whitish; the legs grey; and the claws black. These beautiful colours, says Buffon, are found only in the adult.

This species is the Plata roja of Drillon, the P. incarnata of Sloane and Ray, the Brazilian Spoonbill, called Alouette, of Maregrave and Willughby, the Platale de la Touche de Buffon. There is a variety, called Platale de Buffon, which Buffon supposes to be the same bird in its adult state. This rose-coloured Spoonbill is common about the shores of rivers, feeds on small fish, and is, says Maregrave, of an agreeable taste.

It is diffused in the new continent from north to south, from the coasts of Mexico and Florida to Guiana and Brazil. It is also found in Jamaica, and probably in the adjacent islands; but the species is no where numerous. In the morning and evening the Spoonbills are seen on the sea-shore, or resting on trunks that float near the beach; but about the middle of the day in very sultry weather, they enter the creeks, and perch high on the aquatic trees. However, they are not very wild; as they pass at sea very near the canoes, and on land they will allow a person to approach them within gun-shot. Buffon's Birds, vol. vii. p. 327. Eng. Ed.

AJALON, in Scripture Geography, a name given to four different cities, viz. one in the tribe of Dan, between Timniah and Beth-heim, assigned to the Levites; probably that referred to by Joshua chap. x. 12:—another, in the tribe of Benjamin, between Bethel to the north, and Jerusalem to the south:—a third, in the tribe of Ephraim, about two miles from Shechem:—and a fourth, in the tribe of Zebulun, whose precise situation is not known.

AJAN, or AAX, in Geography, a country extending along the eastern coast of Africa, from Magadoxo to Cape Guardafui, comprehending about 10 degrees of latitude. This maritime tract contains several petty kingdoms and states; the principal of which are the kingdoms of Adel or Zella, and Magadoxo or Madagaxo, on the coasts, and some others inland, hardly known even by their names. The eastern coast of Ajan is sandy and barren, the habitation merely of wild beasts, and therefore called the desert coast; but farther towards the north the country is fertile, producing all sorts of provision, and furnishing means of commerce, and particularly an excellent breed of horses, which foreign merchants take in exchange for silk, cottons and other cloths. The inhabitants along the coast are generally white with long hair; but towards the south they become more tawny, and even black. The negroes intermarry with the Bedowin Arabs, and carry on a great commerce with them in gold, slaves, horses and ivory, which they commonly bring from Abyssinia, whether they occasionally repair for the sake of plunder. As they are all either zealous Mohammedans or Bedowins, they are enemies to the Abyssinians, who are Christians; and their interruptions into Abyssinia accustom them to war. Those of them, and especially of the Bedowins, who live near the trading coasts, are arrant thieves. Mod. Un. Hist. vol. xii. p. 504. &c.

AJANDUM, a town of Afalic Turkey, in the province of Natalia; eight leagues well-fourth-well of Sinope.

AJAR, in Natural History, the name given by Adamson to the Chama antiquata of the Linnaeus fylrum.

AJARAFE, in Geography, a fertile district of Spain, in the kingdom of Seville; in which there is a little town situated on the Guadarrama, called Ciudad of St. Lucas la Mayor.

AJAS MONT, a mountain of Marmara, in Africa, according to Ptolemy.

AJAS, a small town of Ask, in Natalia, famous for its mineral waters; called also Therma.

AJAS is also a small town of Arabia Felix, situated in a valley, and about two days journey from Aden.
AJASALUCK, a name given by the Turks to the ancient Ephesus. The name denotes the temple of the moon, and is derived from the magnificent structure formerly dedicated to Diana.

The ruins of this famous city serve now merely as a place of accommodation and shelter for the shepherds and their flocks, and is the occasional habitation of birds and beasts of prey. The glorious pomp, says Dr. Chandler, (Travels, p. 131) of its heathen worship is no longer remembered; and Christianity, which was there muffled by apophthegms and covered by general councils, until it increased to fulness of stature, barely lingered on in an existence hardly visible. By this writer it is described as exhibiting a very gloomy and melancholy appearance, though not absolutely without people. The fires which were lighted in the night among the bushes, and round which the villagers collected, afforded a dim prospect of ruin and desolation. A thril owl, called Cuccavia from its note, with a night-hawk, flitted near them; and a jackal cried mournfully, as if forsaken by his companions on the mountain. The biblical critic may possibly consider this description as a lively comment on the language of the prophet. Zeph. ii. 7, &c.

AJATOCHTI, in Zoology, a name given by Hernandez to the Dasypus orcinarius, or eight-handed armadillo.

AJAX OILIADES, in Classical Biography, one of the leaders of the Greeks, in the expedition against Troy, was the son of Oileus, a powerful chief of the Locrians. Homer (Iliad lib. xiv. v. 520) ascribes to him agility, and a promptitude in executing whatever he undertook, and he is said to have excelled in the use of the bow and javelin, and in swiftness of foot. Horace is by some commentators supposed to refer to him, Od. xvi. i. v. 19. Such was his daring resolution, that even the Gods could not awe and subdue him. Homer Odysseus lib. iv. v. 522.

"Impious he roared defiance to the Gods, To his own prowess all the glory gave."

Pope.

The offence which is reported to have incurred the displeasure of the Gods, was his violation of Callandra, the daughter of Prisim, in the sanctuary of Minerva, where she had taken refuge. Ajax however denied the fact, and imputed the charge to the artifice of Agamenon, who wished to keep Callandra for himself. In his return home, he and his whole fleet were wrecked by the vengeance of Minerva. Some say that he escaped; and that in the moment of danger he impiously exclaimed: "In spite of the Gods, I will escape."—Homer ab supra. v. 504.

"The power defrauding who vouchsafed to save."

AJAX Telamonius, was the son of Telamon, prince of Salamis, and one of the principal heroes of the Iliad, whom Homer represents as inferior only to Achilles in strength and valour, and as the chief buckler of the Greeks, after the secession of that warrior. "His character," says a much approved biographer, "seems to be intended as the model of that steady, agreeable courage which is ever at hand, when its exertions are wanted, and requires no aid of circumstances to excite its energy. He is the only hero, who neither asks nor receives the assistance of a deity:"—and his character is exhibited as a striking instance of impiety and irreligion. It is said, that when he was going to the army, his father recommended to him always to join the assistance of God to his own personal courage. Ajax replied, that even cowards themselves were very often victorious by such aid; but for his part he should have no regard to it, and that he was sure of being able to conquer without it. Thus Sophocles, in Ajax, represents the matter. Homer, however, partly vindicates him from the charge of total irreligion: for though he did not pray to Jupiter himself, when he prepared to engage the valiant Hector, he desired others to pray for him, either with a low voice, lest the Trojan should hear, or louder if they pleased; "for," says he, "I fear no peril in the world." Iliad lib. vii. v. 194.

When the arms of Achilles were adjudged by the Greek chiefsmen to his rival Ulysses, Ajax was bereaved of his understanding; and first venting his rage against a flock of sheep, taking them to be Greeks, he then turned his sword against himself. Fable reports, that the flower called Hyacinth sprang from his blood. The Greeks erected a noble monument to him on the promontory of Rhoetum. Paullus says, (lib. i) that one of their tribes bore the name of Ajax, and that the people of Salamis built a temple to him. Herodotus (lib. viii. c. 64. c. 121), informs us, that the whole country of Greece invoked him a little before the battle of Salamis, and dedicated to him, as part of the first fruits due to the Gods, one of the ships which they had taken from the Persians in that battle. Paullus relates, amongst other wonderful tales, that the waves call the arms of Achilles upon the tomb of Ajax, after the shipwreck of Ulysses. The fate of Ajax was the subject of several eminent tragedies. Gen. Dict.

In his last martial exploit, when he was endeavouring to preserve and rescue the dead body of Patroclus, and when he was overwhelmed with a mill or darkens, which intercepted his view of the Grecian host, he made the following address to Jupiter, which has been much admired for its moral sublimity:

"Lord of earth and air, Oh king! oh father! hear my humble prayer: Dispel this cloud, the light of heaven restore: Give me to see, and Ajax asks no more: If Greece must perish, we they will obey, But let us perish in the face of day."

An ingenious writer has justly appreciated the character of this hero. After a concise abstract of his history, and a detail of his principal exploits, he adds, "Such is the Ajax of the Iliad:—a hero (as far as he rude an age admits of heroism) in grain; tried and proved by every difficulty and danger; not the meteor of a day, but shining with equal lustre through the whole period of action; always in his place; referred to on every emergency, and never in vain; not hurried along by idle bravado or enthusiastic ardour, but making utility the guide of his actions; finally, never yielding but when mortal assistance was unavailable, and when a heaven-born champion, with celestial aid, was necessary to turn the tide of fortune. He may then stand in the number of able and useful men, whose value is inferior to their fame,—a chief of which there are members in every profession and rank of life, and to whom assistance, the first-rate characters owe great part of their celebrity and success."

"Such was the Antipater of Philip of Macedon:—Such was the Labienus of Cesar, the Agrippa of Augustus, the Sully of Henry IV., the Cecil of Elizabeth, the Ireton of Cromwell. Such appear to be the generalty of those officers in the British navy, under whom conduct,
condict the empire of the ocean has been maintained for
their country every where, against all foes, by dint of
equal valour and unvarying skill. In science, in the arts,
in the common business of life, such men might be pointed
out. In general, they are those whom the leaders in
important affairs would choose for their seconds, to supply
their places on occasion, not according to their plans, and
take the management of separate and dependent parts.
Their essential qualifications are a perfect linear for their
pots, and a constant readiness to bring all their powers
into full exertion ;—firmness, vigilance, order, and the
habit of fixing the attention upon particular objects." See
Aikin's Letters to his Son. vol. ii.

Ajax, in Antiquity, a furious kind of dance, in use
among the Greeks: intended to represent the madness
of that hero, after his defeat by Ulysses, to whom the
Greeks had given the preference in his contest for Achilles's
arms.

Lucian, in his treatise of dancing, speaks of dancing the
Ajax. There was also an annual feast, called Ajanskia,
Amai, consecrated to that prince, and observed with great
solemnity in the island of Salamis, as well as in Attica ;
where, in memory of the valour of Ajax, a fire was ex-
plored, set out with a complete suit of armour. Potter,
Archaeol.

Ajax, in Entomology, a species of the Papilio
echer, with wings obtusely canted and brown colour,
yellowish bands and tawny anus. It is the papilio mar-
cellus of Cramer, and found in North America.

Ajax, in Geography, is a variety of the Murex Lampar
of Greece's Linnanum Sytem; called also Rubeta.

AJAZZO, or Ajaccio, a sea-port town in the island of
Corsica, on a gulf of the same name, in the province of Caramania,
an ancient Cilicia, at the north-east extremity of the Me-
diterranean sea, 35 miles north of Antioch, and 50 miles
west of Aleppo; where the city of Issus antiently flood. It
is situated near the gulf of Scanderoon. Here Alexander
the Great defeated Darius a second time, and took his
family prisoners. In the time of the crusades, this be-
longed successively to Chirilians, Saracens, and Turks,
who now possess it. E. long. 35° 10'. N. lat. 37°.

AJAZZO or Ajaccio, a sea-port town, in a bay of
the same name, in the south-west part of the island of
Corsica, with a bishop's see under the archiepiscopal of
Pisa. It is situated in a fertile territory, abounding with
excellent wines. It is guarded by a small citadel; the
streets are straight and large; the houses well built; the
adjacent walks agreeable; and the number of inhabitants
about 4000, many of whom are Greeks. Its commerce
is supplied by a fishery of black, red and white coral, and
by its timber. The bay, though incommodecd by rocks,
affords secure anchorage for ships of considerable burden.
The ancient town was situated about a league from the
present, which was built in 1435; and many ruins of it
are still remaining. A colony of Greeks was established
in the vicinity of Ajazzo in the year 1677; but the pro-
tection of the Genoese could not prevent its being dis-
persed and partly destroyed by the Corsicans. E. long. 8°
50'. N. lat. 41° 50'.

ALBAN-KESRA, an old castle of ancient Babylon,
situate on the banks of the Tigris, in the government of
Bagdad, and supposed to have been the residence of
Cofroc, and other Perisian kings.

AIBLING, a town of Germany in Upper Bavaria,
both to the river Manguald, and not far from its junction with
the Inn. Long. 55°. lat. 34°.

AICHA, a small town of Upper Bavaria, situated on
the Paar; four leagues east-north-east of Augsburg. It
was taken by the Swedes in 1653, and in 1654 laid in
siles by them. E. long. 30° 40'. N. lat. 48° 30'.

AICHEBERG, a town of Germany in Stiria; four
miles south-west of Tividberg. There is also a town of
the same name in the archduchy of Austria; eight
miles north-west of Effersing.

AICKGIRGEN, a town of Germany in the arch-
duchy of Austria; seven miles west-north-west of Schwan-
laut.

AICHELBERG, a town of Germany in Carinthia;
four leagues west-south-west of Villach.

AICHMALOTARCHA. See Ecmhalotarcha.

AICHSTADT, a city of Germany, the capital of a
foreign bishopric of the same name in Franconia, situated
in a fertile valley on the river Altmuhl, and founded in the
year 748, by St. Boniface archbishop of Mentz. The
dioecese is 18 leagues long and 7 broad; and its inhab-
itants generally profess the catholic religion. The place
of the bishop in the general diet of the empire is between
the bishopps of Worms and Spire, and he is the suffragan
of the archbishopric of Mayence. The bishop has for his
ward three companies of infantry, a company of cuirassiers,
and a company of dragoons. At the cathedral of this
city, the eucharist is exhibited in a vessel of gold, denomi-
nated the fan, of the weight of 40 marcs, enriched with
an incredible quantity of diamonds, pearls, and rubies.
They reckon 350 diamonds, 1400 pearls, and 250 rubies,
with many other precious stones. It was presented to the
cathedral by the bishop of the dioecese in 1611. But it is
doubtful, whether some of the precious stones have not
been exchanged, in some period of public ditresses, or
by some artifices, for others of less value, that equally answer
the purpose.

Aichacht is four leagues north of Neuburg, five north-
well of Ingolstadt, and 15 south of Nuremberg. E. long.
11°. N. lat. 49°.

AICHSTADT ober, is a town on the Altmuhl, one league
well of the former.

AID, or AYEDE, Auxilium, literally denotes the help,
faecour, or affittance, which any person lends another,
when too weak to do, or avoid, something.
The word is French; formed, according to M. Menage,
from the Italian attitute, and that from the Latin adjutus,
to help affit.

Aid, or Ayde, in Law, is when a petition is made in
court, for the calling in of help from another person in-
terested in the matter in question; who, if it is probable,
may not only strengthen the party's cause who thus prays for
aid, but also prevent a prejudice arising to his right.
Thus in real actions, the tenant may pray for aid,
and call for assistance of another to help him to plead, becaus
of the feeble ness of his own estate. A tenant for life may
also pray in aid of him that hath the inheritance in remain-
der or reversion; and an incumbent may pray in aid of
the patron or ordinary; that is, that they shall be joined in the
action, and help to defend the title,—This is called aid prior;
but this course of proceeding is now much diffused.

A city, or corporation, holding a fee-farm of the king,
may pray in aid of him, if any thing be demanded of them
relating thereto.
The aid prior is sometimes also used, in the king's behalf,
to prevent any proceedings against him till his counsell be
called, and heard what they have to say for avoiding the
king's prejudice, or lists. Jenk. Cent. 64. Termes de
Ley, S. Stat. 4 Edw. I. and 14 Edw. III.

Aid de camp, an officer in the army, whose business is to attend
AID

attend the general officers, and receive and carry their orders, as occasion requires.

When the king is in the field, he usually appoints young volunteers of quality to carry his orders, who are called the king's aids de camp.

An major, or adjutant, is an officer whose business is to take the major of part of his duty; and to perform it all in his absence.

Some majors have several aid majors.—Each troop of guards has but one major, who has two aid majors under him, or more, according as the buiffiness requires.

Every regiment of foot has as many aid majors as it contains battalions.—When the battalion is drawn up, the aid major's post is on the left, beyond all the captains, and behind the lieutenant-colonel.

Aid, Autlilum, in our Ancient Caftians, denotes a subsidy or sum of money due to the lord, from his tenants, on certain occasions.

It differed from a tax, which is imposed at any time when wanted; whereas the aid could only be levied where it was customary, and where the particular occasion fell out.

Such was the aid de reliefs due from the tenants in fee, upon the death of the lord mefn, to his heirs, towards the charge of a relief of the fee, of the superior lord. This was abolished by king John's magna charta.

Such also was the aid cheval, or capital aid, due by vassals, to the chief lord, or the king, of whom they held in capite. Of this there are three kinds.

The first, of chivalry; or, as they call it, par faire fea chevalier, toward making his eldest son a knight, when arrived at the age of fifteen years; the second of marriage, or par fille marier, towards marrying his eldest daughter.

Both these, with all charges incident thereto, are taken away by law. See Tenure, Service, &c.—Some will have them to have been first established in England by William the Conqueror, and afterwards transferred to Normandy; but the more common opinion is, that the Conqueror brought them with him. The third was of a ransom, due when the lord was taken prisoner by the enemy.

It appears from Bracket (lb. ii. c. 16. § 3) that, in the time of Henry III. these aids, which were allowed by the charter of king John, were supposed to be paid by the vassals, rather than tokens of good will and affection to their lords, than as proper concomitants of the service they owed. Glanville, on the contrary, considered them as due by their tenures. But, both by that author, and in the charter, it is said, that they ought to be taken in reasonable proportions. Glanville questions, whether the feudal lord could demand an aid of his tenants for the support of his war? And replies by saying, that he could not disilain for such aid; but they might give it, as a bencovency, and out of affection to their lord; whereas he considers the aid of relief, as a due, for which the lord, in virtue of his fee, had a legal right to disilain. Lyttelton's Hist. Henry II. vol. iii. p. 108. 8vo.

In some provinces there was a fourth kind of aid; due whenever the lord should undertake an expedition to the Holy Land.

We also read of aids paid the lord, when he was disposed to purchase any new land, or tenement. These were only granted once in his life. Also aids for the repairing and fortifying of castles, fents, &c. and also aids to pay the lord's debts. To prevent this abuse, king John's magna charta ordained, that no aids be taken by the king without consent of parliament, nor in any wise by inferior lords, except only the three ancient ones above-mentioned, viz., for making the lord's eldest son a knight, for marrying his eldest daughter, and for ransomin the lord's person, if taken prisoner. But this provision was omitted in Henry III.'s charter; and the same oppressions were continued till the 23 Edw. I. when the statute called confirmation chartarum was enacted; which in this respect revived king John's charter, by ordaining that none but the ancient aids should be taken. But though the species of aids was thus restrained, yet the quantity of each aid remained arbitrary and uncertain. King John's charter, indeed, ordered that all aids taken by inferior lords should be reasonable; and that the aids taken by the king of his tenants in capite should be settled by parliament. But they were never completely ascertained and adjusted till the statute WeCham. t. 3 Edw. I. c. 36, which fixed the aids of inferior lords at twenty shillings, or the supposed twentieth part of the annual value of every knight's fee, for making the eldest for a knight, or marrying the eldest daughter; and the same was done with regard to the king's tenants in capite, by the 25 Edw. III. c. 1. The other aid, for ransom of the lord's person, being not in its nature capable of any certainty, was therefore never ascertained. Blacklt. Com. lib. ii. c. 5. vol. ii. p. 64. 8vo.

By the lat. 34 Edw. I., it is ordained, that the king shall levy no aid or tax without his parliament.

Aids seem to have been first established with a view to the clients and freedmen of ancient Rome, who made presents to their patron towards his daughter's fortune, as also on his birth-day, and on other solemn occasions. Accordingly, Bouteiller relates, that in his time these aids depended on the courtesy and good will of the vassals; for which reason they were called, droits de complaisance.

The bishops also received aids from their ecclesiastics, called fœdus, and pencefsilis. They were to be paid at the time of their consecration; or when they had a king to entertain; or when called by the pope to his court, or to a council; as also when they went to receive the pallium.

Add, that the archdeacon also exacted aids from the clergy of their jurisdiction. See Procuration.

A kind of feudal aids are still levied in Germany, &c. under the title of collecta.

Aids are also used in matters of polity, for any extraordinary taxes, or impositions, occasionally levied by the king and parliament, upon the subjects, to support the charges of the government, when the ordinary revenue is deficient.

Aid, royal, is a name frequently given to the land-tax.

Aid, in Theology; the aids or affinowes of divine favour, which are offered to man, have been the subject of much dispute between the Jansenists and Jefuits; for the composing whereof, a celebrated congregation was erected at Rome under the title of congregation of aids, congregatio de auxiliis.

Some divines, after St. Augufline, distinguish two kinds of aids, viz., fine quo, and quo.

Auidum fine quo, that which the mind is at liberty either to use or refuse; such is supposed to have been the aid ministered to man in the state of innocency, while his mind and will were found and upright.

Auidum quo amounts to what is otherwise called efficacious grace, which furnishes and subsides the will; such, according to the Calvinists and Jansenists, is supposed to be the aid ministered by grace, in the present fallen state of human nature.

Aids, in the Monage, are helps or affinowes by which the horfman contributes towards the motion or action required of the horfe, by a judicious use of his body, or the appointments of the horfe.
Aids are of the greatest service in the manage, and form the only true language between the master and the horse; by these he is encouraged to act with propriety and energy, and the necessity of correction is prevented; consequently it must be evident that a great mixture of gentleness and spirit are requisite in their exhibition.

The principal aid is derived from the bridle; indeed the different management of this appointment forms several distinct aids, each of which is so useful and necessary that it might constitute a distinct lesson. The cavesson forms at once an aid and a correction of the most powerful kind, and in no way is the obedience of a horse so well secured as by this means. The spur is of this number likewise; when made use of as an aid, it is by gently closing the heels and applying the points only to the skin; but the calves of the legs are perhaps the best aids of this kind.

The whip is used as an aid to keep the attention of the horse alive, by elevating the hand and striking the aid, or gently patting the animal in different parts; judiciously managed to a well drilled horse, it forms a very lively and animating aid. The voice is likewise made use of as an aid. The motions of the thighs, knees, and the calves of the legs, form separate aids; that of the calves is the most important and last, without a proper knowledge of which, both horse and rider must be defective. The calves are used together, or separate; when one calf alone is employed, it is usually accompanied with the hand, to alter the position of the body, or change the leg, by which any action is led. The elevation of the body in the stirrups forms another aid.

The aids made use of to make a horse go in airs, are either different in themselves, or differently applied, to those made use of on the ground. The general application of these aids on the road is a branch of riding in which English horsemen are by foreign masters deemed defective. The inner heel, inner leg, and inner rein, are called inner aids. The outer heel, outer leg, &c. are outer aids. See Berenger's Art of Horsemanship, vol. ii. p. 52, &c.

Aids, in the French Law, denote a duty paid on all goods sold and transported either out of, or into the kingdom. In this sense aids answer to what the Latins call vexilla, a vexanda mercibus, and are paid by all kinds of persons, privileged, or non-privileged; by which they differ from taille, taxes, which are only paid by the peasants, being a sort of capitation, answering to what the Latins call tributum.

Aids, court of, in France, a court erected for the cognizance of matters relating to the taxes. Appeals come to this from the court of elections, where matters relating to the taille are first heard. The court of aids, of a province, is sometimes separated from the parliament of the province, and fixed in another city, as at Montpellier, Montauban, &c. There are twelve courts of aids, of which the principal is that at Paris.

AIDAN, in Biography, a British bishop of the 7th century, was employed in instructing the inhabitants of the Northern parts of England in the Christian religion. He was a monk in the monastery of Hi, or Jona, one of the Hebrides, which was subject to Britain, but given to the Picts, who inhabited those parts of Britain, in recompense of the zeal with which they had preached to them the faith of Christ. The kingdom of Northumberland, though it had received the Christian doctrine from Paulinus, archbishop of York, relapsed into idolatry. When Oswald, in 634, became king of Northumberland, he sent to Scotland for a missionary, qualified for instructing his subjects in the doctrines and duties of Christianity. It happened that a very improper person, an ecclesiastic named Corman, of severe disposition and rugged manners, was sent for this purpose; but it soon appeared that Aidan, who was mild and prudent, was much fitter for the office; accordingly he was consecrated a bishop and sent to the court of Oswald. At his consecration the episcopal fee was removed from York to Lindisfarne, a peninsula adjoining the Northumbrian coast by a narrow isthmus, called also Holy Island, because it was chiefly inhabited by monks. Here Aidan exercised an extensive jurisdiction, and preached the gospel with great success; deriving encouragement and assistance in his labour, from the confederating services of the king himself. After the death of Oswald he continued to reside in the church of Northumberland, and died in the year 651. We have an extraordinary instance of this bishop's liberality to the poor. Having received a present from king Oswin of a fine horse and rich houings, he met with a beggar, and dismounting, gave him the horse thus caparisoned. When the bishop expressed some displeasure at this singular act of humanity, and the flight put upon his favour, Aidan quietly but forcibly asked, "which do you value most, the son of a mare or a son of God?" the king was so affected that he fell upon his knees and intreated the bishop's forgiveness. Bede describes the character of Aidan in terms of high commendation, and ascribes to him miracles, which the credulity of the times in which he lived would be disposed to admit. To the report of one of his miracles we are inclined to give our assent. When the bishop gave the price, who was to conduct the betrothed wife of Oswin by sea to Northumberland, a phial of holy oil, instructing him, in case of a storm, to pour it into the sea, and affuring him that it would soon become calm, it is possible he might not be unacquainted with the efficacy of oil thus applied, which has been long known, and is now sufficiently established by observation and experiment. Bish. Brit.

AIDERBEITZAN, AEBRIBAN, or, as the Persians call it, AZERBAYAN, in Geography, a province of Persia, borders to the coast on the province of Ghilan, the Caspian Sea and Tabrissian, to the east on Trac, Ajeini, to the west and north-west upon Cerdelian and Upper Armenia, and to the north on Schirvan and Georgia. The etymology of the name given by the Persians to this province imports a country of fire, so called on account of the temple erected in it for keeping their sacred fire. The soil is fruitful, and the climate healthy, though cold. The most considerable cities in it are Tauris, Ardevil and Sultania. The province extends from about 48° to 54° E. long. and from 36° to 39° N. lat.

AIDHAB, or GAIDHAB, or ARDHA, a town of Africa, and sea-port of Nubia, on the coast of the Red Sea. E. long. 33° 59'. N. lat. 22° 12'.

AIDONA, a town of Sicily, in the valley of Noto; four miles north-east of Piazza.

AIELLO, a small town and dukedom of Naples, in the Abruzzo Ultra, belonging by marriage to the hereditary prince of Modena.

Aiello is also a town of Naples, in the district of Calabria Citra, with the title of a principality; nine miles south-west of Cosenza.

AIREA, in Ithymboly, the name of a fish of the pallasinus marinus kind, only differing from all the others in that the form of its body is regularly round, or oval, and its head placed far within the verge of its thin part. It is common in the Western Ocean; but it is not much esteemed for the table, being more coarse and flabby in its flesh than the other kinds. Marcgrave.

AIGEN, in Geography, a town of Germany in the arch-
AIG

duchy of Austria, on the confines of Bohemia; 35 miles
well of Vienna. E. long. 13° 52’. N. lat. 48° 55’.

AIGHEENDALE, a liquid measure in Lancashire, con-
taining seven quarts.

AIGITALUS, arnoseus, in Ornithology, a name by
which Aristeus, and some of the old authors call the PARUS,
OT TITMOUSE.

AIGLANDE, in Geography, a town of France, in the
department of the channel, and principal place of a canton,
in the district of St. Lo; four leagues north-east of Con-
tances.

AIGLE (L’), AQUILA, a small well-built town of
France, and capital of a district situated on the Rille, in
the department of Orne; 14 leagues north-east of Alençon.
Its principal commerce is corn, hard-wares and pins.
It contains three parish churches, two convents, and a hospital;
Is surrounded with walls, and has six gates. E. long. 1° 31’.
N. lat. 48° 40’.

AIGLE, a town of Switzerland, in a part of the Lower
Valais, which belongs to the seignory of Berne, and forms
part of a canton. It is situated on a small river, which runs
into the Rhone, about a league below it; 12 leagues call-
north-east of Geneva. The country about it has rich pas-
tures, and good wines and fruit; but it often suffers from
the inundations occasioned by the high mountains that bound
it towards the north. The soil that is collected from the
fallen waters in its vicinity is refined at Aigue. E. long. 6°
51’. N. lat. 26° 22’.

AIGLE, a river of France, which waters part of the
government of Orleans, rises near Mée in Beauce, and dis-
charges itself into the Loir, between Chateaudun and
Clovy.

AIGLETTES, in Heraldry. See Eaglet.

AIGN, in Geography, a town of Germany, in the circle
of Bavaria, and archbishopric of Salzburg, near which is
a medicinal spring; two miles south-east of Salzburg.

AIGNAN, a town of France, in the department of
Gers and district of Nogaro; seven leagues west of Auch.

AIGNEY-LE-DUC, a town of France, in the depart-
ment of the Cote d’Or, a district of Châtillon; 4 1/2 leagues
south-west of Chatillon. It is situated on a small
mountain, at the foot of which runs a stream of the fame
name. Its chief subsistence is derived from bleaching
and the commerce of linen cloth.

AIGRE, a town of France, in the department of the
Charente and district of Ruffec; 5 1/2 leagues north of
Angoulême.

AIGREFEUILLE, a town of France, in the depart-
ment of the Lower Loire and district of Chiffon; 3 1/2 leagues
south of Nantes.

AIGREMONT, a small town of Burgundy in France,
in the generality of Dijon.

AIGRETTE, in Ornithology, a name given by Buffon
to different species of ADEA, or the EGRETS of other
authors.

AIGRETTE, in Zoology, a name given by Buffon to the
SIMIA AYGULA.

AIGUE MARINE, in Natural History. See Aqua
MARINA.

AIGUEBELLE, in Geography, a small town of Savoy,
on the river Arc, surrounded by high mountains; five leagues
call from Chambery. The manufacture of this place is
film.

AIGUEBELLE is also a small town of France, in the de-
partment of the Drome; two leagues south-east of Mont-
telimart.

AIGUE-VERSE, a small town of France, in the de-
partment of Pav-de-Dome, and late province of Auvergne;
18 miles north of Clermont and 261 south of Paris. The
cold water of a fountain near it has the appearance of boiling,
and is said to be fatal to the animals that drink it. E. long.
5° 20’. N. lat. 45° 50’.

AIGUES, a river of France, which runs into the Rhone,
ear Orange.

AIGUESCAUCDES, is situated in the valley of Ollau,
in the principality of Bearn, in France; and is famous for a
spring of water, loopy and sulphurous, and smelling like a
rotten egg, which is deemed salutary in many inward
and outward disorders.

AIGUES-MORTES, a town of France, in the de-
partment of the Gard and district of Nîmes; 44 leagues
south of Montpellier. The soil in the neighbourhood is
fandy, and the air unwholesome on account of the ignan-
ous waters that surround it. It formerly flood on the sea and
had a harbour; but it is now above two leagues up the country,
and the harbour is filled up. This place is famous for an in-
terview which took place in 1538, between Charles V. and
Francis I. after 20 years of open hostility or secret enmity;
by which occasion they vied with each other in expres-
ions of respect and friendship. E. long. 5° 28’. N. lat. 43° 34’.

AIGUES-VIVES, a town of France, in the depart-
ment of the Gard and district of Sommieres, five leagues north-
east of Montpellier.

AIGUILLON, a town of France, in the department
of the Lot and Garonne, and district of Tonnens; six
leagues north-west of Agen. This town carries on a con-
derable trade in wines, brandy and hemp. E. long. 0° 22’.
N. lat. 44° 25’.

AIGUINES, a town of France, in the department
of the Var and district of Barjols; 5 1/2 leagues north-east of
Barjols.

AIGUISCE, AIGUINES, or EGURCE, in Heraldry,
a term applied to a cross, when its four ends are sharpened,
but so as to terminate in obtuse angles.

The crois aigusce differs from the crois fiiishe, in that
the latter goes tapering by degrees to a sharp point; whereas
only the ends of the former are tapered.

Croisces were so formed by the Christians in their pilgrim-
ages for the convenience of fixing them in the ground at
their devotion. In the English blazon this kind of crois is
called a crois arlde.

AIGURANDE, or AGURANDE, in Geography, a town
of France, in the department of the Indre, late province of
Berry, and district of La Chatre; 8 1/2 leagues south of Châ-
teauroux. The country round it furnishes fat cattle. E.
long. 1° 44’. N. lat. 46° 27’.

AIL, a people of India, placed by Ptolemy on this side
the Ganges.

AIKES, a town of Transylvania, six leagues north-east
of Clastenburg.

AIKMAN, WILLIAM, in Biography, a painter of con-
siderable eminence, the son of William Aikman, Esq.
of Cairney in Scotland, was born October 24th, 1682, and
intended by his father, who was an advocate at the Scots
bar, for his own profession; but the son declined the study
of the law, and devoted himself to the fine arts, and par-
ticularly to that of painting. Having prosecuted his studies
for some time in Britain, he removed to Italy in 1707, and
refined for three years at Rome. He then travelled to Con-
stantinople and Smyrna, and in 1712 returned from Rome
to his own country; and in 1723 he settled in London, and
followed the profession of painting under the patronage
of the Duke of Argyle, the Earl of Burlington, Sir Godfrey
Kneller, and some other encouragers of the arts of that
period.
AILANTHUS, formed of the Ambosia name Ay-
lanse, which denotes the tree of heaven, so called on account
of its lofty growth, in Botany, a genus of plants, the clas
and order of which are not ascertained. Prof. Martyn
refers it to the papyramia monoeauc, Scherer to the dicap-
dendria, and Giralt to the decandria trigyna. Its char-
acters are, that it has male, female and hermaphrodite
flowers. The calyx of the male is one-located, five-parted,
very small stamens; the corolla has five petals, lanceolate,
acute, convolute at the base and spreading; the lamina
have ten filaments, compressed, of the length of the corolla;
the anthers are oblong and versatile. The calyx of the female
is like that of the male, permanent; the corolla the same;
the pappus has from three to five germs, curved inwards;
the styles are lateral and the stigmata capitate; the perica-
pus has as many capsules as there are germs, compressed,
membranaceous, ovate-shaped, acute, on one of the edges
emarginate; the seeds are solitary, lens-shaped, bony, close
the emarginate. The calyx of the hermaphrodite is the same
with that of the male and female; the corolla the same
as in the male; the lamina have two or three filaments,
as in the male; the pappus, pericarpium and seed as in the
female. There is one species, viz. A. glandulosa, or tall
ailanthus, which is a tree with a straight trunk, 40 or 50 feet
high, a native of China, and first raised in England about
the year 1751. It grows fast in our climate, and as it rifes
to a considerable height, it is proper for ornamental plan-
tations. A retinuous juice, which soon hardens, flows from
the wounded bark. The wood is hard, heavy, gloire, like
fattin, and susceptible of a very fine polish. This is the
Rhoo Sinens, &c. of Ellis. See Phil. Transl. vol. xxxix.
p. 870, and vol. i. p. 446. Martyn's Miller.

AIL, or AIL, formed of Tr. aul, event, grandfather,
in Latin, a word which lies where the grand-father, or great-
great-grandfather, called fide, was feized of lands or tenements
in fee-simple, on the day he died; and a stranger abates or
enters the same day, and dispossesseth the heir or grand-child.
See Abatement.

AILERONS, a diminutive of the French aile, wing, in
Natural History; petty wings, a French term expressing two
small shelly subfaces, resembling parts of wings, or young
and jut growing wings, and found in the two-winged flies,
situated at the root of the larger wings. Reaumur.

AILLES vivres, in Natural History, a French term used
to express the wings of a series of insects, which form a
middle nature, between the fly and the butterfly kind, and
are therefore called papillon mouche, by these writers. The
wings of these insects are in part covered with dust, or scales,
and in part free from it, and transparent. In their free
parts they look glossy; whence their name, signifying glossy
wings.

AILLESBURY, in Geography. See AYLESBURY.

AILJANT-SUR-THOLON, a town of France, in
the department of the Yonne, and district of Ivgny: a
leagues north-west of Auxerre.

AILLAS, a village of France, in the department of the
Gironde, and district of Bazas; two leagues north-call of
Bazas.

AILLY, a village of France, in the department of the
Somme, and district of Abbeville; five leagues west-north-
west of Amiens.

This is also the name of a town of France, in the same
department, and district of Montdidier; three leagues south-
south-east of Amiens.

AILLY, Peter D', in Biography, bishop of Cambray,
and a bigoted ecclesiastic, was born of an obscure family at
Compiègne in 1530. He finished his studies at Paris, and
gave
gave proofs of a superior understanding even at college by his treatises "On Logic," "On the Nature of the Soul," and "On Meteorology." In 1384 he was appointed grand-master of the college of Navarre, where he had been educated. His zeal for the Catholic faith contributed to his advancement as much as his learning. Having pleaded in 1387, in favour of the miraculous conception, before the pope, he was appointed confessor to Charles VI. and chancellor of the University, and in 1391 bishop of Cambrai. He distinguished himself on various occasions as an advocate for the doctrines and ceremonies of the church; and at the general council of Constance, which lasted from the year 1414 to the year 1418, he was principal agent in the proceedings, which convicted Wickliff and Huts of hereby; and at last brought the latter to the stake, upon whom he pronounced the sentence of death. Notwithstanding his zeal against hereby, he is said to have been a friend to reformation, and that he wrote a book "On the Reformation of the Church," which, however, is not found among his works. His ideas of reformation must have been very partial and restricted, as he took pains to obtain a general council for terminating feuds, and was attached to the absurdities of judicial astrology. On this subject he wrote a treatise, in which he maintained, that Noah's flood, the birth of Christ, and other such miraculous events, might have been predicted by astrology. He died in 1425, as some say, and according to others in 1419 or 1420, with the character of "the Eagle of France, and the indefatigable Mallet of Heretics." The epitaph on his tomb is as follows:

"Mors rapuit Petrum; petram fubit purus corpus;
Scil petram Christum spiritus ipse petit."

i. e. "Death seizes Peter, and under this stone,
His body decays; his spirit is flown
To Jesus his rock."

Of his numerous works several treatises and sermons were printed at Strasburg in 1420; his "Quœsitiones in Spiritum Mundi" was printed at Paris in 1498, and at Venice in 1508; his "Treatise of Meteorology" appeared at Paris in 1504, and his "Life of Celestin V." in 1539. Cave Hist. Lit. vol. ii. Append. p. 84. Gen. Diœt.

AILSA, in Geography, an infallible rock near the isle of Bute, in Scotland, about two miles in circumference and 900 feet high, accessible on the north-east side, and the habitation of rabbits and goats, and tea-fowl, particularly the Solan goose, some of which are taken for food, and others for their feathers. The banks about it are well-flowered with wild fox and other fish.

AIMAKAN, a river of Siberia, which runs into the sea of Ochotoko. E. long. 159° 14'. N. lat. 54° 44'.

AIMARGUES, or AYMARGUES, a town of France, with the title of a barony, in the department of the Gard, and diocese of Nîmes, situated in a marshy country on the river Vidre; 4 leagues south of Arles, and 31 south Nîmes. E. long. 3° 5'. N. lat. 44° 5'.

AIMÉ, AIMNO, or AIMNO, a small town of Savoy, on the river Ile; 6 leagues east-north-east of Montblanc.

AIMÉE, one of the sub-districts of Hindoulon, according to the Annecy-Menthon, or distribution of the emperor Alba, is entirely in the faubon of Savoy, and contains seven communes or counties, and 197 parrish officers or hundreds. Its revenue is 12,841,907 ducats, 320 ducats being equal to a pound sterling. It has 86,500 cavalry, and 437,000 infantry.

AIMON, in Biography, a Benedictine Monk, wrote about the year 810, and is chiefly known as the author of a "History of France."

AIMONTE, in Geography, lies on the east side of the river Garda near its mouth, which is the boundary from Portugal on the west, and one of the best havens on the whole coast. W. long. 7° 15'. N. lat. 37° 5'.

AIMOUTIER, a town of France, in the department of Upper Vienne, and district of St. Leonard; seven leagues south-west of Limoges.

AIN, signifying fountain, is an initial word prefixed to several Hebrew and Arabic appellations of places.

AIN, a river of France, whose one of the departments derives its name. It rises in Mount Jura, near Nevers, and after traversing a course from North to South of about 35 leagues, discharges itself into the Rhône, about five leagues above Lyons. The department of the Ain is one of the four departments, which are composed of the ci-devant Brede, Bugey and Valromey, and the principality of Donze, divided into which the former province of Bourgogne is divided. It is bounded on the north by the department of Jura, on the east, by those of Lyon and Mont Blanc; on the south, by the river Rhône, and on the west, by the department of the Rhône. Its surface is about 1,677,452 square acres, or 549,905 hectares; its population amounts to about 288,700 persons; and it is divided into four communal districts. Its chief town is Bourg.

Aïn, a town of Aïn, in the Arabian Irak; 30 leagues south-west of Balkora.

AINAD, a town of Arabia, in the province of Hadramaut.

AINAY-LE-CHATEAU, a town of France, in the department of Allier and district of Creil; eight leagues north-west of Monluets.

AINCREVILLE, a town of France, in the department of the Monce, and district of Stenay; one league south-east of Don.

AINEB-GUL, a town of Asiatic Turkey, in Totola; 40 miles north-west of Degmaz.

AIN-EL-CALU, a town of Africa, in the province of Trinacria, and kingdom of Fez.

AIN GEBEL, a town of Aïn, in the province of Dierbeik; 16 leagues south-west of Moful.

AINLING, a market town of Germany, in Upper Bavaria; ten miles north-west of Augsburg.

AINOD, a town of Germany, in the duchy of Stiria; eight miles north of Cisly.

AINS, a small town of Spain, in the kingdom of Aragon, on the river Ara; six leagues north of Balbazo.

AINSWORD, HENRY, in Biography, an eminent Nonconformist divine and Biblical commentator, flourished at the close of the 16th and commencement of the 17th century. About the year 1598, he united with the Brownists, and after lingering for some years with the dangers and troubles to which persons of this description were exposed by the indifferency zeal of the bishops and the intolerance
To Ainsworth's judgment, industry, and perseverance in compiling a dictionary for the use of schools, great commendation is due. This useful work was undertaken by him in 1714; and after many interruptions and delays was completed in 1736, and dedicated to Dr. Mead. It has been since improved by Patrick, Ward, Young, and other learned men; and in 1773 there appeared a new edition, further enlarged and improved by Morell. We have an useful abridgment of this dictionary by Mr. Thomas, in two large 8vo. volumes. Patrick's Pref. to the second edition of Ainsworth's Thesaurus, Biog. Brit.

AINZAMIL, in Geography, a town of Africa, in the province of Tremeen and kingdom of Fez.

AIOMAMA, or AIOMANO, a town of European Turkey, on a gulf of the same name, in the province of Romena; 14 leagues south-east of Saloniki. Cape Palibios is the south-east limit of the gulf, and Cape Drapano its north-east extremity. The south point is about E. long. 24° 40', and N. lat. 39° 50'.

AJOVEA, in Botany, a genus of the hesperia monogynia class and order; the characters of which are, that the calyx is single-leaved and tridentated, the corolla has three petals, the filaments are terminated with two glands, the anthers are doubly excavated, the stigma is divided in five segments, and the fruit is a roundish, single-seeded, monoporous berry. There is one species, viz. A. guianensis; which grows in the forests of Guiana.

AIOTOCHTI, in Zoology; the Mexican name of the Aramidello.

AIPIMIXIRA, in Ichthyology, the name of an American fish, more usually known by the name of Tudiano. It is a small fish, of the shape of the perch, with a purple back, and yellow sides and belly. Maregrave.

AIR, in Physics, a thin, fluid, elastic, transparent, ponderous, compressible, and dilatable body; surrounding the terraqueous globe to a considerable height.

Air was considered by some of the ancients as an element; but then, by element, they understood a different thing from what we do. See Elements.

It is certain, that air, taken in the popular sense, is far from the simplicity of an elementary substance; though some of its properties and uses in a state of combination with various subslances, from which it has been extracted by modern analysis, may entitle it to this appellation. Hence air may be distinguished into proper or elementary, and vulgar or heterogeneous.

Air, elementary, or Air properly so called, is a subtile, homogeneous, elastic fluid: the basis, or fundamental ingredient of the atmospheric air, and that which gives it the denomination.

In this sense, it likewise enters into the composition of moist, or perhaps all bodies, existing in them under a solid form, deprived of its elasticity and most of its distinguishing properties, and serving as their cement, and the universal bond of nature; but capable, by certain processes, of being disengaged from them, recovering its elasticity, and reuniting the air of our atmosphere. See Hales's Vegetable Statics, chap. vi.

The peculiar nature of this aerial matter we know but little of; what authors have advanced concerning it being chiefly conjectural. We have no way of altogether separating it from the other matters with which it in purest state it is more or less combined, and consequently no way of ascertaining, with satisfactory evidence, its peculiar properties, abstracted from those of other bodies.

Dr. Hook, and some others, maintain, that it is the
AIR

fume, with their ether, or that fine, fluid, active matter, diffused through the whole expanse of the celestial regions; which coincides with Sir I. Newton's \textit{fuble medium}, or spirit. In this view it is supposed to be a \textit{body sui generis}, ingenereable, incorruptible, immutable, present in all places, and in all bodies.

Others, considering only its property of elasticity, which they account its essential and continual character, suppose it to be mechanically producible; and to be no other than the matter of other bodies, so modified and altered, as to become permanently elastic. Sir Isaac Newton observes, that the particles of dense, compact, and fixed substances, cohering by a strong attractive force, are not separable without a vehement heat, or perhaps not without fermentation; and such bodies being at length rarified by such heat or fermentation, become true permanent air; and distinguishable from vapour, which is only apparent, or transient air, as is evident from the experiment with the zephyr, \textit{Optics}, Qu. 31, p. 371, 372. See \textit{Air, atmospheric}.

\textbf{Air, vulgar or heterogeneous,} is a coalition of corpuses of various kinds, constituting together one fluid mass, in which we live and move, and which we are continually receiving and expelling by inspiration. The whole assemblage of this makes what we call the atmosphere; where this air, or atmosphere, terminates, there ether is supposed to commence; which is distinguished from air by its not making any sensible refraction of the rays of light, as air does.

Air, in this popular and extensive meaning of the term, is acknowledged by Mr. Boyle to be the most heterogeneous body in the universe. Boerhaave flues it to be an universal chaos, or colulvies, of all kinds of created bodies. Besides the matter of light or fire, which continually flows into it from the heavenly bodies, and probably the magnetic effluvia of the earth; whatever fire can volatilize is found in the air.

Hence, for instance, 1. The whole animal kingdom must necessarily be found in it; for all of that tribe, as falts, sulphurs, flues, metals, \\&c. are convertible into fumes, and thus capable of being rendered part of the air. Gold itself, the most fixed of all natural bodies, is found to adhere close to the sulphur in mines; and thus to be raised along with it. Mr. Boyle observes, that beside the saline effluvia of the common fort, such as the nitrous, vitriolic, marine, \\&c. there may be many compounded kinds of falts in the air, which we have not on earth, arising from different saline spirits, fortuitously meeting and mixing together. Thus, the glasses windows of ancient buildings are sometimes observed to be corroded, as if they had been worm-eaten; though none of the simple falts above-mentioned have the faculty of corroding glasses.

Sulphurs too must make a considerable ingredient of the air, on account of those many volcanos, grottos, caverns, and other spirescles chiefly affording that mineral, dispersed through the globe.

2. All the parts of the animal kingdom must also be in the air; for besides the copious effluvia continually emitted from their bodies, by the vital heat, in the ordinary procees of perspiration, by means of which an animal, in the course of its duration, impregnates the air with many times the quantity of its own body; we find that any animal when dead, being exposed to the air, is in a certain time wholly incorporated with it.

3. As to vegetables, none of that class can be supposed wanting; since we know that all vegetables, by putrefaction, become volatile.

The associations, separations, motions, dilutions, and other operations of one sort of matter upon another, may likewise be considered as sources of numerous other neutral, or anonymous bodies, known to us.

\textbf{Water.} It is also diffused through the air in great abundance. Many familiar instances might be alluded to this purpose. A bottle of wine, when taken out of the cellar in the driest and hottest day of summer, will soon be covered with a dense vapour, which is water deposited by the air. The same appearance is observed on the outside of any metal vessel, which, in warm weather, contains water cooled by ice or the solution of salt, or even spring water, which is some degrees colder than the air. For other facts of similar kind, see \textit{Water}.

\textbf{Air, in this general sense,} is one of the most considerable and universal agents in all nature; being concerned in the preservation of life, and the production of most of the phenomena relating to our world. Its properties and effects, including a great part of the researches and discoveries of the modern philosophers, have in a considerable degree been reduced to precise laws and demonstrations, in which form they make a very extensive and important branch of the mixed mathematics, called \textit{pneumatics}.

\textbf{Air, mechanical properties and effects of.} The most considerable of these are its fluidity, weight, and elasticity.

\textit{I. Fluidity.} That the air is a fluid, is evident from the easy passage it affords to bodies through it; as in the propagation of smells, and other effluvia, and the easy conveyance it affords to sounds; for these and similar effects prove it to be a body, whose parts give way to any force impress'd, and, in yielding, are easily moved among themselves; which is the definition of a fluid. Besides, it is certain, that no condensation by pressure, nor any degree of cold that has ever yet been produced, natural or artificial, has been sufficient to deprive it of its fluidity. It is true, indeed, that real permanent air may be extracted from solid bodies, and may be also absorbed by them; and in this state it must be very much condensed; but under what form it exists in those bodies, or how its particles are combined together, the researches of philosophy and chemistry have not yet been able to explore.

They who, with the Cartesians, make fluidity to consist in a perpetual intermingle motion of the parts, find that air answers also to that character; thus, in a darkened room, where the species of external objects are brought in by a single ray, they appear in a continual fluctuation; and thus even the more accurate thermometers are observed never to remain a moment at rest.

The cause of this fluidity of air is attributed by some later philosophers to the fire intermixed with it; without which, they imagine, the atmosphere would harden into a solid impenetrable mass. And hence, the greater the degree of fire, the more fluid, moveable, and pervious is the air; and thus, as the degree of fire is continually varying, according to the circumstances and position of the heavenly bodies, the air is kept in a continual reciprocation. See Buffon's Hift. Nat. Supp. vol. i. Hence, in a great measure, it is said, that on the tops of the higher mountains, the fenes of finding, hearing, \\&c. are found very feeble. The increased rarity of the air at a considerable height may account for this effect; but the above hypothesis is contradicted by the more sensible experience of cold: the air, near the surface of the earth, deriving greater heat from the reflected than from the direct rays of the sun. See Mountains.
II. **Weight or gravity.** Of this property of air the ancients were not altogether unapprehensive; though their sentiments on the subject were confused and unsatisfactory. Aristotle (de Caelo, lib. iv. c. 1. op. tom. ii. p. 485.) observes, that all the elements, fire excepted, have weight; and he adds, that a bladder inflated with air, weighs more than when it is quite empty. Plutarch (de Placitis, lib. i. c. 12. tom. ii. p. 883.) and Stoobius (Ueog. Phys. lib. i. c. 17. p. 32. Ed. 1669.) quote Aristotle as teaching, that the weight of air is between that of fire and earth; and he himself, treating of respiration, (cap. vii. oper. tom. i. p. 722.) reports the opinion of Empedocles, who ascribes the cause of it to the weight of the air, which by its pressure infinates itself with force into the lungs. Plutarch (de Placit. lib. iv. c. xxii. tom. ii. p. 993.) expresses, in similar terms, the opinion of Aelianus on this subject; and represents him as saying, that the external air, by its weight, opened its way with force into the breast. Heron of Alexandria, in his treatise intitled **Spiritualia,** constantly applies the elasticity of the air to produce such effects as are sufficient to convince us that he well understood it as property of it: and Cornelius, admitting the principle of the air's elasticity, invented wind-guns, which have been considered as a modern contrivance. Philo of Byzantium (in Viter. Mathem. p. 77. Ed. Paris.) describes these curious machines, constructed upon the principle of the air's being capable of condensation. Seneca also (Quæst. Nat. lib. v. c. v. and vi.) was acquainted with the weight and elastic force of the air; for he describes the constant effort by which it expands itself when it is compressed, and affirms, that it has the property of condensing itself, and forcing its way through all obstacles that oppose its passage. See Dutens Inquiry into the origin of the Discoveries attributed to the Moderns, p. 186. 1769. The followers of Aристotle, however, abandoned the sentiments of their master on this subject; and for many ages maintained a contrary doctrine. The effects which are now known to result from the weight and elasticity of the air, were for a long time attributed to the imaginary principle, called **fius vacui,** or nature's abhorrence of a vacuum; and Galileo himself admitted the principle, though he assigned a limit to it, corresponding to the weight of a column of water 34 feet high. This distinguished philosopher, however, was well apprised of the weight of the air as a body; and, in his Dialogues, he points out two methods of demonstrating it, by weighing it in bottles. But the pressure of the air was discovered by his disciple, Torricelli. In the year 1643, it occurred to him, that whatever might be the cause by which a column of water, 34 feet high, is sustained above its level, the same force would sustain a column of any other fluid, which weighed as much as that column of water, on the same base; and hence he concluded, that quicksilver, being about 14 times as heavy as water, would not be sustained at a greater height than that of 20 or 30 inches. He then made the experiment, called after his name; and inferred from it, that the weight of the air incumbent on the surface of the external quicksilver, counterbalanced the fluid contained in the tube. By this experiment he not only proved, as Galileo had before done, that the air had weight, but that its weight was the cause of the suspension of water and quicksilver in pumps and tubes, and that the weight of the whole column of it was equal to that of a like column of quicksilver, 35 inches high, or of water 34 or 35 feet high; but he did not ascertain the weight of any particular quantity of it, as a gallon, or a cubic foot; nor its specific gravity to water, which had been done, though inaccurately, by Galileo. Torricelli's experiment was published at Warsaw, in Poland, by Valerianus Magnus, as his own discovery; but from the letters of Boyle, it appears, that Torricelli's claim to priority is indefensible; and that neither Valerianus, nor Hononatus Fabri, to whom it has been ascribed so early as the year 1641, can justly dispute it with him. The first discovery of the weight and elasticity of the air has been lately ascribed to Jean Rey, who wrote in 1659, before Galileo, Torricelli, Des Cartes, and Pafchel. His fourth and tenth essays have been cited in favour of his claims; but though he was apprised that comparison augmented the weight of the air, and he seems to have believed, with Aristotle and others at a very ancient period, that air was heavy, yet the proofs which he adduced were not sufficient to convince the incredulity of the philosophers. The Torricellian experiment, by which the fact was established, and which father Merfonne received an account of in 1644, was immediately communicated to the philosophers of France, and repeated in various ways by Mesifs. Pafchel and Petit: and this gave occasion to the ingenious treatise published by Pafchel, at 23 years of age, intitled, **Experiences Nouvelles touchant la Vuide.** Having, after some hesitation, adopted Torricelli's idea, and abandoned the principle of a fius vacui, he devised several experiments for confirming it. One of these was to make a vacuum above the refovoir of quinfillver, in which case he found that it funk to the common level: and he then engaged M. Perrier, his brother-in-law, to execute the famous experiment of Puy-de-Domme, who found that the height of the quinfillver half way up the mountain was less by some inches than at the foot of it; and that it was still less at the top. These facts incontrovertibly proved, that it was the weight of the atmosphere which counterpoised the quickfillver. Des Cartes had also just notions of the power of the air for sustaining fluids above their level, as appears by some letters about this time, and some years before; and in one of these he lays claim to the idea of the Puy-de-Domme experiment. See Cartesii opera. tom. ii. p. 243, 245.

The experiment of Pafchel was repeated in various parts of the world; and particularly in 1653, by Dr. Power, in England; and in 1661, by Mr. Sinclair, professor of philosophy at Glasgow, in Scotland.

That the air is heavy, follows from its being a body; weight being an essential property of matter. And that it is a body, is evident from its excluding all other bodies out of the space it poiffes: for if a glass jar be inverted into a vefsel of water, the air, of which it is full, will allow but little water to enter into it. But we have many arguments to the fame purpofe from fene and experiment: thus, the hand, applied on the orifice of a vefsel empty of air, soon fells the load of the incumbent atmosphere. Thus, glass veffeles, evacuated of their air, are easily crufhed to pieces by the weight of the air without. So, two small hollow fragments of a sphere, four inches in diameter, exactly fitting each other, being emptied of air, are prefled together with a force equal to 188 pounds, by the weight of the ambient air; and that they are kept together by the preffure of the air is evident, by fufpending them in an exafluated receiver, where they will separate of themselves. Farther, if a tube, clofe at one end, be filled with mercury, and the other end immersed in a bafon of the fame fluid, and thus ereded, the mercury in the tube will be fuspended at the height of about 30 inches above the furface of that in the bafon. The reafon of which fuppofition is, that the mercury in the tube cannot fall lower without raifing that in the bafon; which being prefled down by the weight of the incumbent atmosphere cannot give way, unlefs the weight of the mercury in the tube exceeds that of the air out of it.
it. That this is the case, is evident; because, if the whole apparatus be included in the receiver of an air pump, the mercury will fall in proportion as the air is exhausted: and on gradually letting in the air again, the mercury recedes to its former height. This makes what is usually called the Torricellian experiment.

To say no more, we can actually weigh air; for a vessel, full even of common air, is found, by a very nice balance, to weigh more than when the air is exhausted; a quart of air weighing about 17 grams; and the effect is proportionally more sensible, if the vessel be weighed full of condensed air, and more especially in a receiver void of air.

The weight of air is continually varying, according to the different degree of heat and cold, and the concurrence of other causes. Paehal observed it in France; and Des Cartes in Sweden, in 1650. Mr. Boyle, and others, observed it in England, in 1656. Some observers noticed, that it was generally great on the night and in winter; and that its variations were more considerable during winter, and in the northern regions. Hence arose the application of the barometer to the uses of a weather-glass. Ricelius calculates the weight of air to that of water, to be as 1 to 1000; Mercianus as 1 to 1300, or 1 to 1356; Lana, as 1 to 640; Galileo only makes it as 1 to 400. Mr. Boyle, by a more accurate experiment, found it about London, as 1 to 938; and thinks, all things considered, the proportion of 1 to 1000 may be taken as a medium; for there is no fixing any precise ratio, since not only the air, but the water itself, is continually varying. Besides, experiments made in different places necessarily vary, on account of the different heights of the places, the seasons of making the experiment, and the different densities of air corresponding to these circumstances. It must be added, however, that by experiments made since, before the Royal Society, the proportion of air to water was, first, found as 1 to 840; then, as 1 to 850; and a third time, as 1 to 860. Phil. Trans. N° 181. And lastly, by a very simple and accurate experiment of Mr. Haukhbee, the proportion was settled, as 1 to 885. Phys. Mechan. Exper. But these experiments being all made in the summer months, when the barometer was 29½ inches high, Dr. Jurin thinks, that at a medium between heat and cold, when the barometer is 30 inches high, the proportion between the two fluids may be taken as 1 to 800; which agrees with the observation of the honourable Mr. Cavendish, the thermometer being at 50°, and the barometer at 29¾ inches. Phil. Trans. vol. 111. p. 152.

Sir George Shuckburgh, (Phil. Trans. vol. 111. p. 560.) by a very accurate experiment, found it as 1 to 836; the barometer being at 29½ inches, and the thermometer at 53°; and the comparative gravity of quicksilver to air, as 113646 to 1. The medium of all these is about one to 832 or 833, when reduced to the pressure of 30 inches of the barometer, and the mean temperature 55° of the thermometer. Upon the whole, it may be concluded, that when the barometer is at 30 inches, and the thermometer at the mean temperature of 55°, the density or gravity of water is to that of air as 833 1/3 to 1; that is, as 1000 3/4 to 1, or as 2500 to 3; and for any changes in the height of the barometer, the ratio varies proportionally; and also that the density of the air is altered by the 1/3 part, for every degree of the thermometer above or below temperate. This number, which is a very good medium, having the fraction 3/4, gives exactly 163° of an ounce for the mean weight of a cubic foot of air; the weight of the cubic foot of water being just 1000 ounces avoidandips, and that of quicksilver equal to 15600 ounces.

Air, then, being heavy and fluid, the laws of its gravitation, or pressure, may be inferred to the same as those of other fluids; and consequently its pressure must be proportional to its perpendicular altitude. This is also confirmed by experiment. For removing the Torricellian tube to a more elevated place, where the incumbent column of air is shorter, a proportionally shorter column of mercury is sustained; and that nearly at the rate of 100 feet for 1/16 of an inch of quicksilver. On this principle depend the structure and office of the barometer.

From hence, also, it follows, that the air, like all other fluids, must pref of equally every way. This is confirmed by observing, that soft bodies sustain this pressure without any change of figure, and brittle bodies without breaking; though the pressure upon them be equal to that of a column of mercury thirty inches high, or a column of water of thirty-two or somewhat more feet. It is obvious, that no other cause can preserve such bodies unchanged, but the equable pressure on all sides, which acts as much as it is relented. And hence, upon removing or diminishing the pressure on one side only, the effect of the pressure is soon perceived on the other. For the quantity and effect of this pressure of the atmosphere on the human body, and on the surface of the earth, and the laws of different heights, see Atmosphere.

From the gravity of the air, considered in connection with its fluidity, several of its uses and effects may be easily deduced.

1. By means of its weight, &c. it closely invets the earth, with all the bodies upon it; and conftrines and binds them down with a force amounting, according to the computation of M. Paehal, to 2232 pounds weight upon every square foot, or upwards of 15 pounds upon every square inch. Hence it prevents, &c. the arterial vessels of plants and animals from being too much dilated by the impulse of the circulating juices, or by the elastic force of the air, so plentifully contained in the blood.—Thus we see, in the operation of cupping, that, upon a diminution of the pressure of the air, the parts of the body grow tumbid; which necessarily alters the manner of the circulation through the capillaries, &c.

The same cause hinders the juices from ouning and cleanning through the pores of their containing vessels: this is experienced by such as travel up high mountains, who, in proportion as they ascend, find themselves more and more relaxed; and at length become subject to a futting of blood, and other hemorrhages; because the air doth not sufficiently constring the vessels of the lungs. Similar effects are observed in animals that are enclosed under the receiver of the air-pump, who, as the air is taken from them, pant, fivel, vomit, and discharge their urine and excrements. See Vacuum.

2. The weight of the air promotes the mixture of contigious fluid bodies. Hence many liquids, as oils and salts, which readily and spontaneously mix in air, remain, on the removal of it, in a state of separation.

3. This gravity of air does in some cases determine the action of one body above another.

4. To the same principle are chiefly owing our winds, which are only air put in motion by some alteration in its equilibrium. It is the weight of the air that caues the clouds and vapours to float in it.

111. Elasticity—or a power of yielding to an impression by contracting its dimensions; and upon removing or diminishing the impresssive cause, of returning to its former space or figure, is another quality of air. This elastic force
AIR

force has been long accounted the distinguishing property of air; the other properties hitherto enumerated being common to it with other fluids: though, from late experiments, it appears more than probable, that the capacity of being compressed and expanded is not peculiar to air. See WATER and COMPRESSION.

This property of air has been long known, and was ascertained by some experiments of Lord Bacon, who, upon this principle, constructed his *ventrum calidum*, the first thermometer. Bacon, Nov. Organ. lib. ii. aph. 13.

Of this power we have numerous proofs. — Thus, a blown bladder being squeezed in the hand, we find the included air sufficiently relit: so that upon ceasing to compress, the cavities or impressions, made in its surface, are readily expanded again, and filled up.

On this property of elasticity, the structure and office of the air-pump depend.

Every particle of air always exerts this radius, or endeavour to expand, and thus strives against an equal endeavour of the ambient particles, whose reluctance happening by any means to be weakened, it immediately diffuses itself into an immense extent. Hence it is, that thin glass bubbles, or bladders filled with air, and exactly closed, being included in the exhausted receiver of an air-pump, burst by the force of the included air. So a bladder quite flaccid, containing only the smallest quantity of air, swells in the receiver, and appears quite full. The same effect is also found by carrying the flaccid bladder to the top of a high mountain. This experiment shows, that the elasticity of air is different from that of solid bodies; after these have been compressed, they only resume the figure which they had lost; whereas air, when the compressing force is removed, not only dilates, but occupies a much greater space than it did before, nor is it easy to allude the limits of its expansion. From some experiments of Col. Roy (Phil. Trans. vol. 67. p. 708.) it would seem, that the particles of air may be so far removed from one another, by the diminution of pressure, as to lose a very great part of their elastic force. It also appears that the elastic force of common air is greater than when its density is considerably augmented or diminished by an addition to, or subtraction from the weight with which it is usually loaded: a fact which contradicts the experience of Boyle, Mariotte, and others. These experiments also show, that the elastic force of moist air is greatly superior to that of dry air; in some cases the total expansion of the former was more than four times that of the latter.

It has been questioned among philosophers, whether this elastic power of the air is capable of being destroyed or diminished. Mr. Boyle made several experiments, with a view to discover, how long air, brought to the greatest degree of expansion to which he could reduce it in his air-pump, would retain its spring; and could never observe any sensible diminution. Daghiler found that air, after having been enclosed for half a year in a wind-glass, had lost none of its elasticity; and Roberval, after preserving it in the same manner for sixteen years, observed, that its expansive projectile force was the same as if it had been recently condensed. Nevertheless, Mr. Hankfbee concludes, from a later experiment, that the spring of the air may be so disturbed by a violent pressure, as to require some time to return to its natural tone. Dr. Hales inferred, from a number of experiments, that the elasticity of the air is capable of being impaired and diminished by a variety of causes, and of being actually destroyed, so that it is reduced to a fixed state. Hence he also concludes, that elasticity is not an essential immutable property of the particles of air; and that the atmosphere is a chaos, confining not only of elastic, but also of unelastic air.

particles, which copiously float in it. Statical Essays, vol. i. p. 316.

The weight or pressure of the air, it is obvious, has no dependence on its elasticity; but would be the same, whether the air has such a property or not. But the air, being elastic, is necessarily affected by the pre-pressure, which reduces it into such a space, as that the elasticity which reacts against the compressing weight, is equal to that weight. Indeed, the law of this elasticity is, that it increases as the density of the air increases; and the density increases as the force increases by which it is pressed. Now, there must necessarily be a balance between the action and reaction; i.e. the gravity of the air, which tends to compress it, and the elasticity of the air, which endeavours to expand it, must be equal. And the elasticity of the air not very different from its natural state, being as the density, will of course be inversely as the space which it occupies.

Hence the elasticity increasing, or diminishing, universally, as the density increases or diminishes, i.e. as the distance between the particles diminishes, or increases, it is no matter whether the air be compressed and retained in such space, by the weight of the atmosphere, or by any other means; it must endeavour, in either case, to expand with the same force. And hence, if air near the earth be kept up in a vessel, so as to cut off all communication with the external air, the pressure of the inclosed air will be equal to the weight of the atmosphere. Accordingly, we find mercury sustained to the same height, by the elastic force of air inclosed in a glass vessel, as by the whole atmospheric pressure.

On the same principle air may be artificially condensed; and hence the structure of the air-gun.

Although it may be admitted as a general principle, that the density of the air is proportional to the force by which it is compressed, as the experiments of Mr. Boyle and Mr. Mariotte have evinced; yet in the case of condensed air, the rule will not be strictly applicable. When air is very forcibly compressed, so as to be reduced to 1/3 of its ordinary bulk, it makes a greater resistance, and requires a stronger force to compress it than the above principle allows. Hence it appears probable, that the particles of air cannot, by any possible pressure, be brought into perfect contact, or form a solid mass; and therefore that the degree of condensation has its limit. Thus also in very high degrees of rarefaction, the elasticity is decreased rather more than in an exact proportion to the weight or density of the air: whence it may be concluded, that there is a limit to its rarefaction or expansion, so that it cannot be expanded to infinity. Nevertheless, the utmost limits to which air of the density which it possesses at the surface of the earth, is capable of being compressed, have not been ascertained. Mr. Boyle reduced it at one time to the 14th part, and at another to the 40th part of its natural space. (Works, vol. iii. p. 567.) Dr. Halley says, that he has seen it compressed so as to be 60 times denser than in its natural state, which is further confirmed by Mr. Papin, and M. Huygens. Dr. Hales (Stat. Exp. vol. ii. p. 343, &c.) by means of a pump, condensed it 38 times; and by freezing water in an iron ball or globe, into 1522 times less space than it naturally occupies: in which state its density or specific gravity must be nearly double that of water; and as water is very slightly compressible, the particles of air must be in their nature different from those of water; since it would otherwise be impossible to reduce air to a bulk 800 times less than that which it occupies in its natural state.

However, Dr. Halley has ascertained, in the Philosophical Transactions, (Abr. vol. ii. p. 17.) that from the experiments
ments made at London, and by the Academy del Cimento at Florence, it might be safely concluded, that no force whatever is able to reduce air into 800 times less space than that which it naturally occupies on the surface of our earth. In answer to which, M. Amontons, in the Memoirs of the French Academy, maintains, that there is no affixing any bounds to its condensation; that greater and greater weights will still reduce it into less and less compacts; that it is only elastic in virtue of the fire which it contains; and that as it is impossible ever absolutely to drive all the fire out of it, it is impossible ever to make the utmost condensation. The elasticity of the air excits its force equally in all directions; and when released from the force that compresses it, it affirms a spherical figure in the interstices of the bodies that contain it. By exhausting the air from liquors placed under the receiver of an air-pump, the bubbles that gradually arise and are enlarged in size, retain their round figure. Such are also the bubbles that discharge themselves from a plate of metal immersed in a fluid in the same circumstances. On this account large glasses globes are always formed of a spherical shape by blowing air through an iron tube into a piece of melted glass at the end of the tube.

The dilatation of the air by virtue of its elastic force, is found to be very surprising; and yet Dr. Wallis fuppogest, that we are far from knowing the utmost of which it is capable. In several experiments made by Mr. Boyle, it dilated first into 9 times its former space; then into 31 times, then into 60; and then into 150. Afterwards, it was brought to dilate into 8000 times its first space; then into 10,000, and even at last into 13,679 times its space; and this altogether by its own expansive force, without the help of fire. Boyle's Works by Birch, vol. i. p. 21, 22.

On this depend the structure and use of the MANOMETER. Hence it appears, that the air we breathe near the surface of the earth is comprized by the weight of the superincumbent column into at least the 1567th part of the space it would possess in vacuo. But if the air be condened by art, the space it will take up when most dilated, to that it possesses when condened, will be, according to the same author's experiments, as 550,000 to 1.

We hence see how wild and erroneous the observation of Aristotle was, that air, rendered ten times rarer than before, changes its nature, and becomes fire.

It has generally been suppos'd, that air expands to 1/27 with each degree of the thermometer, commencing from the mean temperature 55°; and upon this principle tables have been computed by astronomers for correcting their mean refractions; but Sir George Shuckburgh allows at this temperature an expansion of 1/27 for v. Phil. Trans. v. 67. p. 564. Mr. Hauksbee observed, that a portion of air, included in a glass tube, when the temperature was at the freezing point, formed a volume which was to that of the same quantity of air in the greateft heat of summer in England as 6 to 7. Moir's air has been expanded into more than 12 times the space occupied by it in its freezing state; and Mephenus by means of the volatile expanded it into more than 70 times its natural bulk. Mufchenb. Introduct. ad Phil. Nat. tom. ii. p. 884, 406.

M. Amontons, and others, we have already observed, attribute the rarefaction of the air wholly to the fire contained in it; and therefore, by increasing the degree of heat, the degree of rarefaction may be carried still farther than its spontaneous dilatation. Air is expanded 4 of its bulk by boiling water. Hift. Acad. Se. 1699.

Dr. Hales found that the air in a retort, when the bottom of the vessel was just beginning to b. red hot, was expanded through twice its former space, and in a white, or almost melting heat, it occupied thrice its former space: but Mr. Robins found, (New Principles of Gunnery, ch. 1. prop. 5. p. 12.) that air was expanded by the heat of iron, just beginning to be white, to four times its former bulk. Thus we account for the apparent inflation of a faddle bladder, when it is warmed by the fire, and on this principle depend the structure and office of the THERMOMETER, and also the formation and ascent of air-balloons. See AEROSTATION.

M. Amontons first discovered that air will expand, in proportion to its density, with the same degree of heat. On this foundation, the ingenious author has a discourse, to prove, that the spring and weight of the air, with a moderate degree of warmth, may enable it to produce even earthquakes, and other of the most vehement commotions of nature.

According to the experiments of this author, and M. de la Hire, a column of air on the surface of the earth, 36 fathoms high, is equal in weight to three lines depth of mercury; and it is found, that equal quantities of air possess spaces reciprocally proportioned to the weights with which they are prefled; the weight of the air, therefore, which would fill the whole space possessed by the terrestrial globe, would be equal to a cylinder of mercury, whose base is equal to the surface of the earth, and its height containing as many times three lines, as the atmospheric space contains orbs equal in weight to 36 fathoms of that wherein the experiment was made.—Hence, taking the densit of all bodis, e. gr. gold, whose gravity is about 14,630 times greater than that of air in our orb, it is easy to compute, that this air would be reduced to the same density as gold, by the pressure of a column of mercury 14,630 times 28 inches high, i. e. 409,640 inches, since the bulbs of air, in that case, would be in the reciprocal ratio of the weights by which they are precled. These 409,640 inches, therefore, express the height at which the barometer must stand, where the air would be as heavy as gold, and the number 2,482,443 lines, the thickness of 11 36 of its column of 36 fathoms of air would be reduced in the same place.

Now, we know, that 43,528 fathoms, which is the depth, where the above pressure, and consequent reduction take place, are only the 74th part of the semidiameter of the earth; and, therefore, beyond that depth, whatever matter exists, it must be heavier than gold. It is not improbable, therefore, that the remaining sphere of 6,451,538 fathoms diameter may be full of dense air, heavier by many degrees than the heaviest bodies which we know. Hence, again, as it is proved, the more air is comprized the more does the same degree of heat increaf the force of its spring, and render it capable of a proportionally greater effect; we may infer, that a degree of heat, which in our orb can only produce a moderate effect, may have a very violent one in such lower orb; and that, as there may be many degrees of heat in nature, beyond that of boiling water, it is probable there may be some, whose violence, thus alleviated by the weight of the air, may be sufficient to tear asunder the solid globe. Mem. de l'Acad. an. 1703. See EARTHQUAKES.

This elastic property of air is suppos'd by many philosophers to depend on the figure of its corpuscles, which they apprehend to be ramous: some maintain that they are so many minute fucculent, resembling fleeces of wood; others conceive them rolled up like hoops, and curled like wires, or shavings of wood, or coiled like the springs of watches, and endeavouring to restore themselves in virtue of their texture; so that to produce air, must be to produce such a figure and disposition of parts; and those bodies only are proper
pores subject, which are susceptible of such disposition; which varies, from the smoothness, roundness, and slippery-ness of their parts, are not.

But Sir Isaac Newton (Optics, p. 371.) explains the matter otherwise; such a texture, he thinks, by no means sufficient to account for that rare power of diffusibility observed in air, which is capable of diffusing itself above a million of times more space than it before possessed.—But, as all bodies are known to have an attractive and repelling power; and as both these are stronger in bodies, the denser, more compact, and solid they are; hence it follows, that when by heat, or any other powerful agent, the attractive force is diminished, and the particles of the body separated so far as to be out of the sphere of attraction, the repelling power which then commences makes them recede from each other with a strong force proportionable to that with which they before cohered; and thus they become permanent air. And he has proved, that particles, endeavouring to recede from each other with forces reciprocally proportionate to the distance between their centres, will compose an elastic fluid, whose density shall be proportional to its compression. Hence, says the same author, it is, that as the particles of permanent air are greater, and rise from denser bodies, than those of transient air, or vapour, true air is more ponderous than vapour; and a moist atmosphere is lighter than a dry one.

The elastic power of the air above illustrated and evinced, is the second great source of the effects of this important fluid. By this property, it invisibly diffuses itself into the pores of bodies, and by possessing this prodigious faculty of expanding, which is to easily excited, it must necessarily put the particles of bodies into which it invisibly diffuses itself into perpetual oscillations. Indeed, the degree of heat, and the air's gravity and density, and consequently its elasticity and expansion, never remaining the same for the least space of time, there must be an incessant vibration, or dilatation and contraction of all bodies.

We observe this reciprocation in several instances, particularly in plants, the tree, or air-vessels of which perform the office of lungs; for the contained air alternately expanding and contracting, as the heat increases or is diminished, by turns compresses the vessels, and eases them again: and thus promotes a circulation of their juices. See Air-vessels.

Hence, we find, that no vegetation nor germination will proceed in vacuo. Indeed beams have been observed to grow a little, when in it; and this has led some to attribute the growth of vegetation, which was really owing to no other cause than the dilatation of the air within them.

The air is very instrumental in the production and growth of vegetables, not only by invigorating their several juices, while in an elastic active state, but also by greatly contributing to a fixed estate to the union and firm connection of their several constituent parts, and by supplying them with that food or palatum, which contributes to their growth.

From the same cause it is, that the air contained in bubbles of ice, by its continual action, dries the ice; and thus also, as well as by the expansion of freezing fluids, glaflies and other vessels frequently crack, when their contained liquors are frozen. Thus also, entire columns of marble sometimes cleave in the winter time, from some little bubble of included air's acquiring an increased elasticity; and to this it is owing, that few stones will hear to be heated by the fire without cracking by the expansive force of the air confined within their pores. From the same principle arise purfication and fermentation; neither of which will proceed, even in the best disposed subjects, in vacuo.

Since we find such great quantities of elastic air, generated in the solution of animal and vegetable sublubcles, a good deal must constantly arise from the dissolution of these elements in the stomach and bowels, which is much promoted by it: and respiration, and even animal life, depend in a great measure upon the air.

In reality, all natural corruption and alteration seem to depend on air; and metals, particularly gold, only seem to be durable and incorruptible, in virtue of their not being pervious to air.

Air, effects of the different ingredients of. Air not only acquires its common properties of gravity and elasticity, but there are numerous other effects, arising from the peculiar ingredients of which it consists.

Thus, 1. It not only dilutes and attenuates bodies by its pressure and attrition, but as a Clair containing all kinds of membra, and consequently possessing powers for diffusing all bodies. It is known that iron and copper readily dissolve, and become rusty in air, unless well defended with oil. Boerhaave affirms us, that he has seen pillars of iron to be reduced by air, that they might be crumbled to dust between the fingers; and as for copper, it is converted by the air into a sublubcle much like the verdigris produced by vinegar.

Mr. Boyle relates, that in the southern English colonies the great guns rust to fail, that after lying in the air for a few years, large cakes of crocus marts can be separated from them. Acosta adds, that in Peru the air diffuses lead, and considerably increases its weight. Yet gold is generally esteemed indiffusable by air; being never found to contract rust, though exposed to it ever so long. In the laboratories of chemists, however, where aqua regia is prepared, the air becoming impregnated with an unusual quantity of this menstruum, gold contracts a rust like other bodies.

Stones also undergo the changes incident to metals.—Thus, Purbeck stone, of which Salisbury cathedral consists, is observed gradually to become softer, and to moulder away in the air; and Mr. Boyle gives the same account of Blackington stone. He adds, that air may have a considerable operation on vitriol, even when a strong fire could act no further upon it. And he has found, that the fumes of a corrosive liquor work more suddenly and manifestly on a certain metal, when filled in the air, than the mensurium itself did, which emitted fumes on those parts of the metal which it covered; referring to the effects of the effluvia of vinegar on copper.

The dissolving power of air is increased by heat, and by other causes. It combines with water, and, by access of cold, deposits part of the matter which was kept dissolved in it, by a greater degree of heat. Hence the water, by being deposited and condensed upon any cold body, such as glasses, &c, in windows, forms fogs, and becomes visible. Air, likewise, has been supposed, by means of its dissolving power, to accelerate evaporation and distillation.

2. Air volatilizes fixed bodies. Thus, sea-salt, being hift calcined, then fused by the fire, and when fused, exposed to the air to liquify; when liquified, set to dry, and then fused again, repeating the operation, will, by degrees, be almost wholly evaporated; nothing but a little earth remaining. Helmont mentions it as an arcanum in chemistry, to render fixed falt of tartar volatile; but this is easily effected by air alone: for, if some of this falt be exposed to the air, in a place releate with acid vapours, the falt draws the acid to itself, and when satureted with it, is volatile.

3. Air also fixes volatile bodies. Thus, though spirit of...
AIR

of nitre, or aquafortis, readily evaporates by the fire; yet if there be any putrefied urine near the place, the volatile spirit will be fixed, and fall down in form of aqua secunda.

4. Air brings many quiescent bodies into action; i.e., excites their latent powers. Thus, if an acid vapour be diffused through the air, all the bodies of which that is the proper menstrum, being dissolved by it, are brought into a state proper for action.

In the various operations of chemistry, air is a very necessary and important agent, the result of particular processes depending on its presence or absence, on its being open or enclosed. Thus the parts of animals and vegetables can only be calcined in open air; in cloze vessels they never become any other than black coals. And these operations are effected by the changes to which the air is liable. Many instances might be adduced to this purpose. Let it suffice to observe, that it is very difficult to procure oil of sulphur, per companion, in a clear dry atmosphere; but in thick moist air it may be obtained with greater ease, and in larger quantities. So pure well-fermented wine, if it be carried to a place where the air is replenished with the fumes of new wine, then fermenting, will begin to ferment afresh.

The changes in the air arise from various causes, and are observable not only in its mechanical properties, such as gravity, density, &c. but in the ingredients that compose it. Thus, at Faslium, in Sweden, noted for copper-mines, the mineral exhalations affect the air in such a manner, as to discolor the silver coin in purses; and the same effluvia change the colour of brasses. In Carniola, Campania, &c. where are mines of sulphur, the air sometimes becomes very unwholesome, which occasions frequent epidemic diseases, &c.

The effluvia of animals also have their effect in varying the air, as is evident in contagious diseases, plague, murrains, and other mortalities, which are spread by an infected air.

The sudden and fatal effect of noxious vapours has generally been supposed to be principally, if not wholly, owing to the fogs and vales of the vivifying spirit of air. But Dr. Halley attributes this effect to the fogs of a considerable part of the air's elasticity, and to the grossness and density of the vapours with which the air is charged. He found, by an experiment made on himself, that the lungs will not rise and dilate as usual, when they draw in such noxious air, the elasticity of which has been considerably diminished. For having made a bladder of very supple by wetting it, and then cutting off so much of the neck as would make a hole wide enough to admit the biggest end of a large foffet, to which the bladder was bound; and then having blown the bladder, he put the small end of the foffet into his mouth, and, at the same time, pinched his nostrils so close, that no air might pass that way, and he could only breathe to and fro the air contained in the bladder, which, with the foffet, contained fifty-four cubic inches. In less than a half a minute, he found a considerable difficulty in breathing; and at the end of a minute, the bladder was become so flaccid, that he could not blow it above half full, with the greatest exertion which he could make; and at the same time, he could plainly perceive that his lungs were much fallen, in the same manner as when we breathe out of them all the air we can at once. Hence he concluded, that a considerable quantity of the elasticity of the air was destroyed; and that when the suffocating quality of the air was the greatest, it was with much difficulty that he could dilate his lungs in a very small degree. From this, and several other experiments, he inferred, that the life of animals is preferred rather by the
dilute force of the air acting on their lungs than by its vivifying spirit; and that candles and matches cease to burn, after having been confined in a small quantity of air, not because they have rendered the air effeet by consuming its vivifying spirit, but because they have discharged a great quantity of acid fufeguous vapours, which partly destroy its elasticity, and retard the dilute motion of the remainder. He likewise found, that air, which passed through cloths dipped in vinegar, could be breathed to and fro as long again as the like quantity of air, which was not thus purified; for that sprinkling the decks of ships with vinegar may refresh the air; and this is confirmed by experience. But where the corruption of the air is much greater, as in close prisons, &c. nothing can be an adequate and effectual remedy but a ventilator. He observed, likewise, that air is not disqualified for respiration merely by the additional moisture which it receives, but by some bad quality in that moisture. See his Statical Essays, vol. i. p. 250. vol. ii. p. 320, &c.

Dr. Priestley observes, that, when animals die upon being put into air, in which other animals have died, after breathing in it as long as they could, it is plain that the cause of their death is not the want of any pabulum ater, which has been supposed to be contained in the air; but because the air is impregnated with something stimulating to their lungs; for they almost always die in convulsions, and are sometimes affected to suddenly, that they are irrecoverable after a single inspiration. And he has found the same effect from many other kinds of noxious air. He concludes, from subsequent experiments, that the air becomes phlogisticated in its passage through the lungs, by means of the blood. Experiments and Observations on Air, vol. i. p. 71. vol. ii. p. 31. vol. iii. p. 55. See Azot, Blood, and Respiration.

Vegetables likewise produce a change in the state of the air. Thus when a great part of the clove trees, which grow so plentifully in the island of Terror, was felled at the solicitation of the Dutch, in order to heighten the value of that fruit, such a change ensued in the air, as showed the fatal effects of the effluvia, or rather of the vegetation of the clove-trees, and their blossoms; the whole island soon after they were cut down, being exceeding sickly. See Azot.

The air is also liable to alterations from the season of the year. Thus few subterraneous effluvia are emitted in the winter, because the pores are locked up by the frost, or covered by snow; the subterraneous heat being at work, and preparing a heat to be discharged in the ensuing spring. Again, from the winter follicle to the summer follicle, the sun's rays become more and more perpendicular, and consequently their impulse on the earth's surface more powerful; so that the globe, or soil, is more and more relaxed, softened, and putrefied, till he arrives at the tropic; where, with the force of a chemical agent, he refolves the superficial parts of the earth into their constituent principles, water, oil, salt, &c. which are all swept away into the atmosphere.

The height and depth of the air produce a further alteration; the exhalations not rising high enough in any great quantity, to ascend above the tops of high mountains.

From some experiments with air-balloons, it has been proved, that the air of the higher regions is more impure than that at the surface of the earth; which is reasonably ascribed to the oxygen supplied by vegetation to the lower and contiguous horizons of air.

Nor must drought and moisture be denied their share, in varying the state of the atmosphere; in Guinea, the heat, with the moisture, conduces so much to putrefaction, that the purest white sugars are often full of maggots; and their drugs
For the refracting power of air, see Refraction.

After all, some of our more curious and penetrating naturalists have observed certain effects of air, which do not appear to flow from any of the properties, or material, above recited. In this view, Mr. Boyle has compos'd a treatise of philosophers about some unknown properties of the air. The phenomena of fire and flame in vacuo seem, according to him, to argue some unknown vital substance diffused through the air, on account of which that fluid becomes so necessary to the subistence of flame. Buffon supposes that air is necessary to the subistence of fire, because it is most adapted to acquire that expansive motion, which is the principal property of fire. On this account fire combines with air; in preference to any other substance, and in a more intimate manner, as being of a nature most nearly approaching to its own; and therefore air is the proper aliment and most powerful of all.

According to Dr. Priestley, the air is a medium for the phlogiston emitted by burning bodies; which must cease to burn when that medium is saturated with it. And he accounts in the same manner for the suffocation of animals in a confined space. When the phlogiston, emitted by burning bodies and breathing animals, can no longer be absorbed by the ambient air, both life and flame are extinguished. Exp. and Ob. see vol. i.

For the modern hypothesis, with regard to this subject, see Combustion and Phlogiston.

Thus we find, that many causes combine to produce very considerable alterations in the state of the air, whereby it becomes less fit for respiration, and other purposes of nature; and if there were no provision for restoring its salubrity, it must, in time, become universally injurious and fatal. Dr. Priestley, in the course of his inquiries on this subject, has discovered the great reitorative, which are provided for this purpose. One of these is vegetation. In order to ascertain this fact, he put a sprig of mint, in a vigorous state, under a glafs jar, inverted in water; and he found, contrary to his expectation, that this plant not only continued to live, though in a languishing way, for two months; but that the confined air was so little corrupted by the effluvia of the mint, that it would neither extinguish a candle, nor kill a small animal, which he conveyed into it. He found, likewise, that air, vitiated by a candle left in it till it was burnt out, was perfectly restored to its quality of supporting flame, after another sprig of mint had vegetated in it for some time. And, in order to shew that the aromatic flavour of the plant had no share in producing this effect, he observed, in a variety of other experiments, that vegetables of an offensive smell, and even such as had fear'd any smell at all, but were of a quick growth, proved the best for this purpose. Nay, more, the virtue of growing vegetables was found to be an antidote to the baneful quality of air, corrupted by animal respiration and putrefaction; and he infers from a number of similar facts, that the injury, which is continually done to the atmosphere, by the respiration of so many animals, and the putrefaction of such masses of both vegetable and animal matter, is, in part at least, repaired by the vegetable creation; and notwithstanding the prodigious mass of air that is corrupted daily by the above mentioned causes; yet, if we consider the immense profusion of vegetables upon the face of the earth, growing in places suited to their nature, and consequently at full liberty to exert all their powers, both inhaling and exhaling, it can hardly be thought, that the remedy is not adequate to the evil. Dr. Franklin, in a reflection on this discovery, expresses his hope, that it will give some check to the rage of destroying trees that grow near houses, which has accompanied our late improvements in gardening, from an opinion of their being uselefs; adding, from long observation, that there is nothing unhealthy in the air of woods, "since the Americans have their country habitations in the midst of woods, and no people on earth enjoy better health, or are more profitable." Dr. Priestley has since discovered that light is necessary to enable plants to purify air: however, pure air is not produced by light, or plants, but only by the purification of the impure air to which the plants have access. Obs. and Exp. on Air, vol. v. p. 18, 24, &c.

The sea, and other large bodies of water, are the second source, which nature has provided for reftoring the salubrity of corrupted air. Dr. Priestley found, that all kinds of noxious air were removed by continued agitation in a trough of water; the noxious effluvia being fewl imbibed by the water, and thereby transmitted to the common atmosphere. And he hence concludes, that the agitation of the sea, and of large lakes and rivers, must be highly useful for the purification of the atmosphere; the putrid matter being absorbed by the water, and imbibed by marine, and other aquatic plants, or applied to purposes yet unknown. Exp. and Ob. vol. i. fect. 2. and 4.

This ingenious philosopher apprehends, that the agitation of water, and the vegetation of plants, purify noxious air, by absorbing part of the phlogiston with which it is loaded; and that this phlogistic matter is the most essential part of the food and support of both vegetable and animal bodies. Ib. vol. i. p. 138, 139.

Dr. Priestley, improving upon the experiments and investigations of Boyle, Hales, Brownrigg, Black, Macbride, Cavendish, and others, has discovered many species of air, extracted by various processes from different kinds of substances; of which a summary account will be given in the course of this work. See also his curious and valuable Experiments and Observations on different Kinds of Air, in five volumes. And for a compendium of the history of discoveries on this subject, Lavoisier's Essays Physical and Chemical, vol. i.

For the resistance of the air, see Resistance. Air, undulation of. See Sound and Undulation. Air, in Chemistry. See Gas.

Air, Atmospheric, common air, Gare atmospherique, Fr. Atmospheric air does not appear to have been the subject of chemical investigation before the time of Boyle; for though Aristotle, Pliny, and Paracelsus, have written largely concerning this fluid, they have confined themselves to the imperfect examination of some of its physical properties, to the mention of a few obvious facts, and to the invention of hypotheses, which, as they do not profess to be founded on experiment, may, in the present state of knowledge, be safely neglected.

It was, indeed, natural, that the great improver of Otto Guericke's original air-pump, fond as he was of chemical pursuits, should exercise his talents in researches on the properties of the atmosphere, more especially as, from the number of substances continually affuming the form of vapour, it was not improbable that common air should prove a very heterogeneous and easily decomposable mixture. The difficulty,
difficulty, however, of separating, by the only method then known, a portion of air from the rest of the atmosphere, and the necessary uncertainty of the first rude attempts to operate upon an invisible effusive substance, occasioned the progress of discovery in this department of chemical science to be unusually slow. The following facts, however, were ascertained by Boyle, which, when we consider the numerous obstacles from bad and imperfect apparatus that he had to contend with, are highly creditable to his industry and sagacity. He proved, that the presence of air was necessary to combustion and to animal life, by shewing, that in the exhausted receiver flame was almost immediately extinguished, and various small animals, and even fish, while in water, were in a short time killed: that the same phenomena take place, but more gradually, in a confined portion of atmospheric air; and that the death of animals in this situation, was not owing to the heated exhalations from their bodies, as was then supposed, since the flame effects took place when the apparatus was put into a frigorous mixture: he also ascertained, that animals live longer, ceteris paribus, in a given bulk of condensed than of rarefied air. On the imperfection of his apparatus, he was induced to believe, that no absorption of air took place in respiration; and he appears to have had no suspicion that pure atmospheric air was a compound substance.

Immediately after Boyle, succeeded Mayow, unquestionably the greatest chemical genius of that age, but whose works, by a singular fatality, excited little or no interest among his contemporaries, and were soon totally forgotten. In this state of unmerited neglect they remained for more than a century; and it is only within a very few years, that the public attention has been directed to the writings of a philosopher, who nearly anticipated those discoveries of Priestley, Lavoisier, and Cavendish, upon which are based almost all the modern improvements in chemistry. The first great improvement of Mayow in the analysis of atmospheric air, was the invention of a proper apparatus; for this purpose, rejecting the use of the air-pump, he made choice of glass jars, inverted in water, as the best method of confining the gasses upon which he experimented. Setting out from the facts discovered by Boyle, he shews, that since a lighted candle is extinguished much sooner in an exhausted receiver than in the same when filled with air, there must be something contained in the atmosphere necessary to the continuance of flame; and that a candle, in confined air, is not suffocated by its own sluggish exhalations, but dies away for want of an aerial pulpum. The necessity of air to combustion is also proved, and respiration, as the impossibility of kindling a combustible body in vacuo by the concentrated solar rays, or by any other method. Having established this first position, he proceeds to infer, that it is not the whole air but only its more active particles, that are capable of supporting flame, because a candle goes out in confined air, while yet the greatest part of the effusive fluid remains unconfined. Also, since sulphur, when mixed with nitre becomes capable of inflammation in vacuo, or even under water, it follows that nitre and atmospheric air contain some substance in common, which he calls fire-air particles (particula igneo-aereae). He next determined the analogy between flame and animal life; and shewed, that each depended for their continuance on a supply of fire-air particles; that there was an actual consumption of air in combustion and respiration he proved, by the rise of water in the jars in which a live animal or a lighted candle was included; and that the loss of bulk was owing to the abstraction of fire-air, appeared from the inability of the residue to support animal life. He also inferred, that the fire-air particles were the heaviest part of atmospheric air, because, if two mice or two candles were confined in a tall cylindrical jar, inverted in water, so that one should be near the upper part of the vessel, and the other at the bottom, the upper one, whether a candle or animal, would be extinguished some time before the lower one. With regard to the proportion of fire-air in the atmosphere, he only observed, that air rendered unfit for combustion by the breathing of an animal, left about one fourteenth of its bulk; at the same time remarking, that there was probably only a part of the fire-air consumed; he afterwards, indeed, found, that the solution of iron in aquafortis occasioned a diminution of about 25 per cent. in atmospheric air; but though, in this case, he produced nitrous gas, and thus abstracted the oxygen of the atmosphere, yet, as he himself draws no conclusions from it, we should rather consider this as an accident than a discovery. Mayow never obtained the fire-air of the atmosphere in a separate state, and therefore was unable to confirm his analysis of atmospheric air by the synthetic proof; nevertheless, he was warranted by a very high probability in affirming that the atmosphere consisted of two kinds of air, of which the igneo-aerial was in the proportion of at least one to 15; that it exceeded the other part in its specific gravity, and was absolutely essential to the continuance of flame and animal life. The influence, however, of the prevalent hypothesis was at that time too strong to be shaken by sober experiment; and the labours and very name of Mayow, shortly sunk into oblivion: the atmosphere was still supposed to be an undecomposable element, and its effect on chemical processes was very generally overlooked.

In 1774, exactly a century after the publication of Mayow's work, the important discovery of dephlogisticated air, by Dr. Priestley, took place. This philosopher having included some mercurial precipitate per se, in a jar filled with mercury, and inverted over the same, procured from it, by means of heat, a quantity of gas, in which a candle burnt with an enlarged flame, and increased light: the coincidence of this, with the effect produced by dephlogisticated nitrous gas in the same circumstances, as had already observed by Dr. Priestley, induced him to believe that there was some common principle in nitrous acid and atmospheric air; and this suspicion was still further confirmed by the discovery, that common red precipitate, which is prepared by means of nitrous acid, yields dephlogisticated nitrous gas in the same manner as the precipitate per se. Hence, too, he concluded, that pure atmospheric air was not an element, and that dephlogisticated air was that one of its component parts to which the continuance of flame and animal life was entirely owing. Thus we find, both Mayow and Priestley arriving at the same general conclusions, through the medium of entirely different experiments; the fire-air of the one, and the dephlogisticated air of the other, being only two words for the same substance; the experiments of the latter pacifies, however, that capital superiority, that they exhibit in a separate uncombined state, that vital part of the atmosphere, the existence of which was only to be inferred from that of the former. There yet remained, however, for the complete proof of the composition of the atmosphere, that a part of it should be actually decomposed, so as to shew its elements separated; and then, by their union, to recombine atmospheric air. This deficiency was supplied by Lavoisier. He confined a few ounces of mercury and a certain portion of atmospheric air in proper glass apparatus, and exposed the mercury for 12 days to a heat nearly equal to that of ebullition; during this period a part of the mercury was converted into a red oxide; a certain portion of
the air disappeared, the remainder was incapable of supporting flame, and the weight of the red oxide exactly corresponded with the base furnished by the mercury and the air; this red oxide, being then heated in a small retort, was decomposed into running mercury and a gas which exhibited all the properties of dephlogisticated air; finally, this air, being mingled with the dephlogisticated and recomposed atmospheric air, from these and various other similar experiments, it appeared, that the lower part of the atmosphere consists of 27 parts oxygen gas, and 73 of a mephitic air, which upon further analysis, yielded about 72 parts of nitrogen gas, and one of carbonic acid. These experiments will be further detailed under the term chemistry.

From the slight adherence of these gases with each other in the air, it is probable that they are not so much in a state of combination as of intimate mixture; and hence there are scarcely any chemical actions produced by the atmosphere, which are not more properly referable to one or other of its constituent parts.

Atmospheric air, as such, is soluble in water; from which it may be separated by the action of the air-pump, or by long boiling or distillation; hence fish, confined in fresh distilled water, soon die for want of air; if, however, the water has been previously exposed to the atmosphere, a sufficient portion is absorbed to supply the demands of these animals. In like manner water is soluble in air, but the proportion of this must necessarily vary according to the differences in temperature and barometrical pressure. Boyle's works, vol. ii. Mayow, Tractatus, &c. Priebley on Air. Lavoisier's Elements.

Air, fictitious. While pneumatic chemistry was in its infancy, all those elastic fluids produced in chemical experiments, were distinguished by this appellation from the air of the atmosphere; since, however, these fictitious airs have acquired peculiar names, the term has fallen into disuse.

Air, acid. See Muriatic acid.

Air, fixed. See Carbonic acid.

Air, vitriolic acid. See Sulphurous acid.

Air, acid. See Fluoric acid.

Air, dephlogisticated marine. See Oxymuriatic acid.

Air, vegetable acid. See Acetous acid.

Air, nitrous. See Nitrous gas.

Air, dephlogisticated nitrous. See Nitrous oxide.

Air, mephitic atmospheric. See Azot.

Air, vital. See Oxygen.

Air, pure. See Fire.

Air, dephlogisticated. See Oxygen.

Air, inflammable. See Hydrogen.

Air, sulphurated inflammable. See Hydrogen sulphurated.

Air, heavy inflammable. See Hydrogen carbonated, or Carbon, effusive oxide of.

Air, alkaline. See Ammonia.

For an account of Dr. Priebley's numerous experiments and observations on these several species of air, the reader is referred to the excellent work already cited.

Air, innate, in Anatomy, is a fine aerial substance, supposed, by some anatomists, to be enclosed in the labyrinth of the inner ear, and to minister to the due conveyance of sound to the faculty.

But the existence of such innate air, has been called in question, and rendered very improbable. See Ear.

Air, in Geography. See Air.

Air, a mountain of Arabia Felix, to the north of Medina, and near it. It abounds with trees that yield frankincense.

Air, atmospheric, in Medicine, when combined with mufk, different degrees of heat, electricity, and various eflFects and medicines, constitutes the atmosphere; and forms one of those fine external circumstances so celebrated in the schools, called non-naturals. Simple atmospheric air is no further an object of medicine or physiology than as it forms the medium of respiration. See the preceding and subsequent articles.

Air, in Music, signifies the melody, or treble part of a musical composition.

The word is also used for a tune, or song itself, that is, for a series of sounds whose movement is regular and graceful. Rhyme is as necessary in a musical air, whether vocal or instrumental, as in the words of a song. Each bar of an air should be well accented, and the periods well placed.

The rules for harmony are mechanical, and neither difficult to learn nor teach, as may easily be conjectured from the innumerable treatises in all languages for combining sounds in composition. Aritotle, Horace, Boileau, and Pepe, have told us how good poems are constructed; but who shall tell us how to think, how to invent, to ferment ideas? Among all the receipts for constructing harmony, we have none that are intelligible for melody: we are told what may be done, by what has been already successfully attempted; but this is only telling us what we may imitate, and whom we may imitate. There are no magic wands to point out, or vapours hovering over springs of invention; no indications where the golden mine of new conceptions lies hidden. So that from age to age, memory and compilation supply common minds, and satisfy common ears. It has been said:

"Sometimes a hero in an age appears;
But scarce a Purcell in a thousand years."

Handel was our magnus Apollo during the last century, and Rameau that of France. At present, Haydn and Mozart are the gods of our idolatry, and tho' of all Europe. But it is only such gifted men as these who furnish the rest of mankind with ideas.

The origin and progress of melody, derived from harmony, and phrased and formed into Air, have been fully detailed in the Gen. Hist. of Music, in tracing the progress of the musical drama or opera. National music every country, not wholly savage, has had from time immemorial. In Europe, Sicily, Spain, Provence, Venice, Scotland, Ireland, and Wales, have characteristic melodies or tunes, of great antiquity. But the first pleasing Airs, in cultivated music, that I have been able to find harmonized, and in regular modulation, were printed in three and four parts in separate books at Naples, in 1575. Of these the mufk are airy, the intervals pleasing, and the counterpoint fine肤色 all the parts generally moving together. They are printed without bars. The modulation borders a little on that of the ecclesiastical modes, but it begins and ends in the same key, which does not often happen in national tunes.

Air, in Music, has various applications: in the melodrama, or opera, it distinguishes measured melody from recitative.

A bal-
A ballad, tune, or short instrumental air, consists of two stanzas or parts.

No very satisfactory etymology has been found for the word Air. Salzman believes that it comes from aria, Lat.; but Menage disputes this derivation, in his Etymological Dictionary, without furnishing a better. The term airs in Italian, is of no high antiquity: the full influence of its use in the Italian Dictionary is from Redi, who died in 1698.

We know, however, that the word became of general use about the middle of the 17th century.

Though Air sometimes implies the words of a song, as well as the melody in general; nice discrimination requires, that we should confine its import to melody, a tune, alone, and not to the words. A line or pleading air has nothing to do with the poetry, which may be free, though ill set. And the air may be beautiful, even to nonsensical words.

Measured air, in an opera, is opposed to recitative, where no regular time is observed. This musical declamation, which needs only two kinds of notes, crotchets and quavers, with pauses at the end of a verse, approaches nearer to what we conceive to have been the vocal music of the ancients, confined to longs and shorts, than any of our Airs, except such as are very simple, can do. Chanting, in the Cathedral service, is more rapid than recitative; but resembles it by the absence of regular measure, more than Air, which must be arranged in some one of the divisions of common or triple time.

In accompanied recitative, short passages or fragments of Air occur in the instrumental parts, in measured melody, which is often called symphony; but the Italians, with more propriety, style these fragments Ritornelli; which see. Sometimes indeed the instruments accompany the reciter in regular time, which obliges the finger to pronounce the recitative in measure, (which likewise see). Of these the performers are informed by the words a tempo, in time.

A vocal air is only the melody of a single part or voice. If another part is added to it, in different intervals, it is styled a Duo, or Duet; in three parts, a Trio; in four, a Quartet, or Quartet, &c.

The Ancients had Airs, both vocal and instrumental, called NOMES. The words of lyric measures, which we should call songs, were styled Scholia, (which see under their several articles).

In the work of Philodemus on music, which has been recovered from the cinders of Herculaneum, the bell and only musical information it contains, after being so long expected, and with such difficulty deciphered, is the solution of the miraculous powers ascribed by the poets to Amphiion, of building cities by music. We find in this tract, (which is but a fragment, and neither a treatise nor a eulogium on music, but a severe satire) that every trade, occupation, and profession, had its names peculiar and appropriate Airs, which were played to the workmen; so that towns were not built by music, but to make them. It has been proved that if an instrument be regulated and animate the rowsers. Orphins, civilising the world, and introducing religion and order among mankind, implied only that religious rites were accompanied by music. See PHILODEMUS.

The derivation and progress of air in dramatic music will be found under the article opera, in which lyric poetry became subordinate to music. We fear the word subordinate will offend the poets, and such as love poetry better than music. "The words (says Franklin) are only an excusè for singing." And Stillings affirms "who reads the words of a long, but the author?" In a musical drama, the bassista is all transfigured in recitative, or declamation: which bassista, at the end of a scene, is illustrated by a finale, or a few passionate lines, let to measured stanzas, in florid counterpoint; and these are calculated to display the talents of a singer, and the genius and abilities of a composer. Were this not the case, and if the poetry were better felt, and understood by the mere articulation and impalpable conjunction of common speech, why disguise and involve it in a tune, accompanied and encumbered by different melodies?

"A song, or the words of an air for a great composer to set, and a capital finger to execute, should consist only of short syllables or patterns, expressed in as few and soft sounds as possible." Metastasio has furnished the best model of words for airs in the Italian opera. And with respect to English dramas for music, on the Italian plan in all things, except the dialogue being declaimed in common speech, instead of the musical tones of recitative, we shall venture to quote on the subject of long-writing opinions which we thought just 50 years ago, and which, during that period, we have few to reason to retract.

"Since the refinement of melody, and the exclusion of recitative, a long, which usually recapitulates, illustrates, or clafles a scene, is not the place for epigrammatic points, or for a number of heterogeneous thoughts and clashing metaphors; if the writer has the least pity for the composer, or love for music, or wishes to afford the poet opportunity for symmetry in the air, the thought should be one, and the numbers as smooth, and the expression as easy and laconic as possible. What sublime ecclesiastical music has Handel composed on the single words Alleluja, and Amen! But, in general, every line in our songs, introduces a new thought; so that if the composer is more tender of the poet's reputation than his own, he must, at every line, change his subject, or be at strife with the bard; and in either case, the alternative is injurious to the general interest of the music, poetry, and audience.

"In an air, it is by reiterated strokes that passion is intensified; and the most passionate of all strains, is, perhaps, that in which a beautiful passage is repeated and varied, and when the finger, by a few appropriate notes of pity, feeling, or spirit, returns to the first subject, while it fills the ear, and is recent in the memory; this licence, no doubt, may be, and often is, abused; but not by men of true genius and taste." Present state of Music in France and Italy.

Alessandro Scarlatti, Vinci, and Pergolesi, were the first who refined, clarified, and polished vocal melody, and settled the form and canthata of dramatic airs. But these elegant strains, composed for great singers, and a polite audience, are totally different from national melodies, which are traditional, and were invented long before either the gamut or modulation was settled: as may be discovered by innumerable old tunes of different nations, that begin in one key, and end in another. Indeed the ancient chants of the Roman church did the same. See CHANT and CANTO FERMO.

The Gluckists, in France, confine all airs that they are unable to sing, or that are likely to draw the attention of the audience from the poet to the musician. M. Suard, in a long and well-written article of the new Encyclopédie Methodique, has analyzed several of the most exquisite and renowned Italian opera airs that have ever been sung on the stage, with a severity that borders on infelicity. All the charms,
charms, illusion, and exotic pleasure, arising to ears disposed to be pleased by vocal embellishment, is roused away. It would be more for the advantage of real lovers of music, if they would reason left and listen more, at musical performances. Music is an object of taste, not of intellect. Does the composition please by its incantation, grace, and variety? Does the voice or tone of the instrument by which it is executed, delight and charm you, by its intrinsic sweetness and accurate execution?—You then may venture to pronounce to yourself, that the composition and performance are perfect, without alluding superciliously, and often superciliously, what you are to say.

In spite of our reverence for poetry, and partiality to the dramas of Mettafio, we are inclined to think that airs, on the best models of Italy, may be introduced in a musical drama, without injuring the poet or the interest of the piece. No one is more delighted with the poetry of Milton, Dryden, or Pope, than the author of this article, when he reads, or hears it read; but he never wishes it to be sung. Lyric poetry is a distinct species of verse, and varied verification, which is to delight by other means thananimation, logic, or philosophy. As painting is a refinement of the occult sense, music purifies and augments the power of the auricular organ. We can exist without either painting or music; both are innocent luxuries: in the one, we have objects in nature to copy and judge by; but in music, wholly a work of art and imagination, of which we have no type in nature; every arrangement and combination of sounds that is grateful, graceful, and pleasing, which has not been rendered uncouth by time, or vulgar by common use, is in the forebouche of a composer; whose business it is to select, adjudge, and introduce it to the ear, as propriety and occasion may require.

To give a specimen of every species of air, vocal and instrumental, which cultivated genius has produced, would occupy many volumes of our work. All we can do is to give the nomenclature of those movements that are, and have been, in most general use, with their definitions: such as prelude, adagio, allegretto, minuet, jig, farabanda, fantana, polonaise, roundel, bourrée, country dance; and in Italy, barcarola, aria alla napoletana, alla curfone, trencianna, &c. &c. all which see under their several heads.

Recitatives and airs for a single voice, succeeded madrigals of three, four, and more voices; as sonatas and concertos did Fantasias for instruments. (See these terms in their several places.)

In dramatic music, there are three several kinds of air: Aria di canzona, a pathetic song; aria di bravura, a song of execution; and aria parlante, a speaking air; besides the ombus, rondel, canzona, &c. There and the several movements in the dance of an opera, are varied to infinity. But the scale, as it is now divided and extended, offers ample materials for them all. If we but consider that the number of changes in eight bells, where there is no modulation or change of key, amounts to 40,320; that the twelve semi-tones of the octave, every one of which made a key-note, major and minor, generates as many transitions as the key of C; that the melodies found in these 12 scales may be ill varied by the different lengths of notes, and may be truly said to be incalculable; and lastly, if we recollect what variety may be given to an air or melody arising warrantably from the fundamental base of each key, by different accompaniments, inversions, and double counterpoint, we shall be lost in the maze of infinite divisibility! The changes upon 12 bells, (suppose from G in alt, 5th space in the treble, to C 6th line in the bass) amounting to 479,000,000; would employ to ring them all, 12 men, night and day, for 75 years, ten months, one week; and three days, according to the proportion of ringing 7,200 changes in an hour of an astronomical day of 24 hours, 366 of which complete the year! See Bells, Carillons, and Changes.

Since du capo have been abandoned in the opera air, which occasioned many dramatic absurdities, the cavalleria, or single strain, without a second part, prevailed; but that not furnishing an opportunity for fingers of great abilities, to manifest all their powers of execution, taste, and expression, in the same air; of late, every air for a great finger is a duo caratteri, of two characters, consisting of two distinct movements, usually an andante and an allegro di bravura. It is often difficult from the sense of the words, to assign any other reason for these sudden shifts of passion, after a soothing and pathetic movement, but that of convincing the audience of a finger's marvellous agility of throat, and powers of exciting surprize by des tours de force. If such airs were composed purposely for a concert, at which a performer, from the multiplicity of his or her engagements, could only day to sing one song, and that connected with nothing else, airs of two characters might encourage the finger's fame, and the pleasure of the audience, without absurdity; but in a serious drama, where character, connexion, and propriety should be supported, after labouring through a slow movement in a melancholy drag, as every finger does, if not gifted with powers of new and appropriate embellishments, the setting off full speed without a word appearing in the libretto, or opera book, for the necessity of taking flight in such an outrageous manner, we pity the poet and ourselves for being thus defrauded of all dramatic interest. In the course even of two acts, to which an opera is now cut down, opportunities for displaying all the powers of a finger, however extraordinary and various, may be found in every principal part, without violating the dignity of character, and rules of common sense. See MELODY, SONG, TONE, AND OPERA.

Air, in Mythology, was adored by the heathens under the names of Jupiter and Juno; the former representing the superior and finer parts of the atmosphere, and the latter the inferior and groffer parts. The augurs also drew prefigs from the clouds, thunder, lightning, &c.

Air, in Painting, &c. denotes the manner and very life of action; or it is that which describes such of those refined expreisions, that do not arise from the motion of the features of the face, which are to be considered as the immediate agents in expreeing the passions of the soul (see Passions); but from the turn of the body, and especially of the head and neck. This term air is more particularly synonymous with gesture, or graceful action of attitude. Painters are in danger of falling into affectation, while they attempt to give an air of elegance above vulgar ideas. Corregio and Guido have excelled in the arts of the heads, as well as of the whole figures they painted; but, perhaps, in some infinities, even they may have exceeded the due bounds of nature.

Air, in Painting, is also a great subject of consideration, as the intersecting medium which tends to diminish the force or strength of objects and colours. See the article Perspective Aerial.

Air, in Surgery. The application of gaseous matters to the purposes of surgery, has not been sufficiently attended to. There is reason to believe that several aeriform substances might be employed locally, as well as internally, to considerable advantage; but it would exceed the bounds we have prefixed to this department of our work, were we to adduce all the facts that might be brought forward to illustrate
illustrate the medicinal powers of air, in its different combinations. The application of fixed air, or carbonic acid gas, by means of the fermenting cataplasm, is pretty generally known, in cases of festid and gangrenous sores. It has been advantageously used also in malignant ulcers of the nose, tongue, and mouth, as well as in caries of the bones.

Fixed air is plentifully obtained from a mixture of alkaline or chalky substances with vitriolic acid; and during the effervescence, applying the gas which is extricated immediately to the morbid part; or by impregnating water with it, compounds may be leaked in the water, and laid frequently over the seat of the disease. Mr. Loefler, a German surgeon, has recommended a particular apparatus for this purpose, which may be easily constructed, and which he employs for saturating water with fixed air, by the mixture of chalk and vitriolic acid, or during the process of fermentation.

When we wish to apply the air to a cancerous breast, for example, we are to fill a bladder with the air as it rises from the above mixture. Then introduce a tube, fixed to its orifice, into another bladder, which is to be cut round in such a manner that it can be applied like an open bag around the breast, and held close to it with the hands. When it is fastened below, it must be united, so that the fixed air may pass out of the fill into the second bladder, and find access to the ulcerated part. In order to facilitate this process, a gentle degree of pressure is to be applied to the bladder; and, as one bladder will not be sufficient, a number of them should be provided in readiness, and filled for immediate use in succession. This operation is to be continued half an hour or longer each time, and repeated twice or thrice a day.

Mr. Wiflock, who has written a German treatise on this subject, and with extraordinary success, recommends us to apply the carbonic acid gas, by means of a receiver or air-bell, connected with a flexible tube or pipe, sufficiently air-tight; but as the vitriolic acid produces too strong a commotion, the gas is extricated for such purposes from a mixture of fixed alkali and vegetable acid.

The medicinal use of fumicious air is a subject which has been diligently considered by Dr. Beddoes, Dr. Thornton, Mr. Hill, Mr. Davy, and some other gentlemen in England; but the enquiry is still in its infancy, and has not been productive of so much public benefit as its zealous friends anticipated. Perhaps the attention of medical men to the local and external influence of gaseous matters, would better repay them for their trouble. Surgeons are not exactly agreed, whether the atmospheric air be hurtful to wounds and internal cavities, merely as air, or as it may be cold, hot, moist, dry, or variously modified. We hope these superficial hints will serve to excite the attention of professional gentlemen to this branch of the healing art. It likewise deserves further enquiry, whether the injection of fluids into the urinary bladder, impregnated with fixed air, &c. &c. be so efficacious, in calculous cases, as some persons have pretended.

From observations on bleeding in rheumatism, and after taking cold, it is evident, the air can enter with all its qualities, and vitiate the whole texture of the blood, and other juices.

From the pustule, vertigo, and other nervous affections caused by damps, mines, &c. it is evident, that air thus qualified can relax and obtrude the whole nervous systen. And from the colics, fluxes, coughs, and consumptions produced by damp, moist, and nitrous air, it is evident it can corrupt and spoil the noble organs, &c. See Atmosphere, and preceding articles.

Air-bags, in Botany, a distended bladder-like seed-vessel, opening on one side, as in the periwinkle, or bladder-sen. It signifies also other kinds of distended air-vessels. See Folliculus.

Air-balans, a name lately given to those aerostatic machines that have been employed in aerial navigation. See Aerostation.

Air-bladder, in Ichthyology, a kind of vesicles, containing elastic air, found in the bodies of fin, by means whereof they are enabled to sustain themselves in any depth of water, and either rise or sink at pleasure.

The air-bladder is the name with what is otherwise called the swim, or swimming-bladder. This membraneous bag lies close to the back-bone, and is furnished with a strong muscular coat, by which it has the power of contraction and dilatation. It is connected with a glacial substance, which contains a quantity of red blood; and some have supposed that the air contained in the swimming-bladder, is derived from this substance. Two processes or appendices issue from its anterior part, and terminate in the funnels; and it is supposed by some writers to be that part which is called the funel.

The discovery of the use of the air-bladder took its rise from observing, that a bubble of air in rising from the bottom of a fluid, continually dilates till it reaches the top, by reason of the continual diminution of the weight, or pressure, of the incumbent water. For the air, in the bladder, is like the bubble, more or less compressed, according to the depth the fish swims at, and rises up less or more space; and consequently the body of the fish, part of whose bulk this bladder is, is greater or less according to the several depths, though it retains the same weight. The rule of hydrostatics is, that a body heavier than so much water as is equal in quantity to the bulk of it, will sink; a body lighter, will swim; a body of equal weight will rest in any part of the water. By which rule, if the fish in the middle region of the water be of equal weight with an equal bulk of the water, the fish will rest there, without any tendency either upwards or downwards; and if the fish be deeper in the water, its bulk becoming less by the compression of the bladder, and yet retaining the same weight; it will sink and rest at the bottom; on the other side, if the fish be higher than the middle region, the air dilating itself, and the bulk of the fish consequently increasing, without any increase of the weight, the fish will rise and rest at the top of the water.

Perhaps the fish by some action can emit air out of the bladder, and afterwards out of its body; and also when there is not enough take in more air, and convey it to this bladder; in which case it will be no wonder, that there should be always a fit proportion of air in the bodies of all fish, to serve their use, according to the depth of water they live in: perhaps also, by some muscle, the fish can contract this bladder beyond the pressure of the weight of water; and perhaps it can by its sides, or some other defence, keep off the pressure of the water, and give the air leave to dilate itself. In these cases, the fish will be helped in all intermediate distanced, and may rise or sink from any region without moving a fin.

If the air-bladder of a fish be pricked or broken, the fish presently sinks to the bottom, unable either to support or raise itself up again. Flat fishes, as sole, plaice, &c. which always lie groveling at the bottom, have no air-bladder.
Dead fishes are found swimming on the surface of the water, because the muscles of the membranous case to act: and their bellies are uppermost, as the back-bone cannot yield, and the dilated lic is protruded into the abdomen, and the back becomes consequently heaviest at its upper part.

In most fishes there is a manifest channel, leading from the pullet or upper orifice of the stomach to the air-bladder, which doublets serves for conveyance air into it. In a Pescatores Mr. Willughby observed, that upon puffing the bladder the stomach presently swelled; so in that fish it seems the air passes freely both ways. Possibly the fish while alive may have a power to raise up this valve, and let out air on occasion.

In a variety of other fishes there are communications with some parts of the alimentary canal, particularly the oesophagus and stomach. The salmon has an opening from the fore-end of the air-bladder into the oesophagus, which is surrounded by a kind of muscular fibres. The herring has a sort of funnel, connecting the bottom of the stomach with the air-bag; by which the air probably comes out from it.

All the fishes of the cartilaginous kind want air-bladders: by what means it is they ascend and descend in water is yet unknown. The cetacous kind, or sea-beasts, are also without the air-bladder: indeed, as these differ little from quadrupeds, but in the want of feet, the air which they receive into their lungs in inspiration, may serve to render their bodies equiponderant to water; and the contraction or dilatation of it, by the help of the diaphragm and muscles of respiration, may possibly assist them to descend, or ascend, in the water, by a light impulse thereof with their fins. Most of the cd-kind have bladders, yet they can hardly raise themselves in the water, by reason of the length and weight of their tails; the air-bladder being near their heads, may help them to lift up their heads and fore part.

There is great diversity in air-bladders, in respect of figure, substance, situation, and connection, in different fish. In some, the air-bladder is divided into two, i.e. gr. in carp; and in others, into three. Needham maintains, that all fish which have teeth in their jaws have only a single air-bladder; whereas those without teeth have a double one; or, which amounts to the same, the air-bladder of these last is divided into two cells. Sig. Redi refutes this dilification; giving instances of fish with teeth, whose air-bladder is double; and of others without teeth, which have only a single air-bladder.

Dr. Priestley conjectures that the air, enclosed in the air-bladder of fishes, serves some further purpose in their economy besides that of enabling them to rise or sink in water. Some fish have no air-bladder, and yet rise or sink without difficulty. That fishes cannot live without air is a well-known fact, established long ago by the experiments of Mr. Haukflee. The fishes he employed were gudgeons, which are lively in the water, and which subsist for a considerable time when taken out of it. Having put three of these into a vessel of water, which had no communication with the external air, and which was designed to resemble a frozen pond, and other three into a vessel of water exhausted of its air; he observed, that in about half an hour the latter manifesterd signs of uneasiness by an unusual motion of their mouth and gills; and the former frequently ascended to the top of the vessel in which they were confined and then sunk down again, without any sensible alteration. After five hours the gudgeons in the vessel exhausted of its air, became less active; and in about three hours more those in the confined air lay at the bottom of the vessel with their bellies upwards, without moving their fins or tail, but indicating life by a motion with their mouths. On uncovering the vessel, they revived in two or three hours, and were perfectly well next morning; at which time those in the vessel purged of its air were also recovered. When this last vessel was put under the receiver of an air-pump, and the air was exhausted, they all died. When the air was exhausted, they remained at the top, but on its readmission, they sunk to the bottom. It is not easy to explain the manner in which fishes are supplied with air, nor the benefit they derive from it; nor are the nature and qualities of the air, contained in their air-bladder, satisfactorily ascertained. Dr. Priestley (Exp. and Obf. relating to Nat. Philos. vol. ii. p. 138), confined minnows, and other small fishes in water without any access of common air, till they died, and upon examining this water, he found that it was somewhat worse than air in which a candle just goes out. Hence he infers, that air contained in water, in an unelastic state, is as necessary to the life of fishes, as air in an elastic state is to that of land-animals. Upon putting fishes into water impregnated with phlogificated air, he found that it was not only injurious, but in process of time fatal to them; although he observes, that fishes, like insects and some other exfangious animals, can live a considerable time without any thing equivalent to respiration. In mentioning some experiments on the state of the air, which is contained in the air-bladder of fishes, he remarks, that when those are taken out of the fish, the air cannot be discharged from them by pressure through any existing aperture, but he was always obliged to cut or burst them. The air itself, obtained from many of them, was not affected by nitrous air; but that of some, particularly of roaches, exhibited slight indications of the effect of this air. Upon the whole it thus appears, that he seldom met with oxygen, and with that only in a small quantity. Fourcroy made experiments on the air contained in the air-veil of the carp, and found that for the most part it was perfectly pure azotic gas, though it sometimes contained a small quantity of carbonic acid gas. From the nature of the fluid he infers, that the air in the bladders of fishes is produced in the stomach. Ann. de Chim. i. 47. Dr. Monroe, in his lectures, led his auditors to conclude, that it was fixed air. But Dr. Brodbelt of Jamaica, collecting a quart of the air from the bladder of a large sword-fish, which, he says, contained of innumerable cells that had no communication with one another, found to his surprise that it was oxygen. A flame was brightened and an ignited stick was rekindled by it; and it was so strong and pure, that the common experiment of a piece of steele wire, heated and put into it, succeeded well, and threw out a most vivid light when melting. This pure air, he supposes, is adapted to serve the purposes of life, when the fish is far below the surface of the water. DuncaM's Ann. of Med. for 1796, p. 393.

The water-snake, in lieu of a bladder, has a large membranous air-bag on its back, which empties and fills with air at pleasure, by an aperture, which it can shut very close, from without inwards, by means of a sort of valve, so that the leaf globule of water cannot enter without its consent. By this artifice it can enlarge or lessen the bulk of its body, and inhabit all depths of the water; though a conjecture has been advanced by Mr. Ray, that it is by the help of water which they take in and let out by two holes in the lower part of their abdomen, near to the ventricle. They sink in the water, by letting in some of it at these holes; the orifices whereof are opened and shut at pleasure, by means of proper muscles. The water being thus received into
into the cavity of their abdomen, serves to make them preponderate the water, and defend; when they would ascend again, a compression is made by the muscles of their abdomen, and the water forced out again, at least so much as suffices to give the degree of levity wanted. Ray's Wild. of God, part ii. p. 346.

Air-bladders, or Air-bags, in Ornithology, are cells or receptacles of air in the bodies of birds, which communicate with the lungs, and which are lodged both among the flinty parts, and in the hollow bones of these animals. Mr. John Hunter, F. R. S. (Philos. Trans, vol. lxiv. part 1. p. 205, &c.) has published some curious observations on this subject, leading to a more particular inquiry into the final cause of this peculiarity in the structure of birds, which had not been sufficiently noticed and examined by anatomists and natural historians. He informs us, that the air-cells, which are found in the soft parts of birds, have no communication with the cavity of the common cellular membrane of the body; some of them communicate immediately with one another; and all of them may be said to have a communication together, by means of the lungs as a common centre. Some of them are placed in larger cavities, such as the abdomen; others are lodged in the interstices of parts, that they would, at first, appear to be the common connecting membrane, as about the breast, axilla, &c. The bones which receive air are of two kinds; some, as the sternum, ribs, and vertebrae, have their internal substance divided into innumerable cells; whilst others, as the os humeri and the os femoris, are hollowed out into one large canal. These bones may be distinguished from those that do not receive air by their less specific gravity; by being less vascular, and consequently whiter, than others; by containing little or no oil; by having no marrow nor bloody pulp substance, even in their cells; by not being, in general, so hard and firm as other bones; and by the ease with which the passage that conveys the air into the bones may be perceived.

The mechanism by which the lungs are adapted for communicating air to the above-mentioned parts consists principally in the attachment of the lungs to the diaphragm and their connection with the ribs and sides of the vertebrae. These adhesions are peculiar to this tribe of animals. For the communication of the air from the lungs to the other parts the diaphragm is perforated with large holes, which open a free passage between the cells of the lungs and the abdomen; and to each of these perforations is annexed a distinct membraneous bag, which is very thin and transparent, and these bags, which receive the air, are extended over the whole abdomen. The lungs open at their anterior part, or towards the sternum, into membranous cells, which lie upon the sides of the pericardium, and communicate with the cells of the sternum. The superior part of the lungs opens into large cells of a loofe net-work, through which the trachea, oesophagus, and large vessels, in their way from and to the heart pass. When these cells are distended with air, the size of the parts where they lie is enlarged, and this dilatation indicates passion, as appears in the turkey-cock, pouting-pigeon, &c. and in the breath of a golde, when it cackles. These cells communicate with others in the axilla, under the large peecoral muscle, &c. and those again with the cavity of the os humeri, by small openings in the hollow surface, near the head of that bone. The posterior edges of the lungs, which lie on the sides of the spine, and project backwards between the ribs, open into the cells of the bodies of the vertebrae, ribs, canal of the medulla spinalis, sacrum, and other bones of the pelvis; and thus the air finds a passage to the cavity of the thigh-bone. This supply of the bones with air is not wholly by means of the cells of the bones of the head, in some birds, are filled with it, as in the eafe of the owl, which has the diapage between the two plates of the scull cellular, and capable of admitting a considerable quantity of air from the Elliphalian tube. Mr. Hunter, in his conjectures concerning the use of these cavities, concluded at last that they were to be considered as appendages to the lungs; and that they answer the same purpose with the two bags that form the lungs of amphibious animals which are continued down through the belly, the upper part of which performs the office of respiration, and the remainder of which is a reservoir of air. In consequence of this communication these animals can breathe less frequently than others; and birds are thus aided in their flight, which must render the frequency of respiration difficult, and a reservoir of air singularly useful. He farther suggests that this construction of the respiratory organs may assist birds in flying; and that the long continuance of the force of a carrier-bird between its breathings may be owing to this cause.

Dr. Latham (Linnaean Transactions, vol. iv. p. 94.) queries, whether this construction may not enable some birds to dive and fly for a considerable time under water. These air vessels, according to Dr. Monro, are of considerable use in two respects. They serve, by dilating the lungs with air, to render the bodies of birds specifically light, and also to flatten the trachea arteria, and thus return the air; and moreover to supply the place of a muscular diaphragm and strong abdominal muscles, and thus to aid the exclusion of the eggs and feces.

Air-chamber, is a name given by Dr. Henfaw to a room contrived for obtaining the benefit of change of air, without going out of the house. According to his whimsical proposal, it is to be twelve feet square, and air-tight, furnished with a very large pair of organ bellows, to or from which air is to be conveyed through the wall by a copper pipe, with valves for opening inwardly and outwardly as occasion shall require. With these bellows, the air in the room is either to be condensed and made heavier, by forcing air in, or lighter and rarer by conveying air out of the room. See his Aero-Chalinos, or Phil. Trans. No 153. See Ventilator and Blowing-Wheel.

Air-gun, or Wind-gun, a machine which serves to explode bullets, and other shot, with great violence, by the expansive force of the air. This fort of implement, charged with air, has an effect scarcely inferior to that of a common firearm charged with gun-power; but it discharges itself with a much less report; and it is this which probably gave occasion to the fable of white gun-power. The first account of an air-gun, that has been noticed, is found in the Elementis d'Artilliere of David Rivaut, who was preceptor to Louis XIII. of France. He ascribes the invention to one Main, a burgler of Lilleux, who presented one to Henry IV.

The common air-gun (Pneumatics, Plate iii. fig. 14.) is made of brass, and has two barrels; the inside barrel K A of a small bore, from which the bullets are shot, and a larger barrel B C D R on the outside of it. In the fock of the gun there is a spring, S M N P, whose rod M draws out to take in air, and piston S N drives the air before it through the valve P into the cavity between the two barrels. The ball K is put down into its place in the small barrel with the rammer, as in another gun. There is another valve at S L, which, being opened by the trigger O, permits the air to come behind the bullet, so as to drive it out with great force. If this valve is opened and shut suddenly, one charge of condensed air may make several discharges of bullets; because only part of the injected air will go out at a time; and a new bullet may be put into the place K; but if the whole air be discharged on a single bullet, the ball
ball will be expelled more forcibly. This discharge is effected by means of a lock $k$ (fig. 15.) placed here as in other guns; for the trigger being pulled, the cock $k$ will go down, and drive a lever $a$, that will open the valve, and let in the air upon the barrel $K$.

An air-gun of the most modern and approved construction is represented in fig. 16. $A$ is the iron gun-barrel, with the lock, stock, ramrod, &c. of about the size and weight of a common fowling-piece. Under the lock at $b$ is a round fixed-tube, with a small movable pin in the inside, which is pushed out by the spring of the lock, when the trigger $a$ is pulled. To this tube, $b$, is screwed a hollow copper-ball, $c$, containing a spring-valve at its aperture; and perfectly air-tight. Each gun has usually two of these balls, which are fully charged with condensed air by means of the condensing syringe $B$, fig. 17. Having screwed down the leaden bullet into the barrel, and screwed the copper ball home to the lock at $b$, let the trigger, $a$, be pulled, and the pin at $b$ will be forcibly and instantly driven out against the valve in the ball, and will thus liberate a portion of the condensed air; which, rushing up through an aperture in the lock into the barrel immediately before the ball, will impel it to the distance of, at least, 60 or 70 yards. By recocking the piece, another discharge may be immediately made, and thus repeated 15 or 16 times, with a very small hissing noise, which at a distance is not audible. The condensed air is forced into the barrel by the following apparatus. The ball, $c$, is screwed to the brass syringe $B$ (fig. 17.) quite close. In this syringe is adapted a moveable piston and iron rod, $a$, at the end of which is a bronze ring, into which is placed a flat iron rod, $k$; upon this rod the feet are firmly placed, and the hands are applied to the wooden handles, $b$, fixed to the syringe. By forcibly moving the barrel $B$, up and down on the rod $a$, the ball, $c$, will become charged with condensed air; and it is easily known when it is filled to the utmost by the irresistible action which the air makes against the piston, when you are working the syringe. At the end of the rod $a$ is usually an eight-square hole, which serves as a key to make the ball fall on the screw, $b$, of the gun, and on the syringe. The piston-rod works air-tight by a collar of leathers on it, is the barrel, $b$; and therefore, when the barrel is pulled up, fresh air will rush in at the hole $b$; when the barrel is pushed down, the air in it can only pass into the barrel at top; the barrel being drawn upwards, the operation is repeated, until the condensation is so strong as to resist the motion of the piston.

Dr. Macbride (Exper. Eff. p. 81.) mentions an improvement of the air-gun by Dr. Ellis, in which the chamber for containing the condensed air is not in the stock, which makes the machine heavy and unWEILY, but has five or six hollow spheres belonging to it, of about three inches diameter, fitted to screw on the lock of the gun. These spheres are contrived with valves for confining the air, which is forced into their cavities, so that a servant can carry them readily charged with condensed air; and thus the gun of this construction is rendered as light and portable as one of the smallest fowling-pieces.

The magazine air-gun is an improvement of the common air-gun, invented by an ingenious artist called L. Colbe. By his contrivance ten bullets are fo lodged in a cavity, near the place of discharge, that they may be drawn into the shooting barrel, and successively shot off quickly, as to be nearly of the same ufe with fo many different guns, the only motion required, when the air has been previously injected, being that of flutting and opening the hammer, and cocking and pulling the trigger. In fig. 18. is exhibited a section of the gun, as large in every part as the gun itself; and so much of its length is shown as is necessary to give a complete idea of the whole. A E E is part of the stock; $G$ is the end of the injection syringe, with its valve, $H$, opening into the cavity, $F F F$, between the barrels. $K$ is the small or floating barrel, which receives the bullets, one at a time, from the magazine, $E D$, which is a serpentine cavity, wherein the bullets, $b l$, &c. are lodged, and closed at the end $D$. The circular part, $S l w k M I$, is the key of a cock, having a cylindrical hole, $I K$, through it, equal to the bore of the small barrel, and forming a part of it in the present situation. When the lock is off, the several parts, $Q R, T S W$, &c. come into view, by means of which the discharge is made, by pulling up the pin, $P w$, which raises and opens a valve, $V$, to let in the air against the barrel, $I$, from the cavity, $F F F$; when valve is immediately shut down again by means of a long spring of brass, $N N$. This valve, $V$, being a conical piece of brass, ground very true in the part which receives it, will of itself be sufficient to confine the air. To make a discharge, pull the trigger, $Z Z$, which throws up the feer, $Y Z$, and disengages it from the notch, $x$; upon which the strong spring, $W W$, moves the tumbler, $T$, to which the cock is fixed. The end, $u$, of this tumbler bears down the end, $v$, of the tumbling lever, $R$, which, by its other end, $m$, pulls the flat end, $l$, of the horizontal lever, $Q$, by which means the pin, $P w$, is pulled up, and opening the valve, $V$, discharges the bullet; all which is evident from a bare view of the figure.

To bring another bullet instantly to succeed $I$, there is a part $H$, called the hammer, represented in figs. 19. and 20. which by a square hole goes upon the square end of the key of the cock, and turns it about so as to place the cylindrical bore of the key $I K$ in any situation required.

Thus, when the bullet is in the gun, the bore of the key coincides with that of the barrel $K K$; but when it is discharged, the hammer $H$ is instantly brought down to shut the pan of the gun; by which motion the bore of the key is turned into the situation $I K$, so as to coincide with the office of the magazine; and upon lifting the gun upright, the ball next the key tumbles into its cavity, and falling behind two small springs, $s r$, fig. 18. is detained. Then opening the hammer again, the ball is brought into its proper place, near the discharging valve, and the bore of the key again coincides with that of the floating barrel. It appears how expeditious a method this is of charging and discharging a gun; and if the force of condensed air was as great as that of gunpowder, such an air-gun would actually answer the end of many guns, and prove the best defence against highwaymen or robbers; because, when there is reason to suspect them, they might then make five or six discharges before the robber can come within pistol-shot.

From the experiments of Mr. Robins, in his New Principles of Gunnery, (See Mathem. Tracts of Robins, by Wilton, vol. i. p. 73.) it appears, that the force of gunpowder, at the moment of its explosion, is 1000 times greater than that of the efficacy of common air; and, therefore, that the latter may produce the same effect with the former, its condensation must be 1000 times greater than that of its natural state. But as the velocities with which equal balls are impelled are directly proportional to the square roots of the forces, the velocity with which an air-gun, containing air condensed only ten times, will project a ball, will be $\frac{1}{5}$th of that arising from gunpowder; and if the air were condensed 20 times, it would communicate a velocity of $\frac{1}{4}$th of that of gunpowder. In the air-gun, however, the reservoir of condensed air is commonly very large, in proportion to the tube which contains
A
tons the ball, and its density will be very little altered by expanding through that narrow tube; consequently the ball will be urged by nearly the same uniform force with that of the jet inflat. whereas the effusive fluid of inflamed gun-powder bears a small proportion to the barrel of the gun, and by diluting from the small portion of it near the but-end into a comparatively large space, its effusive force will be proportionately weakened, and its action on the ball in the barrel will become gradually less and less. Hence it appears, that the air-gun will project its ball with a much greater proportionate degree of velocity than that which is above stated; infomuch that air condensed ten times will produce a velocity not much inferior to that arising from the gun-powder.

However, in this kind of gun, and in all cases which require a very considerable condensation of air, it will be requisite to have the syringe of a small bore, viz. not exceeding half an inch in diameter: because the pressure against every square inch is about 15 pounds, and against every circular inch about 12 pounds. If, therefore, the syringe be one inch in diameter, when one atmosphere is injected, there will be a resistence of 12 pounds against the piston; when two, of 24 pounds; and when ten are injected, there will be a force of 120 pounds to overcome: whereas ten atmospheres act against the circular half inch piston, whose area is but one-fourth part so big, with a force but one-fourth as great, viz. 30 pounds: or 40 atmospheres may be injected with such a syringe as well as ten with the other. Deaguliers's Exp. Phil. vol. ii. p. 308, &c. Martin's Phil. Brit. vol. ii. p. 189, &c. Adams's Lect. on Nat. and Exp. Phil. by Jones, vol. i. p. 133.

Air-jacket, a jacket of leather, furnished with bags or bladders of the same material, inflated with air, and serving to buoy up the perfon who wears it, and to prevent his sinking in water, without any effort of swimming. These bags communicate with each other, and are filled with air by means of a leather pipe, having at the end of it a stop-cock, accurately ground, so as to admit the injected air, and, when closed, to prevent its escape. The jacket must be well moistened with water before the bags are filled: otherwise the air will escape through the pores of the leather.

Air-lamp, a pneumatic machine, formed by the combination of inflammable air and electricity, which, by turning a stop-cock, produces a flame that may be restrained or continued at pleasure. The contrivance of machines of this fort was suggested by the experiments of Mr. Volta, Dr. Ingenhousz, &c. The air-lamp is now constructed in the following manner. A, (Plate iii. Pneumatics, fig. 21.) is a glafs jar for containing the inflammable air; B, an open glafs urn, that contains water, by the pressure of which the air is forced out of the jar A, through the brass-pipe a; C, is the stop-cock, so perforated, that the water may descend from B into A, and the air pass out through the pipe a. By turning the bar of the stop-cock to an horizontal position, the communication between the two vessels is closed, and the passage of the air obstructed: and by turning it into a vertical position, the communication is opened. The lower jar, A, is supplied with inflammable air by means of the bladder, (fig. 22); and two bladders of this kind accompany each lamp. It is used in the following manner: Take off the cover D, from the lamp, and turn the stop-cock upwards; then pour as much clear water into it as will fill the vessel A, up to the pipe a; unfewer this pipe, and in its head screw the small brass piece (fig. 23) and to this screw one of the stop-cocks and bladder, (fig. 22.) With the bladder under one arm, one hand to the cock at C, and the other to that of the bladder, open the apertures and press the bladder at the same time; and thus the air will be forced upon the water in A, and driven up the glass pipe through the tube B, with a bubbling noise. When the vessel, A, is thus charged with air, the stop-cocks are to be turned, so as to cut off the communication with the external air. Care must be taken that the common atmospheric air does not mix with the inflammable; for if a mixture of these airs were fired, the explosion would be great and dangerous.

The apparatus for lighting this lamp is of the electrical kind; and it is as follows. The mahogany box, E, is a sort of box, about 12 inches square, and 5 inches deep; and in this is placed an electrophorus, consisting of a re-nowned cake e, and metallic plate d, which by a hinge at its back, admits of being pulled upwards and let down by the siken flinge a, connected with it and with the stop-cock C. When this cake is once excited, its electrical effect upon the metal plate will be continued for a long time. A metallic chain, G, communicates with a wire and ball e, passing through a glass tube below, in the box over the plate, and above with a fine wire passing through a glass tube. This upper wire is bent to around of an inch distance from the flame-pipe. It is evident that when the electrophorus in the box is previously excited, and the stop-cock, C, turned, the siken flinge b, will raise the metallic plate; and this will give an electric spark to the ball and wire above, which will convey it instantly to the flame-pipe, and inflame the air passing out of the pipe, in consequence of the pressure of the water in its defent into the vessel A. The cock, C, being turned back, the flame ceases; and turned again, appears; and will serve to light a candle, match, &c. whenever it may be thought proper. The number of times in which light may be produced will be very great, and will depend on the quantity of the inflammable air in the vessel A. If the cock is not turned back, the flame will continue till the whole of the inflammable air is consumed. The light thus produced will be sufficient for reading a large print in the night, or seeing the hour by a watch. When the electrophorus is to be excited, the siken flinge, a, is unhooked from the plate, and the apparatus taken out of the box; and the metallic plate is lifted up, whilst, with a siken or dry cat-skin rubber, you briskly rub the surface of the renowed cake. About 20 revolutions in rubbing will be sufficient, so that the plate will give a spark to the knuckle about the distance of an inch; and by the strength of the spark the degree of excitation is to be estimated. The siken flinge and small glass tubes, through which the wire, G, passes, should always be very dry, that the passage of the electrical spark may be quite perfect. The whole length of this apparatus is about 22 inches; but it may be made of any dimensions. Dr. Ingenhousz used a small apparatus, constructed upon a similar principle, in obtaining light for domestic purposes, both when at home and on his travels. Adam's Lectures by Jones, vol. ii. p. 99, &c.

Air-pipes, a contrivance invented by Mr. Sutton, a brewer of London, for clearing the holds of ships and other close places of their foul air. The principle upon which this contrivance is founded is well known. It is no other than the rarefying power of heat, which, by causing a diminution of the density of the air in one place, allows that which is in contact with it to rush in, and to be succeeded by a constant supply from remoter parts, till the air becomes everywhere equally elastic. If a tube, then, be laid in the well, hold, or any other part of a ship, and the upper part of this tube be sufficiently heated

heated
heated to rarefy the impeding column of air, the equilibrium will be maintained by the putrid air from the bottom of the tube, which being thus drawn out, will be succeeded by a supply of fresh air from the other parts of the ship; and by continuing the operation, the air will be changed in all parts of the ship. Upon this principle, Mr. Sutton proposed to purify the bad air of a ship, by means of the fire used for the copper's, or boiling places, with which every ship is provided. Under each copper or boiler there are two holes separated by a grate, one for the fire and the other for the ashes; and there is also a flue, communicating with the fire-place, for the discharge of the fume. The fire, after it is lighted, is preserved by the constant draught of air through these two holes and the flue; and if the two holes are closed, the fire is extinguished. But when these are closed, if another hole, communicating with any other airy place, and also with the fire, be opened, the fire will of course continue to burn. In order to clear the holds of the ships of the bad air, Mr. Sutton proposed to close the two holes above mentioned; viz. the fire-place and ash-place, with substantial iron doors, and to lay a copper or leaden pipe of sufficient size from the hold into the air-place, and thus to supply a draught of air for feeding the fire; a constant discharge of air from the hold will be thus obtained, and fresh air will be supplied down the hatches, and by each other communications as are open into the hold. If other pipes are connected with this principal pipe, communicating either with the wells or lower decks, the air that serves to feed the fire will be drawn from such places.

In large ships, there is not only a copper, but a fire-grate, like those used in kitchens; behind this grate an iron tube might be fixed, and infected quite through the brickwork and through the deck, so that one end of it might stand about a foot, or somewhat more, in the chimney, above the brickwork, and the other made to enter into the hold or any other part of the ship. When the upper end of this tube is heated, the draught of air will be supplied from below, as in the other case. Mr. Sutton's practicable and useful contrivance was much opposed at its first proposal; and though his pipes were recommended by Dr. Mead and Mr. W. Watson, after several trials of their effect, they were very slowly introduced, and in process of time very much neglected. Mr. Sutton, after considerable delay, and with no small difficulty, obtained a patent for his invention.

Mr. Watson recommends the use of these pipes for the circulation of fresh air in houses, prisons, hospitals, wells, &c. And they have undoubtedly this obvious advantage, that by causing the putrid and noxious air to pass into the fire, they not only dilute but destroy it. Phil. Trans. abr. vol. viii. p. 628. 630. Mead's Works, p. 397—437.

For other inventions adapted to the same purpose, see Air-trunks, Bellows, Ship's-lungs, Ventilator, Blowing-wheel, and Wind-fails.

Air-pump, a machine, by means of which the air may be exhausted out of proper vessels.

The use and effect of the air-pump is to make what we popularly call a vacuum; but this, in reality, is only a degree of rarefaction sufficient to suspend the ordinary effects of the atmosphere.

By this machine, therefore, we learn in some measure, what our earth would be without an atmosphere; and how much all vital, generative, nutritive, and alterative powers, depend upon it.

The principle on which the air-pump is constructed, is the elasticity of the air; as that on which the common, or water-pump is founded, is the gravity of the same air.

The structure of the air-pump is, in itself, more simple even than that of the water-pump. The latter supposes two principles, gravity and elasticity likewise: so that the water-pump must first be an air-pump, i.e., it must rarely the air before it can raise the water. In effect, water being a dormant unelastic fluid, needs some external agent to make it ascend; whereas air ascends in virtue of its own elastic activity: its natural tendency is to separate and leave a vacuum; and all that remains for art is to prevent the ambient air from supplying the place of that which thus spontaneously escapes. To make water ascend, the force wherewith it is pressed downwards is either to be diminished or increased in one part more than another; like a balance in equilibrium, one of whose scales may be made to rise, either by diminishing its own weight, or increasing that of the other; the water, therefore, recedes from the common centre of gravity by the very power with which it tends towards it indirectly or secondarily applied; because, two similar centripetal forces being made to act contrary to each other, what in the one over-balances the other must have the effect of a centrifugal force. Whereas, the principle whereby air is rarified or diminished, does not respect the centre of the earth, but the centres of its own particles; being no other than a certain implanted power, whereby they immediately tend to recede from each other.

The invention of this noble instrument, to which the present age is indebted for so many fine discoveries, is ascribed to Otto de Guericke, the celebrated confidant of Magdeburg, who exhibited his first public experiments with it, before the emperor and the empress of Germany; at the breaking up of the imperial diet at Ratibon, in the year 1654; but his description of the instrument, and of the experiments performed with it, is contained in his "Experiments nova Magdeburgica de Vaneo Spatio," and was not published before the year 1672, at Amsterdam.

Dr. Hooke and M. Duhamel, indeed, ascribe the invention of it to Mr. Boyle; but that ingenious author frankly confesses de Guericke to have been beforehand with him. In a letter which he wrote to his nephew, Lord Dungarvan, at Paris, about two years after Schottius's book was published, he introduces the acknowledgment of his obligation, for the discovery of this useful machine, to what he had heard of it, though he had not then perused it, by that well-applied passage of Pliny, "Legumum eft et plenum ingenii pecuris fati per quis profercit." Some attempts, he affirms us, he had made upon the same foundation, before he knew any thing of what had been done abroad; but the information he afterwards received from Schottius's Mechanica Hydraulica Pneumatica, published in 1657, wherein was an account of de Guericke's experiments, first enabled him to bring his design to any thing of maturity. From hence, with the allusion of Dr. Hooke, after two or three unsuccessful trials, arose a new air-pump more easy and manageable than the German one; and hence, or rather from the great variety of experiments that illustrious author applied it to, the engine came to be denominated machine Boyleana, and the vacuum produced by it, vacuum Boyleanum.

Air-pump, structure and use of the. The basic or essential part in the air-pump, is a metallic tube, anfwering to the barrel of a common pump, or syringe; having a valve at the bottom, opening upwards; and a moveable piston or embolus, answering to the sucker of a pump, furnished likewise with a valve opening upwards. The whole must be only fitted to a vessel as a recipient or receiver.

The Bell, resting only circumstances chiefly respecting convenience, have been diversified and improved from time
to time, according to the several views and address of the makers.

In our further account of the air-pump, we shall trace the various alterations it has undergone from the rude and inconvenient construction of Otto de Guericke to its present improved state. Guericke’s machine is exhibited in Plate iv. Pneumatics, fig. 24. It consists of an iron three-legged frame, \( a b c d f \), supporting a round iron plate, \( b c \), in the middle of which is inserted a brass syringe, \( g h \). The upper part of this syringe is furnished with a rim of lead, \( j \), \( \text{(fig. A.)} \); and it is fastened below by means of an iron ring, \( k k \), and three iron arms, \( o o a \), to the legs of the frame. Within the rim \( j \), there is a brass plate \( m n \), \( \text{(fig. B.)} \) encompassed by a ring of leather, and fixed by three screws which terminates upwards in a small tube \( n \), into which the pipe connected with the syringe to be exhausted is fastened, as occasion requires, and to which, on the lower side, is adapted a valve of leather, through which the air passes into the syringe. In this plate there is also another small valve at \( z \), opening upwards, through which it escapes. This plate is covered by a copper vessel, \( x y \), intended for containing water. The piston of the syringe \( s b \), \( \text{(fig. 24, and fig. C.)} \) is connected by a joint at \( t \), with the iron rod \( w t \), which is fastened to the handle, \( w o y z \); and this moves round the pin at \( a o \) by which it is connected with one of the legs of the frame. In order to prevent air from entering into the syringe, a copper vessel of water is suspended by hooks to the arms, \( o o o a \), so that the lower part of the syringe at \( k k \), and the piston, may be always covered with water, when the machine is at work. The receiver, \( L \), is a glass sphere, adapted to a brass cap, \( P P \), which has a pipe with a stop-cock, \( g r \); and this pipe is fitted to the tube, \( n \), above mentioned. From this brief description of the machine, its operation will be easily understood. When the piston, \( s b \), is depressed, the air will be expanded in the syringe, \( g h \), and that of the receiver will descend into it through the valve in the lower surface of the plate, \( m n \); but when the piston is elevated, and the air is compressed, this valve shutting upwards will clothe the passage to the receiver, and make its escape through the valve \( z \), which opens upwards. In order to render the exhaustion more complete, a small exhausting handle is adapted to the plate, which is represented at \( m \). See Guericke’s Exper. Nov. Magdeby. Amlt. 1672. lib. iii. c. iv. and v. p. 77.

This machine, though it might be deemed an excellent contrivance at the time of its invention, when the doctrine of the elasticity and expansion of the air was new, had many defects which it is hardly necessary now to mention. The force necessary for working it was very great, and the progress of its operation very slow. Besides, it was to be wrought under water, and it allowed of little change of subjects for experiments. Mr. Boyle, whose ideas of this machine, first suggested to him by Schottus’s report of Guericke’s construction, were executed by Dr. Hoole, whom he then employed as his operator, removed some of these inconveniences and diminished others.

The form of Mr. Boyle’s air-pump appears in Plate iv. Pneumatics, fig. 25. It consisted of a spherical receiver, \( A \), with a round hole at the top, whose diameter, \( B C \), was about four inches; this was covered with a plate, having a brass rim, \( D E \), which was firmly cemented to the ring of glass that surrounded the hole; and to the tapering orifice of the brass rim was adapted a brass stop-cock, \( F G \), ground so exactly as to exclude as much as possible the admission of air. In the centre of the cover was a hole, \( H I \), of about half an inch in diameter, provided with a socket, to which the brass stop-cock, \( K \), was so fitted as to prevent the entrance of air; and the lower part of this stop-cock was perforated with a hole, through which passed the syringe, \( s, r, t, o \), for the convenience of moving it and fro the subjects of experiments. To the neck of the receiver a stop-cock, \( N \), was fastened; and to the top of the cock, \( X \), a tin-plate, \( M T U W \), was so cemented as to preclude the admission of air. The lower part of this machine consisted of a wooden frame with three legs, \( 1 1 1 \), and a traverse board, \( 2 2 2 \), on which the pump rested. The cylinder of this pump was cast brass; and it was fitted with a stop-cock, \( 4 4 \), \( 5 5 \), of which one part, \( 4 4 \), was covered with shoe- leather, so as exactly to fill the cavity of the cylinder; and to this was fastened the other part, which was a thick and narrow plate of iron, \( 5 5 \), somewhat longer than the cylinder, indented on one edge with narrow teeth, so as to admit the corresponding teeth of a small iron nut, fastened by two staples to the under side of the traverse board, \( 2 2 2 \), on which the cylinder rests; and this is turned to and fro by the handle, \( 7 \). The last part of this cylinder is the valve, \( R \), consisting of a hole bored through at the top of the cylinder, somewhat tapering towards the cavity; into which hole is ground a tapering peg of brass, to be thrust in and taken out at pleasure. In order to prevent more effectually the admission of air, and to prepare the sucker of the pump for motion, a quantity of small oil was poured in at the top of the receiver and also into the cylinder. The operator, having fixed the lower flanks, \( O \), of the stop-cock into the upper orifice of the cylinder, turns the handle, and thus forces the sucker to the top of it, so that no air may be left in its upper part. Then shutting the valve with the plug, and turning the handle the other way, he draws down the sucker to the bottom of the cylinder, and thus its cavity, into which no air is admitted, will be in an exhausted state. By turning the stop-cock, and opening a passage between the cylinder and the receiver, the air contained in the one will descend into the other; and this air being prevented from returning, by turning back the key of the stop-cock, will be made to open the valve and to escape into the external air by forcing the sucker to the top of the cylinder; by alternately moving the sucker upward and downward, turning the key and shutting the valve, as occasion requires, the exhaustion may be continued. See Boyle’s Works, by Birch, vol. i. p. 7-10.

Mr. Boyle has described a second air-pump in the first continuation of his Physico-mechanical experiments. See his works, vol. iii. p. 180. This, like the former, had only one barrel, by which the receiver was exhausted; but it was so contrived as to be every where surrounded with water, that the ingress of air might be more effectually prevented. Besides, the receivers, which were of several forms and sizes, were fastened to an iron plate by means of a soft cement, so that they could be removed and changed at pleasure. The interposition of a moistened leather for fixing them, does not seem at this time to have occurred to him. Notwithstanding all the precautions of Mr. Boyle, and his contrivances for excluding air by oil and leather, he found that the working of his pump by a single barrel was laborious, on account of the prejudice of the atmosphere, a great part of which was to be removed at every elevation of the piston, when the exhaustion was nearly completed: and he himself candidly acknowledges, that it was rarely and with great difficulty, that he was able to produce any great degree of rarefaction. This useful machine was gradually improved by Papin, Mercure, Mariotte, and others; but the introduction of a second barrel and piston was the principal
principal improvement which it received about this period.

To whom this was owing, it is not easy to decide; some
inscribe it to Dr. Hooke, others to Papin, and others
again to Haukbee. An engine of this kind, with a double
tube, is described by Mr. Boyle, in the second continuation
of Phvsiotnieal Mechanical Experiments (works, vol. iv. p. 116);
but the manner of working it, by means of a pulley and
of iron frissars or steadds, upon which the operator stood,
must have been extremely inconvenient. However, by the
use of a second barrel and piston, contrived to rise and fall
alternately with the other, and by the introduction of valves,
which in this third air-pump of Mr. Boyle supplied the
place of the plug and flip-cuck, which he had before used,
as well as by the subsequent improvements of Haukbee,
the pressure of the atmosphere on the descendiug piston al-
ways nearly balanced that of the ascending one; so that the
which worked them up and down was easily moved by a
gentle force with one hand; and the exhaustion was also
made in much less time. See Haukbee's Physico-Mech-
anical Experiments, p. 1, &c. Mr. Vrcam, a pneumatic
operator, employed by Dufagglers, made an improvement
in Haukbee's air-pump, by reducing the alternate motion of
the hand and winch to a circular one. In his method the
winch is turned quite round, and yet the pistons are alter-
nately raised and depressed; by which the trouble of shift-
ning the hand backwards and forwards, as well as the loss of
and the shaking of the pump, are prevented. See
Dufagglers's Course of Exp. Philof. vol. ii. p. 378. For
a brief account of the progressive improvements of the
air-pump, see Cotes's Hydrostatical and Pneumatical Lec-
tures, lect. xii. p. 156, &c.

The structure of the air-pump, thus improved, is repre-
ented in Plate v. Pneumatics, fig. 33. It consists of two
braeus barrels or cylinders, a, a, which communicate with
each other by the ciftern, d d, and with the receiver, 0000,
which is ground level at the bottom, and let over a hole in
the plate, by means of the heat pipe, 6 b. In these barrels
the pistons, which are fastened to tight that no air can get
between them and the barrels, are worked by a toothed
wheel, turned by the handle, b b; and thus the racks, c c,
with their pistons, are worked alternately up and down.
The gage tube, */, is immered in a bafon of quicksilver, m,
at the bottom, and communicates with the receiver at the
top; from which it may be occasionally dendifgared by turn-
ing a cock; and a is another cock, by turning of which the air
is again let into the exhausted receiver, passing into it with
a bililing noise. The action of the toothed wheel and pi-
tons is represented in fig. 34.

As the handle is turned backwards, it raises the piston d e,
in the barrel B K, by means of the wheel E, and rack
D d: and as no air can get between the piston and barrel,
all the air above d is lifted up towards B, and a vacuum is
made in the barrel from e to b: upon which part of the air
in the receiver by its spring rushes through the hole in the
braus plate of the pump along the pipe G G, communicating
with both barres by the hollow trunk H K, and push-
ing up the valve b, enters into the vacant part b s, of the
barrel B K. Then, as the handle F is turned forward, the
piston e f, will be depreed in the barrel; and the air
which had got into the barrel, finding no way of escape
through the closed valve b, will ascend through a hole in
the piston, and make its way into the external air through a
valve at d: and it will be prevented by that valve from
returning into the barrel, when the piston is again raised.
At the next elevation of the piston, a vacuum is again made
in the same manner as before, between b and c: upon which
more of the air that was left in the receiver will get out by
its spring, and flow into the barrel, B K, through the
valve b. The other piston and barrel act in the same man-
er; and as the handle, F, is turned backwards and for-
wards, it alternately raises and depresses the pistons in their
barrels; one being raised whilst the other is depressed. By
thus repeating the operation again and again, the air in the
receiver is at length rarefied to such a degree, that its den-
sity does not exceed the thin air remaining in the barrel when
the piston is raised: which done, the effect of the air-pump
is at an end; the valve cannot now be opened, or if it
could, no air would pass it; there being a just equilibrium
between the air on each side.

To judge of the degree of exhaustion, there is added the
gage-tube, 17, open at both ends, and about 32 inches
long (fig. 33), affixed to a wooden ruler, which is divided
into inches and parts of an inch, from the bottom where it
is even with the quicksilver in the bafon, m, and continued
to the top, a little below the plate of the air-pump, to 30
or 31 inches. Hence the air in the tube rarefying as fast
as that in the receiver, in proportion as the exhaustion ad-
vances, the mercury will be raised by the preasure of the
column of external air, prevailing over that of the column
of air included; till the column of air, and mercury to-
gether, become a balance to that of the external air. When
the mercury is thus rifen to the same height as it stands
in the barometer, which is indicated by the scale of inches
added to the gage, the instrument is a jut Torricellian
tube; and the vacuum may be concluded to be as perfect
as that in the upper end of the barometer. When the
cock, a, is turned, fo as to make a communication with the
external air; this rushes in, and the mercury in the gage
immediately subsides into the bafon. See GAGI.

In estimating the gradual ascent of the quicksilver in the
gage, it is evident that, as we continue to pump, the
mercury continues to ascend; and that it approaches always
more and more to the standard altitude, or about 29 3/4 inches,
more or less according to the variety of seasons. And it is
easy to prove, that the defect of the height of the quick-
silver in the gage from the standard altitude is always pro-
portional to the quantity of air which remains in the re-
ceiver; that the altitude itself of the quicksilver in the gage
is proportional to the quantity of air which has been
exhausted from the receiver; and that the ascent of the
quicksilver, upon every turn of the pump, is proportion-
able to the quantity evacuated by each turn. Let it
be considered, that the whole preasure of the atmos-
phere upon the ciftern of the gage is equal to, and may be
balanced by, a column of quicksilver of the standard alti-
dute; consequently, when the quicksilver in the gage has
not yet arrived to the standard altitude, the defect must be
supplied by some other equal force; and that force is the
capitative power of the air remaining in the receiver; which
communicating with the upper part of the gage, hinders
the quicksilver from ascending, as it would otherwise do,
to the standard altitude. The capillarity of the air in the
receiver is then equivalent to the weight of the deficient
quicksilver; but the weight of this is proportionable to the
space it should occupy; or to the defect of the height of the
quicksilver in the gage from the standard height; therefore
the capillarity of the remaining air is also proportionable
to the same defect. But the density of any portion of air is
proportionable to its capillarity, and the quantity in this case
is proportionable to the density; and therefore the quantity
of air remaining in the receiver is proportionable to the defect
of the quicksilver in the gage from its standard altitude.

Hence
Hence it follows, that the quantity of air which was at first in the receiver before you began to pump, is proportional to the whole standard altitude; and conversely the difference of this air, which was at first in the receiver, and that which remains after any certain number of turns, that is, the quantity of air exhausted, is proportional to the difference of the standard altitude and the before-mentioned defect, that is, to the altitude of the quicksilver in the gage after that number of turns. Hence again it appears, that the quantity of air exhausted at every turn of the pump is proportional to the ascent of the quicksilver upon each turn. See Cotes's Hydrost. and Pneum. Lectures, lett. 13. See Gage.

There are several inconveniences attending air-pumps of the common form, though much improved from what they used to be formerly, and many attempts have been made to remedy them. It is a well-known fact, that pumps merely serve to rarefy the air to a considerable degree, and that none of them can produce a complete exhaustion; as the mercury in the gage is not raised by any of them to the height which it occupies in the Torricellian tube, when well purged of air. Few pumps will bring it within 1/4 of an inch. Hankfhee's, fitted up according to his own instructions, will seldom bring it within 1/4; pumps with cocks of the best construction, and in the most favourable circumstances, will bring it within 1/8; but none with valves fitted up with wet leather, or to any part of which water or any volatile fluids have access, will bring it nearer than 1/4.

Before we proceed to give an abridged account of the improvements that have been made in air-pumps, we observe, that the air-pumps most commonly used are made either with brass stop-cocks, or with valves of oilskin or of leather, for preventing the return of the air into the receivers, out of which it had been exhausted. Pumps with stop-cocks, when well made and newly put together, are generally found to rarefy the air to a greater degree than those which are made with valves; but after having been used for some time, they become less accurate than those with valves. But the valves are also imperfect; as the external air, piercing upon that in the piston, prevents its rising, when the elastic force of the air in the receivers, under exhaustion, is much diminished. Attempts have been made, particularly by the abbé Nollet and Mr. Gravesande, to perfect the construction of cocks. In Gravesande's double-barrelled pump, the cocks at the bottom of the pistons are turned by an apparatus that is moved by the handle of the pump; the piston has no valve, and the rod is connected with it by a flirrup, as in a common pump. This rod has a cylindrical part, which passes through the flirrup, and moves flexibly in it through the space of about half an inch, between a shoulder above and a nut below. The flirrup supports a round plate, which has a short square tube, that fits tight into the hole of a piece of cork, and which has also a square Shank, that goes into the square tube. Between the plate and the cork is put a piece of thin leather, soaked in oil, and another is placed between the cork and the plate which forms the hole of the flirrup. When the winch is turned to raise the piston from the bottom of the barrel, the friction of the piston against the barrel keeps it in its place, and the rod is drawn up through the flirrup. The wheel has thus liberty to turn about an inch; and this is sufficient to turn the cock, so as to shut off the communication with the external air, and to open that with the receiver. When this is done, the continued motion serves to raise up the piston to the top of the barrel. When the winch is turned in the opposite direction, the piston remains fixed till the cock is turned, so as to shut the communication with the receiver; and open that with the external air. The cock has one perforation diametrically through it, and another in a perpendicular direction to this; and after reaching the centre, it passes along the axis of the cock, and communicates with the open air. By this communication, when it is opened, the air rushes in, and balances the prelure on the upper side of the piston in this barrel, so that the pressure on the other must be counteracted by the person who works the pump.

In order to obviate this inconvenience, Gravesande put a valve on the orifice of the cock, by tying over it a flip of wet bladder or oiled leather; and by means of this the piston is pressed down, as long as the air in the barrel is rarer than the outward air, just as if the valve was in the piston itself. Gravesande, and also Mushenbrock, extol the operation of this pump, as exceeding that of pumps with valves. But it is evident that no precise estimate of its performance can be obtained, whilst the pistons, valves, and leathers of the pump are prepared by steeping them in oil, and afterwards in a mixture of water and spirits of wine. With this preparation the gage could not be brought within 1/4 of an inch of the barometer. Besides, a considerable space is left between the piston and cock, from which the air is never expelled; and if this be made very small, the pump must be worked very slowly; otherwise the air will not have time to diffuse itself from the receiver into the barrel, especially when the expelling force or the elasticity of the air, towards the close of the operation, is very small. The rarefaction will likewise be retarded by the valve, which will not open till the air below the piston is considerably denser than the external air. The cocks in pumps of this kind are subject to become loose by use, and to admit air; an inconvenience which might, indeed, be prevented by placing the barrels in a dish filled with oil. For a figure and description of Gravesande's pump, see Gravesande's Mathem. Elem. of Natural Philosophy, by Desaguliers, vol. ii. p. 14. These pumps, if they were ever used in England, have been long superseded by the cheaper and more simple contrivance of valves, formed by tying a flirup of bladder over a small hole, through which the air is allowed to pass in one direction only.

In the year 1750, the ingenious Mr. Smeaton directed his attention to the improvement of valve pumps. In considering the structure of these pumps, he observed, that the principal causes of their imperfection are, partly the difficulty of opening the valves at the bottom of the barrels, and, partly, the piston's not fitting exactly, when put down to the bottom, which leaves a lodgment of air that is of bad effect. The first of these imperfections is owing to the smallness of the common valves, which are made of a piece of thin bladder stretched over a hole generally much less than 1/4 of an inch in diameter, and to the adhesion of the bladder to the plate upon which it is spread, by reason of the oil or water with which it is moistened; as the rarefaction of the air in the receiver is continued by the operation of the pump, its rising becomes slow, that it is not able to overcome the cohesion of the bladder to the plate, the weight of the bladder, and the resistance occasioned by its being stretched. The larger the hole is, over which the bladder is laid, a proportionably greater force is exerted upon it by the included air in order to lift it up; and yet the aperture of the hole cannot be made very large, because the pressure of the incumbent air would either burst the valve, or so far force it down into the cavity as to prevent its lying flat and close upon the plate. In order to avoid these inconveniences, instead of one hole, Mr. Smeaton makes use of seven, all of equal size
face and shape, one being in the centre, and the other fix
round it, so that the valve is supported at proper distances
by a kind of grating, formed by the solid parts between
these holes, and resembling a honeycomb; and that the points
of contact between the bladder and grating may be as few
as possible, the holes are hexagonal, and the partitions are
filed almost to an edge. The breadth of these hexagons is
4ths of an inch, and consequently the surface nine times
larger than common; and as the circumference is
three times greater than that of the common valve, and the cohesion
to be overcome is, in the first moment of the air's exerting
its force, proportional to the circumference of the hole, the
valve over any of these holes will be raised with three times
more ease. Besides, the raising of the valve over the centre-hole
is aided on all sides by those that are placed round it; and
as they all contribute as much to raise the bladder over the
centre hole, as the air immediately acting under it, the
valve will be raised with double the ease already sup posed,
or with a fifth part of the force commonly necessary. After
the bladder begins to rise, it will expose a greater surface to
the air underneath, which will cause it to move more easily.

The other defect in the common construction would fill
hinder the rarefaction from being carried on beyond a certain
degree. For as the piston does not fit so closely to the
bottom of the barrel, as totally to exclude the air, this air,
as the piston rises, will expand itself; and precluding upon the
valves in proportion to its density, hinder the air within the
receiver from coming out. Hence, if the vacancy were equal
to the 150th part of the capacity of the whole barrel, no air
could pass out of the receiver, when expanded 150 times,
though the piston was conjointly drawn to the top; because
the air in the receiver would be in equilibrium with that in
the barrel, when in its most expanded state. In order to obviate
this inconvenience, Mr. Smeaton fitted up the top of the
barrel with a plate, having in the middle a collar of leathers,
through which the cylindrical rod works that carries the
piston. The external air is thus prevented from preffing
upon the piston; but for the discharge of the air that passes
from below through the valve of the piston, there is a valve
applied to the plate at the top, which opens upwards. By
this construction, when the piston is put down to the bottom
of the cylinder, the air under it will evacuate itself so much
the more, as the valve of the piston opens more easily, when
preffed by the rarefied air above it, than when preffed by
the whole weight of the atmosphere; and as the piston may
be made to fit as nearly to the top of the cylinder as it can
to the bottom, the air may be rarefied as much above the
piston, as it could before have been in the receiver. Hence
it follows, that the air may now be rarefied in the receiver
in duplicate proportion of what it could be upon the
common principle. By this contrivance, the pump, confiding
of a single barrel, may be worked with more ease than the
common pump with two barrels, because the preffure of the
outward air is taken off by the upper plate; and when a
considerable degree of rarefaction is desired, it will produce
it more speedily.

Mr. Smeaton has also contrived a new gage, which mea-
sures the expansion with certainty, to much less than the
100th part of the whole. It consists of a bulb of glasss,
in shape resembling a pear, and sufficient to hold about half
a pound of quicksilver. It is open at one end, and the
other is a tube hermetically sealed at top. A scale divided
into parts of about 4ths of an inch each, and answering to
a 100th part of the whole capacity, is annexed to it. This
gage, during the exhaustion of the receiver, is supffended in
it by a flip-wire. When the pump is worked as much as is
thought necessary, the gage is pushed down, till the open
end is immerged in a cistern of quicksilver placed under-
neath. The air being then let in, the quicksilver will
be driven into the gage, till the air remaining in it be-
comes of the same density with the external; and as the air
always takes the highest place, the tube being uppermost,
the expansion will be determined by the number of divisions
occupied by the air at the top. See Gage.

This ingenious artifit has succeeded so well in his con-
struction of the air-pump, as to be able to rarefy air about 1000
times; whereas the best of the common air-pumps, esteemed
good in their kind, and in complete order, never rarefied it
above 140 times. Mr. Smeeart's air-pump acts also as a
condensing engine, by the very simple apparatus of turning a
cock; see Condenser. This air-pump is thus easily made
an universal engine, for shewing any effect arising from an
alteration in the density of air or spring of the air; and with
a little addition may be made to shew the experiments of the
415—423.

A perspective view of the principal parts of this pump
is exhibited in Plate vi. Pneumatics, fig. 45. A is the
barrel, B the ciffer, in which is included the cock, with
several joints, which are covered with water to keep them
air-tight; and a little cock to let the water out of the ciffer
is marked G. C is the triangular handle of the key of
the cock, which, by the marks on its arms, shews how it
must be turned, that the pump may produce the effect de-
fired. D H is the pipe of communication between the
cock and the receiver. E is the pipe that communicates
between the cock and the valve, on the upper plate of the
barrel. F is the upper plate of the pump which contains
the collar of leathers, and V is the valve, which is covered
by the piece F. G I is the syphon-gage, which is screwed
on and off, and adapted to different purposes. It consists
of a glass-tube hermetically sealed at e, and furnished
with quicksilver in each leg, which, before the pump begins
or work, lies level in the line a b; the space b e being
filled with air of the common density. When the pump exhausts,
the air in b e expands, and the quicksilver in the opposite
leg rises, till it becomes a counterbalance to it. Its rise
is shewn upon the scale I, by which the expansion of the
air in the receiver may be nearly estimated. When the pump
condenses, the quicksilver rises in the other leg, and the
degree may be nearly judged of by the contraction of the
air in b e; marks being placed at ½ and ¼ of the length
of b e from e, which shew when the receiver contains double
or treble its common quantity. K L is a screw-frame to
hold down the receiver in condensing experiments, which
takes off at pleasure, and is sufficient to hold down a re-
ceiver, the diameter of whole base is seven inches, when
charged with a treble atmosphere; in which case it acts with
a force of about 1200 pounds against the screw-frame. M
is a screw that fastens a bolt, which slides up and down in
that leg, by means of which the machine is made to stand
fast on uneven ground. The structure, connection, and re-
lative uses of the several parts of this pump will be further
perceived in the following account of Smeaton's air-pump,
constructed and improved by Mr. Nairne.

A perspective view of it appears in Plate vi. Pneu-
matics, fig. 46. A, A, are the two barrels of a simple
double-barrelled air-pump; the tube q q conveys the air
from the receiver placed in the pump-plate T, and the cock
Q serves to cut off the communication between the receiver
and the barrels A, A, when the exhaustion is completed.
In the front of the pedetall Z is a screw, serving to admit
air into the barrels, that the valves may not be preffed after
the cock Q is turned; the button i readmits air into the
receiver.
receiver; the syphon-gage y is made in the usual manner; but the cisterns x, x, prevent the gages from being dirtied by the oil, on the readmission of the air. The large barrel C has a solid plunger, worked by the rod R, which paffes through the collar of leathers u; for the construction of which, as well as the internal structure of the barrel C, see fig. 47.

This is a verticall section of the barrel, &c.; the top or cup U screws on to the screw u, and the cavity b is made conical; the holes e, e, are made just large enough to let the piston rod pass freely; the cavity b is filled with circular greased leathers, through the center of which a hole is made, that barely admits the piston rod to pass; these leathers are crowded into b, and three or four thicknesses of them are left above the surface, f; and consequently, when the cup U is screwed down, these leathers are forced into the smaller part of the conical hollow b; and therefore they bind as much or as little as is requisite on the piston rod. The head a is covered with eight screws on the upper flange or part of the barrel C; the bottom B screws on the lower flange or lower end of C; the plug D is accurately ground into a conical hole in the bottom B and has the lever L standing at right angles. As the whole nicety of the exhaustion of this air-pump depends upon this part, it should be very particularly described. The lever L is represented as standing to the left hand; and the hole 2 with its valve 1 is seen in connection with the pipe P, and consequently with the receiver; see the horizontal section L D P. But if the lever L is brought towards the word "closed," the hole 2 with its valve 1 has moved onwards towards D; no hole is opposite to the hole of P, and consequently all communication between the receiver and the inside of the barrel C is cut off; but upon moving the lever L more towards the right hand, the hole 3 having "no valve" will be in connection with P, and consequently there will be a direct or uninterrupted passage between the receiver and the inside of the barrel C. Upon attentively inspecting the fiction, it will be perceived by the directions in which the valves open and close, and the position of the passages which are drilled through the thickness of the barrel, that the ascent or descent of the solid plunger N exhausts the pipe P, and consequently the receiver.

I must be remarked, that the valves exhibited in the fiction are drawn like lids of boxes, with joints for the purpose of shewing in what direction they open; but in reality the valves are made of oiled silk; and as on the nice construction of these the good action of the pump much depends, the best mode of making them will be illustrated in the fiction, fig. A A, which shews the plug D, on which the valve is to be fixed. In the first place, a groove must be turned, of a convenient size, so as to leave a cylinrical knob F, whose diameter may be four or five eighths, or more, of an inch; the hole which the oiled silk valve is intended to cover, is made through the axis or center of this knob, as is shewn by the dotted lines H; the ring G is to fit nicely into the groove, and to be fluid with the general surface of the knops: the surface of the knob F must be turned away about double the thickness of the oiled silk for the purpose of preventing the oiled silk from injury by the piston's striking it; a flip of oiled silk about the width of four times the diameter of the hole, which it is to cover, must be laid over the hole in the center of the knob F, and the ring G carefully put in its place and there fixed by two or three screws. Fig. B B shews the construction of the reeniron x x, (fig. 46.), for the purpose of keeping the gages clear. The end of the gage G, for instance, passes through the bottom of the reeniron x, and reaches nearly to the top; and a piece of metal, flat, or like an inverted tea-saucer, is fixed to the top of x, fig. B B. The oil which comes from the pump through m is thrown on the back of the saucer, and running to its edges drops into the bottom part of the reeniron, and thus prevents any filth from getting into the tube G, fig. 46.

Having described the particular parts of this pump, we shall now explain the mode of working it, so as to obtain the greatest degree of exhaustion. A receiver well ground and made dry, with oil put upon its edge, is to be placed on the pump plate T, (fig. 46.), over the aperture of the pipe P; and the lever L is to be moved so as to stand under the word "valve." By working the piston of the cylinder C up and down, from the top to the bottom, the receiver becomes partly exhausted, and the mercury will rise from the cistern M up into the tube of the barometer gage G; the exhaustion must be continued till it will rise no higher; and turning the lever L under the word "closed," the piston must be moved two or three times up and down; let it then be left at the bottom of the barrel C; move the lever L under the words "no valve," and gently raise the piston to the top of the barrel. As there is now a direct communication between the receiver and the barrel C, without the intervention of a valve, the air will expand itself freely into the barrel, and the mercury of the gage will rise; keeping the piston at the top of the barrel, turn the lever again under the word "closed," and repeat the operation as before; unscree the receptacle for dirty oil O, and screw in its place the complete small exhausting syringe S; work this a few times, and repeat the operation with the barrel and the lever L as before, till the mercury will rise no higher in the gage.

By the processes now described, the exhaustion has been made so perfect, that when an open cistern barometer, suspended in the room, has been on the rife, the mercury in the gage G has risen within \( \frac{1}{4} \) th of an inch as high.

The double-barrelled air-pump A A being placed on the flame B, and having a communication with the pump plate T, as well as the improved pump C, is intended for exhausting large receivers very expeditiously; as both pumps may be worked at the same time; and more especially for preventing the improved pump from being used for trifling experiments, or those where water is made use of. In the pump plate T are two holes, situated near each other, one communicating with the double-barrelled, and the other with the improved pump, and serving the purpose of cutting off the communication of either with the receiver at pleasure. Indeed, when the double-barrelled pump is only used, the hole of the pipe P, leading to the barrel C, should always be carefully stopped to prevent moisture of any kind from getting into it.

Since the time of Mr. Smeaton the air-pump has received very material improvements; for which we are indebted to the Rev. Mr. Prince, of Salem, in North-America; and to Mr. Cuthbertson, late of Amsterdam, and since settled in London.

Mr. Smeaton's success in facilitating the opening of the valves, at the bottom of the barrel and in the piston, led Mr. Prince to conceive, that if these valves were entirely removed, and the remaining air in the barrel could be more perfectly expelled, the rarefaction might be carried still farther. Upon this plan he constructed his air-pump. He removed the lower valve, and opened the bottom of the barrel into a cistern on which it was placed, and which had a free communication with the receiver; for the valve on the upper plate, at the top of the barrel, constructed like Mr. Smeaton's, made it unnecessary that there should be any at the bottom, in order to rarefy the air in the receiver. The cistern was made deep enough to admit of the piston's descending into it below the bottom of the barrel. If the piston be solid, that is, without a valve, when it enters the
barrel and rises to the top-plate, which is made air-tight with a collar of leathers, like Smeaton's, it forces out all the air above it; and as the air cannot return into the barrel on account of the valve in the top-plate, when the piston descends, there will be a vacuum between it and the plate; everything being supposed perfect. But in working the pump, the piston is not allowed to descend entirely into the cylinder to far as to leave the bottom of the barrel open; but it descends below a hole in the side of the barrel near the bottom, which opens a free communication between the barrel, cillern and receiver. Through this hole the air rushes from the cylinder into the exhausted barrel, when the piston has dropped below it; and by its next ascent this air is forced out as the other was before. If the capacity of the receiver, cylinder, pipe, &c. below the bottom of the barrel, taken together, be equal to the capacity of the barrel, half the remaining air will be expelled by every stroke. But as the working of this pump with a solid piston would be laborious, on account of the resistance it would meet with in its descent from the air beneath, though it would be effaced by every stroke as the air became more rarefied, Mr. Prince pierced three holes in the piston at equal distances from each other, and by a circular piece of bladder, tied over the top of the piston, formed a kind of valves over the holes, which opened with sufficient ease to prevent any labour in working the pump, by allowing the air to pass through the piston in its descent. The escape of the air does not, however, depend upon a passage through the piston into the barrel; for when the air, weakened by rarefaction, cannot open this valve, it will still get into the barrel when the communication is opened by the hole at the bottom. This piston will therefore descend as easily as any other, nor will the valves impede the rarefaction. By this construction the valves, made to open with more ease by Mr. Smeaton, are rendered unnecessary for rarefying the air; and that at the bottom of the barrel is entirely removed; the valve on the top-plate being the only one necessary in rarefying the air.

Having set aside the valves, which partly prevented the air from entering the barrel above the piston, Mr. Prince's next attempt was to expel the air more perfectly out of the barrel than Mr. Smeaton had done, by making a better vacuum between the piston and the top plate, so that more of the air might be allowed to expand itself into the barrel from the receiver. Mr. Prince also contrived to connect the valves on the top plate with the receiver occasionally by means of a pipe and cock, by the turning of which the machine might be made to exhaust or condense at pleasure. In order to remove the pressure of the atmosphere from the valve on the top plate, so that this valve might open as easily as the piston valve, he connected with the duct on the bottom piece, which conveys the air from the valve to the cock, a small pump of the same construction as the large one; having the barrel opening into the cylinder, the piston rod, which is solid, moving through a collar of leathers, and a valve near the top, through which the air is forced into the atmosphere. This pump with one barrel is called the valve-pump; its chief use being to rarify the air above the valves, or to remove the weight of the atmosphere from them. When this valve pump is used, the passage through the cock is shut up; and, therefore, instead of placing three ducts at equal distances round the cock in the manner of Mr. Smeaton's, Mr. Prince divided the whole into five equal parts, leaving the distance of one-fifth part between the ducts leading from the cylinder and the valves to the cock, and two-fifths between each of these and the one leading from the cock to the receiver. By this adjustment, when the communication is open between the receiver and the valves for condensation, the other hole through the cock opens the cillern to the atmosphere; but when the communication is made between the cillerns and the receiver for exhaustion, a solid part of the key comes against the duct leading to the valve, and shuts it up, and the air which is forced out of the barrel passes through the atmosphere into the valve-pump; for the valve of the small pump may be kept open while the great one is worked.

Upon this construction, the pump with two barrels may be made like the common pumps, which cannot be conveniently done where the lower valve is retained. In this pump the pilgrons do not move the whole length of the barrels; an horizontal section being made in them a little more than half way from the bottom, where the top-plates are inserted. The pump is thus made more convenient and simple, as the head of it is brought down upon the top of the barrels in the same manner as in the common air-pump. The barrels also stand upon the same plane with the receiver plate, and this plane is raised high enough to admit the common gage of 32 or 33 inches to stand under it, without inconvenience in working the pump: as the winch moves through a left portion of an arch at each stroke than it would do if the pilgrons moved through the whole length of the barrels.

A gage for measuring the degree of condensation having a free communication with the valves, cock, &c. is placed between the barrels in this pump; and the gage is so constructed that it will also serve to measure the rarefaction above the valves when the air is worked off by the valve-pump. It consists of a pedestal, the die of which is made of glass, which forms a cillern for the mercury, a hollow brass pillar, and glasses tube hermetically sealed at one end, which moves up and down in the pillar through a collar of leathers. When the pump is used as a condenser, the degree of condensation is shown by a scale marked on one edge of the pillar: when it is used as an exhaust, the degree of rarefaction of the air above the valves is shown by a scale on the other edge of the pillar. This gage will also shew, when the valves have done playing, either with the weight of the atmosphere on them, or taken off, in the manner which the author has described. The degree of condensation may be also measured by the number of strokes of the winch. For the purposes of great condensation, Mr. Prince has fitted a condenser of a smaller bore than the barrel of the great pump to the cillern of the valve-pump, to be screwed on occasionally. Or, without this condenser, the valve-pump may be adapted to the purpose by being made a little larger, and by having a plate made to screw into the bottom of the cylinder, with a valve on it opening into the cillern: a hole must be made to be opened on the same occasion near the top of the cylinder, to let air in below the pillow when this is drawn up above it. The common gage, which is generally placed under the receiver-plate, is placed in the front of this pump, that it may be seen by the person who works it, and that the plate may be left free for other uses. The plate is fixed to the pipe leading to the cock, that it may be taken off at pleasure, and nailed as a transfer; and it may also serve for other purposes.

The head of this pump is made whole, except a small piece on the back, where the wheel is let in; and the wheel is freed from the piston-rods by pushing it into the back part of the head, and it is kept in its place by a button screwed into the socket of the axis behind. By this apparatus the piston-rods are dilated from the wheel, and let down into the cillerns, when the pump is not used; and in these cillerns they may also have the advantage of being covered with oil. The principal joints of this pump are sunk into sockets, that the
the leather; which clothe them may be covered with oil to prevent leaking. The lower part of the pump is fitted with drawers to contain the necessary apparatus.

A perspective view of a double-barrelled pump, made by Mr. Jones, according to the construction of Mr. Prince, may be seen in Plate vii. Pneumatick, fig. 48. A, A, are two brass barrels in which the pistons move; the barrels communicate with the receiver placed on the pump by means of the pipe B C, and canal D E; the rods of the pistons are seen at F, G; each of these is connected with a rack or piece having teeth on one side. At I there is a wheel, whose teeth are laid hold of by those of the rack; so that by turning the handle H the pistons are alternately raised or depressed, and the air is exhausted out of the receiver K, the tube B C, and the canal D E, which communicate with one another. At the top of each barrel is a plate, on which is a box n, containing a collar of leathers; through this the cylindrical part of the piston rod moves, air-tight; o o is the place of the valve on the top plate, into which a pipe is soldered that conveys the air from the valves to the duct, passing under the valve-pump P, which is designed for preventing the preëmption of the atmosphere from acting on the valve of the top plate. Q is the piston rod of this pump, and R the handle by which it is worked. Y is a cock to cut off occasionally the communication between the receiver and the working parts of the pump. At S is a screw, which cloths the orifice of the canal D E, by unscrewing which the air may be admitted when required. Z is an oil-vessel for receiving the oil driven over by the action of the pump; and there should be always a small quantity of oil in the cups of the boxes m, n, that hold the collar of leathers through which the piston rods move; a b c is the barometer-gage; d e is the box or cistern containing the mercury; and there is a divided box-scale affixed to the tube, for ascertaining the rise or fall of the mercury; a small ivory tube encompasses the lower end of the glass tube, and floats upon the quicksilver in the cistern; the upper end of this is always to be brought to coincide with the lower division of the box scale, by means of the screw under the cistern; and when its coincides, the divisions on the scale give the true distance from the surface of the mercury in the halsam. The key serves for tightening or loosening the screws of the pump. When either piston is down, in the operation of this pump, there is a free communication from the receiver through the tubes and the canal to the part of the barrel above the piston; when the piston rises, it forces out the air above it through the valve in the top plate; and as this valve prevents the air from returning into the barrel, when the piston descends, a vacuum is formed between it and the under surface of the top plate; as soon, therefore, as the piston has descended below the holes communicating, by the tubes and pipe, with the receiver, the air rushes into the exhausted barrel; on the next ascent of the piston, this air is forced out as before. To prevent the piston from meeting any resistance in its descent, there is a valve in it through which the air passes as the piston descends; but the air does not necessarily depend upon a passage through the piston in order to get into the barrel. By these means the piston descends as easily as in any other construction, while the valve in it does not impede the rarefaction. The valve pump P is, as we have observed, used for taking off the preëmption of the atmosphere from the valve on the top plate of the pump, and for forming a more perfect vacuum between this plate and the piston, that nothing may prevent this instrument from exhausting as far as its expansive power will admit. The barometer gage a b c, serving to measure the exhaustion of the receiver, consists of a tube, divided by an annexed scale of inches and fractional parts of an inch, whose higher orifice communicates with the receiver, and the lower is immersed in a column of mercury. Before any exhaust has taken place the mercury in the tube and cistern is upon the same level; and after any number of turns of the handle of the pump, the air in the tube and receiver is equally rarified, and the mercury will ascend in the tube till the weight of the column above the surface of that in the cistern, and dilution of the air in the receiver, taken together, be equivalent to the weight of the atmosphere; and if the altitude of the column is equal to the standard altitude, the vacuum in the receiver, and that above the mercury in the barometer, are the same. For an account of the pyshon-gage, occasionally substituted for the barometer gage, and the pear gage; see Gage.

In a contrivance, suggested by an ingenious workman of the late Mr. Adams, and annexed to the pumps constructed by Mr. Jones, one of the lower flexible oil-hens, or leather valves in the two barrels, is attached to a brass ring, which is allowed an interval of motion of 1/10th of an inch; a long wire is fixed to a bar over the diameter of the ring, which wire pales along the body of the piston and rod through a collar of leathers in the piston. By the friction of these leathers upon the rod, as they move up and down, the lower valve is occasionally raised and depressed; and thus a communication is opened with the barrel and receiver, and consequently the exhaustion is carried to as great a degree as the nature of the air itself appears to admit. By a comparison of the height of the mercury in a good barometer tube, Mr. Jones did not observe the 1/10th of an inch difference between this and that of the barometer gage to the pump; and consequently the rarefaction was about 1200 times; and hence he concludes that it was equal in power to that of Mr. Cuttbertson or any pump whatever.

We shall now describe more minutely the parts of which Mr. Prince's improved air-pump consists. Fig. 49. Plate vii. represents a perpendicular section of one of the barrels, the two cisterns, condening gage, &c.; where A B is the barrel, C D is the cistern upon which it stands, a a a a a the leathered joint, tube, into a socket, and buried in oil; E F is the piston, with the cylindrical rod passing through a collar of leathers, G G, in the box H. K shows the place of the valve on the top plate K, covered by the croso piece M, into which is soldered the pipe O O, that conveys the air from the valves to the duct going under the valve pump, as may be seen in fig. 51. P is part of the said duct; P is the joint fink into a socket in the croso piece PP, which connects the cisterns, and has a duct through it leading to them. Into this duct open the ducts q and r, the first leading to the gage in front of the pump, and the other to the cock and receiver. The other barrel is left out of the figure, except Q, which is the top of it brought out of its place for the purpose of viewing the top plate which shuts up the barrel, separated from the box, which contains the collar of leathers. S is one of the holes in the plate over which the valve lies, and which is covered by K in the croso piece. V V is the piston shewing the valve open on the top, which is to prevent labour when the pump condenes. W X is the cistern, in which is more diffusely set the shoulder for the leathers, which clous the point between this and the barrel, and also the socket in which the oil lies over the leather. Y Z is the condening gage, with the orifice of the tube raised above the surface of the quicksilver; e e is the collar of leathers, through which the glass tube moves; and i is a small pipe coming up through the quicksilver to form a communication between the valves and the gage. In fig. 50, is seen the upper surface of the top plate.
plate which closes the barrel, being folded into it, drawing the place of the valves over the three small holes. Fig. 51, is a perpendicular division of the bottom piece, pipe, valve-pump, cock, &c. at right angles with the other section, fig. 50. The bottom o is screwed here into the top instead of the gage. C D is the valve-pump and cistern, e the place of the valve under the cup; f the cock, drawing the duct through it leading to the atmosphere; g h the pipe leading from it to the rim of the receiver plate, in which is the cock i, to shut up the duct when the plate is used as a transfer-funnel. k k is the plate; l a piece to shut up the hole, into which tubes, &c. are occasionally screwed to perform experiments without removing the plate. The dotted line at o shows the place of the screw which presses the plate against the pipe; p q the pipe and common gage standing in front of the pump. Fig. 52, is a horizontal section of the cock, and pieces containing the ducts leading from it to the receiver, the cisterns and the valves on the top of the barrels; a b the duct, connecting the cisterns together; c d the duct leading from the cisterns to the cock; g h the duct leading from the cock through the pipe a b (fig. 51) to the valves; d e the duct through the cock, which occasionally connects the two last mentioned ducts with the duct d e, leading from the cock to the receiver; l the duct in the cock leading to the atmosphere, which, when connected with the duct at d, lets the air into the cisterns and barrels for condensation; the other duct through the cock at the same time connecting h and e. This duct also, when connected with e, restores the equilibrium in the receiver. k l is part of the duct leading from the cisterns to the gage. The dotted circles show the places of the pipe and valve-pump on the piece, and e the place where the air enters the valve-pump from the duct g h, and is thrown into the atmosphere when the pump exhausts. Fig. 53, shows the under surface of the boxes which contain the collars of leathers with the grooves piece which connects them together, having a duct through it, as represented by the dotted line, through which the air passes from the valves into the pipe. This figure is chiefly designed to show the places in which the valves play, as at l. American Transactions, vol. i. Boston, 1785. Nicholson's Journal, vol. i. p. 121-128. Adams's Lectures on Nat. and Exp. Philos. by Jones, vol. i. p. 51-54, p. 153.

The air-pump of Mr. Cuthbertson is so excellent in its structure, and so powerful in its effect, that it claims particular notice and description. A perspective view of it appears in Plate viii. Pneumatics, fig. 56. Its two principal gages are screwed into their places; but these need not be used together, except in cafes where the utmost exactness is required. In common experiments, either of them may be taken away, and a stop-screw put into its place. When the pear-gage is used, a small round plate, large enough for the receiver to stand upon, must first be screwed into a hole at a; but when this gage is not used, this hole must be closed with a stop-screw. When all these gages are used, and the receiver is exhausted, the stop-screw B, at the bottom of the pump, must be unscrewed, to admit the air into the receiver; but when the gages are not all used, the stop-screw at A, or either of the other two which are in the place of the gages, may be unscrewed for this purpose. In fig. 57, c d represents one of the barrels of the pump, f the collar of leathers, g a hollow cylindrical vessel to contain oil: k is also an oil-vessel, which receives the oil that is driven with the air through the hole a a, when the piston is drawn upwards; and when this is full, the oil is carried over with the air along the tube T, into the oil vessel G; e e is a wire which is driven upwards from the hole a a, by the passage of the air: and as soon as this has escaped, falls down again by its own weight, flutters up the hole, and prevents any air from returning by that way into the barrel; at d d are fixed two pieces of brass, to keep the wire e e in such a direction as may preserve the hole airtight. H is a cylindrical wire, which carries the piston I, and is made hollow to receive a long wire, q q, that opens and closes the hole L, which forms the communication with the receiver standing on the piece; m is part of a pipe, one end of which is screwed into the wire q q, that opens and shuts the hole L; and upon the other end, o, is screwed a nut, which, stopping in the smaller part of the hole, prevents the wire from being lifted too high. This wire and forew are more clearly seen in fig. 58, and fig. 62: they slide through a collar of leathers, r r, fig. 58, and fig. 61, in the middle piece of the piston. Figures 60 and 61, are the two main parts which compose the piston; and when the pieces in figures 59 and 62 are added to it, the whole is represented by fig. 58. Fig. 61, is a piece of brass, turned in a conical form, with a shoulder or ledge at the bottom; a long female-screw is cut in it, about two-thirds of its length; and the remaining part of the hole, in which there is no forew, is about the same diameter as the screw part, except a thin plate at the end, which is of a breadth exactly equal to the thickness of q q. That part of the inside of the conical piece of brass, in which no thread is cut, is filled with oiled leathers with holes in them, through which q q can slide airtight; there is also a male-screw with a hole in it, which is fitted to q q, and serves to press down the leathers r r. In fig. 60, a a a a is the outside of the piston, the inside of which is turned exactly to fit the outside of fig. 61; b b are round leathers, about 60 in number; c c is a circular plate of brass, of the size of the leathers; and d d is a screw, which serves to press them down as tight as is necessary. The male forew, at the end of fig. 59, is made to fit the female screw in fig. 61. If fig. 62, be pushed into fig. 61, this into fig. 60, and fig. 59 screwed into the end of fig. 61, there will compose the whole piston, as represented by fig. 58. H, in fig. 57, represents the same part as H in fig. 58, and is that to which the rack is fixed. If this, therefore, be drawn upwards, it will make fig. 61 shut close into fig. 60, and drive out the air above it; and when it is pushed downwards, it will open as far as the shoulders a a, (fig. 62,) will allow, and suffer the air to pass through. A A (fig. 63,) is the receiver plate; B B is a long square piece of glass, screwed to the undermost side of the plate, through which a hole is drilled, corresponding with that in the centre of the receiver plate, and with the three female forews b b.

In order to conceive how the rarefaction of the air is effected, suppose the piston to be at the bottom of the barrel, and a receiver to stand upon the plate, the inside of the barrel, from the top of the piston to a, is full of air, and the piston shuts: when drawn upwards, by the hollow cylindrical wire H, it will drive the air before it, through the hole a a, into the oil-vessel R, and out into the atmosphere by the tube T. The piston will then be at the top of the barrel at a, and the wire q q will stand nearly as it is represented in the figure, just raised from the tube L, and prevented rising higher by means of the nut o. While the piston is moved upwards, the air will expand in the receiver, and be driven along the bent tube m, into the inside of the barrel. Thus the barrel will be filled with air, which, as the piston rises, will be rarefied in proportion as the capacity of the receiver, pipes, and barrel, is to the capacity of the barrel alone. When the piston is moved downwards again by H, it will force the conical part, fig. 61, out of the hollow part, fig. 60, as far as the shoulders a a: fig. 58, will
AIR

will rest upon a, fig. 63, which will then be so far open as to permit the air to pass freely through it, while at the same time the end of $qq$ is forced against the top of the hole, and closes it in order to prevent any air from returning into the receiver. Thus the piston, while moved downwards, suffers the air to pass out between the sides of fig. 66 and fig. 67, and when it is at the bottom of the barrel, will have the column of the air above it; and, consequently, when drawn upward, it will float and drive out this air, and by opening the hole $h$, give a free passage to more air from the receiver. This process being continued, the air will be exhausted out of the receiver as far as its expansive power will permit: for in this machine there are no valves, as in the common air-pumps, to be forced open by the air in the receiver, which, when its elasticity is diminished, it becomes unable to feel; nor is there anything to prevent the air from expanding to the greatest degree.

In using this machine for exhaustion, no directions are necessary besides those which relate to common pumps, nor is any peculiar care required to keep it in order, except that the oil-vessel, $G$, be always kept about half full of oil. When it has stood for a considerable time without being used, it will be proper to draw a table-spoonful or two of oil through it, by pouring it into the hole in the middle of the receiver plate, when the piston is at the bottom of the barrel; then, by moving the winch backward and forward to raise and depress the piston, the oil will be drawn through all the parts of the machine; and the superfluous part will be forced out through the tube $T$, into the oil-vessel $G$. Near the top of the cylindrical wire $H$, is a square hole, which is intended to let in some of the oil from the vessel $G$, so that the oiled leathers, through which the wire $qq$ slides, may always be duly supplied with it.

When the pump is required to condense, either at the time when it exhausts, or separately, the piece which contains the bent tube $T$, must be taken away, and fig. 64 put into its place, and filled with the same screws. In the plate, fig. 64, is drawn as it is made for a double-barrelled pump; but for a single barrel, one piece is used, represented by $aaa$, the double piece being cut off at the dotted line $aaa$. In this piece is a female screw, for receiving the end of a long brafs tube; to which a bladder, if sufficient for the experiment, must be tied; or else a glass, properly confined for this purpose, must be screwed to it. Then the air, which is exhausted out of a receiver having the plate, will be forced into the bladder or glass connected with the brafs tube. But if the pump be double-barrelled, the apparatus, as represented by fig. 64, must be used, and the long brass tube screwed into the female screw at C.

The two gages are represented in fig. 65, and fig. 66; the one is the syphon-gage, and the other the barometer or long gage. When these are used, fig. 65, must be screwed into the female screw, $e$, or into that at the other end $e$, fig. 63; and fig. 66 into the female screw $e$, fig. 63.

If it be used as a single air-pump, either to exhaust or condense, the screw $K$, which falls on the rack to the cylindrical wire $H$, must be taken out; then turning the winch till this wire is depressed as low as possible, the machine will be rendered fit to exhaust as a single air-pump; and if it be required to condense, the directions already given with regard to the bent tube $T$, and fig. 68, must be observed.

Mr. Cuthbertson has, by a variety of experiments with this air-pump, shewn its great powers of exhaustion. With the double syphon gage, and also with the long gage, compared with an attached barometer, in which the mercury had been repeatedly boiled, the difference between the heights

of the mercurial column proved to be no more than $\frac{1}{2}$ of an inch, the barometer standing at 30 inches, which gives an exhaustion of 1200 times. On some occasions, when the air was in a very dry state, he observed the difference to be as low as a $\frac{1}{4}$ of an inch, which indicates more than double the rarefaction. See Description of an improved Air-pump, by John Cuthbertson, 8vo. London: for an abridgment, Nicholason's Journal, vol. i. p. 128—130.

We shall close our account of the two pumps of Prince and Cuthbertson with the following judicious remarks of Mr. Nicholason (in his Journal, vol. i. p. 131) on their respective merits and imperfections. "There is no provision to open the upper fixed valve of Prince's greater barrel, except the difference between the pressures of the elastic fluid on each side of the strip of bladder; and this may reasonably be inferred to limit the power of his small pump. In Cuthbertson's pump, the same valve is exposed to the action of the atmosphere, together with that of a column of oil in the oil-vessel. The mischief in either instrument is probably trifling; but in both, the valve might have been opened mechanically. If this were done, the small pump of Prince might perhaps be unnecessary in most states of the atmosphere. With regard to the lower valves, Cuthbertson, by an admirable display of talents as a workman, has infused their action, Prince, on the other hand, has, by the process of reasoning, so far improved the instrument, that no valves are wanted. In this respect, he has the advantage of simplicity and cheapness, with equal effect. The mechanical combination of Cuthbertson's pump reduces the operation to one simple act of the handle: but Prince's engine requires some manipulation with regard to the play of the small pump; though this might have been remedied by a more skilful disposition of the first mover."

"The most perfect scheme for an air-pump, taking advantage of the labours of these judicious operators, seems to be that in which two pilions of the construction of Prince should work in one barrel; one pilon being fixed at the lower end of the rod, and the other at the middle. The lower pilon must come clear out of the barrel when down, and work air-tight through a diaphragm at an equal distance from the effective ends of the barrel. In the diaphragm must be a metallic valve, of the form of Cuthbertson's lower-valve, but with a short tail beneath, that it may be mechanically opened when the pilon comes up. Above the diaphragm must work the other pilon, similar to the first; but as it cannot quit the barrel when down, a small portion of the barrel must be enlarged, just above the diaphragm, so that the leathers may be clear in that position. Lastly, the top of the barrel must be closed and fitted with a valve and oil-vessel, according to the excellent contrivance of Cuthbertson."

"If we suppose the workmanship of such a pump to leave the space between the diaphragm and lower pilon, when up, equal to one thousandth part of the space padded through by the stroke of that pilon, the rarefaction produced by this part of the engine will in theory bear the same proportion to that of the external air; and the same supposition applied to the upper pilon, would increase the effect one thousand times more: whence the rarefaction would be one million times. How far the practical effect might fall short of this from the imperfections of workmanship, or the nature of the air, which in high rarefactions, may not diffuse itself equally through the containing spaces, or from other yet unobserved circumstances, cannot be deduced from mere reasoning without experiment."

It is observed in the Encyclopaedia Britannica, (vol. xv. p. 107.) that a construction of the air-pump, similar to that of
of Mr. Cuthbertson, was invented, and, in fact, executed, before the end of 1779, by Dr. Daniel Rutherford, afterwards professor of botany in the university of Edinburgh. He made a drawing of a pump, having a conical metal valve in the bottom, furnished with a long slender wire, sliding in the inside of the piston-rod with a gentle friction sufficient for lifting the valve, and secured against all chance of failure by a spring at the top, which took hold of a notch in the inside of the piston-rod, about a quarter of an inch from the lower end, so as certainly to lift the valve during the half quarter of an inch of the piston's motion. He had executed a valve on this principle; but his thoughts were diverted from the further prosecution of the business.

In Phil. Trans. (vol. lxxii. p. 435) we have a description by Mr. Cavallo, of an air-pump contrived and executed by Melsirs. Haas and Hutter, instrument-makers in London, in the construction of which these artists have revived Guericke's method of opening the barrel-valve during the half strokes of the pump, by an external force; of this pump Mr. Cavallo says, that when it had been long used, it had, in the course of some experiments, received 600 times.

The description and description of a new air-pump, acting by means of a quantity of oil in the barrel, and invented by James Sadler, Esq., have been published by Mr. Nicholson, in his journal, vol. i. p. 341, &c. He says, that it possesses the desirable requisites of simplicity, cheapness, and power; though at the same time he very properly suggests, that the oil, in process of time, may become changed by the circulation, and loss fit for the purpose, and probably carry with it bubbles of air. He does not mention its practical effects.

A new air-pump, similar in its principle to those of Mr. Screaton and Mr. Cuthbertson, has lately been constructed by the Rev. Mr. Little, of the county of Mayo in Ireland. The principal parts of this machine are one barrel and piston, one stop-cock, one valve, and two pipes of communication. It is of a portable size, and so contrived as to be confined in a very small space. The barrel is placed horizontally, and the rack by which the piston is moved under the barrel, so that the machine may be packed in a box two feet long, 18 inches wide, and seven in depth. It is adapted to the purposes of a condensing as well as of an exhausting engine. As to the effects of this pump, the author informs us, that in several trials of exhaustion, in the months of July, August, and September, 1795, the air being generally very dry, the rarefaction produced, as shown by the pear-gage, was, five times, between 3000 and 4000: the mercury in the barometer gage standing at the tame time always above \( \frac{3}{4} \)th part of an inch higher than it stood in a standard barometer of a wider bore, which was filled with mercury made very hot and poured into a hot tube, and the mercury in the reduced barometer-gage sunk below the level of the surrounding mercury. In the other nine trials, the rarefaction, as shown by the pear-gage, was from 9000 to 26000; when the barometer-gage stood \( \frac{3}{4} \)\( \frac{3}{4} \)th of an inch higher than that in the standard barometer, and sunk in the reduced barometer still lower than before beneath the flagrant mercury. For a particular description and drawing of this instrument, and a minute detail of its practical effects; see Transactions of the Royal Irish Academy, vol. vi. p. 319—391.

The portable or table air-pump differs principally in size and the structure of the gage from the common air-pump described at the beginning of this article. It has two brass barrels, which are firmly retained in a perpendicular situation to the square wooden table on which they rest by a transverse beam, which is pressed upon them by serews at the top of two pillars. From the hole in the center of the pump-plate, there is a perforation or canal in a brass piece, to the fore part of the frame of the pump; and from this canal there is a perforation right-angular to the former, pitting to the center of the bellows of each barrel. At each of these centers a valve is placed opening upwards to admit the air into the barrels. To each barrel a piston is fitted so that the air cannot pass between it and the sides of the barrel. Each piston has a valve opening upwards, that the air in the lower part of the barrel may escape through them into the common air. They are also connected with a rack, and are raised or depressed by a handle, the lower part of which is fixed to the axis of a cog-wheel, whose teeth lay on the teeth of the rack. One piston is raised, and the other is depressed, by the same turn of the handle. The operation of exhausting is the same as in the common pump. Two barrels are advantageous, because they perform the work more speedily, and also because the weight of the atmosphere, pressing upon the rising piston, is counterbalanced by the same weight pressing upon the other piston defending.

Behind the large receiver upon the pump-plate, there is a small plate for sustaining a small receiver. From the hole at the center of this plate there is a canul communicating with that which pusses from the large receiver to the barrels. Under the receiver is a small bottle containing mercury, a small tube filled with mercury and freed from air, and inverted with the open end in the mercury; this is called the short barometer-gage. As the air is taken out of the receiver on this small plate, it is taken at the same time from the larger one; and the deficit of the mercury in the tube will point out the degree of rarefaction in the receiver. The mercury, however, does not begin to descend in this tube till near three-fourths of the air have been exhausted; and the air is said to be as many times rarer than the atmosphere, as the column of mercury sustained in this tube is less than the height at which the mercury stands, at that time, in a common barometer. The pythom-gage, which is sometimes used, is a glass tube, bent in the form of a pythom, hermatically sealed at one end and open at the other. The longest leg is four inches, each of which is divided on an adjoining scale, into 20 equal parts. After considerable exhaustion the gage begins to act; and whilst the mercury falls in one leg, it rises in the other; and the quantity of air remaining will be determined by the difference of the height, at which it stands in both tubes. This gage is placed in the same situation with the short barometer gage.

See Gage.

The small single-barrelled pump has two plates, one for receivers, and the other for a short barometer-gage. Its principle is the same with that of the air-pump just described; excepting that it has only one barrel, and that its piston is merely worked by the hand. In general the single-barrelled pump is made only with one receiver-plate and a mahogany basis, to save expenses, and with its small apparatus, to be packed in a portable mahogany case.

Air-pump, laws of rarefaction in the receiver of it.—1. For the proportion of air remaining at any time in the receiver, (supposing no vapour from moisture, &c.) we have the following general theorem.—"In a vessel exhausted by the air-pump, the primitive or natural air contained therein, is to the air remaining, as the aggregate of the capacity of the vessel and of the pump, (i.e. the cylinder left vacant in an elevation of the piston, with the pipe and other parts between the cylinder and the receiver) raised to a power whose exponent is equal to the number of strokes of the piston, to the capacity of the vessel alone raised to the same power." M. Variignon gives an algebraical demonstration.
of this theorem, in the Memoires de l'Acad. Roy. an. 1693, p. 233; seq. Id. an. 1705, p. 397, seq.; but it may be also demonstrated pneumatically, thus:—Calling the air remaining after the first stroke, the \textit{first residual}; that after the second, the \textit{second residual}, &c. and remembering that the air in the receiver is of the same density as that in the cylinder, when the piston is raised; it is evident, that the quantity of air in the receiver, is to the quantity of air in the cylinder, pipe, &c. as the capacity of the receiver to that of the cylinder, and consequently, the aggregate of the air in the receiver and the cylinder, \emph{i.e.} the whole primitive air, is to the air in the vessel alone, \emph{i.e.} to the first residual air, as the aggregate of the capacity of the receiver and the cylinder, to the capacity of the receiver alone. After the same manner it may be proved, that the quantity of the first residual air, is to the second residual, as the aggregate of the capacity of the receiver and cylinder to the capacity of the vessel alone. And the same proportion does the second residual bear to the third, and so of the rest.

This may be illustrated by an example. Suppose the capacity of the receiver to be twice as great as the capacity of the cylinder or barrel, then will the capacity of the barrel be to that of the barrel and receiver together as one to three; and the quantity of air exhausted at each turn of the pump is to the quantity of air which was in the receiver immediately before that turn, in the same proportion. So that by the first stroke of the pump, a third part of the air in the receiver is taken away; by the second stroke a third part of the remaining air is taken away; by the third stroke a third part of the next remainder is exhausted; and so on continually; the quantity of air evacuated at each stroke decreasing in the same proportion with the quantity of air remaining in the receiver immediately before that stroke; for it is very evident that the third part, or any other determinate part of any quantity must be diminished in the same proportion with the whole quantity itself. And as the quantity of air in the receiver is by each stroke of the pump diminished in the proportion of the capacity of the receiver to the capacity of the barrel and receiver taken together; each remainder will therefore be always less than the preceding remainder in the same given ratio; or, in other words, these remainders will be in a geometrical progression continually decreasing. To recur to the preceding example; the quantity exhausted at the first turn was a third part of the air in the receiver, and therefore the remaining air will be two-thirds of the same; and for the like reason, the remainder after the second turn will be two-thirds of the foregoing remainder; and so on continually; the decrease being always made, in the same proportion of two to three; consequently the decreasing quantities themselves are in a geometrical progression. And as the quantities exhausted at every turn decrease in the same proportion with these remainders; therefore the quantities exhausted at every turn are also in the same geometrical progression. Thus it appears, that the evacuations and the remainders do both decrease in the same geometrical progression. If the remainders decrease in a geometrical progression, it is plain that, by continuing the operations of the pump, you may render them as small as you please; that is, you may approach as near as you please to a perfect vacuum; but you can never entirely take away the remainder.

From the above reasoning it appears, that the product of the primitive air into the first, second, third, fourth, &c. residuals, is to the product of the first residual into the second, third, fourth, fifth, &c. as the product of the capacity of the receiver and cylinder together, multiplied as often into itself as the number of strokes of the piston contains units, is to the product arising from the capacity of the receiver alone, multiplied so often by itself; that is, as the power of the aggregate of the capacity of the receiver and cylinder together, whose exponent is the number of strokes of the piston, to the capacity of the vessel alone, raised to the same power. Consequently, the primitive air is to the last residual, in the ratio of those powers.

2. The number of strokes of the piston, together with the capacity of the receiver and cylinder with the wire, &c. being given; to find the ratio of the primitive air to the air remaining.

Subtract the logarithm of the capacity of the receiver, from that of the sum of the capacity of the receiver and the cylinder; then, the remainder being multiplied by the number of strokes of the piston, the product will be a logarithm, whose natural number shows how often the primitive air contains the remainder required.

Thus, if the capacity of the receiver be 450, and the number of strokes of the piston 6; the primitive air will be found to the remaining air as \(1335^3\) to 1, or 1335 to 1.

For, suppose the capacity of the vessel = \(v\), that of the cylinder and vessel together = \(a\), the number of strokes of the piston = \(n\), and the remaining air = \(r\). Since the primitive is to the remaining air as \(av\) to \(rv\), the primitive air will also be to the remaining air, as \(av/n\) to \(rv/n\). Consequently, if the remaining air be 1, the logarithm of the primitive air is \(\log a - \log v \times n\).

3. The capacity of the barrel and the barrel being given; to find the number of strokes of the piston required to rarefy the air to a given degree.

Subtract the logarithm of the remaining air from the logarithm of the primitive air; and the logarithm of the capacity of the receiver, from that of the aggregate of the capacity of the receiver and cylinder; then, dividing the former difference by the latter, the quotient is the number of strokes required.

Let the primitive air be \(p\), the remaining air \(r\), and the other quantities as before; and we shall have \(p : r = a : v\); and the \(\log p - \log r = n \times \log a - \log v\); and \(n = \log p - \log r + \log a - \log v\).

Thus, if the capacity of the cylinder be supposed 580, that of the receiver 460, and the primitive air to the remaining air, as 1335 to 10: the number of strokes required will be found to be 6.

4. The proportion of the primitive air to the remaining air, together with the capacity of the receiver and the number of strokes of the piston, being given; to find the capacity of the barrel.

Let the first-mentioned proportion be that of \(p : r\); the capacity of the receiver, \(v\), that of the barrel, \(x\), and the number of strokes of the piston, \(n\); then \(p : r = v + x : v\); and \(\log p - \log r = n \times \log v + x - n \times \log v\); consequently, \(\log v + \log p - \log r = \log v + x\). Hence, find the logarithm of the capacity of the receiver and barrel, and from this the capacity itself, and subtracting that of the receiver, the capacity of the barrel will be known.

To the air-pump belongs a large apparatus of other vessels, accommodated to various kinds of experiments.

Besides the effects, and the phenomena of the air-pump, recounted under the articles Vacuum, Air, &c. we may add some others; which, related at large, make the substance of Mr. Boyle's Physico-Mech. Exp. As, that the flame of a candle in vacuo usually goes out in a minute, though it sometimes lasts two, but the wick thereof continues ignited after; and even emits a smoke, which ascends upwards.—That a kindled charcoal is totally extinguished in about five minutes, though in open air it remain alive half an hour; that it goes out by degrees, beginning from the top and the outsides.—That red-hot iron is not affected by the absence of the air; and yet that sulphur or gunpowder will not be lighted thereby, but only fuzed.—That a match, after lying seemingly extinct in vacuo a long time, revives again upon the re-admission of the air.—That a flat and feelrike sparks of fire as copiously in vacuo as out of it; and that the sparks move in all directions, upwards, downwards, &c. here as in the air.—That magnets and magnetic needles, are the same in vacuo as in air.—That smoke in an exhausted receiver, the luminary being extinct, gradually settles to the bottom in a darkish body, leaving the upper part clear and transparent; and that inclining the vessel sometimes on one side, and sometimes another, the fume keeps its surface horizontal, after the nature of other fluids.—That the pyphon does not run in vacuo.—That water freezes in vacuo.—That heat may be produced by attrition in the exhausted receiver.—That camphor will not take fire in vacuo; and that gun-powder, though some grains of a heap be kindled by a burning-glas in vacuo, will not give fire to the contiguous grains.—That glow-worms lose their light in proportion as the air is exhausted, and at length become totally obscure; but upon the re-admission of air, prefently recover it all.—That electricity appears like the Aurora borealis.—That vipers and frogs swell much in vacuo, but will live an hour and half, or two hours; and though feemingly quite dead in that time, come to life again after being some hours in the air.—That finals survive ten hours; and efts or low-worms, two or three days; leeches five or fix.—That fishes will ride up to the top of water, placed under an exhausted receiver, because the air-bladder is expanded, and they are thus made specifically lighter than water; but if the bladder breaks, they sink down to the bottom and ride no more.—That animals who live in water will not die by exhausting the air out of the receiver, unless they are kept for a considerable time in vacuo.—That oysters will remain alive in vacuo 24 hours without harm.—That the heart of an elk taken out of the body, continues to beat in vacuo, more minily than in air; and this for a good part of an hour.—That warm blood, milk, gall, &c. undergo a considerable intumescence and ebullition in vacuo.—That a mouse, or other animal, may be brought, by degrees, to survive longer in rared air, than naturally it does.—That air may retain its usual prefire, after it is become unift for respiration.—And that flock-worms' eggs will hatch in vacuo.

Besides the above-mentioned phenomena, many others are related by different writers on this subject, and they may be found in the Philosophical Transaction of various Academies and Societies, and in the works of Torricelli, Pafcal, Merfenne, Guenick, Schottus, Boyle, Hooke, Haukbree, Duhannel, Mariotte, Hales, Mulchenbroek, Graevfande, Defaguliers, Franklin, Cotes, Helbsam, Martin, Ferguion, Adams, &c. &c. We shall join for the exerciz and amufement of our readers some farther experiments, arranged under different heads. For experiments that require peculiar accuracy, the receiver should not be placed upon leather, either oiled or soaked in water; but the plate of the pump should be made very dry, and the inside of the receiver should be dried and rubbed with a warm cloth. The receiver may then be let upon the plate, and hog's lard, either alone or mixed with oil, be smeared round its outward edge. After performing any experiments, the pump should be cleared of any vapour that has been generated, by exhausting a large receiver to as great a degree as possible; and the vapour that remained in the barrel and pipes will be diffused through the receiver; and if this be large, one exhaustion will be sufficient for clearing the pump. With small receivers the operation should be repeated two or three times. In some of the best pumps, the plate and edges of the receiver are ground so accurately as not to require any leathers; but as the plate is liable to be scratched by letting the receivers upon it, hog's lard or tallow spread upon their edges will be useful. This will prevent the edges from damaging the plate, and will not admit any vapour. When leathers are used for connecting the receiver with a pump plate and for making the junction air-tight, they are previously soaked in water, oil, or a mixture of melted bees' wax and hog's lard. When experiments are performed that require the use of mercury, a small pipe should be screwed into the hole of the pump plate, in order to prevent any of it, that may be accidentally spilt, from passing into the air-pipe and barrels; which would loosen the folder and corrode the brafs.

1. Experiments for measuring the weight and prefire of the air.

1. Exhaust of its air a copper ball, such as C (Plate v. Pneumatics, fig. 26.) the neck of which is furnished with a stop-cock and a screw by means of which it may be fixed to the plate of an air-pump; suspend it, when exhausted, on the end B of one arm of a balance, A B, and lay upon it the small weight p, which must be counterpoised by a weight P in the opposite scale of the balance. Turn the cock of the ball, and the air will rush in and render it so much heavier, that the weight p must be removed in order to restore the equilibrium. If the ball holds a gallon, it will thus be found that a gallon of air weighs about the fifth part of an ounce. See Weight of the Air.

2. Place the small receiver O (fig. 35.) over the hole of the pump plate, and upon exhausting the air, the receiver will be fixed down to the plate by the prefire on its outside; and this prefire will be equal to as many times 15 pounds as there are square inches in that part of the plate, which the receiver covers. By turning the cock of the pump and readmitting the air, the receiver will become loose. In order to prove that the receiver O is held down by the prefire of the air, suspend it on the hook of the wire P P passing through the collar of leathers at the top of the receiver M, by which it is covered, and thus let it down on the plate of the pump; and when the air is exhausted from both receivers, the large receiver M will be fixed to the plate by the prefire of the external air; but the small one O will he loose and may be easily removed; on letting in the air, the leiffer O will be fixed down upon the plate and the other will be released.

3. Place a small brafs or glafs vessel A B (fig. 27.) which is open at both ends over the hole of the pump plate, and cover the top of it with the hand; which, when the air is exhausted, will be prefled down by the weight of the external air, so that it cannot be released without difficulty till the air is readmitted.

4. Tie a piece of wet bladder, as b (fig. 28.) over the open top of the glafs A; when it is dry, let the open end
A over the hole of the pump plate, and as you exhaust the air, the bladder will be pressed down and assume within the glass a concave figure, and at length it will break with a loud report. If a piece of flat glass be laid upon the top of this receiver, and joined to it by a rim of wet leather, the pressure of the outward air will break the glass, when the internal air is exhausted.

5. Immerse the neck d of the hollow glass ball c b (fig. 29.) in the water of the phial a s; place it on the plate of the pump, and cover it and the hole of the plate with the receiver A; exhaust this receiver, and the air will escape by its spiring from the ball c b, through the neck d e, rise in bubbles through the water, and pass off into the external air. When it has done bubbling, turn the cock of the pump, and the air that is admitted will, by its prelure on the surface of the water force it up in a jet into the ball c b, and almost fill it; the small quantity of remaining air, which occupied the whole ball, and which is now reduced to a small space of condensation, preventing the water from filling the whole cavity of the ball. This experiment may be varied by severing the end A of the brass pipe A B E (fig. 30.) into the hole of the pump plate, and placing, by means of wet leather, upon the plate c d a tall receiver G H close at the top, exhausting the receiver of its air and filling the pipe by the cock e f; when this is done remove the apparatus from the pump, let its end A in a basin of water, and open the pipe by turning the cock e; and the prelure of the air on the water will force it up through the pipe, so that it will ascend in a jet to the top of the receiver.

See Fountain.

6. Set the jar D (fig. 31.) containing quicksilver, near the hole of the pump plate, and cover both with the tall open receiver A B. Into the plate C, placed upon the upper end of this receiver, introduce the open glass tube g; immerse at its lower extremity in the quicksilver of the jar D, and screw by a brass top annexed to it at b to the syringe H, which is itself screwed to the plate C. By the ring I, draw up the piston of the syringe, and thus exhaust the tube of its air; and the quicksilver in the basin pressed by the undilated air of the receiver A B will ascend in the tube. That this ascent is owing to the prelure of the air, and not to what some have called suction, may be evinced by exhausting the receiver of its air, which will cause the quicksilver to descend into the jar, and by readmitting the air, which will raise it again in the tube, although the piston of the syringe be not moved. If the tube be about 32 or 33 inches high, the quicksilver will rise nearly as high in the tube as it stands at that time in the barometer. If the syringe has a small hole at m, and the piston be drawn up above that hole, the air will pass through it into the syringe and tube, and the quicksilver will immediately fall down into the jar.

7. Place the jar A (fig. 32.) with quicksilver in it on the pump plate, cover it with the receiver B, and push the open end of the glass tube d e through the collar of leathers in the brass neck C, almost down to the quicksilver in the jar. Exhaust the receiver B of its air, and the tube d e, which is close at the top f, will at the same time be exhausted. When the receiver has been well exhausted, put the open end of the tube into the quicksilver of the jar; and though the tube be exhausted of its air, the quicksilver will not rise in it, because there is no prelure on the surface of that in the jar. But upon admitting the air into the receiver, the quicksilver will immediately rise and stand as high as it did in consequence of the action of the syringe in the preceding experiment.

Vol. I.

These two last experiments not only exhibit the weight and prelure of the air, but they also show that there are increased or diminished in proportion to the increase or decrease of the air's depth. See Barometer and Torricellian Experiment.

8. Join the two brass hemispheres A and B together (fig. 36.) by the interposition of a wet leather, with a hole in the middle of it; then screw the end D into the plate of the pump, and turn the cock E of the pipe, C D, communicating with the hemispheres; and having exhausted the air, turn the cock f, so as to slip the pipe. Having removed it from the pump, screw at the end D, the piece F b, and two strong men pulling at the handles g and h, will find it difficult to separate the hemispheres; for if the diameter be four inches, they will cohere together with a force equal to 188 pounds, the area being equal to the square of the diameter multiplied by 7854, and the prelure on every square inch being 15 pounds. If they be suspended by either of the rings on the hook P of the receiver M (fig. 37.), and the receiver be exhausted of its air, they will separate of themselves.

9. Set the square phial A (fig. 37.) upon the pump plate, and cover it with the wire cage B; then placing it under a close receiver, exhaust the receiver and the phial which has a small hole under a valve at b of their air; and the air upon its readmission into the receiver, being prevented from passing into the phial by the valve b, will break it into a number of pieces by its prelure. Quicksilver may be also forced into wood, and made to pass through it by the prelure of the air.

II. Experiments for showing the elasticity or spring of the air.

1. Place a bladder, containing a small quantity of air and well tied up, under a receiver; and when the receiver is exhausted, the air will expand and fill the bladder so that it will appear as if it were blown with common air. Upon letting in the air, the bladder pressed by it will be reduced to its original flaccid state. This bladder put into a box under a weight of 20 or 30 pounds, and covered with a receiver, will, upon the exhaustion of the receiver, raise the weight by means of the spring of the internal air.

2. Take the glass ball (fig. 29.) which was filled with water, a small bubble of air at the top of it excepted, and having placed it with its neck downward into the empty jar a s, and covered it with a close receiver, exhaust the receiver of its air, and the air-bubble will expand itself, and by its elastic force protrude the water out of the ball into the jar. Or, screw the pipe A B (fig. 30.) into the pump plate, and place the tall receiver G H upon the plate d e; exhaust the receiver, and then remove the apparatus and screw it into the copper vessel C C (fig. 38.) half filled with water. Then turning the cock e (fig. 32.) and the air confined in this vessel will by its spring force the water through the pipe A B, and cause it to form a jet into the exhausted receiver, equal to that which was produced by the prelure of the air in a former experiment; other circumstances being alike.

2. Let the balls annexed to the heads of the hollow glass images (fig. 39.) contain water sufficient to render them specifically heavier than water. Place them under a receiver and exhaust it; and the air in the balls will dilate, force part of the water out, and render the images lighter than water, so that they will ascend. On re-admitting the air, they will descend. Small apertures made in the feet of these images will vary the experiment, and answer the same purpose.

3 Q

3. Animals
3. Animals that die in an exhausted receiver are evidently opiumed at first with a great weight, then convulsed, and at last expire in apparent agony. Instead of repeating experiments of this kind, the effect of exhaustion is ascertained by what is usually, though improperly, called the lungs-plat. This consists of a bladder tied round a small tube which passes into a bottle, and scaled so tight, that the air cannot escape any way but through the tube. When this machine is put under a receiver and the air begins to be exhausted, the spring of that, which is contained in the bottle, and which cannot escape, compresses the bladder; and when air is again let in, the bladder expands; and these alternate motions of compression and dilatation have been supposed analogous to those of the lungs. See fig. 42.

4. Pour quicksilver into the bottle A (fig. 41.) and screw the brass collar c, of the tube B C, into the brass neck b of the bottle, and let the lower end of the tube be immersed into the quicksilver, so that the air above the quicksilver may be confined there. Cover this tube, which is open at the top, with the receiver G and large tube E F, fixed by brass collars to the receiver and close at the top. Exhaust the receiver and its tube; and the air will be thus exhausted out of the inner tube B C through its open top C; and then the air confined in the bottle A will, by its spring, force the quicksilver in the inner tube as it was raised in a former experiment by the pressure of the atmosphere; and thus it appears that the elasticity of the air is equivalent to its weight.

5. Screw the end C of the pipe C D (fig. 42.) into the hole of the pump plate, and open the communication between the three pipes E, F, and D, in the hollow trunk A, B, by turning the three cocks d, G, and H. Cover the plate g and b with wet leathers, having holes in their middle, so as to communicate with the pipes; place the close receiver I upon the plate g; put the pipe F, by turning the cock H; and exhaust the air out of the receiver I. Shut out the air by turning the cock d; remove the machine from the pump; screw it to the wooden stand L; and put the receiver K upon the plate b, on which it will be loose whilst it is full of air; but upon turning the cock H, and opening the communication between the pipes F and E, through the trunk A, B, the air in K will, by its spring, pass from K to I, till it becomes of equal density in both receivers; and then they will be held down with equal force upon their respective plates by the pressure of the atmosphere, and the force with which K was held down will be divided between K and I.

Thus it appears, that a force equal to half the elastic force of common air will act within the receivers against the whole pressure of the common air on their outsides. This instrument is called a double transferrer, and it serves to transfer the air from one vessel into another.

6. Tapp a cork in the square phial A (fig. 37.) with wax or cement; put it upon the pump plate, cover it with the wire cage B, and place a close receiver over the cage. Upon exhausting the receiver of its air, that which was enclosed within the phial will dilate itself, and having no counter pressure on the outside, will break the phial outwards by the force of its spring.

7. Place a thrivelled apple under a receiver, and as it is exhausted, the spring of the air within the apple will pump it out and cause the wrinkles to disappear; but upon readmitting the air, it will return to its thrivelled state.

8. Put a fresh egg, from the small end of which a little of the shell and film is removed, under the receiver; and when the air is pumped out, the small bubble of air contained between the shell and film at the larger end, will dilate itself, and protrude the contents of the egg into the receiver. If the egg be placed in a jar of water under the receiver, its surface will be covered with bubbles of air in the progress of exhaustion.

9. Warm beer put under a receiver, exhausted of its air, will discharge bubbles, which will rise to the surface, and at length give it the appearance of boiling.

10. A piece of dry wanton or other wood, being put into warm water and covered with a receiver, will discharge air, as the receiver is exhausted, and exhibit bubbles of air, especially about its ends, because the pores be longitudinal. A cubic inch of dry wanton has so much air in it, that it will continue bubbling for half an hour together.

If a piece of wood be made to pass through a plate covering the top of a receiver, with one port exposed to the air and the other immersed in a jar of water under the receiver, and the thumb be put on the top of the wood whilst the pump is working, the air contained in the pores of the wood will rise in bubbles through the water; but if the thumb be taken off, a stream of air will flow in through the wood; and thus by alternately taking off the thumb and placing it on the wood, the influx of the air will be alternately admitted and interrupted. See Air and Elasticity of the Air.

III. Experiments for shewing the resistence of the air.

1. The machine (fig. 43.) consists of two mills, a and b, of equal weight, and moving independently and freely on their axes. Each mill has four thin vanes or fans, fixed in the axis; those of the mill a having their planes perpendicular to the axis, and those of the mill b having their planes parallel to it. When the mill a turns round in common air, it will suffer little resitance, because its fans cut the air with their thin edges; but the mill b is much resisted, because the broad sides of its fans move against the air, when it turns round. Each axle has a pin near the middle of the frame, which passes through the axle and projects a little on each side of it; upon these pins the slider d may be made to bear, and thus hinder the mills from going, when the spring e is set on bend against the opposite ends of the pins. Having set the machine upon the pump plate, draw up the slider d to the pins on one side, and set the spring e at bend upon the opposite ends of the pins; then push down the slider d, and the spring acting with equal strength on each mill will set them at work with equal forces and velocities; but the mill a will run much longer than b, because it meets with much less resistance. Draw up the slider again, and set the spring upon the pins as before; then cover the machine with the receiver M (fig. 35.) upon the pump plate; and having exhausted it, push down the wire P P, through the collar of leathers in the neck g, upon the slider, which disengaging it from the pins will allow the mills to turn round by the impulse of the spring; and as there is no air in the receiver that yields any sensible resistance, they will move for a longer time than in the open air, and when one stops, the other will stop also. Hence it appears, that the air resists moving bodies, and that equal bodies meet with different degrees of resistance, according as they present greater or less surfaces to the air, in the planes of their motions.

2. Put the guinea a and feather b (fig. 44.) upon the brass flap c; turn up the flap, and shut it into the notch d. Then putting a wet leaf over the top of the tail receiver A B, which is open at both ends, cover it with the plate C, so that the tongues c d may hang within the receiver. Then having exhausted the receiver, draw up the wire f, and the tongues c d will be opened by a piece at its end, and the flap e falling.
AIR

falling down, the guinea and feather will be observed to
defend with equal velocities, and by looking steadily to the
bottom of the receiver, to fall to the pump plate at the same
instant. When air is in the receiver, the guinea will fall in
an instant, and the feather will descend gently and by an in-
direct motion. This apparatus is sometimes so contrived
as to let three guineas with their feathers fall separately
at three different times, without taking it off or exhausting
the air. See Resistance of the Air.

IV. Miscellaneous Experiments.

1. Suck the syringing H (fig. 31.) to a piece of lead,
weighing at least one pound; pull up the piston, which
will cause a vacuum in the syringe, and the air by its pre
dure will drive back the lead upon it; raising it, and counteracting
its natural weight. But if the syringe and annexed weight
be placed in an exhausted receiver, they will fall upon the piston
by their natural gravity, and upon readmitting the air, they
will be drove upward again, so that the piston will be at
the bottom of the syringe.

2. To a balance A B, Plate vii. Pneumatics, fig. 54. suspend
a weight of lead, and let it be in equilibrium with a piece of cork.
Place this apparatus under a receiver and exhaust the air, and
the cork will preponderate; but let the air be admitted, and
the equilibrium will be restored. As the air is a fluid, all
bodies lose as much of their weight in it as is equal to the
weight of an equal bulk of the fluid; and as the cork is
larger, it loses more of its absolute weight than the lead,
and of course must be heavier in order to compensate this
greater loss; but when the air is removed, all bodies grav
titate according to their quantities of matter, and therefore
the cork, which balanced the lead in air, will appear to be
heavier in vacuo. A more elegant apparatus for this experi
ment, confiding of a light glass ball A, and a brafs weight
B, is exhibited in fig. 55.

3. Set a clean receiver upon the plate of a pump, and
when you begin to exhaust it, hold a candle to the side of
the receiver opposite to your eye, and several colours, re
sembling a halo, will appear about the candle, which are oc
casional by the vapours that arise from the wet leathers and
their refraction of the light.

4. Place a lighted candle under a tall receiver, and if it
holds about a gallon, the candle will continue to burn about
a minute; and its light will gradually decay and at length
be extinguished. The smoke of the candle will ascend and
form a kind of cloud at the top of the receiver; but upon
exhausting it, the smoke will fall down to the bottom; thus
shewing, that smoke does not ascend because it is positively
light, but because it is lighter than air.

5. Let the pipe represented in Plate viii. Pneumatics, fig. 68,
be annexed to the top of an open receiver, and the air be
exhausted; then place one end of the pipe in the middle of
a charcoal fire, and open the cock; and the noxious air of the
charcoal will pass through the pipe into the receiver; remove
the pipe from it, and let down a small lighted wax taper into
the receiver, and it will be immediately extinguished. A mouse
or bird let down into the receiver will be killed by the air
which it contains. If a candle be let down gently, it will
purify the air as it descends.

6. By connecting the wire that passes through the collar
of leathers of a receiver with the trigger of a pistol lock,
placed under it, exhausting the air, and then drawing the
trigger, the flint will strike the steel and produce sparks of
fire, which will not be visible as in the open air. Or, if
two iron bullets be made red-hot, and one of them be under
an exhausted receiver, it will not appear luminous, like the
other which remains in the open air.

7. Set a bell upon a cushion under a receiver on the pump
plate; and shake the pump so as to make the clapper
strike against the bell, and the sound will be distinctly
heard; but exhaust the receiver, and if the clapper be
made to strike with great force against the bell, it will make
no audible sound; hence it is inferred, that air is nece
sary for the propagation of sound.

Air-shafts, among Miners, denote holes or shafts let
down from the open air to meet the adits, and furnish fresh
air. The damp, want, and impurity of air, which occur,
when adits are wrought 30 or 40 fathoms long, make it
necessary to let down air-shafts, in order to give the air
liberty to play through the whole work, and thus discharge
bad vapours, and furnish good air for respiration: the
expenditure of which shafts, in regard of their vast depths, hard
ness of the rock, drawing of water, &c. sometimes equal
some exceeds, the ordinary charge of the whole adit.

Sir Robert Murray describes a method, used in the coal
mines at Liege, of working mines without air-shafts. Phil.
Trans. No. 39. See Mining.

Air-threads of spiders. See Threads.

Air-trunk, a simple contrivance by Dr. Hales, for
preventing the stagnation of putrid effluvium, and purifying
the air in cellars and close rooms; which consists of a square
trunk open at both ends, one of which is fixed in the ceiling
and the other is extended to a considerable height above
the roof. The noxious effluvium, ascending to the top of
the room, escapes by this trunk. Some of these have been
nine and others five fathoms in the clear; but whatever be their
diameter, their length should be proportionable, in order to
promote the ascent of the vapour. As the prelude of
fluids, and consequent on the air, corresponds to their
perpendicular altitude, the longer these trunks are, so much
the greater will be the difference between columns of air
tending at the bottom and at the top; and of course so
much the greater will be their effect. See Ventilator.

Air-vessel, in Hydraulics, is a name given to those met
alline cylinders, which are placed between the two fore
pumps in the improved fire-engines. The water is injected
by the action of the pistons through two pipes, with valves,
to this vessel; the air previously contained in it will be
compressed by the water, in proportion to the quantity ad
mitted, and by its spring force the water into a pipe, which
will discharge a constant and equal stream; whereas in the
common squirting engine, the steam is discontinued between the
two or three strokes. Other water-engines are furnished with
vessels of this kind.

Air-vessels, in Botany, are certain canals, or ducts, where
by a kind of assimilation and respiration is effected in vege
table bodies.

Air-vessels have been distinguished from sap-vessels; the
former being supposed to correspond to the tracheas, and

3 Q 2

lunge
large of animals; the latter to their lacteals and blood-veils.

Dr. Grew, in an enquiry into the motion and cause of the air in vegetables, shews, that it enters them various ways, not only by the trunk, leaves, and other parts above ground, but at the root. For the reception, as well as expulsion of air, the pores are so very large in the trunks of some plants, as in the better sort of thick walking canes, that they are visible to a good eye without a glass; but with a glass, the cane seems as if it were full of large pin-holes resembling the pores of the skin in the ends of the fingers, and ball of the hand. In the leaves of the pine, through a glass, they make an elegant flaw, spanning almost exactly in rank and file throughout the length of the leaves.

But though the air enters in partly at the trunk and also at other parts, especially in some plants, yet its chief admission is at the root: much as in animals, some part of the air may continually pass into the body and blood by the pores of the skin; but the chief draught is at the mouth. If the chief entrance of the air were at the trunk, before it could be mixed with the sap in the root, it must descend; and so move not only contrary to its own nature, but in a contrary course to the sap: whereas by its reception at the root, and its transmission thence, it has a more natural and easy motion of ascent. See Circulation of Air.

The same fact is farther deduced, from the likeness and smallness of the diametral apertures in the trunk, in comparison of those in the root; which nature has plainly designed for the separation of the air from the sap, after they are both together received into them. Grew, Annt. of Root, chap. ii. p. 127.

Air-veils are found in the leaves of all plants, and are evendiscoverable in many without the help of glasses; for upon breaking the stalk or chief fibres of a leaf, the likenesses of a fine wholly sublunience, or rather of curious small cobwebs, may be seen to hang at both the broken ends. This is taken notice of only in some few plants, as in Jacobea, where it is more visible: but may also be seen more or less in most others, if the leaves be very tenderly broken. This wool is really a skein of air-veils, or rather of the fibres of the air-veils, loosed from their spiral position, and so drawn out in length. Id. ibid. chap. iv. p. 155.

That air is inspired by vegetables, has been fully proved by Dr. Hales, in his Statical Essays, (vol. i. p. 155, &c.) and he has in many instances shewn, that air freely enters the vessels of trees, and that it is in great abundance wrought into their sublunience. But as to particular air-veils in plants, he seems to speak doubtfully. He says, by way of question, may not the use of those spiral wreathes, that are coiled round the insides of those veils, which are supposed to be air-veils, and which are manifestly to be seen in several trees, and also in the leaves of the vine and ficabious, may not these be designed by nature to promote the quicker ascent of air, by being in some measure conformed to its elastic contortions? For such spiral wreathes seem to altogether deflects, for promoting the ascent of any liquor, as the sap, which ascends most freely through innumerable other capillary veils, having no such spiral coils in them: not that we are to suppose the air in its elastic state actually to touch, and thereby to be determined in the course of these spirals, as any liquor would be. But as the rays of light, when they are reflected from a solid body, are found to be reflected, without cutting the reflecting body in the point of reflection; so it is not unreasonable to suppose, that elastic air may, like light, be diverted from one course, and so be determined to another, by the solid bodies it approaches, without touching them, but rebounding like light from those solid bodies near the point of contact.

Dr. Hales has observed, that these spirals are coiled in a course opposite to the course of the sun, that is, from west to east. Vide Statick. Efay. vol. ii. p. 265, 266.

Dr. Darwin, in his Phytology, observes, that the vessels which Malphi, Grew, and many others, have denominated bronches, and erroneously thought to be air-veils, and to serve the purpose of respiratory organs, are absorbent veils, defined to imbibe the nutriment of plants, and that they are the genuine lungs of vegetables. These absorbent veils, he says, which resemble the lacteals of animal bodies, are found in the roots of plants for imbiping nourishment from the moist earth, on the external surfaces of the bark and leaves, for absorbing the humidity of the atmosphere, and also in the internal surfaces of the cells and cavities of the vegetable system, where they absorb the secreted fluids, after they have performed the offices to which they are adapted. The existence of the first sort of absorbent vessels, is evidenced by the growth of plants, whilst moisture is applied to their roots, and by their withering when it is withdrawn. Those of the second sort are manifested by plucking off a leaf and laying it in water, which is found not to wither so soon as if it were left exposed to the dry air. The third class of vessels of this kind will be perceived to perform its office by moistening the albumen or sap-wood, and the inner surface of the bark of a branch severed from a tree, which are thus preferred, whilst the same parts left unmoistened in the dry air are observed to wither. Besides, if vegetables be infected in glass-tubes or narrow veils, filled with water, the surface of the water will be seen to subside much sooner than by evaporation alone in similar circumstances. Dr. Darwin also contended to evince these absorbent veils to the eye, by cipping twigs of a fig-tree in a decoction of madder and of logwood, which after some time, upon cutting off about an inch of the stalk near the bottom, exhibited a circle of red points, believed by him to be the coloured ends of the absorbents, that existed in the newly formed albumen. This ingenious writer expresses his allowance that any person should have conceived these veils, that are found in the albumen, and which consist of a spiral line, to be air-veils or tubes. He farther observes, that the absorbent veils of trees, in pulling down their trunks, consist of long hollow cylinders, of a spiral form, and of such large diameters in some vegetables, e.g. in cane, as to be visible, when dry and empty, to the naked eye. Through these air will pass rapidly upward and downward; and hence Dr. Hales has been led to coincide with Grew and others in opinion, that they are air-veils or lungs, designed for respiration, and receiving atmospheric air in their natural state. But to their use as air-veils he objects, because they have no communication with the horizontal air-veils of plants, and they exist in the roots as well as in the trunks of plants, where, not being exposed to the atmosphere, they cannot serve the purpose of respiration. Air, however, in its combined state, or dissolved in water, may be absorbed by these veils; and may appear when the pressure of the atmosphere is removed in the exhaled receiver, or when it is expanded by heat, as is the case in the froth observed at one end of a green stick, when the other is burning in the fire. Dr. Darwin apprehends, that the structure of these large vegetable absorbents, which have been erroneously called air-veils, consists of a spiral line,
line, and not of a vessel interrupted with valves; and in this respect it differs from that of animal lymphatics.

According to this writer, the proper air-vessels are horizontal vessels of large diameter, which pass through the bark of trees to the alburnum. Malpiglii has given a figure of these vessels, and Duhemel mentions fine horizontal perforations through the bark of trees, which he believes to be perforatory or excretory organs; and besides these, he takes notice of others, that are larger, standing prominent in the birch-tree, and piercing the exterior bark; which probably contain air during the living state of the tree. Dr. Darwin supposes, that the horizontal vessels first mentioned contain air, enclosed in a thin moist membrane, which may serve the purpose of oxygenating the fluid in the extremities of some fine arteries of the embryo buds, in a manner similar to that by which the air at the broad end of the egg is thought to oxygenate the fluids in the termination of the placental vessels of the embryo chick.

AIRA, Ais of Hippocrates and Theophrastus, hair-grafs, in Botany, a genus of the triandra digynia class and order, and of the natural order of graminum or grasses. Its characters are, that the calyx is a two-flowered, two-valved glume; the valves ovate-lanceolate, acute and equal; the corolla bivale, the valves like the former;nectary two-leafed, leaflets acute, gibbous at the base; the lamina have capillary filaments, of the length of the flower, with oblong anthers, forked at each end; the piliillum is an ovate germ, the styles actinomorphic spreading, with pubeceous stigmas; no pericarpium; the seed fibrous, crowned with the corolla. It differs from Melica, in having no rudiment of a third between each pair of floecules, the number of which varies. Martyn enumerates 14, and Gmelin, in his edition of Linnaeus, 25 species; some of which are naked or awlfuls, and others awned.

Of the former, Martyn specifies, 1. A. arundinacea, or reedy hair-grafs, with oblong panicle, on one side imbricate, and flat leaves, found in the Levant and in Cochinchina. 2. A. minutes, with loose panicle, almost level-topped, and very branching; an annual grass, found in Spain. 3. A. aquatica, water hair-grafs, with panicle spreading, flowers smooth, longer than the calyx, and leaves flat. This grass generally grows in the margins of pools and watery places, running in the water to a considerable distance, and is known by the purple or bluish colour of the panicles, and sweet taste of the flowers: perennial, flowering in May and June. This is the author of the Farmer's Dictionary, is the grass which contributes chiefly to the sweetness of Cottentom cheafe, and the finesse of Cambridge butter. There is a variety of this which grows in dry soils, with the calyces five-flowered, and the flowers very remote from each other. It occurs in sandy lands near Exmouth, about Northfleet in Kent, in Lancashire, and Yorkshire. In Dr. Withers's arrangement it is the poa diffusa; and Dr. Stokes supposes the poa retroflora of Mr. Curtis to be the same with this. Gmelin adds to the clas of the naked aica; 4. A. coelebs, with a ramose culm, racemose flowers, and hairy corolla. 5. A. sericeus, with dense panicle, smooth calyces, and ascending culm; the poa difflora of some authors. 6. A. hibisfera of some authors. 7. A. millettes, with very numerous panicles, with floecules in three, obtuse and distinct, and smooth articulated leaves. 8. A. agilisoides, with flowers turned to one side, with one valve of the corolla ovated and acuminate, and the other columnar and obtrude. Dr. Smith (Flor. Brit. vol. i. p. 83.) adds, A. crista, with panicle spicate, calyces longer than the peduncle, petals acuminated and unequal. It grows in high barren pastures and walls; perennial; flowering in July and August.

The awned aica enumerated by Martyn are as follow: 9. A. fabri, with leaves flat, panicle spicate, flowers awned on the middle; awn reflex and loose; found on the mountains of Switzerland, Savoy, Denmark, and Lapland; perennial. 10. A. cespitosa or hairy hair-grafs, with leaves flat, panicle spreading; petals villos, and awned at the base; awn short and short; growing in moist meadows and woods, perennial, flowering in June and July, sometimes trailing on the ground to the length of several feet, and the panicle exhibiting a beautiful purple silky appearance. Dr. Withers mentions a variety of this with panicle viviparous, flowering in October, and found on Highland mountains. This is apt to grow in tufts, and occasion irregularities in the surface of meadows. Cows, goats, and swine eat it; but horses are not fond of it. It is the roughest and coarseted hair-grafs that grows in pastures or meadows; and cattle will not touch it, unless compelled by hunger. It is called by the vulgar haflocks, rough-caps, and bull's faces. To get rid of it, the land should first be drained, and the tufts of this noxious weed pared off and burnt; and the ashes they yield will be a good manure. 11. A. flexuosa, or waved mountain hair-grafs, with leaves sectaceus, culms almost naked, panicle spreading trichotomous, peduncles flexuose, and awns geniculatae; perennial; flowering in July, and growing in heaths, woods, and barren pastures; eaten by horses, kine, and sheep. Dr. Withers fuggrets, that this is a variety of the A. montana, or rather the same in a more mature state. This is a principal grass on Banks Down, Mendip, &c. and is equally fine and nutritious with theep's fescue. It is of difficult cultivation. Dr. Smith (Fl. Br. vol. i. p. 85.) mentions two varieties; one with a panicle, legs spreading, and peduncles feebly flexuose. This is the A. montana of Hudson, Withering, Relham, and Leers, but not of Linnaeus. The A. festucus of Hudson does not differ from this; but the A. montana of Linnaeus is a very different grafs, and has not yet been found in Britain. The other has a culm more leavy, a white panicle, feebly flexuose, and grows in shady places. 12. A. montana, with leaves sectaceus, panicle narrowed, flowers hairy at the base and awned, awn twilled and very long; supposed to be a variety of the former; perennial, in July and August; a native of high heaths and shady pastures; eaten with avidity by sheep. A variety, called festucus, with awns twice the length of the florets, is mentioned by Hudson. 13. A. alpina, with leaves subulate, panicle dense, flowers hairy at the base and awned, awn short; growing on the mountains of Germany, Savoy, and Lapland. 14. A. vulgo, with leaves subulate, panicle long and narrow, flowers fescaulostrament, flagggy, awned; awn straight and short; found by Thunberg at the Cape of Good Hope. 15. A. consolens, grey hair-grafs, with leaves sectaceus, culm leavy, the upper one involving the panicle at bottom, like a spathe; awns clavated at the apex, shorter than the calyx; a native of sandy shores, on the coasts of Norfolk and Suffolk, the walls of Bafi, and the sandy fields of Germany and Piedmont; perennial, flowering in July; the avena consolens of Wiggers. 16. A. precurs, early hair-grafs, with leaves sectaceus, sheaths angled, flowers panicle-spiked, floecules sileels, naked at the base and awned on the back; found on dry commons, in ditches, on banks of streams, and in wet meadows; perennial, flowering in May and June, ripening its seeds in June; and called by Wiggers, avena spilota. It has a sweet taste; cows are very fond of it; and it is eaten by horses and sheep. 17. A. cryphioides, silver hair-grafs, with leaves sectaceus, panicle diversirachis, trichotonous, floecules.
AIR

floscules seifile, dor fal owm genieuate; a native of sandy
pastures, and heat of England, France, Switzerland,
and England, Germany, and Denmark; annual, flowering
in July. 18. A. auriculata, four-seed hair-grass, with leaves
flat, pale seed compound, spreading, callyces three-flowered,
floscules awned in the middle, awn elongated straight; a
native of New Zealand. 19. A. innotata, with palate
spreading, involucres with bristles at the base; floscules
awned; a native of Spain, on barren hills near Madrid;
annual, and flowering in June and July. To these Gmelin
dadds, 20. A. paludosa, with flat leaves, patent palate, flos-
cules hairy at the base, and the awn short and bent inwards.
21. A. fflavipes, with flliform leaves, erect palate, leaves
coloured, and awned beyond the middle. 22. A. jucunda,
with leaves fubulate, palate patent, very obtuse, awn
from the base of the length of the calyx. 23. A. jucnifil
with fesaceous leaves, erect palate, and villos floscules.
24. A. moenia, with fesaceous leaves, narrow palate, floscules
hairy at the base, awn fubterminal, shorter. 25. A. perpbrana,
with leaves fubulate-fesaceous, palate facted, one valve
of the corolla entire, plumo, and cufm erect. For the
propagation and culture of Air; See Grass. Gmelin’s
vol. ii. p. 135, &c.

AIRAUD, in Church History, a foct of Arians, in the
fourth century, who denied the divinity of the Holy Ghost
with the Father and the Son.
They are otherwise called Aireaud, and are said to have
taken their name from one Airas, who distinguished himself
at the head of this party, in the reigns of Valentinian and
Graetian.
AIRANO, in Geography, a town of Italy in the
Milanese, 10 leagues south-east of Como.
AIRAY, Peter, in Latin Erodus, in Biography,
Lieutenant-criminal in the prefect of Angiers, was born
there in the year 1556, and executed the office in a manner
that obtained for him the title of the “Rock of the
Assisted.” He died in 1601, and left several treatises. His
eldest son was educated by the Jesuits, and retained in their
society, notwithstanding all the remonstrances and efforts of
AIRAY, Henry, an English divine, was born in Wel-
mereand, educated under the care of Bernard Gipin,
and sent to St. Edmund’s Hall, Oxford, in 1579, at the age of
nineteen years. He was afterwards removed to Queen’s
college, where he was successively fervitor, fellow, and mas-
ter. In 1598, he was chosen provost, and in 1606, vic-
chancellor of the university. He was a constant and zeal-
ous preacher, and a zealous Calvinist. He was much ef-
tereed for his learning, gravity, and piety, and for his
industry in discharging the duties of his office; and died in
1616. The following treatises, written by him, were pub-
lished after his death, viz: “Lectures on the Epistle to the
Philippians, 410. 1618.” “A Treatise against Bowing at
the Name of Jesus.” And, “A just and necessary Apo-
AIRGE, in Geography, a town of France, in the depart-
ment of Landes, formerly Gascony, and in the district of St.
Sever, situate on the Adour, 155 leagues from Paris, and 5 leagues
south-east of Mont-de-Marsan. It is a very ancient town,
and the see of the suffragan bishop of Auch, containing
241 parishes. Its ancient name was Vicus-Junia, having
been taken by the Romans, under the command of Julius
Caesar. The Visigoths afterwards took possession of it;
and Alaric, one of their kings, adorned it and fortified it
with a caftle. It has often since changed masters, and
suffered much during the religious wars in France. N. lat.
43° 31’. E. long. 5° 26’.
AIRE, a town of France, in the department of Pas-de-
Calais, formerly Artois; situate on the Lys, fortified by a
caftle, and communicating with St. Omer by a canal; and
also with the fort St. Francois. It was taken by the allies
in 1710, and refotted to France by the peace of Utrecht.
It is 9 leagues from St. Omer, 9 from Dunkirk, and 51
north of Paris. N. lat. 50° 30’. E. long. 2° 17’.
AIRE, a river of England, bifoming into the Humber, and
navigable to Leeds in Yorkshire.
AIRING, in the general fene of taking, or going into
the fresh air, is too well known to need any explanation.
See Aerophobia.
The word is particularly used for exercising horses in
the open air, which is of the greatest advantage to these animals.
Many of the difeases to which horses are liable, are brought
on by negleeting to exercise them.
AIRING a horse, should be distinguished from that species
of exercise ufed in training horses for racing, as this is con-
ducted at regular periods, and has in view not only the
general health, but particularly the acquirement of wind
and speed. Airing a horse, in a general way, may be done
at any part of the day, but when the heat of the sun is
intenfe, as by this means he perspires too much, and is ren-
dered irritable from the flogs and bites of insects. It is
better to give a horse a moderate airing twice a day, than a
longer one at one time. It should be avoided immediately
after a full meal; at thefe times the chill has not room to
expand, therefore the wind is endangered; the food is like-
wise hurried, by the pressure of the abdominal muscles, too
soon through the flomach to be digefted, and too foon through
the intestines, to be properly absorbed by the flomachs.
In an airing the horse should ftrike be walked, then
trotted, and slowly moderately galloped; it is usually prac-
ticed in a faddle-biide, the propriety of which depends on
the horse’s mouth, and the hand of the rider; if the groom
is not perfectly acquainted with the art of riding with a
fine hand, which few of them are, a large bitted saddle
should be used. An airing field could be continued long enough
to give a horse an aperitif, but not to long as to weaken his
flomach. When horses are very fat it should be continued
longer, that the absorbents may be stimulated to take up
more of the aedes of the body. In foul, gross, greatly fomahes,
the airlings should be gentle, but continued for fome time;
in fawy this should be particularly observed. And in all
difeases where there appears a defect in the absorbents, the
exercife should be gentle, continued long, and frequently
repeated. The numerous caution made use of to air such
particular horses, at particular times, have their foundation
in whines and caprice: reafon and science point out, that
any time between the meals, when the fun is not in its full
luifer, is proper for airing them. See Exercise.
AIROLA, in Geography, a town of the canton of Uri,
in Switzerland, six leagues north of Altorf.
AIRON, a river of France which runs into the Loire
near Decife.
AIRS, in Heyenmabpfi, denote the artificial or prafticed
motions of a managed horse.
Such are the demi-volt, curvet, caprio, croupade, hal-
tadle, flep, and leap; also, advancing, yerking, and bounding.
Some authors take airs in a more extensive fene; and di-
vide them into low and high.
The low airs include the natural paces, as walking, trot-
ing,
ting, galloping, and term-a-terne. To which may be added, prancing, fledging, flapping, and turning.

The high, or raised airs, are all such motions as rise higher than the term-a-terne; as the demi- volt, curvet, &c.

AIRVAULT, in Geography, a town of France, in the department of the two-Sevres, in the district of Thouars, four leagues north-north-east of Partheny.

AIRY triplicity, among Astrologers, the signs of Gemini, Libra, and Aquarius. See Triplicity.

AISA, in Geography, a town of Spain, in the Kingdom of Arragon, two leagues and an half north of Jaca.

AISCH, a river of Germany, in Franconia, which rises near Isleheim, and discharges itself into the Regnitz, between Bamberg and Forcheim.

AISE, a river of France, which runs into the Orne, three leagues above Caen.

AISEAU, a town of Germany, in the circle of Westphalia, three miles south-east of Chaleleit.

AISEDABAD, a town of Persia, in the province of Irak Agemi, 22 leagues north-north-east of Amadan.

AISEREY, a town of France, in the department of the Cote d'Or, in the district of St. Jean de Lofie, three leagues south-east of Dijon.

AISEY-LE-VEC, a town of France, in the department of the Cote d'Or, in the district of Châtillon, 11 leagues south of Châtillon.

AISIAMENTA, in Lact. See Easement.

AISNE, in Geography, a river of France, which rises in Champagne, runs by Soissons, and falls into the Oise above Compiegne. It gives name to a department which is one of the five formed of the ci-devant Soissons, le Beauvaisis, and le Vexin Francois; and it is one of the five into which the ancient Ille de France is divided. It is bounded on the north by the department of the North; on the east, by that of the Ardennes, and part of that of Marne; on the south, by part of Marne, and the department of Seine and Marne; and on the west, by the departments of the Oise and Somme. The extent is about 1,467,881 square acres, or 749,183 hectares; its population about 408,172 individuals; and it is divided into five communal districts. Its chief town is Laon.

AISTULPH, or ASTULPHUS, in Biography and History, king of the Lombards, was chosen to succeed his brother Ratchis, who resigned the crown, A.D. 751; and by his gallantry in the field and wisdom in council advanced the kingdom to a pitch of greatness, which occasioned its total ruin. Having ratified a peace with pope Stephen, and extended the term of it for 40 years, he seized the opportunity, which was afforded him by a war with the Saracens and Bulgarians, that engaged the attention of the eastern emperor Constantine Copronymus, to invade the exarchate of Ravenna, which he subdued, with all its dependencies, and added to the kingdom of the Lombards. Thus terminated the exarchate, which was reduced by the Lombards to a dukedom. Aistulphus proceeded to invade the Roman dukedom, and marching towards Rome, threatened to plunder the city and massacre the inhabitants, unless they acknowledged his sovereignty and paid him a yearly tribute. Pope Stephen was alarmed, and applied to the emperor for succour; but deriving no effectual assistance from the emperor, he retired to Pepin, king of France, who marched an army into Italy, and after routing Aistulphus and his army invested Pavia, where he had taken refuge. The Lombard king was glad to purchase peace by reuniting all the places he had taken, and even the exarchate, which was surrendered by Pepin to the fee of Rome. But as soon as Pepin had departed, the Lombard king, in violation of his engagements, and regardless of his hostages, approached Rome with his army and closely besieged it. Stephen renewed his application to his protector, and by the suppliant style of the letters which he addressed to him engaged him again to have recourse to arms. Aistulphus threw himself a second time into Pavia, whither he was pursued by Pepin, who closely invested the city. The siege was preceded with vigour, and Aistulphus reduced to such distress, that he was under a necessity of suing again for peace, which he obtained upon a promise to perform immediately the treaty that had been made the year before, and as an additional security to deliver up to the pope the city of Commanchio, which was a place of great importance. Upon this Pepin renewed his donation to the pope; yielding to St. Peter and his successors the exarchate, Emilia now Romagna, and Pentapolis now Marc'Ancara, with all their cities, to be held by him for ever. See Exarchate. Aistulphus, lamenting the humbled fate to which he was reduced, began again to prepare for recovering by force what he had been obliged to resign; but in the midst of his hostile preparations, he was killed whilst he was hunting, A.D. 756, and left the male line. The code of laws which he published in the 5th year of his reign is still extant. Anc. En. Hist. vol. xvii. p. 452.

AISNE, in Geography. See THEALIA and ELEB.

AISTOCZU, a considerable river of Lower Asia, which rises in Mount Taurus, and falls into the south part of the Euxine sea.

AITON, WILLIAM, in Biography, an eminent botanist and gardener, was born in 1731 at a small village near Hamilton, in Lanarkshire, in Scotland. Having been trained betimes in the science and practice of horticulture, he came into England in 1754, and was engaged as an agent by Mr. Philip Miller, well known as the author of the Gardener's Dictionary, who was then superintendent of the physic-garden at Chelsea. In this situation he soon attracted notice, and in 1759 he was recommended to the Prince's Dowager of Wales, as a fit person to manage the botanical garden at Kew. In this office to which he was then appointed he continued during life; and here he laid the foundation both of his fame and fortune. As the garden at Kew was designed to be the repository of all the curious plants, that could be collected from the various quarters of the globe, Mr. Aiton had the most favourable opportunity for indulging his taste, and employing his care and skill in their cultivation; and in so doing he acquired distinguished reputation amongst the lovers of this science, and the particular esteem of his royal patrons. Under his superintendence Kew gardens became the principal scene of botanical culture in the kingdom. In 1783 Mr. Aiton was promoted to the more lucrative office of managing the pleasure and kitchen gardens at Kew, which he was allowed to retain in connection with the botanical department which he had before occupied. In 1789 he published his "Hortus Kewenesis, or Catalogue of the Plants cultivated in the Royal Botanic garden at Kew," in three volumes 8vo, with 13 plates; a work, which had been the labour of many years, and which justly entitled him to respectful commemoration among the promoters of science. The number of species, contained in this Catalogue, is between 5 and 6000. A new and curious article in it relates to the first introduction of particular exotics into the English gardens. The system of arrangement is that of Linnaeus, with such improvements as the advanced state of botanical science required. To Sir Joseph Banks, Dr. Solander, and Mr. Dryander, Mr. Aiton respectfully
spectively acknowledges his obligations for subsistence in compounding this celebrated work. The " Hortus Kewensis" was much valued by the best judges, and a large impression of it found a rapid sale. Notwithstanding the temperament and activity of Mr. Aiton, he laboured under the incurable malady of a feverous liver, which occasioned his death in 1793, in his 62d year. His chief love, devoted to the fame purity, and distinguished by his talents, was appointed, by the king's own nomination, to all his father's employments. The private character of Mr. Aiton was highly estimable for mildness, benevolence, piety, and every domestic and social virtue. He was interred in the church-yard of Kew, and died a most respectable concourse of friends. Gen. Bot.

AITTENBA, in Geography, a small town of Spain in Catalonia, the capital of a marquisate.

AITZEM, Leo, in Biography, an eminent historian and diplomatist, was born at Doccum, in Friesland, in the year 1660. He was councilor of the Hans Towns, and their resident at the Hague for 40 years; where he died in 1699, with the reputation of an excellent linguist, an able politician, and amiable manners. His "History of the United Provinces," written in Dutch, contains a large collection of treaties of peace, memoirs of ambassadors, letters, capitulations and other public acts, which is very valuable. The history is more faithful than elegant, and as far as it concerns religion, it is written with impartiality. The work was published in 15 volumes 4to, and was succeeded by another edition of seven volumes in folio. The period which the history comprehends begins with the year 1621 and terminates with 1663, and it has been continued to 1692.

Gen. Diet.

AUBATIPITA BRASILIENSIN, in Botany, the name of a shrub that bears a black fruit like an almond, which yields much oil.

AJUGA, Bagula of Jussieu, Tournefort and Miller, bagis, a genus of the dianthina gymnophylla clas and order, and of the natural order of verbascum or labiate. Its characters are, that the calyx is a one-leafed, short perianthium, cut half-way into five clefs, with the segments nearly equal; the corolla is monopetalous and ringent; tube cylindrical and bent in, the upper lip, very small, erect, bifid, obtuse, lower large, spreading, trigid, obtuse, middle division very large and obcordate, five ones small; the laminae have pubescent, erect filaments, longer than the upper lip, antithesis twin; the pistillum has a four-parted germ, style bilobate, and with respect to situation and length as in the lamina, limbanus two, slender, the lowest shorter; one pericarpium, the calyx, which is converging, folders the seeds, which are somewhat oblong. There are six species, viz. 1. A. orientalis, calthia bugis, with flowers inverted; first brought into Europe from the Levant by Tournefort, since obtained by Thunberg in Japan, and by Loureiro in Cochinchina; cultivated in 1732. Of this there are two or three varieties, differing only in the colours of their flowers. 2. A. pyramidalis, pyramidal bugis, of which the spike is a quadrangular villos pyramid, the leaves approximating, the root-leaves very large, the bracteae nearly entire; binomial, flowering in April, or with us later; a native of Italy, France, Germany, Switzerland, Sweden, Denmark, Wales, and Scotland. 3. A. alpina, alpine or mountain bugis, with stem simple, leaves smooth, unequally dentated, subuliform, the remote verticillii bearing many flowers; growing naturally on the Alps, and in mountainous places in Carpathia, Austria, and on the summit of a mountain near Cafferlo, Derbyshire; admitted into gardens for variety, and propagated by its trailing stalks; requiring a moist shady situation; perennial, and flowering in July. This is the A. pyramidalis of Hudson, and the A. genevensis of Withering. 4. A. genevensis, Geneva bugis, with leaves downy, streaked with lines, lowermost narrower, calyces shaggy, bracteae or floral leaves generally three-lobed; growing wild about Geneva, and in many of the southern countries of Europe; cultivated in 1759, by Miller. 5. A. reptans, common bugis, smooth, with solitary stem, and creeping by runners; perennial, flowering in May; growing in moht meadows, pastures, and woods in most parts of England; becoming somewhat hairy in high and dry situations, with a rounder stem and shorter creepers. Prof. Martyn mentions two varieties, one with a white and the other with a pale purple flower, which grow in several parts of Westmoreland; but they differ only in the colour of their flowers from the blue fort. The common bugis, called by official writers, consolida media, or middle confudant, is recommended as a vulnerary herb, both internally and externally. For this purpose, infusions of the leaves, or the expressed juice, have been administered; and also as mild astringents and corroboration of fluxes and other disorders. Decotions of them have been communicated by Riverius and others in phthisis and internal ulcerations. Malouin recommends a gargarium of the root in the angina. The roots appear to be considerably astringent, both by their taste and by their striking a black colour with solution of calomel by vitriol. Lewis Mat. Med. Murray Mat. Med. vol. ii. p. 154. 6. A. decumbens, Japonice bugis, decumbent and villous; leaves ovate and toothed; with flowers in whirs, small and blue; claffed by Loureiro as a variety of A. reptans.

To this genus Dr. Smith adds (Flor. Brit. vol. ii. p. 605.) the tueerie chamaepyss of Linneus, the ground pine of English writers. Accordingly the A. chamaepyss is described as having a spreading ramose stem, trifid linear entire leaves, and solitary axillary flowers. It grows in sandy fallow fields in Cambridgeshire and Kent; is annual, and flowers in April and May. The leaves of ground pine are moderately bitter, and of a ruminous smell, approaching in this respect, as well as in their external form, to those of the
the pine-tree. Their virtues are extracted both by water and spirit, but most perfectly by the latter. The aqueous
linacre is yellowish, and the spirituous green. The wa-
tery extract is bitter and acrid; the spirituous is lightly
toeth and warm. The oil, collected by distilling large
quantities of the herb, approaches in quality to that of
parrotine. The leaves are recommended as aperients, and
corroborants of the nervous system; and are said to be
particularly serviceable in female obstructions, paralytic dis-
orders, and when continued for a long time, in rheumatic,
itchidic, and gouty pains. It was denominated by some
of the ancient botanists *P. a. auritlicina*, from its use in ar-
thritic pains. It has been recommended by foreign writers
in flow fevers, asthma, and apoplectic seizures; and also
in inflammations of the viceria and jaundice; and externally
for cleaning and confolating ulcers, as well as for an antido-
to the cancer. But its medical reputation has, in later
times, considerably declined. Lewis's Mat. Med. Murray

The firft species of Ajuga may be propagated by seeds,
rown when they are ripe in a pot filled with earth, and
placed in a shady situation till Autumn, and then removed
under a frame. In the Spring, they should be transplanted
into separate pots. In the hard frost of Winter they
should be covered. This species may be more slowly
increased by off-sets, of which it affords but a few. The
fixth. fort may be propagated in the fame manner. As for
the root, they are hardy and easily multiplied by the side
shoots: they delight in a moif shady situation, and are apt
to fpread too much. Martyn.

**AJURU PARROT, Phittacus Astilbus, in Ornithology, the
Ajuru-Curau of Maregrave, the Acuru-Courau of Buffon,
the middle-sized parrot of Willughby, and the common
Amazonas parrot of Latham, is of a green colour, lightly
spotted with yellow; with a blue front, blood-red shoulders,
and flesh-coloured orbits. It is 12 inches long, and its body
about the size of a pigeon: the back has a number of
tawny yellow feathers, scattered through its green plumage.
The face is yellow, with a blue forehead and white crown;
the tail-quills are green with paler tips: the first, second,
and third on each side are red on their inner webs near the
base; the outer web of the first being blue: the shoulders
are either tawny or blood-red; the primary wing-quills are
black, with blue tips, the outer webs being green, and
the inner black: the first four or five of the secondaries
have their outer webs red near the base; the bill is black
at the tip. This species of parrot inhabits Amazonia,
Guiana and Brazil; and it has several varieties, to the four
of which the above description is applicable: c. g. 1.
The A. of Jamaica, with the head and breast yellow,
the front and chin blufh, the edges of the wings and vent-
red. This is the phittacus viridis melanochrous of Aldro-
vand, the black-billed green parrot of Willughby, and the
Jamaica parrot of Brown and Latham. 2. The main A.
parrot, with the left wing coverts red; the crown yellow,
the cheeks and chin paler; the forehead blue; the under
half of the five middle wing-quills, and the inner webs at
the base of four tail-quills on each side, red. This variety
inhabits Guiana and Amazonia. 3. Brazillian A. parrot,
with cap blue, variegated with black; a yellow spot on
the crown, and one on each side below the eyes, and a blue
chin. This is the pf. Brasili cyanocophalus of Briffon,
the Ajuru-curau of Maregrave, Ray and Willughby,
and the blue-topped parrot of Latham. The primary wing
quills, according to Mr. Latham, are variegated with
yellow, red and violet blue. It inhabits Brazil. 4. Va-
ried A. parrot, with the crown, cheeks and chin yellow,
and the front blue. The crown is varied with blue, the
fem and upper part of the back with yellow, and the bill
is ash-coloured. This is the Ajuru-Curau succedens of
Maregrave and Ray, and the West-India green parrot of
Edwards and Latham. 5. Amazonian A. parrot, pale
green, with a pale yellow front and tawny temples. This
is the pf. amazoonicus of Gilchrist, and the Brasilian yellow
fronted parrot of Latham. It inhabits Brazil and Amazonia.
This variety is almost twice the size of those above-
mentioned. 6. Great A. parrot, green, with a blue fore-
head; the crown, checks and chin, and middle of the belly
yellow. It is nearly as large as the former, and inhabits
Brazil. 7. Yellow-necked A. parrot, green, with yellow
head and neck, and red shoulders; of the size of the
former, and like it, the wing-quills are marked with a red
spot, and the lateral tail-quills are red at the base. 8.
Counterfeit A. parrot, green, variegated with yellow, hav-
ing a blue forehead and red shoulders. It inhabits Brazil.

**AJURU-CATINGA**, the Guiana red billed parrot,
a variety of the *phittacus rubrifrons*, the *phittacus aquorum*
*Lupurium infide* of Briffon, the Guiana green parrot of Bau-
croft, and of Latham; has the bill, legs, feet and claws of
a whith red colour, and the orbits ash-coloured. It
inhabit South America; and is about the size of a thrush,
and the irides have two coloured circles, of which the outer
is reddish, and the inner ash-coloured.

**AJURU-PARA**, a Brasilian species of parrot of a
small size, all over of a beautiful green, and with white legs,
a white beak, and white skinny circles round its eyes.

**AJUS LOQUENS, or Locutius, i.e. a speaking voice,
in Mythology, the name of a Roman deity, to whom a tem-
ple was erected at Rome, on the following occasion.—M.
Cedratus, a plebeian, informed the tribunes, that, as he
was passing through the New Street in the night, he heard
a supernatural voice near the temple of Vesta, which warned
the Romans of the approach of the Gauls; but the warn-
ing was disregarded on account of the meannefs of the
perfon who reported it, in confequence of which, the Ro-
mans suffered very much from their invasion. Camillus,
however, delivered them, and advised them to expiate the
offence by erecting a temple in the New Street to this ima-
ginary deity. Cicero, de Divin. lib. i. § 45. Oper. tom. iii.
Drakenb.

**AJUTAGE, or Adjutage, formed of the verb, ajou-
ter, to adapt, in Hydrocles, part of the apparatus of an
artificial fountain, or *jet d'eau*; being a sort of tube, fitt-
ed to the mouth or aperture of the vessel, through which
the water is to be played, and by it determined into any
figure and direction.

It is chiefly the diversity in the ajutages, that makes the
different kinds of fountains.—And hence, by having several
ajutages to be supplied occasionally, one fountain comes
to have the effect of many.

Marriott inquires into the beft kind of ajutages, or *spouts*,
for *jets d'eau*, affirming, from experiment, that an even po-
lihed round hole, in the end of the pipe, gives a higher jet
than either a cylindrical, or a conical ajutage: of which,
however, the latter is the better. Vide Trait. du Mouem.

The quantity of water discharged by ajutages of equal
area, but of different figures, is the fame. But for thofe of
the fame figure, and different sizes, the quantity discharged is

3 R
directly proportional to the area of the aljutage, or to the square of its diameter, or of any side or other linear dimension; thus, an aljutage of a double diameter or side will discharge four times the quantity of water, of a triple diameter, nine times the quantity &c.; supposing that they are at an equal depth below the surface or head of water. But if the aljutages be at different depths, the celerity with which the water flows, and consequently the quantity issuing in any given time, is directly proportional to the square root of the altitude of the head, or the depth of the hole, so that at four times the depth, the celerity, and of course quantity, are double; at nine times, triple, &c. It has been found by experiment, that the jet is higher or lower according to the size of the aljutage; that a circular hole of an inch and a quarter in diameter jets highest; and that it is worse as it recedes from that size. Experience also shows, that the pipe leading to the aljutage should be much larger than the aljutage itself; and if the pipe be long, it should be wider according to its distance from the aljutage. Encyclopedic Physique, tom. i. p. 152. Hutton's Dict.

For the various sorts of aljutages, their structure, application, &c. see Fountain. See also Fluid and Jet d'Eau.

AIX, in Geography, a city of France, the capital of the department of the Bouches du Rhone, formerly Provence, and one of the most pleasant and belt-built cities in the kingdom. It is situated north of the river Arc, between hills planted with olives and vines. It is said to have been founded by C. Sextius Calvinus, a Roman confid, who established a Roman colony in it A.D. 630, about 124 years before Christ, and called it Aquae Sextiae from his own name, and the warm baths which he found there. It is rather populous than large; its houses are well built, and its streets are straight and well paved; and within the city there is a spacious walk called Orbitelle, which consists of three rows of trees interposed with fountains, and surrounded by many handsome and spacious buildings. The preacher's square, as it is called, is seated on the side of a hill, about 160 yards long, encompassed with trees and lofty houses built with stone. Of the public buildings some of the principal are the town-hall, the hall of audience, the hotel of the city, the cathedral church, which is a fine Gothic structure, the church of the fathers of the oratory, the chapel of the blue penitents, and the convent of the preachers, in whose church is a silver statue of the Virgin Mary, almost as big as life. There are also other churches and buildings which contain many paintings and other rarities. Adjoining to the baths, which were re-discovered in 1704, there are many edifices that have been raised at a great expense for the accommodation of those who use the waters. These waters were formerly supposed to possess peculiar virtues in cures of deformity; as several altars consecrated to Priapus, and bearing inscriptions expressive of gratitude for his assistance, have been dug up in their vicinity. Aix was an archbishopric with five suffragans, and 84 parishes; and it was the place of resort of the nobility of Provence and of Itinerant men. The neighbourhood affords excellent wines; but its chief article of trade is oil. Some flours are also manufactured here. It is distant five leagues north from Marseilles, and 163 south-east of Paris. N. lat. 43° 21' 35". E. long. 5° 26' 15".

AIX, a town of France, in the department of the Upper Vienne, in the district of Limoges; two leagues south-west of Limoges.

Aix, Aquae Gratianae, or Schanvax, Allobrogum, a small town of Savoy, situate near the lake of Bourget, between Chambery, Annecy and Rumilly, with the title of a Marquisate. The hot baths, which were originally constructed by the emperor Gratian, are free of access without expense, and are much frequented. In this place are seen the ruins of a Roman triumphal arch. N. lat. 45° 40'. E. long. 5° 48'.

AIX, a small island on the west coast of France, between the Isle of Oleron and the Continent; about 12 miles north-west of Rochefort, and as far south-south-west of Rochelle. Its fort was destroyed by the English in 1757, and again in 1761, but afterwards rebuilt. N. lat. 40° 5'. E. long. 1° 8'.

Aix en Othe, a town of France, in the department of the Aube, in the district of Eyvry; five leagues west of Troyes.

Aix d'Angoulême, a town of France, in the department of the Cher, in the district of Bourges; three leagues north-east of Bourges.

AIX-LA-CHAPELLE, a free Imperial city of Germany, in the circle of Wallphalia and duchy of Juliers, and the capital of the department of Koer. This is a very ancient city; and appears from the testimonies of Cæsar and Tacitus, to have been occupied and fortified by Roman colonies in their wars with the Germans. It was called in Latin Aquis-Graniun, or the waters of Granus, Aquæ, and Urbs Aquenia, in German, the city of Aachen or Aachen, and also Aach; and derived its name from its warm baths, which have been long held in high estimation. By the French it is denominated Aix-la-Chapelle, by way of distinction from other places called Aix, on account of a chapel of the Holy Virgin built by Charlemagne, which repaired and beautified the city, which had been destroyed by the Huns in the reign of Attila in 451, and who made it the place of his usual residence. The king of the Romans or emperor, was generally crowned in this city, as the place appointed by the golden bull for this purpose; and on this account called the Royal city; and it is the depository of the sword of Charlemagne, the belt, a book of the gospels, and other jewels of the empire, that are used in the ceremony of coronation. Charles V. was crowned here in 1520, and Ferdinand his brother was crowned king of the Romans in this place in 1531. Charlemagne died and was buried in this city, to which he had always manifested a peculiar attachment, and on which he conferred many signal privileges. On the Rhinenh bank, in the college of the cities of the empire, and among the Imperial cities which have a seat and voice at the Diet of the circle of Wallphalia, Aix-la-Chapelle poises the second place; and it lays claim to the first on the Rhinenh bank. The town is situated in a valley, and though surrounded with mountains and woods is not unfavorable. It consists in reality of two cities, enclosed one within the other. The inner city, which is the most ancient, is flanked with ten towers, and is about three quarters of a league in circumference; the outer, founded about the year 1772, has eight gates, and the circuit of it is about two leagues. There are several ravines which run through the city, and 20 public fountains, besides several private ones. The principal buildings, which are constructed of stone from quarries in the vicinity of the town, are the fladt-houte and the cathedral. The fladt-houte is adorned with the statues of all the emperors since Charlemagne; and in the front of it, there is a fountain, on the top of which is placed the statue of this emperor, made of brass gilt, holding in his right hand a sceptre, and in his left a globe. The upper story of this building consists of one room, 162 feet long and 60 broad, in which the newly elected emperor formerly entertained all the electors of the empire. The government of this city is entrusted with the great and little.
fate; the former composed of 129 persons, who judge in
criminal cases, and the latter of 41 members, who have ju-
ridication over the police and commerce of the city, and the
management of the public revenues. The duke of Brabant
is protector of the city; and the duke of Jutère is borough-
master or perpetual mayor of the burgesses. The title of its
magistracy is that of burgomaster, sheriff, and council of the
holy Roman Imperial free city of Aix-la-Chapelle. The
prevailing religion is the Roman Catholic; and the Protestant
inhabitants, both Lutherans and Calvinists, not allowed the
free exercise of their religion within the city, celebrate their
worship at Vaels, about an hour's journey from the city in the
duchy of Limburg. The manufactures of the city are
those of cloth, copper and brass. Councils have been held
in this city in the eighth and ninth centuries, and treaties
of peace have been concluded here; particularly those between
France and Spain in 1665, and between France and England,

It was taken by the French in 1792, lost after a severe
battle in 1793, and retaken in 1794. It is 21 miles from
Spa, 30 well from Cologn, and 36 north-east from Liege.
N. lat. 51° 55'. E. long. 5° 54'.

Aix-la-Chapelle, says Mr. G. Forster, in his Travels 1792,
which once contained above 100,000 inhabitants, has not
now a third part of this number, and has lost all its ancient
wealth and prosperity; owing partly to the rise of rival
towns, but principally to religious intolerance and a bad
government. The streets now swarm with beggars, and the
morals of the people are licentious and corrupt. Those
whose skill and industry might have enriched the city are
driven from it by the partial and oppressive conduct of the
guilds, and have established their manufactories in other
places, where they enjoy greater liberty. Thence, he adds,
of Burghheid, Vael, Eupen, Monjoia, and of other places
in the duchy of Limburg, are in a very flourishing state;
the wool is imported from Spain, and the cloth is exported
chiefly to the Levant. Vael, which 30 years ago, was an
inconsiderable village, is now become a respectable town;
the protestants, weary of the oppression and bigotry which
they had experienced at Aix-la-Chapelle, were easily induced
to settle in a place where they were allowed the advantages
of religious freedom; and it has now five different churches,
in which Roman Catholics, Lutherans, Calvinists, Baptists,
and Jews, worship the Deity according to their several fen-
timents, and live peaceably with each other.

AIX-LA-CHAPELLE, or AIX Waters. Therme Aqui-
gramenfer.

The thermal sulphureous waters of Aix-la-Chapelle
have long held a most distinguished place among the min-
eral springs of Europe, and have not a little contributed
to the celebrity and opulence of this ancient city.

These mineral waters rose to very high reputation in the
time of Charlemagne, who made Aix his Imperial residence;
and he appears to have much delighted in the use of its
baths, which he rebuilt and improved.

The hot sulphureous water rises in great abundance from
several copious springs in different parts of the town; and
is more than amply sufficient to supply the numerous baths
and refectories in which it is collected. The principal spring
is enclosed in a square stone cistern, the upper part of
which is vaulted and contracted in its dimensions; and
over the top a large stone is fitted in, and closely cemented,
to prevent the escape of the sulphureous vapours, on which
depends so much of the efficacy of the water. A re-
markable circumstance takes place in this cistern, which is,
the actual sublimation of a quantity of pure sulphur, which
is carried up from the water along with the sulphureous
gas, and is deposited beneath the upper stone, to which it
adheres in the form of a fine powder. This is taken out
from time to time, and sold under the name of Aix ful-
phur.

The baths of this city are numerous, and very commo-
dious for the purpose of warm and vapour bathing. The
natural heat of the water is sufficient for both these pur-
poses; and for the latter, openings are made in the brick
chambers that convey the water to the baths, through
which the vapour ascends. These vapour baths are so con-
structed that the whole, or any part of the body may be
exposed to its action; and likewise many of the baths are
furnished with pumps, from which the hot water may be
dished on any part of the patient. This operation is
known by the technical name of the douche.

Aken water posesses very striking sensible properties,
particularly to the feeling and the smell. The water rises
with great rapidity through the springs; and at the same
time sends forth very copious air-bubbles, which break
on the surface with a slight explosion. It is at first per-
fectly clear and colourless, and emits a large volume of
steam, mixed with sulphurated hydrogen gas of great vol-
atility and pungency. The odour of this vapour, (which
resembles that of Harrowgate water,) is so powerful as to
be perceived by strangers at a considerable distance from
the spring head. The inhabitants, from long custom,
seem to regard it.

The temperature of Aix water is various, according to
the distance from the spring at which the observation is
made. The highest is about 143° of Fahrenheit; and at
the pump, where it is drawn for drinking, it is about 112.
The heat is therefore so great, that the water requires to
stand for 15 or 18 hours before it can be used as a bath.

This water, though perfectly clear when first drawn
from the spring, becomes turbid and somewhat milky as
it cools, and deposits a calcareous sediment, at the same time
it loses its sulphureous smell. To the touch, the water is
soft and somewhat fuscous and white, owing doubtless to
the small quantity of soda which it contains. It will even, in
some degree, lather by agitation; and is used for fulling
and cleansing wool and linen, to which also, the heat
much contributes.

The chemical analysis of this water is curious and in-
teresting. The most striking feature is its gaseous contents,
which are a small quantity of carbonic acid, but especi-
ally much sulphurated hydrogen gas; not merely in the flate
in which it is found, in the cold sulphurated waters of Great
Britain, but highly super-saturated with sulphur, which
is sublimed in a solid form, as we have just mentioned. The
whole of the sulphur contained in the water is volatilized
by evaporation, for no traces of this inflammable substance
are to be detected in the refiduum of any quantity of the
water boiled down to dryness.

The solid contents of this water are few. The most
important of these is a quantity of uncombined soda, suf-
ficient to give the water the properties of a very dilute
alkaline solution; and which probably afflicts in the union of
so large a portion of sulphurated hydrogen, and causes it
to adhere to the water with some more force than it
would do if no alkali were present. Hence it is, that
even after the water has stood for many hours in the baths
to cool, it still retains enough of the sulphureous vapour to
give it all the requisite medical virtues. The other solid
contents are, a small quantity of common salt and car-
bonated lime, which last is deposited as the water cools,
and the carbonic acid escapes.
No traces of metal of any kind are discoverable in this water. The solid content of Aix water are variously estimated as to quantity. From Bergman's analysis, we may reckon the following to approximate pretty accurately to the truth: A wins pint (English weight and measure) contains

- Of carbonated lime, four grains and three quarters.
- Of common salt, five grains.
- Of carbonated soda, twelve grains.

The proportion of the gaseous contents has not been accurately determined with accuracy.

The above analysis will explain the appearances which take place with the common regents.

Solutions of lead and tannin, added to the hot fresh water, produce a black precipitate, composed of the sulfuretted metal, but mixed with the mineral; for, when the sulphations are added to the boiled water, the precipitate is white.

A piece of polished lead, suspended in the vapour of the water, is soon blackened, and in a few days corroded throughout.

Symp of violets changes to a green, even after the carbonate of lime has precipitated by cooling, indicating thereby the presence of an alkali in excess.

The effects of this water, as a medicine, are very striking and well established. Its immediate operation, when drank in a moderate quantity, is to raise the spirits, and in some persons to produce a degree of vertigo. This is the greater,\textit{e.g.} phorética pulvis, the hotter the water is. It afterwards proves diuretic, encreases perspiration, and keeps the skin in a soft, moist state, highly favourable to the removal of many disorders.

The waters are referred to for a great variety of complaints, particularly in the complicated disorders of the digestive and biliary organs, which follow a long habit of free living. They are also highly serviceable in diseases of the kidneys and bladder.

Aken waters, like all the most celebrated thermal springs, were long in high repute as baths, before physicians ventured to prescribe them internally. The vaat profusion of water which is thrown up, the high temperature which it possesses, its strong impregnation with sulphur in a very active form, and its alkaline ingredient, give it most valuable properties for external uses. It is employed to stimulate cold paralytic limbs; and to soften the rigidity of the joints and ligaments left by gout and rheumatism. It is also of great service in cutaneous complaints, to the cure of which, the sulphur and the alkali probably highly contribute. A long continued course of this, (as of every other) sulphurous water, cauases the whole body to acquire a smell of sulphur, and tarnishes silver kept in the pockets.

These waters have been imitated artificially by palling sulfuretted hydrogen gas through a hot and very weak alkaline water, but the imitation is attended with much difficulty.

AIXO, or AIXOS, flats or shallows within the second fort, at the entrance into Carthagea harbor, on the Spanish main, South America, which stretch out nearly south-south-west, towards the main land within the islands that lie before the harbour.

AIZENA, a town of France, in the department of Vendee, in the district of La Roche fur Yonne; ten leagues south of Nantes.

AIZOON, An \textit{Azo,} sempervivum, or ever-living, in Bohemia, a genus of the \textit{Isodium paestinum} clafs and order, of the natural order of \textit{fuculate}, and of the \textit{fucides} of Jussieu.

In Gimelius's Linnaeus, it is a genus of the \textit{polyandria pentagranum} clafs and order. Its characters are, that the calyx is a one-leaved perianthium, divided into five lanceolate, permanent segments; no corolla: the flama have very many capillary filaments, inserted by bunches into the fissures of the calyx, the anthers simple; the pistil lininum has a germ five-celled, superior, the styles five and simple: the Rigman's form, the perianth is a five-celled, five-valved, felling and reticule capsule; the seeds are several, roundish or kidney-shaped. There are ten species, \textit{e.g.} 1. \textit{A. cataria}, purplish-leaved \textit{A.} with leaves wedge-ovate, flowers fesile; the \textit{fucides} of Nilollus, and \textit{balle} of Plaknet: a native of the Canary islands; annual; cultivated in 1731. 2. \textit{A. lepidum}, Spanish \textit{A.} with leaves lanceolate; flowers fesile; the \textit{fucides} of Dillenius; an annual plant, growing naturally in Spain and Africa; a variety of this was brought from the Cape, and cultivated in 1728. 3. \textit{A. lanceolatum}, panieled \textit{A.} with leaves lanceolate, flowers panieled; biennial; growing naturally at the Cape of Good Hope; cultivated in 1750. 4. \textit{A. fomentosum}, with leaves linear-lancifolium, panieled dichotomous, flowers solitary, peduncled; brought from the Cape by Sparman. 5. \textit{A. paniculatum}, shaggy, leaves lanceolate, flowers fesile, branches erect. 6. \textit{A. perfoliatum}, downy, leaves inverely-ovate, conjoined, crystaline-dotted-flowers, peduncled. 7. \textit{A. gilvula}, hairy \textit{A.} shaggy, herbaceous, procumbent, leaves ovate, flowers fesile, ditrifol. 8. \textit{A. secundum}, shag-hoary, herbaceous, procumbent, leaves ovate, flowers fesile, imbricate, one-ranked. 9. \textit{A. strigosum}, shrubby \textit{A.} shrubby, erect, smooth, leaves lanceolate, flowers fesile. 10. \textit{A. rigidum}, stiff \textit{A.} shrubby, procumbent, downy, leaves ovate, flowers fesile, remote. The fix last species were brought from the Cape by Thanburg. The three first species may be raised on moderate hot-beds, in the spring; and the other species must be managed like other Cape plants.

AIZOON. See Sedum.

AIZU, in Geography, a town of Japan, and capital of a small country of the same name.

AKABA, a gulf or arm of the Red-Sea, formed by a tongue of land, which is part of Arabia, that separates this gulf from that of Suez; about 30 leagues long and 3 wide.

AKABAR, or CALAEL EKABA, a town of Arabia, on the gulf to which it gives name; 57 leagues south of Jerusalem, and 53 leagues east of Suez.

AKACHAN, a river of Siberia, which joins the Judoma. N. lat. 60° 8'. E. long. 139° 22'.

AKALCALAKI, a town of Georgia, in Asiatic Turkey, about 70 miles south-west of Teflis, and 88 miles north-west of Erivan.

AKALZIKA, or Acalziek, a town of Asiatic Turkey, in the province of Satabago, a country of Georgia. See Acalziek.

AKAM, or ACAM, a country of Africa, on the coast of Guinea, near the source of the Volta.

AKANIMA, a town or village of Africa, on the Ivory coast, near Cape Apolloia. It stands on rising ground, and commands an extensive sea and land prospect.

AKANNI. See Achem.

AKANSA, a town of North America, in South Carolina, situate on the river Milllpippi, near a river of the same name. N. lat. 36°. W. long. 89° 40'.

AKAGT, a town of Hindostan, in the district of Berar. N. lat. 24° 13'. E. long. 77° 39'.

AKARA, in Botany, a species of Calophyllym.

AKASAKI, in Geography, a small town of Tenylvania, between the river Carulna and a branch of that river, not far from Zainar.
AKASAKI, a town of Japan, in the province of Mikawa.
AKAST, a town of Japan, in the province of Fumia.
AKASSED-ASELM, a town of Egypt, marking the boundary of Aka and Africa.
AKAST, a town of Arabia, 25 leagues east of Jerusalem.

AKBAR, or Akker, Sultan, in Biography and History, the sixth of the descendants of Timur Bek or Tamerlane, who reigned in Hindostan under the appellation of Moguls, was born in 1542, and succeeded his father Hemşan in 1556. He was proclaimed emperor at Calaror, in the province of Lahore, and assumed the title of 

Having overcome the Patans and taken possession of Delhi, he was inaugurated in this city, and assumed the government which had been at first administered by his tutor, Boryram Khan. He then made himself master of the strong fortresses of Chitor, after a severe engagement with a rebel chief, and quelled other insurrections; and having obtained an interval of tranquillity, he made a pilgrimage, barefoot, to Azmir, at the distance of 200 miles, for the purpose of visiting the tomb of Haji Mondi, and of obtaining children by the intercession of this saint. During his abode at Fettipur on his return, he was informed of a rebellion at Guzerat, which hastened his march to this province; and having subdued the rebels, reduced the castle of Surat, and secured the province by fortifying Ahmed-abad, he returned to Hindostan. In this year he finished the castle of Agra at an expense of two millions 300 thousand rupees, laid out 1½ million on the walls and palace of Fettipur, and began to erect the stupendous sepulchres of his family at Schander, five miles from Agra. At this time he directed his views to the conquest of Bengal, and having, after a long siege, taken possession of Patan, he became master of the whole country. His next acquisitions were Kabul, Kandahar, Kaimir and Sind. Having united these countries to his empire, he employed a powerful army in the invasion of Dekan, which, notwithstanding vigorous resistance on the part of the queen of this country, subdued several provinces and annexed them to the Mogul empire. Whilst Akbar was engaged in the prosecution of the Dekan war, his prosperity was interrupted by a concurrence of domestic misfortunes. He was deprived of two of his sons, viz. Sultan Morad, in 1598, and Sultan Daulat, in 1604, by intestine quarrels; and his son Selim took the advantage of his absence, for seizing his treasures and marching a numerous army towards Agra, in order to take possession of his father's throne. Akbar, as soon as he received intelligence of his son's rebellion, hastened back to Agra, and having made ineffectual overtures of accommodation, in enforcing which his Vizir Aul Fazl lost his life, he resolved to turn his arms against Selim. But as he had lost his other sons, he once more attempted to persuade his son into submission. With this view he employed the tutor of Selim to convey letters to him, in which he reproached him for his rebellion; but at the same time declared, that, as he was his only son and heir, he was ready to receive him to favour. The father's letters and the tutor's arguments produced no effect; Selim returned to Agra and submitted. Akbar at first treated him with authority, but at length pardoned him, though he still retained fulgurances of his son's trickery. The emperor did not long survive this reconciliation. Being incensed against a Mirza, who governed one of his provinces, he resolved to remove him by poison; and for this purpose he ordered two pills of opium, in one of which there was poison. Having held these in his hand for some time, he gave one to the Mirza, and by mistake took the poisoned one himself. The consequence, notwithstanding the use of remedies as soon as the mistake was discovered, was fatal. When Selim paid his dying father a visit, he put his own turban on the prince's head, and gave him with his father Hemiau's sword; but on the 12th day after he had taken the poison, Akbar died, A.D. 1605, at the age of 63 years, and was buried in the family sepulchre near Agra.

Akbar was distinguished by his conquests, and by his success in reducing almost the whole of India to obedience. He was also one of the few sovereigns intitled to the appellation both of Great and Good, and the only one of the Mohammedan race, whose mind was so far divested of the liberal prejudices of the fossilical religion in which he was educated, as to be capable of forming a plan worthy of a monarch who loved his people, and was solicitous to render them happy. Although he was not attached by profession to any form of religion himself, he was not a persecuter of any. In 1582 he wrote a letter to the king of Portugal, preferred by Farter, and containing an avowal of sentiments liberal and enlightened; in which he declared that a translation of the Chrlilian scriptures into Arabic or Persian might be sent him, and at the same time a learned person to explain the Chrlilian religion. One Ceronimo Xavier was dispatched, and with this view learned the Persian language; but the gospels, which were translated into this language, and presented to the Mogul in 1602, were so intermingled with popish legends, that they were not likely to be very intelligible or to produce any very good effect. As in every province of his extensive dominions, the Hindoos formed the great body of his subjects, Akbar endeavoured to acquire a perfect knowledge of their religion, their sciences, their laws, and their institutions; in order that he might conduct every part of his government, particularly the administration of justice, in a manner as much accommodated as possible to their own ideas. In these generous views he was seconded by Abul Fazl, a minister whose understanding was not less enlightened than that of his master. By their affable researches, and consultations of learned men, such information was obtained as enabled this Vizir to publish a brief compendium of Hindoo jurisprudence in the Aycen Akberry, which may be considered as the first genuine communication of its principles to persons of a different religion. In what estimation the mild government of Akbar was held by the Hindoos we may learn from a beautiful letter of Jefwaint Sing, Rajah of Jondpore, to Aurengzebe, his fanatical and persecuting successor. "Your royal ancestor, Akbar, whole throne is now in heaven, conducted the affairs of this empire in equity and firm security for the space of 52 years, preserving every tribe of men in ease and happiness. Whether they were followers of Jesus, or of Moses, of David, or of Mahomed; were they Brahmins, were they of the sect of Dharma, which denies the eternity of matter, or of that which affords the existence of the world to chance, they all equally enjoyed his countenance and favour; insomuch that his people, in gratitude for the indierminate protection which he afforded them, distinguished him by the appellation of Jugger Greco, guardian of mankind. - If your Majesty places any faith in these books, by distillation called divine, you will there be instructed, that God is the God of all mankind, not the God of Mahomedans alone. The Pagan and the Mussulman are equally in his presence. Distillations of colours are of his ordination. It is He who gives existence. In your temples, to his name the voice is raised in prayer; in a house of images, where the bell is shaken, fill He is the object of adoration. To vify the religion and customs of other men, is to set at naught the pleasure of the Almighty. When we deface a picture, we naturally incur the resentment of the painter; and justly has the poet said,
A肯

In Dr. Akenfide's poems, and the notes annexed to them, we may discover his extensive acquaintance with ancient literature, and his ardent attachment to the cause of civil and religious liberty. His politics were thought to incline to republicanism, but no evidence to this purpose is deductible from his poems; and his theology is supposed to have verged towards deism: and yet, in his ode to HAdding, and to the author of the Memoirs of the House of Brandenburg, he has testified his regard for pure Chirillanity, and his dislike of attempts for setting men free from the restraints of religion. Our readers may be gratified with the following extract from the first of these odes.

"To him the teacher bids'd,
Who sent religion from the palmy field
By Jordan, like the morn to cheer—the wells,
And lifted up the veil which heav'n from earth conceal'd,
To Hadding thus his mandate he address'd:
Go, then, and rescue my dishonoured law
From hands impious, and from tongues impure:
Let not my peaceful name be made a lure,
Fell perdition's mortal snares to aid:
Let not my words be impious chains, to draw
The free-born soul in more than brutal awe,
To faith without assent, allegiance unrepaid."

Dr. Akenfide's rank among the English poets is assigned to him in consequence of his "Pleasures of the Imagination," founded on Addison's well-known papers on the same subject, in the Spectator: "the most beautiful didactic poem," says Mr. Cooper, in his letters concerning it; "that ever adorned the English language;" and though abstracted in its nature, so popular, that when it first appeared, it passed through several editions, and "is still read," says an excellent judge (Dr. Aikin), "with enthusiasm by those who have acquired a relish for the lofty conceptions of pure poetry, and the strains of numerous blank verse." The merit of this poem, and of the writer,
The beauty of the text is greatly appreciated by Mrs. Barbauld in an Essay prefixed to an ornamented edition of this poem, published in 1795, that we shall gratify our readers by furnishing a part of the summmary with which it concludes. "If the genius of Akenfield is to be esteemed from this poem, it will be seen to be lofty and elegant, chaste, correct, and classical; not marked with strong traits of originality, not ardent nor exuberant. His enthusiasm was rather of that kind which is kindled by reading and imbibing the spirit of authors, than by contemplating at first hand the works of nature. As a verifier, Akenfield is allowed to stand amongst those who have given the most finished models of blank verse. His periods are long but harmonious; the cadences fall with grace, and the measure is supported with uniform dignity. His muse possest the "inn crede", and "high commanding guilt." We shall scarcely find a low or trivial expression introduced; a careless and unfitted line permitted to stand. His flatfines, however, is somewhat allied to lieffnifs. His verse is sometimes feeble through too much a redundancy of ornament, and sometimes laboured into a degree of obscurity from too anxious a desire of avoiding natural and simple expressions." Biog. Brit. Gen. Biog.

AKERKUF, in Geography, a mountain of Asiatic Turkey, east of the Euphrates, in the government of Bagdad. Tavernier placed it between the Euphrates and the Tigris, supposing that the ruins found here are those of the tower of Babel.

AKERMAN, or BIELGORD, in Geography, a town of Besarabia, on the coast of the Black Sea, at the mouth of the Dneifter, 22 miles south-east of Bender. E. long. 31° 14'. N. lat. 46° 8'.

AKERSLOOT, William, in Biography, a painter and engraver, who lived at Haarlem, and flourished in 1624.

AKERSUND, in Geography, a bay on the coast of Norway, ten leagues west-north-west of Frederikshald.

AKHISAR, q. d. white-castle, a name given by the Turks to the ancient THYATIRA, on account of the white marble that abounds there. It is a town of Natalia, in Asiatic Turkey, 14 leagues south-east of Bergamo; situated in a fertile plain on the river Hermus, abounding with grain and cotton, and carrying on a commerce of opium and Turkey carpets. N. lat. 38° 50'. E. long. 28° 30'.

AKI, a province of Japan, in the western part of the island of Niphon; with a town of the same name.

AKIBA, in Biography, a famous Jewish Rabbi, lived in the first century of the Christian era, soon after the destruction of Jerusalem, and devoted himself to the study of the Cabalistic philosophy. In the earlier period of his life, and till he was 40 years of age, he was a shepherd in the service of a rich citizen of Jerusalem; but his master's daughter having promised to marry him, if he became a learned man, he industriously applied to study. So successful was his application, that he became one of the most eminent teachers in the schools of Jewish learning, first at Lydda, and afterwards at Jaffa; and if the Jewish accounts may be credited, he had 24,000 disciples. The Jews of Palestine esteemed him so highly, that they scrupled not to say, that God revealed to him what he had concealed from Moses. The book intitled Jetirah, which has been ascribed to Abraham, is said to have been written by him, and, though it abounds with trifles and absurdities, it was quoted by the Jews at this period, as of divine authority. Towards the close of his life, Akiba joined the standard of the impotlor Barchocheba, who appeared under the chararacter of the Messiah, to deliver his countrymen from the power of the emperor Adrian. When this impositor was taken prisoner, and his followers put to the sword, Akiba and his son Pappus were slain alive. This happened, according to the Jewish chronologists, in the year 120; but, according to Balnage (lib. vii. c. 12.), in 138. Akiba was honoured by the Jews, after his death, as an eminent doctot of their law; and his tomb, supphed to be at Tiberias, was visited with great solemnity. He is said to have altered the Hebrew text of the Bible, with respect to the age of the patriarchs, when they began to have children, which is greater according to the Septuagint than in the Hebrew text; and he did this, it is said, to put off the period of the Messiah's advent, which, according to the tradition of the Jews, was not to take place till the completion of 6000 years. It has been argued, that the translation of Aquila, which was published in the 12th year of Adrian, agrees with the Hebrew text of this time, and that this Aquila having gone over from the profession of Christianity to that of the Jewish religion, and enlisted among the disciples of Akiba, persuaded his master to make this alteration. Per son Antiq. e. 16. This charge, however, is feebly supported, and the difference between the two texts is a difficulty that remains still to be satisfactorily solved. Gen. Dict. Brucker's Philos. by Enfield, vol. ii. p. 200.

AKIM, in Geography, a town of Africa, on the Gold Coast.

AKIUREEK, a town of Asiatic Turkey, in Natalia, eight leagues south-west of Kafframon.

AKKER, a city of Syria, situate upon mount Barraglus, about nine leagues to the south-east of Tartus; also a river that runs by it. This, says Dr. Shaw, (Trav. p. 269.) must have been formerly as noted for its strength, extent, and beauty, as it is now for the goodness of the apricots, peaches, nectarines, and other fruit, which it produces; and he suggets, that it is the Kir, i.e. the city, mentioned in Scripture. Amos. iv. 7.

AKKIA, an island near the west coast of Eall Green- land. N. lat. 60° 30'. W. long. 46°.

AKKIAH, a town of Romania, in European Turkey, eight miles south of Burgas.

AKOND, an officer of justice in Perfa, who takes cognizance of the-causes of orphans and widows; of contracts, and other civil concerns. He is the head of the school of law, and gives lectures to all the infern officers; he has his deputies in all the courts of the kingdom, who, with the second sudra, make all contracts.

AKOUSCHY, in Zoology, the Cavia Auemby, the olive cavy of Perina, has a short tail, with the upper parts of the body of an olive colour, and the under part whitish. Some have reckoned this animal a variety of the Agouti; but it differs from it in having a tail, which the other wants, or rather a longer tail than that of the other; in being smaller; and in having its hair of an olive, and not a red, colour; which are differences, says Buffon, sufficient to constitute two distinct species. It is about the fize of a half-grown rabbit, isWall tame, is hunted with dogs, and reckoned the finest game in South America. Its flesh is white and delicate, and much esteemed by the inhabitants of Guiana, Cayenne, and Brazil, where this animal is found. It inhabits the woods, and lives on fruits; has such a dread of water, that it will submit to be feized by the dogs rather than go into it; and it will sometimes, though rarely, cry like the reifles cavy. Buffon Smellie, vol. v. p. 61. vol. viii. p. 270.

AKQEDAN, in Geography, a town of Africa, with a Dutch factory, on the Gold Coast.

AKRIDA, a town of Macedonia, in European Turkey, situate on the Driho, 134 leagues west of Constantinople, and 45 leagues south-east of Ragula. N. lat. 41° 46'. E. long. 20° 30'.

AKR
AKSA, a river of Georgia in Asia, that runs into the Caspian Sea, near Zirnak or Terek.

AKSIHINSKA, a town and fortress of Ruffia, 16 leagues south of Daronlun.

AKSERAWA, a town of Natolia, in Asiatic Turkey, 20 leagues east-north-east of Konieh, or Cogni. N. lat. 38° 26'. E. long. 31° 14'.

AKSEBAH, a town of Natolia, nine leagues south-west of Lepri.

AKSEHH, a town of Natolia, 23 leagues west of Konieh. N. lat. 38° 26'. E. long. 31° 14'.

AKSU, a province of Little Bubaria, to the north of Kafhgar, and west of the province of Turfan, about 350 miles long, and 70 in breadth. Its chief town, of the same name, lies on the north side of a small river, which runs south-east, and loses itself in the sands. N. lat. 42° 50'. E. long. 83° 21'.

AKULA, an ancient city of Asia, situate on the calbern bank of the Tigris.

AKUN, ARKNO, and AKUTAN. See FOX ISLANDS.

AKURA, a town of Asiatic Turkey, in the government of TARKUCC, or Tripoli of Syria, seven or eight leagues from mount Libanus. It has a Maronite bishop.

AL, an Arabic particle, prefixed to words, to exalt, or give them a more emphatical signification.—As, in ALKORAN, AGEBA, &c.

AL, or ALD, in our Ancient Writers, signifies as much as old, ancient.—This being prefixed to the names of places, expresses their antiquity; as ALBOURNE, ALใคร, &c.

AL, a Latine term, literally signifying wing, used, in Anatomy, for several parts of the body, which bear some resemblance to the figure of a wing.

Thus, the lobes of the liver are sometimes called ala.

The soft fpongy bodies in the *Asclepium nobile, usually called the symphe, are denominated ala.

The two cartilages of the nose, which form the nostrils, are called ala.

And the same denomination is given to the tip of the auricle; and to the whole cartilaginous part of the ear, by way of distinction, from the tip and pendent part below, called the lobe. It is also applied to the procus of the os sphenoides.

The term ala is sometimes applied to the arm-pits, otherwise called axilla. Thesf parts abound with glands, and are great receptacles of humour; whence a rank smell sometimes exhalts, called *feter alarinm.

ALA, in Botany, a name given by the Latin writers of Medicin, in the later ages, to the *telenium, or elecampane.

ALA is also used in Botany, for the angle which the leaves, or the stalks, or pedicles of the leaves, form with the stem, or branches of the plant from which they arise. This angle is usually acute, and always is directed upwards.

ALA is sometimes also applied to the angle formed by the branches themselves with the stem, which is also observed to be very regular and uniform.

ALA has several other different significations. It moist frequently is used to express the hollow of the stalk of a plant, which either the leaf or the pedicle of the leaf, makes it; or it is that hollow turning, or *florus, placed between the stalk, or branch of a plant, and its leaf, from whence a new offspring is wont to put forth. Sometimes it is taken also for a little branch, as when we say, a *stock, or *item of a plant, is armed with many ala; because these small branches stand out from it, in form of so many wings.

ALA is also used to signify those petals, or leaves of the papilionaceous flowers, placed between those others which are called the *vexillum and the carina, which make the top and bottom of the flower. Influences of flowers of this structure are seen in the flowers of peas and beans, in which the top leaf or petal, is the vexillum, the bottom the carina, and the side ones the ala.

ALA is also used for those extremely slender and membranous parts of some seeds, which appear as wings placed on them, as in the plumage, the fruit of the trumpet-flower, the fruit of the maple, and the like, which are called by botanists *alate seeds.

ALA is finally used also for those membranous expansions, which run all the way along the items of some plants, and are therefore called *alate filaments.

ALA, in the Military Art, the two wings or extremities of an army ranged in form of battle.

An ala of horse, amongst the Romans, consisted of 300 horsemen, and was divided into turme and decuriae; each turma consisting of 30 men, and each decuria of ten; so that there were in every ala ten turme, and in every turma three decuriae.

ALA, in Geography, a town of Japan, in the province of SAKUHIN.

ALA, or AL, a town of Arabia, 21 leagues north-east of HAGIAZ.

ALA-MILLAIENIS, in Ancient Geography, an episcopal city of Africa, in the Mauritania Cæsariensis.

ALA-NOA, a town of Pannonia, according to Antonine.

ALABA, a small island in the Indian ocean, near Taprobana, according to Ptolemy.

ALABAC, of ALABAC, in Geography, a small district or province of Spain, extending along the river Ebro, from the mountains of Bilbao to the frontiers of Navarre, and comprehending about seven or eight leagues in length, and six or seven leagues in breadth. The soil is fruitful in rye, barley, vines, and several sorts of fruits; and the iron mines of the country furnish materials for the manufacture of arms and other utensils, which furnish articles of commerce. The chief town is Vitoria.

ALABA, a large kingdom of Africa, forming a part of Monemugi, is situate to the east of Cambate, and extends to the coast of Zanguebar. It is inhabited by a cruel people, called Gallas.

ALABAGIUM, in Ancient Geography, a promontory of Asia, in Carmania, upon the borders of the Ichthyophagi, according to Ptolemy.

ALABAH, in Geography, a considerable river of America, in East Florida.

ALABAMA, an Indian village, delightfully situate on the banks of the Mississipp, the inhabitants are the remains of the ancient Alabama nation, which inhabited the east arm of the great Mobile river, that still bears their name, now possessed by the Creeks, or Mufengulges, by whom they were conquered.

ALABAMA is also the name of a river in America, which is formed by the junction of the Coofee or High-town river, and Tallapooshee river, at Little Tallacee, and runs in a south-west direction, until it meets Tombigbee river from the north-west at the great island which it there forms, 90 miles from the mouth of Mobile bay, in the gulf of Mexico. This beautiful river has a gentle current, pure waters, and excellent fish; and its banks abound with valuable productions in the vegetable and mineral kingdoms. Travellers have travailed this river in boats, in the month of May, in nine days from Little Tallacee to Mobile bay, a distance of about 330 miles.

ALABANA, a town of Arabia Felix, placed by Ptolemy in long. 74° 30' and lat. 20° 15'.
ALAANADA, a town of Caria, in Asia Minor, south of the river Meander. It was founded by Albauneus, who on this account was worshipped by its inhabitants, called Alabandi, Alabandii, and Alabandenses. In the time of Pliny it was a free city, whence it was proverbially denominated the most fortunate city of the Carians. Strabo (vol. xii. p. 976.) represents the Alabandenses as luxurious and glutinous, and devoted to pleasure. Some writers have given the name Alabanda to Antiochia.

ALABARCHA, in Antiquity, a kind of magistracy among the Jews of Alexandria, whom the emperors allowed them to elect, to have the superintendence of their policy, and to decide differences and disputes which arose among them.

ALABARDA, the name of a spear anciently used by the Helvetians and Germans.

ALABASTER, William, in Biography, an English divine, was born at Hadleigh, in Suffolk, in the 16th century, educated in Trinity college, Cambridge; and accompanied the Earl of Essex, as his chaplain, in his expedition to Cadiz, in the reign of Queen Elizabeth. Tickle in his temper, unstable in his principles, and dissatisfied with his situation, and at the same time seduced by the pomp of the Romanish worship and the respect paid to his priests, he became a convert to the church of Rome. But in his new connection he was disappointed; and upon his return to England, he refused the Protestant profession, and obtained preferments in the English church; being appointed to a living in Hertfordshire, and a prebend of St. Paul's. He was well acquainted with the Hebrew language; but so much attached to the unintelligible mysteries of the Jewish cabala, that his knowledge of the original language of the Old Testament was of little service to him in the interpretation of scripture. Of his talents as a Biblical commentator, we may form some judgment by the sermon which he preached on taking his degree of doctor in divinity at Cambridge. His text was 1 Chron. i. 1. Adam, Seth, Enos; and having just touched upon the literal sense, he enlarged upon its mystical meaning; explaining Adam by misfortune and misery, and so of the rest. He wrote a Lexicon Pentaglotton, which was printed in folio, in 1637; and other works of a mystical kind, viz. "Apparatus in Revelationem Jehvi Chirilli," printed at Antwerp, in 1607; "Spincolum Tubarum, seu fossa Spiritualium ex equin. vocis Pentateucis significationibus," and "Ecc. Sponsus, seu Tuba pulchritudinis, hoc est, demonstratio quo non fit illeicitum, nec impossibile, computare durationem Mundi et tempus secundus adventus Chirilli," all printed in London. He was also the author of a Latin tragedy intitled Romanza, which, at its exhibition in a college at Cambridge, produced a singular accident. When the last words, sequar sequar, were pronounced, the voice and manner of the actor so terrified a lady who was present, that she irrecoverably lost her senses. Alabaster died in the year 1642.

Gen. Dic.

ALABASTER, alabstir, Fr. alabastristes of Pliny, in Mineralogy. Some derive the word from alabas, because of the whitenece of this stone. Others from albus, which they form from the priv. al, and ab, to take; this stone being too smooth and slippery for the hand to fasten hold of it. Under this name are confounded two minerals, wholly distinct from each other when pure, but which, in some of the varieties, are occasionally mixed together.

The compact gypsum of Kirwan (Alabaster, La Metb. alabâtre gypseux de Lille, Dichter Gypsein, Kirven) when of a white or yellowish, or greenish colour, semi-transparent, and capable of receiving a polish, is known among flatters by the name of alabaster, which term is also retained as a secondary appellation in most books of mineralogy; and it certainly the alabasterites of Pliny, which is characterized by that author as a stone resembling gypsein. When its colours are diposed in bands or clouds, it is called, in the first cafe, onyx alabaster, and in the latter, agate alabaster. It not infrequently contains a sufficient portion of carbonated lime to produce a brisk effervescence with nitrous acid; and hence has originated the confusion of authors, who make the circumstance of effervescence an essential distinctive character between the gypsein and calcareous alabaster. Its specific gravity seldom exceeds 1.9. Its fracture is compact—splintery, sometimes verging on the fine-grained foliated. In transparency, it is considerably superior to white wax, allowing light to pass readily through it, but not transmitting the forms of objects.

By light calcination it is converted into Paris plaster.

Gypseous alabaster is very easily worked, but is not susceptible of a polish equal to marble. It is made into vases, columns, tables, and other ornamental articles of furniture: thin slabs of it have been used in one of the churches of Florence instead of window glass. Its brittleness however, and want of lustre, have caused it to be almost wholly superceded by more durable materials. Among the ancients, the most esteemed came from Campania, Upper Egypt, and Syria: of the variety called onyx, the boxes for holding perfumes were mostly fabricated; thus, in Horace, we meet with "Nardi parvis onyx.

The calcareous alabaster, or finter (albâtre calcare), is a stone of the same family as onyx, containing chiefly of carbonat of lime, and exhibiting a considerable variety of colours; such as pure white, yellowish, greenish, reddish, and bluish grey: its fracture is fratis or fibrous, the fibre sometimes parallel and sometimes divergent; its hardness is somewhere inferior to that of marble, which nevertheless does not prevent it from receiving a good polish; its specific gravity from 2.4 to 2.8: its transparency is nearly equal to that of white wax; it charmese with acids and burns to lime. Two sorts of alabaster are distinguished by flutters, the common and oriental: under the latter of these are ranked the hardest, the finest, and the best coloured pieces; a number of sub-varieties are also produced by the colours being in veins, or dendritic, or in concentric undulating zones. Italy and Spain yield the most beautiful specimens; the inferior kinds are found in Germany and France. It is manufactured, like the gypseous alabaster, into tables, vases, fittas, chimney-pieces, &c.

Many of the hot sulphurous waters rise out of the ground of a turbid wheyish colour, on account of a large quantity of gypsein and chalk, which they hold suspended, and in a state of half solution; so that these grow cool and lose their carbonic acid, the earthy particles are for the most part deposited, lining the bottom and sides of the channels in which they flow with a compact alabaster. Advantage has been occasionally taken of this circumstance to obtain very beautiful impressions of bas-reliefs, by exposing the moulds to a current of such water, till they have become filled with the earthy deposit. The most remarkable of these springs in Europe, is that which supplies the baths of St. Philip in Tuscany; it is situated on a mountain near Radicefani, and forms the source of the little river Paglia. The water as it issuest forth is very hot, springs out with great impetuosity, has a strong sulphurous odour, and holds in solution a large quantity of calcareous matter. From its very source it flows in deep channels, covered with a thick crust of flatterite, of a dazzling white, especially when the sun shines upon it; and which is harder or softer
in proportion to the rapidity of the stream, and the obliquity of its fall. This circumstance suggested to Dr. Vegni the idea of effecting, on this mountain, a manufacture of artificial alabaster. For this purpose, he first collected a number of plaster models, of the best bas-reliefs, in Rome and other places of Italy. These models serve to form the hollow moulds, which are made of sulphur, according to the following process. The plaster model is surrounded with an edging of plaster, of the same height as the intended thickness of the subflet bas-relief. Then sulphur, melted with jufli sufficient heat to make it flow, is poured on the plaster model, and filled to the height of the edging. The sulphur mould that is made, is placed in a kind of wooden tub, roughly put together, open at top and bottom, and of left diameter below than above. This tub has on the inside a false bottom, made of slips of wood laid cross-wise, in order to detain, for a short time, the water which dafhes on them. Just above this, is a row of wooden pegs, falled to the tub, around its whole inner circumference, on which the sulphur mould is let down, and thus supported. The whole is then placed under the boiling spring, and inclofed with walls, to prevent it from being displaced by the wind. The water, which thus dafhes on the moulds, deposits its earth both within and without them, giving the impression in bas-relief within, and depositing itself in an undulated surface on the outside. The hardness of the alabaster depends on the degree of obliquity at which the mould is placed, in order to receive the dashing of the water. The more vertical its position, the harder is the alabaster. However, as the hardest models are not so white as the fottet, the water is in some cafes caused to make a circuitous course, in order to deposit all its grosser particles before it arrives at the mould. Even the fottet ones, however, are as hard as Carrara marble, and furnifh it in whitenefs. The time required for these productions varies, according to the thickness, from one month to four. When the sulphur mould is sufficiently filled, and the ground of the model has acquired a thickness capable of supporting the figures, the whole is removed from the water; the wooden supports are broken by gentle frokes of the hammer, and the incrustation on the outside of the mould is chipped off by repeated frokes. Then the tub is struck with a smart blow of a hammer, which separates the model from the mould; generally, however, cracking the latter. The brilliancy of the models is completed by brushing them with a fliff hair-brush, and rubbing with the palm of the hand.

The composition of this alabaster is gypsum, mixed with a small proportion of carbonated lime. Dr. de Vegni has, after many attempts, succeeded in giving a fine black, or flet colour to the figures thus formed, by putting a veffel half full of colouring matter into the water, before it arrives at the mould. The colouring may also be varied, by protecting particular parts of the mould, while the water continues charged with colouring matter.

A spring of the fame kind as that just described, and applied to similar purposes, is that of Guancavelica in Peru. The water rises from the ground into a large bonfire boiling hot, and of a muddy yellowish white colour. At a little distance from the bonfire, the water becoming cool, deposits calcareous matter in such vast abundance, as to fill large moulds with a compact stone, of which fome of the houses of the town are constructed. The moulds of statues, in like manner, being expoed to the water, are filled with hard confusedly crystallized alabaster, and the bas-reliefs thus produced, by polishing, become femitransparent and very beautiful. The images made use of by the Catholicks of Lima, in their religious ceremonies, are said to be all formed in this manner.

Alabaster, in Antiquity, is also used for a vase, wherein odorous liquors were anciently put.

The reason of the denomination is, that vefels for this purpose were frequently made of alabaster-stone, which Phyl and other ancients represent as peculiarly proper for this purpose.

Several critics will have the box mentioned in the Gospel as made of alabaster, to have been of glass. And though the texts say, that the woman broke it, yet the pieces seem miraculously to have been united, since we are told, the entire box was purchased by the emperor Constantine, and preserved as a relic of great price.

Others will have it, that the name alabaster denotes the form rather than the matter of this box. In this view, they define alabaster, by a box without a handle, deriving the word from the privative a, and l怪, handle.

The expression, σωματικα χορωδη, used by the evangelist Mark, (xiv. 3) and which our translators have rendered "She brake the box," has occasioned some difficulty in the interpretation of this passage; but by referring the term σωματικα, to the ointment, and not to the alabaster-box; and rendering the words, with Bishop Pearce, "breaking the poured the box," i.e. breaking the parts of the ointment, and liquefying them by shaking it, the poured some of the ointment out of the box upon his head; or, with Mr. Wakefield, "After shaking the box together, she poured it out upon his head," the difficulty is obviated. To justify this translation, and interpretation of the word σωματικα, it may be observed, that Luke (ix. 39.) uses σωματικα for braking. Blackwall, Sacred Classics, vol. ii. p. 166. has remarked, that the shaking of this nature breaks and separates their parts, and thereby makes them more liquid and fragrant; and that the word σωματικα is an excellent one for that purpose; and he very justly quotes, on this occasion, Plato in Rhe-done, Διαρμα χορωδη: Martial's Epigrams, iii. 55. Ed. Delphin.

— "Et fluere exufo cinnama funa vitro."
and Lucretius iv. 700.

— "Fracla magis redolere videntur
Omnia quod contrita."

See Pearce's Com. vol. i. p. 276. Wakefield's Silva critica. Pars. i. 111. p. 156.

Sir Edward Knatchbull and Dr. Hammond have sug-
stigted the fame interpretation of this passage.

Alabaster is also said to have been used for an ancient liquid measure, containing ten ounces of wine, or nine of oil, and in this sense the alabaster was equal to half the fextary.

Alabaster Island, in Geography. See Eleutheria.

Alabaster, in Botany, are those little herbaceous leaves which encompass the bottoms of flowers, particularly the rofe. See Calyx, &c.

Some, with Jungius, explain alabastra, by the globe or roundish bud of the rofe just peeping out.

Alabaster, in Ancient Geography, a town of Phrygia, mentioned by Steph. Byz. on the authority of Herodotus, but probably mistaken for Alaha. Ptolemy mentions a town of this name in Egypt.

ALABASTRITAE,
ALAABRISTE, alabaster, in Natural History, the name of a genus of fossils allied to the marbles, and defined to be stones composed of large separate concretions, of great brightness, and an elegant, but blunter structure, not very hard, nor having fire with fleck, effervescing with and soluble in acids, and calcining in a bright flame. See ALABASTER.

ALABASTRITES is often used as synonymous with alabaster. But Anfelmus Boetius distinguishes between alabaster and alabstrites, in making the criterion of the former to be so soft, that it may be cut with a knife; and of the latter, that it is so hard that it cannot be so cut.

Grew speaks of a sort of alabstrites representing the transverse section of the trunk of a tree.

ALABASTRUM dudovicum, a name given by authors to a species of alabaster, found in great abundance in the province of Hohenstein, and famous for the elegant delineations of trees and other figures described in it. See ALABASTRUS.

ALABASTRUS, in Ancient Geography, a town of the Thebaid, in Egypt, where Pliny says topazes were found.

ALABASTRUS, a river of Troas, which flowed from Mount Ida.

ALABATER, a promontory of Carmania.

ALABON, or ALABUS, now Cataca, a river of Sicily between Myla and Megara, which Diodorus (li. 27. tom. i. p. 321.) represents as a large river, which discharged itself into the neighbouring sea. Stephano Byz. (vol. i. p. 58.) mentions also a city of this name.

ALABOR, a town of the ancient Rufsand, situate in the present government of Olonetz.

ALABUA, in Geography, a small town of Arabia Petraea, where it is said Abdalla, the father of Mahomet, died, and which is a station of the pilgrims that visit Mecca.

ALABURIA, in Ancient Geography, a town of Syria, mentioned by Stephan. Byz.

ALACH, in Geography, a prefecture belonging to the territory of Erfurt, containing 13 parishes.

ALACHUAH SAVANAH, a level green plain in the country of the Indians of that name in East Florida, situate about 75 miles west from St. Augustine. It is about 15 miles wide and 80 miles in circumference, and encircled with high floating hills, covered with waving forests, and fragrant orange groves, which rise from a very fertile soil. The ancient Alachua town stood on the borders of this Savannah, but the Indians removed to Cuscovilla, about two miles distant, on account of the infallibility of the situation. The herded cattle and horses bred in these meadows are large and fat, but they are subject to mortal diseases, such as the water rot or scald, occasioned by the warm water of the Savannah.

ALACRANES, a range of rocks and shoals on the south side of the gulf of Mexico, situate over against the peninsula of Yucatan; cast from Stonebank, and west from Cape St. Antonio, within the 24th degree of north latitude, and between 80° and 91° W. long. They are said to derive their name from the great number of scorpions that are found there.

ALADA, an island in the Indian Ocean, near the coast of Siam. N. lat. 9° 27'. E. long. 97° 52'.

ALADAG, or AMADAG, the highest mountain of Natolia, in Asia, north of Augora, and not far from the Cape of Coromba. N. lat. 40° 10'. E. long. 52° 46'.

ALADINISTS, a sect among the Arabs, antipathizing to free-thinkers among us.

The Aladdins multiplied greatly under the two learned kings Almanfar and Miramolinus.

ALADUILA, a considerable province of Turkey in Asia, between Amafa and the Mediterranean, towards Mount Taurus. Some have represented it as the third division of Asia Minor, and made it to comprehend Cappadocia and Lesser Armenia. IOn it flows the right to Trebizond, and is called by the Turks the beglebegate of Marash, and sometimes Dulgadir. The soil is fruitful for tillage, but affords abundance of pasture, which breeds a great number of cattle, especially horses and camels, and large herds of sheep and goats. Cappadocia, besides its pasture grounds, produces wines and fruits in great plenty; and its mountains, particularly the chain called Antitaurus, have mines of silver, copper, iron and alum. Marash and Cezarea are well built and populous cities. Armenia the latter, so called by way of distinction from the greater Armenia, has this country which belongs to Peria on the east, Syria on the south, the Euxine on the west, and Cappadocia on the north. The people are addicted to war and plunder.

ALENUS, in Ancient Geography, a river of Britain, according to Ptolemey, supposed to be the river Ax, and its mouth Ax-mouth. It was so called perhaps from the British A han in, the full river.

ALES. See ALESA.

ALAFONS, in Geography, a district of the province of Beira, in Portugal, containing 37 parishes, and erected into a duchy in 1718, by John V.

LAGNON, a rapid river of France, in the late province of Anjou, whose source is at Cazal, and which falls into the Allier.

ALAGOA, a town of Africa, in Upper Guinea, where the Portuguese have an establishment.

ALAGOA bay lies on the easterly coast of Africa, in the Indian Ocean. S. lat. 25° 30'. E. long. 38° 28'.

ALAGOA is also the name of a town of South America, in the country of Brasil, and government of Xaracu.

ALAGON, a river of Spain, which rises in the mountain of Leon, and runs into the Tagus, a little above Alcántara. It is also the name of a small town of Aragon, standing on a peninsula formed by the rivers Ebro and Xalcon, about four leagues from Saragossa.

ALACTAGA, in Zoology, the Tartarian name of the Siberian Jerboa, signifies an animal which cannot walk. Buffon. (Nat. Hist. by Smellie, vol. vii. p. 202.) characterizes it as having legs like those of the Jerboa, but with five toes on the fore feet, and three on the hind, with a spur, that may pass for a thumb or fourth toe, much shorter than the others.

ALAIN, Chartrier, in Biography, secretary to Charles VII. king of France, was born in 1386. He was the author of several works in prose and verse; but his considerable work was the "Chronicle of King Charles VII." It is said that Margaret, daughter to the king of Scotland, and wife of the dauphin, finding him asleep at an early hour of the day, and when they expressed their surplice at her coquetry to a person who possessed few charms, she replied: "I did not kiss the man, but the mouth, from which proceeded so many excellent sayings, so many witty discourses, and so many elegant expressions." On this incident Fontenelle has founded one of his Dialogues of the dead. Paquier extols the character of Alain, and compares him to Seneque, on account of the infinite number of beautiful sentiments, that are interposed in his writings. Gen. Dict.

ALAIN, John, a Danish writer, was born in 1563, and died in 1632. He published a treatise "On the Origin of the Cimbri, and their various Establishments;" another "On Logic, natural and artificial," and a third "On the
pronunciation of the Greek Language, with an Apology for Saxon Grammaticus.

ALAIN, Dr Lafa, a native of Lille, in Flanders, flourished in the thirteenth century, with such reputation for his skill in theology, philosophy and poetry, that he was called the Universal Doctor. He died in 1299, and left behind him many pieces in prose and verse, which were collected into one volume in folio, at Antwerp, in 1647. His fame was so great, that it was thought a happiness to know him; and it was proverbially said, "Suffice it to have seen Alain."

ALAINC, in Geography, a small river of France, in the department of Nièvre.

ALAJOR, one of the four quarters into which the island of Minorca is divided, so called from a small place near it.

ALAIN, or ALAI, a large and populous city of France, in the department of the Gard, situated on the river Gard, at the foot of the Cevennes. Julius Cæsar in his commentaries calls it Aelia. A bifloric was founded in this place in 1691, with a view, as it is said, of converting the provincials, who were numerous; and a citadel had been built in 1689, in order to save them. The dioecese consists of 80 parishes. The country about it is well cultivated, and produces grain, olives and mulberries, but the principal wealth of the place has been hitherto derived from its manufactures of ferges and rattanes, and from its exportation of raw and wrought silk. It is distant 14 leagues north of Montpellier, and 140 south-east of Paris. N. lat. 44° 8'. E. long. 3° 46'.

ALABSEE, in Heraldry, the name with bunetty, of rac-courcy.

ALASKIAN MOUNTAINS, in Geography, a part of the Altay mountains in Russia, comprising that range which advances from the origin of the Alay to the two sides of this river, and between it and the Ouba and Irtish, and runs out into the great Saline plain, which is skirted by the Alay, the Irtish, and the Ob. See SLUDNA.

ALACOMENIA, in Ancient Geography, a town in the island of Ithaca, where, according to Plutarch, Ulysses was born.

ALACOMENIUM, or ALACOMENE, a small town of Beotia, fourth-eaft of Chersonae, near the lake Copais, founded according to Pausanias (in Beotic, lib. ix.) either by Alacomenian, father-father of Minerva, or by Alacomenia, one of the daughters of Ogyges, the nurse of Minerva, near which the had a temple, and a statue of ivory, which was removed by Sulla to Rome. Hence Homer deduces the epithet Alacomenian, ascribed to Minerva.

ALACOMENIUS, in Ancient Chronology, the Beotian name for the Athenian month Mæmactrion, which was the fourth of their year, and answered to the latter part of our September and beginning of October.

ALALIA, or ALALIS, in Ancient Geography, a town of Syria, placed by Ptolomy in the Palmyren, near the Euphrates, and by M. d'Anville, north-west of Rafaba.

ALAMA, a town of Alia, in Mesopotamia, situated on the river Elisha, north-west of Nicephorion.

ALALOEI, small islands in the Arabian gulf, where, according to the Periplus of Arrian, turtles were found; the name with the Alloc of Pliny.

ALAMAN, or the island of the Conception, in Geography, one of the Ladrones, or Marianas islands, about 10 miles from Guaynan, and 18 miles in compass. There is a volcano on the north-west part of this island, which flakes close to the sea, forming a cone in height about 500 yards, with a base of about 400 yards; and the sides are marked by Arems of black lava, which, passing through a rich vegetation of cocoa-nut trees, may be traced to the shore, where they have entered the sea. This cone is encompassed with cinders, which, at the distance of about a mile and a half, are covered with a black vegetable foil, which produces trees as large as any upon the island. At a nearer distance there is not for several acres the least sign of vegetation. In the year 1799, the volcano seemed to be preparing by its rumbling noise, and the smoke that issued from it, for a new eruption. The lower parts of the island are covered with trees of a thick foliage; some few open spots produce a thick and long grass; but the most plentiful productions of the island are the cocoa-nuts, which grow in clumps near the shores close down to the beaches, and which may be easily obtained in great abundance. Trees, resembling the pines of Port Jackson, bearing a small cone, and riling to the height of 30 or 40 feet, are very numerous. A supply of the fruit of the papaw tree may be gathered about the middle of August. No quadrupeds have been observed upon this island except green-tailed lizards; land crabs are numerous and large; partridges and quails, owls, thrushes, bullfinches and pigeons are found here. The island may be seen at the distance of 12 or 14 leagues. Its shores are rocky to windward, but in the bay to leeward there are two or three beaches. On the west or left side of the island the shore boands into a kind of bay, where, as the trade wind in general blows steadily to the eastward, ships might ride securely as long as they had occasion to stay. N. lat. 18° 5'. L. long. 146° 47'. The variation of the compass in 1759 was 41 east.

ALAMA, a town of Switzerland, in the Canton of Berne, three leagues north-east of Nion.

ALAMANDUS, LEWIS, Dr. Aleman, in Biography, archbishop of Arles and cardinal of St. Cecilia, was one of the greatest men in the 15th century. He preceeded in the council of Basll, which depoosed Eugenius IV. and elected the Antipope Felix V. Aeneas Sylvius highly commends him, as a man admirably formed for prefiding in such assemblies, firm and vigorous, illstitial by his virtue, learned, and endowed with a memory, which enabled him to recapitulate every thing that had been said by the orators and disputants. Although he was deprived of his dignities by pope Eugenius, and very injudiciously treated, he is said to have performed miracles at his death, and he was beatified by Clement VII. in the year 1527. He died at the age of 60 years, in 1450. Gen. Hist.

ALAMANNI, LOUIS, or LEWIS, was born at Florence, of a family of distinction, in 1495; and by his early progres in philosophy and Greek literature, acquired great reputation. He was at first attached to the Medici family, but having entered into a conspiracy against Cardinal Julius de Medici, who became pope Clement VII., he was obliged to take refuge at Venice. He was afterwards imprisoned at Brescia, and upon his release he was under a necessity of abandoning his country, and of wandering, as an exile in France and in Genoa, till the year 1527, when he was recalled to Florence, on the expulsion of the Medici family. When the authority of that family was re-established in 1530, he was again disgraced, and retired to France, where he was chiefly occupied in poetic compositions. At length Francis I. called him to court, invited him with the order of St. Michael, appointed him to a considerable office in the household of Catharine de Medici, and employed him in various concerns at Rome and Naples. In 1544 he was sent on an embassy to the emperor Charles V.; and having been entrusted with different negociations by Henry II. he died at Amboise in 1556, and left two sons, one of whom was made bishop of Macon. The works of Alamann confit of Italian poetry. The first publication of them at Lyons in 1532 and 1533, contained elegies, eclogues, satires, fables, hymns, psalms, &c. and a translation of the Antigone of Sophocles; which
which are much esteemed for their elegance. A didactic poem on Agriculture, in blank verse, "Della Coltivazione," first printed at Paris in 1546, added to his reputation. A piece of greater bulk, intitled, "Girone il Cortece," taken from a French romance, "Girofio la Courteous," was published in 1548. His epic poem, called "l'Avarechide," on the siege of Bourges, and his comedy "La Floria," which he left behind him, did not much succeed. But his Tuscan epigrams, a species of writings, first attempted by himself, were well received, and produced many imitators. Alamanni is considered upon the whole, as a writer to whom Italian poetry lies under particular obligations.

Antonio Alamanni, whose burlesque poems were printed with those of Burchiello, was a relation of Luigi. Gen. Dict.

ALAMANNICUM, in Antiquity, a tribute imposed on the people by the emperor Alexius Angelus, for raising the sum of sixteen talents of gold, to be paid the Alamanni, on the conditions of a peace stipulated with them.

The ecclesiastics themselves were not exempted from this tax.

ALAMATOU, in Botany, the fruit of a tree that grows in Madagascar, resembling in its tattle the black plum, but instead of the flower of the plum, it has 10 or 12 flat kernels; the leaf of the tree is like that of the plum-tree. There are two sorts of this fruit, one like the plum and the other like the fig, which is dangerous when taken to excess.

ALAMBIAY, in Geography, one of the Sonda islands in the Pacific Ocean, 30 leagues south of Borneo.

ALAMEH, a town of Ahatic Turkey, in Nautalia, 53 leagues south of Kutaja. N. lat. 35° 35'. E. long. 31° 25'.

A-LA-MI-RE, in the Guidonian Scale of Majes, or Gamut, is the octave above A-re, or A in the first space in the base [5|3]. As A is the note above G in every part of an instrument, it is, of course, the third found below each tenor clef; and is likewise the found that occupies the second space, and the fifth line in the treble. The letter A itself is an abbreviation of A-re and A-la-ri, in the scale of Guido, and is the found to which all instruments are tuned at an opera, concert, or other musical performance. A in the Italian musical language, when it precedes a sublantive, has the power of in; as A battute, in time, or measure, after recitative, or an ad libitum. A capella, faced music, compositions in the church style. See Gamut and Guidonian Scale.

ALAMODALITY, alamodalitas, is defined by a late writer, a fludy or endeavour to accommodate a man's self in point of behaviour, drefs, conversation, and other actions of life, to the reigning talle or custom, from a motive of complaisance, and to avoid the imputation of ill-breeding.

Alamodality of writing, alamodalitas feribilis, is defined by the same perfon, a particular fludy or endeavour of learned men to adapt the productions of their minds, both as to the choice of subject and the manner of treating it, to the genius or talle of the times, in order to render then more acceptable to the readers.

A German writer, under the name of Gemocenus, has a differentiation on alamodality in writing.

ALAMODE, in Commerce, a thin, light, glossy, black silk, not quilied or croched; chiefly used for woman's hoods, and men's mourning veares.

The name is French, though not given in that country to this fabric, for which they have no other name than taftat noir hybré.

ALAMOS, BALIRAZAR, in Biography, a Spanish writer, was born at Medina del Campo, in Castile. He studied the law at Salamanca, served in a subordinate office under Philip II. was imprisoned upon the diligence of his patron, Anthony Perez, secretary of state to this prince, and after a confinement of 11 years, released by Philip III. By the duke of Olivares, the favourite of Philip IV. he was called to public employments. He was deemed a man of wit and judgment. He died in the 88th year of his age; and his Spanish translation of Tacitus, with marginal aphantoriums, was published at Madrid, in 1614. Biog. Dict.

ALAMPO, ALAMPO, or LAY, in Geography, a town on the gold coast of Africa, call of Ningo, and four leagues from the mountain Redondo, which presents itself in the form of a sugar-loaf to the north-north-west. The town is situated on the declivity of a mountain, which has a northern aspect; and the adjacent coast is bounded by hills of considerable height, that are covered with palm-trees. The inhabitants are gentle and timid; their principal commerce is that of slaves. The anchorage of this port is very good. N. lat. 5°. W. long. 3°.

ALAN, or LYNN, Alarum de Lynnau, in Biography, an English divine of the 15th century, was born at Lynn, in Norfolk, educated at Cambridge, and distinguished as a fludent and a preacher. He was addicted to allegorical interpretations of Scripture, and to the application of the historical parts of the Old Testament, to the concerns of religion and moral conduct, a practice blamed by Bale, but commended by Pits. He wrote tracts on the interpretation of Scripture, sermons, and elucidations of Aristotle; and he was famous for the pains which he took in making indexes to most of the books he read, of which Bale has given a long fill. He at length became a Carmelite in the town of his nativity, and was buried in the convent of his order.

Another person of this name was abbot of Tewkesbury, about the year 1177, and died in 1201. He wrote a book, "De Vita et Exilo Thome Cantuariensi." Biog. Brit.

ALAN, ALAN, of ALLYN, WILLIAM, a cardinal-priest of the Roman church, was born at Roffald, in Lancashire, in the year 1522; and entered, in 1547, at Oriel College, in the university of Oxford, where he made a considerable proficiency, particularly in logic and philosophy, and passed through several gradations of honour. In 1556, he became principal of St. Mary's hall, and one of the proctors of the university; and in 1558, he was made canon of York. But on the accession of queen Elizabeth, as he was a zealous catholic, he lost all hopes of preferment; and in 1560, retired to Louvain in the Spanish Netherlands, where he connected himself with the English college, and was much esteemed on account of his learning and the urbanity of his manners. In this situation he distinguished himself by writing in favour of the catholic cause; and his first piece was "A defence of the Doctrine of Catholics, concerning Purgatory and Prayers for the Dead," printed at Antwerp, in 1565, which commenced a controversy of some continuance. The state of his health, which had been injured by his application to study, rendered it advisable to return to his native country, in 1555; but he soon became obnoxious by the zeal of his attachment to the principles and profession of popery, and by his industry in making profiteers; and he was under a necessity of concealing himself in the neighbourhood of Oxford. In this retreat he wrote an apology for his party, entitled, "Brief Reasons concerning the Catholic Faith," and he prosecuted his labours for reclaiming apolites and encouraging the wavering, to such a degree, as to make it necessary for him, notwithstanding the patronage
As a zealous catholic, Allen might unquestionably allege the obligations devolved upon him by the conviction of his mind; but how far the plea of conscience will justify the avowal of sentiments, and the encouragement of practices, incompatible with the fundamental principles of personal and social virtue, we must leave for those who undertake the vindication of his character to determine. As an English subject, he was undoubtedly a traitor and rebel; and no casuistry can justify his attempts to overturn the government of a country, deserted by himself, but approved by a majority of its inhabitants. As a writer he may be justly considered as one of the ablest advocates of the Romish church, at the period in which he lived. His works, besides those already mentioned, are, “A Defence of the Lawful Power and Authority of the Priesthood to Remit Sins,” to which are annexed two other tracts, viz. “The People’s Duty in Confessing” and “An Explanation of the Doctrine of the Catholic Church, with Respect to Indulgences.” Printed at Louvain in 1567, 8vo; “Of Sacraments in General, of the Enchiridion, of the Sacraments of the Masses, three books, addressed to pope Gregory XIII.” Printed at Antwerp in 1576; “Of the worship due to Saints, and their Relics;” “A True, sincere, and modest defence of Christian Catholics, that suffered for their faith at home and abroad, &c.” Printed in 1583, which was an answer to a book written by lord Burleigh, and esteemed the best of the cardinal’s writings; so that the learned Edmund Bolton says of it, “a princely, grave, and flourishing piece of natural and exquisite English is Cardinal Alan’s Apology.” Biog. Brit.

Alan, in Geography, a town and province of Turkestan in Persia.

Alan, or Camel, a river of England, rises north of Camelford, and runs into the sea two miles below Padstow, in Cornwall.

Alan Bay, lies on the west side of Cornwall, in the Mediterranean.

ALANA, in Ancient Geography, a town of Ethiopia in Egypt, according to Pliny.

ALANCH, in Geography, a town of France, in the department of the Monts of the Rhone, two leagues north-east of Marseilles, and four south of Aix.

ALAND, an island in the Baltic, at the entrance of the Gulf of Bothnia, situated between the province of Upland in Sweden and Finland, gives name to a cluster of islands, and is about 40 miles in length, and from 12 to 16 in breadth. It contains about 15 villages, and 9000 inhabitants, who speak the Swedish language; but are included under the government.
government of Finland, since the year 1634, both as to spiritual and temporal affairs. The banks of the soil, as to Mr. Coke, who visited it, to be granite. It is so fertile, that the inhabitants seldom experience any scarcity of corn; it has also rich pastures, forests of wood, and lime-stone quarries. The inhabitants chiefly cultivate by agriculture, hunting, and fishing; and they traffic in butter, woodenware, coals and lime. The principal place is Cattelholm. This cluster of islands appears as a ridge of rocks, which had been once joined to each other, and the continent, but undermined and separated by the sea. N. lat. 60° 18'. E. long. 19° 40'.

Ala is also the name of an island on the Norway coast, nearly well of Bergen. Ala, a river of Germany, which runs into the Elbe, near Schwakeburg, in the principality of Lauenburg. Alaia, a river, lies on the south coast of Ireland, between the harbour of Waterford and Tramore bay; eight miles south of Waterford. ALANDER, in Ancient Geography, a river of Aria Minor, the source of which is referred by Livy to Plutarch Major.

ALANDSHAGE, a cape at the southern extremity of the island of Amaack.

Alans, or Alani, a people, like the Huns, of Arian origin, but represented by Amnianus Marcilinus, as "victu mitiores et cultu", more polished in their customs and manners. Pliny (H. N. lib. iv. c. 12.) erroneously places them in Europe, beyond the mouth of the Danube; but Josephus (De Bell. Jud. lib. vii. c. 29.) traces their origin more accurately, and describes them as Scythians, who dwelt between the river Tanais and the lake Mesost. Ptolemy mentions two forts of Alans, the one in Europe and the other in Asia. From M. de Guigne, Hist. Huns, tom. ii. who has taken pains in investigating their origin and history, we learn that the name Alani signifies mountain, and that these people derived their appellation from the mountains which they inhabited towards the sources of the Jaack and near the districts of Oufa, and Solomon. In process of time they migrated southward, to the plains that are situated to the north of Circassia and Derbend. About A. D. 737, they formed an alliance with the king of Persia, and entered Media; but being prevented at this time, and afterwards by Adrian, A. D. 130, from pursuing their march to the south, they directed their course westward, and established themselves on the borders of the Danube. About the year 465, they advanced from the banks of the Danube to the Rhine, and being joined by the Vandals, and some other nations, they traversed Gaul, and settled at the foot of the Pyrenees. In 499 they took the advantage of the revolt of those troops who were stationed to guard the passage of these mountains, and proceeded into Spain, where they settled in 411. Some of them entered Lutitania, and others the province of Cantabria; and many of them remained in Gaul, particularly in Brittany and Normandy. The Goths in Spain, and the Franks in Gaul, possessed the Alani, so that they were at length confounded with their conquerors. The Alani, according to Amnianus Marcilinus, had no other houses than their waggons, which they removed to such places as they found most convenient for their flocks and herds, which constituted their wealth, and supplied, with their flesh and milk, the means of their subsistence. War was their chief occupation; and whilst their wives and children were left at home, all who were able to bear arms renewed, from time to time, and as they advanced in their progress, their military talents against their neighbours. They deemed it difficult to grow old and die peacefully with their families; those were reckoned the happiest who died in battle, and who had killed the greatest number of their enemies; the feats of those whom they slew formed the chief trappings of their honors; and so devoted were these people to military occupations, that a naked scyphus planted in the ground was the only object of their religious worship. Their divinations were performed by means of rods, chosen with proper charms.

On the banks of the Tanais, says Mr. Gibbon, the military power of the Huns and the Alani encountered each other with equal valor, but with unequal success. The Huns prevailed; the king of the Alani was killed; and the remains of the vanquished nation were dispersed by the ordinary alternative of flight or submission. A colony of exiles found a secure refuge in the mountains of Carccster, between the Euxine and the Caspian, where they still preserve their name and independence. Another colony advanced with more intrepid courage, towards the borders of the Baltic; associated themselves with the northern tribes of Germany, and shared the spoil of the Roman provinces of Gaul and Spain. But the greatest part of the nation of the Alani embraced the offers of an honourable and advantageous union; and the Huns, who esteemed the valor of their foes fortunate enemies, proceeded with an increase of numbers and confidence, to invade the limits of the Gothic empire. Amnianus xxx. 2. M. de Guigne, Hist. des Huns, tom. ii. p. 279. Gibbon's Hist. of the Decl. and Fall of the Rom. Empire, vol. iv. p. 373.

ALANI, a mountain of Scythia, on one side of Imaus, and on the other, of the Hyperborean mountains.

ALANGUER, or ALANQUER, in Geography, a town and district of Portugal, in Estremadura. The town is said to have been built by the Alani, and was anciently called Alekter Kana, i.e. the temple of the Alans. It contains about 3000 inhabitants, five churches, one cafa da miranda, one hospital, and three convents; and it is the chief town of the queen's estates.

ALANORARIOUS, in our Ancient Customs, a keeper or manager of spaniels, or setting-dogs, for the sport of hunting, hawking, &c. The word is formed from the Gothic, alat, a greyhound.

ALAPA, in Geography, mountains of Asiatic Russia, in Siberia, extending from the lake of Jackoia to the confines of Baskia, all having mines of very rich copper.

ALAPAEV, a town of Russia, in the government of Perm, on the river Tagil. N. lat. 58°. E. long. 61° 14'.

ALAPI, in Ornithology, is a species of Torus, in the Linnaean system by Gmelin, and the white-backed thrush of Latham; its specific characters are, that the colour above is olive-brown, the throat and breast black, the abdomen cinerous, and the tail wedge-shaped and blackish. Its legs are yellowish, the wings above cinerous-brown, and superior coverts spotted with white; the male has a white spot on the middle of the back; the female has none, but its chin is white, the rest of the under-part of the body and the points of the coverts of the wings rufy. Its length is six inches; it feeds on ants; seldom flies for any time, though very agile, and is found in the thick woods of Guiana.

ALAPIA, in Ancient Geography, a town of Cilicia, Syria, called also Norca.

ALANGIUM, in Botany, a genus of the decandra monography class and order; the characters of which are, that it has from six to ten linear petals, from 10 to 12 flaminas, the calyx, dentate, in six to ten notches, and superior; the fruit a spherical berry, slightly coraceous, single celled, and
and containing from one to three seeds. There is one spe-
cies, viz., the Alangium of Justice.

Alaric, in Botany, the name of an East-Indian tree, a species of the bixanth, which is used in medicine as a purge and vomits, with the seeds of mulberry.

Alapta, in Ancient Geography, a town of Macedonia, near Aranthus.

Alaquea, a medicinal stone brought from the
Indies, in small glossy fragments; much prized by some
for its efficacy in hemmorhages, when applied externally.

Alar, in Geography, a river of Persia, which runs
into the Caspian sea.

Alaraph, formed from the Arabic verb aris, to
digฤEGE, in the Mahometan Theology, the partition wall
that separates heaven from hell.

Alaraph gives the denomination to the seventh chapter of the
Alcoran, wherein mention is made of this wall. Some
take it for a fort of limbus for the patriarchs, prophets, &c.
others place here each whole good and evil works so exactly
balance each other, that they neither deserve reward nor
punishment. Others again appropriate this intermediate
space to them who go to war without the leave of their
parents and die, and are excluded paradise for their dis-
obedience, but escape hell as martyrs. Sale's Prel. Dif-
coufe to the Koran, p. 95.

Alarbes, a name given to those Arabian who
dwell in tents, and who are distinguished by their drefs
from others who live in towns.

Alarcon, in Geography, a town of Spain, in the
western part of New Gallicia, on the river Xucar. It was
ruined in 1178, under the reign of the Moors, and
re-established by Alphonus IX. N. lat. 39° 40'. W.
long. 3°.

Alares, in Antiquity, are suppos'd by some authors
to have been a kind of militia, or oldrymen, among the
Romans; so called from ala, a wing, because of their light-
nesses and swiftness in the combat.

Others make them a people of Pannonia; but others,
with more probability, take alares for an adjective, or epiti-
phet, and apply it to the Roman cavalry; because they
were placed in the two wings, or ala, of the army; for
which reason, a body of horse was called ala.

An ala, or wing of auxiliary horse, consisted of 400,
and there were two of these wings annexed to each legion;
and therefore, the whole number of cavalry belonging to
a legion was 1200, of which 400 were Romans, and 800 auxiliaries.

Alares mufuli, in Anatomy. See Pterygoideus.

Alaric I., in Biography and History, king of the
Vigoths, was descended from the noble race of the Balt, or
bald, the most illustrious of the Gothic nation, next to
that of the Amali. With his countrypeople, who were ex-
pelled by the Huns, and whose number is said to have
amounted to near a million of persons, of both sexes and
due ages, and of whom about 200,000 men were Gothic
warriors, Alaric passed the Danube, A. D. 376; and served
with great reputation in the war between the Romans and
the Goths, which lasted from that time to the year 382,
when they all submitted to Theodofus, and were allowed
to settle in Thrace, on condition of serving in the Roman
armies. Accordingly, he attended Theodofus in his ex-
pedition against the usurper Eugenius, with a body of his
countrymen under his command. But being refused that
preference to which he aspired, he was dissatisfied; and
after the death of Theodofus, and, as it is said, at the in-
flation of his minister Rufinus, he assembled a numerous
army, consisting chiefly of his countrymen, and having first
ravaged Pannonia and Dacia, he proceeded in 376 to make
an invasion into Greece. Having marched through Ma-
cedon and Thessaly, he passed through the straits of Ther-
apole without opposition on the part of Antiochus, pro-
consul of Achæia, or Garontus, who was appointed to guard
them, and laid waste the fairest realms of ancient Greece.
The Athenians preferred their city by delivering to the
emperor the greatest part of their wealth; but the whole ter-
titory of Attica, from the promontory of Sounium to the
town of Megara, was defoliated by the march of his army;
so that Athens itself, according to the allusive language of a
contemporary philospher, resembled the bleeding and
empty skin of a slaughtered victim. The Gothic prince,
having been liberally and splendidly entertained at Athens,
penetrated without delay into Peloponnesus, and wherever
he came defolation and deserts marked his footsteps. Those
only could be deemed happy, whose premature death pre-
vented their witnessing the misfortune of their females,
the slavery of their families, the conflagration of their cities,
and the destruction of every thing valuable and curious which
they possessed. In this peninsula, the famous general Sti-
licho, with his fleet and army, came up with Alaric, and
obliged him to retreat to the mountain of Phoebo in Arc-
dad, and there invested his camp: but either by negli-
gence or connivance permitted him to escape across the
gulf of Corinth, to Epirus. Being in full possession of
this important province, Alaric had sufficient time to con-
clude the treaty, which he secretly negotiated with the
ministers of Constantinople. In consequence of this treaty,
he was declared master-general of the eastern Illyricum,
which comprehended the cities and provinces he had for-
lately laid waste; and the enemy of Rome became the ally
and servant of the emperor of the east. Whilst the Go-
thic prince was thus preferred by Arcadius, Stilicho
was declared a public enemy, and his calumny feit and
confounded. At the same period, A.D. 395, Alaric,
with the unanimous consent of the barbarian chiefants,
was elevated, according to ancient custom, on a shield,
and solemnly proclaimed king of the Visigoths. In the plenti-
doer of power which he had thus acquired, by the grant
of Arcadius, and the suffrage of his own nation, he
avoided his resolution of invading the dominions of the
west; and having annulled both Arcadius the emperor of
the east, and Honorius the Roman emperor, by deceitful
promises, till he was prepared for the execution of his pur-
pose, he entered Italy in the year 406, laid waste the
country, and carried off a great quantity of spoil and an
incredible number of captives. In 402 he ravaged the
provinces of Venetia and Liguria; in 403, advanced to-
wards Milan, whence Honorius hastily fled; and purifying
the timid emperor to the fortress of Alfi, a town of Li-
guria, on the banks of the Tamar. In the mean while
Stilicho, at the head of the Ostrogoths and imperial
guard, marched to the relief of the Imperial captives, and arrived
soon enough to prevent the indignity of a plunderer by ex-
ploitation, which the barbarians had proposed. By a suc-
sessful action, in which he forced his way through the
Gothic camp to the walls of Alfi, he revived the
hopes, and vindicated the honour of Rome. On this occasion,
a military council of the Gothic nation was assembled, in
which Alaric displayed the spirit of the conquerer of
Rome, and concluded an animating speech, by the solemn
and positive assurance, that he was resolved to find in
Italy either a kingdom or a grave. Whilst the Christian
Goths were devoutly employed in celebrating the festival of
Easter, Stilicho determined to attack them. The
camp of the Goths, which Alaric had pitched in the
neighbourhood
neighbourhood of Pollentia, was thrown into confusion by the sudden and impetuous charge of the Imperial cavalry: the engagement which succeeded was long maintained with equal valour and success; but at the moment when the victory of Alaric was almost decided by the defeat of the cavalry, Stilicho led the Roman and Barbarian infantry to the attack, and determined the fate of the day. The Goths retreated from the field of battle; the intrenchments of their camp were forced; and the scene of rapine and slaughter made some atonement for the calamities which they had inflicted on the subjects of the empire. The magnificent spoils of Corinth and Argos enriched the veterans of the West; the captive wife of Alaric was reduced to the necessity of imploving the mercy of the inflicting foe; and many thousand prisoners, rescued from the Gothic chains, dispersed through the provinces of Italy the praises of their heroic deliverer. Alaric still maintained that invincible spirit, which rife upon every misfortune, and derives new resources from adversity; and he boldly resolved to break through the unguarded pass of the Apennine, to spread devastation over the fruitful face of Tuscany, and to conquer or die before the gates of Rome. But Stilicho saved the capital, entered into a negotiation with the enemy, and induced him to repass the Po, with the remains of the flourishing army which he had led into Italy. In his retreat, however, he took possession of Verona; but having been defeated in a bloody action near the walls of this city, he escaped by the swiftness of his horse. After this disaster he retired with the shattered remains of his army to the mountains, where he left the greatest part of them by hunger and disease, and by devastation; and from hence he finally retreated into Thrace, and thus Italy was liberated.

It was not long after this event before Alaric was recommended by Stilicho to Honorius, and appointed by this weak prince master-general of the Roman armies in Western Illyricum. Whilst Stilicho refused his pretensions to the provinces of the East, and was anxious to employ Alaric and his forces at a distance from Italy, the Gothic king perceived his design; andprotracting his languid operations in Thessaly and Epirus, he held a doubtful, and perhaps a treacherous, correspondence with the two rival courts, and advanced to Aemona, on the confines of Italy, with a view of enforcing his demands on the Roman court, for the recompence of ineffectual services. The demand was supported by Stilicho, who lost his life during the besiegment of the city; and the delay furnished Alaric with a pretext for again entering Italy, in 408. By bold and rapid marches he passed the Alps and the Po; pillaged the cities of Aquileia, Altinum, Concordia, and Cremona, which yielded to his arms; increased his forces by the accession of 30,000 auxiliaries; and at length pitched his camp under the walls of Rome. The city was soon reduced to the utmost extremities of famine and pestilence, and a negotiation was commenced and terminated in a raid, the payment of which induced Alaric, A.D. 409, to raise the siege, and to withdraw his army into Tuscany. Here the Gothic standard became the refuge of 40,000 Barbarian slaves, who had broken their chains, and aspired, under the command of their great deliverer, to revenge the injuries, and the disgrace, of their cruel servitude. About the same time he received a reinforcement of Goths and Huns, whom Ataulphus, or Adolphus, the brother of his wife, had conducted, at his pressing invitation, from the banks of the Danube to those of the Tiber, and who had cut their way, with some difficulty and loss, through the superior numbers of the Imperial troops. Alaric was now at the head of 100,000 fighting men; and though Italy pronounced his name with terror and respect, he professed moderation, and repeatedly declared, that it was his desire to be considered as the friend of peace, and of the Romans. Ambassadors were sent to the court of Honorius at Ravenna to negotiate a treaty; but he insisted on his military rank in the empire, and the possession of some of the provinces between Italy and the Danube. The terms were rejected; and Alaric again advanced to Rome, A.D. 409. Having taken possession of the port of Ostia, he compelled the city to surrender, and deposed Attilius, the prefect of the city, to the dignity of Emperor. He then conducted the new emperor to the gates of Ravenna, with a resolution of depriving Honorius; but Attilius himself was disengaged with Alaric and depposed. The court of Ravenna, however, instead of taking this advantage of his circumstance to effect peace, offered an insult to Alaric, which provoked his resentment and induced him to march back to Rome with a determination to sate his appetite for plunder and vengeance. On the 24th of August, A.D. 410, the Gothic army entered Rome; and thus 1163 years after the foundation of the Imperial city, which had yielded and civilized to considerable part of mankind, it was delivered to the licentious fury of the tribes of Germany and Scythia. As some of the Goths were Christians, they spared the lives of the unsuspecting citizens, and respected the churches as holy and inviolable sanctuaries; but the Huns, and other Heathen Barbarians, committed the most horrid massacres, rapes, and violence of every kind, without restraint. After a pillage and devastation of six days, the Gothic army evacuated Rome; and their intrepid leader, at the head of an army, encumbered with rich and weighty spoils, advanced to the southern parts of Italy, destroying whatever dared to oppose his passage, and contenting himself with the plunder of the unoffending country. Having arrived at the extremity of Italy, his ambition was excited by the near prospect of the fertile isles of Sicily. But when the first division of the Goths had embarked, in order to pass the Straits of Rhgium and Melfina, a tempest arose, which sunk or scattered many of the transports, and daunted the mariners, and their whole design was defeated by the premature death of Alaric, which, fixed, after a short illness, the fatal term of his conquests, A.D. 410. His funeral was celebrated with mournful applause; his body was buried in the bed of the small river Bucinthus, which washed the walls of Constance, and which for this purpose was diverted from its course and then restored; and the place of his interment was concealed by the massacre of the prisoners who had been employed in the work. Of the character of Alaric it is sufficient to say, that he professed more humanity, moderation, and fidelity to his engagements than many of the clans of Barbarian conquerors; and that his exploits have rendered his name memorable in the most civilized parts of the world. Alaric says Lardner, (Works, vol. ix. p. 180), was a Goth, and therefore called a Barbarian; but he was a man of a great and generous mind, and a Christian of the Arian denomination. When Rome was sacked and plunders, the calamity was attended with some favourable circumstances, resulting from the generosity of Alaric, and his profession as a Christian. By ordering the lives of men to be spared as much as possible, and the churches to be respected, many Christians and Pagans were preferred. Although, adds this candid writer, the taking of Rome by Alaric was the occasion of many reflections upon the Christians, from which they have been vindicated both by Augustine and Origen, the event was very prejudicial to the interests of Gentilism, and consequently conducive to the progress of the Christian religion.

ALARIC II. king of the Visigoths, succeeded his father Euric in 484, and reigned over all the country between the Rhone and the Garonne; adapting himself to the Theodosian collection of laws, which he published as the law of the Visigoths, and which has been since known by the title of the code of Alaric. By permission of this Arian prince, the orthodox prelates held a council at Agde in 506; but notwithstanding this influence of toleration, Clovis, the powerful king of the Franks, engaged in a war with a view of dispossessing him of his dominions, and alluded as the motive of it, that he was going to see the Arians proprietors of the fairwell portion of Gaul: "let us march," says he in his speech to the Nobles at Paris, "and with the aid of God vanquish the heretics, and then possess and divide their fertile provinces." After holding a conference with Alaric, in a small island of the Loire, near Amborf, which seemed to terminate amicably, Clovis marched against him with the confidence and enthusiasm of a meigner commisioned from heaven, and having passed the ford of the Tart, over the Vivonne, to which he was guided by a white hart of singular size and beauty, he halted, under the direction of a flaming meteor that hovered over the cathedral of Poitiers, to attack the Gothic army, more numerous than his own, but enfeebled by a long and luxurious peace. At a village about ten miles south of Poitiers, still named Champagné St. Hilaire, the two armies engaged; but that of the Goths was prepared for a defeat by terror and confusion. They rallied, however, in their extreme diftrusts, and the martial youths, who had clamorously demanded the battle, refused to survive the ignominy of flight. The two kings encountered each other in single combat. Alaric fell by the hand of his rival, A. D. 507, and the victorious Frank was preferred by the goodhearts of his curials, and the vigour of his horse, from the spears of two desperate Goths, who furiously rode against him, to revenge the death of their sovereign. Alaric was succeeded by a natural son, Gelas, who took possession of his throne. Mod. Un. Hist. vol. xvi. p. 6. Gibbon's Hist. &c. vol. vi. p. 330—335.

ALARIO, in Ornithology, Cape inch of Latham, or sarrow from the Cape of Good Hope of Albinius, a species of Fringilla, with the head and breast black, the body chesnut-colour and under white, and the four lateral feathers of the tail marked with a small black line. It is in length about 4 inches, and found at the Cape of Good Hope.

ALARIS pinna, in Anatomy, the innert of the three veins in the bend of the arm.

ALARM, in the Military Art, properly denotes a sudden apprehension, conceived from some noise, or report, called also alarm, and signified by firing a cannon, beat of a drum, &c., which makes men run to their arms, and stand on their guard.

The word is French, formed from the Italian allarmi, to alarm; whence gradate allarmi, q. d. to call to arms.

Alarms are either true, that is, founded on just notice, or false. False alarms are frequently given by an enemy, either to fatigue the other's army, or by way of diversion; to keep themselves safe and quiet from attacks. Alarms of this kind are sometimes designed to try the vigilance of the picket-guard, and to render them distinctly attentive to their duty. To remedy the inconveniences of formal alarms, and prevent the horror and confusion of trumpets, and noise of warlike cries, the captains usually give the alarm, by silent advice, without noise.

ALARMS bell, that which is rung to call the people together, on some such occasion as a fire, mutiny, or the appearance of an enemy. This is what the French call tocsin. See Belfry.

ALARUM-post, is the ground appointed to each regiment, by the quarter-miller-general, to which it is to march in case of an alarm. In a garrison, the alarm-post is the place where every regiment is ordered to draw up, on ordinary occasions.

ALARMS, in Fencing, denotes a step, or stamp, made on the ground with the advancing foot.

This coincides with what is otherwise called an appel, or challenge.

ALARUM, or rather ALARUM, is also used for an instrument to awaken persons at a certain hour; one very simple contrivance of this kind, is that used by weavers. See Weaver's Alarm.

ALARO, in Geography, a river of Italy, which rises in the Apennine, and runs into the sea near Cape Stilo, in Calabria Ultra.

ALARODII, in Ancient Geography, a people who probably inhabited a country near Colchis, which was terminated by the western part of the Euxine sea. Stephan. Byz. Not. Herodot. lib. vii. c. 79.

ALARUM Thrush, in Ornithology. See Belfry.

ALARYS Bay, in Geography, lies on the west coast of Ireland, nearly south-east from Achill Head.

ALASARNE, a nation of the island of Cos.

ALASCANI, in Church History, a sect of Anti-churchans, whose dillingueuing tenet, besides their denying baptism, is said to have been this, that the words, This is my body, in the institution of the eucharist, are not to be understood of the bread, but of the whole action, or celebration of the eucharist. They are said to have taken the name from one Euanne a Lafaio, a Polish baron, superintendent of the church of that country, in Ireland.

ALASCA, or ALASKA, in Geography, a long peninsula on the north-west coast of America, formed by Bristol bay and the ocean on the north-west and north, and by the ocean and the waters of Cook's river, on the south and south-east. A number of islands, at its extremity, of which the chief in their order westward, are Oomenak, Oomahka, and Oumunak, form part of the cluster of islands, called the Northern Archipelago. N. lat. 55° 8' to 58° 1 W. long. 150° 30' to 162°.

ALASCHEIR, a town of Natolin, which, according to some Geographers, is the ancient Hyspia; and according to others, Philadelphia.

ALASCO, JOHN, in Biography, a Polish nobleman, uncle to the king of Poland, as Fox (Acts and Monuments, vol. iii. p. 32.) informs us, was a member of the Catholic church, and, as it is said by some writers, possesed episcopal dignity. But imbibing the principles of the Reformation, he became a Protestant Divine; and being under a necessity of leaving Germany by the persecution that followed the imposition of the Interim, he and his congregation found an asylum in London, under the protection of Edward VI. This excellent prince granted them the church which had lately belonged to the Augustin Friars; and by a charter, A. D. 1550, erected their congregation into a corporation. John Alasco was appointed superintendent, and four other ministers were associated with him. There were also 380 of the congregation, that were made Denizens of England. Burnet says, that he did not conduct himself with that decency which became a stranger who was so kindly received; as he wrote against the orders of the English church, both in the matter of the habits, and the posture of the sacrament, being for sitting rather than kneeling. After the accession of Queen Mary, in 1553, their congregation
gregation was dissolved, their charter revoked, and they were ordered to leave the kingdom. Some few of them remained with two of their teachers; but the greater number sought refuge in foreign countries. Alafco, and many of his companions, embarked for Denmark; but when it was understood that they were of the Helvetian confession, they were required to depart in the midst of winter within two days. From thence they emigrated, first to Lubeck, then to Wil- mar, and afterwards to Hamburg; where disputes about the mode of Christ’s preference in the sacrament excited such animosities, that after much barbarous usage, they were banished out of all these towns, and could find no settlement, till the spring of the following year, when they were kindly received at Embden, in Friesland, and permitted to remain unmolested. Such were the eminent talents and virtues of Alafco, that, during his short residence in England, he had formed a friendship with several considerable persons; and his character was so highly esteemed by Queen Elizabeth, that when she came to the crown, he wrote letters of advice and encouragement to her on the reformation of religion. Among his friends were Melancthon and Erasmus. The former addresses him in terms of high respect, and calls him his patron, and apprehending the necessity of seeking an asylum with him, he assures himself of an hospitable reception with one who could adopt the sentiment of the exiled queen. “Non ignara mali, miferis faccurrenc dico.”

“Touch’d with misfortunes I myself have known, I view with pity woes fo like my own.”

Virgil, En. 1. 634.

Erasmus, in a letter written in 1527, says of him, that he found him “a man of so amiable a disposition, that he should have thought himself sufficiently happy in his single friendship;” and in another letter, after enumerating his excellent qualities, he adds, “that which the young ought to learn of the aged, I, an old man, have learned of this youth.” The friendship between them continued as long as Erasmus lived; and Alafco was probably with him in his last sickness, as he purchased of him, when he lay on his death-bed, his valuable library.

ALA SHARR, i. e. beautiful city, in Geography, a name given by the Turks, to the ancient city of Philadelphia, on account of its beautiful situation.

ALASIA, a province of Thibet in Asia.

ALASSAC, a town of France, in the department of the Corrèze, and district of Brive, two and an half leagues north-west of Brive.

ALATA, a name given by Ptolemy to two towns, one in Arabia Decerta, and another in Arabia Felix.

ALATA CASTRUM, a town of Britain, placed by Ptolemy near the Æthnary of Bodotria, supposed to be the site of Edinburgh.

ALATA MAHA, a navigable river of Georgia in North America, rises in the Cherokee mountains, traveries the hilly country though a distance of 250 miles, and then passing through the flat country, under the name of Ockmulgee, for 150 miles, and receiving the Oconee, assumes the name of Alatamaha. After this juncture, it flows with a gentle current for 100 miles, and discharges itself by several mouths into the Atlantic. The north channel enters the ocean between Sapelo and Wolf Islands; the South channel, which is the largest and deepest, pursues its course between McIntosh and Broughton islands, and by the west coast of St. Simon’s found, between the south end of the island of that name, and the north end of Jekyll island. At its confluence with the Atlantic, it is 500 miles broad.

ALATI, or winged, in Botany, an epithet applied to the seed, stem, or leaf-fall. A seed is alated, when it has an ala or membrane affixed to it, which by its flying serves to disperse it. See Seed. The foot-fall, or petiole of a leaf, is alated, when it spreads out on the side, or is winged with membranes. Alated leaves, are those made up of several pinnated ones, or when the sides of a single petiole connect many foliages. See Leaf.

ALATERNOIDES, in Botany. See Quadruped.

ALATERNUS. See RHAMNUS and Phyllica.

ALATI, in Ornithology. See Achachactli.

ALATRO, or Alatro, an ancient city of Italy, in the Campagna di Roma, which is the site of a bishop, and a dukedom, five leagues south-east of Agnani, and 16 south-east of Rome. N. lat. 41° 44’. E. long. 13° 12.’

ALATUNGA, in Ichthyology, a species of the Scor- dier, with the first pectoral fins very long, and even small fins on each side of the tail. It is found periodically gregarious in the Mediterranean.

ALATVR, in Geography, a town of Russa, in the government of Kafan, and circle of Alatyrks, 80 miles west-north-west of Simbirin. N. lat. 54° 55’. E. long. 46° 14.’

ALATVR, a river of Russa, which runs into the Sura, near Kalyt.

ALAVA, Esquiel, Diego, in Biography, a Spanish divine, bishop of Cordova, was born at Victoria in Alava, and allied in the council of Trent, where he proposed the prohibition for holding living in commendam, and of all ecclesiastical pluralities. He died in 1562; and wrote a valuable work, intitled “De Confliis Universifalibus, &c.” c. of general councils, and the regulations that seem necessary to reform the religion and state of the Church. See ALADA.

ALAVA, in Geography. See ALARA.

ALAVDA, in Entomology, a species of Cuculio, cinereus; subglobule thorax, back marked with a transverse band and black spots, and brown legs; found in Pomerania.

ALAVA non irrigata, in Ichthyology, a name given by Rondeletius and Génet to the Blenessis pisitis of Linnaeus, or south Blenny.

ALAVA, Lark, in Ornithology, a genus of birds of the order of passerres; the characters of which are, that the head is cylindrical, subulate, and straight, bending towards the point; the mandibles are of equal size and opening downwards at their base; the tongue is bifid; and the hinder claw is longer than the toe. Pennant adds, that the nostrils are covered with feathers or bristles, and the toes divided to their origin.

The name alauda is, according to Pliny, Stretensius, and Varro, of Gaulish extracdt; and hence the French term, alouette.

The Greeks were acquainted with two species of larks; the one had a tuft on its head, and was denominated κασπαρίδα, or κασπάρια, from κασπάρι, a helmet, which the Latins render galeria, or calista; the other, a common lark, wanted this tuft; though Willughby and Pennant say, that it sometimes bristles the feathers on its head so as to form an occasional crest, which M. Buffon affirms also, from his own observation, with respect to the male. The Germans call it keech, pronouncing it sometimes leứcche, in imitation of its notes; for, according to Linnaeus, it prolongs its tute, tute, tute.
Gmelin enumerates 33 species. 1. A. Acrocephalus vulgaris of Oliva, Cadepeta of Klein, alanda von crysata of Gmelin and Aldrovand, Pallome of Buffon, and field-lark or sky-lark of Ray, Willughby, Pennant, Latham, &c. The specific characters of which are, that the two outermost quills of its tail are white lengthwise externally, and the intermediate ones are ferruginous on the inside; the length is about seven inches. The males of this species are somewhat browner than the females; they have a black collar, and more white on the tail; their size is larger, and their aspect holder; and they exclusively possess the faculty of singing. When the female is impregnated, she forms her nest between two clods of earth, and lines it with herbs and dry roots, being no less attentive to the concealment than to the structure of it. It sometimes builds its nest among corn and in high grass. Each female lays four or five eggs, which are greyish, with brown spots; and the period of her incubation is about 15 days. The young may be taken out of the nest when they are a fortnight old, and they are so hardy, that they may be coldly brought up. Some have said, that the hatches three times in the year; but this must depend on the temperature of the climate. The parent is very tender of her young; and though the does not always cover them with her wings, the directs their motions, supplies their wants, and guards them from danger. The common food of the young sky-larks is worms, caterpillars, ant's eggs, and even grasshopper; and in maturity, they live chiefly on seeds, herbage, and all vegetable substanaces. Those birds, it is said, that are destined for singing, should be caught in October or November; and the males should, as much as possible, be fed; and when they are untractable they should be pinioned, lest they injure themselves by their violence against the roof of the cage. As they cannot cling by the toes it is needless to place bars across their cage; but they should have clean sand at the bottom of the cage, that they may walter in it and be relieved from the vermin which torment them. In Flanders, the young ones are fed with moistened poppy-seeds, and forked crumbs of bread; and when they begin to sing, with sheep's and calves' hearts, lashed with bird eggs; to which are added, wheat, flup, oats, millet, linseed, and the seeds of poppy and hemp, steeped in milk. Their capacity of learning to fly is well known; and to apt is some cock larks, that, after hearing a tune whistled with the pipe, they have caught the whole, and repeat it more agreeably than any linnet or canary bird. In winter every the larks seek the highest and driest situations; but in winter they descend to the plains, and assemble in numerous flocks. In the former fezon they are very lean, and in the latter very fat, as they are always on the ground, and constantly feeding. In mounting to the air, they ascend almost perpendicularly, by successeful springs, and hover at a great height; but in descending, they make an oblique sweep, unless they are pursued by a ravenous bird, or attracted by a mate, in either of which cases they fall like a stone. These small birds, at the height to which they soar, are liable to be wafted by the wind; and they have been observed at sea, clinging to the masts and cordage of ships. Sir Hans Sloane observed some of them 40 miles from the coast, and count Tarrigeti met them on the Mediterranean. It is conjectured, that those which are found in America have been driven thither by the wind. Some have suppos'd, that they are not birds of sallage, at least in the more southern and milder climates of Europe; but they are occasionally concealed under some rock or sheltered cave; and this concealment was known to Aristotle (Hist. Anim. lib. viii. 16.), and has been ascertained by Klein. Thoren (Voyage du Levant, tom. i. p. 493.) says, that the larks appear in Egypt in the month of September, and continue there till the end of the year. See Migration.

The lark is found in all the inhabited parts of both continents, as far as the Cape of Good Hope; though Vilhaut says, that it is not found on the Gold coast; nor, according to Averroes, in Andalusia.

This bird, and the wood-lark, are the only birds which sing whilst they fly. The higher it soars, the more it strains its voice, and lowers it till it quite dies away in descending. When it ascends beyond our sight, its music is distinctly heard; and its song, which is full of swells and falls, and thus delightful for its variety, commences before the earliest dawn. Milton, in his, Allegro, has admirably expressed these circumstances; and bishop Newton observes, that the poet gives a fine picture of the state of the mind, whilst he is beautifully describing the scene of rural cheerfulness, in a situation,

"To hear the lark begin his flight,
And singing startle the dull night,
From his watch-tower in the skies,
Till the dapple dawn doth rise."

In a state of freedom, the lark begins its song early in the spring, which is its season of love and pairing, and continues to warble during the whole of the summer. The Hon. Daines Barrington (Phil. Trans. vol. lxxxiii. part ii. p. 282.), reckons this among the best of the singing larks: and as it copies the warble of every other bird, he terms it a mocking-bird. See Song of Birds.

These birds, which are esteemed a delicacy for the table, though Linnaeus thinks the food improper for gravely complaints, are taken with us in the greatest numbers, in the neighbourhood of Dundable. The fenon begins about the 14th of September, and ends the 25th of February; and during this time, about 4000 dozen are caufe for supplying the London markets. These caught in the day, are taken in Clap-nets, till the 14th of November. See DOING. But when the weather becomes gloomy, and also in the night, the larker makes use of a tramnel-net, 27 or 28 feet long, and five broad, which is put upon two poles 18 feet long, and carried by men under each arm, who pass over the fields, and quarter the grounds as a setting dog. When they see or feel a lark strike the net, they drop it down, and thus the birds are taken. The darkest nights are the most proper for their sport; and the net will not only take larks, but all other birds that roost on the ground; among which are woodcocks, fine pipes, partridges, quails, field-fares, and several others. In the depth of winter people sometimes take great numbers of larks by nooses of horse-hair. The method is this: take 100 or 200 yards of packthread; filter at every six inches a noose made of double horse-hair; at every 20 yards the line is to be pegged down to the ground, and so left ready to take them. The time to use this is, when the ground is covered with snow, and the larks are to be allowed to it by some white cats, scattered among the nooses; they will soon fly to these, and in eating will be hung by the nooses. They must be taken away as soon as three or four are hung, otherwise the net will be frightened; but though the others are feared away just where the sportman comes, some will be feeding at the other end of the line, and the sport may be thus continued for a long time. As the sky-lark is a kind of mocking-bird, and apt to catch the note of any other which hangs near it, even after its own note is fixed; the bird-fanciers often place it next to one which hath not been long caught, in order, as they term it, to keep the caged sky-lark honest.

The
The method of catching larks by lime-twigs, practised in French Lorraine, is as follows. For this purpose, 1500 or 2000 willow rods, about three feet, ten inches long, straight and well smoothed, are provided. These are sharpened and slightly burnt at one end, and the space of about a foot from the other end is covered with bird-lime. The flake is planted in parallel rows, in a situation which abounds with larks; the rows are at such a distance as to admit of a person passing between them; and the flake is fixed at the distance of a foot from each other, and opposite to the interval in the next row. The chief art consists in placing them, so that they shall retain their perpendicular position till they are touched, and fall immediately upon a lark’s brushing against them in its flight. When the lined rods are planted, an oblong square is traced, with one of its sides presented to the ground where the larks are lodged, and at each corner is erected a flag, which serves as a mark to the fowlers, and sometimes as a signal for their manoeuvres. In Autumn, about four or five o’clock in the afternoon, the company attending this sport is divided into two detachments; one is assembled at the flag on the right, and the other at that on the left; and each observing the most profound silence, extends itself in an arch, so as to meet at the distance of half a league from the front, and then form one rank, gradually closing as it advances to the rods, and thus driving the larks before it. About five-fifteen, the middle of the line ought to be within two or three hundred paces from the front; and this is the time when they charge; that is, they proceed cautiously, pause or lie on the ground, rise up or pull forward, according to the commands of their leader. Upon the proper conduct of these manoeuvres depends the success of the sport; for thus the larks will be enclosed, and mounting no higher than three or four feet, they will rush forward and be caught among the lime-rods, and falling to the ground with these, they may be picked up by the hand. If it be not too late, a second line is made on the opposite side, at the distance of 50 paces, which drives back the larks that had escaped; and this is called taking about. One hundred dozen of larks or more are sometimes caught in one of these sweeps, and the sport is reckoned bad when only 25 dozen are taken. Although lark numbers are taken in this way, and others destroyed by the voracious tribes, their fecundity is very great; and they are naturally long-lived, the term of their excellence being, according to Olbius, ten years, and as others say, 12, 22 and even 24 years. Larks abound in various parts of Germany, and Keyfier (Travels, vol. iv. p. 315.) informs us, that those about Leipzig, where they are very numerous, are very fat, and have a very delicate flavour. The excise on these birds produces 6000 dollars, or about 500/. yearly. They are also taken in great numbers in the country about Naumburg, Meinfurg, and Halie. Of these species there are three varieties; viz. the white sky-lark, which is seldom of a snowy white colour, but tinged with yellow or brown, and which is chiefly found on the northern shores of the Baltic, in Denmark and Sweden, and in Norway; and occasionally in the vicinity of Hildeheim in Lower Saxony, and in other places. A second variety is the black sky-lark, represented by Albin as entirely of a dull brown and reddish colour, verging to black, excepting the back of the head, which is of a dun yellow, and the lower part of the belly, which has feathers edged with white: the feet, toes and nails, being of a dirty yellow. The subject of this description was caught in a meadow near Highgate, where such birds are found. A perfectly black lark is mentioned by Mauduit, which was caught in the plain of Mont-}

{A. pratensis, or pratorum sphenodymae of Aldrovand and Willoughby, abente de pre, or la faulque of Buffon, tit-lark of Tennant, Ray, Allen, and Latham, &c. of which the specific characters are, that above it is a greenish brown; its two outer tail-feathers are externally white, and it has a white line on its eyebrows. This bird is of an elegant slender shape; five inches and a half long; its bill is black; the back and head of a greenish brown, spotted with black; the throat and lower part of the belly are white; the breast yellow, marked with oblong spots of black: the tail is dull: the exterior feather is varied by a bar of white, which runs across the end and takes in the whole outmost web; the claw on the hind toe is very long, and the feet yellowish. The male has in general more yellow than the female, on the throat, breast, legs and feet. The tit-lark is found generally in meadows and low marshy grounds; and, like other larks, it makes its nest among the grasses, and lays five or six eggs, which are roundish, of a duny red colour, with many small spots. While the female hatches, the male sits on a neighbouring tree, and rides at times, flapping and clapping its wings. It feeds chiefly on the worms and insects, which it finds in new-ploughed lands; and it will live for a long time on no other food than small seeds. Like the wood-lark, it sits on trees; but it is flushed at the head noise, and shoots with a rapid flight; it has a very remarkable fine note, flanging in all situations; on trees, on the ground, while it is sporting in the air, and particularly in its descent. This bird, and many others, such as the thrush, blackbird, willow-wren, &c. become silent about Midsummer, and resume their notes in September; hence this interval is the most mute of the year’s three vocal seasons, Spring, Summer and Autumn. Perhaps the birds are induced to sing again as the autumnal temperament resembles the vernal. The tit-lark inhabits England, France, Germany, Italy, and Sweden. Albin says, that it appears in England about the beginning of April, and that it departs about the month of September. It is said to be fond of the company of its fellows, and when it cannot get the society of these, it will intermingle with the flocks of finches and limnates, which it meets with in its peregrination. The varieties of this species are the white tit-lark, differing from the preceding in its plumage, which is yellowish white, but yellower on the wings, with brown bill and feet, seen by Aldrovand in Italy, and reckoned by Ray in the birds of Poland; and the tit-lark with black feet. 3. A. arvensis, le cuivre de Buffon, wood-lark of English writers, is specifically characterized by a white annular belt, encircling its head. This bird is smaller than the sky-lark, and of a shorter thicker form; the colour of the plumage paler; the first feather of the wing is shorter than the second; the bill is very long and somewhat bent; it perches on trees; it haunts the uncultivated tracts near copses, without penetrating the woods, whence its name; its wings, or its form, makes warble of the nightingale, or the whistling of the blackbird, than that of the sky-lark; its note being less sonorous and less varied, though not less sweet; and it is heard not only in the day but in the night, both when it flies and when it sits on a bough.

This bird builds on the ground, and forms its nest on the outside with moss, and on the inside with dried bents, lined with a few hairs, and conceals it with a turf; and the situation of the eggs is ground where the grass is rank, or become brown. It lays four or five eggs, which are dusky and blotched with deep brown; its fecundity is inferior to that
that of the sky-lark, and its numbers are not so great; it breeds earlier, since its young are sometimes flown in the middle of March, and therefore they pair in February, at which time, and not before, they part with their last year's brood; whereas the common lark does not hatch before the month of May. This is a very tender and delicate bird; so that, according to Albin, it is impossible to rear the young taken out of the nest: but this is the case only in England and such cold climates, for in Italy they are removed from the nest, and reared at first like the nightingale, and afterwards fed upon pane and milklet. The wood-lark feeds on beetles, caterpillars, and seeds; its tongue is forked; its flomach muscular and feedy; and it has no claw, but a moderate dilatation of the lower part of the oesophagus, and its ceca are very small. It lives ten or twelve years. The males are distinguished from the females by their larger size; the crown of the head is also of a darker colour, and the hind tail longer; its breast is more spotted, and its great wing-quills edged with olive, which in the female is grey. The wood-lark mounts high, warbling its notes, and hovering in the air; it flies in flocks during the winter colds; it is found in Sweden and Italy, and is probably diffused through the intervening countries, and consequently over the greatest part of Europe. It is also found in Siberia, as far as Kamtchatska, and in the island of Madagascar. Of these larks, like the common fort, some are migratory, and some stationary. In autumn the wood-lark is fat, and is then excellent for food. There are three feafons, according to Albin, for catching wood-larks. The first is the summer, or the months of June, July, and August, when the small branchers begin to chirp, before they undergo the moulding. The second is the month of September, when they fly in flocks and roam from one country to another, roving over the pasture grounds, and perching on trees near lime kilns. The young birds now change their plumage, and are not distinguished from the old ones. The third and the most favourable season for catching wood-larks, begins with the month of January, and lasts till the end of February, when they separate to pair. The young birds, which are then caught, make generally the bell fingers; they chirp a few days after, and with a clearer tone than those that are caught at any other season. Those that are taken in the Summer months are usually taken in nets, by the help of a hawk. With this view, the sportman is to go out in a dewy morning, and fixing on some hill, he is to go to that side of it which faces the rising sun; for this is the place which they are sure to frequent. He is then to take out a hawk, and a small net at the end of a flick: when he fees a bird, he is to shew the hawk, upon which it will squat down; and on his approaching near, and making the hawk flutter over the place, the bird will only lie so much the closer, so that he may go up and lay the net over it, and thus take it without injury. The bell wood-larks that are kept in cages, have been caught in this manner. A better way of taking numbers of them, is to prepare a net made like that for taking partridges, only with much smaller meshes; three or four perfections are to go out with this, and one of them is to take out a hawk, which serves in the same manner for the larks, as the setting-dog does for the partridges. Wherever a flock of these larks is seen together, which is very common, the whole flight keeping with the female till the next coupling season, the hawk is to be shewn; and on his hovering, they will all lie still, and the net may be easily drawn so completely over them, that not one can escape. The best time for taking this bird for the cage is July, or the preceding or following month. Those that are put into the cage at this time, sing presently, but their long-time is not lasting, for they soon fall to molting, in which late many die; but if they get over it, they commonly prove very healthful afterwards, become very tame and familiar, and sing sweetly. Those which are taken in the latter end of September are generally very strong and sprightly; but they do not sing till after Christmas. Those taken in January and February generally prove the best of all; they generally begin singing in two or three days, or at the utmost in a week after they are taken.

The method of keeping them in health in the cage is: there must be two pans of food, one containing meat, the other oatmeal and hampce. The following is very good food: boil an egg very hard, to which add the crumb of a half-penny loaf and as much hemp-fee; let the egg be chopped very small, and the hempseed bruised in a mortar; when these are mixed, the bread is to be crumbled in among the ort, and the whole to be rolled together with a common rolling-pin, and kept for use. There must be some fine small gravel strewn at the bottom of the cage, and renewed at farthest once in a week. This will prevent the bird's feet from injury by being clogged with dung; and if it is basking in this will also keep him from being lousy, after which few birds are of much use. A perch must be in the cage, and it should be lined with green baize, or made of fine matting, of which the lark is very fond. When the bird is first taken, some meat should be thrown on the sand in the bottom of the cage; for the bird will be sometimes almost famished before he finds the meat in the pan. The cock-bird of this kind is known from the hen by the loudness and length of his call, by his tailfeathers he walks about the cage, and by his doubling his notes in the evening, as if he were going with his mate to roost. A better rule than all others, however, is his singing strongly; for the hen wood-lark sings but very weakly. Both the cock and hen of this kind are tender, and subject to many disorders; the principal of these are, cramps, giddiness of the head, and breathing lice. Cleanliness is the best cure for the first, and the least of these complaints; but we know of no cure for the other. A good strong bird will last very well for five or six years, and frequently improve during the whole of this time. The lark is not only a very agreeable bird for the cage, but it will also live upon almost any food, so that it have once a week a fresh tuft of three-leaved grasses put into the cage with it. The wood-lark is one of the sweetest of our singing-birds, and is indeed very little inferior to the nightingale, when in good health; but we are not to judge by such as are made feebly by improper food, or want of cleanliness in their cages.
wagtail and tilt-lark. It inhabits heaths and uncultivated tracts, and frequently the oat-field, after the corn is reaped, where birds of this species gather together in numerous flocks. In spring, the male perches to discover or to woo his mate, and sometimes he mounts into the air, lingering with all his might, and then descends quickly to pair on the ground. When a person approaches the nest, the female betrays her fear by her cries; whereas, other larks are silent and unmoved, when danger is apprehended. They make their nest close to the ground, sometimes in furze-bushes, and form it of moss, lined with straw and horsehair. The egg is half the size of that of the sky-lark, which it resembles, and its tints are lighter. When the young males are reared for the sake of their song, they require great attention. The egg must be covered with a green cloth, little light be admitted, and plenty of ant's eggs must be provided. By degrees bluish hemp-feed, mixed with flour and yolks of eggs, may be substituted. The meadow larks are caught like the sky larks, with the drag-net, and also with line twigs, placed in the trees which they haunt. They associate with the finches; and both arrive and depart with these. They are found in Italy, Germany, England, Sweden, &c. They live on small seeds and insects; and their flesh, when fat, is excellent. The meadow-lark of Britain differs from that of Linnaeus; as in that of the latter, all the quills of the tail, except the two middle ones, are white from their origin to half their length, but in that of the former, the two outermost quills only are white. Of this species there is a variety, viz. the pinicola.

5. A. trivialis. A. siponaria of Brünn, pipola f. anthus of Aldrovand, L'audou io pipio of Buffon, the small lark of Ray and Willughby, the pipit lark of Albin, the graffunner of Latham, is distinguished by brown tail-quills, the outermost half white, the second white at its middle like tip, with a double whitish line on the wings. The German epithet pipio, and the English pipit, formed from the Latin pipo, which signifies to utter a feeble cry like chickens, alludes to the bibulous notes of this bird. Its cry, especially in winter, is like that of the graffunner, but stronger and shriller, and it utters this, both when perched on the tailed branches among the bushes, and when it is on the wing. Its tones are soft, harmonious and clear. This little bird builds its nest in solitary spots, concealed under a turf, and its young are frequently a prey to the adders. It lays five eggs of a light greenish colour, thinly sprinkled with deeper coloured specks. The graffunner larks appear in England about the middle of September, and great numbers of them are caught in the environs of London. They are found in Sweden and Germany, as well as in England: they frequent the heaths and plains, and flutter at a moderate height; they chiefly feed, as the slender form of their bill indicates, on insects and small seeds, and from the diminutive size of this bird, being about five inches and a half long, it may be inferred, that it is not long-lived.

6. A. crista, Ketoabas; astra, astra, i.e. the helmet-lark having a crest of Ariflett; the galeria of Pliny and galera of Varro; A. cristata of Brünn, A. cristata major of Ray, Aldrovand and Gmelin; lathina cristata of Oliva; le coque de Buffon, the helmet or crest of the German, and crested lark of Willughby, Albin and Latham, is distinguished by black tail-quills, the two outermost white at their exterior edge, its head crested, and its feet black. Its length is about six inches and three quarters. It lives in the meadows and fields, on the sides of ditches and the backs of furrows; it is often seen at the margin of water, and on the high roads, rarely in the skirts of woods, perched on a tree, and sometimes on the tops of houses, and of abbeys, &c. This lark, though not so common as the sky-lark, is found in most parts of Europe, in Italy, France, Germany, Poland, Denmark, Russia, Scotland; and does not change its abode in winter. The song of the males is loud, and yet mellow and pleasant; and their whistling is usually accompanied with a quivering of the wings. They use the field to hail the return of spring, and the dawn of the morning, and they sometimes warble in the night; being animated by fine weather, but depressed and silenced by clouds and rain; and they generally fly till the end of September. The male is distinguished, not only by the excellence of his warble, but by the strength of his call, the bulk of his head, and by a large portion of black on his breast. The female contracts her neck like the common lark, but often near the highways; the lays four or five eggs, which are all-coloured, with numerous dingy brown spots, and takes little concern in hatching them; but when the young are excluded, the provides for them till they are flown. They are said to breed twice in the year. They are easily reared, but cannot be supported in a cage, without difficulty, for a whole year: their bell food is ant's eggs, ox and sheep's hearts minced, and bruised hemp-feed and millet. The proper season for raising these birds is autumn; and great numbers are then caught in a plump flate on the verge of the forests. They may be decoyed by the call, and thus differ from sky-larks; besides, they never conure in flocks; their plumage is less varied and more white; the bill longer, the tail and wings shorter; they do not mount so high in the air, are less able to struggle with the wind, and return sooner to the ground. In other respects the two species are alike.

The crested lark is the only one that may be instructed in a month; it learns many airs perfectly, which it repeats without confusion, and retains nothing of its native warble; and in these particulars it is superior to the canary.

7. A. cristata, L'Alouette noir d'or des Sabres of Buffon, the rufous-tailed lark of Latham, is specifically distinguished by its blackish brown colour; its neck and back rufous-orange; the tail-quills rufous at their outward margin, the lefter and middle convarts of the wings blackish and fulvous, or of a deep yellow at their margin. Its length is scarcely five inches, is much smaller than the common sky-lark, and found at Buenos-Ayres. Buffon observing its plumage to exhibit so striking a resemblance to that of the sky-lark, considers it as a variety of that species.

8. A. capricorn. A. capricornus of Brünn, la cravatte jaune ou calandre du cap de bonne espece of Buffon, cape lark of Latham, has its three lateral tail-quills tift with white, its throat yellow, margined with black, and its eyebrows yellow. Its length is eight inches, and it is found at the Cape of Good Hope.

9. A. calandra. A. corn crista major and terra prava of Gmelin, calandra of Buffon, calandra of other writers, calandra lark of Latham, is specifically described as having its outermost tail-quill externally altogether white, the second and third tift with white, and a brown stripe on the breast. This bird is mentioned by Oppian in the second century of the Christian Era, under the appellation of Ka22x222; and he describes the bent method of catching it, since recommended by Oliva, which is to spread a net near the brook to which it usually retorts to drink. It is larger than the sky-lark, its length being seven and one-fourth inches, and its bill stronger and shorter; in other respects it exactly resembles the common lark. Its warble is more sonorous, but not less pleasant; so that in Italy a person who sings well is complimented.
complimented by saying, that he sings like a calandra. It
can, like the common lark, imitate the notes of several
birds, and even the chirping of chickens and the love-scall of
the hawk. When calanders are to be caged, in order to have
good singers, they should be taken from the nest before the
first moult, and those are to be preferred which are hatched
in August. Their food should be quite mixed with their
heart, together with seeds and crumbs of bread; and rubbish
should be laid in the cage for whetting their bill, and fuel
for them to welter in when teased with vermin. Their
wings should at first be pinioned, and instead of the top
of the cage, a canvas and feathers should be sublimated. When they are
reconciled to their situation, they will sing incessantly, and
even neglect their food to repeat their warble. The male
is larger and blacker round the neck than the female, which
has only a very narrow collar. The calandra needles on the
ground, like the common lark, under a gravelly tuft, and lays
four or five eggs. It is found in Italy, Sarathina, Provence
in France, the Phrynes, Syria, near Aleppo, the southern
part of Russia, the defects of Tartary, and even America
whether it might have been driven by the winds across the
Atlantic and thence thrive and become naturalized. Adan-
fon regards the calandra as intermediate between the fly-
lark and the thrush; but this is an analogy which must be
refracted to the plumage and external form, for the habits
of this bird and the thrush are very different.

10. A. alpaeus, A. virginiana of Buffon, bauge-col noir
of Buffon, lark, with a yellow throat of Catesby, and fin-
lark of Pennant. Latham, &c. has these specific characters;
the tail-quirks are half white on the inside, the throat is
yellow, the fripe under the eyes, and on its back, is black.
Its length is fix and an half inches, and in bulk and habit it
resembles the common lark. It inhabits North America,
Siberia, Russia and Poland; migrates in flocks, feeds on
oats and other grains and grasses; lives upon the ground;
has little or no song, and its flesh is delicious.

11. A. magnus, merula americana torquata of Buffon, la fer-
acheval ou merle a collier d'americque of Buffon, large lark of
Catesby, and rofent lfe of Peint and Latham, is char-
acterized by Limnæus as having the under-side of the body
yellow, a black curved band on the breast, and the three
lateral quills of the tail white. Above, says Latham, it is
variegated with rusty brown and black'fih, below yellow, with
a black curved fripe on the breast, and the three lateral
quills of the tail white. Its length is 11 inches. It is found
not only in Virginia and Carolina, but in almost the whole
Continent of America; and Limnæus affirms that it occurs
also in Africa. In the late of New York it appears in the
beginning of April, breeds in June, and retires in September
or October. It needles on the ground, and its eggs are
whitish. It lives in Savannas, perches on the tops of bushes,
has a brisk motion upwards and downwards of its tail, eats
carelessly anything that are found on the ground, such as those of the yellow bloomed ornith-
galum; sings agreeably in the spring; and is reckoned good
food.

12. A. minor, lesser field lark of Willughby, field lark
of Latham, is of a reddish brown colour, and the two outer
quirs of the tail are externally white. The throat is yellow;
the breast also yellow, marked with large black spots; the
belly and vent feathers white; the covert of the wings
darkly edged with white; and the legs of a very pale brown.
It is larger than the tit-lark, but distinguished from it by
the very short claw on the hind toe.

13. A. italicus, giraola of Ray and Willughby, gira-
ole of Buffon, and Italian lark of Latham, has the middle quills
of the tail bay, the left but one white at the tip, the two
outermost entirely white. Its fize is that of the fly-lark,
and it has a long nail projecting from each foot. Its head,
neck, back, and wings are of a motled colour, resembling
that of the quail. The general colour of the feathers is a
chactn brown, and their edges are variegated with white,
yellow and red; the back part of its head has a fort of
crown or ring of white feathers; its belly is white; its bill
red; and the corners of the mouth yellow, and its tail is fo
short, that it feems to have none; it is bold, however, and
elegantly variegated with chestnut-colour and white. The
feet are flesh-coloured and the nails white. It is eight
inches long, and inhabits Italy.

14. A. interudiana, farronenne of Buffon, and Longi-
lark of Latham, resembles the tit-lark. Its specific char-
acters are that the left quills but one of the tail are tont
with white; the outermost are partly brown, partly white.
Its length is seven inches. It is found in Louthiana.

15. A. rubra, A. Penfivactia of Buffon, pellucida aux
jones brunes de Penfivactia of Buffon, and red lark of
Pennant and Latham, is of a brown colour, and has the space
about its eyes black, and the two outermost quills of the
tail white. It is about the fize of the meadow-lark. Its
bill, feet, and nails are of a deep brown colour; its neck,
breast, and underpart of the body, of a reddish fulvous
colour, speckled with brown; and the brown foot that sur-
rounds the eyes descends on the cheeks and is bounded by a
zone, partly white and partly bright fulvous. This is a
migratory bird, common to both continents. It appears
in Pennsylvania in the month of March, and advances north-
ward at the end of May; and it was seen by Mr. Edwards
in the vicinity of London. He remarks, that when the
wing is gathered up, the third primary feather reaches to
the tip of the first.

16. A. moffillana, la rouflaine of Buffon, and munl-lark
of Latham, is rufous, below rufous white; its checks and
breast are marked with brown lines; its tail is black with a
rufous margin. Its length is six and one-fourth inches.
The bill, feet and nails are yellowAH. It haunts wet
situations, frequents the sandly margin of the Mefelle, and
sometimes breeds on its banks, near Metz, where it appears
annually in October, and some few are caught. It begins
its song at dawn, which is said to be very pleasant.

17. A. mahabaria, Malabar lark of Latham, has the
primary and secondary wing-feathers and the tail, of a forsid
brown colour, tawny at their margin. The bill is black,
the feathers that form the crest on the head are brown,
and their apex white; those on the neck are tawny with a black
longitudinal streak aalling along the middle; the throat and
abdomen reddish white; the feathers of the back and the
coverts of the wings brown, towards their edge tawny,
and marked with a white spot, and the feet are tawny. This
is a beautiful species and found in Malabar.

18. A. gingica, Gingi lark of Latham, has the upper part
of the body celerous brown, its under side black. The
bill and feet are reddish grey. Its length is four and one-
half inches, and it is found in Coromandel.

19. A. tartara, A. nigra of Fæloc, and black lark
of Latham, has a subfuscated tail, the two intermediate
quirs of the tail slightly white at their limb, the next
whitish at the apex, and the lateral very black. This bird
inhabits the very dry salt deserts between the rivers Volga
and Ural, the Caspian deserts, and the whole southern desert
of Tartary; it is gregarious in winter, solitary in summer,
and has scarcely any song.

20. A. mutabilis, mutable lark of Latham, has a black
forked
furred tail, the outer quills of the tail on both sides unspotted, the rest grey at their apex, and the bill white. It is about seven inches in length, and inhabits the deserts of Africa. This bird, when young, is wholly cinnamon, and the colour gradually changes into black.

21. *A. semirufa*, *A. cristata minor* of Ray and Brünn, the *Ibu* of Buffon, and *A. cristata minor* of Pennant, Willoughby and Latham, is characterized by black tail-quills, the outermost being white on their exterior edge, its head crested, and its back red. The crest is very long in proportion to its face. This bird is distinguished by its cry, *tu, tu, tu*, which is disagreeable, and never uttered except it flies; it likewise mimics oddly the songs of other birds; it frequents heaths, commons, and open woods, where it builds its nest; and in the rigour of winter, when the ground is covered with snow, it returns to dunghills, and picks up its food about barns, and also haunts the highways for the same purpose. It is found in Italy, Austria, Silesia, and Poland, and seen in flocks in the northern counties of England. It remains in Germany through the winter, and leaves the country about the equinox.

22. *A. undulata creola* of Buffon, *undulata lar* of Latham, has its tail quills brown, tawny at the edge, its feet yellowish, and the feathers of its crest black, edged with white. Its length is six and three-fourths inches. This bird can elevate its crest at pleasure; it is properly the bird of the morning, and it begins its song with the earliest dawn, and seems to route the other birds. The male does not lose its mate when the hatches, and when the one is employed in seeking its food, which consists of caterpillars, grasshoppers, and snails, the other keeps watch, to give signal when danger threatens. It was found by M. Guy, in Provence; and Sonnerat brought a bird very like it from the Cape of Good Hope, only that it had no crest, that the colour of the under part of the body was more yellowish, and that none of the quills of the tail or wings were edged with white. It was perhaps a female, or a young bird of the year’s hatch.

23. *A. senegalensis*, *A. senegalensis* of Buffon, *la cristata* of Buffon, and *Senegal lar* of Latham, has the two middle quills of the tail grey, the rest brown, the outermost rufous white on the outer side, and the head somewhat crested. Its length is five and a half inches. It inhabits Africa, and perches on the trees, which grow on the banks of the Niger; and is also seen in the island of Senegal.

24. *A. tchenna*, *tellevacca lar* of Latham, has the four intermediate quills of the tail black, the rest tawny white, the body above tawny, and below tawny white. It inhabits the vicinity of Gibraltar.

25. *A. lophana*, *Portugal lar*, has the quills of the tail tawny latte-cast, the exterior ochreous, the feet flesh-coloured, and the bill red. It is found in Portugal.

26. *A. africana*, le *fide du cap de bonne esperance* of Buffon, *African lar* of Latham, has the tail, the quills, and the covert of the wings brown, edged with white, the inferior part of the body white, variegated with oblong brown spots. Its length is eight inches. It is found at the Cape of Good Hope.

27. *A. cenera*, la *cendrille* of Buffon, *cinereous lar* of Latham, is of a cinereous colour; its belly and vent white; the quills of its wings and tail brown, the outermost externally white near the tip. Its length is six inches. Buffon queries whether there be any analogy between this bird and the cinereous lark which Dr. Shaw saw in great numbers near Bilerta, in Africa?

28. *A. rufa*, la *variacore* of Buffon, *rufous lar* of Latham, has its tail-quills brown, the eight intermediate ones rufily-coloured at the edge, and the outermost white at the edge. The bill is brown; the body blackish above, variegated with rufous tints, and below white; the feet are yellowish; the length five and one-fourth inches. Comerfon brought this beautiful bird from Buenos Ayres, near the river de la Plata.

29. *A. Nova Zelandiae*, New Zealand lark of Latham, has white eyebrows, a black bar on each eye, its vent cinereous, and its feet reddish cinereous. It is seven and a half inches long. The bill is ash black above; the body black above, white below, the feathers edged with ash colour; the claws black, the hind one almost straight. It is found in New Zealand.

30. *A. mongolica*, mongolian lark of Latham, has the crest of the head ferruginous, bound with a white annular fillet, and in the middle a white spot. It is larger than the calandra, which it resembles; it sings sweetly on the ground, and inhabits the famine marshes that lie between the rivers. Onon and Argon.

31. *A. fibrica* has the secondaries white, the crown of the head, ears and shoulders ferruginous, and the outer tail quill externally altogether white. It inhabits the fields of Siberia, near the Irtis, skimming on the ground, in its flight and song inferior to the sky-lark, in stature larger, and similar to the calandra.

32. *A. flavus*, la *couverture de pierre* of Buffon, has the upper part of its body red and grey, varied with brown, the under part whitish, the face, throat and sides of the head yellow, the tail-quills black, edged with grey, except the outermost which are white at their margin. The yellow of the face, &c. is set off by a black spot between the eye and the bill, that joins to another larger one immediately below the eye; and the breast is ornamented with a broad black girdle. The bill and feet are leaden-grey. Its length is five and three-fourths inches. It inhabits Siberia, but is rarely found. Of all the birds denominated larks, this is the most conspicuous for beauty of plumage.

33. *A. obscura* has the under part of the body white without spots, and the posterior claw shorter than the toe. It inhabits Sardinia, and agrees with the common lark in its size and nearly in its colour, but as the hind claw, though longer than the others, is shorter than the toe. Gmelin queries whether it belongs to the genus alauda.

The *alauda* yellowgoa, or yellow lark, is black, variegated with rufous and white. It is found at the lake Yelton, beyond the Volga; is gregarious, and in the month of August is fat and delicious.

The *A. obscura* of Latham, or dufky lark of Lewin, is now described under the name of the *A. petrofa*, or rock lark, by Mr. G. Montagu. Its specific characters are, that it is olive brown, yellowish under the body, the sides of the neck and breast are spotted with brown, and the half of the outermost tail-quill is white. Mr. M. in 1791 discovered this bird to be a native of the coast of South Wales, and all the rocky situations; and it was known to the fishermen, under the name of the rock lark. Mr. Pennant is supposed to have met with this bird, as in his felloo edition of British Zoology, he has given a variety of the tit-lark (*A. pratensis*) with dufky legs, shot on the rocks on the coast of Cornwall.

This bird affects only the rocky parts of the coast; and in winter it is occasionally found in the marshes, seeking its food, which is marine infects. It begins its song early in the Spring, which very much resembles that of the *A. pratensis*; as it mounts in the air like that bird, and returns again to the ground, or to some neighbouring rock, with motionless wing. It breeds early in the Spring, a nest with five eggs having been found on the 15th of April; it was placed upon the shelf of a rock, behind a tuft of eanie
A LA

grafs, under a small bush, and was formed of dry grafts, marine plants, and dry moss externally, and lined with finer grafts and a few long hairs. The eggs were of a dirty white, sprinkled with numerous specks of brown. The length of the bird was fix and three-fourths. Mr. M. has lately observed this bird on the coast of Kent and Suffolk. TRANSACT. OF LINNEAN SOCIETY, vol. iv. p. 41—43.

A LAUNA, in Ancient Geography, a town of Britain, belonging to the Damini, situated, according to Horley, near Falkirk, upon the Roman wall, at a place called Camelon, where are still some vestiges of a Roman town; but Baxter mentions that it was where Stirling now stands. Alunna was also a town of Gaul, placed by M. d'Anville among the Unelli, north of Coffedia, and west of Crociatunum.

A LAUNIUM, a town of Gaul, placed by M. d'Anville in the mountains between Sagunero to the north-east, and Apta Julia to the south-east.

A LAUNUS, a river of Britain, which Horley supposes to be the Tweed, but Camden and Baxter think it is the river Alne, in Northumberland; and their conjecture is favoured by the affinity of the names. A LAUNUS mons, a name given by the ancient geographers to the Valday mountains of Russia.

A LAUSA, or ALOSA, in Ichthyology, a species of Clupea. See Shad.

A LAUSI, or ATUASI, in Geography, a town of South America, in the jurisdiction of Cuenca, in Terra Firma.

A LAUT, or ALT, a river of Turkey, in Europe, which rises in the mountains that separate Moldavia from Transylvania, and runs into the Danube near Nicopolis, in Bulgaria.

A LAY, denoting in the Turkish language, "the triumph," in Modern History, a ceremony which accompanies the assembling of the forces of the Turks upon the breaking out of a war. It is described by Baron Tott, in his memoirs, as a kind of masquerade, in which persons of the several trades and manufactures present to the spectators the implements and exercice of their respective occupations. The labourer draws his plough, the weaver handles his shuttle, the joiner his plane; and these persons are seated in cars, richly ornamented, and commence the procession; then follows the standard of Mahomet, which is brought out of the foragio, and carried to the army, in order to enforce victory to the Ottoman troops. An air precedes this banner, proclaiming with a loud voice; "Let no infidel dare to profane with his presence the holy standard of the prophet; and let every Mussulman who perceives an unbeliever, make it known, under pain of repudiation." From this moment, a religious fury seizes the people, and impels them to commit acts of the most shocking barbarity. No regard is paid to sex or age, and many fall victims on the occasion.

A LAYA Cape, in Geography, the easter extremity of Venezuela, or Little Venice, which extends to and from the entrance of the gulf of that name, 130 leagues.

A LAYMO, MARC ANTHONY, in Biography, a Sicilian by birth; in the year 1610, being then only 20 years of age, was made doctor in medicine. He then went to Palermo, where he was particularly celebrated for his fascinations in treating the plague, which raged in that city, in the year 1623. He died 1662, aged 72 years, and was buried in the church of St. Mary of the Agonizers. In what estimation he was held by his fellow-citizens may be judged by the following lines, part of the inscription on his monument:

"En humi firmatur, "Quia humo ipse totam Siciliam dira feviente "pelle liberavit."

He left several works, part in manuscript, the following were printed: Discurso interno alla prelevazione del morbo contagioso e mortale, che regna al presente in Palermo, &c. 1625. 4to. Consolitatio pro ulceris Syriaci nane vagantis curatione, Fanorni, 1632. 4to. Dailiceticus live de succedaneis medicamentis, 1637. 4to.; Consigli medicopoliti, &c, della pezza. 1652. 4to.

A LAZELAIA, in Geography, a river of Siberia, which runs into the Frozen Ocean. N. lat. 72° 40'. E. long. 142° 14'.

A LAZELISKO, a settlement in Siberia, on the river Alazeya, 30 leagues west-north-west of Nizmi Kovinski. N. lat. 69° 40'. E. long. 144° 14'.

A LAZIA, in Ancient Geography, a town of Asia, situated on the river Rymus, which passes through Mygdonia. Strabo, Geog. tom. ii. p. 828.

A LAZONES, a people of Asia, mentioned by Strabo, Stephanus Byz. &c. whose origin and history are unknown. They were reckoned among the Scythians, who dwelt on the borders of the Euxine sea, and Alazia was probably their capital. Apollo was the object of their worship.

A LAZONIUS, a river of Asia, which descended from Mount Caucasus, and ran into the Cyrus; but Pliny says, that this river separated the Iberians from the Albians, and was therefore more to the west. Strabo. tom. ii. p. 764.

A LB. See ASPER.

A LB, in Geography, a river of Germany, which rises three miles west-north-west of Wildbad, in the circle of Swabia, and runs into the Rhine, about five miles west-north-west of Durlach.

A LBA, a city of Italy, in the duchy of Montferrat, situated on the river Tanaro; the fee of a bishop, who is suffragan to the archbishop of Milan, and whose diocese is of considerable extent. Besides the cathedral, it has three parochial and three other churches, with several convents. It is 18 miles south-east of Turin. N. lat. 44° 40'. E. long. 7° 50'.

A LBA, in Ancient Geography, a city of Dacia, which some suppose to have been the site of the present Bie:

GORD.

A LBA, a town of Spain, in the country of the Baiti-

tani, south-east of Bari.

A LBA, now Elvas, a city of Lusitania.

A LBA, a river of Gaul, now Aube.

A LBA FERMA, or ALBAM, in Antiquity, was a yearly rent, payable to the chief lord of a hundred; so called, because it was paid in white money, or silver, and not in corn, which was called black meal.

A LBA Fanfis, now Alba, in Ancient Geography, a town of Italy, to the north-west of the river Euphrasus, in the country of the Maril. It was denominated Fanfis, in order to distinguish it from other Italian cities of the same name, and particularly from Alba Longa. The inhabitants were denominated Albones. Silvius Italicus (Tunici. lib. viii. v. 508.) refers to it:

A LBA. Interioreque per nodos "Alba sedet campos, pomnique repandit ariditas."

This town was situated in the centre of Italy, amidst mountains
mountainous pastures, and excluded from all means of escape; and it was therefore chosen for the state-prison, to which the Romans confined captive princes, after having barbarously dragged them through the streets of Rome, at the chariot-wheels of a triumphant cavalcade. Here Perdicca, king of Macedon, and his son Alexander, terminated their career, after the triumph of Philip. Syrakus, the Numidian, and Biminus, king of the Aequi, were also condemned to this gaol, by the particular clemency of the senate, which sometimes indulged its savage disposition, by putting its captives to death. The natural security of this place was augmented by artificial fortifications: the ruins of which prove, at this day, their ancient solidity. For the entertainment of the gaolers, which was required in a place of such importance, an amphitheatre was erected, the shattered remains of which are still visible, as well as the foundations of a temple, and other buildings, of Roman times. Lucius Vitellius, brother of the emperor of the same name, had a villa near this place, famous for the variety and excellence of its fruit-trees, which he brought from Syria. His gardens were the nurseries, where several of the most delicious stone-fruits, that are now so common in Europe, were first cultivated and multiplied. Against the severity of this climate, in which the adjoining lake is frequently frozen over, it was necessary to hibernate the trees transplanted from Asia, and to treat them with peculiar attention, in order to rear them to perfection. Suidas's Travels, vol. iv. p. 357.

Alba Helviorum, or Alba Longa, i.e. Alba Longa, a town of Gaul, in the provincia Noricum, was the capital of the Helvis, and situated at a small distance from the Rhone. Hence the Helvis were denominated Albenae. This town was afterwards called Vivarium, and it is now Viviers.

Alba Julia, now Weissenburg, a town of Transylvania, on the river Maurus or Marisch, supposed to be called Alba Julia, after Julia Domna, the wife of Severus, and mother of Caracalla. There are several inscriptions, however, near this place, which bear Cal. Apuli, i.e. colonia Apulensis, without the least mention of Alba Julia, though they were inscribed after the time of Caracalla. Besides, Ulpian, reciting the colonies of Dacia, calls this colony Apulensis, and another Alba nor Julia. From these circumstances it has been inferred, that Alba Julia is a corruption of Apulius. It was also called Apulum Angustianum. Ceilienius, tom. i. p. 381.

Alba Longa, a city of Italy, in Latium, south-east of Rome, founded by Alcitus, the son of Eneas, and a colony from Lavinium, at the foot of mount Albaneus, according to Blaris's Chronology, in the year 1152 before Christ, or 300 years before the foundation of Albaneus, and selected by him as the place of his residence, and the capital of his kingdom. It was called Alba, we are told, from a white snow found by Eneas, which swelled 30 pigs on that spot, and which afforded an omen, that a city would be built there within 30 years. See Varro, R. R. (l. xi. r. iv.) Aurelius Victor de orig. Rom. gentis, and Propertius, lib. iv. eleg. 1. ver. xxxv.

"Et fletit Alba potens, alba fuis omine nata."

The epithet longa, was added to distinguish it from the Alba of the Mars, or to express its length, as it was extended along the lake near which it was built. Its situation was at an equal distance between the lake and the mountain; probably between the present city of Albano and the lake of Castel Gandolfo, and peopled by a mixed colony of Latins and Trojans. The inhabitants of this city were called Albani. It was 30 years after Lavinium was built, that Alcitus fixed his abode at Alba: and there he died, after a reign of about 33 years, of which he parted at his new settlement. Upon the death of Alcitus, the Latins resolved to unite Albani and Lavinium into one sovereignty, under Sylvius; and Sylvius was succeeded by 13 kings of the same race, who, for near 400 years, reigned at Alba. Procas, one of them, bequeathed the throne to his elder son Numitor; but he was deposed of the kingdom by his brother Amulus, who, in order the more effectually to secure himself, killed the son of Numitor, and consorted his daughter, Rhea Sylvia, to the worship of Vesta. Rhea, however, was delivered of the twins, Romulus and Remus; who, after having been refused from the Tiber, into which they were thrown by order of Amulus, were suckled by Acca Laurentia, the wife of Faustulus, and educated by the Galli, under the direction and order of Faustulus. Upon a quarrel between the hereditary house of Amulus and that of Numitor, the two brothers took part with the former against the latter; and, in consequence of the fray that was thus occasioned, Remus was carried before Numitor to receive punishment. When he was questioned concerning his birth and parentage, his reply excited, in the mind of Numitor, a lively remembrance of his two grandsons, and his anger was changed into tenderness. The two brothers concurred at length in dethroning Amulus, and restoring their grandfather Numitor to the throne. They then, by the advice of Numitor, undertook to found a new colony on the lands near the Tiber, where they had been taken up, and which he granted them for this purpose. Romulus and Remus differed concerning the precise spot where the new city was to be erected; the latter declaring for the Aventine, and the former for the Palatine mount. Remus, as it is said, fell in the contest that was then occasioned, and Romulus prevailed, and laid the foundations of the new city, which was called Rome, after his name. Rome, in a little while, became the rival of Alba; and soon after the accession of Tullus Hostilius to the throne, a dispute arose between the Albani and the Romans, and preparations were made for war. In an interview that occurred between Tullus and Faustus, or, as others call him, Faustus, the Albani general Tullus, proposed to determine the dispute by a single combat between himself and Faustus, which the latter declined. It was at length agreed, that three champions should be selected out of each camp to decide the difference. The champions, on the part of Rome, were the Horatius; and on that of Alba, the Curatii. Rome ultimately gained the victory over Alba, her mother-city. When Tullus afterwards made war upon the Veientes, Faustus joined him with the Alban troops, but afterwards proved treacherous and deserted him. This treachery being known, Tullus detached Horatius, who had conquered the three Albans, with a chosen body of horse and foot, to demolish Alba, as he had previously concerted the business with the senate. Faustus was ordered to be fastened to two chariots drawn by horses; and to be torn asunder; his accomplices were put to the sword; but the rest of the Alban soldiers were carried to Rome with the citizens, and the chief men among them were even admitted into the Roman senate. Thus fell, A. U. C. 89, ante Chr. 665, the city of Alba, famous for its riches, the number of its inhabitants, and, above all, for being the mother of Rome. The temple only, says Strabo, was preserved. Dion. Hal. lib. i. p. 52. Lib. iv. p. 152—157. tom. i.EDIT. Oxon. Livy, lib. i. c. 2—c. 24—29. tom. i. p. 22—38. p. 101—134. Ed. Elzev. Plut.
Romul. is dean Geography, eminent town Baka, chureli 8 the and England, of monk Picardy, not Rome, town his that follows A. Plut. Geog. were called Albenes Pompianum. It is now called Alba, without any epithet.

A. Plut. Terra, in Albem, one of the many names that were anciently given to the philosopher's Rome.

A. Plut. Bacete, or Albaeez, in Geography, a small town of Spain, in the canton of La Sierra, in the eastern part of New Calilie, situate in a fertile vale not far from the mountains that separate La Mancha from the country called the Defor. W. long. 1° 46'. N. lat. 38° 55'.

A. Plut. Albaecen, or Albasen, a town of Germany, in the circle of Wellphalia, three miles north of Covex.

A. Plut. Alback, a town of Perilia, in the province of Alderbeizan, 55 leagues south-west of Tauris.

A. Plut. Alback, is situated on the western coast of Africa, in N. lat. about 27° 15', and about 35 leagues south-west from the river Oryluls. It has a bay to called, and a cape denominated Chabbi.

A. Plut. Albarn, (St. in Biography, the first Christian martyr in England, and usually called the martyr of Britain, was born at Verulam, of pagan parents, and flourished in the third century. In his youth, he went to Rome, with Amphibalus, a monk of Caerleon, and served seven years in the army of Dioclesian. On his return to England, he was instructed by Amphibalus in the Christian faith, became a convert, and lived in the profession of Christianity till the year 303, when the Dioclesian persecution commenced; but being cited before the Roman governor, for having afforded an asylum to his preceptor, who was a Christian, and avowing his own conversion, he was ordered immediately to be beheaded. The traditionary tales of the times report many miracles which happened on occasion of his death. Bede, and other ancient writers, relate, that in his way to execution, a stream was miraculously divided to afford a passage for him and a thousand persons who accompanied him; that the executioner was converted by the miracle; that a fountain opened at the feet of St. Alban, which afforded water in answer to his prayer for allaying his thirst; and that the eyes of the executioner dropped out of his head at the instant of his giving the fatal stroke. We learn from the same authority, that many of the spectators were converted by these miracles. But the testimony of those who report them deferves little credit; and they seem to be duly appreciated by Milton, who, in his History of England, speaking of St. Alban, says: "The story of whose martyrdom, foiled and worse martyred with the sable veil of some idle fancies, more fond of miracles than apprehensive of truth, deferves no longer digression." When the east end of the church of St. Alban's was repaired, in 1257, the labourers found some leaden chalices, containing relics; and on a plate of lead, the following inscription:—

"In hoc manuolo, inventum est venerabilis corpus Sancti Albani, protomartyris Anglorum; i. e. In this manuolo is found the venerable body of St. Alban, the protomartyr of the English." Part of the hymn formerly sung on the festival of this saint, is as follows:

"Ace protomartyr Anglorum,
Miles regis angelorum,
O Albane, flos martyrorum."
but his figures of the other sex were usually lean and without masculine beauty, except in some of his heads. In his drawings he was sometimes haughty and incorrect. His pictures of the four elements in the palace of the king of Sardina, at Turin, are of an extraordinary beauty, and well preferred; the design is excellent, the draperies perfectly elegant, the colouring lovely, and the whole very correct. His other principal works are at Rome and Bologna; but as he was extremely industrious, and the productions of his pencil were highly esteemed, his cabinet pictures are found in all considerable collections. As an engraver, he made one small folio etching of Diadocida killing herself, in which he did not succeed; and in this art he did not add to the character which his other works have established. He was fond of Italian poetry, and lamented that his early education had not enabled him to read the originals of the Latin poets. In private life he was modest, affable, unaffected, attached to his family, pious in conversation, confiding to his pupils, whose works he occasionally retouched and improved. His life and faculties were continued to old age; and he died at Bologna, in 1665, aged 82 years. Pilling- ton and Strutt. Gen. Diet.  

ALBANI, Giovanni Battista, was the brother and disciple of the former, and became an admirable painter in the style, manner, and colouring of his brother. He excelled in landscape, which he designed in an exquisite taste, toucing the trees with great spirit, and giving them a peculiar sweetness of colour. He died in 1668. Pillington.  

ALBANI, John Jerom, was born at Bergamo, of a noble family, and devoted himself to the study of the civil and canon law. By the zeal with which he profected some of his own relations in the Inquisition, he recommended himself to Cardinal Alexanderinus, the inquisitor, who, upon his being advanced to the papal see, under the name of Pius V. conferred upon Albani a cardinal's hat. He died in 1591. His works were a treatise "De immaculat Ecclesiis," published in 1553; another, "De potestate Papae et Concilii," printed at Venice, in 1561; and a third, "De Cardinalibus, &c." Nouv. Diet. Hist.  

ALBANI, in History, the inhabitants of Albania, in Asia, who are said by some writers to have derived their name from their fair complexion. Ptolemy mentions a people of this denomination on the confines of Macedonia.  

ALBANIA, in Ancient Geography, a country of Asia, was bounded on the west by Iberia, on the east by the Caspian sea, on the north by mount Caucasus, and on the south by Armenia. The cities which it contained, and mentioned by Strabo, Ptolemy, and Pliny, were Teleba, Thalbis, Gela, Thiana, Thabiskas, Alban, Chadaca, Mifs, Bociata, and Cabalica, which last Pliny calls the metropolis of Albania. Its chief rivers were Cyrus, now Kur, Albanus, Caebus, Garrus, Soana, Cambyces, and Alazon, all of which discharged themselves into the Caspian sea. The whole country, now known by the names of Schirwan and East Georgia, is extremely fertile and pleasant. Strabo (tom. ii. p. 767.) describes the inhabitants as tall, robust, and graceful in their persons, excelling those of other nations in comeliness as well as in stature, and as very simple in their manners. He adds, that they were unacquainted with weights and measures, and the use of money; that they could not count above one hundred, and that they carried on trade by exchange. They chiefly devoted themselves to pasturage, and had some resemblance of the wandering tribes; they were not altogether unacquainted with the art of war, nor unused to the practice of it; their common weapons were bows and arrows; they defended themselves with shields, and bore on their heads helmets made of the skins of wild beasts. They excelled in hunting, and were famous for the dogs which they reared for this purpose. They respected age, both in their parents and others; they thought it wrong to take any notice of the dead; they buried their money with them, and lived in poverty, as they had thus no patrimony. They worshipped, as gods, the sun, Jupiter, and the moon; and the priest was next in honour to the king. Pliny (II. N. tom. i. p. 371.) says, that they were of a white complexion, and that they could see by night as well as by day. Tacitus (lib. v.) and Pliny (tom. ii. p. 311.) trace their origin to the Thessalians, who attended Jason in his expedition to Colchis, and settled in this part of the illusmus, between the Euxine and Caspian seas. According to Justin (lib. xiii.), they were descended from the inhabitants of Alba in Italy; and Ammianus Marcellinus derives them from the Maffagates. Albania was anciently divided into several small kingdoms; and Strabo (ubi supra) says, that the country had 26 different languages, and as many kings and kingdoms as languages. But the Albanians, in process of time, overcame the other petty princes, and made themselves masters of the whole country. In the time of Pompey, as we learn from Strabo, they could bring into the field 60,000 foot and 20,000 horse. Of their kings we have no account, before the reign of Alexander the Great, to whom the king of Albania is said, by Pliny (tom. i. p. 461.), to have presented a dog of extraordinary size and beauty. The next king, mentioned in history and named Orasus, was defeated by Pompey, and obliged to retire to mount Caucasus. Another king of Albania, named Pharamenes, committed great devastations in Armenia, Cappadocia, and Media, in the time of Adrian, and was summoned by the emperor to Rome. Instead of attending, he sent a number of such great coats as were then worn, made of cloth of gold, in which the emperor, as an insult to the king, ordered 300 criminals to be clad, and in that attire to fight the wild beasts in the public theatre. Upon Adrian's death, the Albanian king attended the summons of Antoninus Pius, who received him with respect and distinguished him with presents. Two other kings are mentioned; one the contemporary of Valerian, and the other of Constantin the son of Constantin the Great. The Albanians continued to be governed by their own princes till the reign of Julian the II., who is said by Zonaras and other writers to have subdued Albania by his general Leontius. Anc. Univ. Hist. vol. ix. p. 122—126.  

ALBANIA, a city of Asia in Affryia, was situate to the east of the river Titana.  

ALBANIA, in Modern Geography, sometimes called Arnaud, a province of Turkey in Europe, comprehending the ancient Illyricum, and Epirus, situate in the Adriatic, and bounded on the north by Dalmatia and Servia, on the east by Macedonia and Thessaly, on the south by Illyria, and on the west by the Adriatic. Its length is about 80 leagues, and its breadth about 20. Its capital was formerly Albanopolis; but it is now Durazzo. The other principal towns are Scutari, Du- cigno, Anti-vari, Croya, Alaffo, Velon, Datarto, Dbro, &c. The most remarkable river is Delichi, formerly Acheron; amongst the lakes we may reckon Scutari, and to the cliffs of mountains we may refer the Acrocera- num, or mountains of Chimæa. The soil of this province is fertile, and produces excellent wine. Its manufactur is chiefly carpets. Its inhabitants are robust and courageous, and make good soldiers, especially cavalry. In the Turkish army, they are distinguished by the name of arnauds. The religion of Albania is that of the Greek church. This province was annexed to the Ottoman em-
ALEB, in Ancient Geography, a town of Pamonia. Albainum Pompeii, a name anciently given to the present Albano.

Albanum mare, a name given by Pliny to that part of the Caspian sea, which bordered on Armenia.

Albanus, Joannes, in Biography, was received Doctor in Medicine at Bologna, in the year 1616, where he taught the theory and practice of physic several years, and published a treatise on the regimen to be observed by convalescents.

Albanus, in Ancient Geography, a river of Albani, thought by M. d'Anville to be Samara.

Albanus Mons, the mountain adjoining to Alla Longa or Albano; and also a part of the Albii Mons of Strabo, which the Ancients considered as forming the extremity of the Alps, and together with the Montes Bulbi separating the further Liburnia and Dalmatia from Pannonia.

Albany, a county of America, on Hudson's river, in the state of New York, lies between Ulster and Saratoga. Its extent is 46 miles by 28. By the census in 1796, the number of electors in this county was 6537, and the number of towns 11.

Albany, the chief town of the above county, is situated on the west bank of Hudson's river, 160 miles north of the city of New York, and 340 south of Quebec. N. lat. 42° 39'. W. long. 73° 30'. This city and the suburbs, in 1797, contained 6321 inhabitants. The situation of Albany is peculiarly favorable for residence and for commerce. It is at the head of a flood navigation, on one of the noblest rivers in the world; the air is salubrious; and by the improvements of roads and canals, which are contemplated, it is expected to encrease and flourish. The public buildings in this town are a low Dutch church of ancient and curious construction, one for the Episcopalians, two for Presbyterian, one for Germans or High Dutch, and one for Methodists; an hospital, city hall, and well-built brick gaol. The corporation consists of a mayor, recorder, six aldermen and as many assistants. In the vicinity of this city there are extensive works, in which the machinery is moved by water, for the manufacture of Scotch and Rappahannock, roll and cut tobacco, chocolate, mustard, flour, hair-powder, split pease, and hulled barley.

Albany, a British fortress in New South Wales, in North America, situated on a river of the same name. N. lat. 52° 14’. W. long. 48° 59’. W. long. 50° 8’.

Albany River, a river of North America, which, after running in a north-eaft direction, and communicating with several small lakes, falls into James's bay, in N. lat. 51° 30’. W. long. 84° 30’.

Albara, in Botany. See Cana.

Albara, in Ancient Geography, a town of Syria, on the borders of Phoenicia.

Albarazin, or Albaracin, in Geography, a fortified town of Spain, in the kingdom of Aragon, on the river Guadalquivir, and near the frontiers of New Castile, is the see of a bishop, suffragan to the archbishop of Saragossa, and famous for its excellent wool, called by this name. It is 30 miles south-west of Saragossa, and 40 miles east of Madrid. N. lat. 40° 32’. E. long. 2° 16’.

Albardeola, in Ornithology, a name given by many authors to the Spoon-bill.

Albarri, in Antiquity, properly denoted those who gave the whitening to earthen vessels, &c. In which sense they stood contrasting United from dark-brow, whitened walls.

Albarum Opus, in the Ancient Building, the incrustation or covering of the roofs of houses with white plaster, made of mere lime. The workmen were called albinus, or balabrius.

This
This is otherwise called opus album. It differs from terebinum, which is a common name given to all roofing or ceiling, including even that formed of lime and sand, or even lime and marble; whereas Albarium was restrained to that made of lime alone.

ALBAS, in Geography, a town of France, in the department of Lot, three leagues west of Cahors.

ALBASANO, a town of Albania, in European Turkey, 132 leagues west of Constantinople. N. lat. 41° 32'. E. long. 26° 15'.

ALBASTRA, an ancient town of Egypt, on the Arabian coast: the inhabitants of which are called by Ephiphanus Alpharadis.

ALBATEGNI, in Biography, a celebrated astronomer of the ninth century, was a native of Batus, in Mopotiam, and hence called Al Battani, or Albattani. As Batus was one of the dependencies of Harran, he was also denominated Mohammed Ebn Jabber Ebn Senan Abu Abdallah al Harrani and Mohammad of Aracius. His astronomical observations were made about the years 882 and 883, at Antioch, and at Araca or Aracius, a town of Chaldea; and Blair, in his chronology, states the time of his death about the year 888. Dr. Halley highly commends him (Phil. Trans. for 1693, n° 204.), as a man of admirable genius, and an excellent observer, though he detects many errors in the editions of his works. He observed the autumnal equinox at Aracius on September 19th, one hour and 15 minutes after midnight, A. D. 882; and he also observed, about 883, that the first star of Aries was 18° 2' from the equinoctial point; he states the obliquity of the ecliptic at 23° 55', and the motion of the sun's apogee, since Ptolemy's time, as well as the motion of the stars, one degree in 70 years. He computed new astronomical tables, instead of those of Ptolemy, which were imperfect, and adapted them to the meridian of Aracia or Raca; and they were long used as the bell among the Arabs. He also composed a work, entitled "The Science of the Stars," comprising all parts of astronomy, according to his own observations and those of Ptolemy. This work was translated into Latin by Plato of Tibur, and published at Nuremberg in 1537, with some additions by Regiomontanus; and reprinted at Bologna in 1645, with the notes of this author. The Alphonic tables of the moon's motions were founded on the observations of Albategni. The original Arabic of this work, which was never published, is in the library of the Vatican, Blair's Chronol. N° 38. D'Herbelot Bibl. Orient. Hutton's Math. Dict. vol. i. p. 59, &c.

ALBATEL, in Geography, a Cape on the coast of Barbary, about 12 leagues north-east of Cape de Tamos, wherein are several good roads, particularly at Marsolach, to the west of Cerceili island and point.

ALBATENIUS, an Armenian physician, lived towards the end of the 11th century, contemporarily with Serapon. He translated the works of Galen into Arabic.

ALBATI equi, in Antiquity, was a denomination given to those horses in the games of the circus, which were distinguished by white cloths or furniture. In which sense, they are contradistinguished from rangi, prafini and veneti.

ALBATROSS, in Ornithology. See Dromidea.

ALBAZIN, in Geography, a town of Great Tartary, in the road from Pekin to Moscow, situated on the river Amur, and defended by a good fortres against the attacks of the Chinese and Tartar Mongols. N. lat. 54°. E. long. 104° 13'.

ALBEE, in Commerce, a small coin, current in Germany, salted at a French sol and seven deniers.

ALBEC, in Geography, a river of Switzerland, runs into the Rhine, near Furthman.

ALBECK, a town of Germany, in the district of Ulm, which is the capital of a prefecture of the same name, is situated on the river Alb, five miles north-east of Ulm, and eight miles west-south-west of Augsburg. N. lat. 48° 27'. E. long. 9° 58'.

ALBECOR, in Ichthyology, the Scionbar Thyimus of the Linnean system.

ALBEGNA, in Geography, a river of Tuscany, runs into the sea between Toscana and Orbitena.

ALBEKIRK, a town of Holland, 15 leagues south-west of Medemblick.

ALBELO, a river which rises in Mount Abol, in the country of the Girunus, and discharges itself into the Rhine near Bergum.

ALBELIDA, a town of Spain, on the river Iregua, in the country of Rioza.

ALBELIEN, in Ichthyology, called also Albula, and resembling the forma, caught in the German and other lakes, is a fish of a fine slivery white colour, and from five or six to twelve pounds in weight.

ALBELLA, in Conchology, a species of Helix, with an umbilicated smooth shell, the under part gibbous, and a semeundated aperture; found on the rocks of Europe.

ALBELUS, in Ornithology, a species of Mergus. See Smeew.

ALBEMARLE, in Geography, a town of France, which gives the title of Earl to the noble family of Keppel. See Aumale.

ALBEMARLE, a county of America, in the state of Virginia, lies between the Blue Ridge and the Tides Waters, and contains 12,585 inhabitants, in an extent of about 35 square miles.

ALBEMARLE Port, a spacious bay or harbour, on the southern coast of Falkland islands, is situated between Fox bay and Port Stephens, and may be known by a small island off the entrance.

ALBEMARLE Sound, an inlet of the sea, on the coast of North Carolina, 60 miles long, and from eight to 12 broad. It communicates with Pamlico sound, and with Currituck inlet, and receives Roanoke and Meherins rivers. The passage into it from the sea is called Roanoke inlet. N. lat. 35° 50'. W. long. 76° 10'.

ALBEN, a town of Austria, in the Inner Carniola, is environed on all sides with high mountains, large forests and deferts, and is distant two miles north-west from Cirknitz. There are mines of mercury in the vicinity of this town. From the mountain of the same name on which it is situated, called also Monte del carso, the river Allen flows, which runs into the gulf of Venice, between Laubach and Capo d'Intia.

ALBENEC, a lake of Austria, 13 miles west of Windisch-Garten.

ALBENGA, a small island on the coast of Genoa, opposite to the town of Albenga, and called also Gallinara.

ALBENGUA, or Albenga, anciently Albinium Inganum, or Allingaanum, a sea-port town of Italy, in the territory of Genoa, is the seat of a bishop, suffragan to the archbishop of Genoa. It was formerly a very considerable and well-fortified town, but has suffered by the wars, and is deserted on account of the infallibility of the air. The vicinity abounds with olive trees, and produces great quantities of hemp. It was burnt by the Pisans in 1175, but rebuilt by the Genoese. It is about 15 leagues south-west of Genoa. N. lat. 44° 42'. E. long. 8° 15'.

ALBENQUE,
ALBENQUE, a small town of France, in the district of Cahors and department of Lot, distant 64 leagues from Moutauban.

ALBEOLO, in Ornithology, the Asas albola of the Linnaean System by Gmelin, the quequedula hoediciana of Buffon, little black and white duck of Edwards, the spirit of the Arctic Zoology, and the white and black Jarcelle or raw of Buffon, is specifically distinguished by a white colour; black back and wing-quaills, bluish head, and back of the head white. Its white robe, and white band with a black cap and mantle, have given occasion for calling it religifer, or nun. The back of the head is decorated with green and purple luster, and the white band encircles it behind from the eyes. The Newfoundland fibers call it spirit, as Edwards fuggettes, because it is a very nimble diver, appearing at a great distance, very soon after it has plunged. It is found in America, from Hudson's bay to Carolina, and forms its nest in trees near fresh water.

ALBERCHE, in Geography, a river of Spain, which runs into the Tagus, near Talavera.

ALBERDORT, a town of Austria, on the river Dulekau, seven miles eal of Schrattental.

ALBERGOTTI, Francis, in Biography, an eminent civilian, of the 14th century, fluctuated under Baldi, and exerted his profession at Arezzo, in the state of Florence; but removing to Florence, he was there emmoted. His character for integrity is no less applauded than his skill in the law; so that the appendage annexed to his name is, "solidus veritas doctor, or the teacher of solid truth. He wrote "Commentaries on the Digest," and some other pieces in law; and died in 1376. Gen. Biog.

ALBERGUS, John, a native of Mazarran, in Sicily, where he practiced medicine with success, towards the end of the 17th century, published at Palermo in 1703, "Summa Tractatium Chimurgiae praecox, 12mo."

ALBERIC, or Albert, a French historian, was canon of the church of Aix in Provence, in the 12th century, and wrote a history of the first crusade, from the reports of those who attended it. His narrative extends from 1095 to 1120, and is contained in two distinct works, viz. "Chronicon Hierofyfmanum," printed in 4to., at Helmanfadt in 1584; and "Gesta Dei per Francos," in folio, 1611. Gen. Biog.

ALBERIZZI, Peter Joseph, studied medicine at Pisa, and practiced several years at Milan, where he died 1722, aged only 31 years. He published "Crotologia Medica de causis suis pestiferae, ejusdemque cura, qua vermi-culi, de quiibus fomniarunt nonnulli, expeluntur." ALBERNUO, in Commerc, a kind of cambril brought from the Levant, by way of Marselles.

ALBERONE, in Geography, a town of Naples, in the province of Capitanata, eight miles south-south-east of Volutara.

ALBERONI, Cardinal, in Biography, a celebrated statesman, was born at Placentia in Italy, in 1604, and employed till the age of 14 in the occupation of his father, who was a gardener. Having relieved M. Campitron, secretary to the duke of Vendome, when he was robbed near the village where he lived, he was recommended by him to his general, who took him into Spain. From this menial low state he rose by several gradations to the dignity of cardinal and archbishop of Valencia, and to the office of prime minister, in the court of Spain. For both these honours he was indebted to the patronage of the princes of Parma, whose marriage with Philip V. he had projected and accomplished. His disposition was intriguing and enterprising; and not content with effecting some domestic reforms and arrange-

ments, he formed the design of an expedition against Sar- 
dum and Sicily, and in order to prevent the interference of other powers, he made an alliance with Czar Peter, Charles XII. of Sweden, and, as some say, with the Ottoman Porte. He also proposed exciting the Turks to make war on the emperor, to advance the Pretender to the throne of England by means of Peter and Charles, to dethrone the duke of Or-
leans of the regency of France, and to annihilate the German power in Italy. But an union between England and France was the result of the discovery of this plan, and both these powers concurred in declaring war against Spain in 1719, and the condition of peace was the removal of Alberone, and his banishment from the kingdom. Having received an order in Dec. 1725, to quit Madrid in 24 hours, and to leave Spain in a fortnight, he retired with great wealth; nor was it discovered before he had been two days on his journey, that he had taken with him the tretament of Charles II. of Spain, which appointed Philip universal heir of the monarchy. The intrinm was wrested from his possession by force; and purifying his journey to Genoa, he was there arrested by order of the pope, on the charge of negotiating with the Turks. On his exsolation, and sub-
sequent liberation from the convent of the Jesuits, to which he was confined for a year, he engaged in new intrigues, and particularly in an unsuccessful enterprise against the small republic of St. Marino. A bon mot of Benedict XIV. on this occasion was very generally circulated: "Alberoni is like a gluton, who, after having eaten a large salmon, cannot help casting a withifh eye at a minnow." His views were more laudably directed to the establishment and endowment of a seminary of education for poor scholars in his native city. Alberoni preferred his health and vivacity to old age; his conversation chiefly turned on the recital of his own exploits, and was instructive and amusing; though in his temper he was irascible and impatient of contradiction. He died in 1752, at the advanced age of 87, and left behind him the character of "a great politician, as daring as Richelieu, and as supple as Mazarran, with as little principle as either. His life, to the year 1719, has been published by John Rouletet, translated from the Spanish. A pretended "Political Testament," in the name of cardinal Alberoni, printed in 1753, is considered as spurious. Nouv. Dict. Hist. Gen. Biog.

ALBERT I., duke of Austria, and emperor, was the son of the emperor Rodolphus, and a competitor for the Imperial crown with Adolphus of Nassau, whom he defeated and killed in battle. Before this victory, he had been elected king of the Romans; but apprehending that his election would be contested, he obtained the confirmation of it, and was solemnly crowned at Aix-la-Chapelle, in the year 1298. He began his reign with renewing the ancient leagues between the emperor, and with forming a treaty of marriage between his son Rodolphus and Blanche, the daugh-
ter of Philip the French king. The alliance with France was protected against by the three ecclesiastical electors, and upon the emperor's appeal to pope Boniface, with a demand that he would ratify his election, the pope declared that it was null and void, and that Albert ought to be treated as a murderer. Boniface proceeded, upon the complaint and remonstrance of the electors, to prohibit the subjedts of the empire from acknowledging the claims of Albert, and to release them from the obligation of their oath of allegiance. The emperor, incensed at the conduct of the ecclesiastical electors, declared war against them, and soon compelled them to sue for peace. In 1303, the pope having quar-reled with Philip the Fair of France, made advances to Albert,
Albert, confirmed his election, invited him to Rome to receive the imperial crown, and exhorted him to declare war against Philip, whom he had excommunicated. The conditions, however, were humiliating; but the emperor acquiesced, and agreed to take the oath of allegiance to the pope, after acknowledging that kings and emperors received the power of the temporal sword from the holy see, and confining to perform all the promises made by Rodolphus and his predecessors, and to defend the rights of the holy see against all its enemies. Before this reconciliation between the pope and the emperor took place, Albert had engaged in an unsuccessful war with John d'Avennes, next heir to John count of Holland, who had lately died, under a claim of his dominions, as heirs reverible to the empire. The war terminated with a stipulated condition that John d'Avennes should enjoy the countries of Holland, Wiel Frieland, and Zealand, in consideration of doing homage to the emperor, from whom he accordingly received the investiture of these dominions. Albert, likewise, in 1303, invaded Bohemia, but was obliged to retreat with loss. But upon the death of Wincentius the younger, who was affiliated by his subjects, and who died without issue, the emperor seized Bohemia, and placed his son Rodolphus on the throne; but Rodolphus dying suddenly, Albert could not secure the crown for his next son, Frederic. His next object was to support Philip of Nafan, brother of Rodolphus, the late emperor, in an iniquitous attempt to recover Bungaria and Thuringia from the rightful possessors; but this exploit terminated in a disgraceful defeat. In another instance he was no less mortified, but the event proved singularly important. The three cantons of Uri, Schwyz, and Underwald, though they do not seem to have been in any respect dependent upon the house of Austria, had voluntarily fought the protection of Rodolphus; and he treated them with great indulgence, and defended their rights and privileges, without ever considering them as foes of the house of Austria. But the conduct of his son Albert was directly the reverse: he wished to govern them as an absolute sovereign, and had formed a scheme for converting Switzerland into a principality for one of his sons. By his own influence and oppression, and by the similar conduct of the government who appointed them, they were so aggrieved and incensed, that the three cantons above-mentioned formed a confederacy for the purpose of emancipating themselves from the Austrian yoke. They succeeded in their efforts, and retrieved that liberty which they have since enjoyed. The other cantons soon engaged in the confederacy, and thus was laid the foundation of the Helvetian republic. Albert was uniformly influenced by a spirit of rapacity and an unwarrantable delirium of aggrandizing his own family; and he at length fell a sacrifice to his ambition and avarice. Having refused to put his nephew John, duke of Swabia, in possession of his paternal estates, which, it is thought, he designed for one of his own sons, the nephew formed a conspiracy against him. With this view, he engaged three confederates, who contrived to meet Albert on his progress from Bafl to Rhenpfeld, after he had crossed the river Rhine, near Schaffhausen; and John, having flabbed him in the throat, his accomplices completed the murder in the sight of his son and their attendants, who were incapable of affording him any succour. In the place where the emperor was slain, A.D. 1308, a cloister was built, and called Koningsfeld, from whence his body, after having been deposited there for some time, was carried to Spire, and kept among his predecessors. His character has been differently appreciated by different writers. Some represent him as a prince of a brutal disposition and manners, and of the most lordly avair; whilst others describe him as a prince of singular courage and address, and distinguished by an excellent understanding, and an inviolable attachment to truth. All agree, however, in charging him with an insatiable degree of avarice. It is said, that he was equally abhorred by flattery and slander; and that there were three sorts of persons for whom he had a particular regard, viz., women of honour, men of courage, and priest ecclesiastics. He was called "the Triumphant" in account of his generosity and valour, and the many victories he obtained over his enemies; and the "one-eyed," because he had lost one eye by the operation of poison, which was given to him at his own palace in Vienna, above three years before he was elected emperor. Albert, by his wife Elizabeth, daughter of the duke of Carinthia and Gorcia, had six sons and five daughters. By his youngest son Albert, surnamed the "Counterfeit," the male line of the family is derived. Mod. Un. Hist. vol. xxvi. p. 156, 142.

**ALB**

Albert II., duke of Austria, and emperor, surnamed the "Grave" and "Magnanimous," was the son of Albert of Austria, called the "Wonder of the World," and married Elizabeth, daughter of the emperor Sigismund. By his wife conduct he established the security of his Austrian subjects, which had been for a long time interrupted by intestine wars and rapine; and if his life had been prolonged, he would probably have been the greatest prince that ever sat upon the imperial throne. In one year, he was honoured with three crowns. To the Hungarian throne he was advanced in consequence of the will of Sigismund, whose daughter and heiress he had married; and he was elected king of Bohemia, in consequence of a convention between the two families, which stipulated, that when the lawful heir male of the house of Bohemia should be out of age, the crown should devolve upon a prince of the house of Austria. The throne, however, was disputed by Caimimir; but after a successful struggle secured by Albert, who was crowned at Prague. During his conflict with Caimimir, he was elected emperor at Frankfort. After his election and coronation at Aix-la-chapelle, it was his chief care to reform the administration of justice, and to abolish the tribunals, called the secret or Weltphalia judgment, which condemned without trial, or even public accusation. He also confirmed the neutrality which had been adopted by the German electors and princes, with respect to pope Innocent and the council of Bafil, and by the mediation of the pope and council he concluded a peace between Hungary and Poland. When Bulgaria was invaded by Amurath, the Turfkih Sultan, Albert took arms in its defence, and marched to Buda; but being there seized with a violent dysentery, he was under a necessity of returning to Vienna; and in his way thither the disordered proved fatal, A.D. 1439; and he was interred at Weissenburg. He left a posthumous son and two daughters. In one of the diets which were held at Nuremberg during the short reign of this prince, Germany was divided into four circles, viz., Bavaria and Franconia, the countries about the Rhine together with Almenia, Westphalia, and the Low Countries, and Saxony. In another diet, it was proposed to divide the empire into six circles, and this division was established by the emperor Maximilian I. Albert was of tall stature and great strength, liberal and just in his disposition, and of a virtuous character; he cherished a warm affection for his people, a great zeal for religion, and an uncommon esteem for learned men. Mod. Un. Hist. vol. xxvi. p. 273-278.

**ALB**

Albert the Great, so called on account of his great erudition, in Biography, was born at Lawingen in Swabia, about the year 1193, or, as some say, 1205. He was
was educated at Paris, and in 1256 he was made doctor of medicine at Paris; where having learned of the Dominicans, he was induced to take the habit; and on the death of Jordanus, who was made vicar-general, then provincial of that order, he taught philosophy, medicine and theology at Cologne, and at Paris, to numerous auditors. At Cologne St. Thomas Aquinas was his pupil. In 1260, he was made bishop of Ratibus; but at the end of three years he resigned that dignity, and retired to Cologne. From hence he went to Germany and Bohemia, to preach the crocuses; and in 1274, he attended the council of Lyons. Allowing for this occasional absence, he continued to instruct the religious of his order in this city, till the 15th of November 1289, the time of his death. His works, which were very voluminous, were collected by Father Janani, a Dominican of Grenoble, and published at Lyons in 1515, in 21 volumes in folio; but many of them are supposed to be spurious. The treatise "De secretis Mathematicis, item de virtutibus herbarum, lapidum et animantium," published under his name, was written by Henry of Saxon, one of his pupils. He was undoubtedly the author of several works on the mathematical sciences; as arithmetic, geometry, perspective or optics, music, astronomy and astrology; under the titles.—"De Sphaera, de Altiris, de Astrarum, item speculums Aftrometricum." As he was a man of genius and knowledge superior to his contemporaries, and particularly devoted to mathematical disquisitions, he was charged, according to the can of the times, with being a magician. He is said to have contrived a kind of androides, or machine in the human form, which he had brought to such perfection, that it could speak: and of this machine many tales are related, but they are not worth recording. It is not at all incredible, that by his knowledge of mechanics and acoustics, he might have contructed a machine, which, by means of the air and certain springs, produced sounds, resembling those of the human voice; and that he might apply his knowledge in chemistry to the production of artificial flowers and fruits. Some hare, without foundation, ascribed to Albert the invention of fire-arms. The chief object of his investigation, was probably the philosopher's stone, as this was the "ignis fatuus" of the age. Gen. Dict. Hutton's Dict. Dupin cont. xiii. Brucker's Hill. Philos. by Lohschl. vol. ii. p. 371-372.

Albert of Aix, or Albertus Aquensis, was a canon of Aix-la-Chapelle, in the 12th century, who travelled into the Holy Land, and wrote in Latin, "A History of the Expedition to Jerusalem, under Godfrey of Boulogne, and other Leaders." This history comprehends a period of 24 years, terminating in 1126, and is esteemed accurate. It was printed by Reinaecius, in 1584. Cave. H. L. tom. ii. p. 226.

Albert, Erasmus, a German divine of the 16th century, was born at Frankfurt; from a book entitled, "The Harmony between Jesus Christ and St. Francis," and highly valued by the Franciscans, he collected many absurdities in a book which he entitled—"The Alcoran of the Cordeliers." To this book Luther, of whom Albert was a disciple, prefixed a preface, and it has passed through a great number of editions. The author wrote other works in Latin and German, and died in 1551.

Albert, Krantz, an historical writer, was professor of divinity at Hamburg, in the beginning of the 16th century. His works are—"Metropolis?" or, "A History of the Churches established or restored in the reign of Charlemagne."—"A History of Saxony?"—"A History of the Vandals;" and "A Chronicle of the Affairs of the

North, from the time of Charlemagne to the year 1564." He died in 1517. He is said to have collected facts with diligence, and to have related them with wit, liberty and freedom. Voss, de Hist. Lat. Cave, H. L. tom. ii. p. 243.

Albert of Steinfeld, a Benedictine monk, flourished about the middle of the 13th century. He wrote "A Chronicle," comprehending the whole period, from the beginning of the world to the year 1256, which was published with notes, by Reinaecius, in 1587. Cave.

Albert of Stichbury, or Albertus Aquensis, flourished in the 14th century, and published in Latin, "A History or Chronicle of Affairs from the Reign of Rodolphus I. in 1270 to the Death of Charles IV., in 1358." This work, which is faithfully written, was edited by Urtifius, in a collection of authors, who wrote on the affairs of Germany. Voelfl. Cave.

Albert, Solomon, a pupil of Fabricius ab Aquapendente, a learned and ingenious anatomist, studied medicine at Wittenberg, where he was several years professor. He is said to have discovered the valve of the colon, sift in a caffer, afterwards more distinctly in the body of a man, and to have made many other improvements in anatomy. Haller Biblio. Anatomic. vol. i. p. 251. His works are—"Iliridia, &c. humani corporis partium in usum Pyronum edita, figura illustrata, Witte-}

nberg, 1584, 8vo." The plates, with the exception of two, are from Vefalus. This work has passed through several editions. "Tres orationes, quorum tertia aigit de disciplina anatomica, quo oris caperit, &c. tum de Galeni libro qui de diffusis inferibilir. Annexum eff thema de hachymaram utilitate in levando animi affec-}

tus." Norimberge 1585, 8vo. This Discourse on the Efficiency of Tears, in allaying the Affections of the Mind, is inserted in Hiller's collection of dissertations. "Oratio de furitate et mutitate; Norim. 1591, 8vo." "Orationes quatuor, de felle rectagrande, de fidore cento, &c. ibid." 1592, &c. He died March 29th, 1600. His age is not known.

Albert, in Geography, a town of France, in the department of Somme, and district of Peronne, five leagues north-east of Amiens, and four north-west of Peronne.

Alberti Borghegiario, Cherubino, in Biography, an eminent painter and engraver, was born at Borgio S. Sepulchro in 1522, and died in 1615. The rudiments of historical painting he acquired from his father, Michael Alberti; and in this art he made very considerable progress. His best works are in Perugia at Rome; and there are also paintings in oil, which are admired for their judicious disposition, lively and beautiful colouring; and fine expression. His superior merit, as an engraver, is also acknowledged; and in this respect his skill of execution seems to have been founded on the prints of C. Cort and Aggolino Caracci, which in his etchings and other lighter plates, he was indebted to the works of Francesco Vecellio, whose freedom in handling the graver is justly admired. He worked entirely, like these artists, with the graver, and seems never to have called in the assistance of the point. His engravings are never highly finished, or powerful in effect. The great fault of his time was the little attention paid to the chiaro-foire. The lights are scattered and left unadorned, as well upon the distances, as upon the principal figures of the fore ground, which destroys the harmony, and prevents the proper gradation of the objects. The drawing of the naked parts of the figure, in the works of this artist, is rarely incorrect; the extremities are well marked; and the characters of the heads generally very expressive; but his draperies are apt to be rather stiff and hard. His prints
prints may be considered as very extraordinary efforts of a great genius; whilst the art was at a considerable distance from perfection. The number of plates engraved by Alberti, amounts to nearly 180; of which 75 are from his own compositions, and the rest from Michael Angelo, Buonarroti, Raphael, Polidoro, Andrea del Sarto, &c. Of these we shall enumerate the following, viz.—A large nativity; a dead Christ, supported by an angel; St. Jerom feated in a landscape, meditating upon the cross; the resurrection of our Saviour; a holy family; creation of Adam and Eve, their expulsion from paradise, their subjection to labour; and the miracle of St. Philip Benizzo, where the men, who despised the exhortations of the saint, are struck dead with lightning, which is esteemed one of the most excellent prints of this master. Pilkington and Strutt.

Alberti, Domenico, a Venetian diletante, gifted with genius and an exquisite taste. He was of the corps diplomatique, and secretary to the Venetian ambassador at Madrid. At a time when there was little melody in harpichord lefions, he brought about a revolution in the study of playing that instrument, by giving a singing treble to a rapid base, composed of chords broken into groups of semiquavers, which it was so easy to imitate, that composers and players soon grew tired and ashamed of it. Jerig at Paris, and Vento in London, gladdened the public with whole volumes of lefions upon Alberti's base, but none ever composed such elegant treble parts for keyed instruments; the melody of which still lasts its ground, through all the vicissitudes of 60 years—a prodigious longevity for a musical production in point of taste! There is a little history, belonging to the publication of Alberti's lefions in England, worth recording, as a beacon to plagiarists. The first time these lefions were heard in London, was at Hickford's room, when they were admirably performed by Jozzi, the second figure at the Opera, at his own benefit; who, not only puffed them off for his own compositions, but printed them, and had the courage to affix his name to the title-page, and the confidence to sell them for a guinea a book, equal at least to two guineas now. Unluckily for the author of this fraud, but not before many copies were sold, a gentleman, just returned from Venice, being possessed of a MS. copy of these sonatas in Alberti's own hand-writing, made Walsh, the music-feller, a present of the book, on purpose to expose the transgression. Walsh having obtained the MS. upon such easy terms, fold the eight charming sonatas for six shillings a hook. The style being new, and so much more within the power of gentlemens and ladies to execute, than the rich and complicated pieces of Handel, and wild and original legedermain of Scarlatti, had a prodigious sale, and soon obliged Jozzi to make a precipitate retreat to Holland, where he practiced the same trick, but not with equal profit.

Alberti, Durante, flourished in 1590, and died at Rome in 1613, at the age of 75. He, and his two brothers, Cofmio and Giorio, who were painters and engravers, were natives of Borgo S. Sepulcro. The two first engraved upon copper and wood; the last upon copper only, and died young in 1597. They are not supposed to have been artists of any great note. The son of this artist, viz. Pietro Francesco Alberti, was born in 1584, and died in 1638. He was an historical painter, and we have a print, called the “Academia de Pitori,” and containing many figures slightly etched, but with spirit and in a style that indicates much of the matter.

Alberti, Giovanni, a painter of perspective and history, brother of Cherubino, was born at Florence in 1558, and died in 1601. After receiving early instruction from his father, he went to Rome, where he studied geometry, and the works of Buonarroti and other great masters. His principal attention was devoted to perspective, in which he arrived at great eminence. He was distinguished by the elegance of his composition, the firmness and delicacy of his pencil, the grandeur of his thoughts, the judicious distribution of the parts, and the spirit visible through the whole. Pilkington.

Alberti, John, a learned German lawyer, was born at Widmannstadt, and flourished in the 16th century. He was well acquainted with the oriental languages, and wrote "An Abridgment of the Koran," with notes, published at Nuremberg in 1543. In 1556, he published in 4to., at Vienna, at the expense of the emperor Ferdinand I. a New Testament in the Syrian character and language, for the use of the Jacobite sect, in which book are omitted the second epistle of Peter, the second and third of John, the epistle of Jude, and the Revelation. Alberti also wrote a Syrian grammar, with a preface, tracing the progress of the oriental languages among the Latins. Nouv Dict. Hist. Gen. Biog.

Alberti, Leon-Baptista, an eminent architect of Italy, was born of a noble family at Florence in 1490, and pursued his studies at the University of Bologna with such success, that at the age of 20 he composed a Latin comedy, intitled "Philodoxeaos," under the name of Lepidus, which Aldus Manutius conceived to be antique. Here he took the degree of doctor of laws, and was ordained priest. However he chiefly devoted himself to the study of design, and to the examination of ancient edifices; and at Rome he was employed by pope Nicholas V. in several works of architecture. He also planned several considerable buildings at Mantua, Rimini, and Florence. Alberti was a painter, and a good mechanic; and invented an instrument for the practice of perspective; but he is principally known as a writer. His Latin work "On the Art of Architecture," in 10 books, was printed in 1481, much esteemed, and translated by Bartoli, into Italian, in 1546, and afterwards into French. He also wrote, in Latin, a work upon sculpture and painting, in three books, which was translated by Domenichi. He lived to an advanced age, and died at Rome in 1480, as some say, but according to Tiraboschi, in 1472. His funeral oration was pronounced by Angelo Poliziano, and he was celebrated by the contemporary Italian poets. Gen. Biog.

Alberti, Michel, professor of medicine at Hall, in Saxony, and member of the Royal Academy at Berlin, a renowned defender of the principles of Stahl, against the mechanical physicians, particularly against Heister, was born at Fribourg, November 13th, 1682; he published "Epistolae qua Thermarum et Acidilarum idolum medicum defuntur," Hale 1714, 4to. "Introductio in Universum Medicinam," ibid. 1718, 1719, 1720, 3 vols. 4to., containing a multitude of theses on different parts of medicine. For the titles of these, see Heister's Bibliotheca Medicinae Practice, vol. iv. p. 386, &c. "Syntagma jurisprudentiae medicarum Schneeburg," 4to. 1725. Heiller give a particular account of this work, which he highly commends. See as above; also for accounts of the remaining works of the author, who died at Hall, May 17th, 1757.
ALBERTI, Francis, a Calabrian, resigned a rich abbey in order to become a Jesuit. He died in 1619. In his "Systema Theologicum," he attempts to reconcile divinity with philosophy; and in a treatise "De Angeli Custode," he endeavors to prove that brutes have their guardian angels. Eng. Dict.

ALBERTIUS, Mussatian, an historian and poet of Italy, was born at Padua, and flourished in the 11th century. He wrote concerning the reign of the emperor Henry VII., 12 books on the affairs of Italy after Henry VII., and a third part of the history of Lewis of Bavaria; and he has been esteemed a judicious, faithful, and for the time in which he lived, an elegant historian. He also wrote a tragedy on the tyrannies of Accauci, which, with other poetical productions, gained him distinguished laurels in the University of Padua. Petrarch mentions him with respect, as a diligent and accurate inquirer into facts. He died in 828, Vossius, Gen. Blag.

ALBERTISTS, a sect of Scholastics, were thus denounced from their leader Albertus Magnus.

ALBERTO, Baxos 82, in Geography, a shelter of rocks before the city of St. Salvador, in the bay of All Saints, on the coast of Brazil. On one of them is a strong fort which commands the road, and between them and the city is a very good harbour, where ships may ride with safety.

ALBERTON, or PORT ALBERT, a sea-port town of Africa, in the kingdom of Barea, on the confines of Tripoli, 55 leagues from Alexandria.

ALBERTUS, in Commerce, a gold coin, worth about 13 French livres, which was struck during the reign of Albertus, Archdeak of Austria.

ALBESIA, in Asia, a kind of shield used by the ancient Albeans, a nation of the Marsi.

ALBESTROFF, in Geography, a town of France, in the department of the Meurte, three leagues north-north-east of Duren.

ALBERTSS point, a rocky prominence on the coast of New Holland. S. lat. 38° 45'. W. long. 184° 42'.

ALBI, a town of Italy, in the province of Aixen. Ulter. See also AIN Ceaux.

ALBI is also a town of Savoy in the Genevois, nine miles north-north-east of Aix.

ALBI, or ALBY, Albige or Civitas Albigensium, a city of France, in the department of the Tarn, and situate on the river Tarn, was, before the revolution, the capital of a small country called the Albigeois, in Upper Languedoc. It has been the residence of a royal tribunal, and since 1677 the fee of an archbishop. Its cathedral is dedicated to St. Cecilia, and has one of the finest choir in the kingdom. The archbishop was metropolitan of five bishops, and they reckoned 30 cardinals, who had been bishops of this see. The diocese contained about 327 parishes, and produced about 35,000 livres. It stands upon an eminence, and the number of inhabitants has been estimated at 10,000. In the cathedral was a valuable silver shrine, of the Moaica kind, and of exquisite workmanship, which contained the relics of St. Clair, said to have been the first bishop of this city. There is a pleasant walk, called La Lice, a little above the city; and the archiepiscopal palace is very magnificent, and the small town of Châteauveaux serves as a suburb. The river Tarn washes the walls of the city, and serves both for an ornament and a defence. It is 15 miles north-east of Toulouse, and 270 miles south of Paris. The territory of the Albigeois, is about 10 leagues long and seven wide, is well peopled, and produces abundance of grapes, corn, wood, faltron, and sheep. It has also coal-mines. The trade of this district consists of dried prunes, grapes, wine, and a coarse kind of cloth. N. lat. 43° 55' 44". E. long. 2° 8' 45'

ALBII, in Ecclesiastical History. See White Bohemian.

ALBIAN, in Geography, a town on the Ixvory coast of Africa, in five miles south of Hinn.

ALBIAECA Cape, lies on the north-west point of the island of Cyprus, near the eastern extremity of the Mediterranean. N. lat. 35° 20'. E. long. 32° 18'.

ALBIAS, a small town of France, in the district of Quevri, divided into two parts by the river Ayeron.

ALBICELIA, in Audiology, a species of Falco, in the Linnean system, the aquila albigella of Briffon, the peregrin albigella, a bird of Prevalent, with bold reddish feathers, and slender pointed beak of a yellowish brown colour.

ALBICELIA, in Genealogy, a species of the Nerita, with a flared shell, subflexated lips, the interior tuberculated. It is found at the Cape of Good Hope and in the Indian sea.

ALBICUS, in Biography, an archbishop of Prague, was raised to that dignity by Sigismund, king of Bohemia, and distinguished by the liberality of his sentiments. His character has been reproached by the papists on account of the indulgence which he exercised towards John Halius, and the other croupers of Dizifill. He composed three medical treatises, viz. "Praxis Medicin," Regimen Sanitatis," and "Regimen Pellicinian," printed at Leipsie, in 1484, 8vo., long after his death.

ALBIGAUNUM, or Albium Inaugum, in Ancient Geography. See Albigauna.

ALBIGENSES, in Ecclesiastical History, a sect or party of reformers, who appeared about Toulouse and the Albigeois, in Languedoc, in the 12th century; and who derived their name, not from Albi's being the place of their birth, or residence, or the seat of their principal assembly, but from their having been condemned in a council held in that town, in the year 1176. Their origin may be traced to the Paulicians, who, with a view of propagating their opinions, or of escaping opprobrium and persecution, retired from Bulgaria and Thrace, and formed settlements in other countries. Their first migration was into Italy, thence, in process of time, they sent colonies into almost all the other parts of Europe, and gradually formed a considerable number of religious assemblies of persons who adhered to their sect, who were severely persecuted by the Roman pontiffs. About the middle of the 11th century many of the Paulicians settled in Lombardy, Infideln, and principally at Milan; and from hence they migrated to France, Germany, and other countries, where by their piety and zeal they captivated the admiration and esteem of the multitude. In Italy they
they were called Albigeniæ, and Cathari or Cazzari; in France they obtained the appellation of Albigeniæ, from the circumstance already mentioned; and they were also denounced Bulgarians, because they originally came from Bulgaria; Publicans probably by exception from Publicans, Jews, Heretics, or Good Men; Petrus Brunius from Peter Bruns, who is said by some to have first brought them into Languedoc; Arnaldus, Albigensius, Hierarchus, from the names of Arnold de Bere, Peter Abelard, and Henry, who adopted their opinions. They were also called Paffingers, Albi, and Albigeniæ; but some consider the latter as distinct from the Albigeniæ, though they avowed similar sentiments, and trace their origin to the 8th century. As the Albigeniæ were distinguished by their opposition to the discipline and ceremonies of the church of Rome, the Popish writers have comprehended all the adversities of this church under the same appellation. Accordingly they have confounded them with the Waldenses, or vomitor, who sprang up at a later period, and differed from them in some of their opinions. But the bishop of Meaux, contends, that they were different sects; and he adds, that the Albigeniæ were heresies and manieches; and that the Waldenses were merely schismatics, who were found to be articles of faith, and separated from the church of Rome on account of forms and discipline. But they were unquestionably agreed in their opposition to the papal hierarchy, and in affirming the utterance, tyranny, and idolatry of the Roman church, and in representing the pope as Antichrist. The learned Linboch has taken pains to investigate and ascertain the difference between these two sects; and he states, in detail, the several opinions and practices in which they both agreed and differed. They concurred in maintaining the unholiness andfulness of every kind of oath, and the inutility of confession to the priest, and the inefficacy of absolution, and in representing the church of Rome as antichristian. The opinions in which they disagreed were those of the manichees, which he inclines to think were adopted by many of the Albigeniæ, but which are not justly chargeable against the Waldenses. The former are said, upon the authority of the book of the Sentences of the Inquisition at Toulouse, to which this writer refers, to have believed, that there were two Gods and Lords, the one good, the other evil; that all things visible and corporeal were created not by God, our Heavenly Father, and the Lord Jesus Christ, but by the devil, the evil god, who is the god of this world, and the maker and prince of it. They also maintained, that the sacraments of the church of Rome are vain and unprofitable; viz. the eucharist, baptism, confirmation, orders and extreme unction. In the eucharist they believed, that there was not the body of Christ, and nothing but mere bread; the baptism of water they condemned as unnecafsary, and particularly that of children; extreme unction was, in their judgment, of no avail; and as to the orders of the church of Rome, they reproached and condemned its whole constitution; marriage was lawful, and not appointed by the good God; they also denied the incarnation of Christ; and maintained, that he did not take a real human body, nor rise again with it, but merely with the likeness of it; and that it was impossible for God to be incarnate; they also charged with denying the resurrection of bodies, alleging that though the souls of men shall come to judgment, they shall not then appear in their bodies; they objected to the adoration of the cros, the sign of which they represented as a defileable emblem of the devil; and they believed, that the souls of men were spirits banished from heaven because of their sins. The Albigeniæ differed also from the Waldenses in their rites and customs, as well as in their doctrines.

Of the former, it is said, there were two sects, some professing their faith, and conforming to the customs of their sect, and were called perfessi or confessi, perfect or confirmed. Others only entered into a covenant with these perfect persons, which they call La Conformare, the agreement that at the end of life they would be received into their sect; for this reception they were prepared by certain abstinence or falls; and the admissio, called spiritual baptism, was believed to save the soul of the person admitted, and was delayed to the last sickbed, when there were no hopes of recovery. Those who were thus received were commanded to make use of the eucharist, i.e. fasting themselves to death, and even to hasten their death by opening a vein and bleeding. Of the manichism of the Albigeniæ and other opinions and practices, which have been charged upon them by inquisitors and popish writers, they have been excused by protestant authors; and the charges have been ascribed to that malignant zeal, which has induced persecutors to vindicate their own conduct, and to fix reproach on those who have been deemed heretics. The errors and crimes of individuals have been, not infrequently, charged upon whole bodies of men; and we have reason to think, that this has been very much the case in the present instance. However this be, the Albigeniæ became so formidable, both by their number and zeal, that a holy league, or crusade, was agreed upon among the Catholic; and pope Innocent III. exhorted all princes to oppress them as much as possible, and to expel them from their dominions. Raymond, earl of Toulouse, afforded them temporary protection and favour; upon which the pope ordered him to be excommunicated as a favourite of heretics. He also sent his legate, with letters to many of the prelates, commanding them to make inquisition against the Albigeniæ, and to destroy them. He also engaged Philip, king of France, to co-operate in this work of persecution. The pope's legate was accompanied by 12 abbots of the Cistercian order, preaching the crois against the Albigeniæ, and promising, by the authority of Innocent, a plenary remission of all sins to all who took upon them the crusade. To these Dominick joined himself, and in that expedition invented the inquisition; and he decreed those who were denounced cross-bearers to unite their efforts for suppressing these heretics. When these deputies of Dominick and the pope were suspected of being lea zealous than they wished them to be, a plenary indulgence was protracted in order to engage a greater number of adherents in this warfare of intolerance and blood. The cross-bearers on this occasion wore the cros on their breast, as those who took it up against the Saracens bore it on their backs or shoulders. Raymond, who was still forbearing and indulgent, was excomunicated by a bull of Innocent, his subjects were abjured from their oath of allegiance, and power was given to any catholic, not only to set against his person, but to take possession of his country. The Earl was at last overcome, promised obedience, and sought reconciliation with the church. After the reconciliation of the earl, the cross-bearers were boldly employed in attacking the heretics, seizing their cities, filling all places with slaughter and blood, and burning many whom they had taken captives. In the year 1209 Biterre was taken, the inhabitants without distinction put to the sword, and the city burned. Carefsone was also destroyed; and Simon, earl of Montfort, made governor of the whole country, for the purpose of extirpating heretics, which he faithfully fulfilled. In the next year a new expedition of the cross-bearers was undertaken against the Albigeniæ. They feized Albi, and other towns, and either hanged or burnt those heretics, whom they captured. The earl of Toulouse was alarmed by the delusive
progress of Simon Montfort, and fearing for himself, and for his country, raised a large army, and received succour from the kings of England and Aragon, to whom he was related. Having been deprived of his dominions by Montfort, he appealed, for redress, to the council of Lateran in 1215, but without avail. The feud becoming less, he went excluded, he went to Spain, and his son Raymond to Provence, in order to collect auxiliary forces; and with these he recovered part of his dominions, and the title of Toullouc itself. Montfort was killed at the siege in his endeavour to retake it. The Earl died in 1221, and was succeeded by his son, who was unable to procure Christian burial for his father. When Raymond had recovered his father's dominions, the Inquisition was banished from the country of Toullouc; but pope Honorius III. used every effort to render him obnoxious, and earnestly urged King Louis of France to take up arms against the Albigenses. The French king undertook the expedition against Raymond and the heretics, and laid siege to Aivignon; where he and many of his army died of a dysentery and other diseases. Aivignon was at length taken by treachery, and Toullouc was compelled to surrender. Raymond obtained peace upon very humiliating conditions; being required to alijure his heresy, and to be for ever subject to the See of Rome, to expel all heretics, and to no cafe to defend them; to pay a fine of 2000 marks, and to surrender a considerable part of his dominions to the king and the church. He was then led to the high altar, in a linen garment and with naked feet, and absolved from the sentence of excommunication. Oppressed afterwards by a series of misfortunes, he bowed his neck to the papal yoke, and signified to the pope his desire that herey might be wholly extirpated from his dominions. Soon after this act of servile humiliation, viz. in 1249, he died, and was the last earl of Toullouc of that line. In consequence of these events, the Albigenses were suppressed, and they were little known or heard of till the time of the Reformation, when those who remained fell in with the Vaudois, and conformed to the doctrine of Zuinglius, and the discipline of Geneva. Limborch's Hist. of the Inquisition by Chandler, vol. i. p. 42—70. Medleine's Eccl. Hist. vol. ii. p. 580. 8vo.

ALBIN, in Geography, a town of France, in the department of the Aveyron, six leagues north-west of Rhodes.

ALBINA, in Conchology, a species of Helix, with a smooth perforated white shell, gibbous below, and quadrangular aperture. It resembles the Albita.

ALBINALI, in Geography, a town of Africa, in Arabia Felix.

ALBINATUS, see Aubaine.

ALBINE. See Assine.

ALBINE, in Entomology, a species of Phalaena Tinea, with brown wings, and a single golden line, arched on the fore part, found in the groves of the northern part of Europe.

ALBINEN, or Alpes, in Geography, a town of Switzerland, in the Vallis, 22 miles east of Sion.

ALBINGAUNUM, or Albium Ingaunum, a town of Italy on the north east side of Liguria. See Albenga.

ALBINI, in Antiquity. See Albarium Opus.

ALBINOS, in Zoology and Geography, a denomination given to the white negroes of Africa, who have light hair, blue eyes, and a white body, resembling that of the Europeans, when viewed at a distance; but, upon a nearer approach the whiteness is pale and livid, like that of leprous persons, or of a dead body. Their eyes are so weak that they can hardly see any object in the day, or hear the raves of the fun, and yet, when the moon shines, they see as well, and run through the deepest shades of their forests, with as much ease and activity, as other men do in the brighttest daylight. Their complexion is delicate; they are less rebuilt and vigorous than other men; they generally sleep in the day, and go abroad in the night. The negroes regard them as monstrosities, and will not allow them to propagate their kind. In Africa this variety of the human species very frequently occurs. Wafer informs us, that there are white Indians of the same general character among the yellow or copper-coloured Indians of the island of Darien; and the Chacoplas of Java, as well as the Bedas of Ceylon, seem to be of the same description. M. Buffon observes, that this variation of nature takes place from black to white only, and not from white to black; and that all the people in the East Indies, in Africa, and in America, among whom these white men appear, lie under the same latitude: the island of Darien, the Negro country, and the island of Ceylon being under the same parallel. It has been a subject of inquiry, whether these men form a peculiar and distinct race, and a permanent variety of the human species, or are merely individuals who have accidentally degenerated from their original stock. Buffon inclines to the latter opinion, and he adheres in proof of it, that in the island of America a husband and wife, both of a copper-colour, produce one of these white children; so that the singular colour and constitution of these white Indians must be a species of disease which they derive from their parents; and the production of whites by negro parents, which sometimes happen, confirms the same theory. According to this author, white appears to be the primitive colour of nature, which may be varied by climate, food, and manners, to yellow, brown, and black; and which, in certain circumstances, returns, but so much altered, that it has no resemblance to the original whites, because it has been adulterated by the caules that are affliigned. Nature, he says, in her most perfect exertions, made men white; and the same nature, after suffering every possible change, will renders them white; but the natural or specific whites is very different from the individual or accidental. Of this we have examples in vegetables, as well as in men and other animals. A white rofe is very different, even in the quality of whitefefs, from a red rofe, which has been rendered white by the annual frosts. He deduces a farther proof that these white men are merely degenerated individuals from the comparative weaknesses of their constitution, and from the extreme feebleness of their eyes. This last fact, he says, will appear to be less singular, when it is considered, that, in Europe, very fair men have generally weak eyes; and he has remarked, that their organs of hearing are often dull: and it has been alleged by others, that dogs of a perfectly white colour are deaf. This is a subject which demands farther investigation. Buffon, Nat. Hist. by Smellie, vol. iii. p. 179—182.

M. Sanfure, in his "Voyages dans les Alpes," gives an account of two boys at Chamouni, whom he refers to the chiefs of Albinois. One of them was about 20 or 21 years of age, and the other about two years younger. The elder had a dząd look, with thicklips, but his features in other respects were not different from those of other people. The youngt was of a more agreeable figure, and more sprightly. Their eyes were not blue; the iris was rose-coloured; and the pupil, when viewed in the light, appeared red; whence he infers, that the interior membranes were deprived of the vein, and of the black mucous matter by which they should have been lined. In their infancy, their hair, eye-brows, eye-lashes, and the down upon their skin, were very fine, and of a perfect milk-white colour; but at the age above-mentioned, the hair was of a reddish cast and more strong. Their sight was also strengthened, and, even in their infancy, was not much affected.
offended by the light of the day. They were unable to labour with persons of their age, and were maintained by the charity of a relation. Although they had not the thick lips and flat noses of the white negroes, this difference is owing, as M. Saurille thinks, to their being Albinos of Europe, and not of Africa. The malady that affects the eyes, the complexion, and the colour of the hair, enfeebles also their strength, without altering the configuration of their features; and of this malady, he apprehends, there are different degrees; so that it produces, in various instances, different effects. He at first ascribed it to an organic debility; in consequence of which, a relaxation of the lymphatic vessels within the eye, might admit the globules of the blood in too great abundance into the iris, uvea, and even the retina, and thus occasion the redness of the iris and of the pupil. This debility, he supposed, might account for the intolerance of the light, and for the whiteness of the hair. But M. Blumenbach, professor in the university at Gottingen, attributes it to a different cause. He has observed the same phenomenon in brutes, in white dogs, and in owls; and he says, that it generally occurs in the warm-blooded animals, and that he has never found it in those with cold blood. This ingenious phlogist is of opinion, that the redness of the iris, and of the other internal parts of the eye, as well as the extreme sensibility that accompanies it, is owing to the total privation of that brown or blackish mucus, which, about the fifth week after conception, covers all the internal parts of the eye in its fluid state. He observes, that Simon Pontius, in his treatise, "De coloribus oculorum," long ago remarked, that the interior membranes of blue eyes are less abundantly provided with this black mucus, and are therefore more sensible of the action of light. He adds, that this sensibility of blue eyes is very conformable to the situation of northern people, during their long twilight; and that, on the contrary, the deep black in the eyes of negroes enables them to bear the strong glare of the sun's beams in the torrid zone. As to the connection between this red colour of the eyes, and the whiteness of the skin and hair, he says, it is owing to a similarity of structure. This black mucus is formed, as he affirms, only in the delicate cellular substance, which has numerous blood-vessels contiguous to it, but contains no fat, like the inside of the eye, the skin of negroes, the spotted palate of several domestic animals, &c., and the colour of the hair generally corresponds with that of the iris. Gazette Lit. de Gottingue, Oct. 1784.

M. Buzzi, surgeon to the hospital at Milan, published, at the same time, in the "Opusc. Scelti de Milan, 1784, tom. vii. p. 11," a very interesting memoir, in which he demonstrates, by dissection, the hypothesis of M. Blumenbach. Having an opportunity of dissecting the body of a peasant, who died at the age of 30 years, in the hospital of Milan, of a pulmonary disorder; and who was remarkable for the uncommon whiteness of his skin, hair, beard, and all the other covered parts of the body: he found the iris of the eyes perfectly white, and the pupil of a rosy-colour; and the eyes were altogether destitute of that black membrane, called the uvea, which was not discernible, either behind the iris or under the retina. Within the eye, there was only found the choroidal coat, extremely thin, and tinged of a pale red colour, by vessels filled with discoloured blood. The skin, when separated from different parts of the body, appeared to be almost wholly divested of the rete mucosum, nor was the least trace of it to be discovered by maceration, even in the wrinkles of the abdomen, where it is most abundant and most visible. The whiteness of the skin and hair is ascribed by M. Buzzi to the absence of the rete mucosum, which, in his judgment, gives the colour to the cuticle, and to the hairs that are scattered over it. In proof of this opinion, he alleges a well-known fact, that if the skin of the blackest horse be accidentally destroyed in any part of the body, the hairs that afterwards grow on that part are always white, because the rete mucosum, which tinges those hairs, is never regenerated with the skin. M. Buzzi having assigned the probable proximate cause of this phenomenon, it still remains to determine, what is the remote cause of it, or how the rete mucosum is destroyed in such subjects. It seems to be a fact, very generally admitted, that persons of this description do not form a distinct species, as they are produced from parents with dark skins and black eyes. This was the case with respect to the Albinos of Chalmon. M. Buzzi relates a fact, cited by M. Saurille, which seems to throw some light on the subject. A woman of Milan had seven sons, of whom the two eldest, and the two youngest had brown hair and black eyes; the other three had white skins, white hair, and red eyes. During the pregnancies that produced these Albinos, the woman had a constant and immediate appetite for milk, which she took in great quantities, but when she was pregnant with the other four, she had no such desire. But it does not appear, that this preternatural appetite was not the effect of a certain heat, or internal disquiet, which destroyed the rete mucosum in the children before they were born. M. Saurille observes, that this faulty constitution is more rare among women than among men; and it does not seem to be owing to the air of the mountains; for though he traversed the greatest part of the Alps, and the other mountains of Europe, he met with no other individuals of this kind.

ALBINOVANTES, Pedo, in Biography, a Latin post, to whom Ovid address his 10th epistle, "Ex Ponto," Op. tom. iii. p. 876. Ed. Burmann. There are extant of his writings, his Elegy on Drusus, and another on the death of Mecenas, published by Le Clerc in 1793, 8vo. and in 1715, 12mo. at Amsterdam, with a prolix commentary.

ALBINUS, Bernhard, called Weiss of White, in Biography, was born at Deslaw, in the province of Anhalt, in Saxony, January 7th, 1653, and studied medicine at Leyden. In 1666, having taken his doctor's degree, he returned to his own country, where he soon distinguished himself for his sagacity and learning. In 1680, he was nominated professor of medicine at Frankfort on the Oder, and became so celebrated for the pericpicity of his lectures, that pupils flocked to him from all parts of Germany. In 1694, Frederic, elector of Brandenburgh, appointed him his physician, with a pension of 600 florins, and soon after gave him a canonry at Magdeburgh. In 1702, he was chosen professor of medicine at Leyden. Having filled that office 19 years with the highest reputation, he died on the 7th of September 1721, aged 68 years. A large collection of Theses is published under his name, the titles of which may be seen in Haller's Bibl. Med. Pract.

ALBINUS, Bernhard Sigefred, son of the former, prosecuted his studies with so much zeal and success, that on the recommendation of Boerhaave, he was appointed professor of anatomy and surgery at Leyden, in 1718, when he was only 20 years of age. This office he continued.
continued to fill by an uncommon fidelity, Haller says, for 50 years, and acquired a greater degree of reputation, as teacher, or demonstrator in anatomy, to which he exclusively dedicated himself, than had been enjoyed by any of his predecessors. He died, Sept. 9th, 1770, aged 73 years. His last work, entitled, "Historia musculorum hominis," 4to. appeared in 1754. In composing this, he took great pains to measure and describe all the injuries of the muscles in the bones, and to mark them in with aqua fortis, which he afterwards caused to be drawn by an excellent artist. In 1737, he gave some coloured plates of the arteries and veins of the intime, and some elegant figures of the bones of the fetus. An anatomical explanation of the plates of Eulachius, with a new edition of the plates themselves, was published by him in 1753, and republished with improvements in 1761. His own large tables of the skeleton and muscles appeared in 1747; and about the same time, seven tables of the gravid uterus. His great tables of the bones was edited in 1753; and again, in an improved state, in 1762. Eight volumes, 4to, of "Anatomical Annotations," replete with curious matter, but too much occupied with controversy, appeared successively from 1754 to 1768.

Besides his original works, which are numerous, and highly illustrative of the science, he published in 1755, an edition of the works of Vesalius, with an account of his life; in the same year, "Index capitellarum Raviann," and in the year 1737, "Galichini Harvei Opera, et Hieronimi Fabricii ab Aquapendente." See Haller's Bibliotheca Anatomica, vol. ii.

ALBINUS, CHRISTIAN BERNARD, though eclipsed by the imperial family of his brother, was so much esteemed for his skill and diligence, as he was raised to the chair of professor of anatomy, at Utrecht. He died April 5, 1752, aged 55 years. He published, in 1722, "Specimen Anatomicum, exhibens novum terrenum hominis intellimum descriptionem," 4to.; and the next year, "De anatome errores detegente in Medicina," also in 4to.

Two other authors of the same name are noticed by bibliographers; James, a native of Hamburg, who published in 1726, a "Dissertation on the Scary," and Eleazer, who published natural histories of Birds and Insects.

ALBINUS, JAMES, or WEISS, a celebrated historian and good poet of the 16th century, was born at Steenberg in Mufcia, and became professor of poetry and mathematics in the academy of Wittemberg, and then secretary to the elector at Dresden, where he published a second enlarged edition of the "Chronicles of Musia," which he had printed at Wittemberg in 1590. His other works, principally historical, were much esteemed. Biog. Diet.

ALBINUS, DECIMUS CLODIUS, was born at Aedriatum in Africa, and called Albinus, on account of his fair complexion at his birth. In his youth he was instructed in the Greek and Latin languages, and he is said to have written a treatise on agriculture, and a collection of Mithian tales, which was a licentious performance; but his prevailing taste inclined to a military life, and he was acculturated at school to repeat frequently, and with peculiar pleasure, the following verses from Virgil:

"Arma amens capio, nec fat rationis in armis."

_Alexiad, ii. v. 314._

"With frenzy seiz'd, I run to meet th' alarms;"

"Resolv'd on death, resolv'd to die in arms!"

DRYDEN.

He commenced his career under the emperor Antoninus, whose faults he acquired; and after some previous gradations of advancement, he commanded the army in Dithyrys, when Aurelius Cæsarius revolted against Marcus Aurelius. On this occasion he distinguished himself by his fidelity to his prince, and by his active services, for which he was rewarded, as it is said, with the consulship. Under Commodus he acquired reputation in several battles on the Rhine and on the Danube, and he was at length appointed commander of the legions in Britain. Whilst he governed Britain, Commodus, by the account of Capitolinus, which is not generally credited, indulged him with permission to assume the title of Caesar, with all the emblems proper to that dignity. However this be, Severus, as we are informed by Dion Cassius and Herodian, footed his ambition and engaged his attachment, by giving him this title. Albinus was deluded by this honour, and by the expectation which the emperor led him to entertain of sharing with him in the imperial government. Severus also appointed him his colleague in the consulsship in the year 154, ordered statues to be erected to him, and conferred upon him other distinctions, which afforded an opportunity ultimately of destroying him. Having defeated and killed Niger, whom he had animadverted and deceived by the same kind of diffamation which he was practising on the credulous Albinus, he determined to get rid of this rival, whose character, contrasted with his own, induced the senate to exchange one matter for another. Some say that, before he had recourse to open force of arms, he tried the base and pernicious means of affronting; but Dion Cassius's account is more probable, who says, that Severus, after his victory over Niger, deprived Albinus of the title and prerogatives of Caesar, and that Albinus, on the other hand, pretended even to the title of Augustus. Accordingly Albinus was proclaimed under this appellation, engaged Gaul and Spain in his interest, and followed with a powerful force to meet Severus, who had proclaimed him a public enemy. The two rivals, after some previous skirmishes, decided the contest for the empire in the plain between Lyons and Treveaux. Their two armies were equal in number, each of them consisting of 150,000 men, and they were led on by the two emperors. The troops on each side fought with great valour. The British legions under Albinus were not inferior to those of Ilyricum; but Severus was thought to be an able general than his competitor. The victory was long doubtful, but at length Severus prevailed; and Albinus was compelled to fly with the shattered relics of his army, first to Lyons, and then to a house near the Rhone, where he either destroyed himself with his own sword, or made one of his slaves perform the fatal office for him. He was not quite dead, when a detachment of the enemy arrived, cut off his head, and carried it to Severus. His wife and children were at first pardoned; but afterwards inhumanly maimed, and their bodies thrown into the river. The whole family of Albinus, all his friends, and most distant relations, without distinction of age or sex, were, by the orders of Severus, barbarously slaughtered, and their estates confiscated. Most of the great men of Gaul and Spain, who had manifested any attachment to Albinus, underwent the same fate. By means of these murders and confiscations, Severus amassed an immense treasure, enriched his soldiers, and, at his death, left incredible wealth to his children. This event happened on the 19th of February, according to Tillemont, A. D. 197, the 4th year of Severus's reign.

Of the character of Albinus, different accounts have been given. Capitolinus, on whose report we cannot much depend, represents him as stern, resolute, unfeignedly, rigid to cruelty in his discipline, glutinous and brutal. But this account is not very credible, when it is considered that his soldiers
soilers were attached to him, and that he was exceedingly beloved by the senate, and applauded for his justice and humanity. He seems, however, to have been a brave warrior, who had the art of making himself beloved; but who had not cunning enough to guard against the arts of his enemy, and this was the cause of his ruin. Crevier, Hist. of the Emperors, vol. viii. p. 63—66. Anc. Uni.

Hill. vol. xiii. p. 374—293.

ALBINUS, A. Posthumius, the colleague of Licinianus Luçinius in the confultum, in the year before Christ 151, wrote a History of the Affairs of Rome, in the Greek language. He is mentioned by Cicero in his Brutus (Oper. tom. i. p. 399. Ed. Olivet.) as a man of learning and eloquence. Upon his making an apology, and intreating pardon for the improprieties of expression that occurred in a work written in a language so different from that of his own country, Cato factiously asked, "Why did you choose rather to solicit pardon for a fault than not to have committed it?" His conduct however in this respect needed no apology, as the Greek language was known to almost all nations, whilst the latter was almost wholly confined to the Roman territory, and therefore his history would be more extensively read.

See Cicero per Archia, Oper. tom. v. 405.

ALBIOUCE, or ALBROCE, in Ancient Geography, called also Reij Apollinaris, from their worship of Apollo, and

Rerius Renfium, was a Roman colony of Gallia Narbonensis. It is now Rieus or Rieux, in Provence.

ALBION, a name formerly given to the island of Britain, comprehending England, Scotland and Wales, by way of contradiction from Hibernia, and the other British islands. Thus Agathemerus, (lib. xii. e. 47.) speaking of the British islands, saith, they are many in number; but the most considerable are Hibernia and Albion; and Ptolemy (lib. ii. e. 3.) calls Albion a British island. Pliny also (H. N. lib. iv. e. 16. tom. i. p. 222.) observes, that the island of Britain, so much celebrated by the Greek and Latin writers, was formerly called Albion; the name of Britain being common to all the islands round it. The etymology of the name is uncertain. Some derive it from the Greek αἶβον, alben, signifying white, in reference to the chalky cliffs on our coasts; others pretend that its name was borrowed from a giant, the son of Neptune, mentioned by several ancient writers. Some of our etymologists have recourse to the Hebrew tongue, and some to the Phoenician; αἶβον in the former signifying white, and ἀλπ or ἀλφιν in the latter, denoting high and high mountain, the land appearing for the first time of its duration from the continent. The derivation from the Greek or Hebrew word signifying white, seems to be countenanced by the fact that the poet, who called Britain Inis Wen, i.e. the White Island. Selden's notes on Polybius, p. 29.

ALBION, New, in Geography, the name given by Sir Francis Drake to the California, and part of the north-west coast of America, which he took possession of in 1578. Captain Cook discovered the coast of New Albion, March 7, 1778, and landed in a place situated in N. lat. 44° 33'. E. long. 235° 20'. He describes the land as abounding with mountains, the summits of which were covered with snow; but the valleys that lay between them and the sea-coasts, high as well as low, produced a great number of trees, which appeared like a large forest. The inhabitants at first seemed to prefer iron to every other article of commerce; but they afterwards liked such a predilection for brass, that scarcely a fragment of it was left in the ships except that which belonged to the necessary instruments. They were also observed to be much more tenacious of their property than those of the other savage nations which the voyagers had met with, so that they would not part with wood, water, grass, or even the most trifling article, without a compensation; and they were sometimes very unreasonable in their demands. The place in which the Resolution anchored was called by Captain Cook, St. George's Sound; but he afterwards understood that the natives gave it the name of Noottka. Its entrance was situated in the east corner of Hope bay, in N. lat. 45° 33', E. long. 235° 12'. The climate seemed to be much milder than that of the eastern coast of America, in the same parallel of latitude; and the thermometer, even in the night, never fell lower than 42°, and in the daytime frequently rose to 60°. The trees of this country are chiefly the Canadian pine, white cypress, and some other kinds of pine. The birds were few, and much harried by the natives, who use their feathers as ornaments for their darts, and their flesh for food. The people are acquainted with the use of metals, having many iron tools; and two silver spoons were procured, which were similar in their constitution to those seen in some Flemish pictures, and were worn by one of the natives as an ornament round his neck. These metals had probably been conveyed to them by the way of Hudson's bay and Canada, or some of them might have been introduced from the north-western parts of Mexico.

On the 18th of April, 1792, Captain Vancouver employed in an expedition for completing the survey of the western coast of North America, from the latitude of 36° to 66° N., fell in with the coast of New Albion in N. lat. 39° 27', E. long. 236° 25'. As he approached the land, the shore seemed to be perfectly compact, formed, generally speaking, by cliffs of a moderate height and nearly perpendicular. The inland country, which arose in a pleasing diversity of hills and dales, was completely clothed with forest trees of considerable magnitude, and those spots, which were delititude of wood, were beautifully green, with a luxuriant vegetation, interspersed by breaks of natural earth. This part of the coast abounded with whales, most of which were of the tribe called the Greenlanders. In directing their course along the coast northward, they passed Cape Mendocino, in lat. 40° 19', long. 235° 55'. This Cape is the first headland that this part of New Albion. The mountains behind it are considerately elevated, and form a high rock mass, composed of various hills that rise abruptly, and are divided by many deep chasms. Dwarf-trees were thinly fattered in the cliffs and on the ridges of the hills; and the general surface was covered with vegetables of a dull green colour, occasionally interfered with perpendicular strata of red earth or clay. As they advanced further north, the diffused interior country was composed of mountains of great elevation, before which were perceived hills and dales, with woodland and clear spots, as if they were in a state of cultivation; but they could discern neither houses, huts, smoke, nor any other signs of its being inhabited. On the coast to which they next approached, and which was formed by rocky precipices, the most projecting part, situates in lat. 41° 8', long. 236° 5', was called Rocky Point. Near this point the colour of the sea changed to a light river-coloured water, which gave reason for concluding that some considerable river or rivers were in the neighbourhood; but pursuing their course they arrived again, in oceanic-coloured water, in lat. 41° 30', long. 235° 58'. The land in this part, formed a conspicuous point, which was distinguished Point St. George, in lat. 41° 46', and long. 235° 57', and a dangerous cluster of rocks extending from thence, the Dragon rocks. The point forms a bay, and the north point of it was called St. George's bay. The inland mountains were much elevated, and clothed with a variety of trees, chiefly of the pines, and some spreading trees of considerable magnitude were observed. Proceeding further along the coast they call anchor in lat.
42° 38', long. 235° 44'; a cliff which projected into the sea near their station, and terminated in the form of a wedge, was called Cape Orford, lat. 42° 52', long. 235° 15'. Some canoes came from the coast to visit the ships, and approached alongside of them with the greatest confidence. The people were distinguished by a pleasing and courteous deportment; their countenances indicated nothing ferocious; their features partook of the European character; their colour was a light olive; and besides being punctuated like that of the south-sea islanders, their skin had many other marks, which were either the effects of injury in roving through the forests with thin clothing, or purely ornamental. Their stature did not exceed five feet six inches; they were well-limbed, but flender in their persons, bony little or no resemblance to the people of Nootka; nor did they seem to have the least knowledge of their language. They preferred cleanliness to the painting of their bodies; in their ears and noses they had small ornaments of bone; their hair, which was long and black, was clean and neatly combed, and generally tied in a club behind, and some of them had it thus tied in front. They were drest in garments, nearly covering them, made principally of the skins of deer, bear, fox, and river otter. Their canoes, capable of carrying about eight people, were rudely wrought out of a single tree, resembling in shape a butcher's tray, and appearing to be unfit for either a sea voyage or any dilatent expedition. *They brought but a few articles to barter, and they anxiously solicited in exchange iron and beads. In their traffic they were scrupulously honest in fixing their bargain with the fullest bidder, and in refusing any presents without an equivalent in return.*

In their progress from their last station near Cape Orford, they discovered a point of land which they considered to be the Cape Blanco of Martin d'Aguilar, in lat. 43° 28', long. 235° 56', and the Cape Gregory of Captain Cook; and they fought for the river or straits, which are said to have been discovered by this navigator. They next arrived at a promontory, which Captain Cook calls Cape Perpetua, in latitude 44° 11', longitude 236° 51'; and purving in the vicinity of this point the whole stretch of land to the southward of Cape Orford, and at this place, seen any inhabitants, or met with any circumstances, that in the most distant manner indicated a probability of the country being inhabited. Since they had passed Cape Orford, they had a constant current, setting in the line of the coast northward, at an uniform rate of near half a league per hour.

In this part of the coast the most remarkable mountain which they had seen, presented itself: its summit, covered with perpetual snow, was divided into a very elegant double fork, and rose conspicuously from a base of lofty mountains clothed in the same manner, which defended to hills of a moderate height, and terminated in low cliffs, falling perpendicularly on a sandy beach. This was considered to be the mount Olympus of Mr. Mears, in latitude 47° 10', though the latitude of the observers was 47° 38', and the mountain was north of them. Purving their course further northward, they distinguished the south point of entrance into De Fuca's straits, and on the opposite side of the strait an opening of considerable extent. They perceived that this coast, like that which had been explored from Cape Mendocino, was firm and compleat, without any opening into the Mediterranean sea, as stated in latitude 45° 45', or the least appearance of a secure harbour, either in that latitude, or from it southward to Cape Mendocino; although, in that space, geographers have thought it expedient to furnish many. They now saw several villages clustered along the shore, whose inhabitants came off, as it was suppos'd, for the purpose of trading. Having passed between Tatoosh or Island, and a rock, called Rock Duncan, along the southern shore of the supposed straits of De Fuca, they anxiously looked for the point which Captain Cook had denominated Cape Flattery; and at last concluded, that Chaffet, a projecting and conspicuous promontory, at the south entrance of the inlet, is the point, with an island lying off it, which Captain Cook called Cape Flattery. The village of Chaffet is situated about two miles within the cape, and appeared to be extensive and populous. The few natives, who came off to the ship, resembled in most respects the people of Nootka; their persons, garments and behaviour, were very similar; but instead of the ornamental crecent at the nose, used by the inhabitants of Nootka, they wore flaked pieces of bone; their canoes, arms and implements were the same, and they spoke the same language. They anchored about eight miles within the entrance, on the southern shore of the supposed straits of De Fuca. The shores on each side of the straits are of a moderate height; those on the south side are composed of low sandy cliffs, and from the top of thebe the land appeared to ascend gently, and to be covered with trees, chiefly of the pine tribe, until the forest reached a range of high craggy mountains, the summits of which were covered with snow. The northern shore did not appear quite so high, nor were the mountains, which formed a compact range, so much covered with snow. Steering to the east, along the southern shore, their latitude was 48° 19', and longitude 236° 19', one of the last; the variation of the compass 18° east. The north promontory of Chaffet was situated in latitude 48° 23', longitude 235° 38'. Proceeding forward, they came to anchor in 14 fathoms water, about three miles from a low sandy point of land, resembling Duengenes in the British Channel, and called New Dungenes: whence they discovered a lofty mountain, which they called Mount Baker, apparently at a very remote distance. "We had now," says Mr. V. "advanced further up this inlet than any other person from the civilized world; although it should hereafter be proved to be the fame which is said to have been entered.
tered by De Fuca; in support of which, oral testimony is the only authority produced, a tradition rendered still more doubtful, by its entrance differing at least 40° in latitude. This difference of latitude, however, is not sufficient altogether to discredit the traditional accounts to which Mr. V. refers; and as a flint, with a considerable extent of sea, has been actually found, and to the north of the flint many islands, or an archipelago of islands, it is much more reasonable to suppose that some error has been introduced into the old accounts, or that the situations may originally have been erroneously described, than that an admission of the existence of a flint and of an archipelago of islands should have been the mere result of random conjecture.

It must be considered as a very singular circumstance, that in no great an extent of sea coast, as 215 leagues, to which the inquiries of these navigators had been directed, they should not till now have seen the appearance of any opening on its shores, which afforded any certain prospect of affording shelter; the whole coast forming one compact, solid, and nearly flint barrier against the sea. The hills observed to the southward of Clatsch, were built exactly like the houses at Nootka; and were composed of a few masses thrown over crooks and slacks, and plainly indicated the residence of the natives to be merely temporary. The inhabitants viewed their European visitors with the utmost indifference; they traded with them in a civil and friendly manner, but did not appear to understand the Nootka language. Their next remove was to a harbour called Port Discovery, where they moored about a quarter of a mile from the shore under a kind of promontory, which afforded them shelter; and which they called Protection island. The entrance of port Discovery is situated in lat. 49° 40', long. 237° 20'. The country in its neighbourhood is bounded on the west by mountains covered with snow; the soil is generally a light sandy loam, which being mixed with decayed vegetables, forms a rich fertile mould. Iron ore was generally found here, and appeared tolerably rich. Quartz, agate, the common flint, and a great intermixture of other silicious matter, with some variety of calcareous, magnesian, and argillaceous earths, were the mineral productions commonly found. The vegetables that grew most luxuriantly were the Canadian and Norwegian hemlock, silver pines, the Turamallie and Canadian poplar, arbor-vita, common yew, black and common dwarf oak, American ash, common hazel, fycamore, fugar, mountain, and Pentylvanian maple, oriental arbutus, American alder, and common willow. These, with the Canadian elder, small fruited crab, and Pennylvanian cherry-trees, constituted the forests. Of excelent vegetables few were found; the white or dead-nettle, and samphire, the wild orchase and the vetch were the most common. Two or three sorts of wild peas, and the common hedge mustard were met with occasionally; they were excellent of their kind, and proved extremely agreeable and useful. The only living quadrupeds that were seen were a black bear, two or three wild dogs, as many rabbits, several small brown squirrels, rats, mice, and the skunk of a peculiarly offensive smell. The aquatic birds were few, and so timid that they could not be killed. About the shores and on the rocks were found some species of the tern, the common gull, sea pigeon of Newfoundland, curlews, sand-larks, shags, and the black sea-pye, like those in New Holland and New Zealand; but not in great abundance. In the woods they saw two or three spruce-partridges; few small birds were discovered, and of these the humming birds were the most numerous. At the outskirts of the woods, and about the water side, they saw a great number of the white-headed and brown eagle, ravens, carrion crows, American king-fisher, and a very handsome wood-pecker, and also a bird unknown to them, which they considered as a specks of crane or heron, the eggs of which were of a bluish colour, larger than those of a turkey, and well tailed, with long legs and necks, of the size of the largest turkey, and with a light brown plumage. Some blue, and some white herons of the common size were also seen. The supply of fish was scanty, and confined in general of the common sorts of small flat-fish, elephant fish, sea bream, sea perch, a large sort of tuncipin, weighing fix or eight pounds, with a greenish colour about their throat, belly and gills, and affording coarse, but not unwholesome food, a few trout, and a small eel of a yellowish green colour and well tailed. Of the reptile tribe they found a small common black snake, a few lizards and frogs, together with a great variety of common insects.

The country, in an agricultural view, seemed capable of improvement, though the soil was light and sandy. The spontaneous productions are nearly the same, and grow in equal luxuriance with those under the same parallel in Europe. The climate is mild, and every species of plants forward in its growth. Fresh water is very scarce; but sufficient for common domestic purposes. As for the inhabitants, they are thinly scattered along the shores. From New Dundegn's to Port Discovery, our voyagers travelled near 150 miles of these shores without seeing as many inhabitants. Those whom they observed, nearly resembled the people of Nootka; but were not so robust in stature, nor so filthy in their habits. Their weapons, implements, canoes, and disbris near the same. Their native woollen garment was most fashionable, and next to this the skins of deer, bear, &c.; and some few were drest manufactured from bark, which, like their woollen ones, were very neatly wrought. Their spears, arrows, fish-hooks, and other weapons, were shaped like those of Nootka; but none of them were pointed with copper or mufle-shell. The three former were generally barbed, and those of their own manufacture were pointed with common flint, agate, and bone. Their arrows were pointed with thin flint iron; and their bows were of a superior construction, and made of yew, and the bow-string of the sinew of some marine animal. From the form and structure of their habitations, they seemed frequently to change them; and their deserted villages indicated their being migratory in their disposition and habits. Mr. V. supposes, however, that though the country seems to be thinly inhabited, it was once much more populous. In different excursions, they found the skulfs, limbs, ribs, and back-bones, or other vestiges of the human body, scattered about in great abundance; and hence it is inferred that there has been occasionally, and not at any very remote period, a great waste of human life. Several skeletons were found deposited in caves, and suspended on the branches of trees about 12 feet from the ground; these were probably the remains of the chiefs, priests, and leaders of particular tribes, to whom they paid particular respect. Baskets, containing the skeletons of young children, were also found in the same situation; and in other places, dead bodies were discovered in holes, which were slightly covered over, and in different states of decay. But the skeletons found in caves and baskets bore a very small proportion to the skull and other human bones indiscriminately scattered about the shores. Whether these were the reult of epidemic disease, or of recent wars, our navigator does not determine. From the character of the people, he thinks the latter cause not to be probable; for he represents them as uniformly civil and friendly, without manifesting the least sign of fear or suspicion at the approach of strangers, or any indication of their having been injured to hostility. The
small-pox seemed to have been very fatal amongst them. The present depopulation, it is apprehended, may have arisen, in some measure, "from the inhabitants of this interior part having been induced to quit their former abode, and to have moved nearer the exterior coast, for the convenience of obtaining in the immediate mart, with more ease and at a cheaper rate, those valuable articles of commerce that within these late years have been brought to the seacoasts of this continent by Europeans and the citizens of America, and which are in great estimation among these people, and policed by all in a greater or less degree."

From Port Discovery, our navigators pursued their route up the inlet, viewing in their progress a very picturesque and fertile country, and seeming to require only inhabitants and cultivators; having found a convenient roadstead, they anchored near a village in which the inhabitants were employed, in their temporary huts, in curing, by the smoke of the fire, deer's, muskets, and a few other kinds of fish, which seemed to be intended for their winter's subsistence. Several of these were handily engaged, like swine, in rooting up a beautiful verdant meadow, in quest of a species of wild onion and other roots, for the sake of which they appeared to be attached to this spot. One of these roots resembled the Saranne, and was gathered with great industry and activity, for the purpose of making a paste with which they filled small boxes, placed in the baskets containing the flickets of their children. In their manner, these people were friendly and hospitable, and very thankfully received the presents that were given them. They also bartered for any articles that were offered them; but they chiefly preferred copper. Bows and arrows, woollen and skin garments, and a few indifferent otter skins, composed the whole of their allotment for trading; and these they exchanged, in a very fair and honest manner, for copper, hawk's bells, and buttons, articles that greatly attracted their attention.

The dogs belonging to this tribe of Indians were numerous, and resembled those of Pomerania, but were larger in size. They were all thorn close to the skin, like our sheep; their fleeces were compact, and composed of a mixture of a coarse kind of wool, with very fine long hair, capable of being spun into yarn. It was conjectured, that their woollen clothing might be formed partly of this material, mixed with a finer kind of wool from some other animal, which, though it must have been very common, was not discovered.

Here was discovered a narrow passage, which seemed to communicate with an opening of some extent, and to this harbour was given the name of Port Orchard. In their present situation, they were presented by some of their Indian friends with a whole deer, in the chase of which and another they and their dogs had been busily engaged for almost a whole day. It was found that these people had a great aversion for human flesh; for conceiving that some pieces of the deer that were offered them were of this kind, they threw them away with gestures of great displeasure. Hence it was inferred, that the character given of North-west America does not attach to every tribe; but though these people were not in this respect savages, they were not wholly exempt from the general failing attendant on a savage life; for one of them secreted a knife and fork under his garment, and when detected gave them up with the utmost good humour and unconcern.

Our navigators, having advanced into an opening, situate in lat. 47° 19', and long. 237° 42', halted on an island about a mile from the eastern shore, which was one of the most extensive islands discovered in the examination of this coast, and which they called Fajhon's Island. In one inlet which they examined, they found a tribe of Indians, who manifested hostile dispositions, and prepared their bows and arrows for an attack. Upon the firing of a gun, though they expressed no alarm or concern, they unfurled their bows, and commenced a friendly traffic. The village point near their present station, situate in lat. 47° 30', long. 237° 46', was called Restoration Point. Their next anchorage was in an excellent harbour, sheltered from all winds, in lat. 48° 21', long. 237° 57'. The inlet, which they had spent a fortnight in examining, they denominated Admiralty Inlet. On the 5th of June, they quitted this inlet, falling down Passiehon Sound, and proceeded northward; the north point of this inlet, lat. 48° 16', long. 237° 31', they called Point Partridge; and the west point, lat. 48° 10', long. 237° 31', they denominated Port Wilson. On the west side of Strawberry Bay, where they anchored, there was an island, which producing abundance of upright cypresses, they called Cyprus Island, lat. 48° 56', long. 237° 34'. It was also found, that the eastern shore of the gulphs, from the passage into Port Gardner, called Deepion Passage, in lat. 48° 27', long. 237° 27', to the north point of the entrance into Passiehon Sound, in lat. 47° 53', long. 237° 47', was an island about 4 miles wide in its broadest part; and this was distinguished by the name of Winday's Island. In pursuing their investigation, they discovered a point, in lat. 45° 57', long. 237° 26', Point Roberts; another, in lat. 45° 10', long. 237° 26', Point Grey; a third, about a league distant, Point Aikinon; an island which they called, Passage Island; and a canal near it, Bernard's Canal; and another island, in lat. 49° 35', long. 237° 45', Angus Island, from the shape of the mountain that compacts it; a found to the southward, Howe's Sound; and a point in lat. 49° 23', long. 236° 51', Point Geese, near which is an extensive group of islands of various sizes. In their return to their ships, they reached the north point of the inlet, which producing the first Scotch fir that had been seen, was called Scotch Point, in lat. 49° 42', long. 236° 17'; and to the arm of the sea they gave the name of Foreland Canal. The south point of the land which they passed in lat. 49° 28', long. 236° 24', was called Point Upwood; and a shoal, near which they purchased of the natives some excellent turbot, weighing from 14 to 20 lb. each, they called Sturgeon Bank. Near a cluster of islands, in lat. 48° 36° to 48° 48', and long. 237° 50', at its eastern extremity, they found an extensive bay, which was distinguished as Bellingham's Bay. In their progress northward, the forests were composed of a much less variety of trees, and their growth was less luxuriant. Those most common were pines of different sizes, the arbor vitae, the oriental arbutus, and some species of cypresses. On the islands were seen some few small oaks, with the Virginian juniper; and at the place where their ships were last stationed, the Weymouth pine, Canadian elder, and black birch, which gave it the name of Birch Bay, situate in lat. 48° 53', long. 237° 33'. From this bay they failed northward, June 24th, directing their course through the canal del Neultra Signora del Rosario, in extent about ten leagues from Point Upwood to Point Marshall, the north-west point of the island of Feveda, in lat. 49° 48', long. 235° 47'; near which is another island, called Harwood Island, and not far off, in lat. 39° 57', long. 235° 54', Savary Island. In lat. 50° 44', long. 235° 25', was a point which they called Point Sarah; and the opposite point, about half a league distant, they called Point Mary. In a canal, denominated But's Canal, they found an Indian village on the face of a steep rock, lat. 50° 24', long. 235° 8', containing about 150 of the natives, who plentifully supplied them with fresh herrings and other fish in
in barter for nails. Before the entrance into this canal was a
round island, three or four miles in circuit, which obtained the
name of Saint's Island. Quitting Deception Sound, in lat. 50° 11',
long. 235° 21', they sailed through an immense
Expanse of islands and rocks, and in the midst of whales and
dolphins, to more pleasant shores, from which the
friendly Indians came to visit them, with young birds,
particularly sea-fowl, fish, and some berries, which they bartered for
inlets; and they anchored about 20 miles to the northward of
Point Mortay, in lat. 50°, long. 235° 9', where was a large
village of the natives, who conducted themselves with great
convenience and respect, and who were not fewer in number than
300 persons. Near Johnstone's Straits was a point, called
Point Chatham, in lat. 50° 19', long. 234° 45'. About ten
miles from this point they anchored under a narrow island,
distinguished by the name of Thevenot's Island. To a snug and commodious port, to which they afterwards arrived,
they gave the name of Port Neville; near which was a large
village, the inhabitants of which understood the language of
Nootka, and who bartered with the skins of the Sea-
otter of excellent quality, for sheet-copper and blue cloth.
Here they found the fabrication of mats for various pur-
poses, and a kind of basket, wrought so closely as to con-
tain water without the least leakage; and in this manu-
facture, the women were chiefly employed. They next pro-
cceeded by Call's Canal, in lat. 50° 42', long. 234° 31'.
Knights Canal, in lat. 50° 1', long. 234° 13'; and Deepsea
Bluff, a point of land in lat. 50° 52', long. 234°, through an
exclusive cluster of islands, rocky inlets and rocks, called
Dronkton's Archipelago, to a station in lat. 50° 35',
long. 233° 19'.
Afterwards they entered a channel called Fiji's
Passage, and found its eastern point, named Point Diff, to be
in lat. 50° 48', long. 233° 0'. Passing Point Philips, at the distance of eight miles from Deep Sea Diff, they
reached the base of a remarkable mountain, in lat. 50° 1',
long. 233° 20', called Mount Stephen's, which is thus marked
in the author's chart, and may seem as an excellent guide
to the entrance of the various channels with which this
country abound. The next place of their meeting was
named Point Belcher, in lat. 50° 51', long. 233° 52', near
the west point of a channel called Wells's Passage. Having
pursued their course through a channel not more than half a
mule wide, bounded on one side by islands, rocks, and
breakers, which appeared almost to meet the continental
shore on the other, they anchored in lat. 50° 2', long. 233° 25'.
They afterwards proceeded through a channel about two
miles wide, between rocks and rocky islands, which seemed
to be connected with the southern broken shore, and reached
that part of the coast that had been visited and named by
several of the traders from Europe and India. The inlet
through which they had lately passed was Queen Charlotte's
Sound, so called by Mr. S. Wedgborough, in August 1786;
an opening on the continental shore had in the same year been
named Smith's Inlet, by Mr. J. Hanna; a high Distant
mountain that appeared to be separated from the main land,
formed part of a cluster denominated by Mr. Duncan,
Colvert's Islands; and the channel between them and the main
land had been called by Mr. Hanna, Fitzburgh's Sound.
Their estimated latitude in this situation was 51° 4', and
long. 232° 8'. They next sailed across Charlotte's Sound
for the entrance of Smith's Inlet; afterwards stealing along
the eastern side of Colvert's Island, they sought for Port
Safety, laid down in Mr. Duncan's chart, or some other
convenient anchorage. A cave within the fourth entrance of
Fitzburgh's Sound, afforded them a secure and comfort-
able retreat from the dangers to which they had been ex-
posed, and they called it Safety Cove. Determining to
abandon the northern survey of the continental shore for
this season, they made the heel of their way towards
Nootka Sound, at which port they anchored on the 28th of August 1792. In this survey, they had traced the
western continental shore of America, with all its various
turnings, windings, numerous arms, inlets, creeks, bays, and
large inlets to the northward of that point. They also found that the land forming the north face of that point is part of an island, or
rather of an Archipelago, extending nearly 100 leagues in
length from south to north, and on the side of this land most distant from the continent is Nootka Sound.
In October 1792, our navigators left Nootka Sound, and
proceeded to re-examine the coast of New Albion to the
southward, and particularly a river and a harbour discovered
by Mr. Gray, commander of the Columbia, between the 45th and 46th degrees of north latitude. They directed their course towards Cape Flattery, to which they referred
Captain Cook's original appellation of Cape Flattery. One
of the most copious promontories southward from this
cape was Point de los Reyes, as it is called by the Spaniards,
in lat. 37° 6', long. 237° 24'.
Southward of this point, the shore forms the north point of a bay, in which, according to the
Spaniards, Sir Francis Drake anchored, in the vicinity of
which is a port called by the Spaniards Bodega. They next proceeded to port S. Francisco, a Spanish settlement, in
lat. 37° 48', long. 237° 52'. The mean variation of the compasses was 12° 48'.
Leaving this port, they sailed for Monterey, another Spanish settlement. From hence they receded towards the Sandwich islands.
In April 1795, our navigators again visited the coast of
New Albion; they first sailed for the coast at Cape Mendocino,
and anchored, on the 2d of May, in Port de la Trinidad,
so called by the Spaniards, which they discovered in 1775;
but they found it a less convenient haven than they had been led to expect from the description given of it in the journal of Don Francisco Maurelli, translated by the Honourable
Daines Barrington. The inhabitants of an Indian village
in this neighbourhood, who visited the ships in their canoes,
shadowing the other Indians as they drew near, and traffic-
ked in bow and arrows, inferior sea-otter skins, small
knives, and fish. They were roughly made, but of a
lower stature than any other Indians on this coast. Their
perons were mutilated or disfigured, either for ornament or
from a regard to some religious institution, or for some
other unknown purpose. All the teeth of both sexes were,
by some procures, ground uniformly down, horizontally,
to the gums; the women especially, carrying the fashion to an
extreme, had their teeth reduced even below this level; and
ornamented their lower lip with three perpendicular
columns of punctuation, one from each corner of the
mouth, and one in the middle, occupying three-ninths of the lip, and
chin. The latitude of the ship's station was 41° 3', and
that of Rocky Point, five miles to the north, 41° 8', and the
longitude of Trinidad Bay 236° 6'. From Trinidad,
pursuing their course to latitude 45° 53', longitude 233° 17',
they saw the coast of the island of Quadrant and Vancouver,
and were within a league of Ponta de Ferron; and passing
along the shore of the Isle de Ferron, they proceeded to
Nootka, and anchored in Friendly Cove. From hence they
failed to Fitzburgh's Sound, and recommenced their ex-
amination of the part there where it had been discontinued in
in the preceding year. The survey now made, in most of its cir-
cumstances, resembled the former. They found the same
kind
kind of broken coast, with inlets and channels almost insurmountable, and the same extraordinary depth of water close to the shore, and in places included within the land. In the space of four months, devoted to this northern survey, they advanced little more than four degrees northward, leaving off between the 56th and 57th degrees of north latitude.

In a place near Fijner's Canal, in lat. 52° 29' latt. 23° 51', the natives offered for sale the skins of the animals whose wool is manufactured into the garments worn by the inhabitants of north-west America. They were too large to belong to any of the canine race, as our navigators had formerly supposed. Exclusively of the head or tail, they were 56 inches long, and 36 inches broad, exclusively of the legs. The skin afforded but little wool in proportion to its size; and it is chiefly produced on the back and towards the shoulders, where a kind of creel is formed by long pointed hairs, protruding themselves through the wool, and the same sort of hair forms an outer covering to the whole animal, and entirely hides the wool, which is short and of a very fine quality. The skins were cream-coloured, the pelt was thick, and appeared to be of a strong texture; but they were too much mutilated for ascertaining the animal to which they belonged. The females of this part adopted a singular ornament. An horizontal incision was made about three-tenths of an inch below the upper part of the under lip, extending from one corner of the mouth to the other, justly through the flesh; this orifice was then stretched sufficiently for admitting an ornament of wood, of an oval form, and hollow on both sides; which was confined closely to the gums of the lower jaws, and whose external surface projected horizontally. The clothing of the natives was formed either of these skins or of the pine bark, and ornamented with woollen yarn, very fine, well spun, and dyed with a very lively and beautiful yellow. As to their dispositions and manners, they seemed to be civil, good-humoured and friendly; and they manifested a considerable degree of vivacity and humour. They approached and left the ships with songs; they appeared to be happy and cheerful, and to live in the strictest harmony and good fellowship with one another. They were well versed in commerce. In examining some of the openings, which presented themselves in the continental shore, and which Mr. V. traversed in boats for 23 days, through a distance of 700 geographical miles, he was attacked by a party of Indians, under the direction of an old woman, who seemed to be their leader. In this survey they discovered a river, in 55° N. lat. on a bay, in the eastern side of the entrance of an arm of the sea, named by Captain V., Observatory Inlet. This small river, and another in Port Effington, were the only two forams that had yet been discovered to the north of the river Columbia. In September our navigators returned from between 56° and 57°, the highest latitude to which they advanced in this voyage, towards the south, keeping at a distance from the continent, and to the westward of Queen Charlotte's islands. Having finished their survey of the coast of north-west America, from the 30th to the 65th degree of north latitude, they concluded that no navigable communication exists between the north Pacific, and north Atlantic oceans; nor between the waters of the Pacific, nor any of the lakes or rivers in the interior part of the continent of North America.

In a third voyage, in 1794, Capt. Vancouver and his associates surveyed the higher latitudes of the north-western coast of America. Their first object was Cook's Inlet; hence they proceeded to examine Prince William's Sound; passing some points and capes of lesser note, they steered southward from Cape Fairweather, in N. lat. 58°
drought. The rainy season is from the month of December to March; the autumn in general being very dry. However the absence of rain is compensated by dew, which serve to supply, in some measure, the want of moisture from running streams, which are few. The climate at the settlements is, upon the whole, healthy; the soil is of a light and sandy nature, generally fertile, and capable of improvement; but in some places it is so barren and unproductive, that good mould has been brought from a distance, to places where they wished to establish missions. The Spaniards have not turned to any solid advantage even the most fertile part. They have excellent sheep and poultry in the vicinity of Santa Barbara, which is the most barren part; and the sea affords an ample supply of good fish. The neighbourhood of Buena Ventura furnishes fruit in great abundance, and of excellent quality. The fruit consists chiefly of apples, pears, plums, figs, oranges, grapes, peaches and pomegranates, together with the plantain, banana, cocoa-nut, sugar-cane, indigo, and a great variety of the most useful kitchen herbs, plants, and roots. The pueblos differ from the missions and pueblos, and may be better expressed by the term villages. They are composed of about 30 or 40 old Spanish soldiers, or creoles, who, having served in the missions or pueblos, are exempted from any farther military duty; and they plant colonies in some of the most fertile spots of the country. The number of the natives, at this period, who have embraced the Roman Catholic religion, under the Franciscan and Dominican missionaries in New Albion, and through the peninsula of California, amounts to about 20,000, and they are estimated at about an eighth or tenth of the whole native population; and their progress towards civilization is very slow. The number of the military does not exceed 400 men. Mr. Vancouver says, that the natives neither are, nor can be tributary; because they possess no tribute to offer. But this declaration seems to undervalue a country, which has, in many parts of it, a peculiarly fertile soil, and the coast of which abounds with sea-otters. The labour of the natives is subject to the direction and control of the Spanish missionaries, who are absolutely under the authority of the Spanish government; and we learn from the unfortunate navigator M. de la Pérone, that it was the plan of the viceroy of Mexico, to refer for government the exclusive trade of sea-otter skins; and that the Spanish settlements furnish 10,000 annually, and are capable, if duly collected, of supplying 50,000 annually. Vancouver's Voyage of Discovery to the north Pacific Ocean, &c., three vols. 1798.

ALBIREO, in Astronomy, a star of the third or fourth magnitude, in the constellation of Cygnus.

ALBIS, in Ancient Geography, now the Elbe, ran through the middle of Germany, and marked the limit of the knowledge of the Romans, with regard to this country. The only Roman, who passed this river with his army was L. Domitius Ahenobarbus, A. D. C. 74; and though he made no farther progress, the passage of the Albis was deemed worthy of a triumph. See Tacitus, Anni. iv. c. 44. Drusus and Tiberius were the only Romans who had advanced to this river. In the latter period of the Roman state, the Albis became the boundary of Germany to the north; the Sarmatae having poissified themselves of that part which lay beyond it, called Transthalin Germany. See Elbe.

ALBIS, in Geography, a town of Switzerland, in the canton of Zurich, three miles south-west of Zurich. It is also the name of a mountain in the same canton.

ALBISOLA, a town of Italy, in the state of Genoa, having in its vicinity the country houses of the Genoese nobility, and also a manufacture of porcelain. This town was bombarded by the English in 1745. N. lat. 44° 15' E. long. 8° 20'.

ALBISTRUM, or ABISTRUM, in Ancient Geography, a town placed by Ptolemy, in Magna Grecia.

ALBIUM INGAUNUM and TEMETELIUM. See ALBIUM INGAUNUM and ALBIUM TEMETELIUM.

ALBIUS MONS, was the name given to one of the mountains of the Alps, on the side of Rhetun and Carnia.

ALBIZI, or BARTELMUMI, in Ficta, in Biography, a Franciscan of the 14th century, who, in a book intitled, "The Conformities of St. Francis with Jesus Christ," attempts to exalt his favourite saint not only above all the other saints, but to an equality with Jesus Christ. It has been often printed, and much sought after as a curiosity. It was printed at Cologne, in 1532, with alterations, under the title of "Antiquitates Franciscanae." Another corrected edition was printed by Marcus, at Liege, in 1538.

ALBO, in Geography, a river on the easterly boundary of the Gold Coast of Africa.

ALBOCELLA, in Ancient Geography, a town of Spain, which, according to Ptolemy, belonged to the Vaccei.

ALBOCENIS, a town of Dacia, the inhabitants of which were denominated Albocenii.

ALBOGALERUS, in Roman Antiquity, a facerdotal cap, or ornament worn by the flamen dialis; otherwise called galerus.

ALBOIN, in Biography and History, king of the Lombards, was the son of Audoic, under whose conduct they obtained leave of the emperor Julianian to settle in Pannonia, and succeeded his father in the kingdom. Whilst he was fighting under his father's standard, he encountered and flew the son of Turfund, king of the Gepides; and in consequence of this act of youthful heroism, the Lombards unanimously solicited that his father would admit him to take his seat at the royal feast which was kept in celebration of the victory. But according to the custom of the country, no prince was permitted to sit at table with his father, till he had been invested with arms by a foreign sovereign. For this purpose Alboin, with 40 selected companions, visited the court of Turfund, who, according to the usual laws of hospitality, entertained even the murderer of his son. At the banquet, when Alboin occupied the seat of the youth whom he had slain, Turfund, the father, could not brook his agitation; Cunimund, his surviving son, and the Gepides who were present perceived it; and determined to be revenged. They prepared for the assault by contemptuous and reproachful language: "the Lombards," said they, "refuscal, in figure and in smell, the mares of our Sarmatian plains:" referring by this coarse allusion, to the white bands which envelops their legs. As soon as these insulting words were pronounced, the Gepides started from their tents, and Alboin, with his 40 companions, laid their hands on their swords. Turfund, however, appeased the tumult, saved the life of Alboin, and dismissed him with the bloody arms of his murdered son. On his succession to the crown, Alboin, though previously contracted to the grand-daughter of Cloris, aedile in marriage the beautiful Rosamond, the daughter of Curimund, who, upon his father's death, ascended the throne of the Gepides. His request was refused, and he prepared to obtain by force of arms the object of his wishes. With this view he engaged the support of the Avars on very lucrative conditions, and with their assistance he utterly destroyed the kingdom of the
The perfom acknowledged but mule represented 1557 fail elegant spic the town with Lagos. call St. mountain town 1562, splendid and transient as michris accomplished worked in the case of the tomb and the memory of their victorious lord. The ambitious Rofamond having procured the death of the king, A. D. 173, apered to succeed him; but neither she nor her daughter occupied the throne, which was filled by Clepho, one of the noblest chiefs, in confequence of the free suffrage of the nation. Having poisoned Helmichris by a cup of liquor which she presented to him, she was compelled to drink of the same cup by her disheartened lover, as soon as he perceived its fatal operation on himself; and the death of the one was in a few minutes succeeded by that of the other. In the character and exploits of Alboin we see savage valour combined with military talents, and a considerable degree of proficiency in the art of government. He is said to have been the inventor of several instruiments of war, that were in use long after his time. Un. Hist. vol. viii. p. 337—342. Gibbon's Hist. vol. viii. p. 117—132.

ALBOLODUY, in Geography, a small town of Murcia, in Spain, situate at the confluence of two rivers, which flow from the mountains called Los Alpujarras, between Almeria and Guadix. N. lat. 35° 5' W. long. 2° 16'.

ALBON, James D', in Biography, Marquis of Fronsac, was one of the greatest generals of the 16th century; and rose to high military eminence, in the reigns of Henry II. and Charles IX. of France. By the former he was made Marshall of France in 1547, and he was chosen to carry the collar of his order to Henry VIII. of England, who decorated him with that of the garter. He acquired great reputation in the wars of 1552 and 1554, and in 1557 he was made prisoner at the battle of St. Quintin. After the death of Henry II. he was one of the triumvirates who governed the kingdom four or five years in spite of Catherine of Medicis. He was killed in 1562, at the battle of Dreux, by a person whose confiscate estate he possessed. The Huguenots, who did not love him, used to call him "the Harquebusier of the west." He had the qualities of a soldier and a courtier; was addicted to every kind of pleasure and luxury, excelled in politeness and the amiable accomplishments, and on the day of battle was distinguished by his prudence and his courage. His daughter and heiress is said to have been poisoned by her own mother for her property. Gen. Biog.

ALBONA, in Geography, a town of Iliria, belonging to Venice, situate at the foot of a mountain, near the gulf of Carniero; 16 miles east of Rovigo. Albona is also a river of Italy, which runs into the Po, nine miles east-south-east of Lamello.

ALBONAL, a town of Spain, in the province of Grenada, six leagues east-north-east of Motril. Albors, or Alvor, a mountain of Portugal, in the province of Algarve, one league west of Lagos. In a caille on this mountain, John II., king of Portugal, died in 1495.

ALBORAK, in the Mahometan Theology, the beast on which the prophet is said to have rode in his extraordinary aerial journies. It reprefented as of an intermediate shape and fize between an asf and a mule; and many
of philosophy and physic, which are dispersed in several libraries of England. Gen. Dict.

ALBUCA, formed from alluia, white, in Botany, a genus of the becardia monogyna clads and order, of the natural order of liina or liliae, the coronae of Limnanthes, and the aphodelix of Jullieu; the characters of which are, that it has no calyx; the corolla has six oblong-oval permanent petals, the three outer spreading; and the three inner converging; the filaments have filaments shorter than the corolla; three opposite to the inner petals, linear-fusiform, complicate a little about the base, then flat, three opposite to the outer petals, thicker: authors on the former oblong, fixed to the middle tip of the filaments below the middle, uprightly on the latter, similar but effuse, or none; the pistillum has an oblong, triangular germ, style three-filded, stigma a triangular pyramid; the perianthum an oblong, obtuse, triangular, three-celled, three-valved capsule; the seeds numerous, flat, lying over each other, and widening outwards. There are eight species, of which the first five have only three filaments fertile, and the others have all the filaments fertile. 1. a. alata or tall, with interior petals glandulose and bent in at the tip, leaves subulate, channelled, convolute: flowers in April and May, and was introduced about 1780, by Muffra. Kennedy and Lee. 2. A. major, with interior petals, glandulose and bent in at the tip, leaves linear-lanceolate, flatish, flowers in May, and was introduced about 1767, by Mr. W. Malcolm. 3. A. miuor, with interior petals, glandulose and bent in at the tip, leaves linear-lanceolate, flatish, flowers in May and June, and was cultivated by Mr. Miller in 1768. 4. A. euvata, or channel-leaved, with interior petals vaulted at the tip; leaves smooth, linear-fusiform, channelled, peduncle the length of the bracteae; flowers in May, and was introduced in 1774. 5. A. spicata, or ferial-leaved, with interior petals vaulted at the tip, and leaves spiral. 6. A. fagihiata, or upright-flowered, with interior petals vaulted at the tip, leaves smooth, peduncles very long, flowers in May, and was introduced in 1774. 7. A. elisofa, with interior petals vaulted at the tip, leaves hairy-glandulose, flowers in May and June, and was introduced about 1770, by Dr. J. Fothergill. 8. A. abyssinica, A. alba of Laminar, with leaves linear, channelled, and smooth. To the above species Wildenow has added A. fuscata, with interior petals glandulose, and bent in at the tip; peduncles spreading at right angles, leaves lanceolate-linear, and obliquely bent. A. viridiflora, with interior petals like the former, scape erect flexuous, flowers hanging downwards, leaves linear-fusiform camificulate, and externally hairy. A. caudata, with petals like the last, leaves linear-lanceolate, convolute at the margin, shorter than double the scape, peduncles very long and spreading at right angles, and straight flowers. A. setosa, with petals as before, leaves linear-lanceolate and smooth, peduncles rectangularly patent and erect flowers. A. aurea, with petals and leaves like the last, peduncles very long, erect and spreading, and erect flowers. A. frorins, with interior petals vaulted at the apex, leaves linear-lanceolate, channelled, panicles spreading of the length of the woody flower, and very short bractae. All the species are brought from the Cape of Good Hope. They may be cultivated by keeping the roots in pots, filled with light earth, and sheltered under a hot-bed frame in winter, in which case they will thrive and produce flowers; but the best method is to have a border in the front of a green-house or stove, where the roots of most of the bulbous flowers may be planted in the full ground, and fermented in winter from frost; in such situations they thrive much better.
better, and flower stronger, than when kept in pots. Martin's Miller.

ALBUCASIS, in Biography, an Arabian physician and surgeon, of singular merit. At what time he lived is not precisely known; but as he defends the art of surgery, as greatly degenerated in his time, and gives proofs of the ignorance of many of his contemporaries, it is thought he could not be earlier than the middle of the 12th century; that is, about an hundred years after Avicenna, when surgery was faceiy cultivated. It appears by a MS. in the Eeal Library, (Bibl. Ar. Hist., tom. ii. p. 156,) that he died in 1166. Much of what he has left on the subject of his art, is copied from Rhaees, from Paulus Aegaeus, and other preceding writers; but there are also many original observations; and although in the present improved state of surgery, little can be learned from him, yet by those who love to see in the first drawers of improvement in science, his works will be still turned over with pleasure. He inferred on the necessity of a surgeon's being skilled in anatomy, to enable him to operate with success; he also held it to be equally necessary that he should be acquainted with the Materia Medica, or the properties of the medicines employed in curing diseases; and inveighs against those who undertake for gain the cure of diseases, of the nature and causes of which they are unacquainted. It appears from his writings, that he extracted polyphi from the nostrils, performed the operation of bronchotomy, and used a preparation similar to the lapis infernalis, as a caustic. He made great use of the actual cautery, and is extravagant in his elogia on its properties. He is the first writer who left distinct descriptions and delineations of the instruments used in surgery, and of the manner of employing them. His works, which have been translated into Latin, at first barbarous, Haller says, have passed through several editions; the most esteemed is that published 1541, under the following title:—"Medendi Methodus certa, clara, et brevis, pleraque qua ad Medicinae partes omnes, praecipue qua ad Chirurgiam recipit. liber tribus exponens." Balsfex, 1541, folio, "Cum Chirurgia Guidonis de Chauliacii." Haller has given a detailed, and pretty extended account of the subjects treated of in the volume. Vid. Bibliotheca Chirurgica, vol. i. p. 137.

ALBUGINEA Tunica Oculi, in Anatomy, has been said to be the expansion of the tendons of the four straight muscles of the eye, on the front of the fecterota. Modern anatomists, however, do not speak of a tunica albuginea; the whitecaps of part of the eye-ball being owing to the colour of the tunica conjunctiva, where it covers the front of the fecterota. See CONJUNCTIVA.

ALBUGINEA Tunica Testis, one of the coats of the testis, which is white and strong, and closely invests its glandular structure.

ALBUGINUS is applied by some, to denote the aqueous humour of the eye.

ALBUGUS, or ALBUM oculi, the same with albuginea, or the white of the eye.

ALBUS, in Surgery, otherwise called LEUCOMA, is a whitish opaque speck, on the transparent part of the eye. It is denominated by popular writers, a tear, film, bire, pearl, dragon, &c. The transmigration of the rays of light through the cornea being obstructed by this density of its coat, is followed by a partial or total blindness, according to the extent of the disease. There are different stages and causes of the albigo, accompanied with more or less inflamm-
mation. The cure will be difficult in proportion to the degree of opacity, and the concomitant circumstances. Sometimes it entirely baffles the skill of the surgeon; and at other times, it disappears without any attention.

When the disease is accompanied with much active inflammation, leeches should be applied on the temples or under the eye. If a superficial turgid blood-vesse be observed going into the affected part, and keeping up the disorder, it may be safely divided by the point of a lancet. But when there is no inflammation, and especially, if there be a fluid interposed between the anterior membranes of the corne, lightly stimulating applications should be employed; such as a dream of electric effluvia, drawn from a wooden point; or the vapour of warm camphorated spirits, or oil of turpentine; or a composition of pulvified sugar, aloes, and finely levigated glasses, blown through a quill. Great caution, however, should be observed in the use of these remedies; for, by injudicious management, the eye may be much aggravated, and even rendered incurable.

Some persons advise us to excite the absorbents of the eye by collyria of alum, nitrated silver, vitriolated zinc, vitriolated copper, or a very weak solution of mucritated mercury; accompanied with repeated small doses of calomel and cinchona; but it too frequently happens that more harm than good is done by strong irritating applications to fo tender an organ. The cutting of an inlie in the arms, or a feto in the neck of the patient, has been also recommended in albigo; although we think their efficacy is very problematical.

It has been supposed that TOBIST's blindness, mentioned in the second chapter of that apocryphal book, was the disease of which we have here treated. Vide Tobist's Lecnumata Differt. med. diiideit. Prof. Mauchard, &e. Tuming. 1748; in Haller, Diph. Chirurg. vol. i. p. 366, 440.

ALBUHANAZ-IBUN-HAILOR, philosopher, physician, and allogaster, at Fes, in Barbary, phisicia in several of their kings, died of the plague in 1415, and left a treatise on the cure of that disease. Dey. Dict. Hist. vol. i. p. 73.

ALBULA, in Ancient Geography, a town of Mauritania, in Africa.

ALBUL, in the Linnean System of Ichthyology, a species of SALMO. It is also the name of a species of MUGIL, with the anterior dorsal-fin quadriradiated, the albula Bakamenis of Catech, and the lesser silver-rayed magil of Brown (Jam.), with the anterior dorsal-fin composed of four rays. It is found in America.

ALBULA Indica, the name of a small fish, resembling a herring, caught about the shores of the East-Indies, and called by the Dutch, the Wit-fish. Ray.

ALBULA nubilis, of Mullighby and Ray, the Lavanet Salmo of the Linnean system, and the Gwiniad of the British Zoology.

ALBULA, is also the name given by some writers to the Lanceolus Cyprinus of the Linnean system, and the Dace of English writers.

ALBULA is also the name of a species of NERITA, called mammilla, in the Linnean system of Zoology.

ALBULA, is also a name given by some naturalists, to mineral waters of the luminous kind, ending with an atstringent quality, and of use in wounds.

ALBULUS, in the Linnean system of Zoology, a species of Turba, with an imperforate smooth shell, and spires rotenuated and frirated; found, rarely, in the deep seas of Greenland.

ALBULUS, in Antiquity, denotes a white table, or register, in which the names of magistrates, public transactions, &c. were to be inscribed or entered.

Hence
Hence we meet with *album postorius*, *album decorum*, *album judicium*, &c.

*Album Decorum* was the register of the Decuriones, called also *matricularis Decorum*.

*Album Indicum*, contained the names of those persons of the decurio who at certain times performed the office of judges.

*Album Postorius* was a roll of the names of all actions, and the names of such judges as were appointed by the prator for certain causes.

*Album Senatorium* contained a list of the names of senators, first introduced by Augustus, and renewed yearly.

The high-priest entered the chief transactions of each year into an album, or table, which was hung up in his house for the public use.

*Album*, among Chemists, is used for white lead, popularly called *ceruta*.

*Album* is also used, among Alchemists, for a tincture pretended to transmute metals.

*Album*, in Ancient Geography, a promontory of Palestine, to the north-west of Upper Galilee, south of Tyre, and near Alexandria.

It was also the epithet of a promontory of Africa, situated in the limits of Heraclea or Ghibaltar, East of Amelasia, well of, Mount Abila, and opposite to Mellaria, on the coast of Spain.

*Album*, in Literary History, is used to denote a kind of table, or pocket-book, wherein the men of letters with whom a person has conversed, inscribe their names, with some sentence or motto.

This is called by divers names and titles, as *album amicorum*, *repertorium amicorum*, &c.

The famous Alcicnon Sydney, being in Denmark, was by the university of Copenhagen presented with their *album*, whereupon he wrote these words:

"Manus lice inimica tyrannis
Enfe petit placidum sub libertate quietem."

*Album* is also applied, in Pharmacy, as a title, or epithet, of divers compound medicines. Thus we meet with *unguentum album con convorum*, &c.

*Album Graecum*, dogs white dung, a medicinal drug, formerly used with honey, to cleanse and destroy, chiefly in inflammations of the throat; and for the most part outwardly, as a plaster; but, as Dr. Quincy observes, seldom to any great purpose. See Neumann's Works, p. 385.

Some speak of its use internally, in the angina, and other inflammations; as also in the dyer's trade, colic, &c. and to prevent burns from rising into blisters.

Medicines of this kind have long since sunk into disuse.

*Album graecum* is in much request among the leather-dressers, for softening down the leather after the application of lime.

*Album nigrum* is used, among Medical Writers, for mescal, by some also called *mucicera*.

*Album oculi*, among Anatomists, denotes the tunica adusta; sometimes also called *albigo*, popularly the white of the eye.

*Albumazar*, or *Albassar*, Al Abi Mafhar, the father of Maffhar, in Biography, a celebrated Arabian philosopher and astrologer, who lived, according to some writers, in the 9th or 10th century; but, according to others, at a much earlier period. The time of his death is not mentioned in the Eusebian catalogue, but he is said to have lived to the age of 100 years; and if he died, as it is supposed, in the year 885, his birth must have been 15 years prior to the date assigned by Herbelot. Some have represented him as one of the most learned astronomers of his age. He wrote an astrological work, intitled, "De magnis conjunctionibus annorum revolutionibus, ac comum perfectionibus," printed at Venice in 1515; and "Introductio in Alphronomiam," printed in 1480. It is said, that he observed a comet above the orb of Venus. Hutton's Math. Dict. Ruffell's Apollo, vol. ii. p. 100.

*ALBUMEN*, in the Linnaean system of Zoology, a species of *Nerita*, with a convex shell, subcordated umbilicus, and a distint lobe. It is found very rarely at the Cape of Good Hope, and on the shores of the islands of Nicobar and the Moluccas.

*Albumen*, Albuminous matter. *Albumen*. Fr.—This word, which in the Latin language whence it is borrowed, signifies the white of an egg, is at present introduced into the modern chemical nomenclature, as the name of a peculiar substance, which, though existing in the greatest purity and abundance in the white of eggs, is to be found in various natural compounds, both of animal and vegetable origin.

Pure albumen is a fluid of a somewhat viscous consistence, perfectly soluble in pure water at the common temperature; but when exposed to a heat above 153° Fah. it coagulates, and is then no longer soluble in water.

Animal albumen, in its purest natural state, constitutes the white of all birds' eggs, and the serum of blood: the vitreous and crystalline humours of the eye, the liquor that fills the abdominal cavities in cases of dropsy, and the fluid contents of the lymphatic vessels also contain a considerable portion of this substance. In the vegetable kingdom, it is found principally in the tetrasyphonous or cruciferous plants, in the farinaceous seeds, and in the young succulent shoots of trees and shrubs.

*Albumen*, Animal, has a slight sublimate taste, and never fails to turn the blue colour of syrup of violets green, thus indicating the presence of diglucosidated or carbonated alkali. When heated to about 153° Fah. a number of white fibres begin to make their appearance, and these rapidly increasing, the whole mass is in a short time converted into a white opake concrete solid, considerably elastic, and of a smooth compact fracture. By exposure to a dry heat, not exceeding that of boiling water, the coagulated albumen loses the greatest part of its moisture, shrinks in consequence in its volume, becomes hard, transparent, and very similar to horn; and when broken, exhibits a bright polished surface, and vitreous fracture. The application of a stronger heat destroys the equilibrium of its elementary parts, and produces the diglucosidation of ammonical gas, of carbonated ammonia, of a fictitious empyreumatic oil, and sulphurated hydrogen; there remains behind in the retort a spungy coal, from which may be obtained by lixiviation, muriat, phosphiat, and carbonat of soda.

Liquid albumen is completely soluble in fresh distilled water, but if this liquid be charged with atmospheric air, the mass upon mixture becomes in some measure turbid, and a flocculent precipitate is by degrees deposited. The action of acids, more especially of the three mineral ones, causes an immediate coagulation, and the same effect is produced by all the metallic salts. Caustic alkalis, on the contrary, hold albumen, whether liquid or coagulated, in permanent solution. The addition of lime water occasions a precipitation, but the substance thus deposited, being phosphiat of lime, shews that this is not so much a chemical action on the albumen itself, as a decomposition of the phosphiat of soda which it contains.

There has been a considerable diversity of opinion among chemists respecting the cause of the coagulation which is observed to take place in liquid albumen. Scheele, in his admirable essay on milk, attributes it to a combination with caloric; this is effected in the simplest way by the direct
addition of heat; and during the process, there does not appear to be any increase or diminution of weight. In further confirmation of this method of accounting for the fact, the following ingenious experiments were invented by the Benedick chemists. Having mixed one part of white of egg with four parts of water, he divided the mass into two equal parts, and added to one a solution of caustic alkali, and to the other the same quantity of carbonated alkali; the liquor, in both cases, remained perfectly clear; then, upon dropping into the first a little muriatic acid, an immediate coagulation took place, while a like quantity of acid produced no effect on the latter solution. This is accounted for by Scheele in the following manner. By the combination of acid with caustic alkali, the heat given out is absorbed by the albumen which thus coagulates, but when the acid is added to the carbonated alkali, the whole of the caloric is taken up by the diffused carbonic acid, and in consequence no coagulation is the result.

According to Fourcroy, the coagulation of albumen is owing to an absorption of oxygen, and the facts which appear to him to prove this are the following: If the red oxide of mercury is triturated with albumen, it is reduced to the state of black oxide, at the same time that the albumen becomes opake, thick, and in some degree coagulated. The white of a fresh laid egg is incapable of being reduced by boiling to so firm a consistence as that of an egg which has been kept several days.

On the other hand, Carradori has shown that albumen is coagulable by heat without the access of air, and even that when this effect takes place in oxygen gas, there is not the smallest portion of air absorbed.

It was the opinion of Bucquet, that albumen is a kind of natural soap, and that its coagulation by acids was merely owing to their combination with the soda which it contains.

These differences between chemists of acknowledged ability, founded also upon undisputed facts, appear to arise from a mistaken necessity of considering coagulation as the constant effect of some one uniform cause, when a little consideration cannot fail of convincing us of the very equivoal nature of this phenomenon. Albumen certainly concretes by the mere action of heat unaided by any other substance; and this is probably owing in part to the fixation of caloric, and in part to the disengagement of sulphurated hydrogen, as is manifest from the tarnishing of silver, and the blackening of acetic lead; by the white of a newly boiled egg; that the extraction of sulphurated hydrogen is a necessary concomitant in most cases of the coagulation of albumen, is obvious also from certain other facts: thus coagulated albumen is soluble in a very dilute acid, and upon the addition of a few drops of a more concentrated one, is immediately precipitated, at the same time that a strong smell of sulphurated hydrogen is manifested. Again, nitrate of silver instantly coagulates albumen, and black breaks at the same time begin to appear, owing to the formation of hydroslphuret of silver. The coagulation produced by the red oxide of mercury may be occasioned by the absorption of oxygen; it indeed the blackness of the mercury is not rather produced by combination with sulphurated hydrogen; and this is the more probable, as even metallic mercury undergoes a similar change. The thickening produced by metallic fusis, is neither caused by the mere communication of heat nor of oxygen, since the coagulum is an imprerfcte combination of the albumen with the metallic oxide. In like manner a coagulation is formed by the combination of albumen with tannin, which has also a specific chemical action. Lastly, pure alcohol will coagulate albumen, probably by the mere abstraction of the water necessary to its liquidity, since the curd thus obtained is resoluble in water, without any remarkable change of properties.

Besides the general effect of acids on albumen, some of them produce peculiar changes which require notice. By concentrated sulphuric acid it is blackened and charred, exalting at the same time a nauseous odour; while, by the same acid diluted, it is merely coagulated and preferred from further change. Muriatic acid gives a violet tinge to the coagulum, and by long contact effects a partial decomposition, so far as to become saturated with ammonia. Nitrous acid, at the temperature of about 70° Fahr., causes a plentiful diffuseness of acetic gas; if further heated, a quantity of prussic acid is formed; and this change is immediately rendered sensible, by the peculiar odour of this acid, similar to that of bitter almonds; this is succeeded by the separation of carbonic acid and carbonated hydrogen; and as soon as this change comes on, the residue in the retort is found to contract of little less than water, covered with a lemon-coloured fat oil, and holding in solution oxalic acid, which may be afterwards separated by crystallization. If dry caustic potash or soda be triturated with albumen, either liquid or solid, ammoniacal gas is set at liberty; and the calcination of the residue yields a prussicated alkali, capable of producing a blue precipitate with the salts of iron.

The neutral fats appear to have little or no action, except that of preferring the albumen from putrefaction.

By spontaneous decomposition in the open air, albumen pales rapidly, and probably without first becoming acid, into the putrid fermentation; in this state it exhales a fetid odour, assumes a brown colour, gives out ammonia, and remains a considerable time before the decomposition is completed.

Albume, Vegetable. The discovery of albumen in vegetables is due to Fourcroy. This chemist having observed that the clarification of the expressed juices of the antiscorbutic plants was effected by the spontaneous coagulation of their colouring matter, at the temperature of boiling water, was induced to examine whether this property did not depend on the presence of albumen. For this purpose, having obtained the juice of two pounds of young cresses, he filtered it while cold, through blotting paper, and by this means separated the greater parts of the colouring secta; the liquor was, however, full of a bright green, but upon being exposed in a broad shallow vessel to the air, at a temperature of about 80° Fahr., in two hours it became turbid and depotted a greenish matter, becoming itself almost colourless; in this state it was exposed to the heat of boiling water, and in a few minutes there separated a large quantity of whitish flocculent matter. Another part of the same clarified liquor being exposed to the air, deposited at the end of two days a similar coagulum; and the same effect was produced on a third portion by the addition of sulphuric acid. The substance thus obtained being first repeatedly washed in cold water, exhibited all the properties of animal albumen. It was easily and quickly dissolved by any of the alkalies; it experienced no change in boiling water, except that of becoming more solid; it converted the purple juice of malows to green, and by distillation, yielded a notable quantity of ammonia; when
when exposed with a little water to a warm air, it swelled considerably, exuded a fetid ammoniacal odour, and gave all the usual signs of active putrefaction; hence explaining the reason of the rank disagreeable smell that characterises the spontaneous decomposition of all the cruciform plants. When dried, by pressure between two pieces of paper, it exhibited a considerable degree of ductility and transparence, like glue.

Albumen was afterwards found in the roots of various vegetables, especially of the Rumex-patentia; also in wheat and the farinaceous seeds; and in general in all the green and succulent parts of plants. The acid pulps of fruits are totally defective of this sub stance, but abound with jelly; and it is the opinion of Fourcroy, that in all these cases there is a conversion of albumen into jelly, by the gradual evolution of the acid, and consequent fixation of oxygen. Diet. Method. Art. Albumine Vegetal. Fourcroy Syst. des Comp. Chimiq. vol. viii.

ALBINEA Fons, or Albule aque, in Ancient Geography, a fountain and small river in the country of the Sabines, west of the Tiber. It was famous for its sulphurous waters, which occasioned baths to be erected near them, mentioned by Suetonius, and Hyginus the goddes of health to be worshipped there.

ALBUNELAS, in Geography, a town of Spain, in the province of Grenada, four leagues east of Alhama.

ALBUOLA, a town of the kingdom of Naples, in the province of Bafficatta, eight miles south of Potenza.

ALBUQUERQUE, a town of Spain, in the province of Estremadura, on the frontiers of Portugal, situate on an eminence, and defended by a strong castle. It has a considerable trade of wool and woollen manufactures. N. lat. 38° 52'. W. long. 6° 6'.

ALBUQUERQUE, Alphonso de, in Biography, a Portuguese governor of the Indies, contributed more than any other to extend the territories and to establish the power of the court of Portugal in that country. The first exploit which he performed, after being appointed governor, was the reduction of Calicut, which he attacked at once by land and sea, with such fury, that he soon became master of the town, which he burnt; and of the fortresses, which he demolished. As soon as he recovered from an accidental injury which he received on this occasion, he proceeded against Goa, and took it. This city, in 1559, became the residence of the governor, and the seat of an archbishop and primate of the Indies. His next object was, Malacca, which he attacked by sea and land, took by storm, and delivered to the pillage of the Portuguese soldiers. The clear fifth reserved for the king, amounted in value to 200,000 pieces of gold. The last enterprise of any moment in which he was engaged, was the siege and capture of Ormuz. He had formed other great projects, which, however, he did not live to execute. One of these regarded the revival of the Indian trade by way of Alexandria, in which he knew the Venetians would have affiicted the Turks, or any other persons, for their own emolument. He proposed, therefore, to the emperor of Ethiopia, that for his own security, he should divert the channel of the Nile, by cutting a piaffic for it into the Arabian sea before it reached Egypt; and by so doing, he would have rendered the greatest part of Egypt uninhabitable; and at the same time made it impracticable to renew the old mode of transporting East-India commodities from the Red Sea to Alexandria, which was the object he had principally in view.

Another project was to transport 300 horses from the isle of Ormuz to the opposite coast of Arabia, and thus to plunder the tomb of Mahomet at Mecca, which he conceived would be beneficial in a variety of respects, and chiefly in refilling the trade of the coast of the lands of the Turks and other Mahometan nations. But death prevented the accomplishment of his various purposes; for after his return to Goa, he was seized with a delirium which in a few days proved fatal; so that he died, Dec, 10, 1513, at the age of 63. He was called by the Mahometans, Albarbkerque Malandy, because he was born at Mehdia in Africa; but, by the Portuguese, he was justly denominated Albarbkerque the Great. He was the ablest statesman, and the most consummate general they ever had in India, and left their affairs in the best situation; and yet he performed his numerous exploits with a very incomprehensible force. With 30 ships he took Calicut; with 21 he became master of Goa; with 23 he surprized Malacca; and he had no more than 22 in his expedition against Ormuz. His funeral was performed with great solemnity, and his body interred in a chapel built by him at Goa, and dedicated to the blessed Virgin, which chapel was much enlarged by his son, Alphonso Albarbkerque, who lived to the age of 80, and wrote a large work of Memoirs, in which he recorded his father's actions.

He studied the disposition of the people among whom he lived, and conformed in outward pomp and magnificence on public days to the habits of the Indians; though in his private mode of living, he was strict and abstemious. In exacting the dues of the crown, he was severe; but as to his personal fortune, he had scarcely any thing which he could call his own. His officers were his children, to whose instruction he was as attentive as the most affectionate parent is to the education of his sons. Whilst he overlooked trivial faults, he punished treachery or neglect of duty with inexorable severity. He was liberal in bountiful recompense and applause on those officers who distinguished themselves by any great actions; at the same time he was not only strict as to his own, but would not permit others to commend them. It was a maxim which he often repeated, "that he was afraid of nothing but flattery;" and it was observed, that he never preferred any who attempted to gain his favour in that way. Some of the Portuguese historians have observed, that the vanity of his predecessor Almeida, made him affect the state of a prince when the Portuguese power was very imperfectly established; whereas the modesty of Albarbkerque was most conspicuous when his victories left him nothing to fear, and when the greatest princes of the east sent ambassadors to solicit his friendship. Albarbkerque, however, was actuated by boundless ambition; and his extravagant desire of extending the dominions of Portugal, made him regardles of the measures which he adopted for this purpose. In private life, he was a man of the strictest honour; but in his public character, liable to just reproach and censure. After serving his prince and country with singular zeal and success, he had the misfortune to die in disgrace. His ambition, authority, and strict regard to justice, had raised enemies, who were afileous in their endeavours to prejudice the king against him; and as he had solicited with a view to the preservation of Goa, the grant of it, together with the title of a duchy, as a reward for his services, this was made a pretext for exciting and increasing the jealousy of the king: and thus, before his death, he was displaced from the office of governor, and another person appointed in his room. When Albarbkerque heard of this appointment, he is said to have exclaimed: "I incurred the hatred of men by my love for the king, and am disgraced by him through his propensity for other men. To the grave, unhappy old man! it is time thou wentest there; to the grave!" His letter to the king,
ALB

king, recommending his natural son to his favour, cloths with these words: "I say nothing of the ladies; they will speak for themselves, and for n.c." Mod. Un. Hist. vol. vol. p. 43-50.

Albuquerque Coelho, Edward, marquis of Inhão, count of Ferumambu in Brazil, and gentleman of the chamber to Philip IV, king of Portugal, was distinguished by his valour in the Portuguese army, against the Dutch at Bafin. He wrote a "Journal of the War," from the year 1628, which was printed at Madrid, in 1631, and 1634. He died at Madrid, in 1658. Gen. Biog.

Alb., or Albian coach, a whitish brown, or a mixt yellow, attaining to red and white. Skinner derives the word, in that sense, from the Latin, album, white; and the Italian, burma, from bruno, brown.

Alburnum, in Phytology, denotes the white, soft sublimature that lies between the inner bark and the wood of trees, composed of layers of the former, which have not attained the solidity of the latter. In this state, dealers in timber call it the sap.

Alburnum, in the Limnean system of Zoology, a species of Alycyonum, white, very ramose, attenuated, and subdivided, with terminal tubulous pores. It is found in the Indian sea.

Alburnus, in Ichthyology, a species of the Cyprinus of Limnea, and the Bleak of Ray and Pennant.

Alburnus is also a species of the Perca.

Alburnus Portus et Mon, in Ancient Geography, lay to the north of Paullum, in that part of Magna Graecia, called Lucania.

Albus Pugio, or Venus, a village of Arabia, mentioned by Strabo, and called, according to the Greek idiom, Ainos kape.

Albus fesus, in Ichthyology, the white fish, a name by which Sylvius has distinguished the fish, more usually called the capito-largulus, and seeming to be the same with the blue chub; or, as it is more generally called, the jellyfish. It is the Cyprinus fesus of the Limnean system.

Albuseira, in Geography, a small town of Algarve in Portugal, consisting of two parishes, and containing about 1000 inhabitants. It is situated on the sea-coast, between Lagos on the north, Faro to the east, and Sylves to the north. N. lat 57° W. long. 5° 21'.

Albufera is also a lake in the island of Majorca, in the Mediterranean.

Albutius, Silus (Caicus), in Biography, an orator of some celebrity at Rome, in the time of Augustus, was born at Novara, and advanced to the office of Edile; but receiving a public insult, by being dragged from the tribunal, in consequence of a judgment he pronounced, he left his native place and settled at Rome. Here he formed a friendship with the orator Munatiius Planecus, and afterwards became his rival. In his public pleadings he was too free in the use of rhetorical figures, and sunk into dif repay, so that he renounced the bar. In advanced life he returned to Novara, where he laboured under an asthma, and having delivered a discourse in justification of suicide, he starved himself to death. The elder Scaeca commends him as a man of eminent probity, not knowing how to offer or to bear an injury. From a passage in Quintilian it appears that he was the author of a treatise on rhetoric. Suetonius de Clar. Orat. c. vi. Quin. Infl. lib. ii. c. v. Gen. Diet.

Albutius, Titus, a Roman philosopher of the Epicurean sect, flourished about 120 years before Christ. Having been educated at Athens, he became so attached to Greek manners, that he preferred being regarded as a Greek rather than a Roman. According to Cicero, (De Finibus, lib. i. c. 5. and De Oratione, lib. iii. c. 43.) Sexvola often rallied him on account of this affectation. Thus, he compares his style to a kind of inlaid or mosaic work.

"Quam leptus lexibus composite. ut teferinde omnes Arte pavimento, atque emblematc vermiculato."

"How neatly are his polished words inlaid! Not nicer skill the artift has display'd,
Whole patient hand, on smooth mosaic ground,
Figures that live and speak, has firew'd around."

Whilest he was propertor of Sardinia, he celebrated a kind of triumph in his province; and this arrogance induced the senate to refuse him a "suppllication" or public thanksgiving to the gods for the honour of his exploits. On his return from Sardinia he was accused of peculation in his office, and sentenced to exile. He withdrew to Athens, and devoted his remaining days to the study of philosophy. Although he possessed some talents for oratory, they were of the inferior kind; and he had no claim on the character of a flateman or a philopher. From the foreable appellativo of "Grac.-

Albutiius, Afinius, Calpetharius and Raffle, four physicians, all lived in the time of Augustus, and acquired considerable wealth by practising medicine at Rome. Haller, Bibl. Med. vol. i. p. 166.

Albutiius, John Peter, a celebrated philosopher and physician of the 16th century, taught medicine at the University of Padua, for forty years, where he also practised, we are told, with great reputation and success, particularly in the plague which raged in that city, in the year 1577. He died February 14th, 1583, aged 75 years. His son John Francis, who succeeded him in his practice, procured him to be buried at the church of St. Ctirperg, at Milan, where a handsom monument was raised to his memory, with an inscription, at once celebrating his talents, and virtues, the piety of his son, and the gratitude of his fellow citizens.

Albuzańska, a fortres which the Czarina poisselled on the river Amur, in Mongolian Tartary, about 1200 leagues from Moscov.

ALBY. See Albi.

ALCA, in Geography, a small and very fertile island in the Caspian sea, on the coast of Tahiristan.

Alca, Aes., in Ornithology, a genus of the order of Aves, in the Limnean system, and of the Palmipes, in the distribution of Latham; the characters of which are, that the bill is without teeth, short, compressed, convex, frequently furrowed transversely; the inferior mandible is gibbous before the base; the nostrils are behind the bill; and the feet have generally three toes. This genus comprehends 12 species, viz. 1. A. toria, with four furrows on the bill, and a white line on each side running from the bill to the eyes. This is the alca of Clitius, Warmsius, and Brifon; the plautus bonor of Klein; the penguinus of Buffon; and the razor-bill, auk, or murre of Pennant, Ray, Willisby, Albinus, Edwards, and Latham; the falk of Martin, and the marbot of Sibbald. This species weighs about 22½ ounces, its length is about 18 inches, and alar breadth 27; the bill is 2 inches long and black; the grooves of the upper mandible are four, and of the lower three, and the widest of them is white; the side of the mouth is of a fine pale yellow; the head, throat, and whole under side of the body are black; the wings are of the same colour, except the tips of the lesser quill-feathers which are white; the tail consists of 12 black feathers, and is sharp pointed; the whole under side of the body is white, the legs are black. The female, says Buffon, wants the white streak between the bill and the eye, but
but its throat is white. These birds, in company with the
guillimot, appear in our seas in the beginning of February;
but do not settle in their breeding-places till they begin to
lay, about the beginning of May. When they take pos-
session of the ledges of the highest rocks that hang over the
sea, they fit close together and in rows one above another,
and form a very grotesque appearance. They lay only one
egg at a time, which is of a large size, in proportion to that
of the bird, being three inches long, either white or of a
pale sea-green, irregularly spotted with black; if this egg
be destroyed, both the muk and the guillimot will lay an-
other, and if this be taken, a third; as they make no hull, they
deposit the egg on the bare rock, poising it in such a manner
as no human art can effect, and fixing it by means of the
vigorous moisture that bedews its surface on its exclusion;
and though such multitudes of eggs are contiguous to each
other, each bird distinguishes its own. These eggs serve
as food to the inhabitants of the coasts which the birds fre-
cquent, and are procured with great hazard by perfsons let
down with ropes, held by their companions, and who for
want of flable footing, are precipitated down the rocks and
perish together. These birds are found in the northern
gu of America, Europe, and Asia. They come to breed
on the Ferroe islands, along the west of England, and on
the isle of Wight, where they add to the multitude of sea-
fowl that inhabit the great rocks, called the Needles. Their
winter residence is not positively ascertained. As they cannot
remain on the sea in that season, and never appear on shore,
nor retire to southern climates, Edwards supposes that
they pass the winter in the caverns of rocks, which open under
water, but rise internally as much above the level of the
water as to admit a recce, and here, as he apprehends, they
remain torpid, and live upon their abundant fat. The pace of
this bird is heavy and sluggish; and its ordinary posture is
that of swimming or floating on the water, or lying stretched
on the rocks or on the ice.

John. Will. and Ray, aca undulate of Bruna. Muller,
and black-billed aunt of Pennant and Latham, has its bill
smooth and compressed, the whole under side of the body,
and the tips of the posterior wing-quills, white, and its legs
red. This species weighs 15 ounces, its length is 15 inches
and breadth 25 inches; the bill is of the same form
with that of the preceding, but is entirely black. The
cheeks, chin and throat, are white; in all other respects it
agrees with the former species. It has been found on our
coasts in winter, when the other part has left them. It is
very common in Greenland, where it breeds on the cliffs,
feeds on marine infects and grows very fat. In winter these
birds pass the day in the hays, and in the evening retire to
the sea. The Greenlanders eat their flesh half putrid, suck
their raw fat, and clothe themselves with their skins. When
this bird is dressed with its entrails, it is esteemed by those
people a great delicacy. Some have doubted whether these
birds migrate so far southward as the Mediterranean, while
others affirm that they have been found on the coast of
Canada; and Mr. Latham says, that they are common in the
bay of Gibraltar, where they have been particularly noticed
on account of the adroitness and activity with which they
plunge into the water, and move through it in pursuit of their
prey.

The A. baltica of Brunick, with black tail and wings, is
a variety of this species.

3. A. infrequens, A major of Briffon, mergus americanus
of Cluflus, choenoapect of Mooching, goorflgl of Cluflus,
Nierebr. and Jonif. Penguin of Worm. Will. Ray, Martin,
Edwards, &c. gare of Sibb. grand pingouin of Buon,
and great aunt of Pennant and Latham, has its bill
compressed and arrowed on both sides, and has an oval spot on
each side before the eyes. Its length to the end of its toes
is three feet; the bill to the corner of the mouth is 4 inches;
part of the upper mandible is covered with short,
black, celly feathers; the head, neck, back, tail and
wings are of a glossy black, the tips of the lefter quill-
feathers white, the whole under side of the body white, and
the legs black. The wings are so small as to be useless for
flight, their length, from the tip of the longest quill-fathers
to the hip joint, being only 4 inches; and these birds are
therefore observed by fenners never to wander beyond
foundings, and by the flight of them they are able to affec-
tain the nearness of the land. They can fearlessly even walk,
and of course continue on the water, except in the time of
breeding. According to Mr. Martin, they breed on the isle
of St. Kilda, appearing there in the beginning of May and
retiring in the middle of June. They lay one egg, six inches
long, of a white colour; and if the egg be taken away, no
other is laid in the same season. Some eggs are irregularly
marked with purplish lines crossing each other, and others
are blotched black and ferruginous about the thinner end.
Mr. Macnulay, in his history of St. Kilda, p. 156, observes,
that this bird does not visit that island annually, but some-
times keeps away for several years together; and that it lays
its eggs close to the sea-mark, as it is incapable, by the
shortness of its wings, of mounting higher. Birds of this
species are said not to be numerous; they seldom appear on
the coasts of Norway. They are met with near Newfoundland
and Iceland. They do not return annually to the Ferroe
islands, and they rarely descend more to the south in the
European seas. They feed on the cyclopterus, and fuch
fish, and on the rofe-root and other plants. The skirts
are used by the Equinnaux for garments. The aca of the
Greenlanders, which is about the size of a duck, with the
back black and the belly white, and which can neither run
nor fly, is suppos’d by M. Buffon to be this bird. These
birds live in flocks at sea, and never approach the land except
in very severe cold; and in this case they are so numerous
that they cover the water like a thick dark fog. The Green-
landers drive them on the coast and catch them with the
hand, as they can neither run nor fly. At the mouth of the
Balf river they afford suifidence to the inhabitants in the
months of February and March, and their down serves to
line winter garments.

Olear. Alb. and Sibb. linda of Nierebr. and Jonif. frater-
cula of Briffon, bowger of Martin, puffinus anglicus of
Gefer, macareux of Buffon, and puffun of Pennant and
Latham; has its bill compressed, charneled on each side
with four furrows, the orbits and temples white, and its
upper eye-lid pointed. For a further account of this spe-
cies, see Buffon.

5. A. alca, auria minor of Briffon, mergus melanoleucus,
with a short sharp bill of Ray, small black and white diver
of Will and Edwards, Greenland dove or sea-turtle of Albin,
rotes of Martin’s Spitzb. and little aunt of Pennant and
Latham, has a smooth conical bill, the whole under part of
the abdomen and the tips of the posterior wing-quills white,
and the legs black. The bill is short, strong and black; the
cheeks, throat, and under side of the body white, the crown
of the head, hind part of the neck, back, tail, and wings
black, the inner covers of the wings grey, the fcparal
feathers black and white; the legs and feet covered with dirty
greenish white feathers; the webs black. The size of the bird,
from which this description was taken by Pennant, was not
superior to that of a blackbird. Mr. Edwards describes
another
another varying very little from this, which he makes differ only in size; the head and neck are wholly black, and the inner covert of the wings heron with a dirty white. Conrad mentions two varieties, viz., A. cambilis, or white of Brummick, and the A. with a red breast. This species inhabits America and Europe, especially in the arctic sea, is found sometimes among fragments of ice, about nine inches long, as to the disposition of its legs, neck, food, and manners resembling the other species, but more capable of walking, laying twie blow fish eggs, laying swiftly, and becoming fat in stormy weather, in consequence of the small fish that are brought within its reach; whilst at rest on the water or swimming, it is perpetually dipping its bill in the water. In Greenland it is called the ice-bird.

6. A. Labradortis, or labrador an of Pennant and Latham, has a keel-shaped bill, its lower mandible angulated, the inner nostrils covered with an opaque membrane. The bill is narrow, the upper mandible of a dark red colour, the lower whitish, spotted with black, the temples dull white, the throat, wings, and short tail of a dark colour: and the legs red. It is about 12 inches long, and found in the country of Labrador.

7. A. eolophus, or crested ank of Pennant and Latham, has its bill somewhat ascending, conoidal, crimson-coloured, white at the tip, with a furrow running on each side of the lower mandible from the throat, and a crested front. It is about the size of the thrush, 12 inches long, and found in the islands adjacent to Japan, and in Bird island, situated between America and the northern part of Asia, in the day sawning on the sea, and at night in the rabbit holes of the shore and the cliffs of rocks.

8. A. titraula, or dusky ank of Pennant and Latham, has an ascending bill conoid, of a dingy brown colour, the lower mandible triangular, and the front somewhat crested. It is 11 inches long, and found in the sea of Kamtchatka, on the sea by day, and in the night concealed in the rabbit holes, caves and fissures of rocks, where it forms its nest; it walks and flies very indifferently, feeds crested, swims swiftly on the water, and dives well.

9. A. ptilaola, or percoletank of Pennant and Latham, has its bill subovate, compressed and crimson-coloured, with a single furrow in each mandible, with a white spot in the middle of the upper eye-lid and below the eye. The head and upper part of the body are dusky, the lower whitish, varied with black edges; from the remote corner of each eye a tuft of white feathers hangs down the neck; the tail is very short, the legs of a dirty yellow, and the membrane connecting the toes brown. This species is about the size of the little ank, is found in the sea that lies between the northern parts of Asia and America, sometimes by day in flocks swimming on the water, though not very far from land, unless driven out by storms, and in the night harbouiring in the crevices of rocks. About the middle of June they lay upon the rock or sand a single egg, about the size of that of a hen, of a dirty white or yellowish colour, spotted with brown, which is esteemed good. These birds, like others of the same clafs, are stupid, and are mostly taken by the natives, who place themselves in the evening among the rocks, dried in garments of fur with large open sleeves, into which the birds fly for shelter as the night comes on, and thus they become an easy prey. They sometimes at sea mistake a ship for a rooiling-place, and thus warn navigators of their being near the land at the accout of night, or on the approach of storms.

10. A. Giribata, macareux of Kamtchata of Buffon, or tufted ank of Pennant and Latham, is entirely black, has four furrows in its bill, the sides of the head, the space about the eyes, and the corner of the throat white, and a yellowish longitudinal tuft from the eye-brows to the nape. This tuft is white near the head, and afterwards of a buff-yellow; the bill and legs are crimson. It resembles the puffin in its appearance and manners, but is somewhat larger, being about 18 inches long; swimming about for whole days in the sea, where it dives well, and occasionally flies swiftly, but never departing far from the rocks and islands; and feeding on shrimps, crabs, and shell-fish, which it forces from the rocks with its strong bill; in the night it comes to shore, burrows about a yard deep under ground, and makes a nest with feathers and sea-weed, in which it lodges with its mate, being monogamous. It lays one egg in May or June, which is fit to be eaten and used for food, but the flesh of the bird is hard and infipid. This species inhabits the shores of Kamtchata, the Kurile islands, and those that lie between Kamtchata and America. The young women of Kamtchata form an ornament of the glutton's skin, in the shape of a crescent, which they suspend behind each ear, resembling the tufts of this bird; and a prentice of this kind from a lover to his mistress is in high estimation. The bills mixed with those of the common puffin, and the hairs of the feal, were formerly regarded by these people as a powerful amulet: they are now used as an appendage to their dref, and the skins of the birds are fewed together as garments. This bird is called by the natives, monichagatha, or mishagachi, and igilma.

11. A. alca, or ancient ank of Pennant and Latham, has a black bill white at the base, covered with down, a small whitish cret on each side of the head, and another long white one on the neck. The crown of the head and throat are black; the back, wings, and tail are fuliginous. This species is somewhat larger than the little ank, being almost 11 inches long, and is found near Kamtchata, and the Kurile islands.

12. A. pygmaea, or pygmy ank of Pennant and Latham, has a black bill, the crown of the head, neck, back, wings, tail, and feet of a dusky colour, the throat and breast grey, the abdomen dirty white. The bill is furrowed on the back and slightly bent at the ends. This species is less than the little ank, or seven inches long, is found in large flocks about Bird islands, between the northern parts of Asia and America. See Linnæus by Gmelin, Buffon, Pennant, and Latham.

ALCAEBUS,
ALCABUS, in Classical Biography, a famous Greek lyric poet, was born at Mytilene in the island of Lesbos, and finished in the 44th Olympiad, about 664 years before Christ, and was contemporary with Sappho, to whom it is said he was affectionately attached. A verse, insinuating his passion to Sappho, with her answer, is preserved by Aristotle, (Rh. lib. i. c. 9.), thus translated:

Alcæus.—"I sail to Sappho with impart,
But fear locks up the secret in my heart."

Sappho.—"Thy down-call looks, repulse, and timid air,
Too plain the nature of thy with declare;
If lawless, wild, inordinate desire,
Did not with thoughts inspire thy bosom fire,
Thy tongue and eyes, by innocence made bold,
Ere now the secret of thy soul had told."

The invention of lyric poetry is some attributed to Alcæus, and it seems to be implied by Horace (Od. xxxii., lib. i.), unless he only intimates that he invented the harp, or lisp. From him, however, the lyric measure, called "the Alcaic verse," derived its name. He was no less a votary of Mars than of love and the muses. He fiercely asserted the liberty of his country against the tyrants who usurped dominion, and particularly against Pittacus; and took up arms in its defence. But his courage failed him in the day of battle, and he attempted to save himself by flight, when his party was defeated, but was taken prisoner by Pittacus, who generously granted him both his life and liberty. He was afterwards sentenced to exile; but what was the issue of his conflicts, and how and where his life terminated, history does not inform us. Horace seems to intimate, that he became a confir. His poetical talents have never been disputed. His poems, of which only a few fragments now remain, collected by Næsæus, H. Stephens, and Uranus, were written in the Attic dialect, and in the measure of his own invention. The subjects of them were very various, sometimes aatory and bacchanalian, but more generally grave and poetical. They are described by Horace in the following verses:

"Et te sonantem plenius aureo,
Alceo, plectro dura navis,
Dura fuge mala, dura bellis!
Utque sacro signo silento
Miratur umbra diece: fed magis
Pugna, et exactos tyrannos
Dentum humanae bitit aure vulgus."

Od. xiii. i. ii.

"Alcæus strikes the golden strings,
And feeds, and war, and exile sings:
Thus while they strike the various lyre,
The ghosts of the sacred sounds admire;
But when Alcæus lifts the strain,
To deeds of war and tyrants slain,
In thicker crowds the shadowy throng,
Drink deeper down the martial song."

Francis.

There were other ancient poets of this name (see Fabr. Bib. Græc. n. 246.) such as an Athenian tragic poet, who is said by some to have been the

vol. i.

first composer of tragedies; and who, according to Suidas, was different from Alcæus, the son of Myrissus, a comic poet, the fifth author of the ancient comedy. One of his pieces, intitled Psiphos, was produced in his dispute with Aristophanes in the fourth year of the 97th Olympiad. Plutarch (in Flamin. Oper. tom. i. p. 373.) mentions another Alcæus, who lived in the 145th Olympiad, A. U. C. 555. B. C. 190, who ridiculed Philip, king of Macedon, on account of the battle which Titus Flaminus gained over him in Thessaly. An Alcæus of Meleager also lived in the time of Vergil and Titus, of whose epigrams some are preferred in the Anthology. One of these is supposed to have figured a singular kind of death for his handwriting, which was the punishment said to have been inflicted by means of a radius, or the fish called a mullet, on adulterers, and referred to by Juvenal, Sat. x. v. 317. p. 295. Ed. Cumari.

"quidam moccus et mugillus introit," and also in the testace of Catullus, epig. 51. ad Aureliam:

"Ah tum te miserum, malique fati
Quem aequos pedibus, patente porta,
Perspectis phante, mugiliaque."!

"Ah wretched thou, and born to unlucky fate,
Who art dancer'd by the insatiate gate!
If once, alas! the jealous husband come,
The radish or the sea-fish is thy doom?"

ALCÆUS, in Mythology, the son of Pericles and Andromeda, the father of Amphitryon, the supposed father of Hercules; hence called Alcides.

ALCAIUS, in Geography, a high and fertile mountain of Africa, in the kingdom of Fez, about 12 leagues from the capital. It is inhabited by many rich and powerful peasants.

ALCAICS, in Ancient Poetry, a name common to several kinds of verses; so called from the poet Alcæus, the inventor of them.

The first species of alcaics consists of five feet, of which the first may be either spondee, or iambic; the second, is an iambic; the third, a long syllable; the fourth a dactyl; and the fifth, a dactyl, or amphimachic, as thefe of Horace.

"Omnis eodem cognitor, omnium
Versatur una, serius, ocius,
Sors exitura."

The second species of alcaics consists of two dactyls, and two trochees; as,

"Exilium impositura cymba."!

Besides these two kinds of verses, which are properly called dactylis alcaics, there is a third sort, called simply alcaic; wherein the first is an epitrese, the second and third are choriambics, and the fourth a bacchius; as,

"Cur timet fla | vum Tiberim | tangere? cur | olivum ?"

ALCAIC Odes, consists of four strophes, each of which contains four verses: the two first are alcaic verses of the first kind; the third an iambic diameter hypercatalectic, i.e. of four feet and a long syllable; as,

"Sors exitura, et nas in externum."!

The fourth is an alcaic of the second kind—The entire alcaic strophe is as follows:

"Omnis eodem cognitor, omnium
Versatur una, serius, ocius
Sors exitura, et nas in externum
Exilium impositura cymba."
The following is also of this species which Hieracum call
" Non poffidentem multa vocaveris
Rebe beatum: reftius occupat
Nomen beat, qui deorum
Muneribus faipienter uti," &c.—Od. ix. lib. iv.

ALCAID, in matters of Polity, an officer of justice
among the Moors, Spaniards, and Portuguese.
The word is also written alcalde, alcald, and alcaicd: sometimes also alvido.
It is originally Arabic, compounded of the particle al,
and the verb had, or akal, to rule, govern, administer.
The emperor of Morocco's court confinls chiefly of seven
or eight alcalds, his devoted slaves.
The alcald, or governor of a city or castle in Barbary,
hath sovereign jurisdiction in civil and criminal concerns;
and all fines and punishments are inflicted at his pleasure.

In some places the alcalds are much the same with the
emperor's tax-gatherers.
Alcaicd, among the Spaniards, &c. is a kind of inferior
judge, or minister of justice, who takes cognizance of cases
in the first instance, and answers in good measure to the
French procure, and an English justice of peace.

They had also their alcald of the shires, who took cognis-
ance of cases of whoredom and adulterv. This officer
was otherwise called alcald of honour. Du-Cange.

ALCALA de los Gazules, in Geography, a very ancient
town of Spain in Seville, situated on a mountain, and
surrounded by a fertile plain, 10 miles east-north-east from
Medina Sidonia.
ALCALA de Guadaira, a small town of Spain in Seville, on
the river Guadaira, two leagues south-east from Seville.
N. lat. 37° 22'. W. long. 5° 56'.
ALCALA de Henares, formerly Complutum, a town of
Spain, in New Castile, situated on the river Henares, in
a beautiful plain, and clothed with well-built houses, which
form handsome streets, and which are disposed in a kind of
oval figure. N. lat. 40° 35'. W. long. 4° 20'. It is sur-
rounded by piazzas, where the tradesmen keep their shops,
which are well supplied with a variety of goods. The ad-
joining land, watered by the Henares, is fertile and well
cultivated, and yields plenty of grain, good mustard wine,
and excellent melons. Near the town is a spring, the wa-
ter of which is preferred, on account of its peculiar purity,
for the king's use, and conveyed to Madrid. This town
belongs to the archbishop of Toledo. It has a collegiate
church, and a celebrated university, which was restored in
1494, by Cardinal Ximenes; and in the church belonging to
it this Cardinal was buried. This university possessed a very
considerable library, and many curious manuscripts. Go-
nex says, that they cost 4000 aurei, and that among them
were seven of the Hebrew Bible. Here, it is probable,
were deposited, the Greek manuscripts used for the Complu-
tenian edition of the Greek Testament. Professor Molden-
hawer went to Alcala, in 1784, with a view of discovering
thee manuscripts; but, to his extreme astonishment, he found
that about 35 years before that time, a very illiterate libra-
rian, who wanted room for some new books, sold the ancient
vellum manuscripts to one Toro, who dealt in fire-works,
as materials for making rockets. Martinez, a Greek schol-
lar, as soon as he heard of this outrage, hastened to save
thee treasures from destruction; but they were actually de-
stroyed, except a few scattered leaves, which are now pre-
erved in the library. It is added, as a circumstance of
aggravation, that the number of manuscripts was very con-
 siderable. However, as rockets are not made of vellum, a
learned writer confesses himself with the reflection, that the
manuscripts were written on paper, and therefore of no
great antiquity. Michaelis's Intro. to the New Test. by

ALCALA real, a town of Spain in Cordova, lies in a
hilly country, but produces fine fruits and good wine. It
is 12 leagues south-east from Cordova. N. lat. 37° 18'.
W. long. 4° 15'.
ALCALA del Rio, a town of Spain in Seville, on the
Guadalquivir, two leagues above Seville.
ALCALS and ALCALIZATUM. See ALCAI and
ALCALIZATION.

ALCAMENES, in Biography, a satirical, the scholar of
ALCAMO, in Geography, a considerable town of Sicily in the
valley of Mazara, about 20 miles south-west from Palermo.
It is situated on high ground, in a fine open cultivated country,
and well sheltered by large woods of olive trees. The num-
ber of inhabitants is about 8,500. It derives its name from
Adalcarn, the caliph's lieutenant, who, in 827, conquered
Sicily, and who erected a fortress in Monte Bonifati; but
Frederick of Swabia, having dispossessed the Saracens,
destroyed the fort, and erected the borough of Alcam on the
foot of the mountain. Having passed through several Spa-
nish families, it now belongs to the duke of Femandi-
na, heir to the possessions of Toledo duke of Alba. The
church is adorned with some good pictures by Pietro Novello,
commonly called the Raphael of Sicily; and with alto-
reliefs of great merit by Gagini. The streets of the town
command a superb view: the belt land in the vicinity is
famous for corn, the next fort is planted with vines, and the
woof soil is cultivated with myrtle-leaved fennel, the leaves
and flowers of which are dined and pulverized, and exported
in bags, for the purpose of tanning fine leather. N. lat. 38° 2'.

ALCANDRO, a town of Spain in Old Castile, situate
on the Ebro; four leagues from Calahorra.

ALCANI, or ALCAN, a town of Africa in Egypt, on
the western branch of the Nile, 30 miles N. N. W. of Cairo.

ALCANITZ, or ALCANIS, a town of Spain in Aragon,
on the river Guadaloupe, and the frontiers of Catalonio,
15 leagues south-east from Saragossa. It was formerly the
capital of the Moors, but now belongs to the order of Cal-
latrava. It has a collegiate church and a fortres, and is
surrounded with gardens and fruit-trees. A fountain in
this town throws up water through 42 pipes. N. lat. 41°
10'. W. long. 0° 10'.

ALCANIZOS, a town of Spain in Leon, on the fron-
tiers of Portugal, four leagues west from Zamora.

ALCANN, or ALKANNA, in Commerce, by the Turks
called knab, a dying dung, brought from Egypt and the
Levant, being the leaves of a plant called Riquium Egy-
tium, the Egyptian privet, or the Lawsonia inermis of the
Linnaean system. The tree is also called elhanna, tamar-
hendi, poutaletis of Rhud, and grows in the East Indies,
as Malabar and Ceylon, in Egypt, and also in Cyprus, and
in all parts of Syria. The colours drawn from these leaves
are either red or yellow, adapted to the mode of preparing
it; yellow, when steeped in common water; and red, when
infused in vinegar or alum water. The people of Cairo
make a considerable traffic of these leaves, which they re-
duce to a powder, called archenda, much used by the women
to dye their nails, hands, hair, and other parts of the body
of a golden yellow hue. They apply it also for the same
purpose to the mantles and tiles of their houses. This

7
custom amongst the oriental nations is very ancient, and has generally prevailed. This powder has been also used as an astringent, for the purpose of drying ulcers of the gums, and for removing the fetid smell of the feet; and many other virtues are ascribed to it by Rumphius. It is seldom met with in the shops, but may be used without injury. The root of the Anacampsis tinctoria is substituted for it, principally for giving a red colour to tinctures, decoctions, and ointments. Murray, Mat. Med. vol. ii. p. 112. 119.

From the berries of Alcanna an oil is extracted of a very agreeable smell, and which has been of some use in physic, as a calmer, called oil of Cypris, a name which is sometimes also given to the plant. Phil. Trans. abr. x. pt. ii. p. 741.

ALCANTARA, in Geography, a small but strongly fortified town of Spain in Estremadura, situated in a fertile country on the banks of the river Tagus. It takes its name, which signifies a stone-bridge, from an old bridge, erected in the time of the emperor Trajan over the Tagus, at the expense of several Lusitanian nations. This bridge was 200 feet high, 570 in length and 28 broad; and on account of the bridge the Moors built the city. A chapel hewn out of a rock at the entrance of the bridge, was dedicated by the ancient Pagans to Trajan, and by the Christians to St. Julian. It was taken from the Moors in 1214, by Alphonso IX. king of Castile, and given to the knights of Calatrava, who afterwards assumed the name of Alcántara. In April 1706, it was taken by the Portuguese and the earl of Galloway, and retaken by the French in the November following. It is 45 leagues west-south-west from Madrid, and 38 west from Toledo. N. lat. 39° 32'. W. long. 7° 12'.

ALCANTARA, or Alcantarilla, a town of Spain in Andalusia, near the Guadalquivir, five leagues from Sevilla.

ALCANTARA, a district of Portugal, about a league from Lisbon. On a hill in this district there is a remarkable mine of faltpetre.

ALCANTARA, one of the most confiderable rivers of Sicily, rises on the north side of mount Etna, and marks out the boundary of the mountain for about 60 miles. In many places its course has been interrupted by the eruptions of the volcano; and in others, its current, which is very rapid, has worn down the solid lava to the depth of 50 or 60 feet. Its rise is attributed to the melting of the snows on the mountain; as its waters resemble by their whitish colour those that run from the glaciers amongst the Alps. Byrdone's Tour, vol. i. p. 119.

ALCANTARA, Order of, an ancient military order of Spain, which took its name from the city above-mentioned. The princiue year of its institution is not settled among antiquaries. The knights of Alcántara make the same vows as those of Calatrava, and are only distinguished from them by this, that the crofs fleur de lis, which they bear over a large white cloak, is of a green colour: they poftes 37 commandaries.

By the terms of the surrender of Alcántara to this order, it was stipulated, that there should be a confraternity between the two orders, with the same practice and observances in both; and that the order of Alcántara should be subject to be visited by the grand-master of Calatrava. But the former conformed themselves from this engagement, on pretence that their grand-master had not been called to the election of that of Calatrava, as had been likewise stipulated in the articles.

After the expulsion of the Moors, and the taking of Granada, the sovereign of the order of Alcántara, and that of Calatrava, was settled in the town of Càstille, by Ferdinand and Isabella.

In 1542, the knights of Alcántara sued for leave to marry; which was granted them. The history of this order was chiefly taken up in expeditions against the Moors, and broils with their neighbours. See Calatrava.

ALCARAZ, in Geography, a town of Spain, in the canton of la Mancha in New Castile, situated on an eminence near the river Guardamera, in a very fertile country, defended by a strong castle, and remarkable for an ancient aqueduct. It is famous for a breed of small horses that are very fleet and strong. It is ten leagues north of the capital of Andalusia, 40 south of Cuenca, and 55 south-west of Madrid. N. lat. 39° 28'. W. long. 2° 3'.

ALCARIZ, a town of Spain, in the province of Galicia, on the river Arnoia, eight miles south of Orense.

ALCARAZAS, in Pottery, are kind of vessels used in Spain for cooling water. What distinguishes them essentially from other kinds of earthen ware is their porosity: this is so considerable as to allow the liquor to ooze slowly through, and stand in small drops on the outside; hence there is a constant evaporation from their surface when immersed in a current of warm air, by which means the water remaining in the jar continues at a temperature much lower than that of the atmosphere.

These vessels appear to have been first introduced into Spain by the Saracens; and their use has since been extended into all the Spanish colonies in America and India. They have also been known from time immemorial in China, Hindoostan, Peru, Arabia, Egypt, and Syria.

The most celebrated manufacture of this kind in Spain, is at Anduxar in Andalusia, the hell earth for the purpose being found in the neighbourhood, on the bank of the little river Tamuzor. This is a kind of white clay, containing principally of carbonated lime, with about 30 per cent. of flint, and a little aluminiun, and oxid of iron.

The process of the manufacture is very simple, and is as follows. The fresh dug earth is first dried in the sun till it becomes pulverizable; and when beaten to powder, it is passed through a fine sieve, in order to separate with accuracy all the flints and coarse sand that may be mixed with it: being then put into a wooden or copper vessel with water, it is tempered by hand to the confidence of a soft uniform paste. In this state it continues twelve hours, and is then spread upon bricks, previously covered with wood ashes, till the appearance of cracks upon its surface, owing to the draining off of part of the moisture.

This first preparation being completed, the tempered earth is weighed and put into a broad shallow vessel, where it is trodden with the naked feet, and at the same time mixed with salt, in the proportion of seven pounds for every 150 of earth, to be made into large jars, and half the above quantity of salt for the manufacture of jugs and other small articles. The reason of this difference is obvious: the greater the vessel is, the thicker must its sides be, to give it the necessary strength; but its porosity would be diminished in the same proportion, a greater quantity of soluble matter must be mixed with the earth. After this a sufficient mass of the material being put on a potter's wheel, it is shaped in the usual manner into a jar or other vessel: being then gradually dried, it is baked in a common pottery oven for 10 or 12 hours, according to the heat, care being taken that the salt be not so far decomposed as to become insoluble in water.

There is scarcely a house in Spain where Alcarazas are not in constant use. Being filled with water, and exposed for a few hours to a current of air, a very small portion of the fluid is lost by evaporation, and the remainder will
have acquired a degree of coolness very grateful in that warm climate.

Estremadura possesses a manufacture of large red jars called Bacares, which are applied to the same purposes as the true Alcarrazas, but are much inferior, being less porous, and communicating to the water an unpleasant earthy taste.

Another use to which these vessels are applied in Portugal, is that of moistening stuff or tobacco. For this purpose, the jar being filled with snuff is placed in water, which, altering through its fides very slowly, gives in a few hours, to the inclosed powder, the requisite humidity.

The editor of the Journal de Pluqique is of opinion that the mixture of fossil meal with common potter's earth might afford an useful sublimate both for the Alcarrazas and the filtering flones. The fossil meal is that earth of which the flating bricks of Ticany are made; and which, according to the testimony of Pliny and Strabo, was anciently found in great plentiy, both in Asia and Spain. To the proposed use, however, of this sublimate, the earthy flavour which it would communicate to the water is a radical objection.

ALCASSAR, Louis Dr, in Biogrophy, a Spanish Jesuit, was born at Seville in 1551, and was at first a teacher of philosophy, and afterwards of divinity at Cordova and at Seville for above 20 years. He directed for so many years his chief attention to the study of the book of Revelation, and his work on this subject, intitled “Vestigia Arcana fenfus in Apocalypsis,” is much esteemed among the Catholicks, and has been printed several times. Grotius is said to have borrowed many of his ideas from this book. His works, comprehending a commentary on such parts of the Old Testament as had been subject to the Apocalyptic, and including a treatise “On Sacred Weights and Measures,” and another “On Bad Physicians,” form two folio volumes. Heydeger in his “Mysticum Babylonis magnus,” published at Leyden in 1687, has examined some of his apocalyptic hypotheses. Alcazar died at Seville, June 16, 1673, at the age of 60 years. Gen. Dict.

ALCASSAR, or Alcázar, in Geography, formerly Caifar al Cahir, a city of Africa, on the coast of Barbary, in the kingdom of Fez. It is said to have been built by Jacob Almanzar, about the year 1376, during his war with Spain, and intended as a depot for the immense forces that were collected for this purpose. It was formerly the residence of the Alcazar government, and a town of good trade, till the Portuguese made themselves masters of it in 1458; but though it was not long in their possession, it gradually sank into decay, and lies now in a ruinous condition. Its situation is so low, that it is overflowed with water in the winter, and molested with heat in summer. The floors of this place are so numerous and so familiar, that they occupy the tops of the houses and mosques without molestation; the inhabitants esteem them sacred birds, and thinking it sinful to disturb them. The bahaw of Tetuan now appoints a governor for this town, which is the laft of his dominions towards Morocco. In the vicinity of this town, there is a ridge of mountains running towards Tetuan, whose inhabitants are a band of robbers, whom it was not possible to restrain or extirpate, as they find an inaccessible shelter in their mountainous forests. It was near this town, on the river Elma-haffan, that a famous battle was fought in 1578, when three kings were slain, viz. Abdemelech king of Morocco, Mahomet the usurper, and Sebastian king of Portugal. The Portuguese indulge a fanciful notion, that Sebastian was transported to an enchanted island, and they expect his return to establish their power, and to render their kingdom the first on the globe. This city, N. lat. 35° 15'. W. long. 12° 35', is called Alcafar quibririm, or the great castle, to distinguish it from the alcazar of the next article.

ALCASSAR Zeguir, or Ceguer, q. d. the little palace, a town or fortress of Africa, in the kingdom of Fez, between Tangiers and Ceuta. It was taken by Alphonso king of Portugal, in 1458, but soon after abandoned to the Moors. It lies on the south-side of the straits of Gibraltar, and a shallow bay between two points of land, affords anchorage for ships, and on the west of this are two long narrow islands, parallel to the coast. N. lat. 35° 48'. W. long. 5° 36'.

ALCASSAR de Guete, a town of Spain, in New Castile, almost between Cuenza and Guete, with which it forms nearly a triangle. N. lat. 42° 10'. W. long. 2° 16'.

ALCASSAR do Sol, a town of Portugal, in Estremadura, six leagues from the sea, on the confines of Alentejo, guarded by a castle, which is said to be impregnable. The salt-work in this town yields very fine white salt, and gives it its name. Of the rushes that are gathered in the adjoining fields, mats are made for exportation. N. lat. 38° 18'. W. long. 9° 10'.

ALCATILE, a town of India in the Carnatic, west of Madras.

ALCA TRASES, an island in the Pacific Ocean, about 21 leagues from Acapulco; and half a league from the continent. N. lat. 15° 50'. W. long. 102° 30'.

ALCATRAZ, in Ornithology, a name given by the Spaniards, also by Fernandez, Hernandez, and Nieenburg, to the pelican of Mexico; and erroneously by Callius and others after him, to the Indian horn-bill, or Bucerotis Hydrocorax.

ALCAVALA, in Polities, a tax upon transferrable property imposed by the Spanish government. It was at first 10, afterwards 14, and at present it is only 6 per cent. upon the sale of every sort of property, whether movable or immovable; and it is repeated every time the property is sold. The levying of this tax requires a multitude of revenue-officers, sufficient to guard the transportation of goods, not only from one province to another, but from one shop to another. It subjects not only the dealers in some sorts of goods, but those in all sorts; every farmer, every manufacturer, every merchant and shopkeeper; to the continual visits and examinations of the tax-gatherers. Through the greater part of the country, in which a tax of this kind is established, nothing can be produced for distant sale. The produce of every part of the country must be proportioned to the consumption of the neighbourhood. It is to the Aleavala accordingly, that Ularitz imputes the ruin of the manufactures of Spain. He might have imputed it to lievise, says a very competent judge, the declension of agriculture; as it is imposed not only upon manufactures, but upon the rude produce of the land.

In the kingdom of Naples, there is a similar tax of three per cent, upon the value of all contracts, and consequently upon that of all contracts for sale. This is both lighter than the Spanish tax, and the greater part of towns and parishes is allowed to pay a composition in lieu of it; which composition is levied in any mode they please, and generally so as to give no interruption to the interior commerce of the place. The Neapolitan tax is therefore not nearly so ruinous as the Spanish one. Smith's Wealth of Nations, vol. iii. p. 381.

ALCAUDET, in Geography, a beautiful town of Spain, in the province of Andaula and district of Cordova, between
between Cordova and Jaen. N. lat. 37° 35'. W. long. 3° 26'.

ALCAZAR, or ALCAZAR, ANDREW, of Guadalaxara, in New Calilfe, in Biography, a celebrated physician of the 16th century, published in 1775 at Salamanca, "Chirurgia libris sex, in quibus multis antiquiorum et recentiorum fubfPicura loca hactenus non declarata interpretatur," fol. In the fifth book, he treats, "De pudendraga vel mentagra villicen, valgo, morbo Gallico." He contends this disease was known to the antients, and cites Pliny, and various other writers in proof of this position; but admits, that in certain stages of the disease, it is only to be cured by mercurial injection. See a full account of this work, and a refutation of his opinion of the antiquity of the lues, in Altrae's treatise, De Morbis Venereal, vol. ii. p. 792.

ALCE, in Ancient Geography, a town of Peloponnesus, mentioned by Plutarch, in his life of Cleomenes. Alce is also, according to Livy, a town of Spain, belonging to the Celtiberians. It is likewise a name given by Pliny to a river of Bithynia.

ALCE, in Ornithology, a species of ank of Alca.

ALCE, in Zoology, a species of Ceratæ. See Elek.

ALCEA, HOLLYHOCK, Make of Tournefort, in Botany, a genus of the monadelphi polyandra class and order, of the natural order of columnifera, and the makeuse of Jussieu. Its characters are, that the calyx is double, each one-leaved; the outer cut half way into five parts, permanent and very spreading; the inner cut half-way into five parts, larger and permanent; the corolla consists of five, obcordate emarginate, spreading petals, coalescing at their bases; the stamina are filaments unifying into a sort of five-sided cylinder at bottom, loose at top, and inserted into the corolla; the anthers almost kidney-shaped; the pistillum has a germin orbiculate, Ryle cylindric, short, fliform about 25, testaceous, of the length of the style; the pericarpium is composed of many joined arils, in a ring round a columnar flatted receptacle, parting and opening on the inside; the seed is one, flat, kidney shaped in each aril. Schreber and Jussieu join this genus to Althea.

Professor Martyn enumerates three, and Gmelin five species; viz. 1. A. rosea, common hollyhock, with leaves lanceo-rectangular. 2. A. fruticosa, with cordated, rough, crested, angular leaves, and stem below ramose. 3. A. acutiflora, with numerous cordated roundulo-lobeated leaves, spike flowers, and a stem thick and very small. 4. A. coromandulina, with subfircular crested obtuse quinquevernum subfibrilose leaves, and solitary flowers. The A. Africana or African H. of Martyn, is described as having leaves three-lobed crested, flowers solitary axillary, both calyces tipped. 5. A. fruticosa, fig-liced H. with inferior palmated seven-loved crested leaves, the superior halfed. Linnaeus doubts, whether the first and fifth species, above enumerated, are distinct, and seems to think that the half is a variety of the first. But Prof. Martyn observes, that the difference in the form of their leaves always continues. Both these sorts were cultivated by Gerard in 1597. Allione says, that the hollyhock grows wild in the county of Nice. The colour of the flowers is accidental, and the double flowers are only varieties proceeding from culture. The various colours that have been noticed are white, pink, red, deep-red, blackish-red, purple, yellow, and flesh colour. Prof. Martyn informs us, that he has seen some plants with variegated flowers, raised from seeds which were brought from China. Although these varieties of double hollyhocks are not constant, yet the greatest number of plants, produced by seeds carefully sown from the most double flowers, will arise nearly the same with the plants from which they were taken, provided they are kept separate from single or bad coloured flowers.

The first species grows naturally in China, the fifth in India, and has also been brought from Madras. Linnaeus refers it to Siberia. A dwarf sort, with beautiful double variegated flowers, has been for some years in great esteem, under the name of Chinese hollyhock. These plants, though natives of warm countries, are sufficiently hardy to thrive in the open air in England, and have contributed much to the ornament of gardens towards the close of summer. In large gardens, they make a fine appearance; a succession of spikes arising on the same stem for two months. The flowers on the lower part of the spike appear in July, and new flowers will be produced till the end of September. In good ground the spikes will often rise to the height of eight or nine feet, and near six feet of each will be garnished with flowers. The African hollyhock is a native of the eastern shore of Africa; and the alcea indica of Burm. ind. p. 149, agrees with this in having three-lobed creased leaves; but differs from it in having the flowers terminating and yellow; with the inner calyx five-cleft. The hollyhocks are propagated by seeds, which should be saved from plants of the best colours, and of the most double flowers, and they should be sown in a bed of light earth, about the middle of April, and covered about half an inch deep. When the plants have put out six or eight leaves, they should be transplanted into nursery-beds, at a foot distance from each other, watering them till they have taken root, and afterwards keeping them clean from weeds till October, when they should be removed to the situation where they are to remain.

ALCEA. See Hibiscus and Malva.

ALCEA Floridana. See Gondonia.

ALCEAE, in Entomology, a species of Papilio plebejus, with divaricated wings, of brown and cinereous colour, the primores marked with points, and the posterior cinereous underneath; found in the southern parts of Ruffia.

ALCEDO, king-fisher, in Ornithology, a genus of the order of Picæ. The characters are, that the bill is threelfided, thick, bright, long and pointed; the tongue is fleshy, very short, flat and sharp, and the feet are for the most part gryffory. The species enumerated by Gmelin, besides several varieties, amount to 41. These birds are dispersed over the whole globe; inhabiting chiefly the water and living upon fish, which they catch with surprising alacrity and swallow whole, rejecting afterwards the unpalatable parts; though their wings are short, they fly swiftly; their prevailing colour is sky-blue; their nostrils are small, and generally covered. 1. A. crystagallus, A. ambobennis cristafl of Seba, Hipidea philippensis cristafl of Belling, vinh of Buffon, and crested king-fisher of Latham, is short tailed, sky-blue above, rufous beneath, and has its crest undulated with black. The bill is black, crested greenish, on each side of the neck is a bluish white beginning from the eye; the shoulders, the upper covers of the wings, and the margins of the wing-feathers and tail-feathers, and the whole of the intermediate tail-feathers are violet, the chin rufous, the throat rufous, and white, the wing-feathers, brown, and the legs with the claws reddish. It is about five inches long, and found in Ambony and the Philippine isles. The hipidea indica crystallus, or A. crystallus elegantissima pectra of Seba is a variety. 2. A. indus, spotted king-fisher of Edwards and Latham, is short tailed, greenish, yellow beneath, with a nebulous pectoral falcin. The bill is black, the line above and below the eyes yellow, the wings punctated with white, and the feet red. It is seven inches long, and found in Guiana. 3. A. hipidea, hipidea of Geíner, Ray, Okl,
Olm. Albr. and Briff., aleyon of Genn. and Albr., martinspacher or alcyon of Buffon, king-fisher of Albin. and Will. European king-fisher of Pennant, and common king-fisher of Latham, is short-tailed, sky-blue above, fulvous below, and its traps are rufous. This bird is seven inches long and 1½ broad, of a clumsy shape, the head and bill being very large, and the legs disproportionately small; the bill is two inches long, the upper mandible black, and the lower yellow; and the iris is red; but the colours of its plumage amply compensate for the meagreness of its form. The crown of the head, and the coverts of the wings are of a deep blackish green, spotted with bright azure; the scapular feathers and coverts of the tail are also of a repellant azure; the whole under-side of the body is orange-coloured, and a broad mark of the same pafs from the bill beyond the eye; beyond that is a large white spot; the tail is short, and conflits of 

feathers of a rich deep blue; the feet are of a redish yellow; the three lower joints of the outermost toe adhere to the middle toe, and the inner toe adhears to it by one joint.

The king-fisher frequents the banks of rivers, and feeds

on fish. It takes its prey somewhat in the manner of the

oPrey, balancing itself at a certain distance over the water

for some time, and then darting below the surface brings

the prey up in its feet. When it remains fixed in the

air, in a bright day, the plumage exhibits a most beautiful

variety of the most dazzling and brilliant colours. To this

attitude the ancients refer; for Thucydides, quoting by

Athenaeus (Deipnoi. lib. ix. p. 388) calls these birds 'πελαγός οὐράκτωρ',

the halcyons with expanded wings. It makes its nest in

holes in the sides of the cliffs, which it scoops to the depth

of three feet, and lays from five to nine eggs, of a most

beautiful semi-transparent white. The nest is very fortid,

on account of the refuse of fish with which the young are fed.

It begins to hatch its young early in the season; and

excludes the first brood in the beginning of April. Whilst

the female is thus employed, the male is unquestioning in

his attendance, supplying his mate with fish in such abundance

that she is found at this season plump and fat. He ceases

to twitter at this time, and enters the nest as quietly and

privately as possible. The young are hatched in about 20

days, but differ both in size and beauty. The ancients

believed that the halcyons were so amorous, that the male died

in the embrace, and Aristotle affirms (lib. ix. c. i. 14.)

that they begin to breed when only four months old. The species

now described is the ηικίον, or mate halcyon of Aris.

(Hift. An. 892. 105.) which he describes with a precision,

to which he is not accustomed. His description of the bird is

followed by that of the nest; which, he says, resembled

those confections that are formed by the sea-water; that it

was like the long-necked gourd, hollow within and having

a narrow entrance, so that if it overtop the water could not

enter; that it refilled any violence from iron, but might

be broken with a blow of the hand; and that it was com-

posed of the bones of the Bream, or sea-needle. The nest

was called halcyonyon, and medical virtues were ascribed to

it. Mr. Pennant inclines to credit part at least of Arisotle's

account, as to the form of the nest, which agrees with the

description given of it by Count Zinzanni; and as to the ma-

terials of which it is composed, and the fragments of bones

and scales of fish that were found in it, he adds, that those

who will not allow this to be a bird that frequents the sea

should recollect that Arisotle made his observations in a

milder climate than our's, and yet from Zinzanni we learn

that even in Italy the king-fisher breeds in May on banks of

streams that are near the sea, and the ancient Statirite allows,
(Hift. An. 1050.) that the halcyon sometimes ascended rivers posibly to breed. M. Buffon is of opinion,

that the halcyonia, of which Pliny, (lib. XXII. 8.),

reckons four kinds, and which some have supposed to be

the nells of king-fishers, are only clusters of sea-weeds; and

with regard to the nells of Tonquin and China, which, are

eclined such deficiencies, and have also been attributed to

the halcyon, they are the indispensible productions of the

pedant swallow. On the precious foundation laid by

Aristotle, very absurd and incredible tales have been formed by

frequent writers; and the poets, indulging the powers of

imagination have added many fictions to the account of the

philosopher. Accordingly the nest has been represented as a

floating one:

"Incedat halcyone pendentibus aquarum nidos." 

Ovid. Met. lib. xi.

It was therefore necessary to place it in a tranquil sea, and

to supply the bird with charms to allay the fury of a tor-

bulent element, during the season of incubation. At
	
time it had, therefore, control over the seas and the

winds:

"X' ηικίον ροφίν ρηχ η ηυμικια τωρι θαλάσσων

Το τι τιναν, τον γενος, ις εισχειδε φωκα κινημα."

Αλκοκ. Γρακκας: Νηρες τα τι μαλακας

Ομυλας θαλασσων."—THEOCRIT. Idyll. viii. 1. 57.

"May halcyons smooth the waves, and calm the seas, and

the rough south-east dish sink to a breeze;

Halcyons of all the birds that haunt the main,

most lov'd and honour'd by the Nereid train."

PANKES.

These birds were equally favourites with Thetis, as well as the

Nereids:

"Dilecte Thetidi Haleynes."

VIRG. Georg. i. 390.

As if to their influence these deities owed a repose in

the midst of the storms of winter, and by their means were

secured from those winds that disturb their submarine retreats,

and agitated even the plants at the bottom of the ocean.

Such are the accounts given by the Roman and Sicilian poets.

Aristotle and Pliny tell us, that this bird is most common in

the seas of Sicily; that it fat only a few days, and those in

the depth of winter; and during that period the mariner

might fall in full security; for which reason they were filled

Halevon-days. By the poets the king-fisher was also made a

bird of song. Virgil ranks it with the limnet:

"Litoraue Alcyones resonant, Aecanitha deum." 

Georg. iii. 338.

And Silius Italicus celebrates its music, and its floating nest:

"Cum sonat halcyones cantu, nidificoque matantes

Immota gelat, foptis fluibitibus, unda." 

lib. xiv, 275.

But these poets have probably transferred to this species the

powers of song that belonged to the alleco of the philo-

sopher (Hift. An. 892.), which was vocal and perched upon

reeds; and which, according to his account, was the lead

of the two, but that both of them have a cyanan back.

Belon supposes the vocal alleco to be the greater reed par-

tow, tardus aurumnaceus of Linnaeus, a bird of a fine note

and converfant among reeds; but Mr. Pennant litters from

his opinion, because the colours of the latter are very plain,

and conceives that the alleco vocalis of Arisotle is one of

the loft birds of the ancients. Some have even doubted,

whether the king-fisher of the moderns and the allecon of

the ancients are the same bird. But the description of Aris-

tolte sufficiently identifies them. The allecon, says that

philosopher,
philosopher, (lib. ii. 14) is not much larger than a sparrow; its plumage is painted with blue and green, and lightly tinged with purple; these colours are not distinct, but melted together, and shining variously over the whole body, the wings and the neck; its bill is yellowish, long, and slender. The habits of these birds also resemble one another. The aleyon is solitary and pensive; and the king-fisher is almost always seen alone, and the pairing season is of short duration. The former was not only an inhabitant of the sea-shore, but haunted the banks of rivers, and the latter has also been found to seek shall-fish and large worms, that abound on the shore of the sea, and in rivulets that flow into it. Aleyon was seldom seen and rapid in its flight; it wheeled swiftly round ships, and infantly retired into its little grot on the shore. The same character belongs also to the king-fisher. The aleyon and the king-fisher have the same mode of taking their prey, by diving vertically upon it. The king-fisher is the most beautiful bird in our climates, as to the richness and luxuriance of the colours of its plumage. It has, says Buffon, all the shades of the rainbow, the brilliancy of enamel, and the glossy softness of silk; and Gellner compares the glowing yellow red, which colours the beak, to the red glare of a burning coal; and yet the king-fisher has stayed from those climates where its repulident and glowing colours would appear to the greatest advantage. There is a species that is common in all the islands of the South Sea; and Forster, in his observations in Capt. Cook's second voyage, has remarked, that its plumage is much more brilliant between the tropics than in the regions situated beyond the temperate zone, in New Zealand. In the language of the Society islands, the king-fisher is called Evora, and at Otaheite it is accounted sacred, and not allowed to be taken or killed. King-fishers were found not only at Otaheite, but in Huahine and Ulieta, and in the islands that are scattered over the South Sea, though they are more than 1500 leagues distant from any continent. These king-fishers are of a dull green, with a collar of the same about their neck. The islanders entertain a superstitious veneration for them. The chief at Ulieta intreated Capt. Cook's companions, in a very serious tone, to spare the king-fishers and herons of his island, giving permission to kill all the other birds. There are 22 species in Africa and Asia, and eight more that are known in the warm parts of America. The European king-fisher is scattered through Asia and Africa; many of those sent from China and Egypt are found to be the same with ours, and Belon has met with them in Greece and in Thrace. This bird, though it derives its origin from the hottest climates, bears the rigour of our feasons. It is seen in the winter along the brooks, diving under the ice, and emerging with its prey. The Germans have called it effovgel, or ice-bird; and it has been found even among the Tartars and Siberians. The Tartars and Ottomans use the feathers of these birds for many superfluous purposes. The former use them as love-amulets; pretending that those which float on water will induce a woman who is touched with them to fall in love with the person who thus applies it. The Ottomans take the skin, the bill and the claws of this bird, and enclose them in a purée; and whilst they prefer this amulet, they think they have no ill to fear. Credulity has admitted and reported many other familiar tales concerning the extraordinary powers and virtues of this bird; but it is needless to recite them. Its flight has the odour of balsam musk, and is unpainable food. Although these birds are found in cold as well as warm climates, they are often found dead under the ice. M. Daubenton has preferred some of them alive for several months, by feeding them every day with young fry, which is their only proper nourishment; for they reject every other kind of food; and they may be kept in rooms for some time, provided that they are placed near basins of water full of small fish. Olina describes the method of taking them; at day-break, or in the dusk of the evening, by setting a trap at the edge of the water; he adds, that they live four or five years. 4. A. alcyon, tipida belloniensis. In China, Bengal K. of Albinius, and red-headed K. of Latham; is the smallest; it has a long tail; its back is blue, its abdomen yellow, its head and rump purple, its throat and nose white. The bill and the feet are red. This bird is about the size of the last species, somewhat more than six inches long, and is found in Bengal. There is a variety called A. minor, or red-headed K. with the head and neck of an orange-red colour. 5. A. madagascariensis, tipida Ani-sala-ny or Drifil, martiuis-peeueur de Madagascar of Buffon, this K. of Latham; has a short tail, rufous body, white throat, black tail feathers; the bill and feet are red. It is five inches and a half long, and inhabits Madagascar. 6. A. superciliosa, tipida Americna viridis of Drifil, martiuis-peeueur de Madagascar of Buffon, little green or orange K. of Edwards, and supercilious K. of Latham; is green above, white below, with a green band, and yellow eyebrows. It is about six inches long, and found in America. Buffon had it from Cayenne. 7. A. aleyon, tipida crinita carolinensis of Drifil, aleyon of Ray, king-fisher of Catesby, and belted K. of Pennant and Latham; is long tailed, crested and blichi, with a white abdomen, ferruginous breast, and a white spot before and behind the eyes. There are three varieties, viz. tipida Indioecius, martiuis-peeueur de Louisiane of Buffon, or crab-catcher of Sloane; tipida Dominicus crinita of Drifil, martiuis-peeueur de St. Domingue, and jaquacati of Buffon, or American K. of Edwards; and tipida Brasiliensis crinita of Drifil, and jaquacati-siaca of Maregrage, Ray and Willughby. This species inhabits America, and seems to migrate from Hudson's Bay to Mexico, where it is eaten, though it has a rank fishy taste. It is about 13 inches long, feeds on fish, nereis in high banks, into which it penetrates in a horizontal direction, lays four white eggs, and hatches in June. 8. A. torquata. See Achalalacili. 9. A. capitis, tipida capitis bone spis of Drifil, martiuis-peeueur a gros bec of Buffon; is short-tailed, or blue, below fulvous, its breast brick-colour, and bill red. It is 14 inches long, and found at the Cape of Good Hope. 10. A. Senegalensis, tipida Senegalensis major of Drifil, A. senegalensis of Forke, martiuis-peeueur a tete grise of Buffon; is long-tailed, sky-blue, below white, with a hoary head, and coverts of the wings black. There are three other varieties, viz. A. bleue and yellow, the crab-eating K. of Latham; the A., with the head and neck ochreously white; and A. above sky-blue, below rufous-yellow, and white throat. This species inhabits Arabia and Africa, and particularly the banks of the Senegal, where they are numerous; and the name of the K. is, in the language of the country, Baboucard. The second variety is found in St. Jago and Abyssinia. 11. A. Smyrnensis, Smyrna K. of Albinius and Latham; is long-tailed, ferruginous, with green wings, tail and back. It is found near Smyrna. There are two other varieties, viz. the great Gambia K. of Edwards, found in Gambia and Madagascar, 10 inches long; and the great Bengal K. of Albinius, found in Bengal, and on the coast of Malabar; 9 and 10 inches long. 12. A. rubida, tipida ex albo et atro varia of Drifil, martiuis-peeueur pie of Buffon, black and white K. of Edwards and Latham; is short-tailed, black variegated with whitish, and below white. It is 11 inches long, and found in Asia and Africa. This bird is about the size of the Royal crow, and its cry is not unlike
that of the common cromer. 13. A. supo, nipha termiata, is, a pretty small long-browsed buffoon, Ter-
ax, of Latham, has the two tail-quills very long, at-
 chew in the middle, its body dark bluish, and its wings greenish. It is called this bird, on account of its beauty, the "Cromer of Terame; and he says, that as the feathers on
the tail are one-third longer in the male than in the female. It is 1.5 inches long, and inhabits the island of Terame.
14. A. parvula, galbana longicuda of Gwillihby, jaccarn a large quill of Buffon, swallow-tailed K. of Edwards, and peculiar jaccar of Latham, has the two intermediate tail-feathers very long, the body greenish gold, and the feet lamellar. The bill of this species is quadrangular, acumina-
ted and black, the legs are black, and plumes so far as
the eye, the head is violet brown, the throat, neck, and
inner covert of the wings are white; the two middle tail-
feathers are longer than the others by an inch: the plumage
is principally of a dull deep green, in which are distinguished
one orange and violet reflections. The female is diffi-
cult to sex from the male by the middle quills of the tail,
which is much shorter, and by its plumage being deficient
of the orange and violet reflections. These birds inhabit
the forests, live on insects, fly to great distances, and perch
on the tops of trees, go in pairs, not being so solitary and so
solitary as the other jaccarns; nor have they the same
waddle, but a cry or soft whistle, which is heard only at a
small distance, and seldom repeated. 15. A. galbana, galb-
a of Buffon, jaccarn of Maregrave, Ray, Willughby,
and Edwards, jaccarn of Buffon, green jaccar of La-
tham; has a wedge-shaped tail, body gold and green, rufous
below, and its feet lamellar. The bill is quadrangular,
two inches long, acuminate, black, with nodules ovated
at the base, deep blue irides, white chin, sometimes yellowish,
flanks, wings and plumage legs of a greenish yellow colour,
and black claws; the plumage is of a very brilliant gold-green,
with red copper reflections. The size is about that of a
lark, and its length scarcely nine inches; it inhabits the
thick forests and damp situations of Guiana and Brazil: it
is solitary, and prefers the most sequestered and obscure
coverts; it perches on the middle boughs, and remains there
along and at rest for the greater part of the day and night;
it's flight is quick, but short, it lives on insects: it has a
feebly broken waddle, which is tolerably pleasant; and Plro
says, that its flesh, though hard, is eaten in Brazil. The
jaccarns of Cayenne call this bird venenous; and the creoles
denominate it colibri des grands bois. 16. A. orientalis,
nipha India of Buffon, eastern K. of Latham, is green,
brown, rufous, head, throat, band of the eye, and tail-fea-
thers fley-blue. The bill is red; the feet and claws black.
It is four and an half inches long, and inhabits India. 17.
A. Surinamensis, Surinam K. of Latham, is short-tailed
and blue, whitish below, with a rufous breast, greenish black head,
and transfere green spots. Its bill is black, and the back
marked with black spots. It inhabits Guiana, settling in
lakes near the waters, laying five or six eggs, and living on
fishs. 18. A. purpurea, purple K. of Latham, is below
a verdous gold colour: the head, ramp, and tail, are rufous-
gold; the back and covert of the wings bluish-black, the
tail-feathers black, and the throat white; the tail and feet
are red; a purple blue stiles from behind the eyes to-
wards the back, terminated by blue. It is about the size
of the fourth species, and inhabits India. Of all the king-
fishers, M. Buffon says, this is the handomell and the richest
in colour. 19. A. corvina-capiitla, blue-headed K. of La-
tham, is of a blue-colour, rufous below, with a white throat
and blackish tail-feathers. The bill and feet are red; and
the crown of the head of a bright blue, tained with waves
of a lighter blue. It is four inches long and inhabits
Madagascar. 20. A. Bungarofir, little Indian K. of Ed-
wards, and Indian K. of Latham, is bluish-green, rufous
below, with brown tail and tail-feathers, and the head marked
transversely with blue streaks; the bill is black. It is four
and an half inches long, and inhabits Bengal. The little Indian
K. of Edwards is a variety, which instead of the rufous ocular
band of the former, has two rufous spots. 21. A. leucotyrta,
nipha Americano caceulea of Buffon; A. American or
mipsla of Nelsa, martin-catcher by her blane of Buffon,
and white-billed K. of Latham, is of a bluish-green colour,
yellowish below, with the head and neck bay-coloured, the
tail-feathers cinnereous, the tail above blue, and below cinnе-
reous. The bill is whitish. It is barely five inches long,
and inhabits America. 22. A. Brasilianus, nipha Brasil-
on, and Brasilian K. of Latham, is rufous varied, with bay
and brown, and white below, with the greater tail-fea-
thers and tail rufous, marked transversely with white spots.
The bill and eyes are black, the ocular band, feet, and
claws are brown. It is about the size of the lark, and
inhabit Brazil. Its cry, giip-giip, resembles the piling of
young turkeys. 23. A. americana, white and green K. of
Latham, is blackish green, white below, spotted with green,
and the space of the breast and throat blue. The bill is
black, a white line puffed from its base below the beak
through the occiput; the feet are red: the female has no rufous
space at the breast and throat, but the throat is white. It is
five inches long, and inhabits Cayenne. 24. A. rufa, rufous
and green K. of Latham, is green, rufous-golden below,
with a zone warded with white and black on the breast,
distinguishing the male, and wings and tail spotted with white.
It is eight inches long, and inhabits Cayenne. 25. A. ma-
oula, nipha Brasilienis novis of Buffon, matissi of Ray,
Willughby, and Buffon, Brazilian spotted K. of Latham;
itis brown spotted with yellowish, below white spotted
with brown, with yellow throat. The bill is red; the feet and
claws cinnereous. It is of the size of the fance, and inhab-
its Brazil. 26. A. Cayennensis, taparam of Buffon, Cayenne
K. of Latham, is blue, below white, with a transverse black
band below the back of the head. The upper mandible is
black, the lower red, the rump azure, the tail, and tail-
feathers with a blue margin, the feet red. This species is
numerous, solitary, lays its eggs in holes on the river-banks,
is nine and an half inches long, and inhabits Cayenne and
Guiana. The time of its incubation is September, and its
cry is, came, came. 27. A. minapella, black capped K. of
Latham, is violet-blue, below white, with the head,
neck, shoulders, and tips of the wings black, and red-dish
abdomen. The bill and feet are red. It is ten inches long,
and inhabits China. This bird is one of the most beautifull
of the king-fishers. There is a variety, viz. A. Lucia,ii,
found in the island of Luzon, black above, white below,
with a farruginous abdomen. 28. A. tuta, reputed K.
of Latham, is long-tailed, olive above, white below,
with white eye-brows and greenish-black collar. The bill is
black, with the inferior mandible white, and the feet black.
It is eight and an half inches long, and inhabits Otaheite,
where it is held fared by the inhabitants. 29. A. ve
nerata, venerated K. of Latham, is brown, pale be-
low, with a roundish tail; and the margin of the tail-fea-
thers, wing-coverts, and wing-feathers green. The bill is
black, and the feet dunce. It is nine inches long, inhabits the
friendly islands, particularly Apye, and is deemed fa-
cred. 30. A. ferae, fared K. of Latham, is dilute blue-
green, below white, with pale farruginous eye-brows, and
the tail and tail-feathers blackish. There are four other va-
rieties, viz. A. with white eye-brows, A. with head greenish
black, pale farruginous below, and on the maee; A. with black
head, blue crown, dirty yellow eye-brows, head and abdomen,
and
and blue wings and tail; and A. with a white collar. This species inhabits the Society Islands; the third variety is found in New Zealand; and the fourth, in the Philippine Islands. It is nine and an half inches long, and reckoned farred by the inhabitants. 31. A. chloropcephala, green-headed K. of Latham, is green, with a white neck and black collar, the wings and tail of a green.- The bill, under part of the tail, and feet, are blackish. It is nine inches long, and found in Bouro, one of the Mohuene islands. 32. A. ceruleus, white-collared K. of Latham, is blue, rufous below, with white eye-brows and collar. It is almost seven inches long, and inhabits India. 33. A. johnstoni, great brown K. of Latham, is eredit, olive-coloured, below white, otherwise black, with the temples and back of the head dingy white; the tail roundish, of a rufus fulvous, crossed with black waves, and white at the end. The upper mandible is black; the lower white, and black at the base; the female has no eredit. The crown of the female and the sides of the chin and neck of both sexes blackish brown; the collar of the female white, and the back olive; that of the male, at its lower part with the rump, pale green-colour, with a spot of the same in the middle of the coverts of the wings; the tail-feathers of the female greenish-brown; the exterior margin of those of the male blue, but black within, and at their tip, sometimes white at the base, yellow feet, and black claws. This bird is the largest of the kind, its length being 18 inches, and inhabits New Guinea. 34. A. maxima, great African K. of Latham, is sub-ceredit, head-black colour, pointed with white, with white throat, black neck, and ganguineous breast and abdomen. The bill is black, with linear nostrils, and the feet are very black. It is about the size of a crow, and inhabits Africa. 35. A. leucoccephala, white-headed K. of Latham, is blue-green, with its head, neck, and under surface white, and wing-quills brown. It is 12 inches long, and inhabits Java. 36. A. flavicollis, is yellowish below, with the head and back green; the bill red, and the tail blue. It inhabits the island of Ceylon, where it is called by the natives, ten-rou-joulon. This bird is peculiarly dexterous in catching its prey: when it feeds the fish in the river itارات upon it and feizes it with its bill, transports it to its nest, subrubs a day or two upon the spoil, and spends the whole time in singing. 37. A. Newtonii, New Guinea K. of Latham, is black spotted with white. 38. A. Aegyptis, Egyptian K. of Latham, is brown, with ferruginous spots, and whitish below with cinereous spots. The bill is blackish; the throat ferruginous-white; the upper coverts of the tail wholly white; the tail ash, the feet greenish, and the claws blackish. It is about the size of a crow, nests in the fycamore and palm-trees, feeds on frogs, fish, and insects, and is found in Egypt. Haffcliquifit has particularly described this bird. 39. A. grandis, great jaca-marrow of Latham, is copper-gold coloured, below ferruginous, with the head and limbs green-gold, and the feet scarl. 40. A. tridaetys, three-toed K. of Latham, is rich and brilliant in its plumage; the upper side of the head and back is of a deep lilac, the feathers of the wings are of a dull indigo, heightened by a border of vivid and shining blue that surrounds each feather; the under side of the body is white; the bill and legs are reddish. It is about four inches long, and inhabits Surinam and India, and the islands of the Indian ocean: Sonnerat found it in the island of Lucon. 41. A. feminaevelus, is short-tailed, with the hind part of the back, the tail, and the middle of the wings blue, the shoulders black, the head and breast cinereous, and the belly ferruginous. The bill and feet are vermilion. This bird is found near Yemen in Arabia, and is about a span long. Linnaeus by Gunin. Latham, Buffon.

ALCEDO vocalis, a name by which Bulleiusis, Aldrovandus, and some others have called the reed-sparrow. See the preceding article.

ALCES, in Entomology, a species of Lucanus, with exserted mandibles quadridentated at the apex. It inhabits Asia.

ALCES, in Zoology, a species of Cervus. See Ele.

ALCESTER, or Alnchester, in Geography, an ancient small town of England, in the county of Warwick, situated at the union of the rivers Aln and Arrow; the chief manufacture is needles, and the market-day Tuesday. It is 103 miles north-west of London, and near it is Ragley, a noble seat of the Marquis of Hertford.

ALCHABITUS, in Biography, an Arabian astrologer, wrote an introduction to the knowledge of the celestial influences, entitled, " Hagoge ad Magicarium Judiciorum Altorum," a Treatise on the Conjunctio of the Planets, and another "On Optics." His astrological works were translated by J. Hispalenus, and printed at Venice in 1491, with explanations by Joannes de Saxonia, and in 1521 with the correction of Antony De Pantis, physician of Tavole, in Italy. It is not known at what time Alchabitus lived. Gen. Dict.

ALCHABUR, in Geography, a town of Asia, in Diar-bekir, upon the Euphrates, in a very agreeable situation, south-east of Aleppo and south-west of Mosul. It serves as a resting-place for the caravans from Babara. N. lat. 34°. E. long. 57° 54'.

ALCHABUR is also a river of Asia, in the same province.

ALCHAMARUM, a town of Arabia, situated on a high mountain, near the river Ormannus. The access to it is narrow and difficult, that two men can guard it. The summit of the mountain is very fertile, and affords all necessary supplies to the inhabitants. This is the residence of an Arabian king.

ALCHARNI, Judah, in Biography, a celebrated Jew of the 12th century, was reckoned at the period in which he lived a great poet, and undertook to translate the comments of Maimonides on the Mishna, and his Mochr Nevochim, at the request of the Marzial doctors, who did not understand Arabic.

ALCHATA, in Ornithology, a species of Tetrao.

ALCHMILLA, Ladies' Mantle, in Botany, a genus of the tetranda monogynia class and order, of the natural order of fentifera, and rofeta of Jussieu. Its characters are, that the calyx is a one-leafed, tubulous, permanent perianthium, with edge flat, divided into eight segments; no corolla; the lamina have erect, awl-shaped, very small filaments on the edge of the calyx, the anthers roundish; the piliillum has an ovate germ, ftyle filiform, of the length of the flamina, infected at the base of the germ, stigma globular; no pericarpium, the neck of the calyx closing and never opening; the seeds are solitary, elliptic and compressed. There are four species, vis. 1. A. vulgaris, common ladies' mantle or bearfoot, with leaves lobed. This herb is frequent in meadows and pastures in England. It is perennial, and flowers in June and July. Horsey, sheep, and goats eat it. Cows are said not to be fond of it; and yet Haller, in his Iter Helveticum, informs us, that the astonishing richness of the milk in the famous dairies of the Alps, described by Schuchzer, is attributed altogether to the plenty of this plant, and that of the ribwort plantain. The whole plant is astringent. In the province of Smolundia, in Gothland, they make a tincture of the leaves, and give it in spasmotic or convulsive diseases. In an epidemic complaint of this kind, which occurred in 1754, it was found of great use. Before this period the infusion, tincture, and
extract of it had been found effectual in milder cases of a similar kind. The root is more astringent than the herb, and the virtues are communicated alike to water and spirit of wine. It does not rank among the more powerful astringents, nor does it deserve that high commendation which has been bestowed upon it in hemorrhages, diarrheas, the flux albus, and the healing of wounds. Murray Mat. Med. vol. iii. p. 153. There is a variety of this species, which is the A. minor of Hudson, and the A. alpina pubescens minor of Plukkenet, in which the leaves are more silky, smaller and whiter; and the stems less branching, and the flowers in less clusters. 2. A. alpina, cinquefoil or Alpine ladies' mantle, with digitate ferrate leaves, under silky, grows naturally on the mountains in Yorkshire, Cumberland, Wellmorland, North Wales, and the Highlands of Scotland. It is also a native of Sweden, Denmark, the Alps, and other cold parts of Europe; and is admitted into gardens on account of its elegance. It is perennial, and flowers in July. 3. A. phanerolea, with many parted leaves and item erect, is found in New Granada, by Mutis. 4. A. pentaphyllea, with leaves quinate, multilobed, smooth, grows naturally on the high Alps, as Gotheard, Furca, &c. and is only found in some few curious botanic gardens in this country. It was cultivated by Mr. Miller in 1748. These species may be propagated by parting their roots, for which the best time is Autumn. They should have a moist soil and a shady situation. When they are propagated by seeds, they should be sown in Autumn, on a shady moist border, and when the plants come up, they will only need to be kept from weeds.—Martyn's Miller. Dr. Smith (Flor. Brit. vol. i. p. 156) has added to this genus the Aphanes argentea of Linnæus.

ALCHEMIST, a person who professes ALCHEMY.

ALCHEMY, Alchimie, Fr. The subject of alchemy occupies so large a space in the humiliating history of the misapplication of brilliant talents, and the wanderings of the human understanding, as to justify and indeed demand a particular enquiry into the causes of its origin, the grounds of its continuance, and the reason of its gradual decline, and at length total retirement from public notice. Instead, therefore, of merely quoting the conceit and fantastic definition given of it by Harris. "Ars fine artes, cujus principium eit mentis, medium laborare, finis medicare," (an art without art, originating in falsehood, and proceeding through labour to bureaucracy), we shall treat of it at some length, considering first, the origin of the institution; secondly, its history; thirdly, the theory and arguments that are alleged in its support; and fourthly, the facts upon which it professes to be established.

I. The word alchemy occurs for the first time in the writings of Julius Firmicus Maternus, who lived in the fourth century, under the reign of Constantine. This, however, is rather the date of the separation between chemistry and alchemy than of the origin of either. The fact seems to be, that a considerable quantity of real chemical knowledge but abundantly mixed, as the cunnion was, with false and hypothesis, was possessed by the priests of Egypt; and by these it was communicated, mostly under a promise of secrecy, to the Alexandrian Greeks. It is probable also that as there were several orders of initiation into their sacred rites to be passed through in succession by the aspirant before he was entrusted with their highest mysteries, so there might be a similar rule observed with regard to the communication of the different subjects of the Hermetic philosophy; thus the lowest secrets might be the preparation of the commoner chemical mixtures; the next in order might be the composition of glasses and the art of dying, both of which appear, even in the time of Pliny, to have been chiefly practised in Egypt, and contain at the present day more secrets than any other of our chemical arts; the knowledge of the most efficacious medicines would be esteemed as a proof of still higher confidence; and from the love of mystery inherent in the human mind, the most valuable communications of all would be that mixture of alchemy with medical and chemical theories, which, appearing to unfold the secret connection between the great powers of nature, flattered the imagination with the hope of performing things wholly impossible to other mortals. The actual possession and exertion of much lucrative knowledge, and the reputation of still more valuable secrets, would naturally attract the notice of the credulous, the interested, and, if any such existed at that period, of the philosophers, the real disinterested enquirers after science. In process of time, as the influence of the Egyptian priesthood declined by the consequences of the Roman conquest and from other causes; when too the persons enthralled with the secrets of chemistry were considerably increased in number, and were diffused through all the great cities of the Empire, it would necessarily happen that many from choice or necessity would advance no further in the study than was immediately conducive to their profit, by the refining of metals and the preparation of chemical compounds of general demand and utility, while the more theoretical and mysterious parts of the science would remain in possession of a few. The complicated economy of the Egyptian hierarchy being broken up, and there existing no longer any acknowledged heads of the science, the distinction between chemistry and alchemy would immediately commence. The chemists, or artists in chemistry, having no other object in view than pecuniary emolument from the sale of chemical articles, would confine their attention to the improvement of the particular manufactories in which they were engaged. The theoretical chemists or alchemists, on the other hand, having in view a certain mysterious unattainable and probably unattainable object, would look with contempt on the occupations of the chemist, and would consider themselves as in possession of the only liberal part of the science; their language partly from policy and partly from the want of clear ideas on the subject, would become more and more obscure, and knaves and impostors would creep in among them who would endeavour to indemnify themselves for the ill success of their experiments by frauds and impostions on the unwary. The original difference therefore between chemistry and alchemy seems to have been that the former was a mere art contriving in the preparation of substances by known processes, while the latter proceeding from general principles, either assumed gratuitously or taken up on very inadequate proof, was always aiming through the medium of new and uncertain experiments at the discovery of those powers which were supposed to be characteristic of the sublimer parts of the Hermetic philosophy.

II. It appears certain from the uniformly concurrent testimony of ancient history, that Europe was originally indebted to Egypt for its knowledge of chemical science. This knowledge, however, was but sparingly dealt out to a few of the Greek philosophers, at the expense of much solicitation, and many years of study by the Egyptian priests, as long as that country retained its independence. Afterwards, when by the victorious expedition of Alexander, a race of Greek monarchs was placed on the throne of the Pharaohs, and the foundation of the university of Alexandria had effected a coalition between the arts of Greece and the science of Egypt, chemistry being rendered more accessible, was studied more generally and with increased ardour. The same spirit, however, which pervaded their researches into metaphysics and theology, appears to have animated
The writings of these able men raised the study of alchemy to a degree of credit which it little merited, especially among the ecclesiastics, who professed at that time almost all the learning of the age; and even a pope John XXII. was weak enough to assert in his treatise on the art of transmutation, that he himself had made two hundred ingots of gold, of the weight of an hundred pounds each. The 15th century exhibits the same combination of chemistry with alchemy, but in which it is pleasing to discover a great diminution of reserve with regard to the processes of common chemistry, which are for the most part told in sufficiently plain language by the very men who, when treating of alchemy, are utterly unintelligible. The great authors during this period are Ifac and John Itac Hollandais, George Ripley, and Bafil Valentine.

Hitherto alchemy had been confined to the sibby object of changing the baser metals into silver and gold, and, the materia medica consisting wholly of vegetable and animal preparations, there existed little or no connexion between the chemists and physicians. The prevalence, however, of the leprous and the rife and rapid progress of the venereal diseases, rendered it necessary to have recourse to more potent remedies. The Asiatic practice of physic with regard to the use of mercury was introduced with the happiest effects by Curpus; antimony found an able advocate in Bafil Valentine, whose "Curris Triumphalis Antimoni," is a curious mixture of enthusiasm and knowledge.—The credit of the Galenists began to be shaken, and chemistry, by thus associating itself with the most philosophical of the three learned professions, acquired an immense accession of abilities.

The unexpected success which attended the first medical use of chemical preparations, awakened a new hope in the minds of the alchemists; and this was no less than the discovery of a universal medicine, which should heal all disorders, and prolong the duration of human existence to an indefinite period. The great authors of this fact were Paracelcis and Van Helmont, who, by their vigorous use of opium and mercury, effected a number of important cures, impossible to the common Galenical practice of the age. About the same time flourished Henry Cornelius Agrippa, and George Agricola, the first of whom, half knave and half enthusiast, belonged decidedly to the alchemical party; but the latter, though bewildered in youth, by the false philosophy of his time, made ample amends to the cause of true science in his mature years, by his admirable treatises on metallurgy and mineralogy.

From this time we meet with few authors of reputation who wrote professedly on alchemy, though a kind of half belief in the thing still clung about even the most eminent chemists, and may be clearly traced in their writings. A bold attempt to support the falling cause was made in the beginning of the 17th century by the Rosicrucians, a secret society which originated in Germany, and attracted the attention of the rest of Europe for 25 years. By pretending however too much, even to more than the ancient chemists, when in the plenteous of their power and influence, ever arrogated to themselves, the fraternity made few converts, and speedily sunk into total oblivion. The first philosophical society, for the express purpose of improving natural and mathematical knowledge, was formed at Naples, by Bapitlta Porta in 1664; and the noble example was followed by most of the other Italian states. The liberal spirit of free inquiry then prevailing the Alman, established similar societies in England, France, and Germany: the experimental method of philosophizing was introduced by Bacon; public lectures in chemistry began to be instituted; and the principles and facts of alchemy underwent
underwent a severe examination, from the Jesuit Athanasius Kircher, which it never afterwards recovered. The most eminent chemists now abjured altogether the researches of alchemy; and it lost ground daily, as well by its own want of evidence, as by the frauds and ignorance of the cheats into whose hands it had fallen. Thus, rapidly declining, it was at length wholly lost to the view of the scientific world, and at present is rarely detected, even by the officers of public justice, to whose care itself, with its ancient associate alchemy, has been commended in all the civilized nations of Europe.

111. According to the present theory, each metal is considered as a peculiar chemical element, perfectly undecomposable by any known method, a necessary consequence of which is the utter improbability and hopelessness of all alchemical purities; since their object is the composition and decomposition of bodies which are either absolutely simple, or at least as yet incapable of further analysis. This formidable difficulty at the very outset, may well dissuade from all modern attempts at metallic transmutation; but the great fathers of chemical philosophy ought not, in common candour, to be misrepresented as fools or impostors, for it is manifestly maintaining doctrines which are only, in the present advanced state of the science, futilly attempted. In the following summary of the leading theories relative to alchemy, the reader will scarcely expect to find a perfect uniformity and consistency of the several parts with each other, especially when it is considered that they are necessarily collected from a variety of authors differing in abilities, in communicative pens, and in the periods at which they lived.

It appears to have been admitted on all hands, that the metals were compounds of metallic earth and sulphur, (by sulphur was merely understood any pure inflammable substance). This earth being supposed to exist in a larger proportion and less mixed with sulphur in mercury than in any other metal, it came in time to be commonly known by the name of mercurial earth. Gold, as being the most fixed and unchanged of the metals, was considered as an intimate combination of pure sulphur and mercurial earth, while the other metallic bodies were thought to contain, besides these two essential parts, various impurities. Of this opinion, Geber, Roger Bacon, Ripley, Homberg, &c. were fervent advocates; and it is especially to the latter of these chemists that we owe the development of this theory, together with a memorable experimental argument in its support. Having expounded regula of antimony to the action of the great burning-glass of the Duke of Orleans, he found that it increased 10th in weight, and at the same time became more fixed: a similar effect was produced by exposing mercury to a digesting heat for some days; it was converted into a red powder of greater fixity than the original mercury, had gained in weight, and upon exposure to a red heat was almost wholly volatilized and converted into mercury, except a small portion of white hard ponderous metal which remained behind. From this experiment, Homberg deduces the following conclusions: that the pure sulphur of metals is solar light; that it unites with, and increases the weight of all metals that are exposed to its action, except gold; that it gives them a greater fixity; and that, although when loosely combined with mercury it only changes it into a red powder, yet by the further action of heat a part of the mercury becomes saturated with this sulphur, and is converted into a hard fixed metal while the red is volatilized. To their experiments, important as they were supposed to be at the time of their invention, the superior accuracy of modern chemistry would object, that the gaseous products were wholly overlooked, and that the fixed metallic residue from the decomposition of the mercurial oxide, is only a proof of the original impurity of the mercury employed, since no attempt was made by a repetition of the processes to effect the fixation of the whole of the mercury. From these and similar experiments, however, the old chemists drew the inferences already mentioned; and by bearing this in mind, it is easy to discover the objects which they had in view, in each of their processes as they endeavoured to publish in intelligible language. They were supposed to be two methods of making gold, by synthesis and transmutation. The former of these was effected by the direct combination of the pure sulphur and mercurial earth; hence we see the reason of the numberless distillations and digitations, and processes of all kinds for depriving sulphur of its impurities, and bringing it to the last state of rectification or exaltation: hence also the multiplied experiments on quicksilver, in order to give it fixity in the fire: this method however was generally acknowledged to be too difficult, that few alchemists have even pretended to be able to do more than fix the mercury. The art of transmutation was carried much further: it was taken for granted that the object of Nature, in producing metals, was the formation of gold, as being the most perfect of these substances; and that the failure, in all cases, was owing solely to the interpolation of certain impurities: it was known also, that the common methods of refining depended on the separation of the precious metals from the baser ones, with which they were mixed and contaminated; the conclusion, therefore, did not seem a priori, very extravagant; that, by an improvement in the art of refining, such of the cheaper metals as appeared the most to resemble gold, might be freed from those impurities in which the whole difference between them and gold consisted. Lead, from its specific gravity, and copper, from its colour, were the principal subjects of experiment; and when it is considered that arsenic was not yet discovered to be a metal, and the amazing effects of this substance in disguising the properties of gold, instead of being surpised at the accounts of transmutations, the principal wonder is, that they are not still more numerous and supported by more unexceptionable evidence. The substance capable of effecting this extraordinary change was called the elixir, or medicine of metals, the tincture, the powder of projection or philosopher's stone, a very small portion of which was adequate to the transmutation of a very large proportion of lead or copper; and by using a greater quantity than necessary of this powder, the gold resulting from the operation acquired the property of acting itself as an elixir. Such is the simplest and most confident theory of the great art, as delivered in the writings of the best and most philosophical of the alchemists, nor when its real importance is considered in regard to chemical science and many of the arts, when too it is remembered how numerous and unexplored fources of error existed at that early period of chemical investigation in which it flourished, and the impeding theory whereby it was supported, shall we lightly rigmatize those who honestly devoted much of their time to the pursuit, with the opprobrious appellation of pertinacious folly.

IV. If we were to enter upon a minute examination of the evidence, by which the principal instances of transmuration are supported, it would extend this article beyond its due limits; the documents besides are so equivocal, and the witnesses so dubious or incompetent, that the inquiry would but ill repay the trouble; in the room of this, therefore,
Therefore, we shall lay down some general considerations, which by their agreement or disagreement with any particular case, will enable us to form a probable judgment of its truth or falsehood. Nor is this, although a summary way of treating the question, unfair or unallowed. In any system that is offered to our belief, if we can point out a fundamental error or contradiction, we may well excuse ourselves from discarding the proofs adduced in favour of detached parts. With what strength of evidence are many stories of apparitions and witchcraft supported, how generally were they believed at the time of their occurrence, and how universally are they rejected and ridiculed at present, not from any new flaw discoverable in the evidence, but from their variance with general principles and experience?

That the philosopher's stone never existed, that no metal has ever yet, by human art, been produced or decomposed, is highly probable, from the convincing proofs which have been afforded by the progress of chemical philosophy, of the fundamental errors, both in fact and theory, to which even the ablest of the alchemists were subject. All chemical knowledge was anciently made a secret of; but by the invention of printing, and the rise of a more liberal spirit of communication, it may be added also, by the superiority of modern over ancient science, all nostrums and mysteries have in a great measure disappeared, and whatever was of sufficient importance to attract general attention, has been added to the stock of general information. In the mean time, alchemy has ceased to be an object of curiosity, not because its end was mean and trivial, but because all its supposed great facts have been resolved into mistakes. The value of the precious metals, instead of diminishing has rather been increasing, the direct contrary to which would have been the case, had they been capable of being produced by any of the safer ones. The professors of alchemy have been chiefly poor, and have in many cases even offered to divulge their secret for a sum of money; that is, being in position of the art of producing gold ad infinitum, they have offered to communicate this wonderful knowledge for a few ounces of the very substance which they could manufacture by the hundred weight. Some of the alchemists in the dark ages, especially in Germany, who had the unfortunate reputation of poising the philosopher's stone, were imprisoned by the princes of the country and furnished with chemical apparatus, till they should have purchased their liberty, by producing a certain weight of gold, but not an ounce was ever procured by this method. It is remarkable too, that the most skillful and reputable of the alchemists, although they maintain the possibility of transmutation, and profess to know the method by which it is to be effected, are very far from affirming, that they have themselves actually succeeded in the attempt. Again, if from the best attested instances of gold-making, we exclude those which depend on the fabulous testimony of the alchemists themselves, or the incompetent evidence of men entirely ignorant of chemical science, we shall find the remainder reduced almost to nothing. The royal academy of sciences at Paris, during the first years of its institution, was almost overwhelmed with applications from men who professed to be able to make or deteriorate gold at pleasure; either in this respect deceiving themselves, or in the hope of deceiving their attempts on the public credulity, by the function of that learned body; many experiments were in consequence made in their presence, all of which totally failed of success. These repeated detections, like those on the subject of witchcraft, appear to have decided the opinions of philosophers respecting the falsehood of alchemy, and though the wonder of the ignorant is still occasionally called forth on both these subjects, they are no longer considered as worthy of a serious refutation.

A L C I A M E L E C H, in Botany, the Egyptian mullet. Ray.

A L C H I N D U S, James, in Biography, an Arabian physician, is supposed to have lived about the middle of the twelfth century. His work, "De Medicinarum compositione gradibus investigandis," was published with the works of Avicenna, at Venice, in folio, in 1561, and 1603.

A L C H O L L E A, a kind of food in use among the western Moors, being fishy meat, pickled, dried, boiled, and powdered.

A L C H O R N E A, in Botany, a genus of the dicotyledonous class and order of professor Martyr, and monadelphus egenia of Swartz and Gmelin, the characters of which are, that the calyx of the male is a three or five-leaved perianthium; leaflets ovate, concave, equal, coloured, and deciduous: no corolla; the laminae have eight filaments, equal, scarcely longer than the calyx, slightly ciliate at the base, anthers ovate and upright; the pistillum is a rudiment: the calyx of the female is a one-leaved, four or five-toothed perianthium, the teeth equal and small; no corolla; the pistillum has a germ twin, superior, styles two, very long and siliform, stigmas simple and acute; the pericarpium is a capsule berried, two-seeded, two-celled, two-valved; the seeds are solitary, large and oblong; there is one species, Ar. latifolia.

A L C I A T I, Andrew, in Biography, an eminent civilian, was born at Milan in 1492. Having studied the law in the university of Pavia, and in that of Bologna, he commenced the exercise of his profession at Milan in 1517, and became professor of civil law, in the university of Avignon, in 1518. Although his salary amounted to 600 crowns, and the number of his auditors was 200, he left this lucrative and honourable situation in disgust, because the city of Avignon was unable to make a regular payment of his stipend, in 1522, and refused his full profession at Milan. In 1529, he was invited by Francis I. the king of France, to promote the study of the civil law at Bourges; but impelled by avarice, he successively changed his situation to Pavia, Bologna, and Ferrara, in each of which places he had many felibars and clients, and received ample remuneration for his labours. When he was engaged by his friends for his frequent changes, he vainly interrogated them, whether they blamed the fun for revolting to enlighten all nations; or, whether, when they admired the fixed stars, they found fault with the planets. But his predominant principle was avarice: and this principle induced him to decline accepting the offer of Paul III. to quit Ferrara and settle at Rome. "Why," said he, "should I, for the uncertain and empty hope of the purple, relinquish the honours of my profession, accompanied with the possession of a rich stipend?" Francis Ferrara, Alciati returned to Pavia, and in 1550, died of a suscit, occasioned by excess of eating. He poissled, without doubt, distinguished talents, blended with a considerable degree of felicities and meanents; and he very materially contributed to the improvement of his profession, introducing a taste for polite literature, and animating that barbarous nation, which had before his time prevailed in the lectures and writings of the civilians. Erasmus beholds upon this his highest encomium: "The prais which Cicero divides between Secundus and Graffius, when
when he calls the latter the utter boul & infaid in law, and
the former the lawyer who was the most eloquent, is, by
the consent of the learned, named to Alciati." His first
work was, "An Explanation and direction of the Greek
verses which are conti. with the 1564," first published
in Italy and 4to. at Strasburg, in 1575. This was fol-
lowed by "Facsimiles of the Civil Law," "Disputationes
et Peregrination," published about the year 1577. His
next work, "De Verborum Significatione," was printed at
Rouen in 1579. Twelve and many other works on juris-
prudence, were published in 1571, in feto folio volumes.
He also wrote notes on Tacitus, of whose style he says,
that language contains with elegance. He also
wrote "Exempla" in verse, of which the elder Scaliger
says, that "they are entertaining, chaste, and elegant,
and not without strength;" and that "the sentiments are such
as may be useful, even in civil life." These were published
at Augsburg, in 1591; and in 1601, at Padua, with
notes, in 1601: and they have been translated into various
languages. Other works of Alciati, not included in the
3d edition, are "Refutations," Lugd. 1561; "Histories
Mediolanenses," Svo. 1625; "De forna Romani Imperii,
Svo. 1559; "Epigrammatas," Svo. 1629. A volume of
his letters was published at Utrecht in 1697; and in 1699,
appeared a letter, which he wrote to a friend who had be-
come a heretick, representing the imprudence of his conduct,
and exposing, with great spirit, the abuses of monastic life.

ALCIATI, JOHN PAUL, a native of Milan, distingui-
she himself in the 16th century, among those protestants
who receded to the greatest distance from the Catholic faith,
by denying the doctrine of the Trinity, and asserting that Jesus
Christ did not exist before he was born of the Virgin Mary.
With a view of indulging his speculations and prosecuting his
inquiries without molestation, he removed to Geneva.
Here he found protestants no less intolerant than papists.
From hence the zeal of Calvin in the persecution of Scribe-
tus, and the demand of subscription to the formulary of the
Italian church at Geneva, obliged him, and others denomi-
nated Socinians, to seek refuge in some other country. Ac-
cordingly they fled to Poland, where Alciati and Blundrata
were very successful in disseminating their opinions.
Towards the close of his life, Alciati was reproached
with having renounced Christianity, and becoming a Mahom-
taan; but this is probably a calumny, similar to that which
has been alleged against others, because they have concur-
red with the Mahometans in maintaining the simple unity
of the divine nature. Calvin and Beza have been very severe
in their charges against Alciati, representing him not only
as ignorant, but frantic; this, however, is one of those in-
f inade in which allowance should be made for that vehe-
ence and invective which are often the result of difference
of opinion. Alciati eloqted his life at Dantzic. In 1564,
he published his "Letters to Gregorio Pauli" against the pre-

ALCIDIADES, an Athenian general, was the son of
Chian, the nephew of Pericles, and lineally descended
from Ajax; and as much distinguished by the conneclens
of his person and the natural endowments of his understanding,
as by his rank and fortune. In early life he manifested those
talents and properties, which duly cultivated and directed
would have rendered him eminent and illustrious. But his
accomplishments and connections betrayed him into many
shames and dangers, which he wanted resolution to avoid.
Nature, in him, says Cornelius Nepos, had exerted her un-
mot fit force; since, whether we consider his virtues or his
vices, he was distingiushed from his fellow-citizens. He was
adapted to command attention and esteem, he became a very general
object of that love, which among the Greeks was sometimes
a pure, sometimes an ambiguous, and sometimes a leandalous
attachment. It was his felicity to engage the honourable
regard and friendship of Soearates; and to his instruction and
influence, he was much indebted; and though his preceptor
was less successful than he wished, in restraining his vicious in-
culations, implanting in his mind good principles, and guiding
him to laudable pursuits, his pupil seems never to have to-
tally lost the benefit of his good counsel. Of his vivacity
and resolution, when he was very young, the writers of his
life have recorded several instances, which indicate his cha-
acteristic temper. When he wished to fly a waggon which
was passing along the road, and interrupting a play in which
he was engaged, and his persuasion had proved ineffectual,
he threw himself directly before it and challenged the driver
to proceed; and this sudden display of resolution frightened
him and made him stop his horses. On another occasion he
went into a grammar school, and asked for a volume of Homer,
which the master was unable to produce; he gave him a box on the ear and departed; intimating by this action,
that a person who was not conversant with Homer was not fit
for to be a teacher of youth. As an act of rolic, and for
the gratification of his companions, he committed the fame
act of insolence on Hippomencia, a respectable man of rank
and fortune; but early on the next morning he went to his
house, and being admitted into his presence, stripped himself,
and offered his withered body to any chastisement which Hip-
ponion might think due to him. By this humiliation he
not only appeased Hipponon, but conciliated his esteem,
and afterwards obtained his daughter Hippapre in marriage.
Alikbeides, as he advanced in years, addicted himself to the
chariot-races, and he is said to have been the first person
who fent seven chariots at one time to the Olympic games.
The magnificence which he displayed on these occasions,
rendered him popular in the Greckian states; and at Athens
in particular his conduct in various respects became the topic
of very general conversation. In order to divert their at-
tenion from the more frivolous and faulty parts of his char-
acter, he is said to have cut off the tail of a very beautiful
dog, which he much valued. The aspiring and active dif-
polition of Alikbeides led him at an early period to military
service. His first campaign was in the war which Athens
carried on against Potidea; Soearates attended him, and
preferred his life, when, after fighting valiantly, he fell
wounded in the field. In the battle of Delium, some years
afterwards, he returned the obligation, by guarding Soearates
in the retreat, and bringing him off securely. A treaty of
peace having been established between the Athenians and
Spartans, by the instrumentality of Nicias, who by this event
had acquired popularity and influence, the jealousy of Ali-
beides was excited, and his ambition led him to overturn
the pacific system which Nicias was anxious to preserve.
With this view he encouraged the people of Argos to break
with the Spartans, and promised them the succour of the
Athenians; and he exerted himself in widening the differ-
ence that still subsisted between the Lacedemonians and the
latter. He also represented Nicias as more attached to
Sparta than Athens, and by his eloquence contributed to

subvert
subvert his popularity, and to make him odious to the people. When ambassadors arrived from Lacedaemonia, with full powers to terminate all differences, he contrived, by an artifice, to prepossess them in his favour; and to induce them to declare, that though they were not empowered to bring matters to a conclusion. He then charged them with prevarication, and defeated the object of their embassy. Having to far succeeded, he immediately recommended the cause of the Argives, Mantinians and Eleans, who fought the friendship of Athens; but before any resolution could be adopted, an earthquake happened, which of course dissolved the assembly. When Nicias returned from Sparta, without having succeeded in his negotiations, the Athenians concluded a league with the Argives and the other states above mentioned, for 100 years. Aleibiades was now become so popular, that he was appointed to the command of a fleet which was destined toaffil the Argives, and to put an end to the disputes which prevailed in their capital. The disposition of the people with regard to Aleibiades is justified by Aristotle, in his comedy of "The Frogs," (Act. v. Sc. 4.) "They hate Aleibiades, says he, and yet cannot do without him." The Misanthropic Timon formed a much better judgment of this conduct of Aleibiades. When he met him as he was coming from the assembly, and observed the respect with which he was treated, he asked him by the hand and addressed him: "Go on and prosper, my son; thou dost right in pushing thy fortune, for thy advancement will be the ruin of all these people." The war of Sicily, which soon followed, proved that Timon was not mistaken. The Athenians had long been desirous of establishing themselves in this island. Their ardour was inflamed by Aleibiades, who encouraged the delusive hope, that Sicily would be only their place of arms and arsenal; and that they should proceed from hence to the conquest of Carthage, and make themselves masters of all Africa and the sea, as far as the pillars of Hercules. Nicias and Aleibiades had harangued the people on this subject; but the latter prevailed. A powerful armament was prepared for the expedition; and Aleibiades, Nicias and Lamachus were appointed joint commanders. When every thing was prepared, and the fleet was ready for sailing, several unfavourable omens occurred, which excited in the minds of the people very disturbing apprehensions. One of these omens was particularly momentous to the fortune of Aleibiades. The Hermae, or half statues of Mercury, which floated at the entrances of private houses and temples at Athens, were in one night mutilated and destroyed. Aleibiades was suspected of being concerned in this act of impiety, and he was actually charged with having defaced other statues and with having ridiculed some of the sacred mysteries. The fleet, however, sailed; but soon after their arrival in Sicily, Aleibiades was recalled; but having accompanied the messengers as far as Thurium, he absconded and withdrew to Peloponnese. Being asked, on this occasion, whether he would not rely on his country, with regard to the judgment it might pass on him, he replied, "I would not rely on my mother, lest she should mistake a black bean for a white one," referring to the use of beans in giving suffrages, in which a black bean denoted condemnation. On his non-appearance he was condemned, his property confiscated, and the priests and priests' letters were commanded to curfe him. Among the latter was Thucano, who opposed this decree, alluding, 4 that she had been appointed priestess, not to curfe but to bless." When news was some time after brought to Aleibiades, that the Athenians had condemned him to die, he is said to have declared: "I will make them sensible, that I am still alive." Aleibiades, in consequence of this event, abandoned the interest of his country, and induced the Spartans to succour the Syracusans, and to declare war against Athens. At Sparta he assumed the Lacedemonian discipline, and by his versatility of disposition and manners, gained universal esteem. He cut his hair short, bathed in cold water, fed upon coarse bread and black broth, and affected simplicity and gravity of demeanour. He was at the same time active in his exertions, induced several of the cities of Ionia to revolt from the Athenians, and engaged Tissaphernes, the king of Perse's lieutenant, to concur in a league with the Spartans. Whilt he was thus employed, he engaged in an intrigue with the wife of the Spartan king, Agis, with the vain ambition, as he pretended, of giving a line of kings to the Lacedaemonians; and Agis became his implacable enemy. He saved his life by taking refuge with Tissaphernes, and in this new situation, he conformed to the luxurious manners of the Persians, and practiced adulation to such a degree, as completely to ingratiate himself with the Satrap. By his counsel, Tissaphernes maintained an even balance between the Athenians and Lacedaemonians; and Aleibiades at length contrived to make the friendship of the Persians the means of his own return to Athens. The constitution of the government having been changed, partly by his counsell and agency, from a democracy to an oligarchy, he was recalled by unanimous consent. But before his return, he determined to merit the honour to which he was aspiring by some illustrious exploit. Accordingly, in conjunction with the other Athenian commanders, Theramenes and Themysdrus, he took several places and gained several victories over the Spartans and their allies, and then set sail for Athens, with a fleet of 200 ships laden with rich spoils, together with the ships and flags captured from the enemy. A. M. 3597, B. C. 427. His reception was in a very high degree flattering and honourable; and in an assembly of the people, he deplor'd his misfortunes, which he ascribed to his own evil genius more than to the ill-will of his countrymen; and by his eloquent and pathetic speech so pleased his audience, that crowns of gold were decreed him; he was appointed general by sea and land, with unlimited power; his fortunes were restored to him; and he was absoleved by the Eumolpides and Corycians from all the executions that had been denounced against him. "As for me," says Theodorus, one of the persons employed in revoking the imprecations, "I have not curfed him, if he has done no evil to his country." When this pageantry was concluded, he set sail with 100 ships for the island of Andros, which had revolted; and having gained a victory, he departed for Caria in order to raise money, and left the fleet in the charge of Antiochus. Before his return, Lyander, the Spartan commander, brought on a battle, defeated the Athenian fleet, and slew Antiochus. The consequence of this disater was discontent at Athens, and the loss of his command. Instead of returning home, he collected a band of soldiers of fortune, and enriched himself by the booty which he took among the Thracian tribes; avoided the fate of the 10 new commanders appointed by the Athenians, most of whom lost their lives, on account of their ill success; and warned the Athenian commanders of the danger to which their fleet was exposed at Aegospotamis. When Athens was taken by Lyander, Aleibiades retired to Phocis, where he was plundered of part of his property, and from hence he went to Phrygia, and obtained the protection of Pharnabazus the Persian governor. The Athenians, suffering under the oppression of the 30 tyrants, directed their views to Aleibiades; and as soon as the tyrants

A L C I B I A D E S, was the name of one of the martyrs
at Lyons, A. D. 177. He came originally from Phrygia,
and lived a very afront life, living upon bread and
water: but was afterwards perfused, in order to avoid
giving offence, to partake of all sorts of food promiscuously,

A L C I B I A D E S, in Entomology, a species of Papilio
erque,
with white wings, the anterior bounded by a black margin,
the posterior marked below and at their tip with ferruginous
black spots, found at Tranquebar.

A L C I B I U M, in Botany, a word used sometimes by
the ancients as an epithet for a kind of echium, or viper's
bubo,
and sometimes as the name of a peculiar plant.

A L C I D A M A S, in Biography, a native of Elea, in
Elea,
was the disciple of Gorgias Leontius, and contemporary
with Iocrates, and lived about 400 years before Chrifi.
Two orations are extant under his name, viz. :
"Ulysses contra Palamedes," published by Aldus,
in his edition of the Orations of Alcines, Lyons, &c.
in fol. at Venice in 1513, and by H. Stephens in 1575;
and another "Contra Sophiliptas," annexed to Aldus's edition
tom. ii. p. 346, ed. Olivet.) mentions Alcidas as the author
c. 26. tom. i. p. 906.

A L C I D A M A S, in Entomology, a name given by Grazer
to the Papilio Turnus of Linnaeus.

A L C I D E S, in Entomology, a species of Papilio philojeus,
with cendated black wings dotted with blue, ferruginous
below, and marked with a yellowish streak; found in Sierra
Leona in Africa.

A L C I D E S, is also a species of Scarabæus, with
the horn of the thorax bent, bearded below, and unidentated,
and the head recurved and naked, found in India.

A L C I D E S, in Mythology, the surname of Hercules. See
A L C E A S.

A L C I D O N, in Ancient Geography, a river of Triphyla,
which rose on the frontiers of Arcadia, and discharged
itself into the Jardanus.

A L C I M E D O N, a plain of Arcadia, north of Man-
tinea.

A L C I N O U S, in Biography and History, is represented
by Homer as king of the Phaeacians, in the island now
called Corfu. His subjects were excellent mariners, and
much addicted to the dance and song, and every kind of
social pleasure; they were employed in conducting the ship-
wrecked Ulysses, who was hospitably received by Alcinous,
and Ithaca. The tale of Alcinous for horticulture is much
celebrated; and his garden, or orchard, is described by Ho-
mer as affording an abundance of fruit in quick succession,
and also copious streams and pleasant shade. Homer Odys
lib. vii. v. 108.

Hence we read in ancient geography, of the port, and
also of the gardens of Alcinous, which pertained to this
island.

A L C I N O U S, a Platonic philosopher, probably lived about
the

...
the beginning of the second century of the Christian era, and wrote a perspicuous and elegant "Introduction to the Philosophy of Plato," containing a summary of his doctrine. It was published in Greek by Aldus, at Venice, in 1521 and 1532, 8vo.; and with Ficinus's Latin translation, at Basle, in 1532; and at Paris, in 1562, 4to.; by Charpentier, with a Commentary, at Paris, in 1753; by Ficinus, Gr. and Lat. 8vo., at Leyden, in 1657, and reprinted at Oxford in 1657, 8vo.; and in English, by Stanley, London, in 1655, 1657, 1659, &c. Fabr. Bibl. Greec. lib. iv. c. 23. vol. iv. p. 40. &c.

ALCIONIO, Peter, a learned Italian, contributed to the revival of letters in the 16th century. He studied the Latin and Greek languages with great diligence, and was for many years corrector of the press to Aldus Manutius at Venice. His learning advanced him to a professorship at Florence, under the pontificate of Adrian VI. He translated many Greek works into Latin, and his translations have been highly commended. He was also the author of many original productions, which prove him to be a man of talents. In his disposition and manners, however, he was chargeable with moroseness and ingratitude, and with temperance and gluttony. Whilst he unduly valued himself on account of his own performances, he detracted from the merit of others. In the troubles excited at Rome by the Colonnas, he lost his estate; and in the year 1577, when the Emperor's forces took the city, he received a wound as he was going to join the Pope in the castle of St. Angelo; but upon the raising of the siege, he deserted his patron, and united with Cardinal Pompey Colonna, at whose house he fainted and died. His piece on exile, in the composition of which he was reported to have purloined a treatise of Ciceron, "de Gloria," which he had found in the library of a monastery, and afterwards destroyed, his "Orations on the taking of Rome by Charles V., and on the knights who died at the siege of Rhodes," are all the original works which he left. The former was printed at Venice, in 1522, in 4to.; and again at Leipzig, in 1702, under the title of "Analecta de Calamitate Libri." Gen. Biog.

ALCIPHRON, a philosopher of Magna Graecia, mentioned by A. Antoninus and Suidas, flourished in the time of Alexander the Great. He is different from Aleiphron, the sophist, whose age is unknown, who wrote epistles on various topics, of which an edition was published at Leipzig, in 8vo., in 1715. Fabr. Bibl. Greec. lib. ii. c. 10. vol. i. p. 423.

ALCIPHRON, in Entomology, a name given to the Phalæna moths, carius, with cinereous wings, white hatreds and point in the middle, yellow at the base, and five black points, found in the Indian fig.

ALCIPUPS, a species of Papilio Danaus, with yellow entire wings, a black margin, and white points, the posterior having a white disc, and black points, found in America.

ALCIS, in Mythology, the name of a deity worshipped by the Naheuri, a nation of Germans: and a name given to Minerva by the Macedonians. Tacit. Germ. 43. Liv. 42. 51.

ALCKHAUSEN, in Geography, a town of Swabia, belonging to the grand-master of the Teutonic order, in the county of Wehringen.

ALCMEON, in Biography, a physician and philosopher, was born at Crotona, and probably flourished about 520 years before Christ, as he was a disciple of Pythagoras, and attended his lectures. He is said to have been the first person who attempted the dissection of a dead body, and of various animals, in order to examine the structure of the parts and to have discovered the cochlea, one of the bones forming the organ of hearing. Le Clerc, Hist. de la Medicine, p. 94. He is said by Chalcidius, Haller observes, (Bibl. Anat. vol. i. p. 10.) to have attempted a treatise on anatomy, which, however, is lost. The sum of his tenets, as far as they can be collected from scattered fragments, is this: 1. Natural objects, which appear multiform to men, are in reality two-fold; intelligible natures, which are immutable, and material forms, which are infinitely variable. The sun, moon, and stars are eternal, and are inhabited by portions of that divine fire, which is the first principle in nature. The brain is the chief seat of the soul, which is in perpetual action and immortal. Health consists in preserving a due mean between the extremes of heat and cold, dryness and moisture." Diogen. Lact. lib. viii. § 83. Clem. Alex. Strom. lib. i. p. 305. Artifl. Met. lib. ii. c. 5. lib. v. c. 1. Jamblec. Vit. Pyth. c. 23. n. 104. Cicer. de Nat. Deor. lib. ii. c. 11. Stob. Ecl. Phys. p. 54, 60, 93. Plut. Plac. Phil. lii. c. 16, 27. lib. iv. c. 17. Fabr. Bibl. Greec. lib. vi. c. 9. tom. xii. p. 49. Brucker's Phil. by Enfield, vol. i. p. 401.

ALCMAR, or ALKMAAR, in Geography, a town of the United Provinces in North Holland, about four miles from the sea, and 18 miles from Amsterdam. The streets are regular, the houses well built, and it is kept clean and neat by means of its canals. The land about the town was formerly full of moraines, but since it has been drained it is become exceeding good meadow-land, and the town is surrounded by productive orchards and gardens. The town, both within and without, has several beautiful walks. The noble canal that reaches from Alkmaar to Hoorn, was cut towards the beginning of the 17th century. This place was once very strong, and in 1573, obliged the Spaniards to raise the siege, after being encamped before it seven weeks. In the register of this town it is recorded, that in 1645, 120 tulips, with the offsets, sold for 90,000 florins. The butter and cheese that are made in the neighbourhood are reckoned the best in Holland, and furnish considerable articles of trade. N. lat. 52° 28'. E. long. 4° 26'.

ALCMAN, in Biography, a Lyric poet, was born at Sardis, or at Sparta, and flourished in the 27th Olympiad, about 670 years B.C. Herculeus of Pontus assures us, that he was in his youth a slave at Sparta, and that by his genius and good qualities he obtained his freedom and a high degree of reputation in Lyric poetry. He was a performer on the cithara, and probably sung verses to the flute. Clemens Alexandrinus (Strom. lib. i. c. 16) tom. i. p. 364—363, ed. Potter.) makes him the author of music for chorul dances, and according to Archytas Hermigenus, cited by Athenaeus, (Deipn. lib. xii. c. 8, p. 600.) Alcman was one of the first and most eminent composers of songs upon love and gallantries. Suidas says, that he was the first who excelled hexameters from the verses that were to be sung to the lyre, which afterwards obtained the title of Lyric poetry; and Allan tells us, that he was one of the great musicians that was called to Lacedemon by the exigencies of the state, and that he sang his airs to the sound of the flute; by which Dr. Burney understands that he taught the Spartan army to perform their evolutions to the sound of this instrument. Alcman, according to Athenaeus, was not more remarkable for a musical genius than for a voracious appetite, and Allan charge him among the greatest gluttons of antiquity; and his improvidence was probably the cause of the particular difficulty of which he died. The Spartans erected a monument to him, which fabriked in the time of

4 C

Pompeius.
Athenaicus. Of the many poems attributed to him by antiquity, nothing remains besides a few fragments furnished by citations in Athenaeus and other ancient writers, and preferred by Neander, H. Stephens, and Urfinus. The name of his mistress was Megalolitra, a poetess. Alcman used the Doric dialect. Fabr. Bib. Græc. lib. ii. c. 15. tom. i. p. 366. Burney’s Hist. Music, vol. i. p. 385, &c. Some have confounded Alcman with Alcmeson, the son of Perichilus of Creton, who, as Clem. Alex. (vii. 7) informs us, was the first who wrote a book concerning nature. See also Membr. ad Laetcr. viii. 83.

ALCMENIAN, in the Ancient Poetry, a kind of lyric verse, or metre, consisting of two dactyles, and two trochees. Such r. gr. is

"Virginius puerique cano."

The word is formed from Alcman, the name of an ancient Greek poet, in great esteem for his Erotics, or amorous compositions.

Some authors assign other Alcmanian verses, composed of three dactyles and a long syllable.

E. gr. "Munere lepismiamque Dei."

Others give an Alcmanian, composed of a dactyl, spondee, and another dactyl, and a long syllable.

E. gr. "Ne dubita, nam vera siles."

ALCMENA, in Mythology, the daughter of Electryon, king of Mycene or Argos, wife of Amphitryon, and mother of Heracles by Jupiter.

ALCMENON, in Biography. See ALCMENON.

ALCMONE, in Entomology, a species of the Papilio Danaus, with rounded wings of the same colour, yellow at the base and white at the tip, found in Malabar.

ALCO, in Zoology, the name given to the Canis Americanus of Linnaeus, about the size of a squirrel, with a small head, pendulous ears, curved body, and short tail. There are two varieties, viz. the fat alco, yzceuinte-porzoti, canis Mexicanus of Hernandez, or michuacanensis of Fernandes, which is extremely fat, head very small, ears pendulous, with the fore part of the head white, and yellowish ears, short neck, arched back, yellow hair, white, short pendulous tail, large belly, spotted with black, white legs and feet, and the female with six conspicuous paps; and the techichi of Fernandes, which is like the small dogs of Europe, except that it has a wild and melancholy air. The first of these approaches the Iceland dog, and the second is perhaps the same animal with the keparua, or crab-dog of Guiana, which in figure resembles the fox, and in its hair the jackal; and has been called the crab-dog, because it lives chiefly upon crabs and other tetttaceous animals.

ALCOBACA, in Geography, a town of Portugal, in Estremadura, situated upon a small river near the sea, and surrounded by mountains, in a beautiful situation. It has a celebrated Cistercian abbey, built by Alphonso I. in 1148, which has been the general sepulchre of the kings of that kingdom. It is south-east of Liria, and 65 leagues north-east of Peniche. This town carries on various manufactures, the oldest of which is in the monastery, established by Pombal. Cambres and fine linens are made here, but the woollen manufacture, and that for spinning of wool, which is performed by machinery, are more important. Link’s Travels in Portugal, p. 278.

ALCOCK, John, in Biography, an English Divine, was born at Beverley, in Yorkshire, and educated in the university of Cambridge, where he took the degree of doctor of laws. His ecclesiastical preferment was rapid, and he was successively bishop of Rochester, Worcester, and Ely. In 1462 he was appointed master of the rolls; in 1470 a privy-councillor, and one of the ambassadors to the king of Caltile; in 1471 a commissioner to treat with the commissioners of the king of Scotland; and in 1472 lord-high-chancellor of England. He is represented as a prelate of distinguished learning and piety, and also of singular affinence and purity. He was not only a considerable writer, but an excellent architect, so that he was made comptroller of the royal works and buildings under Henry VII. He improved the palaces of his several fees; founded a school, according to Fuller, at Beverley; and he was also the founder of Jesus college in Cambridge, appropriating to this purpose a nunnery, which was so notorious for incontinence, that the society was called a community of spiritual harlots. This college was first designed for a maister, six fellows, and as many scholars; but under the patronage of the bishops of Ely, it has much increased in buildings and revenues, and now consists of a maister, 16 fellows, and 30 scholars. Alcock was famous for preaching long sermon; one of his sermons before the university lasted upwards of two hours. He wrote severall pieces, viz. "Mons perfectionis ad Carchthiannos;" "Abbattia Spiritus Sancti in pura Conscientia fundata;" "Penitential Pfalms," in English verse; "Homilies vulgares;" "Meditations pie;" and "Spauage of a Virgin to Christ." Besides these he wrote a treatise with the whimsical and punning title of "Galli Cantus ad confratres suos," or the crowing of the cock to his brethren; at the beginning of which is a print of the bishop preaching to the clergy, with a cock on each side, and having also a cock in the first page. This prelate died Oct. 1, 1569, at Wilbech, and was buried at a sumptuous chapel, which he had built for himself, and which, though now neglected, is a noble specimen of his skill in architecture. Biog. Brit.

ALCOER, in Geography, a small town of Spain, in New Calidé, situated in a fine country, between the Tagus and the river Cuyar. N. lat. 38° 55’. W. long. 4° 26’.

ALCOHOL, ardent spirit, spirit of wine. Alcohol, Ethyl de vin. Fr. Weingiff, Germ. Spiritu ardentis, spirti de vino. Acquarante, Italian. The term alcohol is applied exclusively by modern chemists, to the purely spirits part of all liquors that have undergone the vinous fermentation. As this substance bears a very high importance, both as a chemical agent and in its various combinations, we shall below upon it considerable attention.

Alcohol is in all cases the product of the faccharine principle, and is formed by the successive procresses of vinous fermentation and distillation. All fermented liquors, therefore, agree in these two points; the one, that a faccharine juice has been necessary to their production; and the other, that they are all capable of furnishing an ardent spirit by distillation.

Various kinds of ardent spirits are known in commerce, such as brandy, rum, arrack, malt-spirits, and the like; these differ from each other in colour, smell, taste, and strength; but the spiritsuous part, to which they owe their inflammability, their hot fiery taste, and their intoxicating quality, is the same in each, and may be procured in its purest state by a second distillation, which is termed in technical language, rectification.

We shall refer the reader to the articles of Fermentation (vinous), Distillation, and the several species of distilled spirits, for an account of the progressive stages in the formation of alcohol; and we shall here take up the subj ect with the procress of rectification or the second distillation, whereby alcohol is brought to that state of purity
in which its chemical properties are the most conspicuous.

Alcohol, as well as ardent spirits of different kinds, is procured most largely in this country from a fermented grain-liquor, prepared for the express purpose of distillation, from grain, molasses, &c.; but in the wine countries, the spirit is obtained from the distillation of wine; whence the synonymous term, spirit of wine. We shall only take the example of brandy, which is the product of the first distillation of wine, and mention the method by which alcohol is procured from it by rectification.

Brandy is a compound of alcohol, water, a colouring extraneous matter, and a small quantity of oil. It is to the two last that it owes its peculiar flavour, smell, and appearance, whereby it is distinguished from other distilled spirits. The object of the process of rectification is to separate the first from the other ingredients, and this separation is effected upon the principle that alcohol is the most easily volatilized when a gentle heat is applied, and therefore appears in the first product of distillation, whilst the extraneous matter and much of the water remain behind. It is more difficult, however, to get rid of the small portion of oil which brandy contains, as this is soluble in alcohol, and will mix with it in distillation, unless prevented by the means which will be presently mentioned.

The observations of M. Baumé, and his directions for the preparation of alcohol, are so judicious and accurate that we shall here mention them.

The following is the process given by this able chemist:

"To procure rectified alcohol, put a quantity of brandy in the water bath of an alembic, and proceed to distillation. Set apart the first product of the distillation when it amounts to about a fourth part of the liquor put into the alembic. Then continue the process till about as much more is obtained, or till the liquor comes over white and milky. Then re-distil the latter product, and mix the first half which comes over with the first part of the former distillation, and continue to distil as long as any spirit comes over. This latter portion may be again distilled, and the first product mixed with the former first products, as before. After each distillation, there remains in the alembic a watery liquor which retains the smell of brandy, but is entirely deprived of inflammable spirit, and is thrown away as useless.

"Having thus procured all the spirit from the brandy, return all the referred first products to the alembic, and distil with a gentle fire. When about half the liquor has come over, it should be kept apart as pure rectified alcohol; the remainder is to be distilled as long as it is inflammable, and may either be again rectified, or reserved for those purposes where a spirit of inferior strength is required."

The reason given by this judicious chemist for the above process is this: the spirit which first passes over in distillation is the purest, and contains the leal part of gross effential oil; the latter portion, on the other hand, is almost saturated with this oil, and the difference between the two is easily distinguishable when rubbed on the hands; the first product leaves no smell of brandy, but the tail gives an odour like the breath of drunkards, who digel their food imperfectly. The quantity of oil, however, varies according to the nature of the brandy; that which is made from wine alone containing the leal oil, but that which is procured from wine lees being so full of it as to leave a bratment of the oil swimming on the watery extraneous liquor left in the alembic, after all the spirit has been distilled off.

M. Dublouin remarks concerning this oil, that the liqueudes brandies contain much more of it than the Cognacs; and that after distilling a large quantity of the former, the head of the alembic was covered with expanded drops of the oil, which adhered to the vessel. When collected together, and quite cold, they became as stiff as suet, had a chefnt colour, a strong disagreeable taste, and a smell like turpentine.

Various additions have likewise been made to the impure spirit, in order to affix in the separation of this oil. The simplest, and one of the most efficacious is water. This, when added to the oily spirit, turns it milky (as is the case with any other solution of effential oil in alcohol), and by weakening the adhesion between the oil and the spirit, it enables the latter to rise in distillation, unmixed with the former. The chief inconvenience of this addition is, that it weakens the strength of the spirit so much as to require succesive rectifications before it can be sufficiently deprived of its watery part.

Chalk, crumb of bread, bran, and other substances, are also added before distillation to the spirit, when oily and ill flavoured; and they all have a good effect in keeping down the matters which contaminate the alcohol, and render the distillation more effectual in purifying it.

Quicklime is still more efficacious, but it much leffens the product of alcohol, alters its nature in some degree, and makes it more penetrating. It would appear, however, that there are some kinds of wine in which the adherent particles are so intimately mixed with the spirituous part, that it is scarcely possible to separate them by simple distillation, however cautiously and skillfully conducted.

The common still with the worm-tube and refrigeratory, is very well calculated for the rectification of spirits, only allowance must be made for the readjusts with which ardent spirit, when heated, assumes the state of vapour, and the very great expansion which it then undergoes.

Alcohol, freed from all foreign ingredients but water, and already of considerable strength, may be brought to the specific gravity of 0.825, at the temperature of 70°, by single distillation, where the heat is moderate and applied very gradually, and the condensation flow. When about a third or half of the spirit is distilled over, the strength of the decreasing portion is diminished, the specific gravity increases, and it becomes more watery, and therefore the first product should be kept apart. This cannot be rendered stronger by any repetition of simple distillation, but it may be still further depregnated by means which will be mentioned hereafter.

We shall now proceed to the properties of alcohol.

Alcohol is a colourless transparent liquor, appearing to the eye like pure water. It pōllexis a peculiar penetrating smell, diffent from the proper odour of the distilled spirit from which it has been procured. To the palate it is exceptionally hot and burning, but without any peculiar flavour. From its great lightness and mobility, the bubbles which are formed on shaking it fille like almost instantaneous, and this is one method of judging of its purity. Alcohol is very easily volatilized by the heat of the hand, it even begins to be converted into a very expanlible vapour at the temperature of 55° Fahr.; and the quickness of evaporation always produces a considerable cold. It boils at about 165°, and the vapours when condensed return unaltered to their former state. It has never been frozen by any cold, natural or artificial, and hence its use in thermometers to measure very low temperatures.

Alcohol takes fire very readily on the application of any lighted body, the speedier in proportion to its purity. It burns with a pale flame, white in the centre and blue at the edges; this gives but a small degree of heat, and is so faint as to be scarcely visible in bright day-light. It burns with
Alcohol mixes with water in every proportion. Heat is
extracted during the mixture, which is sensible to the hand,
even in small quantities. At the same time, there is a mutual
penetration of parts, so that the bulk of the two liquors,
when mixed, is less than when separate. Consequently
the specific gravity of the mixture is greater than the mean
specific gravity of the two liquors taken apart. The alco-
hol may be again for the most part separated from the water
by distillation with a gentle heat. See Gravity (Specific).

Owing to the great affinity which subsists between water
and alcohol, this latter has the power of precipitating from
the solution various salts dissolved in water. Thus, if some
dilute alcohol be added to a saturated solution of Glauber's
salt in water, a coagulum is immediately produced, consist-
ing of the salt separated from the water in a very divided
form, whilst the alcohol and water form a chemical union.
This precipitation, however, only takes place in solutions of
those salts which are insoluble in alcohol. This circumstance
has been very ingeniously applied to the analysis of various
tartar solutions, and especially to the examination of mineral
waters. The power of precipitating some of these salts ex-
tends to very dilute solutions. Mr. Kirwan, in his valuable
work on mineral waters, has found by experiment that cele-
trate may be completely precipitated from water which con-
tains only one-thousandth of its weight of this earthy salt,
by any alcohol whose specific gravity is below 0.850. For
further particulars on this subject, we must refer the reader
to the article: Waters (Mineral, Analysis of).

Alcohol is capable of uniting with a great number of
substances, a circumstance which renders its use very exten-
sive in a variety of chemical processes and in analysis. These
we shall enumerate.

Some of the weaker acids, such as the boracic and tar-
taric, are soluble in alcohol without any apparent decom-
position, and may be again recovered by evaporating the
spirit. The stronger acids, however, exercise a very powerful
action on alcohol, and produce several very curious and
important compounds, particularly that singular liquor called
Ether. See the articles Ether, Oil of Wine, and
Oeixiant Gas.

All the alkalies, when pure, may be dissolved in alcohol,
but the fixed alkalies, when combined with carbonic acid,
are not soluble in this menstruum. This affords a very con-
venient method of procuring the caustic fixed alkalies in a
state of purity, and by proper management they may be
made to crystallize from their spirituous solution. The
colour of a solution of alkali in alcohol is always somewhat
red, however pure the alkali be, which is owing to a partial
decomposition of the spirit. See the article Potash and
Tincture of Salt of Tartar.

Several of the neutral, earthy, and metallic salts are solu-
ble in alcohol. It is of some importance in chemical ana-
lysis to ascertain the degree of solubility of these salts, and
many experiments have been made for this purpose.

The first of any importance are those of M. Macquer.
He employed a spirit rectified so far, that a phial holding
a Paris ounce of distilled water, at the temperature of 45°
Fahr. would contain fix gros and fifty-four grains of the
spirit. The salts which he employed were previously dried
with care, so as to expel their water of crystallization. He
poured into a matrauch upon each of the salts half an ounce
of the spirit, and left the vessel in a hot sand-bath. When
the spirit began to boil, he filtered it while hot, and then
left it to cool. He then evaporated the spirit, and weighed
the false residuum; and from these he inferred the quantity
of salt which the spirit had dissolved.

This method, however, cannot be considered as accurate,
as some of the spirit must have evaporated during boiling,
and some of the salt must have been deposited in the pores
of the filter. Neither would the errors produced in this
way be uniform, since it appears that some salts are, in a
greater proportion than others, more soluble in hot than
in cold spirit.

Wenzel also published a series of experiments, in 1777,
on this subject. He varied the heat which he employed,
according to the solubility of the salt.

He has, however, been guilty of a great omission in not
mentioning the specific gravity of the alcohol which he used,
but it may be supposed to be nearly the same as that of
Macquer.

Lallly, Mr. Kirwan, with that accuracy for which he is
so justly distinguished, has given in his treatise on mineral
waters, a table of the solubility of certain salts, in which
alcohol of different densities is employed, and the tempera-
ture properly noticed.

Our readers will find the results of all the above-mentioned
experiments in the following Table.

</table>

On examining the comparative results given in the above Table, we cannot consider them as very satisfactory, and in some instances we perceive a striking difference in the results, that it must depend on some more extensive cause than mere casual error. Probably the degree and continuance of heat employed, in drying the salt and expelling its water of crystallization, must have differed considerably in the respective experiments. It would be useless to attempt to explain the cause of difference in all the results, but this shews the great necessity of attending minutely to every particular in such experiments.

The most important of the salts insoluble in highly rectified alcohol are the following—all the sulphates, both of the alkalies, earths and metals; some of the nitrate metals; some of the muriated metals; and the carbonated fixed alkalies.

A peculiar colour is perceived in the flame of some of these solutions in alcohol when set on fire. The solution of nitrate gives a pale yellow flame, that of boric acid is a faint green, all the solutions of copper burn with a beautiful bright green, and those of nitrate or muriated iron, like that of a deep blood red.

Ammonia, both pure and carbonated, dissolves readily in alcohol. They are generally united by means of distillation, a moderate heat being sufficient to volatilize each. These combinations are principally employed in pharmacy.

Alcohol will readily unite with the carbonic acid gas, and will take up full its own bulk of it at a medium temperature.
perature.—The gas, however, appears to have little or no action on the spirit, since it is expelled from it by heat unaltered.

Neither metals, nor metallic oxys, nor metallic acids, appear to be in any degree soluble in alcohol.

Sulphur will not contract any union with alcohol by simple distillation either cold or hot; but when they are both reduced to the form of vapour, and then mixed, a true solution is effected, and the result is a very pungent spirit with a strong odour of liver of sulphur, and which becomes milky and deposits the sulphur on dilution with water.

Ardent spirit acts in a slight degree on Phosphorus, and dissolves to much of this inflammable substance as to become slightly luminous in the dark when the solution is dropped into water.

None of the pure earths are soluble in alcohol, and this latter has the power of precipitating lime, barities, and frontian, from their watery solutions.

It is on the chemical substances belonging to the vegetable kingdom that alcohol exerts its most powerful action as a solvent, and herein consists its very extensive use in pharmacy, in preparing liquors for the table, in some of the arts, and in a very important part of chemical analysis.

Most of the acids belonging to the vegetable kingdom are highly soluble in ardent spirit, such as the tartaric, the citric, the oxalic, and the gallic. In procuring the latter from the gall-nut, alcohol furnishes us with a very elegant and commodious method of separating the acid from the mucilaginous extractive matter with which it is naturally mixed.

The acetic acid, when of the usual strength, simply mixes with alcohol, without producing any decomposition, but chemists have succeeded in forming an acetic Ether, by employing the acid in its most concentrated state.

Alcohol will readily dissolve Sugar. Wenzel estimates the quantity at about one-fifth of the spirit. In all the sweet native vegetable juices, such as the sap of the fugar cane and the maple, or the expressed liquor from the parsnip and beet root, the fugar is mixed with a large quantity of a mucilage very little soluble in alcohol. This furnishes a ready method for separating the pure acecharom part, a method which is much employed in the analysis of various vegetable substances for the purpose of ascertaining the comparative quantity of sugar which they may be expected to yield to the manufacturer. This solution, when left to spontaneous evaporation, yields minute crystals of sugar, which are at first brown, and require a further purification.

Ardent spirit is an excellent solvent for effusent oils, and in general, for the most odorous and inflammable of the vegetable productions. In the effusent oil of a plant refines the Spiritus Rectior, or the AROMA, that which gives the exquisite perfume to the roe or jellamine. When these odoriferous plants are distilled with alcohol, it rises strongly impregnated with their scent and flavour, and as it takes up no colouring matter it remains perfectly clear as before. Thus, the common lavender water is alcohol distilled off the lavender plant, and holding in solution the effusent oil in which the scent refines. The Distilled Spirits in pharmacy, are similar preparations of alcohol, containing the flavour of spices, aromatics or other substances with which it has been distilled. (See Oils Essential).

All the Resins are highly soluble in alcohol, but fearfully, if at all, in water. These solutions have the peculiar colour, and acid taste of the resin which they contain. An addition of water renders them all turbid, and from the pure resinous solutions it precipitates almost the whole of the diffused contents in the form of thick flakes. The solution of guaiacum affords an example of this.

The Gum Resins, which are natural mixtures of gum and resin, yield their resinous part to pure alcohol and but little of their gum; water on the contrary dissolves the gum and leaves the resin; but a mixture of alcohol and water will hold both the ingredients in solution. These preparations are called Tinctures in pharmacy, and they are of considerable use in containing within a small bulk, the medicinal virtues of larger quantities of the ingredients employed.

Artificial resins, or Resinous Extracts, are also made by evaporating to dryness solutions of the resinous parts of several vegetables in alcohol.

Camphor is readily and largely soluble in ardent spirit. This solution, when saturated, will let fall almost the whole of the camphor on the addition of water. Camphor also remarkably afflicts the solution of the resins.

Solutions of resinous substances in alcohol form the basis of the spirit Varnishes, which when applied in thin layers over any substance, soon dry from the evaporation of the spirit, whilst the resin remains behind furnishing a smooth thin coating to the surface which they are intended to protect.

The fixed oils, when in their simple state, are entirely insoluble in alcohol, but they may be rendered soluble in this menstruum, either when they have been converted into drying oils by the action of metallic oxys, or when they are united with alkalies in the form of Soap. A solution of fine soap in alcohol is perfectly colourless and transparent, and will bear dilution with water without becoming turbid. It is employed in medicine as an external application, and is also a good reagent in the analysis of mineral waters to discover the presence of earthy salts. These decompose the soap by double affinity, and produce curdling.

The effect of alcohol on animal substances bears a considerable resemblance to its operation on the vegetable kingdom.

Mucilaginous fibres and the coagulum of blood are not soluble in this menstruum, but are rendered by it hard, contracted, and incapable of putrefaction.

Allumens is equally insoluble in alcohol and is coagulated by it, probably owing to abstraction of the water which held it in solution. Milk is speedily curdled by ardent spirit of every kind.

Alcohol will dissolve Wax, Spermacte, Biliary Calculi, and the strong scented animal resins or resinous extracts, such as Musk and Ambergris. This menstruum, however, does not appear to be so extensively applicable to the analysis of animal substances as of those from the vegetable kingdom.

We have already mentioned that alcohol well rectified may be brought to the specific gravity of 0.825 (at 60° temperature) by a simple distillation, where the process is slowly and carefully conducted, and when only the first third, or half of the spirit which comes over is taken. Chemists have, however, been able to bring it to a higher state of depagation, and consequently a less specific gravity. This is done by adding to the spirit in the alembic or still a quantity of a salt which is itself insoluble in alcohol, and which has such a greedy attraction for water as to be able to separate it from the spirit. Beerhaave recommends for this purpose common salt, hot, dry, and decrepitated. He allows the salt and the spirit to stand together for twelve hours, and then to be heated in a water-bath so as to distill off the spirit by
by a very gentle warmth. The salt is left moist in the still, and contains much of the water of the spirit employed. Some recommend burnt alum in the room of salt, but the bell addition is very dry, hot, and carbonated alkali. A highly dephlegmated alcohol may be prepared in this method without the intermediate process of distillation, only then the spirit will be of reddish colour, and contain that small portion of caustic alkali which is always mixed with common carbonated potash, and which is soluble in ardent spirit. The following is Boerhaave's process: "Take a clean glass body containing common spirit of wine, and add thereto one-third of its weight of pure and dry potash, (carbonated potash), which immediately falls to the bottom. Shake the glass, and the salt directly grows moist and begins to diffuse at the bottom, whilst a red thin liquor floats above it; the more the vessel is shaken, the more liquid is the lower part of the salt, and the more distinctly separated from the upper liquor, nor is it ever possible to mix them together, but upon refting they will immediately separate into two liquors." This process may be continued, he adds, by decanter the upper of the two liquors, which is the alcohol reddened by a little caustic alkali that it holds dissolved) and adding to it more carbonated alkali, till the portion left added will no longer become wet on shaking, a sign that the alcohol is as fully deprived of water as it is capable of being made by means of alkali. As a proof of the high dephlegmation of the spirit by this method, it may be observed, that if a drop or two of water be added to alcohol in which salt of tartar has long remained dry, the alkali immediately becomes moist, and appears to run entirely from the sides of the vessel.

If the alcohol be distilled off the alkaline salt with a gentle heat, the part which comes over will be about the specific gravity of 0.817, at the temperature of 60°, and this is as high a degree of purity as it has been brought to in the accurate experiments made in this country, by Dr. Blagden and others, for the purpose of ascertaining its specific gravity. (See Gravity of Alcohol.)

M. Lowitz, however, affirms, that he has brought alcohol to the specific gravity of 0.791, chiefly by adding, before distillation, a large quantity of alkali so as almost entirely to absorb the spirit.

After distillation, the wet alkaline salt which is left may be dried, and again used for the same purpose; but Boerhaave affirms, that after repeating the use of the same alkali for a number of times, it becomes changed in its nature, and unfit for the purpose. This would imply a decomposition of the alcohol, which deserves to be further examined.

Various tests have been devised for ascertaining the purity of alcohol, and the proportion of water which it contains. A spirit, which is very free from water will, when set fire to, burn away without leaving any residue; if it is of moderate strength it will burn for a certain time, and then become extinguished, and leave a portion of water more or less considerable, according to the degree of dephlegmation; if, on the contrary, it is very weak and watery, it will not kindle at all. This test, however, is by no means accurate, since the heat of the burning spirit will drive off part of the water which should be left in the residuum. Another test is, to drop a small quantity of spirit on a small heap of gunpowder and kindle it. The spirit burns quietly on the surface of the powder till it is all consumed, and the last portion fires the powder if the spirit was pure, but if watery, the powder becomes too damp and will not explode. This test, also, is very inaccurate; for if the powder be drenched with even a strong spirit, it remains too damp to be fired; and if it be only barely moistened, any spirit that will burn will inflame it. A better test is, as we have mentioned, to shake the spirit in a phial with some dry carbonated alkali; but the most accurate of all is to ascertain its specific gravity, and compare it with the density of known quantities of alcohol and water, previously mixed for the purpose of giving a standard of comparison. The very extensive and accurate labours on this subject, conducted by Beaume, Blagden, Goumoun, and other eminent scientific men, belong with more propriety to the subject of Specific Gravity.

It remains for us to mention the chemical nature of alcohol, and the appearances which attend its decomposition. The remarkable circumstance of a vegetable product burning away, without the smallest trace of smoke or fuliginous vapour of any kind, had long engaged the attention of chemists. Junker and Boerhaave threw much light on the subject by remarking, that the product of the combustion of alcohol was always a quantity of pure water; and this fact was more fully illustrated by the experiments of the illustrious Lavoisier. The ready evaporation of alcohol, and the cæse with which its vapour will fill a large vessel, renders it a dangerous experiment to submit a considerable quantity at once to combustion, in oxygen gas confined in any vessel, but this difficulty was surmounted in an ingenious manner. His first experiment was simply to ascertain the quantity of water yielded by the combustion of a given weight of alcohol. This was performed in the following apparatus, contrived by M. Meusnier. See Plates of Chemistry, fig. 10.

E F is a worm, contained in the cooler A B C D. To the upper part of the worm E, the chimney G H is fixed, which is composed of two tubes, one within the other, the inner of which is a continuation of the worm, and the outer one is a cæse of tin plate, which surrounds it at about an inch distance, and the interval is filled with sand. At the inferior extremity K of the inner tube, a glass tube is fixed, to which is adopted the argand lamp J M, for burning alcohol.

Things being thus disposed, and the lamp being filled with a determinate quantity of alcohol, it is set on fire; the water which is formed during combustion, rises in the chimney K E, and being condensed in the worm, runs out at its extremity F, into the bottle P. The use of the outer tube G H, and of the sand between it and the inner tube, is to prevent the latter which proceeds from the worm, from being cooled during combustion, to fall back on the lamp instead of passing on into the worm.

This apparatus, though not perfect, has the advantage of enabling the chemist to operate with larger quantities than can be admitted in the more accurate experiments on combustion, and by it, the above-mentioned chemists were able to establish the important fact, that the quantity of water collected by the combustion of alcohol very sensibly exceeds the quantity of the alcohol which is consumed. The product of water must vary according to the strength of the alcohol, and the care of conducting the experiment; but it is so considerable, that from sixteen ounces of ardent spirit, Lavoisier obtained eighteen ounces and a half of pure water. There is besides, however, a large quantity of carbonic acid produced in this experiment which escapes, and cannot be eliminated by this apparatus. Some of this gas unites with the water which is collected, and causes it to precipitate lime-water.

Having thus ascertained in a general way the products of
of the combustion of alcohol, Lavoisier proceeded to repeat the experiment, in vessels which might determine the result with accuracy. He employed, for this purpose, a large bell glass, holding from 700 to 800 cubic inches, and inverted over a mercurial trough. A small lamp filled with a known weight of alcohol, was introduced under the glafs swimming on the surface of the mercury, and the wick was armed with a very minute portion of phlogiston. The atmospheric air within the glafs was sucked out by a syphon, till the mercury rose to a certain height which was noted; and the phlogistons on the wick being then kindled by a hot iron, the spirit soon took fire. As the air within the glafs would be soon consumed, and the inflammation of the spirit stopped, a constant supply of oxygen gas was lent into the glafs through a syphon tube, connected with a resevoir of this gas, and which passed under the mercury into the glafs where the combustion was going on. Great precaution was required not to let in more oxygen than was barely necessary to keep up the combustion; otherwise the heat, volatilizing part of the spirit, would have filled the glafs with vapour of alcohol, and this mixing with the oxygen, would have suddenly exploded by the combustion. In this, as in other respects, the combustion of alcohol strikingly resembles that of pure hydrogen gas. The experiment was at last halted by the quantity of carbonic acid generated; and on examining the results, (proper corrections being made for pressure and temperature) it was found, that 93.5 grains of alcohol and 116.32 grains of oxygen had been consumed. The products of these were 94.8 grains of carbonic acid and 106.2 grains of water, which last therefore exceeded by 12.7 grains the quantity of alcohol employed. From these data, and from previous experiments (wherein Lavoisier estimated, that 100 grains of oxygen take up 58.8 grains of carbon, for the production of carbonic acid gas; and that the same quantity of oxygen takes up 17.64 grains of hydrogen for the production of water), he concluded the composition of alcohol to be the following,

We may observe, however, that the result of this experiment can only be considered as an approximation to the truth, since the estimation of the component parts of alcohol here given, does no agree with that which is deduced by the same chemist, from the result of vinous fermentation. Neither is there any light thrown on the mode of union between the component parts, and their degree of oxygenation as they exist in the spirit before combustion.

Alcohol has likewise been more directly decomposed without the assistance of oxygen gas. Dr. Priestley procured inflammable air by pulling the electric spark through spirit of wine. But the most striking experiments on this subject, performed by this excellent philosopher, were the decomposition of spirit by pulling it through red-hot tubes, both of earth and metal. He first transmitted two ounce measures of alcohol, reduced to vapour by boiling, through an ignited porcelain tube, and procured 1500 ounce measures of air, which was all inflammable without a "mixture of fixed air in it," and which burned with a "blue lambent flame." (We here quote the very words of the author, which the writer of the article Alcool, in the Encyclopédie Méthodique, has made to correspond with the experiments of Lavoisier, by adopting the following singular translation—M. Priestley, en faisant passer de l'alcool dans un tube d'argile rongé au feu, en a retiré du gaz hydrogène mêlé de gaz acide carbonique.) Dr. Priestley's next experiments are still more curious, as they determine the existence of carbonaceous matter in spirit of wine. Having found interesting results from the transmutation of the vapour of water through a heated copper tube, he repeated the experiments, only substituting the vapour of spirit of wine for that of water. "In this case," he observes, "the vapour of the spirit had no sooner entered the hot copper tube, than it was perfectly allonished at the rapid production of air. It resembled the blowing of belows. But I had not used four ounces of the spirit of wine before I very unexpectedly found that the tube was perforated in several places, and presently afterwards it was so far destroyed, that in attempting to remove it from the fire, it actually fell in pieces. The inside was full of a black dusty matter, resembling lamp-black." He then varied the experiment by using earthen tubes, placing within them copper filings, and transmitting the vapour of alcohol. The copper was as before, converted into a black friable substance, obviously produced by the addition of carbonaceous matter furnished by one part of the spirit, whilst the other part appeared in the form of a copious stream of inflammable air. It is however by no means the whole of the charcoal of the alcohol which is detained by the copper, for much of it escapes mixed with the inflammable air in the form of fine feet, giving the gas the appearance of a dense black cloud; and when the tube is strongly heated, this volatilized charcoal will give an uniform black coating to any bulbous or large vessel in which the gas is received. Dr. Priestley found some other metals to undergo a similar change by the vapour of alcohol, but none in so striking a manner as copper. On heating some of this charcoal of copper, as he calls it, in oxygen gas, he found it to burn very readily to a certain point, after which the remainder could not be again kindled. The gas produced by the combustion, was pure fixed air or carbonic acid.

The excellent Dutch chemists, of the Teylerian institution, Van Marum and colleagues, repeated Dr. Priestley's experiments with great accuracy, and found the same results in every essential particular. They employed, as well as Dr. Priestley, Wedgwood's porcelain tubes, which they enclosed in iron tubes to prevent the sudden action of the fire which is apt to crack them. One extremity of the earthen tube received a small retort in which was put the alcohol, and the other entered a metallic serpentine tube, immersed in a refrigeratory, and provided at the further end with a bottle to receive the gaseous products. In the first experiment which was performed, an ounce and a half of alcohol in vapour had been transmitted through the heated copper, and had produced about six cubic feet of inflammable air.

In the second experiment the heat was greater, and the production of the gas more rapid. In all, the copper was reduced to a black and very friable sublimate, which fell to pieces between the fingers. The proportion of charcoal added to the copper by the experiments, varied at different times apparently owing to the greater or less rapidity with which the process was conducted. Dr. Priestley had united 456 grains of charcoal to 28 of copper, in one instance; and 508 to 19, in another; but the Dutch chemists found a much less proportion of charcoal, being only an addition of 292 grains to 378 of copper in one case, and in another, 180 of charcoal to 612 of the metal. The great difference in the results is, however, of little consequence in attempt-
A L C.

Alcohol is sometimes also used for a very fine, impalpable powder, which women in the East make use of as a kind of paint. Kohl is a general term applied to a substance applied to the eye-ball, on the inside of the eye-lids, in the form of a powder finely levigated. That which is employed for ornament is called simply al kohl, or istiphanah; when other ingredients, as flowers of olumbam, amber, and the like, are added, on account of some particular disorders, the kohl is distinguished by some appropriate epithet. Dr. Shaw, in his Travels, speaking of the women in Barbary, says, that none of these ladies think themselves completely dressed, until they have tinged their hair and edges of their eye-lids with al-korbal, the powder of lead-ore.

Lady Montague (Letters, vol. ii. p. 32) takes notice of this custom among the Eastern women; and in her slightly manner, the supplices our English ladies would be overjoyed to know this secret. This ore is called at Aleppo, called Stibium by the ancients, but very different from antimony, is brought from Persia, and is prepared by roasting it in a quince, an apple, or a truffle, then adding a few drops of oil of almonds, it is ground to a libitive powder on a marble. Of late years the lead ore, brought from England, under the name of Arcifoglio, has been used instead of the istiphanah. The quantity of kohl contained in the East is incredibly great. It has been said by one of their poets, in allusion to the probe used for applying the powder, and the mountains where the mineral is found, "that the mountains have been worn away by a bodkin." This probe or bodkin, called meed, is made of ivory, silver, or wood; it is dipped in water, and when a little of the powder has been sprinkled on it, it is applied horizontally to the eye, and the eye-lids being filled with it, the probe is drawn between them, leaving the inside tinged, and a black rim all round the edge. The Roman Satyril aludes to this custom, as well as that of blackening the eyebrows:

"Illa supercilium malida fuliginem taceat
Obliqua product acu, pinguitque trementes
Attollens oculos."

Juvenal, Sat. ii. v. 67, and Cafaubon's note.

The kohl is also used by the men for strengthening the sight, and preventing various disorders of the eye, for which purpose different ingredients are occasionally added. It is also applied to the eyes of children, as soon as they are born, and is renewed at the interval of a few days through the several periods of their adolescence. The use of the kohl is of very ancient date. Passages relative to it, in sacred history, may be seen in Shaw, (Travels, p. 239), Harmer, (Observations, vol. ii. p. 405), and Lowth's Notes on Isaiah, chap. iii. v. 16. Harmer conceives that the riches of the eye, as it is in our v. 8, which the dying patriarch mentions in addressing Judith, (Gen. xxix. 14), is to be explained by this usage. Dr. Ruffell observes, on a passage in Xenophon referred to by Shaw, that blackening the eyes, though a custom among the Medes, was not at that time in use among the Persians; for Cyrus, among other things, seems to have been surprised at the painted eyes of his grandfather Alyattes. Cyrop. i. p. 8. See Ruffell's Aleppo, vol. i. p. 337, Ed. 1794. From this impalpable powder the name was transferred to other fabric powders, and afterwards to spirits of wine exalted to its highest purity and perfection. See Porphyrization.

Alcohol, in the Arabian Alecho, is when a heavy

flow-paced
flowed impoverished planet receives another lighter one within its orb, so as to come in conjunction therewith.

Alcohol *Moris*, filings of steel reduced to an impalpable powder, by turning it into dust with urine, then levigating it, and mixing it with a large quantity of water; that is, about a gallon to two pounds and a half of filings. After it has stood a quarter of an hour, the upper part of the water is to be poured off, and evaporated to a dryness. The powder at the bottom is to be put into a paper, in the form of a fugar-loaf, and washed, by gradually pouring in hot-water, till it is freed from the minute salt. With regard to the remaining gross powder, the same processes is to be repeated.

Mufgrave has a great opinion of this preparation, as a remedy to bring the gout from the nobler parts to the joints. He prefers it thus: take of *alcohol moris* from five to ten grains, *therian* *Andromachi* from half a scruple to one dram, mix these with as much syrup of clove-july-flowers, as is sufficient to make a bolus.

**ALCOHOLIZATION**, in *Chemistry*, the rectification of a vinous spirit.

This is otherwise called *alcolization*.

**Alcolization**, according to Starkey, denotes the circu-lation of a volatile spirit on a fixed alkali, till such time as out of the two arise one neutral body different from both the former. *Alcolization* is one way of volatilizing alkalis.

**Alcoholization** is also used for *Pulverization*.

**ALCOL**, or *Ancol*, in * Geography*, lies on the coast of Barbary, on the easterly side of the Cape de Tence, under which there is a small bay and good road, but open to the north and north-east; so that when a Levant gale is expected, ships should move round the cape to the west-side.

**ALCOLA** is used by *alcoholis*, for the tartar of urine. *Alcoa* is found in three different forms, viz. 1. Resolved, or reduced into an impalpable substance. 2. Sandy, or voided in the appearance of small grains of whitish or reddish sand. 3. Maculatious, or可视ে.

**ALCOLEA**, in * Geography*, a small town of Spain, in New Castile, situated in a fine county, a few leagues north of Madrid. N. lat. 40° 40'. W. long. 3° 6'.

**ALCOLEA** is also a town of Spain, in Andalusia, on the banks of the Guadalquivir, six miles north of Carmona.

**ALCOLEA** is also another town of Spain, in Aragon, on the confines of Castile, south of Balbasro, and north-east of the river Yzuela. N. lat. 41° 30'. E. long. 2° 14'.

**ALCONE** was also a town of the island of Ithaca, whence Ulysses was called Alcmeenius.

**ALCON**, in * Biography*, a surgeon of great eminence in the first century of the Christian era, acquired considerable wealth in his profession, under the Emperor Claudius. He is said to have been expert in the art of reducing fractured, or luxated bones, and in curing hernias by incision. He is probably the person mentioned by Martial, in the following epigram, lib. xi. ep. 85.

Mitior implicitas Alecon fecat enterocelas,
Fraxaque fabilibi dedolo offa manu.

See more of him in Le Clerc’s Hist. de la Medicine, p. 581.

**Alcon**, in * Entomology*, a species of *Papilio Philobus*, with entire cerulean wings, brown margin, below cinereous brown, and numerous ociliary points; found in Austria.

**ALCOR**, in *Astronomy*, a small star adjoining to the large bright one in the middle of the tail of *Ursa major*.

The word is Arabic. It is a proverb among the Ara-

**ALCORAN**, or *AL KORAN*, the Mahometan Scripture or Bible, containing the revelations, doctrines, and prophecies, of the pretended prophet Mahomet.

It is vulgarly called *Alkoran*; but the first syllable of the word is nothing more than an article signifying the; and therefore the true orthography of the word is *Al Koran*, or *Al Koran*, that is, the Koran. It is derived from the Arabic word *luran*, to read, and signifies the reading; or what ought to be read. Thus Mahomet gave it this title by way of eminence, in imitation of the Jews and Christians, who call the Old and New Testament, *Scripture*; and the Bible, i.e. the book; and *Al Dikir*, the adoration.

Besides this peculiar name, the Koran is also honoured with several appellations common to other books of Scripture; as *Al Farkan* from the verb *faraka*, to divide or distinguish, denoting a fection or portion of scripture. It is also called *Al Muhafs*, the volume, and *Al Kitab*, the book, by way of eminence.

It is the common opinion among us, that Mahomet, affiled by one Sergius, a monk, composed this book; but the Misulfemen believe it as an article of their faith, that the prophet, who, they say, was an illiterate man, had no concern in inditing it; but that it was given him by God, who, to that end, made use of the ministry of the angel Gabriel; that, however, it was communicated to him by little and little, a verse at a time, and in different places, during the course of twenty-three years:—And hence, say they, proceed the disorder and confusion visible in the work:—which, in truth, are so great, that all their doctors had never been able to adjust them. For Mahomet, or rather his copyists, having put all these loose verses promiscuously in a book together, it was impossible ever to retrieve the order wherein they were delivered.

Those twenty-three years which the angel employed in conveying the *Koran* to Mahomet are of wonderful service to his followers; inasmuch as they furnished them with an answer to such as tax them with the glaring contradictions of which the book is full: those contradictions they piously father upon God himself; alledging, that, in the course of so long a time, he repealed and altered several doctrines and precepts which the prophet had before received of him.

The Mahometan doctors obviate any objection deduced from these contradictory passages by the doctrine of abrogation; and they diluting the abrogated passages into three kinds; the *jeft*, where the letter and sense are both abrogated; the *second*, where the letter only is abrogated, but the sense remains; and the *third*, where the sense is abrogated, though the letter remains. Of the first kind were several verses, which by the tradition of Ans Ebn Malec, were in the prophet’s life-time read in the chapter of repentance, but are not now extant. Another instance of this kind we trace from the tradition of Abdallah Ebn Mufaid, who reported that the prophet gave him a verse to read which he wrote down, but the next morning looking in his book, he found it was vanished, and the leaf blank; upon acquainting Mahomet with this circumstance, he was assured by the prophet that the verse was revoked the same night. Of the second kind is the verse called the verse of *foning*, which, according to the tradition of Omar, afterwards Khalif, was extant, while Mahomet was living, though it be not now to be found. Of the last kind are observed several verses, in 63 different chapters, to the number of 225: such as the precepts of turning in prayer to Jerusalem, falling
failing after the old custom, forbearance towards idolaters, avoiding the ignorant, and the like.

M. D'Herbelot thinks it probable, that when the heretics of the Nestorians, Eutychians, &c. had been condemned by ecclesiastical councils, many bishops, priests, monks, &c. being driven into the deserts of Arabia and Egypt, furnished the impostor with passages, and crude ill-conceived doctrines, out of the scriptures; and that it was hence that the Koran became so full of the wild and erroneous opinions of those heretics.

The Jews also, who were very numerous in Arabia, furnished materials for the Koran; nor is it without some reason that they boast twelve of their chief doctors to have been the authors of this work.

The Koran, it is to be observed, while Mahomet lived, was only kept in loose sheets; his successor, Abubeker, first collected the contents into a volume, not only from the palm leaves and skins on which they had been written, but also from the mouths of those who had committed them to memory; and when the transcript was completed, entrusted the keeping of it to Haftha, the daughter of Omar, one of the widows of Mahomet, in order to be consulted as an original; and there being a good deal of diversity between the several copies already dispersed throughout the provinces, Ottoman, or Othman, successor of Abubeker, in the 30th year of the Hegira, procured a great number of copies to be taken from that of Haftha; at the same time supplanting all the others not conformable to the original.

The chief differences, in the present copies of this book, consist in the points, which were not in use in the time of Mahomet and his immediate successors, but were added since, to ascertain the reading; after the example of the Masoretes, who added the like points to the Hebrew texts of scripture.

The Koran is divided into 114 suras, or chapters, of very unequal length; which, in the manuscript copies, are not distinguished by their numerical order, though they are actually numbered in Sale's edition, but by particular titles, which, except the initial chapter, are taken sometimes from a particular matter treated of, or prefixed mentioned therein, but usually from the first word of note. Some chapters have two or more titles, occasioned by the difference of the copies. Some of the chapters having been revealed at Mecca and others at Medina, this difference is noted in the title. Several of them are said to have been revealed partly at Mecca and partly at Medina; and as to others, it is not agreed among commentators to which of these two places they belong. The suras are divided into little verses, in Arabic, called ayats, signs or wonders, which are all compos'd in a broken interrupted style, resembling prose rather than verse. Many of these have their particular titles formed in the same manner as those of the chapters.

Befidia these unequal divisions of chapter and verse, the Koran is divided into 60 equal portions, called aHzab, each of which is again subdivided into four equal parts. But it is more usually divided into 30 fections, named azza, each of twice the length of the former, and subdivided in like manner into four parts. These divisions are for the use of the readers of the Koran in the royal temples, or in the adjoining chapels where the emperors and great men are interested. Of these readers, there are 50 belonging to every chapel, and each reads his section every day, so that the whole Koran is read over once a day. Under the title, at the head of every chapter, except the ninth, is prefixed the following folium form, called by the Mahometans the hijmillah, in the name of the most merciful God;

which form, as well as the titles, are considered by some commentators of divine original; though others believe them to be human additions.

This form they constantly place at the beginning of all their books and writings, in general, as a peculiar and characteristic mark of their religion; and it is deemed a sort of impropriety to omit it. There are 29 chapters of the Koran, which have this peculiarity, that they begin with certain letters of the alphabet; one with a single one, and others with more. These letters are considered as peculiar marks of the Koran; and as concealing profound mysteries, the certain understanding of which, the more intelligent confesses, has not been communicated to any mortal, their prophet alone excepted.

There are seven principal editions of the Koran; two at Medina, one at Mecca, one at Cufa, one at Bassora, one in Syria, and the common, or vulgate edition. The first contains 6000 verses; the second and fifth 6214; the third 6219; the fourth 6236; the fifth 6226; and the last 6225; but the number of words and letters is the same in all, viz. 77629 words, and 32305 letters.

The Koran is held not only of divine original, but eternal and uncreated, remaining, as some express it, in the very essence of God. The first transcript has been from everlasting by God's throne, written on a table of sult bigaes, in which are also recorded the divine decrees, past and future. A copy from this table, in one volume, on paper, was sent down to the lowest heaven, by the ministry of the angel Gabriel, in the month of Ramadan, on the night of power; from whence it was delivered out by Gabriel to Mahomet, in parcels, some at Mecca, and some at Medina; though he had the confirmation of seeing the whole once a year, and in the last year of his life twice. Some few chapters were delivered entire, the greater part only in separate portions, which were written down from time to time by the prophet's amanuensis, in such a manner as any particular chapter, as he directed. The first parcel that was revealed, was the first five verses of the 93rd chapter, which the prophet received in a cave of mount Harah, near Mecca.

Although the Sunnites or Orthodox believe, that the Koran is uncreated and eternal, and Mahomet himself is said to have pronounced him an infidel who affir med the contrary, yet several have been of a different opinion; particularly the sect of the Mo'tazalites, and the followers of Ibrahimb. Sobe Abn Mufa, sumanamed Al-Mozdar, who accused those who held the Koran to be uncreated, of infidelity, as affor ters of two eternal beings. The dispute, which occasioned much warm contention, was at length compromised by Al Ghazali, who maintained that the original idea of the Koran only is really in God, and consequently co-existent and co-eternal with him, but that the copies are created and the work of man.

The Koran is universally allowed to be written with the utmost elegance and purity of language, in the dialect of the tribe of Koreith, the most noble and polite of all the Arabsians, but with some mixture, though very rarely, of other dialects. It is confessedly the standard of the Arabic tongue; and as the more orthodox believe, and are taught by the book itself, inimitable by any human pen; and therefore insinuated as a permanent miracle, greater than that of raising the dead, and of itself sufficient to convince the world of its divine original. Accordingly, Mahomet himself appealed to this miracle as the chief confirmation of his mission; publickly challenging the most eloquent man in Arabia, then abounding with persons whole sole
and admired it was to excel in elegance of style and composition, to produce even a single chapter that might be compared with it. Brevity, there have not been wanting, even among the Mahometans themselves, who have asserted that there is nothing miraculous in this book with respect to style or composition, excepting only the prophetic relations of things past, and predictions of things to come; and that God had left men to their natural liberty, and not restrained them in that particular, the Arabsians could have composed something not only equal, but superior to the Koran in elegance, method, and purity of language. This was the opinion of the Motazalites, and in particular of Al Mezdar and Al Nooham.

The style of the Koran is generally beautiful and fine, especially where it imitates the prophet's manner and scripture-philo
tology. It is concise and often concise, adorned with bold figures after the cadet taste, enriched with florid and sententious expressions, and in many places, especially where the majesty and attributes of God are described, sublime and magnificent. Although it be written in prose, yet the sentences generally conclude in a long continued rhyme, for the sake of which the sense is often interrupted, and unnecessary repetitions are too frequently made. But this kind of jingling delights the Arabsians; and they are fond of employing it in their most elaborate compositions; which they confide with frequent citations from the Koran, and additions to it. To this pomp and harmony of expression, force have ascribed the whole force and effect of the Koran, whilst others suppose, that the eulogial pleurures of paradise, which are so often displayed to the imagination of the reader, are the chief allurements to which it owes its efficacy.

"By the advocates of Mahometanism," says a learned and ingenious writer, "the Koran has been always held forth as the greatest of miracles, and equally stupendous with the act of raising the dead. The miracles of Moses and Jesus, they say, were transient and temporary; but that of the Koran is permanent and perpetual; and therefore far surpasses all the miraculous events of preceding ages. We will not detract from the real merit of the Koran; we allow it to be generally elegant, and often sublime; but at the same time, we reject with disdain its arrogant pretense to any thing supernatural. The real excellence of the work is to be referred to natural and visible causes." Besides the general impressions of admiration and astonishment, which the pretended prophet had produced on the minds of his followers, by the external sanctity of his demeanour, and his long and splendid series of victories, Mahomet found, in the language of Arabia, a language extremely loved and diligently cultivated, by the people to whom it was vernacular, "advantages which were never enjoyed by any former or succeeding prophet. It requires not the eye of a philosopher, to discover in every fold and country a principle of national pride; and if we look back for many ages in the history of the Arabsians, we shall easily perceive that pride among them invariably to have confined in the knowledge and improvement of their native language. The Arabic, which has been justly esteemed the most copious of the eastern tongues; which had existed from the remotest antiquity; which had been embellished by numberless poets, and refined by the constant exercise of the natives, was the most serviceable instrument which Mahomet employed in planting his new religion among them. Admirably adapted by its unrivaled harmony, and by its cadence variety to

add painting to expansion, and to pursue the imagination in its unbounded flight, it became in the hands of Mahomet an irresistible charm, to blind the judgment, and to captivate the fancy of his followers." Of that description of men, who first composed the adherents of Mahomet, and to whom the Koran was addressed, few, probably, were able to pass a very accurate judgment on the property of the sentiments, or on the beauty of the diction: but all could judge of the military abilities of their leader; and in the midst of their admiration, it is not difficult to conceive, that they would ascribe to his compositions every imaginary beauty of inspired language. The shepheard and the fiddler, though awake to the charms of their wild but beautiful compositions, in which they celebrated their favourite occupations of love or war, were yet little able to criticise any other works than those which were addressed to the imagination or the heart; to abstract reasonings on the attributes and dispensations of the Deity, to the comparative excellencies of rival religions, to the consistency of any one religious system in all its parts, and to the force of its various proofs, they were quite inattentive. In such a situation, the appearance of a work, which professed something like wisdom and constancy; which prescribed the rules, and illustrated the duties of life; and which contained the principles of a new and comparatively sublime theology, independently of its real and permanent merit, was likely to excite their admiration, and to become the standard of future composition.

"In the first periods of the literature of every country, something of this kind has happened. The father of Greek poetry very obviously influenced the taste and imitation of his countrymen. The modern nations of Europe all possess some original author, who, rising from the dark and obscure periods of former ages, has begun the career of composition, and tinctured with the character of his own imagination the stream which has flowed through his posterity. But the prophet of Arabia had, in this respect, advantages peculiar to himself. His compositions were not to his followers the works of man, but the genuine language of heaven which had sent him. They were not confined, therefore, to that admiration, which is so liberally bestowed on the earliest productions of genius; or to that fond attachment with which men every where regard the original compositions of their country; but with their admiration they blended their piety. To know and to feel the beauties of the Koran, was in some respect to share in the temple of heaven; and he who was most affected with admiration in the perusal of its beauties, seemed most truly the object of that mercy, which had given it to ignorant men. The Koran, therefore, became naturally and necessarily the standard of taste. With a language thus hollowed in their imaginations, they were too well satisfied, either to dispute its elegance, or improve its structure. In succeeding ages the additional function of antiquity or prescription, was given to those compositions which their fathers had admired; and while the belief of its divine original continues, that admiration which has thus become the test and the duty of the faithful, can neither be altered nor diminished."

"When, therefore, we consider these peculiar advantages of the Koran, we have no reason to be surprised at the admiration in which it is held. But, if descending to a more minute investigation of it, we consider its perpetual inconstancy and absurdity, we shall indeed have cause for astonishment at that weakness of humanity, which could ever have received such impostures as the work of the Deity.

"The
The first praise of all the productions of genius is invention. That quality of the mind, which, by the extent and quickness of its views, is capable of the largest conceptions, and of forming new combinations of objects the most distant and unusual. But the Koran bears little impression of this transcendent character. Its materials are wholly borrowed from the Jewish and Chaldaic scriptures, from the Talmudical legends, and apocryphal gores, then current in the East, and from the traditions and fables which abounded in Arabia. The materials, collected from these several sources, are here heaped together, with perpetual and needless repetitions, without any artful principle or visible connection. When a great part of the life of Mahomet had been spent in preparatory meditation on the system he was about to establish, his chapters were drawn out slowly and separately during the long period of 23 years. Yet this defective in its structure, and not least exceptionable in its doctrines, was the work which Mahomet delivered to his followers as the oracles of God.

The most prominent feature of the Koran, that point of excellence in which the partiality of its admirers has ever delighted to view it, is the sublime notion it generally imprints of the nature and attributes of God. If its author had really derived these just conceptions from the inspiration of that being, whom they attempt to describe, they would not have been surmounted, as they now are, on every side, with error and absurdity. But it might easily be proved, that whatever it justly defines of the divine attributes, was borrowed from our holy scripture; which even from its first promulgation, and especially from the completion of the new testament, has extended the views, and enlightened the understandings of mankind; and thus furnished them with arms, which have too often been ineffectually turned against itself by its ungenerous enemies.

In this instance particularly, the copy is far below the great original, both in the propriety of its images, and the force of its descriptions. Our holy scriptures are the only compositions that can enable the dim light of mortality to penetrate into the invisible world, and to behold a glimpse of the divine perfections. Accordingly, when they would refer us to the happiness of heaven, they describe it, not by any thing minute and particular, but by something general and great: something, that without descending to any determinate object, may, at once by its beauty and immensity, excite our wishes and elevate our affections. Though, in the prophetic and evangelical writings, the joys that shall attend us in a future state are often mentioned with ardent admiration, they are expressed rather by allusions than similitude, rather by indefinite and figurative terms, than by any thing fixed and determinate. ¹ Eye hath not seen, nor ear heard, neither hath entered into the heart of man the things which God hath prepared for them that love him. 1 Cor. ii. 9.

What a reverence and astonishment does this passage excite in every hearer of tale and piety! What energy, and at the same time, what simplicity in the expression! How sublime, and at the same time, how obvious is the imagery! Different was the conduct of Mahomet in his descriptions of heaven and of paradise. Unaffected by the necessary influence of virtuous intentions and divine inspiration, he was neither definite, nor indeed able to excite the minds of men to sublime conceptions or to rational expectations. By attempting to explain what is inconceivable, to describe what is ineffable, and to materialize what in itself is spiritual, he absurdly and impiously defied to substantiate the purity of the divine essence. Thus he fabricated a sytem of incoherence, a religion of depravity, totally repugnant indeed to the nature of that Being, who, as he pretended, was its object; but therefore more liable to accord with the appetites and conceptions of a corrupted and fallen age.

That I may not appear," says the preacher, "to exalt our scriptures thus far above the Koran by an unreasonable preference, I shall produce a part of the said chapter of the latter, which is deservedly admired by the Mahometans, who wear it embroidered on their ornaments, and recite it in their prayers." God! there is to God but he; the living, the self-sufficing; neither number nor speech seizeth him: to him belongeth whatever is in heaven and on earth. Who is he that can intercourse with him but through his good pleasure? He knoweth that which is past, and that which is to come. His throne is extended over heaven and earth, and the preservation of both is to him no burden: he is the high, the mighty. To this description who can refine the praise of magnificence? Part of that magnificence, however, is to be referred to that verse of the psalmist, whence it was borrowed: ³ He that keepeth Israel, shall neither number nor speech. Ps. cxli. 4. But if we compare it with that other passage of the same inspired psalmist, all his boasted grandeur is at once obscured, and lost in the blaze of a greater light. ³ O my God, take me not away in the midst of my days: thy years are throughout all generations. Of old hast thou laid the foundations of the earth; and the heavens are the works of thy hands. They shall perish, but thou shalt endure; yea, all of them shall wax old, as doth a garment: as a vesture shalt thou change them, and they shall be changed; but thou art the same, and thy years shall not fail.

The Koran, therefore, upon a retrospective view of these several circumstances, far from supporting its arrogant claim to a supernatural work, sinks below the level of many compositions confidedly of human original; and still lower does it fall in our estimation, when compared with that pure and perfect pattern which we justly admire in the scriptures of truth. It is then abundantly apparent that no miracle either was externally performed for the support, or is internally involved in the composition, of the Mahometan revelation." White's Sermons, containing a View of Chriftianity and Mahometanism, in their history, their evidence, and their effects, p. 236-271. Ed. 2.

The general aim of the Koran was to unite the professors of the three different religions, then followed in Arabia, Idolaters, Jews, and Chaldaics, in the knowledge and worship of one God, under the sanction of certain laws, and the outward signs of ceremonies, partly of ancient, and partly of novel institution, enforced by the consideration of rewards and punishments, both temporal and eternal; and to bring all to the obedience of Mahomet, as the prophet and ambassador of God, who was to establish the true religion on earth, and be acknowledged chief pontiff in spiritual matters as well as supreme prince in temporal. The chief point therefore inculcated in the Koran is the unity of God, to restore which the prophet pretended was the chief end of his mission: it being laid down by him as a fundamental truth, that there never was nor ever can be more than one true orthodox religion. The reef is taken up in preferring necessary laws and directions, frequent admonitions to moral and divine virtues, the worship and reverence of the Supreme Being, and reparation to his will. One of their most learned commentators distinguishes the contents of the Koran into allegorical and literal; under the former are comprehended all the obscure, parabolical, and

alc

arbitrary passages, with such as are repealed or abrogated; the latter, such as are clear, and in full force. See Mahometans.

Among the Mahometans this book is in the greatest reverence and effect. The Musulmen dare not so much as touch the Koran without being first washed, or legally purified; to prevent which, an inscription is put on the cover or label: "Let none touch it, but they who are clean." It is read with great care and respect, being never held below the girdle. They fear by it, take oaths from it on all weighty occasions, carry it with them to war, write sentences of it in their banners, adorn it with gold and precious stones, and knowingly suffer it not to be in the possession of any of a different religion. Some say that it is imitable even with death in a Christian to touch it; others, that the veneration of the Musulmen leads them to condemn the translating it into any other language as a profanation; but these seem to be aggravations. The Mahometans have taken care to have their scripture translated into the Persian, the Javan, the Mahayan, and other languages; though out of respect to the original, these versions are generally, if not always, interdicted. It has been often published in Europe, in Arabic and in other languages. Maracci published it in Arabic and Latin, at Padua, in 1698, fol. with a partial and often silly confusion. The German translation of Boyfen was printed at Halle, in 1713; the French of Savary, at Paris, in 1782; and the English of Sale, at London, in 1734.

The number of commentaries on the Koran is so large that the bare titles would make a huge volume.—Ben Of
diary has written the history of them, intitled, Tarikh Ben Of
diary. The principal among them are, Reishoiri Thaa
diary, Zamalechfiari, and Baci.

Beside the Koran which is the basis of the Mahometan faith, they have also a book containing their traditions, which they call Senan.

The Mahometans have a positive theology, built on the Koran and tradition; as well as a fehical one, built on
reason. They have likewise their casuists, and a kind of canon law; wherein they distinguish between what is of
divine, and what of positive right.

They have their beneficiaries too, chaplains, almoners, and canons, who read a chapter every day out of the Koran, in the mosques; and have prebends annexed to their office.

The harif or the mosque is what we call the parson of the parish; and the febees are the preachers, who take their text
out of the Alcoran. See Sale's Translation of the Koran, preliminary discourse.

Alcoran is also used in a more limited sense, for a portion or chapter of the Koran.

In which sense, the word is synonymous with sura.

Alcoran is also figuratively applied to certain other books full of impieties and impossibilities.

In this sense we meet with the Alcoran of the Cordeliers, which has made a great noise wherein St. Francis is extra
vagantly magnified, and put on a level with Jesus Christ.

Alcoran, among the Persians, likewise signifies a kind of tower, or fleaee, very high and narrow, surrounded without by two or three galleries, one over another; whence the Morwites, a sort of priests, repeat their prayers thrice a day, with a very loud voice; making the tour of the gallery all the while, that they may be the better heard all round.

Alcoranists, among Mahometans, those who adhere strictly to the letter or text of the Alcoran, from an opinion of its ultimate sufficiency and perfection. The Persians are generally Alcoranists, as admitting the Alcoran alone for their rule of faith. The Turks, Tartars, Arabs, &c. besides the Alcoran, admit a multitude of traditions.

The Alcoranists, among Mahometans, amount to much the same with the talmudists among the Jews. The Alcoranists can find nothing excellent out of the Alcoran; are enemies of philosophers, metaphysicians, and scholastic writers. With them the Alcoran is every thing.

AUCUCHETE, in Geography, a town of Portugal, in the province of Elbemadura, on the south coast of the Tagus, ten miles to the south of Lisbon. N. lat. 38° 55'. W. long. 8° 26'.

AULCOT, a town of Portugal, in the province of Aparece, on the border of Alentejo, defended by a castle, and containing six parishes. It is situated on the Guadiana, and six and one-half leagues north-north-east of Tavira.

ALCOVE, in Architecture, a recess in a sleeping room, made for the purpose of receiving the bed. It is also an arched seat in a garden.

The word is derived from the Spanish alcoba, which, according to the older Dictionaries of that language, signifies a vaulted cabinet in a chamber, open on one side, without windows, and large enough to contain a bed. The Spanish word is derived from the Arabic al-kubbah, the alcove, the place for the bed, and al-kubbah is probably from al-kabah, the tent, or more probably from kabab, sleek, al-kabah, the bed, alkaab the cave. The relation of these words is curious. According to the Spanish description an alcove is not unlike a cave or recess in a rock, in which a wandering Arab might make his abide for the night.

Alcoves in ordinary rooms are square recesses conformable to the definition we have given, and are finished in a style corresponding with the apartments to which they belong, and with flat or vaulted ceilings, as table may direct, or the height of the alcove may require. But in chambers of greater magnificence, and rooms of parade, they are not always alcoves; but more properly a portion of a large apartment separated from the rest by an arch, or bulblustrade, a screen of columns, or some other decorations, and elevated a few steps above the general level of the floor. On this elevated platform, a flat bed is usually placed, and sometimes seats and sofas to entertain company. This is what the French architects denominate an alcove. The recess to which the English have appropriated the term, and which is conformable to its primary signification, the French denominate a niche, as may be seen in Blondel de la Decoration des Edifices en general. (See Plate 1. of Architecture.)

The authors of the Encyclopedic Methodique are of opinion, that alcoves, were in use among the ancients, and this would be indisputably true if we could receive the term in the lax sense in which they have explained it. But we cannot give the name of alcoves to the enclosures which they mention, confining of a kind of moveable balustrade hung round with drapery, and placed in any part of a chamber at pleasure, nor to those draperies supported by terms, or affixed to the wall, which frequently occur in antique bas-reliefs. It must be confessed that we know very little of the private apartments of the ancients; yet if a recess for the bed to stand in had been a fashionable feature in a Greek or Roman bed chamber, it is probable that it would have been mentioned by Vitruvius, or others, and especially by Pliny, who is so minute and particular in the description of his Laurentine and Tufculan villas. In each of these villas he describes a small elegant retiring closet, furnished with a bed, which by means of glafs folding doors and curtains, could be occasionally laid into or separated from the adjoining.
ing apartment. These alcoves appear to have been somewhat similar to alcoves, but they differ essentially from modern alcoves in having windows. The recesses discovered by the Abbé Winkelmann, in one of the chambers of Pompeia, in which he conjectures, perhaps rightly, that a bed had been placed, and those recesses which lie found on the second story of Adrian's villa, at Tivoli, have better pretensions to the name of alcoves, but something more than a verbal description is wanting to enable us to determine whether they were formed for the express purpose of receiving a bed, or for some other purpose; or whether they were not such accidental recesses as are made by necessity in the arrangement of a building which the architect turns to the best use in his power.

Be this as it may, alcoves, according to the modern manner, undoubtedly originated in Africa, or Asia, for we read of them perpetually in the Arabian stories, and in descriptions of Asiatic palaces and gardens. From Arabia they were introduced among the Spaniards by their Saracen conquerors, and by the Spaniards, after the expulsion of the Moors, at the close of the fifteenth century, into Germany, France, and other nations, as the name they bear in every country sufficiently evinces.

At this time the Spaniards would scarcely have influence enough to make anything fashionable north of the Pyrenees; but at the period we are speaking of they were held in high consideration, and many of their customs and manners were adopted in the other dominions of Charles the fifth. It is remarkable that in the designs of Palladio, and of several Roman architects of the same age, whose works have been consulted, we find no example of alcoves, from whence it may be inferred that they had not then become fashionable either in Rome or Venice. Whether they were more so in those parts of Italy which were under the dominion of Charles might be an amusing subject of inquiry to an antiquary. It is said that alcoves are still frequent in the houses of the Spanish nobility, and Swinburne mentions two yet remaining in the Royal bedchamber of the Moorish palace of the Alhambra, at Grenada, which are probably the oldest in Europe, though it is uncertain whether their decorations are not of a more modern date, as the apartment was repaired for the use of Philip V. The beds were placed upon raised pavements of blue and white tiles, a fountain placed in the middle to refresh the apartment in hot weather, and two small doors behind the alcoves led to the royal baths.

In England, alcoves of every kind have been much in use, but the change of manners, in consequence of the general diffusion of wealth, has nearly banished the most magnificent kind with state beds, and the parade of which they were appendages. Even in private bed-rooms they are now seldom constructed, except to obtain uniformity, or to communicate to some other apartment, as they are found less convenient, and by confining the air, supposed to be less healthy to sleep in, than the uncontracted space of the chamber.

ALCOY, in Geography, a small town of Spain, in Valencia, at the source of a river of the same name, which traverses the whole province from south-west to north-east. N. lat. 38° 45'. W. long. 0° 21'.

ALCRANES Rocks lie in a direction north-west from Cape Catoche, the north-east point of the province of Jucatan, on the Spanish main, and about north-north-east from Cape Condecedo, the north-west point of Jucatan; extending from N. lat. 22° 50', to 22° 10' in breadth, and from W. long. 89° 50', to 91° 10' in length.

ALCUDIA, a town of Spain, in Valencia, eight miles north-west of St. Felipe. ALCUDIA, a small town of Africa, near the Cape of the Three Slaves. ALCUDIA is also a town of the island of Majorca, on the coast between Pugierza and Cape de la Piedra, which gives name to a large bay with good anchorage, and a Cape forming the northern limit of the bay. In July and August there is a fishery of coral. N. lat. 39° 50'. E. long. 3° 24'.

ALCUESAR, or ALCOUESAR, a town of Spain, in Aragon, upon the river Jero, north of Balbastro, situated in a fertile country. N. lat. 42°. E. long. 10°.

ALCUIN, or ALBINSUS FLACCUS. Biography, flourished towards the close of the eighth century, and was famous for his genius and erudition. He was born in the north of England, and educated at York, under the direction of archbishop Egbert. Some say that he received part of his education in early life from Venerable Bede, but as he survived him about 70 years, others have disputed this fact. Egbert appointed him keeper of the curious library which he had founded at York; and he was also dean of the church in this city, and abbot of Canterbury. In 793 he was sent on an embassy by Offa, king of Mercia, to the emperor Charlemagne, who conceived so high an opinion of him, that he solicited him to settle in his court, and to become his preceptor in the sciences, as well as to assist him in settling some ecclesiastical disputes that agitated the country at that period. Accordingly he instructed the emperor in rhetoric, logic, mathematics, and divinity, and was in such high esteem at court that he was called, by way of eminence, "the emperor's delight." Charlemagne likewise employed his learned favourite to write several books against the heretical opinions of Felix, bishop of Urgel, in Catalonia, who maintained that Jesus Christ was the son of God, not by nature but by adoption; and Alcuin accompanied the emperor in 794 to the council of Frankfort, which consisted of 500 bishops, and of which he was admitted a member. Although this council decreed, that Jesus Christ, as man, ought to be called the proper, not the adopted, son of God, the dispute was continued; and Felix being allowed to defend his opinion before an assembly of bishops at Aix la Chapelle, in 799, Alcuin was employed as his opponent, and performed the office to the entire satisfaction of the emperor and other attendants, and to the conviction of Felix and his followers, who were thus induced to abandon their errors and to accede to the opinion of the church. Alcuin performed other services on behalf of religion. He wrote commentaries for explaining the scriptures, but chiefly with a view to the investigation of their mystical meaning; he corrected the errors of the Latin translation in common use; and the first German translation of the scriptures has been ascribed to his direction and superintendence. He was also appointed, in concurrence with Paulus Diaconus, to compile, from the writings of the fathers, homilies or discourses upon select portions of scripture, which the ignorant priests of that period might commit to memory, and recite to the people. Alcuin, under the patronage and with the assistance of Charlemagne, contributed very much to the advancement of learning, by establishing public schools, particularly in France. Cave (Hist. Lit. tom. i. p. 637.) says, that France was indebted to Alcuin for all the polite learning of which it boasted in the eighth century and the following ages. The universities of Paris, Tours, Fulden, Soissons, and many others, were indebted to him for their origin and increase; some of which he was not the superior and founder, being
being at least enlightened by his doctrine and example, and excited by the benefits he procured for them from Charlemagne. A German poet, cited by Camdan, thus extols the merit of Alcuin in introducing literature into France:

"Quid non Alcuino, faciundia Latitutin, debes! \nFulmanum bonum abqui felicer artes, \nBarbarieaque procuct lutos depelere, capit."

"Let Gallia's sons, nurtured in ancient lore, \nTo Alcuin's name a grateful tribute pay; \nThe light of science to restore, \nAnd bid Barbarian darkness flee away."

Dr. Warlow, however, (Hist. of English Poetry, vol. i. p. 2) cautiously in forming "too magnificent ideas of those celebrated masters of science, who were thus invited into foreign countries to conduct the education of mighty monarchs, and to plan the rudiments of the most illustrious academies. Their merits are in a great measure relative. Their circle of reading was contracted, their systems of philosophy jeane; and their lectures rather served to stop the growth of ignorance than to produce any positive or important improvements in knowledge." After Alcuin had spent many years in the most intimate familiarity with the greatest prince of his age, he obtained, at length, with great difficulty, in 801, leave to retire from court to his abbey of St. Martin's, at Tours. Here he kept up a constant correspondence by letters with Charlemagne; from which it appears, that both the emperor and his learned friend were animated with the most ardent love to learning and religion, and constantly employed in contriving and executing the noblest designs for their advancement. The emperor often and earnestly solicited him to return to court, but no arguments could induce him to quit this honourable retreat, where he was employed in the education of the youth of the school which he had founded in this city; and where he died on Whitsunday, in the year 804. He was a person of distinguished piety and learning, and reckoned by William of Malmsbury the best English divine after Bede and Aldhelm. He composed many treatises on a great variety of subjects, in a style much superior with respect to purity and elegance to that of the generality of writers in the age in which he flourished. Besides his poem, "De pontificibus et Sanctis Ecclesie Eboracensis," first discovered by Mabillon, and published by Dr. Gale among his "Quindecim Scriptores;" his other writings are extremely voluminous. They consist of commentaries on the Bible, homilies, lives of saints, theological and metaphysical dissertations, epitaphs, verses, and treatises on orthography, grammar, rhetoric, and music; they are recited in the Biog. Brit. and by Cave, (vol. ii.) and amount in number to 53; and an edition of them was published by Duchene, at Paris, in folio, in 1617, and at Ratibon in 1777. Some additional pieces are enumerated by Dupin. It has been said that Alcuin advised Bede to publish his eclesiastical history, and furnished materials for it; but the assertion is contradicted by chronology; this work having been published in 731. There was another Alcuinus, or Albinus, abbot of St. Aulfin's church at Canterbury, the cotemporary of Bede, who died three years before him. By this Alcuin Bede was urged to publish his history, and assisted with communications. Biog. Brit. Henry's Hist. vol. iv. p. 33-40. Soho. More's Eccl. Hist. vol. iv. p. 354, &c. 8vo.

ALCYON. See Halcyon.

Alyon, or Alcyonium, in Ornithology, a name given by the ancients to the ifida or king-fisher, and also to a species of the Alcedo.

Alcyon, a name given by Brown to the Delcanus aquilina.

ALCYONE, in Entomology, a species of the Papilio Nymphalis, with dentate brown wings, with yellow bands, the anterior having two ocelli on both sides, and the posterior marked below; found in the mountains of the southern parts of Russia.

ALCYONION, in the Linnaean system of Zoology, a genus of Zoophyes; the characters of which are, that the animal grows in the form of a plant; the item or root is fixed, fleshy, gelatinous, spongy, or coriaceous, with a cellular epidermis, penetrated with fleshy pores, and flossing out tenuculated ovisparous hydræ. The number of species, mentioned and considered by Gmelin, is 28; viz. 1. A. arborium, with fleshy item, obtuse branches, and pores in the form of pimplies, found in Norway, White and Indian bees, sometimes of the human height. 2. A. ceris, with item arborescent, coriaceous, crimson-coloured, above ramous, and with fleshy papilíter, called by several authors the fish-hand, and found at the bottom of the Mediterranean sea. 3. A. epipitrum, with item fleshy, cavitated, and reddish: the finger-shaped sea-pen of Ellis, and fish-apple of Rondeletius, found in the Mediterranean, about four inches long, and of the thickness of the finger. 4. A. auriculium, with item siliaceous, and reniform pileus, kidney-shaped purple sea-pen of Ellis, found in the sea, washing the coast of Carolina. 5. A. digitatum, siliaceous, fleshy, yellow and warty, the philotheca spherica of Donat, found in the Mediterranean, and at the Cape of Good Hope, about the size of an orange and cartilaginous. 6. A. schlofferi, roundish and fopose, penetrated with ray-like thars, the alcyonium ramosum lividum, &c. of Solander and Ellis, the ura marina of Géner, the bottyris philothecus of Gaertner, found on the coast of Cornwall, brown or sly, and covering other bodies. 7. A. lyncus, globose, fibrous, yellow and tethya of Donat, found in the Mediterranean, and at the Cape of Good Hope, about the size of an orange and cartilaginous. 8. A. baris, globose, pulpous and green, the sea-orange of Marius, found in the English and Mediterranean seas, about the size of a middling apple, and coriaceous. 9. A. cydonium, roundish, spongy, yellow and slyne, found in the African, Mediterranean, and Northern seas, affixed to rocks and corals, and sometimes loosened by the agitation of the waves. 10. A. fixus, siliaceous, pulpous and luid, the sea-fish of Ellis, and sea-lungs of Ray, the alcyonium tuberofum of J. Bubin, found in the Mediterranean and English seas, very rare among fofils, of an olive colour, and within granulose. 11. A. gelatinosum, polymorphous and gelatinous, the alcyonium luteum gelatinosum polymorphum of Solander and Ellis, fpongia ramosa, &c. of Parkinson, fucus gelatinosus of Hudson, and fucus nodosus and fpongius of Ray, found in the European ocean and the Icy sea, adhering to the algae, stones, fleshy, &c. 12. A. manis diaboli, polymorphous, perforated with oblique protuberances, found in Iceland. 13. A. una, yellow, spongy, patulous, with five radiated small thars, and black center, found in the sea of Norway. 14. A. crassum, tuberiform, white and blynt, found in the Norway sea. 15. A. rubrum, crambaceous, fofit, sprinkled with reddish scattered spots, found in the Norway sea. 16. A. mammillatum, white, coriaceous, with convex mamille, and the center hollow and subfattellated, found in the American sea. 17. A. ocellatum, ferruginous, coriaceous, with rugose subcylindric cells, and radiated ocellate spots, found adhering to rocks, with twelve rays of thars, in the island of
of St. Dominica. 18. A. tuberosum, yellowish and tubulous, with the spicules frequently subfused, and tubulous pores, found adhering to rocks in the island of Mauritius. 19. A. gorgonides, conicaceous, fandy-fluffy, with radiated woody cuticles, found, with 12 rays of cellules, adhering to corals and rocks, in the island of Curaçao. 20. A. echinatum, with a roundish stem, and oblong pores scattered over every part of it, found, in the sea washing the American coast, very porous, white, and with red-coloured. 21. A. alfuratum, white, very ramous, attenuated and subfused, with tubulous terminal pores, found in the Indian sea. 22. A. papillosum, conicaceous, with large papille thickly set and convex, the botulus marinus of Marilgh. 23. A. conglomeratum, gelatinous, convex, with conglomeration lingers, and terminal mouths without teeth, found in the Cornish seas. 24. A. aequicellulare, conicaceous, conicaceous, with divided papille, and two subdulated mouths, found in the Cornish seas. 25. A. Johnsonum, with many cylindric flaky items, and an orifice scattered at the apex, found, on the northern shore of Spitzbergen. 26. A. commutabile, green, ramous, with cylindrical obtuse pyramidal branches, found on the rocks of the island of Nisia, opposite to Neapolis. 27. A. globulatum, with two elongated terminal mouths. 28. A. cornutum, with four elongated mouths, encompassing a papilla, and four small erect corn buds, found, in the sea of Holland.

From a series of experiments made by Mr. Hatchett, on a few species of alcyonium, vis. aballicum, ficus, and arboreum, he was led to conclude, that they were all composed of a soft, flexible, membraneous substance, slightly hardened by carbonate, mixed with a small portion of phosphate of lime. Phil. Trans. for 1800. P. ii. p. 364.

Alcyonium is also a name given, with various epithets, to the Tubifera maccus of the Linnean system, and also to several species of Millepora.

Alcyonium is also a name given by Lloyd to a peculiar kind of foliose coral, of the Astrotites kind, found in Wales. It is very plentiful in that country, and put on the appearance of a fort of marble, being bedded in a marly matter for its matrix. Phil. Trans. No. 252.

Alcyonium Mare, in Ancient Geography, a name given to that part of the gulf of Corinth, which stretched itself between the western coast of Berotia, the northern coast of Megaris, and a small part of Corinth, as far as the promontory of Olmita.

Alcyonium was also the name of a lake in Corinth, of unfathomable depth, and which Nero attempted unsuccessfully to found. Bacchus is said to have defended himself through this lake to bring back Semelae. Near this lake was a temple constructed by the Oropians to Amphiarraus, the Sorcerer. Panbankis. Ed. Kumin. p. 200.

Aldehyraram, in Oeconomy, a name given by some to the seafanoid bones of the great toe.

Alban, in Geography, a river of Siberia, which rises in the mountains of Onkotik, on the borders of China, N. lat. 51° 50', and E. long. 125° 44', and taking a north-east course to lat. 68°, changes its direction to west-north-west, and at N. lat. 63° 25', E. long. 128° 24', joins the Lena.

Aldaru, in Botany, a name given by Avicenna, Serapion, and other Arabic writers, to the lentise tree.

Aldborough, in Geography, a sea-port town of England, in the county of Suffolk, deriving its name from the river Ald, near it, and pleasantly situated between the sea on the east and a high hill on the west, on which the church stands. The barony of this town in the salus is considerable, and near it there is a quay, with warehouses for the fifth, and conveniences for drying those of the north sea. Herrings and sprats are the principal objects of attention; and it is said that this is the only place for curing red sprats. The town is corporate, and sends two members to parliament. Its markets are on Wednesday and Saturday. It is 91 miles north-east of London. N. lat. 52° 10', E. long. 1° 30'

Aldeburgh is also a market town in the West Riding of Yorkshire, on the river Ouse, 15 miles north-west of York, and 208 miles north of London. N. lat. 54° 15', W. long. 2° 20'. It sends two members to parliament. It was formerly a Roman station, called Ilurium Britannum, and probably the capital of the Brangtines. Its market day is Wednesday.

Alde, or Olds, a small island on the west-coast of Norway. N. lat. 61° 25', E. long. 5° 0'.

Alde, Henry Van, in Biography, a painter who flourished in 1652, and excelled in portraits.

Aldea Gallega, d. Gallician village, a small market town of Portugal, in Extremadura, situate in a kind of island formed by the Tagus, north of Setillum, and south of Lisbon. On an eminence, a church dedicated to Nois Senhorada Atelia, our lady of the watch-tower; to which the negroes in Lisbon annually make a pilgrimage; and this black procession is attended by a great concourse of people. N. lat. 38° 45', W. long. 6° 31'.

Aldea el Murro, or del Pozo, a town of Spain, in Old Castile, on the frontiers of Aragon.

Aldea del Riso, a town of Spain, in the province of Andalusia, and district of Cordova, situate on an eminence, to the south of the Guadalquivir; eight miles north-west of Cordova.

Aldea river is on the coast of Brazil, in about S. lat. 19° 40', W. long. 40° 3', on which stands the town and port of Reys Magos. There is a large Cape to the south of it.

Aldea de Trinidad, lies on the coast of Brazil, called Paraguay, to the north-east part of the gulf of Santos, in S. lat. 24° 30', W. long. 48° 30'.

Aldeas bay is about 16 leagues north-east from Cape Negro, on the southern part of the west coast of Africa, in S. lat. 15° 25', E. long. 16° 25'. The bay is small but secure; and European ships, trading to the coast for slaves, frequently touch at it.

Aldebaran, in the Materia Medica of the ancient Arabian physicians, the name by which they have called the fourth star in Virgo, and which they reckoned among the vegetable poisons.

Aldebaran, in Astronomy, the Arabian name of a fixed star, of the first magnitude, in the eye of the constellation Taurus, or the bull; and hence popularly called the bull's eye. For the beginning of the year 1800 its Right ascension was 66° 6' 51", 10

Aldebert, or Adebert, in Biography, a native of France, who, in the eighth century, deduced the people by pretended visions and revelations. He exercised episcopal dignity without the authority of Synod, the pope's legate, and among other irregularities, with which he was chargeable, both as to his principles and conduct, he forged a letter, addressed to the human race which he pretended to have been written by Jesus Christ, and to have been transmitted to him by the archangel Michael. He also remitted fines without confession, and required his followers to quit the churches, and to worship God in houses which he erected in the fields, and to kneel before crosses which he placed in woods and near fountains. His popularity
was the cause of sedition and tumult among the eastern Franks. He was condemned at the insurrection of Boniface by the pontiff Zachary, in a council held at Rome, A.D. 748, and thrown into prison, where he probably ended his days. His forged letter was published by Stephen Baluze, in the second vol. of the "Capitulm Regum Francorum." Mollenhoff's Excl. Hist. vol. ii. p. 273.

ALDEGEO, in Geography, a river of Italy, which rises near Montefello in the Vicentin, and joins the Adige in the estates of Venice, near Zevio.

ALDEGRETUS, or ANDREGEETUS, in Geography, an Adel family at Padua, taught a medicine at that university 34 years, and died of the plague in the year 1631, aged 58 years. He published "Luis Venerac perfectissimus vir disillusion ex ore Hercules Saxonic. Patavinii Medici clarissimi." 1597. 4to. See Adene de Merici Vencratis. p. 917.

ALDEGREVER, Henry, a considerable engraver and painter, was born at Zount in Weilphalia, in 1502. He is said to have studied under Albert Durer, at Nuremberg, while he was there. The mechanical part of his engraving is very neat, and executed entirely with the graver, in the style of Albert Durer. The light parts upon his fles. are rendered soft and clear, by the addition of small lines, by which he has occasionally interperfed with judgment. His drawing of the naked figure is more correct than that of the old German masters, and he has the far of that light tuff which appears in the best of their works. It is observed, however, that his figures of men are more correct than those of his women. His heads are in general very expressive, and his other extremities well marked, but sometimes rather heavy. As a painter also, he is spoken of very highly, and considered as nearly if not altogether equal to his master, Albert Durer. His principal works are: his own portraits, and several others, such as those of Kippenhulch, Melchthlon, &c.; the history of Solomon and the two elders; Dives and Lazarus; the passion of Christ; the labours of Hercules; several Madonias; many historical subjects; a variety of Goldsmith ornaments, very beautifully engraved; and some few pictures, amongst which is the Sacrament of Nativity. There is only one etching attributed to this master, which is Ophus playing on a violin, and Enulide at the foot of a tree, dated 1528. It has been observed, that Aldergrever would have been very eminent in his profession, if in early life he had been introduced to a knowledge of the antique, and a more intimate acquaintance with the Roman masters. This artist has been erroneously called Aldergraft, and his Christian name has been Albert instead of Henry; but his name upon his own portrait is Aldergrever. The time of his decease is not known; but the last date which appears upon his prints is 1558. The number of his plates amounts to no less than 350. Strutt.

ALDEN, Fort, in Geography, is situate in Cherry-valley, in the state of New York.

ALDENHAIR, a small town of Germany, in the circle of the Lower Rhine, in a prefecture of the same name, and in the archiepiscopie of Cologne, situate on the river Ahr, eight leagues south of Cologne. N. lat. 50° 35'. E. long. 6° 43'.

ALENDAU, a small town of the Lower Rhine, and archiepiscopie of Cologne, in a prefecture of the same name, to leagues south of Cologne. N. lat. 50° 29'. E. long. 6° 30'.

ALDENBERG, a town in the circle of Weilphalia and duchy of Berg, four leagues north-east of Cologen.

ALDENGROB, a town of ancient Rulphad, now Old Ladoga, which lies in the government of St. Peterburg.
ALDERMAN. This, however, was owing to the increasing power of the abbey and to the prodigious wealth and influence of a few great families, rather than to any formal change in the constitution. Henry's Hist. vol. iii. p. 342.

It must be observed, however, that among our Saxon ancestors, there were several magistrates who bore the title of alderman. Among them there were aldermannus totius Anglie, aldermannus totius comitatus, etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc., etc,
Aldred, in Biography, an English prelate of the 11th century, was a man of an enterprising and ambitious spirit, and gradually rose from being a monk of Winehelter and abbot of Tavistock, to the see of Worcestcr and the archiepiscopacy of York. Four years after he was promoted to the see of Worcestcr, which he obtained in 1046, he took a journey through Hungary to Jerusalem, the first adventure of the kind which any Englishman had performed; and upon his return he was deputed by Edward, the Confessor, on an important embassy to the emperor Henry II. On his arrival in England, after some flay in Germany, where he acquainted himself with the church discipline, which he introduced into his own country, he procured the administration of the see of Wilton for three years, during the absence of his bishop, and that of Hereford for four years, after the death of its incumbent. In 1061 he was advanced to the archiepiscopacy of York, and allowed, as it has been said, by means of bribery, to hold the see of Worcestcr in commendam. Pope Nicholas II., having heard of his monastic practices, not only refused him the pall, for which he applied, but deprived him of his other preferments, but being robbed in his way home over the Alps, he was under a necessity of returning to Rome, and by the bold interference of Earl Toli, the pope was prevailed upon to grant him the pall, on condition of his resigning the see of Worcestcr. Afterwards the king, considering the deprivations which the see of York had suffered by the incursions of the Barbarians, permitted Aldred to retain 12 towns or manors belonging to the see of Worcestcr for his own use. Others, however, lay, that he detained them by violence and injustice. The following instance of revolution, and of priestly arrogance, is recorded by his panegyrist Stubbs. The high sheriff having intercepted some provisions, which the archbishop's servants were conveying to the palace at York, and seized them for the king's use, Aldred, instead of seeking legal redress, gave a deputation of clergy and citizens to demand restitution, and enforced the demand by threats of excommunication. Upon the sheriff's refusal, the archbishop, with a train of ecclesiastics, hasted to the king, who was then sitting in council at Wolminister, and abruptly addressed him in this imperious language. "Hear me, William! when thouwert an alien, and God had permitted thee, for our sins, and through much blood, to reign over us, I anointed thee king, and placed the crown upon thy head with a blessing; but now, because thou defervest it not, I will change that blessing into a curse against thee, as a per-
ALD

A persecutor of God and his ministers, and a breaker and contemner of those laws and promises, which thou madest unto me before the altar of St. Peter. The king was affronted and terrified, threw himself at the feet of the archbishop, and anxiously entreated to know what offence he had committed. When the nobility who were present expressed their indignation at the prelate's insolence, and at his suffering the king to be at his feet; "let him alone!" said the archbishop; "let him lie; he is not fallen at my feet, but at the feet of St. Peter." At length he raised the king and delivered his complaint; upon which an order was issued, that the prelates should be fully restored, and the prelate was thrown away loaded with rich presents.

Alfred's veracity of principle was sufficiently manifest in his conduct under the changes of government that occurred during the latter part of his life. When his patron Edward was dead, he affilied Harold in obtaining the crown. On the arrival of William the Norman, when Stigand, archbishop of Canterbury, refused to crown him, Alfred fell in with the stream, and performed the ceremony. Upon the Danish invasion, when the citizens of York, and others, declared for prince Edgar Atheling's title, the archbishop sicknessed at the news, and died Sept. 10, 1066, just before the Danes landed; and was buried in the cathedral church of York. Blog. Brit.

ALDRICH, or ALDRIDGE, ROBERT, was bishop of Carlisle, in the reigns of Henry VIII., Edward VI., and Mary, and of course accommodated his principles to the changes of the times. He was born at Burnham, in Buckinghamshire, educated at Eton School, and elected scholar of king's college, Cambridge, in 1507, where he took the degree of master of arts. At this time Erazmus fliyed him "blanda eloquentia juvenis." Leland has also dedicated him to his admirable parts and learning. In 1540 he was incorporated bachelor of divinity at Oxford, and in 1550 he was licensed as doctor in the same faculty. He successively became archdeacon of Colchester, canons of Windsor, and registrar of the order of the garter, and at length, in 1553, bishop of Carlisle. He died March 25, 1555, at Horn-Castle, in Lincolnshire, which was a house belonging to the bishops of Carlisle. He wrote several pieces, such as "Reflections concerning the Sacraments," "Answers to Queries, concerning the Abuses of the Mass," "Various Epigrams," and "Reflections," of some questions relating to bishops and priests, and other matters, tending to the reformation of the church, begun by Henry VIII. Blog. Brit.

ALDRICH, HENRY, an eminent divine and polite scholar, was born at Welfinfield, in 1647, and educated in the college school, under the famous Bubly. In 1662 he was admitted into Christchurch college, Oxford, where he continued, in the several situations and with the appropriate commendations of a diligent student, useful tutor, and excellent master, to the day of his death, Dec. 14, 1710. Having passed through the gradations of bachelor of arts in 1666, and master in 1669, he took orders, and became an eminent tutor in his college. In 1681 he was installed canon of Christ church, and in the same year accumulated the degrees of bachelor and doctor in divinity. During the reign of James II. he bore a conspicuous part in the controversy with the papists, and published several tracts; ranking, according to bishop Burnet, (Hist. of his own Times,) among those eminent English clergymen, "who examined all the points of popery, with a solidity of judgment, a clearness of arguing, a depth of learning, and a vivacity of writing, far beyond anything that had before that time appeared in our language." Soon after the Revolution, viz. in 1689, Dr. Aldrich was installed dean of Christchurch, in which high station he behaved in the most worthy and exemplary manner, and exerted himself in promoting learning, virtue, and religion. By his skill in architecture he improved the buildings of the college; and that part of it called Backwater quadrangle, so deservedly admired, was designed by him. The parish church of All Saints, in Oxford, and the chapel of Trinity College, which he designed, are further speciments of his architectural knowledge. In order to excite and cherish a taste for polite literature, he annually published some piece of an ancient Greek author, as a new year's gift to the students of his house. The works of this kind which he edited were "Xenophon's Memoralia," Gr. and Lat. Oxon. 1696, 8vo.; "Xenophonis Sermo de Agricella," Gr. and Lat. Oxon. 1691, 8vo.; "Ariflex Historia LXXII. Interpretum," Gr. and Lat. Oxon. 1692, 8vo.; "Xenophonis de re equilibri," Gr. and Lat. Oxon. 1693, 8vo.; "Epictetus et Theophrastus," Gr. and Lat. Oxon. 1707, 8vo.; "Platonis, Xenophonis, Plutarchi, Luciani Sympoas," Gr. Oxon. 1711, 8vo. He wrote likewise a fylem of Logic, intitled "Artis Logica Compendium," Oxon. 1691, 8vo.; and "Elements of Geometry," in Latin, never published.

He was also concerned in Gregory's Greek Testament, printed at Oxford in 1703, fol. He wrote notes on Haver camp's edition of Josephus, and in concurrence with bishop Sprat, he revised the MS. of Lord Clarendon's History of the Rebellion. The tracts which he published in the papish controversy were, "A Reply to two Difficulties, lately printed at Oxford, concerning the Adoration of our Dear Lord Saviour in the Holy Eucharist," Oxford, 1687, 4to; and "A Defence of the Oxford Reply, &c." Oxford, 1688, 4to.

Dr. Aldrich amused his academic leisure with music and poetry. His abilities as a musician rank him, in the opinion of competent judges, among the masters of the science. He composed many services and anthems for the church service, and adapted English words to many of the motets of the Italian masters, some of which are frequently sung in our cathedrals as anthems. He established a musical school in his college, and at his deccate bequeathed to it a most capital collection of church music. Although he chiefly applied himself to sacred music, yet being of a cheerful temper, and possessing a fund of humour, he occasionally diverted himself by producing pieces of a lighter kind. For the entertainment of smokers, to which fraternity he belonged, he composed a smoking catch to be sung by four persons while they were smoking; and he was also the author of the popular catch "Hark the happy Christ church bells," As a Latin poet, Aldrich is entitled to some distinction. Two elegant pieces written by him are contained in the "Muse Anglicana," viz. on the accession of William III., the other on the death of the Duke of Gloucester. The following epigram, intitled, "Caesae Bibendi," is also ascribed to him:

"Si bene quid memini, causae sunt quinque bibendi,
Hospitio adventus, praeclara sitis, atque futura,
Aut vini bonitas, aut quaelib et alia causa."

Thus translated: "If on my theme I rightly think,
There are five reasons why men drink:
Good wine, a friend, because I'm dry,
Or left I shoule be by and by,
Or any other reason why."

The candour of Aldrich's temper, and the moderation of his principles, may be inferred from his having been appointed by William III. in 1689, one of the commissioners for preparing matters towards introducing alterations in the service of the church, and accomplishing a comprehension with
A L D

with the differences; but the hand of innovation has always
prevented the publication of the work. This the preter-
ence, however, did not prevent the living of
Hawkins in Bologna, and in 1553 was made proctor of
the university. In 1560, he died in his college, having
spent the whole of his life without any emolument, in the
cathedral. Thus was the man who, by easy pleasures, his
attention to small matters, and to the credit of his college,
the discovery of the commencement of plants, and the
publication of a number of botanical tables, various
memorials, and valuable quatrains, wrote to transmit his
name to his home, to posterity." Bio. Brit. Burney's

ALDROVANDI, in History, a genus of the plantae
Gnetea class and order; the characters of which are, that
the calyx is a five-parted, erect, equal, permanent perian-
thum; the corolla has five petals, oblong, acuminate,
of the length of the calyx, and permanent; the stamina have
filaments of the length of the flowers, and simple anthers;
the pistil has a globose fenn, floral white, and obtuse
stigma; the pericarpium is a globose capsule with five blunt
angles, five-valved, one-seeded; and the seeds are ten, longish,
feeling to the inner wall of the pericarpium. There is one
species, viz. A. advena, the type of the genus, and bocardo
of the Antilles, which is found in marathas, both in Italy and
India, with bladders like utricularia, but in bunches. Martyn.

ALDROVANDI, Ulysses, in Biography, a celebrated
naturalist, sometimes called the Modern Pliny, was born of
a noble family, at Bologna, in 1522, and pursued his studies
partly at his native place and partly at Padua. The truth
of his religious opinions having been suspected, he travelled
to Rome in 1552, for the purpose of vindicating himself;
and there he took the advantage of studying the antiquities
of the place, and drew up a treatise on the ancient statues,
which was published in the work of his friend Lucio Mauro,
on Roman antiquities. On this occasion he likewise became
acquainted with Rondozio, whose researches into the his-
tory of fishes gave him a taste for the knowledge of nature.
Upon his return to Bologna he engaged in the study of
Botany, and went to Pisa to obtain an audience from professor
Chirif. Having graduated in physic at Bologna in 1553,
he was in the following year appointed to the chair of phi-
losophy and logic, and to the lecturership of botany, and by
his interest the botanical garden of Bologna was founded in
1567. The duties of his profession, to which he sedulously
attended, did not prevent his devoting his time and property
to the important objects of collecting books, conducting an
extensive correspondence, and taking journeys, with a view
to obtain information concerning every branch of natural
history. He also expended large sums, and involved himself
in pecuniary difficulties, in the design of forming a museum
of rare and curious productions, and in employing the best
artists in delineating them. He not only caused to be de-
linated the external face of the objects he describes, but
frequently gives anatomical accounts of their internal struc-
ture, with the uses of the parts; more especially of birds,
in which he made some valuable discoveries. As the result
of this labour and expence, he published four folio volumes
with plates: three on ornithology, and one on insects. One
volume on blooded animals, and another on fishes, were
likewise composed by him. The rest, making the whole
number 13 volumes, and treating on serpents, quadrupeds,
monsters, metals and trees, were compiled after his death,
principally from the materials which he had collected. For
the titles of the several treatises, see Haller's Bib. Botanica,
Anatomica, and Medica, under the art. Aldrovandus. Not-
withstanding the liberal affluence which he received in the
execution of his extensive and magnificent plan, the expence
of it ruined his fortune and exhausted all his resources so
completely, that he died in 1603, after having lost his sight,
as it is said, at the height of 83 years. Holdfast, he was acquainted with the
apothecaries and physicians of Bologna, and was expelled the
college of physicians. To his industry he ascribed his
immense collection, and it formed the basis of the museum
now existing at Bologna, where his memory is held in great
and deserved honour. Although his industry and zeal seem to
have exceeded his judgment, and his works are defective
in arrangement, and afloat with superficial and dubious
matters, yet natural history is greatly indebted to his
diligence and liberality. Buffon calls him the most laborious
and learned of all the naturalists, and commends the plan
and distribution of his work, and the exactness of his de-
scriptions. Boyle observes, that antiquity does not furnish
us with a design so extensive and labious as that of
Aldrovandus with regard to natural history. Pliny, he says,
has treated of a greater number of subjects, but he only
touches them lightly, and says but little upon anything,
wheras Aldrovandus has collected all he could meet with.
His Hortus Sicus, or collection of dried specimens of
plants, which filled fifteen large folio volumes, was exuding;
Haller says, near a century after the collection was formed.
Besides his manuscripts in natural history, he left various writ-
ings in almost every other department of the arts and sciences.
His praisies are celebrated by Barbier, afterwards pope
Urban VIII. in the following epigram:

"Multiplicis rerum formas quis putas atque,
Exibet et quaeque primit abdit humus,
Mons hortus, spectant ocular, dum vaceta fagacii
Aldoranda tuta digerit arte lice.

Miratur propinquis foliora industrid factus
Quamque tibi nulli neget efficarum,
Obstrepita sese simul renum secundar creatrix,
Et cupit efficium quem vidit artis opus."  

"The various forms that thrive the watery plains,
Whence the earth's copious womb contains,
The trees and herbs that on her face appear,
And all the wing'd inhabitants of air,
In thy stupendous work collected lies,
To seal the soul, and make the totality eye,
Her own productions industry no more,
Darcs own, but wonders at the fruit the bower;
And fruitful nature at thy deeds amaze'd:
Wishes her own towe works thy art has rais'd."  

Gen. Dict.

ALDUABIS, or ALDUA DUBIS, now DOUX or
DOUBS, in Ancient Geography, a river of Celtic Gaul, which
rofe in Mount Jura, and separating the Sequani from the
Helvetii, and running through Burgundy, or the Franche
Comte, abounded encompassed Befanron, and fell into the
Suone, near Chalons. The word is formed of Aldua, the
Alde, and Dubis, the Doux, the names of two rivers which
unite near Monthbehrard.

ALDUIDES, in Geography, mountains that are part of
the Pyrenees, in Lower Navarre, between Pampeluna and
St. Jean De Port.

ALE, a kingdom of Africa, in Guinea, to the south of
Senegal, and almost opposite to Cape Verd. Its capital,
which is the residence of the king, is Yagao. N. lat. 13°
W. long. 12° 40'.

ALE, a river of Scotland, which runs into the Tiviot,
three miles north-north-west of Jedburgh.

ALE, in Ancient Geography, a town of Afia, upon the
coast of Syri a, between Pedalia and Selinus.

A L E
Ale, a popular fermented drink, made from malt and hops; and chiefly distinguished from beer, another potable liquor made from the same ingredients, by the quantity of hops used therein, which is greater in beer, and therefore renders the liquor more bitter, and fitter for keeping. For the method of brewing ale, see B e e r . The brewers also distil pale, or fine ale, broken ale, &c. There are several properties, effects, &c. under Malt-Liquor.

The art of making an infusion of corn, and particularly of barley, similar to our ale, seems to have been known and practised in very ancient times among those people who lived in climates that did not afford grapes. It is said that beer was first brought from Egypt into those nations, which were settled by the colonies that migrated from the Nile. The Zinthus and curium, mentioned by Tacitus, as the beverage of the ancient Germans, are supposed by Mattheus and others to correspond to our ale and beer. Dio Dorothes Siculus says (lib. iv. c. 26. tom. 1. p. 350.), that the Gauls, who lived in a country that produced neither grapes nor olives, made a strong liquor of barley, which they called Zinthus. The nations of Spain, the inhabitants of France, and the aborigines of Britain, used this liquor, under the different apppellations of cura and cersa in the first country, of cerevina in the second, and of cura in the last; all which names literally denote the strong liquor.

After the introduction of agriculture into this island, ale or beer was substituted for mead, and became the most general drink of all the British nations which practised that art, as it had been of all the Celtic people on the continent. "All the several nations, (says Pliny, H. N. xiv. 20. tom. 1. p. 729.) who inhabit the west of Europe, have a liquor with which they intoxicate themselves, made with corn and water, fruges maliuli. The manner of making this liquor is somewhat different in Gaul, Spain and other countries, and it is called by many various names; but its nature and properties are everywhere the same. The people of Spain, in particular, brew this liquor so well, that it will keep good for a long time. So exquisite is the ingenuity of mankind in gratifying their various appetites, that they have thus invented a method to make water itself intoxicating. The manner in which the ancient Britons and other Celtic nations, made their ale is thus described by Ialdorius, (Orig. lib. xx. c. 2.) and Orosius, (lib. iv. p. 279.), cited by Henry of Hitt, (Hist. of England, vol. ii. p. 564. 8vo.) "the grain is steeped in water, and made to germinate, by which its spirits are excited and set at liberty; it is then dried and grained; after which it is infused in a certain quantity of water, which, being fermented, becomes a pleasant, warming, strengthening, and intoxicating liquor." This ale was most commonly made of barley, but sometimes of wheat, oats, and millet. Geopon. lib. vii. c. 34. p. 203. This liquor is of such antiquity in England, that we find mention of it in the laws of Ina, king of Welles. Ale was the favourite liquor of the Anglo-Saxons and Danes, as it had been of their ancestors, the Germans. Tacitus de Mor. Germ. c. 23. Before their conversion to Christianity, they believed that drinking large and frequent draughts of ale was one of the chief felicities which those heroes enjoyed who were admitted into the hall of Odin. Amongst the liquors provided for a royal banquet, in the reign of Edward the Confessor, ale is particularly specified. In Scotland and Wales they had two kinds of ale, called common ale and spiced ale; and their value was thus ascertained by law: "if a farmer hath no mead, he shall pay two casks of spiced ale, or four casks of common ale, for one cask of mead." By this law, a cask of spiced ale, nine palms long, and 18 palms in diameter, was valued at a sum of money equal in effect to 5l. 10s. of our present money; and a cask of common ale, of the same dimensions, at a sum equal to 3l. 15s. Hence it appears, that common ale was at this period an article of luxury among the Welsh, and that it could only be obtained by the great and opulent. Wine at this time seems to have been unknown even to the king of Wales, as it is not mentioned in their laws; though Giraldus Cambrensis, who flourished a century after the conquest, informs us, that there was a vineyard in his time at Machenepar, near Pembroke, in South-Wales. Henry's Hist. vol. vi. p. 390. By a statute of 35 Henry III. in 1272, mentioned by Tune (Hist. Eng. vol. ii. p. 234.), a brewer was allowed to fell two gallons of ale for a shilling in cities, and three or four gallons in the same price in the country. But the first attile of ale was fixed by the famous Stat. 51 Henry II.

The following method for preserving ale from turning four in long voyages, was first published by Dr. Stobbe (Hist. Prod. N. 27.), and experience has evinced its utility. To every tun of five gallons, after being placed in a cask on shipboard, not to be fitted any more, put in two new-fab eggs whole, and let them lie in it. In a fortnight or a little more, the eggs- shells will be entirely dissolved, and the eggs become like wind-eggs enclosed only in a thin skin; after this the white is pressed on, but the yolks are not touched or corrupted; and by these means the ale has been so well preserved, that it was found better in Jamaica than at Deal.

The duties on ale and beer make a considerable branch of the revenue in England. They were first imposed in 1643, when the excise was first established, again by Car. II. and have been continued by several subsequent acts of parliament. By 27 Geo. III. c. 15., for every barrel of beer or ale, above six shillings a barrel, (exclusive of the duty hereby imposed, and not being two-penny ale, nor table beer) the brewer shall pay eight shillings; and for every barrel of six shillings, or under, (exclusive of the duty) one shilling and fourpence, and for every barrel of beer or ale above six shillings the barrel (exclusive of the duty), not exceeding 138. (33 Geo. III. c. 23. f. 1.) commonly called table beer, brewed by common brewers, according to 22 Geo. III. the brewer shall pay three shillings; and for every barrel of two-penny ale three shillings and fourpence.

The faceharne matter extracted from the farinoeous seeds of which ales are made, and subjected to a fermentation analogous to that of wine, imparts to our ales a quantity of alcohol; and they have, therefore, in general, the cordial, exhilarating, intoxicating, and sedative qualities of wine. But their effect, in these respects, depends partly upon the quantity and condition of the faceharne matter that is employed, and partly upon the management of the fermentation to which they are subjected. Ale is chiefly employed for the purpose of making ales, though it might be prepared from any of the cereals; and this fermentation is very properly made, because its germination is most easily conducted, and under its germination it gives out its sugar most readily, and in greatest quantity. Ales, made in the ordinary manner, will be stronger or weaker according to the quantity of the faceharne matter that is used; and this will be greater or less according to the quantity of well-ripened farina in the barley that is employed, according to the mode in which it is malted, according to the proper and complete extraction of the faceharne matter by water, and according to the dissipation in a greater or lesser degree, of a quantity of the superfluous water. The other qualities of ales, besides their strength or weakness, will depend upon the conduct of the fermentation. As the infusion of malt or wort, is not so well disposed to fermentation as the juices of fruits, it will require the addition of a ferment; and afterwards the conduct of the fermentation will be very much the same with that of wines; at first very active, and then slowly protracted for a long time; but however ale is managed,
pasted, its fermentation; not 6, capable of being rendered sigh complete and perfect, as that of wine. In most ales, there is probably a large portion of unalimented savourous matter, which of coarse renders ales more nourishing than wines, and they are, ceteris paribus, more liable to acrimony in the stomach than wines. It has been commonly supposed, that the virulence of nature is not entirely corrected by the fermentation, and that ales are more apt than wines to fill the vessels of the human body with viced fluids; but Dr. Cullen thinks that this circumstance deserves little attention, as it is probable that the power of the gallic fluid, and of the fermentation which happens in the stomach and intestines, reduces the whole nearly to an equality in respect of fluidity. Cullen's Med. vol. i. p. 418, &c.

A. E. ceresi, is also a denomination given to divers medicated liquors, or diet-drinks, of which ale is the base or vehicle. The medicated ales make a large article in our old dispensaries. Such are the ceresia oculorum, for the eyes; ceresia antiarcritica, against the gout; ceresia expul- sion, for the head; ceresia epileptica, &c.

A. E. gilt, is prepared by infusing the dry leaves of gill or ground-ivy, in malt-liquor, which hereby becomes impregnated with the virtues of that simple; and is therefore reputed abortive and vulnerary, good in disorders of the breast, and against obstructions of the vixera.

A. E. Dr. Bird's purging, is prepared of polypody, fena, farfepardis, aniceds, baregalls, agrimony, and maiden-hair, put up in a bag, and hung in a vessel of ale.

We also meet in some dispensaries with syrup of ale, made by boiling that liquor to a confection; which has been used against obstructions in the kidneys, and the floor albus.

A. E. ale. See BEER.

A. E. ale-berry, is ale boiled with bread and mace; sweetened, strained, and drunk hot.

A. E. conner, an officer in the city of London, whose business is to inspect the measures of the public houses. There are four of them, and they are chosen by the common-hall of the city.

A. E. houseful must be licenced by justices of the peace, who take recognizances of the persons licensed, viz. 10l. each, and of their sureties, 5l. each, that they will not suffer unlawful gaming, nor other disorderly practices in their houses. By 39 Geo. III. c. 113, every person, excepting those who sell ale in fairs, who shall sell by retail ale or beer without licence, is liable to a penalty of 20l. for the first offence, and for the second shall moreover be incapable of being afterwards licenced to keep an alehouse, with all costs. The licence is granted on the first of September, or within twenty days after, at a general meeting of the justices for the division to which he belongs, upon his producing a certificate to his character, unless, by living in a city or town-corporate, this last circumstance is dispensed with, and continues in force for one year only. Ale-house keepers, selling ale in short measure, are liable to a penalty not exceeding 40l. and not less than 10s. and likewise to a fine of 10s. for permitting tipping, &c. 26 Geo. II. c. 41. 29 Geo. II. c. 12. 5 Geo. III. c. 46. 30 Geo. III. c. 38, and 32 Geo. III. c. 59. By the last act no person can sell wine by retail to be drank in his own house, who has not an ale-licence.

A. E. measure. See MEASURE.

A. E. ale-fizer, a rent, or tribute, yearly paid to the lord-mayor of London, by those who sell ale within the city.

A. E. aler, is an officer appointed and sworn, in every court-leet, to take heed that there be a due size, and goodness of bread, ale, and beer, sold within the jurisdiction of the leet.

A. E. is used by some of our ancient English writers, and particularly in composition with other words, for featial.

Thus, bridal or bride-ale is the feast in honour of the bride or marriage; leet-ale in some parts of England denotes the dinner at a court-leet of a mayor for the jury and customary tenants; lamb-ale is used for an annual feast at lamb-flucting; Whitfun-ale is the name by which in the midland counties the rural sports and feasting at Whitfuntide are denominated; and church-ale was a feast established for the repair of the church, or in honour of the church-saint, &c. See Warton's Hist. of English Poetry, vol. iii. p. 128.

Church-ales, as they are described by Pierce, bishop of Bath and Wells, in his answer to the inquiries of archbishop Laud, are when the people go from afternoon-prayers on Sundays to their lawful sports and festivities in the churchyard, or in the neighbourhood, or in some public-house, where they drink and make merry. By the benevolence of the people at these festivities many poor parishes have cast their bells, and beautified their churches, and raised flock for the poor.

Clerk-ales, or lesser church-ales, were so called because they were for the better maintenance of the parish clerk; and there is great reason for them, says his lordship, for in poor country parishes, where the wages of the clerk are but small, the people thinking it unfit that the clerk should duly attend at church, and not gain by his office, send him in provision, and then come on Sundays and feast with him, by which means he sells more ale, and makes more of the liberality of the people, than their quarterly payment would amount to in many years; and since these have been put down, many ministers have complained to me, says his lordship, that they are afraid they shall have no parish clerks. A 'bid-ale is when a poor man, decayed in his substance, is set up again by the liberal benevolence and contribution of his friends at a Sunday's feast. The people were fond of these recreations, and the bishop recommends them, as bringing the people more willingly to church, as tending to civilize them, and to compose differences among them, and as serving to increase love and unity. But the justices of the peace were of a different opinion, and signed a petition to the king, in which they declare that these revels had not only introduced a great profana- tion of the Lord's day, but riotous tipping, contempt of authority, quarrels, murders, &c. and were very prejudicial to the peace, plenty, and good government of the country, and therefore they prayed that they might be suppressed. Two judges in the western circuit, in 1653, made an order for suppressing them; but Laud complained to king Charles I. of their invading the episcopal jurisdiction, and they were summoned before the council, reprimanded, and enjoined to revoke this order at the next assemblies. Neal's Hist. Puritans, vol. i. p. 567, 410.

A. E., in Roman Antiquity, signifies, in general, games of chance. They were forbidden by the Cornelian, Publician, and Titian laws, except in the month of December. Hor. Od. iii. 24. 58. Martial, iv. 14. v. 89. xiv. 1. These laws, however, were not strictly observed. The character of gamblers, aleatoris or alones, was held infamous. Cic. Cat. ii. 10. Pliny, ii. 27.

A. E., in a more limited sense is applied by Roman writers to a particular game played with dice, in a pair of tables, somewhat after the manner of our back-gammon, or trictrac. Instead of our men, they played with white and black stones, which were moved this way or that, as the dice directed. Alea in this sense appears to have been the same game with what the Greeks called petitia and chibia; the Romans sometimes tabula, tessafrus, and XII. scripta.

A. E., the surname of Minerva, given to her by Ales, king of Arcadia.

A. E., in Ancient Geography, a town of Arcadia, south-east of Stymphalus. It was founded by Ales, and had three
three considerable temples, viz. those of the Ephesian Diana, of
Minerva Alea, and of Bacchus. The fall of Bacchus, called
Skiira, was celebrated every third year; and Pausanias
relates, that on this occasion they privately scourged the
women at the altar of this deity.

Alea was also a town of Thessaly, and another of Spain,
where Steph. Byz. places the Carpetani.

ALEANDER, Jerome, in Biography, was born in
1480, and distinguished himself in the 16th century by his
violent opposition to Luther and the Reformation. Luther
says he was a Jew, probably on account of his accurate ac-
quaintance with the Hebrew language; but Bayle feews that
he was descended from a Catholic family of distinction in Il-
tria. His memory was singularly retentive, and enabled him
to acquire not only the Hebrew, Greek and Latin, but also
many modern languages. According to Luther, who is con-
tradicted by Bayle, he was at Rome in the pontificate of
Alexander VI. and was secretary to the infamous Cesar
Borgia. It is acknowledged, however, that he was invited to
France by Lewis XII. in 1508, to teach the Belles Lettres
in the university of Paris. In this situation he was so much
clemenced, that he attracted the attention of Leo X. and by
the recommendation of this pontiff he became secretary to
the cardinal de Medici; and afterwards succeeded Acciaioli
as librarian of the Vatican. In 1519 he was sent by Leo as
his nuncio into Germany; and in the diet of Worms he de-
claimed for three hours against the doctrine of Luther.
Although he declined the contend to which Luther challenged
him, he had influence sufficient to obtain an edict, which he
himself drew up, for burning his books and prostrating his
person. In 1531 he was again nuncio in Germany, and at-
ttempted, though unsuccessfully, to dissuade Charles V. from
making a truce with the Protestant in this country. Having
been created cardinal by Paul III. in 1537, he was sent a
third time into Germany, where, as the pope's legate, he ex-
serted himself in checking the progress of the Reformation.
Upon his return to Rome he died in 1542, in consequence of
taking too many unnecessary medicines, and just as he was
finishing a large work against all the professors of literature,
which was never published. The works which he has left are
Greek and Latin Lexicon, printed at Paris in 1521, fol. and a
Greek Grammar, printed at Straßburg in 1517, 8vo. Luther
represents Alexander as a man destitute of principle,
violence of passions, inflamable avarice, and licentious conduct;
but he was an adversary, and allowance should be made for
the feelings and language of resentment. Erasmus speaks
with respect of his learning, but complains of his undecided-
ness as a friend, of his want of veracity, and of the injury
which he suffered from his accusations. Alexander's mortifi-
cation at feeling the progress of heresy, notwithstanding his
utmost efforts to refrain it, is emphatically expressed in the
epitaph, which he composed for his own tomb.

"Kατάπνων ὑπὸ διασέκερα ὑπὸ πεπεραὶομένου
Πολέμου, ὄψιν ἡν αὐτοὺς ἐν μοιραῖς.

"Not unwilling I resign my breath,
For to behold life's ill is worse than death."  
Gen. Diet.

ALEXANDER, Jerome, the Younger, the nephew of the
former, was by profession a civilian, and a writer of some
discrimination in the 17th century. He was secretary first to Ban-
dini, and afterwards to Barberini at Rome, and a member of
the literary academy denominated Humorists; for which
society he wrote several pieces, and one on the device adopted
by the society. In the way of his profession he wrote
"Commentaries on the Institutes of Caixus," and as an anti-
quarian he wrote a piece intitled, "Explication antique to-

bulae Marmorae Solis effigie sculptae," &c. printed in 1610
at Rome, in 1616, and at Paris in 1617. He also wrote
Italian and Latin poems, and a couple of ecclesiastical af-
fairs. His death, which is laid to be owing to excess of eat-
ing, happened in 1631; and his funeral, which was magnifi-
cient, was conducted and attended by his associates of the

ALEATORIUM, in Roman Antiquity, was the place
where they played at alea.

The aleatorium was near the sphæricum; that the sporti-
omen, when tired with the pila, or more robust exercices,
might refresh themselves in the aleatorium.

ALEBECCE, in Ancient Geography, a town of Gaul,
supposed to be the same with Albece.

ALEBUS, a river of Spain.

ALEC, in Ethnology, a name given by Gaza, in his com-
mentaries on Aridote, to the fish called by that author ma-
htes, and by Ovid meneca. It is of the sparus kind.

ALECOST. See Tabacetae.

ALECTO, in Mythology, one of the three Furies, daugh-
ter of Acheron and Night, or of Pluto and Proserpine; she
was represented with vipers about her head and wings, and
armed with vipers, scourges, and torches. The name de-
notes envy, or that which has no reft; being derived from
α ἂν ψευδόμενον, I refl. See a fine description of this Fury in
Virgil, Æn. vii.

ALECTO, in Entomology, a species of Sphinx, with the
fore wings grey above, and the posterior red, with a black
base and margin; found in India.

ALECTOR, in Ornithology, a species of Crax, with a
yellow cere, black body, and white belly.

ALECTORIA, derived from alactor, a cock, in Natu-
ral History, a fome faid to be found in the stomach, liver, or
rather gall-bladder of old cocks.

It is ordinarily the figure of a lupine, and seldom ex-
cedes the bigness of a bean. It has abundance of virtues at-
tributed to it, but most of them are fabulous.

This is otherwise called alectorius lapis, sometimes alector-
libera, in English the cock-stone.

The more modern naturalists hold the alectorius lapis to be
originally swallowed down, not generated in the stomach or
gizzard of cocks and capons.

ALECTORICARDITES, compounded of the Greek
alactor, cock, and νεφρός, heart, in Natural History, a name
given by Plut to a figured fome resembling a pullet's heart,
with the fat near the fahas of it, and the coronary vessels de-
scended from it.

ALECTORIUS lapis, is used for a small species of bufo-
rites, or disjoint segment of a palate of a fifh, approaching to
the nature of the cedalonius lapis.

ALECTOROLOPHUS, in Botany. See BARTIA, PEDICULARIS, and RHINANTHUS.

ALECTOROMANTIA, from alactor, a cock, and μαν-
tia, divination, in Antiquity, an ancient kind of divination,
performed by means of a cock.

This art was in use among the Greeks; and the usual
maner of it was this. A circle was made on the ground,
and divided into twenty-four equal portions, or fpaces; in
each of which spaces was written one of the letters of the
alphabet, and upon each of these letters was laid a grain of
wheat. This done, a cock was turned loose in the circle,
and careful observation was made of the grain he pecked.
The letters corresponding to those grains were afterwards
formed into a word; which word was to be the answer de-
fined.

It was thus that Libanius and Jamblichus sought who
should succeed the emperor Valens; and the cock answering

VOL. I.
to the spaces of F.O., they concluded upon Theodore, but by a mistake, instead of Theodosius. The truth of this story is disputed.

There are also other species of alderetornia: in some the angi, in others, addressed to the crown of the neck, wherein regard was had to the time of the day, whilst before noon or after: to which some added the consideration of the sign the sun was in, and the motion of the moon. Others speak of a kind of alderetornia performed by help of a ring.

Phil. Trans. N. S. 162.

ALECTRA, in Botany, a genus of the dicynum anginodermum class and order: its characters are, that the calyx is a perianthium, one-leaved, two-dipped, upper lip two-cleft, lower three-cleft; the leaves ovate, obtuse, shorter than the tube; the corolla one-petalled, tubular; the tube gradually widened; the border expanding, five-parted; the parts broadly lanceolate, obtuse; the filaments, four filaments, inserted into the tube, filiform, bearded, of the length of the tube, two of them a little shorter, anthers twin; the pistillum, a germ exiate, fylle filiform, of the length of the filaments, stigma incurved, a little thicker than the style, and of the same length, situated on both sides; the pericarpium, a capsule, ovate, oblong, smooth, two-celled and two-valved; the seeds foliary and ovate. There is one species, viz. A. Caprifer, a native of the Cape of Good Hope, in grassy places near rivers, flowering in November and December, and growing black in drying. Martyn.

ALECTRAGONUS graven. See Festucu.

ALED, in Geography, a river of Wales, in Denbighshire, which runs into the Elwy.

ALEE, in Sea-Language, the situation of the helm, when it is pulled down to the lee-side of the ship, in order to put the ship about, or lay her head to the windward. See Hardehe.

ALECHIMO, in Geography, a baiia or district of the island Cyprus, situated on the coast, containing 28 villages, and 10,000 people.

ALEGAMBE, Philip, in Biography, a learned Jesuit, was born at Bruffel in 1592; and having finished his education, entered into the service of the duke of Olfara in Spain, and accompanied him to Sicily. After he assumed the habit of a Jesuit at Palermo in 1613, he taught philosophy at Cratz in Austria; and became professor and doctor of divinity in 1629. During this period he travelled through Germany, France, Spain and Italy, and was sent by the pope Urban VIII. to teach in his embassy to pope Urban VIII. When this mission was finished, he was retained at Rome by the general of the Jesuits as secretary of the Latin dispatches to Germany, and afterwards appointed privy of spiritual affairs, and auditor of confessions in the professed house. He died of the dropsy in 1656. His chief works was a "Bibliotheca de Antwerp," printed at Antwerp in 1645, and at Rome, by Botola, in 1675. Gen. DicM.

ALEGER, a name given to an inferior sort of vinegar, made of ale, or malt liquor, instead of wine. Power. Has given a description of the cheese in Alger. V. Power, Exper. Philos. Off. 5. p. 32.

ALEGRANZA, in Geography, one of the smaller of the Canary islands, situated at the north-east end of the Lanzarote, one of the larger. ALEGRE, a town of France, in the department of the Upper Loire, and district of Puy-en-Velay, five leagues south-east of Brooade, and four north-east of Puy-en-Velay.

ALEGRETE, a town of Portugal in Alentejo, upon the river Caiu, with the title of a marquisate, and containing about 900 inhabitants; 24 leagues south-east of Pont-Alegre. N. lat. 40° 6'. W. long. 6° 36'.

ALEGRINUS, John, in Biography, cardinal and patriarch of Constantinople, was a native of Abbeville in Picardy. He was legate a latere in Spain and Portugal, and died in 1240. His works were formerly in estimation, but are now disregarded.

ALEHOOF, in Botany. See Glichoma.

ALEI, in Geography, a river of Russia, which runs into the Ob on the left side of it.

ALENTHA, from 24.2.4, ecuone, in the Materia Medica of the ancients, a word used for all fatty bodies whatever. The oils of vegetables, and the fat of animals were all called by this general name. But these simple substances were not the only ones called by it, for it is very frequently used to express any sort of medicated oil impregnated with aromatic vegetables: but its general acceptation in this sense, was for such compositions as were intended to anoint the body; and therefore they were properly only vegetable or animal fats impregnated with the lighter parts of plants, and not clogged with an addition of powders, or with wax, or any thing of that kind, which might have given them the confluence ofointments. The ancient physicians were very fond of these compositions, which they applied either to some diseased part only, or to the whole body, and after they had made the patient use the warm bath to relax and open the pores.

ALEIUS CAMPUS, in Ancient Geography, a plain of Cilicia, placed by Strabo to the east of Sarus, between Adana and the sea. It is so called from Bellerophon's wandering and perishing there, after being thrown off Pegusus.

ALEKSEVKI, in Geography, a town of Russia, in the government of Simbirk, 30 leagues south-east of Simbirk. N. lat. 53° 15'. E. long. 50° 14'.

ALEKSIJEKSKE, a town of Russia, in the government of Saratov, 37 leagues north-east of Saratov.

ALEKSN, a town of Russia, in the government of Tula on the Ooca, nine leagues north-east of Kaluga. N. lat. 54° 44'. E. long. 36° 44'.

ALEMA, a city of Ciled, beyond Jordan, mentioned in the Macab. v. 26; and perhaps the same with Helmont-Debehani.

ALEMAN, Louis, in Biography, was born in 1390, and advanced rapidly through several gradations of ecclesiastical preferment to the archbishopric of Arles. He was much respected by Louis III. king of Naples, who, on his account, confirmed the privileges granted to the city of Arles; and he was honoured by pope Martin V. who had employed him in several services, with the dignity of cardinal. After the death of Martin V. he embroiled himself with pope Eugenius IV. by holding the council of Bari, of which he was president, in contradiction to his wishes; and he was excommunicated by this pontiff. He was again restored to his communion and dignities by pope Nicholas V. and sent as his legate to Lower Germany. On his return to his dioceses, he was usefully employed in reforming the clergy, and instructing the people. He died at Salon in 1450, and was canonized. With the virtues of an ecclesiastic he united the talents of a statesman. Nouv. Dict. Hist. Gen. Biog.

ALEMAN, Louis Augustin, was born at Grenoble in 1653, where he followed the profession of an advocate. His works were, "Remarks of M. de Vaugelas on the French Language," with a preface by himself; "New Observations, or a Civil War in France Upon Language," 12mo. Paris, 1683; "Monastic History of Ireland," 12mo. Paris, 1690; "Historical Journal of Europe for the Year 1694." Nouv. Dict. Hist.

ALEMANN, Alemanni, of Aleman, in Ancient Geography
Geography and History, the denomination of a body of Suevi, who appeared on the banks of the Main, and in the neighborhood of the Roman provinces, in quest either of food, or plunder, or of martial glory, about the year 214, or the 4th of the reign of the emperor Caracalla. Dion. C. H. L. X. v. p. 1350. Aenius Quadratus, an original Roman historian, cited by Agathias, (ib. i. c. 5.) informs us, that this hostile army of volunteers, which coalesced into a great and permanent nation, was composed of many different tribes, and on this account assumed the name of Allemanni, or All-men, i.e. men of all nations, to denote at once their various lineage, and their common bravery. They consisted chiefly of Suevi, who, in process of time, were joined by several other German nations and some Gauls; for we are told by Tacitus, that a considerable number of Gauls, abandoning their own country, went to settle beyond the Rhine, in that territory which had formerly belonged to the Suevi. Aurelius Victor, St. Jerome, and other writers place them between the Danube, the Upper Rhine, and the Main, in the present duchy of Wirtemberg. They were numerous and warlike, and were chiefly celebrated for fighting with great dexterity and bravery on horseback. Their abhorrence of slavery was so great, that even those who were taken prisoners by Caracalla chose rather to die than to be sold for slaves: for when they were actually sold, they not only destroyed themselves, but some of them dispatched also their children. Dion. C. H. L. X. v. p. 86. Their government was monarchical; and the objects of their worship were the same with those of the other German nations. Caracalla, in consequence of a victory which he gained over the Alemanni, in the year 214, was distinguished by the surname of Alamanicus. In 234, the 15th year of the emperor Alexander Severus, the Alemanni, accompanied with other German nations, passed the Rhine, took possession of the forts on the banks of the river, and ravaged Gaul. Alexander, returning from Persia, hastened to the banks of the Rhine, and as the Alemanni had repulsed the river upon the news of his approach, he ordered a bridge to be thrown over, preparing to attack them in their own country. But being affrighted by the numerous flocks, at the sight of Maximinus, this business devolved upon his successor. Accordingly Maximinus pursed them with great slaughter, and took many of their prisoners, with great spoil of corn and cattle; and the advantages he gained were thought to be so considerable, that the senate conferred upon him and his son the title of Germanicus. In the year 236, the fourth of Valerian's reign, the Alemanni made an unexpected incursion into Gaul, and laid waste the country; whilst those who dwelt on the banks of the Danube penetrated through the Rhenish Alps into the plains of Lombardy, advanced as far as Ravenna, and displayed the victorious banners of barbarians almost in sight of Rome. A large army was suddenly convened, at the appearance of which the Alemanni were terrified, and retired into Germany laden with spoil. On another occasion 500,000 of this warlike people are said to have been vanquished in a battle near Milan, by Gallicanus, at the head of only 10,000 Romans. Whether we give credit to the relation of this victory or not, Gallicanus seems to have formed an alliance with the Alemanni, and protected Italy from their fury, by marrying Pipa, the daughter of a king of the Marcomanni, a tribe of the Suevi, often confounded with the Alemanni. A party of them was defeated by Claudius in 258, and compelled to leave themselves by a precipitate flight into their own country. As soon, however, as they heard of the death of Claudius, they prepared for again invading Italy; 40,000 horse appeared in the field, and the number of the infantry doubled that of the cavalry. Their first object was a few cities on the Rhenish frontier; but as they proceeded they enlarged their views, and they traced a line of defences from the Danube to the Po. Aurelian, A.D. 270, having collected an active body of troops, marched with silence and secrecy along the skirts of the Hercynian forest; and when the Alemanni, laden with the spoils of Italy, arrived at the Danube, the Roman army, which lay concealed, intercepted their return. The dismayed barbarians, enclosed by the Roman legions, and reduced to a condition abject and distempered, sued for peace. Their ambassadors were received by Aurelian with every appellation of dignity; and when they ceded to his offer to conciliate a large sum, as the price of the alliance which they offered to the Romans. The emperor's reply was stern and imperious. He treated their offer with contempt, and their demand with indignation; and dissected them with the choice only of submitting to his unconditional mercy, or awaiting the utmost severity of his resentment. Aurelian, being suddenly called away into Pannonia, committed the destruction of the Alemanni, either by sword or by famine, to his lieutenants. But the barbarians made their escape, and returned towards the mountains of Italy. As soon as the emperor heard that they had liberated themselves, and were ravaging the territory of Milan, he hastened to march to the relief of Italy. The Alemanni, in the mean while, had spread themselves from the Alps to the Apennines; and, by a defolatory war, the force of the enemy remained unsubdued. Three considerable battles are mentioned, in which the principal force of both armies was obstinately engaged. In the first battle, fought near Phcenitia, the Romans received a severe blow, that the immediate disjunction of the empire was apprehended. But the firmness of the emperor restored in some degree the honour of his arms. The second battle was fought near Pano in Umbria; and here the Alemanni were totally and irrecoverably defeated. The flying remnant of their host was exterminated in a third and last battle near Pavia; and Italy was rescued from the inroads of these barbarians. During the alarm which preceded the decisive battle of Pano, the Sibylline books were consulted, A.D. 271; and the ceremonies which were enjoined were punctiliously observed. "These superfluous arts, says Mr. Gibbon, however puerile to themselves, were subfervient to the successes of the war; and, if, in the decisive battle of Pano, the Alemanni fancied they saw an army of espectres combing on the side of Aurelian, he received a real and effectual aid from this imaginary reinforcement." The emperor Probus, A.D. 277, delivered Gaul from the invasion of the Germans, and recovered 70 flourishing cities, which had been oppressed by those barbarians, who, since the death of Aurelian, had ravaged that great province with impunity. Probus pursed his Gallic victories, passed the Rhine, compelled nine of the most considerable princes of Germany to repair to his camp, to fall prostrate at his feet, and to accept such conditions as he thought proper to dictate: and in order to raise a bulwark against their future incursions, he constructed a stone wall of considerable height, and strengthened it by towers at convenient distances. From the neighbourhood of Neustadt and Raiffen on the Danube, it stretched across hills, valleys, rivers, and morasses, as far as Wimpfen on the Neckar, and at length terminated on the banks of the Rhine, after a winding course of near 200 miles. Within a few years after the death of Probus, this wall was overthrown by the Alemanni. In 287 they made another incursion into Gaul, but were defeated by Maximian, who in the following year passed the Rhine, and laid their country waste wherever he came with fire and sword. Dioclesian also at the same time entered Germany through
through Rhétia, and is said to have extended the confines of the empire to the source of the Danube. In the year 291 the Burgundians feized on part of the country belonging to the Alemani; and in 301 Conulfian us Chlorus, the father of Conulfian the Great, gained a signal victory over them, on which occasion the Alemani are said to have lost 65,000 men. Notwithstanding this loss, they did not long remain quiet; for in 310 they again crossed the Rhine, and ravaged the neighboring provinces: but Conulfian marching against them, defeated them in a battle, and obliged them to quit their booty and repair the Rhine. Some say he was called Maximus on account of this victory. In the 15th year of Conulfian's reign, the Alemani again attempted to make an incursion into Italy; and having advanced as far as the lake of Conifance, the emperor marched against them, and put them to flight. In the course of the same year another body of them, breaking into Gaul with the Franks and Saxons, took and plundered above 40 towns on the banks of the Rhine, and among these was the city of Cologne, which they almost entirely ruined. They were at length driven out of Gaul by Julian; but assembling near Strasburg, they marched against them, A.D. 317; and after victoriously they had remained for some time in full pursuit, the Alemani were entirely defeated, and driven completely out of Gaul. Julian ravaged the countries of the Alemani and their allies for some time, and granted them a truce for ten months. When the truce expired, he passed the Rhine on a bridge of boats, entered their country, and compelled them to sue for peace. Upon the death of Julian they again ravage Gaul; defeat the Romans in a pitched battle, but were afterwards defeated by Jovinus in three battles, A.D. 366. In the close of the following year they again rally, and pass the Rhine; but Valentinian gains a signal victory over them. In 369 Valentinian invades their country; and in 374 concludes a peace with their king Macrianus. In 378 they again pass the Rhine, and seize the neighboring provinces, but are defeated with great slaughter by Gratian. In 388 they submitted to Maximus, who had usurped the empire in Gaul, and agreed to pay him a yearly tribute. In the reign of Honorius a colony of the Alemani was allowed to settle in that part of the present Switzerland, which is separated by mount Jura from the Franche Comté, and by the lake of Geneva and the Rhine from the present Savoy and province of Vienne. About the year 411 the country bordering on the lake Lemano, or the lake of Geneva, was, according to Servius, inhabited by the Alemani. In 477 Audaciscus, king of the Saxons, and Childeric, king of the Franks, marched against those who had settled among the Alps, and put many of them to death. Upon the destruction of the western empire, the Alemani subdued that part of Gaul, which is now known by the name of Alsace, where they settled. These were joined by their countrymen in Germany, and those who dwelt between Mount Jura and the lake of Geneva; and in 496 entered Germania secunda, and waited the country; but they were overcome by Clovis, king of the Salian Franks, and dispersed. Those who settled in Alsace and near the lake of Geneva acknowledged him for their king. Others took refuge in Rhaetia and Noricum, where they were allowed by Theodoric, king of Italy, to reside. Many of them were transplanted by the fame prince into Italy, and the rest were permitted to settle between the Alps and the Danube. From this time the Alemani had no king of their own; but continued, as they were dispersed in several countries, subject partly to the Ostrogoths, who were masters of Italy, and partly to the Franks, who had dominion in Gaul. When the Ostrogoths ceded their territories out of Italy to the children of Clovis, the Alemani, those excepted whom Theodoric had transplanted into that country, submitted to the Franks. Gibbon's History, &c. vol. i. p. 417, &c. Vol. ii. p. 21, &c. Aene. Un. Hist. vol. xvii. p. 293-299.

ALEMMANNIA, or ALEMANNIA, in Ancient Geography, a name given to Germany, which was not known before the time of the Antonines, and then applied only to a part of it. The appellation is derived from the Alemani.

A L E M B E R T, JOHN LE ROND D', in Biography, an eminent mathematician and philosopher, and an elegant writer, was born at Paris, November 16, 1717. His surname D'Allemont was derived from that of the church near which he was expelled as a foundling by his mother, who is said to have been Madeleine Tencin, sister of the Abbé, afterwards Cardinal, Tencin. His father Defouches Canon, hearing of his situation in the house of a glazier, with whose wife he was put to nurse, yielded to the impulse of affection and duty, and took measures for his future subsistence and education. In acquiring the first rudiments of education among the Jansenists, he manifested signs of those extraordinary powers, by which he was afterwards distinguished. At the age of 10 years, his schoolmaster declared that he had nothing further to teach him; and during his attention to theological studies, he composed at a very early period, "A Commentary on the Epistle of St Paul to the Romans," which led the Jansenists to expect, that he would be an able champion in their cause, and become a second Pascal. But pursuing his education at the college of Mazarin, he transferred his attention from theology to mathematics, in which he found greater satisfaction, and in the knowledge of which he afterwards excelled.

Upon leaving the college, he retired to the house of his nurse, for the purpose of enjoying a tranquil retreat, and of prosecuting his studies without interruption. He hoped likewise to testify his gratitude for her former kindnefs by sharing with her the means of subsistence with which he was provided, and thus contributing to the increase of her domestic comfort. In this obscure situation he lived for many years, with the greatest simplicity, and derived satisfaction to himself from administering to the happiness of those with whom he was connected. His holier had no just conception of the extraordinary talents of his guest; and she could not help occasionally considering him as still an object of compassion. "You will never," said the one day to him, "be any thing but a philopber; and what is a philopher but a fool, who toils and plagues himself, that people may talk of him after he is dead?" With a view to the improvement of his fortune, or rather of the means of comfortably subsistence, he followed the advice of his friends in directing his attention, first, to the law, in which he took his degrees, and afterwards to medicine; but his attachment to mathematics prevailed over every other consideration, and induced him to decline the advantage which he might reasonably expect to derive from any other lucrative profession. At the age of 24, in 1741, he attracted attention by correcting the errors of Reynouard's "Analyse De Montre," which was a work of high estimation in the department of analytics; and he was admitted a member of the Academy of Sciences. He then affiduously examined the path in which a body moves in falling obliquely from a rarer into a denser fluid; and this investigation, which he satisfactorily prosecuted, engaged him in extending his views to the forces of moving bodies. The result of his speculations was, his "Treatise on Dynamics;" (Traité de Dynamique, 4to, Paris, 1743. Ed. 2. 1758;) in which he separates into two parts the action of the moving powers,
and considers the one as alone producing the motion of the body, in the second instant, and the other as employed to destroy that which it had in the first. This principle had been applied by M. d'Alembert, so early as the year 1744, to the theory of the equilibrium, and the motion of fluids, (Traité de l'Equilibre et du Mouvement des Fluides, Paris, 1744. Ed. 2. 1770,) and the discovery of it was succeeded by a new calculus, the first essays of which were published in a "Dificourse on the General Theory of the Winds," (Réflexions sur la Causé Generale des Vents, Paris, 4to, 1747.) which the academy of Berlin honoured with the prize-medal in 1746; and at the same time the author was elected an honorary member. This work was dedicated to the king of Prussia, who was terminating a glorious campaign by an honourable peace, in the three following Latin verses:

"Hæc ego de ventis, dum ventorum aecef alias
Palantes agit Aureliacos Fredericus, et orbi,
Infignis lauro, ramum pretentit olivae."

"Swifter than wind, while of the winds I write,
The fees of conquering Frederic speed their flight;
While laurel o'er the hero's temple bends,
To the tir'd world the olive branch he sends."

The numerous and valuable productions above recited, entitle d'Alembert to rank among the most celebrated mathematicians of the age. But he is no less distinguished by his genius, judgment, and taste, than by his mathematical knowledge; and he is deservedly regarded in France as one of the first writers of that nation. To him the original design of the French Encyclopedia has been generally ascribed; a work which was begun in 1750 by d'Alembert, Diderot, Voltaire, and many other learned men, and which has contributed in a very eminent degree to the diffusion of knowledge. Many of the most valuable articles in mathematics, history, and polite literature, were composed by M. d'Alembert; and the preliminary discourse, concerning the rise, progress, connections, and affinities, of the various branches of human knowledge, will be ever confidered by the best judges as the evidence of a well-informed and comprehensive mind, as a specimen of judicious arrangement and correct criticism, and also as a model of just thinking and good writing. Besides the valuable store with which he furnished this treasure of universal science, his talents were displayed in many separate publications on subjects of classical and polite literature. His "Traduction of select parts of Tacitus, ("Traduction de divers morceaux deTacite,") in 2 vols. 12mo. affords, says one of his biographers, an elegant specimen of his learning; and his "Memoirs of Chriftina queen of Sweden," is a masterly piece of biographical writing, in which the author evinces his acquaintance
acquaintance with the rights of mankind, and his courage in exerting them. His "Epistle on the Intercourse of Men of Letters," with Persons high in rank and office, exposed the mean servility of the former, and the insolent tyranny of the latter. A lady of the court, who heard the author blamed for exaggerating the despotism of the great, and the insufficiency which they required, observed: "If he had confuted me, I could have told him still more of the matter." These pieces, with other essays on subjects of polite literature, "Eloges" on Bernouilli, Terrasson, Montefquiens, Mallet and Dumaresqu, and "Elements of Philosophy," were collected into 5 vols. 12mo, about the year 1760, and published under the title of "Mélanges de Littérate, de Littérate, et de Philosophie." In 1765, M. d'Alembert published his "Dissertation on the Destruction of the Jefuits," (De la Destruction des Jéfuites,) in 12mo. Paris; a work which not only ridicules, with the keenest satire, the disciples of Ignatius Loyola, but treats with just severity their adveraries, and which exposed the writer to many opprobrious and unmerited reflections. In the year 1772, he was chosen secretary to the Academy of Sciences; and soon after this honour, he formed the design of writing the lives of all the deceased academicians from 1700 to 1771, as a continuation of the "History of the Academy," published by Medri, Pellon, and d'Olivet. This design he executed in three years, by composing 70 elegies or panegyrics, comprised in 6 vols. 12mo, and published at Paris in 1787, under the title of "Histoire des Mémorables de l'Académie Française, morts depuis," 1700, jusqu'en 1771. "This collection, notwithstanding some inequalities of style, is justly admired; it abounds with lively portraits, amusing anecdotes, ingenious paradoxes, and just reflections." As soon as M. d'Alembert engaged in the design of publishing the Encyclopædia, he emerged from obscurity, and became an object of attention, not only in the circle of his friends, to which he had hitherto been confined, but to the public at large. Whilst many approved and commended both the design and the execution of it, the freedom with which several articles were written, was condemned by others, and subjeeted M. d'Alembert, as well as others of his colleagues, to considerable obloquy. However, his literary merit was now thought sufficient to entitle him to royal patronage. In 1756 the interest of the minister, Count d'Argenson, obtained for him a pension of 1200 livres. In 1762, he was invited by the empress of Russia to undertake the education of her son, the Grand Duke, with the offer of a salary of 100,000 livres, and other privileges: but this lucrative and honourable office, though enforced a second time by a letter under the empress's own hand, his attachment to his country and friends, and his preference of literary leisure, induced him to decline. The next year he was invited to an interview with the king of Prussia at Weil; when they met, the king affectionately embraced him; and enquiring of the philosopher, "whether the mathematics furnished any method of calculating political probabilities?" M. d'Alembert replied, "That if such a method existed, it could be of no use to a hero, who could conquer against all probability." The king offered him the presidency of the Academy of Berlin, vacant by the death of Maupertuis. But though the ferment, occasioned in France by some articles in the Encyclopædia, and especially that of Geneva, and the odium he had personally incurred, might have led him to seek an asylum in the court of a philosophical prince, he declined accepting the flattering proposal; nevertheless a correspondence subsisted between the king and him as long as he lived. The letters are published in the "Polhumous works of the king of Prussia." This correspondence, and that with Voltaire and other eminent persons, his constant intercourse with learned foreigners, as well as disillusioned characters at home, and his influence in the academy, conduced to give importance to M. d'Alembert; and though he was called the Mazarin of literature, candour leads us to believe that his influence was owing more to his talents, learning, and virtues, than to artful management, and fupple address. His abhorrence of superflity and pritectude, it must be allowed, drove him into the extreme of infidelity; and he was not only lax in his religious principles, but on some occasions indecorous in his mede of attacking doctrines that have been generally received even among those who have been accustomed to think freely on the subject of religion. He seems to have adopted that style of deified nature, which becaves the world of a designing cause, and predilecting intelligence; and his zeal in propagating the free notions he had imbibed, actuated by his enmity to the Jesuits and clergy, and animated by intercourse with confidential friends of the same description, sometimes received a check, and required a leon of moderation even from the philosopher Frederic. "The eccentricity of his opinions," says a liberal biographer, "did not, however, destroy the virtues of his heart. A love of truth, and a zeal for the progress of science and freedom, formed the basis of his character: strict probity, a noble disinterestedness, and an habitual desire of obligeing, were its distinguishing features. Many young people, who discovered talents for science and learning, found in him a patron and guide. To worthy men, even in adversity and persecution, he was a firm and courageous friend. To those who had shewn him kindness, he never ceased to be grateful. Gratitude induced him to dedicate two of his works to two ministers, when they were in disgrace, the Count d'Argenson, to whom he owed his pension, and the Marquis d'Argenson, who had given him many proofs of respect and esteem. When in early life, Mad. de Tencin, informed of his singular talents, came to him, and fondly entreating him, discovered to him the secret of his birth: "What do you tell me?" he cried out: "Ah! you are but a stepmother; it is the glazier's wife who is my mother." Through life he retained for his nurse the affectionate tenderness of a grateful son. He remained in her house near 30 years; and did not leave it till in 1785, after a severe illness, he physicin represented to him the necessity of removing to a more airy lodging. His health, being reënited, he continued to occupy his honourable station among philosophers, till the 29th of October, 1783, when, in the 66th year of his age, he expired; leaving behind him the reputation of amiable virtues and eminent talents. Perhaps no charaster has ever appeared, which has more completely exemplified the union of strong mathematical genius with an elegant taste for polite literature." His eulogy by Condorcet is published in the "Histoire de l'Academie Royale des Sciences," 1784. Monthly Rev. vol. xxvi, p. 238. Nouv. Dicr. Hist. Hutton's Math. Dicr. Gen. Biol. ALEMERIC, Linnet, Alembie, Fr. An alembic is one of the numerous articles of distillatory apparatus. In the English laboratories and manufacturies its use is almost superceeded by the retort and still; but on the continent, especially in France, it continues to be the favourite vessel for distillations in the large way. The French indeed appear to have no word in their language synonymous with the English one still, and hence the difference between these two vessels is but very imperfectly noticed even in their best authors. As distillation depends on the separation of the volatile from the more fixed parts of a compound by the action of fire, it is obviously essential to
every apparatus for this purpose that it should consist of
at least two parts; the one for the reception and heating
of the matter to be distilled, and the other for the collec-
tion and condensation of the more volatile part when in
a state of vapour. Of all the vessels defined to this use
the alembic is the simplest and the most ancient.

Both Dioscorides and Pliny mention the 
\( \text{alembic} \) (ambix) which is described by the latter of these writers, as a
hemispherical iron cover, luted upon the earthen pots in
which mercury was procured by the distillation of cinnamar:
its proper, however, that the ambix was in the time of
Pliny a mere plain still, without any beak or gutter,
but that the mercury was being wiped off in small
drops from the inside of the vessel, the necessity of which
manipulation would be superceded by the invention of a
beak. The alchemists having adopted this instrument,
affixed the Arabian article \( \text{al} \) to its name, and made con-
siderable alterations in its form. Their object in all dis-
tillations and distillations being to separate, as much as pos-
able, the most volatile products from those that are less
so, they imagined that the greater distance which the va-
pour had to pass through, in its passage from the boiler
to the condenser, the more perfectly would the spirit or
quintessence be dephlegmated; for this purpose the body
of the alembic was made of a globular form, terminating
above in a long narrow neck, to the end of which was
luted the capital; (Chemistry, plate iii. fig. 10. A. the
body, B the neck, C the capital) sometimes for the purpose
of more effectually keeping down the impure particles,
the neck was bent in a zig zag or spiral direction. The char-
acteristic difference between an alembic and a still seems to
be in the condensation of the head or capital, which in the
alembic is contrived not merely to collect, but to condense
the vapour; whereas, the corresponding part of a still
serves merely to collect the vapour, which is transmitted
in an elastic state through the neck, and condensed in the
worm. In the figure already referred to, the distance
between the body and the capital is so great, that much of
the heat must be given off from the vapour before it
arrives in this part; the mere refrigerating power, there-
fore, of the atmosphere is amply sufficient to condense the
vapour into drops on the inner surface of the capital,
which, trickling down into the channel or gutter at the
bottom, are delivered by the beak into any vessel placed
to receive them. The length and narrowness, and con-
vulsion of the neck were, however, found to condense so
much of the vapour before it reached the capital, as to
render all procresses, in which it was employed, unsuccess-
tively tedious; besides requiring so high a heat as to alter
and injure the products very considerably; the neck was
therefore shortened and made wider, and in consequence
of this the vapour came into the capital more heated than
before; it was necessary to substitute a more powerful re-
frigertating caufe to the conical and varying action of the
external air; with this intention, the capital of the met-
talus alembics was inserted into a vellum of water, (fig. 11.)
called a refrigertatory, and thus the alembic, as far as con-
cerned the number and general disposition of its parts, was
completed.

The glass and earthen-ware alembics soon received all
the perfection of form which their materials would allow;
the body, instead of being a globe with a long neck, was
altered into a cucurbit; and the capital assumed a more
conical shape; the two parts of the apparatus were also
fitted closely into each other, by grinding with emery.
The irregular expansion and contraction of glass by heat,
rendered the use of a refrigertatory impossible, so that
when distilling briskly, it is necessary to cover the capital
with cloth soaked in cold water and frequently renewed;
thus requiring a constant attention, besides running the
risk of cracking the cucurbit, by a drop of cold water falling
upon it from the head. On this account, the glass alembic
is but little employed, although capable, when skillfully
managed, of distilling a much larger quantity in a given
time, than a vellum of equal capacity. (Fig. 12. A. the
body of the cucurbit, B the capital, C the cylinder, D the
neck.)

The metallic alembics being formed of more manageable
substances, and being appropriated to large procresses,
in which economy of time and fuel was of great importance,
invited and obtained a number of valuable improvements.
The most considerable of these are due to Beaume, a re-
presentation of whole alembic, as further improved by
Chaptal, is given in fig. 14. This vellum is composed of three
parts; the one marked A is the boiler, being a
hollow cylinder of tinned copper, of equal diameter at top
and bottom, but bulging out into a shouder at \( p \), by
which it is suspended over the furnace; in this part are
fixed two handles \( a a \), and a short pipe \( f \), fitted with a
cork, for the purpose of supplying water or any other fluid,
without the necessity of taking the apparatus as a
whole. B is a cucurbit or balneum made of tin,
of a cylindrical figure, with two handles, and a collar on
the outside, which fitting into the inner groove \( b \), of
the boiler, supports it when suspended within this last.
This third part of the apparatus is the capital, a section
of which is represented at C: \( s \) is the collar, by which it is
fixed on the inner groove \( b \), of the cucurbit \( B \); \( k \) is
the proper capital, in shape a short cone, made of tin,
terminating at its base in a circular channel \( a \), slightly inclined
wards the beak \( n \). Surrounding the capital, and closely
folded to it is the refrigeratory \( e \), made of copper,
and accommodated in shape to the capital; at the bottom is
a large stop-cock \( p \). For the distillation of water, or of
spirits from the wath, where a brisk boiling heat is required,
the liquor is put into the boiler, and the cucurbit is
omitted; but for the rectification of alcohol and other
similar procresses, the substance to be distilled is to be put
into the cucurbit, and the boiler being filled with water,
the heat is conveyed through the medium of this fluid,
and of course is more moderate and equal.

Most of the French brandies are prepared in alembics,
whereas all British spirits are manufactured in stills; the
advantage of the alembic is that less fuel is required, and
the spirit is but little exposed to the risk of becoming
empyreumatic. Its disadvantage consists in being less
expeditious, and in requiring greater accuracy in the tempera-
ture of the refrigeratory; if too cold, the vapour is
part condensed before it touches the inside of the capital,
and falls back into the boiler; if too hot, a portion of va-
pour escapes into the air; a greater proportion of water is required for the condensation of a given quantity
of vapour, than where a worm and still is made use of.

de Pharmacie.—Macquer's Dict.—Boerhave's Chemistry.

ALEMBROTHER. SALT OF. This term, the use of
which is derived from the alchemists, has been successively
applied to a variety of preparations and native salts. The
general idea which the word seems to convey, is that of
a flux or solvent, either to assist in the fusion of metallic
ores and earths, or to dissolve obstructions, and attenuate
vexed humour in the human body, when employed medi-
sicinaly. A peculiar kind, found at mount Olympus in
the island of Cyprus, was called alembroth, which was
said...
ALENQUER, in Geography, a town of Portugal, in Estremadura, situated on an eminence near a small river, which falls into the Tagus. It is said to have been built by the Alans, being anciently called Alenker rana, i.e. the temple of the Alans. It contains about 2500 inhabitants, is a marquisate, and has 13 parishes belonging to its district.

ALENSTEIG, a town of Germany, in the archduchy of Austria; four miles south of Bohmish Waidhoven.

ALENTAKIE, or ALENTÁK, a province of Littóon, upon the gulf of Finland; the capital of which is Narva.

ALENTEJO, or ALENTÉGIO, one of the largest but least populous provinces in Portugal, situated between the rivers Tagus and Guadiana, and extending from the mountains of Algarve on the south, to the frontiers of Estremadura on the north, and from the sea and Tagus on the west, to the borders of Spanish Estremadura and Andalusia on the east. Its length from north to south is computed at 36 leagues, and its breadth from east to west is nearly the same. It is called Alemtejo, i.e. alem do rio Tejo, q. d. beyond the river Tagus, because it lies in that direction with regard to Estremadura and the countries further north. It contains four cities, the chief of which is Evora, 105 towns, 358 parishes, and about 339,355 inhabitants. The towns are very populous; but there is a scarcity of villages, which contribute most to cultivation; and another cause of its scanty population is its always having been the theatre of war between Spain and Portugal. It contains a great number of fortresses, maintains ten regiments of infantry and four of cavalry, which are constantly recruited here, and form a fourth part of the military establishment of the whole country. The lands in this province are far from being well cultivated, being found only once in three years; though some of our geographers represent it as a fertile province, and call it the granary of Portugal. Its principal products are wheat and barley, and in many places it also affords grapes, olives, and other fruits, as well as game and fish. Some parts yield marble and gneiss. In this province there are three kinds of foil, viz. fertile black bold flat earth, which is found in the red clay of Elvas, Campomayor, Olivença, Fronteira, Estremoz, Beja, and Serpa; a lighter earth mixed with a little sand, which forms the foil round Evora and Arrabobos, where the bad kinds of wheat, barley and rye, succed very well, and cork trees and evergreen oaks also grow; and a sandy barren soil, which forms the heaths of Catarrinho, Ponte de Sor, Monte Argil, Tanus and Vendas Novas, a tract of country about 35 leagues in circumference. At present these heaths, which afford beautiful varieties of heath plants and evergreen shrubs, serve only as pasture for goats; though the clayey soil is very capable of cultivation; as are also marshy tracts which might be drained. The rivers in Alemtejo, particularly in winter, are very rapid, and do much damage. There is a small chain of mountains in this province, about seven leagues long, and two and one-half broad, which runs between the city of Evora and the town of Estremos, and which in reality belongs to the chain of Toledo. The coniferous trees are generally covered with cedars, which is used in some parts for heating ovens, and in other parts as pasture for cattle. The whole province is full of vagabond beggars, who beg or steal by day, and at night sleep in the huts of the huts of the bandits. The nobility keep large herds of sheep and goats, and thus prevent the heaths from being cultivated. The prosperity of this province is impeded also by the luxury of the peasantry, by the number of half-days, and of religious houses, and by the badness of the roads. The Upper

ALENTEJO
Aleppo would export, and consequently grow, much more corn, if there were but roads for its conveyance. See Link's Journey through Portugal, p. 150—164.

ALEOS, in Ancient Geography, a river of Asia, to the west of Smyrna, according to Pliny. 'To the waters of it was attributed the virtue of making the hair and skin to grow on different parts of the body.

ALEPPO, in Geography, the metropolis of Syria, is deemed, in importance, the third city in the Ottoman dominions. Although it is much inferior to Constantinople and Cairo with regard to situation, magnitude, population, opulence, and courtly splendour, it may be reckoned inferior to both these cities in the fulness of its air, the facility and elegance of its private buildings, and also the convenience and neatness of its streets. With respect to commercial advantages, it has much declined, but still continues to maintain a trade that is far from being inconsiderable. In Arabic, Aleppo is called Haleb, to which is usually added the epithet Al Shabba. According to the fabulous history of the Arabian writers, who trace the origin of this city to the migration of the patriarch Abraham into the land of Canaan, who reést for some time on the hill, where the castle of Aleppo is now situated, the appellation Haleb is derived from the circumstance of his distributing milk to the poor of a neighbouring village. Their frequent repetition of the words " Ibrahim, haleb," or "Abraham has milked," gave occasion, as it is said, to the name Haleb, which was conferred on the town that was afterwards built on this spot. The same history refers the epithet Al Shabba to a pied cow, which the populace distinguished by its bawling in the herd of the patriarch. Goliath and others, with much greater probability, deduce this term, which denotes a variegated grey and white colour, from the colour of the soil and of the buildings. Some have supposed that Aleppo was the Zobah of Scripture; but it was, more probably, the Berera of the Greeks. Aleppo is situated, according to celestial observations (see Com. des Temps, 1792) in N. lat. 36° 11' 25'' and E. long. 37° 9'', at a considerable height above the level of the sea, near the river Kowick, which runs in a small stream to the west of the city. Its distance from Scanderoon or Alexandretta, the nearest sea port, is in a direct line between 60 and 70 miles, but in the caravans between 90 and 120 miles. It is encompassed, at the distance of a few miles, by a circle of hills, which are in general rocky, scantily provided with springs, and totally destitute of trees, but affording good pasture for sheep and goats. Within this circle, there are hills and hillocks, which are intersected by plains and little valleys; the soil of which is in some parts of a reddish or black colour, rich and fertile, but in general whith, shallow, and mixed with many small flows. This city, including its extensive suburbs, occupies eight small hills, the intermediate valleys, and a considerable extent of flat ground, comprehending in the whole a circuit of about seven miles; though the city itself is not above three and one-half miles in circumference. The wall that surrounds it, which was built, or at least repaired by the Mamaluke princes, is neglected and mouldering in ruin. Besides this wall, the city was formerly defended by a wide and deep ditch, which is now filled with rubbish or converted into garden grounds. It has, at this time, nine gates, two to the south, two to the east, two to the north, and three to the west. One of the northern gates, formerly called the Jews' gate, which the son of Saladin changed into Bab al Nafer, or Gate of Victory, was once, according to the Missionsaries, the residence of the prophet Elisha, and it has lamps which are kept constantly burning in commemoration of that event. The castle, which stands on a hill near the north-east corner of the city, and which is encompassed by a broad deep ditch, about half a mile in circumference, may be distinguished at a considerable distance, but a traveller, approaching from the west, can hardly any other part of the city, till he gains the brow of one of the hills within two or three miles of the gates; and thus it becomes an extensive and striking object. The mosques, the minarets, and numerous cupolas, form a splendid spectacle, and the flat roofs of the houses which are situated on the hills, rising one behind another, present a succession of hanging terraces, intermixed with cypresses and poplar trees.

Aleppo is, in general, a well-built city, and the houses within are grand and handsomely. The streets are better disposed and broader than those of eastern cities: they are well paved and remarkably clean, and they have a commodious foot-way, on each side, raised half a foot above the other part. The mosques in Aleppo are numerous; of which seven or eight are reckoned magnificent, though none more than a single minaret, or spire, whence the people are accustomed to prayers. These minarets were first annexed to the mosques, as it is said, by Al Waleed, who succeeded to the Caliphate, in the 86th year of the Hegira. Into these mosques none but Moslems are permitted to enter; and at Aleppo, it is only one of them into the courtyard of which Jews and Christians are allowed admission. The public edifices, next in importance to the mosques, are the Khanes, or Caravansaries, intended principally for the accommodation of strangers, and partly as warehouses for goods. The Bazaars, or Markets, are lofty stone edifices, arranged in the form of a long gallery, arched above or roofed with wood. Of these the principal are situated close to one another, in that part of the city that is contiguous to the great khane; and others are distributed through several parts of the town, and the suburb called Bankia, where the corn-market is kept. The streets, in which are shops, for the necessaries of life, are also called bazaars, and they are defended from the sun by mats spread on wooden rafters, projecting from each side. The bazar gates are regularly shut at sun-set, and watchmen, provided with a pole and a lamp, are stationed for the night within them. These gates are secured merely by wooden locks and keys. There are also gates and watchmen in the principal streets, and by these the town is secured from nocturnal brawls and depredations. The natives, who are habitually sober and regular, retire to their habitations at an early hour, and the dread of being carried by the patrol to the Seraglio restrains the most intemperate from drunken frolics. The public baths, or hammams, do not contribute much to the embellishment of the city, as their fronts to the street are very simple; but the coffee-houses, which are spacious and handsome, and are opened through all quarters of the town, attract the notice of strangers. They are gaudily painted, and furnished with matted platforms and benches; and those of the better sort have a fountain in the middle, with a gallery for musicians. At certain hours of the day the coffee-houses are full of company, though they are not frequented by persons of the first rank. The dwelling-houses of Aleppo comprehend the fergelios, or palaces, the houses of the opulent merchants, and the habitations of the middling and ordinary people. The seraglio, in which the Bakhaw of Aleppo usually resides, is situated near the castle, and is a very ancient and extensive building, surrounded by a strong and lofty wall. The gates of this edifice lead to several interior courts, which are destined for barracks, stables, an hippodrome, and various other offices. The principal build-

Vol. I.
The city is supplied with water by means of an aqueduct from two springs, at the distance of about eight miles to the north. This aqueduct, which is laid to be coeval with the city, was repaired by the empress Helena, the mother of Constantine, and again repaired and enlarged by the son of Saladin, in 1218. It supplies with water a range of gardens, formed on its banks, and called the gardens of Babullah, which is the name of an adjoining village, and the water is distributed through the grounds by means of small intersecting channels dug in the earth; and regulations are established for its communication in due proportion to different perrons. This tract of gardens extends about 12 miles, and generally belongs to some effendee or aga, possessing sufficient authority for the protection of his tenants, or forms a part of some religious estate. The whole extent of these gardens is subdivided into square or oblong fields, bordered with dwarf trees, flowering shrubs, and taller trees, such as the plane, weeping willow, ash, and white poplar. Within these inclosures are cultivated mad-apples, melons, and cucumbers, with a variety of excellent roots, cabbages and greens for the kitchen; and in others, cotton, tobacco, fænum, palm-chrifti, and lucern; and fome are fown with barley, which is used in the spring as green fodder for the horses. Among these inclosures are large plantations of pomegranate, plum and cherry trees, and sometimes groves, compofed of the various fruit trees which the country produces. The gardens, tho' of Babullah excepted, are supplied from the river by means of Perlian wheels. In most of the gardens, there are summer-houses, furnished with fountains, and with kiofka, or a kind of balconies, projecting over the river. The Aleppo gardens are spoken of with rapture by the natives. They supply the city with greens, and fruits, and contribute both to the health and amusement of the inhabitants, by affording scope for exercise and a pure air.

In the vicinity of the city are many extensive quarries, which afford a gritty flone, when first dug easily cut and in-durated by exposure to the air; and the more ancient of these quarries have subterraneous excavations of great length, which serve the Bedouins for winter habitations, as stables for the camels, and as dens of debauchery to the Janizaries. The marble of Aleppo is of a yellowish colour, but by rubbing it with oil and exposing it to the moderate heat of an oven, it is made to re semble the red marble of Damascus. Aleppo is supplied with salt from an extensive plain at the distance of about 18 miles, called the valley of salt, or salt lake.

Aleppo, though encompassed by hills, is well ventilated, and enjoys a pure penetrating air, which is reckoned so healthful, that from the end of May to the middle of September, the inhabitants are accustomed to sleep exposed in their terraces, without receiving any injury. The spring her comes early in February, when the fields are covered with an agreeable verdure; the almond tree blossoms about the middle of the month, and is soon followed by the apricot, peach and plum. Early in May the corn begins to be yellow; and a few weeks bring on the harvest, and when the grain has been plucked up by the roots, the whole country bears a parched and barren aspect. Some flowers commonly fall in the beginning of June; but from the middle of this month to the middle of September, it is extraordinary to see rain. The heat of July and August is mitigated by the westerly breezes; but when these fail, the weather becomes extremely hot. When the wind blows from the north,
north-west, east, north-east, or south-east, the heat is extremely oppressive, and the air is dry and scorching, as if it proceeded from an oven. The eyes, lips, and nostrils are parched, and it produces a latitude, attended with an oppression at the breast, of which the natives are not less sensible than the Europeans. It is usual to exclude these hot winds by shutting the doors and windows. They do not, however, occur every year, nor do they produce such fatal effects as the desert wind, named 

The at end of August the Nile clouds, as they are called, make their appearance, and are often attended with dew. About the autumnal equinox the air is refreshed with flowers, which are termed the first rains, and are usually preceded by irregular gusts of wind that raise the dust in vortices. There are succeeded in 20 or 30 days by the second rains, which are more plentiful than the first, and after them the weather becomes variable and much cooler. The transition from the Autumn to the Winter is slower than that from Spring to Summer. The trees retain their leaves till the beginning of December, and the most delicate perennials have no fires till the middle of this month. The rigour of winter commences about the middle of December, and lasts forty days; but though there is almost always some frost in winter, many years pass without snow. The narcissus is in flower during the greatest part of the winter, and violets and hyacinths are plentiful in January. Although violent storms of wind are rare at Aleppo, squalls accompanied with heavy flowers, and sometimes with thunder, are frequent in the Spring and Autumn. Lightning, unaccompanied with thunder, is frequently seen in the night during the months of September and October; and it is sometimes seen in Summer; but the nocturnal sky, in the hot months, is almost always serene, exhibiting a glorious scene to the astronomer, who may indulge his study, and at the same time enjoy the cool air on the terrace. There are few years in which earthquakes do not occur at Aleppo; but they are generally slight and do no injury.

The nature of the soil near Aleppo has been already mentioned: in the more distant plains, it consists of a reddish, sometines of a blackish, light mould, and produces the fruits of the earth in great abundance. The fields near the city yield, in consequence of much manure, two or three crops of different kinds every year; but without manure, they are sown only once a year with different sorts of grain alternately, but are seldom suffered to remain fallow. They begin to plough in September; and the plough is drawn by one or two small cows, or by a single ass, in furrows so straight, that one would imagine a line muft have been used in tracing them. They sow wheat, barley, lentils, chickes, beans, chiceling, small vetch, a small green kidney bean, and Indian millet. The earliest wheat is sown about the middle of October, and barley so late as the end of February. They sowed the barley harvest begins by repelling the plough along the edge of the furrow; in sandy soil, they sow first, and then plough. The barley harvest begins in May, about 10 or 14 days before that of the wheat, and early in June corn of every kind is taken off the ground. Amongst the reapers in Syria, a custom prevails of accosting a passing traveller and presenting him a handful of corn, with a general flout; and a small present is expected in return. The corn, when reaped, is carried on asses to the summit of the nearest hill, and being laid on hard even ground, it is separated from the chaff, not by threshing, but by means of a sledge fixed on two or three rollers, and armed with several iron rings, with ferrated edges, so sharp as to cut the straw. This machine is drawn by oxen, mules, or asses, and driven by a man seated on the sledge, and as it
cultivated, it has been inferred from this circumstance, that the winters in Syria are now more rigorous than they were in former times, and this is the opinion entertained by the natives. Among the vegetables which form part of the diet of the inhabitants, the mad-apple (Solanum Mclunguena of Linneas), of which there are three varieties, claims a principal place. Their other edible vegetables, we shall not recite. Of the vegetables produced in the fields without culture there are capers, horace, common mallow, forcel, dandelion, water cress and trifles. Savory is much used to give a relish to their bread.

The number of inhabitants at Aleppo has been computed at 300,000, but Dr. Ruffell conjectures that they do not now exceed 255,000, of whom 220,000 are Turks, 35,000 Christians, and 5,000 Jews. M. d'Arvieux (Memoires, tom. vi. p. 474. Paris, 1755.) makes the whole number of houses and public buildings in 1693 to amount to somewhat more than 14,100, and the number of dwelling-houses 13,530. From an account preferred by Dr. Ruffell, and supposed to be obtained from the office of the Mohaffil, the number of houses in 1752, amounted only to 10,742; so that, if these accounts be true, there had been a decrease from 1693 to 1752 of 2,628 houses. M. Volney observes, that as this city is not larger than Nantes or Marfilles, and the houses consist only of one story, it is not probable that the number of inhabitants should exceed 100,000. The language universally spoken by the natives is the vulgar Arabic; and the 'Turkiah,' which is spoken by people of condition, and which is the court language used in the franglés, is said to be corrupted by the concourse of strangers from the northern provinces.

The people are generally of a middle stature, rather meagre than corpulent, and neither vigorous nor active. Their complexion is naturally fair, their hair black, or of a dark chestnut colour, and their eyes for the most part black. The females affect to appear full and plump; they use no flax, and wear their girdles very loose. The men gird themselves tightly with a broad belt, and a long shawl寺院. The people that are exposed to the sun become swarthy.

The men dress in the long eastern habit, and during six months in the year wear furs. Under the furs their garments consist of a silk or linen skirt, and drawers, wide trousers of red cloth, to which are feathered flocks of yellow feathers, serving for breeches, stockings, and within doors, for shoes; but in walking, they use slippers without heels. They also wear a waistcoat, called a kuhbaz, that comes lower than the knee, and a long veil reaching down to the heels, which covers all, and is named a dalmah. Above the dalmah, they have a long Persian shawl, and a belt under the waistcoat, and to this shawl they attach a small dagger or knife, and with men of business it serves to support a silver inkbird. For an account of the turban, see Turban. The Abai is a silk, or camlet gown, with large sleeves, laced down the fronts with narrow gold lace, which is worn in summer instead of the kurk, or loose gown trimmed with furs. Abai is the name of the ordinary vestment of the Arabs. The drap of the ladies in many respects resembles that of the men. But their dalmah and kuhbaz fit clover to the shape, and not folding over the breasts, leave the neck uncovered. Instead of the costly, long-haired furs of the men, they use fable or ermine, and they are formed in a different fashion. The ladies are fond of thick long hair, and their head-drefs, consisting of a warm cloth cap, under cotton and muffin, which compose the rest of the attire, is much warmer than that of the men. They wear ear-rings, a necklace, or collar, of gold, large clumsy gold bracelets, on the wrist and ankles, a string of zechins close to the hair, on the forehead, and another, very long, across the body in the manner of a sash. Both sexes wear rings on the fingers, and some women wear them on the toes. The use of rouge is very little known; but the women tinge their fingers, hands, feet and toes, of a dusky red or yellow colour, by means of a paste formed of the powdered leaves of henna and water. See Alcanna. The hands and feet are afterwards covered with another paste, composed of flour and water, with crude salt ammoniac and quicklime, which changes the colour into a fort of black or very dark green. They also tinge the inside of the eyes-alls with a powder, called kholol. See Alcohol. The women apply another composition called khatat, to the eye-brows, which tinges them of a fine black colour, and makes the hair smooth and glossy. It is the custom with the men to let the beard grow, after a certain age, or after performing the pilgrimage to Mecca, and much pains are bestowed upon dressing it, but many of the Turks wear whiskers only. Some conceal the appearance of grey hair by tying the beard with a black or red dye; the practice, however, is not deemed reputable, and is not common. Perims of both sexes use a variety of perfumes, composed of musk, sandal wood, and spikenard, which they few up in small bags and carry in the breast pockets. Women of every class, when they go abroad, wear thin yellow boots, reaching up half the leg, and over these yellow baboos or flippers, or in wet weather wooden clogs, called kubkak. They never appear in the streets without their veils. The ordinary Aleppo veil is a linen flasck, covering the whole habit from head to foot, and concealing the whole face, except one eye. The veils of the Christians and Jewish women, are formed of plain white calico, which the Turkish women checker with blue and red, and the Jewish women have one arm free, somewhat in the manner of the Scots plaids.
