The existence of a principle of this kind is so clearly manifested by many of the most common phenomena of nature, which fall under our daily inspection, that it must have been known in very early times; but the information we have hitherto obtained of the progress made by the ancients in physical investigations, is too vague and obscure to afford any proof of their ever having applied the action or influence of this power to the purposes of science. The philosopher Anaxagoras, who flourished about 500 years before the Christian era, is reported, by Diogenes Laertius, to have attributed to the celestial bodies a tendency towards the earth, which he considered as the centre of their motions; and the doctrines of Democritus and Epicurus are founded upon the same principle, as appears from their elegant interpreter Lucretius, who thence derives the confluence of the universe being without bounds. But though some bold and original characters had embraced these opinions, it is no less certain, from the testimonies of other writers, that they were far from being generally received in the ancient world.

The first, among the moderns, who appears to have had full notions of this doctrine, was Nicholas Copernicus, the celebrated relocator of the old Pythagorean system of the universe, who, in his work "De Revolut. Orb. Caelest.," (lib. I. c. 9,) expresses himself thus: "I consider gravity as nothing more than a certain natural aptness (aptitutia) that the Creator has imprinted upon the parts of matter, in order to their uniting and coalescing into a globular form, for their better preservation; and it is probable that the same power is also inherent in the sun, moon, and planets, that those bodies may confantly retain that round figure in which we behold them." He also considered the sun as the chief governing power of all the roll, as may be inferred from some of the last words of Tycho Brahe, who perceiving the approach of death, called for the celebrated Kepler (then a young man, and his assistant in his observatory at Prague), and after charging him with completing the Astronomical Tables which he had left unfinished, thus addressed him: "My friend, although what I ascribe to a voluntary, and as it were, an oblique motion of the planets round the
the sun, you attribute to an attractive energy of that body, yet I must entreat, that, in the publication of my observations, you would explain all the celestial motions by my hypothesis, rather than by that of Copernicus, which I know you would otherwise incline to follow." (Lily of Tycho Brahe.)

Kepler, however, in his own works, constantly maintains the doctrine of attraction, and even carries it farther than Copernicus had ever done. Thus, he calls gravity a corporeal and mutual affection between similar bodies, in order to their union." He also remarks, with Copernicus, against the Panpsychists, that "the heavenly bodies do not lie at the centre of the universe, but to the centre of those large round bodies, of which they make a part; so that if the earth were not spherical, things would not fall from all points toward its centre. If a stone, for instance, were to be placed at a distance from another stone, in any part of the universe, without the sphere of action of a third body, like two magnets, they would come together in some intermediate point; each advancing, in space, in the inverse proportion of their quantities of matter. Hence, if the moon and the earth were not kept together by some power, in their respective orbits, they would move towards each other; the moon passing over fifty-three parts of the way while the earth pulled over one, supposing their densities equal." (Alton, Nov. in Introd.)

From the same principle, Kepler also accounted for the general motion of the tides; viz. by the attraction of the moon, and expressly calls it 

\[ \text{summa gravitas in tempore} \]

adding, that if the earth did not exert an attractive power over its own waters, they would rise and fall to the moon. We also find him insisting on that certain irregularities in the motion of the moon are owing to the combination of the earth and sun upon this body. (Ibid.)

These and other reflections concerning the universality of attraction, he accompanies with an ingenious recapitulation of a law of nature, from conjecture only, but which was afterwards verified by experiment. The schools had taught that some bodies were by their nature heavy, and so fell to the ground; and that others were naturally light, and for that reason ascended. But Kepler pronounced, that no bodies whatever are absolutely light, but only relatively so; and consequently that all matter is subjected to the law of gravitation. So far the genius of Kepler was fortunate, in tracing out the great principle which prevents the planets from flying off from the sun; but his sagacity failed him, when he endeavoured to fly by what means they were kept from falling into that immense body, and what power perpetuated their motion in their orbits; a general investigation of the laws of motion was yet wanting; the discovery of which, as well as many other things, being referred, as he himself prophesies at the end of his work, "for the succeeding age, when the Author of nature would be pleased to reveal these mysteries."

The first person in this country, who embraced the doctrine of attraction, was Dr. Gilbert, a native of Cukholfer, and a physician at London, in a work published in the year 1600, intitled, "De Magnete Magnetisque Corporibus," which contains a number of curious things; but he did not properly distinguish between attraction and magnetism. The next after him was lord Bacon, who, though not a convert to the Copernican system, yet acknowledged an attractive power in matter (Nov. Organ. Lib. ii. cap. 26. 45. & 48.); and in the dawn of philosophy, in which he lived, he constantly recommends an inquiry into the physical causes and reasons of things; observing, "that he who shall duly attend to the apprehensions and general affections of matter (which both in the earth and heavens are exceedingly powerful, and indeed pervade the universe), will receive, from what he sees passing on the earth, clear information concerning the nature of the celestial bodies; and, contrariwise, from notions which he shall discover in the heavens, will learn many particulars relating to the things below, which now he conceals from us." (D. Diggis & Augus. Scient. lib. ii. ch. 3. 1660.)

In France, also, we find Rigaud and Rabelais, mathematicians of great eminence, maintaining the same opinion. The latter, in particular, in his "De l'ordre de physique," published in 1614, under the title of "Art, Sans Art," says: "In this work, Rabelais attributes to all the things of nature of which the universe is composed, the property of having a tendency towards each other; observing, that this is the reason why they arrange themselves in spherical figures, set by virtue of a centre, but by their natural attraction, and so that one may be placed in an equilibrium with another. Galileo, in Italy, had likewise conceived this idea; but with far less precision and extension than we find it in his contemporaries Bacon and Kepler."

But no one, before Newton, had entertained such just and clear notions of the doctrine of universal gravitation, or had approached so near to the making a general application of it to the laws of nature, as the celebrated Dr. Hooke. The philosophers before mentioned had seized, some one branch, and some another; but Hooke, in his work, called "An attempt to prove the motion of the Earth," 1664, 4to, appears to have embraced it in nearly the whole of its generality. He there, besides, that the hypothesis upon which he explains the motions of the world, is, in many respects different from all other, and which is founded upon the three following principles: 1. That all the celestial bodies have not only an attraction or gravitation towards their proper centres, but that they mutually attract each other within their sphere of influence. 2. That all bodies which have a simple and direct motion, continue to move in a right line, if no force, which operates without ceasing, does not contrain them to describe a circle, an ellipse, or some other more complicated curve. 3. That the attraction is so much the more powerful, as the attracting bodies are nearer to each other.

He also made several experiments with a view to strengthen the preceding conjectures. For this purpose, he suspended a bullet to the end of a long string, and after it had been made to oscillate, he impressed it upon a small lateral motion; and remarked, that the bullet described an ellipse, or a curve of that form, round the vertical line. He then attached to the string of the first bullet, another, which carried a smaller one; and after having, given to the latter circular motion round the vertical line, he put the other in motion, as in the former experiment; when it was found, that neither one or the other described an ellipse, but moved round a point at a mean distance between them, which appeared to be their centre of gravity. (Life of Dr. Hooke, prefixed to his posthumous works.)

This was certainly very ingenious; but Hooke did not consider that the centre of force resides in one of the foci of the ellipse, and not in its centre; and though the observation was suggested to him, and he was even excited by the promise of a very considerable reward, to determine the law of attraction, which would occasion a body to describe an ellipse round another quadrilateral body, placed in one of its foci; he was unable to accomplish the undertaking. The problem, which belongs to the higher geometry, was too difficult: for that time; this admirable discovery, which does the highest honour to the human mind, being reserved for the
the genius of Newton; and though Hooke claimed a share of the glory of this discovery, it was without the smallest foundation; as his conjectures were far short of the proofs which were required in the sublime demonstrations by which the former established this law of the universe.

Such was the progress of the system of universal gravitation, when this extraordinary man first appeared; who, according to Pemberton (View of Sir Isaac Newton's Philosophy, 1735, 4to.), first began, about the year 1666, to suspect the existence of this principle, and to attempt to apply it to the celestial motions. Gravity was retired into the country to avoid the plague, which about this time prevailed in London and its vicinity, his meditations turned upon the nature of gravity; and one of his first reflections appears to have been, that this power, which, by its continual action, occasions the fall of bodies towards the surface of the earth, to whatever height they are taken, might possibly extend much farther than was commonly imagined; as for instance, to the distance of the moon, or still higher. And if so, he began to consider, that it might be this force which retained the moon in her orbit, by counterbalancing the centripetal force which arises from her revolution round the earth. It also occurred to him, at the same time, that though this power appears to suffer no diminution at any heights to which we can ascend, these being comparatively extremely small, yet it was highly probable, that, at very great distances from the earth, it might be considerably weakened.

In following therefore this conjecture, he was farther led to conceive, that if the attraction of the earth was the cause of retaining the moon in her orbit, the planets, in like manner, must be retained in their orbits by the attractive force of the sun; and as the squares of the times of the revolutions of the planets had been found by Kepler to be proportional to the cubes of their mean distances from the sun, it followed that the diminution of their centripetal forces, and of course that of gravity, would be reciprocal as the squares of their distances from that body. Hence, from the experiments which had been already made on the descent of heavy bodies at small elevations, he determined the height from which the moon, if left freely to herself, would descend towards the earth in a short interval of time; this is well known to be the vered line of the arc that the describes in that time; and which, by means of the lunar parallax, may be determined in parts of the earth's radius, so that to compare the diminution of gravity with the observations, nothing more was necessary than to know the magnitude of this line.

But Newton having at that time only an incorrect measure of the terrestrial meridian, obtained a result considerably different from that which he expected; whence, imagining that some unknown forces might be connected with the gravity of the moon, he abandoned his first ideas. Some years afterwards, however, his attention was again called to the subject by a letter of Dr. Hooke; and as Picard, about this time, had measured a degree of the earth in France with great exactness, he employed this measure in his calculations instead of the one he had before made use of, and found, by that means, that the moon is retained in her orbit by the sole power of gravity, supposing to be reciprocally proportional to the squares of the distances.

According to this law, he also found that the line described by bodies in their descent is an ellipse, of which the centre of the earth occupies one of the foci; and considering, afterwards, that the orbits of the planets are, in like manner, ellipses, having the centre of the sun in one of their foci, he had the satisfaction to perceive, that the solution which he had undertaken, only from curiosity, was applicable to some of the most sublime objects of nature. These discoveries gave birth to his celebrated work entitled, "Philosophiae Naturalis Principia Mathematica," which appeared in 1707; and is justly considered as one of the greatest monuments that has ever been erected by human genius to the honour of science.

In generalizing these researches, this profound geometer afterwards showed, that a projectile may describe any conic section whatever, by virtue of a force directed towards its focus, and acting in proportion to the reciprocal squares of the distances. He also developed the various properties of motion in these kinds of curves, and determined the necessary conditions, so that the section should be a circle, an ellipse, a parabola, or a hyperbola, which depend only upon the velocity and primitive position of the body; assigning, in each case, the conic section which the body would describe. He also applied these researches to the motion of the satellites and comets, showing that the former move round their primaries, and the latter round the sun, according to the same law; and he pointed out the means of determining, by observation, the elements of these ellipses.

In considering that the satellites move round the planets in nearly the same manner as if these planets were quiescent, Newton perceived that they must all equally gravitate towards the sun. The equality of action and reaction, did not allow him to doubt that the sun gravitates towards the planets, as well as these towards their satellites; and that the earth is attracted by all the bodies that are attracted towards her. He afterwards extended, by analogy, this property to all the parts of which bodies are composed, and established it as a principle, that every molecule of matter attracts every other body in proportion to its mass, and reciprocally as the square of the distance from the body attracted.

Having arrived at this principle, Newton soon saw that all the great phenomena of the system of the world might be easily derived from it. In considering the force of gravity at the surface of the celestial bodies as the refulbante of the attractions of all their molecules, he arrived at these remarkable conclusions: that the attractive force of a body, or spherical spheroid, on a point placed without it, is the same as if the whole of its mass was united in the centre; and that a point placed within the body, or more generally in any spheroid terminated by two similar elliptical surfaces, similarly situated, is equally attracted on all parts. He also proved that the rotation of the earth upon its axis must occasion a flattening of it about its poles, which was afterwards verified by an actual measurement; and he determined the law of the variation of the degrees, in different latitudes, upon the supposition that the matter of the earth was homogeneous. He likewise saw, that the actions of the sun and moon upon the terrestrial spheroid, must produce a movement of rotation of its axis, as well as occasion a retrocession of the equinoxes, and the various oscillations of the waters of the ocean which are called the tides. In short, he also assured himself, that the inequalities of the motion of the moon arise from the combined actions of the sun and earth upon this satellite.

But, with the exception of what concerns the elliptical motions of the planets and comets, and the attractions of spherical bodies, these discoveries were not wholly completed by Newton. His theory of the figures of the planets is limited by the supposition of their homogeneity; and his solution of the problem of the precession of the equinoxes, although extremely ingenious, and nearly agreeing with the results obtained from observations, is defective in several respects; as among the great number of perturbations of the celestial motions, several small ones, and particularly
that which arises from the ejection of the moon, escaped his observation. He has perfectly established the principle which he had discovered; but left the complete development of its consequences and advantages to the geometers that should succeed him.

The profound analysis, of which this great man was also the inventor, has not, at this time, been sufficiently perfected, to enable him to give complete solutions to all the difficult problems which arise in considering the theory of the system of the world; so that he was sometimes obliged to give only imperfect sketches or approximations, and leave them to be verified by a more rigorous calculation. But, notwithstanding these inevitable defects, the importance and generality of his discoveries, and the great number of his original and profound views, which have given rise to the most brilliant mathematical theories of the present age, will always affure to this performance the pre-eminence above every other similar production of the human mind.

Having thus given a concise history of the discovery of this extensive principle, and its application to the laws of motion, it is proper to observe, that though Newton makes use of the word attraction in common with the school philosophers, yet he very judiciously distinguished between the ideas. The ancient attraction was suppos'd to be a kind of quality, inherent in certain bodies themselves, and arising from their particular or specific forms; but the Newtonian attraction is a more indefinite principle, denoting no particular kind or manner of action, nor the physical causes of such action, but only tendency in the general, a \textit{coniunct accedend}y, to whatever cause, physical or metaphysical, such effects be owing, whether to a power inherent in the bodies themselves, or to the impullse of an external agent.

He accordingly lays in his Philos. Nat. Prin. Math. that he uses the words attraction, impullse, and proportion to the centre, indifferently; and cautions the reader not to imagine, that by attraction he expresses the modus of the action, or the efficient cause thereof, as if there were any proper powers in the centres, which in reality are only mathematical points or as if centres could attract. Lib. i. p. 5.

In like manner he considers centripetal power as attractions, though he physically speaking, it were more just to call them impullses. Ib. p. 148. He also adds, that what he calls attraction may possibly be effected by impullse, though not a common or corporeal impullse, but after some other manner unknown to us. Optics, p. 322.

Attraction indeed, if considered as a quality arising from the specific forms of bodies, ought, together with sympathv, antipathy, and the whole tribe of occult qualities, to be exploded. But when we have fet these aside, there will remain innumerable phenomena of nature, and particularly the gravity or weight of bodies, or their tendency to a centre, which argue a principle of action feemingly distinct from impullse, or where at least there is no sensible impullion concerned. It is also well known, that this action differs, in some respects, from all impullion we know of, the latter being always found to act in proportion to the surface of bodies; whereas gravity acts according to their solid contents; and consequently must arise from some cause that penetrates or pervades their whole substance. This unknown principle, which can be considered so only with respect to its caufe (for its phenomena and effects are most obvious), with all the species and modifications of it, is what we call attraction, which is a general name under which all mutual tendencies, where no physical impullion appears, and which cannot therefore be accounted for from any known laws of nature, may be ranged; and here arise several particular kinds of attractions, as gravity, magnetism, electricity, &c. which are so many different laws; and only agreeing in this, that we do not see any physical causes of them; but that as to our senses, they may really arise from some power or efficacy in such bodies, by which they are enabled to act, even upon distant bodies, though our reason absolutely disallows of any such action.

Attraction may be divided with respect to the law it observes, into two kinds: 1. That which extends to sensible distances; such are the actions of gravity found in all bodies; and the attraction of magnetism and electricity found in some particular bodies; the several laws and phenomena of which fee under their respective articles.

Among these, the attraction of gravity, which is also called the centripetal force, is one of the greatest and most universal principles in nature; we see and feel it operate on bodies near the earth, and find by observation, that the same force also obtains in the moon, and in both the primary and secondary planets, as well as in the comet; and that this is the power by which they are all retained in their orbits, &c. and hence, as gravity is found in all the bodies which come under our observation, it is easily inferred, by one of the settled rules of philosophizing, that it obtains in all others; and as it is found to be as the quantity of matter in each body, it must be in every particle thereof; and hence, every particle in nature is proved to attract every other particle, &c. See the demonstration of this laid down at large under the articles Centripetal, Centrifugal, Centripetal, Comet, Moon, Newtonian Philosophy, Planet, Satellite, Sun, &c.

From this attraction arise all the motion, and consequently all the mutation, in the universe; by this, heavy bodies descend and light ones ascend, projectiles are directed, vapours and exhalations arise, and rains, &c. fall. Also from the same cause rivers glide, the air presses, the ocean swells, &c. In effect, the motions arising from this principle, make the subject of that extensive branch of mathematics called Mechanics or Statics, with the parts or appendages thereof Hydrostatics, Pneumatics. See Mathematics, Philosophy, &c.

2. That which extends only to small distances.—Such is found to obtain in the minute particulars, wherein all bodies are composed, which attract each other at or extremely near the point of contact, with a force much inferior to that of gravity; but which at any distance from it decreases much faster than the power of gravity. This power is known by the name of the \textit{Attraction of Cohesion}, as being that by which the atoms or insensible particles of bodies are united with larger and more sensible figures. See Cohesion.

The latter kind of attraction owns Newton for its discoverer, as the former does for its improver. The laws of motion, perception, &c. in sensible bodies, under various circumstances, as falling, projected, &c. arecertained by the later philosophers, do not reach to those more remote innate motions of the component particles of the same bodies, on which the changes of their texture, colour, properties, &c. depend; so that our philosophy, if it were founded wholly on the principle of gravitation, and carried no farther than that would lead us, would necessarily be very deficient.

But beside the common laws of sensible matters, the minute parts which they are composed of are found subject to some others which have been only of late taken notice of, and are yet very imperfectly known. Newton, to whose happy penetration we owe the hint, contents himself with establishing that there are such motions in the \textit{minima nature}, and that they flow from certain powers or forces,
not reducible to any of those in the great world. — By virtue of these powers he shows, "that the small particles act on each other even at a distance, and that many of the phenomena of nature are the result of this action. Sensible bodies, as we have already observed, act on each other several ways; and as we thus perceive the tenor and course of nature, it appears highly probable that there may be other powers of the like kind, nature being always uniform and consistent with itself. — Those just mentioned, relating to sensible distances, have been generally observed; but there may be others, which reach to such small distances as have hitherto escaped observation; and this, it is probable, may be the cause with electricity, even without being excited by friction.

He then proceeds to confirm the reality of these speculations from a great number of phenomena and experiments, which plainly argue such powers and actions between the particles of bodies, e.g. of filts and water, oil of vitriol and water, aqua fortis and iron. Spirit of vitriol and salt petre, and many other chemical fabulances. He also shows that these powers are unequally strong between different bodies; e.g. stronger between the particles of salt and those of aqua fortis, than those of silver; and between aqua fortis and lapsis calaminaris, than those of iron; between iron and copper, silver and copper, mercury and copper, &c. So spirit of vitriol acts on water, but more on iron or copper, &c. The other experiments which constitute the existence of such principles of attraction in the particles of matter are innumerable, many of which may be found enumerated under the article Affinity, Acid, Matter, Mineralium, Salt, &c.

These actions, by virtue of which the particles of the bodies above mentioned tend towards each other, are called by the general indefinite name attraction, which is equally applicable to all actions by which distant bodies tend towards each other, whether by impelle, or by any other more latent power; and hence we can account for an infinity of phenomena which would be otherwise inexplicable from the principle of gravity; such as cohesion, dissoluzione, coagulacion, crystallization, the ascent of fluids in capillary tubes, animal secretion, fluidity, fluidity, fermentation, &c.; which see under their proper names.

"Thus" (adds our incomparable author) "will nature be found conformable to herself, and very simple, performing all the great motions of the heavenly bodies by the attraction of gravity which intercedes those bodies, and almost all the small ones of their parts, by some other attractive power diffused through their particles. Without such principles, there never would have been any motion in the world; and without the continuance thereof, motion would soon perish, there being otherwise a great decrease or diminution thereof which is only supplied by these active principles." Optics, p. 373.

For these reasons it is certainly unjust to declare against a principle which furthers so beautiful a view, for no other reason but because we cannot perceive how one body should act on another at a distance. It is certain that philosophy allows of no action but what is by immediate contact or impulsion (for how can a body exert any active power where it does not exist?) to suppose this of any thing, even of the Supreme Being himself, would perhaps imply a contradiction; yet we fee effects without seeing any such impulsion; and where there are effects, we can easily infer there are causes, whether we see them or not. We may consider such effects, therefore, without entering into the consideration of the causes, as indeed it seems the business of a philosopher to do; for to exclude a number of phenomena which we see, would be to leave a great chasm in the history of nature: and to argue about those which we do not see, would be to build castles in the air. Hence it follows, that the phenomena of attraction are matter of physical consideration, and as such entitled to a share in the system of physics; but that the causes of them will only become so when they become sensible, i.e. when they appear to be the effect of some other higher causes (for a cause is no otherwise seen than as itself is an effect, so that the first cause must, from the nature of things, be invisible); we are, therefore, at liberty to suppose the causes of attraction what we please, without any injury to the effects. The illustrious Newton himself seems, indeed, a little intolerable as to the causes, inclining sometimes to attribute gravity to the action of an immaterial cause, Optics, p. 343, &c.; and sometimes to that of a material one, Ibis. p. 325.

In his philosophy, the research into causes is the last thing, and never comes under consideration till the laws and phenomena of the effects be settled; it being to these phenomena that the cause is to be accommodated. The cause even of any of the greatest and most sensible actions is not adequately known; how impulse or percussion itself, for instance, produces its effect, that is, how motion is communicated by one body to another, confounds the deepest philosophers; yet impulse is received not only into philosophy, but into mathematics; and accordingly the laws and phenomena of the effects make the greatest part of common mechanics.

The other species of attraction, therefore, in which no impulse is remarkable, when their phenomena are sufficiently ascertained, have the same title to be promoted from physical to mathematical consideration; and this without any previous inquiry into their causes, which our conceptions may not be proportioned to let them be occult, as all causes strictly speaking are, so that their effects, which alone immediately concern us, be but apparent. See Cause.

Our illustrious countryman, therefore, far from adulterating philosophy with any thing foreign or metaphysical, as many have reproached him with doing, has the glory of having thrown every thing of this kind out of his system, and of having opened a new source of the most sublime mechanics yet known; it is hence, therefore, that we must expect to learn the manner of the changes, productions, generations, corruptions, &c. of natural things; with all that scene of wonders which is opened to us by the operations of chemistry.

The cause of attraction was long accounted for, by supposing that there existed a certain unknown substance which impelled all bodies towards each other; an hypothesis to which philosophers had recourse, from an opinion which had constantly been admitted as a first principle, "that body can act where it is not;" as if it were more difficult to conceive why a change is produced in a body by another which is placed at a greater distance, than why it is produced by one which is situated at a small distance; it being not only as impossible to explain the phenomena of attraction by impulsion as it is to conceive how bodies should be urged towards each other by the action of an external substance, as how they should be urged towards each other by a power inherent in themselves. The fact is, that we can neither comprehend the one nor the other; nor can any reason be assigned why the Creator might not as easily bow the matter of acting upon matter at a distance, as the power of being acted upon and changed by matter in actual contact.

But we have no reason besides for supposing that bodies are ever in any case actually in contact. "For all bodies are diminished in bulk by cold, that is to say, their particles
are brought nearer each other, which would be impossible, unless they had been at some distance before the application of the cold. Almost all bodies are diminished in bulk by prehure, and consequently their particles are brought nearer each other; and the diminution of bulk is always proportioned to the prehure. Newton has also shown that it requires a force of many pounds to bring two glasses within the 800th part of an inch of each other; that a much greater force is necessary to diminish that distance, and that no prehure whatever is capable of diminishing it beyond a certain point. Consequently there is a force which impedes the actual contact of bodies, which increases inversely as some power or function of the distance, and which no power whatever is capable of overcoming. Boscovich has likewise demonstrated that a body in motion communicates part of its motion to another body before it actually reaches it. Hence we may conclude, that, as far as we know, there is no such thing as actual contact in nature; and that bodies of course always act upon each other at a distance. Even prehure, therefore, or prehure, is an instance of bodies acting on each other without being in contact, and consequently this is no better explanation of attraction than the supposition that it is an inherent power. We must therefore be satisfied with considering attraction as an unknown power, by which all bodies are drawn towards each other, and which acts constantly and uniformly in all times and places, so as always to diminish the distance between them, unless when they are prevented from approaching each other by some force equally powerful. But why it diminishes as the distance increases, it is impossible to say; although the fact is certain, and is almost incompatible with the supposition of impulse being the cause of attraction. The truth is, that we must not be too precipitate in drawing conclusions, but must wait, with patience, till future discoveries shall enable us to advance farther; satisfying ourselves, in the mean time, in arranging the laws of nature which have been ascertained, without attempting to develope the causes upon which they depend.

Attraction, in Chemistry. See Affinity.

Attraction, Centre of. See Centre.

Attraction of Mountains. According to the Newtonian theory of attraction, this principle pervades the minutest particles of matter, and the combined action of all the parts of the earth forms the attraction of the whole. For the same reason, therefore, that a heavy body tends downwards in a perpendicular to the earth's surface, considered as smooth and even, it must be attracted towards the centre of a heavy mountain, by a force proportional to the quantity of matter contained in it; and the effect of this attraction, or the accelerative force produced by it, must depend on the nearness or distance of the mountain from the gravitating body, because this force increases as the squares of the distances decrease. Upon these principles it is obvious, that the plumb-line of a quadrant, or of any other astronomical instrument, must be deflected from its proper situation, by a small quantity, towards the mountain, and the apparent altitudes and zenith distances of the stars, taken with the instrument, be altered accordingly; e.g. if the zenith distance of a star on the meridian was observed at two stations under the same meridian, one on the southern side of a mountain, the other on the north; and the plumb-line of the instrument were attracted out of its vertical position by the mountain, the star must appear too much to the north, by the observation at the southern station, and too much to the south by that at the northern station; and consequently the difference of the altitudes of the two stations, resulting from these observations, would be greater than it really is. If then the true difference of their latitudes be determined by measuring the distance between the two stations on the ground, the excess of the difference, found by the deflections of the star above that found by this measurement, must have been produced by the attraction of the mountain; and the half of it will be the effect of such attraction on the plumb-line in each observation, provided that the mountain attracts equally on both sides.

The first hint for determining the quantity of this attraction was suggested by Newton in his Treatise of the System of the World; and the first experiment for this purpose was conducted by M. Bouguer, and M. de la Condamine, in the year 1738. Whilst they were employed in measuring three degrees of the meridian, near Quito in Peru, they endeavoured to ascertain the effect of the attraction of Chimborazo, a mountain in that neighbourhood, which, by a rough computation, they supposed to be equal to about the zoeth part of the attraction of the whole earth. By observing the altitudes of fixed stars at two stations, one on the south side of the mountain, and the other on the north, they found the quantity of 71" in favour of the attraction of the mountain by a mean of their observations; whereas the vertical line, according to the theory, should have declined from the true vertical line of 43". However, though the general result is favourable to the Newtonian doctrine, the experiment was performed under so many disadvantages, as not to afford the satisfaction which was to be obtained; and M. Bouguer terminates his account of their observations, with expressing his hopes, that the experiment might be repeated under more favourable circumstances either in France or in England. Bouguer, Figure de la Terre.

Nothing was afterwards done, till Mr. (now Dr.) Maclayyne, the present astronomer royal, made a proposal to the Royal Society for this purpose in the year 1772; and in 1774, he was deputed to make the trial accompanied with proper assistants, and furnished with the most accurate instruments. He made choice of the mountain Schehallian, in Scotland, for the scene of his operations; the direction of which is nearly from east to west, its mean height above the surrounding valley about 2000 feet, and its highest part above the level of the sea 3550 feet. Two stations for observations were selected, one on the north, and the other on the south side of the mountain. Every circumstance that could contribute to the accuracy of the experiment was regarded; and from the observations of ten stars near the zenith, Mr. Maclayyne found the apparent deference of the altitude of the two stations to be 14.5" and from the observation by triangles, formed from two bases on the sides of the mountain, he found the distance of their poles to be 4564 feet, which, in the latitude of Schehallian, viz. 56° 49', answers to an arch of the meridian of 4°, which is less by 11.6 than that found by the sectors. half, therefore, or 5.8° is the mean effect of the attraction of the mountain. From this experiment, conducted with great affility and accuracy, and tending to the establishment of the Newtonian theory, Mr. Maclayyne infers, that the mountain Schehallian exerts a sensible attraction; and, therefore, that every mountain, and every particle of the earth, is endued with the same property, in proportion to its quantity of matter. The law of the variation of this force, in the inverse ratio of the squares of the distances, is likewise confirmed by it; for if the force of the attraction of the hill had been only to that of the earth as the matter in the hill to that of the earth, and had not been greatly increased by the near approach to its centre, the attraction must have been wholly inapparent. He infers also, that the mean density of the earth is at least double of that at the surface.
surface; and consequently, that the density of the internal parts of the earth is much greater than that of those near
the surface; also that the whole quantity of matter in the earth
will be at least twice as great as if it were composed of
matter of the same density with that at the surface; and
therefore that the hypothesis of those naturalists, who sup-
pose the earth to be only a great hollow shell of matter, is
groundless. And finally, that the sensible deflections in the
plumb-lines of astronomical instruments, by the density of
the superficial parts of the earth, must cause apparent in-
equalities in the menstruation of degrees in the meridian.

He candidly acknowledges, however, that a single experiment
is not sufficient to ascertain a matter of such importance,
and recommends other experiments of a similar kind to be
repeated in various places, and attended with different cir-
cumstances; since Schickhnen may differ in its internal con-
stitution from other mountains, as there is no appearance of
its ever having been a volcano, which is the case of many
others. Phil. Trans. vol. B. part 2. No. 48 and 49.

ATTRIBUTES in Ancient Geography. See ATRE-
BATI.

ATTRIBUTE, from attributes, in a general sense, that
which agrees to some person or thing; or a quality which
determines something to be after a certain manner. Among
logicians, it denotes the predicate of any subject, or whatever
may be affirmed or denied concerning it. But more strictly
speaking, an attribute is the same with an essential mode, or
it is that which belongs to the nature or essence of the
subject in which it is. Thus, understanding is an attribute
of mind; figure, an attribute of body, &c.

Of the several attributes belonging to any substance, that
which presents itself first, and which the mind conceives
as the foundation of all the rest, is called its essential attribute.
Thus, extension is by some, and solidity by others, made
the essential attribute of body or matter. The other attri-
butes are called accidental ones; e.g. roundness in wood,
or learning in a man. Mr. Locke endeavours to prove, that
thinking, which the Cartesians make the essential attri-
bute of the mind, is only an accidental one.

Mr. Harris (Hermes, p. 29.) considering all things what-
ever that exist either as the energies or affections of some
other thing, or as not being the energies or affections of
something else, refers the former to the denomination of
attributes, and the latter to that of substances. Thus, to
think is the attribute of a man; to be white, of a fawn; to
fly, of an eagle, &c. If they exist not after this manner,
then they are called substances.

Spinoza makes the soul and the body to be of the same
substance, with this only difference, that the soul is to be
conceived under the attribute of thought, and the body
under that of extension.

Attributes, in Theology, denote the several qualities and
perfections which we conceive in God, and which con-
stitute his proper essence; as justice, goodness, wisdom,
&c. The perfections of God are called his attributes, be-
cause he cannot be without them. Theological writers have
distributed the attributes of the deity into natural, such as
knowledge and power; and moral, such as justice and be-
noveleness. Of these writers some have maintained that all
the natural attributes are comprehended under power and
knowledge; and that benevolence comprehends all those
that are denominated moral. Others, alleging that God always
does that which is right and fit, have considered all his moral
attributes, viz. justice, truth, faithfulness, mercy, patience,
&c. as merely different modifications of rectitude. Others,
again, have represented wisdom as the spring of all the di-
vine actions. Accordingly, they have stated the moral
attributes of God to be only different ways of considering
his will, as invariably determined by his wisdom to that
which is best in all possible circumstances. The attributes
determined by his wisdom, are goodness, justice, truth,
and faithfulness. Goodness is the will of God, determined by
his wisdom, to the communication of being and happiness,
because it is fit, and as far as it is fit; justice is the will of God,
determined by his wisdom, to maintain right and order, and
for this purpose to do all that is necessary for convincing his
reasonable creatures of the regard he hath for the prefer-
avation of his own rights, and of theirs; truth, or sincerity,
is the will of God determined by his wisdom to avoid
using all signs in his intercourse with his intelligent crea-
tures, from which they may not only take occasion, with-
out necessity, to deceive themselves, but would have just
ground to charge him with being their deceiver, having a
meaning to himself quite different from that which the
words or other signs he made use of naturally suggested,
and were intended to fuddle; faithfulness is the will of
God, determined by his wisdom to make good all his
promises and engagements; and the holiness of God seems
to stand for all these perfections in conjunction, the Deity
being separated from them by all society and friendship
with false gods. According to this statement it is alleged,
that we have clear, distinct, and proper, though not ade-
quate, ideas of the moral attributes of the divine nature;
whereas some have maintained, that our notions of justice
and goodness do not at all agree to these attributes as they
tertain to the Deity, in whom they signify something, of
which we have only a confused or rather no apprehen-
sions, and very different from what they do when ascribed to
men. To this purpose, Lord Bolingbroke (Works, vol. iv. and v.)
found his system on this extravagant paradox, as it has been
justly called, that we have no adequate ideas of God’s mo-
oral attributes, his goodness and justice, as we have of
his natural, his wisdom and power; and accordingly he
denies justice and goodness to be the same in kind in God as
in man; and he pretends, that the ideas of God’s moral attri-
butes cannot be acquired by any reasoning at all, either apri-
or a posteriori, and hence concludes, that if a man has
such ideas, they were not found but invented by him. See
his objections stated and answered by the late bishop War-
burton, in his “View of Lord Bolingbroke’s Philosophy,”
Letter I. See Hartley’s Obs. on Man, p. 316. Days
on Divine Benevolence. Wolston’s Rel. of Nat. p. 116
—119. Grove’s Wisdom the first Spring of Action in the
Deity, in his Works, vol. iv. p. 1—46, &c. Balguy’s Di-
vine Rectitude, p. 3—8.

The heathen mythologists divide the deity into as many
different beings as he has attributes; thus the power of
God was called Jupiter; the wrath of God, Juno; the absolute
will of God, Fate, or Destiny, to which even his power is sub-
ject.

Attributes, in Painting and Sculpture, are symbols
added to figures and statues, to denote their particular office
and character. Thus the club is an attribute of Hercules;
the palm is an attribute of victory; the peacock, of Juno;
the eagle, of Jupiter; the trident, of Neptune; the balance,
of justice; the olive, of peace, &c. See Painting.

ATTRIBUTES, in Grammar, are words which are
significant of attributes; and thus include adjectives, verbs,
and participles, which are attributes of substances, and
adverbs, which denote the attributes only of attributes.
Mr. Harris, who has introduced this distribution of words, de-
nominates the former attributes of the first order, and the
latter attributes of the second order. Harris’s Hermes.

ATTRITION, formed of atterere, to wear, triturate or
friction,
friction, expresses such a motion of bodies against one another, as strikes off some superficial particles, whereby they gradually become less and less. The grinding and polishing of bodies is performed by attrition. The effects of attrition in exciting heat, light, electricity, &c. see under Electricity, Fire, Heat, and Light.

Attrition, among Divines, denotes a sorrow or regret for having offended God; arising from a sense of the obligations of sin, and the apprehensions of punishment; i.e. of the loss of heaven, and the pains of hell.

Attrition is esteemed the lowest degree of repentance, being a step short of contrition, which supposes the love of God an ingredient or motive of our sorrow and repentance. Attrition, in the church of Rome, was considered as a sufficient disposition for a man in the sacrament of penance to receive absolution, and be justified by God, by removing his guilt, and the obligation to punishment. Hence Dr. Jer. Taylor mentions this notion as one of those which accidentally taught or led to an ill life. Liberty of Prophecy, p. 252.

ATTROW, in Botany, a name given by the people of Guinea to a plant which they use in cafes of feedlings, boiling the leaves in water, and using the decoction by way of a fomentation.

It is a species of Kali, and is called by Peltier kali Guinea folis polygoni, floribus verticillati in medium dispositi, from its leaves resembling the common knot-grass, and its flowers growing in bundles round the stalks. Phil. Trans. Nov. 252.

ATRUMMAPHOC, a name given by the people of Guinea to a thorn which they use in medicine; they boil it in water, and give the decoction in the venereal disease. The juice of it, when fresh pressed out, is also used, snuffed up the nostrils, to promote sneezing, and cure several disorders of the head and eyes. Phil. Trans. Nov. 252.

It is a species of Colutea, called by Peltier, Colutea lanuginae floribus parvis filiquis pilosis deorum tendentibus; and Dr. Herman calls it an amygdalus.

ATTUARI, in Ancient Geography, a people of Germany, called by Strabo Chattuari, and placed by him in the neighbourhood of Casses. By Tacitus they are denominated Chazuari. Julian marched against these people, and after an expedition of three months, defeated them.

ATTUIE, in Geography, a town of Arabia, 76 miles W. S. W. of Saade.

ATTUND, or OSTUND, a country of Sweden, being one of the three parts of Upland, between Stockholm, Upland, and the Baltic sea; famous for its mines.

ATTURNATO facienda vel recipienda, in Law. See Attornato, &c.

ATTUSA, in Ancient Geography, a town of Asia Minor, on the confines of Bithynia and Myia. Pliny.

ATUACA, or ATTACA, a town of Belgic Gaul, mentioned by Caesar as belonging to the Eburones, and called by Antonian (1st.) Advoca Tungurum. This city, under the appellation of Tongres, was ruined by Attilla in 451, and its episcopal see was transferred to Maestricht; and from thence, in 881, to Liége.

ATUED, or ATUET, in Geography, a town of Sweden, in East Gothland, having in its vicinity some good mines; six leagues south-east of Lindkoping.

ATUN-JAUXA. See Jauxa.

ATUN-CANAR, or GREAT CANAR, a village of South America, in the jurisdiction of Cuenca, and a province of Quito, famous for its fertility and the treasures supposed to be buried in the earth. One of the Incas is said to have built in this place several magnificent temples, splendid pav...
in N. lat. 22° 5'. E. long. 97° 54'. It is divided into an upper and lower city; both of which are fortified: the lower is the most extensive, and is supposed to be about four miles in circumference; it is protected by a wall thirty feet high, with a broad and deep foss. The communication between the fort and the country is over a mound of earth, crouching a ditch that supports a causeway; the upper or smaller fort, which may be called the citadel, and does not exceed a mile in circuit, was much flranger and more compact than the lower; but neither the upper nor the lower had a ditch on the side of the river. This ancient capital has been suffered to sink into ruins, since the recent foundation of Ummarpaora. "The walls" says colonel Symes, "are now mouldering into decay; ivy clings to the sides; and bushes, suffered to grow at the bottom, undermine the foundation, and have already caufed large chains in the different faces of the fort. The materials of the houfes, consisting chiefly of wood, had, on the first order for removing, been transported to the new city of Ummarpaora; but the ground, unless where it is covered with bushes, or rank grasses, still retains traces of former buildings and streets. The lines of the royal palace of the Lotoo, or grand council hall, the apartments of the women, and the spot on which the piafath, or imperial spire, had fiood, were pointed out to us by our guide. Clumps of bamboo, a few plantain trees, and tall thorns, occupy the greater part of the area of this lately flourishing capital. We observed two dwelling-houfes of brick and mortar, the roofs of which had fallen in; these, our guide said, had belonged to Colars, or foreigners: on entering one, we found it inhabited only by bats, which flew in our faces, whilst our sense of smelling was offended by their filth, and by the noifome mewd that hung upon the walls. Numerous temples, on which the Birman never lay facrilegious hands, were dilapidated by time. It is impossible to draw a more flrking picture of defolation and ruin." To the gloomy and deserted walls of Ava, a fine contrast is exhibited by the new city of Ummarpaora.

**AVA, River of, now called Irrawaddy, is the chief river of the Birman empire; according to major Rennell (Memoir, p. 298.), it is the Nou-Kian, little, if at all, inferior to the Ganges, and it runs to the south through that angle of Yunnan which approaches nearest to Bengal. It is said to be navigable from the city of Ava to Yunnan; it passes by Moguang to Bamboo, and thence to Ummarpaora and Chagain, and thence to Prome towards the sea, into which it discharges itself by many mouths, after a comparative course of near 1200 British miles. The two extreme branches of the Ava river are the Perfaim and Syrian rivers, which major Rennell (Mem. p. 39.) has been able to trace to the place where they separate from the main river, at about 150 geographical miles from the sea. The bearings of these two branches intersect each other at an angle of about fifty degrees. The mouths of the Ava river form an affemblage of low islands like those of the Ganges. M. D'Auville erroneously supposed the Sampaoo, Thibet river, or Buriram-pooter, to be the fame with that which is called, in the lowest part of its course, the river of Ava; and the Nou-Kian he supposed to be the fame with the river of Pegu. This river of Pegu, according to Buchanan (see Symes's Embaffy, vol. ii. p. 414.), which is supposed to come from China, rifes among hills about 120 miles from the sea, which form the boundary between the Birman and Pegu kingdoms. The river coming from Thibet, supposed to be that of Arracan, is in reality the Keenduem, or the great western branch of the Ava river. That which is supposed to be the western branch of the Irrawaddy, is in fact the calfern one, which passes by Ava, and runs to the north, keeping well from the province of Yunnan, and leaving between it and that part of China a country subject to the Birman. He adds, that between the Pegu and Martaban rivers there is a lake from which two rivers proceed; the one runs north to Old Ava, where it joins the Myeongnya, a little river of Ava, which comes from mountains on the frontiers of China; the other river runs south from the lake to the sea, and is called Sitang. The country bordering on the Ava river, from the sea to Lundey, is flat, and the soil rich, and refembles the lower parts of the courses of the Ganges, Indus, and other capital rivers, formed out of the mud deposited by the inundations of the river. This low tract is called Pegu. Rennell's Mem. p. 297. Symes's Embassy to Ava, vol. ii. p. 413.

**AVA, Cape, a point of land in the island of Japan, in the eastern ocean, lying in N. lat. 34° 45', and E. long. 140° 55'.**

**AVA, Ava, in Botany, a plant so called by the inhabitants of Otaheite, in the South Sea, from the leaves of which they express an intoxicating juice. It is drank very freely by the chiefs and other considerable persons, who vie with each other in drinking the greatest number of draughts, each draught being about a pint: but it is carefully kept from their women. Hawksworth's Voyages, vol. ii. p. 260.**

**AVADLE, in Ancient Geography, a people of Asia, placed by Ptolemy in Bactria.**

**AVADOUTAS, a seat of Indian braminis, distinguished by their austerity and abstinence, and depending on accidental benefices for their necessary supplies.**

**AVAIL of Marriage, in Scots Law, denotes that cautel' in ward-holding, by which the superior was entitled to a certain sum from his vaifal, upon his attaining the age of puberty, as the value or arval of his tocher.**

**AVAILLE, in Geography, a town of France, in the department of the Vienne, and chief place of a canton in the district of Civray; five leagues eaff of Civray, and fix and a half S. W. of Montmorillon.**

**AVAL, the largest of the islands in the gulf of Perfia, known to the Europeans by the name of Bahrein. In this island were once 350 towns and villages; but at present it contains, besides Bahrein the capital, only sixty wretched villages; the others having been ruined by a long series of wars. This island produces great abundance of dates; but its chief dependence is upon the pearl-fihery, as the beft pearls are supplied by it. The duties upon the two articles of dates and pearls affords its sovereign a lack of rupees, out of which he is obliged to maintain a garrifon in the city.**

**AVALANCHEs, a name given in Switzerland and Savoy to those prodigious maffes of snow, which are precipitated, with a noise like thunder, and in large torrents, from the mountains, and which destroy every thing in their course, and have sometimes overwhelmed even whole villages. In 1719, an avalanche from a neighbouring glacier overflepd the greater part of the houfes and baths at Lenk, and destroyed a considerable number of inhabitants. The bell prefervative against their effects being the forests, with which the Alps abound, there is fearely a village situated at the foot of a mountain, that is not feltered by trees; which the inhabitants preferre with uncommon reverence. Thus, what constitutes one of the principal beauties of the country, affords also feurity to the people. Our readers may be gratified by the description which Thomson has given of the avalanches, in his "Seasons;"**

"Among
Among these hilly regions, where brace'd
In peaceful vales, the happy Grifons dwell;
Oft, rushing sudden from the loaded cliffs,
Mountains of snow their gathering terrors roll
From steep to steep, loud thund'ring down they come,
A wintry walk in dire commotion all;
And herds and flocks, and travellers and slaves,
And sometimes whole brigades of marching troops,
Or hamlets sleeping in the dead of night,
Are deep beneath the fmothering ruin hush'd.

AVALAS, a town of Servia, twelve miles south of Belgrade.

AVALITES Sinus, in Ancient Geography, a gulf on the right of the Erythraean sea. In this gulf was a fea-port, called Avalis, on the coast of Ethiopia: and the people of Ethiopia who lived near this gulf were called Avalites, and Ablites. Potency.

AVALLON, in Geography, a town of France, in the department of the Yonne, and principal place of a district, seated on the river Cousin. This is a town of considerable trade in grain, wine, and cattle, with a cloth manufacture; twenty-three miles S. S. W. from Auxerre, and fifty south of Troyes. N. lat. 47° 29'. E. long. 3° 5'.

AVALON, a peninsula of the island of Newfoundland, not far from the fourth-call port of it, with Placentia bay on the south, and Trinity bay on the north.

AVANCAY, a turban town, the diocese of Cufco, in South America, lying north-east of the city of Cufco, and extending above thirty leagues. The climate is variable, but in general hot, and many parts of it are cultivated with eanes, which yield a very rich sugar. The more temperate parts abound in wheat, maize, and fruits, which are sent to the city of Cufco. In this province is the valley of Xaquipajuna, or Xaiquiguna, where Gonzalo Pizarro was defeated and taken prisoner by Pedro de la Cufco.

AVANCHE. See AVANCHE.

AVANIA, in the Turkish Legisature, a fine for crimes, and on deaths, paid to the governor of the place. In the places where several nations live together under a Turkish governor, he takes this profitable method of punishing all crimes among the Christians or Jews, unless it be the murder of a Turk. Pococke's Env. vol. ii. part ii. p. 30.

AVANT, a French preposition, signifying before, or any priority either in respect of time or place; sometimes used in composition in our language, but more usually contracted, and wrote vaut, or vant, or even van.

AVANT FoFle, &c. See VAN FOFle.

AVANT Guard, &c. See VAN Guard, &c.

AVANTICI, in Ancient Geography, a people reckoned among the inhabitants of the Alps, and, according to Pliny, comprehended by Galba within the province called Narbonneis. Some have represented them as the inhabitants of Avaricum or Aventicum, the capital of Helvetia; but as Galba Narbonneis never extended so far, Hardouin rejects this opinion. Menard (Mem de Litt. t. xxix. p. 248.) fixes them in a place, now called Avaron, between Gap and Embrun.

AVANTURINE, in Natural History, a yellowish stone full of sparkles, resembling gold, very common in France. An artificial imitation of it is made by mixing sparkles of copper with glaze, whilst it is in fusion, which is used by enamellers, and to sprinkle as sand upon writing. Various stones have been known by this appellation. See QUARTZ, and FELSAR.

AVAOU, in Ichthyology, the name given by the natives of Otahite to a species of Gobius figured by Bouffon, in his decade of fishes. See GOBIUS OCCELLARIS.
fame Avars of haughty defiance; and he derived his confidence from the God of the Christians, the ancient glory of Rome, and the recent triumphs of Justinian. The Chagan was awed by the report of his ambassadors; and instead of executing his threats against the eastern empire, he marched into the poor and savage countries of Germany, which were subject to the dominion of the Franks; but after two doubtful battles, he consented to retire. The spirit of the Avars being chilled by repeated disappointments, their power would have dissolved away in the Sarmatian desert, if the alliance of Alboin, king of the Lombards, had not given a new object to their arms, and a lasting settlement to their wearied fortunes. (See Alboin, and Lombards.) By the departure of the Lombards, and the ruin of the Gepide, between the years 570 and 600, the balance of power was destroyed on the Danube; and the Avars, at this time, spread their permanent dominion from the foot of the Alps to the sea-coast of the Euxine. The reign of Bajan is the brightest era of their monarchy; and the Chagan, who occupied the rudi palace of Attila, appears to have imitated his character and policy. The pride of Julian II. of Tiberius, and of Maurice, was awed by a proud barbarian, more prompt to injure, than exposed to suffer, the injuries of war; and as often as Asia was threatened by the Perrian arms, Europe was oppressed by the dangerous inroads, or costly friendship, of the Avars. As the successor of the Lombards, the Chagan asserted his claim to the important city of Sirmium, the ancient bulwark of the Illyrian provinces. The plains of the Lower Hungary were covered with the Avar horse, and a fleet of large boats were built in the Hercynian wood, for the purpose of defending the Danube, and transporting into the Save, the materials of a bridge. But as the strong garrison of Singidunum, which commanded the confluence of the two rivers, might have flapped their passage and baffled his designs, he dispelled their apprehensions by a solemn oath that his views were not hostile to the empire. Sirmium, however, was invested by the pernicious Bajan, and its defence was prolonged above three years; but at length, it was reduced by famine, a merciless capitulation allowed the escape of the naked and hungry inhabitants. Singidunum, at the distance of fifty miles, experienced a more cruel fate; its buildings were razed, and the vanquished people condemned to servitude and exile. From Belgrade to the walls of Constantinople a line extended of 600 miles, which was marked with flames and blood. The horses of the Avars were alternately bathed in the Euxine and the Adriatic; and the Roman pontiff, alarmed at the approach of a more savage enemy, was reduced to cherish the Lombards as the protectors of Italy. The defeat of a captive, whom his country refused to ransom, dispelled to the Avars the invention and practice of military engines, but in the first attempts they were rudely framed and awkwardly managed; and the refinance of Diocletianopolis and Beroea, of Philippopolis and Adrianople, was only a triumph of the infidels. Although the warfare of Bajan was that of a Tartar, his mind was susceptible of sentiments that were generous and humane; accordingly, he spared Antichus, by whose salutary waters the health of the belt beloved of his wives was restored; and the Romans confide, that their starving army was fed and disarmed by the liberality of a foe. His empire extended over Hungary, Poland, and Prussia, from the mouth of the Danube to that of the Oder; and his new subjects were divided and transplanted by the jealous policy of the conqueror. The eastern regions of Germany, which had been left vacant by the emigration of the Vandals, were replenished with Slavonian conquered; the same tribes are discovered in the neighbour-

hood of the Adriatic and the Baltic, and with the name of Bajan himself, the Illyrian cities of Nefs and Litia are again found in the heart of Sileia. In the disposition both of his troops and provinces, the Chagan exposted the vassals, whole lives he disregarded, to the first assault, and the swords of the enemy were blunted before they encountered the native valour of the Avars. The emperor Maurice, after having, for ten years, supported the insolence of the Chagan, declared his purpose of marching against the barbarians. Deaf to the advice and intreaty of the senate, the patriarch, and the empress Contantina, who diffidated him from personally encountering the tutiges and perils of a Scythian campaign, he boldly advanced seven miles from the capital; but Attila was the limit of his progress both by sea and land. In five succedanea battles, 17,000 barbarians were made prisoners; near 60,000, with four tons of the Chagan, were slain; the Roman general, Priscus, surprised a peaceful district of the Gepide, protected by the Avars; and his left trophies were erected on the banks of the Danube and the Teyfa. Bajan, however, again prepared, with dauntless spirit and recruited forces, to avenge his defeat under the walls of Constantinople. In the reign of Heraclius, A.D. 621—622, Syria, Egypt, and the provinces of Asia, were subjugated by the Perrian arms under Chofroes; while Europe, from the confines of Illyria to the long wall of Thrace, was oppressed by the Avars, unfatigued with the blood and rapine of the Italian war. They had coolly mastered their male captives in the field of Pannonia; the women and children were reduced to servitude, and the noblest virgins were abandoned to the promiscuous lust of the barbarians. When Heraclius was preparing to abandon his capital, and to transfer his person and government to the more secure residence of Carthage, the Chagan was encamped in the plains of Thrace; and dissembling his pernicious designs, solicited an interview, for the purpose of reconciliation, with the emperor, near the town of Heraclia. On a sudden, the Hippodrome was encompassed by the Scythian cavalry; the tremendous sound of the Chagan's trumpet gave the signal of assault; and Heraclius was saved by the fleetness of his horse. So rapid was the pursuit, that the Avars almost entered the golden gate of Contantinople with the flying crowds; but the plunder of the suburbs rewarded their treason, and they transported beyond the Danube 270,000 captives. The Perrian king having ratified a treaty of alliance and partition with the Chagan, A.D. 626; 35,000 Barbarians, the vanguard of the Avars, forced the long wall of Contantinople, and drove into the city a profuse crowd of peasants, citizens, and soldiers. In the mean while the magistrates of the capital repeatedly drove the Roman legions to purchase the retreat of the Chagan, but their deputies were rejected and insulted; and he suffered the patricians to stand before his throne, while the Perrian envoys, richly drest, were feated by his side. For ten succedanea days, the capital was assaulted by the Avars, who had made some progress in the science of attack. At length however, by the vigorous resistance of the inhabitants, the Avars were repulsed; a fleet of Sclavonian canoes was also destroyed in the harbour; the vassals of the Chagan threatened to desert; his provisos were exhausted, and after burning his engines, he gave the signal of a faw and formidable retreat. To the hostile league of Chofroes with the Avars, the Roman emperor opposed the honourable and useful alliance of the Turks; and the Perrians were then reduced to the necessity of retreating with precipitation. Gibbon's Hist. vol. vii. viii.

From the annals of France, cited by Bolandus, we learn, that Thudun, a leader of the Avars, sent ambassadors to Charle-
Charlemagne, in 795, with proposals for surrendering himself
and his people to that prince, and for embracing Christianity
under his auspices.

At this day there exists an Avarian nation in Daghestan,
in the district of Derbent and Kuhet, who, though, through
their cohabitation for several centuries with various nations,
they have adopted their language and the Mahometan religion,
have nevertheless retained some Sarmatian words, that,
their ancient origin. They marched, says Mr. Tottke (Hist.
Ruff. vol. i. p. 9.), in the fourth century to Pannonia, disper-
sefled the flames, and establishted themselves with those
that remained. On the arrival of the Mahears and Romanes,
they collectively assumed the name Mahears, and by this
name they are still distinguished.

AVARICUM, called also Bituriges, now Bouzgar, the
capital of the Bituriges-Cubi, and afterwards of Aqui-
tania Prima, was one of the most considerable cities of
Gaul at the time of the Roman conquest. About the
forty-seventh Olympiad, or 592 years before the Christi-an
era, it was the capital of Gaul, of part of it which
was subject to the Celts. The Romans erected an amphi-
theatre in this place, which was not demolished before the
year 560; and also a capitol.

AVARILLO, Capé, lies N. E. from Pedaran bay, and
nearly in the eastward extremity of Cambodia. N. lat. 11°

AVAROMO TEMU, in Botany, the name of a filiqueu-
tre, which grows in the Brazil. The bark is externally of
a cinctuous, and internally of a deep red colour; and is the
only part of the plant used by the Skilful for medicinal pur-
poses; though the fame affingent qualities are by some
applied to the leaves: for the bark, which is of a bitter
taste, whether reduced to a powder, or boiled and used by
way of fomentation, happily cures invertebrate and oblitinate
ulcers; and, as is said, has been found to cure cancers
themselves, by means of its remarkably cleansing and drying
nature.

Befide these purpofes, it is also made ufe of on account of
its effeetually affingent quality, for baths defigned to
strengthen and invigorate the muscular parts of the body,
when weakened, or too much relaxed. Ray fays it is much
ufed by courtezans for contracting the pudenda.

AVARUM, in Ancient Geography, a promontory of
Hifpania Tarragonensis. Poletomy.

AVAS. See Athamania.

AVAS, in Geography, a mountain of Hungary, in the di-
strict of Marnarufs.

AVAST, a term frequently ufed on board a ship, fignify-
ing, to flop, hold, or fly. The word is formed of the Italian
vaffa, or bufia, it is enough, it flufles.

AVASTOMATES, in Ancient Geography, a people
of Africa, in Mauritania. Amm. Marc.

AVATCHA or AWATSKA, called alfo St. Peter and St.
Paul, in Geography, a fea-port of Kamtchatka, lying in
N. lat. 52° 51', and E. long. 136° 48'. The bay of Avat-
cha lies in the bight of another formed by cape Gavareca
the fourth, and Cheepofkoi Nofs to the north: the latter
fearing from the former N. E. by N. and diverf from it
thirty-two leagues. From cape Gavareca to the entrance
of Avatsha bay the caflf bears to the north, extends about
eleven leagues, confifts of a chain of ragged cliffs and rocks,
and preffes in many parts an appearance of bays or inlets,
which on a nearer approach are found to be low grounds con-
necting the head-lands. From the entrance of Avatsha bay,
Cheepofkoi-nofs bears E. N. E. at the distance offeventeen
leagues. The shore on this fide is flat and low, with hills
behind that front gradually to a coniderable height. When

navigators approach this bay from the southward, this
difference of the land on both fides of cape Gavareca to lat.
52° 21', will direct them in their course: when they ap-
proach it from the northward, Cheepefko-nofs becomes
very affingent, as it is a high projecting head-land, exten-
sed to the continent by a large extent of level ground
lower than the Nofs, and it presents the fame appearance
both from the north and south. The entrance of Avatsha
may be known, in clear weather, by the two high mountains
to the south of it; of which the nearest of the
bay is in the form of augar-leaf, and the other far and not fo
tall. These very affingent mountains also appear on
the north side of the bay; that to the west being the
highest; the next, which is a volcano, may be known by its
smoke; and the third, which is the most northly, is a
crater of mountains, with fural flat tops. Within the
capes, the entrance of Avatsha bay to the north, is pointed
out by a light-house on a perpendicular headland, to the
calitward of which are many funken rocks, stretching two
or three miles into the fea: four miles to the south of the
entrance lies a small round island, principally compofed of
high pointed rocks. The entrance into the bay is at first
about three miles wide, and in the narrow part 18; the
length in a north-west direction is four miles. Within the
mouth is a noble haven about twenty-five miles in circum-
fence; in which are the harbours of Rakoweca to the
east, Tarenska to the west, and St. Peter and St. Paul to
the north. Such is the account of Avatsha given in the
continuation of Cook's voyages. The bay of Avatsha, ac-
cording to the relation of La Perouse, who visited it in 1787,
is certainly the finest, most commodious, and fafest that can
pofibly be met with in any part of the world. Its mouth
is narrow, and ships would be compelled to paft under the
guns of the fort, which might be erected there. It has ex-
cellent holding ground, as the bottom is of mud. Two
vall harbours, one on the eafT, and the other on the western
coaft, would contain all the ships of England and France.
The rivers of Avatsha and Paratounha empty themfelves
into this bay; but they are impeded by land banks, and
can only be entered at high water. The village of St. Peter
and St. Paul is situated on a tongue of land, which, like an
artificial bank, forms behind the village a little harbour
inclined like a circle, which might accommodate three or
four difmantled ships during the winter: its entrance is
less than twenty-five fteps wide. On the fide of this haven
M. Kalloff, the governor, propofed to correct the idea
of a town defigned to be the capital of Kamtchatka, and
perhaps the grand centre of commerce with China, Japan,
the Philipines, and America. A large lake of salt water
lies to the north of the fite of this projected city, and at
the distance of only 350 toises are many small brooks, the
junction of which would facilitate the conveyance of all
the commodities neceffary for a large eftablifhment.

M. Kalloff gave orders for announcing, that an union of several districts
with that of St. Peter and St. Paul would soon take place,
and that he intended immediately to build a church. The
dee in the bay of Avatsha never extends within 3 or 450
toises from the bank; and during the winter it often hap-
sens, that the land winds difperfe that which obstructs the
pafage into the rivers of Paratounha and Avatsha, when
the navigation again becomes practicable. This bay is fud
to bear a great resemblance to that of Duf., but it affords
better anchorage by the mud of its bafiset, its mouth is
narrower, and of course more easily defended. The two
feas at the entrance of this bay, which are separated by a
large channel for the pafage of ships, may be easily avoided,
by leaving two detached rocks on the eafT shore open with
the
the light-house point, and by keeping, on the contrary, shut in with the west shore, a large rock on the harbourside, and which is only separated from the shore by a channel less than a cable's length wide. The tides in this bay are very regular; and the greatest rise of high water, which happens at half past three on the days of new and full moon, is four feet. From M. Daget's observations, the governor's house at St. Peter and St. Paul, is situated in N. lat. 53° 1', and E. long. from Paris, 156° 30'. La Perouze's Voyage, vol. ii. ch. 22. p. 117, &c. Eng. Transl.

AVAT'ICI, a people of Europe, in Gallia Narbonensis, whose capital according to Piny was Maritima; or as Steph. Byz. has it, Maiorvancula.

AVAUNCHERS, among Hunters, the second branches of a hart's horn.

AUAXA, or AUAX, in Ancient Geography, a town of Asia, in Pontus. Not. Imp.

AUB, in Geography, a town of Germany, in the circle of Franconia, and bispoch of Wurzburg, on the river Gollach, seventeen miles south of Wurzburg, and twenty-eight north-west of Anspach.

AUBADE, Fr. in Music, a concert given at day-break in hot climates, in the open air; generally by a lover under the window of his mistress. The Italians term this harmonious morning salute, mattinata; a noon song of the same kind, giornoata; evening long or concert, serenata; a midnight concert, notturno.

AUBAGNE, in Geography, a town of France, in the department of the mouths of the Rhone, and chief place of a canton in the district of Aix; three leagues east of Marfelles and five S. E. of Aix. N. lat. 43° 17'. E. long. 5° 52'.

AUBAINE, in the French Cyclopedia, a right vested in the king, of being heir to a foreigner, who died within his dominions.

The word is formed of aubain, a foreigner; which Menage derives farther from the Latin, aliis natus; Cujus, from adventa, which is the name foreigners bear in the capitularies of Charlemagne; Du-Cange, from Albus, a Scot, or Irishman; because these were anciently much given to travelling and living abroad.

The king of France, by the right of aubaine, claimed the inheritance of all foreigners in his dominions; exclusive of all other lords, and even of any testament the deceased could make. An ambassador, though not naturalized, is not subject to the right of aubaine. The Swifs, Savoyards, Scots, and Portugueze, are also exempted from the aubaine, as being reputed natives and regneze.

M. de Lauriere (Glosfiaire du Droit Francais, art. Aubaine, p. 92.) produces several ancient deeds which prove, that in different provinces of France, strangers became the faves of the lord on whose lands they settled. Beaumanoor says (Cout. de Deauv. ch. 45. p. 254.), that there are several places in France, in which if a stranger fixes his residence for a year and a day, he becomes the fave of the lord of the manor. As a practice so contrary to humanity could not subsist, the superior lords found it necessary to reftatisfied with levying certain annual taxes from aliens, or imposing on them some extraordinary duties or services. But when any stranger died, he could not convey his effects by a will; and all his real as well as personal estate fell to the king, or to the lord of the barony, to the exclusion of his natural heirs. This practice of confiscating the estates of strangers upon their death, was very ancient. It is mentioned, though very obscurely, in a law of Charlemagne, A. D. 813. Not only persons who were born in a foreign country were subject to the droit d'aubaine, but in some countries such as removed from one diocefe to another, or from the lands of one baron to another. "It is scarcely possible," says Dr. Robertson (Hist. Ch. V. vol. i. p. 397.), "to conceive any law more unfavourable to the intercourse between nations. Something similar to it may be found in the ancient laws of every kingdom in Europe. With respect to Italy, see Murant. Ant. vol. ii. p. 14." It is no small disgrace to the French jurisprudence, that this barbarous, inhospitable custom, should have so long remained in a nation so highly civilized.

AUBAIS, in Geography, a town of France, in the department of the Gard, one league S. E. of Sommieres, and three and a half S. W. of Nîmes.

AUBE, a river of France, which rises near Aubervie, in the department of the Upper Marne, passes by Vert fur Aube, Bar fur Arbe, Dieuville, Arçis, &c. and joins the Seine seven miles below Mery. Aube gives name to a department which it waters. This department is one of the four into which the province of Champagne is distributed. It is bounded on the north by the departments of Upper Marne, Marne and Seine, and Marne; on the east by that of the Upper Marne; on the south by those of Coté d'Or and the Yonne; and on the west by this last, and that of the Seine and Marne. The superficial is about 1,196,370 square acres, or 416,468 hectares; its population confists of 228,814 persons; and it is divided into fifteen commual districts.

AUBENAS, a town of France, in the department of the Ardèche, and chief place of a canton, in the district of Comon, three and a half leagues S. W. of Privas. N. lat. 44° 32'. E. long. 4° 32'.

AUBÉTONT, a town of France, in the department of the Aîné, and chief place of a canton, in the district of Vervins, nine leagues N. E. of Laon, and three and three quarters east of Vervins.

AUBERG, a town of Germany, in the archduchy of Austria, on the north side of the Danube, opposite to Linz.

AUBERVIE, a town of France, in the department of the Marne, and chief place of a canton, in the district of Rheims, on the Siuppe, 15 miles north of Chalon.—Alfo, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Langres, 12 miles south-west of Langres.—Alfo, a town of France, in the department of the Isere, and chief place of a canton in the district of Vienne, five miles south of Vienne.

AUBERT, Peter, in Biography, a French lawyer, was born at Lyons in 1642, and at an early age discovered marks of genius, and a fondness for books. He was distinguished by reputation and success in his profession, and employed in several offices in his native city. His library, which was large and valuable, he left for public use to the city of Lyons. He published, besides a small romance which he wrote at seventeen, intitled "Retour de L'Ille Amour," a collection of 14 Factions of various advocates, in 2 vols. 4to., printed at Lyons in 1710; and a much improved edition of "Richelieu's Dictionary," published in 1728, in 3 vols. fol. Nouv. Dict. de l'Hom.

AUBERTIN, Emmon, a learned French divine of the reformed church, was born at Chalon on the Marne, in 1595, chosen minister of the church of Chartres, in 1618; and removed to the church of Paris, in 1631. His famous work, intitled "L'Eucharistie de l'Ancienne Eglise," and printed in folio in 1643, was highly esteemed by the reformers, but gave great offence to the catholics. In this work
work he discourses of the subject of the ancient church, on the grounds of reason and scripture, and examines the faith of the church for the six first centuries, in order to shew, that, through the whole of this period, the doctrines of transubstantiation and of the real person were unknown. The historical part of this performance was answered by Arnaud, and other Port Royal divines, in a work intitled "La Perpetuité de la Foi." Aubertin became the object of clerical odium; a proceed was instituted against him for flinging himself pallor of the reformed church of Paris, and he was tried two or three years for some expressions which he used in the pulpit. Intolerant bigotry pursued him to his last moment. On his death-bed, and when he was just expiring, Aubertin, the curate of St. Sulpice, with a bailiff and an armed mob, confining of four persons, intruded on his retirement; under a pretence, that he wished to make an abjuration before a priest, which he was prevented from doing, and that they would give him an opportunity of disburdening his conscience. The leader of this gang obtained admittance by feigning himself to be a physician. The honest Aubertin, roused by this intrusion and assault, distinctly declared his perseverance in the faith of the reformed church. When the curate and bailiff withdrew, the mob were with difficulty persuaded to depart without plundering the house. In these happier days this extreme of bigotry, which would not allow a man of distinguished probity and worth to die in peace, and which at a season, when

"Claudicat ingenium, delirat linguasque menfque," Laerc. l. iii. v. 454.

"When reason halts, and thought and speech are wild," endeavoured to extort from him a declaration, which his found reason had disclaimed, will be universally repro tested and condemned. This good man died at Paris in the year 1632, at the age of 57 years. A Latin translation of his work by himself, was published at Deventer in 1634, folio. Gen. Diet. of

AUBERY, or AUBRY, John, was physician to the Due de Montpensier. He was educated under the famous Du Laurens; published in 1604, "Les Bains de Bourbon-Lancy," and in 1606, "De refitienda et vindicandae Medicinae Dignitate," both at Paris: but the work which gained him most reputation, and which is still in request, is his "Antidote de l'Amour," 12mo., first printed in 1599, and since at Delft, 1663.

AUBERY, Anthony, a French historian, was born in 1617, and after having been educated at Paris for the law, retired into the tranquility of private life, and devoted himself to historical researches. In 1642, his "General History of the Cardinals," was published in 5 vols. 4to.; in 1649, appeared his historical treatise "On the Pre-eminence of the Kings of France above the Kings of Spain and the Emperors;" in 1654, the "History of the Cardinal de Joyeuse, and Collection of Letters written by that Cardinal to Henry 111.;" and in 1660, his "History of Cardinal Richelieu, containing the principal events in the reign of Louis XIII.," in folio, which was accompanied by two other volumes of titles, letters, dispatches, instructions, and memoirs, serving as documents and vouchers to the general history. When Bertier the printer waited upon the queen regent, requesting her authority for the publication of the work, which contained severe directions on many persons in high life, it is said that the queen replied, "Finish your work without fear; and put vice to the blush, that virtue alone may dare to show her face in France." Aubery, notwithstanding the freedom with which he wrote, has been charged with drawings, in this work, too flattering a picture of Cardinal Richelieu, and it has been said that this was done, from lucrative motives, for gratifying the vanity of the duchess d'Argoullon, the cardinal's niece. A book, written by Aubery in 1667, on the just pretensions of the king of France to the empire, and dedicated to Louis XIV. alarmed the princes of the empire, and excited complaints against the author, who was committed to the Baille, in order to silence and condemn them, but he was soon released. This work was followed by a treatise "On the dignity of Cardinal," and another of little value, "On the Regale, or the right of enjoying the Revenues of vacant bishoprics." His last work, published in 4 vols. 12mo. in 1731, was "The History of Cardinal Mazarin." The facts collected in this publication from the registers of parliament, now no longer to be found, constitute its chief excellence; for neither the style nor method of it have much to recommend them, and the author had not sufficient independence of mind or situation to write with impartiality. While he was preparing for the first historical collections, his life, which had been spent in a course of literary labour and industry, was terminated by an accident in 1695, at the age of 78. Journal des Scien. t. xxii. p. 185. Nouv. Déc. Hist.

AUBERY, Louis de Maurier, a French historian of the 17th century, accompanied his father, who went, whilst he was young, as ambassador to Holland, and visited Germany, Poland, and Italy. On his return to Paris, he obtained the favour of the queen regent; but having no public employment, he retired, after the death of Richelieu, to his family manor, and spent his time in literary avocations. He died in 1687, and his works were "Memoirs for the history of Holland," published in 2 vols. 12mo. in 1682; and "Memoirs of Hamburg, Lubeck, Holstein, Denmark, Sweden, and Poland," published after his death, and both printed together at Amsterdam in 1736. The former work contains interesting facts, though it gives offence to the Dutch. Nouv. Déc. Hist.

AUBETTERRE, in Geography, a town of France, in the department of the Charente, and chief place of a canton in the district of Barbeufex, six leagues south-east of Barbeufex, and 74 south of Angouleme. N. lat. 45° 15'. L. long. 0° 10'.

AUBETTE, a river of France, which runs into the Seine, near Rouen.

AUBEVILLIERS, a town of France, in the department of the Somme, and chief place of a canton in the district of Montdidier, thirteen miles S.S.E. of Amiens.

AUBEVILLIERS (Let.), a town of France, one league N.N.E. of Paris.

AUBIERES, a town of France, in the department of Puy de Dome, and chief place of a canton in the district of Clermont-Serand, one league south-east of Clermont.

AUBIERES (Let.), a town of France, in the department of the Two Sevres, and chief place of a canton in the district of Chatillon for Sevre, 24 leagues E.N.E. of Chartillon.

AUBIGNE, Theodore-Agrrippa D'., in Biography, was born at St. Maury, near Pons, in Saintonge, in 1557; but, although he was betimes a proficient in literature, the circumstances of his family, on the death of his father, obliged him to return to the profession of arms. In the service of Henry IV. of France, then king of Navarre, he so far recommended himself to the royal favour, as to obtain several considerable posts, both of honour and profit. Such was his known and approved fidelity, that his royal master received his remittances on such parts of his private and public conduct as deferred animadversion, without offence. "The word of D'Aubigné disconcerted (said Henry on one occasion,) is worth as much as the gratitude of another man."
AUBIGNY, in Geography, a town of France, in the department of the Aisne, and chief place of a canton in the district of St. Pol, eight miles W.N.W. of St. Pol.—Also, a town of France, and chief place of a district in the department of the Cher, five leagues north-west of Sancerre, and 74 north of Bourges. In 1442, Charles VII. granted the estate of Aubigny to John Stuart, constable of England and his heirs male, as a recompence for services rendered to him in France, with remainder to the crown on failure of male issue. This royal donation took effect in the 16th century, by the death of Charles Stuart without issue. Lewis XIV. made a new grant in favour of Charles II. king of England, the descendant of John Stuart, and made the estate a duchy-annexing a peerage to it in favour of Charles Lenox, duke of Richmond, (natural son of Charles II. by Louisa de Quenville, the dutchesse of Portsmouth), from whom it descended to the present duke. The right of peerage to this estate was guaranteed by the treaty of Utrecht, confirmed to the present duke, and registered in the parliament of Paris, in 1777. N. int. 47° 25'. E. long. 2° 20'.

AUBIN, in French Hobbin, in the Mâne, is derived from the Italian word Ubbia, signifying a little horse. Accordingly the light-armed troops were termed in unclassical Latin Hobbarbi, in contradistinction to the cataphracti, or heavy-armed troops. Berenger. See HOBBY.

AUBIN, St., Boy, in Geography, lies on the island of Jersey, in the English channel; and at the bottom of it is a town of the same name with a good harbour, defended by a fort near the south-west extremity; three miles west from St. Helier's. N. lat. 49° 24'. W. long. 2° 15'.

AUBIN, St., is also a town of Switzerland, in the principality of Neuchâtel.

Clusa, polyandra monogynia. Gen. Char. Col. perianth five-leaved, rigid, spreading, coloured within, pubescent without, deciduous, five-parted; parts linear-lanceolate, acute, with thick margins, which before flowering are contiguous. Cor. petals five, roundish-oblong, smaller than the calyx, with very short claws. Stem. filaments very many, very short; anthers ovate-oblong, outwardly gibbous, gaping on the inner side, foliaceous at the tip, acute, the outer ones terete, lanceolate; ending in a foliaceous point, shorter than the corolla. Fil. germ roundish, depressed; style long, filiform, gradually thickening, slightly incurved; stigma spreading, perforated, ten-touched. Per. capsule large, oblong, depressed, coriaceous, ciliate, ten-celled, gaping at the base. Seeds, very many, small, roundish, somewhat compressed; receptacle of the seeds, heliophilous.

Species. 1. A. Tibouhou, aephe ibinhobu. Aubl. l. c. Swartz. I. c. "Leaves acutely serrate, hisrate." A tree of a middling size, having a trunk seven or eight feet high, and a foot in diameter, with ragged, choppy, soft bark, which is fibrous, and fit for making ropes. Wood white and light; branches spreading in all directions, and bent down; twigs villose; leaves alternate, ovate-oblong, cordate at the base, green above, on short petioles; stipules in pairs, acute; flowers in racemes, opposite to the leaves. A pair of opposite bractes placed at the origin of each twig, and four at the peduncle. The raceme, peduncles, and under side of the leaves, are covered with ruffet-coloured hairs. A native of Brazil, Guiana, the islands of the Caribbees, and Tobago. Apeiba is the Brazilian name, and Tibouhou the Caribbees. 2. A. Potamo aephe potamo. Aubl. l. c. Swartz. I. c. "Leaves elliptic, acute, ferrulate, hoary beneath." This tree often riles forty feet high, with a brown, thick, filamentous bark, fit for cordage. Wood whitish, soft; branches spreading, arising from the top of the trunk; leaves alternate, nine inches long, and four broad, entire, smooth, ending in a point, petiolated; flowers yellow, in racemes opposite to the leaves, on long peduncles, surrounded by four large scales at the base. A native of Guiana, in the vault forests of Sinemari. It is called potamo by the Caribbees. 3. A. effera. Aubl. and Swartz. I. c. "Leaves quite entire, pubescent beneath; fruit comprefsed." A tree from thirty to forty feet high, with bark and wood like those of the preceding. Leaves alternate, ovate, smooth, pointed, rounded at the base, five inches long, on a short footstalk; at the base of which are two stipules, which soon fall off; flowers at the extremities of the branches, in racemes which have at the base two bractes, and at the divisions three or four scales, from which spring three yellow flowers. A native of Guiana and Cayenne. It is also called potamo by the Caribbees. 4. A. I., Aubl. l. c. 2:24, (apheiba globra) "Leaves quite entire, smooth on both sides; fruit rough, deprected." A tree of middling size, with a trunk from ten to twelve feet high; its wood is very light; leaves ovate, acuminate, on short footstalks; stipules in pairs, short, deciduous; flowers in racemes, greenish. A native of Guiana, flowering in May. The inhabitants call it l'ovura, and use pieces of the wood rounded and pointed to procure fire: hence the Creoles call it bois de mâche.

AUBONDAGE, in Geography, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Château-Salins, six miles N.N.E. of Château-Salins.

AUBONNE, the name of a government and of a town in the canton of Berne, in Switzerland, which was formerly a lordship, belonging to the marquis du Queine, purchased by him of the famous traveller, Tavernier, and afterwards fold
AUBREY, in Latin ABERICUS, John, in Biography, an eminent English antiquary, was born at Easton Piercy in Wiltshire, in 1625 or 1626; and after preparatory education at Malmesbury, entered in 1642 as a gentleman commoner of Trinity college at Oxford. Whilst he was at the university, he affiliated in compiling materials for the "Monasticon Angliae." In 1646, he was admitted a student in the Middle Temple; but the death of his father, and the derangement of his affairs, devolved upon him much business and many perplexing law-suits, which prevented him from prosecuting his legal studies. However he did not abandon his favourite pursuit, but maintained a regular correspondence with the lovers of antiquities, and furnished Antony Wood with many valuable materials for his great work. He also preferred an intimacy with several of those philosophical friends, who formed the Royal Society, of which he became a member in 1662. His domestic circunstances were peculiarly distrefling; for he married unhappily, and by the total loss of his patrimony he was reduced to absolute indigence. But he had the wisdom and fortitude to adapt his mind to his circumstances; and accordingly he says of himself, "From 1670, I have, I thank God, enjoyed a happy delitelse." "This obscurity, which he calls happy, consisted in following the bent of his genius, and he owed his sublimity to the kindness of his friends; and in labouring to inform the world, in which he knew not how to live." The principal of those who contributed to his support was lady Long of Draycot in Wiltshire, in whose house he had an apartment till his death, which happened about the year 1700, as he was on a journey to Oxford. Aubrey was a good classical scholar, a tolerable naturalist, and a most laborious antiquarian; but he was credulous, and addicted to superstitious. His works were numerous, but most of them were left behind him in MS. There are 1. "The life of Thomas Hobbes of Malmesbury," never published, but having supplied materials for Dr. Blackmore's account of this philosopher. 2. "Miscellanea upon the following subjects: viz. Day-fatality, Local-fatality, Oletanta, Omens, Dreams, Apparitions, Voices, &c. &c. Corpse-candles in Wales, Magic, &c. Second-fighted persons, &c." This work, the title of which sufficiently indicates the trifling taste and credulous disposition of the author, was printed in 1666, and Aubrey left corrections and additions for a second edition, which was not printed till the year 1721. 3. "A Perambulation of the county of Surrey, begun 1673; ended 1672." printed in 1719, in 5 vols. 8vo, and often referred to by topographical writers. 4. "The Natural History of the north division of Wiltshire," never published. 5. "Monumenta Britannica, or a discourse concerning Stonehenge, and Rolleth stones in Oxfordshire." MS. On these subjects, Aubrey's judgment was held in high estimation by Mr. Toland; and it was his opinion that these remain unriducible, and anterior to the Roman invasion of Britain.

AUBURN, in Geography, a town in the circle of Welphalia, and county of Diepholz, six miles east of Diepholz.

AUBZEN, or AUBERN, is a small town in Wiltshire, 76 miles west from London. It is situated on a branch of the river Kennet, and has a small market on Tuesdays. Its inhabitants are principally employed in the manufacture of furriers, a considerable quantity of which is annually sent to the metropolis. The soil of Auburn and its vicinity is chiefly gravel, with a substratum of chalk. About one mile from the town is a very extensive rabbit Warren, whence many hundred couples of rabbits are sent to London during the proper season. Auburn suffered materially in its trade and buildings by a burning fire that occurred here on the twelfth of September 1762, when seventy-two houses, and all the property, to the estimated amount of 20,000l., were consumed. By means of a public subscription, the distressed inhabitants obtained some remuneration for their losses; but the town has never recovered the serious injury it then sustained.

AUCHASS, in Geography, the name of a tribe of mount Caucasus, called also Abaras, or Abarigis, who dwell in the mountains.
on the southern side of the Kuban, and on the eastern coast of the Euxine. The proper Achaia or Abasa is under the Ottoman supremacy, having a prince, who resides at Anaphopia. The western races of the Achaefians acknowledge the paramount sovereignty of the Khan of the Crimea; and these are they who at present belong to the Russian Kuban. They mostly live about the river Iba. See ABAERA.

AUCHATZ, in Ancient Geography, a people of Asia, in Scythia.

AUCHENIA, in Entomology, the name of a genus of coleopterous insects, adopted after professor Thunderby, by Mr. Marshall, in his late and very excellent work intitled Entomologia Britannica. It comprehends a tribe of insects before arranged with the Linnaean chrysomelids, and among them several which Linnaeus had himself assigned to that genus; such as meridians, 12-punctata, aparagi, cyanella, melanope, flavipes, hirta, 4-maculata, and tenella; to which Mr. Marshall adds the subpinnifs and rufipes (cripressides) of Fabricius; and a new species which he names flavicollis. The character of the auchenia genus is, antenna filiform, head advanced; thorax cylindrical, and narrower than the wing-cases; and the body oblong. T. 1. p. 213.

AUCHIS, in Ancient Geography, a people of Africa, in the Cyrenaic territory.

AUCKLAND, or Bishop Auckland, in Geography, is a neat market and corporate town situated about ten miles south-west from Durham, and 246 N. by W. from London. This place obtained the latter name at the time of bishop Bec, who is said to have built a magnificent castle on a height here during his prelacy, which continued from 1283 to 1310. But this building has been wholly destroyed, and succeeding bishops have erected and enlarged another noble manor where the present diocesan occasionally resides. Mr. Pennant describes the palace and gardens as peculiarly beautiful and grand. "Nothing" he observes, "can equal the approach to the former through the latter, which is varied with verdant slopes, rising hills, woods, and deep precipices impending over the Wear." The ground on which the town and castle are placed is of an angular form, and the streets are extended on the sides of the angle, having the castle at one of the terminating points. The eminence is washed on the north side by the river Wear, and on the south-east by the river Gainsel; the banks are formed into hanging gardens, and the whole aspect is extremely beautiful. The town is built on high ground, which rises nearly one hundred and forty feet from the level of the plain below, and the steepness of the roads that approach the town renders them very disagreeable and difficult for the passage of carriages. A free grammar school was founded here by Anne Swy Ire, under letters patent from James I. in the second year of his reign. It has been further endowed in 1783, and is held in an apartment under a small and neat chapel which was then rebuilt by a subscription of the inhabitants, and dedicated to St. Ann. As the parish church is at St. Andrew Auckland, a village about one mile distant from the town, this was a necessary improvement. Here are a weekly market on Thursday, and three annual fairs. The market place is a large open space in the middle of the town, and on its western side has lately been erected and established a large manufactury for printing all kinds of cottons, callicces, muffins, &c. On the north-west is a substantial old bridge, built by bishop Skirhaw about 1453, over the river Wear; and in the vicinity of the town are four or five respectable and handsome gentlemen's seats. Land's Itin. vol. i. and Hutchin's History of the County of Durham, vol. iii.

AUCTA, in Entomology, a species of Chrysomela, with an azure shining thorax; wing-cases blue, dotted, with a red margin. Fabricius. A native of Europe. In size and appearance it resembles Chrysomela marginata.

AUCTA, a species of Vespa, of a black colour, with the anterior margin yellow; two yellow dots and a transverse line on the scutellum; and five yellow bands, the first with a dot on each side, upon the abdomen. This kind inhabits Germany. Gmel. &c.

Auction, in Commerce, denotes a kind of public sale, much in use for plate, houses, houfehold goods, and other commodities, subject to certain conditions, in which the highest bidder is the buyer. These sales are subject to legal regulations. By 129 G. I. c. 56, an auctioneer is required to take out a licence, setting forth his true name and place of abode; and for the said licence, if it be within the limits of the chief office of excise in London, he shall immediately pay the sum of 20s. and elsewhere 5s over and besides any other duties or payments for trading in or vending any gold or silver plate, or otherwise; and acting without such a licence incurs, within the bills, a forfeiture of 100l. and elsewhere 30l. The said licence must be renewed annually; and bond must be given at the time of taking it out with two sureties in the sum of 200l. within the bills, and elsewhere in 50l. that he will deliver in a just account, and make payment of the duties. These duties are as follow: viz. for every 20s. of the purchase money arising by virtue of any sale by auction of any interest in possession or reversion, in any freehold, copyhold, or leasehold lands, tenements, houses, or hereditaments, and of any annuities, or money charged thereon; and of any utensils in husbandry and farming stock, ships and vessels; and of any reversionary interest in the public funds; and of any plate or jewels, shall be paid by the auctioneer or agent 4d. viz. 3½ d. by 27 G. III. c. 13, and 3 d. more by 37 G. III. c. 14. And for every 20s. of the purchase money arising or payable by virtue of any sale by auction, of furniture, fixtures, pictures, books, horfe, and carriages, and all other goods and chattels whatever, 10 d. viz. 7 d. by 27 G. III. c. 13, and 3 d. more by 37 G. III. c. 14. Piece goods are exempted from duty by 29 G. III. c. 63; and all and all goods imported from Yucatan, and fundry commodities imported from Africa in British ships, or from any British settlement abroad by 32 G. III. c. 41. There are also further exemptions specified in the statutes 17 G. III. c. 15, § 11, 15, 13, and 19 G. III. c. 56, § 13, 14, 15. The auctioneer is required to give previous notice to the office of excise of the day of sale, and deliver a written or printed catalogue specifying the several articles to be sold, attested by himself or his known clerk, under a penalty of 20l. 19 G. III. c. 56, § 9. He shall also within 28 days, within the limits of the chief excise office in London, and elsewhere within six weeks, deliver in an account in writing of the total amount of the money bid at each sale, and of the several articles or lots there fore, and the price of each; and at the same time make payment of the duties: the truth of the account to be attested upon oath. And by 38 G. III. c. 54, every auctioneer, neglecting to make payment within the limited time, shall forfeit double the duty.

Auction, or Autus, was originally a kind of sale among the ancient Romans, performed by the public crier "fab hafla," that is under a spear stuck up on that occasion, and by some magistrate, who made good the sale by delivery of the goods. This custom of setting up a spear at an auction seems to have been derived from this circumstance, that at first only those things which were taken in war were sold in that manner. Hence hafla is put for a public sale, and "fab haflam venire" denotes to be publicly sold. This was termed autus, q. d. increas; because, according to Sigenius, the goods
goods were sold to him, "qui plurimum rem angrevit," who would bid most for them. The day, and sometimes the hour, and the terms of the auction, were advertised, either by a common crier, or in writing; and there were courts in the forum, called "aucta auctionaria," where auctions were made; and to these juvenal is supposed to allude. (Sat. vii. 7.) A money-broker, "argentarius," was also present, who marked down what was hidden, and to whom the purchasers either paid down the price, or gave security for it. The seller was called "auctor," and the right of property conveyed to the purchaser was called "auctoritas."

**Auction by Inch of Candle.** See *Candle.*

**Auctorati, in Roman Antiquity,** an appellation given to such as entered the list as gladiators, and who received wages; or who hired themselves for money to perform in the games or spectacles. The auctorati degraded themselves by the act, and became servile and infamous.

**Auctorati Militis** also denoted soldiers bound by oath, and the receipt of wages, to serve in war. In this sense auctorati fland opposed to exauctorati, who were disbanded. The flipend they received for their service was denominated auctoramentum.

**Auctoritas Senatus, in Roman Antiquity.** See Senatus Auctoritatis.

**Auctus, in Botany,** an epithet applied to the calyx, when it has the addition of another smaller calyx; or when it is augmented by a series of distinct leaves shorter than its own, that surround its base.

**Auctus, in Entomology,** a species of *Cimex (Lygus Fabr.),* the thorax of which is firmly black, with two fulvous spots; a yellow band on the upper wings; thanks of the posterior leg membranaceous and yellow.

**Inhabit Cayenne.**

**Species.** 1. *A. japonica.* Thumb. Jap. 64. 12, 13. Kempf. Am. falc. 5. 775. Ic. flect. t. 6. A large tree. Branches and subdivisions dichotomous, smooth, divaricate, creet, angular; leaves aggregate at the tops of the branch, petiole, opposite, oblong, sharp, remotely serrate, smooth, nerved; flowers terminal, panicked; peduncles and pedicels villose; bracts lanceolate. It varies with brown green unpotted leaves, and bright green leaves, variegated with white. It is distinguished from the ferpulae by the receptacle of the male being smooth, not torulose, but perforated in the middle. A native of Japan. Introduced by Mr. John Grevier in 1783.

**Audienc SqlDataAdapter.** in *Ancient Geography,* a people of Macedonia, in Paeonia. Pliny.

**Audattha, a town of Arabin Deferta.** Ptolemy.

**Aude, in Geography,** a river of France, which rises in the Pyrenees, falls by Quilan, Alet, Limoux, Carcassonne, &c. and discharges itself into the Mediterranean, about ten miles east of Narbonne. It gives name to a department through which it flows. This department is one of the seven formed by Languedoc, Comminges, &c. It is bounded on the north by the departments of Herault, Tarn, and Upper Garonne; on the east, by the Mediterranean; on the south, by the departments of the Eastern Pyrenees and Ariège; and on the west, by those of Ariège and Upper Garonne. Its sujefcies is about 1,275,593 square acres, or 655,096 hectares; its population consists of 219,101 persons; and it is divided into four communal districts.

**Audela, in Ancient Geography,** a town of Afa, in Mecopotamia.

**Audena, a river of Italy, in Liguria.**

**Auida, a town of Arabia Petraea.** Ptolemy.

**Audianism, in Ecclesiastical History,** the system or sentiments of Audius, and his followers; particularly as to the belief of the human figure of the deity. See Anthro- pomorphites, and Audius.

**Audience, in a general sense.** See *Hearing.*

The word is formed from audire, to hear.

Audience is also used for the ceremonies practiced in courts, at the admission of ambassadors and public ministers to a hearing. In England, audience is given to ambassadors in the presence chamber; to envoys and residents, in a gallery, closet, or any place where the king happens to be. At their admission, the way in all courts is to make three bows after which they cover and sit down, the king first covering and sitting down, and giving them the sign to put on their hats. When the king cares not to have them be covered and sit, he continues uncovered himself, and standing all the while, which is taken as a sign and an affront. After the first audience, it does not look well to be too hasty in demanding another. At Constantinople, ministers usually have audience of the prime vizir; in his absence the caimacan admits them to audience.

**Audience is also a name of courts of justice or tribunals established by the Spaniards in America, and formed upon the model of the court of chancery in Spain. Of these there are eleven, which dispense justice to as many districts, into which the Spanish dominions in America are divided. They are established at the following places: viz. St. Domingo in the island of Hispaniola, Mexico in New Spain, Lima in Peru, Panama in Terra Firme, Santo in Guat- emala, Guadalaxara in New Galicia, Santa Fé in the new kingdom of Granada, La Plata in the country of Los Charcas, St. Francisco de Quito, St. Jago de Chil, and Buenos Ayres. To each of these are subjected several large provinces; and some far removed from the cities where the courts are held, that they may derive little benefit from their jurisdiction. The Spanish writers commonly reckon twelve courts of audience, including that of Manila in the Philippine islands. The number of judges is various, according to the extent and importance of their jurisdiction. Both civil and criminal causes come under their cognizance; and for each peculiar judges are set apart. The Spanish viceroys have often attempted to intrude themselves into the seat of justice; and, therefore, in order to check this interference, which must have annihilated justice and security in the Spanish colonies, the viceroyes have been prohibited by repeated laws, from interfering in the judicial proceedings of the courts of audience, or from delivering an opinion, or giving a voice with respect to any point litigated before them. These courts of audience are subject to restraint and limitation. They may advise, they may remonstrate; but in the event of a direct collision between their opinion and the will of the viceroy, what he determines must be executed, and nothing remains for them but to lay the matter before the king and the council of the Indias.
AUDIENCE is also the name of one of the ecclesiastical courts in England, which is held wherever the archbishop calls a cause to his own hearing.

The two archbishops have their courts of audience; that of the archbishop of Canterbury is under the direction of the dean of the arches, who is official of the audience, and keeps his court in the hall of Doctors Commons.

The court of audience is chiefly concerned in differences arising upon elections, confecrations, infitions, marriages, &c.

Audiendo & terminando, a writ, or rather commission, directed to certain persons, when an infraction or great misdemeanour is committed in any place, for the appeasing and punishment thereof.

Audiens, of Auditories, in Ecclesiastical History, an order of cathedrals; consisting of those who were mainly instructed in the mysteries of the Christian religion, and not yet admitted to baptism.

Audienne, in Geography, a town of France, in the department of Finisterre, and chief place of a canton in the district of Pontereix, five and a half leagues west of Quimper.

Audifret, John-Baptist, in Biography, a French geographer, was a native of Draguignan, in Provence, or of Marseilles, and flourished at the end of the seventeenth, or beginning of the eighteenth centuries. He was appointed by Louis XIV. in 1698, envoy extraordinary to the courts of Mantua, Parma, and Modena. He died at Nacery, in 1733, at the age of seventy-six years. His much esteemed work, intitled "Geographie Ancienne, Moderne, et Historique," was printed in three volumes, 4to., at Paris, in 1698 and 1699, and in 12mo., at Paris in 1694. This work, which unites geography and history, comprehends only Europe, and, being left unfinished, it wants Spain, Italy, and part of Turkey in Europe. Nouv. Dict. Hist.

Audiguier, Vital de, a French noble, was born at Naive, near Villefranche de Rouergue, about the year 1565, and united literature with the profession of arms. Of his writings, the principal are, "A Traitte on the True and Ancient Usage of Duels," printed in 8vo. at Paris, in 1617, dwelling on the injustice of common duels, and recommending a revival of the ancient practice of public combats on great occasions, under royal authority; "Poema," in two volumes, 8vo, printed in Paris, in 1614; and two romances under the titles of "The Loves of Lyfander and Callida," printed at Lyons, in 1622; and "The Loves of Ariastator and Cleonice," at Paris, in 1625. His style is clear and sprightly; and his romances were much read. He is said to have been assassinated about the year 1630. Nouv. Dict. Hist.

Ajudicatar, a regular hearing and examining of an account, by officers appointed for that purpose. See Auditor.

Audita querida, in Law, is a writ by which a defendant, against whom judgment is recovered, and who is, therefore, in danger of execution, or perhaps actually in execution (or on a statute-merchant, statute-fole, or recognition), may be relieved upon good matter of discharge, which has happened since the judgment; as if the plaintiff had given him a general release; or if the defendant hath paid the debt to the plaintiff, without procuring satisfaction to be entered upon the record. In these and like cases, wherein the defendant hath good matter to plead, but hath no opportunity of pleading it (whether at the beginning of the suit, or "post defensione," which must always be before judgment), an audita querida lies, in the nature of a bill in equity, to be received against the oppression of a plaintiff. It is a writ directed to the court, stating, that the complaint of the defendant hath been heard, audita querida defensit, and then setting out the matter of the complaint, it at length enjoins the court to call the parties before them, and having heard their allegations and proofs, to cause justice to be done between them. Finch L. 488. F. N. D. 192. It also lies for bail, when judgment is obtained against them by faire facias, to answer the debt of their principal, and it happens afterwards that the original judgment against their principal is reversed; for here the bail, after judgment had against them, have an opportunity to plead this special matter, and therefore they shall have redres by audita querida (1 Roll. Abr. 308.) which is a writ of a most remedial nature, and seems to have been invented, left in any case there should be an oppressive deceit of justice, where a party, who hath a good defence, is too late to make it in the ordinary forms of law. But the indulgence now shown by the courts in granting a summary relief upon motion, in cases of such evident oppression (Lord Rysm. 459.), has almost rendered useless the writ of audita querida, and driven it quite out of practice. Blackst. Com. vol. iii. p. 406.

Auditionalis Scholasticus, in Middle Age Writers, is used for an advocate who pleads causes for his clients in audiences. Du-Cange.

Auditor, a hearer, one who listens or attends to any thing.

Auditor is also used for several officers, appointed to audit or hear accounts, pleadings, &c.

Anciently the word auditor was also used for a judge, and even for an inquisitor, appointed by judges to examine and find out the truth of some matter in concern. Notaries are also frequently called auditors.

Auditor, in our Law, is an officer of the king, or some other person, or corporation, who yearly, by examining the accounts of under-officers that are accountable, makes up a general book, with the difference between the receipts and charges, and their allowances or allocations.

Receivers-general of fee-farm rents, &c. are also termed auditors, and hold their audits for adjudging the accounts of the said rents, at certain times and places appointed. There are also auditors alligned by the court to audit and settle accounts, in actions of account, and other cases, who are proper judges of the cause, and pleas are made before them, &c. 1 Brownl. 24. See Account, and Assumpsit.

Auditors of the Revenue, or of the Exchequer, are officers who take the accounts of those who collect the revenues, taxes, &c. raised by parliament; as also of the sheriffs, exchequers,
cheaters, collectors, tenants, and customers; and let them down, and perfect them.

Auditors of the Privy, or Impress, are officers in the exchequer, who formerly had the charge of auditing the great accounts of the kings' customs, naval and military expenses, and of all monies impressed to any man for the king's service: but they are now superceded by the commissioners for auditing the public accounts. See Public Accounts.

Auditor of the Receipts is an officer of the exchequer who files the tellers' bills, and makes an entry of them, and gives the lord-treasurer a certificate of the money received the week before. He makes debentures to every teller, before they receive any money, and takes their accounts. He also keeps the black book of receipts, and the treasurer's key of the treasury (where the ancient leagues of the realm, and many records of the king's bench, and common pleas, are reposited); and fees every teller's money locked up in the new treasury. 4 Inst. 107. All the exchequer bills, orders, debentures, patents, and other instruments which pass the office of the exchequer, are signed by him.

There are also auditors of the first fruits; of the principality of Wales; of the duchy of Cornwall, &c. See First Fruits, &c.

Auditor of the Rolls, the apostolic chamber, the chatelet, &c. See Rolls, Chamber, &c.

Auditors, in Church History. See Auditors.

The auditors formed one branch of the Manichean sect, which was divided into elect and auditors; corresponding, according to some writers, to clergy and laity; and, according to others, to the faithful and catechumens among the catholics. By the Manichean rule, a different course of life was preferred to the elect from that of the auditors. The latter might eat flesh, drink wine, bathe, marry, traffic, possess estates, bear magistracy, and the like; all which things were forbidden to the elect. The auditors were obliged to maintain the elect, and kneel down to ask their blessing. Beaumord observes, that the elect were ecclesiastics, and in general such as made profession of observing certain counsels, called evangelic; such as the clergy and monks; and they were called the perfect by Theodoric. The auditors were the laity, and so denounced, because they heard in the church, whilst others taught and instructed. Lardner's Works, vol. iii. p. 424, &c.

Auditors, Conventual, Collegiate, &c. were officers formerly appointed among the religious, to examine and pass the accounts of the house.

Auditorius Meatus, or Auditorium, in Anatomy. There are two passages distinguished by this title; an external one, by which the air has access to the tympanum; and an internal one, by which the seventh nerve passes from the brain into the petrous part of the temporal bone. See the Description of the Ear.

Auditory, in an adjective sense, something belonging to the sense of Hearing.

Auditory, Audience, is also a collective name, denoting an assembly of persons, hearing or attending to a person who speaks in public.

Auditory is also used for the seat or bench where a magistrate or judge hears causes.

At Rome, the several magistrates had auditories, or seats of justice, according to their dignity. The chief of the superior officers were called tribunals; those of the inferior, jubilation.

The pedanei had their benches or auditories in the portaico of the imperial palace. Those of the Hebrews, at the gates of cities. The judges appointed by the ancient lords distributed justice under an elm, which was usually planted before the manor-house, and served them for an auditory.

Auditory, Auditorium, in the Ancient Churches, was that part of the church where the audienses stood to hear, and be instructed; and it was that part now called audiæ ecclesie. See Naves. In the primitive times, the church was so strict in keeping the people together in that place, that the person who went from thence in solemn times was ordered by the council of Carthage to be excommunicated.

Auditory Passage, or Canal, Disparato de his, in Surgery, are described under the articles Ear, and Deafness.

Auditory Nerves, the seventh pair. See Nerves, Description of the.

AUDITUS, in Biography, the founder of a Christian sect, was a native of Mesopotamia, and flourished about the year 530. In his own country he was much esteemed on account of the holiness of his life, and zeal for the faith; but he exposed himself to ill-treatment by his freedom in admonishing the bishops and prudsters, and particularly in reproving the rich clergy, who pursued a luxurious course of life. At length, he separated from the church, formed an assembly of those who were attached to him, and became their bishop. The clergy, offended by his rebukes, and jealous of his popularity, accused him to the emperor, either Constantine or one of his successors, who banished him into Scythia; and here he converted many Goths to the Christian faith. His followers, who were called Audians, adopted some peculiar tenets and customs. They celebrated Easter, or the paschal feast, with the Jews, on the fourteenth day of the moon, alleging that this was the ancient custom, confirmed by the apocryphal constitutions, and that the council of Nice had innovated in compliance to Constantine; and they are also said to have used the apocryphal books in their assemblies. They have been likewise charged with some errors in point of doctrine, and particularly with attributing to the deity a human form; whence they have been classed with the Anthropomorphists. Mofells E. H. vol. i. p. 632. Lardner's Works, vol. iv. p. 504.

AUDON, in Ancient Geography, a promontory of Africa, in Mauritania Cæsariana. Ptolemy.

AUDRAW, in Biography, the name of a celebrated family of artists, who acquired eminence in painting and engraving. Claude, the head of the family, was the son of Louis, who lived in the reign of Henry IV. of France. He was born at Paris in 1692; but as he made no great progress in the art of engraving, his prints are held in little or no estimation. He resided at Lyons, and died there in 1677.

Carl, or Karl, was the brother, or as some say, the confidemman of Claude, and born at Paris in 1594. For the purpose of gratifying and improving an early taste for the arts, he went to Rome, and at his return adopted that species of engraving, which is performed merely with the graver. His style was that of Cornelius Clouetant, but reeler. The abbe Marolles, who speaks of this artist in terms of high commendation, attributes 159 prints to him, amongst which "The Annunciation," a middling-sized plate, upright, from Annibale Caracci; and "The Assumption," in a circle from Dominichino, are the most esteemed. His first prints were marked with the letter C; and he afterwards, by way of distinguishing his prints from those of his brother Claude, used the letter K. He died at Paris, in 1674.

German was the elder son of Claude, first mentioned, and born at Lyons in 1631. At Paris, he perfected himself under his uncle Carl, and on his return to Lyons, published several prints which did honour to his graver. Such was the estimation in which he was held, that he was a member and professor of the Academy established in this town. He died at Lyons in 1710, and left four sons, all artists.
AUDRUICK, in Geography, a town of France, in the department of the Straits of Calais, and chief place of a canton in the district of Calais, 34 leagues north-west of St. Omer.

AUDUN LE ROMANT, a town of France, in the department of the Molsé, and chief place of a canton in the district of Longwy, 34 leagues west of Thionville.

AUDUS, in Ancient Geography, a river of Africa, placed by Ptolemy at the bottom of the Sinus Numidicus, but no traces of it now remain. Alto, a mountainous district in the interior part of Mauritania Sittifensis, the Mons Africanus of the middle age, and Jibbel-Aures, as the Turks pronounce it. It is a chain of eminences running one into another, with several beautiful little plains and valleys intervening. The higher and the lower parts of it are very fertile, and are regarded as the garden of this province. The whole mountainous tract is reckoned to be about 120 miles in circuit, and the northern part, which is visited every year by a flying camp of the Algerines, is posseced by such a number of clans, viz. the Bouzeenah, Lakadhah, Mafah, and Booarf, that it requires 40 of their nations to bring them all under contribution. Shaw's Trav. p. 57. This mountain, according to Bruce (Travels, &c. Introd. p. 28.), is inhabited by a savage tribe, of fair complexion, red hair, and blue eyes; called Nerdich, and supposéd to be a remnant of Vandals, who have maintained themselves in the fastnesses, in defiance of the Moors and Arabs. Each of the people of this tribe have in the middle of the face, between their eyes, a Greek cross, marked with antiquity; and

Claude was the second son of Claude, and born at Lyons in 1639: having studied painting at Rome, he was, on his return, employed by Le Brun, to assist him in the battles of Alexander, which he was then painting for the king of France. He was admitted into the Royal Academy in 1677, and died at Paris in 1684, applauded no less for his virtues than his talents.

Girard, the most celebrated artist of the whole family of Audran, was the third son of Claude, and born at Lyons in 1640. Having learned from his father the first principles of design and engraving, he removed to Paris, where his reputation introduced him to the acquaintance of Le Brun, by whom he was employed in engraving the battle of Constantinople, and the triumph of that emperor. At Rome, he studied under Carlo Maratti, and engraved several fine plates, and particularly the portrait of pope Clement IX. Recalled to Paris by Louis XIV. at the invitation of M. Colbert, after a residence of three years at Rome, he affidually applied to engraving, and was appointed engraver to the king, who greatly encouraged him. In 1681, he was named counsellor of the Royal Academy, and died at Paris in 1703. Of all the greater masters of Paris, without any exception, that ever exili'd in the historical line; and a careful examination, he says, of the battles of Alexander, engraved by this artist, will of itself justify this assertion. His distinguishing excellence consists in his contracting no manner of his own, but transferring on copper finely, with great truth and spirit, the figure of the muller whose picture he copied. “On viewing his prints, you lose sight of the engraver, and naturally say, it is Le Brun, it is Pouffin, it is Mignard, or it is Le Sueur, &c.; as you turn to the prints which he engraved from those masters.” His works, exclusively of his portraits, are distributed into four classes; viz. 1. his print designs or etchings, to which little or nothing was done with the graver, among which are the “deulges,” the “paffage through the red sea,” the “combat of Joshua against the Amalekites,” the “empire of Flora,” the “preference of Pyrrhus,” a “ceiling” from Le Brun, representing the “four fælons” of the year. 2. Those more finished, but in a rough, bold manner; e.g. “Paul and Barnabas at Lystra?” “Coriolanus appeared by his family,” “Time supporting Truth,” the ceiling of the chapcl de Saulx, representing the “Accomplishment of the old law by the new one,” engraved in 1684, from Le Brun, wonderfully uniting great spirit, character, expression, and beautiful drawing; and the “death of St. Francis.” 3. Those in his most finished manner; as the “battles of Alexander,” from Le Brun; viz. 4. “The paflage of the Granius,” “the battle of Arbela,” “Porus brought to Alexander,” after his defeat; “Alexander entering the tent of Darius;” and “the triumphal entry of Alexander into Babylon;” the “Peft,” from Peter Mignard; the “baptism of the Parthian,” from N. Pouffin; the “martyrdom of St. Laurence,” from Le Sueur; the “martyrdom of St. Agnes,” from Dominichino. 4. Such as he did with the graver only, which are few, and of inferior merit; such as “Æneas saving his father Anchises” after Dominichino; and a small folio “Frontispiece” to the effigies of the popes and cardinals, from Cyro Ferri.

Boisot, second son of Germain Audran, was born at Lyons in 1661, and after receiving instruction from his father, removed to Paris, to enjoy the tuition of his uncle Girard, where he acquired great reputation. He died at Louzouer in 1721. His manner was founded upon the bold clear style of his uncle. His outlines were firm, and determined; his drawing correct; the heads of his figures are in general very expressive; and the other extremities well marked.” But his works, compared with those of his uncle, want the mellowness and harmony, which are so conspicuous in the latter. Among his newest prints may be reckoned—that which represents “Alexander sick,” from Le Sueur.

John, the third son of Germain, was born at Lyons in 1657, and perfected himself in the art of engraving, at Paris, under his uncle Girard. His reputation began to display itself at the age of twenty years; and such was his future success, that in 1707, he obtained the title of engraver to the king, and had a pension from his majesty, with apartments in the Gobelins; and in 1728, he was made a member of the royal academy. He was eighty years of age before he quitted the graver, and near ninety when he died. In his most masterly and best prints, the etching constitutes a great part; and he has finished them in a bold, rough style. The drawing of the human figure is correct; the heads are expressive, and finely finished; the other extremities are well marked; but he is inferior to his uncle. He wants that harmony in the effect; his lights are too much and too equally covered; and there is not sufficient difference in the style, in which he has engraved his back grounds, and his draperies. The following prints, besides many others, are worthy of much attention; viz. “Moles fayed by Pharaoh’s daughter;” “Athaliah roffing her clothes, in discovering the king in the temple;” “Either before Aluminus;” “Cupid and Psyche;” all from Ant. Coppet. “The presentation of Christ in the temple,” from Cornelle. “The miraculous draught of fishes,” and its companion “The resurrection of Lazarus,” from Jouvenet. “The battles of Alexander,” small, from the large prints; “Moles defending the daughters of Jethro,” and its companion, “Moles eponuing the daughter of Jethro;” the miracle of the five loaves; “Christ healing the sick and lame;” and “Christ carrying the crofs,” both from Ant. Dieu, &c.

Louis, the last son of Germain, was born at Lyons in 1670, and studied at Paris in the school of his uncle Girard. He died suddenly at Paris in 1712. Among his most eminent prints are, “The seven acts of mercy,” from Seb. Bourdon, and “The Cadavre or Corps,” from R. A. Houaife. Strutt’s Diet.
and this mark seems to be the chief vestige of Christianity among them, which religion they not only acknowledge, but boast that their ancestors professed it. Propontis (Bell. Vand. i. ii. c. 13.) mentions the defeat of an army of the Vandal nation near this place, of which these probably remains. They pay no taxes to the Bey, but live in constant defiance of him. In this mountain is the Lambea of Ptolemy — also the name of a small port in the eastern part of Mauritania Cæsariensis, mentioned by Ptolemy, and placed by him in the promontory Jarifh, north-east of the mouth of the river Nafalav.

AUE, in Geography, a river of Germany, which runs into the Wefer, three miles south of Nieuwburg, in the circle of Welfphalia. — Also, a river of Germany, in Lower Saxony, which runs into the Fulbe, two miles S.S.E. of Zell. — Also, a town of Germany, in Upper Saxony, and circle of Erzgebirg, five miles north-west of Schwartzenberg.

AUE, a river of Portugal, which runs into the sea near Villa de Conde, in the province of Entre Duero è Minho.

AVEBURY, or Aubury, a name given to a village in England, situated in the county of Wilts, about five miles west of the town of Marlborough, nineteen miles from Stonehenge, and eighty miles from London. As a village it presents no particular claims to public notice, but as the site of the most remarkable and stupendous monument of British Antiquity in the island, it becomes exceedingly interesting to the antiquary and historian. The British hirds and druids have been repeatedly noticed and often decried by our ancient historians; some of whom have given very copious accounts of their religious and juridical rites and ceremonies; but none of them have left complete and satisfactory information relating to the men, their manners, or monuments. Hence arises the great difficulty of giving a decisive description of those subjects, and the repeated wars and invasions that have hurried this country, have nearly destroyed all documents and monuments of British antiquity. Among the vestiges of former times, we recognize the stupendous temple at Avebury, which was unquestionably the most considerable and important in Great Britain. It consisted of a number of large unhewn stones, set perpendicularly in the ground, and disposed in parallel rows and circles. There were four of the latter included within a fifth of larger circumference, and at the end of the southern avenue, about one mile distant from the great circle, were two concentric oval arrangements of stones. The number of stones originally employed in the whole work amounted to fix hundred and fifty, and most of them measured from ten to nineteen feet in height above the ground, forty feet in circumference, and weighed from forty to fifty-four tons each. The large circle, and the principal part of the temple, were surrounded with a very considerable vallum and ditch, which included an area of twenty-two acres of ground, and measured about 1400 feet in a transverse diameter. This bank and ditch must have been produced with immense labour, and its peculiarity of formation proves that it was never intended for a fortified place in time of war, as the bank is thrown up on the outer verge of the ditch; whereas all military encampments have the bank within the ditch, to give an advantageous height of ground to the beleaguered inhabitants. The vallum measures about 30 feet in height from the top to the middle of the ditch. Supposing that it was raised for spectators to behold any ceremonies performed in the enclosed area, it would accommodate above 70,000 persons, and allow two square feet to each. This boundary embraced one large, and four small circular arrangements of stones. The frill was about thirty-five feet within the ditch, and consisted of 150 flones, placed at nearly regular distances from each other. Within this circle were two double concentric circles composed with eighty-eight stones, three others called the core, and one called the central obelisk. From the large circle proceeded two avenues, or double rows of large upright stones, placed at nearly regular distances in each row, and from one row to the other. These consisted of 200 stones, extended about one mile in length each way, and were called the Beckhampton and Kennett avenues. The first proceeded from the temple in a westerly direction, and was terminated with a single stone; whilst the other took a south-easterly course, and had two oval rows of stones at the extremity. The objects we have already described, are considered by some persons as the whole of this extraordinary monument; but it seems very probable that Silbury Hill, some cromlechs, other circles, and numerous mounds, were originally connected with it. Silbury Hill is considered as the largest tumulus, or haw, in England, and its situation implies that it was intended to mark the meridian line from the centre of the temple. Dr. Stukeley states, that it is directly south of the great circle. It measures 155 feet diameter at top. 360 feet at the base, 240 feet in height, following the surface of its northern side, and 1680 feet in circumference at the bottom. From the top of this artificial hill a spectator commands a view of the western avenue, and the whole area of the temple, with a considerable tract of flat country to the north and west. This barrow has been dug into by some persons, who expected to make interesting discoveries; but for want of perseverance, or well-directed research, they discontinued their operations, without gratifying their curiosity, or rewarding their labour.

The Goths, Vandals, and Turfks, have often been stigmatized as the merciless destroyors of every venerable and interesting monument of antiquity; but surely they are not more reprehensible than many of the inhabitants of this highly-civilized and refined country; some of whom have exercised much ingenuity and labour in wantonly and deliberately destroying this singular monument of ancient customs. We have already stated that it originally consisted of 650 flones, but most of these have been broken to pieces, by means of fire and manual labour, and the diftevered fragments appropriated to the construction of walls, hovels, and common roads. In 1722, only forty remained of the great circle, of which number seventeen were flanding; but these are now reduced to nine. The interior circles were almost entire in 1716, but in 1725 only two flones were left erect belonging to the outward circle of the northern temple. Of the Kennett avenue, there were seventy-two flones in 1722, of which only eight or ten remain; and only two of the Beckhampton avenue.

The flones used in forming this temple are called by the inhabitants, Bolderstones and Sarfons. They are of siliceous grit, being of the same species as those that accompany the great stratums of chalk, which crosses England from L. N. E. to W. S. W. These flones lie on the surface of the ground in detached mafies, unconnected with any stratum of rock.

Having shown what the temple was, and what it is, we will next endeavour to explain its appropriation and use; in doing which, we found our deductions principally on the trials and traditions of the Welsh bard, a class of people more likely to prof-ve correct memorials of the ancient Britons, than will be found in any of the Roman histories. By these writers we learn that Avebury was the great national temple, or circle of convention of the Ancient Britons; in which they assembled from all parts of the Island, on the four grand festivals, which were held at the time of the two solstices
and the two equinoctes, but more particularly on midsummer day, and new-year's day, or the winter solstice. The Bardic triads call the temple at Avebury, one of the three primary Gorseddau, or supreme seats of the island of Britain; the other two were those of Beigafawen and Mod Eovan.

The circles at Avebury and Silbury Hill had their names reciprocally from each other, for the former was termed Gorsedd-Bria-Gwyvon, or the supreme seat of the Hill of preference, or cognition; and the other was called Clydr-Gyvergion, or the tumulus of the circle of conventions. In this place the legislative, baronial, and scientific classes, which formed the ancient British constitution, held their meetings, under the apppellations of Bairn, Derwynon, and Ovion, or Bards, Druids, and Ovates. We are informed by Caesar, that the Druids of Gaul, "who wished to be perfectly skilled in the Druidical science," occasionally visited England to learn it. From the magnitude and situation of Avebury, we are induced to believe that it was their place of meeting or convention. The situation was the most convenient of any in Great Britain; and that it was the grand metropolitan station, seems satisfactorily ascertained by its magnitude above all others in the island; by the various British roads or ridgeways which converged to this spot; by the vast number of barrows scattered all over these plains, and by several other relics of remote antiquity to be found in the neighbourhood. To Dr. Stukeley we are indebted for much information concerning this place, and for his diligent inquiries and researches in 1722, &c., we should never have been able to ascertain the figure and dimensions of the temple; with his assistance, aided by repeated examination of the spot, we are enabled to present our readers with an account which we hope will prove as satisfactory as it is faithful. To those who wish for a more minute description, we must refer to Britton's Beauties of Wiltshire, vol. iii.; and for accounts of some subjects collateral connected with this, see bard, barrow, cornish, Druid, Kirstvæn, Stônehenge, &c.

Avehen, a town of North America, in the country of Mexico, and district of Chiaemtan.

Aveia, in Ancient Geography, a town of Italy, in Sannium, south of Amatium.

Avein, in Geography, a village of the Netherlands, in the duchy of Luxembourg, near which the army of France defeated the Spaniards; two leagues from Rochefort.

Aveiro, or Braganza Nova, a sea-port town of Portugal, in the province of Beira, situated in a flat and marshy country, at the mouth of the Vouga, and containing about 14,000 houses, divided into four parishes, and six monasteries. The river Vouga flows through the town, where it is very narrow; but it is adorned with a handsome quay. Near the town it divides into two branches, one to the left and running southward to the sea, the other flowing northward to Ovar. Its trade is inconsiderable, as small boats only come to the town; and as the bar is continually shifting, none but small flaps can pass it. The nobility of this place is alone worthy of notice; for Aveiro chiefly supplies the province of Beira with Sarceans, which are carried by large troops of mules into the higher parts of the province. Salt is also produced here in large quantities; though it is not reckoned so good as that at St. Ives and Llêven. The town is, on account of its marshy situation, unhealthy, which expouses the inhabitants to frequent attacks of agues and putrid disorders. Aveiro is nine leagues from Coimbra, and eleven south of Oporto. N. lat. 40° 30'. W. long. 9° 8'.

Aveiro, a river of France, which runs into the Tarn, four leagues below Montauban.

Aveline, in Conchology, a name given by French naturalists to one kind of land-fowl found in Amboyna, and called by Linnaeus biceps fournardus.

Avella, in Geography, a town of Italy, in the kingdom of Naples, and country of Lavora, four miles north-east of Nola. The situation of this town, with its castle, is delightful, and it commands a view as far as Naples. Not far from this place are the ruins of Abella. It now gives the title of prince to the family of Doris.

Aveliana, in Botany. See Corylus.

Aveliana, in Conchology, a species of Helix, with a slightly umbilicated shell, of an oblate and somewhat triangular form, rough, pitted, and silverly within; aperture smooth and carid; and an elevated circle on the flint whorls of the spire.

Aveliana, a species of Patella with a thin white shell, very finely fluted; and an oblong perforation divided by a ligament. Native place unknown. Menchen. Naturf. Aveliana, in Eononology, a species of Phalana (Turris) found on the nut-tree in the north of Europe. The wings tellaceous, with three short bands. Lin. Gmel. &c.

Aveliana, a species of Attelabus, of a black colour, with the wing-cages, thorax, and legs red. This insect Gmelin conjectures, may be only a variety of atelabus coryli; it inhabits Germany, and is called by Scopoli curculio collaris.

Aveliana, a species of Cinex, of a black colour, with brown upper-wings that are white at the base and tip; legs fulvous. Found on the nut-tree. Gmel. Scop. &c.

Aveliana, a species of Phalana (Bomblyx) that is found on the nut-trees in Europe. The wings are dull ash-coloured, with an obscure fioseus band, and without spots. Fabr. Gmel. &c.

Aveliana, in Heraldry, is a term peculiar to the form of a cres, whose quarters resemble the nux avellana, or siber-nut.

Avellin, in Geography, a town of Italy, in the kingdom of Naples, and Principato Ultra, the fee of a bishop, and suffragan of the archbishop of Benevento. Aveline, which was probably founded by the Lombards, is a considerable city, extending a mile in length down the cavity of a hill, with ugly streets, but tolerable houses. The churches are crowded with monstrous ornaments in a barbarous style, which the Neapolitans seem to have borrowed from the Spaniards. The cathedral is a poor building, adorned merely with uncount Latin ditches, and thapedile Gothic sculpture. The inhabitants have access to a statue of St. Lawrence, with a phial of his blood, which for eight days in the month of August enthralls them with a miraculous liquefaction similar to that of St. Janarius at Naples. The only edifice of note is a public granary, of the comfitic order, adorned with antique statues, and an elegant bronze one of Charles II. king of Spain, while a boy, cast by Cavalier Coimo. The number of inhabitants amounts to 8 or 10,000. The bishop's revenue is about 6000 ducats or 1,125 l. a year. The naggisitie consists of a fynic and four eletti, who are chosen annually; but these offices are engrossed by a certain number of families of some distinction, who neither intermarry nor associate with the other burghers. The elates of the prince amount to the yearly value of 20,000 ducats and 5,750 l. and 2000 arile from duties on the dye of cloth, which is made of various qualities and colours, but chiefly blue. The fine sells for thirty carlini a canna, and pays twenty-six grana duty of entrance into Naples. Many wealthy merchants are concerned in this cloth manufacture, some of whom employ in it a capital of 80,000 ducats, or 15,000 l. The poor women who spin the wool, must work very diligently to earn about four grana.
A V E

grana a day. The second article of trade is macearoni and paiste of many kinds, which are of excellent quality, and much esteemed through the country. Wooden chairs are also made and sold here in great quantities. Avellino abounds with all sorts of provisions; each street is supplied with fresh water; but the wine is indifferent. The foil of this district, consisting chiefly of vineyards, produces little corn, but abundance of fruit, of which the apple is held in high estimation. The most profitable of all fruit-trees, however, is the hazel. Nut-bushes cover the face of the valley, and in good years yield a profit of 50,000 ducats or 11,7501. The nuts are mostly of the large round species of filbert, which we call Spanish; and the bushes were originally imported into Italy from Pontus, and known among the Romans by the appellation of "Nux Pontica," which, in progress of time, was changed into that of "Nux Avellana," from the place where they had been most successfully propagated. The proprietors plant them in rows, and by dressing, form them into large bushes of many stems. Every year they refresh the roots with new earth, and prune off the straggling roots with great attention. Swinburne's Travels, vol. i. p. 171, &c.

AVE-MARIA, or Ave-Mary, the angel Gabriel's salutation of the Virgin Mary, at his bringing her the tidings of the incarnation; thus called, as beginning with these words, Ave, Maria, q. d. Hail, Mary.

The Ave-mary is a prayer or formula of devotion very usual in the Romish church. It was added to their prayers by order of pope John XXII. in the fourteenth century. — Their chaplets and rosaries are divided into so many ave-marys, and so many pater-nosters; and hence the beads themselves which include them, are also called avea, or ave-marys.

AVENA, in Botany, oat-grass (a crop from which to derive, or to covert, cattle being fond of it). Lin. 9:1. Schreb. 122. If. 39:2. Clas. triandria digyna. Nat. Ord. graminis. Gen Char. Cyl. glume generally many-flowered, two-valved, loosely collecting the flowers; vales lanceolat., acute, ventricose, loofe, large, awnless. Cor. two-valved; lower valve harder than the calyx, the size of the calyx, roundish, ventricose, acuminate at both ends, emitting from the back an awn spirally twisted, reflex; nectary two-leaved; leaflets lanceolat., gibbous at the base. Stam. filaments three, capillary; anthers oblong, forked. Pili. germ obtuse; styles two, reflex, hairy; stigma simple. Per. none. Cor. moll firmly closed, grows to the seed and does not gap. Seed, one, slender, oblong, acuminate at both ends, marked with a longitudinal furrow.

Species. 1. A. flijlica, Siberian oat-grasf; seluca glumis villosis, arilis calycce tripolo longissimis. Gmel. Sib. 1. 113. 1. 22. "Paniced; calyxes one-flowered; seeds hirolute; awns thre the length of the calyx." Cilms very slender, from two to three feet high; leaves rolled up at the edges, from five to twelve inches long; panicle resembliing a spike, often directed to one side; glumes of the calyx almost equal, dagger-pointed, membraneous towards the point; glumes of the corolla of the same length, extremely villosa. A native of Siberia, introduced in 1777 by Meff. Kennedy and Lee. It flowers in July and August. 2. A. elator, tall oat-grasf. Hoff. With. Curt. Lond. 3. 6. (2) gramen canum nodosum; Ger. "Paniced; calyxes two-flowered; hermaphrodite, floccul. almo villosus, male awned." Root perennial, stems erect, round, smooth, with four or five purplish joints, above three feet high; leaves frilled from seven inches to a foot in length; panicule erect, shining, numerousl. branched; spikelets two-flowered, one male and the other hermaphrodite; vales of the calyx unequal, the largest marked with three, the smallest with one green nerve. In the hermaphrodite flower, the midrib of the outer valve forms a short awn, and the bottom very hairy, nectary two small lanceolat. glumes, somewhat globular at bottom; germ villosa. It is common on banks, in hedges, on the borders of fields, and sometimes in wet meadows. It flowers in June and July; and in early years, very productive, and yields a plentiful aftermat. In some other situations the hue of the hist becomes brownish and forms the variety above noticed, which, in some ambe land, is very troublesome, and is one of the several
g. 3. A. jufT. minima. "Paniced; calyxes two-flowered; awn twice the length of the seed; culm branching." Cilms a foot high, often branching, smooth, with brown points; branches from each axil, short; one glume of the calyx lanceolat., the other ovate; flory two, feifie; corolla smooth, except the outer glume, which is rough with hairs. A native of the Cape. 4. A. proffuscus, Pennsylvanian oat-grasf. "Panicle attenuated, calyxes two-flowered; seeds villosa; awns twice the length of the calyx." Observed in Pennsylvanial by Haly. Introduced here in 1785, by Dr. Pitcairn. 5. A. feet. Spanish oat-grasf. Cavan. Hisp. t. 45. f. 1. "Panicle contracted; floret in pairs, hirolute; one-peduncled, with two awns at the top, the middle own largest." Root annual, capillary; culms several, from two to four inches high; leaves short, flatish; one of the florets is fistul., the other on a villosa pedicel; valves of the corolla brick-colored at the tip, with a twisted awn on the back twice the length of the valve. It grows near Madrid, and at the village of Good Hope. Introduced here by Mons. Ricqand. in 1777. 6. A. fution, cultivated oat. Of this there are four varieties, the white, black, brown or red, and the blue oat. "Paniced; calyxes two-footed; seeds very smooth, one awned." Annual; culm or straw upwards of two feet high; panicle various in different varieties, but always loose and pendulous; the two glumes or chaffs of the calyx are marked with lines, pointed at the end, longer than the flower, and unequal. There are usually two flowers and seeds in each calyx; they are alternate, conical, the smaller one is awnless, the larger puts forth a strong, two coloured, bent awn, from the middle of the back. No botanist has been able to ascertain satisfactorily the native place of growth of this, or indeed of any other fort of grain now commonly cul-ivated in Europe. The varieties mentioned above have been long known, and others have been introduced, as the Poland, the Fritland, the Dutch, and the Siberian or Tatarian oat. The blue oat is probably what is called Scotch greys. The white oat is most common about London, and these countries where the inhabitants live much upon oat-cakes, as it makes the whitest meal. The black is more cultivated in the northern parts of England, and is esteemed a very neat and good for horses. The red oat is much cultivated in Derby- shire, Staffordshire, and Cheshire; it is a very hardy oat, and gives a good increase. The straw is of a brownish red colour, very heavy, and esteemed better food for horses than either of the former sorts. In Lincolnshire, they cultivate the oat called the Scotch greys. The Polish oat has a short plump grain, but the thickness of the skin seems to have brought it into disrepute among farmers. Add to this the straw is very short. It was first by Mr. Link, in 1759. Friedland, or Dutch, oat affords more straw, and a thinner flake, and the grains mostly double. A white oat, called the potato oat in Cumberland, where it was lately discovered, promises, from the size of the grain and the length of the straw, to be the most valuable we possess; it
is now very generally bought for sowing. The oat is a
very profitable grain, and a great improvement to many
estates in the north of England, Scotland, and Wales; for
it will thrive in cold barren soils, which will produce no
other sort of grain; it will also thrive on the hottest land;
in short there is no soil too rich, or too poor, too hot, or
too cold for it; and in wet harvets, when other grain is
spoiled, this will receive little or no damage. The meal of
this grain makes a tolerably good bread, and is the common
food of the country people in the north. It is also esteemed
for potage and other viands, and in some places they make be
with it. 7. A. nudum, naked oat, pleon, or pollis. •
Paniced; calyces three-flowered; receptacle exceeding the
calyx; petals awned at the back; the third floret anwelfe.
This has been considered as a Britifh plant by Ray, Hud-
on, and Withering: but Dr. Smith fays it is by no means
to be classed among our indigenous plants. Linneus observes
it is very nearly allied to the finea; and Haller remarks
that the calyx is sometimes two-flowered, but that the awn
is neither twifled nor jointed. We are told the heads have
been cultivated, and for the uses of the poor answer all the
purpofes of oatmeal. 8. A. finea, wild oat or haver. Hud.
calyces mofly three-flowered; florets awned, and hairy at the
bafhe. Annual; culm erect, fimple, three feet high, a
leafy, twifted, very free; leaves linear, petant, nervation,
feabrous; fheath fha
d, fheathes fha
d, fheathes fha
d, fheathes thin, nervation, smooth; fipules
obtuse, tooth-letted, lacerated; panice erect, much branched,
and spreading; peduncles alternate, capillary, feabrous,
thickened towards the apex, nodling; calyce glumes
equal, lanceolate, acute, nerved, smooth, longer than the
florets; florets for the most part three, remote, gradually
diminifhing, roundifh, befted with tufts of hair at the bafe,
awned from the middle of the back, awn twice the length
of the calyx, rough, jointed, twifled at the end; interior
fheath concave, nerved, ciliated. Seed has a foft hairy
covering. It grows in fields and hedges, and is one of our
most proftrative annual weeds among corn. The awns are
fometimes used for hydrometers, and the feds inflead of
artificial fhes, in fowing for trout. 9. A. felytica. Scheuch.
Gram. 220. t. 4. f. 17. • Paniced; calyces mofly three-
flowered; all the florets awned; receptacles bearded. Pan
oblong; the flowers appear to be hairy, but all the
fars fit on pedicles or receptacles within the calyx among
the flowers. The third fower is imperfect. Haller thinks
it to be only a variety of the flavea. A native of Ger-
many, Swifland, &c. 10. A. pudefcent, soft oat-grafs.
Hud. With. Smith. • Panice erect, almoft fimple, calyces
commonly three-flowered, receptacle bearded, leaves flat,
pubeften. f Perennif: culme onfe or two feet high, eredt,
fimple, roundifh, smooth, twifted, leafy; leaves spreading,
short, obtufe, flat, which together with the fheathes are
covered with a foft down; ifipule fhort, defidio; panice con-
tacted to as to appear like a fpike; calyce glumes very
equal, keelled, fcrabrfe, pointed, membranaceous, nerved,
in-
terior much longer, three-nerved; florets three, the third of
frequent aborptive, remotif: clubbed-cylindric, nervation,
roughifh, diaphanous, awned towards the bafe of the back;
interior glume smaller and weaker, rough at the edge;
common receptacle elongated above the florets, befted with white hairs.
It grows in dry meadows and chalky paifures, flowering in June. 11. A. flerilis, great wild, or bearded oat-grafs.
• Paniced; calyces five-flowered; the outer florets and
awns hairy at the bafe, the inner ones awnles. Annual;
culme three or four feet high, smooth; leaves smooth, flat,
sharp, very long; flowers pendulous; calyces four or five-
flowered; valves lanceolate, accinear, concave, equal,
smooth, white with green streaks. In the two outer florets,
the outer valve of the corolla refembles a valve of the calyx
in form, but shorter, and puts forth an awn two inches long.
The other florets are awnles. A native of Babary and
Spain. Introduced into the Kew garden by M. Thomin, in
1777. 12. A. fpoletos, narrow-leaved oat-grafs. Hud. \nWith. Smith. Curt. Lond. 3. t. 5. • Paniced much branched,
loofe, calyces mofly three-flowered, unequial; receptacle
hairy; leaves flat, fubptefent. • Calum erect, hair ferved
at the bafe, a foot and a half high, twifted, jointed; leaves
flat, acute, twifted, more or fefs pubefcent; panice fome-
what nodding, spreading, branched very much, many-
flowered, of a fhipping golden colour; calyce glumes acute,
keelled, fcabranch on the bace, one twice the fize of the
other, three-nerved; florets two or three, rematih, lanceo-
cate, fimplicif: obtusely nerved, awned; awn twice the
length of the floret, fcabranch; interior glume narrower;
receptacle hairy. It grows in meadows, lafsures, and the
fides of roads, flowering in June and July. In many of
our counties, this species forms the principal part of the
finel faturages on the downs, and in some meadows it con-
tributes to the goodfairs as well as greatnefs of the crop.
13. A. hispidus. • Paniced; calyces three-flowered, hairy.
Culme a foot high, fMOOTH: fheaths hairy; panice or ra-
come with undivided pedicles, three or four; glumes oblong,
acinarine, hairy, upright; corolla awl-shaped; awns
twifled, twice or three times the length of the flowers.
14. A. roefae. • Paniced contracted; calyces three-flowered,
subulate; corolla pubefcent; middle awn twifled, curved.
Root creeping; leaves few, smooth, with a rugged edge;
culme a foot high, smooth; panice spike-like, ovate-ob-
long, purple; the falt pedicles capillary; calyce the length
of the flower; valves equal, ftattuated into an awn; outer
valve of the corolla subpubefcent, bifid, terminated by two
ftraight awns, and an intermediate one twifled, double the
length of the others; inner valve fhort. This and the his-
ipus are natives of the Cape. 15. A. purpurea. • Panice
contracted; calyces two-flowered, ovate; corollas villofe;
outer glume bifid; awn terminal, bent in. A very little,
smooth, jointed grafs; leaves brifte-shaped, fMOOTH:
taffed, fhort, like thofe of felifca ovina; panice small; glumes of
the calyx purpure; valves lanceolate, keelled, smooth; all
the florets are awned, and covered with a white down. A
native of Martinico. 16. A. luena. • Panice spreading;
calyces two-flowered, subulate; corollas naked, three-awned,
middle awn flexuof. This refeembles aira flexufoth both
in habit and colour. A native of Martinico. 17. A. lipulina.
• Panice contracted, ovate; calyces three-flowered, lance-
olate; corollas villofe, outer glume bifidulate; middle awn
reflex. This is not readily diftinguifhcd from the 15th.
It is larger, with fheaths extremely tomentofe. Panice yel-
low, clofely crowded; flowers longer than thofe of the
15th, with the corolla bifid and more bifid; the divisions
bifidulate, awned. A native of the Cape, found by Thou-
• Spike twifted; calyces four-flowered, longer than the floret.
Culms many, smooth, with three joints, fix or seven inches
high; leaves flat, ciliate; spike the length of the culm; flo-
rets in a double row, pressfed clofe, and alternate; calyx two
or four-flowered, lateral, oblong, pubefcent; one valve twice
the length of the other; outer valve of the corolla ftarf,
with an awn from the back. This is the only avea truly
spiked. A native of Spajen. Introduced by Monf. Richard,
252. n. 2 & 345. Scheuch. Agr. 230. • Spike erect;
calyces mofly five-flowered; receptacles hairy; leaves invo-
lute,
late, ferrulate, naked." Root perennial; culms many, a foot or a foot and a half high, erect, simple, with a single joint near the base, above naked, fribled, roughish; radical leaves linear, acute, rigid, incurved, smooth on both sides, with the edges ferrulate-fimbrous; those on the culms broadened, nervet, with long sheaths which are nervous and smooth; θspale lanceolate; θpike erect, commonly very simple; upper spiklets subculms; under ones long, pedunculated; calyces glumes subequal, acute, three-nerved, a little keeled, fimbrous of the length of the lower floret; florets four or more, subcuneate, rounded, roughish, nerves at the apex, membraneous, lacerated, awned from above the middle of the back; awn double the length of the floret, purple, with a white apex; interior glume smaller, very slender, minutely ciliate; receptacle under the florets, beak with short hairs. It grows on dry pastures and heaths, flowering in July. 20. A. fico "Spiked; calyces five-flowered, longer than the outer petal, which is awned and forked at top." Spike compounded of three or four remote upright spiklets; flowers f, f, f, upright; calyx subulate, equal, longer than the spikellet; outer petal bilt at the top, with a joined awn between the divisions, the length of the spikellet. It has the habit of fistulae decumbents. A native of Pennsylvania. 21. A. broomoides, Gr. alpinum aven. &c. Scheuch. Gram. 228. t. 4. f. 21. "Subspiked; spikules binate, one peduncled; awns divericate; calyces five-flowered." Two feet high; culm slender; spikellets round, generally in pairs, one fiddle, the other peduncled; calyces from four to eight-flowered; awns from the middle of the back, twisted. A native of Switzerland, and about Montpellier. 22. A. giroga. "Panicked; calyces two-flowered; corolla smooth at the base; outer valve ending in two awns, shorter than the valve, and with a bent awn from the back." Annual; culm and leaves baret; peduncles from one to four, rough; calyx the length of the florets; valves seven or ten-ribbed, bordered with a row of minute dots; valve of the corolla smooth below; segments terminating in purple awns white at the tip; ears hairy. This has been found growing with the cultivated oat, but it is not a native of this country. See Smith. 23. A. anata, golden oat-grass. "Calyces two-flowered; panicle scattered, erect; corollas golden, villous at the base." A hardy grass, nine inches high; leaves very slender, bristle-shaped; panicle fluff, with mucronate spiklets, one shorter than the other; corolla elliptic, pubescent at the base; top plaited, fereate; at the base of the outer glume, a jointed awn, longer than the flower. When this grass arrives at maturity, it is of a resplendent gold colour. A native of the Alps, of Switzerland, and Piedmont. 24. A. fiebercelleri. Scheuch. Gram. 23. t. 3. "Spikellets five-flowered, pubescent at the base; peduncles branching." Culm from six to twelve inches high; leaves smooth, two lines broad, keeled; panicle narrow like a spike; calyx purple, shining, curved at the top; glumes unequal, mucronate; outer glume of the corolla mucronate, green, variegated with bay and gold colour; inner with a gold and silver colour, membraneous, awn long, brown, jointed, twisted. A native of the same places as A. anata. 25. A. filiformis. Forl. Flor. n. 65. "Panicle erect, very slender; calyces one-flowered; awns twice the length of the calyx." A native of New Zealand and Easter Island.

Propagation and Culture. For the grasses, see Grass. Oat. The best time for fowling oats is in February or March, according to the season is early or late. The black and red oats may be fown a month earlier than the white, because they are harder. The advantage of early sowing is proved by experiment to be found in the papers of the Bath Agricultural Society. White oats sown the first week in May have produced seven quarters the acre, and in Hertfordshire they do not sow them till after they have done fowing barley, which is found to be a good practice; this oat being more tender than the others. Mr. Marshall mentions the fowling of the fallow as a direction for the fowling of this grain. He says, "most people allow four bushels of oats to an acre, but I am convinced, that three bushels are more than enough; the usual produce is about twenty-five bushels to an acre, though I have sometimes known more than thirty." But forty bushels and more are certainly no unusual crop. It appears from Mr. Young's "Four through the Southern Coast", that the quantity of oats sown varies from five bushels to twenty bushels and a half, and that the produce may follows:

From 5 bushels and upwards  
4 bushels  
3 bushels and a half  
2 bushels and a half  
2 bushels and a half  
2 bushels and a half

He thinks the quantity of feed should be proportioned to the power of the ground; for in rich land corn tillers so much as apparently to cover the field; but in poor land it does not tiller at all, consequently the grain should be the nearer. Mr. Young, in his "Northern Tour," gives another table of the different quantities of feed corn, with their respective average produce, as follows:

From 7 bushels sown, average produce  
6 bushels  
5 bushels  
4 bushels and a half  
3 bushels  
2 bushels and a half  
1 bushel

Or thus:

From 6 and 7 bushels  
4 bushels and a half five  
3 and 4 bushels  
2 bushels and a half five  
1 bushel

Hence it appears, that although some points remain doubtful, yet the superiority of six or seven bushels is so great, that there is abundant reason to think the other quantities are not equal to those in advantage, and that the modern ideas of sowing small quantities of feed are not universally to be adopted. Mr. Young therefore recommends that experiments should be tried on all sorts of soils, and in every situation, on small pieces of land, to decide this important point.

AVENÆ, in Entomology, a species of Musca, of a black colour and shining; eyes brownish; wings red and green and very shining. Habits Sweden. Gmelin. &c.

AVENAGE, formed of the Latin avens, oats, in Latin, a certain quantity of oats paid to a landlord in lieu of some other duties, or as a rent, from the tenant.

AVENAY, in Geogr.-phy, a town of Trance, in the department of the Marne, seated on the river Marne, one league and a half north-east of Epernay, and five W.N.W. of Chalons sur Marne.

AVENCHÉ, or AVANCHE, a town of Switzerlant, in the canton of Bern, and the principal burgh of a bailiwick in the Pays de Vaud. Some contended that it was the capital of Helvetia, because Tacitus (Hist. li. c. 63.) calls it "Aventicum gentis caput," while others have endeavoured to prove that by this expression the historian only intended to denote
denote the capital town of its particular district. According to some accounts, the city was built, and a Roman colony founded, by Vepsvian; but with greater probability, according to others, it was only repaired and beautified by Vepsvian, after it had been laid waste and almost ruined by Cezina, one of the lieutenants of Vitellius, when many thousands were slain, and many thousands sold for slaves. It was afterwards taken and pillaged by the Burgundians; and reduced to a heap of ruins by Attila. Without doubt it was formerly a very considerable town, and subject to the dominion of the Romans, as we may conclude not only from several mile stones found in many parts of the Pays de Vaud, most of which are numbered from Aventicum, as the principal place of reference, and more particularly from the present ruins. The ancient walls appear to have included a space near five miles in circumference; of which the present town occupies but a very small spot; the remainder being covered with corn fields and meadows. In an adjoining field is a mosaic pavement, which was the floor of an ancient bath, about sixty feet long, and forty broad; coælating of three compartments, in which are represented human figures in various attitudes, but chiefly baccanals. From a glory that surrounds the head of Bacchus in this Mosaic, it has been inferred that it was wrought during some part of the intervening age between Vepsvian and Marcus Aurelius; because that mark of divinity is not usual upon monuments of Roman antiquity before that period. Besides, the head-dres of a Bacchanalian woman represented in this Mosaic, resemles the head-dres on the medals of the emperors Plautius and Sabina. The ancient amphitheatre appears, from the ruins that remain, to have had an arena of about 80 yards in diameter; and under a tower is a cell from which the animals were probably let loose upon the arena. On the outside, remains of five dvens are visible; and the walls are adorned with several pieces of rude sculpture dilapidated. Not far from these ruins stands a column of white marble about fifty feet high, composed of large masses neatly joined without cement; and near it lies a considerable fragment of defaced sculpture, which seems once to have formed part of the portal belonging to a magnificent temple. There are also several other relics of the ancient extent and grandeur of this place. Cose's Travels in Switzerland, vol. ii. p. 175, &c. Avenche is situated at the fourth end of the lake Morat, 16 miles south-west of Bern. N. lat. 46° 50' E. long. 7° 7'.

AVENIA FOLIA, in Botany, denote leaves which have no viable veins.

AVENIO, now Avenign, in Ancient Geography, a town of Gallia Narbonensis, upon the left bank of the Rhone. See Avenign.

AVENOR, in Antiquity, an officer under the master of the horse, who by order or warrant from him, made up the accounts of the flables, and inflicted detentions for paying the officers and servants.

In a flat, Car. II. we find the avener mentioned as an officer who provides oats for the stables. In the Rot. Parl. Edw. III. we also read of avener of the queen, of the prince, &c.

AVENPACE, in Biography, a philosopher among the Spanith Saracens, who flourished about the middle of the twelfth century, and was a follower of Aritoffte. He wrote a commentary upon Euclid, as well as philosophical and theological epistles. He was intimately conversant with the Peripatetic philosophy, and applied it to the illustration of the Islamic system of theology, and to the explanation of the Koran; and on this account he was suspected of hereby, and thrown into prison at Corduba. It is said that he was poisoned at Fcz, in the year of the Hegira 533, A.D. 1138; or, according to others, 535, A.D. 1135. Pococke Spec. Hist. Arab. p. 375. Gen. Diet. Among the Arabian writers he is commonly known by the name of Ebne al Siyeg; and was born in Spain, of Jewish ancestors.

AVENIS, in Botany. See Glem.

AVENS, in Ancient Geography, a river of Italy, in the Sabine territory, which discharged itself into the Tiber, and which is supposed to have given the name of Ager Aventinus to the neighbouring district.

AVENTIA, now Avenna, a river of Italy, in Etruria.

AVENTINE, John, in Biography, a German historian, was the son of an inn-keeper at Abenperg in Bavaria, and born in 1466. Having studied at Ingoldstadt and Paris, he gave private lectures on eloquence and poetry at Vienna, in 1503, and in 1507 taught the Greek language at Grazow in Poland. After spending some time at Ratibon, upon his return to Germany, he removed to Ingoldstadt, in 1509, and explained some books of Cicero; and in 1512, he went to Munich to undertake the office of preceptor to prince Lewis and prince Ernert. His remaining time was principally devoted to the collection and compilation of materials for the work, intitled, "Annales Boierum," or "Annales of the Bavarians," by which he gained great reputation. This work, which was not published till the year 1559, several years after his death, contained some severe criticisms on the conduct of the Roman clergy, and portions of secret clerical history, which Zieglerus, the first editor, chose to suppress, but which were afterwards published from an unmutated MS. by Cifner, at Basle, in 1560. In the year 1529, Aventine, for some reason now unknown, was committed to prison, but he was soon released by the duke of Bavaria; and after a celibacy of fifty-four years, he formed an imprudent matrimonial connection, which disturbed the tranquility of his latter days. He died in the year 1534. The Catholics charged him with being secretly a protestant; but though he corresponded with some of the reformers, and disapproved some of the popish doctrines, it does not appear that he ever abandoned the Roman church. On the contrary, his adherence to it may be inferred from his having been buried at Ratibon, in the monastery of St. Hemaron, with the usual popish ceremonies. Like Erasmus, he seems to have been well inclined to the reformation; but he contented himself with serving it within the pale of the church, by laying the vices of the monks and clergy. Another curious work of Aventine, intitled, "Numerandi per digitos manuque, &c." was published in 1552, at Ratibon, together with heads of a plan for a large work on the antiquities of Germany. His "Annales of Bavaria" were reprinted in folio, in 1710. Gen. Diet. Nouv. Diet. Hist.

AVENTINUS MONS, in Ancient Geography, one of the seven hills which formed the site of ancient Rome, and the fourteenth region of the city. The origin of the name is uncertain; but some have derived it from Avenso, the river which watered the district, whose inhabitants were afterwards transplanted thither. It was also called "Murius," from Murcia, the goddes of sloth, who had a little chapel there; and "Collis Diane," from the temple of Diana; and also "Rernuria," from the time when Remus rel owed to build the city there. But Dionysius of Halicarnassus speaks of mount Aventine and Remuria as two different places; and Stephanus says, that Remuria was a city in the neighbourhood of Rome. The Aventine mount was taken within the compass of the city by Ancus Martius, who, thinking it might serve as a place of defence against hursels, surrounded it with a wall and a ditch. To the east, it had the city walls; to the south the campus Figulinus; to the west, the Tiber;
Tiber; and to the north, Mons Palatinus. It had a good height, and was 18 stadia in compass. It is now called the mount of St. Sabine; and it is thought that the church of St. Sabine was built on the ruins of the temple of Diana. The street that passed from the gate of Oliba to the amphitheatre and Colliseum, divided the Aventine mount into two summits; whence it was called "Biceps."

AVENTURE, in our Ancient Writers, signify tournaments, or military excercises on horseback.

AVENTURE, or rather Adventure, in our Law Books, a mischance, causing the death of a man, without felony; as, when he is suddenly drowned, or burnt by an accident or mischance, falling into the water or fire. See MISAVENTURE, and CHANCE-Medley.

AVENTURINE, in Minerals. See QUARTZ, and FELSPAR.

AVENUE, formed of avens, or advenirs, to arrive at, in Fortification, an opening or inlet into a fort, bulwark, or the like place; or the paifeways to and from it. See FORT, and BASTION.

AVENUE, in Ornamental Gardening, is a large and generally straight walk, bounded on each side by one, two, or more rows of foreft or other trees, designed sometimes as a principal way from the common road to the mansion house of a country-feft, and often to form views, or to lead to different districts of the neighbouring country. But though avenues of the more regular kind, when formed about extensive feas, or detached in parks, or other extensive pleasure-grounds, always exhibit an air of grandeur, it is more agreeable to the present taste to have the principal front of the mansion entirely open, and unincumbered with trees or any other kind of plantation, as it is certainly a great absurdity to hide a good front, and obstruct the prospect; an avenue can therefore seldom be admitted with propriety in that part of the ground. A spacious lawn of grass should, as frequently as possible, be exhibited in due extension in the most conspicuous fronts of such dwellings. See LAWN.

But in directions from the wings, detached at considerable distance, avenues may perhaps with propriety be occasionally introduced, and extended on the sides of spacious lawns, serving by way of boundaries, being backed up next the lawns with shrubs and lower trees, disposed irregularly; and if they be carried in an oblique direction, the lawns will widen gradually, and the prospects be more comprehensive.

Avenues may also be admitted at some distance from either the ends or the back fronts of the dwellings, in either of which situations, one may be extended towards any common road, village, or town, serving as the common entrance to the habitation, or merely by way of ornament, &c. And in still more extensive situations, they may occupy different parts at a distance, being directed towards woods, groves, edifices, or particular districts about an estate; which, when formed of considerable width, and bounded on each side by a proper variety of trees, the noblest of the foreft, and other kinds, afford a striking effect as well as an air of dignity to the site.

Avenues of this sort should always be planted with the stateliest trees; an assemblage of the different sorts of which effects the most agreeable variety.

The width of the avenue in such cases should seldom be less than sixty feet; and when it is to be extended any considerable length, an hundred feet in width is not too much; as when the trees grow up, the branches on the opposite sides continue to approach each other, which by degrees greatly contract the views; so that if a considerable width be not at first allowed, the avenues in time appear narrow and confined.

The trees in the rows on the sides should be planted at least thirty feet distant from each other, that they may have full scope to display their heads, and each exhibit itself conspicuously, according to its natural form and habit.

The sorts of trees most proper for this purpose are those of the deciduous kinds, as the elm, birch, Spanish-chestnut, horse-chestnut, white poplar, fycamore, maple, sycamore, wild-cherry, &c. all of which, by the bringing of lofty growth, when disposed in a proper manner, will have a fine effect. Sometimes evergreen trees are used among these; where this is intended, the moss proper sorts are the various species of the pine, including all the different varieties of the fir, of which attain a great height and magnitude, with beautiful spreading heads, that are extremely ornamental and pleasing.

Avenues of the more rural kind, such as common ways or roads through parks or other pleasure grounds, to habitations, may be continued either in direct lines, or carried round in a moderate sweep, or the course directed in two, three, or more very gentle bends, or easy serpentine turns, each side being ornamented with different sorts of trees, thinly interspersed, some singly, others in clumps or groups, of two, three, or more together, exhibiting them variously, some breaking forward, others hanging more backward; and, for the full greater diversity, a clump of tall flowering shrubs may be added and there be introduced, having the whole to considerably detached, as to admit a full prospect of the adjacent lawns, fields, or plantations, in the whole extent. This is the most modern method of forming avenues, but it cannot be practiced with full effect except where the situation is of considerable extent. In short, walks and confined situations, the row method is mostly to be preferred, as having a better effect.

All the trees that are employed in this way, whether deciduous or evergreen, should be permitted to take their natural growth, without being much cut or pruned.

AVENZAOAR, whose true name was, AL WAZIR ABU MERWAN ABDELMELECH IBN ZOMA, in Biography, was the son of a physician of considerable eminence of Seville in Spain, under whom he received the first rudiments of his education, which he afterwards improved by close application and travel. He appears also to have had the care of a hospital, and to have acquired an uncommon share of knowledge for the age in which he lived, both in the theory and practice of medicine. He was for some time under the displeasure of Haid, the governor of Seville, by whom he was imprisoned, but seems at length to have surmounted all his difficulties, as he was made physician to King Almanzor, in which post he continued probably to the end of his life. He is said to have died at Morocco in 1167, at the great age of 135 years; though it is probable the age of his son, who succeeded to his fame and practice, is included in this term. From a manuscript in the Library (Bib. tom. ii. p. 122), cited by Dr. Ruffell in the appendix to his "History of Almoravidos," it appears that Avenzaoar died at Seville, and not at Morocco, about the year 1167; and if it be true, that he had lived to the age of 135 years, and began to practice very young, he must have made a figure in the 11th century, and been born eight or nine years before the death of Avenzaoar. He prepared his own medicines, reduced lacerated bones, and performed other extraordinary operations, but did not cut for the stone; the Mahometan religion, which he proscribed, prohibiting him from operating or handling the naked genitals.

The work by which he is principally known, called "Al Thofir," is a compendium of the practice of medicine, a compendium of the practice of medicine, in which some diseases are described, not found in other
writers. It includes a number of cases, candidly, it should seem, related, as the author does not conceal those in which he was unsuccessful. Avernoes, not ordinarily profuse in his commendation of other writers, speaks very favourably of our author, whom he esteemed the best physician that had appeared since the time of Galen. From his active and inquisitive turn of mind, and the pains he took to learn from practice the real powers of the medicines he used, he was called the "Experimenter."

"Al Theifer," which has been several times reprinted, was first published at Venice, in folio, 1590. In 1628, J. Celle published "De cognitum difficilibus in praxi ex libro Avernno,", 4to. Venet. "Le Clerc Histoire de Med. Halter Bib. Med. Prac."

AVER, in Agriculture, a general name, in some districts, for a labouring beast of any kind.

AUEK, in Geography, a river of Lithuanian Russia, which runs into the Pregel, twelve miles west of Insterburg.

AVERA, in Drompley-Book, denotes a day's work of a ploughman, or other labourer, which the king's tenants in his demesne lands were obliged to pay the thirieth, and which was valued at eight-pence.

AVERAGE, in Agriculture, a term used by the farmers in many parts of England, for the stubble, or remainder of straw or grass left in corn fields after the harvest is carried away. In Kent, it is called gerraton, in other places roughings, &c. In this sense it may be derived from baucer, an English name for oats; or from averia, hoffs; being as much as feeding for cattle, or ploughing. Ray.

AVERAGE, Averagium, in Law, that duty or service which the tenant is to pay the king, or other lord, by his beasts and carriages. The word is derived from the base Latin averia, cattle or goods; or the French averre, work.

AVERAGE, or Averidege, in Navigation and Commerce, is used to denote the damage which happens to ships and their cargoes, from the time of their loading and sailing, till their return and unloading. It is divided into three kinds. 1. The simple average, which consists in the extraordinary expenses incurred for the ship, such as the los of anchors, masts, and rigging, by common accidents at sea; or for the merchandise, such as the damages which they have sustained by flames, capture, shipwreck, wet, or rotting; all which must be defrayed by the thing that suffered the damage. 2. The large and common average, being expenses incurred, and damage sustained, for the common & county both of the merchandise and ship, which were to be borne by the ship and cargo: such as random-money, goods thrown overboard, expenses of unloading, or entering into a river or harbour, and the provisions and hire of the sailors, when the ship is detained by embargo. 3. The small averages, which are charges of towing and piloting the ship, one third of which must be charged to the ship, and two-thirds to the cargo.

Average, is more particularly used for the quota or proportion which each merchant or proprietor in the ship or loading is adjudged, upon a reasonable estimation, to contribute to a common average. Such sum shall be divided among the several claimants, by way of average, in proportion to their respective interests and demands. 10 Ann. cap. 17.

Average is also a small duty, which the merchants who send goods in another man's ship pay to the master thereof, for his care of them, over and above the freight. Hence, in bills of lading it is expressed:—Paying so much for the said goods, with primage and average accosted.

AVERANI, Benedict, in Biography, a learned Florentine, was born in 1562, and taught the Greek language with great reputation in the university of Pisa. He wrote excellent "Dissertationes," on the "Anthologia" on Thucydides, on Euripides, and other ancient Greek classies. His acquaintance with Roman literature was accurate and profound, as appears from his "Remarks and Discourses on Livy, Cicero, and Virgil;" and his lectures and writings were well calculated to promote a correct and elegant taste in polite literature; so that he contributed much to reform the bad taste of his age, and to bring back in Italy the golden period of the 16th century. Averani died at Pisa in 1707, in the 55th year of his age. His works were collected and printed at Florence, in 3 large volumes, in 1716 and 1717. Gen. Biojg.

AVERANO, in Ornithology, the name of the variegated Chatterer (Amelia variagata, Gmel.), in Buffon's History of Birds.

AUBERBACH, in Geography, a town of Germany, in the circle of Upper Saxony, 14 miles south of Zwickau, and 60 W. S. W. of Dresden. N. lat. 50° 26'. E. long. 12° 26'.

AVER-CORN, in Ancient Writings, such corn as by custom is brought by the tenants' carriages, to the lord's granary.

AVERDUPOIS Pound. See Pound. AVERDUPOIS Weight. See Weight.

AURERHANN, in Ornithology, a name assigned by Frisch, Bloch, and others, to the wood grous, or Mountain cock. tetra aragallus of Linnaeus.

AVERIA, in our Law Books, properly signifies oxen or horses used for the plough; but, in a general sense, any cattle; and sometimes the term includes all personal cattle.

When mention is made of one beast, they say, quidam equus, vel quidam bovis: when of two or more, they do not say, equi or boves, but averia.

AVERIA, in Commerce, a branch of the Spanish revenue, denotes a tax paid on account of convoys to guard the ships sailing to and from America, which was first imposed when Sir Francis Drake filled the New World with terror by his expedition to the South sea. It amounts to 2 per cent. on the value of goods. Robertson's Amer. vol. iii. P. 490.

AVERIA, Repliciae de Averiis. See REPLICAIRE.

AVERIS capitis in Wilbernam, in Law, a writ for the taking of cattle to his use who hath cattle unlawfully distained by another, and driven out of the county where they were taken, so that they cannot be reprieved by the sheriff. Reg. Orig. 82. See DISTRESS.

AVERIUM. See HERIOT.

AVER-LAND, a term employed, under the feudal fyllem, to signify such lands as were ploughed by the tenants for the use of their lords.

AVERMENT, in Law, usually signifies an offer of the defendant to make good or justify an exception, pleaded in abatement or bar of the plaintiff's action.

The word also sometimes signifies the act, as well as the offer, of justifying the exception; and not only the form, but the matter thereof. Co. Litt. 352. Averment is either general or particular.

Averment, in general, is the conclusion of every plea to the writ, or in bar of replications or other pleadings (for counts, or averories in nature of counts, need not to be averred), containing matter affirmative; and ought to be with the words, "hoc paratus est verificare." See Plead-

Averment, particular, is when the life of a tenant for life, or tenant in tail, or the parson of a church, is averred, &c.
&c. The use of averment being to ascertain what is alleged doubtfully, deeds may sometimes be made good by averment, where a person is not certainly named; but where the deed itself is void for uncertainty, it cannot be made good by averment. 5 Rep. 155. Averment, which is merely the allegation of a party, cannot be made against a record, which imports an uncontrivable verity. Co. Lit. 246. Jenk. 322. Lil. R. P. 155. Averment does not lie against the proceedings of a court of record. 2 Hawk. P. C. c. i. § 14. Nor shall it be admitted against a will concerning lands. 5 Rep. 68. And an averment shall not be allowed where the intent of the testator cannot be collected out of the words of the will. 4 Rep. 44. Nor shall any one aver a thing contrary to the condition of an obligation, which is supposed to be made upon good deliberation, and before witnesses, and therefore not to be contradicted by a bare averment. 1 Litt. Abr. 156. If an heir is fixed on the bond of his ancestor, it must be averred that the heirs of the obliger were expressly bound. 2 Saw. 136. Another consideration than that mentioned in a deed may be averred, where it is not represent or contrary to the deed. Dyer. 156. But a consideration may not be averred, that is against a particular express consideration; nor may averment be made against a consideration mentioned in the deed, that there was no consideration given. 1 Rep. 156. 8 Rep. 155. If one has two masters by the name of W., and levies a fine, or grants an annuity out of his own of W., he shall by averment ascertain which of them it was. 6 Mod. 235. Chn. Rep. 138. If a piece of ground was anciently called by one name, and of late is called by another, and it is granted to me by this new name, an averment that it is the same shall make it good. Dyer. 37. 44. No averment lies against any returns of writings, that are definitive to the trial of the thing returned; as the return of a scriffer upon his writings, &c.; but it may be where such are not definitive; and against certificates upon commissions out of any court; also against the returns of bailiffs of franchises, so that the lords be not prejudiced by it. Dyer. 348. 8 Rep. 121. 2 Cro. 13. A special averment must be made upon the pleading of a general pardon, for the party to bring himself within the pardon. Hob. 67. A person may aver he is not the same person on appeal of death in favour of life. 1 Nell. Abr. 305. Where a man is to take a benefit by an act of parliament, he shall condition his pleading, that he is not a person excepted. Plow. Com. 87. 406. Pleas merely in the negative shall not be averred, because they cannot be proved: nor shall what is against premission of law or any thing apparent to the court. Co. Litt. 362. 373. By lat. 4 & 5 Ann. c. 16. no exception or advantage shall be taken upon a demurrer, for want of averment hic parauit eft, &c. except the fame be specially set down for caufe of demurrer.

AVERNI, among the Ancient Naturalists, certain lakes, groottes, and other places, which infect the air with putaneous exhalations or vapours; called also malíiples.

The word is formed of the privative a, and epis, bird, as intimating that birds could not fly over them, but dropped down dead. Avernus, q. d. avenus, lacus sae avinis.

Avernii are said to be frequent in Hungary, on account of the abundance of mines therein. The Grotto del Cani, in Italy, is a famous one. But the most celebrated Avernus was a lake near Baia, in Campania, by the modern Italians called Lago di Tripergola, and situate in the country of Lavoria in Naples, near Puzzuoli; and said to be about 600 yards in diameter, and in some places 58 feet deep. The fumes it emitted were represented by the ancients as being of so malignant a nature, that birds could not fly over it, but sunk down dead; which some later writers have chosen to attribute to this, that its fulphurous effusion not being of confidence to sustain the birds, they dropped by their own weight. This circumstance, joined with the great depth of the lake, occasioned the ancients to take it for the gate or entrance of hell; and accordingly Homer brings Ulysses to Avernus, as to the mouth of the infernal regions; and in imitation of the Grecian bard, Virgil makes Aeneas descend this way into the same abodes.—Vibius Seckler says, that no bottom of it has been found. (See HELL.) Next to the Baie (says Strabo) lies the Lucrine bay, and within it the lake Avernus; which is a deep darksome lake, with a narrow entry from the outer bay: it is surrounded with steep banks, that hang threatening over it; and is only accessible by the narrow passage through which you fall in. These banks were anciently quite overgrown with a wild wood, incomprehensible by a human foot. Its glomy shade impressed an awful superstition upon the minds of the beholders; whence it was reputed the seat of the Cimmerians, who dwelt in perpetual night. Whoever failed hither, first offered sacrifice; and endeavoured to gratify the infernal powers, with the affiduate of some priests, who attended upon the place, and directed the mystic performance. Within, a fountain of pure water broke out jull over the sea; but no creature ever tasted of it, believing it to be a vein of the river Styx: somewhat near this fountain was the oracle: and the hot waters frequent in these parts, made them think they were branches of the burning Pilegton.

The holmns of these fhades (says a modern traveller) remained unimpeached for many ages. Hannibal marched his army to offer incense at this altar; though, perhaps, he was led to this act of devotion, rather by the hopes of surpassing the garlion of Puteoli, than by his piety. After a long reign of undisturbed gloom and celebrity, a sudden glare of light was let in upon Avernus; the horrors were dispelled, and with them vanished the sanctity of the lake: the axe of Agrippa brought its forer to the ground, disturbed its sleepy waters with fits, and gave room for all its malignant effusion to escape. The violence of these exhalations is described by ancient authors as very extraordinary; but modern writers, who know the place merely in a cleared state, charge these accounts with exaggeration; and yet it must be owned that they claim some reality, as the air is even now feverish and dangerous, which the jaundiced eyes of the vine-dressers, who have succeeded the Sibyls and Cimmerians in the possession of the temple, most respectfully testify. Boccaccio relates, that during his residence at the Neapolitan court, the surface of this lake was suddenly covered with dead fish, black and dined, as if killed by some subaqueous eruption of fire. At present, however, it is carpeted with mat, and the dusky Avernus is become clear and serene; so that it offers a most alluring surface and a charming scene for amusements similar to those which were fought for at the Lucrine lake in the time of Seneca, and which he has described. Spallanzani informs us, that these great numbers of seals swimming on its surface; and the peacocks afforded him, that the lake abounded with water-fowl in the winter. "Nor do I know," says this writer, "any cause which can at present drive them from a place where they may find plenty of food, as neither the environs, nor the lake itself, afford any indication of noxious exhalations." There can be no doubt that this lake was the crater of an ancient volcano. Like other volcanic craters, its internal fires become narrowed towards the bottom; and both the bottom and the external part of Monte Nuovo, so called because it was produced by subterraneaus fires in 1878, consist of a friable tufa, in many places covered with plants. The sea bathes the
the sides of this volcano, which, if dug into as well within the water as without, are found very warm. The same warmth is likewise perceived at the bottom of the crater. From such excavations likewise arise thin warm vapours. In fact, in the internal parts of Monte Nuovo, we find all the lakes remain of volcanic conflagration. In the external sides of the mountain many pieces of lava were found, which were of a middle character between lava and pumice-stone, and which Spallanzani on this account denominates pumice of lavas. The base of these flakes is a horn-flone, mixed with a few feltlike flakes; they fearlessly adhere to the tongue, and emit a light argillaceous colour. In the furnace they produce a compact enamel of a dark grey colour, transparent at the angles, and which gives a few sparks with feel. Towards the interior bottom of the crater, Spallanzani found, projecting from the tufa, the same kind of lava, penetrated with feltspars, but more compact and heavy, and intermixed with beautiful and flashing veins of black enamel of various thickness. On the side of the bottom, within the tufa, this fragacious observer discovered a small cavity, formed either by nature, or that abounds with fallacious effluvia, which he at first imagined to be a mixture of ammoniac (sal ammoniac), or sulphate of alumine (slim); but their mellow acid taste, the green colour which they gave to syrup of violets, and other qualities that are proper to soda, let no doubt that they were formed from that fact. On the tufaceous sides of the crater, both internal and external, Spallanzani perceived, as he had done in the lake Aqanno, a great number of frogs that were leaping about, nearly half an inch long, and about a quarter in breadth. They had the complete form of the frog, were of a dark yellow colour, and their fore-feet were divided into four toes, and their hinder into five; though they have not the shape of the hand, which constitutes an essential difference between these frogs, and the others of those countries. It was difficult to account for the production of these amphibious animals. Among all the different species of European frogs," says Spallanzani "and under this genus, I, with Linnaeus, likewise include toads, I know none, which do not begin their existence in water, and continue to live in it some time, until they throw off the mantle of the tadpole, and assume the shape of frogs. But Monte Nuovo is not only entirely without saline, but as I learned from the peasants who reside in the neighbourhood, even when heavy rains fall, the bottom of the crater, which is the only place where rain water can be collected and retained, imbibes all the water immediately, as if it were a mill; since it confounds a light spongy tufa, full of cracks and fissures. The only water near is that of the lake Aqanno, about half a mile distant, from which these animals might be supposed to have derived their origin, were it not that the frogs of that lake are of a totally different species." Upon the whole this ingenious naturalist concludes, that the presence of these creatures in this place was to him an enigma, which it required a longer stay in this volcanic country to enable him to solve.

The cave, called the Sibyl's Grotto, near Avernus, which is opposite to the temple, seems more likely, as Mr. Swinburne apprehends, to have been the mouth of a communication between Cumae and Avernus, than the abode of a prophet; especially as the Sibyl is positively said by historians to have dwelt in a cavern under the Cumaean citadel. Some have conjectured that it was part of the canal actually projected by Nero, from the mouth of the Tiber to the Julian port. On every hill, and in every vale of these environs, appear the ruins of extensive villas, once embellished with all the elegancies of combined art, but now traced only by half-buried moulting walls, and some marble fragments, the remaining indications of the table and collars with which they were constructed. Among the ruins of this country, one, in particular, claims attention; and this is the villa in which Cicero had his academy, where he penned some of his most admirable productions, and which probably stood on a spot covered by the eruption of 1538. Swinburne's Travels, vol. iii. p. 51, &c. Spallanzani's Travels, vol. i. p. 128, &c.

AUERROCHS, in Ornithology, a synonymous name of the wild ox, given by Gmelin and Ridinger. See Bos FERUS.

AYERON, in Geography, an island in the North sea, near the coast of Norway. N. lat. 63° 6'. E. long. 7° 44'.

AVERPENNY, q. d. AVERAGE-PENNY, in Antiquity, money contributed towards the king's averages, or money given to be freed thereof. See AVERAGE.

AVERROES, in Botany (so named after the famous commentator on Aristotle and Avicenna; commonly called Averrhoes, of Corduba, in Spain; his "Colligens," or the plants used in food, &c. was written about the end of the twelfth century). Lin. p. 576. Schreb. 784. Juss. 375. Clafa, decandria pentagynia. (Pentandria, Linn.) Nat. Order, gramineae-teretricineae. Juss. Gen. Char. Col. pendunt five-leaved, erect scut. Leaflets lanceolate, permanent. Cor. petals five, lanceolate, the lower pair crest, the upper spreading. Sepals filaments ten, falcate, alternately the length of the corolla, and shorter; anthers roundish. Pflg. germ oblong, obliquely five-cornered; styles five, falcate, erect; lignum simple. Per. pome turbinate, five-cornered, five-celled; seeds angular, separated by membranes.

Species. 1. A. bilunata. Rumph. Amb. t. 118. t. 36. Rheed. Mal. 3. 55. t. 45. 56. Lour. Cochin. 289. "Trunk naked, fruit-bearing; pomes oblong, obtuse-angled." A tree about eight feet in height, with few reclining branches; leaves pinnate, with ten or more pairs of leaflets; flowers on racemes adhering to the trunk, of a red purple colour; calyx five-cleft; fruit an oblong pome, the thickens of a finger, smooth. A native of Cina and of both sides of the Ganges. 2. A. Carambola. Rumph. l. c. t. 35. Rheed. l. c. t. 43. 44. Phil. Trans. vol. 75. Linn. l. c. "Axil of the leaves fruit-bearing; pomes oblong, acute-angled. This is a tree above the middle size, with spreading branches, and a very clove head; leaves with about four pairs of leaflets, which are ovate, acuminate, entire, opposite, the upper ones larger; flowers lateral, on short racemes; corolla bell-shaped, variegated with purple and white; flamens always five; pome the size of a hen's egg, with a yellow rind. Dr. Bruce gives a curious detail of the feasibility of the petals and even branches of this tree. The fruit of both the species affords a pleasanter acid juice, especially the former. The Brahmans and Portuguese call this tree carambola; in Malabar it is named tamar-tonga; and in Bengal, camrunc, or camrunga. Both these Indian trees have been introduced into the New garden.

AVERROES, or AVERROES, or Abu al Walid Moorammed Ebn Ahmed Ebn Rekhit, in Biography, an eminent philosopher and physician, was born about the middle of the twelfth century, at Cordoba, the chief city of the Saracens in Spain, where his grandfather and father had occupied the posts of chief priest and chief magistrat. The first care of his education was entrusted with Thophilus of Seville, who instructed him in the Islamic law; and after the manners of the Arabian schools, in the Mahometan theology,
the treatise but dcTree giving fume was the superlittus he his discharged he is learned truly him, substitute man, defence course of the day that the change of severer literary occupations for that of poetry or history, and spending whole nights in study. In his judicial capacity, he discharges his duty with great wisdom and integrity; and his humanity was such, that he could not pass sentence of death upon any criminal, but performed this office by his deputies. In the exercise of forbearance, meekness, and self-command, he was calmly exemplary. When a servant, employed by an enemy, revealed upon him in one of his public lectures, and whispered some abusive language, Averroes, with perfect equanimity, turned round to him, and said, "Well well," and proceeded with his business. This servant waited upon the next day to implore his pardon for the insult he had offered him. "God forgive thee," said Averroes, "thou hast publicly shown me to be a patent man; and as for thine sentence, it is not worthy of notice." He then gave him money, and dismissed him with the admonition: "what thou hast done to me, do not to another." In the exercise of his liberality to learned men, Averroes made no discrimination between his friends and his enemies; and for his conduct in this respect, his apology was, that in giving to his friends and relations, he merely followed the dictates of nature; but in giving to his enemies, he fulfilled the obligations of virtue; and he also boasted that by this method he had converted enemies into friends. Upon the occasion of burning some heretical verses which he had written in his youth, he remarked, that when he was young, he was disobedient to reason; but now in his old age, he followed it; and he added this singular with that he had been born an old man: "utiam natura sufficit facere." However, when he was compelled to exercise his magisterial authority in the suppression of some licentious poems that had been published by a learned Jew, and informed him that his own son had copied some of the verses, and that there was not a man, woman, or child in Corduba, who had not learnt some of the songs of Sahel, he exclaimed, "Can a single hand stop a thousand mouths?"

In philosophy, Averroes was an enthusiastic admirer of Aristotle, and yielded a superlitative deference to his authority; he even indulged his admiration to such an extent, that he ascribed to the writings of the Stagirite a degree of perfection "which is truly miraculous, and which proves him to have been rather a divine than a human being."—"The doctrine of Aristotle," says he, "is the perfection of truth, and his understanding attained the utmost limit of human ability; so that it might be truly said of him, that he was created and given to the world by divine providence, that we might see in him how much it is possible for man to know." This extravagance of admiration on the part of Averroes is the more surprising, as he was acquainted with the Greek language, and was therefore obliged to peruse the writings of his oracle in watchted Arabic translations, taken immediately from Latin or Syriac versions. His commentators, however, though they abound with error, misrepresentation, and confusion, have been held in such high estimation, even since the revival of letters, that Averroes has been filled by way of eminence, "The Commentator." Many of his writings in this way were so much admired by the Jews, that several of them were translated into Hebrew. Averroes also wrote a paraphrase of Plato's Republic; and a treatise in defence of philosophy against Al-Gazel, intitled, "Habapalah Alhabalalah," or "Destructione Destructiwm;" the design of which was to confute the metaphysical opinions maintained against those philosophers, who affect two uncreated natures.

"Though it is evident from the whole tenor of his life, that
Averroes could have little time for the practice of physic, whence Bayle, as well as several other writers, have supposed, that his knowledge of medicine was merely theoretical, yet we have the authority of his own words to prove, he was engaged in the practice also, though probably to no great extent. One observation (Friend says) we find made by him, which does not occur in any earlier writer, is "that the fame perfon could have the small-pox but once." His principal medical work, the "Colliget," or "Universal," written at the command of the Miramotin of Morocco, is a compendium of physic, collected from the writings of other authors, with some very material additions from his own flores. He wrote also a Commentary on the Cantica of Avicenna, which he calls the bolt introduction to the knowledge of medicine extant. This affords a complete answer to those who accuse him of having been jealous of the fame of that celebrated physician. As a proof, however, that he regarded him as a rival, it is alleged, that he avoids the mention of him, and in confuting a doctrine maintained by Avicenna, he treats it merely as the opinion of Galen. Besides the works above mentioned, Averroes wrote, "De Venenis," "De Febribus," "De Theriac," and "De Simplicibus Medicinis," all of which have been translated into Latin, and published in various forms. Averroes wrote many other treatises in theology, philology, jurisprudence, and medicine. In the Eufetral catalogue (c. i. p. 299), mention is made of an index of his books, amounting in all to seventy-eight. His commentary on Aristotle was published in Latin, at Venice, in folio, in 1495. An edition of his works was published in 1606, at Lyons, in 1557; another, in folio, with the famous Latin translation, by Bagolin, at Venice, in 1552; and a third by Moffa, at Venice, in 1608. Of the MSS. preserved in different libraries, and particularly at Vienna, many are either Hebrew translations from the Arabic, or Arabic written in Hebrew characters.

As to the religious opinions of Averroes, he was by profession a Mahometan; but he does not seem to have entertained any great reverence for his prophet. It is related of him, that he called Christianity an impossible religion, because it taught men to eat their god: similar to the reflection of Cicero (De Nat. Deor. lib. iii. c. 16), when he considered, that the name of Ceres was given to bread, and that of Bacchus to wine: "Quoque tam amentem esse putas qui illud, quod vetueatur, Deum credat esse?" that Judaeum, on account of its rites and ceremonies, was a religion for children; that Mahometanism, offering only sensual rewards, was the religion of faine; and that he exclaimed, "Let my soul, at death, be among the philosophers." It is also said, that he wrote against the three great law-givers, Moses, Christ, and Mahomet; and that he furnished materials for the book "De tribus Impofoiribus." His doctrine concerning the soul is supposed, not to have been peculiarly his own, but to have been affected by Aristotele, and to have been embraced by Theophrastus, Simplicius, and Theophrastus; which was this, that intellect does not exist individually in this or that man, but that there is one intellect belonging to the whole race of human beings, the common source of all individual thought, as the sun is the common source of light to the world. Similar to this was the doctrine of Malebranche, who ascribed the production of ideas immediately to God, and taught that the human mind perceives God, and sees all things in him. Averroes, however, proceeded farther; and he seems to have conceived, that there was no other cause of thought in individual men, than one universal intelligence, which, without multiplying itself, is actually united to all the individuals of the species, as a common soul. This notion, with its obvious consequences, as they concern the distinct existence and immortality of the human soul, obtained so much credit among philosophers for several centuries, and particularly in Italy, where their advocates were denominated "Averroists," that it was thought necessary to employ the papal authority for its suppression. At present, the notions of Averroes are exploded, and his writings are forgotten. Dr. Friend (Hist. Physic, p. 118), anxious to vindicate Averroes from the charge of infidelity, with regard to a future state, refers to two passages in his works; in one of which (Physic. Disput. 3.) he affirms, that the soul is not mortal; and in another, (b. 4.) that it is immortal. Leo Afric. de Vir. Illudr. Arab. Gen. Did. Brücher's Philol. by Enfield, vol. ii. p. 215. &c. Fabr. Bib. Italic. t. xiil. p. 95. 282, &c. Friend's Hist. of Physic, vol. ii. p. 115; &c. Haller, Bib. Med. Pract.

AVERRHOISTS, a sect of Peripatetic philosophers, who appeared in Italy some time before the reform of learning, and attacked the natural immortality of the soul; and who took their denomination from Averroes. The opinion of this sect was condemned by the last council of the Lateran, under Leo X.

AVERRUNCATION, from averrare, I prove, in Agriculture, the act of cutting or lopping off the superfluous branches of trees. See PRUNING.

AVERRUNCI, from averrare, I convert, in Antiquity, an order of deities among the Romans, whose peculiar office was to avert dangers and evils. The Greeks called these deities alexioi, and apopompai. They were Hercules, Apollo, the Dioscuri, and Jupiter.

The Egyptians had also their di averrunci, or apopropai, who were pictured in a roaring posture, and sometimes with whips in their hands.—This was a divinity of this kind; as is shown by Kircher. See Oedip. Egypt. tom. iii. p. 497.

aversa, in Geography, a town of Italy, in the kingdom of Naples, and territory of Lavora, the see of a bishop, is suffragan to the archbishop of Naples. This town was built and fortified A.D. 1029, by count Raimulf, the first leader of the Normans, who came into Italy to seek their fortunes in the service of the Italian princes. The feast of this town was chosen, in a fertile district, as a central spot to which the Normans might resort, and where they might obtain a fixed settlement. Accordingly, it attracted every year new swarms of pilgrims and pilgrims; some urged by necrility, and others by the hope of fame and renown. The outskirts of every province associated with the settlers in this place, and were soon assimilated in manners and language to the Gallic colony. The spot was situated near the ruins of Atella, at the junction of two highways, that formed an easy communication with every part of the country, and from its being opposed to Capua, and from his averse to Pandolph, prince of that city, Raimulf called it Aversa. This town was burnt to the ground by king Roger; and many years after, it underwent a similar fate, by order of Charles of Anjou. Its ancient palace, on the foundation of which a convent has been since erected, was frequently the residence of the sovereigns, before the murder of Andrew of Hungary, husband to Joan the filial, who was assassinated by the instigation of a brutal monk, called friar Robert, in the year 1347. It is situated ten miles north of Naples. Lat. 41° 45', E. long. 14° 20'.

aversa, in Entomology, a species of Phalæna, (Geometra), with pale wings; breed at the base; head in the middle and dot brown. Ind. In. Suec. Inhabits Europe.

aver-
AVES, in Geography, a small island in the gulf of Venice, near the coast of Friuli. N. lat. 45° 46'. E. long. 13° 32'.

AVERY, a place where oaks, or provender; are kept for the king's horses. See AVERIA.

AVÉS. See AVES.

AVES, or Birds, Island of, in Geography, an island of the West Indies, nearly west of Dominica, and south from the Virgin islands; so called from the number of birds which breed here, and lay their eggs in the sand. N. lat. 15° 26'. W. long. 66° 27'.—Alfo, a small island, not far from the coast of Terra Firma, south-east from Bonaire island. N. lat. 11° 56'. W. long. 67° 23'. On the north side it has a good harbour for careening ships, and fome wells. It is about four miles long, and half a mile broad at the east end. Within three miles there is a dangerous reef of rocks, extending from east to north, and then trending to the west.—Alfo, an isle near the eastern coast of Newfoundland. N. lat. 59° 5'.

AVÉSA, a river of Italy, which runs into the Adriatic, near Rimini.

AVESBURY, Robert of, in Biography, an ancient English historian. flourished in the fourteenth century. He was regifter of the archbishop of Canterbury's court, and wrote a history of England in his own time, intitled, "Mirabilis Gesta Magni Regis Anglie Dominici Edvardi tertii, &c.". As this history reaches only to the death of Edward III. A.D. 1376, the author was probably prevented by death from finishing his plan. He appears to have taken great pains in procuring the most authentic information; his facts are authenticated by original papers; his dates are accurate; and the defect of his style is compensated by his candour and impartiality as an historian. This valuable work lay long concealed; till, in the year 1725, the indefatigable antiquary, Thomas Hearne, printed it at Oxford, from a MS. belonging to Sir Thomas Seabright, which had been formerly in the hands of archbishop Parker, and two other MSS., one in the Harleian library, and the other in the university library at Cambridge; all which are thought to be as old as the time when the author flourished. Mr. Tyrrell, in the preface to the third volume of his General History of England, cites this historian, and says, that he was a considerable writer of that age, and very exact in his account of king Edward's actions beyond the seas, as having taken them from several original letters of persons of note. To Hearne's edition is added an appendix, containing several curious pieces in English antiquities, unconnected with the work itself; and particularly, a transcript of the love-letters between Henry VIII. and Anne Boleyn, taken from the originals kept in the Vatican at Rome, A.D. 1682. Biog. Brit.

AVESNE, in Geography, a town of France, in the departament of the Aisne, and chief place of a canton in the district of St. Pol, three leagues west of Arras.

AVEZNES, a strong town of France, in the department of the North, and principal place of a district. It is situated in Hainaut, on the small river Hesper. Its fortifications were repaired by Vauban; and it was ceded to the French by the Spaniards in 1659. It is distant ten leagues south from Cambrai, even from Valenciennes, and forty north-east from Paris. N. lat. 50° 7'. E. long. 3° 43'.

AVEYRON, a department of France, comprehending part of the province of Guyenne; bounded on the north by the department of Cantal; on the east, by those of Lot and Aveyron; on the south, by those of Gard, Herault, and Tarn; and on the west, by those of Tarn and Lot. Its superficies is about 1,767,424 square acres, or 902,926 hectares. Its population consists of about 332,952 persons; and it is divided into five communal districts. Its chief city is Rodez.

AVEZARIAS, a river of France, in Gascony, which the territory of Aveyron, and discharges itself into the Adour, between Garonne and St. Sernin.

AVEZZANO, a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra. This town was founded in 860, and contains 2700 inhabitants. It is built on an almost imperceptible declivity one mile from the lake of Celeno, to which an avenue of poplar leads from the baronial castle, which is a square edifice, flanked with towers, at a small distance from the town.

AUPEDO, a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra, twenty-one miles W.S.W. of Aguglia.

AUFENA, or AUFINA, in Ancient Geography, Offena, a town of Italy, in Samnium, belonging to the Veiiitii; south-east of Ametrum.

AUFENTE, in Geography, a river of Italy, in the Campagna of Rome, has its source near Sezze, and its mouth in the sea, near Terracina.

AUFFAY, a town of France, in the department of the Lower Seine, and chief place of a canton in the district of Dieppe, six leagues north of Rouen.

AUFIDENA, in Ancient Geography, Aflidena, a town of Italy; in Samnium, and the capital of the people called Carduci, situate near Sagus. The inhabitants were called Aflidenses.

AUFIDUS, a river of Italy, the most considerable in Apulia. For the juftrices of the description given of it by Horace, see OANTO.

AUFINA, or AUFINUM. See AUFEN.

AUFNAY, in Geography, a small island of Swizerland, in the lake of Zurich, containing two churches.

AUG., in Ancient Geography, a town of Macedonia, in the Chaediae territory. Potamien.

AUGALA, in Ancient Geography, a town of Macedonia, in the Chaediae territory. Potamien.

AUGAL, in Geography, a people of South America, in Brasil, in the province of the government of Puerto-Seguro.

AUGÉ, in Entomology, a species of Spinax (Zygina Tarsa) of a black colour, with fanguineous hair on the sides of the body; wings transparent; black behind; and the acaenem pectinated. Fabr. This is Psilidus eugenes of Cramer. It is a native of America.

AUGE. This specific name Cramer has given to a variety of Psilidus botini. Linn.

AUGE, in Geography, a district of France, in the late province of Normandy, extending from Étancour and Argentan, as far as the sea, between the rivers Dives, Vie, and Touques.
Tongues, formerly giving name to a viccount. Its productions are grain, flax, and apples. The pastures are rich, and fat are the cattle that are brought hither from Poictou and Brittany.

AUGLE, in Ancient Geography, a town of Greece, in the Peloponnesus, written by Pausanius. Angus, by Homer, and supposed by Paulinians to be the same with the small town of Aegae, situate on the coast of Lacedaemon, and at the distance of thirty stadia from Githium. It had a temple consecrated to Neptune.

AUGELA, Augella, or Aquila, in Geography, one of the Oaics, or islands, in the eastern division of that ocean of land, called the Great Desert, or Sahara, in Africa. It lies on the western part of the desert of Barca, and is separated from the kingdom of Tripoli by mount Meys.

AUGENIO, Horace, De Monte Sandito, in Ancona, in Biography, professor of medicine, born about the year 1527. He was early initiated into the knowledge of medicine by his father, Lewis Augenio, physician to pope Clement VII. Horace was first advanced to the chair of professor at Rome, which office he filled five years. He afterwards gave lectures with success at Turin; and in the year 1592, he was appointed professor at Padua; where he continued to the time of his death in 1603. Haller is diffuse in his account of his works, which however were principally controversial, and not now much noticed. In his "Epit. et Con. Med.," fol. Ven. 1580, he recommends millepedes, in calculous cases, by which, he says, he saw a boy cured, after he had been condemned to the knife; he forbids injecting the bladder in these cases, as frequently mischievous. He gave water, in which quicksilver had been boiled, for the cure of worms in the bowels; and in diabetes, he gave, he says, narcotics, with advantage.

His works were collected and published under the title of "Opera Omnia," at Venice, in 1597, 1602, and 1607, in folio. His treatises, published separately were, "Epit. Medicinal."

AUGER, Edmund, a French jester, was born of poor parents, in 1536, at Alleman near Sarazanne, in the diocese of Troyes; and having received the rudiments of education under an uncle who was a clergyman, was sent by his brother, a physician at Lyons, to Rome, with a recommendation to the celebrated father Le Fvre; but with a supply of money so scanty, that he was obliged to beg alms before he arrived to the end of his journey. Le Fvre was dead before he reached Rome; and he was obliged to hire himself as a domestic servant to a jester. In this humble situation his talents and conduct attracted the notice of his master, who procured for him, as a novice, the means of further instruction. In the order of jests, to which he was admitted, he taught rhetoric and poetry, and manifested great powers of eloquence. His talents recommended him to a monarch, employed by father Laynez, the general of the society of jests, and dispatched to France, in the year 1559, for flopping the progress of the reformation. On this occasion he distinguished himself by his zeal and success in the conversion of heretics; and he was appointed preacher and confessor to Henry III. His attachment to the king rendered him odious to the Catholics who had entered into the league, and by an order of the general he returned to Rome, where he was treated as an excommunicated perfon, and obliged to travel on foot the midift of winter. In the year 1591, he died in consequence of the fatigue and vexation which he endured, in the fifty-third year of his age. Such was the closing scene of a man, who is said to have converted 40,000 heretics. The intolerant spirit of Auger was sufficiently displayed in his work, intitled "Le Polagoge des Armées," designed to instruct a Christian prince, how to undertake, and happily complete a good war, victorious over all the enemies of the state and the church. Nouv. Dict. Hiflor.

AUGER, in Geography, a small town of Ireland, in the county of Tyrone and province of Ulster, which before the union, returned two members of parliament; but is now deprived of that privilege. It is distant seventy-five Irish miles north-west from Dublin.

AUGES, in Afocony, two points in a planet's orbit, otherwise called ophiodes. See Afsus.

One of the ages particularly denominated the apoge, the other perige.

AVGHANS, in Geography. See Afghan.

AUGHNA CLOY, a poet and market town of the county of Tyrone in Ireland, situated on the river Blackwater, at the distance of 704 Irish miles from Dublin, on the high road to Londonderry. The linen manufacture is carried on briskly in its neighbourhood. N. lat. 54° 25'. W. long. 6° 53'.

AUGHRIM. See Aghrim.

AUGIAN, a town of Alba, in the province of Aderbigan or Aiderbeitan.

AUGIAN MS, Codex Augiensis, in Biblical History, is a Greek-Latin MS. of the epistles of St. Paul, which is however defective from the beginning to Rom. iii. 8, and the epistle to the Hebrews is found only in the Latin version. This MS. is noted F in the second part of Wetstein's N.T. It is supposed to have been written in the ninth century, and has taken its title from Augia-Major, the name of a monastery at Rheinau, to which it belonged at the time of the council of Basal. It was purchased by Bentley in 1718, for 250 Dutch florins, and is at present in the library of Trinity college in Cambridge, where it was deposited in 1787, after the death of the younger Bentley, together with the other MSS. of the celebrated Dr. Richard Bentley. The Greek text is written in uncial letters and without accents; there are intervals between the words, and at the end of every word there is a dot. The Latin is written in Anglo-Saxon letters; whence it is inferred that it must have been written in the west of Europe, where that formation of the Latin letters, vulgarly called Anglo-Saxon, was in general use between the seventh and twelfth centuries. This MS. has been collated by Wettstein. Marth's Michaelis, vol. ii. p. 210. vol. iii. p. 662.

AUGIAS, or Auguus, in Ancient History and Mythology, a king of Elia, who was one of the Argonauts. Fabulous history reports that he had a flable, which contained a great number of cattle, as some say 5000 oxen, and which had not been cleaned for thirty years, so that the exhalations which proceeded from it infested the country; and to cleanse it was considered as a work surpassing human effort. Hercules undertook the labour, and engaged to perform it in one day, on condition that Augias should give him a tenth part of the cattle. This work Hercules is said to have accomplished by making the river Alpheus to pass through the flable. Augias withheld the promised recompence; upon which Hercules flew him, and placed his son Phileus
Aug.

Phileus upon the throne, because he advised his father to fulfill his promise. This fable, however, is variously related by different authors. Hence has arisen the ancient proverb of "cleaning the flables of Augias," for expressing a difficult or impracticable enterprise.

Augias, in Entomology, a species of Papilio (Hesperioid Fabr.). The wings are diversiform and suavious, with an oblique band, and margin behind black. Fabricius.—Donov. Inf. India. Habits India.

Augicourt, in Geography, a town of France, in the department of the Upper Saone, and chief place of acanton, in the district of Jaffay, 44 leagues north-west from Vesoul.

Augiles, or Augilius, in Ancient Geography, a people of Africa, who inhabited the country by which the Garamantes were separated from the Trogolodies. Pomponius Mela says, they were vagabonds, who acknowledged no other deities besides the manes of their ancestors, whom they invoked on all interesting occasions. They are said to have slept upon the tombs, in order to receive the inspiration from which they derived the rules of their conduct. It was a custom amongst their women, to grant the first favour after their marriage to any who solicited it, and who made them presents; and they valued themselves upon the number of their votaries on this occasion. In other respects, says P. Mela, they were distinguished by their wisdom and discretion.

Augilites, Silex Augilites, in Mineralogy, pyroxene of Hanoy; a var. of basaltic hornblende of Kirwan; &c. fcelor volcanic Daubenton, &c. Trachyte Lametleris.

The colour of this mineral is a very deep olive or pear green, which at first may be mistaken for a blackish green.

It occurs sometimes in rounded fragments; but more usually crystallized. Its varieties of figure are:

1. A fixed-ridged prisms, of which two opposite ones are broader than the rest. The two bases, which are oblique, are terminated by wedges more or less obtuse.

2. Var. 1, with the edges that separate the small sides of the prism, truncated; or an eight-sided prism.

3. Two or more crystals connected by their lateral faces, so as to form a right or oblique-angled cros.

The crystals are usually small and very small, rarely of middling size. They are also, for the most part, imbedded. Externally, when no decomposition has taken place, the surface of the augit is smooth and shining; but when it begins to be decomposed, it becomes dull. Internally, it is shining or mucous shining with a greyish lustre.

Its fracture is perfectly lamellar. It flies when broken into rhomboidal parallelepipeds.

It is translucent on the edges, but only so throughout. It is hard, scratchs glass, and gives fire plentifully with the flint; it is brittle, and easily broken. Sp. gr. 3.182—3.377.

The augit is not easily fusible before the blowpipe, but in small pieces it affords a black enamel. Its analysis by Vauquelin afforded

| 52 | Silex |

This mineral is found in basalt, with olivin and hornblende; it is also met with in certain amygdaloid. It abounds in Bohemia, and is found besides in Hungary, Transylvania, Tyrol, Elms, &c.

It refills decomposition much longer than olivin; but not so long as basaltic hornblende. It is at length, however, reduced to a greenish yellow argillaceous mass, and acts as the olivin, to a ferruginous oehre. Brochon, vol. i. p. 179.

Augment, in the Greek Grammar, an accident of certain tenses—being either the prefixing of a syllable, or an increase of the quantity of the initial vowel. There are two kinds of augmenta.—Temporal, or of a letter; when a short vowel is changed into a long one; or a diphthong into another longer one: thus called, because the time of its pronunciation is now lengthened: and augmentum syllabicum, or of a syllable, which, is, when a letter, viz. s, is added at the beginning of the word; so that the number of syllables is increased.

Augments, in Mathematics. See Fluxions, and Moments.

Augmentation, in a general sense, the act of augmenting; that is, of adding or joining something to another, to render it larger or more considerable.

The governors of the bounty of queen Anne, for the "augmentation of the maintenance of the poor clergy" (see First Fruits), by virtue of the several acts of parliament made for that purpose, are empowered to augment all living not exceeding 50l. per annum; and the number of livings following were certified to be capable of augmentation.

1074 Livings not exceeding 50l. per annum, which may be augmented (with the bounty alone) six times each, pursuant to the present rules of the governors, which will make 6426 augmentations.

1467 Livings above 50l. and not exceeding 50l. per annum, may be augmented four times each, which will make 5868 augmentations.

1126 Livings above 50l. and not exceeding 30l. per annum, may be augmented three times each, which will make 3538 augmentations.

1049 Livings above 30l. and not exceeding 40l. per annum, may be augmented twice each, which will make 2098 augmentations.

884 Livings above 40l. and not exceeding 50l. per annum, may be once augmented, which will make 884 augmentations.

Total number of augmentations, which must be made (by the bounty alone) before the livings already certified will exceed 50l. per annum.

Computing the clear amount of the bounty to make 55 augmentations yearly, it will be 339 years, from the year 1714 (which was the first year in which any livings were augmented), before all the small livings above certified can exceed 50l. per annum; and if it be computed, that one half of such augmentations may be made in conjunction with other benefactors (which is very improbable), it will require 226 years before all the livings above certified will exceed 50l. per annum.

Dr. Warner, in the appendix to his "Ecclesiastical History," published in 1757, observes, that it will be 50 years before every living can be raised to 50l. a year by queen Anne's bounty, supposing the same money to be distributed as there has been for some years past. In the course of between eighty and ninety years, many livings have been augmented.
mented by this bounty; nevertheless, the bounty, afforded by private beneficents, has been found inadequate to the end of making a reasonable and competent provision for the parochial clergy in a short time. In order to accelerate the beneficial effect of this bounty, it was propounded by the learned Dr. Watson, the precentor of Landaff, in a "Letter to his grace the archbishop of Canterbury," printed in 1783, that a bill should be introduced into parliament, for appropriating, as they become vacant, one-third, or some other definite part, of the income of every deanery, prebend, or canonry, of the churches of Wellsminster, Wind- 

for, Chichlechurch, Canterbury, Worcester, Durham, Nor- 

wich, Lich, Peterborough, Carlisle, &c. to the same pur- 

pose, mutatis mutandis, as the first-fruits and tithes were 

appropriated by the act, passed in the fifth of queen Anne. 

This plan, it is suggested, would produce a wonderful 

change for the better, in 80 or 100 years, in the condition 

of the inferior clergy, and it would immediately begin 

to operate for their benefit. "If the reduction of deans and 

chapters," says this excellent writer, "should be looked 

upon as a step towards their annihilation, and should, on 

that account, be diffilicted by those who think them of use 

in our ecclesiastical establishment; there is another method 

in which the poor clergy might be, in no great length of 

time, well provided for. The clergy at present pay into 

the exchequer about 14,000l. a year for first-fruits and 
tithes, according to a valuation of the church revenues, 

which was made above 250 years ago; the clear revenue, 

arising to the governors of queen Anne’s bounty from this 

source, may be estimated at near 13,000l. a year. If the 

clergy were to pay first-fruits and tithes according to a new 

valuation of their benefices, and the sum thence arising 

was applied to the augmentation of small livings, every one must 

see how greatly the operation of what is called queen 

Anne’s bounty would be accelerated. See Curate, 

Ecclesiastical Revenue, and Vicar.

Augmentation is also used for the augment; i.e. for the 

additament, or the thing added. Thus it is said, such a 

minister petitioned the king for an augmentation of salary, 

wages, &c.

Augmentation, Court of. See Court, &c.

Augmentation, in Heraldry, denotes additional charges 
to a coat armour frequently given as particular marks of 

honour, and generally borne, either on an escutcheon, or a 
canton.—Such are the arms of Ullser, borne by all the 

baronets of England.

AUGON, in Geography, a mountain of Italy, being part 
of the Apennines, on the confines of Liguria and Paviean.

AUGOXSAS, a small island of Africa, on the coast of 

Mozambique.

AUGRE, or Awar, a carpenter’s and joiner’s instru-

ment, leving to bore large round holes.

The augre consists of a wooden handle, and an iron blade, 
terminated at bottom with a steel bit.

AUGSBURG, or AUSBURG, i.e. Augsthus-burgh, 
anciently called Augsthus-vindelicorum, in Geography, an imperial 
city of Germany, and the capital of Swabia. It is situated 
in a delightful and fertile country, betwwixt the rivers Lach 
and Wartach, near their confluence. It is not only one of the 
most ancient, but one of the largest cities in Germany. 
According to Ritterbeck (Tour through Germany, p. 117.) its 
circumference is 91 miles, and it contains about 35,000 
people; others say, that the number of inhabitants amounts 
to 35,000, and some reckon them at 40,000. It is environed 
with ramparts, walls, and deep ditches; and besides four 
large and six small gates, which open and shut without any 
visible interference, it has a secret wicket, of curious con-

piration, for admitting both birds and foot in the right, or 
in time of war. The town is supplied with water from the 
river Lech, by means of aqueducts, and of engines and 
towers, which furnish a sufficient quantity for using fev-

erous for cleaning the streets, and for the domestic uses of the inhabitants. Some of its streets 

are steep and incommodeous; but others are broad and well 
paved. This city, since the earliest periods, had small sub-
terraneous passages under the streets, like our cellars, and 
the Roman cloacas, for conveying away filth; and the whole town was paved soon after the year 1450, when a 
rich merchant suggested the utility of it by casting a foot-
path to be made before his own house. Many of the 
houses are built of wood, and others of stone, and they serve 
as speciments of the architecture that prevailed at the period 
of their construction; and, compared with other houses built 
in German towns, they exhibit the superior improvement and 
magnificence to which Augsburg had arrived. The more 
modern part of this town may be reckoned handsome; many of 
its churches are statily coiffesed, and adorned with curious 
workmanship and paintings. The town-house, completed 
after six years’ labour, in 1620, is a magnificent edifice, and 
resembled little inferior to that of Amsterdam. It is a large 
quadra building of stone, with a marble portico; at the top 
of the front, within the pediment, is a large spread eagle, 
holding in its talons a sceptre and globe of gilt brases; the 
great portal is formed of a beautiful red slie marble, over 
which is a balcony of the same colour, supported by two 
pillars of white marble; over the gate are two large griffins 
of brases; and most of the rooms are wainscoted, and 
cicled with very fine timber. The balcony is 110 feet long, 58 
broad, and 52 high; its roof is supported by eight columns 
of red marble; the cicled is constructed of polished alab, 
and divided into compartments, enriched with gilded sculptu-
res; it is filled with pictures and other ornaments; and 
supported by eight pillars with bases and chapeters of 
bras. In the square, near the town-house, is the fountain of 
Augsthus, or a large marble basin, surrounded with iron 
boulefrades, with four bras statues as large as life at the 
four corners; in the middle is a pedestal, having on its top 
the statue of Augsthus, and at the foot are four large 
phinxes discharging water from their breasts, with four in-

fants above them, holding in their arms four dolphins which 
pour water out of their mouths, and over these infants are fer-
toons and pine-apples of bras. Near this basin is a 
fountain, called that of Hercules, of a hexagonal form, with 
several bras figures, and particularly Hercules engaging the 
Hydra. Beside the cathedral, which is a large, gloomy, 
gothic building, with two spire steeples, adorned with paint-
ings, and opening with a bras gate, with its fourteen 
chapels; there are six Roman catholic parochial churches, a 
splendid college belonging to the Jentes, five monasteries, 
three nunneries, and six Lutheran parih churches; and also 
a Lutheran gymnasium, which contains a good library. 
The Beneficence abbey is a large Gothic building, the ceil-
ing of which is said to be the highest in Germany; it is 
adorned with several statues, and a grand altar. The church 
of St. Croix surpasses the others in its architecture, 
sculpture, gilding, and fire spire. The Imperial Franciscan 
academy for arts and sciences, was instituted here in 1775. 
It is under the protection of the magistrates, and its princi-
pal aim is to produce good mechanics, and to preserve the 
manufactures of the city. The part of the city that was 
erecled in 1519, by the noble family of the Fuggers, who 
are lords of the adjacent country, and in some measure endow-
ed by them, consists of 166 houses, inhabited by the poor 
burghers at a low rent; some of whom are maintained by 

an
an annual pension. The burglers of this city are computed
at 6000. The inhabitants are partly Lutherans, and partly
Catholics. The Jews are excluded from the town; but
they occupy a village at the distance of about a league, and
pay a tax for the liberty of trading in the day. The aspect
of the inhabitants is very different; that of the Protestants
resembling the Savians; and the catholics being like the
Bavarians. The government is stillocratic; it is vested
with 45 persons, of whom 31 are patricians, 5 merchants, and
five of the commonalty; the council is formed of an equal
number of Lutherans and Roman Catholics. The police is
good; and though the town has no territory, it has no
depts. In former times, Augsburg was the great mart for
Indian commodities in the interior parts of that extensive
country: its trade was very considerable; and we meet with
many examples of such large fortunes accumulated by mer-
cantile industry, as raised the proprietors of them to high
rank and consideration in the empire. It was celebrated for
its curious artistics, whose manufactures, particularly in tin and
silver, were much admired. Augsburg, however, is no longer
what it was in this respect. It has no longer a Fugger and
a Weller in it, to lend the emperor millions. Here are no
merchants who have capitals of more than 20,000l.; others,
with small capitals, do the business of brokers and commission
ers; and next to these are the engravers, itaturics, and
painters. Their productions, like the toys of Nuremberg,
have a general circulation. Augsburg supplies all Ger-
many with little pictures for prayer-books: and in various
ways, its trade is still considerable, though far from being so
great as it formerly was. The bishop takes his name from
this town, though he resides at Dillingen. His income is
about 20,000l. per annum. He is a prince of the empire; and
he sits and votes in the college of princes, betwixt the bishops
of Constance and Halleshim; the territory belonging to the
bishopric lies between the rivers Lech, Isar, and Danube.

In the diet of the empire, Augsburg was originally
called Vindellca, and was the capital of the Vindellci;
afterwards it had the name of Augulta Vindelicorum, and
Rheterorum, when it came under the dominion of the Ro-
mans, and a colony was settled in it by Drusus (Ger.
c. xlii.) calls it the most splendid city of Rheta.
From the Romans it was transferred to the Alemanns, the
Goths, and the Franks; under the last of whom it declined
much; but it recovered again under Charles the Fat. The
emperor Henry III. took it under his protection, but it suf-
fired much by its contetls with the bishops, and its condition
became very precarious. From Frederic I. it obtained
several privileges; and in 1273, King Rudolph I. confirmed
and enlarged its imperial rights.

Augsburg has acquired celebrity, not merely on account of
its antiquity and pro-eminence for a long series of ages,
and for the extent of its commerce in the 14th and 15th centuries,
but from its having been the scene of several considerable tran-
actions. In this place, a council held in 972, confirmed the order
for the celibacy of priests. In 1518, a diet was held at this
place, for concerting and promoting a general crusade against
Turks. At a diet, attended by the emperor Charles V. in the
1530, the creed of the Protestants called the Augsulian or
Augsburg confession, was prefixed and publicly read. In
1547, the emperor held a diet in this place for finally com-
posing the controversies with regard to religion, which had
long disturbed the empire; and having, at the head of his
Spanish troops, taken possession of the cathedral and one of
the principal churches, he re-established with great pomp
the rites of the Romish worship. Before this diet, he laid
the syllable of doctrine, known afterwards by the name of
the Interim; and in 1548, he made his first attack upon
this city, on account of the part it took in its opposition to
this syllable, issuing a decree, after he had taken for his sub-
mission of the towns, by which he abolished its form of go-

government, dissolved all its corporations and franchises of its

cities and towns, and nominated a small number of patricians, in
whom he vested the future right of administration, and each of
whom was constrained to take an oath for observing the Interi-

In 1550, a diet was summoned by the emperor at this
place for further enforcing the observance of the Interim.
The diet held here in 1555, settled the religious peace of Germany, by an act called the Reuss.
In this city an alliance called the league or treaty of Aug-

turgh, was concluded in 1566, between the emperor,
the king of Spain, the republic of Holland, the elector Palatine,
Bavaria, and the duke of Savoy; the principal object
of which was to restrain the ambition of the French
monarch; but the real motive, says M. Augustin in his "Mo-

tifs des Guerres et des Traites de Paix de la France, &c. 1798," which led William prince of Orange to effect this

league was, to keep Louis XIV. out of the continent, while
who's exigency foretold to what the intemperate folly of James
II. of England would lead, might with more ease ascend the
French throne in his stead. The hostilities consequent on
this league commenced in 1688, which was followed by a
continental war, terminated by the peace of Ryswick in 1697.
Although the Protestants were very powerful at
Augsburg, they were driven from thence by the Bavarians,
and restored again by Gustavus Adolphus in 1632; since
which time they have continued, and shared the government
with the Catholics. In 1703, the elector of Bavaria
besieg'd the city and took it, and demolished its fortifica-

tions; but the battle of Hockiledon restored its liberty,
which it enjoys under its own magistrates; the bishop hav-
ing no temporal dominion in the city. The chapter is com-
poised of persons who can produce proofs of their nobility.
The canons have a right of electing their bishop, who is a
sovereign, like several of the other German bishops. Aug-

sburg is situated in N. lat. 45° 25'. E. long. 10° 58'.

AUGSBURG Confession. See Augustan.

AUGST, a village of Switzerland, near the Rhine, for-

merly a celebrated city called Augulsa Reaumusorum, whither
Munatius Plancus conducted a Roman colony under the
empire of Augustus, A. U. C. 750, B. C. 14. It is
set on the river Ergetz, two leagues from Basle. It was
ruined by Attila. Of its ancient magnificence many monuments
have been discovered; such as the ruins of an amphitheatre,
of towers, of subterranean vaults, and also medals, and
fragments of statues and inscriptions.

AUGUR, in antiquity, a minister of religion among
the Romans, appointed to take auguries or oracles con-

cerning futurity from birds, beasts, and the appearances of
the heavens.

The word is by some derived from avus, hired, and garri-
tus, chatterer; whence the original office of the augurs is
supposed to have been to observe, and take indications from
the noisance, calling, fingling, chirping, and chattering of
birds. Agreeably to which, augur is commonly divided
without from aopex, as the latter was supposed to play in
observing the flight of birds.—P. dr. derives it from the
Latin augere, to increase, and augus, more: so that, according to
him, an augur was properly a person who inspected the entrails,
and divined by means of the liver. On which principle,
augur would have been the name of Ariuspons.

The augurs constituted a college or community, which at
first consisted of three persons, one being appointed by
Romulus for each tribe; then of four, when Servius Tull-

ius increased the tribes to that number; then of nine, four
of them patricians, and five plebeians, added in the year of
U. Rome

Vol. III.
AUG

Rome 454. at the solicitation of the tribunes, and elected from among the common people; lastly, Sylla, in the year 672, increased the number to fifteen. They were at first ebonen, like the other priests, by the comitia curiata, but their election afterwards underwent the same changes with that of the pontifices.

The eldest of these prefixed over the rest, and was honoured with the title of "Magister Collegii." Their office, which terminated only with their death, and of which no crime or forfeiture could deprive them, as it is comprised in the augural law mentioned by Cicero (De Divin. l. ii.), was to interpret dreams, oracles, prodigies, &c. and to tell whether any action should be fortunate or prejudicial to particular persons, or to the whole state. Thus they were the interpreters of the will of the gods with respect to the making of war or peace; and all were obliged to obey them in no important an article.

They bore an augural flail, or wand, called litus, as the ensign of their office and authority. The other badges of their office were a kind of robe called tecthe, and a cap of a conical shape like that of the pontifices. No affair of moment could be resolved on, without first consulting them; and their advice, be it what it would, was, by a decree of the senate, appointed to be exactly and religiously observed.

The office was important and honourable. It was aspired after by some of the principal persons of the Roman state. Cato was a member of the college of augurs; and Cicero also was dignified with this title, and perfectly understood the whole art practiced by himself and his colleagues. Although he ridicules the profession (De Divin. l. ii.), and demonstrates by various proofs the inutility, impotence, and absolute impossibility of the art, and relates a saying of Cato concerning it, "that he could not imagine how one aruspex could look another in the face without laughing;" yet, notwithstanding his contempt of its superfluities, he blamed those generals and magistrates, who on important occasions had neglected them; and maintains, that this practice, though allowed to be subject to many abuses and frauds, ought to be regarded on account of religion and the prejudices of the people. Pliny was also raised by Trajan to the dignity of augur; and through every period of the Roman state, this office was the highest rank in the priesthood to which any senator could be raised. Of this Augustus was so well apprized, that by seizing the office of high priest on the death of Lepidus in the year of Rome 725, B.C. 29, he, and his successors in the empire, obtained a control over all religious matters; and by thus placing themselves at the head of all the colleges of priests, augurs, and keepers of the Sibylline books and others, they became the sole arbitrators in all sacrificial as well as profane concerns. For an abstract of the history and office of augurs, see Augury.

Augur, in Entomology, a species of Cimex, of a rufous colour, with the antennae, under-wings, and legs black. A native of the East Indies, and the cape of Good Hope.

Augur, a species of Phalaena (Moth), with brown wings, characterized with black. Inhabits Germany. Fabricius.

Augur, a species of Musca that inhabits New Holland. It is cinereous; abdomen blueish; flies teataceous and diaphanous. Fabricius, &c.

Augural, something relating to the Augurs.

The augural instruments are represented on several ancient medals. Exeuch Medals, chap. ii.

Augural epber, caea auguralis, that given by a priest on his first admission into the order, called also by Varro adjunctus. De Re Rutil. lib. iii. cap. 6.

Augural books, libri auguralis, those wherein the discipline and rules of augury were laid down. Cic. de Divin. lib. i. cap. 33. Priscian (l. 788.) says, that Julius Caesar compiled augural books.

Augurale, the place in a camp where the general took auspicia. This answered to the auguratorium in the city. Augurale is also used, in Seneca, for the ensign or badge of an augur, as the litus. De Tranquil. cap. xvi.

Auguratorium, a building on the Palatine Mount, where public auguries were taken. This is also called auguracae and aera.

Augurello, Giovanni Aurelio, in Biography, a learned Italian, was born at Rimini about 1441, flourished at Padua, and became professor of polite literature at Treviso, where he had a cottonary, and where he died in 1524. He was addicted to the study of alchemy; and it is said that pope Leo X. in return for the deduction of his Latin poem, intitled "Chrysopeia," gave him a large empty purse, saying, that he knew how to fill it. From this poem, however, it appears that Augurello was no believer in the art. He published, besides the Chrysopeia many Latin poems, odes, elegies, and cantos; some of which possess elegance and purity. The poems in his own language were not published till 1765. Tirabolchi. Gen. Biog.

Augury, the discipline of the augurs, or the practice of consulting the gods, and learning their will, by divers kinds of omens.

The observation of auguries is very ancient, as having been prohibited by Moses in Leviticus.—The cup put in Benjamin's sack, in Egypt, is said to have been that used by Joseph for making auguries.

However this be, augury was undoubtedly a very ancient superition. Heofod informs us, that the operations of agriculture were regulated by the migration of birds; and it had probably been in use long before his time, for marking the changes of the seasons. At length the flight of birds was more particularly observed; and their different motions were thought to be of such consequence, that no concern of importance, either private or public, was undertaken without consulting them. Aband as this superstition may now appear, and as it certainly was in the extensive application and use of it, it seems to have derived its origin from nature. The appearance and disappearance of particular birds at different seasons, would probably suggest to those who were ignorant of the places to which they migrated, and from which they occasionally returned, that they might visit the ethereal regions, and there converse with the gods, and acquire an infinit or faculty for foretelling future events. A superstitious people might argue in this manner; and as birds are found capable of imitating the human voice, some impostor might have availed himself of this circumstance, and deduced presumptions in favour of the fallacious syltem of augury. An ingenious writer fuggels (see Stillingsheet's Calendar of Flora), that this might have been the case; and it is alleged, that the institution of augury seems to have been more ancient than that of aruspicy; for Homer supplies us with several instances of the former, but none of the latter. Upon the whole, it is not improbable that natural augury gave rise to religious augury; and this again, by a transition not unnatural, to aruspicy. A passage in Aritlophanes furnishes a hint that led to these observations. In his comedy of the birds, he represents one of them as saying, "The greatest blessing which can happen to you, mortals, are derived from us; first, we shew you the feasons, spring, autumn, and winter; the crane points out the time for lowing, when the flies with her warning notes into Egypt; the birds the sailor hang up his and take his rest, and every prudent man provide himself with winter garments; the kite appears next, announcing another
another season, when it is time to shear the sheep; after
that, the swallow informs you when it is time to put on
summer clothes: we are to you, adds the Chorus, Ammon,
Dodona, Apollo; for after consulting us, you undertake
every thing; merchandize, sacrifices, marriages, &c.

"Exsultavit Amenem, Sphaxi, Melampus, in Ambac,
which seems the general fo
was made in the speculations of men which appear in
the words of the poet; and that they were easily induced to
think that the surplising foresight of birds as to the time of
migration, indicated something of a divine nature in them;
against which opinion, Virgil, as an Epicurean, protests,
when he fays,

"Haud equidem credo, quia fit divinitas illis ingenium."

From these speculations of a conjugal kind we proceed to
observe, that some have ascribed the invention of this art
to Prometheus, or Melampus, the sons of Amythaon and
Dorippe. Pliny (i. vii. c. 55.), fays, that the Carians were
the first observers of birds, and that Orpheus first directed
his attention to other animals. Paulanias (Phoecic.) attributes
the first observation of the flight of birds to Parならばus,
who gave his name to mount Parناسus. Clement of Alex-
andria reports, that the Phrygians were the inventors of
this art. Upon the whole, it feems probable, that this spec-
ies of divination was transmitted from the Chaldaeas,
Asiatics, and perhaps the Egyptians, to the Greeks; from
them to the Hetrurians; and from the Hetrurians to the
Latinss and Romans.

We find five sorts of auguries mentioned by the ancients.
1. From the appearances in the heavens, as thunder, light-
nning, and other meteors. 2. From birds, whence they de-
ned the name of Auguries. Some birds furnished them
with observations from their chattering or singing, and
others from their flying. The former were called Ofelines,
and the latter Præpetes. For the taking of both these
sorts of auguries, the augur went up to some high place,
took the augural staff, bent at one end like a crook, and
marked out with it the four temples or quarters of the
heavens. Then he turned to the east, and in that situ-
ation, waited for the dawn; which was of no significane,
unless it was confirmed by another of the same sort. In
this manner Romulus perceived Jupiter’s approbation of his
election to the crown; having seen lightning that came out
on his left side and proceeded to his right. This ceremony,
which was also observed when Numa was called to the crown,
is largely described by Livy, i. c. 18. 3. From birds
kept in a coop for that purpofe. The manner of divining
from them was as follows: early in the morning the augur
that was to take the obfervation, after having commanded
a general silence, ordered the coop to be opened, and then
threw in a handful of crumbs or corn. If the chickens
did not eat greedily, scattered the food about with their
wings, let fall a great deal of it from their mouths to the ground,
or, above all, refused to eat, the omen was reckoned unlucky,
and some great mischief portended; but if they fed greedily,
and let none of the food drop out of their mouths, they
obtained all desirable assurance of happiness and succefs.
This fort of augury was called tripudium, from the ancient
Latin word paare, to strike, and terra, the earth; because
the birds, in eating greedily, struck the ground with their
beaks. The story of P. Claudius the confluf is well known
(Vol. Max. i. c. 4.), who, ready to engage at sea in the
first Punic war, and hearing that the chickens would not
come out of their coop, ordered them to be thrown into
the sea, with this Jeff, “If they will not eat, let them drink.”
But he was vanquished; not, it will be thought, by the
contempt of this silly and childish ceremony, but in confe-
quence of his own rashnefs. 4. The next fort of augury
was from beasts, viz. wolves, goats, foxes, hifters, af-
AUG

to his relations; and from the reign of Adrian, at least, was appropriated to the second period of the state, who was considered as the presumptive heir of the empire. Accordingly, the position, who was defined to succeed to the dignity, was first created Caesar; which was a step necessary to arrive at that of Augustus or emperor.—Yet T. Sicius maintains the reverse; viz. that it was necessary to be Augustus previously to the being Caesar; and alludes the influence of Valentinian 1, who proclaimed his brother Valens Augustus before he was created Caesar; but this single fact is not sufficient to invalidate the evidence of common practice.

The empress also took the quality of Augusta; and even some ladies of the imperial family, who had never been wives of emperors, but mothers or daughters.

Of medals and coins, some of the ancient kings of France are also found with the appellation Augusti; particularly Childbert, Clothaire, and Clovis; add, that the wife of this last, Chrothchilda, is also called by Herrie, in his book of the miracles of St. Germain, indifferently either Augusta or queen.

Augustus, in respect of Chronology, denotes the eighth month of the Julian year.

This was called in the ancient Roman calendar, Sextilis, as being the sixth from March, from which the Romans began their computation. The emperor Augustus changed the name, and gave it his own; not that it was the month in which he was born, which was September, and which was first proposed for bearing his name, but because it had been fortunate to him by several victories which he had gained in it.

He preferred this month to September for the reasons mentioned in the deliberations of the senate, preferred by Macrobius. The tenor of them is as follows: "As it was in the month, hitherto called Sextilis, that the emperor Caesar Augustus took possession of his first confidant; that he celebrated three triumphs; that he received the oath of allegiance of the legions that occupied the janizary; that he reduced Egypt under the power of the Roman people; that he put an end to all civil wars; it appears that this month is and has been a most happy month to this empire; the senate therefore ordains, that this month shall henceforth be called Augustus. This decree of the senate was ratified by an order of the people."

Our Saxon ancestors called it Wod-monath, that is wood-month, on account of the plenty of weeds in this season.

Spelman.

This month is esteemed one of the richest in the whole year, because of the harvest of the several sorts of grain which is produced in that season. Hence is to be derived the French proverb, a man has made bis August; which proverb is much used among merchants, to signify that a man has been successful in trade, and got an estate.

Augustus also used, in Middle Age Writers, for a power or licence, of going out of a city in harvest-time, to reap, &c. De Caige.

AUGUSTA, in Ancient Geography, a name given singly, or in connection with some epithets, to several towns in honour of Augustus the Roman emperor. Thus, Augusta was a town of Galia Narbonensis, founded by Augustus, with the title of a colony; situate 1/4 league from the Rhone, and having a temple of Jupiter, a circus, and an amphitheatre.—Albo, a town of Cilicia, seated on mount Taurus, five or six leagues north of Adana. Pliney, l. v. c. 27. It became subject to Rome in the reign of Augustus.—Albo, a town of Dacia Ripensis.—Albo, a town of Rhacia.—Albo, a port of Sicily, nearly north of Syracuse. Augusta Asturica, Astorga, an ancient town of Spain, in Asturia.—A. Augurum, a town of Aquitania, originally called Cibberum, which name it afterwards resumed. In the middle age it took the name of the people Aughis, and is now Auch.—A. Batienorum, or Batiscanorum, an ancient town of Italy, in Liguria; called also A. Vogienorum.—A. Bracara, Braga, an ancient town of Hispainia Citerior. Pliny.—A. Emerita, a town of Lusitania, on the river Anas, the capital of the province: it was a colony of the Emeriti, or of such soldiers as had served out their legal time, were men of experience, or had received marks of favour, founded by Augustus; adorned by him with stately buildings, a long and magnificent bridge over the Gaudiana, and two aqueducts. It is now called Merida.—A. Ephratias, a town of Asia, in Comagene, on the banks of the Euphrates.—A. Gemella, a town of Bocica in Spain, in the country of the Turduli.—A. Magna, a town of Asia, situate at the confluence of the Apur and Phasis. Ptolemy.—Augustianum, a division of Egypt, which commenced about the time of Theodor II. comprehending that part of Lower Egypt, which extends from the right arm of the Nile to the east of Delta, to the frontier of Arabia.—A. Novo, a town of Hispainia Tarragonensis, on the river Areu, in the country of the Areuaci; called by Ptolemy Porta Augusti.—A. Pratonia, a town of Gallia Cisalpina, at the foot of the Alps Graiae, in Duria, so called because Augustus sent thither a colony of the pretorian soldiers: inhabited by the Salassi: now Aoste.—A. Rauretorum, a town of Helvetia, now called Auzt. A. Susoenum, a town of Gallia Belgia, on the Axona, now Soissons.—A. Tarunorum, a town of the Turunni, at the foot of the Alps, where the Doria Minor falls into the Po, so called because Augustus established here a Roman colony; now Turin.—A. Tiberii, a town upon the Danube, on the confines of Hhetia and Doria; now Ratisbon.—A. Trebis, a town of the Eupi, near the springs of the river Arno in Italy, now Trevisa, in Umbria.—A. Trinobi, a town of Gallia Belgia, belonging to the Treveri, a people inhabiting the territory between the Rhine and the Moselle, now Trevi or Triers.—A. Tripontum, a town of the Trinobantes, in the Isle of Albion, called Augusta from its grandeur; now London.—A. Vagnenorum, the seat of a Roman colony, among the mountains, now Vico near Mondovi.—A. Veromandureum, a town of Gallia Belgica, now St. Quintin.—A. Valeria, a town of Hispainia Tarragonensis, belonging to the Celticrians. Ptolemy.—A. Vindelitivrum, a town of Vindelicia, now Augsburg.

Augusta, in Geography, a town of Sicily, eighteen miles by land, and nine by sea, distant from Syracuse, was built by the emperor Frederick II. near the ruins of the Greek city of Megara; and covered a small low peninsula, joined to Sicily on the north side by a long causeway, having on each side extensive salt-ponds. This projection forms a very fine harbour, the largest and most easy of access in Sicily, opening to a southern exposure, but sheltered by the points of the coast from both wind and wave, with nine fathom of water in almost every part. A ruinous citadel guards the land gate; and three forts, built on little islands, defend the entrance of the port. The country along the opposite shore is beautifully diversified in its culture. The order of Malta has established at Augusta magazines of salt meat, biscuit, and flour, for the supply of their ships that are continually passing between the islands. The town is fearfully recovered from the devastation caused by the earthquake in 1693, which destroyed by the falling of the houses about one third of the inhabitants, set fire to the powder magazine in the citadel, which blew up, and threw the light-house precipitately into the sea. Since that time the town has been rebuilt on a regular plan, with low houses to prevent injury from another shock if it should occur. The number of inhabitants
habitants is reckoned at 9303 by an enumeration. Swinburne says its population amounts to 16,000 persons. Travels, vol. iv. p. 116.

Augusta, a county of Virginia, in North America, lying partly on the east and partly on the west of the North Mount, a ridge of the Alleghany. The soil is fertile, and the country contains 10,886 inhabitants, including 1567 slaves. In this district there is a remarkable cascade, called "the falling spring," which is a branch of the James, where it is called Jackson's river, rising in the mountains twenty miles south-west from the "warm or hot spring," in N. lat. 38° 5'. W. long. 80° 6'. At the "falling spring," the water falls two hundred feet, being fifty feet higher than the fall of Niagara; and the fleet of water is only twelve or fifteen feet wide above, and somewhat wider below.

Augusta, a town of North America, in the upper district of Georgia, situated on a fine plain in Richmond county, on the south-west bank of the Savannah river, where it is near five hundred yards broad, at the bend of the river, 127 miles north-west from Savannah, and 934 south-west from Philadelphia. At the first settlement of the colony, general Oglethorpe erected a fort here for protecting the Indian trade, and holding treaties with the natives. In 1787, it contained 200 houses. The country round it has an excellent soil, which, together with its central situation between the upper and lower countries, infuses its improvement. N. lat. 33° 19'. W. long. 80° 46'.

Augusta, a town of Upper Canada.

Augusta, a river in the south-east part of the island of Cuba, in the West Indies, navigable for several leagues from the mouth, in which is Cumberland harbour.

Augusta, Historia, is the history of the Roman emperors from the time of Adrian to Carinus, composed by six Latin writers, Æl. Spartanus, Julius Capitolinus, Æl. Lampridius, Vulciatus, Gallicanus, Trebellius Pollio, and Flavius Vopiscus. They all lived in the reign of Diocletian, though some of them flourished under his successors, near the end of the third and beginning of the fourth century. They are rather biographers than historians, and take more care to inform us of the good and bad qualities of the emperors, of their birth, education, fortune, and even their diet, and the clothes they wear, than to describe their wars, the laws they enacted, and the great revolutions that happened during their respective reigns. Vopiscus, who was a Syracuse, and who is said, in the life of Probus, to have imitated Suetonius, according to the general opinion of the learned, far excels the rest, both as to his method and style; nevertheless he has many imperfections, and is not to be compared with any of the Latin historians. The other five betray great want of judgment in their choice, and of method in digressing their materials. Of these six writers, Capitolinus is the most confused and injudicious; whence some have suspected that the author of this collection had blended together the relations of Capitolinus, Spartan, and some others. Their style is vulgar and unpolished, their expressions uncouth, and sometimes hardly intelligible. Vopiscus observes, that Lampridius and Capitolinus attended more to truth than to elegance in their narrations. Pollio acknowledges that his style has nothing of the dignity of the ancients. Fabr. Bibl. Lat. vol. ii. p. 371, &c. Anc. Uni. Hist. vol. xiv. p. 67. The histories of these writers were published together, with the notes of Cabaubon, Salmasius, and Gruter, in two vols. 8vo. 1671; and re-published by I. P. Schmidt, in 1771.

Augustales, or Sodales Augustales, or Flaminii Augustales, were the priests of Augustus, appointed after the decease of that emperor by Tiberius, and instituted by him, to perform the service of the new god. Three of these were Drusius, Claudius, and Germanicus; and the others, who supplied the number of twenty-one, were chosen by lot among the citizens of the first families in Rome. The name of Augustales was also applied to other colleges of priests, instituted in honour of the successors of Augustus, and who like him were deified. The appellation is also extended to those who conducted the first ranks of the army; to the prefects of Egypt, who were established by Augustus after the defeat of Antony and Cleopatra; to all the officers of the imperial palace; and to those citizens in the colonies and municipia, who held the middle rank between the emperors and the people. The Augustales of the provinces were probably set apart for the worship of Augustus in the same manner as those of Rome.

Augustalia, in Antiquity, a feast instituted in honour of the emperor Augustus.

This festival was first established in the year 755, being the fourth after he had ended all his wars, and settled the affairs of Sicily, Greece, Asia, Syria, and the Parthians. The day when he made his entry into Rome, being the fourth of the ides of October, was appointed to be kept a feast, and was called Augustalia.

Augustalia was also a name given to the games celebrated in honour of the same prince, on the fourth of the ides of October.

Augustalis, or Proflitus Augustalis, a Roman magistrate who was appointed to govern Egypt, with a power much like that of a proconsul in other provinces.

Augustan, relating to Augustus or August.

Augustan Era. See Actian.

Augustan, or Augsburg Confession, in Ecclesiastical History, denotes a celebrated confession of faith, drawn up by Luther and Melanchthon, on behalf of themselves and other ancient reformers, and presented, in 1530, to the emperor Charles V. at the diet of Augusta or Augsburg, in the name of the evangelical body. This confession contains twenty-eight chapters, of which the greater part is employed, in representing, with pertinacy and truth, the religious opinions of the protestants, and the ref in pointing out the errors and abuses that occasioned their separation from the church of Rome. The style in which it is written is plain, elegant, grave, and perspicuous, such as becomes the nature of the subject, and does honour to the eloquence of Melanchthon. The matter of this confession was supported by Luther, who, during the diet, resided at Coburg, a town in the neighbourhood of Augsburg; and even the form it received from the acute judgment of his colleagues was authorized by his counsel and approbation. The Roman Catholics attempted a refutation of this confession: this refutation was read publicly in the assembly; and the emperor demanded submission on the part of the Protestant members; but the Protestants were not satisfied, and requested a copy of this reply, that they might demonstrate at large its insufficiency and weakness. The emperor refused this request, interposed by his authority to suspend any further proceeding, and solemnly prohibited the publication of any new writings or declarations that might contribute to lengthen out these religious debates. Melanchthon prepared an answer, which was presented to the emperor, but he refused to receive it. This answer was afterwards enlarged and published in 1531, with the other pieces that related to the doctrine and discipline of the Lutheran church, under the title of "A Defence of the Confession of Augsburg," or "Apologia Confessionis Augsbutinae." In composing this defence,
defence, Melanthon's love of peace and concord seems to have carried him beyond what he owed to the truth; and through fervile fear, excessive charity, or indecision of mind, he makes several erroneous conclusions to the church of Rome. Modern's Eccl. Hist., vol. iv. p. 285. In some subsequent editions of the "Apologia," the obnoxious passages were omitted, and the pharisaery that had given the objectors matterially altered. See Philippius.

AUGUSTATUM, in Middle Age Writers, denotes a largese or donative, of an emperor to the people or foleiery.

AUGUSTENBERG, in Geography, a town of Germany, in the circle of Upper Saxon, and county of Schwartzbach; three miles east of Arnstadt.

AUGUSTENBERG, a town of Denmark, in the duchy of Sleeswick, six miles east of Sonderborg.

AUGUSTEUR MARMOR, in the Natural History of the Ancients, a name given to the common green and white marble so frequent in use with us for tables, &c.; and called by our artificers, Egyptian marble.

AUGUSTIN, Anthony, in Biography, archbishop of Tarragona, was born at Saragossa, of parents of distinction, and studied in various universities both of Spain and Italy. At the age of twenty-five, he published a treatise of law, intitled, "Emendationes et Opinionis Juris Civilis." He was sent as nuncio to England by pope Julius III. in 1554; and in 1562, he distinguished himself at the council of Trent. From the year 1574 to 1586, the time of his death, he prostituted the archiepiscopate of Tarragona. His liberality to the poor was such, that when he died, there was not found money sufficient to defray the expenses of a funeral suitable to his rank. Of many writings in law, which he left, the most valuable is a treatise "De Emendatione Gratiani," first printed at Tarragona in 1587, and afterwards published in 1672, by Balzar, 8vo., and esteemed an elaborate treatise on the canon law. He wrote also "Antique Collectiones Decretalum," printed at Paris in 1621, folio, with notes; "Dialogues on Medals," published at Tarragona, in 1587; and other treatises, chiefly on canon law: with skill in the law, he united purity of language. Nouv. Dict. Hist.

AUGUSTIN, and by contradiction AUSTIN, St. usually styled "the Apostle of the English," was the first archbishop of Canterbury, and flourished about the close of the fifth century. He was originally a monk in the convent of St. Andrew at Rome, educated under St. Gregory, afterwards pope of Gregory I.; and about the year 596, deputed by him on a mission to Britain, for the conversion of the English Saxons. Whilfe Augulfin, and forty monks, who were his associates in this mission, were pursuing their journey, they were discouraged by apprehension of the dangers which they were likely to encounter; and Augulfin was sent back from France to Rome, with a petition to be recalled from this hazardous undertaking. Gregory, however, was determined not to abandon his project; he therefore encouraged them to proceed, furnished them with recommendatory letters to the king and queen of France, and to the bishop of Arles, and instructed them to take with them some interpreters from the Franks, whose language still resembled that of the Anglo-Saxons. In the year 597, the missionaries landed in the isle of Thanet; and having informed Ethelbert, king of Kent, whose queen Bertha was a Christian, and who was disposed to give them a favourable reception, of their arrival, and of the design of their mission, they were introduced into the royal presence. The king, however, chose to receive them in the open air, from a superfluitous notion that he would be thus more secure from the delusive influence of their magical arts, than within the walls of a house. Augulfin, by means of his interpreters, opened his commission; and after stating to Ethelbert the leading doctrines of Christianity, he allured him to embrace the religion of Christ by the assurance of an eternal kingdom in heaven. The king, after a candid hearing, hesitated in abandoning the religion of his ancestors; but with a liberality which reflects honour upon his memory, and under a due sense of the kind intention with which the missionaries had undertaken so long a journey, he allowed them to remain in the country, and to use their efforts for the conversion of his subjects. Accordingly he assigned for their residence that part of the ancient Durovernum, or the modern Canterbury, which is now called "Stable-gate," and which had been formerly a kind of oratory or chapel for the royal family, where they worshipped and offered sacrifice to their gods. The missionaries entered the city in procession, singing a hymn. Their ministerial labours were at first confined to the precincts of the city, where the accession of new converts was inconsiderable; but as soon as the king himself was profelyted and baptized, they obtained liberty to extend their communion to every part of his dominions; and their success was so great, that Augulfin is said to have baptized 10,000 persons of both sexes in one day, in the river Swale, at the mouth of the Medway. In the commencement of his mission, he thought it expedient to refrain from coercive measures; and, as Bede informs us (Eccl. Hist. i. c. 26), he instructed Ethelbert, that the service of Christ must be voluntary, and that no compulsion ought to be used in propagating the gospel; nor does it appear that any violence was used in the first establishment of Christianity in England, besides that of demolishing idols, and converting pagan temples into Christian churches.

Augulfin, who seems to have been consecrated archbishop of Canterbury before his arrival in England, was actuated by his rapid success with the ambition of possessing, under the sanction of the pope, the supreme authority in the English churches. For the purpose of soliciting this honour, or that of primate of England, and also of obtaining instructions with regard to other subjects, which may now be deemed of very questionable or trivial importance, he deputed messengers to the pope, who speedily returned with a full answer to the archbishop's inquiries. They also brought with them a pall (see Pall), as a badge of archepiscopal dignity, and various other ecclesiastical vestments and utensils. The pope also gave Augulfin directions for erecting twelve sees within his province, and particularly for appointing one at York, which, if the country should become Christian, he was to form into a province with twelve suffragans. Among the counsels communicated by the pontiff to Augulfin on this occasion, was an admonition not to be elated with pride on account of the miracles which he had been enabled to perform in confirmation of his ministrity, but to consider that this power was given him, not for his own sake, but for the sake of those whose salvation he was appointed to procure. Augulfin, having fixed his seat at Canterbury, dedicated an ancient church, formerly built by some Roman Christians, to the honour of Christ; and king Ethelbert founded the abbey of St. Peter and St. Paul, afterwards called St. Augulfin's, and since converted into the archbishop's palace. Such was the attachment of St. Augulfin to the see of Rome, that he attempted to bring the Britifh bishops in Wales under the authority of the Roman see. From the time when the ancient Britons, or Welsh, were first instructed in the Christian faith by Faganus and Damianus, who had been sent at the request
request of Lucius, in the second century, as missionaries by Eleutherius bishop of Rome, these churches had followed the rules of their first masters, without regarding the subsequent alterations prescribed by the church of Rome. But pope Gregory, by appointing Augustin metropolitan of the whole island, had claimed jurisdiction over the churches of Wales; and Augustin was well inclined to support the claim. Two conferences were held on this business; both of which were unsuccessful. At the second conference, seven British bishops attended, and many monks from the monastery of Bangor, under the direction of their abbot Dinod. Disposed as they were to pay all due respect to the archepiscopal dignity of Augustin, they took measures, previously to their meeting, for preventing the Voluntary question which would be unfavourable to their interest. Accordingly they consulted a hermit of acknowledged understanding, and requested his opinion, whether they should surrender their independence, and their ancient customs and privileges, to the pretensions of Augustin. The hermit, probably apprized of the disposition and character of the metropolitan, gave them the following instructions: “If this man follows the example of his master, who was meek and lowly of heart, he is a servant of God, and you ought to obey him; if not, his claim is not to be regarded: let Augustin and his brethren be first seated in the place of meeting; if upon your entrance, he rise up to salute you, honour him as a messenger from God; if he neglect to shew you this civility, reject his offers, for he has not taken upon him the yoke of Christ.” When the British bishops and monks entered the hall, Augustin, who had taken the chair, received them sitting. Upon which, conformably to the advice of the hermit, they declined complying with the proposals of the haughty prelate, and disclaimed all subjection to the see of Canterbury, and virtually to that of Rome. Augustin, incensed by their conduct, took leave of the assembly, and denounced upon the British clergy this menacing sentence: “If you will not accept of peace with your brethren, receive war from your enemies; if ye will not prayer the way of life to the English, suffer death from their hands.” The event corresponded with the menace: Ethelfrid, king of Northumberland, soon afterwards marched with a large army to Caerleon, and made a great slaughter, in which near 1200 of the monks of Bangor were put to the sword. The memory of Augustin has been loaded with the infamy of having, to satiate his revenge, fulfilled his own prophecy. Bishop Godwin (De Prefid. Angl. p. 43. ed. 1616) exclaims, “Excellent prophet! who could predicke what he knew to well how to accomphish,” and he affeets, upon the authority of an anonymous manuscript, and of an old French annalist, that Augustin, refenting the rejection of his proposal by the Welsh bishops, ilminated Ethelbert to fall upon them, as a wolf upon a flock of sheep, with a large army, borrowed in part from Ethelfrid; and that the bishop himself joined the army of Ethelfrid at Chester, and assisted him to gain a complete victory. In opposition to this testimony, however, it is urged by the learned Wharton (Angl. Sacr. t. i. p. 89.), on the credit of an ancient book cited by William Thorn, that Augustin and pope Gregory both died in the same year, that is, in the year 604, when it is certain Gregory died; whereas the death of the monks happened, according to Godwin (ubi supra), in 605. Bede, who mentions this battle (Litt. c. 2.), adds, that it was fought after the death of Augustin; and though this passage has been suspected of interpolation, the suspicion has been founded merely on the omission of it in Alfred’s Saxon version, though it is found in all the most ancient manuscripts; and on Augustin’s having signed a charter with Ethelbert, in 605; whereas the custom of signing written instruments is not older than the year 700. It is not easy to decide with any degree of certainty, whether Augustin assisted in the war against Wales; but however this be, he cannot be exculpated from the charge of having entertained sentiments of revenge against the Welsh bishops, and it may be justly suspected of having at least advised the battery, which, in the issue, proved to fatal to the monks. (See Cave Hill. Lit. t. i. p. 549.) Augustin, after having appointed Laurence for his successor in the see of Canterbury, died, as some say, and particularly Wharton, who urges good reasons for his opinion, in the year 605, and according to others, in 604 or 614. The remains of this prelate were deposited first in the monastery, and afterwards in the cathedral of Canterbury. In 691, some of them were re-covered by an abbot in a small urn, guarded by iron and lead, and hid in a wall, left the precious treasure should fall into the sacrilegious hands of the Danes and Normans. After the lapse of another century, what yet remained of the holy relics was by another abbot ornamented with gold and precious flowers, and reposited by itself; and in the year 1200, a third abbot laid what he could find of the holy relics in a marble tomb adorned with beautiful carved work, and bearing an inscription of the following juggling compleat:

Ad tumulum hauds patris almi duceus amore,
Albans hunc tumulum Thomas defatavit honore.

As to the miracles ascribed to St. Aulbin, they are authenticated merely by lying legends, to which no credit is due. Besides restoring a blind man to sight, for the purpose of establishing his authority and vindicating his claims in the first conference with the British bishops, he is said to have left the print of his foot on the stone which received his first step on his landing in the isle of Thanet; to have caused a fountain of water to spring up for baptizing; and to have called up first the corpse of an excommunicated man to make confession of having refused the payment of tithes, and then that of the priest who had excommunicated him, to give him absolution, in the presence of the people; after which both of them returned to their graves.

As the apostle of the English, Augustin may deserve to be remembered with honour, as the immediate agent in the dispersion of Pagan superstition, and the introduction of a purer system of religious but other superstitions, it must be confessed, were introduced in the room of those which were removed, and the people, under the dominion of Christian priests and monks, still remained in a state of mental vassalage. The personal merit of this missionary will bear no comparison with that of the first Christian apostle. While Paul and his brethren, in their journeys for the propagation of the gospel, exposed themselves to innumerable perils, without any project of temporal advantage, this apostle traveled under the protection of princes, enjoyed the support and assistance of the civil power, and found his spiritual labours the direct path to worldly honour and emolument. A pope was his master; a king was first his patron, and then his disciple; and the sole government of his new church, with all the advantages of supremacy in a well-arranged hierarchy, was his recompense. That which decisively fixes the reproach of inordinate ambition upon his character is, that he not only eagerly seized the metropolitan dignity in the English church before it was well formed, but endeavored to bring the ancient and independent British churches under his yoke; and that, meeting with more reluctance than he expected from the free spirit of the ancient Britons, his haughty temper could not brook the
the opposition, and he at least meditated revenge. We can only judge of the character of this apostle by his actions, imperfectly recorded; for none of his writings remain." Biog. Brit. Gen. Biog.

AUGUSTINE, SAINT, a celebrated Christian divine of the Catholic church, the son of Patricius, a citizen of Milan, and Monica, celebrated for her piety, was born at Tagaste, a small town of Africa, in the year 314. His mother, anxious for his imbibing the principles of the Christian religion, placed him among the catechumens; and during a dangerous illness, he expressed a desire of being baptized; but upon his recovery, he phốioned the ceremony, for a superficial notion that fins committed after baptism were more heinous than those committed before. By his father he was sent for classical learning, much against his own inclination, first to a school in the place of his nativity, and afterwards to Madara. But he was idle and dissipated, and guilty of deceiving his masters, and of pilfering from his parents. To the study of Greek he was at this time particularly averse; nor does he feem in mature life to have made any great proficiency in it, as he confesses that he read the Platonists in a Latin version. At the age of sixteen, and in the year 371, he was removed to the schools of Carthage; but, in the mean while, notwithstanding the counsel and remonstrances of his mother, he acquired habits of incontinence, which were not soon abandoned, and which he ingenuously acknowledges and laments, in a book of "Confessions," written by him at a subsequent period, when he became feasible of his folly. At Carthage he devoted himself to the study of rhetoric and polite literature; and still possessing sentiments not wholly depraved, he found great pleasure in perusing the philosophical writings of Cicero, particularly his Hortensius, or "An exhortation to the study of Philosophy," not now extant. Having been sometimes instructed in religion, he occasionally read the scriptures; but not finding in them that kind of eloquence which he met with in Pagan writers, he disliked their simplicity, and threw them aside. However, during his continuance at Carthage, he attached himself to the Manichees, and from the sixteenth to the twenty-eighth or twenty-ninth year of his age, he was a disciple and advocate of this sect. When he was about eighteen, his mother, who was then become a widow, visited him at Carthage, and made every effort in her power for reclaiming him from debauchery and heresy; and she persuaded him to return to Tagaste, where he opened a school of grammar and rhetoric. Notwithstanding the reputation he acquired, his mother had still reason to bawil his conduct; and Augustine himself, in his "Confessions," (l. iii.) expresses, with great tenderness, his sense of the prayers which she prefented, and the tears which she shed, on his account. About the clofe of the year 379, Augustine removed to Carthage, and taught rhetoric in that city. He was also at this time a zealous advocate for the Manichæan system. But his love of pleasure, whatever were his other engagements, continued to be his predominant passion; and he formed a connection with a mistress, by whom he had a child, and to whom he remained constant. Regardless of decorum, he named this child "Adocontius," the gift of God; and he speaks of him, at the age of fifteen, as a young person of extraordinary talents. Provoked by the influence of his scholars at Carthage, Augustine removed with his mistress and child to Rome, and taught grammar and rhetoric in that city; but having reason to be dissatisfied with his situation, he fought a new settlement; and, by the recommendation of Symmachus, prefect of Rome, he was appointed, in the year 383, professor of rhetoric at Milan. Here he had an opportunity of attend-
printed at Paris in 1679, and reprinted at Antwerp in 1722; and fill eleven volumes in folio. His remains were carried by the Catholic bishops of Africa into Sardinia, the place of their exile; and from thence, after an interval of 200 years, they were conveyed by Luftprand, king of the Lombards, to Pavia, his capital.

In estimating the talents and learning, the disposition and character, and the value of the writings of Augustine, some have exalted him far above, and others have degraded him as much below his just rank. Molemein obersives, that his fable filled the whole Christian world; and "not without reason, as a variety of great and flinking qualities were united in the character of that illustrious man. A sublime genius, an uninterrupted and zealous pursuit of truth, an indefatigable application, an invincible patience, a fierce piety, and a subtle and lively wit, confided to establish his fame upon the most lalling foundations. It is however certain, that the accuracy and solidity of his judgment were by no means proportionable to the eminent talents now mentioned; and that, upon many occasions, he was more guided by the violent impulse of a warm imagination, than by the cool dictates of reason and prudence. Hence that ambiguity which appears in his writings, and which has sometimes rendered the most attentive readers uncertain with respect to his real sentiments; and hence also the just complaints which many have made of the contradictions that are so frequent in his works, and of the levity and precipitation with which he felt himself to write upon a variety of subjects, before he had examined them with a sufficient degree of attention and diligence."

That he professed a strong, capacious, argumentative mind, is generally allowed; but his style, though sometimes animated by the eloquence of passion, is usually clouded by faulty and affected rhetoric. "It has (says one of his biographers) more argument than oratory, more fluency than elegance, and more wit than learning; he has a certain subtility and intricate involution of ideas through long periods, which require in the reader acute penetration, close attention, and quick recollection. In fine, he is, as Eranus has observed, a writer of obscure subtlety, and unpleasant prolixity."

And, as many of his speculations are in themselves uninteresting, it is no wonder that his voluminous writings are now very much, and perhaps unfully, neglected. At the same time it is much to be lamented, that the doctrines of this father in the church should have led men to adopt a gloomy system of religion, and to support it with all the rigour of persecution. Such particularly are those charged upon him by Le Clerc (Letter prefixed to Supplement to Hammond's Paraphrasis), which take away good-name and justice both from God and man; the one representing God as confining men to eternal torments, for sins which they could not avoid: the other, bringing up magnifies to persecute those who differ from them in religion. It has also been regretted, that no writings, those of Arilote excepted, have contributed more than Augustine's, to encourage that spirit of faith disputatioon which distinguished the scholastic age. The learning of Augustine, and particularly his knowledge of the Greek language, have been despised: and hence the importance of his scriptural criticisms has been depreciated. But although it be allowed that his commentaries chiefly confit of moral reflections, spiritual and moral, or allegorical and mystical perverions of the literal meaning, yet the works of this father are not wholly diffuse of remarks and critical interpretations, that are pertinent and judicious. To such, after a detail of extracts from the writings of Augustine, the impartial and candid Dr. Lardner has referred. With regard to his knowledge of the Greek language, this excellent writer is of opinion, that he understood Greek better than some have supposed; and he has cited several passages, from which it may be argued, that Augustine frequently compared his copies of the Latin version with those of the Greek original. M. Le Clerc himself allows, that Augustine does sometimes very happily explain Greek words; but on such occasions he suspects, without sufficient reason, that he had the assistance of another.

As to the character of Augustine, it must be acknowledged that his "Confessions," whatever claim they may have to the praise of ingenuity and honesty, must a man a perpetual memorial of diligence. Besides, although this father of the church entertained, in the earlier part of his ministry, sentiments of mildness and charity towards heretics, yet, in the period of his episcopate, and under the influence of passion, excited by jural disputes, the advocate of intolerance and persecution. In a letter to Vincentius (Epift. 93.), a Donatist bishop, written about the year 428, he alludes several reasons for the exercise of secular authority against heretics; and urges the good effects which the terror of the imperial laws had produced in the conversion of several whole cities. Having once thought, as he confesses, that no man ought to be forced, he at last yielded to experience. In another letter of the same date, he incites the prelates of Africa to restrain the Donatists, but not to punish them with death; and yet in this letter, written profusely for urging the magistrate to persecution, Augustine, with an inconsequence, the reproach of which he too often incurs, thus liberally concludes (Ep. 100): "it is a more troublesome than profitable labour to compel men to forfay a great evil by force, rather than by instruction." Upon this inconsequence Voltaire pleasantly remarks (Treatise on Tolerations): "I would say to the bishop of Hippo, as your reverence has two opinions, you will have the goodfiefs to permit me to abide by the firft, for I really think it the better."

Although his conduct in procuring the first law to compel Christians to baptize their infants, in a council at Mile in Numidia, in the year 416, is altogether indefensible; and the writer of this article, abhorring every species of religious constraint and persecution, cannot attempt its vindication; yet he cannot adopt the severe strictures of the sprightly writer that refers to this fact in their whole extent and unqualified acrimony. "The name of Augustine (says he) had funk, before this time, below contempt in every free country. He was a crafty irritable man, often disappointed, and foiled by able opponents; passion for power was his ruling disposition, after his fénsual appetites had spent their force in debauchery. Too insignificant to obtain distinction in the state, he reconnoitred the church, and felf himself excellently qualified to cast out of Solomon's song to unsatisfying Christians, efficaciously single fitters and monks. A superannuated bishop, to whom he made himself convenient, lilted him into preferment. From that day he became a mercifles tyrant, and truckled to the bishop of Rome only for the fake of playing Jupiter in Africa. When he obtained the support of the emperor, and got his dreamer to imperial decrees, he became the champion of all good men within his reach, whose confinations, ban ftates, and death, with the ruin of their families, lay at his door. He confidered himself as an oracle of God, the only man who had appointed to execute his decrees." Robinon's History of Baptism. p. 217. Gen. A. Mo- themer's Eccles. Hist. vol. i. p. 362. Dupin's Eccles. Hist. v. century, ii. p. 125. Lardner's works. vol. v. c. 117, p. 81-123. Gibbon's Hist. vol. v. p. 62. Gen. P. 5.

AUGUSTINE, St. in Georgia, a town of America, the capital of East Florida, is situated on the sea-coast, about eighty leagues from the mouth of the gulf of Florida, 180 miles east from St. Mark's, and 126 south-west from Xx Charitowas.
Charles-town, in South Carolina. Its figure is oblong, and it is intersected by four streets at right angles. It is well fortified, and has a church and monastery of the order of its name. N. lat. 30°. W. long. 81° 30'.

AUGUSTINE, Cape St., lies on the coast of Brazil, in the Atlantic ocean, 300 miles north-east from the bay of All Souls. S. lat. 8° 30'. W. long. 35° 40'.—Alfo, a cape of the Mandanac islands in the Eastern ocean. N. lat. 6° 40'. E. long. 126° 20'.

AUGUSTINE's, St., a port and river on the coast of Labrador, near the straits of Belleisle, and opposite to St. John's bay in Newfoundland. In the harbour are two small iſlands, and about two miles south-west, a chain of little iſlands, called "St. Augustine's chain." It is about 25 miles from Great Mecatina íſland. N. lat. 51° 10'. W. long. 58° 50'.

AUGUSTINE's Square, St., a number of small iſlands on the coast of Labrador, in the gulph of St. Lawrence, near its mouth.

AUGUSTINE's, St. Bay, is a commodious bay that lies on the west side of Madagacar íſland, near the south entrance of the Mofambique channel, between the east coast of Africa and the west coast of the íſland. It abounds with fish, and furnishes a plentiful supply of beef, mutton, goats, and fowls. S. lat. 23° 55' 29'. E. long. 43° 8'.

AUGUSTINUS, or AUGUSTINUS, an Ecclæfiaftical Historian, and author of religious works; thus called from St. Augustin, whose rule they observe. The Augustins, properly also called Avgil Frieris, were originally hermits, whose pope Alexander IV. first congregrated into one body, under their general Lanfranc, in 1256. Soon after this institution, this order was brought into England, where they had about thirty-two houses at the time of their suppression. The Augustins are clothed in black, and make one of the four orders of mendicants. From these arose a reform, under the denomination of Bare-foot Augustins, or Minorites, or Frieri Minor.

There are also canons regular of St. Augustin, who are clothed in white, excepting their cope, which is black.

At Paris they are known under the denomination of Reli-igious of Genevieve; that abbey being the chief of the order. There are also nuns and canonesses, who observe the rules of St. Augustin.

AUGUSTINIANs are also those divines who maintain, on the authority of St. Augustin, that grace is efectual from its nature, absolutely and morally, and not relatively and gradually. They are divided into rigid, and relaxed.

AUGUSTOBONA, or AUGUSTOMANA, in Ancient Geography, a city of Gaul, belonging to the Savoies, called also Cretam Triaffium; now Troyes.

AUGUSTOBIRGA, or AUGUSTOBrica, a city of Hispantia Taragonensis, in the country of the people denominated "Pelasgonans," called of Numantia, and north-west of Bilbils.

AUGUSTODUNUM, a famous city of Gaul, the capital of the Édou; now Autun.

AUGUSTOMAGUS, an ancient town of Belgium Gaul, placed, in the Itinerary of Antonine, between Caeremonagus and Siffeone; now Senlis.

AUGUSTONOMETUM, a city of Gaul, the capital of the Averni; now Clermont en Auvergne.

AUGUSTPOLIS, an episcopal town of Arabia.—Also, a town of Phrygia Salutaris.

AUGUSTORITUM, a town of Gallia Aquitanica, and capital of the Lémovécs; now Limoges.

AUGUSTOW, in Geography, a town of Poland, in the palatinate of Bieville, fifty-six miles N. N. W. of Bieville.

AUGUSTULUS, or ROMULUS AUGUSTUS, in Biography, the laſt of the Roman emperors in the west, was the fon of Orestes, who, having deposèd Julius Nepos by means of the troops in Gaul, of which he was general, and declining the imperial rank, advanced him to the throne, in the year 476. Orestes, however, retained the administration on account of the youth of his son; but in a year after he had attained the object of his ambition, his tranquility was interrupted by Odoacer, a bold barbarian, who put himself at the head of those mercenaries that formed a part of the armies of Italy. These barbarians had made a peremptory demand, that a third part of the lands of Italy should be immediately divided among them; and Odoacer affurèd his fellow soldiers, that if they dared to associate under his command, they might soon extort the justice which had been denied to their dutiful petitions. Orestes was soon compelled by this confederate band to retire to the strong city of Pavia, which was besieged, taken, and pillagèd. Odoacer, having put Orestes to death, proceeded to Ravenna, and feizing the young emperor, Augufaliaus, he stripped him of his imperial ensigns, and obliged him to-signify his resignation to the Roman senate. The life of this inoffensive youth was spared by the generous clemency of Odoacer; who disfurnished him, with his whole family, from the imperial palace, fixed his annual allowance at fix thousand pieces of gold, and assigned the caille of Lucullus in Campania, for the place of his exile or retirèment. Thus, in the fon of a youth, who united the names of the first king and first emperor of Rome, was the Roman empire finally extinguished, A. D. 476, or A. D. 479; about 507 years after the battle of Actium, when the Roman emperors properly begin; 523 years after the battle of Pharsalia, when the kingdom of Italy begins; and 1229 years from the foundation of Rome. Gibbon's Uni. Hist. vol. vi. p. 222.

AUGUSTUM, in Ancient Geography, a town of Africa Propria. Ptolomy.—Alfo, a place of Gallia Narbonensis, fourteen miles from Labifco, and fifteen miles east from Bergufa, upon the Rhone; now Agele.

AUGUSTURSHUNN, in Geography, a town of Germany, in the circle of Upper Saxony, and marquisate of Meiffen, near Kadeberg.

AUGUSTUS, in Biography, a name given first and by way of eminence to Octavius Cæfar, and afterwards appropriated to his successors. (See August.) Cælius Julius Caesar Octavius, originally called Cælius Octavius, was the fon of a senator of the same name, who had been praetor of Macedon, and of Accia, daughter to Julia, the sifter of Julius Cæfar. He was born, during the consulate of Cicero and Caius Antonius, in the year of Rome, 691. B. C. 63; at the age of four years he lost his father; and his mother Accia contrived a second marriage with Lucius Marcus Philippus. The charge of his education was enjoined by his mother and father-in-law with the best mothers in Rome; and such was his proficiency that when he was nine years old, he harangued the people with extraordinary confidence, and before he had quite attained the age of twelve, he pronounced the funeral oration of his grandfather Julia. His talents and accomplishments recommended him to Julius Cæfar, his great uncle; who at an early period formed the design of adopting him, if he died without children. Whilft Octavius was at Apollonia, improving his powers of eloquence under the famous rhetorician, Apollodorus of Pergamum, he received the news of his uncle's tragical death, and of his own adoption. Although he was diffibed by his father and mother, and other tender friends, from declaring either his pretensions or his retentment, he determined to pass over into Italy without delay, and to judge for himself what measures it would be proper for him to adopt. Accordingly he landed at Lupis, now La Rocca, a small port between Brundulium and Hydram-

AUGUSTUS, in Biography, a name given first and by way of eminence to Octavius Cæfar, and afterwards appropriated to his successors. (See August.) Cælius Julius Caesar Octavius, originally called Cælius Octavius, was the son of a senator of the same name, who had been praetor of Macedon, and of Accia, daughter to Julia, the sister of Julius Cæfar. He was born, during the consulate of Cicero and Caius Antonius, in the year of Rome, 691. B. C. 63; at the age of four years he lost his father; and his mother Accia contrived a second marriage with Lucius Marcus Philippus. The charge of his education was enjoined by his mother and father-in-law with the best mothers in Rome; and such was his proficiency that when he was nine years old, he harangued the people with extraordinary confidence, and before he had quite attained the age of twelve, he pronounced the funeral oration of his grandfather Julia. His talents and accomplishments recommended him to Julius Cæfar, his great uncle; who at an early period formed the design of adopting him, if he died without children. Whilft Octavius was at Apollonia, improving his powers of eloquence under the famous rhetorician, Apollodorus of Pergamum, he received the news of his uncle's tragic death, and of his own adoption. Although he was diffibed by his father and mother, and other tender friends, from declaring either his pretensions or his retentment, he determined to pass over into Italy without delay, and to judge for himself what measures it would be proper for him to adopt. Accordingly he landed at Lupis, now La Rocca, a small port between Brundulium and Hydrum-
Upon his arrival, the garrison of Brundisium, which was very numerous and which consisted of veteran soldiers, went out to meet him, and introduced him by a kind of triumph into the city. Octavius thanked them for their attachment and respect, and having offered a solemn sacrifice to the gods, declared himself Caesar's heir, and added the titles of Caius Julius Caesar Octavianus; assuming himself by the latter of these appellations to be of the Octavian family. Having supplied himself with money, arms, and provisions, he purposed his route through Campania, and after paying a visit to Cicero in the neighbourhood of Cumae, arrived at Rome, where the party of Antony and Lepidus, which, under a pretence of avenging Caesar's death, aimed at establishing its own power, had obtained an universal sway. As Octavianus approached the capital, he was met by most of the magistrates, the officers of the army, and the people; but Antony declined showing him any tokens of respect. As soon as his adoption was publicly ratified in the forum, and duly registered, he waited upon Antony; and requested to have delivered to him, as Caesar's chief heir, the money which he had conveyed from Caesar's house to his own, that he might be enabled to discharge his legacies. Antony's behaviour, at this interview, was haughty and imperious; his reply with regard to the money, which he demanded, and of which part had been appropriated to the purposes of avance and ambition, was unsatisfactory; and his address closed with reminding Octavianus, in a style of authority and menace, that the favourites of the people are, generally speaking, short-lived, and that popular affection is more inconstant than the waves of the ocean. Octavianus retired, disqualified and offended; and apprised, that the confid ant withheld his father's money and estate from him in order to disable him from purchasing the favour of the people, he sold his own patrimony, and the estates of his mother and father-in-law, and with the produce of these sales, he paid part of Caesar's legacies; and by this act of generosity he charmed the populace, that they unanimously espoused his interest, and broke out into bitter invectives against Antony, for withholding his father's estate. An attempt, however, was made to reconcile these two competitors for the public favour; and it was attended with a partial and temporary success. But new occasions of variance occurred; and at length Octavianus was charged with a design of afflicting his rival. This furnished Antony with a pretext for drawing into Italy a considerable army. Octavianus, alarmed by this hostile preparation, hastened into Campania, and having collected 10,000 brave veterans who had served under Caesar, marched immediately towards Rome. But as he had no military title, nor any magistracy which gave him a right to command the forces of the republic, especially against a confidant, he thought it advisable to halt at the temple of Mars, within two miles of the city, till he obtained the consent of the people for his entry, which was soon granted him. Antony was at this time at Brundisium, and as he was hourly expected with a considerable force, it was justly apprehended that the flames of a civil war would be instantly kindled within the walls of the city. Parties were formed for one and the other of these formidable rivals; and whilst many of the senators were deliberating which side to take, Cicero, probably, as it has been said, more with a view of procuring for himself a bountiful matter, than for removing his country from tyranny, declared for Octavianus. At his motion, Antony, who had actually invaded the province of Cilatpine Gaul, and laid siege to Mutina, was declared an enemy to his country. Two new confederations, viz. Pansa and Hirius, who had both served under Caesar, and who were the intimate friends of Cicero, were ordered to raise troops, and to march to the relief of Decimus Brutus, who was chiefly biegied in Mutina. In two battles that were fought by the contending armies in the neighbourhood of this town, both the confis fell; and Octavianus became commander in chief of the whole army. Pansa, when he was borne of the wounds which he had received, earnestly advised Octavianus to commove his difference with Antony, as the only means of saving his life and advancing his fortunes; and the confidant's dying wish would have made a deep impression on the mind of Octavianus. The senate, concerning Antony's being utterly ruined, began to think Octavianus, of whom they were afraid, as they thought, they should have no further occasion: and refused his demand of a triumph, which they granted to Decimus Brutus; heaping upon him various favours, and appointing him commander of all the forces in Cilatpine Gaul; charging him at the same time, without even mentioning Octavianus, to pursue Antony, and treat him as a public enemy. Whilst Antony, after experiencing some vicissitudes, and after having fled before Brutus, and abandoned Italy, was ready to re-enter it with the command of twenty-three legions and above 10,000 horse, Octavianus was at Bononia, where he had been endeavouring, by the interest of Cicero, to obtain the confidant. But being disappointed with regard to this object of his ambition, he resolved no longer to defer his reconciliation with Antony. Accordingly, this bunion being settled, and a treaty having been concluded between them and Lepidus, of which the senate was wholly ignorant; Octavianus being placed at the head of an army, for the purpose of conducting the war, in conjunction with Decimus Brutus, against Antony and Lepidus, marched towards Rome in order to demand the confidant. It was now too late to concert or to carry into effect any measures of retribution. Octavianus was received in the capital with the loudest acclamations of the people; he was immediately joined by the legions stationed in the city; and he was unanimously elected first confidant, though he had not yet completed his twentieth year. A. U. C. 711. B. C. 43. Immediately after his promotion to the confidantship, he procured the confirmation of his adoption in a general assembly of the people; he caused the decree against Antony and Lepidus to be revoked; and he invited them into Italy. As they advanced, he went out to meet them; and their meeting took place at a small island formed by the river Rhenus, now Reno, which falls into the Po, after having watered the territory of Bononia, or Bologna. Here was planned the famous system of power called the Triumvirates; which fee. Having cemented and disengaged their new connection by the detestable proscription, which was to cut off all their enemies public and private, and to fill their treasury by confiscations, and by the mutual sacrifice of some of their nearest friends and relations, among whom was Cicero; they proceeded to Rome, and filled the city with blood and rapine. In fulfilment of one article of the treaty, settled on this occasion, Octavianus and Antony prepared for an expedition against Marcus Brutus and Cassius, who had made themselves masters of most of the provinces of the East. Accordingly they passed over into Macedon; and met the republican leaders on the plains of Philippi, where the contest was decided by two battles, the second of which terminated with the death of Brutus. (See Brutus.) On this occasion, Octavianus, who was actuated by an implacable spirit of revenge against the authors of Caesar's death, is chargeable with a degree of cruelty which fixed an indelible stain upon his reputation. Before his return to Rome, he found a difficulty, and incurred considerable danger, in the distribution of the forfeited
feited lands among the soldiers. He was also involved in a civil war by the violence of Fulvia, and of Lucius the brother of Antony, which was terminated by the surrender and capitulation of Perusia. On this occasion, Octavianus excelled the most inhuman barbarity. See Perusia. After the conclusion of this war, a partition was made of the Roman empire between Antony (see Antony) and Octavianus: Rome and the west being assigned to the latter. The next and most important event that engaged the attention of the triumvirs, was the war with Sextus Pompey. Whilist Octavianus was preparing for this war, he was captivated by the personal and mental charms of Livius, then the wife of Cladius Tiberius Nero. In order to obtain possession of her, he divorced his own wife Scribonia, and caused Livia to be divorced from her husband, though she was at the time far advanced in her pregnancy, and was, within three months after he married her, delivered of a son, who was named Tiberius, and who was afterwards emperor. The war with Pompey, though at first disastrous, was soon concluded by a general engagement, in which Pompey was entirely defeated.

Upon the deposition of Lepidus from his authority as one of the triumvirs, the Roman state was governed by a duumvirate; which was not likely to be of long duration. Antony, advancing to old age, and yet addicted to youthful follies, gave Octavianus advantages, which he had deference to perceive, and of which he availed himself by his political wisdom. Whilist he ingratiated himself with the people by several popular acts, and was invested with the dignity of perpetual triumvir of the people, which rendered his person sacred and inviolable, he contributed by various charges to degrade Antony in the public estimation. The commencement and termination of the civil war, in which Antony and Octavianus were engaged, have been already related under the article Antony. It will be sufficient here to say, that it was the successes gained by Octavianus, for which he was chiefly indebted to the conduct of his admiral Agrippa, at the famous battle of Actium, fought in the year B.C. 31, which made him master of the Roman world. Having followed his rival into Egypt, and there terminated the war, he remained in the field two years, and settled all the affairs of Egypt, Greece, Syria, Asia Minor, and the islands.

Upon his return to Rome, he triumphed for three successive days with great splendor. Having attained the summit of his ambition, it now remained with him to determine under what title, and in what mode he should exercise the supreme authority which he had acquired. That he ever seriously intended to surrender the power which he possessed, and to which he had made such sacrifices, is not at all probable; and yet it is by no means unlikely that he should have conferred with his confidential friends, Mecenas and Agrippa, in the manner which historians have recorded. Agrippa’s name is the most famous for his probity than his valor; recommended a generous resignation; represented the inevitable dangers which attend monarchy, insupportable to a free people and to men educated in a commonwealth; portrayed the examples of Sylla and Caesar; and closed his speech with exhorting Octavianus to convince the world, by restoring liberty to his country, that the only motive for his taking up arms was to revenge his father’s death. Mecenas, a man of great penetration, and generally esteemed the most refined politician of his age, urged, that he had gone too far to recede; that he could be safe only on the throne; and that it was absolutely necessary for the welfare and tranquility of the republic, that the sovereign power should be lodged in one person, and not divided among many individuals, whose ambiitious views would ill occasion a perpetual succession of miseries to the public. Octavianus thanked them both for their friendly advice, but avowed his purpose, a purpose without doubt previously formed, of adhering to the opinion of Mecenas; upon which this sage counsellor recommended his governing others as he would wish to be governed himself, if he had been born to obey and not to command; that he might then secure successes in all his undertakings, happiness during his life, and reputation after his death; adding, that if he dreaded the name of king, to odious in a commonwealth, he might content himself with the title of "Caesar," or "Emperor," and under that appellation, which was familiar to the Romans, enjoy all the authority of a sovereign. Dio. Call. I. lib. p. 464.

Octavianus, having formed his purpose, began to amuse and gratify the people, to adorn the city by public buildings, to new-model the senate by introducing his own partisans, by annulling many unjust and severe laws that had been enacted during the triumvirate, and by reforming a great variety of abuses. At length, in his 7th consulate, B.C. 27, in the 36th year of his age, he went to the Senate-house, and in a studied oration, which displayed his patriotism and dignified his ambition, he proposed to abdicate his authority. Those who were in the secret applauded; others were greatly embarrassed. But amidst this confusion of sentiments, the answer of the senate was unanimous and decisive. They refused to accept his resignation, and conjured him not to defeat the republic which he had saved. After a decent refusall, the crafty tyrant submitted to the orders of the senate; and contented to receive the government of the provinces, and the general command of the Roman armies, under the well-known names of "Proconsul" and "Imperator." But he would receive it only for ten years. At the motion of Municius Flaccus, he also assumed the title of Augustus. The powers which he united in himself, of which some, indeed, were not conferred immediately, were those of 1. "Imperator" or "Emperor," extended to signify commander-in-chief of all the forces of the state, arbiter of peace and war, and uncontrolled head of the executive power, as well over the citizens as soldiers: 2. Of "Proconsul," giving him the legal supremacy in every province which he might visit: 3. Of "Tribune," rendering his person sacred, and conferring upon him the right of veto on all public proceedings: 4. Of "Censor," or superintendant of manners: 5. Of "Supreme Pontiff," or the head of religion: 6. Of "Diplomacy" from observing the laws, when he should think fit to exercise it. To the preceding privileges of an absolute prince was added the venerable and respectable character of "Father of his Country," implying a kind of paternal relation to his people.

Augustus, besides the limitation of ten years which he annexed to the possession of his authority, lowered the senate by sharing with it the government of the provinces, referring to himself those which were most liable to tumults and seditions, that he might thus have at his command all the forces of the empire. He also contrived to retain ancient names, forms, and institutions; and to commit a portion of real authority to the senate, the people, and officers of state; so that his government was rather a monarchy than a despotic.

The first and chief care of Augustus, after he had obtained the dignity of absolute master of the empire, was to satisfy his soldiers, and attach them more firmly to his interest. With this view he dispersed them all over Italy in 32 colonies, and thus they might easily be re-assembled
in case of any sudden commotion. His land forces consisted of 25 legions, of which eight were on the Rhine, four on the Danube, three in Spain, and two in Dalmatia. The other eight were sent into Asia and Africa, four being quartered in the newly subdued parts of the Parthians and in Syria, two in Egypt, and two in the province of Africa, consisting of the ancient dominions of Carthage.

The whole number of these, constantly maintained by Augustus, and for some years by his successors, amounted to 170,000 men. In the vicinage of Rome were always quartered 12 cohorts, about 10,000 men, of which nine were called praetorian cohorts, and the other three city cohorts. They were established to guard the emperor's person, and to maintain the peace of the city.

That the former might be vigilant and faithful in their duty for the safety of the emperor's person, the senate ordered their pay to be doubled. Besides these numerous and well-disciplined land-forces, Augustus kept constantly at sea two powerful fleets; one riding at anchor near Ravenna, in the Upper or Adriatic sea, the other at Milocum, in the Lower or Mediterranean sea.

Augustus, having settled all affairs in the capital, patted into Gaul, towards the close of the year B.C. 27, with a design of proceeding to the reduction of the British islands; but on his arrival at Narbonne, he received information that the Salassiuns at the foot of the Alps, and the Cattabrians and Afturians in Spain, had shaken off the Roman yoke: he therefore discontinued his progress, and marched in person into Spain, for the purpose of subduing these nations that had revolted. The conquest of the Salassiuns he committed to his generals. In the year B.C. 23, Augustus married his daughter Julia to his nephew Marcellus; and in the course of the year he was seized with a dangerous disorder, which threatened his life, of which he was cured by his physician Antonius Mela, who devoted from the common practice in administering cooling potions, and recommending the use of the cold bath. His health was not only restored, but his constitution was rendered more firm and vigorous than it had ever been before.

When his life was thought to be in danger, he delivered his ring to Agrippa, thus intimating that he deemed him to be a proper successor. Marcellus, who was generally regarded as his intended successor, was disgusted by this preference; but the death of this prince, who was greatly regretted by the Roman people, made way for the introduction of Agrippa to court, and from this time he continued the most confidential friend of Augustus. At this time the administration of the empire was conducted with great equity and moderation; and many infirmities were recorded, in which Augustus exercised lenity and clemency, and recommended himself by the respect which he manifested to the senate and to the courts of justice. In the year B.C. 22, he declined the office of dictator and of censor, which were offered him by the senate, and in his general conduct he affected to appear no otherwise than as a private citizen. To him it is said, the title of "lord," and "master" was always an object of detestation, because its counterpart was that of a "slave," and to those who believed to him with disrespect, and who liked him in their speeches or writings, he was singularly meek and forgiving. Nevertheless, mild and equitable as was the government of Augustus, several conspiracies were formed against him, during the course of his reign; that of Tannus Caepio and Lucinius Murena, which was detected, so that the principals were punished, gave occasion to two new laws in the administration of criminal justice; one of which was, that accused persons might be freed and condemned, though they did not appear, as if they were present; and the other, that judges in criminal cases should give their opinions verbally, and not by ballot.

Rome being now at peace, Augustus determined to visit the eastern part of the empire; but as it was necessary to invest some person with authority for keeping the city in order during his absence, he appointed Agrippa for this purpose; and in order to meet additional gravity to his character in the discharge of the trust that was committed to him, he gave him in marriage his daughter Julia, the widow of Marcellus. Such was the respect with which Agrippa was treated, and to which yet more was his administration, that Rome barely perceived that it was be-
The vie of the whole Roman empire; and the temple of Janus was shut, for the third time, in this reign, and remained in this state about 12 years. Before this time Augustus had lost his beloved sister Octavia, who never recovered the death of her son Marcellus; and this afflictive event was succeeded by the decease of his favourite minister Mecenas, between whom and Augustus a coolness had subsisted, which is said to have been owing to the emperor's intrigues with his wife, Terentia. During this period, however, Augustus received many unequivocal testimonies of the attachment and affection of the people (Suet. Aug. 57-60); and after enjoying the imperial authority for 20 years, he was unanimously requested to accept it for 10 years more. The year 8 B.C. was rendered memorable by the reformation introduced by Augustus into the calendar. (See Bissextile, and Calendar.) About the year B.C. 6, the ambition of the young Caesar, Caius and Lucius, the adopted sons of Augustus, began to give him uneasiness; and the jealousy which subsisted between them and Tiberius induced the latter to quell the liberty of retiring to Rhodes, which was reluctantly granted, and whence he was not allowed to return for seven years. On occasion of Caius Caesar's assuming the toga virilis in the year B.C. 8, Augustus accepted the confidate for the twelfth time; and this year (four years before the vulgar era), was rendered fingularly illustrious by the birth of Jesus Christ. When Lucius Caesar took the toga virilis in the year B.C. 2, Augustus became confidate for the thirteenth and last time. But this year was bitten to him by the discovery of the very licentious and shameful conduct of his daughter Julia, which had been for some time known to every one but himself. After deliberating whether her punishment should be death or exile, he determined to divorce her from Tiberius, and banish her to the island of Pandateria on the coast of Campania, where she was allowed merely necessaries, and whence she was never recalled. Of those with whom she had criminal intercourse, some were exiled, and others put to death.

Augustus, having lost his two adopted sons; Caius having died A.D. 3, of a wound which he received in Armenia, and Lucius at Marseilles, A.D. 2; had no hopes of perpetuating any of his own family on the imperial throne. He therefore recalled Tiberius from Rhodes, and adopted him four months after the death of Caius Caesar. He also adopted the last of his grandsons Agrippa Poethamus; but his untractable disposition and gross manners induced him afterwards to annul his adoption, and to banish him to the isle of Panafia or Pinnafa, on the south of the isle of the Elbe. The emperor likewise obliged Tiberius to adopt Germanicus, the son of Drusus.

In the year 4, Augustus, who was a fifth time continued as commander in chief of the armies, and in the government of the provinces in his department, prosecuted his labours for settling the civil administration of the republic. He again reviewed the senate, numbered the inhabitants of Italy, and established some other regulations for the benefit of the state. But of all the occurrences of this year, the most glorious for Augustus was the pardon of Cinsa, Pompey's grandson; who was accused of a conspiracy against his life. Having admitted the criminal into his closet, he reminded him of the favours which had been conferred upon him, and charged him with the ingratitude of his design; and then doled an address of two hours with these words: "Again, Cinsa, I give you your life; I spared you, though you were my enemy; I now forgive you, though to that name you have added those of traitor and Parricide. Let us from this day begin to be sincere friends; let us vie with each other; I, to support the good I have done; you, to make a suitable return; let us try to make it a doubt, whether I am most generous, or you most grateful." The emperor named him confidate for the next year; and from this time, Cinsa, overcome by the emperor's goodnefs, became his faithful and zealous friend; and when he died, made Augustus his sole heir. The clemency of Augustus on this occasion interested the people so much in his favour, that no conspiracy was ever more attempted against him.

The conduct of Julia, the grand-daughter of Augustus, who copied after her mother's example, offended and grieved him; and he banished her A.D. 9, to the isle of Trinemi, now Tremitus, on the gulf of Venice. The poet Ovid, who is supposed to have participated her guilt, was banished at the same time, to Tomi in Scythia, on the borders of the Euxine sea. The two Julia, and Agrippa Poethamus, falsely interrupted the domestic felicity of Augustus, so that he used to call them his three consorts, his three afofeffes; he never heard their names without a figh, and often applied to them a verse of Homer, II. iii. 40.

"Ας το ξαφνιασάμενοι κρόνοι, μηκάνσετε, οσμάλης, χρόνοι τε, και έλευσίνα με." i.e. "Would to heaven I had never married, but had died without pollity!"

In the following year, A.D. 10, the destruction of Varus with three entire legions in Germany, in consequence of a confederacy formed by Arminius, the lobs of the standards of the legions, and two of their eagles, and the infolence and cruelty with which the captives were treated by the conqueror, were the occasion of great distress and terror at Rome. Augustus, accustomd to glory and prosperity, lamented this humiliating and dishonourable event with the excels of sorrow. He not only put an mourning, and suffered his heart and hair to grow, but often exclaimed in an agony; "Return me my legions, Varus." As long as he lived, the day of Varus's defeat was observed by him as a day of annual regret and sorrow. Tiberius, however, by his military skill restrained the ravages of the Germans, re-established the reputation of the Roman arms, and relieved Rome amidst its anxiety and fears. Augustus was highly gratified by his success, expressed his approbation in very strong and affectionate terms, and hailed him to an equal share of the imperial authority. Upon his return to Rome A.D. 12, he obtained a magnificent triumph. Towards the close of his life Augustus enacted several regulations, which under succeeding emperors became the means of extending and vindicating tyranny and despotism. As he was unable to go frequently to the senate, he caused his privy council to be invelled with the authority of the whole body; he also weakened the power of the people, which his successor actually annihilated, by nominating magistrates, whom they had been accustomed to elect, and by authoritatively recommending to the people such as he chose to have employed. He likewise revived and extended an old law, which was levelled against actions detrimental to the state, by enacting, that all authors of defamatory letters should be guilty of high treason, and punished accordingly. As his health and strength declined, he devolved the principal cares of empire upon Tiberius. The access of the complaint that terminated in his death has been, without sufficient reason, attributed to poison, administered by his wife Livia, who was alarmed, on account of her own son, by his returning affection to his grandson, Agrippa Poethamus. But the truth is, that his disorder was
AUG

was owing to a weakness of the stomach and bowels; and he was feized with it, as he was conducting Tiberius towards Illyrium. On his return towards Rome, his complaint increased, and obliged him to stop at Nola, where he took to his bed, and patiently waited the approach of death. On the last day of his life, he called for a mirror; he had his head dressed, and something to be done which might prevent his cheeks from appearing flimy; and then calling his friends to his bed-side, asked them, whether they did not think he had acted his part pretty well in the comedy of human life? and then addressed them in a Greek verse, with which they generally closed their plays:

i. e. "Clap your hands, and let all applaud with joy."

After this kind of comic adieu, he ordered every body to retire, and died in Livia's arms; saying, "Liviv, conjugi molliri memori, vive et vale!" i. e. "Liviv, farewell, forget not a husband who has loved you tenderly." His death happened on the 16th of August, A. D. 14, A. U. C. 767, and in the seventy-sixth year of his age. The duration of his power, if we reckon from the time of the triumvate, of which he took possession the 27th of November in the year of Rome 711. B. C. 43, was about 56 years. If we reckon from the battle of Actium, fought the 2d of September, in the year of Rome 723. B. C. 31, when his sole possession of the Roman empire properly commences, Augustus will then appear to have enjoyed the sovereign power about forty-four years. Crevier states the true time of his becoming emperor to have been the 7th of January, in the year of his seventh consulship, which, according to his reckoning, was the 725th of Rome, and referring his death to the 756th of Rome, he governed as prince and emperor forty years, seven months, and thirteen days. "All the rent (he says) was manifest usurpation and tyranny." Josephus (Ant. l. xxi. c. 2. § 2. De Bell. i. i. e. c. § 1.), and others after him, compute the beginning of the reign of Augustus from the year in which Caesar was killed, A. U. C. 710. B. C. 44, and make its duration fifty-seven years, six months, and some odd days. Ptolemy, in his canon, and St. Clement of Alexandria (Strom. l. i. i. p. 405. ed. Potter.), date the commencement of his reign in the year after the battle of Actium, A. U. C. 744, and compute its duration to be forty-three years.

Before the funeral of Augustus, his will was presented to the female-house by the veil virgins, in whose custody it had been deposited, and read aloud by Polibius, one of his freedmen. By this will, made sixteen months before his death, Tiberius and Livia were appointed his first heirs, his grand-children and their children his second, and the great men of Rome his third heirs. Livia was adopted into the Julian family, and honoured with the title of Augusta. He bequeathed, as a legacy, forty millions of sesterces (about 5,000,000 livres) to the Roman people; three millions five hundred thousand (125,500 livres) to the tribes, that is an hundred thousand (12,500 livres) to each; to each of his guards a thousand sesterces (125 livres); to each of the soldiers appointed to guard the city 500 sesterces (62 livres); and to each legi onary soldier 300 sesterces (37 livres). Augustus left also four memorials, written by his own hand, which were produced to the senate by Drusus. The first of these contained regulations relating to his obsequies; the second was a journal of the most memorable actions of his life, which he ordered to be engraved on the pillars of braves which supported the front piece of his flately mausoleum; part of which has been preserved in an ancient marble, found about 200 years ago in the city of Ancyra; the third contained a summary of the strength and income of the empire; and the fourth was a summary of instructions for the use of Tiberius, and the other governors and magistrates of the republic.

The funeral of Augustus was performed with very extraordinary magnificence. After a short eulogy by Drusus, and a funeral oration by Tiberius, fire was let to the pile in the Campus Martius, on which his body was laid, and at this moment an eagle was let loose from the top of it to carry his soul to heaven. His ashes were collected by Livia, and inclosed in an urn of gold, which she deposited in the mausoleum erected by Augustus in a grove between the Tiber and the Flaminian way. After the funeral, divine worship was decreed to him, with a temple and priests; the house in which he was born, that in which he died, and most of the houses in which he had lived, were converted into sanctuaries. Livia assumed the office of chief priestess to the new deities; and made a present of a million of sesterces to an old priest, named Numerius Atticus, who swore that he saw the soul of Augustus in flight to heaven.

The character of Augustus appears under very different aspects in the various periods of his life and reign. In the outset of his career of ambition, he was crafty and dissembling (Gen. Bing.), violent and fanatical; but as he advanced in years, and after he had attained the object of his views, he was in his general conduct, mild, affable, and conciliating. In the exercise of that love for and absolute power, which he acquired by means which none can exempt to justify, and which he contrived most effectually to hide by apparent moderation and self-denial, he seems to have been solicitous for making the people contented and happy: and in many respects he was entitled to the character of a wise and equitable governor. "As a compensation for liberty," says one of his biographers, "he gave his subjects security, safety, prosperity, and all the advantages of high civilization, with as little as possible of the severity of restraint and coercion. He filled Rome and all Italy with improvements of every kind; made highways, constructed harbours, raised edifices for use and convenience, and could boast that he received a capital built of brick, and left one of marble. He so encouraged letters, that one of the great age of excellent human productions takes its name from him." (See Age.) Those whom he encouraged by his liberality, repaid him with an adulation, which was not honourable to themselves, and which made no addition to his reputation. The love of flattery, however, is not charged upon him as one of his predominant fancies. In private life he had many estimable qualities. Affectionate to his family and friends, condescending and indulgent to his domestics and dependents, frugal and sober; with regard to every indulgence, one excepted, which regarded himself; he commanded affection and respect. But his disposition to gallantry and frivoufness in his conduct towards the female sex, exposed him to just censure and reproach; nor did the counsel of his friends (see Athenodorus), nor the wisdom of experience, avail to the due restraint of his criminal passions. Sometimes indeed, it has been said, his intrigues were the result of that policy which directed his general conduct, as they served to discover secrets of state, and to obtain information concerning any plot or sedition that might have been formed by the husbands of those wives with whom he was connected. In other respects he paid a high regard to external decorum; and whatever might have been his sentiments with regard to religion in early life, he appears in mature and more advanced age to have been much inclined to superstition. He took great pains to establish order in every branch of the administration which he lived; and recommended it to his successors not to extend the limits of an empire that was already
ready too large. "Upon the whole," says the biographer above cited, "if not entitled to rank among the greatest and best of mankind, he will be ever respected as one of those foreigners whose personal qualities had a great influence in promoting the happiness of the people he governed."

A popular historian (see Gibbon's Hist. vol. i. p. 114.) has given the following sketch of the chiefer and history of Augustus. "The tender respect of Augustus for a free constitution which he had destroyed, can only be explained by an attentive consideration of the character of that subtle tyrant. A cool head, an unfeeling heart, and a cowardly disposition, prompted him, at the age of nineteen, to assume the mask of hypocrisy, which he never afterwards laid aside. With the same hand, and probably with the same temper, he signed the procription of Cicero, and the pardon of Cinna. His virtues, and even his vices, were artificial, and according to the various dictates of his interest, he was at first the enemy, and at last the father of the Roman nation. When he framed the artful system of the imperial authority, his moderation was inspired by his fears. He wished to deceive the people by an image of civil liberty, and the armies by an image of civil government." Among the ancients, the principal writers who have portrayed the character and reign of Augustus, are Suetonius, Dio Cassius, Valerius Paternicus, and Tacitus. Julian (Cæsars, p. 359) says of him, that as Octavius advanced to the banquet of the Cæsars, his colour changed like that of the camelion; pale at first, then red, afterwards black, he at last assumed the mild livery of Venus and the graces. Horace, in the introduction to the first epistle of the second book, gives the following fine and judicious summary of the emperor's characteristic merits:

"Cum tota flexibus, et tanta negotia,
Res Italas armis tuitis, moribus oris.
Legibus emendes ; in publica commoda puecem,
Sì longo sermone morer tua tempora, Cæsar."

Augustus, Fort ; in Geography, a small fortres stood on a plain at the head of Loch Nefs, in Scotland, between the rivers Tarff and Oich, just where they discharge themselves into the lake. The fortres consists of four small buildings; and now exhibits tokens of decay, though a governor constantly resides in it, and all the regulations of a garrison are observed in it. It was taken by the rebels in 1746, who, after doing it all the injury in their power, deferted it. Its distance from the sea prevents its being of any further service, in a tranquil state of the country, than that of affording a retreat for a few invalid officers and soldiers. A small village lies behind the fort, and it serves as a kind of refit in the way to the Isles of Skye, distant from it about 52 miles.

Augustusburg, a town of Germany, in Upper Saxony, and circle of Erzgebirg, seven miles east of Chemnitz.

Au-Guy-l'an-Neuf, or Augillanneuf. See Misletho.

Auhaff, in Geography, a town of Germany, in the archdiocese of Anhira, six miles south-west of Ips.

AVIA, in Ancient Geography, a town of Hispania Tarraconensis, in the country of the Vaccaens.—Alfo, a town of Italy, in the territory of the Velones. Polytime.

Aviano, in Geography, a town of Italy, belonging to the state of Venice, in the province of Friuli, twenty-eight miles west of Udine, and fifteen E.S. E. of Belluno.

AVIARY, formed of avis, bird, a house or apartment kept for the keeping, feeding, and propagating of birds.

AVICENNA, or Abu Aly Hassen Eru Abdullah, or Eru Sina, in Biography, the son of Hali of Bochara, in Chorasan, a celebrated philosopher and physician, born about the year of the Hegira 370, A. D. 980, became early distinguished for his proficiency in literature. He had a ready genius, and extraordinary memory, so that at the age of ten he could repeat the whole Koran by heart. Serenus, or Ginzgian, his disciple, says, he was master of Euclid at the age of sixteen. Having completed his studies under Abdallah, a private tutor, who taught him logic and philosophy, and in the school of Bagdat, he was made doctor in medicine, and began to practice at the age of eighteen. He is said to have discovered by the pulse, the delirium which Caubus, nephew to the emperor, laboured under. The story as related by the Arabic writers, is so like, Friend observes, what is told by Appian of the legitimacy of Eufiphtatus, in discovering the disease of Antiochus, son of Seleucus, that it seems to have been borrowed thence, to raise the character of this physician. However this may be, Avicenna was in high repute, and attained to great wealth and honour in the court of the caliph. During the latter part of his life, after having spent several years in travelling, he refided at Hppanah, where by his irregularities he so impaired his constitution, that it was observed of him, that he had totally lost his labour, his philosophy neither enabling him to govern his passions, nor his knowledge of medicine to preserve him from diseases. He died of a dysentery, owing in some measure to his intemperance, at Hamadah, in the year 1016 of the Hegira, A. D. 428, in the 58th year of his age. The works of Avicenna were numerous, but whatever may have been paid of his genius and learning, they have contributed little to the improvement of philosophy, being for the most part imperfect and obscure representations of the doctrine of Aristotle; they consist of "Twenty Books on the Utility of the Sciences;" "The Heads of Logic;" and treatises on metaphysics and morals. The principal of them, the Canon, or "Canon Medicines," though almost entirely borrowed from Galen, Dioscorides, and other Greek writers, acquired such reputation, that it was taught at all the European colleges, and retained its popularity until near the middle of the 16th century. Haller fills several pages of his Bib. Med. Pract. and of his Bib. Botan. with the titles of his books, their different editions, and of the commentators upon them. The earliest edition was published at Padua, in folio, 1473.

"One would naturally expect, Friend says (Hist. of Phyfic, vol. ii. p. 73), to find in this author something anwerable to the fame he acquired, but though I have very often looked into his writings upon several occasions, I could meet with little or nothing there, but what is taken from Galen, or what at leaft, occurs, with a very small variation, in Rhazes, or Haly Abas:" and Haller says (Bib. Med. Pract. vol. i. p. 384.) "Mii, sapra omneo patientiam, loquax, et diffilus visetur," and adds, though you should spend whole months in poring over his works, you would scarce meet a single original observation. He had, however, before (Bib. Botan. vol. i. p. 187.) bestowed some commendations on his industry in investigating the properties of plants, and acknowledged he had enriched that part of medicine, by the introduction of several vegetables unknown to Dioscorides. The works of this physician and philosopher were printed in the original Arabic, at Rome, in 1502. A Latin translation of them, by Gerard of Cremona and others, was published in folio at Venice, in 1595, and 1658; and Vopifcus Fortunatus published a new translation, with notes by various authors, in folio,
AVI

AVIENUS, Rufus Festus, in *Biographia*, a Latin poet, lived towards the close of the fourth century, under the emperors Gratian and Theodosius. His works are translations in Latin verse of the "Phenomena of Aratus" and the "Periges of Dionysius," a description in Iambic verse "Of the Maritime coasts;" "Alop's Tables," in elegiac verse; "The Allegory of the Sirens;" "The History of Livy," in Iambics; and the "Fables of Virgil," in the same kind of verse; and a few other pieces. Some of the former performances are now extant. The best edition is that of Campanius, 8vo, 1731. Gen. Biogr.

AUJEST, in Geography, a town of Istria, in the circle of Chudum, four miles north of Pozon.

AUJESTIZ, a town of Istria, in the circle of Chudim, five miles south of Leutmisibl.

AVIGLIANO, a town of Italy, in the kingdom of Naples, and province of Otranto, seven miles east of Otranto.

AVIGLIO, a town of Italy, in the principality of Piedmont, and marquisate of Sisfo, situated on a hill near the Cottian Alps, in an open and exposed situation; the air is fabulous, and the land about it fertile. The town is fortified and defended by a castle. It contains three parish churches, and several religious houses; eleven miles west of Turin, and twelve E.S.E. of Susa. N. lat. 44° 40'. E. long. 7° 5'.

AVIGNON, a city of France, the capital of one of its re-united departments, viz. VAUCOULEUX, with the Bouche du Rhone, formerly the capital of the country of Venaunin in Provence, situated on the east side of the Rhone. Before the revolution, it belonged to the pope, whose legate resided here, and it was the see of an archbishop, created in 1475. In the year 1509, the papal see was transferred to Avignon by pope Clement V.; and this city flourished, about seventy years, the seat of the Roman pontiff, and the metropolis of Chifredan. By land, by sea, and by the Rhone, the possession of Avignon was on all sides accessible; the southern provinces of France are not inferior even to Italy; new palaces arose for the accommodation of the pope and cardinals; and the arts of luxury were soon attracting by the treasures of the church. They were already puffed into the adjacent territory, the Venaunin country, a populous and fertile spot, which had been ceded to the papes, in 1273, by Philip III., king of France; and the sovereignty of Avignon was afterwards purchased from the youth and distress of Jane, the first queen of Naples, and countess of Provence, for the inadequate price of 80,000 florins. Under the shadow of the French monarchy, amid the obedient people, the pipes enjoyed an honourable and tranquil state, to which they had long been strangers; but Italy deplored their absence, and Rome, in solitude and poverty, might repent of the unwise innovations which had driven from the Vatican the successor of St. Peter. As the old members of the sacred college died, it was filled with French cardinals, who beheld Rome and Italy with abhorrence and contempt, and perpetuated a series of national, and even provincial popes, attached to indefatigable ties to their native country. At length the celebrated Petrarch warmly interested himself in restoring the Roman bishop to his ancient and peculiar diocese, and he addressed his exhortations to five successive papes, with an eloquence that was injured by the enthusiasm of the former. Without sentiment, and the freedom of language. Avignon, which had become the sink of vice and corruption, was the object of his abhorrence and contempt: and whilst he allowed that the successor of St. Peter was the bishop of the universal church, he was of opinion, that it was not on the banks of the Rhone, but of the Tiber, that the apostle fixed his footsteps.
fixed his everlasting throne. Since the removal of the holy fee, the sacred buildings of the Lateran and the Vatican, their altars and their fonts, were left in a state of poverty and decay; and Rome was often painted under the image of a disconsolate matron. But it was alleged, that the cloud which hung over the seven hills, would be dispelled by the presence of their lawful sovereign; eternal fame, the prosperity of Rome, and the peace of Italy, would be the recompence of the pope who should dare to embrace this generous resolution. Of the five popes to whom Petrarch addressed his exhortations, the three first, John XXII., Benedict XI., and Clement VI., were inopportunely or unkindly the builders of the altar; but the memorable change, which had been attempted by Urban V., between the years 1366 and 1370, was finally accomplished by Gregory XI. A.D. 1377, who did not forswear his return to the Vatican above fourteen months. His decease was followed by the "Great western schism," which began after the decease of Gregory XI., A.D. 1378, by the election of Clement VII. in opposition to Urban VI., and continued for about forty years, till the council of Constance, A.D. 1415—1418, when the elevation of Martin V. was the era of the restoration and establishment of the popes in the Vatican. During this interval, there were two popes, one residing at Rome or in Italy, and the other at Avignon. See Schist.

This city is about three miles and two furlongs in circumference, and is in general irregular and badly built; but it is surrounded by walls and turrets with battlements, not unlike those of Rome, and its public edifices are large and grand, according to the taste of the fourteenth century. The church of Notre Dame is ancient, and is one of the best adorned in the city; the archiepiscopal palace overlooks the Rhone, the city, and the fields. These buildings, together with the mint, adorn a large square, which is the common walk of the inhabitants. The church of the Caledelins is very magnificent, and is full of fine monuments. The university has four colleges; the place in which the Jews have been accustomed to live is a distinct quarter; and those who pay tribute are forbidden to leave it without yellow hats, and the women also wear something yellow about their heads; and they are thus distinguished from the Christianites. Their number is considerable, though the district of their residence is very confined. Near the Rhone is a large rock, within the circuit of the walls, upon which is a platform, whence the whole city and the places about it may be seen. The bridge, about a quarter of a mile in length, that crossed the Rhone, was demolished by an inundation in 1609. The fountain of Vaucluse, which is the source of the river Sorgue that waters the city, and whither Petrarch often retired to indulge his grief and hopeless love, is situated in a winding valley, forming the figure of a horse-shoe, about five miles from Avignon. The fountain is a basin of water, several hundred feet in circumference, very deep, and clear as crystal, but overflowed by an incumbent rock. The water discharged from this fountain, by a narrow passage, forms a cascade, which is precipitated along a rocky channel. The rocks, which invest this romantic spot, are worn by time and the inconstancy of the weather, into a thousand fantastic forms. And on one of the pointed extremities, in a situation almost inaccessible, are seen the remains of an ancient castle, projecting over the water called by the peasants "Il Caffelo del Canto," and they add, that Laura lived upon the opposite side of the river, under the bed of which was a subterraneous passage, by which the two lovers visited each other. The residence of the poet was much lower down, and nearer to the banks of the Sorgue, as appears from his account of it, and from his relation of his contests with the maidens of the stream, who during winter encroached on his small adjoining territory; but no remains of it are now to be discovered. Below the bridge is an islet, where the Sorgue joins the Rhone, in which are several houses of pleasure. The inhabitants of Avignon were estimated before the revolution at 30,000, 1000 of these being ecclesiastics, and some hundreds Jews. N. lat. 45° 56'. E. long. 4° 48' 10''.

AVIGNON. Berry, called also France-de-Berry, in Botany, is the fruit of a shrub, by some authors called lyceum; growing plentifully near Avignon, and other parts of France. See Lyceum.

AVIGNONET, in Geography, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of Villefranche, twenty miles south-east of Toulouse, and four miles south-east of Villefranche.

AVILA, Gilles Gonzales, in Biography, a Spanish ecclesiastic and historian of the seventeenth century, was a native of Avila, and acquired at Rome, where he studied, a great knowledge of sacred and civil history. On his return to Spain, he had an ecclesiastical benefice at Salamanca; and in 1612, he removed to Madrid, and was appointed historiographer to the king. He died in 1678, at the age of 80 years. His principal works, published in Spanish, were "The History of the Antiquities of Salamanca," and "The Theatre of the Churches of the Indies, &c." Nouv. Dict. Hist.

AVILA, in Geography, a city of Spain, in Old Castile, seated on the river Apace, on a large plain, surrounded with mountains and plantations of fruit-trees and vineyards, and having a manufacture of cloths, that are said to be equal to those of Segovia. It is fortified by nature and art, having a wall 9275 feet in circuit, with twenty-six lofty towers, and ten hand-wrought gates. It has fourteen principal streets, containing several good and flatly houses; nine squares, 2000 houses, nine parishes, and as many monasteries, seven nunneries, two colleges, nine hospitals, eighteen chapels, and an annual allowance of 10,000 ducats for the maintenance of orphans and other poor people. The university was founded in 1445, confirmed by pope Gregory XIII. in 1538, and afterwards enlarged; and its cathedral has eight dignitaries, twenty canons, and the same number of minor canons. N. lat. 40° 35'. W. long. 4° 14'.

This city has been rendered famous by the deposition of Henry IV. A.D. 1645. The indignation of the Castilian nobility against the weak and fagacious administration of this prince, led them to combine against him, and to exercise the right, which they arrogated as one of the privileges of their order, of trying and of passing sentence on their sovereign. For this purpose they erected a spacious theatre in a place without the walls of the town, and having prepared an image, clad in royal robes, representing the king, they placed it on a throne, with a crown on its head, a sceptre in its hand, and the sword of justice by its side. The accusation against the king was then read, and the sentence of deposition was pronounced in presence of a numerous assembly; and whilst the several charges were delivered, they proceeded to tear the crown from the head of the image, to snatch the sword of justice from its side, to wound the sceptre from its hand, and, at the close of the whole, to tumble it headlong from the throne. When this ceremony was finished, Don Alfonso, Henry's brother, was proclaimed king of Castile and Leon in his stead. Robertson's Hist. Ch. V. vol. i. p. 179.

AVILA, or Atéa, a town of Spain, in Asturia, near the bay of Biscay, nine leagues from Oviedo.
AVILA, a city of South America, in the province of Quito, and government of Quixos, situate in S. lat. 0° 44', and about 2° 20' E. of Quito. It is less than Archidona, a small city, lying in S. lat. one degree and a few minutes, and about one degree fifty minutes E. of Quito. Like this latter place, its houses are of wood covered with straw; and as the whole number of inhabitants in Archidona is reckoned at 650 or 700, and of Spaniards, Indians, Melizos, and Mulattas, those of Avila Fearily amount to 250 of both sexes. Like the other it has one priest; and his ecclesiastical jurisdiction comprehends six towns: viz. La Conception, Loreto, San Salvador, Motte, Cota Pini, and Santa Rosa.

AVILA Fuelte, a town of Spain, in Old Castile, six leagues from Segovia.

AVILER, Augustin-Charles D', in Biography, an eminent French architect, was born at Paris in 1653, and from his youth devoted himself to the study of architecture. In his way to Rome, whether he was sent for improvement by the royal academy, at the age of twenty, he was carried into slavery by an Algerine corsair, and in this situation he manifested his talents by making a design for a grand mosque at Tunis. After sixteen months he was liberated, and pursued his studies at Rome for five years. On his return he was placed under Mansart, first architect to the king, and had a principal concern in the conduct of all public works. His "Courte de Architecture" was founded on the work of Vignola; but by the enlargement of that writer's plan, was rendered a complete treatise of the art. It has been much esteemed; the first edition was that of 1693, 2 vols. 4to.; and it has since passed through several other editions. Being invited to Montpellier, he superintended the construction of a grand triumphal arch to Louis XIV., was afterwards appointed architect to the province of Languedoc, and, besides other buildings in which he was employed, he erected the archiepiscopal palace at Toulouse. He died at Montpellier in 1700. Moreni. Gen. Biog.

AVINO, in Geography, a town of North America, in the province of New Galicia, where the Spaniards have a silver mine; between Durango and Elkera.

Avino, La Planes, a town of North America, in the western part of the kingdom of Leon, between two of the head-branches of Nafias river.

AVIORA, a town of Aflatic Turkey, in Caramania, sixty miles north-call of Tocat.

AVIOTI, a town of France, in the department of the Meuse, and chief place of a canton in the district of Stenay, three miles north of Montmedy.

AVIRA, in Ancient Geography, a town of Asia, in the Palmyrene. Ptolemy.

AVIS INDICUS, in Astronomy. See AVIS.

AVIS, or AYIS, in Geography, a town of Portugal, in the province of Alentejo, giving name to an order of knights; three leagues west of Elremos. The land surrounding it is covered with cactus, which is usually cut down once in eight years and burnt, and the ground tawon with corn. Lat. 38° 40'. W. long. 7°.

AVIS, in Haraldy, a military order of knighthood, instituted by Alphonso Henriques king of Portugal, in 1142, in testimony of the great services done for him at the siege of Lisbon, by the nobility led to his allegiance by Don Ferdinand Rodrigues de Monteyro, whom he appointed to be their grand master. For some years after they were called Nouvelle Milice, or the New Military; which appellation continued until the year 1166, when they having taken Evora by surprize, the king conferred on them the govern-

A V I

ment of that town, and commanded that they should thenceforth be called Knights of Evora: lately, the same king having, in the year 1181, taken from the Moors a place very advantageously situated, and called Avis, granted the same to the before-mentioned knights, on condition that they should build a fort in that place, and reside therein. The knights accordingly planted themselves thither, and from that time took the denomination of Evora de Avis. In the year 1204, pope Innocent III. confirmed this order. The badge of the order is a cross, or silver, cut in the form of a fleur-de-lis or; and which they wear pendant to a green ribbon round the neck; and the same badge is embroidered on the left shoulder of the robe of state, which is of white satin.

AVIS, Bird. Aves, Birds, among Naturalists, the second chief of animals; a race of creatures sufficiently distinguished from the others in having the body covered with feathers, two feet, and two wings formed for flight. Birds have the mandible protacted and naked, and are defteine of external ears, lips, teeth, forefoot, subject, urinary vesel or bladder, epiglottis, corpus callosum, or its fornik (covering of the two lateral ventricles of the brain, or its arch) and diaphragm.—In the Linneas system, birds are divided into five orders; viz. accipitres, picr, anifer, grallae, galinice, and pafiere. See Ornithology.

AVIS, Longa, in Ornithology, a name given by Nieremberg to the boiltattoe of the Americans, a bird remarkable for its swiftnefs in running. The boiltattoe appears to be the phasianus mexicanus of Gmelin, and curicis profusus of Latham.

AVIS Nova, a name under which Nieremberg has described an American bird of the size of a thrush; of a brown and black colour on the back, and yellow under the belly; it imitates the human voice, and is called by the natives cacow.

AVIS Pennipulchra, the name of an American bird described by Nieremberg, and called by the Indians quintaclalotoul. It is the size of a pigeon, and is faid to be all over the body of the more beautiful colours of the peacock. The species alluded to is not accurately known; and Ray has arranged it with some others as doubtful kinds.

AVIS Seica, or Hoastili. See Aerea Hoastili, Gmelin; and Hoastii, Buffon.

AVIS Tropicorum, and avis rables forecas, the name of a bird, among old authors, called in English the tropic bird; and by Gmelin Phaeton Aetherius.

AVIS Venti, the bird of the wind, or heathfothead; cestoloth, Lavis venti aker, Ray, &c. oblitute names of the Mercur us Encullatus, or hoiled mersuger, of America. Avis Paradis, bird of Paradise. See Paradisea.

AVIS Mexicana grandis rubra, Seba. See Loria Mexicana.

AVIS Mexicana altera, Seba. See Pira Erythrocaphala, &c. &c.

AVISE, in Geography, a town of Piedmont, in the duchy of Aosta, in the grand Doria, eight miles west of Aosta.

AVISO, a town of Italy, in the kingdom of Naples, and country of Lavora, six miles south of Sora.

AVISO, Italian, advol, chiefly used in matters of Commerce, denotes advice, piece of intelligence, or advertisement, to notify some event or matter worthy of knowledge.

AVISON, Charles, in Biography, organist of New-

castle,
castle, was an ingenious and polished man, esteemed and respected by all who knew him; and an elegant writer upon his art. He had visited Italy early in his youth, and at his return, having received instructions from Geminiani, a bias in his Compositions for Violins, and in his Essay on Musical Expression, towards that matter, is manifest. Rameau was likewise model'd in harpsichord music; and Marcello's passions were much over-rated by him, in order to depreciate Handel; whom he cenured more by implication than open hostility. We find in his book, which is elegantly written, and in the prefaces to his musical compositions, many prejudices, and particularly against German symphonies; ascribing to them the corruption and decay of music! His compositions for the harpsichord, when played by the lady Milbanke, and accompanied by Giardini, had a pleasing effect. They were formed on the plan of Rameau's concertos, as those for violins were on the concertos of Geminiani; and there was the same difference between them in point of excellence, as is always discoverable between an original production, and an imitation.

His violin concertos were revived, after they became of age, at the concert of ancient music; where 20 years are the period which renders musical compositions venerable. Here they are still played in turn with those of Corelli, Geminiani, Handel, and San Martini; with whose productions, however, they but ill support a parallel: they want force, correctness, and originality, sufficient to be ranked very high among the works of masters of the first clafs.

AVITUS, Sextus Alcinus Ecdicius, a Christian divine, bishop of Vienna in France, was nephew to Marcus Mecillus Avitus, emperor of the West, and flourished at the beginning of the sixth century. He succeeded his father Ilychius in the see of Vienna, in the year 490. He was the friend of Clavin, the first Christian king of France, and contributed to his conversion. As a zealous opponent of the Arians, he reclaimed Gondebald, king of the Burgundians, from his connexion with this sect, to the Catholic faith; he prefided in the council of Epom in 517, and in that of Lyons in 523, in which year he died. He wrote 87 letters on subjects that formed the disputes of the age in which he lived, sermons, and poems on the Mo-

AULADIS, a town of Aria, in Mepotamia. Ptol.

AULÆ, a part of Aria, in Cilicia, between Tarus and Anchial. Suidas.
AULIC, the walls of Aulicus, a maritime place of Thrace, upon the Euxine sea, not far from Apollonia, and at some distance north from Salmydessus.

AULANA, a town of Patæens, 50 stadia distant from Jerusalem. HEGEFOXOSS.

AULAS, in Geography, a town of France, in the department of the Gard, and chief place of a canton in the district of Le Vigan, near Le Vigan.

AULAX, in Botany. See Pentel.

AULESTER. See Aulester.

AULENDORF, in Geography, a town of Germany, in the circle of Swabia, and barony belonging to the family of Koenigegg, sited on a hill near the Schus, eight miles north of Ravenburg. N. lat. 47° 56'. E. long. 9° 30'.

AULEON, in Ancient Geography, a gulf of Thrace, near Byzantium.

AULERI BRANDES, a people subject to the Edus, who are supposed to have inhabited that part of Gaul, where is now the canton called Briennos, near the Loire, in the diocese of Mâcon.—A. Ceramani, a people who inhabited that part of Gaul which now forms the diocese of Mâcon.—A. Eubroques, a people who occupied the country which is now the diocese of Evreux: their capital was Mediolanum.

AULETAE, aestae, in Antiquity, denotes a flute-player.

One of the Pethecan, kings of Egypt, father of Cleopatra, bore the surname or denomination of Auletta.

AULETTA, in Geography, a town of Italy, in the kingdom of Naples, and province of Principato Citera, four miles W. S. W. from Cagnano.

AULI, in Ancient Geography, a people of Europe, in Maccandia, who occupied a town, to which they gave their name.

AULIC, Aulicus, an act which a young divine maintains in some foreign universities, upon the admission of a new doctor of divinity. It is so called from the Latin aula, a hall; it being in the hall of the university that this act is usually held.

The person who presides at the disputation, is the same that is to take the doctor's cap.

AULIC, Aulicus, is also an appellation given to certain officers of the emperor, who compose a superior court of council, which has an universal jurisdiction, and without appeal, over all the subjects of the empire, in all processes entered therein.

All causes relating to points of feudal right or jurisdiction, together with such as respect the territories which held the empire in Italy, belong properly to the jurisdiction of the aulic council. This tribunal was formed upon the model of the ancient court of the palace instituted by the emperors of Germany. It depended not upon the states of the empire, but upon the emperor; who has the right of appointing, at pleasure, all the judges of whom it is composed.

Maximilian, in order to procure some compensation for the diminution of his authority, by the powers vested in the imperial chamber, prevailed on the diet A.D. 1512, to give its consent to the establishment of the aulic council. Since that time it has been a great object of policy in the court of Vienna, to extend the jurisdiction, and support the authority of the aulic council, and to circumferbe and weaken those of the imperial chamber, for which the tedious form of the imperial proceeding has furnished the emperor with pretexts. "Lites Spirae," according to the witticism of a German lawyer, "spirant, sed nunquam expirant"; such delays are unavoidable in a court composed of members named by states, jealous of each other.

Whereas the judges of the aulic council, depending on one matter, and being responsible to him alone, are more vigorous and decisive.

PEFFENDORF, De Statu Imper. Germ. c. 25.

The aulic council is established by the emperor, who nominates the officers; but the elector of Mentz has a right of retiring it. It is composed of a president, who is a catholic; a vice-chancellor, presented by the elector of Mentz; and of eighteen officers, or counsellors, nine whereof are Protestant, and nine Romanists. They are divided into two branches, one of which is occupied by the rights, and the other by the lawyers. They hold their assizes in the presence of the emperor; and for that reason are called "judicium imperatoris," the "emperor's justice," and "aulic council," because their decisions are given in the emperor's court, aula, and has its residence in the place where he is. This court classifies a little with the imperial chamber of Spris, as they are preventive of each other; it not being allowed to move any causes from the one to the other. Nor can the emperor himself hinder or supplant the decisions of either court; much less call any cause before himself, which has been once before them, without the consent of the states of the empire. Yet, in some cases, the same council forbears making any peremptory conclusion, without the consent of the states of the empire, and only decrees thus, "Fiat votum ad Caesarem," that is, to make a report hereof to the emperor in his privy-council.

AULICA, in Entomology, a species of Phalaena (Bombus) that inhabits Europe and Siberia. The anterior wings are greyish dotted with yellow; posterior ones fulvous, spotted with black. Lin. Fn. Succ.

AULICK, in Geography, a town of Germany, in the circle of Upper Saxony and bishopric of Naumburg; six miles north of Letz.

AULICUS, in Conchology, a species of Conus, marked with brown reticulated veins, and interrupted bands of the same colour. It is a native of Asia, and may be only a variety of the conus textile, being extremely variable in its colours and marks. Gmelin mentions seven different kinds, with references to different figures in the works of Martini, Knorr, and Seba; the most remarkable is the fourth variety, the shell of which is yellowish-brown instead of white, and marked reticularly with heart-shaped spots, disposed in a perpendicular direction.

AULICUS, in Entomology, a species of Cerambix (Callidium Fab.) Thorax smooth and shining; body opaque, black; wing-cases smooth; antennæ short. Inhabits Europe.

AULICUS, a species of Cymex, that inhabits South America; the colour is red and black, varied with a black band on the upper wings; lower wings black with a white line at the base. This is cymex irroratus of Thunberg, Nov. Inf. or at least a variety of it.

AULICUS, a species of Cryptopeclus (Cifera) found in Africa, especially at the cape of Good Hope. It is black, with a rufous thorax, and azure-blue wing-cases. Fabricius.

AULICUS, in Zoology, a species of Coluber, having 184 abdominal plates, and sixty sub-caudal scales. It is of a greyish colour with numerous linear white bands which bifurcate on the sides; on each side behind the head is a triangular white spot, and these almost unite at the nape. The length of this kind is about six inches, and its diameter one third of an inch. It inhabits America, and is deemed a poisonous snake.

AULIS, in Ancient Geography, a sea-port town of Carctia, sittuate at the bottom of a small gulf, opposite to Chalcis of Euobea; and famous for being the place where
the Greek chiefs resolved upon the destruction of Troy. The district belonging to it, and called "Aulide," lay toward Euripus, in that part which separated Boeotia from Euboea. Diana had a temple in this territory, with a statue of white marble holding a flame in the hand.

AULENE, in Geography, a town of the island of Corfu, four miles north of Tallano.

AULNAGER, in Commerce. See ALNAGER.

AULNAY, in Geography, a town of France, in the department of the Calvados, and chief place of a canton in the district of Vire, 43 leagues south-west of Caen.

AULO, a Greek long measure. See Measure.

AULOCRENE, in Ancient Geography, a mountain of Phrygia, towards the north-east of Apamea-Cibotos.

AULON, a valley of Palatine, extending along the banks of Jordan, from Libanus to the defert of Pharan. Scythopolis, Jericho, and Tiberias were situated in this valley. —Also, a town of Melemea, upon a river of the same name, north of Elchea. —Also, a town and port of the Macedonian sea, in the country of the Thessalians. Potamia. —Also, a town of Peloponnesus, in Laconia. —Also, another in Arcadia. —Another ancient town in the ile of Crete. —Also, a hill of Italy, near Tarentum, which was fertile in vines, and said by Horace not to be inferior to those of Falernum.

AULOS, in Ornithology, a name by which several of the ancient writers call the sphen, or as it is rather improperly named the raven-fish.

AULPS, or Aups, in Geography, a town of France, in the department of the Var, and chief place of a canton in the district of Barjols, 84 leagues W. N. W. of Frejus.

AULT, a town of France, in the department of the Somme, and chief place of a canton in the district of Abbeville, five leagues west of Abbeville.

AULUS GELLIUS, or AGELLIUS, in Biography, a Roman grammarian and critic, flourished at Rome, where he was born, in the second century, under the emperors Adrian and Antoninus Pius; and died in the beginning of the reign of Marcus Aurelius Antoninus. He studied grammar and rhetoric at Rome, and philosophy at Athens, where he enjoyed the society of Calvinsius Taurus, Peregrinus Protesus, Herodes Atticus and other learned persons. Having travelled through Greece, he returned to Rome, devoted himself to the study and practice of the law, and was appointed a judge. From the frequent citations of his works by writers on Roman law, it may be inferred, that he attained to considerable reputation in his profession. His "Noctes Atticae," or "Artic Nights," the only work extant, and the greatest part of which was written at Athens, furnishing an amusing occupation for many long winter evenings, is a collection of incidents, and anecdotes, historical and biographical, with critical observations and reflections on various authors and topics. The instructions and entertaing of his children, and rendered valuable by many fragments of ancient authors, that are not elsewhere to be found. It was edited in folio, at Rome, in 1469, by Swinemi and Panzer; a second edition was published in 1472, by Jenson at Venice; in the sixteenth century are found the editions of Aldus, 8vo. at Venice, in 1515; of Paris, in folio, 1519, 1524, 1526; of Basel, 8vo. in 1526; of Paris, 8vo. in 1535, with the critical notes of H. Stephens. Editions of a later date are those, in natum Delphini, 8vo., 1681; of the Elzevirs at Amsterdam, 1651, 1800; at Leyden, can notis variorum, 1660; by Gronovius 4to. in 1706; and at Leipzig, in two vols. 8vo. by Conradus, in 1762. An elegant translation of this amusing, but frequently obscure and difficult author, with valuable notes, was given in English, in 3 vols. 8vo. by Mr. Beloe, in 1795, with the translation of Fabr. Bib. Lat. 1. c. 1. l. p. 71 &c.

AUMA, in Geography, a town of Germany, in Upper Saxony, and circle of Neudalitz, forty-four miles S. S. W. of Leipzig, and six S. E. of Neudalitz.

AUMA WIESENDORFF, a town of Germany, in Upper Saxony, two miles S. E. of Auma.

AUMALLE, a town of France, in the department of the Lower Seine, and chief place of a canton in the district of Neufchatel, nine leagues S. E. of Dieppe, and eleven N. E. of Rouen. N. lat. 49° 46'. E. long. 1° 38'.

AUMONE, or AUMS. See AINS.

AUMONT, in Geography, a town of France, in the department of the Lozère, and chief place of a canton in the district of St. Chely; five leagues N. W. of Mendé.

AUN, a town of Peria, in the province of Segeslan, forty-four leagues S. S. E. of Zareng.

AUNALASKENSIS, in Ornithology, a species of Oryolus, that inhabits the island of Oonalafsha. The length of this bird is eight inches; it is of a brown colour, with a spot under the eyes, and chin white; throat and breast rufous brown. Gmelin. The beak and legs are brown.

AUNAY, in Geography, a town of France, in the department of the Nivern, and chief place of a canton in the district of Château-Chinon; nine miles north of Moulins. —Also, a town of France, in the department of the Lower Loiret, and chief place of a canton in the district of St. Jean d'Angely; eight miles north-east of St. Jean d'Angely.

AUNCEL-WEIGHT, quasi "Handak-Weight," an ancient mode of weighing by a kind of balance, consisting of scales hanging on hooks fastened at each end of a beam or flail, which a man lifts up by his hand or forefinger, and so discovers the equality or difference between the weight and the thing weighed. There being great deceits practised in these weights, they were prohibited by several statutes: and the even balance alone commanded. The word is still used in some parts of England, to signify meat sold by poising in the hand, without putting it into the scales. See STYLES.

AUNCESTOR, Affe of Mort d'. See ASSE.

AUNCESTREL HOMAGE. See HOMAGE.

AUNE, in Commerce, a long measure used in France and other countries, of different lengths in different places. See ELL.

AUNE, in Geography, a river of England, which runs into the sea near Plymouth.

AUNEAU, a town of France, in the department of the Eure and Loira, and chief place of a canton, in the district of Chartres; four leagues west of Chartres.

AUNEUIL, a town of France, in the department of the Oise, and chief place of a canton in the district of Beauvais; five miles S. S. W. of Beauvais.

AUNGERVILLE, Richard, or Richard of Burj, in Biography, an English bishop, was born at St. Edmundsbury, in Suffolk, in 1281, studied at Oxford, and became a Benedictine monk at Durham. He was tutor to prince Edward, afterwards Edward III. and upon his accession to the throne, he was loaded with honours and preferments. In 1333, he was consecrated bishop of Durham; in 1334, he was appointed high chancellor; and in 1336, treasurer of England. He was himself eminently learned, and a great patron and encourager of learning. Petrarch, with whom he corresponded, calls him "virum ardentis ingenii." He was a great collector of books, and poissied, it is said, more
more books than all the bishops of England together. Notwithstanding the expense which he incurred in this way, by employing persons to collect books for him abroad, and also binders, illuminators, and writers in his several palaces, he was distinguished by his charity and beneficence. He does not seem to have contemplated himself merely with the possession of a large library; for he was a diligent student; and it was his custom for some of his attendants to read to him at his meals, and afterwards to discourse with his chaplains on the subjects that occurred. His "Philobibliae" was a curious treatise, finished at Auckland in 1545, when he was sixty-three years of age, and containing a declaration in praise of books, with directions concerning the preservation and use of them. It was printed at Spire in 1483; at Paris, in 1500; at Oxford, in 1509, 416; and at Leipsic, in 1574, at the close of "Philologiarum Epitomarum Centuriae una." This work is distributed into twenty chapters; in which, among other particulars, he affirms, that books are to be preferred to riches and pleasures; that they are injurious only by ignorant people; that the ancients surpassed the moderns in hard study; that learning arrives at perfection by degrees, and that he had provided for students Greek and Hebrew grammars in his libraries; that the law and law books are not properly learning; that grammar is peculiarly useful and necessary; that poetry also is useful; but he makes an apology for admitting poets into his collection, observing, "we have not neglected the fables of the poets."

Amensyly founded a noble library at Oxford for the use of students, and appointed five keepers, to whom he granted yearly salaries. This learned and worthy prelate died at Auckland, in his diocese of Durham, April 24, 1,1345. Biog. Brit. Wharton's Hist. Poet. vol. i. 2d Prin. Diff. p. 129, 121.

AUNIS, in Geography, a district of France, which, before the revolution, was reckoned a part of Saintonge, but is now with Saintonge included in the department of the Lower Charente; is bounded on the east and south by Saintonge, on the west by the ocean, and on the north by Poitou, and comprehends the isles of Ré and Oleron. It is watered by the river Sevre and Charente, and has several good harbours along the coast. The soil is fertile, and produces great quantities of corn and wine; the swampy parts afford good paiturage, and the salt-marshes yield an excellent salt, which is a considerable article of commerce.

AUNOT. See Annot.

AUNOY, Mary Catherine Jumelle De Berneville, Contes de, in Biography, a distinguished writer of fiction and romance towards the close of the eighteenth century, was niece of the celebrated Madame Dufloges, and wife of the count D'Aunoy. She wrote with facility of style and facility of invention; and her "Contes des Fées" or fairy tales, and "Aventures d'Hippolyte Comte de Douglas," or adventures of Hippolytus Earl Douglas, are read with pleasure by those who merely seek amusement. Some of her other pieces, uniting history with fable, such as "Historical Memoirs of the most remarkable Events in Europe from 1672 to 1679," "Memoirs of the Count of Spain," "History of John of Bourbon, prince de Carentey," are less valued. She died in 1785. Nouv. Dict. Hlst.

AUNUS, in Entomology, a species of Papilio, of a blue colour with a black border and three small tails, black bendets, and striped with white. Cramer, Gmelin, &c.

AVOCADO, or Avocato, Pear, in Botany, a species of linnns. See Laurus.

AVOCATORIA, a mandate of the emperor of Germany, directed to some prince or subject of the empire, to stop his unlawful proceedings in any cause brought by way of appeal before him.

AVOCETTA, in Ornithology, a species of Recurvirostra that is distinguished from two other birds of the same genus, being variegated only with black and white. Linn. Gmel. &c.

The length of this bird is from eighteen to twenty inches; it has a small body, and legs remarkably long; irides hazel; head black; crown black; front of the neck, breast, back, belly, and outer part of the wings white; legs blueish-black; bill black, about three inches and a half in length, and like the rest of the genus, slender, flexible, turning upwards towards the end, and terminating in a point.

"This bird is common in winter on the eastern coasts of England, particularly those of Suffolk and Norfolk; and sometimes on the lakes of Shropshire. They are found great plenty in the breeding season, in the fens about Fof- dyke Wath in Lincolnshire, and in the fens of Cambridgshire. They feed on worms and insects, which they scoop out of the mud and sand, and are sometimes observed to wade or swim, but always close to the shore. "They lay two eggs, which are about the size of those of a pigeon. Pennant says they are white, tinged with green, and marked with large black spots. In the description of them given by Latham it is observed, they are of a cinnereous grey, whimsically marked with deep brownish-black patches of irregular sizes and shapes, besides some under markings of a dusky hue. "The avocet is far more frequent in some other parts of Europe than in this country. Albin says, it is common in Venice; and according to Salerne, they are so plentiful on the coasts of Bari Poictou, that the peasants take their eggs by thousands. They are also found in Russia and Siberia, Denmark, Sweden, and other northern countries." Donov. Brit. Birds, &c.

This bird is called avocetta s. recurvirostra, by Gmelin; avocette, by Buffon; krummfiich, by Cramer; Theykha, Alit. Linn. Po. Succ.; the scopet, by Charls; crooked bill, by Dale; and avocet, or avocot, by English writers.

AVOGLI, in Geography, a town of Perhia, in the province of Adirbeitzan, eighteen leagues south-east of Tauines.

AVOIDANCE, in Law, is applied generally to a benefit which becomes void of an incumbent, and is oppoited to plenary. Avoidances are either in fact, as by the death of the incumbent; or in law; and may be by cession, deprivation, resignation, &c. See Usurpation.

AVOIRDUPOIS, or Averdupois Weight, a kind of weight used in England; the pound avoirdupois contains fifteen ounces. See Weight.

The proportion of a pound of avoirdupois to a pound troy is as 17 to 14; or the avoirdupois pound contains 7000 grains, and the troy pound 5760.

All the larger and coarser commodities are weighed by avoirdupois weight; as groceries, cheese, wool, lead, hops, &c.

AVOISE, in Geography, a town of France, in the department of the Sarts, four leagues from La Fleche.

AVOIA, or Aula, a town of Sicily, in the valley of Noto, six miles from Noto, and sixteen from Syracuse. This city, which formerly stood on a hill, boisted of being the "Hippa Minor," celebrated for its honey; but the justice of its claim, in common with many other cities, cannot be safely decided. After its destruction by the earthquake of 1693, the inhabitants rebuilt it more commodiously in the plain, in a fertile territory, luxuriant in corn and fruits, and principally in almonds, a considerable article of
of commerce. The houses still prove, by being extremely low, the dread entertained of earthquakes. The streets are wide and regular.

AVOLTOJO, in Ornithology, a name given by Cetti to some birds of the Vultur genus; as for example, *vultur fuscus* is called by that writer *avoltojo Griffone*; and *vultur niger, avoltojo nero*.

AVON, or Aon, in the British Language, signifies a river generally; but in its present application designates only a few of the streams in Great Britain. The principal are the Warwickshire Avon, and the Wilshire Avon. The former is sometimes called "The Upper Avon." It brings a great influx of waters from the north-call, rising on the borders of Leicestershire, and adds great beauty to the delightful territory of Warwick castles, as it flows beneath the cliff on which those lofty towers are situated. It then glides through a charming country, to the celebrated spot of Stratford-on-Avon, the birth-place of our immortal Shakespeare, and the repository of his bones. Hence it traverses the great level of Worcesherrile, by Erovham, having received the upper *Stour* at Stratford, and turning to the south at Perthishore, meets the Severn at the flourishing town of Tewkswell. Ireland's picturesque views on the Avon.

The Wilshire or Lower Avon derives its source from various springs in the north of Wilts, and becomes a considerable river at the ancient town of Malmhury. In this part of the country, we are informed by Ethelward, that it formed a boundary line between the West Saxon and Mercian kingdoms, and was often stained with the blood of murdered soldiers during the dishonourable warfare between those two powers. Leaving Malmhury, it meanders through a level tract of fine pasture land to Great Sumnerford, Dantery, and Chippemham, where its stream becomes expanded by many contributory rivulets. Quitting Chippemham, its windings are numerous, from the hilly nature of the country through which it flows. Having passed the clothing towns of Melkham and Bradford, it moves slowly through the gay city of Bath, thence passes on to Bridgol, and soon afterwards unites its waters with the Severn. It is navigable for small vessels up to Bridgol, and some considerable barges come up as high as Bath.

The *Upper Avon*, another Wilshire river, rises among the hills near the centre of that county, and flows southward through a number of small villages to Amebury and Salibury, where it receives the united streams of the Willey and the Nadder; and, running through Downton, crosses the county of Hants, and discharges itself into the British channel at Christchurch.

Another *Avon* rises in the north part of Glamorganshire, and running south, falls into the Severn at Aber-Avon, south-west of Neath.

Acon, or *Acon Fine*, a river in Merionethshire, rises among the high mountains of that county, and after passing by the small town of Dolgelly, soon discharges itself into the Irish sea at the town of Barmouth.—*Acon* gives name to two rivers in Scotland. Britton's Beauties of Wilthwe, vol.i. and Skiries General Account of Rivers.

*Avon* is also the name of a river of Nova Scotia, which discharges itself into the Atlantic ocean, east of Halifax. It is navigable as far as Fort Edward for vessels of 400 tons; and for vessels of 60 tons, two miles higher.

AVORTON, Fr. in Midweifery, an abortive child.

AVOSTOLA, in Geography, a river of Piedmont, which runs into the Cervo; 2½ miles west of Baronza, in the Vercellois.

AVOWEE, Advocate, in Law. Avowee is the person to whom the right of adowment of any church belongs, so that he may present to it in his own name; thus called by way of distinction from those who sometimes present in another man's name, as a guardian, who presents in the name of his ward; as also from those who only have the lands to which an adowment belongs for term of life or years, by intimation or direction. See Advocate, and Advocate.

AVORY, in Lexicographical Antiquity, was originally the advocate of a monastery; and in times of confusion the avoys became captains and protectors of convents, to whom the said convents gave lands in consideration of their protection; but when these monasteries erected themselves into principalities, the avoys became noblemen; and the title was connected with great dignity. Thus we find, that when Otto was elected to the empire, A.D. 1205, and his election was approved by pope Innocent III, who invited him to Italy to be crowned, he appointed Rodolphus, count of Hamburg, prefect, vicar of the empire, and principal avoy of all Upper Germany, with power to maintain the imperial rights, inspect the finances, levy subsidies, tribute, tolls, and taxes, and, in a word, to represent the person of the emperor in his absence.

AUPILLARTOK, in Geography, an island of Greenland, near Bear island, about eight or ten leagues long, and very high. These two islands, which are about the same form and extent, divide the channel, in which they are situated, into two bays.

AU-PIS-PINNER, a French phrase, sometimes used among English writers, signifying, at the present.

AUPS, in Geography. See Aupps.

AURA, in Chemistry, a certain fine and pure spirit, supposed to be found in every animal and vegetable body, but so subtle as only to be perceptible by smell and taste.

This term was much employed by the ancient alchemists, and even some of the most eminent chemists, but is now disused. It is nearly equivalent to spiritus rector, concerning which fee the article Aroma.

AURA, in Ornithology, a species of Vultur, of a brownish grey colour, with black wings, and white bill. This bird is described by authors under several different names. In Henrik Mav. it is called tzopilote f. aura; by Willinghy, uruhi, tzopilote, or aura; by Ullo, galliavuza; vultur Bra- linicus by Ray; vautour du Bréil by Buffon; Turkey buzzard by Castelby; carrion-crow by Sloane; and carrion vulture by Pennant and Latham. Inhabit Brazil.

Aura, among Physiogonists, an airy exhalation or vapour.

The word is derived from the Greek *auras*, call.

AURACH, in Geography, a town of Germany, in the circle of Swabia, and county of Wallburg; nine miles E.N.E. of Warzach.—Allo, a river of Germany, in Franconia, which runs into the Rednitz; three miles south of Erlang.

AURÆ, in Mythology, a name given by the Romans to the nymphs of the air. They are mostly to be found in the ancient paintings of ciclodes; where they are represented as light and airy; generally with long robes, and flying veils.
AUR

rely, of some lively colour or other, and flattering about in the rare and pleasing element assigned to them. They are sportive and happy in themselves, and well-wishers to mankind.

AURACO, in Entomology, a species of Phalaena (Nactus) that inhabits Austria. The wings are brownish; splash at the base, and broad band in the middle, yellow. Hübner, Gmel. &c.

AVRAINVILLE, in Geography, a town of France, in the department of the Meuse, and chief place of a canton in the district of Toul, a league north of Toul.

AURAN, a town of Arabia, sixty miles south of Damascus.

AURANA, in Entomology, a species of Phalaena (Turris), with brown wings, and two golden-yellow spots in each. Fabricius. Donov. Brit. Inf.

AURANA, Lucania, or Bracca, in Geography, one of the most delightful places of Dalmatia, in the county of Zara, on a lake of the same name. It had formerly a rich convent of Benedictines, whose revenues were, about the year 1277, alienated in favour of the knights templars, by Andrew II., king of Hungary, who instituted a commandery in this place. About this time the place was fortified. The suburb is large. It continued for some time in the hands of the Turks; but, in 1684, they were dispossessed of it.

AVRANCHES, AFRICANTE, OR AFRICA, OR Africana tertium opimum, a city of France, and principal town of a district in the department of the Channel, seated on an eminence near the river Seine. Before the revolution, it was the see of a bishop, suffragan of Rouen. Besides the cathedral, which stands on a hill, terminating abruptly, it had three parish churches, a convent, a college, a public school, and an hospital. This is a very ancient town, and, before the county of Bretagne was united to the crown of France, it was called the "Boulevard of Toulon." But when the Bretons made themselves masters of it, they destroyed its fortifications, in 1203. These were rebuilt in the reign of St. Louis. Here, it is said, Henry II. of England received abdication from the pope's nuncio for the murder of St. Thomas à Becket, in 1172; and the stone on which he kneaded during the ceremony is still thrown to strangers; and on it is engraved a chalice, in commemoration of the event. The ruins of the castle are extensive, and near it is an extent of fertile country, abounding in grain and orchards, which produce the best cider in this part of France. N. lat. 43° 41' 18". W. long. 1° 22' 38".

AURANTIA, in Conchology, a species of Voluta, of a tapering shape, and orange color; the first four whorls are inflected with white; lip denticulated, and four points on the pillar. Gmelin.

AURANTIA, a species of Patella, the shell of which is ovate, solid, ciren color, with brown waves; elevated, crossed, wrinkled frill, and white bottom. Native country unknown. Schott. n. Litt.

AURANTIA, a species of Ostrea. The shell is subrotund, plaited, and finely fringed longitudinally, with a semicircular white band near the hinge. Native country unknown. Regan. Conch.

AURANTI, a species of Venus, with an orbicular orange-coloured shell. This shell is two inches long, and two inches and a quarter in breadth. Its native country is unknown.

AURANTI, in Ornithology, a species of Loxia, of an orange color; crown black; wing and tail-feathers black, edged with orange. Gmelin.

The length of this bird is four inches and a half; bill Vol. III.

dusky; some of the inner quill-feathers red with white; legs pale red. In the female, the whole of the head and fore-part of the body are white; the rest dull orange. Inhabit the Isle of Bourbon.

AURANTIA, a species of Muscaria, called by Latham orange-browed fly-catcher, and in botany the root is known as orange de Cayenne by Buffon. The colour is tawny, tinted in parts with green; breast orange; head and nape greenish brown; quill-feathers black, edged with Rufous. Gmelin. Length of this kind four inches and three quarters; bill flat and broad; tail Rufous; legs pale. Dr. Latham informs us, in his Gen. Orn, that it frequents the shrubs of woods, and the fountains; and is perhaps a scarce species, only a single specimen of it having been brought to Europe.

AURANTI, a species of Motacilla that inhabits the Cape of Good Hope. It is brown above, beneath orange; chin whitish, varied below with black; larger wing and tail-coverts white; tail-feathers brown, lateral ones tipped with white. This is the orange-browed warbler of Latham. Length six inches.

AURANTI, a species of Certhia, called by Latham the orange-browed creeper. It is green; beneath yellowish; breast orange; wings and tail black. Length four inches; bill black; legs dusky. Inhabits Surinam, and was first discovered by Mr. Smethmann.

AURANTI, in Zoology, a species of Rana, described by Dr. Shaw, as being of an orange-colour, with very slender body and limbs. This is a native of South America, and is of a smaller size than the European tree-frog; it inhabits trees.

AURANTI, in Néphrology, orange-peel. The aurantium Hispalense, or Seville orange, is the only one of this species which is employed in pharmacy.

The outer yellow rind of the fruit is a grateful aromatic bitter, highly esteemed as a stimulant. It is kept in the shops, dried with a gentle heat. It contains a large portion of aromatic effulgent oil, which admirably invigorates the flaccid powers, and renders it highly grateful to the palate. The virtue of the orange-peel is readily extracted by proof spirit; and accordingly this is the form in which it is usually employed. The London college have ordered a simple tincture of this sub stance (tinctura auranti coriaceae}, in the proportion of three ounces to a quart of proof spirit. It is also employed in several of the compound tinctures, such as Huxham's tincture of bark, to give an agreeable flavour, and to add to the floridum virtue. A syrup of a very grateful flavour is also prepared, by dissolving the requisite proportion of sugar in a strong infusion of the peel. See Citrus Aurantium.
Auratus, in Ornithology, a species of Falco that inhabits Surinam, the bill and legs of which are lead colour; body above dusky brown, with decussating narrow whitish lines; chin with long narrow whitish feathers; throat and breast orange; belly and tail brown, with interrupted streaks. Gmelin. This bird is about fifteen inches in length; bill three quarters of an inch long, and whitish at the base; on the throat a round white spot; lower coverts of the tail ferruginous; tail near the base suffused with white; legs long, slender, with black claws.

Auratus, a species of Picus or wood-pecker, about ten inches in length. It inhabits the Cape of Good Hope; is of an orange colour above, with the nape, rump, and tail black. Gmelin. Drifon calls this bird Picus capitis Bona Spisi; and Latham the orange wood-pecker.

Auratus, a species of Trochilus, called by Latham the orange-throated humming-bird. It is of a brown colour, with the head orange; chin and breast yellow; wings purple; tail ferruginous. Gmelin. Native place unknown.

Auratus, a species of Turdus, of a blackish brown colour, with the chin and abdomen whitish; beak and legs orange. Gmelin. This is the white-chinned thrush of Latham; merula Jamaicensis of Drifon; and merle brun de la Jamaïque of Buffon. This kind lives in the woods in Jamaica. Of this species Gmelin mentions three varieties; namely, (2) merula gula fuscata (with the chin brown) that has been discovered in New Caledonia; (3) merula nigra (with the body black), a native of Surinam; and merula Americana of Brif. and which, as its name implies, is an inhabitant of America.

Auraria junctio, penso, or professio, in Antiquity, a tax or tribute to be paid in gold. The collector of it was denominated fajceptor aurarius, or rœfpeodettes.

Auras, in Geography, a town of Silefia, in the principality of Breflaw, situate near the Oder; twelve miles north-west of Breflaw.

Aurasius Mons, in Ancient Geography. See Audus.

Aurata, in Entomology, a species of Buprestis, of a large size, that is found in America. This kind is golden; wing-cases ferrated; thorax brassy. Fabricius, Olivier, &c. Olf. The head is grooved; eyes tetaceous; teeth of the antennæ black; thorax smooth.

Aurata, a species of Chrysis that inhabits Europe. It is glabrous and shining, with a green thorax, and golden abdomen; with two teeth at the vent. Linn. Fabr. &c.

Aurata, a species of Mutilla that inhabits New Holland. It is blueish, with a large golden spot on the abdomen. Fabricius.

Aurata, a species of Musca found in Europe. This insect is shining; thorax brassy; abdomen obtuse and golden. Fabricius, &c.

Aurata, a species of Phaëna (Geometra), described by Linnaeus as a native of Europe. The wings are yellow, and without spots.

Aurata, a species of Phaëna (Geometra) that inhabits Surinam, and is figured by Cramer under the name of phaëna aurana. The wings are fulvous, with a dot and posterior fircak golden. Fabricius, &c.

Aurata, a species of Vespa, of a small size, that is found in Sierra Leona. The colour is black; abdomen golden and polished. Fabr. &c.

Aurata, in Ichthyology, a species of Sparus, called in England the lunate gilt-head, and distinguised by having a lunate golden mark between the eyes. Linneus Muf. Ad Fr. It inhabits the Mediterranean and American seas.

Aurata Bahamensis, Catesby’s name of the fish called Sparus cymbopis by Gmelin.

Aurata, in Zoology, a species of Lacerta found in the island of Jerfey. When living, it is said to be of a fine golden colour, but after death this splendid colour disappears. It has a round and rather longish tail; scales round and glabrous; sides brownish. Gmelin. The body is round, and apparently corpulent, and the ears are concave. This kind is Lacerta berbarea of Muf. Ad Fr.

Aurat us, in Entomology, a species of Scarabæus (Cetonia Fabr.) that inhabits Europe. This insect is golden, with a single tooth on each side of the fifth segment; wing-cases spotted with white. Fabricius. The colours in this species are variable. From the vent, it omits a fetid liquor when handled. Degeer calls it Scarabæus finarogus.

Auratus, a species of Carabus, of the anterous kind; wing-cases golden and furrowed; antennæ and legs rufous. Fabricius. Found in woods in Europe.

Aurat us, a species of Cerambyx that inhabits America. It is green, bronzed, with a lateral depressed tooth on the thorax; antennæ black, and posterior thays blue. Gmelin.

Auratus, a species of Curculio, of a green-gold colour; antennæ and dilated tip of the beak black. A native of Italy. Scopolii.

Auratus, a species of Elater that inhabits China. The colour is green-gold; legs black. Fabricius.

Auratus, in Ichthyology, a species of Sparus, that inhabits the Mediterranean and European seas, and is called in England the lunate gilt-head. It is distingused by having a semi-lunar golden spot between the eyes. Linn. Muf. Ad Fr. This kind feeds chiefly on worms and shell-fish, the latter of which it grinds with its teeth before it swallows them. The back is greenish, sides rather pale and glosed with gold; on the upper part of the gills is a black spot, and beneath that another of purple; inside of the mouth fine red; dorval fin extending nearly the whole length of the back; tail much forked.

Aurat us, a species of Cyprinus, well known in England by the name of gold-fish. Authors are by no means agreed on the specific characters by which this fish ought to be distingused; some think the trifurcated tail is a striking character of the species; but this is rather accidental, for it is sometimes found with a bifurcated tail; and the telescope carp cyprinus bispinichirinus of Dr. Shaw, has a trifurcated tail likewise; the anal fin is sometimes single, and sometimes double; so that the Linnean definition of the species is equally liable to objection. The specific character assigned by Bloch is taken exclusively from the briliant, or golden red colour, by which, as he observes, this fish is distingused from all the other species of the Carp or Cyprinus genus.

This fish is without dispute, the most superb creature of the fishy tribes at this time known. It was originally confined to a certain lake, or on near the mountain Tiencing, at a small distance from the village of Tchanghou in the province of The-Kiang in China, from whence it was transport to other parts of that empire, and Japan; and afterwards brought to Europe. The Chinese have completely domesticated this fish, and they are now generally kept in ponds, basins, or vessels of porcelain, as ornaments in the garden of the rich; and afford one of the few amusements the ladies are allowed to enjoy in that country by their jealous husbands. One writer has observed that the fish is no larger than a pilehead; but in this he is mistaken, for we know instances of its increasing to the size of a herring. The male is said to be of a bright red colour, from the top of the head to the middle of the body; the rest of a bright gold
gold colour, superior to the richest gilding with that metal; the female white, with the tail and half the body enamelled the finest silver. Du Halde observes that the red and white colours are not always the distinguishing marks of the male and female; but that the female is known by several white spots which are seen round the orifices that serve them as organs of hearing, and that the male by having these spots much brighter. Grosier, in his description of China, says, great care is necessary to preserve them; for they are extremely delicate, and liable to the least injuries of the air; a loud noise, such as that of thunder or cannons; a strong smell; a violent shaking of the vessel; or even a single touch, will oftentimes destroy them. These fish live with little nourishment; those small worms which are engendered in the water, or the earthy particles which are mixed with it, are sufficient for their food. The Chinese, however, take great care from time to time to throw into the basins and reservoirs where they are kept, small balls of paste, which they are very fond of, when diffusely; they give them also lean pork dried in the sun, and reduced to a fine and delicate powder, and sometimes nails; the slime which these infects leave at the bottom of the vessel is a great delicacy for them, and they eagerly feed on it. In winter they are removed from the grounds or open air to a warm chamber, where they are kept generally in vessels of porcelain. During this season, they receive no nourishment; but however in the spring, when they are carried back to their former basins or reservoirs, they sport and play with the same strength and liveliness as they did in the preceding year. In warm countries these fish multiply fast, provided care be taken to collect their spawn, which floats on the water, and which they almost entirely devour. This spawn is put into a particular kind of vessel, exposed to the sun, and preserved there until vivified by the heat; gold-fish, however, seldom multiply when they are kept in close vessels, because they are then too much confined. In order to render them fruitful, they must be put into reservoirs of considerable depth, in some places at least, and which are constantly supplied with fresh water. At certain times of the year a prodigious number of barks may be seen in the great river Yangtsé-Kiang, which go thither to purchase the spawn of these fish. Towards the month of May, the neighbouring inhabitants shut up the river in several places with mats and hurdles, which occupy an extent of almost nine or ten leagues, and they leave only a place in the middle sufficient for the passage of barks. The spawn of this fish, which the Chinese can distinguish at first sight, although a stranger could perceive no traces of it in the water, is floated by these hurdles. The water mixed with spawn is then drawn up, and after it has been put into large vessels, it is sold to the merchants, who transport it afterwards to every part of the empire. This water is sold by measure, and purchased by those who are delirious of flocking their ponds and rivers with gold-fish.

Notwithstanding the tenderness of this fish in its native climate, it is now naturalized in England, France, Holland, several parts of Germany, and other countries of Europe. They are said to have been first introduced into Great Britain about the year 1691, but were not generally known, according to Pennant, till 1748, when a great number were brought over, and presented to Sir Matthew Deckler, and by him circulated round the neighbourhood of London, from whence they were disseminated to most parts of the country. "Nothing," says one writer, (Enc. Brit.) "can be more amusing than a glass bowl containing such fishes; the double refractions of the glasses and water represent them, when moving, in a shifting and changeable variety of dimensions, shades, and colours; while the two mediums alluded to the concave-convex shape of the vessel, magnify and distort them vastly; not to mention that the introduction of another element and its inhabitants into our parlours engages the spectator in an agreeable manner. Some people exhibit this sort of fish in a very fanciful way; for they cause a glass bowl to be blown with a large hollow space within, that does not communicate with it. In this cavity, they put a bird occasionally; so that you see a gold fish or a linnet hopping as it were in the midst of the water, and the fishes swimming in a circle round it. The simple exhibition of the fishes is agreeable and pleasant; but so complicated a way becomes whimsical and unnatural, and liable to the objection due to him, qui variari capite rem prodigat alterum unam."

One circumstance that has been remarked of the fish, deserves particular mention. It is said, when young, to be not unfrequently of a deep black colour, and that after a time little silver specks begin to appear through the black; these increasing in size very gradually, till the black entirely disappears, the whole fish becomes of a fine and resplendent silver; from which it at last changes to a red. Sometimes, however, it appears of a beautiful golden-red in the first instance.

Auratris, in Ornithology, a species of Cuculus, about seven inches in length, that inhabits the cape of Good Hope. Buffon calls this bird coucouvert doré et blanc; Hilt. Off., and in his Pl. Enlum. coucou vert du cap de Bonne Eſperance. The tail is wedge-shaped; body above golden-green, beneath white; on the head five streaks; wing-coverts, secondary quill-feathers, with those of the tail, white at the tips. By Lahmann, it is named in English the gilted cuckow.

Auratris, a species of Picus or wood-pecker, called by Buffon peli Canadensi striatus; peli de Canadas, et ppiel ailes dorées by Buffon; peli major altis auratis by Kalm; cuculus auratus, Linn. Syll. Nat. X.; and gold-winged wood-pecker by Catesby and other English writers. Forster and Gmelin describe it as being transversely streaked with grey and black; chin and breast black; nose red; rump white.

The length of this bird is eleven inches; bill an inch and a half long, black, and rather bent; and contrary to others of the same genus, is rounded and rieged only on the top, with the point sharp. The female differs from the male in having the crown and neck behind grey brown; the red of the hind head less vivid; greater quill feathers not spotted on the edges, and being delitrate of the black stripe on the throat. It inhabits Virginia, Canada, and other parts of North America. About New Jersey, and New York, it is called by some bitock or pint, and by others high-hole; the two former, from the sound of its note, and the latter from the situation of its nest. It is almost continually on the ground, and is not observed to climb on the trees like other birds of the same genus.

The food of this bird is chiefly insects, and berries of the red cedar; it is very fat, and in esteem for the table. Forster, in the Philosophical Transactions, informs us that it is a bird of passage in the northern parts of America, visiting the neighbourhood of Albany fort in April, and leaving it in September; that it lays four, five, or six eggs in hollow trees, and feeds on worms and insects. It is called by the natives ochre-quaun-naw.

Auratris, a species of Turdus, the general colour of which is violet; back and wings golden-green; band on the inner margin of the wings, tail, and upper tail-coverts, blue. Gmelin. This beautiful bird is rather larger than turdus merula, or common black bird, and inhabits the kingdom of Whidah, in Africa. Buffon calls it le merle violet du royaume de juida; and Latham the gild. thrush.

Auratris, a species of Trochilus, called by Latham Z 2 2 the
AUR

the garnet-throated humming-bird. The colour is golden-green; chin, throat, and breast golden-red; belly black. Gelatin.—Of: There is a variety of this brilliantly coloured species, in which the cheeks, nap, and chin are of a golden-red; and the head and body of a dark glossy green. The latter is called genera by Buffon; and it measured five inches in length, being half an inch more than the bird mentioned kind.—The legs and bill are black, and in the female, the chin, throat, and breast are golden-green.

AURAY, in Geography, a sea-port town of France, in the department and in the gulf of Morbihan, and principal place of a district; at the mouth of a river of the same name. N. lat. 43° 53'. W. long. 2° 50'.

AURBACH, a town of Germany, in the circle of Bavaria, and Upper Palatinate; thirty miles north-east of Nuremberg.

AURBURG, a town and castle of Germany, in Upper Bavaria; four miles north of Kuffstein.

AURE, a river of France, which runs into the Eure, near Anet.

AUREA, in Conchology, a species of Venus of a furbolicular form, golden, inequilateral, with crowded, minute, transferic spire. Lillie, Gelatin. Inhabits Europe.

Aurea, in Entomology, a species of Leptura, described by Degeer. The colour is greenish gold, thorax spinous; two black longitudinal stripes on the wing-cases; thighs rufous. About two-thirds of an inch in length.

Aurea, a species of Meloe (Mylabris) of a green-gold colour, with fulvous wings. Length one third of an inch. Degeer. Native country unknown.

Aurea, a species of Cicada (Ceratopis Sec.) of an aulic colour, glossed with gold, shining, and without spots. This is of the middle size, and inhabits Caymen.

Aurea, in Ornithology, a species of Paradisea, about the size of the turtle-dove. It is eroded; crown, cheeks, and chin violent and shining; throat, breast, and spot on the neck, golden-green. Gelatin. This is Pappea paradis a burse doric of Someronat; fillet ou maine de a far siles of Buffon; and gold-breasted bird of paradise of Latham.

The bill is blackish; irides yellow; plumage very brilliant; legs blackish; beneath each wing ane long black feathers, which fall over the wings, when the bird is at rest; the webs of these feathers are booke like those of the oath. From the mutilated state in which the skins of these birds are sent to Europe, these feathers are not always observable in specimens of this species: Buffon mentions a figure of it published by M. Marvi, in which even the crest is wanting. This kind inhabits New Guinea.

Aurea, a species of Loxia that inhabits Bengal. It is of a black colour; back golden; wing coverts pale brown, spotted with black. This bird is the golden-backed Check of Brown, and gold-backed Grosbeak of Latham. According to the late author, it is six inches in length; bill, head, and neck, deep black; the feathers not velvety, as in the Cape grosbeak; breast and belly black; legs bluish; rump and upper tail-coverts yellow; the latter fringed with a dusky colour; and all the tail feathers very pale at the edges.

Aurea Alexandrina, in Pharmacy, a compound optate confection, much in request among the ancient physicians, but now entirely disfigured, like all the other medicines of these sorts; it was considered as a powerful alexipharmic, or antidote for wounds.

Aurec, in Geography, a town of France, in the department of the Upper Loire, and chief place of a canton in the district of Mansfield; three leagues south-west of St. Etienne, and 15 north of Mansfield.

Aurelia, in Entomology, a term employed by naturalists, about the middle of the last century, to express that intermediate state in which all lepadiptherous, and most other insects, remain for some time, between the caterpillar form and the period in which they are furnished with wings, with antennae, and other organs appertaining to the perfect insect. Aurelia and chrysalis are synonymous words, both alluding to the metallic or golden splendor of the case in which the creature, during that state, is contained. This brilliant appearance, it must be observed however, seems confined alone to insects of the papilio or butterfly tribe; and it is even peculiar only to certain kinds of those; so that the terms aurelia and chrysalis are altogether inapplicable, in a general manner, to insects in that state. Among entomologists of the higher class, these terms have been long since discarded in favour of the more expressive one pupa, which Linnaeus had adopted in their stead; a term implying that the insect, like an infant, yet remains in its swaddling clothes; and nothing can be more applicable than this comparative allusion, while the tender insect yet remains enveloped in the drapery of its membranaceous covering; a creature now exposed to every danger, and yet unable to defend itself from the slightest harm; in happy infancy it must wait the more complete formation of its limbs, and new acquisition of strength, ere it can buril from these, its trammels of youth, and appear what nature had ultimately designed it for—a mature and matured creature.—See Entomology, and Pupa.

The term auria is still retained by some few practical entomologists in this country; or, in other words, by those who amuse themselves with collecting and breeding insects, without regarding them scientifically; and persons, engaged in this agreeable pursuit, occasionally denominate themselves Aurelians. The word chrysalis is in more general use than its precise meaning can justify; that of aurelia, as before remarked, is nowhere obfolute. The current denominations of an insect in the pupa state among the French naturalists, are nympha, or nymphale, and chrysalis.

"The Aurelian" was likewise the title which Moses Harris gave to his well-known folio work on Insects; a wretched plagiarism from the beautiful etchings of Ammiral, which had been published a short time before in Holland; and in which, Harris, by a singular good fortune, not only escaped detection, but actually acquired that very celebrity as a delineator of insects, which attaches an importance to his memory in the present day.

Aurelia, in Natural History, a species of Paramesia (venere incubator), of an oblong form, pointed longitudinally on the anterior part. Möll. Hermann, &c. Hill describes it thus: paramesia corporis fabellino medium versus angula. It is found in great abundance in ditch water, and vegetable infusions, about the month of June; it is membraneous; breadth one fourth of the length; anterior part obtuse, hyaline; posterior part filled with molecules of various sizes; longitudinally fold extending from the middle to the front of the head.

Aurélian, in Biography, a Roman emperor, was a native of Sirmium, in Pannonia. His father cultivated the lands which a Roman senator, called Aurelius, possessed in the country where he lived; and his mother was a priestess of the sun, and pretended to divinities. Aurelius was from his youth distinguished by his strength and courage, and addicted to military exercises and achievements. On this occasion he entered betimes; and, from his warlike passion and talents, he obtained, by way of distinction from another Aurelian, the name of "Aurelianus man ad ferum," or "Aurelian sword in hand," as he was ready on all occasions to draw his sword, and encounter the enemy. He is said to have killed with his own hand forty-eight Sar-matians.
AUR

matians in one day; and within some few succeeding days, 950; so that he became the subject of popular songs, which were sung by the youth at the public festivals. Aurelian was the first Roman who fought against the Franks, and subdued them. As chief commander of the cavalry, to which office he was advanced from the low station of a common soldier, he was a strict officer of military discipline, and punished with the utmost severity the smallest neglect of duty on the part of his followers, and the slightest injury done by any of them to the inhabitants of the provinces through which he marched. His military talents and conduct attracted the peculiar attention of the emperor Valerian, who appointed him inspector and reformer of all the Roman camps, gave him the command of Illyricum, under Ulpius Crinthus, a defenclant of the same family with Trajan, by whom he was adopted, and whose daughter he married; and at length, A.D. 258, created him consul, with a special order, that, on account of his poverty, the public treasury should defray the expenses which that high office incurred. Under Gallienus we find no mention of him, either because he had removed him from jealously of his merit, or because he himself did not choose to serve a prince so indolent and despotic. Claudius II. upon his advancement to the empire, duly acknowledged the merit of Aurelian, and was affiled by him in the defeat of Aurelius. In the war against the Goths he was eminently distinguished; and this discerning emperor on his death-bed recommended him as the fittest person to be his successor. Accordingly Aurelian was elected to the empire by the legions of Illyricum, in the year 270; and after the death of Quintillus, the brother of Claudius, who closed a short reign of seventeen days by opening his veins, the election of Aurelian was confirmed by the Senate, and he was honoured with the title of Augustus. Having been thus acknowledged and invested with the imperial dignity at Rome, he returned to Pannonia, which the Goths had threatened with a new invasion. The Goths before his arrival had passed the Danube; but, after an indecisive battle, which was terminated by the approach of night, the Barbarians retraced, and re-crossed the river, and sent deputies to sue for peace, which was granted them by the emperor. Having withdrawn the Roman troops from Dacia, and relinquished that province to the Goths and Vandals, he hastened to Italy to repel an invasion of the Alamanni, and other German tribes. After three decisive victories, the first near Placentia, a second at Lepanto, and a third at Pavia, he drove those Barbarians out of Italy, and reduced Rome from the calamities which were impending, and which the city had endeavoured to avert by a variety of superstitious practices, functioned by the concurrence of the emperor himself, with a view of appeasing the anger of the gods.

Aurelian, on his return to the capital, put to death several senators, who were suspected of having been concerned in conspiracies against him; and having enlarged the city, he provided for its future security by erecting new walls, which bore his name, though they were not finished till the reign of Probus. The extent of these walls was magnified by popular estimation to near fifty, but has been reduced by accurate measurement to about twenty one miles.

About this time Aurelian marched into Gaul, which had been for some time infested and oppressed by a rapid succession of usurpers, and where Tetricus, who, from being governor of the peaceful province of Aquitaine, had assumed the enigmas of royalty, and reigned four or five years over Gaul, Spain, and Britain, "the slave and sovereign," says Gibbon, "of a licentious army, whom he dreaded, and by whom he was despised." The power of Tetricus, however, was of precarious duration; and he invited Aurelian to hasten to his relief. Accordingly, in the summer of the year 271, Aurelian arrived in Gaul; and Tetricus, in order to disguise the act of treason by which he was about to resign the sceptre of the west, affected the appearances of a civil war, and led his forces into the field against the emperor; but he posted them in the most disadvantageous manner, betrayed his own counsellors to the enemy, and with a few chosen friends deserted in the beginning of the action. The rebel legions, though disordered and dismayed by the unexpected treachery of their chief, defended themselves with desperate valour, till they were cut in pieces almost to a man, in the bloody and memorable battle, which was fought near Chalon, in Champagne. The retreat of the irregular auxiliaries, Franks and Batavians, whom the conqueror soon compelled or persuaded to repel the Rhine, restored the general tranquillity, and the power of Aurelian was acknowledged from the wall of Antoninus to the columns of Hercules.

Aurelian, having secured the person and provinces of Tetricus, turned his arms, A.D. 272, against Zenobia, the celebrated queen of Palmyra and the East. Upon his arrival in Asia, he advanced at the head of his legions, and took possession of Antioch and Tyana; and as he approached Antioch, it was deserted by the inhabitants; but by his flattering edicts he recalled the fugitives, and granted a general pardon to all, who, from necessity rather than choice, had been engaged in the service of the Palmyrenian queen. This unexpected mildness of conduct, on the part of the emperor, conciliated the minds of the Syrians; and as far as the gates of Emesa, the wishes of the people seconded the terror of his arms. Zenobia attempted to check his further progress; but the fate of the east was decided in two great battles; the first of which was fought near Antioch, and the second near Emesa. In these battles, Zenobia animated the armies by her presence; but the veteran troops of Aurelian, whose valour had been severely tried in the Alemannian war, prevailed. After the defeat at Emesa, Zenobia found it impossible to collect a third army. As far as the frontier of Egypt, the nations subject to her empire had joined the standard of the conqueror, who detached Probus, the bravest of his generals, to possess himself of the Egyptian provinces. The queen retired within the walls of her capital, Palmyra; and for some time resisted, with the intrepidity and firmness of a heroine, the arms of the emperor, who invested the city. But disappointed of adequate succours, and alarmed by the return of Probus with his victorious troops from the conquest of Egypt, she at length resolved to fly. She mounted the fleete of her dromedaries, and had already reached the banks of the Euphrates, about 60 miles from Palmyra, when she was overtaken by the pursuit of Aurelian's light horse, seized, and brought back a captive to the feet of the emperor. A.D. 273. To the consuls of her friends she imputed the guilt of her obdurate resistance; and on their heads, and particularly against the celebrated Longinus, she directed the vengeance of the cruel Aurelian. (See ZENOBIA.) Soon after her capital surrendered, and was treated with unexpected lenity. By a war thus terminated, those provinces that had renounced their allegiance, since the captivity of Valerian, were restored to the obedience of Rome.

Aurelian, on his return from the conquest of the East, had already crossed the Rhine which divide Europe from Asia, when he was suddenly recalled by the news of the revolt of the Palmyrenians, who had murdered the governor and garrison, and proclaimed a new emperor. Without a
moment's deliberation, he turned his face towards Syria, and soon arrived to execute vengeance on the revolted city, which for three days was delivered to the unexampled rage and rapine of the soldiery. Women, children, and servants, were involved in this dreadful execution, which ought to have been confined to armed rebellion; and although the emperor's principal concern seems to have been directed to the re-establishment of a temple of the Sun, he discovered some pity for the remnant of the Palmyreans, to whom he granted the permission of rebuilding and inhabiting their city. See PALMYRA.

Aurelian, having thus completely reduced Palmyra, and having also suppressed a rebellion in Egypt, excited by Firmus, a wealthy merchant, and a friend and ally of Odenathus and Zenobia, who had taken possession of Alexandria, and affirmed the purple, and whom he first tortured and then put to death; returned to Rome; congratulating the Senate, himself, and the people, that in little less than thirty years he had restored universal peace and order to the Roman world.

Since the foundation of Rome, no general had more nobly deferred a triumph than Aurelian; nor was any triumph ever celebrated with superior pride and magnificence. It is thus described by Gibbon: "The pomp was opened by twenty elephants, four royal tigers, and above two hundred of the most curious animals from every climate of the North, the East, and the South. They were followed by 1600 gladiators, devoted to the cruel amusement of the amphitheatre. The wealth of Asia, the arms and envoys of so many conquered nations, and the magnificent plate and wardrobe of the Syrian queen, were disposed in exact symmetry at artful disorder. The ambassadors of the most remote parts of the earth, of Ethiopia, Arabia, Persia, Bactriana, India, and China, all remarkable by their rich or singular dressings, displayed the fame and power of the Roman emperor, who exposed like-wise to the public view the presents he had received, and particularly a great number of crowns of gold, the offerings of grateful cities. The victories of Aurelian were attested by the long train of captives who reluctantly attended his triumph; Goths, Vandals, Saracens, Alemani, Franks, Gauls, Syrians, and Egyptians. Each people was distinguished by its peculiar inscription; and the title of Amazons was bestowed on ten martial heroines of the Gothic nation, who had been taken in arms. But every eye, disregarding the crowd of captives, was fixed on the emperor Tetricus, and the queen of the East. The former, as well as his son, whom he had created Augustus, was drest in Gallic trowsers, a faffron tunic, and a robe of purple. The beauteous figure of Zenobia was confined by fetters of gold; a slave supported the gold chain which encircled her neck, and the almost fainting under the intolerable weight of jewels. She preceded on foot the magnificent chariot, in which she once hoped to enter the gates of Rome. It was followed by two other chariots, till more sumptuous, of Odenathus, and of the Perian monarch. The triumphal car of Aurelian (it had formerly been used by a Gothic king) was raised, on this memorable occasion, either by four stags or by four elephants. The most illustrious of the senate, the people, and the army, clothed the solemn procession. Unfeigned joy, wonder, and gratitude, swelled the acclamations of the multitude; but the satisfaction of the senate was clouded by the appearance of Tetricus; nor could they suppress a rising murmur, that the haughty emperor should thus expose to public ignominy the perfom of a Roman and a magistrate.

"But, however, in the treatment of his unfortunate rivals, Aurelian might indulge his pride, he beheld towards them with a generous clemency, which was seldom exercised by the ancient conquerors. Princes who, without success, had defended their throne or freedom, were frequently flanged in prison, as soon as the triumphal pomp ascended the Capitol. These usurpers, whom their defeat had convicted of the crime of treason, were permitted to spend their lives in influence and honourable repose. The emperor presented Zenobia with an elegant villa at Tibur, or Tivoli, about twenty miles from the capital: the Syrian queen indescribably sunk into a Roman matron, her daughters married into noble families, and her race was not yet extinct in the fifth century. Tetricus and his sons were re-initiated in their rank and fortunes. They erected on the Celian hill a magnificent palace, and as soon as it was finished, invited Aurelian to supper. On his entrance, he was agreeably surprized with a picture which represented their singular history. They were delineated offering to the emperor a civic crown and the sceptre of Gaul, and again receiving at his hands the ornaments of the senatorial dignity. The father was afterwards invested with the government of Lydia; and Aurelian, who soon admitted the abdicated monarch to his friendship and conversation, familiarly asked him, Whether it were not more desirable to administer a province of Italy, than to reign beyond the Alps? The son long continued a respectable member of the senate; nor was there any one of the Roman nobility more esteemed by Aurelian, as well as by his successors.

"The festival was protracted by theatrical representations, the games of the circus, the hunting of wild beasts, combats of gladiators, and naval engagements. Liberal donations were distributed to the army and people; and several institutions, agreeable or beneficial to the city, contributed to perpetuate the glory of Aurelian. A considerable portion of his oriental spoils was consecrated to the gods of Rome; the Capitol, and every other temple, glittered with the offerings of his ostentatious piety; and the temple of the sun alone received above 15,000 pounds of gold."

The arms of Aurelian vanquished the foreign and domes-
tic foes of the republic; and we are affured, that by his s\lalutary rigour, crimes and factions, the luxuriant growth of a feble and opprressive government, were eradicated through the Roman world. Nevertheless, a few short intervals of peace were insufficient for the arduous work of reformation; and even his attempt to restore the integrity of the coin was opposed by a formidable insurrection, which originated with the workmen of the mint, and terminated by a bloody battle, in which the emperor lost 7000 of his troops. Of this insurrection, the real cause was disfigured, and the reformation of the coin furnished merely a feigned pretence to a party already powerful and discontented. The emperor, who was himself a pietist, and who always expressed a peculiar fondness for this order, had excited the jealousy and incurred the hatred and opposition of the senate, the equestrian order, and the Pretorian guards; and it was a conspiracy of the several orders that procured a strength capable of contending in battle with the veteran legions of the Danube. The rebellion, however, was suppressed, and Aurelian used his victory with unrelenting rigour. The noblest families of the capital were involved in the guilt or fulpiion of this dark conspiracy; and it was punished with a spirit of revenge that produced the most sanguinary effects. The executioners, says Calpurnius a contemporary poet, were fatigued; the prisons were crowded; and the unhappy senate lamented the death or absence of its most illustrious members.

Some of the concluding months of Aurelian's reign were occupied
occupied by a visit to Gaul, where he rebuilt the ancient city of Genabum, called after his own name "Aurelianum," now Orleans, and by an expedition against the barbarians who had made an insurrection in Vindelicia. But the object, which engaged his principal attention, was an expedition against Persia; in the prosecution of which he advanced as far as the Istrus, which divide Europe from Asia. Here a conspiracy was formed against his life by one of his secretaries, who was accused of extortion. This criminal, dreading the effects of the emperor's displeasure, determined to involve some of the principal officers of the army in his danger, or at least in his fears. With this view he artfully counterfeited his master's hand, and slewed them in a long and bloody list their own names devoted to death. Without suspecting or examining the fraud, they resolved to secure their lives by the murder of the emperor. On his march, between Byzantium and Herculaea, Aurelian was suddenly attacked by the conspirators, and, after a short resistance, fell by the hand of Mucapor, a general whom he had always loved and trusted. Accordingly he died, A.D. 275, regretted by the army, detested by the senate, but universally acknowledged as a warlike and fortunate prince, the useful, though fever, reformer of a degenerate state.

As to his general disposition and character, it has been observed by Dioceleon, one of the most sagacious of the Roman princes, that the talents of his predecessor Aurelian were better suited to the command of an army, than to the government of an empire. His temper was haughty and vindictive. Trained from his youth in the exercise of arms, he transferred the discipline of the camp into the civil administration of the laws; and his love of justice often became a blind and furious passion. Ignorant or impatient of the restraints of civil institutions, he disdained to hold his power by any other title than that of the sword, and governed by right of conquest an empire which he had saved and subdued. Aurelian has been reckoned by several Christian authors among the persecutors of the church; and it is said that he not only intended persecution and framed cruel edicts for this purpose, but had his images to the death, but did actually persecute. His persecution, however, reckoned by Augustine the length, was short; as he died soon after the publication of his edicts, and before they could reach the more distant provinces. Molheim is of opinion that many Christians did not suffer at this time; but considering Aurelian's cruel temper, and how much he was addicted to the Gentile superstitions, he thinks that if he had lived, his persecution would have exceeded all the former persecutions in severity.

AURELIANA, in Botany. See Pana.

AURELIOPOLIS, in Ancient Geography, an episcopal city of Afa Minor, in Lydia. - Also, another episcopal city of Afa Minor, in Asia properly so called.

AURELIUS, Ambrusius. See Ambrosius.

Aurelius, Marcian. See Antoninus.

Aurelius Victor, Sextus, in Biography, a Roman historian, flourished in the 4th century, probably from the reign of Constans to that of Theodosius; was born of mean and illiterate parents, perhaps in Africa, and notwithstanding the obscurity of his origin, was advanced by his talents to distinction. In 361, he was appointed by Julian, prefect of the second Pannonia; afterwards prefect of Rome; and in 369, consul with Valentinian. The abridgment of the Roman history, intitled "Libellus de origine Gentis Roman," and by some ascribed to Aemilius Pedianus, though it bears the names of Victor and Liutius, proposes a history of the whole period, from the uncertain time of Janus and Saturn to the 12th centiphery of Constantius, but really closes in the first year of the city. This treatise was published, together with the works of Dionysius Halicarnassens, at Frankfurt, in 1506; and with a collection of ancient historians, by Gothafer, in 1800, at Lyons, in 1511. The biographical treatise under the title "De Viris Illustribus Urbis Romae" received by many as the work of Aurelius Victor, commences with Procu king of the Albanians, and terminates with Pompey; it was published in 450. with notes, by Machameus, at Leipsic, in 1516, and with those of Lycothecenes, in folio, at Basl, in 1503. "The History of the Caesars from Augustus to Constantius," the unquestionable production of Victor, was first published by Schureus at Stralsburg, in 180, in 1503; at Venice, by Aldus, in 1516; by Schottus, at Antwerp, in 1759, in 8vo.; and at Basl, in folio, in 1546, with Saturnius and other Augustan writers. The first general edition of all the writings of Aurelius Victor was printed at Antwerp, in 8vo. with the commentary of Schottus, in 1579, by Plantin, and in 1582, again by Groter, at Hanau, in the 2d volume of the "Historiae Augustae Scriptores," in folio, in 1610. An elegant edition, with heads, "cum notis variantis," was printed in 8vo. in 167; another by Pritius, at Utrecht, in 1690; and a third by Arnaeus, in 8vo. at Amsterdam, in 1753.

Aurelius Victor is reckoned an indulgent and faithful historian; but his style is much less elegant than that of the earlier writers of the Roman history. Fabr. Bib. Lat. lili. c. g. t. 2. p. 79. &c. See Augusta Hilaria.

Aurelius, in Entomology, a species of Papilio that inhabits India. The wings are brown, black at the tip, and spotted with white; two eye-shaped spots on the posterior ones beneath. Fabricus, &c.

Aurelius, in Geography, a military township of New York, in Onondago county, on the Oswego lake, having the Cayuga reservation lands on the west, and Marcellus to the east, nine miles east of the ferry on the Cayuga lake. By the state census of 1796, 125 of the inhabitants are electors.

Aurella, in Entomology, a species of Phalaena (Tineo), wings golden, posterior ones black, with a stripe of silver on the first pair. A minute insect that inhabits Europe, and feeds on apple trees.

Aureng-Zebe, Aureng-Zebe, or Aurung-Zebe, denoting "Ornament of the throne," in Biography, the great mogul, was the third son of Shah Jehan, and born in the year 1618. His disposition was ferocious and thoughtful; and in order to prevent jealousy and suspicion, he assumed the authority of a religious mendicant. Dara, however, his elder brother, discovered his real character through this disguise; and as he had contribed to gain the esteem and confidence of his father, Dara used to say of him, "I fear none of all my brothers but this teller of heads." Shah Jehan, who thought it most prudent and safe to remove all his sons from court, sent Aurung-Zebe to govern the Deccan, where he made an unsuccessful attempt against the king of Golconda. Towards the close of the year 1656, Dara, endeavoring to gain possession of the empire, confined his father Shah Jehan upon which Aurung-Zebe hastened to make preparations, and with the professed design of securing the throne to his brother Morad, who was then at Akmedabad, requested that he would join him with his forces at Eugene, the capital of the province of Malwa. In the beginning of the year 1658, he marched form
from Aurungabad in the Deccan, and the two brothers joined at Eugene, near which place they encountered and defeated the troops which Dara had sent to oppose them. They afterwards marched towards Delhi; and in the fields of Kajoojah, near Agra, obtained a complete victory over Dara and his army; so that Dara himself fled towards Lahore, and Aureng-Zebe entered the castle of Agra. After this victory he took possession of the throne, July 29, A.D.1658, and was proclaimed emperor at the town of Eazbad, about six miles from Delhi. On the 15th of May 1659, he was proclaimed a second time, and he then issued a decree, that for the future the beginning of his reign should be dated from the first Ramazan, in the year 1669 of the Hegira, or the 12th of May 1659. For the security of his throne, he confined his father at Agra; and his brother Morad, in violation of a solemn oath of fidelity, he imprisoned in a fortress near Delhi, where he was afterwards beheaded. During the civil war which commenced at the time of his accession to the throne, and which was continued till his power was completely established, his brother Shah was first defeated at a place called Aurrav, in the province of Bengal, and compelled to fly; but beingencouraged in a plot for dethroning him, he was put to death, and his whole family was extirpated. Dara was taken prisoner, and brought in triumph to Delhi, and sent from thence to Kheerabad, a place at the distance of about 118 miles, where he was murdered by Aureng-Zebe's order, August 28th, 1659. In 1661, Aureng-Zebe confined his own son Mahomed, and the son of Dara, in the castle of Guhah, where the former died, as some say, in consequence of confinement, and the latter was dispatched by slow poifon. Aureng-Zebe, after his accession to the throne, found some difficulty in perfusing the chief cadi to acknowledge his sovereignty, because the old king, Shah Jehan, was still living. But another cadi being appointed in his room, the ceremonial of coronation was performed, and Aureng-Zebe obtained undisputed and peaceable possession of the throne. The recollection, however, of the crimes by which he had gained the sovereignty, was an occasion of remorse; and in order to quiet his mind, he imposed upon himself a rigorous penance; eating only barley bread, herbs, and fruits, and drinking nothing but water. This abfolens diet brought on an ilness, which endangered his life; and during the agitation which ensued at court, he had an opportunity of displaying that resolution and firmness of mind for which he was always distinguished. Although he had deplored his father, his behaviour to him was respectful and submissive, that he at length obtained, before his death in 1666, his forgiveness and paternal blessing. When Aureng-Zebe became emperor, he assumed the titles of "Mohy o'din," i.e. the reviver of religion; and "Alamguir," or the conqueror of the world, of which his ignorance and vanity led him to believe that he possessed three parts in four.

From the year 1660 until the year 1678, there prevailed, through Hindoostan in general, the most profound peace that had ever perhaps been known; but Aureng-Zebe desired to have any other boundary on the south besides the ocean. Accordingly, the conquest of the remote part of the Deccan employed a very considerable part of his leisure, during the latter part of his reign, when the whole of that region, together with the peninsula, a few mountainous and inaccessible tracts excepted, were either entirely subdued, or rendered tributary to the throne of Delhi. Aureng-Zebe was particularly induced to subdue the Deccan, by the determined spirit and growing power of Sevajee, the founder of the Mahratta state, who, by his conquests in Vifiapour, appeared under the character of his rival. Soon after he had quelled by his personal presence a rebellion of the Patans beyond the Indus, in 1578, his persecution of the Hindoos stirred up the Rajpoet tribes in Agimere. This war he also undertook in person; but he and his whole army were shut up between the mountains, and the empress herself was taken prisoner. She, however, and also the emperor, were permitted to escape. This disaster did not discourage him from carrying the war into the Rajpoet country again, in 1681; when he took and destroyed Chetiere, the famous capital of the Rana, as well as all the objects of Hindoo worship which he found in this place. Nevertheless the spirits of the gallant people were still unshaken, and Aureng-Zebe was under a necessity of granting them peace. In Mr. Orme's "Historical Fragments of the Mogul Empire," we have a letter written by Jefewat Sing, rajah of Jundypour, to Aureng-Zebe, expostulating with him on the unjust measures he was pursuing with respect to the Hindoos. This letter breathes the most admirable spirit of philanthropy, and of toleration in matters of religion, together with the most determined resolution to oppose the meditated attack on the civil and religious rights of the Hindoos. Whilst Aureng-Zebe was engaged in his contests with the Rajpoets, confiding of several of the most warlike tribes among the Indians, his son, Sultan Mohammad Akbar, revolted from him, and joined them; but he was purged by the emperor to Deccan, from whence he found means for escaping to Peria. In the year 1680, upon the death of Sevajee, the rising state of the Mahrattas devolved on his son Sambaijee, who was afterwards betrayed into the hands of Aureng-Zebe, and barbarously put to death. Still, however, the mountainous parts of Baglana were unsubdued; and although the kingdom of Vifiapour was reduced in 1686, and Golconda in the following year, he found it very difficult to prostrate his conquests towards the west, as we may infer from his camp's being fixed on the Kiltshah river, about 200 miles to the north-east of Goa, in 1695. But we have no regular history of any later period than the 10th year of Aureng-Zebe, or the year 1670, when Mr. Dow's history terminates. It is said, that Aureng-Zebe was employed in the Deccan from the year 1678 to the time of his death, and was actually in the field during the greatest part of the last fifteen years of his life. This dereliction of his original empire and capital for nearly thirty years, was the occasion of various disorders. To this circumstance were owing the second rebellion of the Rajpoets in Agimere, that of the Patans towards the Indus, and also that of the Iats, or Iates, in the province of Agra. Besides the conquests of Vifiapour, Golconda, and the Carnatie, to the south; and those in the kingdom of Aam to the north, Aureng-Zebe reduced Bengal, and refused the mouths of the Ganges from the Portuguese pirates, who had long infested them. Under his reign the empire attained its full measure of extent. His authority reached from the 10th to the 35th degree of latitude, and nearly as much in longitude; and his revenue, says major Rennell, exceeded thirty-two millions of pounds sterling, in a country where the products of the earth are about four times as cheap as in England. Fraser estimates the whole revenue of the empire from 21 fowalas, or provinces, at 12,071,876,810 dums, which at 320 dums to a pound sterling, amount to 37,724,615 l. 2s. 6d. Such indeed was the reputation for power and wealth which Aureng-Zebe acquired, that embassies were sent to him from all the neighbouring nations, as well as from the European powers, who wished to obtain commercial advantages in his dominions. But under an apprehension of the designs of his sons both against himself and against each other, he was obliged to pass most of his time
in his camp, which formed a kind of moving city. It is
descried by the curious traveller Bernier, who followed it
from Delhi to Cashmire. The guard of cavalry consisted of
35,000 men, that of infantry of 10,000. The number of
horses, mules, and elephants, was computed at 150,000; of
camels and oxen at 50,000 each; and of perambulations
between 300,000 and 400,000. Almost all Delhi followed the court,
whose magnificence supported the industry of its traders and
artisans.

Aureng-Zebe fixed his residence, when in winter quarters,
at Ahmednagar in the Deccan; and here he died, February
21st, 1707, in the 59th year of his age. According to
his directions of his will, he was buried in the cell of a holy
decree near this city: and as he professed great zeal for
Mahometanism, the vortaries of this religion deemed it a me-
tiorious pilgrimage to visit his tomb, particularly on the 29th of the month Zamind, the day on which he died.

In his will, after making this declaration, "I came naked
into the world, and naked I go out of it," he prohibits any
enlarges or royal pomp to accompany his funeral, and any
concern to be manifested by his fortunate children about a
monument; and he orders 10,000 rupees, about 125 l. to be
distributed among the poor at his funeral. Aureng-Zebe
forewarned the contents that would arise between his sons for
the empire; and it has been asserted that he made a part
ition of it among them. His will expressly intimates, that
he had made a division among his children, for preventing
confusion and bloodshed; and he states, that as there were
two imperial seats, Agra and Delhi, whoever settled in
Agra might have the provinces thereof, Deccan, Malwa, and
Guzarat; and who resided at Delhi, might have
Cablet and the other provinces. Nevertheless, two letters,
written by Aureng-Zebe to two of his sons a few days before
his death, cited by major Rennell, indicate no intention of
dividing the empire, but express in doubtful terms his ap
prehension of a civil war. These letters furnish this florid
leison to frail mortality, that however men may forget
themselves during the tide of prosperity, a day of 'recul-
lecion' will inevitably come sooner or later. Here we
are presented with the dying confession of an aged monarch,
who made his way to the throne by the murder of his br
then, and the imprisonment of his father; and who, after
being in power, confission of it, persecuted the most in
offensive part of his subjects, either through bigotry or hy
periodically. Here we behold him in the act of resigning that,
to obtain possession of which he incurred his guilt; and pre
ferred to us as a mere sinful man, trembling on the verge of
eternity; equally depraving the past, and dreading the fu
ture. How awful must his situation appear to him, when
he says, ' wherever I look. I see nothing but the Divinity.'

Aureng-Zebe left four sons; Mauzum, afterwards
peror, under the title of Behader Shah; Azem, and
Kaum Bukhá, who severally contested the empire with their
clother brother; and Akbar, who had rebelled against his
father, and fled to Persia. The death of their father was
the signal of hostility between Mauzum and Azem; the
former approached from Cablet, and the latter from the
Deccan, and disputed the possession of the whole empire
(for Azem had propped a partition of it), with armies of
about 300,000 men each. Neer Agra it was decided by
a battle, and the death of Azem. Mauzum was pro
claimed emperor, and reigned between five and fix years.
In the course of fifty years after the death of Aureng-Zebe,
a succession of weak princes and wicked ministers annihilated the extensive and mighty empire which he had esta
lished.

Aureng-Zebe possessed many talents which qualified him
Vol. III.
to the mosaic Auros of the middle age, and the mosaic Auros of Pudemny, being a part of the Atlas, extending southward from Constantin, quite to Bledughera. See Auros.

AURETTE, a river of France, which runs into the Seine near Bourges.

Aureus, in Entomology, a species of Staphylinus, that inhabits Siam. The head, thorax, and wing-cases, are covered with yellowish or golden down; abdomen black, furnished with ash-colour. Fabricius, &c.,

Aureus, Mons, in Geography, a mountain of Maria Prima, near the Danube.—And also, a town of the same name at the foot of it on the same river. Also, a mountain of the northern part of the island of Corsica, the ridge of which runs out to the north-east and south-east, and forms a kind of elbow. The emperor Probus planted vines on this mountain. Pulemy.

Aureus, in Ichthyology, a very splendid species of Car
todon, figured and described by Bloch in his History of Fishes, under the title of C. aureus, and by Bandoulière dorée. This author acquaints us, that he found the drawing of this species amongst the designs of father Plumier, and that it inhabits the Antilles, but of its history he is entirely ignorant.

The body is of an oval form, golden-yellow colour, and covered with hard denticulated scales; the mouth is small, lips strong, and jaws furnished with feteacious teeth; gill-cover of a single piece; lateral line rather arched; fins yellow, green at the end; pectoral and tail fin rounded, the others falcated; in the dorsal fin twelve rays. It is specifically distinguished by being of a golden colour, and having a spine near the check bone. Gmelin, Bloch, &c.

Aureus, in Natural History, a species of Limax, that inhabits trees in Denmark and Norway, and described by Müller as being yellow, and without spots. This creature is an inch and a half in length; beneath white; feelers, and a line between them, black.

Aureus, in Ornithology, a species of Oriolus in the Linnean system, and Parallel bird in that of Latham. A bird that is supposed to inhabit New Guinea. General colour tawny yellow, with the frontlet, chin, edges of the wings, and tail black. Olf. The length of this bird is eight inches; bill an inch long, and rather bent; shafts of the tail feathers, and fringe, near the tip yellow. This is the golden paradise bird of Latham; le troupiel de l'Indes d'Orfin; and le roulier de paradis de Buffon.

Aureus, a species of Psittacus, that inhabits Brazil, and is called by English naturalists the golden-crowned parakeet. This kind is green, with the cere and orbits blue-flith colour; crown golden; an oblique blue band on the wing-coverts. Gmelin. Brift. calls it pitcauta Brasiliensis; and Buff. perturche couronne d'or.

Aureus, in Zoology, the species of Canis usually called the Jackal; an animal about the size of a middling dog, and specifically distinguished by having a straight tail, and body pale fulvous. Schrèber Sæugth.—Gmel. &c. Kämp-fer calls it lupus aureus; Valcnt. vulpes Indice Orientalis; Brift. add; Buffon, clacal, advise; Volfser, chien sauvage Indien; and Gmel. and Penn. schakall, &c.

This animal inhabits the warmer parts of Afa and Africa, lurking among the woods and mountains in the day time, and venturing out in search of prey only during the night; when they assemble together in herds to the amount of two or three hundred, and indiscriminately attack and devour the fatter kinds of animals and birds; and will occasionally eat also certain kinds of vegetables. The voice of the jackal is described as peculiarly hideous, confiding of a kind of howl-
ing and indistinct barking; and when they hunt in troops, by their dreadful yelpings alarm and put to flight deer, antelopes, and other timid quadrupeds; while the lion, insen-
sciently attending to the clamour, is said to follow till the jackals have hunted down the prey, and having fattened himself, leaves only the manglest remains to be devoured by the jackals. It is for this reason, Dr. Shaw observes, that the jackal is popularly termed the lion's provider. When prefted by hunger, jackals have been frequently known to enter towns, and devour indiscriminately whatever animal substance they can find. They commit ravages among the flocks, kill fowls, &c. and have been known to attack mankind.

There is great reso, according to Dr. Shaw, for supposing this animal to be the real origin of the dog, since almost all its manners and propenities are the same. When taken young, it is easily tamed; attaches itself to mankind, distinguishes its master, comes on being called by its name, shews an attachment to dogs instead of flying from them, and has all the other peculiarities of character by which the dog is distinguished; amongst others, the important observation of prof.-lor Guldenslath, who has given an accurate description of the jackal in the Peterburgh Transations, shou'd by no means be omitted, viz. that the jackal and dog, agree in the structure of the coccyx or short inteline, and differ in that respect both from the wolf and the fox.

Dr. Pallas has favoured the world with an accurate de-
scription of this animal. In external figure, he remarks, the jackal resembles the wolf more than the fox. It is also larger and flanks higher on its legs than the fox. The head is of a fox-red colour above, mixed with ash-grey hairs which have each a blackish ring and tip; the upper lip is white on each side of the nose, and the throat is of the same colour; the whistles, the long hairs on the chin, and those above the eyes, which are five in number, are black; the ears are fox-red externally, and white internally; the neck and back are all over grey-yellow, and both, but especially the latter, are dined with a shade of dusky, owing to the tips of the long hairs on those parts; the under part of the body, and the legs, are of a light reddish yellow, but the shoulders and thighs are externally of a fox-red; the claws are black; the thumb claw stands higher than that of the dog, and is crooked; the tail is straight, somewhat longer and more hairy than in the wolf, and is of a greyish-yellow, more inclining to fox-red towards the end; the long hairs have black tips, and consequently the tip of the tail appears black; the hair of the jackal is coarser and stronger than that of the wolf, and is longest on the shoulders and tail, where it measures four inches; on the neck and back it is shorter by an inch; between the hairs is situated a woolly fur of a grey colour; the four middle front teeth are of a truncated form, or, as if cut off, flat, not perceptibly notched or indented; the two exterior larger ones in the upper jaw are somewhat larger than the under; the grinders are fix on each side, the first being the smallest, and of a conical shape; the next grinders, to the number of two in the upper, and three in the lower, are gradually larger, and divided into three points; the fourth of the upper jaw and the fifth of the under are the largest, and have two points; the remaining ones stand deeper in the jaw or more inwards, and are smaller than the preceding; the tongue has, on each side, a border or row of small verrucose or warts.

Mr. Pennant describes the usual length of the jackal to be about two feet and a half; the female rather smaller than the male, and with fix to eight paps. Dr. Pallas describes in a young jackal three teats on one side, and four on
on the other, of which the foremost one was situated near the side of the breast.

The more we consider the nature and manners of this animal, says Dr. Shaw, the more reason we shall find to coincide with professor Guldenstadt in opinion, that the jackal is the real origin of the dog (unless, indeed, we allow the wild dogs of Africa to be the dog in a state of nature). M. Guldenstadt very properly observes, that the natalorum of the wolf does not seem to fit it for the suppos'd origin of the dog, since it is generally confined to the frigid zone; its size is also against the supposition; for the natural size of any species of animal appears to be greater than that of the large and small varieties. The fox is still more unlike the dog, as to some particulars in the structure of the intestines; the native country of the jackal, which is properly Asia Minor, is the land where we should naturally suppose the primitive domestic dog to have originated. The jackal, according to M. Guldenstadt, has a natural propensity to follow mankind, instead of flying from him, like the wolf and the fox. The whelp, he adds, is very readily tamed, and when grown up, assumes all the habits of the domestic dog. That the jackal and dog readily intermix, appears from various testimonies, according to Buffon. M. Guldenstadt cannot consider the recurvate tail as a specific character of the dog, but thinks it may have originated from circumcision. The general colour of the jackals, which this author has seen, is a dirty fulvous, rather blacker on the back, and yellowish-white beneath; on each knee in a general black patch, and the tip of the tail of the same colour.

AUREUS, in Antiquity, the Roman gold coin, equivalent to 25 denarii, or 100 sesterces. Suet. in Oth. c. iv. Tacit. Hist. lib. i. Beverin, de Ponder. p. 33, seq.

In Modern and Middle Age Writers, it is called solidus, or solidus aureus.

The aureus, according to Arbuthnot, generally weighed double the denarius; whence it must have been worth, according to the first proportion of coinage mentioned by Pliny, l. 4. s. 3d. sterling.—According to the proportion that now obtains among us, l. 8s. 9d. Plin. lib. xxxix. c. 3. Arbuth. tab. 25. —Ainfworth, however, makes the aurei (denarii) of the higher empire, weigh only five pennyweights; and under the lower empire, little more than half so much.

The weight of the aureus was gradually diminished by the emperors. The confular aureus weighed at a mean 126 troy grains, 40 of them being contained in the Roman pound; the imperial aureus, being 45 to the pound, weighed 112 grains; and the solidus, being 72 to the pound, weighed 70 grains. Alexander Severus coined pieces of one-half and one-third of the aureus, called semis and tremisses; whence the aureus came to be called solidus, as being their integer. Phil. Trans. vol. xxi. part ii. art. 42. See Coin, and Denarius.

AURIA, VINCENT, in Biography, an Italian historian, was born at Palermo in 1623; devoted himself to the profession of the law, and was admitted doctor of laws at Catania, in 1652. He afterwards relinquished this employment, and following a liberal fortune, dedicated his time to literature. His works were chiefly Italian, and partly Latin, on subjects of history and antiquities. Thence in highbred estimation are called "An History of the Great Men in Sicily," 4to, Palermo, 1701; and "An History of the Viceroys of Sicily," fol. Palermo, 1697. Nouv. Dict. Hist.

AURICELLA, in Entomology, a species of Phalane (Tinea) found in France. It is snowy-white, with telfaceous streaks on the wings, and a projecting tuft of hairs on the first joint of the antennae.

AURICHELLA, in Entomology, a species of Scaraeus, of a brassy-opake colour, wing-casus pointed and spotted with white. Fabricius. Inhabits the East Indies.

AURICHELUS, a species of Cerambyx (Calilium Fabr.), of a small size. It is brassy-brown and shining, thorax depressed; antennæ and legs black. Degeer.

AURICHELUS. See Osrichalcus.

AURICHELUS. AURICULA, in Anatomy, the external ear, or that part of the ear which is prominent from the head. The word is a diminution of auris, ear; for the description of this part, see Ear.

AURICHELUS. AURICULARIA, in Anatomy, a species of Palena (Notur), with wings of a greyish-brown colour; upper pair marked with black, in streaks and characters; legs annulated with white at the tip. Gmelin &c.

AURICULA LEAF, in Botany. See Buphthalmum, and Bupleurum.

AURICULA MURIS. See Arnaria, Cestarium, Hieracium, Myosotis, and Silene.

AURICULA URIS. See Arctia, Primula, Dodecatheon, and Verbascum.

AURICULA, in Conchology, a species of cardium, with a white and very pellucid shell, that is found on the shores of Arabia and Egypt. It is heart-shaped and sub-rombic; ribs twenty-four on each side; the grooves very finely crenelated; beaks remote. Fork. About two inches and a quarter in length, and one inch and three quarters in breadth.

AURICULA, A species of Patella, with a subround shell, radiated with furrows and striae; apex recurved; internal cavity car-shaped. Inhabits the shores of the islands of Borneo, Santa Cruz, and St. Thomas. This shell is snowy-white, with the crown sometimes encircled with violet; sometimes radiated with black; brown within; border white or yellow; and the vertex brown. Gmelin, &c.

AURICULA, in Gardening, a well-known beautiful plant of the flower kind. This is considered in the Linnean system as a species of primula. See Primula.

The varieties of the plant are extremely numerous, as every year produces a great number of flowers, different in shape, size, and colour; in the leaves also there is often great variety, so that the experienced florist is frequently capable of distinguishing the particular sorts by that means. The characters of a good auricula are, that the stems of the flowers be lofty and strong; the footstalks of the single flowers short, with the umbels regular and close; the neck of each flower short, and the flowers large, regular, and spreading, but not inclinable to cup; the colours very bright.
AURICULAR Confusion, is that made in the ear privately.

AURICULAR Medicines, are such as are suited to the cure of the diseases of the ear.

AURICULARIA, in Botany, See Hydrotis.

Auricularia, in Conchology, a species of Helix, or fresh-water snail, found in stagnant waters in Europe. This shell is imperforate, obtusely-ovate, with a short and acute spine, and capacious aperture. Linnaeum. Succ. Mull. Zool. Dan. Donov. Brit. Shells, &c. It is a very thin and brittle shell, rather polished, and of a horn or whitish colour; length from half an inch to an inch and a quarter, and easily known by the very ventricose appearance of the first whorl.

Auricularia, in Entomology, a species of Forticula, that is perfectly known in England by the name of common ear-wig, or ear-piercer, from an opinion generally prevalent that it creeps into the ears, and thence into the brain, of people who inadvertently lie down to sleep in fields, gardens, and other places where those creatures inhabit. It is specifically distinguished from other insects of the same genus by having the wings-cases twisted, and the antennae. Lister calls it scabreus fulvus cauda furcatas; and Frisch vermis auricularius.

The ear-wig is a very destractive creature, both in the orchard and flower-garden, and especially to wall-fruit, carnations, and roses. In order to prevent the mischief attending them, it is usual to erect stands supporting bassons of water, or to hang the hollow claws of crabs or lobsters, tobacco-pipes, &c. on thongs in different parts of the garden, for them to creep into in the day-time, in order to catch and destroy them. Reeds open at both ends, and placed among the branches of fruit-trees, are also a good trap for them, as they crowd into their open channels, and may be easily collected, and thrown into a tub of water.

That the ear-wig or ear-piercer will creep into the ears of such as sleep in the open air, in those places where they inhabit, cannot be denied; but those who are acquainted with the anatomy of the head, affirm that it is impossible it can ever enter the brain, because, say they, there is no open communication between the ear and the brain, and the jaws of the insect are too weak to effect one. In France the same prejudice prevails against this creature, among the lower orders of people, as in England; and, as with us, it is called from that circumstance the ear-piercer (pierce-oreille). Its mottlable formidable weapon, in their opinion, is the pair of forceps at the extremity of the body, a character peculiar to the genus, and not to this particular species. "C'est cette arme," says Dugger, "qui a fait donner a ces insectes le nom de forticula, et en françois le nom redoutable de perce-oreille, parce qu'on l'aït imaginé que cet insecte s'introduit dans les oreilles, que de la il pénètre dans le cerveau, et fait périr. Ceux qui savent l'anatomie, reconnaissent l'impossibilité d'une pareille introduction dans l'intérieur du crâne, attendu qu'il n'y a point d'ouverture qui y communique; mais la frappe de qe quelque chose qui en ces insectes fera par hâbard entré dans la conduite de l'oreille, aura pu donner lieu à cette faible, &c."

The use of the forceps, with which the ear-wig is furnished, is to defend itself against other small insects, and when touched it never fails to displace them in a threatening posture, by turning up the extremity of its abdomen. The larva differs very little from the complete insect, and runs with great agility.

Auricularia, in Anatomy. See Abductor.

The finger next the little finger is also called auricularis, by the Greeks, because used in picking the ears.

AURICUL...
AURICULATA, in Natural History, a species of Vor-
ticella that inhabits the fresh waters of Dänmark. It is
naked, with two small bristles at the tail. Abb. Hist. Vern.
This kind is pellucid, cylindrical; the aperture dilated into a
small car on each side.

AURICULATA, a species of Doris, of a white colour,
with dorsal fuscous papille of a red colour tipped with
white. This kind inhabits the North sea. Gmelin.

AURICULATED Leaf, in Botany, is a leaf which has
a leaf on each side towards the base.

AURIENSIIS, in Ancient Geography, an episcopal city of
Africa, in Mauritania.

AURIFER, in Entomology, a species of Cuculio, with
a ferruginous body spotted with gold. Fabricius, Sp. Inf.
Inhabits America, and has the front legs long.

AURIFER, a beautiful species of Buprestis that inhabits
Cayenne. The wing-cases are green, with numerous im-
presied golden dots, and each terminating in two teeth; legs
azure. Fabricius. Olivier.

AURIFLAMMA, in the French History, properly de-
notes a flag or standard, belonging to the abbey of St. Den-
na, suspended over the tomb of that saint, which the reli-
gious, on occasion of any war in defence of their lands or
rights, took down, with great ceremony, and gave to
their protector or advocate, to be borne at the head of their
forces. Du-Cange.

AURIFLAMMA is also sometimes used to denote the chief
flag or standard, in any army.

AURILUA, in Entomology, a species of Phalea
(Donkey), that infest the apple-trees in Germany, and bears
a strong resemblance to phalea chryfophaca. The wings
are white, with a brown rip on the under-side of the ante-
pair; tail bearded and yellow. The larva is hairy, black,
with red lines, and white dots on the sides; a protruber-
ance on the neck, and another near the tail. Gmelin.

AURIGA, in Astronomy, the Waggoner; a con-
fellion of flars in the northern hemisphere: white flars, in Pi-
tomy's catalogue, at 4; in Tycho's, 27; in Hevelius's, 40;
in the Britannic catalogue, 66. This is one of the 48 af-
termics, mentioned by all the ancient astronomers; and
represented by the figure of an old man in a kind of fitting
pouture, with a goat and her kids in his left hand, and a
bridge in his right. Besides the Hoedi, this constellation
includes another of the flars which the ancients distingui-
shed by peculiar names, that is, Capella, the goat Capra, and
Amalthea Capra, which is the bright one near the shoulder,
and supposed to be the mother of the Hoedi, and the
nurse of Jupiter. The Hoedi, or the two flars in the arm
of Auriga, were regarded by the ancients as affording
preages of the weather: and they were so much dreaded
on account of the storms and tempests that succeeded their
rising, that they are said to shut up the navigation of the
sea at this season. When the day of their peculiar influence
was past, they celebrated a festival with sports and games.
under the denomination of "Natali Navigations." Ger-
mancis calls them unfriendly flars to mariners; and Vir-
gil joins them with Arcturus, mentioning their setting and
rising as circumstances of the most important preage.
The same purpose all the ancient critics represent a part of
the constellation Auriga, if not the whole of it, as de-
fering particular attention, and as much an object of terror
as the blazing Arcturus.

AURIGA, in Ichthyology, a species of Ctenodon, found
in the Arabian seas. It is whitish, obliquely facedated with
brown; and the fifth ray of the dorsal fin, filiform. Forc.
Fow. Arab.

The length of this fish is five inches; form nearly rhom-
bic; whitish colour tiaged with blue; the brown oblique
lands fifteen in number, and disposed nearly parallel to
each other. The scales are rhombic; head landed, above
flat, seys, of a reddish white colour, with four transverse
fulvous stripes; iris black; mouth conic and compressed;
lip rotenated and equal; posterior margin of the dorsal fin
black; anal fin varied with black and yellowish-white; tail
truncated and fulvous; lateral line bent.

AURIGNAC, in Geography, a town of France, in the
department of the Upper Garonne, and chief place of a
canton in the district of St. Gaudens, 32 miles southwest
of Toulouse, and 10 northeast of St. Gaudens.

AURIGNY, Hayastho Robertseit, in France, a
French historian, was born at Caen in 1605, became a
member of the society of Jesuits in 1627, and died in 1719.
His works, compiled in four volumes, were not printed at
Paris in 1725 and 1727, are "Memoires, chronologica-
domical, for Ecclesiastical History, from 1660 to 1716,"
with critical remarks; and "Memoirs for the Universal His-
ory of Europe," for the same period. They are much
valued for variety of materials, accuracy of dates, and
elegance of style; but are not deemed in part. Now.
Dict. Hift.

AURIGRAPHUS, from aurum, gold, and grapho, to
write, in Middle Age Writers, a copyist, or calligrapher, who
wrote in gold letters.

AURILLAC, in Geography, a town of France, and
principal place of a district in the department of Chalon,
and, before the revolution, the capital of Lower Auvergne.
It is situated on the river Jordan, in a fertile valley; and
the castle, which is high, commands the town. N. lat.
44° 35'; E. long. 2° 37' 27".

AURILLE, a town of France, in the department of
the Mayne et Loire, and chief place of a canton in the
district of Angers, one league north of Angers.

AURIMS, in Ancient Geography, a town of Italy, in
Etruria.

AURICOL, in Geography, a town of France, in the de-
partment of the Mouths of the Rhone, and chief place of a
canton in the district of Aix, four leagues south-east of Aix,
and four N. E. of Martiilucles.

AURIPIGMENT, called also Orpiment. St. Arsenic.
Note of p. 5. var. 2.

AURIS, the ear. See Ear.

AURIS DIAM., in Conchology, a species of Stom-
bus, adopted by Linnæus and Gmelin, after Argenteuille.
The lip projects into a sharp point; back micracere; tail erect
and pointed. Linn. Inhabit the southern coasts of Africa;
is about three inches long; thick; falcantium one colour,
but variegated; on the back are generally three, and some-
times four, rows of tubercles, with the interstices trans-
versely ribbed; and the outer whorl cannulated; mouth
white colour; pillar white. Gmelin, &c.

AURIS HIJOSUTA, a name given by Rumphius to the
shell, since called maria Anglica. Linn. and Gmel.,
andchrist by Argenteuille.

AURIS JUNX, a species of Voluta, with a contracted
oblong shell, having a smooth spine, and splayed column.
Linn. Muf. Lond.—Gmel., describes it as helix tuta
cylindrica subgranulata, operculum conico, libra ad axin
tridentato. This shell habits the seas in India, and re-
sembles voluta auris modest, but is smaller, and narrower.
The colour is brown, or white with brown waved spots;
whors of six spires, the first and exterior ones very finely
fringed. Gmelin.

AURIS MALCHI, a species of Voluta, about three
inches in length, and is a native of New Caledonia. The
shell is fusiform, granulated, with an oval aperture; pilar-
lip cut and much spread. This is called *voluta auris malchi* by
AUR

by Miill; verm. flax. et terr. Chemnitz figures it, and

See. It the AuRis AURITA, Gmelii, var.; turb. ovate, &c. and Turb. ovate, is a specie of Turbo, that inhabits the Mediterranean sea. This shell is white, and very smooth; aperture with an advanced flatlips, concave, obtuse lip. Gmel. &c. This kind is milky-white and fibrous; whorls of the spire seven or eight; aperture dilated, and resembling an ear-picker; with a margin. 

AURICALCIUM, an instrument wherewith to pick and cleanse the ear from wax; and also serving for some other operations relating to that part. The word is compounded of auris, ear, and scala, I scratch, or pick.

AURISPA, JOHN, in Biography, was born in 1769, at Noto, in Sicily. He studied the Greek language at Constanti- 

nople; and on his return to Italy, brought with him more than 100 Greek MSS. chiefly of pagan writers, which were more easily obtained than the writings of Christians; after a second visit to Constantinople in the train of the emperor John Palaeologus, he taught the Greek and Latin languages at Bologna, Florence, and Ferrara. He was secretary to pope Eugenius IV. and Nicholas V. and enjoyed benefits in Italy. After the death of the latter, who was his patron, he returned to Ferrara, and continued the breach and untimely for the time of his death in 1460. He translated some of the writings of Archimedes, and the commentaries of Hierocles on the golden verses of Pythagoras; and published poems and letters. His version of Hierocles was printed at Bifte in 1543. Nouv. Dict. Hist. Gen. Biog.

AURIST, in Medicine and Surgery, one whole profession it is to cure diseases of the ear.

AURITA, in Conchology, a species of Balanus, which inhabits the North Seas, and is described by Lillius. This shell is membranaceous, ventricose, seated on a tube, and carted; mouth with eight valves, and dentated. Gmelin, &c.—Ellis calls this lepas nada conoma aurita.

AURITA, a species of ANOMIA, with a shell of a somewhat ovate form, flattened, and slightly caved; back perforated. Guait. Inhabits the seas about Norway, and bears some affinity to another species of the same genus, called by Linn. and Gmel. caput foranima. 

AURITA, a species of Mysa, that inhabits New Zealand. The shell is ovate, compressed, and closed; hinge with two lateral teeth. Chemnitz. Colour forlaid ochraceous.

AURITA, in Entomology, a species of Ramula, with the thorax margined, dilated in front; each side on the wing-cases bicinicated. Inhabits Siberia, and is entirely of a black colour. Pallis, &c.

AURITA, a species of Philamena (Neosia) that inhabits Spain. The wings are shining-brown, with a cinereous band in the middle; two denticles of fliff hairs on the head, and four others on the thorax. Fabricius, &c.

AURITA, a species of Cicada, that inhabits Europe. The thorax is dilated into the form of two cars; shield of the head spreading, and rounded. Geoffroy calls this cicada thorace obtuse bicornis. It feeds on the oak and nut trees, and is entirely of a cinereous colour. Gmel. &c.

AURITA, in Natural History, a species of Medusa, having four cavities beneath. Linn. In Succ. This kind inhabits the Baltic and other seas; is of an hemispherical form; hyaenae; from two to four inches in diameter; and when floating on the sea in sunshine, reflects a beautiful splendor. The margins are fringed and yellow. Aldrovandus calls this aurita festa.

AURITA, in Zoology, a species of Laperta that inhabits the sandy parts of Siberia about Naryn, and the desert of Coman. It is described by Pallis as having a tail of a moderate size, round, with callous dots on each side, dilated into a femoribicuiar, fus, februous, dentated creed. This animal is rather larger than aurita pecs; the colour above is cinereous and yellowish, clouded, and thickly speckled with brown; beneath whitish; spot on the cheek, and tip of the tail beneath, black. The head is retuse; crest of the animal, when alive, turgid with blood; body ventricose and depressed, and with the legs and tail rough, with acute prominent dots; toes five, each furnished with a claw, and the three middle-most ones serrated, the inner one having a single notch, and the others two notches each. Gmelin, &c.

AURITAE, called also Hyksos, and Shepherds, in Ancient History, the denomination of a large body of adventurers who migrated into Egypt at a very early period. Ancient and modern writers have not agreed in their conjectures concerning these enterprising and fortunate people. Manetho supposes the Aurite to have been Egyptians; but the learned Bryan maintains that they were Arkites, who had been expelled from Babylon by the ions of Shem, at the second dispersion. Unwilling to remain at home ingent and inactive, or unable to reful the flock of some powerful foe, they abandoned a region which they could no longer pull as in tranquillity, precipitated themselves into Egypt, drove the disintegrated tribes of Ham from the most fertile part of their territories at the upper end of the Delta, and settled there. This invasion happened soon after the Syracans had become formidable by the conquests of Nimus; for we are told that the Aurite fortified the eastern borders of their new settlements towards Arabia and Cappadocia. About this time, as all the ancient historians assert, the Delta had acquired the confidence of a moral. Drained by the shepherds, it soon became a temperate and beautiful, as it naturally was a fertile, region. For the space of two centuries and a half, this bold and enterprising race kept possession of Middle and Lower Egypt. In the course of this period they discovered, we are told, many useful arts and inventions, and from time to time sent out colonies in quest of new settlements. Two hundred and sixty years after their arrival in Egypt, the poverty of the original nations, not
AUR

AUR

founding sufficient accommodation in Upper Egypt, to which they had been hitherto confined, or evading the furs of their fortunate invaders, commenced hostilities against them. After a long, doubtful, and bloody contest, the Aurens were obliged to retire. They separated into several bodies, and migrated into Phenicia, Syria, Greece, and other regions, carrying their inventions and improvements along with them. This memorable revolution happened not long before the defeat of Jacob. Playfair's Chronology, p. 63. See Dispersion of Mankind, and Shepherds.

AURITUS, in Entomology, a species of Cancer that inhabits Iceland; and is distinguished by having a single spine on both sides of the anterior part of the thorax; back grooved, and foifih. Fabricius.—Obs. This is crbysoma aurita of Linnaeus. Syll. Nat.

AURITUS, in Natural History, a species of Echinus that inhabits the Persian seas. The colour is yellowish-grey, with the upper margin chestnut; base flat; punctured and marked with radiated streaks; anus oblong and situated near the mouth. It is specifically described by Leske as a new species, having a waved margin, the lower one rounded, upper one nearly square, and twice divided, and a gaping pore between every two avenues.——Goeaerde Tornp-hart. P. E. Zee-eg, &c.

AURITUS, a species of Cryptopus, found on the oak, in Saxony. It is black, with a yellow spot on both sides of the thorax, and shanks of the legs yellow. Fabricius.—Obs. This is cycrops aurita of Linnaeus. Syll. Nat.

AURITUS, in Ornithology, a species of Turdus that inhabits Cayenne, and is called fourmilier a oreilles blanches by Buffon; and white-eared thrush by Latham. Above, it is varied with rufous and olive; beneath white; crown and pectoral band reddish-brown; chin and throat black; irides behind the eye defneding on the neck, and consisting of elongated, white, glossy feathers. Gmelin. &c. Length four inches and three quarters.

AURITUS, a species of Columbus, with a black head, and ears crested with a tuft of rufeous feathers. Linn. Fn. Suec.

"The length of this species is twelve inches. In England, they inhabit the fens near Spalding, where they breed; they are found in the northern parts of Europe, and in the temperate parts of Siberia and Iceland. It is said by Bougainville to be met with in the Falkland Islands, where it is called the Thrush with spectacle. The neck, like that of most other birds in this genus, is composed of twigs, roots, and flakes of aquatic-plants, and is usually found floating among the reeds and flags nearly filed with water. The female lays four or five small white eggs, which are hatched in the nest while it remains thus immersed in water." Donov. Brit. Birds, &c. C. auritus, eared grebe. Gelfer calls this species mergiti genus alterum; and Buffon le petit grebe huppé. Gmelin speaks of a variety of this species colymbus corvus minor of Erifvon; and colymbus jux poecile minor of Will. Oren. Ray. and Albin.

Auritus, a species of Trochilus, of a green-gold colour above, and white beneath, below the eyes a band of black; and in the male two tufts of feathers of a violet colour on each side of the head under the ears; legs downy. This is multilloa Cayennensis of Bril.; and l'oiseau-mouche à oreilles of Buff. Latham describes it under the name of violet-eared humming-bird. There is a variety of this bird with a purple stripe below the eyes; near the ears a black spot, and beneath it another of blue. This species inhabits Cayenne, and is about four inches and a half in length.

Aurium Abscessis, in Antiquity, cutting off the ears, was a punishment inflicted by the ancient law on those who robbed churches; and afterwards on every thief; and at length on divers other criminals.

AurobiMunster, in Geography, a town of Germany, in the circle of Bavaria, 15 mil. south of Passau.

Aurocapilla, in Ornithology, a species of Motacilla, found in St. Domingo, Jamaica, and other islands in the American seas. It is olive, beneath white; crown golden; eye-brows black; breast spotted with black. Gmelin. This is dieseota Pennsylvaniae aurocapilla of Blas. grisee vol de S. Domingue of Buff. and golden-crowned thrush of the Arctic Zoology.

Aurogallus, Matthew, in Biography, a grammarian of the 16th century, was a native of Belgium; and became professor of languages in the university of Wittenberg. Before the assistance he gave to Luther in translating the Bible, he wrote in Latin a "Compendium of Hebrew and Chaldean Grammar," printed at Wittenberg, in 1525, and at Basle, in 1539; and a treatise on the geography of the Holy Land, intitled "De Hebræis Urbium, Regionum, Populorum, &c. Nominibus," printed at Wittenberg, in 1526, and at Basle, in 1529. 8vo. He died in 1542. Gen. Diet.

Auroir, in Geography, a town of France, in the department of the Cher, 21 leagues north-west of Sarceaux.

Auron, a river of France which runs into the Loire, near Bourges.

Auronitens, in Entomology, a species of Carabus of the aperous kind. The shells are green and rough, with raised lines; thighs rufous. Inhabits Saxony. An intermediate species between ceratius auritus, and initus.

Auronzia, in Geography, a town of Italy, belonging to the ilate of Venice, in the Cadorin, seven miles north of Pieve di Cadora.

Aurora, in Astronomy, the morning twilight; or that faint light which begins to appear in a morning, when the sun is within eighteen degrees of the horizon.

Aurora, in Conchology, a very rare species of Cypræa, discovered on the coast of Otahete by captain Cook. It is rather ova; margin white; back fine orange, and without spots. Among collectors of exotic shells, it is known by the name of cypra aurora, or morning-dawn cowry.

Aurora, in Entomology, a species of Phalæna, in Abbot's Insects of Georgia. The upper wings are yellow, base and margin speckled with red. Smith.

Aurora, the specific name under which Papilio Can- damines is described by Linn. In Fn. Suec. i. n. 501.

Aurora, a species of Papilio (Don. Can.) found in Siberia. The wings are fulvous; beneath, an ocellar dot on the anterior wings, and a selye dot, with a contiguous one still smaller in the middle of the posterior pair. Fabricius, Gmelin. &c.

Aurora, a species of Lampyris (Pyræbro Fשb.), given by Hebril. as a native of Pomerania. It is black; thorax red and cancelled; wing-cases chefnut, with four elevated lines, and the intermediate spaces dotted in rows.

Aurora, in Geography, an island belonging to the Archipelago of the New Hebrides, in the South Pacific ocean, discovered by Bougainville, in 1768. It is about twenty leagues long, and two broad, and lies nearly north and south. Its eastern shore is steep, but it has a small bay on the north-west coast. It abounds with wood and fresh water; and is inhabited. The vegetation of this island is luxuriant. The middle of it lies in 5 lat. 15° 8'. E. long. 160° 19'.

Aurora.
Aurora, in Mythology, the goddess of the morning, was, according to Heiod, the daughter of Thea and Hyperion, and sister of Sol and Luna; but according to others, the daughter of Titan and Terra. Under this title the ancients defined the light which precedes the rising of the sun above our hemisphere. The poets represent it as rising out of the ocean in a chariot, drawn by two rote-coloured horses, called by Homer, Lampus and Phaeton, with rosy fingers dropping gentle dew. The large vein on her head was folded backwards, to denote that the brightness of day was already advanced, to as to disperse the darkness of the night. Virgil describes her as ascending in a flame-coloured chariot with four horses.

Aurora, in Ornithology, a species of Psittacus that inhabits Brazil. It is yellow; scar-pits, margins of the wings, and outer great quill-feathers in the middle, red. This is Psittacus lucens of Drift, pororogut jaune of Saturn. Orn. amarow jaune Buffon, and aurora-porat of Latham.

The length of this bird is twelve inches; bill, cere, legs and claws white; eye-brows and irides red; tail rounded, and four exterior feathers red within from the base to the middle. Gmelin.

Aurora, in Zoology, a species of Columba with 179 abdominal plates, and thirty-seven subcaudal scales. This is a native of America, and is of a livid colour, with the back yellow. Gmelin. Dr. Shaw describes it as an orange-coloured snape, with yellow dorsal band and abdomen. Length about two feet and a half, and moderately thick in proportion; head rather large, and covered with very large scales; tail short, and tapering to an obtuse point.

Aurora Borealis, or Aurora Septentrionalis, in Phystiology, the northern dawn or light, sometimes called firemoters, is an extraordinary meteor, or luminous appearance, showing itself in the night-time, in the northern part of the heavens: and most usually in frosty weather.

It is usually of a reddish colour, inclining to yellow, and sends out frequent conflagrations of pale light, which seem to rise from the horizon in a pyramidal undulating form, and shoot, with great velocity, up to the zenith. This light sometimes appears remarkably red, as it happened Dec. 5, 1772, of which we have very full accounts from divers parts of Europe, in the Phil. Trans. No. 495. sect. 7. p. 582. 606.

The aurora borealis appears frequently in form of an arch; chiefly in the spring and autumn; after a dry year. The arch is partly bright, partly dark; but generally transparent. And the matter of which it consists is also found to have no effect on the rays of light which pass through it. Dr. Hamilton observes, that he could plainly discern the smallest speck in the Pleadiuns through the denseness of those clouds which formed the aurora borealis in 1763, without the least diminution of its splendour, or incarescence of twinkling. Phil. Trans. 1763. p. 506.

Sometimes it produces an iric.—M. Godin judges, that most of the extraordinary meteors and appearances in the skies, related as prodigies by historian, e. g. Battles, and the like, may be probably enough reduced to the clafs of aurora borealis. Vide Phil. Acad. R. Scien. an. 1762. p. 405.

This kind of meteor, which is more uncommon as we approach towards the equator, is almost constant during the long winter, and appears with the greatest lasure, in the polar regions.

In the Shetland islands, the "merry dancers," as the northern lights are there called, are the constant attendants of clear evenings, and afford great relief amidst the gloom of the long winter nights. They commonly appear at twilight, near the horizon, of a dun colour, approaching to yellow; they sometimes continue in that state for several hours, without any perceptible motion; and afterwards they break out into streams of stronger light, spreading into columns, and altering slowly into 10,000 different shapes, and varying their colours from all the tints of yellow to the most obscure rufle. They often cover the whole hemisphere, and then exhibit the most brilliant appearance. Their motions at this time are most amazingly quick; and they allure with the spectator with the rapid change of motion forms. They break out in places where none were seen before. Shewing themselves with the heavens, are suddenly extinguished, and are succeeded by an uniform dusky tract. This again is brilliantly illuminated in the same manner, and as suddenly left a dark space. In some nights, they assume the appearance of large columns, on one side of the deepest yellow, and on the other, gradually changing till it becomes undistinguishable from the sky. They have generally a strong tremulous motion from one end to the other, and this continues till the whole vanishes. As for us, who fee only the extremities of these northern phenomena, we can but a faint idea of their splendour and motions. According to the state of the atmosphere, they differ in colour; and sometimes alternating the colour of blood, they make a dreadful appearance. The rufle fages, who observe them, become prophetic, and terrific the spectators with alarms of war, pestilence, and famine: nor, indeed, were these suppositions prefaces peculiar to the northern nations: appearances of a similar nature are of ancient date; and they were distinguished by the appellations of "plasmata," "trabes," and "bolides," according to their forms and colours. In old times they were either more rare, or less frequently noticed; but when they occurred, they were supposed to portend great events, and the timid imagination formed of them aerial conflicts.

In the northern latitudes of Sweden and Lapland, the aurorae boreales are not only singularly beautiful in their appearance, but afford travellers by their almost constant occurrence a very beautiful light during the whole night. In Hudson's bay, the aurora borealis diffuses a variegated splendor, which is said to equal that of the full moon. In the north-eastern parts of Siberia, according to the description of Gmelin (Reise durch Siberien, vol. iii. p. 135.), cited and translated by Dr. Blagden (Phil. Trans. vol. lxxiv. p. 228.), these northern lights are observed to begin with single bright pillars, rising in the north, and almost at the same time in the north-east, which gradually increasing comprehend a large space of the heavens, rush about from place to place with incredible velocity, and finally almost cover the whole sky up to the zenith, and produce an appearance as if a vault was expanded in the heavens, glittering with gold, rubies, and sapphires. A more beautiful spectacle cannot be painted; but whoever should see such a northern light for the first time, could not behold it without terror. For however fine the illumination may be, it is attended, as I have learned from the relation of many persons, with such a hissing, cracking, and rushing noise through the air, as if the largest fire-works were being off. To describe what they then hear, they make use of the expression "spoclochi chod'at," that is, the raging holt is piling. The hunters, who pursue the white and blue foxes in the confines of the icy sea, are often overtaken in their course by these northern lights. Their dogs are then in such frighted, that they will not move, but lie obstinately on the ground till the noise has ceased. Commonly clear and calm weather follows this kind of northern lights. I have heard this account, not from one person only, but confirmed by the uniform testimony of many who have spent part of several years in these very northern regions, and inhabited different
different countries from the Yenieli to the Lena; so that no
doubt of its truth can remain. This seems indeed to be the
real birth-place of the aurora borealis. This account of
the noisiers attending the aurora borealis, allowing for some
degree of exaggeration, has been corroborated by other
testimonies. Dr. Paladin, who resided seven years at Hudson's
Bay, confirms Mr. Gmelin's relation of the fine appearance
and brilliant colours of the northern lights, and particularly
of their rushing noise, which he affirms he has frequently
heard, and compares it to the sound produced by whirling
round a flick twistly at the end of a string. A similar noise
has also been heard in Sweden. Mr. Nairne also, being in
Northampton, at a time when the northern lights were
remarkably bright, is confident he perceived a hissing or whis-
zining sound. Mr. Belknap, of Dover, in New Hampshire,
North America, testifies to this fact. American Tram.
vol. ii. p. 196. M. Cavallo says that the cracking noise is
distinctly audibil, and that he has heard it more than once.
Elem. of Nat. and Exper. Philos. vol. iii. p. 449. See also
Beccaria dell' Elettricismo Artif. et Nat. p. 221.

Similar lights, called aurora australis, have been long
since observed towards the south pole (see Phil. Trans.
N° 461. § 23, 24, and 25, and vol. iv. N° 53); and their
existence has been more lately ascertained by Mr. Forlari,
who affirms, that, in his voyage round the world with
captain Cook, he observed them in high southern latitudes,
though attended with phenomena somewhat different from
those which are seen here. On Feb. 17, 1773, in fortuit
38.°, a beautiful phenomenon (he fays) was observed dur-
ing the preceding night, which appeared again this and se-
veral following nights. It consisted of long columns of a
clear white light, blossing up from the horizon to the east-
ward, almoit to the zenith, and gradually spreading on
the whole southern part of the sky. These columns were
sometimes bent sideways at their upper extremities; and
though in most respects similar to the northern lights (au-
rora borealis) of our hemisphere, yet differed from them in
being always of a whitish colour, whereas our assume various
tints, especially those of a fiery and purple hue.
The sky was generally clear when they appeared, and the
air sharp and cold, the thermometer standing at the freez-
ing point.

The periods of the appearance of these northern lights
are very inconstant. In some years they occur very fre-
quently, and in others they are more rare: and it has been
observed that they are more common about the time of the
equinoxes than at other feasons of the year.

Dr. Halley (see Philos. Trans. N° 347. p. 426. or Abr.
vol. iv. p. 138.) has collected together several observations,
which form a kind of history of this phenomenon. After
having particularly described the various circumstances which
attended that observed by himself and many others in March
1716, and which was singularly brilliant, he proceeds with
informing us, that the first account of similar phemenon
recorded in the English annals, is that of the appearance
which was noticed Jan. 30, 1556, and called "burning
spears" by the author of a book intitled "A Description of Meteors."
by W. F. D. D. reprinted at London, in
1674. The next appearance of a like kind, recorded by
Stow, occurred on October 7, 1554. In 1574, as Camden
and Stow inform us, an aurora borealis was seen for two suc-
cessive nights, viz. 14th and 15th of November, with ap-
pearances similar to those observed in 1516, and which are
now commonly noticed. The same phenomenon was twice
seen in Brabant in 1575, viz. on the 13th of February and
the 28th of September; and the circumstances attending it
were described by Cornelius Gemma, who compares them
to spears, fortified cities, and armies fighting in the air. In
the year 1580, M. Malein observed these phænma, as he
calls them, at Bakun, in the county of Wirtenberg, in
Germany, no less than seven times, in the space of twelve
months; and again, at several different times, in 1581.
On September 28, 1621, the same phenomenon was seen
over all France; and it was particularly described by Gaf-
fandus, in his "Physic," who gave it the name of "au-
rora borealis." Another was seen all over Germany, in
Nov. 1623, and was described by Kepler. Since that
time, for more than eighty years, we have no account of any
such phenomenon either at home or abroad. In 1727, Mr.
Neve observed one of small continuance in Ireland; and in
the same year, a similar appearance was seen by Romer at
Copenhagen; and during an interval of eighteen months, in
the years 1707 and 1708, this fort of light had been seen
no less than five times. Hence it should seem, fays Dr.
Halley, that the air, or earth, or both, are not at all times
dispofed to produce this phenomenon, though it is possible
it may happen in the day time, in bright moon-shine, or in
cloudy weather, and so pass unobserved. Dr. Halley fur-
ther observes, that the aurora borealis of 1716, which he
observed, was visible from the west of Ireland to the con-
fines of Russia, and to the eall of Poland; extending at
least near 30° of longitude, and from about the 50th degree
of north latitude, over almost all the north of Europe; and in
all places at the same time. It exhibited appearances similar
to those which he observed at London. He regrets, howe-
ever, that he was unable to determine its height for want of con-
temporary observations at different places. Father Doco-
wich has determined the height of an aurora borealis, ob-
served on the 16th of December 1737, by the marquis
of Poleni, to have been 825 miles; and Mr. Bergman,
from a mean of thirty computations, makes the average
height of the aurora borealis to be 72 Swedish, or (fup-
poling a Swedish mile to be about 61 English miles) 468
English miles. Euler supposes the height to be several
thousands of miles; and Mairan also affigns to these phe-
omena a very elevated region, the far greater number of
them being, according to him, about 200 leagues above
the surface of the earth. Dr. Blagden, speaking of the
height of some fiery meteors (Philos. Trans. vol bxxiv. p. 227),
says, that "the aurora borealis appears to occupy as high, if
not a higher region, above the surface of the earth. as
may be judged from the very distant countries to which
it has been visible at the same time:" he adds, that "the
great accumulation of clectric matter seems to lie beyond
the verge of our atmosphere, as cultivated by the eellation
of twilight." However the height of these meteors, none
of which appear to have ascended so high as 100 miles,
is trivial, compared with the elevations above ascribed to
the aurora borealis. But as it is difficult to make such
observations on this phenomenon as are sufficient to afford
a just estimate of its altitude, they must be subject to con-
tiderable variation and to material error. It is not impro-
table, that the highest regions of the aurora borealis are
the fame with those in which fire-balls move; more espe-
cially as Dr. Blagden informs us, that inflances are re-
corded, in which the northern lights have been seen to
join, and form luminous balls, darting about with great
velocity, and even leaving a train behind like the common
fire-balls. This ingenious author, however, conjecturing that
diflrent regions are allotted to the electrical phenomena
of our atmosphere, affigns the appearance of fire-balls to
that region which lies beyond the limits of our cromptical
atmosphere; and a greater elevation above the earth to that
accumulation
accumulation of electricity in a lighter and less condensed form, which produces the wonderfully diversified streams and coruscations of the aurora borealis.

Many attempts have been made to assign the cause of this phenomenon. Dr. Halley first imagined that the watery vapours, or effluvia, rarefied exceedingly by subterraneous fire, and tinged with sulphureous streams, which many naturalists have supposed to be the cause of earthquakes, might have also been the cause of this appearance. But this hypothesis was not sufficient to account for the immense extent of these phenomena over the surface of the earth, and for their being always seen on the north side of the horizon, and never to the south. Abandoning this hypothesis, he conceived that the aurora borealis is produced by a kind of sublimate matter, or magnetic effluvia, freely pervading the pores of the earth, and which, entering into it near its southern pole, passes out again with a like force into the aether at the same distance from the northern; the obliquity of its direction being proportioned to its distance from the pole. This sublimate matter, by becoming some way or other more dense, or having its velocity increased, may be capable of producing a small degree of light, after the manner of effluvia from electric bodies, which, by a strong and quick friction, emit light in the dark; to which fort of light this seems to have a great affinity. If Dr. Halley had known that an electric flame would give polarity to a needle deflective of it, and reverce the poles of one previously endued with it, he would have been led of course to conclude the electric and magnetic effluvia to be the same, and that the aurora borealis was this fluid performing its circulation from one pole of the earth to another; and he would thus have anticipated the hypothesis of Sign. Beccaria. See Mr. Cotes's description of this phenomenon, and method of explaining it, by streams emitted from the heterogeneous and fermenting vapours of the atmosphere, in Smith's Optics, p. 69, &c. or Phil. Trans. Abr. vol. vi. part ii.

The celebrated M. de Miran, in an express treatise on the aurora borealis, published in 1731, assigns its cause to be the ZODIACAL LIGHT, which, according to him, is none other than the sun's atmosphere; this light happening, on some occasions, to meet the upper parts of our air, on the side of the limits where universal gravity begins to act more forcibly towards the earth than towards the sun, falls into our atmosphere, to a greater or less depth, as its specific gravity is greater or less, compared with the air through which it pales. Although the whole atmosphere of the earth be involved in the solar atmosphere, it is thrown off both ways from the equatorial to the polar regions. This projection is owing partly to the centrifugal force arising from the diurnal motion of the earth, which, being greatest at the equator, and decreasing towards the poles, turns aside the zodiacal matter towards each pole; so that by his hypothesis he anticipates the discovery of auroras australis; and partly to the progressive motion of the earth in its annual orbit. In this case the light should dart from the equator to the poles, and not, as it really does, from the poles to the equator. Vide Tract. Phys. & Hist. del Aureo Boreali. Suites des Mem. de l'Acad. R. des Sciences, ann. 1731. p. 3. seqq.

There is an abstract of M. Miran's Physical and Historical Treatise of the aurora borealis, in the Phil. Trans. No. 433, or Abridg. vol. viii. p. 450.

M. Euler thinks the cause of the aurora borealis not owing to the zodiacal light, as Mr. de Miran supposes; but to particles of our atmosphere, driven beyond its limits by the impulse of the light of the sun. On this supposition he endeavours to account for the phenomena observed concerning this light. He supposes the zodiacal light, and the tails of comets, to be owing to a similar cause. See Tail of Comets, and ZodiacaL Light.

Ever since the identity of lightning and of the electric matter has been ascertained, philosophers have been naturally led to seek the explanation of aerial meteors in the principles of electricity; and there is now no doubt but most of them, and especially the aurora borealis, are electrical phenomena. Beside the more obvious and known appearances which constitute a resemblance between this meteor and the electric matter whereby lightning is produced, it has been observed, that the aurora occasions a very sensible fluctuation in the magnetic needle; that the atmosphere yields, at the time of its occurrence, a quantity of electric fire; and that, when it has extended lower than usual into the atmosphere, the flashes have been attended with various sounds of rumbling and hissing, already mentioned, and attributed by Dr. Bleden (ubi supra) to small streams of electric matter running off to the earth from the great mafles, or accumulations, of electricity, by which he supposes both meteors and the northern lights to be produced. Besides, the aurora borealis may be partly imitated by means of artificial electricity. Dr. Hamilton, of Dublin (Phil. Trans. ii.) seems to have been the first person who attempted to discover any positive evidence of the electrical quality of the aurora borealis; but the only proof he produces is an experiment of Mr. Hawksbee, by which the electrical fluid is thrown to assume appearances resembling the aurora borealis, when it passes through a vacuum. He observed, that when the air was most perfectly exhausted, the streams of electric matter were then quite white; but when a small quantity of air was let in, the light assumed more of a purple colour. The flashing of this light, therefore, from the dense regions of the atmosphere into such as are more rare, and the transitions through medium of different denities, he considers as the cause of the aurora borealis, and of the different colours it assumes. Mr. Canton, soon after he had obtained electricity from the clouds, offered a conjecture, that the aurora borealis is occasioned by the flashing of electric fire from positive towards negative clouds at a great distance, through the upper part of the atmosphere where the resistance is least. And he supposes, that the aurora, which happens at the time when the magnetic needle is disturbed by the heat of the earth, is the electricity of the heated air above it; and this appears chiefly in the northern regions, as the alteration in the heat of the air in those parts will be the greatest; nor is this hypothesis, he says, improbable, when it is considered, that electricity is the known cause of thunder and lightning; that it has been extracted from the air at the time of an aurora borealis (see Condenser); that the inhabitants of the northern countries observe it to be remarkably strong when a sudden thaw succeeds severe cold weather; and that the tournails is known to emit and absorb the electric fluid only by the increase or diminution of its heat. Positive and negative electricity in the air, with a proper quantity of moisture to serve as a conductor, will, he conceives, account for this and other meteors sometimes seen in a ference sky. Mr. Canton afterwards contrived to exhibit this meteor by means of the Torricellian vacuum, in a glass tube about three feet long, and sealed hermatically. When one end of the tube is held in the hand, and the other applied to the conductor, the whole tube will be illuminated from end to end; and will continue luminous without interruption for a considerable time after it has been removed from the conductor. If, after this, it be drawn through the hand either way, the light will be uncommonly intense, and without the least interruption, from one hand to the other, even to its whole length. And though
though a great part of the electricity is discharged by this operation, it will flash at intervals, when held only at one extremity, and kept quite still; but if it be grasped by the other hand at the same time in a different place, strong flashes of light will hardly ever fail to dart from one end to the other, and there will continue twenty-four hours and longer, without any further excitement. An arched double barometer of a considerable height is an improvement of this contrivance, for exhibiting the appearance of aurora borealis, by means of the electric fire. To Mr. Canton's hypothesis it has been objected, that the electrical fire would flash in every direction, according to the position of the clouds, as well as from north to south; and that upon his hypothesis, illustrated by the tournaiels, the aurora borealis ought to be most frequent in summer, when the air is most heated, whereas it is found to be the reverse. Signior Beccaria, who pursued his observations on atmospheric electricity farther than any of his associates in these inquiries, conjectures that there is a confluent and regular circulation of the electric fluid from north to south, which may be the original cause of magnetism in general; and he thinks, that the aurora borealis may be this electric matter performing its circulation in such a flate of the atmosphere as renders it visible, or approaching nearer the earth than usual. Against this supposé circulation it has been alleged that it ought to dart from the horizon towards the zenith in the northern hemisphere, and from the zenith towards the horizon in the southern one; whereas Mr. Forster, as we have already mentioned, informs us, that the columns shot up from the horizon towards the zenith as well in the southern hemisphere as in the northern; so that if the aurora borealis is to be regarded as the flashings of electric matter, its course is plainly directed from both poles towards the equator, and not from one pole to the other. Why the electricity of the atmosphere should be constantly found to direct its course from the poles towards the equator, and not from the equator to the poles, suggests a difficulty which an anonymous writer (Encycl. Brit.) has attempted to solve in the following manner.—Assuming three axioms, viz. that all electric bodies, when considerably heated, become conductors of electricity; that, é conduira, non-electrics when subjected to violent degrees of cold, ought to become electrified; and that cold must also increase the electric powers of such substances as are already electric; in short, (says this writer) to deduce from these principles the cause of the aurora borealis. "The air, all round the globe, at a certain height above its surface, is found to be exceedingly cold, and as far as experiments have yet determined, exceedingly electrified also. The inferior parts of the atmosphere between the tropics, are violently heated during the day-time by the reflection of the sun's rays from the earth. Such air will therefore be a kind of conductor, and much more readily part with its electricity to the clouds and vapours floating in it, than the colder air towards the north and south poles. Hence the prodigious appearances of electricity in these regions, fleeing itself in thunder and other tempels of this most terrible kind. Immensi quantities of the electric fluid are thus communicated to the earth, and the inferior warm atmosphere having once exhausted itself, must necessarily be recruited from the upper and colder region. This becomes very probable from what the French mathematicians observed when on the top of one of the Andes. They were often involved in clouds, which, sinking down into the warmer air, appeared there to be highly electrified, and discharged themselves in violent tempeples of thunder and lightning; while in the mean time, on the top of the mountain, they enjoyed a calm and serene sky. In the temperate and frigid zones, the inferior parts of the atmosphere, never being so strongly heated, do not part with their electricity so easily as in the torrid zone, and consequently do not require such recruits from the upper regions; but notwithstanding the difference of heat observed in different parts of the earth near its surface, it is very probable that at considerable heights the degrees of cold are nearly equal all round it. Were there a like equality in the heat of the under part, there could never be any considerable loss of equilibrium in the electricity of the atmosphere; but as the hot air of the torrid zone is perpetually bringing down vast quantities of electric matter from the cold air that lies directly above it; and as the inferior parts of the atmosphere lying towards the north and south poles do not conduct in any great degree, it thence follows, that the upper parts of the atmosphere lying over the torrid zone will continually require a supply from the northern and southern regions. This easily shews the necessity of an electric current in the upper parts of the atmosphere from each pole towards the equator: and thus we are also furnished with a reason why the aurora borealis appears more frequently in winter than in summer; namely, because at that time the electric power of the inferior atmosphere is greater on account of the cold, than in summer; and consequently the abundant electricity of the upper regions must go almost wholly off to the equatorial parts, it being impossible for it to get down to the earth; hence also the aurora borealis appears very frequent and bright in the frigid zones, the degree of cold in the upper and under regions of the atmosphere being much more nearly equal in these parts than in any other. In some parts of Siberia particularly, this meteor appears constantly from October to Christmas, and its coruscations are said to be very tryfing. Travellers agree, that here the aurora borealis appears in greatest perfection; and it is to be remarked, that Siberia is the coldest country on earth. In confirmation of this, it may also be observed, that, from the experiments hitherto made with the electrical kite, the air appears considerably more electrical in winter than in summer, though the clouds are known to be often most violently electrified in the summer-time; a proof, that the electricity naturally belonging to the air is in summer much more dangerously driven off by the clouds than in the winter, owing to the excess of heat in summer as already observed.

A considerable difficulty, however, still remains from the upright position which the streams of the aurora borealis are generally supposed to have; whereas, according to the hypothesis above-mentioned, they ought rather to run directly from north to south. This difficulty occurred to Dr. Halley; but he answers it by supposing his magnetic effluvia to pass from one pole to another in arches of great circles, arving to a vast height above the earth, and consequently darting from the places whence they arose almost like the radii of a circle; in which case, being set off in a direction nearly perpendicular to the surface of the earth, they must necessarily appear erect to those who see them from any part of the surface, as is demonstrated by mathematicians. It is also reasonable to think that they will take this direction rather than any other, on account of their meeting with less obscurity in the very high regions of the air than in such as are lower.

But the greatest difficulty still remains: for we have supposed the equilibrium of the atmosphere to be broken in the day-time, and restored only in the night; whereas, considering the immense velocity with which the electric fluid moves, the equilibrium ought to be restored in all parts almost instantaneously; yet the aurora borealis never appears except...
except in the night, although its brightness is such as must sometimes make it visible to us if it really exist in the daytime.

In answer to this it must be observed, that though the passage of electricity through a good conductor is instantaneous, yet through a bad conductor it is observed to take some time in passing. As our atmosphere therefore, unless very violently heated, is but a bad conductor of electricity; though the equilibrium in it is broken, it can by no means be instantly restored. Add to this, that as it is the action of the sun which breaks the equilibrium, so the same action, extending over half the globe, prevents almost any attempt to restore it till night, when flashes arise from various parts of the atmosphere, gradually extending themselves with a variety of undulations towards the equator.

It has been observed, that the streams of the aurora borealis do not always move with rapidity; but they sometimes appear for a considerable time quite stationary, and they are sometimes carried in different directions with a slow motion. In order to account for these circumstances, it should be considered, that weak electric lights have been sometimes observed to exhibit the same appearance at the surface of the earth, and we may therefore suppose them much more capable of doing so at great heights above it, where the conductors are fewer in number, and much more imperfect. From instances that might be adduced, we may reasonably conclude, that small portions of our atmosphere may by various causes be so much electrified as to shine, and likewise be moved from one place to another, without parting with the electricity they have received for a considerable time. In this manner we may account for the corona, or circle, which is often formed near the zenith by the aurora borealis, when any of its parallel streams of light that shoot upwards, and by the laws of perspective, appear to converge towards a point, are over our heads, and actually come to a point. As this corona is commonly stationary for some time, it would serve as a mark by which to determine the distance of the object; e.g., let two fars, one at London, and the other at Edinburgh, observe an aurora borealis; then by noting the fars among which the corona was observed at each place, its true altitude from the surface of the earth may easily be determined by trigonometry. Although the true height of the aurora borealis has never yet been determined, there is no sufficient reason for supposing that it is higher than a meteor, seventy miles above the surface of the earth, which meteor, both by its splendor and figure, seems to prove that the air possest the considerable degree of density at that distance from the earth. Besides, if its streams resemble the passage of electric light through a vacuum, it cannot be hence inferred, that the air is a flat similar to the vacuum of an air pump in those places where the aurora borealis is produced; because we have instances of similar appearances that are produced in very dense air. "The plate of an electrophorus is often so highly electrified, as to throw out flashes from different parts as soon as it is lifted up, and by proper management it may be always made to emit long and broad flashes, which shall scarcely be felt by the finger; instead of small, dense, and pungent sparks; so that, though long flashes may be produced in rarefied air, it by no means follows, that the same may not also be produced in denser air. As little can we infer any thing from the colours, for we observe the electric spark sometimes white, sometimes blue, and sometimes purple, in the very same state of the atmosphere, and from the same substance." Mr. Little, the inventor of an air-pump of a new construction, stating the boundaries of the atmosphere within which the aurora borealis, considered as an electrical phenomenon, is visible, conceives that it cannot appear in air less rarefied than near 4000 times, and consequently that its nearest distance from the earth is about 45 miles, according to Dr. Halley's table of the air's refraction at different altitudes; and that in air rarefied more than 26000 times, it would not be visible, and therefore its greatest distance is about fifty miles, by the same table. He is also of opinion, that it is air burnt and exploded in its passage, which makes the electric matter visible, and that without air, if it could pass at all, it would not be luminous. Upon the whole he concludes, that the aurora borealis is confined within our atmosphere. Irth Trans. vol. vi. p. 397.

Dr. Franklin supposes, that the electrical fire discharged into the polar regions from many leagues of vaporous air raised from the ocean between the tropics, accounts for the aurora borealis; and that it appears first, where it is first in motion, i.e. in the most northern part, and the appearance proceeds southward, though the fire really moves northward. Franklin's Exper. and Obs. 1769. p. 49. Phil. Trans. vol. xlviii. part i. p. 356, part ii. p. 784. 1st vol. part i. p. 453. 1st vol. ixxxii. p. 15. Letter dell'Elleretri, p. 269. 1; or Prieley's Hill of Electricity, vol. 1.

Mr. Kirwan (Ialth Trans. 1788, p. 70, &c.) supposes, that the rarefaction of the atmosphere in the polar regions proceeds from the aurora borealis and aurorals, and that these are produced by a combination of inflammable air, caused by electricity. This inflammable air is generated, particularly between the tropics, by many natural operations, such as the putrefaction of animal and vegetable substances, volcanoes, &c.; and being lighter than any other, occupies of course the highest regions of the atmosphere. Consequently, this kind of air is chiefly thrown off towards the poles, and occasions the northern lights, which are the highest of all meteors, though they sometimes extend pretty low into the atmosphere. Mr. Kirwan further adds, that after the appearance of an aurora borealis, the barometer commonly falls, and that it is generally followed by high winds, proceeding usually from the south; all which facts strongly prove a rarefaction in the northern regions. To the same purpose, it is observed by Dr. Winn (Phil. Trans. vol. 73.) that the appearance of an aurora borealis is a certain sign of an hard gale of wind from the south or south-west. This occurred, without fail, in twenty-three instances; and he thinks that the splendor of meteors will enable the observer to form some judgment concerning the ensuing tempest. If the aurora is bright, the gale will come on within twenty-four hours, but will be of no long duration; if the light is faint and dull, the gale will be less violent, and longer in coming on, but will last longer. His observations were made in the English Channel, where such winds are very dangerous; and by attending to the aurora, he says, that he often escaped, when others were nearly wrecked. Observations of this kind would serve to lessen the dangers of navigation.

That the aurora borealis might be succeeded by winds, may be easily deduced from the hypothesis above-mentioned. If this phenomenon is occasioned by the vast quantity of electric matter conveyed to the equatorial parts of the earth, it is certain that the earth cannot receive any great quantity of this matter at one place without emitting it at another. The electricity, therefore, which is constantly received at the equator, must be emitted nearer the poles, in order to perform its course; otherwise there would not be a constant supply of it for the common operations of nature. It is to be observed, that electrified bodies are always
always surrounded by a blast of air, which is sent forth from them in all directions; hence, if the electric matter find a more ready passage through one part of the earth than another, a wind will be found to blow from that quarter.

If, therefore, one of these places happens to be in the Atlantic ocean, near the coast of France, or in the bay of Biscay, the electric matter which has been received at the equator during an aurora borealis, will be discharged there some time after, and consequently a wind will blow from that quarter, which will be from the south-west to those ships which are in the English channel. It cannot be imagined, however, that all the matter can be discharged from one place; and therefore, according to the different situations of those electrical vents, winds may blow in different directions; and thus the same aurora borealis may produce a south-west wind in the English channel, and a north-west one in Scotland.

**Aurora Borealis**, a phrase used by Alchemists, to express the multiplicative virtue of the philosopher's stone.

**Aurorea**, in Ornithology, a species of Motacilla, called by Latham the *Daurian warbler*. This bird is fulvous beneath; crown and upper part of the neck hoary; front white; throat black; back and wings black, with a white triangular spot on the latter; tail-feathers fulvous, two middle feathers black. Pallas. This bird is the size of the red-fart, and inhabits Siberia to the confines of China; most common in the vicinity of the river Selenga, among willows.

**Auros**, in Geography, a town of France, in the department of the Gironde, and chief place of a canton in the district of Bazas, five miles north-east of Bazas.

**Aurota**, in Entomology, a species of Papilio (Dan. Cand.) that inhabits the coast of Coromandel. The wings are entire and white; margin black, spotted with white; posterior ones yellow beneath. Cramer.

**Aurotus**, a species of Phalæna, of the larger kind of Bombyxes, with falcated wings; above and beneath of the same yellowish colour; with a white band, and transparent lunar spot in the dilk of each. This kind inhabits America, and was described by Fabricius from a specimen in the Museum of the late Dr. Hunter.

**Auroux**, in Geography, a town of France, in the department of the Lozère, and chief place of a canton in the district of Langogne, seventeen miles north of Mende.

**Auralenta**, in Entomology, a species of Burpestis, of a somewhat oblong or rather narrow form, that inhabits Carolina. The wing-cafes are faggiate, bidentated at the end, and green with a golden margin; body golden; thorax slightly dotted. Fabricius.

**Auralenta**, a species of Cicada (Rosatara Sec.), of the fize and shape of cimex obtusa. The head and thorax are rufous; wing-cafes brown, cinereous at the tip. A native of Cayenne. Fabricius.

**Auralenta**, a species of sphex, the head and thorax of which are covered with golden coloured down; the abdomen black, with the margin of the segments ah-colour, and the legs rufous. This insect is of the middle size, and inhabits China. Fabricius.—*Olive*. Both Fabricius and Grindin have evidently described this insect twice, once under the specific name aurulenta, and afterwards under that of aurata; or at least the only difference in the description is, that the legs are not mentioned in the specific character of the latter, but we are told in the general description, that they are of a ferruginous colour, which approaches pretty nearly to that of rufous; and as both kinds are said to be natives of Asia, the one of China, and the other of India, we have no doubt that Fabricius has inadvertently described the same insect in both

**Aurum**, in Natural History, denotes gold. See Gold. The word is chiefly used among us as applied to certain chemical preparations, whereof gold is the basis, or principal ingredient.—Such are the aurum potabile, aurum fulminans, &c.

**Aurum Fulminans**, in Chemistry. See Gold, Salt of. See Aurum fulminans, in Chemistry, are gold, a liquid preparation of this metal formerly much used in medicine, but now entirely obsolete.

The discovery of an universal medicine was a favourite speculation of the ancient alchemists, and they eagerly indulged the hope of finding it in the precious metal which alone was the object of all their attention. Hence we meet with a number of vaunted preparations of gold, most of them kept secret, but some revealed by the inventors, all of which had a certain reputation for a time, but are now sunk into deserved neglect.

Two methods were practised for the preparation of this metal as a medicine; the one was to grind gold leaves to a moi impalpable powder, by a trituration of several days or even weeks; the other was to dissolve the metal in its proper menstruum, the nitro-muriatic acid, and to mix it with ether or any efficient oil, which by operating a reduction of the metal in a very divided state, has the power of separating it from its acid solvent. As this fact is important in the chemical history of this metal, we shall mention it more particularly under the article Gold.

The potable gold of Helvetius, retained till within these few years in the Paris pharmacopoeia, is thus prepared. "Dissolve half a dram of pure gold in two ounces of aqua regia, employing a gentle heat; to the solution add one ounce of oil of rosmmary, shake the mixture, and immediately the gold will quit the acid, and unite with the efficient oil, giving it a beautiful yellow colour; this is to be decanted from off the acid which remains at the bottom, and mixed with fifteen ounces of rectified spirit of wine, which forms the potable gold."

The dose is from six to twenty drops.

The powers of this medicine are supposed to be in a high degree cordial, stimulating, and tonic.

In such a preparation as this, when the quantity of gold in each dose is so extremely minute (though still sufficient to give it something of a yellow colour), it requires little discernment to see that all the medicinal powers, whatever they may be, depend altogether on the ethereal oil and the ardent spirit with which the gold is united; and accordingly it is now entirely rejected in every pharmacopoeia.

A fairer trial, however, has been made of the virtues of gold in medicine. We read that some of the crafty alchemical empiricks had the adroits to perforce several of their noble patrons that the royal metal was peculiarly well calculated to cure the diseases of persons of exalted rank; and under this circumstance this precious metal has been swallowed in larger doses. These, however, are not the follies of the present day, public credulity being diverted into other channels.

From all that we know concerning the properties of gold, it appears, that its inertness when taken into the human body, depends on the cafe with which it is reduced to the reguline state, and when in this state, its absolute insolubility in any of the animal juices. As the nitro-muriate of gold poisons the power, and in a very high degree, of staining almost every animal matter, it is probable that it would act...
as a topical stimulant with equal energy as the lunar caustic, or nitrate of silver, but it does not appear that gold would in any case be preferable to the other metals. It is now, therefore, entirely rejected from the Materia Medica.

Aurum, Problematicum, Paradoxum, and Graphicum, in Mineralogy. See Gold, Ores of; and Titanium, Ores of:

Aurum, Regius, in Antiquity. See Queen Gold.

Aurum Coronarium, See Coronary Gold.

Aurum Sophisticum, minium gold, in Chemistry, a preparation made as follows: take the distilled verdigris, eight ounces; crude Alexandrian turp; four ounces; borax; twelve ounces; falt-petra, one ounce and a half; pulverize and mix them all together, tempering them with oil to the confidence of a plaster; then put a German crucible into a wind-furnace, heat it red-hot, and putting your mafs into it, let it be covered, and the furnace filled with coals over the crucible. When the mafs is melted, let it cool of itself, then break the crucible, and you will find at the bottom a fine regulus, like gold, weighing about four ounces, which being malleable, may be wrought into any form.

Aurum Vegetab. a name given to faffron.

Aururni, in Ancient Geography, a people of Italy, in Latium. They have been often confounded with the Aunones; though Pliny distinguishes them. They appeared in a war against the Romans, in the year of Rome 258; but were entirely defeated in 408.

Aurungabad, Aurangabad, or Aurangabad, in Geography, a modern city of India, owing its rise from a small town to the capital of the province of Dowlaabad, in the Deccan, to Aurang-Zeb; from whom also it had its name. When the Deccan became a province of the Mogul empire, this city became the provincial capital, and continued to retain its rank after the Nizams became independent of Delhi; and until the encroachments of the Poonah Mahattas, of late years, made it an uncomfortable residence to the Nizam.

It is situated on a plain, almost surrounded with mountains; it is large and populous; and was encompassed, by Aurang-Zeb, with walls and bastions. His palace, in which he resided, was also surrounded by walls and gates of entrance. The country about is fertile, and produces millet, wheat, and other provisions, but not sufficient for the immense number of its inhabitants, as it is one of the largest and most populous cities of India. N. lat. 19° 45', E. long. 76° 2' 30'.

Aurungzebed. See Aurungzebed.

Aurupsi, in Ancient Geography, a people of Africa, in Ethiopia, whose capital, according to Pliny, was not far from the Nile.

Aurusuliana, an episcopal city of Africa, in Numidia.

Ausa, in the middle ages called Aofon, a town of Hispania Citerior or Tarraconensis, south-west of the Indigetes, between Gerunda and Mandreca. The inhabitants were called Aofetani and Anauthani. It is now Vic or Vich de Ojana, in Catalonia. N. lat. 41° 50'. E. long. 2'.

Ausana, a village of Belgic Gaul, where the twelfth legion had its winter quarters.—Alfo, an episcopal see of Africa, in the proconsular province.

AusancaU, a town of Italy, in Liburnia. Pro ley.

Aurara, a town of Arabia Felix, in the country of the Sasichites, near the sea.—Alfo, a town in the interior part of Arabia Felix. Pro ley.

Auscbe, in Geography, a town of Bohemia, in the circle of Leitmeritz, eight miles E. N. E. of Leitmeritz.

Auschise, in Ancient Geography, a people of Africa, in Libya, to the west of the Abyssin and east of the Naf- mons. Herodotus.

Auscili, a people of Europe, in that part of Gaul called Aquitania. Their capital was Clunemena, which afterwards assumed the name of the people. They occupied the country corresponding to the territory of Auci, west of the Tolstales. See Atex.

Ausculttare, in Ancient Customs.—For the reading of prayers with a graceful tone or accent, makes some impression on the hearers; there was anciently a perfom appointed, in mabillaryes, to hear the monks read and sing, who instructed them how to perform, before they were admitted to read or chant publicly in the church, or before the people.—This was called ayscultare, q. d. to hear, or listen.

Auser, or Ausar, in Ancient Geography, now Serchio, a small river of Italy, in Tuscus, which discharges itself into the sea, about six miles north of the mouth of the Arno.

Ausi, a people of Africa, on the sea-coast of Libya, encompassing the lake of Tritonis, and separated by the river Triton from the Machelys. Herodotus relates, that these savage people celebrated a feast in honour of Minerva, at which the young women separated into two companies, and fought against one another with clubs and stones; those who fell in the combat, or died of their wounds, were deemed not to have been virgins. They paid no respect to marriage, but prostitued their women in common. Their children were nursed by their mothers till they were able to walk; and they were then introduced to an assembly of the men, who met every three months, and the man to whom any child first spake, was acknowledged as its father.

Ausigida, a town of Africa, in the Pentapolis, watered by the river Cinymidius. An island of the same name is mentioned by Stephanus.

Ausilium, a place of Africa, in the province of Tripoli, on the road from Tapsape to the greater Leptis.

Ausium, or Ailium, an ancient Roman colony, in the Picenum; now Ofius or Osino.

Ausinza, a town of Alfa, in Persia Propria. Pro ley.

Ausite. See Esita.

Ausona, a town of the Auiones, reckoned among the most ancient people of Italy, who occupied that part of Italy, which extends from the promontory of Circeum to the Strait of Sicily; but they were afterwards reduced to a more limited territory between the montes Circei and Maf- fic. They were extinguished before the time of Pliny. Vir- gil represents them as a colony of Trojans.

Ausonia, a name first restricted to the territory of the Auiones, and afterwards applied to the whole of Italy.

Austinum Mare, denotes that part of the Mediterranean called the sea of Sicily. It was formerly a part of the sea called Ionian, extending southwards from the pro- montory of Japygium to Sicily, which it washes on the eaf, as it does the Brunt and Magna Gracca on the south and eaf. It is separated from the Tuscan sea by the Strait of Meff- fina.

Ausoneus, Decius, or Decimus Magnus, in Biography, a Roman poet of the fourth century, was a native of Boudaux, where his father Julius Auenius was an eminent physician. Having enjoyed the advantages of an excel lent education, under his grandfather Arborius at Tou- lone, and also under other eminent professors of grammar and rhetoric, he became himself professor in those depart- ments of literature in his native city. Such was his reputa-
tion, that he was called to court by the emperor Valentinian, and appointed preceptor to his son Gratian. But the latter he was advanced to the office of praetorian prefect of Gaul and Italy about the year 376, and to the consilium in 379. He was much esteemed by the emperor Theodosius, and as some say, created by him a patrician. The time of his death is not accurately ascertained; but he appears to have been alive in 392, and probably lived to an advanced age. Amongst the learned it has been a subject of dispute, whether Aufonius was a Christian or a Pagan. If he was not a Christian, the poems on Christian topics ascribed to him might have been supposititious; and the licentiousness of several of his pieces signifies a presumption that he had not embraced Christiannity.

His poems manifest learning and ingenuity; but they cannot bear the test of comparison with the productions of the Augustan age, as they are generally impious, harsh and inelegant, and bear obvious marks of the declining genius and taste of the period in which they were written. The "Cento Nuptialis" is altogether formed of lines and hemisyllables from Virgil, and the latter part of it is highly confusional and incoherent. The epigrams are generally flat and incoherent. The best editions of Aufonius are "the Voritorum" of 1671, and the "Dolphin" of 1730. Gen. Dict. Fabr. Bib. Lat. t. ii. p. 87, 88.

AUSPEX, in Roman Antiquity, a name originally given to those who were afterwards denominated augurs. In which sense the word is supposed to be formed from avis, bird, and inspecter, to inspect; augur, q. d. inspecter, or inspectors of birds.

At first the augurie were properly those who prefaged future events by inspection of the flight of birds; as the auguries predicted them by the inspection of victims, and augurs by the singeing of the same birds. But Pintarch informs us (Quint. Rom. 72.), that in process of time these distinctions were disfigured; and that the name of augurs was given to those who had been originally called augurie.

AUSPICIIUM, AUSPEX, the fame with AUGURY.

Servius, indeed, distinguishes between auspex and augury; making auspex comprehend the consideration merely of birds, and of their flight; augury, of the notes of birds, and of all sensible objects; he adds, that the former was allowed a man anywhere abroad, whereas the latter might only be performed in his native place. And it is certain, that consuls, generals, and others, who took omens out of Rome, were properly said auspex: nevertheless, custom appears to have over-rulled this distinction.

The auspices were consulted on a variety of occasions, so that nothing was done respecting the public, either at home or abroad, in peace or war, without this ceremony; and at first in important affairs of a private nature, they were scrupulously regarded. The auspices were referred to before any battle; they swailed at marriage; (Juvenal, x. 576); and they were consulted on the choice of pledge and patrician magistrates; and on the first day of every year, in order to determine whether the progress of it would be happy or otherwise. To this purpose Ovid, in his Fasti (1. 167.), says:

"Tempora committit aspitius rebus agendas;
Tota ab auspicio ne forte annus inxta;
Quaeque fas arte ob idem delibat agendo,
Nec plus quam foetum testificatur opus."

And in a case of war he obviates (Trist. ii. 173.):

"Per quam bella geris, cujus sum corporc pugnas;
Auspicium ei das grando, deosque tuos."

AUSPITZ, in Geography, a town of Moravia, in the circle of Brunn, forty-two miles S. S. W. of Olmutz, and 114 S. E. of Prague.

AUSSEE, New, a town of Germany, in the duchy of Stiria, forty-eight miles W. N. W. of Judenburg.

AUSSES, or AUSTI, a town of Bohemia, in the circle of Leitmeritz, on the Elbe; ten miles N. W. of Leitmeritz.

AUST, a very small village of England, in the county of Gloucester, on the side of the Severn; whence is a passage-boat or ferry to the opposite shore in Gloucestershire, and thence across the Wye to Chepstow; 12 miles north of Bristol, and 6 south of Chepstow.

AUSTER, in Mythology, was like each of the other winds, one of the sons of Atlas and Aurora; and it denoted the south wind. See WIND.

AUSTERE, in general applied to a rough grating taff, united with that of four rails. It is really synonymous with acerb.

AUSTERITY, among Moral Writers, sometimes denotes rigour in the inflicting of punishments. We say also, austerity of manners; the austerities of the monastic life. The austerity of the Roman consuls kept the people in their duty. The greatest austerity of the Carthaginians was perpetual solitude.

AUSTERTITUS, or Sallust, in Geography, a town of Moravia, in the circle of Brunn, which was almost destroyed by the Swedes, in the seventeenth century. Twelve miles S. E. of Brunn, and 112 E. S. E. of Prague.

AUSTIL, or St. Ausvil, is a market and flannary town of Cornwall, in England. It is built on the eastern side of a hill, and has greatly increased during the last century in the number of its houses and inhabitants. This augmentation may be attributed to the prosperous tin mines that are in the immediate vicinity, to the privilege of having one of the flannary courts held here, and in consequence of having a turnpike road carried through the town from Plymouth to the land's end. The church is a large ancient pile of building dedicated to St. Austin, and the town is ornamented with several dams in canopied niches. The seats of the church, and the external walls, are carved with various devices emblematical of the crucifixion. The original charter for holding a weekly market was granted by queen Elizabeth, who directed that the tolls should be applied to the relief and maintenance of the poor. The principal part of the inhabitants are employed in the mining concerns, in the pitch-iron smelting, and in a small manufactory of coarse woollens. At the west end of the town are three blowing-houses, where the tin is separated from the ore by means of fire. This process was formerly effected by smelting-furnaces, but the present method seems to be more economical, and far preferable. The old smelting-furnaces, some of which are still used, are supplied with coal, and are reverberatory; but the blowing-houses, the fire is made with charcoal, and ignited by air impelled through cylindrical tubes. Beauties of England and Wales, vol. ii. p. 412, &c. See Blowing House, Mines, Stannary.

AUSTIN, St. See AUGUSTIN.

AUSTIN Friers. See AUGUSTINES, and HERMITES.

AUSTRAL, derived from austral, south wind, the same with southern.

Thus austral signis are the six last signs of the zodiac; so called, because they are on the south side of the equinoctial. AUSTRAL Earth, in Mineralogy. See TERRA SYSTEMA AUSTRALIS.

AUSTRALASIA, in Geography, a name given, about half a century ago, by the learned president De Brocques (Histoire des Navigations aux Terres Australes, Paris, 1756, 2 vols.)
The new species is from Papua, Joseph Banks's isles, and the New Hebrides are left in Australasia, while a considerable interval leaves the Fijiee isles in Polynesia. Thence a wide and open sea gives the line of demarcation an ample sweep, about fix or seven degrees, to the east of New Zealand, when bending S.W. it joins the southern boundary.

"From these indications it will be perceived, that Australasia contains the following countries: 1. The central and chief land of Notasia, or New Holland, with any isles which may be discovered in the adjacent Indian ocean, twenty degrees to the W., and between twenty and thirty degrees to the E., including particularly all the large islands that follow. 2. Papua, or New Guinea. 3. New Britain, and New Ireland, with the Solomon isles. 4. New Caledonia, and the New Hebrides. 5. New Zealand. 6. The large island called Van Diemen's land, recently discovered to be separated from New Holland by a strait, or rather channel, called Bafa's strain." See the several articles. Pinkerton's Mod. Geog. vol. ii. p. 431-464, &c.

AUSTRALASIA, one of the New Holland species of Phalena, described by Fabricius in his Spec. Inf. The wings reddish-orange; base of the lower ones beneath ferruginous. Muf. ir J. Banks.

AUSTRALASIA, a species of Scorpio, described by Forster as a native of the islands in the Southern ocean. It is distinguished by having combs with fix teeth, and the hands, or hand-claws being smooth. The body is rather depressed; brown above, paler beneath; extreme joint of the tail and legs pale.

AUSTRALASIAN Snake, in Zoology, a trivial name assigned by Dr. Shaw to a species of Coluber that is figured in White's Journal of a Voyage to New South Wales; and which he describes as a blackish-brown snake, speckled with yellow, with very narrow seuta, and abdomen clouded with brown and yellow. This is a large snake, measuring nine or ten feet, and is rather slender in proportion to its length. The number of abdominal seuta, and subcaudal flakes, from the imperfect manner in which the dried skins of this kind have been preferred, has not yet been ascertained.

AUSTRAL, in Conchology, a species of Buccinum, found in rivers in New Zealand. The shell is oblong, smooth, thin, calcified; aperture ovate and entire. Ob. This appears to be an intermediate species between the Buccinum, Bulla, and Helix genera. Gmelin.

AUSTRALIS CORONA, in Alfronomy. See CORONA Australis.

AUSTRALIS PSEUS, is a constellation of the southern hemisphere, being one of the forty-eight constellations mentioned by the ancients, not visible in our latitude. The stars in Ptolemy's catalogue are 18; and in the Britannic catalogue 24. The star Fomalhaut, of the first magnitude, is in the mouth of this fish.

AUSTRALIS, in Conchology, a species of Haliotis, rather exceeding three inches in length, and two inches in breadth. This shell is varied with grey, bluish, and red; form ovate, convex, and cancelled; spire prominent and inflated. Found adhering to the rocks upon the coast of New Zealand. Within, this kind is very pearly, and finely glossed with red and yellow.

AUSTRALIS, a species of Murex that is found in the South Seas. The shell is ovate, with longitudinal striae; lip undulated; whorls of the spire guttered; first whorl turgid with four plait; second with three plait. Gmel. Spougl. This shell bears affinity to Murex Itinæmius; is about an inch and a half in length; of a straw colour, with a yellow pillar; and lip pure white.
AUS

AUSTRALIS, in **Entomolog.**, a species of **Cancer** (Scyllarus, Fabr.), described by Fabricius from a specim in the collection of Sir Joseph Banks, that was brought from the South Seas. The plates of the antennae are smooth and rounded. This kind bears some resemblance to **Cancer Arctis**; but it is of a narrower shape; the plates of two joints; thorax unequal, with a crenated margin; legs ten; claws simple.

AUSTRALIS, a species of **Scorpio** that inhabits Africa, and, according to Degeer and Fabricius, has thirty-two teeth in the comb, and the hand-claws smooth.

AUSTRALIS, a species of **Musca** (Stratogyrus) that inhabits South America. It is large and glabrous, with black eyes, and is specifically described as being tatefusce, with a bidentate scutell; and the first segment of the abdomen brownish. Fabricius.

AUSTRALIS, a species of **Formica** found in New Holland. It is black, with the thorax unarm'd; and pediolar scale armed with two spines. Fabricius.

AUSTRALIS, a species of **Sphec** that inhabits New Holland. The colour is blackish blue; thorax lobed, fulvous in front. Fabr. Gmel. &c.

AUSTRALIS, a species of **Myrmela** that inhabits the south of Europe. The wings are white, with a black spot on the margin; and the body variegated. Fabricius.

AUSTRALIS, a species of **Lygæus** (Fabr.) that inhabits Otagoiste. It is black; thorax slightly finispinus, with a red anterior band; shanks of the posterior legs membranaceous.

AUSTRALIS, a species of **Cimex**, with the upper-wing rufous, marked with a waved black Iread; under-wings black, with a white dot in the middle. Inhabitats New Holland; and called by Fabricius *ligans* 2-guttatus.

AUSTRALIS, a species of **Gryllus** that inhabits Amsterdam Island. It is greenish; thorax rotundate; wings and wing-cafes equal; legs anteriorly very spiny; is larger, but bears some affinity to the Brazilian species spihtes.

AUSTRALIS, a species of **Lampros** that inhabits New Holland. It is of a yellowish colour, with the head and wing-cafes brown. Fabricius.

AUSTRALIS, a species of **Carabax**. (Calidubra Fabr.) On the thorax two white lines; on the wing-cafes four; the two middle ones united and abbreviated. Inhabitats New Zealand. Fabricius.

AUSTRALIS, a species of **Cryptoccephalus** (Crranitis) that inhabits New Holland. The colour is rufous; thorax cylindrical; and two stripes of white on the wing-cafes. Fabricius.

AUSTRALIS, a species of **Cyrinus**, found in the fresh waters in New Holland. It is slightly iritlated; greenish; wing-cafes short; and furnished with a single tooth. Fabricius.

AUSTRALIS, in **Orihology**, a species of **Tringa** that inhabits Cayenne, and is about eleven inches in length. It is grey above, spotted with brown; beneath reddish; belly and rump whitish; tail and wings dusky; bill and legs black. Gmelin, &c. The crown is iritlated with brown.

AUSTRALIS, a species of **Sternostrum** of Tern, that inhabits Nativity Island, in the South Seas. It is grey; bill and legs black; front fordist yellow; quill feathers white; connecting membrane of the feet tawny; length from seven inches and a half to nine inches; and called by Latham the southern Tern.

Vol. III.

AUSTRALIS, a species of **Copa**, about eleven inches in length, that inhabits Cayenne. It is black above, beneath cinereous; bill red; wing-coverts spotted with white; tail rounded. Gmelin. This is the Cayenne red-billed crested of Latham. *C. ars*. Gmelin has another kind under the same name, *corus ars*, which he describes as having entirely black feathers on the chin lax; quill feathers brownish-black. This is the Southern Sea Raven of Latham, and inhabits the Friendly Islands in the South Sea. Length nineteen inches.

AUSTRALIS, a species of **Psittacus**, of a green colour; crown blue, and crofted with long feathers; chin and middle of front broad red; thighs purple. A native of the Sandwich islands, and described by Latham under the name of the blue-crafted parakeet. The length of this bird is six inches and a half; beak orange; front pal-green; two middle tail feathers green, and yellow at the extremity; the others yellowish-edged, and tipped with green; legs, dusky; claws black. Gmelin.

AUSTRALIS, a species of **Falco** that inhabits New Zealand. It is brown; eyes yellow; tail black, dotted at the end with fordist white; face of the plaintive eagle; voice like a hen. Gmelin.

AUSTRIA, ARCHDUCHY OF, in Geography, one of the principal provinces of Germany, derives its name from its situation towards the east: Otago-ryuh, or Ofterich signifying in German the eastern kingdom. This name was conferred upon Austria by the Italian and French nomenclature; and this division, which may be considered as partly belonging to ancient Pannonia, arose after Charlemagne had established the western empire; being a remnant of the foreignty of what was called Eastern France, established by that conqueror. It was also styled “Marchia Orientalis,” the eastern march, or boundary; and after the failure of the Franconic line, became a magnificient feudatory to the dukes of Bavaria, till the emperor Frederic Barbarossa, in 1156, converted it a duchy held immediately of the empire. See Archduke.

The archduchy of Austria is bounded to the north by Bohemia and Moravia, on the east by Hungary, on the south by Styria, and on the west by Bavaria. It is divided by the river Ens into Upper and Lower Austria; the capital of the latter is Vienna, besides which it contains 35 other cities, and 236 market towns; and that of the former is Linz, besides which it has 13 other cities, and 88 market towns. The population of this archduchy has been usually computed at 1,685,000 persons; and more lately by Hoeck, in his “Statistical View of the states of Germany,” at 1,820,000.

The Austrian dominions, or hereditary states of the house of Austria, comprehended, before the late war, besides the archduchy of Lower Austria, containing the country on this side the river Ens, sometimes called Lower-Austria, and the country beyond the Ens, denominated Upper Austria, and also the country called the Inn-Viertel, or the part taken from Bavaria, of which the capital is Brunn, the following territories viz. Interior Austria, including the duchies of Styria, Carinthia, Carniola, Austrian Friuli, and Trieste; Upper Austria, or the Tyrolese; Anterior Austria, comprising the Brvgau, Austrian territories in Swabia, Holzsemb, Falkenlein, Langenargen, and Teten; the kingdom of Bohemia; the magistrature of Moravia; Austrian Silesia; Austrian Netherlands, now in possession of the French; Lombardy, including the duchies of Milan and of Mantua, now in possession of the French; the kingdom of Hungary, and banuate of Trans-
war; Illyricum, including Dalmatia, Croatia, and Slovenia; Transylvania; the province of Bukovina, annexed to the Austrian territory in 1777; and the provinces of Galicia and Lodomoria, being that part of Poland acquired by Austria in the partition of 1772. From the frontiers of Switzeland to the utmost limits of Transylvania, the length of the Austrian dominions may be reckoned at about 760 British miles, and the breadth about 520, from the river Bug, which forms a boundary between Austria and Prussian Poland, to the Save, which divides the Austrian from the Turkish sovereignty. The contents may be about 184,000 square miles; and Boetticher estimates the inhabitants at 108 to a square mile. Since he wrote, the populous region of the Netherlands has been withdrawn; however the population of the Venetian territories is little inferior. Towards the east, the Austrian dominions border on those of Russia and Turkey; to the north, on those of Prussia, Upper Saxony, Bavaria, from which it is separated by the river Inn, and Swabia; and on the well-known South and the Italian flates.

The original population of these extensive regions is various; but chiefly Gothic and Slavonic. The native ancient Germans, a Gothic race, form the ruling, most industrious, and most important part of the inhabitants. The preface population of the Austrian dominions is computed at more than 25,000,000; that of Hungary, Transylvania, and the Bukovina, being estimated at 41 millions. Some authorities, however, have computed the population of Hungary alone, at 7,000,000; and a late German author (see Pownon. ch. v.) has consequently dwelt on the general population of the Austrian dominions to 25,000,000; and a modern geographer (see Pinkerton's Mod. Geog. vol. i. p. 345.) thinks it reasonable to allow 25,000,000 as a material correction of the number subject to the Austrian system. Of the other chief provinces, Bohemia is supposed to hold 2½ millions; Moravia 1½ millions; the acquisitions in Poland, more than 3 millions; and the archduchy of Austria, as we have already stated, 1,687,000.

Hoek (ubi supra) has exhibited the hereditary flates of Austria, with their respective population, in three tables, from which it appears, that Bohemia contains 2,805,403 persons; Moravia, 1,256,424; the duchy of Austrian Silesia, 250,000; Lower Austria, 1,820,000; Interior Austria or Stria, &c. 1,645,000; Superior Austria, or the Tyrolese, 610,000; Anterior Austria, 295,433; Roveret and the Vorarberg, 77,971; Hungary and Illyria, 7,350,000; Transylvania, 1,443,364; Bukovina, 1,000,000; Eastern Galicia, 2,797,119; and Western Galicia, 4,106,178; amounting in the whole to 21,585,798 persons. The army is computed by Boetticher at 305,455 men, in 136 regiments, of which 46 are German, and only 11 Hungarian. But in the present, as with France, this army has been greatly diminished: and, at present, it is supposed not to number to that of Prussia, estimated at about 150,000; and far less than that of Russia, which is supposed to number double this number. The revenue is computed at more than ten millions sterling; to which Austria contributes about three millions; and Hungary a little more than a million and a half. This revenue used to exceed the expenditures; but the public debt is now supposed to be only 6,000,000l. sterling, and the recent wars have occasioned great defalcations.

Austria, before the acquisition of Venice, might have been regarded as an inland power; as the small harbour of Trieste had no commercial importance. Since the Austrian dominions have acquired their present extent and power, determined rivalry has subsisted between them and France. There are also causes of confirmed jealousy between Austria and Prussia, and of irreconcilable hatred between the Austrians and Turks. As Austria is also jealous of Russian power, it is not easy to select any state on the continent with which it could enter into a brief and permanent alliance.

The aspect of the Austrian dominions is rather mountainous than level, and presents in this respect a striking contrast to that of Russia and Prussia. Of the elevated chains which diversify the Austrian territories, the first that deferves mention is the Rhetian or Tyrolese Alps, called the Brenner mountains (see Alps, and Brenner), among which are several glaciers; and there are also considerable hills, which branch from the Siff and Tyrolese Alps, in the northern parts of the territory that was formerly Venetian, such as Mount Baldo, mount Bocla, and the Euganean hills near Padua. The provinces of Carninthia and Carniola present many chains of mountains, as that of Lobel, which separates these countries, and the Julian or Carnic Alps, now called Birnbaum-Wald, which divide Carnithia from Italy. The summits of the Carniolan mountains are covered with permanent snow; of these, the most memorable are the Kalenberg near the river Save, and the Runberg, and the Kard to the south of Iridia. Here also terminates the vast chain which proceeds by the north of Dalmatia towards the Heran, and is known by many local apppellations, as mount Promina near Guin, mount Proloch, mount Gobri, &c. &c. but better distinguished by the Dalmatian chain. The latter mountains are chiefly calcareous. Towards the north in the south of Styria, there first occurs the chain of Bacher; mount Grafin on the east of Judenburg; and the chief mountains in this province, or those of Grimin, in its western extremity towards Salzburg. On the east towards Hungary, this country is more plain and fertile. On the south of Austria is a chain of insconsiderable elevation. (See Cetius, and Kalenberg.) Upper Austria, or the westerly part of this province, contains many considerable mountains, the highest of which is in the maps called Priol, but the proper name is Greifenberg. Towards the south, Austria is divided from Bohemia by a ridge of considerable elevation, which passes to the north-call of Bavaria. On the north-west, Bohemia is parted from Saxony by a chain of metallic mountains called the Erzgebirg, a word that denotes hills containing mines. On the west of the river Eger, near its junction with the Elbe, stands the mountainous group of Mileffo, supposed to be the highest in the province. On the north-call the Sudette chain, which branching from the Carpathian, divides Bohemia and Moravia from Silesia and the Prussian dominions. The Carpathian mountains, bounding Hungary on the north-call, deserve particular notice. See Carpathian.

Of the rivers which pervade the Austrian dominions, the principal is the Donuz. Next to this in importance is the Tisza; and there are also the Save, the Drau, the Inn, the Mulda, the Elbe, the Morau, the Adige, and several others of less note. The lakes are numerous, and some are of considerable size. In Austria proper, are the lake Traun, the Ebensee, and others. Carnithia contains a large central lake not far from Clagenfurt, and Carniola another, called the Cirknitz see. Tyrol has no lake of any consequence, except a part of the Lago Di Garda; but its glaciers are numerous. For the moraines and lakes of Hungary, see Hungary. See Neusidler and Palitzier. In Transylvania is the Tefenge To; and many small lakes are situated amidst the Carpathian mountains.
The full of the Austrian dominions is upon the whole extremely fertile and productive, in spite of the neglect of industry, which has permitted many parts of Hungary, and of the Polith provinces, to pass into wide forests and marshes. In Austria Proper, Mr. Marshal oberves (Travels, vol. iii. p. 104.), that oats were little cultivated; the other products were rich as those of England, particularly abundance of cabbages and potatoes; but the cultivation was not neat, small waffe spots being left by the plough, which harvested wedes to the great detriment of the field. The vineyards and fields of faifon were numerous; cattle appeared in abundance; and large herds of swine, which fed all the summer in the woods. At a more recent period, Mr. Coxe (Travels in Poland, &c. vol. i. p. 155, &c.) gives a deplorable picture of the want of cultivation in the southern provinces of Poland, now subject to Austria; the country being chiefly overgrown with wild tracts of gloomy forests, and exhibiting few symptoms of an inhabited, and full keis of a civilized country. In travelling the high road from Cracow to Warfaw, in the course of 258 miles, he met with only two carriages and a dozen carts. The country was equally thin of human habitation; a few wooden villages succeeded one another at long intervals, whose miserable appearance corresponded with the wretchedness of the surrounding country. The darkness of the night, during which he travelled for want of decent accommodation, deprived him of nothing but the sight of indifferent crops of corn, gloomy forests, and objects of human misery. The natives were poorer, humbler, and more miserable, than any he had observed in the course of his travels; wherever he stopped, they flocked around him in crowds, and demanded charity with the most abject gestures. The whole country is for the most part sandy or marshy. According to this description, Austria seems to have made no great acquisition in the Polish provinces.

The domestic animals in the Austrian dominions are commonly excellent, particularly the cattle. The mineralogy of these territories is the most various and interesting of any in Europe. There is scarcely a province from the frontiers of Swifterland to those of Turkey, which cannot boast of its minerals, and the acquisitions made by the house of Austria in Poland, contain one of the most remarkable mines in Europe, the saline excavations of Wilizka. See SALT, and WILIZKA. See also BOHEMIA, and MORAVIA.

The fertile archduchy of Austria furnishes few minerals; though mines of gold are found near the abbey Goettwig, and those of silver near Krems; falt-petre, however, is prepared in abundance, and at a little distance from St. Annaberg, near the frontiers of Sirtia, a rich mine of silver was opened in 1754. The southern provinces of Sirtia, Carnithia, and Carniola, afford many important minerals. See these articles. The northern parts of Italy, now subject to Austria, have been remarkable for mineralogy, but on passing into the Tyrol, several mines occur of ancient reputation, such as that of silver and lead near Lernes; and in the same quarter, those of Naferist, in the Verner mountains, about 30 miles north-west of Innspruck, which are rich in silver, copper, lead, and iron; nor is the southern region of Trent wholly deficite of mines. But the principal mines in the Austrian dominions are situated in the easter provinces of HUNGARY and TRANSYLVANIA. See also CHEN- NITZ, and SHENNITZ.

The climate of Austria Proper is commonly mild and salubrious, though occasionally exposed to violent winds; and the southern provinces in general enjoy a delightful temperature, excepting merely the severities of Alpine winter in the mountainous parts. The more northern regions of Bohemia and Moravia, with the late acquisitions in Poland, can likewise boast of the maturity of the grapes, and of gentle and favourable weather. The numerous lakes and morasses of Hungary, and the prodigious plains resembling deserts, are supposed to render the air damp and unhealthy, the cold of the night rivalling the heat of the day; but the keen blizzards from the Carpathian mountains seem to have been to remedy these evils, the inhabitants being remarkable for health and vigour.

The manufactures are not to have been cultivated to any great extent in any part of the Austrian dominions. Those of Vienna are the most considerable. (See VIENNA, and also BOHEMIA.) The commerce of these dominions depends principally on their native opulence; Austria Proper, and the southern provinces, producing abundance of horses and cattle, corn, flax, flannel, and various wines, with several metals, particularly quicksilver, and copper from the mines of Idria. Bohemia and Moravia are also rich in oxen and sheep, corn, flax, hemp; in which they are rivaled by the dismembered provinces of Poland. The linen manufactures of Bohemia, according to Hoek, amount annually to 16,000,000 loins, besides home in wool and in cotton. The woolen manufactures at Lintz employ 30,000 persons; and in the whole archduchy of Austria there are seven great manufactures of cotton cloth, which occupy 140,000 individuals. The wide and marshy plains of Hungary afford excellent pasturage for numerous herds of cattle; and other parts of the same country produce corn, rice, the rich wines of Tokay, and tobacco of an excellent flavour, with extensive mines of various metals and minerals. Upon the whole, the Austrian territories in general abound to such a degree with the various necessaries and luxuries of life, which are found either in the north or south of Europe, that the imports would seem to be few and inconsiderable; and before the acquisition of Venice, the chief exports were from the port of Trelle, consisting of quicksilver and other metals, with wines and other native products. From a table of the exports of Hungary for one year, given by Dr. Townson, it appears, that they consisted chiefly of cattle, hogs, sheep, flour, wheat, rye, wool, and wine, carried to other Austrian provinces; and only about one-seventh part sent to foreign countries.

The prevailing religion of the Austrian dominions is the Roman Catholic. However, Protestants of various sects are found in Bohemia and Moravia; nor are Lutherans unknown at Vienna, though they chiefly abound in Transylvania; and in Hungary the Protetants are supposed to be equal in number to the catholics. The form of government is an hereditary monarchy, approaching to absolute power. Hungary, indeed, retains its ancient flates, or rather an aristocratical senate; but as the military force is lodged wholly with the sovereign, no distinct kingdom or state can withstand his will. Austria also has its flates, consisting of four orders, clergy, peers, knights, and burghers: the assembly for Lower Austria being held at Vienna, and that of the Upper at Lintz. But these local constitutions can little avail against the will of a powerful monarch, supported by a numerous army. The laws vary according to the different provinces; and almost every state has its peculiar code. (See HUNGARY.) Upon the whole, the laws may be regarded as mild and salutary; and the Austrians in particular are well regulated and contented people, while the Hungarians are often dissatisfied, and retain much of their ancient animosity against the Germans.

The history of Austria properly so called, may be concisely delineated in the following epochs, collected and detailed by Mr. Pinkerton, in his "Modern Geography," vol. i. p. 537.

"1. The house of Austria, which, by successive fortunate marriages since the fifteenth century, has arisen to such a summit of power, is well known to have sprung from the humble counts of Hapburg. Those lords possessed a small territory in Swifferland, in the northern corner of the canton of Bern, near the river Aar, about three miles south of the town of Bruck, and the same distance to the north of Mellingen. On a lofty eminence, crowned with beech, flanks an ancient tower, the first seat of the house of Austria. In the twelfth century Otho was destined count of Hapburg, and even hereditary can fearfully ascend beyond his grandfathers Radebot, brother of Werner, bishop of Strasburg. In 1723, Rodolph of Hapburg was called to the imperial throne, after an inter-regnum, during which the German potentates had increased, and secured their own power; and widely preferred a nominal suzerain, whose humble extract, and small possessions, could afford no check to their ambition. Yet Rodolph was at this time lord of the greater part of Switzerland; after the extinction of the powerful house of Zwingen, and that of the counts of Kyburg, whose joint inheritance devolving to Rodolph, became the basis of his power, and that of his successors. (See Planta's Swiss, i. 170.)"

"2. Another emperor of the house of Austria appeared in Albert, A.D. 1268; from whom the Swifs made their signal revolt in 1307. His son Frederic was obliged to yield the empire to Louis of Bavaria. (See Albert I.)"

"3. Albert II. duke of Austria, A.D. 1438, succeeded to three crowns, on the death of his father-in-law the emperor Sigismund, thole of Hungary, and Bohemia, and that of the empire by unanimous election. This was the epoch of the lasting grandeur of the house of Austria. Yet his successors Frederic III. and Maximilian I. were feeble princes; and Charles V. first astonished Europe with a real display of Austrian power. (See Albert II.)"

"4. Maximilian having married the heiresses of Burgundy, the Netherlands became subject to the house of Austria in 1477; and his son Philip, in 1496, marrying the heiress of Arragon and Castile, the ample dominions of Spain fell afterwards under the Austrian sceptre. Charles V. inherited all these dominions but one on his reignation, Spain and the Netherlands passed to his son Philip II. and the former crown continued in the Austrian line till the close of the 17th century, Austria, Bohemia, and Hungary, passed to Ferdinand, the brother of Charles V. who was also chosen emperor of Germany.

"5. The noted bigotry of the house of Austria was not confined to the Spanish branch, for though Maximilian II. about 1570, had granted liberty of conscience even to the Protestant of Austria, yet those of Bohemia, and other parts, were afterwards so much oppressed, that the Protestant princes of Germany called in Guelf Adolph, the celebrated Swedish monarch, to their assistance, who shook the empire to its very foundation. Even France supported the Protestants, in the view of weakening the Austrian power; and the war continued till 1648, when the famous treaty of Westphalia was signed, which has served as a basis for other diplomatic transactions. (See Westphalia.)"

"6. The war with France was often rekindled during the long reign of Leopold I. 1658 to 1705; and in 1683, the Turks were so successful as to lay siege to Vienna.

"7. His son Joseph I. joined the allies against France, and shared in their successes. He married the daughter of John Frederic, duke of Hanover.

"8. By the death of the emperor Charles VI., on the 20th of October 1743, without male issue, the house of Austria became extinct. The elector of Bavaria seized the kingdom of Bohemia, and was elected emperor in 1744, but died in 1745.

"9. Francis of Lorraine, son of Leopold duke of Lor- rain, having married Maria Theresa, daughter of the emperor Charles VI. succeeded to the Austrian dominions, which continue to be held by his descendant. In 1745 he was elected emperor, and his successors have enjoyed the imperial crown, as hereditary. The powerful house of Lorraine is of great antiquity, descending from Gerard count of Alsea, in the 11th century, whose origin is referred to a collateral branch of the house of Austria.

"10. The reign of the emperor Joseph II. a beneficent but impetuous prince, whose grand designs of reformation were frustrated by his ignorance of the invertecy of habits and prejudices, which must ever be considered in a due estimate of human affairs.

"11. The obdurate and sanguinary contielt with France, the events of which are known to all."

For an abridged detail of the history of the other Austrian dominions; see Bohemia, Hungary, Venice, &c.

AUSTRIACA Syndera, in Aftromeny, a name given by Maupertuis to the spots in the sun, as supposing them to be small stars between the sun and us.

Austriaca, in Entomology, a species of Seréx found in Austria, and described by Schranck. It is of a black colour, with a sulphur-coloured band, and two dots of the same at the base of the abdomen; legs sulphur-colour, with the thighs of the posterior ones thick.

Austriaca, a species of Cicada (Ramntra Sec.), of a small size, that inhabits Austria. It is black, with pale legs; white at the base of the eyes; wings transparent, with five faint bands of black. Schranck, &c.

Austriaca, a species of Buprestis, with brassy, striated, and bidentated wing-cases; head and thorax greenish; abdomen violet. Gmelin. This kind inhabits India, is about the size of buprestis rutila, and is called moriela gigantea by Scopoli.

Austriaca, a species of Cicindela found in Austria. This insect is green, with the breast and belly golden red; wing-cases with a thin golden margin, and a few white spots. Schranck, &c.

Austriacus, in Entomology, a species of Cixex that inhabits Austria. This insect is ferruginous, and has the feet divided by a black band. Schranck.

Austriacus, a species of Curculio found in Austria. It is apterous, cinereous; wing-cases lined with whitish, and dotted with black. Fabricius.

Austriacus, a species of Scarabæus (Melolitba) found in Austria. This kind is gibusous; wing-cases brown, with an exterior elevated margin, and four spots on the femur. Herbill, &c. It is uncertain whether this is a distinct species or a variety only of scarabæus agricolae.

Austriacus, in Ornithology, a species of Falco, named by Latham the Austriacus Aes. Cere and legs rather woolly and yellow; body above chestnut; beneath tawny, spotted with brown; tail forked. inhabits the woods in Germany, and feeds on small birds and bats. Gmelin.

Austriacus, in Zoology, a species of Coluber that is found in the environs of Vienna, and is so very analogous to coluber.
A

T

coluber matrix, or common snake, as to be formerly con-
confounded with it. Laurenti, in his work on the Amphibians,
appears to be the first writer who distinguished them; the
principal difference seems to consist in the perfect smooth-
ness of the scales in aphisaurus, while those of matrix are
slightly carinated. It is of a blueish-gray, inclining to rufous
on the sides and abdomen, with a double row of alternate
rufous spots along the back. This kind lives in moist
meadows, hedges, and watery places, and is of a fierce dis-
position, but incapable of producing injury, being unpro-
vided with poisonous fangs. It occasionally varies a little in
colour. Gmelin, Shaw, &c.

AUTRO AFRICUS, in Meteorology, the south-south-
west point, or wind.

AUSTROMANCY, in Mythology, properly denotes
soothsaying, or a vain method of predicting futurity, from
observations of the winds.

AUSUFAL, in Ancient Geography, the name of a place
in Africa, on the road from Carthage to Alexandria,
thirty-four miles from this latter city. Anton. Itin.

AUSUM, a town of Africa, in Mauritania Cifariensis.
Prolemy.

AUTARIATES, a people of Illyria, mentioned by
Arrian, in his account of Alexander's expedition into this
country; and probably the same with those placed by
Strabo in Thrace, to the north of mount Rhodopes.

AUTARIS, a place in Arabia Felix. Plin.

AUTEFAJE, in Geography, a town of France, in the
department of the Lot et Garonne, and chief place of a
canton in the department of Villeneuve d'Agen, nine miles
N. E. of Agen.

AUTENIQUA, an extensive and beautiful country of
Africa, lying to the east of the Cape of Good Hope, and partly
inhabited by Dutch colonists. The term "Auteniqua," in
the language of the Hottentots, denotes, "loaded with
honey," and is strictly applicable to this country, as you
cannot advance a step in it, proceeding from the Cape,
without seeing innumerable swarms of bees. M. Vaillant,
who visited this country in 1782, calls it the most delightful
region in the universe. It is intermixed with hills and
valleys, enameled meads and beautiful pastures; and it
abounds with small rivulets, which contribute both to the
fertility of the soil. The whole of Auteniqua, from the
chain of mountains which divides it from the race of
Hottentots called "Gonaqua," to the sea, is inhabited by
planters, who rear cattle, make butter, cut down timber,
and collect honey, with all which they supply the Cape.
But though they employ wood in commerce, they use none
of it for building houses. Their habitations are wretched
hovels, constructed of wicker work, daubed over with clay;
the skin of a buffalo, fixed at the four corners to as many
flakes, serves them for a bed; and the door, which serves
also for a window, is shut by a mat. The furniture is mean
and scanty, as the dwelling is incommodes. With this
appearance of poverty and wretchedness, the people live
well; they have plenty of game and salt-water fish, and
vegetables of every kind in their gardens through the
year. For these they are indebted to the fertility of the
soil, and the rivulets flowing in various directions from the
mountains, by which it is watered. In the mountainous
regions of this district, there are multitudes of elephants,
buffaloes, panthers, hyenas, and antelopes of every species,
which are hunted and killed by the natives, partly for food,
and partly with a view to the preservation of their herds and
flocks. The kites and vultures of this country are singularly
fierce and voracious. Beyond the limits of the country

called "Auteniqua," is a spacious bay, with sufficient
depth of water for the largest vessels, and safe anchoring
ground; known to navigators by the name of the bay of
"Agana," but called by the colonists "Bluffentag's" bay,
from the name of a governor who visited it. In
advancing about a league along the coast, there is a con-
siderable river called "Quorar-Boon," which would afford
an ample supply of water. The Hottentots, who in fter-
ted "kaal," inhabit this delightful country, are de-
scribed by Vaillant as a faithful, gentle, and rather timid
race. He affirms, but probably without sufficient evidence,
that they have not any notion of superior powers who
govern the world. He also says that, totally free from
jealousy, they lend their wives to travellers who visit
them. In Vaillant's map, Auteniqua lies between 32°
30' and 34° 50' S. lat. and between 20° and 23° 40' L.

AUTENOW, a town of Poland, in the palatinate of
Kiev, eighteen miles W. S. W. of Bialacerkiew.

AUTENTUM, in Ancient Geography, a town of Africa,
in the route from Thene to Thuberta, thirty miles from
Suffetula, and twenty-five miles from Amudara. Anton.
Itin.

AUTER Droit, in Law, is that which serves for or are
fixed, in another's right; as executors, administrators, &c.

AUTER Place; a person who holds an estate by the life
of another, is usually called tenant per auter vit. Litt. feet.
5°

AUTERFOITS Acquit, a plea by a criminal, that he was
heretofore acquitted of the same treason or felony.
For one shall not be brought in danger of his life, for the
same offence, more than once. 3 Inst. 213. But by flat.
3 Hen VII. c. 1. this plea shall be no bar to the prosecution
of any appeal. See Acquittal.

AUTERFOITS Attain, a plea of former attainder, which
is a good plea in bar, whether it be for the same or any
other felony, under some exceptions; so that this plea is
never good but when a second trial would be quite superfluous.
See Attainder.

AUTERFOITS Conviit, a plea upon a former conviction
for the same identical crime, though no judgment was or
ever will be given; and this is a good plea in bar to an
indictment.

AUTE RIVE, in Geography, a town of France, in the
department of the Upper Garonne, and chief place of a
canton in the department of the Arriegue, fifteen miles south
of Toulouse.

AUTHENTIC, something of received authority. It
also signifies something solemn, and celebrated; clothed in
all its formalities; and attested by proper persons, to whom
credit has been regularly given.

Biblical writers have differed in opinion about the mean-
ing of the phrase "Authentic letters," used by Tertullian,
De Praelect. c. 36. p. 243. B. Some by authentic letters
have understood the originals themselves, in the apostle's
hand-writing, or that of his amanuensis, and digested at
the conclusion by himself. Others are of opinion, that
Tertullian means letter in their original language. But Dr.
Lardner, rejecting these two interpretations, maintains that
this ancient father means by authentic letters such as were
certain and well attested. In this sense the word authentic
is used by Cicero Ad Attic. l. x. ep. 9. Accordingly, by
"Authentic letters" we are not to understand "Authentic
letters, or epistles," but "Scriptures;" and fo the word
should have been rendered. Hence it may be inferred,
agreedly to the argument used by Tertullian, that the
scriptures
AUTHOR, in matters of Literature, denotes a person who has wrote or composed some book or writing. Accordingly we say, the sacred authors, anonymous authors, ancient and modern authors, &c. An original author is he who first treated of any point or subject; who did not follow any other person, or imitate any model either in the matter or the manner of what he has wrote.

AUTHORITY, in a general sense, denotes a right or power to command, and make one's self obeyed. In this sense we say, the supreme or sovereign authority; absolute or despotic authority; the royal authority; the ecclesiastical authority; the authority of the church; of a father, &c. the authority of scripture, of a creed, confession, or the like.

Authority is also used for the testimony of an author or writing.

The word is also particularly understood of an apostle, or sentence of some great or eminent person, quoted in a discourse, either by way of proof, or embellishment.

Authority also includes rules, laws, canons, decrees, decisions, &c. alleged in confirmation of a matter in dispute. Passages quoted from Arilottas were of great authority in the schools: texts of scripture are of decisive authority.

 Authorities make a species of arguments called by rhetoricians inartificial or extrinsic arguments. See Arguments.

For the use and effect of authorities, see Evidence, Faith, Prejudice, Probability, Reason, Revelation, &c.

AUTHOR, in Law, is a power to do something, conveyed by word or writing; as also by writ, warrant, commission, letter of attorney, &c.; and sometimes by law.

AUTHORITY, or Authorities, likewise denote the treatises of ancient authors, such as Plutarch, Bruton, the author of the book Peta, Hengham, Littleton, Statham, Brooke, Fitzherbert, Stanfield, and some others of ancient date, which are cited as authority; and furnish evidence that cases have formerly happened in which particular points were determined, which are now become settled and first principles.

One of the last of these methodical writers, in point of time, whose works are of any intrinsic authority in the courts of justice, and do not entirely depend on the strength of their quotations from older authors, is Sir Edward Coke, who hath written four volumes of Institutes, as he is pleased to call them, though, says judge Blackstone, they have little of the institutional method to warrant such a title.

AUTHIRE, in Geography, a river of France, which runs into the sea, eight miles north from the mouth of the Somme, and separates the department of the flats of Calais from the department of the Somme, through among its whole course.

AUTHION, a river of France, which runs into the Loire, two miles south of Angers.

AUTHON, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Nogent le Rotrou; six leagues west-north-west of Chateaudun.

AUTHOR, formed of aures, ipse, or rather from the Latin participle autem, or augeo, I increase; properly denotes one who created or produced anything; and is applied, by way of eminence, to the first cause; viz. God. Thus we say, the author of nature; author of the universè, &c.

The term author is sometimes used in the same sense with infitutor or inventor. Polydore Virgilius has wrote eight books of the authors or inventors of things, &c. See Invention.

AUTHOR, see Bible and Testament.

AUTHENTIC, in Music, a term used in speaking of the ecclesiastical modes of capo fermo, or plain-song. An authentic tone or mode is that, when the octave is harmonically divided in this proportion, 6:4:3: that is to say, when the fifth is at the bottom, and the fourth at the top. When the octave is divided arithmetically, as 4:3: where the fifth is above the fourth, as D, then the mode is termed plagal. Of the eight ancient ecclesiastical modes, four are authentic; namely, the first, third, fifth, and seventh. The reff that is, the second, fourth, fifth, and eighth are plagal. See Modes.

AUTHENTICATING, the punishing an adulteress by public whipping, and flinging her up in a convent for two years after which, if the husband be not willing to take her back, she is thrown, veiled, and shut up for life. It is so called, as being the punishment prescribed in the Authentics. In the event of the year, the feems to have a right to petition the court for her liberty; at least, another man, willing to marry her, may petition, and probably obtain it.

AUTHENTICS, AUTHENTIC, in the Civil Law, is a name given to the Novels of Julianus. See Novel.

The reason of the denomination is not well known. Alcian will have it to have been first given them by Accursius. The Novels were originally composed in Greek, and afterwards translated into Latin by the patronian Julianus, who also reduced them into fewer books, and left compacts. And in the time of Bulgarias, there was a second version made, more exact and literal, though not quite so elegant as the former.

This translation, says the author just cited, being preferred by Accursius, he called it authentic, by way of preference to that of Julianus, as being more conformable to the original. They are hereby distinguished from some other publications of later imperial constitutions, which are not regarded as of much authority.

AUCHE, in Geography, a river of France, which runs into the sea, eight miles north from the mouth of the Somme, and separates the department of the flats of Calais from the department of the Somme, through among its whole course.

AUTHOR, see Bible and Testament.

AUTHON, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Nogent le Rotrou; six leagues west-north-west of Chateaudun.

AUTHOR, formed of aures, ipse, or rather from the Latin participle autem, or augeo, I increase, properly denotes one who created or produced anything; and is applied, by way of eminence, to the first cause; viz. God. Thus we say, the author of nature; author of the universè, &c.

The term author is sometimes used in the same sense with infitutor or inventor. Polydore Virgilius has wrote eight books of the authors or inventors of things, &c. See Invention.
but this is not to be understood in the full latitude of the words; but only as intimating, that the autographs have the same authority over their bishops, that patriarchs had over their archbishops; in which sense, only, they are equal to patriarchs.

**AUTOCHTHONES,** from ἀυτός, ἄγγελος, and ἀυτός, τέρα; an appellation assumed by some nations, importing, that they sprung, or were produced, from the same soil which they still inhabited. In this sense, autochthonous amounts to the same with Aborigines. In this sense it was that the Greeks, and especially the Athenians, pretended to be autochthonous, and, as a badge thereof, wore a golden grashopper woven in their hair, an insect supposed to have the fame origin.

This favourite epithet of the Athenians, which gave denomination to one of the tribes of Athens, signifies only, "people born in the country where they live," in opposition to strangers. The common people of Athens perverted this to signify people sprung from the earth. See what Plato makes Socrates say on this matter, in Menexen, p. 318. See also Hor. in Fimig. p. 67. Cicero Orat. pro L. Fisece. 26. Isocrates says, that people of fene at Athens understand, by this epithet, that Athens was the most ancient of the Greek cities; and that it had been built by those who, from time immemorial, had been established in the country known by the name of Attica. See Herod, l. vi. § 161. Suid. voc. Autochthonos, t. l. p. 280. Hilfory, however, destroys this fall pretention; as few circumstances are better known than the time of the building of Athens.

**AUTOCRATOR,** from ἀυτός, and κράτος, power; a person vested with an absolute independent power, by which he is rendered unaccountable to any other for his actions. The power of the Athenian generals, or commanders, was usually limited; so that, at the expiration of their office, they were liable to render an account of their administration. But, on some extraordinary occasions, they were exempted from this restraint, and feized with a full and uncontrollable authority: in which case they were styled ἀυτοκράτης.

The same people also applied the name to some of their ambassadors, who were vested with a full power of determining matters according to their own discretion, and resembled our plenipotentiaries.

**AUTOCRATOR was also a title given to the Roman emperors, first to Julius, and afterwards to his successors, like that of Caesar, or Augustus.**

**AUTODIDACTUS,** from autós, and didaktós, I teach; a peron self-taught.

It is used in divers senses, sometimes to denote a person who received his knowledge immediately from heaven without any help or advice. In which sense the word occurs in Homer, and Clemens Alexandrinus.—Sometimes for him who acquires his knowledge without instruction, either by word of mouth, or reading of books. Such were the inventors of sciences and laws.—Sometimes, and that most usually, for him who arrives at learning by the use of books alone, without the assistance of any master, or instruction void voci.

**AUTOGLYPHUS Lapid, a stone, mentioned by Plutarch, and some other of the ancient, as having naturally impressed on it the figure of Cybele. It is said to have been found in Sagaris, a river of Perusia. Doubtless, if any such stone ever existed, the priests had got it made to deceive the people.**

**AUTOGRAPHUM,** formed of autós, and graphés, scribo, the very hand writing of any peron; or the original of a treatise, or discourse.—The word is used in opposition to a copy.

**Autojsona, or original MSS. of the New Testament, are the first copies of each book, which were written either by the apostles themselves or by amanuenses under their immediate inspection. St. Paul usually adopted the latter mode; but to prevent the circulation of spurious epistles, he wrote the concluding benediction with his own hand. See Rom. xvi. 22. Gal. vi. 11. and 2 Thes. iii. 17, 18.**

None of these original MSS. are now remaining, nor could they have been preserved, without the interposition of a miracle, during the space of eighteen centuries. "But what beneficet (says Michaelis, Introd to the N. T. by Marsh, vol. i. p. 247.) should we derive from the possession of these MSS.; what inconvenience do we sustain from their loss? No critic in classical literature inquires after the original of a profane author, or doubts of the authenticity of Cicero's Offices, because the copy is no longer extant which Cicero wrote with his own hand. An antiquarian, or collector of ancient records, will hardly maintain, that the probability of these books being genuine, is inferior to the probability that a book in his possession of the twelfth century is an authentic document of that period. But though his record is only 600 years old, and the works of Cicero are three times as ancient, we are more exposed to imposition in the former instance, as the forgery of antiquities is often praefided by those, whose business and profit are to lead the curious into error. But supposing that the original MSS. of Cicero, Caesar, Paul, and Peter, were now extant, it would be impossible to decide whether they were spurious, or whether they were actually written by the hands of these authors. The case is different with respect to persons, who have lived in the two last centuries, whose handwriting is known, with which a copy in question may be compared and determined; but we have no criterion, that can be applied to MSS. so old as the Christian era. Yet admitting that these original writings were extant, that we had positive proofs of their authenticity, and, what is still more, that the long period of seventeen centuries had left the colour of the letters unfaded, still they would be no infallible guide in regard to the various readings."

Knittel, in his edition of a fragment of Ulphilas, p. 129. accounts for the losses of the original MSS. of the N. T. by supposing that the original gospels and epistles, as soon as the different communities, for whose use they were written had taken a copy, were returned to the authors; and he says, that it was the general practice among the Christians of that age, and in support of the assertion appeals to a passage in Polycarp, and another in Irenaeus. But his arguments, in the opinion of Michaelis, are very unsatisfactory; and he thinks it reasonable to suppose, that the very same accidents, which have robbed us of other ancient documents, have deprived us likewise of these originals. From a passage of Ignatius, in the eighth chapter of his epistle to the Philadelphiaians, it has been inferred, that some of the first Christians appealed to the original MSS. at that time extant, and held them in great veneration; for which they were ridiculed, as the fame passage is thought to fuggel, by the early fathers, and those who had the greatest authority in the church. But the passage to which appeal is made, in order to prove the exisstence of the original MSS. in the time of Ignatius, is found to relate to a different subject. See Authentic.
MSS. of Luther and other eminent men who lived at the time of the reformation, whose writings are of much less importance than those of the apostles, are still publishing. Various copies may have contributed to this circumstance, of which several have been alleged in Griesbach's "Historia
Textus Epiilorum Pauli," fect. ii. § 7, 8. Michaelis has given the following account of it. The several books of the N. T. were circulated among the Christians in numerous copies; "there were few collected into a volume, and formed the edition in general use; and as no disputes had then arisen on the subject of various readings, they felt not the necessity of preserving in a common archive the MSS. of the apostles." The situation of the Christian churches was at that time extremely different from the present; the most eminent, which were those of Rome, and Corinth, consisted of a number of small societies, that assembled separately in private houses, having no public building as a common receptacle for the whole community; and even in these private houses a moderate number only could meet together, as it was their custom not merely to pray and to teach, but likewise to celebrate their feasts of love. The epistle, which they had received from St. Paul, was not the property of any one society in particular, but belonged to the community at large, and that which was sent to the Corinthians was addressed to the communities throughout all Achaia. Each society copied the epistle in its turn, and beside the general copies, many individuals probably took copies for themselves, whence the original MS. of the apostle, in passing through so many hands, where perhaps not always the greatest care was taken, must unavoidably have suffered. The Christian communities in Rome and Corinth had no common archive, or public library, in which the MS. of the apostle might have been afterwards deposited, for want of which, the original, as soon as a sufficient number of copies had been made, was forgotten and lost. In other cities, the number of single societies, among which the epistle was divided, was inferior indeed to that in Rome, Corinth, or Ephesus, but the same causes contributed in each to the loss of the original epistle.

The same learned author adds, "the late or early losses of the autographs have no influence on the grounds of our faith; for the credibility of a book, which during the life of the author has been made known to the world, depends not on the preservation of the author's manuscript. No reader of the present work will inquire after the copy, which I lend to the printer, to determine whether the work itself is spurious or authentic; nor was it necessary, for determining the authenticity of the New Testament, to preserve the originals; for each book, during the lives of the apostles, was circulated throughout the Christian world, in numberless copies, though they were not collected during that period into a single volume." As the autographs of the N. T. fell so early into oblivion, it seems reasonable, in certain cases, to make use of critical conjecture for settling the true reading of disputed passages in the N. T., as well as in other books. On this subject, see Michaelis Intro. vol. i. § 2. p. 253, &c.

For the purpose of multiplying autographs, or original copies of the same writing, several machines have been invented. See Writing Machine.

AUTOISON, in Geography, a town of France, in the department of the Upper Saône, and chief place of a canton, in the district of Vézoul; five leagues south of Beaugeon.

AUTOLITHIOTHOMUS, he who cuts himself for the flame. See Lepidotomy.

Of this we have a very extraordinary instance given by Reifelius, in the Ephemerides of the Academic Nature Curiatorium, an. 3. obi. 1190.

AUTOLIVE, in Ancient Geography, a town of Gtulia, in Libya Interior, which flourished between the Siculus and the Sitalus, the only two rivers of note, except the Gis and Niger, that watered Gtulia. Nothing is now known of this ancient city, but that it gave name to the Autolakes, a powerful tribe of Gtulian Proper, that spread themselves over that part of Tingitania which bordered on the coast of the Atlantic ocean.

AUTOLYCUS, in Biography, a Greek mathematician and astronomer of Pitane, in Asia, flourished about 320 years before Christ. He was preceptor in mathematics to Archelaus, who was also a disciple of Theophratus, the successor of Aristotle. That he was an eminent mathematician appears from two of his works that are extant; viz. a treatise "On the moveable Sphere," published by Dafypodius in Greek and Latin, 5vo., at Strauburg, in 1572; and in a Latin translation in the "Synopsis Mathematica" of Merelenium, published in 4to., at Paris, in 1644; and also a treatise "On the rising and setting of the Stars," edited with the former work by Dafypodius. Dlg. Laert. Vit. Arcutil. Fabr. Bib. Græc. tom. ii. p. 89. Montucla Hist. Mathem. t. i. p. 192.

AUTOMATON, or Automatum, compounded of αὐτός, ipse, and μαχητής, I am excited or ready, whence αὐτομαχητής, spontaneous; a self-moving engine; or a machine which has the principle of motion within itself. Such were Archytas's flying dove, mentioned by Aulus Gellius, Noël. At. lib. x. c. 12. (see Aerostation); and Regiomontanus's wooden eagle, which, as hiliarus relates, flew forth from the city of Nuremburg, met the emperor Maximilian on his arrival, June 7, 1472, saluted him, and returned; as also his iron fly, which, at a feast, flew out of his hands and taking a round, returned thither again; and also Dr. Hooke's flying chariot, capable of supporting itself in the air. Hakew. Apol. c. x. sect. 1. None of the contemporary writers, though they often mention Regiomontanus, take any notice of these pieces of mechanism that have been ascribed to him; and it is probable, says Beckmann (Hist. Invent. vol. iii. p. 325) that the whole tale originated from Peter Ramus (Schol. Mathem. l. ii. p. 65.), who never was at Nuremberg till the year 1571. Charles V., it is said, after his abdication, amused himself during the latter period of his life, with automata of various kinds.

Among automata are also reckoned all mechanical engines which go by springs, weights, &c. included within them; such are clocks, watches, &c. Vide Bap. Port. Mag. Nat. c. 19. Scalig. Subtil. 326.

When clocks were brought to perfection, some artists added to them figures, which, at the time of striking, performed certain movements; and as they succeeded in these, some of them attempted to contructCTingle figures, detached from clocks, which either moved certain limbs, or advanced forward and ran. In the middle of the sixteenth century, when Hans Bullman, of Nuremberg, constructed figures of men and women, which moved backwards and forwards by clockwork, beat a drum, and played on the lute, according to musical time, they excited universal astonishment. The most ancient automata, of which we have any record, are the tripods constructed by Vulcan (see IIiad, xviii. 373. Philodrat. Oper. ed. Olearii, p. 117 and 240.), which being furnished with wheels, advanced forwards to be used, and again
again returned to their places. These tripods, which are mentioned also by Arilottre (Polite, i. 3.) were probably only a kind of small tables, or dumb waiters, with wheels so contrived that they could be put in motion, and driven to a distance, on the smallest impulse.

Automata that represent human figures are called Androïdes. (See Androïdes, under which article an account has been given of several figures of this kind.) From a letter addressed by Thomas Collins, eq. to Dr. Hutton, we learn, that the secret of the chef-playing figure exhibited in various places by M. Kempelen (baron Kempell), was discovered by a gentleman of rank and talents named Joseph Fridriech Freyhere, who published, at Dresden, in 1789, a treatise explaining its principles. A well-trained boy, very thin and small of his age, so that he might be concealed in a drawer almost immediately under the chef-board, agitated the whole machine. M. Droz of La Chaux de Fonds, in the province of Neufchatel, has also executed some very curious pieces of mechanism. One of these was a clock, presented to the king of Spain, to which pertained, among other curious contrivances, a sheep thatimitated the bleating of this animal, and a dog, watching a basket of fruit, that barked and snarled when any one offered to take it away, and a variety of moving human figures. Mr. Collin informs us, that when he was at Geneva, Droz, the son of the former, shewed him an oval gold snuff-box, about 4½ inches long, 3 broad, and 1½ thick, which was double, with an horizontal partition; one of the partitions contained snuff, and in the other, upon opening the lid, there sprung up a very small bird, of green enamelled gold, perching on a gold stand. This minute curiositv, being only three quarters of an inch from the bezil to the extremity of the tail, wagged its tail, shook its wings, opened its bill of white enamelled gold, and poured forth such a clear melodious song as would have filled a room of twenty or thirty feet square with its harmony. Another automaton of Droz's was the figure of a man, about the natural size, which held in his hand a metal style; and by touching a spring that released the internal clock-work from its stop, the figure began to draw on a card of Dutch vellum laid under the style. Having finished its drawings on the first card, the figure refilled. It then proceeded to draw different subjects on five or six other cards, which number limited its delineating powers. The first card exhibited elegant portraits and likenesses of the king and queen facing each other; and the figure was observed with the most surpassing precision to lift its pencil, in the transition from one point of the draft to the other; as, e.g. from the forehead to the eye, nose, and chin, and from the waving curls of the hair to the ear, &c. without making the leaf blur.

AUTOMEDON,  in Enumology, a species of Papilio (Hecaleius), with broad angular wings of a brown colour above, and livid beneath; an ocular spot in the anal angle. Fabricius, &c. Native place unknown.

AUTONINE, BERNARD, in Biography, a French lawyer and advocate to the parliament of Bourdeaux, was born at Agenois, in 1587, and died in 1666. The principal of the law treatises which he wrote in French, "A Comparison of the Roman Law with the Roman Law," published in 2 vols. fol. in 1644, and "A Commentary upon the Provincial Law, or La Coutume, of Bourdeaux," the best edition of which is that of Dupin, 1728, fol. with notes. He also wrote in Latin "Censura Gallica in jus Civile Romanum," Paris, 1615; and he published at Paris, in 1607, in two volumes, 8vo., an edition of Juvenal and Persius, with ample notes. He has been deemed an industrious rather than a judicious author. Nouv. Diet. Hist.

AUTONNE, in Geography, a river of France, which runs into the Oise near Vertouie.

AUTONOMI, in Ancient Geography, so called because they were their own law-givers, a people who inhabited the most rocky and barren parts of Thrace, separated from Macedonia by mount Haemus. In their engagement with Alexander, they behaved with extraordinary valor; but their whole army was cut in pieces, and their baggage taken, together with their wives and children. After this defeat, they submitted to the conqueror, who, in order to prevent their revolt during his absence, took with him into Asia all the chief men of their nation. They afterwards served under Pericles against the Romans; but were allowed to live according to their own laws till the reign of Vespasian, who made their country part of the province of Thrace.

AUTOPRACTI, from auti, self, and verti, law, a power of living or being governed by our own laws and magistrates. The liberty of the cities which lived under the protection and protection of the Romans, confided in their autonomy, i.e. they were allowed to make their own laws, and elect their own magistrates, by whom justice was to be administered, and not by Roman princes or judges, as was done in other places which were not indulged the autonomy.

AUTOPSY, compounded of auti, one's self, and opsi, sight, ocular inspection, o the facing a thing with one's own eyes.

AUTOPYROS, from auti, and pyros, wheat, in the Ancient Diet, an epithet given to a species of bread, wherein the whole substance of the wheat was retained, without re-trenching any part of the bran.

Galen describes it otherwise, viz. as bread where only the outer bran was taken out.—And thus, it was a medium between the fine, bread, called fadigines, and the coarsest, called farinac. This was also called antpyrites, and jovemisflur.

AUTOUR, in Ornithology, the name under which Butin describes the gull, or fula palmaria of Linneus. Autous, in Natural History, a sort of bark which resembles cinnamon, but is paler and thicker; it is of the colour of a broken nutmeg, and full of spangles. It comes from the Levant, and is an ingredient in the carmine dye.

AUTREAU, JAMES D', in Biography, a painter and poet, was born at Paris, in 1656; but being of a singular and misanthropic disposition, secluded himself from the world, lived in obscurity, and died in an hospital. As a painter, though not eminent, he produced some pieces that were esteemed. With a view of doing honour to the character of cardinal Fleury, he adopted the device of exhibiting Diogenes with a lantern searching for an honest man, and pointing him out in a portrait of the cardinal. Having nearly attained the age of sixty, he began to write for the stage; and the species of composition which he first adopted, notwithstanding his contrary disposition and habits, was light and humorous comedy. He wrote both for the Italian and French theatres. His "Fort a l'Aeglois" was
his first piece, and another of his works was the "Amans Ignorans." He also composed some tragedies and serious pieces for the French theatre; and wrote Lyric compositions for the opera. The plots of his pieces are simple and artificial; but the dialogue is easy and natural; and some of his scenes contain genuine comedy. Notwithstanding all his exertions, Autreau died in extreme poverty, at the hospital of the Incurables in Paris, in 1745. His works were collected and published, with a preface, by Peflier, in four volumes, 1749. Nov. Dict. Hilbr.

AUTRECOURT, in Geography, a town of France, in the department of the Meuse, and chief place of a canton in the district of Chalmilte; one league north-west of Gray.

AUTREY, a town of France, in the department of the Upper Saone, and chief place of a canton in the district of Champliite; one league north-west of Gray.

AUTRICOURT, a town of France, in the department of the Coté d’Or, and chief place of a canton in the district of Chatillon sur Seine, eight miles north of Chatillon.

AUTRICUM, in Ancient Geography, now Chartres, a town of Gaul, the capital of the Carnutes, and called Civitas Carnotum, and Carnotena. It was seated on an eminence, and seems to have derived its first name from the river Autura. It was celebrated in Gaul, as the principal residence of the Druids, who held their assemblies among the woods in its vicinity. The name of Carnotum was probably derived from the Celtic Kar or Ker, denoting a city, and expressing its peculiar excellence.

AUTRIGANES, a people of Hispania Citerior, in Cantabria, who dwelt near the foot of the Pyrenees, towards the south-west. The only town they had on the coast was Flavibrigia.

AUTRUCHE, in Ornithology. See Struthio Camelus.

AUTRY, in Geography, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Grandpré; three leagues west of Varennes.

AUTUMN, the third season of the year; being that in which the harvest and the fruits of the summer are gathered. It begins on the day when the sun’s meridian distance from the zenith, being on the decrease, is a mean between the greatest and the least; which in these countries is supposed to happen when the sun enters Libra, or about the twenty-second day of September. Its end coincides with the beginning of winter.

Divers nations have computed the year by autumns; the English Saxons, by winters.—Tacitus tells us, the ancient Germans were acquainted with all the other seasons of the year, but had no notion of autumn.

Autumn has always been reputed an unhealthy season. Tertullian calls it "tentator valetudinis;" and the laterists speak of it in the same light:

"Autumnus Libitinæ quæstus acerba."

Autumn is commonly represented by painters under the figure of a female crowned with vine branches, and bunches of grapes; naked in that part which respects summer, and clothed in that which corresponds to winter. Its garment is covered with flowers, like that of Bacchus.

AUTUMNAL, something peculiar to autumn. Thus, Autumnal Point, is one of the equinoctial points; being that from which the sun begins to descend towards the southern pole.

AUTUMNAL Equinox, is the time when the sun enters the autumnal point. See Equinox.

AUTUMNAL Flowers. See Flower.

AUTUMNAL Plants, in Gardening, all such as attain perfection in autumn, either in their growth, or in their flowering, &c.

AUTUMNAL Season, that period, which, in regard to the numerous operations to be performed in it, is commonly considered to be, from about the beginning or middle of August to the latter end of November; and in which the different works of laying, planting, and propagation, &c. are most successfully accomplished; as, for instance, the putting in various sorts of excellent plants to flower the winter for the ensuing spring and summer, such as cabbages, cauliflowers, carrots, lettuces, spinach, onions, &c., in the more early part; and in the latter, beans, peas, coleworts, and early cabbage plants; likewise cauliflowers, fome to remain under and bell glafles, others in frames, to fand till spring; also lettuces on warm borders, and in frames, to stand the winter; and celery in shallow trenches, for spring use; and the making and spawning of mushroom-heds, for winter and spring. Different sorts of bulbous-rooted flower-plants are also increased at this season, by dividing or putting their roots, particularly in the months of September, October, and November, when the flower-fleams decay; the flippèd or divided parts mostly flowering the following year; and from the middle of September to the middle or end of November, is the time for transplanting from one place to another different kinds of hardy bulbous-rooted perennials, as directed under their proper genera. Most sorts of bulbous flower-roots, that were taken up in summer, are now planted in order to exhibit an early spring and summer bloom, in the following year. The seeds of many sorts of flowers are likewise at this time to be sown, which do not grow so freely when sown at other seasons, as is shown under their proper heads. In the latter part of this season it is necessary to plant cuttings, and make layers, for the propagation of various trees and shrubs of the hardy kind. The seeds of many sorts of hardy trees and shrubs may also be sown. Besides these, many other parts of garden culture are particularly necessary at this season.

AUTUMNAL Signs, are those through which the fun passes during the season of autumn, Libra, Scorpio, and Sagittarius.

AUTUMNALIS, in Ornithology, a species of Psittacus, called by Briff. psittacus americanus; crick à tête bleue by Buff; jeffer green parrot by Edwards, Av. and autumnal parrot by Latham. It is distinguished by being of a green colour, with the front and spot on the quill feathers scarlet; crown and primary quill feathers green. Gmel.

Of this kind there are two distinct varieties; one with the front and chin blue, and the other with the head varied with red and white. The first is var. (2) psittacus fronte gualeque caruleis of Gmel.; crick à tête bleue de Buff; blue-faced green parrot of Edwards; and blue-headed creature of Banc. Gujau. The latter is called Cocho in Fernando. Hil. Nov. Hilp. Inhabits Guiana.

This species is about the size of a pigeon; region of the eyes blue; primary wing-coverts blue, and red at the base; tail feathers green above, and tipped with yellowish, outer one blue at the exterior edge: beneath yellowish, reddish at the base, with a green spot in the middle.

AUTUMNALIS, a species of Aras or duck, that inhabits South America. It is greyish; wings, tail, and belly black; spot on the wing twany and white. Jacquin Beytr. This is the red-billed whistling duck of Edwards; anas fluctuata.
liris americana of Brill; and fillleur à bec rouge et marines jaunes of Buffon.

This bird is represented to be of a very quarrelsome disposition, but may be tamed; sits on trees, and makes in length twenty-one inches. The bill is red, black at the tip; crown, back, and scapulars chestnut; breast yellowish aft; legs yellow.

A U T U M N A L I S, a species of Fringilla, called by Latham the autumnal finch. It inhabits Surinam; is of a greenish colour, with a ferruginous cap, and vent telleaceous. Linnæus. The bill is even at the end.

A U T U M N U S, in Entomology, the name given by Ammarnius to the nort, or phalæna, called by Gmelin P. figuana; which fee.

A U T U N, in Geography, an ancient city of France, and chief place of a district in the department of the Saone and Loire; and, before the revolution, the capital of a district called Autunus, with a bishop's fee. It is situated near the river Arroux, at the foot of three mountains, in which are three springs, that supply the city with water. The city itself is small, being about 2 miles in length, and about the same breadth; it has now few good buildings, but its ruins indicate its former magnificence; and those of its walls in particular, seem, by the firm union of the stones that compose them, as if they had been cut out of the solid rock. Here are the remains of three ancient temples, one dedicated to Janus, and another to Diana; and also of a theatre, and a pyramid, the last probably having been a tomb. It has also two beautiful antique gates; the field in which it stands is called the field of urns, because several urns have been dug in it. Autun was made a Roman colony by Augustus, and after him called Augustodunum; and as early as the reign of Claudius, it ventured of itself, and without assent, to declare against the armies of Gaul. After a siege of seven months, they stormed and plundered this unfortunate city, already wasted by famine; nor was it restored till the reign of Dioclesian. The country from Chalon to Autun is very rich in vineyards and cornfields, and presents, by its lofty hills and swelling outline, a picturesque scene. The approach to it is by a road which winds over hills, that is covered with an underwood of brion, and crowned with a forest of birch and fir-trees. The cathedral is a handsome building. N. lat. 46° 56'. E. long. 4° 17'.

A U T U R A, in Ancient Geography, a river of Gallia Celsica, now the Eve, which falls into the Seine on the south side.

A U T Z, in Geography, a town of the duchy of Coupland, thirty-six miles S. S. E. of Goldingen.

A U V E, a town of France, in the department of the Marne, and chief place of a canton in the district of St. Menchelous, thirteen miles E. N. E. of Chalon.

A U V E R G N E, a province of France, before the revolution, but now forming the two departments of Puy de Dôme, and Cantal, bounded on the east by Forez, on the north by Bourbonnais, on the west by Limousin, Quercy, and La Marne, and on the south by Rouergue, and the Cévennes. Its extent from south to north is about forty French leagues, and from west to east thirty. It is divided into Upper and Lower Auvergne. The former is cold and mountainous, and yet has excellent pastures, and supplies many large cattle; the latter, to which belongs the valley of Lézard, and by which appellation it has sometimes been distinguished, is a fertile and pleasant country, abounding in wine, grain, fruit, and hemp. Auvergne supplies Lyons and Paris with fat cattle; a large quantity of check is made in this province; and it has several manufactures. It has mines of silver, iron, lead, and coal. Its principal rivers are the Allier, the Dordogne, and the Allagnon; which feed. The capital of the whole province is Clermont. The basaltic mountains of this ancient province are famous; and have been ascribed by some eminent naturalists to volcanoes; but as they consist chiefly of basaltic columns, and elevations, others, among whom may be reckoned the best judges, allege that they have no claim to a volcanic origin. Those of Auvergne are too extensive to have been produced by a single volcano, and it would be too bold a conjecture to attribute them to a chain of volcanoes. 'The northern part of the chain is called the Puy de Dôme, while the southern is called that of Cantal. The Monts d'Or form the centre, and are the highest mountains in France. The chief elevation is that of the Puy de Sancy, which rises about 6,500 feet above the level of the sea, while the Puy de Dôme is about 5,000, and the Plomb du Cantal, the highest of that part, is about 6,200 feet. Near the Puy de Sancy is Angouleme, a gigantic mountain, and Ecorchade, a shattered and wrecked elevation. The Plomb du Cantal is also accompanied by bold rival mountains, as the Puy de Giroix, le Col-de-Caille, le Puy Mari, and the Vauban. This enormous assemblage of rocks covers an extent of about 120 miles, and according to the French authors, is chiefly basaltic. The Puy de Sancy is capped with almost perpetual snow, followed in the descent by naked rocks and ancient pines; from its side issues, from two sources, the river Dordogne, and many picturesque cascades descend amidst basaltic columns. On the 23d of June, 1727, Pradines, a village on the slope of one of these mountains, was totally overwhelmed by its fall; the whole mountain with its basaltic columns rolling into the valley. The inhabitants were fortunately engaged in the celebration of Midsummer eve, round a bonfire at some distance. These mountains are in winter exposed to dreadful snow-hurricanes, called Airtis, which in a few hours obliterate the ravines, and even the precipices, and descending to the paths and streets, confine the inhabitants to their dwellings, till a communication can be opened with their neighbours, sometimes in the form of an arch under the vast mass of snow. Wretched the traveller who is thus overtaken: his path disappears, the precipice cannot be distinguished from the level; if he flounder he is chilled, and buried if he proceed; his eye-sight fails amidst the snowy darkness; his respiration is impeded; his head becomes giddy; he falls and perishes. In summer, thunder storms are frequent and terrible, and accompanied with torrents of large hail, which destroy the fruits and flocks, which for six months pasture on the mountains, guarded by shepherds, who have temporary cabins of turf and reed, fyled burons.' Pinkerton's Mod. Geog. vol. i. p. 274.
AVU

elder son of Clovis. At length, however, Childebert, the king of Paris was tempted by the neighbourhood and beauty of Auvergne; and on the false report that their lawful sovereign was slain in Germany, the city and diocese were betrayed by the grandson of Sidonius Apollinaris. Childebert enjoyed this clandestine victory. Theodoric having promised to the Franks of Austria the possession of this rich and productive country, forfeited the allegiance of the inhabitants, and devoted them to destruction. His troops, reinforced by the fierce barbarians of Germany, spread desolation over the fruitful face of Auvergne, and two places only, the strong castle of Merlois, and the holy shrine of St. Julian at Brivas or Brioude, were saved or redeemed from their licentious fury. Before the Austrasian army retreated from Auvergne, Theodoric exacted some pledges of the future loyalty of a people, whose servile hatred could only be restrained by their fear. A select band of noble youths, the sons of the principal senators, were delivered to the conqueror, as the hostages of the faith of Childebert and of their countrymen; and, on the first rumour of war, or conspiracy, these guileless youths were reduced to a state of servitude; and one of them only, whose name was Attalus, escaped by a singular adventure. See Gibbon's Hist. vol. vi. p. 362—369.

Auvergne, a town of Switzerland, one league south of Neufchatel.

Auvernas, a very deep-coloured heathy wine, made of black damius fo called, which comes from Orleans. It is not fit to drink before it is above a year old; but if kept two or three years, it becomes excellent.

Auigny, N. Castres b', in Biography, a French historian, was born at Hainault in 1712, and in his youth refided with La Fontaine. But engaging in the military profession, he entered into a company of life-guards, and was killed in the battle of Dettingen, in 1743. In the province of literature, he distinguished himself by severall works, the principal of which was " The Lives of Illustrious Men of France, from the commencement of the Monarchy to the present time." Of this work, 8 volumes in 12mo appeared in the author's life-time; two posthumous volumes were published by his brother; and the publication has since continued by the abbé Perauc and M. Turpin. The biographical sketches of Auigny are written with animation and elegance, but they approach too much to fiction that they cannot be implicitly relied on as historical truth. An abridged history, written by Auigny, and published in two volumes 12mo. is intitled "An Abrigment of the Hillogy of France, and of the Roman Hillogy, in quation and answer." In 1735, he published, in five volumes 12mo. "An Hillogy of the City of Paris," but part of the fourth and the whole of the fifth, were written by M. de la Barre. The principal of Auigny's works of imagination is "Memoirs of Madame de Barnevelt." Nouv. Dict. Hist.

Auvillard, in Geography, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diocese of Agen; 13 miles south-east of Agen, and two south of Valence. N. lat. 44° 3'. E. long. 0° 48'.

Auvillers-les-Forges, a town of France, in the department of the Ardennes, and chief place of a canton in the diocese of Rocroi, ten miles W. N. W. of Mezieres.

Avus, in Ancient Geography, a river of Spain, in the territory of the Callaici, whose course lay from east to west, and which discharged itself into the sea towards the north.

Auw, in Geography, a town of Germany, in the archbishopric of Aix, on the Danube; ten miles W. S. W. of Greiz.

Auwawa, in Ichthyology. See Balistes Kleinii.

AUX, in Astronomy. See Auges.

Some use aux to denote the arch of the ecliptic, intercepted between the first point of Aries, and the point wherein the sun, or a planet, is at its greatest distance from the earth. Wolf. Lex. Math. p. 222.

AUXACIA, in Ancient Geography, a town of Aix, in Seythia, beyond mount Imaus, and to the west of Isfedom Seythia.

Auxentius, in Biography, an Arian divine, was a native of Cappadocia, and flourished in the fourth century. In the contest between the Arians and Catholics, he was advanced by the emperor Constans to the see of Milan. By Hilary, bishop of Poitiers, he was accused to the emperor Vitalianus, as an enemy of Christ, and a blasphemer; and in order to silence his enemies, he made a declaration of his faith, with which the emperor was satisfied. But the Catholics proceeded against him, and a council, which was held at Rome by pope Damasus, in 368, excommunicated him. He was also condemned by Athanasius, and the prelates of Gaul at the same time. However, he retained the see of Milan to the time of his death in 374, and was succeeded by Ambrose. Cave, H. L. tom. i. p. 214.

Auxerre, in Geography, a city of France, and capital of the department of the Yonne, esteemed advantageously for trade, on the side of a hill, near the Yonne, which washes its walls. Before the revolution, it was the see of a bishop, and capital of a country called Auxerrois. The episcopal palace was one of the most beautiful in France. N. lat. 47° 37' 57". E. long. 4° 34' 6".

Auxerrois, a name given before the revolution to a country of France, in the northern part of Burgundy; bounded on the east and north by Champagne, north-west by Nivernais, and on the south by the revolt of Burgundy, about nine leagues long and five broad. Its capital was Auxerre.

Auxesius, in Mythology, a goddes worshipped by the inhabitants of Egina, and mentioned by Herodotus and Pausanias.

Auxesius, auxes, auxes, auxes, in Rhetoric, a figure whereby any thing is magnified too much. See Amplification, and Incremenement.

Auxiliary, any thing that is helping or affihling to another. For an account of the auxiliary troops of the Romans, see Alliance.

Auxiliary Verbs, in Grammar, are such as help to ascertain or limit the sense of others; that is, are prefixed to them to form or denote their moods or tenses.

Such, in English, are have, am, or be; in French, être and avoir; in Italian, essere, and fare, &c.—The auxiliary am supplies the want of Passives in our language.

All the modern languages we know of make use of auxiliary verbs. The reason is, that the verbs thereof do not change their terminations or endings, as those of the Latin and Greek, to denote the different tenses or times of being, doing, or suffering; nor the different moods or manners of their suffering, &c.: so that, to supply this defect, recourse is had to different auxiliary verbs.

Besides the perfect auxiliary verbs, we have several defective ones; as do, will, shall, may, can, and have; which, by charging the terminations, save the necessity of changing those of the verbs to which they are added. Thus, instead of
AUXIM, in *Ancient Geography*, a town of Spain, mentioned by Ptolemy.

AUXIMIS, a town of Africa, in Mauritania Castraeniatis.

Ptolemy.

AUXIMUS, or AUXIM, OSIMO, a town of Italy, in the Picenum, south of Ancona. It was a Roman colony.

AUXO, in *Mythology*, the name of one of two graces worshipped by the Athenians. See Hegemone.

AUXORS, in *Geography*, a name given before the late division, to a territory of France, of which Semuren-Auxois was the capital.

AUXON, a town of France, in the department of the Aube, and chief of a canton in the district of Ecy; 41 leagues south of Troyes, and 14 north of Ecy.

AUXONNE, a town of France, in the department of the Coxonne, and chief place of a canton, and seat of a tribunal, in the district of St. Jean de Lofne, situated in a plain near the east side of the Saone. It is surrounded by a double wall built in the 17th century, and has a bridge of 23 arches over the Saone, serving for the passage of the waters when the river overflows; and at the end of the bridge is a caisway of 2250 paces in length; 55 leagues E. S. E. of Dijon. N. lat. 47° 11' 24''. E. long. 5° 23' 35''.

AUXY, a town of France, in the department of the fraits of Calais, and chief place of a canton, in the district of Montreuil; three leagues S. S. E. of Hefdin.

AUXY, in the *French Manufactures*, a name given to that sort of wool which is spun in the neighbourhood of Auberville, by those workmen who are called bowiers. It is a very fine and beautiful wool, which is commonly used to make the finest frockings.

Auzagurel, or Auzagurel, in *Geography*, a town of Africa, in the kingdom of ADEL, reckoned by some the capital, and situated on an eminence near the Havannah. See ADEL.

Auzance, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Eravix, seated on a hill, surrounded with ponds; 25 miles E. S. E. of Gueret, and nine south of Eravix.

Azara, Osara, in *Ancient Geography*, a town of Asia; or according to Ptolemy, in Arabia Defera, S. S. E. of Circceum; situated on the western bank of the Euphrates.

Auzara, or Auza, a town of Libya, built according to Josephus, in his "Antiquities," by Ithobal, king of the Tyrrans; situated, according to Ptolemy, in the interior of Mauritania Castraeniatis, to the east of a lake from which flowed the river Canaoph. It was the capital of the Auzara, who were situated to the west of the river Triton. Tacitus informs us, that it was built in a small plain, surrounded on all sides with barren forests of immense extent. The ruins of this city were called by the neighbouring Arabs "Sour Gullan," or "the walls of the Antelopes," a great part of which, hanked at proper distances with little square towers, is still remaining.

Auzils, in *Geography*, a town of France, in the department of the Aveyron, and chief place of a canton in the district of Albigeois; 15 miles north-west of Rhodez.

Auzon, a town of France, in the department of the Upper Loire, and chief place of a canton, in the district of Brioude, on the Allier, six miles north of Brioude.

Auzent, Auza, in *Biography*, a French mathematician of the 17th century, and one of the first members of the Academy of Sciences at Paris, was born at Rouen, and died in 1653. Some have ascribed to him the honour of having invented the Micrometer; but he is more justly entitled to the praise of having contributed to the improvement of it, in pursuance of the ideas suggested by M. Huysgens, and the marquis of Malvaxia. (See Micrometer.) Auzent's treatise on this subject was published in 1667, and may be found in the Memoirs of the Academy for 1693, tom. viii. Auzent was also concerned with M. Picard in the important discovery of the method of applying the telescope to the quadrant, which has been highly useful to astronomers. It has been said, particularly by M. de la Hire, that M. Auzent had a principal part in this discovery; but from the description given of it by M. Picard, in his "D生產 de la Terre," the reader cannot hesitate in pronouncing M. Picard himself to have been the original and sole author. It appears, however, from several fragments of letters in a correspondence between our ingenious but unfortunate countryman Mr. Caillevon, who was killed in the battle of Marillon-Moor, and Meijers, Horrox and Crabtree, and which are recorded by Derham, in the Phil. Trans. of 1723 (vol. 48. p. 190.), that the method of constructing a micrometer, and also of applying telescopic sights to quadrants, was known to him before the time of the civil wars. But as these two important discoveries were not published even in England, and were not likely to be made known on the continent at this early period; it is not improbable that Auzent and Picard might also have a just claim to the honour of being original, though not the first inventors. The honour of having discovered the method of applying the telescope to astronomical instruments in the year 1665, was also claimed by Dr. Hooke. M. Auzent published "An Ephemeris of the Comet of 1665," "A Letter to the Abbé Charles on the Observations of Campani," in 1665; his "Treatise on the Micrometer," in 1667; and some "Remarks on the Machine of Hooke." These three last pieces were contained in the 6th volume of the Memoirs of the Academy. Montucla, Hist. Mathem. t. ii. p. 569—572.

Aw, in *Geography*, a town of Germany, in the county of Bregentz, 25 miles S. E. of Bregentz.

Awa, a town of Japan, in the province of the same name—Allo, a town of Peria, in the province of Irakz, 28 leagues south of Caffin.

Awa, in our old *Statutes*, is used to signify what we now call waiting, or lying in wait, to execute some mischief. In 1573 R. I. c. 1, it is ordained, that no charter of pardon shall be allowed before any justice, for the death of any man slain by awa, or malice prepended, &c.

Award, in *Law*, the judgment of some person who
AWATCHA, in Ornithology, a species of Motacilla, that inhabits Kamtschaka. It is of a brown colour; chin and breast white; spotted with black; middle of the belly and fores white; primary quill-feathers bordered with white; tail-feathers orange at the base. Afiz. Zool.—Gmelin.

AWATSKA, in Geography. See AVATESHA.

AWCHAI, a town of Perfia, in the province of Adiheraz, 50 leagues S. W. of Tauris.

AWL, a river of Scotland, in the Highlands. See LOC.

A-WEIGH, in Sea-Language, the same as A-trip, when applied to the anchor.

AWENYDHION, in British Antiquity, a name that was given to certain persons in Wales, and derived from Awen, was, of course, expressive of poetical raptures. Those persons, when consulted about any thing doubtful, appeared to be inflamed with a high degree of enthusiasm, and even to be possessed by an invisible spirit. They were neither halting, nor very direct and explicit in their answers, or in the solution of the difficulties that were propounded to them; but in the course of a long and wild circumlocution, the required answer or solution would be obtained by means of some turn or digression in the speech, which was thought to imply or express it. Those persons were at length routed from their feeming ecstasy as from a deep sleep, and they were compelled as it were, by violence, to return to their natural condition. When persons of this description recovered their reason, after an apparent and temporary alienation of mind, they did not recollect any of those circumstances that had occurred, or of the words which they had uttered during their ecstasy. If they were, therefore, again consulted about the same subject, they would express themselves in very different words. The gift, which they possessed, was conferred upon them, as they imagined, in their sleep, and the mode of communication seemed, says Giral-

dus, as if new milk or honey was poured into their mouths; to others, as if a written scroll had been put into their mouths; and when they awoke, they knew and declared that they had been endowed with this extraordinary spirit of divination. Some gift, resembling that to which the Awenydhion of Wales pretended, has been long known in Scotland, under the denomination of Second Sight. War-

nings Pilot, Wales, p. 102, &c.

ÄWERII, in Geography, a town of Africa, and capital of a kingdom of the same name, about 20 leagues from Benin to the south.

AWIN-ÉA, a river of Ireland, which rises in lake Éa, in the province of Donegal, and runs into the sea, seven miles north of Killebegs.

AWK. See AUK.

AWL, or Aul, a shoemaker's implement, wherewith holes are bored in leather, to facilitate theitching or sawing the same.—The blade of the awl is usually a little flat, and bending; and the point. ground to an acute angle.

AWME, or Aume, a Dutch measure of capacity for liquids; containing eight jekcens, or twenty verges, or vertels; answering to what in England is called a trecce, or one-sixth of a ton of France, or one-seventh of an English ton. Arbuth. Tab. 53.

AWN, Arista, 15 Betany, the needle-like bristles which form beards of different sorts of grass or grain, as wheat, barley, &c. The word is, in some districts, pronounced

Aulis. It is sometimes used to signify a sharp point terminating a leaf. See Arista.

AWNING, on board a ship, is, when a sail, a tarpaulin, or the like, is hung over any part of the ship, above the decks, to keep off the sun, rain, or wind.

Awnings are made of canvas. The length of the main deck awning is from the centre of the fore-mast to the centre of the main-mast; the width corresponds to the breadths of the ship, taken at the main-mast, fore-mast, and at the mid-way between. The length of the quarter deck awning is from the centre of the main-mast to the centre of the mizen-mast; and the width answers to the breadths of the ship, at the main-mast, mizen-mast, and at the mid-way between. The canvas is cut to the given breadths of the awning, allowing about nine inches to hang down on each side, which is sometimes scalloped and bound with green bales, and is fewed together with an inch seam, and tabled all round with a two or three inch tabling. Half the diameter of the masts is cut out in the middle at each end, and lacing-holes are made across the ends to connect one awning to another. On the upper part, along the middle and sides, is fewed a one inch and half or two inch rope, to which the trucks are fewed at about three quarters of a yard asunder. A thimble is spliced in each end of the rope. Sometimes curtains are made to hang to the sides of the awnings, of the same length as the awnings. Their depth is taken from the sides of the awning to the gun-wale, supposing the awning to be in its place. The seams and tablings are the same as those of the awnings, and lacing-holes are made along the upper tabling of the curtain, and the side tabling of the awning. Clarke's Elem. and Practice of Rigging, vol. 1. p. 140. 236.

In the long-boat they make an awning, by bringing the sail over the yard and lany, and booming it out with the boat-hook.

AX, a carpenter's instrument, serving to hew wood.—The ax differs from the joiner's hatchet, in that it is much larger, and heavier, as serving to hew large fluffs; and its edge tapering into the middle of its blade.—It is furnished with a long handle or helve, as being to be used with both hands.

AX, in Geography, a town of France, in the department of the Arrière, and chief place of a canton in the district of Tarascon, on the Arrière; 9 leagues west of Prades, and 4½ S. E. of Tarascon.

AX. See AXBRIDGE, and AXMINSTER.

A: See BATTLE. See CELT.

AXAMENTA, in Antiquity, a denomination given to the verdes, or fongs, of the faists, which they sung in honour of all men.

The word is formed according to fome, from axa q. d. nominare. Others will have the carnus fulsaria to have been denominated axamenta, on account of their being written in axatus, or on wooden tables.

The axamenta were not composed, as some have asserted, but only sung by the faists. The author of them was Numa Pomphilus; and, as the fyle might not be altered, they grew in time to obscurity, that the faists themselves did not understand them. Varro says they were seven hundred years old. Quint. Inst. Or. lib. i. c. 11.

AXAMENTA, or Axamenta, in Ancient Music, hymns or fongs performed wholly with human voices.
AXAS, in Geography, a town of America, in the interior part of New Albion. N. lat. 39° 5'. W. long. 114° 30'.

AXAT, or Axat, a town of France, in the department of the Aude, and chief place of a canton, in the district of Quillan, on the Aude; twenty-five miles south of Carca-

fonne, and five S. E. of Quillan.

AXBERG, a town of Sweden, in the province of Neric-
cia.

AXBRIDGE, a town of England, in the county of Somerset, about eight miles north of Wells, and 133

miles west of London. The river Ax divides the bridge from

Over-Wear, and gives the place its appellation. This

town is pleasantly situated at the south-western roots of the
dark Mendip hills. It has a corporation consisting of a

mayor, bailiff, eight capital burgesses, and twenty-two

common councillors; and fent members to parliament, till

excluded at the requisit of the inhabitants, in the reign of

Edward the third. Its market is corn, sheep, pigs, &c.

is on Saturday, and two fairs are held annually for the

sale of cattle and cheeses. Its only manufacture is knit-hose,

in which a great number of families is employed. The

church is particularly noted for its beautiful and uniform

architecture, and for the illytate monuments which it con-
tains. Most of them are erected to the memory of the

Prowse family, many of whom were interred within the

walls. This town contains 130 houses, and 1,000 inhabi-
tants. About two miles south of Axbridge is the village of

Cheddar which is celebrated for its fine cheese; and ex-

traordinary rocks or cliffs. The village is situated under

Mendip hills, having the flat moors which extend to Glaston-

bury on the south side, and a high ridge of hills on the

north. The Cheddar cliffs seem to have been the effect

of some great convulsion of nature, which rent the

hill asunder and formed an opening or chasm completely

through it. This chasm is now appropriated to a road,

which leads from the bottom to the top of the hill, having its

sides formed by the high craggy rocks. The length of

this gap is nearly two miles, in a winding direction.

In many parts the cliffs rise to the height of full 300 feet,

quite perpendicularly, some terminating in bold pinnacles,

others in irregular fragments like shattered battlements,

and others impending over head in an awful manner. Yews

project out of several of the fissures, forming lofty canopies,

and many of the rocks wear long mantles of ivy, which produce a

picturesque appearance, and form a pleasing contrast to the

craggy nakedness of others. The romantic and grand

appearance of these rocks attracts the notice of many tra-

vellers. Mendip hills, which are often called the alps of

Somersetshire, abound with lead and calcamine, and like the

similar hills of Derbyshire, contain many salt caverns and

subterraneous vaults. Various coralloidal relics are found in

this limetone. Several curious plants are also obtained

here, among which the following are the most rare:—danthus

cervi (Cheddar Pink). d. arenarius, and ibatidium minor.

Maton's Observations on the Western Counties, and Collin-

son's History of Somersetshire.

AXEL, a strongly fortified town of Flanders; it was

taken from the Spaniards by Maurice, prince of Nassau, in

1586; nine leagues W. of Antwerp. N. lat. 51° 15'. E.

long. 3° 45'.

AXENS, a town of Germany, in the county of Tyrol; nine

miles S. W. of Innsbruck.

AXHOLM, an island of England, in the N. W. part of

Lincolnshire, formed by the rivers Trent, Idle and Dan,

about ten miles long and five broad; the lower part is

marshy; the middle part fertile, and produces flax in abun-
dance. The chief town, or rather village, thinly inhabited,
is called Axey.

AXIA, in Ancient Geography, a town of Greece, in the

country of the Locrian Orazians.—Also, a town of Italy,
in Etruria; and the inhabitants were called Asziot.

AXICACA, a town of Sarmatia, to the left of the river

Sarmathan and north of Odefin (Ozskow).

AXIACES, a river of European Sarmatia, a little

above Axia; and the people who inhabited the district to

the right of this river were called Axica.

AXICA, or Azica, an ancient town of India, on this

side of the Ganges. Ptolemy.

AXILLI.A, in Anatomy, or Axia, the cavity under the

upper-part of the arm; commonly called the arm-pit.

The word is a diminutive of axis, a. d. kile axit.

Abceffes in the axilla are usually dangerous on account of

the many blood-vessels, lymphatics, nerves &c. there-

about, which form several large plasms.—By the ancient

laws, criminals were to be hanged by the axilla if they were

under the age of puberty.

AXILLA, in Botany, is the space comprehended between

the items of plants and their leaves.

Hence we say, those flowers grow in the axilla of

the leaves; i.e. at the base of the leaves or just within the

angles of their pedicles.

AXILLARY, in Anatomy, something that belongs to

the axilla, or lies near them.

AXILLARY Artery, a certain portion of the great artery

which supplies the upper part of the trunk, and upper

extremity. See Artery, Distribution of those Vessels.

AXILLARY Vein, a certain extent of the vein correspond-

ning to the above-mentioned artery. See the account of

the Distribution of the Veins.

AXILLARY Nerves, are branches of the four lower cervi-
cal and first dorsal, which form a plexus in the axilla. See

Nerve, Distribution of.

AXILLARY Glands, the glands belonging to the absorb-
ing vessels which are situated in the axilla. See Absor-

bing Vessels, Distribution of.

AXILLARY Leaves, in Botany. See Leaf.

AXIM, in Geography, a small district or canton of Africa,

on the Gold Coast, between Cape Apollonia, and Tree

Puntas. The climate is unhealthy, being foetid, that,

according to the proverb of the country, it rains eleven

months and twenty-nine days in the year. The maize, on

account of the humidity of the soil, is neither plentiful nor

excellent; but it produces a great quantity of rice, which

is exported to all the kingdoms of the Coast, in exchange

for millet, yams, potatoes, and palm-oil; and it yields also

water-melons, bananas, cocoa, oranges, two kinds of

lemons, and all sorts of fruits and vegetables. Axim also

produces great numbers of black cattle, sheep, goats, and
tame pigonets, as well as other fowls. The whole country

is filled with populous villages; some on the sea-side, others

farther up the country; and all of them rich and beautiful.
The intermediate lands are well cultivated, and the soil is so

toxic as richly to compensate the labour of the husbandman;

besides which the natives are wealthy, from a constant traf-

fic they maintain in gold with the Europeans. The capital

of this district is Axim, or Achomboz, standing under a

Dutch fort, and screened behind by a thick wood, that

covers the whole declivity of a neighbouring hill. The

river Axim runs through the town, and the coast is defended

by a number of small-pointed rocks, which project from

the shore, and render all access to it dangerous. The Euro-

pean settlements are:—The Dutch fort of St. Anthony,
AXIOM. AXIOM, from αξίω, I am worthy, a self-evident truth, or a proposition whose truth every person receives at first sight; and to which the term dignity is applied, on account of its importance in a process of reasoning. These axioms are self-evident truths that are necessary, and not limited to time and place, but must be true at all times and in all places.

Thus, that the whole is greater than a part; that a thing cannot be and not be at the same time; and that from nothing, nothing can arise, are axioms.

By axioms, called also maxims, are underlaid all common notions of the mind, whose evidence is so clear and forcible, that a man cannot deny them without renouncing common sense, and natural reason.

Self-evident propositions furnish the first principles of reasoning; and it is certain, that if in our researches we merely employ such principles as these, and apply them properly, we shall be in no danger in advancing from one discovery to another. For this we may appeal to the writings of mathematicians, which being conducted agreeably to this standard, incontestibly prove the validity of human knowledge, when it is made to rest on so sure a foundation. The propositions of this kind of science have not only floated the test of ages; but they are found to be attended with that invincible evidence, which confines the assent of all who consider the proofs by means of which they are established.

Lord Bacon proposes a new science, to consist of general axioms, under the denomination of philosoplia prima. For an account of the origin and evidence of those truths called axioms, as well as of their importance and utility in the pursuit of knowledge and truth, see INTUITION, PRINCIPLES, and COMMON SENSE.

An axiom is also an established principle in some art or science. Thus, it is an axiom in Physics, that nature does nothing in vain; that effects are proportional to their causes, &c. So it is an axiom in Geometry, that things equal to the same third are also equal to one another; that if to equal things you add equals, the sums will be equal, &c. It is an axiom in Optics, that the angle of incidence is equal to the angle of reflection, &c. In this sense the general laws of motion are called axioms; as that all motion is rectilinear, that action and reaction are equal, &c. See Laws of Motion.

These particular axioms, it may be observed, do not immediately arise from any first notions or ideas, but are deduced from certain hypotheses; this is particularly observable in physical matters, wherein, as several experiments contribute to make one hypothesis, so several hypotheses contribute to one axiom.

The axioms of Euclid are very general propositions, and so are the axioms of the Newtonian philosophy; but these two kinds of axioms have very different origins. The former appear true upon a bare contemplation of our ideas; whereas the latter are the result of most laborious induction.
Lord Bacon, therefore, strenuously contends, that they should never be admitted upon conjecture, or even upon the authority of the learned; but, as they are the general principles and grounds of all learning, they should be canvassed and examined with the most scrupulous attention, "ut axiomatum corrigatur iniquitas, quae plenunque in exemplis vulgaris fundamentum habeat." De Augm. Sec. l. ii. c. 2.

A late writer (see Tatham's Chart, and Scale of Truth) distinguishes between axioms intuitives, and jeoff-evident. The former, he says, pas through the first inlets of knowledge, and flash direct conviction on the mind, as external objects do on the senses, all men; in the formation of the latter, reason judges by single comparisons, without the aid of a third idea or middle term; so that they have their evidence in themselves, and though inductively framed, they cannot be fallylogically proved. If we admit this distinction, and its ramifications must be allowed, the character of intuitive axioms will be restricted to particular truths. See Induction, Reasoning, and Syllogism.

AXIOM, in Rhetoric, is used by Hermogenes to denote grandeur, dignity, and sublimity of style.

AXIOPOLIS, in Ancient Geography, a town of Lower Macedonia, according to Ptolemy, situated near the spot where the Danube assumed the name of Ister, north-east of Durotonus. It is now a town of European Turkey, in Bulgaria, called Axigpol, on the right bank of the Danube. N. lat. 45° 40'. E. long. 34°.

AXIOS, a form of acclamation, anciently used by the people in the election of bishops. When they were all unanimous, they cried out έξω, he is worthy, or αξιώ, unworthy.

AXIOSIS, in Rhetoric, denotes a third part of an exordium; sometimes also called προς, and containing some new proposition more nearly relating to the matter in hand, than the προσ

Thus, in Cicero's oration pro Milone, the protasis is, "Non possum non timere, judices, viva hac nova judicii forma;" the κατακρόνω, "Nec enim ca corona confusus venter cinctus eft quan folebat;" the έξω, "Sed me mear Pompeii conifhum, cujus lapicis non fuerit, quem fententias judicum tradidit, tellis mildum dedet;" the bafi, περιή, "Quamobrem adfedte animis, judices, & timorem, quem habetis, deponente.

AXIOTHEA, in Geography, a female philosopher of Greece, who lived in the time of Plato. Such was her thirst for knowledge, that she disguised herself in men's clothes, in order to attend the lectures of that philosopher. Menag. in Diog. Laert. l. iii. c. 48.

AXIS properly signifies a line, or long piece of iron or wood passing through the centre of a sphere, which is movable upon the same. In this sense we say, the axis of a sphere or globe; the axis, or axis-line of a wheel, &c.

Axis, in Anatomy, is the second vertebra of the neck, reckoning from the skull.

It is thus called, because the first vertebra, with the head, move therewith, as an axis. See Skeleton.

Axis, Spiral, in Architecture, is the axis of a twisted column, drawn spirally, in order to trace the circumvolutions without. See Column, Twisted.

Axis of the Ionic capital is a line passing perpendicularly through the middle of the eye of the volute.

Axis of the world, in Astronomy, is an imaginary right line, which is conceived to pass through the centre of the earth, and to terminate at each end in the surface of the mundane sphere.

About this line as an axis, the sphere in the Ptolemaic system, is supposed daily to revolve.

This axis is represented by the line PQ, Plate II. Adden., fig. 18. The two extreme points in the surface of the sphere, viz. P and Q, are called its poles.

Axis of the earth is a right line upon which the earth performs its diurnal rotation from west to east.

Such is the line PQ, fig. 19. The two extreme points are also called poles.

The axis of the earth is a part of the axis of the world.—It always remains parallel to itself, and at right angles with the equator. See Angle, Inclination, and Parallelism.

Axis of a planet, is a line drawn through its centre, about which the planet revolves.

The Sun, Earth, Moon, Jupiter, Mars, and Venus, are known, by observation, to move about their several axes; and the like motion is easily inferred of Mercury, Saturn, and the Georgian planet.

Axis of the horizon, equator, ecliptic, sidereal, &c. are right lines drawn through the centres of those circles, perpendicular to their planes.

Axis, in Botany, a taper column placed in the centre of some flowers orKatkins, about which the other parts are disposed. It is synonymous with columna.

Axis, in Geometry.—Axis of rotation or circumference, is an imaginary right line, about which any plane figure is conceived to revolve, in order to generate a solid.

Thus a sphere is conceived to be formed by the rotation of a semicircle about its diameter or axis, and a right cone by that of a right angled triangle about its perpendicular leg, which is here its axis.

Axis is yet more generally used for a right line proceeding from the vertex of a figure to the middle of its base.

Axis of a circle or sphere, is a line passing through the centre of the circle or sphere, and terminating at each end in its circumference.

The axis of a circle, &c. is otherwise called its diameter.

Axis of a right or rectangular cylinder, is properly that quiescent right line, about which the rectangular parallelogram turns, by whose revolution the cylinder is formed.

In general, the right line which joins the centres of the opposite bases of cylinders, whether they be right or oblique, is denominated their axis.

Axis of a right cone, is the right line or side upon which the right-angled triangle forming the cone makes its motion.

Hence it follows, that only a right cone can properly have an axis; because an oblique one cannot be generated by any motion of a plane figure about a right line at right. But because the axis of a right cone is a right line drawn from the centre of its base to the vertex; the writers of conics, by way of analogy, likewise call the line, drawn from the centre of the base of an oblique cone to the vertex, its axis.

Axis of a conic section, is a line passing through the middle of the figure, and bisecting all the ordinates at right angles.

Thus if AP (Plate, Conics, fig. 31,) be drawn perpendicularly to FF, so as to divide the section into two equal parts, it is called the axis of the section.

Or, the axis of a conic section is a line drawn from the principal vertex, or vertices, perpendicular to the tangent at that point.

Axis, transversal, called also the first or principal axis of an ellipse,
elixpe, is the axis AP, left defined; being thus called in con-
tradistinction to the conjugate or secondary axis.

Or, in the ellipse and hyperbola, it is the diameter that
passes through the two foci, and the two principal vertices of
the figure.

The transverse axis in the ellipse is the longest; and in
the hyperbola it cuts the curve in the points A and P (fig. 32)
and is the shortest diameter.

Axis, conjugate, or second axis, of the ellipse and hyper-
bola, is the diameter passing through the centre and perpen-
dicular to the transverse axis. Such is the line EF (fig. 31) drawn through the centre of the ellipse C, parallel
to the ordinate MN, and perpendicular to the transverse
axis AP; being terminated at each extreme by the curve.
And such, in the hyperbola, is the right line FE (fig. 32)
drawn through the centre parallel to the ordinate MN,
MN, perpendicular to the transverse axis AP. In the
eLLipse and hyperbola, the conjugate axis is the shortest
of all the conjugate diameters. The axis of a parabola is of
an indeterminate length; that is, is infinite. The axis of the
ellipse is determinate. The parabola has only one axis;
the ellipse and hyperbola have two.

Axis of a Curve Line, in general, denotes that diameter
which has its ordinates at right angles to it, when that is
possible. For, as in the conic sections, any diameter bisects
all its parallel ordinates, making the two parts of them on
both sides of it equal, and the diameter which is perpendi-
cular to such ordinates is an axis; so in curves of the second
order, if any two parallel lines meet with the curve in three
points, the right line which cuts these two parallels so that
the sum of the two parts on one side of the intersecting line, between
it and the curve, is equal to the third part terminated by the
curve on the other side, then the said line will in like manner
cut all other parallels to the former two lines, so that
with respect to every one of them, the sum of the two parts,
or ordinates, on one side, will be equal to the third part,
or ordinates on the other side. Such intersecting line is
then a diameter; and that diameter, whose parallel ordinates
are at right angles to it, when that is possible, is an axis.
The same is the same with regard to other curves of still
higher orders. Newton, Enumeratio Linearum Territer Ordi-
dinis, § 2. art. 1.

Axis of a Magnet, or Magnetic Axis, is a line passing
through the middle of a magnet lengthwise; in such man-
er, as that however the magnet be divided, provided the
division be made according to a plane, in which such line is
found, the magnet will be cut or separated into two load-
fones; and the extremes of such lines are called the poles
of the force. See Magnet.

Axis, in Mechanics. The axis of a balance is the line
upon which it moves or turns. See Balance.

Axis of Oscillation, is a right line parallel to the horizon,
passing through the centre, about which a pendulum vi-
bilates; and perpendicular to the plane in which it oscillates.
See Oscillation, and Pendulum.

Axis in Peritrochoid, or Wheel and Axis, is one of the five
mechanical powers, or simple machines, contrived chiefly
for the raising of weights to a considerable height. It con-
stitutes of a circle, represented AB (Plate I. Mechanica, fig. 2)
concentric with the base of a cylinder, and moveable toge-
ther with it, about its axis EF. This cylinder is called the
axis; and the circle, the peritrochoid; and the radii, or
spokes, which are sometimes fitted immediately into the
cylinder, without any circle, the festalae. Round the axis
winds a rope, or chain, by means of which the weights,
k.e. are to be raised, upon turning the wheel.

The axis in peritrochoid takes place in the motion of every

machine, where a circle may be conceived as described about
a fixed axis, concentric to the plane of a cylinder, about
which it is placed; as in crane-wheels, mill-wheels, capstan,
etc.; a gibbet and an augre to bore with may also be re-
ferred to the wheel and axis.

Axis in Peritrochoid, properties of the. 1. If the power
applied to the axis in peritrocho, in the direction AL,
(fig. 6.), being a tangent to the periphery of the wheel,
or perpendicular to the festalae or spoke, be to a weight W,
as the radius of the axis CE is to the radius of the wheel CA,
or the length of the spoke; the power will just sustain
the weight; i.e. the weight and the power will be in equi-
librio.

Den. The same power is required to support W, what-
ever be the point of the axis to which it is applied, because
the distance from the corresponding centre of motion is the
same, and the wheel and axis may be reduced to a bent
lever; and consequently there will be an equilibrium, when
P : W:: W's distance from the centre of motion, or ra-
dius of the axis; radius of the wheel. Or, since the direc-
tions of P and W are perpendicular to their respective
distances from their centres of motion, they are wholly ef-
ecient; and P's velocity is to W's velocity, as the per-
iphery of the wheel to the periphery of the axis; and con-
sequently, when there is an equilibrium, P : W:: peri-
iphery of the axis : periphery of the wheel :: radius of the
axis : radius of the wheel.

If the thickness of the rope, to which W is appended,
be not inconceivable, it ought not to be neglected; for
when one or more coils or spires of the rope are folded
about the axis, the distance of W's direction from the cen-
tre of motion is increased, and becomes equal to the sum
of the semidiameters of the axis and ropes; and there is an
equilibrium when P : W:: the whole distance of W's di-
rection from the centre of motion : semidiameter of the
wheel.

2. If a power applied in F, pull down the wheel ac-
cording to the line of direction FD, which is oblique to
the radius of the wheel, though parallel to the perpen-
dicular direction; it will have the same proportion to a power
which acts according to the perpendicular direction AL,
which the whole line has to the line of the angle of direc-
tion DFC. For, since FD is perpendicular to AC, DC
will be the distance of the power applied at F from the
centre of motion; consequently the power at F : W:: EC
: CD; and the power at A : W:: EC : CA; conse-
quently the power at F : power at A:: CA : CD. But
if CA or CF be taken for the whole line or radius, CD
will be the line of the angle DFC; and the power at F
will be to the power at A:: the whole line is to the line of
the angle of direction DFC, in case of an equilibrium between
the power and weight.

Hence, since the distance of the power in A is the radius
CA, the angle of direction DFC being given, the distance
DC is easily found.

3. Powers applied to the wheel in several points, F and
K, according to the directions FD and KI, parallel to the
perpendicular one AL, are to each other as the distances
from the centre of motion CD and CI, reciprocally. For
the power at F : W:: EC : CD; and the power at K
: W:: EC : IC; consequently the power at F: power at
K:: IC : CD.

Hence, as the distance from the centre of motion in-
creases, the power decreases, and vice versâ, the weight
being the same. Hence also, since the radius AC is the
greatest distance, and corresponds to the power acting ac-
cording to the line of direction; the perpendicular power
will
will be the smallest of all those able to sustain the weight W, according to the several parallel lines of direction.

4. If a power acting according to the perpendicular AL, raise the weight W, the space passed through by the power will be to the space passed through by the weight, as the weight to the power which is able to sustain it.

For, in each revolution of the wheel, the power passes through its whole periphery; and in the same time the weight is raised through an interval equal to the periphery of the axis; the space of the power therefore is to the space of the weight, as the periphery of the wheel to that of the axis; but the power is to the weight, as the radius of the axis to that of the wheel. Therefore, &c.

5. A power and a weight being given, to construct an axis in peritrochio, by which the weight shall be sustained and raised by the given power. Let the axis be large enough to support the weight without breaking. Then, as the weight is to the power, so make the radius of the wheel, or the length of the spoke, to the radius of the axis.

Hence, if the power be but a small part of the weight, the radius of the wheel must be vastly great. — E. gr. Suppose the weight 4050 and the power 50, the radius of the wheel will be to that of the axis as 81 to 1. But such a machine would be of an inconvenient size: and it may therefore be provided against by increasing the number of the wheels and axes, and making one to turn round another by means of teeth or pinions.

To find the effect of a number of wheels and axes, thus turning one another, multiply together all the radii of the axes, and all the radii of the wheels, and then it will be, as the product of the former is to the product of the latter, so is the power to the weight. Thus, if there be four wheels and axes, the radius of each axis being one foot, and the radius of each wheel being three feet; then the continual product of all the radii of the wheels is $3^2 \times 3^2$, or 81 feet, and that of the radii of the axes only 1; consequently the effect is as 81 to 1, or the weight may be 81 times the power. On the contrary, if it be required to find the diameter of each of four equal wheels, by which a weight of 4050 lb. shall be balanced by a power of 50 lb., the diameter of each axis being one foot; divide 4050 by 50, and the quotient is 81; extract the fourth root of 81, or twice the square root, and it will be 3, for the diameter of each of the four wheels sought. See Wheels. See also Mechanical Powers.

6. If P and W act in the same plane, and in the directions PD and WD (figs. 7 and 8.), meeting in D, and be in equilibrio, they are equivalent to a third force, or prefigure upon the axis at A, whose direction meets PD and WD in D (see Motion); and producing PD, WD, these three forces are to each other, as the sides DF, DE, and diagonal DG, of the parallelogram EF; consequently P : W :: DF : DE, or drawing AN, AM, perpendicular to WD and FDP respectively, P : W :: AN : AM. See Levers.

7. The prefigure upon the axis at A (i.e. Pr) : P :: DG : DF :: sin. \( \angle \) DFG or PWD : sin. \( \angle \) FGD or ADW; Pr : W :: DG : DE :: sin. \( \angle \) DGE or PWD : sin. \( \angle \) DEG or ADP; and P : W :: sin. \( \angle \) ADW : sin. \( \angle \) ADP. When the angle PWD is infinitely small, or PD and WD are parallel, the perpendiculars AN, AM are to each other as AW : PA. Parkinson's System of Mechanics, &c. p. 137.

Axis of a Vessel, is that quiescent right line passing through the middle thereof, perpendicularly to its base, and equally distant from its sides.

Axis, in Optics. Optic axis, or visual axis, is a ray passing through the centre of the eye; or it is that ray, which, proceeding through the middle of the luminous cone, falls perpendicularly on the crystalline humour, and consequently passes through the centre of the eye.

Axis, Common, or Mean, is a right line drawn from the point of concurrence of the two optic nerves, through the middle of the right line which joins the extremity of the same optic nerves.

Axis of a Lens, or Glass, is a right line passing along the axis of that fold, of which the lens is a segment.

Thus, a spherical convex lens being a segment of some sphere, the axis of the lens is the same perpendicular of the sphere: or it is a right line passing through the centre thereof. Or, the axis of a glass is a right line joining the middle points of the two opposite surfaces of the glass. See Lens.

Axis of Incidence, in Dioptrics, is a right line drawn through the point of incidence, perpendicularly to the refracting surface. See Incidence.

Axis of Refraction, is a right line continued from the point of incidence or refraction perpendicularly to the refracting surface, along the farther medium. Or, it is that made by the incident ray, perpendicularly prolonged on the side of the second medium. See Refraction.

Axis, in Zoology, a species of the Cer tus, or Stag genus, with branched, round, ereth horns, that are hid at the summit; and the body spotted with white. Erxleb. Mamm. p. 312. Schreber, &c.

The axis, according to Sonini and others, is an animal almost peculiar to the colder parts of Asia; it inhabits the wooded mountains of the Celebes, Java, and Ceylon, in great numbers, but it is still more abundant on the banks of the river Ganges, and for that reason is not unfrequently called the Ganges flag. The axis multiplies fast in the parks and menageries of England, France, and other parts of Europe; and being a most graceful animal, is no small ornament to the grounds of the nobility and gentry. It is said to propagate with the female of the common flag; and it is equally probable, that the female axis would produce with the male of the other kind.

This animal was known to the ancients by the name of axis. Pliny speaks of it as a native of India, and informs us likewise that it was consacrificed to Bacchus. Its size is nearly that of the fallow deer; colour above pale rufous brown, elegantly spotted with white, beneath white; tail like that of the fallow deer, and rufous above, and white beneath. The axis is easily tamed; its smell is exquisite; and fleth very good when faited.

Gmelin, on the authority of Pennant, speaks of two varieties of this creature; the first, with a body uniformly of one colour, with the extremity of the horns trifurcated; and the other with horns that are also trifurcated, but larger, and whiter. These are the middle axis and spotted axis of Dr. Shaw; and are thus noticed in the Gen. Zool. of that author. "Middle axis. Whether this be a variety of the former (spotted), or specifically distinct, does not appear perfectly clear. It is, according to Mr. Pennant, of a middle size between the spotted axis and the great axis or following kind. In the colour of its hair, it resembles the siff fort; but is never spotted. It, however, is said to vary into white, in which state it is considered as a great rarity. It inhabits dry hilly forests in Ceylon, Borneo, Celebes, and Java, where it is found in very numerous herds. Its fleth is much esteemed by the natives, and is dried and salted for use."—Great Axis. The existence of this species, or variety, is ascertained from a pair of horns in the British Museum, resembling the former kinds in shape, but of a larger size;
they measure two feet nine inches in length, are of a whitish colour, and are very strong, thick, and rugged. Mr. Pennant conjectures that they were brought from Ceylon or Borneo, having been informed by Mr. Loten, who had long resided in the former of these islands, that a very large kind of flag, as tall as a horse, of a reddish colour, and with trifurcated horns, existed there as well as at Borneo. In Borneo, they are said to frequent low marshy tracts, and to be called by the name of water flags.”

AXIUS, DOW VARDARI, in Ancient Geography, the largest river in Macedonia, sprung from two fountains in the Scardian mountains, and after a course of eighty miles, spread itself into an extensive lake below the city of Edessa. There receiving the Egron, it fell into the bay of Thessalonica, almost opposite to that city.—Alfo, a river of Syria, which passed Apamea.

AXILE-TREE. See Axis.

AXMINSTER, fpelt in old writings AXMISTER, in Geography, is the name of a market town in Devonshire, situated on the great leading road from London to the Weft of England. It is said to derive its name from the river Axe, on which it is seated, and a minster, founded here by king Athelflaf, for seven priests, who were appointed to pray for the souls of some of his army who had fallen in a dreadful conflict with the Danes. A place in the neighbourhood is ftill called King-fiel, and another place bears the name of Kilmington, from Kil-main-ton. A cattle was formerly flanding in the town; and the market, held on Saturday, is kept in a place ftill bearing that name. Whatever fire or character the minfter might originally possess, it has been nearly destroyed; and the parish church, though large, has scarcely any appearance of antiquity. A small Saxon arch, with zigzag mouldings and appropriate capitals, is preferred in the call end of the south aisle. Axminster is a healthy, clean town, pleasantly situated on rising ground, which slopes on the western side to the river. A confiderable manufactory of carpets is carried on here, the peculiar make and character of which have obtained them the name of Axminster carpets. They are woven in one entire piece, and several persons are employed at the fame time in working the coloured patterns. The manufactory was firft established here in 1755, by the grandfather of the present proprietor. Since that time the trade has much increafed, and now above one hundred hands are uninterruptedly employed in the different branches of making a carpet. {See Carpet.} Besides the persons engaged in this manufactory, Axminster is inhabited by several others, who carry on the making of broad and narrow cloths, cotton tapes, draperies, leather breeches, and gloves. Here are two meeting-houses, one for Independents, and the other for Methodists; also a Roman Catholic chapel. Axminster has the advantage of a Sunday school, and also a free school. The neighbourhood is adorned with several respectable and handsome mansions, of which Blute House and Ford Abbey are the most confiderable. The fifl belongs to the De La Pole family, and the second to Francis Gwynn, esq. This is a large respectable structure, many parts of which are the fame as originally belonged to the ancient abbey. Polwhele's History of Devon, vol. ii. p. 288.; and Beauties of England and Wales, vol. iv.

AXOLOTI, in Ichthyology, a fingular fish found in the lake of Mexico. It has four feet like the lizard, no scales, a matrix like a woman, and the menftrual flux. It has the taste of an eel.

AXON, in Ancient Geography, a river of Alia Minor, in Caria, formed by the re-union of two small streams, and running south from the town of Calydra, discharged itself into the north-west part of the gulf of Caucus, to the north-west of the promontory of Pedilmum.

AXONA, a river of Belgic Gaul, now the Aine.

AXUM, in Geography, once the large and populous capital of Abyssinia, in the province of Tigré, existed in a flourishing state fo lately as about the beginning of the 16th century, but was ruined in that century by the Turkish invasion. It is now a village, or at leaft an inconsiderable town, exhibiting in its ruins traces of its ancient magnificence and importance. The ancient city of Axum was built, according to Mr. Bruce, by a colony of Cufhites, and he cites an Abyssinian tradition, which says, that it was built by them early in the days of Abraham. See Abyssinia. As the Cufhites never built any city, and no ruins of any city at this day in the whole country, this traveller conceives, that Axum was the magnificent metropolis of the trading people, or Troglydye Ethiopian, called Cufhites, who constructed, in many places, buildings of great strength, magnitude, and expense, especially at Azab, fituable to the magnificence and riches of a state, which was from the frill ages the emporium of the Indian and African trade. As Axum is situated about midway between Azab and Meroe, it points out the road taken by the caravans that carried on the intercourse between the Ganges and the Mediterranea.n. The ruins of Axum are very extensive, but like those of the cities of ancient times, they confift altogether of public buildings. In one square, supposed by Mr. Bruce to have been the centre of the town, there are forty obelisks, none of which have any hieroglyphics upon them. One of thefe, which is still standing, is larger than the rest; and there are two of a larger size that are fallen. They confift of one piece of granite; and on the top of that which is flanding, there is a patera exceedingly well carved in the Greek taffe. The structure of this obelisk, and of the two larger that are fallen, is afcribed by Mr. Bruce to Ptolomy Euergetes. Upon the face of the obelisk, there is a great deal of carving in the Gothic taffe, somwhat like metopes, triglyphs, and guttes, difposed rudely and without order; but there are no characters or figures. The face of this pyramid, of which Mr. Bruce has given a geometrical elevation, looks due fouth; it has been placed with great exactness, and has preferred its perpendicular position to the preffent time. On the face, fronting the fouth, is the representation of a door, with a lock and bolt, such as are used at this day in Egypt and Palefline. This obelisk is supposed to have been erected by Ptolomy Euergetes, who conquered this city and the neighbouring kingdom, and who was the patron of Eratofthenes, for the ufe of this afternoon in determining the latitude. Its top was firft cut into a narrow neck, then spread out like a fan in a femicircular form, with a pavement curiously levelled to receive the fpade, and to mark the fpiration of the true fhadow from the penumbra as diftinctly as possible. The edifice, thus constructed, was probably intended for verifying the experiments of Eratofthenes with a larger radius, and not for observing the obliquity of the ecliptic at Axum. For though Axum, by its situation, was a very proper place, the fun falling over that city and obelisk twice a year; yet he could not make ufe of the fun's being twice vertical to this city, because it is vertical about the 25th of April and about the 20th of August; and at both thefe dates, the heavens are overcast with clouds, and the rain so continual, espefially at noon, that it must have been very extraordinary if Ptolomy had once ufed the fun during the months of his residence in this place. Beyond the convent of Abba Pantaleon, and a small obelisk situated on a rock above,
above, there is to the south a road cut in a mountain of red marble, having on the left a parapet wall about five feet high, solid, and of the same materials. In this wall, at equal distances, are hewn solid pedestals, bearing on their tops the marks where flood the colouful statues of Sirius, the latrator ambus, or dog-star. Of these pedestals, with the marks of the statues just mentioned, there are 133 full in their places; but there remained only two figures of the dog, which were much mutilated, and evidently in the Egyptian taste. Those are composed of granite; but some of them appeared to Mr. Bruce to have been metal. There are also pedestals, on which the figures of the sphinx have been placed. Two magnificent flights of steps several hundred feet long, all of granite, exceedingly well fashioned, and still in their places, are the only remains of a magnificent temple. In the angle of this platform, where the temple stood, is the present small church of Axum, substituted for one destroyed by Mahomet Gragné in the reign of king David III., and which was probably the remains of a temple built by Ptolemy Euergetes, if not the work of more remote times. The church is a mean, small building, and very negligently kept. Mr. Bruce apprehends, that some ancient copy of the O. T. was deposited here, probably that from which the first version was made; but whatever it might be, it was destroyed, together with the church itself, by Mahomet Gragné; though the superstitious people have a tradition that it still subsists there. Another relic, preferred in this place, is a picture of Christ's head crowned with thorns, said to have been painted by St. Luke, which, upon occasions of singular importance, is brought out and carried with the army, especially in a war with Mahometans and Pagans. Within the outer gate of the church are three small square inclines, all of granite, with small octagon pillars in the angles, apparently Egyptian; on the top of which were formerly small images of the dog-star, probably of metal. Upon a stone, in the middle of one of these, the king sits and is crowned, and this ceremony has always sufficed since the days of Paganism; and below it, where he places his feet, is a large oblong slab of free-stone; bearing the following inscription, much defaced,

"HITOEMAIOY EYPOPETOY BAXIAEOY."

Adjoining to Axum is a road, formed by large stones flanking edgeways, or heaped upon one another, which is apparently the remains of an old causeway, part of the magnificent works about this city.

The present town of Axum stands at the foot of a hill, and contains about 600 houses. It is watered by a small stream, which flows constantly from a fountain in the narrow valley, where the rows of obelisk flat. The spring is received into a magnificent basin, 50 feet square, and thence it is carried, at pleasure, to the neighboring gardens, where there is little fruit, except pomegranates, which are not very excellent. In the town are several manufactures of coarse cotton cloth; and here also the best parchment is made of goats' skins, which is the ordinary employment of the monks. Every kind of vegetable seemed long at Axum, and its vicinity, than at Adowa. N. lat. 14° 36'. E. long. 36° 39'. Bruce's Travels, vol. iii. p. 128, &c.

AXUNGLA, a kind of fat, the hardest and driest of any in the bodies of animals. The word is supposed to be formed ab axe rotorum que angustur, from its being used as the grease of wheels. The Latins ditionfat into pinungus, and adapo, or avum; which last, when old, is particularly called axungia: but many of our modern writers confound them. Pileus make use of the axungia of the geese, the dog, the viper, and some others, which is held by some to be of extraordinary service in the drawing and ripening of tumours, &c.

AXUNGIA of grapes, called also the gall, and tail of grapes, is a gum taken from the top of the matter of grapes before it be thoroughly vitrified. It is used in cleaning the teeth, and for fumier for cleaning the eyes of horses.

AXYLON, in Ancient Geography, a country of Asia, towards Bithynia and Cappadocia. Livy.

Species. 1. A. amostraoides. Simple spiked axyris. Gmel. lib. 3. 21. t. 2. f. 2. and t. 3. "Leaves ovate; stem erect; spikes simple." Leaves rough, with ferrule hairs; fur-bearings branches, naked at the base; spike very small, subcapillary, quite simple, terminal. It is observed by Gmelin, that the calyx of the female flower is two or three-leaved. Cultivated by Miller in 1758., 2. A. hybridus. Gmel. l. c. "Leaves ovate; stem erect; spikes congestorae." This differs from the first, in the spike of flowers being on long peduncles, congestorae, or directed the same way, twisted with the fruit bearing branches crowded close to the stem, and the leaves more rough. Pallas supposes this to be only a variety of the former plant. According to Gmelin, the calyx is three-leaved, and there is but one style in the female flower. 3. A. prostrata. Gmel. l. c. "Leaves obovate; stem subdivided; flowers headed." Stem much branched, fix or seven inches high; leaves on stalks; flowers at the ends of the branches, congestorae, with numerous leaves among them. The female calyx has also three leaves according to Gmelin. All these are annual plants, and natives of Siberia.

AXYRIS Ceratoidea now constitutes a new genus, under the name Diotis; which see.

AY, in Geography, a town of France, in the department of the Marne, and chief place of a canton in the district of Eperney, seated on the Marne; famous for its good wines; four leagues south of Rheims, and one N. of Eperney. N. lat. 49° 4'. E. long. 2° 15'.

AY, Pulo, one of the Banda islands, in the Indian sea, about three leagues in circumference, where the Dutch have erected a fort.

AYAG, or Kayachu, one of the Andeasofkie islands, in the Eastern or Pacific Ocean, about 150 versts in circumference, and consisting of several high and rocky mountains, the intervals of which are bare heath and moor ground; but in the whole island, there is not one forest tree. The vegetables resemble those of Kamtschatka. It furnishes small quantities of crow or crate-berries, and the larger sort of bilberries; but of the roots of burnet and all kinds of heath, such abundance as to afford, in case of necessity, a plentiful provision for the inhabitants. There is one small rivulet; and there are many good bays and anchoring places. The population cannot be precisely ascertained, as the natives are continually emigrating from island to island in their baidars.

AYAMONTE,
AYANONTE, a sea-port town of Spain, situate at the mouth of the Guadiana, on the frontiers of Portugal, with a good haven in the gulf of Cadiz; small, but well fortified, and defended by a castle on a rock; 3½ miles W. S. W. of Seville. The adjacent vineyards are fruitful, and the wine excellent. N. lat. 37° 13'. W. long. 8° 5'. See AYMONTE.

AYAMS, derived from an Arabic word which signifies eye, a name given to a class of officers in the provinces of the Ottoman empire, whose business it is to watch over the safety and fortune of individuals, and also over the order and defence of a town; to restrain the unjust encroachments of the pashas, and the exactions of the military, and to concur in the just assessment of the taxes.—Appointed by the people, those who undertake this honourable function, are generally men reputed the most virtuous; there are several of them in the great towns, and a single person superintends several villages in the plains. They receive no other reward for their trouble and zeal, than the respect with which they are treated, and the satisfaction of being useful. The Ayams call to their aid the notables of the town and the lawyers, in order to discuss the more important subjects, to dictate the remonstrances that are proper to be made to the pasha, and to establish of the grounds of those complaints which they judge necessary to be presented against him to the Porte. Olivier's Trav. in the Ottom. Emp. p. 200.

AYBAR, in Geography, a town of Spain, in Navarre, on the river Arragon; one league from Sanguesa.

AYBED, a place of Egypt, on the gulf of the Red Sea, where the merchandise of Alia were landed.

AYBLENG, a town of Germany, in Upper Bavaria, twenty-six miles S. E. of Munich.

AYCHA, a town of Bohemia, in the circle of Bokhaw; sixteen miles north of Jung-Bantzel.

AYDHAB, a place of Africa, in Egypt, on the coasts of the Red Sea. N. lat. 21° 53'. E. long. 56° 26'. See AIDHAB.

AYE, a town of Norway, in the island of Shierney.

AYE-AYE, in Zoology, a singular quadruped discovered by Somcrat, in the island of Madagascar; and described in his voyage to the East Indies (Tom. ii. p. 157). The name appears to have no precise meaning; it is an exclamation of the people in Madagascar, and which M. Soncncrat applied to this animal. It is found chiefly, if not exclusively, on the western side of the island.

In size the creature is equal to a rabbit, measuring in a right line from the muzzle to the origin of the tail, fourteen or fifteen inches, and the tail being rather longer than the body. The head is formed like that of a squirrel; the incisive teeth are very contiguous, and so placed as to refilem in some manner, the back of a parquelet; but the two in the lower jaw are much stronger than those in the upper one. The ears are naked, large, and rounded at the tip, as in several of the bat tribe. The toes on each foot are five in number; and the first or innermost one, which serves as a thumb to the hind feet, has a large and flat nail as in the maki tribe (macaca, or lemur). A very distinguished character of this animal is the length of the toes on the fore-feet; the two last joints of the middle toe above all are very long, slender, and defittude of hair, and the nails are hooked. The fur is as coarse as horse-hair; and is of a purplish, or muffly-brown colour, intermixed with black and griseous ash; upon the head, and back, about the eyes, legs, and thighs, is a deep mufk-colour; on the eyelids, and several parts of the body and limbs, black however predominates, and the tail is of this latter colour; that of the face, throat, and belly is greyish white, or slightly tinged with rufous in some places; it does not carry the tail elevated like a squirrel. The female has two teats on the lower part of the belly.

M. Somcrat, who saw both the male and female, speaks of them as being very useful and gentle animals; and which, like the owls, are scarcely able to discern objects in the day time. They live chiefly under ground, feeding on worms and insects which they find in the earth, or in crevices in the trunks of trees, whence they extract them with the greatest facility, by means of their long hinder toe before mentioned. Those which Somcrat kept alive, were fed with rice, and he observed that they fed themselves with the two long toes of their forefoot, in the same manner as the Chinese do with their chopsticks when eating rice at their meals.

Sonnini forms a new genus of this animal, under the name of Cheiromys (or rot à main), observing that it is the only species of its genus known. The generic character, according to this author, consists in the toes being very long, and the thumb of the hinder pair being bent aside, or turning rather backwards. He confers Genulinus for calling its fur's Madagascanis or Madagascar squirrel, because a quadraped of that genus really exists in Madagascar.—Genulinus thus specifically describes his S. Madagascanus; middle toe of the fore-feet naked, and very long; thumb nail of the hind-pair rounded.

AYEL, Fr. or Ayle, in Law, a writ which lies where the grandfather was seized in his demesne on the day he died; a stranger enters the same day and dispossesses the heir. See Asis. de Mort, &c.

AYEN, in Geography, a town of France, in the department of the Corrèze, and chief place of a canton in the district of Brive; fourteen miles S. S. W. of Uzerche.

AYENIA, in Botany, (named in honour of the duke D'Ayen, duke of Marcehalle de Noailles). Lin. g. 1020. Schreb. 367. Gärtn. 79. Jul. 278. Claus. gymandra pendula; or according to Schreber, pendulata monogynia. Nat. Order of columnifera.—Malvaceae. Juss. Gen. Char. Cal. perianth one-leafed, five parted; parts ovate, oblong, acute, coloured in the middle, reflex, withering. Cor. five-leafed, united at the top to the nectary into a flat star; claws of the stamens capillary, very long, bowed outwards; borders of the lobes alternate, reflex, and with flat tips turned inwards; nectary bell-shaped, situated on a cylindrical, erect column, shorter than the calyx; border five-lobed, lobes elevated, above flatish, with a longitudinal furrow, excava
ted underneath, sharp. Stem. filaments five, very short, inserted into the margin of the nectary, on the top of the ribs, between the divisions of the border, each bent downwards through a notch at the end of each petal; anthers roundish, under the borders of the petals. Iyl. germ roundish, five-cornered, at the bottom of the nectary; stye cylindric; stigma obtuse, five-lobed. Per. capsule five-grained, roundish, mucrate, five-celled, ten-valved, flat. Seeds solitary, rather oblong, gibbous on one side, angular on the other.

Species, 1. A. pufilla; smooth acinace. Mill. Dict. fig. t. 18. "Leaves cordate, smooth." Stem weak, woody, from nine inches to a foot high; leaves alternate, indented, pointed, falked; flowers at the base of the petals, two, three, or four, from the same point, on separate peduncles; corolla purple, tubulous, spreading at the top into five feder
ments, each terminated by a slender tail. A native of Peru. Cultivated by Miller, in 1756. Its flowers appear in suc
cession from July till winter. 2. A. tomentosa. "Leaves ovate,
A Y E

ovate, roundish, tomentose." Leaflets of the calyx lanceolate, acute, permanent; corolla without petals, but composed of a one-leaved bell-shaped nectary, with a five-cleft margin; filaments on the outside of the nectary, longer than the calyx, bowed, bent in, and fixed by a broad membranous tip, to the edge of the nectary; anthers three. A native of South America. 3. A. magna, Jacq. Amer. Pict. p. 112. "Leaves ovate pubescent; germ of the flowers scidble." An upright shrub, five feet high; leaves acuminate, serrate, alternate, on tomentose footstalks; peduncles short, axillary, mostly in fours; three-flowered; flowers small, herbaceous, not gynandrous. A native of Carthagena and other places of South America. 4. A. levigata. Swartz. Prod. 97. "Leaves ovate, entire, very smooth, germ pedicellate, nectary ten-cleft, radiated." A native of Jamaica.

Propagation and Culture. These plants are to be propagated by seeds sown on a temperature hot-bed, early in the spring, and when they have four leaves, they should be transplanted in another hot-bed to bring them forward, or in pots, and planted into a hot-bed of brier's bark. They must be shaded till they have taken root, and afterwards have free air admitted to them every day in proportion to the warmth of the season; they also require frequent watering. In winter they may be preferred in a moderate flume, but as they perfect their seeds the first year it is not necessary to continue the old plants. See Martyn's Miller's Diet.

AYENNIS, in Geography, the name of an Indian tribe of America, in Florida.

AYERBA, a town of Spain, in Arragon, on the Gallego, between Saragossa and Jaca.

AYERBENGAI, a town of the island of Sumatra.

AYERSTOWN. See AYESTOWN.

AYESHA, in Biography, the favourite wife of Mahomet, was the daughter of Abubeker, and the only one of Mahomet's numerous wives who was a virgin when she came to his bed. With this view, he married her at seven years of age, and cohabited with her at nine. He had no children by her; but so affectionate and confant was his attachment to her, that in his last illness he was conveyed to her house, and expired in her arms. Her enemies charged her with adultery on a particular occasion; and though the prophet had suspicions of her infidelity, he thought it most prudent, for preserving the dignity of his own character, to produce a seafonable revelation from heaven, attesting her innocence; and he punished her accusers as calumniators. After the death of Mahomet, Ayesha was held in great veneration by the Mussulmans, denominated "the mother of the faithful," and confided on important occasions. Against the caliph Othman she conceived, for some reason that is not known, an invincible prejudice, and formed a plot for detrothing him. When Othman was assassinated by another enemy, she vigorously opposed the succession of Ali, because he had concurred in the accusation of her infidelity. Uniting with her favourites Téba and Zobeir at Mecca, and under a pretence of avenging the murder of Othman, she marched in a litter borne by a very strong camel, at the head of an army, towards Bajors, and on approaching the town, after some ineffectual resistance on the part of the inhabitants, she was met by a deputation sent to know her intentions, whom the harangued with great passion, and in a loud shrill voice, in a long speech. To her speech, one of the Arabs replied, "O mother of the faithful, the murder of Othman was a circumstance of less moment than thy leaving home upon this curated camel. God has bellowed on thee a veil and a protection; but thou hast rent the veil, and set at nought the protection." After some contet, the troops of Ayesha gained possession of Bajors. But Ali advanced, and as Ayesha obstinately rejected all pacific counsels, a fierce battle ensued at a place called Horasie, in which both Téba and Zobeir were slain. The combat closed with hamstringing the camel on which Ayesha was carried, and taking her prisoner. After some mutual approaches between her and Ali, she was civilly dismissed, and sent to Medina with an injunction to live peaceably at home, and to concern herself no more in affairs of state. This reiteration the afterwards referred to by suffr. Hasan, the son of Ali, to be buried near the tomb of the prophet, which was her property. Having regained some degree of influence in the reign of the caliph Moosiyah, she was con- 

AYGULUS, in Zoology, a species of SIMIA, charactcrized by Linnaeus as the long-tailed, bearded, grey monkey, with a riling longitudinal tuft on the crown; the simia nigra magnitudinis medice of Edwards; agrette de Buf- 

AYELEUSA, in Biography, the favourite wife of Maho- 

AYLEBURY, in Geography, is a large market and borough town in Buckinghamshire, in England; and may be considered the most considerable town in the county. It consists of several streets and lanes, which are irregularly disposed over an extensive surface of ground that rises in the midst of the rich vale of Aylebury. Leland describes the town as being principally built with timber when he visited it, but since that time it has been considerably enlarged and improved, and most of the houses constructed with brick. The improvements originated with Sir John Baldwin, who erected some considerable buildings, and raised a caufeway three miles in length to facilitate the approach to the town through a road that was often miry and dangerous. This gentleman, in the time of Henry the eighth, also procured the alizers to be held here which had before been kept at Buckingham. In consequence of this, a county goal, and also a handfome county hall, were erected. About the year 1660, Aylebury became famous as the burial place of St. Olyth, who was born at Quareniod in this neighbour- 

AYLAH. See AYAH.

AYLESBURY, in Geography, is a large market and

borough town in Buckinghamshire, in England; and may be considered the most considerable town in the county. It consists of several streets and lanes, which are irregularly disposed over an extensive surface of ground that rises in the midst of the rich vale of Aylebury. Leland describes the town as being principally built with timber when he visited it, but since that time it has been considerably enlarged and improved, and most of the houses constructed with brick. The improvements originated with Sir John Baldwin, who erected some considerable buildings, and raised a caufeway three miles in length to facilitate the approach to the town through a road that was often miry and dangerous. This gentleman, in the time of Henry the eighth, also procured the alizers to be held here which had before been kept at Buckingham. In consequence of this, a county goal, and also a handfome county hall, were erected. About the year 1660, Aylebury became famous as the burial place of St. Olyth, who was born at Quareniod in this neighbour-

king's bed and chamber, three cists for his use in winter; and in summer, fraw, ruthles, and two green geese, thrice every year, if he visited Aylesbury so many times. The church is a spacious and ancient structure, built in the shape of a cross, with a low tower rising from the intersection of the nave and transepts. It contains a few ancient monuments and on the south side is a room appropriated for a free-school. The church-yard is large, and divided into several walks, which are planted with double rows of trees. This town was made a borough by charter, and empowered to send members to parliament on the 14th of January, 1553/4. The right of voting is vested in all the householders who do not receive alms, and they commonly amount to about 350. Here are six annual fairs, and a market held on Saturday: at the latter, great numbers of calves and ducks are sold to dealers from London. Many people in this town and its neighbourhood derive support from their peculiar skill in breeding and rearing of ducks. To gratify fashionable luxury they contrive to prevent the ducks laying till the months of October and November; when by heating and stimulating food, they are induced to drop their eggs; these are collected and put under different hens, which are also impelled to sit at an unseasonable time, and often made to continue in the nest for two or three broods. By this treatment the poor bird is often exhausted, and dies under her compellative duty. When the young ducks are hatched, they are placed near the fire and nursed with particular care. By these methods, many ducklings are sent to the metropolis at Christmas, and have been known to fall at fifteen shillings and a guinea per couple. The parish of Aylesbury, including the hamlet of Walton, occupies a large space of ground, and comprehends 697 houses and about 3082 inhabitants, the lower class of whom are usually employed in making of lace.

The vale of Aylesbury is particularly celebrated among agriculturists, for its richness and fertility of soil. It extends for many miles east and west, nearly from Tame in Oxfordshire to Leigham Buzzard in Bedfordshire, and is mostly appropriated to the grazing and fattening of cattle and sheep. About five miles from Aylesbury, is Eythorp, a fast of the Earl of Chesterfield; and at ten miles distance is Wotton-under-Bernwood, an ancient seat of the Grenville family, and now occupied by the earl of Temple. Britton and Brayley's Beauties of England and Wales, vol. i. p. 343, &c.

AYLESFORD, a considerable village of England, in the county of Kent, seated on the northern bank of the river Medway, over which there is a landscope stone bridge of six arches. It is four miles from Maidstone, and thirty from London. The ancient name of this place is found to have been Saïffenaig-iball; but in consequence of a bloody battle which was fought here betwixt the Britons and Saxons in 455, the name was changed to Anglesford, and that afterwards contracted to Aylesford. This battle is rendered memorable in the annals of English history, as being the first great conflict between the invading Saxons under Hengist, and the harried Britons under Gwthlyern. Concerning the issue of this battle our historians are very contradictory; some have described the Britons as completely victorious; but the learned Mr. Turner observes, that as Hengist and his son Eca poikily Kent after this event, we may presume that the engagement was unfavourable to the natives. In this sharp battle, Hægel, brother to Hengist, and Cuthigern, brother to Vortimer, were laid to have fought hand to hand, and were both killed on the spot. The former was interred on the eastern side of the Medway, at a place which still retains the name of Hought; and Cuthigern was buried at a place nearer the scene of battle, where it is stated a large Cromloch was erected to his memory. This monument is still existing at the place, and consists of three large upright stones, about eight feet high, with another lying on the top, measuring eleven feet by eight, and two feet in thickness. It is called Kittisely-house. (See Cromlech.) At the distance of about two fields are other stones erect and some lying down in a circular arrangement. In the reign of Henry the Third, a monastery of Carmelites was founded at Aylesford, by lord Grey of Codnor. It was granted by Henry the eighth to sir Thomas Wyat, and has at length devolved to the earl of Aylesford. Here is a hospital for six poor people, each of whom is allowed ten pounds a year. Haile's History of Kent, 5v. edition. Turner's History of the Anglo-Saxons.

AYLETS, or SEA-SWALLOWES. In Heraldry, they are often called Cervus Chough, and are painted fable beaked, and legged gules.

AYLM, or AILM, John, in Biography, an English divine and bishop, was descended from an ancient family at Aylmer-hall, in the county of Norfolk, and born in the year 1521. Being a younger son, he was educated at Cambridge under the patronage and at the charge of Henry Grey, archbishop of York, and afterwards duke of Suffolk; who, when his studies were finished, took him into his house, as preceptor to his children, one of whom was lady Jane Grey. Under his tuition, this lady became an excellent proficient in the Latin and Greek languages, so that she could not only read them with ease, but write them with elegance. Aylmer, as a preacher, zealously inculcated the principles of the reformers; and having, in consequence of his preference to the archdeaconry of Stow, in the diocese of Lincoln, a seat in the convocation, held in the first year of queen Mary, he resolutely opposed that return to popery to which the clergy in general seemed to be inclined; and he was one of six persons who offered to debase all the controverted points of religion with the most learned champions of the Papists. His zeal for the reformation rendered him obnoxious to the government; so that he found it necessary to withdraw from the country; and as he was of a diminutive figure, he made his escape by being concealed in a pipe of wine which had a false bottom, the wine being drawn from the lower half, whilst Aylmer lay hid in the upper. During the time of his exile, he resided first at Strasburgh, and afterwards at Zurich in Switzerland, purifying his studies, and improving himself by travelling, in the course of which he visited most of the universities in Italy and Germany. Towards the close of his exile, he wrote an answer to John Knox's book against the government of women, intitled, "The first Blair against the monarchical Regiment and Empire of Women." His piece was intitled, "An Harboure for faithfull and trewe Subjects against the late bloune Blaife, &c." printed at Strasburgh, in 1559. This book was written with vivacity and learning; but it contained some passages which seemed to indicate a tendency towards puritanism, and particularly one in which he exhorted the bishops to content themselves with moderate incomes, and with a portion "priestlike, and not prince-like." However, when this passage was afterwards objected to him by his enemies, he vindicated himself by saying, "When I was a child, I spoke as a child, and thought like a child, &c." After the accession of queen Elizabeth, Aylmer returned home, and was one of the eight divines appointed to dispute with as many popish bishops at Westminster, in the presence of a great assembly. In 1562, he obtained the archdeaconry of Lincoln, and in right of this dignity, he sat in the famous synod held this year for examining and settling the doctrine and discipline of the reformed
reformed church. In this situation he continued for several years, attending to his duties as a justice of the peace, and one of the ecclesiastical commissioners, and entering very little into those disputes that would have subjected him to the notice of either of the two parties by whom he was suspected. In 1573, he accumulated the degrees of bachelor and doctor in divinity, in the university of Oxford; and in 1576, he succeeded his intimate friend and fellow exile in the fee of London; but he incurred censure by commencing, and prosecuting for some years, a suit against him for dilapidations. Indeed, a prudent attention to his own interest was a discriminating feature in the bishop's character. In his clerical and episcopal capacity, he was affable in public praying, occasionally rousing, as it is said, the hagard attention of his audience by reciting Hebrew verses from a pocket bible; and in his efforts for guarding the church against the attacks both of papists and puritans. Perils of both these describings, and particularly the latter, were treated by him with a degree of severity, which was not only unwarrantable in itself, but which incurred occasional admonition from the ruling powers. His virulent abuse of some puritan ministers exposed him to the no less acrimonious affront of their fastidious writers, so that he became the hero of the celebrated Martha Mar-prelate. See Fuller's Church History, i. p. 225, 224. He was involved in a variety of disputes with respect both to the temporalities of his fee, and his exercise of his spiritual jurisdiction; so that his life was far from being tranquil, though his spirit was bold and resolute, and enabled him to surmount the difficulties with which he had to encounter. Of his resolution and personal courage the following instances are recorded: one was his submitting to the extraction of a tooth, in order to encourage queen Elizabeth to undergo the same operation; and the other was his cudgelling his son-in-law for misconduct towards his wife, who was a favourite daughter. Bishop Aylmer died at Fulham, in 1594, at the age of 73 years, and was buried in St. Paul's cathedral. He left seven sons and two or three daughters, to all of whom he left large legacies, which he was enabled to do by his economy and avarice. The character of Aylmer deferentially ranks high with respect to talents and learning, but his temper was irritable and violent; he was immoderately fond both of power and money; and he undoubtedly possessed an arbitrary and perfecting spirit. Biog. Brit. Andrews's Hist. of Gr. Brit. vol. i. p. 524.

Aylsham, or Alesham, in Geography, is a respected market town in Norfolk, in England, situated in a flat and fertile country on the banks of the river Bure. In 1773, an act of parliament was obtained for making this river navigable hence to Coltishall in its course to Yarmouth, a distance of about ten miles, in which space there are five locks; the undertaking was completed in 1799. This town is the capital of the manor of the duchy of Lancaster, in consequence of which the duchy court is always held here. The manor was granted by Edward III. to the famous John of Gaunt, duke of Lancaster, who built a handson church in the town, and dedicated it to St. Michael. A free-school was founded here in 1577, by Robert Jannys, who was then mayor of Norwich. Aylsham is about eleven miles from Norwich, and 125 from London. It has two annual fairs, and a weekly market on Tuesday; this was formerly held on Saturdays, but has been altered to the former day. History and Antiquities of Norfolk, 10 vols. 8vo.

Aymeraæ, a jurisdiction of South America, in the diocese of Cufco, about 40 leagues south-west from Cufco. This territory abounds in fugar, cattle, and grain, and also in mines of gold and silver, which formerly produced large quantities of those valuable metals; but at present few of them are wrought, the country being too thinly inhabited. Aymargues, See Aimargues.

Aymouth, See Easter Ayrmouth.

Aynac, a town of France, in the department of the Lot, and chief place of a canton in the district of Figeac, twelve miles N. W. of Figeac.

Ayoquantottol, or Ovis Ayoquantottol, in Ornithology, the name under which the Ovis Cantabrius of Ginchi is described by some old writers. Vide Hera. Mex. Seba, &c.

Ayro, in Geography, a small place of Spain, in the province of Valencia, upon the river Xucar, at the foot of a mountain, one league from the frontiers of New Cadiz; the inhabitants of which are said to speak Catalan in its purity.

Ayotecos, high mountains of America, in Mexico, in the province of Tlaxcala, towards the coast of the South sea.

Ayrshire, a county in the south-western part of Scotland, bounded on the north by the county of Renfrew, on the south by the counties of Lanark and Dumfries, on the west by the frith of Clyde. Its extent is about sixty-five miles in breadth by thirty-five in breadth, and it is divided into three great bailiages or warwicks, which bear the names of Kyle, Cunninghame, and Carrick. These districts are extremely different from each other in appearance, as Carrick and the interior parts of Kyle are mountains, and only fitted for pasture; while the coast of Kyle, and the greater part of Cunningham, present a fine, level, cultivated country, intermixed with numerous towns and villages. Its rivers are the Tweed, the Ayr, the Esk, the Aman, the Urr, the Gurnan, the Doon, and the Lugar. This county includes two royal burghs, Ayr and Irvine, and several towns, among which are Beith, Bellantrae, Girvan, Kilnamnoss, Kilwilling, Large, and Salcoats. Ayrshire possesses many valuable teems of coal, also some quarries of freestone, limestone, irontone, and several rich beds of lead and copper ore. A few curious specimens of agates, porphyries, and calcareous petrifications are often found in the hills of Carrick; and a species of whetstone, known by the name of Ayr-stone, is obtained from this county. The population of it, as returned to the house of commons in 1800, was 84,306, of which 39,666 were males, and 44,640 females.

Ayr, the principal town in the above county, is a royal borough of considerable antiquity, and the seat of a judicatory court. It was nominated a royal borough by William the Lion, in 1180, and the privileges by charter then granted are still enjoyed by the town. It is pleasantly seated on the point of land which projects into the sea, between the influx of the rivers Doon and Ayr, and the principal street is broad and ornamented with a row of good houses on each side. Ayr has been a town of considerable trade, but the rising opulence of Glasgow has attracted the merchants from this place. The inconvenience entrance to the harbour proved detrimental to the commerce of the town, but the inhabitants are carrying on extensive works to remove all obstructions at the mouth of the river, and render it more commodious for trading vessels; and two new reflecting light-houses are now erecting near the entrance to the harbour. The salmon fishery of the two rivers furnishes employ for many of the inhabitants, and the fund banks of the coast abound with all kinds of white fish. Its population is 5,492, and it has 755 houses.

Ayr, New Town of, is the name of another town, seated on the north side of the river Ayr. It has baronial jurisdiction, and a distinct magistracy from the other town. This place seems to have arisen under the influence of Robert Bruce, who
A Z A

retired here upon being attacked with a leprosy, established a lazaret-house, and conferred considerable favours on the town, and the neighbouring village of Prielwich. Its population is 1724.

AYR, a river of Scotland, rises in the parish of Muirkirk, in the above county, and after a course of about eighteen miles due west, falls into the Frith of Clyde, at the town just described. Its banks are steep and romantic in some places, but in others it often overflows its shores, and does considerable damage.—Allo, a river of France, which runs into the Aisne near Graupre.

AYRINES, a town of France, in the department of the Somme, and chief place of a canton in the district of Amiens, nine miles S. S. E. of Abbeville.

AYRSTOWN, or AYERSTOWN, a town of America, in Burlington county, New Jersey, situated on the middle branch of Ancous creek, sixteen miles from the mouth of the creek in the Delaware, and thirteen south from Burlington.

AYRY. See AERY.

AYSCEUE, AYSGOUGH, or ASKEW, Sir George, in Biography, an eminent English admiral of the seventeenth century, was defended from a good family in Lincolnshire; and entering into the sea-service in his youth, acquired the reputation of an able and experienced officer, and obtained the honour of knighthood from King Charles I. Adhering, however, to the parliament in the civil war, he was constituted admiral of the Irish seas, where he failed to have rendered great service to the protestant interest, and to have contributed much to the reduction of the whole island. In 1641, he reduced the islands of Scilly, and also Barbadoes and Virginia, to the obedience of the parliament; and he afterwards beheld with great honour in the war with the Dutch. In 1666, while he was engaged with the Dutch fleet, his ship was driven upon the Galley sands; and being surrounded with enemies, and despairing of help from friends, he was obliged to surrender. After this disaster, he went no more to sea; but spent the remainder of his days in retirement. Biog. Brit.

AYSIAMENTA, or AZIAMENTA. See EASEMENT.

AYSLINGEN, in Geography, a market town of Germany, in a preface of the same name, in the dioceze of Augsburg, situate on the Danube.

AYST, a river of Austria, in the Black quarter, on which is seated the market town of Waldshafen.

AYTON, or AYTON, a small town of Greece, in Lydadia, five leagues north of the Dardanelles of Leponiso. This is thought to be the ancient town of Astolia, called Calydon Apula.

AYUD, AUDUS, or HAWD, a province of Hindoostan, containing the most northern countries belonging to the Moguls, such as Kakeares, Bankiil, Nagarkat, Siba, and others. It is situated to the north-west of the Ganges, and watered by rivers which fall into it; so that, notwithstanding its mountains, it is exceedingly fertile; and its trade with the countries to the north-east renders it very rich. In this province there are many independent rajahs, and two remarkable pagodas, one at Nagarkat, dedicated to the idol Matta, and the other at Kalamak, which is venerated, because the Indians regard it as miraculous, that the water of the town should be very cold, and yet spring from a rock that continually throws out flames.

AZA, in Ancient Geography, a town of Asia, in Syria, seated on an eminence to the west of one of the branches of the river Chalus, south-west of Chaonia.—Allo, an ancient town of the Lesser Armenia, placed by the Antonine Itinerary in the route from Caffarea to Sangala, 26 miles from the latter place.—Allo, a name given in the time of Steph.
A Z A

wished to be considered as the favourite abodes of their divi-
nities. It appears, however, from the best authorities, that 
Merign, Axum, and Azab, were places that had a common 
origin, and were most probably, as we have already ob-
erved, the principal stations of the caravans that traded to 
Arabia, while Thebes and Ammonium continued the com-
munication toward Carthage. Whether from Azab there 
was an intercourse with the Ethiopians of the more southern 
parts of Africa, toward cape Gardafan, and the present 
Zanquebar, is a question that defers particular investiga-
tion. On this subject, see professor Heeren's "Ideen liber 
die Politik, &c." or "Ideen on the Policy, Intercourse, 
and Commerce, of the principal Nations of Antiquity."
Gottingen, 1793.

Azab, in the Military Order of the Turks, signifies a par-
ticular body of the foldiery taken in, or added first to the 
janizaries, but now become a separate body from them.
The word, in the Oriental languages, signifies an unmar-
ried person, and the original order of these was, that they 
should be single men.

The janizaries in Egypt have been great rivals to the jani-
zaries, and sometimes they have got the better. Their in-
stitution and officers are the same with those of the jani-
zaries; but with this difference, that from odd-bathers they 
amongst me are married, and from that office cajus, and come 
into the divan. On the contrary, among the janizaries, 
when any one is made a ferbajee, it is laying him aside, and 
he is no farther advanced. Poecoeck's Egypt.

AZABE-KABER, from taber, jaspis, and azab, term, 
denotes a temporary punishment, which, as the Ma-
hometans say, the wicked must suffer after death. Their 
emises are hereby expiated, and Mahomet opens the gate of 
paradise to all who believe in him.

AZADARICTHA, in Botany. See MELIA.

AZADKAR, in Geography, a large town of Perlia, 
called allo Yeun, and placed by Taverney in an extensive 
plain, watered by 400 Nubian canals.

AZAGARIUM, in Ancient Geography, a town of the 
European Sarmatia, in the vicinity of the Borythenes.
Ptolemy.

AZAGRA, in Geography, a town of Spain, in Navarre, 
on the Ebro; two leagues from Calahorn.

AZAIZY, a poor and inconsiderable tribe of Arabs, 
inhabiting a village of Egypt, called Bir Ambar, between 
the Nile and the Red Sea, about N. lat. 26°, and E. long. 
33°; who subside by letting out their cattle for hire to the 
caravans that go to Coffein. The village probably 
derived its name Bir Ambar, or the wall of fishes, from 
its having been formerly a station of the caravans from 
the Red Sea, loaded with this kind of merchandise from 
India. The habitations of the Azaizy are constructed of 
potter's clay, in one piece, in shape of a bee-hive: the 
largest not above ten feet high, and the greateft diameter 
fix.

Bruce's Trav. vol. i. p. 170.

AZALEA, in Botany. (Neve, dry; from its growing 
158. Clas. pentandra monogyna. Nat. Order. dicoty-
Rhododendra, Jull. Gen. Char. Cal. perianth five-parted, 
acute, creaf, small, coloured, permanent. Cor. monopetal-
aus, bell-shaped, fumagineous; the frutes of the divi-
sions bent in. Stam. filaments fign, filiform, inferted into 
the receptacle, free; authors fimple. Pykl. gerb roundish; 
syle filiform, the length of the cor., permanent; stigma 
obtuse. Per. capsule round, 5, five-celled, five-valved. Seed 
many, roundish. Ohj. In some species the corolla is fumel-
shaped. Eff. Gen. Char. Cor. bell-shaped; flamina inferted into 
the receptacle; capsule five-celled.

Species, 1. A. pontica, Pontic azalea. "Flowers shinning, 
lancolote, smooth on both fides, racemes terminal." This 
species much resembles rhododendron ponticum; but its 
flowers are yellow, its leaves smaller, ovate and ciliata. 
A native of Pontus. 2. A. indica, Indian Azalea. Thunb. 
Jap. 84. "Flowers sub-foliaceous; calyces hairy." A shrub, 
three feet high, with a rough cimereous-brown bark. Branches 
short, twilled, irregular. Leaves fuf, villous, close ever-green. 
Flowers cover the whole upper part of the shrub, and are of 
a beautiful bright red colour. A native of the East Indies. 
It is much cultivated in Japan for the elegance of its flowers, 
and variety in their size and colours. 3. A. nudiflora, naked-flowered azalea. The var-
ieties are as follow: A. coccinea, deep scarlet azalea. Curt. 
A. carnea, pale red azalea. " Tube red at the base, calyces 
leafy." A. alba, early white azalea. "Calyxes of a mid-
dling length." A. bicolor, red and white azalea. " Limb 
of the corolla pale; tube red; calyx small; branchlets 
hairy." A. papilionacea, variegated azalea. " Corolla red, 
the lowest segment white; calyces leafy." A. partita, 
downy azalea. "Corolla pale red, divided to the base into 
five parts." Sp. Char. "Leaves ovate, corollas hairy, fla-
mens very long." In its native country this frequently ex-
ceeds fourteen feet in height, but in England, we never see 
it half this height. Several items arise from the root. 
Leaves oblong, smooth, alternate, falked. Poduncle ax-
illary, long, naked, supporting a cluster of red flowers, 
which are tubulous, and dwelling at the base, like those of 
the hyacinth, and contracted at the neck; they are divided at 
the top into five unequal segments, which 
read open. The filaments and stigfes are much longer than the petals, 
and flate creaf. "A native of North America; and intro-
duced thence by Peter Collinson, esquire, in 1734. 
4. A. volei, vilid azalea. "Leaves feaious at the edges; cor-
ollas with glutinous hairs." Its varieties are, A. odorata, 
common white azalea. "Branches diffused; leaves deep 
green, fining." A. vittata, white-striped flowered azalea. 
"Corolla white, with pale red keels; styles elongated; red 
at the end; leaves pale, ovate, oblong." A. fiafa, narrow-
petalled white azalea. "Corolla divided to the very base; 
leaves deep green, fining." A. floribunda, cluster-flowered 
white azalea. "Styles longer than the corolla; leaves glau-
cous underneath." A. glauca, glaucous azalea. "Corolla 
white; leaves glaucous on both sides, the younger with 
scattered hairs on the upper surface." This shrub rises 
with several stems near four feet high. Leaves f-parasolid, 
arrow, at the base, beft at the edges with thin rough teeth, 
and fold in clusters at the ends of the shoots. Flowers 
in clusters at the extremities of the branches, white, with 
a mixture of dirty yellow on the outside; tube an inch long; 
the two upper segments at the top reflex; the two side ones 
bent inwards; and the lower one turned downwards. These 
flowers have the appearance of fhow of honey-fuckle, and 
are as agreeably fcented; they appear in July. This is 
nearly allied to the foregoing; but does not flower till after 
the leaves are expanded. It is a native of North America, 
and was introduced here by P. Collinson, esquire. 
5. A. lapponica, Lapland azalea. "Leaves with excavated dots 
round the edges." A shrub fix or seven inches high. It 
is to be dillinguished from rhododendron dauricum only 
by its having five flaments, whereas that has ten. 
Pan. t. 9. "Branches procumbent, diffufe; leaves opposite, 
revolute, very smooth." Stem woody, much branched; 
branches leafy, round, smooth; leaves opposite, falked, 
spread much, elliptic, obtuse, revolute, entire, smooth; pe-

3 F 2

itudes
tides channelled, ciliate; peduncles in pairs, commonly oneflowered, reddish, with bracts at the base; flowers red, of a deep rosy colour, bell-shaped, regular; capsule subho-rtund-ovate, acute, five-celled, margins of the valves inflex.

It grows on most of the high mountains of Scotland. 7.

AZUMATU, dotted azalea. Linn. Cochinch., 113. "Leaves ruggned about the edge; flowers dotted, heaped." Five sep't high, creft, branched; leaves lanceolate, entire, smooth, alternate; corolla white; calyx whitish, dotted with red, as are also the corollas, anthers, and germ. A native of the woods of Cochinchina.

Propogation and Culture. 1, 2. The Pontic and Indian species have not yet been cultivated in Europe. 3, 4. grow naturally in shade, and in moist ground; many of the plants have been sent to late years from North America to Eng-

land, and produced beautiful flowers in this country. They must have a moist soil and shady situation; and can only be propagated by shoots from their roots, or by laying down their branches, for they do not produce seeds here. When any of them are laid down, it should be only the young shoots of the same year, for the old branches will not put out roots. The time for this is at Michaelmas, and if they are covered with some old tan, to keep out the frost, it will be of use to them. The autumn is the best time to remove the plants, but the ground about the roots should be covered in winter; a practice necessary for the old plants to preserve them in vigour, and cause them to flower well.

5, 6. are low plants, of little beauty, and will only throng on boggy ground upon mountains. See Martyn's Miller's Dict.

AZAMA, in Ancient Geography, a town of Africa, placed by Ptolemy fifteen days journey distant from Carthage bay; south-east of Cirta. It is supposed to be the present Zamora.

AZAMBULGA, in Geography, a small town of Portug-al, containing from seven to eight hundred houses, seated in a well-cultivated plain, on the banks of the Tagus, not far from Lisbon.

AZAMOGLANS. See Agemoglans.

AZAMOR, in Geography, a small sea-port town of Africa, in the kingdom of Morocco, and province of Du-

quella. It is seated on the river Morbeya, at some distance from its mouth. This town is not adapted to maritime commerce, because the entrance of the river is dangerous. It was unsuccessfully besieged by the Portuguese in 1508; but taken in 1513 by the duke of Braganza, and abandoned about the end of the sixteenth century. At a little distance from Azamor, facing a spacious bay, are the ruins of the ancient city of Titus, supposed by Cherier (Prefont State, &c. of Morocco, vol. i. p. 37.) to have been one of the cities founded by order of the Senate of Carthage. Near the same place are the ruins of Almedina, a town built by the Moors. The cape of Azamor stretches out to the west. See MAZAGAN. N. lat. 33° 20'. W. long. 8° 20'.

AZAMORA, in Ancient Geography, a strong place of the Lesser Armenia, in Catania, Strabo.

AZANAGHIS, in Geography, a people on the coast of Africa, near cape Blanco. They inhabit the adjacent deserts, and are not far from the Arabs of Hoden. Their food is dates, barley, and the milk of their camels. They acknow-

ledge no matter, but the more wealthy among them are treated with some tokens of respect. Their general char-

acter is that of being perfidious and fraudulent; they are poor and wretched, and live in hordes dispersed in several places along the coast.

AZANI, in Ancient Geography, a people of Asia, in Phrygla, to which they were annexed. Strabo.

AZANIA, one of the three grand divisions of Arcadia, according to Strabo. Steph. Byz. says, that it contained seventeen towns.—Also, a part of the maritime coast of Ethiopia, Piny.

AZANITIS, a country of Asia Minor, in Phrygia, in which was the source of the river Rhynacenus. Strabo.

AZAOTON, or AZAI, a sandy defect of Africa, in Libya, almost defitute of water, and which is traversed by the compass, like the fen.

AZAPES. See ASAPPES.

AZAR, in Ancient Geography, a mountain in Egypt. Ptolemy.

AZAR, in Geography, a town of Arabia, seventy-six miles south-west of Ammaninidin.

AZARA, in Ancient Geography, a town of Asa, in Ar-

menia Major, seated on the river Araxes. Strabo.—Also, an ancient town of Asatic Sarmata. Ptolemy.—Also, a temple of Diana, in Allyria. Strabo.

AZARABA, a town of Asa, in Sarmatia. Ptolemy.

AZARECAH, or ARASKITES, in History, the deno-

mination of a sect of heretical Muslims, so called from Naif Ebn al Azarak their founder, who acknowledged no power or government, temporal or spiritual. They consisted of a combination or assemblage of all who rejected and op-

posed the Malmoean faith; they were sworn enemies of the house of Omnyah; and committed dreadful ravages in all the Mollem territories through which they passed. In the sixty-eighth year of the Hegira, they made an irruption into Iraq, and carried their barbarous excesses to such a height, that they murdered all persons whom they met with, ripped open women with child, and committed every species of cruelty that could be invented on people of every de-

scription, without discrimination. During this period their founder died, and was succeeded by Kitri Ebn al Fejat, under whole, conduct they continued their depredations. Mufah, the governor of Mosul and Melopotamia, sent a body of troops against them, commanded by Omar Ebn Abd-adlaha Temimi, who completely routed them at Naiabur, in Chorasan, flew many of them, and pursued the rest as far as Kishan and the province of Kerman. See MAHOMETANS.

AZAREDO, in Geography, a ten-port town of South America, in the bay of Spirito Santo, on the coast of Bra-

sil. This is a famous port for sugar. S. lat. 20° 18' W. long. 40° 10'.

AZARIAH, or UZZIAH, in Biography, one of the kings of Judah, succeeded his father Amaziah in the year 809 before Christ. The early part of his reign, in which he was pious and virtuous, was prosperous and happy; and he obtained great advantages over the Philistines, Ammonites, and Arabsians. He was devoted to agriculture, though he had a fielding army of 30,500 men, with large magazines, well furnished with arms both offensive and defensive; he employed many husbandmen in the plains, vine-dressers in the mountains, and shepherds in the valleys. Towards the close of his life, and of his reign, which lasted fifty-two years, he became an idolater, died of a leprous, and was buried, not in the royal sepulchre, but in an adjacent field. 2 Kings, xv. 2 Chron. xxvi. There are many high-priests and others, mentioned in scripture, and in the Jewish histroy, who bore the name of Azariah.

AZARIAS, a learned Italian rabbi, lived in the sixteenth century, and published at Mantua, in 1574, a Hebrew treatise, intitled, "Meor en Ajin," or "The light of the eyes," in which are discussed, with considerabe learning and knowledge of the Chriftian scriptures, several points of chro-

nology and criticism. The work contains a Hebrew transl-

AZAROLUS, or ARAROL, in Botany. See CRATAEUS.

AZARUM,
AZARUM, a small, dry, blackish, fragrant, medicinal root, much used in France as a specific for the gout and in horses. The azafran, called also *cardiis festuginis*, grows in the Levant, Canada, and about Lyons in France. The flower is reported the best. It is given in powder, from the quantity of an ounce to two.

AZATA, in Ancient Geography, a town of Achaia, in Media. Polenx.

AZATHA, a town of Achaia, in Armenia Major, Prox.

AZAY LE FERON, in Geography, a town of France, in the department of the Indre, and chief place of a canton in the district of Chatillon sur Indre; nine miles S.S.E. of Chatillon.

AZAY & RIchau, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Chinon, four leagues south-west of Tours, and four north-east of Chinon.

AZAZEL, in Jewish Antiquity. See Scope-ihat.

AZED, in the Materia Medica, a name given by the Arabian writers to a kind of camphor, which they make the third in value, placing it after the *alumafuri* and *abriagi*. The first of these was the finest of all the kinds of camphor, and was collected tolerably pure from the tree, as it grew in Canfur, the place whence it was named. The abriagi was the same camphor, rendered yet more pure by sublimation; this was a discovery of one of the kings of that country, and the camphor was named from him. The third kind, or azed, was the same with what we now receive from the Indies, under the name of crude or rough camphor. The word *ased* signifies only large, and was used to express the camphor formed into such large cakes, as it is also at this time. Avicenna says, this camphor was gross, of a dulky colour, and much less bright and pellucid than the other kinds. See Camphor.

AZEDARACH, in Botany. See Melia.

AZEKAH, or *azeceh*, in Ancient Geography, a city of Judaea, throng both by situation and its walls; in the tribe of Judah, and seated in the fame north-west corner with Lebna and Makkedah, in the valley of Terebinth, where David slew Goliath. Josh. xxv. 55. 1 Sam. xvii. 1. Ezechias and St. Jerome inform us, that, in their time, there was a city of this name between Jerusalen and Eleutherapolis.

AZELFOCE, in Algonomy, a fixed ilar of the second magnitude, in the tail of Cygnus.

AZEM, in Geography. See Asam, and Asen.

AZARAILLES, a town of France, in the department of the Meuse, and chief place of a canton in the district of Lunyille, three leagues south-east of Lunyille.

AZETENE, sometimes called Anasintes, in Ancient Geography, a country of Asia, in Armenia Major, between the sources of the Tigris and Euphrates, to the south of Sapena. Ptolomy.

AZEVEDO, Ignatius, in Biography, a Portuguese Jesuit, was born at Oporto, in 1527, and reigning an ample fortune of which he was heir to a younger brother, he devoted himself to religion in the society of the Jesuists of Coimbra. In process of time he became a missionary, and was deputed as such to the Indies and Brazil, under the title of procurator-general for those countries. Having given an account of his first voyage to the general at Rome, he set out on a second mission with a great number of attendants; but whilst the ship was sailing, in 1570, towards the island of Palma, it was taken by corsairs, and all the missionaries were put to death. On this account, Azevedo and his thirty-nine companions have been honored as martyrs in the church of Rome; and the history of their mission and martyrdom was published by Beauvais, a Jesuit, in 1744. Moret.

A Z E Y T AO, in Geography, a small town of Portugal, in Extremadura, consisting of 552 houses, and 2342 inhabitants. It has a manufacture of cottons, and carries on a considerable trade in wine and oil, for which its situation, between the two harbours of Lisbon and St. Uber, is convenient.

AZIACOLLAR, a town or Spain, in the country of Seville, sixteen miles north-west of Seville.

AZIBINTA, in Ancient Geography, an island of the Mediterranean. Phinix.

AZILAR, in Geography, a town of Asia Minor, in the road between Cilicia and Tripoli. Azirilla, a town of France, in the department of the Aude, and chief place of a canton in the district of Carcenfole; thirteen miles N.N.E. of Carcenfole. Lat. 45' 15". Long. 27' 30".

AZIMUGUR, a town of Hindostan, in the country of Allahabad; 108 miles W.N.W. of Patna, and 50 north of Benares.

AZIMUS, or Azimundus, in Ancient Geography, a small city of Thrace, on the Illyrian borders. This city, formerly mentioned by geographers, has been distinguished in the annals of history by the martial spirit of its youth, the fell and reputation of the leaders whom they had chosen, and their daring exploits against the innumerable host of the northern barbarians. Instead of tamely expecting their approach, the Azimundites attacked, in frequent and successful alliances, the troops of the Huns, rescued from their hands the spoil of the captives, and recruited their domestic force by the voluntary association of fugitives and deserters. After the treaty of peace between Attila and the eastern empire, A.D. 446, the Barbarian conqueror still menace the empire with implacable war, unless the Azimundites were purged, or compelled, to comply with the humiliating conditions which their sovereign had accepted. Theodosius, disdaining authority over a society of men who so bravely asserted their national independence, the king of the Huns conducted edged to negotiate an exchange with the citizens of Azimus. They demanded the restitution of some shepherds, who, with their cattle, had been accidentally surprised. After diligent, but fruitless inquiry, the Huns were obliged to swear, that they did not detain any prisoner belonging to the city, before they could recover two surviving countrymen, whom the Azimundites had detained as pledges for the safety of their bail companions. Attila was satisfied, and deceived by their solemn affirmation, that the rest of the captives had been put to the sword; and that it was their constant practice immediately to dismember the Romans and the defectors, who had obtained the security of the public faith. If the race of the Azimundites, whether this dissimulation on their part be excused or condemned by political calufts, had been encouraged and multiplied, the Barbarians would have ceased to trample on the majesty of the empire. At a subsequent period, in the war of the emperor Maurice against the Avars, A.D. 595—602, the Azimundites manifested a considerable degree of the invincible spirit of their ancestors. See Gibbon's Hist. vol. vi. p. 63, &c. vol. vii. p. 201, &c.

AZIMUTH, in Algonomy. The azimuth of the sun, or of a star, is an arc of the horizon, comprehended between the meridian of the place, and any vertical circle passing through the sun or star; and it is equal to the angle at the zenith formed by the said meridian and vertical circle, which is measured by the fore-mentioned arc. The word is pure Arabic, which signifies the same thing. The azimuth is reckoned eastward in the morning, and westward in the afternoon; and it is usually estimated from the south, or from the north, as it is nearer to the one or to the other of those points. Thus if it be found by observation, that the vertical circle which passes through the zenith and a star intersects the horizon just in the midway between the
the east and the south, then the star's azimuth is said to be 45° eastward of the south. It is the complement of the calendar or western altitude to a quadrant.

The azimuth is found trigonometrically, by this proportion: as radius is to the tangent of the altitude, so is the tangent of the sun's altitude to the cosine of the azimuth from the south at the time of the equinox. Otherwise, suppose the latitude of the place, and the fun's declination to be given, and let it be required to find the sun's altitude and azimuth at 6 o'clock. E. G. Let London be the place in N. lat. 51° 32', and let his declination be 23° 32', as it is on the longest day; then to find his altitude and azimuth at 6 o'clock in the morning and evening, construct a figure in the following manner. Describe the meridian (Plate II. Astronomy, fig. 20.), draw the horizon HR, and prime vertical ZN; make RP = latitude 51° 32' N.; draw the 6 o'clock semicircle PS, the equator EQ; the 23° 32' N. parallel of declination nm, intersecting the 6 o'clock semicircle PS in O; and through Z, O, N, describe the azimuth circle ZON, intersecting the horizon in A; then the triangles ZOP and OA are supplemental triangles to one another. In the spherical triangle ZOP, right-angled at P, we have:

<table>
<thead>
<tr>
<th>As Radius</th>
<th>To find the altitude AO</th>
<th>10.000000</th>
</tr>
</thead>
<tbody>
<tr>
<td>To fin. decl. = 23° 32'</td>
<td>9.060112</td>
<td></td>
</tr>
<tr>
<td>So fin. lat. = 51° 32'</td>
<td>8.984735</td>
<td></td>
</tr>
<tr>
<td>To fin. alt. = 18° 10'</td>
<td>9.49287</td>
<td></td>
</tr>
</tbody>
</table>

To find the azimuth AR.

<table>
<thead>
<tr>
<th>As Radius</th>
<th>10.000000</th>
</tr>
</thead>
<tbody>
<tr>
<td>To CoF lat. = 51° 32'</td>
<td>9.79383</td>
</tr>
<tr>
<td>So tang. decl. = 23° 32'</td>
<td>8.63761</td>
</tr>
<tr>
<td>To co. tang. azimuth = 74° 53'</td>
<td>9.43144</td>
</tr>
</tbody>
</table>

For the arc AR measures the angle RZA, the azimuth.

On the shortest day at London the parallel of south declination cuts the 6 o'clock hour-circle below the horizon; and as the triangles APO and ACO are congruent, the depression below the horizon, on the shortest day at 6 o'clock, will be equal to the altitude at the same hour on the longest day; and the azimuth will also be equal, if estimated from the south. Thus, on the 21st of December, the sun will bear N. 74° 53' E. at 6 o'clock in the morning, and N. 74° 53' W. at 6 in the evening; but on the 21st of December, at the same hours, it will bear S. 74° 53' E., and S. 74° 53' W. From this problem, it appears, that as the declination increases, the altitude increases and the azimuth lessens, and the contrary happens while the declination is decreasing; so that on the days of the equinoxes, when the fun has no declination, the altitude and azimuth will be nothing, or the fun will be in the horizon; and the azimuth being then 90°, the fun will be due east in the morning, and west in the evening; that is, on the days of the equinoxes, the fun rises and sets at the east and west points of the horizon.

Again, given the latitude of a place, the sun's declination and altitude; required the hour from noon, and the sun's azimuth. E. G. In the latitude of 51° 32' N, the fun's altitude was observed to be 46° 20', when his declination was 23° 32' N.; what was the sun's azimuth, and the hour when the observation was made?

Let the primitive circle ZRN (fig. 21.) represent the meridian of London, HR the horizon, and ZN the prime vertical; make RP = latitude 51° 32' N., and describe the parallel of declination nm, and the parallel of altitude m, and the hour when the observation was made.

In the oblique-angled spherical triangle PZ, the co-alt. or zenith distance ZO = 43° 45'; the co-declina. or polar distance OP = 66° 30'. Required the azimuth, ZOP, and the hour from noon ZOP.

To find the azimuth, or angle OP.

Here ZO = 43° 45';
ZP = 38° 28';
OP = 66° 30';

Then co-arith. fin. co-lat. = 38° 28' - 0.20617
co-arith. fin. co-alt. = 43° 45' - 0.16089
fin. 1/3 sum. co-declina. and D = 35° 52' 9.76783
fin. 1/3 diff. co-declina. and D = 35° 52' 9.70761

The sum of the four logs. - 19.84246
The 1/3 sum gives 56° 31'; and 56° 31' doubled gives 112° 6' for the azimuth sought, reckoning from the north.

To find the hour from noon, or ZOP.

Here PO = 66° 32';
PZ = 38° 28';

PO - PZ = 28° 4'; ______
ZO = 43° 45';______

Then co-arith. fin. co-declina. = 66° 32' - 0.03749
co-arith. fin. co-lat. = 38° 28' - 0.20617
fin. 1/3 sum. co-alt. and D = 55° 52' 1.76782
fin. 1/3 diff. co-alt. and D = 7° 48' - 1.13206

The sun's azimuth.

The 1/3 sum gives 21° 55'; - 9.3726

This 21° 55' doubled gives 43° 10' for the measure of the hour from noon, which is 2° 55' 20'.
AZO

AZO is a region in the government of Ekatarinoflaf; which, belonging partly to Little Ruffia and partly to the Zaporogian Kozaks, till the year 1752, when it began to be occupied by colonists from all nations, was one continued waste steppe, entirely void of inhabitants, but has since proved a great acquisition to the industry and trade of the country, under the name of New Servia. The ecclesiastical affairs of

AZOV, in Geography, a town and fortres on the Don, containing about 3800 inhabitants; distant from St. Petersburg 1998, and from Moico 1268 versts. It is well known that the Don is the Tanais of antiquity. Now, in this region, many ages ago, a town of the same name with the river, which had been built by the Greeks. Chardin pretends that Azof is situate fifteen Italian miles inland from the river; whereas the old town of Tanais is only three such miles distant from the river. What reasons Chardin had for giving this statement, concerning one or the other, it is difficult to discern. Though we cannot absolutely prove that the town Tanais, found precisely on the site of the present Azof, yet it is manifest that it was in this district. The more ancient a town is, the more likely it is to have undergone considerable and frequent alterations; and the less reason there is for imagining that it stands exactly on the old primitive spot, of which Rome alone may afford an example. Concerning Tanais, however, Clavdas Ptolemaeus affirmst, it to have been situate near the present Azof. For admitting, as he does, the Don to be the boundary between Europe and Asia, he gives the town Tanais to the Asiatic division. Strabo likewife (p. 215. 340. ed. Cusaub.), placing the town on the same side, at the same time informs us that it was built by the Bosphorian Greeks. Greece, in its earlier periods, was extremely populous; and some parts of it, from the nature of their soil, were not productive enough for the nourishment and support of their prolific inhabitants. Hence they were necessitated to contrive numerous towns on the sea-coast and on several islands, in order to devise means for remedying so great a defect. The commerce, to which the sea gave them all necessary accommodations, furnished this people at the same time with other means of rescuing themselves from poverty. For, at one time, particular towns, at another whole tribes, united to send colonies to different places out of Greece. These new settlers gradually formed colonies, on the shores of Natolia, Sicily, the inferior parts of Italy, in France, and several other countries; so that the commerce of almost the whole world then known was imperceptibly drawn into their hands. In like manner they planted their colonies round the whole coast of the Euxine, where, on the coasts of the peninsula of the Crimea, Theodolia, Chermon, Pantiapeum, and other towns, became particularly famous.—At what time the town Tana, or the present Azof, fell into the possession of the Genoese, is not now to be ascertained. It may however be surmised, that they obtained it from the Polovtze before the incursion of the Tartars, and therefore prior to the year 1257, as they would not have been able to cope with the Tartarian forces. The Genoese were still in possession of the Crimea, and at the same time of Tana or Azof, in 1474, though the Turks had conquered Constaninople in the year 1453. In 1637, Azof was captured from the Turks by the Kozaks; and in 1642, after being reduced to ashes, it was reconquered by the Turks. On the twenty-eighth of July 1666, it surrendered to the arms of Peter the Great; who in 1711, in consequence of the unfortunate affair at the Pruth, restored it to the Turks at the treaty of Breda; from the Turks it was again captured by the Russians, in 1739; but by the treaty of Belgrade they were obliged to cede it to the foundations. It remained in an abandoned state during thirty years. But in the last war against the Turks, Catharine II. caused it to be re-ceded, and it is now in the belli state of defence. Coins of Azof have been found, bearing on them the name of Khan Taktamysh.

AZOF is situate in the government of Ekatarinoflaf; which, belonging partly to Little Ruffia and partly to the Zaporogian Kozaks, till the year 1752, when it began to be occupied by colonists from all nations, was one continued waste steppe, entirely void of inhabitants, but has since proved a great acquisition to the industry and trade of the country, under the name of New Servia. The ecclesiastical affairs of
the Russians are under the archbishop of Ekaterinoflaf and Chertstonefortaika; and in his absence under his vicar the bishop of Fedofoia and Mariopol. The other religious
communities are governed by their own spiritual prelates.

AZOR, Sinof, called by the ancients Puls Meotis, formerly by the Russians the Patriarh sea, and in some maps Zabolee fea, is a gulf in the Euxine, to which it is joined by a strait. It is situated in the dominions of Russia, Long. 52° to 57° east; Lat. 45° 20' to 47° 20' N. It is about 210 miles in length, and from 40 to 60 in breadth. It has six harbours: Taganrokh, Mariopol, and the little fort of Petrofik close to the shore, Azof, Nahitchevan, and fort St. Dmiitri near the mouth of the Don. Of all these, Taganrokh has the greatest trade in exports; being next to that of Kerch in the Euxine. Azof at present is not by far of so much consequence as it formerly was, Russia having now so many harbours on the Turkish waters, and as that arm of the Don, on which Azof lies, is gradually filling with sand from year to year. The other harbours are for the most part of little significance as to foreign commerce. From Taganrokh, in 1793, were exported bar-
iron, tallow and tallow-candles, butter, wheat, and wheat-
meal, linen, petly, tow and cordage, wax and wax-candles, fish, caviar, leather, marble blocks, teeth, honey, soap, failcloth, sheeps wool, &c. to the amount of 428,087 rub-
bles. It is mostly inhabited by Armenians, who fled hither from the Crimean, in 1780; and at present contains several excellent manufactories of silk, cotton, &c. The amount of the exports from the other ports is not known; probably it is but small. The importation consists in raw and wrought silk and cotton, mulins, Turkish stuffs and car-
pets, wool and angora goats hair, Greek wines, oil, va-
rious kinds of fruit, tobacco and snuff, spiceries, sal-
trum, medicinal drugs, pearls, precious stones, gold and silver, &c. The whole northern coast of the sea of Azof, from the Don to Terek, is laid out in fisheries, to which occupation thefe districts are extremely favourable. They fish with nets that have in the middle a conical bag, in which the fish affible; and one single draught, which ge-
nervally lasts only six hours, yields 60,000 fish; among which, however, are found but few flurgeon, odes, and other large kinds of fish. The salted and smoked mack-
arel, called by the Turks Krumir, are an important article of trade in the Crimea, and are frequently sent from Fedo-
foia and Balakhva to Constantinople, and to all the mar-
itime towns of Natalia and Romelia. These fish are trans-
ported in barrels, and a thousand of them are sold on the
for three and a half or four piastras. Tude's View of
the Russian Empire, iii. 72.

AZOGA SHIPS, in Commerce, are those Spanish ships
commonly called the quicksilver ships, from their carrying quicksilver to the Spanish West Indies, in order to extract
the silver out of the mines in Peru and Mexico. But it is a
great mistake to imagine that these ships are absolutely laden
with quicksilver only; for though sthnicly speaking, they are
to carry no goods unles on the king of Spain's account, they
are usually fully laden, notwithstanding this regulation, by reason that the merchants procure special licences of the
king to load, upon paying a consideration for such licences.

AZONI, derived from the privative α, and ζώον, ζώνη, or

country, in Mythology, a term anciently applied to such of
the gods as were not the peculiar divinities of any particular
country or people, but were acknowledged as gods in every
country, and worshipped by every nation. See God.

These azoni were a degree above the visible and sensible
gods, which were called ζώον, who inhabited some partic-
ular part of the world, and never throve out of the district
or zone that was assigned them. Such in Egypt were Æ-
rups, Ophis, and Bacchus; and in Greece, the Sun, Mars, the
Moon, and Pluto. They were called by the Romans
di comitum.

AZOOPHAGUS, from α, ζώον, animal, and ζώον, I
eat, in Natural History, a term used by authors to express
such infects or animals as feed on herbs, never eating the
flesh of any living creature.

AZOR, or Azon, in Ancient Geography, a town of the
northern part of Palestine, to the south of Dan.

AZORES, in Geography, called also Western Islands, from
their situation, and Terecras from the name of the principal
island, are a group of islands lying in the Atlantic ocean,
the 36° and 40° N. lat. and 25° and 33° W. long. Geographers have frequently chaffed them among the
African islands; but they more properly belong to Europe, as
they are about 13° distant from Cape St. Vincent, in Po-
tugal, and about one degree more remote from the African
more. Besides, their latitude connects them more naturally
with Europe than with Africa, and they were first peopled by
Europeans. They are feven in number, viz. St. Michael,
Sta. Maria, Tercera, Gratiosa, St. George, Pico, and Fayal,
besides the smaller ones of Flores and Corvo, which lie at a
considerable distance to the west; but as they all belong to
the government of Portugal, they are all now included under
the same general appellation. These isles were all discovered
by the Portuguese, but the precise period is a subject of
discourse. According to the account inscribed on his globe
by the celebrated geographer Behaim, or Behem, they were
discovered in 1431; but Murr says, that they were explored
successively from 1432 to 1459. It is certain, however,
that they were first discovered by the Portuguese, before
the year 1459; and they are said to have given them the name
of Azores, from azor, a falcon, on account of the number of
goshawks, which were here remarkably tame, there being
never man nor quadruped to disturb them. In 1466, they
were given by the king of Portugal to his filler the duches
of Burgundy. They were colonized by Flemings and Ger-
mans, among whom was Job de Huerten, the father-in-law
of the geographer Behain, or lord of Makirchen, being
driven by Flemers by war and famine. Huerten after-
wards refided at Fayal, and appears to have had a grant of
the arms from the duches of Burgundy. Although
the subsequent history of these isles is rather obscure, the
Flemish inhabitants seem always to have acknowledged the
king of Portugal. The Azores are discovered at a great
distance from the sea, on account of a high mountain called
the Pico, or Peak (see Pico), of a conical form, resembling
the peak of Tenerife. They are generally mountains,
and exposed to earthquakes and eruptions of volcanos, one
of which occurred July 9th, 1757, when St. George's, Pico,
and Fayal, which form a closer group than the others,
being scarcely five leagues asunder, and Tercera, though at
twice that distance from St. George's, were suddenly disturbed
at the same instant, and shaken to their foundation by terri-
ble convulsions of the earth. The first shock lasted two
minutes. On this occasion the ocean overflowed, many
persons lost their lives, and these isles were covered with
ruins. The consequence of this dreadful convulsion of na-
ture was the production of eighteen little islands, that rose
infernally from beneath the sea, at the distance of about ten
yards from the north coast of St. George's. They disapp-
peared in a few months, as those produced by the volcano
of St. Michael had done before. It was observed, that
Flores, Corvo, St. Michael, and St. Mary's, were not at all
affected by this eruption of St. George's, and that Gratiosa
suffered very little. They are subject also to violent winds,
and the fury of the waves, which are frequently very inju-
rious, by overflowing the low grounds, sweeping off whole
fields.
AZO

fields of grain and folds of cattle, breaking down their fences, and overwhelming their houses. Nevertheless they produce wheat, wine, fruits, and abundance of wood; and they have many quadrupeds both wild and tame. One of the latest accounts we have of these islands is that of Mr. Adamson, who visited them in 1753, on his return from Senegal; but it is to be regretted, that these interesting islands, like all the other Portuguese settlements, are almost unknown.

AZORIUM, or Azorus, in Ancient Geography, a town of Greece, in Pelagonia Tripolitidis, according to Strabo and Livy. It was situated among the Parchianians, at the confluence of two rivers which formed the river Curatus.

AZOT, in Agriculture, a substance which is only distinguishable in its different states of combination with other matters. Its effects on vegetation, when in the state of gas, are probably not yet fully ascertained. According to the observations of Humboldt and Scopoli, some sorts of plants when exposed in it soon droop and die, while others, as licorns, continue to increase and grow in a perfect manner.

Azot, in Chemistry, is one of the most important of the substances hitherto considered as elementary, existing very abundantly in nature, forming the greater part of the atmosphere, the peculiar and almost characteristic ingredient of animal matter, the basis of the nitric acid, and one of the constituents of the volatile alkali.

Pure or uncombined azot is only known in the form of a gas; it is then synonymous with the phlogificated air of Scheele and Priestley, the atmospheric mephist of Lavoisier, and the nitrogen gas of Chaptal and some other French chemists.

It was by experiments on the various substances which alter, corrupt, and deteriorate common air, that the properties of azotic gas became first familiar to chemists. In all these, and in the direct eunomotetical experiments, or such as decompose the air in order to ascertain its purity, it is the oxygen, together with the carbonic acid and other causal ingredients, which is subtracted by the chemical re-agents; whilst the azotic gas alone remains unaltered and unabridged. Hence, chemists had as first no other knowledge of azot than as a residue untouched in chemical operations, and its properties could only be described by negatives, till the important discoveries of the composition of nitric acid, of amonia, and of animal matter, gave a new interest to azot as a chemical element. Azotic gas may be obtained in various methods. In every eunometrical process, as we have just mentioned, the residue is azotic gas of greater or less purity. Thus, if phosphorus be burned in a confined quantity of common air, after the combustion has ceased, the residue is azotic gas in considerable purity, generally however holding some of the phosphorus in solution.

Another method of obtaining this gas, first employed by Scheele, is to moisten a quantity of iron filings and sulphur, inclose them in a glass vessel full of common air inverted over water, and in a few days by the absorption of all the oxygen of the air, the azotic gas will be left pure.

Another, and a very speedy method of procuring this gas in great purity, is by agitating common air in contact with a solution of sulphat of iron faturated with nitrous gas.

These methods, with the precautions to be observed, will be further noticed under the article Eunometria, in which it will be seen that the proportion of azotic gas in the atmosphere is, with little variation, about 73 per cent.

Azotic gas may also be readily procured in large quantities by the decomposition of animal matter by means of nitric acid.

Vol. III.

If very dilute nitric acid be poured on any animal matter, particularly muscular flesh or the coagulum of blood, and a gentle heat be used, azotic gas is given out in great purity. This experiment is one of a series of excellent observations on Animal Matter made by Berthollet, which we have already noticed under that article. The azot in this instance proceeds from the animal matter, and not from the acid.

In the decomposition of Ammonia by the oxynitric acid, and in the reduction of some metallic oxides by this alkali, azotic gas is also given out in great purity.

In a single instance, azotic gas may be said to be necessary, for a very considerable quantity of this air rises up in bubbles through the springs of several of the native hot springs, such as those of Bath and Buxton. The nature of the air thus obtained was first observed by Mr. Priestley.

Azotic gas is absolutely incapable of supporting combustion. When a lighted taper is dipped in a jar of this air, it becomes instantly extinguished without any noise or explosion. It is equally destructive to animal life (whence its derivation, from α, and ζωή, deriving of life); and the fatal effects to an animal immersed in it come on only speedily, that it has been thought by some to pupils a positively noxious power independent of the mere absence of oxygen.

Azotic gas is somewhat lighter than common air. Its specific gravity, when obtained from common air by iron filings and sulphur, is stated by Kirwan to be 0.9421, or in the proportion of 939 : 1000 compared with atmospheric air. Lavoisier makes it only 0.9347, or 1000 common air, as 942.6 : 1000.

With oxygen, azot forms a variety of combinations. That of atmospheric air has already been mentioned. A simple admixture of oxygen with a small proportion of azotic gas produces no particular effect, but when the combination is effected by the electric spark, a true combustion of azot takes place, and the product is the Nitric Acid. This beautiful discovery we owe to Mr. Cavendish.

When azot and hydrogen are mixed together, both in the gasous form, no union appears to take place; but under different circumstances Ammonia is produced.

Azotic gas, when heated with Charcoal, with Sulphur, or with Phosphorus, dissolves a small portion of these simple substances, and holds them in solution for a considerable time.

Very little is known concerning the action of azot in its simple form upon metallic or false substances; and in the state of gas, it appears to be more inactive and unwilling to enter into combination than any other substance in nature.

Azot has not hitherto been decomposed, so that it must be considered as a chemical element. Several attempts, however, have been made for this purpose, but none of them have proved satisfactory. The latest of these, which excited much attention in Germany, was that of Weigleb, a justly eminent chemist, an account of which he published in Crell's Annals for 1796. The chief experiment on which this philosopher grounds his theory of the composition of azot is the following: if an earthen tube of small diameter (the stem of a tobacco-pipe for instance), be heated quite red-hot, and the stem of water be sent through the tube in this state without any obvious connection with the external air, a considerable quantity of a gas is generated, which consists almost entirely of azotic gas, mixed with a small quantity of carbonic acid. Hence, this chemist would infer, that as nothing but water and heat are present, the azotic gas here produced is formed by the union of the vapour of water with caloric at a very high temperature. A second experiment is to pass the vapour of water over the oxyd of manganese.
manganese, enclosed in an earthen tube, and already heated for a considerable time, so as to expel all the oxygen which it will yield; in this case also, there will be a very considerable production of azotic gas. A third experiment is to pass the vapour of water through heated glass tubes, of no more than two lines in diameter, when azotic gas will be equally produced. The inference of the composition of azotic gas derived from these experiments, would be very legitimate, if no cause of error could be detected; but the society of Dutch chemists, who have enriched the science with so many valuable observations, on repeating the experiments, fully explained the reason of this singular phenomenon, in demonstrating the permeability of every kind of earthen-ware not glazed, when exposed to a considerable heat. Therefore, in these experiments, the vapour of water in passing through the tube, is found partly to make its way through its pores into the surrounding coals; and at the same time the air circulating through the furnace, partly enters the tube, and is collected at the further extremity; and, this air being vitiated by the burning fuel, is principally azotic gas, mixed with a certain portion of carbonic acid. This permeability of heated earthen-ware (which had been before observed by Dr. Priestley), should always be kept in mind by chemists; as many of the most important experiments of research are performed by the ingenious apparatus of a heated tube. With regard to the production of azotic gas, when the vapour of water was sent through a red-hot glass tube, it was fully ascertained by the above-mentioned chemists, that no gas of whatever kind appears while the tube remains perfect, but that the least crack or fissure is sufficient to give admittance to the air of the furnace with as much ease as the pores of the earthen tube. As an additional proof that the gas in these instances came from without, we may add, that on removing the fire from the earthen tube, and continuing the transmigration of the aqueous vapour, some gas still continued to be given out whilst it remained red-hot, and this latter portion was atmospheric air, or that which now surrounded the heated tube.

Several other circumstances relating to azotic gas, are connected with the theory of Philogiston, to which we shall further refer the reader. Ann. de Chem. tom. 26 and 29.

AZOT, Gaseous Oxid of. See Nitrous Oxid.

AZOTH, among the Ancient Chemists, signified the first matter of metals; or the mercury of the metal, more particularly that which they call the mercury of the philosophers, which they pretend to draw from all sorts of metallic bodies.

Paracelsus's azoth, which he boasted of as an universal remedy, is pretended to have been a preparation of gold, silver, and mercury; a quantity of this he is said to have always carried with him in the pomell of his sword.

AZOTUS, AZOTH, or ASHIDOD, in Ancient Geography, one of the five Philistine fatrumpies, was a celebrated sea-port of Phoenicia, on the Mediterranean, situate about fourteen or fifteen miles south of Ekron or Accaron, between that and Alcalon, and about thirty miles distant from Gaza, towards Joppa. It fell at first to the lot of Judah, but continued for a considerable time in the hands of its ancient owners. It was in this city that the ark of God triumphed over the idol Dagon, which fell down and was crushed before it (1 Sam. v. 2); and it was to this place that Philip was conveyed, after he had baptized the Ethiopian eunuch. Acts, viii. 40. This place was fortified by the Egyptians as a barrier against the Affyrians; and it was so strong, if we may believe Herodotus, that it sustained a blockade and siege of twenty-nine years, under Pharnamctlhus, king of Egypt, about 631 years before the Christian era. It was again re-established, but taken, and its fortresses and towers burned, by the Maccabees, in the year 137 B.C. Afterwards Gabinius, the Roman president of Syria, ordered it to be rebuilt. In was again captured by Vespasian, in the Jewish war, under the reign of Nero, a.D. 67. The ruins of that once famous city are now called "Ezcod;" it is distinguished, says Volney (Travels in Egypt and Syria, vol. ii. p. 338.), at present by its scorpions, but exhibits no proofs of its ancient importance. Three leagues from Ezcod, is the village of El-Mujdal, where they spin the finest cottons in Palelinne, which, however, are very coarse. This traveller reports, that the whole coast is daily accumulating lands, infomuch, that many places which were known to be abundantly fea-ports, are now 4 or 5p00 acres within land. Imperial Greek medals were struck at Azotus, in honour of Septimius Severus, and of Domitian.

AZPILCUETA, MARTIN, married NAVARRE, in Biography, a Spanish lawyer, esteemed one of the most learned lawyers of his time, was born in 1594, at Verafo near Pamplunna. He was incessively professor of jurisprudence at Toulon, Salamanca, and Coimbra, and consulted by persons from all parts as an oracle of law. When his friend Bartholomew Caranza, archbishop of Toledo, was summoned to Rome by the inquisition, on a charge of herey, Alpilcueta, though eighty years of age, went thither to plead for him; and at this advanced age he retained his faculties in their full vigour. Such was his charity to the poor, that he seldom passed a beggar without giving him alms; and it is said, that the male on which he usually rode would drop of its own accord when he saw a beggar. He died at Rome, in 1596, at the great age of ninety-two years. A collection of his works was printed at Lyons, in 6 volumes fol. in 1597; and at Venice, in 1602. Nouv. Dict. Hist.

AZRAIL, in the Mahometan Theology, the angel of death, whole office it is, according to the Mahometans (who relate many ridiculous stories concerning this angel), to separate the souls of men from their bodies.

AZATL, in Ornithology, a name by which a kind of white heron is known in Mexico.

AZUA DE COMPOSTELLA, or AZUCA, in Geography, a sea-port town on the sea-coast of St. Domingo; twelve leagues S. S. E. of Cape Salinas.

AZUGA, a town of Spain, in the province of Estremadura; three leagues south-east of Llerana.

AZUIS, in Ancient Geography, an ancient town of Africa Propria. Potenamy.

AZUMAR, in Geography, a town of Portugal, in the province of Alentejo.

AZUN, a valley in that part of the department of the Upper Pyrenees, formerly called Bigore, in France, distinguished by the number of its valuable mines, of silver, copper, iron, lead, and tin. Those that are already known amount to no fewer than twenty; but lead chiefly abounds throughout the whole of this mountainous country.

AZURE, the blue colour of the sky. See Blue, Cloud, and Sky.

AZURE, in Heraldry, signifies blue; in heraldic engraving it is expressed by horizontal lines.

AZURE. See Ultramarine.

AZUR, or ULTRAMAR, See Cobalt.

AZUREA, in Entomology, a species of Phryganea, with black wings, violet behind. Linn. The lower wings are obliquely violet. It inhabits the north of Europe.

AZUREA, in Zoology, a species of Lacerta that inhabits Africa, and is distinguished by having the tail verticillated, short, with mucronated scales. Linn. Gmelin speaks of two
two varieties of this creature; one, a native of Africa, is rather larger than the preceding, and is described under the name of *cereus brasiliensis*; the other has a deep chestnut coloured stripe on the shoulders.

The colour of this species in its natural state, Dr. Shaw imagines to be an elegant pale blue, fuscated on the body and tail with several transverse and somewhat alternate bands either of black, or very deep blue. The kind figured in the *Gen. Zool.* of that writer to illustrate the species, appears to be the second variety mentioned by Gmelin, having a dark band on the shoulders. Dr. Shaw observes that the head is rather obtuse; the body moderately thick, and covered as well as the limbs with very small smooth scales; and the tail on the contrary, which is of a moderate length, is very distinctly and strongly verticillated by rows of large carinated scales, the extremities of which project considerably so as to form so many shining points.

AZURENSIS, (or AjuRENSIS, in *Ancient Geography*, an episcopal see of Africa, in Numidia.)

AZUREUS, in *Entomology*, a species of *Carabus*, of an azure colour, with red legs and antennae. Inhabits Leptice. Fabricius.

AZUREUS, a species of *Cineas*, of a middle size; dull green colour; and yellowish mouth and legs. This kind inhabits Guinea. *Obs.* The abdomen is yellowish, with black dots in the middle.

AZURIN, in *Ornithology*, a name assigned by Buffon to the species of *Turdus*, since called specifically *cyanurus* by Gmelin, which see.

AZUROUX, a name given by Buffon to the *emberiza cyanura* of Gmelin. See *Emberiza* *Cerulea*.

AZYGOS, in *Anatomy*, a vein arisid out of the cava, otherwise called *vena cerulea*, because blue, whence its name. See *Veins, Description of*.

AZYMITES, in *Ecclesiastical History*, Christians who communicate in bread not leavened or fermented. See *Azymus*. This appellation is given by Cerularius to those of the Latin church, upon his excommunicating them in the eleventh century. Du-Cange. The Armenians and Maronites also use azymus, or unleavened bread, in their office; on which account some Greeks call them azymites.

AZYMUS, composed of the privative *a* and *zyg*; fermented, something not fermented, or that is made without leaven.

The term azymus is much used in the disputes betwixt those of the Greek and Romish church; the latter of whom contend that the bread in the mass ought to be *azymus, unleavened*, in imitation of the paschal bread of the Jews, and of our Saviour, who instituted the sacrament on the day of the passover; and the former strenuously maintaining the contrary, from tradition and the constant usage of the church. This dispute was not the occasion of the rupture between the Greek and Latin churches; Photius having broken with the popes 200 years before; though it is urged that before the time of Photius, A. D. 867, azymus was used in the Romish church; and that it was more generally used through the West, for which authority of Alcinus, who died in 794, is alleged. St. Thomas, in *4 Sent. diff.* 2. q. 11. art. 3. *quodlibet*. 3. relates, that during the first ages of the church, none but unleavened bread was used in the eucharist, 'till such time as the Ebionites arose, who held that all the observances prescribed by Moses were still in force; upon which both the eastern and western churches took to the use of leavened bread; and, after the extinction of that heresy, the western church returned to the azymus; the easterm perniciously adhering to the former usage.

This account is controverted by father Sirmond, in a dissertation on the subject wherein he shews, that the Latins had constantly communicated in leavened bread, till the tenth century, and cardinal Boia, *Reurum Liturgic.* c. 23. p. 183, greatly disputes what St. Thomas alleges.—In the council of Florence it was decreed, that the point lay at the discretion of the church; and that either leavened or unleavened bread might be used; the western church has preferred the latter.

AZZALUM, in the *Ancient Physiology*, a species of iron, reputed the most excellent of all, supposed to have been brought from India, whence it was called *Indicum*, but in reality, according to some, brought from China. *Phiz.* *Hist. Nat.* lib. xxxiv. c. 14.

AZZO, PORTUS, in *Biography*, an eminent Italian lawyer, who held the professorship of jurisprudence at Bologna, from the year 1192, till his death, which probably happened not long after 1220, and at this time the university was attended by 10,000 students. Such was his affinity as a lecturer, that he said he never was ill but in the vacations. He was the author of a "Summary of the Code and the Institutes," which has passed through several editions. Of this work, Gravina says, (De Orig. Jur. v. i. p. 93.) that it is so ingenious and profound, that although written in a barbarous age, we cannot, with all our present erudition, be safely without it. One of his scholars collected the "Introduction to the Code" of this author, which has been printed; and several of his writings remain in manuscript. *Nuov. Diz.* *Hist.*

AZZOGILIO, in *Geography*, a town of Italy, in the principality of Maffarano; six miles N. N. E. of Maffarano.
B.

B, the second letter of our alphabet, and of most others.

This observation fails in the ancient Irish alphabet, where B is the first, and A the seventeenth; and in the Abyssinian, where A is the third. B is the first consonant, and first mute, and in its pronunciation is supposed to resemble the bleating of a sheep; upon which account Petrus tells us, in his Hieroglyphics, that the Egyptians represented the sound of this letter by the figure of that animal.

It is also one of those letters which the eastern grammarians call labial, because the principal organs employed in its pronunciation are the lips. It has a near affinity with the other labials P and V, and is often used for P, both by the Armenians, and other orientals; as in Betrus for Petrus, aspera for asper, &c.; and by the Romans for V, as in amaba for amicit, bona for bona, &c. whence arose that jelt of Aurelian on the emperor Bonosus, Non ut vivat natus est, sed ut labat. See V.

The final B was also sometimes changed into L in the ancient languages, as Beetschul for Bleetschuh. Dohart (Hieroz. p. ii. l. iv. c. 9. p. 501.) and Grotius (in Matth. x. 25.), have given instances of such changes.

B and C, or the K of the Greeks, are often subtilized for one another. Thus, the Greeks say, Βαββοσευ for Καβσευς; and the Latins Ausa for Ausa. B and D are also used interchangeably, as in Bellum and Duellum. See Quint. de Ort. c. 45.

Plutarch observes that the Macedonians changed Φ into B, and pronounced Βιβος, Βερενος, &c. for Φιλιπ, Φερενος, &c.; and that those of Delphos used B, instead of Π; as Βασιλεως for Πασιλεως, &c. See P.

The Εβλιος change the B into Γ, as Γαφαγον for Βαβαγος. The modern Greeks call the beta, χιτα.

The Latins said Σεφονα, Σεφονα, for Σεθονα, Σελονα, and pronounced optimus, though they wrote olimaius, as Quintilian has observed. They also used B for F or Ph; thus in an ancient inscription mentioned by Gruter, ΟFENBIARO is used for GENEBIARO. See F, &c.

B requires an entire closure and pressure of the lips, and is pronounced by forcing them open with a strong breath. This letter also, if it pass through the nose, becomes an M; as appears by those who have the nostrils stopped by a cold or otherwise, when they endeavour to pronounce the letter M; for instance, many men, is by such a one pronounced many men. See M.

With the ancients, B, as a numeral, is used for 300, as appears by this verse:

"Et B trecentum per se recintare videtur."
pellation to their respective idols; and thus were introduced a variety of deities under the denomination of Baal, called Baalim, or Baal, with some epithets annexed to it, as Baal-Berith, Baal-Gad, Baal-Molech, Baal-Peor, Baal-Zebub, &c. Some have supposed that the founders of Ham first worshipped the sun under the title of Baal (see 2 Kings, xiii. 5, 11.), and that they afterwards ascribed it to the patriarch who was the head of their line; making the sun only an emblem of his influence or power. It is certain, however, that when the custom prevailed of deifying and worshipping those who were in any respect distinguished amongst mankind, the appellation of Baal was not restricted to the sun, but extended to those eminent persons who were deified, and who became objects of worship in different nations. The Phoenicians had several deities of this kind, who were not intended to represent the sun. It is probable that Baal, Belus, or Bel, the great god of the Carthaginians, and also of the Sidonians, Babylonians, and Affyrians, who from the testimony of scripture appears to have been delighted with human sacrifice, was the Moloch of the Ammonites, the Chronus of the Greeks, who was the chief object of adoration in Italy, Crete, Cyprus, and Rhodes, and all other countries where divine honours were paid him, and the Saturn of the Latins. In process of time, many other deities, besides the principal one just mentioned, were distinguished by the title of Baal among the Phoenicians, particularly those of Tyre, and of course among the Carthaginians, and other nations. Such were Jupiter, Mars, Bacchus, and Apollo or the sun.

The term Baal, as we have already observed, denoted God or Lord among the orientals; and the Zeus of the Greeks had the same meaning. Servius (in Aen. i.), who is followed by Vossius (Theol. Gent. I. ii. c. 4.), observes, that Baal in the Punic tongue had two significations, either denoting Saturn, or being equivalent to the Latin deus or god. Accordingly, if Baal and Zeus, or J. piter, be words of the same import in different languages, we may apply to the former what Varro, cited by Tertullian, says of the latter, that the number of those deities who pleased under this denomination amounted to 300. Some, however, are of opinion, that there were originally only two gods of the Phoenicians, and consequently of the Carthaginians; and that all the other deities were comprehended under two; viz. Baal and Astartaroth, or Belus and Astarte. See Selden, de Deis Syr. Synt. 2. c. 2. p. 145; Shackford’s Connect. b. v.

The temples and altars of Baal were generally placed on eminences; they were places inclosed with walls, wherein was maintained a perpetual fire; and some of them had statues or images, called in scripture “Chamam.” Maundrell, in his journey from Aleppo to Jerusalem, observed some remains of these monuments in Syria. Baal had his prophets and his priests in great numbers; accordingly we read of 450 of them that were fed at the table of Jeroboam only; and they conducted the worship of this deity, by offering sacrifices, by dancing round his altar with violent gestures, exclamations, and lamentations, by cutting their bodies with knives and lancets, and by raving and pretending to prophesy, as if they were possessed of some invisible power. Several of these practices, and particularly that of cutting the body, were, according to Mede (vol. ii. p. 776.), funeral rites, as appears from Lev. xxi. 5. xix. 28. Deut. xiv. 1. Jerem. xviii. 37. xvi. 6.; and they were retained, says this learned author, in the funeral worship of those who were deified after their death. Hence, and from other circumstances, he infers, that Baal was a demon-god. See BAALEH, DEMON, and IDOLATRY.

BAALBEK, in Geography. See BAALBEK.

BAAL-BERITH, in Ancient Mythology, derived from baal, sovereign, and berith, covenant; a deity acknowledged under this title by the Carthaginians and Phoenicians in their alliances.

Jupiter was worshipped by these people under the denomination of Belus or Baal; to him they addressed their oaths, and they placed him at the head of their treaties. Hence some have not scrupled to affirm, that he was the Baal-Berith of the Phoenicians (see Banier, in Mythol. vol. i.); but Cumberland (see Sanchonatho’s Phcen. Hist. p. 152.) supposes that Baal-Berith was Cronus, or Ham, worshipped anciently at Berytos. See Judg. viii. 33. ix. 4. According to Bryant (Anal. Anc. Mythol. vol. ii. p. 355.), the Baal-Berith of the Canaanites was no other than the Arkite god; with whose idolatry the Israelites in general were instructed, soon after they were settled in the land of Canaan. (See Berytos.) The Greeks, however, had their Zeus, or Jupiter, the withe sand arbiter of oaths; and the Latins their Deus Julius, or Jupiter Pius, whom they regarded as the god of honesty and integrity, and who professed to treatises and alliances.

BAAL-GAD, BAAL-GAD, or BAGAD, an idol of the Syrians, whose whole name was composed of baal, lord, and gad, chance or fortune; the god of chance or fortune. After the god of thunder, the god of fortune was one of the first worshipped by mankind. See Phil. Trans. vol. Iv. N. 2. art. 1766.

BAAL-GAD, in Ancient Geography, a city of Palatine, at the foot of mount Hermon, so called from the deity Baal-Gad, who was worshipped in this place. Jos. xi. 17.

BAAL-HAMMON. See BALAT.

BAAL Hazor, a city of Ephraim, where Abimael kept his becaaks; 2 Sam. xii. 23.

BAAL-HARMON, a town of Palatine, generally placed north of the tribe of Issachar. 1 Chron. v. 23.

The temple of Baal-Harmon in mount Libanus (judges, iii. 13.), was probably founded, says Bryant (Anal. Anc. Mythol. vol. ii. p. 163.), by the Cadmians, who formed one of the Hivite nations in those parts.

BAALIM, in Ancient Mythology, inferior deities among the Phoenicians.

The learned Joseph Mede (vol. ii. p. 776.) having suggested that Baal, or in the Chaldee dialect Bal, was the first king of Babel after Nimrod, and the first that was deified and reputed a god after his death, apprehends that this gave occasion for denominating all other deities Baalim. The Baal, he conceives, were the deified souls of the dead. Bryant also (vol. ii. p. 529.) is of opinion that the most early deification to idolatry consisted in the worship of the funerary image of the dead, and that of dnemons, called Baalim. See DEMON.

BAAL-MON, in Ancient Geography, a city of Canaan, in the tribe of Reuben, taken by the Moabites, and possessed by them in the time of Ezekiel. Num. xxxii. 38. 1 Chron. v. 8. Ezek. xxv. 6. Luke and Jeremiah place it nine miles from Ebus or Ecbon, at the foot of mount Baara or Abrim.

BAAL-POR, or BAAL-PHAGOR, in Mythology, an idol deity of the Moabites and Midianites, supposed by some to have been Priapus, whose worship was conducted with great impurity; by others to have been Adonis; and by others to have been Saturn, adorned under this appellation in Arabia. The learned Mede, supposing Peor to be the name of a mountain in Moshe, upon which a temple of Baal was erected, concludes that Baal-Por was only another name of Baal, derived from the situation of his temple; and to add no more, Selden (De Dios Syrius, Syntag. i. c. 5.) supposes that Baal-Por is Pluto, founding his conjecture on Pf. xvi. 28. where it is said, "They joined themselves unto Baal-Por, and ate the offerings of the dead." The sacrifices to which their words refer, says this author, were offered
offered to appease the names of the dead. But these sacrifices or offerings of the dead may mean no more than the sacrifices or offerings made to idols, or false gods, who are properly called "the dead," in contradistinction to the true God, called in scripture "the living God."

BAAL-PERAZIM, in Ancient Geography, a place of Palestine, in the valley of Rephaim, not far from Jerusalem, where David put to flight the Philistines. 2 Sam. v. 20.

BAAL-SAMIM, or BAAL-SHAMAIM, according to the Hebrew mode of expression, q. d. the Lord of heaven, in Mythology, a deity of the Phoenicians, which was probably the fun, to whom they and the Carthaginians paid divine honours, addressing him with their arms extended. Belifima, or the queen of heaven, was the moon.

BAAL-TAMAR, in Ancient Geography, a place of Judæa, in the tribe of Benjamin, situate, according to Eusebius, near Gibeah, where the children of Israel engaged the tribe of Benjamin. Judg. xx. 33.

BAALTIS, in Mythology, a goddess among the Phœnicians, chiefly worshipped at Byblos; supposed by some to have been the same with the Diana of the Greeks.

BAAL-ZEBUB. See BEELZEBUB.

BAAL-ZEPHON, or BAAL-TSHEPHON, q. d. the god or idol of the north, in Mythology, a deity of the ancient Egyptians, so called, according to Dr. Shaw, (Trav. p. 353.) in contradistinction, perhaps, to others of the Lower Thebais, whose places of worship were to the south or east. But if Tzephon be derived from Tzéph, to fly out, or observe, then Baal-tzephon will probably signify the "god of the watch-tower," or "the guardian god," such as the Hermes or Terminus of the Romans, the Ekepeor of the Greeks, &c. At the temple of this deity, according to the Jerusalem Targum, Pharaoh, when he was purifying the Israelites in their exodus, offered sacrifice, wainting till the next day for an attack upon Israel, whom he believed his god had delivered into his hands; but, in the mean time, they passed the Red sea, and escaped.

BAAL-ZEPHON, in Ancient Geography, a place thought by some to be a city, opposite to Pihaaliroth, where the Israelites encamped before they passed the Red sea. It was distinguished either by its northern situation, NNE, signifying the north, in Exod. xxvi. 20. Joh. viii. 11. and in other places of scripture; or by some watch-tower or idol temple that was erected upon it. Dr. Shaw supposes, that this place was at the extreme of the mountains of Suez, or Attackah, the most conspicuous of these defects; inasmuch as it overlooks a great part of the lower Thebais, as well as the wilderness that reaches towards, or which rather makes a part of, the land of the Philistines. Accordingly Migdol might lie to the south, and Baal-tzephon to the north of Pihaaliroth. For the march of the Israelites from the edge of the wilderness being towards the sea, or the south-east, their encampment between Migdol and the sea, or before Migdol, could not well have any other situation. See Exod. xiv. 2. xix. 2. Numb. xxxiii. 7. Eusebius reports, from ancient traditions, that the Israelites passed at Clyfma, the Koloum of the Arabs, both of the terms signifying destruction, which was a very expressive appellation, if it was deduced from the destruc tion of the Egyptian army. The situation of Koloum, it has been said, is near Suez; and hence it has been thought, that Baal-tzephon was at Suez, though Pococke, Shaw, and Bruce, place it farther to the south. In support of this opinion it has been further alleged, that the appellation Baal-tzephon, the god of the north, implies, that the temple of this deity stood either on the northern extremity of the Red sea itself, or on the northern extremity of the gullet called Pihaaliroth. "Baal-tzephon," says Bruce (Travels, vol. i. p. 233.) "was probably some idol's temple, which served for a signal-house upon the cape which forms the north-entrance of the bay, opposite to Jabel Attakalah, where there is still a mosque, or faint's tomb. It was probably a light-house, for the direction of ships going to the bottom of the gulf, to prevent mistaking it for another foul bay, under the high land, where is also a tomb of a saint, called Aboun Derage." See PIHAALIROTH.

BAAL'S RIVER, and BAY, in Geography, lie in Wilt Greenland, between Bear Sound on the south-east, and Delft's Point on the north-west, and opposite to the mouth of Hudson's Strait.

BAAN, John de, in Biography, an eminent portrait-painter, was born at Haarlem, in 1653, and after receiving instructions in the art of painting from his uncle Piamons, pursued his studies with singular facility under Bakker, at Amsterdam. Having determined to form himself upon the model of Van Dyck, his merit was soon universally known; and he was invited by Charles I. to London, where he painted the portraits of the king, queen, and chief nobility at court, and was much admired for the elegance of his attitudes, and also for his clean, natural, and lively tone of colouring. After his return to the Hague, he painted a noble portrait of the duke of Zell, for which he received a sum amounting nearly to 500l. The best of de Baan's performances is the portrait of prince Maurice of Nassau, in the execution of which he exerted the utmost efforts of his pencil. He died in 1702, Pilkington.

BAAN, Jacob de, the son of the former, was born at the Hague in 1673, and having acquired eminence as a painter under the instruction and by the example of his father, he came over to England about the age of twenty, among the attendants of William III., where he was favourably received. From England, where he gained by his performances in portrait-painting distinguished reputation, he travelled through Tuscany to Rome, and he there devoted himself to the prosecution of his studies. However, though he gained a considerable sum of money by painting several portraits and conversations, during his residence at Rome, he squandered it away by various modes of profusion and expense. His premature death, at the age of twenty-seven, A.D. 1700, and the previous intermission of his affluence, prevented his arriving at that excellence of which his talents were capable. Pilkington.

BAANITES, in Ecclesiastical History, the followers of Baanes, who adopted and disseminated the Manichæan notions in the ninth century, about the year 810.

BAAR, in Geography, a land-gravitate of Germany, in the circle of Swabia, belonging to Furrenberg, situate to the east of Bridgen. The source of the Danube is in this territory.

BAARAS, BAHARAS, or BACHARAS, in Boian, an extraordinary kind of root, said to grow on mount Lebanon, in a valley called Baarar, whence the name, near the city Macheron. By the account which Josephus gives of it, it seems to be a sort of vegetable phosphorus, for he represents it as of a flame colour, emitting rays of light in the night, and disappearing by day.

BAARIOU, in Geography, a river of Asia, in Kamtschatka, which runs in a valley between two mountains.

BAAT, in the language of the Siamefs, anwering to the English in that of the Chineses, denotes a weight and coin current in those kingdoms. It weighs about half an ounce.

BABA, in Biography, a Turcoman impostor, and pretender to prophecy, who appeared among the Mahometans, in the city of Amaia in Nodaria, in the year of the Hegira 638, A.D. 1240, and who seduced a great multitude of followers. One of his disciples, named Isaac, published his commission, and gained a number of adherents. Baba and Isaac concurred in commencing acts of hostility against all
all who would not adopt their profession of faith, viz. 

"There is but one God, and Baba is his apostle;" and they put several Mahometans and Christians, who refused them, to death. At length, the Mahometans and Christians uniting together, raised an army, which entirely routed their followers, destroyed many of them, and took their two chiefs captives, who were afterwards beheaded; and thus their fece was totally annihilated. Herbelot. Bib. Orient. Sale's Koran. Introd. p. 187.

BABA, in Geography, a territory in the jurisdiction of Guayaquil, in South America, extending to the shores of the Cordilleras, or the mountains of Anga Marca, belonging to the jurisdiction of Latacunga. Besides the principal town of the same name, at some distance from a river of the same appellation, there are two other places called San Lorenzo and Palenque, far from the capital, and near the Cordilleras, whose inhabitants are little civilized. The exac-trees, which abound in this district, produce fruit twice in the year.

BABA, or Temisfar, a town of European Turkey, in Bulgaria, 63 miles east of Silihtia.

BABA, Cape, a cape of Natolia, in Asia Minor, between the islands of Tenedos and Lesbos, and near the gulf of Adramytti, on the coast of the Archipelago. N. lat. 39° 33'; E. long. 26° 22'. It was formerly the promontory Lade. A small town of the same name, situated to the east of the cape, on a floating ground, has a small harbour for boats; and is famous in Turkey for the knife and sword blades which are manufactured there for the use of the orientals. It is peopled by Turks and Greeks; the adjacent soil is tolerably good, and furnishes the same productions as that of Traos. Olivier's Trav. vol. ii. p. 66.

BABA, in Ornithology, the Ruffian name of the PELICAN.

BABA CHOKA, in Geography, one of the Bilfagos islands.

BABAHOYO, a territory and town of the jurisdiction of Guayaquil, in South America. The town is the seat of the grand custom-house, where account is taken of the various commodities that are conveyed to or from the Cordilleras and adjacent countries. Besides the principal town, this district contains Ubja, Caracol, Quezna, and Mangaches, the two last border on the Cordilleras, and are at a considerable distance from Ubja, where therief refises during winter, and whence he removes to Babahoyo in the summer. The capital, besides its settled inhabitants, has always a great number of traders from other ports. This country, being level and low, is overflowed by the swellings of the rivers Caluma, Ubja, and Caracol; so that at Babahoyo the water rises to the fifth story of the houses; and during winter it is entirely deflected. In this district cacao are abundant. It also produces cotton, rice, Guinea pepper, and a great variety of fruits. It has likewise large droves of black cattle, horses, and mules, which, in winter, are kept in the mountains, and in summer are removed to the low lands to feed on the ganamole, a plant so luxuriant as to cover the ground, and rising to the height of two and a half yards.

BABAIN, a town of Peru, in the province of Kerman, ninety miles south-east of Qerchan.

BABAIN, a village or burgh of Egypt, built on the ruins of an ancient town, about six miles west of ACHMOUNT.

BABAHABA, one of the richest countries of Abyssinia, about twelve miles from the river Bah, and near the lake Tzana. This on the south, and Woggora on the north, are the two granaries that supply the rest of the kingdom. It contains a number of small villages; in which the queen and many of her relations have their houses and possessions. These villages are all surrounded with Kolquill trees, as large in the trunk as those of the province of Tygr, but

BABBI, GREGORIO, in Biography, a tenor singer in the Italian opera, with the sweetest, most flexible, and most powerful voice of its kind, that his country could boast at the time. He flowered from 1720 to 1740; never was in England; but we have seen the principal songs that were composed for him, and converted with many good judges that heard him sing them, and have no doubt but that he was a dignified, splendid, and powerful performer.

BABBIN, in Geography, a town of Pomerania, in the island of Rugen, twelve miles north of Bergen.

BABBIN, MATTEO, in Biography, fo named from being the scholar or imitator of Babbi, arrived in England in 1786, at the same time as Rubini. He had a tenor voice that was sweet, though not powerful, had an elegant and pleasing style of singing; but it was easy to imagine that his voice had been better; and not difficult to discover, though his taste was modern, and many of his ritornelli refined and judicious, that his graces were sometimes redundant, and his manner affectitious. His importance was very much diminished, when he sung with the Nara; and after the arrival of Rubini, he sunk into insignificance.

BABBLING, among Hunters, is when the hounds are too busy after they have found a good scent.

BABEL, WILLIAM, in Biography, organist of all-hallows, Bread-freet, seems to have been the first in this country at hail, who thinned, simplified, and divested the mimic of keyed-instruments of the crowded and complicated harmony, with which, from the convenience of the clavier, and passion for full and elaborate music, it had been embar- rassed from its earliest cultivation. This author acquired great celebrity by wire-drawing the favourite songs of the opera of Rinaldo, and others of the same period, into showy and brilliant lesons, which, by mere rapidity of finger in playing single sounds, without the assistance of talf, expression, harmony, or modulation, enabled the performer to allain ignorance, and acquire the reputation of a great player, at a small expense. There is no instrument so favourable to such frothy and unmeaning music as the harp-chord. Arpeggios, which lie under the fingers, and running up and down the fiddles of easy keys with velocity, are not difficult, on an instrument of which neither the tone nor timing depends on the player; as neither his breath nor bow-hand is requisite to give existence or sweetness to its sounds. And Mr. Bachel, by avoiding its chief difficulties of full harmony, and difficult motion of the parts, at once grati- fied idleness and vanity. We remember well, in the early part of our life, being duped to the glare and glitter of this kind of tinsel; this poussiere que les yeux, which Mr. Felton continued, and other dealers in notes, et rien que des notes, till Joze, the figner, by his neat and elegant manner of execut- ing the brilliant, graceful, and pleasing lesons of Alberti, rendered them the objects of imitation. At length, on the arrival of the late Mr. Bach, and construction of pianofortes in this country, the performers on keyed-instruments were obliged wholly to change their ground; and instead of surpring by the seeming labour and dexterity of execution, had the real and more useful difficulties of talf, expression, and light and shade, to encounter. Bachel, who was one of his Majesty George the First's private music, died about the year 1722.

The materials of which this tower was constructed were, as the scripture informs us (Gen. xi. 3.), burnt bricks instead of stone, and slime instead of water. According to an earlier tradition, three years were employed in making and burning these bricks, and each of them was 13 cubits long, 10 broad, and 5 thick. The slime was of a pitchy sublimance, or bitumen, brought from a city in the neighborhood of Babylon, called Is or Hit. Oriental writers, on whose report we can repose little confidence, pretend that the city was 513 fathoms in length, and 151 in breadth; that the walls were 5333 fathoms high, and 33 broad; and that the tower itself was no less than 10,000 fathoms or 12 miles high. St. Jerome affirms, from the testimony of eye-witnesses, who, as he says, had examined the remains of the tower, that it was four miles high. But it is needful to account for these fables. See BABYLON.

BABEL-MANDEB, sometimes called BABEL-MANDER, in Geography, a narrow strait at the entrance into the Red Sea, which connects it with the Indian ocean, lying between the south-western coast of Yemen or Arabia Felix, and the coast of Aden in Africa, and formed by the projecting land of Arabia on the east, and that of Abyssinia on the west. N. lat. 12° 52'. E. long. 43° 56'. The whole breadth of this strait is about 30 geographical miles; and within it, about a league from the coast of Yemen, is the small barren island of Perim, sometimes called Babel-mandel, which has a good port, but is without fresh water. This island is called by Arrian the isle of Didoorus. Near the African coast are several small islands, and on the continent is the town of Zeila, which is subject to the Imam of Yemen. Vessels that navigate this strait most commonly pass between the isle of Perim and Arabia, though the passage is narrow, on account of the number of small islands on the African coast. The currents are strong, and the swell high, so that it is difficult to pass without a fair wind; hence this navigation has been dreaded by the unskilful mariners of the adjoining countries. In ancient times the navigation of the Arabian gulf, which is even now flow and difficult, was considered by nations around it to be so extremely perilous, that it led them to give such names to several of its promontories, bays, and harbours, as convey a striking idea of the impiety which the dread of this danger had made upon their imagination. Accordingly, the entry into the gulf, they called Babel-mandeb, which signifies the gate or port of
of destruction; to a harbour not far distant, they gave the name of Meta, or death; and an adjacent headland they called Gardesfan, or the cape of burial. Near this strait Ptolemy places a town, which he calls, in the Greek, Mandaia, probably a corruption of Mandiai; and the promontory on the south side of the strait, and the city upon it, is Diræa, which means the Hades, or Hell, by Ptolemy called Agor. A cluster of islands met with in the canal, after passing Mochia, is called Jibbel Zekir, or the islands of prayer for the remembrance of the dead. And in the same course up the gulf, others are called Schaffa Gizer, praise or glory to God, as we may suppose, for the return from this dangerous navigation. Niebuhr and Bruce.

In the "Periplus of the Erythraean sea," by Dr. Vincent, the flats of Babel-mandeb are contracted to 23 miles, and divided into two channels, by the intervention of Paren and other isles; and they open in an easterly direction to Cama or Cape Partaouque on the Arabian side, and to Aramata or Gardesfan on the coast of Africa; which two promontories form the proper entrance to the flats from the Indian ocean, and are about 350 geographical miles asunder.

BABENHAUSEN, a town of Germany in the circle of Swabia, to which belongs a branch of the counts of Fugger, seated on the Gunz; 26 miles W. S. W. of Augsburg, and 16 S. E. of Ulm. N. lat. 48° 11'. E. long. 9° 16'.

BABENSKOJ, a town of Roufis, in the government of Archangel, 90 miles S. W. of Kola.

BABIA, a river of Ruffian Lapland, which runs into the White sea, fix miles south of Pillitza.

BABIA, in Mythology, a goddeff of Syria, worshipped particularly at Damas. She was supposed to be the goddeff of youth, and to have been their Venus, who presided over love and marriage. Selden, de Diis Syris, Syntag. 11. c. 4.

BABIBA, in Ancient Geography, a town of Africa, in Libya interior, on the Western coast, between the rivers Aradus and Stachir.

BABICA, in Geography, a town of Poland, in the Palatinate of Minkel, eight miles east of Mozyr.

BABIN, Francis, in Biography, a theologian and canonist of France, was born at Angers in 1651, and elected professor of divinity, in the university of his native city. Here he read lectures to numerous classes for 20 years. In 1706, he was appointed by the bishop of Angers one of his grand vicars, and employed to collect and regulate the minutes of the conferences of the diocese. This work was published in 18 volumes 12mo, and is much esteemed for its method and style. In 1697, Babin published in 4to. a work, intitled, "A Narrative of what passed in the university of Angers, on the Subjeet of Janenfim and Cartefianism." Louis XIV. allowed him a pension of 2000 livres, and appointed him to several lucrative and honourable offices, from which he enjoyed till his death in 1734, at the age of 83. He retained his faculties to the last, and was often consulted on ecclesiastical questions and cases of conscience. Nouv. Dict. Hill.

Babin, in Geography, a town of Poland, in the palatinate of Lublin; eight miles south-west of Lublin. - Alfo, a town of Poland, in the palatinate of Braslaw; twenty-eight miles north-east of Braslaw. - Also, a town of Poland, in the palatinate of Beliez, thirty-six miles east of Beliez.

BABBINGTON, Greville, in Biography, an English bishop, was born about the middle of the sixteenth century, in Nottinghamshire, as some say, but according to others, in Devonshire, and educated in Trinity college, Cambridge. When he was domestic chaplain to Henry earl of Pembroke, Vol. III. prefident of the council in the marches of Wales, he is said to have offered lady Mary Sidney, the countess of Pembroke, in her English metreal version of the Psalms of David. By the interest of his patron, he was appointed treasurer of the church of Landaff, and in 1551 became bishop of that see, from which he was translated 1609 to Exeter, and afterwards to Worcester, where he resigned for thirty years, till the time of his death in 1610. Notwithstanding his liberality in repairing the cathedral of the diocese, and bequeathing to it his library, no monument was erected on his grave. For leanting and piety, and a pathetic and popular preacher, Dr. Babbington has been highly extolled. He was not humble and diligent, and with the exception of having alienated from the bishopric of Exeter the rich manor of Credton in Devonshire, he has been deemed unobnoxious to the charge of avarice. His works, published in 1615 and 1637, contain "Comfortable Notes on the Pentateuch," an "Exposition of the Creed, Commandments, and Lord's Prayer," a "Conference between Man thia Justice and Faith," and three sermons. They are written in the quaint style of the times, and are distinguished by their piety more than by their literary merit. Bot. Brit.

BABINOVITCHI, in Geography, a district of the government of Moldavia in Russia, on the river Lutsholla, falling into the Duna. N. lat. 54° 52'. E. long. 50° 14'.

BABIROSIA, BARBIROSSA, and BARDIROSSE. See BABEOSA.

BABITZ, in Geography, a town of Babemia, in the circle of Czadau; five miles W. N. W. of Teutich Brod.

BABOEUF, a town of France, in the department of the Oise, and chief place of a canton in the district of Noyon; two miles E. N. E. of Noyon.

BABOLZA, a town of Lower Hungary, in Scavonia, between Pofleg and Zliget, towards the Danube; supposed by some to have been the ancient Manujectunum, or Port Manuentum.

BADOON, in Zoology, the name of that tribe of Apes (Simia Linn.) which have short tails;—cauda abbreviata: papiones uncus 24-24 zetarium, Cmel. Linn. Syft. Nat.; and comprehending the species nemellina, apedia, Iphinix, moron, mimon, and porcarias. The baboons of Dr. Shaw are such of the Simia genus as have very muscular bodies, and whose tails are commonly short. Biboone in the English language has the same application as baboein in the French, and of which many accounts have been given by Buffon, Sonnini, and others. Verne observes, that the baboeis are a ferocious and very lascivious kind of ape, found in many parts of the old world, and especially in Africa. Their muzzles, he remarks, is a little lengthened in the same manner as that of a dog, and on that account they have sometimes been called finger cyanecephali, and also magoia. They live on fruits, seeds, roots, leaves, insects, &c. like the other kinds of apes; and are observed to be a mischievous and thievish race. In a state of captivity they are altogether untameable, are fond of wine and spirituous liquors; and the females, it is asserted, have an antipathy to the fair sex, as the males have against men. See Simia.

BABOPAS, in Geography, a town in the interior part of New Albion, east of the long range of mountains which extend northward from the head of the peninsula of California. N. lat. 37° 45'. W. long. 114° 25'.

BABORA, in Geography, the palatinate of Lemberg; twelve miles south of Lemberg.

BABOUARD, in Ornithology, the name given by Buffon to the Senegal variety of Accola Ipidea (6 Gmelin), or common king-fisher; and which Britton calls Ipidea Senegalefsa.
BAB

BABOUIN A MUSÉE DE CHIEN, in Soummi (edit. Buffon), in Zasloggy, the Sitha hamadryas, Linn.; and dog-faced ape, Penn. Sec Simia Hamadryas.

BABRA, in Geography, a town of North America, in the country of New Navarre; 205 miles south of Cafa Grand.

BABUCO, a small town of Italy, in the Campagna of Rome.

BABUL, a town of the East Indies, in an island of the river Indus, supposed by some to be Cambaya, and by others Patan, stretching out towards the islands Formosa and Lequios.

BABUYANES, a cluster of six or seven small islands, about nineteen leagues north of the isle of Luzon, in the Pacific ocean; one of them contains about 500 inhabitants; and the chief produce is wax, ebony, bananas, coconuts, and plantains.

BABUYEA, a town of North America, in the province of Cullinca; 65 miles north-east of Culliaca.

BABYLAS, in Biography, a celebrated martyr of the Christian church, was chosen bishop of the see of Antioch, A. D. 328, under the emperor Gordian; and after govern-
ing this church for thirteen years, he either died in prison, or was put to death, in the persecution of Decius. Chry-
folonius applauds his courage for refusing admission into the church to an emperor who had killed the son of a king, whom he had received as an hostage; and this emperor is
supposed to have been Philip, who put his colleague, the young Gordian, to death. This is said to have been the
came of the bishop's death. But there are several circum-
stances that invalidate the truth of this story. However
this be, the remains of Babylas were transported about
one hundred years after his death, by order of the Cesar
Gallus, into the midst of the grove of Daphne, where was
a temple of Apollo; a magnificent church was erected over
them; a portion of the sacred lands was appropriated to
the maintenance of the clergy, and the burial of the Christian
at Antioch; and the heathen oracle was silenced, as it was
supposed, by the presence of the saint's dust, but more pro-
bably, as Van Dale fuggels (De Oraculis, p. 392.), by an
apprehension of the priestl, that the Christians, who daily
visited the tomb of the martyr, would detect their impure-
ness. Julian soon after demolished this church; and the Christians removed the relics of St. Babylas, with acclama-
tions of triumph, to their former habitation within the
walls of Antioch. On this occasion, Julian exerted his
pride to dissemble his repentment; but during the night which
terminated this proceeding, the temple of Daphne was in
flames, the statue of Apollo was consumed, and the walls of
the edifice were left a naked and awful monument of
ruin. The Christians of Antioch confidently asserted, that
the powerful intercession of St. Babylas had pointed the
lightnings of heaven against the devoted roof. Julian,
however, could disfringe and restrain his indignation no
longer. Imputing the fire of Daphne to the revenge of the
Christians, whom he oppressively denominated Galileans,
his ordered the doors of the cathedral at Antioch to be shut,
and its wealth to be confiscated. For the purpose of disco-
vering the criminals, several ecclesiastics were tortured, and
a prebendary of the name of Theodoret was beheaded. Eu-
vol. iv. p. 1121. Sec.

BABYLON, in Ancient Geography, the capital of the ancient Babylon, or Chaldæa, supposed to have been situated in N. lat. 33°, E. long. 42° 40' 20"; or according to the observations of M. Beuchamp (Mem. Ac. Sc. Paris, 1787), N. lat. 32° 34', and E. long. 44° 12' 30". This an-
cient city, reckoned for many ages one of the wonders of
the world, was situated on the Euphrates; and its ruins, of
which few vestiges now remain, are placed by geographical
writers at a town called Hilla, or Elugos, about fifteen
leagues to the south-west of Bagdad. It was seated on a
plain, and surrounded by water; and hence appears the
propriety of the scripture expreffion (Isa. xxii. 1.) "the bur-
den of the desert of the sea," or rather "of the plain of
the sea;" and besides, the places about Babylon, as Aby-
I. ix. c. 41. p. 427.) are said from the beginning to have
been overwhelmed with waters, and to have been called "the
sea." Nevertheless, it is no less properly denominated "a
mountain" (Jer. li. 25.) on account of the great height of
its walls and towers, its palaces and temples; and accord-
ingly Berothus cited by Jophesus (ubi infra), says of some
of the buildings, that they resembled mountains. It was
founded, as some say, by Semiramis, and according to others,
by Belus, who is thought by many to be the same with
Nimrod. But whoever was the first founder of it, it was
in process of time much improved; and Nebuchadnezzar,
in particular, repaired, enlarged, and beautified it to such
a degree, that he may be said to have built it, according
to his own vanglorious boast (Dan. iv. 30.) "Is not this
great Babylon, that I have built for the house of the king-
dom, by the might of my power, and for the honour of my
majesty?" Nor is this asserted only in scripture, but it is
likewise attested by heathen authors, Megalithenes, Berothus,
and Abydenus, whose words are quoted by Jophesus (Ant-
tiq. l. x. 11. § 5. t. i. p. 526. ed. Haverc.) and Eudefius
means or other Babylon became a city so great and famous,
that it gave name to a very large empire; and it is dem-
nenated by a variety of jult and appropriate terms in
scripture, such as "great Babylon" (Dan. iv. 40.); "the
glory of kingdoms," and "the beauty of the Chaldees
excellency" (II. xiii. 10.); "the golden city" (II. xiv. 4.);
"the lady of kingdoms" (II. xlvii. 5.); "abundant in
treasures" (Jer. li. 13.); and "the pride of the whole
country" (Jer. li. 41.)

The most famous works in and about this ancient city,
as they are enumerated and described by Prideaux from an-
cient authors, were the walls, the temple of Belus, the pal-
lace of Nebuchadnezzar, the hanging gardens, the banks of
the river, the artificial lake, and the canals.

This city was surrounded with walls, which, according
to the account of Herodotus (ll.), the most ancient author
who mentions them, and who himself had been at Babylon,
were 87 feet thick, 350 feet high, and in compass 480 furlongs,
or 60 miles. Other writers, who differ from Herodotus in
some particulars, give nearly the same account of the dimensions
of the walls. Diodorus Siculus indeed (ll. ii.) has very con-
diderably diminished the circumference of these walls, and
some what reduced their height as stated by Herodotus, but he has
enlarged their breadth by saying that six chariots might
drive upon them abreast; whereas the former observes, that
one chariot only might turn upon them; but then he places
buildings on each side of the top of these walls, which, ac-
cording to him, were only one story high; and thus these
two writers may be tolerably reconciled. As for those
who assign fifty cubits as the height of these walls, which, repre-
sent them as they were after the time of Darius Hystaspes,
who had caused them to be beaten down to that level. See
l. i. c. 18.

These walls formed an exact square, each side of which
was
was 170 furlongs, or 15 miles long, built of large bricks cemented together with bitumen, a glutinous slime which issues out of the earth in that country, and in a short time becomes harder than the brick or stone cemented by it. Without the walls, the city was encompassed by a large ditch filled with water, and lined on both sides with bricks made of earth dug out of the site of the ditch, whose dimensions are indicated by those of the walls. In the compass of the walls there were 100 gates, or 25 in each of the four sides, all of which were formed of solid bricks, referred to by the prophet Isaiah, ch. xlv. 2. Between every two of these gates were three towers, and four more at the four angles of this large square, and three between each angle and the next gate on either side; and each of these towers was ten feet higher than the walls. This, however, is to be understood merely of those parts of the walls where towers were necessary for defence; for as some parts were seated on a morass, and consequently inaccessible by an enemy, there the labour and expense were spared; and therefore the whole number of these towers amounted to no more than 250. From the 25 gates on each side of this square proceeded 25 streets, extending in straight lines to the corresponding gates in the opposite sides, so that the number of the streets was 50, each of them being about 15 miles long, and all croosing one another respectively at right angles. Besides these there were also four half streets, which were rows of houses, facing the four inner sides of the walls. These latter were properly the four sides of the city within the walls, and each of them was 200 feet broad; the whole streets being about 150 feet in breadth. By this interjection of the 50 streets, the city was divided into 676 squares, each of which was a furlong and a half on each side, or two miles and a quarter in compass. Round these squares on every side toward the streets flow the houses, all of three or four stories in height, and beautified with every kind of ornaments; and the space within each of the squares was vacant, and occupied only by court-yards or gardens, adapted to convenience or pleasure.

A branch of the river Euphrates intersected the city, running through the middle of it from north to south; and over the river, in the central part of the city, was a bridge, a furlong, as some say, but according to others, much more, in length, and thirty feet broad; which bridge was ingeniously constructed in order to supply a defect in the bed of the river, which was composed of sand. At the two ends of this bridge were two towers, the old place, on the east side, and the new one on the west side of the river; the former occupying four of the above mentioned squares, and the latter nine. The temple of Belus, which stood next to the old palace, took up another of these squares.

The whole city stood on a large plain, in a fat and deep soil; that part or half of it which lay on the east side of the river, was the old city; the other on the west was added by Nebuchadnezzar; and both were included within the square bounded by the walls already described. The form of the whole was seemingly borrowed from Nineveh, which was also 480 furlongs in compass, but its form was that of a parallelogram, whereas that of Babylon was an exact square. Nebuchadnezzar, who had destroyed that old seat of the Assyrian empire, is supposed to have designed that this new one should exceed it in size and in magnificence. It appears, however, that it was never wholly inhabited, though Nebuchadnezzar carried thither a great number of captives out of Judea and other conquered countries; nor was time allowed for its arriving at that population and glory, which were the objects aimed at by Nebuchadnezzar; for Cyrus removing the seat of empire to Shushan, Babylon gradually sunk into utter decay. When Alexander came to Babylon, we learn from Quintus Curtius, that no more than 8100 square furlongs were then occupied by buildings; but the whole space within the walls contained 14,400 square furlongs; and therefore there must have been 6300 square furlongs, which, as Curtius informs us, were ploiged and owned. Nor indeed were the houses contiguous, but a void space was left on each side between one house and another.

According to the observations of major Rennell (Geographical System of Herodotus examined and explained, &c. p. 341.), there seems to be no mode of invalidating the fact respecting the extent of the space included by the walls of ancient Babylon: "nor (says he) can it in our idea be reduced to less than a square of about 8½ British miles, giving an area of 72 square miles. But that even 72 contiguous square miles should have been in any degree covered with buildings, is on every account too improbable for belief. The inhabitants of London, taken at a ninth part of the whole population of South Britain (say about 7,000,000, or for London 800,000), require for their supply of provisions and necessaries, a proportion of land equal to about 6000 square British miles, on a supposition that they were confined to its produce alone, and that it was taken as it generally runs throughout the kingdom."—"If there be allowed to Babylon an area of seventy-two miles, we conceive that it would then bear a proportion to the space which the buildings of London occupy, taking in all its suburbs and members, whether contiguous or otherwise, and allowing the man area of 15½ British miles, as 9 to 1 nearly. But as most of the large Asiatic cities that we have seen or heard of, scarcely contain within the same space half the number of inhabitants that European cities do, we must reckon the proportion of population that Babylon would have contained to that of London, as 9 to 4. In this case, 15,000 square miles of such land as the common run of that in England would have been required for the support of the people of Babylon. But as the simpler manner of living among the lower classes of people in Asia requires a less quantity of land to support it, a considerable deduction may be made, and instead of 15,000 square miles, we may perhaps substitute 12,000. Now it will appear, that this reduced sum of square miles equals, within one-twelfth part, the whole area of Lower Mesoopotamia; and even the whole tract properly denominated Babylonia and Chaldea, including all the arable and fallow land, from whose Babylon could have been conveniently supplied by the inland navigations, was little more than double the above aggregate, taken at 14,000 square miles. And though it be true, that the quality of the Babylonish lands, in most places, was superior in fertility to those of England; yet, on the other hand, a prodigious deduction must be made for the marshes and lakes of Lower Mesoopotamia and Chaldea." Hence the author very justly infers, that the houses occupied only a part of the wall space included by the walls, and he furnishes a modern instance, in the same region, of a city surrounded by a wall seven miles in circuit; and yet Buxton contains only from 40 to 50,000 inhabitants; the wall inclosing date groves and corn fields. Besides, it should be remembered that the Euphrates flowed through the centre of Babylon, in which part of its course it is from 400 to 500 feet wide. The palace of the Babylonish kings, the temple of Belus, and other public buildings must also have occupied a considerable part of the space within the walls.

The next object particularly worthy of notice in the city of Babylon, was the temple of Belus. In the middle of this temple stood the ancient tower, supposed by Bochart to have been the temple of Belus.
BAB B

(Pinleg, p. 1. i. e. 9.) to have been the famous tower of Babel. This tower was at its base a square of 26 furlongs on each side, or half a mile in compass, and consisted of eight towers, as they appeared to be, built one above the other; the height of each being 75 feet, and that of the whole 650 feet. The ascent to its top was by stairs on the outside, formed by a sloping line from the bottom to the top eight times round it, so as to exhibit the appearance of eight towers. As these compartments or stories had many rooms with arched roofs supported by pillars, they made parts of the temple, when the tower became consecrated to idolatrous purposes. The uppermost story was the most sacred, and the most appropriate to the uses of devotion. Over the whole of the top of the tower there was, it is said, an observatory (Diod. Sic. i. ii.), by the advantage of which the Babylonians extended their skill in astronomy beyond other nations. For when Alexander took Babylon, Callisthenes, the philosopher, who accompanied him thither, found they had astronomical observations for 1903 years from that time, which carried up the account as high as the 115th year after the flood, or within 15 years after the tower of Babel was built, or to the year B.C. 2334. Till the time of Nebuchadnezzar, the temple of Belus contained only this tower, the rooms of which served all the occasions of its idolatrous worship. But he enlarged it by erecting edifices round it in a square of two furlongs on every side, and a mile in circumference, exceeding the square at the temple of Jerusalem by 1800 feet. The whole of these buildings was inclosed by a wall, which is computed to have been two miles and a half in circumference. In this wall were several gates of solid brases, supposed to have been formed out of the brazen sea, brazen pillars, and other vefels and ornaments, which Nebuchadnezzar had brought to Babylon from Jerusalem; for he is said to have dedicated in this temple the spoils of that expedition. Dan. i. 2. 2 Chron. xxvii. 7. In the same place were several images or idols of mally gold; one of them, which was a statue of Belus, in an erect posture, forty feet high, crowning the summit, and reeling on a pedestal of fifty feet in height. As this is said to have weighed 1000 Babylonian talents, it is computed to have been worth three millions and a half of our money.

According to Diiodorus Siculus (ubi supra), the weight of the statues and decorations amounted to five thousand and odd talents in gold, and their value has been estimated at above twenty-one millions of our money; and the like fum is allowed for the treasures, utensils, and ornaments.

On the east side of the river flood the old palace of the kings of Babylon, four miles in circuit; and opposite to it, on the other side of the river, was the new palace built by Nebuchadnezzar, which was eight miles in circumference.

For an account of the hanging gardens of Babylon, see PINSILS HORTI. The other works ascribed to Nebuchadnezzar, by Berosus and Abydenus, were the banks of the river, the artificial canals, and the completion of the artificial lake, said to have been sunk by Semiramis. The canals were cut out on the east side of the Euphrates, in order to convey the waters of the river, when it overflowed its banks, into the Tigris, before they reached Babylon. The chief of these was the NAARMACHA.

The lake was on the west side of Babylon, and, according to the lowest computation, 40 miles square, 160 in compass, and 35 feet deep as Herodotus says, and 75 according to Megalithenes. It was dug to receive the waters of the river, while the banks were building on each side of it; but the lake, and the canal that led to it, were afterwards preserved, and found useful to prevent inundations, and to serve as a referrue, from which water was occasionally let out by sluices for improving the land. The banks were constructed of bricks and bitumen, on both sides of the river, to keep it within its channel, and were extended through and beyond the city, occupying an interval of twenty miles. Opposite to each street, on either side of the river, was a brazen gate in the wall, with stairs leading down from it to the river; which gates were open in the day, and shut in the night.

All these works are attributed by Berosus, Megalithenes, and Abydenus, to Nebuchadnezzar; but Herodotus says, that the bridge, the banks, and the lake, were the work of a queen who reigned after him, called Nitoeris, who probably finished what Nebuchadnezzar had begun and left imperfect.

Babylon fulfilled with singular reputation, and was for a long time considered as one of the wonders of the east. At length Cyrus, having subdued the several nations that inhabited the great continent from the Egean sea to the Euphrates, and likewise Syria and Arabia, entered Assyria, and directed his march towards Babylon. Nabonadius, Labynitus, or Belhazzer, who then reigned at Babylon, hearing that he was advancing to his metropolis, marched out to give him battle; but being put to flight, he returned into the city, where he was closely besieged by Cyrus. But the capture of a place so strong, and furnished with all kinds of provisions for twenty years, was no easy enterprise. Depairing of succeeding against it by force, he drew round it a line of circumvallation, with a large and deep ditch, to intercept its communication with the country. He also divided his army into twelve bodies, each being appointed to guard the trenches for a month; but the besieged, triumphing in the height of their walls, and the amplitude of their fores, infilled Cyrus from the ramparts, and seemed to defy all his efforts. Cyrus, having spent two years before Babylon without making any impression, adopted the following stratagem, which proved successful. Information that a great annual inundation was to be kept in the city, and that the Babylonians were accustomed, on this occasion, to spend the whole night in drinking and debauchery, he thought this a proper time for surprizing them. Accordingly he sent a strong detachment to the head of the canal leading to the great lake, already derelict, with orders, at an appointed time, to break down the bank which separated between the lake and the canal, and to turn the whole current of the river into the lake. At the same time he appointed one body of troops to occupy the place where the river entered into the city, and another to station themselves where it came out; and he ordered them to march in by the bed of the river, which was two fadias broad, as soon as they should find it fordable. Towards the evening, he opened the head of the trenches on both sides of the river above the city, that the water might discharge itself into them, and by these means, and the breaking down of the great dam, the river was soon drained. Then the two bodies of troops above-mentioned entered the channel, according to the instructions which they had received; and advancing towards the city, they found the gates left open, in consequence of the riot and disorder of the night, and penetrated into the city without opposition. Meeting at the palace, according to their previous agreement, they surprized the guards, and cut them in pieces. Those who were in the palace, opening the gates to know the cause of the confusion, made way for the Persians to rush in; and thus they took possession of the palace, and killed the king, who with his sword in his hand came out to meet them. The king being killed, and those who were about him being put to flight, the rest submitted, and the Medes and Persians became masters of the place; B.C. 538. The reduction of Babylon put an end to the Babylonian empire, and finally fulfilled, in the same and character
rater of the conqueror, and in the various circumstances that attended this event, the prophecies which Ishaiah, Jere-
miah, and Daniel, had uttered against this proud metropolis; but in his return from the Grecian expedition, lie first plundered it of its wealth, then demolished the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, proposed to rebuild it, and to make it the seat of his empire; but his death prevented his accomplishing that design. After the death of Alexander, the city of Babylon began to decline apiece; and its decay was chiefly owing to the vicinity of Scelcus, which was built by Scelcus Necator, as it is said to mortify the Babyloniens, and peopled with 500,000 persons drawn from Babylon.

We learn further from a fragment of Diodorus Siculus, produced by Valesius, and quoted from him by Vitringa (Comment. in Jejatum, c. 13. vol. i. p. 421.), that a king of Parthia sent many of the Babylonians, under the most trivial pretences, into slavery, burnt the forum and some of the temples of Babylon, and demolished the half parts of the city. This happened about 130 years B.C. Diodorus Siculus (l. ii.) describes the buildings as ruined or destroyed in his time (B.C. 44.), and affirms that only a small part of the city was inhabited, but that the greatest part of it within the walls was burnt. Strabo (l. xvi. p. 1073.), who wrote not long after Diodorus (B.C. 30.), lays, that part of the city was demolished by the Persians, and particularly of its decay by time and the neglect of the Macedonians, particularly after the building of Scelcus, and the removal of the royal court thither. Strabo applies to Babylon what a comic poet said of Megalopolis in Arcadia; "The great city is now become a great defect." Play alf (H. N. l. 6. c. 52.) affirms (A.D. 66.), that it was reduced to solitude by the neighbourhood of Scelcus. Paulusins, about A.D. 153, compares Megalopolis to Babylon, and says (Arcad. c. 33. p. 608. ed. Kuhnii), that of Babylon, the greatest city which the sun ever saw, nothing remained but the walls. Maximus Tyrius (Diff. 6.) mentions it as lying neglected and forsaken; and Lucian intimates (Epitom. five Contemplantes), that in a little time it would be fought for and not be found, like Nineveh. Constans the Great, in an observation preferred by Eunibus, says, that he himself was upon the spot, and beheld the defeate and miserable condition of the city. In the time of Jerome, about the close of the fourth century, it was converted into a chase for keeping wild beasts within the compas of its walls, for the hunting of the later kings of Persia. St. Jerome adds, that, excepting the brick walls, which after many years are repaired for the inclusion of wild beasts, the whole space within is defolation. Hieron. Comment. in Haf. c. 13. c. 14. vol. iii. p. 111. 115. ed. Benedict. Benjamin of Tudela, who lived in the twelfth century, affirms (Itin. p. 76.), that ancient Babylon is now laid waste, but that some ruins are still to be seen of Nebuchadnezzar's palace, into which men fear to enter on account of the serpents and scorpions that are in the midst of it. Tezeira, a Portugeuse, in his description of his travels from India to Italy, cited by Bochart (Phleg. i. 14. c. 5.), and by Prideaux (pt. i. b. 8.), affirms, that of this great and famous city nothing but a few vestiges remained, and that there was not any place in the whole region less frequented. Ruwulf, a German traveller, whose travels have been edited by Ray, paffed this way, A.D. 1574, and describes the ruins of this famous city, which he found in the village of Ebigo, not far from Bagdad. He mentions some piers and arches of the old bridge over the Euphrates, and the ruins of the castle and tower, which are the habitations of venomous creatures, that are so dangerous as not to be accessible with safety,
might God allege this as a memorable instance of his prescience, and challenge all the false gods and their votaries to produce the like. II. xiv. 21, xvi. 10. And indeed where can you find a similar instance, but in scripture, from the beginning of the world to this day?" The triumphal ode upon the fall of Babylon, recited in the fourteenth chapter of Isaiah, merits particular attention, as it is truly admirable for the fervent strokes of irony, as well as for the sublime strain of poetry. "The Greek poet Alceus, who is celebrated for his hatred to tyrants, and whose odes were animated with the spirit of liberty no less than with the spirit of poetry, we may presume to say, never wrote any thing comparable to it." Bithop Lowth, in his excellent lecture upon the sacred posy of the Hebrews, hath jolly described it as one of the most spirited, most sublime, and most perfect compositions of the lyric kind, superior to any of the productions of Greece or Rome. See his Prelct. xiii. p. 129, &c. Prelcet. xxvii. p. 277, &c. Mr. Mason hath also imitated it in an English ode, published with some other odes, in 1756.

Babylon, a city of Egypt, which was watered by the river Trajanus, according to Ptolemy. It was situated near the Nile, where Grand Cairo now stands, or at a small distance from it, and had a castle strongly fortified both by nature and art. Some say, that it was founded by the Persians when they ravaged Egypt under Cambyses, (see Jofeph. Antiq.) and that it was erected in the place where Latopolis stood; or according to others, when Semiramis visited this country at the head of a formidable army. Strabo says (l. xvii.), that it was built by some Barbarians, who retired thither by permission of their sovereign, and that in his time the Romans kept in garrison there one of the three legions that were stationed in Egypt. From the fortresses of Babylon the mountain gently sloped to the bank of the Nile; and 150 fathoms were continually employed there in raising the water by means of wheels and an aqueduct. The Persians, who were worshippers of the sun, kept up a perpetual fire in this place, which occasioned its being called by the Arabs "The castle of the Lights." See Cairo, and Fostat.

Babylon, in Scripture History, is a name figuratively given by the sacred writers, particularly by St. Peter, I Ep. ch. v. 15, and by the author of the Revelations, ch. xvi. and xxi. and also by the fathers, to Rome; partly on account of her greatness, pride, and oppression of God's people, and partly for her renunciation of it in idolatry; that kingdom fully representing the idolatry of the church of Rome in the description given of it in the fifth chapter of Baruch, that fearlessly any real difference between them can be observed. Whitby's Paraphrase, vol. ii. p. 661. p. 753.

BABYLONIA, or Chaldæa, an ancient kingdom of Asia, was founded by Nimrod, the grandson of Ham, and continued distinct and separate from that of Assyria, till Ninus conquered Babylon, and made it tributary to the Assyrian empire. (See Assyria.) This country was known, in ancient times, by the names of Shinar, and Shinau, which appellation it seems to have retained even in the time of Daniel. The name of Babylon is universally supposed to have been derived from that of the tower of Babel; and the name of Chaldæa arose from the Chaldeans, or Chaldim. (Joseph. Ant. l. i. c. 77.) These two names sometimes extend to the whole country, being indiscriminately taken for each other; and sometimes they are limited to certain parts. By Babylon, or Babylonia, is meant the country more immediately in the neighborhood of the city of Babylon; and by Chaldæa, that which extends southward to the Persian Gulf. Chaldeæa is used by the writers of the Old Testament for the whole country (Jer. xxiv. 5-xxv. 12. l. 8. Ezek. xii. 13; and Babylonia, generally speaking, by profane authors. (Diodor. Sic. l. ii. c. 11, 12. Strabo. l. xvi. sub init.) It lies between thirty and thirty-five degrees of north latitude; and was bounded, according to Ptolemy, on the north by Mesopotamia, on the east by the Tigris, on the west by Arabia Deserta, and on the south by the Persian gulf and part of Arabia Felix. In Babylonia, property is called and considered as a distinct province from Chaldeæ, were the following cities; viz. Babylon, the metropolis, (See Babylon); Vologena, or Vologefocerta, built on the Euphrates by Vologena, king of the Parthians, in the time of Vespasian; Barbita, probably Strabo's Borippa, faced to Diana and Apollo, famous in the time of this geographer for a woolen manufacture, and for being the habitation of a certain sect of Chaldeans, thence called Borippenes; Idicera, on the Euphrates and the borders of Arabi Deserta; Coche, in the island Mele, formed by the Tigris; Sur,a; and Pombeditis, of which the situation is very uncertain. In ancient times the Babylonian name, extending far beyond the limits both of Babylonia and Chaldeæ, comprised all, or the greater part of the provinces subject to the Babylonian empire. See Empire.

The air of this country was generally temperate and salubrious; though it was occasionally subject to extraordinary heat and a pestilential wind. As it seldom rained, the inhabitants were under a necessity of watering their lands by means of wheels and engines, and of trenches and canals, which flowed from the Euphrates to the Tigris. The soil was rich, the climate was for the most part excellent, and the inhabitants were industrious; and therefore this country yielded, in respect of fertility, with any other spot on the face of the earth. The southern part of it, between the rivers, have been compared with the Delta of Egypt, which it resembles by its natural and artificial islands, and by being almost under the same parallel of latitude; and the other part of it, or Chaldæa properly so called, between the Euphrates and the mountains of Babylon, as they are commonly termed, is not much less watered by rivers and canals conducted from the Euphrates, and large refervoirs of lakes borrowed from the same river. Hence Herodotus (l. i. c. 195), compares this country with Egypt; and he says, that, with regard to the plenty of its productions, it was reckoned to be equal to a third part of Asia, or of the Persian empire; and that, in the same year, it yielded 350,000 fold, but generally 400. As it was low, flat, and well-watered, it abounded with willows, and was called "the valley of willows," as Fridericus. (Conn. p. i. b. i. p. 105), after Buchart, corrects the text, II. xxv. 7. The palm also flourished naturally every where, and particularly the date kind, which afforded bread, wine, and honey; but the vine, olive, and fig-tree, did not succeed here any more than in Egypt. But as to grain, it exceeded every other land; the millet and sawne shot up to the size of trees; and the leaves of the barley and wheat were usually four fingers broad. The sawne afforded oil, instead of the olive; and the palm yielded wine instead of the grape. This fertility was owing in a great measure to the inundations of the Euphrates and Tigris, in the months of June, July, and August; the snow of the mountains of Armenia melting in those months; and to guard against injury from these inundations, the inhabitants formed artificial rivers and canals, by which they distributed the waters, and maintained an easy communication with one another. For the purpose of mutual intercourse, and particularly of navigating the Euphrates, they had boats, of a round form, constructed like wicker-baskets, which were covered
covered with hides, and guided by two oars or paddles. They had neither head nor stern; but being of different sizes, they served for carrying various quantities of their commodities to Babylon, whence they returned by land, the rapidity of the stream not allowing them to return by water.

The government of Babylon, like that of Assyria, was despotical, and the feeple feeems to have been hereditary. Their potentates, however, who assumed divine titles, and who received divine honours, administered their government by a variety of officers, civil and military; and these were divided into three classes: the first had the charge of virgins, and of their disposal in marriage, and were to judge in cases of adultery, and similar matters; the second took cognizance of thefts; and the third of all other crimes. The chief officers of the king's household were the captain of his guard, who had the execution of his arbitrary and fanguine commands; the prince of the counsellors, who had the charge of the education and subsistence of the youth of the palace; and the prime minister, resembling the Turkish vizier, who sat in the king's gate, as it was called, to hear complaints, and to pass judgment. Besides these, there was also a matter of the magicians, whose province it was to satisfy the king on subjects that reflected the propogization of futurity. Among their laws, which were vague and variable, one of the most peculiar and remarkable was that which required marriage, and which was calculated to increase the number of inhabitants; for which, see ASRYIN. Their punishments were arbitrary, and depended upon the will of a capricious monarch. Bending, cutting to pieces, turning the horse of the criminal into a duaghill, and burning in a fiery furnace, were penalties, which were executed by order of the kings of Babylon. The religion and boasted learning of the Babylonians were so blended together, that they are not easily separated: for the Chaldees, properly so called, were not only their priests, but also their learned men; whole science feems to have been subservient to the purposes of superstition. (See BELLUS, and BABAISM.) As the Babylonians gave rife to all the idolaties and superstitions that prevailed among the neighbouring nations, they are charged with having introduced the horrible custom of sacrificing human victims, in order to appease or conciliate their deities. The Babylonians were much addicted to judicial astrology; and ascribed an influence to the stars and planets, in the explication of which their chief science consisted. Astronomy was with them subservient to astrology, and the former was cultivated in subordination to the latter. Indeed, the principal part, if not the whole, of their philosophical and learning, consisted in the application of this fanciful and unfounded science. However, some have distinguished, with justice, between the Chaldees, and Babylonians, ascribing to the latter a more accurate and extensive acquaintance with the principles of astronomy, mathematics, and mechanics, than the former. (See CHALDEAN PHILOSOPHY.) Of their music and poetry, we have few certain records. They are said to have excelled in architecture and sculpture, in the arts of designing, and of casting metals, as the ornaments of their metropolis to tellify. Their manufactures, particularly of rich embroideries, sumptuous vestments, magnificent carpets, and fine linen, were famous; and they sent their purple into the eastern parts as an article of traffic. Their commerce, especially when Babylon was in the meridian of her glory, must have been considerable. The metropolis was advantageously situated for this purpose; being as it were in the midst of the world, and having, by means of the Euphrates and Tigris, an easy communication with the western and northern parts, and also with the eastern by means of the Persian gulf. With regard to their customs, we may mention in particular their mode of treating field persons. Having no physicians, they exposed them publicly in the most frequented places, that all who saw them might offer their advice, if they had, either from their own experience, or that of others, any knowledge of their case. Their dead they embalmed with honey and wax, and their manner of mourning resembled that of the Egyptians. The Babylonians were, in a high degree, credulous and supposititious: and much addicted to licentiousness and debauchery in their general conduct. In their drefs, they affected pride and effeminacy. Their under garment was a linen veil, which hung down to their knees; over this they had another of woollen; and their outer garment was a white mantle or cloak. They flared their hair to grow; adorned their legs with a turban or mitre; and anointed their bodies with the oil of seamma. Every individual wore a ring with a seal on his finger, and bade to his hand a carved flail or sceptre, the head of which was adorning with some figure, as that of an apple, rose, eagle, or some such emblem. On their feet they wore a kind of slippers. The inhabitants of this country were divided not only into two great tribes, the Babylonians, and Chaldeans, properly so called, but into other subordinate sects. Three of these are said to have fed upon nothing but fish, which they dried in the sun, and formed into pate, thus supplying the want of bread.

As to the history of the kingdom of Babylon, distinguished from the kingdom of Assyria, the first king of this country mentioned in Ptolemy's Almanac, is Nebonafar, to whom Pulp or Phulp bequeathed it, as he did that of Assyria to Tiglath-Pilefer, in the year 747 B.C. The latter reigned at Nineveh; and the former at Babylon. From this period, commonly denominated the era of Nebonafar, to the year 625, B.C. when Nabopolasnar began his reign, nothing remarkable occurs in the history of the kings of Babylon; excepting that Assurabadnaus, or Enlil-aidon, king of Assyria, the brother and successor of Sennacherib, took possession of the kingdom of Babylon, B.C. 680; and that upon his death, these kingdoms of Assyria and Babylon were again separated, B.C. 668. In the twentieth year of Nabopolasnar, B.C. 606, Nineveh was taken and destroyed by the united armies of Cynaxares and Nabopolasnar, and the seat of the empire transferred to Babylon. This Nabopolasnar, sometimes called Nebuchadnezzar, was the father of the famous Nebuchadnezzar, or Nabocolasaar, whose history occurs in the recited narratives, and who commenced his reign in the year 645 B.C. From this period, to the conquest of Babylon by Cyrus, in the reign of Nabonadius, Labyrinthus of Herodotus, and Belhazzar of Scripture, the son of Evil-Merodach by Nitocris, and the grandson of Nebuchadnezzar, in the year 538 B.C. the history of Babylon presents nothing worthy of particular notice. For an account of the conquest of Cyrus, which terminated the Babylonian empire and subjected it to the Persians, see BABYLON. From this time, Babylon was never erected into a distinct kingdom, but has shared the vicissitudes of the great conquerors who have at different times appeared in Asia. It is now frequently the object of contention between the Turks and Persians. See BABYLONIA.

BABYLONIAN, BABYLON, OF BABYLONISM, CIVILTY, EMPIRE, EPOCA, GENARA, HOUR, TALMUD, YEAR. See the several articles.

BABYLONICA TEXTA, in Antiquity, denote a rich fort of weavings, or hangings, denominated from the city of Babylon, where the practice of interweaving divers colours in their hangings first obtained. Plin. H. N. lib. viii. c. 48.
B A B

Hence also Babylonian garments, Babylonian skins, Babylonian carpets, housings, &c.; and Babylonian solana, which were coverings laid over couches, &c. painted with gold, purple, and other colours.

Babylonian, Babylonian, is also used in some Ancient Writers, for an astrologer, or any thing relating to astrology. Hence Babylonian Curâ, the art of calling nativities; and numeri Babylonii, the computation of astrologers. Hor. bib. i. ed. 12.

Babylonics, or Chaldaics, in Literary History, a fragment of the ancient history of the world, ending at 267 years before Christ; and composed by Berosus or a priest of Babylon, about the time of Alexander. Stanley Hill, Phil.

The Babylonians were very consonant with Scripture, as Josephus and the ancient Chaldaic chroniclers assure us; whence the author is usually supposed to have consulted the Jewish writers. He speaks of an universal deluge, an ark, &c.; he reckons ten generations between the first man and the deluge; and he marks the duration of the several generations by Sarei or periods of 223 lunar months, which reduced to years, differ but little from the chronology of Moses. There now remain only a few imperfect extracts, preferred chiefly by Josephus and Syncellus. They were forged by Annus of Viterbo, Fabio Filo, and Grand. Tom. iv. p. 175. See Berosus, and Chaldaean Philosophy.

BABYRSA, in Ancient Geography, a strong place of Armenia Major, situated in the mountains, near Artaxates, where were kept the treasures of Tiganes and Artabazus.

BABYRUSSA, in Zoology, a species of Sus, or hog, having two tufts growing from the lower part of the front. This is the horned-hog of Grew; porcus indicus baburuia dictus of Ray; and baby-roffa of Buffon. In the arrangement of the French naturalists, it belongs to the genus of coccus, and order pacchyrhines.

The babyrusses is described by Dr. Shaw, to be nearly of the size of a common hog, but of a somewhat longer form, and with more slender limbs; and to be covered, instead of being long, with fine, soft, and somewhat woolly hair, of a deep brown or blackish color, intermixed with a few dark brown or blackish tufts on the upper and hinder part of the back. It is also distinguished by the very extraordinary position and form of the upper tufts, which instead of being situated internally on the edge of the jaw as in other animals, are placed externally, perforating the skin of the snout, and turning upwards towards the forehead; and as the animal advances in age, becoming extremely long and curved as to touch the forehead. These continue their curvature downwards, by which means they must of necessity lose their power as offensive weapons, which they probably possess in the younger animals; the tufts of the lower jaw are formed as in the rest of the genus, and are also long, sharp, and curved; but not of equal magnitude with those of the upper. The upper tufts are of a fine hard skin, like that of ivory; the eyes are small; the ears somewhat erect, and pointed; the tail rather long, slender, and tufted at the end with long hairs.

The babyrusses is a gregarious animal, and is found in large herds in many parts of Java, Ambaia, and some other islands of Indian seas; but is said never to be found on the continent of India. Their food is entirely of a vegetable nature, and they often feed on the leaves of trees. When keeping, or resting themselves in a standing posture, they are said often to bark or support themselves by placing the upper tufts acroos the lower branches of the tree. When pursued, they will often plunge into a river, or even into the sea, if near, and can swim with great vigour and facility, and to a vast distance. The voice of the babyrusses is said to resemble that of the common hog, but it occasionally utters also a strong or loud growling note. It is sometimes tamed by the inhabitants of the Indian islands, and the flesh is considered as wholesome food. Vide Shaw Gen. Zool. Erxleben, &c.

Some writers imagine this quadruped to have been mentioned by Elias, Pliny, and other ancient writers. It is thought to be the animal noticed under the name of tetrachore, or four-horned, by the former; and that kind of Indian boar, described by Pliny as having two very long bent teeth in the lower jaw, and two others rising in front. Aper in India, Plin. &c. Aper cornutus, Calpurn. Aper indicus orientalis babu raja dictus, Schu; strange hogs, hogs with horns, Purch. pilgr.: cheririche oder hirchehner, Knorrelic, &c.

BABYSENGA, in Ancient Geography, an ancient town of India, on the other side of the Ganges. Poemly.

BABTACE, a town of Asia, cited on the northern bank of the Tigris. Pliny.

BAC, in Navigation, is used for a pram or ferry-boat.

BAC, in Dressing. See Back.

BACA, or BATATHA, in Ancient Geography, a village of Palestine, which served as a boundary between the Tyrians and Galilei.

BACA, in Geography, a town of North America, in New Nueva, forty-five miles north-east of Cincaloa.

BACA. See Baza.

BACACUM, or BACACUM, in Ancient Geography, a town of the Nervii, in Gallia Belgica; now Bacay.

BACADUCHI, in Geography, a town of North America, in New Nueva, 240 miles north of Cincaloa.

BACAIM, or BACAM. See Basseen.

BACAIA, a town of India, on this side of the Ganges, on the eastern coast, in the kingdom of Arracan.

BACALAL, a lake and small country of North America, in the peninsula of Yucatan.

BACALAN, a town of Asia, in Tokarefan, one of the southern provinces of Great Bucharia, at a small distance N. W. from Andrab. N. lat. 36° 12'. E. long. 67° 35'.

BACALEO, BACAILIEU, BACCHOL, or BACCELAI, an island on the east coast of Newfoundland, about nine leagues from cape St. Francis, and eight leagues north by east from Portugal coast; is about two leagues long, and half a league broad. This island is about a league from the main, with a fair channel between for any ships. N. lat. 48° 24'. W. long. 52° 34'.

BACAN, a town of North America, in New Nueva, 165 miles north-west of Cincaloa.

BACANO, a small lake of Italy, near a village of the same name, in the patrimony of St. Peter, out of which it flows the small river CREMERA.

BACANORA, a town of North America, in New Nueva, 230 miles south of Cafa Grand.

BACANTIBI, in Ecclesiastical Antiquity, wandering clerks, who roamed from church to church. Bingham.

The word lecim is formed by corruption from vaccinum.

BACAPA, in Geography, a town of North America, in New Nueva, 120 miles south-west of Cafa Grand.

BACAR. See BAIR.

BACARAT, a town of France, in the department of the Meurte, and chief place of a canton in the district of Loneville; four leagues south-east of Loneville.

BACARDO, a town of Italy, in the state of Genoa, three miles N. N. E. of Vintimiglia.

BACASERAI, or BARTSCHIRAR, a town in the peninsula of the Crim-Tartary, where the khan usually resided, seventy miles south of Perekop. It was partly burned by the Russians in 1736. N. lat. 45° 30'. E. long. 35° 10'.

BACAY, a town of India, on the other side of the Ganges,
Ganges, the capital of a country of the same name, on the eastern bank of the river Ava.

BACABIRI, in Ornithology, the name by which le merle à plastron noir de Ceylan of Buffon, is known at the cape of Good Hope; because its note very clearly expresses the syllables bac-bak-ri. This is the green-pye from Ceylon of Edwards; Ceylon thrush of Latham; and tarsus Ceylonus of Linnean.

BACCA, BERRY, in Botany, denotes such fruits as consist of a pericarpium folic of juice and seeds, without any valves. The seeds have no membranous capsular or covering, but are disposed profusely throughout the pulp, as in taxus, &c, and are generally placed on foot-halls attached to receptacles within the pulp, as in rubus, &c. The berry is said to be proper when it is a true pericarpium, formed of a germin; and improper, when it is formed from other parts of the fructification, as in morus, ros. juniperus, taxus, &c. A large succulent calyx becomes a berry; in juniperus the three petals become the umbilicus; in potosinum the berry is formed of the tube of the corolla; in fragaria, &c, it is formed of the top of the receptacle; in rubus, &c. it is formed from a seed, which is the receptacle of the berry; in rubus, &c. it is inclosed within, and is part of the nectary. The berry is commonly either round or oval; and is frequently furnished with an umbilicus, as in rubus, &c. It does not naturally open to disperse the seeds like the capsular; that office being performed by birds and other animals.

BACCÆ Bermudianæs, in the Materia Medica, the name of the fruit or berries of the savinum, or chap-berries-tree. BACCALÆ, in Ancient Geography, a town of Asia, in Syria, located on a plain between the mountains and the river Orontes.

BACCALAN, in Geography, a small island in the Red sea, on the coast of Arabia Felix, about 36 geographical miles N.W. of Lobaia. It is inhabited by fishermen, and has no water in summer, which is then brought from Poohot.

BACCALARIA, in Middle Age Writers, denotes a kind of country farms, consisting of several manors. DUCANGE.

BACCALARIA Dominica, or Indominate, was more particularly used for a farm belonging to the lord, and kept in his own hands.

BACCANELLUS, IOHANNES, in Biography, a native of Rheggio, lived in the early part of the sixteenth century. He was deformed in body, and of a diminutive stature, but these defects were abundantly compensated by the powers of his mind, as Bravallus tells us. We have of him the following works, which were much esteemed: "De confenu Medicorum, in curandis morbis," lib. 4.; and "De ConSeNEN Medicorum in cognoscendis simphicibus Liberi," Lut. 1554; Ven. 1555 and 1558, and Lugd. 1572, 12mo, containing a judicious abridgment of the opinions of the early Greek writers, on these subjects. Linden. Rediv. p. 524.

BACCHARACH, in Geography, a town of Germany, in the Lower Palatinate, formerly imperial and free, but now subject to the elector palatine, who has contributed to its prosperity by allowing the Calvinists and Lutherans to establish their forms of worship there, under equal privileges with the Roman Catholics; located on the left bank of the Rhine, at the foot of a mountain called Vettisberg. It is famous for its wines; whence it is supposed to have its name corrupted from Bacchus, the altar of Baccharach. Baccarach was so completely pillaged by the troops of Louis XIV. in 1689, that the French commander was obliged, on the night before he left the town, to sleep on straw, which was used next day for burning it; eight miles north of Deux Ponts, and Vol. III.

Twenty-three south of Coblenz. N. lat. 50° 2'. E. long. 7° 52'.

BACCHARACH Wine, a name of a particular kind of wine, by some esteemed a kind of Rheinh; but Portzius, who has written expressly on the subject, observes that it differs from all the common Rheinh wine, in colour, odour, taste, and virtue.

BACCARUM, in Entomology, a species of Acarus, found on gooseberries, currants, and other fruit-trees. The abdomen is dilated, red, and dusty on the fides. Linn. Ti. Suec.

BACCARUM, a species of Citrus, of a somewhat fulous colour; margin of the abdomen spotted with brown. Dee, Gmelin. Inhabits Europe.

BACCHÆ, in Antiquity, the priests of Bacchus, who celebrated the orgia, or mysteries of that god.

The word was also used for the ivy crowns and garlands worn by the priests of Bacchus, in offering sacrifices to him.

BACCHANALIA, religious feasts in honour of Bacchus, celebrated with much solemnity among the ancients, particularly the Athenians, who even computed their years by them, till the commencement of Olympiads.

The bacchanalia are sometimes also called orgia, derived, as some conceive, from the Greek ὄγερε, orgy; on account of the madness and enthusiasm wherewith the people appeared to be possessed at the time of their celebration.

They were held in autumn, and took their rise, according to Herodotus, from Egypt, where they were known under the name of the mysteries of Isis and Osiris; whence, according to Dio-dorus, they were brought into Greece by Melampus; and they afterwards passed into Italy and Gaul, and were adopted almost throughout the whole pagan world.

The form and disposition of the solemnity depended, at Athens, on the archon, and was at first exceedingly simple; but, by degrees, it became incumbered with a number of ridiculous ceremonies, and attended with much dissoluteness and debauchery; infomuch that the Romans, who grew ashamed of them, suppressed them by a senatus-consulturn throughout all Italy, A.U.C. 568. B.C. 396. It was a saying of Plato, recorded by Diogenes Laertius, (f. iii. segm. 39.), that to drink to excess was not allowable, except upon the festival of that god who is the giver of wine.

The women had a great share in the solemnity, which is said to have been instituted on their account; for a great number of them attended Bacchus in his expedition to India, carrying in their hands the thyrsus, i.e. a little lance, covered with ivy and vine leaves, singling his victories and triumphs wherever they went; the ceremony was kept up after Bacchus's destruction, under the title of Bacchanalia, and the women were infallible priests in these, under that of Baccarum or Baccantes.

These priests, at the time of the feast, ran through the streets, and over the mountains, covered with tiger's skins, their hair dishevelled, their thyrsus in one hand, and torches in the other, howling and thrashing themselves, &c. to Taxy, or to Bacchus; or to Bacchus.

Men and women met promiscuously at the feast, all perfectly naked, except only for the vine-leaves and choppers of grapes, which bound their heads and hips; here they danced and jumped tumultuously, and, with strange gesticulations, sung hymns to Bacchus, till, being weary and giddy, they tumbled down.

The licentiousness of these, and of some other festivals, was so well known, that it was the advice of wise men to marry...
BAG
This that B. Gen. this their is introduced. Hence difficult the Calyx 5. p. a may foft Stam. the A. In the "AriHippus, Ceres, basib- jnediti" siding of France. bly tion cups; 949. unchanged. ple. fix "Eupatorium very lanceolate, of petiolcd." This E. eight spikes of the boar, s feet bar, high. This differs from the indices in having fliffer, lissile, and fearcely toothed leaves, and its flowers larger, fewer, and more re- mote. A native of Brazil. 8. B. feidia. "Leaves lanceolate, ferrate-toothed, coryms leafy." Six or seven feet high; leaves long, hoary on the under side, of a disagree- able smell when handled; coryms terminal. A native of North America. Cultivated here in 1729. 9. B. ebneri- fels. Lorr. Coch. 494. "Leaves lanceolate, quite entire, tomen- tole beneath, falked; peduncles many-flowered, astillary." An under-hrub, three feet high, erect, humble, round; leaves alternate, falked; flowers yellow, oblong. A na- tive of China, near Canton.

Propagation and Culture. Species 1. may be propagated by cuttings, planted in a hsbby border, during any of the summer months; or by seeds sown on a common border in the spring. If planted in a warm situation, it will live in mild winters in the open air; but it is usually kept in the green-house, and placed out in summer. It requires much water in warm weather. The second species is difficult to propagate, for the cuttings will seldom take root, and it rarely has shoots near the ground to lay down, so that in Holland they lay down the entire head of young plants, filling the smaller branches, in the same manner as is prac- tised for carnations, laying them into the ground, and fork- ing each down to prevent their rifting: these, when duly watered, will put out roots in one year, when they may be taken off, and planted in small pots filled with light earth, and placed in the shade till they have taken new root. In summer they ought to be kept in a sheltered situation, and in the green-house in winter. The fourth species may be pro- pagated by cuttings planted in April or May, in a hsbby border, and if properly watered they will be fit for transplanting in the places where they are to remain at Michaelmas. The eighth species may be also propagated by cuttings, which in about two months take root, when they are to be potted and kept under a frame during the winter. The others are more tender and require the protection of a flute, but are little known in this country. See Martiny's Miller's Dict.

BACCHARIS. See Athanasia, Chrysocoma, Con- nyza.

Baccharis was also the name of a sweet ointment among the ancients, so called perhaps from this herb's being a principal ingredient in it.

BACCHAROIDES. See Conya.

BACCHI, in Mechanic, a kind of ancient machines, in form of goats, used by Jupiter in his wars against the giants. Rudbeck
Rudbeck describes two kinds of bacchi, one made like the batting-ram, whereas Jupiter demolished the enemies' forti fications; the other contrived to cast fire out of, from whence the Greeks are conjectured to have framed their idea of chimera.

**BACCHIAS, and ANTI-BACCHIAS, in Ancient Geography,** the name of two islands in the Arabic gulf, according to P liny. They are called by Ptolemy and Stephanus, Bacchi and Anti-bacchi insulae.

**BACCHIC, something relating to the ceremonies of Bacchus.** The celebrated intaglio, called Michael Angelo's ring, is a representation of a bacchic feast.

**Bacchic Sugal, is sometimes used for a clauda à la boire, or composition to inspire jollity.** But, in a more proper sense, it is refferred to a dithyrambic ode, or hymn.

**BACCHICA, in Botany, is sometimes used for hdera, or ivy.**

**BACCHIGLIONE, in Geography,** a river of Italy, in the state of Venice, which, after watering Vicenza and Padua, discharges itself into the gulf of Venice, near Chi ozza.

**BACCHINI, Benedict, in Biography,** a learned monk, was born at Borgo San Donino, in the duchy of Parma, in the year 1651. At the age of fixtieen he entered into the order of St. Benedict, in the monastery of Mount Caffin, and applied to his studies so inten sely as to injure his health. After having travelled with Arcioni, abbot of the Benedic tines at Ferrara, to whom he was secretary, he resigned his office, and settled at Parma. Here he published a liter ary journal, manifesting great learning and judgment; but it excited against him many enemies, who prevailed with the duke of Parma to banish him from his territory. Bacchini then retired to Modena, where he was patronied by the duke of Medena, and appointed his historiographer and librarian. The materials which he collected for investigating the genealogy and history of the house of Este, were transferred to his successor Muratori, upon his removal to the abbey of the Benedic tines of Modena.

In 1705, he founded at Modena an academy of ecclesiastical literature. His left preference was that of professor of ecclesiastical history in the university of Bologna, where he died, at the age of seventy, in the year 1721. Bacchini was one of the most celebrated scholars of his age, distinguished by his uni versal learning, refined taste, theological skill, and ecclesi astical philology; to all which he added in early life elo queence as a preacher; and in more mature years critical acumen, and eminent skill in deciphering manuscripts. Bes ides his literary journal, commenced at Parma in 1686, and continued to 1690, refumed at Modena from 1692 to 1697, and extant in nine volumes 4to.; he wrote in Italian "the History of the Benediclite Monastery of Pelironi;" and in Latin, "De Sifironius Figuris ac Differentiala," 4to. Bononia, 1691, and reprinted at Utrecht, 4to. 1696, with notes by Toffili; "De Ecclesiastico Hierarchice Originibus," 4to. Modena, 1703; and some other small pieces. Nouv. Diction. Hiflor. Gen. Biol.

**BACCHIS, in Ancient Geography,** a town of Egypt, near the lake Meiris. Ptolomy.

**BACCHUS,** an island of the Ægean sea, opposite to Phocene, at the entrance of the gulf of Smyrna. The temples and statues, with which it was richly adorned, were раrfacked by the Romans.

**BACCHUS, in the Latin Poetry,** a kind of foot, consisting of three syllables; whereof the first is short, and the two latter long, as ἐγγίζειν.

The bacchus is the reverse of a dactyl, and takes its name from that of Bacchus, because frequently used in the hymns composed in his honour. It was also called among the ancients, anotius, tripodius, sultan; and by the Greeks, 

**BACCHUS SENIOR, in Biography,** one of the seven Greek writers in music, collected and published with a Latin translation and notes, by Melchior, in 1652, is supposed to have flourished about the time of Ptolemy, that is, in the second century. His "Introduction to the Art of Music," is in dialogue; in the course of which all the terms used in the ancient Greek music are defined, and explained in Greek characters of notation.

Bacchus is the only one of these seven ancient musical writers, who, like Ptolemy, allows of no more than seven modes. See Muses. On the subject of rhythm, he quotes Arifoxenus, Neomachus, Leophasus, and Didymus; so that it is certain he wrote fabulously to all those authors.

**BACCHUS, in Entomology,** a large species of Scoraseus, that inhabits the cape of Good Hope. The shield of the head is four-toothed; thorax gibbous, and with the wing-cases glabrous. Fabricius.

**Bacchus, a species of Cerculio that inhabits Europe.** It is coppery, with the stout and ends of the feet black. Fabricius, &c.

**BACCHUS, a species of Monoculus, with an orbicular shell; antennae extended horizontally; tail denticulated on each side. Müller entomol. Inhabits rivers.**

**Bacchus, in Mythology,** a name synonymous among the Phœnicians with "mourning," and supposed to be derived from the Phœnician term baphob, to weep, and given to several deities, or rather to the same god, acknowledged under various distinct epithets and characters in the different countries where he was worshipped. In Egypt, he was called Ofiris; in Arabia, Adonis; in Mytta, Phænecus; in India, Dionysus, or Dionysus; by the Lucanians, Penthebus; throughout the Roman dominions, Llevis, &c. &c. The reasons assigned for these different appellations, by which the same god was distinguished, are flated by Banier in the second volume of his "Mythology." It is natural to suppose that the Greeks and Romans, in their usual manner, bestowed upon the one Bacchus whom they worshipped, the several actions and attributes of the many divinities known by that name, and by other equivalent denominations in different countries. Cicero (de Nat. D.or. iii. 23.) mentions five divinities known by the name of Bacchus, and thus adds two to the three of Duoderns Siculus and Philotharus. Antiquity, however, has chiefly distinguished two gods, under the title of Bacchus; that of Egypt, the son of Ammon, and the name with Ofiris; and that of the Greeks, or of Thebes in Boeotia, the son of Jupiter and Semele. The Bacchus of Egypt was the Dionysus of the Arabsians, so called from the city of Nysa in Arabia Felix, where he was brought up, and worshipped by them in consecration of the glory he had acquired by leading his army into India. (See Dionysus.) According to Mr Isaac Newton (Chron. and Op. vol. v. p. 77–86.), this great Bacchus, whom the Arabians so denominated from a word which in their language signified "great," was the same with Sesac or Sebalus, who became king of Egypt in the reign of Solomon. (1 Kings xi. 40.) See Sesac, and Seraphus.

All agree (says this author) that Bacchus was the same king of Egypt with Ofiris (see Osiris); and he supposes that the Calus, or Uranus, or Jupiter Uranus of the Arabians, the other god besides Dionysus whom they worshipped, was the same king of Egypt with Ammon, the father of Bacchus, according to the poet:

> "Quamvis..."
"Quamvis Aristarchus, Arachneque hostis
Græthunus, atque Indus unus fit Jupiter Ammon." (See Ammon.) Dr Isaac Newton adds, that when Ariadne, the daughter of Minos, was defeated by Theseus in the island Naxos or Dia, and taken up by Glauce, an Egyptian commander at sea, the beasts and members of the priest Bacchus, who was at that time returning from India in triumph; and by him she had two sons, Pylas and Eumelion, who were Argonauts. This Bacchus was caught in bed in Phrygia with Venus, the mother of Aineas, according to Homer (Odyss. l. viii. v. 202.), just before he came over the Hellepont and invaded Thrace; and he married Ariadne, the daughter of Minos, according to Hesiod (Theogon. v. 947.); and therefore, by the testimony of both Homer and Hesiod, who wrote before the Greeks and Egyptians corrupted their antiquities, this Bacchus was one generation older than the Argonauts; and so being king of Egypt at the time with Sefotris, they must be one and the same king. They also agree in their actions: Bacchus invaded India and Greece; and after he was routed by the army of Perseus, and the war was composed, the Greeks did him great honours, and built a temple to him at Argos, and called it the temple of the Cretian Bacchus, because, as Paulusias relates (l. c. 2. c. 23.), Ariadne was buried in it.

The distinctive character of this Indian Bacchus was a long beard, whence he was denominat'd "the bearded Bacchus," or Καθαρυς. Some have supposed that there was another Bacchus peculiar to Egypt, and the most ancient of all; and, indeed, Diodorus Siculo's seems to warrant this opinion, by mentioning three different deities under this appellation. Accordingly, Bickham (Geog. Sacr. I. c. 18. apud Oper. t. c. 430.) says, "that Bacchus was the same with Nimrod the father of Ninos; and he supposes that the worship of this deity originated in Assyria, and from thence was transmitted to the Syrians and Phenicians; and that it was communicated by the Phenicians to the Greeks. Many of his names, attributes, and actions bear an obvious allusion to the scripture history, and are most satisfactorily elucidated by it. Amongst those who have referred the origin of Bacchus, and the worship that was performed in honour of him, to the earliest antiquity, and very nearly to the dispersion at Babel, we may mention the learned Mr. Bryant, who discovers in the history of the exploits of this illustrious person, references to the migration of the Cushite colonies, or of the sons of Cush, who, upon the dispersion, partly betook themselves easterward to the Indus and Ganges, and partly passed into Egypt. See CUSHITES, and DISPERSION.

The Theban Bacchus, or Grecian Bacchus, is particularly distinguished by Diodorus Siculo's, l. iii. This historian informs us, that Orpheus had divided the son of Semele by the name of Bacchus, and that he appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious. Semele, it is said, was stung with lightning at the very instant of her son's birth; and the child was probably denominated Bacchus, from the grief which this melancholy accident might have occasioned in the family. Cadmus, with a view of covering his daughter's dishonour, conveyed away his infant grandson, as it were, from some of his relations in Phoenicia or Egypt. After having been there instructed in the mysteries of Isis and Osiris, and initiated in all the magical or juggling tricks of the Egyptian priests and hierophants, and having attained the maturity of age, he returned to Thebes with the traditional retinue of the original deity of the same name, and claimed divine honours; which, after some opposition, were allowed him. To this Grecian Bacchus the actions of Osiris were ascribed, together with a variety of absurd and disgraceful adventures in which his prototype had no concern. Hence the Theban Bacchus became a monster of licentiousness and debauchery; whereas the Egyptian was of a very contrary character. Of course the mysteries of the former were attended with the most shocking abominations. See BACCHANALIA.

According to the account of Diodorus Siculo's (l. iii. p. 257.) there was no nation upon earth, neither Graecia nor foreign, that was not indebted to this deity for some mark of his munificence and favour. He taught the people to plant the vine, and to preserve the juice of the grape, and to lay up the fruits of the earth in proper repositories. Those who possessed an harsh and ungenial soil, not adapted to the cultivation of the vine, were shown the art of making a drink from barley, not less grateful than that which proceeded from the grape. He adds (l. iv. p. 210), that the perfon, from whom these blessings were derived, is represented of the highest antiquity, and the greatest benefactor ever known by mankind. Such is also the history given of Osiris, under which character, says Bryant (Anc. Myth. vol. iii. p. 445.): we are to understand a people who went forth and performed all that has been mentioned. Their religion confided in the worship of the god under various titles; accordingly however Dionysus or Bacchus may be diversified by various names or titles, all of them, as this learned writer imagines, with regard to worship, relate ultimately to the one. Such was also the opinion of Selden (De Deis Syriis, p. 77.): To this worship were added, by the ancient people to whom Bryant refers, diverse honours paid to their ancestors, the Delphim of the first age; all which were attended with particular mystic rites, in which were commemorated the circumstances of the deluge, and the history of the great patriarch by whom mankind was preferred. Bacchus was esteemed one of the founders of medicine.

Diodorus Siculo's further informs us, that it was Bacchus, the son of Semele, who invented harps and theatres, and who first established a musing school, exempting from all military functions such musicians as discovered great abilities in their art; on which account, says the same author, musicians formed into companies have since frequently enjoyed great privileges.

Dr. Burrow (Hist. Muft., vol. i. p. 258.) observes, that the dithyrambs, which gave birth to dramatic representations, are as ancient as the worship of Bacchus in Greece; and there is little doubt but that the ceremonies of his mysteries gave rise to the pomp and illusions of the theatre. Many of the most splendid exhibitions upon the stage for the entertainment of the people at Athens and Rome being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, "servants of Bacchus." Paulus, in his Attics (p. 7. ed. Kuhnii), speaks of a place at Athens consecrated to Bacchus the finger; thus named, he says, for the same reason as Apollo is called the chief and conductor of the Muses. Whence it should seem, says Burrow (ubi supra.), that Bacchus was regarded by the Athenians not only as the god of wine, but of song; and it must be owned, that his followers, in their cups, have been much inclined to singing ever since. Indeed we are certain, that in none of the orgies, processions, triumphs, and festivals, instituted by the ancients to the honour and memory of this prince of θοι mουσικαν, music was forgotten, as may be still gathered from ancient sculpture, where we find not only that musicians, male and female, regaled him with the lyre,
lyre, the flute, and with song; but that he was accompanied by faws and sayers playing upon timbrels, cymbals, bagpipes, and horns; these Suidas calls his minstrels; and Stрабo gives them the appellations of Bacchi, Sksen, Satyr, Bacchoz, Lirae, Thyog, M-anillonae, Naiades, Nymphs, and Tityrs. These representations have furnished subjects for the main remains of ancient sculpture; and the most voluptuous passages of ancient poetry are descriptions of the orgies and festivals of Bacchus.  

Nancy, an edition of Petar刺(0x0), who lived in the fifth century, has collected all the fabulous adventures of Bacchus, and exhibited them in a beautiful, but irregular, poem, under the title of "Dionysiac." See the "Dionysiac," and Nonnus.  

The Greek Bacchus, the god of wine and song, is usually represented under the figure of a jolly bearded youth, crowned with ivy (that plant, as it is said, being reputed an antidote to the intoxicating effects of wine), and also vine-leaves; bearing in one hand a spear or thyrsus, wrapped with the fame, and in the other, grapes, a cup or a horn for drinking; and drawn on a car by tigers and panthers. He is sometimes exhibited with a mitre on the head, or a kind of hood or fillet nailed in front, and falling back over the shoulders, and with his temple ornamented by horns. These horns originated from the relation he fulfilled to the fun, whose rays were thus represented. On the Greek medals, Bacchus is known by his crown of ivy or vine, his diadem and horns, with a tiger and satyrs around him.

Bacchus, in Experimental Philosophy, is the name of a small brass apparatus (Pneumatics, P. IX. fg. 73.) fixed on a table, with a tube proceeding from the mouth to the barrel; this is filled with red wine, or coloured water, so that being put under a receiver, when the wine is exhausted, the liquor is thrown up into his mouth, by the expansion of confined air, and the reedy god feems to be at his usual employment; while he is drinking, his belly expands, which is effected by a bladder, containing a small quantity of air, concealed under his shirt.

Bachylides, in Biography, a celebrated Greek lyric poet, the nephew of Simonides, was a native of the island of Ceos, and flourished in the 8th Olympiad, B.C. 452. He is reckoned the last of the nine lyric poets of ancient Greece. The purity of his style, the correctness of his manner, and the regular and connected beauties of his work (See Longin. de Sublim. c. 33.), obtained for him an applause of which Pindar might have been jealous. These two poets divided, for some time, the favour of king Hiero, and the suffrages of his courtiers; but when the royal patronage no longer prevented each from taking his true place, Pindar feared to the skies, and Bachylides remained on earth. The compositions of Bachylides consisted of hymns, odes, and epigrams, which abounded in moral sentiment; so that the emperor Julian, according to Ammianus Marcellinus, was so much delighted with them, that he was frequently accustomed to repeat their versicks. Horace is said sometimes to have imitated him in some of his pieces, particularly in the prophecy of Nereus, which was suggested by the Greek poet's vaticination of Cisandrea. Some fragments only of Bachylides now remain. See Anacharsis, vol. vi. p. 342.  

Bacchus, a Christian divine, was bishop of Corinth in the second century. He is mentioned by Eusebius, with Polycarpos, bishop of Antioch, and others, who had learnt the mysteries of the orthodoxy of their faith in writing. He afterwards speaks of a letter written by Bacchylus, about the time of celebrating Easter. Ierom, in his Catalogue, says, that Bacchylus, bishop of Corinth, who flourished in the time of the emperor Severus, wrote an elegant book about Easter, in the name of all the bishops of Asia. His works are lost. Enfleb. H. E. l. v. c. 22, 23. p. 190. Hieron. de Vir. Illust. c. 44. Lardner's Works, vol. ii. p. 325.

BACCIFEROUS Plants, in Botany, are such as bear berries, i.e. fruit, covered with a thin membrane, wherein is contained a pulp, which grows soft and moist when ripe, andanel to the fruit within its substance. The bacciferous trees Mr. Ray divides into four kinds: 1. Such as bear a calcilate, or naked berry, the flower and calyx both falling off together, and leaving the berry bare, as the Luffa tree, &c. 2. Such as have a naked monoporous fruit, that is, containing in it only one seed, as the terebinthus, laurina, &c. 3. Such as have a naked, but a polypporous fruit, that is, containing two or more kernels or seeds within it, as the jasminum, ligustrum, &c. 4. Such as have their fruit composed of many alccini or round soft balls, set close together, like a bunch of grapes; as the aua arania, the rubus vulgaris, rubus Idris, and the rubus minor fruticu curculo.  

BACCINIUM, or Baccina, in Antiquity, a bason or vessel to hold water to wash the hands. The holding the bason, or waiting at the bason, on the day of the king's coronation, was an ancient tenure in tercenary. Lib. Rub. Sceccar. f. 157.  

BACCICI, or Baccii, in Biography. See Gaul.  

BACIO, Fra. Bartolomeo, called Bartolommeo di S. Marco, a painter of history and portrait, was born at Savignano, near Florence, in 1460, and became a disciple of Cosimo Roselli; but derived his principal knowledge in the art of painting from Leonardo da Vinci. He understood the true principles of design better than most masters of his time, and was also a considerable painter in perspective; so that he directed the studies of Raphael with regard to the art of managing and uniting colours, as well as the rules of perspective. Some years after Raphael left Florence, Baccio visited Rome; and by the observations he made on the antiques, and the works of Raphael, he made great improvement, which was manifested in his picture of St. Sebastian. This picture, which he finished after his return to Florence, was so well designed, to naturally and beautifully coloured, and had also such an expression of pain and agony, that it was removed from public view in the chapel of the convent, because it made too strong an impression on the imaginations of many women who beheld it. He was very laborious, and studied nature; he digested the naked correctly; his figures had much grace, and his colouring was admirable. To him is ascribed the first invention of the machine called by the artists a layman, and at this day generally used. Upon this he placed his draperies, for the purpose of more accurately observing their natural and their more elegant folds. A capital picture of the Affection by Baccio is in the Florence Collection. He died in 1517. Tukington.  

BACCUS, Andrew, a native of Ancora, practiced medicine at Rome, towards the end of the 16th century. He was physician to Cardinal Mеноio Columna, and afterwards to pope Sixtus the fifth. A man of indefatigable industry, and of great genius and learning, as his numerous publications testify. The principal of them "De Thermen, Lacibus, Flammaibus, et Balneis totius Orbis," lib. vi. was first printed at Venice, 1571; again 1588; then at Rome, 1622, at Padua, 1711, &c. The last edition is augmented with an eighth book, containing analyses of the different mineral waters, with observations extracted from other writers on the subject. We have also of this author, treatises, "De Veneris, et de Antidotis," 4to. Rome, 1585; "De Dignitate

BACCOPOE, in Botany, the name of a fruit very common in Guinea. It is like the banana, except that it is thicker, and shorter. The taste and smell are both very agreeable, and some pretend, that on cutting it through transferably, there is the figure of a crucifix on each side of it. Phil. Trans. N.°108.

BACH, Sebastian, in Biography. The illustrious family of Bach has produced more great musicians, than any other single family in Germany, or, perhaps, in Europe; as previous to the great eminence to which Sebastian had arrived, early in the last century, his family, according to Walther, had distinguished itself in the profession of music, particularly in organ-playing, for four generations. Immemorial are the stories still circulating in Germany, of Sebastian Bach's conflicts and triumphs over great competitors. till at length, like a courser often victorious, his form was so high, as to discourage all competition. He was superior to all organ-players on the continent, as Handel was in England. The performances and compositions of these two great musicians, not only surpassed those of all their contemporaries, but established a style of playing and writing for the organ, which is still respected and imitated by the greatest organists in Germany, where men of superior abilities have always abounded, and been celebrated, not only for treating the manuals, but the pedals of that noble instrument. Sebastian Bach is said by Marpurg, in his "Art de la Fugue," to have been "many great musicians in one, profound in sciences, fertile in fancy, and in taste easy and natural;" he should rather have said, original and refined, for to the ephebites easy and natural many are unwilling to affront; as this truly great man seems by his works for the organ, to have been constantly in search of what was new and difficult, without the leaflet attention to nature and faculty.

Old Kirkman, the harpsichord maker, used to relate the extraordinary curiosity excited at Salzburg, when Handel and Sebastian Bach happened to meet in that city. On their going together to the cathedral, they found it so full that they could scarcely get to the organ-loft; and when one of them opened the organ, it was not possible for more perfoms to crowd into the church. But so great was the fame of these performers, that those who could not gain admission into the interior of the building, procured ladders, and placed them at the windows, in order to gratify their ears with all the passages which the full organ could convey to them through all impediments.

Of Sebastian Bach, who was successively cantor, organist, and music director, at Leipzig, all the musical writers of Germany for the last fifty years, have been testimony to the abilities. Quantz in his "Art of Playing the Flute," written during the life of Bach, says, that this admirable musician had brought organ playing to the highest degree of perfection.

The challenge which he received and accepted, from the celebrated French organist Marchand, at Dresden, is well known in Germany. Upon the arrival of Marchand in that city, after he had vanquished all the organists of France and Italy, he offered to play extempore with any German whom the king of Poland could prevail upon to enter the lists against him; no one at Dresden had the courage to encounter so successful a champion; but an express being sent to Sebastian Bach, who was at that time a young man, and residing at Weimar, he came away immediately, and, like another David, vanquished this Goliah. It must not, however, be concluded from this defeat, that Marchand was a mean performer; if that had been the case, the victory over him would have added nothing to the fame of his competitor. It was an honour to Pompey that he was conquered by Cæsar, and to Marchand to be only vanquished by Bach.

This was the Bach whom the learned editor of the Latin Theoforum, John Matthias Gfner, has celebrated in his notes on Quintilian, i. xii. p. 61. where the ancient eitheraeals are extolled for the use they made of their feet as well as their hands (perhaps merely to beat time) in their performances. The critic addressing himself to the shade of Quintilian, exclaims; "you would think but slightly, my dear Fabres, of all those exertions of the eitheraeals, if you could revist the world, and attend the exhibitions of Bach, one of my colleagues in the university of Leipzig: who, when at the great organ, while every finger of both hands is engaged at the manuals, their feet are running over the pedals with skill and velocity which several of your eitheraeals with 500 tibiae could not emulate; nor is his dexterity in directing a band of thirty or forty performers, all employed at once; correcting the time of one by his hand, of another by his foot; and of a third by holding up a threatening finger; giving the right note to one from the top of his voice, to another from the bottom, and to a third from the middle of it; if you could have seen him avoid the very powerful sounds with which he was surrounded, performing a very difficult part himself, yet marking whence proceeded the leaflet discordance, and aiding those that erred; favourer as I am of antiquity, the exertions of our Bach appear to me to effect what not many Orpheus, nor twenty Arions, could achieve."—

"Maximus aliquo antiquitatis fuctor, multis unum Orphei et viginti Arionas complexum Bachium meum, et qui quis illi similis fit forte, arbitrur." Sebastian Bach died at Leipzig in 1753.

BACH, Charles Philip Emanuel, son of Sebastian, resided many years at Berlin, in the service of Frederic II. king of Prussia: he was afterwards music-director at Hamburg, and long regarded as the greatest composer and performer on keyed instruments of his time; he was certainly the founder of the present style of composition for the piano-forte, as his father and Handel had been for that of the organ. It was observed by Abel, that if Sebastian Bach and his admirable son Emanuel, instead of being music-directors in commercial cities, had been fortunately employed to compose for the stage and public of great capitals, such as Naples, Paris, or London, and for performers of the first class, they would doubtless have simplified their fyle more to the level of their judges; the one would have sacrificed all unmeaning art and contrivance, and the other, he, himself has written, the most simple and easy style. Useless to add, that both, in writing a fyle more popular, and generally intelligible and pleasing, would have extended their fame, and been indubitably the greatest musicians of the eighteenth century.

Emanuel Bach, in his life, written at our request by himself, has some excellent reflections on his own fyle, which he formed and polished by hearing the greatest performers, vocal and instrumental, of his youth, who visited his father, or were employed in the theatre at Berlin. When the critics, says he, are disposed to judge impartially, which seldom happens, they are frequently too severe on works that come under their lath, from not knowing the circumstances that gave them birth, or remembering
ing the author's original intention. But how seldom are critics found to profess feeling; firmness, probity, and courage; qualities without which no one should sit up for a sovereign judge. It is a melancholy truth, that musical criticism, which ought to be useful to the art, is in Germany a trade, com-
monly carried on by dry, malignant, and rapid writers. He then declares that all his works, those for the clave-
chord or piano-forte are the chief in which he has indulged his own feelings and ideas. His principal wish has been to play and compose in the most vocal manner possible, not withstanding the great defect of all keyed instruments, ex-
cept the organ, in not sustaining their tone. But to make a harpsichord or piano-forte sing, is not easily accomplished; as the ear must not be tired by too thin a harmony, nor
flattered by too full an accomplishment. In his opinion, music ought to touch the heart, and he never found that this could be effected by running, rattling, dunning, or arpeggios.

If Haydn ever looked up to any great master as a mo-
tel, it seems to have been C. P. E. Bach; the bold modula-
tion, relts, pauses, and free use of fermatas, and unex-
pected flights of Haydn, remind us frequently of Bach's early works more than of any other composer. But in writing for violins, he has surpassed his model in facility and invention; freaks, whims, and even buffoonery, appear natural to Haydn, which in the works of his imitators seem downright caprice and affectation. Em. Bach used to be confessed for his extraordinary conceptions, crudities, and difficulties; but, like the hard words of Dr. Johnson, to which the public by degrees became reconciled, every Ger-
man composer takes the same liberties now as Bach, and
every English writer uses Johnson's language with impu-
nity. Emanuel Bach died at Hamburg, 1788, at near
eighty years of age.

BACH, John Christian, arrived in England 1763, during the opera reigny of the admirable female singer and actress, Colonna Mattei, who had engaged him as a composer of the serios opera. He was the youngest son of Sebastian Bach, and had been a considerable time in Italy, where he added new lustre to his name and family by his dramatic productions, and had been appointed by the censors queen ornanit of the Duomo at Milan.

On his arrival here, he was extremely mortified to find
that he had no better fingers to write for than Gardoni and the Cremonini, two performers hardly worthy to be ranked in the second class; and for some time he totally declined composing for our stage, being unwilling, as a stranger, to
trul his reputation to such performers. But, at length, having heard the De Amicis sing two or three serios songs in private, it suggested to him the idea of giving her the first
woman's part in his serios opera; and having communi-
cated his design to Mattei the impresario, masters were soon arranged, and the De Amicis, who afterwards held the first
rank among female singers in the serios operas of Naples and other cities of Italy, was now first taken from the comic opera, and invested with the character of principal
woman in the serios. A\nA during the rest of the season, on Tuesday nights, she delighted the town as the representa-
tive of Thalia, and on Saturdays as that of Melpo-
mene. John Christian Bach's first opera in England, called Ori-

care, a fara Diana venandata, was honoured with the praise of
their Majesties on the first night, February the 19th,
1763, and extremely applauded by a very numerous audi-
ence. Every judge of music perceived the emanations of
genius throughout the whole performance; but were chiefly
struck with the richness of the harmony, the ingenious

texture of the parts, and above all with the new and happy
use he had made of wind-instruments; this being the first
time that clarinets had obtained admission in our opera or-
chestra. Their Majesties honoured the second representa-
tion likewise with their presence, and no other serios opera
was produced for near three months. Zambula, however, a

fond serios opera of this admirable composer, was brought out in May, which ran more than a month, when the season closed.

The principal songs of these two operas, though ex-
cellent, being calculated to display the compass of voice and
delicate and difficult expression and execution of De Ami-
cis, were not likely to become common or of much use
out of the opera house. The role of the airs were for dif-
ferently sung, that they were more admired as instrumental
pieces, than compositions for the voice. But this excellent
master soon convinced us that he possessed every requisite
for a great musician, by the songs he afterwards composed
in every style of good singing; by his symphonies, quartets, and
concertos for almost every species of instrument, as well
as by his expressive and masterly performance on the
piano-forte. It is with pleasure that we take this oppor-
tunity of doing justice to the talents and abilities of a
man who improved our taste both in composition and per-
formance. Having very early in life been deprived of the in-
structions of his father, the great Sebastian Bach, he was for
some time a scholar of his elder brother, the celebrated
Charles Phil. Emanuel Bach, under whom he became a fine
performer on keyed-instruments; but on going to Italy, where his chief study was the composition of vocal music, he acquired us, that during many years he made little use of a harpsichord or piano-forte but to com-
pone for or accompany a voice. When he arrived in En-

land, his style of playing was so much admired, that he re-
covered many of the ladies his hand had hitherto been
suitable and by being constantly clapped andcrippled with a pen; but he never was able to reinstate it with force and readiness sufficient for great difficulties; and in general his composi-
tions for the piano-forte are such as ladies can execute with
little trouble; and the allegros rather resemble bravura songs than instrumental pieces for the display of great execution. On which account, they lose much of their effect when played without the accompaniments, which are admirable, and too mately and interesting to an audience, that want of
hand, or complication in the harpsichord part is never dis-
covered.

There are many admirable airs in the operas he composed
for our stage that long remained in favour. The richness
of the accompaniments perhaps deferve more praise than
the originality of the melodies; which, however, are always
natural, elegant, and in the best taste of Italy at the time
he came over. The Neapolitan school where he studied, is
manifest in his cantilena, and the elegance of his father and
brother in his harmony. The operas of this master are the
first in which Da Capo donoes appear, and which, about this
time, began to be generally discontinued; the second part
being incorporated with the first, to which, after modulat-
ing into the fifth of the key, the finger generally returns.

Bach seems to have been the first composer who observed
the law of contrapunct as a principle. Before his time, contrap
there frequently was, in the works of others; but it seems
to have been accidental. Bach in his symphonies and other
instrumental pieces, as well as his songs, seldom failed,
after a rapid and noisy passage, to introduce one that was
flow and bountiful. His symphonies seem infinitely more
original than either his songs or harpsichord pieces, of which
the harmony, mixture of wind-instruments, and general
richness and variety of accompaniment, are certainly the
most
most prominent features. In the sonatas and concertos which he composed for his own playing, when his hand was feeble, or likely to tire, he diverted the attention of the audience to some other instrument; and he had Abel, Pichler, Cramer, Croftill, Cervetto, and other excellent musicians to write for, and take his part, whenever he wanted support.

In 1725, he new set Metafazio's Adriano in Sirla, in the performance of which the rich, powerful, and mellifluous voice of Manzoli was assigned the principal part. The expectations of the public the first night this drama was performed, occasioned such a crowd at the King's theatre as had been seldom seen there before. It was impossible for a third part of the company collected together on this occasion to obtain places. But whether from heat or inconvenience, the unreasonableness of expectation, the composer being out of fancy, or too anxious to please, the opera failed. Every one seemed to come out of the theatre disappointed, and the drama was performed but two or three times. This seemed matter of great triumph to the Italians, who began to be jealous of the Germanic body of musicians at this time in the kingdom. The songs were printed by the elder Wecker, and many of them sung afterwards at concerts with great applause, and found, as detached airs, excellent, though they had been unfortunate in their totality.

Soon after his arrival in England, J. C. Bach and his countryman Abel uniting interests, opened a subscription for a weekly concert; and as their own compositions were new and excellent, and the best performers of all kinds which our capital could supply enlisted under their banners, this concert was better patronized and longer supported than perhaps any one had ever been in this country; having continued for full twenty years with uninterrupted prosperity. Bach had not been long in London before he had the honour of being appointed chamber-musician and music-master to her majesty; and his merit seems to have been constantly well understood and royally patronized at St. James's to the end of his life, which he terminated, after a short illness, in 1752. And having much more genius than worldly prudence, he left his widow Mrs. Bach (formerly the signora Gräfin, first woman at the opera during the run of Gluck's Ofeo) in very indigent circumstances; but her majesty finding that she wished to return to her own country, settled a pençon upon her to enable her to end her days there in ease and comfort.

BACH, in Geography. See BATH.

BACHAASH, in Ornithology, a species of Falco figured in the fifteenth plate of Le Vaillant's work on the birds of Africa. It is about the size of that kind of falcon which we call the common buzzard; and it naturally belongs to that tribe of rapacious birds. The prevailing colour is a very deep brown, with the lower parts of the body and belly spotted with white, and a large band of the same white colour disposed transversely upon the tail. On the back of the head is a tuft of white feathers, with black tips, that forms a crest; the beak and legs are yellow. The plumage of the female is varied with whitish and yellow.

This is a solitary and ferocious creature; and its chief haunts are the barren mountainous parts of South America. It utters a piercing cry, which as it redounds among the rocks is truly lamentable. The rapidity of this bird in flight is remarkable; and its patience when waiting for its prey is not less deserving mention; it will remain for hours together in one posture, and be during that time so completely immovable as to be mistaken for a point of the rock on which it rests; but the moment a lizard or any other reptile appears on which it feeds, it darts down upon it with the greatest velocity. These birds build their nests in the craggy hollows of the rock; and the female lays two, or at most three eggs at a time.

BACHELERI, La, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Martignac; four leagues north of Sarlat.

BACHELOR, or BACHELOR, BACCALAUREUS, in Middle Age Writers, was a denomination given to those who had attained to knighthood, but were not rich enough, or had not a sufficient number of vassals, to have their banner carried before them in battle; or, if they were of the order of bannerets, were not yet of age to display their own banner, but obliged to march to war under the banner of another.

Camden and others define bachelor, a person of a middle degree between a knight and an esquire, of less age and standing than the former, but superior to the latter.

Others will have bachelor to have been a common name for all degrees between a mere gentleman and a baronet.

Thus we find the lord admiral, when he was neither an earl nor baron, denominated a bachelor. "And it is to weet, that when the admiral rideth to assemble a flippage of war, or other, for the business and affairs of the realm, if he be a bachelor, he shall take for his day-wages four shillings sterling; if he be an earl or baron, he shall take wages after his estate and degree." BACHELOR was more peculiarly a title given to a young cavalier, who made his first campaign, and received the military grade accordingly.

BACHELOR was also a denomination given to him who had overcome another in a tournament, the first time he ever engaged.

BACHELORS, Knights, in Heraldry. See Knights Bachelors.

BACHELORS is also used in a college sense, to denote a person posseised of the baccalaureate, which is the first degree in the liberal arts or sciences.

The degree of bachelor was first introduced in the thirteenth century by pope Gregory IX. but it remains still unknown in Italy. At Oxford, before a person is entitled to the degree of bachelor of arts, he must have studied there four years; three years more to become master of arts; and seven more to commence bachelor of divinity.

At Cambridge, to commence bachelor of arts, he must have been admitted near four years, and above three years more before he commence master; and seven more full to become bachelor of divinity. He may commence bachelor of law after having studied it five years.

At Paris, to pass bachelor in theology, a person must have studied two years in philosophy and three years in theology, and held two acts of examination in the Sorbonne. Bachelors in the canon law are admitted after two years study in the same, and obtaining an act according to the forms. A bachelor of physic must have studied two years in medicine, after having been four years master of arts in the university, and having flood an examination; after which he is invested with the rank, in order to be licenced.

In the university of Paris, before the foundation of divinity-professorships, those who had studied divinity five years were admitted to go through their courses, whence they were called baccalaurii curiarii; and as there were two courses, the first employed in explaining the Bible, during three successive years; the second, in explaining the master of the sentences for one year; those who were in their Bible course were
were called *baccalarii Biblii*; and those arrived at the sentences, *baccalarii sententiarii*; and, lastly, those who had gone through both, were denominated *baccalarii formati*, or formed bachelors.

At present, formed bachelor denotes a person who has taken the degree regularly after the due course of study and exercises, required by the statutes; by way of opposition to a current bachelor, who is admitted in the way of grace, or by diploma.

We also find mention of bachelors of the church, *baccalarii ecclesiastici*. The bishop with his canons and bachelors, *cum confitio & confessus omnium canoniceorum fuerat* & *baccalariarum*.

There is scarce any word whose origin is more controverted among the critics than that of bachelor, *baccalarius*, or *baccalureus*; the two different acceptations of the word literary and military, above recited, have each of them their advocates, who affect each to be the primitive sense, and derive the word accordingly.

Among those who hold the military bachelor to be the more ancient, is Ciujas, who derives the word from *baccalarius*, a kind of cavalry, anciently in great esteem. Du Cange deduces it from *baccalaria*, a kind of fesc, or farms, consisting of several pieces of ground, each wherein contained twelve acres, or as much as two oxen would plough; the possessors of which *baccalaria* were called bachelors.

Cafeneve and Alfatera derive bachelor from *baculus* or *baculis*, a staff, because the young cavaliers exercised themselves in fighting with staves. Martinius derives it from *baccalureus*, i.e. *bacci laurei donatus*, in allusion to the ancient custom of crowning poets with laurels, *bacis lauri*; as was the case with Petrarch at Rome in 1341. Alciat and Vives are of the same opinion; nor is this etymology improbable.

Bachelors, in the livery companies of London, are those not yet admitted to the livery.

These companies generally confit a master, two wardens, the livery, and the bachelors, who are yet but in expectation of dignity in the company, and have their function only in attendance on the master and wardens; they are also called yeenons.

Bachelors is also a name given in the six companies of merchants at Paris to the elders, and such as having served the offices, have a right to be called by the masters and wardens to be present with them, and affix their names in some of their functions; in particular it relates to the *chef d'oeuvres* or master-pieces, of such as are candidates for being admitted masters.

Bachelors is also particularly used for a man not married, or who is yet in a state of celibacy.

The Roman censors frequently imposed fines on old bachelors. Dion. Halicarnassius mentions an old constitution, by which all persons of full age were obliged to marry. But the most celebrated law of this kind was that made under Augustus, called the *lex Julia de maritiis ordinatis*, and by Horace (Carm. Secul. v. 5.) *lex maritai*, by which bachelors were made incapable of legacies of inheritances by will, unless from their near relations. See Papian-Pop. LXX.

The Rabbins maintain, that, by the laws of Moses, every person, except some few, is obliged in confidence to marry at twenty years of age: this makes one of their 613 precepts. Hence those maxims so frequent among their causals; such as, that he who does not take the necessary measures to leave heirs behind him, is not a man, but ought to be reputed a homicide. Lycurgus was not more favourable; by his laws bachelors are branded with infamy, excluded from all offices civil and military, and even from the flames and public sports. At certain feasts they were forced to appear, to be exposed to the public derision, and led naked round the market-places. At one of their feasts, the women led them in this condition to the altars, where they obliged them to make an *amende honorable* to nature, accompanied with a number of blows, and lashes with a rod at discretion. To complete the affront, they forced them to sing certain songs composed in their own derision.

The Christian religion is more indulgent to the bachelor-state: the ancient church recommended it as preferable to, and more perfect than the matrimonial state.

In the canon law, we find injunctions on bachelors, when arrived at puberty, either to marry, or convert monk and profess chastity in canons.

In Great Britain, taxes have been occasionally levied on bachelors, as by 7 W. III. 1695, which imposed a tax on such, after 25 years of age, of 12l., 10s. for a duke, and 15. for a common person; and the taxes laid on others have been increased with regard to bachelors, as in the case of the duty on servants by Stat. 25 Geo. III. c. 45. See Service.

Bachelors, in Geography, a river of South America, which runs into a bay of the same name, on the north side of the isle of Magellan. N. lat. 58° 28'. W. long. 73° 52'.

BACHER, the name of a chain of Austrian mountains, in the south of Styria.

BACH'S Toxic Pills, in the Mediziris Medicina. See Helber, and Pills.

BACHIAN, or Batchian, in Geography, one of the Molucca islands, lying south from Machian, and possess'd, since the year 1610, by the Dutch. This is the largest of the little Moluccas, and is governed by a sultan, who is likewise sovereign of Oubi and Ceram, together with Gorom. This monarch has a pension from the Dutch, either for the destruction or supply of nutmegs; but he is otherwise little subservient. Bachian rises into woody hills, and through the idlenes or oppression of its inhabitants, is suffered to become wild and desert, although by cultivation it is capable of becoming fertile and productive, and it was represented as formerly producing the best cloves in the Moluccas. On the shores, as in most of the other isles of this archipelago, there are prodigious rocks of coral, of infinite variety and beauty. Its principal town is Sabangó; it is about twice twelve leagues in circuit, and has a burning mountain. It is situated nearly under the equinoctial line. S. lat. 0° 25', and E. long. 145° 5'.

BACHINA, in Ancient Geography, an island of the Mediterranean sea, near Smyrna, according to Plyn; called by Livy, Bachium.

BAChIMUT, a town of Russia, in the province of Ekaterinolov, 104 miles W. N. W. of Azof. N. lat. 48° 25'. E. long. 37° 44'.

BACHO, a river of North Wales, which runs into the Severn near Llanllo, in Montgomeryshire.

BACHOIKZ, or SKVCHTSCH, a town of Poland, in the Palatinate of Sandomierz, 20 miles south of Radom.

BACIOVIUS, Rheiher, in Biography, a German citizen, was born at Cologne, in 1544, and resided at Leipsic, where he suffered persecution on account of his religious principles, as he professed attachment to the doctrines of Calvin, rather than to those of Luther. Compelled not only to resign his public offices, but to quit Leipsic, he withdrew into the Palatinate, and found in the elector a generous patron. At Heidelberg, he held several honourable and lucrative posts till his death in 1614. In a theological tract,
to the horse's length, and the number of dips, will give a mean depth. When this is done, try being made in different parts of the back, until one is found which answers exactly to the mean depth; let a mark or notch be made at the side of the back, to point it out as the true dipping place for the future.

The bottom of large backs ought to be everywhere equally and well supported, to secure them from warping, which else they will do, more and more as they grow older. Those who make backs and other vessels for brewers, are denominated back-makers; and the workmanship confers partly of carpentry and partly of cooperage.

Back, in the Distillery, a vessel in which liquor is put to be fermented.

Back, or Dutchman's Cap, in Geography, one of the small islands of Scotland, eleven miles south-east of Coll.

Back, Iron, a large plate of cast iron, frequently adorned with figures in low relief, intended to preserve the work of a chimney-back, and to reflect the heat of the fire.

Back a Ship, To, in Sea Language: when the wind is cross, or nearly off shore, or in the opposite direction, ships will always back by the main top-sail, affixed, if necessary, by the mizen top-sail. If there be no mizen top-sail, the main top-sail is used. In backing, always keep a flight cable, to wind the ship, that the anchor may be drawn round. If the wind be not sufficient for this purpose, the ship must be hove a-peak.

Back the Anchor, is to carry out a small anchor a-head of the large one, in order to support it in bad ground, and to prevent its loosening or coming home.

Back a-tern, To, in rowing, is to impel the boat with her stern foremost, by means of the oars.

Back of the Pofl. See Stern-Pofl.

Back the Stills, is to put them in a situation that will occasion the ship to retreat or move a-tern. This operation, however, is only performed in narrow channels, when a ship is carried along sideways by the tide or current, and strives to avoid any thing that may interrupt her progress, as shoals, vessels at anchor, &c. or in the line of battle, when a ship would put herself into a situation opposite to another with which she is engaged.

Backberond, or Backberend, in Law Writers, denotes a criminal caught carrying off something on his back.

In this sense Bracton uses it for a species of which the civilians call manifet theft, jurtum manifetum.

In the Forrest Law, backberond is one of the four circumstances, or cases, wherein a forester may arrest the body of an offender against vert or venison in the forest. The others are flat-billed, back-armed, and bloody-bay.

Back-Board, in Maritime Affairs, is of a semicircular figure, placed transversely in the after-part of a boat, like the back of a chair, to recline against while fitting in the flour-stocks.

Backleys, in Zoology, a denomination, derived from backley, which in the Hottentot language signifies war, and given by the Hottentots to those oxen which they train for war and use with success, as the Indians employ the elephants in their combats. In all their armies there are considerable troops of these oxen, which are easily governed, and which are let loose by the chief, when a proper opportunity occurs. They invariably dart with impetuosity on the enemy; flanking with their horns, kicking, and trampling under their feet every thing that opposes their fury. By running furiously into the ranks and putting them into disorder, they prepare an easy victory for their masters. These animals are likewise of great use in guarding the flocks. At the smallest signal from the keeper, they collect and bring back those that wander; and they also...
also run with great fury upon strangers, and serve to secure
the flocks and herds against the attacks of the bukeys,
or robbers of cattle. Every kral has at least six of these
beckyels, which are chosen from among the fiercest oxen;
and after they have been duly trained, they distinguish friends
from enemies, understand signals, and obey the voice of
their master. If a bukey, and particularly an European,
should approach the cattle, without being accompanied by
a Hotentot, his life would be in great danger. These
beckyels would soon run round him at full gallop, and if
not protected by the shepherds, by fire arms, or by disorderly
climbing a tree, his destruction would be inevitable. Kobo,
Voyage et Description du cap de Bonne Espérance, cited by

BACKER, or Bakker, Jacob, in Biography, an histo-
rical painter was born at Antwerp in 1530, and received
instruction from his father; after the death of his father,
he resided in the house of Jacopo Palermo, a picture-dealer,
who, for the gratification of his own averses, kept him in-
cently employed, and disposed of his pictures at Paris,
where they were much admired and fetched a high price;
whilst the artist himself was continued in an obscure and
depressed condition. He was distinguished by a clean light
manner of pencilling, and a very pleasing tint of colour.

He died in 1560. Pilkington.

Backer, or Bakker, William, was born at Antwerp, and was a disciple of Rubens, at
the same time with Vandyck. At the commencement of the exer-
cice of their profession, Backer was esteemed little, if
at all, inferior to Vandyck; as appears from the works of the
former in the church of the Augustin monks at Antwerp,
where these two great artists painted as competitors; and each
possessing a mode peculiar to himself, the superiority was
not determined in favour of either. Backereel, by the exer-
cise of his poetical talents, and particularly by his fancies
against the Jesuits, incurred the persecution of this power-
ful fraternity, and by their persecution, he was compelled to
leave Antwerp, so that his country was deprived of the
honour which mull have accrued to it from his perform-
ances as a painter. In Italy, and the Low Countries, there
were seven or eight eminent painters, of the name of Back-
reel. Pilkington.

Back-Gammon, a game played with dice and tables, to
be learned only by observation and practice. This game is
said to have been invented in Wales, in the period preceding
the conquest, and to have derived its name from two Welsh
words, back, little, and common, battle. Gloss. ad Leges
Svo.

Back-Heater, in Agriculture, a machine long used in
several parts of England, particularly in Hampshire, Wilt-
shire, and Suffolk, for winnowing corn. An improved
construction of this machine, illustrated by a figure, was
proposed by Dr. Hales, in the year 1747, which, he says,
will not only render it fit for winnowing corn sooner and
better than by any other means hitherto used, but also for
clearing it of the small corn, feeds, black, best-balls, &c.
to fuch perfection, as to make it proper for feed-corn. See
Hales’s UEs of Ventilation, part. p. 247, &c.

Backhuysen, Ludolph, in Biography, an eminent
painter of ships, sea-pieces, and sea-port, was born at
Embden, in 1681, and after receiving early instruction
from Albert van Everdingen, acquired his principal knowledge
by frequenting the painting-rooms of great masters, and
particularly Henry Drubbels, and observing their various
methods of touching and colouring. His improvement was
very considerable, and his drawings were in such estimation,
that several of them were purchased at 100 florins apiece.
While he was painting, his mind was so much engaged, that
he would not allow his most intimate friends to have access
to him, lest his ideas should be interrupted. He studied
nature with singular attention in all her forms; in gales,
calms, storms, clouds, rocks, fides, lights, and shadows; and
he expressed every subject with so sweet a pencil, and such
a degree of transparency and lucidity, as placed him above all
the artists of his time in that style, the younger Van-
derveele excepted. It was his frequent custom to go out to
sea in a storm, in order to store his mind with grand
images, directly deduced from nature; and at the moment
of his landing, he flew to his palette, that the traces of
those incidents which had occurred might not be obliterated
by delay. Backhuysen perfectly understood the manage-
ment of the chiaro-uro; and he was thus able to give
uncommon force and beauty to his objects. He also
freely observed the truth of perspective, in the distances of his
vessels, the reeding of the grounds on the shores, and the
different buildings, which he described in the sea-ports. His
works may be easily distinguished by 100 florins apiece,
from the freedom and neatness of his touch; from the
clearness, and natural agitation or quiescence of the water;
from a peculiar tint in his clouds and skies; and also from
the exact proportions of his ships, and the gracefulness of
their position.

For a picture, exhibiting a multitude of vessels, and a
view of the city at a distance, he received from the burgo-
masters of Amsterdam 1500 gilders, and a considerable
present; and this picture was afterwards given to the king
of France, who placed it in the Louvre. No painter was
ever more honoured by the visits of kings and princes
than Backhuysen; the king of Prussia was one of their
number; and the Czar Peter the Great took delight in
seeing him at work, and often endeavoured to draw, after
vessels which he had described. He was remarkably afflu-
ous; and yet the number of pictures which he finished, and
the exquisite manner in which they are painted, are aston-
ishing. He died in 1750. Pilkington.

Backing a Coat, in the Match, the operation of bring-
ing him to the floor, or bringing him to endure a rider.

To back a cot, they usually take him into ploughed
ground, trot him a while, to rid him of his wantonness;
then having one flay to his head, and govern the charging-
rein, the miler mounts his back, not suddenly, but by
degrees, first making several offers, or half-rulings; when he
beats thee patiently, he mounts in earnest, and settles in his
place, cherishing him, &c.

Backing Warrants, in Law, denotes the signing of
3 2
such as have been inflicted by a justice of the peace in one county, by a justice of the peace in another county, which is necessary before they can be executed there. This practice, which has long prevailed without law, is authorized by statutes 23 Geo. 11. c. 26. and 24 Geo. 11. c. 55. And now, by statute 13 Geo. 111. c. 31. any warrant for apprehending an English offender, who may have escaped to Scotland, and vice versa, may be endorsed and executed by the local magistrates, and the offender conveyed back to that part of the united kingdom, in which such offence was committed.

Back-Nails. See Nail.

Back-Painting. is used by some for the art of pasting of prints and other designs on glass.

The art consists chiefly in laying the print upon a piece of crown-glass, of such a size as fits the print. In order to do this, the print must be soaked in clean water for forty-eight hours, if it be on very strong, close, and hard gummed paper; but if on a soft, spongy paper, two hours will sometimes be sufficient. The picture, being well soaked, must be laid between four sheets of paper, two over and two under it, that the moisture may be drawn out of it. Instead of soaking the print, it may be rolled up and boiled for about two hours, more or less, according to the quality of the paper, in water; and this mode will answer the purpose as well as soaking it. In the mean while, let the glafs upon which the print is to be laid be heated at the fire; then with a hog's-hard brush dipped in melted Straburg turpentine, spread the turpentine smoothly and evenly on the glafs. Then lay the print upon the glafs, rubbing it gently from one end to the other, that it may lie close. With the finger, rub off the paper from the back side of the print, till nothing can be seen but the print, like a thin film left upon the glafs, and let it abide to dry. When it is dry, varnish it over with some white transparent varnish, that the print may be seen through it, which is now fit for painting.

Having prepared a variety of oil colours, which must be ground very fine, and tempered very stiff, lay such colours on the transparent print as each particular part requires, the matter-lines of the print guiding the pencil; and thus each colour will appear fair to the eye on the other side of the glafs, and look almost as well as a painted piece, if it be done neatly. The shadows of the print are generally sufficient for the shadow of every colour; but if it be desired to give a shadow by the pencil, the shadows should be laid on first, and the other colours afterward. The chief care to be used in this part of the work, is that of laying the colours on thick enough, that they may be struck plainly through the glafs.

Back-River, in Geography. See Baltimore.

Backs, among dealers in leather, denote the thickest and belt tanned hides, used chiefly for foles of shoes. See Butts.

Backs of a Hip. See Hip.

Back-Staff, in Navigation, an instrument, by the French called the English quadrant. It was invented by captain Davis, about the year 1590; and is of good use in taking the sun's altitude at sea. It consists of three vales, A, B, and C, and of two concentric arches (Plate 1. Navigation, fig. 2.) ; the vane at A, called the horizon-vane; that at B, the shade-vane; and that at C, the light-vane. The left arch B (or ED) is of 60 degrees, and that of C (or FG) of 30 degrees.

T. of the back-staff. The shadow-vane B is set upon the 60 arh, to an even degree of bore latitude, left by 10 or 15 degrees than you judge the complement of the sun's altitude will be; the horizon vane is put on at A, and the light-vane on the 30 arh FG; the observer's back being then turned to the sun (whence the name of back-staff, or back-quadrant), he lifts up the instrument, and looks through the light-vane, raising or falling the quadrant, till the shadow of the upper edge of the shade-vane fall on the upper edge of the slit of the horizon vane; and then if he can see the horizon through the said slit, the observation is well made; but if the sea appear instead of the horizon, the light vane must be moved lower towards F; if the sky appear, it must be moved upward towards G; and thus tried till it comes right: then he observes how many degrees and minutes are cut by that edge of the light-vane which answers to the light-hole, and to them adds the degrees cut by the upper edge of the shade-vane: the sum is the sun's distance from the zenith, or the complement of his altitude. To find the sun's meridian, or greatest altitude on any day, continue the observation as long as the altitude is found to increase, which you will perceive by the appearance of the sea, instead of the horizon, removing the light-vane lower; but when you perceive the sky appear instead of the horizon, the altitude is diminished; therefore, desist from further observation at that time, and add the degrees upon the 60 arch to the degrees and minutes upon the 30 arch, and the sum is the zenith distance, or co-altitude of the sun's upper limb.

And because it is the zenith distance, or co-altitude of the upper limb of the sun, and not the centre, that is given by the quadrant, in observing by the upper edge of the shade-vane, add 16 minutes, the sun's femidiameter, to that which is produced by your observation, and the sum is the true zenith distance of the sun's centre. If you observe by the lower part of the shadow of the shade-vane, then the lower limb of the sun gives the shadow; and, therefore, you must subtract 16 minutes from what the instrument gives; but considering the height of the observer above the surface of the sea, which is commonly between 16 and 20 feet, you may take 5 or 6 minutes from the 16 minutes, and make the allowance but of 10 minutes or 12 minutes, to be added instead of 16 minutes.

Mr. Flamstead contrived a glass lens, or double convex, to be placed in the middle of the shade-vane, which makes a small bright spot on the slit of the horizon-vane, instead of the shade; which is a great improvement, if the glasses be truly made: for, by this means, the instrument may be used in hazy weather, and a much more accurate observation made in clear weather than could be by the shadow.

The theory of this quadrant is very intelligible: for the line AC being horizontal, the arc JGC is equal to the height of the sun above the horizon; but this arc JGC is equal to the sum of the arcs BD + GC; and the arc of F = 90° = the altitude and zenith distance taken together; consequently the zenith distance = the arcs JD + CF = DB + CF.

When the horizon is obscured by hazy weather, Davis's quadrant is of no use; and this often occasions distressing consequences. Means have therefore been sought for to remedy this defect. Mr. Hadley has recommended and described a spirit level for this purpose. Mr. Leigh proposed to fix a water-level to the quadrant; and he has likewise given the description and use of an apparatus to be used to this instrument, confiding of a metallic level, which he named the level glass, in a second Trans. N. A. S., or Martin's Astr. Abt. vol. viii. p. 57. 360. &c.

It has been observed, that one great objection against this instrument is the trouble and time lost in fixing the light-vane upward or downward, which sometimes cannot conveniently
BAC

conveniently be done without taking the quadrant from the eye, by which an opportunity may be lost for making the observation. But this defect is easily removed by having a long index or ruler fitted to the quadrant; one end moving round the centre to which the horizon-vane is fixed, and having the right-vane fixed to the other end. By this contrivance the right vane may be readily raised higher, or lowered, by the motion of the index about its centre; and this may be done without taking the instrument from the eye. See QUADRANT.

Back-Stays of a Ship, are ropes belonging to the main-mast and fore-mast, and the masts belonging to them, serving to keep them from pitching forwards or overboard. See STAYS.

Back-Slaves, Travelling, are used in bad weather to support the fore and main-top masts; they fiddle into a span, round the top-mast, under the parcel, and let up in the chain, with a huff-tackle, to an eye-bolt. They travel up and down the top-mast occasionally with tricing lines that fiddle into a thimble, on each side of the span, and through blackskized to the top-mast tackle-trees, and lead into the top.

Back-Worm, a name given by Sempach to a disease very common among hawks, and called also fliauder; which fec.

BACO, in Geography, the capital of Mindoro, one of the Philippine islands, where the Alcaide, or governor, resides. Its environs are well watered by springs proceeding from mountains covered with farmpaluria. See MINDORO.

BACOBA, in Botany, a name by which some authors call the banana tree, or nufa frutta brevett. Pifio.

BACOFEN, in Geography, a town of Bohemia, in the circle of Budeslaw, five miles N. N. E. from Jung Buntzhu.

BACON, swine's flesh, salted, and dried in the chimney. Writers on this branch of economics give rules for the hanging, the salting, and curing of bacon, larding with bacon, &c.

This appears to be in general an extremely improper and unhealthy aliment, especially for people who do not use great exercise; for those who do eat almost any thing without injury. Swine's flesh, considered as an aliment, is none of the belter; and when hardened by salt, and dried by smoke, it is rendered more indigestible, and in consequence of that, productive of obstructions in a very great degree. We may add, that the fat of bacon frequently becomes rancid and acrimonious, and often even excites the mouth and throat.

BACON-Sward, denotes the thick outer skin taken off the lard or fat. Old historians and law writers speak of the sward of the bacon, a custom in the manor of Whitchurch in Staffordshire, and priory of Dunmow in Essex; in the former of which places, by an ancient grant of the lord, a flock of bacon, with half a quarter of wheat, was to be given to every married couple, who could swear, that having been married a year and a day, they would never within that time have exchanged their mate for any other person on earth, however richer, fairer, or the like. But they were to bring two of their neighbours to swear with them, that they believed they swore the truth. On this, the lord of another neighbouring manor, of Rudlow, was to find a horse saddled, and a fack to carry the bounty in, with drums and trumpets, as far as a day's journey out of the manor; all the tenants of the manor being summoned to attend, and pay service to the bacon. Platt's Hill, Staff. c. x.

The bacon of Dunmow, first granted under Henry III. was on much the same footing; only the tenor of the oath was, that the parties had never once repented, or wished themselves unmarried again. In. c. x. Art. 82.

Bacon, Robert, in Biography, an English divine of the thirteenth century, was born about the year 1168, completed his education at Paris, and returning to Oxford, where he had commenced his studies, read lectures in divinity, and became a famous preacher. In one of his sermons, preached at Oxford, in 1233, before Henry III., he reproved the king for his partiality to foreigners, and faithfully informed him, that this was the principal cause of the discontent which prevailed among his subjects. Such was the impression made by this address, that the king is said to have discovered a disposition to listen to the complaints of his nobles. Bacon was privileged with the friendship and patronage of Edmund Rich, called St. Edmund, archbishop of Canterbury; and after his decease, in 1240, wrote his life. He was also the author of several commentaries, sermons, and lectures. Some have supposed that he was the brother of the celebrated Roger Bacon; but as Robert died in 1248, at an advanced age, and Roger was not born till the year 1214, it is not probable that they were brothers. Biog. Brit.

Bacon, Roger, a celebrated English monk of the Franciscan order, was born at Ichthel in Somersetshire, in the year 1214, and at an early age received the rudiments of learning and science at Oxford, where he prosecuted his studies with an ardour and success which secured him the patronage and friendship of the most eminent men in that university. In the number of these we may reckon Robert Grouthhead, bishop of Lincoln, to whom he was particularly indebted, and of whom he speaks in terms of high commendation; Edmund Rich, archbishop of Canterbury; William Shirwood, chancellor of Lincoln; and Richard Rich, who was a distinguished lecturer in the sciences both at Oxford and at Paris. Having spent some years at Oxford in the study of languages, logic, mathematics, and various branches of philosophy, he removed, according to the custom of that age, to Paris, where he was distinguished both by his affability and improvement, and where, in token of his acknowledged eminence in literature and science, he received the degree of doctor in theology. While he was in France, or soon after his return to England, in the year 1240, he took the monastic habit in the order of St. Francis, and with a view of pursuing his studies and researches with the greater advantage, he settled at Oxford. Such was the esteem in which he was generally held, and so high were the expectations which his contemporaries entertained of the benefits that would result from science from the vigour of his mind and the affability of his application, that he was enabled, by generous contributions, to collect books, to construct instruments, and to prosecute his experiments, during a course of twenty years, at an expense of 2000l, which, considering the time in which he lived, was a very large sum. His growing fame, however, excited envy; and the monks of his own order indifferently circulated a report, that he held converse with evil spirits, and practised magical arts. His enemies so far prevailed, that, under a pretence of dangerous innovations, tending to disturb the peace of the church, which Bacon was attempting to introduce, he was restrained from reading lectures to the young students in the university; and at length so closely confined as to be debarred from all intercourse with his friends, and from receiving a necessary supply of food. The prelates and the monks, says Bacon himself (Epist. ad Claud. IV.), were afraid lest his own discoveries should extend beyond the limits of his consent, and be seen by any members of the same college and the papal. But other circumstancles had contributed to excite against Bacon the spirit of persecution. He had confounded the clergy, on account both of their ignorance and immorality; he was particularly intimate with bishop Grouthhead, who had written a letter of reproof to pope Innocent IV., and declared to his confidential
BAC

dent associates, that in his judgment the pope was anti-Christian; and he himself had written freely to the pope, concerning the necessity of a reformation. The efforts of malice, whatever might have been the real or pretended causes from which they originated, could not deprive this great man of the esteem and respect to which his distinguished talents and character entitled him. Such was the high opinion entertained by the cardinal bishop of Sabina, who was the pope's legate in England, of his genius and merit, that he requested from him a complete copy of all his works. As he was restrained, by the prohibition of his own fraternity, from communicating any of his works to any person whatever, he at first declined complying with the cardinal's request; but as soon as he heard that the cardinal-legate was raised to the pontifical dignity, under the name of Clement IV., he signified to him by letter his resolution to perform what his holiness had desired; and the pope assured him of protection against any interference of his own order. Bacon immediately began to collect, arrange, and improve the pieces he had already written, and having digested them into one volume under the title of "Opus Majus" (the greater work), he sent it to the pope, in the year 1292, by a special messenger, whose name was John of Paris, and who was his own favourite disciple. This John of Paris was a poor boy, of promising talents, taken by Bacon under his tuition, in order to try by experience the efficacy of his peculiar mode of instruction; and, as the result of it, he observes, "that there was no room to conceive any high notions of the perfection of human wisdom, when it was possible, in a year's time, to teach a young man all that, with the utmost industry and application, a zealous inquirer after knowledge was able either to acquire or to discover in the space of twenty, or even forty years." (See Opus Majus, p. 29, and Jebb's Preface.) The pope was so gratified with the present of this learned work, that it procured for Bacon extraordinary favour and encouragement in his studies.

With the life of the enlightened and liberal Clement IV., terminated the tranquillity of this philosopher; for in 1278, under the pontificate of Nicholas III., and with the sanction of his authority, Jerem de Estefo, general of the Franciscan order, prohibited the reading of his works, and sentenced him to imprisonment. The pretended cause of this severity has been fought by some writers in tracts of Bacon on accursacy, astrology, and alchemy; but the true reason was most probably that dread of innovation which Bacon's improvements in science caused in the minds of bigotted or interested persons. Bacon continued in prison for ten years; but upon the accession of Jerem de Estefo to the papal see, under the name of Nicholas IV., he attempted to conciliate the favour of the pope, by prenticing to him a treatise, "On the Means of avoiding the Infirmities of Old Age." But his endeavours seem to have been ineffectual, as he still remained in prison, and was not released till about the latter end of this pontificate, when some English noblemen interceded in his favour, and obtained for him his liberty. Upon his return to Oxford, he wrote, at the request of his friends, "A Compendium of Theology," of which a copy is preserved in the Royal library. This work appears, from internal evidence, to have been written about the year 1291; and as additions were afterwards made to it, it is hence inferred that the author lived till the year 1293, or the seventy-eighth year of his age. The learned editor of his "Opus Majus" dates his death in 1294; but Anthony Wood, from two MSS. which he mentions, fixes the time of it to the 1st of June, 1292; and Dr. Freind acquiesces in this opinion. He is said to have died in tranquillity, in the college of his order, and to have been interred in their church. Tradition reports, that in order to prevent the unlearned being occasioned by his enemies, in the earlier period of his life, and while he was professing his studies, and performing his experiments at Brazen-nock-hall at Oxford, he was obliged to retire from the university into a solitary place, called to this day "Friar Bacon's Study." and Mr. Hearne informs us, that he sometimes retired in the summer to Sunning Well.

When we contemplate the extraordinary powers and attainments of Bacon, and review the important and useful discoveries that were made by him in various branches of science, and compare them with the period in which he lived, we shall not be surprised that he was distinguished by the title of "doctor infallible," or wonderful doctor; whatever might be the reasons which induced the monks of his order thus to discriminate him. With respect to his knowledge of the languages, which he thought to be the foundation of all true learning, it appears that he was perfect master of the Latin, Greek, and Hebrew, and that he had studied those languages with a degree of critical exactness which renders some of his observations in that part of the "Opus Majus," which treats on this subject, judicious and instructive. With various branches of the mathematics he was well acquainted; and in mechanics his knowledge was such, that, in the judgment of Dr. Freind, "a greater genius had not arisen since the days of Archimedes." Accordingly, in his treatise, intitled, "Epitola Pratis Rogeri Baconis de secrectis Operibus Artis et Naturae, et de Nullitate Magnis," he propounds the construction of wonderful instruments, which may be artificially contrived, by which fuch things (says he) may be done without the help of magic, as magic itself is incapable of performing. "For a veil may be so constructed, and oars therein so disposed, as to make more way with one man in her, than another veil fully manned." "It is possible (says he) to make a chariot which, without any assistance of animals, shall move with that irresistible force which is ascribed to those feythed chariots in which the ancients fought." "It is possible," adds our author, "to make instruments for flying, so that a man sitting in the middle thereof, and gliding with a kind of rudder, may manage what is contrived to answer the ends of wings, so as to divide and pass through the air. It is not less possible to make a machine of a very small size, and yet capable of raising or sinking the greatest weights, which may be of infinite use on certain occasions, for the help of such an instrument, not above three inches high, or less, a man may be able to deliver himself and his companions out of prison, and to ascend or descend at pleasure." Hence it has been inferred that Bacon was acquainted with the perpetual screw. Our author's knowledge of the science of optics was so accurate and comprehensive, that he is justly allowed to have understood the theory and practice of many of those discoveries, the application of which has been so important and useful in more modern times. Besides the descriptions of the camera obscura, and of burning glasses, which are found in his writings, we have unquestionable evidence that he was well acquainted with the properties of convex and concave lenses, and with the effects of refraction; and some have even ascribed to him the honour of having invented the telescope. (See these several articles.) In geography his researches were various and extensive; and his acquaintance with astronomy enabled him to discover the errors of the calendar, and to propose the proper method of correcting them. See Calendar.

Although Roger Bacon was in some instances misled by the visionary projects of the alchemists of his age, and though...
though he indulged chimical notions of the medicinal virtues of the aurum potabile, or tincture of gold, and of a secret charm for renewing the native heat of old men, he was led by his chemical processes into an acquaintance with the properties of bodies, and a variety of discoveries that were no less important and useful than novel and curious. Such, in particular, was that of the ingredients and effects of gunpowder, which was for a long time supposed to have been the invention of a much later period. (See Gunpowder.) Of his medical knowledge we have evidence in his "Treatise on Old Age," blended with many things that are obscure and fanciful; and though he so far partook of the superlition of the times as to place some confidence in judicial astrology, he was an enemy to necromancy and magic. The imputation on his character of his leaning to magic, was altogether unfounded; and the story of his having constructed a brazen head, which propofed and answered questions, is as ridiculous as it is groundless. The first object of this calumny, was his patron Robert Grossethead or Grosפילhead, bishop of Lincoln; and familiar tales have been related of pope Sylvester II., Albertus Magnus, and other eminent philosophers; but they gained credit merely with men and ignorant persons. In logic and metaphysics, as well as in philosophy, and the politer parts of learning, Bacon was equal, if not superior, to most of his contemporaries; and his treatise on Ethics, or moral philosophy, contains many excellent principles for directing the judgment, and regulating the conduct. To theology, all his other studies were subordinated; and he directed both his actions and his writings to the glory of God, and the good of his fellow-creatures. To the holy scriptures he paid due deference; and he enforced the study of them in their original languages, and an affidious application to the several branches of learning which he thought necessary for rightly understanding and interpreting them. This seems to have been the object of his last treatise, which he left as a kind of testament to his order.

As the whole life of friar Bacon was spent in study and writing, we need not wonder that his works were very numerous. Bale speaks of upwards of fourscore books written by him; and Dr. Jebb has digested a still greater number, under the distinct heads of grammar, mathematics, physics, optics, geography, astronomy, chronology, chemistry, magic, medicine, logic, metaphysics, ethics, theology, philosophy, and micellany. It feems, however, that the number has been multiplied by means of the different titles under which various copies of the same treatise have been diffpered, and by considering the titles of distinct chapters of his works, as the titles of separate treatises. Accordingly, eleven of these pieces will be found in the work intitled, "Epitola Fratris Rogeri Baconis, &c." already mentioned, published in 4to. at Paris, in 1542; in 8vo. at Basile, in 1593; in 8vo. at Hamburgh, in 1608 and 1618. This treatise abounds with various physical facts and observations, and exposes the futility of the several practices of necromancy, charms, divination, and magic. The "Opus Majus," written in the form of an epistle or address to pope Clement IV. is professedly a digest of the author's former writings. "In this curious and valuable work, Bacon describes the impediments which hinder men from arriving at true and useful knowledge; illustrates, at large, the usefulness of the studies of grammar, mathematics, and perspective; explains the nature and value of experiments in philosophy; and earnestly exhorts the pontiff whom he addresses, to give all possible encouragement to science in general, and particularly to the study of nature. This work, which affords abundant proofs of the author's superior talents, and, confidering the time in which he lived, of his wonderful knowledge, long remained buried in oblivion, and never appeared in print till, in 1733, Dr. Jebb, from various collated MSS. text from the prens of William Bawyer, a correct and beautifull edition in folio. Bacon wrote many chemical treatises, most of which may be found in "Theafrasus Chemicus," printed in 8vo. at Frankfort, 1603, 1620: others are in MS. in the university library of Leyden. His treatise "On the Means of avoiding the Infirmities of Old Age," in which, beside a regular course of life, he recommends the use of certain secret and extraordinary medicines, was first printed at Oxford in 1702, and afterwards translated into English, with notes, by Dr. Richard Browne, under the title of "The Cure of Old Age, and Preservation of Youth," 8vo. 1685. Several treatises of friar Bacon, yet unpublished, remain in MS.; a piece, bearing the title of "Liber Naturalium," a treatise on Chronology, intitled, "Computus Rogeri Baconis," and the "Compendium of Theology," are to be seen in the King's library; and two other works, which the author called "Opus Minus," and "Opus Tertium," remain in the Cotton library; and other pieces might probably be found by diligent search."

Although in the present advanced state of literature and science, we could not expect to derive much assistance from our means of knowledge from the publication and study of friar Bacon's works, yet as a display of the astonishing powers of the human intellect, and as a valuable part of the history of knowledge, they ought to be preferred and known. The want of a complete edition of his works is the less to be regretted, since the public have been put into possession of his "Opus Majus," by Dr. Jebb.

From the brief account that has been given of the talents and performances of friar Bacon, it will appear, that he contributed, in a very eminent degree, to illuminate the dark age in which he lived, and to prepare the way, by emancipating the mind from the authority of Aristotle, and pursuing a plan of experiment and induction in the prosecution of science, for those discoveries and improvements, which have distinguished a later period. Although allowance should be made for the language of panegyric, which characterizes Bacon as the "brightest and most universal genius that perhaps the world ever saw," he must ever be regarded as a prodigy of learning and science, and a very high rank must be assigned to him among those who have been instruments of enlightening and reforming the world. Jebb's Pref. to Bacon's Opus Majus. Cave, H.L. i. n. p. 325. Baging, Brit.

Bacon, Sir Nicholas, an eminent lawyer, and lord keeper of the great seal in the reign of queen Elizabeth, was the descendant of an ancient and honourable family in the county of Suffolk, and born in the year 1510 at Chilshurst in Kent. He was sent at an early age to Corpus Christi or Bennet college at Cambridge, and finished his education by travelling into France. Upon his return, he entered at Gray's Inn, and distinguished himself by the study of the law. By favour of Henry VIII. he obtained a grant of several manors in Suffolk, when the monastary of St. Edmondsbury was dissolved; and was appointed attorney in the court of records; which office he retained during the reign of Edward VI. Having, by his prudence and moderation, escaped the dangers of the reign of Mary, he was honoured with knighthood on the accession of queen Elizabeth; and in 1558, he was intrusted with the custody of the great seal, and admitted a member of the privy council. He took an active part in the administration of this period, and was eminently instrumental in the settlement of religion. It has been said, that he incurred the displeasure of Elizabeth by joining
joining the party that was adverse to the title of the queen of Scots; but from "A Discourse upon certain points touching the inheritance of the crown, conceived by Sir Anthony Brown, and answered by Sir Nicholas Bacon," published in 1753, by Nathaniel Bacon, of Gray's inn, Esq., from the original MS., it has been inferred, that Sir Nicholas Bacon was a stout strenuous asserter of the title of the queen of Scots, in opposition to Sir Anthony Brown, who had contended for the right of the house of Suffolk. However this be, he was placed by Elizabeth, in 1568, at the head of the commission for hearing the disputes between that unfortunate princess and her rebellious subjects; and in 1571, 1 year after the death of his father. From this time he was a principal agent in the council of Elizabeth, and by his inflexible adherence to the Protestant cause, shared the odium of the Popish faction in common with her other principal ministers. As a statesman, he manifested great skill in properly balancing the different parties, and it is thought that he instructed the queen in this art, which she found so necessary and useful. In the chancery he distinguished himself by a very moderate use of power, and by3ying great respect to the common law. His private as well as his public conduct was regulated with great discretion, and a moderate use of the fortune which he had acquired. His motto was "Vindicatio firma," and he was accordingly content to be safe, but did not wish to be great. In his later speeches he attained the reputation of uniting two opposite characters, viz. those of a witty and a weighty speaker. That he was not unduly exalted in his own opinion, notwithstanding his eminent talents and preference, appears from his modest answer to Queen Elizabeth, when on a visit to him at Redgrave, she told him that his house was too little for him: "Not so, madam," replied Sir Nicholas, "but your majesty has made me too great for my house." In deference to her majesty's opinion, he added two wings to it; and he also indulged his taste for building and gardening, at Gorhambury, near St. Albans, which was a manor taken from the ancient abbey of this place. Having retained his office of lord keeper for more than twenty years, with the reputation of a wise statesman and faithful councillor, he died, after a illness of a few days, on the twentieth of February 1579, in the sixty-ninth year of his age. Of his writings there are extant in MS. several discourses on topics of law and politics, and also a commentary on the twelve minor prophets. Bibliography.

Bacon, Francis, Baron of Verulam, Viscount of St. Albans, and high chancellor of England in the reign of James I. the glory and ornament of his age and nation, was the son of Sir Nicholas Bacon, mentioned in the last article, by his second wife Anne, the daughter of Sir Anthony Cook, tutor to King Edward VI.; and born in London on the twenty-second of January 1561. In his childhood he manifested indications of singular genius, from which those who conversed with him might have deduced prelages of his future attainments. In reply to Queen Elizabeth, who asked him how old he was, he infantly replied, "Just two years younger than your majesty's happy reign," and her majesty, condescendingly frequently to converse with him, and forming a high opinion of the solidity of his sence, and the gravity of his behaviour, used pleasantly to call him "her young lord keeper." At the age of thirteen, in the year 1573, he was entered a student in Trinity college, in the university of Cambridge, where his progress under the tuition of Dr. John Whitgift, afterwards archbishop of Canterbury, was rapid and flattering. Before he had completed his sixteenth year, he began to perceive the imperfections of the Aristotelian philosophy, which was then the reigning fitem, and probably to form designs of introducing a more rational and profitable method of purifying philosophical researches. To this purpose, we are assured by Dr. Rawley, who was his chaplain and biographer, and to whom he communicated several particulars relating to the earlier period of his life, that his objections against the prevalent philosophy were not owing to any disrespect of Aristotelian himself, of whom he entertained a very high opinion, but to the mutability of his philosophy, which was calculated to produce and perpetuate disputes, rather than to afford any substantial benefit to mankind; and these sentiments of it he retained through life. In order to perfect his education, and to extend his knowledge of the world, his father sent him to France, and placed under the patronage of Sir Amias Paulet, who was then the queen's ambassador at Paris. In this situation he gained the esteem and confidence of Sir Amias to such a degree, that he was intrusted by him with a commission to the queen, which required both secrecy and dispatch; and having executed this commission in a manner highly honourable to himself, and equally satisfactory to the queen and ambassador, he returned to Paris, and from thence travelled through several of the provinces, for the purpose of gaining a more accurate and extensive acquaintance with the manners and customs of the country. The result of his inquiries appears in a treatise, intitled "Of the State of Europe," and written when he was not more than nineteen years of age. The unexpected death of his father obliged him to return suddenly from France, and to engage in some lucrative profession. Accordingly he determined upon the profession of the law, and entered himself in the Society of Gray's Inn, where by assiduous application he obtained such a degree of reputation, that at the age of twenty-eight years he was appointed by the queen to the honourable office of her learned counsel extraordinary in the law. Whilst he was studying at Gray's Inn, and in the twenty-fifth year of his age, he formed the plan of that great philosophical work, afterwards completed, and intitled, the "Inauguration of the Sciences," which will not only render his name immortal, but do honour to his age and country, as long as learning shall flourish. The title of the work which our author composed at this time, was "Terpsichores, quem maximum," or the "Greatest Birth of Times," with respect to which it appears, from a letter written towards the close of his life to father Fulgenzio, a learned Italian, that he lived to regret the juvenile folly and vain confidence which led him to prefix to it this pompous title. These rudiments of Bacon's philosophy have been supposed to be lost; but it has been suggested (see Mallet's edition of Bacon's works, Appendix, vol. i. p. 17) that they probably remain under the more modest title "Of the Interpretation of Nature," and that philosophers may still have the pleasure of tracing the steps by which this great genius advanced from one discovery in science to another in forming and establishing his system. From the high rank of a philosopher, in which Bacon appears with acknowledged pre-emience, we are obliged to descend, in tracing the outlines of his history, to the level of ordinary men, and to contemplate him as an humiliating example of human frailty. Reduced by his father's death to circumstances which rendered it necessary for him either to pursue his philosophical speculations in obscure retirement, or to become an obsequious dependant on the court; he unfortunately chose the latter alternative. Allied by marriage to the lord treasurer Burleigh, and to his son Robert Cecil, principal secretary of state, he indulged reasonable expectations of advancement; but his friendship for the Earl of Essex, Cecil's avowed enemy, interposed an obstacle in the way of
his preferment. The interest of lord Burleigh procured for him merely the reversion of the office of regifter to the star-chamber, worth about £600 a year, which he did not obtain for twenty years. In 1594, Cecil represented him to the queen as a man wholly devoted to speculation, and prevented his being advanced to the post of solicitor-general, which the earl of Essex endeavoured to procure for him; but as a compensation for this disappointment, the earl presented him with a landed estate, which was afterwards sold, at less than its value, for £800. Bacon, however, after this singular expression of friendly attachment on the part of Essex, proved ungrateful; and in the moment of danger abandoned his friend and benefactor: pleaded against him on his trial for high treason; produced evidence to his injury from his letters; and after his execution, vindicated the conduct of administration, in an appeal to the public, under the title of "A Declaration of the Treatments of Robert earl of Essex."

In this "Declaration" there occurred some apparent marks of tenderness for the reputation of Essex, which led the queen to obverse to him, that "old love could not be forgotten;" but whilst they proved that he was counteracting his feelings by his conduct, they were insufficient to excite the benevolence of his ingratitude. His conduct on this occasion excited against him such general dissatisfaction, that he found it necessary to write an elaborate defence under the title of "Apology," but no art or eloquence could avail to shield the public indignation. From the queen he received no additional honours or emoluments during the remainder of her reign; and to persons in power he was an object of jealousy and aversion.

In public concerns, however, he acted with firmness and dignity. Having been chosen, in 1593, to represent the county of Middlesex in parliament, he took the popular side, though a servant of the crown, against her majesty's ministers; and in the question of subsidies, to which he indeed assented, he delivered a speech, the freedom of which offended the queen, and prevented his advancement. Towards the end of her reign he became more servile in his parliamentary conduct; for which his only plea was his poverty, and debts which he had incurred, and for which he had been twice arrested.

Upon the accession of James I. Bacon was distinguished by the favour of his new sovereign, and in 1603 received the honour of knighthood. In the first parliament of this reign, he regained his popularity by undertaking the redress of grievances, arising from the exactions of the royal purveyors; and in the conduct of this business he gave satisfaction both to the house and to the king. From the former he received a vote of thanks, and from the latter a patent to be one of the king's counsel, with a salary of £61. a year, accompanied with a pension from the crown of £60. a year, for special services rendered by his brother Anthony Bacon and himself. Notwithstanding the opposition of Cecil, now earl of Salisbury, and of Sir Edward Coke, attorney-general, he pursued with steady perseverance his plans of advancement; and by promoting the king's favourite object of an union between the two kingdoms, and by publishing, in 1605, one of his most important works "On the advancement of learning," he so far succeeded in gaining the favour of his royal master, that in 1607 he was appointed to supply the place of Sir John Dodridge, as solicitor-general. His practice also was at this time very extensive and profitable, and he also improved his fortune by marriage with the daughter of Benedict Barnham Esq., a wealthy alderman of the city of London. Whilst he displayed his eminent talents both in the senate and in the courts, he was not insatiable to his grand philosophical speculations and purports.
all his powers of eloquence to induce the peers to content themselves with dismissing him from the high office which he had disgraced. They initiated, however, on a particular con-

fession, respecting each article of bribery and corruption of which he was accused; and the chancellor confessed his guilt with regard to most of the twenty-three articles of corruption which were exhibited against him, whilst he extenuated some of them, and again threw himself on the mercy of the House. Upon being asked whether the confession which had been read was written by his own hand, he replied, "It is my act, my hand, my heart; I beseech your lordships to be merciful to a broken reed." The House moved his majesty to sequestrate the seals, which was accordingly done; and then proceeded to pass sentence; which was, "That the lord lin-
count St. Albans, lord chancellor of England, shall undergo fine and ransom of 4,000l.; that he shall be imprisoned in the Tower during the king's pleasure; that he shall for ever be incapable of any office or employment in the state or commonwealth; and that he shall never fit in parliament, or come within the verge of the court." This sentence, severe as it may seem, and for which collateral causes have been alleged, was the result of the brief exercise of justice. Thus degraded under a just sentence, we cannot forbear pitying a man, who, among other crimes, suffered his servants to become the instruments of his ruin; and who in paying for several of his retinue, that flood up to salute him,, fortuitously failed to them; "Sit down, my masters; your rife has been my fall." Thus degraded and banished into solitude, reproached by his own mind as well as by the public cenuse, and deprived by a load of debt, he retained the vigour of his faculties to such a degree, that he returned with ardour to his favourite pursuits, and produced various writings of singular merit in history, morals, and philosophy. Through all the vicissitudes of his life, he kept in view the great objects of the improve-

ment of science, to which his attention was directed in the early period of his youth. From contemplating the examples of Demothenes, Cicero, and Seneca, who, like himself, had occupied high stations, had fallen into delinquency, and had been banished into retirement, he derived consolation; and in imitation of them, he determined to devote the remain-

der of his time to philosophy, and writing. He might, indeed, have adopted the language in which Cicero addresses philo-

sophy: "Ad te confugimur; a te opem petimus; tibi nos, ut anteae magnae ex parte, sic nunc penitus totoque tradamus." "To thee I fly; from thee I seek support; to thee I devote myself, as formerly in part, to now entirely and altogether." It is observed, however, that neither philosophy nor expe-

rience had taught Bacon a lesson of moderation. After his re-

lease from confinement in the Tower, which was soon granted him, and the entire remission of his sentence gradually ob-

tained, he possessed a royal pension of 1,200l. a year, in addi-

tion to 600l. a year, accruing to him from the alienation office; and 700l. a year derived from his own estates; but he lived with a magnificence and splendor which had no bounds.

In his way to London, his coach was attended by a number of attendants on horseback; he was met by the prince of Wales, who alked whole equipage it was, and being told that it was lord St. Albans, attended by his friends, his highness remarked: "Well, do what we can, this man learns to go out like a snuff." With such prodigality, it is no wonder that at his death his debts should have amounted to 22,000l. As an instance of his humility, we may cite his reply to the French ambassador, who upon reading a French translation of his Essays, paid him the fullsome compliment of comparing him to angels; "If the politiciens of others compare me to an angel, my own infirmities remind me that I am a man:" and of self-command we have a singular dis-

play in his behaviour, when he received information by a friend that his application for an important favour at court had proved unsuccessful; at this time he was dictating to his chaplain an account of some experiments in philosophy, and he calmly said, "Be it so!" and dismissing his friend with thanks for his service, he turned to his chaplain, saying: "Well, Sir, if that business will not succeed, let us go on with this, which is in our power;" and he continued to dis-

tate to him for some time, without hesitation of speech, or interruption of thought.

Lord Bacon pursued his philosophical researches to the last, in the midst of bodily infirmities, occasioned by intense

fitful, multiplicity of business, and, above all, by anxiety and anguish of mind. In the winter of 1625, his health and spirits were much impaired; but in the following spring he made an excursion into the country, for the purpose of making experiments on the preservation of bodies. Having ex-

plored himself imprudently to noxious effluvia, he was sud-

denly seized with pains in his head and stomach, which made it necessary for him to stop at the earl of Arundel's house at

Higherge. Here he fell sick of a fever, and, after a week's

illness, expired on the ninth of April 1626, in the sixty-fifth year of his age. In a letter addressed to the nobleman in

whole house he expired, he compares himself to the elder

Pliny, who left his life by approaching too near to mount

Vesuvius during an irruption. He was buried in the

chapel of St. Michael's church, within the precincts of Old

Verulam. Veres to his memory were written in various

languages by the most eminent scholars of the university of

Cambridge; but the most honourable memorial of this

great man is found in his immortal writings.

Before we can duly appreciate the value of lord Bacon's

philosophical works, we should duly consider the state of

philosophy, and the method of pursuiving science which pre-

vailed, at the period in which he lived. The authority of

Aristotle was absolute; his logic, physics, and metaphysics,

were the principal guides in all scholastic disquisitions; and

the science that was principally cultivated was such as con-

fined of words and notions, and seemed to exclude the study

of nature. Instead of investigating the properties of bodies

and the laws of motion by which all effects are produced,

this science, or philosophy, if it may be so called, was con-

verted about logical definitions and distinctions, and about

speculations that were altogether barren and unprofitable.

This kind of capacious philosophy was not only useless, but

a real obstacle to all advances in sound learning, human and

divine. Some few perorls, indeed, had before the time of

lord Bacon ventured to difent from Aristotle; and the fields

of natural knowledge had been cultivated and improved by

friar Bacon, Galileo, Copernicus, and others. But there

was still wanting one great and comprehensive plan that

might embrace the almost infinite varieties of science, and

guide our inquiries aright in all. This, lord Bacon first

conceived in its utmost extent, to his own lasting honour, and

to the general advantage of mankind. To him belongs the

praise of having invented, methodised, and in a considerable
degree perfected, this general plan for the improvement of

natural science by the only pure method of experiment.

With a mind commanding and comprehensive, prompt in in-

vention, patient in inquiry, and subtle in discrimination, ne-

ither affecting novelty nor idolising antiquity, he formed and

in a great measure executed his grand plan, "The Inftaura-

tion of the Sciences." This plan comprehended six capital

parts. Of these, the first part proposes a general survey of

human knowledge, and is executed in the admirable treatise,

intitled, "The Advancement of Learning." He begins with
with accurately reviewing the state of learning as it flowed through all its provinces and divisons; that he might not lose himself on a subject to vait and of such variety, as ranges, according to the three faculties of the soul, memory, fancy, and understanding, the several sciences and arts under three great classes, history, poetry, and philosophy. He observes and points out defects and errors; and then suggests proper means for supplying omissions and rectifying mistakes. At the end of this treatise he has marked out in one general chart the several tracts of science that lay still neglected or unknown.

The second, and the most considerable part, is the "Novum Organum," or new method of employing the reasoning faculties in the pursuit of truth. Here our author offers to the world a new and better logic, calculated not to supply arguments for controversy, but arts for the use of mankind; not to triumph over an enemy by the sophistry of disputation, but to subdue nature itself by experiment and inquiry. Rejecting syllogism as a mere instrument of disputation, and finding no certainty in the hypothetical systems of ancient philosophy, the author recommends and explains the more slow but more satisfactory method of induction, which subjects natural objects to the test of observation and experience, in order to furnish certain facts as the foundation of general truths.

The third part is the "Sylva Sylvarum," or history of nature, which furnishes materials for a natural and experimental history; upon which the organ, or the instrument, which the author has provided for the investigation of nature, may be employed. The phenomena of the universe are ranged in this repository under three principal heads, viz. the history of generations or the production of all species, according to the ordinary laws of nature; that of pre-ter-gerations, or births deviating from the flated rule; and the history of nature as confined or afflicted, changed or tortured by the art of man. Of such a history the use is either to acquire the knowledge of qualities in themselivs, or to serve for the first matter of a true and useful philosophy. The facts and observations that are here collected together are possibly not always correct; but they are valuable, as they furnish a pattern of the manner in which such references should be pursued.

The fourth part, or "Scala Intellectus," is a series of steps by which the understanding might regularly ascend in its philosophical inquiries; and it is evidently intended as a particular application and illustration of the author's method of philosophising.

The fifth part, or "Anticipations Philosophiz secundae," was designed to contain philosophical hints and fuggelitions, but nothing of this remains besides the title and scheme.

The sixth, and sublimest part, was proposed for exhibiting the universal principles of natural knowledge, deduced from experiments, in a regular and complete sytem; but this the author depairied of being himself able to accomplish. Having laid the foundation of a grand edifice, he left the superfirute to be completed by the united and continued labours of philosophers in future ages.

Among the more popular works of lord Bacon, the principal are his "History of Henry VII." which, allowing for some faults, and particularly for its partiality to Henry, with a view of flattering his grandson James, at whose death it was written, may be justly admired for vigorous conception and energy of language; his "Wisdom of the Ancients," in which he endeavours, with greater ingenuity than solidity, to unveil the hidden sense of the fables of antiquity; his "Moral Essays," containing many just reflections on subjects, which, in the author's own phraseology, "come home to men's business and bosoms;" and his law tracts, speeches, letters, and other miscellaneous papers, relative to personal or public affairs, and abounding with curious and interesting matter. These valuable writings, which were gradually collected, have been repeatedly published on the continent in Latin. An edition in folio was printed at Frankfort in 1665; and another by Arnold at Leipzic, in 1694. They have passed separately and collectively through several editions in English; in 1704, they were published in 4 volumes, folio; but the most complete edition is that printed at London in 1778, in five volumes, quarto.

The character of lord Bacon seems to be pretty justly delineated by Mrs. Hume in his History, vol. vi. p. 52. He represents him as "a man universally admired for the greatness of his genius, and beloved for the courtliness and humanity of his behaviour. He was the great ornament of his age and nation; and nought was wanting to render him the ornament of human nature itself, but that strength of mind which might check his inconstant desire of preference that could add nothing to his dignity, and restrain his profuse inclination to expence that could be requisite neither for his honour nor entertainment. His want of economy, and his indulgence to servants, had involved him in necessities; and, in order to supply his prodigality, he had been tempted to take bribes, and that in a very open manner, from tutors in chancery." "If we consider," says he, "the variety of talents displayed by this man; as a public speaker, a man of business, a wit, a courtier, a companion, an author, and a philosopher, he is justly the object of great admiration." He adds; "if we consider him merely as an author and philosopher, the light in which we view him at present, though very estimable, he was yet inferior to his contemporaries Galileo, perhaps even to Kepler." "The national spirit," adds Hume, "which prevails among the English, and which forms their great happiness, is the cause why they below on all their eminent writers, and on Bacon among the rest, such praises and acclamations as may often appear partial and excessive." In answer to these strictures it has been justly observed (Brit. Biog. vol. iv. p. 154.) that "Galileo was undoubtedly an illustrious man, and Kepler an admirable astronomer; but though we admire their superiority in altrons and in some particular branches of physical knowledge, it does by no means follow that either of them was a greater philosopher than Bacon. The praise of Bacon is founded not upon his skill in this or that particular branch of knowledge, but on his great and comprehensive understanding, which took in almost the whole extent of universal science. And he was so little indebted to the partiality of his countrymen, that his writings appear, for some time at least, to have been more esteemed and admired in foreign countries than in England." Mrs. Macaulay expresses in very strong terms her abhorrence of his character, when she says (vol. i. p. 157.), that "philosophy itself was degraded by a conjunction with his mean soul." But with respect to the strength and extent of his genius, this female writer says, "his precious bequests to posterity paint him stronger than can any other pen." It must however be confessed, that it was some difference to Bacon, that he could not perceive the refinements of the system of Copernicus; but perhaps he understood less of astronomy, and was left capable of philosophical sciences, than of any other part of science and philosophy. With confidence in the merit of his own productions, and assuring himself of posthumous fame, lord Bacon introduces in his last will this remarkable passage:—"My name and memory I leave to foreign nations; and to mine own countrymen, after some time is past over." Upon the superstructure that has been raised on the foundation of experimental philosophy...
BAC

lo sophy which he has established, this inscription will be read, says one of his biographers, by dint of pravity,
"BACON, THE FATHER OF EXPERIMENTAL PHILOSOPHY."

Upon the while, in contemplating the character of Bacon, exclusively of his incontestible merit as a philosopher, notwith standing all the allowances that are made in his favour, from the spirit of the times, from his own peculiar circum stances, and from other confiderations, yet, when we come to mind his valuable immolation in general to the will of the crown, and especially his ingratitude to Essex, and his corruption as a judge, we are convinced, though not without great regret, to acquiesce in the justice of the confession given of him by Mr. Pope. (Eff. on Man, ep. iv. v. 278.)

"If parts allure thee, think how Bacon thin'd,
The wifed, bright'ned, mean'ned of mankind."

Acknowledging the propriety of this representation, we may infer from it the infinite superiority of the purfuits of intellect above thofe of ambition. "Had Bacon contended himself with being a philosopher, without aspiring after the honours of a latefman and a courtier, he would have been a greater and a happier man," Mallet's Life of lord Bacon, prefixed to the edition of his works, 1753. Brucker's Hist. Phil. by Enfield, vol. ii. p. 520, &c. Biog. Brit. Gen. Biog.

Though not a practifal musician, nor a writer on profesfio on the musical art or science, yet it is fo manifest by his Nat. Hist. cent. ii. that he had done much the honour to befall much meditation on the theory of found, we are proud to devote to him an article among music's benefactors.

He treats of the phylosophy or production of found, not by calculation, but by obfervation and experiments on Nature herself. He does not call octaves replicates (which is a Gallicism), but a recurrency. He thinks (and thinks rightly), that our not cultivating quarter tones, or eharmonic, is from their not being capable of harmony; and it seems a proof, among others, that the ancient Greeks had no harmony, or music in parts.

He speaks of fliding from one found to another by small degrees, which are delightful. This we used to think a refinement of late times.

The claves oculares, or ocular harpsichord of Pore Caffel, was certainly suggested to him by the experiment, N° 3, second cent.

The powers of found on the affections and affections; that founded on motion; that the inclosure of found increases its force; that the tone of voice at the fame pitch is of a different quality in a room, and in the open air, and in different rooms, are his discoveries. He denies, indeed, what was afterwards proved by the air-pump, that found cannot be produced in an exhausted receiver.

Sound is carried along a wall better than in open space; and better on the smooth surface of a river or piece of water, than on land.

Dr. Holder, in his Elements of Speech, has but ingeniously extended one of sir Francis Bacon's experiments. Derham's experiments on the propagation and motion of found, were pointed out by the 2018 experiment of sir Francis.

The late honourable Daines Barrington's experiments on birds, their power of imitation, and of teaching each other, seem to have sprung from sir Francis's experiments on the imitation of found, cent.

Confent of visibles and invisibles, advances somewhat further towards the oculair harpsichord.

The fon harmoniques, which Galileo and father Mercænus were observing about this time, had not escaped the penetrat- ing and active mind of our great philosopher; and the acouflicon, or ear-trumpet, is here first pointed out, N° 285.

His reflection at the end of N° 290, shall close this article.

"We have laboured, as may appear in this difquisition of sounds, diligently; both because found is one of the most hidden portions of nature, and because it is of a virtue that may be called incorporeal and immaterial; whereas there be in nature but few. Before, we were willing, now in these our few centuries, to make a pattern or precedent of an exact inquisition, and we shall do the like hereafter on some other subjects that require it. For we desire that men should learn and perceive, how severe a thing the true disquisition of nature is; and should accustom themselves by the light of particulars to enlarge their minds to the amplitude of the world, and not reduce the world to the narrowness of their minds."

BACON, in Geography, a town of Peria, in the province of Segellan : 90 miles N. N. E. of Zareng.

BACON, a town of Italy, in the duchy of Tuscany, 28 miles N. E. of Florence.

BACONTHORP, or Bacon, John, in Biography, an English monk of the thirteenth century, was born at Baconthorp, a village in Norfolk, and assumed the monastic habit in the convent of Blackney in the same county. He received his education at Oxford and Paris; and in his youth was attached to the philosophy of Averroes, who taught that one intelligent principle animates all human beings. At a general assembly of the order of English carmelites held in London in 1329, he was chosen one of their provincials. Being invited to Rome about four years afterwards, he gave offence by allowing, in public disputation, too much latitude in the marriage of persons mutually related. But he afterwards maintained, that in degrees of consanguinity prohibited by the divine law, the pope has no dispensing power. His stature was small; but his mind was eminently vigorous and active. He was distinguished through life by the appellation of the "Refolute Doctor;" and after his death he was celebrated both in prose and verse, as a zealous defender of the Catholic faith against Jews, Turks, and Heretics. Some few of the many books which he wrote were printed; among these were "Commentaries, or Questions on the four books of Sentences," Milan, 1510, and 1611; and "A Compendium of the Law of Chrift," Venice, 1527.

BACOPA, in Botany. Lin. gen. Schreb. n. 266. Aulth. 49. Jaff. 313. Clafl. pentandra monogynia. Nat. Ord. fucculentæ : portulacæ. Jaff. Gen. Char. Cal. perianth one-leaved, five parted; two of the parts oblong, concave, acute; the two inferior defex, ovate, acute; the fngle superior one broader, roundish, undulated. Cor. one-petalled; tube short, towards the orifice a little enlarged; border five parted; parts ovate, oblong, obtuse, equal, spreading. Stam. filaments five, inserted into the tube of the corolla; anthers in gazette. Pfl. germ ovate, compressed, below incised by the calyx growing to it; style short; stigma headed. Per. capula one-celled. Seeds many, extremely small.

E.F. Gen. Char. Cor. with a short tube, spreading at the top. Stam. inserted into the tube of the corolla; stigma headed, capst. one-celled. Aulth. t. 19. 1. B. aquatica. Aulth. Galian. 120. t. 19. This plant puts forth several cylindric, succulent, knotty stems; leaves opposite, flim cladging or rather connate, thick, oblong, concave, sharp, smooth; flowers solitary, pedunculat, alternate from the axillae; below the calyx there stands a pair of fleshy bracts on the long pedicule; corolla blue, It.
It puts forth roots from the knots, both as it runs along the ground, and as it lies on the surface of the water. A native of CeyLANe, on the borders of rivulets, flowering in December. The inhabitants of the island call it *berbe aux brulures*, on account of its being used for curing burns.

**Bacquer, Benedict**, in *Biography*. Of this writer, who lived towards the end of the seventeenth century, but of whose life no memorials have come to us, we have a much esteemed work, "Servator Senum," published 1672; and, if it is not the same work, "Servum Medicum, praebentibus observando, ut sine magna molestia ludentur." Colon. 1672, and 1672, 8vo. Haller Bib. Med. Pract. Prof. Carra fays, that Bacquer was professor of theology, and prior of the abbey of Dunes, which Eloy observes is very probable, as at the end of the directions for the preservation of the health of aged persons, is another work intitled, "Servator Senum, remedia fuggerans pro Senum salute eterna." Eloy, Dict. Hifl. de la Med. v. p. 242.

**Bacquet, John**, a learned French lawyer, was advocate to the king, and flourished at the close of the sixteenth century. He wrote many excellent law-tracts, which were published with notes by Ferriere at Lyons, in 2 vols. folio, in 1744. He died in 1597. Nouv. Dict. Hifl.

**Bactishua, or Bock Jus**, Servants of *f. Isr.*, a Chriftian family famed in the East for their knowledge of phyfic.

**Bactishua, George**, the first of the family of whom we have any account, who besides his skill in medicine, was eminent for his proficiency in the Persian and Arabic languages, received his education at Jondifabur, or Nifabur, the capital of Korasan. Sapor's king of the Persians is faid to have built this city, A. C. 273, in honour of his queen, the daughter of the emperor Aurelian, who Kent with her several Greek physicians. These men, fettling there, received and propagated the doctrines of Hippocrates, in the eall, and hence, Freind conjectures, it happened, that most of the celebrated Arabian physicians, Razes, Haly Abbas, Avicenna, were educated in the more eastern parts of Asia. George, being fent for to Bagdad, by Almanzar, the second caliph of the house of Abbas, to relieve him of a complaint of his thigh, in which he was successful, was detained there, and at the desire of the caliph, translated several books of phyfic; and when, on account of his ill health, he defire J leave to return to his county, Almanzar fent him home with great honour, and a reward of 10,000 aurei. Razes and Serapion have recorded in their works many of the maxims and medicines of George. The anfwer was remarkable which he made to Almanzar, who had condescended to folici his conversion from Chriftianity to Mahometanifm, and offered to infure him a place in paradise upon his compliance. "No," replied the doctor, "I am very well contented to go whereverof my forfathers have gone, be it to heaven or to hell." Ruffel's *Aleppo*, vol. ii. Append. p. 5.

**Gabriel**, the son of *George*, was in equal estimation with the caliph Haroun Al Rafchid, whom he cured of an apoplexy, by directing him to be blooded, which was performed, though contrary to the opinion of the other physicians. Freind annexed to his History of Phyfic, the life of Gabriel, translated into Latin, from the Arabic of Abi-Obsi. The translation was performed at the expense of Dr. Mead. The work is principally remarkable for the extravagant præfies bestowed on Gabriel, and the account of the high honours and prodigious wealth heaped by the caliph upon the physicians. Freind's *History of Phyfic*, vol. ii. Haller. Bib. Med. Pract. For an account of others of this family, which in succession supplied the caliphs with physicians for above two centuries; see Ruffel's *Aleppo* (ubi supra).

**Bactria, or Bactriana**, in *Ancient Geography*, a country of Asia, was bounded on the west by Margiana and Aria, on the north by the river Oxus, which separated it from Sogdiana, on the south by the mountains called Paropamisus, which covered the north of India, and on the east by mountains which separated it from Asiatie Scythia and the country of the Mallagete. It comprehended the present provinces of Balk and Gaur, and probably, says major Rennell, part of Korasan. It was a large, fruitful, and well-peopled country, and contained, according to Ammianus Marcellinus (l. xxi.), a great number of cities mentioned by the ancients; but the metropolis was *Badra*, called also Zariafpa, and now Balk, from which, or from the river Basket, the country derived its name. Quintus Curtius (l. vii. c. 4.) deduces the name both of the city and country from the river Basket, which watered the environs of the capital. Pliny (l. vii. c. 15, 16.) places Basket on the river Zariafpa; and Curtius, on the Basket, at the foot of mount Paropamisus; but Ptolemy describes it as situated on the river Dargdus, in the heart of the country, at a great distance from this mountain, which was the southern boundary. The chief rivers of Basket, with regard to the names of which there is considerable confusion, were the Oxus, the Ocheus, the Organomis, or a Medus calls it, Dargomis, which, uniting with the Oxus, fell into the Oxus; the Zariafpa, or Zariafpes; the Arctins; and the Dargdus. That part of Basket, which was watered by the river Oxus, is described by the ancients as a very fruitful country, abounding with pastures, and well watered by a large river of a very large size; but the southern parts were sandy deserts, through which travellers journeyed only in the night, being under a necessity of guiding themselves by the stars, as if they were at sea, and exposed to the danger of being buried in the sand. The country was inhabited by the following nations: the Salonc and Zariafpa; the Chumari, or Comarians, placed by Ptolemy near the sources of the Jaxartes, toward the eastern boundaries of Sogdiana; the Comi; the Acinaces; the Tan baze, or Tambyzi; the Tboarce, or Tocharis, who were mountaineers on the declivity which regards Basketiana, whence the modern Toka tofand the Marzak; the Sioras; the Varai; the Arting; the Orfipsi; the Amarispi, and some others. The Bactrians in general were reckoned good soldiers, and were always at war, either among themselves, or with the neighbouring nations. Herodotus says they were archers, and used bows made of their country reed or cane, and had short darts. In other respects they were accoutred, like the Medes, who wore tiaras, tunics, and breeches, with a dagger at their girdles. They were enemies to every kind of luxury. Pliny informs us, that they used to expel their old people after a certain age, to be devoured by fierce mastiffs, which they kept for that purpose, and called felpulchral dogs. He adds, that they allowed their daughters to associate with any whom they liked, and that incontinence was not displeasurably even to the women.

The early history of Basketia is, like that of other ancient nations, involved in considerable obscurity and uncertainty. According to Diodorus, the Bactrian government, in the earier ages, was monarchal. Zoroaster is said by Eufebius (in Chron.) to have reigned in Basketia, and to have been contemporary with Nimus, who made war upon him, and subdued his country. But Ctesias, followed by Diodorus, mentions one Oxyartes, who reigned in Basketia, when that country was reduced by Nimus, and he says that Zoroaster was contemporary with Cyrus the Great. But the history of this Persian lawyer is lost in remote antiquity. It has been affected by some writers, that Nimus subdued all Asia, except India and Basketiana. However this be, all authors...
are agreed, that Bactria was subdued, first by the Afrians, and afterwards by the Persians under Cyrus the Great. After the overthrow of the Persian empire by Alexander (B.C. 338.), it fell under the power of the Macedonians, and was held by the successors of Seleucus Nicator, till the reign of Antiochus Theos, when Theodotus, about the year B.C. 149, from being governor of that province, became king, and strengthened himself so effectually in his new kingdom, while Antiochus was engaged in a war with Ptolomy Philadelphia, king of Egypt, that he could never afterwards dispossess him of his acquisitions. He was succeeded by his son Theodotus, who, strengthening himself by an alliance with Afacies, the founder of the Parchian monarchy, considerably enlarged his kingdom. Theodotus, being vanquished by Euthydemos, was expelled the kingdom; and Euthydemos was succeeded by his brother Menander, who extended his conquests to several countries that were unknown to Alexander the Great. The possessions which Menander had reduced were retained by his nephew and successor Demetrius, and enlarged by several new acquisitions. Having left the kingdom of Bactria in a very flourishing condition, he was succeeded by his son Eucratides, who invaded India, and made himself master of all those provinces which had been subdued by Alexander. During the reign of these five princes, the commerce of Bactria with India was very considerable. The district near the mouth of the Indus, which Alexander had subdued, was recovered; and military operations were carried on in India, with such success, that the Bactrian kings penetrated far into the interior part of the country; and proud of the conquests which they had made, as well as of the extensive dominions over which they reigned, some of them assumed the title of “Great King,” which distinguished the Persian monarchs in the days of their highest splendour. Apollodorus, the Bactrian historian, affirms that Eucratides possessed one thousand cities. The learned Dacier, in his interesting history, advances many arguments to prove that the Greeks of Bactria imparted the first lineaments of science to the Hindoos. M. Perton, in his “Antiquities of Nations,” alleges, that there was a people in the upper regions of Asia, beyond Media and mount Imaus, who in the first ages spread themselves over Bactria and Margiana, and proceeding by Armenia and Cappadocia, at last passed over into Europe. These people were called Sacæ. In the mean time, the Cimmerians, who were of the same family, went by the north; and having made various incursions, at last settled above the Euxine sea, near the Palus Mazota. The learned Bryant is of opinion, that this account is not warranted by sufficient authority on the part of the writers to whom M. Perton appeals. Although such people as the Cimmerians actually existed upon the Mazota, yet that they came from Bactria, and fought their way through different countries; and that they were the brethren of the Scythians styled Sacæ, and took the upper route, when the others were making their inroad below, are circumstances which, says Bryant (Anal. Mythol. vol. iii. p. 131.), have not the least shadow of evidence. Another writer of our own nation (see W'F's Hist. & Chron. of the Fabulous Ages, p. 119.) supports, that all sciences centered old in Bactria, called Bocarya, or “the land of books.” (See Sacæ, and SCYTHIA.) But to return from this digression: Eucratides, king of Bactria, was treacherously murdered by his son of the same name, who usurped the throne; but he was expelled by the united forces of the Scythians who attacked it in one side, and of the Parthians who attacked it on the other, and was soon after killed in attempting to recover it. The Greeks, says Strabo (l. x. p. 779.), were deprived of Bactria by tribes or herds of Scythian Nomades, who came from the country beyond the Iaxartes, and were known by the names of Afii, Pañani, Tachari, and Saca-Sahuli. This fact concides with the relation of the Chinese historians, cited by M. de Guignes (Mem. de Litter. t. xxv. Mem. p. 195.), and is confirmed by it. By them we are informed, that about 126 years before the Christian era, a powerful host of Tartars, pushed from their native seats on the confines of China, and obliged to move towards the west by the pressure of a more numerous body that rolled on behind them, passed the Iaxartes, and pouring in upon Bactria, like an irresistible torrent, overwhelmed that kingdom, and put an end to the dominion of the Greeks there, after it had been established near 150 years. The kings, who reigned in Bactria in the times of the Roman emperors Adrian, Antoninus Pius, and Vale- 
arian, were all of Scythian extraction; but the Scythians were in their turn driven out by the Huns, who reigned in Bactria in the time of Laddush IV. king of Hungary.

BACTRIANIA, in Geography, a town of Asia, in the country of Georgia, 60 miles north of Tiflis.

BACTRIANUS, in Zoology, a species of Camelus, having two bunches on the back. LINN. This differs very little in appearance from the common Arabian camel, except in being rather larger, and having two bunches on the back instead of one. It is an inhabitant of the western and northern parts of India, and also of the deserts bordering on China; the breeds of this kind are in more esteem for their swiftness than the other. In Arabia, we are told, it is chiefly kept for the use of the great, being not a native of that country, but imported from India, &c. Of this animal, as well as of the Arabian kind, there are several races or varieties, differing like those of horses in strength, size, swiftness, and elegance of form. A breed of peculiar swiftness is said to be reared in China, where it is distinguished by the expressive title of Fung Kyo Fo, or camels with feet of wind. A white variety occurs in some parts of Siberia; and lastly, a hybrid or mixed breed is said to be occasionally obtained between the Bactrian and the Arabian camel. SHAW, &c.

BACTRIS, in Botany (pro evi et Nabg, a staff; canes being made of the items). LIN. gen. Schreb. n. 1693. Jacqui. Amer. i. l. 171. Geer. t. 9. cl. Clafs. monoeica hexasandra. Nat. Ord. Palm. Generic character; * Male flowers. Col. spathae univalve, one-leaved; spadix branched; perianth one-leaved, three-parted, small; parts lanceolate, concave, coloured. Cor. one-petalled, three-cleft; tube short; clefts ovate, acute, erect. Stam. filaments five, filiform, erect, of the length of the corolla, inserted into the middle of the tube; anthers oblong, incumbent. * Female flowers few, in the same spadix, intermixed with the male ones. Col. spathe the same as in the males; perianth one-leaved, bell-shaped, three-toothed, pointed, coloured, very small, permanent. Cor. one-petalled, erect, three-toothed, permanent. Fit. germ ovate, large; style very short; stigma divided; obliquely three-cleft. Per. drupe coriaceous, roundish, fibrous-fusculent, sharp-pointed with the style. Seed, nut roundish, depressed on each side; marked on the sides with three holes; kernel solid.

Species, 1. B. minor. Jacqui. l. c. Gen. 131. t. 256. B. minima Gaertn. Fruet. 2. 269.—conf. B. globosa minor. Eijso, l. 22. que the Cocos aculeata, Swartz & Hort. Kew Palma. 7. Brown Jan. 344. "Fruit roundish." Root creeping; trunk upright, armed with numerous prickles, about an inch in diameter, seldom more than twelve feet high. The flowers usually appear as soon as it has attained the
the height of about four feet; leaves frondose, few, flem.
clopping at the base, pinnate; the prickly; the leaflets
eniform, acuminated, shining, flat, ferrate-prickly; spathe
axillary, solitary, spreading, terminating long after the fruit
is ripe; flowers without scent, very slightly tinged with
yellow; fruit the colour and size of a common cherry,
containing an acid juice of which the Americans make a fort
of wine. Canes are made of the stem; they are dark-co-
oured, shining, jointed, very light, and called by the
French Canes de Tabago. 2. B. major. Jacq. l. c. " Fruit
ovate." This resembles the former, but grows to the height
of two or three feet with a stem more than two inches in
diameter. Leaves fix feet long; leaflets nearly two feet,
with the marginal prickles brown, and more conspicuous
than those in the other species; spadix compressed, flat,
reclining; fruit of the form and size of an egg, acuminate
with the fyle, fibrous, succulent, covered with a dark pur-
ple coriaceous coat, of which the natives make a vinous li-
quor. The nut is large, of a dark colour, ovate-oblong,
with an acuminate trifid apex, and three obscure holes, two
above the middle, and the third higher; kernel oblong,
blunt at both ends, cartilaginous, solid. The fruits are
called Cococeres, and fold in the market. Both these plants
are natives of Carthagea in South America.

BACTRIS, in Entomology, a species of Bruchus that
lives in the nuts of the American palms. It is cinceros;
wing-cases rather smooth; posterior thighs ovate; thorns

BACTROPERATA, also written bactroperata, com-
pounded of Bactro, flag, and pera, bag, or budget; an ancient
appellation given to philosophers by way of contempt,
de-taining a man with a flail and a budget.

BACUACHO, in Geography, a town of North America,
in New Navarre, 135 miles south of Cafa Grand.

BACULARES, a foot of Anabaptists, so called, as
holding it unlawful to bear a sword, or any other arms be-
fides a staff.

BACULARIUS, in Writings of the Middle Age, an ec-
clesiastical apparatus, or verger, who carries a staff, baculus,
in his hand, as an ensign of his office.

BACULE, in Fortification, a kind of portcullis, or gate,
made like a pit-fall with a counterpoise, and supported by
two great flake. It is usually made before the corps de

guard advancing near the gate.

BACULLI. See Bacilli.

BACULI, Sancti Pauli, or batons of St. Paul, a kind of
figured stones, of the same substance with those refumbling
the brillies of some Ancient empress, called by Dr. Plott
lapides Judaei.

BACULOMETRY, the art of measuring accessible and
inaccessible distances, by the help of Bactro, flag, or rods.
Schwenter has explained this art in his " Geometria Prac-
tica," the rules of it are also laid down by Wollius in his Ele-
ments; Ouzam also gives an illustration of the principles
of bactrometry. See Distance, and Longimetry.

BACULOSUS ECCLESIASTICUS, in some Ancient
Lawas, is used for a bishop or abbot, dignified with the
pastoral staff, or crozier.

BACULUS DIVINATORII, or Virgula Divina, a
branch of a hazel-tree, of a forked figure, used for the dis-
covory of mines, springs, &c. See Virgula Divina.

BADA, in Ancient Geography, a town of Africa, ac-
cording to Ortelius and St. Cyrilman.—Also a river of Phaenicia,
in the vicinity of the town of Paltos, near which was a tomb
said to be that of Memnon, son of Tithonus, and nephew of
Priam, king of Troy. Strabo, I. xx.

BADA, or Badas, in Zoology. This is the name of the
Rhinoceros among the negroes on the coast of Angola.

BADACUM, in Ancient Geography, a town of Norcia,
situate near the Danube. Ptolemy.

BADAGIS, in Geography, a town of Korasan, on the
northern borders of the ancient defert of Margiana. N. lat.
35° 25'. E. long. 59° 28'.

BADAGSHAN, or Badarkshn, an ancient city of
Independent Tartary, in Great Bacharia, seated on the
north side of the river Amu, or Harrat, not far to the
north of Andarab in Tokarakan. In the last century, this
city belonged to the khan of Great Bacharia, or rather of
Samarcand; and being excluded in a branch of the Bela-
Alpa, was used as a flate prison for rivas or infidants.
Badakshn was small, but well built and populous; and its
inhabitants were enriched by the gold, silver, and rubies
found in its neighbourhood; the grains of gold and silver
abounding in the torrents which descend from the moun-
tains, when the snow melts in the beginning of summer.
Several Caravans for Little Becharia and China pass by this
city. Ebn Haukal mentions that there were not only mines
of rubies and lazulite near Badakshn; but that there was
abundance of musk. It is situated above 100 miles from
the source of the Amu, 230 from Balk, and 210 from
Anghien in the province of Samarcand. N. lat. 36° 15'.
E. long. 68° 45'.

BADAGRY, a town of Africa, in the country of Be-
nin.

BADAJOZ, Pax Augusta, a confederal town of
Spain, being the capital of Extremadura, and a frontier
fortress towards Portugal. It is leated near the river Gu-
diana, on a gentle rile, which on one side is covered with
olive-trees, and on the other side of the river are some forti-
fied hills. Over the river is a handsome stone bridge, built,
as it has been said, by the Romans, but as the inscription
on it states, by Philip II. The streets are clean, and partly
straight, and well-paved; and there are a few large houses,
with some handsome churches and towers. The fortifica-
tions are not very strong; but it has furnished two floges,
each by the Portuguese in 1658; and another by the Eng-
lish and Dutch, aided by the Portuguese, in 1705. N. lat.
43° 47'. W. long. 6° 19'.

BADANATHA, in Ancient Geography, a town of Ara-
bia Felix, in the country of the Thamudii. Pliny.

BADARA, a town of Afia, in Caramania. Ptolemy.

BADASKA, in Geography, a town of Siberia, on the
side of the Angara; 80 miles N. N.W. of Tchuschi.

BADATIUM, in Ancient Geography, a town of the
Tauric Chersonese. Ptolemy.

BADAUSSA, a town of Afia, in Mesopotamia. Pto-
lemy.

BADAMI, in Geography, a town of Hindolass, in
the country of the Vifapour. eighty miles south of Vifap-
pour. N. lat. 16° 10'. E. long. 75° 40'.

BADELONIA, BADAUS, or BETULA, an ancient
town of Spain, in Catalonia, seated on the coast of the Me-
diterranean, about six miles north-east of Barcelona.

BADELU, or BADERO, a country of Africa, on the
borders of the river Combia.

BADELUNDSAHS, a long narrow sandy tract of
land in Sweden, in the province of Wefmarland, where
the Danes were totally defeated in 1721.

BADEN, a district or county of Switzerland, lying on
both sides of the river Limmat, and bounded on the west
by the river Aar, on the north by the Rhone, and on the
south by the Reus, became a bailiage of the eight ancient
cantons in 1418, when the canton of Zurie took possession
of the town and county, and so continued till the year
1712. A civil war breaking out at that time between the
Pro-
Protestant and Catholic cantons, Baden was besieged and taken by the troops of Zürich and Bern; and at the peace of Aarau, it was ceded to the two cantons and Glarus, which, on account of its neutrality, preserved its right of joint sovereignty. Until 1712, the diet assembled at Baden; but was afterwards transferred to Frauenfeld. The three cantons alternately appointed a bailiff, who resided in the castle. The inhabitants elected their own magistrates, and had their own judicial courts. In civil proceedings, an appeal lies to the bailiff, and from his decision to the syndicate, composed of the deputies of the three cantons, and in the last resort to the three cantons themselves. In penal cases, the criminal court condemns, and the bailiff enjoys the power of pardoning, or mitigating the sentence. This bailiwick comprehends about 138 square geographical miles, and contains 24,000 persons. In consequence of the French revolution, a new division took place in 1798; the county of Baden, the free bailiwick, and a small portion of the south-western part of Zürich, were constituted one of the 18 Swiss departments or cantons, and Baden was its capital; but according to the constitution of the 29th of May 1801, Argovia, re-united with Baden and with the upper part of the Frickthal, was made one of the 17 departments or cantons of Switzerland; and six representatives were appointed to be deputed by it to the diet. The soil of this district is fertile; in general it abounds with grain and fruit, and on the sides of the Limmatt it produces wine. The mountains yield excellent free-clay, marble, and iron ore. The greater number of the inhabitants are Roman Catholics.

Baden, the capital of the above district or canton, is situated on the side of the river Limmat, in a plain flanked by two hills, between which the river runs. It derived its name and its origin from the warm baths in its neighbouring-hood, which were famous before the Christian era, and are mentioned by the ancients under the name of Aquae et Thermo Helvetiae. It was a Roman fortress, erected to curb the Alemanni or Germans, and was razed when the Helvetians, who supported Otho, were routed by Cæcina, general to Vitellius. Being rebuilt, it was taken by the Germans; fell afterwards under the dominion of the Franks, and was in the tenth century incorporated in the German empire, and became successively subject to the dukes of Züringen, to the counts of Kyburg, and to Rhodolph of Hapburg. When its descendant Frederic, duke of Austria, was put under the ban of the empire, in 1418, it came into the possession of the canton of Zürich, which purchased it of the emperor Sigismund, and subjected it to the eight cantons. (See the preceding article.) Many monuments of antiquity have been found in this place; such as statues of several heathen gods, made of alabaster; Roman coins, formed of bronze, of Augustus, Vespasian, Decius, &c.; and several medals of the Roman emperors, of gold, silver, copper, and bronze. There are two churches in this city; one collegiate, and the other a monastary of canons, near the town-house, in which the diet formerly assembled. Before the castle, which is the residence of the bailiff, there is a stone-pillar, erected in honour of the emperor Trajan, who passed in this country a road eighty-five Italian miles long. The inhabitants are rigid Roman Catholics, and were formerly inflamed in their behaviour towards the Protestants. The baths are seated on each side of the river, about a quarter of a league from the city. Adjacent to the small baths is a village, and to the large, a town, seated on a hill of steep ascent. The water of the baths is conveyed to inns and private houses by means of pipes, of which there are about sixty. And in the middle of the towns there are public baths, supplied by a spring in the street, where the poor may bathe gratis. All the baths are hot, and they are used for drinking as well as for bathing. They serve, like others of a similar kind, to give relief in a variety of diseases. (See Waters, Medical.) About a mile from Baden, at a place called Wettinning, where the Limmatt flows with the greatest rapidity, there is a beautiful piece of mechanism, which is a wooden bridge, 240 feet long, and suspended above twenty feet from the surface of the water. It was the last work of Grubenman, the self-taught architect, and exceeds in elegance that of Schaffhausen. Mr. Coxe (Trav. Switl. vol. i. 157) has given a geometrical elevation of it. Baden is distant 14½ miles from Zürich. N. lat. 47° 21'. E. long. 8° 12'.

Baden, a margrave of Germany, in the circle of Swabia, is divided into the upper and lower margravate. The upper, or the margravate of Baden-Baden, terminates well-ward on the Rhine, though a small part of it lies west of that river, and is bounded on the north-west by the lower margravate of Baden-Durlach, on the east by the duchy of Wurttemberg and the county of Eberlein, and on the south by the Ortenau and the Brisgau. The principal towns are Rastadt, Baden, Etlingen, Steinbach, and Stolhoven. The margrave is a foreign prince, and has a vote in the college of princes. The established religion is Roman Catholic. The lower margravate, or that of Baden-Durlach, is bounded on the west by the Rhine, on the south by the upper margravate of Baden, on the east by the duchy of Wurttemberg, and on the north by the bishopric of Spire. The principal towns are Carlshue, Durlach, Pfalzheim, Muhlburg, and Emmingen. This prince has two votes in the college of princes, one for Baden-Durlach, and the other for the margravate of Stockberg, which belongs to him, and lies in and along the Brisgau. The reigning family, and the country in general, profess Lutheranism, with a toleration of Protessants, Catholics, and Jews at Carlshue. The whole margravate of Baden is a populous and fertile country, abounding with corn, hemp, flax, hoes-wax, wood, and wine. Venison and wild-fowl are to plentiful that they are the common diet of the peasants. Their hogs, being fed with cheetnuts, furnish excellent bacon. They have freestone for building, marble of various colours, and some agate. Manufactures are much encouraged, and the country is in a flourishing condition. The territories of the margrave of Baden comprehend 832 square miles, and 200,000 inhabitants. The annual revenue is estimated at 1,200,000 florin; and the military establishment consists of 3,000 men, of whom 900 are cavalry.

Baden, a town of Germany, and capital of the upper margravate of Baden, is seated on the river Oalbach near the Rhine, among vineyards. It has a fine castle, on the top of a mountain, where the prince often resides during the summer. It is famous for its hot baths, whence it derives its name; distant four miles south from Rastadt. N. lat. 48° 14'. E. long. 9° 24'.

Baden, a town of Germany, in the archiduchy of Austria, seated on the river Schwocha, and much frequented on account of its baths. The town is walled, and has three churches; twelve miles S. S. W. from Vienna. N. lat. 48° 3'. E. long. 16° 12'.

BADENOCH, a district forming the eastern part of Inverness-shire, in Scotland, extending from east to west about thirty-three miles, and in the breadth part twenty-seven miles from north-east to south-west. It is barren and hilly, and abounds with deer and game.

BADENS, Francis, in Biography, a painter of hillory and portraits, was born at Antwerp, in 1571, and acquired the first rudiments of the art from his father; and, by visiting Rome and other parts of Italy, acquired a good taste in
in design, and a very pleasing manner. Upon his return to his own country, his merit was so generally acknowledged, that he was distinguished by the name of the Italian painter. His touch was light and spirited, and his colouring warm, so that he had the honour of being the first who introduced among his countrymen a good taste for colouring. The news of his brother's affiliation occasioned his death in 1623, which was much regretted by every lover of the art. Pulteney.

BADEN-SIS, in Entomology, a species of Cerculio, about the size of C. ceris. It is black; legs pitchy. Gmelin. This insect inhabits Germany; the thorax is rather smooth and ovate; wing-cases obliquely fluted; thighs elevated.

BADEN-SIS, in Ornithology, a species of Emberiza found in the neighbourhood of Baden. The colour is olive, streaked with blackish, beneath paler; chin orange; breast with blackish. Sander Naturf.

BADENUCHI, in Geography, a town of North America, in the province of New Nauvoo; 125 miles south of Cafa Grand.

BADENWEIL, a town of Germany, in the circle of Swabia, and margrave of Baden-Baden. N. lat. 47° 55'. E. long. 8° 50'.

BADERA, in Ancient Geography, Bafgey, a place of Gaul, belonging to the Volsci Tectofages, in the Narboniensis prima, on the right from Toulouse to Narbonne, and south-east of the first of these towns.

BADESSUS, a town of Afa, placed by Ptolemy in Caria.

Badey, in Geography, a town of Persia, in the province of Korasan; 140 miles north-west of Herat.

Bage in Noviis Architecturae signifies a falt of ornament placed on the outside of small ships very near the stern, containing either a window, for the convenience of the cabin, or a representation of it. It is commonly decorated with marine figures, martial instruments, or such like emblems.

Baged, in Heraldry. See Device.

BADGER, Common, in Zoology, urfus males of Linnaeus and Gmel. See Ursus Meles. The badger's skin is of some use in commerce. Their fat is sold by the druggists, as a remedy against disorders of the kidneys and the sciatica; and their hair, for making the pencils for painters and gilders.

Badger, from bajula, I carry, or from the Fr. bagage, a bundle; whence bagager, a carrier of goods; a licensed huckster, or person privileged to buy corn, or other provisions, and to carry them from one place to another to make profit of them, without being reputed an engrosser. In the statutes he is also called a kidder, or lader of corn. 5 & 6 Ed. VI. c. 14. 5 Eliz. c. 12. We also read of badgers, or retailers of falt, 9 W. III. c. 6. If any person shall act as a badger without licence, which continues in force one year, he shall forfeit five pounds, one moiety to the king, and the other to the proprietor. 13 Eliz. c. 25. § 20.

Badger-hunting. See Hunting.

Badia, in Conchology, a species of Cyprea, having an oblong gibbose shell, above bay-colour, dotted with brown and white. Gmelin, &c. Its native place is unknown.

Badia, a species of Helix, called by Born helix usigynna; it is about an inch in height, and rather more than an inch and a half in length; and of a chestnut colour. The shell is umbilicated, subglobulose, smooth, depressed above; aperture lunare. Gmelin.

Badia, a species of Patella, the shell of which is Vol. III.

somewhat convex, brown, bay-colour within; with twelve larger rays, each surrounded on both sides by a rib; and smaller rays. The varieties of this kind are numerous and no less than sixteen of them are described by Schloot. Enul. in Conch. n. Litterat. &c. This shell is usually about two inches and three quarters in length; more or less flat in different specimens, and rarely produced; sometimes they are dotted with green, but slightly; and in others the upper surface is spotted all over with that colour; shells of this kind occur in which green or brown is dispersed in rays, or in rows of dots; sometimes they are pale ash-colour, waved or spotted with yellow or black, or liver colour. The crown is often variegated with rays, and not unfrequently with five rows of blue dots; and a flat plate liver-coloured or green foot in the bottom, furnished by a front, and double band, which is more or less pale, and of different colores or different shells; the inner surface is usually other brown, yellow, liver-colour, or liver-green.

Badia, in Ancient Geography, a town of Spain, in Bética, supposed to be the present Badajoz.

Badia, in Geography, a town of Italy, in the duchy of Tuscany, seventeen miles north of Florence.—Alio, a town in the same district, fifteen miles west of Volterra.

Badiaga, in the Materia Medica, the name of a sort of fpongy substance, common in the shops in Florence, and some other northern kingdoms: used for taking away the livid marks from blows and bruises, which the powder of it is said to do in a night's time.

We owe the knowledge of this medicine, and its virtues, to the accurate Baxbaum. He observes, that the substance is always found under water, and is of a very singular and peculiar nature. It somewhat resembles the a. spongia, and somewhat the sponges, but differs greatly from both, in that it is full of small round granules, resembling seeds. It is of a brown, light, and fpongy structure, and is made up of a number of fibres of an herbaceous matter, and is dry, rigid, and friable between the fingers. This may serve as the generical character of the badiaga, of which this accurate observer has found three different species. Linnaeus makes it a species of fponge.

Badian, or Badian, the seed of the anise-tree, or of a tree resembling it, that grows in China; and sometimes used by the Chinese, and also by the Dutch, to give an aromatic taste to their tea.

Badiath, in Ancient Geography, a town of Africa, in Libya interior.

Badiogeon, a mixture of piafler and free-stone, well ground together, and sifted; used by flatuaries to fill up the little holes, and repair the defects in stones, whereof they make their statues and other work.

The same term is also used by joiners, for saw-dust mixed with strong glue, wherewith they fill up the chips, and other defects in wood, after it is wrought.

Badiile, Antonio, in Biography, a painter of history and portrait, was born at Verona in 1480, and by a skilful application excelled his predecessors in an acquaintance with the true principles of his art. He was allowed to be a very eminent artist; and he had the honour of having for his disciples, Paolo Veronese, and Baptista Zelotti. His portraiture was admirable; his caricatures beautiful; and his portraits preferred the perfect resemblance of flesh and real life. He died in 1560. Pilkington.

Badilleterriers, a name given to a race of horsemen resident in the mountains, in the vicinity of Circassia, and of the Mogul Tartars, who in some measure retain their independence.

Badingen, in Geography, a town of Germany, in the circle
BAD, B bonding.

BADJOURA, a large village of Egypt, on the westem shore of the Nile, not far from Firthout, in N. lat. 26° 3' N.

BADIS, in Ancient Geography, a town of Carmania, seated on the coast of the Persian gulf, near the promontory of Carphala. Near the Periplus.—Alfo, an episcopal town of Africa, according to Ortschus, who cites St. Augufinus.

BADIS, in Geography, a fortress of Livonia, on the south side of the gulf of Finland, about seven leagues east from Revel, in N. lat. 59° 15', and E. long. 24° 3'.

BADIUS, in Entomology, a species of Clarabnx (Stenocera), that inhabits Siberia. It is of a bay colour, with the thorax and wing cad, Lepesclt, 1t.

BADUUS, in Ornithology, a species of Falco, about thirteen inches in length; a native of Coren; and described in Brown's illustrations under the name of the brown hawk. The legs are pule; head and body above brown, beneath white with yellow lunar spots; tail pale brown, with four ducky lines. Gmelin, 6c.

BADKIS, in Geography, a town of Peref, in the province of Korasan, thirty-six miles north of Herat. N. lat. 35° 26'. E. long. 65° 37'.

BADOLI, a town of Russia, on the north coast of lake Bieco, in the government of Novgorod, 196 miles north-east of Novgorod.

BADOUC, in Natural History, the East Indian name of a fruit very common in that part of the world. It is round, and of the size of one of our common apples; it is yellow on the outside, and white within. It resembles the mangoflan, but its pulp is more transparent; its taste is very agreeable, and has some resemblance to that of our gooseberries.

BADRAC, in Geography, a town of Hindoftern, in the Mogoljee Bafmifh country, 72 miles N. E. of Jahanudar, and 50 east of Byear.

BADRALI, a town of Eoupean Turkey, in Moldavla, ten miles north of Stephanowne.

BADRINUS, in Ancient Geography, Pasfato Grande, a river of Italy, in the territory of the Bad.

BADUGA, in Botany. See CAPPARIUS.

BADUEL, in Biography, a protestant divine of the sixteenth century, was a native of Nimes, and under the patronage of the queen of Navarre was appointed rector of the university in that city. In 1553 he became the pater of a church in the neighbourhood of Geneva, and taught mathematics and philosophy till his death in 1561. He translated into Latin, the sermons and some other works, of Calvin, published at Geneva in 1557, 8vo. He also wrote "De ratione vita studiorum et literarum in Matrimonio collateneae ac d. gendae," 4to, printed at Lyons in 1544, and translated into Latin in 1548: "De Collegio et Univeritate Niewenfend," printed at Lyons in 1543: "Acta Martianum nostri Saxelli," Genev. 1556; and also Latin orations and epifides. His Latinity is commended; and he was much esteemed for his learning and piety. Gen. Dut.

BADUENAE LUCUS, or BADUENNA, in Ancient Geography, the name of a ferey in Germany, mentioned by Tacitus. Its situation is not ascertained. This was the place where Cilia formed his conspiracy against the Romans.

BADULATO, in Geography, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, four miles S. S. E. of Squillace.

B A D Y, a river and an adjacent place of Peloponnesus in the territory of Elia, mentioned by Paulusinus. After a war which depopulated the country, the women, it is said, presented their supplications to Minerva, that they might supply the want by a new progeny in consequence of their first intercourse with their husbands; their petitions were granted; and they erected a temple in honour of the goddess, and hence the name Badly or Bady, Bady, or in the Doric dialect Ab, i. e. placid or agreeable.

B A D O, the name of a mountain in the island of Cephalonia.

B A D O R A, or B A D O R A K E, a town of Asia, in Asia Minor.

B A D E B R O, the name of a town of Spain, mentioned by Pline.

SpecieB, B. frutifera. Reich. 2. 200. Offb. It. 25t. t. 11. This shrub has the habit of southernwood, with wand-like branches, and opposite short simple twigs; leaves opposite, linear, sharp, smooth, entire; flowers axillary, solitary, on a naked peduncle the length of the flower, much shorter than the leaves. A native of China, where it is called Tsiogiu.

B E C O L I C U M, or B r i c o l i c o s, in Ancient Geography, a mountain of Africa, in the Pentapolis. Tulemy.

B E C O R, a place of Spain, in Bedia, where Vizir's wintered after having been defeated by Fabius Maximus Amilius. Appian.

B E C U L A, a town of Hispania Tarragonensis, in the territory, or at least in the vicinity of the Aithucani. Tulemy.

B E D O O, in Geography, a district of Africa, to the west of the river Niger, mentioned by Mr. Park in the narrative of his journey.

B E L A (Claps Beliana), in Ichthyology, the name of a fish found in the Red Sea, and described by York. Fn. Arab.—It is clays fiesntensis of Gmelin.

B E L O N, in Ancient Geography, a town of Spain, north-west of Mallaria, upon the Iberis of Gades, which carried on a considerable commerce in salt with Tungis, on the opposite shore.

B A E N, in Geography, a town of European Turkey, in Moldavia, sixteen miles miles N. N. W. of Niercez.

B E O B O T R Y S, in Botany, (from B a e n s, small, and B o r p o s, a raceme, the fructifications being in thin racemes). Lin. gen. Schreb. 318. Forster, Gen. 11. Clufs. pentandra monogynia. Gen. Char. Cal. perianth double; exterior three-leaved; leaflets roundish, concave, smaller; inferior one-leaved, bell-shaped, short, five-cleft, growing to the germ; clefts ovate, permanent, converging after flowering, and crowning the fruit. Cor. one-petalled, tabular; tube very short; border five cleft, erect; clefts rounded, very short.
short. Stem, filaments five, very short, in the middle of the tube; anthers heart-shaped. *Pfl.* germ globule, half-superior; style cylindric, very short, permanent; stigma oblong, tuberculated. *Per.* berry globose, somewhat dry, one-celled, growing to the calyx. Seeds several, angular, affixed to a columnar receptacle in the bottom of the berry.

BERONES, in Geography, the name given by Arrian to an island in the Indian ocean, on the other side of the river Indus.

BAER, and WESSS, in Zoology, the names of the black bear, and Polar bear, in *Ridinger's Animals.*

BARENBEISSER, the Bull Dog, Ridinger. Canis molossus. Gmel.

BAERSIUS, or Vekenstil, Henry, in Biography, a mathematician, flourished in the beginning of the sixteenth century. He was a printer at Louvain, and the author of the following curious mathematical treatises: "Tabula perpeta Longitudinum ac Locitubum Planetarum," 1528; "De compositione et usu Decretorii Planetarum," 1530; "De compositione et usu Quadrantis," 1537. Morey.

BÆRSFAT, a printer of sea-ports, sea-shores, and firth, was an eminent master, whose works were much esteemed, though the place and time of his nativity are unknown. His pictures are easily distinguished by a general brightness diffused through the whole, and particularly in his laces. His drawing was correct, and his perspective true; he copied every object from nature, and was exact in his representations of sea-ports, ships of war, and vellis of a smaller size, which he distributed with judgment, so as to produce a very pleasing effect. His pencil is light and clean, his touch spirited, and his colouring always transparent; and he generally finished his pictures very neatly. He died in 1687. Parkerton.

BÆRUS, in Ancient Geography, a town of Macedonia. Ptolemy.

BÆSAMPSA, a town situated in the Arabian gulf, supposing by some interpreters to be the same with the Beth-Shemesh, or the house of the fun, mentioned by Judges.

BÆSIPPO, a town of Spain, situated about twelve miles from Baion, and at a somewhat less distance southward from the promontory of Juno. Anton. Itin.

BÆTANA, a town of India, on this side the Ganges, seated on the river Nanaguma, and said by Ptolemy to be the capital and residence of the Siropollimi.

BÆTERRÆ, Baeziers, a town, which was a Roman colony, situated in Narbonensis Prima, a southern province of Gaul, at a small distance north-east from Narbo. It was the station of the veterans of the seventh legion, who built two temples, one dedicated to Augustus, and another to his daughter Julia. Tiberius also adorned this city; and in the fourth century it was one of the most considerable in Gaul. But in the fifth century it was taken by the Visigoths, who demolished its splendid edifices. It was afterwards re-established; but taken possession of by the Saracens in 736. In the next year Charles expelled them, and destroyed the city, so that they might not be able to re-fortify it.

BÆTHAUTA, a town of Asia, in Mesopotamia. Ptolemy.

BÆTICA, a province comprehending the southern part of Spain, and corresponding to the present Andalusia and Granada. This was one of the three provinces into which Augustus divided Spain; the other two being Lusitania and Tarraconensis. It derived its name from the river Bétis, since called Tartessus, and now Guadalquivir, or the great river; and was bounded on the west side by Lusitania, on the south by the Mediterraneum and gulf of Gades, and on the north by the Conscarbus, or the sea of Biscaia. Its limits towards the north-east were fluctuating, and cannot be easily ascertained. The Baetis divided this province into two parts; on the one side of which, towards the Ancus, were situated the Turdetsians, whose kingdom was called Turdetania; but this was better known by the name of Bética. On the other side were situated the Balfins, the Bétumans, and the Costellans, along the Matarrana coast. It was the richest and the best known province of Spain. It was famous for its wool; and its fertility was such, that its produce, according to Pevyn (Lexin, c. 10.), was an hundred fold. It is well known that the Phenicians were long ago established on these coasts, and that the Carthaginians had settlements in this country. Polibius speaks in high terms of the wealth of Bética, and of the magnificence of the court of one of its sovereigns. Bética, according to this author, contained 173 cities; of which eight were coloniae, eight municipal, twenty-nine enjoyed the usus Latii. four were called, six free, and one hundred, or such as paid taxes. The chief mountains were Marianus, now Sierra Morena, and Orofpa being a part of the present Sierra Nevada. The principal rivers were the Auras and Bétis; and the chief towns were Bétii, Acci, Elberius, Calatu, Corduba, Aligii, Hifalas, and Gades.

BÉTIM, now GUADALQUIVR, a river of Spain, in Bética, which had its source, according to Piny, in the mountains called Saltus Figigenis; or to the north-east of Orofpa, purified its course towards the west, washing Coftulu, Corduba, and Hifalas, and discharged itself in many outlets or mouths into the sea. The habitations of the country called it Cirium and Cortis, and the Arabs Cirits, derived, according to Mariana, from the oriental term *kirad*, a town, and denoting the river of towns, on account of the number of those which it watered. See GUADALQUIVR.

BÉTITUM, the name of a town of Macedonia.

BÉTUANO, a town of Spain, belonging to the Laietani, at a small distance south-east from Barcino; now Badessa. BÉTUANIA. See BÉTICA.

BÉTULUS, in Ichthyology, a name given by Aristotle and others of the ancient Greeks, to a fish called by some Latin writers *cotta*; and particularly to one kind supposing to be that described by Linnaeus under the name of *gobio*; and called the *bullhead,* or *millers thumb,* in England.

BÉTYLOS, or BÉTYLON, in Antiquity, a kind of stones worshipped among the Greeks, Phrygians, and other nations of the East; supposing by some modern naturalists to be the same with our *caramin,* or thunder-stone. The priests of Cybele carried a *betylos* on their breast, representing the mother of the gods.

According to Damascus, cited by Photius, they had many of these betyls, which were consecrated to different gods, as Saturn, Jupiter, the sun, &c. Bochart (Chanaan, i. ii. c. 2. vol. i. p. 708.) derives the origin of this superstitious practice from the river which Jacob erected at Bethel. Whereforever the practice was deduced, it was very extensive and prevalent; for in the eastern countries no idol was more common than eblong stones, which were denominated by the Greeks *betyl,* pillars. In four parts of Egypt, they were planted on both sides of their roads, in the temple of Helogabalus, in Syria, there was one which they pretended
pretended to have fallen from heaven: and a black stone of this kind was fetched from Purgatory, with great ceremony, together with the priests that belonged to it, by a Roman embassy, at the head of which was Scipio Nasica.

BEZÀ, in Geography, a town of Spain, in the province of Andalusia, and country of Jaen, situated on a high hill three miles from the river Guadalquivir. It was anciently the seat of a bishop, which was removed to Jaen in 1249, and a kind of university founded by John d'Avila. It was taken by the Moors about the end of the fifteenth century. N. lat. 37° 45'. E. long. 3° 15'.

BEZIILLO, a town of Spain, in Old Castile, three leagues from Valladolid.

BAFTA, or BATTAS, or BATTAS, a cloth made entirely of coarse white cotton thread, which comes from the East Indies. Those of Surat are the best.

BAFFA, or BATO, in Geography, a neat village of Africa, on the Grain coast, about a mile east of Sanguin; which supplies ships with ivory and pepper. It is easily distinguished by a long sandy point, surrounded with rocks, that project into the sea. The language spoken in this place is a kind of corrupt Portuguese, or rather a mixed language.

BAFFA, Capo, is the south-west point of the island of Cyprus in the Mediterranean, in N. lat. 34° 37'. E. long. 32° 18'. Near this harbour stood the ancient Paphos, where was a temple consecrated to Venus (see PAPHOS); it is now succeeded by ruins, a village, a mean castle, and equally mean houses, and a few Greek churches of the same description; and the name Paphos is converted into Baffa or Baffo. In the rocks is found a very fine rock-crystal, which is called the Baffa diamond, because it is procured from the environs of Baffa.

BAFFIN'S BAY, is the largest gulf or bay of North America, and was called by William Baffin, who, accompanied by captain Robert Bylot, attempted, in 1616, to find a passage through Davis's Straits. In a large gulf it extends nearly north and north-west from Cape Farewell in Well Greenland, as far as Whale sound, passing through the part of it called Davis's Straits, and reaches from the parallel of 62° to that of 50° N. lat. is a more confined gulf, it comprehend from 70° to 80°, being bounded on the north by the Arctic continent or lands approaching towards the north pole, on the east by Greenland, on the south by Davis's Straits, the ocean, and several islands which lie between this gulf and Hudson's bay, and on the west by a part of North America. Baffin seems to have restricted this appellation to the sea between 72° and 78° N. lat. and says that he traded with the Greenlanders at Horn sound, in the seventy-third degree, but in the seventy-fourth degree he found no natives, but several plains where tents had been set up, from which he concluded, that at certain feasons of the summer people resided there. The sea was full of seals and unicorn fish; and in Sir Thomas Smith's found, in the seventy-eighth degree, he found the large whales. See Grant's Hill of Greenland, vol. i. p. 16. In our maps it opens into the Atlantic ocean through Baffin's and Davis's Straits, between the broken land on the American coast, and that west of New Greenland, and between cape Chidley on the Labrador coast and cape Farewell on that of West Greenland; and on the south-west of Davis's Straits it has a communication with Hudson's bay, through a cluster of islands. Some maps shew a communication with Hudson's bay in the 76th degree of N. lat. and in the 70th of W. long. Baffin's bay is laid down as extending from 46° W. long. to 64°, which allowing only sixteen geographical miles for the degree, would give a length of 768 geographical miles; and the breadth on the west side is represented as little inferior. But the extent and limits of this sea have not yet been accurately ascertained: nor has the west coast of Greenland been explored beyond N. lat. 72° or Sanderson's Hope, and an old Danish settlement called Opencorrig. In the middle of Baffin's bay many maps present a large tract called James's Land, which some have imagined to be a promontory pilling from Greenland: or it is probably a large land in the north of Hudson's bay laid down from erroneous observations. This bay has been sometimes called Bylot's bay.

BAFFIN'S STRAIT is a passage between James island and the most easterly of the Cumberland islands, from the gulf of the ocean into Baffin's bay. This, and Davis's Strait, or the easterly of James island, and Cumberland Strait on the south-west of the Cumberland islands, seem to shew that the proper boundary of Baffin's bay does not reach to far south as to cape Farewell.

BAFING, or BLACK, RIVER, a principal branch of the Senegal river in Africa. Mr. Park, in his "Travels in the Interior Districts of Africa," describes a singular bridge erected by the Iallonkas over this river. It consists of two tall trees, which when tied together by the tops, reach from one side of the river to the other; the roots resting upon the rocks, and the tops floating in the water. When a few trees have been placed in this direction, they are covered with dry bamboos, so as to form a floating bridge, with a sloping gangway at each end, where the trees rest upon the rocks. In the rainy season this bridge is carried away by the swelling of the river.

BAFWEN LAKE lies in that part of Sweden called Sodermanland; it is extensive, and contains many islands.

BAG, in Commerce, a term used to signify different quantities of certain commodities: a bag of almonds, for instance, is about 3 cwt.; of mace, from 3 to 4 cwt.; of pepper, from 1 to 3 cwt.; of goats-hair, from 2 to 4 cwt.; of cotton-yarn, from 2 to 4 cwt. &c.

Bag, in Surgery, in Medicine and Pharmacy, denotes a kind of fomentation, prepared of proper ingredients, included in a bag, to be applied externally to a part afflicted for present relief. Dispensatory writers describe several bags, used in deliquiouns; bags for the side, for the stomach; in weaknefes of the stomach; andyone bags to cause pain in any part. Wines and oils are frequently medicated by putting into them bags full of proper ingredients.

Sweet bags are compositions of perfumes, scented powders, and the like, included in bags, to give a fragrance to clothes, &c.
BAG

BAG, Oil. See Oil.

BAG, Petty. See Petty.

BAGS, Sand. See Sand.

BAG, or Baggy Point, in Geography, is a noted promontory among the coast of Devon, at the north-west point of the entrance into Barnstaple bay. N. lat. 51° 10'. W. long. 4° 32'.

BAGA, in Ancient Geography, a town of Africa Propria, being one of those which were re-established by the emperor Julianus, according to Procopius.

BAGA, or Bagga, a town of Afia, in Paphlagonia.

BAGADA, a town of Ethiopia, near Egypt. Play.—

BAGADANIA, a large plain of Afia, in Cappadocia, placed by Strabo between mount Taurus and mount Argen, about 3000 fudias more southerly than the Enaaxea sea.

BAGADAT, a name by which some call the carrier pigeon, the columba tibetaria of Moore. This name is probably a corruption of the word Bega, the name of a city from whence they are sometimes brought to Europe; being originally brought thither from Bafoura.

BAGADUSCA POINT, in Geography, a headland of America within Penobscot bay, in the district of Maine.

BAGAGNANA, in Ancient Geography, a mountain of Afia, in Armenia, where they obtained, according to the ancient physiographer Ethus, the Armenian honey.

BAGAN, in Geography, a town of Servia, twenty miles north from Nissa.

BAGANZA, a river of Italy, which joins the river Parma, at the city of Parma.

BAGANZOLA, a town of Italy, in the duchy of Parma, four miles north of Parma.—Also, another town in the same duchy, four miles south of Parma.

BAGARACA, in Ancient Geography, a town of Thrace, Anton. Iun.

BAGARD, Charles, in Biography, born at Nanci, in Jan. 1696, was early initiated into the practice of physic by his father Anthony, who had acquired considerable reputation in that art. To the influence our physician had with Stanislaus the first titular king of Poland, and duke of Lorraine, we are indebted for the botanical garden and the college of medicine at Nanci, of which he was the first president. He died of apoplexy in December 1772. Besides numerous dissertations on medical and philosophical subjects, we have the following, by this author: "Difcours fur l'histoire de la Therapeutique," published 1755; "Difpensai- torium Pharmac. Chymicum," Paris, 1771, fol.; "Phyto Medicinalis," &c. 1771, 8vo. "Difcours fur les Monlres du Regne Vegetal, Nanci, 1708, 8vo. Elyo. Dict. Hift. Haller, Biblioth. Botan.

BAGARDA, in Ancient Geography, a town of Afia, in Paropamisus. Ptolemy.

BAGASE, a town of Africa, in Libya Interior. Ptolemy.

BAGASIS, Bagaja, a town of Africa, situated on a river at the foot and to the east of mount Audes.

BAGAT, in Geography, a town of France, one league well from Paris.

BAGATHUSA, Cape, lies on the south-east coast of Arabia, fifteen leagues east from Shabar. Under the lee of this cape there is good anchorage; but the fea ranges on this coast from April to July to such a degree that no ship can live there.

BAGATINS, or Couriers, a name given to the pigeon-carriers.

BAGAUDIÆ, or BACAUDIÆ, in History, an ancient faction of peasants, or malecontents, who ravaged Gaul, and assumed the name bagauda, which, according to some authors, signifies, in the Gallic language, forced rebels; according to others, tributes; according to others, robbers; which last designation others allow the word had, but then it was only after the time of the bagauda, and doubtless took its rise from them.

The bagauda were a rabble troop of low-men and sheperds, whom the grievous weight of their taxes induced to take up arms under the reign of Claudius II., about A. D. 269, in order to rid themselves of a tyranny which seemed to them worse than death. Irritated by oppression, they resembled by their rages the fury of the barbarians, and laid wale the countries which they ought to have cultivated. At this time their strength must have been considerable, as they held a large number of towns to the city of Autum, and at length took it by force. Under Aureliam and Probus no mention of them occurs, because it is probable that the value and activity of these warlike princes kept them in awe. But under the reign of Diocletian, about the year 286, exasperated by the injustice, violence, and cruelty of Carinus, they renewed their revolt, and they were commanded by two men, whose names were AElanus and Amandus, each of whom had the boldness to assume the title of Augustus. Maximan, who was admitted by Diocletian as a colleague in the government, A. D. 286, subdued the bagauda partly by clemency and partly by force. It does not appear what became of the two chiefs of the rebels; but Sallust informs us, that the name and the faction of the bagauda were revived in the fifth century. Croce's Hist. Emp. vol. ix. p. 282.

BAGAUZE, is the name which is given, in the Antilles islands, to the sugar-canes after they have passed through the mill. They are dried, and used for boiling the sugar.

BAGADAI, in Geography, a large and populous city of Asia Minor, in that division of Diarbek which called Irak-Arabi, is seated on the upper banks of the Tigris, N. lat. 33° 22'. E. long. 44° 21'. It has been erroneously supposed by several geographers to be the old Babylon, though it be at a distance from the ruins of this ancient metropolis. It is computed to be about 1300 paces in length, 7 or 800 in breadth, and 3000 in circumference. Mr. Jackin, in his "Journey from India to England," in 1797, 1798, that it extends three miles along the eastern bank of the river, and the length of the walls from the river being about two miles, it has the form of an oblong square. Its walls are all of brick, with terraces and large towers at proper distances, in form of bastions, and defended by about 60 pieces of cannon. The calie is large, and flanked by some small towers with cannon, and the garrison usually consists of 300 foot, 4000 horse, and 60 gunners. The number of inhabitants, if we may credit the accounts of the Arabians writers, was formerly very considerable; but it is now reduced to fifteen or twenty thousand, including those who live in a suburb on the other side of the Tigris, at the end of the bridge of boats, which are separated every night to prevent surprise. But notwithstanding this number of inhabitants, the town has still many empty spaces within its walls, and it is for the most part built indifferently built. Many of the public buildings, however, such as the mosques, minarets, and hammams, are constructed of stone and make a very handsome appearance. Here is also an extensive bazar, which is well supplied with a variety of articles. Several of these buildings are arched, in order to guard against the excessive heat of the sun; and the concavities, tarantulas, and other noxious insects, are numerous, perils, in order to avoid them. In the summer season, the tops of their houses. The environs of Bagdad to the west
well and north are altogether barren; to the east there are excellent gardens; and the opposite bank of the river supplies a great variety of fruit and vegetables. The city itself, though much reduced in extent, and wealth, as well as population, is now supposed to contain more treasure than any other city of equal size in the world; and the immense quantity of specie and bullion, fays Johnson (nbi supr.); found in the coffers of the late Kya, or prime minister, amounting to upwards of three millions fléthling, seems to warrant such a conjecture.

This city, which was for many ages the capital of the Saracens, and the residence of the caliphs, was founded by Al-Manfor, the second of the family of the Al-Abbä, in the 147th year of the Hegira, A.D. 662. The Romans having attempted to subdue the city, and failing, Al-Mansur, determined to build a new city, and he selected for the site of it, a spot, sufficiently distant from Cufa, the inhabitants of which were treacherous and insolent in their attachment, secure against the attacks of those who might wish to dispute the caliphate with him, and situated in the middle of a tract which would furnish an ample supply of provisions by means of the rivers to which it gave easy access. Having consulted his architects and engineers, he commenced his undertaking. As to the name by which it was to be distinguished, some have derived it from the Persia Bâghdâd, which signifies the gift or present of Bâgh, pretending that the plain on which it stood was given by Chosrau, named Al-Munbarwan, to one of his wives, and that she had there erected a palace or castle dedicated to her favourite idol called Bâgh. In process of time this capital became the chosen residence of a venerable heir to the throne, who returned to Al-Manfor a tradition that a city was to be built in this place: but it is needless to relate any further particulars. Others say, that the verdant plain on which this city was built, had been the cell of a Christian monk, called Baghdad; and others say, that this monk was called Dad, and that he peopled a beautiful and extensive garden, whence the place where the city was founded received the appellation of Bâghdâd, or the garden of Dad. The new metropolis was also denominatred Medinan Al-Salam the city of peace; either in allusion to the name of Jerusalem, or because, at the time when it was finished, all the commotions in the empire were appeased, and almost every nation in Asia had submitted, or was become tributary. The first city erected by Al-Manfor was situated on the west, or bank of the Tigris; but the Persians taking offence at the erection of a city so near their frontiers, a new city was afterwards built on the east bank of the river called the camp, or fortress of Al-Mahdi, and both these cities being united, formed the ancient Bâghdâd. The caliph had a stately and magnificent palace in each portion of the new city. Bâghdâd was erected on the ruins of Seleucia, the remains of which, as well as of Ctesiphon, furnished the materials; and it seems to have been divided by the Tigris, as ancient Babylon was by the Euphrates. In the 149th year of the Hegira, A.D. 766, this famous capital of the Moslem empire was finished. It was of a circular form, inclosed by a double wall, and flanked with a considerable number of towers. The palace, or citadel, was in the middle of it, and commanded every part of the town. Between the canal and western parts of the city a bridge was constructed in order to facilitate a communication between them. Besides several public buildings erected by the caliph Al-Mansur Billâh, there was a famous college founded by this prince, which has been extolled by Abû-l-aravrûs, on account of the beauty and elegance of its structure, the number of students it contained, as well as the learned men it produced, and the ample revenues settled upon it, and superior in his time to every other house of learning in the known world. Among the students there were 300 who devoted themselves entirely to the study of the Mahometan law, according to the decisions of the four chief sects of the Sonnites, each of which sects had a professor in this college. For several ages Bâghdâd, besides being the seat of power, abounded more with learned men than any other place in the Mahometan dominions, except Mecca and Medina. It was also extremely populous, and contained several forts and caliphs, capable of making a tolerable defence, and deriving their repute from their founders. The language spoken in this city was one of the most polite and elegant dialects of the Arabic, as there was greater concourse of nobility and learned men, who excelled in many branches of literature, for several ages, in this city than in almost any other of the caliph. The city had also a mint, in which were coined a great number of dirhems and drachms. Bâghdâd continued to be the seat of the caliphs of the race of Al-Abbas for 500 years; but at length, in the year of the Hegira 656, A.D. 1258, the conquest of Iran, or Persia, was achieved by Holak Khan, the grandson of Zingis, the brother and lieutenant of the two successful emperors Mongon and Cublai. After a siege of two months, it was stormed and sacked by the Mongols; and their savage commander pronounced the death of the caliph Mufaïsm, the last of the temporal successors of Mahomet; and thus the family of the Abbasides was extinguished. The Tartars or Mongols having plundered and set it on fire, and massacred many of the inhabitants, enriched themselves by its spoil, as it was then reckoned one of the most considerable cities in the world; and they retained possession of it till the year of the Hegira 795, A.D. 1392, when it was taken by Tamerlane. For the first time, from Sultan Ahmed, the son of Avs, who conveyed his baggage beyond the Tigris, and abandoned the capital to the conqueror; and it was taken a second time in the year of the Hegira 853, A.D. 1440, from the same sultan, who had recovered possession of it. After this capture, it was restored by Tamerlane to the sultan; but in the year 815, A.D. 1412, the sultan was finally expelled by the Turcoman Cara Joffe. The descendants and successors of Tamerlane remained masters of Bâghdâd till the year of the Hegira 875, A.D. 1470, when they were expelled by Hafsan, surnamed Uzun, or Ufîn-Cafe. The princes of this family possessed it till the year of the Hegira 914, A.D. 1508, when Shah Ismael, surnamed Soh, the first prince of that race which afterwards reigned in Persia, made himself master of it. From that time it was an object of contest in the wars between the Persians and the Turks, for 150 years. The Turks took it under Sultan Soliman, and the Persians retake it under Shah Abbas the Great, king of Persia; but being at length besieged by a formidable army under Abdul Hamid III, it was surrendered to him by Shah Soh, king of Persia, A.D. 1638; and from this time it has remained in possession of the Turks. Herbelot, E. B. Or. p. 154. From this defile by the trade of the place has considerably decayed, as the sultan railed all the rich merchants. However, though it groans at present under the Turkish yoke, Bâghdâd is a celebrated emporium and frontier of the Ottoman empire, on the side of Persia, to which not only many merchants, but likewise an incredible number of passengers, travelling from Natolia, Syria, Palestine, and Egypt, into Persia, continually resort. Its situation on the banks of the Tigris renders it convenient for trade; but the heat of the climate is so excessive, that the inhabitants are obliged to keep their markets in the night during the summer, and to sleep, as we have already said,
on their terraces. The military government is under a pacha or basha, who uses various despotic methods to extort money from the inhabitants, and particularly from the Jews and Christians, who are the principal merchants of the city, and who have been in a great measure driven from it by the oppression they have suffered. The civil administration is exercised by a cadi, who acts as judge, president, and mufti, with a testamentary executor. Each of these men collects the revenue of the grand signor. The pilgrims that visit Mecca by land are obliged to pass through Bagdad, and every one of them pays a tribute or toll, equivalent to four piastres, to the bahawor, which branch of the revenue yields annually a considerable sum to the grand signor. The revenues are computed at 125½ dollars, amounting to about 1,525,000 dollars; but of these, not more than one quarter are collected, by reason of the insolence of the Turks, and the bahawor lives in all the splendor of a foreign prince, and maintains a very large army, he has recourse to great injustice and oppression, in order to obtain the necessary supplies. The inhabitants of this city are chiefly Persians, Armenians, Turks, Arabs, and Jews, and of these: the last act as schroffs, or bankers, to the merchants. The Jews, notwithstanding the severity with which they are treated, are induced to live here from a reverence to the prophet Ezekiel, whose mausoleum they pretend is a day's journey from the city. Many of them likewise annually retort hither from other parts to visit the prophet's tomb. Two chapels are allowed for those of the Romish and Greek persuasion. In this city there are several beautiful mosques, into which Christians are not suffered to enter, for fear of their being defiled. The Mahometan women are very richly dressed, wearing bracelets on their arms and jewels in their ears. The Arab women wear rings in the partition between their nostrils, which are bored for this purpose.

The ruins of ancient Babylon are situated about fifteen leagues to the south of Bagdad. See Babylon.

BAGGEDIN, MAHOMET, in Biography, an Arabic mathematician, lived in the tenth century and is reported to be the author of several treatises in geometry, among which is one "On the division of superficies," translated into Latin by John Dee of London, and by Frederic Commandini of Urbino, who published this treatise at Padua in 1576. Some have supposed that Baggedin was merely the translator of this work from Greek into Arabic, and that it was written by Euclid, or some other ancient mathematician.

Moreni.

BAGENBON HEAD, in Geography, a cape of Ireland, in the Atlantic ocean, on the coast of Wexford. N. lat. 52° 0', W. long. 6° 40'.

BAGGAGE, is particularly used, in the Military Art, for the necessaries, utensils, apparel, &c. of the officers and soldiers. The baggage includes also women, children, flutterers, &c.

The baggage is well called by the Roman writers, impedimenta, on account of the great trouble and expense attending it. Unless strict discipline be kept, great inconveniences may arise from it; whence several military laws and ordinances relating to the baggage.

The baggage-wagons, before a march, are appointed a rendezvous, where they are marshalled by the waggon-master-general, according to the rank: the several regiments bear in the army. On a march, they are sometimes ordered to follow the respective columns of the army, sometimes to follow the march of the artillery, and sometimes to make a column of themselves. The general's baggage is generally first. If the army march from the right, the baggage of that wing has the van; if from the left, the baggage of the left has the van. Each waggon has a distinguishing flag, to show to what regiment it belongs.

BAGGAGE, PAKING up the, as well as a term among the Romans, for preparing to go to war, or to be ready for an expedition.

The formula by which the soldiers declared they were in readiness, was vox canis lamarce.

The Romans divided two kinds of baggage, a greater and a less; the latter was carried by the forlorn on his back, and called sacris: consisting of the things most necessary to life, and which he could not do without. Hence colisage sacris, packing up the baggage, is used for decamping, opus muneris. The greater and heavier was carried on horses and vehicles, and called onera. Hence onera scissibus, sacris bonorum. The baggage-horses were denominated saeculum et equi.

The Roman soldiers in their marches were heavy laden, informed that they were called, by way of jest, multis, mariam, and armon. They had four forts of baggage, which they never went without, viz. corn, or butellatum; utensils, valis, and arms.—Cicero observes, that they used to carry with them above half a month's provisions; and we have instances in Livy, where they carried provisions for a whole month. Their utensils comprehended those proper for gathering fuel, dressing their meat, and even for fortification, or intrenchment; and what is more, a chain for binding captives.

For arms, the foot carried a spear, shield, sword, bafket, rurum, hatchet, forum, plates, &c. Also flake, or sledges, valis, for the sudden fortifying a camp; sometimes seven, or even twelve of these pales were carried by each man, though generally, as Polybius tells us, only three or four. On the Trajan column we see soldiers represented with this sacle of corn, utensils, pales, &c. gathered into a bundle, and laid on their shoulders.

Thus inured to labour, they grew strong, and able to undergo any fatigue in battle; the greatest part of which never tired them, or put them out of breath. In after-times, when discipline declined, this baggage was thrown on carriages, and porters' shoulders.

The Macedonians were not left inured to hardship like the Romans; when Philip first formed an army, he forbid all use of carriages; yet with all their load, they would march in a summer's day, twenty miles in military ranks.

BAGGER, JOHN, in Biography, a Danish divine, and bishop of Copenhagen, was born at Lund in 1645. After professing his studies under the abbeys in Germany, the Netherlands, and England, he settled in his native place, and was appointed professor of the oriental languages. At the age of twenty-nine years, he was advanced to the episcopal see of Copenhagen, and discharged the duties of his office with distinguished approbation. He revised the ritual of public worship established by Christin IV., and published several learned and eloquent discourses in Latin and Danish. He died at the early age of forty-seven. A logical treatise of Bagger, under the title of "De principis perfecctissim Sylllogismorum," was printed in 1480. at Copenhagen in 1665. Moreni.

BAGGING of Hope. See Hope.

BAGHYRETTO, in Geography, a river of India, sup- posed by major Renell, to be the true head of the Ganges, which joins the Alacknandra river, the former proceeding from the north, and the latter from the north-west, at Deobrah, or the middle Gangoutra. i.e. the fall or cascade of the Ganga, or Ganges, at a few miles distance below Sirinagar; and then they form the proper Ganges of Hindoostan, which after-
afterwards issues through mount Sewallick, at Hardwar, the lower Gangoutra. Of these two streams Akuckundra is the largest; and at Sirnagun, seated on its banks, being confined in a channel 100 yards wide, it runs with astonishing rapidity, and is crossed by means of rope bridges of singular construction. This river has its source in the snowy mountains of Thibet; and it is probably the same river which Du Halde mentions under the name of Manchon. The Baghretty river has its source far more remote; but the direction of its course above the upper Gangoutra is unknown. According to the information of Mr. Daniel, the Baghretty river separates, at a considerate distance below the Cow's Mouth, into two branches; the calf-trunoff of which is said to be the Akuckundra. But this depends upon a vague report of travellers, which, says Major Rennell, cannot be depended upon. Rennell's Memoir, p. 371.

BAGIA, in Ancient Geography, a promontory of Carmania, near which was a rock consecrated to the fun. Ptolemy.

BAGIA, in Geography, a town of Persia, in the province of Fariliana, 120 miles north-east of Schiras.

BAGIENNA, in Ancient Geography, a town of Asia, in Armenia Major. Ptolemy.

BAGIEU, JACOBS, in Biography, surgeon to a regiment of cavalry, in the middle of the last century, and author of several valuable works on chirurgical subjects, particularly on the method of treating gun-flot wounds. He opposes the frequent amputation of limbs, so common in France, and reduces the cases, rendering that operation necessary, to a very small number. He defends experience, as more valuable than theory; no course of reading, or study, being competent to supply the place of practice, the light or knowledge obtained from which is often incommunicable. He commends Amb. Parey's practice in gun-flot wounds, of first using emollient applications, and then making large openings for discharging the confined matter. He does not admit the efficacy of the Peruvian bark in checking the progres of gangrene, which he thinks has its boundaries affixed by nature. He is suppos'd, by Portal, to be the author of "Lettre de M. Chirurgien de Province, a M. Chirurgien de Paris," 8vo, 1740.—Allo, "Deux Lettres d'un Chirurgien de l'Armée, l'une fur plusieurs chapitres du tr. de la gangrene de M. Quefai, l'autre fur le tr. des armes a feu, de M. Deftortes;" Paris, 1750, 12mo. "Nouvelle Lettre de M. Bagieu, &c." 1751, 12mo. "Examen du Plusieurs parties de la Chirurgie, &c." 2 vol. 1756. Haller Bib. Chirurg.

BAGISARA, in Ancient Geography, a port of Carmania. Arrian.

BAGISTANA, a town of Asia, in Upper Media, at the foot of the mountains in which are the fourasses of the river Gyndes; south-west of Ecbatan.

BAGISTANUS, a mountain of Asia, between Babylon and Media; consecrated to Jupiter. Diod. Sicul.

BAGIYAN, in Geography, a town of Persia, in the province of Segellan, 110 miles north of Zarpag.

BAGIURA, a town of Egypt, twenty-five miles south of Girgë.

BAGLAFCHITE, in Ornithology, the name of Gmelin's basil philippina, var. S, in Buffon's history of birds.

BAGLANA, or BLAGLAN, in Geography, a province of the Mogul empire, in the peninsula of India, encompassed by Guzerat, Dowlatabad, and Candieff. It is included within a ridge of the Gaua, and is exceedingly mountainous, but contains also many fertile and pleasant tracts. Few countries possess greater advantages, with regard to natural strength; and these are augmented by no fewer than nine strong fortresses, seated on the summits of rocks, of which Saltheir and Mulhir are accounted impregnable. According to Abdul Humed, Baghiana extended from the sea-coast near Surat, which was its western boundary, to the borders of Dowlatabad (or Aurungabad) eastward; being in length 100 common coffs, and in breadth, from Naderbar and Sultanpur on the north, to Nafluck Trimbuck on the south, 70 coffs. Shahwazw, though he agrees with Abdul Humed, with respect to the length, allows about 30 for the breadth; and mayor Rennell says, that it certainly is not 70 coffs, and yet much more than 35, in distance between the alligned limits on the north and south. It has owed its independence, not merely to its natural strength, but to the address of its rajahs, who courted the princes of the kingdoms of Guzerat, Dowlatabad, and Candieff, by which it was surrounded. Whenever the conquest of it was attempted by any one of these princes, the other two armed in its defence. When the surrounding kingdoms successively fell under the Mogul power, the rajah, for the first time, acknowledged a superior, and visited the court of Achar. But even then the Moguls contented themselves merely with a tribute, until the rapid progress of Aurung Zeli's conquests and power in the Deccan. Its revenue, previously to the Mogul conquest, was about 86,000. Rennell's Mem. p. 259.

BAGLIONE, COSTANZA, in Biography, a most pleasing, and excellent author, in the comédie, born at Milan, in 1750; at the head of a Bolonafe musical family, of which six sisters were all singers, doubling the number of our Abrams's, but not the merit. Three of these singers went afterwards to Paris, "who pleased there so much (says M. La Borde), as to make us wish to hear the rest." Eslaf furla la Malique.

BAGLIIVI, GEORGES, born, Haller says, in Ragusa, a city in Dalmatia, in the year 1668, applied himself early to the study of medicine. After attending the lessons of the professors at Naples and at Padua, at which latter place he graduated, to improve himself further, he travelled over Italy, and settling at length at Rome, viz. in 1692, was advanced to the chair of professor of the theory of medicine and of anatomy, by pope Innocent XII. to whom he dedicated his first work, "De Praxi Medicie, ad priscam observanda rationem revocanda;" lib. iv. printed in 1696, 8vo.

In this work the author laments the degraded state of medicine in his time, which he attributes to the neglect of observation and experiment, and of the study of the writings of the ancient Greek physicians, particularly of Hippocrates, joined to an inordinate passion for speculative reasoning. He acknowledges, however, the improvements that had been made in anatomy and physiology, and that the theory of the moderns, founded on these improvements, far excelled the hypothetical reasoning of the ancients; and thence conjectures, that when we shall sedulously bend our minds to practical observations, we shall as far exceed the ancients in our knowledge of the true method of treating diseases, as we then excelled them in theory.

Examining the question, whether theory or practice conduce more to a knowledge of the method of curing diseases, he determines in favour of practice, but recommends both; "Quaecumque," he says (Opera omnia, 4to, p. 127.), "de medicina meditatus f setis, pro veris non habetis, nisi prius ad lydem praexos lapidem revocaveris; quod si repetita experientia inventus vero, pro veris temper habetis. De bono, aut malo vino, judicatur non poteris, nisi gutavcris; perfectus musicus non erit, nisi cecemir; nec miles firemus, nisi bella gesserit." Bagliivi is accused of plagiarism, and
of being himself too much addicted to theory; his credulity is also confounded, for suffering himself to be imposed on by vagabonds, pretending to labour under various nervous affections, in consequence of having been bitten by a tarantula, a species of spider common in some parts of Italy, and that they could only be cured by certain musical sounds. But we shall be disposed to moderate our cenure of Baglivi, when we find our countryman Dr. Mead (who, though born about the same time, lived nearly fifty years after him) attempting to account for these extraordinary effects of the bite of the insect, attributing them to the temperature of the climate, and of the inhabitants of Apulia, where the spider is most frequent, and explaining, on philosophical principles, the manner in which music operates in allaying the tumult in the constitution occasioned by the poison. Mead seems to think it not improbable that Pythagoras first introduced this mode of practice, in curing the effects of the bite of the tarantula. See his Medical Works, 4to. p. 66, &c. The same year, vis. 1695, Baglivi published his dissertation "De Animae, morbus, et effectibus Tarantulae," then followed his treatise "De Fibra motrice et morbo." In this work is contained the author's theory, borrowed from Pachini (to whom, however, he says, Op. Om. p. 258, he communicated his observations), of the origin of the motion of the follicles, which he attributes, cap. iv. to a conflict between the heart and the dura mater. In 1704 he published at Rome "De Medicina foliadorum ad rectum flavum Cancri," and in 1705, "De progresione Terra motu." These, with various other dissertations, have been collected and published under the title of "Opera Omnibus," which has passed through numerous editions; and though his theory has long since given place to others, in their turn to yield to theories perhaps equally fallacious, the work will always deserve the attention of the medical students, for the numerous and valuable observations with which it abounds. Baglivi died in the year 1702, aged only 38 years. Haller. Bib. Med. Prac. and Bib. Anatomi.

BAGNOLI, in Geography, a town of France, in the department of the Gard, and chief place of a canton in the district of Pont St. Esprit, two leagues south of Pont St. Esprit.

BAGNOLS, in France, a town of the Rhone, in the department of the Lozere, and chief place of a canton in the district of Mende, eight miles west of Mende.

BAGNUOLO, a town of Italy, in the kingdom of Naples, and Principato Ulitra, twelve miles west of Conza.

BAGO, among the Ancients, were the Franks with those called by the Latin Sarmatians, viz. a species of Scyths, in whom the canal of the penis was so contorted by a tight viscousula, that they could not emit the semen.

BAGORODITZ, in Geography, one of the twelve districts of the government of Tula, in Russia, seated on the river Upa.

BAGOIS, in Ancient Geography, a name given to a ridge of mountains which were part of mount Imus, towards the source of the river Ivas.

BAGPIPE, a musical instrument of the wind kind, chiefly used in country places, especially in the North. It consists of two principal parts: the first a leather bag, which is blown up like a foot-ball, by means of a port vent, or little tube, fitted to it, and stopped by a valve.

The other part consists of three pipes or flutes; the first, called the great pipe, or drone; and the second, the little one, which puffs the wind only out at the bottom; the third has a reed, and is played on by compressing the bag under the arm when full, and opening or stopping the holes, which are eight, with the fingers. The little pipe is ordinarily a foot long, that played on thirteen inches, and the port vent fix.

The bagpipe takes in the compass of three octaves.

This instrument was not unknown to the ancients. It was called by the Greeks *αποθάλασσα* by the Romans *tuba cicbonicularia*. The Italians call it *la* *tromba*, the French *musette* and *chabaco*. In the first edition of the French Encyclopaedia, there is a minute and elaborate description of the instrument, its construction, scale, &c. By the ornaments mentioned, it must have been admitted into good company.

The invention of it is derived from some from Tubal; others ascribe it to Pan; others to Mercury, to Fauns, to Mars.
B A H

fyas, and to the young Sicilian shepherd Daphnis, who first composed pastoral.

An anonymous French author has published a treatise of the bagpipe, "Traité de la Mutette," with a new method of learning to play on it without a master. Fol. Par. 1672.

BAGPIPE the Miscin, in Sea Language, is to lay it aback, by bringing the flett to the mizzin-shrouds.

BAGRADA, or Braga, now Mejorda, in Ancient Geography, a river of Africa Propria, the source of which Ptolemy fixes in mount Mamפרαυς, erroneously representing its course to have been from north to south; whereas it flows in a direction from west to east. It is equal, says Dr. Shaw (Travels, p. 77.), to the Isis united with the Cherwell; and continues winding, through its whole course, along a rich and fertile country, with the fole of which it becomes so well saturated, that it is of the fame colour with the Nile, and has the fame property of making encroachments on the sea. To this circumstance may be ascribed the many changes which appear to have been made at one time or other in the channel of it; and to this also it is owing that an open creek of the sea, into which the Mejorda about a century ago dilfcharged itself, is now circumfcribed by the mud, and become a large navigable pond, the anti-harbour, as Dr. Shaw calls it, to port Farina. The situation of Utica and of Carthage, with respect to this river, are materially altered. (See CARThAGE, and Utica.) Bochart (i. c. 251.) deduces the name Bagrada, from βάγραδος: barato, a pond, agreeably to the description of Silius Italicus, i. vi. 140.:—

"Turbidus arctens lento pede fulcet harenas
Bagrada, non ullo Libycis in fuisse amne
Victus limosar extedere latius undas,
Et flagnante vado patulos involvere campos."

BAGRADA, in Architecture, a river which flowed on the confines of Perìa and Carmania, and dilfcharged itself into the Perìan gulf. Ptolemy.

BAGRE, in Ichthyology, a species of Silurus that inhabits South Africa. The posterior dorsal fin is fat or fhiphy; firt ray of the dorifal and pectoral fin fetaeoccus; beards four. Gmel.

BAG-REEF, in Sea Language, denotes a fourth or lower reef of fial, sometines used in the royal navy.

BAGSZELAR, in Geography, a town of European Turkey, in the province of Bulgaria, 20 miles north-east of Ternoa.

BAGUETTE, in Architecture, a little round moulding, lefs than an arbal; sometines carved and enriched with foliages, pears, ribbands, laurels, &c. According to M. Le Clerc, when the baguette is enriched with ornaments, it changes its name, and is called chaplet and unornamented, it is a bead.

BAHAMA ISLANDS, in Geography, a name commonly applied by the English geographers to that cluster of small islands, reefs, and rocks of fand, which fhretch in a north-westfher direction for the space of near 500 leagues from the northern coast of Spanifalia to the Bahama frait, oppofite to the Florida shore; or from about 20° to 28° N. lat. and from about 70° to 80° W. long. This whole group is called by the Spaniards Lucyuer. The island of Bahama, which gives name to the reft, N.lat. 26° 45', W. long. 78° 35', is about 25 leagues diftant from the continent of Florida; it is about 50 miles long, and scarcely any where 16 broad. The number of these islands is faid to be about 500; of which, however, fome are mereiy rocks. Though their number is confiderable, and fome of them are of a large fize, our knowledge of them is very imperfect.

They were first discovered by Columbus, A.D. 1521; and the firft land he discovered was that of Guanahani, on which he landed to return thanks for his fuccefs, and to erect a crofs; and he denominated the island San Salvador, taking poftition of it in the name of his Catholic majesty. This island, in the vicinity of Providence islan, is known to the English navigators by the name of Cat island. Columbus, however, made no fettlement in these islands. About the year 1629, it is faid (see Anderson's Comm. vol. ii. p. 37.), the English began to plant on the island of Providence, which till then was uninhabited; and after the conclusion of peace with Spain, king Charles I. renewed his grant of this and the other Bahama islands. In the year 1666, captain Sayle, an Englishman, was forced in his passage to Carolina, by ftrrefs of weather, to land upon one of these islands; and upon his return to England, he made fo favourable a report of them, that his of the proprietaries of Carolina follicited, and obtained a grant of them. Captain Sayle, in a fecond vifit to the island of Providence, which was one of them, discovered the advantage which England might derive from it; and he made the government of England fo fensible of it that about the year 1672 they fent thither a governor and a colony. But the fettlement was interrupted by Spanifh pirates; and the island of Providence, and the other Bahamas, were abandoned. The chief town of Providence, called Naflau, confifted at this time of 150 houses. The island afterwards became a neft of pirates, who interrupted the American navigation; and on this account, an order was iffued by his majefly king George I. on the conclufion of a peace with Spain in 1721, to fortify and fettle the island, and to diflodge thofe outlaws. The Engliih in the Bahama iflands have been computed at three or four thoufand; half being fettled in Providence, where is the fort called Naflau; and a small harbour. But the natural barrens of the foil, and the narrow length of thofe ifles, which expofes them to the heat and to the winds, account for their comparative infignificance in this grand commercial archipelago. Of their prefent state, little satisfactory information has been obtained even by the lords of the committee of council for the affairs of trade and plantations. To the inquiries of their lordfhips in 1789, as to the extent of territory in these iflands, the quantity of land in cultivation, the number of white inhabitants, productions, and exports, &c. the only anfwer that could be obtained from the governor was this, "that it was at that time impoflible to ascerufn any of those particulars." It appears, however, from the testimony of other perfons, that thofe iflands in general are rocky and barren; that the only article cultivated for exportation is cotton, of which the medium export is 1500 bags of two hundred weight; that the inhabitants, who in 1773 confided of 2052 whites and 2241 blacks, have been of late years considerably augmented by emigrants from North America; but of their prefent number no precise account is given. Edwards's Hist. of the Wett Indies, vol. i. p. 170.

BAHAMA STRAITS, called the gulf of Florida, the narrow sea between the coast of America and the Bahama islands, about 45 leagues long, and 16 broad.

BAHAMA BANK, Great, a bank of fand extending from near the island of Cuba, N. lat. 22° 20', to the Bahama islands, N. lat. 26° 15'. The fand which lies to the north of the island Bahama is called Little Bahama Bank.

BAHAR, or BARR, in Commerce, a weight used at Ternate, Moca, in the Moluccas, Achem, and divers other parts of the East Indies. There are two kinds, the great, with which fpace is weighed, equal to 542 lb. 9 oz. avoirdupois The little bahar ferved for the weighing quick-f
ver, vermilion, ivory, silk, musk, and other precious wares, equal to 43 lb. 9 oz. avoidopous weight.

Bahar, in Geography, one of the eleven soubahs, or provinces, into which Acbar divided Hindoostan proper; bounded on the east by Bengal, on the north by Napaul and Bootan, on the south by Orissa, and on the west by Oude, Benares, and Allehabad. It has been estimated at 252 miles from north to south, and at 200 miles from west to east. It produces wheat, rice, peas, &c.; but the principal article of export is saltpetre; most of that which is imported by the East India company being manufactured within this province. The capital is Patna. Mr. Fraser, in his "Life of Nadir Shah," states the revenues of this province, under Aurenge-Beze, at 1014 lacs of rupees. The greatest part of Bahar is polled by the British nation; but there are several pargannahs, or hundred, on the south-west of Little Nagpore, that were formerly ceded as belonging to Bahar, which are now in the possession of the Maharrats.

Bahar, a town of Hindoostan, in the province of the same name; remarkable for its number of funeral monuments; 30 miles south-east of Patna, and 220 north-west of Calcutta. N. lat. 25° 14'. E. long. 85° 45'.

Bahar, or Bazar, a town of Peria, in the province of Kerman; 40 miles south-east of Sirgan.

Bahirites, derived from the Arabian babar, or race, and denoting maritime, in History, the denomination of a class of perfins in Egypt, who having affiliated Touran Chah, the last of the family of the Aoubutes, reigned over Egypt and Syria for 136 years, and had 27 kings. The Babirites were of Turkish origin. Nejm Eddin purchased them of the Syrian merchants. They were deterreined in their turn by the Mamulakes or Cirezian flaves, in the year 784 of the Hegira, A. D. 1382; who formed a new dynasty, which kept possession of Egypt until the conquest of Selim, emperor of the Ottomans, in the year 923 of the Hegira, A. D. 1527.

Baharnagash, a country of Abyssinia, adjoining to the province of Tigre, and situated between the river Altufaspes and the Arabian gulf. Its capital is Dobarwa, in N. lat. 15° 22'. E. long. 39°.

Bahas, in Geography, a town of Arabia, sixteen miles N. W. of Loheia.

Babielong, a town of Hindostan, in the country of Baglasa; 65 miles south of Aurungabad. N. lat. 20° 45'. E. long. 74° 51' 30'.

Bahi, a province of the island of Lucon or Manila, one of the Philippine islands. It produces excellent betel, which the Spaniards are continually chewing; and it is the place where most of the ships are built. The province is about 30 leagues in circuit, and contains about 6000 tributary natives.

Bahia, De Todos Los Sanctos, a province of Brazil, in South America, and the richest in the whole country; but the air and climate do not correspond with other natural advantages. The province is so fertile in figar and other articles of commerce, that the Portuguese resort in great numbers to it, as the seat of affluence, and also of pleasure and grandeur. The capital called St. Salvador, or Cruzial de Bahia, is populous and magnificent, and by far the most gay and opulent city in Brazil. It stands in a bay in S. lat. 12° 11'; it is naturally strong, and is also well fortified and defended by a numerous garrison. See All Saints, and St. Salvador.

Bahir, in Literary History, denotes famous and illustrious, and is particularly used for a book of the Jews, treating of the profound mysteries of the cabbala; being the most ancient of the Rabbinical works.

Bahira, or Rip, in Geography, the northern division of Egypt, extending from the division of the Nile to the east and west branches, on both sides to the Mediterranean. The principal towns are Alexandra, Rosetta, Damietta, Menouf, Manifoura, Tineh, Catch, and Fouche.

Bahira, among the Ancient Arabs, a name given to one of the four kinds of camels or sheep, which, for some reasons of their religion, were turned out at liberty with an ear-mark, no longer to be used for service like other cattle.

The bahirs, with the sidar, wafita, and kami, were abolished by Mahomet as no ordinance of God.

Authors are not agreed as to the characters of the bahira.

Bahraitch, in Geography, a town of Hindostan, in the province of Oude, 55 miles N. N. E. of Lucknow. N. lat. 27° 32'. E. long. 81° 57'.

Bahirdt, Charles Frederic, in Biography, a theological and satirical writer, was born at Bichofaverda, Aug. 25th, 1741. Having commenced his education, without much improvement, under private tuition at Leipfie, where his father lived, he was removed to a public school, and afterwards to the grammar school at Pforte. From hence he returned to Leipfie, where after receiving some private instruction in the Greek and Latin from Erneth, he entered in the university, and quitting it after two years, he commenced preacher in the vicinity of Leipfie. In 1761, he was admitted to the degree of master of arts, and some years after he was appointed extraordinary professor of sacred philosophy. In 1763, he published a work, intitled, "The true Christian in Solitude," and also his "Commentary on Malachi," in which he endeavoured to display his talents in biblical criticism, and his knowledge of oriental literature. An intrigue, which rendered him a father, defeated all his expectations at Leipfie, and obliged him to retire to Hall; and he was appointed professor of biblical antiquities at Erfurt. Having no salary, but supplied with money by his father, he found his situation agreeable; however he introduced some remarks of a theological kind, which were not thought orthodox; and complaints were preferred against him by Schmidt and Vogel, two clergyment of that city. In order the more successfully to repel the accusation of his antagonists, he published the degree of doctor in theology from the university of Erlangen, which gave him a right to read public lectures in divinity; and in 1769, he published in his defence the first part of his "Effays towards a System of the Doctrines contained in the Bible." About this period he also published "The earnest Wishes of a dumb Patriot," in which he attacked the weakest proofs of the fundamental truths of the theological system, and endeavoured to raise suspicions against professor Schmidt of being a Jefuitical facetian. His conduct in this respect was reproved by the faculty of divines at Wittenberg, and those of Gottingen recommended reconciliation. In 1770, Bahrdt published at Eifenach his "System of Moral Theology," which was favourably received, and he embarked, from a desire of fame and love of money, in some other projects and undertakings. The approbation generally bestowed on his critical performances induced him to undertake an edition of the Old Testament similar to that announced by Dr. Kiiocct; but neither his knowledge nor situation promised success, and his intentions were never fulfilled. He afterwards thought of improving his finances by marriage, and espoused a young widow of Mullhausen with a fortune of 6000 dollars. In 1771, he entered on the office of fourth professor of philosophy at Gieflen in Hesse; and here, in the space of four years, he published two "Collections of Sermons," a "Book of
of Homilies," his "Apparatus Criticus Veteris Testamenti," "A general Theological Repository," "Outlines of an Ecclesiastical History of the New Testament," "Proposals for explaining the Doctrines of the Church," "A Critical Examination of Michaelis's Translation of the Bible," and "The purest Revelation of God," i.e. a translation of the New Testament with notes. The heterodoxy of his opinions raisd a violent storm against him at Gießen; but he escaped it by a removal to the office of director of the philanthropium of Von Salis at Marichlau, in Switserland, with a salary of 2000 florins. He soon however changed his situation, and in 1776 removed to Durckheim, and established a seminary of education at Heidehein. His philanthropium was opened in 1777, and for some time it prospered; but he involved himself in debt, and being under a necessity of removing, he determined to visit Holland and England for the purpose of procuring pupils in those countries. On his return to Heidehein with 13 pupils, he was informed that he had been suspended from all his employments by a conclusion of the imperial council. Bahrdt had now no other resource besides that of quitting the empire, and seeking refuge in Prufia. Accordingly, in 1779, he retired with his family to Halle; and had again recourse to his pen. Here he published extracts from the sacred scripture, under the title of "The Bible in Miniature," which was printed in 1780; and he delivered private lectures on philosophy, humanity, and rhetoric; and he also read lectures on Tacitus and Juvenal. Upon his first arrival at Halle, he acknowledges, in his life, that there were some latent sparks of religion in his mind; but that they were soon totally extinguished by his intercourse with deists. In the works, therefore, which he now published, he endeavoured to teach the doctrine and history of Christianity separate from every thing supernatural, accommodated to reason, and agreeable to his own ideas of its original simplicity. But his health declining, he was under the necessity of altering his mode of life, and he purchased a vineyard with a small farm attached to it in the neighbourhood of Halle. Part of his manion was fitted up as a tavern and coffee house; and in this situation Bahrdt acquitted himself as a landlord and a pleasant companion. But his affection and confidence being directed towards a maid-servant who managed his house, he oblied his wife, by the most cruel treatment, to leave him; and when the afterwards returned to him, she became a victim to still greater barbarities.

Bahrdt, whilst he was in England, had been initiated in masonry; and in the year 1781, upon the perusal of Stark's book on the mysteries, he adopted the notion that Jesus Christ must have intended, by establishing a secret society, to prefer and diffuse among mankind truth almost banished from the world by priests. This idea he propagated in his "Accomplishment of the Plan and Object of Jesus," and in the third edition of his "Translation of the New Testament." In the year 1784 or 1785, a society of twenty-two united masons was established in Germany, with a view of improving the arts and sciences, commerce, and above all, religion, among the common people. Bahrdt became a member of this society, and proposed that it should engrave the bullfecks of book-selling, partly with a view to gain money, and partly for obtaining the complete sovereignty of the republic of letters in Germany. This plan, however, not being approved, failed. In 1782 or 1786, he formed another project, which was that of making himself the founder of an avowed critical sect in Prufia; but it does not appear that he ever seriously attempted it. In 1787, he exerted himself with zeal in supporting the union, and assembled the members; but after a second meeting, he received notice to discontinue these assemblies. But his own activity was unintermitting, and he continued to propagate his ideas by an epistolary correspondence during the whole of the year 1788. He also published several works calculated to promote his views, and relating to the union, such as "Observations on the Liberty of the Pref and its Boundaries," and "Zamoor, or the Man of the Moon," in which he delineates free-masonry in Germany, as corrupted by the wildest fanaticism and the darkness of popery. There also appeared about this time a comedy, called "The Edict of Religion," universally ascribed to him, on account of which he was arrested, and confined at Halle; and during his imprisonment, he wrote "Morality for the People," which has been reprinted as the belt finifhed and most valuable of his works, though he completed it in the course of three weeks. Upon his trial, he was acquitted with regard to the charge that related to the union, but declared guilty of having written the comedy, and sentenced to two years imprisonment in the fortresses of Magdeburg, which term was mitigated by the king to half that period. During his confinement, his leisure moments were employed in writing the "History of his own Life." After his release, he returned to his vineyard, and renewed his barbarities towards his wife, who abandoned him, and left him at liberty to take home his maid-servant and her children. Here he continued his former life as landlord and writer. Being attacked by a disorder in his throat, he recurred to the too liberal life of mercury, and a fever ensuing, he expired on the 23rd of April 1792. His works on morality and religion, besides those already mentioned, were very numerous. His satellite pieces, being of a temporary nature, have sunk into merid oblivion. The genius of Bahrdt was comprehensive and veritable; but his principles and his conduct were licentious; and his history exhibits the perversion of talents, which properly employed and accompanied with integrity, might have rendered him respectable and useful. Gen. Biog. BAHREIN, BAHRKEIN, or BAHRIN, a fortified town of Arabia, situate on an island of the same name, called also AVAIL; which see. The name is extended to a group of small islands adjacent to one another, the largest of which is Bahrein. Bahrein once belonged to the Portuguese. When they were driven out of the Ierian gulf, it fell into the hands of the sheik of Lachfa; but was taken from him by the Persians. The imam of Oman then made himself master of it; but gave it up again to the Persian monarch for a sum of money. It afterwards changed its owners; but in 1765 it reverted into the possession of the sheik of Abu Scheih, and he was then sole monarch of the island. It is famous for its pearl fisheries. (See Pearl.) N. lat. 26°. E. long. 49°.

Bahrein is an appellation sometimes given to the province of Lachfa; which see.

BAHR EL ABIAD, or the WHITE RIVER, a name given to the real Nile, near its brt origin; the sources of which in the African Alps of Kumi remain to be explored.

BAHR EL AZREEK, BLUE RIVER, or ABBFANIAN Nile, has its chief spring in a small hill, situated in a marth, and joins the Bahr el Abiad, or true Nile, about N. lat. 16°; the latter is tinged, the former is clear. The Bahr el Azreek was mislaken for the real Nile, by the Portuguese writers, Alvarecs, Pilze, &c. probably misled by the vain glory of the Abyssinians: though it was well known to the ancients as quite a dillent river, being the Aftapus flowing into the Nile from the Coloe Pahs, now the lake of Deinbea. Mr. Bruce has adopted the same mistake; and it is said, that when M. d'Auwile shewed him his mistake, he resolved to expunge the White river from his map, though
BAI

though he acknowledges in his work that it is the largest
stream. The Bahr el Azrek is dyed Abawi by the Babil-
ians. The sources of this river were accurately described
in the nineteenth century by Payz, a Portuguese milita-
mary, whose account was published by Kircher and Isaac
Vossius; and has been not long ago minutely copied by
Bruce, as Hartman has shown by printing the two accounts
P. 715.

BAHRENBERG, in Geography, a town of Germany,
in the circle of Weilphalia, and county of Iloya, on the
river Schillingen, fourteen miles S.S.W. of Iloya.

BAHUS, in Geography, a river of France, which runs
into the Adour, about a league above the Sever.

BAHUS. See BAHUS.

BAJA, in Entomology, a species of Phalaena (Nodla),
of the middle size, that inhabits Europe. The wings are
ferruginous, with a small black dot at the base, and a dou-
ble one at the apex. This is produced from a variegated
grey and brown caterpillar, having three dorsal white line,
and yellowish sides. Feeds on the deadly nightshade.

Gmel. Fabr.

BAJA, in "Ancient Geography. See BAYA.

BAJA, in Geography, a town of Hungary, on the river
Danube, 50 miles N. N. W. of Peterwaradin. N. lat. 46°
40'. E. long. 19° 57'.

BAJA, a sea-port town of Italy, in the kingdom of
Naples, and county of Lavoro, eleven miles west of Naples.
See BAYA.

BAJABAD, a town of Africa, in the province of
Caramania, 28 miles south-east of Kallamoni.

BAJAD, in Ichthyology, a species of Silurus, having
the posterior dorsal fin fleshy or fat; twelve rays in the
anal fin; and beads of the month eight. Forsk. Fl. Arab.
Inhabits the Nile; colour glaucous; length one foot or
more.

BAJADOR, or Bagador, Cape, in Geography, a cape
on the west coast of Africa, in the Atlantic ocean; 120
leagues distant from Cape Cecr. N. lat. 26° 29'. W. long.
14° 56'—Bagador is also a cape at the north-western extre-
mit of the island of Lucon, one of the Philippine
islands.

BALE, in "Ancient Geography, now BAJA, an ancient
village of Campania, in Italy, situated between the promon-
tory of Mifenum and Putoii, on the Sinus Baianus; fa-
mous for its hot baths, which served the Romans for the
purposes both of medicine and pleasure. The hot springs
and medicinal vapours that abounded in the environs of this
place melt, at a very early period, have excited the atten-
tion of valeiitarians, as bathing was the constant amuse-
ment and refreshment of the Greeks while in health, and
their remedy when diseased; but Baiz does not seem to have
attained a degree of celebrity superior to that of other
baths, till the Roman commonwealth began to decline. As
soon as the plunder of a conquered world was transferred
from works of public use and ornament to objects of pri-
vate luxury, the transcendent advantages which Baiz offered
to Roman voluptuaries, lying from the capital in search of
health and pleasure, became an object of peculiar attention.
The variety of its natural baths, the softness of its climate,
and the beauties of its landscape, captivated the minds of
those whose passion for bathing knew no bounds. The ab-
lations which they might wish to practice at Rome required
an enormous expense in aqueducts, fountains, and attendant;
but here they found a place, most delightfully seated, where
water was naturally heated to any degree of necessary warmth
bubbled spontaneously out of the ground; and its easy com-
munication with Rome was also a circumstance that recom-
mended it. Hither the mighty rulers of the empire retired
at will for a temporary relaxation, after the fatigue of
blood campaigns and civil contests. Their habitations were
small and model, but increasing luxury soon added palace
to palace, with fountains, tubs, and fountaineous, that space
was wanting for the vast demand. Accordingly architectural
study was fostered, and their foundations
into the sea, and drove that element back from its ancient
shift. See House express it:

"Marique Louis Obregent's urges
Sun move our litter."

But the sea has since recovered much more than it lost.
From being a place of resort for a few Baiz grew up to
a permanent city; and its wealthy inhabitants rendered it
a much a miracle of art as it was before of nature. Its
fiflons may be inferred from its innumerable ruins, heap
of marble, mosaics, fountains, and other precious fragments
of art. It flourished in full glory to the days of Theodore
the Great; but the destruction of these enriched palaces
soon followed the impetuous of the northern conquerors, who
overturned the Roman fylvan, burned and burnt all before
them, and destroyed or disp.led the whole race of nobility.
No fountain had influence withdrawn its support, than the un-
bridled torrent heaved back upon its old domain; miles and
miles of the sands were torn afunder and washed away; while promon-
tories, with the leaved towers that once enclosed their brows,
were undermined and tumbled headlong into the deep, where,
many of below the waters, pavements of bricks, foundations
of houses, and mounds of ruins, may be discovered. In-
ternal commotions of the earth contributed also in a great
degree to this general devastation. M phis vapours and
fluctuated waters have converted this favour to seat of health
into the dun of pestilence, at least during the summer
heat; and yet Baiz in its ruined state, and stripped of its
ornaments, still presents many beautiful and striking fubjects
for the pencil of the artist. N. lat. 41° G. E. long. 14°
44'. Swinh. Trav. vol. iii. p. 42, &c.

BAJANA, in Conchology, a species of Venus found
on the shores of Brail. The colour is ochraceous, varied
with black; and the shell is specifically distinguished by a very
frail, glabrous, and marked transversely with a few tran-
versal lines. Figured by Bonnani.

BAJANUS, in "Ancient Geography, a bay of Italy
in the kingdom of Naples, so called from Baius, Portus Bia-
num or Phoceus, which was enlarged by Augustus, by giving
entrance to the sea into the Lucus Lucrius, and Averna,
ordering it to be called Portus Jucun apud Baius. (Suctum.
We also read in Tacitus of Bajana Lucum, which term have
interpreted Lucurn. This Gulf is denominated Citrus by
Strabo; and he places it between the cape of Minerva and
that of Misenus. The modern name is Golfo di Pozzuoli.
From the highest point that forms the bay, a large column
commands the road, where foreign fhips of war usually ride
at anchor, the harbour of Naples not being sufficiently pa-
sted for the reception of a fleet; here they enjoy good
fretter, watering, and virtualion; but in summer, risk the
health of their crews, on account of the unwholesomeness
of the air. At the bottom of the bay, and at the foot of the
beach rocks which serve as a foundation to the ruins called
"Nero's house," are some dark caves of great depth, leading
to the bottom of all vapour baths. These baths are thirty
in number; and they are said to have been adorned with
Greek inscriptions and statues denoting, by their expressions
and attitudes, what particular part of the human frame was
affected and relieved from its pains by each particular bath.
The springs at the bottom of the grotto are so hot as to
boil an egg hard almost instantaneously. These caverns
seem to be the spot where Nature has opened the readiit
access

"..."
access to the focus of a volcano, which has been within the two last centuries most outrageous in its operations; for to them must he attributed the overturning of the adjacents country, and the total alteration of its surface by the birth of Monte Nuovo, which now blocks up the valley of Averno.

Swinh. Trav. vol. iii. p. 48.

BAJAZET I., in Biography, sultan of the Turks, was the son and successor of Amurath I., and denominated "I-Hussein," or lightning, on account of the fiery energy of his soul, and the rapidity of his destructive march. He succeeded Amurath in the year 1389, being then about 44 years of age; and having fecured his authority at home by the execution of his younger brother, who attempted to excite a revolt against him, he prosecuted the ambitious designs of his father. During the fourteen years of his reign, he incessantly moved, at the head of his armies, from Bursa to Adrianople, from the Danube to the Euphrates; and though he strenuously laboured for the propagation of the law, he invaded, with impartial ambition, the Christian and Mahometan princes of Europe and Asia. Having reduced to his obedience the northern regions of Anatolia, made himself master of Caramania, and imposed a regular form of servitude on the Servians and Bulgarians, he paused the Danube to feck new enemies and new subjects in the heart of Moldavia. Whatever yet adhered to the Greek empire in Thrace, Macedonia, and Thessaly, acknowledged a Turkish master, and he was led through the gates of Thermopylae into Greece by an obsequious bishop. The Turkish communication between Europe and Asia had been dangerous and doubtful. till he united at Gallipoli a fleet of galleys to command the Hellespont, and intercept the Latin succours of Constan tinople. While the monarch indulged his passions in a boundless range of injustice and cruelty, he imposed on his solders the most rigid laws of modesty and abstinence; and the harvest was peaceably reap'd and fold within the precincts of his camp. Having obtained the title of sultan from the caliphs who served in Egypt under the yoke of the mamalukes, he was ambitious of deserving this title; and accordingly he turned his arms against the kingdom of Hungary, the principal theatre of the Turkish victories and defeats. At Nicopolis, near the Danube, he defeated, in 1396, a confederate army of a hundred thousand Christians, headed by Sigismund, the Hungarian king; most of whom were slain or driven into the Danube: and Sigismund, escaping to Constan tinople by the river and Black sea, returned after a long circuit to his exhausted kingdom. Among the captives was a body of French crusaders, and in this number were John count of Nevers, the son of the duke of Burgundy, and some of the noblest lords in France. In the pride of victory, Bajazet threatened that he would besiege Buda, that he would subdue the adjacent countries of Germany and Italy, and that he would feed his horse with a bushel of oats on the altar of St. Peter at Rome. Whilst the military talents of Bajazet, manifested on this occasion by the speed and celerity of his march, and also by the order and evolutions of the battle, have been acknowledged even by his enemies, he has justly been accused of cruelty in the use of victory. The French captives, who survived the slaughter of the day (the count of Nevers and twenty-four lords excepted, who were afterwards ransomed for two hundred thousand ducats) were led before his throne; and as they refused to abjure their faith, they were successively beheaded in his presence. So absolute was his authority, that his word, pronounced either by way of mercy or destruction, was irreversible. In the treaty, after the battle of Nicopolis, it was stipulated, that the French captives should swear never to bear arms against the person of their conqueror; but this ungenrous refrant was abolished by Bajazet himself. "I despise," said he to the heir of Burgundy, "thy oaths and thy arms. Thou art young, and mayest he ambitious of evincing the disgrace or misfortune of thy first chivalry. Assemble thy powers, proclaim thy design, and be assured that Bajazet will rejoice to meet thee a second time in the field of battle." The progress of Bajazet, notwithstanding his threats, was checked by a long and painful fit of the gout. Before he directed his arms against the feeble remains of the Eastern empire, he rendered the emperor, Manuel Palaeologus, tributary, and imposed upon him the humiliating condition of having a Turkish ead and a mofesh in his capital. He next threatened and actually invaded Constantinople; but he was called away by the menace of a more formidable tyrant than himself. This was the great Timour, or Tamerlane, who, in the year 1390, began his march from Georgia towards Asia Minor. In his first expedition, Timour was satisfied with the siege and destruction of Siwas, or Sebulti, a strong city on the borders of Anatolia; and with cauing 4000 Armenians, who formed the garrison, to be buried alive for the brave and faithful discharge of their duty. He then turned aside to the invasion of Syria and Egypt, sacked and destroyed Aleppo and Damascus, and took possession of Damascus. To Bajazet he offered peace on moderate terms; but the sultan, confiding in his strength, employed the interval in collecting all the forces of his empire, and these two potentates met on the plains that surrounded the city of Angora, in July, A. D. 1402, to a memorable conflict, which has immortalized the glory of Timour, and the shame of Bajazet. Such was the event of this severe contest, in which two very numerous and powerful hosts were engaged, that the Turks were entirely broken with dreadful slaughter; and Bajazet, afflicted with the gout in his hands and feet, was transported from the field on the litter of his horses. He was pursued and taken, and at fun-fet brought to the tent of Timour. Bajazet, by the mild expostulation of the conqueror, who, with a soothing pity for his rank and misfortune, mingled just reproaches for his pride and obstinacy, was softened into humiliation. "Had you vanquished," said Timour, "I am not ignorant of the fate which you revered for myself and my troops; but I disdain to retaliate; your life and honour are secure, and I shall express my gratitude to God by my clemency to man." The "iron cage," in which Bajazet is said to have been imprisoned by Tamerlane, so long and so often repeated as a moral lesson, is now rejected as a fable by the modern writers, who smile at the vulgar credulity. It has been suggested, indeed, that Timour might display an oftentimes magnificence and liberality, towards Bajazet; while, with a view to secureity, he kept his important prize in a "moveable apartment guarded with bars," and indulged his own pride in carrying him about in triumph. "In the fear of victory," says Gibbon, "to which Bajazet was invited, the Mogul emperor placed a crown on his head, and a sceptre in his hand, with a solemn assurance of restoring him with an increafe of glory to the throne of his ancestors. But the effect of this promise was disappointed by the sultan's untimely death; amidst the care of the most skilful physicians, he expired of an apoplexy at Akkéhur, the Antioch of Pindia, about nine months after his defeat," A. D. 1405, in the fifteenth year of his reign, and fifty-eighth of his life. "The victor dropped a tear over his grave; his body, with royal pomp, was conveyed to the mausoleum to which he had erected at Boursa; and his son Mogul, after receiving a rich present of gold and jewels, of horses and arms, was invested by a patent in red ink with the kingdom of Anatolia." The character of Bajazet was that of a despot with vio

BAJAZET II., sultan of the Turks, succeeded his father Mahomet II. in 1451. After being freed from the competition of his brother Zizim, or Jem, he engaged, like his predecessors, in wars, and made conquests in Moldavia and Caramania; and he manifested the ferocity of his own disposition by putting to death, at an entertainment in his palace, his famous general Achmet. His war with the sultan of Egypt terminated in the ruin of the latter power; but at its commencement Bajazet lost a great number of troops in an invasion of Syria. He afterwards overran Circassia, and carried many of its inhabitants into captivity. On the expedition of the Moors from Spain, Bajazet, at the head of the Mahometan religion, was solicited to receive their cause; and he sent a fleet into the Mediterranean, which defeated the Christian navy, and ravaged the coasts. He afterwards reduced Croatia and Bosnia. In consequence of the request of Sforza, duke of Milan, he declared war against the Venetians, and invaded and plundered Friuli. Marching in person into the Morca, he took Lepanto, Moden, and Durazzo; but in 1503, peace took place between him and the Venetians, who had taken possession of Cephalonia. Besides these foreign wars, Bajazet encountered many civil commotions, occasioned by the rebellion of his son Selim. The issue of these conflicts was the reignition of the crown to his son, upon which Bajazet, wishing to live in peace and retirement at Demotica, set out on a journey thither, attended by a few friends. His progress was slow, and his son suspected that he was waiting for some favourable turn in his affairs; and therefore his death, after he had proceeded to the distance of about forty miles from Constantinople, was not without reason ascribed to poison administered by a Jewish physician. He died in 1512, at the age of 62, after a reign of 32 years. He was active and vigorous in body and mind, a patron of the learned, himself a proficient in literature, and well versed in the philosophy of Averrhoes, and a punctual observer of the rites of his religion. At the same time he had the fierceness common to the Ottoman princes, and shed blood without remorse. He is commendable for his attention to the improvement and decoration of his dominions by many edifices of grandeur and utility. Mod. Un. Hist. Gen. Biox.

BAIBACHTA, in Geography, a town of Siberia, on the river Irtysh, 72 miles N.W. of Tara.

BAIBARAZAR, a town of Asiatic Turkey, in the province of Caramania, 48 miles west of Angora.

BAIBOUL, a town of Armenia, 45 miles south of Trebizond.

BAICHA, two rivers of Siberia, which run into the Turuchan; one 32, and the other 56 miles N.W. of Turuchan.

BAIDARS, the name of a kind of small canoes, used among the natives of the Kuril islands, and of the northwestern coast of America. In Sauer's "Account of a geographical and astronomical Expedition to the northern Parts of Russia, by Billings, in the Years 1785 to 1794," we have the following account of their construction. The keel is eighteen feet long, four inches thick on the top, and not three inches deep, or somewhat less, at the bottom. Two upper frames, one on each side, about 1½ inch square, and sixteen feet long, join to a sharp flat board at the head, and are about sixteen inches shorter than the stern, connected by a thwart which keeps them about twelve inches asunder. Two similar frames are placed near the bottom of the boat, six inches below the upper ones, about one inch square. Round fitches, thin, and about six inches distant from each other, are tied to these frames, and project from the sides; and for the top thwarts and fitches very strong fitches, nearly as thick as the upper frames, curved, fitches to raise the middle of the boat about two inches higher than the fitches. Of these thwarts or beams there are thirteen; one of them is placed seven feet from the stern; another is twenty inches nearer the head; and a loop is fastened between them, in which the rower is seated. This is made strong, and grooved for fastening an open skin, which is tied round the body, so as to prevent any water from getting into the boat, although it were rough. The frame is covered with the skin of the sea-lion, drawn and fowed over it like a caufe. The whole is so extremely light, even when loaded with water, that it may be carried with ease in one hand. The head of the boat is double the lower part, sharp, and the upper part is flat, resembling the open mouth of a fish, but thus contrived to keep the head from finking too deep in the water; and a fitch is tied from one end to the other, to prevent its entangling with the sea-weeds. They are easily rowed in a sea, moderately smooth, about ten miles in the hour, and they keep the ftre in a fresh gale of wind. The paddles which they use, and which serve for oars and rudders, are double, seven or eight feet long, and are cut in the shape of a peal. If the baidar runs aground, the favage fayly fets it afloat again. These baidars are used in the fishery for whales, in the capture of sea-otters, and for other purposes.

BAIDER, in Geography, a town of Prussia, in the province of Lithuania, on the north side of the Piafa, four miles east of Gumbinnen.

BAIER, JOHN JAMES, in Biography, born at Iena, in Upper Saxony, in 1677, applied himself early to the study of medicine, and was admitted to the degree of doctor there in the year 1700. In 1704, he was made professor of physiology at Altdorf; and in 1730, president of the academy Nature Curifororum. Besides numerous dissertations on various branches of medicine, he published, "Adagiorum Medicorum Centuria," Afd. 1708. "Historia Horti Medicorum Altdorff," 1724. "Orationum Varii Argumenti Fabuliceps," 1724. "Biographia Profefforum Medicinæ qui in Academia Altdorf unquam vixerunt," 1728. Nurmb. cum Iconibus, Nummis, et Scriptorum Cenfus. His son Ferdinand James was in considerable esteem as physician at Nuremburg, at the time of his death, which happened in 1755. Haller Bib. Med. Præf. et Botan.

BAIEU, in Zoology, the name of Cervus Mexicano or Mexican flag, in Bancroft's Guinea, &c.

BAIJE, in Biography, was born at Venice, in 1522, where he probably acquired and cherished his passion for music. He was the natural son of the French ambassador to that republic; had been a fellow student with the poet Ronfard, and was closely united to him by friendship and kindred arts. Baire, like our sir Philip Sidney, wished to introduce the feet and cadence of the dead languages into the living, and with the like success. He set his own verses to music; not to such music as might be expected from a man of letters, or a dilettante, confifing of a fingle melody, but to counterpoint, or music in different parts. Of this kind he published, in 1561, twelve hymns, or spiritual songs; and, in 1578, several books of songs, all in four parts, of which both the words and the music were his own. When men of learning condescend to study music à fond, professors think the art highly honoured by their notice; but poets are very unwilling to return the compliment, and seldom allow a musician
fician to mount Parnassus, or let his foot within the preci-
dnosti of their dominions. Baif, however, was allowed to
be as good a musician as poet; and what entitles him to the
more notice here, is the having established an academy, or
concert at his house, in the suburbs of Paris, where the per-
formance was frequently honoured with the presence of
Charles IX. Henry III. and the principal perfonages of the
court.

Merfennus, in Genet. p. 1683, has given a particular ac-
count of this establishment, the first in France of which we
have met with any record. In this academy or concert,
dignifed by a royal charter, in which voices, viols, and
flutes were employed (acribus, fildibus, et fildulis coniunctis),
it was expected to recover the three genera of the Greeks, and
all the miraculous powers of their ancient music.

BAIKAL, Lake, or inland Sea, in Geography. In the
deepest part of the Sarave mountains (the eastern continu-
ation of the Altay), at the extremity of the chain, where
the country changes to a level plain, lies itself, only a
lower mountain between the lofty snow-capped summits, lies
a monument of one of the greatest revolutions that the
surface of our earth has ever undergone. A lake, not less
remarkable for its internal condition than for the space
which it occupies, hastens its billows within the crag
chifs of mountains, through which it is to all appearance
impossible that any dream can force its way to supply its
enormous bason. Nature, in the remotest periods of anti-
quity, seems here to have opened, by some tremendous con-
vulsion, an abyss into which she might pour her innume-
rous billows of water, and cause a part of it to flow over
the western level.

This lake extends from 52° N lat. to 55° 41', in a di-
rection from south-west to north and north-east. Its
most common appellation is Baikal, in the maps, Baik; but
in the surrounding regions it is generally called the
Sea, without further addition; or sometimes the Holy sea.
Both these denominations are extremely natural in a country,
which to a vast distance round knows no larger mass of
waters, and in the mouths of people who so frequently ex-
perience the benefits it bestows and the perils it threatens.
It is therefore not at all surprizing that Ginolin's pilot should
have ascribed a subterraneous torrent to the anger of the incensed
devie of the waters, who felt himself inflamed by the foreign
inuidel who called his venerable sea a lake. Safe from the
like danger, we shall however pay greater respect to geo-
ographical justice, by making use of the latter term.

The lake Baikal is 550 versts in length, and in breadth,
where it is the narrowest, 30 versts. To the north it
widens to between 70 and 80 versts. Its depth is very
unequal: proceeding from 20 to 80 and 100 fathom (the
fathom at seventeen feet). In some places, particularly near the
Lale of Olechon, according to the affirmation of a fisherman,
even a founding-line of 200 fathom would not reach the
bottom. A number of brooks and rivulets pour their waters into this bason; on the map in Georgi's travels, we
count fifty of them; many indeed very considerable,
though several others may be deemed large: for example,
the Selenge and the Upper Angars, which performs a course
of more than 700 versts. The lake has only one outlet;
the Lower Angara, which flows into the Yenift'-y. Though
its bed at the part where it comes from the Baikal is two
versts broad, and has a very rapid current, yet is it not by
far capacious enough for carrying off all the water collected
in that refervoir. Notwithstanding which, the lake never
rises more than three feet above its ordinary level, even in
the spring season; and therefore it probably may have some
subterraneous drain. The bottom, at the shores, consists of
gradually rounded rocky fragments, piled on one another; in
the middle, of gravely sand. The lake is extremely clear,
so that in eight fathom water the bottom is distinctly seen;
in five or six fathom the smallest objects are discernible.

At a distance it appears of a greenish hue, owing to the verdant
moss with which the sandy bottom is overgrown. It is pure,
and very agreeable to the taste; but in the month of July it
gets into a fort of fermentation, which is called its flowering,
whence it becomes turbid as if mixed with a fine yellowish
sand, and lores its good taste. More danger is to be appre-
headed when keeping within shore, than out upon the main;
for the Baikal is extremely subject to violent gales and
florums, which strike and spit against the lofty mountains
that surround it. The mariners know of no more than three
winds, which they denominate after the prominentes. The
north-west, which is the most constant, and the north-east, are
innoxious; the north is more formidable, by reason of its
violence, and on account of the shallow shores to the south.
But the agitation of the water is out of all proportion to the
wind; since in a very moderate breeze the lake frequently
rages with great fury, whereas furious winds only just increase
its agitation. There being no rocks or banks in the middle,
the waves usually swell seven feet high, almost always quite to
the shore. Even when the violence of the storm has abated, the turbulence of the water remains high for several
hours. The internal agitation of the lake are still more alarming.
With a bright sky, and the surface of the water
as smooth as a mirror, all at once the veil is toffed about
with such violent shocks, that the people on board have
much ado to save it. In like manner in a particular place a
single wave will suddenly arise, which at the same spot is fol-
lowed by several others. These curious phenomena are
supposed to happen in consequence of the contiguity in which
the lake is situated below with cliffs in the adjacent moun-
tains, the drafts of wind falling from which force up the
water, though not always perceptible above to the fame
degree.

Thus continually restless, it is very comprehensible that,
notwithstanding the severity of the climate, the Baikal is not
frozen over till the month of December or January.
Icefields, sometimes of ten versts in dimension, unit form in
the bays, and then unite in places, which, previous to the freez-
ing, are covered with a dense cloud. The surface being at
length thoroughly consolidated, frequently presents one vast
plain of glaffy smoothness, though sometimes like wise ex-
tremely rough. Snow, on account of the winds, seldom ad\n
ces to it; and therefore, especially to the first travellers, it
is extremely laborious to the horses. The furious gales
of winds at times project the people who run by the side of
the fledge, to the distance of several fathoms forwards;
whereby they are in imminent danger of being frozen, or of
falling into the chinks of the ice. These chinks become
wider and more frequent as the time of the breaking up
draws on; boards are then laid across them to facilitate the
passage; and in cafes of necessity, when the apertures are
become too wide to be remedied in that way, canoes are in-
roduced. The ice usually breaks up in May, and then it
requires only a few days for discharging; in several of the
bays, however, it lies the whole summer through.

The weather is generally inclement in the parts about the
Baikal. The summer is short, and fea/erely ever passes
without night frosts; the winter announces its approach so early
as August, by falls of snow. On the sandy coasts, such
plants grow as are elsewhere only found on the coldest
mountains. The cause of this inck money of climate is prin-
cipally to be attributed to the elevation of the whole region,
the lowly summits and icy clefts of the huge mountains,
and the want of sufficient protection against the north winds.

In the Baikal are numerous islands; most of them, however, very small. The largest is Olchon, in the northern part, separate from the main land by a sound, in which are eight islands of inferior dimensions. Olchon is 50 versts in length, eight in a ten broad, and terminates to the north in a promontory; the southern part is lower and defilement of forests; in the southern part grows pines, poplars, birch, and willows. The land is so favourable to the nurture of cattle, that the fine draws belonging to the inhabitants find pasture all the winter through, without any particular tending. The population consists of 150 Burat families, many of whom are owners of between four and five hundred head of sheep. The natural propensity to idleness in all pastoral people here finds so much encouragement, that the Burets pass the greater part of the day in carousing.

Round the coast are several objects of consequence to the naturalist. On the western side, above Olchon, in a very beautiful situation, is a necklace of majestic forests, with a fine view of the lake, are several springs, mostly cold. Amidst these is one of hot water, more remarkable than the rest on account of its basking properties. A Russian officer belonging to the mines having obtained a boat from it in some disorder, reduced it to a conduit, which yields 52 gallons every hour; and it is found to be only necessary to dig in its vicinity for coming to hot water. The water is clear, but has somewhat of a fiery taste; the vapour smells like fired gunpowder, and occasions sneezing; birds are boiled in it in twelve minutes, split fish in seventeen minutes. No news therefore remains here upon the ground; the lake likewise continues free from ice: and even the cold springs, where they run through the territory of the hot, are teald. These hot fountains are used for bathing as well as for drinking. Some years ago a hama performed extraordinary cures by means of these waters; since his death, however, the Russian soldiers are the only perons who occasionally resort to them.

The Upper Angara flows through the northern margin into the lake, after having pursued a course of 800 versts, down several precipices, forming tremendous cascades, along a tract of near a hundred miles. Not far from its mouth, half-a-dozen islands, in the Frolivka lake, fifteen versts long, and from one to five versts across, remarkable for its extraordinary depth, and for a current on its way to the Baskal. The river Frolivka, between fifteen and twenty fathoms wide, forms this cascade by rolling over a succession of rocks, extending half a verst, and being twenty feet in perpendicular height. More to the south is again a hot source, pellucid, and in taste resembling soap-water; in the morning the effluvia it calls around is enough to make one sick. The water inflows in a copious stream, but is turned to no account.

On the Shamane promontory stands a curious lulus nature: namely, three rocks adjacent to each other, upwards of two hundred feet in height; above the water's level. Their tops resemble human heads, with caps on them. It may well be imagined that the particular features are not small. Of the middle-most, which is the biggest, the note is in length seven feet, in the slit of the mouth two families of sea-gulls are commodiously lodged; even the eyebrows are not wanting; only there is no trace of an ear. The Tunguses revere these three rocks, as the sea-god Dlanda, with his two subordinate deities. He is able to save any Tungus from drowning, to cause a good draught of fishes, &c.

The peninsula Bargunin, thirty versts long and fifteen broad, is thickly wooded, but void of game and fish, confe-
already conjectured; and if this be admitted, it is far from improbable, that, in heavy gales, the wind furiously rushing through these vents, may lift them from their holes into the upper water, where, unacustomed to the outward air, they cannot long survive this change of place. The holes that are call where are partly devoured by the sea-fowls, and partly boiled to oil by the inhabitants of the island, which is said to be very fine and well tasted; at least it must be fed to the Chinese, who buy it in great quantities.

Another particularity, at least to the Baikal, are the porpoises. As they elsewhere only live in salt water, and never travel far up the rivers, it is the more surprising how they came into this fresh-water lake, which has no communication with the sea, nor with any river that contains these animals. Though the first furmice may fall on the Yenifley and the Angara, yet in neither of those rivers are any of them, now at least, to be found, and it would be extremely difficult for them to shoot the cataracts on the passage from the Yenifley to the Baikal. Perhaps in some great inundation, the sources of the Lena might have communicated with the rivers of the Baikal; and on that occasion the primitive race of them might have found hither. They are of the same species with those of the Caspian and the Baltic; excepting that fearlessly any of them are of varied hues. They are particularly fond of the ice; and flew themselves above water rather in the winter than in the summer; for which purpose they blow up of themselves air-holes in the ice, which they have the art of keeping constantly open; and in the spring drop their young upon the ice, for the whole accommodation they make little huts of snow. The reason for the change of them lasts from the beginning of March to the breaking up of the ice at the latter end of May; the right of catching them is farmed out. They are shot with fire-arms or pierced with javelins; in both cases from a concealment behind a fence of white linen, which the animals mistake for a piece of ice. The old ones are made to yield their blubber, but the young are chiefly sought after because the Chinoe are extremely partial to their silver grey skins. In the carrions, the Buruts share with the crows. The annual capture is estimated at between 1500 and 2000 of these animals.

The omul (Salmo migratorius) is a fish of great consequence, in regard to its prodigious numbers, not only to the Baikal, but to all the country round. His ordinary length is from fourteen to sixteen inches; seldom extending to two feet. His flesh is white and tender, and so delicate that he dies as soon as taken out of the water, even though immediately thrown in again. In August, the omuls generally begin to advance in flocks of various bulk, in order to ascend the rivers in which they spawn. In September they return, but in so emaciated a condition, that multitudes die upon the passage. They do not go up every river; those on the western side: not at all, and even not every one on the eastern side of the lake. Each fish is wont to go to spawn in the place where itself received life. They are caught the whole summer long; but mostly at the time of their floating in the rivers. With small nets 2000 of them are taken at a draught. They are thrown together in great heaps upon the shore; but ere the fishermen have time to prepare them, the Tunguses, the dogs, and the birds of prey, have devoured a good part of them. The omuls are salted, oil is obtained from them, and even some wine, which however will keep only a very short time. Besides these, the Baikal produces many other sorts of fish; such as sturgeon, quabs, carp, perch, tench, trout, pike, &c. in great abundance.

One very singular natural phenomenon of the Baikal we have referred to the hill, as being probably the original cause of the existence of the lake itself; we mean the earthquakes that are very frequent in the parts adjacent. They are most usual in the spring and autumn; generally once, sometimes twice a year. The shocks are not violent, last a few minutes, and do scarcely any mischief. At half the utmost injury that attended any one of the sixteen earthquakes described by professor Georgii, was, that it gently walked him out of his sleep, threw down the floor in the police-office at Schinginsk, and flew off some of the croffes from the tops of the church-towers. Nature seems to have exhausted herself in forming the bed of the Baikal; for it is highly probable that it was the effect of some tremendous earthquake, attended by an extraordinary falling-in of the earth. We are naturally led to this hypothesis by considering the rate of the circumjacent region, and of the bottom of the lake. This latter consisting of fragments of denuded rocks, the largest of which thrust up their tops as islands; the coast around is one amazing congeries of rent, broken, and split rocks, to the height generally of forty fathoms; shattered portions of rocks lift their bare turmuts to the clouds, while the other parts of them lie rooted in the heart of the earth. On the craggy pinnacles of some of the snow-covered mountains lie broken tops of rocks in the shape of bee-hives, which only the powerful hand of nature could have projected hither; as it was the one who forced the Baikal round with majestic cliffs, and fixed their bases in unfathomable pits. But when?—History is silent. —And how?—The naturalist can only conjecture; he has recourse to an earthquake, and imagines, that here perhaps first the streams of the Upper Angara flowed, the territory whereof is now ingulphed by the broad lake.

The country round the Baikal forms a part of the government of Irkutsk, and belongs chiefly to the province of Nerchinsk. Irkutsk lies at the distance of about 50 miles westwards from the Baikal. The inhabitants of the confines of the lake are Tunguses, Buruts, and Mongoles; the Russians are less numerous, because the land adjacent to it is not favourable to agriculture; though even on the eastern side winter-rye, oats, and barley thrive tolerably well. The whole of the population on the eastern side of the lake, from Turkul to the Upper Angara, amounted, in 1771, to not more than 5000 souls.

Besides the numerous birds of prey that seek their food in the neighbouring forests, multitudes of winged guests are attracted hither by the exuberant flowers of fish with which the lake abounds. These consist of the various tribes of mews and hawks; but more numerous than all are the gulls, in fify resembling a full grown duck, but incomparably heavier. They come in the month of April, and take their departure in October. Every thing bears marks of their devastation; the very trees in which they roost perish, partly by their corrosive dung, and partly in consequence of their biting off the buds. They are said to consume more than one half of the omuls that go up the rivers. This may be thought surprising after what has been before observed of the prodigious quantities of these fish; not however so altogether incredible, when we are informed that these fowls hatch about ten young ones at a brood, and are extremely voracious. Not content with eating their fill, they overload themselves in such a manner, that beneath the rocks where they nestled, the foxes, ermines, magpies, and crows constantly find a plentiful banquet. In many places the nets of them are so numerous, that the people have much ado to pass along the rocks. The files in the found between Olchon and the main land, being the principal haunt of these birds, take their name from them.

The forests are overrun with quadrupeds. Wolves and bears roam there in great abundance; but the latter at least
are by no means formidable. Nothing scares them so easily as firing; consequently the Buruts are so considerate as to compose particular tunes for them. The louder the vocal performer pitches his notes, the fatter the stupid deer gormandize from him. The Buruts hunt them for the sake of their flesh. Stags, elks and roe-deers are very numerous; rein-deer are far less frequent on the northern shore. The wild boars are silver gray, and scarce; both perhaps in consequence of the cold climate. The race of fables is not yet so thinned in these regions as in some others; those taken here are esteemed as eminently valuable; such especially as range about the Upper Angara, are prized for the blackness of their fur. Ermines are so prolific, that while M. Georgi was at Irkutske, a contract for twenty thousand skins to be delivered at St. Petersburg might be completed in a couple of days. Not lefs numerous in winter are the white hares, of whose large and stout ears pelisses are made, each at one and one and a half rubles. The Tunguses pay their tribute in squirrel-skins; besides these, many Ruffian hunters collect a thousand skins in one winter, and yet there is no perceptible diminution of the animals.

BAIKAL, Mines of the. In the region of the Baikal, 434 versts from Irkutske, on the Lena, extends a bed of copper ore, which seems to reach, for 500 versts, to the river Kiren. The country of the latter river is far more hilly, confounding partly of lime-flone, whence several mineral fourses proceed. Nor are specimens of copper wanting. Iron ores and ferruginous limes are everywhere met with in abundance. On the Lena here and there are falls of argentiferous glatz galon, intermixed with lime-flone, and at times appears in lumps of two or three pounds. It was first explored about forty years ago by Meifs. Make and Kutuzof. They keep four machines at work at the copper-flatz, near the villages Botova and Shemenova. The ores are green-copper, brown-copper, copper-glafs, fahlzter-ores and malague. The gourges are calcarceous and sandy. The narrower the gourge, the richer it is. The proportion is one fourth to forty per cent. copper, but scarcely a trace of silver. On an average one hundred pounds of ore yields four pounds of good copper.

BAIKAL, Mountains of the. This range of mountains takes nearly the same direction with the Baikal lake, accompanying it on both sides from south to north and north-east, runs down to the west on the right of the Angara, where it flattens in a moraiffe of prodigious extent: to the east it advances from the origin of the Lena, on both sides of that river, and here likewise dies away in a widely extended flat-tzridge. In general it is a very greaty highpitched mountain, partly confisting of granite, partly of flint-brecia and lime-flone. In the inferior regions of the Angara, and the Lena, its flatz-mountain greatly declines, and frequently produces coal. From the upper Angarian ridge there runs, as it should seem, a branch westward, through the region between the Podkamennia, and the lower Tungufsia, away over the Yenissef, and confists probably of mere flettz-mountains. About the north-eastern part of the Baikal, the Upper Angara, the rivers Mama and Vitim, where lie the famous pits of mufcovy-glafs, all the mountain is granitic. The mineral contents of these mountains are as yet by far not thoroughly known. The principal of what has been discovered in them, are coals, sulphar, sulphur-source, native sulphur, alum, common salt sources, lapis lazuli, mufcovy-glafs, carnelians, natural prussian blue, and specimens of copper, iron, and lead.---Some tracts of mountains about the Baikal. For example, the Burgundu, and others, are so high that they are covered with never-waiting snow. In the lake itself many lofty and steep cliffs ascend above the water as islands; some whereof confist of solid white quartz.---The mountains are partly bare, but mostly decked with forests. The most usual kinds of trees are the pinus sylvestris and the birch; but here are likewise great numbers of larches and cedars. The principal rivers which hence derive their names, are the Selenga, the Angara, the Lena, the Vilui, and the Tungufa. For further particulars, see Tocque's View of the Russian Empire, vol. i. p. 157, &c.

BAIKALENSIS, in Heptalogy, a species of Calycynus that inhabits the deep parts of the lake Baikal. It is about nine inches long, soft, slender, and rather compressed; and has ventral fins; first dorsal fin very small; the second with cirriform rays. Pallas, Gmelin, &c.

BAIKALITE, in Mineralogy, a variety of Jasparite.

BAIKALOVA, in Geography, a town of Siberia, 150 miles S. S. E. of Abakanrk.

BAIL, Louis, in Biography, a French divine, born at Abbeville, flourished in the seventeenth century, and wrote several voluminous works, among which are "A Summary of Councils," being a continuation of that by father Sr. Longus de Coriolan, printed in 2 large folio volumes, at Paris, in 1675; and an account of the most celebrated preachers in all ages, under the title of "Sapientia fovis praeclarissim," or "Wisdom uttering her voice in the streets." Nouv. Dict. Hilier.

BAIL, in Law, the setting at liberty one arrested or imprisoned upon any action either civil or criminal, under furies taken for his appearance at a day and place assigned. It is called bail, because hereby the party confined is bailed, from the Greek ballein, delivered into the hands of those who bind themselves for his forthcoming: or from bails, used in the fefte of a guardian, into whose hands the party is put for security sake: and the end of bail is to satisfy the condemnation and costs, or render the defendant to prizon.

Manwood distinguishes between bail and mainprize thus: he that is mainprised is paid to be at large, and to go about at his liberty, without ward, till the time of appearance; whereas he who is let to bail or two or more men, is always accounted by law to be in their ward and custody for the time; and they may, if they please, actually keep him in prizon.

With respect to bail in civil cases, it is to be observed, that there is both common and special bail.

Common bail is that given in actions of small prejudice, or flight proof; in which case any nominal furties are taken; as John Doe, and Richard Roe: this being no other than a form of appearance: whereas special bail is given in cases of greater moment, where it is required that the furties be substantial men, and according to the value of the matter in question.

It has been enacted that no persons should be held to special bail in any action brought for less than ten pounds. In order to which it is required by stat. 13 Car. II. c. 2. that the true cause of action should be expressed in the body of the writ or process. Also no security can be taken in a greater than 340. This is observed as to writs issed out of the courts of Westminster-hall, and extended to all inferior courts by 19 Geo. III. c. 70.

The method of putting in bail to the sheriff, is by entering into a bond or obligation, with one or more furties (not fictitious persons, as in the case of common bail, but real, substantial, responsible bondmen), which obligation is called the bail-bond. The sheriff, if he pleases, may let the defendant go without any furties; but that is at his own peril: for, after once taking him, the sheriff is bound to keep him safely, so as to be forth-coming in court; otherwise an action lies against him for an escape. But, en
the other hand, he is obliged, by Stat. 22 Hen. VI. c. 10. to take, if it be tendered, a sufficient bail-bond; and by Stat. 12 Geo. I. c. 29, the sheriff shall take bail for no other sum than such as is sworn to by the plaintiff, and endorsed on the back of the writ. By rule M. 1654, no attorney shall be bail for a defendant in any action, nor his clerk. Cowper, 228, n. But an attorney may be admitted as bail in a criminal case. No sheriff's officer, bailiff, or other peron concerned in the execution of process, shall be permitted to be bail in any action or suit depending in K. B. nor persons outlawed after judgment, R. M. 14 Geo. II. Upon the return of the writ, or within four days after, the defendant must appear according to the exigency of the writ. This appearance is effected by putting in a full and justifying bail to the action; which is commonly called bail above. If this be not done, and the bail that were taken by the sheriff below are reprobable persons, the plaintiff may take an assignment from the sheriff of the bail-bond (under the statute 4 & 5 Ann. c. 16), and bring an action thereupon against the sheriff's bail. But if the bail so accepted by the sheriff be insolvent persons, the plaintiff may proceed against the sheriff himself, by calling upon him, first to return the writ, if not already done, and afterwards to bring in the body of the defendant; and, if the sheriff does not then cause sufficient bail to be put in and perfected above, he will himself be responsible to the plaintiff. 

The bail above, or bail to the action, must be put in, either in open court, or before one of the judges thereof; or, in the country, before a commissioner appointed for that purpose by virtue of the statute 4 W. & M. c. 4, which must be transmitted to the court. The bail, who must be at least two in number, must enter into a recognizance in court or before the judge; or commissioner, in a sum equal (or in some cases double), to that which the plaintiff has sworn to; whereby they do jointly and severally undertake, that if the defendant be condemned in the action, he shall pay the costs and condemnation, or render himself a prisoner, or that they will pay it for him; which recognizance is transmitted to the court in a slip of parchment entitled a bail-piece. And if excepted to, the bail must be perfected, that is, they must justify themselves in court, or before the commissioner in the country, by swearing themselves housekeepers, and each of them to be worth the full sum for which they are bail, after payment of all their debts. See Satisfat. 

Special bail is required (as of course), only upon actions of debt, or actions on the case in trover, or for money due, where the plaintiff can swear that the cause of action amounts to ten pounds; but in actions where the damages are precarious, being to be ascribed ad iditionem by a jury, as in actions for words, ejectment, or trespass, it is very seldom possible for a plaintiff to swear to the amount of his cause of action; and therefore no special bail is taken therein, unless by a judge's order, or the particular directions of the court, in some peculiar species of injuries, as in cases of mayhem or atrocious battery; or upon such special circumstances, as make it absolutely necessary that the defendant should be kept within the reach of justice. Also in actions against heirs, executors, and administrators, for debts of the deceased, special bail is demandable; for the action is not so properly against them in person, as against the effects of the deceased in their possession. But special bail is required even of them, in actions for a demurrer, or waiting the goods of the deceased; that wrong being of their own commission.

In civil cases every defendant is bailable; but in criminal matters it is otherwise. Bail may be taken either in court, or in some particular cases by the sheriff, coroner, or other magistrates; but most usually by the justices of the peace. Regularly in all offences, either against the common law or act of parliament, that are below felony, the offender ought to be admitted to bail, unless it be prohibited by some special act of parliament. By the ancient common law before and since the conquest (2 Inl. 189. Glanv. l. xiv. c. 11.), all felonies were bailable, till murder was excepted by statute; so that persons might be admitted to bail before conviction almost in every case. But the statute Wilm. 1. 3 Edward I. c. 15. takes away the power of bailing in treason, and in divers inferences of felony. The statutes 23 Hen. VI. c. 9, and 1 & 2 Ph. & Mar. c. 13. give further regulations in this matter; and upon the whole we may collect (2 Inl. 186. 2 Hal. P. C. 129), that no justice of the peace can bail, upon an accusation of treason, of murder, of manslaughter, if the person be clearly the fayer, and not barely suspected to be so, or if any indictment be found against him; such, as being committed for felony, have broken prison, because it not only carries a presumption of guilt, but is also superseding one felony to another; persons outlawed; such as have abandoned the realm; approvers, and persons by them accused; persons taken with the mainour, or in the fact of felony; persons charged with arson; and excommunicated persons, taken by writ de excommunicato cœnstantia. Others are of a dubious nature, as thieves openly detected and known; persons charged with other felonies, or manifest and enormious offences, not being of good fame, and accessories to felony, that haue under the same want of reputation. These seem to be in the discretion of the justices, whether bailable or not. Those who must be bailed, on offering sufficient security, are persons of good fame, charged with a bare suspicion of manslaughter, or other inferior homicide; such persons, charged with petit larceny, or any felony, not before specified; or with being accessory to any felony. Lastly, it is agreed, that the court of king's bench, or any judge thereof in time of vacation, may bail for any crime whatsoever, be it treason, murder, or any other offence, according to the circumstances of the case; such persons only excepted, who are committed by either house of parliament during the session, or such as are committed for contempt by any of the king's superior courts of justice. The refusal, or delay, of bail for any person bailable, is an offence against the liberty of the subject in any magistrates, by the common law, as well as by the statute Wilm. 1. 13. Edw. I. c. 15, and the habeas corpus act, 31 Car. II. c. 2. And it is expressly declared by statute 1 W. & M. c. 2. c. 1, that excessive bail ought not to be required; though it is left with the courts to determine, on considering the circumstances of the case, what bail shall be called excessive. On the other hand, if the magistrate take insufficient bail, he is liable to be fined, if the criminal doth not appear. Blackst. Com. vol. iii. vol. iv. For several circumstances and considerations with regard to bail in civil cases and in criminal matters, see Jacob's Law Dict. by Tonyns, vol. i. Art. Bail. 

Bail above, or Bail to the Action, succeeds the return of the writ, or the appearance of the person bailed. See Bail. 

Bail-Bond, is a bond or obligation entered into by one or more sureties, upon putting in bail to the sheriff, infuring the defendant's appearance at the return of the writ. See Bail. 

Bail in Error, expresses the bail given by a person who brings a writ of error after verdict, or who is plaintiff in error. 

Bail-Pieces, a small square slip of parchment, with the corners cut off at the bottom, on which is the recognizance of persons who put in bail. See Bail.
BAI

BAIL, Clerk of the, is an officer belonging to the court of king's bench. He files the bail-pieces taken in that court, and attains for that purpose.

BAILACAN, in Geography, a town of Armenia, 181 miles east of Erivan.

BAILAN, a town of Syria, ten miles south of Alexandretta.

BAIL, or Bail, in the Sea Language.—The seamen call lalias or calling the water by hand out of a boat or ship's hold with buckets, cans, or the like, bailings. When the water is thus bailed out, they say the boat is freed. They also call those hoops that bear up the till of the boat, its bailers.

BAILEMENT, in Law. See BAILMENT.

BAILEY, or Bailage, is used for the office of a bailiff, for the place where he keeps his seat, and for the territory subject to his jurisdiction; which last is also denominated bailiwick.

BAILIFF, Water, is an ancient duty received by the city of London, for all goods and merchandises brought into or carried out of the port. See Bailage.

BAILEY, in Scots Law, a judge anciently appointed by the king over such lands not erected into a reility as happened to fall to the crown by forfeiture or otherwise; now abolished. It is also the name of a magistracy in royal boroughs, and of the judge appointed by a baron over lands erected into a barony.

BAILIES, William, M.D. in Biography, practised medicine at London, and then at Bath, about the middle of the 18th century, but having a dispute with Drs. Oliver and Lucas, who had the greatest share of the business there, he soon quitted that city, and went to Prussia, and was made physician to Frederick the Great, to whom he was recommended as a person of great knowledge and experience in his profession. The king telling him, on his being introduced to him, he must certainly have killed a great number of persons in the course of acquiring his experience, the physician is said to have answered, "pas tant que votre majesté"—not so many as your majesty. The boon met not happened to displease, and the doctor continued in favour with the king to the time of his death.

In 1787, Dr. Bailies published an essay on the Waters of Bath, with the view probably of making himself known there; also a narrative of facts, proving a conspiracy between the Drs. Oliver and Lucas, to exclude him from all consultations at Bath. Gen. Biog. Dict.

BAILIFF, in a general sense, denotes an officer appointed for the administration of justice within a certain district, called bailiwick.

The word is also written baiel, bailey, bayly, baylies, and bailiff, in Latin bailivus.—It is formed from the French bailiff, that is prefectus provincie, of bail, an old word denoting a guardian or governor of a youth, originally derived from the Latin boiulus, which signified the same.

Pascalier maintains, that bailiffs were originally a kind of commissioners, or judges delegate, sent into the provinces to examine whether or not a justice were well distributed by the counts, who were then the ordinary judges. Loycens, with more probability, refers the origin of bailiffs to the usurpation and idleness of the great lords, who, having got the administration of justice into their own hands, and being weary of the burden, turned it over to their deputies, whom they called bailiffs.

The bailiffs had, at first, the superintendence of arms, of justice, and of the finances; but abusing their power, they were by degrees stripped of it, and the greatest part of their authority transferred to their lieutenants, who were to be men of the long robe. In France, they assumed some prerogatives, as being reputed the heads of their respective districts; in their name justice was administered, contracts and other deeds passed, and to them was committed the command of the militia.

From the English bailiffs originally took both their name and their office: for as the French had eight parliaments, which were supreme courts whence no appeal lay, within the precincts of the several parliaments or provinces, and in which justice was administered by bailiffs, at least by their lieutenants; so in England there are several counties wherein justice was and is still administered by a vicount or sheriff, who appears likewise to have been called bailiff; and his district or county, bailiwick or bailiency. In the statute of magna charta, c. 28. and 14 Edw. III. c. 9, the word bailiff seems to comprehend as well sheriffs, as bailiffs of hundreds. Farther, the counties were again subdivided into hundreds: within which it is manifest, justice was anciently rendered by officers called bailiffs. And it appears by Drayton (I. 3. qu. 2. c. 14.), that bailiffs of hundreds might anciently hold plea of appeal and approvers. But those hundred-courts were now swallowed up by the county-courts, certain franchises alone excepted; and the bailiff's name and office grown into such contempt, at least those bailiffs of hundreds, that they are now no more than bare messengers, and mandatories within their liberties, to serve writs, and such mean offices. In other respects, the name is still in good esteem; for the chief magistrates in divers towns are called bailiffs; and sometimes the persons to whom the king's cattle are committed are called bailiffs as the bailiff of Dover castle, &c.

Of the ordinary bailiffs, there are several sorts: viz. bailiffs of liberties, sheriff's bailiffs, bailiffs of lord's manors; bailiffs of husbandry, &c.

BAILIFFS OF LIBERTIES, are those bailiffs who are appointed by every lord within his liberty, to execute proceedings and perform such offices therein as the bailiff errant doth at large in the county; but bailiffs errant or itinerant, as they were formerly called, who went up and down the country to serve processes, are now out of use.

Bailiffs of liberties and franchises are to be sworn to take civilities, impanel jurors, make returns by indenture between them and their bailiffs; and if they be not duly punished for malicious directions by fire and treble damages, by ancient statutes 12 Ed. II. b. 1. c. 5. 14 Ed. III. b. 1. c. 9. 20 Ed. III. b. 1. c. 4. 1 Ed. III. b. 1. c. 5. 2 Ed. III. c. 4. 5 Ed. III. c. 1. 11 Hen. VII. c. 15. 17 Hen. VIII. c. 24. 3 Geo. I. c. 15. § 10.

The bailiff of a liberty may make an inquisition and extend upon an elegit. Cru. Car. 519. These bailiffs of liberties cannot arrest a man without a warrant from the sheriff of the county; and yet the sheriff may not enter the liberty himself, at the suit of a subject (unless it be on a quo non, or capias ulterius), without a claire in his writ, ex omnibus propter aliquid libertatem. &c. If the sheriff, &c. enter the liberty without such warrant, the lord of the liberty may have an action against him; though the execution of the writ may stand good. 1 Vent. 60. 2 Inst. 545.

BAILIFFS OF SHERIFFS, are either bailiffs of hundreds, or special bailiffs. Bailiffs of hundreds are officers appointed over those respective districts by the sheriffs to collect fines therein; to summon juries; to attend the judges and justices at the assizes and quarter fairs; and also to execute writs and process in the several hundreds. But as there are generally plain men, and not thoroughly skilled in the latter part of their office, that of serving writs, and making arrests and executions, it is now usual to join special bailiffs with them;
them; who are generally mean persons employed by the sheriffs on account only of their adroitness and dexterity in hunting and felting their prey. A bailiff of a liberty is an officer which, when the court takes notice of; but a sheriff's bailiff is not an officer of the court, but only the sheriff himself. Parch. 23 Cor. 1. B. R. The arrest of the sheriff's bailiff is the arrest of the sheriff himself; and if any recusa be made of any person arrested, it shall be adjudged done to the sheriff: also, if the bailiff permit a prisoner to escape, an action may be brought against the sheriff. Co. Lit. 61. 168. Sheriffs are answerable for the misdemeanor of their bailiffs, and are to have remedy against them. 2 Inst. 19. The latter are therefore usually bound in an obligation with fortunes for the execution of their office, and thence are called bound-bailiffs, which the common people have corrupted into a much more homely appellation.

There are thirty-six servants at once in London, who may be termed bailiffs, and each of them gives security to the sheriffs. By Stat. 14 Ed. III. c. 9. sheriffs shall appoint such bailiffs for whom they will answer; and by Stat. 1 Hen. V. c. 4. no sheriff's bailiff shall be attorney in the king's court. R. M. 1654.

Bailiffs of Lords of Admiralty, are those that collect their rents, and levy their fines and amercements; but such a bailiff cannot detain for an amercement without a special warrant from the lord or his steward. Cro. Eliz. 668. He cannot give licence to commit a trespass, as to cut down trees, &c., though he may licence one to go overhead, being a trespass to the poiffession only, the profits of which are at his disposal. Cro. Jae. 537. 377. A bailiff may, by himself, or by command of another, take cattle damage-feasant upon the land. 1 Dany. Abr. 650. Yet amends cannot be tendered to the bailiff, for he may not accept of amends, nor deliver the diffracts when once taken. 5 Rep. 76. These bailiffs may do any thing for the benefit of their matters; and it shall stand good till the matter disagrees; but they can do nothing to the prejudice of their matters. Lit. Rep. 70.

Bailiffs of Courts Baron, sumne the courts, and execute the process thereof; they present all pound-breaches, cattle stray'd, &c.

Bailiffs of Hydrandry, are such as belong to private persons of good estates, and have the disposition of the inferior servants, with regard to their labour; they also fell trees, repair houes, hedges, &c.; and collect the profits of the land for their lord and master, and they render account to him yearly, &c. Besides these, there are also bailiffs of the forest, for which see Manwood, pt. I. p. 113.

We also meet with divers other species and denominations of bailiffs in these and the neighbouring counties; as provincial, royal, tenuerant, and heritable, bailiffs; bailiffs of France, of the empire, of boroughs, &c.

Bailiff, Provincial, bailivus provincialis, among the French, was an officer appointed to administer justice in a certain province or county, with an authority somewhat like that of our justice of assize, instituted by the dukes and counts in their several territories, after they had procured the inheritance of them. These acted in the name, and by authority, not of the king, as juries, but of the dukes or counts who appointed them, and whose deputies they were. Spelman takes them to be the same with, among our Saxon ancestors, were denominated aldermen of counties, and gynoæ or reeves, which afterwards became ecoremoniers, and sheriffs.

Appeals lay from these to the bailiffs of France, bailivi Francis, who were those appointed over the provinces originally belonging to the crown.

Bailifes, Royal, bailivi regii, were those over provinces afterwards annexed to the crown. Something like these fill subiefs in Scotland, under the title of high or heritable bailiffs, as those of Cunningham, Carrick, and Kyle; the first in the families of the earls of Eglington, the second of the earl of Cassills, the third of the earl of Louden.

Bailiffs of Boroughs, bailivi burgorum, were magistrates anciently in cities and towns, answering, in some measure, to what of later times was called portmayors, mayor, &c.

Canterbury was a bailiff town five hundred years before it was made a mayor town. Westminster, Southwark, Scarborough, &c., are still governed by bailiffs.

Bailiffs differ in this from mayors, that the latter are always single in one place, whereas there were usually two bailiffs to a city, as formerly at London, and sometimes four, as at Norwich.

Bailiff of the Empire, was anciently the vicar or regent of the empire; as appears from a letter of Henry of Hanover to pope Innocent III. wherein he says, the princes, barons, and knights, have elected me bailiff of the empire; bailivus imperii.

Bailiff, Water, is an officer anciently established in all port-towns for the searching of ships, as appears from 23 Hen. VI. cap. 5.

There is such an officer still on foot in the city of London, who supervises and searches all ships brought thither; and gathers the toll arising from the river of Thames. He attends also on the lord mayor in his expeditions by water, and hath the principal care of marshalling the gales at the table. He also arrests men for debt, or other personal or criminal matters, on the river of Thames, by warrant of his superiors.

BAILI, David, in Biography, a painter of perspectival views, and portraits, was born at Leyden in 1684, learned to draw and design under his father, and prosecuted his studies under Adrian Verburg, and Cornelius Van der Hoort, with the latter of whom he spent five years. Baili copied many capital paintings of some great masters, in the possession of Van der Hoort, with critical care and observation; and particularly a perspectival view of the inside of a church, originally painted by Stenwicke, which was so accurately finished, that Stenwicke himself could scarce distinguish the original from the copy. He travelled for improvement through several parts of Italy, and for some time resided at Rome; and the correctness of his drawings, and the delicate finishing and finition of his pictures, procured for him every where employment, admirers, and friends. In the latter part of his life he discontinued painting, and only drew portraits on vellum with a pen, which he heightened with black-lead, so as to give them wonderful force and roundness. He died in 1638. Pilkington.

BAILIWICK, Bailywick, of Baileywick, the territory of a bailiff, or the place within which his jurisdiction is terminated. This is not only taken for the county, as it is frequently called in the writs, but signifies generally that liberty which is exempted from the jurisdiction of the county, over which the lord of the liberty appointed a bailiff, with such powers within his precinct, as an under-sheriff exercised under the sheriff of the county; such as the bailiff of Westminster, &c. Stat. 27 Eliz. c. 12. Wood's Hist. 206.

BAILLEAU L'EVEQUE, in Geography, a town of France, in the department of the Eure and Loir, and chief place of a canton in the district of Chartres, 14 league north-west of Chartres.

BAILLE, a town of France, in the department of the Mayenne, and chief place of a canton in the district of
of Chateaugontier, 44 leagues north-east of Chateaugontier.

BAILLER, in Law. See Bailment.

BAILLIE, ADRIAN, in Biography, an eminent French critic, was born in 1639, of obscure parents, at Neuville, a village near Beauvais. Having completed his education in the college of the city, he took the orders in 1676, but soon quitted the clerical profession, and devoted himself entirely to study. Lumiois, president of the parliament of Paris, made him his librarian, and in this station he continued till his death in 1706. He was a man of indefatigable application, and extensive erudition. As he was always reading or writing, it is no wonder that his acquaintance with authors was great, and his works numerous. His principal work, published in 1685, treat of printers, critics, translators, authors of discoveries, &c.; and the next five on poets. The work would have been professedly agreeable to a plan presented by the author to the public in 1694, if he had not been discouraged by severe criticism and satire in the Ant-Baillie de Menage, and other pieces. Abandoning this design, he directed his attention to other subjects; and he wrote, in 1693, "A treatise on the worship of the Virgin Mary," another in 1695, "On the Care of Souls," "The Lives of Saints" in 4 vols. fol., and in 17 vols. 8vo. in 1701; "The Life of Defacres," in 2 vols. 4to. in 1691, and abridged in 2 vols. in 1692; "The Life of Richer, doctor of the Sorbonne," written in 1692, and published in 1714. "The Life of Godfrey Hermant, doctor of the Sorbonne," printed at Amsterdam in 1717, 12mo; "An History of Holland, from the truce of 1609" where Grotius finishe, "to the peace of Nimeguen," published at Paris, under the name of "Neuville," in 4 vols. 12mo. in 1693; "A new and curious Account of Muleyow," under the same name, in 12mo. at Paris, 1698; and "An History of the conquests of pope Boniface VIII, with Philip the Fair, King of France," published by father Long, in 12mo. 1718. The "Jugemens des Savans," was revised and enlarged by M. de la Monnaye, member of the French academy, and printed at Paris in 7 vols. 4to. in 1723, and in 17 vols. 12mo. at Amsterdam, in 1725.

Baillet is a tedious and uninteresting, and culpably negligent with regard to his style. Gen. Dict.

BAILLEUL, JOHN DE, Abbé de Jowell, was so famed for his skill in reducing lapsed jointed, Haller says, that his name passed into a proverb, and an expert bone-fetter was called a Bailleul. Hal. Bib. Chirurg.

BAILLEUL, in Geography, a town of France, in the departinent of the North, and chief place of a canton in the district of Hazenbrocq; it was formerly fortified, but is now without defence. It contains about 500 houses; three leagues E. S. E. of Caflon, and 44 W. N. W. of Lille. N. lat. 40° 35'. E. long. 2° 55'.

BAILLEUL, a town of France, in the department of the Sarte, two leagues from La Fleche.

BAILLIAGE, in History, the name of a government in Swifferland, of which there are two sorts: the one consisting of certain districts, in which all the arboforensic cantons are divided, on this particular sort of officer, called a bailiff, is appointed by government, to which he is accountable for his administration: the other sort is composed of territories belonging to two or more of them, who alternately appoint a bailiff. This officer, when not restrained by the peculiar privilege of certain districts, has the care of the police, and jurisdiction in civil and criminal causes in the same limitations; and enjoys a limited revenue arising in different places from various duties and taxes. In case of exaction or mal-administration, an appeal always lies from the bailiff to the cantons, to which the bailiff belongs; and the place, the time, and the member who receive the appeal, are regulated with the utmost exactness. Cox's Trav. Swiz. vol. I. p. 37.

BAILLIE, ROBERT, in Biography, a Presbyterian divine of the church of Scotland, who was born at Glasgow, in the year 1599, and educated in the university of his native city. After he had taken his degree of master of arts, he applied with diligence to the study of divinity; and having, in 1622, received orders from archbishop Law, he was chosen a regent of philosophy in the university of Glasgow. In 1633, he modestly declined an offer which was made him of a church at Edinburgh, and in 1637 refused to preach a sermon before the assembly in this city for recommending the canons and service book, then published by authority; and stated in a letter to the archbishop of Glasgow the reasons of his refusal. In 1638, he was a member of the famous assembly at Glasgow, which was a prelude to the civil war, and it appears, notwithstanding the moderation of his conduct, that he was not deficient in his zeal against prelacy and Arminianism. He was a member of the following general assemblies till 1653, the time excepted during which he attended the Westminster assembly. In 1640 he was sent by the covenanting lords to London, to draw up an accusation against archbishop Laud, for the innovations he had obtruded upon the church of Scotland. Soon after his return, in 1642, he was appointed one of the professors of divinity at Glasgow; and his reputation was such that he received invitations before this time from the other three universities, all of which he refused. He retained his professorship till the restoration; but was often interrupted in the exercise of it by his residence in England; for in 1643 he was chosen one of the commissioners of the church of Scotland, to the assembly of divines at Westminster. In the principles and views of this assembly he seems to have entirely concurred; he returned, however, to his own country in 1646. When Charles II. was proclaimed in Scotland after the execution of Charles I., Bailie was one of the divines appointed by the general assembly to wait upon his majesty at the Hague, and in a speech delivered on that occasion he expressed, in the strongest terms, his abhorrence of the murder of the late king, and in his sentiments with regard to this event the Presbyterian divines of that period, both at home and abroad, were almost universally agreed. After the restoration, Mr. Bailie was appointed, in 1661, principal of the university of Glasgow; but it is said that a bishopric was offered him, which he absolutely refused. In the course of the year 1662, his health began to decline; and during his illness he was visited by the newly created archbishop of Glasgow, whom he addressed in the following uncourtly language: "Mr. Andrew (I will not call you my lord), king Charles would have made me one of their lords; but I do not find in the New Testament that Christ has any lords in his house." In July of this year Mr. Bailie died at the age of sixty-three years. His character was not more distinguished by his loyalty, than by his zeal for prebendary, and his aversion to prelacy; and he seems to have been actuated, in a very considerable degree, by the intolerant spirit of the age in which he lived. In his letters, he very much manifesls his dislike of sectaries; and he hardly omits any convenient opportunity of flowing his disapprobation of the doctrine of toleration. He had also inclined a considerable portion of that enthusiastic spirit
spirit which was then prevalent, and which prostrated the religious services to an astonishing length. Accordingly, M. Bailly, in one of his letters, written whilst he was attending the Westminster assembly, speaks of a devotional service that lasted nine hours. Nevertheless, he was a man of considerable learning and ability; he is said to have understood twelve or thirteen languages; and Mr. Wedow, his biographer, commends his Latin style as not unsuitable even to the Augustan age. Of his diligence and learning, he left sufficient evidence in his historical work, intitled, "Opus Historicum et Chronologiam." His other writings, which were chiefly on controversial and temporary subjects, and which indicated a degree of violence that is said to have flowed rather from the inflation of other persons than from his own inclinations, are of inferior value. His "Letters and Journals," published at Edinburgh by Robert Aiken, in 1755, in two volumes in 4to, contain an account of public transactions, both in Scotland and England, from 1757 to 1762, and may call some light on the civil and religious history of that period. Biog. Brit.

BAILLOU, Guillaume De (Bailly), M.D., a physician of considerable eminence in the sixteenth century, was born at Paris in the year 1538. After making great progress in the Greek and Latin languages, and in philosophy, he applied to the study of medicine. In 1750, he was created doctor; and in the year 1752, dean of the faculty of medicine at Paris. In his time the dispute between the surgeons and physicians at Paris, as to their precedence, bagon, in which Bailly took an active part. It was decided in favour of the physicians, and the privileges usurped by the surgeons annulled. Bailly was a prolific writer; but as his works are now little noticed, we shall refer our readers to the titles of the particular treatises, and for an account of their contents, to Halle's Bib. Med. Prat.

BAILLY, Jean-Sylvain, a celebrated astronomer and writer of France, was born at Paris, on the fifteenth of September 1736, of a family which had produced distinguished painters for four successive generations. He was bred to the fame professed, but manifested an early taste for poetry and the belles lettres. By an accidental acquaintance with La Caille, his attention was directed to the sciences, which he cultivated with industry and success. He calculated the orbit of the comet of 1759; and in 1763 he published an useful and elaborate compilation, being the reduction of the observations made by La Caille in 1760 and 1761, on the zodiacal stars. About this time the theory of Jupiter's satellites became a particular object of his inquiries, and in the competition for this prize question of 1764, he had a formidable rival in La Grange, afterwards known as one of the first mathematicians in Europe. The results of his investigations were collected into a treatise, published in 1766, which also contained the first part of his "History of Astronomy." In 1771, he gave a very curious and important memoir on the light of the satellites, and introduced a degree of accuracy till that time unknown in the observations of their eclipses; and in the Journal Encyclopedique for May and July 1773, he added a letter to M. Bernoulli on some discoveries relating to Jupiter's moons, which he had contrived. However, the studies of M. Bailly were not confined to the abstract sciences; but he was no less successful in his cultivation of polite literature. His "Choe de Lobitz," published in 1768, gained the prize of the academy of Berlin; this, and also the "Alcove of Charles V.," of Cornelle, of La Caille, of Cook, of Molieres, and of Greffet, printed in 1770, were much admired. In 1775, appeared the first volume of his "History of Astronomy," which indeed drews the path of science with flowers, and in every respect is a most valuable work; abundant with animated description, luminous narrative, and interesting detail. His peculiar ideas concerning the early state of Upper Asia, occasioned an ingenious correspondence and discussion with the veteran philosopher Voltaire, the facility of which he appeared in two volumes, intitled, "Letters on the Origin of Sciences," and "Letters on the Atlantide of Plato." If imagination flourished in these essays, erudition was not his companion in a great work composed in the years 1781 and 1782, on the fables and religious creeds of antiquity; which still exists in manuscript, and the publication of which would extend the fame of its author, and gratify the learned world. His opinions on some points happening to coincide with the theories of Buffon, he contracted with that celebrated naturalist an intimate friendship, which was disturbed by Bailly's unceasing opposition to the election of the able Maury into the acadame Francaise. The other volumes of the "History of Astronomy," successively appeared, and that capital work was completed in 1787, by the "History of the Indian and Oriental Astronomy," a production of singular acuteness, research, and nice calculation. His "Discours and Memoirs," which include the essays before mentioned, were published in two volumes, in 1765; and his memoirs communicated to the French academy, as they appear in Roziere's index, are as follows: "Memoir upon the theory of the comet of 1759," "Memoir upon the epochs of the moon's motions, at the end of the last century," "First, Second, and Third Memoirs on the theory of Jupiter's satellites, 1753," "Memoir upon the comet of 1762," vol. for 1763; "Astronomical observations made at Nolin, 1764," "On the sun's eclipse of the first of April 1764," "On the longitude of Pollans, 1764," "Observations made at the Louvre from 1760 to 1761," "On the cause of the variation of the inclination of the orbit of Jupiter's second satellite, 1765," "On the motion of the Nodes, and on the variation of the inclination of Jupiter's satellites, 1766," "On the theory of Jupiter's satellites, published by M. Bailly, with tables of their motions, and of those of Jupiter, published by M. Jeanrat, 1766," "Observations on the opposition of the sun and Jupiter, 1758," "On the equation of Jupiter's centre, and on some other elements of the theory of that planet, 1768," "On the transit of Venus over the sun, on the third of June 1760; and on the solar eclipse, the fourth of June, the same year 1769." Such was the reputation of Bailly, that he was received as an adjunct in the French academy, on the 29th of January 1763, and in the 14th of July 1770. In 1771, he was a candidate, under the patronage of Buffon, for the office of secretary; but the interest of Condorcet, and the influence of D'Alembert, prevailed in favour of Condorcet. Of the acadame Francaise, he was chosen secretary in 1754; and he was admitted in the following year, into the Academy of Inscriptions and Belles Lettres; the only instance, since Portevinelle, of the same person being at once a member of all the three academies. In 1784, he was nominated one of the commission to examine and report concerning the annual magnetism of Meenier, as practiced by Dufon. His report was not only decisive with regard to its objects, but furnishes a rule for the investigation of similar phenomena. It likewise throws light upon the physical effects produced by moral causes; and these are peculiarly interesting, as causes of this nature have a political influence on the general opinions of society, and the destiny of nations. M. Bailly, with an ardent, and, as it is generally believed, an honest mind, engaged in the support of that revolution of France, which at the time convulsed Europe, and which, with regard to its consequences, has not yetfabbed. His
rise, as a principal agent in the transactions of this event, was very rapid. On the 26th of April 1789, he was nominated secretary by the electors of Paris; he was afterwards appointed deputy to the states general; then chosen president of the 'Tiers Etat;' and when this chamber was constituted the national assembly, he continued in the chair. During the struggle between the popular part of the subsisting assemblies and the court, Bailly was the most forward to assert the popular rights, which at that time were new in France; and his temerity would probably have been fatal to himself, if he had not been supported by Mirabeau. Bailly dictated the oath to the members of the tiers etat, to refuse tyrants and tyranny, and never to separate, until they had obtained a free constitution. After the capture of the Bastille, on the 14th of July 1789, he was appointed by public acclamation mayor of the city; and in all his several functions he is said to have acted with integrity, courage, and moderation. But in the midst of revolutions the course which his pursuit was adapted to please neither of the contending parties; and though he acquired great popularity in the various steps by which the cause of the people gained predominance over that of the court, a circumstance occurred, which gave a turn to the popular opinion, and which rendered him an object of inveterate enmity. On the 17th of July 1790, the populace having collected tumultuously to demand the abdication of monarchy, Bailly received orders from the national assembly to disperse the mob. Dirigons that the existing laws and regulations should be respected, he arrested certain deputies who came from some military insurgents at Nancy; he opposed the rash proceedings of Marat and Hubert; he was member of a club left promiscuous in its admission of members than that of the jacobins; and he exerted himself in endeavouring to persuade the populace to permit the royal family to depart to St. Cloud. Finally, on an occasion when the multitude assaulted theroyale, Bailly ordered the latter to fire, by which about forty persons were killed, and more than one hundred wounded. By these concurrend circumstances his popularity declined, and at the dissolution of the constituent assembly, in the close of the year 1791, he resigned his office, and was succeeded by Petion. His health was impaired, and he retired from the scene of tumult, travelled through different provinces of France in the years 1792 and 1793, and purified his literary and scientific researches. During this period, he wrote memoirs of the events which he had witnessed, and in which he had been a principal actor. Instead of withdrawing from France, which some of his friends advised him to do, he chose rather to submit to the injustice and ingratitude of his country. At the nod of a tyrant he was arrested, summarily condemned by a farcical tribunal, and, on the 15th of November 1793, was delivered over to appease the vengeance of an incensed and indifferging populace. His sufferings were flindly protracted; circumstances of peculiar ignominy attended his execution; and he was executed near the spot where he gave orders for the military to fire on the people. He wore the red shirt, or badge of conspiracy, and was placed in a cart, with his hands tied behind him. In his progress to the place of execution, he was insulted and abused; and when he arrived at the fatal spot, during the removal of the guillotine, he was forced to defend from the cart, and to walk round the field, in order to gratify more completely the rancour of the mob. But all these trials were endured by him with firmness and magnanimity. A bystander, at the time of his ascending the platform, infultingly exclaimed, "Bailly, you tremble," to which he infantly replied, "Yes, but not with fear." He sought, indeed on account of the inclemency of the weather. The character of Bailly, thus prematurely cut off in the fiftyseventh year of his age, may be estimated by his works. In his person he was tall; his deportment was sedate and grave; and he blende firmness with sensibility. During his magistracy, he spent part of his fortune in relieving the wants of the poor; and he retired from office, impoverished rather than enriched; and in the various transactions of his life, he established the character of integrity and disinterestedness. His wife, who was the widow of his intimate friend Raymond Gaye, and whom he married in 1787, survived him. He had eight nephews, whom he educated with all the attention and tenderness of a father. With regard to the motives which actuated his public conduct, there seems to be no difference of opinion, whatever discordant sentiments may be entertained concerning the cause to which his talents and life were devoted. Lalande's Eloge de Bailly.

BAILLI, or BAILLIE, de la Rivièe, physician to king Henry IV., was born at Falaise in Normandy, about the middle of the sixteenth century. He was a frequent advocate for the doctrines of Paracelsus; and in 1578 he published his "Demonstracion, seu Aphorismi centesimam summan doctrinam Paracelse," 8vo. Paris. It contains a defence of his practice, which being strongly opposed by the contemporary physicians, in the following year he gave his "Re-aponio ad questiones propositas a Medicus Parthenifibus," also in 8vo. In 1580, he published "De peste tradactus," 8vo. Voces vini, Haller says, vix sefum admittunt. We shall omit the titles of his various other writings, which may be found recited in Haller's Bib. Med. Pract. vol. ii. p. 218.

Monc. Carrere says of this physician, that, perceiving he was about to die, he called his servants to him singly, and gave to each of them a portion, first of his money, then of his plate and furniture, bidding them, as soon as they had taken what he had given, to leave the house, and fix him no more. When the physicians came to visit him, they told him they had found his door open, and the servants and the furniture removed and gone, nothing in fact remaining but the bed on which he lay. They then asked, where are his physicians, said, since his baggage was packed up and gone, it was time that he should go also. He died the same day, November the 5th, 1625. Ely Drift Hist.

BAILMENT, from Fr. baille, to deliver, in Lavois, is a delivery of goods in trust; upon a contract expressed or implied that the trust shall be faithfully executed on the part of the bailer, a person to whom they are delivered; and the goods re-delivered as soon as the time or use for which they were bailed shall have elapsed or be performed. There are fix sorts of bailments, which involve a care and obligation on the party to whom goods are bailed; and which consequently subject him to an action, if he misbehave with regard to the trust reposed in him.

1. A bare and naked bailment, to keep for the use of the bailer, which is called depositum; and such bailer is not chargeable for a common neglect, but it must be a gross one to make him liable. 2. A delivery of goods which are useful to keep, and they are to be returned again in specie, which is called accommodatum, or a lending grant; and in such case the borrower is freely bound to keep them; for if he be guilty of the least breach, he shall be answerable, but he shall set he charged where there is no defect in him. 3. A delivery of goods for hire, called locatio or condutitis; and the hire is to take all imaginable care, and restore them at the time; and if he use such care, he shall not be bound. 3 P 4 A
4. A delivery by way of pledge, called *waadum;* and in such goods the pawnee has a special property; and if the goods be the work for wearing, the pawnee must not use them; otherwise he may use them at his peril; as jewels pawned to a lady, if she keep them in a bag, and they are stolen, she shall not be charged; but if she go with them to a play, and they are stolen, she shall be answerable. If the pawnee be at a charge in keeping them, he may use them for his reasonable charge; but if, notwithstanding all his diligence, he lose the pledge, yet he shall recover the debt. But if he lose it after the money tendered, he shall be chargable, for he is a wrong-doer; after money paid (and tender and refusal is the same) it ceases to be a pledge, and therefore the pawner may either bring an action of *ajumujiffit,* and declare that the defendant promised to return the goods upon request; or trover, the property being vested in him by the tender.

5. A delivery of goods to be carried for a reward. (See *Carrier.*) 6. A delivery of goods to do some act about them (as to carry) without a reward, called by Bracton *mandatum,* in English, an acting by commission; and though he get nothing for his pains, yet if there were any neglect in him, he will be answerable, for his having undertaken a trust is a sufficient consideration; but if the goods be mistreated by a third person, in the way, without any neglect of his, he will not be liable, being to have no reward.

On this subject, Sir William Jones's "Essay on the Law of Bailment" merits particular attention; and the following analysis will convey much knowledge in a short compass.

"Definitions. 1. Bailment, as before at the beginning of this article. 2. Deposit is a bailment of goods to be kept for the bailor without remuneration. 3. Mandate is a bailment of goods, without reward, to be carried from place to place, or to have some act performed about them. 4. Lending for use is a bailment of a thing for a certain time, to be used by the borrower without paying for it. 5. Pledging, is a bailment of goods by a debtor to his creditor, to be kept till the debt be discharged. 6. Letting to hire is (1) a bailment of a thing to be used by the hiree for a compensation in money; or (2) a letting out of work and labour to be done, or care and attention to be bestowed, by the bailee on the goods bailed, and that for a pecuniary remuneration; or (3) care and pains in carrying the things delivered from one place to another, for a stipulated or implied reward. 7. *Innominate bailments* are those where the compensation for the use of a thing, or for labour and attention is not pecuniary; but either (1) the reciprocal use or the gift of some other thing; or (2) work and pains reciprocally undertaken; or (3) the use or gift of another thing in consideration of care and labour; and conversely. 8. *Ordinary neglect,* is the omission of that care, which every man of common prudence, and capable of governing a family, takes of his own concerns. 9. *Grofs neglect,* is the want of that care which every man of common sense, how inattentive soever, takes of his own property. 10. *Sligh neglect* is the omission of that diligence which very circumspect and thoughtful persons use in securing their own goods and chattels. 11. A *naked contract* is a contract made without consideration or remuneration.

11. The rules which may be considered as axioms flowing from natural reason, good morals, and sound policy, are these. 1. A bailee who derives no benefit from its undertaking, is responsible only for a gross neglect. 2. A bailee who alone receives benefit from the bailment, is responsible for slight neglect. 3. When the bailment is beneficial to both parties, the bailee must answer for ordinary neglect. 4. A special agreement of any bailee to answer for more or less, is in general valid. 5. All bailees are answerable for actual fraud, even though the contrary be stipulated. 6. No bailee shall be charged for a loss by inevitable accident or irresistible force, except by special agreement. 7. Robbery by force is considered as irresistible; but a loss by private theft is presumptive evidence of ordinary neglect. 8. Grofs neglect is a violation of good faith. 9. No action lies to compel performance of a naked contract. 10. A reparation may be obtained by suit for every damage occasioned by an injury. 11. The negligence of a servant, acting by his master's express or implied order, is the negligence of the master.

111. From these rules the following propositions are evidently deducible. 1. A depositary is responsible only for grofs neglect; or, in other words, for a violation of good faith. 2. A depositary, whose character is known to his depositor, shall not answer for mere neglect, if he take no better care of his own goods, and they also be spoiled or destroyed. 3. A mandatory to carry is responsible only for grofs neglect, or a breach of good faith. 4. A mandatory to perform a work is bound to use a degree of diligence adequate to the performance of it. 5. A man cannot be compelled by action to perform his promise of engaging in a deposit or mandate; but,—6. A reparation may be obtained by suit for damage occasioned by the non-performance of a promise to become a depositary, or a mandatory. 7. A hirer for hire is responsible for flight negligence. 8. A pawnee is answerable for ordinary neglect. 9. The hirer of a thing is answerable for ordinary neglect. 10. A workman for hire must answer for ordinary neglect of the goods bailed, and must apply a degree of skill equal to his undertaking. 11. A letter to hire of his care and attention, is responsible for ordinary negligence. 12. A carrier for hire by land or by water is answerable for ordinary neglect.

IV. Exceptions to the above rules and propositions. 1. A man who gratuitously and officiously engages to keep or to carry the goods of another, though without reward, must answer for flight neglect. 2. If a man through strong persuasion and with reluctance undertake the execution of a mandate, no more can be required of him than a fair exertion of his ability. 3. All bailees become responsible for losses by casualty or violence, after their refusal to return the things bailed; on a lawful demand. 4. A borrower and a hirer are answerable in all events, if they keep the things borrowed or hired after the stipulated time, or use them differently from their agreement. 5. A depositary and a pawnee are answerable in all events if they use the things deposited or pawned. 6. An inn-keeper is chargeable for the goods of his guest within his inn, if the guests be robbed by the servants or inmates of the keeper. 7. A common carrier by land or by water must indemnify the owner of the goods carried, if he be robbed of them.

V. It is no exception, but a corollary from the rules, that every bailee is responsible for a loss by accident or force, however inevitable or irresistible; if it be occasioned by that degree of negligence for which the nature of his contract makes him generally answerable.'"
BAI

of the owner. 1 Lill. Abr. 193, 194. And vide 1 Rol. Abr. 338. 2 Show. pl. 166.

If I deliver wool, to A. to buy cattle, and he be longs to C. of it in cattle, and I bring an action of debt for all, I shall be barred in that action for the money loaned and charges, &c. but for the rest I shall recover. Hob. 287.

If one delivers his goods to another person, to deliver over to a stranger: the deliverer may countermand his power, and require the goods again; and if the bailee refuse to deliver them, he may have an action of account for them. Co. Litt. 286.

If A. delivers goods to B. to be delivered over to C. hath the property, and C. hath the action against B. for B. undertakes for the safe delivery to C. and hath no property or interest but in order to that purpose. 1 Rol. Abr. 606.: see 1 Bull. 68, 69, where it is said that in case of conversion to his own use, the bailee shall be answerable to both.

But if the bailee were not on valuable consideration, the delivery is countermandable; and in that case, if A. the bailor bring trover, he reduces the property again in himself, for the action amounts to a countermand, but if the delivery was on a valuable consideration, then C. cannot have trover, because the property is altered; and in trover the property must be proved in the plaintiff. 1 Bull. 65.; vide 1 Leon. 36.

And where a man delivers goods to another to be re-delivered to the deliverer at such a day, and before that day the bailee doth sell the goods in market over, the bailor may at the day feize and take his goods, for the property is not altered. Godd. 169.

If A. borrows a horse to ride to Dover, and he rides out of his way, and the owner of the horse meets him, he cannot take the horse from him; for A. has a special property in the horse till the journey is determined; and being in lawful possession of the horse, the owner cannot violently seize and take it away; for the continuance of all property is to be taken from the form of the original bargain, which in this case was limited till the appointed journey was finished. Yelv. 172. But the owner may have an action on the case against the bailee for exceeding the purposes of the loan; for so far it is a secret and fallacious abuse of his property; but no general action of trespass, because it is not an open and violent invasion of it. 1 Rol. Rep. 128.

As to borrowing a thing pernicious, as corn, wine, or money, or the like, a man must, from the nature of the thing, have an absolute property in them; otherwise it could not supply the uses for which it was lent; and therefore he is obliged to return something of the same sort, the same in quantity and quality with what is borrowed. Dr. & Stud. 129.

But if one lend a horse, &c. he must have the same recovery. If a thing lent for use be used to any other end or purpose than that for which it was borrowed, the party may have his action on the case for it, though the thing be never the worse; and if what is borrowed be lost, although it be not by any negligence of the borrower, as if he be robbed of it; or where the thing is injured or destroyed by his neglect, admitting that it was to no more service than that for which borrowed, he must make it good; so where one borrows a horse, and puts him in an old rotten horse ready to fall, which falls on and kills him, the borrower must answer for the horse. But if such goods borrowed perish by the act of God (or rather, as Sir William Jones fays, it ought more reverentially to be termed, by inevitable accident) in the right use of them; as where the borrower puts the horse, &c. in a strong house, and it falls and kills him, or it dies by disease, or by default of the owner, the borrower shall not be charged. 1 Inst. 89. 29 Ass. 28. 2 H. 7. 11.

If one delivers a ring to another to keep, and he breaks and converts it to his own use; or if I deliver my face to another to be kept, and he suffers them to be drowned by his negligence, or if the bailee of a horse, or goods, &c. kill or spoil them, in these cases action will lie. 5 Rep. 13. 15 E. 4. 20 H. 12 E. 4. 13.

If a man delivers goods to another, the bailee shall have a general action of trespass against a stranger, because he is answerable over to the bailor; for a man ought not to be charged with an injury to another, without being able to retire to the original cause of that injury, and in and among there to do himself right. 14 Co. 69. 14 H. 4. 28. 25 H. 7. 14. See Jacob's Law Dictionary by Tomlin, art. Bailment. Blackl. Com. vol. ii. p. 396, 451, &c.

BAILO, or BAIIIO, a name given at Constanstipole to the ambassador of Venice residing at the Potos; who also does the office of conful of his nation.

The word is doubtles the remains of the word bajuia, which the modern Greeks and Turks have formed into bals.

The Venetian consul at Aleppo, Alexandria, Smyrna, and other parts of the Levant, are also denominated bals.

BALLYBOROUGH, in Geography, a market and port town of the county of Cavan in Ireland, which, though at very mean appearance, has an excellent market. The crops in its vicinity consist of potatoes, flax, and oats, and are very poor. There is a bleach-green contiguous to the town, where are some small farmers in the neighbourhood, who make better for market, which is sent to Newry for exportation. Their pigs, which form a considerable article of trade, are sent to the fame place. This town has been hitherto very much neglected; but such are its advantages of situation, that if any encouragement were given, it might be easily raised to a state of prosperity and consequence. Between this town and King's Court is a lake, or rather pool, on the summit of a mountain, which is celebrated for its autobiography virtues, and is much frequented from June to August. Many bathe in the lake; but the mud, which is taken up from the depth of thirty feet, and rubbed on the affected parts, is deemed the most efficacious. This mud is a greyish fluid, resembling tar. The lake covers about half a square mile in area, and has a range of lofty hills to the east and west. For about six feet from the surface the water is pure and clear, with something of a chalky hue. It is observed of it, that the sun or atmosphere has no effect either in imparting its genial influence, or in reducing the waters by abstraction nor has it ever been frozen, or its temperature altered in the severest winter. Ballyborough is five miles north-west from Dublin. Cone. Stat. Sur. of Cavan.

BALLYBURG, a town of Sweden, in the province of Uppland.

BAIN, a town of France, and principal place of a district in the department of the Is and Vienne, 56 leagues south of Lyons. N. lat. 47° 50'. W. long. 0° 45'.

Vain Gonga, a river of Hindustan, for the recent knowledge of which we are indebted to Col. Gore. It rises 52
BAI

near the southern bank of the Neubuddah, and runs southward through the heart of Berar; and after a course of 400 miles, the Godavery, within the hills that bound our northern circars, about sixty miles above the sea. It is not certain how far the Bain Gonga is navigable; but it is mentioned as a large river in the early part of its course, and is probably equal in bulk to the Godavery, when it joins it. Rennell's Mem. p. 246.

BAINBRIDGE, John, in Biography, an eminent physician and astronomer, was born at Ashby de la Zouch, in Leicestershire, in 1585, finished his education at Emmanuel college in the university of Cambridge, and then retired to his own country, where for some years he taught a grammar school, and practised physic. He also applied himself to the study of mathematics and astronomy, to which he had been devoted from his earliest years. Upon his removal to London, he was admitted a fellow of the college of physicians. His "Description of the comet" in 1618, introduced him to an acquaintance with Sir Henry Saville, by whom he was appointed, in 1619, his first professor of astronomy at Oxford, where he settled, having entered himself a master commoner of Merton college, for some years. At the age of forty years he began the study of Arabic, with a view of publishers correct editions of the ancient astronomers. He died at Oxford, November the 3d, 1643, in the sixty-second year of his age. His works that were published are "An Astronomical Description of the late comet from November 18th, 1618, to the 16th of December following," London, 1619, 4to; "Procli sphara;" and "Prolemet de hypothesibus Planetarum liber singularis;" to which he added Ptolemy's "Canon regnorum," 1620, 4to; "Canticularia," published at Oxford, in 1648, by Mr. Greaves, together with a demonstration of the heliacal rising of Sirius or the dog-star for the parallel of Lower Egypt, written at the request of Archbishop Usher. Several other treatises were prepared for the press, and left in MS. Biog. Brit.

BAINDER, in Geography, a town of Asiatic Turkey, in the province of Natoth, forty-four miles east from Boli.

BAINDT, a town of Germany, in the circle of Swabia, fix miles N. K. E. of Rauenburg.

BAINE, a river of England, in Lincolnshire, which passes by Horncastle, Tatterhall, &c. and joins the Welham near the last-mentioned place.

BAINETTA, a town of Piedmont, in the province of Coni, on the Orbib, six miles S. E. from Coni, and eight W. S. W. from Monfort.

BAINS, a town of France, in the department of the Voges, and chief place of a canton in the district of Darnay 24 leagues west of Plombieres, and 34 south-east of Darnay.

BAIICO, in Commerce, a copper coin in modern Rome, equivalent to a tenth part of the lira, or a hundredth part of the ducat.

The baiocco is worth about nine deniers, French money.

BAJOLE, in Geography, the most northerly cape of Minorca island, in the Mediterranean, ten leagues from the most northerly cape of the island of Majorca.

BAIPIA, a town of North America, in New Navarre, 165 miles south-west from Cafa Grand.

BAIRAM, a name given to the great annual feast of the Mahometans.

The word is also written, by some authors, more conformably to the oriental orthography, biiram. It is originally Turkish, and signifies literally, a feast, day, or holiday.

The Mahometans have two bairams, the great and the little, which Scaliger, Erpenius, Rycaut, Hyde, Chardin, Bobovius, and other European writers, commonly interchange, giving the appellation great to that which the Turks call little, and vice versa.

This feast commencing with the new moon, the Mahometans are very scrupulous in observing the time when the new moon commences; to which purpose, observants are sent to the tops of the high mountains, who, the moment they spy the appearance of a new moon, run to the city, and proclaim muzadalah, welcome news; as it is the signal for beginning the festivity.

The ceremonies are described at large by Rycaut and Tournefort.

BAIRAM, the Greater, is properly that held by the pilgrims at Mecca, commencing on the tenth of Dha'laby, when the victims are slain, and lading three days. This is called by the Arabs, id al kurban, id al adha, that is, the feast of the sacrifice, as being celebrated in memory of the sacrifice of Abraham, whose son God redeemed with a great victim. By European writers it is called the iffer bairam, as being lefts taken notice of by the generality of the people, who are not fruck with it, because the ceremonies attending it are performed at Mecca, the only scene of the solemnity.

The Iffar Bairam is called in Arabic Id al Fezir, that is, the feast of breaking the fast, and begins the first of Shawal, immediately succeeding the fast of Ramadan. This is called by the vulgar, and by most others who have written of the Mahometan affairs, the greater bairam, because it is observed in an extraordinary manner, and lasts for three days at Constantinople and in other parts of Turkey, and for five or six days in Persia, during which no work is done; but presents pass from one to another, with many other manifestations of joy. If the day after Ramdan should prove so cloudy as to prevent the flight of the new moon, the bairam is put off to the next day, when it begins, though the moon be still obscured. When they celebrate this feast, after numerous ceremonies, or rather frangne mimicries, in their mosque, they end it with a solemn prayer against the infidels, to root out Christian princes, or to arm them one against another, that they may have an opportunity to extend the borders of their law.

BAIRDSTOWN, or BEARDSTOWN, in Geography, a flourishing town of America, in Nelson county, Kentucky, containing 216 inhabitants, seated on the head-waters of Salt-river, fifty miles S. E. from Louisville, and about the same distance S. W. from Danville.

BAIROUT, as it is pronounced by the Arabs, and as the modern Greeks pronounce Paira, Bairoút, or the ancient Berytus, a town of Syria, in the pachalie of Saide or Acre, is situated in a plain, which runs out from the foot of mount Lebanon into the sea, narrowing to a point about two leagues from the ordinary line of the shore, and on the north side forms a pretty long road, receiving the river of Nahri el-Salib, called also Nahr-Bairout. The frequent floods to which this river is subject in winter, have occasioned the erection of a considerable bridge; but this is in so ruinous a state as to be impassable. The bottom of the road is rocky, which chafes the cables, and renders it dangerous. The town of Bairoút, which lies about an hour's journey westward towards the point, belonged till of late to the Druzes, but Djezzar took it from them, and placed in it a Turkish garrison. It still continues, however, to be the emporium of the Maronites and the Druzes, where they export their cottons and their filks, almost all of which are sent to Cairo. In return, they receive rice, tobacco, coffee, and specie, which they exchange again for the corn of the Bekaa and the
the Haoran. This commerce maintains near 5000 persons.
The dialect of the inhabitants is the most corrupt of any in
the country, and is said to unite in itself the twelve faults
enumerated by the Arabian grammarians. The port of
Bairout, formed like all the others on the coast by a pier,
is, like them, choked up with sand and ruins. The town
is surrounded by a wall, the soft and sandy stone of which
may be pierced by a cannon-ball, without breaking or crum-
bbling; in other respects this wall, and its old towers, are
defenceless. Bairout is subject to two inconveniences,
which will always prevent its becoming a strong place: for it
is commanded by a chain of hills to the south-east, and it is
altogether deficient of water, which is fetched by the women
at the distance of half a quarter of a league, and even this is
but indifferent. Djezzar has undertaken to construct a
public fountain, as he has done at Acre; but the canal
will soon become useless. In digging, in order to form
referors, subterraneous ruins have been discovered, from
which it appears that the modern town is built on the site
of the ancient Berytus; and without the walls, towards the
corn, heaps of rubbish and shafts of columns indicate that
Bairout has formerly been much larger than it is at present.
The plain around it is entirely planted with white mul-
berry trees, which are young and flourishing, and therefore
the silk produced here is of the finest quality. In descend-
ing from the mountains, the verdure formed by the tops of
these trees in the distant bottom of the valley exhibits a very
delightful prospect. The heat, and the warmth of the water,
render Bairout in summer an inconvenient place of residence;
the town, however, is not unhealthy; more especially since
the emir Fakr-el-din has planted a wood of fir trees about a
league southward of the town. Volney's Travels in Egypt
BAISE, a river of France, which runs into the Garonne,
near Aguilhon.
BAIT, White, in Ichthyology, a small fish, which is caught
in great plenty, from August 1, to October 1, by lat. 30
Ge. II. c. 21, in the river Thames. See White Bait.
BAIT, in Fishing. Baits make a capital article in angling;
on the choice whereof much of the sport depends; different
species, and different game, look for their appropriate
baits. The red, or earthworm, is good for the small fry
moll of the year round; and small fish are good baits for
pikes and other fishes at all times; sheep's blood and cheese are good bait
for small wild fish; the bobbin, dried wafers, and bees, are for May,
brown flies for June; maggots, hornets, wafers, and bees,
for July; sailes in Anglai, grashoppers in September;
corn, bramble-berries, and seeds, at the fall of the leaf;
artificial baits are for May, June, July, and frogs for
March.
Baits are either natural or artificial.
BAITS, Natural, include all kinds of worms, as the red
worm, maggott, &c. also frogs, grashoppers, hornets, bees,
small, roaches, bleak, gudgeon, and loaches. &c.
These baits are to be kept each fort separate, and fed with
those things which they like best.
The red worm is to be kept in rich black mould, with a
little fennel chopped among it; a little ox or cow dung,
newly made, is also a very acceptable thing to them. They
may be kept in a box, with small holes in it, or in a bag.
Red worms, and all other forts, feour quickly, and grow
very tough and bright, on putting them into a thin clou,
greased with fresh butter, or grease, before they are put into
mofs.
This is the best of all things to keep them in; but the
mofs must be firr very well washed, and the water squeezed
out again. As to food, a spoonful of cream, dropped into
the moss once in three or four days, is better than any thing
else. The moss is to changed every week, and kept in a
cool place.
White large maggots are an excellent bait for many sorts
of fish, and they are to be kept on sheep's fat and liver
chopped small.
Frogs and grasshoppers are to be kept in wet mosses, and
long grasses; and on moistening this after every evening it
will keep a long time. They are to have their legs and
wings cut off when they are used.
Live flies must be used as they are caught; but wafps,
bees, hornets, and humble-bees, may be preferred dry. The
bull method of drying them, is putting them in an even
after the bread is drawn. Care must be taken that they are
not strucked; and when they are taken out they are to
have the heads dipped in sheep's blood. This is to be
suffered to dry on, and then they are to be preferred in
a box. They will keep for three or four months. See
Angling.
BAITS, Artificial, are flies of all kinds and shapes, made
of silk, feathers, and the like. The variety of these is very great;
there being not only different ones for every season and
month in the year, but almost for every fish. See Angling.
There are several artificial baits, for intoxicating of fowl,
and yet without tainting or hurting the flesh, so as to make
it unfit to eat.
BAITS, Dead, are pales of divers sorts, made of corn,
cheefe, fruits, wafers, sheep's blood, boiled beans, &c.
BAIT, Ground. See Angling.
BAIT, Ledger, is that which remains fixed in one certain
place, while the angler may be absent; especially in fishing
for pike.
BAIT, Walking, is that which the angler attends while he
keeps moving from place to place, in quest of the fish.
BAITS of Hemp, denote bundle of that plant, pulled
and tied up, ready for fishing in water. See Fly-
Fishing.
BAIT-EL-LAHAM, the ancient Bethlehem, in Geography,
section of Damascus, is a village about two leagues south-east of Jerusalem, seated on an
eminence in a country full of hills and valleys. The adjac-
ent soil is the belt in all these districts: so that fruits, vine-
olives, and sandalwood, succeed here extremely well; and
nothing is wanting but cultivation. They reckon about 600
men in this village capable of occupying arms; and occasions of this kind frequently recur, sometimes to
refit the pacha, sometimes to make war with the adjourning
villages, and sometimes in consequence of intestine divi-
sions. Of these 600 men, about 100 are Latin Christians,
who have a vicar dependent on the great convent at Jeru-
alem. The whole trade formerly co-efficient in the manu-
facture of beads; but not finding a sufficient vent for them,
they have resumed the cultivation of their lands. They
make a white wine, which justifies the former celebrity of
the wines of Judea, but it has the property of being very
heady. The necessity of uniting for their common defence
prevails over their religious differences, and induces the
Christians here to live in tolerable harmony with their fel-
low-citizens the Mahometans. Both are of the party of
Zamun, which, with its opposite called Kasf, divides the
whole of Palestine into two factions that are perpetually
at variance. The courage of these peasants has been fre-
quent prince, and renders them formidable through the
Bethlehem.
BAITHOSUS, in Geography, a Jewish teacher, and one
of the founders of the sect of the Sadducees, flourished in
Judea,
BAJ

Judea, in the third century before Christ. See Antiquus Socræus.

BAITING, or rather Bating, in Falconry, is when a hawk flutters with its wings, either from perch or sill, as it were striving to get away.

Baiting also denotes the act of smaller or weaker beasts in attacking or harassing greater and stronger ones.

In this sense we hear of the baiting of bulls and bears by masts, or bull-dogs with short noles, that they may take the better hold.

The baiting of this animal makes his flesh tender and more digestible. In reality, it disposes it for putrefaction, so that, unless taken in time, baited flesh is soon lost.

Bulls, bears, and also horses, and other animals, were formerly trained for this purpose. This barbarous practice, the first rise of which cannot be satisfactorily ascertained, has the function of high antiquity. Eraz-Stephen, who lived in the reign of Henry II., and wrote "Description of the City of London" was written in 1174, informs us, that in the forenoon of every holyday, during the winter season, the young Londoners were amnest with bears opposed to each other in battle; or with bulls and full-grown bears, baited by dogs. The baiting of horses was never a general practice; but asses, which did not sufficiently answer the purpose of sport, were occasionally treated with the same inhumanity. The practice of bull-baiting was much approved by the nobility in former ages, and was countenanced even by persons of the most exalted rank, without exception even of females. Erasmus, who visited England in the reign of Henry VIII., says (Adagia, p. 361.), that there were many herds of bears maintained in this country for the purpose of baiting. When Queen Mary visited her sister the princess Elizabeth, during her confinement at Hatfield house, a great exhibition of bear-baiting was presented, immediately after mas in the morning, for their amusement. The same princess, soon after her accession to the throne, entertained the foreign ambassadors with the baiting of bulls and bears. In the sixteenth century there was a place built in the form of a theatre, which served for baiting of bulls and bears: they were fattened behind, and then worked by large English bull-dogs; but not without ril to the dogs from the teeth of the one, and the horns of the other; and it sometimes happened that they were killed on the spot, and fresh ones were supplied in the room of those who were destroyed, wounded, or tired.

When the bull was baited, a collar was put about his neck, fastened to a thick rope about three, four, or five yards long, hung to a hook, and so attached to a stake that it might turn round. By means of this rope, the bull circulated to watch his enemy, which was a mastiff dog with a short nole. This dog, when properly trained, would leap upon his belly, that he might, if possible, seize the bull by the nole, which he carefully endeavoured to defend by laying it close to the ground, and with his horns he attempted to toss the dog. On some occasions a dog has been tossed by a bull to the height of thirty or forty feet, and their fall has proved injurious and even fatal to them. The men have been also frequently tossed as well the dogs. The barbarous palrine of bull and bear-baiting is not encouraged by persons of rank and opulence in the present day, but attempts have been projected for suppressing it by legislative interference: when it is practiced, which rarely happens, it is attended only by the lowest and most defpicable part of the people, a circumstance which indicates a general refinement of manners and prevalence of humanity among the moderns.

Houghton's Collections, Strutt's Sports, &c.

Whales are baited by a kind of fish called ois, or Pilfers; ten or twelve of which will attack a young whale at once, and not leave him till he is killed. Philosoph. Trans. 1728, p. 263.

BAJULARIA, in Entomology, a species of Phaléna (M. Au'r) that inhabits Ambonya. The anterior wings are brown, with two white spots, and a streak of the same colour, posterior ones yellow, with black spots. Fabricius, Cramer.

BAJULATIO, the office of a bajulus or bailiff.

BAJULUS, an ancient officer in the court of the Greek emperors; whereof there were several degrees: as the grand bajulus, who was preceptor of the emperor, and the simple bajulis, who were sub-preceptors.

Hence the Italians use the word bajulus of a kingdom in the same sense with protector of a kingdom among the English. The word is derived from the Latin verb bajulare, to carry, or bear a thing on the arms, or on the shoulders.

Children, and especially those of condition, had anciently, before his nurse, a woman called gerula, as appears from several passages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about to take care of them, who were called geruli, and bajulus, a gerula & bajulando.

Bajulus is also used by Latin writers in the several other senses wherein bailiff is used among us.

Bajulus was also the name of a conventual officer in the ancient monasteries, to whom belonged the charge of gathering and distributing the money and legacies left for masses and obits; whence he was also demonstrated bajulus obitum notorium.

Bajulus, in Entomology, a species of Cerambix (Calidium) that is found in the trunks of trees in the northern parts of Europe. The thorax is villous, with two tubercles; body brown. Fabricius. This is cerambix caudatus of Degeer; and leptura bajula of Scopoli. Gmelin.—Of this variety (b) is described by Linnaeus. Fn. Succ. i. n. 490. The colour of which is tesselaceous: thorax cinereous, and villous, with two little glebrous lines; in the Fabrician manifis. Another variety (c) is noticed; it is a native of Saxony, and only half the size of the former.

Bajus, Michael, in Biography, a professor of divinity at Louvain, was born at Melin, in the territory of Aeth, in the year 1513, and educated in the university of Louvain; where he was elected, in 1541, principal of one of the colleges; and in 1544, lecturer in philosophy. In 1550 he took his doctor's degree, and was appointed professor of the holy scriptures. Bajus and his associate having adopted the tenets of Luther, and appealing to the authority of Augustin, taught doctrines concerning grace and free-will, contrary to those which had been commonly received in the church of Rome. The complaint of heresy was excited; Bajus was accused as a chief instrument of promoting it; and the doctors of the Sorbonne at Paris pronounced a sentence of censure. The clamour against him was circulated; and a number of propositions, collected from books published by him in 1563 and 1564, were transmitted in 1567 to pope Pius IV. The pope issued a bull condemning these propositions; but without mentioning the name of the author, and adding a kind of ambiguous clause, which seemed to intimate, that some of the propositions which he condemned, admitted of a favourable construction. By these measures of policy, suggested by the experience of the evils that had arisen from pursuing a more temperate conduct with regard to Luther, the person of Bajus was exempted from the penalties of ex-
communication, and he continued to exercise his functions, and even to vindicate his doctrines; whilst he solicited the pope to abjure the irregularity. About thirteen years after this transgression, complaints against Baius were renewed; and pope Gregory XIII., at the instigation of the Jesuits, confirmed the sentence of Pius IV. Baius quietly acquiesced in the papal sentence, and concurred in condemning the propositions agreeably to the definition and meaning of the bull. Baius, notwithstanding the popular odium which he incurred, retained his office, and received further preference. He, and Heffels, his successor in the professorship at Louvain, were the two divines commissioned to attend the council of Trent, in the year 1563. In 1575, he was preferred to the deanship of St. Peter at Louvain, and elected chancellor of the university; and, in 1578, was appointed confessor of its privileges. In 1580 he died, at the age of seventy-seven years. Molinus represents him as equally remarkable on account of the warmth of his piety as the extent of his learning. In proof of his charitable disposition it is alleged, that by his will he left his whole estate to the poor. His historians were engaging; and Tolet, one of his admirers of the fraternity of Jesuits, said of him, "Michaelis Baius nihil docet, nihil humilium;" nothing can be more learned, nothing more humble than Baius. As his works, relating chiefly to the controversy concerning grace and free-will, are not likely to be now much sought after, it is needless to enumerate them. They were printed entire in 4to. at Cologne, in 1604. They are written with logical precision, and in a neat style. Gen. Dict. Moh. Eccl. Hist. vol. iv. p. 235. 236.

BAIX, in Geography, a town of France, in the department of the Ardeche, two leagues and a half south-east of Prias.

BAIZE, in Commerce. See Bays.

BAKAL, in Geography, a town of Ruffia, in the government of Ufa, ninety-six miles west of Ufa.

BAKAN, a town of Asia, in the Birman empire, seated on the river Ava. N. lat. 19° 35'. E. long. 98° 0'.

BAKER, Sir Richard, in Biography, an English historian, was the grandson of Sir John Baker, chancellor of the exchequer, in the reign of Henry VIII., and born at Sillingherrf in Kent, about the year 1568. He was entered a commoner at Hart's hall, in Oxford, in 1583; and having spent three years in academic studies, finished his education in one of the inns of court, and by travelling. In 1593, he obtained the honour of knighthood; and in 1629 he was appointed high-sheriff for the county of Oxford. By involving himself in pecuniary embarrassment, in consequence of his marriage, he was obliged to take refuge in the Fleet prison, where, after remaining there several years, he terminated his life in 1648. In these circumstances of confinement and humilitating the affronts, he obtained relief by study, and from the influence of religious principles. Besides other tracts of less importance, in the composition of which he amused himself, his principal work was the "Chronicle of the Kings of England from the Time of the Romans Government unto the Death of King James," published in folio, at London, in 1641, and afterwards continued by Edward Phillips, a nephew of Milton. This chronicle continued to be popular for several years, and deservedly so, if the author's account of it be just; for he says, "that it was collected with so great care and diligence, that if all other of our chronicles should be lost, this only would be sufficient to inform posterity of all passages memorable or worthy to be known." But of this performance a less favourable opinion has been entertained by others; and the critical examination of Thomas Blount in his "Anecdotoms," 1672, in which many and gross errors, respecting dates, names, places, and facts, were pointed out, greatly depreciated its value in the public estimation. Although a new corrected edition, with a second continuation, appeared in 1730, yet Baker's chronicle remained, after all, a performance ill-contructed, injudicious, and unworthy of confidence. Of the writer's taste and style the following commendation of his pamphlet, for Henry Wotton, will afford an adequate idea: "I much admire the character of your style, which seemeth unto me to have not a little of the African idea of St. Aurin's age; full of sweet raptures, and of researching notions; nothing borrowed, nothing vulgar, and yet all flowing from you. I know not how, with a certain equal facility." Biog. Brit.

BAKER, Thomas, an eminent mathematician, was born at Ilton in Somersetshire, about the year 1625; and was educated at Oxford. In 1645 he was elected scholar of Wadham college, took his degree of bachelor of arts in 1647, and soon afterwards left the university. As vicar of Bishops-Nymett in Devonshire, he lived in studious retirement, and chily applied himself to the study of mathematics, in which he excelled. Of this we have sufficient evidence in his work, intitled, "The Geometrical Keys, or the State of Equations unlocked," and published at London in 1654, 4to. in Latin and English. An account of this book is given in the Phil. Transol. vol. iv. N° 157. p. 549. 550. (See Central Rule.) To some mathematical queries, sent to him by the members of the Royal Society, not long before his death, he returned an answer so satisfactory, that they gave him a medal, with an inscription honourable and respectful. He died at Bishops-Nymett, June 6th, 1699, and was buried in his own church. Biog. Brit.

BAKER, Thomas, a writer and antiquary of eminence, was born at Lancaster in the county of Durham, in 1656, and studied at St. John's college, Cambridge, where he became a fellow. In 1669 he published, in 8vo., an anonymous work, intitled, "Reflections upon Learning, wherein is shewn the Insufficiency thereof, in several Particulars, in order to evince the Necessity and Usefulness of Revelation," which passed through several editions, and was regarded, for many years, as a standard of fine writing. As to its style, however, it has been observed, that, whilst it is allowed to be periphrastic and many, it has no claim to any high degree of elegance; and whatever merit the work in general may be supposed to possess, it will be justly questioned, whether an author, who belows cold and partial praise on Bacon, who in a chapter of metaphysics omits the mention of Locke, who speaks contemptuously of the Copernican system, and who attacked Le Clerc with an unbecoming acrimony, was duly qualified to pass judgment upon general learning. The ingenious Dr. Jortin says of him (Life of Erasmus, p. 550, 551), "that he was no critical himself, and not at all acquainted with the true state of classical books, and particularly of Greek authors." Baker, though he professed real erudition, and though his remarks are often acute and ingenious, has unduly disparaged the writings of able men, and the discoveries of modern science. In the progress of his life, he pursued studies for which he seems to have been better qualified. As a collector of antiquities, and particularly of such as related to the church and university, he excelled. His talents in this way were employed in collecting materials for a history of the university of Cambridge; but though he lived to an advanced age, the history was never completed.
Baker was unquestionably a man of integrity and candour. By his conscientious refusal to take the oaths required by government at the accession of George I. he lost his fellowship; but he retained his chambers at St. John's college, where he was highly esteemed, and Mr. Prior, the celebrated poet, gave the profits of his own fellowship to Baker, in order to supply the loss of income which he had suffered. His correspondence with men of learning was extensive, and he was liberal in his literary communications to those who solicited information; and particularly to bishop Burnet, who was indebted to him for several remarks and corrections relating to his "History of the Reformation."

Thee two persons, though very different from each other with regard to their part and principles, maintained a mutual friendship and a candid intercourse, which were honourable to both. Baker's private character was amiable, and he was beloved and respected by all who knew him. He died at Cambridge, July 2d, 1740, in his eighty-fourth year. Of his extensive collections, he left twenty-three volumes in folio, written by his own hand, to lord Oxford, and they now compose part of the Harleian collection in the British museum. He also bequeathed fifteen volumes folio, of a like kind, to the public library at Cambridge, together with other MSS, and printed books. Biog. Brit.

"Mr. Baker," says a late biographer, Horatio Walpole earl of Orford, "lived and died in charity with all mankind, and was perhaps the sole instance of a man, who bequeathed his worldly goods to a society that ejected him, and to the ministers of a church in which he had lost preference."

Memoirs of the Life and Writings of the late Thomas Baker, &c. by R. Melfers, 1784.

Baker, Henry, an ingenious and diligent naturalist, was born in London near the close of the seventeenth or the beginning of the eighteenth century, and apprenticed to a bookseller. This employment, if he ever engaged in it after the expiration of his apprenticeship, he soon relinquished; and having directed particular attention to the methods which might be practicable and useful in the cure of flowering, he engaged in teaching deaf and dumb persons to speak; and in this undertaking he was very successful. He married a daughter of the celebrated Daniel Defoe. In the latter period of his life, he indulged a taste for poetry, and published, in 1725 and 1726, "Original Poems, fiercous and humorous," in two parts, in which there are some tales that resemble in wit, and also in licentiousness, those of Prior. He was the author likewise of "The Universe, a Poem intended to restrain the Pride of Man," several times reprinted, and of "An Invitation to Health," reprinted in his "Original Poems." At a more advanced period of life, he purled various branches of study and experiment in philosophy and natural history, and devoted himself more especially to microscopical researches and observations. In 1745, he was elected a fellow of the Antiquarian and Royal Societies; in both which he was a regular attendant. In 1744, the Royal Society honoured him with Sir Godfrey Copley's medal in recompense of his microscopical discoveries, the crystallizations and configurations of saline particles. Among various topics, on which he communicated papers to the Royal Society, that have been published in their Transactions, one was the water-polypus (see Polyzoa); and his remarks on this curious animal were enlarged into a separate treatise, which passed through several editions. The most important and valuable of his observations are contained in his two principal works, intitled, "The Microscope made easy," and "Employment for the Microscope," of which many editions have been published. Mr. Baker was one of the earliest and most zealous members of the society for the encouragement of arts, manufactures, and commerce; and by his extensive correspondence he was eminently useful in introducing into his own country several valuable methods of culture. To him we are indebted for the true history of the "Coccus Polonicus," for the "Alpine Strawberry," and for the "Rhoeum Palmatum." After the first discoveries in electricity, he was one of the first who announced to the public the approach of medicinal effects that might result from the application of it, and to relate the experiments of this kind which had been made at Rome and Bologna. He did not, however, escape the strictures of critics, and particularly of Dr. Hill, in his review of the works of the Royal Society. It has been said of him, more to the disfavour of those who have thrown out this unjust and invidious reflection than to his disgrace, that he was a philosopher in little things; but cavillers of this description feem to forget that the minute productions of nature display the great first cause as much as the largest; and they too generally escape the vulgar eye. Mr. Baker, says one of his biographers, was "an intelligent, upright, benevolent man, much respected by those who knew him but. His friends were the friends of science and virtue; and it will be always remembered by his cotemporaries, that no one was more ready than himself to afford those with whom he was conversant, in their various researches and endeavours for the advancement of knowledge and the benefit of society. After a life industriously devoted to these great objects, he died at his apartments in the Strand, Nov. 25th, 1774. The bulk of his fortune was bequeathed to his only grandson; and he left 1001. to the Royal Society for an anatomical or chemical lecture. Biog. Brit.

Baker's Central Rule, in Mathematics. See Central Rule.

Baker's Dozen Islands, in Geography, a cluster of islands near the east side of Hudson's bay, about N. lat. 77° 30', and W. long. 81°, to the west of an opening which goes to the east and north-east as far as the south-east end of Hudson's straits.

Bakersfield, a newly-settled township of America, in Franklin county, Vermont, formerly in Chittenango county.

Bakerstown, lies in Cumberland county, and district of Maine, containing 1276 inhabitants; distant 162 miles north-east from Boston.

Bakeu, or Bacou, a town of European Turkey, in the province of Moldavia, 60 miles south-west of Jaffy.

Bakewell, or Bakewell, is an ancient market town of England, in the county of Derby. In the Saxon chronicle it is called Bodecweallam; from which circumstance Mr. Bray conjectures that a bath had been used in this place previous to the year 924, at which time Edward the elder ordered a strongly fortified town to be built in the vicinity. The parish of Bakewell is the most extensive in the county; its length from north to south being more than twenty miles, and its breadth upwards of eight. Its number of houses is 299, and that of inhabitants 1412. In consequence of the extent of this parish, it has nine chapels of ease besides the church in the town. The latter, situated on an eminence, is an ancient and handsome structure, built in the form of a cros, with an octagonal tower in the centre, supporting lofty spire. The architecture of this fabric combines a variety of styles. The plain Saxon appears in the nave, and the arch of the western doorway is enriched with zigzag ornaments; but the other parts are built in that style which prevailed in the fifteenth century. Here are some ancient and curious monuments. In the church yard is a Catholic stone cros, whose sides are ornamented with a rudely executed
The market was formerly held on a Monday, but it is now kept on Fridays. Near the entrance of the town from Ashford is a large mill for the carding, roving, doubling, spinning, and twining of cotton; in which manufacture from 300 to 350 persons of both sexes are constantly employed. This mill was erected by the late Sir Richard Arkwright, who was the founder of the cotton trade in this neighbourhood. Between the gritstone and limestone frata about Bakewell, is a thick stratum of shale, which being of an argillaceous nature, and retentive of moisture, renders the paturage extremely good and thriving. Bakewell is 25 miles north of Derby, and 152 miles north-west of London. About three miles south of this town is Chatsworth, a magnificent seat of the duke of Devonshire. This celebrated mansion was erected by William the first duke of Devonshire, in the year 1702. It is built in the Ionic order, with a flat roof, surrounded by a balustrade. Its form is nearly a square, of about 150 feet, including a spacious quadrangular court, having a fountain in the centre, with the statue of Orpheus. The fronts which form the quadrangle, are decorated with rich sculptural representations of military trophies. This mansion is sumptuously furnished, and embellished with carved ornaments by the celebrated Gibbons, with painted walls and ceilings, with portraits, also a collection of sottis, &c. The unfortunate Mary, queen of Scots, was doomed to thirteen years' captivity in the old mansion at this place. The park is about nine miles in circumference, and is diversified with much grand, picturesque, and beautiful scenery. The Miller-works, which about fifty or sixty years ago gave Chatsworth great celebrity, are still preserved near the south-east and south sides of the house; but they attract little attention in the midst of such a variety of natural beauties.

About two miles south of Bakewell is Haddon Hall, a truly venerable mansion belonging to his grace the duke of Rutland. The high turrets and embattlements of this house, when beheld at some distance, give it the resemblance of an ancient fortified castle. It consists of numerous apartments and offices, which surround two paved quadrangular courts. The most ancient part is the tower of the gateway, which was probably built about the time of Edward the Third. The gallery was erected in the time of queen Elizabeth; but the chapel was raised in the reign of Henry the Sixth. Many of the rooms are very spacious; and the doors were concealed behind the hangings of arms, which must have been always lifted up for persons to pass in and out. Haddon Hall presents perhaps a more complete specimen of the ancient English haromonic mansion, than is to be found in any other house in the kingdom. For a particular description of it see the Beauties of England and Wales, vol. iii. p. 494.

At a short distance from Bakewell is Ashford, where are some considerable marble works. These were the first of the kind establisht in England, and great quantities of black and grey marble are faved and polished. This operation is performed by machinery, which is kept in motion by water. One part, called the sweeping mill from its circular motion, will work upon, and level a lot of marble slabs of eighty superficial feet. Beauties of England and Wales, vol. iii.

Bakewell Breed, an improved species of sheep, which have been bred by Mr. Bakewell of Disheleigh. See Sheep.

Bakhuysen. See Backhuysen.

Bakan. See Bachian.

Baking, the art of preparing bread, or of reducing meals of any kind, whether simple or compound, into bread. Vol. III.
vessels in these islands that could bear the fire, the inhabitants of them had no idea of hot water, or its effects, and therefore always roasted or baked their meat in the manner above related." Hawkesworth's Account of Voyages in the Southern Hemisphere, vol. i. p. 483.

Baking is used for the expelling a subsistence, inclosed in a crust, to the fire. See Dressing of Matter.

Baking Porcelain. See Porcelain.

BAKON, in Geography, a large forest of Hungary, near Vepfrin, where Andrew, king of Hungary, in a battle with his brother, was forsook by his followers, and trampled to death by his enemies.

BAKSAISKAIA, a fortress of Russian Tartary, in the government of Caucasus, on the west side of the Ural; 32 miles north of Gurien.

BAKTEGAN, the name of a salt lake of Persia, about fifty miles east of Shiraz, which receives the rivers of Kuren and Bundamir. It is represented in the maps, as being about 40 British miles long, and 10 broad.

BAKU, a town of Persia, in the province of Shirvan, on the west coast of the Caspian sea, with a harbour. N. lat. 40° 25'. E. long. 50° 2'.

The bay of Baku is reckoned the safest harbour of the Caspian, because ships may lie there at anchor in seven fathom water; yet in some places the entrance is dangerous, on account of shallows, illauds, and sand-banks. Baku, like Derbent, is inhabited by Perfians, Tartars, and some few Armenian merchants. The principal articles of export by which the traffic of this place is chiefly supported, are the naphtha, and the fine rock-salt, both of which are collected on the east side of the bay. The inhabitants indeed cultivate flax and cotton, but not with any considerable advantage. The trade of Baku is doubtless of more consequence than that of Derbent, though in fact but very confined, and is mostly carried on with Shamachy, whence it gets silk and silk-fluffs. A Russian confidant usually resides here.

BALA, in Botany, a name used by some authors for the majus, or plaitain tree; called also the banana and ficoides, by others.

Bala, in Ancient Geography, a city of Pentapolis, so called because it was fawallowed up, as the word imports, when Lot quitted it. It is more usually denominated Zabar.

Bala, in Geography, a town in the county of Merioneth, in North Wales, consisting of one street, with a high artificial mountain, apparently the keep of a fortress, at the south end of it. It is situated on the easter extremity of the fine lake to which it gives a name, and whose fish contribute largely towards the subsistence of its inhabitants. The fairs and markets are considerable, and abundantly supplied with the produce of the surrounding country, and with flannels, gloves, stockings, &c. In the manufacture of the latter articles, the inhabitants of the town and of the neighbouring villages are constantly employed. "Knotting," observes Mr. Aikin, "is the general leisure work of both sexes in Wales, especially about Bala: and it cannot fail of giving brawlers a high idea of the industry of the people, to see the men and women going to market with burdens on their heads, while their hands are employed in working the designs of their own sheep into articles of dress, coarse indeed, but equally warm and serviceable with the more costly and elaborate manufactures." Bala is in the parish of Llanyrhych, a village about one mile from the town. The whole parish includes a population of 2445. Though endowed with many valuable privileges, Bala cannot boast of any particular or elegant structures. It is an incorporated town by prescription, and the government is vested in two bailiffs and a common council; but neither this nor any other town in the county has ever sent members to parliament. The affizes are kept here and at Dolgelly alternately. Its market is on Saturdays, and here are two fairs annually. It is 35 miles from Holywell, and 203 from London. "The object best worth notice in this neighbourhood is—"

"Bala-Pool, or Pimble-mere, or Llyn-taygdd, which is the largest lake in Wales. Its length from N. E. to S. W. is about four miles, and its breadth in the widest part is 1200 yards. The water, like that of most rocky lakes, is so pure that the most delicate chemical tests detected scarcely any perceivable quantity of foreign admixture. The south-western extremity, where three mountain torrents fall into the pool, is the shallowest, owing to the great quantity of earth and flints which are borne down in flood-time from the country through which they flow: the gradual aggregations have formed several banks and low islands in this end of the lake, and in consequence obliged it to encroach proportionally on the north-eastern boundary. This tendency is further increased by the prevalence of strong westerly winds, which drive on the shore a heavy surf, which would be imagined. Whenever that not unfrequently happens, the waters rise to such an alarming height, as to threaten the town of Bala with an inundation, were it not for a dyke that is raised on the shore: the water being thus obstructed pours over the road at the extremity of the mound, and discharges itself into the low grounds through which the Dee flows, doing no small damage to the rich and extensive parishes. The lake is well stocked with excellent fish, of which the red trout and the gwyniad are esteemed the most delicious. These are all caught by angling from the shore, and tho' W. Wynne, who claims the property of the whole pool, will not allow any boats to be kept on it. The feynery round this lake is much admired for its diversified, wooded, and rocky characteristics. Aikin's Journal of a Tour through North Wales, &c.

From the bottom of this lake issues the river Dee, which is said to pass through it without mingling its waters with those of the lake (see Abyssinia); and falling under a romantic old bridge, winds gently in a wide and deep stream towards Corwen and Llangollen.

Bala is surrounded with mountains, through which various roads are forced towards Dinamowth, towards Llan-rhys, having the Berwin, and towards Llannilin in the vicinity of Snowdon.

Balaam, in Scripture Biography, the son of Beor or Bolar, a prophet or diviner, of the city of Pethor on the Euphrates. He was sent for by Balak, king of the Moabites, to curse the Israielis: but he pronounced upon them a blessing. He was killed, together with Balak, in a battle, in which the Israielites de-feated the Moabites, about 1450 years before Christ. Numb. xxv., xxvi., xxvii. Deut. xiv. 4. 2 Pet. ii. 15. Jude, ver. 11. Rom. ix. 11. It has been a subject of controversy, whether Balaam was a true prophet or a mere diviner, magician, or fortune-teller, barmica, as he is called. Numb. xxv. 5.Origin says, that his whole power consisted in magic and divination. Theodoret is of opinion that Balaam did not consult the Lord, but that he was supernaturally inspired, and constrained to speak against his own inclination. Cyril says, that he was a magician, an idler, and a false prophet, who spoke truth against his will; and St. Ambrose compares him to Caïaphas, who prophesied without being aware of the import of what he said. Jerome seems to have adopted the opinion of the Hebrews; which was, that Balaam knew the true God, exalted alters to him, and that he was a true prophet, though corrupt.
BAL

BALADE, the name of a harbour on the north-west coast of New Caledonia island, in the South Pacific ocean, formed by a reef which runs parallel to the coast, at the distance of three leagues, and near the western extremity of the island. S. lat. 29° 15'. E. long. 166° 42'.

BALAZNA, Wibad, in Zululand. Whales are a tribe of cetaceous creatures, which in external appearance, and certain habits of life, in their manner of swimming and feeding, are very remarkable. In entering the mouth of a whale, the vessel, from the26. approach so near to the other kinds of the same race, that the sailor and whalers, who were little acquainted with their habits and manners, fell full with their internal parts, and were in great danger of being drowned by the numerous whales which assist to form them to the tribe of fishes. To save nothing of their anatomy, the whale, which is an enormous fish, and, being one among other cetaceous races, requires the service of his teeth for retaining it with the latter. Our countrymen, Ray and Willughby, both include the whale in their systems of ichthyology. Ray, whose natural arrangement of the animal fishes divides no common prince, divides his fishes into two principal sections, one comprehending those which have lungs for respiration, and the other, those which breathe by means of the gills, and are truly fishes. The reason he offers for including the former with the fishes are these: because the form of their bodies agrees with those of fishes; because they are entirely naked, or covered only with a smooth skin, and because they live entirely in the water, and have all the actions of fishes. Notwithstanding this, Linnaeus, whose accuracy of discrimination an enlightened posterity bid fair to honour and exalt, has referred them to the mammalia tribe of animals: a reference extremely just, but the propriety of which will not appear so obvious at the first glance to the cursory observer, as to the accurate anatomist, or indefatigable hunter of nature.

The whale, notwithstanding its fish-like external appearance, and residence in the waters, has no other claim to a place among fishes; for its internal anatomy is precisely the same as that of the terrestrial animals, and of the quadruped tribe in particular. Such is the opinion advanced by that illustrious naturalist, Linnaeus; and such is the opinion confirmed by the remarks of that able anatomist the late Mr. Hunter. In a paper prefixed to the account of the whales, he states that whales, instead of being of the same species, to the Royal Society of London, a few years ago by the latter, it is observed, that this order of animals has nothing peculiar to fish, except living in the same element, and being endowed with the same powers of progressive motion, as those fish which are intended to move with a considerable velocity. Although inhabitants of the waters, they belong to the same class as quadrupeds; breathing air, being furnished with lungs, and all other parts peculiar to the economy of that class, and having warm blood. The projecting part, or tail, contains the power which produces progressive motion, and moves the broad terminus of the motion of which is similar to that of an oar in propelling a boat; it supercedes the necessity of posterior extremities, and allows of the proper shape for swimming. The tail is flattened horizontally, which is contrary to that of fish; this projection of the tail giving the direction to the animal in the progressive motion of the body. The two lateral fins, which are analogous to the anterior extremities in the quadruped, are commonly small, varying however in size, and seem to serve as a kind of oars. The element in which they live renders some parts, which are of importance in other animals, useless to them: gives to some parts a different action, and renders others of less account. The larynx, size of the trachea, and number of ribs differ exceedingly. The coccyx is only found in some of them. The teeth in some are wanting. The blow-holes are two in number in many; in others only one. The bones alone, in many animals, when properly united...
into what is called the skeleton, give the general shape and character of the animal. Thus a quadruped is distinguished from a bird, and even one quadruped from another; it only requiring a skin to be thrown over the skeleton to make the species known. But this is not so decidedly the case in this order of animals, for the skeleton in them does not give the true shape. An immense head, a small neck, few ribs, and in many a short ilium, and no pelvis, with a long spine, terminating in a point, require more than a skin being laid over them in order to give the regular and characteristic form of the animal. The structure of the bones is similar to that of the bones of quadrupeds; they are composed of an animal fibubance, and an earth that is not animal; they are less compact than those of quadrupeds that are similar to them. From these, and other observations we may infer, that the structure, formation, arrangement, and union of the bones, which compose the forms of parts in this order of animals, are much upon the same principle as in quadrupeds. The flesh and muscles of this order of animals are red, resembling those of quadrupeds, and perhaps more like those of the bull or horse than any other animal.

The Linnaean definition of the mammalia class, having a heart with two auricles and two ventricles, and the blood warm and red, applies most strictly to the whale. "The heart," Mr. Hunter says, "is inclosed in its pericardium, which is attached by a broad surface to the diaphragm, as in the human body. It is composed of four cavities, two auricles, and two ventricles; it is more flat than in the

B A L

quadruped, and adapted to the shape of the chest. The auricles have more rafiiice, and these pass more across the cavity from side to side, than in many other animals; besides being more muscular, they are very elastic, for being stretched they contract again very confidenly. There is nothing uncommon or particular in the structure of the ventricles, in the valves of the ventricles, or in that of the arteries." In their amours and mode of producing their young, the whales agree with other creatures of the mammalia tribe; and like them they have teats, and suckle them.

The balena genus is distinguished, according to Linnaeus, by having horny laminae in the superior jaw instead of teeth, and a double respiratory orifice on the upper part of the head. By these characters the true whales may be distinguished from the other genera of cetaceous animals, as the monodon, phylister, and delphinus. The history of the whales will be considered under the respective species, of which Linnaeus and Gmelin describe the following: Mysticetus (common whale), Physalus (sea-fish), Boops (pike-headed whale), Gribosa (hunched whale), Musculus (round lipped whale), and Rostrata (beaked whale). The French naturalists distinguish two other species; Virké speaks of la balene Franche, or balene de Greenland (B. mysticetus Linn.), le nord coper, or balene de l'Orlande (balena glacialis Bonn.), le gibrar, or fin-fish (fin-fish Eng. and balena physalus Linn.), la balene tamean (balena nodola Bonn.), la jubarte (balena boops Linn.), le requeal (balena musculus Linn.), and la balene a bce (balena rostrata Linn.).

In conclusion these remarks on the whale tribe, we cannot avoid advertmg to the British Zoology of Mr. Pkennant, in which these and the other cetaceous animals found on our coasts are admitted under the title of cetaceous fishes; he follows the arrangement proposed by Ray, and seems to object chiefly to that of Linnaeus, because "he has preferred the chain of beings entire," he says, Linnaeus "should have made the genus of phoecce, or seals, and that of trichecus or manati, immediately precede the whale, those being the links that connect the mammalia or quadrupeds with the fish; for the seals, in respect to its legs, are the most imperfect of the former class, and in the manati the hind feet coalesce, assum-
monastery, five brick, and ten timber churches. N. lat. 56° 50'. E. long. 45° 5'.

BALAKLAVA, a fishing town of Crim Tartary, or Taurida, containing about 200 houses, and seated on a bay of the Black or Euxine sea, in N. lat. 44° 35'. E. long. 33° 14'. The bay forms a harbour; which, in the imperial proclamation declaring Theodosia and Eupatoria free ports, is debarred from navigation.

BALAKZEL, in Ornithology, the Turkish name of the heron.

BALALAIA, in Music, a musical instrument of the bandour kind, of very ancient Scelaroni origin; it is in common use both with the Russians and Tartars; according to Niebuhr, it is also frequent in Egypt and Arabia. The body of it is an oblong truncated, about a span in length, with a neck or finger-board of four fingers. It is played on with the fingers like the bandour or guitar; but has only two wires, one of which gives a monotonous bass, and by the other the piece is produced. Under the touch of able fingers, accompanied by a good voice, it sounds agreeably enough; and therefore it is not unfrequently seen in the hands of people of fashion.

BALAMBANGAN, in Geography, a small island in the Eastern Pacific ocean, near the northern point of Borneo, between this island and Palawa, remarkable for a settlement attempted by the English in 1773; but evacuated either on account of the unhealthy climate, or of a Dutch invasion. N. lat. 7° 10'. E. long. 117° 40'.

BALAMBANJ, or PALAMBANJ, the name of a district or territory on the east part of the island of Java, which produces pepper, cotton, rice, Indian corn, and fruit in great plenty, and which abounds with pastures that feed a great number of horses, antelopes, buffaloes, and oxen. The capital, which is a strong trading town, is of the same name.

S. lat. 7° 10'. E. long. 117° 30'.

BALAMBANJ Channel. See Balli.

BALAMIS, Ferdinand, in Biography, born in the island of Sicily, about the middle of the sixteenth century, not less celebrated for his accomplishments in polite literature, and his skill in the Greek language, than for his knowledge of medicine, was greatly esteemed by pope Leo X. to whom he was physician. He published in 1556, at Lyons, “De cibis boni et mali fuscii,” translated from the works of Galen; also “Galeni liber de officiis, ad Tyrones,” 8vo. re-published at Frankfort, in fol. with observations, by Galpar Hoffman, 1630. The above are inserted in the edition of Galen’s works, published by the Junctus, 1586, fol. Since his death the following was printed at Rothen: “De optimo corporis nostrorum constitutione”; “De bona valutudine”; “De horticultura, cucurbitula, &c.” 1636, 8vo. Haller Bib. Med. Prat. Elsy Dict. Hist.

BALAM FULLI, in Botany, a name used by some authors for the tree whose fruit is the tamarind of the shops.

BALANCE, or BALANCE, Libra, in Mechanics, one of the seven simple powers, or rather a species of that mechanical power called the lever, used principally for determining the equality or difference of weights in heavy bodies, and consequently their masses or quantities of matter.

The balance is of two kinds, viz. the ancient and modern. The ancient or Roman, called also flatra Romana, or lead-yard, consists of a lever or beam, movable on a centre, and suspended near one of its extremes; on one side the centre are applied the bodies to be weighed, and their weight is estimated by the division marked on the beam, on the other side, where a weight moveable along it keeps the balance in equilibrio. See Steel-Yard.

The modern balance, now ordinarily in use, consists of a lever, or beam, suspended exactly by the middle; to the extremes whereof are hung scales or balances.

In each case, the beam is called the jugum, and the two weights thereof on each side the axis, the brachia, or arms; and the handle whereby it is held, trunca; the line on which the beam turns, or which divides its brachia, is called the axis; and when considered with regard to the length of the brachia, is esteemed but a point, and called the centre of the balance; and the places where the weights are applied, the points of suspension, or application.—That slender part perpendicular to the jugum, by which either the equilibrium, or preponderancy of bodies is indicated, is called the tongue of the balance.

In the Roman balance, therefore, the weight used for a counterbalance is the same, but the points of application are various; in the common balance, the counterpoise is various, and the point of application the same.

The principle on which each is founded is the same, and may be conceived from what follows.

Balance, Doctrine of the.—The beam AB (Plate Mechanics, fig. 8.) the principal part of the balance, is a lever of the first kind, which, instead of resting on a fulcrum at C, its centre of motion, is suspended by somewhat fastened to the centre C: so that the mechanism of the balance depends on the same theorem as that of the lever.

Hence, as the known weight is to the unknown, so is the distance of the unknown weight from the centre of motion to the distance of the known weight, where the two weights will counterpoise each other; consequently, the known weights shew the quantity of the unknown.

Or thus: the action of a weight to move a balance is by so much greater, as the point prefixed by the weight is more distant from the centre of the balance; and that action follows the proportion of the distance of the said point from that centre. When the balance moves about its centre, the point B describes the arch BE (fig. 9); whilst the point A describes the arch AE, which is the largest of the two; therefore in the motion of the balance, the action of the same weight is different, according to the point to which it is applied; hence it follows, that the proportion of the space gone through by the point at A is as A to B, and at B as B, but those arches are to one another as CA, CB.

Balance, Varieties in the Application of the.—If the brachia of a balance be divided into equal parts, one ounce applied to the ninth division from the centre, will equiponderate with three ounces at the third; and two ounces at the sixth division as strongly as three at the fourth, &c.

Hence it follows, that the action of a power to move a balance is in a ratio compounded of the power itself, and its distance from the centre; for that distance is as the space gone through in the motion of the balance.

It may be here observed, that the weight equally prefixed the point of suspension at whatever height it hangs from it, and in the same manner as if it was fixed at the very point for the weight at all heights equally stretches the cord by which it hangs.

A balance is said to be in equilibrio, when the actions of the weights upon the brachia to move the balance are equal, so as mutually to destroy each other. When a balance is in equilibrio, the weights on each side are said to equiponderate: unequal weights may also equiponderate; but then the distances from the centre must be reciprocally as the weights. In which case, if each weight be multiplied by its distance, the products will be equal; which is the foundation of the lead-yard, which fee.

Thus in a balance whose brachia are very unequal, a scale hanging at the shortest, and the longest divided into equal parts: if such a weight be applied to it, as at the
the first division shall equiponderate with one ounce in the scale; and the body to be weighed be put in the scale, and the above mentioned weight be moved along the long-ell brachium, till the equilibrium be found; the number of divisions between the body and the centre files the number of ounces that the body weighs, and the subdivisions the parts of an ounce. On the same principle is founded the deceitful balance, which cheats by the inequality of the brachium; for instance, take two scales of unequal weights, in the proportion of 9 to 10, and one of them at the tenth division of the balance above described, and another at the ninth division, so that there may be an equilibrium; if then you take any weights, which are to one another as 9 to 10, and put the first in the first scale, and the second in the other scale, they will equiponderate.

But it is easy to discover the deceit of a false balance by changing the weights that are in equilibrio to the contrary scales; and thus the owner of the balance must either confess the fraud, or add to the commodity sold by means of such a balance, not only the quantity by which it was deficient, but also as much as he intended to gain by the fraud, and a fraction of that added weight proportional to the inequality of the arms of the balance. In this case, the buyer, instead of 9½, offered to him for 10½, his due, will have by changing the scales, 1½ pounds. For 9 : 10 :: 9½ : 11½.

Several weights, hanging at several distances on one side, may equiponderate with a single weight on the other side: to do this it is required, that the product of that weight, by its distance from the centre, be equal to the sum of the products of all the other weights, each being multiplied by its distance from the centre.

To demonstrate which, hang three weights of an ounce each, at the second, third, and fifth divisions from the centre, and they will equiponderate with the weight of one single ounce applied to the tenth division of the other brachium; and the weight of one ounce at the sixth division, and another of three ounces at the fourth division will equiponderate with a weight of two ounces on the other side at the ninth division.

Several weights unequal in number on either side, may equiponderate: in this case if each of them be multiplied by its distance from the centre, the sums of the products on either side will be equal; and if those sums be equal, there will be an equilibrio.

To prove which, hang on a weight of two ounces at the fifth division, and two others, each of one ounce, at the second and seventh; and on the other side hang two weights, each also of one ounce, at the ninth and tenth divisions; and these two will equiponderate with those three. A balance of this kind, the arms of which are equally divided, has been sometimes called an arithmetical balance; because the arithmetical operations of addition, subtraction, multiplication, and the rule of three, may be easily performed by it.

E. g. To add the numbers 2, 3, and 7; apply an ounce weight at the second division, and another on the same arm at the third, and another at the seventh, then take an ounce weight, and move it along the other arm, till the beam is in equilibrio, which will be at the twelfth division; so that

\[2 + 3 + 7 = 12.\]

To subtrah 5 from 12; hang an ounce weight at one end of the arm at 12 inches, and another at the other end at 5; then move a third ounce weight along the arm till the equilibrium is restored, and it will be found at the seventh division, which gives 12 - 5 = 7.

To multiply 4 by 3; suspend a four ounce weight at the third division on one arm, and move an ounce weight on the other, till the beam be in equilibrio, and it will mark out 12 = 4 × 3.

To divide 12 by 4; suspend an ounce at the twelfth division, and move a four ounce weight on the other arm, till there is an equilibrium, and it will be found at the quotient 3 = \(\frac{1}{4}\) = \(\frac{1}{4}\).

To the justness of a balance it is required, that the points of suspension be exactly in the same line as the centre of the balance; that they be precisely equidistant from that centre on either side; that the brachia be as long as conveniently they may, in relation to their thicknesses, and the weight which they are intended to support; that there be as little friction as possible in the motion of the beam and scales; and lastly, that the centre of gravity of the beam be placed a little below the centre of motion.

We shall here subjoin further observations, which may serve to illustrate these properties of a good balance, and which deserve attention in the construction of this instrument: for purposes that require peculiar accuracy. The balance is properly a lever, whose axis of motion is formed with an edge like that of a knife, and the two ditches or scales at its extremities are hung upon edges of the same kind, which are first made sharp, and then rounded with a fine hone, or a piece of buff leather. On the regular form of this rounded part the excellence of the instrument very much depends. When the lever, or beam of the balance, is considered as a mere line, the two outer edges are called points of suspension, and the inner the fulcrum. The points of suspension are supposed to be at equal distances from the fulcrum, and to be pressed with equal weights when loaded.

1. If the fulcrum be placed in the centre of gravity of the beam, and the three edges be all in the same right line, the beam of the balance will have no tendency to one position more than another, but will rest in any position in which it may be placed, whether the scales be on or off, empty or loaded.

2. If the centre of gravity of the beam, when level, be immediately above the fulcrum, it will overstep by the smallest action; that is, the end which is lowest will descend; and it will do this with the greater velocity, in proportion as the center of gravity is higher, and the points of suspension are less loaded.

3. But if the center of gravity of the beam be immediately below the fulcrum, the beam will not rest in any position but when level; and, if disturbed from that position, and then left at liberty, it will vibrate, and at last come to rest in an horizontal position. Its vibrations will be quicker, and its horizontal tendency stronger, the lower the center of gravity, and the less the weight upon the points of suspension.

If the fulcrum be below the beam, joining the points of suspension, and these be loaded, the beam will overstep, unless prevented by the weight of the beam tending to produce an horizontal position, as in the third case. In this last case small weights will equilibrate, as in the last case; certain exact weight will rest in any position of the beam, as in the first case; and all greater weights will cause the beam to overstep, as in the second case.

Money scales are often made this way, and will overstep with any considerable load. 5. If the fulcrum be above the line joining the points of suspension, the beam will come to the horizontal position, unless prevented by its own weight, as in the second case. If the centre of gravity be nearly in the fulcrum, all the vibrations of the loaded beam will be made in times nearly equal, unless the weights be very small, when they will be flower. The vibrations of balances are quicker, and the horizontal tendency stronger, the higher the fulcrum. When the fulcrum, or centre of motion C, (see fig. 10.) is in the line right joining the centres of suspension, it is evident that the equilibrio of equal weights, e. g. P and W, will obtain in every position; for the perpendicular
diculars let fall from C upon the directions will be always equal to each other. But when C is above or below WP, an equilibrium of equal weights does not occur, unless WP coincide with the horizontal line AB. In this case, the perpendiculars let fall from C upon the directions of W and P, are equal to GB and GA, CG being perpendicular to AB; but when the balance is in any other position WP, the perpendicular CI is greater than CH, because g L, which is less than CI, is equal to gM, which is greater than CH. W will therefore descend and continue to vibrate till its motion be damped by friction. (See Letter.) If P and W be unequal, and C be in the right line WP, the heavier of them will descend till WP be perpendicular to the horizon, or, if the center of motion be in WP, till P is on the horizon.

It is evident from what has been said, that the nearer the centre of gravity of the beam is to the centre of motion, the nicer will be the balance, and the flower its vibrations: thus, if aCt (fig. 11.) be the beam, and C the center of motion, the difference between the effects of having the centre of gravity at K, or e, will be the same as if we compared the velocities of two pendulums, of the length CK and Ce, which are in a subduplicate ratio of their lengths. The tendency to an horizontal position is, therefore, increased by lowering the center of gravity, in which case it will also require a greater additional weight to cause it to turn or incline to any given angle, and it is consequently less sensible with a greater load. The fixing of the centre of motion in a balance is, therefore, of peculiar importance, for on this depends the ease with which it will be affected by a smaller weight; and the readiness with which it will return to its horizontal position: and it is evident, that the belt position is that in which the centre of motion is a little above the centre of gravity; and even in this it should be proportioned to the distance of the weights from the fulcrum, and the quantity of matter to be weighed, which, in different beams, can only be attained by the practice and experience of the maker.

It has already appeared, that if the arms of a balance be unequal, the weights in equipoile will be unequal in the same proportion. But it should be observed, that though the equality of the arms of a balance is the basis of the making of weights by bisection, a balance with unequal arms will weigh as accurately as another with equal arms, provided the standard weight itself be first counterpoised, then taken out of the scale, and the thing to be weighed be put into the scale, and adjusted against the counterpoise: or, when proportional quantities only are considered, the bodies under examination may be weighed against the weights, taking care always to put the weights in the same scale; for then, though the bodies may not be really equal to the weights, yet their proportions to one another will be the same as if they had been accurately equal to them. However, it is indispensible necessary that their relative lengths should continue invariable. For this purpose it is necessary either that the three edges be all truly parallel, or that the points of suspension and support should be always in the same part of the edge, which last requisite is most easily obtained.

If a beam be adjusted so as to have no tendency to any one position, as in case 1. above stated, and the scales be equally loaded; then, if a small weight be added in one of the scales, that balance will turn, and the points of suspension will move with an accelerated motion, similar to that of falling bodies, but as much flower in proportion, very nearly, as the added weight is less than the whole weight borne by the fulcrum. The stronger the tendency to an horizontal position in any balance, or the quicker its vibrations (see cases 3. and 5.), the greater additional weight will be required to cause it to turn or incline to any given angle. If a balance were to turn with the ten thousandth part of the weight, it would move at the quickest 10,000 times slower than a falling body; that is, if the weight containing the weight, instead of falling through sixteen feet in a second of time, would fall through nearly two hundredths of an inch, and it would require four seconds to move through one third part of an inch; consequently, all accurate weighing must be slow.

Long beams have been generally recommended, because the quantity of motion in a given body varies as its distance from the fulcrum; and, therefore, the greater the distance, the more distinctible will be the motion arising from any small difference between, e.g. P and W. Long beams are also less likely to have lost friction, but this has been disputed.

And it has been remarked, that the quicker angular motion, greater strength, and less weight of a short balance, are certain advantages.

The index that is placed perpendicularly to the beam of a balance, in order to ascertain its position, affects its equilibrium, except it be in an horizontal situation; the momentum of the index being measured by its weight multiplied into the distance of its centre of gravity, from a line perpendicular to the horizon. But the error that would arise from hence is corrected by continuing the index, or placing a weight on the opposite side of the beam. The seals of a balance should be suspended in such a manner, that in all positions the things of the scales may be parallel to one another; otherwise the weights, though equal, will not be in equilibrum.

Very delicate balances are not only useful in nice experiments, but they are much more expeditious than others in common weighing. If a pair of scales, with a certain load, be barely sensible to the fourth of a grain, it will require a considerable time to ascertain the weight to that degree of accuracy, because the turn must be observed several times, and it is very small. But if no greater accuracy were required, and scales were used which would turn with the hundredth of a grain, a tenth of a grain, more or less, would make no great a difference in the turn, that it would be seen immediately. A degree of sensibility may be given to a balance, that turns with a certain addition, but is not moved by any smaller weight, by producing a tremulous motion in its parts. Thus, if the edge of a blunt saw, a file, or other similar instrument, be drawn along any part of the case or support of a balance, it will produce a jarring, which will diminish the friction in the moving parts so much, that the turn will be evident with one third or one fourth of the addition that would else have been required. In this way a beam which would only turn by the addition of a tenth of a grain, will turn with the thirtieth or fortieth of a grain. In order to regulate the horizontal tendency in some beams, the fulcrum is placed below the points of suspension, and a sliding-weight is put upon the style or index, by means of which the centre of gravity may be raised or lowered.

Mr. Nicholson, of whose observations on the properties of the balance we have availed ourselves in the preceding part of this article, has recommended the following set of weights, as proper to accompany it, when it is applied to chemical and similar purposes: viz. 1,000 grams, 900 g., 500 g., 300 g., 200 g., 100 g., 90 g., 50 g., 25 g., 10 g., 5 g., 2 g., 1 g., 500 milligrams, 250 milligrams, 125 milligrams, and 62 1/2 milligrams.

Mr. Nicholson subjoins an account of some balances, which have been constructed
acted by different persons for nice experiments. The frst he mentions is that of Mulchenbrook, which turned with \( \frac{1}{4} \) of a grain, and which weighed to \( \frac{3}{4} \) part of the whole; ascertaining high weights truly to four places of figures. In the Philos. Trans. vol. lxxvi. p. 59, we have mention of two accurate balances of Mr. Bolton; one of which would weigh a pound, and turn with \( \frac{1}{4} \) of a grain, and give the \( \frac{3}{4} \) part of the weight; and the other \( \frac{1}{4} \) in ounces, and turned with \( \frac{1}{2} \) of a grain, or the \( \frac{3}{4} \) part of the weight. Mr. Rad's balance, mentioned in p. 511 of the same volume, turned with less than a penny-weight, and even with four grains, when loaded with fifty-five pounds, i.e. about \( \frac{2}{5} \) part of the weight, and which might be relied on to five places of figures. Mr. Whitehurst's balance (ibid. p. 576) weighs one penny weight, and is sensibly affected with \( \frac{2}{5} \) part of a grain, or \( \frac{3}{4} \) part of the whole. This balance, he says, will serve to determine all weights between 100 grains, and 4000 grains to four places of figures. Mr. Alembic's (mentioned ibid. vol. lxxvii. p. 205) is true to three grains with 1\( \frac{1}{2} \) an inch; and hence the weight is known to \( \frac{3}{4} \) part, or to four, or barely five places of figures. The balance of Dr. George Forder, made by Mr. Ramsden, mentioned in bxxvth volume of the Philos. Trans. when loaded with four or five ounces, showed a difference of \( \frac{3}{4} \) part of a grain, or \( \frac{3}{4} \) part of the weight. Mr. Magellan's balance would bear several pounds, and show \( \frac{1}{2} \) of a grain, with one pound an inch. This is the \( \frac{3}{4} \) part of the weight and answers to five figures. The Royal Society's balance, lately made by Mr. Ramsden, turns on feel'd edges upon planes of polished crystal, and affects a weight to the seventh millionth part, and may be used in general practice to determine weights to five places and better. To which we may add, that the balance used by count Rumford, in his experiments for ascertaining the weight ascribed to heat (Phil. Trans. for 1799. part ii.), served, as he informs us (p. 187.), to measure \( \frac{3}{4} \) part of the weight which he examined. Nicholson's System of Mechanics, &c. p. 154, &c. Defageliers's Exp. Philol. vol. I. p. 145, &c. Defageliers's balance is a balance of a new construction for the woolen manufacturers. Their thread is made into slats of the same length; and the fineness of it is denominated from the number of slats which go into a pound; the coarsest being about twelve to the pound, and the finest near fifty. This machine is designed for weighing the slats, in order to determine their respective fineness. It resembles the beam of a common pair of scales; at one end of it is fixed a weight, called a counterpoise, and at the other end a hook; in forging, the beam to be examined is put upon the hook, and pulls down more or less, according to its weight, till the counterpoise, by rising, balances it: then the index or cock of the beam, points out on a graduated arch the number of slats of that sort which goes to the pound.

A scale, instead of the hook, might be used for weighing money, if the arch were properly divided for that purpose. See a drawing of this machine and the explanation of the theory of it, in Phil. Trans. vol. lx. No. 25, p. 205.

The bent lever balance, is a balance (fig. 12.) which acts by a fixed weight \( G \), increasing in power as it ascends along the arc \( FG \) of a circle, and pointing by an index to the number or division of the arc which denotes the weight of any body put into the scale \( E \). With this instrument, one constant weight serves to weigh all others, by only varying the position of the arms of the balance, instead of varying the places or points of suspension in the arms themselves. The following property of the balance was first fug-
gled by Dr. Helsham (see his Course of Lectures in Natural Philosophy, published by Dr. Robinson, p. 91), communicated by him to Dr. Defageliers (see his Course of Experimental Philosophy, vol. 1. p. 152.), and published in the Philos. Trans. for 1729. The property is this, that if a man standing in one scale and counterpoised by a weight in the other, lays his hand to any part of the beam, and presses it upwards, he will destroy the equilibrium and cause the scale in which he stands to preponderate. Thus, if a man, whose weight is equal to \( W \), standing in one scale and in equilibrio with \( P \) placed in the other (fig. 37.), presses the beam upwards in \( D \) with a force equal to \( Q \), the diminution of \( W \)’s momentum is equal to \( Q \times F \); and because the reaction at the scale is equal to \( Q \), the increase of \( W \)’s momentum is equal to \( Q \times FA \), and consequently \( W \) will descend with a force equal to \( Q \times AD \). If the pressure be upwards in \( E \), \( W \) will descend with a force resulting from this pressure, equal to \( Q \times EF \), and from the reaction with a force equal to \( Q \times FA \); and, therefore, the whole force of descent is equal to \( Q \times EA \). Thus, also, if the pressure be downwards in \( D \), the increase of \( W \)’s momentum, or the increase of \( P \)’s momentum, is equal to \( Q \times FD \), and the diminution of its momentum \( = Q \times FA \); and, consequently, \( W \) will ascend with a force equal to \( W \times DA \). If the pressure be downwards in \( E \), the diminution of \( W \)’s momentum, or the increase of \( P \)’s momentum, is equal to \( Q \times EF \), and a part \( Q \) of \( W \)’s weight being transferred to \( E \), the diminution of its momentum, on that account, is equal to \( Q \times FA \), and consequently the whole diminution of \( W \)’s momentum, or force of \( P \)’s ascent, is equal to \( Q \times FA \).

Balance of the Air, is used to denote the weight of that fluid, whereby, according to its known property, it presses where it is least resisted, till it be equally adjudged in all parts.

Balance, Affray, is a nice balance used in determining the exact weight of minute bodies. Its structure is very little different from that of the common fort; except that it is made of the best steel, and fitted for moving with the smallest weight.

The beam of this balance is suspended in a fork, the two legs of which are steel springs joined at the top, but kept together below with a brass plain clasp, parallel to one another, and at the distance of 2 feet and a half. When this clasp is taken off, and the legs of the fork stretched out, the axis of the beam may be put into two holes at the ends of the legs, or removed from them. A sharp needle is fixed in the head of the fork, which stands perpendicular, when the fork is suspended, and is so long, as almost to touch the top of the tongue of the beam put into the fork when in equilibrio. This needle is thefelt or mark of the equilibrium; and for the convenience of observing it, the legs of the fork are broader in that place, and have an opening two or three lines wide. Two scales made of a thin plate of silver, \( \frac{3}{8} \) inch in diameter, suspended on three small silver springs, almost as long as the beam, and tied together at the top with a silver hook in the form of an S, are hung to the extremities of the beam; and to each of these scales belongs a small dish of silver or blue lead, somewhat less than one inch in diameter, and both of equal weight; the bodies to be weighed are put into these dishes, with a pair of pincers, or with a spoon, or small holed, when they are pounded; and then the dishes are put into the scales. The balance is suspended on a moveable bress or copper support, consisting of a pedestal, and a pillar set upon it about twenty inches high, at the top of which projects at right angles, an arm one inch in length: at the extremity of this arm is a small pulley three lines in diameter, another at the top of the pillar, and a third near the bottom of it; all which pulleys move with ease on their respective axes. At the distance of \( \frac{1}{2} \) inch below the upper
upper arm, another arm 1½ inch long, projects from the pillar
at right angles, with a hole through it two lines long, and a
quarter of a line broad, and placed perpendicularly below
the pelley of the upper arm, to receive a small plate 1½ inch
long, and of such breadth and thickness that it may freely
move up and down, and yet not play too freely in the hole.
At each extremity of the plate is a small hook. The whole
of this apparatus is enclosed in a small case (fig. 13.), fur-
nished with glasses, a, a, a, at the top and about it. The
manner of using the aifay-bal ance is to pass a silk fling
over the three pulleys of the support and arm; then the sup-
port is placed in the middle of the small case, and the other
end of the silk fling is passed below through a hole in the
middle of the lower part of the frame, containing the win-
dow in the fore part of the case, and fastened to a small
weight of a cubic form. The fork of the balance is sus-
pended on the inferior hook of the plate. By moving
backwards and forwards the weight fastened to the fling,
placed upon the top of the drawer projecting beyond the
fore part of the case, the balance within is either raised or
lowered. The bodies to be weighed, and the weights
themselves, being put into the difees, the difees are put
into the scales, through the side windows, which must be
opened for that purpose. When any thing is added or
taken away, by means either of the pinces, or of the small
shovel, or spoon, the balance is let down that the scales
may rest upon the bottom of the case; and before it is lift-
ed up again the windows must be shut, especially if the air
is not perfectly still. The flat pieces of glass, often placed
under the scales of an aifay-bal ance, seem, by their electro-
power, capable of attracting, and of thus causing the light-
er scale to preponderate where the whole matter weigh-
ed is fo very small. See Phil. Trans. No. 480. p. 245.
The electricity of a flat surface about three inches square
has been known to hold down a scale, when there was a
weight of about 200 grains in the other.

Balance, in Hydrography, is that part of a clock or watch,
which by its motion regulates and determines the beats.—
The circular part of it is called the rim, and its spindle the
verge; there belong to it also two pallets or nuts, which
play in the fans of the crown-wheel; in pocket watches,
that strong ftil, in which the lower pivot of the verge
plays, and in the middle of which one pivot of the crown-
wheel runs, is called the patience; the wrought piece which
covers the balance, and in which the upper pivot of the bal-
ance plays, is the cock; the small spring in the new pocket-
watches is called the Regulator.

It appears from the testimony of historical accounts, as
well as other evidences, that the balance was universally
adopted in the construction of the first clocks and watches;
nor was it till the year 1657, that Mr. Huygens united pen-
dulums with clock-work. (See Pendulum.) In watches of
early construction, the balance vibrated merely by the
impulses of the wheels, without any other control or regu-
lation; the motion communicated to the balance by one
impulse continued till it was destroyed, partly by fri-
cion, and partly by a succeeding impulse in the opposite di-
rection; and therefore the vibrations must, of course, have
been very unsteady and irregular. These imperfections were
in a great measure remedied by Dr. Hooke's ingenious inven-
tion of applying a spiral spring to the balance, the action
of which on the balance of a watch is similar to that of gra-
vity on a pendulum; each kind of force having the effect
of correcting the irregularities of impulse and reliance
which otherwise disturb the chronifm of the vibrations.
In clocks and watches, the real measure of time is the ba-
lance, and all the other work serves merely to continue the
motion of the balance, and to indicate the time as measured
by its vibrations. The regularity of a time-keeper will
therefore depend on that of the time in which the balance
vibrates; and the investigation of this time of vibration,
from the several data or conditions on which it depends, is
an important object in this part of mechanical science. See
Escapement, Clock, Time-keepers, and Watches.

That the balances of watches, when manufactured of
steel, are generally, are, might be in a small degree mag-
netic, and that this property might have some influence in
disturbing their vibrations, some have suspected, and others
have denied; but Mr. Varley has lately (see Philos. Magaz.
vol. I. p. 18.) pointed out a source of error which has been bi-
therto little, if at all, apprehended; and this is the polarity
of the balance, or tendency of a particular point to the north;
and of an opposite point to the south, so long as to be
sufficient materially to alter the rate of going of the machine,
when put in different positions. If this cause of error had
been known, the use of steel balances would have been laid
aside long ago, particularly where accurate performance is
indispensable, as in time-pieces for astronomers and nautical
purposes. Mr. Varley, having ascertained the fact, and
knowing the position of the poles, proceeded to examine
the effects produced by this cause upon the watch's rate
of going. Having put on the pendulum spring, and re-
placed the balance in the watch, he laid the watch with
the dial upwards, that is, with the plane of the balance
horizontally, and in such a position that the balance when
at its place of rest should have its marked side towards the
north; in this situation it gained 5' 35" in 24 hours. He
then changed its position, so that the marked side of the
balance when at rest should be towards the south, and in
24 hours it lost 6° 47'; producing, by its change of po-
position only, a difference of 12° 23' in its rate. This dif-
ference must be still further augmented or diminished as the
weaver might happen to carry in his waistcoat pocket,
a key, a knife, or any other article made of steel.
Substituting, in the room of the steel-balance, one made of
gold, he found that the watch's rate of going was as un-
iform as that of any watch on the like construction.

Balance, Hydrostatical, in Hydrostatics, is an instrument
for determining the specific gravities of bodies. See Hy-
drostatical, and Specific Gravity.

Balance of Forces, in Mechanics. See Compound
Motion.

Balance, in the Accounts of Merchants, is, when the
debtor and creditor fides of any distinct account are equal.
In such case the account is said to be balanced.

Balance of a merchant, or trader's books, is a branch
of the art of accountantship. In the method of keep-
ing the books of traders, according to that excellent
art of charge and discharge by double entry, such
books, if correctly kept, will always be fit for a general
balance. For such is the excellence of that method, that
the books of themselves must necessarily balance on the
whole, though not in every distinct account throughout the
ledger. See Book-keeping.

Balance, among Painters. See Equilibrium.

Balance of the Constitution, in Political Economy,
denotes the security which each part of the legislature pos-
sesses in the exercise of the powers assigned to it from
the encroachment of the other parts. The political equi-
librium signified by this phrase, consists in two contriv-
cances, viz. a balance of power and a balance of inter-
s. By the former is meant, that there is no power posses-
sed by one part of the legislature, the abuse or excess of which

Vol. III. 3R 15
is not checked by some antagonal power, resulting in another part. Thus the power of the two houses of parliament to frame laws is checked by the king's negative; on the other hand the arbitrary application of this negative is checked by the privilege that parliament possesses of refusing supplies of money to the exigencies of the king's administration. The constitutional maxim, "that the king can do no wrong," is balanced by another maxim not less constitutional, "that the illegal commands of the king do not justify those who afford, or concur, in carrying them into execution;" and by a second rule, subsidiary to this, "that the acts of the crown require not any legal force, until authenticated by the subscription of some of its great officers." The power of the crown to direct the military force of the kingdom is balanced by the annual necessity of resorting to parliament for the maintenance and government of that force. The power of the king to declare war is checked by the privilege of the house of commons to grant or withhold supplies by which the war must be carried on. The king's choice of ministers is controlled by the obligation he is under of appointing those men to offices in the state, who are found capable of managing the affairs of his government with the two houses of parliament. By the balance of interest, which accompanies and gives efficacy to the balance of power, is meant this, that the respective interests of the three states of the empire are so disposed and adjusted, that whichever of the three shall attempt any encroachment, the other two will unite in resisting it. If the king should endeavour to extend his authority by contracting the power and privileges of the commons, the house of lords would see their own dignity endangered by every advance which the crown made to independency, upon the resolutions of parliament. The admission of arbitrary power is no less formidable to the grandeur of the aristocracy than it is fatal to the liberty of the republic; that is, it would reduce the nobility from the hereditary share they possess in the national councils, in which their real greatness consists, to being a part of the empty pageantry of a despotic court. On the other hand, if the house of commons should intrench upon the distinct province, or usurp the established prerogative of the crown, the lords would receive an instant alarm from every new flinch of popular power. In every contest in which the king may be engaged with the representative body, in defence of his established share of authority, he will find a sure ally in the collective power of the nobility. If the nobles should attempt to revive the superiors exerced by their ancestors under the feudal constitution, the king and the people would alike remember how the one had been inflected, and the other enslaved by that barbarous tyranny. Paley's Principles of Philosophy, vol. ii. p. 208-213.

Balance of Power, in the Political System, originates from, and is maintained by, the alliances of different nations, as their circumstances and interest may require. See this subject flated and discussed more at large under the article Power.

Balance of Trade, denotes an equality between the value of commodities bought of foreigners, and the value of the native productions transported into other nations. The balance of trade with any foreign nation is said to be against or in favour of the country simply as it tends to carry money out, or to bring it in; that is, according as the price of the imports exceeds or falls short of the price of the exports: so invariably is the increase or diminution of the value of a country regarded as a test of the public advantage or detriment, which arises from any branch of its commerce. According to Dr. Smith (Wealth of Nations, vol. ii. p. 212.), there is no certain criterion by which we can determine on which side what is called the balance between any two countries lies, of which exports to the greatest value. The two criteria to which an appeal has been usually made on such occasions are, the custom-houses, and the course of exchange. The custom-books, says this writer, are now generally acknowledged to be a very uncertain criterion, on account of the inaccuracy of the valuation at which the greater part of goods is rated in them; and the course of exchange is, perhaps, almost equally precarious.

Balance of Annual Produce and Consumption, is that which, according to Dr. Smith (vol. ii. p. 250.), necessarily occasions the prosperity or decay of every nation, as it happens to be either favourable or unfavourable. If the exchangeable value of the annual produce exceeds that of the annual consumption, the capital of the society must annually increase in proportion to the excess. The society in this case lives within its revenue, and what is annually saved out of its revenue is naturally added to its capital, and employed so as to increase still further the annual produce. On the contrary, if the exchangeable value of the annual produce fall short of the annual consumption, the capital of the society must annually decay in proportion to this deficiency. The expence of the society in this case exceeds its revenue, and necessarily encroaches upon its capital. Its capital must, therefore, necessarily decay, and together with it, the exchangeable value of the annual produce of its industry. The balance of produce and consumption is entirely different from that which is called the balance of trade. It might take place in a nation which had no foreign trade, but which was entirely separated from all the world. It may take place in the whole globe of the earth, of which the wealth, population, and improvement may be either gradually increasing, or gradually decaying. This balance may be constantly in favour of a nation, though the balance of trade should be generally against it. A nation may import to a greater value than it exports for half a century, perhaps, together; the gold and silver which come into it during all this time may be immediately sent out of it; its circulating coin may gradually decay, different forts of paper money being sublimated in its place, and even the debts too which it contracts in the principal nations with which it deals may be gradually increasing; and yet its real wealth, the exchangeable value of the annual produce of its lands and labour, may, during the same period, have been increasing in a much greater proportion. See on this subject more largely, under the articles Commerce and Trade.

Balance-to, in Sea Language, signifies to contract a fall into a narrow compass, in a storm, by retrenching, or, folding up a part of it in one corner. To this purpose serves the balance-ref, which is a reef-band that crosses the fall diagonally. See Reef.

Balance of the Boom Main-fall, is performed after all its reefs are taken in, by rolling up a similar portion of the hindmost or aftmost lower corner called the edes, and fastening it strongly to the boom, securing it from being fretted by the cord that fastens it. See Boom.

Balance of the Mizen is thus performed; the mizen-yard is lowered a little, a small portion of the sail is rolled up at the peak, or upper corner, and fastened to the yard, about one-fifth inward from the outer end, or yard-arm, towards the main. See Mizen.

Balance-
BALANCE-Fish, in Ichthyology, an English name of the
Squalus Wulgaris of Petiver; and a variety of it with a long tubular
stalk is described by Da Costa, Pennant, and Donz. Brit. Shells.

BALANOIDES, in Conchology, a species of Lepas,
with a conic truncated smooth shell, and obtuse operculum.
Linn. Eu. Succ.—Donov. &c. This is Balanous, balanides
vulgaris of Petiver; and a variety of it with a long tubular
stalk is described by Da Costa, Pennant, and Donz. Brit. Shells.

BALANCES, or Poizers, in Entomology, a term
synonymous with the French word balanciers, and balaters of
Linnaeus; denoting those little filamentous bodies which
terminate in a round, truncated, or oval capitulum, or knob;
and of which one is placed on each side of all the ditterous,
or two-winged insects, immediately under a small scale or
arch, below the wing. In different genera these vary a little
in respect of situation, and are also of larger or smaller
size in proportion to the other parts of the insect in different
kinds.

The use of these organs is by no means obvious. Some
imagine that they best the little arch or scale, beneath
which they are situated, in the motion of flying, and thereby
occasion that humming or buzzing noise, which every one
must have observed the house-fly, flesh-fly, and other very
common two-winged insects to emit in flight. The insect
will, we well know, make a like noise by means of somewhat
similar organs under the lamellae, but whether the noise
which the ditterous insect makes is occasioned in this
manner or not, we shall not presume to say. Olivier thinks
it not, because it appears from certain experiments, that
when any of these insects are deprived of the balaters, and
are permitted to refume their flight, the same buzzing sound
is heard without the flightless variation. The more general
opinion is, that they are designed to facilitate the motion
of the creature in the air, by equipolling, or preferring the
two equilibrium, just as a flick, made heavy at each end, is
held by rope-dancers to preserve their balance, and hence
these organs have been called the balaters. This is most
probably the real use of the balaters, notwithstanding that
their diminutive size is some objection to such opinion, for
when these are accidentally injured, the motion of the creature
becomes very irregular, and it evidences itself unable to direct its course with the same facility as before;
either suffering great pain, or being deprived of the means
it previously possessed.

BALANCER, a machine used in the striking of coins,
medals, counters, and the like. See Coinage.

BALANAES, in Ancient Geography, a town seated
on the coast of Syria, between the towns of Gabala, and Anta-
radas; convenient for commerce, and furnished with
grain and fruits in abundance. Strabo, Phylus, and Ptolemay
place it in Syria, properly so called; to the north of the
river Eleuthrus, which separated Syria from Phcenicia.
Under the reign of Theodosius the younger, this town was
comprised in the province called Syria Scita; but afterwards
belonged to a new province which the emperor Julian
formed under the name of Theodoriae.

BALANITES, in Natural History, a name given by the
ancients to a tree, seeming to have been of the sepulch-
lucid gems. They describe two species of it; the one of
which was yellow, and the other green, but both having
vessels of a fine colour. Their descriptions are too short
for us to be able to ascertained these flowers, among those
known at this time; they meant.

Some think the balanites have been the lapis Judaeus,
on account of its acorn-like figure and size. Plin. Nat.
pomegranate, and will strike a black with solutions of iron. They have little or no smell, and readily yield their alrigenent virtue to watery or spirituous menstrua. An extract was formerly prepared from the balanitines, and it entered into some of the officinal powders. It is now almost, if not entirely, diffused.

BALAYAN, in Geography, a district or province in the island of Manila or Luzon, with a town of the same name. It lies near the city of Manila, and extends along the coast on the eait side of the island, inhabited by about 2500 tributary Indians, and abounds in cotton, rice, and palm trees.

BALASTRE, Claude, in Biography, an eminent organist at Paris, and a spirited composer, of the old school, for keyed-instruments. He was born at Dijon, 1729, and was a favourite disciple of Ramanz, and organist of Notre-Dame and St. Roch. He was a zealous cultivator of his art, and faggedelled to harpischord and piano-forte makers many improvements.

BALASTRO, in Geography, an episcopal town of Spain, in Arragon, seated on the Vero, near its confluence with the Cinca, with a diocese extending over 170 parishes, forty-seven miles N. W. of Barcelona, and forty E. N. E. of Saragossa. N. lat. 41° 50'. E. long. 0° 20'.

BALBEC, Balbec, or Balbesc, a famous city of Syria, in the pachalic of Saide, celebrated by the Greeks and Latins under the name of Helopolis, or the city of the sun; descried by the Arabians as the wonder of Syria, and denoting by its present Arabic name Balbesc, i.e. the sole of Badia, its connection with the worship of the sun, of which Badia, the chief idol deity of the country, was an appropriate denomination. It is pleasantly situated near the north-ea extremity of the valley of Bocat, or Bekaa, at the foot of mount Anti-Libanus, on the last rising ground where the mountain terminates in the plain: it is well watered by the Litane, rising from Anti-Libanus, and the Barbouni from the foot of Libanus, and abounds in gardens. It is of a square figure, extensive, as Maundrell conjectured (Journey from Aleppo to Jerusalem, p. 155), about two furlongs on each side; and its houses are of the meanest structure, being such as are usually seen in Turkish villages. Its distance from Damascus is about fifty miles to the north-west, and about thirty miles from the nearest sea-coast, which is the situation of the ancient Bybus. N. lat. 34°. E. long. 36° 45'.

As we arrive from the south (says Volney, Travels in Egypt and Syria, vol. ii. p. 232, &c.), we discover the city at the distance of only a league, and a half, behind a hedge of trees, over the verdant tops of which appears a white edging of domes and minarets. After an hour's journey we reach these trees, which are very fine walnuts; and soon after, crossing some ill-cultivated gardens, by winding paths arrive at the entrance of the city. We there perceive a ruined wall, flanked with square towers, which ascends the declivity to the right, and traces the precincts of the ancient city. This wall, which is only ten or twelve feet high, permits us to have a view of those void spaces, and heaps of ruins which are the invariable appenage of every Turkish city; but what principally attracts our attention, is a large edifice on the left, which, by its lofty walls, and rich columns, manifestly appears to be one of those temples which antiquity has left for our admiration. These ruins, which are some of the most beautiful and best preserved of any in Asia, merit a particular description.

To give a just idea of them, we must suppose ourselves defending from the interior of the town. After having crossed the rubbish and huts with which it is filled, we arrive at a vacant place, which appears to have been a square; there, in front towards the well, we perceive a grand ruin, which consists of two pavilions ornamented with pilasters, joined at their bottom angle by a wall 160 feet in length. This front commands the open country from a fort of terrace, on the edge of which we distinguish, with difficulty, the bases of twelve columns, which formerly extended from one pavilion to the other, and formed a portico. The principal gate is obstructed by heaps of stones; but that obelisk surmounted, we enter an empty space, which is an hexagonal court of 180 feet diameter. This court is adorned with broken columns, mutilated capitals, and the remains of pilasters, entablatures, and cornices; around is a row of ruined edifices, which display all the ornaments of the richest architecture. At the end of this court, opposite the well, is an outlet, which formerly was a gate through which we perceive a still more extensive range of ruins, whose magnificence strongly excites curiosity. To have a full prospect of these, we must ascend a slope, up which were the steps to this gate, and we then arrive at the entrance of a square court, much more spacious than the former. The eye is first attracted by the end of this court, where six enormous and majestic columns render the scene astonishingly grand and picturesque. Another object not less interesting, is a second range of columns to the left which appear to have been part of the peristyle of a temple; but before we pass thither, we cannot refuse particular attention to the edifices, which enclose this court on each side. They form a sort of gallery which contains various chambers, seven of which may be reckoned in each of the principal wings; viz. two in a semicircle, and five in an oblong square. The bottom of these apartments full retains pediments of niches and tabernacles, the supports of which are destroyed. On the side of the court they are open, and present only four and six columns, totally destroyed. It is not easy to conceive the use of these apartments; but this does not diminish our admiration at the beauty of their pilasters, and the richness of the frieze of the entablature. Neither is it possible to avoid remarking the singular effect which results from the mixture of the garlands, the large foliage of the capitals, and the sculpture of wild plants with which they are every where ornamented. In traversing the length of the court, we find in the middle a little square esplanade, where was a pavilion, of which nothing remains but the foundation. At length we arrive at the foot of the six columns; and then first conceive all the boldness of their elevation, and the richness of their workmanship. Their shafts are twenty-one feet eight inches in circumference, and fifty-eight high; so that the total height, including the entablature, is from forty-one to seventy-two feet. The height of this superstructure, thus solitary and unaccompanied, at first strikes us with astonishment; but on a more attentive examination, we discover a series of foundations, which mark an oblong square of 268 feet in length, and 146 wide; and which, it seems probable, was the peristyle of a grand temple, the primary purpose of this whole structure. It presented to the great court, that is to the east, a front of ten columns, with nineteen on each side, which, with the other six, make in all fifty-four. The ground on which it stood was an oblong square, on a level with this court, but narrower than it, so that there was only a terrace of twenty-seven feet wide round the colonnade. The esplanade which produces, fronts the open country, toward the west, by a flowing wall of about thirty feet. This descent, as you approach the city, becomes less steep, so that the foundation of the pavilion is on a level with
with the termination of the hill, whence it is evident that the whole ground of the courts has been artificially raised. Such was the former state of this edifice; but the southern side of the grand temple was afterwards blocked up to build a smaller one, the peristyle and wall of which are still remaining. This temple, situated some feet lower than the other, presents a side of thirteen columns, by eight in front (in all thirty-four), which are likewise of the Corinthian order; their shafts are fifteen feet eight inches in circumference, and forty-four in height. The building they surround is an oblong square, the front of which, facing the east, is out of the line of the left wing of the great court. To reach it you must cross trunks of columns, heaps of stone, and a ruinous wall by which it is now hid. After surmounting these obstacles, you arrive at the gate, where you may survey the incoherence which was once the habitation of a god; but instead of the awful scene of a prostrate people, and sacrifices offering by a multitude of priests, the styx, which is open from the falling in of the roof, only lets in light to shew a chaos of ruins, covered with dust and weeds. The walls, formerly enriched with all the ornaments of the Corinthian order, now present nothing but pediments of niches, and tabernacles of which almost all the supporters are fallen to the ground. Between these niches is a range of fluted pilasters, whose capitals support a broken entablature; but what remains of it, displays a rich frieze of foliage resting on the heads of fables, horses, bulls, &c. Over this entablature was the ancient roof, which was fifty-seven feet wide, and 110 in length. The walls which supported it are thirty-one feet high, and without a window. It is impossible to form any idea of the ornaments of this roof, except from the fragments lying on the ground; but it could not have been richer than the gallery of the peristyle; the principal remaining parts contain tablets in the form of lozenges, on which are represented Jupiter seated on his eagle; Leda carried by the swan; Diana with her bow and crescent, and several bulls which seem to be figures of emperors and empresses. It would lead us too far, to enter more minutely into the description of this astonishing edifice. The lovers of the arts will find it described with the greatest truth and accuracy in a work published at London in 1757, under the title of "Ruins of Balbec." This work, compiled by Mr. Robert Wood, the world owes to the attention and liberality of Mr. Dawkins, who, in 1751, visited Balbec and Palmyra. It is impossible to add any thing to the fidelity of their description.

Several changes, however, have taken place since their journey: for example, they found nine large columns standing; and, in 1784, there were but five. They reckoned nine and twenty at the relieving temple, but there now remain but twenty; the others have been overthrown by the earthquake of 1759. It has likewise choked the walls of the relieving temple, that the stone of the foftit of the gate has slid between the two adjoining ones, and defended eight inches; by which means the body of the bird, sculptured on that stone, is suspended, detached from its wings, and the two garlands, which hung from his neck and terminated in two genii. Nature alone has not effectually worked this devastation; the Turks have had their share in the destruction of the columns. Their motive is to procure the iron cramps, which serve to join the several blocks of which each column is composed. These cramps answer as well the end intended, that several of the columns are not even disjointed by their fall: one, among others, as Mr. Wood observes, has penetrated a stone of the temple wall without giving way. Nothing can surpass the workmanship of these columns; they are joined without any cement, yet there is not room for the blade of a knife between their interstices. After so many ages, they in general still retain their original whiteness. But what is still more astonishing is, the enormous stones which compose the floating wall. To the west, the second layer is formed of stones which are from twenty-eight to thirty-five feet long, by about nine in height. Over this layer, at the north-west angle, there are three stones, which alone occupy a space of 175 feet and one half; viz. the first, fifty-eight feet seven inches; the second, fifty-eight feet eleven; and the third, exactly fifty-eight feet; and each of these are twelve feet thick. These stones are of a white granite, with large flinty flakes, like gypse; there is a quarry of this kind of stone under the whole city, and in the adjacent mountain, which is open in several places; and, among others, on the right, as we approach the city. There is still lying there a stone, hewn on three sides, which is sixty-nine feet two inches long, twelve feet ten inches broad, and thirteen feet three in thickness. By what means could the ancients move these enormous masses? This is doubtless a problem in mechanics curious to resolve. The inhabitants of Balbec have a very commodious manner of explaining it, by supposing these edifices to have been constructed by Djenoua, or Genii, who obeyed the orders of king Solomon; adding, that the motive of such immense works was to conceal, in subterraneous caverns, with treasures, which fill remain there. To discover these, many have descended into these vaults which range under the whole edifice; but the intrepidity of their researches, added to the oppressions and extortions of the governors, who have made their supposéd discoveries a pretext, have at length disheartened them; but they imagine the Europeans will be more successful; nor would it be possible to persuade them, but what we are possed of the magic art of destroying Talismans. It is in vain to oppose reason to ignorance and prejudice: and it would be no less ridiculous to attempt to prove to them that Solomon never was acquainted with the Corinthian order, which was only in use under the Roman emperors. The tradition which ascribes the buildings at Balbec, and also at Palmyra, to Solomon, and on which the inhabitants of the country confidently rely, is founded on an opinion generally prevalent, of his wisdom and love of pleasure, with both which the magnificence, beauty, and disposition, of these buildings perfectly agree; and on the mention of "Tadmor in the wilderness, and the tower of Lebanon looking towards Damascus," which are said in the Old Testament to have been built by his direction. Some have supposed that these are the ruins of a temple of the sun, built by the Phœnicians, because it is certain that the sun was worshipped at this place when the Phœnicians were in their most flourishing state. Others have thought, that these buildings were erected by the Greeks, who succeeded the Phœnicians in the possession of this country, because they are of the Corinthian and Ionic order: but as they are not mentioned from the time of Alexander’s conquest to that of Pompey, there is great reason to suppose that they are of later date.

When we consider the extraordinary magnificence of the temple of Balbec, we cannot but be astonished at the silence of the Greek and Roman authors. Mr. Wood, who has carefully examined all the ancient writers, has found no mention of it, except in a fragment of John of Antioch, named Malala, who attributes the building of this edifice to Antoninus Pius. He says that this emperor "built a great temple to Jupiter at Heliopolis, near Libanus, in Phœnicia, which was one of the wonders of the world." This is the only historical authority that has yet been discovered.
covered relating to this subject. As these buildings seem to have been erected between the time of Pompey and Caracalla, it is very probable that they were the work of Antoninus Pius. The inscriptions which remain corroborate this opinion, which perfectly accounts for the constant use of the Corinthian order, since that order was not in general use before the third age of Rome; but we ought by no means to allege as an additional proof, the bird sculptured over the gate, for if his crooked beak, large claws, and the end of his head, give him the appearance of an eagle, the tuft of feathers on his head, like that of certain pigeons, proves that he is not the Roman eagle: besides that the same bird is found in the temple of Palmyra, and is therefore evidently an oriental eagle, consecrated to the sun, who was the divinity adored in both these temples. His worship existed at Balbec, in the most remote antiquity. His statue, which resembled that of Oiris, had been brought thither from the Heliepolis of Egypt, and the ceremonies with which he was worshipped there have been described by Macrobius, in his curious work, intitled, “Saturnalia.” Mr. Wood supposes, with reason, that the name of Balbec, which in Syriac signifies City of Baal, or of the Sun, originated in this worship. The Greeks, by naming it Heliepolis, have, in this instance, only given a literal translation of the oriental word, a practice to which they have not always adhered. We are ignorant of the fate of this city in remote antiquity; but it is to be presumed that its situation, on the road from Tyre to Palmyra, gave it some part of the commerce of those opulent capitals. Under the Romans, Heliepolis was constituted a colony by Julius Cæsar, and in the time of Augustus, it is mentioned as a garrison town, for it received part of the veterans of the fifth and eighth legions; and there is still remaining, on the wall of the southern gate on the right, as we enter, an inscription which proves the truth of this, the words Kentiria Prima, in Greek characters, being very legible. One hundred and forty years after, Antoninus built there the present temple, instead of the ancient one, which was doubtless falling into ruins; but Christianity having gained the ascendency under Constantine, the modern temple was neglected, and afterwards converted into a church, a wall of which is now remaining, that hid the sanctuary of the idols. It continued thus until the invasion of the Arabs, when it is probable they enveiled the Christians so beautiful a building. The church being less frequented, fell to decay; walls succeeded, and it was converted into a place of defence, battlements were built on the wall which surrounded it, on the pavilions, and at the angles, which still subsist; and from that time, the temple, exposed to the ravages of war, fell rapidly to ruin.

The fate of the city is not less deplorable: the wretched government of the Emirs of the house of Haroufe had already greatly impaired it: and the earthquake of 1759 completed its destruction. The wars of the Emir Yousuf, and Djezzar, have rendered it still more deserted and ruined: of 5000 inhabitants, at which number they were estimated in 1751, not 1200 are now remaining, and all these poor, without industry or commerce, and cultivating nothing but a little cotton, fome maize, and water-melons.

BALBI, John, in Biography, a learned Dominican monk of the thirteenth century, was born at Genoa, and hence called “Balbi Januensis;” and distinguished as the author of a grammatical work, intitled “Catholicus,” published in 1386, and entitled to attention principally from its having been one of the first printed books. It was printed in folio at Mentz, in 1468; and this edition is become very scarce.

BALBIAN, Justus, of Alofi, in Flanders, studied at Padua, where he was admitted doctor in medicine, which he practiced with considerable reputation, towards the latter end of the sixteenth century, at Gouda. He openly professed the Calvinistic religion, in which faith he died in 1616, and was buried in the principal church of that city, with the following inscription on his tomb:

Singulos dies, singulas vitas putas.

Obit anno 1616.

BALBINUS, Decimus Cælius, a Roman emperor, was a descendant of a noble family, founded by Cornelius Balbus Theophranès, originally of Cadiz in Spain, who was the friend and histrionographer of Pompey, and admitted into the freedom of the city under his patronage. Balbinus was distinguished both as a poet and an orator; and as a magistrate he had governed several provinces with reputation. His fortune was affluent; and his manners liberal and affable. After the defeat and death of the two Gordians, on the 3d of July, A. D. 237, Balbinus was elected emperor by the senate in conjunction with Maximus. Their election was soon succeeded by a tumult at Rome, occasioned by a licentious multitude; who neither loved the rigid Maximus, nor sufficiently feared the mild and humane Balbinus; and who surrounding the temple of Jupiter, demanded, that, besides the two emperors chosen by the senate, a third should be added of the family of the Gordians, as a just return of gratitude to those princes who had sacrificed their lives for the republic. Accordingly, Maximus and Balbinus being driven back into the capital, a boy, thirteen years of age, the grandson of the elder, and nephew of the younger Gordian, was presented to them, and invested with the title and ornaments of Caesar. The tumult was appealed by this easy condescension; and the two emperors, as soon as they had been peaceably acknowledged in Rome, prepared to defend Italy against the common enemy. Maximus marched against Maximin, who was then laying siege to Aquileia; but this tyrant having been abandoned by his guards, and affrighted in his tent, Maximin returned in triumph to Rome, and was received with cordial congratulations, not only by his colleague and young Gordian, but by the senate and the people, who persuaded themselves that a golden age would succeed an age of iron. The conduct of the two emperors corresponded with these expectations. The rigour of the one was tempered by the clemency of the other: the oppressive taxes imposed by Maximin were repealed or moderated, discipline was revived, and many salutary laws were enacted.

"What reward," said Maximus, "may we expect for delivering Rome from a monster?" To which question Balbinus replied, "the love of the senate, of the people, and of all mankind." "Alas!" rejoined his more penetrating colleague, "Alas! I dread the hatred of the soldiery, and the fatal effects of their resentment." His apprehensions were justified by the event. At length jealousies broke out between the two emperors, and they were thus prevented from uniting in any vigorous measures of defence against their common enemies of the Perizonian camp. These fierce troops, proceeding to an open revolt, seized on both the emperors, stripped them of their garments, dragged them
them ignominiously through the streets of Rome, and terminated the tragedy by inhumanly mutilating them. Thus they both fell after a reign of little more than a year, July 1517, A. D. 238. Crevier's Hist. Emp. vol. viii. p. 382, &c. Gibbon's Hist. vol. i. p. 290—305.

BALBOA, Vasco Nunez De, a famous Spanish adventurer, was a native of Cadiz, and one of those who formed a settlement in Florida. In 1514, he commanded a feele colony, established at Santa Maria de Antiqua, or the ancient, so called because it was the first settlement on the southern continent of America. Anxious for being invested with a legal title to the supreme command, he dispatched one of his officers to Spain, in order to solicit a royal commission; and with a view of more effectually recommending himself to the patronage which he was endeavouring to obtain, he made frequent inroads into the adjacent country, subdued several of the caciques, and collected a considerable quantity of gold, which abounded more in that part of the continent than in the islands. In one of his expeditions he met with a young cacique, who expressed his astonishment at the high value which was set upon the gold, which the Spaniards were weighing and distributing:

"Why do you quarrel," said he, "about such a trifle? If you are so passionately fond of gold, as to abandon your own country, and to disturb the tranquillity of distant nations for its sake, I will conduct you to a region where the metal, which forms the chief object of your admiration and desire, is so common that the meanest utensils are formed of it." Transported with the intelligence, Balboa eagerly inquired where this happy country lay, and how they might arrive at it. The cacique informed them, that at the distance of six furlongs, or six days journey to the south, they would discover another ocean, near which this wealthy kingdom was situated; but if they intended to attack it, they must assemble forces far superior in number and strength to those which now attended them. This was the first information which the Spaniards received concerning the great southern continent known afterwards by the name of Peru. Balboa diligently prepared for the enterprise; and possessing talents for conducting hazardous and almost desperate an undertaking as that of marching across the isthmus of Darien, he arranged his troops, amounting upon a muster to only 150 men, who were hardy veterans, that had been injured to the climate of America, and who were ready to follow him through every danger. A thousand Indians attended them to carry their provisions; and to complete their warlike array, they took with them several of those fierce dogs which were no less formidable than destructive to their naked enemies. On the 11th of September, A. D. 1513, he set out on this expedition; and having continued their progress for 25 days through woods and mountains, and amidst contending enemies, he at length reached the top of a mountain from which he was able to discover the ocean, which was the object of their wishes. On viewing this glorious spectacle, which no European eye had ever before beheld, he fell on his knees, and returned thanks to heaven with uplifted hands for conducting him to a discovery so beneficial to his country, and so honourable to himself. His followers united with him in expressions of wonder, exultation, and gratitude. Pursuing their course, they at length arrived at the shore of the ocean; when Balboa, advancing into the waves with his sword and buckler, took possession of it in the name of the king his master, and vowed to defend it with these arms against all his enemies. The part of the great Pacific, or Southern ocean, which Balboa first discovered, still retains the name of the gulf of St. Michael, which he gave to it, and is situated to the east of Panama.

Here he obtained a supply of provisions; and partly by force and partly by free gift, he enriched himself with a considerable quantity of gold and office. He also received information, that there was a mighty and opulent kingdom situated far towards the south-west, where the inhabitants had tame animals, meaning the Llamas afterwards found in Peru, to carry their burdens. His followers were exhausted by fatigue and disease; and he therefore determined to lead them back, instead of attempting to take possession of this country, to their settlement at Santa Maria in Darien; and after an absence of four months, he returned to it with greater glory and more treasure than the Spaniards had thereto acquired in any of their expeditions against the New World. Balboa hastened to transmit information of his important discovery to Spain, and to solicit a reinforcement of 1000 men for the conquest of the opulent country, of which he had received so favourable an account. Ferdinand, the king of Spain, determined to avail himself of the intelligence which Balboa had communicated; but regardless of his merit, he appointed Pedrarias Davila to supercede him in the government of Darien. He also provided him with a well equipped fleet and 1200 soldiers, who were joined by a great number of voluntary adventurers. Upon their arrival at Darien, they found Balboa, whose fame had reached Spain, and of whose opulence they had formed such high ideas, clad in a canvas jacket, with coarse hempen sandals, and enveloped in thatching his own tent with reeds. Balboa, however, received them with dignity; and treated Pedrarias with the deference due to his character. Pedrarias appointed a judicial inquiry to be made into Balboa's conduct, and imposed upon him a considerable fine. At length reflection on the part of one, and the envy of the other, produced dissensions which were very detrimental to the colony. Pedrarias lost many of his men by sickness, and this dilatoriness was further augmented by an extreme scarcity of provisions; and the new governor incensed the natives by rapacious proceedings, which decimated the whole country from the gulf of Darien to the lake of Nicaragua. Balboa sent violent remonstrances to Spain against the imprudent government of Pedrarias, which had ruined a happy and flourishing colony; and Pedrarias recriminated by accusing him of having deceived the king, by magnifying his own exploits, as well as by a false representation of the opulence and value of the country. Ferdinand, sensible of his own imprudence in having superceded Balboa, appointed him Adelantado or lieutenant-governor of the countries upon the South sea, with very extensive privileges and authority; and he enjoined Pedrarias to avail himself of Balboa's counsel in all his operations. After some time Pedrarias and Balboa were apparently reconciled; and by way of cementing the union between them, the former agreed to give his daughter in marriage to the latter. This happened in 1515. Jealousy still rankled in the breast of the governor; and when Balboa had with much labour finished four small brigantines, and provided 500 chieftains, in order to sail towards Peru, Pedrarias defied him to pollute the waters, and having solicited an interview, ordered him to be arrested, and then to be tried on an accusation of disloyalty to the king, and of an intention to revolt against the governor. He was found guilty, and sentence of death was pronounced; and though the judges who passed it, seconded by the whole colony, warmly interceded for his pardon, the governor continued inexorable; and the Spaniards beheld, with astonishment and sorrow, the public execution of a man whom they universally deemed more capable than any who had borne command in America, of forming and accomplishing great designs. Upon his premature death in 1517, at the age of
BAL.

43. the expedition, which he had planned, was relinquished. Balboa was distinguished among his countrymen by a variety of important and useful qualities, adapted to the situation he occupied, and the services in which he engaged. Besides bravery, which he possessed in an eminent degree, he was prudent in conduct, generous, affable, and possessed of those popular talents which, in the most delicate undertakings, inspire confidence and secure attachment. Robertson's Hist. Amer. vol. i. p. 276—301.

BALBRIGGEN, in Geography, a small port town of Ireland, in the county of Dublin. It has a safe harbour with a pier, within which ships of 200 tons burden may lay their broadsides, and unload on the quay. The base of the pier is 18 feet thick, and on the outside is a considerable rampart of large fragments of rock, funk to defend the pier against the waves. At this town there once was an extensive cotton manufactury; but it has lately declined so much, that the proprietors are now converting one of their principal cotton mills into a flour mill. Many of the inhabitants derive a subsistence from fishing, in which nine seamen are employed. On the shore near the town is a slate rock, which is a good quarry for blocks of sufficient size for making ton flutes. It is distant from Dublin 15½ Irish miles. N. lat. 53° 36'. W. long. 6° 13'.

BALSULU, in Ornithology, a species of Anas, or duck, having a black beak, and spot of the wing above obliquely green, beneath obliquely black. Forth. Fin. Arab.

BALBURA, in Ancient Geography, a town of Asea Minor, in Cabellia, a country of Caria, situated in the vicinity of Cybrys Major. When the praetor Murena extended the principality of Cybrys, Balbura was annexed to Ly西亚.

BALBUS, a mountain of Africa, between the town of Chupaca, the territory of Carthage, Numidian; and the sea. Hither Maffiull retired, after having been defeated by Syphax, king of Numidia.

BALSUSARDUS, in Ornithology. See BALD—BUZZARD.

BALCAH, Tengis, or Barkati, in Geography, a lake of Independent Tartary, in the country of the Kalnus, subject to China, is about 140 British miles in length by half that breadth; being the largest lake in Asia, next to the seas of Aral and Baikal.

BALCUTHA, a settlement in the eastern part of Kentucky, in America, on the west side of Big Sandy river.

BALS, a river of Germany, which runs into the Rhine at Cologne.

BALKHANSKOI, a town of Siberia, 140 miles south-west of Dordinqu.

BALKHUYSEN, a town of Germany, in the circle of Wettphalia, and duchy of Juliers, nine miles west of Cologne.

BÁLCONY, from the French balcon, in Architecture, a kind of open gallery without the walls of buildings, reserved chiefly for the convenience of looking around, feasting processions, cavalcades, and the like.

Where there is but one, it is usually in the middle of the front of the edifice, and level with the first floor; sometimes they are made of wood, sometimes of cast iron; the former surrounded with a rail or balustrade, the latter wrought in various figures in demi-relief. Some are also made of bar iron, fashioned in crail-work, or florishes of divers fancies.

BÁLCONY, in a ship, denotes a gallery either covered or open, made abaft, either for ornament or convenience of the captain's cabin.

BÁLDA, in Ancient Geography, a town of Hispania Bética, in the country of the Turduli. Ptolemy.

BALDACHIN, or Baldacen, generally Baldekin, in Middle Age Writers, denotes a rich kind of cloth made of gold warp and silk woof, variously figured. It took the denomination from its being formerly brought into these countries from Baldacin, or Babylon.

BALD—BUZZARD, in Ornithology, the name under which Falco Halarius is described by Willughby and other English naturalists. It is also called falenaur by Buffon.

BALD—EAGLE, in Geography, or Warrior Mountains, lie about 200 miles W. of Philadelphia, in the county of Bedford, in Pennsylvania, and form the western boundary of Bald-eagle valley.

BALD—EAGLE is also a river which runs a north-east course forty-four miles, and falls into the western branch of the Susquehanna river. In 1779, it is a pleasant vale of lime-stone bottom, about five miles wide; and its vicinity abounds with lead-ore. The valley and after conveying them several miles underground, return them again upon the surface. The subterraneous passages have given occasion to the name of "Sinking-Spring Valley." Of these the most remarkable is called the "Arch Springs," which run close upon the road from the town to the fort; being a deep hollow formed in the lime-stone rock, about thirty feet wide, covered with a flinty arch, and giving passage to a fine stream of water. The subterraneous river enters the mouth of a spacious cave, whose exterior aperture is sufficient to admit a shallop with her tails full spread; and in the midst of this cave, from eighteen to twenty feet wide, are timber, bodies and branches of trees, &c. which are cemented up to the roof of the passage, shews that the water rises to the top during floods. The cave, extending about forty yards, widens into a large kind of room, at the bottom of which is a vortex, where the water forms a whirlpool, and absorbs pieces of floating timber, which are inlandly conveyed out of site. From the top of the Bald-eagle mountains there is a fine prospect of those of the Alleghany, stretching along till they seem to meet the clouds. Much slate is found here; and there are strong signs of pitch.
events of that fanatical expedition from its commencement to the year 1009, when Jerusalem was taken by Godfrey of Bouillon. This work may be found in “Gesta Dei per Francos a Borgaro,” folio, 1511. He also wrote “Poemis,” preferred in the fourth volume of Du Chesne’s collection of French historians. Nov. Dict. Hist.

BALDERN, in Geography, a town of Germany, in the circle of Swabia, and county of Ottingen, one mile S.S.E. of Zobingen.

BAldHead, a cape of the north-west coast of America, and on the west coast of Norton found. N. lat. 64° 43'. E. long. 198° 18'.

Bald-head is also the southernmost of two heads on the east coast of Newfoundland, between Ferronnes harbour on the S.S.W. and fort Agua on the N.N.E.

Baldhead lies also at the mouth of Cape Fear river in North Carolina, and being at the south-west end of Smith’s island, forms with Oak island the main entrance into the river.

Bald-head makes also the south-west part of what is called Wells bay, in the district of Maine.

BALDI, Bernardino, in Biography, a learned Italian, was born at Urbino, in 1553. Such was his ardour in the prosecution of knowledge, that he sacrificed both his meals and his sleep to the attainment of it. Having studied mathematics under Commandino in the place of his nativity, he pursued his studies in the university of Padua; where in his twentieth year, he was distinguished by his literary application and proficiency. Such was his acquaintance with the Greek language, that he translated the Phenomena of Aratus into Italian verse, and other Greek writers into Latin; and he possessed such a talent for acquiring the knowledge of languages, that he learned twelve of them, several of which were oriental. When he left Padua, he became mathematician to Ferrante Gonzaga II, duke of Guastalla; and in 1586, he was created abbot of Guastalla, which church he governed for many years with great reputation. At Rome, where he spent part of his time, he obtained the title of apostolical prothonotary. Towards the latter part of his life, he resigned the church of Guastalla, and retiring to Urbino, devoted himself entirely to his studies. He died in that city in 1617, at the age of 64 years. Baldi obtained as high a rank among the Italian poets as he possessed among the scholars and mathematicians. In pastoral poetry, his “Celeo,” or “Orto,” is thought to be excelled by few works in the language; and his blank verse is much esteemed. In mathematics and mechanics his labours were numerous. He translated into Italian the Greek work of Hero of Alexandria, “On Automata, or Self-moving Machines;” and into Latin, the same author’s treatise, “On warlike Machines.” He also wrote “Exercitationes on the Mechanics of Arithmet”; and published two Latin works relative to Vitruvius, the one containing an explanation of all the terms used by him, and the other inquiring into the meaning of his “Scamiuli impares.” A polished work, intitled, “Cronica de Matematiche,” being a compendium of a larger one on the lives of mathematicians, was printed in 1507. Many other monuments of his genius and industry, which obtained reputation in their time, are now consigned to oblivion. Nouv. Dict. Hist.

Baldi, de Ubaldis, a celebrated lawyer, was born at Perugia in 1319, and carefully educated by his father Francis Ubald, a learned physician. After having studied law at Perugia under Bartoli, he became a preceptor, and acquired high reputation in most of the universities of Italy. He was the rival of his master Bartoli, and contradicted many of his opinions. The duke, John Galeazzo, was his generous patron; and he was liberally rewarded by pope Urban VI. for pleading his cause against Clement. Having retained the full vigour of his faculties and his distinguished reputation as an oracle of jurisprudence till the year 1400, when he had attained the age of 76, he died at Pavia, in conformance of the bite of a dog, with which he was playing. His numerous treatises of law, published in three volumes folio, manifest deep knowledge and excellent talents; but they are written too much in the barbarous style of the age. His reputation was so great, that his family after his death affirmed the name of Baldechedi instead of that of Ubaldii. Nouv. Dict. Hist.

Baldinger, Ernestus Gottfried, a medical writer, of whom we have no memorial, but that, in 1764, he published at Berlin “Introductio in Notitiam Scriptorum Medicinæ Militaris,” 8vo. a valuable work, in which, besides the titles of the books, the author has given a critical account of their contents. Haller. Bib. Med. Præct.

Baldini, John Anthony, Count, was born at Piacenza, July 7, 1654, finished his studies at Bologna and at Rome, and then travelled into France and Poland. In 1698, he went to Spain, and continued there nine years as ambassador from the duke of Parma. On his return to Parma, he was again dispatched to German courts, and at last to England, whence he was sent to attend the congregats at Utrecht. His figure was handsome, and his manners engaging; and the greater part of his time was devoted to the study of natural philosophy, mathematics, and more especially civil and ecclesiastical history. In England, he was elected fellow of the Royal Society; and in Spain, he collected many rare gems, with a view of having them engraved; but in the progress of this work he was interrupted by his public occupations and travels. At Amsterdam, he enriched his cabinet of curiosities with many Indian and Chinese subjects; and he purchased, at a great expense, all the lexicons, atlases, and books of travels he could procure that related to the Eastern countries. The editor of the “Atlas Historique,” in 5 vol. published at Amsterdam in 1719, was much indebted to Baldini’s collection; and the discourse annexed to these maps was originally written in Italian by Baldini. On the 23d of February 1725, Baldini died, in consequence of a stroke of the apoplexy. Gen. Biog.

Baldinucci, Philip, was born at Florence in 1624; and distinguished himself by his knowledge of the arts of design, and his researches concerning the lives of their professors. His great undertaking was a general history of the most eminent painters from Cimabue to his own time, comprehended in five volumes, and divided into centuries. A new edition of this whole work was published at Florence in 1731, and it has been since reprinted at Florence and at Turin, with copious notes and additions, by Sig. Ignazio Piacenza. Baldinucci likewise published “A Vocabulary of Design,” in consequence of which he was admitted into the Academy della Crueta. His work, intitled, “The Commencement and Progress of the Art of Engraving on Copper,” Florence, 1686, 4to. abounds with curious information. He also published several smaller works,one of which drew upon him a furious and unjust attack from Cinioli. He died in 1698, at the age of 72 years. Nouv. Dict. Hist.

Baldinus, Bernardo, an Italian physician, who flourished about the middle of the sixteenth century, taught medicine at the university of Padua, and afterwards at Milan, where he died in the year 1602. In 1562, he published at Venice, “Problemata excerpta ex Commentariis Galeni in Hippocratem,” 8vo.

BALDIVIA, or Valdivia, in Geography, the name of a government in the kingdom of Chili, in South America. It was formerly subject to the viceroy of Lima, but is now annexed to the jurisdiction of the president of Chili. Baldivio, or Valdivia, is also the name of a port town, situated on the north-east side of a bay of the same name, in S. lat. 40° 5', W. long. 80° 5'. The town was built by the Spanish general Baldivio, about the year 1551; in 1559, the people of Chili chased the Spaniards from this settlement, burned the town, and put the inhabitants to the sword. Near this place are many gold mines, and therefore the Spaniards have fortified it, regarding it as the key to the South seas; and the fortifications are supported by the whites of Peru and Chili, who are banished hither for their crimes. In 1643, it was taken possession of by the Dutch; but they were compelled to abandon it, and to leave all their cannon, consisting of 30 or 40 pieces, their baggage, and their stores, on receiving intelligence that succours were transmitted from Peru. Valdivia receives from the treasury of Lima an annual supply of 70,000 dollars; 50,000 in specie, the value of 50,000 in clothes for the soldiers, and 10,000 in specie which is paid to the king's soldiers at Santiago, in order to purchase flour and other necessaries for the garrison at Valdivia. These remittances are conveyed in ships which fall from Valparaíso. The bay has a narrow entrance, and is spacious within; it is well secured from winds by point Galera and Bonacifio, which is remarkable for its high land just on the north of the bay. The rivers of Valdivia and Guyaquil are the largest on this coast; but neither of them can carry a ship of burden fix leagues within land.

BALDMONIE, an old English name for gentian, the root of which is used in medicine; some also have called the meun, or epignel, by this name.

BALD-MOUNTAIN, in Geography, a noted promontory in the Gulf of St. Lawrence, in North America, being a mark on the main, about 30 leagues from the nearest or north-west point of Anticosti island.

BALDNESS, CAVITIES, a falling of the hair, especially of the inciput. It differs from alopecia, areo, ophiasis, and tines, as these all arise from some vice in the nutritious humour; baldness, from the defect of it. But the distinction is not always observed by modern physicians.

When the eyelids shed their hair, it is called a pilosis. Among the causes of baldness, immediate venery is reputed one of the chief: old age usually brings it on of course. Some will have the proximate cause of baldness to be the dryness of the brain, and its shrinking from the cranium; it has been observed, that in bald persons there is always a vacuity or empty space between the skull and the brain.

Bullion says, that the crown of the head, and the space immediately above the temples, are the parts which first become bald; but that the hair below the temples, and on the inferior part of the back of the head, seldom falls off. He adds, baldness is peculiar to men: women, in the most advanced age, though their hair becomes white, are seldom affected with baldness. Children and women are not more subject to it than women. It is alleged by Aristotle, that no man becomes bald before having intercourse with women, except such as have been bald from their birth. The ancient writers upbraid the inhabitants of the islands of the Archipelago with the epithet "bald-heads," and assert, that these islands are all brought into the world with this defect. Buff. Nat. Hist. by Smellie, vol. ii. p. 442.

Calvus, "bald pate," was a frequent term of reproach among the Romans; among whom this defect was in great disrepute. Hence divers arts to conceal it, as false hair, and a galerischeus, contrived for purpose. The later Romans, however, seemed to have been reconciled to baldness; for we and among them a kind of officers or servants, called gladiatoris, or glabrarum, whose business was to take off the hair from all parts, even from the head. In an ancient inscription, there is mention of one Didophilus, t. c. praef. ornat. clar. that is, ornat glabrarum. See Alopebia.

BALDO, Mount, in Geography, a part of the Alps, in the Austrian territories, lying on the east of the lake Guida, and separating the country of Tyrol from that of Verona, about 30 miles in circumference.

BALDOCK, Ralph de, in Biography, an English divine of the fourteenth century, was educated at Oxford, appointed bishop of London in 1304, chosen in 1307 lord chancellor of England, and in 1313 died at Stepney. His history of the British affairs, intitled, "Historia Anglica," seen by Leland, is now lost. Bigg. Brit.

Ballock, in Geography, is a neat and pleasant market town of Hertfordshire, in England. It is seated between hills on that great Roman road which bore the name of Ickling-way, or Ickmield-street. This town has been considerably improved of late years by the erection of many respectable houses; and being on a great travelling road, it has a constant succession of new company. Here are a good market on Thursday, and five annual fairs; the former is plentifully supplied with barley; and a great quantity of malt is made in this town. Ballock dates its origin and the foundation of its church to an earl of Pembroke, who granted two hundred acres of waste land, in the reign of king Stephen, for that purpose. This was conferred on the knights Templars, who dedicated the church to the Virgin Mary, and named the town Balheic, from the name of their former place of residence in Syria. The knights hospitals of St. John, and those of Jerusalem, also erected buildings at the east end of the town, in the parish of Clothall. On the hills in the vicinity are four ancient enclaves. Here is an alms-house founded by William Wynn, in 1621, for twelve poor widows, who are also provided with a small legacy of forty shillings annually by the will of the same worthy founder. According to the returns published by authority of the house of commons, this town has 231 houses, and 1283 inhabitants; of whom 648 are males, and 635 are females.

BALDOVINI, Francisco, in Biography, an Italian poet, was born at Florence, in 1634. His first studies were devoted to the law, for which profession his father intended him; but after the death of his parents, he surrendered himself wholly to the enchantments of poetry and music. On visiting Rome, he obtained, through the interest of his uncle cardinal Flavio Chigi, the place of secretary to cardinal Jacopo Filippo, and at the age of 49, entered into holy orders. In 1676, he obtained the living of St. Leonardo d'Arminio; and in 1694, Cosimo III. grand duke of Tuscany, conferred on him the priorship of Orsatico, which he changed, in 1699, for that of Santa Felicita. In the discharge of his new functions, he gave equal satisfaction to the court, the religious orders, and his parishioners, by his exemplary piety, and his rigid attention to the duties of his station, to which the amiabilities of his manners, his knowledge of the world, and his proficiency in learning, rendered...
rendered him perfectly adequate. He lived in prosperity and health till his 82d year, and died in 1216. He excelled in that species of simple, rustic, and pleasant poetry, which is neither heroic nor burlesque, and which perhaps no poetry in our language resembles more than Gay's pastorals. His "Il Lamento de Cecco da Varlungo," or "Cecco's Complaint," is a playful poem, written in the provincial dialect of Tuscany, and published first at Florence in 1634, by Barto Connet; and afterwards, in 1755, with the author's life by Domenico Manni, and curious notes by Mariini. The poem was translated into English by John Hunter, eq. in 1820, London, 5vo. See the Translator's Preface.

Baldus, or as he wrote his name, Baldus, Sebastian, a native of Genoa, who flourished in the middle of the seventeenth century, was one of the earliest writers on the properties of the Peruvian bark, and the most luminous affectors of its value. It appears that he penned the latter part of his life at Rome, where he was patronized by the cardinal De Lugo, himself an admirer of that celebrated medicine, and who procured a supply of it to be imported from Spain into Italy, in 1619. Baldus learned from Bollari, a Genoese merchant, that the tree producing the bark, of which he gives a description, grows at Quito, a Spanish province in South America; and that its power in curing intermittents became first known to the Spaniards, from its being successfully administered to the courtiers of Chinchon, the wife of the governor. He is very diffuse in his account of the qualities of the bark, and of the most efficacious mode of administering it; and gives numerous examples of the cures performed by it, not only in intermittents, but in continued fevers likewise. His works, which are all controvertial, are: "Sanguis expiatus, fen de Sanguine incolértente," Genzio, 1643; "Cortex Peruvianus redivivus, contra Plempium," Genzio, 1656, 12mo. "Anathésis Corticis Peruv. fen Chima Defenio contra Ventilationes J. Jacobhi Chiflet, et gemitus V. F. Plempini," Genzio, 1653, 4to.; "Neceftitas Phicbotonie in Exantheinatibus," Genzio, 1653, 4to. Haller, Bib. Med. Præct. Elyo. Dict. Hist.

Baldus, Baldus, M.D., a native of Florence, flourished about the middle of the seventeenth century. After acquiring considerable reputation in his own country, he removed to Rome, where he was soon advanced to be physician to pope Innocent the tenth, and archbiter; but died a few months after being elevated to that post. He published, in 1631, "Pred lectio de Contagione peliferia," 4to.; and in 1637, "Difquisition ad textum fecundum Hippocrates, de Aere, Aquis, et Locis, accedit, de Calculorum Caufis; Acue Tiberis Bonitate; Quelto de majori nunc quam prexercito Scule, calculorum in urbe frequenter," 4to. Hall. Bib. Med. Præct. Elyo. Dict. Hist.

Baldus, in Entomology, a species of Papilio, with very conspicuous wings. The posterior ones above and beneath, an ocular spot, with a double pupil; on the posterior ones, four ocular spots above and six beneath. Fabricius. Inhabits India. Donov. Inf. Ind.

BALDWIN I. in Biography, emperor of Constantinople, was born in 1172, and succeeded his father as count of Flanders and Hainault. In the fourth crusade, which commenced A.D. 1198, he assailed the crofs at Bruges, together with his brother Henry, and the principal knights and citizens of the rich and industrious province of Flanders, and distinguished himself so much in the wars which preceded the capture of Constantinople, that after this event he was chosen emperor of the eft, A.D. 1204. But the Greeks soon revolted against this foreign empire; and formed an alliance with John, or Culo-John, the revolted chief of the Bulgarians and Walachians. Baldwin, in his attempt to recover Atriumple, from which the French and Venetians had been expelled, was drawn into an ambush; by the feigned flight of the enemy, and taken prisoner, A.D. 1229. He soon after died in prison; but the time and manner of his death are not known. Some say, that after a confinement of sixteen months, he was cruelly murdered by an amputation of his hands and feet, and by exposing his bleeding trunk to birds of prey. The Flemings for a long time believed that he was alive; and about twenty years after his death, found a hermit in a wood of the Netherlands, who was acknowledged as the true Baldwin, the emperor of Constantinople, and lawful sovereign of Flanders. But the French court detested the impolier, and he was punished with an ignominious death. Baldwin, who was esteemed for his private virtues, and for his military and princely qualities, was succeeded in the empire by his brother Henry; and in his county of Flanders by his daughter Joan or Jane, who has been accused, by some grave historians, of sacrificing to her ambition the life of an unfortunate father. Gibbon's Hist. vol. xi. p. 190—262.

Baldwin II. emperor of Constantinople, was the son of the emperor Peter of Courtenay; and in his eleventh year, succeeded his brother Robert, A.D. 1229. On account of his youth, John of Brienne, the vicegerent of Jerusalem, was appointed to be regent, and invested for his life with the title and prerogatives of emperor, on the sole condition that Baldwin should marry his second daughter, and succeed, at a mature age, to the throne of Constantinople. The royal youth was sent to visit the western courts, and to obtain some supplies of men and money, for the relief of the sinking empire. He thrice repeated these mendicant visits, in which he seemed to prolong his stay, and prolong his return. Of the twenty-five years of his reign, a greater number was spent abroad than at home; and in no place did the emperor deem himself free and secure than in his native country and his capital. In his first visit to England he was stopped at Dover, and checked by a severe remand for preying, without leave, to enter an independent kingdom. After some delay, he was permitted to proceed, and after a reception of cold civility, thankfully departed with a present of 700 marks. From the avance of Rome he could only obtain the proclamation of a crusade, and a treasurc of indulgences. By various humbling and ruinous expedients, he at length returned to Romania, with an army of 30,000 soldiers, and obtained some partial and temporary success. But his poverty and weakness admitted of no effectual relief; and by the sale of sacred relics, such as the crown of thorns which had been placed on the head of Christ, a portion of the true cross, the holy-linen of the tomb of God, the lance, the sponge, and the chains of his passion, the rod of Moses, and part of the skull of John the Baptist, he could only raise a treasure of very limited extent, and of short duration. His kingdom was soon reduced to the limits of Constantinople; and in 1261, this city was taken from him by Michael Palaeologus. Baldwin, with some of the principal families, embarked on board the Venetian galleys, and entered first for the isle of Eubea, and afterwards for Italy, where the royal fugitive was entertained by the pope and Sicilian king with a mixture of contempt and pity. Having consumed thirteen years in soliciting the Catholic powers to join in his restoration, without success, he died in 1273, and his son Philip became the heir of an ideal empire; and by Catherine, the daughter of Philip, it was transferred, in consequence of her marriage, to Charles of Valois, the brother of Philip the fair, king of France. Gibbon's Hist. vol. xi. 273—287.
Baldwin, archbishop of Canterbury, was born of obscure parents at Exeter, where he received the rudiments of a classical education, and taught school; and afterwards he took orders, and was preferred to the archdeaconry of his native place. But changing his course of advancement, he assumed the monastic habit in the Cistercian order, and took through the abbacy of his monastery to the episcopal see of Worchester, and from thence, in 1184, to the metropolitan see of Canterbury. From the monks he met with some obstruion in this last stage of his preferment; and therefore, in order to counteract their interest and power, he formed a plan for establishing a church and monastery at Hackington near Canterbury, for the reception of secular priests; but the monks, by their interest with the pope, disconcerted the design. Under the next pope the project was resumed, and Baldwin purchased a manor at Lambeth, where, upon the spot where the archbishop's palace now stands, he began to build his college, with the materials collected at Hackington; but he did not live to complete his design. In 1189, he performed the ceremony of consecration for Richard I. at Weilminister; and upon the translation of the bishop of Lincoln to the see of York, he took occasion to establish the preeminence of the archbishop of Canterbury, by forbidding any English bishop to receive consecration from any other hands than those of this metropolitan. Archbishop Baldwin took a part in the crusade for the recovery of the holy land, and when Richard I. conducted an army into Palestine, this prelate appeared in his train; and by his private contributions and pious exertions encouraged the enthusiastic adventurers to persevere. At the siege of Acre or Ptolemais, or, as some relate, at Tyre, the bishop was feized with a violent disorder, which terminated in his death, A.D. 1191, or A.D. 1193. During his illness, he directed his executor, the bishop of Salisbury, to distribute, at his discretion, all his effects among the sufferers. He was distinguished by his humanity and generosity; but the mildness of his temper betrayed him into refusals in his pastoral offices; so that a letter was addressed to him by pope Urban III. with this supercession; "Urban, bishop, servant of the servants of God, to Baldwin, a most zealous monk, a fervent abbot, a lukewarm bishop, and a negligent archbishop." Baldwin wrote several tracts, chiefly theological, which were collected and published by father Tuffier, and which may be found in the fifth volume of the "Bibliotheca Citerciensia." Cave, H. L. vol. ii. p. 250. Biog. Brit.

Baldwin's Phosphorus, in Medicine, a phosphorescent substance, formed by calcining the nitrate of lime in a low red heat. See Phosphorus, Baldwin's.

Bale, John, in Latin Balus, in Biography, an English divine and historian, was born at Cote, near Dunwich, in Suffolk, in the year 1495. From the monastery of Carlethe at Norwich, where he was entered at the age of twelve years, he was sent to Jesus college in Cambridge. Bale, probably illuminated by Lord Wentworth, and partly conceiving a dislike to celibacy, abandoned the church of Rome in which he was educated, and became a zealous protestant. The acrimonious and virulence with which his writings against popery were tinctured, expos'd him to a variety of severe persecutions; and after the death of lord Cromwell, whole protection he enjoyed in early life, he was under a necessity of seeking an asylum in the Netherlands. Upon the execution of Edward VI. he returned to England, and, distinguished by his zeal for the reformation, he was first presented to the living of Bishop's Stote in the county of Southampton, and afterwards obtained, by nomination from the crown, the bishoprick of Offory in Ireland; and in 1553, consecrated by the archbishop of Dublin. In this situation, by his attachment to the doctrines of the reformation, he was subject to constant terror, and his life was frequently in danger. On occasion of one tumult, five of his disciples were killed in his presence, and he escaped the sequelaneous protection of his alarms and troubles in Ireland, he has given a particular account in his "Vocacyon of John Bale to the Bishoprick of Offory in Ireland, his Perfections in the same, and final Deliverance;" printed in black letters, folio, 1553. In making his escape, after temporary concealment in Dublin, the trading vessel in which he was conveyed away was taken by a Dutch man of war, and he was stripped by the captain of all his money and effects. Being driven by tempests on the coast of Cornwall, the bishop was seized on suspicion of treason, in consequence of the accusation of a pilot, who wished to share his money; and a similar charge was brought against him at Dover, whether he was conveyed in the same ship. Being removed as a prisoner to Holland, he was under a necessity of purshing his liberty by a large ransom; and after his liberation he removed from Holland to Basel in Switzerland, and remained abroad till the end of queen Mary's reign. Upon the accession of Elizabeth, he returned to England; and fearful of encountering the difficulties and hazards of his Irish see, he retired to a prebendal stall in the church of Canterbury, to which he was preferred in 1560; and here he died in November 1563, in the sixty-eighth year of his age. Before his conversion from popery, Bale composed many spiritual interludes, founded upon incidents recorded in the New Testament; such as the life of St. John the Baptist, Christ in his twelfth year, baptism, and temptation, the resurrection of Lazarus, the council of the high-priests, Simon the leper, the Lord's supper, and his washing the feet of his disciples, Christ's burial and resurrection, the passion of Christ, &c. His comedy of the three laws of nature, Moses, and Christ, printed by Nicholas Bambridge in 1538, was so popular, that it was reprinted by Colwell in 1562. In his "Vocacyon to the Bishoprick of Offory," he informs us, that his comedy of "John the Baptist," and his tragedy of "God's promises to men," written in 1558, and first printed by Charlewood in 1577, 4to., were acted by the youths upon a Sunday, at the market-crosses of Kilkeny. But the fashion of acting mysteries seems to have expired with this writer. He says that he wrote a book of hymns, and another of jests and tales, and that he translated the tragedy of Panmachus, probably the fame that was acted at Christ's college in Cambridge in 1544, and afterwards laid before the privy council as a libel on the reformation. After he renounced popery, the productions of his pen, both in Latin and English, were very numerous. Most of his English writings in prose were pointed against popery; and two of his pamphlets against the papists, all of whom he considered as monks, are intitled the "Mafs of the Gluttons," and the "Accon of the Prelates." Next to exposing the impostures of popery, literary history was his favourite pursuit. His "Chronicle concerning Sir John Oldcastle," was reprinted in 1729. The only work of bishop Bale, which has given him distinction among authors, is his "Scriptorum Illustrium Majors Britanniae Catalogus," or, "An account of the lives of eminent writers of Great Britain," commencing from Nephet one of the sons of Noah, and brought down through a series of 3618 years, to the year of the Christian era 1557; the period at which the author was an exile in Germany. This work is compiled from various authors, and chiefly from the labours of the eminent antiquary, John Leland. The bitterness of his invectives against popery and papists gave great offence to Roman
Roman Catholic writers; and he has been charged with

disingenuity and credulity by several respectable critics;
among whom we may reckon Wharton and Nicolson.
Granger (Bióg. Hift. vol. i. p. 139, 8vo.) allows, that the
intemperate zeal of this prelate often carried him beyond
the bounds of decency and candour in his accounts of the
papists; nevertheless, his sufferings may furnish some apolo-
gy for his sincerity, and many things which he relates,
though before discreetly concealed or ingeniously glossed
over by Roman Catholic writers, might probably be true.
His biographical work, with considerable allowances for the
strong bias of party zeal, may be read with advantage.
Balaus de Steflfa, apud Script. Wharton, Pref. to Anglia
Sacra, and Hist. of Eng. Lit. by Parny and Poretsz, vol. iii. p. 79.

Bales, in Commerce, a term denoting a quantity of mer-
chandise wrapped or packed up in cloth, and cored round
very tight, after having been well secured with hay or
straw, to keep it from breaking, or to preserve it from the
weather. Most of the merchandise, capable of this kind
of package, that is sent to fairs, or intended for exportation,
ought to be in bales; and too much care cannot be taken in
packing them, to secure them from damage. To sell
goods in the bale is to sell them in the lump, on showing a
specimen, without unpacking or taking off the cording.
Thus it is the East India company sell their bale-goods.

Bale-goods, in the East India Trade, the bulky goods, as
salt-petre, pepper, red-earth, tea, &c. The bale goods
stand opposed to piece goods.

Bales of Camel, at Smyrna, are called tables, on account of
their flat square figure.

A bale of cotton yarn is from three to four hundred
weight; of raw silk, from one to four hundred; of
lockram or dowlas, either three, three and a half, or
four pieces, &c.

Bale of Paper, denotes a certain number of reams packed
together in a bundle.

There are bales of more and fewer reams. Those sent from
Marieilles to Constantinople usually contain twelve reams.
A bale or hollon of crown paper manufactured in some parts
of Provence, consists of fourteen reams, and is sold in the
Levant for Venice paper.

Bale of Dice, denotes a little packet or paper, containing
some dozens of dice for playing with.

Bale in Geography. See BALE.

Balaearica, or Balearic Islands, in Ancient Geography,
the name by which the two islands of Majorca and
Minorca, and some others in the Mediterranean sea,
were formerly distinguished. They derived their name from
that of the inhabitants, who were denominated Balarcs,
as some have supposed from Bauxa, to throw, because they
were excellent fencers. Bochart (Geog. Sacr. apud, Op. i.
col. 634.) deduces the appellation, as well as the people,
from a Punic or Phoenician origin; and he says, citing the
authorities of Polybius, Strabo, and Stephanus, that the
name is formed of the two words בַּלָּלָה בָּלָל יִנְדָּה BAL-bal, bal-yndah, denot-
ing a master of throwing; and thus he adds, the term בַּלָּל
Ban be hift. Gen. xlix. 23. signifies skilful archers.
The Greeks called these islands Gymnaios, either as Livy
or Diordorus fuggest, because in summer the inhabitants were
γυμνοί, naked, or, rather, as Hefychius observes, because
they went to battle armed only with a fling. M. Gebelin inti-
mates, that Bals signified among the orientals, the fun,
and hence it became a denomination for elevated objects; so that
the Balarae were persons who projected darts or dories from
flings to a very great height. Whatever be the precise ety-

mology of the name, the Balarae were famous for their
dexterity in the use of the fling; and in order to attain per-
fection, they accustomed themselves from their infancy to
this kind of exercise; insomuch that mothers did not let
breast into the hands of their children, but obliged them
by beating down from a considerable distance with their
flings. They also united force with this address, and the best
tempers were rarely proof against the flings they dis-
charged. When they went to battle they carried with them
three flings of unequal length, according to the different
distances to which they might have occasion to use them
against the enemy. They were originally Phoenicians or
Carthaginians, who poissessed the islands called by their name
from such remote antiquity, that their first arrival is prior to
every thing related of them by every historian now extant,
except their peopling the island Ebusus or Erus, now
Yvica, about 160 years, as Diodorus Sicilus (i.e. c. 1 & 2)
informs us, after the foundation of Carthage. This island,
according to Vitruvius, was reckoned to belong to the
Balarae islands. We learn from Justin (i. xiv.), that the first
expedition which the Carthaginians made to Spain, was in
order to abduct the city of Gades (now Cadiz); and as the
Carthaginian fleet, sailing from Carthage to Gades, might
easily take Ebusus and the other Balarae islands in its way,
there is great reason to believe, that Gades was relieved,
and Ebusus, with the other Balarae islands, placed under
much about the same time. The Balarae lived for a
long time in the simplicity of uncultivated nature. Caves
under the rocks, or holes dug in the earth, served them for
habitations. They were almost naked, except that during the
cold of winter they covered themselves with sheep-furs.
The soil of their country was fertile, and furnished them with
the necessaries of life; but being very eager for wine, such
of them as had served in the Carthaginian armies did not
fail at their return to lay out all the money they had acquired
in this article: indeed, they were not allowed to bring
money into their country, as the use of it was prohibited in
both islands. They said, as Diodorus Sicilus informs us,
that Geryon's riches had of old been fatal to him, in drawing
Hercules upon him as an enemy; and that, taught by
this example, they had from the most remote antiquity al-
ways dreaded introducing Among them a metal, capable of
exciting the avidity of other nations, and thus dangerous to
their tranquillity. They were in general a pacific people.
However, some individuals having leagued themselves with
the Carthaginians, pirates that infested the seas, Metellus,
who was consul of Rome, about the year of the city 630. B. C.
did, project an expedition for invading their country. In order
to secure his succes, he is said to have rendered their ships
useless, by placing skins on the sides of the decks, which
deadencl the blows. As soon as the Roman troops landed,
the inhabitants fled, and dispersed themselves over the coun-
try, so that it was more difficult to find than to defeat them.
Metellus, for securing his conquest, planted two colonies,
viz. Palm and Pollentia, the one at the exit, and the other at
the west extremity of Balarica maior. He obtained a tri-
umph A. U. C. 631. B. C. 123, and assigned the surname of
Balaricicus. Flor. i. c. 8. The largest of these islands was
called Balarica maior, now Majorca, and the least Balarica
minor, now Minorca. They were divided from one another,
according to Pliny, thirty miles; and in the latter of the
two islands, the most considerable towns were Mago and
Jaimo. These were at first caities or forts; but being erect-
ed near the mouths of two convenient harbours, they be-
came considerable sea-ports, especially that of Mago, now
known as Port Mahon. The Balarae formed a part of the
province Tarragonensis, and were denominated "Fortara-
tes," on account of their situation and harbours.

BALEARICA,
BALEARICA, in Geograph.This is a trival name given to the islands and some other ornithological writers to the crowned hison of Latham, and arca pereoni Gmelin.

BALECHOU, John Joseph, in Biog., a celebrated French engraver, flourished about the year 1750, and died not many years since at Avignon. He was perfect master of the graver, with which he entirely worked; and distinguished by the clearness of his strokes, and the depth of colour which he produced; but for want of drawing well, his prints fail in point of freedom, correctness, and harmony. His two large plates from Vernet, one representing a "Storm," the other a "Calm," are well known, and universally admired. Strutt.

BALEME, in Geography, is a port of North America, two leagues distant from Louisbourg, on the coast of the island of Cape Breton. The rocks, which are covered by a high sea, render it difficult of access.

BALEN, Hendrick Van, in Biog., a painter of history and portrait, was born at Antwerp, in 1560; and after having been a disciple of Adam Van Oort, he pursued his studies at Rome. By copying the antiques, and attending to the works of eminent modern artists, his improvement was such, that, in his return to his own country, he obtained the esteem of the ablest judges. He was distinguished by a good manner of designing, and his works are admitted into the cabinets of the curious, among those of the principal painters. He particularly excelled in the naked, and gave to his figures so much truth, roundness, and correctness of outline, that few of his contemporaries could enter into competition with him. Several of his fine portraits are at the Hague; and particularly one adorned with the figures of wisdom and justice, which is very highly commended. His designs of the deluge, of Moses striking the rock, and the drowning of Pharaoh, are grand and noble compositions. His "Judgment of Paris" is also accounted a masterly performance; in which the figure of Venus is so elegantly designed, so full of life, and so round, that it seems to stand forth from the surface. He died in 1632. Pilkington.

BALEN, Jacob Van, a painter of history, landscapes, and boys, was born at Antwerp, in 1611, and derived from his father Hendrick Van Balen his knowledge of the art, and his nice taste of drawing and design. He afterwards travelled to Rome, and other cities of Italy. His particular merit was exhibited in his figures of boys, cupids, and nymphs bathing or hunting; and he gained wealth and fame by his landscapes and histories. His pictures were well handled, his trees touched with spirit, and his herbage and verdure appeared natural and lively. The carications of his figures were clear and fresh, his colouring in general was transparent, and the airs of his heads were in the manner of Albano. Pilkington.

BALENBERG, in Geography, a town of Germany, in the circle of the Lower Rhine, and territory of Mentz, two miles north-west of Krauthain.

BALENGER, in Middle Age Writers, a kind of vefsel of war, but what in particular seems not well known. Blount says, that by the fift. 28 Hen. VI. cap. 5. balenger seems to have been a kind of barge.

BALES, Peter, in Biog., an extraordinary master of penmanship and fine writing, was born in 1547, and deserves to be recorded on account of the skill which he acquired in the exercise of his art. Anthony Wood mentions him as "a most dexterous person in his profession," and as having spent several years in sciences among the Oxonians, particularly as it seems in Gloucester hall; but that study which he used for a diversion only, proved at length an employment of profit." Holinshed, in his Chronicle, A.D. 1575, records his skill in micrography or miniature writing; and Mr. Evelyn (Numismata, fol. 1697, p. 262.) says of him, that in 1557 he wrote the lord's prayer, creed, decalogue, with two short Latin prayers, his own name, motto, day of the month, year of our Lord, and of the queen's reign, to whom he presented it at Hampton Court, all within the circle of a single penny, enclosed in a ring and border of gold, and covered with gold; so nicely wrote as to be plainly legible, to the admiration of her majesty, her privy-council, and several ambassadors, who then saw it." He professed also an extraordinary skill in imitating the writing of others; and he seems to have been employed in this and similar ways for the service of the state, with a view to the complete discovery and conviction of traitors, between the years 1586 and 1589. At this time he had reason to expect some place or preferment at court; but being disappointed in his expectations by the death of secretary Wallingham, he pursued the business of a writing-master in the Old Bailey; and in 1590, he published his "Writing Schoolmaster, in three Parts," containing the art of bractigraphy, or swift writing; the order of orthography, or true writing; and the key of calligraphy, or fair writing. In 1595, he was engaged in a trial of skill with another performer in the same way, for a golden pen of 20l. value, which he gained; and in another more general competition, he obtained the arms of calligraphy, which are "aurum, a pen, or." By various exercises of his pen, he recommended himself to several persons of knowledge and distinction; and Anthony Wood says, that he was engaged in the treasons of the earl of Essex, in 1600; but the real fact was, that Bales was innocently employed in serving the treacherous purposes of one of the earl's mercenary dependants. Towards the close of life, he seems to have been reduced to a deplorable and distressing condition, either by his own extravagance, or by imprudent confidence in others; and to have died about the year 1610. Biog. Brit.

BALESCOU de Tharary, or Vallesco of Tarenta, a Portuguese. It appears from his own testimony, that he began writing in the year 1418, after thirty-six years experience. His first publication "De Philionio," was printed at Venice, 1490; then at Lyons, in folio, in 1521; and his works, "De Morbis Curantibus," edited by Guido de Serderius, at Lyons, in 1560, in 4to. and afterwards at Frankfort 1590. A short treatise, "Tractatus Chirurgiae," is printed with the Philemonium. He proposes extinguishing scours by an application, in which arsenic is an ingredient. This drug, we know, formed the basis of a preparation of late introduced, for the same purpose, by Plunket. Our author, however, admonishes practitioners, that arsenic is not used without danger. He saw a person who died suddenly in the night, whose head had been anointed with an arseneal preparation, for the cure of aseptic carotitis. It appears from his works, that he was well acquainted with the doctrine of Galen, and of the Arabian writers. Haller. Bib. Chirurg.

BALESIUM, in Ancient Geography, a town of Italy, in Magna Graecia, in the country called Messapia. Phly and Mela.

BALEOS, an island of the Aegean Sea, between Thrace and the isle of Crete. Anton. Itin.

BALESSAN, in Botany. See Balsam.

BALESTRA, Antonio, in Biog., an historical painter, was born at Verona, in 1660: at the age of twenty-one, entered himself in the school of Antonio Bellucci, at Venice, and afterwards visited Bologna and Rome, at which latter place he became the disciple of Carlo Maratti. Having
ing made great proficiency in designing after the antiques, after Raphael, Correggio, Anibal Caracci, and other admired painters, he obtained the prize of merit in the academy of St. Luke, in the year 1694, when he was only twenty-eight years of age. From that time his reputation was established, and his paintings were admired in every part of Europe. His style is sweet and agreeable, not unlike that of Maratti; and men of judgment observed, with delight and approbation, a certain mixture in his works of the several manners of Raphael, Correggio and Caracci. At Venice there are two capital pictures of this master, one representing the nativity of our Saviour, in the church of Santa Maria Mater Domini; and another, a dead Christ, in the arms of the Virgin, in a chapel belonging to the church of St. Geminiarno. We have some etchings by him, in a bold, masterly style, but very slight. According to Pilkington, he died in 1720; but Strutt says, he died in 1740, at the age of 73.

BALESTRINA, in Geography, a town of Italy, in the state of Genoa, a fief of the empire, nine miles north of Albenga.

BALET DE LA ROYNE, in Music. This dance, more ancient than any mentioned in the long article on the subject, in the Encyc. Metls., where it has not been honoured with notice, merited a place, as a curiosities, if not for its superior plan and execution.

Henry III. of France having, in 1581, married his favourite minion, the duc de Joyeuse, to mademoiselle de Vaudemont, fitter to his queen Louise de Lorraine, almost ruined his kingdom in balls, masquerades, tilt, tournaments, and every species of expensive festivity which could be devised on the occasion.

The queen, likewise, in honour of her fitter's nuptials, gave an entertainment at the Louvre, in which a ballet was exhibited, called "Ceres and Nimphs," which was then a new kind of spectacle in France, avec une grande musique, composed by the celebrated Claude le Jeune. The Entrées de Ballets, in this fete, were invented by Baltazar de Beaujoyeux, the famous Piedmontese performer on the violin, who having published an account of his devises in a book which is now become extremely scarce, we shall prefent our readers with its title, and a sketch of its contents.

"Balét comique de la Royne, faite aux nappes de monfieur le duc de Joyeuse et mademoiselle de Vaudemont sa femme." Par Baltazar de Beaujoyeux, valet de chambre du Roy, et de la Royne sa femme." A Paris, 1581, 4to. The types and paper equal in beauty those of Elzevir in the next century; and the musical characters, though cut in wood, are much more clear and neat than any we ever saw of the kind. But as to the music itself, it is more barbarous, in point of melody, than any we have ever seen on paper. The counterpoint, indeed, is not incorrect; nor can the French be justly accused of ever being deficient in the mechanical rules of composition, since they were first established; but for fancy, air, and rhythm, there is not a passage in this whole performance, except in a few of the dances, by which we are reminded of their existence. But it seems as if dancing could not subsist without a marked measure; indeed, when poetry is sung without measure, it becomes worse than prose. In the operas of Lulli and Rameau, the music of the dances was always much more pleasing to foreigners than that which was sung, from its being necessarily more marked and accentuated: this is, in what was danced some determined measure and movement was always perceptible. But in the vocal part of de Beaujoyeux ballets, there is nothing that resembles an air, or that seems to imply a selection of notes, or to suggest a reason for one found being higher or lower, more quick or more slow, than another.

But it should be remembered, that the music of this old French ballet was not composed by Baltazarini, the Italian, who only acted as ballet master on the occasion, but by Melle. de Beaujol, and Salmon, of the king's band, whom his majesty had ordered to assist him in composing and preparing all that was needful in music for this festival; and M. Beaujol, says Baltazarini, "whom all professors regard as an excellent musician, has, on this occasion, even surpassed himself, assisted by Malheur Salmon, whom M. Beaujol and others highly esteem in his art."

We have dwelt the longer on this performance, as it is the only French theatrical music extant of the time. And in comparing it with that of Lulli, it appears that he did not disdain to comply with the national taste, which had been long established, with respect to measure and melody; he certainly added much to both, but conformed to the genre.

As it will be no kindness to curious readers to refer them to a book for examples of this music, we may venture to mention the Gen. Hist. of Muf. vol. viii. where copious extracts from it are infected.

BALEY, Walter, in Biography, born in the county of Dorset, in the year 1529, received his education at Winchester, and went thence to New college, Oxford. Applying himself to the study of medicine, in the year 1558 he was licensed to practise. About the same time he was made a prebendary in the cathedral church of Wells, which office he resigned the following year. He was then appointed Queen's professor of physic at Oxford. In the year 1553, he was created doctor in medicine (Wood's Fasti Oxon. vol. ii. p. 92), and soon after, physician to Queen Elizabeth. For the remainder of his life, which was extended to the age of 65 years, he enjoyed a considerable share of reputation and practice. Of this physician we have the following works, three of which were published in his lifetime. "A Discourse of three kinds of pepper in common use," 1588, 8vo. "A brief treatise on the preservation of the eye-light," in which he attributes great virtues to the herb eye-bright. This was re-published in 1616, and in 1622 was added to Banister's treatise of 113 diseases of the eyes and eyelids, but without the name of the author. "Directions for health, natural and artificial, with medicines for all diseases of the eyes," 1626, 4to. "A brief discourse of certain medicinal waters in the county of Warwick, near Newnham," 1587. In the library of Robert earl of Aylefbury was a MS. of this author, intitled "Explication Galeti de potu convalecentium, et femum, et precipue de pollice alce et birze paratis." Biograph. Mem. of Med. J. Aikin.

BALFRUSCH, in Geography, a town of Peria, the capital of the province of Mafanderan, situated at the southern extremity of the Caspian sea. Hither the Russians and Armenians convey their merchandise, though the traffic is much less considerable than it was, on account of the insurrections of the khan of Mafanderan. The chief productions are silk, rice, and cotton, of which articles there is a large exportation. Merchants from Kafdon, Isphahan, Shiras, and Kurasan resort to Balfrusch, and bring for the Persian and Indian commodities. N. lat. 33° 40'. E. long. 50° 30'.

BALGA, a town of Frisia, in the province of Natangen, 25 miles south-west of Keningberg.

BALGU, Jonas, in Biography, an English divine, was born at Sheffield in Yorkshire, in the year 1686. Having received instruction first from his father, who was master of a free grammar school in that place, and after his death from his successor Mr. Daunuz, author of an effedent commentary on the revelations, he was admitted in 1702, of St. John's
John's college, Cambridge. From the frivolous occupation of reading romances, in which he left two years of his academic education, a circumstance which he mentions with regret, he was diverted by reading Livy, and afterwards devoted himself with pleasure to serious studies. In 1711, he took orders, and diligently discharged the duties of his profession in the living of Lamely and Tansfield in Durham, composing for several years a new discourse for the pulpituvery week. Balguy was an early advocate for religious liberty in the Bangorian controversy; and in 1718, wrote a vindication of bishop Hoadly, entitled "An Examination of certain doctrines lately taught and defended by the Rev. Mr. Stebbing," and in the following year, "A Letter to the Rev. Dr. Sherlock," both under the fictitious name of Silvius. In 1720, he published a third tract, intitled "Silvius's defence of a dialogue between a Papist and a Protestant." In a controversy concerning the nature and foundation of virtue, occasioned about this time by lord Shaftesbury, who, in his "Characteristics" referred it to an instinctive sentiment; and by Hutcheson, who, in his "Inquiry into the Original of our Ideas of Beauty and Virtue," maintains the same notion; Mr. Balguy took a principal part. In 1726, he wrote, in reply to Shaftesbury, "A Letter to a Deil, concerning the beauty and excellence of moral virtue, and the support and improvement which it receives from the Christian revelation;" and in 1728, he published a tract, intitled, "The foundation of moral goodness, or a farther inquiry into the original of our idea of virtue;" which in the next year was followed by a second part, illustrating the principles and refonings of the former, and replying to certain remarks communicated by lord Darcey to the author. (See Virtue.) In 1730, he published a treatise, under the title of "Divine Rectitude; or a brief Inquiry concerning the moral perfections of the Deity, particularly in respect of Creation and Providence. (See Attributes.) This tractive was followed by "A Second Letter to a Deil," occasioned by Tindal's "Christianity as old as the Creation." and by another tract, intitled, "The Law of Truth, or the Obligations of Reason essential to all Religion." In 1741, Mr. Balguy published an "Essay on Redemption," explaining the doctrine of atonement in a manner similar to that afterwards adopted by Dr. Taylor of Norwich. (See Atonement.) Of this tractive, bishop Hoadly expressed his opinion, that the author had been more successful in refucing Christianity from some absurd doctrines, long considered as essential to it, than in refuting others in their stead. The only additional publication of Mr. Balguy was a volume of Sermons, to which has been since added a posthumous volume; the subjects of both are chiefly practical, and the discourses have been justly admired as models of the plain and simple style of preaching. Towards the close of his life, his health declined, and he found it necessary to withdraw from company, except such as he selected at Harrowgate, which he frequented every season, and where he died in 1748, in the sixty-third year of his age. The only church preferences which Mr. Balguy enjoyed were the vicarage of North-Allerton in Yorkshire, worth about 27l. a year, and a prebend in the church of Salisbury, to which he was collated by bishop Hoadly in 1728. Mr. Balguy may justly be reckoned among the divines and writers who rank with Clarke and Hoadly, and who associated with these illustrious characters in maintaining the cause of rational religion and Christian liberty. Candid and liberal in his own sentiments and dispositions, he cultivated friendship with worthy perfons of all denominations; and his writings very much contributed to promote liberal discussion and rational inquiry. Biog. Brit.

BALHARY, in Geography, a town of Hindostan, in the Mynore country, seventy miles north-east of Chittagong, and twenty miles north-east of Raideroo. N. lat. 15° 6'. E. long. 76° 54'.

BALI, or BALLY, one of the isles of Sunda, situate in the Java sea, on the east side of the strait of Balli, which separates it from Java; 25 leagues long, and 15 wide, fertile and populous. It seems only remarkable for furnishing slaves, cotton-yarn, and pickled-pork. S. lat. 8° 30'. L. long. 115° 10'.

BALI, or BALLY, Strait, lies on the west side of the island of this name, in the Indian ocean. Its north entrance is in S. lat. 7° 54', and the south entrance in S. lat. 8° 39'. E. long. 114° 25'. It is sometimes called the Balamban channel. Through this strait the European East India merchant ships occasionally pass in their return from China. It is sometimes called Java Strait.

BALI, a province which once belonged to Abyfinia, and the first taken by the Balli. It lies to the north-east of Narea, and to the west of the kingdom of Adel, which separates it from the sea, about N. lat. 10°, and E. long. 41°.

BALICASSE, balicafe of the Philippines, in Ornithology. Under this name, Buffon describes the corvus balicaius, Gmel. in his Nat. Hist. Birds; in the Planch. Enl. it is called chacuan des Philippines.

BALICASSIUS, a species of Corvus, of a greenish black colour, with a forked tail. Gmelin. Corvus splendide nigro-viridans. Brill. Av. The beaks, legs, and claws, are black.

BALAMESRI, in Geography, a town of European Turkey, in the province of Natalia, fifty-two miles north-east of Pegramo. N. lat. 30° 45'. E. long. 27° 50'.

BALINCALLACH, a cape on the west coast of Banbucala, one of the western islands of Scotland.

BALINE, Head and Cove, lie between cape Broyle and the bay of Balla, on the coast of Newfoundland. The cove is a small place behind a rock, called the Whale's back, and a slarge for fishing, with two or three boats.

BALIOL, or BALIOL, JOHN, in Biography, king of Scotland, was descended from an illustrious family, which possessed large estates in Scotland and France, as well as England. He is supposed to have been born about the year 1260, or at a somewhat earlier period; and was a competitor with Robert Bruce for the crown of Scotland; the right of succession to which belonged to the descendants of David earl of Huntingdon, third son of king David I. Bruce was the son of Isobel, the second daughter of earl David; and Baliol, the son of John Baliol, who founded Baliol college in Oxford, was the grandson of Margaret, the eldest daughter of earl David. According to the rules of succession which are now established, the right of Baliol was preferable; and notwithstanding Bruce's plea of being nearer in blood to earl David, Baliol's claim, as the representative of his brother and grandmother, would be deemed incontestible. But in that age, the order of succession was not acertained with the same precision; and though the prejudices of the people, and perhaps the laws of the kingdom, favoured Bruce, each of the rivals was supported by a powerful faction. In order to avoid the miseries of a civil war, to which it was feared recourse would be had for deciding a dispute which the laws could not settle, king Edward of England was chosen umpire, and both parties agreed to acquiesce in his decree. Under pretence of examining the question with the folomony, this prince summoned all the Scottish barons to Norham, May 10th, 1291; and having gained some, and intimidated others, he prevailed on all who were present, not excepting
excepting Bruce and Baliol, the competitors, to acknowledge Scotland as a fief of the English crown, and to swear fealty to them as their sovereign or liege lord. He also demanded possession of the kingdom, that he might be able to deliver it to him whose right should be preferable. This strange demand obtained assent, and Edward finding Baliol the most obsequious, and the least formidable of the two rivals, soon after gave judgment in his favour. Baliol once more professed himself the vassal of England, A.D. 1312, and submitted to every condition which the sovereign whom he had now acknowledged was pleased to prescribe. Edward having thus, as he conceived, established his dominion, began too soon to assume the matter: but his new vassals, fierce and independent, bore with impatience a yoke to which they were not accustomed. The palive spirit even of Baliol began to mutiny, upon which Edward forced him to resign the crown, and openly attempted to seize it as fallen to himself by the rebellion of his vassal. At this critical period, Sir William Wallace, to whom his countrymen have ascribed many fabulous acts of prowess, ventured to take up arms in defence of the kingdom, and by his boldness revived the spirit of the nation. At last Robert Bruce, the grandson of Baliol’s competitor, appeared to assume his own rights, and to vindicate the honour of his country. The nobles, ashamed of their former base-necks, and enraged at the many indignities offered to the nation, crowded to his standard. In order to crush them at once, the English monarch entered Scotland, at the head of a mighty army; many battles were fought, but the Scots, though often vanquished, were not subdued. The ardent zeal with which the nobles contended for the independence of the kingdom, the prudent valour of Bruce, and above all, a national enthusiasm inspired by such a cause, baffled the repeated efforts of Edward, and counterbalanced all the advantages which he derived from the number and wealth of his subjeéts. And though the war continued, with little interruption, upwards of 70 years, Bruce and his posterity kept possession of the throne of Scotland, and ruled with an authority not inferior to that of his former monarchs. During the contest in favour of Bruce, John Baliol lived quietly as a private man on his own estates, which were very considerable, in France, without interfering in the affairs of Scotland. Some writers say, that he lived till he was blind, which, if true, must have been the effect of some disease, since it is certain that he died A.D. 1341, when he could not be above 55 years of age at most. “Thus ended,” says Sir David Dalrymple, in his Annals of Scotland, “the short and disastrous reign of John Baliol; an ill-fated prince confounded for doing homage to Edward, never applauded for assuring the national independence. Yet, in his original offence, he had the example of Bruce; at his revolt, he saw the royal family combating under the banners of England. His attempt to shake off a foreign yoke, speaks him of a high spirit, impatient of injuries. He erred in entering beyond his strength; in the caufe of liberty, it was a meritorious error. He confided in the valour and unanimity of his subjeéts, and in the affilience of France. The efforts of his subjeéts were languid and diffident; and France beheld his ruin with the indifference of an unconcerned spectator.” Robertson’s Hist. of Scotland, vol. i. p. 10, &c. Biog. Brit.

BALIPA'TNA, or Palue-Patna, in Ancient Geography, a maritime town of India, nearly at an equal distance from the gulf of Canthi-Colpus, and that of Bigaragenus. The periphery of the Erythraean sea places it to the south-east of Mandagora. See Patna.

BALIPA'TUA, a town of India, on this side of the Ganges. Ptolemy.

Vol. III.
fertile and well cultivated, the prince draws from it a considerable revenue. The country abounds with silk, which furnishes the inhabitants with a valuable article of manufacture. The Ubeeks, subject to the khan of Balk, are the most civilized of all the Tartars inhabiting Great Buhara, which circumstance is attributed to their commerce with the Persians. This country has been divided into several provinces, of which the most remarkable are Khotan, Tokareftan, and Badakhshan. Its chief cities are Balk, Fariyab, Tulkam, Badakhshan, and Anderab. Mod. Uni. Hist. vol. iv. p. 358.

Balk, a distinguished city of the above-mentioned province, seated towards the borders of Persia, on the river Dewall, which flows into the Amu from the mountains of Gaur or Paropamisus. It was probably the ancient Battery, which is. The historians of Persia say that it was founded by Kaimurath, the first khan of Persia, and that he gave it this name because he had found his brother, whom he had left, on this spot: balkidien, or balgedin, signifying, in their language, to receive and embrace a friend. The first kings of Persia, who inhabited the province of Aderbjan in Media, considered this city of Battriana as the frontier of their country. After severe contests between the oriental Turks and Persians, the kings of Persia of the second dynasty made this city the capital of their empire, as it served to prevent the people of Turquistan or Tokareftan from obtaining the pashage of the river Oxus or Gihon. The kings of the succeeding dynasties established other principal cities, and Balk was merely the capital of Khorasan, which pre-eminance belonged to it when it was taken by Ahanf, the son of Alkais, the Arabian commander, under the caliphate of Othman. Under the Abbaside caliphs, and succeeding sultans, Balk was a city of peculiar distinction: it was called Cohab al Eflam, or the Metropolis of Musulmanin, and extended its jurisdiction over the countries of Badakhshan, Khotan, and Tokareftan. It was taken by the Moguls or Tartars, under Jenghiz Khan, in the year of the Higira 618, A. D. 1221, and by his orders its inhabitants were removed out of the walls of the city, and cruelly massacred. In the year of the Higira 771, A. D. 1369, Tamerlane compelled sultan Hussain, the last of the race of Jenghiz Khan, to surrender the city; and his successors retained possession of it till they were expelled by the Ubeeks in the fifteenth century. Between the Ubeek Tartars and the Persians it has been the occasion of continual wars. The principal mosque of this city is constructed upon the model of that at Mecca. Herbel. Bibl. Orient. p. 167.

In the beginning of the last century, Balk was the most considerable of all the towns possessed by the Mahometan Tartars, as Bentnik informs us, being large, handsome, and well peopled. Most of its buildings are of brick or stone; and its fortifications consist of earthen bulwarks, lined on the outside with a strong wall. The khan's castle is a magnificent structure, after the eastern fashion, built wholly of marble, dug out of the neighbouring mountains. In 1739, Balk was obliged to submit to the arms of Nadir Shah, or Kuli Khan; but has since recovered its independence. As foreigners have free liberty to trade in this city, it is the chief seat of the commerce between Great Buhara and Hindoostan. N. lat. 36° 21'. E. long. 65° 31'.

BALKAN, a bay on the eastern coast of the Caspian sea, in which are islands inhabited chiefly by pirates of the race of Turcoman Tartars. These islands produce rice and cotton, and one of them, called Naphthonia, abounds in naphtha. The traffic, says Mr. Coxe ('Trav. in Russia', vol. iii. p. 332.), might be increased to the advantage of Russia; as it would he far more commodious to trade with the Tartars of Khiva and Buhara from these parts than from Orenburg, through the country of the warlike and independent Kirghises.

BALKAN, a mountain of European Turkey, which divides Romania from Bulgaria.

BALK, a town in Hindostan, in the country of Dowlatabad, 15 miles W.N.W. of Beder.

BALKERS, in the Fifhery, persons placed on rocks and eminences at sea, to spy the hering-droves, and give notice to the fishermen by waving buahis, in what way they go, and where they may be found. 1 Stat. Cap. 1. cap. 23.

BALI, John, in Biography, an English divine, was born at Caffington, near Woodstock, in Oxfordshire. Although educated at Oxford, he attached himself to the cause of the Puritans. Ordained by an Irish bishop without subscription, he served a curacy of 20l. a year at Whitmore in Staffordshire, and with this, together with the produce of a small school, he lived contentedly. In this obscure and lowly condition, he distinguished himself by his writings. His chief work was "A Short Treatise concerning all the principal grounds of the Christian religion," and so popular was this treatise that it passed through fourteen editions before the year 1632, and was translated into the Turkish language. He also wrote "A Treatise on Faith," 4to. 1631; "A Friendly Trial of the Grounds of Separation," 4to. 1649; and several devotional pieces. Although he disliked ceremonies, he wrote against those who thought them a sufficient ground of separation. He died in 1649, with the character of a laborious preacher, and an ingenious writer. Biog. Brit.

Ball, in a general sense, a round body, found naturally, or formed by art, of this figure.

Ball, in Antiquity, gives the denomination to a species of game or sport frequent among the ancients.

The Romans had four kinds of ball, or balls: the first called tragus, or triconas, because the three gamesters at it were placed in a triangle: these alternately caught and tossed the ball, and he who first let it fall to the ground, was the looser. The second called folli, or folliculus, was made of leather, blown up like our foot-balls: the largest sort of these were strung with the arm, the smaller with the fingers: the former seems to have been distinguished by the appellation poganus, as being much used in country villages: the fourth was the barbar, a kind of small ball, so called, because the gamesters endeavoured to snatch it from each other.

Galen has an entire treatise on the exercise of the leffer ball.

Balls, in Architecture, are represented at C, in the figure of the basilic (see Basile); and are used for supporting Attic pedeata.

Balls, in Brewing. They are either brown or pale, and used to fat, feed, preferre, and colour malt-drinks, wines, and cyders. See the composition of them described under Brewing.

Balls, Martial, in Gladiery, a preparation of iron now entirely diffused in this form, but retained in the Materia Media cum as a powder. It is the ferrum tartaricum, tartar of iron; or this metal united with, and partly dissolved by, cream of tartar.

To make martial balls, take one part of filings of iron, and two parts of powdered cream of tartar; mix them well together, and put them into an earthen or iron vesel with some water: stir the mixture from time to time, till it becomes almost dry; add more water, and stir it as before, till it acquires, when nearly dry, somewhat of the consistence and
and tenacity of softened rosin; then it is rolled into the form of a ball, generally kept tied up in a rag, and when it is used, infused into water, till it gives some colour to that liquid. Mac. Chem. Dict. Eng. Ed.

Balls, Mercurial, an amalgam of mercury and tin sufficiently solid to be moulded, and to prepare a solid form.

To make mercurial balls, add mercury to its weight of melted tin, and pour the fluid mass into a round and shallow mould.

These balls have been employed to purify water in which they are boiled, an opinion which is perhaps in some degree well-founded, since mercury even in imperceptible quantity is known to destroy animalculae. However, the boiling alone would probably produce nearly the same effect, and the mercurial balls are no longer in use. The tin is not an useless addition, since besides giving the mass a proper consistence, it affords most materially in the oxidation, and therefore the solubility, of the mercury.

Balls, in Electricity, are two pieces of cork, or pith of elder, nicely turned in a lathe, to the size of a small pea, and suspended by fine linen threads; intended by Mr. Canton as electrometers, and of excellent use to discover small degrees of electricity, to observe the changes of it from positive to negative, and vice versa; and to estimate the force of a shock before the discharge, so that the operator shall always be able to tell very nearly before the discharge, by knowing how high he has charged his jars, what the explosion will be.

Balls, Crystaline, in Natural History. There are two sorts of fibrous bodies mentioned in authors by this name, and distinguished into the calcined and concave. The first are roundish nodules of strong matter, covered over with points of crystal; and the other, flints and other flakes, having cavities in their middles, which are lined, or crusted over with these crystals.

Ball, Vegetable, a very particular kind of plant of a deep green colour, of an irregularly spherical shape, hollow within, and of different sizes, from an inch and a half to three inches in diameter. It probably belongs to the Conifer genus, in the class of mosses; though Mr. Ray has ranged a similar plant under the genus of Alcyonium. (See Coral.) Phil. Trans. vol. xlvii. art. 83. an. 1752.

Ball, Puff. See Lycoperson.

Ball, Herb’s, Pila Heronis, in Hydraulics, is a kind of artificial fountain, wherein the water is made to spout from a hollow ball or globe.

It takes the denomination from the inventor, Hero of Alexandria, who has left the description of it in his Spiritæa. See Fountain.

Balls of Fire in the air, in Meteorology, are meteors sometimes seen falling over countries, and computed by philosophers to be at a very considerable height in the atmosphere. They sometimes burst at that height; and though the air must be exceeding rare there, yet the explosion is heard at that distance, and for seventy miles round on the surface of the earth, &c. Does not this look as if a rare atmosphere, almost a vacuum, was no bad conductor of sound? Dr. Franklin’s Works, p. 437.

Among the phenomena of the atmosphere, the large meteors called fire-balls, and bolide, have in modern times excited particular attention. Mr. C. E. Fuldé has collected a variety of observations respecting these phenomena, in a paper read to the Physical Society of Gottingen, Dec. 7, 1756, and published in professor Gmelin’s “Gotttingisches Journal der Naturwiflenchaften,” vol. i. part 2. These meteors, he observes, appear in every climate in souther and northern latitude, as well as under the equator. They are also seen at every season of the year, and at every period of the day, and for the most part when the sky is serene, some proceeding from light clouds, which has given occasion for supposing that they originated at a greater height than these clouds; and they have been observed to move with different degrees of rapidity, one proceeding at about 1350 feet in a second or even with a slower motion, and others moving at the rate of thirty English miles in the same time, or with a velocity greater than that of the earth in its orbit. They proceed from, as well as towards, all points of the compass: however, most of them have appeared in the northern or southern part of the horizon; and yet no general conclusion, in respect of their connection with the northern or southern lights, can be deduced from this circumstance, though some observations made in Sweden seem to favour such an hypothesis. They do not always move according to the direction of the wind nor is their velocity proportioned to that of the wind. When, indeed, they have appeared, it has generally been calm; but some of them have been succeeded by even a violent wind. They almost all descend towards the earth, and from a greater to a denser atmosphere, as may be inferred from their soon becoming considerably enlarged. Some, however, have proceeded in an horizontal direction over the surface of the earth, but none of them appear to move upwards. Their form is sometimes perfectly globular, and sometimes more spindle-shaped, so that their length has occupied seven or eight degrees of the heavens. When they move with a great velocity, they have been followed by a long tail, which has been ascribed to the continuance of the impression made on the eye. Others, that have moved faster, have appeared as if the tail, or part of it, belonged to the body itself; and it should seem that the long train, which marks their course, ought often to be accounted for by traces left behind them rather than by mere impression. Their apparent magnitude has been very different; but frequently larger than that of the moon. Few of them have had an apparent motion round their axes. Most of them dissipated of a very lively dazzling light; but the smaller number have exhibited a faint light; their colour and splendour have been very different and variable, sometimes red, sometimes blue, sometimes violet, sometimes in part yellow or dazzling white, and sometimes exhibiting the prismatic colours. Some have been seen to burn with a bright flame, and others as if in a state of ignition. Their real diameter, ascertained by actual measurement or by conjecture, has been always very considerable. The diameter of that concerning which sir John Pringle made calculations from various observations which he collected (Phil. Trans. vol. li. pt. i. p. 218.) and that of the meteor seen by Mr. Rittenhouse at Philadelphia, in October 1759 (American Trans. vol. ii. p. 1750), were at most about half a German mile. These meteors seem to originate at a very different, but most of them at a very considerable, height above the surface of the earth. All of them, whose mean or greatest height has been the subject of calculation, were elevated above the highest clouds, as clouds are scarcely perceptible at the height of 13,500 toises; and Silberichlau found the greatest height of the fire-ball, which appeared in July 1762, to be 78,276 toises. On this account their origin, as Ritter and Chladni have supposed, is not to be attributed merely to electricity; but others have considered them as produced by the action of the electric fluid between the clouds and the northern lights; and this hypothesis sufficiently corresponds to their actual height, because by the measurement
of Bergman, Kässner, and Lambert, the northern lights have an altitude of more than 20 or 30 German miles, and according to every appearance, no fire balls have been seen higher. (See AURORA BOREALIS.) On the other hand, this general conclusion led Halley, Franklin, and Rittenhouze, to adopt the notion ingeniously defended by Chladni, that these phenomena, as well as shooting stars, are comi-
cetrical meteors belonging to the atmosphere of the sun, which, meeting our earth in its curve round that luminary, are in-
flamed, by some cause or other, when they enter the earth's atmosphere. The time of their duration has been very dif-
ferent; some of them having continued half an hour, and others not longer than half a minute. Many of them in
their course have thrown out spars, and most of them have been seen to separate into several larger and smaller parts be-
fore they entirely disappeared. From this division it has been inferred, that these phenomena cannot be accounted for
by the hypothesis of a tract of inflammable air set on fire; to which hypothesis Chladni has objected on other grounds.
This separation has been accompanied with a rumbling noise like thunder, or a sudden report. Several, after bursting, seemed to disolve into smoke; but most of them, after exploding, have left behind them no visible traces.
In some cases, after their disappearance, a fulphu-
reous smell has been perceived, which led Muelchenbroek to
form his hypothesis of an accumulation of sulphurous in-
flammable vapours that arise from volcanoes and subterranean
pits, which, being driven together by the winds, form clouds
that are by some accident or other set on fire; but this hy-
pothesis cannot be reconciled with their prodigious height
any more than that of Silberschlag's oily and flamy vapours.
As scoriaceous mafes have frequently been either actually
seen to fall at the time of the disappearance of these pheno-
mena, or have been soon after found on the surface of the
earth; and as it has been sufficiently proved by various ac-
counts, that flones have fallen from the atmosphere, Dr.
Chladni concludes, that both these phenomena are con-
ected; but this point can be determined only by future ac-
curate observations.
This ingenious professor of Wittenberg, in his "Ober-
vationes on a Mafs of Iron found in Siberia by Professor Pal-
las, &c," has investigated the origin of fire-balls in general.
This mass, declared by Pallass in his "Travels," vol. iii,
p. 311, was found between Krafnojarfe and Archkanse,
in the high flate mountains, open and uncovered. It weighed
1600 pounds; resembked in figure a rough granite; was cov-
ered externally with a ferruginous kind of crust; and with
in confused with malleable iron, brittle when heated, porous
like a large sea sponge, and having its interstices filled with
a brittle hard vitrified subfance of an amber yellow colour.
This texture and the vitrified subfance appeared uniformly
throughout the whole mass, and without any traces of flag or
artificial fire. This mafs, which the Tartars consider as a fa-
ced relic dropped from heaven, Chladni refers to the fame or-
gin, and supposes to be of the fame nature with the bolides,
or fire-balls. From a variety of observations relating to these
phenomena, he endeavours to prove that they do not arise
from an accumulation of the matter of the aurora borealis;
but a transition of electricity from one part of the atmosphere to
another; an accumulation of porous inflammable subfances
in the higher regions; or the catching fire of a long train of
inflammable air; but that their component parts must be
considerably denser and heavy, as their course shews in so
apparent a manner the effects of gravity; and because their
mafs, though it defends to a monstrous size, retains suffi-
cient conftancy and weight to continue an exceedingly
rapid movement through a very large space, without being
decomposed or diffolvd, notwithstanding the resistance of
the atmosphere. It seems to him probable, that this sub-
fance is by the effect of fire reduced to a tough fluid con-
dition; because its form appears sometimes round and some-
times elongated, and as its extending till it bursts, as well
as the burling itself, allows us to suppose a previous capa-
biity of extension by elastic fluidity. At any rate, it ap-
ppears to be certain, that such dense matter at so great a
height is not collected from particles to be found in our at-
om
atmosphere. But even when it is allowed that a great many foreign substances are dissolved in the atmosphere, the quantity of them, especially in regions at the distance of eighty miles or more, from which such fire-balls are seen to fall in the form of a luminous point, is too small to admit of our supposing such large masses to be formed of it. Should the solid particles, which may perhaps be dissolved in the atmosphere, precipitate themselves, it would be rather in the form of a fine powder. I consider it, therefore, with Anaxagoras, Maffekyne, Halley, &c. as more probable that these masses come to our regions from the common expanse of the universe; and that, besides planetary bodies, there are smaller accumulations of matter, when they approach too near our earth must fall down. That material bodies actually exist in the remotest regions, is shown both by the single and accumulated luminous sparks which Dr. Schröter saw pass over the field of his telescope; as also by the floating stars which pass by our earth, probably at a greater distance and with greater velocity than to allow their being attracted by it, and made to fall to its surface; and to which fire-balls, on their first appearance, when they seem to approach like a luminous point, have a perfect semblance. There are many reasons for inducing us to believe that floating stars cannot be mere electric phenomena, without the presence of some coarser substances.

The paradoxes of this mode of explanation, which is contrary to no known observations of nature, is rather apparent than real, and consists only in this, that people have not been accustomed to it; or that, on account of the rarity of these phenomena, many facts of this kind have been denied, or have escaped notice. For this reason, after I had written the Treatise on the Mafa of Iron &c covered by Professor Pallas, I hesitated whether I should publish it, because I expected that it would meet with considerable opposition. The more I endeavoured however to compare, without partiality for any system, the observations already made, which correspond so much with each other, and which I found that these phenomena could not be properly explained in any other manner, without either contradicting observations already made, or well-known laws of nature: so that I see no grounds for retracting anything I have advanced on this subject.” See Height of the Atmosphere, and Meteor.

Ball, in the Military and Pyrotechnical Arts, is a composition of divers ingredients, generally of the combustible kinds, serving to burn and destroy, give light, smoke, stench, or the like.

In this sense we read of fire-balls, light-balls, smoke-balls, flint-balls, sky-balls, water-balls, land-balls, &c.

Balls are likewise used for all sorts of fire-arms; those for cannon are made of iron, and are distinguished by their respective calibres; and those for muskets, &c. of lead.

Balls, Fire, are bags of canvas filled with gunpowder, sulphur, saltpetre, pitch, &c. to be thrown by the soldiers, or out of mortars, in order to fire houses, incommode trenches, advanced posts, or the like.

The Greeks had divers kinds of fire-balls made of wood, sometimes a foot, or even a cubit long; their heads being armed with spikes of iron, beneath which were hemp, pitch, and other combustibles, which being set on fire, were cast among the enemy.

The preparations of fire-balls, among the moderns, consists of several operations, viz. making the bag, preparing the composition, tying, and, lastly, dipping the ball.

The bags for this purpose are either oval or round.

The composition whereby fire-balls are filled is various.

To ten pounds of meal gunpowder, add two of saltpetre, one of sulphur, and one of colophony; or, to six pounds of gunpowder, add four of saltpetre, four of sulphur, one of powdered glass, half a pound of antimony, as much camphor, an ounce of sal ammoniac, and four of common salt, all pulverized. Sometimes they even fill fire-balls with hand granadoes. For tying the fire-balls, they prepare two iron rings, one fitted round the aperture, where the ball is to be lighted, the other near its base. A cord is tied to these rings in such manner as that the several turns represent fencemicelles, or meridians of the sphere, cutting the globe through the poles; over the cords, extended according to the length of the ball, others are tied, cutting the former at right angles, and parallel to each other, making a knot at each intersection. Lastly, putting in a leaden bullet, the rest of the space is filled with tow or paper. Thus completed, the fire-ball remains to be dipped in a composition of melted pitch, colophony, and linseed oil, or oil of turpentine; after dipping, they cover it round with tow, and dip again, till it be brought to the full diameter required.

Balls, Land, those which being thrown out of a mortar, fall to the ground, burn, and burst there. The ingredients are much the same as in the water-balls, only the specific gravity is not attended to.

Balls, Light, are such as diffuse an intense light around; or they are balls which, being cast out of a mortar, or the hand, burn for some time, and illuminate the adjacent parts.

Those for the hand are made of ground powder, saltpetre, brimstone, camphor, and borax, all sprinkled with oil, and moulded into a mafs with sand, common and Greek pitch, to the size of an ordinary granado: this is wrapped up in toy, with a sheet of strong paper over it. To fire it, a hole is made in it with a bodkin, into which is put some priming that will burn slowly. Its use is, to cast into any works that are to be discovered in the night time.

For the larger light-balls, or those to be thrown to a greater distance, they are prepared by melting equal quantities of sulphur, turpentine, and pitch; and by dipping in this composition an earthen or stone ball, of a diameter much less than that of the mortar out of which the fire-ball is to be cast; then rolling it in gun-powder, and covering it round with gauze, the dipping is repeated till it comes to fit the cavity of the mortar; lastly, it is sprinkled around with gun-powder. This being once kindled, will strongly illuminate all round the place where it is thrown, and give opportunity for examining the state and condition thereof.

Balls, Sky, those cast on high out of mortars, and which, when arrived at their height, burst like rockets, and afford a spectacle of decoration. Sky-balls are made of a wooden shell, filled with various compositions, particularly that of the flars of rockets.

These are sometimes intermixed with crackers and other combustibles, making rains of fire, &c.

Balls, Smoke, or Dark, those which fill the air with smoke, and thus darken a place, to prevent discovery. To prepare a darkening ball, make an oval or spherical bag; melt rosin over the scals, and add an equal part of saltpetre not purified, also of sulphur, and a fifth part of charcoal. The whole being well incorporated, put in tow first fired, and fill the bag with this composition, and dip it after the same manner as a fire-ball.

Balls, Sink, those which yield a great stink where fired to annoy the enemy.

Their preparation is thus: melt ten pounds of pitch, &c.
of rosin, twenty of saltpetre, eight of gun-powder: and four of copolophy: to these add two of charcoal, fix of horse-hoofs cut small, three of alfa-septida, one of flinking faracen, and any other offensive ingredients. Then proceed as in making smoke and fire-balls.

**Balls, Water,** those which swim and burn a considerable time in the water, and at length burst therein.

These are made in a wooden shell, the cavity of which is filled with a composition of refined saltpetre, sulphur, sawdust boiled in water of saltpetre, and dried; to which sometimes other ingredients are added, as iron-filings, Greek pitch, amber-dust, glass powdered, and camphor. The ingredients are to be ground and mixed up, and moistened with linseed-oil, nut-oil, olive-oil, hempseed-oil, or petrol. At the bottom is placed an iron coffin, filled with whole gunpowder that the ball may at last burst with a great noise; and lastly, the ball is, by the addition of lead, or otherwise, made of the same specific gravity with water.

**Balls, Anchor,** are made in the same manner as light balls, and filled with the same composition; and, besides, they have an iron bar two-thirds of the ball’s diameter in length, and three or four inches square. One half is fixed within the ball, and the other half remains without; and the exterior end is made to grapple with a hook. These are useful for firing wooden bridges or buildings, the rigging of ships, &c.; as the pole end being the heaviest, flies foremost, and wherever it touches, falls, and sets fire to all about it.

**Balls, Chain.** See Chain-balls.

Balls, Stang. See Stang-balls.

**Ball, in Mineralogy,** is also used in Cornwall, &c. for a tin-mines.

In this sense Godolphin’s ball is said to be the most famous of all the balls or mines in Cornwall, for quantity of metal.

Phil. Trans. No. 138. p. 95.

**Ball-VEin,** a name given by the miners in Suffix to a fort of iron ore, common there, and wrought to considerable advantage. It yields not only great quantity of metal, but what it has runs freely in the fire; it is usually found in loose mafles, not in form of stratata, and is often covered with one or more crusts. It generally contains some sparkling particles, and is usually of a circular form in the perfect mafles; thicker in the middle, and gradually thinner as it approaches the sides. The ores of Suffix in general are poor, but they require very little trouble in the working, so that a considerable profit is annually made from them.

**Ball of a Pendulum,** the weight at the bottom. In shorter pendulums, this is called the bob.

**Ball, among Printers,** a kind of wooden tunnel stuffed with wool, contained in a cover of sheep’s skin, which is nailed to the wood; with which the ink is applied on the forms, to be wrought off.

The printers holding one of these balls in either hand, hold them on the ink-block, then working them on each other, he applies them afterwards on the forms, which made the ink necessary to make an impression.

**Balls for Horses,** in Veterinary Science, mafles made into this form which is the most usual and most convenient mode of administering medicine to these animals.

Being mixed with some vivid Substances, the proposed medicine is formed into mafles of an oblong or oval form, which are conveyed by the hand or other wise to the root of the tongue, from whence they readily pass to the stomach.

This mode of administering medicines to horses is of great antiquity. These balls were termed by the Romans **_eitra;_** by the Greeks, **_σφαίρας._** They, however, generally preferred giving their remedies as a potion or drink. The kinds of balls will necessarily be as various as the nature of the medicine which is administered; as purging balls, cordial balls, diuretic, diaphoretic, febrifugus, worm-balls, cough-balls, alternative balls, &c. Any tenacious substance not possessing active properties, will serve for the admixture of them, as paste made of boiled flour, or boiled linseed meal; these particularly serve for balls that are to be immediately given, and not kept for any length of time, as they are apt to grow hard and dry, and sometimes mouldy. To prevent this, they may be immersed in melted wax, which will effectually coat them over and preserve them, and this was a mode also well known to the ancients. Honey, treacle, terpine, and tar, are not subject to the above objection, and are all used by different persons for this purpose. The two last, however, cannot be supposed devoid of effect as a medicine; and therefore should not be employed, unless when they co-operate with, or do not destroy, the effect of the medicine preferred.

Soft soap is also an adhesive particularly useful in the admixture of diuretic and purging balls for horses, as not dry ing nor being particularly expensive. Aloe, almost the only purgative at present known for horses, operates better when united with this subsance than in any other way that we have tried. Colomel also operates as a purgative on horses. For the particular method of preparing them, see **Pharmacopoeia Equina.**

These balls should not be made too large, or be suffered to get too hard; in either case, by lodging in the ceophagus, they may prove fatal.

It may not be unnecessary also to observe, that for the easy administration of them the following circumstances should be observed. The tongue should be drawn from the mouth with the left hand over the grinder teeth, the right hand holding the ball between the thumb and first finger, the ball should then suddenly and at once be thrust into the throat by gliding the hand along the roof of the mouth; when this is done slowly, the tongue rises, oppo tes the hand, and renders it difficult. An iron ring with a handle is sometimes used to defend their jaws; but in this country these balls are generally given without.

When the jaw is very narrow so as not conveniently to admit the hand, the ball is placed on the end of a pointed stick, or it might be placed loosely in a cup or pocket at the end of a small cane or whalebone, and be thus very conveniently given.

**Balls, in Zoology,** various substances under this form found in the flomach and intestines of several animals; they occur most frequently in those quadrupeds which lick the surface of their bodies, in which case they are swoln, off the hair that has been removed by the tongue; the hair, partly by the operation of licking, and still more by the motion of the flomach, becomes mixed and interwoven in such a manner, that it resembles the texture of a hat, and when moulded into a round figure, receives a smooth, shining coat, or calcareous incrustation. These are the fort of balls usually met with in the cow, sheep, and goat kind, (speically the chamois. Every indigestible substance that is swallowed is liable, however, to give origin to these balls, or to form a nucleus for calculous concretion; hence we meet with them composed of the reedy fibres of vegetables, bulks of seeds, feathers, and different animal and vegetable cuxaves. When such substances as stones of fruit, nuts, or inorganic substances, as pabbles, coins, &c. are long detained, and have been covered with a deep incrustation, they constitute the beazatic stones. See Bezoar. See also Agogropilis.

According to
According to authors, the human subject is liable to the formation of balls in the intestines, in consequence of indigestible matters not being regularly expelled. Thus cafes have been related of death ensuing from accumulations of gooseberry seeds, which had been rolled into a solid ball in the stomach; and Sir Hans Sloane gives the history of a ball found in the intestines of a man, much afflicted with the colic, six inches in circumference, of a spongy consistence, and which, when viewed with a microscope, appeared made up of small transparent hairs or fibres, wrought together like the *robus viridis*; in the middle was a common plumb stone, which made, as it were, the core or nucleus upon which the fibrous matter had collected, stratum super stratum. Phil. Trans. N° 309. p. 2387. Sloane, in Phil. Trans. N° 282. p. 183.

**Balls of Silk-worms and Spiders**, are little cakes or cones of worm silk, wherein those insects deposit their eggs. See Silk.

Spiders are extremely tender of their balls, which they carry about with them, adhering to the papillae about their anus. Grose speaks of bulbs or bags of a species of silk-worms in Virginia, as big as hen's eggs, and containing each four aurelia. Phil. Trans. N° 362. p. 1837.

**Ball of the Foot of a Dog**, is the prominent part of the middle of the foot, called by Latin writers of the middle age, *pelta*, which is to be taken away in expediency. Du Cange Gloss. Lat.

**Balls, Billiard**, are ivory balls used in the game of billiards. Moxon describes the method of turning hollow ivory balls one within another. Mechan. Exerc. p. 219.

**Balls, Tennis**, is a little globe, made and covered with cloth or leather, used in playing at the game of tennis. It is also used, in a well-known sense, for an assemblage of both sexes, who dance to the sound of instruments.

**Balls, Glass, Balls, Soap.** See Glass-Balls.

**Ball and Socket**, a machine contrived to give an instrument full play and motion every way. It consists of a ball or sphere of brass, fitted within a concave semi-globe, so as to be moveable every way, horizontally, vertically, and obliquely. It is carried by an endless screw, and is principally used for the managing of surveying instruments; to which it is a very necessary appendage.

The ancient balls and sockets had two or three, or channels, the one for the horizontal, the other for the vertical direction.

**Balls, Wool.** See Wool.

**Balls, Pyramid, in Geography, a rock in the great Southern Pacific ocean.** S. lat. 31° 30'. E. long. 159° 8'.

**Ballabuan, Straits of.** See Ball.

**Ballad, or Ballet**, a popular song containing the recital of some action, adventure, or intrigue.

The French confine their ballads to flatter terms. A ballad, according to Richet, is a song consisting of three strophes, or stanzas, of eight verses each, besides a half strophe; the whole in rhyme, of two, three, or four verses, with a burden repeated at the end of each strophe, as well as of the half strophe.

In the old English version of the Bible, the book of Canticles is intitled the *ballad of ballads*, which has given scandal to some Romish writers as countenancing the opinion of those who hold that book a ballad of love, or a recital of the amours between Solomon and his concubine, as Cantalou and some others have conceived it to be.

Some have fogged that a collection of ballads is necessary to a minstrel, in order to learn the temper and inclination of a people, which are here frequently uttered with great simplicity. The great Cecil, chief minstrel to queen Elizabeth, is said to have made a most ample collection of ballads on this account.

A very ingenious political writer, Mr. Fletcher of Saltoun, says, that if he could but make the ballads of a nation, he would care very little who made the religion of it. There is a very curious collection of old English and Scottish ballads, published in 3 vols. 8vo. by Dr. Percy; in which, and in a dissertation prefixed to Aikin's Collection of Songs, &c. the curious in this way may find abundance of entertainment and information concerning the old ballads, and ballad-makers.

**Ballad, a mean and trifling song, generally, such as is sung in the streets.** In the new French Encyclopædia we are told, that we dance and sing our ballads at the same time, as the French do their *vendelles*. We have often heard ballads sung, and seen country-dances danced; but never at the same time, if there was a fiddle to be had.

The movement of our country-dances is too rapid for the utterance of words; though the term ballad, we have no doubt, was derived from the Italian *ballata*, a long to be sung and danced at the same time, as it is defined in the Critica Dictonary: *consonante fere continua ballada*. *Ballateuia* and *Ballateueta*, are diminutives of the same word: *piccola consonetta a ballo*. The English ballad has long been detached from dancing, and, since the old translation of the Bible, been confined to a lower order of song. In Shakespeare's time this species of vulgar and popular poetry was wholly degraded and turned into the streets—

"As I have not ballads made on you all, and sung to filthy tunes, may a cup of sack be my poison." Hem. IV.

**Balladuk, in Geography, a town in Arabia Deserta, 140 miles E. N. E. of Damascis.**

**Ballaga, or Gout**, denoting the higher or upper Gout, an elevated tract of the peninsula of India, being the western part of the Carnatic, or of that part of the peninsula that lies south of the Gondegama and Toombuddra (or Tungabhadra) rivers, from the coast of Coromandel callyward to the Gout mountains westward, and containing the districts which lately composed the country of Tippan. The other or eastern part, which is the Carnatic according to its present definition, is denominated *Payen-Gaut*, or the lower Gouts. (See *Ballagat*.) The Balla-Great mountains denote that elevated tract, across which goods were formerly conveyed from Tanjore, or the modern Dowlatabad, to Bardach. See Atlantic Researches, vol. I. p. 369, 370. 8vo.

**Ballagh, or Ballagha**, a cape on the east coast of Ireland, in the county of Louth, at the south-west entrance of Carlingford bay: eleven miles south-east of Newry. N. lat. 53° 48'. W. long. 6° 4'.

**Ballantine, or Ballantry**, a sea-port town or rather populous village of Scotland, on the west coast of the county of Ayr. In that subdivision called Carrick, on the frith of Clyde, containing about eighty houses, and 300 inhabitants. They have a good salmon fishery at the mouth of a small river called Ardslinchar which joins the frith near the town; but the principal fishery of this district is that of laddocks, whiting, cod, ling, skate, &c.: twenty-eight miles S. S. W. of Ayr.

**Ballard, Cape**, lies on the east coast of Newfoundland, four leagues N. N. E. from cape Race, and four miles from Fresh-water bay. N. lat. 46° 45'. W. long. 53° 40'.

**Ballard's Point**, a cape on the west coast of Ireland, in the county of Clare. N. lat. 52° 42'. W. long. 9° 32'.

**Ballad**

BALLARINA, in Ornithology, a name under which Olina describes the white-wagtail, motacilla alba.

BALLAS, a town of Egypt, ten miles south of Dendera.

BALLAST, in Navigation, any heavy matter used to sink a vessel to its proper depth in water, or to give it a just balance and counterpoise, and enable it to bear full sail upright, without overturning.

The word comes from the Flemish belaff, formed of bel and left or left. The French call it simplement left. In the Mediterranean, quartage. In Latin writers of the lower age it is denominated latifugium.

The ordinary ballast is sand or stones, flowed in the bottom, or held, next the false keel of a vessel: sometimes, iron, lead, corn, or other heavy goods, serve for ballast.—Ships are said to be in ballast, when they have no other loading.

That ballast is hell which is heaviest, lies closest and farthest, and drift, both for the ship, bearing a sail, flowing of goods, health of the company, and serving of calls and other goods. If a ship have too much ballast, the vessel will draw too much water; if too little, she will bear no fall. The ballast is sometimes one-half, sometimes a third, and sometimes a fourth part of the burden of a vessel. But there is often great difference in the proportion of ballast required to prepare ships of equal burden for a voyage; the quantity being always greater or less, according to the sharpness or flatness of the ship's bottom, which sooner or later.

Although ships in general will not carry a sufficient quantity of ballast still they are laden so deep that the surface of the water will nearly glance on the extreme breadth amidship, yet a great weight of heavy ballast, as iron, lead, &c. in the bottom, will place the centre of gravity too low, and in the case, though they may be able to carry a great fall, they will move heavily, and hazard being displaced by their violent rolling. The art of properly ballasting a ship is that of disposing of the materials of which it consists, &c. so that it may be duly poised, and maintain a just equilibrium on the water, and be neither too light nor too cramp. In the first case, though the ship may be able to carry a great fall, yet its velocity will not be proportionally increased, whilst her masts are more endangered by her sudden jolks and excessive labouring; and in the last case, she will be incapable of carrying fall, without the danger of overloading. Stiffness in ballasting is occasioned by laying a great quantity of heavy ballast, as iron, lead, &c. in the bottom, which of course will place the centre of gravity very near the keel; and cramp is occasioned by having too little ballast, or by dispensing the ship's lading in such a manner as to raise the centre of gravity too high.

As the tendency of a ship to pitch or roll depends, not only on her form, but also in a greater degree upon the due distribution of the heaviest part of her cargo, the knowledge of properly ballasting a ship, as well as of allowing her cargo, is of great importance to the mariner. Particular attention should be paid to moderate her pitching, as this roff fatigues a ship and her masts; and it is usually in one of these motions that masts break, particularly when the head rises after having pitched. Rolling, indeed, is more considerable movement than pitching; but it is slow, and seldom attended with any accident. However, it should be prevented as much as possible; and this may be easily done in general, without any detriment to the ship's still carrying of fall, by flowing up the ballast, when it is iron, to the floor-heads; because the ship will be restored by it with less violence after she has inclined, and it will act on a point at a little distance from the centre of gravity.

For the farther illustration of this important subject, let it be premised, that various methods have been recommended for finding the following points of a ship; viz. its centre of gravity, centre of cavity, centre of motion, and metacentre. (See these articles.) Some of these points are fixed; others are variable. When a ship is completely loaded, the centre of gravity is fixed, howsoever the vessel may alter her position. The centre of motion is always in a line with the water's edge, when the centre of gravity is even with or below the surface of the water; but, whenever the centre of gravity is above the water's surface, the centre of gravity is then the centre of motion. In circular bodies the centre of motion will be the centre of the circle. The centre of cavity varies with every inclination of the ship, because that depends upon the shape of the body immersed. The metacentre, called the shifting centre, depends upon the situation of the centre of cavity; for it is that point where a vertical line drawn from the centre of cavity cuts a line passing through the centre of gravity and perpendicular to the keel. The centre of gravity must not by any means be placed above this point; because, if that were the case, the vessel would overtop.

Let the segment of a circle 1 2 3 (fig. 14. Plate II. Mechan.) represent the transverse section of a vessel's bottom; W L. the surface of the water; M the metacentre as well as the centre of motion, because this is a circle; C the centre of cavity; G the centre of gravity; and the line 2 4 the vertical axis of the vessel which may be turned round the point M, as on a fulcrum, supported by the centre of cavity. By thus simply considering the vessel as a lever in the direction of her vertical axis playing round her centre of motion, it is plain, that if the centre of gravity were placed above the point M, being the metacentre too, the vessel would upset; therefore that the ship may have flability, the centre of gravity must be below this point: and it may be observed, that the farther G is removed from the metacentre, the greater must be its force, as the gravity then acts with a greater length of lever, considering the fulcrum of that lever to be at the centre of motion; er. if the weight at G be augmented, it will likewise increase the force; therefore the force of G may be expressed, by multiplying the balance of weight beneath the centre of motion, by the distance of the centre of gravity from the centre of motion.

The centres of cavity and motion (in circular bodies) will ever be in a line perpendicular to the horizon, but the centre of gravity may be either on one side or the other of this line. When such a body is at rest, the centre of gravity will be in this line; but if in motion it will be diverted from it. Thus the points M and G will always be perpendicular to W L; but the point G, by the body's rolling, may be on either side; for instance at g. While G is perpendicularly beneath the centre of motion, its action can only tend to produce this circular body in her erect position; but if it is removed to either side as at g, its action is to return it to the erect position; and this action increases as the distance G g, which is the sine of the angle of roll g M G, the distance M G being considered as the radius. Thus, to g in the force of gravity with any roll as g M G, let the balance of weight beneath the centre of motion be multiplied by the sine of the angle of roll G g.

But the tendency to roll may be also diminished by the shape of the hull: for, let us suppose that the transverse section be allowed more beam, and increased by the dotted lines. Now when this vessel is rolled over, it is plain that the cavity will be augmented towards the side L, of course
its centre must remove towards L, now to: and, if from be erected a perpendicular to the horizon, it will cut the vertical axis at n, which will, in this case, be the metacentre, above which, if the centre of gravity were placed, it would act in conjunction with the centre of gravity to overturn the vessel; but, as the centre of gravity is here below at g, her stability will be increased by the increased distance of G from n, the metacentre, and the vessel will roll round the point M as her centre of motion.

When falling in smooth water, the greater the stability the better; but if a vessel with a heavy cargo, floated low in her bottom, she were to fall into a rough tempestuous sea, where every wave will throw her from her equilibrium, she will return with such violence as to endanger her masts; and should she be dismasted, her roll will then be with still greater force, possibly to the destruction of her hull. Was the cargo in this labourous vessel to be removed higher up towards the centre of motion, so as to lessen her stability, she would be found considerably easier; her roll would be by such deliberate motions, as to lessen the danger to her masts and hull.

The ballast is placed round and very near the centre of gravity of the ship, because it will prevent the motion of the pitching being so hard as it would be, if that weight were distant either afore or abaft that point. Whenever the sea runs a little high, the ship is never carried by a single wave; there are generally two or three always passing under at the same time, unless when the sea is extremely long, the swells coming from a great distance, and in latitudes very remote from land; for, then, it happens that the largest ships are sometimes carried by one single wave. But, in either circumstance, the ballast ought not to be fitched afores or abaft the centre of gravity, as soon as the ship is in the parallel to her draught of water marked for the ballast, which it is absolutely essential to pay attention to. To prove this principle, suppose in either cafe a long or short surge, and that the water strikes the ship forward, whereby the may be exposed to the greatest and hardest pitching; for when the wave takes a ship under the stern, her motions, if she has not a little head-way, are not dangerous; because, as she flies before the wave, the reeds in some measure from its impulse; while, in the first case, the increases the contrary that same impulse in the ratio of the square of all her velocity.

First, the ship whose extremities are light or little loaded, being supposed to run with any velocity whatever against the wave which comes to her a-head, shocks that wave with a force expressed by the square of the sum of the two velocities; she divides it and goes through it, at the same instant that she is raised by the vertical impulse of that column of water, which opposes to her a supporting power too considerable for her weight to displace; the wave which follows produces the same effect in receiving the fall of the ship, because the first is already under the middle of the ship, whence it passes to the stern, which is supported by it, while the second takes its place in the middle, and the third is come to support the head; and this is an uninterrupted succession. This motion continuing as long as the sea is agitated, it follows that the ship is never at rest; no sooner has she been raised by a wave, but she falls again when that wave is gone, which falling is proportionally less sharp as her head is less heavy; the shake is then less violent, since she shocks the water with a less mass, which prevents her pitching so deep as she would do, if she were more heavy; consequently, the malling does not suffer, and the head-way is less delayed, as the fullest part of the bows is not so much exposed to the shock of the water.

Secondly, when the ship is carried by one single wave, her fall is still less sharp if she is loaded a-head, than when she is carried only by the middle. She rides therefore, more easily at the moment the other wave comes to unhull her, and the shake is not so violent. Was the to plunge deeper into the fluid, it might happen that the column of water would become higher than her head, and, passing partly over it, would expose her to the danger of swamping.

In the flowing of the cargo, it is proper to place the heaviest part of the flowage as low as possible, taking care to preserve that draught of the ship which is most advantageous for her, whether she be in ballast or when laden. Those points are marked both at the head and stern; in a word, the great art of flowing lies, in endeavouring that each of the vertical parts, in which the extremities of a ship may be supposed to be equally divided, be lighter, when her having its complete, than the weight of the masts of water they are to displace; observing always, that the vertical parts of the middle admit of being loaded more heavily than the weight of water they are able to displace.

In the royal navy, the iron ballast is first floated fore and aft, from bulkhead to bulkhead in the main hold; next to far cants nailed on the limber-breast, on each side the keelson, five or more inches clear of the limber-board; and is winged up three or more pigs above the floor-boards under the midships, or bearing part of the ship, and there are two tiers of pigs, in the wake of the main hatchway and well-wings. Ships, built with a very clean run aft, seldom do any iron ballast floated abaft the pump-well or after-hold. Ships that have floor and fatstock riders, have the iron ballast floated either lengthways or athwart ships, agreeably to the length of the chambers, which are the clear spaces between the riders.

The thongle ballast is next spread and levelled over the iron ballast; on which is flowing the ground tier of water, hung up and bilge free from the sides, either chine and chine, or bulge and chine, beginning at the coal-room bulkhead, being the foremost, and making the breakage, if any, at the main hatch. The midship tiers, fore and aft, are the first laid down, and the casks are work about one quarter of their diameter into the thongle; the sides are fitted in with wingers of small casks, as half-bilge-heads, gantry casks, or breakers; observing not to raise the wingers above the level of the tier, to cause a breakage in the next tier above, which is flowed in the cutiline of the ground tier, hung up and bilge free; and so on, for as many tiers as can be floated sufficiently clear of the beams.

In the after hold, between the aft-side of the pump-well and thongle-room bulkhead, are flowed the provisions above the ground tier; between the casks, billet, or other wood, and thongle ballast.

In the thonge-room are flowed some of the spirits, or wine, and sometimes coals; and in the spirit room, are flowed the wine and spirits for the ship's use.

In the merchant service, the flowage consists, besides the ballast, of casks, cafes, bales, boxes, &c. which are all carefully wended off from the bottom, sides, pump well, &c. and great attention paid that the most weighty materials are flowed nearest to the centre of gravity, or bearing of the ship; and higher or lower in the hold agreeably to the form of the vessel. A full low-built vessel requires them to be floated high up, that the centre of gravity may be raised, to keep her from rolling away her masts, and from being too light and labourous; as, on the contrary, a narrow high-built vessel requires the most weighty materials to be flowed low down, near the keelson, that the centre of gravity may be kept low, to enable her to carry full, and to prevent her over-turning.
Ballad allowed to the following Ships.

By the 15th Geo. II. it is enacted, that if after June 1, 1746, any master or owner, or any person acting as master of any ship or other vessel whatever, shall cast, throw out, or unblade, or if there shall be thrown out, &c. of any vessel, being within any haven, port, road, channel, or navigable river within England, any ballast, rubbish, gravel, earth, flake, wreck, or titch, but only upon the land, where the tide or water never flows or runs; any one or more justices for the county or place where or near which the offence shall be committed, upon the information thereof, shall summon or issue his warrant for bringing the master or owner of the vessel, or other person acting as such, before him; and upon appearance or default, shall proceed to examine the matter of and upon proof made thereof, either by confession of the party, or on view of the justice, or upon the oath of one or more credible witnesses, shall convict the said master, &c., and fine him at his discretion for every such offence any sum not exceeding £1, nor under £50, &c.; and for want of sufficient diliences, the justice is to commit the master, or person acting as such, and convicted as aforesaid, to the common gaol or house of correction, for the space of two months, or until payment of the penalties.

Baldes the above general act relating to ballast, there are the 6 Geo. II. c. 29. and the 32 Geo. II. which regulate the ballasting of merchant vessels in the river Thames, placing it under the direction of the corporation of Trinity-houfe. Elements and Practice of Rigging and Seamanship, vol. ii. p. 283, &c.

Ballast, to trench the, denotes, to divide the ballast into two several parts or more, in the ship's hold, commonly done to find a leak in the bottom of a ship, or to undo her.

Ballast, the, floats, that is, runs over from the one side to the other. Hence it is that corn, and all kinds of grain, is dangerous landing, for that is apt to shoot. To prevent which, they make poules, that is, bulk-heads of boards, to keep it up fast, that it may not run from side to side, as the ship heels upon a tack.

Ballastage. See Lastage.

Ballatoons, large, heavy luggage-boats, carrying goods by the river from Aislaun and the Caffian sea to Moscowa. These will carry from a hundred to two hundred ton; and have from a hundred to a hundred and twenty, or twenty men employed to row, and tow them along.

Ballenden, or Ballenden, Sir John, in Biography, an elegant Scots writer of the sixteenth century, descended of an ancient and honourable family in Scotland, was probably born and educated in France. Having in his youth served in the court, and, as some writers suggeft, having been employed in the education of James V., he was distingiihened by the favour and patronage of that prince, and obtained extraordinary preferment in the church, as well as the office of clerk of accounts, occupied by his father Mr. Thomas Ballenden of Auchenstrath, in 1541. The work by which he gained the highest reputation, was his translation of Hector Bocheus out of Latin into the Scots tongue, performed by the command of his royal master, intitled, "The History and Chronicles of Scotland," and published in folio at Edinburgh, A.D. 1536. This version, in which the translator took the liberty of augmenting and amending the original as he thought proper, was well received both in Scotland and England, and soon became the standard of that history. In the succeeding reign, he was one of the lords of fiction; and being a zealous Romanist, he affiduously laboured, in conjunction with Dr. Lang, to hinder the progress of the reformation. His zeal involved him in disputes, which obliged him to quit Scotland, and remove to Rome, where, it is said, he died A.D. 1550. He was a man of great parts, and one of the finest poets of which his country could boast. His works, that are still extant, are distinguished by that noble enthusiasm which is the soul of poetry. His poem, intitled "Vertue and Vyce," was addressed to the monarch of the Scots, James V.; and his other pieces, both printed and in MS., are now buried in oblivion. In Carmichael's collection of Scottish poems, there are some of this author on various subjects. Biog. Brit.

Ballendy, or Ballenden, in Geography, a projecting point in the bottom of Donegal bay, on the north-west coast of Ireland, south-west by south-west 4 miles from Ennismore island.

Balleness Islands, are four small islands on the south of Troy island, off the N.W. point of Ireland, called Beg, Doway, Bohin, and Maghere Welkey. Between Troy island and Ballenes, there is a good road and safe anchorage from a sounder or easterly wind.

Ballentay Port, is about 2½ leagues east from Skerries island, or port Rufhe, upon the main, on the north coast of Ireland; south and somewhat west from Rathlin island, and Dummer's rocks.

Ballery, a town of France, in the department of the Calvados, and chief place of a canton in the district of Bovaux, six leagues south of Caen, and 2½ S.S.W. of Bayeux.

Ballerus, in lepidoce, the name under which the Guadalcan turpis latus is noticed by Jonith, and other old authors.

Ballerus, a species of Cyprinus, with forty rays in the anal fin. Linnaeus Lin. Suec. This fish inhabits the lakes in some parts of Europe, and near the Caffian sea. The head is small, obtuse, and brown in the front; checks and gill-covers alternately blue, yellow, or red; eyes large; iris yellow, with two black spots; jaws equal, lower one curved; back carinated; lateral line straight, variegated with brown dots; edges of the fins blue; dorsal fin placed farther back from the head than the pectoral one; anal fin very broad; tail lunate. Weight in general about a pound; deposits an immense number of eggs in April; grows slowly, is thin, and covered with minute lax scales; the colour above is blackish-blue, yellowish on the sides, silver below, and reddish on the belly; flesh not very good. Bloch observes that the number of rays in the anal fin amount to one more than Linnaeus mentions, and characterizes the species as having forty-one rays in the anal fin; cyprinus pinna ani radis 41. Bloch.

Ballet, or Balet, Baloëto, a kind of dramatic poem, representing some fabulous action or subject, divided into
Ballet is one of the longest and most elaborate articles of the new French Encyclopædia. When M. Fracery seems to have exhausted the subject, it is refued by his colleague in the musical department, M. Guirguen, who has still found much to say on the subject. Ballet, he informs us, is a term that includes three different kinds of exhibition on the lyric stage. In the first, the dance constitutes only a subordinate part of the action represented; in the second it is the principal part; and in the third, the whole business is performed in dancing; and in representing an action in which the performers neither speak nor sing, only dance. The first kind is simply called a ballet; the second a ballet-opera, or opera ballet; an opera with dances analogous to the drama; the third is called a pantomime ballet.

"To treat this subject in its full extent (says M. Guirguen) would require a volume." And an excellent volume has already been written on the subject, by the celebrated Noverre, intitled "Lettres sur la Danse," 1760. In 1754, M. Cahusac had published a pleasing work in 3 vols. "Sur la Danse ancienne et moderne," an historical treatise. But father Mendelssohn's treatise, "Des Ballets anc. et mod. selon la rigle du Theatre," 1682, is perhaps the most curious of them all, in the historical part.

Music is so indispensable from the dancer, that the word ballet may be regarded as a musical term. The music to opera dances used to be furnished by the composer of the airs and recitatives. Handel, Jommelli, and Gluck, distinguished themselves as much by the music of grand ballets, as by the opera itself; as did our countryman Dr. Arne, by the dances in Comus. Of late years, it has been generally assigned to the principal second violin to compose the music and head the band, in the dances between the acts of an opera. After Noverre, and Le Brun the danceplayer, performed this office during many seasons; and their business was executed for a considerable time to the satisfaction of the public and the performers, by the late Sig. Poffi. The airs of many ballets were usually brought from France, particularly those of Rameau; but Teller, a German, about twenty years ago, acquired great reputation by the music of his chaconnes and ballets bergeres. See Dance, and Pantomime.

Ballet, in English Poetry, &c. See Ballad.

BALLEZE, Ballize, or Wallis, in Geography, a river in the peninsula of Yucatan, New Spain, runs northwardly above 200 miles, and discharges itself into the bay of Honduras, opposite to the north end of Turneff island. By the treaty of peace in 1783, it is agreed that British subjects shall have the right of cutting and carrying away logswood in the district lying between this river and that of Rio Honda on the north, which falls into Hanover bay. The unalterable boundaries are the course of the rivers.

BALLIACE, in Ancient Geography, a town of Illyria, in the vicinity of Apollonia. Strabo.

BALLIAGE, a small duty paid to the city of London, by aliens, and even denizens, for certain commodities exported by them; which they claim by their charter, dated the 5th of September, in the sixteenth of Charles II. confirmed by the twentieth rule of the Book of Rates, and by 2 W. & M. cap. 8.
BALLIANI, John Baptist, in Biography, a senator of Geneva, was born in 1586, and distinguished himself among natural philosophers by a Latin treatise, "On the natural motion of heavy bodies," first printed in 1638, and republished in 1645, with many valuable additions. Having palled with honour through many public offices, he died in 1666.

BALLIBAY, in Geography, a market and port town of the county of Monaghan, province of Ulster, Ireland, situated 53 miles north by west of Dublin. This town was in a wretched state; but of late years, since the establishment of its linen market, it is greatly improved, and several new houses have been built. There is a market-house, and a market on Saturdays, at which weirs are purchased to the amount of 1500l. weekly. In the neighbourhood of the town are the extensive bleach-greens and mills of Crieve, at which 50,000 weirs are bleached. Turf is so abundant, that it is sold in the town of Ballibay at 6d. for a horsecarg. A district called the Cahills, in this neighbourhood, is remarkable for producing a heavy crop of flax, equal to twenty-eight fowre of frachted flax to the quarter of an acre, and from one bushel of feed fowed; this is an immense produce, but the quality is proportionally coarse. Sir Charles Coote's Statistical Account of Monaghan.

BALLIBOY, a small port and fair town of the King's county, province of Leinster, Ireland, situated on the Silver river, and giving name to one of the baronies in that county; which, from the average rent, fixted by Mr. Young, and compared with that of the other baronies, seems to contain the worth ground in it. Distance from Dublin 56Irish miles. N. lat. 53° 8'. W. long. 7° 39'. Young's Tour.

BALLIELLA, or BALLIELA POINT, the south-east point of Galway bay, on the west coast of Ireland, eleven leagues north-east by east from Loup's head.

BALLIMONEY, a port and market-town of the county of Antrim in Ireland, not far from Coleraine, and 157 Irish miles from Dublin. It is a pretty large town, and has a good market, especially for linens, 3d. the wick, called Coleraine. Between it and Ballymena is much grazing land, from which Belfast is in great measure supplied with provisions for exportation. N. lat. 55° 4'. W. long. 6° 23'.

BALLIMORE, a small port town, or rather village, of the county of Wigtown, in Ireland, seated on the west side of Lough Scudy. It was a strong garrison of the English forces towards the latter end of the war of 1644, being conveniently situated between Mullingar and Athlone, and deriving great advantage from the lake. The name of this place implies the great town, and it may probably have declined considerably in importance; but the idea of a great town, when this name was given, must have been very different from that now entertained. Distance from Dublin 50Irish miles. N. lat. 53° 26'. W. long. 7° 33'. Collect. Hib. Beaufort's Map, &c.

BALLIMORE EUGFAC, a small town, in a detached part of the county of Dublin, in Ireland, pleasantly situated on the Liffey, over which it has a landsome bridgew; it has decayed on account of the great southern road from Dublin having been turned so as to pass through Killocull. Near this town is Rufsborough, the seat of Lord Milltown, universally esteemed one of the most superb in Ireland, and containing a valuable collection of paintings by several eminent masters. There is also a great natural curiosity in the neighbourhood, the water-fall of Polla-pluca, or the demon's hole, formed by a river which rises in the county of Wicklow, and here falls into the Liffey. Lord Milltown, the proprietor, has spared no pains to afford the natural beauties of the spot, having planted its fine hanging banks, and built several cottages and grottoes for the reception and accommodation of the numerous parties that resort to it. Distance from Dublin 174 miles. N. lat. 55° 7'; W. long. 6° 73'. Wilson's Book of Roads. Dodd's Traveller's Director, 1801.

BALLIMOTE, a village in the county of Sligo, Ireland, which deserves to be mentioned, on account of the flourishing aspect which the linen business wears in the neighbourhood. The great extrensions of the late Mr. Fitzmaurice, brother of the present marquis of Landford, first established this manufacture, which has spread throughout all the adjoining country. Beaufort, Young.

BALLINA, a town of the county of Mayo, in Ireland, situated on the river Moy, and connected by a bridge over that river with Ardara; in the county of Sligo, forming together one town, which is neat and thriving, and has a brisk market for linen every week. Mr. Arthur Young describes its situation as uncommonly pleasing. It has a salmon fishery, which is one of the most considerable in the island, supplying seventy or eighty tons of salted fish, besides the fresh. It was let for 520l. a year in 1776. This town, being near Killala, was soon taken possession of by the French under general Humbert in the late invasion, and many depredations were committed there by the rebels. Its distance from Dublin 120Irish miles. N. lat. 54° 6° 30'. W. long. 8° 59'. Beaufort, Young.

BALLINACOURTY POINT, a cape on the south coast of Ireland, in the county of Waterford, and north side of Dungarvon bay, four miles east of Dungarvon.

BALLINAHINCH, a barony in the western part of the county of Galway, and province of Connaught, Ireland, better known by its ancient name of Connamara, or Connacnenara, which implies the chief tribe on the great sea. This large district is very rude and mountainous, and as might be expected, very thinly inhabited. Some of the hills are very high; especially the vast ridge called Bannaboola, or the twelve pins, which is a well-known landmark, consisting of almost perpendicular rocks. At the foot of this ridge, close to the little village of Ballinahinch, a charming lake spreads itself for some miles; and on the river which runs from it into Roundstone bay, there is a great salmon fishery. On the sides of hills, and in the valleys, which are watered by rivers and small lakes, and sheltered in some places by the venerable remains of ancient woods, the soil is mostly inclined to a black bog; but gravel, sand, or rock lie at no greater depth than from one to three feet below the surface. Great quantities of kelp are made all along the coast, and by mariners with sea wrack, the land is rendered very productive to the fatteried families that inhabit it, who are all little farmers and hardy fishermen. Besides the herring fishery, which employs a great many persons, there is a fishery of fun-fish on the coast from the 20th of April to the 10th of May, which is carried on by the herring boats. Mr. Young says, that one fish is valued at five pounds, and that if a boat takes three fish in a month, it is reckoned good luck. The number of boats employed is from 40 to 50. The indented shores of this barony abound in well-sheltered havens, of which no use is made except by smugglers, who carry on bufinesses very extensively, and almost without interruption. The bays of Kilkeran, Birtberbuy, Roundstone, and Ballinakill, are the largest; and the fine harbour of Killcray, on which is a fishing town, is at the northern extremity of this district. On the promontory of Slymhead, forming the north extremity of Birtberbuy bay, is a light-house. In this barony are made those woollen stockings, known throughout Ireland by the name
name of Connamara, and very good blankets; and the en-
couragement given by the present palliasor (Col. Martin, M. P. for the county) to settlers from Ulster, will probably contribute much to the improvement of what is now one of the most rude and uncivilized districts in Ireland.

A late traveller observes, that even in Galway, within 15 miles of it, Connamara was less known than the islands of the Paci-

fic ocean; and that he was advised not to venture into it. Such a dread had the inhabitants of this town of the clan of O'Flaherty, which possessed it, that death was threat-

ened, by an insurrection over the gate, to every person of that name found within the walls. Yet notwithstanding their ancient character, the above-mentioned traveller, in his ramble through the country, found the people peaceable and friendly, and left savages in their appearance than the peasantry near the capital. They are in general much better

clothed, and are more industrious. The women, like those of Wales, knit as they go from one place to another. Smuggling is very general; and it is considered such an an-
ylum for delinquents, that it is not uncommon for poor peasants to go across Lough Corrib, and enlist; and when they are paid and clothed, take the first opportunity of returning, after which they are never heard of. There are many traces throughout the country of its having been cultivated in an
cent times by some intelligent people. Dr. Beaufort's Me-

moirs. Mr. Young's Tour. Latocnay's Rambles through Ireland.

ballinasloe, a small but neat and well-built town of

the county of Galway, in the province of Connacht, Ireland. It is situated on the west bank of the river Suck (though in many maps it is placed on the east side), in the county of Roscommon, which river from the nature of the country might be easily navigable to the Shannon. It is one of the most thriving towns in the county, having a great wool fair on the 13th of July, and several cattle fairs, at which 100,000 oxen and 150,000 sheep were sold annually from the purlers of Galway, Clare, and Mayo. From the increase of tillage however, and other causes, the num-

ber of sheep is said to have decreased. At one of these

fairs, a show of cattle and premiums have lately been intro-
duced, under the auspices of the farming society of Ireland, for the laudable purpose of improving the breeds. The wool fair was established in 1757, by Mr. Trench, father of the present lord viscount Dunlo, to whom the town belongs; and on account of the more convenient situation of Balli-

nasloke in the heart of the wool country, and the great at-
tention paid to the accommodation of those who frequent it, it has taken the lead of Mullingar fair, and is now per-

haps the greatest for wool in the united kingdom. Several
days generally elapse before the buyers and sellers can agree respecting the price; during which period, the news of the day is eagerly sought as on the Stock Exchange, and

often produces a considerable effect. The number of bags

usually brought to the fair for some years past was about

1500, each containing about eight hundred weight; but this is a fourth part of what is engaged from the country gentlemen at the same time, at a somewhat higher

price. Mr. A. Young has made a comparison between the

price of wool in the fleece in Ireland, and in Lincolnshire;

from which it appears, that for 16 years ending in 1770,

the average price in Ireland was 13 s. 8 d. per fonce of

sixteen pounds; and in Lincolnshire during the same years, it was 9 s. 3 d. for the same quantity. The height of price

in Ireland he attributes to a decrease in the quantity pro-
duced, from ploughing up great tracts of sheep-walks, and

an increase in the consumption. The same causes have con-
tinued to operate in a still greater degree, so that the ave-
grage price for four years ending in 1801, was 18 s. as the

writer of this article was informed by an eminent manu-

facturer. A good deal of large combing wool was bought

indeed at a lower price, but not that fit for making cloth.

In comparing the price of English and Irish wool, it should

be mentioned that in Leinster and Connacht, the bags are

always paid for as wool, which makes an addition of four-
pence per fonce to the price. Yet though the price of wool

is so much higher, such is the difference in the price of

labour, that there is in time of peace a considerable export

of worsted yarn to Norwich and Manchester. The dis-

tance of Ballinasloe from Dublin is 72 Irish miles. N.

lat. 53° 15'. W. long. 8° 58'. Mr. A. Young. Dr. Bea-

fort.

ballinrobe, a market, post, and occasionally an

affice town of the county of Mayo, in Ireland, which is

small, but flourishing, situated on the river Robe, which

runs into Lough Mask. Here are the ruins of an abbey;

and in the neighbourhood a charter school for forty

boys. Within a few miles of it, on the road to Castlebar, are the ruins of Ballinteehe abbey. The part that yet re-

mains entire of this venerable structure, exhibits a fine spec-

imen of Gothic architecture; the rafters, if they may be to-

tered,
termed, being formed of hewn stone joined in a very irregular manner. A view and description of this abbey may be found in Ledwich's edition of Grose's Antiquities of Ireland. The distance of Ballinrobe from Dublin is 120 miles. N. lat. 53° 34'. W. long. 9° 6'.

BALLINTOY, a small town on the northern coast of the county of Antrim, formerly called Belltree, which has a tolerably good bay. A vein of coal was discovered here in 1756, which is wrought with such effect, as not only to supply a saltwork here, but others also at Portrush and Coleraine. A grant of 2000 pounds was made by parliament in 1758 for improving the harbour. The distance from Dublin is 150 miles. N. lat. 55° 14'. W. long. 6° 12'.

A little to the eastward of Ballintoy, on an abrupt and romantic shore, is a small rocky island called Carrick-a-rede. This rock is separated from the adjacent land by a chasm full sixty feet in breadth, and of a depth frightful to look at; at the bottom of which the sea continually breaks with an uninterrupted roar among the rocks. This island is peculiarly well situated for the salmon fishery; but being inaccessible from the water except at one spot, and the turbulency of the sea making it difficult to land even here unless the weather be extremely calm, the fishermen have contrived a singular bridge over the abyss. Two strong cables are extended across the gulph by an expert climber, and fastened firmly into iron rings mortised into the rock on each side. Between these ropes, a number of boards about a foot in breadth are laid in succession, supported at intervals by cross cords; and thus the pathway is formed, which, though broad enough to bear a man's foot with tolerable convenience, does by no means hide from view "the rocks and raging sea beneath," which in this situation exhibit the fatal effects of a fall in very strong colouring, while the swelling and undulations of the bridge itself, and of a single hand rope, which scarcely any degree of tenfion can prevent in so great a length, suggest no very comfortable feelings to persons of weak nerves. Upon the whole, it is a beautiful bridge in the scenery of a landscape, but a frightful one in real life. Hamilton's Letters on the Coast of Antrim.

BALLISTA, or BALISTA, in Antiquity, a military engine in use among the ancients, somewhat like our crofs-bow, though much larger, more forcible, and more complicated in its form. It was used in the besieging cities, to throw in stones and sometimes darts and javelins; and received its name from the Greek ballista, to throw.

Marcelinus describes the ballista thus: a round iron cylinder is fastened between two planks, from which reaches a hollow square beam placed cross-wise, fastened with cords, to which are added screws; at one end of this stands the engineer, who puts a wooden slant with a big head into the cavity of the beam; this done, two men bend the engine, by drawing some wheels; when the top of the head is drawn to the utmost end of the cords, the shaft is driven out of the ballista, &c. According to Vitruvius, the ballista was made after divers manners, though all used to the same purpose: one fort was framed with levers and bars; another with pulleys; another with a crane; and others with a toothed wheel. The ballista was ranked by the ancients in the first kind; and its structure and effect reduced to the principles of the sling: whence some writers called it spinula and juedicibus. Gauthier calls it Balistaria machina, as a sling peculiar to the Balearic islands.

M. Rollin joined the account of the catapulta and ballista together (Arts and Sciences, vol. ii. p. 52.), observing, that though authors distinguish them, they also often confound them. The ballista was at first chiefly used for throwing stones, and the catapulta for lancing darts and arrows; but by degrees they were confounded and indifferently appropriated to both. (Grose Hill. Eng. Army, vol. i. p. 366.) The ballista, however, must have been the heaviest and most difficult to carry; because there were always a greater number of the catapulta in the army. Livy, in his description of the siege of Carthage, says there were an hundred and twenty great, and two hundred small catapultae taken; with thirty-three great ballista, and fifty-two small ones. Josephus mentions the fame difference among the Romans, who had three hundred catapultae and forty ballista at the siege of Jerusalem.

Vegetius says, that the ballista discharged darts with such rapidity and violence, that nothing could resist their force. Atheneus tells us, that Agephratus made one of little more than two feet in length, which shot darts almost five hundred paces. There were others of much greater force which threw stones of three hundred weight upwards of twenty-five paces. The surprising effects of these machines are particularly recorded by Josephus (Bell. Jud. v. 6.); at Jerusalem, they projected stones which beat down the battlements, and broke the angles of the towers; there was no phalanx so deep, but one of them would sweep an whole file of it from one end to the other: and a man who fled by Josephus, had his head taken off by a stone at the distance of three hundred and seventy-five paces. (Roll. in Arts & Sc. ii. 52, 53.) Tacitus too has recorded more than one instance of their force. (Annal. xvi. 9. Hist. iv. 23.)

Among the Saxons, as we have already mentioned (see Artillery), great military engines of almost every kind seem to have been unknown; it is to the middle ages we look for the introduction of any thing like field artillery. William of Poictou (p. 201.) says, that machines for throwing darts and stones were used with great success at the battle of Haftings. The darts that were shot from these machines, as well as from the crofs-bows, were called quarrels; and were pointed with heavy pieces of steel like pyramids, which made them very sharp, and very destructive. The ballista were more frequently used in sea fights than in battles on shore; nor was this particularly the case in the middle ages; Livy (xii. 21.) says, that both scorpions and ballista were used in a similar way by the Tarentines 30 years ago as 281. Nor was it in the ancient times alone that the names and properties and even the uses of the catapulta and ballista were confounded. In the Latin of the middle ages, ballista, in lieu of arbalet, was frequently the term for the crofs-bow; and catapulta for the sling.

Petrus, in his notes on Vitruvius, gives a contrivance similar to that of the ballista, for throwing bombs without gunpowder.

When the ballista is painted in Armory, it is represented as charged with a stone. Guillim and other heraldic writers call it a spear.

BALLISTA, in Practical Geometry, the geometrical crofs, called also Jacob's staff. See Cross Staff.

BALLISTA, or Os Ballisticum is a denomination given by some anatomists to the first bone of the tarsus, otherwise called talus and afteragus.

BALLISTARIUM, or Ballistaria, in Antiquity, flingers in the ancient armies, or soldiers who fought with the ballista.

There were two kinds of ballistarii; the former cast stones and other missile weapons with the hand, and were called manuballistarii, or sometimes simply manuballista; the latter, called caroballistarii, made use of a machine. Some writers speak of a third kind called arcuballistarii, but these are better reduced to the second. The ballistarii were scarce heard of before the age of Constantine.

Ballista
Balisterium in our ancient history is to be differently explained. Sometimes it refers to the men who shot arrows and darts out of cross-bows; at others to the officers of the fleet-bow-men, or directors of the great brakes or engines, with which the walls of any place were battered; and occasionally even to the fuglers. (See Kelham on Doonid. Doon. Book, p. 161.) Our kings, in early as the Conquest, had an officer called Articlibarius or Balisterius Regis, and bands were held in capite of the king, by the service of presenting annually a cross-bow-shot as often as he passed through a certain district. (See Blount's Ten. p. 57, 76, 87.) Walter de Mofely in the thirty-second year of King Hen III. held lands in Surry by the serjeancy of being the king's balisterius (or cross-bow-man) in his army for forty days in the year. (Pat. rot. in turr. Lond.) And it is not perhaps improbable, that the inspector of the works relating to the balists might occasionally bear the same title. Such an officer occurs in the patent rolls of the same king two years before. (Ibid. 57 Hen. 3. m. 8.)

BALLISTES, in Ichthyology. See Balistes.

BALLISTICA, or Balistea, in Antiquity, a military song or dance used on occasions of victory.

The balists were a kind of popular ballads composed by poets of the lower clafs, without much regard to the laws of metre.

BALLISTIC Pendulum. See Pendulum.

BALLISTICA, Ballistics, is used for the art of throwing heavy bodies. F. Mercier has published a treatise on the projection of bodies, under this title.

BALLITORE, in Geography, a small port town in the county of Kildare, in the province of Leinifter, in Ireland, pleasantly situated in a wide planted valley on the banks of the river Grems, a little on the right of the great road from Dublin to the town. It was chiefly a settlement of Quakers, but the number of these has considerably decreased; and the active part taken by many of the inhabita.ts in the late rebellion, caused it to be in a great measure destroyed. The celebrated Edmund Burke received his early education in this town at the school of Mr. Abraham Shankleton, one of the respectable clafs above-mentioned; which school was then held in high estimation, and has been continued by his descendants of the same name to the present day. Distance from Dublin twenty-eight miles. N. lat. 52°. W. long. 6°.51'.

BALLIUM, or Bailey, in our ancient Military Tactics, was used to signify a certain plot of ground within a fortified place. The outer Bailey was that which presented itself immediately on entering the outer gate of the castle, where we usually see a mount of earth to command some distant work of the besiegers. It was separated by a strong embattled wall and towered gate from the inner Bailey, where were commonly the houffes and barracks for the garrison, the chapel, stables, and hospital; and within which, or at one corner of it, in the early castles, surrounded by a ditch, stood the keep or dungeon, generally a large square tower, sometimes flanked at its angles with small turrets: this keep was to our old fortresses, what the citadel is to modern ones, the last resort or rduit of the garrison. (See Grofe Hift. of the Eng. Army, ii. 3.) And here may be noticed, that the small remains of Oxford castle exhibit a remarkable instance of the double Bailey; in the outer space stands the mount, and at no great distance from it (though without the caflle precincts), the church of St. Peter in the Bailey; behind it at a considerable distance stands the ancient Norman keep, in the upper part of which, on the different sides, are round-head arches filled up with masonry, whence, as from the last retreat of the garrison, the besiegers, though in possession of the mount, might be annoyed. The Old Bailey, or outer space near Ludgate in the ancient fortification of London, has perhaps a similar etymology with St. Peter in the Bailey at Oxford.

BALLOCK, in Geography, the name of rocks on the N. W. coast of the island of Flax.

BALLOGISTAN, a district of Hindoflan, in the country of Delhi, bordering on the north of Mewat, and approaching by its eastern limit within twenty-four miles of Delhi. It is eighty or ninety miles long, and from thirty to forty broad. Within the present century have probably seen the rapid decline of the Mogul empire, this territory was fixed by the Balloges or Balloges. whose proper country adjoins to the western bank of the Indus, opposite to Morstan. Some tribes of them are also found in Makran. They are represented as a most savage race, and appear to be very proper neighbours for the Mewatis. This territory is full of ravines, and difficult of access to invaders. It has, however, undergone the fate of its neighbours, and been successively tributary to the Rohilla chief, Nizig Dowrb; to the Jats; and Nadjiuf Cawn. Wellward, it borders on the Sults. See Men. Intro. p. 101.

BALLOON, in Architecture, is used for a round ball, or globe, placed at the top of a pillar, or the like, by way of acroter, or crowning. That on the top of St. Peter's at Rome is of brass saultained by an iron arm, and being at the height of sixty-feveral fathoms, is above eight feet in diameter.

BALLOON, in Chemistry, Balloon Fr, is a large globular vessel, generally of glass, with a short neck, which is employed in a variety of chemical operations, particularly in receiving the products of distillation; in containing gales for experiments in which heat or combustion are used; and for several other purposes. Frequently, it is made with more than one orifice. It is larger than the mattrats, has a shorter neck, and if heated on a sand-bath, great care must be taken to do it gradually on account of the greater thickness of the glass. In making the glass-balloon, it is simply blown, without a bar at the bottom like the mattrats, whereas the receiver is generally filled on at the neck, and therefore must have the above imperfection at the bottom, unless it is afterwards ground off.

BALLOON, in French Commerce, denotes a quantity of paper, containing twenty-four reams.

BALLOON, Ballon, or Ballo, signifies a certain quantity of glass-plates, greater or less according to their quality. The balloon of white glass contains twenty-five bundles, of six plates per bundle: but the balloon of coloured glass consists only of 12½ bundles, each bundle including three plates.

Balloon also denotes a kind of game something resembling tennis.

The balloon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven on and from with the strength of a man's arm, fortified with a brace of wood.

Balloon, or Balloon, is more particularly used among Travellers, for the flat barges of Siân.

The balloons are a kind of briggantine, managed with oars, of very odd figures, as serpents, sea-horses, &c. but by their finnacles and number of oars, of incredible swiftness. The balloons are tied to be made of a single piece of timber, of incredible length; they are raised high, and much decorated with carving at head and stern: some are gilt over, and carry 120, or even 150, rowers on each side. The oars are either placed over with silver, or gilt, or radiated with gold; and the 'dome' or canopy in the middle, where the company
company is placed, is ornamented with some rich stuff, and furthered with a ballad trade of ivory, or other costly matter, enriched with gilding. The edges of the balloon just touch the water, but the extremities rise with a sweep to a great height. Scent are adorned with a variety of figures, made of pieces of mother of pearl inlaid: the richer fort, instead of a dome, carry a kind of fleape in the middle; so that considering the flenderets of the vessel, which is usually 100 or 120 feet long, and scarce six broad, the height of the two ends, and of the fleape, with the load of decoration, it is a wonder they are not overtop.

Ballloon, in **Pneumatics**, a name lately given to an aerostatic machine, employed for the purposes of aerial navigation. See [AEROSTATION](#).

Ballloon, **in Pyrotechny**. See BALLOON, FIRE-WORKS, and PYROTECHNY.

**BALLOTA**, in Botany, horchound. Lin. p. 720. Schrbl. 975. Juff. 114. Clas. dulyniornamymnleri. Nat. Ord. *verticillate*, or *labbita*. Gen. Char. *Cal.* perianth one-leaved, tubular, falver-shaped, five-cornered, oblong, ten-frieked, erect, permanent, equal; mouth acute, patulous, plaited, five-toothed; involucre of linear leaflets at the whorls. *Cor.* monocapetalous, ringent; tube cylinerd, the length of the calyx; upper lip erect, ovate, entire, concave; lower trifid, obtuse; the middle seginent emarginate, large. Stam. filaments four, the two shorter subulate, bending towards the upper lip, and shorter than it; anthers oblong, lateral. PIfl. germ quadrifid; style filiform; stigma slender, bifid. Per. none. Calyx unchanged, folliculating the seeds in its bozon. Seeds four, ovate.

**Efl. Gen. Char. Cal. svaver-shaped, five-toothed, ten-frieked. Cor. upper lip aecurate, concave.** It is observed that this genus has the involucres of gymnopodium; the calyx of matrrium; and the corolla of flaclys.

Species, 1. **B. ningula**, flinkng or black horchound. Smith. Brit. 635. Hudson 260. With. 533. Eng. Bot. 46. “Leaves ovate, undivided, ferrate, calyces dilated upwards, somewhat truncated.” A hairy plant with an acrid pungent smell; fleet two or three feet high, erect, branched, covered with recurved hairs; leaves petioled, ovate, or subcordate, ferrate; flowers numerous, in axillary whorls, pedunculated, leafy, bracteated; bractes bristle-shaped, ciliate, half the length of the calyx; calyx tubular, hirsute, ten-ribbed, plaited or furrowed at the margin, obtusely five-lobed, reticulated with veins, teeth awned, spreading; corolla purple, the upper lip of which is emarginate, hairy, on the outside; the under three lobed, becat with white veins. It is a perennial plant, common in waste places, and hedges, flowering in July. 2. **B. alba**, white flowered black horchound. “Leaves cordate, undivided, ferrate, calyces subtruncate.” This Scandian plant has not yet been satisfactorily determined.

**Propogation and Culture.** The European sorts are never introduced into gardens. The third species is hardy, but the three last require the protection of a stove. They may all be increased by seeds. See Martyn. Miller’s Dict.

**BALLOTADEC, or BALLOTADEC, in the Manoge**, is a leap in which the horce feems as if he intended to kick out without doing it; he only offers or makes a half kick, steering only the shoes of his hind feet. Beenger farther observes, that the horses defined to their airs (croupades and ballotades), ought to have a light and flaky mouth, and an active and lively disposition, with clean nervous strength; for all the art and knowledge of the horsemens can never confer these qualities, which yet are essentially necessary to the perfection of this manage.

The croupades and ballotades are different from curvets, inasmuch, as they are much higher behind, and consequently their time and measure not fo quick and close, but flower and more extended; therefore, the rider should keep his horse’s croup in awe, by fleeting from time to time with the switch, supporting him not quite so high before, and observing to aid with his legs flower, and not fo forward as in curvets.

To manage the strength and vigour of the horse you intend to work upon the vols, in croupades and ballotades, let the line of the volt be larger than for curvets, and let the action of the shoulders be not quite so high; thus you will not only check and confine his activity and lightness, but by raising his shoulders in a less degree, will give liberty to his croup, and he will be enabled to furnish his air altogether, that is, before and behind, better and with more ease; there is still another reason for this, for when the shoulderers come to the ground from too great a height, the shock alarms and disorders the mouth, and thus the horse losing the steadiness of his appy, he never will raise his croup fo’ high as he ought to make perfect ballotades.

**BALLOTING, a method of voting at elections, &c. by means of little balls, which are usually of different colours, by the French called ballotes; which are put into a box privately.**

**BALLTOWN, in Geography, a township of America, in Saratoga county, New York, formerly in Albany county, contained in the year 1790, 7333 inhabitants, including fifty-nine slaves. By the late census in 1796, there appear to be 266 electors in this township. It lies 36 miles N. from Albany, has a Presbyterian meeting-house, and is in a thriving State. The medicinal waters called ‘Balltown Springs,’ from their being situated within the limits of this town, have acquired a celebrity on account of their sanitating virtue, and the accommodations adjoining to them for valetudinarians. The springs are found in the bottom of a valley, or excavation, forming a kind of basin, and comprehending in their extent about fifty acres. In the vicinity of the springs are several neat bathing-houset, and shower-bathes, for the convenience...**
Balltown, or Balltown, a township in Lincoln county, in the district of Maine, containing 1972 inhabitants, 195 miles N. E. from Boston.

Ballus, in Entomology, a species of Papilio (Peb. Rur.), with entire fulvous wings dotted with black; posterior one green, with a brown margin. Gmelin, &c. inhabits Spain.

Balluster, or Ballister, in Architecture, a small kind of column or pillar, whereof ballasters are formed. The word is French, balustre, which signifies the fame, formed from the Latin basilrum or ballistrum, a place among the ancients where the baths were railed in. Ballusters are of divers forms, as well as matters, according to different occasions, and different orders of architecture.

Balluster of the Ionic capital, denotes the lateral part of the volute answering to what Vitruvius calls pulicinata on account of its resemblance to a pillow.

Ballustrade, an assemblage of one or more rows of balusters high enough to rest the elbow on, fixed upon a terrace, or on the top of a building, by way of security; sometimes also to make a separation between one part and another, as though around altars, fonts, &c. See figure of Basilica.

Bally, Ballin, or Bally, prefixed to names of places in Ireland, signifies a town or inclosed place of habitation. It comes from the Irish baile, which O'Brien, in his dictionary, supposes to be derived from the Latin villa, changing v into b, and that both come from collo, on account of the preference given to low situations. General Vallancey derives it from the Arabic babat, a province; and quotes J. Bapt. Pafferi, as explaining the Phenician bafl in the same sense as the Irish baile. But Mr. Ledwich, in his Antiquities of Ireland, observes, that it is plainly the Teutonic baile, an inclosure.

Ballycastle, a sea-port town, in the northern part of the county of Antrim, province of Ulter, Ireland, situated on the west of Fairhead, near the mouth of the little river Glenfleck, and opposite to the island of Raggery. Between this town and Fairhead are valuable collieries, in an abrupt branch which overhangs the sea; a circumstance, however, from which little advantage can be derived, as the unfettered situation of the place, and the prevailing wetter winds, make a day on the coast extremely dangerous, and render it difficult to embark the coals. As the want of capital has always been an impediment to such undertakings in Ireland, application was made to the legislature, on the discovery of the mine in 1721, for aid to work it; and 6000 pounds were granted for this purpose, as well as the large sum of 23,000l, at different times for making a harbour there, and building a pier to protect it; which expence was incurred in the hope that Dublin would be in a great measure supplied from this colliery, and thus be rendered less dependent on the proprietors of the Cumberland mines. The pier, however, has been washed away, and the harbour so choked up with sand, that like many other publick grants in Ireland, it has been productive of little or no national benefit. By the exertions of an individual, some years ago, much coal was procured, and several manufactures were established in the town, but since his death the latter have been neglected. The colliers, however, continue to be worked, and from the latest accounts seem to be productive, though not to the degree that was expected. The coal is said to resemble the Scotch coal, but does not burn so fast. The different fossils commonly situated above it are ironstone, black shivery slate, grey, brown, or yellowish sandstone, and whin-flone. The accidental discovery of an old mine in 1765, which was very extensive, and was found to be a complete gallery, branching into numerous chambers, which were filled in a workmanlike manner, and most have been wrought by persons at all as expert in the business as the present generation, has furnished Mr. Hamilton with an argument in favour of the ancient civilisation of Ireland. As no coal mine at this place is mentioned either by Boote, or by Sir William Petty, the latter of whom visited Ballycastle between 1660 and 1670, and is particular in his account of it; as for many centuries previous to the reign of James I. a work of this nature was not likely to have been carried on; as the cinders of fossil-coal are visible in the cement with which a caille of great antiquity in the adjoining isle of Raggery was built; and as the tradition of the natives refers it to a very early period, he concludes that it must have been worked previously to the eighth century. This opinion seems to be strengthened by Mr. Whitaker's reasons for supposing fossil-coal to have been known to the ancient Britons. Mr. Ledwich, on the other hand, affirms, on the authority of Lombard, that this coal was not discovered and used in Ireland long before A.D. 1652. Near Ballycastle are two mineral springs, one of them vitriolic, and the other chalybite. Distance from Dublin 113 Irish miles. N. lat. 53° 11'. W. long. 6° 16'. Hamilton's Letters on Antrim. Statutes of Ireland. Latonophy's Rambles. Ledwich's Antiquities. Beaufort's Memoirs. Rutty on Mineral Waters.

Ballyclare, a port and fair town in the county of Antrim, province of Ulter, Ireland, ninety-five miles north of Dublin.

Ballyconnell, a small market and port town of the county of Cavan, Ireland, situated sixty-four Irish miles north-west from Dublin, on the borders of a wild and mountainous district. The peasants are hardy and industrious, yet hitherto much deprested for want of encouragement. The women spin a good deal of wool as well as flax, and friezes are made for home use; but every thing is on a very narrow and contracted scale. Agriculture has lately improved, and the culture of wheat has been increased by the establishment of a good flour-mill; and there is also an excellent black-ash near the town. The mineral treasures of this neighbourhood are, however, the most valuable. Coal is found in the adjoining mountain of Slieve-Ruffell, and generally dug out of the side of the hill, in blocks, near the surface. No attention to this valuable concern has yet acciated the proprietors on whose estates this mineral is found in such abundance, and so easily raised. In the mountain of Oxnaugallagh, both silver and lead ore are carried down the stream which flows from it. Besides the, pure sulphur is frequently found; and Fuller's earth is in abundance. There is much pipe-clay also, which is found very soft, and when baked in the sun acquires a proper consistence. Sir C. Coste's Statistical Account of Cavan.

Ballycotton, a village on the sea-coast of the county of Cork, province of Munster, Ireland, inhabited by fishermen, and frequented for fishing. It is four miles from Clonakil, and is from four miles in the neighbourhood. It gives name to a large but dangerous bay, nearly hemispherical, which is remarkable for abundance of
fine flat fish and lobsters, which are chiefly sent to Cork. There is a small island of the same name, which forms one extremity of the bay, and is almost covered, in the season, with the nets and eggs of various sea-fowl, especially puffins. N. lat. 51° 50'. W. long. 5° 59'.

**BALLYDONEGAN**, a bay on the south coast of Ireland, in the county of Cork, on the south side of the entrance into Kenmare river. It has an open entrance, with a good depth of water and anchorage.

**BALLYELA**, a bay in the Atlantic ocean, on the west coast of Ireland, twelve miles south-east of South Arran islands. N. lat. 54° 53'. W. long. 9° 20'. See **Ballyshannon**.

**BALLYGELLY HEAD**, a cape on the east coast of Ireland, in the Irish sea. N. lat. 54° 54'. W. long. 5° 44'.

**BALLYHAVEN**, in Geography, lies within the entrance of Strangford haven, on the east coast of Ireland, beyond Port Ferry on the east side.

**BALLYHAUNS**, a port-town, or rather village, in the county of Mayo, province of Connacht, Ireland, where are the ruins of a monastery; 100 Irish miles north-west of Dublin.

**BALLYHAYES**, a small town of the county of Cavan in Ireland, which has an improving market, and mists for flour and oatmeal. The market-house and the ring of the old town are arched, and built of brick. These antique and fantastic buildings show it to have been once a place of considerable note, being remarkably furnished with all the old-fashioned ornaments that the lords of this county were particularly attached to. This town and the adjoining demesne have suffered much from a long dispute respecting the possession. Distance from Dublin 57 Irish miles north-west.

**BALLYKAIA**, an island on the north-west side of the sea of Azof, and near the northern extremity of it. N. lat. 46° 38'. E. long. 56° 18'.

**BALLYLANY**, a small island in the Atlantic ocean, near the west coast of Ireland. N. lat. 53° 23'. W. long. 10° 16'.

**BALLYLEIGH HEAD**, or *Kerry-head*, the south point of the entrance of Shannon river.

**BALLYLESS BAY**, a small harbour on the north-west coast of Ireland, towards the western point, having Dunsink head for its eastern limit, and directly west from Sligo bay, and east from Bredon haven.

**BALLYMACHUS POINT**, the western point of the entrance into Oyster-haven, without the eastern point of the entrance into Kinfare harbour, on the south-east coast of Ireland.

**BALLYMEHON**, a market and post town in the county of Longford, province of Leinster, Ireland, 58 Irish miles north-west of Dublin.

**BALLYMENAH**, a town of Ireland, in the county of Antrim; ten miles north of Antrim.

**BALLYNAMORE**, a post-town in the county of Galway, province of Connaught, Ireland, eighty-five Irish miles west of Dublin.

**BALLYQUINTON POINT**, a cape on the coast of the county of Down in Ireland, in the Irish sea, at the easterly point of the entrance into Strangford lough; seven miles east of Downpatrick. N. lat. 54° 19'. W. long. 5° 26'.

**BALLYSERAY CAPE**, lies north-west of Ballykinal island, in the sea of Azof, on a peninsula. N. lat. 46° 50'. E. long. 56° 48'. It is also called *Kofa Bethel Sierai Kava*.

**BALLYSHANNON**, a town of the county of Donegal, in the province of Ulster, Ireland, situated on the river Erne, which discharges the waters of Lough Erne into the bay of Donegal, at the distance of about three miles from the sea. It is the principal town in the county, and was formerly of some consequence as a fortified place, though at present it derives its importance chiefly from its salmon fishery. The harbour is a barred one, but at high water is navigable for vessels of 40 or 50 tons burthen up to the waterfall, where is safe anchorage for a great deal of shipping; but the bar is for some hundreds of yards fo exposed to south-western storms, as to render it quite inaccessible during high winds. The salmon leap, which is near the town, has a very beautiful appearance; the fall is down a ridge of rocks about twelve feet high, and at low water forms a very picturesque object. It is one of the principal salmon leaps in Ireland, and when last visited was set for near 11001. It has during the last two years (1802) been much more productive. There is also an ed fishery, which feeds at 3251. 10s. 6d. yearly. Before the fall, in the middle of the river, is a rocky island, on which is a curing-house, instead of the turret of a ruined castle for which it seems formed. The coast of the river is very bold, consisting of perpendicular rocks with grasses of a beautiful verdure to the very edge; it projects in little promontories which grow longer as they approach the sea, and open to give a fine view of the ocean. The town is prettily situated on the rising ground on each side of the river, over which there is a bridge of fourteen arches. It has improved much within a few years, and is acquiring some degree of importance in trade, which would incastrate much more if a strong wall was built to shelter the entrance of the harbour. The completion of the canal which has been undertaken to join Lough Erne to the sea at Ballyshannon, would also be of material service to it. Near the town, the Rt. Hon. Thomas Conolly has established a linen manufactory, viz. twenty houses with two looms in each house, and a certain portion of land annexed to it. The Tyrone Farmers Society has also offered premiums for establishing a linen market at Ballyshannon. A little north of the town of Ballyshannon, on Mr. Conolly's estate, is a large bank of yellow *pyrites*. This town was made a corporation in 1611, and sent two members to parliament; but this privilege has been discontinued since the union. Its distance from Dublin is 101 Irish miles. Longitude 8° 24'. west of Greenwich, latitude 54° 31'. N. Young's Tour. Beato. Dr. Beaumont. M'Farlane's Stat. Account of Donegal.

**BALLYTHEIGH BAY** lies round the east point of the entrance into Bannow or Bannow bay. (See Bannow.) At the south end is a small island called Inch island.

**BALLYVAGHAN**, a bay on the west coast of Ireland, and north part of the county of Clare, in the south part of Galway bay.

**BALLYVARY**, a post and fair town in the county of Mayo, province of Connaught, Ireland, 135 Irish miles north-west of Dublin.

**BALLYWATER**, the mouth of the entrance into Carrickfergus bay, on the north-east coast of Ireland, and the opening of Belfast river. The name is sometimes given to the sea southward along the east coast of the peninsula, of which Strangford lough, or lake, is the west side.

**BALM**, in Botany. See **MELISA**.

**BALM** of *Gilead*. See *Dracocephalum*.

**Balm of Balsam**. See *Balsam*.

**Balm**, in Geography, a town of Germany, in the circle of Upper Saxony, and Hinder Pomerania, 17 miles S. W. of Stargard, and 17 south of Old Stettin. N. lat. 53° 8'. E. long. 14° 48'.
B A L

BALMALA, a town of Africa, in the desert of Ber-
don. BALMAMAT, a town of Asiatic Turkey, twelve
miles west of Karhanfar.
BALMARINO, in the county of Fife, in Scotland, is
the name of a parish within whose limits is a small har-
bour, and the remains of an abbey which bears the name
of the parish. From the former a considerable quantity
of grain is annually exported; and a salmon fishery is es-
ablished near this place in the frith of Tay. The abbey of
Balmarno, which was founded in 1229, for monks of the
Cistercian order, has been a magnificent and extensive pile
of building; but its grandeur is nearly annihilated, and only
a few fragments remain to mark its site and character.
It is about ten miles to the east of Perth.
BALMING. See ENBALNING.
BALMUCCIA, a town of Piedmont, in the valley of
Sofa, seven miles west of Varallo.
BALNAVES, Henry, in Biography, a Scots Protestant
divine, was born in the time of James V., and educated in
the university of St. Andrews. He fi-
nished his studies in France; and on his return to Scotland,
was admitted into the family of the earl of Argyll, and dif-
muled in 1542, for embracing the Protestant religion.
Have
ing joined the murders of Cardinal Beaton in 1564, he was
declared a traitor, and excommunicated. During the siege
of St. Andrews, he was sent by this party to England,
and returned with a considerable supply of provisions and money;
but being compelled to surrender to the French, he was
sent with the rest of the garrison to France. After his re-
turn to Scotland, about the year 1559, he was appointed
one of the commissioners to treat with the duke of Norfolk
on the part of queen Elizabeth. In 1563, he was made
one of the lords of session; and appointed, with other
learned men, to revile the book of discipline. Knox, who
was his fellow-labourer, gives him the character of a very
learned and pious divine. He died at Edinburgh in 1579.
Its writings are "A Treatise concerning justification," and
BALNEARI S S E R V I , in Antiquity, servants or attend-
ants belonging to the baths.
Some were appointed to heat them, called fornici
tores; others were denominated custodii, who kept the clothes
of those that went into them; others alpiti, whose care it was
to pull off the hair; others undinarii, who anointed and per-
fumed the body.
BALNEARIUS FER, a kind of thief who practised
stealing the clothes of persons in the baths; sometimes also
called far balnearum.
The crime of these thieves was a kind of sacrilege; for
the hot baths were sacred: hence they were more severely
punished than common thieves, who flew out of private
houses. The latter were acquitted with paying double the
value of the thing stolen; whereas the former were pu-

Dental, near the coast of Arrascan. N. lat. 19° 50' to 20°
5'; E. long. 93° to 93° 20'.
BALONICHI, in the Materia Medica of the ancients, a
name given by Avicenna, Averroes, and others, to a kind of
camphor, which they describe as coarse, brown, and of
less value than the other sorts. This is probably the name
with our rough camphor, as brought over to us from the
East Indies.
BALONITES, in Geography, a people of Africa, who in-
hibit the banks of the river Ganges; the channel which sepa-
rates Baffo from the main land. Their territory is about
thirteen leagues in length, and about as much in breadth.
The Balontes maintain to intercede with the neighbouring
negroes, either on the continent or islands; and though
they sometimes travel beyond their own limits, they will
permit no foreign negroes to pass their frontiers. Their
religion is idolatry, and their form of government an aristo-
cracy. They allow of no slavery; they are bold, intrepid,
and warlike; but crafty, treacherous, and fraudulent.
Their arms are alphagues, arrows, and sabres. The Balon-
tes are supposed to have gold mines in their country; and
under this idea the Portuguese assembled a large body of
troops at Baffo in 1665, and invaded the country. Yet
the rain of the seafarers rendered their arms and ammunition
useless; and the Balontes attacked them with this disad-
antage so vigorously, with their alphagues and sabres, as
soon to rout them and force them to retire with a consider-
able loss of men, and of all their ammunition and stores.
BALOU, a town of Asia, in Armenia, twenty-five
miles northwest of Cars.
BALQUHIDDER is a parish in Perthshire, in the
highlands of Scotland, and is noted for its mountainous
scenery. Some of the mountains are very high and steep;
among them, those of Benmore and BenVorlich are the
most lofty and conspicuous; the first rising to the height of
3903 feet above the level of the sea, and the latter to
that of 3300 feet. In this parish is a considerable extent
of the ancient Caledonian forest; but it is annually abridged
by the including fytham, which has at length found its way
into these northern regions. Here are also several lakes
or lochs, of which the principal are those of Lochdoidhe,
Lochvol, part of Lochlahuan, and part of Lochearn.
The military road from Strirling to Fort William passes
through this parish. The great inequality of ground pre-
vents the farmers from appropriating any of their lands
to arable; and the pature on the sides of the hills is
chiefly fed by sheep.
BALS, a river of Greenland, which runs into the sea.
N. lat. 64° 30'; W. long. 50° 12'.
BALSAM, in Ancient Geography, Tabwera, a town of Hi-
pania, in Lusitania; belonging, according to Ptolemy, to
the Tardecati. It was in the past called Canopus, near the
sea, and not far from Ama to the west.—Also, a borough of
the interior of Africa, reckoned by Pliny among the
conquests of Cornelius Balbus.
BALSAM, in Chemistry and Medicine, Balsamus, Gr.;
Balsamum, Balsamum, Lat. ; balsam, Fr. Various meanings
have been affixed to this term, which it is of some import-
ance to distinguish, as the oils of natural balsams have been
effected from the earliest ages as some of the most valuable
productions of the vegetable kingdom, have formed the
most precious articles of commerce in the East, and have
been used for medicinal purposes, and about the human
body, as long as the art of medicine and the practice of ad-
orning the perfum have been cultivated.
The term balsam appears to have been originally confined

3 X 2

to
to a certain fragrant viscid juice exuding from a tree in Arabia and Egypt, and now denominated the balsam of Mecca, or Opobalsamum. Hence it was extended to other productions of the same nature; and we may define the true
meaning of a balsam to be a fragrant, oily, viscid, inflammable juice, exuding from various trees and plants, not soluble in water, incapable of putrefaction, andpossessed of the power of preferring animal matter from spontaneous change for a considerable length of time. This latter property has given rise to the term embalming or balsamation of bodies, so universally practiced among the Egyptians.

Balsams are generally more or less acid to the taste, particularly after having been for some time chewed in the mouth. They have the strongest affinity to Resins, from which they seem to differ only in containing a larger portion of essential oil, so that if any of the liquid balsams (turpentine for example) be distilled per se with a gentle heat, an oil rises in considerable quantity, and the residuum is a substance now dry and brittle, scarcely in any respect different from a resin.

Of late years a distinction has been made, and admitted into the French nomenclature, between balsams and resins, in the circumstance of the former containing a portion of the Benzoic acid, which considerably adds to the penetrating fragrance of these substances, especially when warmed, and may be expelled from them by a gentle heat. This distinction was proposed by Bucquet, and has since been very generally adopted. We cannot however allow of its propriety, since it would confine the term to a very small number of substances, even to the exclusion of the original balsam of Mecca and many others to which the term has long been appropriated; and it would extend to the solid and brittle gum benzoin contrary to the quality of *opobalsamum* or *viscidum* which has always been considered as essential to a balsam, so much so that even the solution of sulphur in oil has on this account been termed a balsam.

Balsams are natural or artificial. The latter are composed exclusively belonging to pharmacy, and generally composed of essential oils, resins, and aromatics brought to the confidence of a balsam, sometimes by oil, sometimes by ardent spirit. These preparations are so numerous and often complex, that we shall only mention a few of the most celebrated; but first we shall notice the—

§ 1. Natural Balsams.

*Balfamum Meccae.*—B. *Opobalsamum.*—B. *Gileadense.*—B. *Judaeum.*—B. *Syriacum.*—The genuine opobalsam or balm of Mecca.

This celebrated balsam has preferred almost from time immemorial the high value in which it has been invariably held by the eastern nations. This indeed is partly owing to the exclusive spirit of oriental despotism, which prevents this precious drug from entering the common markets; so that all our knowledge of its properties is derived either from report, or from the rare opportunities which individuals have enjoyed of possessing a specimen of it.

The tree that yields it is the *Amyris*, of which there appear to be several species, all of them fragrant and balsamic. It is commonly obtained by incisions: the *xylobalsum* being prepared from the wood, and the *carpobalsamum* from the fruit. It is chiefly collected in Arabia, in the interior of the country, between Mecca and Medina. According to Bruce, when fresh from the tree, the balsam is of a light yellow colour, a little turbid. It presently grows clear and yellow like honey, which deepens by age. Its smell is exquisitely fragrant and very pungent, giving a sensation like that of volatile salts. This remains for years if the balsam is kept carefully corked. The taste is bitter, acid, aromatic, and astrignent.

The quantity yielded by one tree is very small, seldom more than about a dram daily, which alone must render it an expensive article; but in all probability it might be obtained without much difficulty by Europeans, if it was likely to repay the expense. On pouring a drop of this balsam on a glass of cold water, it spreads itself over the surface in a thin pellicle, which may afterwards be taken off by a pin, whilst the water becomes strongly impregnated with the scent and flavour of the balsam. This is generally mentioned as a test of the genuineness of this article, but it is entirely fallacious, for when long kept the true balsam will not exhibit this appearance, and many of the other thin balsams will show it with as much ease as the opobalsam.

When rubbed with water it becomes milky, and is resolved into a mass resembling lard in appearance. On adding more water it separates altogether, and flows at the top. Spirit of wine highly rectified diffuses this balsam without much difficulty; on adding water, the whole becomes milky. It is also soluble in the expressed and the essential oils. If a solution in olive oil is mixed with water very gradually, it forms a kind of pommaud.

This colly balsam is in the highest esteem among the Turks and other eastern nations both as a medicine and a cosmetic. The Turks take it in the dose of a few drops to fortify the stomach and excite the animal powers: externally it is used as a vulnerary. It may readily be imagined that the oriental spirit of exaggeration should have extolled the superior virtues of this admired balsam; but fair experiments on its medicinal properties are still wanting, nor is it probable that it would be found to exceed the other balsams in this respect, so much as it does in fragrance of scent.

The Mecca balsam is also employed at Constantinople as a cosmetic in the feraglio, according to the testimony of lady Wortley Montague. Under what form it is used does not appear, but its acrimony is such as to irritate the skin very considerably when rubbed on the face unmixed, as the fame eminent lady experienced on her own person. It is scarcely necessary to add that the substance sometimes torn in the shops for balsam of Mecca, and at no great price, must be a mixed and adulterated compound in no degree to be depended on as the true opobalsam.

The dried berries of this tree were formerly kept in the shops, and called, as well as the balsam, *carposbalsamum*; and the dried twigs, *xylobalsum*.

*Balfamum Coparica.*—B. *Copaiba.*—B. *Brazilense*—Copaiba or *Capivi Balsam.*

This balsam, one of the most active and valuable for medicine, is obtained from the *Copaifera officinalis*, Linnaeus, a tall and elegant tree growing in Brazil and several other parts of South America. To procure it, several incisions or sometimes augur-holes are made near the ground penetrating through the bark into the substance of the wood, when the balsam flows out in such abundance, that sometimes in three hours twelve pounds have been obtained.

This balsam is colourless when flowing from the tree; after a while it becomes of an amber yellow, and considerablv viscid, but retains its transparency; it is never known to become perfectly solid. The smell of capivi balsam is fragrant and powerful; to the taste it is bitterish, heating, aromatic, and permanent on the tongue; it stains paper as oil does. It is nearly insoluble in water; but on being long rubbed with it, a kind of milky emulsion is produced, from which however the balsam soon separates and rises to the top. It is readily soluble in fixed and volatile oils, and in spirit.
spirit of wine: the latter makes a very strong penetrating tincture. Distillation readily separates the balsam into an oil which has all the sensible properties of the capiví, and into an infusid resin. If carelessly distilled, with water, from a fifth to half the weight of oil obtained, which is highly fragrant and nearly colourless. The resinum is a resin, at first green and tenacious, afterwards growing yellow and brittle, soluble in alcohol, but not in water. The water with which the balsam has been distilled becomes slightly impregnated with the colour and flavour of the capiví. Distilled per se, or mixed with ashes and subjected to a strong heat, the oil which rises at first fragrant and clear, afterwards bluish, thick, empyreumatic, but not ungrateful to the smell.

The capiví balsam is unquestionably an active substance when taken into the stomach; and its medicinal virtues, though perhaps over-rated, are however very considerable. Like turpentine, it determines powerfully to the kidneys, and impregnates the urine with its qualities, and has therefore been supposed peculiarly suited to diseases of the organs. As its effects, however, are heating and irritating, it is capable of producing much mischief as well as good, and its use is now chiefly confined to the cure of gout and go-norrhœa. It is also serviceable in certain states of hemorrhois and diseases of the rectum, a fact which may well be credited, when it is considered of what acid materials the celebrated Ward's paste is composed. In pulmonary affections it has been used strictly as a subery or balsamic, but it is too apt to produce or increase the general fever, and can seldom be employed with safety in these cases. The usual dose of this balsam is about twenty drops, but it is so virulent that this method of division cannot be adopted till it is warmed. The best form of exhibition is triturated with yolk of egg, almonds or mucilage, and thus united with water into an emulsion. This balsam is easily adulterated with the thinner turpentine or with oils; and the detection of this fraud is often difficult on account of the potency of the smell and taste of the capiví, which covers almost every other.

Balsamum Peruvianum exudes from a large tree growing in Peru, Mexico, Brazil, and other parts of America. See Myroxylon Peruvianum.

There are two species of the Peruvian balsam, the white and the brown; the white balsam is very rarely met with in the shops. It is procured by incision of the bark, but very sparingly, and it soon concretes into a fragrant brittle resin, which is brought over in gourd shells. It is also called the white syrops. It is less hot and more fragrant than the black balsam, and more approaches to the properties of syrops.

The common Peruvian balsam is of a dark colour approaching to black; the smell highly fragrant; the taste aromatic, rather bitter, and considerably acid; the confluence always thick and viscid. Drop it into water; it sinks to the bottom, and refuses to mix with it; but by agitation gives it a fragrant smell and somewhat of the sensible properties of the balsam. It disperses readily in spirit of wine. When mixed with the fixed oils and heated, it is decomposed; its essential oily ingredient, which gave it fluidity, is absorbed by the expirled oil, and a thick tenacious resin remains, which gradually becomes solid in the air. In this insolubility in fixed oils it remarkably differs from the other balsams, nor does it readily mingle with the other balsams. Distilled with water, it gives about a sixteenth of an essential fragrant reddish oil, very sparingly soluble in alcohol. Distillation per se gives a similar oil, but empyreumatic. By regulated heat a small quantity of benzoic acid may be sublimed out of this balsam.

Peruvian balsam is one of the most stimulating of all this species of substances, and is therefore applied with advantage in several diseases. It is also particularly recommended as an external application, where a warm sublimine is required. A tincture is made by distilling it in spirit of wine (Tinctura Balsami Peruvianum, Ph. Lond.), and it enters into several of the artificial or compounded balsamic preparations. The dose of this balsam is from two to twelve grains, and it may be given in the form of an emulsion mixed with water through the medium of yolk of egg. Alcoholic and warm cordial pills are conveniently made up with this balsam, and their virtue is somewhat increased by it.

Balsam affords that it is sometimes sublimed by the second oil that rises from gum benzoin in distillation, digested upon poplar buds, which have a fine terbithous odour, and afterwards mixed with a little of the true balsam. The comparatively low price of the genuine balsam, however, would seem to render this falsification scarcely worth the trouble.

Balsamum Tolufanum is the product of the Tolupera Balsamum, a tree which grows in the province of Tolu, in Spanish America, behind Carthagena. The balsam is obtained by making incisions on the bark of the tree, and is brought over in small gourd shells. This balsam is of a reddish yellow colour, and peculiar; its consistence when fresh is extremely tenacious, but by age it becomes brittle; but in hot weather, pieces of this balsam generally coalesce and adhere to the bottom of any vessel in which it is kept. The smell of this balsam is extremely fragrant and grateful; it has but little taste; when chewed, it sticks to the teeth, and appears almost insoluble in the saliva, but gives a gentle aromatic warmth to the tongue. The Tolu balsam is one of those that contain a notable proportion of the benzoic acid, and is therefore strictly a balsam according to the modern acceptance, and probably owing to the presence of this acid, it readily imparts its flavour to watery liquids, though it appears to be scarcely at all soluble in this fluid. Eight ounces of this balsam boiled for two hours in a close vessel in three pints of water make a very fragrant decoction, which, when mixed with the requisite quantity of sugar, forms the Syrupus Tolufanus, Ph. Lond. In the Edinburg Pharmacopoeia the syrup is formed by the admixture of two pounds of simple syrup recently prepared and not yet cold, with one ounce of the tincture of Tolu.

This balsam is perfectly soluble in spirit of wine. The Tinctura Tolufana, Ph. Ed. and tinctura balsami Tolufani Ph. Lond. are prepared by distilling an ounce and a half of Tolu balsam in a pint of rectified spirit of wine. It is easily soluble in the essential oils, but with difficulty in the fixed. By distillation per se, the sublimed benzoic acid is still given out in a very gentle heat, together with a fragrant empyreumatic oil. On account of the benzoic acid, this balsam burns with a remarkably aromatic penetrating smoke, and was often an ingredient in those fumigations which were formerly so much employed either with a view of purifying an infected atmosphere, or for diffusing a grateful scent. When taken medicinally, either the tincture is employed, or the balsam is united with water by egg or mucilage. Its powers are gently stimulating; but it appears altogether a trudging article of the Materia Medica, except on account of its colour. It is given with more sedative power in pulmonary complaints than the other balsams; and it appears to have some effect in checking or disaggregating the exceedingly offensive fumes of the breath of persons suffering under ulceration of the lungs.

Balsamum
Balsamum Redofis is a balsam described by Murray (App. M.d.), which Spichman relates to be brought from India. In confidence, and other valuable properties, it much resembles the Tolu balsam, but appears to be weaker. Its origin is unknown, and it is supposed to be fictitious. It is seldom seen, and never used.

Balsamum Carpathicum, Carpathian or Hungar balsam, Krummholzbaum, Ger.; called also balsamum Ladanum. This fine balsam is procured from the pinus Mugo and the pinus Ambra, which grow abundantly on the Carpathian mountains, the Tyrol, and many parts of Hungary, Germany, and Switzerland. The balsam is esteemed by the common people as a sovereign remedy for almost every disorder external and internal. The Oleum Tempfionum, or Krummholzol is an oil of turpentine prepared by distilling this balsam, and is in equal repute. For a further description of this and of all the turpentines, which are truly and properly balsams in the usual meaning of the term, see the articles Pinus, and Turpentine, particularly the latter, under which we mean to include most of the resinous products of the different species of fir.

Balsamum Canadense, a very fine fragrant and powerful Turpentine, procured from the Pinus balsamifera, the Virginian or Canada fir.

Balsamum Styrax, florax, or liquid amber. See Styrax.

These are preparations of the Materia Medica formerly in much repute, and compounded of a vast variety of resinous and aromatic drugs, the whole brought to a thickish consistence, so as to resemble the natural balsams. They are but little employed at present. Any preparation in which oil was so far thickened as to be brought to a treacly consistence, was termed, in the older Pharmacopoeias, a balsam, and many of these species were equally used as external and internal applications. We shall only mention a few of these preparations.

Balsamum Locatellii.—Of the former London and Edinburgh Pharmacopoeias. In the former, it was prepared by melting half a pound of yellow wax with about half a pint of olive oil, then adding another half pint of oil, with half a pound of Strafburg turpentine, and when nearly cold, filtering in fixed drams of red faders wood to colour the whole. In the latter, instead of the red faders, balsam of Peru, and powdered dragon's blood were added to the melted wax, oil, and turpentine. Another variety of this preparation used in the Paris Pharmacopoeia, is to employ wax, olive oil, white wine (which was evaporated off the wax and oil), turpentine, faunders wood, and Peruvian balsam.

Balsamum Commendatoris, Baume du Commandeur. — Balsam of Berne. — Wode's Balsam. — Jefuit Drops, or Friar's Balsam. Under all these appellations, and with some variation in the ingredients, was this celebrated balsam known and prepared. In the Paris receipt, a tincture is first made of angelica root and the flowers of hypericum in spirit of wine, in this are dissolved myrrh, olibanum, aloes, florax, benzoin, Peruvian balsam, and ambergris. The whole makes a thick, fragrant, and highly stimulating liquid; which is used either internally as a cordial and supposed vulnerary, or externally to promote the cicatrization of wounds. A judicious reformation of this balsam is retained by the London and Edinburgh colleges, under the name of—

Balsamum Traumaticum, or Tinctura Benzois Compota. This is prepared by dissolving three ounces of benzoin, two ounces of florax, one ounce of balsam of Tolu, and half an ounce of aloes, in two pints of rectified spirit of wine. The Edinburgh college omit the florax.

Balsamum Vite, Balsam de Vire. This powerful medicine was prepared by Hoffman, under whose name it went. It consists of a solution of several essential oils, and a small portion of Peruvian balsam, in highly rectified spirit of wine. It is extremely fragrant and stimulating, and is employed almost entirely as an internal medicine in languors, faintings, violent colic, and other cales that require a sudden and powerful stimulant. The ingredients in the Brandenburg pharmacopoeia, adopted as an improvement of Hoffman's balsam of life, are the essential oils of lavender, nutmegs, cloves, rhodium. wild thyme, cinnamon, lemon, bergamot, and balsam of Peru, diffused in spirit of lavender. The present durable quality of simplifying the pharmaceutical preparations, would probably diminish the number of these essential oils which appears to be quite arbitrary.

A mixture of eight ounces of vitriolic acid, and two ounces of olive oil forms the—

Balsamum Arbitrium, a very powerful external application, in which the corrosive power of the vitriolic is moderated, but it requires to be used with great caution. In preparing it, the acid must be added very gradually to the oil with constant agitation, otherwise part of the oil will be charred and reduced to a hard black mass. When well prepared, it is of a very dark brown colour, and an uniform balsamic consistence.

The last of the artificial balsams which we shall mention, are the combinations of sulphur with oil.

Balsamum Sulphuris, or Oleum Sulphuratun; Ph. Lond. and Edin. prepared by melting in an iron pot flowers of sulphur, with four, or with eight times the weight of olive oil.

The result is a thick, solid, tenacious balsam. Petroleum Sulphuratun is prepared the same way, only with the use of petroleum, instead of olive oil.

Balsamum Sulphuris Terdentimentum. B.S. Anijatum, which are now nearly disused, were prepared by digelling the sulphur in oil of turpentine, in glass vessels on a sand heat, and in the latter case, also adding oil of anise feed. Oil of turpentine readily dissolves the sulphur, and with vichemence when in quantities, so that this preparation should be made in a very large manner. All the sulphur balsams differ from the other balsams in having a very offensive smell and taste. They are hot and irritating, and their internal use is very limited. Externally, the thick sulphur balsam is used in farriery.

Balsam Apple, Male, in Botany. See Momordica.

Balsam Boy, in Geography, lies on the west side of Old Cape Francois, and on the north side of the island of Hispaniola, or St. Domingo, in the West Indies. N. lat. 19° 42′ W. long. 65° 35′. See Baume.

Balsamation. See Embalming.

Balsamelles, in Medicine. Before we conclude the article of balsams, it may be proper to make a few observations on their use in medicine. Of the properties which have been attributed to the internal use of all balsams, none is more ancient, and commonly prevalent than that of heating or vulnerary. This idea appears to have arisen from the observations of their use, when externally applied to a recent wound. If a gash is made in the hand with a clean cutting knife, and the parts are brought together and bound up with a rag dipped in any balsam, and left undisturbed for some days, it...
it is a matter of common remark, that the wound will generally heal without any suppuration, by simple union of the divided parts. However, it is highly probable that the balsam acts, in this case, princially as a cement to keep the divided lips in more complete re-union, and to exclude the external air; for the same application to the surface of an open infected wound, is known by every surgeon frequently to bring on extreme pain and inflammation, and to increase all the danger of too extensive suppuration or gangrene.

The natural balsams are some milder than others, but all have a certain degree of astringency, which renders their indiscriminate use in injuries of the body extremely hazardous, though under due management they may be of essential service. But scarcely a single circumstance which recommends their external use, can apply to internal ulceration or rupture of vessels. The healing power depends chiefly on the mode of application, the degree of topical stimulus, and probably the exclusion of external air; and hence, the value which has been set on balsams as internal vulneraries is entirely lost.

A languid indolent ulcer in the kidney might perhaps be affixed by local stimulating remedies, but when the remedy must enter the stomach, and pervade all the vessels mixed with and diluted by the common circulating fluid, the remedy is no longer local, and the irritation which it produces, is either counteracted during the circulation, or is equally diffused over the whole system. Balsams, therefore, though they are by no means to be despised, are no longer viewed with that degree of partiality which the older physicians entertained for them, and repeated experience has shown them to be sometimes absolutely useless, and often positively detrimental in internal ulceration of the lungs, kidney, or other diseases for which they have been long celebrated.

"**BALSAMON, THEODOR, in Biography, an eminent master of the canon law, flourished in the Greek church towards the close of the twelfth century.** He was appointed guardian of the laws and records, i.e. Nomophylax and Chartophylax, of the church of Constantinople; and he was nominated by the Greek church to the patriarchate of Antioch; but this see being seized by the Latins, never came into his possession. By the emperor Isaac Angelus Comnenus he was flattered, for serving his own purposes in favour of Dofithes, with the hope of being advanced to the patriarchate of Constantinople; and thus seduced, he maintained, in the assembly of the prelates, that the translation of the patriarch of Jerusalem to this elevated station, was agreeable to the canon law, and the prelates acquiesced in his opinion. But after this exercise of ingenuity and violation of conscience, he was deceived and disappointed; for Dofithes was preferred, upon the authority of his decision. Balsamon wrote several learned works on canon law; particularly "Commentaries on the Apostolical Canons, the General and Particular Councils, and the Canonical Letters of the Greek fathers," printed in folio, in Greek and Latin, at Paris, in 1520; and in two volumes folio, in "Beveridge's Pandects of Canons," printed at Oxford in 1672. He also wrote a "Collection of Ecclesiastical Constitutions, which may be found in Greek and Latin in "Juffelli Bibliotheca Canonica," and other learned works. Fabr. Bibl. Græc. t. v. p. 33. t. ix. p. 184. t. xii. p. 47. t. xii. p. 207. &c.

**Balsam, Hugh de, in Biography, an English divine, bishop of Ely, and founder of St. Peter's college, or Peter-houe, in Cambridge, was born, probably, at Balsham in Cambridgeshire, towards the beginning of the thirteenth century. In 1247, he was nominated by the monks of the Benedictine monastery of Ely, of which he was sub-prior, to the see of Ely; but Henry III. refused to confirm the nomination. Balsham appealed to the pope, and the bishopric remained for ten years undecided. At last, however, the pope and monks prevailed. When the prelate was seated in his see, he projected the laudable design of providing education for poor scholars, and instituted a college, since known by the name of Peter-houe. He died at Dodington, in 1288, and was buried in the cathedral church of Ely. By his will he left many books to his scholars, and 300 marks for erecting new buildings. An instrument, dated in 1291, his memory is annually celebrated in his college. The distinction of jurisdiction between the chancellor of the university of Cambridge, and the archdeacon of Ely, was settled in 1276 by this prelate. Biog. Brit.

Balteatus, a species of Elater, of a black colour; anterior half of the wing-cases rufous. Linn. Fv. Suec. A native of Europe.

BALTIEUK, in Geography, a town of European Turkey, in the province of Bulgaria, twelve miles north-east of Yana.

BALTEUS, in Entomology, a species of Cerambyx, that inhabits Lusatia. The thorax is spinous; body ferruginous; abdomen ovate; wing-cases with a blackish band. Linnaeus.

BALTHAZAR, Anthony, in Biography, surgeon at Leyden, published in 1722, "Pathologia chirurgica, &c." 8vo. in which are some judicious observations on hernia congenita, and on wounds of the cerebrum, which he does not consider as mortal. He mentions a hernia of the brain, reaching from the occiput to the shoulder, and persons living to an adult age, who were born with spina bifida. True febrirr are not curable, he maintains, by internal medicines. The work has considerable merit; of the author, however, we have no particular account. Haller Bib. Chirurg.

BALTHAZAR, Christopher, a learned French Protestant, was born about the year 1588, at Villeneuve-le-roi, and, though educated in the Roman church, induced by the study of ecclesiastical history to embrace the reformed religion. On account of this change in his religious profession, he was obliged to abandon the lucrative post of advocate to the presidial of Auxerre, and to remove to Chartres, at a distance from his relations and friends, where he was publicly received among the Protestant sect. He was afterwards patronised by a wealthy young counsellor of Caftres, who, as an acknowledgment for the benefit of his instructions, allowed him a liberal pension. But attached to the Protestant cause, desirous of promoting it, he left the house of his patron, and devoted himself to writing. His talents and zeal attracted the notice of the reformed party, and in 1659, the national synod of London granted him a pension of 750 livres. In his differtations on the subjects in dispute between the Catholics and Protestants, he particularly opposed cardinal Baronius, and his papers having been read and approved by M. Dallé, moderator of the synod of London, were ordered for publication. But being returned to their author, who, soon after died, they were probably suppressed by him on account of the defect of his style, as they could not be found. In his animadversions on the annals of Baronius, he is said to have been so attentive to his style, that he was not able to finish a single page of his work in a day. Of his Latinity, a favourable specimen may be seen in his "Panegyric on M. Fouquet," printed in 1640.

BALTIEUS ORIONIS, belt of Orion, in Astronomy, a part of the constellation of Orion, consisting of three bright stars of the second magnitude, placed nearly in a right line in Orion’s girdle.

BALTHICA, in Conchylogy, a species of Tellina that inhabits the Baltic sea. This shell is roundish, smooth, outside carnation colour. Linn. Fv. Suec. About the size of a horf-bean, and very rarely larger; extremely thin, pellucid, brittle, and white within. Chemnitz, &c.

Balthica, a species of Helix found on the shores of the Baltic sea. This shell is imperforated, ovate, and pointed; with elevated wrinkles; aperture ovate, and very ample. Linn. Fv. Suec. The animal is black, with two tentacula; shell pellucid, and with four whorls.

BALTHICUS, a species of Nautilus, of the smaller kind, that is found adhering to the roots of fucu. This shell is sometimes opaque, sometimes glossy, frequently pellucid; and the wreaths either flat, flattened, ribbed, or tuberculated. It is specifically distinguished by being white, convex, aperture linear, and the first wreath much larger than the others. Schrödt.

BALTIC, or East-sea, anciently called Varisfikoi moré, or the sea of the Varagis or Varagians, in Geography, lies westward of Russia. Ptolemy calls it Vendenius sinus; Tacitus, mare Suevicum; and Pliny speaks of it under the name of Codanus sinus. The Russians denominate it Baltiskoi moré; the Germans the Oder-fee; and the Swedes Otter-fee. That part of it which walks the coasts of the governments of St. Petersburg, Reval, and Vyborg, is called the gulf of Finland, which is above four hundred versts in length, and from a hundred to a hundred and twenty broad; the part extending between the government of Riga and the island of Ciefel, is called the gulf of Riga. The chief harbours in the Baltic are, Riga or Durnamunde, Reval, Ferna, Habfalk, Rogery, known called Baltic-port, Peterburg or Cronstadt, Vyborg, Frendrieksby, and Arenburg in the island of Ciefel. The principal islands in this sea are, Rugen, Bornholm, Oland, Gotland, Ciefel, Dago, Tylde, Mohn, Seiffar, Penfur, Lavenaur, Tyske, and Halland, Cronfadt. There are great fisheries in these parts, and numbers of seals are taken; but far more considerable is the navigation; as it may be computed that every year upwards of two thousand ships of burden pass to and from the Russian ports alone. Much skill and caution are requisite for navigating this sea, and especially the gulf of Finland, both on account of the heavy squalls and gales of wind so frequent here, and the multitude of rocks and shelves with which these seas abound. The water is only brackish, and has a very perceptible current, so that in northerly winds it is almost fresh to the taste. It is asserted, on very good foundation, that the water of the Baltic is every year decreasing; indeed, by repeated observations made in Sweden, it is found to subside at the rate of forty-five inches every hundred years. Mr. Otto (ubi infra) is of opinion, that nothing certain can be determined upon this point. Since the time when the Baltic was confined within its present boundaries, the decrease and increase of its water are, as he conceives, merely apparent; and it may have happened from various causes, that land may have been gained in one quarter and lost in another. Large rivers, which flow with great rapidity, may, for example, have carried with them into the sea a great deal of earth and sand, by which the beds at their mouths may have been raised, and the banks extended towards the sea. The Baltic has Denmark on the south, Sweden to the west, Lapland to the north, and to the east Bothnia, Finland, Livonia, Ingria, Courland, and a part of Poland. It communicates with the Cattegatte to the south by the Sound, the great and the lesser Belt. At Pillau and Memel it communicates with two large lakes, the Frich Haff and Courich Haff, both of which contain fresh water. The waves of the Baltic are less high than in the ocean, but they succeed one another in greater number and with more impetuosity, and thus are more harassing to the ships. In its agitation it deposits amber on the shores of Courland and Prussia. It appears from Tacitus (De Moribus German. c. 44, 45.) that the knowledge which the Romans acquired of the maritime powers of the Baltic was obtained by their land journeys in search of amber. The Baltic is liable to be frozen for about three months in the year, which may probably be in part owing to the frequent
of its waters, which again may be occasioned by the numerous rivers that flow into it. The number of streams which directly or indirectly empty themselves into this sea, amount, according to Buffon, to 403; and among these the Oder, the Vistula, &c., are the most considerable. We are assured by history, that this sea has been sometimes totally frozen during the winter. This was the case in 1733, at which time people could travel on ice from Lubec to Prussia and Denmark; and on this occasion tents were erected in different places for the accommodation of travellers. A similar phenomenon occurred in 1599, and in 1533; and in 1423, people could walk and ride on the ice between Königsberg and Lubec. Journeys of this kind were undertaken, at least years after, not only from Prussia to Holstein, but also from Mecklenburg to Denmark; and this was done likewise in 1459. The frosts of the year 1709, and also of 1740, were also very remarkable. The depth of the Baltic, in most places, never exceeds 50 fathoms. In some few places of the Gulf of Bothnia no bottom is to be found; but in others, quite near the coast, the depth is not more than 50 fathoms.

It has been observed, that the water in the Baltic is cooler even in the hottest summers than that of the other seas. The Baltic has no tides, or is not subjected to a regular ebbing and flowing, as it is surrounded by land, and is united with the North Sea only by the Sound and the two belts; which circumstance has given occasion to its being called the inactive sea, or Mare pigrum. During a long continuance of the well wind, its natural efflux is prevented, and a considerable quantity of water is forced into it from the North Sea; so that it then rises on the coasts a little above its usual level. This connection, however, with the German ocean is sometimes the cause that the ebbing and flowing of the latter, though weak, co-operates with the Baltic, so that traces of their effects may be perceived. See Physical Observations on the East or Baltic Sea, by F. W. Otto, from "Abriis einer Naturgeschichte des Meeres, Berlin, 1792 and 1794, 2 vols. 8vo.

Baltic Port, formerly called Roggywick, was raised to a city town in 1783, and one of the five districts of the government of Reval, or Elefonia, according to the geographical dictionary of the Russian empire in 1782 and 1783. Situated in a bay on the Baltic, in the government of Reval, lat. 59° 22'. long. 41° 1' 3", it has 110 timber houses, 211 inhabitants, and a brick church. This harbour has been greatly improved of late by art. Its trade arises from the fishery, &c.; but it has few or no manufactories.

Baltic Fisheries and Commerce. A considerable fishery is carried on along the coasts of the Baltic. The gulfs of Riga and of Finland contain generally the same species of fish, and the employment which the produce of both occasion is nearly equal. The naturalists of Livonia (Fischer) enumerate in the waters belonging to that province forty-nine different species of fish, among which the salmon, streamings, pike, and lampreys, if not for home consumption, yet for exportation, are the most important. The salmon is caught in almost all the rivers, but those in the Diva and the Narova are the best, though they come far behind those of the Angiangel in delicacy and plumptness; they are exported smoked and salted. The streamings, a degenerate species of herring, are everywhere found on the shores of the Baltic, but especially about Pernau, where they are in such quantities, that 300 of these small fish are bought for three or five kopecks; a ton of them when salted costs from three to six rubles. Formerly they were exported; but the northern herring have annihilated this branch of commerce, which are at present even bought by Livonia, the streamings being not sufficient for the home and the foreign consumption. Yet influences are not wanting of 300,000 of them having been taken at one successful draught. One species of fish quite peculiar to these waters is the kyllo streamings, a smaller and more delicate variety of the true streamings, caught in great numbers in autumn near Reval and Rockryck. They are pickled, and form a good substitute for anchovies and lampreys; and are accordingly, thus prepared, sent abroad to various parts. Not less exquisite are the potted lampreys that come particularly from Narva. The greatest store of the Gulf of Finland consists in flutes, salmon, and carp; even sturgeon are found in the Gulf of Cronstadt, and likewise at times in the Neva. Of the smaller ports of fish with which the government of Vyborg is supplied, a great superfluity, an exceedingly great quantity is brought alive in pierced vessels to St. Petersburg, and there sold cheap at the water-sides, in the barks which form a sort of fish market, and others that lie in various parts of the canals. In winter the transport of frozen fish from the remoter parts of the empire is also very considerable. The Russian commerce, in all the ports, which may be generally termed the Baltic trade, as it is stated by Mr. Tocke, from Hermann and Taube, amounted in 1790 to a sum of 35,750,000 rubles, of which the exports made 21,250,000, and the imports 14,500,000 rubles. Tocke's View of the Russian Empire, vol. ii. p. 53. 436.

BALTIMORA, in Botany (a plant to be named by Linnaeus in honour of F. C. Lord Baltimore, proprietor of Maryland in North America). Long. 63° 10' E. Gaz. t. 169. Clas. Linn, Feug. polygamia meditoria. Nat. Ord. compositae. Species libera. CroSB. junc. Gen. Char. Cal. common cylindrical, leafy, slender, lanceolate, erect; the interior ones shorter. Cor. compound, radiate; corollas hemaphrodite of the dish (eleven); females of the ray five; proper of the hemaphrodites funnel-form, with a five-eleft, tomentose border; of the females ligulate, ovate, trifled, the middle one less. Stam. in the hemaphrodite, filaments five; anther cylindrical. Pist. in the hemaphrodite, germ oblong; style short, stigma none; in the females, germ oblong, crowned with a toothed deciduous calyx; style filiform, very short; filaments two, filiform, longer than the corollae. Per. none. Calyx unlobed. Seeds, in the hemaphrodite none; in the females three-rayed, naked, gibbous at the top. Rec. clay. Eff. Gen. Char. Cal. long, biclinic, many-leaved; ray of the corolla five flowered; down none. Rec. clay.

Spec. 1. B. rothi. Gaz. Fruci. 244. An annual upright plant about two feet high. Stem four-cornered, ciliated, green, ruged at the angles. Branches short, lateral; leaves opposite, foliaceous, ovate, acuminate, serrate, three-nerved, somewhat tomentose; flowers yellow, in terminal panicles; corollas of the disk tomentose, with black anthers. This is a distinct genus from Miller's, although the plant much resembles it. A native of Maryland, near Baltimore. Introduced in 1781 by Mons. Thouin. It flows in June and July.

BALTIMORE, in Geography, a county of Maryland, in North America, lies between Patapocc and Gunpowder rivers; the former separating it from Ann Arundel county on the south and south-west, and Gunpowder and Little Gunpowder dividing it from Hartford county on the east and north-east. It has Frederick county on the west and north-west, Pennsylvania on the north, and Chincapaw bay on the south-east. Besides the rivers which bound it, and between the branches, this county has Back and Middle rivers, between the two former, but they are rather arms of Chincapaw bay than rivers. In this county there are numerous iron works; and it contains 25,734 inhabitants, including 5,717 slaves.
Baltimore, the chief town in the above county, and
the largest in the state of Maryland; ranks in size the fourth, and
in commerce the fifth, in the United States. It is leat
on the north side of Patapsco river, at a small distance from
its junction with the Chesapeake, and surrounds what is called the
Bason, in which the water rises at common tides to the
height of five or six feet, and which is reckoned one of the
finest harbours in America. This bason, says Weld, affords
about nine feet of water, and is large enough to contain
2000 sail of merchant vessels. Along this bason are wharfs
and flores through the whole length of the town. Baltimore
is divided into the part called the town, and that called Fell's
point, by a creek, over which are two bridges; but the
houses are irregularly scattered from the one to the other.
At Fell's point the water is deep enough for ships of burden,
but only small vessels go up to the town. Wharfs have
been built at this point, by the side of which vessels of 600
tons burden may lie with perfect safety. Here many per-
sons have been induced to settle, on account of its contiguity
to the shipping. Upwards of 700 houses have been already
erected there, and regular streets laid out, with a large mar-
tet place. These houses, generally speaking, are considered
as a part of Baltimore, though they apparently form a sepa-
rate town, being more than a mile distant from the other part
of the town. Fell's point is chiefly the residence of lare
people, and of the younger partners of merchant houses,
who are stationed there to attend the shipping. The situa-
tion of Baltimore is low, and it was formerly thought in-
falubrious; but by its rapid increase, and the improvements
attending it, the air is less loaded with vapours, and the
town is become more healthy. The seafon of the year, hiat
favourable to health, is autumn, when the more opulent in-
habitants retire to their country seats, delightfully situated
in the neighbourhood. The principal street, called Market
street, is nearly a mile long, and about eighty feet wide,
and runs nearly from east to west, parallel with the water;
it is crossed at right angles, much after the manner of those
in Philadelphia; by other streets, several houses of which are
well built, leading from the water. North and east of the
town the land rises, and affords a fine prospect of the town
and bay; the town, the point, the shipping both in the
bason and at Fell's point, the bay as far as the eye can reach,
rising grand on the right and left of the harbour, a grove
of trees on the declivity at the right, and a stream of water
breaking over the rocks at the foot of the hill on the left,
all concur to complete the beauty and grandeur of the
prospect.

In 1787, Baltimore contained 1555 dwelling-houses, 1200
being in the town, and the rest at Fell's point. It then con-
ained 1525 souls. The number of the inhabitants of the town
and precincts amounted, in 1790, to 13,503, including 12,255
souls. But the number of houses and inhabitants have since
that time very much increas'd. Mr. Weld, who visited this
place in 1795, says that it contains about 16,000 inhabitants;
among whom are to be found English, Irish, Scots, and
French; but the Irish, of whom many are the principal
merchants of the town, are the most numerous. Since the
war it has received a great accession of French, both from
France and from the West Ind'as islands.

Most of the inhabitants are engaged in trade. They are
mostly plain people, sociable, however, among themselves,
says Weld, and very friendly and hospitable towards strangers.
"There are many respectable families in Baltimore," says
Morfo, "who live genteelly, are hospitable to strangers, and
maintain a friendly and improving intercourse with each
other; but the bulk of the inhabitants, recently collected
from almost all quarters of the world, bent on the pursuit
of wealth, varying in their habits, their manners, and their
religion, if they have any, are seculal, unimproved, and un-
hospitable." The churches and places for public worship
are ten in number; one respectively for Episcopalians, Prel-
byterians, German Lutherans, German Calvinists, Reformed
Germans, Niolhites or new Quakers, Baptist's, Roman Cath-
olics, and two for Methodists. The bell building, and the
handsomest in the town, is the Presbyterian church,
lately erected. At Baltimore there are two theatres, that
are used occasionally; cards and dancing are favourite amuse-
ments, both in private and public assemblies, which are held
every fortnight. They have three incorporated banks in
this town, and the number of notes issued from them, some
of which are for so small a sum as a single dollar, is so great
as almost to preclude the circulation of specie. Gold is
extremely scarce. As for the state of the trade of this
town, Morfo informs us, that, in 1790, it owned 27 ships,
one snow, 31 brigantines, 34 schooners, and 9 sloops; in
all 102, whose total tonnage was 13,562. The exports in the
same year amounted to 2,027,770, and the imports to
1,949,899 dollars. In July, August, and September of this
year, they amounted only to 313,584 dollars; but in the
same months in 1795, they were advanced to 1,675,748
dollars. The police of the town is conducted by a board
of town commissioners, a board of special commissioners, and
a board of wardens; the first board supplies its own vacan-
cies, and is perpetual; the two last are appointed by electors,
chosen every fifth year by the citizens. Baltimore is distant
53 miles S.W. from Elkton, 176 N.E. from Richmond.
in Virginia, 50 N.E. from the city of Washington, and
135 S.W. from Philadelphia. N. lat. 39° 21', W. long. 77° 48'.
Morfo's Geog. p. 353. Weld's Travels through N. Am-
rica, in 1795, 1796, and 1797, vol. i. p. 43.

Balitmore Bay, lies near the extremity of the souther-
most coast of Ireland, between two headlands, and runs a con-
erable way into the land towards the north-east. The
town, or village, from which it takes its name, was formerly
a place of trade, but being plundered by the Algerines in
1621, it never recovered itself. It was one of the Iri-
boroughs, and sent two members to parliament. It stands
on the south point of the eastern headland, in N. lat. 51° 15',
and W. long. 9° 12'; and has a good harbour. The bay
extends from Baltimore point on the east to Mizen head
on the west, which are eight leagues asunder. It has sev-
eral coves or harbours besides that of Baltimore, and contains
many small islands.

Baltimore, in Ornithology, a species of Oriolus, of a
blackish colour, with a fulvous breast and belly, and a band:
on the wing of the same colour. Gmelin. Linn. Syst. Nat.
This is le Baltimore of Briffon, Buffon, &c.; Baltimore bird
of Catesby; and Baltimore oriole of Latham.

"Baltimore birds are found in many parts of North
America, the northern parts of which they occupy in sum-
nier, being seen sometimes as far as Montréal in Canada, where-
they come in May; returning southward in the winter,
which accounts for their being seen in Maryland and Vir-
ginia at that time. They make the nest of soft downy
matter, in the shape of a purse, tying it with threads to the
very extreme forked twigs of the tulip, plane, and hickory
trees; in which they lay their eggs, and rear their young,
free from depredators of all kinds.

"They are called fire-birds by the country people; and
indeed, when in high plumage, their motions from branch to
branch not inaptly resemble a flash of fire." Latham Gen.
Syn. This kind is about seven inches in length. The male
bird
has the head, neck, and upper parts black; rest of the body,
head:
bend of the wing, and latter wing-coverts orange; greater
coverts and quills black; the first tipped with white, which
forms a white bar on the wing; two middle tail feathers
black; four outer ones orange from the middle to the tips;
and the two next orange at the tip; legs and claws black.
The female, according to Buffon, has all the foreparts of a
fine black, like the male; tail the same; wing-coverts and
quills blackish; and those parts of a dull red, which are of a
fine orange in the male.

Baltimore. This is rather shorter than the
true Baltimore. The bill is lead colour; forehead and
cheeks black and yellowish mixed; hind head and nape olive-
grey, marked with a few spots of black; upper part of the
back dull black; lower part of the back, the rump, fore-
part of the neck, breast, belly, sides, thighs, upper tail
covers, and under the wings, orange-yellow, brightest on the
breast and tail-coverts; lesser wing-coverts deep brown; the
greater the same, tipped with dirty yellowish white; quills
brown, bordered on both edges with whitish; the two
middle tail feathers are olive and black confusedly mixed;
and the four outer ones of a yellowish olive; legs and
claws bluish.

This latter bird is described by Linnaeus under the specific
name of Phorus. Dr. Latham, to whom we are indebted for the
preceding minute description, observes, that there
seems to be much confusion and uncertainty between the
true and bastard Baltimore and their females; and that at
least they may prove to be mere varieties of one single spe-
cies; all perhaps referable to one or other sex of the true
Baltimore, in different stages of life. See Spurius.

Baltglass, in Geography, a town of Ireland, in
the county of Wicklow, twenty-five miles west from Wick-
low.

Baltistan. See Little Thibet.

Baltrum, an island in the German ocean, near the
coast of East Friesland, about 4 miles long, and about 14
broad. N. lat. 50° 47', E. long. 5° 6'.

Baltshik, a town of Europeans Turkey, in the pro-
vince of Bulgaria, eighteen miles north-east from Varna.

Balturita, a salt lake of Asiatic Raffia, in the go-
vernment of Orenburg, 144 miles S.W. from O.

Baltzar, Thomas, in Biography, the first great
performer on the violin who visited this country from the
continent, whose name appears in our musical annals; and
the account, which Anthony Wood gives of this extraordi-
nary musician, in his life written by himself, is so charac-
teristically quaint, minute, and amusing, that we shall trans-
cribe it in his own words; as it will at once convey an idea
to the musical reader of the superiority of Baltzar's execu-
tion, and of the rate of music at Oxford during the latter
day of the interregnum.

"Thomas Baltzar," says Ant. Wood, "a Lubecker
born, and the most famous artist for the violin that the world
had yet produced, was born (1658) in Oxon, and this day,
July 24, A.W. was with him and Mr. Ed. Low, lately or-
ganist of Ch. Ch. at the house of Will. Ellis. A.W. did
then and there, to his very great astonishment, hear him
play on the violin. He then saw him run up his fingers to
the end of the finger-board of the violin, and run them
back infenibly, and all with agility and in very good taste,
which he nor any in England fair the like before. A.W.
entertained him and Mr. Low with what the house could
then afford, and afterwards, he invited them to the tavern;
but they being engaged to go to other company, he could
not make more of him play, or for him play at that time.
Afterwards, he came to one of the weekly meetings at Mr.
El-

life's house, and he played to the wonder of all the auditory,
and exercising his fingers and instruments several ways to the
utmost of his power. Wilton (Doctor) thereupon, the pub-
lie professor, the greatest judge of musick that ever was, did,
after his humour some way, slope down to Baltzar's feet, to
see whether he had a huff on, that is to say, to see whether
he was a devil or not, because he acted beyond the parts of man.

"About this time it was that Dr. John Wilkins, after-
wards bishop of Chester, and called the flying bishop, warden
of Watham, the greatest curioso of his time, invited him
and some of the musitians to his lodgings in that cell. pur-
pofely to have a concert, and to see and hear him play.
The instriments and hooks were carried thither, but none
could be perfuaded there to play against him in comfort on
the violin. At length the company perceiving A.W. stand-
ing behind in a corner near the dore, they bade him in
among them, and play, forsooth, he must against him.
Whereupon, he being not able to avoid it, he took up a vi-
olin, as poor Troyius did against Achilles. He abashed at
it, yet honour he got by playing with and against such a
grand master as Baltzar was. Mr. Davis Mell was accounted
hither the bell for the violin in England; but after Balt-
zar came into England, and shewed his most wonderful
parts on that instrument, Mell was not so admired, yet he
played sweeter, was a well-bred gentleman, and not given
to excessive drinking as Baltzar was."

At the restoration of king Charles II. Baltzar was placed
at the head of his majesty's new band of violins. His com-
positions have more force and variety in them, and con-
sequently required more hand to execute them, than any mu-
sic then known for his instrument; as appears by a MS.
collection of his pieces, with which we were presented by the
late Rev. Dr. Montagu North.

Ant. Wood tells us, that this celebrated violinist died in
July 1663, and was buried in the cloister belonging to St.
Peter's church, at Westminster; and adds, that "this per-
son being much beloved by all lovers of music, his com-
pany was therefore desired; and company, especially mu-
cisal company, delighting in drinking, made him drink more
than ordinary, which brought him to his grave." A.Wood's
Life, p. 190.

Balu, or Balov. See Balv.

Balucav, or Jambol, a sea-port town of Crimea,
on the Black sea, with a fine harbour; the only one on this
sea capable of accommodating a large fleet.

Balve, in Geography, a town of Germany, in the circle
of the Lower Rhine, a fact of a bailwick in the duchy of
Wellphalia, situated on the Hohn, 10 miles S.W. from Arent-
berg, and 38 N.E. from Cologne.

Baluma Point, lies on the west coast of Africa, to
the north-east from Cape Roso. N. lat. 12°.

Balus Head, the north-west point of the entrance
into Ballinghikising Bay, on the north-west coast of Irel-

land.

Baluze, Stephen, in Biography, was born at Tulle
in 1630, and as he advanced in years, directed his par-
ticular attention to manuscripts, and to new editions of books, upon
which he believed much critical skill and corrective. His
principal object, however, was ecclesiastical history; and in
this department, such works as the lives and letters of popes,
and other eminent ecclesiastics, histories of councils, and
births. In 1656 he was taken under the patronage of the
archbishop of Toulouse, and he was, after his death, libra-
rian to the famous Colbert. The king created in his favour
a chair of canon law in the royal college, appointed him in-
spector of the college, and granted him a pension. His
"Genealogical History of the House of Avignon," writ-

151
ow, at the instigation of cardinal Bouillen, gave such offence to the court, that the work was suppressed by order of the parliament of Paris, and the author deprived of his places and pension, and sent into exile; nor was he recalled to Paris till after the peace of Utrecht. In old age, he amended himself in writing the history of his native place, under the title of "Historia Tullienni," published in 1717, at Paris, in 4to. He died in 1718, much regretted by his friends on account of his amiable, obliging, and communicative disposition; and honoured amongst the learned for his extensive acquaintance with books and manuscripts. Gen. Dict.

BALZAC, John Lewis Guez de, was the son of a gentleman, whose name was William Guez, of Languedoc, and born at Angouleme in 1595, or 1596. In his youth, he attached himself to cardinal de la Valette, who for two years employed him as his agent at Rome. On his return, he was introduced to court, and much admired. By the favour of cardinal Richelieu he obtained a pension, together with the brevets of counsellor of state, and royal historiographer. His "Letters," first published in 1623, established his reputation in early life, and were long regarded as perfect models in that kind of composition. "With much fine sentiment and beauty of language, they are, however, studied, pompous, and inflated." With regard to style and manner, they form a contrast to the cafe and sprightlines of Voltaire, though Balzac excels in respect to weight of matter. Such was this epistolary writer's reputation, that those who were deferent of being thought "bel esprits" in France, wished to engage Balzac in a correspondence, that they might be in possession of one of his letters. His style became the subject of criticism; and even the morality of his writings was abused, without sufficient reason. Disgusted by this treatment, he retired to his estate at Balzac, on the borders of the Charente, near Angouleme; and there employed his time in study and composition, and in correspondence with his friends, among whom were some of the most learned and eminent of his countrymen. He was deemed a good classical scholar; and he wrote Latin with ease and elegance; and his conversation was unaffected and agreeable. His general character was that of a good man, and a devout charitable Christian. He led a private, even in his life-time, eight thousand crowns of his estate, to be distributed to pious uses. He built two chambers in the convent of captives at Angouleme, where he often resided; and at his death he bequeathed 12,000 livres to this hospital, and he left an estate of 100,000 livres to the poor every two years as a prize to him who, in the judgment of the French academy, of which he was a member, should write the best disquisitions upon a subject of religion. He died in 1654, and was buried, according to his own order, "at the feet of the poor interred" in the hospital at Angouleme. "The French language (says Voltaire, age of Louis XIV.) is under very great obligations to Balzac. He first gave number and harmony to its prose." In early life he seems to have been unduly admired, and afterwards he sunk into unmerited degradation and neglect. His principal works are his "Letters," printed at different times; "Le Prince!" Le Socrate Christien:" "L'Arétirement;" "Entretiens;" "Latin verbes," in three books, of which his "Amyntas," and "Christ victorieux," are most esteemed. All these have been collected in two volumes,folio, and were published at Paris in 1669. Gen. Dict. Nouv. Dict. Hill.

BAMBA, in Geography, the largest and richest province or duchy of the kingdom of Congo, in Africa, situat betwixt the rivers Ambri and Loze; the last of which parts it from the marquisate of Pemba on the east, and the Ambri from the county of Songo on the north. Along the sea-coasts it extends still farther northward to the river Lebunda, and on the south to that of Danda, which separates it from the kingdom of Angola. The governors of this province bear the title of dukes, and are always princes of the royal family, being despotic and arbitrary as if they were really kings. The soil is fertile, and capable of producing all the necessaries of life in great abundance, if it were duly cultivated. The sea-coasts produce a large quantity of salt, which forms a considerable article of exportation. The fishery of the Zambesi, whose skill is the current coin in this and the two neighboring kingdoms, furnishes also a valuable source of revenue. Several authors have added a third kind of treasure in this province, viz. the mines of gold, silver, quicksilver, copper, tin, and iron, which are found in the mountainous parts; but the riches, and even the reality of these mines, have been questioned; and it is certain, that the iron mines are only allowed to be used, and that there are severe laws against meddling with any of the ore. The interior of the country furnishes elephants, flags, buffalos, tigers, civets, and parroquets; and here is a considerable traffic of slaves. The people are numerous, strong, and warlike. In this province is a town of the same name, which is large and populous, distant about seventy leagues from the sea, and in the possession of the Portuguese.

BAMBA, a collection of villages in the kingdom of Demba, in Abyssinia, near the western bank of the lake Taza, or Demba. N. lat. 12° 11'. E. long. 37°.

BAMBALA, in Ancient Geography, a maritime town of India, on this side of the Ganges. Itolomy.

BAMBAMARCA, in Geography, a town of South America, in Peru, and jurisdiction of Patas, or Caxamarquina.

BAMBAN, a town of Upper Egypt, seated on the Nile, about forty-two miles S. S. E. of Luxeh. N. lat. 24° 26'.

BAMBARA, an extensive kingdom of Western Africa, bounded by the Moorish kingdom of Beero to the north, and Maffin, a Foulah state south of Beero, by the districts of Gotto, Badeo, and Marciana, and Nelliga and Soulun, to the east, by Kong to the south, and by Lodamar and Karita to the west. The course of the river Jobbah, or Niger, lies through this country; and its capital is Segu, seated on this river, in N. lat. 14° 10' 30" and W. long. 2° 1'. The language of Bambara was found by Mr. Park, in his travels through this country, to be a form of corrupted Mandingo; and from Mandingo, the king, who resided in this province, he received tokens of favour, though from motives of prudence he was not admitted into the royal presence, and he was ordered to leave Segu. This benvolent prince, in spite of the jealous machinations of the Moorish inhabitants, thought a stranger in direft a proper object of compassion and relief; and probably dissimulated him under an apprehension that he might not be able to afford him effectual protection against their blind and invertebrate malice. This country is beautiful and highly cultivated; and at Kabba, which Mr. Park visited, and which is situated at a small distance from Segu, it bore, according to this traveller, a greater resemblance to the centre of England, than to what he should have supposed to have been the middle of Africa. The shea-trees (see SHEA), from which the inhabitants prepare their vegetable butter, constituting a main article of their inland commerce, abound in this part of Bambara. Whilft Mr. Park travelled through this country, he was much incommoded by the tropical rains; and he was chiefly indebted for his daily support to the dooty or chief man in the several towns through which he passed. This officer seems to possess the authority of mayor in the corporate
towns of England; and it reflects great honour on the police of the African kingdom, or on the benevolent manners of the natives, that it is considered as one part of the county's province to bellow food on the indigent traveller. "To suffer the king's stranger to depart hungry," as they express themselves, is an offence of a very heinous nature. See Africa, and Sogu.

BAMBELE, (glatté lambë), in Littobygy, the name of caprificus phoxinus, Gral. in Gefer's Thierb.

BAMBERG, in Geography, a principality and episcopal city of Germany, in the circle of Franconia, is bounded on the north by the principality of Coburg and the Vogtland, on the east by Brandenburg-Bayreuth and the dioceses of Nuremberg, on the south by the dioceses of Nuremberg and the principality of Schwartzzenberg, and on the west by the episcopal city of Wurzburg. It is about sixty miles long, and forty broad; the soil is good, and produces all sorts of grain, fruit, and wine; and in the vicinity of the capital are rich numbers of laurel, fig, lemon, and orange trees, that this spot is generally called the garden of Italy. The inhabitants also rear a considerable number of cattle. The principal rivers are the Mayn, the Rotach, the Ilz, and the Regnitz. It contains eighteen cities and fifteen market-towns. At the diet of the empire, the bishop, whose revenue is about 750,000 florins, takes the fourth place in the council of spiritual princes. The inhabitants are Roman Catholics. The military consists of one company of 100 men, and 50 hussars.

BAMBERG, the capital of the above bishopric, is said to have derived its name from Boba, sister to the emperor Henry I., and is pleasantly situated on the river Regnitz, in the midst of a fruitful country. It was formerly an imperial city, but is now subject to its bishop. The town is large and populous; and being situated in the centre of Germany, contiguous to seven or eight different states, it is a very great thoroughfare. The streets are wide, and the buildings neat and regular. It has no fortifications, but lies open, and has the appearance of a large village. The cathedral is one of the most magnificent in the empire. The chapter is composed of twenty capitular canons, and fifteen domiciled. The bishopric was founded by the emperor Henry II. in 1106. Among other curiosities deposited in the treasury of this church, are the imperial crown of Henry II., consisting of six plates of gold adorned with precious stones, and another of his empress, composed of two circles of gold richly set with pearls and jewels; and also a folio MS. of the four gospels in Latin, upon fine vellum, in a neat Roman character, with Gothic letters intermixed, and very beautiful minatures; the binding is adorned with pearls and precious stones. There is another Latin MS. in folio, of the four gospels, with a commentary by St. Jerome, and fine miniatures; and a third in Gothic letters, with a binding of very great value; all of which were presented to this church by Henry II. In this city there are several convents of men and women, two palaces, and an university, founded in 1585. The bishop is absolute sovereign of this town and district, and has several castles and royalties in Carinthia and other parts of Germany. He holds immediately under the fee of Rome; and he is joint director of the circle of Franconia with the marquis of Culembach. The benefices in this bishopric and that of Wurzburg are reckoned the best in Germany. Within nine miles of Bamberg, at a place called Pommersfelden, there is a beautiful palace belonging to the house of Schonborn, which may be considered as one of the best in Germany. N.lat. 49° 51'. E.long. 10° 50'.

BAMBERG, NEw, a town of Germany, in the circle of the Lower Rhine, twenty miles south-west of Mentz, and eight south of Bingen.

BAMBINO, in Geography, a spirited Italian composer, who arrived at Paris during infancy, with the company of burletta singers who first performed in that capital the Serva Padrona di Perugia, which gave birth to Rouffeau's admirable "Lettre à M. le Musique Françoise," and raised a party for Italian music, which hasincreased ever since. Bambino was the child, whose judicious accompaniment of the burletta singers on the harpsichord, Rouffeau in his letter has so well described, and recommended to clamy thoroughbark players, who let nothing else be heard but the clattering of their chords. This letter, for which Rouffeau was burnt in effigy at the opera-house door at Paris, has never yet been forgiven, even by those who pretend to admire no vocal music but Italian, or German on that model. See Accompaniment.

BAMBIA, in Ornithology, a species of Turdus that inhabits Cayenne, and is about the size of the common or domestic sparrow. It is spotted; above rufous brown; beneath cinnamon; wings black, with a transverse white band. This is the black-winged thrush of Latham, and lambia of Buffon.

BAMPO, in Commerce, an East India measure, containing five English gills.

BAMBOCCHIO, in Biography, an eminent painter of portraits, landscapes, cattle, &c., was born at Laezen, near Narden, in 1612; and for his real name of Peter Van Laer, they substituted in Italy that of Bambocco, from his uncommon figure, the lower part of his body being one-third part longer than the upper, and his neck so short that it was buried between his shoulders. His genius, however, was very great; and his taste extended to every part of painting. He resided at Rome for 16 years, and availed himself of the opportunities for improvement which that city afforded him. His style of painting is sweet and true, and his touch delicate, with great transparency of colouring. His figures are well proportioned and correctly designed; and though his subjects are deduced from the lower kind of nature, such as plunderings, playing at bowls, inns, farriers' shops, cattle, or conversations, his diligence and execution were so excellent, that his manner was adopted by many of the Italian painters of his time; and he has been justly ranked in the first class of eminent masters. His hand was as quick as his imagination, so that he seldom made sketches or delicas; but having marked the subject with a crayon on the canvas, he immediately finished it. He possessed an astonishing memory, and the idea of any objects which he saw was so strongly impressed on his mind, that he could reproduce them with as much truth as if they were placed before his eyes. The cloze of his life was embellished by an althmatic complaint; and it is said, that in order to terminate his misery, he threw himself into a canal, and was drowned, A.D. 1673. Pilkington.

BAMBOO, in Botan. See Arundo, and Nastus.

BAMBOO Inhut, a Chinese invention, by which a person, who cannot swim, may easily keep himself above water. Four bamboo, two before and two behind their bodies, are placed horizontally, and project about twenty-eight inches. They are crooked on each side by two others, and the whole properly secured, leaving a space for their body; it is put over their heads, and tied secure in two minutes.

BAMBOUGHOUGH, in Geography, a village of England, in the county of Northumberland, near the coast of the German ocean, with a castle said to be built by Ina, king of the Northumbrians, in the year 548. This castle with the estate was purchased by Crew, bishop of Durham, and left
left to charitable uses. One of the trustees, Dr. Sharp, prebendary of Durham, refused in this case, and appropriated a part of it to the accommodation of shipwrecked mariners, and to the purposes of a granary, which served for the supply of the poor with corn, in dear seasons, at a low price. A patrol was kept every fortnight night through the whole extent of the manor, which was eight miles, for the succour of the distressed; and by the mode of firing a cannon from the castle, the place where any disastrous accident occurred was pointed out, and directions given for the neighbouring people to afford assistance. This village is four miles east from Belford, and 24 north of London.

BAMBOU, in Ancient Geography, a river of Africa in Lower Libya, from which extended a chain of mountains as far as Mount Teon Ochena. Phiny.

BAMBOUK, in Geography, a kingdom of western Africa, situated between the rivers Bafing and Falame, which, by their junction with the Kokoro and other streams, form the river Senegal; and bounded on the north by Kajapang and Kaffon, on the east by the rivers Dafing and Brooko, on the south by Konkodoo or Concoudou, and Satado, and on the west by the river Falame and Bondon. The town of Bambook is seated on a stream which joins the river Falame, and lies, according to Rennell’s map, in about N. lat. 13° 24'. W. long. 9° 10'. This country, according to the account of the proceedings of the African association, is inhabited by a nation whose woolly hair and fable complexion denote them to be of the negro race; but their character seems to vary in proportion as the country rises from the plains of its western division to the highlands of the eaf. The inhabitants are distinguished into sects or parties like the people of Wooll and Bondou, by the different tenets of Mahometans and Deits; they are equally at peace with one another, and mutually tolerate the opinions they respectively condemn. Their chief occupations are agriculture and pasturage; but they have made such progress in the arts and manufactures, that they are able to circlet iron, and to furnish themselves with the several instruments of husbandry and war. Their procefs for weaving cotton cloth, the habit of this part of Africa, is difficult and laborious. Their common vegetable food appears to consist of rice, and their animal diet of beef or mutton; a liquor prepared from fermented honey supplies the want of wine, and furnishes the means of those festive entertainments that constitute the luxury of the court of Bambook. The king of Bambook gave to major Houghton a friendly reception at Ferbane, where he refided; but the major did not long survive this visit. The mountains of Konkodoo, characteristically so called because it is the “country of mountains,” extend through Bambook and Kaffon, and are productive in gold. Proceedings of the African Association, by major Rennell, 1798.

BAMBRIDGE, or BAINBRIDGE, Christopher, in Biography, an English divine, was a native of Hilton, near Appleby, in Westmoreland, and a student in Queen’s college, Oxford. By a rapid progress he was advanced, in 1597, to the see of Durham; and in the next year, to the archbishopric of York. Under Henry VII. he regained that royal favour, which had been interrupted in the reign of Richard III., was made almoner to that prince, and employed by him in several foreign embassies. In the reign of Henry VIII. he was engaged in a negotiation with pope Julius II. under a pretence of restoring peace to Europe, but in reality to excite the pope’s enmity against the king of France. Bambridge, attentive to his own interest, contrived so to ingratiate himself with the pope, as to obtain a cardinal’s hat and an informal prebend in the conclusion. He was also appointed legate of the ecleciastical army, which was then besieging Balia. Upon his return home, he manifested his gratitude to the pope by inducing his royal master to enter into an unnecessary war in his defence. Ambition seems to have been the ruling principle of Bambridge; of his learning no evidence remains; and as to his temper, no favourable opinion can be entertained of if we advert to the tragic incident that closed his life. Infamed with repentance against his blood, of Modena, his major-domo, he fell upon him with fury and beat him; and the enraged domestic avenged himself for the insult and abuse, by admonishing to his master a dole of poison. This happened at Rome, on the 14th of July 1575. Biog. Brit.

BAMBUKALAISI, in Geography, a town of Arabic Turkey, in the province of Natal, twelve miles north of Derghin.

BAMBUSA, in Botany, Lin. gen. Schreb. 607. Clafs, "Bambus," species nov. Gen. Char. Cal. none, except glume-like bractes scattered, often three under each spikelet, oblong, painted, concave, keeled, unequal, shorter than the stamens; two opposite, the third leaning on the flat side of the spikelet; spikelets lanceolate, dilateous, compressed, short, nearly flowered. Cor. glume two-valved; valve inferior, oblong, ventricose, acuminate, towards the tip keeled and streaked; inferior lanceolate, flat, with complicated margins, ciliate, a little longer than the inferior, and projecting from it; stamens two-leaved, flat at the anterior side of the germ; leaflets ovate, acuminate, bearded at the tip, membranous. Stam. filaments six, capillary, almost the length of the corolla; anthers parallelipiped, two cleft at the base. Pif. germ oblong; style capillary, two cleft; fylages feathery. Per. none; corolla closes the seed, gapes? lets it fall? seed single, oblong. Obs. The superior follicles in several spikelets examined by Schreber were merely male; he therefore says, “ought not this genus to be transferred to polygamia”? For the rest see ARUNDA.

BAMOS, and NAUSTUS, Cmblin has made two genera of this, under Bambus, and Naustus.

BAMBYCE, in Ancient Geography, a town of Asia, in Affryia, beyond the Ephræths; called also, according to Strabo, Edessa, and Hierapolis.

BAMFF, or BANFF, in Geography, the capital of Banff-shire, in Scotland, stands on a gentle declivity at the mouth of the Deveron, a considerable stream which has its source among the mountains of Aberdeenshire, and after winding through narrow valleys and well cultivated plains, falls into the Moray firth, a little below this ancient burgh. The earliest authentic document we meet with relating to this town dates, that Robert II. by virtue of charter, dated October 7, 1372, conferred on it all the immunities and privileges of a royal burgh; which were afterwards confirmed by James VI. and further by his grandson Charles II. Soon after the union of South and North Britain, this burgh, in common with many others, lost much of its political importance; as by that event it was united with Inverary, Culcin, Elgin, and Kintore, which return but one representative to parliament. Agreeable to the Sirs, or municipal government of Banff, two thirds of its magistrates are re-elected annually. Duff-house, the family residence of the earl of Fife, together with the pleasure gardens and plantations around, which are not less magnificent than the harbour which is defended by a battery, and the shipping; the plain substantial bridge of seven arches over the smooth winding Deveron; the castle of Banff belonging to the earl of Linlatter; the town house and prison, including its handsome spire; the parish church, an elegant and newly built structure; are striking and interesting objects, with respect
to the general appearance and commercial consequence of this flourishing sea-port town. The industry of its inhabitants is sufficiently manifested in their various employments; and those of condition fit a laudable example in the improvements carried on in the immediate vicinity; so that in all likelihood Bamff bids fair to accumulate wealth under circumstances favourable to the spirited exertions of those engaged in commerce and trade. The salmon-fishery extends about four miles on the Deveron. It belongs to the earl of Fife; and it yields him a yearly rent of 1250L. The right of this property, together with some land, was, in A.D. 1470, by reason of the poverty of the burghers of Bamff, alienated to perpetuity for a small annual fine-duty or fine for the purpose of keeping the parish church and prison in proper repair. Before the reformation, there was a convent dedicated to the Virgin Mary, which belonged to the order of Carmelites, or white friars; its house and lands were annexed to the old college of Aberdeen, in A.D. 1617; and in the year 1752, these were purchased by the present earl of Fife. The ecclesiastics, both episcopal and presbyterian, are on the belt terms with each other. The former are under the jurisdiction of the bishop of Aberdeen; and the latter is under the presbytery of Fordeyce. The unfortunate James Sharp, archbishop of St. Andrews, the arch-episcopal see of Scotland, was born in the castle of Bamff, in May 1613.

The parish of Bamff is about six miles in length and two in breadth; its surface is beautifully diversified, and the soil is generally good, though of different qualities. The greater part is kept in pasturage, on which a number of black cattle are annually reared. Population of the town in 1800, 3371. Bamff is about 165 miles north of Edinburgh. In the vicinity of this town is Duff-hount, the magnificent mansion of the earl of Fife. This was built after the designs of the late Mr. Adam. It is enriched with fluted columns, sculptured cornices, and statues, vases, &c., which give peculiar elegance to its external appearance. The internal is splendidly furnished, contains a large, well-selected library, and many valuable paintings, &c. Cordiner's Antiquities and Scenery of Scotland.

BAMFORDSHIRE gives name to one of the counties in Scotland; it is bounded on the north by the Moray firth, on the west by the counties of Moray and Inverness, and on the fourth and east by Aberdeenshire. It extends about 36 miles in its longest diameter north and south; and its average breadth is about 16 miles. Within its boundaries are included twenty-four parishes, and two royal boroughs. The surface of the country is agreeably diversified with hill and dale, well-watered with rivers, and ornamented with several feasts and their annexed plantations. The principal of these belong to the duke of Gordon, earl of Findlater, earl of Fife, and lord Bamff. Part of the county is mountainous; but the lower lands, and those in the vicinity of towns, are in high cultivation. Its principal rivers are the Spey, which partly divides this county from Morayshire; the Deveron, which separates it from Aberdeenshire; the Thurn, Conglas, Axon, and Fiddich. Some valuable minerals are found in this county; and great quantities of honeys and whettomes are obtained from a hill in the district of Balvenie. Several mountains are noted for their elevated summits. Of these Cairnorgam, about 4500 feet in height, is the chief, and is reckoned among the highest of the Grampian hills. That of Belrinnes runs to the height of 2660 feet above the level of the sea, and Knockhill is estimated at 2500 feet. At Portfoy, near the north coast, is a stratum of serpentine, called Portfoy marble, also a species of granite, which when polished exhibits various figures and characters, some of them resembling those of the Arabic and Hebrew alphabet. A great number of tumuli are featured over the hills near the coast; and some druidical antiquities are in this district. The population of this county, according to the parliamentary report in 1829, was 53,675. BAMIAN, or Bamiyan, a city which some have referred to Khurasan, in Persia; and others, with greater propriety, to that part of Independent Tartary, called great Buhthara, in its southern limit, at the foot of Mount Caucasus, or near that part of this range of mountains called Paropamisus, and Hindu Koh, and not far from the ancient Alexandria. Bamiyan belongs to the same portion of Bucharria which includes Gaur, and lies between this province and Cabul. It is eighty-eight geographical miles from Ghizni, N. lat. 34° 30'. E. long. 67°. It gives name to a district that extends from Balk towards the east, or the kingdom of Cabul. This famous city, denominated the Thebes of the east, is situated on the road between Buhthar, or Balk, and Cabul; and they reckoned eight manzils, or days' journey, from Cabul to Bamiyan. Like Thebes in Egypt, it is entirely cut out of an inflected mountain, and the valley round it is called, in the language of the country, the Tagavi of Bamiyan; Tagavi being synonymous with Purghan or district. Nearly to the south are the ruins of several buildings of mastenry round a small conical hill; on the summit of which are the remains of the palace of its ancient kings. A rivulet, rising in the adjacent hills, goes through the ruins of Ghalguleh and the Tagavi of Bamiyan, and falls into a small lake, from which issue four rivers, the Hirmand, the Larkali-Sind, the rivers of Buhthar, and of Kunduz. The city of Bamiyan consists of a great number of apartments and recelles, cut out of the rock; some of which, on account of their extraordinary dimensions, are supposed to have been temples. Some of them are adorned with niches and carved work; and there are some remains of figures, in reliëf, which have been destroyed or disfigured by the Mussulmans. Some remains of paintings on the walls are still to be seen; but the smoke has almost obliterated them. In the Ayeen-Akkey it is said, that there are about 12,000 of these recelles in the Tagavi of Bamiyan; and this account is confirmed by the general report of travellers. The country of the Afghanis, as far as Buhthar and Balkhan, abounds with these recelles, called Samach'hes in the language of the country, or Samajes in Perifi. The most perfect are at a place called Mohi, on the road between Bamiyan and Balk; but as they are situated among precipices, the Mussulmans have not thought of using them as habitations; the paintings with which they are adorned appear quite fresh. The attention of travellers is particularly attracted by two colossal statues, which are seen at a great distance. They are ereft, and adhere to the mountain from which they were cut out. They are in a fort of niches, the depth of which is equal to their thickness; and in the Ayeen-Akkey, the largest is said to be eighty ells high, and the other only fifty. But these dimensions are exaggerated; and the truth seems to be, that they are only fifty cubits high. At some distance from these, there is another about fifteen cubits high. Authors are divided both as to their sex and their names. A late traveller says, that the drapery is covered with embroidery and figured work, which was formerly painted of different colours; one seeming to have been red, and the other retaining the original colour of the stone, or having been painted grey. According to Dr. Hyde, one of these statues is called Surkh-But, or the red idol, and the other Khink-But, or the grey idol. Between the legs of the male figure is a door leading into a spacious temple, at the entrance of which are stationed a few wretched Banyans, who sell provisions to travellers. According to Perfi explanatory, Bamiyan must have existed before
before the flood: but the followers of Buddha infilt, that it was built by a religious man called Shama, supposed to be the fame with the patriarch Shem, and that his posterity lived there for several generations. Hence Balk-Bamian is said to have been originally the place of abode of Abraham, who, according to scripture, and the Hindu sacred books, removed with his father to distant countries to the westward. According to Diodorus Siculus, Bamian existed before Ninus; for this historian, as well as the Periwan authors, has mistaken Balhac for Bamian; which he describes as situated among steep hills; whilst Balhac is situated in a low, flat country, and at a great distance from the mountains. The natives look upon Bamian, and the adjacent countries, as the place of abode of the progenitors of mankind, both before and after the flood; meaning by Bamian and the adjacent countries all the country from Sifian to Samarcand, reaching towards the east as far as the Ganges. This tradition is very ancient, and is countenanced equally by Perian authors and the sacred books of the Hindus.

Bamian, as well as Cabul and Balk, were at an early period in the hands of the Mufcilmans. There were even kings of Bamian; but this dynasty lasted but a few years, and ended in 1215. The kings and governors resided at Ghulgech, called at that time the fort or palace of Bamian. It was destroyed by Genghiz Khan, in the year 1210; and because the inhabitants had preferred to refil him, he ordered them to be butchered, without distinction either of age or sex; and in his brutal rage, he spared neither animals nor even trees. He ordered it to be called in his own language Mau-balig, or the 'city of grief and sorrow'; but the inhabitants of the country called it, in their own dialect, Ghulgech, which word used also in Perian, signifies 'the cries of woe.' To have rebuilt it would have been ominous; and, therefore, they erected a fort on a hill to the north of Bamian, which is called to this day the imperial fort. This fort was also destroyed by Zengis the Ulbeck, in 1228, and has not been rebuilt since. The city of Bamian is represented in the ancient legends of the country as the fountain of purity and holiness; and was called Para-Bamian, or Baniyan the pure and holy, and the district of Baniyan might also be called Para-defa, the pure and holy country. It is now barren, and without a single tree; but, according to the sacred books of the Hindus and of the Buddhists, it was otherwise formerly. Tradition also informs us, that the number of inhabitants was at one period so prodigious, that the trees, underwood, grass, and plants were destroyed. The vegetable foil being no longer protected, was in the course of ages washed away by the rains; and it is certain, that the foil in the valleys is very fertile, and the whole district, in its present state, is a most enchanting and delightful spot. The country to the caufward of Baniyan, as far as the Indus, is the native country of the vine, and of almost all the fruit-trees we have in Europe; there they grow spontaneously, and to a great degree of perfection. When the natives find a vine, an apple-tree, &c. in the forests, they clear all the wood about it, dig the ground, and thus the fruit comes to perfect maturity. "When we are told in scripture of Noah cultivating the vine, we may be sure (says captain Wilford, ubi infra), that it was in its native country, or at least very near it." Baniyan, though not mentioned by name in Nonnus's Dionysiacs, is well described by him as the abode of the benevolent Brongus, who lived in Samach'es, or recelles artfully excaved in the mountains. Brongus was the Bhranga of the Paranas; and had several children, who ascended the throne of Caluga, after their father had forsaken the world. Baniyan appears also to be the town called Dralloca by Ptolemy; which is derived from the Sanscrit Drañalata, and implies the stone-city: towns before being merely an assemblage of huts. Its distance and bearing, says captain Wilford, from Cabul, or Orthosena, the present city of Cabul, puts it beyond doubt. See captain Francis Wilford's "Observations on Mount Caucasus," in Asiatic Researches, vol. vi. p. 495.

BAMMAGURNA, in Ancient Geography, a town of India, on this side of the Ganges. Ptolemy.

BAMMAKOO, in Geography, a town of the Mandoa country, in Western Africa, seated on the river Niger, where it ceases to be navigable, about 150 miles below its source. Here the river descends from the high land of Manding into Bambara, on the eastward, with a rapid and furious course; after which it glides smoothly along, and affords an uninterrupted navigation to Housa, and probably by Kaffina to Wangarab. It lies about fifty miles short of Kamahil; and it is reckoned by the natives ten journeys only from Sego. By Mr. Parke's bearings corrected, it lies from Sego W. 25° S. distant 178 geographical miles. N. lat. 12° 54'. W. long. 5° 20'.

BAMMONITIS, in Ancient Geography, a country of Aia Minor, which Strabo places in the vicinity of the river Hals.

BAMOTHAAL, a city of Palestine, beyond Jordan, belonging to the tribe of Reuben, seated in the plain through which lay the confufe of the Arnon. Josh. xiii. 17. In this city was a high place consecrated to Baal, the idol of the Moabites.

BAMPTON, in Geography, is an ancient market town in the county of Devon, in England. Polwhic afferts that it was a Roman station; but this is not proved by his description of the parish, nor by any discoveries that have been made relating to that people. It is seated on a branch of the river Exe, and is also watered by the river Batham, over which is a strong stone bridge. The town is nearly encirclcd with hills which confine a high fly of lime-rock stones. These are burnt on the spot, and the lime used by the neighbouring farmers in mellowing the foil of their lands. Bampton is governed by two postrests, two conftables, and other inferior officers, who are annually elected at the lord's court. The principal manufactory of the place is serges. This was formerly a borough, and sent two members to parliament, whose expenses were defrayed by the inhabitants; but this privilege has long been loft. It gives name to the hundred, and includes within the parish two small villages, whose chapels have only monthly service. The town is irregularly built, and extends about half a mile in length; containing 302 houses, with 1364 inhabitants. Here is a large church with a lofty tower, and the church-yard, which is extensive, contains two yew trees, distinguated for their age and magnitude. The market is held every Saturday, and here are two annual fairs. Bampton is 167 miles west of London, and about twenty-two N. W. from Exeter. Polwhic's Hilerry of Devonshire, vol. ii.

BAN, a fort of smooth fine muflin, which the English import from the East Indies. The piece is a yard broad, and runs about twenty yards and a half.

Bann and Bans. See Bann and Banns.

BAN island, in Geography, is the most southerly of the Ladrones, north of Nev Guinen, in N. lat. 11°, and E. long. of the eft end 142°. Between this and Bato island, on the north is a rocky island.

BAN, Arriere. See Arriere.

BANA, in Ancient Geography, a town of Arabia Felix. Ptolemy.

BANABAUSI, a town of India, on this side of the Ganges. Ptolemy.

BANABA, a town of Afn, in Mesopotamia. Ptolemy.

BANAGHER, in Geography, a market and town of
of the King's county, in the province of Leinster, in Ireland, which, before the union, returned two members to the house of commons. Here was an excellent endowment for a school, and another bridge over the Shannon, on which river it is situated, but it is a very inconsiderable town. Its distance west from Dublin is 63 1/2 miles.

BANAMATAPA, a town of Africa, in the country of Monomotapa.

BANANA, in Botany. See Musa.

BANANA Bird of Jamaica, in Ornithology, the name under which the orbis litorum of Scopoli and Gmelin is figured in Brown's Nat. Hist. Jamaica; and Albion's Birds. — The banana or Indian banana, is the Musa italica bananovira of Gmelin, and bananula of Buffon.

Species, 1. B. guineensis. Asbl. Guian. 548. t. 217. A tree growing about ten or more feet high, and about seven inches in diameter. Its bark is grayish, and its wood whitish and light. Leaves alternate, ovate-oblong, toothed, sharp, green and smooth on the upper surface, pale, and slightly toothed on the lower; petioles short, with two small deciduous stipules at the base of each. The largest leaves are five inches long and two broad; flowers yellow, in axillary and terminal racemes, with a single bracteal to each pedicel; berry black. A native of the island of Cayenne, flowering in May.

BANASA, or BANASSA, in Ancient Geography, a Roman colony established in Africa, in Mauritania Tingitana. It was seated on the river of Subur, at a considerable distance north-east from Gontiana.

BANAW, in Geography, a river of Prufia, which runs into the Frisch Haff, two miles W. N. W. of Heilgerbeul.

BANAZ, a town of Attic Turkey, thirty miles N. W. of Karahisar.

BANDURY, a town of Oxfordshire, in England, lies on the river Cherwell, at the distance of 17 miles north of Oxford, and about 74 miles west from London. This town is supposed to occupy the site of the Roman station named Branaunae, as many coins, and a Roman altar, have been found here. The latter was placed in a niche under the fig of an inn, which was called from thence the Altar-Rome-inn; but this has been converted into a private house, and the altar is probably demolished. A castle was built in this town by Alexander bishop of Lincoln, soon after his consecration, which occurred in 1123. This building was preserved as one of the dioecesan palaces from the above date till the first of Edward VI. when bishop Holbech conveyed it, with about thirty other manors, to the king and his courtiers. The estate was afterwards given by queen Elizabeth to the bishopric of Oxford in exchange for other lands. In the time of Henry VIII, 1543, it was valued at 141. 13s. 10d., but at the time of the above exchange it was estimated at 491. 15s. 9d. a year. This place was made a borough by queen Mary, who being pleased with the inhabitants for their support of her against lady Jane Grey, granted them a charter, and invested the town with several privileges. This charter was altered by James I., who appointed the government of the town to consist of a mayor, twelve aldermen, and six capital burgesses. A new charter was granted by George I. A.D. 1718, and the town is now governed by a mayor, high steward, recorder, six capital burgesses, and thirty freemen, a town-clerk, and two sergeants at arms. The church, which is a large handsome structure, was built by the above bishop Alexander, who is supposed to have been buried in the chancel under a tomb, on which is a recumbent mitred figure. The outer walls of the church are ornamented with a number of carved heads of men and animals. Banbury has been particularly noted for the number of Puntian inhabitants, who have been furnished by Ben John, and other dramatic writers. Camden speaks of it as famous for cakes and ale; and when Holland translated his Britannia, he changed the latter word, and printed it cakes and seal. Here are a free-school, two charity schools, and a workhouse.

Many military transactions and battles have taken place in this town and neighbourhood; and the castle of Banbury is often mentioned by historians as the scene of repeated sieges and retreats. In the time of Edward IV, the earl of Pembroke and lord Stafford entered this town with their army, and a battle was fought between them and an army under the command of the earl of Warwick. After the battle of Edge-hill, the parliament had a garrison of 800 foot and a troop of horse in the castle, which was surrendered to the king in a few days, who gave up it with other garrisons to the Scots general.

The navigable canal from Coventry to Oxford passes by this town, and at the distance of about five miles it is conveyed through a tunnel by a tunnel three quarters of a mile in length. In the grounds adjoining the Ram inn is a well of sulphurated water; and a short distance from the town is another spring of chalybeate water. The Pityes-aureus, or golden fire stone, is often found here in digging wells. A number of the inhabitants are employed in the manufacture of plufh and shag cloth; great quantities of which are annually made here, and sent to London and Portugal. Banbury has a weekly market on Thursday, and seven annual fairs; one of which is appropriated for the hiring of terrains, and is provincially called a mop. The principal fairs in the neighbourhood are, Wroxton-house or priory, belonging to the earl of Guildford; and Boughton castle, the property of lord Say and Sele. The first was a priory of Angoulême canons, founded by Michael Blet, an ecclesiastic, in the reign of king John. Banbury lends one member to parliament, contains 352 houses, and 2777 inhabitants. Bray's Sketch of a Tour into Derbyshire, &c.

BANC, BANCUS, or BANS, in Law, denotes a seat or bench of judgment. See Court. See Bancus, or the privilege of having a bench, was anciently only allowed to the king's judges, qui fumma autonomia judicium. Inferior courts, as courts baron, hundred courts, &c. were not inferior to that prerogative, and even at this day, the hundred court at Fyrbridge in Norfolk, is held under an oak at Heywood; and that of Woolfrey, in Herefordshire, under an oak, near Ashton in that county, called Hundred-oak.

BANCA, in Geography, an island of the East Indies, extending from S. lat. 3° to 15° S., to S. lat. 1° 50', and from E. long. 105° 5' to E. long. 105° 25'. The latitude of Capt. M'Clintock's anchorage at three leagues distance from the northern coast, deduced by the dead reckoning, was 1° 25', S. and long. 105° 27', E. from Paris. It lies on the east side of the island of Sumatra, opposite to the river Palam.

Bang
BAN

BAN

bang in that island; on which the sovereign of Banca, who is posseflor also of the territory of Palambang, keeps his constant residence. He maintains his authority over his own subjects, and his independence of the neighbouring princes, in great measure, by the alliance of the Dutch, who have a settlement and troops at Palambang, and who enjoy the benefit of a contract with the king of Banca for the tin which his subjects procure from thence; and which, like the king of Bantam, with regard to pepper, he compels the miners to deliver to him at a low price, and he sells it to the Dutch at a still higher price, agreeably to his contract. This island is celebrated throughout Asia for its tin-mines, which were first discovered in 1701 or 1711, and which since that time have yielded immense quantities of ore, and appear to be inexhaustible. It is dug chiefly in seven places, which are under the direction of Chinese managers, that provide and pay the labourers, who arc also, in general, of that nation. These miners reduce the ore into metal by employing wood as fuel in their furnaces, and not coal or coke, which is seldom found free from sulphur as to not to affect the malleability of the metal. It is therefore sometimes preferred to European tin at the Canton market; and the profit upon it to the Dutch company is supposed to be not less than the sum of 150,000 pounds. The tin is delivered by the managers of the mines to the king at Palambang for five rix-dollars per 153 pounds, and by him to the Dutch for 15 rix-dollars, equal to about 58s. per cent. English. Raynal, and others, state the quantity of tin received by the Dutch company at 2,000,000l., but it appears that they take at least 3,000,000l. Very little, however, comes to Europe; in 1778, 700,000l. were sold in Holland at f. 42 per 100l., but the greatest part goes to the Chinese market. Stavorinus's Voyage to the East Indies, by Wilcock, vol. i. p. 357. Stenton's Embassy to China, vol. i. p. 305.

BANCA, Straits of, lie between this island and Sumatra; which, on its eastern side, forms the western side of these straits, and its southern extremity forms the northern side of the straits of Sundal. Through these straits there is a safe navigation from the China sea, except near the northern entrance, where a shallow lies off, and another within it, so that it is necessary for a ship to found in that situation. Capt. Marchand, in endeavouring to gain the entrance of these straits, experienced strong currents, some letting to the E.N.E. others to the E. and others to the E.S.E. He therefore renounced the idea of going out of China sea by the straits of Banca, and determined to fall by another strait situated more to the eastward, between the island of Banca and that of Billiton. This strait is known under the names of Gafpar's, Biliton's, or Clement's strait; and has been much frequented in passing to and from the China sea. See Marchand's Voyage, vol. i. p. 98.

BANCALA, a kingdom in the island of Celebes.

BANCALIS, a town of the island of Sumatra, in the kingdom of Acheen. — Also, a bay on the north-east coast of this island, in N. lat. 1° 15'. E. long. 100° 7'. 43 leagues west of Malacca; it is in Bower's chart, which is a branch of that of Malacca; is large, and affords good anchorage, and its navigation, as far as Bancalis, at the south extremity, is safe. BANCAPOUR, a district of Hindostan, in the country of the Mahattas. — Also, a town of this district. N. lat. 1° 55'. E. long. 75° 15'.

BANCAPOUR, Sanore. See SANORE.

BANCK, Laurence, in Biography, a Swedifh lawyer, was born at Norcopin, and after returning from his travels in France, Italy, Spain, &c. acquired great reputation as professor of the civil law in the university of Franeker, where he occupied for 15 years. He died on the 13th of October in the year 1662. In 1649, he published a Latin work "On the Tyranny of the Pope over Christian Kings and Princes," and in 1656, "Rome triumphant, or the Inauguration of Innocent X." But his principal work was his edition of the famous book of "The Tax of the Roman Chancery," in which are fixed the prices of abolition for the mold, heinous and infamous crimes. This edition, formed by a collation of the most ancient copies, both printed and manuscript, was printed at Franeker, in 8vo, in 1651; and several other editions have been, before and since, printed at different places. Julien, in his "Prejuges legitim. contre le Papisme," i. i. p. 305, &c. published the particulars of these taxes. Banck's edition of these taxes, and some others, have been referred to the clafs of prohibited books, in the "Index" of the Inquisition, as corrupted by heretics; but enough remains in uncontroverted editions to induce worthy Catholics to lament that such taxes should ever have disgraced the church. Gen. Dict.

BANCK, Peter Vander, an eminent engraver, was a native of Paris, and received instruction in the art of engraving from the celebrated Francois de Poilly. About the year 1674, he came over to England, and married; but not receiving recompence answerable to his labour as an artift, he was reduced to penury, and to dependence on the brother of his wife. He died at Bradford in 1697, and left his plates to his widow, who sold them to great advantage, and left an easy fortune.

His chief employment was engraving of portraits; and he was the first in England who engraved them on fo large a scale. Like many of Poilly's disciples, his great merit consists in the laboured neatness and management of the mechanical part of the art. In England his productions will be always esteemed, as they preserve the best resemblance of many eminent persons who were living at that time. Strutt.

BANCO, Bank, or Fou, in Geography, a maritime and fortified town of Asia, in the kingdom of Siam, seated on an island formed by the river Menam. N. lat. 13° 25'. E. long. 101° 5'.

BANCOFE, now Fort Victoria, lies on the Malabar coast of India, contiguous to Rajapore. It has a good harbour, and a great trade for falt, &c. from Bombay, whither it makes returns in cattle.

BANCOFT, Richard, in Biography, archbishop of Canterbury in the reign of James I. sprung from a good family at Farworth in Lancashire, and was born in September 1544. Having finished his education in the university of Cambridge, he rose by quick gradations to very distinguished preferment. He was sent on several embassies to the Pope. The Puritans were the objects of his bitter invectives. Accordingly, in a sermon delivered at St. Paul's crofs, on the 9th of February 1589, he accused them, in very intemperate language, of ambition and covetousness; alleging that the principal cause of non-conformity and schism was the prospect of plundering bishops, feizing the endowments of cathedrals, and fermenting for the remainder of the church revenues; and accusing the laity among the non-conformists of an intention to divide the bonds of property, and to introduce a community of goods. He strongly represented the danger of permitting private men to controil the authority, and violate the constitutions of the church, exposed the absurdity of extemporary prayers, and maintained the divine right of bishops, in terms which, in the judgment of Sir Francis Knollys, one of the queen's counsellors, were injurious to the supremacy of the crown. This sermon, preached, as Strype supposes, at the instigation of archibishop Whitgift, furnished ample evidence of Bancroft's inveterate hostility against the Puritans. As one of the commissioners for ecclesiastical causes, he adopted rigorous meafures for the suppression of herefy and schism; and he was an avowed enemy to sects and innovations of every kind. Writings against episcopacy, or recommending any other mode of church discipline, were treated
treated by Bancroft as seditions, and he pursued their authors as enemies to the state. His zeal recommended him to ecclesiastical preferment; and in 1579, he was advanced to the see of London, and the management of the ecclesiastical affairs of the kingdom devolved upon him. In the celebrated conference between the bishops and the Presbyterian ministers, held at Hampton court in 1603, Bancroft took an active part; and when the king required satisfaction in the three points of communion abolition, and private baptisms, he undertook to explain and vindicate these branches of ecclesiastical discipline, as they were exercised in the church of England. In the prosecution of this conference, and with a view to its speedy termination by an act of authority, he moved the king, that an ancient canon, that "Schismatics are not to be heard against Bishops," should be revived; and that, according to a decree of an ancient council, which prohibited any man to plead against his own subscription, thence of the opponents, who had subscribed the communion-book, should be set aside. These absurd and unjust proposals were rejected by the king. When Dr. Reynolds, on the part of the non-conformists, moved for several alterations in doctrine and discipline, the bishop fell upon his knees before the king, praying that care might be taken to provide a praying clergy, as the services of the desk were too much neglected, and the duty of a parish priest wholly restricted to the pulpit; that till men of learning could be procured for every congregation, homilies should be read, and their number increased; and that pulpits might not be turned into batteries, from which every malecontent might be allowed to vent his spleen against his superiors. These requests, whether well or ill-founded, were evidently pointed against the non-conformists. Upon the lord chancellor's taking occasion to argue against pluralities, and expressing a wish that some clergymen might have single coats before others had doubles, adding also, that he had belotted benefits in the king's gift upon this principle, the bishop of London replied, "I commend your honourable care that way; but a doublet is necessary in cold weather." The good bishop, it is said, spoke feelingly, for he had himself experienced the comfort of warm clothing. In 1604, bishop Bancroft was elected and consecrated to succeed archbishop Whitgift in the see of Canterbury; and in this high station he retained his intolerant principles, and pursued the same measures against the non-conformists. To this purpose lord Clarendon (Hist. vol. i. p. 88.), in his early days, testifies, that "if he had lived, he would quickly have extinguished all that fire in England, which had been kindled at Geneva, and would easily have kept out that infection which could not afterwards be so easily expelled." For the rights of the church, the archbishop manifested a jealousy, which involved him in a contest with the judges; against whom he exhibited to the lords of the council, complaints of their encroachments on the ecclesiastical courts in granting prohibitions; but these complaints were over-ruled by the unanimous opinion of the judges, which Coke jauntily calls the highest authority of the law. In the interior discipline of the church, the archbishop was rigorously exact, urging a strict conformity to the rubric and canons, and making no allowance for diversity of opinion. He enforced subscription to the articles in the most unequivocal terms; and it appears, that, not long before his death, forty-nine clergymen were deprived of their benefices for not complying with his rigid requisitions. In 1610, he proposed to parliament a plan for increasing the revenues of the church, by improving the tithes, redeeming lay impropriations, and reforming the practice of mortmain by repealing the statute of mortmain. Parliament wisely refuted this project, which seems to have been the last public act of the archbishop's life; for he died of the stone, at his palace at Lambeth, in November 1610, aged 67. His library was bequeathed to his successors in the metropolitan see of Canterbury. Besides his sermon against the Puntans, we have only two tracts, written by him before his advancement to the episcopal dignity, in defence of the church against the non-conformists, entitled "Dangerous Positions," and "Survey of the pretended holy Discipline." The prominent features in the character of this prelate were intemperate zeal and intolerant severity; and if he rendered any services to episcopal power, the general cause of Protestantism owed him little obligation; for nothing could be more inconsistent with the fundamental principle of the reformation, than the restraint and prohibition of that freedom of judgment and choice in the province of religion, which had been afforded and maintained by the predominant party on their separation from the church of Rome. Bancroft, however, though his principles were narrow and temper rugged, possessed a degree of understanding and of activity of spirit, which fitted him for public business, and which enabled him to occupy important stations in the church with a considerable degree of reputation. A letter written by this prelate to king James I., in vindication of pluralities, is preferred in the advocate's library at Edinburgh, and may be read in the first volume of Sir David Dalrymple's Memorials. Biog. Brit. Gen. Biog.

**BAND**

In a general sense, some small, narrow ligament, wherewith a thing is tied or fastened.

We say, a **flay-band**, a **bow-band**, a **hat-band**, &c.

**Band**, in Architecture, denotes any flat, low member, or moulding. This amount to the same with what is otherwise called a **fist**, from the Latin fistus, which Vitruvius uses for the same thing, and sometimes **fists**, **phial**, &c.

**Bands of Columns**, properly denote a kind of embelishments surrounding shafts of **rubic** columns, at certain distances, by way of decoration.

These are sometimes plain, sometimes picked or vermiculated, and sometimes carved with decorations of low relief, which are different in every different band.

Columns enriched with these bands, are sometimes called **banded columns**.

**Band** in matters of **Artillery**, denotes a hoop of iron used about the carriage of a gun.

Such are the **nave** bands, which are iron hoops binding the nave at both ends.

**Band**, in Geography, a town of Persia, in the province of Mekran, 400 miles S.S.W. of Candahar.

**Band**, Bandum, is used, in Middle Age Writers, for a flag or banner.

**Band of Soldiers**, in Military Language, so many as fight under the same flag or ensign. Thus Romulus called those who fought under the same manipule (a handful of men) being then used for a flag) **manipulus militum**.

Formerly bands especially denoted bodies of foot; and the French formerly called their infantry **bandes Françoises**.

**Band of Pensioners**, is still retained, to denote a company of gentlemen, who receive a yearly allowance of 100l. for attending the king on solemn occasions. See **Pensioners**.

**Band**, trained. See **Trained Bands**.

**Band**, gives the denomination to a military order in Spain, instituted by Alphonso XI. king of Castile, in the year 1332. It takes its name from bands, band, or red riband, which comes across over the right shoulder, and under the left arm of the knight. This order is for none but the younger sons of nobles; the eldest sons of grandees are excluded; and, before admittance, it is requisite to have served at least ten years, either in the army or at court. They are bound to take up arms for the Catholic faith against the infidels.

3 Z 2 The
The king himself is grand-master of the order.

Bands of a Saddle, denote two flat narrow pieces of iron, nailed on each side the bows of the saddle, to retain these bows in the situation which makes the form of a saddle. Bands, to put a bow in the, is to nail down the two ends of each band to each side of the bow.

Besides the two great bands, the fore-bow has a small one called the wither-band, and the hinder-bow another to strengthen it.

BAND, in Surgery, is a long flip of linen, or some other convenient material, intended for the purpose of binding and surrounding any part of the body. When a band has been rolled up for use, into a cylindrical form, it is generally denominated a Bandage or Roller.

BANDA, in Geography, the chief island of a group, which comprises five others, lying close to one another, and situated in the Eastern Pacific ocean, east of Celebes or Macassar, south of Ceram, and south-east of Amboyna, in about 8° lat. 5° 45'. E. long. 130° 20'. These islands are called the Spice or Nutmeg isles, and also Banda isles from the name of the principal of the group. Banda formed the second government of the Dutch to the eastward. The first of these islands is Neira or Nera, where the chief settlement of the province; it has a spacious and commodious harbour, but difficult of access; ships anchor under the cannon of two forts, called Belgica and Nassau, the first landing on an eminence, and commanding the whole extent of the island and of the harbour, as well as fort Nassau; the defence of it would require a garrison of 400 men, and yet the whole number of military in all the islands scarcely ever exceeds 300. The next island is that of Banda, Lanter, or Lontnot; it does not exceed eight British miles in length from east to west, and the greatest breadth at its eastern extremity may be five; it has a fort and two or three redoubts. The third and fourth in importance are Pulaway or Way, and Pulorun or Rohn: upon the first of which is a small fort, and upon the other a redoubt. The other two are Roizenen or Roiligen, in which there is a redoubt, and to this island the Dutch company often banish their traitor prisoners; and Gunong-api, Gunong, or Gampez, which has a volcano constantly emitting smoke, and often flames. The nutmeg-tree is chiefly cultivated in Neira, Gunong, Ay or Way, and Lanter or Lontnot; and it flourishes not only in the rich black mould, but even amidst the lava of Gunong, which is the highest isle, the summit being 1940 feet above the sea. When the English admiral Rucker took possession of the islands of Ambonea and Banda, which he besieged without resistance, in February and March 1766, the annual produce was about 163,000 pounds of nutmegs, and 46,000 pounds of mace. The hurricane and earthquake, in 1778, almost annihilated the nutmeg-trees in Banda, so that the Dutch have become the dupes of their own artificers. From 1766 to 1798, the English East India company imported 8,177,110 of cloves, 93,732 lb. of nutmegs, and 46,730 lb. of mace, besides considerable quantities of each in private trade and privilege goods, amounting to about a third part of the above. The ground being chiefly occupied with these precious plantations, cattle and grain, &c. are imported from Batavia, at the distance of three or four weeks' sail. The inhabitants of the Banda isles were found to be 5763. The English were expelled from Lanter and Rohn, at a period prior to the mischief of Ambonea; but siezed the whole Spice islands in 1796, and relieved them to their Batavian masters by the treaty with France in 1801.

To the government of Banda belong likewise several other islands in the neighbourhood, known by the appellations of the South-Eastern and the South-Western isles. Their inhabitants are in alliance with the company, and furnish a considerable quantity of provisions, consisting of wild-boards, flags, lea-cows, and other articles of food, which they barter at Neira for piece-goods and other necessaries. This trade, however trifling, is very beneficial to the inhabitants of Banda; and it is supposed, that the province would derive greater advantages from it, if the company would allow Neira to become a more commercial place; but this is prevented by the suspicious policy of the government. Stavrinus's Voyages, by Wilckens, vol. ii. p. 331. vol. ii. p. 418.

BANDAGE, in Surgery, is a Strip, a Fillet, Swathe, or Band, applied to its peculiar use upon any member, &c. of the Body. The nature and application of bandages are a study of considerable importance in Surgery; for it often happens that the cure of a local difaffede depends principally or entirely upon the proper management of them. Their habitation and form are various, according to the nature of the cafe, and the intention to be fulfilled in their application. They may be made of linen, flannel, leather, or cloth composed of different materials. Each of these bandages, on particular occasions, has its respective advantages or disadvantages.

The common properties and uses of bandages are—
1. To retain parts in their situation.
2. To separate or keep them finder.
3. To expel morbid fluids, or prevent their accumulation.
4. To confine dressings or external remedies.
5. To compress and obftrute certain veifels.

The bandages most in use are made of linen or cotton. The linen used for this purpose must have been already worn, but still sufficiently strong, cut according to the direction of the threads, and without seam. In order to prevent its unravelling, the edges may be slightly fitched round, but it ought to have no folds whatever.

As it is often impossible to procure long bandages of a fingle piece, and we are consequently obliged to form them of feveral different pieces, they should be fewed together with back-flitches, leaving ends feveral lines in breadth, which must be doubled round and beat perfectly smooth and even. But in order to avoid all the inconveniences that attend the use of bandages made of linen, it will be best to use fillets of flain expressly manufactured for the purpose, which may be woven of different breadthsis and lengths.

Bandages are diftingui{h into fingle bandages, which confit of a fingle piece, and compound bandages, which are conftructed of feveral different pieces, and whose application requires greater trouble and skills. They are also divided into general bandages, or fuch as may be applied to feveral different parts of the body, and particular bandages, which are adapted only for one particular part.

Every fimple bandage conffits of a beginning, middle, and end. The beginning and termination are named its ends; and when the bandage is rolled up, they are called headis. The middle part of the bandage is called its body. When we roll up one end of the bandage to the other, we have a fingle-headed bandage; but when we roll up each end separatey only towards the middle, it is then termed a double-headed bandage. In order to apply any bandage properly, it is neccessary that it should firit be rolled up tight and perfectly even. The operator, when he applies it, holds its head between the thumb and fore-finger of one hand, in such a manner that it lies directed upwards in the band, and the end that has been rolled off is held down with the other hand upon the part till it is sufficiently secured by several turns. In rolling out the bandage, the head must run as close
close as possible to the dissected part, and constantly be turned towards the surgeon; the bandage should never be rolled out too far, and the head should be held neither too tight nor too loose. When we wish to remove the bandage again, we should not pull it forcibly off from any part to which it may adhere, but previously wet it with warm water. It is then cautiously drawn off from the dissected part, and in winding it off, that part of the bandage which has been rolled off is alternately lifted out of the right hand into the left hand if necessary.

To the simple bandages belong the circular bandage, the spiral bandage, the retaining, the expioid, the creeping, and the uniting bandages. To the compound bandages are referred the eighteen-headed bandage, the many-headed bandage, the T bandage, and in some cases also the To-

nique. Some bandages receive their apppellations from the names of the parts to which they are applied, as bandages for the head, eyes, ears, nose, neck, breast, back, belly, &c.

The eighteen-headed bandage may be formed of several (suppose three) pieces of linen, about a foot in length, and ten or twelve inches in breadth, more or less according to the length and thickness of the limb, and all three are laid at the middle over each other. At the middle they are fewed together longitudinally, after which each of them is cut through on each side, till about two fingers breadth from the middle, into three equal parts, which form nine heads on each side. But as in this mode one head covers the other, there always remains a slit between the heads, by which means the limb is unequally pressed upon and secured. This defect may be remedied by arranging the cuts in such a manner that the heads of the middle piece of linen are always covered by a slit and the half of two heads of the two other pieces of linen. This will be the case if, as Lo-

effer advises us, we give the first piece of linen four, the second three, and the third again four heads. See the Many-

headed Bandage.

In cases of compound fractures, in which the bandages are frequently foiled, it will be more convenient, as Definiit, advises, to use a bandage consisting of eleven separate fillets of linen, each a foot and a half in length, and four fingers broad. Four of these are to be laid at the bottom, three in the middle, and again four at the top, at the side of each other: and thus we obtain a twenty-two headed bandage of a more convenient construction. This bandage may still be improved by cutting the middle fillets shorter than the lowest, and the upper shorter than the middle; by which means the bandage will apply far better to the part. Should now any of the fillets be foiled, we have the advantage of being able easily to substitute another in its place; for we need only to few the new fillet to the old one, and draw it by means of the latter through between the rest, without deranging any of the other parts of the bandage.

The Circular Bandage. This bandage may be of various lengths and breadths; it is rolled upon one head, and is used for securing small dressings, such as lint and com-

presses. It is applied in such a manner that one turn entirely covers the other, so that only the last turn is visible.

Retentive Bandage. This is a common simple bandage, which is used for retaining dressings in their proper situation; and it is applied sometimes with circular, sometimes with spiral, and sometimes with creeping turns.

The Neck Bandage. A fillet, two feet or two feet and a half in length, is laid across over the head in such a manner that the ends reach down on both sides to the shoulders; and over this another fillet, five or six feet in length and two or three fingers broad, is rolled round the neck with circular turns. The two ends of the first fillet are then doubled back to the head, and secured to the circular turns with pins; by which means the circular turns are prevented from slipping off, an accident that is particularly to be expected when the neck is long.

Deflexion Bandage. To support the head, is formed with a small fillet, which is laid upon the head in the direction of the sagittal future, so that one end slips over the nose down to the breast, and the other over the back of the neck till between the shoulders; and another larger fillet, sixteen or eighteen feet long and three inches broad, which is rolled upon two heads. The middle part of the latter is laid upon the forehead over the first fillet; it is then carried over the ears, round the head, to the back of the neck; its heads are then shifted to opposite sides, brought forwards under both sides, then carried backwards over the head, and laid again, carried under the neck over the breast, the heads shifted again, and the rest of the bandage laid round with circular turns. The surgeon then takes hold of the two hanging ends of the small fillet, crosses them back over the head, and passes them together, or to the other turns, after having drawn the patietl's head straight.

The Expoliter, or Hesident Bandage. This is a common simple bandage, the length and breadth of which is to be regulated according to the purpose for which it is to be used. It is used in cases of injuries, and wounds made with pointed instruments, in order both to force the pus and blood towards the orifce, and to expel them from the body, and also by bringing their inner surfaces into contact, to promote their healing up. Before the bandage is applied, all the fluids must be expelled out of the wound, ulcer, or fistula, by rubbing, prodding, or throwing injections into it. When this has been done, compresse of various dimensions are applied along the course of the fore, and particularly at the region of its bottom; and generally it is necessary to have compresse that are graduated at one end, the thickest part of which is applied over the bottom of the fore, and the thinnest over its orifice. An assistant holds the compresse flat in their proper situation, whilst the sur-

geon applies a fillet or a two-headed bandage, according to the situation of the ulcer. He commences the operation over the bottom of the compres, so as to secure and press it down by two or three turns of the bandage, which he then carries towards the orifice with spiral turns; after which he carries it back again, and finishes with spiral turns. This mode of bandaging may also be used with great advantage in cases in which a flap of flesh has been partly cut or torn off from the body, whilst it still remains attached by one part, in order to make it heal up again in its proper situation; and in this case the bandage becomes an雪ting one. But when we apply it in this manner, we ought always to be careful to make a sufficient and equal pressure at every point; for otherwise our intention, if not entirely frustrated, will at least be impeded, and the cure protracted.

Gniter's Bandage. The four-headed or fling bandage for the head. This bandage is formed of a piece of linen three or four feet in length, and from four to eight fingers broad, both ends of which are slit open so far as to leave the middle part about eight fingers long. It is generally applied with the middle part straight upon the head, so that the anter-

ior ends hang down over the cheeks, and the two others over the ears; and in order that it may lie more firmly upon the head, the edge of the middle part that lies over the forehead, as well as that on the back of the head, is doubled round. So as to form a kind of band. The two anterior ends of the bandage are then carried over the ears, and fast-

ened at the back of the neck; after which the two posterior ends are carried in the same manner over the ears, and fa-

sted under the chin. The bandage may be applied in a similar manner upon various parts of the head, only it is to
be observed, that the central portion must always be placed over the disfigured part, and the ends carried in opposite directions, either croffed or fromched out.

The Uniting Neck Bandage. This bandage is formed in the following manner. The surgeon takes a napkin four double, lays it under the patient's axilie, and ties it toger in the front of the bref. He then takes two pieces of linen, fafens one end of them to the patient's tight-cap, and the other to the napkin, in fuch a manner, that if the wound be situated in the trach, or at the fore-part of the neck, the ends, after the patient's head has been in- clined forwards a little, can be faftened to the fore-part of the cloth, in order to keep the head in that position. But should the wound be situated in the back of the neck, the head may be inclined a little backwards, and retained by the fame bandage in that position, by drawing the ends of the two small fillets more backwards, and faftening them there to the napkin.

The application of the T bandage, according to Mr. Twer's method, is however more advantageous, efpecially for uniting wounds ahy the throat. For this purpofe, we are to take a fillet, three fingers broad and ten feet long, and fow to the middle of it another of equal breadth and fix feet long, fo as to represent the figure of the letter T. The smaller fillet is now to be fit open all but one foot. In applying it, the part at which the two fillets are fafened together, is placed upon the back of the neck in fuch a manner that the smaller fillet lies over the back of the head upon the vertex. The two heads are next brought forwards over the shoulders, then carried under the axilie, which are guarded with compreffes, to the back; the bandage is then croffed, brought forwards again upon the breadth, and faftened. The fit ends of the smaller fillet are next croffed over the vertex; after which they are carried over the face under the axilie; the patient's chin, if neceffary, being drawn downwards towards the bref, and this fillet is finally faftened like the former. Mr. Koehler has propofed for this purpofe a leathern cap with ftps, by means of which the patient's head may be drawn into any position that may be neceffary. See the T Bandage.

The Square Bandage. The bandage for luxations of the os femoris. This is a bandage eight or nine yards in length, and three or four fingers broad, rolled up into one head. The Six-headed Bandage of Galen. This bandage confifts of a piece of linen from three to four feet in length, and 8—12 fingers breadth; its breadth and length being determined according to the fize of the patient's head. The cloth is folded in fuch a manner that its breadth can be divided into three equal parts, and these parts are fit open from both fides, fo far as to leave entire in the middle a space of the breadth of a man's hand, by which means fix heads are formed. It is applied nearly in the fame manner as the four-headed bandage for the head.

The many-headed Bandage. This bandage is formed of a piece of linen or flannel, the dimenfions being regulated according to thofe of the diffigured part, into which a number of ats are made at both fides, fo as to leave only one part entire in the middle for the purpofe of connecting the ref. In applying it, the whole piece is laid under the diffigured part; the loweft of the ends, which lies on the outer fide, is then brought obliquely upwards on the inner fide, and that which lies within is brought obliquely upwards on the outer fide, and fo on; fo that the lower ends are always half covered and fecured by the upper. A many headed bandage may alfo be formed in another way, by cutting a piece of linen or flannel into feveral strips, of which the one is always longer than the other, but each of the fame breadth with the ref. The fiteft is generally made a foot, and the longeft two feet in length. All these strips are now laid over each other in fuch a manner that always half the breadth of the one is covered by the other. To fecure the whole, a narrow fip of linen or tape is fewed to them behind and alfo in the middle. In applying it, the narroweft part of the bandage must always come to lie over the smallest part of the limb. A bandage of this kind will perform the functions of the belt applied circular or spiral bandage, and it applies to the parts far better than the eighteen-headed bandage; on which account it may be used instead of the latter.

The T Bandage, the bandage for the fimula in ano. This is a common compound bandage, which is chiefly ufed in lefions of the neck, the bref, the abdomen, the back, but particularly the genital organs, the anus, the groin, and the perineum. It is either fingle or double. The fitple T bandage is formed in the following manner: take a fillet from four to eight feet in length, and fold it together in fuch a manner as to get the exact middle point. At this middle point few to it another fillet in a perpendicular diereetion, and of fuch length as may be moft convenient for the purpofe for which it is intended. To form the double T bandage, either two fillets are fowed in the middle obliquely beside each other, or a whole piece is fowed on and afterwards fit open. According to the dimensions of the place to which it is to be applied, it is made more or less broad.

The Creeping Bandage. This is a common fimple bandage rolled upon one head, which is applied in a spiral manner round the limb, fo that the one turn does not cover the other, but only lies close to it, in fuch a manner that no part of the limb remains visible. It may sometimes be used for fecuring compreffes and other dressings.

The Scapular and Napkin. This bandage consists of a napkin, and a fcapular as it is termed. The napkin is folded together, and rolled upon two unequal heads; the middle part is then applied under the arm in fuch a manner that the largest head is carried over the back, and the fmalluer over the bref; but both heads are laid over each other, and then faftened. But in order to prevent the napkin from flipping out of its fition, the fcapular is required. This is formed of a piece of linen 2—4 feet long, and half a foot broad. In the middle of the piece a fit is cut, large enough for the head to pass conveniently through it; and in this manner one end hangs down before over the bref, and the other over the back. These two ends are then faftened to the napkin before applied. We may alfo fit open the ends, and thus attach them more extended to the napkin, by which means they will support it better. This bandage may be ufed in almoft all lefions of the bref, as alfo in simple wounds of the abdomen.

The Spiral Bandage. This is a common fimple bandage, the length and breadth of which must be adapted to the dimenfions of the part: the second turn of the bandage always covers the firft, and the third and following turns always cover each the preceding turn, either half or a little more, fo as to reprefent a spiral figure. The turns may be made either from the upper towards the lower part of the limb, or from the lower towards the upper; in the firft cafe it is termed the defcending, and in the fcond, the ascending spiral bandage. It is generafly applied in the left-mentioned manner, and may be ufed for swathing whole limbs, by which means alone very obfinate difeafes may ofien be cured.

Mr. Thefen (Neue Bemerkungen u. Erfahrungen, &c. Th. I. Berl. 1781, p. 1) was the firft who called the attention of the public to the more frequent and rational ufe of swathing with this bandage; and experience has proved that this practice may certainly be attended with very great advantages. In applying it, every thing depends upon the whole limb being entirely encircled with it from the
the very points of the fingers or toes, so as to leave no part whatever bare, as a tumor would be produced in such a part. The method of applying it is as follows:—For each finger we are to take a fillet a foot in length, and of the breadth of a finger, and wind it round each finger as well as the thumb in the following manner. The first turn is made circularly round the point of the finger, the second, in order to afford a good hold for the rest, immediately over the first; the third turn covers half or a little more of the second, and the fourth and following turns the same. The ends of these fillets are laid upon the back of the hand, and secured with a fillet from 20 to 40 feet long, and 2 or 2½ fingers broad. With this long fillet, the first turn is made immediately over the fingers round the hand, and for the sake of security, the second straight over the first; but the following turns always cover each one half of the preceding turn, and they ascend as high as the elbow, being applied neither too loose nor too tight; for we must always have it in our power to introduce a finger between the turns in case of necessity. If we intend to wet this bandage with any liquid, we must apply it somewhat looser, as it contracts and becomes tighter when it is moist; but afterwards it must be kept constantly moist, as otherwise, when it dries, it becomes too loose, and is consequently rendered useless. Should the person who applies the bandage, not know how to hit the proper measure of tightness in this case, he may wet the bandage before he applies it.

These turns are carried up as high as the elbow, where, if it be a case of injury from blood-letting, a piece of rag spread with a proper ointment is laid upon the inflated or ulcerated part, and the bandage is carried two or three times up to the humerus, and back again, so as to form turns like oo oo, as in the operation of blood-letting. If we cannot cover every part by means of these turns, we may lay an oblong piece of linen, 3—4 fingers broad, and a foot long, under the elbow, draw it tight, and secure it above and below with the bandage. The end of the piece of linen that projects under the bandage is doubled back, and another turn made round it, in order to prevent its giving way. The turns are then continued as high as the deltoid muscle, or to the shoulder, and the end of the bandage is fastened to the neck. When the tumor grows smaller, so as to render the bandage too loose, it may be renewed.

In swathing the lower extremities, it is not necessary to bandage each toe separately, and this would also be very difficult on account of the shortness of these members. We may therefore apply the middle part of a piece of linen, about twice the breadth of a man’s hand in breadth and length, close to the points of the toes, and turn one part over the back of the foot, and the other under the sole; the two folds of the linen are then to be drawn tight towards the foot, and doubled downwards, both at the great and little toe, towards the sole, where they are to be held fast with the left hand. The surgon then takes into his other hand the bandage, which may be from 30 to 40 feet long, and 2—3 fingers broad, and secures the piece of linen that includes the toes, with two circular turns, after which he proceeds to carry the bandage with spiral turns towards the leg. In order to obviate the difficulty that attends the bandaging of the heel, we may apply under the sole another piece of linen, somewhat more than the breadth of a man’s hand, so as to reach above the heel, surround it with the bandage and draw it tight, then double down the ends, and secure them with the bandage in order to prevent their giving way. For the greater security of the bandage, and in order to prevent the pain which it might occasion by its pressure upon the Tendo Achillis, we may fill up the depressions on both sides of the tendon, as high as the termination of the calf, with lint, whilst we are bandaging the limb. As often as it is necessary, namely when any turn is not drawn so as to cover half of the preceding, we must turn the bandage, and this must be done particularly under the calf. When the limb has been swathed, a packing that fits well should be drawn over it.

**Stated Bandage with Two Heads.** This bandage is used after blood-letting at the temporal artery. It is from 16 to 20 feet long, two fingers broad, and rolled upon two heads. Instead of this bandage Mr. B. Bell recommends the use of a well-hardened felt spring, three quarters of an inch broad, and twelve or fourteen inches long, which is covered with soft leather, and of equal strength with the spring of a rupture bandage.

**The Single Star Bandage.** This is a one-headed bandage, from Exten to twenty-four feet long, and four fingers broad, which is used in some affections of the spapule.

**The double Star Bandage.** This bandage is 3—4 fingers broad, 24—32 feet long, and rolled upon two heads: it is likewise used in lesions of the spapule.

**The Bandage for an Umbilical Hernia.** These bandages may either be elastic or non-elastic. With infants an elastic bandage is both troublesome and superfluous. Mr. Richter therefore recommends to apply half a nutmeg, wrapped in a piece of linen to the umbilicus, and to secure this with a single adhesive plaster and a circular roller. But left the bandage should slip, and the plaster together with the nutmeg fall off, he directs the front part of the bandage to be made almost as broad as the hand, and that which lay upon the hips two thirds narrower, in order that if it should slip a little upwards or downwards, it may fill in some degree help to retain the piece of nutmeg in its place. In order to prevent the bandage from wrinkling, it is made of double linen, and at the front part which covers the navel, a piece of leather is interposed between the two pieces of linen; by which means this part of the bandage constantly preserves its proper breadth. When we wish to change the bandage, we should introduce a finger under the bandage, and press down the nutmeg upon the navel till the new bandage has been applied, left the navel should again be protruded. Instead of the nutmeg, we may employ for the same purpose a set of graduated compresses, or any other proper hard substance. See the article RUPTURES.

An unelastic bandage for the umbilical hernia in adults is made in the following manner. We take a piece of parchment four or five feet long and four fingers broad, and cut into the middle of it a slit a foot long, which passes over the patient’s head when it is applied. To the one end, at both corners, two flaps are sewed, which run on in a straight line with the whole. Two other flaps are sewed immediately over the former to the margin of the bandage, so that when the whole is laid upon a horizontal surface, they form a right angle with the slip of parchment, on each side. Finally, to the inner side of the bandage a cushion is attached, which is stuffed with horse-hair, cork, or cotton, and in order that it may lie properly, it ought to have a degree of swell round the margin. In applying it, the patient introduces his head through the slit above-mentioned, so that the longer portion of the slip of parchment hangs down perpendicularly over his back, and the shorter down his back. After the hernia has been reduced, the two upper flaps attached to the margin of the bandage are carried round the body and tied upon the back; or if they be long enough, over the cushion in front. The other two are brought through between the thighs, and fastened at the back to the slit, or to the upper piece of parchment or linen.
But as the hernia is not always of equal size, being smaller in the morning, and larger after meals, and as it alternately rises and sinks in inspiration and expiration, it is evident that these elastic bandages cannot adapt themselves to these diversities, as they either render necessary a stronger, inconvenient, and often hurtful pressure, or do not press sufficiently, so that the hernia is constantly in danger of slipping through.

With adults therefore we can expect no security, except in the use of elastic bandages for the umbilical hernia; and of these there are simple, compound, and double bandages. The simple bandage consists of a somewhat broad, round, or oval cushion, and an elastic bandage. With patients whose umbilical region is more debilitated, an oval cushion is requisite, having in the middle a bulb of the size of a walnut, which comes to lie upon the navel. Mr. Richter also recommends the use of a common bandage for the inguinal hernia, provided in its front with a shield, to the inner side of which a cushion is attached. However, this and the above-mentioned rupture bandages are not sufficiently secure against slipping out of their situation, on account of their being provided only with a single lateral spring.

Mr. Theiden has proposed the use of elastic gum for bandages for the umbilical hernia; and Mr. Juville thinks that it may be sufficient with patients that are not competent, and when the hernia is small. But as elastic gum loses its elasticity when it grows warm, it has been proposed to supercede its use by the application of spiral steel springs to both sides of the cushion. However, both these methods are liable to the objection, that they produce the same pressure upon the whole surrounding part of the abdomen, as they do upon the navel itself; and consequently the cushion either does not compress the navel sufficiently, or it presses it more than is necessary.

A better bandage than these, for the umbilical hernia, is that of Squire, which consists of a plate, with a cushion screwed to it, and two lateral springs proceeding from the plate, which, when it is applied, firmly embrace the body. An elastic bandage of another kind is that of Surrenthe, which Mr. Richter (Abhandlung von den Breechen. Gottingen, 1785, p. 641. tab. vii.) has described, delineated, and in a high degree improved. Two bandages of Mr. Juville for umbilical hernia, of which the one is described and delineated by Mr. Bell, and the other by Mr. Hofer. (Lehrbiécke des Chirurg. Verbandes. Th. II. Erlangen, 1791, p. 278. tab. xi. fig. 77.)

Dr. Alex. Mono, senior, has also described a bandage, consisting of a steel spring, which, after the hernia has been reduced, is placed upon the navel, and retained in this situation by a bandage. It is adopted as tight as may be necessary by means of straps and buckles.

When, as sometimes occurs, the hernia has formed adhesions, either spontaneously, or in consequence of improper bandaging, in which case its reduction is altogether impracticable, we must use a convexe cushion, instead of a convex one, that may receive the hernia into its hollow, and prevent the further protrusion of the intestines. If the bandage be skilfully constructed, the adhesions may gradually be diminished, and the hernia at length reduced.

The united Bandage. This is a common double-headed bandage, and one of the most useful and indispensible which is used in cases of fresh wounds, in order to promote their speedy re-union. Properly it is only adapted for such wounds as run in the direction of the body and limb, and that are situated in parts which admit of the application of a bandage; however, it may also be used in cases of transverse wounds; but then it rather belongs to the compound bandages. It may be formed in different ways: viz. 

1. According to one method of forming it, its length must be regulated by the circumference of the wounded part, and its breadth must be equal to the length of the wound. In general, however, it is rather used narrow than broad, and it must always be so long that the wounded limb can be three times encircled with it. In the middle part it must have a large slit, through which the head of the bandage rolled up may easily be passed. In applying it, the surgeon takes one of its heads into each of his hands, applies that portion of the middle part that is not slit to the side of the limb opposite to the wound, brings both the heads round the limb towards the wound, passes one of the heads through the slit, over the wound, drawing both heads in such a manner as to bring the lips of the wound together; after which the other head is rolled round the limb above the wound, and the other below it. When the wound is deep, a long-guette is applied under the bandage to each of the lips of the wound, at some distance from its edges; the thickness of the long-guette must be proportionate to the depth of the wound, and by means of them the bottom of the wound is pressed together when the bandage is drawn tight.

When the wound is very long, we must either apply several bandages, one at the side of the other, or make several slits in a single bandage, and pass the head through the second slit over the first turn, and there draw the lips of the wound together, and so allo the second and the third time. In this case it will be best to make the slit whilst we are applying the bandages, namely, at the place where the two heads meet each other, as otherwise they do not fit accurately to the wound. The application of this bandage, however, requires great accuracy. If it be applied too tight, it excites pain, swelling, inflammation, and frustrates the purpose of re-union; but if it be applied too loose, the lips of the wound do not come into contact with each other, and the re-union is not properly effected.

2. Another more convenient bandage which is equally applicable to longitudinal and to transverse wounds, is that which has already been recommended by Mr. Henkel. (Anweisung zum verb. Verbande. Berlin, 1767, p. 237. Tab. XV. fig. 104—Alfo Richters Anfangsgrunde des Wundarzneykunfts. B. I. Tab. I. fig. 2.) It consists of four stripes of linen, each of which is from one to two feet in length, and two or three inches in breadth. The dimensions, however, must always be regulated according to the shape of the disfigured part. These four pieces are united by means of six narrow straps in such a manner, that all the six straps cross each other like the fingers of the hand when folded. In this manner we obtain a four-headed crucial bandage, in which the six narrow straps form the centre of the whole.

When it is applied, the narrow straps, or the middle of the bandage, must be placed directly over the wound, and two of the heads must lie on each side of it, in such a manner that the one entirely covers the other. First, the two lowest heads on each side are fastened quite loofe round the limb with circular turns. The two heads above are then also first drawn tight with both hands, and then fastened in the same manner as the former. When this bandage is used, we have conjointly a view of the wound, as the narrow straps lie immediately over it.

3. Mr. Boettcher (Aufwahl des chirurgischen Verbandes, Berlin, 1795. p. 62. § 71.) has also recommended a very simple bandage for promoting the re-union of longitudinal wounds. He takes a common two-headed bandage, two or three fingers in breadth; and first applies to each side of the wound, at the distance of from half an inch to three inches from the edge, a long-guette, which in the mean time is held by an affiant; he then takes one of the heads into each hand, and makes the beginning with the middle of the bandage, on the side of the limb opposite to the wound. The
The two heads are now brought over the longuette, and in the same manner also over the wound; but this must be done in a very loose manner. The heads are then shifted into different hands, and drawn tight, by which means the longuette are brought together, and the wound united.

The two heads are then swung round each other, over the middle of the wound, then shifted again into different hands, and carried back in the same manner as they were brought forwards to the wound. This turn may be repeated three, four, or more times, according to the size of the wound.

The ends are then either entirely wound off in circular turns, or should they not be long enough for that purpose, pinned to the other turn.

Should no unfavourable symptoms supervene, the uniting bladder may be suffered to remain in its situation, five, six, and, if the wound be deep, full nine days. Great accuracy, however, must always be used in applying it, as the wound is not to be united from its bottom; and the dimensions of the longuette, or compresses, must also be regulated accordingly; for with deep wounds they must be thicker, and with superficial wounds thinner. When the wound is entirely superficial, none are required. When the bandage is removed, the part must be retained precisely in the same position that has been given to it, and the new bandage applied in the same manner as the former. Even after the wound has completely healed, it will still be proper, by way of precaution, to leave the bandage in its situation for some days longer.

The Bandage of the Patella fractured longitudinally. For this purpose is required a bandage from sixteen to twenty-four feet long, three fingers broad, and rolled upon two heads. When it is applied, the hollow of the knee must be hollowed with compresses, and a small longuette, about half an inch thick, laid on each end of the knee-pan. The middle part of the bandage is then laid upon the hollow of the knee, and both heads brought forwards; a slit is then cut into the one part, through which the head of the other is passed, in such a manner that the slit fits to the middle of the knee-pan, after which the bandage is drawn tight transversely. The heads are then carried backwards, but obliquely, so that one comes to be situated higher than the other; and the bandaging is completed with circular turns. In order to keep the leg constantly extended, a well-bulleted ferula or splint is laid into the hollow of the knee, which may be fastened there by the slit turns of the bandage. For greater security, the leg may also be enclosed in a box properly lined, which reaches as high as the thigh.

We do not here profess to give an entire treatise on Bandages, but only an account of those which are most commonly used. Several authors, both ancient and modern, have discoursed on this subject very amply. In particular, we recommend the perish of Vidas Vidas, for the opinions and practice of the oldest surgeons, which he has translated from the original Greek, and elucidated by various figures: edit. Lutetiae Parisiorum, fol. 1544. Among the moderns, the best writers on bandages are M. Sue, Thibault, Heiter, Lombard, and Bernin; but all of them are too prolix and tedious, especially the French authors.

Mr. John Bell of Edinburgh has endeavoured to simplify this study in his first volume of "Principles of Surgery;" there is, however, a very singular declaration in that part of Mr. Bell's book, viz. "Tho' innumerable forms in which the ancients turned the roller round the head, neck, and body," says he, "are to be found in the treatises of Soranus, Galenus, Diocles, and Galen. In their treatises I find nothing but what has fallen into deserved neglect, nothing that I could mention either for your amusement or instruction," See page 129. Now it happens in this instance, if not in some others, that Mr. Bell has never perused the authors whom he quotes; for no treatises of the kind are to be found, by Soranus, Galenus, and Diocles, having ever been defended to their policy. Galen, indeed, wrote on Landagi, and his observations are translated by Vidas Vidas, in the collection we have already referred to; but certainly Mr. Bell has had no access to copies of any similar works by the three former physicians.

**BANDAL, or BANDER, in Commerce, the name of a measure used in the south of Ireland, which is somewhat more than half a yard, by which coarse narrow linen is sold in the market; whence it is called band-like.**

**BANDALIER, BANDEREES, or Bandierer, a large leathern belt, thrown over the right shoulder, and hanging down under the left arm; worn by the musqueters in the time of James and Charles I. both for the fastening of their fire-arms, and for the carriage of their musquet-chargers; which being put up in little wooden, tin, or leathern cylindrical boxes, were hung, to the number of twelve, to each bandalier. Each of these boxes contained a single charge of powder.**

The word is originally French bandouiller, formed apparently from bandouiller, a kind of band; particularly inflating the Pyrennes, who were formerly distinguished by this piece of furniture; and were themselves so denominated, quoi ban de voltes, a lust of robbers.

The French soldiery still retain the bandalier; their horses, their musqueters, and common guards, wearing it differently; excepting for some difference in its gariturture. Groc (Treatise on Ancient Armour, p. 251) says, this contrivance seems to have been borrowed from the Dutch or Walloon.

**BANDARMAILANKA, in Geography, a town of Hindostan, in the Circars, situated at the mouth of the river Godavery. N. lat. 16° 25'. E. long. 82° 26'.**

**Bande', or in Band, in Heraldry, expresses the position of a lion, when he is placed diagonally in the field.**

**BANDED, a term applied to a garb. or wheatear, &c. when the band is of a colour different from that of the garb itself.**

**BANDEL CAUS, in Geography, a town of Africa, on the coast of the kingdom of Aden.**

**Ban, a town in the kingdom of Bengal, situated on the western arm of the Ganges, or Hungry river. N. lat. 22° 53'. E. long. 88° 52'.**

**BANDELET, or BANDELET, in Architecture, any little box, or flat moulding, encompassing a column, like a ring; as that which crowns the Doric architrave. It is also called tenes, which Vitruvius uses for the same thing; sometimes filices, diadema, &c. It is sometimes used for the three parts which compose the architrave, called by Vitruvius, filices, and which are sometimes also denominated bands or plat-bands.**

**BANDELO, Matthew, in Biography, bishop of Agen, was born towards the close of the fifteenth century, at Castrilnuevo of Scrivin, in the Milanese. He entered into the society of the Dominicans; and after many changes of situation, he settled in France; and in 1532 was nominated by Henry II. to the bishopric of Agen; but he paid little attention to the duties of his cicalis. The time of his death is not exactly known; but he was living in 1561. He was principally distinguished as a writer of novels. His collection was first printed at Lucca in 1534, in three volumes 4to. under the title of "Novelle del Bandello," to which was added another volume, printed at Lugdunum in 1573. The edition of London in 1540 comprises four volumes 4to. In his narrations the author is said to imitate the manner of Boccaccio, and to write in a lively, pleasing style; but he has also copied his model in those licentious freedoms, which were
were no less unsuitable to his office, than offensive to the church. He was also author of a Latin version of Boccaccio’s story of “Tito et Gitippo,” of eleven cantos, in ottava rima, in honour of Lucretia Gonzaga; and of some other works. Nouv. Dict. Histoire.

BANDELVELLO, or OLD PORT, in Geography, the name of a good harbour at the mouth of the river Doara, on the east coast of Africa, in the Indian ocean; about twenty-seven leagues north of Magadora or Magaduxo, on the same coast.

BANDER ABASI. See GOMERON.

BANDERAS, a large bay of the Pacific ocean, on the west coast of Mexico, in North America; running inland between two points of land, the north point called Tintoque, and the south cape Corientes, with an open entrance, and sufficiently spacious for the accommodation and anchorage of a fleet of ships.

BANDER CONGO, a port town of Asa, on the east side of the Perhian gulf, and thirty-three leagues west from Bander Abasi. N. lat. 27° 5’. E. long. 55° 8’.

BANDERT, a town of Hindoostan, in the circuit of Gobad, one hundred miles south of Agra, and forty-four S. E. of Gobad.

BANDERTI, the name appropriated to the commanders of the militia of the canton of Bern.

BANDEROLY, in Heraldry, is a ornamen affixed by small lines or flings immediately under the crown on the top of the staff of a crozier, and folding over the staff.

BANDEROS, in Military Language, the ornaments which were given to pikes near the point, in order to render their appearance handsome. These sometimes had the name of pencells. (See Grose on Ancient Armour, ii. 277.)

BANDEROLY, in Naval Language, a little flag, in form of a guidon, extended more in length than breadth, used to be hung out on the masts of vessels, &c.

BANDEROLYS, in Military Language, an ancient name for camp-colours.

BANDI, in Geography, a river of Africa, in the country of Calabar, in Lower Guinea, which runs into the sea by two channels. There is a town of the same name on an island at the mouth of the river.

BANDINELLI, Baccio, in Biography, a painter of history, was born at Florence in 1497, and became a disciple of Giovanni Francesco Rustico, a good sculptor. He had the ambition to become a rival of Michael Angelo, in painting as well as in sculpture; but hearing that this great master treated his works contemptuously, he laid aside the pencil, and would never afterwards pursue it. As a layman, he possessed skill and merit, and in that art he deemed himself equal to Buonarroti; however, when he found that the world did not concur with him in opinion, he was much mortified. He died at Florence in 1559, at the age of 62 years. Several of his pupils became eminent artists. The principal part of his works are the bas-reliefs of the tombs of Leo X. and Clement VII. at Rome, St. Peter, a Bacelus, the Laocoon, and some figures of some princes of the Medici family at Florence. His drawing is generally correct, and exhibits an extensive knowledge of anatomy; but his muscles are too strongly marked, and he is deficient in grace. Argenville, Vie de Sculpteurs. Pilkington.

BANDITI, from the Italian bandito, perkins prohibited, or, as we call it, outlawed; sometimes denominated banni, or forma banni.

Banditti, or Bandits, is also a denomination given to highwaymen and robbers, who infest the roads in troops, especially in Italy, France, and Sicily. Mr. Brydone, in his Tour through Sicily, informs us, that in the eastern part called Val Demoni, from the devils that are supposed to in-
county of Cork, province of Munster, Ireland, which rises in the mountains of Carbery, and after watering the large and thriving town of Bandon-bridge, and the village of Inishoman, falls into the harbour of Kinsale. It is navigable for large sloops as far as Collier's quay, near Inishoman, from which place Bandon is supplied with English coal. At the confluence of the Bandon and Brinny rivers, a little above Inishoman, the East India company of England formed a settlement about the year 1612, for carrying on iron works, and building large ships; for which purpose they purchased the adjoining woods and lands. They Garrisoned a castle, and built three villages; but the opposition given to this undertaking by the natives, soon obliged them to relinquish it. The great woods in the neighbourhood were from that time much demolished; though the river has not yet forfeited the character given of it by Spenser in his Fairy Queen:—

BANDON BRIDGE, or, as it is more commonly called, Bandon, a considerable market and post town of the county of Cork, province of Munster, Ireland, situated on both sides of the river Bandon, over which it has a bridge. It was one of the towns which owed their origin to the laudable exertions of Richard Boyle, the first, and frequently called the great, earl of Cork. He built it in the year 1610, in the midst of a waste bog and wood, which had been impassable, and inclosed it with walls, which were of great strength for that period. In 1613, he procured for it a charter of incorporation, in consequence of which it sent two members to the house of commons; and was one of the boroughs which occasioned so violent a debate at the meeting of parliament in that year. It was part of the policy of lord Cork, as appears from his letter to secretary Cook (quoted in Smith's Cork, vol. i. p. 236.), to admit none but Protestants to live in the town; which seems to have been considered a necessary support to the infant colony. The consequence of this was, that the inhabitants, being united among themselves, and all trained to arms, were very powerful, and took an active part in the civil wars which distracted Ireland, in the middle of the seventeenth century. After the restoration of Charles II. the exclusion was not very strictly observed, though it had been confirmed by a byelaw of the corporation; but the adherents of James II. under the earl of Clanclanthy, having destroyed the walls in 1689, and treated the Protestant inhabitants with severity, it was revived, and has been since, with few exceptions, strictly attended to. The wisdom and advantage of this exclusion have been often called in question, but the strongest objection to it certainly is, that it tends to keep alive that animosity which has been the bane of Ireland, and which all who study the true interests of the country will endeavour to appease. The inhabitants of Bandon have been generally industrious. For many years they carried on the manufacture of flax and flaxen manufactures, of flax, cambrics, and flags, very extensively, but these have of late declined. Tallow and superior quality, and coarse green linens 27 inches wide, called velvets, are made in the town and neighbourhood; the latter of which is sent from Cork to London and Bristol. There are also some cotton manufacturers, who employ a great number of people. The town is chiefly the property of the duke of Devonshire, representative of the eldest branch of the Boyle family, and on account of the fruitfulness of the leaves, and the want of proper encouragement, it is in general ill built, the houses not at all corresponding to the wealth of the inhabitants. During the late war, Bandon became a great military station, being conveniently situated for sending ambuscade to any part of the south-western coast at which it might be wanted, and a strong garrison is still continued there. The population is estimated at 12,000, and it sends a member to the imperial parliament. Its distance S. W. from Dublin is 152 miles, and S. W. from Cork 13, N. lat. 51° 15', W. long. 7° 44'.—Smith's Cork, &c.

BANDORA, the capital of Salan island, and separated from Bombay island, on the Malabar coast of India, by a narrow channel, in N. lat. 19° 5', E. long. 72° 52'.

BANDORA, in Malay, an inferior kind of lute, for which the notes were written in the same kind of tablature as for the theorbo or great lute. See Lute.

BANDT, in Geography, a small island in the German ocean, near the coast of East Friesland. N. lat. 53° 50'. E. long. 6° 53'.

BANDURI, Anselme, in Biography, an antiquary of the eighteenth century, was a native of the republic of Ragusa, in Dalmatia, and a Benedictine monk. He studied at Florence, and having made rapid progress in the learned languages, he became a preceptor. Montfaucon appointed him in 1729 to examine MSS. for his projected edition of Chrysostom's works; and for extending his acquaintance with ecclesiastical antiquities, Banduri, under the patronage of the grand duke of Tuscany, spent some years in the abbey of St. Germain in Paris. Here he was enabled to compile his valuable work, intituled, "Imperum Orientale, sive, Antiquitates Constantinopolitanæ," and published at Paris, in 1711, in two volumes, folio. He also published at Paris, in 1718, a collection of Roman medals, under the title of "Numismata Imperatorum Romanorum a Traiano Decio ad Paulos Augustos," which was enriched and enlarged, and republished in 1721 at Hamburg, in 1719, by J. A. Fabricius. In 1724, Banduri was appointed librarian to the duke of Orleans, and he died at Paris in 1745. Nouv. Dict. Hist.

BANDUSIAN FOUNTAIN, in Ancient Geography, a famous spring of Sicily, celebrated by Horace in the thirteenth ode of his third book, placed by some at his Sabine farm; but incontestably proved by the abbe Chajpy, to be near Palazzo, in the principality of St. Gervasio. No bloody groves now hang over its banks to shut out the burning midday fire; its gilded waters no longer tumble down the rocks in beautiful cascades; but chocked with dirt and loft in bogs, are forced to seek their way underground to a vent at the foot of the hill. Swinb. Travels, vol. ii. p. 33.

BANDY-LEGS, in Surgery, are the distillation of the lower extremities, in any direction. This disease is usually occasioned by a defective ossification of the Tibia or leg-bone, which therefore is unable to sustain the weight of the body without yielding. See Distortions, and Mollieties of Joints.

BANE-BERRY, in Botany. See Actea.

BANEE, in Geography, a small island of France, near the English channel, about a league S. W. of Uuant.

BANEJ, in Biography, a famous general of Sweden, descended of an illustrious family, was born in 1621, and was so much distinguished by his proficiency in literature, that Gustavus Adolphus used to call him his learned general. In very early youth, he attracted, by his magnanimity, the notice of that monarch, who pronounced him formed for great events, and placed him in the army; and he soon signaled himself so much, that, under twenty years of age, he was employed in many critical enterprises, which required no less dexterity than bravery. After the death of Gustavus, he supported, as commander in chief, the infante of the Swedish arms, by a series of victories, which reared his military character as high as that of any general of the age. He sustained this reputation undiminished till his death, at Halberstadt, on the 16th of May 1644, in the 40th year of his age. Baner, though not inoffensive of the glory he had
BAN

had acquired by his actions, usually spoke of them with great
modesty. He was accustomed to say, that he never formed
an expedition, nor hazarded an action, without the most
reasonable hopes of success. He was equally feared and
beloved by the followers, and always inspired them with un
bounded confidence. At the head of his troops, he acted
solely from himself, and without dependence, and would
rather have resigned the command, than have been directed
in his military operations by the orders of the cabinet. He
had the absolute disposal of all commitments, and established
a regular order of promotion; he was humane to the vanquished
enemy, cautious in not wantonly expelling his troops to
action, and he blamed those generals who, in judging of
the lives of their men to raise their own military character.
Coxe's Travels in Poland, &c. vol. iv. p. 51.
BANFF, in Geography. See BANFF.

BANGALORE, a town of India, in the country of Whidah,
on the Slave coast.

BANGALORE, a town of Hindostan, in the Myfory
country, situate in the centre of the peninsula, and having
routes passing through it in every direction. It is, in itself,
a place of great political importance, being a fortress
of strength, and from situation, the bulwark of the Myfory
country, towards Arcot. It is placed, by major Recueil,
in N. lat. 15°. E. long. 77° 37' 16". This is the common
point of union, in the centre of the peninsula, as Coim-
betore is in the south-west, and Trichinopoly in the
south-east.

BANGER, one of the principal places in the island
of Belleisle, on the coast of France; and Palais is the
other.

BANGUS, Peter, in Biography, a Swedish divine,
was born at Hellingberg, in 1633, and having studied at
Upsal, travelled with a pupil through Sweden, Denmark,
and the Netherlands. On his return, he was appointed pro-
fessor of theology in the university of Abo in Finland, and
filled the chair with credit 32 years. In 1662, he was ap-
pointed bishop of Wyburg, by Charles IX. of Sweden; and
died in 1665. He took great pains to serve his country,
by establishing schools and promoting knowledge. He
wrote in Latin an ecclesiastical Swedish history; a treatise
on Sacred Chronology; a Commentary on the Hebréw,
and other works.

BANGUS, Thomas, a learned Danish divine, of the uni-
versity of Copenhagen, was born in 1622. He discharged,
with great credit, the duties of the professorship of Hebrew,
philosophy, and divinity; and was the author of several learned
works. He died in 1661. Among his writings in Latin
are various dissertations to elucidate the scriptures; " Philo-
oblogical Observations," printed in 1650, at Copenhagen,
in 1649; "An Exercitation on the origin of Diversity of Lan-
guages, and on the Excellence of the Hebrew?" 1664.

BANGLE ears, in the Banga, an imp-refection in a
horse's ears, remedied in the following manner; place
his ears in such a situation as they are wanted to stand;
bind them with two small boards, so fast as not to fall;
and then clip away the empty wrinkled skin close by
the head.

BANG, in Geography, a long fiaod on the east coast
of Africa, of variable breadth, but in some places about two
leagues. See Cape Corrientes.

BANGOR, a township of America, in Hancock county
in the district of Maine, on the west side of Penobscot river,
25 miles from its mouth at Belfast bay; 65 N.W. by W.
from Machias; 63 N.E. from Hallowell; and 280 N.E.
from Boston.

BANGOR, a small city of Carnarvonshire, North Wales,
Down, in the province of Ulster, in Ireland, situated on the south side of the bay of Carrickfergus; but though parliamentary aid was granted to improve its port, it has very little trade. An abbey was founded here in the sixth century, part of the ruins of which yet subsists. Near this town Schomburg landed with the English army, 13th Augst 1680. Distance N. from Dublin, 90 Irish miles. Lat. 54° 38'. W. long. 5° 33'.

BANGUE, in the Materis Medicas, a species of opiate, in great use throughout the East for drowning cares, and infusing joy.

This, by the Persians, is called aug; by the Arabs, aurum; corruptly effed and effeud; by the Turks, berde, and vulgarly meliab; by the Europeans naturalista, banga or bangue. The Indians, says Acosta, eat the seed and leaves to increase their vigour, and to excite an appetite to their food. The nobles, and chief military officers, when they are disposed to forget their toil, and to sleep in perfect ease and security, take of the powder of the seed and leaves, as much as they think sufficient; and add to it an area, or green Indian hazel-nut, with as much opium as they think fit, and eat them all together with sugar. If they desire to be entertained with variety of scenes, and images of things in their sleep, they add some of the chicory camphor, cloves, nutmegs, and mace. If they have a mind to be merry, witty, and to indulge their amounts, they add ambergise and musk, and make themselves an elixary with sugar. It is by many affirmed that the seed and leaves promote life; whence says J. Bannier, it appears that this herb has no affinity with hemp, though it be very much like it; since hemp, according to Dioscorides, is of a hot and dry nature, and extinguishes amorous desires.

Ray, from whom this account is taken, says, he learned from Sir Hans Sloane, that it is a different plant from hemp. It grows in Hindoostan, and other parts of the East Indies, where it is principally in use. Among the Indians, the seed is prepared among other melecorning and aromatic substance into an elixary, which excites pleasing visions, and as some say, emboldens them to perform the most daring and atrocious deeds. See NATURA.

Bangue, in reality, is a fusicundaeo to wing, and obtain in those countries where Mahometanism is established; which prohibiting the use of that liquor absolutely, the poor musulmen are forced to have recourse to fusicundaeo, to rouse their spirits. The principal are opium, and this bangue, which, says Sale (Pref. Disc. p. 125.), consists of the leaves of hemp in pills or powder, and by the rigid Mahometans is esteemed unlawful, though not mentioned in the Koran, because it intoxicates and disturbs the understanding as wine does, and in a more extraordinary manner. It is, however, commonly used in the East, but they who addict themselves to the use of it, are generally looked upon as debauchees. According to the account given of this substance by Alexander Maurocordato, counsellor and physician to the Ottoman Porte, in a letter to Wedelius, bangue is prepared of the leaves of wild hemp, dried in the shade, then ground to powder, put into a pot, in which butter has been kept; set in an oven till it begin to torrefy, then taken out, and pulverized again; and thus to be used in quantity as much, at a time, as will lie on the point of a knife. As to the opinion among the Europeans, that the Turks prepare themselves for battle by a dose of bangue, which rouses their courage, and impels them with ardour to certain death, Dr. Maurocordato affur us, that it is a popular error. The Turks think they are then going to receive the crown of martyrdom; and would not, for any consideration, forfeit the merit of it, which they would do by eating the bangue, which is held to be unlawful by their apostle, among other things which intoxicate.

BANGUEY, in Geography, an island of the Indian ocean, at the northern extremity of Borneo, not far from Balabac, the most south western of the Philippines. N. lat. 7° 17'. E. long. 117° 27'.

BANGUEY Peak lies in the peninsula of Palca. N. lat. 5° 18'. E. long. 117° 17' 20'.

BANHAS. Pedro dos, a small island and food-lask, north of Madagascar, and near the south-western corner of the island of Madagascar, in about S. lat. 5° 39', and E. long. 50° 40'.

BANHOS. Pedro dos, a small island surrounded by a sand bank, east of the last island, as far as S. lat. 6° 59'. E. long. 50° 20'.

BANI, a small district of Africa, in the county of Calabar, containing nine or ten villages.

BANI, a town of Italy, in the kingdom of Naples, and province of Capitanata, ten miles south of Trani.

BANIA, a river of Croatia, which runs into the Ljubl. BANIC, a small island on the west coast of Sumatra, in about N. lat. 10° 40'. E. long. 96° 52'.

BANJALUKA, or BANJALUK, a considerable town of European Turkey, in B. Sisia, the residence of a pacha, situated near the river Sietra, on the frontier of Dalmatia, 141 miles W. of Belgrad. It is supposed to contain 18,000 persons. N. lat. 42° 20'. E. long. 18° 26'.

BANIAN- Days, in Martin Language, a cast term among sailors, to signify those days in which they have no debent. It seems to be derived from the practice of the people mentioned in the article BANIAN.

BANIAN Trees, in Botany. See FICUS.

BANIANA, in Ancient Geography, a town of Hispания Bética, in the country of the Tartuhi. Ptolemy.

BANIONS, a religious sect in the country of the Mogul, who believe in metempsychosis, and will therefore eat no living creature, nor even kill noxious animals, but endeavour to release them, if they see them in the hands of others.

The Banians are said to be so fearful of having communication with other nations, that they break their cups, if one of a different religion have drank out of them, or even touched them; and empty the water out of a pond where he has washed himself. It is added, that if they happen to touch one another, they must wash and purify themselves before they eat, or enter their own houses. They carry hanging at their necks, a robe called tamarican, as big as an egg, and perforated in the middle, through which run three flying; t.e., flows, they say, represents their great god, and upon this account, they have great respect thrown them by all the Indians.

In a more general sense, the appellation of Banians comprehends all the inhabitants of India, as contradistinguished from the Mahometans; but in a more restricted and peculiar sense, it is appropriated to one of the four principal castes, into which the Indians are commonly divided; the other three being the Brahmans, the Kajaptus, or men of the sword, and the artizans and labourers. See HINDOOS.

The proper Banians are called, in the Nastar, or hook of their law, by the name of juadders, under which are comprehended all who live after the manner of merchants, or that deal and transact for others, as brokers; exclusive of the mechanics, or artificers, who make another cast, called seyges. Their name in the Brahmum language, in which their law is written, signifies an innocent and harmless people; and such they really are; for they cannot bear to see a fly, worm, or any other living creature hurt; and if they receive a blow, they take it meekly and patiently. These Banians have no peculiar sect or religion, unless it be,
be, that two of the eight general precepts given by the legislator. Dremaw to the Indian nation, are, on account of the profession of the Baniars, supposed more immediately to relate to them, viz. those which enjoyn veracity in their words and dealings, and avoiding all practices of circumvention in buying and selling.

The Baniars and the Chinees are the greatest traders in the Indies, to whom must also be added the Jews and Armenians who are greatly dispersed over those parts. But the most considerable trade is carried on by the Baniars, in the whole peninsula on the side of the Ganges. They are extremely skilful and cunning in commerce. Most of them follow brokerage, and most of the brokers of the English, Dutch, and French companies are of that nation. They are deemed, in general, very honest, and have always constantly in their hands the stock and cash of those companies.

They are likewise bankers; and there are few places in the East Indies for which they cannot furnish bills of exchange. They have also a sort of standing cash or bank where persons may deposit their money, and take it out again whenever they please.

Their form of contract, in buying and selling, is remarkable; being done in the profoundest silence, only by touching each other's fingers: the buyer loosening his panieres, or girdle, spreads it on his knee; and both he and the seller having their hands underneath, by the intercurrence of the fingers, mark the price of pounds, shillings, &c. demanded, offered, and at length agreed upon. When the seller takes the buyer's whole hand, it denotes a thousand, and, as many times as he squeezes it as many thousand pagodes, or roupies, according to the species in question, are demanded: when he only takes the five fingers, it denotes five hundred, and when only one, one hundred; taking only half a finger, to the second joint, denotes fifty; the small end of the finger, to the first joint, isds for ten. See CEURAWARTH.

Their children are hettimes accustomed to trade, and to imitate the gentlemens of manners, which distinguishes this class of persons. Those of the Baniars, who have flaves, treat them with great humanity. Their manner of living is very frugal, and they never depart from it, except when they let their children; on which occasion, they spend a sum amounting to not less than 12,500L. Their women are also distinguished by their simplicity of manners. They hold the nuptial tie in great veneration; and never allow themselves the least intercourse with strangers. Their husbands will not be satisfied without this reserve; alleging against every kind of familiaritie between the sexes this proverb: "if you bring butter too near the fire, you can hardly keep it from melting."

BANIAS, in Geography, a town of Syria, fifty miles S.W. of Damascus.

BANIER, Antony, in Biography, a French abbe, was a native of Clermont, in Auverge, who completed his education at Paris. Having been employed in classical instruction, he directed his particular attention to the subject of ancient mythology, and published in two volumes, 12mo., "An Historical Explanation of the Fables of Antiquity." This work gained him the reputation of being a writer of taste and erudition; and 1714, he was admitted into the Academy of Inscriptions and Belles Lettres. In 1715, his treatise, designed to trace the fables of the ancients to historical facts as their true origin, was much enlarged and published in the form of dialogue. The same subject was purposed by the author in several dissertations communicated to the academy of which he was a member, and published in its Memoirs. With a view to the same subject, he presented the public with the result of his researches during the last ten years of his life, first in his "Translation of the Metamorphoses of Ovid," with historical remarks and illustrations, and the plates of Picart, published at Amsterdam, in folio, in 1732, and reprinted in 1738 at Paris, in two volumes, 4to; and afterward, in a work, intitled, "Mythology, or the Fables explained by History," printed in 4to, and also in folio at Paris, in 1740, translated into English, and printed at London in 1743, in 8vo. Soo. Banier died in November 1741, aged 69 years. He published an improved edition of Marville's "Mehanges d'Histoire et de la Literature," and had a great share in the new edition of Picart's "General History of Religious Ceremonies," published in 1741. Nov. Dict. Hist.

BANJERMANSING, or BENDER MASSIN of Med'Anville, in Geography, a town and district on the south side of the island of Borneo; the chief product and trade of which are pepper. The factory of the Dutch lies in S. lat. 3°. They have here a small fort, where a junior merchant, as resident, with about 25 or 30 soldiers, are stationed. The object of this establishment is chiefly the collection or purchase of the pepper and rough diamonds produced in the country. The resident is allowed five per cent on the pepper. The contract with the king obliges him to deliver 60,000 pounds at three shillers per pound; and this is the only article which induces the company to retain this possession; for the profits on the rough diamonds, gold, wax, canes, and fago, would not be sufficient to make good the charges. Banjermansing is of no importance to the company as a source of revenue, for they do not possess a foot of land without their fort, and are obliged to be constantly on their guard against the inordinate attacks of the natives. The charges of this establishment in 1779 were about 1100l. sterling, which, together with those of conveying the pepper to Batavia, are fearfully covered by the profits accruing from this fancy trade. The river Banjar, called Biajos by d'Anville, flows from the centre of the country almost due south, and forms the harbour of the town; and on this river is experienced a difference of twelve feet in the rise and fall of the tide. The Biajos, as they are denominated, come down this river to the port in rude boats, with gold dust, and other articles, among which are diamonds, the Moors called Banjarens being the factors. These Biajos are tattooed blue, with a small wrapper about the loins. The chiefs extract one or two of the fore-teeth, sub-divident others of gold, and strieps of the teeth of tigers, which abound in the island, a real badge of knighthood or of courage, are worn round the neck.

BANILLIA, in the Materia Medica, a name used by some for the vanilla, or vanilla, used in making the scented chocolate.

BANISHMENT, Exile, in Law, among us, is of two kinds; the one voluntary, and upon oath; the other by compulsion, for some offence or crime.

The former, properly called adjuration, was abolished by Stat. 21. Jac. 1. c. 28.; and has now ceased, 2 Inst. 629: the latter is enquired by judgment of parliament. Yet outlawing and transportation may be also considered as a species of exile.

However, no power on earth, except the authority of parliament, can fend any subject of England out of the land against his will; no, not even a criminal. For exile and transportation are punishments at present unknown to the common law: and whenever the latter is now inflicted, it is either by the choice of the criminal himself to escape a capital punishment, or else by the express direction of some modern act of parliament. To this purpose Magna Charta declares (c. 29.) that no freeman shall be banished, unless by the judgment of his peers, or by the law of the land. And
by the lybani corpus a.d. (31 Car. II. e. 2.), it is enacted, that no subject of this realm, who is an inhabitant of England, Wales, or Berwick, shall be sent prisoner into Scotland, Ireland, Jersey, or Guernsey, or places beyond the seas, where they cannot have the full benefit and protection of the common law: but that all such imprisonments shall be illegal; that the person who shall dare to commit another contrary to this law, shall be disabled from bearing any office, shall incur the penalty of a penitentiary, and be incapable of receiving the king's pardon; and the party suffering shall also have his private action against the person committing, and all his aids, advancers, and abettors, and shall recover treble costs besides his damages, which no jury shall affix at left 500l. Blackll. Com. vol. i. P. 137.

BANISTER, John, in Biography, was educated at Oxford. In 1573, having taken a bachelor's degree, he obtained a licence to practice physic. He then went to Nottingham, and professed both medicine and surgery, "wonderfully followed (Wood says) by all sorts of people, for his happy practice in those arts." Banister published several works of which the following are the titles: "A needful, new, and necessary Treatise of Chirurgery, briefly comprehending the general and particular Curation of Ulcers, with certain Experiments of his own Invention," London, 1575, 8vo. It is dedicated to Tho. Stanhope, esq. high sheriff of Nottinghamshire. "The History of Man, fetched from the Sap of the most approved Anatomists," nine books, Fol. Lond. 1578; decorated. Douglas says, with anatomical engravings, copied from Vesalius, but miferably executed. "Compendious Chirurgery, gathered and translated, especially out of Wecker," Lond. 1585, 12mo. This is not a mere translation, the work being corrected and much improved by Banister. "Antidotary Chirurgical," containing variety of all sorts of medicines, Lond. 1589, 8vo. In 1633, several years after his death, his chirurgical works were published together in six books, in 4to. The Antidotary was dedicated to the earl of Warwick, by whom he appears to have been patronized. Wood's Athenae Oxon. Aikin's Biog. Mem.

Banister, Richard, was in great credit in the end of the sixteenth and beginning of the seventeenth century, for his skill in surgery, which he practised at Stamford in Lincolnshire. His knowledge in the art he learned of his near kinsman, John Banister, by whom he had been educated. "Sitting at the feet," he says, "of a Gannick in that art, let his name (he adds) be as a precious ointment poured out; for he was one to whom malice itself could do no mischief, nor hatred hurt." He continued in the general practice of surgery several years. "At length," he says, "I left the greatest maps of that unmeasurable mystery, and confined myself to the cure of the eyes, of the bare lip, the wry neck, and to affid the hearing by an instrument." But his principal object was relieving the blind; to perfect himself in this art, he appears to have associated with Henry Blackbourne, Robert Hall of Worcester, master Velder, Surfield, and Barnabie, of Fenny Stanton, Lynn, and Peterborough, all famed for their skill in couching and performing their operations on the eyes. Following their example, he visited many of the principal cities in the kingdom, particularly London, which place he visited spring and summer for several years. It appears to have been his custom to procure certificates of the cures he performed at each place. "I can shew," he says, "that in the year 1669, I made, with the help of God, twenty-four blind people free in the city of Norwich; and I came thither again in 1641, and all of them had their sight; for confirmation of which, I had a certificate from the mayor and alderman, with the city seal annexed." A similar certificate he obtained from Sir Wm. Cockaine, lord mayor of London, in the year 1621, which appears to have been the last time of his coming to London. But now, he says, I know it is not long to the period of my days, so I mean to rest at home the small remnant that God hath allotted to me." He promises, however, to continue to afflict those who visit him at his house. The time of his death is not known.

In 1622, he published "A Treatise of one hundred and thirteen diseases of the eyes and eye-lids; the second time published with some profitable additions of certain principles and experiments by Richard Banister, master in chyrurgery, occultist, and practitioner in phisic," 12mo. The book is not pagd. The part added by Banister seems to be a small treatise at the beginning of the volume, which he calls "Banister's Brevisry of the Eyes." He here complains of the number of ignorant persons, and among them many women, who interfered in the art, to the hurt of the people. This part is interspersed with poetical effusions, in which he laments at some pretended cures performed by drinking and washing the eyes with the waters of the Malvern and other springs.

"So many folks unto the town did run For water, that alewives were half undone. At first, when this news unto me was told, I doubted was, it touched my freethold. I dwelt from thence, at least some twenty miles, Yet there my patients went o'er fields and fylles." He had the satisfaction, however, to fee them come back, "Their bodies wearied, and their griefs made worse, And eas'd and purg'd only in the purge." The treatise which gives the general title to the volume, and of which Banister has with most people the credit of being the author, was written originally in French by Jacques Guillemeau, translated into English by an anonymous writer, and dedicated to John Banister. Wood's Athenae Oxon. Aikin's Biog. Mem.

BANISTERIA, in Botany, so named by Dr. Houlbou in memory of the Rev. John Banister, a curious botanist, who left his life in the search after plants in Virginia. Linne. gen. n. 573. Reich. 622. Schreb. 780. Cavannilles, t. 243. 258. Gert. t. 116. CHAL. de, decandria trigynia; roundifolia Cav. Nat. Order, tribulata; meliphoi, Jull. Gen. Char. Col. perianth, five parted (four, seldom five, Cav.) very small, ifth underneath with tubercles, permanent: two meliforous glands under each division of the calyx, except one; and they are therefore eight in number. Cor. petals five, orbiculate, very large, spreading, crenate (limbata C.): claws oblong, linear. Stem filaments ten, very small, coalescing at bottom: anthers simple. Pyl. germs three, winged, coalescent: stiles three, simple: stigma obtuse (enlarged into a leaflet, Cav.) Per. capsules three, running out into a long wing, one-celled, marked at the sides with small appendages, not gaping. Stelo foliar, covered, toothed on the lateral edge. Olb. The flower, especially the glands of the calyx, shew the affinity between this and malpighia. It differs however in the leafy glaws and winged fruit. B. leona has ten, the rest have eight glands. Cav. Eff. Char. Col. five-parted, with melancholy pores at the base on the outside. Pet. roundifoli with claus: clavus leaf-shaped; seeds three, winged with membranes.

at top in a short daggery point, green above, whitish beneath, nearly equal to the petioles, on which and near the leaf are two opposite glands; without stipules; flowers in opposite axillary umbels; common peduncle elongated; rays five to seven, an inch long, jointed, with two short, opposite bracts; at the insertion of the rays are two small suborbicular leaves; corolla sulphur-colored. A native of Dominique, Hispaniola, &c. 2. B. purpurea. Lam. Dict. n. 2. Plum. Spec. 18. ic. 15. Mf. t. 2. Aecr. Birm. Amer. t. 15. "Leaves ovate; spikes lateral; seeds erect." Stem strong and woody, dividing into many opposite and twining branches; leaves ovate, on short petioles; there are five or six pairs of branches, nearly of the same size with theirs undersides; flowers axillary, in a kind of spike; petals purple, short; third germ often abortive, whence Plumier says that the fruit is bi-ovulate and twinged; and Miller, that the greater number of species have only two styles. A native of the Caribbean islands, sent to Miller from Campeachy, and cultivated by him in 1750.

3. B. laurifolia. Lamarec. Dict. n. 3. Acer feird, fol. laurinisi. Dcarn. Jan. 2. 16. Plum. Spec. 18. ic. 14. "Leaves ovate-oblong, rigid; racemes terminal." Stem shrubby, climbing, with loose, reflex, diverging, roundish, rugose branches; leaves petiolate, ovate-lanceolate, acute, entire, nervetl, smooth; racemes pedunculate; peduncles commonly one-flowered; short, yellow; leaflets at the base of the peduncles two, minute, tomentose, calyx five-leafed; petals spatulate; anthers elliptic; gern three-cornered, trifid at the tip; styles subulate; short; stigma dilated, one of the three capsules usually abortive; wings three or four times longer than the capsules. A native of Jamaica and Hispaniola.

4. B. longifolia. "Leaves oblong, acuminate, rigid, thinning, panicle terminating; branches spreading very much." A native of the West Indies.

5. B. bengalensis. "Leaves ovate-oblong, acuminate; racemes lateral; seeds spreading." This species recedes from the genus, it has only one style, and the capsule has four wings. It has strong woody flakes, twining about trees which grow near it, and rises twenty feet high. A native of the East and West Indies.

7. B. fulgens. "Leaves fleshy, tomentose underneath; racemes bracteate; peduncles umbellate." Its slender winding stalks rise five or six feet high, and the flowers grow in a round bunch at the extremity of the branches, of a brownish yellow colour; the seeds are smaller, and have narrower wings than in the third species. A native of Jamaica and Barbadoes.

8. B. brachia. "Leaves fleshy; bracteate; racemes bracteate; seeds narrower within." Very like the foregoing; but the leaves more blunt; yielding out many branches, dividing into others, and yielding tendrils which flatten to neighbouring trees, and mounting to a great height; the flowers, in loose clusters at the ends of the branches, are suffruticose, gold-coloured, and fade to a scarlet, succeeded by slender thin seeds. A native of Carthagena.

9. B. aculeata. "Leaves pinnate; leaflets oblong, obtuse; flowers spikelike; stem branching, prickly." Climbing stalks, dividing into many branches with long winged leaves, composed of about twenty pair of small blunt pinnae, each having a deep furrow on the under side; the flowers grow on long spikes at the end of the branches, and are succeeded by single seeds, as large as those of the greater maple. A native of Tolu.

11. B. viti. "Leaves ovate-oblong, quite entire, thinning beneath; panicle terrifying leafy." A native of Brazil, where it was found by Commerson.

12. B. brefiaefolia. "Branches tubercled; leaves ovate-acute, with a broader nipa on the lower surface; wings very long." Found by Commerson near Rio Janeiro in Brazil.

13. B. marginata. "Leaves ovate-acuminate, tomentose beneath; racemes axillary; capsules acuminate." A native of Peru, where it was found by Joseph de Jules.

14. B. Lenana. "Branches tubercled; leaves ovate-acuminate, coriaceous; flowers panicle; racemes terminal." It varies with other more elongated leaves. A native of America, and found by Smeathman at Sierra Leone in Africa, in which perhaps it has been transported.

15. B. flexuosa. "Leaves ovate-acuminate, tomentose beneath; flowers panicle; bracts imbricate." A native of Rio-Janeiro, near St. Sebastian, in Brazil, found there by Commerson.

16. B. marginata. "Leaves ovate, subcorporate, unmarginate; styles at the end, tomentose on the lower surface, flowers raceme-corymbose." A native of America.

17. B. Lapa. "Leaves ovate, tomentose beneath, flowers in corymbs, seeds erect." A shrub, six feet high, putting out many tomentose twining branches, by which it climbs up trees. A native of Guiana, on the borders of meadows, flowering in August, observed there by Aublet.

18. B. forrдинг. "Leaves ovate, acuminate, flowers in corymbs, yellow, wings gradually widening." A shrub with a trunk five feet high, putting forth many flowering twining branches. A native of Guiana, on trees, by the sides of meadows and fields, flowering and fruiting in August, observed there by Aublet. 19. B. orbiculata. "Stem twining; leaves orbiculate, beneath tomentose and silky; petals biglandular." A native of Jamaica, Guadaloupe, and St. Domingo. Cavanilles attributes to this the same synonym of Sloane and Browne, which Linneaeus has given to B. fulgens.

20. B. drilata. "Leaves cordate-radiate, eroded, smooth, ciliate." A native of Brazil, where it was found by Dombey.

22. B. ovata. "Stem twining, leaves ovate, acute, quite entire, flowers in umbels, involucres fluted." A native of the island of Domincque, where it was found by Delportes and Burian.

24. B. fagitea. "Stem twining, leaves fagitate, large, tomentose, petals biglandular." A native of St. Domingo, found there by Delportes.

The species of this genus are all inhabitants of very hot climates, chiefly of America, from Brazil to Louisiana, particularly the islands. They are shrubs, mostly with twining stems, adorning the woods with the beauty of their flowers, and the variety of their opposite leaves. Plumier discovered four sorts: and for the red, we are obliged to Aublet, Commerson, and other modern travellers.

Propagation and Culture. These plants, being natives of hot countries, cannot be preferred in England, unless they are kept in a bark-house. They are propagated by seeds, procured from the countries where they grow, naturally gathered when fully ripe, and brought to England in sand or earth. When they arrive, they should be left immediately in pots, and if it be autumn, or winter, the pots should be plunged into a hot-bed or tanner's bark, and curdled from frost and wet, till spring, when they must be removed to a fresh hot-bed, which will bring up the plants; when the plants come up, let them be put into separate pots, filled with light earth, and plunged into the bark-bed, after which they must be treated like other tender plants from the same countries. Martyn's Miller.
BANK, in Commerce, is a denomination given to certain societies or communities, who take on them the charge of the money of private persons to improve it, or keep it secure; or it is a common repository, where many persons agree to keep their cash, to be always ready at their call, or direction. The word bank in this sense comes from the Italian banco, formed of the Spanish banco, a bench, whereon the ancient money-changers sat in the public markets; or, as others think, a table whereon they told their money; for the Spanish banco signifies a table, as well as a bench; as among the Greeks the word στραξίς signified a bench, as well as a table, whence the word στραξίστηρ for a ledger. Accordingly the institution of banks commenced in Italy, where the Lombard Jews kept benches in the market places, for the exchange of money and bills. Mr. John Law, indeed, in his treatise, intitled, "Money and Trade considered," aferrives the invention of banks to Sweden; alleging that the bulk of their money being copper, rendered it inconvenient; and in order to remedy this, a bank was set up, where the money might be pledged, and paper credit given to the value, which palled in payments, and facilitated trade. But this opinion, says Anderson (Hist. Comm. vol. i. p. 476.), is so far from being barely probable, that it is in a manner past all doubt, that the free cities of Italy were, in very early times, the inventors of banks (lumber-houses, or lambard-houses) and bills of exchange, long before the countries on the north extremity of Europe knew any thing of commerce, which Sweden knew least and latest of all the rest.

It cannot be doubted but that the beginning of traffic was by exchanging one commodity for another, as men could best suit each others occasions. But the necessities of men being so various and different, in respect to the quantity and quality of requisites, money was instituted as the most convenient medium for commerce, whereby people might procure whatsoever they stood in need of, in quantities according to their exigencies.

This changed the term of bartering into that of buying and selling; yet all trading at length reduces into a general barter. For he who sells any thing to receive money for it, perhaps what he requires with the same money. Money then becoming the principal engine for circulating the bulk of commerce, its application to trade is proper to be considered.

Money is used in the minuter kinds of dealings, as retailing, &c. when it is commuted for all kinds of labour, and to furnish the necessary provisions for daily use. This requires its being divided into the smallest denominations of the pieces, as into shillings and pence; so that this way of dealing is not capable of being transacted by bills and affigments.

Money is also employed in the more extensive and wholesale way of trade, wherein large sums are negotiated; and this occasions frequent payments from one traderman to another. In which payments, although strictly speaking ready cash be required as often as contracts are made, yet as commerce in general consists in the mutual dealings and transactions of many traders, it may often so fall out, by means of interchangeable debts and credits, that divers traders may satisfy each others occasions, without making any payments in specie, by transferring their debts to each other.

But when such mutual conveniences do not occur, traders usually receive their money in specie, and to pay it from one to the other. Yet this way of payment is attended with many inconveniences, as trouble in counting the money, hazard in securing it from the attempts of robbers.

Vol. III.
to the ancients, and which is the pride of the modern commercial system.

Bank of England, was first established in the year 1694, partly for the convenience of commerce, and partly also for the enrolment of the proprietors; and it is the greatest bank of circulation in Europe. The project was proposed by Mr. W. Paterson, a merchant, and debated for a long time by the proprietors, till at length, by an act of 5 & 6 William & Mary, cap. 20, it was enacted, that their majesties might grant a commission to take particular subscriptions for 1,200,000l. of any persons, natives or foreigners, whose majesties were hereby empowered to incorporate with a yearly allowance of 100,000l., viz. 96,000l. or 8 per cent. for interest till redeemed, and 400l. to be allowed the intended bank for charges of management. The corporation was to have the name of "The governor and company of the bank of England;" their said fund to be re-deensible upon a year's notice, after the 1st of August 1705, and payment of the principal, and then the corporation to cease. The company was enabled by this act to purchase lands, &c. unlimitedly, and to enjoy the other usual powers of corporations; their stock was to be transferrable. They were restricted from borrowing more than 1,200,000l. except on parliament funds, and from trading in any merchandise, except in bills of exchange, and in bullion, and in the sale of such goods as were the produce of lands purchased by the corporation: and all bills obligatory under the seal of the said corporation, were made affaigible by indorsement. The charter of incorporation was executed July 27, 1694; which directs, that there be a governor, deputy-governor, and twenty-four directors; and specifies the qualifications of voters and directors, together with other regulations, which have been further amended and enlarged by subsequent statutes.

In 1697, the bank was allowed to enlarge its capital stock, by an engraftment of 1,021,171l. 10s. This whole capital stock, therefore, amounted at this time to 2,201,171l. 10s. This engraftment is said to have been for the support of public credit. In 1696, tallies had been at 40, and 50, and 60 per cent. discount, and bank notes at 20 per cent. During the great recoinage of silver, which was going on at this time, the bank had thought proper to discontinue the payment of its notes, which necessarily occasioned their discount. By this engrafting act, as it was called, the capital stock of the bank was to be exempted from any tax; no act of the corporation; nor of its court of directors, nor sub-committees, should subject the particular share of any member to forfeiture; but these shares were subject to the payment of all just debts contracted by the corporation; and it was made felony to counterfeit the common seal of the bank, affixed to their sealed bills, or to alter, or counterfeit any sum in, or any indorsement on their stamped notes, signed by order of the said governor and company, or to forge or counterfeit the said bills or notes. This act was judiciously framed for the restoration of public credit; and it served to effect two points; viz. the rescue of the exchequer tallies and orders from the stock-jobbing harpies by engrafting them into this company, and also by cancelling the bank notes, also engrafted, which had been at 20 per cent. discount; because the government had been greatly deficient in their payments to the bank; and a good interest was secured to the proprietors of the increased capital. By act 6 Anne c. 22, it was enacted, for securing the credit of the bank of England, that no other banking company in England shall consist of more than six persons, empowered to issue bills or notes payable on demand, or for any time less than six months, which is the only exclusive privilege belonging to the bank. In pursuance of the 7th Anne, c. 7, the bank advanced and paid into the exchequer the sum of 400,000l. making in all the sum of 1,600,000l. which it had advanced upon its original annuity of 96,000l. interest, and 400l. for expense of management. In pursuance of the same act, the bank cancelled exchequer bills to the amount of 1,775,027l. 17s. 10d. at 6 per cent. interest; it likewise undertook the circulation of 2,500,000l. of exchequer bills for the supply of the year; and it was at the same time allowed to take in subcriptions for doubling its capital. In 1709, therefore, the capital of the bank amounted to 4,402,343l. 11s. 6d. and it had advanced to government the sum of 3,375,027l. 17s. 10d. By a call of 15 per cent. towards the 400,000l. advanced to government, there was paid in and made stock 656,024l. 15s. 9d.; and by another call of 10 per cent. in 1710, 501,448l. 12s. 1d. In consequence of these two calls, the bank capital amounted to 5,379,995l. 14s. 8d.

The convenience which government found in issuing exchequer bills by means of the bank, produced an agreement in 1713, when the company undertook to circulate new bills for raising 1,200,000l. towards the supplies, on having an allowance of 3 per cent. per annum, payable weekly, and a further allowance of 8000l. per annum, payable quarterly. On this occasion, by 12 Anne, c. 11, the company obtained an additional term of 10 years to the period of their continuance as a corporation; so that they were not to be dissolved but upon twelve months notice after the 1st of August 1742; and to enable them to fulfil their engagements, they were empowered to make a call for money upon the proprietors. In the following year, they first received the subscriptions to a loan for the public service, which had been hitherto usually taken at the exchequer; but the bank, being found more convenient for monied persons, has usually received them ever since.

In pursuance of the act 3 Geo. I. c. 7, 8, 9, in 1717, the bank delivered up two millions of exchequer bills to be cancelled; and it had, therefore, at this time, advanced to government 5,375,027l. 17s. 10d. It was now agreed to reduce the interest from 6 to 5 per cent. In pursuance of the act 8 Geo. I. c. 21. in 1722, the bank purchased of the South Sea company stock to the amount of 4,000,000l. and in this year, in consequence of the subscriptions which it had taken in for enabling it to make this purchase, its capital stock was increased by 3,400,000l. At this time, therefore, the bank had advanced to the public 9,375,027l. 17s. 10d. of which the sum of 1,600,000l. was entitled to 6 per cent. interest, till the 1st of August 1743; but the reil was to be reduced to 4 per cent. from and after Midsummer 1727; and the capital stock of the bank amounted only to 8,959,995l. 14s. 8d. It was upon this occasion, that the sum which the bank had advanced to the public, and for which it received interest, began first to exceed its capital stock, or the sum for which it paid a dividend to the proprietors of bank stock; or, in other words, that the bank began to have an undivided capital, over and above its divided one; and it has continued to have an undivided capital of the same kind ever since.

In 1728, the company of the bank advanced to government 1,750,000l. at 4 per cent. interest, without any power of enlarging their capital. In the following year, they advanced the further sum of 1,550,000l. at 4 per cent. The capital due from government, after fundy redemptions, was 16,100,000l. of which the sum of 1,000,000l. was re-
deemed in 1738, being part of the principal for exchequer
bills cancelled in 1717.

In 1742, the company advanced a further sum of 1,000,000l. towards the supply for that year, without re-
ceiving any additional allowance for interest or manage-
ment; but they were empowered to place their capital
stock to the same amount; and by the act 15 Geo. III. c. 13
establishing this contract, by which the privileges of the
bank were continued till one year's notice after the 1st of
August 1764. It was declared, that the acts of 7 and 12
Anne, and all other acts for determining the corpora-
tion, should be void; and that the governor and company of the
bank should remain a body corporate and politic for ever,
subject to such restrictions and regulations as were contained
in the acts and charters then in force. The whole sum, ad-
vanced on the original fund of 100,000l. per annum, thus
became 3,286,000l. and the interest upon it from 1st of
August 1743, 3 per cent, per annum.

By this act, perfons forging, counterfeiting, or altering
any bank note, bill of exchange, dividend warrant, or any
bond or obligation under that company's seal, or any in-
dorsement upon it, or knowingly uttering the same, shall suffer
death without benefit of clergy. Moreover, the company's
directors breaking their trust to the company, shall suffer
death as a felon without benefit of clergy. It was also
enacted, that when, at a court of directors of the bank, ne-
ither the governor nor deputy governor shall attend in two
hours after the time appointed for business, then 12 or
more of the directors may chuse a chairman for the time, for
the dispatch of business; and that such court shall be as
valid as if either the governor or deputy governor had duly
attended.

In consequence of the bill 19 Geo. III. c. 6. in 1746, the
bank agreed to deliver up to the treasury 986,800l. in ex-
chequer bills; in lieu of which it had to be an annuity of
4 per cent for that sum, out of the fund for licensing
spirrituous liquors; and the bank was empowered to add the
paid 986,800l. to its capital stock, by taking in subscrip-
tions for that purpose. Accordingly, at Michaelmas
1746, the whole debt due to the bank from the public
was 1,168,800l. and its divided capital had been raised
by different calls and subscriptions to 10,780,000l. The
flate of these sums has continued to be the same ever
since.

In 1764, the company of the bank agreed to advance
1,000,000l, towards the supplies, in exchequer bills, to be repaid in 1766; and to pay into the exchequer 110,000l.
without any repayment of the principal or allowance of
interest for the same; in conformation of which, the term of
their charter was extended to 1st of August 1786; and the
dividend on the company's stock was raised at Michaelmas
from 4½ to 5 per cent. At Michaelmas 1776 it was raised to
5½ per cent.

From a very early period after the establishment of the
bank, it had been the practice of the company to affit
bills to government with money in anticipation of the land
and malt taxes, and by making temporary advances on exchequer
bills and other securities. In the year 1781, the sums thus
lent to government amounted to upwards of eight millions,
in addition to the permanent debt of 11,686,800l. An
agreement was now entered into for the renewal of their
charter, the term of which was extended to August 1812,
on the company's engaging to advance 2,000,000l. on ex-
chequer bills, at 3 per cent. interest, to be paid off within
three years out of the sinking fund. In order to enable them
to make this advance, a call of 8 per cent. on their capital
was thought necessary, by which their former capital stock
of 10,780,000l. was increased to 11,642,400l. the sum on
which they now divide. The dividend was also increased
one half per cent. so that it now became 6 per cent. In
consequence of this agreement, the total of their advances to
government on the land and malt taxes, exchequer bills, and
exchequer bills, was increased, on the 25th of February 1782,
to 9,654,670l. The amount of the bank-notes in circu-
mulation must of course be augmented by the increase of advances
to government.

In consequence of large advances to government, the great
exportation of coin and bullion to Germany and Ireland,
and several concouring circumstances, which, at the com-
encement of the year 1797, produced an unusual demand of
specie from different parts of the country on the metropo-
lis, an order of the privy council was issued on the 26th of
February, prohibiting the directors of the bank from issu-
ing any cash in payment till the sense of parliament on the
subject was obtained. This refection was sanctioned by
parliament; and a committee was appointed to examine the
state of the bank, from whose report it appeared, that, on
the 25th of February, after examining the outstanding
claims against it with the corresponding alcts, the amount
of demands on the bank was 13,770,393l; and that of affets,
not including the sum of 11,656,800l. of permanent debt due
by government, was 17,507,298l.; so that there was a
surplus of 3,826,093l.

Soon after the meeting of parliament, in November follow-
ing, the committee of secrecy, appointed to inquire into the
expedency of continuing the restriction on the bank, re-
ported, that the total amount of outstanding demands on the
bank, on the 11th of November, was 17,578,915l. and of the
funds for discharging the fame, exclusively of the permanent
debt, 21,418,448l. leaving a balance in favour of the bank
at that time of 3,857,501l. The report stated that the
advances to government had been reduced to 4,253,840l. and
that the cahh and bullion in the bank had increased to more
than five times the value at which they stood on the 25th of
February 1792, when it was about 1,272,000l.

By this statement, the solvency and solidity of the bank
were satisfactorily evinced; and, indeed, its flability must be
evoeal with that of the British government. All that it has
advanced to the public must be lost before its creditors can
retain any lofs. No other banking company in England
can be established by act of parliament, or can confift of
more than six members. It acts, not only as an ordinary bank,
but as a great engine of state. It receives and pays the
greater part of the annuities which are due to the creditors
of the public (See National Debt, and Fund); it circulates
exchequer bills; and it advances to government the annual
amount of the land and malt taxes, which are frequently not
paid up for some years. It likewise discounts the bills of
merchants, and has, upon several different occasions, sup-
ported the credit of the principal houx, not only of
England, but of Hamburg and Holland. The baiquets of
the bank is under the direction of a governor, a sub-
governor, and 24 directors, who are elected annually by
a general court; and it is conducted by a great number of
subordinate clerks in different offices. The qualification
of a director is 200,000l. of a deputy-governor 100,000l. and
of a governor 40,000l.; 500l. bank stock intitles the proprietor
to vote at the general courts, provided he has been in posses-
sion of it six months.

The company may not improperly be denominated a
trading company, and that which is peculiarly distinguished
by the application of bank stock is a trading stock; the dividen-
arms of which, amounting to 11,642,400l. paid half-yearly,
and now 7 per cent. accreses from the annual income of the com-
pany;
pany; and this arises from the interest received for the money advanced by the proprietors to the public, or the permanent debt of 11,686,800l. from interest on the annual temporary advances; from the profits of their dealings in bullion, and of their discounts; from the interest of stock held by the company; from the sums allowed by government for the management of the annuities paid at the offices of the bank, such as, an allowance of 450l. per million for management of the public funds, and the allowance of 805l. 15s. 10d. per million for receiving the contribution to loans, and from some other smaller articles.

The bank of England may be considered as the main spring of that complicated mechanism, by which the commercial payments of this country are transacted; and by which the comparatively small sum of money with which they are performed is kept in perpetual and regular circulation. The subordinate parts of this machine consist of about 70 private banking-houses in London, and about 366 banks diffused over the country. By the joint operation of these various money-dealers, almost all bank payments, founded on commercial bargains, are ultimately settled in London, with the money which issues from the bank of England. This money circulates in ordinary times, partly of coin, and partly of bank notes. From its large capital and extensive issue of paper, that bank indirectly supplies the whole kingdom with as much gold as is required for circulation. Its notes are issued in loans, granted either for the accommodation of the public treasurer, or for that of merchants by discount of their bills; and in consequence of a common agreement among the bankers, no notes of any private house are current in London. All the large payments of that metropolis are in this manner effected by the paper of the bank of England; and they are chiefly transacted by the private bankers, who, according to a conjectural estimate, make daily payments to the amount of four or five millions, and have probably in their hands a very large proportion of the whole of the notes circulating in the metropolis.

The following table will exhibit, at one view, the rate of the cash and bullion, the average of bank notes in circulation, and also the discounts and advances to government during the several periods which it comprehends.

</table>

In the beginning of 1798, the bank advanced to government 3,000,000 on exchequer bills, and in the progress of the year a farther advance of 500,000; so that the total sum, advanced by the bank for the public service, and out-

funding on the 7th of December, was 6,777,739l. At a general court, held 14th of March 1799, it was agreed to advance to government 1,500,000l. on exchequer bills, and it was proposed to divide among the proprietors the 5 per cent. stock held by the company for the million subscribed to the loyalty-loan; and with this view to purchase 336,240l. of the same stock, to make up the sum held by them 1,164,240l. in order to make a dividend of 10l. 5 per cent. stock for every 100l. bank capital. Accordingly the transfer was made on the 1st of June.

In November following, a negotiation was entered into for renewing the term of the company's charter, although about 13 years of it remained. The proposition was agreed to at a general court held January the 9th, 1800. The conditions were, that the bank should advance to government 3,000,000l. for the service of the year 1800, on exchequer bills, payable, without interest, out of the balances to be granted for the year 1806, in consideration of which the term of their charter was continued till the end of twelve months next after the 1st of August 1833.

The amount of bank notes in circulation had gradually increased since the beginning of 1797; and, during the year 1800, amounted to about 13,500,000l. The amount, on an average of a month, to 25th of January 1801, was 16,475,200l. consisting of 13,845,800l. in notes of 51., and upwards, and 2,629,400l. in 1l. and 2l. notes.

At a general court, held 19th of March 1801, another occasional dividend of stock was proposed. This dividend was to be made of 582,120l. of 5 per cent. navy annuities, at the rate of 5 per cent. for every 100l. bank capital; and the transfer was made on the 1st of May.

The commerce of London itself is immense; not only as a seat of populous and luxurious consumption, but as a flation of manufactures, and an emporium of maritime trade. The number of payments occasioned by such various transactions, is farther increased by the dividends which the national creditors receive on the great sum of our public debt. But in addition to all these payments, originating within the capital itself, bills are drawn upon London, and remittances are sent hither to provide for them, from all parts of the kingdom. Even foreign drafts, on account of merchants in the country, are, with scarcely any exceptions, made payable in London. And thus a great proportion of the pecuniary engagements, to which the whole commerce of the kingdom gives birth, are ultimately settled there. This transfer of the country payments to London, has, in some degree, fulfilled for a long time; the practice, once begun, was likely, from its great advantage, to be gradually extended; and, of late years, it seems to have been reduced to a regular and very commodious system. It was much facilitated by the multiplication of country banks, during that period of high prosperity and confidence which immediately preceded the late war. The formation of these throughout the whole country was actively encouraged by the private bankers of London; and, indeed, the existence of a great national bank, which, like that of England, must provide a constant reservoir of gold, naturally suggests the creation of smaller establishments. Upon the formation of such banks in the country, many traders of all descriptions, who had formerly maintained a direct correspondence with merchants in London, fell into the practice of transacting their business with the metropolis through the banker in their own neighbourhood with whom they kept their cash. On their account, he drew largely upon a banker in London; who agreed to execute the extensive country business he had thus acquired, at a much lower commission than what had formerly been paid by the several country traders to their
their separate correspondents. The rate of commissio was reduced, in consequence of the diminished trouble as well as risk; the labour of keeping accounts, writing letters, receiving and paying bills, was now transferred to one house, which had before been divided among many; and a new security was afforded to the transactions between the metropolis and the country, by the interposed credit of wealthy and respectable country banks.

The establishment of such a system of banks, and the transference of ultimate payments to one particular place, are in the natural course of that progressive feudalisation of labour, which extends itself over an opulent and industrious country. The receipt and payment of money, instead of being conducted at home, are transferred, by every trader, to his banker; who devotes himself to abridging his own labour, and of economising the use of money, especially of that costly part of it which consists of specie. By his skill and success in attaining these objects, he manages an important part of trade, at an expense far inferior to what the merchants themselves must have incurred, had they continued to conduct it separately by their own clerks. In proportion, likewise, as the amount and number of payments and receipts is augmented in one particular place, the business of paying and receiving is more easy and cheaply transacted; the guineas or bank notes required, though more upon the whole, are fewer in proportion to the sums paid and received. So complete, accordingly, and to logical necessity is economy in the use of notes, which long experience has introduced among the London bankers, that the present payments of that metropolis could feebly be transacted, with due regularity, if the quantity of notes were to suffer any considerable diminution. In this they are assisted by the facility of bills of exchange and government securities to supply the place of bank notes; for the interest that grows on such negotiable paper while it is retained, far exceeds the losses which the banker would undergo from the detention of coin or notes; and there is a certain sort and quantity of bills, on the conversion of which into money he may rely almost as confidently as on the changing of a note into guineas, or of a guinea into silver.

The ingenuity of these money-dealers, in sparing the circulating medium, is aptly illustrated by a custom which prevails among the city bankers. Each of them lends a clerk, at an appointed hour in the afternoon, to a room provided for their use. Each clerk there exchanges the drafts on other bankers received at his own house for the drafts on his own house received at the houses of other bankers. The balances of the several bankers are transferred from one to another, in a manner which it is unnecessary to explain in detail, and the several balances are finally wound up by each clerk into one balance. The difference between the whole sum which each banker has to pay to all other city bankers, is, therefore, all that is discharged in bank notes or money; a difference evidently much less in its amount than that to which the several differences would be equal.

But the economising use of circulating medium is by no means the only collateral advantage that arises from this system of banks, connected in subordination to each other, with the great national bank at their head. Although a very few of the country establishments have occasionally subjected themselves to the charge of encouraging rash speculation, the system, in its complex operation, has a real tendency to bring it as well as to enlarge the basis of credit. Bankers profiting, from their situation, very superior means of distinguishing the careful trader from the improvident. The bill transactions of the neighbourhood pass under their inspection; and by this information they are enabled to measure out confidence very nearly in a just proportion. In fact, it is considered as a regular branch of their professional experience, that they should appreciate the credit of the various traders within their district of circulation; and this sort of practical sagacity they are under-
Should the alarm be great and of long continuance, the bank, by maintaining only a million of notes in circulation, may, by the continual return of these, be exhausted of fifty millions of guineas. Besides, a more permanent cause of a run upon the bank of England for specie is the excess of the market price of gold above its mint price. This was formerly occasioned by the debased state of gold currency; and the bank has been reduced to the necessity of coining new guineas, which were immediately melted down, that the bullion might be sold to the bank itself at the high market price. In whatever manner the high price of gold is produced, immediate demands are made upon the bank for guineas, in order to export them. Thence it evanours to replace, though gold cannot be purchased without a considerable loss. A mutual competition will thus be established between the bank, on the one hand, which buys and coins at a great loss, and the clandestine dealers, on the other hand, who melt and sell gold at a great profit. If the unfavourable balance of trade, which has caused this high price of bullion, were not of a temporary nature, the bank of England, by this continued accumulation of unproductive expeune, might ultimately be reduced to very great distress. Besides, the excess of the market price of gold above its mint price may likewise be produced by too great a quantity of paper-money. The bank, indeed, has the power of restricting the country paper, by limiting its own notes to those which are actually needed for the purposes of circulation. It has, therefore, the power in a great degree of preventing that high price of gold, and the consequent drain of its own guineas, which proceed from an excessive circulation of paper. So long, then, as the bank is liable to payments in specie, it has an evident interest to prevent its own paper, as well as that of the whole country, from being so excessive, as to occasion a rise in the price of commodities. To limit the total amount of paper issued, and to reforit, whenever the temptation of borrowing is strong, to some effectual principle of restriction; never to diminish greatly the sum in circulation, but to let it vibrate only within certain limits; to afford a flow and cautious extension of it, as the general trade of the country is enlarged; and to permit a temporary increase during an extraordinary period of difficulty or alarm:—this, according to Mr. Thornton (ubi infra), is the true policy of an institution placed in the circumstances of the bank of England.

If the bank of England, says an anonymous writer (Edin. Rev. N. S. I. p. 196.), must now be considered as a national establishment, not merely influencing, by the superior magnitude of its capital, the fate of commercial circulation, but guiding its movements according to views of public policy, an important revolution has taken place since the first creation of that corporation as a banking establishment. That power of influencing the medium of exchange, with the opportunities it implies of varying its quantity and value, which, while precious coin was in use, was exercised under the immediate prerogative of the crown, is now virtually invested in the governor and directors of the bank of England. In the official character of that board, some of the functions of sovereignty are united to those of a trader; and the opportunities of banking profits are blended with a trust and charge of the public interest. It will be pleasing if these shall prove more happily compatible, than they have been found in other instances. The organization of this establishment, poofed of such means to control the operations of commerce, as well as to facilitate the advance of financial supplies, may, into our political constitution already so complicated, introduce a new principle of action, the effect of which cannot be clearly discerned. Perhaps an unbounded field will be opened for the extension of ministerial influence; perhaps an unexpected control may be gained to the people, over the views and measures of the executive. The suspension of cash payments in 1797, was an event, in the opinion of Mr. Thornton, to which the national bank was liable from its very nature: the probability of which had been so studiously concealed; and to the recurrence of which we may look forward. The gold, in the coffers of the bank, had been much reduced by the effect of an unfavourable balance of trade. The alarms of invasion had led to the failure of some country banks in the north of England; this occasioned a further demand of guineas from the bank, and a diminution in the circulating notes of London. The directors aggravated the difficulty, and augmented the demand for guineas, by unanimously suppressing some of their notes, instead of enlarging the quantity. It has also been alleged, that the loans of the bank to government, which occasioned a limitation in its issue of commercial paper, contributed, by their indirect and unavoidable operation, to aggravate that distress of the circulation which was chiefly produced by other causes. Although the loans to government could have no tendency to diminish the sum of notes in circulation, it nevertheless tended to distress the circulation, by rendering that sum of notes less adequate to the wants of commerce, than if they had flowed into the market through the usual channel of discounts. The suspension of payments in specie was properly continued, according to Mr. Thornton, from the permanence of those circumstances which rendered it originally necessary:—an unfavourable exchange, produced partly by our heavy expenditures, but chiefly aggravated by vast importations of corn, and the prevalence, till the eve of peace, of alarms about hostile invasions. Mr. Thornton maintains that the circulating paper of the bank of England does not in fact amount now to a greater sum than, upon an average of years, was in circulation before the suspension of cash payments. Upon an average of three years, ending in December 1795, their amount, according to the evidence laid before parliament, was 11,975,573l. From a subsequent statement prefetned to the house of Commons, they amounted in December 1800, to 15,456,970l. From the difference between these two sums, Mr. Thornton infills that we ought to deduct the amount of two millions, confiding of one and two pound notes, which according to him have displaced in the circulation an equal sum of guineas. After this deduction, there still remains the sum of 14,755,573l. by which the bank paper exceeded in 1800, its average amount before the suspension of cash payments. But in the spring of 1804, the governor of the bank flated to the house of commons, that the company had reduced its notes to a sum kbs, by about a million and a half, than their amount in the preceding December. Lord King, in his "Thoughts on the Restriction of Payments in Specie at the Banks of England and Ireland," says in 1803, disputes the correctness of Mr. Thornton's statements; and alleges, that in the spring of 1801, the issue of notes amounted to 16,365,526l., which was still farther increased, in the summer of 1802, to 16,727,560l. According to the last account prefetted to the house of commons, the bank of England notes in circulation amounted to 16,108,560l. If we compare, says his lordship, this sum with the above average of three years ending in December 1795, even after we add to the latter the whole two millions of which Mr. Thornton speaks, and which seems a very large allowance, the present issue from the bank will be found to exceed that, which was formerly convertible into specie, by something less than one-sixth.
sixth of the whole. If we consider the quick circulation of which paper admits of, and the increase which an accelerated rate of circulation gives to the effective powers of currency, this addition of almost one-sixth must be regarded as an immense augmentation of the mass of current coin. While the issue of bank of England notes was moderate and restrained, the market price of bullion, particularly of silver bullion, which is a more certain standard than gold, because it is a more regular article of commerce, continued very nearly the same at its established price in our mint. In the summer of 1799, however, about the same time with the great increase of bank paper, a rapid and extraordinary advance took place in the market price of bullion. That of silver rose at once to £5. 6d. above ten per cent. above the mint price. It continued to rise along with the progressive increase of notes; and in 1801, when they exceeded fifteen millions, it was as high as £6. 5s. more than 16 per cent. and even as £8, 1d. more than 17 per cent. above the mint price. Thus also, while the issue of the bank of England notes was moderate and restrained, the rate of exchange at Hamburg continued in favour of this country, being from three to five per cent. above par. But in the summer of 1799, about the same time with the great increase of bank paper, a very rapid fall to l place. It fell at once to 33. above eight per cent. below par; and continued to fall almost regularly, though not quite so regularly as the price of bullion rose, along with the progressive increase of notes. At the commencement of 1801, when they exceeded fifteen millions, the exchange with Hamburg was as low as 23. 10s. almost 16 per cent. below par. Lord King has subjoined a table, which exhibits the remarkable correspondence between the variations in the quantity of bank notes, and the variations in the price of bullion and rate of exchange. His lordship has also shown, that the paper currency of the bank of Ireland has been augmented from £21,017, to 2,653,554; and that its notes at present in circulation exceed more than four times the amount of what were in circulation when the act of restriction was passed. During the same period, the price of silver in Dublin has experienced a great advance, having varied from 6s. 6d. to 7s. Irish currency; an increase, which, admitting the mint price at 5. 7d. is from 14 to 20 per cent. The rate of exchange between Dublin and London has been also remarkably affected; the difference having progressively increased from 8d., the ordinary difference, to 10, 12, 14, and even 16. This proof of the depreciation of bank of Ireland notes has not been confined to the coast of exchange with London; but is felt in the transactions of Dublin with many of the provincial towns, where those notes have not acquired a general circulation; the currency still suffering either of specie, or of country notes. In consequence of this, and of the depreciated condition of the Dublin currency, there is an actual difference of exchange between Dublin and those towns. This is the case, for instance, in Belfast; where a payment is there made in bank of Ireland notes, an additional sum is paid proportional to the difference. Hence Lord King infers, that the measure of 1797 has actually had a perceptible influence upon the fyllem of circulation; and in long terms deprecates its continuance. Mr. Thornton states the following fact, that the enumeration of country-banks taken in 1800, differed from that taken in 1797, by the excess of 386 above 354.

It is not, says Dr. Smith (ubi infra), by augmenting the capital of the country, but by rendering a greater part of that capital active and productive than would otherwise be so, that the most judicious operations of banking can increase the industry of the country. That part of his capital which a dealer is obliged to keep by him unemployed, and in ready money for answering occasional demands, is so much dead stock, which, so long as it remains in this situation, produces nothing either to him or to his country. The judicious operations of banking enable him to convert this dead stock into active and productive stock; into materials to work upon, into tools to work with; and into provisions and fruits to work for; into stock which produces something both to him and to his country. The gold and silver money which circulates in any country, and by means of which the production of its land and labour is annually circulated and distributed to the proper consumers, is, in the same manner, the ready money of the dealer, or dead stock. It is a very valuable part of the capital of the country, which produces nothing to the country. The judicious operations of banking, by substituting paper in the room of a great part of this gold and silver, enable the country to convert a great part of this dead stock into active and productive stock; into stock which produces something to the country. The gold and silver money which circulates in any country may very properly be compared to a highway, which while it circulates and carriies to market all the goods and corn of the country, produces itself not a single pile of either. The judicious operations of banking, by providing, if I may be allowed to use the metaphor, a sort of waggon-way through the air; enable the country to convert, as it were, a great part of its highways into good pittures and corn fields, and thereby to increase very considerably the annual produce of its land and labour. The commerce and industry of the country, however, it must be acknowledged, though they may be somewhat augmented, cannot be altogether so fecures, when they are thus, as it were, suspended upon the Delphic wings of paper money, as when they travel about upon the solid ground of gold and silver. Over and above the accidents to which they are exposed from the unskilfulness of the conductors of this paper money, they are liable to several others, from which no prudence or skill of those conductors can guard them. 

Mr. Hume (Essays, vol. i. p. 301) expresses his doubt concerning the benefit of banks and paper credit. That provisions and labour, he says, should become dear by the increase of trade and money, is, in many respects, an inconvenience, but an inconvenience that is unavoidable, and the effect of that public wealth and prosperity which are the end of all our wishes. It is compensated by the advantages which we derive from the purification of those precious metals, and the weight which they give the nation in all foreign wars and negotiations. But there appears no reason, as he conceives, for increasing that inconvenience by a counterfeit money, which foreigners will not accept of in any payment, and which any great disorder in the rate will reduce to nothing. (See Paper-money) Inquiry into the nature and effects of the Paper Credit of great Britain, by Henry Thornton, Esq. M.P. London, 1802. Smith's Nature and Causes of the Wealth of Nations, vol. i. p. 479—484.

In Scotland, there are two public banks erected at Edinburgh; of which the one, called "The Bank of Scotland," was established by act of parliament in 1695; the other, called "The Royal Bank," by royal charter in 1727. New banking companies have been also erected within the last thirty and forty years in almost every considerable town, and even in some country villages. The business of the country, says Dr. Smith (vol. i. p. 442), is almost entirely carried on by means of the paper of these different banking companies, with which purchases and payments of all kinds are commonly made. Silver very seldom appears except in the change.
change of a twenty shilling bank note, and gold seldom. But though the conduct of all these different companies has not been unexceptionable, and has accordingly required an act of parliament to regulate it; the country, notwithstanding, has derived great benefit from their trade. It has been asserted, says this writer, that the trade of the city of Glasgow doubled in about fifteen years after the first erection of the banks there; and that the trade of Scotland has more than quadrupled since the first erection of the two public banks at Edinburgh. Whether this statement be strictly just or not, it is certain, that the trade and industry of Scotland have increased very considerably during this period, and it must be allowed, as an unquestionable fact, that the banks have greatly contributed to this increase. The whole value of the gold and silver, which circulated in Scotland before the union, cannot be estimated at less than a million sterling. In the present times, says Dr. Smith, the whole circulation of Scotland cannot be estimated at less than two millions, of which that part which consists in gold and silver, most probably, does not amount to half a million. But though the circulating gold and silver of Scotland have suffered to great a diminution during this period, its real riches and prosperity do not appear to have suffered any. In agriculture, manufactures, and trade, on the contrary, the annual produce of its land and labour has evidently been augmented. It is chiefly by discounting bills of exchange, that is, by advancing money upon them before they are due, that the greater number of banks and bankers influence their promissory notes; deducting always, upon the sum they advance, the legal interest till the bill shall become due. The payment of the bill when it becomes due, replaces to the bank the value of what had been advanced, together with a clear profit of the interest. The banker, who advances to the merchant whose bill he discounts, not gold and silver, but his own promissory notes, has the advantage of being able to discount to a greater amount by the whole value of his promissory notes, which he finds by experience are commonly in circulation. He is thereby enabled to make his clear gain of interest into a much larger sum. The commerce of Scotland was much less considerable than it is now, when the two first banking companies were established, and these companies would have had but little trade, if their borrowers had been restricted to the discounting of bills of exchange. They invented, therefore, another method of influencing their promissory notes; by granting, what they called "cash accounts," that is, by giving credit to the extent of a certain sum (e.g. 2 or 3000 pounds), to any individual who could procure two perfons of undoubted credit and good landed estate to become surety for him, that whatever money should be advanced to him within the sum for which the credit had been given, should be repaid upon demand, together with the legal interest. Credits of a similar kind are commonly granted by banks and bankers, in all different parts of the world. But the ca}f} terms upon which the Scotch banking companies accept of repayment are, says Dr. Smith, peculiar to them, and have, perhaps, been the principal cause, both of the great trade of these companies, and of the benefits which the country has received from it. Whoever has a credit of this kind with one of these companies, and borrows e.g. a thousand pounds upon it, may repay this sum by piece-meal, by 20l. and 30l. at a time; the company discounting a proportionable part of the interest of the great sum from the day on which each of those small sums is paid in, till the whole be in this manner repaid. All merchants, therefore, and almost all men of business, find it convenient to keep such cash accounts with them, and are thereby interJOeted to promote the trade of thosc companies, by readily receiving their notes in all payments, and by encouraging all those with whom they have any influence to do the same. The banks, when their customers apply to them for money, generally advance it to them in their own promissory notes. These the merchants pay away to the manufacturers for goods, the manufacturers to the farmers for materials and provisions, the farmers to their landlords for rent, the landlords repay them to the merchants for the conveniences and luxuries with which they supply them, and the merchants again return them to the banks in order to balance their cash accounts, or to replace what they may have borrowed of them; and thus almost the whole money business of the country is transacted by means of them. Hence the great trade of these companies. By means of these cash accounts, every merchant can, without imprudence, carry on a greater trade than he otherwise could do. If there are two merchants, one in London, and the other in Edinburgh, who employ equal flocks in the same branch of trade, the Edinburgh merchant can, without imprudence, carry on a greater trade, and give employment to a greater number of people, than the London merchant. The London merchant must always keep by him a considerable sum of money, either in his own coffers, or those of his banker, who gives him no interest for it, in order to answer the demands continually coming upon him for payment of the goods which he purchases upon credit. Let the ordinary amount of this sum be supposed 500l. The value of the goods in his warehouse must always be les by 500l. than it would have been, had he not been obliged to keep such a sum unemployed. Let us suppose that he generally disposes of his whole stock upon hand, or of goods to the value of his whole stock upon hand, once in the year. By being obliged to keep a great sum unemployed, he must fall in a year 500l. worth less goods than he might otherwise have done. His annual profits must be les by all that he could have made by the sale of 500l. worth more goods; and the number of people employed in preparing his goods for market, must be les by all those that 500l. more stock could have employed. The merchant in Edinburgh, on the other hand, keeps no money unemployed for answering such occasional demands. When he actually comes upon him, he finances them from his cash account with the bank, and gradually replaces the sum borrowed with the money or paper which comes in from the occasional sales of his goods. With the same flock, therefore, he can without imprudence, have at all times in his warehouse a larger quantity of goods than the London merchant; and can thereby both make a greater profit himself, and give constant employment to a greater number of industrious people who prepare those goods for the market. Hence the great benefit which the country has derived from this trade. The late multiplication of banking companies in both parts of the united kingdom, an event by which many people have been much alarmed, instead of diminishing, increases the security of the public. It obliges all of them to be more circumspect in their conduct, and, by not extending their currency beyond its due proportion to their cash, to guard themselves against those malicious runs, which the rivalry of so many competitors is always ready to bring upon them. It refines the circulation of each particular company within a narrower circle, and reduces their circulating notes to a smaller number. By dividing the whole circulation into a greater number of parts, the failure of any company, an accident which, in the course of things, must sometimes happen, becomes of less consequence to the public. This free competition too, obliges all bankers to be more
more liberal in their dealings with their customers, left their rivals should carry them away. In general, if any branch of trade, or any division of labour, be advantageous to the public, the freer and more general the competition, it will always be the more so. Smith's Wealth of Nations, vol. i. p. 446, &c. p. 498, &c.

Banks of Deposit are such as are instituted wholly for the benefit of the public. Of these Dr. Smith has given the following account: "The currency of a great state, such as France or England, generally confines almost entirely of its own coin. Should this currency, therefore, be at any time worn, clipped, or otherwise degraded below its standard value, the state by a reformation of its coin can effectively re-establish its currency. But the currency of a small state, such as Genoa or Hamburg, can seldom confide altogether in its own coin, but must be made up, in a great measure, of the coins of all the neighbouring states with which its inhabitants have a continual intercourse. Such a state, therefore, by reforming its coin, will not always be able to reform its currency. If foreign bills of exchange are paid in this currency, the uncertain value of any sum, of what is in its own nature so uncertain, must render the exchange always very much against such a state, its currency being, in all foreign states, necessarily valued even below what it is worth.

In order to remedy the inconvenience to which this dis-advantageous exchange must have subjected their merchants, such small states, when they began to attend to the interest of trade, have frequently enacted, that foreign bills of exchange of a certain value should be paid, not in common currency, but by an order upon, or by a transfer in the books of a certain bank, established upon the credit, and under the protection of the state; this bank being always obliged to pay, in good and true money, exactly according to the standard of the state. The bank of Venice established in 1157, that of Genoa in 1345, that of Amsterdam in 1609, that of Hamburg in 1619, and the bank of Nuremberg, seem to have been all originally established with this view, though some of them may have afterwards been made subervient to other purposes. The money of such banks being better than the common currency of the country, necessarily bore an agio, which was greater or smaller, according as the currency was supposed to be more or less degraded below the standard of the state. The agio of the bank of Hamburg, for example, which is paid to be commonly about fourteen per cent. is the supposed difference between the good standard money of the state, and the clipped, worn, and diminished currency, poured into it from all the neighbouring states.

Before 1609, the great quantity of clipped and worn foreign coin which the extensive trade of Amsterdam brought from all parts of Europe, reduced the value of its currency about nine per cent. below that of good money fresh from the mint. Such money no longer appeared than it was melted down or carried away, as it always is in such circumstances. The merchants, with plenty of currency, could not always find a sufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of several regulations which were made to prevent it, became in a great measure uncertain. In order to remedy these inconveniences, a bank was established in 1609, under the guarantee of the city. This bank received both foreign coin, and the light and worn coin of the country, at its real intrinsic value in the good standard money of the country, deducting only so much as was necessary for defraying the expense of coining, and the other necessary expense of management. For the value which remained after this small deduction was made, it gave a credit on its books. This credit was called bank money, which, as it represented money exactly according to the standard of the mint, was always of the same real value, and intrinsically worth more than current money. It was at the same time enacted, that all bills drawn upon or negotiated at Amsterdam, of the value of six hundred guilders and upwards, should be paid in bank money, which at once took away all uncertainty in the value of these bills. Every merchant, in consequence of this regulation, was obliged to keep an account with the bank in order to pay his foreign bills of exchange, which necessarily occasioned a certain demand for bank money.

Bank money, over and above both its intrinsic superiority to currency, and the additional value which this demand necessarily gives it, has likewise some other advantages. It is secure from fire, robbery, and other accidents; the city of Amsterdam is bound for it; it can be paid away by a simple transfer, without the trouble of counting, or the risk of transporting it from one place to another. In consequence of these different advantages, it seems from the beginning to have borne an agio, and it is generally believed, that all the money originally deposited in the bank was allowed to remain there, nobody caring to demand payment of a debt which he could sell for a premium in the market. By demanding payment of the bank, the owner of a bank credit would lose this premium. As a filling fresh from the mint will buy no more goods in the market than one or two common worn shillings, so the good and true money which might be brought from the coffers of the bank into those of a private person, being mixed and confounded with the common currency of the country, would be of no more value than that currency, from which it could no longer be readily distinguished. While it remained in the coffers of the bank, its superiority was known and ascertained. When it had come into those of a private person, its superiority could not well be ascertained without more trouble than perhaps the difference was worth. By being brought from the coffers of the bank, besides, it left all the other advantages of bank money; its security, its easy and safe transmissibility, its use in paying foreign bills of exchange. Over and above all this, it could not be brought from those coffers, as will appear by and by, without previously paying for the keeping.

Those deposits of coin, or those deposits which the bank was bound to restore in coin, constituted the original capital of the bank, or the whole value of what was represented by what is called bank money. At present they are supposed to constitute but a very small part of it. In order to facilitate the trade in bullion, the bank has been for these many years in the practice of giving credit in its books upon deposits of gold and silver bullion. This credit is generally about five per cent. below the mint price of such bullion. The bank grants at the same time what is called a receipt or recipt, entitling the person who makes the deposit, or the bearer, to take out the bullion again at the same price within six months, upon transferring to the bank a quantity of bank money equal to that for which credit had been given in its books when the deposit was made, and upon paying one-fourth per cent. for the keeping, if the deposit was in silver; and one-half per cent. if it was in gold; but at the same time declaring, that in default of such payment, and upon the expiration of this term, the deposit should belong to the bank at the price at which it had been received, or for which credit had been given in the transfer books.

What is thus paid for the keeping of the deposit may be considered as a sort of warehouse rent; and why this vice
house rent should be so much dearer for gold than for silver, several different reasons have been assigned. The fines of gold, it has been said, is more difficult to ascertain than that of silver. Frauds are more easily practiced, and occasion a greater loss in the most precious metal. Silver, besides, being the standard metal, the state, it has been said, wishes to encourage more the making of deposits of silver than those of gold.

Deposits of bullion are most commonly made when the price is somewhat lower than ordinary; and they are taken out again when it happens to rise. In Holland, the market price of bullion is generally above the mint price, for the same reason that it was so in England before the late reformation of the gold coin. The difference is said to be commonly from about fix to sixteen florins upon the mark, or eight ounces of silver of eleven parts fine, and one part alloy. The bank price, or the credit which the bank gives for the deposits of such silver (when made in foreign coin, of which the fineness is well known and ascertained, such as Mexican dollars), is twenty-two guilders the mark; the mint-price is about twenty-three guilders, and the market-price is from twenty-three guilders six, to twenty-three guilders sixteen florins, or from two to three per cent. above the mint price. The proportions between the bank price, the mint price, and the market price, of gold bullion, are nearly the same. A person can generally sell his receipt for the difference between the mint price of bullion and the market price. A receipt for bullion is almost always worth something, and it very seldom happens, therefore, that any body falsifies his receipt to expire, or allows his bullion to fall to the bank at the price at which it had been received, either by not taking it out before the end of the six months, or by neglecting to pay the one-fourth or one-half per cent. in order to obtain a new receipt for another six months. This, however, though it happens seldom, is said to happen sometimes, and more frequently with regard to silver, on account of the higher warehouse rent which is paid for keeping of the more precious metal.

The person who by making a deposit of bullion obtains both a bank credit and a receipt, pays his bills of exchange as they become due with his bank credit; and either sells or keeps his receipt according as he judges that the price of bullion is likely to rise or to fall. The receipt and the bank credit seldom keep long together, and there is no occasion that they should. The person who has a receipt, and who wants to take out bullion, finds always plenty of bank credits, or bank money to buy at the ordinary price; and the person who has bank money, and wants to take out bullion, finds receipts always in equal abundance.

The owners of bank credits, and the holders of receipts, constitute two different forts of creditors against the bank. The holder of a receipt cannot draw out the bullion for which it is granted, without re-assigning to the bank a sum of bank money equal to the price at which the bullion had been received. If he has no bank money of his own, he must purchase it of those who have it. The owner of bank money cannot draw out bullion without producing to the bank receipts for the quantity which he wants. If he has none of his own, he must buy them of those who have them. The holder of a receipt, when he purchases bank money, purchases the power of taking out a quantity of bullion, of which the mint price is five per cent. above the bank price. The agio of five per cent. therefore, which he commonly pays for it, is paid, not for an imaginary, but for a real value. The owner of bank money, when he purchases a receipt, purchases the power of taking out a quantity of bullion of which the market price is commonly from two to three per cent. above the mint price. The price of the receipt, and the price of the bank money, compounded or made up between them the full value or price of the bullion.

Upon deposits of the coin current in the country, the bank grants receipts likewise as bank credits; but those receipts are frequently of no value, and will bring no price in the market. Upon ducatoons, for example, which in the currency pays for three guilders three florins each, the bank gives a credit of three guilders only, or five per cent. below their current value. It grants a receipt likewise entitling the bearer to take out the number of ducatoons deposited at any time within six months, upon paying one-fourth per cent. for the keeping. This receipt will frequently bring no price in the market. Three guilders bank money generally fall in the market for three guilders three florins, the full value of the ducatoons, if they were taken out of the bank; and before they can be taken out, one-fourth per cent. must be paid for the keeping, which would be more loss to the holder of the receipt. If the agio of the bank, however, should at any time fall to three per cent. such receipts might bring some price in the market, and might fall for one and three-fifths per cent. But the agio of the bank being now generally about five per cent. such receipts are frequently allowed to expire, or, as they express it, to fall to the bank. The receipts which are given for deposits of gold ducatoons fall to it yet more frequently, because a higher warehouse rent, or one half per cent. must be paid for the keeping of them before they can be taken out again. The five per cent. which the bank gains, when deposits either of coin or bullion are allowed to fall to it, may be considered as the warehouse rent for the perpetual keeping of such deposits.

The sum of bank money for which the receipts are expired must be very considerable. It must comprehend the whole original capital of the bank, which, it is generally supposed, has been allowed to remain there from the time it was first deposited, nobody caring either to renew his receipt or to take out his deposit, as for the reasons already assigned, neither the one nor the other could be done without loss. But whatever may be the amount of this sum, the proportion which it bears to the whole mass of bank money is supposed to be very small. The bank of Amsterdam has for these many years paid been the great warehouse of Europe for bullion, for which the receipts are very seldom allowed to expire, or, as they express it, to fall to the bank. The five per cent. of the bank money, or of the credits upon the books of the bank, is supposed to have been created, for these many years past, by such deposits which the dealers in bullion are continually both making and withdrawing.

No demand can be made upon the bank but by means of a receipt or receipt. The smaller sums of bank money, for which the receipts are expired, is mixed and confounded with the much greater sums for which they are still in force; so that, though there may be a considerable sum of bank money, for which there are no receipts, there is no specific sum or portion of it which may not at any time be demanded by one. The bank cannot be debtor to two persons for the same thing; and the owner of bank money who has no receipt, cannot demand payment of the bank till he buys one. In ordinary and quiet times, he can find no difficulty in getting one to buy at the market price, which generally corresponds with the price at which he can sell the coin or bullion, it entitles him to take out of the bank.

It might be otherwise during a public calamity; an invasion
invasion for example, such as that of the French in 1672. The owners of bank money being then all eager to draw it out of the bank, in order to have it in their own keeping, the demand for receipts might raise their price to an exorbitant height. The holders of them might form extravagant expectations, and instead of two or three per cent. demand half the bank money for which credit had been given upon the deposits that the receipts had been respectively granted for. The enemy, informed of the condition of the bank, might even buy them up, in order to prevent the carrying away of the treasure. In such emergencies, the bank, it is supposed, would break through its ordinary rule of making payment only to the holders of the receipts. The holders of receipts, who had no bank money, must have received within two or three per cent. of the value of the deposit for which their respective receipts had been granted. The bank, therefore, it is said, would in this case make no remittance of paying, either with money or bullion, the full value of what the owners of bank money who could get no receipts were credited for in its books: paying at the same time two or three per cent. to such holders of receipts as had no bank money, that being the whole value which in this state of things could justly be supposed due to them.

Even in ordinary and quiet times it is the interest of the holders of receipts to depress the ago, in order either to buy bank money (and consequently the bullion, which their receipts would then enable them to take out of the bank) so much cheaper, or to sell their receipts to those who have bank money, and who want to take out bullion, so much dearer; the price of a receipt being generally equal to the difference between the market price of bank money and that of the coin or bullion for which the receipt had been granted. It is the interest of the owners of bank money, on the contrary, to raise the ago, in order either to sell their bank money so much dearer, or to buy a receipt so much cheaper. To prevent the stock jobbing tricks which these opposite interests might sometimes occasion, the bank has of late years come to the resolution to sell at all times bank money for currency, at five per cent. ago, and to buy it again at four per cent. ago. In consequence of this resolution, the ago may never either rise above five, or sink below four per cent. and the proportion between the market price of bank and that of current money, is kept at all times very near to that proportion between their intrinsic values. Before this resolution was taken, the market price of bank money used sometimes to rise so high as nine per cent. ago, and sometimes to sink so low as par, according as opposite interests happened to influence the market.

The bank of Amsterdam proffesse to lend out no part of what is deposited with it, but, for every guider for which it gives credit in its books, to keep in its repositories the value of a guider either in money or bullion. That it keeps in its repositories all the money or bullion for which there are receipts in force, for which it is at all times hable to be called upon, and which, in reality, is continually going from it and returning to it again, cannot well be doubted. But whether it does so likewise with regard to that part of its capital, for which the receipts are long ago expired, for which in ordinary and quiet times it cannot be called upon, and which in reality is very likely to remain with it for ever, or as long as the rates of the United Provinces shall, may perhaps appear more uncertain.

At Amsterdam, however, no point of faith is better established than that for every guider, circulated as bank money, there is a correspondent guider in gold or silver to be found in the treasure of the bank. The city is guarantee that it should be so. The bank is under the direction of four reigning burgozemlers, who are changed every year. Each new set of burgomasters visits the treasure, compares it with the books, receives it upon oath, and delivers it over, with the same solemnity to the set which succeeds; and in this sober and religious country, caths are not yet discredided.

A rotation of this kind leaves alone a sufficient outcry against any practices which cannot be avowed. Amidst all the revolutions which faction has ever occasioned in the government of Amsterdam, the prevailing party has at no time accused their predecessors of insolvency in the administration of the bank. No exaggeration could have affected more deeply the reputation and fortune of the difpelled party, and if such an accusation could have been supported, we may be assured, that it would have been brought to pass. In 1672, when the French king was at Utrecht, the bank of Amsterdam paid so readily as left no doubt of the fidelity with which it had observed its engagements. Some of the pieces which were then brought from its repositories appeared to have been scorch'd with the fire which happened in the town-houses soon after the bank was established. Those pieces, therefore, must have lain there from that time.

What may be the amount of the treasure in the bank, is a question which has long employed the speculations of the curious. Nothing but conjecture can be offered concerning it. It is generally reckoned that there are about two thousand people who keep accounts with the bank, and allowing them to have, one with another, the value of fifteen hundred pounds sterling lying upon their respective accounts (a very large allowance), the whole quantity of bank money, and consequently of treasure in the bank, will amount to about three millions sterling, or at eleven guiders the pound sterling, thirty-three millions of guiders, a great sum, and sufficient to carry on a very extensive circulation, but vastly below the extravagant ideas which some people have formed of this treasure.

The city of Amsterdam derives a considerable revenue from the bank. Besides what may be called the warehouse rent above-mentioned, each person, upon first opening an account with the bank, pays a fee of ten guiders; and for every new account, three guiders three shillings; for every transfer two shillings; and if the transfer is for less than three hundred guiders, fix shillings, in order to discourage the multiplicity of small transactions. The person who neglects to balance his account twice in the year forfeits twenty-five guiders. The person who orders a transfer for more than is upon his account, is obliged to pay three per cent. for the sum overdrawn, and his order is set aside into the bargain. The bank is supposed too to make a considerable profit by the sale of the foreign coin or bullion which sometimes falls to it by the expiring of receipts, and which is always kept till it can be sold with advantage. It makes a profit likewise by selling bank money at five per cent. ago, and buying it in at four. These different emoluments amount to a good deal more than what is necessary for paying the salaries of officers, and defraying the expense of management. What is paid for the keeping of bullion upon receipts, is alone supposed to amount to an annual revenue of between one hundred and fifty thousand and two hundred thousand guiders. Public utility, however, and not revenue, was the original object of this institution. Its object was to relieve the merchants from the inconvenience of a disadvantageous exchange. The revenue which has arisen from it was unforeseen, and may be considered as accidental. Smith's Wealth of Nations, vol. ii. p. 219.
Bank of France was first projected by Mr. Law, a native of Scotland, with a view of paying off the public debts of France, by drawing his creditors into the newly projected Mississippi and India companies, and erected in the year 1716. It was taken into the king's hands in 1718, and denominated the royal bank; and by its union with both the companies above-mentioned, formed a bubble, which occasioned great confusion and distress in the year 1720.

Bank. Millen, derived its name from King William's million lottery in the year 1693, the proprietors agreeing in partnership to purchase tickets in this lottery. They afterwards purchased many revisions of the 14 per cent. annuities, and admitted many proprietors of annuities to purchase their joint stock, which amounted to 500,000l. They were a partnership by deed enrolled in chancery, in the year 1721. They divided 5 per cent. till Lady-day 1728, when they reduced their annual dividend to 4 per cent. and it was again raised to 5 per cent. which it continued till its dissolution.

Bank of Loan, Copenhagen, has a capital stock, consisting of 500,000 rix-dollars, each being of the value of about 4s. 6d. Sterling. Its notes are receivable in payment of the royal revenues. It lends money on pledges, not exceeding 100 rix-dollars, at an interest of 4 per cent. In 1762, his Danish majesty directed the bank for current call-notes, to exchange their 100 rix-dollar notes, for notes of 50, 10, or 1 rix-dollar; and not to pay to any one person above one crown in specie.

Bank of Rotterdam was erected in 1635. It pays bills of exchange in large money, and only 10 per cent. in specie.

Bank of Affiliation, a new bank established in Russia during the hostilities against the Turks. When copper-money could not be coined with sufficient expedition to answer the necessities of the state, bank-notes to the value of 50, 75, and 100 rubles, in copper, were issued. These notes are changed at the bank in Peterburgh and Moscov. The former is a brick building, containing several vaulted rooms, each capable of holding 400,000l. of copper coin in bags, piled one above another. Since the year 1784, the old bank notes were called in, and a new issue made to the acknowledged amount of 100,000,000 roubles, in notes of 5, 10, 15, 25, and 100 roubles. On the first appearance of this paper, it was received, particularly in the remote parts of the empire, not without difficulty, and the discount against it was commonly about 3½, and in some places even 6 per cent. The obvious advantages, however, over copper money sooon beneficial to commerce, that in 1779 the discount in favour of silver specie was only 1 per cent, and it bore a premium of 14 per cent. over copper money. But so large a quantity was circulated, and the loans to government so lowered the credit of the state, that in 1790 the discount against the paper currency was near 20 per cent.

The Loan Bank is an institution established at Peterburgh for the benefit of the nobility and corporations. With this view Catherine II. in 1785, made a deposit of 22 millions of roubles for the nobility, 11 millions for the corporate towns, and 3 millions for the province of Taurida, to be lent out for the improvement of rural economy, of social industry, and the benefit of civilization in general. This bank lends only on real estates. As the value of a landed estate in Russia is estimated according to the number of boors upon it, the bank takes the boors at 40 rubles per head; so that the proprietor of an estate, requiring the loan of 1000 rubles, must give 25 boors as his pledge. The loan is made for 20 years; the mortgagor annually paying 5 per cent. interest, and 3 per cent. on the capital, so that after 20 years he has paid back the whole of his loan. The loans are subject to no other limitations than that arise from the value and the security of the pledge; every one being allowed to apply for and receive as much money as he is capable of laying down a lawful pledge for. The bank, however, lends no sum under 1000 rubles, and only by thousands, for the sake of avoiding perplexing accounts. The mortgaged property is subject to no fictitious, or no conclusive, nor any demands from the crown or from private individuals. Every four years one part of the paws is discharged, equal in value to that part of the capital already paid. The bank can redeem estates elsewhere mortgaged or appropriated to the payment of debts; and mortgaged estates may be sold; but in that case the purchaser takes upon himself all the obligations which the seller was under to the bank. The municipal magistracy vouchers for the worth of the pledge; and must be responsible for it. The interest is paid annually. The bank gives ten days grace: whoever exceeds one month pays a flat per cent. and this likewise holds good the second and third month. If payment be delayed beyond three months, the mortgaged estate is taken into charge by the noble court of wards. The interest and fines are paid from the receipts of the estate, and the remainder is paid to the proprietor. 3 The inhabitants of towns obtain loans on their real estates, paying yearly 3 per cent. interest, and 3 per cent. capital, and are consequently freed from their debt in 22 years. Storch's Pict. of Peterfb. p. 211.

Bank of Philadelphia, called the bank of the United States, was founded in 1787, and seems to have been successful. Its capital stock was 10 millions of dollars.

Bank of Stockholm owes its origin to Palmshut, a merchant, who carried on an extensive trade, and possessed great property in iron mines. He established at Stockholm a bank for the purpose of exchanging and lending money, divided into two departments. Such was his credit, and such were his resources, that, though he was the only banker in the kingdom, and his connections of course very extensive, the notes which he issued at the interest of 8 per cent. for a term of ten years and upwards, were circulated through the kingdom, and received as cash by the trading part of the nation. In process of time, by the issue of counterfeit notes and other unfavourable circumstances, the bank was drained of cash, and its credit was in danger of sinking into diftinction. To this difficulty Palmshut applied to Charles XI., and induced the king to take the bank under his royal direction. Accordingly, the king appointed Palmshut director, and having established the credit of the bank, transferred the direction of it to the states of the kingdom assembled in 1688; and declared himself and his successors protectors of the bank, but renounced all interference in the disposal of the money. The states being thus declared guarantors, proprietors, and directors of the bank, several regulations were made. The bank was permitted to lend money on good security, at the interest of 8 per cent. but to pay for all money borrowed only 6 per cent.; the debtors to discharge interest upon interest, but the bank not to pay interest upon interest; all the king's revenues were to be deposited in the bank, without receiving interest. The bank was empowered to issue notes not exceeding the value of thirty-six dollars copper mint, or ten shillings; and it was finally resolved, that the states, or those whom they should depute, should have the power of inspecting the accounts, and inquiring into the nature of its constitution. By these regulations the credit and riches of the bank increased to such a degree, that towards the close of the 17th century, it became the universal depository of the whole kingdom, both
both as to public and private circulation, and lowered the interest from 8 to 7, and afterwards to 6, 4, and 3 per cent. In return, the interest for all money borrowed, or deposited in the bank by way of loan, was likewise lowered from 6 to 4, 3, and 2 per cent. The large quantity of copper money then current in the country, being of bulk and weight extremely inconvenient, the circulation of bank notes became advantageous to commerce. From 1714 to 1717, the bank supplied Charles XII. with such considerable sums, that the revenues arising from the tolls and customs were insufficient to pay the interest, and of course there was a considerableness deficiency. These supplies lowered the credit of the bank in the estimation of the public; and therefore the king, on the remonstrance of the states, mortgaged certain revenues of the crown, for the discharge of the interest; and declared that all the revenues then mortgaged should remain in the bank till the debt should be fully discharged, and also promised, that he would not, on any pretext or emergency, recur again to the bank for money, except for such as belonged to the crown. Its credit was thus in force greatly increased, and its stock was too firm to be drained to repay its former credit, until Baron Goertz unfoundedly contributed it to by a scheme which was in every other respect detrimental to the nation. To supply Charles with money for his constant wars, Goertz compelled perfons, by means of fines and penalties, and afterwards by a species of torture, to deliver up their plate, jewels, and coin. In return for these effects, they received copper-money, called "Myntel," or signs of coins, each weighing only one-third of a silver, but passing for a silver dollar, of which it was only a ninety-sixth part. The public secretly transferred their property, consisting of plate, jewels, and money, which was thus to be forced from them and exchanged for a debased currency, to the bank, confiding in the royal promise, that the bank should be exempted from the interference and inspection of the crown. Goertz advised the king to seize the property deposited in the bank; but Charles refused to violate his promise, and prohibited Goertz from making any proposals tending to the prejudice of the bank. In this crisis, the bank received such large sums of money, a great part of which paid no interest, that the profits were very considerable. Accordingly the bank, in this flourishing state, was induced, by order of the states, in 1741, to present the king with a donative of 100,000 silver dollars, or 8,333: 4s., and to furnish him with 500,000, or 41,666l., without interest, towards carrying on the war against Russia. Since that period it has frequently advanced large sums of money to the crown and to the board of manufactures, by order of the states. The bank is divided into two departments; one, for loan; and other, for exchange; each keeping separate accounts, but mutually supplying the other as occasion requires. The former lends money on mortgages or pledges. The proprietors on depositing these pledges or the bank, receive the full value, on paying 3 per cent. annual interest; these pledges consist of gold and silver in bulk, copper, brass, and lead, of different weights, or certificates of having lent money to the bank; in particular, for which latter article the proprietor receives three-fourths of its value at the interest of 3 per cent.; and when he disposes of it, it is again delivered to him on producing a certificate from the bank that the loan is duly discharged. Jewels were formerly received as pledges; but as their value is fluctuating, and the bank was once defrauded in that article, they are no longer admitted. Mortgaged lands and houses, being of a less certain value than other articles, pay an interest of 4 per cent. on the money borrowed; and for the purpose of liquidating the debt, the following regulations were adopted: all borrowers on lands and houses shall pay 6 per cent. yearly; of this sum 4 per cent. is the lawful interest, and the remaining 2 per cent. is annually deducted from the capital, by which means the original debt is gradually diminished.

The exchange, or exchange bank, exchanges and issues bank notes, discounts bills, receives and advances the money deposited for interest or security, and discharges the interest of 2 per cent. on all money placed in their hands. Towards the latter end of the reign of Adolphus. Frederick, bank notes were issued in such numbers, and many of them at 5 per 100, that scarcely any specie was left in the kingdom; the bank was so drained of cash as not to be able to exchange its notes except in copper-money, and paper was almost the only currency. For preventing a total bankruptcy, and calling in the paper currency, the states, in 1766, voted a loan of 3,000,000 rix-dollars, or 750,000l., to effect the realization of the bank notes, and to circulate a sufficient quantity of specie. Other regulations were also adopted; and in order to counteract the efforts of party, the act, in 1772, committed to the king the difficult province of realizing the bank notes, and reforming the currency, which was happily effected. In 1777 and 1779, the states confirmed the realization, and made several new regulations, for securing the credit of the bank, and rendering it still further independent of the crown. The independence of the bank was further established by the act of 1784. The accounts were submitted to a committee of revisors, which consists of a certain number of persons chosen by the three houses of nobles, clergy, and burghers, from their respective orders, who continue in office till the meeting of a new diet, when they are either renewed or confirmed. They assemble once every three years, and continue sitting not more than a month. They inspect the general state of the bank, compare the accounts of the directors, and observe that no abuses have been committed, and that the regulations of the states have been observed. Coxe's Travels in Sweden, &c. vol. iv. p. 130—139.

Bank, Land, an institution projected during the years 1694 and 1695, by Dr. Hugh Chamberlain, for lending money at a low interest on land security, which was the principal difference between this and the bank of England; in opposition to which corporation, then in its infancy and struggling with difficulties, this ill-judged project was set up. It was principally encouraged by the Tory party, and an act of parliament, viz. 7 & 8 W. III. c. 31, was obtained for the purpose. The subscriptions for its establishment failed, and the plan proved abortive.

Bank Note. See Note.
Bank, or Banks, in Law. See Bank.
Bank, Foot. See Banquettes.
Bank, in Natural History, denotes an elevation of the ground, or bottom of the sea, so as sometimes to surmount the surface of the water, or at least to leave the water below it; its slope not to allow a vessel to remain afloat over it. In this sense, a bank amounts to much the same as flat, hald, &c.

There are banks of sand, and others of stone, called also shelves or rocks. In the North sea, they also speak of banks of ice, which are large pieces of that matter floating. See Icebergs.

Vapors at sea sometimes occasion such a dense fog, that mariners imagine they see land with trees, &c. They call
call such deceptions fog-banks. For the account of a remarkable deception of this kind, see Dr. Hawksworth's Account of the Voyages to the Southern Hemisphere, vol. i. p. 10. A long narrow bank is sometimes called a rib.

The bank absolutely so called, or the main bank, or great bank, denotes that of Newfoundland, the scene of the cod-fishery. It is called the great bank, not only by reason of its vast extent, being, according to the English computation, two hundred miles long, and, according to the French, one hundred leagues, or three hundred miles; but also on account of several leffer banks near it, where cod are also caught. These left the French call bancenous.

This is one of those banks which have water enough to float a ship, and which, on this account, are not dangerous.

Banks are usually distinguished by buoys, post, or the like. On charts, sand-banks are usually marked by little dots, and banks of stone by crosses. The colours of the buoys are also varied accordingly; sand-banks being denoted by light-coloured buoys, and rocks by black ones.

In large rivers, as the Elbe, &c. sandbanks, by high tides and inundations, are liable to change places; care is therefore taken to shift the buoys from time to time, to keep the true channel of the river.

An exact knowledge of the banks, their extent, and the depth of water on them, makes the most essential part of the science of a pilot, and a matter of a ship: if the vessel be large, and draw much water, great attention will be necessary to keep clear of the banks: on the contrary, if it be small, the same banks afford a sure asylum, where it may brave the largest and stoutest vessels, which dare not follow it here. By means of this barrier, many a small craft has escaped its enemy.

Banks, in vessels which move with cars, is used for the bench where the rowers are seated; popularly called, by our seamen, the thought.

In this sense we read of banks of galleys, of galleasses, of gallions, of brigantines, and the like.

The Venetian gondolas have no banks; for the watermen row flanding.

The common galleys have twenty-five banks, that is, twenty-five on each side, in all fifty banks, with one oar to each bank, and four or five men to each oar. The galleasses have thirty-two banks on a side, and fix or seven rowers to a bank. See Double-banked.

Bank also denotes an elevation of earth, flones, flakes, or other materials in form of a wall, or caufeway, to flop the waters, and prevent inundations.

These, on other occasions, are denominated dams, and sea-walls, &c. and by the ancients aggore; those on the coasts of Holland are more particularly denominated dykts. The left bank, in the opinion of Dr. Wark of Scotland, is that contriv'd by Dr. Wark of Scotland. A quantity of furze is fixed to the bottom of the channel, of such a breadth as is proportioned to the force which it is to resist. The sand, or flone, will soon settle in the furze, and when this is covered, another bed of furze is to be laid on as before, and so on till the bank is raised to a sufficient height.

Bank is also used in several games, for the flock or fund of him who undertakes the game.

Bank at buffet, a fund of money laid down by the tailleur, before the gamblers, to answer all the winning cards that shall turn up in his course of dealing. Yet it is to be observed, that what the banker's gain per cent. of all the money ad-

ventured at play, is greater than that at buffet; it being two points nineteen shillings and ten-pence per cent. in the first, and but sixteen shillings and three-pence in the second. Vide De Moivre. De B. Chance. p. 93.

BANKER, in Commerces, a person who traffics in money, and remits it from place to place, and supplies his correspondents or customers with money from the stock deposited in his hands for bills of exchange and other securities. (See Banks.) The history of private banks is as follows. The royal mint in the tower of London had for some years, before the year 1645, been made use of as a kind of bank, or deposit, for merchants to lodge their cash in. But king Charles the First having in that year made free with their money, the mint lost its credit. After this, the merchants and tradesmen of London generally trusted their cash with their banks, until the breaking out of the civil war, when it was very customary for apprentices and clerks to have their money and go into the army. Whereupon, in such unsettled times, merchants, not daring longer to confide in their apprentices, began to prudent, about the year 1645, to lodge their necessary cash in goldsmith's hands, both to receive and pay for them; until which time, the whole and proper business of London goldsmiths was to buy and sell plate, and foreign coins of gold and silver, to melt and turn them, to coin some at the mint, and to coin others to supply the refiners, plate-makers, and merchants, as they found the price necessary. This account of the matter we have from a curious and most curious pamphlet, published in 1676, intitled, "The Mystery of the new-fashioned Goldsmiths, or Bankers, discovered," in only eight quarto pages.

Bankers on their first establishment allowed to those who entrusted their money in their hands a moderate interest for the same, and hereby their business was very considerably increased, and rose to great reputation in the year 1667, when the Dutch burnt our ships at Chatham; but this event caused a run on the bankers, which hurt their credit; and in the year 1672, king Charles II. shut up the exchequer, and seized the money which the bankers had lent him at 8 per cent. interest, the whole sum amounting to 1,328,561. The king was afterwards necessitated to pay fix per cent. interest for this debt out of his hereditary excise, but the principal was never paid. However, the parliament of 12 William, cap. 12, provided for a large arrear of interest, and settled an interest of three per cent. for the future. The debt was hereby made redeemable, on paying one moiety of the principal sum, viz. 662,463l. farther confirmed by an act of 2 & 3 Anne, cap. 15, which moiety now became the proper debt of the public; and being reduced from fix per cent. in 1717, was finally subscribed into the South-sea capital stock in the year 1720.

Bankers now allow no interest, and by involving a certain proportion of their capital in the funds, or laying it out on other sufficient security, and trafficking with it in the stocks, in discounts, &c. reap very considerable advantage from it; and by negotiating bills, &c. on the part of their creditors, greatly contribute to the convenience and dispatch of business.

When the people of any particular country, says Dr. Smith (ubi infra), have such confidence in the fortune, probity, and prudence of a particular banker, as to believe that he is always ready to pay upon demand such of his promissory notes as are likely to be at any time presented to him, those notes come to have the same current as gold and silver money, from the confidence that such money can at any time be had for them.

A particular banker lends among his customers his own promissory notes, to the extent, we shall suppose, of a hundred
dred thousand pounds. As those notes serve all the purposes of money, his debtors pay him the same interest as if he had lent them so much money. This interest is the source of his gain. Though some of these notes are continually coming back upon him for payment, part of them continue to circulate for months and years together. Though he has generally in circulation, therefore, notes to the extent of a hundred thousand pounds, twenty thousand pounds in gold and silver may, frequently, be a sufficient provision for answering occasional demands. By this operation, therefore, twenty thousand pounds in gold and silver perform all the functions which a hundred thousand could otherwise have performed. The same exchanges may be made, the same quantity of consumable goods may be circulated and distributed to their proper consumers, by means of his promissory notes, to the value of a hundred thousand pounds, as by an equal value of gold and silver money.

Eighty thousand pounds in gold and silver, therefore, can, in this manner, be spared from the circulation of the country; and if different operations of the same kind should, at the same time, be carried on by many different banks and bankers, the whole circulation may thus be conducted with a fifth part only of the gold and silver which would otherwise have been requisite.

Let us suppose, for example, that the whole circulating money of some particular country amounted, at a particular time, to one million sterling, that sum being then sufficient for circulating the whole annual produce of their land and labour. Let us suppose, too, that some time thereafter, different banks and bankers issued promissory notes, payable to the bearer, to the extent of one million, referring in their different offices two hundred thousand pounds for answering occasional demands. There would remain, therefore, in circulation, eight hundred thousand pounds in gold and silver, and a million of bank notes, or eighteen hundred thousand pounds of paper and money together. But the annual produce of the land and labour of the country had before required only one million to circulate and distribute it to its proper consumers, and that annual produce cannot be immediately augmented by those operations of banking. One million, therefore, will be sufficient to circulate it after them.

The goods to be bought and sold being precisely the same as before, the same quantity of money will be sufficient for buying and selling them. The channel of circulation, if I may be allowed such an expression, will remain precisely the same as before. One million we have supposed sufficient to fill that channel. Whatever, therefore, is poured into it beyond this sum, cannot run in it, but must overflow. One million eight hundred thousand pounds are poured into it. Eight hundred thousand pounds therefore must overflow, that sum being over and above what can be employed in the circulation of the country. But though this sum cannot be employed at home, it is too valuable to be allowed to lie idle. It will, therefore, be sent abroad, in order to seek that profitable employment which it cannot find at home. But the paper cannot go abroad; because at a distance from the banks which issue it, and from the country in which payment of it can be exacted by law, it will not be received in common payments. Gold and silver, therefore, to the amount of eight hundred thousand pounds, will be sent abroad, and the channel of home circulation will remain filled with a million of paper, instead of a million of those metals which filled it before.

But though so great a quantity of gold and silver is thus sent abroad, we must not imagine that it is sent abroad for nothing, or that its proprietors make a present of it to foreign nations. They will exchange it for foreign goods of some kind or another, in order to supply the consumption either of some other foreign country, or of their own.

If they employ it in purchasing goods in one foreign country in order to supply the consumption of another, or in what is called the carrying trade, whatever profit they make will be an addition to the net revenue of their own country. It is like a new fund, created for carrying on a new trade; domestic business being now transacted by paper, and the gold and silver being converted into a fund for this new trade.

If they employ it in purchasing foreign goods for home consumption, they may either, first, purchase such goods as are likely to be consumed by idle people who produce nothing, such as foreign wines, foreign silks, &c.; or, secondly, they may purchase an additional stock of materials, tools, and provisions, in order to maintain and employ an additional number of industrious people, who re-produce, with a profit, the value of their annual consumption.

So far as it is employed in the first way, it promotes prodigality, increases expence and consumption, without increasing production, or establishing any permanent fund for supporting that expence, and is in every respect hurtful to society.

So far as it is employed in the second way, it promotes industry; and though it increases the consumption of the society, it provides a permanent fund for supporting that consumption, the people who consume, re-producing, with a profit, the whole value of their annual consumption. The gross revenue of the society, the annual produce of their land and labour, is increased by the whole value which the labour of those workmen adds to the materials upon which they are employed; and their net revenue by what remains of this value, after deducting what is necessary for supporting the tools and instruments of their trade. Smith's Wealth of Nations, vol. i. p. 134, &c.

In Italy, the employment of a banker, especially in republics, does not derogate from nobility; and hence it is, that most of the cadets, or younger sons of persons of condition, undertake it for the support of their family. The nobility of Venice and Genoa were for a long time the chief bankers in the other countries of Europe.

The ancient bankers were called argentinarii, and nummula-riri; and by the Greeks, τραγιματιαι, καλλιεργειαι, and μεμο-μουζειαι. Their chief business was to put out the money of private persons to interest; they had their boards and benches for this purpose in all the markets and public places, where they took in the money from home to lend it to others. The Romans had two kinds of bankers, though their office was much more extensive than that of the bankers among us, theirs being that of public officers, in whom were united the functions of a broker, agent, banker, and notary; in managing the exchange, taking in money, affixing in buying and selling, and drawing up the writings necessary on all those occasions.

Bankers in the Court of Rome, are persons authorized, exclusive of all others, to solicit and procure by their correspondents at Rome, all bulls, dispensations, and other acts dispatched at the papal dietary, or in the legation ship of Avignon; they are dispersed in all the cities of France, where there is a parliament, or a prefidial; and were erected into a regular and hereditary office, by an edict in 1675.

They owe their origin to the Guelphs, who took shelter at Avignon, and in other cities within the obedience of the pope, in the time of the civil wars in Italy. The favour they were in with the pontiffs, for having espoused the pape
pal cape, occasioned their being employed in procuring expeditions of the court of Rome. But the heavy extor-
tions they practised towards their clients, soon rendered
them odious, and occasioned several denominations of re-
proach, as corruini, catarumini, confalini, confoni, &c. from the
city Cahors, the native place of pope John XXII, in whose
pontificate they were in their highest power.

Banker, in Bricklaying, a piece of timber wherein they
cut the bricks.

The banker is six feet long or more, according to the
number of men to work at it, and nine or ten inches
square: it is to be laid on two plaers of timber, three feet
high from the floor they stand on.

Banker, in Sea Language, signifies a vessel employed in
the coal-trade on the banks of Newfoundland.

BANKEEs, Sir John, in Biogrophy, lord chief justice of
the common pleas in the reign of King Charles I. was
defended from a good family at Kelwick in Cumberland,
and born there in the year 1580. In 1624 he removed to
Queen's college, Oxford, and afterwards purified the study
of the law in Gray's Inn. By his application and pro-
cency he acquired a reputation which recommended him
to his sovereign Charles I. who, in 1629, made him his at-
torney. In August 1634, he was knighted, and appointed
to the office of attorney-general; from which office he
was advanced, in 1640, to that of chief justice of the common
pleas. In both these offices he acted with wisdom and in-
tegrity, and obtained universal approbation. So singular
was his merit, that, though he decidedly took part with
the king in his contest with the parliament, it was defined by
the latter, in 1643, that he might be continued in office.
However, he soon after lost all his credit at Westminster;
for he declared from the bench at Salisbury, that the actions
of Essex, Mancheiter, and Waller, were treasonable; and the
commons voted him and the rest of the judges who were of
this opinion, traitors. Lady Bankes manifested extraordin-
ary fortitude in the defence of Corf castle in the isle of
Parbeck, where Sir John and his family refided. When it
was besieged by the parliamentary forces, she refused to
surrender it, though she had about her only her children, a
few servants and tenants, amounting at one time only to five
and at most to no more than forty. When the town was
obliged to surrender, and the besiegers became remiss under
a notion that their business was completed, lady Bankes
procured a supply of proviilion and ammunition, and was
thus enabled to hold out till the siege was raised. Sir John
remained with the king at Oxford, in the discharge of his
duty as a pay-counselor, till his death, which occurred in
December 1644. By his will he bequeathed, besides
many charities, an annuity of thirty pounds to the town of
Kelwick for the support of manufacture of coarse cottons,
which had been lately established, and which, without this
aid, would have been lost. Sir John Bankes was distin-
guished by sound integrity, cool judgment, and an amiable
temper. Brit. &c.

BANKIANA, in Entomology, a species of Phalanx
Tenellus), named after Sir Joseph Banks; it inhabits the
woods of England and Germany: is of a large size; and
is distinguished by having the wings brown, with two snowy
white bands, the posterior one undated. Fabricius.

BANKING, in general, the making of banks to oppose
the forces of the sea, rivers, or the like, and secure the land
from being overflowed thereby.

With respect to the water which is to be kept out, this
is called banking: with respect to the land, which is hereby
to be defended, embanking.

BANKING, in a Self-Wor, the raising a fence against the

The word is formed from the ancient Latin banca, a
bench, or table, and ruptus, broken.

Bank, we have elsewhere observed, originally signified
a bench, which the first bankers had in the public places, in
markets, fairs, &c. on which they told their money, write
their bills of exchange, &c. Hence, it is evident, that the
banker failed, they broke his bank, to advertise the public,
that the person to whom the bank belonged was no longer
in a condition to continue his business. As this prac-
tice was very frequent in Italy, it is said the term bank-
rupt is derived from the Italian banco rosto, broken bench.

Cowel rather chuses to deduce the word from the French
banque, table, and route, vessigium, trace, by metaphor from
the sign left in the ground, of a table once fastened to it
and now gone. On this principle he traces the origin of
bankrupts from the ancient Roman menfarii, or argentarii,
who had their tabernae or mansa in certain public places;
and who, when they fled, or made off with the money
that had been trusted to them, left only the sign or
shadow of their former station behind them. 4 Inst. 277.

And it is observable, that the title of the first English
statute concerning this offence, 34 Hen VIII. cap. 1
"against such persons as do make bankrupt," is a literal
translation of the French idiom qui font banque route.

A bankrupt was formerly considered merely as a criminal
or offender (lat. 1. Jac. I. c. 15, § 17.); but at present
the laws of bankruptcy are regarded as laws calculated for
the benefit of trade, and founded on the principles of humanity
as well as justice: and to that end, they confer some privi-
leges, not only on the creditors, but also on the bankrupt
himself:—on the creditors, by compelling the bankrupt to
give up all his effects to their use, without any fraudulent
concealment;—and on the debtor, by exempting him from
the rigour of the general law, whereby his person might be
confined at the direction of his creditor, though in reality
he has nothing to satisfy the debt; whereas the law of bank-
rupts, taking into consideration the sudden and unavoidable
accidents to which men in trade are liable, has given them
the liberty of their persons, and some pecuniary encomiums,
upon condition of surrendering their whole estate to be di-
vided among the creditors.

By the Roman law of the twelve tables, the creditors
might cut the debtor's body into pieces, and each of them
take his proportionable share; though some learned men
have declared, that the law "de debito in parte fermen-
do," is to be understood in f0 very broad sense; but there
were also other laws, left human, for prohibiting the
debtor's person in chains, subjepting him to stripes and hard
labour, at the mercy of his rigid creditor, and sometimes
selling him, his wife and children, to perpetual foreign
slavery "trans Thibem;" but this was an oppreension that
produced many popular insurrections, and fcedotions to the
"mons facier." In Pegn, and the adjacent countries in
East India, the creditor is entitled to dispofe of the debtor
himself, and likewise of his wife and children; informeth
that he may even violate with impunity the chastity of the
debtor's wife: but then, by fo doing, the debt is understood to
be discharged. In some places, bankrupts are condemned to
war.
wear a green cap; at Lucca, an orange cap. Our legis-
lators, however, in framing the laws of bankruptcy, seem
humanely and wisely to have attended to the example of the
Roman law of "Clefion," introduced by the Christian em-
perors; by which, if a debtor ceded or yielded up all his
fortune to his creditors, he was secured from being dragged
to a gaol; "Omni quoque corporali cruciata femina." (Cod.
7. 71. per tot.) For as the emperor Justinian observes (Inst. 4.
6. 40.), "inhumanum erat spoliam fortunis suis in fidulum
damnari." But by a deviation into the other extreme, it
was afterwards enacted (Nov. 135. c. 1.), that if the debtor
by any unforeseen accident was reduced to low circum-
stances, and would swear that he had not sufficient left to
pay his debts, he should not be compelled to cede or give
up even that which he had in his possession: a law which,
under a false notion of humanity, seems to be fertile of per-
jury, injustice, and absurdity. The laws of England flcer
between these extremes; providing at one against the in-
humanity of the creditor, who is not suffered to confine an
honest bankrupt who has delivered up all his effects, and
at the same time taking care that all his just debts shall be
paid, so far as the effects will extend. But they are still
effusions of encouraging prodigality and extravagance by
this indulgence to debtors; and, accordingly, allow the
benefit of the laws of bankruptcy in no but actual
traders, who, generally speaking, are the only persons liable
to accidental losses, and to an inability of paying their debts,
without any fault of their own. Trade cannot be carried
on without mutual credit on both sides; and here the con-
tracting of debts is not only justifiable, but even necessary.
And if by accidental calamities, as by the loss of a ship in a
tempest, the failure of brother traders, or by the non-pay-
ment of persons out of trade, a merchant or trader becomes
incapable of discharging his own debts, it is his misfortune
and not his fault. To the misfortunes of debtors, there-
fore, the law has given a compassionate remedy, but denied
it to their faults; since, while it provides for the security of
commerce, by enacting that every considerable trader may
be declared a bankrupt, for the benefit of his creditors as
well as himself, it has also, with a view of discouraging ex-
travagance, declared, that no one shall be capable of being
made a bankrupt, but only a trader; nor capable of receiv-
ing the full benefit of the statutes, but only an indifferen-
trader.

The first statute made concerning any English bankrupts
was 34 Hen. VIII. c. 4. when trade began first to be pro-
perly cultivated in England: which has been almost totally
altered by statute 13 Eliz. c. 7, whereby bankruptcy is con-
fined to such persons only as have used the trade of mer-
chandise, in goods or by retail, by way of bargaining, ex-
change, rechange, bartering, cheviance, or otherwise; or
have bought their living by buying and selling. And by
statute 21 Jac. I. c. 19. persons uflng the trade or profession
of a frivener, receiving other men's monies and effects into
their trust and custody, are also made liable to the statutes
of bankruptcy; and the benefits, as well as the penal parts
of the law, are extended as well to aliens and denizens as to
natural born subjects, being intended entirely for the pro-
tection of trade, in which aliens are often as deeply con-
cerned as natives. By many subsequent statutes, but lately
by statute 5 Geo. II. c. 30. bankers, brokers, and factors,
are declared liable to the statutes of bankruptcy; and this
upon the same reason that friveners are included by the
statute of James I. viz. for the relief of their creditors; whom
they have otherwise more opportunities of defrauding than
any other sort of dealers; and they are properly to be looked
upon as traders, since they make merchandise of money, in
the same manner as other merchants do of goods and other
moveable chattels. But by the same act, no farmer, grazer
or drover, shall (as such) be liable to be deemed a bankrupt;
for though they buy and sell corn, and hay, and beasts, in the
course of husbandry, yet trade is not their principal, but only
a collateral, object; their chief concern being to manage and
profit on the ground, and to make the best advantage of its pro-
duct. And, besides, the subjecting them to the laws of bankruptcy
might be a means of defeating their landlords of the security
which the law has given them above all others, for the pay-
ment of their rents, whereof the farmer shall, on a smaller
reason, a receiver of the king's taxes is not capable, as such,
of being a bankrupt; left the king should be declared of these
extensive remedies against his debtors, which are put into his hands by the prerogative. By the same statute, no per-
son shall have a commissio of bankrupt awarded against
him, unless at the petition of some one creditor to whom he owes 100l.; or of two, to whom he is indebted 15cl.; or of
more, to whom altogether he is indebted 20cl. For the
law does not look upon persons, whose debts amount to less,
to be traders considerable enough, either to enjoy the benefit
of the statute themselves, or to entitle the creditors, for
the benefit of public commerce to demand the distribution of
their effects.

In the interpretation of these several statutes, it hath
been held, that buying only, or selling only, will not qualify
a man to be a bankrupt: but it must be both buying and
selling, and also getting a livelihood by it; as, by exercis-
ing the calling of a merchant, a grocer, a mercer, or, in one
general word, a chapman, who is one that buys and sells any
thing. But no handcraft occupation (where nothing is
bought and sold, and where the profit of an extensive credit for
the stock in trade is not necessary to be had) will make a man
a regular bankrupt; as that of a husbandman, a gardener, and
the like, who are paid for their work and labour, as also an
inn-keeper cannot, as such, be a bankrupt; for his general
livelihood does not arise from buying and selling in the way of
merchandise, but in a great degree from the use of his rooms
and furniture, his attendance, and the like; and though he may
buy corn and victuals, to sell again at a profit, yet that no
more makes him a trader, than a schoolmaster or other per-
son is, that keeps a boarding-house, and makes considerable
gains by buying and selling what he spends in the house;
and such a one is clearly not within the statute.

But where persons buy goods, and make them up into saleable commod-
ities, as shoe-makers, smiths, and the like; here, though
part of the gain is by bodily labour, and not by buying and
selling, yet they are within the statutes of bankrupts; for the
labour is only in melioration of the commodity, and render-
ing it more fit for sale.

One single act of buying and selling will not make a man
a trader; but a repeated practice, and profit by it. Buying
and selling bank-stock, or other government securities, will
not make a man a bankrupt: they not being goods, wares,
or merchandizes, within the intent of the statute, which a
profit may be fairly made. Neither will buying and selling
under particular restraints, or for particular purposes; as if a
commissioner of the navy ufts to buy victualls for the fleet,
and dispose of the surplus and refuse, he is not thereby made
a trader within the statute. An infant, though a trader,
cannot be made a bankrupt; for an infant can owe nothing
but for necessaries; and the statutes of bankruptcy create no
new debts, but only give a specifical and more effectual
remedy for recovering such as were before due; and no per-
on can be made a bankrupt for debts which he is not liable at
law to pay. But a feme covert in London, being a sole

Vol. III.
Bankrupt, according to the custom, is liable to a commission of bankruptcy. 

Having shewn who may, and who may not be made a bankrupt, the next subject of inquiry comprehends the particular acts of bankruptcy which render a man a bankrupt. For full satisfaction on this point, it will be necessary to consult the several statutes, and the resolutions formed upon them by the courts. Among these may be reckoned, 1. Departing from the realm, whereby a man withdraws himself from the jurisdiction and coercion of the law, with intent to defraud his creditors. 2. Departing from his own house, with intent to secrete himself, and avoid his creditors. 3. Keeping in his own house, privately, so as not to be seen or spoken with by his creditors (except for just and necessary cause), which is likewise construed an intention to defraud his creditors, by avoiding the proceed of the law. 4. Procuring or suffering himself willingly to be arrested, or outlawed, or imprisoned, without just and lawful cause; which is likewise deemed an attempt to defraud his creditors. 5. Procuring his money, goods, chattels, and effects, to be attached or sequestered by any legal process; which is another plain and direct endeavour to dispossess his creditors of their security. 6. Making any fraudulent conveyance to a friend, or secrete trustee, of his lands, tenements, goods, or chattels; which is an act of the same fulcipesious nature with the last. 7. Procuring or protecting, not being himself privileged by parliament, in order to screen his person from arrest; which also is an endeavour to evade the justice of the law. 8. Deceiving or defrauding, by any petition to the king, or bill exhibited in any of the king's courts against any creditors, to compel them to take less than their just debts; or to procrastinate the time of payment, originally contracted for, which are an acknowledgment of either his poverty or his knavery. 9. Lying in prison for two months, or more, upon arrest or other detention for debt, without finding bail, in order to obtain his liberty. For the inability to procure bail, argues a strong deficiency in his credit, owing either to his suspected poverty, or ill character; and his neglect to do it, if able, can arise only from a fraudulent intention; in either of which cases it is high time for his creditors to look to themselves, and compel a distribution of his effects. 10. Escaping from prison after an arrest for a just debt of 100l. or upwards. For no man would break prison that was able and desirous to procure bail; which brings it within the reason of the last case. 11. Neglecting to make satisfaction for any just debt to the amount of 100l. within two months after service of legal process, for such debt, upon any trader having privilege of parliament. Stat. 13 Eliz. c. 7. 1 Jac. 1. c. 15. 21 Jac. 1. c. 19. 4 Geo. III. c. 33.

The legislature having thus by public laws declared what are the acts which shall be regarded as criteria of insolvency or fraud, on which a commission of bankruptcy may be grounded, our courts of justice will not allow of extending or multiplying acts of bankruptcy by any construction or implication. And, therefore, Sir John Holt held (Lord Raym. 725.) that a man's removing his goods privately to prevent their being seized in execution, was no act of bankruptcy. It has also been determined expressly, that a banker's stopping or refusing payment is no act of bankruptcy; and if in consequence of such refusal, he is arrested and puts in bail, it is still no act of bankruptcy (7 Mod. 139.); but if he goes to prison, and lies there two months, then, and not before, he is become a bankrupt.

The proceedings in a commission of bankruptcy, depend entirely on the several statutes of bankruptcy; and they are digested by Blackstone into the following concise order.

And, first, there must be a petition to the lord chancellor by one creditor to the amount of 100l., or by two to the amount of 150l., or by three or more to the amount of 200l.; which debts must be proved by affidavit upon which he grants a commission to such different persons as to him shall seem good, who are then elected commissioners of bankruptcy. The petitioners, to prevent malicious applications, must be bound in a security or bond to the lord chancellor of 200l., to make the party agrees in case they do not prove him a bankrupt. And if on the other hand they receive any money or effects from the bankrupt, as a recompense for suing out the commission, so as to receive more than their rateable dividends of the bankrupt's estate, they forfeit not only what they shall have so received, but their whole debt. These provisions are made, as well to secure persons in good credit from being disabled by malicious petitions, as to prevent knavish combinations between the creditors and bankrupt, in order to obtain the benefit of a commission. When the commission is awarded and issued, the commissioners are to meet, at their own expense, and to take an oath for the due execution of their commission, and to be allowed a sum not exceeding 20s. per diem each, at every sitting. And no commission of bankrupt shall abate, or be void, by the death of the bankrupt, subseqently to the commission, Stat. 1 Jac. I. c. 50. to fence him from any detriment of the estate, Stat. 5 Geo. II. c. 70. The granting of a commission of bankruptcy is not directionary, but a matter of right. 1 Vern. 155. Stat. 13 Eliz. c. 7.

When the commissioners have received their commission, they are first to receive proof of the person's being a trader, and having committed some act of bankruptcy; and then to declare him a bankrupt, if proved so; and to give notice thereof in the gazette, and at the same time to appoint three meetings. At one of these meetings an election must be made of assignees. And at the third meeting, at farthest, which must be on the forty-second day after the advertisement in the gazette (unless the time be enlarged by the lord chancellor), the bankrupt, upon notice also personally served upon him or left at his usual place of abode, must surrender himself personally to the commissioners; which surrender (if voluntary) protects him from all arrests till his final examination is past: and he must thereupon in all respects conform to the directions of the statutes of bankruptcy; or, in default of either surrender or conformity, shall be guilty of felony without benefit of clergy, and shall suffer death, and his goods and estate shall be distributed among his creditors. Stat. 5 Geo. II. c. 30.

In case the bankrupt absconds, or is likely to run away, between the time of the commission issued, and the last day of surrender, he may be warrant from any judge or justice of the peace be apprehended and committed to the county goal, in order to be forthcoming to the commissioners, who are also empowered immediately to grant a warrant for seizing his goods and papers. Stat. 5 Geo. II. c. 30.

When the bankrupt appears, the commissioners are to examine him touching all matters relating to his trade and effects. They may also summon before them, and examine the bankrupt's wife, and any other person whatsoever, as to all matters relating to the bankrupt's affairs. And in case any of them shall refuse to answer, or shall not answer fully to any lawful question, or shall refuse to subscribe such their examination, the commissioners may commit them to prison without bail, till they submit themselves and make and sign a full answer; the commissioners specifying in their warrant of commitment the question so refused to be answered.
fwered. And any gaoler, permitting such person to escape, or to go out of prison, shall forfeit 500l. to the creditors.
Stat. 21 Jac. I. c. 19. 5 Geo. II. c. 30.

The bankrupt, upon this examination, is bound upon pain of death to make a full discovery of all his estate and effects, as well in expectancy as postruption, and how he has disposed of the same, together with all books and writings relating thereto: and is to deliver up all in his own power to the commissioners (except the necesseary apparel of himself, his wife, and his children) or, in case he conceals or embezzles any effects to the amount of 20l. or withholds any books or writings, with intent to defraud his creditors, he shall be guilty of felony without benefit of clergy; and his goods and estate shall be divided among his creditors. And unless it shall appear, that his inability to pay his debts arose from some casual loss, he may, upon conviction by indictment of such gross misconduct and negligence, be set upon the pillory for two hours, and have one of his ears nailed to the same and cut off. Stat. 5 Geo. II. c. 30. 21 Jac. I. c. 19.

After the time allowed to the bankrupt for such discovery is expired, any other person voluntarily discovering any part of his estate, before unknown to the assignees, shall be entitled to 5 per cent. out of the effects so discovered, and such further reward as the assignees and commissioners shall think proper. And any traitor, wilfully concealing the estate of any bankrupt, after expiration of the two and forty days, shall forfeit 100l. and double the value of the estate concealed to the creditors. Stat. 5 Geo. II. c. 30.

Hitherto every thing is in favour of the creditors; and the law seems to be pretty rigid and severe against the bankrupt; but, in case he proves honest, it makes him full amends for all this rigour and severity. For if the bankrupt hath made an ingenious discovery (of the truth and sufficiency of which there remains no doubt), and hath conformed in all points to the directions of the law; and if, in consequence thereof, the creditors, or four parts in five of them in number and value (but none of them creditors for less than 20l.), will join a certificate to that purport; the commissioners are then to authenticate such certificate under their hands and seals, and to transmit it to the lord chancellor: and he, or two of the judges whom he shall appoint, on oath made by the bankrupt that such certificate was obtained without fraud, may allow the same; or disallow it, upon cause shown by any of the creditors of the bankrupt.

Stat. 5 Geo. II. c. 30.

If no cause be shown to the contrary, the certificate is allowed of course; and then the bankrupt is entitled to a decent and reasonable allowance out of his effects, for his future support and maintenance, and to put him in a way of honest industry. This allowance is also in proportion to his former good behaviour, in the early discovery of the decline of his affairs, and thereby giving his creditors a larger dividend. For, if his effects will not pay one half of his debts, or ten shillings in the pound, he is left to the discretion of the commissioners and assignees, to have a competent sum allowed him, not exceeding 3 per cent.; but if they pay ten shillings in the pound, he is to be allowed 5 per cent.; if twelve shillings and sixpence, then 7½ per cent.; and if fifteen shillings in the pound, then the bankrupt shall be allowed 10 per cent.; provided, that such allowance do not in the first case exceed 500l. in the second 250l., and in the third 50l. Stat. 5 Geo. II. c. 30.

Besides this allowance, he has also an indemnity granted him, of being free and discharged for ever from all debts owing by him at the time he became a bankrupt; even though judgement shall have been obtained against him, and he lies in prison upon execution for such debts; and, for that among other purposes, all proceedings on commissions of bankruptcy are, on petition, to be entered of record, as a perpetual bar against actions to be commenced on this account: though, in general, the production of the certificate properly allowed shall be sufficient evidence of all previous proceedings. Stat. 5 Geo. II. c. 30.

The certificate, when allowed, will not discharge the sureties of a bankrupt: but, if he obtains it before his bonds are fixed, it will discharge them; whereas it not all after they are fixed, they will remain liable notwithstanding the certificate: and if the creditor prove his debt, with intent to obstruct the certificate, it does not preclude him from pursuing his legal remedies; and even if he had received his debt or part of it, under the commission, still he might proceed to fix the bail who would be entitled to their remedy, so far as they are oppressed by "audia querelle," or by "mutuum." (1 Ark. 84. 1 Burr. 2442. 2 Burr. 716.)

The certificate does not discharge a bankrupt from his own express collateral covenant, which does not run with the land (2 Burr. 2443); nor from a covenant to pay rent. (4 Term Rep. 92.) A bankrupt, after a commission of bankruptcy is fixed out, may, in consideration of a debt due before the bankruptcy, and for which the creditor agrees to accept no dividend or benefit under the commission, make such creditor a satisfaction, in part, or for the whole of his debt, by a new undertaking or agreement; and "affirmative" will lie upon such new promise or undertaking. (1 Ark. 67.) Although a creditor of a bankrupt under 20l. is excluded from affent or dissent to the certificate, yet as he is affected by the consequence of allowing the certificate, he has a right to petition and try any fraud against allowing the certificate. 7 Vin. Abr. 134. pl. 18.

No allowance or indemnity shall be given to a bankrupt, unless its certificate be signed and allowed: and also, if any creditor predicates a fictitious debt, and the bankrupt does not make discovery of it, but suffers the fair creditors to be imposed upon, he loses all title to these advantages. Neither can be claimed them, if he has given with any of his children above 100l. for a marriage portion, unless he had at that time sufficient left to pay all his debts; or if he has lost at any one time 5l. or in the whole 100l. within a twelvemonth before he became bankrupt, by any manner of gaming or waging whatsoever; or, within the same time, has lost to the value of 100l. by stock-breaking. Also to prevent the too common practice of frequent and fraudulent or careless breaking, a mark is set upon such as have been once clearly by a commission of bankruptcy, or have compounded with their creditors, or have been delivered by an act of insolvency. Persons who have been once clearly by any of these methods, and afterwards become bankrupts again, unless they pay full fifteen shillings in the pound, are only thereby indemnified as to the commencement of their bodies; but any future estate they shall acquire remains liable to their creditors, excepting their necessary apparel, household goods, and the tools and implements of their trades. Stat. 5 Geo. II. c. 30. 24 Geo. III. c. 57.

By the statute 13 Eliz. c. 7, the commissioners for that purpose, when a man is declared a bankrupt, shall have full power to dispose of all his lands and tenements, which he had in his own right at the time when he became a bankrupt, or which shall descend or come to him at any time afterwards, before his debts are satisfied or agreed for; and all lands and tenements which were purchased by him jointly
jointly with his wife or children to his own use (or such interest therein as he may lawfully part with), or purchased with any other person upon secret trust for his own use; and to cause them to be appraised to their full value, and to sell the same by deed indented and enrolled, or divide them proportionably among the creditors. This statute expressly included not only free, but customary and copyhold, lands; and the lord of the manor is thereby bound to admit the assignee (Cros. Car. 568. 1 Atk. 567): but did not extend to estates-tall, farther than for the bankrupt's life; nor to equities of redemption on a mortgaged estate, wherein the bankrupt has no legal interest, but only an equitable reversion. Whereupon the statute 11 Jac. I. c. 19, enacts, that the commissioners shall be empowered to fell or convey, by deed indented and enrolled, any lands or tenements of the bankrupt, wherein he shall be seised of an estate-tall in possession, remainder, or reversion, unless the remainder or reversion thereof shall be in the crown; and that such sale shall be good against all such issues in tail, remaindermen, and reversioners, whom the bankrupt himself might have barred by a common recovery, or other means: and that all equities of redemption upon mortgaged estates, shall be at the disposal of the commissioners; for they shall have power to redeem the same, as the bankrupt himself might have done, and after redemption to sell them. And the commissioners may sell a copyhold entailed by custom. (Stone 125. Billing 148.) And also, by this and a former act, all fraudulent conveyances to defeat the intent of these statutes are declared void; but that no purchaser bona fide, for a good or valuable consideration, shall be affected by the bankrupt laws, unless the commission be made forth within five years after the act of bankruptcy committed. 1 Jac. I. c. 15.

By virtue of these statutes a bankrupt may lose all his real estates; which may at once be transferred by his commissioners to their assignees, without his participation or consent. See Assignees.

The property vested in the assignees is the whole that the bankrupt had in himself, at the time he committed the first act of bankruptcy, or that has been vested in him since, before his debts are satisfied or agreed for. And therefore, if a commissioner is afterwards awarded, the commission and the property of the assignees shall have a relation, or reference, back to the first and original act of bankruptcy. Infornuch that all transactings of the bankrupt are from that time absolutely null and void, either with regard to the alienation of his property, or the receipt of his debts from such as are privy to his bankruptcy; for they are no longer his property or his debts, but those of the future assignees. If a banker pay the draft of a trader keeping cash with him, after knowledge of an act of bankruptcy, the assignees may recover the money. (2 Term Rep. 113. 3 Bro. C. R. 313.) And if an execution be found out, but not served and executed on the bankrupt's effects till after the act of bankruptcy, it is void as against the assignees. But the king is not bound by this fictitious relation, nor is within the statutes of bankrupts; for if, after the act of bankruptcy committed and before the assignment of his effects, an extent issues for the debt of the crown, the goods are bound thereby. As these acts of bankruptcy may sometimes be secret to all but a few, and it would be prejudicial to trade to carry this notion to its utmost length, it is provided by statute 19 Geo. II. c. 52, that no money paid by a bankrupt to a bona fide or real creditor, in a course of trade, even after an act of bankruptcy done, shall be liable to be refunded. Nor, by statute 1 Jac. I. c. 15, shall any debtor of a bankrupt, that pays him his debt, without knowing of his bankruptcy, be liable to account for it again. The intention of this relative power being only to reach fraudulent transactions, and not to disturb the fair trader.

Sale of goods by a bankrupt, after an act of bankruptcy, is not merely void; the contract is good between the parties; but it may be avoided by the commissioners or assignees at pleasure; so that they may either bring the goods, as supposing the contract may be void, or may bring debt or account for the value, which affirms the contract. (3 Salk. 36. pf. 2. 2 T. R. 143. 4 T. R. 216. 7.) And so if a bankrupt on the eve of bankruptcy fraudulently delivers goods to a creditor. (4 Term Rep. 211.) The assignees after four, and within twelve months after the commission issued, must give twenty-one days notice to the creditors of a meeting for a dividend; at which time they must produce their accounts, and verify them upon oath, if required. And then the commissioners shall direct a dividend to be made, at so much in the pound, to all creditors who have before proved, or shall then prove, their debts. This dividend must be made equally, and in a rateable proportion, to all the creditors, according to the quantity of their debts; no regard being had to the quality of them. Mortgages indeed, for which the creditor has a real security in his own hands, are entirely safe; for the commission of bankruptcy reaches only the equity of redemption. So are also personal debts, where the creditor has a chattel in his hands, as a pledge or pawn for the payment, or has taken the debtor's lands or goods in execution. And, upon the equity of the statute 8 Ann. c. 14. which directs, that, upon all executions of goods being on any premises demised to a tenant, one year's rent and no more shall, if due, be paid to the landlord) it hath also been held, that under a commission of bankruptcy, which is in the nature of a statute-execution, the landlord shall be allowed his arrears of rent to the same amount, in preference to other creditors, even though he hath neglected to distrain, while the goods remained on the premises: which he is otherwise entitled to do for his entire rent, be the quantum what it may. But, otherwise, judgments and recognizances (both which are debts of record, and therefore at other times have a priority), and also bonds and obligations by deed or special instrument (which are called debts by specialty, and are usually the next in order), these are all put on a level with debts by mere simple contract, and all paid pari passu. Nay, so far is this matter carried, that, by the express provision of the statutes, debts not due at the time of the dividend made, as bonds or notes of hand payable at a future day certain, shall be proved and paid equally with the rest, allowing a discount or drawback in proportion. And inferences, and obligations upon bottomry or reffondantia, bona fide made by the bankrupt, though forfeited after the commission is awarded, shall be looked upon in the same light as debts contracted before any act of bankruptcy Stat. 21 Jac. c. 19. 7 Geo. I. c. 31. 19 Geo. II. c. 32.

Within eighteen months after the commission issued, a second and final dividend shall be made, unless all the effects were exhausted by the first. And if any surplus remains, after selling his estates and paying every creditor his full debt, it shall be returned to the bankrupt. This is a case which sometimes happens to men in trade, who involuntarily, or at least unwarily, commit acts of bankruptcy by abjuring and the like, while their effects are more than sufficient to pay their creditors. And, if any selfish or malevolent creditor will take the advantage of such acts, and sue out a commission, the bankrupt has no remedy, but must quietly submit to the effects of his own imprudence;
dence; except that, upon satisfaction made to all the creditors, the commission may be superceded. This case may also happen, when a knife is defaced of defrauding its creditors, and is compelled by a commission to do them that justice, which otherwise he wanted to evade. And therefore, though the usual rule is, that all interest on debts carrying interest shall cease from the time of issuing the commission, yet, in case of surplus left after payment of every debt, such interest shall again revive, and be chargeable on the bankrupt, or his representatives. Stat. 5 Geo. III. c. 30. 13 Eliz. c. 7.

The first step to be taken towards procuring a commission of bankruptcy is for the petitioning creditor to make an affidavit of his debt before a mafter in chancery; or if he resides altogether in the country, before a master extrao-

nary there, to be filed in the secretary of bankrupt’s office in London, and exhibited to the commissioners at their first meeting. When the affidavit is sworn, it is carried to the secretary of bankrupt’s office, where the party suing for the commission enters into the bond to the chancellor. The clerk of the bankrupts fills up a blank petition in the name of the person that makes the affidavit, and annexes the affidavit and bond to the petition, when he prefers the same to the lord chancellor. This petition is answered in a few days, and the petitioning creditor has a commission without any further trouble. Having got the commission, he must employ one of the messengers to summon a meeting of the major part of the commissioners to open the same, when the petitioning creditor must come prepared to prove his debt, and the party a bankrupt, within the statutes. Upon the commissioners declaring the party a bankrupt, they issue their warrant for seizure of his effects, and the me-

fenger by virtue of it seizes the effects, and continues to keep possession till the commissioners have executed the assignment. The application to enlarge the time for the bankrupt’s surrender must be by petition to the great seal, fix days at least before the last fitting appointed in the gazette; which petition may be either in the name of the bankrupt or of his assignees. It is usual for the commissioner to recommend, and the creditors to agree, to return the bankrupts their rings, monies, &c. particularly the jewels, &c. for their goods or effects. If the bankrupt does not surrender himself to the commissioners by twelve o’clock at night of the last day given, the messenger warns him to do so by proclamation made by him in the middle of Guildhall; the commissioners continuing to sit till that time. The certificate when duly signed, together with the attestations of signature, must be lodged with the secretary of bankrupts, and he will give the messenger an authority to the printer of the gazette, to insert an advertisement signifying that the acting commissioners have certified to the great seal, that the bankrupt hath conformed, and that the certificate shall be allowed and confirmed, unless caufc be flown to the contrary within twenty-one days from the date of the said advertisement. If no caufc be flown within twenty-one days against the allowance of the certificate, the lord chancellor will allow the same by a subscription upon it. Jacob’s Law Dict. by Tomlin, art. Bankrupt.

BANKRUPTCY, the act of becoming a bankrupt. (See Bankrupcy.) The French make this difference between a bankruptcy and a failure, that the first is suppos’d voluntary and fraudulent, and the latter constrained and necessary, by means of accidents, &c.

BANKS’S ISLAND, in Geography, an island in the North Pacific ocean, near the west coast of North America, about 60 miles long and 5 broad. It is separated from Pitt’s archipelago by the canal del Principe; and its north point is situated in N. lat. 53° 30’ W. long. 132° 15’.

Banks’s Island is also an island of the Southern Pacific ocean, about five leagues west of the coast of the northern branch of New Zealand islands. It is about twenty-four leagues in compass; its surface is irregular and elevated; and it may be seen at sea at the distances of twelve or fifteen leagues. Its south point is in S. lat. 43° 32’ W. long. 186° 30’.

Banks, Port, a harbour on the north-west coast of America, south-easterly from cape Edgecombe, and north-westly from Sea Otter found.

BANKSAL POINT, a point of the river of Bafhe, on the coast of Colorado, known by the English ware-

houses that are built on it, and by the town of a Dutchman who was there interred.

BANKSIA SPECIOSA, Retz. in Botany. See Costus Speciosus.

BANKSIA, so named by Linnaeus for Sir Joseph Banks, president of the Royal Society, who first discovered it in his voyage with Captain Cook. Lin. gen. Schreb. n. 191. Suppl. 15. Gard. t. 47. Jull. 70. Cfls. tetrandria monogynia. Nat. Ord. aggregato. Protea Juss. Gen. Char. r. perianth one-leaved, four-cleft, inferior. Cor. one-petalled; tube cylindrical, very short; border very long, four-parten; parts linear, lanceolate at the tip, internally hollowed by a little cavity, acute. Stam. filaments none; anthers four, lanceolate, seifice in the cavity of the parts of the corolla. Filf.erner superior, minute; style filiform, stiff, longer than the corolla; stigma pyramidal, acute. Per. capsule ovate, or globose, woody, one-celled, two-valved. Seed, two, obovate, convex on one side, flat on the other, terminated by a very large membranaceous veined wing. Qu. Is this an Acallis? Efl. Char. Cal, four-cleft, inferior. Cor. four-parten, tube very short; border very long, linear-lanceolate; anthers sefife in the cavity of the parts of the corolla. Caps. two-

seeded, one or two-celled, two-valved.

Species, 1. B. ferrata, ferrate-leaved bankia. White Voy. 223. fig. 1, 2. 3. B. conchifera. Gard. fruct. 221. t. 48. f. 1. "Leaves linear, attenuated into the petiole, equally ferrate, truncate at the end with a point." This is the handfomeliest species of the genus; trunk thick and rugged; leaves alternate, thick at the ends of the branches, on short petioles, obtuse, ferrate, bright green above, beneath obovate and whitish, with a strong rib running through the middle; each branch terminated by a large cylindrical spike of flowers; the capsules covered with thick down; the flowers and fruits collected into a large globular amcin; the seed in each cell of the capsule single, rather large, winged and dark brown. 2. B. integifolia, entire-leaved B. B. sphenis. Gard. frucf. 221. t. 48. f. 2. "Leaves wedge-form, quite entire, white-tomentofo underneath." The flowers and fruits are collected into a cylindrical amcin; and before they are ripe, are pubescent with a nap of white whitcens; capsule conical, orbicular at top, turgidly lens-shaped, and continued at bottom into a conical, compressed beek; within black, two-celled, and gaping at the tip. 3. B. trisepala, heath-leaved B. "Leaves approximating, acute, truncate-emarginate, smooth." The leaves are very small, but more abundant than those of the preceding species. 4. B. dentata, tooth-leaved B. "Leaves oblong, attenuated into the petiole, curved, flexuoue, toothed, teeth ending in a spine-like white underneath." The flowers of this species are smaller than in the others. 5. B. pyriformis, pear-

fruited B. "Flowers solitary; capsules ovate, pubescent;
BAN

leaves lanceolate, very entire, smooth." The capsules are larger than in any other known species, one-celled, and opening longitudinally on the lower side; there are two seeds of a rufous cinnamon colour, convex on one side and flat on the other, with a large, membranaceous, velvety wing. 6. B. gilesii, gibbosus-fruited. B. dasydodes, Martyn’s B. 6. not after very long, but in a short flat, gibbous, flat, capsule-shaped, pointed, with tubercles on the outside; leaves oblong, emarginate." Leaves alternate, from six to eight inches long, and three broad; flowers in a short simple raceme, in which only one or two fruits ripen; the capsule from one inch to two inches or more in length; woody, with roundish tubercles, variegated brown and red colour, one-celled; the seeds are two and dark-brown. 8. B. spinifolius, prickly-leaved B. "Leaves linear-revolute, with a little sharp point, and with spinous dentilaminations towards the top." Stem woody and branched; leaves irregularly scattered, closely covering the branches, on very short footstalks, green and smooth above, white and downy beneath, ending abruptly, tipped with three small spines, and having several hooked upwards in the margin; flowers thick set in a cylindrical erect spike, coming out in pairs. It differs from B. criposa, in having leaves at least four times as long, obtuse, but with a small central sharp point from the midrib between two other terminal points, as well as in having a greater or less number of small sharp-hooked lateral teeth towards the end of each leaf. The inhabitants of New South Wales call it "Wattangre." All these plants are natives of that country, except the 7th, which Rumphius observed in Ambonina, in 1693. This genus is nearly allied to Protas and Embolarium in appearance and character, but sufficiently distinguished from both in the fruit. It boils some of the most splendid species that have been discovered in the South seas, and even in the known world. Those with solitary flowers and one-celled capsules (5, 6, 7.) form a separate genus, which Dr. Smith names Salpinia; which see.

Propagation and Culture. Some of the species have flowered and fedded here; they have been increased merely by seeds. These, and the plants in general from the South seas, are hardy, considering their climate, and may be treated much in the same manner with the Cape plants; they covet much air, and flourish best near the front of the dry house. Martyn’s Millar.

Banksia, tectif. See Pimelea.

Banksia Abyssinica, or Cusso, so called by Mr. Bruce after Sir Joseph Banks, an inhabitant of the high country of Abyssinia, and indigenous there. Mr. Bruce, who has described and given a drawing of it, and who represents it as one of the most beautiful and useful trees, says, that he never saw it in the Kolha nor in Arabia, nor in any other part of Asia or Africa. It seldom grows above 20 feet high, and generally inclined; its leaf is about two inches and a quarter long, divided into two by a strong rib; its colour is a deep unvarnished green, very pleasant to the eye, and the forepart is covered with soft hair or down; it is much indented, and very liable to become yellow from too much air and light. The leaves grow alternately by pairs upon a branch, terminating with a single leaf at the point; the end of the stalk is broad and strong, like that of a palm-branch; and it opens in the part that is without leaves, about an inch and an half from the bottom, and from this aperture proceeds the flower. The whole cluster of flowers is very much the shape of a cluster of grapes, and the stalk that supports it resembles the stalk of the grape; the flower itself is of a greenish colour, tinged with purple; when fully blown, it is altogether of a deep red or purple; the corolla consists of five petals, with a short petiole in the middle, having a round head, and surrounded by eight filaments of the same form, loaded with yellow nectar. The calyx consists of five petals, which much resemble another flower; they are round at the top, and nearly of an equal breadth every way. The bark of the tree is smooth, of a yellowish white, interspersed with brown streaks which pass through the whole body of the tree. On the upper part, before the first branch of leaves set out, are rings round the trunk of small filaments, of the consistence of horse-hair; these are generally 14 or 16 in number, and are a very remarkable characteristic belonging to this tree. The tree is always planted near churches for the use of the town or village; and it is very fireproof as an antidote to a disorder to which the Abyssinians of both sexes and all ages are subject. Every individual once a month evacuates a large quantity of worms of the kind called acaerides; and the method of promoting these evacuations is by infusing a handful of dry Caffo flowers in about two English quarts of bouza, or the beer that is made from teff; after it has been steeped all night, it is next morning fit for use. The feed of this tree is very small, smaller than the femea Santonicum; it is easily killed; and on this account no great quantity of the feed is gathered, and therefore the flower is sbubstituted for it. It is bitter, but much less so than the femea Santonicum. Mr. Bruce conceives that this plant may be found in latitudes 11° or 12° north in the West Indies or America; and having been found a gentle, safe, and efficacious medicine in Abyssinia, it is not doubted but the superior skill of physicians would turn it to the advantage of mankind in general, when used here in Europe. Bruce’s Travels, vol. v. Appendix. P. 73-76.

Banksia, in Extremity, a species of Papilio (Nymph) with angular wings; above brown, with a yellowish disk, and a black ocular spot with a double pupil. Fabr. This is a native of New Holland, and is the Papilio Jf-

Banksia, a species of Scarabaeus (Melolobus) described by Fabr. from a species in the museum of Sir Joseph Banks. The head and thorax are black; wing-cases violet, and with the legs tesselaceous; abdomen short and retuse.

Banksia, a species of Cymex (Reduvius) that inhabits India. It is rufous above, with black wings; abdomen deep black; border rufous. Fabr.

Banksia, 3 species of Chrysobela that inhabits Cal- bria. It is hirsly above, beneath tessellaceous. Fabr.

Banksia, a species of Ceramella that inhabits Cal bria. It is hirsly above, beneath tessellaceous. Fabr.

Banksia, a species of Chrysoula, that is found at the cape of Good Hope. It is of a greyish colour; tho- rax slightly spined; wing-cases speckled with ferruginous, and marked with two circular bands. Fabr.

Banneuga, or Bannileuga, or Banksie, in Middle Age Writers, the territory within which the jurisdiction of municipal magistrates, or ordinary judges of a city, town, or the like, is confined. It is thus called, because within this tract they may make their regulations, prohibitions, and other acts of justice and policy, comprised under the name of Ban, or Ban-

Bann, in Geography, a river in Ireland, which rises in the
the northern part of the Mourne mountains, in the county of Down, and swelled by various little brooks, soon becomes a large stream. It takes a serpentine course to the north-west, having many bridges over it, till it comes to Portadown, where it is joined by the Newry canal, and a few miles farther it falls into Lough Neagh at Bannfoot ferry, after running about thirty miles. The waters of this river, which is distinguished by the name of the South or Upper Bann, are esteemed superior to any other for the purpose of bleaching. After passing through Lough Neagh, out of which it breaks at Toome cauld, where is a bridge over it, it again expands into a small lake called Lough Beg, the views in which are very pleasing. From this, still keeping a north-west direction, it passes through a country formerly overgrown with immense woods, then forces its way over a ridge of rocks called the Salmon-Leap, and having again collected its scattered waters, rushes with an impetuous force into the sea at Bannhaven, a few miles below Coleraine. It is certainly one of the finest rivers in Ireland; and if we include its passage through the lake, runs in the whole near ninety miles, with so pure and limpid a stream, that it has acquired the name of the "Father Bann." The lower or northern part of it, being the only outlet for seven rivers and innumerable streams that pour their tributary waters into Lough Neagh, is broad and rapid; but notwithstanding this, and the ridge of rocks already mentioned, it is thought that it might be rendered navigable, a measure from which great advantages are expected. The salmon caught in this river is very highly esteemed, and the fishery is the greatest in the kingdom. (See Coleraine.) Campbell's Political Survey. Beaumont's Memoir. Young's Tour, &c.

Bann, the name of a river in the north-eastern part of the county of Wexford, Ireland, which falls into the Slaney near Ferna.

Bann, a township in the county of York, in Pennsylvania.

Bann, or Ban, Banum, or Banus, in the Feudal Law, a solemn proclamation, or publication of any thing.

The origin of the word is uncertain; some deduce it from the Britsh ban, clameur, nifie; others from the Saxon ban, a thing spread; whence ban and bane, used for a flag. Bracton mentions banus regis for a proclamation of silence anciently made by the court, before the encounter of the champions in a combat.

Bann is also used for a solemn convocation of the nobility of a province, to attend the king in his army, conformably to their feudal tenures.

Bann, in this sense, differs from rear-bann; as the former respects those who took mediate of him. But the words are now confounded, and bann and rear-bann denote a summons to all the feudal tenants, mediate and immediate, to go to war in the king's service.

Bann also denotes the assembly, or body of nobility and gentry thus convocated.

In this sense, they say, the bann and rear-bann are long in getting into the field; the bann and rear-bann were assembled, &c.

The French nobility appear to have served the king, in the way of bann and rear-bann, from the beginning of the monarchy; though the usage was not regularly settled till the time of the Revolution of Feuds.

Bann is more particularly used to denote a proscription or banishment, for a crime proved; because anciently published by sound of trumpets: or, as Vossius thinks, because those who did not appear at the above mentioned summons were punished by proscription.

Hence, to put a prince under the bann of the empire, is to declare him divested of all his dignities.

The sentence only denotes an intimation of all intercourse and offices of humanity with the offender, the form of which seems taken from that of the Romans, whobanished persons, by forbidding them the use of bread and water.

Sometimes also cities are put under the imperial bann; that is, stripped of their rights and privileges.

Bann also denotes a pecuniary mule or penalty laid on a delinquent for offending against a bann.

BANNS of Marriage are certain solemn notices of matrimonial contracts made, in the parish-church, before the marriage, that if there be any objections to either party, to prior engagements, &c., there may be an opportunity of making them. The publication of banns (popularly called "ageing in the church") was intended as an expedient to prevent clandestine marriages; but a licence or dispensation is now easily procured, for that their use is defeated. By the laws of the church, banns are to be published thrice, on three distant days, in the places where the parties live, on pain of nullity of marriage; and excommunications are threatened against those, who, knowing impediments, conceal them. (But see 26 Geo. II. cap. 35, and Marriage.) The use of matrimonial banns is said to have been first introduced in the Gallican church, though something like it obtained even in the primitive times; and it is this Tertullian is supposed to mean by triminum promulgatio.

Bann is also used for a solemn anathema, or excommunication, attended with curls, &c.

In this sense, we read of papal banns, &c.

BANN OF GOD, bannus Dei, or the judgment of God. Speciman takes it for excommunication.

Bann is also used for a prohibition.

In which sense, the bann of harvest or vintage, &c., in the French customs, imports a prohibition to reap, or gather the grapes, without the leave of the lord.

The former is now taken away, and the peasant may reap his corn when he pleases; but the latter still remains, pernicious not being allowed to open the vintage till publication is made by the officer of the place for that purpose.

BANN-FIN, in the French Customs, a privilege enjoyed by lords, of selling the wine of their own growth, during a certain time, exclusive of all other persons within the compass of their fees or lordships.

The same right, in some places, extends also to other liquors; and even to hogs, cows, and other animals.

BANNALIUS, in Geography, a town of France, in the department of Finisterre, and chief place of a canton in the district of Quimperlé; 21 leagues north-west of Quimperlé.

BANNALIS MOLI, or Bannal-mill, a kind of feudal service, whereby the tenants of a certain district are obliged to carry their corn to be ground at a certain mill, and to be baked at a certain oven, for the benefit of the lord.

The oldest account of such bannal-mills occurs in the eleventh century. Fulbert, bishop of Chartres, and chancellor of France, in a letter to Richard, duke of Normandy, complains, that attempts began to be made to compel the inhabitants of a part of that province to grind their corn at a mill fitted up at the distance of five leagues. Vide "Maxima Bibliotheca Veterum Patrum," London, 1677, tom. xviii. p. 9. Other examples of this species of servitude, in the tenth and thirteenth centuries, may be seen in Du Fresne, under "Molendinum Bannale." De la Mare ("Traite de la Police," ii. p. 151,) gives an instance, where a lord in affranching
chasing his subjects, A.D. 1248, required of them, in remembrance of their former subjection, and that he might draw as much from them in future as possible, that they should agree to pay a certain duty, and to furnish their corn to be ground at his mill, their bread to be baked in his oven, and their grapes to be pressed at his wine-press. The origin of these servitudes may possibly be accounted for thus: the building of mills was at all times expensive, and undertaken only by the rich; who, to indemnify themselves for the money expended in order to benefit the public, stipulated that the people in the neighbourhood should grind their corn at no other mills than those erected by them.

BANNAR, in Geography, a town of Hindustan, in the district of Coorg-Wynaad, erected on the upper branch of the Capany river. N. lat. 11° 48'. E. long. 76° 20'.

BANNAT of Temesfium, a district of Upper Hungary, in the circle on the farther side of the Theis, bounded by the rivers Maros, Theis, and Danube, and watered by the Temes, which is joined by the Bug or Beyhe. In 1552, the Turks became masters of it, and retained it at the peace of Karlowitz, in 1699; but lost it, after a poll-fiion of 164 years, in 1716; and in 1718, it was formally ceded to the emperor, at the peace of Paffarowitz; which cession, one district excepted, which was granted to the Turks, was ratified in 1759, at the treaty of Belgrade. Its government is divided into the civil and military jurisdictions. Its capital is Temesfwan. This banat presents many ridges of considerable height.

BANN-BRIDGE, a market and post-town of the county of Down, province of Ulter, Ireland, which takes its name from a bridge over the river Bann. It is a pleasant town on the road from Dublin to Balfait, and is remarkable for its great linen fairs. Distance north from Dublin 60 ½ Irish miles.

BANNER, in Heraldry, is a small square flag with fringe, fastened to a lance or spear, similar to the standards now borne by the regiments of cavalry, and was always borne in the field before a prince, duke, marquess, earl, viscount, baron, knight of the garter, and knight-banneker.

Menage derives the word from the Latin bandum, a band, or flag; and supposes baniere to have been first written for bandere; which is confirmed by this, that we meet with the word banderia, used, in the same sense, by Latin writers of the barbarous age.

In the reign of Henry VIII. the size of the royal banner was an ell long, and a yard broad; in queen Elizabeth's reign, the length was two yards and a half, and the breadth two yards, besides the fringe; the complement of men to each banner in the field was always one hundred.

BANNER, in Military Language. See COLOURS.

BANNERS of the Romans. See SIGNS.

BANNERETS, an ancient order of knights, or feudal lords, who, profiting several large fees, led their valets to battle, under their own flag, or banner, when summoned thereto by the king.

The word seems formed from banner, a square flag, or from band, which anciently also denoted a flag.--Bannerets are also called in ancient writers, milita vexilliferi, and vexillarii, bannerarii, banneriti, &c.

Aicelately there were two kinds of knights, great and little, the first whereof were called Bannerets, the second Bachelors; the first composed the upper, the second the middle, nobility.

The banneret was a dignitary allowed to march under his own flag, whereas the bachelarini equestr followed that of another. Knights bannerets were originally entitled to display their banners in the field. A knight Banneret must he a gentleman of family, and have land sufficient to enable him to bring into the field fifty men at arms, with the archers and cross-bowmen appertaining thereto, making in the whole one hundred.

Banneret, according to Spelman, was a middle order between a baron and a simple knight; called sometimes a viscellar minor, to distinguish him from the greater, that is, from the baron, to whom alone properly belonged the jus viscelli, or privilege of the square flag.

Hence the banneret was also called banneretius, quasi baro minor, a word frequently used by English writers in the same sense as banneret was by the French; though neither of them occur before the time of Edward II.

Some will have bannerets to have originally been persons who had some portion of a barony assigned them; and enjoyed it under the title of baro proximus, and that with the same prerogatives as the baron himself.

Some again find the origin of bannerets in France; others in Brittany; others in England. These last attribute the institution of bannerets to Conan, lieutenant of Maximus, who commanded the Roman legions in England under the empire of Gratian, in 383. This general, say they, revolving divided England into forty cantons, and in these cantons distributed forty knights, to whom he gave a power of assembling, on occasion, under their several banners, as many of the effective men as were found in their respective districts; whence they are called bannerets.

However this be, it appears from Froissart, &c. that anciently such of the military men as were rich enough to raise and furnish a company of armed men, and had a right to do so, were called bannerets. Not, however, that these qualifications rendered them knights, but only bannerets; the appellation of knight being only added thereto, because they were simple knights before.

At the ceremony of creation, the king, at the head of his army, after a victory, is surrounded by all the field officers and nobles at court, under the royal standard displayed to receive the intended knight banneret, who is led to the sovereign by two renowned knights or valiant men at arms, having his pennon or guidon of arms in his hand, preceded by the heralds, who proclaim his valiant achievements. The king then says to him, "Advance thy banneret," and commands the ends of his pennon or guidon to be torn off, which then becomes a banner, being square (on which he has his arms and supporters embroidered). The new knight banneret then returns to his tent, accompanied by martial music, and attended by many nobles and field officers, where they are highly entertained. A knight banneret has a right to display his banner in the field. Neither the title nor supporters are hereditary. In the 28th of Edward I. the daily pay of a knight banneret was four shillings and their diet at court; they take precedence of the younger sons of viscounts and barons. The last knight banneret was Sir John Smith, by Charles I., after the battle of Edge-hill, where he refused the royal standard from the rebels.

Banneret is also the name of an officer, or magistrate of Rome, towards the close of the fourteenth century.

The people of that city, and throughout the territory of the church, during the disputes of the antipopes, had formed a kind of republican government; where the whole power was lodged in the hands of a magistrate, called senator, and twelve heads of quarters, called bannerets, by reason of the banners which each raised in his district.

Banner-Rolls, in Heraldry, are small flags used at funerals.

BAN-
BANNIMUS, q.d. see banibus, from the obsolete banni, the form of expulsion of any member from the university of Oxford, by affixing the sentence up in some public place, as a denunciation or proclamation of it.

BANNOCK, in Food, is an oat-cake, kneaded only with water, and baked in the embers. These are common in Lancahire and some other counties.

BANNOCKBURN, in Geography, a village of Scotland, in the county of Stirling, where was fought a battle between the English and Scots on the 25th of June 1314, in which the English were defeated with great loss, and by which the independence of Scotland was confirmed, and Bruce fixed on the throne of the kingdom; and where James III. king of Scotland, was in 1487 overpowered by his subjects, wounded, and soon after murdered by a priest taking his confession: two miles south of Stirling.

BANNOW, the name of a town which formerly existed in the county of Wexford, province of Leinster, Ireland, situated at the south-easterly extremity of a small haven of the same name, formerly called Bagganban. This is noted as the place at which Robert Fitzjephans, Harvey of Mountmorres, and Maurice of Pendragon (not earl Strongbow, as some accounts erroneously state), the first of the English adventurers, landed in A.D. 1170. It is said by Giralas Cambrensis, to be a little creek lying in the county of Wexford, near to Feathard a fishing town, the open sea being on the east, and not far from the haven mouth of Waterford on the south. The same writer speaks of it as very unfit for a harbour, and says that it derived its name from that of one of the ships in which the Englishmen arrived. The name Bagganban is retained in an ancient rhyme:

"At the creek of Bagganban, Ireland was lost and won."

And the place was so noted, that some old writers have even spoken of the whole island by the name of Bannow. Though the town seems never to have arrived at the fame consequence that its neighbour Feathard did, it was made a borough and continued to lend members until the union.

"So late as the year 1625," says the writer of a letter to Dr. W. Hamilton, "Bannow is registered in the custom-house books of Wexford, as having four streets which paid quit-rent to the crown, and some buildings surrounding the church." The name of one of these streets, Weavers' street, indicates some manufacture to have been carried on. "The only remains of it," continues the latter writer, "which fland visible at this day (1786) are the walls of its church. There is not in or near the site of the former town even one solitary hut. The election for the representatives of the town is held on the walls of an old chimney, adjoining to the church, which tumbled down piecemeal, and forms the council table of that ancient and loyal corporation. Towns die as well as men; and the village of Bannow are traced with difficulty amid heaps of barren sand, and now the privilege which interested some in its continuance having ceased, in a few years it may be entirely forgotten. Its distance south from Dublin is 761 Irish miles, long. G° 50'. W. lat. 52° 12'. N. Hollinghead. Transactions of Royal Irish Academy.

BANNUM Coptica, was a mulct paid in cattle.

BANNUS, or BANUS, a title anciently given to the governor or viceroys of Croatia, Dalmatia, and Scythia. BANNUS Episcopalis, was a mulct paid to the bishop by those guilty of incendig, or other crimes.

BANONCOURT, in Geography, a town of France, in the department of the Meuse, and chief place of a canton Vol. III. in the district of St. Mihiel, 1/4 league north of St. Mihiel.

BANOY, in Ornithology, the name given by the people of the Philippine islands, to a kind of hawk, somewhat larger than our small-hawk, and of a yellowish colour on the back and wings, and white under the belly. It is the most common of all the kinds of hawk in that part of the world, and is a very voracious animal.

BANQUET, in the Muses, denotes that small part of the branch of a bridle under the eye, which, being rounded like a small rod, gathers and joins the extremities of the bit to the branch. In such a manner, that the branch is not seen, but covered by the cap, or that part of the bit next the branch.

BANQUET-LINE, is an imaginary line drawn by the bit-makers along the banquet, in forging a bit, and prolonging upwards and downwards, to adjust the desired force or weakness of the branch, in order to make it flint or easy; for the branch will be hard and strong if the fevil-hole be on the outside of the banquet, with respect to the neck; and it will be weak and easy, if the sevil-hole be on the inside of the line, taking the centre from the neck.

BANQUETING-ROOM, or house. (See Xenia, Saloon, &c.) The ancient Romans lapped in the atrium of their houses: but, in after-times, magnificent saloons or banquetting-rooms were built for the more commodious and splendid entertainment of their guests. Lucullus had several of these, each distinguished by the name of some god; and there was a particular rate of expense appropriated to each. Plutarch relates (in Lucullum, apud Oper. t.i. p. 519.) with what magnificence he entertained Cicero and Pompey, who went with design to surprize him, by only telling a slave who waited that the cloth should be laid in the Apollo. The emperor Claudius, among others, had a splendid banquetting-room, named Mercury. But every thing of this kind was outdone by the lathe of that celebrated banquetting-house of Nero, called domus Aurea, which, by the circular motion of its partitions and ceilings, imitated the revolution of the heavens, and represented the different seasons of the year, which changed at every service, and showered down flowers, effences, and perfumes on the guests. Helogabalus, nevertheless, is said to have improved as much upon Nero, as the latter had done on Lucullus. Senec. Ep. 90.

BANQUET, in Fortification, is a little foot bank, or an elevation of earth forming a path which runs along the inside of a parapet: by which the musketeers get up to discover the counterfearp, or to fire on the enemies in the most or in the covert-way.

The banquet is generally between two and three feet high, and three feet broad, and four feet and a half lower than the parapet, having two or three steps to mount it by. Where the parapet is very high, they make a double banquet one over the other.

BANSTEAD, in Geography, a village of Surry in England, is celebrated for its, pittance down, and the delicate mutton they produce. The sheep bred here are of a small species, and being fed mostly on the short sweet herbage which abounds with wild thyme, juniper, &c. their flesh is peculiarly rich, and is often sold in the London markets for lamb. (See Sheep.) The soil of these downs consists of chalk, clents, and a thin stratum of blackish mould. Here is an annual horse-race, much frequented by the sporting people of London.

BANSTICKLE, in Ichthyology, a name synonymous with prickle-bag, prickle-back, and tickle-back. See Gasterosteus.
BANSWALEH, in Geography, a district of Hindostan, situated on the west part of Malwa.

BANSWARA, a town of Hindostan, in the country of Telingana or Golconda, twenty miles from Indelovoy.

BANSWARAH, a town of Hindostan, in the country of Malwa, 75 miles west of Ougien, and 105 E.N.E. of Ambedab. N. lat. 23° 25', E. long. 74° 25'.

BANTAM, a sea-port town in the north-west part of the island of Java, and capital of a kingdom. It is situated at the bottom of the bay of the same name, about a quarter of an hour's walk from the sea-side; and lies between two branches of a river that descends from the mountains, in an extensive plain, behind which there is a range of high and lofty hills extending far to the southward. Its distance from Batavia is about 13 Dutch miles, each of which is about 34 English miles. The communication between these places by land is very difficult, and almost impracticable, on account of the thick forests and deep morasses which lie between them; whereas the passage by water, with the advantage of the land and sea-winds, in the light Indian vessels or prams, called flyers, is performed in four hours. The town of Bantam is large, but has no walls or fortifications towards the sea, nor any on the land side, except fort Diamond, in which the king's palace stands. Bantam resembles a grove of cocoanut trees rather than a city. The houses are huddled together, walled up with mud and canes, plastered with clay, and covered with thatch or leaves of palm-trees, and are confusely dispersed, without any arrangement of streets; and round each of them is a plantation of cocoanut trees, the whole being surrounded by a palis of fplit bamboo, by which every family is wholly separated from its neighbours. The river of Bantam, at its mouth, is about 170 or 180 feet wide, and is very shallow. However, at high water and in spring tides, it is from five to seven feet deep. Above the town it divides into three channels, of which that just mentioned is the middle one; the other two branches run into the sea, about the distance of 14 league on each side.

The gulph or bay of Bantam, bounded by a point of the same name and that of Pentang, forms a commodious retreat for ships, where a great number may anchor in safety. Within this bay are several small islands, which are all uninhabited, except Pulo-Fanjang, or the Long island, which is the largest and in which some fishermen reside. Fish are plentiful; and the inhabitants prefer one called the kaalkop or bald-head, which has some resemblance to our cod. This bay was formerly famous for being the principal rendezvous of the shipping from Europe in the east. Bantam was the great mart for pepper and other spices, from whence they were distributed to other parts of the world. The chief factory of the English as well as Dutch East India company was settled there. The merchants of Arabia and Hindostan referred to it. Its sovereigns were so deferent of encouraging trade, by giving security to foreign merchants against the violent and revengeful disposition of the natives, that the crime of murder was never pardoned when committed against a stranger, but might be committed by a foregner for a fine to the relations of the deceased. This place flourished for a considerable time; but the Dutch having conquered the neighbouring province of Jacatra, where they have since built Batavia, and transferred their principal bussines to it; and the English having removed to Hindostan and China, Bantam was reduced to a poor remnant of its former opulence and importance. Other circumstances have also accelerated its decline. The bay is so choked up with daily accretions of new earth washed down from the mountains, as well as by coral shools extending a considerable way to the cast, that it is inaccessible at present to vessels of burden.

A fire also destroyed most of the houses; and few have been since rebuilt. With the trade of Bantam the power of its sovereign declined. In his wars with other princes of Java, he called in the assistance of the Dutch; and from that period he became, in fact, their captive. He resides in a palace, built in the European style, within a fort called the Diamond, situated in a large open field, denominated the Pascebaan, where three roads, leading from different quarters of the town, unite to the westward of the river, and garrisoned by a detachment from Batavia; the commander of which takes his orders, not from the king of Bantam, but from a Dutch governor, who lives in another fort, called Speelwylk, adjoining to the town, on the east side of the river, and nearer to the sea side. The royal palace is an oblong square, 840 feet long, and nearly half as broad; it has regular battlements at the four corners, and several semicircular places of arms on the sides. Stavriancs counted 66 pieces of canon, most of them being brass, and heavy artillery, but old, and few of them fit for service. The Dutch garrison consists of a captain, three subalterns, and 170 privates, who guard the king's person, and keep him always in the company's power. None of its subject, not even his sons, are allowed to approach him without the knowledge of the captain of the Dutch military, and a regular guard is placed with the commandant at fort Speelwylk. No Javanese or Batteram is ever allowed to pass the night within the walls of the fort. The approach to it is by a drawbridge, thrown over the moat; and at the gate of the fort an officer and 24 men mount guard night and day. The walls of the king's seraglio are raised higher than those of the fort, to guard it against the inspection of the curious. When the king's sons arrive at the age of puberty, they are removed from their father, but have each their separate seraglio or harem. All the servas of the palace are women, and even the king's attendant guards are females. However, when he appears in public, he is accompanied by his Bantam life-guards, though they are never admitted within the gates of the fortresses, who, besides their side arms, which are cusses or long daggers, are provided with pikes, having very long and broad iron heads; and when the king goes abroad he is likewise attended by a guard of Europeans from the garrison. Befides maintaining a body of native troops, his Bantamee majesty is allowed to keep several small armed vessels, by means of which he maintains authority over some part of the coast of Sumatra. His subjects are obliged to sell him all the pepper they raise in either island at a low price, which he has contracted to deliver to the Dutch at a small advance, and much under the marketable value of that commodity. The religion of the kingdom of Bantam is the same with that which prevails in the island of Java, or Madomcan; and the present king joins the spiritual to the temporal power, and is high-priest of this religion; with which, indeed, he blends some of the rites and superstitions of the aboriginal inhabitants of Java; adoring, for instance, the great banyan or Indian fig-tree, which is likewise held sacred in Hindostan, and under which religious rites may be conveniently performed; in the same manner as all affairs of state are actually transacted by the Bantamee, under some shadowy tree, by moonlight.

In the middle of the plain, or Pascebaan already mentioned, is a large weringa tree, or cauariara equisetifolia, which by its spreading branches, affords an agreeable shade; and at the foot of it a grave, covered with a large blue stone, on which was buried one of the former kings of Bantam. This is regarded by the inhabitants as a very holy place, and held in great veneration. Near this is a building which is used as a place of circumciscion for the children
children of the king; and on such occasions, it is hung round and richly decorated with costly tapestry and pieces of cloth. The Pafeeban is likewise the scene of horseraces and similar exercises, in which the courtiers appear on horseback, magnificently appareled, to contend with the king or his sons; but they always take care to yield the palm of victory to their royal competitors. The mosque or temple stands at the end of a pleasant lawn, of a square form, with five roofs above one another, decreasing in size and at last terminating in a point, and surrounded by a wall. The spire serves, like the minarets in Turkey, to announce the hours of prayer. Neither Christian nor Pagan may enter this temple upon pain of death.

The chief authority at Bantam, on behalf of the company, is vested in a senior merchant, with the title of commandant, who manages the trade, confining chiefly in pepper and some cotton yarn. To the commandant of Bantam belong the two residencies or factories which the Dutch company possess in the southern part of the island of Sumatra; whence they derive annually a considerable quantity of pepper. At Bantam all heavy goods are weighed by *bharis*, each containing three *picoes*, and these last are estimated at 125 lbs. Stavorinus and some of his companions were admitted to an audience by the Bantam king. His drees consisted of a long Moorish coat, made of stuff interwoven with gold, and manufactured at Surat, called foesjes, which hung down almost to his feet, and the sleeves of which were fastened by a row of small gold buttons. Under this coat, he wore a white shirt, and a pair of drawers reaching down to his heels, of the same stuff as the coat. His head was covered with a round and somewhat sharp-pointed cap, of a violet colour, laced with silver. Behind his chair stood one of his female life-guards; armed with a large gold kris, in a sheath of maffy gold, which she held in an elevated position: two female slaves were seated on each side of him on the ground; one held his tobacco-box and his betel-box, both of which were of gold, and when he wanted either, it was handed to him, wrapped in a silk-handkerchief: the other presented a golden-spitting pot to his majesty, whenever he had occasion for it. Pipes and tobacco were presented to the guests, as soon as they were seated, and the table was furnished with all kinds of Indian food, varieties dished. One singular practice is mentioned, which was that of the king's frequently bawling during his meal, and it was followed by all the company. This cultum, which is an etiquette of the court of Bantam, was designed to show that each person's appetite was good and the food agreeable, which was pleasing to the king. Bantam is situated in S. lat. 6° 20'. E. long. 105° 24'. Stavorinus' Voyages, vol. 1. p. 57—59. Stavonius' Embassy to China, vol. 1. p. 296—298.

**BANTAM-Cock**, in Ornithology, a variety of the Phasinus Gallus, or the Gallus pustuliferus, tibis penitus, pennis pollicis elongatis, in the Linnaean system. It much resembles, says Buffon, the rough-footed cock of France. Its feet are covered with feathers, but only on the outside; the plumage of the legs is very long, and forms a sort of boots which reach a considerable way beyond the claws. It is courageous, and resolutely fights with one stronger than itself. Its iris is red; and it is said, that most of this breed have no tuft.

**Bantam-Work**, a kind of Indian painting and carving on wood, resembling Japan work, only more gay, and decorated with a great variety of gaudy colours. Bantam-work is of less value among connoisseurs, though sometimes preferred by the unskilful, to the true Japan work. Formerly it was in greater use and esteem than at present; and the imitation of it much practised by our japanners.

There are two sorts of Bantam as well as of Japan work; as, in the latter, some are flat, lying even with the black, and others high, or embossed; so in Bantam-work, some are flat, and others in-cut, or carved into the wood, as we find in many large screens; with this difference, that the Japan artists work chiefly in gold and other metals, and the Bantam generally in colours, with a small sprinkling of gold here and there.

As to the flat Bantam-work, it is done in colours, mixed with gum-water, proper for the thing designed to be imitated. The method of performing the carved or in-cut kind is thus described by an ingenious artist. The wood is first to be primed with whiting and size, so often till the primer lie near a quarter of an inch thick; then it is to be water-plased, i.e. rubbed with a fine wet cloth, and, some time after, brushed very smooth, the blacks laid on, varnished up with a good body, and polished well, though with a gentle hand. This done, the design is to be traced out with vermilion and gum-water, exactly in the manner wherein it is intended to be cut; the figures, trees, buildings, &c., in their true proportions. Then the graver is applied, with other tools of proper shapes, differing according to the workman's fancy. With these he cuts deep or shallow, as is found convenient, but never deeper than the whitest lines; the wood being never to feel the edge of the instrument. Lines or parts of the black are left to be, for the draperies and other out-lines, and for the division of one thing from another; the rule being to cut where the white is, and leave the black untouched. The carving being finished, they then use the penile, with which the colours are laid into the cut-work. After this, the gold is to be laid in those places which the design requires; for which purpose, a strong thick gum-arabic water is taken, and laid with a pencil on the wood; and, while this remains wet, leaf-gold is cut with a sharp smooth-edged knife, in little pieces, shaped to the bigness and figure of the places where they are to be laid. These being taken up with a little cotton, they dab them with the flame close to the gum-water, which affords a rich lustr. The work thus finished, they clear up the black with oil, taking care not to touch the colours. The European workmen, in lieu of leaf-gold, ordinarily use bras-duft, which is less bright and beautiful. Park. Treat. of Japan.

**BANTAYAN**, in Geography, a small island of the East Indies, belonging to the group of Philippines, situate northeast of Zebu, near Cape Buruque. It is encompassed by four or five of a smaller size; and the inhabitants employ themselves in fishing and making cotton hofe.

**BANTIEA, or Bantia, in Ancient Geography**, a town of Italy, in Apulia. Plutarch, in his life of Marcellus, speaks of this place in his account of the march of this general against Hannibal: and Horace (Od. iv. lib. 3.) calls the defiles in its vicinity "falsa Bantia."**

**BANTELN**, in Geography, a town of Germany, in the circle of Lower Saxony, and principality of Calenberg; in which is a carpet manufacture.

**BANTI, BRIGIDA GEORGI, in Biography, an opera singer of the first class. In 1777, she was engaged by the proprietors of the pantheon, to supply the place of the Agujari; a measure adopted merely on speculation, upon hearing from Paris of the effects of her fine voice in that capital.**

She was the daughter of a gondolier at Venice, and for some time a piazzera performer in that city. After this exercice of her natural vocal powers, she sung her way to Lyons, where she performed in coffee-houses for such small
donations as are usually bestowed on itinerant talents in such places. Hence, by the power of song, she was conveyed to Paris, where her voice was so much admired, that, after very little teaching by some of her countrymen whom she met with there, she was permitted to sing at the concert spirituel. Here the applause was so loud, that it soon reached England, and induced the proprietors of the pantomime to engage her for three seasons, at 800l. a year, upon condition that 100l. should be deducted each season out of her salary, for the payment of an able master to cultivate her voice. Sacchini was the first appointed to this office; but soon found her so idle and obstinate, that he quitted her as an incurable patient. She was next assigned to signor Piozzi, whose patience was likewise exhausted before she became a perfect singer. In 1779, she returned to Italy as ignorant of music as when she left that country; but from the accuracy of her ear, and power of imitation, she soon improved, more by example than precept or study; and in 1783, we find in musical records that she was engaged at Florence, as first woman, to sing with Marchesi, then at the zenith of his powers and favour. The next year the song at Turin; then at Milan; and in 1786, she went to Vienna; thence to Warsaw in 1787; and in 1788, first performed at Naples, where the theatre is the largest in Europe, and reckoned the poft of honour among singers. And here her favour was so great, that after singing at Milan with Crescentini, and at Venice with Pacchierotti, she was recalled to Naples three several times before the year 1793, when she went to Spain; and at Madrid the feems fall to have increased in fame and favour. His Catholic majesty finding that he had a large family of children, which was increased during her residence in Spain, took two off her hands, and promised to have them educated, and to provide for them. It is hardly credible, with a person and voice so entire and well preferred, but the use to declare, that she had children and mifsarrages to the amount of eighteen!

In 1794, on quitting Spain, she returned to England, where she preferred her voice, increased its powers, and her favour with the public, every season, till 1802, when she again returned to her own country; and in November performed at Bologna, in Antigona, an opera composed by Bianchi. From Bologna she was invited to Naples for the fourth time; and from Naples was invited to sing at Milan, during the carnival of 1803.

We cannot take our leave of this admirable performer, without declaring, that whenever heard a voice of more grateful tone, or more confant in tune; or an execution (as far as the attempted bravura) more neat, brilliant, and articulate. The low notes of her voice were mellifluous, rich, and full to an uncommon degree; and in pathetic airs, the tones through her whole compass were truly touching.

Her knowledge of music was incomparable, and this she always confessed; that is, she could not sing at sight; but who is ever required in public to sing airs at sight? and whether she was an hour or a week in studying a part, it was the same thing to the audience, as she was always perfect on the stage; so that the inconvenience was all her own.

It has been said that she wanted variety in her emblcments; but few female singers are sufficiently skilled in the laws of counterpoint to invent graces themselves, that shall not break the time or injure the harmony; and we believe that composers must rejoice in such ignorance, as meddlesly delivers their melodies unsophisticated, disfigured, and changed by what are vulgarly termed graces, but which persons of true taste and judgment, with more propriety, denominate ignorance and impertinence.

We long wished the Banti's shake a little more open, but even that with was gratified before her departure.

And now, quitting the figner, we shall pay our respects to her as an actress; in which faculty she excelled in grace, dignity, and propriety, all the stage fingers whom we remember ever to have seen; and whoever recollects her performance in the opera of Semiramide, will not dispute her transcendent merit in that particular; ever attentive to the persons who addressed her in each scene, whether good or bad fingers, friends or foes to herself; she never seemed to think them less worthy of her notice than the ladies of her acquaintance in the pit or the boxes.

Her person and figure were good, and her countenance, though not handsome, was expressive, and her features strong and flexible. Upon the whole, we know not whether she gratified us most a finger or an actress.

BANTON, or BAN, in Geography, one of the smaller Philippine islands.

BANTER, a market and port town of the county of Cork, Ireland, situated at the bottom of the extensive bay called Cork, in the south. It was formerly called the Old town, to distinguish it from a settlement more to the north, where general Ireton caused a fortification to be erected, but when the fort went to decay, it was entirely forsaken. Several years ago, Bantry was a thriving town, on account of the pilchard fishery, several thousand pounds worth of them having been sent to Italy, Spain, and Portugal, and much oil made from them. In 1748 and 1749, there was a great herring fishery, as appears from returns made to the Dublin society, but the town has since fallen into decay. It was however brought into notice by the French fleet going there, and fortifications were erected there to prevent a future surprise. Whiddy island, opposite the town, is remarkable for its fertility and beauty; and Glengarriff, between Bantry and Bear island, is a charming place, the rocks of which are covered with Arbutus trees, and plants of different kinds. Bantry is 164 Irish miles S.W. from Dublin. N. lat. 51° 37'. W. long. 9° 20'.

Bantry Bay, a large harbour in the western part of the county of Cork, Ireland, which is one of the finest in the world, being twenty-six miles long, and from three to five broad. There is in some parts from 30 to 40 fathom water, and the tides move very gently right in and out through the whole bay. There are few fiands round it, the coal being all high and stupendous rocks. In this bay, near the entrance, there was an engagement in A. D. 1689, between the French fleet which brought James II. to Ireland, and the British fleet, of very inferior force, under admiral Herbert, when, after engaging some hours, the former got into the bay, and the latter returned to England with very small loss. In 1796, it was fixed as the place of rendezvous for the French force designed to invade Ireland, and some ships arrived there the 22d of December, which caufed a great alarm throughout the country, but general Hoche, the commander in chief, with the rest of the fleet, not arriving, they failed the 27th of the same month, without having attempted to land.

BANUB, a town of Egypt, 52 miles W. N.W. of Mansura.

BANVILLE, a town of France, in the department of the Calvados, three leagues N. N.W. of Caen, and 21 E. of Bayeux.

BANY, the name of a river that lies on the south-west coast of Africa. The Dead island is in this river; and the coast runs here calm and west from Cape Fermosa.

BANYAN TREE, in Botany. See Ficus. BANZA,
BANZA, in Geography, a town of Africa, in the kingdom of Congo, now called St. Salvador.

BANZKOW, a town of Germany, in the circle of Lower Saxony, and county of Schwerin.

BAOBAB, in Natural History, the name of an African fruit, described by Prosper Alpinus. It is of the size of a lemon, but it resembles a gourd, and contains several black seeds, whose extremities are a little crooked. Its substance also much resembles that of the gourd; and, when first pulled off, is moi:dy, red, and of a grateful acid taste. The people of Ethiopia, where it is plentiful, are very fond of it, in the searching heats of summer; and the negroes fort add sugar to it, to correct its acidity. It is a great cooler, and very agreeably quenches thirst; and it has some medicinal use, as it is good in contagious and pestilential fevers. The people of Cairo, where the fresh fruit is not to be had, use its pulp dried and powdered; and it is so used at Senegal in pestilential fevers, the dyfentery, and bloody flux. The doe is a drachm, taken either in common water, or in an infusion of the plantain.

The baobab tree, the *Adansonia digitata* (see *Adansonia*), has been very minutely and accurately described by Mr. Adanson, in the Memoirs of the Academy of Sciences at Paris. It is found at Senegal in Africa; and its bulk is so enormous, that it has more the appearance of a forest than of a single tree. Its trunk, which seldom exceeds twelve feet in height, measures between seventy and eighty feet in circumference, and is crowned with a number of branches, remarkable for their thickness and their length, which is from fifty to sixty feet. They mostly shoot out in an horizontal direction, and give to the trunk the appearance of an hemisphere from fifty to seventy feet high, and about a hundred and forty feet in diameter. The bark is an inch thick, of an ash-coloured grey, greyer to the touch, bright, and very smooth; the outside is covered with a varnish, and the inside is green speckled with red; the wood is white and soft; the leaves are oval, pointed at the end, and about five inches long, and two and a half broad; few of these are generally attached to one pedicle. The tree produces flowers much larger than any hitherto known; the calyx of the flower consists of one piece, the lower part of which forms a short tube, which spreadeth into the shape of a saucer, having its edge divided into five equal parts of a triangular figure. These saucers are five in number, of the same length with the calyx. From the same centre, and within the petal, rises a cone, which spreadeth into about seven hundred filaments, each having a small filiginate in form of a kidney at the end of it, the convex part of which opens into two cells, which feed a dust, consisting of small white transparent particles. The pistil rises from the centre of the calyx, and consists of an ovary, a stylus, and several stigmata, in number from ten to fourteen. The ovary becomes a very considerable fruit. The tree flowers in July, and the fruit ripens in October and November. The bark and leaves are dried, and powdered by the negroes of Senegal, and used like pepper and salt. Mr. Adanson used it as a preservative from the epidemic fever of the country, and found it of great benefit in promoting perpiration, and attemperating the excessive heat of the blood. The woody bark of the fruit, and the fruit itself, supply the negroes with an excellent forip, which they prepare by drawing a ley from the ashes, and boiling it with palm-oil that begins to be rancid. The decaying trunks are hollowed out into burying places for perfous most esteemed by the negroes; such as poets, musicians, and buffoons; and their bodies shut up in these trunks become perfectly dry, without rotting, and form a kind of mummies, without the help of embalment. This is the largest tree in Abyssinia. The wild bees perforate the trunk, which is soft and spongy, and lodge their honey in the holes made in it; and this honey is preferred to any other in Abyssinia. It may be propagated by seeds, procured from the country where it naturally grows. These must be sown in pots and plunged in a hot-bed; and when in about six weeks the plants come up, they should be transplanted into separate pots, filled with light sandy earth, and plunged into a fresh hot-bed, finding them till they have taken new roots; after which they should have free air in warm weather, and be sparingly watered. As the plants advance in growth, they must be lifted into larger pots, and kept constantly plunged in the back-bed, and remain in the frame with other tender exotic plants. In three years, many of them rise to the height of six feet, and put out several lateral branches, and their stems are proportionable; but after four or five years' growth, they are almost at a stand, their usual shoots rarely exceeding two or three inches. Some seeds obtained from Mr. Adamson have exceeded here, and many of the plants grow upwards of twelve or fifteen feet high. Martyn's Miller. The African baobab has been sometimes confounded with the American calabash.

BAOL, or Baut, in Geography, a kingdom of Africa, in the country of Senegal, about eighty leagues long and twenty-four wide.

BAOOM, or Apoom, one of the newly discovered islands in the Southern Pacific Ocean. S. lat. 16° 26', W. long. 186° 17'.

BAONS, Les, a town of France, in the department of the Lower Seine, 21 leagues north of Caudebec.

BAPAUME, a town of France, and principal place of a district in the department of the Frares of Calais, containing about 4500 inhabitants; three polls south of Arras, and 19½ north of Paris.

BAPHE, in the Writings of the Ancients, a word used to express that fine red colour, with which they used to illuminate the capital letters in manuscripts, at the beginning of chapters. It is also called, by some, encyclus ferrus; and, by others, escaus and cinnabaris. It was a very elegant colour, and is said to have been prepared of the purple colour taken from the murex, and some other ingredients. It was called encyclus from its ressembling very much the fine bright red used in enamels.

BAPTACA, in Geography, a town of North America, forty-five miles E.E. of Casa Grand.

BAPTEx, in Antiquity, an effeminate voluptuous kind of priests at Athens, belonging to Cotys or Cotytto, the goddess of wantonness; thus called, from their stilted dippings and washings, by way of purification. It seems, they were to be made very clean and pure, that they might walk and defile themselves with the left reserve; for their rites were performed in the night, and consist of lascivious dances.

Eupolis having composed a comedy to expose them, inti- 

ted *Eutroc-, they threw him into the fen, to be revenged; 
and the same fatetics also fight to have befallen Cratinus, an- 
other Athenian poet, who had written a comedy against the 
baptes, under the same title.

Others deduce the denomination haptes, from the practice of dying and painting their bodies, especially their eye- 
brows, and officiating at the service of their deity with the 
parade and demureness of women. Juvenal describes them in this light. *Sat. ii. ver. 91.*

"Talis secretum cohererunt orgia taba

Cecropia foliis baptis laetare Cotytto."
BAPTISM, in Theology; formed from the Greek ἐπάνω or ἐπάνω, "a dip or plunge," a rite or ceremony by which persons are initiated into the professed of the Christian religion; or, it is the appointed mode by which a person assumes the profession of Christianity, or is admitted to a participation of the privileges belonging to the disciples of Christ. It was by this mode that those who believed the gospel were to be separated from unbelievers, and joined to the visible Christian church; and the rite accompanying it, or washing with water, was probably intended to represent the washing away, or renouncing the impurities of some former state, viz. the fins that had been committed, and the vicious habits that had been contracted: and to this purpose it may be observed, that the profession of repentance always accompanied, or was understood to accompany, the profession of faith in Christ. That Our Lord instituted such an ordinance as baptism, is plain from the commission given to the apostles after his resurrection, and recorded in Matt. xxviii. 19, 20. To this rite, there is also an allusion in Mark. xvi. 16. John, iii. 5. Acts, ii. 41, viii. 12, 36—37. xxii. 16. The design of this institution, which was to express faith in Christ on the part of those who are baptized, and to declare their resolution of openly professing his religion, and cultivating real and universal holiness, appears from Rom. vi. 3, 4. I Peter, iii. 21. Ephes. v. 26. and Tit. iii. 5. Some have inferred from Acts, ii. 38. xxii. 16. Tit. ii. 4—7. that God did thereby give to believers a token of the forgiveness of their sins, according to the terms of the gospel covenant; and they have alleged, that there is a foine in which baptism may be called a seal of the covenant of grace.

We find no account of baptism as a distinct religious rite, before the mission of John, the forerunner of Christ, who was called the "Baptist," on account of his being commanded by God to baptize with water all who should hearken to his invitation to repent. Washing, however, accompanied many of the Jewish rites, and, indeed, was required after contracting any kind of uncleanness. Also, soon after the time of our Saviour, we find it to have been the custom of the Jews solemnly to baptize, as well as to circumcise, all their prolesytes. As their writers treat largely of the reasons for this rite, and give no hint of its being a novel institution, it is probable, that this had always been the custom antecedent to the time of Moses, whose account of the right of circumcision, and of the manner of performing it, is by no means circumstantial. Or, baptism, after circumcision, might have come into use gradually from the natural propriety of the thing, and its easy conformity to other Jewish customs. For if no Jew could approach the tabernacle, or temple, after the most trifling uncleanness, without bathing, much less would it be thought proper to admit a prolesyte from a state so impure and unclean as heathenism was conceived to be, without the same mode of purification. On the other hand, it has been alleged, that none of the washings which were practiced among the Jews, bear the least resemblance to Christian baptism, except in the single circumstance of dipping; and this circumstance is a mere accident, and may as well be taken from Pagan rituals, as from the ceremonies of the Jews; or, in other words, it is so vague and far-fetched, that it deferves, in this point of view, no consideration at all. Accordingly, it is maintained, there was no baptism in the world among any people till John, and that the purification of a prolesyte by dipping himself, which is called baptism, was a late tradition, long after the time of John. The antiquity of this practice of prolesyte-baptism among the Jews, has been a subject of considerable debate. It has been strenuously maintained by Lightfoot (Works, vol. ii. p. 120. &c.), Emlyn (Previous Question in Tracts, vol. i. p. 394.), Wall (History of Infant Baptism, Introduct.); and contested by Dr. Benson (On St. Paul's Epit. vol. i. Disc. viii. p. ii.), Gale (Reflections on Wall), Robinson (Hist. of Baptism, p. 37.) &c. Dr. Benson was at first an advocate for the Jewish custom of initiating heathen prolesytes by baptism: but upon further inquiry he relinquished this opinion: alleging that he had not found any instance of one person's washing another by way of consecration, purification, or justification; except that of Mozes' washing Aaron and his sons, when he set them apart to the office of priests, Lev. viii. 6.; and that he cannot find that the Jews do at present practice any such thing as that of baptizing the prolesytes that go over to them, though they are said to make them wash themselves. He then asks, where is any intimation of such a practice among the Jews, before the coming of our Lord? If any one, he fays, could produce any clear testimony of that kind from the Old Testament, the Apocryph, Jofephus, or Philo, that would be of great moment. He adds, in former times, prolesytes coming over from heathenism to the Jewish religion, used to wash themselves, which is a very different thing from baptism, or one person's being washed by another. The genuine Targums, fay Gill and Gale, written about the close of the first century, and the Midrash, written about the middle of the second century, say nothing on this subject. The Christian writers, called Fathers, speak of Jewish prolesytes, and washings, and purifications from ceremonial uncleannesses; but nothing of admitting prolesytes into the community by baptism. The baptism of prolesytes, it is said, came to light through the later Rabbis, and is chiefly to be found in the writings of Maimonides, who flourished in the eleventh or twelfth century. In the Old Testament there are many precedents of admitting prolesytes into the Jewish church, as Rahab, Ruth, and others; but not one word is said of their being baptized. Among the laws of admission given by Moses, Exod. xii. 48. 49. this is not mentioned. Dr. John Owen (Theologoumena) considers the opinion, that Christian baptism came from the Jews, as delictate of all probability. On the other hand, Mr. Wall has made it highly probable, to say the least, from many testimonies of the Jewish writers, who without one dissenting voice allow the fact, that the practice of Jewish baptism obtained before and at, as well as after, our Saviour's time. There is also a strong intimation, even in the gospel itself, of such a known practice among the Jews in the time of John the Baptist. John i. 25. The testimonies of the Jewish writers are of the greater weight, because the practice, reported by them to have been of so ancient a date, did still remain among them; for if it had not been of that antiquity to which it pretends, viz. before the time of Christ, it is not likely that it would ever have become a custom among the Jews afterwards. Would they begin to prolesyte persons to their religion by baptism in imitation of the disciples of Jesus of Nazareth, whom they held accursed? And yet if this prolesyte baptism were adopted by the Jews since the time of Christ, it must have been a mere innovation in imitation of Christians, which is not very likely. See on this subject Maimon. in Mitch. tom. ii. Nure bia. c. 1. and c. 13. Selden de Juris Naturali, &c. l. ii. c. 2. Altingius de Profetis. diff. 7. § 46. Vir-
tring. Archifynag. c. 18. Cancellari Inflit. I. r. c. 2. s. 7. Aifworth on Gen. xxii. 12. Lightfoot ad Matt. iii. 6. The question of the Pharisees to John the Baptist, "Why baptizest thou?" evidently favours the supposition, that such a custom existed; and our Saviour's question to Nicodemus, "Art thou a master, or teacher, in Israel, and knowest not these things?" is a manifest allusion to the custom of initiating profelytes by water-washing or baptizing, who after being to washed or baptized, were elceemed regenerated or born again; and therefore to a ruler in Israel, who could not be unacquainted with these things, our Saviour's discourse ought not to have appeared to unintelligible. Origen, in his Comm. on Epiph. to the Romans, c. 6. says, that Chrift was baptized by John, not with that baptism which is in Chrift, but with that which is in the law; implying, that under the law there was such a custom of baptizing. See also Arrian in Epitct. l. i. c. 9.

In the primitive times, this ceremony was performed by immersion, as it is to this day in the oriental church; according to the original signification of the word. However, it is not improbable, that when great numbers were baptized at the same time, the water was supplied by sprinkling, which was a practice sufficiently familiar to the Jews. The practice of the western churches is, to sprinkle the water on the head or face of the person to be baptized, except in the church of Milan, in whose ritual, it is ordered, that the head of the infant be plunged three times into the water; the minister at the same time pronouncing the words "I baptize thee in the name of the Father, the Son, and the Holy Ghost;" importing that by this ceremony the person baptized is received among the professors of that religion, which God, the Father of all, revealed to mankind by the ministry of his Son, and confirmed by the miracles of his Spirit.

It is observable that the baptismal form, above cited from St. Matthew, never occurs in the same words, either in the book of the Acts, or in any of the Epistles. But persons are required to be baptized in the name of Chrift, or said to have been baptized into Chrift; that is, they made a profession of faith in Jesus, as the Chrift, and acknowledged their obligations to him, by being baptized. Acts, i. 38. viii. 16. 35. 38. Rom. vi. 3. Gal. iii. 27. But though the form which is in St. Matthew never appears elsewhere, the thing intended thereby is always implied. Nor could any be brought to make a profession of faith in Jesus, as the Chrift, but upon the supposition that he had taught in the name and with the authority of God the Father, and had proved his commission by miraculous attestations which could not be denied nor gainailed. It is observed that the baptism of Jesus was, like that of John, a reception to his instruction, or information in his doctrine, or concerning him; as appears from his own injunction, Matt. xviii. 19, 20; and also from that clause which has been considered as the form of Christian baptism; which ought to have been rendered not 

Hence it would follow, that "to be baptized unto, or upon, Christ," was a public solemn profession of faith in him. However, the baptism of the Ethiopian minister by Philip, in a fene to pray for, and before to two, if indeed before any witnesses, seems to be inconsistent with the notion that baptism was a solemn public profession of faith in Christ, and the requistion of a previous verbal declaration of such faith totally overturns it. See Cappe's Dissertation on Baptism, in Crit. Rem. vol. ii. p. 102.

Baptism is not to be repeated, since it is a right of initiation into Chrift's church. However, these persons might be baptized in the name of Jesus, as the Messiah already come, who had before been baptized by John and his disciples into the general expectation of a Messiah shortly to be revealed. Compare Acts, xix. 5. The Chriftians in Abyflinia repeat their baptism annually, on the festival of Epiphany. The naming of the baptized person is by no means any part of this institution; and when it is used, is to be considered as an address to the person, calling him by his name, rather than as the manner of giving a name to him: though it is probable, that the custom of naming a child at baptism might arise from the practice of the Jews at their circumcision. Luke, i. 59—63. n. 21.

A triple immersion was at an early period used, and continued for a long time: this was to signify either the three days that our Saviour lay in the grave, or the three persons in the Trinity. But it was afterwards laid aside, because the Arians used it; it was then thought proper to plunge but once. (See Immersion.) Some are of opinion that sprinkling in baptism was begun in cold countries. It was introduced into England about the beginning of the ninth century. At the council of Celcynth, in 816, it was ordered, that the priest should not only sprinkle the holy water upon the head of the infant, but likewise pour it in the bason. Some have referred the introduction of sprinkling in the church of Rome to a canon of pope Stephen III., who, during his residence in France, in 754, was consulted by some monks of Crely in Britannia with regard to several questions; one of which is said to have given occasion to the first authentic law for administering baptism by pouring, which in time was interpreted to signify sprinkling. The question proposed was, whether in case of necessity occasioned by illness of an infant, it was lawful to baptize by pouring water out of the hand or a cup on the head of the infant? To which Stephen replied, that if such a baptism were performed in such a case of necessity, in the name of the holy Trinity, it should be held valid. This says the learned James Bafine (Monum. vol. i. prep. c. v. §. 4. de Canone Steph. III. Pape.), is accounted the first law for sprinkling, but it doth not forbid dippling; allowing it only in case of imminent danger. He adds, that the authenticity of it is denied by some Catholics; that many laws were made after this time in Germany, France, and England, to compel dippling, and without any provision for cases of necessity; and therefore that this law did not alter the mode of dipping in public baptisms; and that it was not till 557 years after, that the legislature, in a council at Ravenna, in the year 1211, declared dipping or sprinkling indifferent. It has been alleged, that this answer of Stephen is the true origin of private baptism and of sprinkling. The introduction of sprinkling instead of dipping, in ordinary cases, into this island, is said to have been effected by such English, or more strictly speaking Scots exiles, as were disciples of Calvin at Geneva, during the Marian persecution; and it is added, that the Scots Calvinists, who first introduced sprinkling in ordinary baptism into the northern parts of the isle, were the importers of it into the southern. In the reina
regius of king Edward, the established church practiced in ordinary cases true immersion; and pouring or sprinkling was allowed, only in cases of danger, in private. It is further argued by those who maintain that in the primitive church there is no mention of baptizing by pouring, that the administration of baptism by sprinkling was first invented in Africa in the third century, in favour of theie, or bedridden people; but that even African Catholics, the least enlightened and the most depraved of all Catholics, derided it, and reputed it no baptism. See Jo. Andreae. Bofil de Cliniciis exercet. Hill. Jene, cited by Robison in his "History of Baptism," p. 449. In the liturgy of the English church at Frankfort, king Edward's service book was used, and baptism was administered by true immersion. In the Scots church at Geneva, the minister was directed to take water in his hand, and lay it upon the child's forehead, which was called pouring. About 100 years after, in the assembly of divines, Dr. Lighthart caused dipping to be excluded, and sprinkling declared insufficient. In the Eastern and Greek churches, dipping is said to have been the invariable mode of administering baptism from the first introduction of it to this day. See Dr. King's Rites of the Greek church.

There are many ceremonies delivered by ecclesiastical writers, as used in baptism, which were introduced after the age of Justin Martyr, but were not now disparaged, as the giving milk and honey and of the baptized, in the East; wine and milk in the West, &c. They also added anointing and the imposition of hands. Tertullian is the first who mentions the signing with the sign of the cross, but only as used in private, and not in public worship; and he particularly describes the custom of baptizing without mentioning it. Indeed, it does not appear to have been used in baptism till the latter end of the fourth or fifth century; at which time great virtue was ascribed to it. Laetanius, who lived in the beginning of the fourth century, says (Infl. i. iv. c. 27. p. 439.), the devil cannot approach those who have the heavenly mark of the cross upon them, as an impregnable fortress to defend them; but he does not say it was used in baptism. After the council of Nice, Christians added to baptism the ceremonies of exorcism and adjurations, to make evil spirits depart from the persons to be baptized. They made several signings with the cross, they used to light candles, they gave salt to the baptized person to taste, and the priest touched his mouth and ears with spittle, and also blew and spat upon his face. At that time also baptized persons wore white garments till the Sunday following. They had also various other ceremonies; some of which are now abolished, though others of them remain in the church of Rome to this day.

The Quakers (see Quakers) assert, that water baptism was never intended to continue in the church of Christ any longer than while Jewish prejudices made such an external ceremony necessary; which they argue from that passage, in which one baptism is spoken of as necessary to Christians; Eph. iv. 5, which, as they say, must be a baptism of the spirit. But from comparing the texts that relate to this institution, which have been already cited, it will plainly appear that water baptism was instituted by Christ in more general terms than will agree with this explication. That it was administered to all the Gentile converts, and not confined to the Jews, appears from Matt. xxviii. 19, 20, compared with Acts. x. 47; and that the baptism of the spirit did not supersede water baptism, appears to have been the judgment of Peter and of those that were with him; so that the one baptism spoken of seems to have been that of water; the communication of the Holy Spirit being only called baptism in a figurative sense. As for any objection which could be drawn from 1 Cor. i. 17, it is sufficiently answered by the preceding verses, and all the numerous texts, in which, in epistles written long after this, the apostle speaks of all Christians as baptized; and argues from the obligation of baptism, in such a manner as we can never imagine he would have done, if he had apprehended it to have been the will of God that it should be discontinued in the church. Compare Rom. vi. 3, &c. Col. ii. 12. Gal. iii. 27.

Baptism was also wholly rejected by the Valentinians, Manichees, Paulicians, and many other sects.

Several of the Socinians have maintained, that baptism was only to be used by those who are converted to Christianity from a different profession; and that though the children of such profelytes were to be baptized with their parents, all who declared from them were to be considered as baptized in them; and they urge the practice of profelytic baptism among the Jews in support of this opinion. (See Emlyn's Previous Quelion, ubi supra.) However, it has been alleged in reply, that the antiquity of this practice of profelytic baptism among the Jews has been doubted, and even disallowed by many; and if it be admitted, all the rules and circumstances relating to it might not be known even to the apostles themselves; and it is also probable, that some of the rules of profelyte baptism did not prevail among them so early, particularly that which supposed all natural relations were annulled by it. Besides, although it be acknowledged that no influence occurs in the earhest primitive antiquity, in which the baptism of any child of Christian parents, whether infant or adult, is expressly mentioned; yet it is certain that Christians in general have always been spoken of by the most ancient fathers as baptized persons; and the apostles, when writing to Christian churches planted many years before the date of their respective epistles, argue with the members of them from the obligation which their baptism brought upon them, in such a manner as would lead us to conclude, that they were baptized in their own persons; and it is also certain, that as far as our knowledge of primitive antiquity reaches, no unbaptized person received the Lord's supper, which, nevertheless, was an ordinance none will deny that the descendants of Christians participated. It is added, that on this supposition, genealogies would be of great importance in religion, contrary to what St. Paul intimates; nor can it be reasonably thought that our right to Christian communion should rest on a fact, the evidence of which might sometimes be so obscure, as the baptism of some remote ancestor. See Gale's Serm. vol. ii. No 9. Benson on 2 Tim. p. 134—136. Whitf. Life, vol. i. p. 367, 368.

Theological authors distinguish three kinds of baptism: 1. Water baptism, which is that above-mentioned. 2. Baptism of fire, which is the perfect love of God, joined with an earnest desire to be baptized; called also the baptism of the Holy Ghost; on occasion this may supply the place of water baptism. 3. Baptism of blood, which is the martyrdom of a catechumen.

Baptism, in the primitive times, was only administered at Easter and Whituntide, except in cases of necessity. Adult persons were prepared for baptism by abstinence, prayer, and other pious exercises. It was to answer for them, says Moffom (Held. Hist. vol. i. p. 211.), that sponors, or godfathers, were first instituted in the second century, though they were afterwards admitted also in the baptism of infants. This, according to M. Diire, was not done till the fourth century. Wall (Held. Hist. Bapt. vol. i. p. 49.) refers the origin of sponors, or godfathers, on the authority
authority of Tertullian, to the commencement of the second century; who were used in the baptism of infants that could not answer for themselves. (See Godfathers.) The catechumens were not forward in coming to baptism: St. Ambrose was not baptized before he was elected bishop of Milan; and some of the fathers not till the time of their death. Some deferred it out of a tender confidence; and others out of too much attachment to the world; it being the prevailing opinion of the primitive times, that baptism, whenever conferred, washed away all antecedent stains and sins. Accordingly they deferred this sanctifying rite as long as possible, even till they apprehended they were at the point of death. Cases of this kind occur at the beginning of the third century. Constanine the Great was not baptized till he was at the last gasp, and in this he was followed by his son Constanctus; and two of his other sons, Constanine and Constans, were killed before they were baptized. Divers of the fathers rallied this supercilious delicacy to such a degree, that they introduced a different extreme; the ridiculous zeal of some people carrying them to baptize even the dead, by proxy. Epiphanius, Chrysostom, and Theodoret, observe, that this custom prevailed in some places in their time. See Bagenal Hilt. des Églises Réformées, vol. i. p. 137.

The opinion of the necessity of baptism in order to salvation, is grounded on these two sayings of our Saviour: “He that believeth, and is baptized, shall be saved;” and, “Except a man be born of water, and of the spirit, he cannot enter into the kingdom of God.” Mark xvi. 16.

John iii. 5. In the age immediately following that of the apostles, we find that baptism and regeneration were used as synonymous terms; and whereas, originally, the pardon of fin was supposed to be the consequence of that reformation of life which was only promised at baptism, it was now imagined that there was something in the rite itself, to which that grace was annexed; and in general it seems to have been imagined that this sanctifying virtue was in the water, and in no other part of the ordinance as administered by the priest. Tertullian says, that the Holy Spirit is always given in baptism; and he says, that the spirit of God depends upon the water of baptism like a dove. Chrysostom affirms, that the water ceases to be what it was before, and is not fit for drinking, but is proper for sanctifying; and that the Christian baptism is superior to that of John, as his was the baptism of repentance, but had not the power of forgiving fin. Aulín says, that it touches the body, and purifies the heart. Bagnase (ubi supra), p. 138. And it appears by a passage in Aulín, that the African Christians usually called baptism salvation, and the eucharist life, preferring the former to the latter. Wickliff thought baptism to be necessary for salvation. “The priest,” he says, “in baptism administers only the token or sign, but God, who is the priest and bishop of our souls, administers the spiritual grace.” Gilpin’s Life of Wickl. p. 64. It is also the language of the public forms of the church of England, that baptism is necessary to salvation, and that by baptism an infant is regenerated, becomes a child of God by adoption, and is incorporated into God’s holy church. Similar to this is the doctrine of the church of Scotland; for, in their confession of faith, baptism is said to be a sign and seal of the covenant of grace, of persons ingrafting into Christ, of regeneration, of remission of sins, &c. As to the necessity of baptism, we may observe, however, that, though some seem to have laid too great stress upon it, as if it were indispensably necessary in order to salvation; it must be allowed, that for any person to omit baptism, when he acknowledges it to be an institution of Christ, and that it is the will of Christ that he should submit to it, is an act of disobedience to his authority, which is inconformity with true faith.

Mr. Dodwell maintains that the ordinance of baptism, if administered by persons duly ordained, conveys an immortalizing spirit; whereas persons dying unbaptized are not immortal. Mr. Halket also (Notes on Scripture, vol. iii. p. 299—311), though he does not assert it in express terms, seems to intimate something very like it, when he says, that circumcision was that which gave the infant a right to immortality; and that baptism in this respect comes in the room of circumcision; and yet that no infants are miserable in a future state.
