1819.
BATTERY POINT, in Geography, lies on the north or starboard shore of the channel of Cork, in Ireland.

Battery, formed of battery, to beat or strike, in the Military Art, denotes an eminence called up, on which to plant artillery, that it may play to better advantage. It consists of an epaulement, parapet, or breast-work, about eight feet high, and eighteen or twenty thick. The platform of a battery is laid with planks, that the wheels of the carriages may not sink; and it is made sloping towards the parapet, that the guns may not recoil much, and that they may be more easily drawn back. See Plate II. Fortis. fg. 21, c. 2. and Plate VII. fg. 38.

In all batteries, the open spaces left to put the muzzles of the great guns out at, are called embrasures; and the distances between the embrasures, merlons. The guns are generally from twelve to sixteen feet distant from one another, that the parapet may be strong, and the gunners may have room to work.

There are also batteries of mortars, the same with those of cannon, except that they have no embrasures; the shells being fired over the parapet, commonly at an angle of 45° elevation: and the slope of the breast work is made inwards, contrary to that of other parapets; having their platforms about six feet square and eight feet thick.

The battery of a camp is usually surrounded with a trench and pallisades at the bottom, as also with a parapet on the top, having as many holes as there are pieces of artillery, and two redoubts on the wings, or certain places of arms, capable of covering the troops which are appointed for their defence.

All field batteries consist of four parts, viz. the ditch, the parapet, the platform, and the magazine; which see respectively.

The Sieur Remy, in his Memoirs of Artillery, has given a table for the ready finding of all the requisites for the construction of temporary batteries, and for their daily service; the pieces being twenty-four pounders; and although these batteries are calculated only for sieges, and are of the coffer-kind, yet from this table may be derived such notions as will greatly help young artificers on other occasions.

It is also proper to mention the number of fascines and pickets that is usually expected every day from the labour of each man employed in that service.

Of fascines 5 or 6 feet long, and 5 or 6 inches thick, bound with two wyth bands each, one man will make 16 or 18 in a day, with two pickets to each.

Of fascines 8 or 9 feet long by 8 or 9 inches thick, and two pickets to each, one man usually makes 10 or 12 in a day.

Of fascines 12 feet long by 9 inches thick, with three pickets to each, 8 or 12 are usually expected from the day's work of one man.

The days here underfoot are such in which the men may work about twelve hours.

In the following table C. stands for hundred.
### A Table for the Construction of Batteries

| Number of 24 pounds in battery | Length of the parapet in yards | Number of workmen to construct the battery: viz. | Number of workers' tools used at the battery, viz. | Height of the platform, feet | Plate pieces, matchets, &c. | Fustage-makers, each a bill and hatchets | Fustage-makers, each 8 or 9 inches | Fustage-makers, each 12 feet by 8 or 9 inches | Fustage-makers, each 5 or 6 inches, made by the enemy | Pickets from 3 to 6 feet long, and about 4 inches thick | Mallets to drive the pickets | Hand-hills, 2 for each embrasures, besides hatchets, &c. | Planks for the platforms, 2 or 3/4 inches thick | Gunners to serve in the battery | Soldiers to assist the gunners | Powder for 100 rounds, at 12 lb. each per day | Shot for 24 pounds for 100 rounds |

When batteries are erected at leisure, and are designed to stand for some years, they are built of stone, or brick, or good loamy earth, as the materials may be most easily procured.

To construct the profile of a battery, let its ground line be AB (Plate II. Fortis. Fig. 23. No 2.), BD that of the parapet, the inner slope of which is formed by making DA = 4/3 foot, and the perpendicular, a HI = 6 or 7 feet; the crown of the parapet HI is formed by making HK a foot or two lower than a HI; and the front of the battery IB is found by making KB = 3/4 of HI when of earth, or 3/4 of HK when of masonry. If DC be made = 2 or 3 feet, we shall have C the fill of the embraurse, the floor of which CG is to dip a foot or two below the level line CF. The platform DE is 18 or 20 feet, the tail E rising about 6 inches above the level line AB; the lower double line represents the sleeper laid lengthwise, and the upper double line shaded with the lines across shews the ends of the planks laid on the sleepers. A gun on its carriage, with the wheels against the knocker at D, is annexed to the figure, for the purpose of aiding the apprehension. For the construction of the embraurses, merlons, ramps, &c. see the articles respectively.

Battery, Open, is nothing more than a number of cannon, generally field-pieces, or such as carry a ball not exceeding nine pounds weight, ranged in a line or row a-breast of one another, on some small natural elevation of the ground, or an artificial bank about a yard or two high. These cannon are ranged at the distance of about 15 or 16 feet from one another; their shot and loading utensils lying by their side, and the powder lodged in a hole at some distance behind the battery.

Battery, Covered, is, when the cannon and gunners are covered by a bank made of brush-wood, faggots, and earth; about eighteen or twenty feet thick, and seven or eight feet high. The cannon used in such batteries are generally from nine to eighteen pounders; sometimes twenty-four pounders are used in them. See Fascine Battery.

Battery, sunk or buried, is that whose platform is sunk or let down into the ground, with trenches cut into the earth against the muzzles of the guns, to serve for embrasures.

This fort, which the French call batterie en terre, and ruimante, is generally used upon the first making approaches, to beat down the parapet of the place.

Batteries, Crois, are two batteries at a considerable distance from each other, which play athwart one another at the same time, and upon the same point, forming right angles; so that they thus combine and produce a greater effect;
芭

Battery in Earle, Bracket, or Open Battery, is a name given to a battery, when the face of part of it is so raised that the guns placed on it have an advantageous command over some part of the neighbourhood, and when the guns thus raised fire over the crown of the parapet without any embrasure. These barbets may be made either in a curtin, or at the forward angle of a flanker. They should be always 2½ or 3 feet lower than the crown of the parapet, and about 8 or 9 yards broad at the top, with a proper slope to the base, of a length suitable to the number of guns to be mounted on them, allowing about five or six yards for each, and at each end have a proper ramp for ascending them. For the further illustration of their nature and construction, let PQRVX (Plate III. Fortis, fig. 25.) be a common bank of an earl, the parapet of which is RSTV; the lower base RS being about 6 or 7 feet higher than QR; then the bank mnOR, raised so high that the cannon may fire over the crown of the parapet ST, is the barbet, the height of which np is about 3 or 4 feet. On the top of the barbet is raised a platform, as in other batteries. Let the figures 26 and 27 represent part of the plan of a line, and on: of its flankers, or of a battery constructed in such a form; where As is the length of the barbet, or raised battery, suited to the number of guns to be used, which are to be drawn up the ramps placed at the ends; the breadth being about 8 or 9 feet, and the length As about 7 or 8 yards.

Battery, Cazalier. See Cavallerie.

Battery d'Escalier, is one which sweeps the whole length of a straight line, a street, &c.

Battery en Chargé, is that which plays obliquely.

Battery de Revir, or Murdering Battery, is one that plays on the back of any place; and being placed on an eminence, fires into it.

Battery joint, or par camardes, or camarata, is when several guns play at the same time upon one place.

Battery en Rouge, is that used to dismount the enemy's cannon.

Battery à Ricochet, is adapted to the method of ricochet firing, first invented and practised by Vauban, at the siege of Ath in 1692. The guns are loaded with small charges, and are elevated, so as to fire over the parapet; and the shot is hereby made to roll along the opposite rampart. This method of firing with guns has since been applied to mortars and howitzers with great success.

Battery Coiffe, is that where the tide of the wall and merlons only are formed of fascines, and all the cavities or included spaces filled with earth.

To construct a battery of this kind, mark out with a line the limits of the parapet eighteen or twenty feet thick; and three or four feet before the parapet, mark out with lines or stakes the limits of the ditch; ten or twelve feet broad, or even more, if earth is wanted; allowing eight yards in length for one gun, and six yards more for every other gun. On the outlines of the parapet cut a trench five or six inches wide and deep, and there lay a row of fascines, the ends being jammed one into the other; and let them be flaked down. Lay on them another row, so that the joinings of these may not be directly over the joinings of the lower one, and let all the knots of the bands be turned inwards; flake these down; and on them lay in like manner a third and fourth row, &c. until the height be about three feet. The same kind of work being done at the ends, and for the epaulement if wanted, the coiffe for the wall will be finished. Then let the men be disposed along the place intended for the ditch, and with proper tools break the ground and throw it into the coiffe; where, as the earth is thrown in, other men are to spread it, and flamp it down with rammers; and thus the coiffe is to be finished. When the wall is finished, let the embrasures be flaked out (see MERLIN), and a coiffe formed in like manner for each merlon, which is also to be filled with earth, and rammed down. Proceed to complete it in the same manner with the FASCINE Battery.

Battery, Passe. See FASCINE Battery.

Battery, Gabion. See Gabion.

Battery, in Law, denotes an act that tends to the breach of the peace of the realm, by unlawfully flirking, beating, or offering other violence to another person.

Battery is frequently confounded with assault, though in law they are different offences; because, in the trespas for assault and battery, one may be found guilty of the assault, yet not convicted of the battery; there may therefore be assault without battery; but battery always implies an assault. The leaft touching of another's person wilfully, or in anger, is a battery; for the law cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest degree of it; every man's person being faced, and no other having a right to meddle with it in any the slightest manner. Upon a similar principle the Cornelian law, "de injuriis," prohibited "the pulling," as well as "verberation," distinguishing verberation accompanied with pain from pulvation without any. However, battery is in some cases justifiable or lawful; as where one hath authority, a parent or master, gives moderate correction to his child, his scholar, or his apprentice. Thus also on the principle of self-defence, if one strikes me first, or even only assails me, I may strike in my own defence, and if for it, may plead "for assault demine," or that it was the plaintiff's own original assault that occasioned it. So likewise in defence of my goods or possession, if a man endeavours to deprive me of them, I may justify laying hands upon him to prevent him; and if he perfilt with violence, I may proceed to beat him away. 1 Finch. L. 203. Thus too, in the exercise of an office, as that of churchwarden or beadle, a man may lay hands upon another to turn him out of church, and prevent his disturbing the congregation. 1 Sid. 301. And if for this or the like battery, he may set forth the whole case, and plead that he laid hands upon him gently, "mollius manus imposuit," for this purpose. On account of these causes of justification, battery is defined to be the "unlawful" beating of another; for which the remedy is, as for assault, by action of "trespass vi et armis," in which the jury will give adequate damages. Arrogant battery is subject to trial by inspection in pursuance of the order of the court; in which case the battery must be alleged so certainly in the declaration, that it may appear to be the same with the battery inspected. In the case of a person's beating the servant of another, before the remedy of an action of battery or imprisonment, which the servant himself may have against the aggressor, the matter also, as a recompence for his immediate loss, may maintain an action of trespass, "vi et armis," in which he must allege and prove the special damage he has sustained by the beating of his servant, "per quod servium amittit," and then the jury will make him a proportionable pecuniary satisfaction. A similar practice obtained among the Athenians, with whom matters were entitled to an action against such as beat or ill-treated their servants. A person guilty of battery against a clergyman, is liable to three kinds of prosecution for the same offence; an indictment for the breach of the king's peace, a civil action for damages, and a suit in the ecclesiastical court; first, "pro correctione et salute anime" by exiguing penance, and then...
again for such sum of money as shall be agreed on for taking off the penance enjoined; it being usual in these courts to exchange their spiritual censures for a round compensation in money (2 Roll. Rep. 384); perhaps, says Judge Blackstone, because poverty is generally esteemed by the moralists the best medicine "pro salute animai." Bl. Com. vol. iii. and vol. iv.

Battery is sometimes used in speaking of metalline utensils. In this sense, battery-works include pots, saucepans, kettles, and the like utensils, which, though cast at first, are to be afterwards hammered or beaten into form.

Some make battery for the kitchen, "batterie de cuisine," comprehend all utensils for the service of the kitchen, whether of iron, brass, copper, or other matters. Others take the term in a narrower sense, and restrain it to utensils of brass or copper.

A society for the mineral and battery work of England was incorporated by queen Elizabeth.

Battery, in Electricity, is a combination of coated surfaces of glass, so connected together, that they may be charged at once, and discharged by a common conductor. Mr. Graham, a German electrician, was the first who contrived to increase the shock, by charging several phials at the same time. Dr. Franklin, after he had analyzed the Leyden phial, and found that it held at one surface the electric fire which it received at the other, constructed a battery, confiding of eleven panes of large flat-glass, coated on each side, and connected in such a manner that the whole might be charged together, and with the same labour as one single pane; and by bringing all the giving sides into contact with one wire, and all the receiving sides with another, he contrived to unite the force of all the plates, and to discharge them at once. A more complete battery is described by Dr. Priestley, of which he says, that after long use he sees no reason for wishing the least alteration in any part of it. This battery (see Plate 1. Electricity, fig. 1.) consists of 64 jars, each ten inches long, and 21 inches in diameter, coated within 1½ inch of the top; and contains in the whole 32 square feet. The wire of each jar has a piece of very small wire twisted about the lower end of it, to touch the inside coating in several places; and it is put through a pretty large piece of cork, within the jar, to prevent any part of it from touching the side, which would tend to promote a spontaneous discharge. Each wire is turned round, so as to make a hole at the upper end; and through these holes a pretty thick brass rod with knobs pales, one rod serving for one row of the jars. The communication between these rods is made by laying over them all a thick chain. When part only of the battery is used, the chain is laid over as many rods as will furnish the required number of rows of jars. The bottom of the box, in which the jars stand, is covered with a plate of tin, and a bent wire touching the plate pales through the box, and appears on the outside. To this wire any conductor designed to communicate with the outside of the battery is fastened, as the small wire in the figure, and the discharge is made by bringing the brass knob to any of the knobs of the battery. When a very great force is required, the quantity of coated surface may be increased, or two or more batteries may be used. Franklin's Exp. and Ob. ed. 1769. p. 28. Priestley's Alizk. Sc. of Electricity, ed. 1775. vol. ii. p. 99.

However complete the battery above described appeared to be at the time of its construction, later electricians have discovered many imperfections to which it was subject; of which the principal are those that result from the form and size of the jars, the substance of the glass, the height of the coating, and the connections within the battery. In consequence of these imperfections in its structure and convenience, it is prevented from receiving more than about half the charge which it ought to receive in proportion to the quantity of its coated surface.

The most perfect batteries of modern construction, since those of Dr. Priestley, have been made in Holland for Tycri's museum at Haarlem, by Mr. Cutbush, of Poland, London, then residing at Amsterdam. Of these batteries there are two, differing in their magnitude and mode of construction, but allowed to be equally perfect. The first was completed in the year 1784, and is composed of 153 jars in 9 boxes, each containing 15, which may be used separately or combined, as the nature of the experiment requires. Each box is a separate battery of itself; and the description of one box with a view of the figure, will be sufficient for explaining its construction and use. In Plate 1. Electricity, fig. 2. is exhibited a perspective view of Teyler's first battery, with its parts arranged in proper order for receiving a charge from the electrical machine. Each box, as we have already observed, contains 15 jars; each jar is 11 inch high, and 6 inches in diameter, contracted at the mouth to 4 inches, and coated fo as to contain about 140 square inches; and thus the whole battery will contain about 132 square feet of coated surface. Each box is divided into 15 partitions, 5 of which are in the length and 3 in the breadth; the height of the sides of the box being somewhat lower than the coating of the jars, as are also the partitions in which they stand. The lid of the box is made without hinges, for the convenience of taking it from the box, that it may be removed while experiments are performed. It is taken off by lifting it upwards. The outside coatings of the jars are connected by means of crook wires passing under the bottom of each jar; and those on the inside by means of a brass frame, bearing 15 brass balls, fixed upon the frame above the centre of each jar. All these balls, excepting the four at the corners, have wires ferred to them and hanging downwards into the inside of each jar; but the wires of the four corner jars are ferred to a foot, which is cemented to the bottom of each in the inside. Upon these wires the whole frame rests, and is kept in its proper position. The four corner balls have holes, which receive the ends of the wires, and terminate at a proper height from the jars. By this contrivance the inside connecting frame may at any time be readily removed; and as this part of the machine is important, the construction of the said frame is shewn separately from the battery in fig. 3. It is according to the above construction that Mr. Cuthbertson forms his present batteries, excepting that he has increased the size of the jars, so as to make one battery contain about 17 square feet; and he engages to prove by experiment, that the batteries of his construction are far superior to any others. Teyler's second grand battery was exhibited by Mr. Cuthbertson in 1789. This is the largest and most complete battery that was ever made. The whole battery, standing in proper order for receiving a charge, is exhibited in fig. 4. It consists of 150 jars of the same shape with that of those already described, only that they are so enlarged in size, that each of them contains 51 square feet of coated surface, instead of 140 inches, and the whole battery contains 550 square feet of coating; and for convenience, it is put into four separate cafes, each containing 25 jars in the form of a square, 5 on each side. The boxes are lined with lead on the inside for forming the outside communication; each jar has a perpendicular flange running upon its bottom, and supported from falling sideways by three stays on the inside. Upon the top is screwed a three inch brass globe, from which proceeds a brass tube about one inch in diameter.
B A T

B A T
diameter, to a large brass globe, supported by the middle jar at a proper height, so as to keep the inside communication properly arranged. A view of the figure will shew how the four are combined, so as to charge and discharge all the 100 jars at once.

Lieutenant colonel Haldane proposes the following method for measuring the force of an electrical battery, during the time of its being charged.

Let the battery be inflated, and at a small distance from it place an uninflated electrical jar, and near the jar, one of Mr. Cuthbertson's electrometers. The electrometer being adjusted according to the degree of force which is intended to be employed as a measure of force to be communicated to the battery, connect the electrometer with the jar; make a metallic communication between the interior side of the jar and the exterior side of the battery, and connect the interior side of the battery with the conductor of an electrical machine: then, by the operation of the electrical machine, the battery receives a quantity of the electrical fluid, and becomes charged. The fluid, which departs from the exterior side of the battery, is received by the electrical jar, which also becomes charged; but this jar, being connected with the electrometer, expels as soon as it acquires a force sufficient to put the electrometer into motion. The quantity of the electrical fluid which is received by this jar, between each of the explosions, is a measure of the quantity of the fluid in the battery; and the number of explosions or discharges of this jar shews the number of measures which the battery contains, and consequently the force which it is capable of exerting when discharged.

For the author's demonstration of this method, and the illustration of it by appropriate experiments, we must refer to Nichollos' Journal, vol. i. p. 156, &c.

B A T T E R Y, Galvanic; the name usually given to an apparatus for accumulating the electricity which is produced by the mutual agencies of certain metallic and carbonaceous substances, and peculiar fluids.

The first instrument of this kind was invented by the celebrated Volta of Pavia, in 1800, and various forms of it have been since adopted by different philosophers.

The original battery, or the electrical pile, is composed of plates of zinc, copper, and pieces of pasteboard, of the fire of the plates, moistened in a solution of salt in water; and arranged in the order of zinc, copper, pasteboard, zinc, copper, pasteboard, &c., till a series sufficiently numerous is formed. On account of the expense of silver, copper has been lately generally substituted for it, with but little diminution of effect; and solutions of nitrate of ammonia, of nitric acid, and of muriatic acid, have been employed instead of the solution of common salt, with very great advantage as to the increase of the power of the combination. In general any two metallic substances which are perfect conductors of electricity, may be used, provided the interposed fluid is capable of oxidizing at least one of them.

The powers of galvanic batteries appear to be very much connected with the chemical changes going on in them, and hence plates of one metal may be made to supply the place of the two metals provided their different sides be exposed to different chemically acting fluids, as has been shown by the experiments of Mr. Davy. Thus copper, silver, and lead, all form efficient combinations when they are arranged with two different sides of pasteboard, one moistened with diluted nitric acid, and the other with solution of hydroxylsulphate of potash; the order being metal, pasteboard moistened with acid, pasteboard moistened with hydroxylsulphate, &c. In such a case, if the battery is required to be of considerable permanency as to its effects, it is necessary to separate the pasteboard moistened in the chemical agents from each other by a third or of pasteboards, moistened in common water.

In instances when piles are erected perpendicularly either with two metals or with one metal, in consequence of the oxidation and the loss of moisture from the exterior and evaporation, the electrical action usually ceases after a few days; and in order to renew it, a second construction of the piles becomes necessary. Several methods have been propoed for making improvements more permanent in their operation than the pile, and more safely rendered active; but the most ingenious contrivance appears to be that of the trough, discovered by Mr. Cruickshank. It consists of a box of baked wood, in which plates of copper and zinc, or of silver and zinc, folded together at their edges, are cemented in such a manner as to leave a number of water-tight cells, corresponding to the number of the series; the arrangement becomes active when the cells are filled with the proper saline fluids; and it may at any time be easily freed from oxide by the use of muriatic acid.

In the common apparatus of Volta, that part bounded by the moist oxidizable metal, as, for instance, the zinc, is found in a positive state, with regard to electricity, and the other part, as the copper, in a negative state; and when a communication is made between the two ends, by means of a conducting body, a constant circulation of electricity is established.

The electricity of the galvanic battery is capable of being partly transferred into the Leyden phial; and its effects, as has been fully shown by the experiments of Meiss. Nicholson, Carlile, Wooldaon, Van Marum, and Ritter, are similar to those of common electricity, in a low state of intensity. It gives shocks to living animal organs, and excites muscular contractions in bodies for a considerable time after death. It assumes the form of fire in passing from one conducting body to another in its highly concentrated state; and it ignites small metallic wires or leaves, and causes them to enter into combustion. It sets fire to charcoal, sulphur, alcohol, and other inflammable bodies; and it rapidly decomposes water and various other fluids.

The intensity of the electricity in galvanic batteries is greater in proportion as the series composing them are more numerous; but the quantity of it depends upon the specific weight of the surfaces they contain. Hence, and numbers of large and small plates arranged in different batteries produce nearly the same effects on the human body which is an imperfect conductor, and which can admit of the passage only of a certain quantity of electricity of a low intensity in a given time; but the large plates are in a determinate ratio, much more powerful in igniting the metals, and in affecting imperfect conductors through which a large quantity of electricity, in any state of intensity, easily and instantly passes.

Many important philosophical discoveries, which will be fully described in the article GAPEARISM, have been already made, by means of the galvanic apparatus, in different parts of Europe; and a number of enlightened experimenters have been employed in investigating the principles on which its operation depends. The theory of it is, however, as yet obscure, and the perfect development of it will probably be connected with views more profound than any that have been as yet obtained of the nature and agencies of electricity, and its relations to chemical changes. See Phil. Trans. for 1800 and 1801. Nichollos' Journal, vol. iv. and v., and vol. i. new series. Journal of the Royal Inst. vol. i. Tellch's Phil. Mag. vol. x. xi. and xii. Annalen der physik. Journal de physique. Annales de Chimie.

BATTEURS d'élévant, icôns or horsemen, went out before, and on the wings of an army, two or three miles, to
make discoveries; of which they are to give an account to the general. See Scours.

BATTIEUX, CHARLES, in Biography, honorary canon of the church at Rhône, which was his native city, became professor of philosophy at the Royal College of Paris, and distinguished himself by his judgment, learning, and character. He was chosen a member of the Academy of Inscriptions in 1750, and of the French Academy in 1751. His death, which happened at Paris in 1780, is supposed to have been accelerated by the rigor resulting from the want of success of the elementary works, which he drew up by order of government, for the use of the military school. His chief publications, written in French, are the following: “A Translation of the Works of Horace,” 2 vols. 12mo.; “The Morals of Epictetus, extracted from his own writings,” 12mo. 1757; “A Course of the Belles Lettres,” 3 vols. 12mo. 1762; to which are annexed his treatises, before published: “The Fine Arts reduced to a single Principle,” and “On Oratorical Composition;” “History of Primary Cautes,” 8vo. 1759; “The four Poeticks of Arilottis, Horace, Vida, and Boyleau, with Translations and Remarks,” 2 vols. 8vo. 1771; “Elements of Literature, extracted from the Course of Belles Lettres,” 2 vols. 12mo.; “Elementary Course for the Use of the Military School,” 45 vols. 12mo.; and “Translations of Ocellus Lucanus, and Timeness Locriscus.” Nouv. Di&it. Hist.

BATTIE, WILLIAM, in Biography, born in Devonshire, in 1704, received his education at Eton School, whence he went in 1722, to King’s College in Cambridge. On the death of his father, he joined Eton, and afterwards to Cambridge, that he might be near his son, and affit in lessening his expenses. The Craven Scholarship becoming vacant soon after his admission, the Doctor offered himself as a candidate, and had the good fortune to be successful. Of the importance this small stipend, only 25l. per annum, was to him, we may judge, from what he says on the subject, in a letter to a friend, “I shall now,” he says, “begin to live agreeably, and have, I hope, got through the worst part of my life.” A recollection of the utility of this stipend to him, it is probable, bowyer says, induced him, in the latter part of his life, to found a similar scholarship, at the same university. Pursuing his studies, in 1726, he was made Bachelor, and in 1730, Master of Arts; he was also now one of the Fellows of the College. In 1729 he published a specimen of an edition of Homer, in one volume 8vo. He at first proposed studying the law, and his finances not being equal to the expence of taking chambers in one of the inns of court, in London, he communicated his intention to two wealthy counsellors in the city, of the name of Coleman; but as they declined affisting him, he turned his mind to the study of medicine, and in 1753, he took the degree of Doctor in that faculty. For a short time he practiced medicine at Cambridge. Removing thence, he went to reside at Uxbridge, where, acquiring the confidence of some of the principal families in the neighborhood, he soon came into comfortable practice. About the year 1738, he married the daughter of Daniel Good, one of the masters of Eton, having kept up an intimacy with the lady from the time of his quitting the school. He was now also notified by his relations, the Cowens, who were so much gratified by the confederation to which they saw him rising, that the survivor of them left him 30,000l. Continuing a few years longer at Uxbridge, he at length removed to London. In 1745, we find him, Fellow of the College of Physicians. The same year he spoke the Harveian Oration, which was published the following year. About the same time he was elected Fellow of the Royal Society. In 1749, he completed his edition of Iberocrates, which was published in two volumes 8vo. Though this work was not well received by the critics, it was always a great favourite with the Doctor. The year following he experienced a serious mortification. For taking an active part in a dispute between the College of Physicians and Dr. Schönberg, and being one of the most strenuous in opposing his admission as a Fellow, he was held up to ridicule in a satirical poem, under the name of the Battis, in which a ludicrous account is given of the dispute, as well as some severe sarcasms on his favourite work, to the Battis, is supposed to have been the joint production of Mores Mendez, Paul Whithall, and Dr. Schönberg. It was published, at the time, in folio, and afterwards, in 1756, in a collection of humorous pieces, in 2 vols. 8vo. Another edition of this collection, much enlarged, was printed in 1792, in 4 vols. 12mo. There being at this time but one public asylum in London, for the reception of insane persons, which had been long found insufficient to contain all the indigent objects labouring under this affliction, a subscription was set on foot by some wealthy and benevolent individuals, to erect another establishment for the purpose, on the plan of Bethlehem Hospital. The scheme was so much approved, and so largely patronized, that in 1751 the managers of the fund were enabled to take, and fit up, a large building on the north side of Moorfields for the purpose, and as Dr. Batty had been very active in promoting the subscription, he was appointed physician to the institution, which was called St. Luke’s Hospital. It contained one hundred and ten beds, eighty of which were appropriated to recent cases, such as were supposed capable of being relieved, or cured by medical treatment, and thirty for old and incurable cases. By the good conduct of the managers, and the character the charity acquired, the committee found themselves enabled, in 1781, to take a piece of ground, in Old Street, and erect a large and magnificent building for the reception of the patients, who were removed into it in 1786. The new building contains beds for 187 recent and curable patients, and for 120 incurables. The present physician, who was elected into the office, in 1781, is Dr. Samuel F. Simmons.

In 1757 Dr. Batty published a treatise on Madness, 4to, in which, having thrown out some censures on the medical practice formerly used in Bethlehem Hospital, Dr. John Monro, whose father was implicated in the censures, replied, rebutting his charges, and having humorously taken for the motto to his remarks, “O major tandem parus infamie minor.” The Dr. was afterwards called by the wits, Major Batty. In 1762 he published “Aphorismi de cognoscendis et curandis morbis nonnullis, ad principia animadw accedenda,” taken principally from his Lumeniæ lectures. In February 1763 he was examined before a committee of the House of Commons, on the state of the private mad-houses in the kingdom, which he shewed them, from influences that had fallen under his notice, to be ill conducted, as sometimes to be used as prisons for persons whose relatives were interceded in getting them out of the way. This gave rise to a series of regulations, made by the legislature, with a view of preventing the continuance of those practices, but they were not completely suppressed until the year 1774, when the power of licensing private mad-houses was vested in the college of physicians.

As the Doctor had for several years confined his practice to maniacal cases, he had now leisure to indulge his inclination for building, to which he was much attached. Besides a large house, No. 88, Great Russell Street, Bloomsbury, for his town residence, he built an elegant villa at Twickenham, lately the residence of the Countess Dowager Pawlet. He also
also erected a more considerable house on the banks of the Thames, at Marlow, in Buckinghamshire, where he passed much of his leisure time, in the latter part of his life. These houses were built under the immediate inspection of the Doctor, and after his own designs. He died of a paralytic stroke, at his house in Great Russell Street, the 15th of June 1776, aged seventy-two years. Having no male issue, his great property, upwards of 90,000l. was divided between his three daughters, of whom the elder was married to a captain, afterwards admiral Sir George Young, who sold the house at Marlow, called Court Garden, to Richard Davenport, Esq. an eminent surgeon of Effex Street, in the Strand, London; the second, to Philip Rashleigh, Esq. a gentleman of Cornwall; and the third, to the late Sir John Call, baronet.

**BATTIFOLIUM, or Battifolium, in Antiquity, a kind of tower or defence, frequently mentioned by Latin historians of the middle age. It seems to have been wood, and to have been erected on sudden and hasty occasions.**

**BATTLE, in Geography, a small market town of England, in a hundred of the same name, in Suffex, is situated 5 miles from Hastings, and 56 south-east from London. It was originally called Epiton; but the decisive victory at Hastings, gained by William, duke of Normandy, over king Harold, induced the former, when he was fixed on the throne, and founded the abbey, to change the name of the town to that which at present it retains. Battle consists of one principal street, indifferently built; and the parish church is a neat building, the incumbent of which is titled dean of Battle. The inhabitants support also a charity school for forty boys. The gunpowder which is manufactured here is esteemed the best in Europe, and hence called “Battle powder;” though the town cannot boast of any other trade. The neighbourhood, however, is so fertile, that an incredible number of large cattle are constantly sent up to the London markets for sale, especially what are denominated full-fed oxen, which produce the largest beef in England. Henry I. granted a market to be kept on every “Lord’s day;” but Anthony, lord Montague, who, about 1650, built himself a beautiful seat here, obtained an act of parliament to change the market day to Thursday, as it now continues. Battle is reckoned unhealthy on account of its try dirty situation. Its greatest boast is the magnificent abbey built by William the Conqueror, on Heathfield, near the town, in 1067, to commemorate the small degree of the effusion of blood the year before; the church is the fabric standing on the spot where the body of the brave but unfortunate Harold was found. This abbey was filled with Benedictine monks from Normandy, and endowed with such extensive privileges, that if a convict was palling to execution, it was in the abbot’s power instantly to release him, should they meet on the road. At the dissolution its revenues were valued at £801. 14s. 7d. The ruins of the abbey are very stately; and what remains destroyed, serves as a house for the family of Webler, and for the purposes of the town, the gate-house being used as the hall in which are held felions and other meetings for this peculiar jurisdiction. From Standard and Tillman hills are very extensive prospects. A fact related of abbot Hamo, in 1381, is worth recording; a body of Frenchmen landing and attacking Rye and Winchelsea, Hamo rallied whatever force he could collect, repaired to Winchelsea, and having fortified it as well as he was able, checked the progress of the enemy, till the force of the country was sufficiently powerful effectually to repel them. Battle has three fairs, and two hundred and ninety-four houses, inhabited by 2540 persons.

**Battle Island. See Bay of St. Louis.**

**BATTLE, a river in New South Wales, which runs N.E. into Sackahawan river, S. E. from Mancheater house.**

**BATTLE, or Battel, Wager of, in Law, a species of trial of great antiquity, which had its origin in the military spirit of our ancestors, blended with superstition, and which confined in a kind of appeal to Providence, under an apprehension and hope, however preposterous and unwarrantable, that heaven would give the victory to him who had the right. Concerning the early history and general prevalence of this mode of trial, see Combat. This trial, which had been the immemorial practice of all the northern nations, and which had been first reduced to regular and stated forms among the Burgundi, at the close of the fifth century, and passed from them to the Franks and Normans, was introduced into England, among other Norman customs, by William the Conqueror; but it was only used in three cases, one military, one criminal, and the third civil: the first in the court martial, or court of chivalry and honour; the second in appeals of felony; and the third upon issue joined in a writ of right. In these writs of right, the “jus proprietatis” could not often be ascertained without difficulty; and this mode of determining it was allowed for the sake of such claimants as might have the true right, but yet by the death of witnesses, or other defect of evidence, he unable to prove it to a jury. Although the writ of right itself, and of course this mode of trial, be at present much disused, yet it is still law and in force, if the parties chuse to abide by it.

The last trial by battle that was waged in the court of common pleas at Westminster, though one afterwards occurs in the court of chivalry in 1631, and another in the county palace of Durham in 1638, was in the 13th year of queen Elizabeth, A.D. 1571; and was held in Tothill fields Westminster, “non sine magna juris consulaturum perturbatione,” says sir Henry Spelman, who was himself a witness of the ceremony. The form of it, as described by Blackstone, is as follows.

When the tenant in a writ of right pleads the general issue, viz. that he hath more right to hold than the demandant hath to recover; and offers to prove it by the body of his champion, which tender is accepted by the demandant; the tenant in the first place must produce his champion, who, by throwing down his glove as a gage or pledge, thus wages or stimulates battle with the champion of the demandant; who, by taking up the gage or glove, stimulates his part to accept the challenge. The reason why it is waged by champions, and not by the parties themselves, in civil actions, is because, if any party to the suit dies, the suit must abate and be at an end for the present; and therefore no judgment could be given for the lands in question, if either of the parties were slain in battle: and also that no person might claim an exemption from this trial, as was allowed in criminal cases, where the battle was waged in person.

A piece of ground is then in due time set out, of sixty feet square, enclosed with hedges, and on one side a court erected for the judges of the court of common pleas, who attend there in their scarlet robes; and also a bar is prepared for the learned serjeants at law. When the court sits, which ought to be by fun-rise, proclamation is made for the parties, and their champions; who are introduced by two knights, and are dressed in a coat of armour, with red hoods, barelegged from the knees downwards, bareheaded, and with bare arms to the elbows. The weapons allowed them are only battens, or flaves, of an ell long, and a four-cornered leather target; so that death very seldom ensued this civil combat. In the court military indeed they fought with sword and lance, according to Spelman and Kibworth; as likewise in France only villains fought with the buckler and baton, gentlemen armed at
all points. And upon this and other circumstances, the president Montesquieu hath, with great ingenuity, not only deduced the impious customs of private duels upon imaginary points of honour, but hath also traced the heroic madness of knight-campany, from the same original of judicial combats. But to proceed.

When the champions, thus armed with batons, arrive within the lists, or place of combat, the champion of the tenant then takes his adversary by the hand, and makes oath that the tenements in dispute are not the right of the demandant; and the champion of the demandant, then taking the other by the hand, swears in the same manner that they are; so that each champion is, or ought to be, thoroughly persuaded of the truth of the cause he fights for. Next an oath against forcery and enchantment is to be taken by both the champions, in this or a similar form, "hear this, ye judges, that I have this day neither eat, drink, nor have upon me, neither bone, stone, nor grats; nor any enchantment, forcery, or witchcraft, whereby the law of God may be abased, or the law of the devil exalted. So help me God and his saints."

The battle is thus begun, and the combats are bound to fight till the flars appear in the evening: and, if the champion of the tenant can defend himself till the flars appear, the tenant shall prevail in the cause; for it is sufficient for him to maintain his ground, and make it a drawn battle, he being already in possession; but if victory is obtained, also by itself, or he is condemned for the other party, for he is judgment finally given. This victory may arise, from the death of either of the champions: which indeed hath rarely happened; the whole ceremony, to have the truth, bearing a near resemblance to certain rural athletic diversions, which are probably derived from this original. Or victory is obtained, if either champion proves recusant, that is, yields, and pronounces the horrible word of 

"cease;" a word of disgrace and obloquy, rather than of a determinate meaning. But if either party declare before, or at the banquet or chamber, or he be deprived of the land of his principal, by pronouncing that shameful word, he is condemned, as a recusant, "sinimines liberam legem," that is, to become infamous, and not be accounted "liber et legalis homo," being supped by the event to be proved foresworn, and therefore never to be put upon a jury, or admitted as a witness in any cause.

This is the form of a trial by battle; a trial which the tenant, or defendant, in a writ of right, has in it his election at this day to demand, and which was the only decision of such writ of right after the conquest, till Henry II. by consent of parliament, introduced the grand affer, a peculiar species of trial by jury, in concurrence therewith, giving the tenant his choice of either the one or the other. Which example, of discountenancing these judicial combats, was imitated about a century afterwards in France, by an edict of Louis the Pious, A.D. 1205, and soon after by the rest of Europe. The establishment of this alternative, Glanvil, chief justice to Henry II., and probably his adviser hereon, considers as a most noble improvement, as in fact it was, of the law.

The trial by battle may also be demanded at the election of the appellee, in either an appeal or an approval; and it is carried on with equal solemnity as that on a writ of right; with this difference, that if they party might have a champion, but here they must fight in their proper persons. And therefore if the appellee or approver be a woman, a priest, an infant, or of the age of sixty, or lame, or blind, he or she may countersign, and refuse the wager of battle; and compel the appellee to put himself upon the country. Also peers of the realm, bringing an appeal, shall not be challenged to wage

battled, on account of the dignity of their persons; nor the citizens of London, by special charter, because fighting seems foreign to their education and employment. So likewise if the crime be notorious; as if the thief be taken with the "mainour," or the murderer in the room with a bloody knife, the appellee may refuse the tender of battle from the appellee; for it is unreasonable that an innocent man should make his life against one who is already half-convinced.

The form and manner of waging battle upon appeals are much the same as upon a writ of right: only the oath of the two combatants are vastly more striking and solemn.

The appellee, when appealed of felony, pleads not guilty, and throws down his glove, and declares he will defend the law by his body: the appellee takes up the glove, and replies that he is ready to make good the appeal, body for body. And thereupon the appellee, taking the book in his right hand, and in his left the right hand of his antagonist, swears to this effect. "Hoc audite, homo quem per manum tenes, &c." "Hear this, O man, whom I hold by the hand, who calleth thyself John, by the name of baptism, that I, who call myself Thomas, by the name of baptism, did not feloniously murder thy father, William by name, nor am any way guilty of the said felony. So help me God, and the fants; and this I will defend against thee by my body, as this court shall award." To which the appellee replies, holding the bible and his antagonist's hand, in the manner as the other: "Hear this, O man, whom I hold by the hand, who calleth thyself Thomas, by the name of baptism, that thou art perjured; and therefore perjured, because thou feloniously didst murder my father, William by name. So help me God and the fants; and this I will prove against thee by my body, as this court shall award." The battle is then to be fought with the same weapons, viz. batons, the same forcery, and the same oath against amulets and forcery, that are used in the civil combat: and if the appellee be so far vanquished, that he cannot or will not fight any longer, he shall be adjudged to be hanged immediately; and then, as well as if he be killed in battle, provision is deemed to have determined in favour of the truth, and his blood shall be attainted. But if he kills the appellee, or can maintain the fight from fun-rising till the flars appear in the evening, he shall be acquitted. So also if the appellee becomes recusant, and pronounces the horrible word of 

"cease;" he shall lose his "libera legem," and become infamous; and the appellee shall recover his damages, and also be for ever quit, not only of the appeal, but of all indictments like-wise for the same offence. Black. Com. vol. iii. p. 337, &c. vol. iv. p. 346, &c.

**Bat**

_Battle, in the Military Art_, signifies an engagement between two hostile armies, drawn up in regular order, in a country sufficiently open for them to encounter in front at the same time; or should some obstacle occur to hinder the readily entering into action of the whole line, for the greater part of an army to begin the attack upon the troops opposed to them, the rest remaining in fight, ready to act as occasion may require their assistance or co-operation.

Other conflicts, when only certain points of the armies are engaged, though generally of much longer duration, and often attended with superior slaughter, are only termed fights, or, as they are called by the French, combats. (Fenogna's Memoires, chap. 80.) Under this denomination rank therefore, though as oblinates as most others on record, the engagements of Senesch, of Steinkerke, of Oudenarde, and of later days, those of Zornendorf and Hochkirchen, equally celebrated on account of the carnage which attended them, and the importance of their confinements.

The
The loss of a battle involves almost always that of the artillery of the vanquished, and frequently of the baggage. As all these losses must be repaired before the beaten army can again look their conquerors in the face, the enemy consequently remains for a length of time master of the country, and at liberty to carry all his projects into execution. These inconveniences are rarely to be very felt in case of ill success in a general combat, however desperate. Greater part of the artillery is generally preferved, and the baggage almost entire, for the opposite armies not closing in front, the divisions which have been engaged alone become the sufferers.

But in a field or pitched battle, the present object of attention, where both parties have time and room sufficient to arrange and extend themselves in regular order, the case is widely different. The least unforeseen advantage afforded to an enemy, or the most trivial circumstance unattended to, may balance the efforts of the most experienced general, may snatch the palm of victory from the hands of numbers and valour, convert a successful pursuit to a disorderly flight, and lead to the irretrievable ruin of an army, possibly even of a state.

The ancients never joined battle without a great deal of preparation and religious ceremony; as making auguries, offering up sacrifices, haranguing to excite the courage of the soldiery, giving the word, or a tellera, &c. The signals of battle were, among the Romans, raising the cibclium, or general charge, striking upon their shields with their javelins, and displaying from the praetorium a peculiar flag, called by Plutarch (in Fab. Max. and in Pomp.) a red mantle. Cæsar also mentions this flag in his B. Gallic. I. ii. c. 20. In the moment of onset, a shout was raised by the whole army, for the double purpose of encouraging their fellows, and striking terror into the enemy. Similar to this was the custom which prevailed among the Greeks, of singing the psalm, or hymn of combat, as they moved forward to the charge.

The rigid superition of the Jews at first prevented them from fighting, or even from defending themselves, on the sabbath-day; but fatal experience of the inconvenience of the latter precept, induced them, in their wars with the princes of the Syro-Macedonian dynasty, to dispense with its observance. It was, however, in consequence of the aversion they still retained to a violation of that holy day, that Pompey made master of Jerusalem by assault, without any effectual resistance. Dio. Cæs. lib. lvii. xxix.

The Romans did not carry their regard for religion so far. They had indeed their peculiar days, called "prehares dies," wherein alone it was lawful to join battle; and others whereon it was unfit, called "dies atri;" but less ferupulous than the Hebrews, these latter were only observed in respect of attacking. No day was too sacred for them to defend themselves in. (Macrob. Saturn. lib. i. c. 5.) We observe frequent influences of their engaging by night. It was by night that Scipio destroyed near Utica the armies of Africinus and Syphax (Liv. xxx. c. 5.); and the decisive battle between Pompey and Mithridates (Plut. in Pomp. B. vi.) was fought by moonlight.

The Athenians were prohibited, by the ancient laws of their country, from drawing out their forces for battle till after the 7th day of the month; and Lucian, speaking of the Lacedaemonians, relates, that by the statutes of Lycurgus, they were not to fight before the full moon. A similar custom prevailed among the ancient Germans, who reputed it an impiety to engage in the wake of the moon; and Cæsar intimates that his victory over Ariovistus was owing to that prince's having, contrary to the religious notions of his countrymen, fought during the decrease of the moon. The barbarians were intimidated with the apprehension, and afforded Cæsar an easy conquest. To use his own words: "Acie commissa impeditos religione holte visit." (Cæs. B. Gal. lib. i.)

An idea of the manner in which warlike operations were carried on, and battles fought, among nations in their primitive barbarous state, has been given under the article ATTACK. We shall not here repeat what has been already said on that subject.

Authors are fond of quoting the battle of Thymbra, between Cretans and Cyrenians (Xenoph. Cyrop. lib. vi, vii.), as the first general engagement ever fought. But as it is only related in the Cyropaedia, a work whose historical veracity has been severely called in question, and as its recital is attended with circumstances of the most romantic cast, we shall content ourselves with barely mentioning it, and pass on to influences better authenticated, and less embellished by the marvellous.

At the battle of Marathus (Herod. Eul. c. 107. 117.) the Greeks, conducted by Miltiades the Athenian, demonstrated the possibility of compensating by discipline, valour, and military skill, for any inferiority in numbers. A manoeuvre not without its faults, but novel in the art of war as then understood, obtained for them a victory as splendid as extraordinary; and which we may rank as the earliest in profane history, of which any particular account has been transmitted to us.

The battle of Plataea, from the numerous forces engaged on either side, belted the denomination of a pitched battle. (Herod. Call. lib. c. 61—74.) It was fought upon the true ancient model. Hurry and confusion reigned predominant. Greeks and Persians engaged in several places, without any attempt at co-operation, or the smallest exertion of military genius on the part of their commanders. In the true language of Homer, here "man was opposed to man, and shield met shield;" and the Greeks seem to have fairly achieved this astonishing conquest by excelling their adversaries in the vulgar qualities of bodily strength and brutal courage.

After toiling through the heavy and fanguirinary period of the Peloponnesian war, where, though convinced at every page of the rapid improvement of the Greeks in tactics, we do not meet with any of those general or important contests, the subject of the present article; and after taking a cursory examination of the massacres of Cynaxa; we at length arrive at the battle of Leuctra. (Plut. in Pelo. Xenophon. Hellen. lib. vi. Diod. Sic. lib. x.) This brilliant engagement, between numbers comparatively trifling, deserves from a scientific reader more attention than that of Plataea, as it is indisputably the first occasion on which victory was obtained merely in consequence of an able disposition. The famous column of Epaminondas, which obliged 24,000 Lacedaemonians, the bravest troops in Greece, to yield the honor of the field to 6,000 Thebans, has been repeatedly cited with admiration by the most learned authors, and imitated by the first military geniuses, on various occasions.

The battle of Mantinea, the next instance worthy of particular observation, was won by the same general (Xenophon. Hellen. lib. vii.) on the very same principle. The Lacedaemonians, though conducted by their king Agesilaus, one of the ablest leaders of his age, suffered themselves to be again defeated, by the precise disposition which had already proved so fatal to them at Leuctra. The Spartan glory, by the loss of this battle, sustained a blow it never afterwards recovered. Epaminondas, whose genius had made the bravest soldiers in all Greece shudder before weaker nerves, meager spirits, and
inferior numbers, expired on the field he had immortalized no less by his personal exploits, than his able arrangements before the action. Henceforth pitched battles are more frequently distinguished by masterly strokes of generalship.

The formidable phalanx, then a late invention, no less than his own military talents, secured to Philip of Macedonia his important triumph at Chaeronea. (Died. Soc. ii. xvi. ch. 86.) The three great battles of Alexander against Darius were gained but with little difficulty, owing to the superior tactics of the Greeks. ThoE of Iilus and Arbela in particular (Arr. Alex. iii. sect. 15. Quin. Curt. lib. iv.) were only slaughter. When we read that in the latter, with the loss of only 1200 of his own men, the Macedonian destroyed, according to the least exaggerated accounts, 40,000 of the Persians (Arr. says 300,000), it is pretty plain that the resistance was but nominal, and that the conquerors had little more trouble than to do execution on their enemies.

The Grecian history, subsequent to Alexander, is replete with instances of pitched battles; but of which little or no particular account has been left us. We are for the most part in the dark with respect to the order observed in drawing up the rival armies, and the manoeuvres which accelerated or retarded a victory. The abrupt termination of the history of Diodorus Siculus, deprives us of any details respecting the battle of Iplus, except the abrupt and unsatisfactory account of Plutarch (in Dem.). The number of the slain alone leaves us sometimes a little room to judge of the importance or the obliquity of a conflict.

Polybius, however, has left us (lib. ii.) a full and interesting account of the decisive engagement at Sellasia, which, for a time, completely subjected the Grecian states to the power of Macedon. Here again the phalanx determined the fortune of the day, and demonstrated the superiority of its close and impenetrable order, over the more loose and shallow battalions of their antagonists.

Among the Romans we shall find still further occasion to remark the rapid improvement of ancient tactics. Guided by Polybius and Livy, we perceive with peculiar interest the account of battles fought for the mastery of the world, perpetually differing in situation, in successions, and in consequences. That of Tmvi in particular, between Regulus and Xanthippus, calls strongly upon the attention. We are not dazzled by a long list of numerous forces and barbarous auxiliaries, fatigued by a repetition of desperate attacks and repulses, or bewildered amidst a series of complex manoeuvres. Two armies nearly equal in numbers, of small strength, but supreme in valour, headed by renowned generals, encounter on a spot of ground easily surveyed by the eye of imagination. We remark their several dispositions. The simple narrative of the historian points out clearly and satisfactorily the faults or advantages of those dispositions, the mistaken rations of the Roman, and the consummate generalship of Xanthippus; and before we enter upon the vicissitudes of the action, we are fully convinced that the errors committed by Regulus must ultimately lead to his total defeat. Polyb. ib. i.

The march of Hannibal into Italy furnishes us with several instances of pitched battles, various in their nature, important in their consequences, and interesting in description. Far from being fatigued with following the brave Carthaginian through a continual scene of slaughter, we consider and admire his conduct, feel for his difficulties, eagerly accompany him in the field of carnage, and take a lively interest in his proceedings. The three famous engagements of the Trebin (Polyb. lib. iii. Liv. lib. xxii. sect. 53—56); of the lake Trafymenus (Polyb. ib. Liv. lib. xiii. sect. 4—7); and of Cannæ (Polyb. ib. Liv. xiii. sect. 44—52), rising in importance one above the other, chiefly arrest our attention. We find that previous to every one of these, the arrangements made by Hannibal were such as almost to ensure success. A series of artful movements were constantly employed to draw the Romans into the snare prepared for them; and their commanders, deluded by the genius it was necessary to oppose to so formidable an enemy, rushed, as it were, blindfold upon their ruin; though posted in each of the contents we have just named of every advantage of numbers, resources, and, we may even add, of valour. The talents of a single man reduced those advantages to nothing. Their numbers were converted into an hindrance to themselves, their resources were intercepted or rendered useless, and their valour, degenerating into despair, precipitated them madly upon certain destruction.

No action was ever more obstinately fought, or as a pitched battle displays more consideration, than that of Zama (Liv. lib. xxx. sect. 32—35. Polyb. Fragm. lib. xv.), where the fortune of a Scipio finally triumphed over the Carthaginian republic. Without more than barely naming it here, we refer the reader for a more particular account of that celebrated affair, to the article ZAMA.

From this time, Roman discipline and valour reigned triumphant in every struggle with foreign nations. The armies of Antiochus, Perseus, and Mithridates, were destroyed, for the most part, with scarcely an effort; and the battles they ventured in defence of their dominions are only miserable instances of the inferiority of mere courage, supported by tenfold numbers, to the cool and steady bravery of veteran soldiers, directed and managed by the talents of an experienced general.

But however cheaply the legions of Flamininus, of L. Scipio, of P. Emmius, and of Lucullus, had earned their laurels, a harder task was imposed on those who, under Cornelius Sylla, and Julius Caesar, turned their arms against their own countrymen. They had to engage with troops equally courageous, expert, and skilfully disciplined; with men who, under Marius and the great Pompey, had exterminated the hordes of the savage Cimbri, and had subjugated the eastern world; in a word, with Romans. Three pitched battles, those of Pharsalia, Thapsus, and Munda, signalled this bloody period, and gave ample scope for the exertion of the utmost talents of the matchless Caesar. Yet in the laft of these engagements, that consummate general constituted, that he contended not for victory, but for his life; a satisfactory evidence of the desperation with which it was fought. Plut. in Cat.

The two battles of Philippi are equally famous. Few have been more decisive in the event, or more distinguished for the uncommon perseverance and obstinacy with which they were contested.

In the age of Tacitus, we find the military science of the Romans brought to perfection. Similar to the train of artillery which modern generals carry into the field, the army of Vitellius at Cremona planted its bailets to play upon the enemy, and with showers of immense stones, swept them away by whole ranks. (Tacit. Hist. lib. iii. sect. 23.) This battle, and the subsequent forming of the adverse camp by the legions of Vespasian, gave us a perfect insight into the mode of warfare as then practised. Tacit. ibid. sect. 21—33.

In the lower ages of the empire we meet with very few instances of conflicts, remarkable either for their long duration or for any celebrated manoeuvres put in execution by rival generals. Nations relapsed, even in this derelictive science, into their original barbarism. Armies were no longer comprised.
BATT

Composed of troops regularly trained and inured to service, but of cowardly and undisciplined plunderers, to whom victory or defeat was alike the signal for disbanding, on whose exertions the future dependence could be placed, and from whose successes little or no benefit could be derived. Numbers soon became, as formerly, the criterion of advantage. War teemed with fanatical combats, productive of tedious consequences. Courage supplied the place of generalship; fury and carnage, of discipline.

Never did a series of pitched battles follow each other in more rapid succession, than during the period subsequent to the first irruption of the Arabs into the more civilized provinces of Asia. These enthusiastic followers of their prophet, issuing from a peninsula of contemptible extent when compared to the empires they so madly attacked, dared to match their own puny forces against the united efforts of the Roman and Persian monarchies. As we accompany them in their progress, the most incredible victories crowd upon and harass our reflections. It is true, that among these engagements, so general, so bloody, and so decisive, we do not find the slightest trace of discipline or generalship. A religious fury, altogether irresistible, compensated with the Arabs the want of both these requisites. Alzadzin, Kachech, and Yermouk, are lasting monuments of Moslem glory; but they do not convey the least information to the military reader, or recompense in interest the attention he may bellow in perusing them.

Altogether bare, dry, and uninteresting are the details of most of these battles fought between the time of Charlemagne and the beginning of the fourteenth century. Whether we peruse the murderous annals of the Crusades, where all Europe and Asia seem mingled in reciprocal carnage; or the bloody feats of the Italians in the days of Machiavel, when, after fighting a whole day, armies have separated without the loss of a man on either side (Machiavel. Hist. Flor., lib. vii.) we are alike disgusted with the want of circumstances to excite our attention.

Cressy, Poictiers, and Agincourt are names venerated with reason by every Englishman; but setting aside any consideration of the splendid carnage which attended them, and examining them in a military point of view, how little shall we find to extol, how much to censure. In all the three cases, the English armies were brought into the most imminent danger by the boyish imprudence of their leaders, who marched them, as it were blindfold, into the heart of an enemy's country, without taking the smallest pains, either to secure the necessary supplies of provisions, or to ensure a retreat. Not to be behind hand in imprudence, the French generals, although certain of starving their antagonists into a surrender merely by an inconsiderable delay, had three times successively the infinity to march up and attack the English strongly and advantageously posted, and on ground too where not a fourth of their own numbers was capable of acting. Untaught by experience, they left the three great battles by exactly the same fault; and in all three (the contended tradition of the artillery used at Cressy alone excepted), we find no reason to commend the military science of our ancestors. Indeed, at Poictiers, the Black prince pollied fagacity sufficient to line the hedges on both sides of a narrow way with archers, for the purpose of annoying the French gens d'armes as they advanced through it to the attack; a stratagem not half so commendable as that of Nevil earl of Salisbury at the petty skirmish of Bloreheath in the reign of Henry VI. (Holinhed.); an affair as much surpassing Poictiers in a tactical consideration, as inferior in the bloody lift of the killed, and the consequences that ensued upon it.

In proportion as we approach nearer to modern times, we view the military science making slower strides towards improvement. The invention of gunpowder effected by degrees an important change in the whole art of war. The arms and orders of the battalions underwent a total alteration. The cavalry, formerly the main dependence of an army, много that no peron of family would serve in any other capacity than as a horseman, became a mere appendage to the infantry, who, since the invention of fire-arms, have generally decided the event of battles. The musquet and bayonet are now substituted for the pike and fword; and armies, like fortified places, must be approached in form, and battered down by artillery, while the most complete defeat is rarely attended with worse consequences than the loss of the surrounding territory.

About the year 1620, the entrance of Gustave Adolphus and his Swedes into the German empire, and the great events which signalized the war of thirty years, render military history more interesting. The celebrated battles of Leipzig and Lutzen, where the first modern use was made of the column, now the chief instrument of the gain of victories, are remarkable epochs. One day the hard-earned hurls of Tilly and of Wallenstein faded in a moment before the comprehensive genius of Gustave, who by his skilful dispositions bought, though with his life, the title of the first general of his age. A succession of heroes, Wallenstein, Wallenstein, and Wrangel, adopted and improved upon his maxims. Condé and Turenne profited anew by the example; and a succession of victories obtained under their auspices, rendered the arms of Louis XIV. during 50 years incredible. On entering upon the history of the war of 1630, we are surprized at the rapid improvements made in that part of the military art, the subject of the present article. The engagement of Steinkirk presents a remarkable instance of the recovery of an affair judged entirely desperate. The battle of Lunden shows us an army entrenched behind a number of fortified villages, driven from all its defences, and carried as it were by storm. The bayonet, used first by Catam in the action of Marfaglia, added a new and terrible weapon of offence to the infantry, and by degrees entirely superseded the use of the pike. The reader will now observe armies more numerous and more regularly subsisted than formerly, plans of attack and defence more ingenuous and connected, artillery more formidable and better served, and a degree of method in military operations not before practised.

In the war of succession, or that which took its rise from the separate claims of the houses of Bourbon and Austria to the Spanish monarchy, the three great battles of Höchstädt, of Ramillies, and of Turin, immortalized by the abilities and splendid victories of Eugene and Marlborough, claim particular attention. To enlarge upon each under the present article, would trespass too much on the boundaries assigned to us; we therefore refer the scientific reader to the heads Höchstädt, &c. where he will find a succinct account of those engagements, illustrated by the critical remarks of an excellent military judge, M. de Feuquieres.

Of all the battles fought by Charles XII. in his nine years' war with the Russian empire about the same period, that of Pultowa alone is remarkable in a tactical point of view. Narva, Duma, Ciffow, &c. furnisb splendid and tranitory instances of successful victories in a military madman. The battle, or rather five battles, of Leipsic on the Sulla, fought by general Lewenhaupt against the whole forces of the Czar, are intercelling in so far as they display the astonishing resources of Swedish valour.

C 2 From
From a tranquillity of fifty years, hardly interrupted by the short contest for the succession of Poland, Europe was aroused by the war of 1740. With wonder we behold a nation, hardly before reckoned in the number of her powers, a nation of soldiers, start into energy; and, headed by a monarch who to the most conunenurate generalship joined the qualifications rarely found in military men, of love for the sciences, and genius for their improvement, perform the most astonishing and romantic exploits. It would be superfluous to follow the Prussian hero through his career of victory and glorious deeds, or to enumerate the various means and manoeuvres by which he triumphed at Friedberg, at Prague, at Liffi, at Zorndorf, and at Torgau, over the firmness and discipline of Austrian forces, the talents of a Daun, and the enterprise of a Laudon. Nor have we room to enter into details of his defeats at Kolbin, Hochkirchen, and Gummerdorff; defeats which only throw additional luster on his transcendent abilities.

It seemed impossible for human genius to surmount the bonds impressed by the immortal Frederick to modern tactics. His hand had modelled armies into mere machines, liable to be directed with promptitude at the pleasure of the master. The systems practised in the Prussian and Austrian schools, seemed to defy alteration or improvement; and the art of drawing up armies in order of battle particularly was reduced to certain rules, adapted to all situations, and which ensured every presumptive means of success.

A revolution, the effects of which have been severely felt in the most remote corners of the globe; a revolution, which has shaken the religious and political opinions of the most powerful nations, arrived to overturn monarchies, to change the face of Europe, and to convert it into one vast theatre of war. The military art did not escape the general influence. When the armies of Prussia and Austria, numerous, valiant, and bred up in the schools of Frederick and Laudon, poured their united forces upon the French republic, opposed only by raw levies, undisciplined, half armed, and conducted by generals, many of whom knew nothing of service by experience; what resources could we suppose prepared by thoughtful, capable of counterbalancing such disadvantages? But with amusement we view the disciplined invaders, at the end of the first campaign, driven back with shame and defeat. We view the best officers in Europe in a disgraceful retreat before mere novices in the art of war. We view enthusiasm supply the place of commanders, of numbers, and of discipline.

One general battle had subjugated Belgium to the disposal of France, when the treachery of a general not only occasioned the loss of that country, but endangered the frontier of the republic itself, then covered only by a disorganized army. Nevertheles, during a long and bloody campaign, the forces of almost the whole of Europe united in vain to break through the first line of the bordering fortresses. The scene was soon totally changed. The collected energy of a nation, overcoming all opposition, repelled the attack; retaliated invasion; and by means of the most brilliant campaigns recorded in history, achieved such important, rapid, and extensive conquests as almost exceeded credibility.

We must not place to the false account of enthusiasm these wonderful successes. Enthusiasm alone, though backed by still greater numbers, must ultimately have proved insufficient, when opposed to disciplined troops and skilful generals. The art of war gradually assumed a new face. To the maxims of the German school, others succeeded still more prompt, more energetic, and peculiarly adapted to the nation which carried them into execution. To the excellence of their artillery, their skill in the art of managing the bayonet, and the incredible rapidity with which they have executed the different modes of charging in column, as well as to the extraordinary talents of their self-taught generals, the French owe chiefly their successes in the late war. Under the article Columns, we shall hazard some observations on their mode of engaging.

In a war so productive of bloody and general engagements as the last, it would be superfluous to dwell on particular instances. Never in one campaign did so many battles take place as in 1754, when from the beginning of April onwards hardly a day passed without some desperate conflict. In point of consequences, we must ascribe the first rank to Jemappes, Trelmont, Hougoumont, Fleurbaix, Villers, Arcelo, Marstrong, and Hohenlindcn; but if we only consider the slaughter on both sides, Lodi, Verona, Stockach, Novi, and Zurich stand pre-eminent. A few remarks upon these, with some other affairs of principal consequence, will be found under their proper heads.

When we consider the immense resources required to maintain a large army, and the inconvenience with which the movements of more unwieldy bodies are felt attended, we shall find room to commend the less extensive scale on which we carry on our wars, compared to that of more ancient times. Indeed the armies, which we are assured have been brought forth to battle in the earlier ages, almost stagger our belief. Sestos is said (Diod. Sic. i.) to have had 600,000 foot, 24,000 horse, and 27,000 armed chariots, on his famous expedition into Upper Asia. The same historian swells the armies of Nimus and Semiramis to two and three millions of men. We are told in scripture that Zerah, a barabar poten tat, invaded the kingdom of Judah with a million of his subjects, who were totally exterminated by the Jewish monarch Aza; nor are the accounts of the numbers engaged at Mount Zemarion on both sides, by the carnage of the Israelites on that occasion less marvellous. (II. Chron.) Darius, in his Persian expedition marched at the head of seven hundred thousand of his subjects (1 Cor. i. 2.) Xenexes invaded Greece with a fleet of more than 1350 triremes, and a land army of 2,100,000 men. According to Herodotus (lib. vii.), the whole of his ships and land forces numbered above five millions. These numbers, immense as they are, will hardly appear exaggerated, when we reflect on the hosts afterwards brought into the field by the Goths and Huns, and the formidable swarms of Croifies in the middle ages. The last Darius, when he engaged Alexander at Issus, mustered in his army fix hundred thousand men; and some historians make his forces at the battle of Arbela amount to a million.

The ease with which these immense hosts were defeated by comparatively trifling numbers of Greeks, gives us the most mean idea of their bravery and military skill. We must except the infatuation of Platea, where the victory was obstinately disputed, and the carnage consequently dreadful. There are few infinences upon record of a battle so completely decisive. Of 300,000 men, of whom the Perian army composed at the commencement of the action, not four thousand escaped the destruction of that fatal day. (Herod. i. 8.)

The Romans, although they sometimes kept very numerous forces on foot in different parts of their dominions, seldom employed above forty thousand men in the same army. In their war with the Cisalpine Gauls, subseqent to the first Punic, they levied between seven and eight hundred thousand troops; but these all acted in separate corps. One of the largest armies they ever brought into the field, was that defeated, or rather destroyed, at Cannae by Hannibal. It consisted of 75,000 foot and 7,000 horse, of all whom only
only about 3000 escaped death or captivity. This defeat, terrible as it was, was some years after revenged by the slaughter of 60,000 Carthaginians on the banks of the Mediter-

nus. (Polyb. lib. ii. & iii., Livy.)

We fludder at the cruelties which sometimes accompanied the triumphs of Rome over her more barbarous and undisci- plined enemies. L. Scipio destroyed 50,000 Syrians at Magnesia. Marius, in his contest with the Tontones, took or exterminated above 300,000 of them. In a second bat-
tle, against the Cimbri, he slew 120,000, and captured half that number. In three battles against the generals of Mi-

thridates, Sylla cut in pieces 200,000 men. The bloody de-

feats he sustained from Lucullus, during the siege of Cy-

zicus, cost the fame Mithridates three hundred thousand of his forces. On one occasion, Julius Caesar annihilated an army of 368,000 Helvetii; on another, he extirpated up-
wards of 430,000 Germans, who had crossed the Rhine in quell of new settlements. (Livy. Plut. in Mar., Sylla, &

Lucull. Cest. de Bell. Gall.)

In the civil wars of the Romans themselves, we find in-
stances, considering the inferior numbers of the troops en-
gaged, of slaughter equally dreadful. In the battle before the Colline gate of Rome, Tekfins, a general of the Mar-

ian faction, commanded 79,000 men against Cornelius Sylla; 12,000 of these being taken, were chiefly massacred in cold blood after the action: all the rest perished either on the field or in the flight by the swords of their inexplicable coun-

trymen. In justice to Caesar we must observe, that his tri-
umphs over the Pompeian party were in a great measure exempt from these atrocities. (Plut. in Sylla. Eutrop.)

It is the well-founded remark of a judicious and elegant writer, that our European battles appear only as skirmishes, when compared to those which have deluged the plains of Asia with blood. (Volt., Essai sur l'esprit et les mœurs des nations.) In the year 1218, fatally distinguished as be-
ing the epocha of the first irruption of the Moguls and Tar-
tars into the southern provinces of Asia; the destroyer Ghengis Khan marched to the siege of Otrar at the head of 700,000 combattants. Mohammed, the reigning sultan of Karazm, opposed him with an army 400,000 strong. The weaker party were defeated, and the Tartar conqueror commenced his fannyng career by the destruction of 150,000 of his enemies. This first chastisement only paved the way for others still more terrible. In following the great Khan through his dreadful conquests described by De la Croix from the best Eastern authorities, we are shocked at the unheard of severities exercised upon such cities as most incurred his anger by an obstinate resistance. The particulars of such tragedies would but disturb the reader. To select a few of the most remarkable instances:-At the forming of Karazm, Mohammed's capital, 200,000 persons were massacred, and half that number sold for slaves; 90,000 were shot to death with arrows in cold blood on the plains of Nifah; 1,747,000 were butchered in the two cities of Nihabour and Tash, and their dependencies; 1,500,000 in the district of Herat; and in the last battle fought by Ghengis Khan against the rebels of Tangut, 300,000 are reported to have perished. To dismiss this subject, the Chinese records inform us, that in the first fourteen years of the Mogul empire, the numbers of persons destroyed by Ghengis Khan amounted to the dreadful total of eighteen millions and upwards. (Petit de la Croix, Hist. de Gheng; Khan, Par. 1710. Mod. Univ. Hist. vol. iv.)

The Subsequent wars of the Moguls abounded with exam-

ples of almost equal enormity. In the siege of the capital of the Chinese empire by Oktay Khan, a million of people were slain on both sides. Timur Bek, who carried on his expoditions upon the same plan as Ghengis, could bring

800,000 men at once into the field, with whom he com-
pletely defeated at Ancyra 450,000 Turks under Bojaset, that not a fourth part escaped the common destruction.

In a word, it is in Asia that war has always been waged on
the most gigantic scale.

Laws bloody in their conquests, and more generous in their

disputes, the armies which during the two last centuries have been set on foot by European nations, were compar-
atively trifling in number. The battle of Malplaquet, where 220,000 men were engaged on both sides, is most remark-
able for the number of the combattants; those of Hoeh-

dett and Prague for the destruction of the human species. At Hoehdett, the French and Bavarian army, which before the action murthered 60,000 men, was reduced to one third of that number. The battle of Prague clot the king of Pruss-

ia, by his own confession, 16,000 of his best troops, while the Austrians lost 24,000 men.

It is with sorrow we are obliged to remark, that the car-

nage on several occasions, during the last unhappy contest, has been unexampled in the history of modern war. Upon the Rhine, in particular, the losses on both sides, towards the latter end of December 1793, is computed at 80,000 men.

The following concise list of the most remarkable and de-

cisive battles which have taken place (chiefly in Europe) from the earliest ages, may not prove wholly unacceptable.

B. C.

Marathon, between the Greeks and Persians, fought 490

Himerir, in Sicily, between the Greeks and Carthag-

inians, 480

Plataea, Greeks and Persians, 479

Mycale, in Ionia, 479

Electrum, in Ionia, 479

In Egypt, between the Athenians and Persians, 460

Of the Athenians, in Sicily, between the Athenians and

Syracusan, 413

Cyzaxa, in Peria, 460

Coronea, between Agelaius and the forces of the The-

ban alliance, 394

Lenatra, where the Spartans were entirely defeated by

Epaminondas and the Thebans, 371

Mantinea, 371

Cheronea, 371

Of the Granicus, 334

Iphus, 333

Arbela, or Gaugamela, which subverted the Persian empire,

Of the Hydaspes, between Alexander and Porus, 331

Iphus, in Phrygia, 301

Beneventum, in Italy, between Pyrrhus and the Ro-

mans, 274

Agrigentum, in Sicily, between the Romans and Car-

thaginians, 262

Tunis, in Africa, do. 255

Panormus, in Sicily, do. 251

Of the Macar, in Africa, between Hamilcar Barcas and

the revolted mercenaries, 239

Trebia, in Italy, between Hannibal and the Romans, 218

Of the lake Trisslyfynus, do. 217

Canne, do: one of the most complete defeats men-

tioned in history, 216

Sicca, on the Meturus, where the army of Aesfubal

was cut off by Nero, the Roman consul, 207

In Spain, between Scipio and Aesfubal the son of

Gillo, 206

Zama, Hannibal totally defeated by Scipio, 200

Magnentha, between L. Scipio and Antiochus, 190

Pydna, between Pericles and P. Aemilius, 168

Nepentis,
Nepheris, decline of the third Punic war, 645
Circe, in Numidia, between Marius and Jugurtha, 1702
Near the Rhone, where the Romans sustained a terrible defeat from the Cimbri and Teutones, 1702
Aquae Sextiae, between Marius and the Teutones, 1702
Vercelli, in which Marius totally exterminated the Cimbri, 1702
Chersona, between Sylla and the army of Mithridates, do., 1702
Orthomenus, do., 1702
Before the gates of Rome, between Sylla and the Samnite Telephus, 1702
Cabira, between Lucullus and the Mithridates, 1702
Tigrancorcta, between Lucullus and Tigranes, 1702
Carrhae, Crassus defeated by the Parthians, 1702
Pharsalia, between Caesar and Pompey, 1702
Philippi, 1683
Adium, 1683
Bedriacum, between the legions of Otho and Vitellius, 1683
Cremona, between the generals of Vitellius and Vespasian., 1683
Lugdunum, in Gaul, between Severus and Albinius, 1683
Chalons, between Aetius and Attila, in which 300,000 persons fell on both sides, 1683
Aizanid, in Syria, 1683
Kadefia, in Pera, which subdued the empire of the Saffanides in Peria, 1683
Vermok, in Syria, where the Samcan general Khaled totally defeated the Greeks, 1683
Fontenay, in France, 1683
Hatting, 1683
Afealon in Palestines, between the Croics and the Saracens, 1683
Bouvines, 1683
Otrar in Tartary, 1683
Of the Indus, between Ghengis Khan and Jalalodin, 1683
Bannockburn, 1683
Coffey, 1683
Poictiers, 1683
Angvurt, between Bajazet and Tamerlane, 1683
Agincourt, 1683
Towton, 1683
Bosworth, between Henry VII. and Richard III. which settled the war between the houses of York and Lancaster, 1683
Fildden, 1683
Mariargno, between Francis I. and the Swiss, 1683
Pavia, between Francis I. and Charles V., 1683
Mohat in Hungary, which decided the fate of that kingdom, 1683
S. Quintin, 1683
Neuport, by prince Maurice over Albert, 1683
Prague, by the duke of Bavaria over the Elector Palatine, 1683
Leipzig, by Guillaume Adolphus over count Tilly, 1683
Lutzen, memorable for the death of Guillaume Adolphus, 1683
Nordlingen, where the Protestant league in Germany was totally defeated, 1683
Brittenfeld, near Leipzig, 1683
Edgehill, 1683
Rostroy, 1683
Nafby, 1683
Jancowitz, 1683
Worcester, 1683
Before Vienna, which was relieved in consequence, 1683

Boyne in Ireland, 1690
Fleurus, 1690
Staffarda, in which the Savoyards were defeated by Catini, 1690
Sallankemen, where the Turks were totally defeated by prince Lewis of Baden, 1691
Agrim in Ireland, 1692
Steinkirk, 1693
Londen, 1693
Zentha on the Tibribe, memorable for the total defeat of the Turks by prince Eugene, 1697
Narva, 1700
Cliflow, 1702
Hochled, 1704
Ramililies, 1706
Turin, 1706
14 Aug., 1706
Almanza, 1707
Pultowa, 1709
Malplaquet, 1709
Denain, 1712
Peterwaradin, 1716
Belgrade, 1717
14 Apr., 1717
Pamoa, 1734
Guatalka, 1734
8 Sep., 1734
Molwitz (the first defeat given to the奥匈 by Frederick III.), 1741
Czartow, 1742
Fontenoy, a memorable battle, 1745
Friedberg in Silexia, where the king of Prussia totally defeated the Austrians, 1745
Rotto-freddo in Italy, 1746
Calhoden, 1746
Prague, 1757
Kolin (the first defeat sustained by the king of Prussia), 1757
Plassey, which laid the foundation of the future power of the British nation in Bengal and Hindostan, 23 June, 1757
Roebach, 1757
Dresden, 1757
Liifthal, 1757
2 Dec., 1757
Zorndorf (in this battle the king of Prussia totally defeated the Russians with terrible slaughter), 25 Aug., 1758
Hochkirchen, 1758
Minden, 1758
1 Aug., 1759
Cunnersdorf (the king of Prussia here sustained a complete defeat from the Russians), 12 Aug., 1759
Torgau, 1760
Freyburg, decisive of the seven years' war, 29 Oct., 1762
Choczin, 30 April, 1769
Foczan, 1789
Jemappes, in which the Austrians were defeated by Dumourier, and lost in consequence all their possessions in the Netherlands, 6 Nov., 1792
Tirlemont, where Dumourier was defeated by the prince of Sax Cobourg, and the Netherlands subsequently recovered, 18 March, 1793
Between Dietz and Louvain, fought by the same generals, with similar success, 22 March, 1793
Haguenau, 8 Dec., 1793.
In the neighbourhood of Landau (the Austro-Prussian army was almost destroyed by the republican generals Hoche and Pichegru), from the 22 to the 27 Dec., 1793
Moncorn (Gen. Clairfays was again defeated by Pichegru), 29 April, 1794
Florus (the prince of Cobourg was defeated by Jourdan. This battle ultimately decided the fate of the Netherlands), 26 June, 1794
Lige, 1794

Hohenlinden, 3 Dec. 1800

The chief view of the great commanders of modern times
has been, till of late years, rather to harass, or starve an
enemy, by frequent alarms, by cutting off his supplies of
provisions, seizing his baggage, &c., than to make his fortune and reputation on the event of a
day; a battle generally deciding the fate of a campaign, and
not unfrequently of the war. It is therefore a rule never to
venture a general action without important reasons, or when
absolute necessity leaves no other choice.

Reasons for keeping and engaging the enemy are, a de-
dided superiority in number or quality of forces; discord
among the commanders of the opposite army, when actuated
by different interests; an obvious incapacity on their part,
demonstrated by a neglect of the ordinary precautions in en-
camping, or on a march, the necessity of relieving a con-
 siderable place beleaguered by the adversary; an apprehen-
sion of the total ruin and dispersion of an army, unless prevented
by successes in a general engagement; an intelligence of rein-
forcements coming to the enemy, whose junction would ren-
der him superior, and change the state of affairs; a partic-
ular advantage obtained in some preceding action, which,
however indefinite, has given the enemy a smart check, and
procured an evident superiority; or in fine, the obligation
of putting all the risk of a battle.

The most proper reasons for avoiding it are; the having
lefts to hope for from a victory, than to fear from an over-
throw; inferiority either in number or courage of the troops;
an expectation of fresh succors, or the junction of a con-
 siderable detachment; the impossibility of bringing the ene-
emy, too advantageously posted, to an engagement on fair
terms, or of forcing him in his entrenchments; or the pro-
spect of ruining his army by temporizing, and declining battle.
See Action.

But a resolution to engage being once taken, in con-
sequence of one or other of the reasons above recited, the next
object to be considered is the means of carrying it into exec-
ution with the strongest presumption of success. Those
measures are partly preparatory to the affair; but the most
important and essential chiefly take their rise out of the dif-
ferent circumstances of the action itself, and are those which
almost always determine its success.

Preparatory to fighting, a general should carefully observe
the following particulars. He should form the order of bat-
tle according to the strength and quality of the troops of
which his own army is composed, always having an eye
towards counteracting the disposition in which it is ex-
pected to find the enemy. The general officers should be
assigned their respective posts, and copies of the order of
battle carefully sent to such as have a separate command,
who must be responsible for its observation in every respect.

All the troops must be perfectly armed and equipped; the
proper number of cartridges distributed previously to the
battle; waggons loaded with ammunition, and arms stacion-
in the rear of those battalions, which, it is presumed,
will have the hottest fire to sustain; and a fresh reserve pro-
vided at the park of artillery; as well to give out before and
during the action, if wanted, as after it is over, when there
are generally many missing. Time, if possible, should be
allowed to the troops to rest and refresh themselves, before
the engagement. Physicians, surgeons, and medicines must
be provided, and rather more in number than may be
deemed barely sufficient. The army must be totally dis-
armed of the heavy baggage, and the remainder lodged in
a place of safety at some distance. The advantages of sun
and wind, however trivial, are not to be neglected. The
soldiers should likewise be inspired with the desire of fight-
ing, and a certainty of victory; inflamed with the hope of
plunder and good quarters; and the officers reminded of
confidence and of rewards.

Those occasions of conquering which commonly only pre-
sent themselves on the day of battle are, taking advantage
of the ground; strict observance of the disposition already con-
certed, and, should a correction prove necessary, the making
of it without confusion, and with the knowledge of all those
officers, who, from their situations, should become apprised
of it. The artillery is to be planted along the line, accord-
ing to the nature of the country; and every opportunity
narrowly watched of gaining an advantage, either by ex-
tending the wings to turn, if possible, the flanks of the
enemy; or by closing and protecting, to draught sufficient
troops from them for a grand attack where the enemy may
appear most feeble. Should the march to the enemy be
made by night, or little probability offer of finishing the
action before dark, the word should be given to the whole
line before they march. If the advance is made in line, due
care should be taken to preserve the equality of the wings,
and the requisite distance between the lines; frequent halts
should be made, to give the artillery time to fire and load,
and the ranks to recover their order. Frequent warnings,
above all, should be given the soldiers to receive the
enemy's fire, and abstain from returning it till they have
drawn their adversaries' ammunition from them: for troops
who have parted with their fire will most infallibly give way
on seeing an opponent advance, ready to pour in a heavy
volley upon them. If, however, both parties pursue the
same maxim, the only expedient is, to march up close to the
enemy, give in a general discharge upon them, and prevent
its being returned by immediately having recourse to the
event, under cover of the smoke, which seldom fails to
produce an important effect.

If the advancing army, by reason of the distance it has to
march, or the inequality and close nature of the ground, or
defiles, it must pass, cannot come at the enemy in front, the
approach must be made in a sufficient number of columns, to
admit the formation in order of battle, out of distance of be-
}
The general officers who conduct their columns should also carefully observe the motions of each other, so that the heads of their divisions may at least preserve a front; and that, when arrived at the ground where the army is to deploy into line, the movement may be executed with diligence and caution, and at too great a distance to be attacked by the enemy before all the battalions are drawn up in the preconcerted order.

The commander in chief should post himself where he may best and most conveniently remark the effect of the first charge, and whence he may with the least difficulty interfere his orders, either to sustain the troops who may have broken the enemy, or to replace such as have themselves been thrown into disorder. For both these purposes he should make use of the supernumerary forces stationed between the two lines, or of those of the reserve, so he may judge most advisable. Every other general officer should be at his particular station, either to lead to the charge, or to remedy the disorders which may arise in the brigade entrusted to his command.

If the battle becomes general and bloody, and success inclines to neither side, the commander in chief should direct his principal effort against that part of the line where the enemy's resistence is most obdurate; and in this case he should himself hasten to the spot, to animate the troops by his presence, and induce them to charge, under his eye, with greater vigour. If success is complete throughout the first line, and it entirely overthrows that of the enemy, the principal attention of the general, and of the other officers, should be employed to restrain the soldiers, prevent them from leaving their colours to follow up the flyers, and, committing the pursuit to some detached corps of cavalry and infantry, to march in good order, at a steady pace, to sustain these detachments, and afford the second line of the enemy. The artillery should always accompany the first line, in the order already distributed, in case the nature of the ground allows of it. The remainder of the army should follow the movement, always observing, without confusion, the distance between the two lines appointed by the order of battle.

Should the first line give way, or be thrown into disorder by the enemy, the battalions are to retire through the intervals left between those of the second line, behind which they are to halt and rally. Great care is here necessary to be taken by the officers, that instead of passing through the intervals, the routed troops do not directly rush in upon the ranks of the second line, and either carry them off in the general flight, or throw them into such confusion and disorder as it may be impossible to repair before the enemy are upon them.

On the first line's giving way, the second should march up briskly to its relief, and charge furiously upon the enemy without giving him time to repair the disorder into which the action and pursuit must, of course, have in some measure thrown him. By executing this with promptitude and determination, it is often easy to retrieve the ground which has been lost, and to defeat and repel the enemy's first lines already considerably weakened and deranged by the former attacks. It is the sooner effected, as the enemy's fire which does most execution is thrown away; the frequent discharges, from the great hurry of loading, being of little consequence, in comparison with the first. The great mischief is, that the second line, on seeing the first give way, are usually struck with a panic which magnifies the enemy, and on his nearer approach, either betake themselves to flight, or make but a faint resistance.

If, on the other hand, the victory still remains constant, and the adverse second line is overthrown, the general in chief should use still greater care than formerly to prevent his followers from dispersing, lest they should be charged and routed by the first line of the enemy, which may have retired and rallied behind their second. He should push the beaten troops, still keeping his men in good order, and in line, till their confusion is general. He must then progressively augment the number of his detached forces; without, however, once suffering any individual to quit his colours, unless commanded. It is at this moment that he should employ his reserve, and the different corps which have not been engaged, to pursue the enemy, prevent them from rallying, and, left of all, to make prisoners, which the men should never be suffered to do during the combat, or even to think of the booty, till the victory is absolutely gained, and the enemy is utterly scattered and in disorder. The fear of their turning upon the different detachments employed in the pursuit. The general may then, for the rest of the day, suffer his soldiers to collect the booty. If, in full pursuit, the detachments fall in among the enemy's baggage, they must not be suffered to disband instead of following up their advantage.

Their officers must with extreme attention, severity, and even blows, if milder methods are of no avail, push them forward till they have got clear of the baggage, employ them only in taking the enemy prisoners, or cutting them down, and leave the pillage for the rest of the troops.

The first care of a general after the gain of a battle, should be to pay proper attention to his wounded, and visit, or at least fend to visit, the principals among them; to learn what valiant actions have been performed in different parts of the field; and to praise in general the whole army, particularly those who most deserves it. He should collect the trophies of his conquest, such as the prisoners, colours, standards, kettle-drums, and artillery, taken from the enemy; give, without delay, a first account of his victory to his court, and follow it up by another and more circumstantial detail, accompanied by the colours and standards he has taken. Then, after burying the dead, disembarking his camp of the wounded of both parties, the prisoners, artillery, and other superfluities, and suffered the army to take a little repose, in the execution of all which the least possible delay should be made, the victorious general may apply himself to derive from his success every advantage which time or place can furnish, in execution of the plan already concerted or resolved on.

But as the fortune of war is changeable, and notwithstanding every possible precaution taken to ensure success, a defeat will sometimes happen, the whole care of a general, as well as his officers, should in such an unforeseen event take place, must be exerted to prevent an entire rout. The commander should have this possibility always present to his mind. His own experience and sagacity, pointing out to him the critical moment preceding the loss of a battle, will also teach him to take all those measures proper for diminishing the disorder of a flight. A lauré effort may be made with such troops as yet remain unbroken, to give time to those already routed to re-assemble and rally in the rear, and thus to force them to orderly retreat. A post may be occupied impregnable to the enemy; or a detec be formed through which the defeated army may pass, and re-form behind it in safety.

As the loss of the battle generally involves that of the baggage, should it accompany the troops, and almost always that of the artillery, the general should only remain in the first position to which he has retired for safety, as long as may be necessary to collect the remainder of his forces, after which he may conduct them to a fortified camp, and there repair his losses, as well with cannon and arms brought from the adjacent garrisons, as by the succours which may arrive to him. If the loss is so serious as to threaten that of some considerable place, he should throw the best of his infantry into the garrison, and keep the field with the cavalry, in order
order to incommode the enemy if he form the siege; or keep him in awe, and prevent him from dividing his forces, if his object is only to penetrate into the country, and lay it under contribution. If the conqueror, on account of his losses in the engagement, finds his infantry too much weakened to undertake a heavy siege; should he be disabled from attempting it for want of heavy artillery and ammunition; or should he derive no other profit from his victory than that of disconcerting his enemy's projects, remaining master of the open country during the reti of the campaign, or procuring his men quarters upon hostile territory; the vanquished general ought, after the first retreat, to occupy a defensible position in the vicinity of some large town, whose he may procure those accommodations his defeat may have deprived him of; such as, cordials and medicines for the sick, fresh baggage in lieu of that lost, &c. He should encourage his troops, without again facing the conquerors till he has repaired his losses by the arrival of new succours, new arms, fresh ammunition, and artillery, has cured the wounded, and finds himself strong enough to oppose the enemy, and prevent his establishment in advantageous quarters.

Bland, Military Discipline.—Memoire de l'Ecuquieres, c. Ixxx.

Battle was also a term formerly used to denote a body of forces drawn up in order of battle, and amounts to the same with what is otherwise called Battalion.

In this sense we meet with the length or depth of the Battle; the front, rear, and flanks of the Battle.

Battle, length of, is the number of soldiers in rank, or the space from the left flank to the right.

Battle, depth of, is the extent of a file, or the number of men from front to rear.

Battle, line of. See Line.

Battle array, the same with order of Battle.

Battle, order of, signifies the disposition of the squadrons and battalions of an army, into one or more lines, according to the nature of the ground, either for the purpose of engaging an enemy, or being reviewed by the general.

The Egyptians, whose prioriy in civilization and in communicating the arts to the rest of mankind is universally allowed, were naturally, although they ranked many great conquerors among their first monarchs, a pacific nation. We have no authorities to enable us to judge of the progress they had made in the art of war; but from the factious account of the battle of Thymbra, given by Xenophon in his Cyropedia, we may fairly presume that they usually fought in large and deep battalions, forming a complete square. On the above occasion he mentions twelve of these unwieldy bodies, each consisting of ten thousand men, and who formed the chief dependence of Cyrus against the army of Cyrus.

A people so particularly favoured and protected by heaven, as the ancient Jews, little needed the assistance of human invention, when, on any emergency, a new miracle was always ready to assure them success against their enemies. We find, therefore, nothing in the sacred scriptures that can give us an idea of any order of battle observed among them; although the regular division of their numerous forces under David, who distributed them into twelve main bodies according to their tribes, and each of these into thousands, or regiments, into hundreds or companies, into tens, and even into three, induces us to imagine, that they would not entirely forget such minute in the field. The Jewish writers, following, as the author of the "Dissertation sur la tactique des Hebreux," affirm, that they arranged their armies in one single line of considerable depth, sometimes between twenty and thirty in file. Along the front of these were placed the light armed men, viz. the most expert archers, spearmen, and slingers, who began the onset by a warlike front, and with casting thick showers of darts and stones against the enemy's front, in order to cause terror and confusion, and flop the rushing in of the chariots, which among the Caramites were very numerous, by wounding the horses and drivers. This is the more probable, as it is a method common to most of the Asiatic nations. Anc. Univ. Hist. Vol. ii. p. 184.

The order of battle described by Xenophon (Cyropedia) to have been used by Cyrus at the action of Thymbra, though perhaps a visionary one as applied in the text, may serve to give an idea of the method generally used by the ancient Persians in drawing up their armies, with which Xenophon must have been well acquainted. The cavalry, in the situation which it is indispensably necessary for them to observe, were posted on the wings. The heavy armed infantry, carrying, besides the pike, a sword for close combat, and drawn up twelve deep, formed the first line. The second consisted entirely of light armed, who threw their darts over the heads of the former, and annoyed and disordered the enemy in their approach. The third line, destined to the same purpose as the second, was composed entirely of archers; their bows, which were extremely well bent and stringed, carrying far beyond the front ranks, so as to excessively incommode the enemy. With these were sometimes intermixed slingers, who threw large stones with great effect. For this purpose the Rhodians afterwards substituted leaden balls. The fourth line, consisting of heavy armed, and similar to the first, was intended to support the preceding ones, and prevent them from giving way. It also served as a rearguard and a corps de reserve to repulse the enemy who should penetrate so far. The Persians also made use of mobile towers, erected on large carriages, each drawn by four oxen, and containing twenty men, who threw stones and darts. These were placed in line in the rear of all the army, behind the corps de reserve, and favored the rallying of those troops which were pushed and thrown into confusion by the enemy. They placed likewise great reliance in armed chariots, which they drew up sometimes in front of the battle, and sometimes upon the flanks, when in fear of being enveloped.

Such was the extent of the military science of those nations, who under Xerxes threatened Europe and the West with subjugation. But we see no occasion on which they knew how to profit by the advantage of the ground, to carry the war, when necessary, into a difficult country, to make use of defiles and ambushes, either for the purpose of covering themselves from the attacks of the enemy, or of annoying him on his march; or to protract an unequal campaign by avoiding a decisive action with a superior antagonist, and reducing him to distress for want of forage and ammunition. Neither do we observe that they paid the requisite attention to the supporting their flanks by rivers, mountains, or heights, when it would have been advantageous by giving them an equal front to an army much more numerous, and putting them out of danger of being surrounded. Rollin, Hist. Ancienne; liv. iv. ch. 4.

The Persians made some alterations in this system; but they were far from being judicious. Artaxerxes Mnasus, at the battle of Cunaxa, threw all his forces into one line, for the purpose of surrounding or outflanking those of his brother Cyrus; but he preferred the clumsy order of square battalions, whose narrowness rendered it impossible for them to take advantage of a fluce with the necessary promptitude, to treat with facility, or manœuvre with any effect. The disposition of Mnasus the Rhodian, in opposing the D.
pillage of the Granicus by Alexander was his fault. He formed two lines: the first of cavalry to assail and disorder the Greeks as they attempted to gain the bank of the river; and the second, at some distance, of infantry, with the intention, no doubt, of supporting the first; but, however judicious this arrangement might have been, he wanted genius or inclination to profit by it, and entirely suffered the Macedonians to reach the shore, and defeat the cavalry opposed to them, and form their phalanx unharried for the attack of his heavy-armed foot, without benefit from his position, or calling a single javelin. It is impossible to read, without indignation, the unfeeling details of the pompous march of Darius, and the extreme folly, as also, ignorance, conspicuous in the order of battle he made his armies observe at Issus and Gangarama. His awkward evolutions on the former occasion, disordered his forces before the commencement of the action. In the latter instance he preferred the rabble arrangement of his infantry by nations, in huge square battalions; he intermixed them with corps of horse, no less unwisely, and, not content with having committed faults so is excusable, he surpassed them both by another. The nature of the ground, not allowing his immense army to extend itself upon a single front, seemed to point out the necessity of a second line, or at least a corps de reserve. He indeed drew up, behind his centre, several immense battalions for which he had no room in front; but so close to the first line, that when these gave way, the reserve, instead of supporting, served only to augment their disorder. Against such an enemy, it is by no means surprising that Alexander should have been, with inferior forces, so completely successful. Xenoph. Anab. lib. i. Arrian. in vit. Alex. lib. i. & iii.

We now turn to the Greeks, who, of all people of antiquity, the Romans excepted, were the best judges of warlike affairs and military conduct; but we cannot easily excuse them for the oversight they almost constantly committed in the drawing up of their whole army on one front, and trusting to a single effort the forces of the day. Their infantry consisted of two kinds of soldiers: the heavy armed, who carried large bucklers, lances, and swords, and in whom consisted the principal strength of the army; and the archers and fighters who were generally distributed along the front of the line, and employed their arrows, darts, and arrows, to disorder the ranks of the enemy. Having made their discharges, they retired round the flanks into the rear of the heavy armed, whence they continued throwing their darts during the retreat of the action. As for the heavy armed, or Hoplites, we shall follow Thucydides in describing their disposition, according to the Lacedaemonian system, that nation being then reckoned the most expert among the Greeks in military knowledge. Their battalions consisted of four lesser divisions, each consisting of 128 men, and subdivided into four others, each of 32 men. The effective force of every large corps thus consisted of 512 soldiers, who were usually drawn up in smaller ones of four men in front, and eight in file. We find seven of these regiments engaged at the first battle of Mantinea, during the Peloponnesian War. The depth of the files was, however, often altered, when judged necessary by their commanders.

The Lacedaemonians never made use of cavalry before the Meleagrian war, on which occasion they were convinced of the impracticability of carrying on their operations in a flat country without it. Even then they rarely exceeded the number of six hundred, and these were chiefly composed of the inhabitants of a little district in Laconia called Sciritis, a circumstance from which they derived their appellation of Skiritae. They were always drawn up on the left flank of the army, a post they claimed by right. So near were the Greeks in general to the use of cavalry, that in the most flourishing periods of the Athenian republic, they never numbered above 1,200 in their army.

The Greek taifnicians of the middle ages have exalted their imaginations in forming fanciful orders of battle, principally for the cavalry. Minute geometers and theoretical soldiers, they have considered the art of war in a light entirely mechanical, and employing their pens at random, have given us upon paper such plans and dispositions as only could exist in their own ideas, and could only originate in their ignorance of the practical part of the science. It is hence we derive the rhomb, the wedge, the orbicular, oval, and angular manner of disposing their forces, maneuvers perhaps of use in exercising a squadron, but not to be adopted in the field without imminent and inevitable danger. To form a proper estimation of ancient tactics, we should confute the writings of those celebrated characters, who only recount what they have in person seen, and themselves performed. Such are Xenophon, Polybius, Julius Caesar, and Arrian. In reading them we trace the military art among the ancient Greeks and Romans to its highest pitch of perfection. The principal offensive and defensive operations of a campaign in the open country, or of a siege, are developed with order and perspicuity, and the images they present to us are distinctly imprinted on our imagination. Thucyd. lib. iii.—Rolle. Hist. Antiq. liv. x. ch. 2.—Potter. Archzol. tom. ii. lib. 3. ch. 9.—Albian. tact. ch. 13.—Guiscard's, Memoires Milit. d'Ant. prélim.

Philip and Alexander put the last hand to improving the order of the Greek infantry in the creation and establishment of their formidable phalanx. For a particular account of its formation and evolutions, we must refer the reader to the article PHALANX. For several ages, this was the order of battle which most prevailed among the nations of the then known world. The Carthaginians, the Syrians, the Egyptians, adopted its use. We find the generals of Mithridates employed it against Sulla, and the barbarous Helvetic and Germanians in their contests with Julius Caesar. But the difficulty of preserving the necessary uniform and order in so large and numerous a body; and the want of a second line to support it when obliged to give way, were glaring defects in its disposition, and it was therefore eventually forced to give place to the more convenient and scientific arrangement of the Roman legion.

A Roman legion arranged in order of battle, consisted of thirty maniples, of various strength according to the establishment of the legion. Supposing it of 5,500 men, each manipulus of the Hastati and Principes was composed of 140 soldiers;—those of the Triarii only of 60: the remnant of the troops were Velites, or light armed. Livy, in describing the war with the Latins, gives the following account of the ordnance of the legion. The Hastati, drawn up in separate manipuli, formed the first line. The Principes, chiefly old experienced soldiers, were placed behind the former, but with intervals between their companies sufficiently wide to receive the Hastati in case they should be obliged to retreat. The Triarii, all veterans, who besides the short sword common to all the legionaries, were armed with long pikes, composed the third line; their intervals being so extended as to enable them to receive both the Principes and Hastati within them without any disorder, and still facing the enemy. If therefore the Hastati found themselves unable to sustain the charge, they retired gently within the Principes, and joining with them, renewed the combat. If these proved too weak for resistance, both retired amidst the Triarii, where rallying, they formed a new line, and charged with more vigour than ever.
ever. If again defeated, the battle was lost: the Romans had no further resource. Livy, lib. viii.—Macchiavel, art. di Guer, lib. iii. ch. 1.

These successive retreats are no where mentioned, except in Livy as above stated; and prejudiced as we are in favour of the military science of the Romans, we find it difficult to conceive the practicability of their execution. Livy has, in fact, much mistaken the intention of the disposition in quinques of the ancient legion. Its sole design was to enable the army to form with facility in that order of battle which the situation of the enemy, or nature of the ground, might render most applicable. At the moment which preceded the charge, the manipuli of the second line, marching briskly up into the intervals of the Hastati, formed a continued front, ten files in depth, and equal to that of the enemy. The Triarii remained as a corps de reserve. It was thus, as we shall incontrovertibly prove in account of those actions, that the Roman infantry were arranged at the Tividia and at Carn.) It was this, with some little variation, that they fought at Zama. Neither was it unusual with them to dispose their manipuli according to the principles of the column, as in the battle of Tividia, and that between Scipio and Aemus the pons of G feu, in Spain. Where there was but little or none in the impetus of the enemy, the intervals of the Hastati were filled up by the Velites; the Principes remaining at their polls in a second line; but, opposed to the close and heavy order of the Macedonian phalanx, a directly different disposition was observed. The manipuli of each line, preserving their intervals, and acting as separate corps, harassed the enemy by deflatory attacks, obliged them to abandon their united order, in which situation they were invincible, and penetrating the phalanx in every direction, obtained an easy triumph. Guichard, Memoires Militaires, ch. iv.

As to the Velites, and in later times the archers and slingers, they were not drawn up in this regular manner; but disposed of either before the front of the Hastati, or scattered up and down among the void spaces of the first line, or finally, placed in two bodies on the wings. These always began the battle, skirmishing in flying parties with the foremost troops of the enemy. If they were repulsed, which was usually the case, they fell back to the flanks of the army, or retired through the intervals into the rear. When they retreated, the Hastati advanced to the charge. The auxiliaries generally composed the two points of the battle, and covered the whole body of the Roman infantry. As to the cavalry, it was posted on the wings, fighting sometimes on foot as well as on horseback; and here we find some reason to arrange the judgment of the Romans, who never allotted a proportion of more than 300 cavalry to each legion whatever might be the nature of that country which was the theatre of the war. They made no difference between the plains of Locris and the mountains of Luceria; and in the Alps maintained the same number of squadrons, as in the fertile valleys of Apulia.

But the order of battle in quinques was in process of time abandoned by the Romans. The tactics of Caesar widely differ from those of Scipio and Scipio Paulus; and the march and order observed by Metellus in his Numidian war against Jugurtha, transmitted to us by Scullus, are the last traces we find in history of the disposition which proved so fatal to Hannibal, to Philip, and to Perus. The manipuli with intervals; the three lines of Hastati, Principes, and Triarii, differing in arms and in numbers, disappear, and although the age of Maruis, the legion assumes a new form. Instead of thirty companies, we then find it divided into ten cohorts, equivalent to our battles, since they each consisted of from five to six hundred men, drawn up in a single line, with a depth of eight or sometimes nine in file. The legions of Vepalis, according to Josephus, were drawn up fix deep. This last arrangement continued to be observed without alteration during the flourishing ages of Rome; but as we advance nearer to modern times, we perceive their military art decline in its perfection, in proportion to the decay of their greatness. Under Leo and Mauritius it is as difficult to recognize the tactics, as the empire of the Caesars. The difficulty of ascertaining the period of these successive alterations has deterred those authors who have been most capable from undertaking the office; and finding it easier to suppose that Livy and Plutarch have furnished us with sufficient information on the subject, they have concurred with those writers to maintain and perpetuate the form of marching. Caesar.—Joseph. bat. Ind.—Guichard, prd. dix.

For further observations on the discipline and constitution of the Roman infantry, see the article Legion.

For a long succession of barbarous ages, we find nothing to interest us in military tactics. Imitating in a rude degree the order of battle pointed out to them by their ancestors, the western nations from the fifth to the fifteenth century, fought in large bodies, divided into an indefinite number of lines or squares, in every one of which the infantry, inferior in strength and in importance of service, composed the centre, flanked by the heavy armed cavalry, who always decided the fate of battles. It is vain in search for military science in these periods, and we shall therefore pass them over with all possible rapidity.

The introduction of artillery and fire arms necessarily introduced an alteration in this system. The cavalry ceased to be the arbiters of success, and declined rapidly in their importance. The destructive effect of the newly invented engines rendered it impossible to avoid making a material change in the order of the battalions. Their depth was gradually decreased. The method of engaging in wards was abolished, as exposing numbers of troops to be sacrificed without occasion; and two lines with a corps de reserve were in time thought quite sufficient for the purpose of action. The front of the army was proportionally extended, and embraced a greater extent of country. The advantages of ground, before judged in comparison trivial, were now eagerly sought after. Generals became more skilful tacticians, and by little and little, continually improving, sometimes slowly, sometimes with rapidity, the military art assumed the face it wears in our times; under the auspices progressively of a Gallus, a Conrad, an Eugene, a Marshal Saxe, and a Frederick the Great, whose names will never be forgotten by the latest posterity.

Under the articles Column and Line, to which they of right belong, we shall attempt to illustrate and compare the French and Prussian systems of the order of battle as now practised by both those nations; and accompany them with allusions from among the number which have of late years fallen under our inspection.

Battle, in a Naval Line, denotes an engagement between two fleets, squadrons, or even single ships. See Engagement. The ancients had divers forms of sea-battles; as the half-moon, circle, and fore-zero. In all these, not only the ships engaged each other, and by their beaks and prowes, and sometimes their fangs, endeavoured to daft in pieces, or overfet and sink each other, but the soldiers also annoyed the enemy with darts and slings, and, on their nearer approach, with swords and spears, boarding each other by laying bridges between the ships.

By way of preparation, they took down their sails, and lowered their masts, and secured whatever might expose them to the wind, choosing rather to be governed by their oars.
BATTLE, Line of. See Line.
BATTLE, Square. See Square. BATTLE, Actuated by. See Attacker. BATTLE royal, in Cock-fighting, denotes a fight between five, or seven cocks all together; so as that the cock which stands longest gets the day.

BATTLE-AXE, an ancient military weapon, which, at different periods, formed a principal part of the offensive armament.

Homer never ascribes this weapon to any but the barbarians, for the battle-axe was not used in war by the politer nations. Euripides tells us, it was the favourite weapon of the Amazons. The only instance where Homer has placed it in the hands of a warrior occurs in the thirteenth book of the Iliad, when Priam asks Melampus: it is there called ἀξίων, and is described with singular minuteness.

The Portrai, mentioned in the fifteenth book, l. 710, was perhaps not very different:

Ἀξίων ἐί σπάνιοι στέφανοι, ὀφθαλμὸς συριστος
Οὐκ ἐν πᾶσιν ἑλέστατοι, καὶ ἀξίων μοιράτως.

Norsemen, when they attended Xerxes' expedition: besides bows and arrows, we are told they were armed with a sort of hatchet, called Sagaris: (Herodotus, Polyb. lxxiv.) The Lycians had axes and daggers: (Ibid. xxi.) and the Egyptians huge battle-axes.

At the siege of the Roman capitol, by the Gauls under Brennus, we find one of the most distinguished warriors armed with a battle-axe (Plut. Camillus); and Ammianus Marcellinus, many centuries afterwards, describing a body of Gauls, figures them all with battle-axes and swords. From Tacitus, it should seem the ancient Germans had clubs, but no such weapons as those we are speaking of; and the only instance in his writings where ferusc occurs as an implement of combat, is where the Othonians are particularly described as striking on the helmets of their antagonists with their axes. (Tac. Hist. II. xlii.) In short, it was even then never used but among the Roman auxiliaries.

The introduction of the battle-axe into this country has been frequently attributed to the Danes; but proofs of its earlier use among us are not wanting, and there are instances known where it has been found even among the sepulchres of the ancient Britons. Mr. Rokeby, in the Archæologia of the Antiquity Society (vol. x. p. 113.) has described a fragment of an ancient battle-axe found among some Druidical remains in a barrow at Apstariu in Cumberland, June 1789. And in the same volume (pl. x.) are two representations of the old Galwegian bill, or battle-axe, found in a moss near Terregales, the seat of Marmaduke Maxwell Contable, Esq. of Northdale in Ireland. Others have been found among the barrows on the downs of Wildfire, and in the north of Scotland.

That it was used in the early Saxon times, we have the authority of several manuscripts of the ninth Century; and the French writers have recorded a particular instance of its use in France, so far back as the year 510. Clovis, they say, bribed the minsters and captains of Ragnacharius to deliver up both him and his brother: and when the prisoners were brought before him, he first reproached them for suffering themselves to be chained, and then dispatched them with his battle-axe. See Greg. Turon. I. ii. c. 42.

The battle-axe, however, was more used by the Danes than any other of the Northern nations; and they were, in course, more expert with it. At the battle of Stamford, Oct. 24, 1066, between Harold king of England, and Harold Harfager of Norway, when the Norwegians were obliged to retire, and the English began to pursue them with great eagerness, a total stop was put to their pursuit for several hours by the desperate boldness of a single Norwegian, who defended the pales of Stamford-bridge with his battle-axe: he killed more than forty of the English, and was himself slain only by stratagem. (Hen. Hunt. I. vii. p. 211.) The battle-axe principally in use among the Anglo-Saxons appears to have been the bipennis, or double edged axe; the gisarma is supposed to have been the bipennis with a longer handle or halbert: and the pole-axe, with an edge on one side, and a sharp point on the other, probably came in with the Normans.

During the middle period of our history we read but little of this weapon, though the Welsh infantry at the battle of Agincourt, 1415, found it particularly serviceable in dispatching those whom the archers had wounded with their arrows. One of the last instances of its effectual service was at the battle of Tewksbury, during the quarrel of the Roses, when the Duke of Somerset clave Lord Wenlock's head.

Toward the sixteenth century it seems to have gradually disused, though one instance occurs where a pillock placed in its handle bepeaks a wish in the warriors of that period to improve its use. (See ARMES.) It was perhaps more serviceable when our Knights were completely cased in armour; and has since degenerated into the halbert or part-fane.

BATTLEMENTS, in the Military Art, indentures, or notches in the top of a wall, parapet, or other building, in form of embrasures, for the sake of looking through them, &c. much affected in the old fortification.

BATTIOCHES, or BATTOGUES. See BATTAKES.

BATTLEY, from Bata, battus, labbeler, and λαβέω, I speak, in Grammar a multiplying word of without occasion, or a needlefix and superfluous repetition of the same words, or things.

BATTONI, or BATONI, Pompeo, in Biography, an eminent Italian painter of the Florence school, was born at Lucca in 1706. He was the son of a goldsmith, and brought up to that busines; but discovering a strong predilection for painting, he was supported in the Roman school by a subscription; and at Rome he employed himself in studying the antique, and copying the works of Raphael, and likewise in forming a style of his own, from a diligent observation of nature. Having distinguished himself both as a designer and a colourist, he was engaged in the execution of many important works, and painted altar-pieces and other pictures for various churches in Rome, Milan, Brescia, Lucca, Parma, Modena, and other cities; as well as history-pieces for private persons. One of his most admired works, is a holy family, purchased for a large sum by the grand duke of Russia. Battoni, however, acquired his principal fame as a portrait painter. Besides three papas, he painted several of the Imperial families of Austria and Russia. In recompense for a picture, which commemorated the interview of the emperor Joseph with his brother at Rome in 1779, he received several magnificent presents; and he, with all his male issue, was ennobled by the emperor. By the beautiful daughter of the surveyor of the Farnese palace, whom he married in early life, he had several children; and two of his daughters were highly celebrated for their taste and proficiency in music. As to his character, he was simple and modest, sincere, friendly, and charitable; much attached to religion, and very ambitious in the exercise of his profession. He seldom appeared in public, preferring a retired life, partly on account of the defects of his education, and partly by reason of the awkwardness of his figure, which opposed
proached to deformity. As a painter, he acquired eminence by the native force of his genius; and he had no rival but Mengs, who surpassed him in knowledge and learning, whilst he was inferior to him in natural talents. Battoni, having completed his 75th year, died in 1787. Fiklingston. Biog. Dict.

**BATTOON**, or **Batton.** See BASTON.

**BATTERY, a name given by the Huns to ships on their magazines or quarters abroad**: the chief of which are those at Archangel, Novgorod, Berghen, Lifbon, Venice, and Antwerp.

**BATTOW, in Geography**, a village on the west coast of Africa, S.E. from Cape Cavallo, on the west side of a small river opposite to Zeno, or Swino, on the east side. About half a league east, are two rocks lying under water, and the breakers over them are seen at sea at the distance of a league, and serve to point out the Cape and Road. N. lat. 5°; W. long. 8° 30'.

**BATTRE-LA-MESURE, Fr. to beat time, in Music.** There are various ways of marking the measure and accents in music: by dividing each bar into 2, 3, 4 equal parts with the motion of the hand, the foot, a baton, or a roll of paper. In common time of 4 minims or 2 crotchets in a bar, called binary measure, the hand is merely moved down and up. In time of 4 crotchets in a bar, the French frequently mark each portion of it, by beating the hand down to the first crotchet, moving it to the left for the 2d, to the right for the 3d, and lifting it up for the last. In triple time, or ternary measure of 3 minims, 3 crotchets, or 3 quavers, it is usually beaten, 2 down and one up, or the 1st down, the 2d to the left, and the 3d up.

The beating time is of great antiquity. The ancient Greeks had various ways of regulating the accents of song, and the steps of the dance. See RHYTHM and GREEK MUSIC.

The Italians often beat the two first portions of a bar, and lift the hand up for the 3d, both in common and triple time.

At the Opera, concert-spiritual, and even at private concerts (formerly) there was a perfon at Paris, armed with a truncheon (baton de Mesure) like a general, whom Rouffieu, in his Dictionary, ridicules, and says that he had been very aptly called the Bucheron, or wood-cutter; though when he wrote his musical articles for the Encyclopedic, the Italians and other nations, still had a Corfela to regulate the measure in the numerous bands employed in their churches when there was a gran Funzione in celebration of some feast or holy time. But it was in England, at the Commemoration of Handel in Westminster-Abbey, that, in the most numerous bands that ever was assembled in modern times, a Corphius was first diffenenced with. See TIME, MEASURE, ARSYS & THESS, BAR, ACCENT, & BATTUTA.

**BATTUS, LIEVEN**, in Biography, was born at Ghent, about the year 1540; but his father being obliged to remove to Rollock, on account of the troubles about religion, when he was only ten years old, he was put under the bell masters that place could afford, and he so well profited by the instruction he received, that in 1559 he was appointed teacher in mathematics. In this office he continued until the year 1565, when the country being at once afflicted with war and the plague, he went first to Padua, and then to Venice, where he was admitted doctor in medicine. Returning to Rollock, he practised with so much success and reputation, that he was appointed professor in that science, in which post he died, April 1591. Some small medical tracts, left by him in manuscript, were published in the Miscellaneae of Henry Siretus, at Frankf. 1614, 8vo. His son, Conrad Battus, following in the steps of his father, returning from his travels, took the degree of doctor in medicine at Basle, in 1604, but falling down flairs, at his brother's house at Rollock, soon after his return there, he received a wound in his groin, from a knife he had in his pocket, which occasioned his death. He also left some short essays on medical subjects, which were published with his father's, in the Miscellanea.

**BATTUS, CHARLES**, a Flemish writer of some eminence, who flourished about the end of the 16th century, published in 1598, a translation of the works of Guillumain, into his own language, folio, Dordretch, and in 1615, the works of Ambroixe Para, folio, Amsterdam, with numerous plates engraved on wood; also a manual for surgeons, with a treatise on wounds of the head, from Hippocrates, 1 2mo. Haller. Bib. Chirurg. Elyo. Dict. Hist.

**BATTUS, an order of prentits at Avignon, and in Provence, whose pitty carries them to exercise severe discipline upon themselves, both in public and private.**

**BATTUSZANI, in Geography, town of European Tur- key, in the province of Moklavia, 44 miles N.N.W. of Jafy.**

**BATTUTA, Ital. a bar in Muses, or those portions of a musical composition, where the time is beaten, or marked, with the hand or foot.** The Crifa dictionay defines bat- tuta; quella misura di tempo che dà il maestro della musica, in battendo a' canteri. Varchi, who died in 1566, and who is quoted in the Crufca as authority for the use of this term, says; quanto noia, e falfidio n° apportino coloro agli occhi, e agli orecchi, i quale non ballano a tempo, o non cantano a battuta. What pain and uneasy feftions do thofe give us, who neither dance nor sing in time!

Amende parliamo in rime, canzoni, e altre spezie di dire con misura di piede, e di tempo fufficiati. Both pronounced in rhyme, songs, and other species of poetry, in measured feet, and poetical numbers. This passage is cited from a MS. of 1400.

It is not easy to imagine how music, in many parts, could be composed in f sins, without bars or vertical lines drawn through them all, whence the term fone was derived; nor what kind of bars could contain the quantity of a maxima, equal to eight semibreves, unless we suppose that semivrebes were sung or played as quick as quavers are now. See TIME, ACCENT, ARSYS, and MEASURE.

The most ancient kind of time-table that has occurred in the course of our researches, consisted of only four several kinds of musical characters.

Among Italian musicians we frequently find the words a battuta, which import in time or measure, after recitative or an "ad libitum." Accordingly, a in the Italian musical language, when it precedes a sublitative, has the power of in.

**BATU-PURUDAN, fulbus lapides (Valens) in Natural History, one of the synonyms of MADREPOA LABRIN- THICA.**

**BATUA, Batua, Battus, or Bathouse, in Ancient Geo- graphy, a town of Dalmatia, now Budau, which fee.**

**Baty, BATY, **
Bavaria, in Geography, a kingdom of Africa, in the empire of Monomotapa, extending from the mountains of the Moon to the river Magnicano, whose prince is a vassal of the emperor. It is famous for its gold mines.

BATUDA, a method of fishing mentioned in some Middle Age Writers, wherein the fish are driven by beating the water with poles, till flopping into one place, they are the fewer caught.

BATUECAS, LOS, in Geography, a people of Spain, in the kingdom of Leon, and diocese of Coria, inhabiting a valley called "the valley of the Batuecas," encompassed by mountains that are almost inaccessible, between Salamanca to the north, Coria in the south, the river Tormez to the east, and the rock of France to the west. These people are supposed to be the remains of the ancient Goths, who took refuge in this valley among high mountains in their escape from the Moors. Others say, that their ancestors were ancient Spaniards or Iberians, who retired hither at the time of the invasion of the Goths. They are distinguished by their barbarism and rudeness to such a degree, that the Spaniards proverbially denominate an uncivilized person, one who comes from the valley of Batuecas.

BATURIN, a town of the Ukraine, on the river Defina, belonging to the Ruffians, and situated in the district of Nechin, which forms a part of Lefter Ruffia. It was destroyed by the Ruffians in 1708; but the castle has been twice rebuilt, and the town in some degree repaired.

BATUS, in Entomology, a species of Cerambyx, found in India and South America. The thorax is wrinkled and pinnate; wings-cases biculate: Antennae long, with hooked prickles. Linnaeus is Carinus niger. Mot. Paepe.

BATUSABER, in Geography, the capital of the kingdom of Yobor, in the southern extremity of the peninsula of Maccac, situated about 6 leagues from the sea, on the river Yobor or Jor, in a marshy situation, so that its small wooden houses are raised upon poles about 8 feet from the ground.

BATZ, or Baten, in Commerce, a copper coin mixed with silver, and current at different rates, according to the quantity of alloy, in many parts of Germany and Switzerland.

B. A. V. See Character.

BAVANY, or Boweny, in Geography, a river of Hindoostan, which runs into the Cavery, 7 miles north of Erroad in Coimbetore: N. lat. 11° 25'. E. long. 77° 50'.

Bavaria, Circle of, called BAYERN by the Germans, one of the circles of Germany, derives its name from the duchy of Bavaria, which is the most considerable part of it, and is bounded on the east by Austria and Bohemia, on the south by Carinthia and Tyrol, on the west by Suabia and Franchonia, and on the north by the Upper Palatinate, which, if considered as belonging to it, verges towards Upper Saxony. The dominions of the elector of Bavaria and the Palatinate, for these electorates are united, are computed to contain 16,176 square miles, and 1,934,000 inhabitants. Horeck estimates Bavaria at 1,339,000, and the Palatinate at 356,000. See Palatinate. Bulching divides the 32 rates of the circle of Bavaria into ecclesiastic and laic. To the former he refers the archbishopric of Salzburg, the bishoprics of Freisingen, Ratibon, and Pfaffau, together with the priory of Raithofgaden, and the abbeys of St. Emeran, Lower and Upper Munder, all which three lie in the city of Ratibon. The latter are composed of the electorate of Bavaria, the duchies of Neuburg and Sulzbach, the landgraviate of Leuchtenberg, the princely county of Sternsfeld, together with the counties of Ligny and Ortenburg, and also the lordships of Ehrenfeld, Sulzbach, and Pyrbaum, Hohenwaldeck, Breitenneck, and the imperial city of Ratibon. Of this circle, the elector of Bavaria, and the archbishop of Salzburg, are joint summoners of the diet. The diets, though usually held at Ratibon, are sometimes summoned to Woflerburg, Landshut, and Muhlfor. When the military force of the empire, in time of peace, was settled in 1681, at 30,000 men, the number required to be furnished by this circle was 800 cavalry, and 1494 infantry; and towards the 300,000 florins granted in 1707, it paid 18,252 florins, 9 kreuzers. The electorate of Bavaria is the military commander of the forces of the circle.

Bavaria is part of the Ruthia Vindelicia and Neronum of the ancients, and is supposed to have derived its name from the Bosii, a warlike people, that migrated from Gallia Celtica, crossed the Rhine, and first settled in Bohemia. About the time of the emperor Augustus, they were expelled the country by the Marcomanni, and removed into Noricum; and their settlement was called "Boja," or "Bayerland," in Latin, "Bauaria," or "Bauaria," whence, in process of time, it was formed Bavaria. In the 6th century, when the empire of the Franks was divided among the four sons of Clovis, Bavaria became subject to the dominion of the Austrayan kings, and was governed by dukes. In the 6th century, princes of the Francic family assumed the title of kings of Bavaria, while Lieutold in 887, was the first duke; and his progeny extend to the present day, though interrupted in 946, when Berthold dying without children, the emperor Otho gave Bavaria to his brother Henry of Saxony. In 1071, Welf, son of Azzo of Ecle, became duke of Bavaria, which, in 1138, passed to the house of Auffria; but in 1154, it reverted to the house of Welf, in the person of Henry the Lion. In 1180, it finally returned to the first family, by the succession of Otho of Wittelsbach, a descendant of Arnulf, second duke of Bavaria, A.D. 907. After the family had been unjustly deprived for more than two centuries, the Palatinate and Bavaria have recently been inhabited by a branch of the family of Deux Ponts, the son of the elector being now nominal duke of Deux Ponts.

Bavaria, Duchy or Electorate of, comprehends the greater part of the circle, and is divided into Upper and Lower Bavaria, and the Upper Palatinate. The length from north to south is somewhat interrupted, but may be about 150 British miles, and the breadth about 120. The duchy is bounded on the north by Bohemia and the Upper Palatinate; from the east by Austria, and the bishoprics of Salzburg and Pfaffau; on the west by the duchy of Neuburg, the marquisate of Burgau, and the bishopric of Augsburg; on the south by the county of Tyrol, and the bishopric of Brixen. Upper Bavaria is, for the most part, mountainous, cold, and barren, producing little corn and less wine; but it is covered with forests, interspersed with large and small lakes, and abounds in cattle, wild fowl, game, baths, medicinal springs, and salt works. It is also enriched with mines of silver and copper, lead and iron. It has also many quarries of marble. Lower Bavaria, being much more level, is more fertile, and produces plenty of grain, palfurage, and fruit. The mountains of Upper Bavaria may be considered as branches of the Alps. The chief rivers of this duchy are the Danube, the Erf, the Inn, the Lech, the Nobi, the Amthull, and the Regen. Its large inland lakes are 16, and its smaller ones 162. Render, in his "Tour through Germany," (Volkstrauft, 29th edition), 353 cities, besides Munich, the capital, 86 marked towns, 3,000 villages and hamlets, 39,949 taxable farms, 12,000 solitary houses, 1,600 uninhabited farm-houses, 180,000 hearths, 3,010 churches, 543 chapels, 906 parishes, 12 collegiate foundations, and 144 convents. Upper Bavaria is divided into two governments or regencies; that of Munich, and that of Birkhausen. The principal
principal towns of the former are Munich, Pfaffenhauen, Abensberg, Ingolstadt, Donauw, Friedrich, Landberg, Weltheim, Tolz, Wafflerburg, Traunstein, and Reichenhall. Those of the latter, are Burkhausen, Coblenz, Truburg, Brauneit, Uttendorf, Truburg, Ried, and Scharding. Lower Bavaria is also divided into two governments; that of Landshut, comprehendings, besides other towns, Landhout, Er- ding, Dingelshof, Teufich, Hals, Rottenburg, Nabburg, and Osterhofen; and that of Straubing, the chief places of which are Amberg, Pogen, Chem, Erlheim, Stadt-am-Hoff, and Deckendorf. The states of the duchy consist of the clergy, nobility, and burghers, of which a committee assembles at Munich whenever it may be necessary: but before the accession of the house of Hapsburg, the administration had become the most lethargic of any in Germany; and on this account the political importance of Bavaria has, in some measure, declined; and in the dangerous crisis that has subsided, and may still subsist between France and Austria, it may be difficult for this power to preserve a shadow of independence. By the fifth secret article of the treaty of Campo Formio, October 17, 1797, the French republic engages to employ its influence, that his majesty the emperor shall receive the archbishopric of Salzburg, and that part of the circle of Bavaria which lies between the archbishopric of Salzburg, the river Inn, Sazan, and Tyrol; including the town of Wafflerburg, on the right bank of the Inn, with an annuity of 9,000 tosols.

The established religion of Bavaria is the Roman Catholic; and no other is even tolerated: and thus the spirit of industry is very materially checked and restrained. The clergy, both secular and regular, are very rich; but the peasants are wretched in the extreme, their chief subsistence arising from the herds of swine that are fed on acorns and crabs in the woods and forests. The number of inhabitants in this duchy is estimated at 3,000,000, and the regular military force at 12,000.

The principal manufactures of the country are those of coarse woollen cloth, silk and woollen flannel, velvet, tapestry, Rockings, clocks, and watches. The principal exports are wheat, oats, wood, salt, and iron. Besides the mines of silver and copper near Pzenmen, in the bailliage of Vielsbach, and of lead at Reichenbach, the chief mineral riches of Bavaria consist in the salt springs at Traunstein, which pervade mountains of saline earth, like those at Halz, in the archbishopric of Salzburg, and occupy many people in productive industry. There are other springs at Reichenbach. These latter springs are 20 in number; but salt is only made from 4 of them: for which purpose part of the water proceeding from them is conveyed by pipes to the cauldrons at Traunstein, which is about 3 leagues distant. The salt annually made from these springs amounts to 250,000 quintals.

The title of the elector is "By the grace of God, duke of Upper and Lower Bavaria, as also of the Upper Palatinate; Pfalzgrave of the Rhine, arch-earl of the holy Roman empire, and elector and landgrave of Leuchtenberg." He has 5 hereditary officers, viz. a master of the household, a kinsman, marshal, cup bearer, and huntsman. The Bavarian order of St. George was revived in 1720, by the elector Albert. The knights of the order are styled "defenders of the immaculate conception of the blessed Virgin Mary," and are required to produce unquestionable proofs of the nobility of their ancestry for 8 generations in both lines. The elector is grand master; and his emblazon is a cross, enameled blue, with a St. George in the middle; on the reverse of which is the name of the elector of the order in a cypher surmounted with the electoral cap, and bearing at the angles the letters J. V. F. E., which signify "justus velut palma florebit," i.e. the righteous shall flourish like a palm-tree. The cross is worn pendent to a broad blue ribbon, with a black and white border. The elector has the fifth seat in the electoral college, and several votes at the diets, both of the empire and the circle, in the colleges of the princes and counts. His ordinary revenue, including the tolls on all the vessels which pass up and down the Danube, and other navigable rivers, with that which arises from the monopoly of corn, salt, beer, tobacco, and minerals, together with his own domain, is supposed, by some, to amount to 700,000l. per ann. Bucich and baron Reischbach estimate it at 800,000l. Render at 1,031,250l. and others at 1,166,600l.

The Bavarians are little distinguished in literature; but they are a vigorous race, adapted to the fatigues of war. They have, however, an university at Ingolstadt, and an Academy of Sciences at Munich. Baron Reischbach (Trav. I. 107) gives a very unfavourable account of their corporeal form and general disposition and character. The characteristic of a Bavarian, he says, is a very round head, a little broad chin, a large belly, and a pale complexion; so that many of them appear like caricatures of men! They have large fat bellies, short clubbed feet, narrow shoulders, a thick round head, and short necks; and they are heavy and awkward in their carriage. But the women are, in general, extremely beautiful, well shaped, of clear transparent complexions, and much more lively and graceful in their gestures than the men. The chief ornament of the men is a long broad waistcoat, frantically embroidered, from which their breeches hang low and loose. The women disguise themselves with stays in the shape of a funnel, covering the breast and shoulders, and hiding the whole neck. He says, that no pen can describe the ridiculous mixture of debauchery and devotion, which is exhibited every day; and he adds, that the propensity to fasting, in- dolence, and beggary, which prevails in Bavaria, is con- tenanced and sanctioned by the example of the priests. In- dolence, he says, is the prevailing character of the Bavarians: and Bavaria well deserves the character given of it by an officer of Gasson, of being the greatest brothel in the world. With their indolence, intemperance, and devotion, they unite, according to his account, a certain ferocity of temper, which often occasions quarrels, mutual abuse, and scene of blood. The Bavarian peasant, says this writer, is gruff, fat, dirty, lazy, drunken, and undisciplined; but he is brave, economical, patriotic, and such a slave to his word, that when it has once been given, it is never violated. Considerable benefit, however, has been derived from the laudable plans for destroying mendicancy and encouraging industry, proposed and carried into effect at Munich by count Rumford. See Munich.

By the plan of indemnities, agreed upon between the First Coalition of France and the emperor of Russia, in pursuance of the 7th article of the treaty of Luneville, it was agreed to propose that the indemnities to the archduke, grand duke, should be for Tuscany, and its dependencies, the archbishopric of Salzburg, the provoyschiff of Berchtesgaden, the bishopric of Treunt, that of Brixen, and part of that of Paffau, diturate beyond the Ilz and the Inn, on the side of Austria, except the suburbs of Paffau, with a radius of 500 tosols, and the abbeys, chapters, and convents, diturate in the abovementioned dioceses. These principalities were to be taken out of the circle of Bavaria, and incorporated in the circle of Austria, and their ecclesiastical jurisdictions, both metropolitan and diocesan, were to be also separated by the limits of the two circles; Munich to be united to Bavaria, and its equivalent in revenue taken from those of Freisingen. To the elector Palatine of Bavaria were to be assigned, for the duchy of Den-
Deux-Ponts, the duchy of Juliers, the palatinate of the Rhine, the marquisate of Berg-on-Zoom, the seignory of Raunheim, and others situated in Belgium and Allice; the bishoprics of Paffau, with the reservation of the part of the archdiocese of Salzburg with the reservations herein after mentioned; of Bamberg, of Anglesford, of Frémingen, and of Angersburgh; the provostship of Kempen; the imperial cities of Rothenburgh, Weissenburg, Wittenberg, Schweinfurt, Gotha, Sennefelt, Altshausen, Kempen, Saxony, Memmingen, Dinkellah, Nödingen, Ulm, Bohmen, Buchhorn, Wutzen, Lentkirch, Ravenshov, and Allschhausen; the abbey of St. Ulric, Heiden, Wottingen, Södingen, Elchingen, Uerburg, Rothenburgh, Woltenhouse, and Obtenbeuren, and Kaiserhein.

BAPTARIA, Palatinate of. See Upper Palatinate.

BAVAY, Paul, Ignatius De, in Biography, born at Brussels in 1704, applied himself early, and exclusively, to the study of chemistry, in which his father had walted a considerable patrimony. At length, in 1735, he went to Lovain, where, at the end of two years, he was admitted Doctor in Medicine. He now returned to Brussels, and acquired so much reputation by his successes in his practice, that, in 1746, when the French were in possession of the city, he was made physician to the military hospital there. In 1749, the French having evacuated Brussels, he was appointed Demonstrator in Anatomy, but being opposed by the principal physicians, and his practice condemned, probably on account of his professing to cure some difeases by a nostrum of his invention, he went to Dendermond, where he continued for some time. Returning again to Brussels, he died there, Feb. 20, 1768. His works are, "Petit Recueil D'Observations en medecine sur les vers de la confection tonique, resolutive et diurétique," Bruxelles 1753, 12mo. "Méthode courte, aisée, peu couteuse, utile aux medecins, et abolumen nécessaire au public indigent pour le guérison des plusieurs maladies." Bruxelles, 1759, 12mo. The principal ingredients in his medicine, are said to be quills and Florentine orris. Eloy. Dict. Hift.

BAVAY, in Geography, a town of France, in the department of the North, and chief place of a canton in the district of le Quefnay. It was formerly a considerable town, but is now reduced to the condition of a village. N. lat. 56° 25'. E. long. 3° 45'.

BAUDEE, a term used in Scotland for a halfpenny. Johnson.

BAUBIGNY, in Geography, a town of France, 1 1/2 league from Paris.

BAUBIS, in Zoology, a French name of a race of running dogs, called Chien Normain, or Dogs of Normandy.

BAUBULA, in Geography, a river of Spain, in the province of Aragon, which runs into the Xalon, about a league below Castellaud.

BAUCIDIAS, in Ancient Geography, an island of Greece, in the Saronic gulf. Phiny.

BAUCONICA, a town of the Vangiones, in Gallia Belgica, 9 miles from Mogontiacum, and 11 from Barbitongium; supposed to be Oppenheim, which see.

BAUD, in Geography, a town of France, in the department of Morbihan, and chief place of a canton in the district of Pontivy, 32 leagues south of Pontivy.

BAUDANVILLER, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Blamont, 12 league south of Blamont.

BAUDEKIN. See Baldachin.

BAUDELOT, Charles-César, in Biography, was born at Paris in 1648, and studied first at Beauvais, and then at Paris. He was, against his inclination, bred to the law, and pleaded as councillor of the parliament of Paris for some time with success. But he afterwards devoted himself to the study of antiquities. Having had an opportunity, in a journey to Dijon, to visit the libraries and cabinets of the place, he began to make a collection of books and medals; and he was thus led to write a book "On the Utility of Travelling," 2 vols. 12mo, 1686, the subject of which was inscriptions, medals, statues, bas-reliefs, and other relics of antiquity. It passed through several editions in French, and was translated into English. This work introduced him into an acquaintance with the most celebrated antiquaries of Europe, and was the means of his admission into the academy of Ricoverati at Padua. In 1705, he was made a member of the academy of Belles Lettres; and he had the charge of the valuable cabinet of the duchess of Orleans. He was the author of several dissertations on subjects of Medallia history and antiquities; and he is said to have composed the first travels of Paul Lucas. He died in 1723, with the character of a mild, modest, and benevolent man. Nouv. Dict. Hift.

BAUDERON, Barer, born at Charolles, about the middle of the 16th century, distinguished himself by his knowledge in pharmacy, to which he applied with such success, that a Pharmacopoeia, published in 1569, became the高标准 book for many years in France. It was founded on the Pharm. Lyonensis, and of Du Boys, with the observations of Catalans on distilled waters. Philonem Holland translated it into Latin, and published it in London, in folio, 1699, and at the Hague in 1640. It has been since many times reprinted, both in French and Latin. He also published "Praxis de febris, et de symptomatibus in morbis internis," 4to, 1620, Paris. In the preface to this book, he says, he is now 80 years of age. He died three years after, 1623. His son, Gratian Bauderon, who was brought up to the same profession as his father, died in 1615, aged 55 years. Haller Bib. Med. praet. Eloy. Dict. Hift.

BAUDIER, Michael, historiographer of France under Lewis XIII, was born of a noble family in Languedoc. He was the author of many works, containing valuable information, collected with greater industry than tafte or genius. The principal are "A general History of the feraglio and court of the grand Signior," 8vo, Paris, 1633; "A general History of the religion of the Turks, with the life of their prophet Mahomet, and the first caliphs," &c. 8vo, 1636; "A History of the Administration of Card. d'Ambois, minister of State under Louis XII," 8vo, Paris, 1634, 4to; "History of Marshal de Thorias," Paris, 1644, fol. and 1666, 2 vols. 12mo. He left in MS. a history of Marguer of Anjon, wife of Henry VI. of England, which is said to have been translated and published as an original work in England. Baudier was attached to the polite arts, and made a collection of medals and curiosities, such as his fortune would allow. The time of his death is not known. Nouv. Dict. Hift.

BAUDIUS, Domine, a learned philologus, was born in 1561, at Lille, in Flanders, and retired with his parents, who were of the reformed religion, from the perfecution of the duke of Alva, to Aix-la-Chapelle. After having studied at Leyden, Geneva, Ghent, and other places, he settled at Leyden, where he applied with assiduity to the study of jurisprudence, and was made doctor of laws in 1585. He visited England, and then travelled into France, where he obtained several distinguished patrons, and resided for 10 years. In 1602, he was nominated professor of eloquence at Leyden, and he also delivered lectures in history and jurisprudence. In 1611, the States made him joint historiographer with Mefrurius, and as such he wrote in po
BAUDRAND, Michael Antony, a celebrated geographer, was born at Paris in 1632. When he had finished his studies, he accompanied cardinal Antonio Barberini as his secretary to Rome; and upon his return to France, he was employed in revising Ferrarius's Geographical Dictionary, which he enlarged by one half, and published at Paris in 1671, fol. By his travels in Germany, and his visit to England, he was furnished with a variety of observations that were useful to him in the compilation of his geography. Upon his return to France in 1677, he composed his Geographical Dictionary in Latin, intituled "Geographia ordine literarum disposita," Paris 1682, 2 vols. fol. After a journey to Rome in 1691, he applied himself at Paris to the completion of his French Geographical Dictionary, which he was prevented from publishing by his death in the year 1700. This work was published at Paris in 1702, in folio, but it is said to be a corruption rather than a translation of the Latin Dictionary, printed in 1682. Gen. Dict.

BAUDROYE, in Ichthyology, the name of the angler, or fishing frog (Lophius piscatorius) in Camper, ad. Paris. &c.

BAUGE, in Commerce, a druggist manufactured in Burgundy, with thread, spun thick, and coarse wool.

BAUGE, in Geography, a town of France, and principal place of a district, in the department of the Maye and Loire, lettered on the river Cosnon, containing about 4000 inhabitants; 6 leagues E. N. E. from Angers. N. lat. 47° 30'. E. long. 0° 16'.

BAUGE, a town of Bresse in France, pleasantly situated on a fruitful hill. N. lat. 46° 40'. E. long. 4° 55'.

BAUERWITZ, or PAURWITZ, a town of Silesia, in the province of Jagendorf, on the river Zinn, 10 miles N. W. from Ratibor. The neighbourhood is a rich corn country.

BAUHIN, John, in Biography, born at Amiens in 1511, was early sent by his father to learn the practice of medicine and surgery, under an uncle of the same name at Paris. Here he had opportunity of hearing the lectures of Fernelius and Sylvius, and of seeing the practice of Tagaul, then in high reputation. Under these celebrated masters he made such progress, that when only seventeen years of age, he was taken into the service of Catherine Queen of Navarre, and made her physician. Reading about this time the translation of the New Testament into Latin by Erasmus, and becoming thence a profiyote to the reformed religion, to avoid persecution he came to England, but at the end of twelve months, being assured of protection, he returned to Paris. Here, however, he was soon laid hold of, accused of heresy, and committed to prison, whence, at the end of eighteen months, he only escaped with his life, through the intercession of his patroness, queen Catherine. Removing from Paris, he went to Antwerp, where for some time he taught and practised medicine and surgery; but the persecution against the followers of the new doctrines commencing there, he fled with his family to Basel. Here he was at first employed by Frobenius, the famed printer, in correcting the proofs, until after giving the necessary proofs of his proficiency in medicine, he was admitted to practice, and soon acquired considerable celebrity, and in 1580, was made dean of the faculty. He died in 1582, aged 71 years. The only work left by him, is "Quelques tres medecins, todtimes conclusions," printed at Basle, in 1578, fol.: probably an academical exercise. Athene Baurice.

BAUHIN, John, son of the former, born at Lyons, in 1541, shewing early a disposition to the study of botany, after going through the preliminary excercises, was sent by his father, when only twenty years of age, to accompany the celebrated Gesner in his excursions over the greater part of Latin, a "History of the Tree." He also acquired great reputation, both as a poet and prose-writer in that language. Towards the close of his life, he incurred the displeasure of prince Maurice, by his harangues in favour of peace; and he offended many persons by his political and religious sentiments, as well as by his moral conduct, which was not such as to secure respect. His poems indicate an irritable temper, and abound with classical allusion and metaphors; and particularly against the enemies of Scaliger. Moreover, he was boastful, vain, importunate, and a philosophe; and his licentiousness, both with regard to wine and women, involved him in much disgrace. He died at Leyden in 1613. His poems, which manifest gravity and soberness of diction and elevation of sentiment, were first collected and printed in 1587; and a more complete collection was printed at Leyden in 1607, and reprinted at Amsterdam, and other places. The "Letters" of Bandius, published after his death, are more esteemed for their style, than for his poems. He also published "Harangues," and some other pieces, all in Latin. Gen. Dict.

BAUDEBUC, or BAUDEBRI, in Ancient Geography, a place of Gallia Belgica, upon the banks of the Rhine, south of Confluentes. The machines of war, called Ballifat, were under the conduct of a prefect residing in this place; and the head-quarters of the general were at Mogniacum, or Mayence. Bauedbric was also another place of Belgica Prima, north-east of Augilia Treverorum, now Boppard.

BAUDEOIN, Francis, in Latin Baldewinus, in Biography, an eminent civilian and man of letters, was born at Arras in 1520, lived at Louvain, and in his youth resided at the court of Charles V. At Geneva he became intimate with Calvin, and embraced the reformed religion. In France he conformed to the religion of the country, and taught the law at Bourges from 1538 to 1545. In Germany he delivered lectures at Strasbourg, Heidelberg, and other places, avowing himself a Protestant; but by joining Calixtian in a project for bringing about a coalition of religions, he excited the laity displeasure of Calvin and Beza, and others of the reformed party. He enjoyed the favour of cardinal Lorrain, the invertebrate enemy of the Calvinites, and is supposed to have induced Antony, the weak king of Navarre, to abandon them. By that prince he was patronized, and appointed his delegate at the council of Trent. Upon the death of Antony in 1562, he was invited to Douay and Berinfon, and finally settled at Paris, where his reputation, acquired by several learned works which he had published, rendered his lectures popular among persons of the first distinction. The duke of Anjou, afterwards Henry III, wished to engage his services in the justification of the massacre of St. Bartholomew's; but to this prince he delivered his sentiments like an honest man, and was so much esteemed by him that he appointed him one of his counsellors of state. Whilst he was preparing to follow Henry to Poland, he was seized with a fever, which terminated his life at the college of Arras in Paris in 1572. He was distinguished by his extensive knowledge, admirable memory, and perspicuous eloquence. Notwithstanding the just reproach which he incurred by his veracity in religion, so that he was opprobriously denominated an "Heraphrodite," he appears to have been a man of moderate and tolerating principles, and whilst he condemned the severities exercised against the Protestants in the Low Countries, he also confounded the unjust zeal of Calvin in the persecution of Servetus. His Latin style was pure and elegant, and he left several works on the civil law, and also in ecclesiastical history and controversy, which have been much esteemed. Gen. Dict. Nouv. Dict. Hist. Vol. IV.
of France, Germany, Italy and Switzerland. In this journey he collected a prodigious number of plants, which formed the basis of his principal work, the "Historia Plantarum," which he even then had in contemplation, as appears by his correspondence with Gesner, carried on long after his return, but which was not published until several years after his death. Having accomplished the principal object of his travels, he first settled at Basle, where in 1560 he was elected professor in rhetoric. Some time after he removed to Yverdun, and at length, on the invitation of the duke of Wurttemberg, to whom he was made principal physician, he went to Montpellier, where he continued to reside the remaining forty years of his life. Though botany engaged the greater part of his time and attention, yet was not altogether full of other parts of natural history, as appears by his account of the medicinal properties of the principal mineral waters of Europe, particularly of the waters at Boll, in the principality of Wurttemberg, written at the command of the duke, to which he has added descriptions of the complaints in which mineral waters are invaluable; and his "Historia memorabilis laporum aliquot rubidorum, quia circa annum 1500, apud Monpelgarum, martorum damno, publica graeffati sunt," published at Montpellier, 1591, 8vo. He died in 1613, aged 72 years. His correspondence with Gesner, principally on botanical subjects, with his book "De plantis divis et fastice nomen habentibus," was published by his brother Gaspar, at Basle, 8vo, 1591, parvum bibliam, Haller says, et quin specie venec furoris operis. In 1593, he published at Montpellier, ib., in 8vo, "De plantis abintibus nomen habentibus." The proemium of his great work was published at Yverdun, in one volume 4to, in 1619, under the names of J. Bauhin and Henry Ceder, his brother-in-law, who had contributed to its perfection. In this specimen, Haller says, you see the rudiments of a natural classification of plants. The "Historia plantarum novas et absolutissimas, cum autorum continuo et diligentia, circa eos," upon which the author had bestowed above forty years' labour, was at length published at Yverdun in 1650 and 1651, in three volumes folio, under the care of Dr. Chabré. Notwithstanding the numerous errors in this book, many of which Haller says should be imputed to the editor, who was but indifferently qualified for the task he had undertaken, it is a noble and valuable work, and deservedly places the author in the first rank among the improvers of botany.

BAUHIN, GASPARD, born at Basle in 1560, twenty years later than his brother John, having the advantage of his brother's experience to guide him in his inquiries, made proportionally early advances in knowledge. After passing through the necessary preliminary studies, under Fabricius ab Aquapendente, 8vo. Pinax, and other celebrated anatomists at Padua, Montpellier, and Paris, and having collected in his travels a large number of plants, many of which he originated, by his brother, he returned to Basle in 1560, and was admitted doctor of medicine. In 1572, he was made Greek professor, and in 1578, professor of anatomy and botany, of which he is called in his epitaph the Phoenix. He was afterwards made professor of the practice of medicine, archistar, or principal physician to the city of Basle, dean of the faculty of medicine, and rector of the university, which distinguished honours he continued to hold to the time of his death, which happened in 1624.

Indefatigable in his attention to the duties of his several offices, he discharged them with such regularity as to secure to him the affection of his pupils, who materially assisted him in collecting plants, necessary in completing his botanical works, to which also his correspondents in different parts of Europe largely contributed.

Notwithstanding the number and variety of his offices, much of his time must have been employed in composing and preparing for the press his numerous publications on anatomy and botany; and though great additions and improvements have been made in our knowledge in those sciences since his time, many of his author's works are still consulted, and held in estimation. A few of the titles to his principal works follow: for the ref, see the Bib. Anat. and Bot. of Haller. "Franc. Ronfletti 1. de parte causar. e Gallico in Latinum transl." 4to. 1586, Basle. Two years after he published this work with an appendix, containing additional cases of women who are found to have undergone the operation and recovered; to which is also added a description of the valve of which he claimed the discovery. "Theorum Anatomicum, infinita locis autem, Francof. 1621, 4to., including several smaller works on anatomy, published by him before at various times. "Vive imagines partim corporis humani ante formis express, ex theatro anatomico Cup. Bauhini defuncti." Basle 1620. The figures are principally from Vefalusius and Entschius: some are proper to the author. In this work also are contained other discoveries in anatomy made by the author. "De hemiprophidorum nonulorumque partium natural," Openheim, 1618, 8vo. In 1598, he published "Matthioli opera, quae extant omnia," fol. Franc. in which there are many plants, Haller says, not before described. "Pinax theriophyti, ut index in Theophrausti Dioscoridis, Plini, et botanicorum qui a faciculoierperant opera," &c. Basle 1623, 4to. a work extremely useful to persons consulting the older botanists. "Catalogus plantarum circa B. Flacianum," Basl. 1622, 8vo; the largest catalogue extant, Haller says, of plants growing in a single district.

BAUHIN, JOHN GASPARD, son of the former, born March 12th 1569, after being well instructed in the Latin and Greek languages, and initiated in the knowledge of botany, anatomy, and other branches of medicine under his father, went to Paris in 1624, where he continued two years, attending the schools of the most celebrated masters there. He afterwards visited England, Leyden, Padua, and various other places; the fame of his ancestors procuring him an easy introduction, wherever he went, to the most distinguished personages. Returning to Basle in 1628, he was made doctor in medicine, and two years after professor in anatomy and botany, which offices he held for thirty years. In 1660, he was made professor in the practice of medicine, and was several times appointed dean of the faculty, and rector of the university. He died July 14, 1685.

Notwithstanding the numerous honours conferred upon him, he does not appear to have contributed much to the improvement of the science he professed, having only left three dissertations of little note or value.  "De pelle, de morborum differentiis et caulis, et de Epilepsia." BATHTINIA, fo named by Plinius in honour of the two famous botanists, John and Caspar Bauhin, in Botany. Lin. gen. 511. Reich. 354. Schreber, 697. Plun. 13. Juss. 551. Clas and ord. decandria monogynia. Nat. Ord. leguminosis: leguminosse Juss. Gen. CHAR. Gall. perinath oblong, gaping longitudinally on the lower side, recumbent on the other, gaping also five ways at the base, with five adhering leaves above deciduous. Cor. petals five, oblong, waved, with attenuated reflexed tops, expanding; the lower ones a little larger, the upper ones more dilate, all with claws placed on the calyx. Stamina 10, declining, shorter than the corolla; the tenth much the longest; anthers ovate, always on the tenth, felow on the rach. Pyli germ oblong, fitting on a pedicel; style filiform, declining; stigma obtuse, reflexing. Per. legume long, subbulbunar, one-celled. Seeds many, roundish, compressed, placed according to the length of the legume.
legume. Eff. Char. Col. five-leafed, deciduous. Pet. expanding, oblong, with claws, the upper one more dilatant, all inserted into the calyx. Legume. Of the yellow-flowered kind.

1. B. scandens, climbing mountain ebony. Folkam lingue, Rumph. Amb. 2. t. 1. Clennalitis Indica, Ray Suppl. 328. n. 13 & 14. Naga-mu-ralls, Rhed. Mal. t. 57. t. 30, 31. Stem circling, very rough, with many slender flakes, which put out tendrils and fall to the neighbouring trees; leaves alternate, heart-shaped, on long, sharp, six inches long, three and a half broad in the middle, deeply cut into two-pointed lobes, each having three prominent longitudinal ribs; leaves at first white, turning to a yellowish white; fruit slender and flat, containing six or eight flat bony seeds, black with a silvery border. A native of both Indies, not producing flowers in England. The seeds were sent to Mr. Miller from Campeachy, probably before the year 1752. 2. B. acutea, prickly, flaked mountain E. "I Flem prickly." An erect inelegant shrub, about a man's height; trunk and branches prickly, leaves roundish, with two roundish blunt lobes; cloven to one-third of their depth, smooth with white nerves; petiole thicker and callous at both ends, from the base of which proceeds on each side a sharp slender prickle, distilling when young, astringent; flowers large, white, and having an unpleasant scent; rising, in Jamaica, to the height of sixteen or eighteen feet, and plentiful there and in the other fuggy islands of America; the flowers are succeeded by pods, about three inches long, containing two or three swelling seeds; the pods are glutinous, and thick, as well as the bruised leaves, have a strong balsamic scent; called in America the Indian fig-tree, from its strong colour, which somewhat resembles the common fig. It is frequent about Carthagena in woods; cultivated by Mr. Miller in 1752.

3. B. divaricata, dwarf mountain E. "Leaves smooth, lobes divaricated, acute, two-nerved; petals lanceolate." A low shrub, seldom rising more than five or six feet high, dividing into several branches; corolla, white, and flowers in a simple upright raceme; having an agreeable scent, appearing during the greatest part of summer, and exhibiting one of the chief beauties of the hot-house; the pods are taper, about four inches long, and contain four or five dark-coloured seeds. A native of the north side of Jamaica, where it grows plentifully; cultivated by R. J. Lord Petre, before 1742, flowering from June to September. 4. B. angustata, "Leaves ovate, lobes parallel," differing from the others in its more oblong leaves, entire at the base, cloven to the middle into two straight parallel lobes, and having nine nerves. The calyx is long, streaked, and of a grey colour; the petals are subulate, flamous alternately shorter; legume very long, pendulous. It rises to the height of twenty feet, with a smooth item, dividing into many small branches, terminated by loose bunches of white flowers, which are succeeded by very long, narrow, compressed pods, each containing eight or ten seeds. A native of America; the seeds were received by Mr. Miller from Campeachy. 5. B. variata, variegated mountain E. Arbor S. Thomas, Zanon. Hith. 26. t. 15. Chavonna-Mandaru; 1. Rhed. Mal. t. 57. t. 32. "Calyxes one-leaved, burfting; petals fefhipe, ovate; lobes of the leaves obtuse." It rises with a strong item, upwards of twenty feet high, dividing into many strong branches; flowers large, in loose panicles, at the extremity of the branches, of a purplish red colour, marked with white, and the bottom yellow; pods about six inches long, and ½ of an inch broad, each containing three or four compressed seeds. Growing naturally in both Indies, and introduced here by Mr. Bentick in 1690. 6. B. purpurea, purple mountain E. Chovanna-Mandaru; 2. Rhed. Mal. t. 59. t. 33. "Leaves subcordate, two parted, rounded, tumulare underneath." A tall tree, differing from the foregoing in having larger leaves, more deeply cut, and more contracted on the sides; the calyx is yellowish green, and red; the corolla of a very red purple, and one petal out of the five streaked with white on the claw within and without; all lanceolate and dilatant; legumes larger than those of any other sort, being one and half to two spans long, and an inch broad. A native of the East Indies, where it flowers through the year. Introduced here in 1777. 7. B. emarginata, downy mountain E. Mandaru Madeira-patent. Philk. Alm. 245. p. 144. f. 6. Canfchen-pow, Rhed. Mal. t. 62. t. 35. "Leaves cordate, lobes semi-orbicular tomentose." This grows to the height of two fathoms, with a trunk nearly six inches in diameter, and divides into many branches; leaves smaller than those of the foregoing, rounded, one and half way, seven-nerved and blunt, with rounded lobes; having a strong scent if rubbed during the night, when the leaves are clapped together; the calyx of the flowers green and bell-shaped, and the corolla yellowish white; one of the petals having a dusky red purple spot at the claw; flaments yellowish white; flowers without smell. A native of the East Indies. Cultivated, says Ray, by Compton bishop of London, in 1657. 8. B. acumínata, sharp-leaved mountain E. Velutina-Mandaru, Rhed. Mal. t. 61. t. 34. "Leaves ovate, lobes acuminate semi-ovate." This rises to a man's height, with a trunk as thick as his arm; leaves more deeply cut, longer, contracted into a cusp or point towards the end, nine-nerved, leaves divided; flowers bell-shaped, pure white, without scent; petals rounded and blunt; flaments white; legumes smaller than in the others, being four or five inches long, an inch broad, smooth, with a round broad back. A native of the East Indies. 9. B. emarginata, "Fem prickly, leaves cordate with round lobes, tomentose underneath;" differing more than ten feet high, dividing into many branches, armed with short crooked spines; leaves alternate, heart-shaped, with two roundish lobes; flowers two or three together at the extremity of the branches, large, of a dirty white colour, and succeeded by flat pods, each containing two or three seeds. 10. B. rotundata, "Fem prickly, leaves subcordate, two-parted, rounded, flowers scattered;" rising twenty feet high, with a strong upright stem, sending out branches towards the top, armed with spines in pairs, strong and crooked; leaves like the former; flowers large and white, succeeding by long flat pods, narrow, and each including five or six seeds. This and the preceding are natives of Carthagena in New Spain. 11. B. aurita, long-corded mountain E. "Leaves bifid transfixed at the base, lobes lanceolate, perverted, three-nerved; petals lanceolate." Cultivated by Mr. Miller, in 1756, and flowering in September. 12. B. porrecta, smooth broad-leaved mountain E. "Leaves cordate, lobes porrected, acute, three-nerved; petals lanceolate." A tree rising about fifteen feet high, with several straight trunks, thick as a man's leg, covered with a whitish bark, dividing into many branches and twigs; leaves three inches long and two broad, yellowish-green, smooth, with seven or more ribs, and some transverse; the petals an inch long; the flowers at the ends of the twigs, on pedicels half an inch long; petals long, red-white variegated or fringed; flaments long and white; legumes of five or six inches long, brown. Growing on the hills in Jamaica. The wood very hard, and stained with black, whence the name of ebony. Cultivated by Mr. Miller, in 1739, and flowering in July. 13. B. can'da, white-leaved mountain E. "Leaves cordate, pubescent underneath, lobes ovate, obtuse; calyces attenuated upwards and elongated." A native of the East Indies, introduced by Dr. P. Ruffell in 1777; flowering in May and June. There are many other species both from the East and West Indies, not yet introduced.
yet sufficiently determined. The whole genus needs further investigation.

Propagation.—All these plants, being natives of hot countries, will not thrive in England out of the bark-root. They are propagated by seeds, procured from their native countries, which should be brought over in their pods. These must be sown in pots filled with light fresh earth, and plunged into a moderate hot bed of tanner’s bark; and if the seeds be good, they will come up in six weeks, and in a month after they should be carefully shaken out of the seed pot, without injuring their roots, and each of them planted in a separate small pot filled with light loamy earth, and plunged again into the hot-bed, shading them till they have taken fresh root, and then admitting fresh air to them every day in warm weather. In autumn they must be placed in the bark-root, and treated like other tender exotics, giving them but little water in winter. As these plants frequently flower in winter, they deserve a place in the rose. Martyr’s Miller’s Dict.

BAVINS, in War, faggots, made of birch, heath, or other furt of bruth-wood, that is both quickly fired and tough, 2½ or 3 feet long, with the bruth-ends all laid one way, and the other ends tied with two bands. They are dipped and sprinkled with sulphur, like reeds, excepting only that the bruth-ends only are dipped, and should be cloed togetheter before they are sprinkled, to keep them more close, in order to give a stronger fire, and to keep the branches from breaking off in shifting and handling them. See Fascines.

BAULA, in Ancient Geography, a district of Italy in Campania, between Baiae and the Lurcine lake, formed, according to Tacitus, by the sea; and the seat of many country houes.

BAULAS, in Geography, a town of Syria, 50 miles east of Damascus.

BAULEM’s Kill, a western water of Hudson’s river, 8½ miles below Albany.

BAULOT, or BEAULIEU, James, in Biography, of mean and obscure parentage, was born in the province of Burgundy, in 1651. Becoming acquainted with Pauloni, an Italian itinerant lithotomist, he travelled with him, as an assistant, for some years; but having at length, from observation, acquired the art of cutting for the ilone, and of curing ruptures, he separated from him, and soon became celebrated for his skill in both those arts. Though illustrious, and totally unacquainted with anatomy, yet he is said to have considerably improved on the method of operating used by his master and others; and to have approached very near the mode now followed by the most celebrated surgeons. Following the steps of Pauloni, he visited in turn all the principal cities on the continent. In 1697, he went to Paris, where he first operated with success, but failing in some cases, he went to Geneva, Aix-la-Chapelle, and Amsterdum: in each of which places he was much resorted to; for having both improved his instruments, and his mode of using them, he was now generally successful. He next went to Strasbourg, where he cut successfully a great number of patients, then to Venice, Padua, and Rome, every where acquiring additional fame and reputation. He was of a singular disposition, and wore a sort of monkish habit, whence he became generally known by the title of Friar James. He at length settled in a village near Besançon, where he died, 1720, being sixty-nine years of age. In gratitude for the numerous cures he had performed at Amsterdum, the magnificence of that city caused his portrait to be engraved, and a medal to be struck, bearing for impresa his boil. Haller Bib. Chirurg. Gen. Bio. Dict.

BAULTE, in Geography, a river of Prussia, which runs into the Fisch Haff, a little below Frauenburg.

BAUM, in Botany, See Melissa.

BAUM, Bolland. See MELITTA.

BAUM, Molucca. See MOLUCCELLA.

BAUM, Mohaviom and Turkey. See Dracophalum.

BAUMA, in Ancient Geography, a town of Ethiopia near Egypt. Pliny.

BAUME, an ancient town of Asia, in Mesopotamia, founded, according to Tolyemo, on the Euphrates.

BAUMAN, a remarkable cave in Lower Saxony, about 18 miles from Rolla; which has a narrow entrance, but within is spacious, and has many winding paths. The peafants traverse it in search of bones, which they fell for unicorn’s horns. Some say that it extends as far as Rolla; and skeletons have been found in it, supposed to be those of men who have been lost in its devious windings.

BAUMANNIANA, in Entomology, a species of Phalaena (Turtis) that inhabits Austria. The anterior wings are yellow, with two ferruginous anastomosing bands bordered with filers; posterior one interrupted. Fabriciius.

BAUME, Anthony, in Biography, chemist and apothecary, born at Salon, February 26th, 1728. Applying early and diligently to the study of chemistry and pharmacy, he was soon distinguished for his superior attainments in those arts. In 1752 he was received into the company of apothecaries at Paris, and in 1775 made a member of the Royal Academy of Sciences. He was also several years lecturer in chemistry, an office he filled with distinguished credit to himself, and advantage to his pupils. In 1757 he published, in conjunction with doctor Macquer, “Plut d’un Cours de Chimie experimentale et raisonnee, avec un discourse historique sur la Chimie,” 8vo. Paris. “Elements de Pharmacie theorique et pratique,” Paris 1762. 8vo. “Manuel de Chimric, ou expose des operations,” &c. Paris, 1763. 8vo. These two works have passed through several editions. He also published “Memoires sur les Argilles, et recherches et experiences chimiques et physiques sur la nature des terreurs, les plus propres a l’agriculture, et sur les moyens de fertiliser celles qui sont stériles,” Paris, 1800. 1770, which was well received. Elay Dict. Hist.

BAUM, St. in Geography, a mountain of France in the department of Var, between Aix, Marseille, and Toulon. It is much frequented from a superstitious notion that Mary Magdalen died in this place.

BAUME Bay, See Balsam Bay.

BAUMER, John William, in Biography, a German naturalist and physician, was born at Rheydt in 1719, studied philosophy and medicine at Jena and Halle, and after having been settled as a clergyman in 1743, at Krauthen, returned to Halle to study medicine, and in 1763, took the degree of doctor in that science. He afterwards became first professor of medicine at Erfurt, where he died August 4, 1788. His principal works are “Natural History of the Mineral Kingdom, particularly in regard to the Prosec,” Gotha, 1763, 1764, 2 vols. 8vo. “Historia Naturalis lapidum pretiosorum omnium,” &c. Frankfort, 1771, 8vo. “Fundamenta politiae medicinae,” &c. “Frankfort and Lips, 1777, 8vo. “Fundamenta Geographiae et Hydrographiae Subterraneae.” Cif. 1779, 8vo. and “Historia Naturalis Regni Mineralogici, ad naturae ductum tradita.” 1780, 8vo. Gen. Bio.

BAUMES, Les Dames, or BAUMES LES NONES, in Geography, a town of France, and principal place of a district in the department of Doubs, on the river Doubs, 5 leagues N. E. of Besançon, and 82 N. of Pontarlier. It derives its origin from an abbey of canonelles, which is said to have been founded in the 5th century, by St. Romain, abbot of Coutan. Others assert that it was founded in the 7th century. About 5 miles from this town is shown a remarkable caver,
BAUMGANS, in Orthography, the name of the bennicola geese; Asas Bernicia, in Frühbl. Hift. Birds.

BAUMGARTEN, Alexander Gottlieb, in Biography, an eminent philosophical writer, was born at Berthe in 1714, and educated at Halle. Here he distinguished himself by his private lectures in philosophy; and after having officiated for some time as extraordinary professor he was invited in 1740 to be professor of philosophy at Frankfort on the Oder. His constitution, being naturally feeble, was much impaired before the year 1751 by close application to study, and his infirmities were aggravated by the loss of a great part of his property, during the bombardment of the fortress of Carthum, whether he had fled for shelter. In 1760, his health being in some degree restored, he returned his labours with new ardor; but in 1762 he was carried off by a stroke of the apoplexy; having established the character of an acute and found philosopher, who united to an extensive acquaintance with the sciences, a distinguishing accuracy of judgment, and an agreeable cheerfulness of temper. His principal works are "Melopohyca," Halle, 1730, 1743, 8vo, published in German by Meyer, with many alterations, and republished by professor Eberhard: "Ethica Philosophica," Halle, 1740, 1751, 8vo. "Æsthetica," Frankf. in Oder, 1750, 1758, 8vo. and "Initia Philosophica Practica Primaria," Frankf. 1760, 8vo. Gen. Biog.

BAUMGARTEN, Siegmund Jacob, brother of the above, was born in 1706 at Weimundstadt on the Ohra, and having studied at Halle became professor of theology. He died in 1757, leaving numerous writings on theological subjects, and many translations of French and English works into German. Gen. Biog.

BAUMGARTEN, in Geography, a town of Germany, in the archduchy of Austria, 6 miles west of Weilburg.

BAUMGARTEN, a town of Bohemia, in the circle of Crudin, 3 miles west of Politzka.

BAUMHOLDER, a town of Germany, in the circle of Upper Rhine, and district of Deux Ponts, 10 miles west of Lauterce, and 25 miles north of Deux Ponts.

BAUMSWALDE, a forest of Prussia, on the borders of Lithuania, about 10 leagues long and 7 wide.

BAUNACH, a town of Germany, in the circle of Franconia, and bishopric of Bamberg, near the river Mayne; 7 miles north of Bamberg. This is also the name of a canton of Swabia, so called from the river Baunach, which runs into the Mayne.

BAVOSA, in Ichthyology, a name given by the Italians to a species of Ray, called by modern naturalists Raja Oxyrinchus, which fea.

BAVOTA, Pascasia, in Ancient Geography, a town of Italy in Iapigia.

BAUR, BAWR, or BOUWER, John William, in Biography, an eminent painter of landscapes and architecture, was born at Strasburg in 1610. After having been the disciple of Frederick Brendel, he went to Rome for improvement; but though he possessed great genius and a fertile imagination, and refined for a considerable time in and about Naples and Rome, where he devoted himself entirely to architecture and landscapes, he retained the German turn in all his figures, and neglected the study of nature or the antique; so that he never arrived at a grandeur of design. However his pencil was light, his composition good, and his general expression beautiful, though his figures were somewhat heavy. His paintings in water-colours on velvum are held in the highest estimation. For the duke of Bracciano, at whose court he resided for several years, he finished some charming perspective views of gardens, with statues and fountains, and a number of elegant buildings, with many figures, couches, castle, and horsemens; and he generally distinguished people of different nations by their respective dress. This artist also engraved a great number of plates from his own designs. His engravings from the Metamorphoses of Ovid are generally preferred to the rest. They are lightly etched, and toned with the graver. The figures are small, and incorrectly drawn. The background are dark and heavy, and the trees are defect of that lightness and freedom, which would render the effect agreeable. His pieces of architecture are well executed, and the perspective finely preferred. In his style of engraving he looks, in some degree, to have imitated Callot, and the nearer he approaches it, the better are his productions. His Metamorphoses consist of 50 middling-sized plates. Baur died at Vienna in 1650. Pulkington and Strutt.

BAURAC, an ancient name for nitre, but in some places used in a restrained sense, as not signifying every thing that was called by that name, but only one of two different sorts that were confusively called nitre.

The Arabians give the name baurac to tincor or ticaul, which when refined is called borax, but when it is rough, little crystalline masses like the small crystals of sal gem, mixed with earth or other impurities, it is always distinguished by the name of ticaul. Neumann, p. 227. See Natron.

BAURINKEL, in Geography, a town of Germany, in the circle of Westphalia, and county of Lingen, 6 miles N.E. of Lingen.

BAUSCH, Leonard, in Biography, a physician of Schweinfurt in Franconia, acquired considerable reputation by his commentaries on the works of Hippocrates, published 1594, folio, at Madrid. His son, John Laurence Bausch, born at Schweinfurt, September 30th 1605, after the usual school education at home, visited the principal seminaries in Germany, France, and Italy, and was made doctor in medicine at Altdorf in 1630. He had the merit of forming a society of physicians, in 1652, who met at stated periods, and communicated such observations in philosophy and medicine as occurred in their practice, and deemed deserving of being preferred. This, in time, gave birth to the Academia Naturae Curiosorum, of which he was the first president, and in 1671 they began to publish their memoirs, under the title of "Miscellanea Curiosi, Medico-Physica, Academia Naturae Curiosorum," 4to. The society still continue their meetings, and have published near seventy volumes of the Miscellanea. Haller ibid. Med. Pract. Floy. Diet. Hist.

BAUSCHWITZ, in Geography, a town of Silesia, in the principality of Noyz, 8 miles E. N. E. of Noyz.

BAUSK, or BAUTKO, a town of Courland, seated on the river Mesta, on the borders of Poland. It was taken by the Swedes, under Gustavus Adolphus, in 1625, and by the Russians under Czar Peter, in 1705, after a bloody battle between the Russians and Swedes. N. lat. 56° 50'. E. long. 24° 44'.

BAUTSCHE, a town of Moravia, in the circle of Pressau, 18 miles N. of Pressau.

BAUTZEN, or Budzsin, the capital of Upper Lusatia, in Germany, situates in the circle of Budzsin, on the river Saarp, subject to the elector of Saxon, and fortified by a citadel, called the Castle of Ortenburg, standing on a high
high rocks, and separated from the town by a ditch and ramparts. This citadel was founded before the town, which had its rise in the 9th century. This town had formerly a considerable manufacture of linen, hats, stockings, and gloves, and also of glazed leather, cloth, sattin, &c. It has frequently suffered much from fire. It was taken by the Prussians in 1757; and after their retreat, taken possession of by the citizens. The Lutherans and Catholics are allowed the free exercise of their religion. N. lat. 51° 10'. E. long. 14° 42'.

BAUX, Les, or BAUX, in Latin BALLYUN, a town of France, in the county of the mountains of the Rhone, and chief place of a canton in the district of Tarascon, seated on a hill having a strong castle, formerly an independent barony, and afterwards a markizate. N. lat. 43° 42'. E. long. 5° 0'.

BAUX ISLAND, a name given by captain Marchand to a small island of the Pacific Ocean; being one of the group called Herzel's islands near the Marquises, and denominated by Herzel, Sir Henry Martin's Island; which fee.

BAWD, a person who keeps a place of prostitution, or makes a trade of debauching women, and procuring or conducting criminal intrigues. Some think the word is derived from the old French bawde, bold or impudent; though Ver- siqian has a conjecture which would carry it higher, viz. from habbe, anciently written balt. In which sense, bawd originally imported no more than bath-holder, as if bagnios had anciently been the chief femeans of such prostitution. The Romans had their male as well as female bawds; the former denominated musicae and proseg, among us panderers; the latter, bawds.

By a law of Constantin, bawds were to be punished by pouring melted lead down their throats.

BAWDER, in Geography, a river of England, which runs into the Tees, about 3 miles N. W. of Barnard- castle in the county of Durham.

BAWD-MONEY, in Botany. See AETHUSA MEUM.

BAWDSEY HAVEN, in Geography, a small bay or anchoring place near the southern point of the coast of Suffolk, formed by the ocean, and the mouth of the small river Deben, about a league to the east of Langford.

BAWDY-HOUSE, a house of ill-fame, to which lewd persons of both sexes resort for the purpose of licentious and criminal indulgence. Houses of this kind, under the denomination of brothels and rees, are licenced in some countries; and in England they were privileged by patent, regulated by statute, and tolerated as a necessary drain for corruption, from the reign of Henry II. to the last year of Henry VIII. when they were suppressed by the power of trumpet; and their suppression was perhaps attended with greater solemnity than that of the convents. Their suppression, however, failed to extirpate lewdness; and Latimer (Sermons, p. 432) whose sermons are replete with a barbarous eloquence, inveighs bitterly at its fabidomest prevalence. In 1560, the repeated act of keeping a brothel, and also of committing fornication, was, upon a second conviction, made felony without benefit of clergy. But at the restoration, when hypocrisy deviated into the extreme of licentiousness, it was not thought proper to renew a law of such unfashionable rigour. The keeping of a bawdy-house is cognizable by the temporal law, as a common nuisance, not only because it endangers the public peace by drawing together dissolute and debauched persons, and promoting quarrels, but because it tends to corrupt the manners of the people by an open profession of lewdness. (3 Inst. 205. 1 Hawk. P. C. c. 75.) Those who keep bawdy-houses are punished with fine and imprisonment, and also such infamous punishment, as pillory, &c. as the court shall inflict; and a lodger, who keeps only a single room for the use of bawdry, is indictable for keeping a bawdy-house. (1 Stat. 58.) Persons resorting to a bawdy-house are punishable; and they may be bound to their good behaviour. But if a person be indicted for keeping or frequenting a bawdy-house, it shall be expressly alleged to be such a house, and that the party knew it to be such. (Papr. 208.) A man may be indicted for keeping or having in his own house. (1 Hawk. P. C. c. 61, s. 2.) A contable, upon information that a man and woman are gone to a bawdy-house, or about to commit fornication or adultery, may, if he finds them together, carry them before a justice of peace without any warrant, and the justice may bind them over to the Sessions. (Dale. 214.) Contables may enter bawdy-houses, call others to their assistance, and arrest the offenders for a breach of the peace. In London, they may carry them to prison; and by the custom of the city, whereas and bawds may be carted. (3 Inst. 206.) By flat. 25 Geo. II. c. 56, made perpetual by flat. 28 Geo. II. c. 19, if two inhabitants, paying fees and lot, shall give notice to a constable of any person keeping a bawdy-house, the constable shall go with them before a justice of peace, and shall, upon the oath of such inhabitants, that they believe the contents of such notice to be true, and that they entered into a recognition of 20l. each, to give material evidence of the offence, enter into a recognition of 30l. to prosecute with effect such person for such offence at the next lections. The constable shall be paid his reasonable expenses by the officers of the poor, ascertainable by two justices; and upon conviction of the offender, the constables shall pay the two inhabitants 20l. each. A constable, neglecting his duty, forfeits 20l. Any person appearing as master, or mistress, or as having the care or management of any bawdy-house, shall be deemed the keeper of it, and liable to be punished as such. A wife may be indicted and set in the pillory with her husband, for keeping a brothel; for this is an offence respecting the domestic economy and government of the house, in which the wife has a principal share; and it is such an offence as the law presumes to be generally conducted by the intrigues of the female sex. 1 Hawk. P. C. 2, 3.

BAWLING, among HUNTERS, is spoken of the dogs, when they are too busy before they find the scent good.

BAWN, or BAWN, derived from the Tventonish bawzen, to construct and secure with branches of trees, in Antiquity, an area enclosed with thick hedges of earth square or circular, impaled with wooden stakes or the branches of trees, and surrounded with a deep trench. This was called in Irish daingean, a word of Celtic origin. Numerous remains of such fortresses are found not only in various parts of Ireland, but also in Britain, Germany, Sweden, and almost every country of Europe. The Irish gave great trouble to the English for many centuries by fortifying passes between the hills and mountains in this manner, so that it was a tedious work to cut through them, and make the roads passable. This was called plashing or pafns, from the Franco-Callie word plafzer, which, like bawzen, signifies to entwine; and it con- fided in securing the top of the wallum with picks interlaced with branches. Before the English invasion, each family of the Irish is supposed by Mr. Ledwich to have lived in a mud cabin surrounded by a bawzen. The English introduced, in which they were initiated by the natives. In course of time, bawzen came to signify an enclosure with a wall, instead of plashed stakes; and we find Queen Elizabeth and James I., requiring those to whom grants were made, to construct walls with bawzen, or courts round them, for the protection of
of their families and tenants. When the grant was not very considerable, a bawn with a house within it was sufficient.
Of the latter kind was Hernest's bawn, in the county of Armagh, which is mentioned in Dean Swift's works, and
which now gives name to a village in that county. This
was built of lime and stone, eighty feet square, with two
round towers for flanks, and two stories high, vaulted,
the wall itself being thirteen feet high. Within the bawn
was a house of lime and stone, thirty-six feet long and
twenty feet broad. Further particulars may be found in
Ludwick's Antiquities of Ireland, p. 180—196.
B A W R O W , in Geography, a town of Red Ruffia,
in the palatinate of Lemborg, 64 miles east of Lemborg.
B A W T , a town of Persia, in the province of Irak-
Agami, 80 miles north of Ispanah.
B A W T R Y , a market-town in the west riding of Yorks-
shire, and in the confines of Nottinghamshire, in Eng-
land, is seated on the high road to Scotland, and con-
forms principally of one broad street, well furnished with
inns. It is 9 miles from Doncaster, and 152 north from London.
The river Idle induces a considerable trade from Derbyshire,
of milk and grain-stones, as well as of lead and iron ware
from Sheffield, which are conveyed hence to Hull and other
parts of the country. The market is held on Wednesday
and Saturday; and the town has also three annual fairs.
Its houses are 174, inhabited by 978 persons. N. lat. 53°
27'; W. long. 1°.
B A X A , Terra, or Barber Bay, lies on the west coast
of Africa, 4 leagues south of the river Oro, which is in
N. lat. 23° 30'. It is large, and has in several places good
anchorage, especially on its northern side.
B A X A B a n i a , lies on the coast of Brazil, in South
America, 30 leagues E. and E. by S. from the sand bank of
Tortugas, on Tortoise harbour. It has good anchorage, hard
ground, and deep water; and it is well sheltered by a sand-
bank from the north wind, and by the land from all other
winds.
B A X a s, Das, Punda, denoting a cape of shoals, is a low
point, 12 leagues from the former, and 18 from Tort-
ugas.
B A X E A D O R E, Cape, is situated in the island of Lu-
conia or Manilla, in N. lat. 18° 44'. E. long. 120° 35'.
B A X I O s, A b a x o s, or A b a f f er, are two chippers of
rocks on the south-east side of the island of Ceylon, called
the Great and the Little Baffes. The former is in N. lat.
6° 10', E. long. 81° 50'; and the latter in N. lat. 6° 25',
E. long. 82° 16'.
B A X O s d e A b r o l h o s. See A b r o l h o s.
B a x o s d e B a u h u n. See A b r o l h o s.
B a x o s d e l a C a n d e l a r i a , a spoil of reef of rocks, in
the Pacific ocean, so called by Mendana in 1567, and lying,
by M. Fleurié's calculation, near S. lat. 64°, and E. long.
from Paris 1571'.
B a x o s, Cape, or Low Cape, is the exit point of the en-
terence into the river Sebo, on the coast of Africa. It lies
well of both cape Formosa and Palmas island, 2 leagues di-
siant from the latter. On the coast of this cape are several
dangerous rocks, some of which are under water, and should
therefore be carefully avoided by the trading ships that
navigte in these parts.
B a x o s Cape, lies also on the coast of Africa, eastward
of the river Volta, 2 leagues from the Quatre Montes, or
hills so called that are clofe together.
B a x t e r, Richard, in Biography, an eminent divine
among the non-conformists of England, was born at Row-
ton, a small village in the county of Salop, in 1615. His
father was a small freetholder of exemplary character, who,
duced him to a state of great languor, was the occasion of his being separated from the army in 1647, and of preventing that service to his country, which might have been expected from a person of his principles and moderation. However, he refused to the utmost of his power, the measures of those who afterwards usurped the government of the kingdom; he opposed taking the covenant, preached against the engagement, and diffused the folders from fighting against the Scots troops who came into the kingdom with Charles II.; and therefore the charge alleged against him, of his having been a trumpeter of rebellion, is altogether without foundation. When Cromwell assumed the supreme power, he boldly and openly declared, that he disliked his usurpation; and in a private conference, expressly told him, that in his opinion the ancient monarchy was a blessing. To that form of government Baxter always avowed his attachment; and in a sermon preached before the parliament on the 30th of April 1660, the day preceding that on which they voted the king's return, he maintained, that loyalty to their prince was a thing essential to all true protestants of whatever persuasion. About the same time he preached a thanksgiving sermon at St. Paul's, on occasion of the success of general Monk; and this circumstance refutes the charge of his having diffused his excellence from concurring in, or bringing about that change.

After the restoration, Baxter was made one of the king's chaplains, and was always treated by him with peculiar respect. To his majesty he spoke with the same freedom which he had used with the protector Cromwell. He strongly represented the great importance of tolerating those pious men who entertained doubts concerning the ceremonies and discipline of the church; and he observed, that the late usurpers had so well understood their own interest, that they had found the way of doing good to be the most effectual means to promote it; and therefore he besought the king that "he would never suffer himself to be tempted to undo the good which Cromwell or any other had done, because they were usurpers that did it;" and on the contrary, "that he would rather outgo them in doing good." At the Savoy conference he was one of the commissioners, and was employed in compiling the reformed liturgy. Having declined the prebend of the bishopric of Hereford, which was offered him, he wished to retire to his friends at Kidderminster, and to officiate among them in the humble station of a curate, but was not permitted. Disappointed with respect to the object of his wishes, he preached for some time occasionally in London; but the 70 against conventicles obliged him to retire first to Aclon, and then to Totteridge. During the persecution of the non-conformists, he preached, as opportunity offered, and the state of the times allowed, either more openly or more privately; and he was sometimes a sufferer for his zeal, and sometimes unmolested. After the indulgence of 1672, he chiefly resided in London, and exercised his ministry, either occasionally or frequently, but not without interruption and molestation. "To the sufferings attendant on his profession were added the infirmities of a feeble constitution and frequent bodily disorders, together with the loss of the greatest part of his fortune in consequence of the fluctuating of the exchequer in 1671, and by the penalties inflicted upon him for the exercise of his ministry; but he bore all these evils with singular fortitude and patience. In 1684, he was treated with peculiar severity. Although he was so ill as not to be able to stand, a warrant was granted against him in order to his being bound to his good behaviour; and the constables, who were entrusted with its execution, watched him so incessantly, that they prevented his going from his study to his bed-chamber; and by thus depriving him both of food and sleep, at length effected their purpose, though they were not empowered to break open doors, and took him away to the Seftons-house, where he was bound in the penalty of £500, to keep the peace, and he was brought up twice afterwards, though he kept his bed during the greatest part of the time. In 1685, he was committed to prison by a warrant from lord chief-justice Jeffries, for his pamphlete on the New Testament, which was charged with being hostile to episcopacy, and brought to trial for sedition. In the course of this trial, he was treated with all the brutal insolence and tyranny, to the exercise of which that reign of the law, Jeffries, was accustomed; reviled by his judge in the grossest terms, and prevented from obtaining the full defence of his counsel; and at last found guilty on the most frivolous grounds, and sentenced to pay 500 marks, to lie in prison till he paid it, and to be bound to his good behaviour for seven years. From this heavy penalty however, after a confinement of several months, he was released, in 1686, by king James, and allowed to remain in London, notwithstanding the provisions of the Oxford act. From this time he lived in a retired manner, neither interfering in the concerns of his party, nor taking any part in those addresses which some of his brethren prevented to James II. on his indulgence. He professed, however, in the shape of his ministerial duties, still increasing week by week, to have contrived him to his chamber. The close of his life corresponded to the uniform tenor of it; the approaches of dissolution were regarded by him with pious resignation; and he died, with the tranquillity and hope appropriate to his exemplary character, on the 8th of December 1691. Urged by extreme pain to wish for a release, he checked himself by saying, "It is not fit for me to prescribe; where thou wilt, when thou wilt, and how thou wilt." To one who asked him in his sickabed how he did, he replied, "Am well." In 1662, Mr. Baxter married the daughter of Francis Charlton, Esq. a distinguished magistrate of the county of Salop; a woman of great piety, who entered thoroughly into his views concerning religion, and cordially approved all the pacifics which he made from a conscientious regard to duty. She accompanied him in prison, and submitted without repining to all the hardships consequent upon the persecution which he suffered. She died 10 years before him.

"Richard Baxter was a man, whose whole soul was engaged in his profession. Ancient poet towards God, and poet for the best interests of his fellow creatures, were the active springs of his conduct; and few men have ever devoted more time and labour to those objects. He passed a life of much contention and eloquence; but at this cool distance, no candid enquirer can mistake his true character. His early studies in divinity were not, perhaps, the best adapted to form a theologian. They confounded chiefly of the schoolmen and metaphysicians of a dark age, and gave him a turn to subtleties of distinction, which made him stand apart in some theoretical points from all his contemporaries. Yet in practical religion, the devotion and warmth of his temper allied him to the pious of all denominations, and inspired him with an enlargement of mind, which let him above the differences resulting from party controverties. He was a most voluminous writer, and his works are sufficient to make a library of themselves. Above 145 distinct treatises of his composition have been reckoned up; of which 4 were folios, 75 quartos, and 49 octavos, besides several others of a smaller size. They comprise bodies of theology, practical and theorectical, besides a vast number of tracts on particular topics." His practical works have been collected together in
in 4 vols. in folio. His income, it is said, which was not great, was increased by the profit which he made of his writings, for which he sometimes received 60 or 80l. a year of the booksellers. But this money he seems to have employed in charitable purposes. Of his numerous works some of the principal were his "Methodus Theologica," printed in Latin in 1674, folio; his English body of practical divinity, published in 1673, folio, under the title of "The Christian Directory," &c.; "Gildas Salvianus, or the Reformed Pastor," 8vo. 1676, much esteemed by many divines; "Universal Concord," 12mo. 1658, giving an account of the terms upon which all Christian churches may hold communion; "Reasons for the Christian Religion," 1667; "Catholic Theology," fol. 1673, intended to reconcile the differences between the Arminians and the Calvinists; "A Treatise of Episcopacy," 4to. 1681; "A Treatise of Universal Redemption," 8vo. 1694. The most popular of his practical pieces were his "Saints Everlasting Rest," and his "Call to the Unconverted," of which latter 20,000 were sold in one year, and it was translated into all the European languages, and into the Indian tongue. To those which we have enumerated, we may add his "Reformed Liturgy," his "Poor Man's Family Book," his "Dying Thoughts," and his "Paraphrase on the New Testament." The first book he published was his "Aphorisms of Jullification" and the "Covenants," printed in 1649; and the last in his lifetime, "The Certainty of the World of Spirits," printed in 1691; so that he was an author 42 years. One of his works is "A Narrative of his own Life and Times;" which, though a rhapsody, says Mr. Granger, "composed in the manner of a diary, contains a great variety of memorable things, and is itself, as far as it goes, a history of non-conformity." Mr. Baxter was distinguished not only as a practical, but also as a controversial writer; and under this latter character, he particularly opposed the Antinomians. Few persons have suffered more rancorous abuse than Mr. Baxter; and few have been more highly respected both by his contemporaries and posterity. Among his friends and admirers we may reckon some of the most distinguished characters of the age in which he lived, of whom many were members of the establishment, such as chief justice Hale, Sir John Maynard, Dr. Barrow, bishop Wilkins, bishop Patrick, and bishop Burnet. The great chief justice Hale honoured him with an intimate friendship, gave him a high encomium of his piety and learning to all the judges, and when he was in prison, on the Oxford act, left him a legacy in his will, and several large books, in his own hand-writing, on the matter of their conversations. Dr. Barrow has testified concerning his works, that "his practical writings were never meoded, his controversial style confuted." Bishop Wilkins affirms, "that he has cultivated every subject which he has handled;" and he used to say of him, "that if he had lived in the primitive times, he had been one of the fathers of the church. Bishop Burnet's testimony is somewhat qualified. "Baxter," says he, "was a man of great piety, and, if he had not meddled in too many things, would have been esteemed one of the learned men of the age. He had a very moving and pathetic way of writing, and was his whole life long a man of great zeal and much impatience; but was most unhappily subtle and metaphysical in everything." Baxter was one of the last divines, whose name has distinguished a particular denomination or description of persons. See BAXTERIANS. Calamy's Life of Baxter. Biog. Brit. Gen. Biog.

BAXTER, William, an eminent philologist and antiquarian, was the nephew and heir of Richard Baxter, and born of parents in mean circumstances at Llanugatyn, an obscure village of Shropshire, in 1659. He derived his pedigree, like a true Cambro-Briton, through a long series of ancestors from John Baxter, who, in the reign of Henry VI., settled at Shrewsbury; and he shews, that the name Baxter signifies originally a baker, in Saxon "Becceler," and that it was given to that family, because they were bakers to the ancient princes of Wales, in which part, according to the custom of the ancient Celts and Greeks, the noblest persons were employed.

In his infancy and youth, his education was so much neglected, that when he was sent to Harrow School in Middlesex at the age of 18, he knew not one letter, nor understood one word of any language but Welsh. But such were his talents and application, that he soon became distinguished by his extensive knowledge. In 1679 he published a Latin grammar, entitled "De Analogia, seu arte Latine lingus commentator," &c. 12mo. Thus qualified for the profession of a schoolmaster, to which he devoted himself, he employed the greatest part of his life in this occupation. For fourteen years he kept a boarding-school at Tottenham High Crosses in Middlesex; and he was afterwards elected master of the Merchant's School in London. Having acquired great celebrity as a scholar, and in the profession of antiquarian researches, and distinguished, perhaps, more by his learning than his judgment, he died in 1723. In 1695 he published a new and correct edition of "Anacreon," with notes, which was reprinted with considerable additions and improvements in 1710. His abuse of Tanaguill Faber, a former editor of Anacreon, was amply retorted upon himself by J. Cornelius de Pauw, in his 4to. edition of the same poet, published at Utrecht in 1732, who held his comments in great contempt. His edition of "Horace," printed in 1721, and reprinted with improvements in 1725, has obtained a more lasting reputation. Dr. Harwood pronounces this the best edition ever published, and the learned Güiner has testified his approbation of it, by making it the ground-work of his excellent edition. Bentley, famed for the rarity of his criticisms, in speaking of it, calls Baxter "Vir reconditiss informator," in 1719 Baxter published his dictionary of British antiquities, under the title of "Glossarium Antiquitatum Britannicarum in quibus syllabus etymologicos antiquitatum veteris Britanniarum et Ibericae, temporibus Romanorum," 8vo. By his skill in the British or Welsh tongue, and by means of etymology, he professed to correct Camden, and to add about 250 names of ancient places and rivers omitted in his Britannia; of this work, a second edition was published, after the author's decease, in 1733. His Glossary of Roman antiquities, proceeding no farther than the letter A, was published in 1726 by Mr. Mothes Williams, under the title of "Reliquiae Baxterianae," &c.; and republished in 1731, with the title "Glossarium Antiquitatum Romanorum, &c." Lond. 8vo. Baxter also wrote four letters on subjects of antiquity, inserted in the first volume of the "Archologia." He left behind him notes on Persius and Juvenal, and was the translator of some of Plutarch's lives "done into English" by several hands. Biog. Brit.

BAXTER, Andrew, an ingenious metaphysician and philosopher, was the son of a merchant at Aberdeen, and born there in 1686 or 1687. He was educated in King's College in that city, and afterwards undertook the care of private pupils, some of whom were persons of rank and fortune. About the year 1730, he published in 4to. his celebrated work, entitled, "An Enquiry into the Nature of the Human Soul; wherein the Immateriality of the Soul..."
Soul is evinced, from the principles of Reason and Philosophy." This work, which was reprinted in 2 vols. 8vo. in 1737 and in 1745, was much applauded by several persons of eminence, and particularly by bishop Warburton, who, in his "Divine Legation," speaks of it as containing "the just and precise notions of God and the Soul," and as one of the most finished of the kind, that the present time, greatly advanced in true philosophy, have produced." Of the author's sentiments, see some account under the articles Dream, Soul, and Vis Inertis. In 1741 Mr. Baxter went abroad with one of his pupils, and settled for some time at Utrecht, where he became acquainted with several literary persons, and whence he made several excursions into Flanders, France, and Germany. Upon his return to Scotland in 1741, he refuted till his death at Whittingham, in the isle of Farther Lothian. His work, entitled "Matho, Five Coformitha Puerulis," was drawn up for the use of his pupils, and first printed in Latin, and afterwards greatly enlarged, and published in English, in 2 vols. 8vo. The second edition of this work was published in 1745, and the third in 2 vols. 12mo. in 1765. The design of this work was to deduce the principles of natural religion from the phenomena of the material world. A mistake in the astronomical theory, which the author did not live to rectify, as he had intended, has disguised some readers; and therefore, in the third edition, the conference that was chiefly affected by that error, was suppressed, and the vacancies supplied by another. In 1752 the author published an Appendix to the first part of his Enquiry into the Nature of the Soul," indicating it from some objections, which was dedicated to Mr. Wilkes, with whom he formed an intimate acquaintance abroad. In this year Mr. Baxter, after having endured great sufferings from the gout, and a complication of disorders, with exemplary patience, closed his life about the sixty-third year of his age. He left behind him several unfinished MSS. on philosophical subjects, and one in a complete state, concerning the controversy between the English and foreign philosophers on the subject of the force of bodies moving in free spaces, which however was never published.

Mr. Baxter's learning and talents are sufficiently displayed in his writings. His application was such, that he sometimes sat up whole nights reading and writing; and yet his disposition was cheerful and sociable. In conversation he was modest and unassuming; and in the discharge of the social and relative duties of life, his conduct was exemplary. His mind was puffed with the most reverential sentiments of the Deity, and the general tenor of his life was conformable to the rules of virtue. He was economical without parsimony; such was his difinterestedness, that he declined considerable offers of preferment, which he might have obtained if he had taken orders in the church of England. His knowledge of the modern languages was extensive; so that he could write and speak in French, German, Dutch, Italian, and Spanish. By his wife, whom he married in 1724, and who survived him ten years, he had one son and three daughters. Biog. Brit. Ait. BAXTER.

BAY, in Botany. See LAURUS.

Bay, Lobelly. See GORGONIA.

Bay, Rose. See NERIUM.

Bay, Dwarf Rose, and Mountain Rose. See RHODENDRUM.

Bay, Sweet Flowering. See MAGNOLIA.

Bay Plum. See PSIDIUM.

Bay, in Building, denotes any kind of opening in walls; as a door, window, or even chimney.

Bay windows are the same with what we otherwise call bow windows.

Bay, in Geography, denotes a little gulf, or an arm of the sea, tretching up into the land; being larger in the middle within, than at its entrance, which is called the mouth of the bay. The largest and most remarkable bays are those of Biscay, Bengal, Hudson's, Panama, &c.

Bay of All Saints. See ALL SAINTS.

Bay of Antongil. See ANTONGIL.

Bay, Bank's. See Baffin.

Bay of Cacancal. See CANCAL.

Bay, Chequitan. See CHEQUITAN.

Bay of Chesapeake. See CHESAPEAK.

Bay of Fires lies on the east coast of New South Wales or New Holland, in the Pacific ocean, to the north of St. Patrick's Head. The north point of the bay is called Edystone, and the south point St. Helen's. A small rocky island is near the middle of its entrance, on each side of which is an open passage.

Bay of Frosh Water, lies south of Ascension bay in the north part of the gulf of Mexico. N. lat. 30°. W. long. 93°.

Bay of Funky. See FUNDY.

Bay of Good Fortune, lies on the north coast of Chaleur bay, which is a large bay of the gulf of St. Lawrence, and on the north east coast of Nova Scotia in North America.

Bay, Hudson's. See HUDSON.

Bay of Inlets, a bay on the south east coast of New Holland,
BAY

land, between cape Palmerston and cape Townshend. S. lat. 21° 30’ to 22° 30’, W. long. 200° 36’ to 210° 45’. 

Bay of Ilands is also a bay on the coast of Nova Scotia, on the continent of North America, about 6 leagues south-west from Cape St. Mary.

Bay of Ilands is also a bay on the northern island of New Zealand in the south Pacific ocean, lying on the north-east coast between cape Brett and cape Pooche. This bay is large and deep, and has many small islands in it. The best entrance into the bay is on the west side; within it are several larger bays. S. lat. 35° 12’, E. long. 174° 57’. 

Bay of Ilands is also a bay on the south coast of the flairets of Magellan, towards the western entrance, W. by N. from Upright bay, and E. by S. from the bay of Disappointment. A chaff of small islands lies in the entrance, and in the east part of the bay: but the best entrance is between the westernmost of the two islands off the point of cape Up- right, and a small island farther west, where a ship may have safe passage, and anchor in 20 fathoms soft mud, near the west coast of the cape, in S. lat. 53° 0’, W. long. 75° 32’.

Bay of IJles is an extensive bay of the gulf of St. Lawrence, on the west coast of Newfoundland, about 8 or 9 leagues to the S. W. from la Belle bay, and 14 or 15 leagues to N. N. E. from Porta port. The centre of the bay lies in about N. lat. 49° 5’, W. long. 58° 15’.

Bay of IJles is also a bay situated towards the west end of the north coast of South Georgia island, in the south Atlantic ocean.

Bay of St. Louis, lies on the Labrador coast, and has Cape St. Louis on the north, and Cape Charles on the south. It has many small islands; the largest of which is Battle island, in the mouth of the bay. The middle of the bay is in N. lat. 52° 23’, W. long. 55° 23’.

Bay, de Rochef Fente lies on the west side of Lake Champlain, and the site of New York, 17 miles above Crown-point.

Bay of Rocks is a spacious bay of the Arabian sea, which forms a part of the Indian ocean, and lies on the east coast of Arabia, with good anchorage for ships.

Bay of Seven Ilands lies W. N. W. from Misifie river, and about 18 leagues to N. N. E. from Trinity point, on the north shore of the gulf of St. Lawrence.

Bay of Sboda. See BAXAS Bacia.

Bay of St. Spirit, is a large bay of the Indian ocean, on the south-east coast of Africa, on the north of the island and cape of Unhafa. It is sufficiently spacious to receive a fleet of ships, and is so called from the river St. Spirit, or Manica, which falls into this bay.

Bay, among Farmers, is that part of the barn where the mow is placed.

Bay, in Hydrography, signifies a pen, or pond-head, made up a great height, to keep in a flow of water for driving the wheels of a forge or furnace of an iron-mill, by the stream that comes thence through a passage, or flood-gate, called the pen-block.

Bay colour, in Mange. The word bay is formed from the Latin bains, or badis, and that from the Greek θαίνος, a palm-branch, to that bains or bay properly denotes color phaeus. Hence also, among the ancients, those now called bay horses, were denominated equi palmati.

The bay is the most usual colour among horses. It is a strong and perhaps invariable character in this colour to be attended with a black mane and tail, which the chestnut or any other colour that approaches it never is. The bay is also most frequently attended with black legs and feet up to the knees and hocks: the feet, however, are often varying to the white in horses of this colour, which is not with us esteemed so handsome as when entirely black. There are several kinds of bays, as light bay, dark bay, brown bay, golden bay, dappled bay, &c.

Bay, à miroir, the same as DAPPLE bay.

Bay, among Sportmen, is applied to flags, hawks, foxes, &c. and also to dogs when they turn head against one another. Thus when a flag has been so long pursued, that he is almost exhausted, he turns round, and facing the hounds, defends himself with his antlers, and keeps the hounds at bay, till the sportmen come up, draw off the dogs, and face his life. When a flag takes fail, that is, takes to the water, he will defend himself, and keep the hounds for a long time at bay, provided that he fathoms the lake or river so well as to keep the hounds swimming, without going out of his own depth, but if he is obliged to swim at the time, he is quite tired, and being surrounded by the dogs, he is inevitably drowned. In fox hunting, when the fox is supposed to have entered the earth, the place of his retreat is soon discovered by the terriers, “laying well at him,” provided he has not turned in the earth; but if he has, the terrier and the fox are face to face, and are both baying, or keeping each other at bay; and the contest terminates with digging out the fox.

Bay, fals. See SALT.

Bay yard, is a denomination sometimes used promiscuously with swoollen yarn. 10 and 11 W. III. c. 10. 5 G. II. c. 21. See YARN, &c.

Bay, in Geography. See BAYA, and BAYJA.

Bayo, low, marshy land on the Gold coast of Africa, without any towns or people near the shore; 4 leagues W. S. W. from the river Volta, and 8 leagues E. and L. N. E. from Ningbo ground.

Bayo, in Ornithology, Indian grosebeak, or Loxia indica, is rather larger than a sparrow, with yellow brown plumage, a yellowish head and feet, a light-coloured breast, and a conic beak, very thick in proportion to his body. This bird is very common in Hindustan; and is described as suivingly sensible, faithful, and docile; never voluntarily defecting the place where its young are hatched, not averse from the society of mankind, and easily taught to perch on the hand of his master. In a state of nature the bayo builds his nest on the highest tree which he can find; generally on the palmry or Indian fig-tree, pretending that which overhangs a well or rivulet, forming it of grasa in the shape of a large bottle, suspending it on the branches so as to be firm and yet to rock with the wind, and placing it with its entrance downwards, to secure it from birds of prey. This bird is taught with ease to fetch a piece of paper, or any small thing which his master wants. If a ring be dropped into a deep well, and a signal given to the bird, he will fly down with astonishing celerity, and bring it up to his master with apparent exultation; and it is confidently offered, that if a house or any other place be thrown to him once or twice, he will carry a note thither immediately, on observing a proper signal. They are also trained by the youthful libertines of Benares to pluck off the pieces of gold called tias, placed by way of ornament between the eye-brows of their mistresses, which they bring in triumph to their lovers. The bayo’s natural food is grasshoppers and other insects; but it subsists, when tame, on pulse macerated in water. The female lays many beautiful eggs, resembling large pearls: their white, when boiled, is transparent, and the flavour of them is exquisitely delicate.

BAYAGARAS, in Geography, a town on the island of St. Domingo.

BAYAMO, called also St. Salvador, a town in the eastern part of the island of Cuba, having the town of Almo to the west, and St. Barbara to the south. It lies on the east side of
of Eloro river, about 20 miles from the sea; and it gives name to a channel, that runs between the numerous small islands and rocks, called "Jardin de la Reyna, or Queen's garden," on the north-west, and the shoals and rocks that lie the coal on the south-east side of it, from the bold point called Cabo de Cruz.

BAYARD, or Baillard, in some Old Writers, is an appellative for a horse. Hence the phrares, blind bayard, bayard's watering, bayard's green, &c.

BAYER, in Geography, a small town of the Crimea or Tartary, which gives name to the delightful valley, called by the natives the "Tauric Arcadia," the "Crimian Tempor," &c. which is watered by two gentle murmuring streams. It is of an oval form, about 20 miles long, and surrounded by high mountains, covered with beautiful woods, intermixed with odoriferous flowering shrubs. It contains a number of Tartar villages, romantically situated and inhabited by the families of shepherds and husbandmen.

BAYEUX. See Bayador.

BAYEN, Peter, in Biography, a French chemist, was born at Chalons in 1725. In 1749, he served under Charas in pharmacy. He gave analyses of the mineral waters of France; and he wrote memoirs on marbles, fereptume stones, porphyries, granites, jaspers, fchitas, and iron spar. He doubted the existence of the phlogiston of Stahl; and by operating on mercurial precipitates, he found that what are called metallic oxides owe their flave, when obtained by calcining metals, to the absorption of one of the constituent ingredients of atmospheric air. This chemist also discovered the fulminating property of metals, when mixed with a very little sulphur; and he showed that tin was not necessarily contaminated by arsenic; that what is used by potters contains copper and antimony, by which it is rendered hard; zinc, by which it is whitened; fbrnuth, by which it is rendered porous; and lead, in order to diminish the price.

Bayer died at the age of 72 years. Mem. de l'Institut National, &c. vol. ii.

BAYER, Gottlieb Sigfried, a celebrated philologist, was born at Konigberg, in Prussia, in 1694, and studied, chiefly, the languages, first in his native city, and afterwards at Dantzeg, Berlin, and Leipjef; at which latter place he took the degree of master of arts in 1717. On his return to Konigberg in the following year, he was appointed librarian of the public library. In 1726 he removed to Peterburgi, became professor of the Greek and Roman antiquities in the Academy of Sciences, and acquired an extensive knowledge of the Chinese and other Asiatic languages. In 1730 he was chosen member of the Academy of Sciences at Berlin; and in 1731 invited to be professor of eloquence at Halle; which he was not allowed to accept, but continued in Roffa with a considerable increase of salary. He died at Peterburg in 1738. His numerous dissertations on different subjects are published in Lichenthal's "Select. Histor. & Liter.," the "Acta Eruditorum," and the "Comment. Acad. Petropol.," &c. His "Museum Sinicum," published in 1732, in 2 vols. 8vo, is a work of great learning and ingenuity. Gen. Biog.

BAYER, John, a German astronomer, flourished at the close of the 16th and commencement of the 17th centuries; but the time and place of his birth are not ascertained. Some have supposed that he was the grandfather of the subject of the preceding article, and that he was born at Augsburg. It was at Augsburg, however, that he published, in 1603, his excellent and useful work, entitled "Uranometria." This is a large celestial atlas, consisting of folio charts of all the constellations, with a nomenclature, collected from all the tables of astronomy, ancient and modern, improved by his own useful invention of denoting the stars in each constellation by Greek letters, in alphabetical order according to the magnitude of each. The stars are thus as easily distinguished as if each of them had an appropriate name; and the utility of this mode of classification has been so much approved, that it has been retained, since Bayer's time, in all the atlases, catalogues, and celestial globes through the scientific world. This valuable work was gradually improved and augmented by the author himself. In the year 1627 Julius Schiller, a civilian, projected by the suggestion of Bayer, and published his Uranographia, under the title of "Celeni-Stellatum Christiannum," in which he rejected the heathen names, characters, and figures of the constellations, and inserted in their stead others taken from the Scriptures. Accordingly he placed the twelve apostles in the zodiac; and he deduced the southern constellations from the Old Testament, and the northern ones from the New Testament. This innovation, however, tended to embarrass astronomers, and was never adopted. The ancient names were therefore reëd in the later editions of the Uranometria of 1654 and 1661. Montucla, Hist. des Math. tom. ii. p. 333. See Catalogue.

BAYERSDORF, in Geography, a town of Germany, in the circle of Franconia, and principality of Bayreuth, seated on the Rednitz, with a tribunal of justice and a large hungarian of 4 miles north of Erlen, one of Lhymn, in Libris, a French name of the species of Silurus observed by Sonnin in the Nile, and figured pl. 27 of his "Voyage en Egypte." It is the same kind which Forkal calls Silurus bajad. It grows to a large size, but its flesh is not much esteemed.

Bayeux, in Geography, a town of France, and principal place of a district, in the department of Calvados. Before the revolution it was the capital of Deilin, in the province of Normandy, the seat of a governor and the fee of a bishop, whose diocese included 611 parishes. The cathedral is much admired. The number of inhabitants is computed at 3000, and the principal commerce is leather. It is seated on the river Aure, about 4 miles from the sea. N. lat. 49° 16' 30". W. long. 1. 42° 51'.

The celebrated tapestry of Bayeux, which still exists, and is publicly exhibited at stated periods in the cathedral of the city, is a very curious monument of the state of the art of embroidering at the time of the Norman conquest. It is a web of linen, nearly two feet in breadth, and 442 in length, embroidered with the history of that memorable expedition, from the embassy of Harold to the Norman court in 1065, till his death in the following year. The scenes of this byui period are successively exhibited, and consist of many hundred figures of men, horses, beasts, birds, trees, houses, cabins, and churches, with inscriptions over them explanatory of their meaning and history. This work is understood to have been performed under the direction of Matilda, consort to William I, and was not improbably executed by the hands of English women, whose superiority in performances of this kind was then universally acknowledged. The entire contents of this tapestry are represented in a series of engravings, which may be seen in Montfaucon, tom. i & 2; and Ducarel, Anglo-Norman Antiquities, App. No. 1.

Baye, or Baif, Lazare Des, in Biography, was the son of a gentleman of Anjou, and having studied under Du-
after his return was made matter of requets, and had also the abbacies of Grenetiere and Charroux. The precife time of his birth and death is unknown. As a writer he seems to have been the first who introduced the Greek tragedy among his countrymen, by his translations of the "Electra," of Sophocles, and the "Hecuba," of Euripides, into French verse. He was also the author of two learned treatises, "De re veteraria, et de vaefulis," Baill. 1526, 4to. and "De re Navalii," Par. 1536, 4to. and he translated some Lives of Plutarch. Moreni.

Bayf, John Anthony. See Baf.

Bayfa, Baja or Bafra, in Geography, a town of Africa, in the kingdom of Tunis, not far from the frontiers of the Algerines, is supposed to be the ancient "Vacca" of Salilul, the "Oppidum Vagenfe" of Pliny, and the "Baja" of Plutarch; and it is at this day, as it was formerly, a place of great trade, being the chief mart of the whole kingdom, particularly for corn, which is supplied in such abundance by the plains of Butlara, along the banks of the Mejarda, that the Tunisians pay proverbially concerning it, that if there was another such town for plenty of corn, it would become as common and cheap as sand. It has also every summer a public fair, to which the most distant Arabian tribes resort with their flocks, their manufactures, and their families. However, the inhabitants, subject to the oppressive exactions of government, and the frequent incursions of the Arabs, who are numerous and powerful in its vicinity, are extremely poor, and a great part of their ground remains uncultivated. It is faid on the declivity of a hill in the road to Constantine, about 10 leagues from the northern caft, and 36 W. S. W. from Tunis; and has the convenience of being well watered. On the summit of the hill is a citadel of no great strength. The walls, which are raised out of the materials of the old Roman Vacca, are still entire, and have some ancient inscriptions. N. lat. 39° 42'. E. long. 9° 35'. Shaw's Travels, p. 92.

Bayle, Peter, in Biography, an eminent critic and philosopher, was the fon of a protestant minister at Carls, in the county of Foix in France, where he was born in 1647. Whilst he pursued his studies, first under his father, and afterwards in the protestant academy at Puylaurens, whether he was sent in 1665, his application was fo intense and unpermitting as to injure his health. His reading was very extensive; but his favourite authors were Plutarch and Montagne. From Puylaurens he removed in 1669 to the university of Toulouse, with the hope of enjoying superior advantages for improvement, and of making more rapid progress. Here he attended the philosophical lectures that were read in the college of the Jenuits; and his disputes with a popish prieit, who lodged in the same house with him, served to increase the feeruples which he had already begun to entertain against the protestant religion, and at length to induce him to avow himself a Roman catholic. This change of opinion, which seemed to be on his part the reult of inquiry and of conviction, although produced by arguments which mature examination would discover to be inadequate, manifested an ingenuity of mind. However, it fo grieved and offended his father, that he withdrew from him the necessaries means of subsistence. In these deftitute circumstances, he was generously relieved by the bishop of Rieux, who mutt unquestionably have been gratified by the accepition of such a convert. Upon further inquiry Bayle found, that he had been too precipitate in abandoning his religion; and he therefore determined to leave Toulouse after having continued there about eighteen months, and to renounce the errors into which he had been betrayed. Having made his abjuration in the presence of his eldest brother and some other miniters, he immediately set out for Geneva, in order to prosecute his studies. Here he soon found reason for relinquishing the philosophy of Aristotle, to which he had been zealously attached, and to adopt that of Descartes. His reputation introduced him to an acquaintance with several persons of eminence at Geneva, and particularly with Mr. James Bafnage; between whom and Bayle an intimate friendship subsisted as long as they both lived. At this time Bayle acquired the means of support by private tuition; but disfattisfied with this mode of life, which did not suit the independence of his spirit, nor correspond to his desire of further improvement, he willed to exchange it for some situation better adapted to his genius and views. After a few years employed in this way, an opportunity offered for gratifying his wishes. In the spring of 1675 he removed to Paris, and undertook the tuition of Meifs, de Beringhen, brothers to a counsellor in the parliament of Paris. From this city, however, to which his wishes had been directed, he soon removed, at the desire of his friend Mr. Bafnage, in order to offer himself as a candidate for the vacant professorship of philosophy in the protestant university of Sedan. His views were favoured by Mr. Jurieu, the professor of divinity, who favoured Bayle, partly because he was anxious to exclude another candidate. Bayle evinced a decided superiority to the other competitors in a public disputation, and having secured his election, began his lectures, Nov. 11, 1675. By the affidity with which he discharged the duties of his public office, and by the amiable temper which he manifested in private life, he gained great reputation, and many friends, at Sedan; and he devoted his hours of leisure to compositions of the critical kind, which habituated him to that accuracy and depth of reasoning, that afterwards constituted his distinguished excellence. The first work, which he committed to the press, was his Observations on the comet that made its appearance in December 1682; the first edition of which was printed at Rotterdam in 1682, without a name, and under the assumed character of a Roman catholic, under the title of "Lettre a M. L. A. D. C. docteur de Sorbonne," &c. and Cologne was the pretended place of publication. In this treatise, afterwards called "Penitences a la Comete," &c. many delicate questions are discussed, relative to supposed miracles wrought, and prefaces given among the heathens, to the comparison of the miracles of atheism with those of idolaters, and to other points which afforded a range to the author's spirit of free enquriy. In 1685 the university of Sedan was suppressed by an arbitrary edict of Lewis XIV.; and Mr. Bayle, deprived of his professorship, was reduced to the necessity of seeking some new employment. At this time the magistrates of Rotterdam effalibed a "Schola Histor," and Bayle was appointed professor of philosophy and history; and at his recommendation Jurieu was engaged as professor of divinity. In December 1681, Bayle entered on his new office. In the next year he published a criticism on Mainbourg's "Histoire de Calvinisme," in the form of letters, under the title of "Critique Generale de l'Histoire du Calvinisme de M. Mainbourg," This work, written in a lively manner, and with a vein of raillery, was read with pleasure by persons of the reformed religion, and it was particularly agreeable to the prince of Condé, who was no friend to Mainbourg. Although it was publicly condemned at Paris, it became popular in Holland, and a new edition of it, with enlargements, was speedily published. Jurieu had also published a refutation of Mainbourg; but bringing less less popular than Bayle's, the author began to regard his brother professor with a considerable degree of jealousy.
jealousy. In 1684 Mr. Bayle was induced, by the freedom of the press in Holland, to print several controversial works, that were sent him from France; and particularly "A collection of some curious pieces relative to the philosophy of Descartes," with a preface, giving an account of these pieces, and containing some reflections on the inquisitorial power exercised in France over books on scientific topics. In this year he began his monthly literary journal, entitled "Nouvelles de la Republique des Lettres," which was written in a manner that served not only to support, but to increase the reputation which he had already gained. About this time he declared an offer of the professorship of philosophy at Franeker, though it was proposed very much to augment the salary which he received at Rotterdam. His "Nouvelles Lettres de l'Auteur de la Critique generale de l'Histoire du Calvinisme de M. Mainmbrach," which was a continuation or second part of his former work, and printed in 1685, excited much less attention than the first. Having given an opinion in favour of M. Malebranche in his account of Arnauld's book written against him, he was engaged in a dispute with the latter; and in 1686 he had a correspondence with Chriftina, queen of Sweden, concerning a letter of her majesty, in which he mentioned his journal, and which he condemned as having been suffered by the protestants in France. This letter, he had, was "the remainder of the Protestant religion in her." This expression had given some offence to the queen, and Bayle addressed her a letter of apology. In an ample reply the queen declared her satisfaction with his excuses; and adds, "I will lay a penance upon you, which is, that for the future you fend me all the curious books, in French, Latin, or Italian, upon all kinds of sciences and all sorts of subjects, provided they be worth reading." Her majesty made no exception of romances or fables, and particularly requested books of chemistry, and the author's journal. Bayle was much affected by the revocation of the edict of Nantes, and the cruelties exercised against the protestants in France for the purpose of inducing them to abjure their religion. Upon this conduct he made some jilt and pointed reflections in his journal; and in 1686, he published a pamphlet, entitled, "Ce que c'est que la France toute Catholique sous le regne de Louis le grand," or, a character of France, become entirely catholic under Louis the great. It was published without his name; and contained very severe cenfures on the treatment which the protestants received, as well as on the injustice and folly of all attempts to procure conversion by force. This was soon followed by his famous work, intitled, "Commentaria Philosophica, &c." or, a Philosophical Commentary on the words "Compel them to come in." This work was an elaborate defence of toleration, which formed the first part of it; and in the second the author answers all the objections against it. It was published in 1686, in a third part, containing a confutation of St. Augulfin's apology for persecution. The free sentiments expressed in this work gave offence to Jurieu; and though he was ignorant of the author, who had taken pains to conceal his name, he wrote a treatise against it. Bayle's health was so much impaired by the application devoted to the composition of his commentary, and probably also by the vexation occafioned by his controversy relating to queen Chriftina, that he found it necessary to discontinue his literary journal, in the conduct of which he had obtained numerous testimonies of approbation, not only from private persons, but from several socie ties of learned men, and particularly from the French Academy and the Royal Society of England. His situation also at Rotterdam became unsatisfactory to him, on account of
BAY

argumentation he had spent his life in acquiring." The text is concise; but the notes, which contain much valuable information, are spun out to a tiresome and interminable length. This dictionary, generally so well received, and containing a variety of unexceptionable matter, displayed freedoms of several kinds, both as to sentiment and diction, which were not likely to escape censure. Jurieu, the avowed and impachable antagonist of Bayle, attacked it from the press, and endeavoured to procure its condemnation from the ecclesiastical assemblies. "The confenility of the Walloon church of Rotterdam contained itself with the detail of several objections against particular articles, for which indeed no satisfactory apology can be offered; but finished with Mr. Bayle's promise of amendment in a second edition, they proceeded no further. In 1702, Mr. Bayle published a second edition, with many additions. In the following year he wrote a volume entitled, "Réponse aux Questions d'un Provincial," containing an entertaining and instructive variety of historical, critical, and literary observations, to which he added a second and third volume in 1705, and a fourth in 1706. In 1704, he published "A Vindication of his Thoughts on Comets," which involved him in new disputes, particularly with the ingenious and learned Le Clerc. With his fame his adversaries multiplied; and attempts were made to prejudice lord Sunderland, the English minister of state, against him, and to procure his exclusion from the United States, as a man who was not only an enemy to religion, but chargeable with treason against the government. The storm, however, was diverted by the influence of lordShaftesbury. He was offered at this time a liberal provision and hospitable refuge by several persons of distinction in England; but he declined all these generous proposals. The decline of his health made him averse from changing his situation; and towards the close of the year 1706, he was reduced by a pulmonary disorder, which was hereditary, to a very weak state. The approaches of death were regarded by him with philosophical firmness, nor did he interrupt his literary labours to the last period of his life. In the morning of December 28, 1706, when his landlord entered his chamber, he asked him in a faint voice if his fire was kindled, and immediately expired; having attained the age of somewhat more than 59 years.

By his panegyrists, Mr. Bayle's talents, learning, and powers of reasoning have been unduly extolled; by his adversaries they have been no less unjustly degraded. M. Le Clerc, who belongs to the latter class, and whose judgment is evidently biased by prejudice, has not allowed him the merit to which he is unquestionably entitled. He represents him as ignorant of geometry, that, according to his own confession, he could never understand the demonstration of Euclid's first problem, and as having written in the latter period of his life against the evidence of mathematical demonstration. As a reasoner, he says, he had no settled principles, and he argued only with a design to puzzle the unlearned readers. His arguments, he adds, contain much more froth and empty words than sound reasoning. He was unacquainted with the books written in England upon experimental philosophy, and understood only a little of the philosophy of Des Cartes. He had perused only a few translations of English books upon metaphysical subjects. His knowledge of divinity was derived from his catechism, from sermons, or from a few French books. In ecclesiastical antiquity, and in that of Greece and Rome, he was indirectly skilled; law and phylic were to him hidden treasures; and his knowledge of modern history was partial and imperfect. He had collected with great labour a thousand literary trifles and inconsiderable circumstances; and though he wrote in a very agreeable manner, it was only when he was not in a passion. Saurin says of him, that he was one of those extraordinary men, whose opposite qualities leave room to doubt whether we ought to look upon him as the bel of the world of men. On the one hand, he was a great philosopher, knowing how to distinguish truth from falsehood, and perceiving at one view all the consequences of a principle and their connection; and on the other hand, a great sophist, confounding truth with falsehood, and deducing false inferences from his affirmed principles. On the one hand, a man of learning and knowledge, who has read all that can be read, and remembered all that can be remembered; and on the other, ignorant, or feigning ignorance, with regard to the most common subjects, propounding difficulties which have been thousand times solved, and urging objections which a school-boy could not make without blushing. On the one hand, attacking the most eminent men, opening a large field for their labours, and giving them a great deal of trouble to vanquish him; and on the other, using the world authors, to whom he was lavish of his praises, and disgracing his works by such names (meaning probably Brantome and Ribelais) as a learned mouth never pronounced. On the one hand, free, at least in appearance, from all the passions which are inconsistent with the spirit of Christianity, grave in his discourses, temperate in his diet, mild in his manner of living; and on the other, employing all the strength of his genius to overthrow the foundations of moral virtue, and attacking as much as lay in his power, chastity, modesty, and all the Christian virtues. On the one hand, appealing to the throne of the most severe orthodoxy, going to the purest springs, and borrowing his arguments from the least suspected writers; and on the other, following the paths of heretics, propounding against the objections of the ancient heretics, lending them new arms, and collecting together in one age all the errors of past ages. The eloquent preacher closes this detail with the following benevolent wishes: "May that man, who had been endowed with so many talents, be acquitted, before God of the ill use he made of them! May that Jesus, whom he so often attacked, have expiated his sins!"

Voltaire, speaking of his Critical Dictionary, says, "It is the first work of the kind in which a man may learn to think." He confines himself, however, to those articles which contain only a detail of minute facts, as upon the title of Bayle, an intelligent reader, or polemics. "In placing him," adds this author, "among the writers who do honour to the age of Louis XIV, although a refugee in Holland, I only conform to the decree of the parliament of Toulouse; which, when it declared his will valid in France, notwithstanding the rigour of the laws, expressly said, "that such a man could not be considered as a foreigner." "Without a country, or a patron, or a prejudice," says Gibbon in his Miscellaneous Works, Bayle claimed the liberty, and subsisted by the labours of his pen. The inequality of his voluminous works is explained and excused by his alternately writing for himself, for the booksellers, and for polemics; and if a severe critic would reduce him to a single folio, that relic, like the books of the Sibyl, would become still more valuable. The ancient paradox of Plutarch, continues this writer, that atheism is less pernicious than superstition, acquires a tenfold vigour when it is adorned with the colours of his wit, and pointed with the acuteness of his logic. His "Critical Dictionary" is a vast repository of facts and opinions, and he balances the false religions in their sceptical scales, till the opposite quantities, adopting the language of algebra, annihilate each other. The wonderful power which he so boldly exercised of assembling doubts and objections had tempted him joyously to assume the title of the Βαγγέλιον Ζεύς, the cloud-compelling Jove; and in a conversation with the
the ingenious abbot, afterwards cardinal, de Polignac, he freely disclosed his universal Pyrrhonism. "I am truly (said Bayle) a protestant, for I protest indifferently against all systems and all facts."

Upon the whole we may observe, that in private life Mr. Bayle was sober and temperate, modest and unassuming, disinterested and sincere. As a writer, his sentiments were fluctuating and sceptical, and he is not unjustly placed at the head of modern sceptics. Although he often takes pleasure in propagating his doubts, and perplexing his readers with a mixture of opinions, yet he frequently combats hurtful prejudice and unwarrantable dogmatism. In many articles of his Dictionary, it does not appear to what country, &c., or person he belongs; and this circumstance has been regarded by some persons as contributing a qualification for historical dissection. For the propriety of his ideas, for his notorious want of delicacy, and for his disposition to introduce offensive topics, his most partial advocates will find it difficult to devise an apology. The pernicious tendency of his sceptical system, with regard to religion and society, is well exposed by lord Lyttleton in his "Dialogues of the Dead," vol. ii. p. 317. "You have endeavoured," says this exalted writer, thinking Locke, "and with some degree of success, to shake these foundations, on which the whole moral world, and the great fabric of social happiness, entirely rest; how could you, as a philosopher, in the sober hours of reflection, answer for this to your conscience, even supposing you had doubts of the truth of a system, which gives to virtue its sweetest hope, to imperious vice its greatest fears, and to true pietism its best consolations; which renews even the lost approaches to guilt, and yet makes those allowances for the infirmities of our nature, which the socratic pride denied to it, but which its real imperfection, and the goodness of its infinitely benevolent Creator, so evidently require?" As to his style of writing, it is natural and lively, but not always correct, and inclining to prolixity; his manner is rather satirical and humourous, than inflammatory. The best editions of his Dictionary are those of 1729 and 1740. The English translation of Mr. de Maiziere is reckoned a good one. A new and accurate translation of Bayle's dictionary is incorporated in the "General Dictionary, Historical and Critical," with reflections on each passage of Mr. Bayle, as far as it favours scepticism and the Manichean system. Maiziere's Life of Bayle, Gen. Dict. Gen. Biog.

Bayle, Francis, many years professor in medicine and philosophy at Toulouse, and author of numerous learned and ingenious works, died September 24th, 1709, aged 87 years. The most celebrated of his productions are: "De Menstrualia Mulierum," "Sympathia partium corporis humani cum utero, utraque ad tabidos, &c." Tolos. 1679, 4to. He attributes the menstrual flux to a fermentation occurring periodically in the mucous sinus of the uterus, distending and opening their mouths, which collapse and close as soon as fermentation subsides; a notion as philosophical as the periodical plethora of Friend. "Dissertationes phylicae ex c. Tolos. 1677, 12mo. The third dissertation is on phlogismy, in which the author had faith, as well as in the power of the imagination of the mother, in marking and muttering the foetus in utero. "Discours sur l'experience et la raison," Paris, 1675, 12mo. He here affords the superiority of experience over theory in medicine, "Histoiro d'un enfant qui a demeuré 25 ans dans le ventre de la mere," Tolos. 1678, 12mo. The foetus was found uncorrupted, surmised by a firm crust or shell. For the titles of the remainder of this author's works, which were collected and published in four volumes, 4to, in the year 1703, at Toulouse, see Hall. Bibl. Annt. & Eloy's Dict. Hist.

Bayle, in Fortification, the space outside the ditch of our ancient fortresses, commonly surrounded by strong palisades, and sometimes by a low embattled wall.

Bayly, Lewis, in Biography, an English bishop in the reign of James I., was born at Carmarthen, in South Wales, and educated at Oxford. Being an eminent preacher, he was appointed one of the king's chaplains, and promoted to the see of Bangor in 1646. In 1621 he was committed to the Fleet, probably on account of his concern in prince Henry's match with the Infanta of Spain. He died in 1632, and was buried in the church of Danger. This prelate was the author of a famous piece called "The Practice of Piety," which has been so popular, that the edition of 1734 was the 50th. It was translated into Welsh and also into French in 1733, and a complaint was alleged against it, that the common people regarded its authority as equal to that of the Bible. Biog. Brit.

Bayna, in Geography, a town of Hungary, in the Barok district, the inhabitants of which are principally farmers and husbandmen.

Baynes, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Bayeux, 34 leagues W.S.W. of Bayeux.

Baynet, a town and bay on the south side of the island of St. Domingo, 45 leagues from Petit Guave, on the north side of the island, and about 8 leagues west of Jackmel. N. lat. 18° 17'.

Bayon, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Lunville, seated on the Moselle. N. lat. 43° 30'. E. long. 14° 42'.

Bayona, a sea-port town of Spain in Galicia, situated in a small gulf, near the mouth of the Minho, with a convenient harbour. The coast near it abounds with excellent fish; and the land, watered by many springs, is fertile. N. lat. 42° 15'. W. long. 8° 52'.

Bayona Bay and Islands, lie on the south part of the great bay of Vigo, and to the east of Cape Fafeh, on the west coast of Spain, in the Atlantic ocean. The bay forms the harbour of the town of Bayona. The two islands are situated to the west of the town. They were anciently called "Infante Deorum," or the isles of the Gods. A large rock, with many small ones about it, lies at the north end of Bayona islands.

Bayonnet, in the Military Art, signifies a short broad dagger, used by all modern armies, since the sword has been laid aside, as a necessary appendage to the infantry. The origin of the term is not correctly known; but it is most probably derived from having been first manufactured at the city of Bayonne, or originally invented by an engineer of that place.

Bayonets were formerly made with a round handle, adapted to the bore of a firelock, so as to be fixed there after the folder had discharged his piece. They are now constructed with iron handles and rings which go over the muzzle of the firelock, and are screwed fast; thus enabling the folder to fire and load with his bayonet fixed, and ready to act, if necessary, against horse. This is particularly of service to dragoons and fusiliers, after they have expended all their powder and ball.

The use of the bayonet fastened on the muzzle of the firelock was a great improvement, first introduced by the French, and to which, according to the chevalier de Polard (Comm. fur Polib. vol. i. p. 135. edit. Paris, 1727), they owed in a great measure their victories obtained in the war of 1668. To it is due the victory in the next war, the same writer attributes most of the losses they sustained. It is to marshal Catane, the French are indebted for the great superiority they
they poise in the management of this weapon. During greater part of the seventeenth century, one half of a battalion was armed with pikes, the other carried musquets; but the feble effect of these last, and the frequent misfiring fire from the awkward use of matchlocks, suggested the improvement of lances with bayonets, which unites the two arms in the most effectual manner.

The battle of Marfaglia, in 1659, was the first occasion on which Catinat put this improvement in practice, against the Spaniards and Savoyards. The French infantry marched boldly up to the enemy, received their fire, and without returning a shot, charged furiously with their bayonets. The slaughter was horrible, and the rout of the allies complete. The same method was adopted by marshal Tallard at the battle of Spire in 1703; and by the due de Vendôme at the battle of Collinato in Italy, in 1705. On both occasions success was the fame as in the former instances. Of late the bayonet has come into very general use; and battles of importance have been gained by it without the discharge of a musquet.

The late king of Prussia, although he relied greatly on the running fire which he taught his troops to practise with such terrible effect, yet highly recommended the charge with the bayonet as the most effectual means of throwing a warring enemy into irreparable disorder.

But the French, whole natural genius seems particularly adapted to the use of this weapon, have not only invented, but have also employed it with the most astonishing success.

In the late war, the favourite maxim of their generals, instead of losing time by cannonading and firing on the enemy with musquets, has been to bring the illusing of the affair as early as possible to the point of the bayonet. The battles of Jemappes, Haguenau, and Ettingen, in particular, not to mention many others, were almost exclusively gained by it; and the Spaniards, throughout the dreadful contests between their own and the French forces, at the conclusion of the campaign of 1794, were uniformly defeated by the use of the bayonet alone.

**BAYONNE,** in Geography, a pleasant sea-port town, on the western coast of France, in a corner of the bay of Biscay. It is situated in the district of Ustaritz, and department of the lower Pyrenees, at the confluence of the rivers Adour and Nive, about a league from the sea, with a good harbour, and having a narrow and dangerous entrance. The Adour divides the suburb from the citadel, and through the town itself flows the river Nive. A wooden drawbridge, which admits vessels to pass, connects the suburb with the town. The style of the buildings at Bayonne is principally Spanish, with balconies at every window, and arcades before the houses. From the "place de la Liberté", which is surrounded by very neat houses, and appears very gay, a gate leads to a pleasant promenade on the Adou. The trade of this town is very considerable, on account of its vicinity to Spain, and of the great quantity of wines which are brought hither from the adjacent country, and which the Dutch have been accustomed to take in exchange for spices and other commodities. Masts are also brought from the Pyrenees by means of the Nive, the Gave of Oloron, and the Adour, to Bayonne, whence they are shipped to Breil, and other ports. The common people generally speak the old Basque or Basque language. At Bayonne, and in the neighboring country, the young women are very beautiful, combining with a tall slender shape great symmetry of features, a fair complexion, and black lively eyes.

**BAYS,** in Commerce, a kind of coarse, open, woollen stuff, having a long nap; sometimes frized, according to the uses for which it is intended.

This stuff is without wale, being wrought on a loom with two tredles like flannel. It is chiefly manufactured about Calais, and Bocking in Essex; and in Flanders, about Lille and Tournaie, &c.

This manufacture was first brought into England, together with that of fays, ferges, &c. by the Flemings, who fled hither from the persecution of the duke of Alva, about the fifth year of the reign of queen Elizabeth, and had afterwards peculiar privileges granted them by the 12 Car. II. in 1660. The exportation of rays was formerly much more considerable than it is now, as the French manufacturers have learned to imitate them, and have set up manufactures of their own at Nimes, Montpelier, &c. However a considerable quantity of fays is still exported to Spain, Portugal, and Italy. Their chief use is for the religious, and for linings in the army; the looking-glass makers also use them behind their glasses, to preserve the tin or quicksilver; and the cafe makers to line their cafes.

The breadth of fays is commonly a yard and half, yard and three quarters, or two yards; by forty-two, or forty-eight in length: those of a yard and three quarters are most proper for the Spanish trade.

**BAYS,** in Geography, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Mayenne, 21° 43' south. E. S. E. of Mayenne.

**BAZA,** or BAZA, in Commerce, fine spun cotton, which comes from Jerusalem, whence it is also called Jerusalem cotton.

**BAZAR,** or **BAZA,** in Geography, a town of Germany, in the duchy of Carniola, 7 miles S.S.W. of Felde.

**BAZA,** or **Baza,** a town of Spain, in the province of Granada, between Guadix and Huescar, supposed to be the ancient Bath. N. lat. 37° 31'. W. long. 2° 31'.

**BAZADOBIS,** a district of the province of Guipuzcoa before the revolution, situated between Azenos, Condomos, and Guayene. The soil is sandy and unproductive. The capital is Bazas.

**Bazar,** or **Basar,** in Commerce, a denomination among the Turks and Persians, given to a kind of exchanges or places where their finest stuffs and other wares are sold. They are also called bazarlaine.

The word bazar seems of Arabic, or rather of Persian and Turkish origin, where it denotes bazar, or exchange of goods.

Some of the eastern bazars are open, like the marketplaces in Europe, and serve for the same ufe, more particularly for the sale of the more bulky and less valuable commodities. Others are covered with lofty ceilings, or even domes pierced to give light; and it is in these the jewellers, goldsmiths, and other dealers in the richer wares, have their shops.

The bazar or market of Isphahan is one of the finest places in all Persia, and even surpasses all the exchanges in Europe; yet, notwithstanding its magnificence, it is excelled by the bazar of Turin, where is the largest that is known, having several times held thirty thousand men ranged in order of battle.

At Constantinople there are the old and the new bazar, which are large, square buildings, covered with domes, and sustained by arches and pillars; the former chiefly for arms, harness, and the like; the latter for goldsmiths, jewellers, furriers, and all sorts of manufacturers. For an account of the bazaars of Aleppo, see Aleppo.

**Bazar,** or **Bazar,** a town of Hindoostan, 20 miles N.E. of Attock, seated near the Indus, Nila or Sinde river. N. lat. 35° 45'. E. long. 71° 18'.

**BAZARUTO,** or Bocca islands, lie off the South-east coast of Africa, in the Indian ocean, opposite to Asoora bay. S. lat. 21° 25'. E. long. 34° 32'.

**BAZAR,** a city of France, and principal place of a district,
BAZIERE, Sr., a town of France, in the department of the Lot and Garonne, in the district of Marmande, 4 leagues N.W. of Marmande.

BAZENGENDES, in Natural History, the name of a substance used by the Turks, and other eastern nations, in their febrile dyings; they mix it for this purpose with cochineal and tartar, the proportions being two ounces of the bazedengres to one ounce of cochineal. The bazedengres seem to be no other than the horns of the turpentine tree in the eastern parts of the world; and it is not only in Syria that they are found, but China also affords them. Many things of this kind were sent over to M. Geoffroy at Paris from China, as the substances used in the scarlet dyeing of that country, and they all proved wholly the same with the Syrian and Turkish bazedengres; and with the common turpentine horns. The latter or mallic tree is also frequently found producing many horns, of a like kind with these, and of the same origin, all being owing to the phcehons, which make their way into the leaves, and breed their young there. Reaumur's Hist. of Infests, vol. vi. p. 37.

BAZIEGE, in Geography, a town of France, in the department of the upper Garonne, and chief place of a canton, in the district of Villefranche, 4 leagues S.E. of Toulouse.

BAZIN, Niccolas, in Biography, a French physician and corresponding Member of the academy of Sciences at Paris, graduated at Strasbourg, where he afterwards refined, and acquired considerable reputation as a practitioner in medicine, though his attention was principally turned to the study of natural history, which he enriched with the following valuable productions. Observations sur les plantes, et sur leur analogie avec les infests. Strasbourg, 1741, 8vo. He believed that plants respired, and that the juices absorbed by them for their nourishment were digested, or concocted in the root, prior to their distribution. "Hist. des Abeilles," 2 vol. 12mo. Paris, 1744. "Lettre au fiujet des animans, appellees polypes," 1745, 12mo. He died in March 1754. Hall. bib. Bot. Eloy. Diet. Hist.

BAZIRA, in Ancient Geography, now Bijore, a district of a territory adjoining to the country of the Affaceni, or Affascani, corresponding to the present Sewad or Sewhad, between the rivers Bijore and Penjekoreh in Hindostan. When Alexander had taken Maffaga, he summoned Bazira, the capital of the next adjacent territory; and the modern district of Bijore pretends itself in a petition that answers most unequivocally to that of Bazira; and the similarity of their names is no lies striking. See BIZORE.

BAZIRGON, a town of Persia, in the province of Larifan, 57 miles sail of Lar.

BAZIUM, a promontory of Egypt, on the western coast of the Red Sea. Ptolomy.

BAZOCHE, or Bassche, in Lower, formerly a royal kind of jurisdiction exercised among the clerks of the palais, or courts of justice at Paris. It was administered in the name and by the authority of the king of Bassche, roi de la Bassche, by virtue of an ancient grant of the kings of France; the clerks among the clerks were the officers; and he who presided was the chancellor. This court only took cognizance of cause in the clerks, or between clerks and artificers for goods bought, or work done. The freedom they exercised with regard to private characters in their inquisition and remonstrances, occasioned several arrests to restrain their power, and prohibit their holding pleas without leave.

A collection of statutes, ordinances, regulations, monuments, and prerogatives of the kingdom of Bazoche, was published at Paris in 1654, 8vo.

BAZOCHES, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Nogent-le-Rotrou, 5 miles S.E. of Autun.

BAZOCHES, a town of France, in the department of the Orne, and chief place of a canton, in the district of Argentan, 9 miles N.W. of Argentan.—Allo, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Neuvy-Bois, 6 miles N. of Neuvy-Bois. Allo, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Soissons, 4 leagues E. of Soissons.

BAZOGE, in Geography, a town of France, in the department of the Sarte, and chief place of a canton, in the district of le Mans, six miles N. of le Mans.

BAZOUNGES, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval, 24 leagues S. E. of Laval.

BAZOUGES LA PERDUE, a town of France, in the department of the Ille et Vilaine, and chief place of a canton, in the district of Dol, 34 leagues S. S. E. of Dol.

BDELLIUM, bdellius, an aromatic gum, brought from the Levant, of some use, both as a medicine and a perfume. The word is supposed to have been formed of the Hebrew בדיל, bdollath, which the English translators render by the appellation bdellium. It is also written bdellium, bedello, pellitium, petallium, negallium, and tellium.

There is much uncertainty concerning both the plant and the place of its production, which is supposed to be in Africa. We find mention of the name both among the ancients naturalists, and in Scripture; but it is doubtful whether any of these be the same with the modern kind. As for the Scripture bdellium, we know very little of it. Moses describes it as the colour of bdellium; and Josephus explains the paille, by saying it is the gum of a tree resembling the olive tree; and that the manna whereby the Jews were fed in the desert resembled this drug.—But Scaliger and others set aside this explanation, and own they do not know what the bdellium mentioned in Scripture is.

The bdellium of the moderns is a gum resin in irregular brittle mallees, of a deep brown when broken, interspersed with more transparent parts; and mixed with small twigs and other accidental impurities. Its external appearance is a good deal resembles myrrh. The smell of this gum-resin is somewhat fragrant, and its taste somewhat bitter and pungent. It grows soft and tenacious when chewed. It burns with cafe, giving a fragrant smoke and a crackling noise. It is partly soluble in alcohol, and partly in water, or completely (the impurities excepted) in diluted spirit. By Neuman's experiments only about one fifth is pure resin. The watery solution is tea-green, the frititious red. Diluted with water it impregnates the liquid with its flavour, but it does not yield any sensible quantity of effluent oil, when only a moderate quantity is used.

Bdellium was formerly employed as a stimulating remedy, chiefly for external application, and is still retained in some of the warm plasters of the Paris dispensatories. It is entirely diffused here, and seldom to be found in the shops. It resembles myrrh in its properties, but is less in degree, and is very deservedly neglected. Murray. Lewis. Li Grange Etem. de Pramh.

BEACH Fork, in Geography, a branch of Salt river, which rises in Nelson county, Kentucky, in America. On this river is found a fine clay, which it is thought might be manufactured into good porcelain.
BEAUCHY-HEAD, is a bold promontory which projects into the English channel on the Sussex coast, between Hastings and Shoreham. This commanding headland consists of alternate strata of chalk and clay; though the latter is only seen in thin layers or veins. “It is esteemed,” says Camden, “the highest cliff of all the south coast of England;” and on its south side is a large semicircular intrenchment. It is divided into seven cliffs, and so called by seamen. The coast round this head is very dangerous in stormy weather, particularly when the wind sets in from S.S.E. or S.W. From this promontory to Arundel, the country along the coast rises into high hills, which are known by the name of South-downs, and celebrated for their sheep walks. Beachy-head is memorable for the defeat of the English and Dutch fleets near it by a superior force of the French, June 30th 1690. N. lat. 50° 34′ 30″. E. long. 0° 19′ 40″. See Eastbourne.

BEACHY-HEAD, lies also on the eastern coast of South America, in Patagonia, about S.S.W. from Port Julian, and N.N.E. from Cape Farewell. S. lat. 50° 21′. W. long. 67° 40′.

BEACON, a signal for the better security the kingdom against foreign invasions.

Different methods have been taken in different countries, both anciently and of later ages, to convey the notice of any impending danger to distant places with the greatest expedition. But no kind of signals has more generally prevailed than that of fires in the night. That this was practiced among the Jews we learn from the sacred writers. Hence the prophet Isaiah, in allusion to that custom, threatens them that they should be left “as a Beacon upon the top of a mountain, and as an ensign on a hill.” (chap.xxx. 17.) And in the like manner Jeremial slams them by saying, “Set up a sign of fire in Beth-lacamem, for evil appeareth out of the north, and great destruction” (chap.vi. 11.) And as to other countries, Arifotole (de Mundo) informs us, that these signals were so disposed on towers through all the territories of the king of Perse, that in the space of twenty-four hours he could receive advice at Susa and Ecbatana, his two capital cities, of any commotions or disturbances that might be raised in the most distant parts of his dominions. But the Greeks, as Thucydides relates, made use of torches for signals, which by a different management served either to give notice of the approach of an enemy or the arrival of a friend to their assistance. For as the Scholast says, in the former case “the torches were shook by those who held them, and in the latter they were kept steady.” (lb. xi. c. xxiv. lib. iii. c. xxii.) Among the Greeks they were called opheroi; and their use is particularly described in the Argeneamon of Eikelyn. The like custom of nocturnal fires obtained also among the Romans, as appears from Cicero, where speaking of the Middlefort of Verres, when governor of Sicily, he says, “Non enim sunt acta conludenda erat prudens adventum significationem igni e fucula frabilis; fed flammas e ipsa incendio navium, et calamitatem acceptam et periculum reliquum muniaebat:” (lib.vi in Verrem, § 91.) Wherefore signals of this sort are called by Pliny ignes præemittativi.” (Nat. Hist. lib. xi. § 73.) which he distinguishes from the Phari, or light houses that were placed upon the coasts for the direction of ships; the latter of which were constant, but the former only occasional.

Established signals were repeated, says Charnock, in his "Marine Architecture", by means of beacons or light-houses erected in proper positions, from mountain to mountain, through a chain of stations, which are laid to have commanded an extent of more than 500 miles; so that even the inhabitants of Constantinople were capable of being informed, within the short space of a few hours, of any motions that might be attempted by their Saracen enemies in Tarshum.

In our own country, the name of beacon is derived from the Anglo-Saxon becanon, to shew by sign or beacon. It was usually placed upon a high ground, and sometimes on a turnpike. From Lord Coke we learn (Fourth Infinit. cxxv. p. 184.) that before the reign of Edward the third, beacons were but flacks of wood set up on high places, which were fired when the coming of an enemy was despaired; but in his reign pitched boxes were set up instead of them. In time of danger a watch was kept at them, and horsemen called hobbahs were stationed by most of them to give notice of an enemy’s approach.

Beacons are also marks and signs erected on the coasts, for the guidance and preservation of mariners at sea by night as well as by day. The erection of beacons, light houses, and sea-marks, both for alarming the country in case of the approach of an enemy, and for the direction and safety of ships, is a branch of the royal prerogative. For the pur- pose of the king hath the exclusive power, by commission under his great seal, to cause them to be erected in convenient places, as well as upon the lands of the subject as upon the demesnes of the crown; which power is usually yoked by letters patent in the office of lord high admiral.

Nevertheless it must be understood that the power of erecting beacons was occasionally given to individuals, and limited by grants from the crown, whence, or for some achievements performed in times of danger, the beacon is worn as a crest in the arms of several families, as Belknap, Butler, Mountford, Sudley, and Shelly of Michell Grove, one or two of whom obtained especial grants which empowered them to erect and maintain beacons at their own expense.

The care of these when erected by the crown, was committed to one or more of the adjacent hundreds; and the money due or payable for their maintenance, called becanageum, was levied by the Sheriff of the county upon each hundred. (Archaeologia, vol.i. part 1. Hutchin’s, Hist. of Dorset, vol.i. p. lx. Canad. Brit. Edit. 1690. p. 196.)

By Stat. 8 Eliz. c. 13. the corporation of the Trinity house are empowered to set up any beacons or sea-marks wherever they shall think them necessary: and if the owner of the land or any other person shall destroy them, or shall take down any reecle, tree, or other known sea-mark, he shall forfeit 100l. or in case of inability to pay it, shall be imprisoned outwised.

BEACONAGE, money paid towards the maintenance of a beacon. A suit for beaconage of a beacon standing on a rock in the sea may be brought in the court of admiralty, the admiral having an original jurisdiction over beacons. 1 Sid. 178.

BEACON HILL, in Geography. See Harwich.

BEAUFIELD, a small market town of Buckinghamshire, in England, at the distance of 23 miles N.W. from London. The town is built on high ground, whence some antiquaries have inferred, that it derived its name from a beacon formerly occupying this spot. The abbeys, on which it stands is chiefly gravel, and the houses are built with flints or brick, there being no stone quarries in this part of the county. Beaconsfield has little claim to popular attention, there being no particular historical events or antiquities attached to it. Here are a small weekly market on Wednesdays and two annual fairs. Seated on the great public road between London and Oxford, it derives some advantages from travellers; but it has been particularly noted in the literary annals of this country, by the continuous residence of Edmund Waller the poet, and Edmund G. Burke.
Berk the politician, both of whom possessed estates near Beaconsfield, and the memories both are commemorated by inscriptions at the parish church. See WALLER, and TURKE.

About three miles east of Beaconsfield is Bulstrode, a seat of the duke of Portland. This ducal residence was formerly in the possession of the Bulstrode family, but reverting to the crown, was given by king William III. to William Bentinck, who had long been the constant attendant and faithful servant of that monarch, and who was created by him earl of Portland in 1669. From him it descended to the present nobleman, who has made considerable additions and improvements to the house and grounds. The former is a large irregular brick building, seated on a high knoll, in the centre of a fine park which abounds with venerable trees, and is diversified with that variety of surface, which constitutes the foundation of the picturesque. This park contains about 800 acres, and in the eastern part of it is a large circular entrenchment enclosing an area of twenty acres. See Beauties of England and Wales, vol. i. 1851.

BEAD, Baguette, Fr. in Architecture, a little round moulding, the decorative ornament of the volute main of a pillar. This moulding is generally found in the cornices of antique buildings, where it is uniformly carved with ornaments, sometimes in the shape of a string of beads, sometimes a twisted ribbon or a rope. See Plate XXI. of Architecture. Plain beads are very much used in modern joiners' and plasterers' work, as the mouldings of doors, shutters, skirting, impofts, and cornices.

Bead, in Affaying, the small lump or mass of pure metal separated from the scoria, and seen distinct and pure in the middle of the coppers while in the fire.

Thus, in separating silver from its ore by means of lead, the silver remains in form of a bead, when the lead, that had before affiliated in the operation, is reduced to scoria. In this process, the bead of silver must be taken out of the copper as soon as it is seen pure and fine, left growing cold; it should be conglutinated to the coppel or latharge. This bead, when rightly made, is always porous underneath. Cramer.

Beads are more particularly used among us for a sort of glass necklace, made in imitation of the colour and figure of pearl.

Beads are also used in speaking of those glass globules vended to the savages on the coast of Africa, thus denominated because they are strung together for the convenience of traffic.

The common black glass of which beads are made for necklaces, &c. is coloured with manganese only; one part of manganese is sufficient to give a black colour to near twenty of glases. Lewis's Comm. Phil. p. 422. See Artificial Pearls.

Beads, in a religious sense. See Chaplet.

Bead-Roll, among the Romish priests, a lift or catalogue of such persons, for the roll of whose names they are obliged to recite a certain number of prayers, &c. which are told by means of their beads.

Bead-Makers, called by the French paternoftriers, are those employed in the making, forging, and selling of beads. At Paris there are three companies of paternoftriers, or bead-makers; one who makes them of glass or crystal; another in wood and horn; and a third in amber, coral, jet, &c.

Bead Proof, or Double Proof, terms used by our distillers, to express that sort of proof of the standard strength of spirituous liquors, which consists in their having, when shaken in a phial, or poured from on high into a glass, a crown of bubbles, which stand on the surface some time after. This is esteemed a proof that the spirit consists of equal parts of rancid spirits and phlegm.

This is a fallacious rule as to the degree of strength in the liquor; because any thing that will increase the tenacity of the spirit, will give it this proof though it be under the due strength. Our malt distillers spoil the greater part of their goods, by leaving too much of the flinking oil of the malt in their spirit, in order to give it this proof, when somewhat under the standard strength. But this is a great deceit on the purchasers of malt spirits, as they have them by this means not only weaker than they ought to be, but flinking with an oil, which they are not easily cleared of afterwards.

On the other hand, the dealers in brandy, who usually have the art of sophifying it to a great nicety, are in the right when they buy it by the strongest bead proof, as the grand mark of the best; for being a proof of the brandy containing a large quantity of its oil, it is, at the same time, a token of its high flavour, and of its being capable of bearing a very large addition of the common spirits of our own produce, without betraying their flavour or losing its own.

We value the French brandy for the quantity of this essential oil of the grape which it contains, and that with good reason; for it is with us principally used for drinking as an agreeably flavoured cordial; but the French themselves, when they want it for any curious purposes, are as careful in the rectification of it, and take as much pains to clear it from this oil, as we do to free our malt spirit from that nauseous and fettid oil, which it originally contains.

No judgment can be formed of brandies by the bead proof as to their mixed or adulterated, or their pure state, farther than that they are likely to be most pure when they have the greatest proportion of this oil, in regard to mixtures of other spirits. There are many occasions where we want spirit, merely as spirit, and where any oil, whether sweet or flinking, must be equally improper. Shaw's Essay on Distillery.

Bead Tree, in Botany. See Myelia.

BEADLE or Bedell, Bedellus, signifies a messenger or apparitor of a court, who cites men to appear and answer in the court to what is alleged against them.

Beadle is also used for an officer in universities, whose place it is to walk before the masters at all public proceedings, &c. with a mace. The office of church and parish beadles is well known.

Spelman, Vellius, and Somner, derive beadle from the Saxon bidul, a public crier; in which sense bishops, in some ancient Saxon manuscripts, are called beadles of God, Dei bedelli. The translator of the Saxon New Testament renders executor by bidde; and the word is used in the same sense in the laws of Scotland.

Beadle of the Forest, is an officer, that warns all the courts of the forest, and executes process, makes all proclamations, &c. 4 Inst. 313.

BEAGLE, in Zoology. See Canis Familiaris, and Dog.

Bengals are of divers kinds; as the southern beagle, something less and shorter, but thicker than the deep-mouthed hound; the fleet northern, or eat beagle, small, and of a finer shape than the southern, and a harder runner. From the two, by crossing the strains, is bred a third sort held preferable to either.

To these may be added a still smaller sort of beagles scarce bigger than lap-dogs, which make pretty diversion in hunting the coney, or even fmall hare in dry weather; but otherwise unserviceable, by reason of their size. Beagles, both rough and smooth, have their admirers among sportmen; their tongues are musical, and they go faster than the southern hounds; they run so close to the ground,
as to enjoy the scent better than taller dogs, especially when the atmosphere is low. In an inclosed country they are said to do well, as they are good at trailing or default, and for hedge-rows; but they require a clever huntsman, for out of eighty couple in the field, during a winter's sport, scarcely four couple are to be depended upon. Of the two forts, the wire-haired, as having good shoulders and being well filleted, are preferred. Smooth-haired bagels are commonly deep hung, thick-lipped, with large nozils, but often so soft and bad quartered, as to be shoulder-shook and crippled the first season they hunt; among them are frequently seen crooked legs, like the Bartholomew; and after two hours running many of them are disabled. Their form and shape sufficiently denote them not designed for hard exercise. Daniel's Rural Sports, vol. i. p. 373.

BEAK, Roftrum, in Ornithology, the bill of a bird; from the form and structure of which, Linnaeus divides this whole family or general class of animals into fix orders. See Bird, and Ornithology.

BEAK, in Architecture, a little fillet left on the edge of a larnarch, which forms a cyma, and makes a kind of pendant chin, answering to w. trivium calls the mentum.

BEAK, or End-Head of a Ship, is that part without the ship before the forecastle, which is fastened to the stem, and is supported by the main knee; this is usually carved and painted, and, besides its use, makes the becoming part, or grace of a ship.

The beak was anciently made of wood, but fortified with brass, and fastened to the prow, serving to annoy the enemies' vessels. Its invention is attributed to Pius, an Italian. The first beaks were made long and high; but afterwards a Corinthian, named Arillo, contrived to make them short and strong, and placed so low as to pierce the enemies' vessels under water. By the help of these, great havoc was made by the Syracusans in the Athenian fleet. Pott. Arch. tab. iii. c. 17.

BEAK was also used for one of the ancient battalia, or forms of ranging an army for battle, particularly used by the Macedonians.

BEAK is also applied to the slender crooked prominences of divers boills, bearing some analogy or resemblance to the beaks of birds.

In this sense we meet with beaks of flies, roftrum calceorum, for long peaked toes, in use of old. Du Cange.

Among Farriers beak denotes a little horse-shoe, turned up, and fastened in upon the forepart of the hoof.

It is used to keep the shoes fast, and not liable to be struck off by the horse, when by reason of any itch, or being much disturbed by the flies in hot weather, he stamps his feet violently on the ground.

BEAKED, Becuq, in Heraldry, is used when the beak or bill of a bow is of a different tincture from the body.

In this case, they say beaked and membered of such a tincture.

BEAKING, in Cock-Fighting, expresses the fighting of these birds with their bills, or holding with the bill, and striking with the heels.

BEAL, in Geography, a river of Ireland, which runs into the Shannon near Athcaslon, in the county of Limerick.

BEALE, Mary, in Biography, a female portrait painter in the reign of king Charles II., was the daughter of Mr. Craddock, minister of Walton upon Thames, and was born in Suffolk in 1632. Although she was not instructed in the rudiments of painting by Sir Peter Lely, as some have supposed, she diligently copied the works of that great master, as well as those of Vandyke. She painted in oil, water-colours, and crayons; and by copying some pictures of Italian masters, improved her taste and pencil, and acquired much of their air and style, which appear in her portraits. She was little inferior to any of her contemporaries with respect to colouring, strength, force, or life; and she worked with a great body of colours. Her performances were held in high estimation by Sir Peter Lely. Amiable in her conduct, and affable in her profession, she was very much encouraged and employed, both by the clergy and by several persons of rank, whose portraits she painted. It appears, that in one year she received for pictures 450l., and that she and her husband devoted about two fullings in the pound of their income to charitable purposes. In the MSS. of Mr. Oldys, Mrs. Beale is celebrated for her poetry as well as her painting. She died Dec. 28, 1697; and left two sons, Charles and Bartholomew, both of whom exercised the art of painting; but the latter relinquished painting, and studied physic under Dr. Sydenham, and practised at Coventry, where he and his father died. Walpole's Anecdotes of Painting, vol. iii. Biog. Brit. Pilkington.

BEALNABRUCH, in Geography, the name of a river in the county of Galway, province of Connaught, Ireland, which rises in Joyce's country near the Killeries, north of the mountain of Beannchobla or the twelve pins, and flows through a mountainous country into Lough Corrib, near the base of the stupendous Ben Leabh. The valley through which it runs is pretty well peopled. A great error is committed in Roque's and all the old maps, in representing this river as flowing into Roundstone, and affording a second outlet to Lough Corrib, instead of carrying it into a large supply of water. Dr. Beaumont's Map and Memoirs.

BEALSBURG, a small town of America in Nelson county, Kentucky, on the easterly bank of Rolling fork, containing twenty house, and also a tobacco warehouse; 15 miles W. S. W. from Bardstown, and 60 from Philadelphia. N. lat 37° 42'; W. long. 85° 50'.

BEALT: See Built. 

BEAM, in Architecture, is any piece of timber of a rectangular section of equal depth and thickness in height, applied in an horizontal position in various situations in a building, for the purpose of resisting some external pressure, or to prevent the rafter of roofs from pulling out adjacent walls upon which they rest, or to sustain a superincumbent part of a wall instead of an arch. This word, however, is not much used technically, and only in combination with other words, which denote its position or use. When a beam is placed at the bottom of a pair of rafters it is called "a Tie-beam;" but if placed in a higher situation it is called "a Collar-beam." When a beam is placed over piers of masonry or wooden poles to support a superincumbent wall, it is called a "breadsummer," or "summer-beam." When a beam is placed across of a floor to support the ends of joists and shorten their bearings, it is called a "girden," or girding-beam. See Carpenter.

Some of the best authors have considered the force or strength of beams, and brought their resistance to a precise calculation; particularly M. Vauquen and M. Parent. See Strength of Timber.

BEAM of a Plough, in Agriculture, a name given by our farmers to the great timber of the plough, in which all the other parts of the plough-land are fixed.

This is usually made of ash, and is straight, and eight feet long in the common plough; but in the four-centered plough, it is ten feet long, and its upper part square. The head of this beam lies on the pillow of the plough, and is called.
B A

raffed higher, or sunk lower, as that pillow is elevated or depressed by being rolled along the crow-plates. Near the middle, it has an iron collar, which receives the tow-chain from the box, and the bridg-chain from the flake or gallowes of the plough is fixed in it a little below the collar. Some inches below this, there is a hole, which letts through the coulter; and below that there are two other small ones, through which the heads of the retches pass. These are the irons which support the fheat, and with it the thare. Further backward ill is a larger perforation, through which the body of the fheat passes; and behind that, very near the extremity, is another hole through which the piece called the hinder-fheat passes. See Plough.

Beams of a ship, are the large, main, cross timbers, stretching from side to side, which hold the sides of a ship from falling together, and which also support the decks and orlops of the ship.

The main beam is that next the main mast; and from it they are reckoned by first, second, and third beam. The great beam of all is called the midship beam.

There are usually twenty-four beams on the lower deck of a ship of 74 guns, and on the other decks additional ones in proportion, as the ship lengths above.

Beam, on the, in Sea-Language, denotes any distance from the ship on a line with the beams, or at right angles with the keel. Any object that lies east or west, when the ship flees northward, is said to be on the larboard or larboard beam.

Beam, before the, signifies an arch of the horizon comprehended between the line of the beam, and that point of the compass which the beams. See Abast.

Beam, on the Weather, signifies on the weather side of the ship.

Bean, Camber. See Camber-Bean.

Beam of an anchor. See Anchor.

Beam of a balance, is that piece of iron or wood, somewhat bigger toward the middle than at the ends, where there are holes through which run the ropes or stringes which hold the scales: the beam is divided into two equal parts, by a needle placed over it perpendicularly: and the centre of motion must be placed a little above the centre of gravity, that the beam may rest exactly in a horizontal position. See Balance.

Beam, or Roller, among Weavers, is a long and thick wooden cylinder placed lengthways on the back part of the loom of those who work with the shuttle. The threads of the warp, of linen or woollen cloth, serges, or other woollen stuffs, are rolled upon the beam, and unrolled as the work goes on. That cylinder on which the stuff is rolled as it is woven is also called the beam or roller, and is placed on the fore part of the loom.

Beam, in Heraldry, is used to express the main horn of a hart or buck.

Bean, among Hunters, denotes the main item of a deer's head; or that part which bears the antlers, royals, and tops; the little breaks of which are called circles.

Bean is also used for a fiery meteor in the shape of a pillar: and for a ray of the sun.

Bean compasses. See Compasses.

Bean feathers, in Falconry, the longest feathers of a hawk's wing.

Bean-filling, in Building, the filling up the vacant space between the rising plate and roof, with flones, or bricks, laid between the rafters on the rising plate, and plastered on with loom; this is frequent where the garrets are not pargeted, or plastered.

Bean tree. See Crategus Aria.

BEAMINSTER. See Beminstar.

BEAN, in Botany. See Vicia Faba.

Bean, faba. The medicinal and dietetic qualities of beans are said to be nutritive, but flatulent: the pods yield a water held good against the gripes in children. Some have used the horse bean as a succedaneum to coffee; which in principle it much resembles; only that it contains but half the quantity of oil. Mr. Boyle has several experiments of beans treated systematically to flow the great plenty of air they afford, on which their flatulence depends. This air, which beans contain in a fixed state, is extirpated during their digestion in the stomach, in greater quantity than can be again absorbed; and upon that account thef, and other leguminous, have been at all times noted for occasioning flatulence, and sometimes colic pains. The expansion of beans in growing, Mr. Boyle also found so considerable that it would raise a plough clogged with above a hundred pounds weight. Boyle's Works, abr. tom. i. p. 285, tom. ii. p. 615, &c.

Beans with proper management make one of the finest of all baits for fish. The method of preparing them for this purpose is this: take a new earthen pot glazed on the inside; boil some beans in it, supposing a quarter of a peck; they must be boiled in river water, and should be previously steeped in some warm water for six or seven hours. When they are about half boiled, put in three or four ounces of honey, and two or three grains of musk; let them boil a little on, then take them off the fire, and use them in this manner: feek out a clean place, where there are no weeds, that the fish may fish and take the beans at the bottom of the water. Throw in some beans at five or six in the morning, and in the evening for some days. This will draw them together, and they may be taken in a casting net in great numbers.

The ancients made use of beans in gathering the votes of the people, and for the election of magistrates. A white bean signified abolition, and a black one condemnation. Beans had a mysterious use in the temuralia and parentalia; where the matter of the family, after wattling, was to throw a sort of black bean over his head, still repeating the words, "I redeem myself and family by these beans." Ovid gives a lively description of the whole ceremony in his Fasti, lib. v. ver. 435. Abstinence from beans is said to have been enjoined by Pythagoras, for which prohibition various reasons have been assigned. Some have supposed that it was intended to restrain his disciples from immoderately eating meat, which were decided by throwing beans into an urn. Others founding their opinion on the double sense of the word κείμενος, which signifies both a bean and the common vegetable, explain it by abstaining from venery. Clemens Alexandrinus grounds the abstinence from beans on their tendency to render women barren; which property is confirmed by Thaerphilus, who extended the fame effect even to plants. Cicero fuggles another reason; viz., that beans are very injurious to mental tranquility. Hence Amphiarasus is said to have forborne the use of beans, before Pythagoras, that he might be better prepared for divining by dreams. The Egyptian priests held it a crime to look at beans, judging the very light unclean. The flamen dialis was not permitted even to mention the name. Lucian introduces the famous philosopher in hell, saying, that to eat beans, and to eat our father's head, were equal crimes. After all, both the gnomonick of the precept, and the reality of any such abstinence among the ancient Pythagorians have been disputed. Some attribute the precept to Empedocles, a disciple of Pythagoras. Arisotomus, an ancient writer cited by A. Gallus, (i. iv. c. 11.) introduces Pythagoras saying, that he eat more frequently of
of beans than of any other pulse, on account of their gentle bowels the belly. Accordingly he is said to have permitted the use of them, because he believed them to be wholesome, but his disciples have forbidden them, because they thought them, as Hippocrates also did, productive of flatulence, and otherwise prejudicial to health. Thus, a prohibition, which was at first a civil regulation, or statutory advice, assumed the authority of a sacred law.

Bean. See Menyanthes.

Bean, or Ege. See Zygophyllum.

Bean-cad, in Navigation, a small sailing vessel or pilot boat, used by the Portuguese, which rigs with one mast, similar to the Tartan; which see.

Bean-flower, in Antiquity, called by the Romans lumentum, was of some repute among the ancient ladies as a cosmetic, wherewith to smooth the skin, and take away wrinkles.

Bean-fly, in Natural History, the name given to authors to a very beautiful fly, of a very beautiful purple colour, frequently found on bean-flowers. It is produced from the worm or maggot called by authors mida.

Bean, in Agriculture, a sort of pulse, of which there are several kinds; but those best adapted to field culture are the small sorts, such as the common horse-bean, and the tick-bean. The large sorts, or garden-beans, as the Windsor, Long-pod, and Mazagon, have also been occasionally employed in the field, with success, in some of the southern districts.

Beans constantly prefer a strong moist soil, and on such, where proper culture is given, they most afford an abundant produce. Tick-beans are favored by some farmers to be more productive than horse beans; but the latter grow higher in the stem, and produce a more flagrant flate of the air, or smoother the land more, consequently are the most suitable for the stronger sorts of soil.

The author of the Agricultural Survey of Middlesex observes, that beans are a crop which thrive well in almost any soil that is rather strong, such as medium-loams, sandy-loams, clayey-loams, and chalky-loams; on clay, marl, chalk, and such like, cool subsoils. And the author of the Synopsis of Husbandry remarks that the proper time for planting beans is towards the latter end of January, or early in the following month; though this business may be continued to advantage till the middle or latter end of March, if the weather had prevented their being got in at an earlier season; but in general it is best to embrace the first opportunity of sowing them after Candlemas, as they often miscarry if the sowing be procrastinated beyond that time, especially if a dry summer should succeed. In purchasing beans for seed, care should be taken to choose such as are hard and bright, without being thriven in their appearance.

Mr. Donaldson, in his view of the present state of husbandry observes, that the ordinary mode of preparing land for a crop of beans, is to give one ploughing only, which is generally performed in the spring, immediately before the feed is sown.

Beans are for the most part sown broad-cast, either on the stubble, before ploughing, or on the new turned-up furrows. Sometimes beans are sown or planted in the bottom of every second or third furrow, and afterwards horse and hand hoed. In a few districts they are sown with a drill-machine, and at such distances in the rows as to leave sufficient space, either for hand-hoeing, when that only is intended, or for horse and hand hoeing, when it is supposed that both these operations should be performed. It will at once appear obvious, he thinks, that either of these last-mentioned methods is preferable to sowing the fields broad-cast, as a better opportunity is not only afforded of cleaning the ground properly, but a more abundant return, and a produce of superior quality insured.

The spring fed time in general commences with the sowing of beans. In the southern districts, they are sown in ordinary seasons so early as the middle or towards the end of February; and in the northern parts of Scotland so late as the beginning of April. The month of March may, however, as has been observed, be considered as the general bean feed season.

The first of the above writers thinks, that on land which is inclined to moisture the preparation for this crop should be as follows: Early in autumn lay on the manure, and immediately plough the land into ridges of two feet six inches wide; in which state let it lie until the season for planting, when the seed may be dibbled in, one row of beans into the middle of each ridge, at the distance of about three inches from bean to bean. They should be immediately covered; which may be done by children, with a garden rake or hoe, or, should the surface of the land be dry and crumbly, a horse and a bunch harrow would do as well. In moist places, he observes, it is advisable to set a boy with a rattle to frighten away the rooks until the beans have attained some growth. The distance between the rows will not prevent the crop from completely covering the ground, especially if the land was manured for them, as they will branch out sideways, three or four feet from each root. They should be early planted, in order to their getting sufficient root-hold of the land, and procuring shade against the hot weather sets in. It is also some security against the black bean, which is the greatest enemy the bean is ever attacked by. They require a soil that can seldom be worked without damage during the winter and spring; consequently it ought to be manured and gathered into one boat ridges in the autumn. The shape of these ridges keeps the land more dry through the winter than any other, and prevents excessive rains from washing away the manure, which had been previously folded by the plough into the centre of such ridges; in which state it should lie, as has been already observed, until the season for sowing; when the land thus prepared will be so dry as to admit of dibbling every day; which secures to the farmer the advantage ofchosen his season. He ploughs, he says, about ten acres in September 1793, and ploughed the land into ridges of two feet and a half wide, burying the dung in the middle of them. The land lay dry through the winter, and he dibbled one row of beans into the middle of each ridge during the first week of February 1794. My neighbours, says he, on a similar soil, who ploughed into flat ridges of about fifteen feet wide, could not get their feed in till March. The ensuing summer was uncommonly dry; my beans being so unusually wide apart, admitted the plough and hoe to work as freely between the rows as a stubborn foot would allow. The plants tillered or branched till they completely covered the intervals, and the field appeared as completely cropped as though it had been sown broad-cast. When my neighbour's plants, says he, were beginning to pod, nine were half set. The whole were alike attacked by the black-fly, which reduced their crops to a bushel or two per acre, while I had twenty.

Mr. Young, however, remarks in the Survey of Suffolk, that it is there uncommon to give more than one earth for beans, and generally improper, as they love a whole firm furrow, and never thrive better than on a layer.

There are many different methods, Mr. Bannister says, of raising crops of beans. In some counties they sow this pulse by broad-cast, which is by no means an eligible way, since much of the seed will be left above ground, and a great part of that which is covered by the harrow will not be covered
to a proper depth; and many other objections might, he thinks, be urged against this method of fowing beans at random, of which it is not one of the least, that such irregular fowl crops are in great danger of being injured by weeds, which cannot so easily be exterminated when the beans are fowled at random as when they are planted regularly in drills.

In some districts, as Middlesex, Surrey, &c., the method is, to plant this pulse in rows struck out by a line, by which a great saving is made in the article of seed, a circumstance which is thought to compensate for the extraordinary charge of this mode of husbandry; and thus far it may be fairly acknowledged, that the method of planting beans by the dibble is greatly to be preferred to that of fowing the seed at random. The economy of this agricultural process he thus explains: - the rows are marked out one foot distant, and the seed planted in holes made two inches apart; the lines are fretted across the land, which are formed about six feet over, so that when one row is planted, the ticks to which the line is fastened are moved by a regular measurement to the distance required, and the same method pursued till the field is completed. The usual price for this work is 9d. per peck, and the allowance two bushels per acre. Great confidence must necessarily be reposed in the people who plant the bushels of planting beans by the dibble, who, if inclined to trust, have in their power to deceive their employers by throwing great part of the seed into the hedge, from which their daily profits are considerably enhanced, their own labour spared, and every discovery effectually precluded, till the appearance of the crop, when the frequent chafes in the rows will give sufficient indications of the fraud; and by this time perhaps the villainous authors of the mischief may have escaped all possibility of detection, by having conveyed themselves from the scene of their iniquity. Such is the method of planting beans by the dibble; but theickest and most expeditious way of sowing this pulse, especially the field bean, is, he observes, that pursued by the Kentish farmers. The usual course in that county, is to plough up the oat or barley grattens, which are designed for beans, from after the wheat harvest, in which condition the fallows are to lie till towards Candlemas, or later, as the state of the weather, or the farmer's convenience may require, and then to strike out the furrows.

About eleven furrows to a row's breadth is the usual
width of setting out the rows, though some prefer a wider distance, whilst others strike them still narrower; and this difference in the width of the rows is the cause why the farmers vary so essentially in respect to the quantity of seed to be fown on the same given space of ground; for, whilst some will content themselves with an allowance of two bushels per acre, others will throw a sack of beans upon the same compacts of land. When the furrows are struck at the distance mentioned before, two bushels and a half of middled red-tick beans are sufficient to feed an acre, and on good land (for if the ground be not either rich in itself, or rendered fertile by art, it is of little consequence to attempt the cultivation of this crop,) a person, in his opinion, stands a much fairer chance for a crop when the beans are thinly planted, than when a more liberal quantity of seed is allowed; for, when beans stand so thick in the rows, they never pod so kindly as when the walks are less crowded; and although the crop of beans may be more abundant, the increase will not be adequate to the large bulk of straw.

In Suffolk, according to Mr. Young, beans have been dibbled by forms a row on every flag by others, on every other flag. He has found it more advantageous to plant in clusters four or five beans in every hole; and eight or nine inches from hole to hole, which admits of much better hoeing than when more thickly set. Dibbling, says he, is the best and most effective method of cultivating beans. In the Synopsis of Husbandry it is further observed, that in Kent some people make use of a drill plough at bean feed time; but as these pulps, especially the larger ticks, are very unequal in size, they cannot be let out of the hopper with sufficient regularity; for by this inequality in size, many yards of ground in the length of a furrow will be left vacant from the casual obstruction of a large bean, and when this is removed, numbers of a smaller size crowd to the chafes, and shoot out of the hopper for a considerable space, till another large bean intervenes to obstruct the passage, and thus the crop makes a very unsightly appearance in the rows, and at the time of harvest is very unequal; the injury in large fields being not inconsiderable: for, in those parts of the furrows, where no beans had been fown, an increase cannot be expected; and those which are buddled together by a quart or more in a spot, will, from the thickness of their growth, in course come to little. Some farmers are so nice as to pick and pull their feed before it goes into the hopper, in order to render the beans more even, and prevent the injury above mentioned; but this is a very tedious practice, and after all, he believes, very seldom answers the expense. The best method of fowing this crop, according to this writer, is from an instrument called a box, which is held by a man who follows the striking plough, and who, by striking the box filled with beans, drops them with regularity in the furrow, keeping even pace with it; so that by two men, and two or three horses to the striking plough, a man to box, and a boy and two horses to harrow down the ground after the plough, three acres may be finished off in a day, and the whole conducted with regularity.

The writer of the Agricultural Survey of Middlesex thinks that beans should be manured for, and kept perfectly clean while growing, by ploughing, horse and hand-hoeing, and hand-weeding; and that where they are so managed, they are an excellent preparation for either wheat or oats. They have a tap root, and hence they are more likely to succeed after crops that have fibrous roots; though he never heard that they would not grow after any crop. They are generally sown after wheat, barley, or oats; and ought, as has been already observed, to be planted on ridges, especially on wet thin land.

In the Synopsis of Husbandry it is recommended as a good method to roll and harrow beans in the latter end of March. By the roll, says this writer, the clubs are broken so as to afford fresh nourishment to the roots; and the harrows following this operation pulverize and loosen the surface, which had been flattened and baked down by the rains in the preceding month, by which the beans are considerably assisted in the progress of their growth. Soon after this the crop should be edge-hed, and afterwards balled; which method of braking is a piece of husbandry peculiar to the county of Kent, and in every respect claims the preference to that of hoeing the whole space between the rows, not only because the braking is performed at an inferior expense, but it is likewise more efficacious, as well for extinguishing the weeds that may have sprung up between the rows, as in furthering the advance of the beans in growth, by loosening the soil, and conveying fresh earth to the banks. This operation of braking may be continued at the interval of three weeks or a month, from the beginning of May till the crop becomes in bloom. When it is proposed to earth up the beans, this may be effected with great facility by fixing a small block of wood on the fibr of the brake; the manner of doing which is familiar to every Kentish ploughman; and according to the diameter of this block, the earth may be thrown
thrown to different heights on the bean flanks, as they advance in growth.

In dry summers, when easterly winds prevail, beans are very apt to be stivered with the dolphiin fly, an insect which in a very short space of time will destroy the produce of a whole field. In this case it has been found very beneficial to take off the tops with the fcythe, as the dolphin generally effects its first lodgment in the upper part of the flalk. Where this pulse is grown broad-calt, there remains no other way of cleaning the field, than by cutting up the weeds with a hook, or by turning in a flock of sheep in May, where the ground is very foul, as this animal will devour the weeds, and leave the beans untouched. From this very partial method of weeding, it may fairly be concluded little benefit can accrue, and that the grattens will be abundantly stocked with weeds at harvall, and the ground be totally unfit for fowing with wheat; and, indeed, the practice of fowing bean gatten with wheat is never attempted in those countries where this method of fowing beans at random prevails; and, therefore, the bean and pea grattens generally come in course the next year for a fallow. This is a practice that cannot be recommended.

It is remarked in the Survey of Middlesex, that beans are seldom ripe enough to cut till the latter end of Augull, and the proper time is when the kids are turning black, about ten days before they would begin to open at the ends. Though in some parts of the field the kids may not be fo black as in others, this should not prevent their being cut; for they will ripen and harden after that is done, by letting the fheaves upright, and leaving them in the field for a week or ten days. If they are cut long before they are ripe, they will shrink and shrivel; and if too ripe, they will fliare considerably; though there is much lefs danger in reaping them too early, than in letting them stand too long. Those that are over-riple should be cut with the dew on them, and carried to the barn in the same flake; the green parts of the crop being cut in the middle of the day. When the intention is to low wheat or tares after beans, they ought to be set up fo as to occupy as little space as possible; that the vacant ground may be immediately prepared for the next crop. The writer of the Synopsis of Husbandry affers, that after a growing fummer, and on land which is in good heart, there will be many green pods when the crop is upon the whole fit for the hook; for the flalks having run to a great length, and being very replete with moisfit, the upper part of the leaves, pods, and flalks, will appear to be in a growing flate long after the pods on the lower part of the flalk are fully ripened. To wait the ripening of these upper pods would be very ill-judged, as by this delay some part of the crop will be lost, from the shedding of those which were already come to maturity. The best method, therefore, is to cut the beans when the major part have ripened, and by suftering the flacks to remain some time in the field, the upper part of the flalks will be sufficiently withered, so as to prevent all ill effects from their humidity, when laid in the barn or fack; nor will the beans from these unripened pods be of any injury to the sample. At harvall time, the fame author informs us, that in Kent those beans which were fowen broad-calt are mown with a fcythe, and carried loose into the barn; a practice which is fraught with many inconveniences; but that in Middlesex, where the beans are planted in rows with a dibbler, as before mentioned, the intervals are carefully cleansed during their growth by means of the hoe; and to this purpose the farmers are under the neceflity of employing a number of hands; the Kentifh method of cleaning the intervals by the brake not having yet been introduced into that county; since the whole ground between the rows must be cut-down.

At harvall, the flalks are cut with a hook, bound into fheaves, and set up four together; and as a substitite for firings, it is usual to sow the headlands with peas, the haum of which answers the purpose of bands to tie up the fheaves. The Kentifh mode of husbandry is greatly to be preferred, he thinks, to that of the Middlesex farmers, as is evident from the confideration of the comparative disadvantages which attend a crop raised and managed according to the latter method, with the superior benefits of the former. At seed-time the planting by a dibbler is infinitely more tedious and expenfive than that of dropping the feed into the furrow after the flaking plough; and in the course of husbandry required to cleanse the intervals, the several flat-hoesings cause a far heavier charge than what attends the braking and edge-hoeing; and after all, the ground is not so well prepared for a wheat scean at Michalmas, a method of husbandry generally pursued by the Middlefex farmers. One reason may be affigned, he says, why the Kentifh husbandry has not yet been adopted by the Middlefex farmers; and this is from the nature of the land in that county, which in many parts is a deep heavy clay, so that on these adhesive soils the fixed-plough is generally used, and the ground divided into partitions, or as they are termed lands to guard against the contingency of a wet fcean. But lately, fays he, this foil might be worked with a turnefl-foot plough, and by proper drains be fecured from the ill effects of a moisft time; and the field being thus laid on a level, the rows might easily be flriken out, and the fubfquent brakings be executed to advantage during the fummer, as usual with the Kentifh farmers. It is added, that in those parts of Kent where the round tithl husbandry is pursued, the farmers are particularly attentive to the feveral operations of hoeing and braking the ground during the growth of the beans; for, as the land in that county is of a nature so ferile as not to require the intervention of a fummer fallow, they spare no pains in the cultivation of their bean and pea grounds, in order to render it as clean and well pulverized as possible by means of the hoe and brake, fo that this latter instrument is fcarcey ever out of the field, from the beginning of May till the time when the beans are advanced to that height, as to obftruft the working of it; by which the ground becomes fo intimately divided, that every particle of soil in the interlace is exposed to the beneficial influence of the fun and air, and at harvall fearely a weed is perceptible throughout the crop. In order to detroy what few weeds may remain in the rows, and to give that part of the ground its due share of pulverization, and to cleanse it from the bean haum, a plough is set to work soon after harvall to fpuddle the grattens; and for this purpose a plate of iron is fixed across the fhare at about four or five inches from the point, and the fame axle-tree and wheels are made ufe of that were before employed for flriking out the furrows; and with this plough and two horfes three acres of ground may be fpuddled in a day, by fettling the fhare point in the inter-val, fo that the iron or fin may embrace a row on each fide; and when the whole field is thus fpuddled, the harrows and rollers are to fucceed, by which the haum and weeds will be completely extinguished at a trifling charge, and the ground be laid in readines for ploughing the feed furrows, at which time thofe beans or pefae which may have been fpilled will have vegetated, and are defroyed by the plough; fo that the farmer may, from this mode of husbandry, be not lefs confident of growing a clean sample of wheat, than if his ground had been fummer fallowed.

On thin, chalky, or gravelly grounds, notwithstanding what has juft been urged of the good effects of fpuddling, he
observes that it would perhaps be more prudent to omit that
work, left it might contribute towards loosening the soil be-

beyond a due medium; for on these soils the chief aim should be
to clothe them as much as possible, that at wheat feed-
time the surface may be perfectly tight; and therefore to
roll and harrow the bean and pea ground on such soils,
in order to rid the field of the haurn, &c. and when it has lain
some time, to plough the seed furrows, are the whole pro-
cesses necessary to prepare it for the succeeding crop of wheat:
and this shows, he thinks, the necessity of sowing with this
grain or with peas that part of the farm which is moist free
from weeds, and in the belt heart; not only that this practice,
both of them (especially beans) require to be sown on good
land, and on such as has been improved by man, but likewise
that the gratification may be so perfectly clean, as not to require
the operation of spudding. In Kent, they cut their beans
with a hook, and bind them into sheaves with rope-yarns.
These sheaves are set up in shocks of various forms, either
five on each side, in the manner of wheat shocks, or in a
circular form, four sheaves to the shock. The expense of
cutting, binding, and setting up is from 3d. to 4s. or 7s.
per acre, according to the degree of goodness in the yarn.
Some farmers, in such years when the hops have failed,
cut up the bind, and refer it as a substitute for rope-yarns
to tie their bean sheaves. But though this practice may at
first sight bear the appearance of frugality, it will be found
eventually to be the most expensive; as the cutting the hop-

vines at that season will be apt to cause them to bleed,
to the infinite prejudice of the shocks; and thus the future

shocks may be subject to the premature removal of the bind-

of these years when, from the failure of the hops, it should

seem to be of no further use. Mr. Marshall, however,

recommends the pulling beans in preference to cutting; for,

he says, the benefit the soil receives will more than pay for

the extra labour in clearing. Another advantage arising

from their being pulled, is the flummors of the roots
keeping the mow open, and admitting a circulation of air.
And he says in another place, that by experience he found

pulling up by hand far preferable to cutting with sickles;
as they may be pulled up not only much fuller, but much
cleaner from weeds and grubs than when cut, besides leaving
the land in a state greatly superior. The waffle is also left,
so much so as to lose scarcely a bean; and the bean flaks
are immediately ready to bind and set up; and by the roots
lifting them from the ground, the air acquires a free circula-
tion. The work is also easier to the labourer, who stands
more upright, and the power required is much less, especially
in dry weather. By striking the roots of each handful against
the foot, the mould is almost wholly diffigured from the fibres.
The soil in the drills, instead of being bound by the roots,
and encumbered by the flakle, is left as loose as a garden,
and the surface free from obstructions; and if thoroughly
hoed, is as fit as a fallow to be sowed with wheat on one ploughing.

Beans are everywhere a strange crop, consequently
the average produce difficult to estimate. In Kent, Mr.
Young thinks, they probably exceed four quarters; but
in Suffolk he should not estimate them at more than
three; yet five or six are not uncommon. According to
Mr. Donaldson, a crop of beans, taking the island at large,
may be supposed to vary from fifteen to forty bushels; but
that a good average crop cannot be reckoned to exceed
twenty. And in Middlesex; Mr. Middleton tells us, that
bean crops vary from ten to eighty bushels per acre. They
are rendered a very precarious crop by the ravages of my-
riads of small black insects of the same species. The lady-
hirds are supposed either to generate or feed on them, as
they are observed to be much among them. Mr. Foot says,

the average produce is from three and a half to four quar-
ters per acre.

It is asserted, by the author of the Synopsis of Husbandry,
that bean straw, if well harrowed, forms a very hearty and
nutritious diet for cattle in the winter-time; and that both
oxen and horses, when not worked, will thrive on it. Sheep
are also very fond of browsing on the pods; and the cowpea
are very nutritious manger meat for horses. But in Middle-
sex the straw is generally employed in bedding the farmer's
horses and other cattle, and in littering the farm yards,
where it is picked over by young flocks; though sometimes
the straw is sold for 20s. or 25s. delivered in. When the
bean-straw and the cowpea-choff are made use of as a fodder
for cattle, they should always be newly threshed, as in that
state they are much more nutritious than when they have
been kept some length of time.

Crops of this kind are for the most part applied to the
purpose of feeding horses, logs, and other domestic
animals. In the county of Middlesex all are given to horses,
except what are preferred for feed, and such as are podded
while green, and sent to the London markets. When pigs
are fed with beans, it is observed that the meat becomes
so hard as to make very ordinary pork, but good bacon. It is
also supposed that the mealmen grind many horse-beans among
wheat, to be manufactured into bread. And Dr. Darwin
remarks in his Phytologia, that a strake or bushel of oats
weighs perhaps forty pounds, and a strake or bushel of peas
and beans sixty pounds; and that as the skin of peas and
beans is much less in quantity than that of oats, he supposes
there may be at least fifteen pounds of flour more in a strake
of peas and beans than in a strake of oats. There is also
reason to believe, he says, that the flour of beans is more
nutritive than that of oats, as appears in the fattening of
hogs; whence, according to the respective prices of these
two articles, he supposes that peas and beans generally
supply a cheaper provender for horses than oats, as well as
for other domestic animals. But as the flour of peas and
beans is more oily, he believes, than that of oats, it may in
general be somewhat more difficult of digestion; hence,
when a horse has taken a stomach full of peas and beans
alone, he will be less active for an hour or two, as his
strength will be more employed in the digestion of them,
than when he has taken a stomach full of oats. Hence it
may be found advisable to mix the bran of wheat with the
peas and beans, a food of less nutriment but of easier di-
gestion; or to let the horses eat before or after them the
coarse tuffeaks of four grafs, which remain in moist pastures
in the winter; or lastly, to mix finely cut straw with them.

Bean, in Gardening. See Vicia.

Bean, Goose. See Anas.

Bean, Kidney, or French, in Botany. See Phaseolus.

Bean, Kidney, Tree. See Glycine.

Bean, Malacea, the anacardium orientale, is a fruit of a
finishing black colour, of the shape of a heart flattened,
with a very thick pedicle occupying almost the whole basis.
For the characters of the plant that produces it, see Avicennia
Fontenifol; and for its qualities, see Anacardium.

Bean, Malacea, a name given by Sir Robert Sibbald in
his Prodromus, and by Mr. Wallace in his description of the
Orkney islands to a sort of fruit frequently call on shore in
a load from the north-west islands of Scotland, especially on the coasts
most exposed to the waves of the great ocean. They are
called by some Orkney beans, and are not the produce of
that island, or indeed of any other part of Europe, but of
America. Sir Hans Sloane procured four species of them
little
little injured by the sea, and found on examination that
dived by the fire, and found on examination that
three of them were the common produce of the island of Ja-
maica; where he had himself gathered them, and described
them in his catalogue and history.
The shrill fort was a kind of kidney bean, and the plant
which produces it is described by Sir Hans under the name
of the great perennal kidney bean, with a great crooked
lobe. It is also figured in the Hortus Malabaricus by the
name of perin kokrewr, and Sir Robert Sibbald also calls it
nix Indica ex qua pyrodes prae pitea flaminario parent.
This is a native of the East and West Indies, and is sometimes
found thrown on shore in the county of Kerry in Ireland,
and in some other places. A second kind of fruit thrown
on shore in the Orkneys, is a very common fruit in Jamaica,
known there by the name of the horse-eye bean; it has
this name from its resembling the eye of some large animal,
by reason of a dilus or welt which surrounds it. This is
described by many authors, and among the rest by Sir Hans
Sloane, in his catalogue of Jamaica plants; and is found in
many other of the hotter parts, both of the East and West
Indies. A third kind of fruit found on these shores, is that
called by the people of Jamaica the ash-coloured nickar nut;
it has this name from its colour, and from its being perfectly
round, of the shape of a nickar, or marble, such as boys play
with. This is also common in the East and West Indies. A
fourth kind is also a Jamaica fruit, with the history of which
we are not yet well acquainted; nobody has seen it growing,
but the fruit itself is preferred in many of the collections
of the curious, and has been figured and described by Clistas
and others under the name of a round exotic fruit rigid with
four rising nerves.

These are the principal kinds of fruits thus tossed on shore
with us; but how the products of Jamaica, or other parts
of America, should be brought to the shores of Scotland
and Ireland, seems difficult to determine on any certain
foundation. It is easy to conceive, that when they grow by
the sides of rivers, they may fall off from the trees into
them, and be thence conveyed into the sea. It is likewise
easy to fee, that when they are thus floating on the surface
of the sea, they may be carried about by the winds and
currents, and thus come to the mouths of rivers, where they
are often found floating on the surface. Thus far it is easy
to trace our fruits from their native soil: but how after this
they should be forwarded to us is unaccountable, unless we
suppose, that as ships when they go south expect a trade
easterly wind, and when they come north expect and gen-
erally find a westerly wind, for at least two parts in three of
the year; so these fruits being brought north by the current
from the Gulf of Florida, are put into the way of these westerly
winds, and by them conveyed to the coasts of Scotland

By the fame means that these beans came to Scotland, it
is reasatable to believe what the fame winds and currents
brought from America thefe several things towards the Azores
and Porto Santo, which are recorded by Ferdinand
Columbus in the life of his father; which gave this bold ad-
venturer the firft notion that there was fuch a place as Ame-
rica. Among the things he mentions as washed ashore in
this manner, was a piece of wood very ingeniously wrought,
but evidently without the help of iron tools. This was taken
up by a Portuguese pilot, four hundred and fifty leagues
from shore, off Cape St. Vincent, after a west wind which
had blown violently for many days: after this a fuch another
piece of wood was taken up on the shore of Porto Santo,
after such another long and violent wind. Large

canes, equally superior to any of the growth of the then known
parts of the world, were also found thrown on the fame
shores, and the fruits of pines which did not grow in any
known part of the world; and finally the bodies of two
men appearing to be of a different nation from any of the
known people, and two of the canes, were driven on shore
on the island Flores, one of the Azores. All these things
having been found only after long and continued well
winds, it appeared very evident, that there must be land
somewhere to the west, where fruits and men were to be
found; and that these men had no knowledge of our arts,
by their want of iron. From these conjectural conclu-
sions sprang the greatfe discovery of modern times.

clear glafs.

**Bean Tree, Erythrina.** See Coralrodendron.

**Bean Tree, binding.** See Mimosa.

**Bean Trefoil.** See Anagyrus, and Cyrtisus.

**Bean** is also ufed by fome Anatomy to denote the planes
of the pers, on account of its figure and refeemance to that
pulse.

**Bean** is also improperly ufed for a weight, containing
the third part of a faepule.

**BEANA,** in *Ancient Geography,* a town of Aiol, placed
by Ptolemy in Babylonia.

**BEAR,** in *Afronomoy,* a name given to two conftellations
called the Greater and the Lesser Bear, or Urfa major and
minor.

The pole flar is laid to be in the tail of the Lesser Bear;
this flar is never above two degrees defant from the north
pole of the world. See **Ursa.**

**Bear,** or **Bere,** in *Agriculture,* is a species of barley
cultivated in Scotland and Ireland, and the northern parts
of England. It yields a large return, but is not deftrd fo
good for malting as the common barley.

**Bear,** in *Zoology,* See *Urisus.*

**Bear, Ant.** See Tapir, and Ant-eater.

**Bear, Polair.** See Polair Bear.

**Bear, Sand,** is supposed to be a variety of the badger,
or *Urisus Meico,* and the fame animal which naturalifts have
defcribed under the name of the "fox-badger." Its colour
is a yellowish white; its eyes are small, and its head thicker
than that of the common badger; its legs are short, and on
each foot are four toes, armed with fharp white claws. It
is almoft without hair, very fensible of cold, and burrows
in the ground. Bewicke's Quadrupeds, p. 284.

**Bear, Sea.** See Sea-Bear.

**Bear's Flib** was much deferved by the ancient; even
at this day the paw of a bear falted and fmoaked is ferved
up at the tables of princes.

Bear's flix is reckoned one of the greafeft rarities among
the Chinese; infomuch that, as Du-Halde informs us, the
emperor will fend fifty or a hundred leagues into Tartary,
to procure them for a great entertainment. The flix is
reckoned fuch a dainty among the inhabitants of Kant-
fehats, that they feldom eat it alone, but ufually invite a
number of guests to partake of the delicious repast. The in-
telligence also, when cleaned and properly scraped, are worn by
the fairs as melks to guard their faces from the fim-beams,
which being reflected from the snow, are generally found to blacken the skin; by which means the Kamthadale ladies prefer a fine complexion. The Ruffians of Kamthakta make window-panes of these interlenses, which are as clear and transparent as those made of Mucovy glasses. Of the shoulder blades of the bear are made sickles for cutting grass; and the heads and the haunches are hung up by the Kamthadales, as ornaments or trophies, on the trees about their dwellings.

Bear's Grease, is esteemed by some a sovereign remedy against cold disorders, especially rheumatism. Some have also employed it with success in the gout, and against tumors and ulcers. To be good, it must be newly melted, greyish, glutinous, of a strong disagreeable smell, and a moderate consistence. That which is too white is adulterated with common lard. It is now much used by hairdressers, and is laid to be of service in thickening the hair, and for other purposes.

The inhabitants of Kamthakta hold in high estimation the fat of the bear, as a very savoury and wholesome nourishment; and when melted, and thus rendered fluid, it supplies the use of oil.

Bear's Skin makes a fur in great esteem, and on which depends a considerable article of commerce, being used in hounfins, on coach-boxes, &c. In some countries, cloaths are made of it, more especially bags wherein to keep the feet warm in severe cold. Of the skins of bears-cubs are made gloves, muffs, and the like. It is used in Ruffia for beds, cover-tries, caps, gloves, and collars for their fledge-dogs. Those who traverse the ice for the capture of marine animals make their shoes-foles of bears' skin, which prevents the danger of slipping. A light black bear skin is one of the most comfortable and costly articles of the winter wardrobe of a man of fashion at Peterburgh or Moscow; and even the small white hand of a belle is lifted into the large bear muff which covers the half of her elegant shape. The exportation of bear-skins forms a very considerable article of Russian commerce, independently of those that are used for home consumption.

Bear Garden, a place where bears and other beasts are exposed as a public spectacle to be baited. See Baiting.

Bear, hunting and killing of the. The bear is in a variety of respects so useful an animal in Russia and northern countries, that the inhabitants have devised several ingenious methods of taking and destroying them. The most usual way of killing this animal is with fire-arms, and spears or darts. The Laplanders knock them down with clubs, as they can easily overtake them in running with their snow-shoes; but they are generally first shot, and then dispatched with spears. In some parts of Siberia, the hunters catch a feafold of several flocks laid on one another, which falling down, crushes the bear, on his slipping upon the trap placed under it. Another method is to dig pits, in which is fixed a smooth, solid, and very sharp-pointed pole, which rifes about a foot above the bottom. The pit is carefully covered with sods, and across the track of the bear is stretched a thin rope with an elastic bug bear. As soon as the bear touches the rope, the wooden bug-bear farts loose; and the scared animal, endeavouring to save himself by flight, falls with violence into the pit, and is killed by the pointed pole. If he escape this snare, at a small distance, perhaps, several caltops (see Caltrop) and other instruments of annoyance await him, amongst which a similar terrific log is erected, and where the perfecuted bear, the more he strives to get free, fixes himself more firmly to the spot at which the blood-thirsty hunter lies in ambush for him. The Koriaks find out a crooked tree, which is grown up in the form of a gibbet, and at the bent summit of it they attach a noose, with a bait suspended to it. The hungry bear, thus allured, eagerly climbs up the tree, and on his moving the branch, the noose draws together, and the animal remains suspended to the tree. But the method adopted by the inhabitants of the mountainous parts of Siberia to make this ferocious animal kill himself is more singular and ingenious. They jall a very heavy block to a rope, terminating at the other end with a loop. This is laid near a steep precipice on the path which the bear usually takes. On having his neck in the noose, and finding that he cannot proceed on account of the clog, he takes it up in a rage, and to free himself from it, throws down the precipice, which of course pulls him after it, and he is commonly killed by the fall. Should this accidentally not be the case, he drops the block again up the acclivity, and renew his efforts, till with increasing fury he either sinks to the ground, or kills himself by a decisive plunge.

The white or polar bear (Ursus Maritimus) lives on the coasts of the Frozen ocean, and in some of the eastern and northern islands, where the chase of him is a collateral occupation of the mariners who visit these coasts for the capture of the morse. Black bears are so numerous in Kamthakta, that they are seen roaming about the plains in troops, and multitudes since have been exterminated, if they were not here more tame and gentle than in any other part of the world. In spring, they descend from the mountains where they have wintered, to the mouths of the rivers for catching fish, which swarm in all the streams of that peninsula. If the fish are plentiful, they eat only the heads; and when they find nets laid in any place, they dexterously drag them out of the water, and empty them of the fish. Towards autumn, when the fish go up the rivers, they advance with them gradually to the mountains. When a Kamthadale spies a bear, he endeavours to conciliate his friendship at a distance, accompanying his gestures by courteous words. Indeed they are so familiar, that the women and girls, when they are gathering roots and herbs, or turf for fuel, are never disturbed in their employment, even in the midst of a whole drove of bears; and if one of these animals comes up to one of them, it is merely to take something out of their hands. They have never been known to attack a man, except when they are routed from their sleep, and they seldom turn upon the markmen when they are hit or not. Not withstanding this gentleness of the bear, its utility renders it a valuable object of prey. When the hunter and the bear meet, the coxcomb is generally bloody, but it generally terminates to the advantage of the artful hunter. Armed with spears and clubs, the Kamthadale goes in quest of the peaceful bear in his calm retreat, who, thinking only of his defence, takes the foggs brought by his pursuer, and光学 with them the entrance into his den. The mouth of the cavern being closed, the hunter bores a hole through the top, and then with the greatest security spears his defenceless foe. Tooke's View of Ruffia, vol. ii. p. 442, &c.

Dr. Barton, in his "Fragments of the Natural History of Pennsylvania," informs us, that the bears migrate in great numbers, every autumn, across the Missipilu, proceeding south, perhaps to the mountains of New Mexico, in search of a milder climate. In the spring they return again by the same route. This migration of the bears is particularly observed at Manchar, on the Missipilu.

Bear hunting, to shew tricks, is an ancient practice, which we find prohibited in the canons of the church. Du Cange.

Bear wards, nefarii, were a kind of servants in great families among the Romans, who had the care of breeding and feeding those animals. Plut. Leg. Ant. tom. ii. p. 1110.
Bear Lake, Great, is situated in the north-west part of North America, near the Arctic circle, in N. lat. 65°, and W. long. 121°; and a river flows from it in a W.N.W. course, called Great Bear river, which runs into Mackenzie's river.

Bear Lake, Black, lies in New South Wales, north-west from Cumberland house, N. lat. 53° 30'. W. long. 107° 30'.

Bear Lake, White, lies due west from another small lake called Bear lake, both in N. lat. 43° 15'; and the former in W. long. 65° 30'. These lakes are said to give rise to the river Milinippi.

Bear's Point, of the east part of St. Peter's river, on the coast of Labrador, in North America, so called from the great number of bears that were seen there. N. lat. 51° 35'. W. long. 55° 30'.

Bear's Port, one of the ports on the coast of Nova Scotia, in North America, between port and cape de l'Heve to the north-east, and cape Sable, the south-west point of Nova Scotia.

Bear River, a river of the north-west part of North America, which runs into the Unijah, or Peace river, in N. lat. 56° 12'. W. long. 110° 28'.

Great Bear River. See Bear Lake.

Bear Rocks, New, are situated about south by west from the extreme west part of the island of Jamaica. N. lat. 16° 20'. W. long. 78° 55'.

Bear Sound, or Barfand, lies on the west coast of West Greenland. N. lat. 62° 20'. W. long. 49°.

Bear Town, a town of America, in Carolina county, Maryland, about 7 miles north of Greenburg, and about 15 south-east from Chaffey-town.

Bear, to, denotes to bring forth young, or to produce fruit. See BEARLSTON. in Geography.

BEARLSTON, in Geography. See BEARLSTON.

BEARD, John, in Biography, an energetic English finger, and an excellent actor, was brought up in the king's chapel. He knew as much of music as was necessary to sing a single part at sight, and with a voice that was more powerful than sweet, he became the most useful and favourite singer of his time, on the stage, at Ranelagh, at all concerts; and in Handel's oratorios, he had always a capital part; being, by his knowledge of music, the most steady support of the choruses, not only of Handel, but in the odes of Green and Boyce. Having married for his second wife a daughter of Rich, the patentee of Covent-garden theatre, upon the death of his father-in-law, he became manager of that play-house, and discontinued all public singing; which a deafness that had been long encroaching rendered necessary. His first marriage was with a lady of quality, a sister of the late Earl of Walgrave, to whom he was a very indulgent and tender husband; and he proved himself to be a man of honour and principle in every transaction of his life. There were so much intelligence and humour in his acting and singing comic parts on the stage, and Scots and Irish ballads in private, as well compensated for deficiencies of voice. He was closely united by friendship to Dr. Boyce, in the performance of whose music he manifested a zeal and even a partiality which were not discoverable for that of any other composer. He died in 1791.

BEAR, in Geography, a town of France, in the department of Nièvre, and chief place of a canton in the district of Decize, on the Loir; 16 miles S. E. of Nevers.

BEARD, in Physiology, the hair growing on the chin, and adjacent parts of the face; chiefly of adults and males.

Various have been and still are the ceremonies and customs of different nations with regard to the beard: Kington affirms us, that a considerable branch of the religion of the Tartars consists in the management of their beards; and that they waged...
waged a long and bloody war with the Persians, and declared them infidels, though, in other respects, of the same faith with themselves, merely because they would not cut their whiskers after the mode or rite of the Tartars. The Spartans from the age of 20 years, suffered their hair and beards to grow: the hair being deemed an ornament, which became the free man and warrior. A Spartan being once asked why he wore so long a beard, replied, "Since it is grown white, it incessantly reminds me not to dishonour my old age." Nevertheless, as they were accustomed to obedience, even in things the most indifferent, the ephors, when they entered on office, proclaimed, by sound of trumpet, a decree, commanding the people to shave their upper lips, and to submit to the laws. The Egyptian priests shaven the head, chin, and whole body. Accordingly, most of the Egyptian figures are without beard. However, Herodotus informs us, that in time of calamity, they suffered their head and hair to grow. The Assyrians had long beards; and Chryfoltos observes, that the kings of Perasia had their beards woven or matted together with gold thread; and some of the first kings of France had, in the same manner, their beards matted and knotted with gold. The Africans wore long beards, as may be seen on the medals of Juba. The Greeks, if tradition may be credited, wore long beards from their heroic times. Cledreus informs us, that at Constantinople, in the thirme of Zeuxippus, there was a statue of Homer with a long beard. Athenæus, from Chryfippus, observes, that the Greeks always wore their beards till the time of Alexander; and that the first who cut it at Athens ever after broke the addition of Mephisto, on medals. Plutarch adds, that Alexander commanded the Macedonians to be shaven, that the length of their beards should give a handle to their enemies: however this be, we admire Philip, his father, as well as Ampyanthus and Archelais, his predecessors, represented on medals without beards. The Greeks continued to shave the beard till the time of Julianus, under whole empire long beards came again into fashion, and so continued till Constantinople was taken by the Turks. The Greek philosophers distinguished themselves from the vulgar by their long beards. According to Laertius (i. vi.) Antiphillenes was the first of the philosophers who suffered his beard to grow. This custom, however, among the philosophers, was not invariable, for the scholaft of Arifophanes (Nub. 120.) pretends, that the ancient philosophers shaved their beards. The Roman philosophers affected to preserve the same distinctive characters of the mantle and long beard.

Thus Horace describes them:

Solatus juflit fapiemtum paelcere barbarum.

Sermon. I. ii. fat. iii. v. 34.

Aulus Gellius and Lucian express themselves in a similar manner. Persius seems to have been so convinced of the beard's being the symbol of wisdom that he thought he could not be a greater encomium on Socrates than calling him "Magistrum barbatum." The Sicilians, and the Etruscans adopted the customs of the Greeks. The latter exhibited all their deities with a beard, except Vulcan, but on the medals of the former their kings appear without a beard.

The Romans for a long time wore beards and long hair. Cicero, in his oration for Cælius, (c. 14.) mentions the "barba horrada, quam in statu antiquis imaginibus videmus."Liv. (v. 51.) speaking of the senators, who remained in Rome, after the entrance of the Gauls, says that they wore a very long beard: "barbam, ut tum omnibus promissa erat." Scipio Africanus appeared with a long beard in his interview with Mutilus. Hence Ovid calls the ancient Romans "intoni;" thus,
Ili meit barbata, erinem hic deposit amati;

"Plena donum libris genialis!"

Slaves, among the Romans, wore their beard and hair long; when manumitted they shaved the head in the temple of Pans, and put on a cap, or "pileus," as a badge of liberty. Those who escaped from shipwreck, shaved their heads; and persons acquitted of a capital crime, cut their hair and shaved, and went to the capital to return thanks to Jupiter.

Persons of quality had their children shaved the first time by others of the same, or greater quality, who by this means became godfathers, or adoptive fathers of the children. Anciently, indeed, a person became godfather of the child by barely touching his beard; thus lihitians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric should touch the beard of Clovis to become his godfather.

As to ecclesiastics, the discipline has been very different on the article of beards; sometimes they have been enjoined to wear them, from a notion of too much immodesty in shaving, and that a long beard was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as imagining pride to lurk beneath a venerable beard. The Greek and Romish churches have long disputed together about their beards; since the time of their separation, the Romish seems to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions "de radendis barbis." The Greeks, on the contrary, cipayo very zealously the cause of long beards, and are extremely scandalized at the bearded images of saints in the Roman churches.

By the litigations of some monasteries, it appears, that the lay-monks were to let their beards grow, and the priests among them to shave; and that the beards of all that were received into the monasteries were blest with a great deal of ceremony; and there are still extant the prayers used in the solemnity of conferring the beard to God, when an ecclesiastic was shaven.

Le Comte observes, that the Chinese affect long beards extravagantly; but nature has balked them, and only given them very little ones, which, however, they cultivate with great care: the Europeans are strangely envied by them on this account.

The Russians wore their beards till within these few years, when the czar Peter enjoined them all to shave; but notwithstanding his injunction, he was obliged to keep on foot a number of officers to cut off by violence the beards of such as would not otherwise part with them. For enforcing his regulation, which was violently opposed, he laxed a tax on long beards, and many submitted to it rather than part with their beard, which was universally held to be an ornament to the person. Superstitious Russians even thought it to be an external characteristic of the orthodox faith; and those who were too poor, or too parsimonious, to pay the tax for retaining the beard, religiously preferred the beard that was shaved off, and had it deposited in the coffin with them on their decease, that they might present it to St. Nicholas, on his refusing to admit them, as bearded christians, into the kingdom of heaven. As a proof of the high estimation in which the beard was held in Russia in early times, it is a law in the Novgorodians code, that whoever plucks hair from another's beard shall be mulcted four times as much as for cutting off a finger.

In the sixteenth century, king Robert of France, the rival of Charles the Simple, was not more famous for his exploits than for his long white beard, which he suffered to hang down on the outside of his cutufla, to encourage the troops in battle, and to rally them when defeated. Upon the death of the great Henry IV. of France, who was succeeded by a beardless youth, the beard was proscribed. Louis XIII. ascended the throne of his glorious ancestor without a beard; and his courtiers immediately reduced their beards to whiskers and a small tuft of hair under the lower lip. The duke of Sully, however, though he encountered ridicule, would never adopt this effeminate custom. Whiskers continued in fashion in the commencement of the reign of Louis XIV. who, as well as his courtiers, were proud of wearing them; so that they were the ornament of Turenne, Condé, Colbert, Corneille, Moliere, &c.

In Spain, Philip V. ascended the throne with a shaven chin; and the courtiers imitated the prince, and their example was followed by the people. The change, however, produced lamentations and murmur. Hence arose the Spanish proverb, denoting, "Since we have lost our beard, we have lost our soul." The Portugueses, whose national character is much the same, have imitated them in this respect. Accordingly we read, that in the reign of Catherine, queen of Portugal, when the brave John de Castro had taken the castle of Diu in India, he was under the necessity of borrowing from the inhabitants of Goa a thousand pilotes for the maintenance of his fleet; and that as a security for the loan, he sent one of his whiskers, telling them, "all the gold in the world cannot equal the value of this national ornament of my valour; and I deposit it in your hands as a security for the money." The inhabitants of Goa, it is said, generously returned both the money and his whiskers.

We have already observed, that the ancient Britons, in the time of Cæsar, shaven the body, except the head and the upper lip; the hair of which they, as well as the Gauls, allowed to grow to a very inconvenient length. The Anglo-Saxons, on their arrival in Britain, and for a considerable time after, allowed their beards to grow, as well as their near neighbours the Longobards, to whom in every respect they bore a near resemblance. After the introduction of Christianity, their clergy were obliged to shave their beards, in obedience to the law, and in imitation of all the western churches. This distinction between the clergy and the laity subsisted for some time: and a writer of the seventeenth century complains, that the manners of the clergy were so corrupted, that they could not be distinguished from the laity by their actions, but only by the want of beards. By degrees the English laity began to imitate the clergy so far as to shave all their beards except their upper lips, on each of which they left a lock of hair; by which they were distinguished from the French and Normans, who shaved their whole beards. The Normans had as great an aversion to beards as they had a fondness for long hair. Among them, to allow the beard to grow, was an indication of the deepest dissipation and misery. They not only shaved their beards themselves, but when they had authority, they obliged others to imitate their example. It is mentioned by some of our ancient historians, as one of the most wanton acts of tyranny in William the Conqueror, that he compelled the English, who had been accustomed to allow the hair of their upper lips to grow, to shave their whole beards. This was so disfiguring to some of that people, that they chose rather to abandon their country than resign their whiskers. In the fourteenth century long beards were in fashion, and continued to the sixteenth century; so that in the reign of Mary I. the beards of bishop Gardiner and cardinal Pole, appear in their portraits to be of a most uncommon size. The lawyers, however, had a regulation imposed upon this important feature. Towards the close of the sixteenth century, the beard was much leaffened, and gradually dwindled into mustachies or whiskers: and in process of time the practice of shaving the whole face became universal.
Among the Turks, it is more infamous for any one to have his beard cut off, than among us to be publicly whipt, or branded with a hot iron. They who serve in the seraglio have their beards plucked as a token of servitude; and when they are set at liberty, they permit it to grow. With them and the Persians the beard is a mark of authority and liberty; and the want of moustachios and beards distinguishes slaves and women. Hence, it is said, arises the unfavourable idea which they form on the first sight of a European. There are many in that country who would prefer death to this kind of punishment. The Arabs make the preservation of the beard a capital article of religion, because Mahomet never cut his. The Moors of Africa hold by their beards while they swear, in order to give validity to their oath, which after this formality they rarely violate.

The Turkish wives kiss their husbands' beards, and children their fathers, as often as they come to salutations. The men kiss one another's beards reciprocally on both sides, when they salute one another in the streets, or come off from a journey.

The Jews wear a beard on the chin, but not on the upper lip or cheeks. Moses forbids them to cut off entirely the angle or extremity of their beard; that is to imitate the Egyptian fashion, who left only a small tuft at the extremity of the chin; whence the Jews to this day suffer a little fillet of hair to grow from the lower end of their ears to their chins, where, as well on as their lower lips, their beards form a pretty long bunch. In time of mourning the Jews neglected to trim their beards, that is, to cut off what was superfluous on the upper lips and cheeks. In time of great affliction they also plucked off the hair of their beards.

It has been advanced by several historians and travellers, that the Indians of America differed from other males of the human species in the want of one very characteristic mark of the sex, viz. that of a beard. From this general observation, the Equinoxians have been excepted; and hence it has been supposed, that they had an origin different from that of the other natives of America. Mr. Cautland, after ten years' residence at Niagara, in the midst of the Six Nations, with frequent opportunities of seeing other nations of Indians, affirms, that they do not differ from the rest of men in this particular more than one European differs from another; and as this imperfection has been attributed to the Indians of North America, equally with those of the rest of the continent, he inclines to think, that the attention is as well of foundation in one region as it is in the other. All the Indians of North America, says this writer, except a very small number, who, from living among white people, have adopted their custom, pluck out the hairs of the beard; and as they addict themselves to this practice from its first appearance, it may be supposed, that to a superstitious observer, their faces will seem smooth and beardless. As farther proofs that they have beards, he alleges that all of them have an infirmity which they use for plucking out the hairs; that when they neglect this for some time, hairs sprout up, and are seen upon the chin and face; that many Indians allow tufts of hair to grow upon their chins or upper lip; and that several of the Mohawks, Delawares, and others, who live among white people, sometimes shave with razors, and sometimes pluck their beards out. Accordingly, colonel Butler affirms, that the men of the Six-Nation Indians have all beards naturally, which is also the case with respect to all other nations of North America, which he has had an opportunity of seeing; but that it is the general practice of the Indians to pluck out the beard by the roots from its earliest appearance; and hence their faces appear smooth. The same fact is confirmed by Captain Brent. Phil. Trans. vol. lxxvi. p. 229. &c.

**BEA**

Beard, or under-beard, called also chock, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

Beard, or under-beard, called also chock, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

**BEA**

Beard, or under-beard, called also chock, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

Beard, or under-beard, called also chock, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

Beard, or under-beard, called also chock, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

Beard, or under-beard, called also chock, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

Beard, or under-beard, called also chock, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.
it fastens itself to flones, or any other heavy substance; the hair of the beard terminating in a spongy substance, that adheres very tenaciously to the smoothest surfaces. The thread of this kind of byflus is sometimes woven as an object of curiosity into gloves, stockings, &c. and in point of durability at least, cannot be inferior to any other material that could be employed for that purpose. Some notice is taken of this among ancient writers, who speak of it as a kind of silk. See Silk.

BEARDED, barbatus, denotes a person or thing with a beard, or some resemblance thereof.

In Middle Age Writers, this is sometimes expressed by mulitaris, q. d. barba in multis faw genis.

The faces on ancient Greek and Roman medals are generally bearded. Some are denominated pomonatis, as having long beards, e. g. the Parthian kings. Others have only a tuft about the chin, as the Scævid family. Adrian was the first of the Roman emperors who nourished his beard; hence all imperial medals before him are beardless; after him, bearded.

The medals of gods, and heroes, in vigorous youth, represent them beardless, except Jupiter, and a few others.

The Romans paid their worship to a bearded Venus, Bcllụ barbatus, supposed to have been of both sexes; a statue of whom was also found in the Isle of Cyprus. The reason of representing the goddesses of beauty with a beard is variously guessed at by the learned.

Baraded women have been all observed to want the manual discharge; a d several influences are given by Hippocrates, and other physicians, of grown women, especially widows, in whom, the menses being stopped, beards appeared. Eufcbius Niccnerbergius mentions a woman, who had a beard reaching to her navel. Bartholomew speaks of a bearded woman at Copenhagen, who partly, in virtue thereof, paffed for a hermaphrodite.

Baraded brothers, fratres barbati, in Ecclesiastical Writers, are those otherwise called fratiess convexi, in the order of Grammont and the Cistercians. They took this denomination because they were allowed to wear their beards contrary to the rule of the professed monks.

Bearded beasts, among florists, a hawk which is hairy on the edges, as is that of the roe, &c.

BEARDING, in Carpentry, denotes diminishing any piece of timber from a given line on its surface, to make the thickness less on the edge.

Bearding of Wool, in the Manufactures. See Wool.

BEARDSTOWN, in Geography. See Beardstown.

BÆRER, in Architecture, any subsidiary or intermediate support in aid of the principal supports, as the small joists or brackets which bear a gutter or the covering board of a cornice, the piers and blockings under the joints of a ground floor; or the joists, &c. which bear any thing independent of or unconnected with the building, as the bearers of a cillern, of a vat, or of a platform.

BÆRERS, in Middle Age Writers, are sometimes used for a child's goffers, because they hold the infant in their arms, and present him to the priests in the ceremony of baptism. Du-Cange.

BÆRERS of a bill of exchange, denote the persons in whose hands it is, and in favour of whom the last order or indorsement was made. See Bill of Exchange.

When a bill is paid to be payable to bearer, it is understood to be payable to the person who first offers himself after it becomes due. To be paid a bill of this kind, there needs neither order nor transfer: yet it is good to know to whom it is paid.

Vol. IV.
served, the distances from the place of observation to the respective objects are required. See **Surveying**.

**Bearing**, in the Sea Language. — When a ship falls to towards the shore, she is said to bear in with the land. — When a ship that was to windward, comes under another ship's stern, and to give her the wind, she is said to bear under her lee. — If a ship falls into a harbour with the wind large, or before the wind, she is said to bear in with the harbour, &c.

In coaling they say, *bear up the helm*, that is, let the ship go more large before the wind — *bear up round*, that is, let the ship go between her two sheets, directly before the wind — *bear a hand*, i.e. make haste.

They also say a ship *bears* when, having two flender a quarter, she will sink too deep into the water with an over light freight, and therefore can carry but a small quantity of goods.

**Bear fail well**, is said of a ship when she is a stiff-guided ship, and will not cough down on a tide, with a great deal of fail.

When a ship is said to *bear out her ordnance*, it is meant, that her ordnance lies too high, and she will go so upright, that in reasonable fighting weather, she will be able to keep out her lower tier, and not be forced to flint in her ports.

A ship is said to *overbear* another, when it is able, in a great gale of wind, to carry out more fails, viz. a top-fail more, or the like.

**Bear off** is also used by Seamen generally in business belonging to shipping, for thrall off.

Thus, in hoisting any thing into the ship, if it hath hold by any part of the ship or ordnance, or the like, they say, *bear it off from the ship's side*.— So if they would have the breech or mouth of a piece of ordnance, or the like, put from one, they say, *bear off or bear about the breech*.

**Bear up**, or bearing away, is improperly used to denote the act of changing the course of a ship, in order to make her fail before the wind, after she had failed some time with a file wind or close-hauled.

**Bear also expresses the situation of any distant object**, from some part of the ship, according to her position. In this sense, the object must be either a head, a stern, on the beam, before the beam, abait the beam, on the lee or weather bow, and on the lee or weather quarters.

**Bear of a piece of timber**, in Carpenter, denotes the space either between the two fixed extremities thereof, when it has no other support; which is called bearing at length; or between one extreme, and a post, brick wall, or the like, trimmed up between the ends to shorten its bearing.

Joists are not to bear above ten feet length; nor single rafters more than nine feet. 19 Car. II. c. 3.

**Bear of an arch or vault**, denotes the effort which the stones make to burst open the piers, or pedquiries.

This amounts to the fame with what the French call *foulees*.

**Bearings**, in Heraldry, a term used to express a coat of arms, or the figures of armories, by which the nobility and gentry are distinguished from the vulgar, and from one another. See *Arms*.

**Bearings of an organ pipe**, denotes an error or variation from the just found it ought to yield. See *Temperature*.

**Bearings, in Midwifery.** The pains in labour or birth are said to be bearing pains, when they force the child downward.

**Bear down of the womb, vagina or anus.** When the uterus descends from the upper part of the pelvis, and presses upon or presses through the os externum, it is called a bearing down (procidentia) of the womb. In this case the uterus is included in a duplication of the vagina, to the upper part of which it is attached. Women who are troubled with the whites (flour albus) or who have borne children, particularly if the perineum was injured, or torn, at the time of the birth of any of them, are most subject to this complaint. It manifes itself at first by a sense of dragging or bearing down of the parts, some time after, there is a difficulty in making water, the uterus lying on, and covering the meatus urinarius. In this stage of the complaint, on passing a finger into the vagina, it meets the os uteri, immediately on getting through the os externum. If not now remedied, the uterus continues descending, until it frees the os externum, and hangs down between the thighs; and if still neglected, the part protruded goes on increasing, from the size of a nut to that of a large pear, and in some cases the uterus, covered with the vagina, has been found hanging down beyond the middle of the thighs, and of the fize of the body of a Florence flask. When a fold of the vagina only descends, and passes through the os externum, it is called a bearing down (procidentia) of the vagina. A similar disposition affects the rectum, a fold of the gut being forced through the sphincter ani, whenever the faces are voided. This complaint is particularly incident to weakly children, though adults are not unfrequently affected with it. As in all these cases there is a relaxed tone of the fibres, the cure is to be effected by the exhibition of such things as strengthen and increase the tone and elaticity of them, by the peruvian bark and chalybeats, the use of the cold bath, exercise, air, astringent applications to the parts, as decoctions of oak bark, pomegranate shells, balatane flowers, red rose leaves, &c. To which a portion of red port wine is to be added, and the medecine so prepared is to be injected into the vagina or rectum, and compresses soaked in it, applied to the parts externally, taking care in the mean time that the body be kept moderately open. When the womb is the part bearing down, in addition to these remedies, after returning the womb to its proper situation, a pessary is to be introduced into the vagina and worn there to prevent its descending again. See *Pessary*; see also *Procidentia Uteri, Vaginse, et Ani*.

**Bear close, among cock-fighters, denote the foremost toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight**.

**Bear of a flag, is used in respect of the flate of his head, or the crotch which he bears on his horns.**

If you be asked what a flag bears, you are only to reckon the crotches, and never to express an odd number; as, if he have four crotch on his near-horn, and five on his far, you must say he bears ten; a false right on his near horn: if but four on the near horn, and fix on the far horn, you may say he bears twelve; a double false right on the near horn.

**Bear Stone**, see *Phosphorus*.

**Bear, in Geography**, was a province of France, before the revolution, at the foot of the Pyrenees, about 16 leagues long and 12 broad; bounded on the south by Bigorre, on the north by Armagnac, Turfan, and Chalosse, on the west by Dax, a part of Soule, and lower Navarre, and on the south by the Pyrenees. The plain country is very fertile, producing flux and Indin corn, and the mountains are covered with fir-trees, and within them are mines of copper, lead, and iron, and the leffer hills are planted with vines, which yield good wine. The Spaniards are supplied from hence with borfes and cattale, and alfo with linen, of which there is in this province a confiderable manufacture. The principal rivers which bear the name of Gaves, are the Gave-Beaufins, and the Gave d'Oleron. Bear now forms the department of the Lower Pyrenees; and its capital is Pau.

**BEAST, in Zoology, an appellation given to all four-footed
footed animals, fit for food, labour, or sport. See Brutes, and Zoology.

Authors make this difference between "beats of the forest" and "of chase," that the first are "silvifretus tantum," the latter "campifretus tantum." "Beats of the forest" make their abode all the day in the great covert's and secret places of the woods; and in the night season they repair into the lawns, meadows, pastures, and pleasant feeding-places: whence their denomination "silvifretus," q. d. beats of the wood.

"Beats of the chase" reside all the day time in the fields, and on the mountains afar off, to prevent surprife; but on night's approach, they feed, as the relf, in meadows, &c. whence their appellation "campifretus," q. d. beats of the field.

In our Statute books, "beats of chase" are five; the buck, doe, fox, martin, and roe. "Beats of the forest," called beats of venery, are the buck, hind, boar, and wolf: and "beats and fowls of the warren" are, the hare, coney, pheasant, and partridge. See Game.

No other, according to Manwod, are accounted beats or fowls of warren, than hares, coneyes, pheafants, and partridges. Lord Coke is of another opinion, distinguishing beats of the warren, from fowls of the warren. Under the former he includes hares, coneyes, and roes; the latter he divides into silvifretus, campifretus, and aquatiles. To the first belong the pheafent, woodcock, &c. to the second the partridge, quail, rail, &c. to the third the mallard, heron, &c. Coke on Littleton, p. 233.

Beast of burden is understood of all quadrupeds employed in carrying goods on their backs. To this class belong elephants, dromedaries, camels, horefes, mules, asfes, and the sheep of Mexico and Peru.

Beast, in Games of Chance, a game at cards, played thus: the beat cards are the king, queen, &c. of which are fored three heaps, denominated the king, the play, and the trolley. Three, four, or five may play; and to every one are dealt five cards. Before the play every one stakes to the three heaps. He that wins most tricks takes up the heap called the play: he that has the king takes up the heap, so called; and he that has three of any fort, as three fours, three lives, three fixes, &c. takes up the trolley heap.

Beast at ambre is where the player or person that undertakes the game, loses it to the other two; the penalty of which is a forfeiture equal to the light played for.

BEASTAN, in Geography, a town of Persia, in the province of Segeftan, 80 miles S. W. of Kin.

Beasts, rather, see Rother.

BEAT, in Fencing, denotes a blow or stroke given with the sword. There are two kinds of beats, the first performed with the foible of a man's sword on the foible of his adversary's, which in the schools is commonly called batterie, from the French batte, and is chiefly used in a pursuit, to make an open upon the adversary. The second and beet kind of beat is performed with the fort of a man's sword upon the foible of his adversary's, not with a spring, as in binding, but with a jerk, or dry beat; and is therefore most proper for the parades without or within the sword, because of the rebound a man's sword has thereby from his adversary's, whereby he procures to himself the better and surer opportunity of ripolting.

BEAT, St., in Geography, a town of France, in the department of the upper Garonne, and chief place of a canton, in the district of St. Gaudens, on the Garonne. All the houses are built of marbles, the neighbourhood supplying no other materials. It is seated between two mountains, close to the town on each side. N. lat. 42° 50'. W. long. 18° 6'.

BEAT, St., mountains of, are mountains of Switzerlaid in the canton of Berne, near the lake Thun; the rocks of which are calcareous and rugged, and containing in a few places broken petrifactions. Some of these rocks are perpendicular, and even impeding, and are marked at different elevations with furrows, occasioned by the waters of the lake, which in former periods was probably several hundred feet above its present level.

BEAT, in Horology. See Beats.

BEAT, in the Manage. A horse is said to beat the dust, when, at each stroke or motion, it does not take in ground or way enough with its fore-legs. It is more particularly said to beat the dust at terra à terra, when he does not take in ground enough with his shoulders, making his strokes or motions too short, as if he made them all in one place. He beats the dust at curves, when he does them too precipitously and too low. He beats upon a walk, when he walks too short, and thus rides but little ground, whether it be in straight lines, rounds, or passings.

Beat upon the hand, see Crack.

BEAT of the Drum, in the Military Art, is differently performed, according to the purposes designd by it. Notice is hereby given of any sudden change; soldiers are summoned to repair to their arms and quarters; and the various movements before and after, and during the engagement, are denoted by different beats of the drum.

The chief beats or beatings on the drum are, the general, the assembly, the chamade, the march, the reveille, the retreat, &c. See Drum.

Beat, in Music, is a grace marked thus: 

Its effect is just the contrary of a transient shake in rapid movements, where it can neither be prepared nor turned ed. It consists merely of three notes: 

Transient shakes:

Beat. Effect.

BEATA, in Church History. See Mass of the Beata.

BEATA, Cape, is at the south point of the island of St. Domingo or Hispaniola. N. lat. 17° 42'. W. long. 72° 2'.

BEATA Island, is about 14 leagues S.W. by W. from the cape.

BEATER is applied, in Matters of Commerce, to divers forts of workmen, whose business is to hammer or flatten certain matters, particularly metals. In this sense we meet with philer-beater, cement-beater, morter-beater, &c.

Beaters, gold, are artificers, who, by beating gold and silver with a hammer on a marble, in moulds of vellum and bullock skins, reduce them to thin leaves fit for gilding or filling of copper, iron, lead, wood, &c.

Gold-beaters differ from flatterers of gold and silver, as the former bring their metals into leaves by the hammer; whereas the latter only flatten it by pressing it through a mill, preparatory to beating. See Gold-beating.

There are also tin-beaters employed in the looking-glass trade, whose business it is to beat tin on large blocks of marble, till it be reduced to thin leaves, fit to be applied with quicksilver behind looking-glasses. See Foliating.

Beater is also used for an instrument with which to gravel walks and alleys in gardens even. It is a piece of wood half a yard long, six inches thick, and eight or nine broad, having a handle fixed obliquely in the middle.

BEATIA,
BEATIX, in Ancient Geography, a town of Spain, in Bética, south-east of Càntulo, and near it.

BEATIFICA, or Ancient Geography, a town of Spain, in Bética, south-east of Càntulo, and near it.

BEATIFICVISION. See Vision.

BEATIFICATION, in Electricity, a term used by professor Boze to denote an electrical experiment, by which he incited the head of a person strongly electrified, and flinging on a large cake of pitch, with a luminous glory, resembling that with which painters ornament the heads of saints. The secret of this experiment, which occasioned many frightful and expensive trials to the first electricians in Europe, consisted in the use of a suit of armour decked with steel, in various figures; and the glory was produced by rays inflowing from the edges of the helmet.

Beatification, in the Romish Church, the act by which the pope declares a person happy after death.

Beatification differs from canonization; in the former, the pope does not act as a judge in determining the state of the beatified, but only grants a privilege to certain persons to honour him by a particular religious worship, without incurring the penalty of superstition worshippers; but in canonization, the pope speaks as a judge, and determines the "ex cathedra" upon the state of the canonized.

Beatification was introduced when it was thought proper to delay the canonization of saints, for the greater assurance of the truth and manifestation of the rigid steps taken in the process.

The ceremony of beatification is a previous one to that of canonization; and cannot be performed till 50 years after the death of the person thus honoured. On this occasion, certificates or attestation of the character and miracles of the person for whom this honour is intended, are produced and examined by the congregation of rite. An advocate, called by the people the devil's advocate, is employed to contest the claims of the candidate; and it is the business of an advocate, engaged on the other side, to obviate and refute the cavils of the adversary. As soon as the saint's claim is confirmed, he is admitted into all the privileges of beatification by the pope's decree. His relics, if any such are found, become henceforth entitled to the veneration of all good Christians; his images are crowned with rays, and a particular office is set apart for him; and the day of his beatification is distinguished by the grant of indulgences and remission of sins.

It is remarkable, that particular orders of monks assume to themselves the power of beatification. Thus Octavia Melchioris was beatified with extraordinary ceremonies by the Dominicans, for a legacy of 7,000 dollars to the order.

BEATING, among sportmen, denotes the noise which hares make in Rutting-stone.

The hare is said to beat, the hart to bell, &c.

Beating, Pulsation, in Medicine, is applied to the reciprocal agitation or pulsation of the heart and pulse. See Pulsation.

Beating of the Heart. See Palpitation.

Beating, Flux, or Hemp, is an operation in the dressing of these matters, contrived to render them more soft andpliant.

When hemp has been wiggled a second time, and the hords laid by; they take the strakes, and dividing them into dozens and half dozens, make them up into large thick rolls, which being broached on long strakes, are set in the chimney corner to dry; after which they lay them in a round trough made for the purpose, and there with beets, beat them well, till they handle, both without and within, as pliant as possible, without any hardness or roughness to be felt; that done, they take them from the trough, open and divide the strakes as before, and if may be found not sufficiently beaten, they roll them up, and beat them over as before.

Beating hemp is a punishment inflicted on loose and disorderly persons.

Beating, in Book-Binding, denotes the knocking a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or stitching. On the beating of it properly, the elegance and excellence of the binding, and the easy opening of the book principally depend.

Beating, in the Paper-Works, signifies the beating of paper on a stone with a heavy hammer with a large smooth head and short handle, in order to render it more smooth and uniform, and fit for writing.

Beating the Wind, was a practice in use in the ancient method of trial by combat. If either of the combattants did not appear in the field at the time appointed, the other was to beat the wind, or to make so many flourishes with his weapon, by which he was intimated to all the advantages of a conqueror.

Du Cange.

Beating the Hands or Feet, by way of praise or approbation. See Applause.

Beating Time, or Measure. See Batterie la Messe.

Beating, in Navigation, the operation of making a progress at sea against the wind, in a zigzag line or traverse, by fleering alternately close-hauled on the larboard and starboard tack. See Tacking.

Beating, Drubbing, or Stripes, make one of the most ancient as well as universal species of punishment. Among the Romans it obtained, under the denomination of Verbore, Subgire, Subgellare, Subfari, &c. In the East it still prevails under the name of Halftandoe.

Some distinguished between pulsation and verbration, as if the former imported a beating with pain, the former without; but this distinction is not always observed.

Beating, in the English Law. See Battrey.

Beating in the Flanks, a diltemper to which black cattle are subject, and is an indication of a great inflammation in the bowels.

Beating, in Hot-houses. See Burning of Land.

BEATTITUDE, imports the supreme good, or the highest degree of happiness human nature is susceptible of.

In which sense, it amounts to the same with what we otherwise called blessedness and sovereign felicity; by the Greeks called μακάριος; and by the Latins summum bonum, beatitudinis, and beatitatis.

Beatitude, among Divines, denotes the beatific vision, or the fruition of God in a future life to all eternity.

Beatitude is also used in speaking of the thres contained in Christ's sermon on the mount, whereby he pronounces blessed the poor in spirit, those that mourn, the meek, &c.

Beatitude was also a title anciently given to all bishops; but of later days restrained to the pope.

It appears to have been amongst others also given to laymen.

BEATON, BETON, or BETHEUN, DAVID, in Biography, primate of Scotland, and cardinal of Rome, was descended from a family originally of France, and the nephew of archbishop James Beaton, his predecessor in the primacy. He was born in 1494; and having passed through the ordinary discipline of the schools, and of the university of St. Andrew's, he was sent to France by his uncle, for the completion of his education. In the university of Paris he applied with diligence to the study of the civil and canon law, and also of divinity, in order to qualify himself for the service
service of the church. As the proper age, he entered into holy orders; but, notwithstanding his clerical character, he was employed in several affairs of importance by John duke of Albany, regent of Scotland, and appointed resident at the court of France in 1519. In 1523 his uncle, being promoted to the archbishopric of St. Andrew's, resigned the rich abbacy of Arbroath in his favour, and having obtained from the pope a dispensation for holding it two years without taking the habit, he returned to Scotland in 1525, and took his seat in parliament as abbot. Having ingratiated himself with the young king, whom he had served in France during his minority, he was promoted in 1528 to the high office of lord privy-seal. In this capacity he obtained the king's confidence; and in 1533 he was entrusted with an important commission which required his return to France, where he was eminently instrumental in maintaining the attachment of James to the French interest, and where he was employed in negociating several important concerns between the two courts, and in demanding for his matter, Magdalen, the king's daughter, in marriage. During his stay at the French court, he gained the esteem of king Francis I. to such a degree, that he granted him several confessional favours; investing him, in 1537, with all the privileges of a native of France, and conferring upon him, in the same year, the valuable bishopric of Mirepoix. King James having espoused the princess Magdalen at Paris in 1537, the abbey of Arbroath accompanied them to Scotland; and after her death, in the same year, he was deputed to negociate a second marriage for the king with Mary, daughter of the duke of Guise, whom he conducted to Scotland in 1538, where their nuptials were celebrated at St. Andrew's. In this year he was advanced by pope Paul III., who wished to attach the clergy of Scotland and England to the See of Rome; to the dignity of cardinal. Upon the death of his uncle soon after, he succeeded to the primacy, and exercised the spiritual powers with which he was invested, in evincing his attachment to the religion and interests of Rome, in conducting a very severe inquisition into heretical doctrines, and in causing persecutions to be instituted against several persons, of whom some were men of family and distinction. It is said, that he had presided to the king a roll of 360 of the chief nobility and barons, as suspected of heresy, and if the king's death had not prevented the execution of his fangious purpose, these, and perhaps many more, must have fallen sacrifices to his persecuting power, which his majesty did not seem disposed to control. At the instigation of the cardinal, James undertook the invasion of England, and at Solway Mors the royal army was totally defeated in 1542; but this unexpected defeat proved fatal to the king, and he died soon afterwards. The cardinal was the only prelate of authority who was present with him in his last moments; and he is accused of having forged a will, in which the king appointed him, together with three other noblemen, to the regency of the kingdom, during the minority of queen Mary. This fact is considered as unquestionable by the generality of modern, as well as the more early historians. But the English interest prevailed, and the cause of Arran was declared to be regent. Upon this cardinal Beaton was apprehended and confined; but in a little while, he contrived by his political ability and influence not only to be liberated, but to be appointed high-chancellor of the kingdom. The commission of legate of interest, which he so soon afterwards obtained from the court of Rome, empowered him to proceed in his favourite design of extinguishing heretics. In the execution of this design, he caused several persons to be condemned and executed; and among the rest, Mr. George Wilhurt, the most famous protestant preacher in Scotland, who was burnt at St. Andrew's in 1545; the cardinal himself, as it has been asserted on the authority of Buchanan, being seated at a window as a spectator of the tragedy. This execution produced great discontent and murmur amongst the adherents of the protestant religion; and as the forms of law had not been duly regarded, they meditated a revenge. The cardinal, himself, however, apprehended no danger; and so prevalent was his interdict at this time, that the earl of Crawford was gratified by marrying his eldest son to the cardinal's natural daughter; notwithstanding his profession and high rank in the church. Beaton, was himself, closely kept a concubine, by whom he had several children. In less than three months after the death of Wilhurt, the event which this good man denounced, and as some have said, without sufficient reasons, predicted, happened to the cardinal. A conspiracy was formed against his life by some persons whom he had disoblige; and they, accompanied by a small number of attendants, surprized the ebole of St. Andrew's, in which the cardinal lodged, rushed into his chamber, and dispatched him with their swords. One of the conspirators, James Mc-Ivillie, expressly imputed his revenge to the cardinal's persecution of Wilhurt. This event happened in the latter end of May 1546, and proved fatal to the ancient religion, and to the French interest in Scotland.

Beaton's character is sufficiently marked in the history of his life. Possessed of talents, which qualified him for the high rank to which his ambition aspired, and which he occupied both in the church and the state, he espoused and promoted the interest of Rome, as the most effectual method of securing his advancement. Dr. Robertson, indeed, ascribes his support of the Romish superstition and his enmity to the reformers, merely to political motives; but there is reason to imagine, more especially when we consider the period in which he lived, that a real bigotry in favour of popery might blend itself with the principles and views of ambition and policy. It is certain, however, that his ambition was unbounded, that he was haughty and violent in his temper, that his inconstancy was carried to the highest pitch, and that his character, upon the whole, was extremely detestable. His violence, as a persecutor, might ever cause his memory to be held in abhorrence, by those who have any feelings of humanity, or any regard for religious liberty. He appears to have had little learning, being prevented from acquiring it by his early and continued application to public business; and his morals were unbecoming his station. Biog. Brit. Robertson's Hist. of Scotland, vol. i. p. 97, &c.

BEATORUM, INSULA, in Ancient Geography, a name given to one of the Oases (See Oasis) of Africa, called an island, because it was surrounded with sand, like an island in the sea, and denominated "insula Beatorum," because, according to Strabo, it abounded with water, wine, and other necessaries of life, though encompassed by salt sandy deserts. Some have supposed that this Oasis was a district of the "Oasis nomia," but seven days journey west of Thebes. Others suppose that it was situated in the "Regio Ammoniac," and that it was the site of the temple of Ammon, which was amply supplied with fountains and vegetation, and afforded a very pleasant habitation. Ulpius says, that it was a place of banishment for real or pretended criminals, whence, as it was surrounded by sand, there was no possibility of escape.

BEATS, inphorology, are the audible strokes which a tooth of the last wheel in a clock or watch movement makes against its pallet, to maintain the vibration of a pendulum, or oscillation of a balance. The interval between two successive beats, in a clock or watch with an ordinary escapement,
BEA

B E A

But, is equal to one vibration or oscillation, but is not exactly contemporary with it, because the latter is counted as commencing at one of the extremities of its arc; whereas, the former begins at such other degree of it, as the nature of the escapement determines: a vibration here implies either one direct or one retrograde passage through the whole arc of a pendulum, and an oscillation one direct or one retrograde motion of a balance through its whole arc. Hence, in a common clock or watch, the words beat, vibration, and oscillation, are synonymous terms, when applied as the measure of the smallest subdivision of time; there being a stroke of the last wheel at some part of every vibration or oscillation: but in those astronomical and marine time-pieces which have detached escapements, there is but one beat in two vibrations or oscillations, the alternate stroke of the piece which unlocks the detent being usually silent; in these machines, therefore, the beats are flower by one half than in ordinary ones, notwithstanding the movements, or mechanism of wheels and pinions, may be the same in both, and the vibrations or oscillations similar. In any horological machine, the number of vibrations or oscillations which it makes in an hour, is the value of its time, which may be thus determined, viz. "Divide double the product of all the wheels, by the exact product of all the pinions, and the quotient will be the time universally;" the great wheel and its pinion, however, being used only to regulate the period of going after winding up, and to communicate motion, are left out of the calculation. The reason why the product of all the wheels is required to be doubled, is, that one tooth of the last wheel does not completely escape its pallet in less than two successive vibrations or oscillations in any escapement. The beats of a pocket watch are a very convenient measure of small portions of time, and might be applied to many useful purposes with advantage, particularly if they were each an exact fraction, such as 1/4 of a second, which they might as easily be as otherwise. (Vid. Nicholson's Journal, vol. III. p. 49—189, and vol. V. p. 40, 410. Series.) In the best time-pieces or chronometers for determining the longitude, this circumstance is attended to, and the trains are usually either 14,400 or 18,000, namely, either four or five oscillations: i.e. either two, or two and a half beats per second, by reason of their escapements being detached. If the same attention was paid to the trains of common pocket watches, the frequency of their beats would fit them for more observations in some of the departments of philosophy, and give them, in this respect, a preference even over more accurate instruments with less frequent beats: but at present, the only attention that is paid by the makers to the value of the train of a common watch is, that, for a small balance, it may be a quick one, and for a large balance a slow one; or, in other words, that the momentum of the balance shall not be too much controlled by the maintaining power, which necessary proportion might be equally attended to, if the beat were made an exact fractional portion of a second. In any watch the whole train or vibrations in an hour divided by 3600, the seconds in an hour, will give the vibrations per second of that watch. See Clock-Movement, Dead-Beat, Escapement, &c.

Beats, in Music, are certain pulsations of two continued sounds, as in an organ, that are out of tune, occasioned by warring vibrations that prevent coincidence in any two concords. This phenomenon, which was first discovered by M. Sauveur, has not only been described by Dr. Smith in his "Harmonics" but made the foundation of a lyre of temperament.

"In tuning musical instruments, (says he, Scli. IV. Prop. X.) especially organs, it is a known thing, that while a confluence is imperfect, it is not smooth and uniform as when perfect, but interrupted with very sensible undulations or beats; which, while the two sounds continue at the same pitch, succeed one another in equal times, and in longer and longer times, while either of the sounds approaches gradually to a perfect confluence with the other; till at last the undulations vanish, and have a smooth, uniform confluence."

These beats, the same author observes, are of use in tuning an organ to any desired degree of exactness.

The work of Dr. Smith, though excellent, is far too profound for the persons most in want of it: the organ and harpsichord tuners are seldom mathematicians, and to comprehend the doctrines laid down in this book, would require as much science as Newton's "Principia."

The beats of two different organ pipes, retard the beating of the pulse to the touch: and, like the human pulse in a fever, the more different are the sounds, the quicker they beat, and the faster they become better in tune; till at length they are lost in the coincident vibrations of the two sounds. See Vibration, Temperament, and Tuning.

BEATTIE, James, L. D., in Biography, a celebrated moral philosopher and poet, was born about 1735, in the county of Kincardine, in North-Britain. His father was a station of life no higher than that of a little farmer, a class of men subject to much hardship and indigence in Scotland. He was, however, possess'd with that laudable spirit which so frequently in that country raises native genius from obscurity; and he bestowed upon his son a literary education, first in the parochial school of his neighbourhood, and then in the college of New Aberdeen. The youth was afflicted in his progress through the studies of the latter, by one of those small exhibitions which have been annexed to it for the encouragement of learning; and it is suspected that he supported himself in the intervals of the jellions by teaching at a country school. For some considerable portion of his early life, it is known that he acted as a schoolmaster at Allona and in Kincardineshire. At length he removed to Aberdeen, and engaged as assistant to the master of the principal grammar school, whose daughter he married.

The talent which first made him known to the world was that of poetry, which he had cultivated from his youth. In 1760, he published a volume of "Original Poems and Translations," which in 1765 was followed by "The Judgment of Paris." These performances were characterized by richness and elegance of language and melody of verification; but rather denoted a refined taste in poetry, than a powerful and inventive genius. They probably brought the author into notice at the place of his residence, but seem to have excited little attention among readers in general.

One of the fruits of his rising reputation was to obtain for him the patronage of the Earl of Errol, who resided in the neighbourhood of Aberdeen. Besides other benefits, the influence of this nobleman acquired for Mr. Beattie the honourable situation of professor of moral philosophy and logic in the marischal college of Aberdeen. In this capacity he next appeared before the public as the author of a philosophical work, entitled "An Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism," 8vo. 1760. The progress made about this time by Mr. Hume's principles, especially among his contemporaries, could not fail of exciting alarm among the friends of revealed religion. How long Beattie had ranked among thefe, does not clearly appear. An admired poem of his, "The Hermit," in its first form strongly expresses that doubt of a future existence, which could not be banished from heathen philoso-
and in a poem hereafter to be mentioned, he warmly congratulates himself on having escaped "From Pyrrho's maze, and Epicurus' fly." There is a vein of acrimony and exasperation in all his allusions to the sceptical philosophy, which renders not improbable the report of a personal offence received by him from Hume; though there is no reason to doubt that when he wrote his book, he was not very sincerely imperilled with the danger of the tenets he opposed, and that he ever after remained zealously attached to the cause of revelation. The author in this work is regarded as a philosophical disciple of Dr. Reid, admitting an infinitive principle of the perception of truth, and founding it upon that faculty of common sense, which acts in a similar manner upon all, or a great majority, of mankind. As he wrote with more eloquence and a more popular manner than Dr. Reid, his performance was much read, and gained him a number of very respectable friends and admirers. It is allowed, that he has successfully detected many of the sophisms of Hume, and has brought together many ingenious and useful thoughts on this subject; but the foundation of its philosophy has by some, especially by Dr. Priceley, been treated as shallow and superficial: and he has been censured for the arrogance which he has displayed towards those of opposite opinions, and for the readiness with which he has impugned to them consequences subversive of morality. Indeed, many parts of his book favour more of the rhetorician than the philosopher. These defects, however, did not render less acceptable an attempt from a layman to serve the cause of religion; and among the friends Beattie acquired on the occasion, were lords Mansfield and Lyttelton, bishops Hurd and Portens, Dr. Johnson, and Mrs. Montague. The influence of lord Mansfield obtained for him a penion of 200l. from his majesty's privy-purse.

In the following year, 1771, his fame as a poet was extended throughout the kingdom by the publication of the first part of "The Minstrel." The subject of this piece, is the reign birth and education of a poet. The term 'minstrel' is not very happily applied to the character described; nor are the famed "Gothic days" in which he is placed to be recognized in real history; but there is great beauty in the delineation of the native poetical disposition assigned to him, and in the invention of circumstances by which it is nourished. The stanza is that of Spenser, which is managed with singular dexterity, and made to produce a melody of verification scarcely exceeded in the range of English poetry. The second part of this poem, which appeared in 1774, contains the mature education of the young bard, and enlightens his mind with the lessons of history, philosophy, and science. There are many fine strains in this part, which, however, deviates from the original conception; and the work is left a fragment, probably because its plan was found to involve unavoidable incongruities. The "Minstrel," whatever be its defects, is probably the performance on which Beattie's future fame will chiefly depend; and it may be regarded as having taken a fixed position of a place amid the most approved poetry in the language.

Mr. Beattie visited London in 1771, and was received with great cordiality by his admirers. The degree of L.L.D. was conferred upon him by his college at Aberdeen not long afterwards, and he repeated his London journey in 1773. A new edition in 4to. of the "Essay on Truth" was published in 1777, by a private subscription among his friends, conducted on the most liberal principles, and to the volume were added three essays upon subjects pertaining to polite literature, which had been read before a private society at Aberdeen. In the Essay on Truth, some corrections were made, and some harsh reflections softened and modified. Other pieces displayed much refined taste, sound judgment, and acquaintance with the best authors, ancient and modern.

Dr. Beattie, in 1783, published a quarto volume consisting of "Dissertations, Moral and Critical." These are detached essays on various subjects, which formed a part of a course of lectures read by the author in his professional capacity. Many useful and curious topics are discussed in them, without any pretensions to extraordinary subtiety and acuteness, but in a mode calculated to improve the heart as well as the understanding. The work is not free from somewhat of the warm and dogmatical manner which characterizes the Essay on Truth; and though not unworthy of the writer's fame, it appears to have made little addition to it. The applause given by the bishop of London to a sketch of manuscript lectures to young persons on the evidence of Christianity, induced Dr. Beattie to draw up and publish in 1786, a work entitled "Evidences of the Christian Religion, briefly and plainly stated," 2 vols. 8vo. This was esteemed a plain, elegant, and popular view of the subject, well calculated for its intended purpose. It was the last publication of the author, whose time was much occupied with the duties of his station, and with social and domestic concerns; of which one of the dearest to his heart was the education of his eldest son, James Hay Beattie, a youth of very extraordinary endowments and uncommon moral excellence. He was so successfully trained by his father, as to be made his affianced in the professorial chair at the age of nineteen; and he was become the most intimate friend and beloved companion of his revered parent, when he fell into a decline, which carried him off in 1790, at the age of 22. Dr. Beattie had sufficiency enough to be the editor of a small volume of the youth's compositions, in verse and prose, to which he prefixed a memoir on his life and character, highly interesting and unaffectedly pathetic. This generous loss was followed in 1796 by that of his younger son, Montague Beattie, in his eighteenth year. The unhappy father was unable, with all his resources, to bear up under this accumulated sorrow. The latter years of his life were a blank of existence, which terminated at Aberdeen, on August 18, 1803, in the 68th year of his age. Dr. Beattie was amiable and exemplary in every department of private life, and fulfilled the duties of his public station in such a manner as to confer honour and credit upon the university of which he was a professor. He was a fellow of the Royal Society of Edinburgh.

BEATUS RHENANUS, a learned man of the 16th century, whose father Anthony Bilde, assumed the name of Rhenanus from Rheinsch, the place of his birth, was born at Schlettstadt in Alsace, in 1485. He pursued his studies at Paris and Strasburg, and from thence proceeded to Basle, where, in 1514, he formed an intimate acquaintance with Erasmus, and applied to the Greek language under J. Conen of Nurenberg, and became a corrector of the press to the celebrated Frobenius. At the age of 35 he returned to Schlettstadt. He first published the two books of the "History of Velleius Paterculus," and first caud the works of Tertullian to be printed from two MSS. which he borrowed from two monasteries in Germany. His notes to Tertullian were censured by the Spanish inquisition, and placed in the Index of prohibited books, because they contained some free reflections on the fumsality of the clergy in his time. Rhenanus was a man of extensive learning, particularly in the Greek language, church history, and the antiquities of Germany. Scaliger says, that he contributed greatly-
greatly to revive ancient literature, and Stricius bears very honourable testimony to his talents as a critic. Towards the close of his life he was afflicted with a diabetes, and obtaining no relief from the baths of Baden in Switzerland, he died at Strafsburg in 1547. He was no less distinguished by his integrity and modesty, and his mild and conciliating temper, than by his great learning. He professed great regard for Luther, and detested the tyranny which the clergy exercised at that period; but he never openly declared in favour either of Luther or of any other reformer. Although he was no less displeased than Erasmus with the errors that had blended themselves with religion, he was an enemy to schism, and, by prudent reformation, to preserve the unity of the Christian church. Of his works, written in Latin, which were numerous, we shall only mention his "Observations on Piny's Natural History," his "Notes on Livy," his "Preface and Annotations to Tacitus," his "Epistle prefixed to Erasmus's edition of the Works of Origen," his "Preface to the Works of Erasmus," and his "Origines Gothicæ," to which we may add his bell work, entitled "De rebus Germanicis libri tres," printed at Ulm in 1593, with the annotations of James Otto. Jortin's Life of Erasmus. Gen. Biog.

BEAU, CHARLES LE, was born at Paris in 1701, and became professor of rhetoric in the collège des Grands, then professor in the college-royal, secretary to the duke of Orleans, and perpetual secretary and peninsory of the academy of inscriptions. Like Rollin, he united the charms of eloquence with profound erudition, and was no less, than this eminent professor, beloved by his pupils. His most considerable work was his "History of the Lower Empire," in French, 22 vols. 12mo., which is written in a correct and elegant style. He also wrote several learned dissertations in the "Memoirs of the Academy of Belles Lettres," and some "Historical Elogies," on the academicians. His private character was admirable, and he was much esteemed for his worth and generosity. He died at Paris in 1778. His younger brother, JOHN LEWIS, also Beau, was professor of rhetoric in the college des Grands, and member of the academy. He published a discourse on the condition of fortune, molt suitable to a man of letters; and an edition of "Homer, Greek and Latin," 2 vols. 1746, and of "Cicero's Orations," 3 vols. 1750; both with notes. Nouv. Dict. Hift.

BEAUPORT, in Geography, a spacious and commodious harbour on the S. E. part of the Falkland islands, capable of accommodating a large fleet of ships in perfect safety. It is almost surrounded by the land, has good anchorage, and sufficient depth of water.

BEAUBASSIN BAY. See Chignecto.

BEAUBASSIN BAY, is also a bay on the south coast of the island of Magellan, at the S. E. angle of the island, where it extends to the W. It is nearly opposite to Wallis's harbour on the north coast, is a spacious bay, and has an open entrance.

BEAUCARIE, a town of France, and principal place of a district in the department of the Gard, on the right bank of the Rhone, opposite to Tarascon, with which it has a communication by a bridge of boats. This town carries on a considerable commerce in wool, flax, fluffs, spices, drugs, leather, cotton, &c.; and it has an annual fair which lasts for six days. The port of the Rhone is well constructed. The principal building is the collegiate church. N. lat. 43° 48'. E. long. 4° 30'.

BEAUVILLE, Francis, in Biography, a polite scholar of the sixteenth century, was defending from an ancient family of the Bourbonnais, and born in 1514.

In consequence of his literary reputation, he was appointed preceptor to cardinal Lorraine, the second son of the first duke of Guise, and attended him to Rome. On his return, he was promoted to the bishopric of Metz, and attended his patron to the council of Trent, where he distinguished himself by his eloquence. He was likewise of singular service in refining the fathers of the council from the perplexity occasioned by different opinions concerning marriage; for he drew up a decree, framed in terms so ambiguous as to be accommodated to the variety of opinions that were held, and by the different fancies in which it might be interpreted to satisfy all parties. However, he gave offence to the rotaries of the papal power by maintaining the independence of the episcopal order, and his opinion on this point was disavowed by the cardinal of Lorraine. In 1568 he resigned his bishopric to Lewis, cardinal of Lorraine, and retired to his castle of la Chatre in the Bourbonnais. Here he employed himself in composing a "History of his own Times," which was written in Latin, and compiled the events from the year 1462 to 1567. This work was discontinued about three years before his death, which happened in 1571. It remained in MS. for several years, the author having declined the publication of it for fear of giving offence; but being found in his library by Philip Dinet, he printed it at Lyons in 1625, in folio. It is deemed a well-written, and upon the whole, a faithful history; though too favourable to the house of Guise, and very hostile to the Huguenot party. Beaucariet one time after he had taken possession of his fees, engaged in a controversy with the Calvinists upon the future estate of children dying unborn. Gen. Dict.

BEAUVRIT, or BEAUVIT, in Geography, the name given before the revolution to a country of France, part of Orleans, now the department of Eure and Loire, which was so fertile in every part, as to be called the granary of France. Its capital was Chartres.

BEAUCHENES ISLAND, in Geography, a small island to the S. of Falkland islands, in S. lat. 53°, and W. long. about 68° 30'.

BEAUCHASTEL, a town of France, in the department of the Ardeche, 24 leagues S.S.W. of Valence.

BEAUCHIEF ABBEY, in Geography, was situated in a pleasant valley, on the north side of Derbyshire, in England, within a short distance of the town of Sheffield. This celebrated religious house was founded by Robert Fitz-Ralph, lord of Airceton, between the years 1172 and 1176, for regular canons of the premonstratian order. Since the dissolution of monasteries, 26th of Henry VIII. this abbey has continued to crumble by the decay of time, and only a part of the chapel remains to mark the character of this once proud pile. See Pegge's History of Beauchief Abbey. 470.

BEAUDAUN, a town of France, in the department of the Var, and chief place of a canton, in the district of Barjols; 12 miles N. E. from Barjols.

BEAUVRIER, or BEAVER, in Zoology, the English name of Castor Fiber, Linnæus, which see. Pennant calls Sorex Moschatus of Pallus, the Long-nosed beaver.

BEAVER, BEVER, and in Latin Fiber, Caflor & Caflorius, John, in Biography, a benedictine monk, in Wellminster Abbey, flourished about the beginning of the 14th century. He is represented as a person of ingenuity and industry, and a great writer of the history and antiquities of England, to the study of which he particularly devoted himself. He wrote, "a Chronicle of the British and English Affairs," from the coming in of Brut to his own time, which remains in MS. in the Cottonian library; and also a book "De Rebus..."
Caribii Welfmonlaniae." He is commended by Leland and Bale, and cited with respect by Stow in his Survey of London and Welfmonther. Dio, Brit.

Beaver Creek, in Geography, a creek of North America, which runs into lake Erie, at the east end, about 7 miles S. E. from Port Erie.

Beaver Creek, Big, falls into the Allegany river, after having received several branches from the north-east, about 28 miles N. W. of Pittsburg. It rises in the fourth, runs north about 6 miles, thence 12 more north-east to the Salt Lick town; then by the Mahoning town and Salt Springs, 34 miles south-to-the-top to the Kili-kilt town, from which its mouth is 22 miles southerly. Its whole course is about 74 miles.

Beaver Dam, a township in Pennsylvania, on the west side of Susquehanna river.

Beaver Eaton, in Zoology. See GLUTTON.

Beaver Island, in Geography, an island in the lake Michigan, N. lat. 45° 15'. W. long. 85° 30'.

Beaver Indians, nations of North America, situate north of Slave lake, in N. lat. about 62°, and W. long. about 120°.

Beaver Kill, is a south-east arm of the Popachton branch of the Delaware. Its mouth is 176 miles east from the Cook House, and 244 N. W. from Kishichon Falls.

Beaver Lake, a lake of North America, forming a part of the Susquehanna river, in N. lat. 54° 30'. W. long. 102° 30'. To the north of it at a little distance is the source of Churchill river; to the south is Cumberland-house; and not far from it are a number of houses belonging to the Hudson's bay company.

Beaver River, a river of North America, which rises in a lake called Beaver lake and the adjoining hills, in about N. lat. 54° 30'. W. long. 119° 15', and discharges itself into Lake Erie, in N. lat. 53° 15', and W. long. 108° 30'.

Beaverrat, in Zoology. See Mus Coypus.

Beaver Skin, the fur or skin of an amphibious animal called the efferon, or beaver, sometimes found in France, Germany, and Poland, but most abundantly in the province of Canada in North America, and the uninhabited wilds of Siberia. The skin of the beaver has hair of two kinds: the lower hairs immediately next to the skin are short, with the upper more sparingly, and are thicker and longer. The latter is of little value; but the fles or down is wrought into hats, stockings, and caps.

"The beaver's skin gives kindliest warmth to weak evereate limbs, when the pale blood flow rises through the veins." Dyer's Fleece.

The merchants distinguish three kinds of efferon, as well as the animal, as the skin of the same animal: there are new efferon, dry efferon, and fat efferon. The new efferon, called also winter efferon, and Maggiovine efferon, because ordinarly referred to send into Flanders, is that taken in the winter. This is the best, and most esteemed for rich furs, as having lost none of its hair by moulting. In the year 1794, the importation of beaver skins into the port of St. Petersburg amounted to the value of 332,550 rubles; a circumstance, which, as Mr. Todd observes, ought to be a matter of concern to every true Kufflan, as it naturally strikes us with surprise, that a country so richly stocked with wild animals of every kind should be dependent on foreign industry in this class of its necessaries. Dry efferon, or lean efferon, is the result of the summer fumers, when the beast is moulting, and has lost half of its hair; this being much inferior to the former, is little used in furs, but mostly in hats. Fat efferon, usually called old efferon, or cost efferon, is that which has contracted a certain fat, unctuous humour, by sweat exuded from the bodies of the fumers, who have worn it for some time; this, though better than the dry, is yet only used for hats.

Its chief use is in the composition of hats, caps, etc. Besides this, in 1669, an attempt was made to employ it in other manufactures; accordingly, a manufactury was settled in the Faubourg St. Antoine near Paris, where they made cloths, flannels, stockings, etc. of efferon, with a mixture of wool. The manufacture flourished for a while, but soon decayed, it being found by experience that the fumes lost their dye when wet, and that when dry again they were hard and stiff as felt.

After the hair is cut off the skin to be used in hats, the pelt or skin itself is used in various works, viz., for the covering of malls and trunks, in flappers, etc.

Beaver is chiefly imported by the Hudson's bay company, from the northern parts of America, where the animal abounds. Beaver skins are also procured in considerable abundance on the western coasts of North America. See Fur.

Beaver's Town, in Geography, lies between Margaret's creek, an upper N. W. branch of Muskingum river, and the north branch of that river; at the head of which branch there is only a mile's portage to Cayahoga river. Beaver's town is distant about 85 miles N. W. from Pittsburg.

BEAUFORT. See BAYFET.

BEAUFORT, Henry, in Biography, cardinal and bishop of Winchesleft, was the natural son, legitimatized by parliament, of John of Gaunt, by Catherine Swineford, who afterwards became his third wife. Having been educated at Oxford and Aix la Chapelle, he was advanced, at an early period of his life, to high stations both in the church and the state. In 1397, he became bishop of Lincoln, in 1399 chancellor of the university of Oxford, and dean of Wells, in 1404 lord high chancellor of England, and in 1405 bishop of Winchester. During the reigns of his brother, Henry IV., and of his nephew, Henry V., he does not seem to have suffered much political importance; but he lived in great splendour, and acquired immense wealth, so that he was able to lend Henry V. 20,000l. to aid his expedition into France, and thus to divert him from his designs of attacking the revenues of the church. Upon the death of Henry V. he was appointed one of the guardians of his son Henry VI. during his minority; and in 1421 he was again made lord chancellor of England. In 1425, the instructions that exhorted him between himself and the protector, Humphrey duke of Gloucester, relative to such a height, that Beaufort thought it necessary to appeal to his nephew, the duke of Bedford, then regent of France, and to request his presence for bringing about an accommodation. Upon the arrival of the regent an assembly of the nobility was convened at St. Albans; but their interposition proving ineffectual, the decision of the contest was referred to the parliament held at Leicester in 1426. The duke of Gloucester produced five articles of accusation against the bishop, of which he was acquitted; and the disputants being enjoined to cultivate mutual friendship, departed with outward appearances of perfect unity. The regent, however, in order to gratify his brother, the protector, took away the great fleet from the bishop. In 1428 the Duke of Bedford returned to France, and was accompanied by Beaumont to Calais, where he was invested with the dignity of cardinal, with the title of St. Euffluus, conferred upon him by pope Martin V. He was also honoured by the same pope with the character of legate; but on his return to England, he was forbidden the exercise of it by royal proclamation.
As he was likewise appointed the pope's legate in Germany, and general of the crusade against the Hufites, or heretics of Bohemia, he obtained from parliament the grant of a sum of money, and a body of forces, for the more successful execution of his office. Having embarked with his troops for France, he was obliged, for some time, with reluctance on his own part, to employ them under the duke of Bedford; and he then proceeded with them to Bohemia, where he remained for some months, till he was recalled by the pope. In 1430 he accompanied King Henry into France, under the title of the king's "principal confessor," and performed the ceremony of crowning the young monarch in the church of Notre Dame, at Paris. The honours, however, which he received during his absence, were, in his estimation, an inadequate compensation for the mortification resulting from the duke of Gloucester's successful attempts for humbling his pride, and restraining his power. He not only procured an order of council, prohibiting any of the king's subjects from accompanying the cardinal, if he should leave the king without his permission; but he attempted to deprive him of his bilhupric, as inconsistent with the dignity of a cardinal. On his return, and for his more effectual security against these hostile attempts, he obtained, by the interception of the house of commons, letters of pardon for all offences committed by him contrary to the statute of "provisors," and other acts of "præmunire." This pardon was renewed five years after, viz. in 1437, for all crimes whatsoever. Notwithstanding these precautions, the duke of Gloucester, in 1442, drew up fourteen articles of impeachment against him, and presented them with his own hands to the king, who referred the matter to his council. The examination of these articles was attended with such delay, that the protector dropped the prosecution, and the cardinal escaped. The cause of the protector's invertebrate enmity against the cardinal is laid to have been the part which he had taken in instigating certain perons to accuse and pervert his dutchefts for treason, witchcraft, and other notorious crimes.

Cardinal Beaufort died in 1447, about a month after the duke of Gloucester, in whose murder, it is supposed, he was concerned. The remorse and horror occasioned by the reflection on this event, in the near approaches of his own death, were "more," says Hume, "than could naturally be expected from a man hardened, during the course of a long life, in falsehood and politics;" and they are exhibited in very imperative characters in the representation of his last scene, by Shakespeare, in the last scene of the third act of the "Second Part of King Henry VI."

"If thou be'ft dead, I'11 give thee England's treasure, Enough to purchase such another island, So thou wilt let me live, and feel no pain."

Again,
"Bring me unto my trial when you will,
Dy'd he not in his bed? where should he die?
Can I make men live, whether they will or no?
Oh! torture me no more: I will confess -
Alive again? Then, shew me where he is:
I'll give a thousand pounds to look upon him-
He hath no eyes, the dust hath blinded them:
Comb down his hair; look! look! it flutters upright,
Like line-twigs set to catch my winged soul.
Give me some drink, and bid th' apothecary
Bring the strong poison that I bought of him."

The cardinal was buried at Wincheftcr. He died rich, and left large sums for pious and charitable purposes, in various parts of the kingdom: and he ordered 10,000 maffes to be said for his soul. Haughty and turbulent, and fond of pomp and power, he is allowed to have been a faithful and able servant of the crown. Mr. Hume describes him as a prelate of great capacity and experience, but of an intriguing and dangerous character. Hume's Hist. vol. iii. p. 135-173. Brit. Hist.

Beaufort, Margaret, distinguished by her munificent encouragement of literature, was the daughter of John Beaufort, duke of Somerset, and granddaughter of John of Gaunt; she was born at Bletfho, in Bedfordshire, in 1441. Her first husband was Edmund earl of Richmond, by whom she had one son, Henry VII. King of England. Her second husband was Sir Henry Stafford, second son of Henry duke of Buckingham; and her third, Thomas lord Stanley, afterwards earl of Derby, by neither of whom she had any issue. Waving all pretensions to the crown in favour of her son, she devoted her life to exercises of piety and charity, and derived her chief pleasure from relieving the indigent and distressed. She kept constantly in her house twelve poor people, whom she lodged, fed, and clothed. She extended her patronage to the students of both universities, and to men of learning throughout England. In 1502 she instituted two perpetual public lectures in divinity, one at Oxford, and the other at Cambridge, which still subsist under the name of Margaret professorships. At Cambridge she established a perpetual public preacher, whose duty it should be to preach, at least, six sermons every year, at certain churches in the dioceses of London, Ely, and Lincoln; and she also founded a perpetual chantry at Winbourne minster, in Dorsetshire, for teaching grammar. But her noblest institutions were the colleges of Chrift and St. John in Cambridge, the former founded in 1505, for one master, twelve fellows, and forty-seven scholars, and the latter in 1508, for a master and fifty fellows and scholars, which being begun just before her death, was finished by her executors. It is, therefore, with justice, that Gray has made this lady the principal object of his eulogy, in his ode on the installation of the duke of Grafton as chancellor of Cambridge.

"Foremoft, and lenning from her golden cloud,
The venerable Margaret see!"
"Welcome, my noble son," the cries aloud,
"To this, thy kindred train, and me;"
"Pleased in thy lineaments we trace
"A Tudor's fire, and a Beaufort's grace."

Her piety and devotion were no less exemplary, though partaking in a great degree of the hyperbolism of the times, than her charity. She died in June 1509, and was interred in the chapel of her grandfather in Westminster Abbey. She is the reputed author of the translation of two devotional pieces from the French; and also of rules and orders for the prudence and attire of noble ladies at fea. Brit. Hist.

Beaufort, in Geography, a town of France, in the department of the Mayenne and Loire, and chief place of a canton, in the district of Bangy. The castle of Beaufort gives the title of duke to the noble family of Somerset, lineally descended from John of Gaunt, duke of Lancaster, and the house of Lancaster obtained this castle from Blanche of Artois, queen of Navarre, wife to Edmund Crouchback, second son of king Henry III., and first earl of Lancaster. N. lat. 49° 26'. W. long. 0° 3'.

Beaufort, a town of France in the department of the Drome, 2 leagues N. E. of Creft.

Beaufort, a town of Italy in Savoy, on the river Oron, 30 miles E. N. E. of Chambery. N. lat. 45° 40'. E. long. 6° 48'.

Beaufort, a district of the lower country of South Carolina, lying on the sea-coast, between Cohabbe and Savannah rivers. It is 69 miles long and 37 broad, and divided into four parishes, containing 18,753 inhabitants, of whom only 4346.
BEAULON, a town of France, in the department of the Ill and Vilaine, and chief place of a canton in the district of Redon, 4 leagues S.W. of Rennes.

BEAULY, is the name of a river in Inverness-shire, Scotland. It is formed by the junction of three small streams, which concentrate near Erklees castle, whence the united waters flow easterly, and after forming the falls of Kilmore and other fine cascades, they are discharged into an arm of the sea. The frith, or mouth of the river, is six miles in length and two in breadth. The banks of this river are richly diversified with some fine natural woods, and various combinations of bold rocky scenery. At one place, the river divides, forming the little island of Agaith, which is of an oval figure, about one mile and a half in circumference, and rises gradually about 100 feet above the level of the water. The Beauly is noted for its salmon fisheries, whose rents have lately produced six hundred and thirty-one pounds per annum.

BEAUMANS, or Bauman's, Islands, a cluster of three islands, so called from the name of the captain who discovered them, part of Roggewein's archipelago, situated in the great Equinocial or Pacific ocean, in about S. lat. 13° W. long. 135° 10'. The discovery of these islands has been ascribed by several geographers to Roggewein; and he named them, in 1721, Beuaman's islands. His own words are these: "we discovered three islands at the same time in the 12th degree of latitude, of a very agreeable appearance; we found them flopped with fine fruit-trees, herbs, vegetables, and plants of every description. The islanders, who came to meet our vessels, offered us all sorts of fish, coconuts, bananas, and other excellent fruit. These islands must be well-peopled, the beech being on our arrival covered with many thousands of men and women, the greater part of the former carrying bows and arrows. All the inhabitants are white, and only differ from Europeans by some of them being much sun-burnt. They seemed good kind of people, lively and gay in conversation, kind and humane towards each other, and nothing of the savage in their manners. Their bodies were not painted like those we had before seen; they were clothed from the waist to the ankles with fringes of silk; and their houses were covered with hats of the same kind, very fine and broad, to protect them from the heat of the sun. Some of these islands were ten, fourteen, and even twenty miles in circumference. We called them Beuaman's islands, from the name of the captain of the ship Tinhowen, who first saw them. It must be confessed (adds the author), that this is the most civilized and honest nation we have met with in the islands of the South sea. All the coasts of these islands have good anchorage, in from 13 to 20 fathoms water." See the extract from the historical account of Roggewein's voyage, written in French, in 1739, by a German of Mecklenburg, who was on board Roggewein's fleet, in La Perouse's Voyage round the World, vol. ii. p. 192. Eng. ed.

The other clusters of islands of Roggewein's archipelago, marked in the hydrographical charts annexed to Marchand's Voyage, are Roggewein and Groning, situated a little to the north of Beuaman's islands, and nearly in the same longitude. Some have supposed Beuaman's islands to have been those which Bougainville has called "Navigators islands;" but neither the history of the inhabitants, nor the geographical position of the islands, warrant this supposition.

BEAUMARCHEZ, a town of France, in the department of the Gers, 7 leagues west of Auch. N. lat. 43° 35'. W. long. 0° 1'.

BEAUMARIS, or Beaumarsh, the principal and county town of the isle of Anglesea, North Wales, is situated
The area is an irregular octagon, about 37 yards from north to south, and 60 from east to west. In the middle of the north side is the hall, twenty yards long and twelve wide. What was formerly the porter's lodge is now used as the bridewell. A gallery of communication extended round the buildings of the inner court; and in different recesses of this were square holes, which seemed to have opened into dungeons beneath. The two eastern towers served alike as dungeons, the defect to which was dark and narrow. On the internal side of the castle was a small chapel, none of which remains.

The town of Beaumaris is not very ancient; nor do we find any particular records of it previous to the erection of the castle, soon after which it assumed some consequence, and Edward I. surrounded it with a wall, made it a corporation, and endowed it with certain privileges. In the 27th of Henry VIII. Beaumaris, with eleven other counties of Wales, were unprivileged and summoned to send members to parliament, but no return was made from this county till the 33d of Henry VIII. when Newborough, now a poor decayed village, sent one member. Since the 2d of Edward VI. Beaumaris has been regularly represented by one member, and the right of voting was veiled in 1529, in a mayor, two bailiffs, and twenty-one capital burgesses. Though this town has had an extensive trade, yet it has a custom house for the exclusive reception of goods, a large town hall with assembly room, a free school, almshouse, and a church or chapel with a lofty square tower. The free school and almshouse were founded by David Hughes; the first in 1603, and the latter in 1613. Here are a weekly market on Saturday, and four annual fairs. It is situated 53 miles west of London, N. 51° 35' W. long. 4° 15'.

The Bay of Beaumaris forms a fine expanse of water before the town, and ships can ride safe in anchor at its feet. When the tide is out. From this to the opposite shore at Aber is a distance of about four miles; yet the channel at low water does not occupy above one mile. The remainder is a uniform bed of sand, called Traeth-Pelavan, or the Levan sands. These, the Welsh suppose, were anciently quite free from water. They were a habitable part of Carnarvonshire; which Mr. Pennant admits, and endeavours to prove, by showing that the sea has made great encroachments at Abergele, and that several bodies and roots of oak trees have been found in a tract of hard loam at a considerable distance from the present shores.

About one mile from Beaumaris land some shattered remains of Llandovery, which Camden called "a famous religious house in times past," and belonged "to the friars minor, unto whom the kings of England yielded themselves very bountiful patrons, as well in regard of the friar's holiness, as also because (that I may speak out of the public records of the kingdom) were buried a daughter of king John, a son of a king of the Danes, the bodies also of the lord Clifford, and other knights and fquires, who in the time of the noble and renowned kings of England were slain in the wars against the Welsh." This monastery, erected by Llewellyn ap Iorwerth, was consecrated in 1240, by Howel, bishop of Bangor; and in a few years afterwards burnt in the insurrection of Madoc. At the dissolution, Henry VIII. sold the convent and its possessions to one of his courtiers. The family of Whyte (now extinct) afterwards became possessors of it, and built a respectable house, which has since been enlarged, modernized, and the grounds much improved. It is now one of the seats of Sir Robert Williams, Bart. Near this place a severe battle was fought in 819, between the Welsh and the Saxons under their leader Egbert, who had invaded the island, and given it then, for the first time, the name of Anglesea. The Saxons at first proved victorious, but...
but were strongly opposed by Mrsyn Frych, the Welsh prince, who after some severe battles expelled the invaders from this island.

Two miles north of Friars are the remains of the priory of Penmon, consisting of little more than the ruinous refectory and part of the church. This priory for Benedictine monks was endowed, if not founded, by prince Llewelyn ap Jorwerth before 1221.

Near Penmon is a well surrounded with a wall and stone seats, having two doors or entrances. This was a sacred, baptismal, or holy well. About a quarter of a mile distant is an ancient crom, six feet high, the shaft of which is curiously ornamented with sculptured chequerwork. At the distance of about one mile from the shore is Tyll Siriol, or Siriol's island, now called Puffin-holme. This was once a monastery, the remains of a square tower still mark its religious appropriation. This island is sometimes called Puffin island, from its being much frequented by birds of that name. From the beginning of April to the beginning of August, immense numbers of these and other sea-fowl resort to this spot. To the west of Puffin-holme are three smaller islands, called Ynys Lligod, or the Mouse islands.

In the channel which waters these islands, the large oysters called the Penmon are taken by the dredge, and great quantities are pickled, packed in barrel casks, and sent to different parts of the kingdom.

Baron Hill, the seat of lord Bulkley, is finely seated on an eminence overlooking the town, castle, &c. The original mansion of this family in Wales was Court Manor, in Caflle-Ifreet, Beaumaris. The present mansion was built by Sir Richard Bulkley, for prince Henry, son of James 1. The house has since been enlarged and greatly improved by its present possessor, under the direction of Mr. S. Wyatt. The grounds of this domain are regularly laid out, and beautiful, and the various prospects of sea, mountains, and blue heath, are highly grand and interesting.

About seven miles south-west of Beaumaris is Pant-New-yell, an elegant modern mansion, built in a cattled style, belonging to the earl of Uxbridge. The house is large, commodious, and handsome, and the ancient woods around it give it a venerable character. Close behind the house are two Cromlechs, the largest of which has been long delineated by the name of "Cromlech of Mony." See Cromlech. See an interesting poem called "Beaumaris Bay," with notes; "A Tour round North Wales," by the Rev. W. Bingley; and "Mr. Pennant's Tours in North Wales."

BEAUMASS. See Mass.

BEAUME CAVE. See BEAUME.

BEAUMEILLE, LAURENT-ANGELIEL DE LA, in Biography, a modern French writer, was born in 1727, at Vallerain, in the diocese of Allier. Having been invited to Denmark to undertake a professorship of French Belles Lettres, he opened his course by a "Discourse," printed in 1751. But the climate being too severe for his constitution, he quitted Denmark with a pension and the title of counsellor. In his return by way of Brinn, he wished to form an acquaintance with Voltaire, of whose writings he was a passionate admirer; but their irritable dispositions produced a quarrel, which admitted of no reconciliation, and which produced personalities equally disagreeable to both. On his arrival at Paris, in 1753, his publication, entitled "Mes Pensées," caused him to be confined in the Bastile; and soon after his liberation he was committed to the same prison on account of his "Memoirs of Maintenon." After his second liberation, he retired into the country; but in 1772, he was called back to Paris to occupy the poet of King's librarian.
fore he had attained the age of 30 years, in March, 1615; and left a daughter, who was in possession of several poems of her father's writings, but they were all lost at sea in a voyage from Ireland, where she had lived for some time in the duke of Ormond's family. Besides the plays in which he was jointly concerned with Mr. Fletcher (for an account of which see Fletcher), he wrote the dramatic piece above mentioned, entitled, "A Mafque, &c." "A Poetical Epistle to Ben Jonson," "Verles to his Friend Master John Fletcher upon his Faithful Shepharders," and other poems, printed together in 1653, 8vo. The elder brother of the preceding, Sir John Beaumont, was distinguished by his poetical talents, and was the author of several pieces which had considerable merit. A volume of his miscellaneous poems was published by his son in 1659. Gen. Dict. Biog. Brit.

Beaumont, in Geography, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Pont l'Evêque, 6 leagues E.N.E. of Caen.

—Allo, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Is-sur-Tille, 16 miles N.E. of Dijon. —Allo, a town of France, in the department of the Channel, and chief place of a canton, in the district of Cherbourg, 8 miles west of Cherbourg.

—Allo, a town of France, in the department of the Pyrénées, and chief place of a canton, in the district of Clermont-Ferrand, 7 miles south of Clermont. —Allo, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Pontoise, on the Oise, 33 miles north of Paris. —Allo, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Belzé, 3 leagues south of Belzé. —Allo, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of Nièvre-le-Vicomte, 1 leagues N.E. of Le Mans.

Beaumont-en-Ardenne, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Sedan, 3 leagues S.S.E. of Sedan.

Beaumont-lès-Forges, a town of France, in the department of the Nievre, and chief place of a canton, in the district of La Charité, on the Nièvre, 13 miles north of Nevers.

Beaumont-en-Gâtines, a town of France, in the department of the Seine-et-Marne, and chief place of a canton, in the district of Nemours, 4 leagues S.W. of Nemours.

Beaumont de Lomagne, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of Grenade, 5 leagues N.W. of Grenade.

Beaumont-le-Roger, a town of France, in the department of the Loire, and chief place of a canton, in the district of Berry, 4 leagues east of Berry. N. lat. 49° 5'.

E. long. 6° 41'.

Beaumont-sur-Loire, a town of France, in the department of the Marne, and chief place of a canton, in the district of Reims, 8 miles S.E. of Reims.

Beaune, a town of France, in the department of the Mayenne and Loire, and chief place of a canton, in the district of Baugé, 3 leagues east of Angers, and 3 miles west of Baugé.

—Allo, a town of France, and principal place of a district, in the department of the Côte d'Or, 7 leagues south of Dijon. N. lat. 47°. E. long. 4° 50'. —Allo, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Bois-Colomby, 1 league north of Bois-Colomby.

Beaupleader, or Beau-pleader, in Law, a writ on the flaut of Marlbridge, 52 Hn. 111. c. 11. whereby it is provided, that no fine shall be taken of any man in any court for fair-pleading, i.e. for not pleading aptly and to the purpose. And beau-pleader is as well in respect of vicarious pleadings, as of the fair-pleading, by way of amendment. 2 Inst. 122.

Beauprêtre, in Geography, an island in the Pacific ocean, so called after the name of Beaucrê, engineer-geographer to the expedition fitted out for search of La Perouse, lying west of the New Hebrides, in S. lat. 26° 14'. E. long. 169° 27'. It is very low, and about 1500 toises long.

Beauveau, a town of France, in the department of the Mayenne and Loire, and chief place of a canton, in the district of St. Florent, 3 leagues S. of St. Florent.

Beauquesne, a town of France, in the department of the Somme, and chief place of a canton, in the district of Doullens, 2 leagues N.E. of Doullens.

Beauregard, a town of France, in the department of the Dordogne, 4 leagues south of Perigueux.

—Allo, a town of France, in the department of the Pyrénées, 3 leagues east of Clermont-Ferrand. —Allo, a town of France, in the department of Lot, 5 leagues E.S.E. of Cahors.

Beauvais, a town of France, in the department of the Somme, and chief place of a canton, in the district of Lorraine, 2 leagues N.E. of Lorraine.

Beauvais, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Laon, 3 leagues N.W. of Reims.

Beauvoir, Isaac de, in Biography, a learned French Calvinist minister, was born at Niort in Swisserland, in 1659, and defended from a family of Provence, originally named Boffart, and changed into Beaufrère on their retreat into Swisserland from the massacre of St. Bartholomew's. Having completed his education at the protestant college of Saumur, he declined the profession of the law, in which he was tempted to engage by flattering prospects, and determined to devote himself to the Christian ministry. Accordingly he was ordained at the age of 22 years, and served a church in France for 3 or 4 years; but when his place of worship was shut up, his zeal prompted him to break the king's seal, which was affixed to the doors; and on this account being condemned to an "amended honorable," he left his country, and took refuge in Holland. Under the patronage of the princes of Orange, he was appointed chaplain to her daughter, the princes of Ahnsht Defian; and in 1686, settled at Defia, where he had leave to prosecute his studies. In 1693, he published the first refit of his theological acquisitions, under the title of "A Defence of the Reformed," which was very favourably received by his party. In 1694, he obtained a very advantageous settlement among the French refugees at Berlin, which was the place of his residence for the remainder of his life. Here he sustained several offices of distinction among his brethren, and discharged the duties connected with them in a manner honourable to himself and satisfactory to them. At the same time he was assiduous in his application to his studies, and thus acquired that extensive erudition, for which he was so eminent. The first work which he undertook, and which occupied many years of his life, was "A History of the Reformation." This work, which he left in manuscript for the press, was published at Berlin in 2 vols. large 8vo. in 1784, 1785; under the title of "Historie de la Reformaion, ou Origin et Progres du Luteranisme dans l'Empire, &c." I.e., A History of the Reformation, or an Account of the Origin and Progress of Lutheranism in the Empire,
Beaufobre was also employed with his colleague the learned l'Enfant by the court of Berlin in a French version of the New Testament. This work, of which St. Paul's epistles fell to the share of Beaufobre, was published in 1718, in 2 vols. 4to. with an ample preface and notes, and was well received. Beaufobre was one of the principal members of the new society, denominated "Anonymous," and contributed several pieces to the "Bibliothèque Germanique," of which journal he was the director as long as he lived. His papers are "A Dissertation on the Adumites of Bohemia;" "A Dissertation on the statue of Panedes;" "On the Virgin Queen of Poland;" and "Conversations on Images." But the most elaborate and esteemed of his works is his "History of Manichæans and of Manicheism," in 2 vols. 4to. French; the first, published at Amsterdam, in 1734, and the second, after his death, in 1739, to which is annexed a posthumous dissertation for les Nazarenes, Lauffanne, 1745. To the character of this work, very generally applauded by the learned for the extent of its erudition and the singularity of its candour, we shall subjoin the following testimonies. The celebrated historian Gibbon says of it (Hist. Decl. &c. vol. viii. p. 260, note): "This is a treasure of ancient philosophy and theology. The learned historian spares with incomparable art the systematic thread of opinion, and transforms himself by turns into the person of a faint, a sage, or an heretic. Yet his refinement is sometimes excessive: he betrays an amiable partiality in favour of the weaker side, and while he guards against calumny, he does not allow sufficient scope for superition and fanaticism." The candid and impartial Lardner (Works, vol. iii. p. 539.), after acknowledging his obligations to Beaufobre, from whom however he occasionally differs, says of this work, that "it contains not only a laboured history of the Manichees, but likewise several entertaining and useful digressions concerning the opinions of the heathen philosophers, and the most early Christian sects;" and he closes with expressing a wish, "that some learned man might have sufficient leisure and encouragement to give us a handom edition of it in English." "As for me," says Beaufobre himself (Hist. Man. t. ii. p. 730.) "whom heaven has preferred from the spirit of the church, who knew no greater good than freedom of thought, nor any more delightful employment than the search of truth, nor greater pleasure than that of finding and speaking it, I have studied ecclesiastical history with as little prejudice as possible." In the composition of his sermons, Beaufobre employed much time and care, and they contained much original matter, moral and theological, and a fund of the most striking oratory. His talents for preaching, and his powers for conversation, continued unimpaired to his seventy-ninth year. He was eminently a polished scholar, and adorned a person, naturally agreeable and prepossessing, with all the acquired graces of good company. The qualities of his heart were no less distinguished than the faculties of his understanding. He was kind, generous, cheerful, and disinterested, always ready to perform acts of friendship, and detesting every degree of malevolence and slander. He enjoyed life without interruption from the weakness of advanced age to his 80th year, and died on June 5th, 1738. Beaufobre was twice married, and left children by both wives, of whom Charles Lewis was pastor of a church in Berlin, and made himself known by some learned works; and Leopold was colonel of a regiment in the Russian service. Four volumes of posthumous sermons were printed at Lauffanne, in 1755. Mem. for la Vie, &c. de Beaufobre, prefixed to the second volume of his Hist. du Manicheism.

BEAUSSET, L. &c., in Geography, a town of France, in the department of the Var, and chief place of a canton, in the district of Toulon, 7 miles N. W. of Toulon.

BEAUTY, in a general and popular sense, denotes that quality, or assemblage and union of qualities in the objects of our perception, whether they be material, intellectual, or moral, which we contemplate with emotions of complaisance and pleasure; and it is referred by many writers to a principle or faculty, called by some an "internal sense," and by others "taste." (See these articles.) In a more strict and philosophical sense, beauty may denote that sentiment or feeling which is excited in the mind by objects of perception, that are adapted to inspire love, or some similar passion, or to give pleasure.

The word Beauty, according to Dr. Hutchinson, (Enquiry concerning Beauty, &c. p. 7.) signifies the idea raised in us; and a sense of beauty denotes our power of receiving this idea, which he denominates an internal sense. This ingenious writer considers beauty as original or absolute, and comparative or relative. By the former, however, he does not understand any quality supposed to exist in the object, which should of itself be beautiful, without relation to any mind which perceives it; for beauty, he says, like other names of sensible ideas, properly denotes the perception of some mind; and, therefore, by absolute beauty he means only that beauty which we perceive in objects without comparison to any thing external, of which the object is supposed to be an imitation or picture; such as that beauty perceived from the works of nature, artificial forms, figures, and theorems. Whereas comparative or relative beauty is that which we perceive in objects, commonly considered as imitations or reminiscences of something else. The general source of our ideas of beauty, according to this writer, is uniformity amidst variety; and what we call beautiful in objects seems to be in a compound ratio of uniformity and variety, so that where the uniformity of bodies is equal, the beauty is as the variety, and vice versa. This position he illustrates by a number of examples deduced from different figures, from the works of nature, from the inward structure and outward form of animals, and the proportion of their parts to each other, from the harmony of sound, from theorems or universal truths, and from the works of art. Relative beauty is founded, as he conceives, on a conformity, or a kind of unity between the original and the copy; and for obtaining this sort of beauty it is not necessary that there should be any beauty in the original; for an exact imitation may still be beautiful, though the original is altogether deficient of beauty. A sense of beauty from uniformity amidst variety is, in his opinion, universally prevalent among mankind; and for the truth of the fact, he appeals to experience. The same ingenious writer deduces all our ideas of virtue from an implanted sense, called "Moral sense" (which see); and he describes moral good and evil by the effects accompanying the perception of them.

Dr. Price, in his inquiry into the origin of our ideas of beauty
beauty and deformity of actions, (see "Review of the principal Querelles in Morals," ch. i. and ii.) distinguishes between our perception of right and wrong, and our perception of beauty and deformity, in considering the actions of moral agents. He observes, that in contemplating such actions, we have both a perception of the understanding and a feeling of the heart; and that the latter, or the effects in us accompanying our moral perceptions, depend on two causes; partly on the positive constitution of our natures, but principally on the external congruity or incongruity between moral ideas and our intellectual faculties. "Plant spiritum naturalis," Seneca. "Etiam futilo ludicorum, natura adhuc usa est," Tully. He apprehends, that the above-mentioned author was led to derive all our ideas of virtue from an implanted sense, in consequence of not duly considering the difference between the "homœum," and "pulchrum," the "beau," and "agréable," of actions; or of not carefully distinguishing between the difference of the mind and the fentiments attending it in our moral perceptions. With him the perception of an action is the fame with its gratification to the observer; and wrong, the contrary. But what, says this writer, can be more evident, than that right and pleasure, wrong and pain, are as different as a cause and its effect; what is underfoot and what is felt; absolute truth, and its falsehoods to the mind. Mr. Boileau indeed (see his "Tracts on the Foundation of Moral Goodness," p. 61,) is of opinion, that all beauty, whether natural or moral, is a species of absolute truth; as resulting from, or confiding in, the necessary relations and congruities of ideas. As to moral beauty, says Dr. Price, one would think, that the author just cited must mean, though his meaning is not very intelligible, that it denotes a real quality of certain actions. But the word beauty seems always to refer to the reception of pleasure; and therefore the beauty of an action, or character, must signify its being such as pleases us, or having an affection for pleasure when perceived. Nor can it be just to conceive more in the action itself, or to affirm more of it, than this epithet, or that objective goodnecfs or rélitùxe on which it depends. Beauty and loveliness are synonymous; but an object jolly-lovely can only mean an object, by its nature, fitted to engage love. It may be added, that the epithets beautiful and amiable are, in common language, confined to actions and characters that please us highly, from the peculiar degree of moral worth and beauty apprehended in them. All virtuous actions must be pleasing to an intelligent observer; but they do not all please to the degree necessary to entitle them to these epithets, as they are generally applied. These observations are applicable, as Dr. Price thinks, with a little variation, to natural beauty; the general fentiments of which, according to Dr. Hutcheson, is uniformity amidst variety. If we ask, why this pleases? The proper answer is, that by its nature it is adapted to please. There seems, as Dr. P. observes, no more occasion in this case to have recourse to an implanted sense than in the former. Regular objects contribute towards producing the complacency of our minds, and the preference we give them, because they are more easily viewed and comprehended by the mind; because order and symmetry give objects their flabilité and strength, and suberviency to any valuable purpose; and because regularity and order evidence art and design. Brutes are incapable of the pleasures of beauty, because they proceed from a comparison of objects, and a deferment of analogy, design, and proportion, to which their faculties do not reach.

To Dr. Hutcheson's theory of beauty, which ascribes it to uniformity amidst variety, it has been objected, that, though it accounts in a satisfactory manner for the beauty of many figures, yet when we endeavour to apply this principle to beautiful objects of some other kind, as to colour or motion, it will be found irrelatable. And even in external figured objects, it is not just, that their beauty is in proportion to their mixture of variety with uniformity, as many are highly beautiful and please us much, which have no variety at all, and others which poffefs variety to a degree of intricacy. With respect to the opinion, that natural beauty is a real quality of objects, it may be observed, that it seems impossible for any one to conceive the objects themselves to poffess more than a particular order of parts, and certain powers, or an affinity to our perceptive faculties, hence arising; and if we call this beauty, then it is an absolute inherent quality of certain objects, and equally existing, whether our mind discerns it or not. However, order and regularity are, more probably, the causes of beauty than beauty itself.

"Beauty," says another ingenious writer, (see Reid's "Essay on the Intellectual Powers of Man," ch. iv.) is found in things so various and so very different in nature, that it is difficult to say, wherein it consists, or what can be common to all the objects in which it is found. Of the objects of sense we find beauty in colour, in form, in motion. There are beauties of speech, and beauties of thought; beauties in the arts, and in the sciences; beauties in actions, in affections, and in characters. To things so different, and so unlike, is there any quality, the fame in all, which we may call by the name of beauty? Why then should things so different be called by the same name? They please, and are denominated beautiful, not in virtue of any one quality common to them all, but by means of several different principles in human nature. The agreeable emotion, excited by them, and called beauty, is produced by different causes. However, though there be nothing common in the things themselves, yet the kinds of beauty, which seem to be as various as the objects to which it is ascribed, must have some common relation to us, or to something else, which lends us to give them the same name. All the objects we call beautiful, agree in two things, which seem to concur in our sense of beauty. First, when they are perceived, or even imagined, they produce a certain agreeable emotion or feeling in the mind; and, secondly, this agreeable emotion is accompanied with an opinion or belief of their having some perfection or excellence belonging to them. Whether the pleasure we feel in contemplating beautiful objects may have any necessary connection with the belief of their excellence, or whether that pleasure be conjunct with this belief, merely by the good pleasure of our Maker, Dr. Reid does not determine. Beautiful objects excite an emotion of a soothing and enlivening kind, that sweetens the temper, allays angry passions, and promotes every benevolent affection, and directs to other agreeable emotions, such as those of love, hope, and joy. "There is nothing," says Mr. Addison, "that makes its way more directly to the soul than beauty, which immediately diffuses a secret satisfaction and complacency through the imagination, and gives a snuffing to any thing that is great and uncommon. The very first discovery of it stirs the mind with an inward joy, and spreads a clearness and delight through all its faculties." This agreeable emotion, produced by beautiful objects, is accompanied with an opinion or judgment of some perfection or excellence of those objects, adapted by its nature for producing that emotion; and this, according to Dr. Reid, is a second ingredient in our sense of beauty. To assert, says this writer, that there is in reality no beauty in those objects, in which all men perceive beauty, is to attribute to man fallacious fencies; and thus to think disrespecfully of the Author of our being; who has diffused over all the works of nature
nature a profusion of beauties, which are real, and not fanciful, and thousands of which our faculties are too dull to perceive. This author distinguishes our determinations with regard to the beauty of objects into two kinds, viz. instinctive and rational. In the former case, objects strike us at once, and appear beautiful at first sight, without any reflection, and without our being able to say why we call them beautiful, or being able to specify any perfection which justifies our judgment. Whereas our rational judgment of beauty is grounded on some agreeable quality of the object, which is distinctly conceived, and may be specified. Beauty itself may be distinguished into original, and derived. It is natural and agreeable to the train of human sentiments and of human language, says Dr. Reid, that in many cases the beauty which originally and properly exists in the things signified, should be transferred to the sign; that which in the cause to the effect; that which is in the end to the means; and that which is in the agent to the instrument. E. C. The beauty of good breeding is not originally in the external behaviour in which it consists; it is derived from the qualities of mind, which it expresses; and though there may be good breeding without the amiable qualities of mind, its beauty is still derived from what naturally expresses it.

Good breeding is the picture; these agreeable qualities are the original; and it is the beauty of the original that is reflected to our senses by the picture.

As to the use of the term beauty, some have extended it so as to include every thing that pleases a good taste; and others have restricted it to the objects of sight, when they are either seen, remembered, or imagined. But the latter sense is much too limited, as there are beauties of various kinds, that are not objects of sight, such as those of music, composition, character, affections, and actions; and persons may be competent judges of several sorts of beauty, who are deprived of the faculty of sight. It may be observed, that as the proper object of admiration is grandeur, beauty is the proper object of love and esteem; and this connection of beauty with real perfection was a capital doctrine of the Socratic school. It is often ascribed to Socrates in the dialogues of Plato and of Xenophon. We may, therefore, justly ascribe beauty to those qualities that are the natural objects of love and kind affection: of this kind are those moral virtues, which in a peculiar manner constitute a lovely character, such as innocence, gentleness, condescension, humanity, natural affection, public spirit, and the whole train of the soft and gentle virtues: qualities which are amiable from their very nature, and on account of their intrinsic worth. There are also many intellectual talents, which excite our love and esteem of those who possess them, such as knowledge, good sense, wit, humour, clearness, good taste, excellence in any of the fine arts, eloquence in dramatic action, and also excellence in every art of peace or war that is useful to society. There are likewise talents or accomplishments, which we refer to the body, that have an original beauty and comingliness; such as health, strength, and agility, the usual attendants of youth, skill in bodily exercise, and skill in the mechanic arts. Dr. Reid is of opinion, that beauty originally dwells in the moral and intellectual perfections of mind, and in its active powers, and that from this, as the fountain, all the beauty which we perceive in the visible world is derived. This was the opinion of the ancient philosophers above named; and it has been adopted by lord Shaftesbury and Dr. Akenstide among the moderns.

"Mind, mind! how bright the morning star bir'ds of heaven, The living fountains in itself contains Of beauties and sublime. Here, hand in hand, Sit paramount the graces. Here, estron'd, of

Celestial Venus, with divinest airs, Invites the soul to never-failing joy." Akenstide.

But neither mind, nor any one of its qualities or powers, is an immediate object of perception to man. These are perceived through the medium of material objects, on which their signatures are impressed. The signs of these qualities are immediately perceived by the senses, and by them reflected to the understanding: and we are apt to attribute to the signs the beauty which is properly and originally in the thing signified. Thus, the Invisible Creator hath stamped on his works signatures of his divine wisdom, power, and benevolence, which are visible to all men. The works of men in science, in the arts of taste, and in the mechanical arts, bear the signatures of those qualities of mind, which were employed in their production. Their external behaviour or conduct in life expresses the good or bad qualities of their minds. In every species of animals we perceive by visible signs their instincts, appetites, affections, or fagacity; and even in the inanimate world, there are many things analogous to the qualities of mind; so that there is hardly anything belonging to mind, which may not be represented by images taken from the objects of sense; and, on the other hand, every object of sense is beautiful, by borrowing attire from attributes of the mind. Thus, the beauties of mind, though invisible in themselves, are perceived in the objects of sense, on which their beauty is impressed. Thus also, in those qualities of sensible objects to which we ascribe beauty, we discover in them some relation to mind, and the greatest in those that are most beautiful. The qualities of inanimate matter, in which we perceive beauty, are found, colour, form, and motion. The first being an object of hearing; and the other three of sight. Those several qualities are particularly illustrated by Dr. Reid, with a view of evincing the beauty that respectively belongs to them. Every beauty in the vegetable creation, of which we form any rational judgment, expresses some perfection in the object, or some wise contrivance in the author. In the animal kingdom we perceive superior beauties, resulting from life, sense, activity, various instincts and affections, and in many cases, great sagacity, which are attributes of mind, and possess an original beauty. In their manner of life we observe that they possess powers, outward form, and inward structure, exactly adapted to it; and the more perfectly any individual is fitted for its end and manner of life, the greater is its beauty. But of all the objects of sense, the most striking and attractive beauty is perceived in the human species, and particularly in the fair sex. In the following well-known passage of Milton, this great poet derives the beauty of the first pair in paradise from those expressions of moral and intellectual qualities, which appeared in their outward form and demeanour.

"Two of far nobler shape, erect and tall, Godlike erect! with native honour clad, In naked majesty, seem'd lords of all, And worthy seem'd, for in their looks divine, The image of their glorious Maker, shone Truth, wisdom, fanctitude severe, and pure: Severe, but in true filial freedom plac'd, Whence true authority in man; though both Not equal, as their sex not equal seem'd, For contemplation he, and valor form'd, For softness she, and sweet attractive grace." Akenstide.

The author of "Crito," or "A Dialogue on Beauty," considered in its reference to the human species, and particularly to the female sex, ascribed to the author of "Polymath," and re-published by Dodstey, in his collection of "Elogiastic Pieces," reduces this species of beauty to the four heads of colour, form, expression, and grace: the two former
of which may be called the body, and the two latter, the 
fool of beauty. As for the beauty of colour, if we allow 
for affections and prepossession arising from difference of 
climate and peculiarities of constitution, that have great in-
fluence on the internal sense, as well as on those senses that 
are external, and consequently on the judgment, it seems 
to depend, according to the common estimate of mankind, on 
that quality, as it expresses perfect health and lineaments, 
and in the fair sex, softness and delicacy; nor can any thing be 
called deformity but what indicates disease and decline. 
The beauty of colour, therefore, is derived from the perfection 
which it expresses. "Venus est pulchritudo corporis 
secerini non potest eunulentum." Cicero. 
The most beautiful 
form or proportion of parts, according to this author, 
is that which indicates delicacy and softness in the fair sex; 
and in the male, either strength or agility; so that the bea-
ty of form lies altogether in expression. With regard to ex-
pression, he observes, that this has greater power than either 
colour or form; and that it is only the expression of the 
tender and kind passions that gives beauty; that all the 
cruel and unkind ones add to deformity; and that, on their 
account, good nature may very properly be said to be the 
best feature, even in the human face. Modesty, sensibility, 
and sweetness, blended together, form either of these other 
correct each other, give almost as much attraction as the 
passions are capable of adding to a very pretty face. It is 
owing to this force of pleasing, to which attends all the 
kinder passions, says this author, that lovers not only seem, 
but really are, more beautiful to each other than to the rest 
of the world; and in their mutual preference and intercourse 
there is, as a French writer has well expressed it, a soul upon 
their countenances, which does not appear when they are 
absent from one another, or even in company that has a 
restraint upon their features. The last and noblest part of 
beauty is grace, which this author thinks to be incapable of 
an accurate definition (see Grace.) All the ingredients 
of beauty, enumerated and described by this ingenious au-
thor, terminate in expression: they express either some per-
fection of the body, as a part of the man, and an instrument 
of the mind, or some amiable quality or attribute of the 
mind itself.

Dr. Blair (Lectures vol. i. p. 101, &c.), in his enume-
ration of the separate principles of beauty, in each of 
those classes of objects, which most remarkably exhibit it, 
begins with introducing the simplest idea of beauty. With 
respect to this subject, he observes, that neither 
variety, nor uniformity, nor any other principle which he 
knows, can be assigned as the foundation of beauty; and 
that it can be referred to no other cause but the structure 
of the eye, which determines us to receive certain modifications 
of the rays of light with more pleasure than others. As this 
organ varies in different persons, they have their different re-
spective favourite colours. In some cases, he thinks it prob-
able, that affection for ideas has influence on the pleasure 
which we receive from colour. Green, for instance, may 
appear more beautiful, by being connected in our ideas with 
rural prospects and scenes; white, with innocence; blue, with 
the serenity of the sky. Independently of such associations, 
these colours, chosen for beauty, are, generally, delicate 
rather than glaring. Figure opens to us forms of beauty 
more complex and diversified. Under this head, regularity 
is first noticed as a source of beauty. Thus a circle, a 
square, a triangle, or a hexagon, pleases the eye, by their 
regularity, as beautiful figures. But regularity is not the 
foil, or the chief foundation of beauty in figure. On the 
contrary, a certain graceful variety is found to be a much 
more powerful principle of Beauty. Regularity, according 
to this author, expresses beauty chiefly, if not solely, on ac-
count of its suggesting the idea of Ideal, propriety, and 
line, which have always a greater connection with orderly and 
proportioned forms, than with those which appear not con-
structed according to any certain rule. Nature, the most 
graceful artist, draws, in all her ornamental works, pursues 
variety with an apparent neglect of regularity. Mr. Ho-
garth, in his "Analysis of Beauty," published about the 
year 1753, enumerates, as elements of beauty, line, varie-
ty, uniformity, simplicity, intensity, and quantity; and he obser-
ves, that figures bounded by curve lines are, in general, more 
beautiful than those bounded by straight lines and angles. 
The beauty of figure principally depends, in his opinion, 
upon two lines which he has selected. One of them is the 
"waving line," somewhat in the form of the letter S; and 
this he calls the "line of beauty," which is found in hills, 
flowers, and such other ornamental works of nature, and is 
also common in the figures designed by painters and sculp-
tors, for the purpose of decoration. The other line, which 
he calls the "line of grace," is the former waving curve, 
twisted round some solid body, and exhibited in twisted 
pillars and twisted horns, and in the curling wrig of a com-
mom jack. Variety plainly appears, in the infinences which 
he mentions, to be an essential principle of beauty, that 
he defines the art of drawing pleasing forms to be the art of 
the varying well; and, according to him, the curve line, 
which is to much the favourite of painters, derives its chief 
avantage from its perpetual bending and variation from the 
flight regularity of the straight line. Motion, says Dr. Blair, 
 furnishes another source of beauty, distinct from figure; being of 
itselI pleasing, so that bodies in motion are, "ceteris paribus, " 
preferred to those at rest. But the quality of beau-
tiful belongs to gentle motion, such as that of a bird gliding 
through the air, and that of a smooth running stream. In 
general, motion in a straight line is least beautiful than that in 
an undulating direction; and motion upwards is also commonly 
more agreeable than motion downwards. The easy curving 
motion of flame and smoke is an object singularly pleasing, 
and exhibits an instance of Mr. Hogarth's waving line of 
beauty. This artill observes, that, as all the common and 
neccessary motions for the business of life are performed in 
straight or plain lines, all the graceful and ornamental move-
ments are made in waving lines. Dr. Beattie, in his " Diff-
ertations Moral and Critical," has introduced, in his digres-
sion on beauty, some ingenious remarks on this subject. 
After observing that custom has a perpetual influence in de-
termining our notions of beauty, he proceeds to prove, that 
no affections founded on habit, many, or perhaps most of 
those pleasing emotions are derived, which accompany the 
perception of what in things visible is called beauty. With 
regard to the beauty or awkwardness of motion, he observes, 
that the one will be found to please, and the other to dis-
please, chiefly on account of certain agreeable ideas sug-
gested by the former, and of certain disagreeable ones associated 
with the latter. Motions, that imply ease, with such an 
arrangement and proportion of parts in the moving object, as 
may give reason to expect its continuance without injury, 
are generally pleasing, at least in animals, especially when 
they betoken a fort of perfection suited to the nature of 
the animal. But motions, that betray infirmity, unwildliness, 
imperfection, or the appearance of danger, cannot be called 
beautiful, because they convey unpleasing ideas. These ob-
servations are illustrated by a variety of apposite inferences. 
Cicero (de Off. i. 4, § 36.) blames every motion that alters 
the countenance, quickens the pulses, or betrays any discom-
fort. Rousseau observes, in running, a woman's di-
titude of that grace which attends her in other occasions. 
Perhaps,
Perhaps, says Beattie, the jutting out of her elbows, the natural effect of her endeavouring with lifted hands to secure the most delicate part of the human frame, may give to her motion the appearance of timidity and constraint. Or, perhaps, she may fail in this exercise, merely because, according to our manners, she cannot be much accustomed to it. See Dancing.

It is not easy to convey, in few words, so many charming ideas of beauty, in its several varieties of colour, shape, attitude, and motion, as Gray has combined in the following image:

"Slow melting strains their queen's approach declare;
Where'er she turns the graces homage pay:
With arms sublime that float upon the air,
In gliding state she wins her easy way:
O'er her warm cheek, and rising bonnet more
The bloom of young desire, and purple light of love."

But to return from this digression. Dr. Blair observes, that though colour, figure, and motion, are separate principles of beauty; yet in many beautiful objects they all meet, and render the beauty both greater, and more complex. Thus, in flowers, trees, animals, we are entertained at once with the delicacy of the colour, with the gracefulness of figure, and sometimes also with the motion of the object. Perhaps, the most complete assemblage of beautiful objects is presented by a rich natural landscape, composed of a sufficient variety of objects; fields in verdure, festooned trees and flowers, running water, animals grazing; to which may be added some productions of art, which suit such a scene, as a bridge with arches over a river, sowing rice from cottages in the midst of trees, and the distant view of a fine building, seen by the rising sun.

The beauty of the human countenance is more complex than any which has yet been considered. It includes the beauty of colour, arising from the delicate shades of the complexion; and the beauty of figure, arising from the lines which form the different features of the face. But chief beauty depends upon a mysterious expression which it conveys of the qualities of the mind; of good sense, or good humour; of sprightliness, candour, benevolence, sensibility, or other amiable dispositions.

Another different species of beauty arises from design or art, or from the perception of means being adapted to an end; or the parts of any thing being well fitted to answer the design of the whole. This is altogether different from the perception of beauty produced by colour, figure, variety, or any of the caues already mentioned. This sense of beauty in fitnes & design, has an extensive influence over many of our ideas. It is the foundation of the beauty which we discover in the proportion of doors, windows, arches, pillars, and all the orders of architecture. We shall here observe, that Mr. Perrault distinguishes two kinds of beauty in architecture. The one he calls "positive," and "convincing," such as the richness of the materials, grandeur of the structure, neatness of the workmanship, symmetry, &c.; the other he calls "arbitrary," which depends on the will, and which would admit of having their proportions changed without deformity. These only please by the connection or association of their ideas with others of a different kind, which please of themselves: they owe their beauty to that perfection of the mind, by which a thing, whose value we do not know, infinuates an esteem for others which we do not know. Thus, he observes, there are many things in architecture, which reason and good sense would judge deform, which, however, custom has not only made tolerable, but even beautiful, by their being always joined with other beauties that are positive. Being first pleased with viewing them in company, and merely on that account, we at length become pleased with them alone; and thus we frequently become fond of faults, and fall in love with deformity. Our sense of fitness and design holds so high a rank among our perceptions as to regulate, in a great degree, our other ideas of beauty. In an epic poem, a history, an oration, or any work of genius, we always require, as in other works, a fitness, or adjustment of means, to the end which the author is supposed to have in view.

Beauty, as it is applied to writing or discourse, denotes all that pleaseth, either in style or sentiment, from whatever principle that pleasure flows; and a beautiful poem or oration means, in common language, no other than a good one, or one well composed. Beauty, besides this indefinite sense of it, is also used to signify a certain grace and amenity in the turn either of style or sentiment, for which some authors have been peculiarly distinguished. In this sense it denotes a manner, neither remarkably sublime, nor vehemently passionate, nor uncommonly sparkling; but such as excites in the reader an emotion of the gentle placid kind, similar to what is excited by the contemplation of beautiful objects in nature, which diffuses over the imagination an agreeable and pleasing serenity. Addision was eminently a writer of this character; and it belongs also to Fenelon, the author of the Adventures of Telemachus. Virgil, among the ancients, is distinguished, in his general manner, by beauty and grace, rather than sublimity. Among orators, Cicero has more of the beautiful than Demosthenes, whose genius led him wholly towards vehemence and strength.

The ingenious Mr. Burke, in his "Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful," excludes from the number of real causes of beauty, the proportion of parts, fitnes, or that idea of utility which consists in a part's being well adapted to answer its end, and also perfection; and he observes (p. 210.) that beauty is, for the greater part, some quality in bodies, acting mechanically upon the human mind by the intervention of the senses. The qualities of beauty, as they are merely sensible qualities, which he enumerates, are the following: they should be comparatively small, smooth, various in the direction of their constituent parts; these parts should not be angular, but melted, as it were, into each other; they should be of a delicate frame, without any remarkable appearance of strength; the colours should be clear and bright, but not very strong and glaring; and any glaring colour that is introduced should be diversified with others. These are the seven properties upon which, according to this author, beauty depends. Properties that operate by nature, and are left liable to be altered by caprice, or confounded by a diversity of tinctures, than any others. The physiognomy also, says Mr. Burke, has a considerable share in beauty, especially in that of our own species. The manners give a certain determination to the countenance, which being observed to correspond pretty regularly with them, is capable of joining the effects of certain agreeable qualities of the mind to those of the body. So that to form a finished human beauty, and to give it its full influence, the face must be expressive of such gentle and amiable qualities as correspond with the softness, smoothness, and delicacy of the outward form. For Mr. Burke's mode of illustrating and confirming his theory of beauty, the reader is referred to his work above cited.

Dr. Sayers, in his "Disquisitions, metaphysical and literary," &c. 1793, has given a new analysis of beauty, conducted on the principles which were applied by Dr. Pritchley, in his "Lectures on Oratory and Criticism," and by Mr. Allston in his "Essays on Taste," to the explanation of the intellectual pleasures, namely the doctrines of the Artarian form. His argument, summed up in a few words, is as follows: that individual of a class of objects is justly to be esteemed more beautiful than the rest, with the whole of which,
which, or with its component parts (when properly under-

flood), the greater number of the excellencies of its class are univerfally acknowledged. The fame may be affirmed of any species of objects, when compared with any other species of its kind; and that object may be juftly deemed a "standard of beauty," with the whole appearance, or with the component parts of which (when properly understood), all the ex-

cellencies of its kind are "universally" acknowledged.

Beauty, in the Arts of Design. Whatever of beauty or perfection becomes an object of contemplation to our minds, whether it be purely mental or perceived through the medium of the felf, or be derived from the beautiful and perfect itself, may be traced back towards its Divine fource. 

However diversified, it proceeds from this source, and directs us where to feek the principles and perfection of all fience and art, of all things metaphysical, physical, and moral, which by their mutual connection and harmony declare their common relation and origins: therefore what is called beauty in the arts of painting and sculpture must be sought for in its principles, metaphysical, physical, and moral. In this research we should do well to take those philosophers for our guides, who were the oracles of Greece, in the times when painting and sculpture attained their highest excellence. In the dialogue between Socrates and the sculptor Clito, (Xenophon's Memorabilia,) Socrates concludes "that atuary must represent the actions of the soul by form." And in the former part of the fame dialogue Parnaias and Socrates agree, that the good and evil qualities of the soul may be represented in the figures of man by painting. Plato, in his dialogues, reasons to the fame purpose, and declares that the 
good and beautiful are one.

Aristotle (De Mor. l. iv. c. 7. t. iii. p. 49. De Poet. c. 7. 
t. ii. p. 628.) observes, that beauty is order in grandeur. Order supposes symmetry, fitness, and harmony; and in grandeur are comprised simplicity, unity, and majesty. How-

ever, in his catalogue of virtues and their families, as well as of the opposite vices and their families, Aristotle concurs with Plato in acknowledging the relation between beauty and good-

nes, evil and deformity. Indeed, it has been one of the great objects of philosophy, through all the ancient schools, to trace and demonstrate not only the likenes but the identity of beauty and goodness. Among the Platonists and the Py-
thagoreans, malignity was abandoned, goodness or the just, and intellect or wisdom cultivated, because by this means, man is elevated to a nearer approach to the divinity. Fortune and temptation were the virtues of the flocks and early epicureans, because the one raises man above common fears and wants, and the other gives him better health and 

enjoyment of his faculties. These conclusions are convincing, and their illustrations may be drawn in great abundance from the history and condition of the human race. Does any one supply the wants of his fellow creatures, and raise them from dire poverty to a state of comfort? In performing these and such good acts his expression is fo tender, and his manner fo gentle, that all profent sympathize in his feelings, and love the bene-

fector. If any one shews a magnanimous contempt of danger in a good cause, or manfully refis the temptation to an evil act, in so doing his features and manner express digni-

ty and fortitude, which inflire the beholders with awe and refept. We look with delight on the florid complexion of a perfon in high health, but with concern and difgust at a pallid colour and flaccid skin, because they are signs of di-

f ease and decay. We are pleased to fee a flant and well made perfon, because such a figure befits great strength and agilily. We are likewise pleased to fee a more slender figure of agreeable and harmonious proportions, because in it fufficient strength is united with varied elegance of attitude. Hence, as almost every circumstance of our exilence furnishes examples to the fame purpose, might we not define the beauty of the hu-

man perfon in the following terms? "Goodness, or virtue and 

wifdom, in a human form befitting to their exprefions and 
exertions." It would be as absurd as prefigmuous for us to at-
temt entering the counsels of Infinite Wisdom to discover why the figure of man was made fuch as it is and no other. 

We might as well inquire why such a particular number of 

worlds were made in or out of our fyllwm subject to fuch laws of gravity, motion, and revolution? But taking man as he is, whether we confider the faculties of his foul, the component parts of his body, or the combined operations of both, the mind is overwhelmed with the stupendous and wonderful structure of the parts, and the harmony, beauty, and utility of the whole.

While we are confidering beauty in the works of painting and sculpture, it will be proper to remember that the word by which the Greeks expreffed this quality was KAAOG, fair, handfome, beautiful, which applied extefsively to almost any being or thing giving pleafure in confequence of its goodness. According, therefore, to this ufe of the term, we 

shall investigate human beauty in both sexes, and their feveral diftions of character. The human figure is wonderfally fitted to its various offices and employments, as well in its internal structure as in its outward form. The mechanical powers, the geometrical figures, the motion and weight of fluids, and the operations of chemistry, are continually 

engaged in its support and renewal; uniting an accumulation of force with a fimplicity of operation truly wonderful, and contributing in their effects and appearances to the beauty of the outward form, which in the prefent inquiry is to be the object of attention. The head contains the brain, which feeds ne ves to all parts of the body and limbs, and the organs of four fenes: this is the fuperior member of the figure, and forms its elevated station, by means of the under-
fanding and will, directs and determines the acts of all the inferior parts. The body, which contains in its cavity those parts which supply the animal functions, is also a center from which, and upon which, the five extremities act. The arms are supported on the body in a manner most favourable to all exertions of strength, and with their hands are fo formed, that these exertions may be also employed in the moft dif-
cult and curious labours. The legs strongly support the superstructure; when clofed refembling two pillars, when extended, like the triangular arch, and when neffary, swiftly conveying the perfon from place to place. It is pro-

per to make thefe general remarks, because, as we proceed, we shall find how diftinquifhing an ingredient utility is in the composition of beauty. After this flight view of the advan-
tageous complication of powers and simplicity of operation in the human form, let us confider its beautiful effect, an-

imated by goodness, and informed by wifdom; and as what has been faid in this part of the article relates to the arts of design, we fhall produce illustrations from the antique sculpture and painting. — The ancients affigned the firlt chief of beauty to the superiors, Divinities, the Icoids to heroes, and the third to faints. Other divinities and genii frequently have partaken more or lefs of thofe claffes. More portraits cannot be enumerated in either, because they are but faithful repre-

sentations of ordinary nature. Of the superior gods, the 

Saturnian family poiffes the rank of sublimity in the Karoc or beautiful. In the fine head of Jupiter ( lately in the pope's mu-
raised with his thunderbolt, or leaning on his sceptre, presents the habitual act of governing the universe. Winkelmann has judiciously remarked, that the Greek sculptors preferred the family resemblance in the Satyric race, with as much exactness as if they had been real portraits; therefore Jupiter's brothers strongly partake of the same character, excepting that Neptune's countenance is more severe and his hair more dishevelled. Pluto's hair hanging over his forehead gives a domy call to his countenance, which is increased by his more open and glaring eyes. Winkelmann has observed, that something of the lion may be traced in the nose, forehead, and hair of Jupiter, which adds might and magnanimity to the benevolence, wisdom, and awful majesty of his character. In the youthful beauty of Apollo, Bacchus, and Mercury, the same benevolence and wisdom are expressed, modified by their peculiar characteristics and offices. Apollo is light and strong in his make; Bacchus more soft and luxurious, and Mercury more athletic. The peculiarity of Hercules is magnanimity and unconquerable strength. The heroes have a more simple character throughout, approaching nearer to common nature. The fauns may be placed in the lowest class of beauty expressed in the human figure. Although their persons are youthful, and rather handiwork, their proportions are shorter than those of the claves above-mentioned; and sometimes their muscles are turgid and tendinous, accommodated to their sylvan habits and activity; their rounded faces have a portion of rude good nature; but their united eye-brows, eyes placed diagonally to the nose, small hollowed noses, and grinning mouths, express some mixture of savage, ferile, and mischievous dispositions. The most engaging and captivating, peculiarities of beauty exist in the female sex; and was represented in perfection by the Greeks in their superior clasres of statues. The large eye and full under lip of Juno, give an air of haughtiness to her countenance; her limbs are round and her figure is majestic. Minerva's figure partakes of Juno's majesty; but her face is not so full, and has an expression of abstractive wisdom. Venus is represented as an assembly of female charms; her form is delicate, perfect, and elegant in the highest degree; her motion graceful, and her countenance expressive of love and sweetness. The beautiful heads of antiquity are oval in the front view; in profile, the low forehead and nose form nearly one straight line; the lips are rather full and the chin rounded. Juno has the largest eye of the goddesss, according to Homer's epithet of "Ox-eyed;" the neck is rounded like a column; the chest is high and expanded; in the male subject the abdomen is flat; and, as Winkelmann remarks, "such as it appears after a found sleep and good digestion;" the arms, defending from full shoulders, are tipped downwards to the wrist with a very gentle flattened hollow towards the inner elbow, to distinguish the bend of the arm; the back of the hand is one mass; the fingers rather long and tapered, with knuckles indicated; in a manner almost imperceptible; the lower limb tapers more sensibly than the arm, because the thigh is larger in its commencement; the knee-pan in youthful statues is nearly oval; and the inner side of the tibia, or principal bone of the leg, is perceptibly marked by a curve of about 30 degrees; the great toe is large, and divided by a considerable space from the lesser toes which are straight, and not bent over each other like fuchs as have been confined in shoes.

In the female form, the limbs are more round and delicate; the knuckles of the hand and foot are expressed by flight dimples; the fingers are more tapered; and their outline determined by a long curve, a little reverbered towards the end. The principal difference of relative proportions is that the female figure should be about one face shorter than the male; each having eight heads in height. The female figure is also narrower in the shoulders and loins, and somewhat broader from the os pubis to the extremities of the nates. The Greeks represented the goddeesses with virgin beauties. Winkelmann, in his "Monumenti inediti," has treated largely on the beauty of the female figures. Professor Camper, in his "Principles of Design," has also given excellent observations and rules on the beauty and proportions of the human head and figure, absolute as well as comparative. For his account of beauty, as exhibited in ancient sculpture and engravings, see his treatise, entitled "Verhandeling over het natuurlijk verhinderde wezen," &c, or, on the natural difference of features in persons of various countries and ages, published by his son, at Utrecht, 1792, 4to. In his dissertation on the beauty of forms, subjoined to his "Lectures," published by his son at the same place and in the same year, entitled "Roden Voeringen," &c. it is his object to prove, that no particular form can, abstractedly considered, constitute beauty; that the real basis of beauty consists in the means being adapted to the end; and that, exclusively of this, our ideas are influenced by customs, national prejudices, implicit confidence in the taste and opinions of others, &c.

Proportion is an essential quality of beauty in the human form; and striking coincidences are afforded in its relation to perfect geometrical figures, and the harmony of sounds and numbers. A man, standing upright, can stretch out his arms to a length equal to his height: consequently his figure may be included in a square; by stretching the arms not so much, and the legs a little, the figure may be contained in a circle, whose centre is the top of the os pubis. The ancients divided the height of the human figure into eight heads, and the face into three parts; five of these parts are the breadth of the loins; three parts, or noses, measure the upper part of the thigh; two, the calf of the leg, and one, the ankle. A well proportioned figure measures three equal parts from the top of the shoulder to the spine of the ilium next the rectus abdominis; from thence to the top of the knee-pan; and from thence to the bottom of the inner ankle.

The term grace, as a quality of beauty, however it may have puzzled the moderns in its definition and application, was clearly understood by the ancients. The graces or graces of the Romans were the charities of the Greeks. XAP££, is grace, beauty, fairness, endearing, agreeable, elegant; and the groupes, gems, &c. are comments which are satisfactory and convincing. The graces are three beautiful felters; whole innocence is their only garment, embracing each other in the gentile manner. The Greek Christians have preferred the ancient signification of this word in its application to all those endearing duties which prefer the happiness of, and believe it on others; nor is it surprising, that these characteristics are given to women, because all the milder and endearing virtues are still more amiable in the female sex. If by grace, the succesion and variation of undulating lines be intended, it is seen most perfectly in an elegant female figure moving slowly. It is remarkable, that man, of all creatures, presents the most perfect view of his figure in front. Quadrupeds, birds, and fishes, are best seen in profile, and we look on the backs of reptiles and insects. It is necessary, to the most advantageous appearance of man, that we should contemplate the affections of his heart, as our operations of his reason continually beaming in his countenance; the waving lines of his body, moving on the centre of gravity, and varied curves and angles formed by his limbs, perfect the whole of his figure, with an union of
of faculties mental and bodily, which reminds us that "God created Man in his own Image."

The various heads touched upon in the latter part of this article, will be treated of in the several articles of Painting and Sculpture.

We cannot forbear subjoining the reflection with which Mr. Thomson (a late writer on the subject of beauty) closes his detail of the various beauties of the female form. "If we should see a person employ himself with a fledge hammer to dash the enchanting form of the Venus de Medicis to pieces, break her lovely limbs, and deface her bounteous features, we should not hesitate a moment to pronounce him a savage barbarian, without taste, feeling, or sentiment, though his frenzy was employed only on a few feathers piece of bone; what then must we think of the diabolical female, who exercises the world of cruelties (because the most lusting and affecting both to body and mind,) on the most beautiful and amiable of all creatures on this side heaven?—made expressly for his happiness, face, and delight, by first corrupting and betraying her, and then baldly abandoning her to perish with want, pain, wretchedness, and misery.

The sentiments of mankind, with regard to female beauty, have been very various in different ages and nations; and it is not possible to establish a standard which shall comprehend all, without discrimination; among the ancients, a small mouth and joined eyebrows were charming features in a female countenance; and, in Peru, large joined eyebrows are highly esteemed. In some Indian countries, black teeth and white hair are necessary ingredients in the character of a beauty; and in the Marian islands, it is a capital object with ladies to blacken their teeth with herbs, and to bleach their hair with certain liquors. Beauty, in China and Japan, is composed of a large countenance, small, and half-concealed eyes, a broad nose, minute feet, and a prominent belly. Some Indians of America and Asia, comprefs the heads of their children between two wooden planks, with a view to enlarge and beautify the face; others compress them laterally, others deprefe the crown onl, and others make the head as round as possible. Every nation has ideas of beauty peculiar to itself; and almost every individual has his own notions and taste concerning this quality. The empire of beauty, however, amiabil these discordant ideas, with respect to the qualities in which it confils, has been very generally acknowledged, and particularly in all civilized countries; and when it is united with other accomplishments that tend to render females amiable, it contributes in no small degree to give them importance and influence, to polish the manners of society, and to contribute to its order and happiness.

BEAUVILLÉS, ALEXANDRE, in Geography, a city of France, and capital of the department of the Oise, seated on the Thérain; and, before the revolution, the capital of the Beauvais, and the see of a bishop. The architecture of the cathedral has been much admired, besides which it has several collegiate and parish churches. The manufacture of the city is a beautiful tapestry, which has supplied a considerable branch of trade. It has also produced great quantities of lace and woollen cloth. This city was unsuccessfully besieged by the English in 1443, and by the duke of Burgundy in 1472, at the head of 85,000 men. On the latter occasion, the women displayed singular courage under the conduct of Jean de Hachette, whose portrait is preferred in the town-hall; and in commemoration of their brave defence, the women form the first rank of a procession, observed annually on the 10th of July.

BEC, a small fertile district of France, bor-

BERENGUER, a town of Germany, in the duchy of Wurtemberg, seated on a lake from which proceeds the river Worm. N. lat. 43° 45'. E. long. 9° 8'.

BEERHAUSEN, a convent in the district of Wurtemberg, called Schonbruck, at a small distance N. E. of Tubingen; the manor of which contains 9 parishes. In this convent is an academy, where students are qualified for admission into the seminary at Tubingen.

BEERNOVA, a town of Poland, in the Psalatinate of Braclaw, 14 miles S. E. of Breslaw.

BERLIN, in Ancient Geography, Katounich, a lake of Mesopotamia, between mount Sugara, and the river Chabora.

BEBRE, in Geography, a river of France, which runs into the Loire, opposite to Bourbon Lancy.

BEBRYCES, in Ancient Geography, the first inhabitants of Bithynia. The origin of these people, and the reason of their name, are uncertain. A people of this appellation, mentioned by Silius Italicus, (l. iii. v. 420.) inhabited that part of Galatia Naborunus, which was situated between Spina and the Voce, or near the Pyrenees, and from them called Bebrices.

BEC, in Geography, a town of France, in the department of the Eure, 9 leagues W. S. W. of Rouen.

BECRES, a town of France, in the department of the Lower Seine, 5 leagues east from Havre.
BECABUNGA, Broekline, in Botany. See Veronica.

BECAH, or BEKH, a Jewish coin, being half a shekel. In Dr. Arbuthnot's table of reductions, the bekah amounts to 13 lid.; in Dr. Prideaux's computation to 1s. 6d.

Every Israelite paid a hundred bekahs a head every year for the support of the temple. Calmet.

BECLAMING, in the Sea Language, is when anything keeps the wind off or away from the vessel.

Thus one ship is said to beclam another, when the one comes up with her on the weather-side: the like is said of the shore, when it keeps the wind away. A ship is likewise said to be bcalmed, when there is no wind stirring.

BECANER, in Geography, a town of Hindoostan, seated on the Ganges, nearly east of Delhi.

BECARDE, in Ornithology, a name under which Buffon describes some birds of the Linnaean genus Lanius: as for example, his becardus is lanius cyanus Gmel. and becard à ventre jaune, lanius sulphuratus of the same author.

BE CASSE, BE Cassina, a generic term in Buffon's Nat. Hist. for some birds of the Scopolax genus, in the Linnaean system.

BE CASSEAU ou Cul-blanc, is also a name given by Buffon to the tringa ochropus of Linnaeus.

BECCA, in the Materia Medica of the Ancients, a name given to a fine kind of resin collected from the turpentine and mallow-trees of Greece and Syria, and mixed together for use. It was much esteemed formerly, and not only used in the country where it was produced, but carried in great quantities to Mecca, and other parts of the Turkish dominions, where it was valued at a very great rate.

BE CABUNGA, in Entomology, a species of Curculio, of a black colour; wing-cases rufous; entirely bordered with black. Fabricius. In size and appearance it resembles curculio cerasi; inhabits Sweden; feeds on the becabunga.

BECCADELLI, Antonio, in Biography, called Antony of Polentia, from the place of his birth; was born in 1574, studied law at Bologna, and entered into the service of the duke of Milan, who allowed him an honourable pension. He also became professor of belles lettres and rhetoric in the university of Pavia, and, in 1532, was honoured by the emperor Sigismund, with the poetic laurel. When Alphonso king of Naples left Milan in 1435, he took Antonio with him to his court; and from this time, he became the inseparable companion of this prince, who conferred upon him many honours and gifts, and intrusted him with many important commissions. In 1451 he was deputed to solicit of the state of Venice, the suppressed arms of the historian Livy, which he obtained. Such indeed was his veneration for Livy, that he is said to have sold a farm in order to purchase a copy of Livy, written by the hand of Poggio the Florentine. After the death of Alphonso, Antonio became the secretary and counsellor of his son and successor Ferdinand. He died at Naples in 1571; leaving behind him ample testimonials of his talents as a Latin writer, both in prose and verse. For his work "De Dictis et factis Alfonsi regis Arragonum," he received the recompense of a thousand gold crowns; which work has been frequently reprinted, with additions. A collection of five books of his epitaphs, two harangues, and some verses, was printed at Venice in 1453. His "Hermaproditus," which was a collection of short poems in two books, excited by its obscenity loud clamours against its author; and was publicly burnt in several cities of Italy, together with the writer's own effigy. Gen. Dog.
body is liable. As the principles of government indirectly supported in this work were hostile to absolute power, they incurred the charge of subverting the legitimate sources of authority; and the marquis owed his protection to the influence of count Fumian. Having escaped the danger that threatened him, he diverted his attention from speculations of this nature to metaphysical subjects. Besides some papers, contributed to a periodical work, entitled "The Coffee-House," he published "Disquisitions on the Nature of Style," maintaining that by nature all men possess an equal degree of genius for poetry and eloquence, and by the observance of proper rules all would be able to write equally well. Beccaria was much attached to men of letters, a patron to those who needed encouragement, and a cordial friend. He was charged, however, with venality in the exercise of an office of magistracy which he held; and hence his enemies compared him to lord Bacon, with respect both to abilities and corruption. He died November 1794.

Beccaria, Gianbattista, an eminent philosopher of the eighteenth century, and a monk of the Societies-Pie, was a native of Mendovi in Piedmont, and became profecor of philosophy and mathematics, first at Palermo, and then at Rome. His established reputation occasioned his removal to Turin, where he occupied the chair of experimental philosophy. During his absence of his appointment to the office of preceptor to the princes of Sardina, he was introduced to the Sardian court; but neither this employment, nor the honour connected with it, diverted him from the indefatigable prosecution of his studies; and the pecuniary advantages that resulted from the appointment were principally devoted to the increase of his library and the improvement of his philosophical apparatus. Amidst the variety of his philosophical pursuits, his attention was particularly engaged by experiments and investigations in electricity; and in this department of science he acquired singular reputation. For an account of his principal discoveries and observations, see Atmosphere, and Electricity. His chief works on this subject were "Dell' Elettricismo Artificiale et Naturale," Turin, 1753, 4to.; of which an English translation was published, in 1776, 4to. and "Lettere dell' Elettrofimo," Bologna, 1756, fol. He also published essays on the cause of Storms and Tempests, and on the Method of Turin," and on other physical and astronomical subjects. Father Beccaria, no less reprehensible for his virtues than his knowledge, died at Turin in an advanced age, May 22, 1781. Nov. Diet. Hist.

Beccaria, James Bartholomew, born at Bononia, in 1682, received the early part of his education among the Jesuits. Turning his mind to the study of natural philosophy, he soon became distinguished for the variety and depth of his knowledge in physics, and in mathematics, of which he was made public professor, and, in conjunction with Morgagni, and other celebrated characters at Bononia, affiliated in forming an academy there for teaching mathematics, natural history, chemistry, anatomy, and medicine. He first gave lectures in natural history, and in 1712, was appointed to the chair of medicine, which he also now practiced with great success. On the death of Valisfa, he was made president of the institution, and on that post, introduced many useful regulations for the government of the academy, which are still continued. He was a frequent correspondent with the Royal Society of London, of which he was made an honorary member. Among other communications from Beccaria, which appear in the Philosophical Transactions, are his "Observations on the Weather," "On the Ignis Fatuus," and "On the power some person have enjoyed of supporting life for a great length of time, without food." This was afterwards published at Padua, under the title of "De ejusmodi longis Differentia," fol. 1748. He died Jan. 1766, being 84 years of age. Among his publications are "Differentia Meteorologica Medica, in qua acris temperas et morbi Bononiensi graffantes annis, 1729, et cogniti, deferentur," "De quinquennis phthisiose in primum detectis, Commentarius," Bonon. 4to. 1744. "Scriptura Medico-legale," 1749. For the titles of his other compositions, and of numerous unedited pieces, see Gen. Biog. and Hal. Bib. Anat.

Beccles, in Geography, is a market and corporate town of Suffolk, in England, situated on the northern border of that county joining to Norfolk. It is fifteen miles S.W. of Yarmouth, and 108 E. from London. Though not a borough town, Beccles has its corporation, consisting of a portreeve, and thirty-six other persons, who are distinguished by the names of fellows, and seventy-four. From the twents, the officer called portreeve is annually elected. The town consists of several streets, which concentrate in a spacious area, where the markets are held every Saturday. Here stands a large handsome church, whose tower is detached from it, and the ruins of another called Ingate church, which was formerly the parish church. The church-yard, from its elevated situation, commands many fine and extended views of the adjacent country, and the meandrias of the river Waveney which adjoins this cemetery. Here are a town-hall and goal; the former is a substantial building where the quarter feffions are held; and the latter has been lately much enlarged and improved conformably to the Howardian plan. A public grammar school was founded here in 1712, by Dr. Fausconbery, who endowed it with certain lands for the maintenance of a clergyman, and to qualify youth for the university. Sir John Leman, knight, also founded a free English school in 1631, for the education of forty-eight boys; also for a master and usher, who are appointed by trustees, being part of the corporation. On the north-west side of the town is a very large common field, containing nearly 1600 acres, where the inhabitants are allowed, under certain restrictions, to turn a number of horses and cattle. Beccles suffered by a destructive fire, which happened on the 29th of November, 1586, when more than 80 houses were consumed, with property calculated at 20,000l. value. It is rather a singular circumstance, that neither mail, nor turnpike roads, communicate with this town: though it was some time since proposed at a public meeting to carry the turnpike road to Yarmouth through this place; but the proposition was negative by a considerable majority of the inhabitants. Here are three annual fairs. The number of houses in the township is 601; of inhabitants 2788, of which 1245 are males, and 1543 are females. In the vicinity of this town are the following, besides other gentlemens feats. Raveningham Hall, Sir Edmund Bacon, bart. —Langley Park, Sir Thomas Beauchamp Proctor, bart. —Benacre Hall, Sir Thomas Gooch, bart. —Sotterley Hall, Miles Barne, esq.

Bec-D'Oiseau, in Zoology, the name lately given by French naturalist to that most singular Australasian animal Platyus anatina of Vivarium nature; and Duck-billed platypus of Dr. Shaw. It is also called Ornithorhynchus paradoxus, by M. Blumenback of Göttingen. See PLATYPUS.

Beede, L.A. in Geography, a small town of France on the Aude, and chief place of a canton in the diocese of Carcassonne, 14 leagues north of Carcassonne.

BEC-AAL, in Ichthyology, a French name of the Electrical eel, anguille électrique.

Bechan, in Geography, a river of North Wales, which
which runs into the Severn, 3 miles W.S.W. of Montegomery.

BECHER, John Joachim, in Biography, an industrious and successful cultivator and improver of chemistry, and an ingenious mechanist, was born at Spires in 1645. After passing through the usual preliminary studies, he was made professor of medicine at Mentz, and soon after physician to the elector there, and to the elector of Bavaria. Acquiring considerable reputation in these honourable posts, he was called to Vienna by the emperor Leopold, where, besides attending to his medical duties, he was instrumental in forming a chamber of commerce, and in improving their manufactures. He is also said to have projected the plan of an East India company there. But getting into disputes with some of the officers about the court, he lost his influence, and was obliged to leave Vienna. He then went to Mannburg, Munich, and Wurtzburg. From Wurtzburg he was driven away, Haller says, on being detected defacing a human body, with the view probably of prosecuting some chemical experiments on some of the humours, as he did not cultivate anatomy. At Haerlem, where he now went, he invented a machine for throwing silk; and, as he tells us in his "La folie sage, et la folie sageille," printed at Frankfort 1682, made some improvement in the art of printing; in what it confined, is not however known. In the main while he was not unmindful of the principal object of his studies, the advancement of the knowledge of chemistry, as appears by a rapid succession of publications on that subject. Getting again involved in disputes with some principal persons at Haerlem, and compelled to quit that place, he came to London, where he died in 1685. That he was of a turbulent and restless disposition is evident by his frequent migrations, and by his constantly losing the favour and protection of his patrons, whom he had made his debtors by his abilities and services. Becher gave a new turn to chemistry, which he employed in analysing and finding out the principles of natural bodies, and thence laid the foundation of the great improvements that have been made in that art. But he was fond of mysteries, and employed no small part of his time and labour in his attempts to transmute metals. That he thought this practicable, appears by his "Experimentum chymicum novum, quo artificiais et infinitans metallogenum generat transmutat et ad oculum demonstrat," and his "Thesee chymicae, veritatem et possibilitatem transmutationum metallogenum in aurum evincientes?" but he was conscious of having done more in the art than had ever been done before, and therefore probably thought hardly anything impossible. He had a project for an universal language, by which all men might make themselves intelligible to each other: "Charakter pro notitia linguarunar universal." On this subject he published, in 1661, a Latin folio; and as he was the first person who gave a complete treatise on this art, since known under the name of paligraphy, he may therefore be considered as the inventor. (See Universal Character, and Papygraphy.) His principal works are his "Physeca substerranea," which has passed through several editions; "Institutionum chymiae," Magnut. 4to. 1663; "Parvaullus medicinalis," Ulm. 1663, fol. For the titles of the rest of his works, see Elyot's Diet. Hist.

BECHERE, or BECHERE, in Geography, a lake of Caramania in Aftric, Turkey, 46 miles W. of Coni.

BECHERLE, a town of France, is the department of the Ille and Vilaine, and chief place of a canton in the district of Montfort, 3 leagues N. of Montfort.

BECHHOVEN, a small market town of Germany, in the principality of Oolzach, seated on the river Wiefet, and having a small castle.

Vol. IV.

BECOCHIES, formed of the Greek ΒΕΚΟ, a cup, and the Materia Medica, medicines proper for relaxing coughs, but the being of various kinds, the general term may indi-lead, and is therefore improper. See Pills. See Pills.

BECHINS, in Geography, a town of Bohemia, and capital of a circle of the same name. It is seated on the river Litice, and its citadel lies on a steep rock. The circle was miserably ravaged and laid waste in the 30 years' war, and the town was taken and burnt by general Bequoi in 1619. N. lat. 49° 14'. E. long. 15° 12'.

BECHTLERSHEIM, a market town of Swabia, in the Rhineh circle of nobility, belonging to four co-heirs, two of whom are Roman Catholics, and the other Lutherans. BECK, a little river or brook, called also rivulet or rill. According to Verleyan, the original word is bere, which properly imports a small stream of water issuing from some burned or spring.

Hence, bell-becks, little brooks so called, on account of their shallowness and depth, or rather from their being covered, or much concealed. See Hell.

Beck is chiefly used among us in the composition of names of places originally situate on rivulets; hence Welbeck, Bournebeck, &c.

The Germans use beck in the same manner.

BECK, David, in Biography, an eminent portrait painter, was born at Arnheim in Guelderland in 1621, and became a disciple of Vandyck, from whom he acquired a fine manner of pencilling, and that sweet style of colouring in which this master excelled, together with that rapidity of execution for which he was so famous. He was appointed portrait painter to Christina queen of Sweden; and by her recommendation, most of the illustrious persons in Europe fat to him for their pictures. In his person and behaviour he was handsome, agreeable, and polite; and though he was much favoured by his royalmistress, he wished to visit his friends in Holland, very much against the queen's inclination; but as he soon after died in Holland, at the early age of 35, it was suspected that he was poisoned. As he travelled through Germany, he was suddenly taken ill at an inn, where he lodged, and the illness terminated in his apparent death, so that he was laid out as a corpse. His valets, who attended, regretted the event, and as they fat by his bedside, relieved their sorrow by drinking freely. One of them, in a state of intoxication, suggested that their master was fond of a glass while he was alive, and proposed to testify his gratitude by giving him a glass, though he were dead. Accordingly, they raised his head, and endeavoured to put some liquor into his mouth. Upon this Beck opened his eyes, and the servant compelled him to swallow what remained in the glass. The painter revived, and, by due attention, not only escaped inter- mission, but perfectly recovered. In testimony of his merit as an artist, he received from different princes nine gold chains, and several medals of gold of a large size. Pilkington.

BECKEM, or BECKUM, in Geography, a small town of Germany, in the circle of Vechelphn and bishopric of Munster, seated on the Wesf, 17 miles S.S. E. of Munster. In 1734 it was almost wholly consumed by fire.

BECKER, Daniel, in Biography, was born at Dantzi, in December 1704. He took his degree of doctor in medicine at Konigz. 17, and was made professor of medicine there, and rector of the university. Becker was author of various medical works, but that which principally contributed to preserve his name, is his "De cultivo Prufiaco, observat. et curatio fugulana," or the extraordinary cure of the Prufiian knife-swallowers; first published in 1635, and since frequently reprinted. The subject of the history is a young man,
body is liable. As the principles of government indirectly supported in this work were hostile to absolute power, they incurred the charge of subverting the legitimate sources of authority; and the marquis owed his protection to the influence of Count Ferman. Having escaped the danger that threatened him, he diverted his attention from speculations of this nature to metaphysical subjects. Besides many papers, contributed to a periodical work, entitled "The Coffee-House," he published "Disquisitions on the Nature of Style," maintaining that by nature all men possess an equal degree of genius for poetry and eloquence, and by the observance of proper rules all would be able to write equally well. Beccaria was much attached to men of letters, a patron to those who needed encouragement, and a cordial friend. He was charged, however, with venality in the exercise of an office of magistracy which he held; and hence his enemies compared him to Lord Bacon, with respect both to abilities and corruption. He died November 1794.

Beccaria, Giambattista, an eminent philosopher of the eighteenth century, and a monk of the Escolas-Pies, was a native of Modena in Piedmont, and became professor of philosophy and mathematics, first at Palermo, and then at Rome. His established reputation occasioned his removal to Turin, where he occupied the chair of experimental philosophy. In consequence of his appointment to the office of preceptor to the princes of Sardinia, he was introduced to the Sardinian court; but neither this employment, nor the honour connected with it, diverted him from the indefatigable prosecution of his studies; and the pecuniary advantages that resulted from the appointment were principally devoted to the increase of his library and the improvement of his philosophical apparatus. Amidst the variety of his philosophical pursuits, his attention was particularly engaged by experiments and investigations in electricity; and in this department of science he acquired singular reputation. For an account of his principal discoveries and observations, see Atmospheres, and Electricity. His chief works on this subject were "Dell' Elettricità Artificiale et Naturale," Turin, 1753, 4to.; of which an English translation was published, in 1766, 4to. and "Lettere dell' Elettricismo," Bologna, 1758, fol. He also published essays "On the caule of Storms and Tempesta," "On the Meridian of Turin," and on other physical and astronomic subjects. Father Beccaria, no less respectable for his virtues than his knowledge, died at Turin in an advanced age, May 22, 1781. Novo. Dict. Hill.

Beccaria, James Bartholomew, born at Bononia, in 1628, received the early part of his education among the Jefuits. Turning his mind to the study of natural philosophy, he soon became distinguished for the variety and depth of his knowledge in physics, and in mathematics, of which he was made public professeur, and, in conjunction with Mornagius, and other celebrated characters at Bononia, afforded in forming an academy there for teaching mathematics, natural history, chemistrty, anatomy, and medicine. He first gave lectures in natural history, and in 1712, was appointed to the chair of medicine, which he also now practised with great success. On the death of Valsalva, he was made president of the institution, and in that post, introduced many useful regulations for the government of the academy, which are still continued. He was a frequent correspondent with the Royal Society of London, of which he was made an honorary member. Among other communications from Beccaria, which appear in the Philosophical Transactions, are his "Observations on the Weather," "On the Ignis Fatuus," and "On the power some persons have enjoyed of supporting life for a great length of time, without food." This was afterwards published at Padua, under the title of "De jeninis longis Differtatio," fol. 1748. He died Jan. 1766, being 84 years of age. Among his publications are "Differtato Meteorologica Medica, in qua serius temperatures et morbi Bononie graffiantes annis, 1729," et sequuntur, dehnbahuntur; "De quaternipum phisiphoris nona primum detectis, Commentarius," Bonon, 4to. 1744. "Scriptura Medico-legals," 1749. For the titles of his other compositions, and of numerous unedited pieces, see Gen. Biog. and Hal. Bib. Anat.

Beccles, in Geography, is a market and corporate town of Suffolks in England, situated on the northern border of that county joining to Norfolk. It is fifteen miles S. W. of Yarmouth, and 158 N. E. from London. Though not a borough town, Beccles has its corporation, confiding of a portreeve, and thirty-fix other persons, who are distinguished by the names of twelve, and twenty-four. From the twelves, the officer called portreeve is annually elected. The town consists of several streets, which concentrate in a spacious area, where the markets are held every Saturday. Here are a large handsome church, whose tower is detached from it, and the ruins of another called Ingate church, which was formerly the parish church. The church-yard, from its elevated situation, commands many fine and extended views of the adjacent country, and the meandring of the river Waveney which adjoins this cemetery. Here are a town-hall and goal; the former is a substantial building where the quarter feyions are held; and the latter has been lately much enlarged and improved conformably to the Howardian plan. A public grammar school was founded here in 1712, by Dr. Vanonberg, who endowed it with certain lands for the maintenance of a clergyman, and to qualify youth for the university. Sir John Leman, knight, also founded a free English school in 1651, for the education of forty-eight boys; also for a master and usher, who are appointed by trueters, being part of the corporation. On the north-west side of the town is a very large common field, containing nearly 1600 acres, where the inhabitants are allowed, under certain restrictions, to turn a number of horses and cattle. Beccles suffered by a destructive fire, which happened on the 29th of November, 1586, when more than 80 houses were consumed, with property calculated at 20,000l. value. It is rather a singular circumstance, that neither mail, nor turnpike roads, communicate with this town: though it was some time since proposed at a public meeting to carry the turnpike road to Yarmouth through this place; but the proposition was negatived by considerable majority of the inhabitants. Here are three annual fairs. The number of houses in the township is 601; of inhabitants 2788, of which 1235 are males, and 1543 are females. In the vicinity of this town are the following, besides other gentlemen's seats.

Raveningham Hall, Sir Edmund Bacon, bart.
—Langley Park, Sir Thomas Beauchamp Proctor, bart.
—Banest Hall, Sir Thomas Gooch, bart.
—Satterly Hall, Miles Barlow, esq.

Bece-D'Oiseau, in Zoology, the name lately given by French naturalists to that most singular Australalian animal Platypus australinus of Vivarium nature; and Duck-killed platypus of Dr. Shaw. It is also called Ornithorhynchos paradoxus, by M. Blumenback of Gottingen. See Platypus.

Beceide, L.A., in Geography, a small town of France on the Aude, and chief place of a canton in the district of Carcausnaud, 14 league north of Carcausnaud.

Bece-F-Al, in Ichthyology, a French name of the Electrical eel, anguilla electrice.

Bechan, in Geography, a river of North Wales, which
which runs into the Severn, 3 miles W.S.W. of Montgomery.

BECHER, JOHANN GAUWIN, in Biography, an industrious and successful cultivator and discoverer of chemistry, and an ingenious mechanist, was born at Spires in 1647. After profiting through the usual preliminary studies, he was made professor of medicine at Mentz, and from physician to the elector there, and to the elector of Bavaria. Acquiring considerable reputation in these honourable posts, he was called to Vienna by the emperor Leopold, where, besides attending to his medical duties, he was instrumental in forming a chamber of commerce, and in improving their manufactures. He is also said to have projected the plan of an East India company there. But getting into disputes with some of the officers about the court, he left his influence, and was obliged to leave Vienna. He then went to Mayence, Munich, and Wurtzburg. From Wurtzburg he was driven away, Haller says, on being detected dissecting a human body, with the view probably of prosecuting some chemical experiments on some of the humours, as he did not cultivate anatomy. At Hartzem, where he now went, he invented a machine for throwing silk; and, as he tells us in his "La fable sage, et la fable fageffe," printed at Frankfort 1652, made some improvement in the art of printing; in what he confided, is not however known. In the mean while he was not unmindful of the principal object of his studies, the advancement of the knowledge of chemistry, as appears by a rapid succession of publications on that subject. Getting again involved in disputes with some principal persons at Hartzem, and compelled to quit that place, he came to London, where he died in 1687. That he was of a turbulent and rebellious disposition is evident by his frequent migrations, and by his constantly losing the favour and protection of his patrons, whom he had made his debtors by his abilities and services. Becher gave a new turn to chemistry, which he employed in analyzing and finding out the principles of natural bodies, and thence laid the foundation of the great improvements that have been made in that art. But he was fond of mysteries, and employed no small part of his time and labour in his attempts to transmute metals. That he thought this practicable, appears by his "Experimentum chymicum novum, quo artificialis et instansanter metalloorum generato et transmutatione ad oculos demonstratur," and his "Thesee chymicum, veritate et possibilitatem transmutationse metallo- reum aurum viventem," but he was conscious of having done more in the art than he had ever been done before, and therefore probably thought hardly any thing impossible. He had a project for an universal language, by which all men might make themselves intelligible to each other: "Character pro notitia lingua universali." On this subject he published, in 1661, a Latin folio; and as he was the first person who gave a complete treatise on this art, since known under the name of phigraphy, he may therefore be considered as the inventor. (See Universal Character, and Pagiography.)

His principal works are his "Physica subterranea," which has passed through several editions; "Institutiones chyminas," Mogunt. 4to. 1652; "Parnassus medicinalis," Ulm. 1655, fol. For the tales of the rest of his works, see Loy's Dict. Hist.

BECHERELE, a town of France, is the department of the Ille and Vilaine, and chief place of a canton in the district of Montfort, 3 leagues N. of Montfort.

BECHHOFFEN, a small market town of Germany, in the principality of Osnobach, situated on the river Wiedel, and having a small castle.

Vol. IV.

BECHICS, formed of the Greek δοκί, απεκφι, a tank, in the Mattera Medica, medicines proper for relieving cough, but these being of various kinds, the general term may include, and is therefore improper.

Electric Pits. See Hills.

BECHLON, in Geography, a town of Bohemian, and capital of a circle of the same name. It is situated on the river Len- nic, and its citadel lies on a steep rock. The town was miserably ravaged and laid waste in the 39th year, and the town was taken and burnt by General Bequier in 1619. N.lat. 49° 14'. E. long. 15° 12'.

BECHTOLSHEIM, a market town of Swabia, in the Rhinische circle of nobility, belonging to four co-heirs, two of whom are Roman Catholics, and two Lutherans.

BECK, a little river or brook, called also rivulet or rill.

According to Verlegan, the original word is beke, which properly imports a small stream of water issuing from some bourn or spring.

Hence, beek-beeks, little brooks so called, on account of their gullielines and depth, or rather from their being curved, or much concealed. See Hell.

Beck is chiefly used among us in the composition of names of places originally situate on rivulets; as, Meulebeck, Boizenbeck, &c.

The Germans use beek in the same manner.

BECK, DAVID, in Biography, an eminent portrait painter, was born at Arnhem in Guelderland in 1621, and became a disciple of Vandyck, from whom he acquired a fine manner of pencilering, and that sweet style of colouring in which this master excelled, together with that rapidity of execution for which he was so famous. He was appointed portrait painter to Christiana queen of Sweden; and by her recommendation, most of the illustrious persons in Europe fat to him for their pictures. In his person and behaviour he was handsome, agreeable, and polite; and though he was much favoured by his royal mistress, he wished to visit his friends in Holland, very much against the queen's inclination; but as he soon after died in Holland, at the early age of 35, it was suspected that he was poisoned. As he travelled through Germany, he was suddenly taken ill at an inn, where he lodged, and the illness terminated in his apparent death, so that he was laid out as a corpse. His valets, who attended, regretted the event, and as they sat by his bed-side, relieved their sorrow by drinking freely. One of them, in a state of intoxication, suggested, that their master was fond of a glass while he was alive, and proposed to tell his gratitude by giving him a glass, though he were dead. Accordingly, they raised his head, and endeavoured to put some liquor into his mouth. Upon this Beck opened his eyes, and the servant compelled him to swallow what remained in the glass. The painter revived, and, by due attention, not only cleared intestinum, but perfectly recovered. In testimony of his merits as an artist, he received from different princes nine gold chains, and several medals of gold of a large size. Pilkington.

BECKEMOR, or BRUECK, in Geography, a small town of Germany, in the circle of Wolfsberg and bishopric of Mann- furt, situated in the Werff, 17 miles S. S. E. of Munich. In 1724, it was almost wholly consumed by fire.

BECKER, DANIEL, in Biography, was born at Dantzsick, in December 1604. He took his degree of doctor in medicine at Konigshg, 1568, and was made professor of medicine there, and rector of the university. Becker was author of various medical works, but that which principally contributed to preserve his name is, his "De cultrivatio Prussico, observario co et curatio singularius," or the extraordinary care of the Prus- sian knife-swallowers; first published in 1656, and since frequently reprinted. The subject of the history is a young man.
man, aged 22 years, who endeavoured to excite vomiting by introducing the handle of a knife, ten inches long, into the oesophagus; the knife slipping from his fingers, dropped into his thorax, where it continued, occasioning much pain, about six weeks. No probable means of relieving him, or of obtaining the discharge of the knife occurring, it was determined, by his medical attendants, to make an incision through the integuments of the abdomen into the thorax, and to extract the knife through the wound. The operation was performed, the knife taken out, and the patient recovered in a few days. The author relates several other cases of persons who had received wounds, penetrating into the thorax. In some, the wounds were completely healed; in others, the edges of the wounds becoming callous, left fatal openings into the thorax, through which the food passed, unless when covered with a compres. This work was translated into English, and published in 1605 by Dan. Lakin, in 1612, under the title of "A miraculous cure of the Prussian swallow knife." Lakin added other cases of wounds penetrating into the thorax, which terminated in the same way, as those related by Becker. To both the Latin and English editions engravings of the subject are added. He died the 14th of October 1655. For the titles of his other works, none of which are of much estimation; see Haller's Bib. Chirurg. et Anatom. His son Daniel, who was educated under his father, after visiting the principal schools on the continent of Europe, was made doctor of medicine at Stras- bourg, in the year 1652; returning to Konigberg, he was appointed professor in ordinary, and soon after physician to the elector of Brandenburg. He died suddenly Feb. 6th 1670, and was succeeded in his honours by his son Daniel Christopher, but they neither of them left any works deserving notice.

Becker, Balthasar. See Becker.

Becket, Thomas, in Biography, an English prelate, famous as the occasion of much political contention during his life, and as the object of much superstitious veneration after his death, was born in London in 1119, and prosecuted his studies at Oxford, Paris, Bologna, and Auxerre. During the interval of his residence at Paris and Bologna, he was introduced to Theobald archbishop of Canterbury, who being captivated with his graceful and winning address, gave him two livings in Kent, and obtained for him two prebends in the cathedrals of London and Lincoln. As at this time he was only in deacon's orders, he probably held these benefices by the pope's dispensation, which his patron might easily have procured. After his return from Auxerre, where he completed his studies, particularly in the civil and canon laws, he was employed by the archbishop as his agent to the pope, in order to solicit the restoration of the legantine powers to the see of Canterbury. Having conducted this negotiation with dexterity and success, he was deputed upon another important commission, the object of which was to obtain from the pope those prohibitory letters against the coronation of prince Euface, by which that design was defeated. Upon his return to England from this successful embassy, the archbishop conferred upon him several new favours, appointing him provost of Beverley and dean of Hall- ings, with the right of retaining his other benefices, and just before the death of Stephen, involving him with the archdeaconry of Canterbury. Immediately upon the accession of Henry II. to the throne, in 1154, he was appointed chancellor of England, at the request of his patron, who thought no dignity or truit above his merit. The chancellor of England, at this time, had no distinct court of judicature in which he presided; but he acted together with the judiciary and other great officers, in matters of the revenue, at the ex- chequer, and sometimes in the counties upon circuits. The great feal being in his custody, he supervised and sealed the writs and precepts that issued in proceedings pending in the king's court, and in the exchequer. He also supervised all charters which were to be sealed with that seal. In the council his rank was very high; and he had the principal direction and conduct of all foreign affairs, performing most of that business which is now done by the secretaries of state. Such was the office to which Becket was raised; but the favour of his master made him greater than even the power of that office. great as it was in itself. In this station he paid his court to successfully to his royal master, not only by his dexterity in business, but also by his splendid manner of living and agreeable conversation, that he became his greatest favourite, and his chief companion in his amuse- ments. Employments and traits of all kinds were heaped upon him without measure or propriety. Besides the office of chancellor, and a froundalous number of ecclesiastical benefices, he had royal castles and forts committed to his custody, the temporalities of vacant prelacies, and the exchequer of great baronies belonging to the crown. These revenues he expended without account or control; and Henry repented in him such a degree of confidence, that he meditated almost to share the throne with the sovereign. He allowed that Becket politic'd in a pre-eminent degree all the qualities that could most powerfully engage the affection of a prince, who had a judgment capable of discerning, and a heart formed to love extraordinary merit, but a temper that required some delicacy of address in those who approached him very nearly, and that yielded most to those friends whose character appeared most congenial to his own. The person of Becket was graceful and his countenance pleasing; his wit was lively and facetious, his judgment acute, his elo- quence flowing and sweet, and his memory capacious and readily on all occasions. The time he had passed in that school of the most exquisite policy, the court of Rome, had greatly improved and refined his understanding. Nor was his capacity limited to the sphere of business. He made himself the king's perpetual companion in most of his pleasures, and confided his taste to naturally, and with so much ease, that in paying his court he seemed only to indulge his own inclinations. He occasionally laid aside the ecclesiasti- cal habit and character. In an expedition with the king to France, he assumed the military profession, headed a body of men in his own pay, and commanded at various fights. In his manners there was a certain inexpressible grace, derived from nature and improved by art, which rendered his virtues more amiable, and even his vices agreeable. Thus his proficiencies and ornamentation appeared like generosity and greatness of spirit; nor indeed was he deficient in these qualities, though he carried them far beyond proper bounds. His expense was enormous, and Henry would have been jealous of it, as intended to acquire too much popularity, if he had not been perplexed, by the address of Becket, that all his magni- ficence in which the son of a private citizen surpass'd even the greatest and most opulent earls, was only designed to do honour to his bountiful master, whose creature he was, and upon whom his whole fortune must absolutely depend. Yet amidst the luxury in which he lived for several years, and all the temptations of a court where gallantry reigned, he was, if the writers of his life may be credited, constantly temper- ate and invincibly chaste.

At the time of the death of archbishop Theobald, Becket's father, the king, was in Normandy; but as soon as he heard of it, he resolved to raise his chancellor to the primacy, in hopes by his means of governing the church in tranquility. This advancement however was retarded for about a year.
year by the opposition of the empress Maud, the king's mother, and of the clergy and bishops of England. But Henry's resolution was fixed, and his fondness for his favourite overcame all remonstrances; so that Becket, being first ordained priest, was consecrated at Canterbury, June 6, 1162. As soon as Becket found himself firmly seated in the archepiscopal chair of Canterbury, he suddenly changed his whole mode of life, and, from being the gayest and most luxurious courtier, he became the most austere and solemn monk. Without the king's previous knowledge of his intention, and very much to his surprise and dissatisfaction, he resigned the office of chancellor. Before the king's return to England in 1163, he had received so many complaints of the severities of the new primate, that he became feisible, when it was too late, that he had made a wrong choice. In his interview with Becket at Southampton, it was observed by the whole court that his affection was cooled; and he soon after manifested his dissatisfaction with the conduct of the prelate, by obliging him, much against his inclination, to resign the archdeaconry of Canterbury. In 1163, Becket attended a council, summoned at Tours by pope Alexander III., where he was treated by the pope and cardinals with particular respect; and where, it is probable, he was animated by the pope in the design of becoming the champion of the liberties of the church, and the immunities of the clergy. It is, however, certain, that soon after his return he began to prosecute this design without his former refreeve; and the zeal which he manifested produced an open breach between him and his sovereign. Henry was determined to be the sovereign of all his subjects, clergy as well as laity; to oblige them to obey his laws, or to answer for their disobedience in his courts of justice. Becket, on the other hand, maintained, that the clergy were subject only to the laws of the church, and were to be judged only in spiritual courts, and to punished only by ecclesiastical censures. In order to bring this question to a speedy issue, which the licentiousness of the clergy, and the atrocious crimes committed by some of them at this time, rendered absolutely necessary, a council of the clergy and nobility was summoned at Winchester; and at this council the king required that the archbishop and other bishops would conent to deliver to his officers a clerk, who was degraded for any crime, in order to his being punished for it according to the laws of the land. This requet was reasonable; but the primate's influence refted the demand; and the council broke up in confusion. Although Becket solemnly promised and swore, in the words of truth, and without refrefe, to obey the laws and customs, commonly called the "constitutions of Clarendon," which reduced ecclesiastics to all denominations to a due submission to the laws of their country, and restrarred the immunities of the clergy; he soon began to exhibit skins of repentance, by extraordinary acts of mortification, and by discontinuing the performance of the sacred offices of his function; and he obtained from the pope a bull, releeting him from the obligation of his oath, and enjoining him to resume the duties of his sacred office. Fearful however of the king's indignation, he determined to retire privately out of the kingdom; but being prevented from making his escape by contrary wifes, he returned to Canterbury; and afterwards waited upon the king at Woodstock, to supplicate forgiveness for attempting to leave the kingdom without his permission. The king received him without any other expression of displeasure, besides asking him, "if he had left England because he thought it too little to contain them both?" This interview was soon succeeded by fresh aggressions on the part of Becket, which induced the king to summons a parliament at Northampton, Oct. 17, 1164, which unanimously found the primate guilty of contumacy, in refusing to attend the king's court when he was summoned, and sentenced him to forfeit all his goods and chattels. He was also required to restore a sum of 500L. which the king had lent to him, when he was chancellor, and to render an account of 250,000 marks, which he had received from vacant benefices. These demands were of so furious a nature, that, though he appealed to the pope, many of his episcopal brethren deferted him through fear, and urged him to resign his office, afruring him that if he did not he would be tried for perjury and high treason. The barons likewise became less and less in their clamours against him, so that Becket thought it more prudent to leave the kingdom. Accordingly he left Northampton about mid-night, accompanied only by two monks, and travelling on foot and by night, he arrived at Lincoln, and from thence he passed by water to a solitary island, where he remained till an opportunity offered of passing over to Flanders. Some say that he travelled to Sandwich, and hired a fishing boat to convey him to Boulogne. However that be, he retired to the monastery of Saint Bertin. Upon his retreat, the king confiscated the revenues of the archbishopric, and sent ambassadors to the king of France, and the earl of Flanders, dissatisfying these princes from affording Becket shelter in their dominions. The ambassadors met with a cold reception at the French court at Compiègne, and were told by Lewis, who was a superflitious bigot, and a great admirer of Becket, that he would protect the perfected prelate with all his power. They then proceeded to Sens, where the pope refused, who after admitting them to an audience, and consulting his cardinals, informed them, that no answer could be given to their petition till the archbishop had been heard. Becket, as soon as he was offered of the favour and protection of the king of France, paid him a visit at Soiffons, where he was affectionately received, and urged to accept an order on the royal treasury for every thing he needed during his stay in France. From Soiffons he proceeded with a numerous retinue for Sens, which he entered in a kind of triumph, and here the pope treated him with the greatest respect and kindness. At a solemn council of all the cardinals and prelates, he was seated at the pope's right hand, and allowed to keep his feast while he explained his cause. Having produced, in the course of an artful speech, a copy of the constitutions of Clarendon, several of which were directly calculated to bridge the power of the pope and cardinals, the whole assembly expressed their abhorrence of them in the strongest terms, and at the same time passing the highest encomiums on the archbishop, declared that his cause was the cause of God and the church, and that he ought to be supported. Becket, with a view of farther ingratiating himself with the pope, resigned his archbishopric into his hands, which, however, the pope, with the advice of his cardinals, immediately restored to him, appointing him a residence in the abbey of Pontigny in Burgundy.

When the ambassadors returned to England, and made their report, Henry was highly offended both with the pope and the archbishop; and in token of his resentment prohibited the payment of pence, and commanded all clerks who preferred to appeal to the pope to be imprisoned. He also commanded all the goods and revenues of the archbishop, and of all the clergy who adhered to him, to be seized; and proceeded to confiscate the estates, and to banish the persons of all the primate's friends, retainers, and relations, to the number of about 400. Becket, during his residence at Pontigny, employed himself in exercises of devotion, and also in writing expiatory letters to the
king and bishops of England, in issuing excommunications against several officers of the crown, and in threatening even to excommunicate the king himself. Notwithstanding a spirited remonstrance addressed to Becket by the English prelates, he persisted in his purpose; and communicated it to the pope in a letter, which represented Henry as a cruel, impious, undutiful perfector, who had tried and concerned Chrift at Northampton, in his person. Henry was much alarmed; and called a council of his barons and prelates at Chilton in Touraine, to consider what was to be done for preventing his excommunication, or for guarding against its consequences. After a long deliberation, it was thought the most expedient to appeal to the pope. In the mean time, Henry sent orders to England to guard the excommunicates, and to take other measures of precaution. Although Becket was prevented by the interposition of the king of France from executing his design of excommunicating Henry, he communicated his threats and chief confidants, and declared the impious constitutions of Clarendon null and void, abdicated all the bishops of England from the unlawful oath they had taken to obey them, and excommunicated all persons who paid any regard to them. Upon these premeditated proceedings Henry threatened to expel all the monks of the Cistercian order from his dominions, if they any longer entertained his enemy the archbishop of Canterbury at Pontigny; upon which he removed to Sans about Martinmas A.D. 1166, where an honorable asylum was provided for him by the king of France. The pertinacity of Becket rendered ineffectual for a long time all the efforts of the English prelates, of the pope, and of the king of France, for terminating the contention between him and the king of England. At length, however, all preliminaries for a reconciliation being adjudged by the papal munificence, the archbishop was conducted in great state to an audience of his sovereign, July 22. A.D. 1170, in a meadow near Fretvilles, where the French and English courts, with a prodigious multitude of people of all ranks, were assembled. The conduct of the king on this occasion was singularly condescending; but Becket's impious and resolute temper was so little impressed by it, that he returned Henry's civility and condescension with complaints and remonstrances. After a promise extorted from the king to repair all the injuries which had been done to the church, the archbishop dismounted in order to throw himself at his feet; but Henry prevented him, and bespoke to low as to hold his stirrup, and afflict him in re mounting. This reconciliation, however, was far from being cordial, on the part either of Henry or Becket, and it was not likely to be permanent. Withdrew the archbishop was waiting at Whiteland, a sea-port in Flanders, previously to his return to England, he met over three bulls, one for suspending the archbishop of York, who had been employed in crowning the young king, and two forcommunicating the bishop of London and Salisbury, who had excommunicated this ceremony. This conduct, which was inexplicable at the moment when he pretended to return in peace, excited against him universal indignation, and eventually proved the cause of his ruin. On his reaching the English shore, attempts were made to prevent his landing, and he was halted by force persons in arms, who compelled him in a threatening tone to abdicate the excommunicated bishops. In his way to Canterbury he was accompanied by a great multitude of people, and entered the city in a kind of triumph amidst the acclamations of his attendants. Soon after his arrival, application was made to him for absolving the bishops whom he had impeded and excommunicated; and the young king, who conccrned in the application, and who had issued an order for this purpose, was much incensed at his refusal, more especially as the cenures which he had inflicted on those prelates who had excommunicated him at his coronation seemed to call in question its validity. In his progress from Canterbury to Woodstock, where the young king refided, he was attended on his approach to London by prodigious crowds of people, and conducted to his lodgings in Southwark with loud acclamations; in return for which he scattered among the populace both money and episcopal benedictions. Here his vanity was mortified by a message from the young king, forbidding to proceed any further, or to enter any royal town or castle, and commanding him to return immediately to Canterbury, and to confine himself within the precincts of his church. After his return to this city, he found himself deserted by many of his friends, and received reports of the insults they had offered, and the depredations that were committed upon his estates, so that he indulged gloomy apprehensions, and said to one of his chief confidants, "that he was now convinced this quarrel would not end without blood, but that he was determined to die for the liberties of the church." When the excommunicated prelates arrived in Normandy, and implored the protection of the king from the intolerance and ruin which they were threatened by the priates, the indignation of Henry was roused, and in the moment of intensest passion, he exclaimed, "shall this fellow, who came to court on a lame horse, with all his estate in a wallet behind him, trample upon his king, the royal family, and the whole kingdom? Will none of all those lazy cowardly knights, whom I maintain, deliver me from this turbulent priest?" This pious exclamation made too deep an impression on those who heard it; and particularly on four barons, who formed a resolution, either to terrify the archbishop into submission, or to put him to death. Accordingly, having concerted their plan, they set out for Canterbury by different routes and arrived at a castle about 6 miles from the city on the 26th of December, A.D. 1170; and on the following day they proceeded to the city, and getting admission into the archbishop's apartment, they told him, that they were sent by the king with a command that he should absolve the prelates, and others whom he had excommunicated, and then go to Winchester, and make satisfaction to the young king, whom he had endeavoured to detrombe. Becket, after a violent altercation, in the course of which hints were given that his life was in danger if he did not comply, perished in his refusel. Upon the departure of the barons, one of them charged his servants not to let him fle; to which Becket, who overheard them, replied with great vehemence; " flee! I will never flee from any man living. I am not come to flee, but to defy the rage of impious assassins." The barons, with their accomplices, finding their threats ineffectual, put on their coats of mail; and taking each a sword in his right hand, and an ax in his left, returned to the palace, but found the gate shut. When they were preparing to break it open, Robert de Broc conducted them up a back stair-case, and let them in through a window. A cry then arose, "they are armed; they are armed!" on which the clergy hurried the archbishop almost by force into the church, hoping that the sacredness of the place would protect him from violence. They would also have shut the door; but he exclaimed "begone, ye cowards! I charge you on your obedience, do not shut the door. What, make a cackle of a church!" The conspirators, having searched the palace, came to the church, and one of them exclaiming "Where is that traitor? where is the archbishop?" Becket advanced boldly, and replied, "here I am, an archbishop, but no traitor; I am ready to suffer in the name of him who redeemed me with his blood. God forbid that I should fly for fear of your swords, or recede from
from justice." They once more commanded him to take off the eccommunication and suspension of the bishops. He replied: "There is no satisfaction has yet been made; nor will I abdicate them." Then," they said, "thou shalt instantly die according to thy defect." "I am ready to die," replied Becket, "that the church may obtain liberty and peace in my blood. But in the name of God, I forbid you to harm any of my people." They now rushed upon him, and endeavoured to drag him out of the church, with an intention, as they themselves afterwards declared, to carry him in bonds to the king, or if they could not do that, to kill him in a lea stoned place. But as he clung fast to one of the pillars of the choir, they could not free him from thence. During the struggle, he shook William de Tracy so roughly, that he almost threw him down; and as Reginald Fitzurse pressed harder upon him than any of the others, he thrust him away, and called him "pimp." This opprobrious language more enraged that violent man; he lifted up his sword against the head of Becket, who, bowing his neck, and joining his hands together, in a posture of prayer, recommended his own soul, and the cause of the church, to God, and to the saints of that cathedral. But Edward Grime, one of the monks of Canterbury, interposing his arm to ward off the blow, it was almost cut off; and the archbishop also was wounded in the crown of his head. He fell a second stroke, which likewise fell on his head, in the same devout posture, without a motion, word, or groan; but after receiving a third, he fell prostrate on his face; and all the accomplices professing now to a harm in the murder, a piece of his skull was struck off by one of them; upon which another scooped out the brains of the dead archbishop with the point of a sword, and scattered them over the pavement of the church.

Thus was affiancted in the 53d year of his age, and 5th of his pontificate, A.D. 1170. Dec. 29, Thomas Becket; — "a man," says lord Lyttelton, "of great talents, of elevated thoughts, and of invincible courage; but of a most violent and turbulent spirit; excessively passionate, haughty, and vainglorious; in his resolutions inextensible, in his repentances implacable. It cannot be denied that he was guilty of a wilful and premeditated perjury; that he opposed the necessary course of public justice, and acted in defiance of the laws of his country, laws which he had most solemnly acknowledged and confirmed; nor is it less evident, that during the heat of this dispute, he was in the highest degree ungrateful to a very kind master, whose confidence in him had been boundless, and who from a private condition had advanced him to be the second man in his kingdom. On what motives he acted can be certainly judged of by him alone, to whom all hearts are open. He might be misled by the prejudices of a bigoted age, and think he was doing an acceptable service to God, in contending, even to death, for the utmost excess of ecclesiastical and papal authority. Yet the strength of his understanding, his conversation in courts and camps, among persons whose notions were more free and enlarged, the different colour of his former life, and the suddenness of the change which seemed to be wrought in him upon his election to Canterbury, would make one suspect, as many did in the times wherein he lived, that he only became the champion of the church from an ambitious desire of hurrying its power; a power more independent upon the favour of the king, and therefore more agreeable to the haughtiness of his mind, than that which he had enjoyed as minister of the crown. And this suspicion is increased by the marks of cunning and falseness which are evidently seen in his conduct on some occasions. Neither is it impossible, that when first he assumed his new character, he might act the part of a zealot, merely or principally from motives of arrogance and ambition; yet afterwards, being engaged and inflamed by the contest, work himself up into a real enthusiasm. The continual prayers of those with whom he acted, the honours done him in his exile by all the clergy of France, and the vanity which appears to predominate in his later life, may have contributed to operate such a change. He certainly showed in the latter part of his life a spirit as fervent as the warmest intuitions; such a spirit indeed as constitutes ktesis, when it exercises itself in a cause beneficial to mankind. Had he defended the established laws of his country, and the fundamental rules of civil justice, with as much zeal and intrepidity as he opposed them, he would have deserved to be ranked with those great men, whose virtues make one easily forget the alloy of some natural imperfections; but unhappily his good qualities were so misapplied, that they became no less hurtful to the public weal of the kingdom, than the worst of his vices." Mr. Hume cloths his account of the affianctation of Becket with the following concise sketch of his character. He was "a prelate of the most lofty, intrepid, and inflexible spirit, who was able to cover to the world, and probably to himself, the enterprizes of pride and ambition under the disguise of fanfality and zeal for the interests of piety and religion. An extraordinary personage, truly, if he had been allowed to remain in his first station, and had directed the veneration of his character to the support of law and justice; instead of being engaged, by the prejudices of the times, to sacrifice all private duties and all public connections to ties which he imagined or represented as superior to every civil or political consideration. But no man, who enters into the genius of that age, can reasonably doubt of this prelate's sincerity." Another judicious historian (Dr. Henry) says of Becket: "He was evidently a man of very great abilities, particularly of consummate cunning, undaunted course, and invincible constancy in the prosecution of his designs. But his schemes were of a most pernicious tendency, to emancipate the ministers of religion from the restraints of law, and to subject his king and country to a foreign power. He was vain, obdurate, and implacable; as little affected by the entreaties of his friends, as by the threats of his enemies. His ingratitude to his royal master admits of no excuse, and hath fixed an indelible stain upon his character. Though his murderers were highly criminal, his death was very reasonable, and probably prevented much mischief and confusion."

The respect paid to the memory of Becket, after his death, was extravagant beyond all bounds, and remains on record as an evidence of the superlision and cruelty which prevailed at the period in which it occurred. The king of England, to whose commands it was generally imputed, was represented as "that horrible perfector of God, who exceeded Nero in cruelty, Julian in perfidy, and Judas in treachery," and the pope was loudly called upon by the kings of France and many prelats to draw the sword of St. Peter, and to inflict some exquisite punishment upon him. But none expressed greater grief and horror at this deed than Henry himself, who broke out into the loudest lamentations, refused to see any company, or admit of any consolation for three days. He also dispatched an embassy to Rome to vindicate himself from the imputation of having been the cause of it. All divine offices were suspended for nearly a year in the church where it had happened; and the church itself was, by order of the pope, re-consecrated. In 1173, Becket was canonized by a bull of pope Alexander; and a particular collect was appointed to be used in all the churches of the province of Canterbury, for expiating the guilt of his murder. In the
the following year, King Henry, on his return to England, went to Canterbury, where he did penance, and underwent a voluntary discipline, walking barefoot to his tomb, prostrating himself before it, and submitting to be fowndred by the monks, pulling all the day and night without any refreshment, kneeling on the bare stones, and bowing great benefactions on the church of Canterbury, as a token of his regard for the murder. His virtues, and the subjects of endless panegyric, and the miracles, operated by his relics, were more than usual, more numerous, more extraordinary, than those which had before filled the legend of any canonizer or martyr. Gervase of Canterbury informs us, that two large volumes of them were preserved in that church. In 1221, his body was taken up, in the presence of King Henry III. and a vast concourse of the nobility and others, and deposited in a rich shrine erected at the expense of archbishop Stephen Langton. This shrine was enriched with presents from all parts of Christendom; pilgrimages were performed to it for obtaining the martyr's relics in intercession with heaven; and it has been computed that, in one year, above 100,000 pilgrims arrived in Canterbury, for the purpose of paying their devotions at this tomb. "It is indeed," says Hume, "a mortifying reflection to those who are actuated by the love of fame, so justly denominated the bane of human minds, that the wise legislator and most exalted genius that ever reformed or enlightened the world, can never expect such tributes of praise as are lavished on the memory of a pretended saint, whose whole conduct was probably, to the last degree, odious or contemptible, and whose industry was entirely devoted to the pursuits of objects pernicious to mankind." Lyttleton's Hill. Henry IV. vol. ii. p. 321; &c. vol. iv. p. 361; &c. 8vo. Hume's Hist. of England, vol. i. p. 447; &c. 8vo. Hume's Hist. of Great Britain, vol. v. p. 340; &c. 8vo.

BECKET, WILLIAM, son of Isaac Becket, a surgeon of some eminence at Abingdon, in Berkshire, under whom he received his education, was born in the year 1684. At a proper age, he was sent to London, and was for some years pupil to Mr. Jef. Bateman, surgeon to St. Thomas's hospital in Southwark. That he was diligent in cultivating his profession, appears by the early specimens he gave of the result of what he had seen in practice; for in 1707, he published a collection of chirurgical observations, containing relations of some curious cases that had fallen under his notice; and in 1712, "New Discoveries in the Cure of Cancers," and soon after, a record of the case of Dr. James Keil, the celebrated physician and mathematician, who died of a cancer in his mouth. Becket had been accused of mismanaging this case, and therefore published the account in vindication of his practice. In his New Discoveries, he pretends to have been frequently successful in removing cancerous tumours, by means of a digestive, the manner of preparing which he does not however disclose. In a subsequent edition of this work, he gives the description of a medicine, which had been used successfully, it was said, in eradicating cancers by the family of the Paines of Northampton. It consists of yellow arsenic and holy arsenic, mixed to the confidence of a pulse with the pulp of an apple. It is called the red caustic. A similar preparation has been since used by Trenchet and others. In 1721, he published two letters addressed to Sir Hans Sloane, in which he refutes the current opinion of the efficacy of the royal touch in curing the evil, which was perhaps preparatory to his being elected fellow of the Royal Society. About this time he published proposals for printing an account of the lives and writings of the most eminent British writers in medicine, in 2 vols. 8vo, which he did not however complete. Dr. Milward, who had formed a similar design, is said to have purchased what manuscripts were left by him on this subject, of his executors; but neither did he carry his intention into execution. It is probable that, while making this search after ancient British writers, Becket met with accounts of the disease called a brenne, and conceiving that to be a symptom of the venereal disease, he was induced to publish his three dissertations on the antiquity of that complaint, which was known, he says, before the discovery of the West Indies by Columbus. These were first printed in the Philosophical Transactions. Becket died at Abingdon in 1738. His works were collected together, and published in 9 vols. 8vo. in 1740, by the noted Mr. Edmund Curl.

BECKET, ISAAC, a mezzotinto engraver of some eminence, was born in Kent in 1653, was originally an apprentice to a calico-printer, and obtained the secret of scoring mezzotinto from one Loyd, a print-feller, with whom he lived for some time. He afterwards connected himself with an engraver in mezzotinto, with whom he had been acquainted at an earlier period of his life, and whom he assisted, as he drew better and more expeditiously than himself. His mezzotintos are often clear and well scraped; but his middle tints are not sufficiently distinguished, so that his shadows appear flat and heavy. One of his best prints is engraved on a middling-sized upright plate, representing Adrian Beveland drawing from a stature, and having in the back ground monuments, pyramids, and several relics of antiquity. The time of his death is not known. Strutt.

BECKET, ST. THOMAS, Brotherhood of, in Commerce, a name given to the most ancient company of English merchants, by which the city furnishes any record, which was established about the end of the 13th century, and thus called in honour of Becket. The design of this company was to export the woollen cloth, which about that time began to be manufactured in considerable quantities in England; and as that manufacture increased, the trade of the brotherhood also increased. Henry IV. A.D. 1406, incorporated this company by a charter, regulating their government and their privileges. By this charter, any merchant of England or Ireland, who defined it, was to be admitted into the company on paying a small fine. This society was composed of the native subjects of the kings of England, it was favoured both by government and by the people, made gradual encroachments on the trade of the merchants of the staple, and at length ruined that company. Anderton. Comm. vol. i. p. 233, 260, &c. See Staple.

BECKET, in Geography, a township of America, in Berkshire county, Massachusetts, containing 751 inhabitants, 10 miles east of Stockbridge, and 150 west from Boston.

BECKETS, in the Marine, signify large hooks, or circular wreaths of rope, or wooden brackets, used to confine ropes, tackles, oars, or spars, in a convenient place, till they are wanted. And to put the tacks and fliers in the becket, is to hang up the weather-main and fore-sheet, and the lee-main and fore-tack, to a little knot and eye-becket on the fore-mast, main, and fore-shrouds, when the ship is close-hauled, to prevent them from hanging in the water. Some becketes have an eye spliced in one end, and a small walnut-knot crowned at the other, and some have both ends spliced together like a wreath. The noose made at the breast of a block, to make fast the tailing part of a fall-to, is also called a becket.

BECKINGTON, THOMAS, in Biography, an English prelate of the 15th century, was born in the parish of Beckington, in Somersetshire, towards the close of the 14th century, educated at Wykeham's school, near Winchester, and
and finished his studies at New College, Oxford, of which he was admitted fellow in 1408. After several ecclesiastical preferments he became dean of the arches about the year 1439, and was employed by a synod held in St. Paul's church, London, in conjunction with two other persons, to draw up a form of law, by which the prosecution of the Wickliffites, or Lollards, was to be conducted. Whilst he was tutor to king Henry VI. he wrote a book, preferred in manuscript in the Cottonian library, in which he strenuously opposed, in opposition to the Salique law, the right of the kings of England to the crown of France; and then gaining the special favour and patronage of that prince, he was made secretary of state, keeper of the great seal, and bishop of Bath and Wells, to which he was consecrated in 1443. He is represented as having been well skilled in polite learning and history, and very convervant in the holy scriptures; as a good preacher, and as a generous patron of ingenuous and learned men, so that he was called the Maccenas of his age. His works of munificence and charity were numerous. He finished Lincoln college in Oxford, procured an endowment for New College, in 1449; laid out a considerable fund of money in repairing houses belonging to his fee; and erected the well side of the cloisters at Wells, and also a conduit in the market place of that city. He died at Wells, in 1455. A large collection of his letters is preferred in the library at Lambeth; and a volume of sermons and some other treatises are ascribed to him. Boc. Brit.

BECMARÉ, in Entomology, a genus of insects established by Geoffroy. See RHINOCERUS.

BECOUYA, in Geography. See BIXIA.

BECIBANGIL, a name sometimes given to a province of Asia, which is a part of Anatolia, bounded on the north by the Black sea, on the west by the sea of Marmora and the Archipelago, on the south by Natolia proper, and on the east by the province of Boll. The capital is Bursa.

BECTIVE, in the county of Meath, Ireland, where are considerable ruins of an abbey which belonged to the Cistercians. It was founded by Murchard O'Melachlin, king of Meath, in 1145; and being richly endowed, the abbots had a place among the peers in the assemblies of parliament, and wore a mitre. The cloisters with a tower are almost entire. It was piously situated on the banks of the Boyne, over which river there was a bridge; and at present a little village, called Bective-bridge-end, has two fairs annually. It is 3 miles from Trim, and about 24 from Dublin. Monastic Hibern. Ware's Antiquities.

BECTASSE, a feet among the Turks denominated from their founder Bectash, preacher to sultan Amurath. All the Janizaries belonging to the Porte are of the religion of Bectase, and are said to have derived their origin from the founder of this sect. Their habit is white; on their heads they wear white caps of several pieces, with turlans of wool twisted rope-fashion. They observe constantly the hour of prayer, which they perform in their own buildings, and they make frequent declarations of the unity of God.

BED, a place prepared to stretch and compose the body on, for rest and sleep; made chiefly of feathers inclosed in a tissen cover. Of beds there are several sorts: as a feather-bed, a down-bed, a flanding-bed, a fettebed, a tent-bed, a truckle-bed, &c.

In the first and ruder ages of mankind, it was the universal practice to sleep upon the skins of beasts. This was the custom among the Greeks and Romans, and also among the Celtic nations, and ancient Britons. This custom prevailed till modern times among the common people in some parts of Germany. These skins, some of which are worn in the day, were spread at night on the floors of their apartments. In process of time, these skins were changed for loose rushes and heath, and afterwards for straw. Pliny (L. viii. c. 48, l. xvi. c. 36.) says, that the beds of the Roman gentility were generally filled with feathers, and those of the inns with the soft down of reeds. Straw was used, even in the royal chambers of England, to late as the close of the 16th century. Beds, filled with chaff, heath, or straw, are used by the common people in many parts of Great Britain and Ireland, and also in France and Italy at this day. Beds were for a long time laid upon the ground; till at length the custom of raising the beds on feet or podestals, which anciently prevailed in the East, and which was introduced into Italy, was adopted in Britain. But fill the materials of which beds are made, and the manner of disposing them, vary among different races, and in different nations. By the English notices, no beds are to be fold, except filled with one sort of stuffing only; e. g. feather beds with only dry pulled feathers; and down beds with clean down alone. No feathered feathers are to be mixed with the former; nor down with the latter, on pain of forfeiture; the mixture of such things being conceived as contagious for man's body to lie on. Stat. 11 Hen. VII. c. 19.

Allo bed quilts, mattrafs, and cushions filled with horse-hair, fen-down, goats' hair, and neat's hair, which are dried in lime; and which the heat of man's body will cause to exhale, and yield a noxious fum, whereby many of the kings' subjects have been destroyed, are prohibited by the same statute.

The ancient Romans had various kinds of beds for repose; as their letus cubiculaiia, or chamber-bed, wherein they slept; their tabor-bed, or letus defenbitorius, wherein they eat (for they always ate lying, or in a recumbent posture), there being usually three persons to one bed, whereof the middle place was accounted the most honourable, as well as the middle bed. See TECLINIUM. These beds were unknown before the second Punic war; the Romans, till then, put down to eat on plain wooden benches, in imitation of the heroes of Homer; or as Varro expresseth it, after the manner of the Lacedaemonians and Cretans. An innovation in this practice is ascribed to Scipio Africanus, who brought from Carthage some of those little beds, called "Panicae," or "Archaei," which were of wood, very low, stuffed only with hay or straw, and covered with the skins of sheep or goats, "hadinis pallibus inflati." These beds in respect of delicacy differed little from the wooden benches; but when the custom of bathing prevailed, the practice of retiring themselves more commodiously by lying along than by sitting down, was adopted. As for the ladies, it did not seem at first confident with their modesty to adopt the mode of lying; accordingly, they kept to the old custom all the time of the commonwealth; but, from the first Cæsars, they ate on their beds. As to the youth, who did not yet put on the toga virilis, they were long kept to the ancient discipline. When they were admitted to table, they only sat on the edge of the beds of their nearest relations. Never, says Tacitus, did the young Cæsars, Cæns and Lucius, eat at the table of Augustus; but they were set "in imo loco," or, as Tacitus expresseth it, "ad lefì fulera." From the greatest simplicity, the Romans, by degrees, carried their dining beds to the most surprising magnificence. Pliny affiures us, it was no new thing to see them covered over with plates of silver, adorned with the softest mats, and the richest counterpanes. Hist. Nat. lib. xxxiii. cap. 11. Lampridius, speaking of Heligabalus, says, that he had beds of folid silver; and Pompey, in his third triumph, introduced beds of gold. They had also their letus lucubratorius, on which they studied; and
Beds of State. See PARLIAMENT.

Beds of Justice. Lit de Justice, in the French Lutres, denoted a throne on which the king used to be seated in parliament. In this suite, he was first to hold his lit de justice, when he went to the parliament of Paris, and held a solemn session, under a high canopy erected for the purpose.

The bed of justice was only held on affairs relating to the state; on which occasion, all the officers of the parliament appeared in red robes; at other times they wore black ones. Several authors have treated expressly on the ceremonies of the bed of justice.

Beds of a great Gun, is a piece of plank laid within the check of the carriage, on the middle transom, for the breach of the gun to roll on.

Beds, or Stool of a Mortar, is a solid piece of oak, in form of a parallelepiped, bigger or less, according to the dimensions of the mortar, hollowed a little in the middle to receive the breech and half the trunnions. On the sides of the bed are fixed the checks or brackets by four bolts of iron.

In ships, when the decks lie too low from the ports, so that the carriages of the pieces, with the trucks, cannot mount the ordnance sufficiently, it is that they lie too near the gunwale, the method is to make a false deck for so much as the piece will require for her traversing to raise it higher, and this they call a bed.

Beds, in Gardening, a small elevated plot or compartment of ground, of three, four, or more feet in breadth, which is useful in the culture of many sorts of plants, especially those of the smaller kinds. It is always an eligible practice to sow and prick out different sorts of small plants on beds having narrow alleys between them, for the greater convenience of weeding, watering, gathering, &c. as by this means such operations can be performed without trampling on the crops. Thus the ground intended for asparagus and strawberries should be divided into four feet wide beds, with eighteen inches or two feet alleys between them. Onions are likewise cultivated to the best advantage on four feet wide beds, having ten or twelve inch alleys; the different sorts of lettuce and endive should also be sown and transplanted into separate beds occasionally; and also various sorts of small plants, which can be more conveniently cultivated on beds, or in borders of similar widths. Early radishes are generally grown on beds, or similar compartments, being more convenient for the purposes of covering them occasionally in frosty nights, and for weeding, thinning, watering, and gathering them.

All sorts of plants that are particularly intended for transplantation, should be sown in beds or narrow borders, so as to admit of standing to weed, water, and draw the plants, without treading upon them; and for the same reason, all plants necessary to be pricked out previously to their final transplantation, should also be put out on such beds; as celeriac, cabbages, cauliflowers, broccoli, &c. Aromatic and medicinal herbs of all sorts should also, for the greatest part, be disposed in beds with twelve or fifteen inch alleys between, or at least in borders of similar widths; particularly mint, thyme, savory, marjoram, farge, hyssop, balm, pennyroyal, tansy, turron, feverfew, rue, &c. as this method of bedding all sorts of small plants is not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations not only more commodious for performing the necessary operations, but has an air of uniformity which is constantly to be observed in garden work.

The most proper dimensions for beds of this sort, as has been observed, is four feet or four feet and a half in width, the length at pleasure, with intervening shallow alleys of from nine, twelve, or fifteen inches to two feet width, according to the different sorts of plants, so that a person in the alleys may easily reach half across them to do the necessary work without trampling the plants down, or treading the surface of the ground hard.

Where flower gardens are wanted to be distant from the general pleasure ground, the spaces should be divided into regular parallel beds, of three or four feet in width, with eighteen inches or two feet wide alleys, especially when chiefly intended for the curious sorts of bulbous-rooted flowers, such as tulips, hyacinths, ranunculuses, anemones, and other choice sorts, where, by being deposited together in beds, having intervening alleys, they admit of raising between them, to perform the necessary bounds of culture more easily, as also to view the plants when in flower. Many sorts likewise appear to greater advantage in this way.

The beds, in these cases, should be neatly edged with box or threes. See EDGING.

The grounds of nurseries intended for raising all sorts of flowers from seeds, slips, cuttings, parting of roots, &c. should also be divided into beds of three or four feet in width. And in large nurseries for trees, the ground intended for the reception of cuttings of most sorts of hardy trees and shrubs, should also be generally divided into three or four feet beds, having twelve or fifteen inch alleys between them.

Beds in common should only be raised a very little higher than the alleys, unless in cafes of too much flagrant moisture, three or four inches higher than the level of the alley is mostly sufficient; for when raised considerably, the alleys assume the appearance of trenches, and have a disagreeable effect.

The earth of all sorts of beds should be well broken down, and laid as even as possible in digging them over, being afterwards raked into neat order on the surface.

Beds for raising melons, mushroom, and the like, are commonly denominated ridges.

Beds, in speaking of hops, denote the floors whereon they are spread to dry.

Beds of Corn, is a heap, flat at top, three or four feet high, otherwise called a course.

Bed-slings, a name given by the Arab Algenomeos to a fixed flare of the frisk magnitude, in the right shoulder of Orion. Bed-slings is of a reddish colour, by which it is easily distinguished.

Bed, in Mosaic, denotes a course or range of stones.

Bed, Joint of the, is the mortar between two stones placed over each other.

Bed, in Sea Language, a flat, thick piece of timber laid under the quarters of ships, containing any liquid, and floated in the ship's hold.

Bed of a River, the bottom of the channel in which the steam flows.

Beds, in speaking of minerals and fossils, signify certain strata, or layers of matter, deposited over each other.

Beds, in the New Husbandry, denote the spaces occupied by the rows of corn, in contradistinction from the open spaces between them, which are called alleys.

BEDALACH, in the Materia Medica, a name given by some writers to the gum bdellium; but particularly to that kind of it which was brought from Arabia, and was of a yellowish colour, like wax.

BED-CHAMBER.—Lords or Gentlemen of the Bed-Chamber, are persons of the first rank, fourteen in number, whose office used to be, each in his turn, to attend a week in the king's bed-chamber, lying by the king on a pallet.
Bede

BED. York. The cornice to the being may be'nt, and his particularly 1587, but Bede, fornt, and his re-

BEDA, or Bede, distinguished by the epithet Venerable, in Biography, a learned monk of the eighth century, and one of the best writers of his time, was born in the neighbourhood of Werrmouth, in the bishopric of Durham, in 672 or 673. At the age of seven years he was brought to the monastery of St. Peter, founded near the place of his nativity about two years after he was born; and the care of his education was entrusted with abbout Benedict, his succ-essor Ceolfrid, and John of Beverley, for twelve years. Endowed with an excellent genius, and distinguished by affici-

ous application, his progress in various branches of learn-
during this period, was very considerable. At the close of it, or when he had attained the age of 10 years, he was ordained a deacon by the late mentioned preceptor, then bishop of Hexham, and afterwards archbishop of York. About this time he seems to have removed from the monas-
fery of St. Peter's at Werrmouth, where he was educated, to that of St. Paul's at Jarrow, near the mouth of the river Tyne, founded, as the former had been, by the abbout Be-

die. Here he was employed in the profession of his own studies, and in aiding those of others who resorted to this monastery for instruction. His whole life, which he spent in this retreat, was devoted, as he himself informs us, to the exercises of devotion in the church, and to those of teaching, reading, and writing. At the age of 30, A.D. 702, he was ordained priest by the same person from whom he had received deacon's orders. Although he lived in re-

tirement, the fame of his learning and character soon spread over Europe; so that pope Sergius addressed a letter to abbot Ceolfrid, in which he urged him to send Bede to Rome. The death of the pope, which probably happened soon after this letter was written, prevented Bede from leaving his own country; nor indeed does it appear, with sufficient evidence, that he ever quitted Northumberland, though some have said that he visited the university founded at Grantham or Cambridge, and this fact they allege as a proof of the antiquity of this university. Within the walls of the monastery, in which he chose to reside, he was indefatigable in the acquisi-

tion of knowledge, and in the communication of it to others. It appears from his numerous works on a variety of subjects, that his knowledge comprehended every kind of literature and science that was known at the period in which he lived; and from other collateral evidence of unquestion-
nable authority, that he was justly entitled to the appellations of "the wise Saxon," and of "Venerable Bede," conferred on him by his contemporaries, and uniformly retained by posterity. From his never having accepted any preference above the humble rank of an unbeneficed priest, we may infer his singular moderation; his letter, addressed to his inti-
mate friend, the learned Egbert, archbishop of York, and containing excellent advice, the result of long experience, evinces the purity of his morals and the liberality of his sentiments; and as he was never canonized as a saint, and the legends of the time record no miracle performed by him, we may reasonably conclude, that enthusiasm and the spirit of his order formed no part of his character. He appears in-

deed, as one of his biographers sums up his account of him, "to have possessed the rare association of learning with mo-
delty, of devotion with liberality, and of high reputation in the church with voluntary and honourable poverty."

The largest and most popular of Bede's works is his his-
tory of the church, intitled, "Ecclesiastica Historia Gentis Anglorum libri quinque," and first published in 731, the year to which he continued his history of Christianity from its first introduction into Britain. In collecting materials for this history, he consulted several chronicles of the Eng-

lish kings before his time; he kept up a correspondence in the several kingdoms of the heptarchy, and he had recourse to various records and archives preserved in several monas-
faries; and his history has been regarded as containing the most authentic and comprehensive account of the early lane of Christianity in this country. The famous Milton, indeed, has objected to this history, that it is deficient with regard to the civil affairs of the country, which are mentioned very curiously, and which form rather a calendar of dates, than a regular history; but if it be duly considered, that his objec-
t was the rate of the church, and not the secular tran-

sections of the period which his history comprehend, this objection must appear to be urged against it without sufficient reason. Milton himself confess'd, that he travelled with much worse guides after he parted with Beda. The charge that has been alleged against him, of partiality to the Saxons in preference to the Britons, seems to be less exceptional.

But the chief objection to which his history is liable, is the diffuse account which he introduced of legendary miracles and of other trivial and absurd circumstances, extracted without sufficient discrimination and with apparent credulity from the chronicles to which he had access; and yet, when we recollect the period in which he lived, and consider, that the principal transactions of the church upon record confided of such fooleries and impurities, we may admit some apolo-

gy for a writer who wished to approve himself a faithful historian. Without advertising to the censures of M. du Pin, which extend to the style and subjects of Bede's works in general, and which are amply flated and satisfactorily obvi-
ated in the Diclg, Brit. it may not be improper to mention the objection urged by father Pezon against the chronology of Bede. This father, who has taken great pains, after Hane Vossius and father Morin, to support the chronology of the Septuagint, informs us, that Bede was the first who endeavoured, in the western church, to maintain the shorter chronology of the Hebrew text; and archbishop Uther, in his "Sacred Chronology," observes, that Bede was con-

idered as an heretic on account of this innovation. However, his computation was afterwards received, and scarcely any other was admitted in the west till the three learned men above-mentioned appeared in defence of the contrary opinion. If Bede, therefore, was singular in being an advocate for the Hebrew chronology, this singularity affords evidence of his learning, penetration, and good sense. The author's ecclesiastical history is written in easy, though not very ele-

gant Latin; and as to the faults in his style, which form, and particularly Du Pin, have cenured, they will not ap-

pear to be very great, if compared with contemporary writers; and to compare him with others is certainly unjust.

Of the Latin original of this History there have been several editions with notes and commentaries; particularly at Ant-

werp in 1550, at Heidelberg in 1587, at Cologne in 1601, at Cambridge in 1644, and at Paris in 1681, and at Cam-

bridge in 1722. A Saxon version attributed to king Al-

fred, with learned notes by Abraham Wheeloc, was printed at Cambridge in 1644; and an English translation by Dr. Stapleton was printed at Antwerp in 1505. The design of the latter translation was to support the popish religion, and of course it is not deemed very faithful; but the history of

Vol. IV.
Bede, even as he has given it in English, might in many passages be flown to be far enough from favouring the doctrines of the church of Rome.

The last literary labor of venerable Bede, was "A Translation of the Gospel of St. John into the Saxon Language," which he completed with difficulty on the day and hour of his death, which happened on the 26th of May, A.D. 735. The disorder of which he died was an Atmnia; and he bore the pain that attended it with exemplary fortitude and patience, discharging the duties of his office, and prosecuting the works in which he was engaged, and which he wished to finish, with unabated fertility. During many sleepless nights, he is said to have sung praises to Almighty God; and in the prospect of dissolution, he did not discern his apprehensions of it, though he expressed the utmost confidence in the divine mercy, and was able, on a review of his conduct, to declare seriously that he had so lived, as not to be ashamed to die. During an act of devotion, and whilst he was pronouncing the last word of it, he expired. It would be easy to cite a great number of testimonies to the extent of Bede's learning, as well as to the excellence of his character. William of Malmesbury, after giving him an extraordinary character, tells us, "that it was much more easy to admire him in thought, than to do him justice in expression." Pole affirms us, that he was so well skilled in the works of pagan authors, that he had fearedly an equal in that age, and that he learned natural philosophy and mathematics from the purest sources, the Greek and Latin authors themselves. Pits says, that he was so well versed in all the branches of learning, that Europe fearlessly ever produced a greater scholar in all respects: that even, while he was living, his writings were of such authority, that it was ordered by a council held in England, and approved afterwards by the catholic church, that they should be publicly read in the churches; that from his earliest years, he was remarkable for his piety and love of learning, alternating without interruption his prayers and his studies; and that his intense application furnished him with a complete knowledge of poetry, rhetoric, natural philosophy, metaphysics, astronomy, arithmetic, music, geometry, colomgraphy, chronology, history, and the whole circle of the liberal arts, and all parts of mathematics, philosophy, and divinity. Camden represents him as the sanguine light of our England; and many testimonies in his favour may be found in the works of our historians and antiquarians, such as Holland, Stowe, Speed, Selden, Sir Henry Spelman, Stillingfleet, Mabillon, Wharton, &c.

Bede's History, the translation of St. John's gospel, and the letter to Egbert, already mentioned, there are a great many works, both published and in manuscript, that have been attributed to Bede; some of which, however, are of dubious genuineness. They are enumerated in the Biographia Britannica, Cave's Hist. Lit. and in the appendix to the fourth volume of Henry's History. They compose a very miscellaneous collection of versions and commentaries upon several books of the Old and New Testament, of legends, and theological dissertations; among which are some of greater value on the scripture chronology, and many elementary compilations, for the use of his scholars, on the subjects of arithmetic, grammar, rhetoric, astronomy, music, and natural philosophy. The first general collection of his works appeared at Paris, in 1544, in 3 vols. folio; and again in 1544, at the same place, in 8 vols.; at Basle, in the same size and number of volumes, in 1503, reprinted at Cologne, in 1612, and at the same place in 1688. Several of Bede's works have been separately printed; and those treatises, which are mentioned in his own catalogue of his works, are nexted to his ecclesiastical history, were published by the learned and industrious Mr. Wharton, from three manuscripts in the archiepiscopal palace at Lambeth, London, 1693, 4to. Cave's Hist. Lit. vol. i. p. 612, &c. Henry's Hist. vol. iv. p. 26, &c. Wharton's Hist. Poetry, vol. i. diff. 2. Biog. Brit. Gen. Diff.

It is from the Ecclesiastical History of this worthy monk, that we know any thing concerning music in our country during the seventh and eighth centuries, the most barbarous period of its annals. In his account of the conversion of the Saxons to Christianity, he speaks of litaniæ and acludades being sung in the Gregorian manner, according to the Roman ritual, when bishop Stillingfleet thinks that the goodness of the music was the principal incitement to the reception of the mafs by the Saxons.

Bede was himself an able musician, and is supposed to have been the author of a short musical tract. "De Musica Theorica, et Practica seu Monumunt." Of the two parts of this treatise ascribed to Bede, the first may have been written by him; the second, however, is manifestly the work of a much more modern author; for we find in it, not only the mention of music in two or three different parts, under the name of difcant, but of inscriptions never mentioned in writers contemporary with Bede; such as the organ, viol, viola, etc., &c. A notation too of much later times appears here, in which the long, the breve, and semibreve, are used, and these upon five lines and spaces, with equivalent rests and pauses. The word modus is also used for time in the sense to which the term modus was applied after it ceased to mean key. Upon the whole it seems as if this last part of the tract attributed to Bede, was written about the twelfth century; that is, between the time of Guido and John de Muris.

Bede, however, informs us that, in 660, John, precentor of St. Peter's in Rome, was sent over by pope Aga-tho to instruct the monks of Weremouth in the art of singing, and particularly to acquaint them with the manner of performing the festival services throughout the year, according to that which was practised at Rome. And such was the reputation of his skill, that "the masters of music from all the other monasteries of the north came to hear him; and prevailed on him to open schools for teaching music in other places of the kingdom of Northumberland." And it is from Bede's information that we have any knowledge of the local and domestic singing to the harp in the Saxon language, upon our island, at the beginning of the eighth century; which is amply detailed in bishop Percy's essay on the ancient English minstrels. Reliques of Ancient Poetry.

Beda, or Bede, NOEL, a doctor of divinity in the university of Paris, was a native of Picardy, and flourished in the beginning of the sixteenth century. His temper was violent and impetuous, and he was a great enemy to every kind of innovation and reform. Erasmus and Faber Stapulenses, who were great promoters of literature, were the objects of his vehement attack. Against the scriptural paraphrases of the former he wrote a book, in which Erasmus detected many misrepresentations and calumnies; and yet such was his influence among his brethren, that he induced the faculty of divinity to confine the works of his antagonist. In his opposition to the design of Francis I. for obliging the Sorbonne to concur with the other universities of France in giving a favourable opinion concerning the divorce of Henry VIII. of England, he acted a more justifiable part; but he injured his character, and ruined his cause, by his passion and turbulent behaviour, and involved himself in the crime of perjury. After having made the amende honorable, by publicly acknowledging that he had spoken against truth and
and the king, before the church of Notre Dame, he was committed to prison in 1535, and afterwards sentenced to be beheaded at the abbey of mount St. Michael, where he died in the year 1537. He was a furious persecutor of the protestants, and one of the chief promoters of the punishment of Lewis de Berquin, the protestant martyr. His Latin works were a treatise “De unicia Magdelana,” against Faver, Paris, 1519; “Two books against Faver’s Commentaries and Erafmus’s Paraphrases,” Paris, 1526; “An Apology against the secret Luthermans, Paris; and “An Apology for the daughters and grand-children of St. Anne,” against Faver. His works in French were “A Redition of the Benediction of the Paschal taper,” and “A Confession of Faith.” Gen. Dict. Nouv. Dict. Hist.

BEDA, a sacred book of the religion and law of the Brahmins of Hindoostan, called also Vedam and Pidiam, which fee; see also BRACHMANS, and SHASTA.

BEDALE, in Geography, a market town of England. It is situated in that division of the north riding of Yorkshire called Richmondshire, at the distance of 6 miles from North Allerton, and 223 miles north of London. Situated on the bank of a small river, it enjoys a pleasant and fertile situation; but being at some distance from any public road, its principal trade is derived from a weekly market and five annual fairs. The fare are abundantly supplied with horses; the buying and selling of which is the chief, which of many persons in this part of Yorkshire. The rector of the town is very valuable; and the church, which is a large handsome structure, contains some ancient monuments, one of which commemorates Brian Fitz Alan, the last male heir of that family. A Roman road passed through this town to Barnard castle, &c.; and some Roman encampments are remaining on the high grounds between this town and Ripon. Here is a charity school; and the township contains 226 houses, with 1005 inhabitants.

BEDANG, a commentary on the Beda of the Brahmins of Hindoostan, called also Shafter or Shafash; which fee.

BEDARRIEUX, in Geography, a town of France, in the department of the Herault, and chief place of a canton, in the district of Beziers, seated on the Orbe, 53 leagues north of Beziers. The inhabitants carry on a manufacture of druggets and other woollen stuffs. N. lat. 43° 27'. E. long. 3° 24'.

BEDAS, BEDANS, or VADHANS, a name given to a species of savages, who occupy a small district in the northern part of the island of Ceylon, and who seem to be (says Buffon) of a peculiar race. The spot which they inhabit is entirely covered with wood, where they conceal themselves in such a manner, that it is difficult to discover them. Their complexion is fair, and sometimes red, like that of the Europeans. Their language has no analogy to that of any of the other Indian languages. They have no villages or houses, and hold no intercourse with the rest of mankind. Their arms are bows and arrows, with which they kill a number of bears, tigers, and other animals. They never dye their meat, but season it with honey, of which they have great abundance. The wildfowl of these woodland wanderers recognize no authority, except that of their own chiefs; but others, without formally acknowledging the sovereignty of the king, furnish him with ivory, wax, and deer. Such of them as live in the European territories, barter their articles with the Cingalese for the simple things which their mode of life requires. To prevent themselves from being surprized or made prisoners, while carrying on this traffic, the method they employ is curious: when they stand in need of cloth, iron, knives, or any other articles of smith’s work, they approach by night some town or village, and deposit, in a place where it is likely to be immediately discovered, a certain quantity of their goods, along with a talipot leaf expressive of what they want in return. On a following night they repair again to the same place, and generally find their expected reward awaiting them. For although they are easily satisfied, and readily allow the advantage to the perfidy with whom they deal, yet if their requests are treated with neglect, they will not fail to watch their opportunity of doing him a mischief. The Cingalese, as they can afterwards dispose of the articles afforded by the Bedas, find the traffic profitable; and in some parts frequently go into the woods, carrying with them articles of barter. This trade, however, can only be carried on in the manner already described; for no native of the woods can be more afraid of approaching a stranger than the Bedas. Few will venture even to converse with other natives; but the wilder classes, known by the name of "Ramba-Vaddhans," are more seldom seen even by stealth than the most timid of the wild animals. The origin of this small tribe, who live in detached families, is unknown. These Bedas, as well as the Chacrelas of Java, who are both fair and few in number, appear (says Buffon) to be of European extraction; and he conjectures, that some European men and women have been formerly left on these islands by shipwreck or otherwise, and that, for fear of being maltreated by the natives, they and their descendants confined themselves to the woody and mountainous parts of their country, where they retain a savage life. See Ceylon.

BEDASPES, in Ancient Geography, the name given by Ptolemy to the Hydaspes, or modern Bolhut, a river of Hindoostan. See HYDASPES, and BEHUT.

BEDAT, Je, in Geography, a river of France, which runs into the Allier, near Montferrand.

BEDBURG, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne, seated on the Erlf, 14 miles west of Cologne. N. lat. 51° E. long. 6° 20'.

BEDDING, herb, in respect of horses and other cattle, denotes straw or litter spread under them to lie. Bedding, in speaking of a roe, is used by sportsmen for the lodging of that beast. A roe is said to bed; a hart to harbour; a fox to kennel.

BEDE POINT, in Geography, the eastern cape at the mouth of Cook’s river, on the north-west coast of North America.

BEDEA, Badea, or Baideah, the name of a valley near the Red sea, which, according to Niebuhr, is 6 German miles from Suez, and where the sea (Bruce says) is something less than 4 leagues broad, by 50 fect deep. This valley ends in a pass between two considerable mountains, called Gewoube on the south, and Jibbel Attakah on the north; and opens into the low triangle of country which runs along the Red sea. The mouth of this valley, opening to the flat country and the sea, was called "Pilahirotth;" and through this valley it has been supposed that the Israelites made their passage from the pursuing army of Pharaoh to the Red sea; and it is added, that they encamped in the bay which terminated this valley, at Pilahirotth, opposite to Baalzerphon (which fee), between Migdol and that sea. In its circumstances, says Dr. Shaw, the Egyptians might well imagine, that the Israelites could have no possible way of escape; inasmuch as the mountains of Gewoube would stop their flight or progress towards the south, as those of Attakah would prevent their passing towards the land of the Philistines: the Red sea like wise lay before them to the east; whilst Pharaoh closed up the valley behind them, with his chariots and horsemen. This valley, adds Dr. Shaw, is called "Tish Beni Israel," i.e. the road of N.
the Israelites, from a tradition, that is still kept up by the Arabs, of their having passed through it. It is also called "Badeah," he says, from the new and unheard-of miracle, that was wrought near it, by dividing the Red sea, and destroying in it Pharaoh, his chariots, and horses. Bruce observes, that Dr. Shaw, by interpreting "Badeah" as the "valley of the miracle," forces an etymology, because there was yet no miracle wrought, nor was there ever any in the valley. But "Badeah," he says, means "barren," and "uninhabited;" such as we may imagine a valley between rocky mountains, a desert valley. To his translation of "Jebel Attabak," as the "mountain of deliverance," Bruce objects, that so far were the Israelites from being delivered, on their arrival at this mountain, that they were then in the greatest distress and danger. Attabak means, according to this traveller, to "arrive," or "come up with;" either because they arrived within sight of the Red sea; or it might more probably derive its name from the arrival of Pharaoh, or his coming in sight of the Israelites, when encamped between Migdol and the Red sea. Shaw's Travels, p. 302. Bruce's Travels in Abyssinia, vol. i. p. 232, &c.

A late writer observes, that this hypothesis of the passage of the Israelites at Bedea, has been given up by our best modern critics; and that the "Sinus Hermonitans," or gulf of Suez, pitched upon as the scene of action. The idea was first suggested by Le Clerc, and since adopted and defended by Michaelis, Niebuhr, and almost all the German commentators. Mr. Bryant, however (Obf. on the Plagues of Egypt, p. 978.), still contends for Bedea, and calls the arguments of Niebuhr prejudices and misconceptions. The writer, to whom we now refer, who excludes from this everything that was miraculous, contends for the pass at Suez, or not far from Suez, where, he says, at this time there are shallows fordable at low water, and which might, in former times, have been frequently dry. Geddes's Critical Remarks, vol. i. p. 225. See Suez.

BEDE, a town of France, in the department of the Ille et Vilaine, and chief place of a canton, in the diocese of Montfort, one league N. of Montfort.

BEDEGUAR, in the Materia Medica, the name of a fungus, or gall, growing upon the rose plant (rofaliservica), which belongs to the class of alringents, as it is posseffed of and celebrated for its alringent power; but it has hardly yet got a place in our dispensatories, and we are quite unacquainted with its powers. Cullen's Mat. Med. vol. i. p. 36.

BEDE, or Bede, in Geography, lies in the gulph of the river of St. Lawrence, on the south-west coast of the island of St. John's, in North America, and is situated S. by E. from Enmont bay, on the same coast of the island.

BEDIKILL, William, in Biography, an eminent prelate of the English church in Ireland, was born at Black Notley in Essex in 1570; and being designed for the church, was educated at Emanual college in the university of Cambridge. Having been chosen fellow of his college in 1593, and taken his degree of bachelor of divinity in 1599, he removed to St. Edmundsbury in Suffolk, where he continued in high estimation for his attention to the duties of his profession till he accompanied Sir Henry Wotton to Venice, as his chaplain. Here he became intimately acquainted with Father Paul Sarpi, who taught him the Italian language, into which he translated the English common prayer book; and in return for the favour conferred upon him by father Paul, he drew up an English grammar for his use, and affix'd him in his studies. During his stay at Venice, he availed himself of the affluence of Rabbi Leo, in acquiring the knowledge of the Hebrew language, and of Rabbinical learning; and by his means he had an opportunity of purchasing a very fair MS. of the Old Testament, which cost, it is said, its weight in silver, and which he presented to Emanuel college. He also formed an acquaintance with Antonio de Donninus, archbishop of Spalato, and communicated to him several corrections of his book "De Republica Ecclesiastica," afterwards printed in London. Upon his leaving Venice, after a residence of eight years, he received from father Paul, as tokens of his esteem and friendship, his picture, and several valuable books, together with a MS. copy of his famous history of the council of Trent, his histories of the Interdict and Inquisition, and a collection of letters. At Edmundsbury, where he settled upon his return to England, he employed himself in translating the histories of the Interdict and Inquisition, and the two last books of the history of the council of Trent into Latin, the two first having been translated by Sir Adam Newton. In 1615, Bedell was presented by Sir John Jernyn to the living of Horningheath, in the see of Norwich; but having lerned a meaning which he regarded as a species of simony, he declined accepting it, however, he was afterwards admitted without fees, and lived in this parish for twelve years unnoticed. To such a degree, indeed, was he disregarded, that when Diodati, a famous divine of Geneva, came to England, he discovered his place of abode by mere accident. Bedell was introduced by Diodati to Morton bishop of Durham, as the esteemed friend of father Paul, and was treated by him with peculiar respect. In his obscurer retreat he evinced his talents by the publication of some letters which had passed between him and James Wadsworth, formerly his fellow-colleague, but since become a convert to popery, and a penitent of the inquisition at Seville, concerning the authority of the church of Rome. These letters were dedicated to King Charles I., then prince of Wales, in 1624. In this work there was a passage which justified reliance to tyrannical princes. Whilst the author lived, the passage escaped animadversion; before the treatise was reprinted in 1687, in order to be bound up with bishop Burnet's life of Bedell, it could not obtain the licence of Sir Roger L'Estrange, till some words were introduced which made the passage appear like a reference to arguments that were used by others. In 1627, Bedell was elected provost of Trinity college, Dublin, which he was con- strained to accept by the king's special command. Upon his return to England, for the purpose of taking over his family, he had former thoughts of resigning his post; but he was persuaded to retain it by an encouraging letter from the primate, Usher. He then engaged in the discharge of the duties of his station with vigour and activity, and was eminently useful in composing divissions among the fellows, stabilishing discipline, and promoting religion by weekly sermons on the church catechism, which he formed into learned lectures of divinity and morals. In this employment he continued about two years, when, by the interest of Sir Thomas Jernyn, and the application of bishop Laud, he was advanced to the fees of Kilmore and Ardagh. He was consecrated at Drogheda in September 1629, being then in the 59th year of his age. In this new station he had to encounter many difficulties: but he determined to adopt plans of reformation, and to correct the abuses and disorders that had prevailed to a very great degree in his diocese. In order to secure successes in his laudable design, and the more effectually to abolish pluralities, he set an example of moderation by separating the fees of Ardagh from that of Kilmore, though he had been at a considerable expense in recovering some of its revenues; these fees, however, have been since re-united, and have so continued. After the compromise of a dispute, which had occurred between him and lord Weathor, afterwards lord Strafford, who was appointed lord deputy of Ireland in 1633,
on account of his having subscribed a petition addressed to
him for the redress of certain grievances, Bedell proceeded
without interruption in his episcopal duties and reforms. In
the exercise of his episcopal functions, he adhered strictly
to the rubric; but in cases that depended on his own determi-
nation, he appeared to be jealous of all approaches to super-
sition. He was extremely averse in preaching, catechis-
ing, and employing all means for disseminating religious
knowledge; and though he never perjured the papists, he
was the most formidable opponent they had in Ireland. He
converted several of their clergy by argument; and laboured
to bring over the natives by delivering among them the scep-
tures, with popular tracts in their own language, and by
casting the common-prayer in Irish to be read every Sunday
in his own cathedral. Bishop Bedell seems to have consid-
erved the theological differences that subsisted among Protestant
in his time as of little moment; and it was his wish to pro-
mote the well-intended project of Mr. Drury for effecting a
reconciliation between the Calvinists and Lutharians.

The character of bishop Bedell was held in such high eli-
mation among the Irish, that when the rebellion broke out in
1641, the most barbarous of them were known to declare,
that he would be the last Englishman whom they would ex-
pel the country. His house in the county of Cavan was an
un molested asylum for many Protestants who were driven
from their own habitations; and he treated them with hospi-
tality and kindness, exhorting them at the same time by
prayers and religious discourses, to prepare for the diftri-ef
that threatened them. His declared resolution not to dismiss
these refugees from his house, and to share the fate that
awaited them, occasioned his being removed, with his two
sons and in-law, to a minuscule cottage in the midst of a lake,
where they suffered much from the severity of the weather.
The bishop and his sons were incessant in preaching and
praying with their distressed companions; and their piety in-
spired the bigoted and rude Irish who guarded them with
such respect, that they never disturbed their devotions. At
length they were removed from this place to the house of
an Irish minifter, and a convert to protestantism, where the
bishop was feized with a fever, which terminated his life,
February 7, 1641-2, in the 7th year of his age. At the
fornineness of his interment, the Irish attended with great
decency, and fired a volley over his grave; excluding in Lan-
tin, "Requie pace in pace ultimus Anglicorum! May the
last of the English rest in peace!" And a popish priest
who attended on the occasion, is said to have paid him a
tribute of respect and veneration, in the following with;
"O lit anima mac cum Bedello! May my soul be with that
of Bedell!"

The character of Bedell, delineated by Mr. Clergy, who
refided in his family, and recorded in bishop Burnet's
life of this Prelate, appears to have been in a very eminent
degree exemplary and amiable; so that in the most appro-
priate fenne of the terms, he was a primitive and apostolical
bishop. His venerable and simple aspect and habit; his in-
defatigable zeal in discharging his duty through all the viciss-
tudes of his life; his profound and unaffected learning, dis-
played however in various ways, and not felicit on a particu-
lar occasion at the table of the earl of Strafford, which pro-
duced the witticism of the primate archbishop Usher, after
the bishop had continued long silent, according to his usual
manner, "Breach him, and you will find good liquor in
him;" his charity and hospitality, exhibited in the supply
afforded by him to many poor Irish families, some of whom
he entertained at Christmas at his own table, and in the fea-
tonable relief which the persecuted protestants obtained in his
house; his detachment from worldly interest, of which an
influence, selected from many more, has been given in the
separation of the fees of Kilmore and Ardglass; his integrity
and honour, and his pious resignation under all the evils of
life, in the obsequies of his humbler station, and amid the
perfections which he suffered after the attainment of a
higher rank;—all these qualities, which have been amply
illustrated in the memoirs of his life, excited his character to
the highest degree of professional excellence. His bequests
at his death corresponded to the uniform tenor of his life;
for out of his very limited fortune he allotted some legacy to
every place to which he had any relation. He thus obtained
the esteem of the most bitter enemies of his faith and country,
while he lived, and he has also secured the veneration of
polarity, and left a model for the imitation of all his suc-
cessors. He studied and wrote much on the controversy be-
tween the papists and protestants, and he had composed a
large treatise in answer to the two questions, addressed by
the former to the latter with a kind of triumph; "Where was
your religion before Luther? and, What became of your an-
cestors who died in popery?" But this treatise, which the
bishop intended to have printed, together with many other
MSs. were lost in the confusion of the times. His Hebrew
MS. Bible was preferred, and is now reposed in Emanuel
college, Cambridge, to which the author bequeathed it.

As bishop Bedell objected to burial in churches, partly
because it indicated superstition and pride, and partly becau-
se the putrid effluvia of dead bodies annoyed the living, he
gave orders for burying his wife in the leaf frequented part
of the church-yard of Kilmore, and directed by his will that
he should be placed near her. By his wife, who was of the
ancient and honourable family of L'Estrange, he had one
daughter and three sons, of whom two survived him; one pro-
vided for by a small benefice of 60l. a year, besides the en-
tailed estate of the family in Essex, and the other by a small
estate of 60l. a year, the only purchase made by the father.

BEDENGIAN, in Botany, a name given by Avicenna
and Serapion to the poma amoris, or loves-apples, a fort
of fruit used in food by the Italians, and some other na-
tions, and seeming to be the third kind of the firethorns, or
tulmam, mentioned by Theophrastus. That author first de-
defines two kinds of this plant, the one of which occasioned
sleepy disorders, and the other threw people who eat of it into
maddens. After these, which he properly accounts poisonous
kinds, he mentions a third, which was cultivated in gar-
 dens, for the sake of the fruit, which, he says, is large and
effulent. This is certainly the same with bedengian, or poma
 amoris.

BEDER, in Ancient Geography. See Bed.

Bedes, in Geography, a fortified city of Hindoostan, in
the territory of the Nizam, about 80 road miles N. W. of Hydra-
bud; was formerly the capital of a considerable kingdom,
and is now celebrated for the number and magnificence of
its pagodas. N. lat. 18°. E. long. 75°.

BEDFORD, Arthur, in Biography, was the son of
Richard Bedford, and was born at Tidenham in Glouce-
shire 1668. Having received the rudiments of learning from
his father, he was, in 1684, at the age of sixteen, admitted
a commoner of Brazen Nofe college, Oxford, where he ac-
quired some reputation as an orientalist. In 1688 he received
holy orders from the bishop of Gloucester. About this
time he removed to Bristol, where the mayor and corporation
presented him to the vicarage of Temple church. At Bristol
he lived a few years, devoting a great portion of his time to
the seconding Mr. Collier's attack upon the statue; he was
involved indeed, in a very brisk controversy with several of
the greatest wits and ablest writers of the age, but acquired
himself
himself with so much force and vivacity, as actually to produce both repentance and amendment, and was a great cause of that decorum which has for the most part been observed by the modern writers of dramatic poetry. From Bristol he went to a small living in Somersetshire, where he employed himself in a work on scripture chronology, which, in consequence of Sir J. Newton's labour, he afterwards relinquished for a time, and was engaged to affilt in correcting an Arabic version of the Pfuller and New Testament, for the benefit of the poor Christians in Asia. In 1719, he communicated his thoughts to Dr. Charlet, in regard to the foundation of a Syriac professorship at Oxford. The letter which contained them is a most excellent production, and is printed at length in Mr. Ellis's History of Short ditch, where he became chaplain to Aife's hospital, in 1724. About 1730, he renewed his attack upon the flag, particularly directed against a new playhouse in Goodman's field, where Garrick made his first appearance. From this period, to the time of his death, we know few particulars of consequence; but the 15th of September 1745, closed a life that had been very useful. Besides many single sermons, and his tracts upon the playhouse, his chief publications were, "The Temple of Music!" 1706, 8vo. "The shoe of Music!" 1711, 8vo. "Eifya on finging David's Psalms!" 1708. "Animadversions on Sir Isaac Newton's Chronology!" 1728, 8vo. "Scripture Chronology!" 1730, fol. "'The Doctrine of Justification by Faith, in Nine Propositions and Answers!" 1731, 8vo.; and "Horae Mathematicae vacui!" 1733, 8vo. BEDFORD, in Geography, the county town of Bedfordshire in England, is seated on the banks of the river Oufe, nearly in the centre of the county, at the distance of 51 miles N.W. from London. It is a place of some antiquity, and was called by the Saxons Bedan-ford, or Bedanic Forda, signifying the fortified on the ford. At the time of Offa, that powerful king of the Mercians, Bedford was probably of some note, as this monarch directed his corpse to be interred in a small chapel here, which, being seated on the river Oufe, was carried away by the floods during an inundation. In the year 572, a pitched battle was fought here between Cuthwulf the Saxon, and the Britons; but the latter were defeated, and obliged to deliver up several of their towns to the haughty conqueror. During the Danilh wars, this town suffered materially by the ravages of these plundering mandars; but in the year 911, they were severely beaten, and driven from this neighbourhood. A strong Norman castle was erected here by Pagan de Bauclamp, the third baron of Bedford, who fortified it with a deep intrenchment and lofty wall. "While it stood," says Camden, "there was no form of civil war which did not burst upon it." King Stephen laid siege to, and conquered this castle; and, according to Camden, slaughtered the inhabitants; but other historians assert that he granted them honourable terms. During the contentions between king John and his barons, it was besieged by the latter, but reconquered again by the forces under Falco de Brent, to whom it was given by the king as a reward for his services. This rebellious villain occasioned his own destruction with that of the castle, by opposing Henry III., who laid siege to the fortres, and after a contest of sixty days, made himself master of this "nursery of sedition." De Brent was sent to London and imprisoned, but his brother and twenty-four other knights were executed on the spot. (For an account of this siege, see Beauties of England and Wales, vol. i. p. 6.) The embankments of the castle form a parallelogram; some of which may be easily traced; but the walls are entirely reared to the ground. The government of the town is vested in a mayor, recorder, deputy-recorder, an indefinite number of aldermen, two bailiffs, and thirteen common councilmen. The bailiffs are lords of the manor, and have the right of fishing in Oufe for an extent of nine miles each way from Bedford. Henry III. granted the borough to the burgesses for 40l. yearly: Edward I. feized it for the crown rents, which the burgesses had neglected to discharge. The last renewal of their charter was in the reign of James II., when the mayor and aldermen were removed from their respective offices by a royal mandate, for not electing two burgesses to serve in parliament. The members were in consequence chosen by his majesty's minillers. The right of election is now vested in the burgesses, freemen, and inhabitants householders not receiving alms, amounting to nearly 1400. This town is seated in a fertile tract of land, called the vale of Bedford, which accompanies the Oufe, and produces abundant crops of wheat, barley, turnips, &c. The land on the north side of the river is a strong clay, that on the south side is much lighter, yet very productive, and its natural fertility is much increased by the overflowing waters of the Oufe. This river flows through, and divides the town, which is connected by a strong old stone bridge. On the centre of this road the old town gaol, which was taken down about thirty-three years since. The river was made navigable to Lynn in Norfolk, by act of parliament. Bedford contains five distinct parishes, and an equal number of churches, two of which are on the south side of the river, and three on the north side. Of these St. Paul's is the principal of fine and architecture, having a handsome octagonal stone spire. It was collegiate before the conquest. Here are four meeting-houses, appropriated to different religious sects, besides one for the Methodists, and another for Moravians. To the latter is attached a dwelling-house for maiden ladies of this sect, called the single sisters' house. This town is distinguished by many charitable endowments. The hospital of St. John is supposed to have been founded in 980 by Robert Delapris, who was the first master. It now consists of a master who is rector of St. John's, and ten poor men. St. Leonard's hospital was built and endowed towards the end of the reign of Edward I. The hospital of Grey Friars was founded in the reign of the succeeding monarch by the lady Mabilla de Paterhall, who was buried in the cemetery. Mr. Thomas Chriftty repaired the old town-hall, founded an hospital for eight poor people, and endowed a charity school for forty children. But the most considerable charity of this town, and one whose augmented revenues have been astonishingly great, was bequeathed by Sir William Harpur, whose name and benevolence it perpetuates. This gentleman was a native of Bedford, and made lord mayor of London in 1561. He purchased for 18él. thirteen acres and one rood of land lying in the parih of St. Andrew, Holborn, London. This, with his dwelling-house in Bedford, he gave to the corpovation of that town, for the endowment of a school and for apportioning young women of the town upon marriage. The annual rent of the above land was only 40l. at first; in 1663 it was leased for forty-one years at the annual rent of 90l. A reverential lease was granted for a further term of fifty-one years at the increased rent of 150l. A number of streets, rows, and courts, were then built on the leased ground, and the annual rent is now 420l. which in three or four years is expected to increase at least another thousand. In consequence of this almost unparalleled augmentation of revenue, the trustees have applied to parliament for two different acts, to extend the objects of the charity, and regulate the application of the receipts. The school endowed by it is situated near St. Paul's church, having over the door a statue in white marble of the founder, and a Latin inscription beneath. Besides the above charities a house of industry has lately been opened for the reception of all the poor of the five
five consolidated parishes. A new town gaol has lately been erected, and a county gaol is just finished; towards the completion of which the late Mr. Whitbread left a legacy of 500l. This town contains 800 houses and 3946 inhabitants.

Bedford was made a dukedom by Henry the fifth, who constituted John Plantagenet, third son of Henry the fourth, the first duke. After being enjoyed by a Nevil, and a de Hatfield, it was bestowed on John Neville, in whose family it still continues. See Nevill.

At Ellow, about one mile from Bedford, was an abbey of benedictine nuns, founded by Judith, niece to the conqueror. At the dissolution its revenues were valued at £284l. 12s. 11d. The church of Ellow is a very fine ancient building, with a detached tower. This place gave birth to John Bunyan in the year 1628. His allegory of the Pilgrim's Progress was written during confinement in the county gaol. See Bunyan. Bauties of England and Wales, vol. i.

Bedford, a township of America, in Hillsborough county, New Hampshire, incorporated in 1750, and containing 898 inhabitants. It lies on the west bank of Merrimack river, 56 miles west of Portsmouth.

Bedford, a township in Middlesex county, Massachusetts, containing 523 inhabitants, 13 miles northerly from Boston.

Bedford, New, a flourishing town of Bristol county, in Massachusetts, containing 3313 inhabitants, lying at the head of navigation on Accushnet river, 58 miles southward of Boston. N. lat. 40° 41'. W. long. 70° 52'.

Bedford, a township of West Chelten county, in the state of New York, containing 2470 inhabitants, including 38 slaves. It lies contiguous to Connecticut, 12 miles N. from Long Island found, and 35 from the city of New York. In the census of 1790, it appeared to have 302 electors.

Bedford, a town on the west end of Long Island in New York, 4 miles N.W. from Jamaica bay, and 6 E. from the city of New York.

Bedford, a village near the Georgia side of Savannah river, 4 miles above Augusta.

Bedford, a county of Pennsylvania, lying on Juniatta river, and having part of the state of Maryland on the south, and Huntingdon county north and north-east. It contains 13,114 inhabitants, including 46 slaves; half of its lands is settled, and it is divided into nine townships. The chief town of this county, lies on the south side of Raystown branch of the same river, 25 miles E. of Berlin, and 210 W. of Philadelphia. It is regularly laid out, and has a stone gaol, and a market-house, court-house, and record-office built of brick. It was incorporated in 1795. N. lat. 40°. W. long. 78° 50'.

Bedford, a county of Virginia, is separated from that of Amherst on the north by James river, and has Cathephel on the east, Botetourt on the west, and Franklin county on the south. It is 34 miles long, 25 broad, and contains 10,531 inhabitants, including 2,754 slaves. Its soil is good, and it is agreeably diversified with hills and valleys. In some parts chalk and gypsum have been discovered. The chief town is New London.

Bedford's bay. See Torrington bay.

Bedford, Cape, is more than 80 leagues E. by N. from the west entrance of Saffin's strait, and the S.E. point of James's island; its latitude is more than 68°, and it forms one of the western limits of Davis's strait.

Bedford, Cape, is also the extreme north east point of the coast of New Holland, opening to the south-west into Endeavour river, in S. lat. 15° 18'. E. long. 145° 15'. The sea to the east and north is almost every where full of shoals and reefs.

Bedford Level, is the name given to a large tract of fenney, boggy land in England, which remained a fruitful waste for many ages. It was calculated to contain 400,000 acres, distributed through the several counties of Cambridge, Huntingdon, Northampton, Lincoln, Norfolk, and Suffolk. The chief part of this extensive tract appears, from the various phenomena noticed by different authors, to have been formerly a dry and cultivated land, but either from injudicious embankments, which prevented the waters from the uplands sluicing at their proper outlets, or from sudden and violent convulsions of nature, it was reduced to the state of a morass; where the waters, stagnating and becoming putrid, filled the air with noxious exhalations; and not only destroyed the health of the inhabitants, but likewise impeded their endeavours to obtain the necessaries of life; the country being almost rendered impassable even to boats, by the fedge, reeds, and slime with which it was covered. The name given to it originated with Francis earl of Bedford, who having large possessions in the fens, mostly granted him by Henry the eight, upon the dissolution of monasteries, engaged, in conjunction with thirteen other gentlemen, to drain the whole upon the condition of having 55,000 acres in the result of successful accomplishment. These terms were acceded to by the commissioners and the country at large, and in 1634 the king granted the adventurers a charter of incorporation. In the course of three years and a half this Herculean task was completed to the satisfaction of the commissioners, who, with the king's surveyor, set out the allotted land to the corporation. Above 100,000l. was expended upon this work. The king, and some perfons devoted to his interest, afterwards opposed the right of the earl of Bedford, and dispossessed him of his property. Other perfons engaged in the concern, but the civil wars breaking out frattal'd all their schemes, and in 1649, William earl of Bedford, the heir and successor of Francis, was restored by the convention-parliament, to all the rights of his father. A new act was obtained to repair the decayed works, and extensive operations were adopted. In 1653 the level was adjudged to be fully drained, and after the adventurers had expended 400,000l. more, the 95,000 acres were confirmed to them. In 1657 the Bedford level was divided into three districts, called north, middle, and south, having one surveyor for each of the former, and two for the latter. This distribution, intended for its better government, proved a cause of considerable opposition and contention, and it was many years before the whole was settled in a systematic and equitable manner. To pursue the history of these litigations, charters, and laws, originating in, and made for this great concern, would lead us into a narrative too extensive for the limits of our work: we must therefore refer those persons, delectious of further information, to the " Beauties of England and Wales," vol. ii. and to a work recently published, entitled "An Historical Account of the Bedford Level," with the laws, &c. relating to the same, 8vo.

That this vast tract was at some former period dry habitable land, is evident from the quantity of trees and various other natural and artificial frustances that have been dug from different depths in various parts of it. Dugdall, in his "History of Embanking," states that many oak, fir, and other trees, were found in draining the isle of Axlholm. These were at the depths of three, four, and five feet from the surface, lying close to the roots, which were in firm earth below the moor. The bodies or boles of the trees appeared to have been burnt asunder (not cut down with saws or axes) as the ends of them being coated do manifest. The oaks were lying
lying in multitudes, and of an extraordinary size, being five yards in compass, and sixteen yards long; and some smaller of a great length, with a great quantity of acorns and small nuts near them.” Other authors relate similar facts: and Mr. Elloth, in his “Historical Account of the Bedford Level,” states that in the year 1764 many roots of trees, standing as the trees had grown, were found near Bolton in Lincolnshire at the depth of eighteen feet below the thin palturne surface. Tacitus, in his life of Agricola, relates, that “the Britons complained of their hands and bodies being worn out and consumed by the Romans, in clearing the woods and embarking the fens.” This sentence seems particularly applicable to the forementioned circumstances, and alludes to the period when some great operations of this nature were executed from the enslaved Britons. The emperor Severus is said to have been the first who intersected the fens with caufeways: one of which is described by Dugdale as extending about 24 miles from Denver in Norfolk to Peterborough. It was composed of gravel three feet in depth and sixty feet wide, and about five feet beneath the surface. In 1653 some workmen discovered, at eight feet below the bottom of Witheld river, a second heavy bottom, with seven boats lying in it covered with fit; and at Whittleton, on digging eight feet beneath the surface, a perfect foil was found with letters of grafs on it; as they lay when first moved. Near Bolton, at the depth of sixteen feet, were discovered a smith’s forge, with many of his tools, some horse shoes, and other iron articles. Various other things have been found at different times, and in different places, all tending to prove the extraordinary effects that nature has produced here in one of her revolutions. The cause and time of this event are not recorded. Henry of Huntington, who wrote in the time of king Stephen, describes this part of the country as then “very pleasant and agreeable to the eye, watered by many rivers which run through it, diversified with many large and small lakes, and adorned with many woods and illands.”

William of Malmbury, living in the first year of Henry II. describes this district in glowing colours, as “a very paradize; for in pleasure and delight it reminded heaven itself; the very marches abounding in trees, whose length without knots do emulate the stars. There is not any wastef place in it; for in some parts thereof there are apple trees; in others vines, which either spread upon the grounds, or run along the poles.” From these testimonies it appears that the great inundation of the fens must have occurred after the time of the latter historian. The first attempt at draining them was in the reign of Edward I.; since which time numerous schemes have been proposed, and tried to render this large tract of country subervient to agriculture.

Bedfordshire, one of the inland counties of England, bounded on the north by Huntingdonshire and Northamptonshire, on the west by Buckinghamshire, on the south by Hertfordshire, and on the east by the latter, and Cambridgehire. Its limits are very irregular and artificial, having only two short spaces of the Ouse as natural boundaries on the east and west.

This part of the kingdom, with the divisions now called Hertfordshire and Buckinghamshire, were inhabited at the time of the Roman invasion, by a tribe of Britons called Cattieuchlani, whose chief or governorcaffellavanus, was chosen by unanimous consent to lead them against the arrognt, invading Cesar. In the year 310 the emperor Constantine divided this island into five Roman provinces, when Bedfordshire was included in the third division, called Flavia Caeranienis. At the establishment of the Mercian kingdom it was made part of that government, and continued so till the year 827, when, with the other divisions of the island, it became subject to the well Saxon under Egbert. Alfred having subdivided his kingdom into thires, hundreds, and tythings, and marked the limits and name of each division, this was called Bedesfordeire, since contracted to its present name. Its length is computed at 35 miles, and breadth at 20. It contains an area of about 1,500,000 acres, which are divided into nine hundreds, containing ten market towns, 124 parishes, 58 vicarages, 550 villages, about 12,000 houses, and nearly 65,000 inhabitants.

The face of the country, though not characterised by high hills and deep valleys, is considerably diversified with some inequalities of surface, and on the southern side is a range of chalk hills. Beneath these is an extensive tract of cold, fertile land. The western side of the county is mostly sandy and flat, yet from the improvements adopted and recommended by the duke of Bedford, lord Ollory, &c. the greatest part is appropriated to some species of agriculture. On the north and north-east the soil is a deep loam, famous from the skill employed in its cultivation, for producing large crops of corn, particularly barley. A large proportion of the land in this county has long continued in open or common fields, but within the last five or six years great quantities have been enclosed, and farther inducements are intended. The chief employment for the lower classes of persons in this county arises from agriculture, making of lace, and the manufacturing of straw hats. In the two latter, numbers of women and children are constantly occupied, and from them derive a bare subsistence. There is no such thing as a lone lace made in the county, and the fuller’s earth pits are all in Buckinghamshire. Bedfordshire is watered by the rivers Ouse and Ivel, and some smaller streams. The former enters the county on the western side, and after a devious course through many fine meadows, passes through the town of Bedford, where it becomes navigable. Flowing eastward it leaves the county at St. Neots, on the confines of Huntingdonshire. (See Ouse.) The river Ivel rives in Hertfordshire, and falling Baldock and Biggleswade, falls into the Ouse a little above Tempford.

Bedfordshire is in the Norfolk circuit, in the province of Canterbury, and bishopric of Lincoln. It is crossed by two Roman roads, the Watling-street and the Icknield-way, and contains some encampments attributed to that people: one at Sandy near Potton, called Salene, and another near Dunstable, called Maiden-bower, supposed to be the magiolvinum of Antoninus. The duke of Bedford has a magnificent seat at Woburn Abbey in this county. Luton Hoo, the marquis of Bute’s; Ampthill Park, lord Ollory’s; and Welb-houfe, lady Lucas’s, are very fine feats in the county.

Bedford, in Ancient Geography, a town of Africa, in the interior of Libya. Polemly.

Bedrique, or BEdnAroN, a fine province of Hindoostan, lying north-west of the Myfore country, and deriving its name from Bednore, the capital. Hyler Ally took possession of this province about the year 1763; and it was afterwards comprehended within the dominions of his fun Tippoo Sultan, who flayed himself regent of Myforeachord who retained it till the time of his death in 1799, when, after the capture of Seringapatam by the British troops, his dominions were distributed among the conquerors. Part of بيدنار was assigned to the Mahrattas; the sons and relations of Tippoo were removed into the Carnatic; and a descendant of the ancient rajahs of Myfores, about five years old, was placed upon the throne, under certain conditions.

Bednor, a city of Hindoostan, and capital of the forementioned province. N. lat. 13° 47’. E. long. 75° 7’.
BED

BEDOOGE, RANNY, a town of Hindooian, seated on the 
Toombuddra river, in the territory called by the treaty of 
1792, to the Mahtrattas. N. lat. 14° 35'. E. long. 
75° 42'.

BEDOWEENS or BEDUINS, in Arabic Bedouin, form-
ed of bid, defert, or country without habitation, a denomi-
nation given to a wandering tribe of Arabs, who retain the 
customs and manners of their ancestors, the "Arabes Scenite," 
and who are said to be descended from Ishmael. They 
originate from the deferts of Arabia, where they live in tents, 
and are separated into distinct tribes, subject to their sheikhs, 
who direct and superintend in every transac tion; and they 
have migrated with their flocks and herds into Egypt and 
Syria, and established both of Asia and Africa, inhabiting 
the vall defts which extend from the confines of Peria to 
Morocco. They select those spots which afford them 
springs and pastures, and they are in the strictest sense a race 
of rovers or wanderers, without any permanent abode.

Although they are divided into independent communities, 
or tribes, not unfrequently hostile to each other, they may 
still be considered as forming one nation. The resemblance 
of their language is a manifest token of this relationship.

The only difference that exists between them is, that the 
African tribes are of a less ancient origin, being posterior 
to the conquest of these countries by the caliphs or successors 
of Mahomet; while the tribes of the deferts of Arabia, pro-
perly so called, have descended by an uninterrupted succession 
from the remoted ages.

The Arabs, says M. Volney, seem to be especially con-
demned to a wandering life, by the very nature of their de-
fters. To paint to himself these deferts, the reader must 
imagine a sky almost perpetually inflated, and without clouds, 
immmense and boundless plains, without houses, trees, rivulet, 
or hills, where the eye frequently meets nothing but an ex-
tensive and uniform horizon like the sea, though in some 
places the ground is uneven and lofty. Almost invariably 
naked on every side, the earth presents nothing but a few 
wild plants thinly scattered, and thickets, whose solitude is 
rarely disturbed but by antelopes, hares, locusts, and rats. 
Such is the nature of nearly the whole country, which ex-
tends 600 leagues in length, and 300 in breadth, and 
travels from Aleppo to the Arabian sea, and from Egypt 
to the Persian gulf. The soil, however, varies considerably 
in different places; and this variety in the qualities of the 
soil is productive of some minute differences in the condi-
tions of the Bedoweens. In the more fertile countries, or 
those which produce few plants, the tribes are feeble and very 
distant; which is the case in the defert of Suez, that of the 
Red Sea, and the interior of the Great Defert, called the 
Najd. Where the soil is more fruitful, as between Damaceus 
and the Euphrates, the tribes are more numerous and less 
distant from each other; and in the cultivable districts, such 
as the pachalics of Aleppo, the Hauran, and the neighbour-
hood of Gaza, the camps are frequent and contiguous. In 
the former case the Bedoweens are merely pastor, and 
submit only to the produce of their herds, and on a few dates 
and fitch-meat, which they eat, either fresh or dried in 
the sun and reduced to a powder. In the latter they sow 
food, and add chert, barley, and even rice to their fitch and 
milk. Such is the situation in which nature has placed the 
Bedoweens, to render them a race of men equally singular 
in their physical and moral character. This singularity is so 
striking, that even their neighbours, the Syrians, regard 
them as extraordinary beings; especially those tribes which 
dwell in the deferts of the deferts, such as the chief of Anaaza, 
Kubit, Tai, and others, which never approach the towns, 
general. The Bedoweens are small, meagre, and tawny; 
more so, however, in the heart of the defert, than on the 
frontiers of the cultivated country; but they are always of a 
darker complexion than the neighbouring peafants. They 
also differ among themselves in the same camp: the sheikhs, 
that is, the rich, and their attendants, were always taller, 
and more corpulent than the common clafs. Some of them 
are more than five feet five or six inches high; though in 
general they do not exceed five feet two inches. This dif-
ference can only be attributed to their food, with which the 
former are more abundantly supplied than the latter. The 
Bedoweens of the lower clafs live in a flate of habitual 
poverty and famine; and it is an undoubted fact, that the 
quantity of food consumed by each of them does not exceed 
four ounces a day. This abiflence is most remarkable 
among the tribes of the Najd and the Hedjaz. Six or seven 
dates soaked in melted butter, a little fresh milk, or curds, 
serve a man a whole day, and he thinks himself happy when 
he can add a small quantity of coarse flour, or a little ball 
of rice. Meat is reserved for the greatest festivities, and 
they never kill a kid but for a marriage or a funeral. A few 
wealthy and generous sheikhs only can kill young camels, 
and eat baked rice with their victuals. In times of dearth 
the vulgar, half famished, eat locuts, rats, lizards, and fer-
rets, which they broil on briars.

It has been already observed, that the Bedoweens are 
divided into tribes, which constitute so many distinct na-
tions. Each of these tribes appropriates to itself a certain 
tract of land, and is collected in one or more camps, which 
are dispersed through the country, and which make a suc-
cesive progress over the whole, in proportion as it is ex-
hausted by the cattle. Such is the law among them, that 
if a tribe, or any of its subjécts, enter upon a foreign 
territory, they are treated as enemies and robbers, and a war 
ensues. Moreover, as all the tribes have affinities to each 
other by alliances of blood or treaties, leagues are formed 
which render these wars more or less general. As soon as 
the offence is made known, they mount their horses, and seek 
the enemy; when they meet, they enter into a parley, and 
the dispute is frequently compromised; if not, they attack 
either in small bodies, or man to man. They encounter 
each other at full speed with fixed lances, which they some-
times dart, notwithstanding their length, at the flying en-
emy; the victory is rarely contested; it is decided by the 
first shock, and the vanquished fly off at full gallop over the 
masked plain of the defert. The tribe which has been de-
feated strikes its tents, removes by forced marches to a dis-
tance, and seeks an asylum among its allies. The enemy, 
fatified with their successes, drive their herds further on, 
and the fugitives soon after return to their former situation. 
Dif
tensions, however, are often perpetuated by the slaughter 
that is made on these occasions; and they have establish-
ed laws among themselves, that the blood of every man 
who is slain must be avenged by that of his murderer. This 
vengeance is called "Tar," or retaliation; and the right of 
exacting it devolves on the nearest of kin to the deceased. 
If any one neglects to seek his retaliation, he is for ever 
disgraced. He therefore watches every opportunity of re-
venge. If his enemy perishes in any other way, he seeks 
 satisfaction by inflicting vengeance on the nearest relation. 
These animosities are transmitted, as it were, by inheritance, 
from father to children, and never cease but by the extinc-
tion of one of the families, unless they agree to facitate 
the criminal, or purchase the blood for a slated price, in money 
or in flocks. Such being the condition of society, most of 
the tribes live in an habitual state of war; and this circumstance, 
together with their mode of life, renders the Bedoweens a 
military people, though they have made no great progress
in war as an art. Their camps are formed in a kind of irregular circle, composed of a single row of tents, with greater or less intervals. These tents, made of goat’s or camel’s hair, are black or brown, or striped black and white, and thus differ from those of the Turkmans, which are white. They are stretched on three or four pickets, only five or six feet high, which gives them a very flat appearance; so that at a distance one of these camps appears like a number of black spots. To the colour of these tents, says Dr. Shaw, there is a beautiful allusion, (Cant. i. 5.) “I am black, but comely like the tents of Kedar.” For nothing, adds this writer, can afford a more delightful prospect than a large extensive plain, in its verdure, or even flecked up by the funnels, with these moveable habitations, situated in circles upon them. These tents are the same with what the ancients called “Mapalas,” (Sil. Ital. l. xvii. 50. Lucan. l. iv. 684.) and are represented by Saluffi, (Bell. Jug. § 21.) as resembling the bottom of a ship turned upside down. The length of these tents is much greater than their breadth; and they are entirely open on one of their long sides, that is sheltered from the wind, and on that which is exposed they are closed. The tent of the sheikh is in some of their encampments distinguished from the others merely by a large plume of black or white feathers placed upon its top. Each tent, inhabited by a family, is divided by a curtain into two apartments, one of which is appropriated to the women. In these tents the Bedoween, when they take their rest, lie stretched out upon the ground, without bed, mattress, or pillow; wrapping themselves in their hykes or blankets, and lying upon a mat or carpet, in any part of them, where they can find room. A number of these tents, from 3 to 500, are arranged in a circle, and called Douwar. The empty space within the large circle serves to fold their cattle every evening. As the shade of trees is very agreeable in torrid regions, the Bedoween in the desert take pains in selecting shaded situations for their encampments; but those of Egypt encamp on spots destitute of trees; and when any happen to be there, it is no consideration with them in the pitching of their tents. They never have any entrenchments, their only advanced guards and patrols are dogs; their horses remain faddled and ready for being mounted on the first alarm; but being utter strangers to all order and discipline, these camps, always open to forrige, afford no defence in case of an attack. Accidents, therefore, frequently happen, and cattle are carried off every day. The tribes which live in the vicinity of the Turks, are still more accustomed to alarms and attacks; for these strangers arrogating to themselves, in right of conquest, the property of the whole country, treat the Arabs as rebel vagrants, or as turbulent and dangerous enemies; and on this principle they never cease to wage secret or open war against them. The Arabs, on their side, regarding the Turks as uflurpers and treacherous enemies, watch every opportunity to do them injury. On the slightest alarm, the Arabs, confounding the innocent with the guilty, cut their harvests, carry off their flocks, and interrupt their communication and commerce. These depredations produce a misunderstanding between the Bedoween and the inhabitants of the cultivated country, which renders them mutual enemies. Such is the external situation of the Arabs.

As to their internal constitution, each tribe is composed of one or more principal families, the members of which have the title of sheikhs; that is, chiefs or lords. One of these sheikhs has the supreme command over the others. He is the general of their little army, and sometimes affixes the title of “Emir,” which signifies commander and prince. The more relations, children, or allies he has, the greater is his influence. To these he adds other adherents, whom he attaches to himself by supplying their wants. Besides, a number of small families, who, not being strong enough to maintain their own independence, and needing alliances and protection, range themselves under the banner of this chief. Such an union is called “Kabila,” or tribe. These tribes are distinguished by the names of their respective chiefs, or by that of the ruling family; and when they speak of any of the individuals that compose them, they call them the “children” of such a chief; as, e. g. “Beni Temim,” or Oulad Tai,” the children of Temim and of Tai.

The sheikhs and their subjects are born to the life of shepherds and soldiers. The more considerable tribes rear many camels, which they either sell to their neighbours, or employ in the carriage of goods, or in their military expeditions. The smaller tribes keep flocks of sheep. Among those tribes which apply to agriculture, the sheikhs live always in tents, and they leave the culture of their ground to their subjects, whose habitations are wretched tents. The peculiar distinctions which characterize their different tribes result from their different modes of living. The genuine Arabs disdain husbandry, as an employment by which they would be degraded. They maintain no domestic animals but sheep and camels, except, perhaps, horses. Those tribes which are of a pure Arab race, live on the flesh of their buffaloes, cows and horses, and on the produce of some little ploughing. The former tribes, distinguished as noble, by their possession of lands, are denominated “Abu el Ahmar,” and the second “Mozan,” which are esteemed a middle class, between genuine Arabs and peasants. These are sometimes mentioned contemptuously, because they keep buffaloes and cows. The “Mozenian” transport their dwellings from one country to another, as paturage fails; so that a village springs up suddenly in a situation where, on a preceding day, was not to be seen a single tent. The genuine Bedoween, living always in the open air, have a very acute smell; and the fetid exhalations produced by cities are one cause of their dislike of them. So acute is their smell, that, according to Niebuhr, if they are carried to the spot from which a camel has frayed, they will follow the animal by smelling its track, and distinguish the traces of its footsteps from those of other animals that have palied the same way. Those Arabs, who wander in the desert, will fastify five days without drinking, and discourse out of water by examining the foil and plant in their environs. Like other people that lead an erratic life, they are addicted to robbery, and of course are formidable enemies to those who traverse the deserts; but they never murder those whom they rob, unless travellers in their own defence should chance to kill a Bedoween, in which case the others are eager to revenge his death. Upon all other occasions they act in a manner consistent with their natural hospitality. Of their hospitality Niebuhr has recorded several very pleasing instances. The pillaging of the caravans, he says, is not always owing merely to their propensity for robbing, but their expeditions for this purpose are commonly confided by themselves as lawful hostilities against enemies, who would depred the natives of their dues, or against rival tribes, who have undertaken to protect those illegal traders.

The government of the Bedoween is at once republican, aristocratic, and even despotic. It is republican, as the people have great influence, and nothing can be transcended without a majority; it is aristocratic, because the families of the sheikhs possess some of the prerogatives which everywhere accompany a power; and it is despotic, because the principal sheik has an indestructible, and almost absolute authority, which he may abuse, though the influence of the tribes confines this abuse within very narrow limits; for if he should kill an Arab, it would be almost impossible for him to escape.
escape punishment, and the law of retaliation would be in
his subjects, haraessed by severity, would abandon
him, and join another tribe; his own relations would depose
him, and advance themselves to his station. The dignity of
chiefs is hereditary, but not confined to the order of pri-
mon keys; the petty chieftains, who form the hereditary no-
ility, chaff the grand chieftain out of the reigning family, with-
out considering his immediate relation to his predecessor.
Little or no revenue is paid to the grand chieftain. In fact,
the principal chief in every tribe discharges the charges of all
who arrive at or leave the camp. His rank subjects him to
great expense by the entertainment of his allies, and of the
principal men, who assemble to deliberate concerning en-
campments and removals, peace and war, and the litigations
between individuals. To these he must give coffee, bread
baked on the ashes, rice, and sometimes roasted kid or ca-
mel. In a word, he must keep open table. On his generos-
ity depend his credit and his power. To provide for these
expenses, the chieftain has nothing but his herds, a few spots of
cultivated ground, the profits of his plunder, and the tribute
he levies on the high roads, the total of which is very in-
considerable. The most powerful chieftains among the Bed-
ouens, though sometimes denominated princes and lords,
may be compared to substantial farmers, whose simplicity
they re semble in their dress, as well as in their domestic life
and manners. A chieftain, who has the command of 500
horses, does not disdain to saddle and bridle his own, nor
to give him his barley and chopped straw. In his tent, his
wife makes the coffee, kneads the dough, and superintends
the dicing of the victuals. His daughters and kinwomen
wash the linen, and go with pitchers on their heads, and
veils over their faces, to draw water from the fountain.
These manners agree precisely with the descriptions in Ho-
er, and the history of Abraham in the book of Gen-
esis.

The simplicity, or rather poverty of the lower classes of the
Bedouens, corresponds to that of their chiefs. The
whole wealth of a family consists of moveables, of which the
following is a pretty exact inventory. A few male
and female camels, some goats and poultry, a mare with
her bridle and saddle, a tent, a lance 16 feet long, a
crooked staff, a rusty musket, with a flint or matchlock,
a pipe, a portable mill, a pot for cooking, a leather
bucket, a small coffee-rounder, a straw mat, which serves
equally for a seat, a table, and a bed, some clothes, which
are put up in leather bags hung up in their tents, a
mantle of black woollen, and a few glasses or silver rings
which the women wear upon their legs and arms. But
the principal and most important article in the posses-
sion of a Bedouen is his mare, which ferret in making his
excursions against hostile tribes, or seeking plunder in the
country or on the highways. The mare is preferred to the
horse, becau se, as Volney, Chenier, and others say,
she does not neigh, is more docile, and yields milk, which
occasionally satisfies the thirst, and even the hunger of her
maler.

The Bedouens of the desert preserve their butter in a
leathern bag; and their water in goat skins. Their heart
consists of a hole made in the ground, and laid with stones;
instead of an oven they use an iron plate for preparing
their bread, which is made into small cakes. In their
excursions, they carry with them a supply of meal, and
their other provisions are dates, milk, cheese, and honey.
They are drenched much like their brethren in Egypt, ex-
cept that they wear shoes of untanned leather, and of a
peculiar shape; and that many of them walk bare-footed
over the scorching sand, which renders their skin at length
intenable. Their women appear less tidy and scrupulous
than the other females of the east, converse more freely
with strangers, and expose themselves with their faces un-
veiled.

The arts of the Arabs, whose wants are few, consist in
weaving their clumsy tents, and in making mats and but-
ter. Their whole commerce only extends to the exchanging
of camels, kids, filiations, and milk, for arms, cloth-
ing, a little rice or cotton, and money, which they bury.
They are totally ignorant of all science, and have not
even an idea of astronomy, geometry, or medicine. They
have not a single book; and nothing is so uncommon
among the sheikhs as to know how to read. Their whole
literature consists in reciting tales and histories, in
the manner of the Arabian Nights Entertainments. For such
stories they have a peculiar passion; and in the evening they
seat themselves on the ground, at the door of their tents,
or under cover, if it be cold, and there, ranged in a circle,
tound a small fire of dung, with their pipes in their mouths
and their legs crooked, after indulging for some time silent
meditation, they amuse themselves with the recital of tales
of this kind. They have likewise, besides their love-stories,
their love-ongs, which have in them more nature and senti-
ment than those of the Turks and the inhabitants of the
towns.

It has been observed, that the Bedouens, though their con-
don in the depth of the desert resembles, in many respects,
that of the savages of America, have not the same ferocity.
So that, accustom to endure hunger, they have never been
addicted to the practice of eating human flesh; and their man-
ers are in general much more docile and mild. Volney attrib-
utes this difference of manners to the difference of their situa-
tion. The American savages have been induced by the nature
of their country to become hunters rather than shepherds;
and their habits have contributed to produce and cherish a fer-
ocity of character. But the Bedouens, whose naked plains,
without water or forests, are delitute of fish or game,
and puffing the camel, have been determined to a pastoral life,
and hence they have acquired manners which have influen-
ced their whole character. Finding at hand a light, but con-
stant and sufficient nourishment, they have acquired the
habit of frugality. Content with the milk of the camel and
dates, they have not defined flesh; they have fixed no blood;
their hands are not accustom to slaughter; nor their ears
to the cries of suffering creatures, and they have preferred a
fertile and humane heart. Nevertheless, when the Arab
shepherd became acquainted with the use of the horse, his
mode of life was considerably changed. The facility of
passing over extensive tracts of country rendered him a wan-
derer. He became greedy from want, and a robber from
greediness: and such is his present character. A plunderer
rather than a warrior, the Arab polishes no fannguinary cou-
rage; he attacks only to defraud; and if he meets with resis-
tance, never thinks a small booty is to be put in competition
with his life. To irritate him, you must fix his blood;
and then he is found to be as oblique in his vengeance as
he was cautious in avoiding danger. The spirit of rapine,
with which the Arabs have been often reproached, is exer-
cised only towards reputed enemies, and is accordingly
founded on the acknowledged laws of almost all nations.
Among themselves they are remarkable for a good faith, a
disinterestedness, and a generosity, which would do honour
to the most civilized people. What can be more noble than
the right of asylum to respected among all the tribes? A
stranger, may even an enemy, touches the tent of the Bed-
ouen, and from that instant his person becomes inviolable. It
would be recond in a disgraceful meanness, an indelible flame,
to satisfy even a just vengeance at the expense of hospitality. Has the Bedoween conformed to eat bread and fall with his gullet, nothing can induce him to betray the mission of himself would not be able to force a refuge from the protection of a tribe but by its total extermination. The Bedoween, so rapacious without his camp, has no sooner set his foot within it, than he becomes liberal and generous. What little he possess he is even ready to divide; and when he takes his repast, he feast himself at the door of his tent, in order to invite pallengers; and this act of generous hospitality he regards as a matter of duty; and of course himself takes the same liberty with others. So far does this reciprocal generosity prevail that one would imagine the Arabs politicized all the goods in common. Nevertheless, they are no strangers to property; but without that selfishness which the increase of the imaginary wants of luxury has given it among politicized nations. Among the Arabs there exist a kind of equality in the partition of property, and a variety of conditions, which have appeared, says Volney, to the wise legislators as the perfection of human policy. From this state of things, it becomes difficult for their sheikhs to form a faction for enslaving and impoverishing the body of the nation. Each individual, capable of supplying all his wants, is better able to preserve his character and independence; and private property becomes at once the foundation and bulwark of public liberty. This liberty extends even to matters of religion. Whilist the Arabs of the towns crouch under the double yoke of political and religious despotism, those of the desert, or the Bedoween, live in a state of perfect freedom from both. On the frontiers of the Turks, indeed, the Bedoween from policy preserve the appearance of Mahometanism; but so relaxed is their observance of its ceremonies, and so little fervour has their devotion, that they are generally considered as infidels, who have murdered of religion. They scruple not to say, that the religion of Mahomet was not made for them; for, they add, "how shall we make ablutions, who have no water? How can we beat alms, who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continued fast? And what necessity is there for us to make the pilgrimage to Mecca, if God he present everywhere?" In short, every man acts and thinks as he pleases; and the most perfect toleration is established among them. Volney observes, that there are few politicized nations, whose morality is, in general, so much to be esteemed as that of the Bedoween Arabs. If this be the fact, we may reasonably ascribe it to a variety of circumstances altogether independent of that singularity which he mentions in connection with it, and which serve to counteract its effects. Among these Bedoween, as well as the Turkmans and Curds, religion is the freest from exterior forms, incomprehensible to us among these classes of people either priests, temples, or regular worship. We can scarcely imagine, that even M. Volney himself, though we are not unpr cooled in his manner of thinking on the subject of religion, would presume to ascribe the excellence of the morality of these tribes to their total want or difuse of all the outward means of producing and maintaining it; but he would probably sug get the inefficacy, in a moral view, of those forms and modes of worship which are established and practiced among the Mahometans. The manners of these people are preferred pure and simple, and such as are described in their ancient histories, as Sonmini observes, by the absence of luxury and fantastic pleasures, bringing immorality in their train, which have made no attempt to fix their abode on the parched and barren lands occupied by the Bedoween.

The Bedoween, who live in tents in the deserts, have never been subdued by any conqueror; but those who have settled near towns, and fertile provinces, are reduced, in some measure, to a state of dependence on the sovereigns of those provinces. Such are the Arabs, in the different parts of the Ottoman empire; some of whom pay a rent or tribute for the towns or paturages which they occupy; and others frequent the banks of the Euphrates only in one season of the year and in winter return to the desert. These last acknowledge no dependence on the Porte, neither are, properly speaking, subject to the Turks; but the police of the latter occasions frequent, but neither long nor bloody, wars among the Bedoween. Whenever the Turks interfere in their quarrels, all the tribes combine to repel the common enemy of the whole nation. Every grand sheik considers himself as absolute lord of his whole territory, and accordingly exacts the same duties upon goods carried through his dominions as are levied by other princes. The Europeans, therefore, are wrong in supposing the sums paid by travellers to the grand sheiks to be merely a ransom to redeem them from pillage. The Turks, who send caravans through the desert to Mecca, have submitted to the payment of these duties, paying a certain sum annually to the tribes who live near the road to Mecca; and these in return keep the wells open, permit the passage of merchandise, and escort the caravans. If the Bedoween sometimes pillage these caravans, the haughty perfidious conduct of the Turkish officers is always the first cause of such hostilities. The tribes of Bedoween on the confines of the desert, are those who have preferred the national character in its greatest purity, and who have maintained their liberty unimpaired. Of these, that denominated "Beni Khaled" is the most powerful, on account of its conquests and wealth, and the number of other tribes subject to it. It has advanced from the desert of Nefjud to the sea, and conquered the country of Lachta. That of the tribe of "Kish" inhabits north from the Persian gulf, and rarely encamp. These have possessions in the province of Chuffait in Peria, in which province there are five different considerate tribes of independent Bedoween. Thos of the tribe "Beni Lam," inhabiting between Korne and Bagdad, upon the banks of the Tigris, receive duties upon goods carried from Baffora to Bagdad, and sometimes pillage caravans. The "Monte fid," or "Monteulk," are the most powerful tribe north from the desert, with respect to extent of territory and number of subaltern tribes, acknowledging their authority. They possess all the country on both sides of the Euphrates, from Korne to Ardej. The Arabs of this tribe often plunder travellers passing between Helle and Baffora, and are frequently assailed by the pacha of Bagdad, who deprecates their feeha, and substibutes another in his room. This tribe derives its appellation from one Monteulk, who came from Hejaz, and was descended from a family, illustrious before the days of Mahomet. All these tribes, that live on the confines of the desert, are genuine Arabs, who breed sheep, camels, and live in tents. This, however, is the case with respect to the reigning tribes; though some of the subaltern ones have lost their nobility, by intermixing the practice of agriculture with the habits of pastoral life. The rich plains of Mesopotamia and Assyria, which were once cultivated by a populous nation, and watered by surprising efforts of human industry, are now inhabited, or rather ravaged, by wandering Arabs. The lands between the Tigris and the Euphrates are occupied by tribes practicing agriculture, or "Moordan." All travellers complain of the robberies of the Bedoween of Assyria. The relliefs and thievish disposition of these people seems to increase the farther they recede from their native deserts, and to approach
toward the country inhabited by the plundering Curds and Turkmans. The pachas of Syria are as much interested in guarding against the depredations of the wandering Arabs, as the Turkish governors on the Persian frontier. As it is of great consequence to the cities of Aleppo and Damascus (which fee) that their caravans travelling to Bagdad or Bascara should be suffered to pass in safety through the desert, the pachas, in order to protect them from insult and pillage, artfully venture to employ one tribe of Arabs against the rest; and with this end they give the title of Emir to the most powerful faction in the neighbourhood. To him they pay an annual sum, or the produce of a certain number of villages, for guiding the caravans, for keeping the other Arabs in awe, and for levying the dues from those who feed their cattle on the pacha’s grounds. The most powerful tribe near Aleppo, is denominated “Masuli,” besides which, there are many other tribes, amounting to twenty, or more, who pay a trifling sum to the Emir for liberty to hire out or sell their camels, and to feed their cattle through the country. Other tribes pay a tax for the privilege of gathering wood in the “Desert of Salt.” In the vicinity of Damascus there are numerous tribes, one of which, named “Abu Salibe,” it is said, confis of Chriftians. The greatest tribe in the desert of Syria is that called “Anfel,” which is spread into Nadsjeed, and reckoned the most numerous tribe in the heart of Arabia. The caravan of Turk- ish pilgrims pay the Bedoweens of this tribe a considerable duty for their free passage through the country; when disfatis ficient, they plunder the caravans, and they often make war on the pacha of Damascus. The Bedoweens, who occupy those countries, that are usually comprehended under the appellation of “Arabia Petraea,” or the deserts that lie between Egypt, Syria, and Arabia, properly so called, are distributed into several tribes which wander among dry sands and rocks, seeking some few intermit- ted points, that afford scanty food for their cattle. The Arabs of Palæstine seem to be poor neglected horses, who inhabit that barren and desert country; and the pilgrims that visit the Holy Land have given exaggerated relations of the molestations and injury which they have suffered from them.

Of the Bedoweens, there are several tribes, who arrive every year in Egypt after the inundation, from the heart of Africa, to profit by the fertility of the country, and who in the spring retire into the depths of the desert. Others of these are stationary in Egypt, where they farm lands, which they fow, and annually change. All of them observe among themselves fixed limits, which they never pass, on pain of war. They all lead nearly the same kind of life, and have the same manners and customs. Ignorant and poor, they preserve an original character different from surrounding nations. Pacific in their camp, they are everywhere in an habitual state of war. Some of these, diff- ered in families, inhabit the rocks, caverns, ruins, and seque- tered places where there is water; others, united in tribes, encamp under low and fmokey tents, and pass their lives in perpetual journeyings, sometimes in the desert, some- times on the banks of rivers; having no other attachment to the soil, than what arises from their own safety, or the subsistence of their flocks. The husbandmen, whom they pillage, hate them; the travellers whom they defpol, speak ill of them; and the Turks, who dread them, endeavor to divide and corrupt them. It is calculated that 17 different tribes of them in Egypt might form a body of 50,000 horsemen; but these are so disperfed and divided, that they are only considered as robbers and vagabonds. The young women, among the Bedoweens of Egypt, might be reckoned not deftitute of beauty, says Sonzini; though they have a tawny hue, and indelible compartments, not easily reconcilable to the eyes of an European, which they painfully mark on the lower part of the face, with a needle and a black dye. The men are, in general, very handsome. A simple and uniform mode of life, uninjured by excesses, prolongs their existence to the period fixed by nature. They live to be very old, and at an advanced age, they are remark- able for their truly venerable and patriarchal physiognomy. ‘Thefe, however, who are wandering, predatory, and wretched, are for the most part of a flender make and mean appear- ance. Some of the Egyptian Bedoweens have among them a tradition, that their ancestors were Egyptians and Chrifti- ans, one of whose ships having been wrecked on the coast of Egypt, the crew had been plundered, and reduced to the necessity of living in the desert. The only remnant they have of the supposed Chriflianity of their forefathers is the sign of the cross, which they traced with their fingers upon the sand. In the plans that have been adopted in Egypt, under Ali Bey, for preventing robbery and establishing public tranquility, the extermination of the Bedoweens has been a principal object. Several hordes fell victims to the policy of the governor; and whole tribes retired into the desert. However, the people of Egypt, far from approving these means of protecting their property, murmured aloud at the severity of camels, fheep, and other animals, with which the Bedoweens had been accustomed to supply them in great abundance, though it was their practice to steal the property which they had sold. It has since appeared, that the prosperity of Egypt is intimately connected with the preservation of the Bedoweens.

To the above accounts of the Bedoweens, extracted from modern travellers, we shall subjoin the description given of their ancestors above 1800 years ago by Diodorus Sicius, l. ix.

“...The wandering Arabs dwell in the open country, without any roof. They themselves call their country a solitude. They do not chuse for their abode places abound- ing in rivers and fountains, left that allurement alone should draw enemies into their neighbourhood. Their law or their custom forbids them to low corn, to plant fruit-trees, to make use of wine, or to inhabit houses. He who should violate these usages would be punished infully with death, because they are perfcribed, that whoever is capable of sub- jecting himself to such conveniences, would soon submit to mafters in order to prefer them. Some lead their camels to graze, some their sheep. The latter are the wealthiest; for, besides the advantages they derive from their flocks, they go to fell in the sea-ports frankincense, myrrh, and other precious aromatics, which they have received in exchange from the inhabitants of Arabia Felix. Extremely jealous of their liberty, at the news of the approach of an army, they take refuge in the depth of the deserts, the extent of which serves them as a rampart. The enemy, in fact, perceiving no water, could not dare to traverse them, whilst the Arabs, being furnished with it by means of velies concealed in the earth, with which they are ac- quainted, are in no danger of this want. The whole fole being composed of clayey and soft earth, they find means to dig deep and vault cellars, of a square form, each side of which is the length of an acre. Having filled them with rain-water, they close up the entrance, which they make uniform with the neighbouring ground, leaving some imperceptible token, known only to themselves. They ac- culturate their flocks to drink only once in three days, so that when they are obliged to fly across these parched sands, they may be habituated to support thirst. As for them-
themselves, they live on flesh and milk, and common and ordinary fruits. They have in their fields the tree which bears pepper; and a great deal of wild honey, which they drink with water. There are other Arabs who cultivate the earth. They are tributary, like the Syrians, and resemble them in other respects, except that they do not dwell in houses. Such are pretty nearly the manners of this people."—Volney's Travels in Egypt and Syria, vol. 1. 

Sennini's Travels in Upper and Lower Egypt, p. 353–357. 

BEDR, or BEDER HOUSENE, in Geography, a place of Arabia, 20 miles from Medina, and 30 from Mecca, lying in the high road of the caravan of Egypt. The fertile vale of Bedr is rendered famous by the battle fought between Mahomet and the Korish of Mecca, in the second year of the Hegira, A. D. 563. In this vale Mahomet was informed by his scouts of the caravan that approached on one side, and of the Korish, consisting of 100 horse, and 350 foot, who advanced on the other. After a short debate, the holy prophet sacrificed the prospect of wealth to the pursuit of glory and revenge; and a flight intrenchment was formed to cover his troops, and a stream of fresh water that flowed through the valley. "O God," he exclaimed, as the Korish defended from the hills, "O God, if these are destroyed, by whom wilt thou be worshipped on the earth? Courage, my children, close your ranks; discharge your arrows, and the day is your own." At these words he placed himself, with Abubeker, on a throne or pulpit, and instantly demanded the feecowry of Gabriel and 3000 angels. His eye was fixed on the field of battle; the Mussulmans fainted and were pressed: in that decisive moment the prophet started from his throne, mounted his horse, and call a handful of saud into the air: "Let their faces be covered with confusion." Both armies heard the thunder of his voice; their fancy beheld the angelic warriors; the Korish trembled and fled; seventy of the bravest were slain; and seventy captives adorned the first victory of the faithful. The dead bodies of the Korish were depoiled and infilted; two of the most obnoxious prisoners were punished with death; and the ran- 

BELL, or BELLING, is a military service which inferior tenants anciently paid their lord, by cutting down his corn, or doing other work in the field. The word is formed from the Saxon bedan, to pray; and repes, to reap, or cut corn.

BEDFORD. In Geography, a town of Spain, in Aragon; 8 leagues from Sanguila.

BEDFORDSHIRE, in the county of Bedford, about 160 miles from London; 30 miles north from Bedford. It is a peculiarly fertile and well-cultivated county, well supplied with fresh water, and abundantly supplied with milk, butter, and cheese. The county is divided into three districts, the western, the central, and the eastern. The western district is the most fertile, and is有许多

BEDFORD, GREAT, in Geography, is an ancient borough town situated on the eastern side of the county of Wilts, in England; at the distance of 70 miles west of London, and 17 miles north from Salisbury. It is an ancient borough by prescription, and held by all the parliaments of Edward the first. During some parts of the subsequent reigns, it intermitted feuding; but from the 9th of Henry VI., two members have constantly represented the borough. They are elected by about eighty persons who possesses freeholds, or inhabit ancient burgage houses. The town is governed by a port-reve, assisted by a bailiff, and some inferior officers, all of whom are chosen by the former. Bedew had formerly a market on Tuesday, but this has been discontinued for some years, in consequence of its proximity to the larger market town of Marlborough. Dr. Stukely and some other antiquaries have given to this place the honours of a Roman station, and a Saxon city; but there is little proof or probability, that it was ever the former. There are some entrenchments remaining on a hill south of the town, where it is said Cissa erected a castle, and in which he was defeated as vicaray of Wiltshire and Berkshire. Towards the end of the seventh century, a severe and destructive battle was fought near this town, between Wulfhere, king of Mercia, andÆthelstan, a powerful Anglo-Saxon monarch, when, as Mr. Turner in his Anglo-Saxon History, characteristically observes, "mutual destruction was more conspicuous, than the decision" of the battle. The church of Bedew is a large ancient structure, built mostly with stones, and shapd in the form of a cross. Among the monuments it contains, is one to Sir John Seymour, who was father of the protector, and of the unfortunate lady Jane Seymour. According to the tradition of the neighbourhood, this lady was married to the tyrannous monarch at a place called Wolf-hall near Bedew, where Sir John Seymou were refided.

Here are two annual fairs. The parish contains 316 houses, and 1693 inhabitants, most of whom are employed in agriculture. The famous Oxonian physician, Dr. Thomas Willis, was born here.

About two miles west of the town is Tottenham park, a seat of the earl of Aylestone. The house was built by the celebrated earl of Burlington, on the site of an ancient palace belonging to the marquis of Hertford, who was afterwards created duke of Someret. Tottenham-park is part of the forest of Sennemake, which is the only private forest in England independently belonging to a subject. It is a large tract of wild ground, profusely wooded, and containing much fine oak timber.

BEE, Apis, in Natural History, a genus of the Hymenopterous order, in the Linnean classification of insects; in Physiology, and in Husbandry, more commonly expressive of the common honey-bee (apis mellifera), although likewise applicable to the various other species of honey-bees; and in a full more general sense to those which do not, as well as those which do, produce honey; those which live in societies, as well as those which lead a life of solitude, or in dependence from their kindred kinds; all which have a certain appearance and cast of character, which, in the common accception of the word, claim the distinctive epithet of bee, or honey-bee, humble bee, wild bee, &c.

The bee, or api tribe, is characterised in the Linnean system as having, in common with other hymenopterous insects, four membraneous wings, and the female being armed
armed with a sting. This genus comprehends an amazing number of distinct species, many of which are clearly ascertained; some are doubtful; and many, if we may be allowed to reason by analogy, are most likely yet unknown. Upon the whole, there are scarcely any genera of insects that comprehend a greater number of various species than the apes. The majority of those correctly known have been already enumerated under the article Avis, to which the reader is requested to refer. The principal subdivisions, or natural families of the genus under which they have been described by Linnaeus, and by various writers before and since the time of that naturalist, will be also found there. Deferring from the minutiae of critical inquiry into the complicated characters of those subdivisions, it rests with us in this place to speak of the apes in another point of view:—as a race of animals highly entertaining, for their manners, habits, and inoffensive properties, to the naturalist; important to the economy in rural life; and familiar to every one by the trivial appellation of "a bee."

Under this head, the common honey, or domesticated bee, demands the first consideration, as it will serve to elucidate the peculiarities of the whole tribe, at least so far as they are of material consequence in the concerns of human life. By the indiscriminate term of the common honey-bee, we comprehend what are individually named the queen bee, or female; male bee, or drone; and working bee, or neuter. The natural history of the common bee has been more fully and impartially considered than that of any other creature of the insect tribe; with the exception of the skiff-worm, and the eocoeus employed in dyeing, there appears to be none more deserving of the regard paid to it. As an object of advantage, the bee has been deemed, by the common confidence of mankind in all ages, of sufficient consequence to be particularly attended to. We are not to forget the occasional recurrence of elastic writers of antiquity to the bee: the pastoral poets celebrate its praise; nor was the cultivation of this useful creature overlooked even by the earliest Britons, of whom we possess any record. Its preservation and its culture were recognized in their laws; the bee itself was considered as a most serviceable domestic, and the honey one of the greatest delicacies the bounty of heaven had granted them. In modern days, the importance of the bee has suffered a very sensible diminution in this country: still it is cultivated, and with advantage, by the thrifty agriculturalists. But in the warmer regions of Europe, such as the south of France, Italy, and the neighbouring parts of Asia, its cultivation is attended with more success than with us; the climate of those countries, mild, invigorating, and abundantly productive of luxuriant vegetation, is perfectly congenial with the nature of the bee; there it requires but little care from the hand of culture, and amply repays that little bestowed on the spontaneous produce of its industry.

Whil'n we are speaking on this particular topic, it will not be thought superfluous to advert to a few remarks that have lately fallen from the pen of M. Latreille, an ingenious French naturalist, in an introductory discourse to the study of bees published last year in Paris. "Dans la grande férie des animaux appelés infêtes (saya that writer), il n'en est pas dont l'histoire ait été aussi formée, de la faîte, et un travail de génie fécondé de mérites, que celle des abeilles. Sous les rapports de l'industrie, ces infêtes font le chef d'œuvre de la toute-puissance du Créateur; et l'homme lui-même, si fier de ses dons naturels, en, en quelque sorte, humilié à la vue de l'intérieur d'une ruche. Cellons de nous extasier sur la cabane singulière du caftron, sur la construction ingénieuse du nid de quelques oiseaux; tout cela a été oublié, lorsqu'on voit les travaux de l'abeille. Quoi
mode of life, we cannot perceive the benefit likely to result to the architect, the geométrician, or the statesman, by making these the subjects of their contemplation.

Thus far we have proceeded only in a general manner; in defecting to particulars, the subject before us naturally divides itself into a variety of distinct branches, under every one of which it is necessary the Bee should be considered. The line of discrimination is to be first drawn between those which herd in societies, and are most conducive to the interest of mankind; those which, living in societies, are rather injurious than of utility; and those which are solitary, and of course, like the latter, live in a state of wildness.

Bees of the first description consist only of a few species; the species of wild associated bees are rather more numerous; but the far greater number are solitary.

While we are speaking of those included in the first class, our attention again reverts with much propriety to the common bee, between which, and the other forts of honey-bees, the line of parallel is so intimately connected, that they cannot easily, and need not necessarily be regarded separately.

Of the common bee we are to consider the queen bee, male bee, and working bee; their structure and anatomy; their economy, generation, preservation, and varieties; the other analogous species productive of honey; and the general habits of those bees which live in societies; and of those which are of a solitary disposition. The architecture of Bees, so far as it relates to the common honey-bee, will fall under notice in the article Honey-Comb—Colonies of Bees, under Hive and Hiving; the fawarmig of Bees, their Wax and Honey, under their respective articles.

Bees, Sense of. There are in every hive or colony three sorts of bees, which Linnaeus calls regina (femina), fuel (mares), and operaria (spadones). The first is the queen, or female; the second the drones, or males; and the last the working bees, or neuters. The queen is larger than the others; she is armed with a sting, and has nineteen joints in the antennae, including the rudicle; those of the male have one joint more in the antennae; the eyes in this sex are large, and it is delutated of a sting: the working bees are armed with a powerful sting, and have fifteen joints in the antennae. And here it will be proper to observe, that the circumference of the antennae in the female and neuter bee, containing the same number of articulations, were not observed till lately. Linnaeus tells us the antennae of the female has ten joints, the male eleven, and the working bee fifteen; the discovery to the contrary is due to Mr. Kirby, who, to use his own language, says: "In every one of those affections, with due deference to a name so great be it spoken, Linnaeus is mistaken."

Bees, Structure and Anatomy of. There is nothing particularly striking in the structure of the bee. In their form they vary in different species, and in different sexes, but generally speaking they are uniformly bully animals, having the head large, the eyes oval and conspicuous, the thorax broad and thick, as well as the body, and most are commonly covered with hair or down; the sexes distinguished by the number of articulations in the antennae (being one more in those of the male than the female), and the mouth furnished with strong instrumenta cilia. The jaws and lip of the apis melifica are membranaceous at the tip, the former bidented; as in other bees, the jaws open to the right and left, and serve to carry out of the hives any thing that incommodes them. To those which have no sting, the teeth of these jaws are of essentical service in their wars with such as possess that formidable weapon; and it is believed, but on what foundation is uncertain, that the wounds inflicted by means of these teeth inevitably prove mortal to the other, or flinging bees, when they bite. The tongue in different kinds of bees is very different in shape. It has been observed, that in the more industrious species, this instrument, when stretched out, is shorter than in the others; be this as it may, the tongue of the common honey-bee is long, inflected, and extremely plant; by means of this, the bee not only procures itself necessary subsistence, but it is also employed by the animal to collect the honey, which we appropriate to ourselves. The parts of the tongue conformed in different bees are not uniformly distinguished by the same terms in the works of entomological writers. Proboscis is that by which Mr. Kirby, after the example of Linnaeus, when defining the Apis genus, calls the tongue, together with all the machinery that belongs to it, inclusive of the sheath or vagina. This is more fully illustrated in his dissections of the proboscis of the male, the female, and the neuter of the common honey bee, wherein the structure of this instrument, and the several parts of which it consists, are correctly discriminated. It may not be altogether irrelevant to our purpose to follow this agreeable writer, in some degree, whilst explaining the structure of the proboscis or tongue. This part of the bee is said to consist of seven pieces; Mr. Kirby speaks of more, viz. the falcum, tubus, valvula, cardo, lora, palpi exteriores, palpi interniores, and lingua. The tubus is that part upon which the tube is seated, and has been noticed both by Swammerdam and Reaumur; the latter of whom calls it le pivot. Tubus is that part called by Fabricius the bafe of the tongue, and by Swammerdam and others the sheath of the tongue, including the bafe of that organ; and in a certain measure answering the same purpose as the valvula. The latter, or valvula, form the exterior sheath of the tongue. As to the cardo, cardines i terrae between the valvula and the lora, and seem to perform the office of hinges. Reaumur mentions these as "fejets tendineux par les quel qu'estigies font attachees a leurs appuis." Lora are so named by Mr. Kirby from their use, which seems to be to let out or pull in the proboscis, being those parts which Reaumur calls "les leviers;" when the proboscis is extended, the angle with which the valvula of the tube fits, is observed to point towards the breast, but when retracted, its position changes, and it points towards the mouth. Palpi exteriores are organs noticed in the rude sketch of the proboscis of the hive bee by Swammerdam, who does not, however, speak of them. In this kind they are small, and consisting only of a single joint; escaped the observation of Reaumur; in some bees they are large, and contain from one to six joints. Palpi interniores are those parts of the proboscis which Reaumur distinguishes by the term "barbes;" in the common bee, these consist only of two articulations; in other species they are known to contain a greater number. De Geer calls these little organs, "les petit barbillon." Lacinie exteriores are to be met with in almost every family of the apis genus. Lacinie interniores are peculiar to the api, and embrace and defend the tongue where it enters the tube; these are called by Swammerdam the third pair of joint of the proboscis; Reaumur mentions them as "pieces qui embrassent et fortifient la trompe;" Latreille, in his Nomada; family, names them "foies latérales." Lingua, or the true tongue, called sometimes by De Geer "le lèvre inferior," or inferior lip, is occasionally mentioned by Fabricius under the term of labium, or lip. Roemer, in a work entitled "Genera Infestorum, &c." lays down the character of apis thus;—"Jaws dentated, with an inflected proboscis, with two bivalve shells, in which the tongue is included." Latreille, in a work recently published, divides the apis genus into two families: the first, corresponding
corresponding with the melitta of Kirby, has these charac-
ters: Mâchoires et langue très longues, deux ou trois
fois plus longues que la tête, dirigées en avant dans l'inac-
tion, et dont la base rejonct inférieurement de la cavité en
telles sont logées. Partie faîlant de la langue évacée, a trois
divisions plus courte que la gaine : celle-ci longue et cylin-
drique. The two Fabriican genera, bylaeus and andrena,
are ranged under this family; the tongue in bylaeus is
described, "langue large; divisions du milieu échan-
cée, dentelle, cilée." In andrena, "langue oblongue; di-
vision du milieu en point renfondue." La gaine, or sheath
of the tongue, is not invariably cylindrical in this division
(melitta) of apo; it is sometimes conical.

In the family which includes the true apo of Kirby, the
tongue is thus described by Latreille: "langue très pour-
longue, étroite, linéaire profonde, cyllindrique, un peu coni-
cée, a papilles vers l'extrémité, facile à la force de la gaine.
Nomada, apo, and euceris of Latreille are included under
this head. His Nomada is thus characterized still further;
"langue d'une pièce avec deux très petites foîtes latérales.
Apis, "langue de cinq pieces."
We have deemed it requisite to be thus minute in following
the observations of Kirby, Latreille, and others, who have
difficult and examined the structure of the probosces in dif-
ferent bees, with the aid of microscopic glases, for the pur-
purpo se of shewing the fallacy of the commonly received op-
inion, that in all bees the structure of this organ must be the
same. For instance, we see that in one family the tongue is
very long, more than twice or thrice the length of the
head, with the extremity opening into three divisions, the
whole of which is contained within a sheath of a cylindrical
form; in others this part is conical. Some have a large
tongue, with the middle division of it flopping, jaggcd, and
chillated, and the end truncated; again, others have an ob-
long tongue, the middle piece of which is cleft or lacerated
at the tip. In many, the tongue is very long, straight or
linear, almost cylindrical and papillous at the extremity;
while the tongue in others consists of a fingle piece, having
two lateral laciniae of a small size; and sometimes, on the
contrary, the tongue is formed of five pieces; in the bylaeus,
andrena, and nomada families, the tongue is three-cleft, in
apo, five-cleft, and in euceris seven-cleft.
In the formation of the probosces, the purpose for which
nature has designed this curious instrument is very apparent.
That of the common bee has been examined with attention.
First, the sheath or external parts are observed to protèc-
t and strengthen the organs of nutrition which they contain;
the valves of the sheath are disposed on each side of the
tongue in pairs; with the tongue itself, which is pervious, the
bee extracts and gathers the nectarous juices from flowers,
which are shortly after converted into honey. The two pieces
of the exterior sheath are horny or membranaceous; those
of the inner sheath are placed higher above the base than the
exterior ones. The probosces is partly membranous, and
partly of a granily nature, and has the lower part formed
in such a manner that it is capable of considerable dilatation,
by means of which the internal cavity may be prodigiously
enlarged, and rendered capacious enough to receive a great
quantity of natiue honey. When the probosces is shut up,
and inactive, it is very much flattened, and broader than it
is thick. The lower and membranous parts of the trunk at
the base have no hairs upon them, but are covered with
little transparent protuberances that are placed in regular
order, and at equal distances from each other; these are
supposed to be glandes, and may have a considerale power in
changing or preparing the honey that is swallowed or
taken up by the probosces." Down the middle of the pro-
boseis there is a tube of a much harder nature than the files,
which becomes rather tapering towards the apex, where the
probosces is very thick set with small hairs, which may
force to keep it in a proper situation when in use.

The probosces is not cylindrical, but rather a kind of
convex blade, terminating to all appearance in a point; and
the sheaths are so contrived as to cover little more than the
upper part of it. These exterior sheaths lap over each other
on the upper part, so that the outside of the probosces is
protected by a very strong double case; a covering that was
unecessary for the under part, because, when this instrument
is in use, the sheaths are opened, but when inactive, it is so
folded, that the under part is protected by the body of the
bee. Within the exterior sheath, and near the bottom, are
two levers, which are fixed to the end of the probosces, and
by the motion of which it is raised or lowered. If a bee is
attentively observed when it alights upon a full blown flow-
er, the activity and address with which it employs this ap-
paratus will prove highly entertaining. The tongue is full
proruted, then lengthened, then shortened, and continually
kept in motion, bending and turning in every possible direc-
tion to adapt itself to the form of the flower.

The fling of the bee is a curious weapon, adapted to the
industrious habits of its life, which expose it to a multitude
of dangers. It is truly an instrument in every manner cal-
till the whole sting is buried in the wound, and the poison injected. When once the bee has completely transfixed its sting into the flesh, the acrid caustic liquor, called the poison, is pressed from the glands in which it is secreted, and pulling down the channels of the darts, discharges its malignant contents into the wound, occupying an acute pain and swelling of the part, the inflammation of which continues not unfrequently for several days after. Dr. Hunter, being desirous of ascertaining the force of this poisonous fluid, dipped needles into it, with which he pricked the back of his hand; the like experiment was tried on the same part, with needles that were not dipped into it, and found that the punctures occasioned by the former grew and inflamed, while the others did not.

But if the wound which the bee inflicts be painful to those who receive it, to the bee it is attended often with more serious harm, for it inevitably proves fatal, if by any accident the sting is broken off in the act of inflicting it. When the creature strikes its sting deep into the flesh, and the person starts, and decomposes the bee before it can disengage itself, the sting is almost certain of being broken off, and left sticking in the wound. On the contrary, if he has patience to bind quiet, the bee will bring the two slender darts close together, and withdraw the whole, in which case the wound is always left painful. A wasp is not so liable to leave its sting in the wound as a bee; the beads of the darts being shorter, and the insect more nimble and vigorous in its operations. When the bee means to sting, it flies about the object of its anger very quickly, and by the velocity of its motions, seems to evade being struck or attacked to advantage, while preparing for the assault. The sound emitted at this time is also peculiar, and to those accustomed to bees is perfectly well understood. "The danger of being stung by bees (it has been said), may be in a great measure prevented by a quiet composed behaviour. A thousand bees will fly and buzz about a person without hurting him, if he will but stand still and forbear disturbing them, even when near his face; in which case he may observe them for hours together without danger; but if he molests or beats them away, he usually suffers for it. In the "Edinburgh Medical Commentaries" it has been affirmed, that a person is in perfect safety in the midst of myriads of bees, if he were to keep his mouth carefully shut, and breathe gently through the nostrils only; the human breath, it would seem, being peculiarly offensive to their delicate organs; and merely with this precaution, it is said, the hives may be turned up, and even part of the comb cut out, while the bees are at work.

Reaumur made use of no other remedy for the stinging of the bee than to bathe the part affected with cold water, a remedy which in most cases will allay the pain and inflammation only during the time of its application. Oil of olives, or sweet almonds, applied to it alleviates the pain. Lombard, a late French writer, in his "Manuel nécessaire au villageois pour guérir les abeilles," prescribes a better remedy. He recommends that the wound be pricked, to cleanse it as much as possible from the venomous fluid, and then rubbed with alkali, or with a little dilute quick lime, by means of which the properties of the poison will be neutralized; the wounded part, after the application of this remedy, must be well washed with cold water, when both the pain and swelling will be found to have received considerable relief.

Bees, Voice of. The bee is capable of emitting either by the mouth or motion of the wings, a variety of sounds, expressive of its anger, fear, contentment, and other passions; a circumstance hitherto but very slightly regarded by those writers who have, in other respects, entered most minutely into the history of this animal. Mr. Hunter, in his paper on the honey-bee, in the Philosophical Transactions, lays a few words on this subject. Bees, he tells us, may be made to have a voice; or at least, that they are able to form several distinct sounds. They give a sound when flying, which they can vary according to circumstances. One accustomed to bees can immediately tell when a bee intends to make an attack by the sound, most likely of the wings, but that is not certain; it may be little from the mouth. The bees may be seen flying at the door of their hive, with the belly rather raised, and moving their wings, by which means a noise is occasioned. But they produce a noise independent of that made by the wings; for if a bee be smeared all over with honey, so as to cause the wings to adhere together, the bee will be perceived to make a shrill and peevish sound while the wings remain motionless. To ascertain this matter with a still greater degree of accuracy, Mr. Hunter held a bee by the leg with a pair of pincers, and very clearly observed that the creature made the same peevish noise while the wings were perfectly still. After this, he even cut the wings off, when the poor bee continued to make the same noise as before. He imurred the bee in water, but it did not then produce any noise, till it was much teazed, when the same sound was heard as in the former instance: during this experiment, he could observe the water, or rather the surface of contact of the water with the air, vibrating at the orifice of an air-hole situated at the root of the wing. The same writer remarks, that the bees, or some kinds of them at least, make a noise the evening before they swarm, which is a kind of ring or found reeling that of a small trompet; and by comparing it with the notes of the pianoforte, it seemed to be the same with the lower;f of the treble. When the bees return from their daily excursions in the fields, to their hives at evening, loaded with farina and honey, they are well known to ring or hum a soft melodious tone expressive of their contentment. Entomologists are well aware that the sound emitted by the bee is susceptible of certain modulations. Some of these proceed undoubtedly from the motion of the wings, and vary in tone as they are moved with greater or less velocity, just as we observe in other insects furnished with transparent wings; and in some degree throughout the whole of the insect race, with the exception of those which have very small wings, or are entirely destitute of them. From the observation of Mr. Hunter on the emission of air from the lateral trachea, or air-veil in the side, it would seem, that a certain sound may be caused by means of these little organs: the remark of this anatomist deserves more consideration than he appeared to be himself persuaded of, since we know that the fening of the cicala, a noisy tribe of insects, proceeds not from the mouth, but from two lateral openings, one on each side of the abdomen; the sound being produced by means of a most singular internal organization, and transmitted through those openings at the pleasure of the creature. It is not unlikely, that many insects may be furnished with lateral organs for the purpose of making a certain noise, although not exactly of the same structure in the cicala, and certainly upon a much smaller scale. That a bee emits a sound from the mouth, is also believed. A gentleman within our knowledge, who has made the manners of bees his particular study, can with the utmost facility declare the sex of any bee that may chance to pass near him, by attending only to the motion and sound emitted by it while in flight.

Bees, Age of. Writers are not agreed as to the duration of the term of life in the honey-bee. Among the ancients it
it was thought to extend to nine or ten years. Virgil and Pliny limit it to seven. Some suppose that they are annual; others, that they live many years, but the latter idea is almost exploded at this time. On the other hand, although they may be considered as annual, a few of the females certainly live through the winter, and lay the foundation for a new society in the ensuing summer. In the month of August, Mr. Hunter imagines the queen, or queens, to be impregnated by the males, and as the males do not provide for themselves, they become burthen-borne to the working bees, and are therefore destroyed as useless, and thrown out of the hives. When the bees are about the business of providing their winter store, every operation ceases, excepting that of collecting honey and bee-bead for the future subsistence of the colony. At this particular crisis, it would seem as if the males were conscious of their approaching danger, for they do not rest as before on the mouth of the hive either when going in or coming out; activity is apparent in all their actions. This avails them little, does nor does it aver, though it may protract, their fate, for a short time; they are commonly attacked by the labouring bees, one, two, or three together, and seeming to be incapable of making any resistance, or anxious to avoid the contest, attempt only to ensure their safety by hastening out of the way of their cruel enemies as speedily as possible. The labourers do not fling the males, Mr. Hunter tells us, but only pinch, tear, and pull them about, as if to wear them out, and hale, by such violent treatment, the death of these hapless creatures, who would die naturally in the space of a little time after.

Bees, Economy of. When we speak in a familiar manner of the economy of bees, such as the secreting of wax, the constructing of honey-combs, ranging the fields and gardens to collect farina and various juices for the preparation of wax and honey; attending, nurturing, and feeding the maggots or larvae, covering in the chrysalides or pupae, &c. the labouring bee alone is meant, for the females and the males are only implicated in the common concern, so far as relates to the well government of the colony, and generation of the future brood. Among those who have minutely treated on this subject, (the economy of bees,) many have related very wonderful and incredible circumstances; the moral virtues (as it has well been said) have all, at one time or other, been attributed to the bees. They have been celebrated for their prudence, industry, mutual affection, unity, loyalty to their sovereign queen, public spirit, sobriety, and cleanliness. The fagacity of bees in foreseeing rain, or cold has been often mentioned; this is not very questionable; for a short time, at least, before we are sensible of the alteration in the state of the weather, their conduct proves that they are not ignorant of it. Mr. Hunter frequently observed their return home in great numbers before rain or cold was coming on, without being able to perceive himself, till some time after, the change in the temperature of the atmosphere. Bees require a considerable degree of heat; the eggs must be kept warm, and neither the larvae nor chrysalides, it is asserted, will live in cold of 60° or 70°. "Bees (says one writer) seem to be warned of the appearance of bad weather, by some particular feeling. It sometimes happens, even when they are very affiduous and busy, that they on a sudden leave from their work; not a single one flies out; instead of this, they are abroad hunting for food...providing crowds, that the doors of their habitations are too small to admit them. On this occasion, look up to the sky, and you will soon discover some of those black clouds which denote impending rain. Whether they see the clouds gathering for it, as some imagine, or whether (as is much more probable) they feel some other effects of it upon their bodies, is not yet determined; but it is alleged, that no bee is ever caught even in what we call a sudden shower, unless it has been at a very great distance from the hive, or have been injured by some accident, or been sickly, and unable to fly so fast as the rest. Cold is a great enemy to them. To defend themselves against its effects during a hard winter, they crowd together in the middle of the hive, and buzz about, and thereby excite a warmth that is often perceptible by laying the hand upon the glass window of the hive. They seem to understand one another by the motion of their wings: when the queen wants to quit the hive, she gives a little buzz; and all the others immediately follow her example, and retire along with her."

Although many of the accounts that have been given of the bee are fabulous, an intimate acquaintance with them in their domestic operations, has furnished many real facts that are as surprising as those which are apparent, or perhaps wholly, groundless. It is not to be disputed, that at certain times, when they think their stores likely to fail short, they make no scruple to kill and throw out of the hives their own offspring; the large and young bees of the male or drone kind, fearlessly extricated from their pupa state, have been carried away and left to perish. They may be just in some respects in their own kingdom, and to those who are to be considered as their fellow subjects, but they rob and plunder strangers whenever they have power and opportunity; and they have frequently battles in committing depredations on neighboring colonies and hives, or in repelling the aggressions of other invaders, in their own defence, which always terminate fatally to many of their number. This indeed does not often happen, except early in the spring, or late in autumn, when honey is scarce in their hives, and there are no flowers abroad to furnish them with more. In this case, when they have ranged the fields without success, they endeavour to supply themselves at the hazard of their lives, from the flowers of other bees. However, in all these conflicts, if the queen of either hive that happens to be engaged is killed, the battle ceases, and both parties unite under the survivor.

The industry and activity of bees in their domestic labours, afford a very instructive and amusing spectacle; all are busily engaged in their several departments. While some are employed in gathering honey and wax, others repair the rotten combs; others carry out the dead, and cleanse the fifth; others keep guard, placing themselves in five or six files eight or ten deep upon the floor of the hives, so that all the bees when they enter must pass between them; some are even paid to serve for bridges or ladders for others to pass over; and when they are tired with labour, they recruit themselves with rest. For this purpose, they form larger or smaller clusters in the following manner: each bee with its two fore-legs lays hold of the hinder legs of the bee that is next above it, and thus a chain is formed by the successive application of one to another, and the first bee supports the weight of all the rest to the bottom of the chain. The larger clusters are only a multitude of these chains, of which there are sometimes an hundred together. The bees, it is said, never lay hold of any part of one another, except the legs. In this way, they likewise guard themselves from the effects of cold, and continue for several weeks together in a state of torpor.

Bees, are told, when they begin to work in their hives, divide themselves into four companies; one of which roves in the fields in search of farina for the wax; another is employed in laying out the bottoms and partitions of the cells; a third in making the inside smooth from the angles P. 2
and corners; and the fourth in collecting and bringing food for the support of the rest, or in relieving those who return heavily laden. Neither of these four companies is kept constantly to one class of work, but often change the office allotted them; those that have been at work, for example, in the construction of the cells, are permitted to go abroad, and those which have been in the fields already, are allowed to take their places in the hive. They are believed, and not without reason, to have certain signs, by means of which they understand each other, and one striking instance is adduced in proof of this: when any one of the bees is in want of food, the creature bends down its trunk to the bee from whom it is expected, the latter immediately opens its honey-bag, and lets some drops of honey fall into the mouth of the other, which is at that time observed open to receive it. Many other circumstances might be likewise mentioned, were they necessary to confirm this idea. These particulars relate almost exclusively to the operations of the wenter, or labouring bee; the males answering no other purpose than simply that of males in their sexual capacity; and the queen or female breeder only attending to the discharge of her many more important duties, the laying of eggs, and influencing, by her presence, the working bees, to persevere in their respective labours.

BEE. Generation of. Those insects begin to breed in the upper part of the hive, in the cells adjoining to those which are filled with honey, and they descend gradually into the lower parts, as the flowers which furnish them with wax increase in plenty. The cells designed for the working bees, are commonly half an inch deep; those for the drones, three quarters of an inch; and those intended to contain the honey only, still deeper. The queen bee is generally concealed in the most secret part of the hive, and is never visible, except when she happens to lay her eggs in such combs as are exposed to sight. When she does appear, she is always attended by ten or a dozen of the common sort, who form a kind of retinue, to follow and guard her wherever she goes. Before she lays her eggs, she examines the cells where she designs to lay them; and if she finds they contain neither honey, wax, nor embryo, she introduces the posterior part of her body into the cell, and fixes to the bottom of it a small white egg, which is composed of a thin membrane, filled with a whitish liquor. In this manner the proceeds on, till she fills as many cells as she has eggs to lay, which are generally many thousands. Sometimes more than one egg has been deposited in the same cell; when this is the case, the working bees remove the supernumerary eggs, and leave only one in each cell. On the first or second day after the eggs are lodged in the cells, the drone bee is suppos'd by many to inject a small quantity of whitish liquid, which in about the course of a day is absorbed by the egg. On the third or fourth day is produced a maggot, which, when it is grown so as to touch the opposite angle of the cell, coils itself up in the shape of a semicircle, and floats in a certain liquid whereby it is nourished, and enlarged in its dimensions: this liquid is of a whitish colour, of the thickness of cream, and of an inoffensive taste, like flour and water. The origin and qualities of this liquid, are not correctly explained: some have suppos'd that it consists of some generative matter injected by the male or drone bee into each cell, in order to give fecundity to the egg: a more probable opinion is, that it is the same with what several writers call the bee-bread; and that it is a mixture of water with the juices of plants and flowers, collected merely for the nutrition of the young while they are in a weak and helpless state. Whatever may be the nature of this aliment, it is certain the bees are very industrious in supplying the worms with it. The larva, or maggot, is fed by the working bees for about eight or ten days, till one end touches the other in the form of a ring, and when it begins to find itself uneasy in its first pedicles, it ceases to eat, and begins to roll itself, thrashing the head forwards towards the mouth of the cell. The attendant bees, observing these symptoms of approaching transformation, defend from their labours in carrying food, and employ themselves in fanning the top of the cell with a lid of wax formed in concentric circles, and by their natural heat assist in cherishing the brood, and hastening the birth. In this state, the larva extends itself at full length, and prepares a kind of silky covering, which forms a complete lining for the cell, and affords a convenient receptacle for the transformation of the larva to the pupa state. Some naturalists suppose, that as each cell is defined to the face-to-face breeding of several larvae, the whole web, which is composed of many cubic or doubles, is, in reality, a collection of as many webs as there have been larvae. M. Maraldi apprehends, that this lining is formed of the skin of the larva, thrown off at its entrance into the nymph or pupa state; but it is urged by others, that if the cells are opened when recently covered by the bees, the larva within will be found in its own form, and detected in the act of spinning its web; and by means of glusses, it will be found composed of fine threads, regularly woven together, like those of other spinning animals.

In the space of eighteen or twenty days, the whole process of transformation is finished, and the bee endeavours to discharge itself from confinement, by forcing an aperture with its jaws through the covering of the cell; the passage is gradually dilated; so that one of the maxillae or jaws appears first; then the head, and afterwards the whole body; this is usually the work of three hours, and sometimes of half a day. The bee, after it has disengaged itself, stands on the surface of the comb, till it has acquired its natural complexion, and full maturity and strength, so as to become fit for labour. The rest of the bees gather round it in this state, congratulate its birth, and offer it honey out of their own mouths. The exuvia, and scattered pieces of wax which are left in the cell, are removed by the working bees; and the cavity is no sooner cleaned, and fit for new incumbrance, but the queen deposits another egg in it; informally, that M. Maraldi says, he has seen five bees produced in the same cell, in the space of three months. The young bees, it is said, are easily distinguished from the others by their colour: they are grey, instead of the yellow brown of the common bees, the reason of which is, that their body is black, and the hairs that grow upon it are white; from the mixture of these that are seen together, refutes a grey; but this colour forms itself into brownish by degrees; the rings of the body becoming more brown, and the hairs yellower.

Reenair suppos'd, before the time of Linneaus, the queen bee to be the only female in the hive, and consequently, the mother of the next generation: that the drones are the males by which she is incumbrant; and that the working bees, or those which collect wax on the flowers, that knead it, and form the combs and cells, and afterwards fill them with honey, are the neutrals.

Schirac, in his "Histoire Naturelle de la Reine des Abeilles, &c" published in 1772, has advanced a different opinion upon this subject. He suppos'd, that all the common, or honey bees, are females in disguise, in which the organs that distinguish the sex, and particularly the ovaria, are obliterated, or at least from their extreme minuteness, have escaped the observer's eye; that every one of these bees, in the earlier period of existence, is capable of becoming a queen bee, if the whole community should think proper to nurse it in a particular manner, and raise it to that rank;
rank; in short, that the queen bee lays only two kinds of eggs, those which are to produce the drones, and those from which the working bees are to proceed. This author made his experiments not only in the spring months, but even as late as November. He cut off from an old hive a piece of the brood comb, taking care that it contained larve (or 
of the as they are termed) which had been hatched about three days. This he fixed in an empty hive, together with a piece of honey-comb for food to his bees, and then introduced a number of common bees into the hive. As soon as the bees found themselves deprived of their queen, and liberty, a dreadful uproar took place, which lasted twenty-four hours. On the elevation of this tumult, they betook themselves to the first procuring to construct a royal cell, and then taking the proper measures for feeding and hatching the brood included within them; sometimes, even on the second day, the foundations of one or more royal cells were to be perceived, which proved a certain indication that they had elected one of the inclosed larve to the sovereignty.

The final result of these experiments seemed to be, that the colony of working bees being thus stirred up with a piece of brood comb, not only hatch, but at the end of eighteen or twenty days, produce from thence one or two queens, which, it was supposed, proceeded from the larve of the common working bee, and which had been converted by the colony into a queen, merely because they wanted one.

From these, and other experiments repeated, Mr. Schrijn concluded, that all the common working bees must be originally of the female sex; although, if they are not fed, lodged, and brought up in a particular manner while in the larve state, their organs are not developed: and that it is this circumstance attending the bringing up of the queen, that allows the full extension in the female organs in the first instance, and produced afterwards that difference in her fize and aspect, so different to that of the working bee.

Mr. Debrauw, an ingenious apothecary of Cambridge, made many experimental remarks on bees, which are inserted in the Philosophical Transactions for 1776. He professes to have detected the impregnation of the eggs by the males, as well as to have discovered the difference in size among the drones or males, of which Maraldi and Reaumur, before some others, had conceived there might be two different kinds. Mr. Debrauw says, he watched the glass hives with indefatigable attention from the moment the bees (among which he took care there should be a large number of drones) were put into them, to the time of the queen's laying her eggs, which generally happens the fourth or fifth day. He observed, that on the first or second days, (always before the third) from the time the eggs are placed in the cells, a great number of bees fastening themselves to one another, hung down in the form of a curtain from the top to the bottom of the hive. They had done the same at the time the queen bee deposited her eggs, an operation which seems contrived on purpose to conceal what is transacting; however, through some parts of the veil he was enabled to see some of the bees infesting the posterior part of their bodies, each into a cell, but continuing there only a short time. When they had retired, it was easy to discover a whitish liquor left in the angle of the basis of each cell which contained an egg. In a day or two this liquor was absorbed into the embryo, which on the fourth day assumes its larve state, and is attended by the working bees, who bring it a little honey for nourishment, and continue to feed it for the space of eight or ten days after its birth. When the bees find that the larva has attained its full bize, they defilt from bringing any new food, knowing that the larva has no more occasion for it while in that state; but they have still another service to perform upon it, in which they never fail to perform their duty: this is to shut up the top of the cell in which the larva is enclosed; for eight days longer it remains within the cell after being thus immured, during which time a further change takes place; the larva, which was before idle, begins to work as soon as the bees commence their operation of closing up the cell; while the latter are employed in making the covering of wax, the larva is at work within the cell, which it lines with a fine film. The larva thus concealed, voids its excrements, quits its skin, and assumes the pupa form; at the end of some days, the young bee acquires sufficient strength to quit the covering of the pupa, tear through the waxen envelope of its cell, and proceed from thence a perfect winged insect.

To prove still further that the eggs are fecundated by the males, and that their presence is necessary at the time of breeding, Mr. Debrauw made the following experiments: he left in the hive the queen, with only the common or working bees, without any drones, to see whether the eggs she laid would be prolific: for this purpose, he took a swarm, and shook all the bees into a tub of water, leaving them there till they were quite senseless, by which means he was able to discover the drones without any fear of being stung by the others: he then restored the queen and working bees to their former state, by spreading them on a brown paper in the sun, after which he placed them in a glass hive, and they began very soon to work as usual. The queen laid eggs, which to his great surprise were impregnated; for he imagined he had separated all the drones, or males, and therefore omitted watching them. At the end of twenty days, he found several of the eggs had, in the usual course of changes, produced bees, while some had withered away and others were covered with honey. Hence he inferred that some of the males had escaped his notice, and impregnated part of the eggs. To convince himself of this, he took away all the brood comb that was in the hive, in order to compel the bees to provide a fresh quantity, being determined to watch narrowly their motions after the new eggs should be laid in the cells. On the second day after the eggs were placed in the cells, he perceived the same operation that was mentioned before, namely, that of the bees hanging down in the form of a curtain, while others thrust their posterior end of the body into the hive. He broke off a piece of the comb in which were two of these infestcs, and found in neither of them any spiriting; (a circumstance peculiar to the drones) upon dissection, with the assistance of a microscope, he discovered the four cylindrical bodies which contain the glutinous liquor, of a whitish colour, as observed by Maraldi in the large drones. He was therefore now under the necessity of repeating his experiments, after destroying the males, and even those which might be suspected to be such.

He once more immersed the same bees in water, and when they appeared to be in a senseless state, he gently pressed every one, in order to distinguish those armed with a sting from those which had none, and which of course he supposed to be males. He replaced the same swarm in a glass hive, where they immediately applied themselves again to the work of making cells, and on the fourth and fifth day, very early in the morning, he had the pleasure to see the queen bee deposit her eggs in those cells; he continued watching most part of the ensuing days, but could discover nothing of what he had seen before.

The eggs, after the fourth day, were found in the same state as on the first day, except that some of them were covered with honey. A singular event happened next day about
about noon; all the bees left their hive, and were seen attempting to get into a neighbouring one, on the floor of which the queen bee was found dead, being, no doubt, slain in an engagement. This event Mr. Debray supposes to have arisen from the desire of the bees to perpetuate their species, to the concurrence of which the males were necessary, and that this consideration alone induced them to desert their habitation where no males were left, and to fix their residence in a new one, where there was a flock of them.

To be more fully satisfied in this respect, Mr. Debray took the brood comb which had been impregnated, and divided it into two parts; one of which he placed under a bell glass with honey-comb, for the food of the bees, taking care to leave a queen, but no drones among the bees confined in it; the other piece of brood-comb, he placed in another bell glass with a few drones, a queen, and proportionable number of common bees. The result was, that in the piece put into the first glass there was no impregnation, the eggs remaining in the same state as they were when first placed in it, and on giving the bees their liberty on the seventh day they all flew away; whereas in the other glass, which contained the second piece of brood-comb, the very day after the bees had been put into it, the eggs were impregnated by the drones, and the bees did not fly the least inclination to abandon their new habitation when the glass was left open to allow them to escape.

Such are briefly the different opinions of those experienced observers of the bee, Reaumur, Marshé, Schirach, and Debray, whose several ideas founded, as it must appear, upon the most laborious, indefatigable, and minute investigations, have met with many advocates. On a subject of this interest we ought not to assume any opinion hastily, or in an affair so mysterious, obtain our own without a considerable degree of caution. Some writers of no mean celebrity have treated, since the time of these observers, upon the same topic, whose remarks deserve to be impartially considered. To the foregoing observations, and some others made by Schirach in particular, the late Mr. Hunter has replied, in a paper written by him expressly on bees, and inserted in the Philosophical Transactions for 1792, of which we are to avail ourselves. The experiments performed by Schirach, Mr. Hunter is disposed to think inaccurate, and the result inferred from them of course unworthy of credit: how far the arguments of the latter are likely to refute the observations of Schirach, remains to be decided, when we have considered them in his own words. The criticisms of this anatomist are introduced to notice, in speaking of the queen bee.

"The queen bee, as she is termed, (says Mr. Hunter) has excited more curiosity than all the others, although much more belongs to the labourers. From the number of those, and from their exposing themselves, they have their history much better made out; but as there is only one queen, and she scarcely ever seen, it being only the effect of her labour we can come at, an opportunity has been given to the ingenuity of conjectures, and more has been said than can well be proved. She is allowed to be bred in the common way, only there is a peculiar cell for her in the first stage, and Reaumur says, "her food is different when in the maggot state;" but there is probably but one queen, and that the whole might not depend on one life it is asserted that the labourers have a power of forming a common maggot into a queen. If authors had given this as an opinion only, we might have passed it over as improbable, but they have endeavoured to prove it by experiments, which require to be examined; and for that purpose I shall give what they say on that head, with my remarks upon it."

Abstractions from Schirach.—"In twelve wooden boxes were placed twelve pieces of the comb; in each box was shut up a handful of working bees. Knowing that when bees are forming a queen, they should be confined, the boxes were kept shut for two days. When examined at the end of that period, (six boxes only were opened) "in all of them royal cells were begun, one, two, or three in each, all these containing a maggot four days old. In four days, the other six boxes were opened, and royal cells were found in each, containing maggots five days old, surrounded by a large provision of jelly, and one of these maggots, examined in the microscope, in every respect resembled a working bee."

"This experiment was repeated, and the maggots selected to be made queens were three days old; and in seventeen days there were found in twelve boxes fifteen lively handsome. These experiments were made in May, and the bees were allowed to work great part of the summer. The bees were examined one by one, but no drone could be discovered, and yet the queens were impregnated, and laid their eggs." [Here is a wonder! queens laying eggs, (which we must suppose Mr. Schirach meant we should believe) and they hatched without the influence of the male.] "The above experiment was repeated with pieces of comb, containing eggs only, in six boxes, but no preparation was made towards producing a queen."

"The experiment of producing a queen bee from a maggot was repeated every month of the year, even in November.

"A maggot of three days old was procured from a friend enclosed in an ordinary cell, and shut up with a piece of comb containing eggs and maggots. That, three days old, was formed into a queen, and all the other maggots and eggs were destroyed."

"In about a hundred experiments a queen bee has been formed from maggots three days old. [The working bees, as all females, although the ovaria is too small for examination, etc. vide Phil. Tran.]"

Mr. Hunter next proceeds to speak of another author who repeated the experiments of Schirach. "Wilhelmi (he says) observes that a queen cell, which is made while the bees are shut up, is formed by breaking down three common cells into one, when the sides are repaired."—"A young queen was put into a hive which had been previously ascertained to contain no drones, and whose queen was removed, and yet the young queen laid eggs. [Probable.] In repeating Mr. Schirach's experiment, he shut up four pieces of comb with one maggot in each: after two days the maggots were all dead, and the bees had defiled from labour. [There is no mystery in this: but did they hatch?]—"A piece of comb, from which all the eggs and maggots had been removed, was shut up with some honey, and a certain number of workers; in a short time they became very busy, and upon the evening of the second day 300 eggs were found in the cells. [This would show that labourers can be changed into queens at will, and that neither they nor their eggs require to be impregnated; if this was the case, there would be no occasion for all the fuss in making a queen or a male.] He repeated this experiment with the same result, and the bees were left to themselves; they placed the queen maggots in the queen cells newly constructed, and others in male cells, the rest were left undisturbed. He again took two pieces of comb, which contained neither eggs nor maggots, and shut them up with a certain number of workers, and carried the box into a flore; next evening one of the pieces of comb contained several eggs, and the beginning of a royal cell was empty."

Besides the short observations contained in the brackets, Mr. Hunter tells us he has his doubts respecting the whole of
of these experiments of Schirach, &c. from several circumstances that occurred in the course of his experiments. The three following facts appear, in his mind, much against their probability. First, a summer's evening in England is commonly too cold for so small a parcel of bees to be lively, so as to set about new operations; they get so benumbed that they could hardly recover in the day, and he supposes, where these experiments were made, it was also too cold; and indeed some were said to have been tried in this country. Secondly, if the weather should be so warm as to prevent this effect, then they are so refractory that they commonly destroy themselves, or weary themselves out; at least, after a few days confinement we find them mostly dead; and, thirdly, the account given of the formation of a royal cell, without mentioning the above inconvenience, which is natural to the experiment, leads him to suspect the whole to be fabricated. To obviate the first objection, which he found from experiment would prevent any success that might otherwise arise, he put parcels of bees with their comb, in which were eggs and maggots, (and in some trials chrysalides besides) into a warmer place, such as a glass frame over the sun, the surface of which was covered with mould to prevent the ill effects of the unwholesome effluvia arising from it; but from knowing that the maggots was fed with bee-bread, or farina, he took care to introduce a cell or two with this substance, and also the flowers of plants that produce a great deal of farina, together with some honey for the old bees. In this manner his bees were preferred from the cold, and also provided with necessaries; but after being confined for several days, upon opening the doors of the hive, those which remained alive came to the door-way, walked and flew about, but gradually left it, and on examining the combs, &c. he found the maggots dead, and nothing like an operation going on. He chose to have some chrysalides in the comb, supposing that if the bees died or flew away, those newly hatched afterwards from those chrysalides, which would happen in a few days, not knowing where to go, might fly and take care of the maggots that would be hatched from the eggs; but to his surprize he found on opening the box that neither the eggs hatched; nor the chrysalides came forth, all died; from which he began to suspect that the presence of the bees was necessary for both. "The queen, the mother of all, (he concludes with laying) in whatever manner produced, is a true female, and different from the labourers and the male." He describes the difference between the female and the male, observes that he believes a hive has only one queen; and mentions Riem, who afferts that there are supernumerary queens, which he has seen killed both by the labourers and the males. With due respect to the memory of so great a man, we had expected better reasoning, and a more copious and extensive investigation of this mysterious affair, from the pen of Mr. John Hunter. After following him through his various remarks, we are at least at a perfect loss to conceive their tendency. He fete forward with expressing his doubts as to the accuracy of Schirach's experiments, who had, it seems, endeavoured to prove, that a queen bee might be reared from the humble condition of the larva of a common worker: the figuration meets his ridicule, a strong vein of which is apparent throughout his notes; and in the true spirit of critical analysis, he proceeds to examine the experiments by which this figuration was supported. Some few inadvertencies of expression in the statement of particulars are noticed by him, and after relating two or three unsatisfactory experiments, made in order to invalidate the observations of Schirach, he tells us, that "the queen bee, the mother of all, in whatever manner produced, is a true female," an inference so logical, that no one would be inclined, we may presume, to dispute it; but surely it could require no matter of argument, nor criticism, nor series of experiments, to prove, that the mother of all must be a female; any ill let was it incumbent to support, by the use of many words, that this female was produced in some manner or another; this is apparent enough; we need not be therefore solicitous to enquire whether she is produced, but to know in what manner that production is accomplished: and here we are left in uncertainty. If Mr. Hunter was convinced, that the observations of Schirach were accurate, he could not, we apprehend, be ignorant of the manner in which he is produced; or, if he was, he must have been unacquainted to produce Schirach. In a word, it ought to be acknowledged in candour, between the two parties, that we had expected, in the outset, Mr. Hunter would have fairly controverted the arguments of his opponent, but in the conclusion perceive, too evidently, that lie is content to contradict them only. But the experiments of Schirach have been found in many respects consistent with the discoveries of later naturalists; experience has proved that in many points he is correct. It is almost enough to say that they are in part confirmed by Huber. The latter writer, after professing his opinion, that there are no such creatures as males or neuters in the society of bees, endeavours to shew that the working bees are all originally of the female sex; and that each is consequently provided with an ovaria, or womb, which neither Swammerdam, Reaumur, and perhaps no other before him, had ever seen, although they had conjectured it must be so. He cites in proof of the position that they must be females, the discovery of Schirach; who, although he had not detected the ovaries, had seen the larve of the working bees converted into queens, when the necessities of the state required it: a fact of which Huber had been occasionally himself a witness. Huber is persuaded, that however strange it may appear, it depends entirely on the manner in which the larva is treated while remaining in the comb, whether the individual will become a perfect female, fitted for the purpose of perpetuating the race, the mother of the future swarm, and of being invested with the powers of sovereignty; or be doomed to a life of labour as a common working bee. If the larva be intended for the latter condition, the egg is lodged within the confines of a narrow cell; which, when the larva hatched from it attains a certain size, effectually prevents the retention of those organs of the ovaria that are necessary to the great purpose of rendering the creature prolific in the last stage of being. Thus it happens, that unless the larva be allowed sufficient room for these organs to expand, they continue to be crippled, compressed, and afterwards incapable of that expansion which is absolutely requisite in impregnation. Hence we perceive the motives for that especial care which the working bees bestow on the enlargement of the cells of those larvae which any fortuitous accident may induce them to adopt for the female parent of the future brood. If the larva of a working bee is to be converted into a prolific female, the cell in which it has been lodged is broken into and made more capacious than before: this permits the creature to attain its full and proper size; the ovaria, no longer straitened by the compression of its cell, assumes a new and more expansive form; and when the insect comes forth in the winged state, the sexual organs are found to have acquired that degree of maturity which can alone render it capable of fulfilling the ordinary functions for which they were designed. There is another cause to which the barrenness of the working bee is attributed, the quantity of aliment which it receives in the larva form. At this time the creature is pent up within its narrow cell, and is allowed only a certain portion of the
the page defined for food: the queen, on the contrary, are
more liberally supported; they are cherished with the utmost
care, and their growth is promoted by every means possible.
There are sometimes several worms, or at any rate two or
three reared in every comb for queens; and for the recep-
tion of which, if the royal chambers had not been before
constructed, several common cells are broken down to effect
an enlargement suitable for the purpose. These larvae are
supplied with what is called by fame the royal jelly, the
powerful properties of which are sometimes observed to ope-
rate on the larvae of the common workers; for when it hap-
pens that the eggs and worms of such, contained within the
cells adjacent to the royal chambers, receive by accident a
quantity of this jelly, we are told they produce prolific
working bees, although such are very rarely observed; but
the reason of which is obvious: the queen bees are no sooner
hatched than they attack these prolific workers without
mercy, and destroy them. The same fate, as is well known,
attends all the queen bees, with the exception of the queen
bee elected, who must support her claim in the first instance
by conquering and destroying her rivals, who would aspire
to the same honours.

There have been many very strane conceptions indulged re-
specting the impregnation of the eggs of bees by the drones,
or male bees. Among the ancients, as well as the moderns,
it was, and is still believed, that the eggs are spermated
like those of fishes by the males diffusing a prolific fluid
over them, corresponding with the milk in the sanny tribe.
Butler, Swammerdam, Maraldi, &c. carried matters to a
much higher pitch of extravagance; they imagined even
that it was sufficient for the female to be for some short time
in the company of the males to become fruitful, conceiving
that the fumes she would imbibe from them would vivify the
eggs within her womb. Reaumuir thought he discovered
the union of the drone with the female, in as in most other
animals; his observations are not however completely satisfac-
tory on this head, although his conjecture has received at
length the sanction of indubitable authority. The discover-
ies of Huber prove him to have been in the right. Huber,
differing from the absurd conceptions of some preceding
writers, affirms that the intimate allufion of the male is re-
quired in this affair. He tells us, that the eggs are impreg-
nated by the male, while in the ovaries of the female bees:
and gives as a reason why this connexion of the sexes has not
been observed before, that it never takes place within the hive.
For this purpose, the bees resort into the fields, first the female
capes from the hive upon a certain signal, and the swarm
immediately follows. If in the first flight the female be
not impregnated by some one of the male attendants, the
returns to the hive, and takes a second flight precisely in the
same manner, but does not afterwards return without being
impregnated. Huber supposes that this single coitionation
of its desire is sufficient to vivify all the eggs she may lay for
the space of two years after, or even of those laid by her
during life, which must amount to many millions, since the
lady four or five thousand at once, or even ten thousand in a
month. But the male, who contributes his assistance to give
life to this numerous brood, has never the pleasure of seeing
his progeny, for he dies in the accomplishment of the duty
imposed on him by nature; the sexual organs remaining too
firmly fixed in the body of the female to be withdrawn, he
is deprived of them in his separation from her, and left
to perish miserably.

One of the most peculiar arguments in favour of Hu-
ber's idea respecting the working-bees being originally of
the female sex, and not neuters, as is almost universally be-
lieved, may be drawn from the recent discovery of Mr.
Kirby, who found that the antennae in both the female and
the neuter contain the same number of joints. While we
tacitly admitted the assertion of Linnaeus, that there were
no less than five articulations more in the antennae of
the neuter than the female bee, it required no small share of
credibility to believe that such an astonishing difference in the
formation of these organs could be produced by the mere
effect of feeding the creature under the larva form in one
particular manner instead of another; but this mistake being
accounted for, removes one difficulty most certainly, namely, the
impossibility of the working bee having been transformed
into a queen. If it does not go so far to prove the fact it-
self. There are, it must be owned, however, some other
objections of a similar nature, which still remain to be re-
moved. Mr. Kirby, than whom we know no firmer advocate
for the opinion of the working bees being strictly neuter
from their origin, does not appear to have been aware,
when he corrected this mistake of Linnaeus, that his ob-
remark would tend, in one notional point, to support an idea
so contrary to that which he entertains himself in this
respect.

Mr. Wildman, who, from his constant habit of rearing
bees, was perfectly conversant with their attachment to the
female, or queen bee, relates one curious particular: the
manner in which he could cause a swarm of bees to follow
him, and sit in any particular spot he might think pur-
pose. "Long experience," says this writer, "has taught me,
that as soon as I turn up the hive, and give it some taps on the
sides and bottom, the queen immediately appears to know the
cause of this alarm, but soon retires again among her people.
Being accustomed to see her so often, I readily perceive her
at first glance; and long practice has enabled me to seize her
instantly with a tenderness that does not in the least endanger
her person; this is of the utmost importance; for the least in-
jury done to her brings immediate destruction to the hive, if
you have not a spare queen to put in her place, as I have too
often experienced in my first attempts. When possest of her,
I can, without injury to her, or exciting that degree of
remonstrance that might tempt her to fly me, flip her into
my other hand, and returning the hive to its place, hold her
there, till the bees, milking her, are all on wings, and in the
utmost confusion. When the bees are thus disposed, I place the queen wherever I have the bees to settle.

The moment a few of them discover her, they give no
notice to those near them, and those to the rest; the knowl-
edge of which soon becomes so general, that in a few
minutes they all collect themselves round her, and are so
happy in having recovered this sole support of their late,
that they will long remain quiet in their situation. Nay,
the scent of her body is so attractive to them, that the flighty
touch of her along any place or substance, will attach the
bees to it, and induce them to take any path she takes."
which is their proper food, not less than a pound and a
half or two pounds at a time. The honey should be first
diluted with water, or small beer, and then poured into an
empty comb. A drone comb is the strongest and best for
the purpose; and in the evening, when the bees are quiet,
the hive should be gently raised on one side, and the comb
put under it, the contents of which will be convected away
the next day into the several magazines.

Read in the contrary manner a place of liquid honey unmix-
ited with water, crossed with straws, and covered with a paper
full of holes, through which the bees will suck the honey
without daubing themselves. But care should be taken that
the hive be well guarded from robbers, whenever it is pro-
vided with a fresh supply. The winter quarters of the bees
should likewise be well secured, both against the weather
and the enemies that would annoy them. Mild winters, as
well as severe cold, are injurious; sunshine in winter tem-
pts them to go abroad, and exposes them to the fatal effects
of sudden changes either of cold or rain. Bees are most likely
to survive in cold winters, because they are then in a torpid
state, and require very little nourishment, provided the api-
ary be well secured from the keen effects of northernly and
callerly winds; whereas a small degree of warmth enlivens
them, when they too often consume their winter flock, and
are left delitute of food in a wet unfavourable spring.

When bees are chilled with cold, and to all appearance
dying with cold, and the clutters of them are broken, so
that they drop down in the hive, they may be recovered
oftentimes by the means of heat. Some have advised the
application of hot or warm ashes to be laid about the hives,
or sprinkled over the clusters of bees which lie seemingly
death at the bottom of the hive. A sufficient warmth may
be given them by putting them into an handkerchief, and
breathing upon them, or by laying them before a fire. This
precaution should be taken immediately when the symptoms
of danger are observed, otherwife their vitals may be impaired,
and the bees be irrecoverably lost. Reaumur made many at-
tempts to preserve the bees from the ill effects of cold in the
winter without removing the hive out of the places where
they stand in the summer. With this view, he covered some
of the hives with straw, by means of ficks fixed round them,
and reaching a few inches above the top; but the most suc-
sessful method he found to be that of preferring them in
large tubs, with earth or hay, contriving at the same
time to convey air to them through a square tube of wood
two inches in width, and half an inch in depth, which
passed through the side of the tub, and was of such a length
as to reach the mouth of the hive, projecting at the same
time three or four inches beyond the sides of the tub. Since
the time of Reaumur, many ingenious contrivances have
been devised to obviate this, and other objections against the
hives that were formerly in use. A new kind of hive, con-
tributed by M. Huber of Geneva, seems to have obtained ce-
lebrity upon the continent at this time. There are also others
constructed by Paitain, Maffac, Bohljan, Blangy, Saint
de Poy, Ravenal, &c. well deserving the attention of the
farmer.

The agricultural committee in Paris has been re-
cently engaged in the examination of the bee, most econo-
mical, and advantageous kinds of hives, when M. Lombard,
a gardener near that city, proposed one for their inspection
on a plan entirely new, under the name of "ruche villa-
gale." He placed beneath the hive a planter for potatoes.

For the sake of preserving the bees, due attention should
be paid to the situation in which the hives are placed: they
ought to be stationed in gardens filled with sweet-scented
plants, fruit trees, and the like. The hives should not be
placed too near to these, because they harbour vermin inju-
rious to the bees, and still more, weeds must not be allowed
to flourish close to the hives, since they nourish others far
more detrimental to the bees than the former.

It is no unusual circumstance for one colony of bees to
attack and plunder the hive of another. This happens
chiefly in the spring and autumn. The most effective way
to guard against their inroads, is to lessen the entrance
into the hive, so as to leave room for only two or three bees
to pass a-breath, or to flop up the hives that are attacked,
till the rovers disappear; or if intruders have gained admis-
sance, the proper insects of the hive may be put to self-
defence by disturbing them with a bunch of shining man-der fastened to the end of a small flieck, which will im-
mediately raise their resentment, and make them leave upon
the robbers. This is indeed needlefl while the queen of the hive
attacked is safe.

Bee Enemies of. In the domestic hive the bee has
many enemies; but in a state of nature there are far more
numerous. While in the apiary, wasps and Lormats are
among the most formidable of these enemies; they will of-
ten contrive to enter the hive, and build their cells in it, and
harass the bees without mercy, till they leave their habita-
tion, unless proper care be taken to prevent such encroach-
ments. The fox is a dangerous enemy in the winter, as he
is able to make a passage into the hive, and devour the
honey. Rats are equally injurious; the house and field-mice
should also be guarded against, by diminishing the entrance
into the hive, as the cold comes on, when the bees become
less able to defend themselves. The hives may be placed
in such a manner that it will be impossible for the mice to reach
them. Birds are bitter enemies to the bees; the sparrow,
hourse-lark, and swallows in particular. Toads and frogs will
place themselves at the entrance of the hive, and devour
many. Spiders will expand their flares near the hive, and
entraps numbers. The species araneus culicis lies in ambush
for the bees in the corolla of flowers, and fastens upon them
when they come to sip the nectarous fluids. Ants of al-
mot every kind penetrate into the hive, attack the young
brood, and plunder the combs of the honey. The flink of
certain species of ants is so offensive to bees, that they will
quit their hives to avoid it, or if they remain, become sickly.
Some larve, or caterpillars, are likewise exceedingly injurious
to the bees, the honey, the comb, and hive. Phaleru mel-
bonella, or honey moth, too frequently fecures its residence
in the hive, and deposits its eggs; which hatching produces
a larva of a pale flesh colour, that subdues entirely on the
honey. The eggs of another phaleru, the wax moth, P.
corvella, give birth to far more destructive larve than the for-
mer; for these no sooner burft from the eggs, than their op-
ervations commence; they attack the comb, which they per-
forate in a variety of intricate passages, burrowing and feed-
ing as they proceed, till they reach the bottom of the cells
in which the bees are lodged; here they remain in security,
and not uncommonly compel the colony of bees to leave their
refidence. The cold combs are those that are generally infected by
this creature. A third sort of moth, Oberla nova), breeds his-
wife in the honey-combs of some bees. Hives of bees that
have swarmed more than once, and such also as contain but
little honey, are most exposed to the depredations of these
insects; for the half-exhausted combs serve to shelter them,
and the scanty flow of honey or wax supplies them at least
with food to the detriment of the colony. Bees are subject
also to a peculiar species of terebralis, called the bee-louse.
Hives of bees that have swarmed more than once, and such
as contain but little honey, are most exposed to those trouble-some vermin. The hives in this case should be inspected
at the first time every week, and the floors on which they stand every morning, for the latter are likely to har-
bour the larvae and moths, or other insects, as well as the

Vol. IV.
hiver. But these obnoxious creatures cannot be entirely ex-
tipated without taking away the infected hive, removing
the bees, and cleaning it, before it is restored to the former
situation. The lice of bees are of a slender shape, or filiform,
and of a ferruginous colour, and may be destroyed by brew-
ing tobacco over the bees. In a wild state the common ho-
oney-bee inhabits the cavities of hollow trees, where they
are unavoidably exposed to a prodigious host of enemies,
especially field and wood-mice of every description, rats,
and birds. Of the bird tribe in particular, some species are
supposed to feed exclusively on bees, such as the honey-
worker (**Apis** *orientalis*), the European beecher (**apeoa
***aethiopica*) or wood-ants. The kingfisher, and many others:
they do not feed, indeed, exclusively on them, as is ima-
gined, but they are formidable enemies to the bee-in a wild
state. The animals and birds which prey upon exotic ho-
ney-bees are numerous likewise; of this kind we might in-
stance the various species of ant-eaters (**myrmecophaga**),
the black bear (**ursus arctos**), the honey-eater (**eicusla in-
dicator**), peacocks, &c.

**Bees, Maladies of.** In the spring the bees are subject to
a kind of dyerentery, which proves often fatal. The mat-
ter which they void at this time, when so affected, instead
of being of a reddish yellow colour, is of a muddy black,
and has an intolerable smell. Columnella supposed this an-
ual distemper to be occasioned by the bees extracting too
freely the juices from the blossoms of the spurge and elm
trees, or, as others believe, from the lime tree. There are
writers who, differing from this opinion, attribute it to
the quantity of new honey, of which they are known to eat
to excess at that season of the year. Again, others imagine
that it is cau ed only by their long stay in the hive during
the winter, when they are congealed to feed on the coarse
was, if their honey fails to afford them a sufficient quantity
of food. Madame Vicat, in the "Memoires, &c." of the
Berne Society for 1764, ascribes this distemper to the honey,
which the cold has candied in the hive during winter. The
true cause of this distemper seems to be unknown; but it is
certainly contagious and very delusive. A good reme-
dy for it was long unknown. Aritomachus recommends the
removal of the vivated combs. For the recovery of the bees
affected with this distemper, a new remedy has been adopted
upon the continent: they prepare a syrup composed with an
equal quantity of good wine and sugar, which is administered
to the bees in every hive, either by pouring it into the cells,
or placing it within the hive in a faucer, or any other shal-
low vesel; this has been found an excellent restorative.

About the end of the spring, another disorder sometimes
makes its appearance, which Du Carnede Blangy calls a "ver-
tige," or vertigo. This is supposod to be occasioned by the
venomous properties of certain plants on which they feed. The
symptoms are manifested by a dizzy manner of flight, by their
involuntary flartings, falls, and other gestures, in attempt-
ing to perform their usual operations, or in approaching the
hive, and by the latency that succeeds these symptoms.
This distemper has been hitherto found incurable.

Bees are liable to a third distemper, the symptoms of
which are a swelling at the extremity of the antennae, which
becomes also much inflamed, and of a yellow colour; the head
assuming shortly after the fame tint, the bees lose their vivacity,
and languish till they die, unless a proper remedy be applied.
In France, they give them Spanish wine for this disorder.

There is still another distemper which sometimes makes its
appearance among bees, for which the continental agricultu-
rists administer Spanish wine, as in the former case. This
is a kind of pellitence by which many bees are cut off. It
happens when the queen bee has placed the eggs carelessly
in the comb, so that the larve perish in the cells, or that
they are killed by the cold, or bad management in nourishing
and feeding them; when numbers die, and infect the rest.
The only attention requisite in this case is to take away the
infected combs, scent the hive with the perfume of aromatic
plants, and give them the wine to dip, as above mentioned, in
order to strengthen and restore them from their sickness.

For the methods of preserving bees in hives and boxes, and
for collecting the produce of their labour, see Hive, Honey,
and Wax.

**Honey-Bees, Varieties and Species of.** The cultivation of
the common honey-bee, in the warmest countries of Eu-
rope, being an object of the utmost consequence to the far-
mer, many practical farmers might devise to improve
the breed and management of these profitable creatures have
been adopted, and with success. They distinguish three
types or varieties of the common bee (**apis mellifica**). The
first is large, and of a dark brown colour; the second is
smaller and blackish; those of the third fort called "the little
Flemings," or "little Hollanders," are much smaller than
either, and of a fine glossy yellow colour. It is the latter
that is very generally cultivated on the continent at this time.
**Apis mellifica** is an European insect. Mr. Hunter supposes
it an inhabitant of Asia and Africa also; its appearance in
America may be accounted for on the presumption that it
was originally introduced there from Europe, and in the
course of time has become completely habituated to that
climate. It is said to have been originally peculiar to the
continent of Europe, but this will admit of doubt. In
these parts of Asia and Africa nearest to the south of Eu-
rope, they cultivate the same kind as ourselves. There are
some other species of bees domesticated like the common
bee with us, in different parts of the world; and others
again, whose wax and honey are sought after by the na-
tives, who do not care to take the charge and trouble of
domesticating them. In Cayenne and Surinam, the species
called by Olivier *amalthea*, is an abundant and very pro-
fitable creature. This little bee is of a black colour, with white
wings and long posterior feet. They build their nest, in the
shape of a bag-pipe, upon the tops of the highest trees.
The honey is very sweet and agreeable, and thin, and of a
reddie colour. From the latter the Indians extract a spiritu-
ous liquor, of which they are passionately fond; of the wax
they make candles. This is supposod to be the small
black innoxious wood-bee of Barrere, which is called *anoo* in
Cayenne. M. Latreille mentions this species, and also an-
other, which he calls "l'abeille sociale" (**apis fritalis**), among
his "apares domestiques," an insect rather smaller than the
common honey-bee (**mellifica**), that is found in India. Spec-
cimens of it, he tells us, were received at the museum of
natural history in Paris, among a collection of other in
tests from Bengal. If we are not mistaken in the species, the
same kind was likewise introduced into the cabinets of the
curious in this country, about twelve months since by Mr.
Fichtell, who found it to be very commonly cultivated by
the inhabitants in the vicinity of Bengal.

**Wild Bees.** Except those species of the bee tribe which
are subservient to the purposes of human life, mankind has
shewn a manifest degree of inattention to this curious race of
creatures. Some few naturalists have regarded them as ob-
jects of amusement: and what the common observer is con-
tent to name a wild bee, without further inquiry, is discrimi-
nated by them as forming many distinct families; each of
which have their peculiar manners and mode of life, and dis-
play a greater or less proportion of economy, skill, industriy,
&c. by no means unworthy of being more minutely attended
to. Of the wild bees there are certain natural families, whose
distinguishing characters, in a scientific point of view, have been
described already; they are distinguished also by their man-
ners.
BEE

ners of life, the formation of their nests, and many other particulars. Some are called leaf-cutters, others wood-piercers, masons, earth-diggers, &c. corresponding with what the French call "abeilles coupefeus, abeilles pierce-bois, abeilles magannes, abeilles qui creuent la terre, &c. Under each of these families many species are arranged by entomologists. A similar mode of nidification (it has been well remarked) may be, and indeed very often is the characteristic of a family, or rather that of a species; thus the cells of the different species of bombanitres are composed of similar materials, and resemble each other in form; and the various genuine species of the genus Vespa (Wasp) construct cells, for the most part, of the fame figure, and employ the same kind of materials, according to Reaumur; the mode of nidification, therefore, should never be assumed as characteristic of a species, but after the moth mature consideration, and the careful investigation of its history; for it generally happens that those insects which agree together in habit, and belong to the same natural divisions or subdivisions of a genus, are connected likewise by their mode of life.

Of the leaf-cutters there are several species; these are so named because they cut the leaves of trees, chiefly those of the rofe, into pieces of a convenient size to compose their little cells, in which the eggs of the future brood are deposited. This description of bees is injurious; the female perforates the solid timber of trees in a surprising manner in order to place her eggs, which are carefully wrapped up in these cylindrical pellets, if they may be fo termed, of leaves, within the cavity. The hollow or pipe which the bees for their reception is usually over the thickness of a small finger, but the depth is very various, being from a few inches to a foot or more; the whole cavity is filled with those little pellets, each of which contains an egg, with a provision of honey for the larva when hatched; so nicely are these pellets formed that they precisely fit the cavity in diameter, and are placed one above the other from the opening to the very bottom of the cavity. Apis centuncularis is one of the species belonging to this natural family. There are others which belong to it likewise, that construct their cells in the same manner, of leaves, but place them in cylindrical cavities in the earth, instead of timber. Some line or envelop their nidus with the downy sub stance collected from the woolly leaves or particular plants; the tapetum bee employs the tender petals of the rose to line its cells, &c. The mason bees are also similar for the mode of nidification which they adopt. Reaumur has entered at length into its history, a brief account of which must close our general remarks upon the subject for the present, since these must be again repeated when speaking of the respective species, or of the families to which those habits are peculiar.—"The female of these bees (for the males, like the drones of the hive-bee, do not work, and these insects have only two sexes) undertakes the whole labour of the building, and is at the same time both architect and mason. Her first step is to fix upon an angle, sheltered by any projection, on the south side of a stone wall. Sometimes she contents herself with a more exposed part of the surface, where the stone happens to be uneven, and fit for her purpose. Having chosen a spot proper to receive the foundations of the future mansions of her offspring, her next care is to provide materials. As her house is to be built entirely of a kind of mortar, the basis of which must be sand; she is very curious in her choice of it, selecting it grain by grain, from such as contains some mixture of earth. To shorten her labour, before she transports it for use, by means of a kind of saliva, which is very viscous, the glue is many grains as she can carry into a little mass, about the size of a small foot. Taking this up with her maxilla, she conveys it to the spot she has fixed upon for the site of her wall.

A circular plane, composed of many of these little masses, forms the basis on which it is to be erected; it contains from three to eight cells, which are similar to each other in their form, and equal in dimensions. Each cell is about an inch in length, and six lines in diameter; and, before its orifice is closed, in form resembles a thimble. When its walls are raised to a sufficient height, our little mason lays up in it a flore of pollen seaconed with honey, for the sustenance of its future inhabitants; sometimes the proportion of honey is so great that this provision is entirely liquid. This business settled, she deposits her egg, finishes and covers in the cell, and then proceeds to the erection of a second, which the furnishes and finishes in the same manner, and so on with respect to the whole cell. These cells are not placed in a line, or any regular order; some are parallel with the wall, others are perpendicular to it, and others are inclined to it at different angles; this occasions some empty spaces between the cells, which this laborious architect fills up with the same kind of cement, and then beinows on the whole group a common covering, made with coarser grains of sand; so that at length the nest becomes a mass of mortar, very hard, and not easily penetrated, even by the blade of a knife; its form is more or less oblong; its colour depends on the colour of the sand employed in its construction."—Another species forms its nidus, with earth intermixed with chalk, upon stone walls; and a third for the sake of greater security prefers the hollows and cavities in the stone itself for this purpose.

BEE, WILD HONEY, Hunting of. In the Philosophical Transactions, No. 376, Mr. Dudley speaks of a method of hunting bees in order to discover the spot in which their nests are secreted, as practised some years ago in the woods of New England in America. It consits merely in catching a bee, then letting it fly, and duly observing the way to which it directs its course; this points out to the hunter the direction in which the nest is to be sought after. To find the distance, he takes an off-let of an hundred pereches, and then lets fly another bee, but which must be of the same nest; and it is ascertained, that the angle or point where these two courses intersect, is the spot in which the nest is concealed.

BEE, Swarming of. See SWARM.

BEE, Writers on. Many authors have written on bees. Among the ancients, Aristomachus is said to have studied them fifty years. Philostratus treated of a defect wood, that he might have the opportunity of observing them to his advantage; Aristotle made a great number of curious observations on this insect, which Virgil has put into Latin verse: they have been enlarged and confirmed by Pliny and others. Theophrastus has a fragment still extant, ἤον μᾶθαι, ἔχον ἐντομών, ἔρπον. Among the moderns, the number of writers who have treated on bees is very great, a few only of which will be expected in this place to mention. Prince Frederic Cels, inflator of the Roman Academy of Sciences, wrote expressly on bees, as did also Swammerdam, Malaczi, and Reaumur, each of whom have treated minutely of them. Schlich is a diligent writer on this subject. Hattorff deserves notice. Among the English, Butler, Gurney, Mills, Levens, Torley, Southern, Remnant, Rudlen, Warder, White, Wildman, Debragh, Hunter, and others, have published discourses on the management of bees, &c. Writers, who have treated scientifically of the species in their entomological works, are such as Linnaeus, Fabricius, Geoffroy, Scefer, Villiers, Podz, Rafaé, De Geer, Foureroy, Donovan, Coquest, &c. A monographie of bees has lately appeared in this country by Kirby, and another in France about the same time by Latrielle. Nor should we omit to mention several works of reputation on this subject that have been
BEE

been published on the continent within the last few years: of this description are the work of Huber of Geneva; "Le Méméro de Bernard sur l’Education des Abeilles;" "Le cours d’Agriculture," by Rozier; "Abrégé de l’Histoire des Infestes pour servir à l’Histoire Naturelle des Abeilles," by Bazin Gilles Auguin, first published in 1747; "Le Manuel Nécessaire au Villageois pour Figner les Abeilles," by Lomeriah; and the works of Berthaud, Duchet, Dacorne, Blangy, Della Rocca, &c.

BEE, in Astronomy. See Apis.

BEE is also used figuratively to denote sweetmeats, induftry, &c. Thus Xenophon calls the Attic bee, on account of the great sweetness of his honey. Antonius got the denomination melfa, or bee, on account of his collection of common places. Leo Allatius gave the appellation of apis urbana to the illusrious men at Rome, from the year 1650 to the year 1652. BEE-lard, in Ornithology. See TROCHILUS MINIMUS; the bee humming bird, or le plus petit Oiseau mouche de Bufon. Some refer this name likewise to Trochilus Bicolor of Emelin, the Colibri de Form. Surin. N. 2.

BEE, Black. See ATHIOPS.

BEE blocks. See Blocks.

BEE-boxes. See Hive.

BEE-bread. See Bee Bread, Farina, and Bee Supra.

BEE-eater, in Ornithology. See Falco Avipurus, Honey Buzzard.

BEE-flower, or Orchys, in Botany. See OPHEYS.

BEE-ghee, a sort unctuous matter employed by bees to cement the combs to the hives, and to clofe up the cells.

BEE-hive. See Hive.

BEE-humble, humming bee, wild bee, synonymous with the Bourbon family of bees, adopted by French writers.

BEE-humble, fly. See BOMBYLUS.

BEE, Order of, was instituted at Sceaux in France, for men and women, in 1703, by Louise, wife of Louis of Bourbon. The ensign is a medal of gold, bearing on one side the portrait of the foundress, and on the other a bee, with this motto, "Je suis petite, mais mes pictures font profondes.

BEE-rocks, in Geography, lie on the coast of France, a little to the west of Norway from the point of St. Maloë. They are called the Great and Little Bee; the latter of which is west of the other, and lies N. W. from the town about a gun-shot. On each of the bee-rocks is a little house. Ships may fall within a cable’s length of the outermost or Little Bee, and anchor on the south of it in 5 or 6 fathoms at low-water, when Bore tower, on the south of St. Maloë, is a little eft of the small tower on the point to the south of the town.

BEECH-tree, in Botany. See FAGUS.

BEECH galls, in Natural History, the name of a species of galls or protuberances found on the beech-tree, and serving for the judgment of insects. These galls are found on the leaves of the beech, and are sometimes only one upon a leaf; sometimes more: they always grow from the same point, owing, no doubt, to the fly’s having laid so many eggs in the same foot. These galls are of an oblong figure, and somewhat flattened. They resemble the flower of a plum in shape, and are so hard that they are not to be broken between the fingers; their substance seems of the same nature with that of a nut shell. In each gall there is only one cavity, inhabited by a white worm, which in time palls through the nymph flate into that of the fly, to which it owed its origin.

BEECH-maff, the fruit of the beech-tree. It fattens hogs and deer, and has sometimes supplied men instead of bread. Chloë is said to have endured a memorable siege by means of it.

BEECH, Oil of, Huile de Faines, the fruit of this tree, the beech-maff, is an oily farinaceous nut highly nutritious to hogs, poultry, and other animals, and like the other fruits of this description, may be made to yield a very large quantity of pure oil by pressure. This oil has long been prepared in several districts in the south of France. An interfering account of this manufacture is published in the Journal de Physique for 1781, by Mr. Verdier.

The taste of the beech-maff is mild, nauseous, and somewhat astringent. About the month of October it falls spontaneously from the tree, and is collected in this and the succeeding month. When gathered and picked it is slowly dried in the shade, or with the heat of a very gentle fire; after which it is at any time fit to be pressed for the oil. The very finest oil is made with the best nuts picked out by hand, but for the larger quantity the maff is lifted and winnowed like corn. It is then ground by a machine similar to a lampm mill, formed of upright beams of wood alternately rising and falling, set on motion by a large wheel, and when the fruit gets too dry in the mill a little water is added. When ground sufficiently fine, it is wrapped up in a coarse hair cloth once doubled, and submitted to the fame kind of press which is employed forcoleed, and other oils.

The beech oil when well made, and from the best selected fruit, is equal to the best olive oil, and with this advantage, that it will keep much longer; olive oil beginning to grow rancid in about a year and a half, whereas the other improves by keeping, to the fifth or eighth year. It is fit for ufe a month after it is made. To obtain the finest oil, besides the perfection of the fruit, it is necessary that the working of the mill in which it is ground, should be very moderate, so as not to overheat it.

The water ufed to give the fruit a proper confinence in grinding, mixes with the oil when pressed, fo that it requires some weeks repose to allow them to separate. In general the oil flands about three months to clarify, after which it is drawn off clear from the water and dregs, and packed up either in bottles or in very close casks. The general yield of oil is about ten pounds from 4½ bushels, Paris measure.

The ufe to which it is applied are all those of the common fixed vegetable oil. The belt forts are equally grateful for the table as the best olive oil. The inferior, are ufed for lamps, for preparing leather, and other purpofes of economy and manufacture.

The cakes that remain after the oil is pressed out are particularly useful in the fabrication of the oil from nuts, as this latter fruit is not alone of a proper confinence for the press, but must be mixed with some more solid substantiae to make it work well. Besides this, the cakes of beech-maff are proper for fattening animals, or make a very good fuel.

An attempt was made in the beginning of the last century to introduce the preparation of beech-maff oil in this country. The poet and Speculator, Aaron Hill, obtained a patent for this manufacture, and went to some expense in establishing it in England about the year 1714. It would appear from a letter of his to the earl of Chefflefield (in the Hawkins Collection, and inserted in the Monthly Magazine for 1805, p. 359) that he had formed very fanguine hopes of the success of this plan. However he was obliged foon to abandon it, probably in part from a want of a proper supply of the fruit, and certainly in a considerable degree from the very limited ufe of oil as an article of food in this country.

BEEF, in Domestic Economy, the flesh of black cattle prepared for food. The flesh of the boar or ox hind, says Dr. Cullen (Mat. Med. vol. i. p. 369), is the moat dene of all the quadrupeds; and how far that denuity goes in preventing solubility, we have an infiance in the bull, whose flesh is feldom chosen as a part of our diet. The flesh of the female sex is of a more soluble nature, and sufficiently fit for nourishment; but we commonly prefer the calrated ox, in which the fat is better mixed, and as more alkafent, the flesh is more fapid;
BEE

fapid; and, unless it be from a very old animal, is generally to be preferred. The chief difference of aliments in the ox kind is that which appears between the old and young. This author observes, that beef, though of a more firm texture, and less soluble than mutton, is equally alkalescent, perfpirable and nutritious. See Food.

BEE-eater, in Ornithology, the English name of Diphaga africana, a bird found on the banks of the rivers in Senegal, and the only species of the genus known. See Diphaga.

BEE-Island, in Geography, a small island near the coast of America, in the south-east angle of the bay of Campeachy, the well end of which is washed by the southward opening of St. Peter's and Paul river. It lies close to Tribble island, is 7 leagues long, and from 3 to 4 broad, and has a fine sandy bay, where ships may ride in 7 or 8 fathoms and be well sheltered. N. lat. 16° 30'; W. long. 91° 30'.

BEE-island is also one of the smaller Virgin islands in the West Indies, situated between Dog island on the west, and Tortola on the east, in Sir Francis Drake's bay. It is about five miles long, and one broad. N. lat. 18° 23'; W. long. 63° 2'.

BEEKMAN, a considerable township of America in Duchess county, New York, containing 3,597 inhabitants, including 105 slaves. In the State census of 1796, there appear to be 502 electors in this township.

BEELE, in Mining, an instrument used by the workmen to break and pick out the ore from the rocks in which it lies. This instrument is called by the tinmen in Cornwall a "rubber." It is an iron instrument of eight or ten pounds weight, made sharp, and fixed at both ends, and having a hole in the middle, where the handle is fixed in. When the ore lies in hard rocks, this instrument wears out so fast, that it must have new points made to it ever fortnight. The miners who dig up the ore in the mines, are, from the use of this instrument, called beele-men; and those who attend them, and whose business is to take up the matter the others loosen or break up, are, from their instrument, which is a broad and hollow iron shovel, or a wooden one, with a very strong iron lip, called the "shovelers." In Cornwall, when the ore lies in a hard bed, they allow two shovelers to three beele-men; and when it lies in a soft and earthy matter, two beelemen and three shovelers are the proportion. Phil. Traut. N. sb. p. 2104.

BEELIKE, in Geography, a town of Germany, in the circle of the Lower Rhine, and county of Welfphalia, 4 miles west of Rhunden, and 10 E.N.E. of Arnsberg.

BEELZEBUB, or BAALZEBUB, i.e. the lord of a fly, in Ancient Mythology, was a god of the Philistines, and had a temple and oracle at Ekron. (2 Kings, iv. 2.) From this paffage it appears, that the name was not given to this object of idolatrous worship by way of contempt; because it was used by Ahaziah at the very time when he was acknowledging his divinity, and deifying of consulting him concerning his recovery. This is farther evident, from the meaning of the appellation and the reason of its being given. History informs us, that those who lived in hot climates, and where the foil was moist, which was the case in the Ekronites, who bordered upon the sea, were exceedingly inflected with flies; and these insects were thought to occasion contagious distempers. Pliny (N. H. l. x. c. 28, § 40.) mentions a people who flopped a pestilence which had been thus occasioned by facilitating to the "fly-hunting god." It seems improbable that some imagined cure of this kind, or a general perspiration of his power of driving away flies from the place they frequented, might be the reason why the god of Ekron was called Beelzebub. For it is customary with the Heathens, to call their gods by the name of those insects from which they were believed to deliver their worshippers. The "god of flies," Mas. and the "fly-hunter," Mans. were titles ascribed to Jupiter as well as to Hercules. Indeed, some of the Greek fathers thought, that this "fly-god" was worshipped under the form of a fly and it is observed by Mr. Young (On Idolatry, vol. ii. p. 91, 92.) that it was customary with the Heathens to represent their gods by some creatures that were familar to them. However, the supposed power of this god over that noxious insect, the fly, seems to be the most probable reason of the name of Beelzebub. Beelzebub, therefore, being a title of honour, and as such applied by his worshippers to the god of Ekron, there is no reason for doubting, that it was in use among the Philistines, as well as among the Jews. (Bechard, vol. ii. p. 26, &c. Op. vol. iii. p. 522.) Belden de Dis. Syr. Synag. ii. e. 6, p. 227, ed. April. 1681.) Among the Jews, the appellation Beelzebub, notwithstanding its seeming meaness, could not be used as a term of derision. For the Jews had learned of the heathens to regard a power of driving away flies, as a divine prerogative; and, admiring to persuade men, that the temple of Jerusalem, though to many faculties were daily offered there, never had a fly upon it; thus copying, rather than deriding, what the heathens failed concerning some of their temples, into which, according to Pliny, Solinus, and others, no fly could enter. It has been said, indeed, that the Greek word used in the New Testament, is not "Beelzebub," but "Beelzebul," which signifies the "lord of a dunghill." and hence it has been inferred, that this name could not have been used by the Heathens; but must have been given by the Jews in derision. Jerom, however, not understanding the common reading, changed Beelzebub into Beelzebul; and this subsitution has been approved by several critics, has been adopted in the vulgate, and thence transferred into Luther's translation. In the ancient languages it was not uncommon to change b into l (see letter b;) and, on this supposition, the Greek word will agree with the Hebrew, (2 Kings, i. 2.) But if Beelzebul be used as a different name from Beelzebub, there will be no reason for supposing that it was used by the Jews as an expression of contempt. The Hebrew word $^7^7^7^7^7^7$ zebel, properly signifies "an habitation," and as Stoekius observes, is applied to the heavens, the mansion of the deity. In this sense it will agree with the title of Beelzebul, or Beelzebub, the "lord of heaven," which the Ekronites, and other Philistines, gave to their supreme nomen. Whetber, therefore, Beelzebub and Beelzebul be different names, or the same name with different terminations, they describe the person whom the Heathens regarded as their chief deity.

Beelzebub, in the New Testament, (Matt. xii. 24, Mark, iii. 22.) is called aggelos tou theou, the prince of demons, (prince of the devils, Engl. Transf.; and it has been commonly apprehended, that demons and their prince are the same spirits as the devil and his angels. Satan and Beelzebub, say those that adopt this opinion, (See Doddridge on Matt. xii. 25. Fam. Expof. vol. i. p. 391, note 5, and Pegge's Answer to Sykes) are names for the same person; for when Christ was reproached with casting out demons by the allusiveness of the prince of demons, he replied, "How can Satan call out Satan? (Matt. xii. 26, Mark, iii. 23, Luke, ix. 18.) Now if Satan, who is considered as the same person with the devil (Rev. ix. 12. Matt. iv. 1. compared with Mark, i. 12.), was the prince of those demons; who were cast out by Christ; then demons are the same spirits as the devil's angel. And on this supposition, there can be no other difference between demons and the devil than one which subsists between a prince and his subjects, who both partake of one common nature, though the prince, as prelating over the rest, hath a peculiar name of his own. Dr. Lardner (Catec of Demences, p. 42. Works, vol. i. p.449.)
BEE Bee

p. 438.) admits, that the devil, who is supposed to be the chief or prince of the fallen angels, is often called Satan and Beelzebub. Mr. Farmer is of opinion (Essay on the

Demonics of the N. T. p. 167, 170) that it doth not follow from the above-cited passage, that the devil is ever called Beel-

zebub. "Satan," he says, is not appropriated to one particular person or spirit, but signifies "an adversary" or

opponent, in general. The Jews called every demon by this name, and used it in the plural number; and the words of our Saviour, "How can Satan cast out Satan," taken in their strictest sense, imply that there were several Satans:

so that our Lord might only mean, "that it was not unre-

suable to suppose that one demon would cast out another.

Or if you understand him to the following purpose: "were Beelzebub, whom you regard as the chief of the pos-

session demons, to expel himself, which would in effect be the case were he to expel all his agents and instruments, he

would act against his own interest, and defeat his own schemes;" it will not follow, that Beelzebub was considered as the same

person with the devil. There seems to be no reference to the latter. He and Beelzebub might be regarded as two

distinct persons; and yet each be called "Satan," an adver-

sary, or opponent. "If Beelzebub and his demons were,

in our Saviour's time, conceived to be the very same person as the devil and his angels, is it not very surprising," says

this author, "that the New Testament, in its original lan-

guage, should always speak of the diabolical persons under consideration as possessed by a "Satan," or "demons," and

never by "the devil" or "devils!" A word, as all must allow, that is never there applied to evil spirits in the plural number;

whatever its use may be in the singular. He adds, "inasmuch as Christ is here replying to the Pharisees, and

reasoning with them on their own principles, he cannot be

supposed to speak of a different order of beings from

what they did. Satan, therefore, must be equivalent to
demon, in the sense in which demon was used by them." See

DEMON. "Should it then appear," says Mr. Farmer,

"that by demons and their prince they understood human

spirits, it will from hence follow, that Christ cannot be

speaking of spirits of a celestial origin." If by the devil, we

are to understand a fallen angel, this writer thinks that he

could not be the same with Beelzebub. The Jews, in their

ancient writings, were not accustomed to call the devil by

this name, but by that of Asmodeus, or Samael; as Bo-

chart, (Oper. vol. iii. p. 501.) Selden, (ubi supra, p. 241.)

and others allow. Beelzebub, in the formation of the Pha-

rissees, was the prince of the "possession demons," and there-

fore, as Mr. Farmer supposes he was, in their expression, a

human spirit; and in proof of this he alleges the testimoni

of Josephus (De Bell. Jud. I. vii. c. 6. § 5.) Besides, Beel-

zebub was, as we have already stated, a heathen deity; ex-
predily denominated in the Old Testament, the god of Ek-

ron; and represented by the Pharisees under the same title

and character as the heathens themselves ascribed to their

gods. "If Beelzebub," subjoins Mr. Farmer, "was a hea-

then demon, or deity, he was no other than a defiled human

spirit; for such were all the heathen demons, who were the

more immediate objects of the public established worship;

and those in particular to whom divination and oracles were

attributed. And if the prince of demons was of human ex-

tract, no doubt his subjects were so likewise.

BEELZEBUL, in Entomology, a species of Scarabæus

that inhabits America. On the thorax is a triple promi-

nence; and three horns on the head, the middle one larger

than the others. Fabricius.

BEELZEBUL, in Zoology, a species of Simia that in-

habits South America; and is tailed, bearded, and black;
tail prehensile; tip, with the feet, brown. Linnaeus. This

appears to be the simile of Mavoriaca; hawking hawk of

Bruce; another name of Peciant; and Pauane of

Buffon. It is said to be about the size of a fox, of a black

colour, and the hair of his fur long, glossy, and remarkably

smooth. This is a fierce animal, and inhabits the woods of

Brazil, and Guiana, in vast numbers; wanders in large flocks

in the right time, and howls hideously. Dr. Shaw observes

that this bowing faculty is owing to the conformation of

the os hyoideus, or throat bone, which is dilated into a

bottle-shaped cavity. Mavoriaca, in speaking of the guaraiba,

acquaints us, that one sometimes mounts the top of a branch,

and allmbeles a multitude below; he then lets up a howl

so loud and horrible, that a person at a distance would im-

agine that a hundred joined in the cry; after a certain space,

he gives a signal with his hand, when the whole assembly

join in clour, but on another signal, a sudden silence pre-

vails, and then the orator finishes his harangue. The
eels call this animal Beelzebub, retaining however at the same
time the name Pauane under which it is described by

Buffon.

BEELMAH, in Geography, a river of Hindostan, which

is a principal branch of the Kinhah, joining it near Edghir,

rises in the mountains, on the north of Poonah, probably not

far from the sources of the Godavery, and passes within 30

miles of the east side of Poonah, where it is named Bewrah,

as well as Beemah. It forms the eastern boundary of Villa-
pour, and passes about 80 or 82 geographical miles to the

east of Golconda, crossing the road from it to Balitcote.

The Beemah, according to Mr. Orme, possesses virtues simi-

lar to those of the rivers esteemed sacred by the Hindoos;

that is, ablations performed in its stream have a religious

efficiency superior to those performed in ordinary streams.

Remelli's Memoir, p. 244, &c.

BEEMEN, or SREMEM, in Astronomy, seven flars of the

fourth magnitude, following each other, in the fourth flexure

of the constellation Eridanus.

BEEMSTER, in Geography, a large drained lake or

marsh of North Holland. It was formerly a lake, covering a

great extent of country, which, by the industry of the

Hollander, who, by means of various canals, have drained the

waters, is converted into an excellent pasturage ground. It

has neither towns nor villages, but a great number of houses,

which are dispersed along the sides of the canals and roads.

BEEN, in Music, the name of an Indian fretted instru-

ment of the guitar kind. The finger-board is 25 5ths in-

ches long. A little beyond each end of the finger-board are

two gours, and beyond these are the pegs and tail-piece which

hold the wires. The whole length of the instrument is three

feet seven inches. The first gourd is fixed at ten inches from

the top, and the second at about two feet 11 1/2. The

gours are very large, about fourteen inches diameter, and

have a round piece cut out of the bottom, about five inches
diameter. The finger-board is about two inches wide. The

wires are seven in number, and consist of two filed ones, very

close together, in the right side; four braus

ones on the finger-board; and one brass one on the left side.

They are tuned in the following manner.

The
The great singularity of this instrument is the height of the frets; that nearest the nut is one inch ½, and that at the other extremity about ¾'s of an inch, and the decrease is pretty gradual. By this means the finger never touches the finger-board itself. The frets are fixed on with wax by the performer himself, which he does entirely by ear.

The frets are nineteen in number. On the wires R and S, which are those principally used, there is an extent of two octaves, a whole note with all the half notes complete in the first octave, but the g, s, and d, b wanting in the second. The performer's apology for this, was, that he could easily get those notes by pressing the finger a little upon the frets f, x, and e, which is very true from the height of the frets; but he asserted that this was no defect in his particular instrument, but that all beings were made so. The wires TU are seldom used, except open.

The hand is held over the left shoulder, the upper gourd resting on that shoulder, and the lower one on the right knee.

The frets are flapped with the left-hand; the first and second fingers are principally used. The little finger of this hand is sometimes used to strike the note v. The third finger is seldom used, the hand shifting up and down the finger-board with great rapidity. The fingers of the right hand are used to strike the strings of this hand; the third finger is never used. The two first fingers strike the wires on the finger-board, and the little finger strikes the two wires. The two first fingers of this hand are defended by a piece of wire put on the tops of them in the manner of a thimble: when the performer plays strongly, this causes a very jarring disagreeable sound; whereas, when he plays softly, the tone of the instrument is remarkably pleasing.

The style of music on this instrument is in general that of great execution. I could hardly ever discover, says Mr. Fowke, any regular air or subject. The music seems to consist of a number of detached passages, some very regular in their ascent and descent and those that are played softly, are most of them both uncommon and pleasing. Asiat. Researches, vol. 1. p. 295, &c. See Plate of Music.

BEER, a spirituous liquor, made from any farinaceous grain; but generally from barley. Accordingly, it is a liquor of very ancient and general use. See Ale.

The word is Saxum, formed from the German Bier, of the Latin Bivere.

Several authors have maintained, that there was no malt liquor known by the appellation of beer, as distinguished from the ancient liquor called ale, till the use of hops was introduced. See Hops. However, we find, by a statute of the twelfth parliament of the 25th year of king James I. of Scotland, (c. 88.) that it was enacted, that no persons should mix wine or "beer," under pain of death. Besides this instance, occurring in 1482, many others might be produced confuting the vulgar tradition, that beer, as a liquor, distinct from ale, was not known in England till the reign of Henry VIII. In the year 1492, we find a licence from king Henry VII. to a Fleming (cited in the 12th tome of the "Faderis," p. 371.) for exporting fifty tons of ale, called "beer" or "bere"; and in the same year one of the king's attendants into France was a beer-brewer of Greenwich in Kent. Although it may probably be true, that beer, brewed with hops, was not known in England till after this time; yet other materials were used, before hops were known, for making the liquor that was called "beer," such as wormwood, and other plants, which served instead of hops, for preferring malt liquors, either by tea or land.

Beer is made from malt by extraction with water and fermentation. With this view, a quantity of malt, freed from its germ, and sufficient for one intended brewing, is coarsely bruised by grinding, and in the mash-tub, first well mixed with some cold, then scalded with hot water drawn upon it from the boiler. It is afterwards strongly and uniformly fired. When the whole mass has floated quietly for a certain time, the extract (malz), or sweet-wort, is brought into the boiler, and the malt remaining in the tub is once more extracted by infusion with hot water. This second extract, treated in like manner, is added to the first, and both are boiled together. This clear decoction is now drawn off, and called boiled wort. To make the beer more fit for digestion, and at the same time to deprive it of its too great and unpleasant sweetness, the wort is mixed with a decoction of hops, or else these are boiled with it. After which it ought to be quickly cooled, to prevent its transition into acetous fermentation, which would enfee, if it were kept too long in a high temperature. On this account, the wort is transferred into the cooler; where it is exposed with a large surface to cold air, and from this to the fermenting tub, that by addition of a sufficient portion of recent yeast it may begin to ferment. When this fermentation has proceeded to a due degree, and the yeast ceases to rise, the beer is conveyed into casks, placed in cool cellars, where it finishes its fermentation, and where it is well kept and preferred under the name of "barrelled beer," with the precaution of occasionally filling up the vacancy cauied in the vessels by evaporation. Or, the beer is bottled before it has done fermenting; and the bottles are flapped a little before the fermentation is completely over. By so doing, the bottled beer is rendered sparkling. In this state it frequently bursts the bottles, by the dilatation of the carbonic acid gas which it contains; and it strongly froths, like champaign, when brought into contact with air on being poured into another vessel. Gren's Chymistry, vol. ii. p. 65.

For the proceeds of brewing, particularly according to the English mode; see Brewing.

Beer, well prepared, should be limpid and clear, possess a due quantity of spirit, excite no disagreeable sweet taste, and contain no digested acid. By these properties, it is a species of vinous beverage, and is distinguished from wine, the wort fene, and other liquors of that kind, by the much greater quantity of unguiligious matter which it has received by extraction from the malted grains; but which also renders it more nourishing. "Brown beer" derives its colour from malt strongly roasted in the kiln, and its bitterish taste from the hops. "Pale beer" is brewed from malt dried in the air, or but slightly roasted, with but little or no hops at all.

Tacitus, in speaking of the ancient Germans, as also Dionysius, Galen, &c. condemn beer, as prejudicial to the head, nerves, and membranous parts, as occasioning a more lasting and more uneasy drunkenness than wine, and as promoting a suppuration of urine, and sometimes a leprosy.

Meff. Perrault, Rainfall, and others, defend the modern beer; urging, that the hops used with us, and which the ancients were strangers to, having a faculty of purifying the blood, and removing obstructions, serve as a corrective, and free our drink from the inconveniences objected to that of the ancients. For the qualities of beer, see Malt-liquor.

In New England they make beer from maize, or even the bread made thereof. Some physicians recommend beer made of cats and birch-water, as preferable, in nephritic cases,
BEE

cares, to that made of barley. Phil. Trans. N° 97, p. 6135.

Mr. Park, in the account of his travels through Africa, informs us, that the negroes make excellent beer of one species of their corn, by malting the seeds nearly in the same manner as barley is malted in England; and he says, that the beer, thus made, was to his taste equal to the best strong beer he had ever tasted in his native country.

Sour or decraved beer may be restored divers ways; as by malt made of the ashes of barley-straw, put into the vessel, and stirr'd; or by three or four handfuls of beech-ashes thrown into the vessel, and stirr'd; or, where the liquor is not very four, by a little put into a bag, without piercing; chalk calcined, oyster-shells, egg-shells burnt, sea-shells, crabs eyes, alkalized coal, &c. do the same, as they imbibe the acidity, and unite with it a sweetnnes. Beer, it is said, may be kept from turning sour in summer by hanging into the vessel a bag containing a new-laid egg, prick'd full of little pin-holes, some laurel-berries, and a few bark-grains; or by a new-laid egg and walnut-tree leaves. Laurel berries alone, their skin being peeled off, will keep beer from decraving; and the throwing fixed air into it will re-serve it. Chausse commends his fal mirabile and fixed nitre, put into a liqin bag, and hung on the top of the calf, so as to reach the liquor, not only for recovering four beer, but for preserving and strengthening it. See Ale.

Beer tallow of the calf, may be freed from it, by putting a handful of wheat in a bag, and hanging it to the vessel.

The grounds of beer form a very rich manure.

Beer-Powder. See Zythogala.

Beer, Euger, is used by callico-printers, chemists, lapi-
daries, scarlet-deers, vinegar merchants, white-leaft-men, &c.

Beer-Misfure. See Measure.

Beer-Vinegar. See Vinegar.

Beer-Haven, in Geography. See Bear-Haven.

BEERING, Bering, or Bering, Vitus, in Biogra-
phy, an eminent navigator, was a native of Denmark, and
born towards the conclusion of the 17th century. After
having made two voyages to India, he entered in 1704, as a
lieutenant in the Russian navy, in which he afterwards rose
to the rank of captain and commodore. In pursuance of a
plan conceived by Peter I., and communicated on his death-
bed to Beering, for making discoveries in that tempestuous
sea which lies between Kamtschekta and America, this adven-
turous navigator set sail in 1728, accompanied by Tischerikof,
from the mouth of the Kamtschekta river, with a view of
ascertaining whether the two continents of Asia and America
were separated, according to the instructions prepared by
Peter I. on his death-bed for this purpose. Coasting
along the eastern shore of Siberia, he arrived at the latitude
of 65° 18', but made no discovery of the opposite continent.
In 1729, soon after his return, he failed again in prosecution
of the same design, but without success. A third expedi-
tion was planned in 1741, and the conduct of it was entrusted
with Beering and Tischerikof, who encountered many dif-
ficulties, and paved the way to all the important discoveries
afterwards made by the Russians. Two vessels, named the
St. Peter, and St. Paul, were defined for this enterprise: the
former was commanded by Capt. Beering, and had on board 76
persons, including officers, and the latter by Capt. Tischerikof,
accompanied by Delile, professor of Altarmony, and the fame
number of mariners. From the bay of Avatfacha, which
they left on the 4th of June, they proceeded northwards;
and the vessels parted in a lorn, and never more saw one
another during the voyage. Beering steered in a southerly
direction from the 5th to the 40th degree of latitude in
search of Tischerikof, but finding the search to be fruitless,
he directed his course easterly, and at the end of fix weeks
from the time of first falling, deferred land in the latitude of
59° and some minutes, and in the longitude of 40° from
Avatfacha. On the 20th of July they anchored among
some islands, on one of which they landed; but they neg-
lected to accomplish the main object of their mission, which
was the discovery of the American coast, which afterwards
appeared to be so near their present station. This, however,
seems to have been owing to the difcontent and inordin-
ation that prevailed among the crew and officers of the
ship. Having observed several islands in the course of their
voyage, they at length, viz. on the 5th of November, found
themselves, as they apprehended, on the coast of Kamtschekta,
near the bay of Avatfacha; but the land which they per-
ceived proved to be an island, on which the ship was wreck-
ed, and where the commander, and several of the crew, died
soon after their landing, of the furious, famine, and fatigues.
Steller, who accompanied Beering, and wrote a journal of
the voyage, obferves, in justice to the commodore, that he
exerted himself to the utmost of his ability in executing the
defign of his mission, but that he was himself conscious of
his infirmity for the arduous task on account of his age and
irresolution. His temper was too mild for the go-

government of a disordered crew: and his deference to his
officers led them to presume on their own importance, and to
deprise his authority. Worn out at last with hunger, thirst, cold,
weakness, and anxiety, the odematous tumours in his feet,
from which he had long suffered, increased by the sever-
rity of the weather, and a mortification of the belly tak-
ing place, he breathed his last on the 8th of December;
and was buried between his aduant commissary and two

grenadiers. "On our departure from the island," says
Steller, "we erected over the grave a wooden croft
to serve as a monument, and at the same time to be a
testimony of our having taken possession of the country."

Steller alludes several arguments to prove that Beering dis-
covered the continent of America, as cape St. Elias, lying,
according to his elimation, in N. lat. 58° 28', and in longi-
itude from Ferro 25°; and that the coast touched at by
Tischerikof was situated in lat. 56° long. 24°. The coasts,
says Steller, were bold, projecting chains of high mountains,
some of which were covered with snow, and their sides clothed
from the bottom to the top with large tracks of thick and
fine wood. Steller went on shore and observed several spe-
cies of birds not known in Siberia, and one in particular,
described by Catesby under the name of the blue jay, peculiar
to North America. The soil was different from that of
Kamtschekta, and of the neighbouring islands, and he found
several plants which botanists deem peculiar to America.
Besides, it has been alluded that they must at least have ap-
proached very near that continent; as the natives of the
islands on which they touched, presented to them the "calu-
mct" or pipe of peace, which is a symbol of friendship uni-

eral among the people of North America, and an usage of
arbitrary institution peculiar to them. Soon after the re-

turn of Beering's crew from the island, where he was ship-
wrecked and died, the inhabitants of Kamtschekta ventured
over to that island, to which the sea-otters and other sea-an-
imals were accustomed to resort in great numbers. Steller's
Journal apud Palas. Cosse's Russian Diocervices, p. 20,
p. 156, vol. iii. p. 42, p. 499. See Asia, and the following
articles, Beering's Bay, &c.

Beering's Bay, in Geography, a name given in honour of
commodore Beering, to that part of the North Pacific Ocean,
compre-
comprehending about 1200 leagues in circuit, which is formed by the Archipelago, called the Aleutian or Aleoutfsie islands, with the north-west coast of America, and the north-east coast of Asia, and which communicates towards the south with the great Boreal ocean by as many straits as the islands form channels between them, and towards the north, under the 66th parallel, with the Arctic ocean, by Beering's Straits alone. See ALEUTIAN.

Beering's, or Beering's Bay, a bay on the north-west coast of America, situated between cape Stelling and cape Fair-weather, and so called in honour of commodore Beering, who, in 1741, discovered this bay, and anchored in it. The extreme points of this bay, in Vancouver's chart, are point Manby and point Turner; cape Philips lies to the south of it, and port Melvagre, formed by islands, and affording a convenient anchoring place secure from all winds, is situated within the bay. In this part of the bay Beering is supposed to have anchored. Beering's mount, St. Elias, lies at a small distance to the north of this bay, Mr. Dixon called it Admiralty bay. La Perouse describes it under the denomination of Beering's river. According to captain Cook, the opening of this bay was in N.lat. 59° 18'; and La Perouse makes it 59° 20'. Cook's longitude was 120° 10' E. or 159° 41' W. 142° 1' W. from the Meridian of Paris. La Perouse fixes his longitude at 142° 2', making only a difference of 1' from that of Cook. Vancouver, who reconnoitred this coast more accurately than Capt. Cook had an opportunity of doing, as he pulled at some distance from the shore, places it further to the north and west, its opening being about 59° 32', and E. long. 220° 35'.

Beering's island, an island in the north Pacific ocean on the north exit of Kamtchata, which some have considered as one of the groups called the Aleutian isles, (see ALEUTIAN) and others have separated from it. This island was discovered by Beering in 1741. This adventurous navigator having been for some time in a state of indigposition and decay, was unable to concern himself about the management of his ship, and his crew were generally attacked by the scurvy, and in a sickly, enfeebled condition. Pursuing their navigation, they were at length driven by the winds and seas on this island, with the position of which, with regard to the two continents, they were unacquainted, and here the ship was cast away. On the 9th of December, Beering died on this island, which has very properly assumed the name of the first navigator who ventured into these seas, and who discovered the western continent of America, in a latitude which, before him, no known voyager had attained. In the following year, the surviving crew contrived, with great trouble, to construct a boat, which conveyed them to Kamtchata. This island is situated between the north latitude of 55° and 56° and E. long. 167° 20', about 50 leagues from the coast of Kamtchata. It is 165 versts in length, and of various breadths, the greatest breadth being 23 versts; and it consists of a range of bold cliffs and islands, which, separated by several very narrow valleys, lying north and south, seem to rise from the sea like a single ridge. The heights of these mountains are elevated perpendicularly, not above a thousand fathoms, covered with a yellow clay, and much riven by storms and weather. The mountains consist of granite, those rows excepted that stand near the sea, which are commonly of sandstone, and form, not frequently, stone walls, that are very deep. In these mountains, there are many caverns. In the year 1741, three smart shocks of earthquakes were perceived in this island; the sea about it is not covered with ice, and the cold is in general moderate, although there are mountains on which the snow never dissolves. Neither thunder nor the Vol. IV.

aurora borealis has been observed here. The island has springs of excellent water, and beautiful caverns. Of animals there are only ice foxes, seals, sea-beaves, inscription of sea-cows, &c. No wood grows upon this island; but several kinds of plants are found upon it. It is infrequently visited. The ships which have been accustomed to navigate these seas have frequently wintered on this island, in order to procure a flock of salted provisions from the sea-cows and other amphibious animals, that are found here in great abundance. Tooke's View of the Russian Empire, vol. i. p. 136, &c. Marchand's Voyage, vol. i. introd. p. 53.

Beering's Straits, separate Asia from America, being bounded on the American side by cape Prince of Wales, is N.lat. 65° 50'; E. long. 151° 50', and on the side of Asia by the cape east cape. In N.lat. 66° 2'; and E. long. 160° 22'. The breadth of this strait is about 15 leagues, or near 40 miles. Its depth is from 12 to 30 fathoms. It was discovered first by Beering, and afterwards by captain Cook. Beering, in his voyage of 1740, is said to have proceeded as far north as 67° 16', and therefore must have reached a latitude more northerly by about a degree and a quarter than that of the most eastern part of the old continent. He had, therefore, entered the Frozen ocean, and must have actually passed this strait, probably in the usual fogs of the climate, without discovering land to the east; however, our great navigator, captain Cook, gave the name of the Damiad adventurer to these straits, when with his usual accuracy he afterwards explored them. To the north of these straits the Asiatic shore leads rapidly to the westward; but the American proceeds nearly in a northern direction, till, at the distance of about 4 or 5 degrees, the continents are joined by solid and impenetrable banks of ice. The sea from the mouth of these straits to the extremity of the continent of Asia is very shallow, and deepens from these straits till foundings are lost in the Pacific ocean, south of these isles. Between them and the straits there is said to be an increase from 12 to 54 fathoms, excepting off cape Thaddaeus, where the channel is of greater depth. From this, and other circumstances, it has been thought not improbable that a separation of the continents may have taken place in some unknown period, at these straits, and that the whole space from the isles to that small opening might once have been dry land; and that the fury of the winter element, armed with 600° of fire, might have subverted and overwhelmed the tract, and left the islands as volcanic remains of this great eruption. The famous Japanese map places some islands apparently within these straits, denominated "Ya Zue," or the kingdom of the dwarfs. Hence it has been imagined, that America was not unknown to the Japanese, and that they had, as Kempfer and Charlevoix have suggested, made voyages of discovery; and according to the late writer, that they had actually wintered upon the continent, where probably meeting with the Equinomaec, they might, in comparison with themselves, justly distinguish them by the name of dwarfs. See ASIA.

BEEH, a Moorish kingdom of Africa, lying to the north of Bambara, and north-west of a French state, called Maffina. Its capital is Walat, situate, according to Mr. Park's information, about 240 geographical miles to the east of Benom. In Kinnell's map of North Africa, Walat is in N. lat. 15° 45', and W. long. 2° 45'. The kingdom of Berto horders on Sahara, or the Great Desert.

BEEROTH, in Ancient Geography, a city of the Gideonites, afterwards of the tribe of Benjamin, Josh. xvi. 17. According to Eusebius, it was distant 7 miles from Jericho, in the way towards Nicopolis.

BEEROTH, of the children of Jaakan, was a station of the R.
BEL

In this sense, the word is correctly written in some places beyt. Skinner derives it from the English beating. For the military use, beetles, called also flammers, are stuck round pieces of wood, a foot and a half long, and eight or ten inches in diameter, having a handle of about four feet long. Their use is for beating or settling the earth of a parapet, or about palisades; which is done by lifting up the beetle a foot or two, and letting it fall with its own weight. The name beetle is also given to the pavement's rammer, or instrument wherewith the stones are beaten down, and falfened.

BEEVES, a general name for oxen.

BEFARIA, in Botany. See BEJARIA.

BEFORT, in Geography, a town of France, and principal place of a district, in the department of the Upper Rhine, ceded to France by the treaty of Aix-la-Chapelle in the year 1668, at the treaty of Weilphala. It was fortified by Vauban. In this town several forges are employed in the manufacture of iron. N. lat. 47° 9'. E. long. 6° 46'.

BEFROI, Grand BEFROI, and PETIT Befroi, in Ornithology, the names of the two species of Turdus, called timiaus and lineatus by Gmelin, in Buffon's Hist. Birds.

BEG, or BEY, in The Turkish Government. See BEY.

BEG, Lough, in Geography, or the Little Lough, in the province of Ulster, Ireland, a small lake into which the waters from Lough Neagh again expand, after a course of about a mile, through a very narrow channel. The form of Loughbeg, its islands, some wooded points of land with intervening lawns and rocks, a magnificent rotunda at Ballyfeullan, and the beautiful light-house of Toome-bridge, produce the most happy effect. It is situated between the counties of Armagh and Londonderry.

BEGA, or BEGEYN, Cornelius, in Biography, a painter and engraver, was born at Haarlem in 1620, and became the discipile of Adrian Ostad, whose manner he imitated, and by whose instructions he profited, so as to acquire considerable reputation as a painter. But contracting habits of dilapidation and licentiousness, he was divorced by his father, and rejecting the indignity, he assumed the name of Beg instead of Begeyn, which was that of his family. He had a fine pencil, and a delicate mode of handling his colours, so as to give them a neat and transparent appearance; and his performances are so much esteemed in the Low Countries as to be placed among the works of the best artists. He also etched several drolleries, and a set of 34 prints, representing ale-house scenes, &c. His death, which happened in 1663, was occasioned by the plague, which he caught from a favourite female, to whom he was so strongly attached that he visited her, against the remonstrances of his friends and physicians, to the last moments of her life; and he outlived her only a few days. Plinkington and Strutt.

BEG, or VEGA, in Geography, a river of Germany, which runs into the Werra, 4 miles N. W. of Lemo, in the circle of Weilphala.

BEGANNA, in Ancient Geography, a town of Arabia Defera, in the neighbourhood of Meopotamia. Potelmy.

BEGARMEE, or BAGHERMI, in Geography, supposed to be the " Begama" of Edrisi, and the " Gorham" of D'Anville, an extensive kingdom of Africa, situate S. E. of Bornou, at the distance of about 20 days' travelling, or allowing, with major Rennell, 15 miles for a day's journey, 300 miles, and separated from it by several small deserts. The extent, according to Browne's Travels in Africa, p. 468, is from E. to W. 12 days, and from N. to S. 15 days, allowing 125 geographical miles per day. The inhabitants are rigid Mahometans, and though perfectly black in their complexion, are not of the Negro cast. Beyond this kingdom to the east, (see Proceedings of the Association for promoting the discovery of the Interior Parts of Africa, p. 155) are several

Israelites (Deut. x. 6.), placed by Eusebius 10 miles from the city of Petra.

BEER-SHEBA, called also DERRABS and Barshema, a city given by Joshua to the tribe of Judah, and afterwards transferred to Simeon. Josh. xv. 28. It derived its name from בֵּית-שֶׁבַע, the well of an oath, from the well on which Abraham and Isaac ratified their alliance by an oath with Abimelech. It was distant south from Bebron 20 miles, and had a Roman garrison in the time of Eusebius and Jerome. The limits of the Holy Land are often expressed in Scripture by the terms "from Dan to Beer-sheba" (2 Sam. xvii. 11, &c.); Dan being the northern and Beer-sheba the southern extremities of the land. It is now a poor village, adjoining a large, sandy, barren desert, altogether uninhabited, except towards the sea-coast.

BEES, in Naval Architecture, denote pieces of clm-plank bolted to the outer ends of bowsprits.

BESENSTADT, in Geography, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld, 6 miles east of Eisleben.

BEES-HEAD, Sr. a cape of England in the western extremity of the county of Cumberland, in the Irish sea, about ten leagues E. by N. from the Isle of Man, and 2 S. of Whitehaven. It has a light-house, and is a noted promontory for sea-fowl. N. lat. 54° 31'. W. long. 35° 43'.

BEESHEN, a town of Germany, in the circle of Weilphala, and county of Lingen, 7 miles S. S. E. of Lingen.

BEESKOW, a town of Germany, in the circle of Upper Saxony and Uekerman of Brandenburg, and capital of a lordship, to which it gives name, seated on the Spree; 16 miles S. W. of Frankfort on the Oder, and 34 E. E. of Berlin. A cloth manufacture is carried on in this town.

BEES-WAX. See WAX.

BEESTINGS, or Feastings, denote the finest milk taken from a cow after calving.

The beetings are of a thick consistence and yellow colour, seemingly impregnated with sulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the excrements gathered in its stomach and intestines during its long habitation in utero. The like quality and virtues he supposes in women's first milk after delivery; and hence infers the necessity of the mother's suckling her own child, rather than committing it to a nurce, whose firit milk is gone.

BEET, in Botany. See Beta.

BEET, harc's, Beta lipponia, a name given by some of the old Latin writers to a small green plant of an acid taste.

BEET-gall-insect. See GALL-insect.

BEETLE, in Entomology, a common English name for all insects that are furnished with hollow-wing-cafes: those which have them divided by a straight future are properly beetles, and belong to the coleoptera order; but the blatter, or cock-roaches, are also called beetles, though the future is oblique, or in other words one wing-case crooks the other; and therefore it belongs to the hemiptera order. See Coleoptera.

The farfares are beetles in the finest fene of the word.

BEETLES, water, is likewise a common name for most insects that have wing-cafes, and inhabit the water, including the dytidi, and some other aquatic insects, that are truly beetles, with such as are not of the same order, such as the neph, notonecte, &c. See HEMIPTERA.

BEETLE, in Mechanical Uses, denotes a large wooden instrument, formed after the manner of the mallet, having each face bound with a strong iron hoop, to keep it from spreading, and used for driving piles, stakes, palisades, wedges, and the like.
several tribes of Negroes, idolaters in their religion, savage in their manners, and acustomed, it is said, to feed on human flesh. They are called the Kardees, the Serrowah, the Shuowah, the Battah, and the Mulguia. These nations, the Begarmees, who fight on horseback, and are great warriors, annually invade; and when they have taken as many prisoners as opportunity affords, or their purpose may require, they drive the captives like cattle to Begaramee. It is said, that if any of them, matured by age, or exhausted by fatigue, happen to linger in their pace, one of the horsemen seizes on the oldish, and cutting off his arm, uses it as a club to drive on the rest. From Begaramee they are sent to Bornou, where they are sold at a low price; and from thence many of them are conveyed to Fezamn, where they generally embrace the Mussulman faith, and are afterwards exported by the way of Tripoli to different parts of the Levant. Begarmee, the capital of the kingdom, lies in N. lat. 15°. E. long. 26°. 30'. according to Remell's Map; but according to Browne, N. lat. 16°. 40'. E. long. 22°. 25'.

BEGARRA, a town of Spain in New Cadiz, 4 leagues from Alacerr.

BEGEMDER, a province of Abyssinia, north east of Tigré, bordering upon Angot, and separated from Amlara, which runs parallel to it on the south, by the river Bafbilo. Both these provinces are bounded by the river Nile on the west. The greatest length of Begemder is about 180 miles, and its breadth 60; and it comprehends "Laifa," a mountainous province, sometimes depending upon Begemder, and often in rebellion. The inhabitants are esteemed the best soldiers in Abyssinia, being men of great strength and stature, but cruel and uncivilized; so that they are called, in common conversation and writing, the peafants, or barbarians of Laifa. They pay to the king 1000 ounces of gold.

Several small provinces are now dismembered from Begemder, such as Foggora, a small strip of land reaching south and north about 35 miles between Einfars and Dars, and about 12 miles broad from east to west, from the mountains of Begemder to the lake Tzana. On the north end of this are two small governments, Dreda and Karoouta, the only territory in Abyssinia that produces wine; the merchants trade to Caffa and Narees, in the country of the Gallas.

Begemder is the strength of Abyssinia in horsemanship. It is said that, with Laifa, it can bring out 45,000 men; but this account Bruce thinks to be much exaggerated. It is well flocked with cattle of every kind, that are very beautiful. The mountains are full of iron mines; they are not so steep and rocky as in other provinces, if we except Laifa, and abound in all sorts of wild fowl and game. The south end of the province near Nefas Mufa is cut into prodigious gullies, apparently by floods, of which no history remains. It is the great barrier against the encroachments of the Gallas, who have made many attempts to obtain a settlement here, but without success; and they have loit whole tribes in these ineffectual efforts. Begemder is a province of such consequence to the state, reaching far to the metropolis, and regularly supplying it with all sorts of provisions, that none but noblemen of rank, family, and character, able to maintain a large number of troops always on foot, and in good order, are trusted with its government. It lies in about N. lat. 11°. 45'. and from 37°. 30'. to 38°. 30'. E. long.

BEGER, Laurence, in Biography, a German antiquarian, was the son of a Tanner at Heidelberg, and born in 1673. At the request of his father he first studied theology, and afterwards gratified his own inclination by the study of the law. Devoting himself to classical literature and antiquities, he acquired such reputation that, in 1677, he was appointed librarian and keeper of the cabinet of antiquities by Charles Lewis, elector Palatine; and he retained the same office under Frederick William, elector of Brandenburg, to whom the cabinet was transferred in 1687. He was a member of the Society of Berlin from its institution, and died there in 1705. He was the author of various learned works. His "Considerations on Marriage, by Daphnis Arcarius," was written in German, as a defence of polygamy, to gratify the elector Palatine, who wished to marry another lady, to whom he was attached, whilst his wife was living. He afterwards gratified the fon by composing a refutation of this work, which was never printed. The principal of his other works, which relate to history and antiquities, are "Thefurus ex Thefauro Palatino Selectus," 1687, fol.; "Thefaurus Reg. elect. Brandenburgii Selectus," 3 vols. fol.; "Regum et Imperator. Roman. Numismata," 1700, fol.; "De Nummis Cretienis Sertopentricis," 1702, fol.; "Lucernae Vetum Tobtulchridae," 1702, fol.; "Numismata Pontif. Roman. aliorumque rariora," 1703, fol.; "Melagrades et Atolim," 1696, 4to.; "Cranz infius Laconica," 1696, 4to.; "Bellum et Excidium Trojanum illus." 1699, 4to. Moreri.

Laurentius Beger, the nephew of this famous antiquarian, was an engraver of some eminence at Berlin, about the year 1700.

BEGER, in Geography, a town of Spain, in the country of Seville, 14 leagues from Medina Sidonia.

BEGGA, in Entomology, a species of Phedias, (Bombys) with white wings, having a black rib. This kind inhabits Surinam. The body is white; antennae and legs yellow, black, and the wings at the tips. Fabricius, Genelin, &c.

BEGGAR. Beggars pretending to be blind, lame, &c. found begging in the streets, are to be removed by the constables; and refusing to be removed, shall be whipped, &c. flat. 12. Anne; and our statutes have been formerly so strict for punishing of beggars, that in the reign of king Henry VIII. a law was enacted, that sturdy beggars convicted of a second offence should be executed as felons. But this statute was afterwards repealed. See ROUGE and VAGABOND.

BEGGING ORDER. See Mendicant.

BEGHARDI, BEGHAARDI, or BEGGHARDI, in Ecclesiastical History, called also in Italy Binnich, and in France Beguins, derive their name from the old German word begen, begger, which signifies "to seek any thing with zeal and importunity." Accordingly, persons of this description were called Beghards, whence probably the English word beggar is derived; and Beguette denoted female beggars. This was a general appellation, and given to no less than thirty sects or orders, that sprung up in the thirteenth century, which differed widely from each other in their opinions, their discipline, and manner of living. It was at first indiscriminately applied to all persons who embraced, with renunciation and free choice, the horrors of absolute poverty; begging their daily bread from door to door, and renouncing all their worldly possessions and occupations. It was afterwards re-fired to those who distinguished themselves by an extraordinary appearance of devotion, and was used much in the same sense with the term Methodist among us. These persons formed a sort of intermediate order between the monks and citizens, resembling the former in their manner of living, without affuming their name, or contracting their obligations. They were divided into two classes, which derived their different denominations of perfect and imperfect from the different degrees of austerity that they discovered in their manner of living. The perfect lived upon alms, abstained from wedlock, and had no fixed habitations. The imperfect conformed to the customs of the rest of their fellow-citizens in these respects. The name was at first honourable, but by degrees it sank into reproach, being adopted by many, who,
The Beghards of Germany, deprived of the protection of the emperor Lewis, suffered extreme misery under Charles IV, who was advanced, by the interest of the pope, to the imperial throne in 1345. Detrions of gratefully the depriver of the court of Rome, he supported by his edicts and by his arms the papal inquisitors, and allowed them to apprehend and put to death all those that were deemed enemies; and among others the Beghards were victims to their perfecuting power. The emperor himself, who resided at Lucca in Italy, not only approved these violent measures, but joined out in 1349 severe edicts, commanding all the German princes to extricate their dominions the Beghards and Beguines, or, as he himself interpreted the name, "the voluntary beggars," as enemies of the church and of the Roman empire, and to afflict the inquirers in their proceedings against them. By another edict, published not long after, he gave the houses of the Beghards to the tribunal of the inquisition, ordering them to be converted into prisons for heretics; and at the same time ordered all the effects of the Beguines to be publickly sold, and the profits arising from them to be equally divided between the inquirers, the magistrates, and the poor of those towns and cities where such sale should be made. The Beghards, being reduced to great distress by this and other mandates of the emperor, and by the constitutions of the popes, found a refuge in those provinces of Swifterland that border upon the Rhine, and also in Holland, Brabant, and Pomerania. But the edicts and mandates of the emperor, together with the papal bulls and inquisitors, followed them wherever they went, and distressed them in their most distant retreats, so that, during the reign of Charles IV., the greatest part of Germany (Swifterland, and those provinces that are contiguous to it, excepted), was thoroughly purged of the Beghards, or rebellious Franciscans, both perfect and imperfect.

The Beghards of Flanders are a denomination by which certain unmarried persons, both bachelors and widowers, are distinguished, who formed themselves into communities of the same kind with those of the female Beguines, referring to themselves the liberty of returning to their former method of life. The first society of those Beghards was estab-lished at Antwerp in the year 1228, and continues still; though the brethren of which it is composed have long since departed from their primitive rule of discipline and manners. This first establishment was succeeded by many others in Germany, France, Holland, and Flanders. These fraternities long enjoyed the toleration of the Roman pontiffs; but most of the convents are now either demolished or converted to other uses. See Brothet of the Free Spirit, Freticelli, and Tertiaris. Medicim's Eccl. Hist. vol. ii. p. 86. 8vo. 1758.

BEGIA, in Geography. See Bayjah.

BEGIS, in Ancient Geography, a town of Illyria, which belonged to the Thracians. Steph. Byz.

BEGWAWE, in Geography, a town of Bohemia, in the circle of Breslau, 3 miles west of Melnik.

BEGLASEH, a town of Asiat Turkey; in the province of Carmania, 8 miles north of Kirkehir.

BEGLERBEG, a Turkish title for the chief governor of a province, who has under him several bey or fugares, that is, subgovernors. The word is also written "beglerbey," "beglerbey," "beglerbeghi," and "begler bey." It is compounded of "begler," lords; the plural of "beg," lord, with the word "beg," unfixed; importing as much as lord of lords.

The next to the vicer, or the first vicer, are the beglerbegs in Turkey, who, according to Rycuaut, may be compared to archdukes in some other countries, being the next ministers below the prime vicer, and having under their jurisdiction many fugares, or provinces, and their begs, agas, &c. To every beglerbeg the grand fingier gives three ensigns or staves, trimmed with a horsetail, to distinguish them from the bahnums, who have but two, and from simple begs, or fugare begs, who have but one. See Bashaw.

The province or government of a beglerbeg is called "beglerbeglik," or "beglerbeglik." These are of two forts; the first called "bajic beglerbeglik," which has a certain rent assigned out of the cities, countries, and provinces allotted to the principality; the second called "fatehe beglerbeglik," for maintenance which is annexed a certain salary or rent, collected by the grand singier's officers with the treasurers of the empire. The borders of the first fort are in number twenty-two, viz. those of Anatolia, Carmania, Dairkheir, Damaicus, Aleppo, Tripoli, Trebizond, Buda, Tenezafer, &c. The beglerbegs of the second fort are in number six, viz. those of Cairo, Babylon, &c. Five of the beglerbegs have the titles of vipers, viz. those of Anatolia, Babylon, Cairo, Romania, and Buda. The beglerbegs appear with great state, and a large retinue, especially in the camp, being obliged to bring a folder for every five thousand aipers rent which they enjoy.

The beglerbegs of Romania brought ten thousand effective men into the field.

Beglerbeg is also a title given to the chief governors of provinces in the Persian empire, having the command over all khan, faltuns, &c. in their respective districts.

BEGON, Michael, in Geography, was born of a good family at Blois, in 1638. After having occupied some law offices in his native province, he was introduced by his kind- man, the marquis de Seignelay, into the marine department, and became successively intendant of Havre, of the French colonies in America, and of the galleys. In 1688, he removed to Rochefort, and polished the켓ness of that post till his death, which happened in 1710. His leisure hours were af- fiduously devoted to the cultivation of literature, and he was owner of a valuable library, which was free of public access. In most of his books was written "Michaelis Begon et amici," i.e. the property of Begon and his friends; and when he was once cautioned by his librarian against lending his books for fear of losing them, he replied, "I would rather lose them, than seem to disfriut any honest man." His cabinet was richly stored with medals, antiques, prints, and various curiosities, collected from all parts of the world. Having procured engravings of several eminent Frenchmen of the seventeenth century, he collected memoirs of their lives, which furnished materials for Perrault's "Homes Illus-

The whole plant in the Begonias is fleshy; the stem in most of the species is herbaceous, but some are stemless. The leaves are petiolated, in the caulecent species alternate. At the base of the petioles is a pair of stipules. The peduncles in the greater part are dichotomous; and in the caulecent species, axillary. They are natives of Asia and America within the tropics. Three species have been found on the islands near the coast of Africa, but none on that continent. To Mr. Dryandor botanists are principally indebted for their knowledge of this genus. Linn. Trans. vol. 1. p. 159. Propagation and Culture. These plants increase readily by cuttings; and if kept in the bark-flour prove highly ornamental.
mental, being much esteemed, both for the beauty of the flowers, and the fragility of the leaves. Where a bank
floe is wanting, they will do very well over the face of the
dry sloe. Martyn's Miller's Dict.

BEGRAS, in Geography, a town of Asiatic Turkey, in
Syria, at the foot of the Black mountain, between Alex-
andretta and Antioch.

BEGUE, Achilles William, in Biography, born in
the district of Orleans, was admitted doctor in medicine by
the university of Paris the 32d of September 1760. He
is known principally by his translations into French of Dr.
Whytt's Treatise on Nervous Afflictions; Dr. Monroe's Ob-
servations on the Defat of the Army: Baron Stork's Ef-
fays on the virtues of hemlock, the thorn-apple, heshane, and
other poisonous vegetables; and Baron Van Swieten's account
of the use of the corrosive sublimate in curing the venereal
difeafe. His original compositions are "Le Conference de la
Sainte," et "Extremei solutaries," both published in 12mo. in
1763, the idea of which seems to have been borrowed from
Thielt's "Avis an People fur la Sainte," of which he published

BEGUINS, in Ecclesiastical History, were, as well as
the Beghards, a kind of half-monks, called Tertiaries, who at-
tached themselves to the genuine followers of St. Francis.
In Italy they were denominated bisecchi, and "Bocafo-
ti"; in France, "Beguins," and in Germany, "Beghards,"
or "Begnards," which last was the denomination by which
they were commonly known in almost all places. If we ex-
cept their forbid habit, and certain obsequies and maxims
which they followed in conformance of the injunctious of the
famous saint now mentioned, they lived after the manner of
other men, and were therefore considered in no other light
than as seculars and laymen. See BEGHARDS, and TERTI-
ARIES.

We must not confound, says Motheim, these Beguins and
Beghards, who derived their origin from an aulter branch of
the Franciscan order, with the German and Belgic Be-
guins, who crept out of their obsecity in the 13th century,
and multiplied prodigiously in a very short space of time.
Their origin was of an earlier date than this century; but
they now acquired a name, and made a noise in the world.
It appears from authentic and unexceptionable records, that,
so early as the 11th and 12th centuries, there had been se-
veral societies of Beguins established in Holland and Flan-
ders. However, the only convent of Beguines that existed
before the 13th century, was that of Wilvorden, in Brabant,
where they were settled, as appears by public acts, in the
years 1065, 1129, and 1151. Their primitive establishment
was undoubtedly the refult of virtuous dispositions and up-
right intentions. A certain number of pious women, both vir-
gins and widows, in order to maintain their integrity, and
prefer their principles from the contagion of a vicious and cor-
rupt age, formed themselves into societies, each of which had
a fixed place of residence, and was under the inspection and
government of a female head. Here they divided their
time between exercises of devotion, and works of honors
industry, referring to themselves the liberty of entering into
the flate of matrimony, as also of quitting the convent,
whenever they thought proper. And as all those among
the female sex, who make extraordinary proffessions of pic-
dy and devotion, were distinguished by the title of Beguine,
and persons who were uncommanly "affidius in prayer,"
as the name imports (see BEGHARDS); that title was given
to the women now mentioned. All the Beghards and Be-
guines that yet remain in Flanders and Holland, where their
convents have almost entirely changed their primitive form,
affirm unanimously, that both their name and institution de-
rive their origin from St. Beghhe, duchess of Brabant,
and daughter of Pepin, mayor of the palace to the king of
Aurora, who lived in the seventh century. This lady,
therefore, they consider as their patroness, and honour her
as a kind of tutelary divinity with the deepest sentiments
of veneration and repect. Thole, on the other hand, who are
no well widders to the caufe of the Beguines, deduce their
origin from Lambert de Begue, a priest and native of Liege,
who lived in the twelfth century, and was much esteemed on
account of his eminent piety.

The first society of this kind, of which record remains,
was formed at Nivel in Brabant, in the year 1226; or,
according to other historians, in 1207; and was followed by
many institutions of a like nature in France, Germany,
Holland, and Flandres; that, towards the middle of the
thirteenth century, there was fearcely a city of any note that
had not its "beguineage," or vineyard, as it was sometimes
called in conformity to the fyle of the "Song of Songs." All
these female societies were not governed by the faine laws;
but in the greatest part of them, the hours that were not de-
oted to prayer, meditation, or other religious exercizes,
were employed in weaving, embroidering, and other manual
labours of various kinds. The poor, sick, and disabled Be-
guines were supported by the pious liberality of fuch opulent
persons as were friends to the order. In the 14th century
these societies were more numerous in various parts of Ger-
many; but, adopting some of the extravagant opinions of
the "Mylic Brethren and Sifters of the Free Spirit," they
flared with them in the perfecution which they suffered.
The "Clementina," or constitution of the council of Vienne,
A.D. 1311, against the Beguines, gave fife to a perfecution
of thefe perfons, which lasted till the reformation by Luther,
and ruined the caufe of the Beguines and Beghards in many
places. From this Clementina, many took occasion to mo-
lelf the Beguines in their houses, to feize and defroy their
goods, to offer them many other infults, and to involve alfo
the Beghards in the like perfecution. In the year 1322,
however, they obtained fome relief by a special constitution
of the Roman pontiff, John XXI. in which he explained the
Clementina, and ordered that the goods, chattels, habi-
itations, and societies of the innocent Beguines should be
preferred from every kind of violence and infult; and this
example of clemency and moderation was afterwards followed
by other popes. The Beguines, on the other hand, in hopes
of difappoifting the malice of their enemies, and avoiding
their flanes, embraced, in many places, the third rule of St.
Francis, and of the Augufines. But this measure was un-
availing; for from this time they were oppreffed in several
provinces by the magiftrates, the clergy, and the monks, who
call a greedy eye on their treasures, and were extremely
eager to divide the fpoil. Motheim's Eccle. Hist. vol. iii.
p. 233, 377, &c.

Communities of Beguines, or Beguinages, fill flubfit in
Holland, Flanders, and Germany. In Brufells, there is a
fingular part of it, which is in fact a little town, inclofed by
a wall and ditch, and divided into ftreets. It is called the
Beguineage. The number of Beguines is near a thou-
sand, governed by matrons, and under the spiritual direc-
tion of the bishop of Antwerp. There are also Beguinages at
Amsterdam, Antwerp, and Malines.

BEZAM, in Geography, a town of Africa, in the coun-
try of Agadez, south of Agad or Agades, the capital of the
country, and at a greater distance south of Abous, and well
of the defert of Jaf. N. lat. 19° 28'. E. long. 12° 52'.

BEHAIRAT-EL-MARDJ, or Lake of the Meadon,
a moras of Syria, about 3 leagues from Domacus to the
outh-eall, into which flow the rivulets that fertilize the gar-
dens in the neighbourhood of the city. See DEMASCUS.

BEHAM, Hans, or JON SEBOLD, in Biography, an
eminen
Eminent engraver, flourished about the year 1540. Like Henry Aldridge and Albert Durer, whose works were the sources from which he derived his greatest improvement, he engraved in wood, and also on copper, and etched some few plates. He was also a painter of reputation, and celebrated by the poets of that age under the name of Bo-phemus. He was a man of good genius, and distinguished by fertility of invention. But the Gothic table which prevailed in Germany in his time, is too apparent in all his works. His brother Bartolomeo Beham flourished as an engraver about the same time. He is said to have fludicd under Marc Antonio Raimondi, whose manner heimitated. His chief residence was at Rome, where he died. Strutt.

BEHAMBURG, in Geography, a town of Germany, in the archduchy of Austria, 3 miles east of Steyr.

BEHAMKIRCHER, a town of Germany, in the archduchy of Austria, 6 miles south-west of St. Polten.

BEHAVIOUR, Good, in Law. See Good Abusing.

BEHEMAN, a town of Peria, in the province of Lar.

BEHUMROO, a country of Hindoostan, in the northern parts of Lahore, near the Imaus mountains, where one branch of the river Ruanve springs.

BEHEADING, a capital punishment, wherein the head is severed from the body by the stroke of an ax, sword, or other cutting instrument.

Behcading was a military punishment among the Romans, known by the name of decollatio. Among them the head was laid on a cippus, or block, placed in a pit dug for the purpose; in the army, without a palus; in the city, without the walls, at a place near the porta decumana. Preparatory to the stroke, the criminal was tied to a stake, and whipped with rods. In the early ages the blow was given with an ax; but in after-times with a sword, which was thought the more reputable manner of dying. The execution was but clumsily performed in the first times; but afterwards they grew more expert, and took the head off clean with one circular stroke.

In England and France, beheading is the punishment of nobles; being reputed not to derogate from nobility, as hanging does.

Behcading is part of the punishment of high treason, affecting the king's person or government. The king may, and often does, discharge all the punishment, except beheading, especially when any of noble blood are attainted. For beheading being part of the judgment, that may be executed, though all the rest be omitted by the king's command.

In Scotland they do not behead with an ax, as in England; nor with a sword, as in Holland and formerly in France where they now use the guillotine; but with an edged instrument called the maiden.

BEHEM, BEHEM, BEHEN, BOWEN, MARTIN, in Biography, supposed to be the same with Martin Behemio, to whom Gerolamo de la Vega ascribes the first discovery of America, was a famous geographer and navigator of the 15th century. The Christian name, says M. Otto, (ubi infra) is the same with that of Gerolamo, and the syllables "ira" he conceives, were added to his name in consequence of his receiving the honour of knighthood from John II., king of Portugal. Behem was born of a noble family, of which some branches still remain at Nuremberg, an imperial city in the circle of Franconia. Addicted from his infancy to the study of geography, astronomy, and navigation, and having enjoyed the advantage of Regiomontanus's instruction, he entertained the thought, at more mature age, of the possibility of the existence of the antipodes, and of a western continent. Under the influence of this imagination, he paid a visit, in 1459, to Isabella, daughter of John I., king of Portugal, and regent of the duchy of Burgundy and Flanders; and having informed her of his designs, he procured a velvel, in which he discovered the island of Fayal in 1460. Here he established a colony of Flemings, whose descendants are said still to exist in the Azores, which were then called the "Flemish islands." For the proof of this fact M. Otto refers to the records of Nuremberg, and to the testimonies of Wagenfeil, one of the most learned men of the last centuries, in his "Universal History and Geography." Having obtained a grant of Fayal from the regent Isabella, and after having resided there 20 years, Behem applied, in 1484, eight years before the expedition of Columbus, to John II., king of Portugal, for the means of undertaking a great expedition towards the south-west. In the prosecution of this undertaking he discovered that part of America, which is now called Brazil, and failed to the straits of Magellan, or to the country of some savage tribes, whom he called Patagonians, because the extremities of their bodies were covered with a skin more like a bear's paws than human hands and feet. One of the records, preserved in the archives of Nuremberg, and containing this fact, affirms, that "Martin Behem, traversing the Atlantic ocean for several years, examined the American islands, and discovered the strait, which bears the name of Magellan, before either Christopher Columbus or Magellan failed those seas; and even mathematically delineated, on a geographical chart, for the king of Lusitania, the situation of the coast, around every part of that famous and renowned strait." This assertion is supported by Behem's own letters, written in German, and preserved in the same archives; which letters are dated in 1484. The discovery of Behem is also noticed by contemporary writers. In the chronicle of Hartman Schell, or Hermann Schelde, entitled "Chronicon Mundii," and of which a German translation was published at Nuremberg in 1493, we have the following passage to this purpose: "In the year 1485, John II., king of Portugal, a man of a magnificent spirit, furnished some galleys with provisions, and sent them to the southward beyond the straits of Gibraltar. He gave the command of his squadron to James Canus, a Portuguefe, and Martin Behem, a German of Nuremberg in Upper Germany, defended of the family of Bonna, a man very well acquainted with the situation of the globe, blessed with a constitution able to bear the fatigues of the sea, and who, by actual experiments and long sailing, had made himself perfectly master with regard to the longitudes and latitudes of Ictolamey, in the west. These two, by the bounty of Heaven, coaling along the southern ocean, and having crossed the equator, got into the other hemisphere, where facing to the eafward, their shadows projected to the south and right hand. Thus, by their industry, they may be said to have opened to us another world hitherto unknown, and for many years attempted by none but the Portuguefe, and by them in vain. Having finished this cruise in the space of 26 months, they returned to Portugal, with the loss of many of their men, by the violence of the climate." This passage was copied by the publishers of the works of Cellarius Sylvius, afterwards pope Pius II. Two years before the expedition of Columbus, Petrus Mattaus, a writer on the canon law, remarks, that "the first Christian voyages to the newly discovered islands became frequent, under the reign of Henry, son of John king of Lusitania. After his death, Alphonfus V. prosecuted the design; and John, who succeeded him, followed the plan of Alphonfus, by the assistance of Martin Behem, a very experienced navigator; so that, in a short time, the name of Lusitania became famous over the whole world." Cellarius also says expressly, "Behem did not think it enough to survey the island of Fayal, which he first discovered, or the other adjacent islands which
which the Lusiadians call Azores, and we, after the example of Behem's companions, call Flemish islands, but advanced still farther and farther south, until he arrived at the remotest strait, beyond which Ferdinand Magellan, following his tract, afterwards failed, and called it after his own name."

Magellan, it is said, saw a chart of the coast of America, drawn by Behem, and preferred in the archives of Nuremberg, and hence conceived the project of following the steps of this great navigator. Riccioli, in his Geog. Reform. i. iii. p. 593, says, "Christopher Columbus never thought of an expedition to the Weil Indies, until some time before, while in the island of Madeira, where, amusing himself in forming and delineating geographical charts, he obtained information from Martin Behem, or, as the Spaniards say, from Ahumado Sanchez de Huida, a pilot, who, by more chance, had fallen in with the island afterwards called Domincues."

In another place he says, "Let Behem and Columbus have each their praise; they were both excellent navigators; but Columbus would never have thought of his expedition to America, had not Behem gone there before him. His name is not so much celebrated as that of Columbus, America, or Magellan, although he is superior to them all." Martin Behem, in consideration of his great services to the crown of Portugal, was knighted by king John in 1485, in the presence of his whole court. In 1492, the chevalier Behem, crowned with honours and riches, undertook a journey to Nuremberg, to visit his native country and his family: and there he made a terrestrial globe of curious construction, which is still preserved in the library of that city. On this globe is marked the tract of his discoveries, under the appellations of the western lands; and from their situation it cannot be doubted, that they are the present coasts of Brazil, and the environs of the straits of Magellan. This globe was made in the same year when Columbus set out on his expedition; and hence it is inferred, that Behem could not have profited by the observations of this navigator. After having performed several other interesting voyages, the chevalier Behem died at Lisbon in July 1506, universally regretted, and leaving behind him no other work besides the globe already mentioned, which was constructed from the writings of Ptolemy, Pliny, Strabo, and especially from the account of Mark Paul the Venetian, a celebrated traveller of the 13th century, and of John Mandeville, an Englishman, who, about the middle of the 14th century, published an account of a journey of 33 years in Africa and Asia. He has also added the important discoveries made by himself on the coasts of Africa and America.

Dr. Robertson treats the history of Behem as a fiction of some German authors, who were inclined to attribute to one of their countrymen a discovery which has produced so great a revolution in the commerce of Europe. Nevertheless, he acknowledges with Herrera, that Behem had settled in the island of Fayal; that he was the intimate friend of Columbus, and that Magellan had a globe made by Behem, by the help of which he undertook his voyage to the south sea. He also relates, that in 1492 this geographer visited his family at Nuremberg, and left there a map drawn by himself, a copy of which was procured for him by Dr. Reinhold Potter, and which, in his opinion, partsake of the imperfection of the cartographical knowledge of the 15th century; as he found in it, under the name of the island of St. Brandon, land which appears to be the present coast of Guinea, and which lies in the same latitude with the Cape Verd islands; and he conceives that this is an imaginary island, which has been admitted into some ancient maps, on no better authority than the legend of the Irish St. Brandon or Brandon, whose story is so childishly fabulous as to be unworthy of any notice. He adds, that hardly any one place is laid down in its true situation. M. Otto thinks that Dr. Robertson furnishes, in his own history, means of refuting his objections against the truth of Behem's history. This learned historian allows, that Behem was very intimate with Columbus, that he was the greatest geographer of his time, and that he had been the disciple of the celebrated John Muller or Regiomontanus; that he had discovered, in 1483, the kingdom of Congo on the coast of Africa; that he constructed a globe, used by Magellan; that he drew a map at Nuremberg, containing the particulars of his discoveries; and that he placed in this chart land, which is found to be in the latitude of Guinea. Whil stalking Roberton affirms, without any proof, that this land was but a fabulous island, we may suppose, says M. Otto, upon the firm foundation, that the chevalier Behem, engaged in an expedition to the kingdom of Congo, was driven by the winds to Fernambuco, and from thence by the currents, very common in these latitudes, towards the coast of Guinea; and that he took for an island the first land which he discovered. The course which Christopher Columbus afterwards steered, makes this supposition still more probable; for if he knew only of the coast of Brazil, which they believe to have been discovered by Behem, he would have laid his course rather to the south-west. The expedition took place in 1483; it is then possible that, at his returning, Behem proposed a voyage to the coasts of Brazil and Patagonia, and that he requested the assent of his sovereign, which has been already mentioned. "It is certain," says M. Otto, "that we cannot have too much deference for the opinion of so eminent a writer as Robertson, but this learned man not having it in his power to consult the German pieces in the original, which we have quoted, we may be allowed to form a different opinion, without being too premeditative." For a farther discussion of this subject, see M. Otto's Memoir on the discovery of America, in the Transactions of the American Society at Philadelphia, vol. i. p. 203, &c. Robertson's Hist. of America, vol. i. p. 371, &c.

**BEHEMÉ, or RAMSEY, SAND, in Geography.** See Ramsey.

**BEHEMOTH,** in Zoology, a huge animal mentioned in Scripture, concerning which interpreters are much divided. The strength of this creature, his manner of life, and some other particulars, we find admirably portrayed in the forty-first chapter of the book of Job, and from that description some have thought he could apply only to the elephant, but it certainly more fully agrees with the hippopotamus, or river horse; and this is now pretty generally believed to be the animal in question. Bochart, Franzius, and others, who have endeavoured to ascertain all the animals mentioned in the Old Testament, entertain this opinion. See Hippopotamus and Mammoth.

**BEHEM,** in Botany. See Centaurea and Cucubalus.

**BEHERUS,** in Geography, a town of Ahí, in the Arabian Irak, 20 miles N.N.E. of Bagdad.

**BEHIRE,** in Geography, a lake of Lower Egypt, 7 leagues in compass, near Aboukir. This is also the name of a district called Bahira, which fec.

**BEHIU,** a town of Egypt, near the Nile, 17 miles S. of Abu Gargé.

**BEKER,** of BAKOR, a district of India, in the southern part of the country of Moultan, confirmed Chiefly to the south side of the Indus. This is also the name of a town, which is the capital of the country to which it gives name, about 215 geographical miles distant from Moulta to the south, and supposes in the Ayin Abarah to be the ancient Manfalih. N. lat. 27° 12'; E. long. 70° 12'.
BEHULIA, a town of Syria, 40 miles south west of Aleppo.

Behmen, or Behmen, Jacob, in Biography, commonly called by his admirers, the "German Theophilius," was born of poor parents at a village near Gorlitz, in Upper Lusatia, in 1575. Having been taught to read and write, at the age of 10 years, he was apprenticed to a shoemaker, or tailor, and in 1594 became a master and was married. Although he never entirely forsook his occupation, his eccentric genius from carried him "ultra crepidam," beyond his left. Engaging in those theological controversies, which were spreading in his time through Germany, among the lower classes of the people, he was much perplexed concerning many articles of faith, and prayed earnestly for divine illumination. In this state of mind he fell into a trance or ecstasy in 1600, which lasted for seven days, and afforded him an intuitive vision of God. Soon afterwards he had a second ecstasy, in which he found himself surrounded on a sudden with celestial irradiations, his spirit being carried to the immort world of nature, and enabled to penetrate through the external forms, lineaments, and colours of bodies, into the recesses of their effences. In a third vision of the same kind, other more sublime mysteries were revealed to him, concerning the origin of nature, and the formation of all things, and even concerning divine principles and intelligent natures. These wonderful communications he committed to writing in 1612; and published a book, entitled "Aurora," the principles and style of which are so mystic and obscure, that it is not easy to understand or explain them. Indeed the author himself declares that the mysteries of this book are incomprehensible to flesh and blood, and that though the words be read, their meaning will lie concealed, till the reader has by prayer obtained illumination from that heavenly spirit, which is in God, and in all nature, and from which all things proceed. Gregorius Richter, a clergyman of Gorlitz, having seen this work, reproved the author from the pulpit, and procured an order from the senate of the city for suppressing it; and Behmen was required to discontinue his attempts for enlightening the world by his writings. Behmen acquiesced, and refrained from writing for 7 years. A copy of the work, however, found its way to the press at Amsterdam, in 1619; and in the same year he wrote another book on the three principles, to which in the course of a few years he added several others. In 1624, he travelled to Dresden, where he was examined by a body of divines, and dismissed without censure. He died in the same year, after having received the sacrament from the hands of Elias Dietrich, and was honourably interred at Gorlitz. His other works are "Of the Three-fold Life of Man;" "Answer to the Forty Questions of the Soul;" "Of the Incarnation of Christ, his Sufferings, Death, and Resurrection;" "A Book on the Six Points;" "On Celestial and Terrestrial Mysteries;" "De Scriptura Sacra;" "On the Four Complexions;" "On True Repentance;" "On True Reformation;" "On the Second Birth;" "Myriarchium Magnum;" "On the First Book of Moses;" "On Spiritual Life," &c. These treatises appeared separately, and were afterwards collected and printed together. The whole edition is said to be that in 12mo. published in German, at Amsterdam, in 1682. An English edition of his works was given by Mr. William Law, in 2 vols. 4to.

In Jacob Behmen, a warm imagination, united with a gloomy temper, produced that kind of enthusiasm, which in its paroxysms diffused the natural faculties of perception and understanding, and produced a general agitation of the nervous system, during which the mind is filled with wild and wonderful conceptions, which pass for visions and revelations. Every page of his works, and even the hieroglyphic figures prefixed to his works, manifest a disordered imagination, and it is in vain to attempt to derive his "Theophphilia," from any other source; unless we incline to admit his own account, in which he boasts that he was neither indebted to human learning, nor was to be ranked among ordinary philosophers. He says that he wrote "not from an external view of nature, but from the dictates of the spirit; and that what he delivered concerning the nature of things, and concerning the works and creatures of God, had been laid open before his mind by God himself." The conceptions of this enthusiast, sufficiently obscure in themselves, are often rendered more obscure by being clothed under allegorical symbols, derived from the chemical art. As he frequently uses the terms, Paracelsus, he was probably conversant with his writings. He also appears to have acquired some knowledge of the doctrine of Robert Fludd, a native of England, and the Rosicrucians, which was propagated in Germany with great excitement during the 17th century. However he feems, upon the whole, to have followed no other guides than his own inventive genius and enthusiastic imagination; and every attempt which has been made by his followers to explain his system has been only raising a fresh ignis fatuus, to lead the bewildered traveller farther astray. Among other tenets, equally inexplicable, this mystic makes God the effence of effences, and he supposes a long series of spiritual natures, and even matter itself to have flowed from the fountain of the divine nature. Upon these subjects his language resembles that of the Jewish cabbala. The whole Divine Trinity, he says, spreading forth bodily forms, produces an image of itself, "as a God in miniature." If any one name the heavens, the earth, the stars, the elements, and whatever is beneath or above the heavens, he herein names the whole deity, who, by a power proceeding from himself, thus makes both his essence corporeal. There is a great darkness, he says, among the stars, where the devil holds his principality; all arts and sciences flow from the ferial spirit of this world; the seven liberal arts proceed from seven spirits of nature; and all human things are composed of the four first properties, bitter, four, heat, and pain. The divine grace, says this chimerical writer, operates by the same rules, and follows the same methods that the divine Providence observes in the natural world; and the minds of men are purged from their vices and corruptions in the same way that metals are purged from their dross; and this maxim was the principle of his fire-theology. But it is needless to give any farther account of a system which exhibits a motley mixture of chemical terms, erudite visions, and mystic jargon. The elements of Behmen's theology may be collected from his "Aurora," and his treatise "on three principles."

Some have bestowed high praise on this enthusiastic, on account of the wisdom which they pretend is contained in his writings, and also of his piety, integrity, and sincere love of truth and virtue. Others have accused him of the most dangerous errors, and have written volumes in opposition to his doctrines. Amongst the most eminent of his followers and admirers, we may reckon John Lewis, Giftethiel, John Angelus, Wendenhagen, Abraham Franckenberg, who wrote his life, Theodore Tincheth, a Silesian nobleman, Paul Felgenhaver, Quirinus Kuhlman, who was burnt at Moscow in 1664, John Jacob Zimmerman, and our visionary countryman William Law, author of "Christian Perfection." Among Behmen's numerous followers, no one rendered himself more conspicuous than John Pordage, a physician and naturalist, and member of the "Philadelphian Society," who pretended to divine revelation, and declared that he was thus convinced of the truth of Behmen's doctrines. He published a book entitled "Divine and True Metaphysics," with other similar works in favour of Behmen's opinions, which being
BEHUT, called also BUTH, ITHYM, or CHELM, in Geography, a river of Hindostan, is the westernmost of the five rivers that water the Punjab; and its general course is east, and nearly parallel to that of the Attock, but it is of less bulk. This is the famous Hydaspes of Alexander, on the banks of which he was opposed by Porus, a powerful monarch of the country, at the head of a numerous army. By the Ayin Acbar, it is said to be anciently called Belduta. The Behut issues from the springs of Wair, or Wair Naig, in the south-east part of Cashmere, and after a north-west course through that valley, enters the mountains at Bachmoisch. During this short course it receives abundance of rivulets and streams from some large lakes, and becomes navigable at a few miles below its remotest spring. After entering the mountains it pursues the direction of the Panjub by a very crooked course, being pent up in a deep winding valley, whilst escaping from the wide base of the Cashmere mountains and falling with force among the violence that even the stoutest elephant cannot prevent his footing in it. It emerges from the mountains in the district of Puckhol, and is afterwards joined by two small but celebrated rivers named Kikangonga and Nainook. After this it traverses the territory of the Ghickers, still holding its course through a hilly country, until it crosses the upper or great road leading from Lahore to Attock, where the hilly tract is confined to the western bank. Hereford, not long since, a city of the name of Ithym, which communicated its name to the river, during the remaining part of its course; and hence it is as commonly named Ithym as Behut. From Ithym it pursues its course along the eastern borders of the Joud mountains, and unites with the Chunaub at about 50 geographical miles above Moutan; losing its name in that of the Chunaub, as heretofore it lost its name of Hydaspes in that of Aceines, the ancient name of the Chunaub. The interval between the Behut and the Indus, in the widest part, is about 24 geographical miles. Pliny allows only 120 Roman miles between the Indus and the Hydaspes. Rennell's Mem. p. 69. Robertson's India, p. 18.

BELA, FAX JULIA, an ancient city of Portugal, in the province of Alentejo, on a lake of the same name. It is mentioned by Pliny, Pomponius, and Antoninus. Several Roman coins and inscriptions have been found near this place. Its situation is on a gentle hill in a fertile country rich in corn, and it is surrounded with walls and gates; and it is the
BEI
fee of a bishop, a corregidor, and a governor. It was taken from the Moors in 1162. N. lat. 57° 58'. W. long. 7° 20'.
BEJA, a large extent of country in Abyssinia, lying between the northern tropic and the mountains of Abyssinia, reaching from Mafaih along the coast of the Red Sea to Sumatra, when burning wellward, and running in that direction, with the Nile on the south, the tropic on the north, to the deserts of Selinga, and the confines of Libya on the west. See ABBYSINIA.
BEJA of Tunis. See BAY-JAH.
BEJAD, a village of Egypt, opposite to Benifonef, partly inhabited by Copts.
BEJEPOUR, or VERSFLOUS, a considerable city of Hindoostan, and once the capital of a large kingdom of the same name. It is now in the hands of the Poonah Maharattas; distant 234 miles from Bombay, from Calcutta by the Circars, 1183, and by Aurungabad 1216, from Delhi 916, from Hyderabad 269, from Madras 534, from Poona 136, from Serimgapatam 405, from Benares 876, and from Agra 825 miles. N. lat. 17° 28'. E. long. 75° 27'.
BEJAR, a small town of Spain in the province of Eilemadura, seated in the midst of a pleasant valley between high mountains, whose tops are continually covered with snow. It is famous for its baths, and in its vicinity is a lake, which is said to prejudice bad weather by an unual affection. It was raised into a duchy in 1448.
Beja de Melena, or Biejer, a town of Spain, in Andalufia, near the straits of Gibraltar, 8 leagues south of Cadiz.
Species, 1. B. asiana. Mutis Amer. i. t. 7. "Leaves lanceolate, flowers in racemes." A throb twelve feet high, with roundish spreading branches. A native of Mexico. Found in New Granada by Mutis. 2. B. refnofa. Mutis Amer. i. t. 8. "Leaves ovate, flowers heaped." A tree with proliferous branches, and an irregular, tender, subpinnate bark; corolla purple, very vunous or vifcid. Found in New Granada by Mutis. Thence have a peculiar bitter flavour, and are allied to the rhododendron. The name was erroneously made "Debardi" by Linneas.
BEJENDELSTELLES, in Afroamer, a name given by some afoinnerous to the principal fixed stars in each constellation.
The appellation is more particularly given to the stars of the first magnitude, otherwise called the hearts, cor de, of the several constellations, though some would distinguish between cor de, and betzine/fe, reftaining the former to flars only of the first magnitude, and extending the latter to several of the second, or even third.
Hermes has a treatise express De Stellaris Bejendelis, published by Juenius, in his Speculum Astralographium, and also in his commentary upon Jo. de Sacrobofo's book De Sphera.
BEICHLINGEN, in Geography, a town of Germany, in the circle of Upper Saxony, and country of Thuringia, 6 miles S. W. of Wicke. N. lat. 51° 20'. E. long. 11° 50'.
BEILIA, a town of Italy, in Piedmont. N. lat. 45° 3'. E. long. 7° 45'.
BEILAM, a town of Syria, S. E. of Scanderon or Alexandretta. N. lat. 36° 26'. E. long. 36° 31'.
BEILNGRIES, a town of Germany, in the circle of Franconia, and bishopric of Aichthal, at the confluent of the Armmühl and the Souls, 16 miles north of Ingolfsadt.
BEILSTEIN, a small town and citadel of Germany, in the Rhinefth circle, and capital of a lordship to which it gives name, comprising about fifty villages, in the principality of Naiffau Dilleburg; 5 miles south of Dilleburg. The lordship belongs to the princely house of Naiffau-Orange Diez, which enjoys, in consequence of it, a fast and voice at the diets of the electoral Rhinefth circle. N. lat. 50° 31'. E. long. 8° 11. Alfo, a small town of Germany, in the duchy of Wurtemberg. In 1693, it was burnt by the French. Its district comprehends several villages.
BEILUL, a town of Abyssinia, situate on the Red Sea north of Affab. N. lat. 14'. E. long. 41° 58'.
BEINA, a river of Norway, in the government of Christiania, which runs into the lake of Sperdillon, and serves for exporting timber.
BEINAC, a town of France, in the department of Correze, and chief place of a canton, in the district of Drive, 8 miles south of Tule.
BEINASCHI, Giovanni Battista, in Biography, an historical painter, was born in Piedmont in 1634, and studied at Rome under Pietro del Po, and as some fay, was afterwards a disciple of Lanfranc. He died in 1688. Beinaschi was an admirable designer, of a lively invention, and not only expeditious but correct. As an acknowledgment of his merits, he received the honour of knighthood.
BEINASCO, in Geography, a town of Piedmont, 44 miles S.S.W. of Turin.
BEINDGHURA, a town of Hindoofan, in the district of Benapour, part of the territory of the Maharatts. N. lat. 15° 15'. E. long. 75° 11'.
BEING, in Metaphyfics, includes not only whatsoever actually is, but whatsoever can be. It is the firt and most obvious, the moft limp and natural conception that we can frame of any thing which we fee, hear, feel, or know. It is in fome fenfe comprehended in all our other concep-
gations to particular actions or abilities: but these considered as moral are only modal; such are law, duty, virtue, vice, sin, rightcounself, judgment, condemnation, reward, punishment. These distinctions however might, perhaps, be more properly referred to the separate classes of different ideas than different beings. Being is the subject of Ontology. See Ontology. See also Essence and Existence.

BEINHEIM, in Geography, a town of Germany, in the circle of Swabia, feated on the west side of the Rhine, and belonging to the marquisate of Baden; 6 leagues N. E. of Strasbourg.

BEINGKEMEN, a town of Lithuania, 12 miles north of Pillkainen.

BEIRA, a large and fertile province of Portugal, bounded on the north by the province of Entre Duero a Minho, from which it is separated by the river Duero or Douro, and by Trasos Montes; on the west by the ocean and part of Extremadura; on the south, by another part of that province and by the Tagus; and on the east by the Spanish Extremadura, and the kingdom of Leon. It is divided into Upper and Lower Beira; the former being the northern part, and lying on the sea-coast; the latter lying towards Spain and Extremadura. Its extent from east to west is generally computed at between 33 and 36 Portuguese miles; and from north to south about as many. It was erected into a principality by John V. in honour of his grandson, the elder son of the prince of Brasil. It produces wheat, rye, and millet; and, in several parts, excellent wine and oil in such abundance, that considerable quantities of each are exported. Beira comprehends eight Jurisdictions, and its principal cities and towns are Coimbra, Lamegmo, Guarda, Vifeu, Miranda do Corvo, Tentugal, Aveiro, Ovar, Pinhel, Almeida, Francoa, Meda, Castello Branco, Penamacor, and Covilha; the four first are episcopal cities. The militia of this province consists of eight regiments, each regiment including about 1000 men.

BEIRAGUR, a town of Hindostan, on the well of Bead, and near the Mahanuddy river, noted in the Ayin Achara, as having a diamond mine in its neighbourhood.

BEIRAM. See Ba'irah.

BEIRUT. See BAIROUT and BERYTUS.

BEISCH, Joachim Francis, in Biography, a painter of landscapes and battles, was born at Ravenburg, in Swabia, in 1665; and having received the first rudiments of the art of painting from his father, who employed himself in this way for his amusement, he became a good artist by the force of his own genius and by assiduous practice. He was engaged at the court of Munich, and painted the battles fought in Hungary by the elector Maximilian Emanuel. During the absence of the emperor on some of his expeditions, Beisch visited Italy, and there, with a view to his further improvement, funded and copied the famous models to which he had access. Before his journey to Italy, his manner was true, but too dark; his second had more clearness and more truth; and his last was more clear, but more weak. The scenes of his landscapes are agreeably picturesque; his touch is light, tender, and full of spirit; and his style of composition frequently resembled that of Gaspar Poussin, or Salvator Rosa. He died in 1748. Pilkington.

BEISHHEHIA, or BEISHEHRI, in Geography, a town of Asian Turkey, in Caramania, situated near a lake. N. lat. 37° 43'; E. long. 32° 1' 43".

BEISSKER, in Ichthyology. See BEYSSKER, or BEYSSKER, and COBIS FOSSILIS. Linn.

BEISSONS, in Geography, a place of Africa, in the kingdom of Tunis, situated between Taberseke and Dugga, at which there are found some antique remains and inscriptions.

BEISTEN, a town of Prussia, in the province of Nottoggen, 26 miles south of Königsberg.

BET AFUFAARA, a town of Arabia, 24 miles N. E. of Wadej.

BET el Adham, a town of Arabia, 24 miles S. W. of Sanaa.

BET Elham, a town of Syria, south of Antakia. N. lat. 36° 5'; E. long. 35° 32'.

BEIT el Fakih, a city of Arabia, in the country of Yemen, situated on a plain, which though far from being naturally fertile, is indistinctly cultivated. The houses, many of which are of stone, are separated from one another; and the city has a citadel, which is thought of the utmost importance in a country where armies are defticate of artillery. The town is much molested by a species of ants, called by the Arabs, "Ard." Be'il el Fakih is not very ancient: though it has existed for some centuries. It owes its origin to a faint, called "Achmed iba Musa" from whom it has derived its name; Be'il el Fakih denoting the "house or dwelling of the sage." Near the city is anlown the tomb of the faint, upon a sandy hill, where a fine mosque has been erected, and where several devout perfons have built cottages round the tomb. When the harbour of Ghalefika was choked up, the inhabitants of that city, for the convenience of trade, removed their effects to the vicinity of this tomb, and settled about it. When it became a considerable city, the lord of the territory erected a citadel for its defence, in the place where water had been found. This city is very favourably situated for trade; being only half a day's journey from the hills in which coffee grows, and but a few days' journey from the harbours of Lobia, Hodeida, and Mocha, from which this commodity is exported. This trade brings hither merchants from Egypt, Syria, Barbary, Persia, Habbebech, India, and often from Europe. Be'il el Fakih is the residence of a Dola, whose jurisdiction extends over a large district. Niebuhr mentions a singular instance, which occurred at this place, and which strikingly indicates the coolness of temper and firmness of mind, that distinguished the Arab character. The southern end of a house caught fire; and as the wind blew strongly from the south, a great part of the city was soon burnt down. The inhabitants, however, retained their usual tranquillity. No cries nor complaints were heard in the streets; and when the people were addressed with expressions of condolence, upon their misfortune, they calmly replied, "It is the will of God." N. lat. 14° 31'; E. long. 43° 12'. Niebuhr's Trav. vol. i. p. 311.

BEIT el Kadi, a town of Arabia, in the country of Yemen, 34 miles north of Chamir.

BEIT el NAU, a town of Arabia, in Yemen, 24 miles south-east of Sanaa.

BEIT Ebn Sufan, a town of Arabia in Yemen, 28 miles S.S.E. of Saada.

BEIT EBN MERI, a town of Arabia, in Yemen, 38 miles N. of Chamir.

BEIT EBN NAFT, a town of Arabia, in Yemen, 34 miles N. of Chamir.

BEIT RODHIE, a town of Arabia, in Yemen, 24 miles S.E. of Sanaa.

BEIT II TABA, a town of Arabia, in Yemen, 28 miles S. of Saada.

BEIT EBN SHOUAR, a town of Arabia, in Yemen, 28 miles E. of Abu-Arishch.

BEIT EI WEIL, a town of Arabia, in Yemen, 3 miles N. of Denn.

BETH, a town of Scotland, in the district of Cunningham, and county of Ayr. It is seated on a small eminence, and the streets pretty regularly laid out. A linen manufactory
factory gives employment to many of its inhabitants, and others are occupied in making flax-lace and cotton. Some considerable manufacturers reside in the town, and though it is said to have conformed only a few inhabitants at the commencement of the last century, yet the population now amounts to about 800. The parish, extending about five miles in length, by four in breadth, consists principally of arable land; but some farms, with others at Dunlop, are appropriated to the dairy system, and have long been famous for a particular chees called the Dunlop cheese. Within the boundary of the parish is a small loch, containing abundance of fish, and near it is plenty of peat moor. Coal is found in many places; freestone is abundant, and the limestone quarries are almost inexhaustible. In the latter sub- stance are frequently found various stratifications of shells, and other marine exuviae; also many other fossil productions of woods, mosses, &c. The population of the parish and town in 1792 was 3972. Sinclair's Statistical Account of Scotland.

BEITHAIR, Bitha, in Biography, a learned Arabian botanist, called Aphon, the botanist, from his cell in the science of plants, was born in Spain; and after visiting Africa, travelled into the Levant, Asia, and even as far as the Indies to improve his knowledge. After his return, he was patronised by Saladin at Cairo, and died in 1248. He wrote "A General History of Plants, or of Plants, arranged in alphabetical order," in which he gives the Greek, Arabic, and vernacular names, with the descriptions of each, and particularly, in a more detailed manner, those not described by Dioscorides and Pliny. Beithair's work is extant in the Pariouan, Eclesial, and other libraries. Heritage's Hill and Biog. Sketches, &c. vol. 1. p. 19.

BEITSTADT, in Geography, a lake in the northern part of Norway.

BEIUCO, in Botany. See Hippocrates.

BEJvara, called also Hofscarop, in Geography, a town of Hindustan, in the country of Lahiore, about 3 journeys or 36 coffee from Sirhind, 16 coffee N.E. of Jallindhar, and about 25 geographical miles north of Rahooon, and about 30 miles from Harapour.

BEIUA, or Beziah, a Hebrew word, signifying an egg; in Jewish Antiquity, a certain measure in use among the ancients; they say that the beiza contains the fifth part of a logg.

The beiza is also a sort of gold coin common among the Persians; it weighs forty drachmas, and from this word, not from the city of Byzantium, the bezaat was formed. A bezaat is worth two dinars, and every dinar twenty or five and twenty drachmas.

BEK, David, in Biography. See Bek.

BEKKA, in Geography, a valley of Syria, anciently called Ccele-Syria, or the hollow Syria, separates the chain of mountains denominated by the ancients Anti-Libanus, from the Libanus of the Druses and Maronites, and being the depositary of the water of the mountains that enclose it, is rendered one of the most fertile districts of all Syria; but the heat of the sun, the rays of which are concentrated by the mountains, is in summer not inferior to that of Egypt. The air, however, which is perpetually refreshed by the north wind and by the agitation of the waters, is not unhealthy. Before the earthquake of 1755, this whole country was covered with villages and plantations of the Motoush, but the destruction occasioned by that terrible calamity, and the subsequent wars with the Turks, have occasioned a general depopulation. In this vale is situated the famous Borko.

BEKAV, or Bekawa, a small town of Poland, in the patinate of Lublin.

BEKES, a town of Upper Hungary, on the river Koros, which gives name to the Gepenfchaft.

BEKI, Beka, or Bex, a river of Hungary, which runs into the Temez, near Temesvar.

BEKIA, Bekova, or Boqito, a small British island of the West Indies, about 12 leagues in compass, and containing 3,700 acres, being the leaf of the Grenadilles, called by the French, "Little Martinico;" 35 miles N.E. of Grenada, and 65 leagues from Barbadoes. It has a safe harbour, called "Admiralty-bay," but no fresh water; and it is principally visited by the inhabitants of Grenada and St. Vincent's for the purpose of catching turtle. The soil produces wild cotton, and plenty of water-melons. This island is dependent on the government of St. Vincent.

BEKIER, a name given by marines to Aboukir, which see.

BEKING, a town of France, in the department of the Mofelle, and chief place of a canton, in the district of Sar-Louis, on the Sar, 5 miles N.W. of Sar-Louis.

BEKKER, or Becker, Baltasar, in Biography, a famous Dutch divine of the 17th century, was born in 1634, at Warthuilen, a village in the province of Groningen, and pursued his studies first in the university of Groningen, and afterwards at Franker, where he became rector of the Latin school. In 1665, he took his degree of doctor of divinity at Franker, and in the following year he was chosen one of the ministers of that city. In 1670, he published a catechism, intended for persons of mature age, in which he maintained some opinions concerning the right of Christian congregations to chuse their own ministers, and concerning the antiquity and usefulness of bishops, archbishops, &c. and in which he introduced some suggestions that implied his doubt of the eternity of hell tortures, as inconsistent with the divine goodnes, which gave offence to several divines, and which incurred a prosecution before the ecclesiastical authorities. This catechism, however, was approved and commended by several learned professors; and it appears that the author had not, at the time of its publication, adopted those sentiments which involved him in future difficulties. In 1679, he was elected minister at Amsterdam; and in 1684, he published his "Inquiry concerning Comets," in which he concurred with Mr. Boyle in maintaining that they are not prelages of any evil. By this work, as well as his "Exposition upon Daniel," he gained great reputation; but having attached himself from an early period of his life to the Cartonian philosophy, he adopted Descartes's definition of spirit, and he was hence led to deny all those operations of the devil and other infernal agents upon mankind, which are related in the scriptures. His argument, as it is briefly stated by Dr. Machine, the translator of Moliere's Historie, is as follows: "The effence of mind is thought, and the effence of matter is extension. Now, since there is no fort of conformity or connexion between a thought and extension, mind cannot act upon matter, unless these two substances be united as soul and body are in man; and therefore no separate spirits, either good or evil, can act upon mankind. Such acting is miraculou; and miracles can be performed by God alone. It follows of conquence, that the scripture accounts of the actions and operations of good and evil spirits must be understood in an allegorical fenee." To this argument it is replied, that by proving too much, it proves nothing at all: for if the want of a connexion or conformity between thought and extension renders mind incapable of acting upon matter, it is hard to see how their union should remove this incapacity, since the want of conformity and connexion remains notwithstanding this union. Besides, according to this reasoning, the mind being cont-
for this would imply, that the whole course of nature was a series of miracles, or in other words, that there are no miracles at all. The author suggested doubts concerning the agency of the devil in several of his sermons; and he alleged, that several were ascribed to the devil, in which this evil spirit had no concern. He was at length, viz. in 1661, persuaded to publish his system at large, in an elaborate work, entitled, "The World Bewitched." This work is divided into four books. The first contains an account of the opinions of the ancient and modern heathens concerning gods and demons, or spirits. In the second book the author examines all the passages of the Holy Scripture, which mention either angels or the devil, and endeavours to make them agree with his opinion, that the devil has not the least power in this world, and to show that those passages, which ascribe several actions to good as well as bad spirits, or angels, must be explained in an allegorical manner. Accordingly, he denies that our first parents were tempted by the devil; alleging that this temptation is ascribed to the devil, only because it does not agree with the good news of God, though Moses does not mention the devil, and that the punishment mentioned by Moses does not suit the devil, but only the serpent. He also urges several objections against the literal sense of our Saviour's temptation; and he maintains that those personified with evil spirits, which our Lord calls out, were merely fick or lunatic perons whom he cured, and in whose sickness the devil had no concern. (See Diss. cap. 2.) Bekker's work, though his system was not new, occasioned great commotion not only in all the United Provinces, but in various parts of Germany. The author, persisting in his opinions, was publicly deposed from his pastoral charge in 1692; but the magistrates of Amsterdam continued his salary till his death, which happened in 1698. Bekker not only retained his opinions after his deposition, but strenuously defended them against a multitude of adversaries as long as he lived. He was a man of a warm imagination, of an active mind, and of a firm resolution. His character was irreproachable; and he avowed to the last his full conviction of the truth of the Christian religion. In his defences he exhibited a moderation which he did not experience from his antagonists. A fatalical medal was struck at his deposition, which exhibited the devil, in the habit of a minister, riding upon an ass, and holding a banner in his hand, as a token of the victory which he had gained in the synods. His opinions found several advocates; and he became the head of a sect which was called after his name. Gen. Dict.

BEKKERANISM, or Bekkerianism, in Ecclesiastical History, the system or sentiments of Balth. Bekker, who denied that spirits can act or operate on bodies. See the preceding article.

BEL, Matthias, in Biography, a learned historian of Hungary, was born at Orlowa, in 1684; and after studying divinity at the university of Halle, he became first, viz. in 1708, rector of the evangelical school at Neufohl, and in 1714, rector of the school at Preßburg. In 1719, he was chosen preacher by the German evangelical congregation in that city, and died senior minister in 1739. His two most valuable works are his "Apparatus ad historiam Hungaricae," and his "Notitia Hungariae Nova." The latter work was held in such high estimation, that it procured for him from the emperor Charles VI. the appointment of imperial historiographer, and the honour of being admitted into the royal academy of sciences at Berlin, and also into that of Peterburgh. Pope Clement XII. also testified his approbation of it by conferring on the author his portrait and eight gold medals. The emperor, upon receiving the second vo-

lume of the work, raised him to the rank of nobility, but this circumstance Bel studiously concealed. Among his other works are "Prodomus Hungariae antiquae et recentius," Vol. 1, fol.; "Notitia Hungariae nova historiae geographicae," Vienna, 1735-1741, 4 vols. fol.; "Apparatus ad Historiam Hungaricae, lucum Collectio Miscellae Monumentorum, &c. dec. 1 & 2," Polon. 1735-46, fol. He also translated into the Bohemian language the Bible, and some other books.

BEL CHARLES ANDREW, son of the former, was born at Preßburg in 1717, and studied at Jena and Altdorf. In 1741, he became extraordinary professor of philosophy at Leipsig; and in 1756, he was appointed public professor of poetry, and librarian to the university, with the rank of counsellor of state. He died suddenly in 1782. Among his writings are "De vera origine et speo his Hominum, Aరα, Hungarorum, in Pantomima," Lpz. 1757, 4to. After the death of Menck, he was employed as editor of the Acta Eruditorum, and of the Leipic literary gazette, which he conducted from the year 1751 to 1781.

BEL JOHN JAMES, we born at Bourdeaux, in 1693, and having pursued his studies with great application in the college of the fathers of the oratory, and made distinguished acquirements in belles lettres, and also in metaphysics and morals; he was admitted counsellor of parliament in 1730. After several visits to Paris, he finally settled at Bourdeaux, and in 1737, he was chosen director of the academy, but the extent of his application to a variety of scientific and literary pursuits hastened his death in 1738. To the academy of Bourdeaux he left the house in which it holds its sittings, and his valuable library. Besides several professional works, M. Bel published "An Apology for Mr. Houdart de la Metter," 1724, 8vo. which is an ironical criticism on the works of that author, and particularly his tragedies; "An Examination of the tragedy of Romulus, by la Mette;" "A Dissertation on the Abbé Dubos's opinion concerning the preference to be given to the perceptions of taste above reasoning, in judging of works of genius;" "Letters containing Observations on Voltairie's tragedy of Mariamne;" all which are inserted, together with some other papers of M. Bel, in "Memoirs of Literature and History," collected by father des Moletz of the oratory. He was also the author of the "Neological Dictionary," augmented by the abbé des Fontaines, and intended to explicate the new words and affected phraseology of several modern writers. Nouv. Dict. Hist.

BEL, in Botany, the name of a plant, and also of its fruit, called by some the cucumis apparius, or caper-cucumber. Aviceena has given the moll copious account of this plant, which is imperfectly described by others; and he says, that the fruit, which resembled a caper, was used in medicine, and resembled ginger in the fiery heat of its taste.

BEL, St. in Geography, a town of France, in the department of the Rhone and Loire, on the Brenven; 3 leagues west of Lyons.

BEL, in Mythology. See Belus.

BEL and the DRAGON, History of, in Biblical History, an apocryphal part of the book of Daniel, which, although it was annexed to this book, and formed the 14th and last chapter of it, was uniformly rejected by the Jews, and made no part of their canon of scripture. It occurs neither in the Hebrew or Chaldean text, nor in the Greek version of the Septuagint, but was taken out of the Greek version of Theodotion. Africanus, Eusebius, and Photinus, have rejected the narration, not only as uncannatical, but also as fabulous; and Jerome also concurs in their opinion. Origen maintains the truth of the history contained in the 13th (see Susanna), and 14th chapters, against Africanus, but does not affect it to be canonical. This history is also cited, as part of
of the prophecy of Daniel, by Irenæus, Clement Alex., Tertullian, Origen, Cyprian, Didymus, Hilary, Paul, Gregory Nazianzen, Ambrose, and Augustine. Sulpius Severus, and the author of the Synopsis of St. Athanasius, also mention these histories as part of the sacred text; and Rufinus upbraids Jerome for having cut off from Daniel the long of the three children, the history of Susanna, and that of Bel and the Dragon. Against the truth of this latter history, allowing it to be apocryphal, it has been alleged, that the ancient title of the LXX, attributed it to Habakkuk, and that Daniel mentioned in this history was a priest; and that therefore he must have been another Daniel to whom this history belongs. To this argument it has been replied, that the character of priest is not given to Daniel in the version of Theodotion, and that the version attributed falsely to the LXX is not exact. Against the history of the Dragon it has been urged that Habakkuk, who lived in the time of Manasseh, was dead when it is supposed he wrote these things, and was called up by the Spirit to carry provision to the prophet Daniel. To this objection it is answered, that there were two Habakkukse one, who was the prophet in the time of Manasseh, and of the tribe of Simeon; and another, mentioned in this passage of Daniel, of the tribe of Levi. Against this history it has also been objected, that it relates the confinement of Daniel in the lion's den to have lasted six days, whereas in chap. vi. 22 it is said, that he had been confined only one night. The advocates of the history reply, that he was twice cast into the lion's den: under Darius, because he proved to God against the king's commandment; and under Cyrus, on account of the dragon. Dunpin's Canon. b. i. c. 3. § 21. See Apocrypha, and Daniel.

BELA, in Geography, a pretty large town of Upper Hungary, situated in a delightful plain, not far from the river Upper Popper, but much reduced by frequent fires.

BELA, or BEILA, a town of Africa, in the kingdom of Senaara, near the river Khad, or Khadd, between Dender and Teawa, in the route from Senaara to Gondara.

BELA-BENYA, i.e. "the white mine," Dith, formerly Fejor-Bensya, a mean town of Lower Hungary, in the Schemnitz district, and gencaschant of Hont, whose mines being exhausted, the inhabitants applied themselves to tillage.

BELABRE, a town of France, in the department of the Indre, and chief place of a canton, in the district of Le Blanc en Berry, 2 leagues south-east of Le Blanc, and 38 south-west of Chateauroux. N. lat. 46° 53'. E. long. 1° 3'.

BELACAN, a town of Spain, in the province of Andalusia, on the frontiers of Extremadura, 9 leagues from Cordova.

BELAN. See Below.

BELANCE ISLAND, in Geography, one of the small islets or rocks which lie between the island of Uthman and St. Matthew's point, at the entrance into the Brith harbour.

BELASAMA, formed from belasama, the mouth of a river, in Ancient Geography, the same given by Ptolemy to the bay near Liverpool, at the mouth of the river Mersey.

BELASI, in Geography, a town of Germany in the Tyrol, 8 miles west of Bolzano.

BELATUCARDUS, or Belatucardus, the name of an ancient British idol, recorded in several old inscriptions, and supposed by Selden (de Ditis Cyprus) and Vossius (de Orig. & Prog. Idol. i. 2. c. 17.) to be the same with Belenus, which see. Bishop Lyttleton and professsor Ward supposed him to have been a local deity (See Archaeologia, vol. i. p. 328.) with a special reference to Apollo, who was worshipped, as they observe, by the Druids. Mr. Pegge, (Id. vol. iv. art. 12.) contends, that it is highly absurd to look out for any other deity in Belatucardus, but the god Mars; This ingenious antiquary acknowledges, that he was a local deity, peculiar in this island to the Drigantes, but at the same time affirms, that he was equivalent to Mars, and that he was invested with the same powers as that god, and that he had not the least concern with Apollo, or any relation to him. The opinion of Mr. Pegge is approved and confirmed by Mr. Gough. (Id. vol. x.) We may add, that it is rendered unquestionable by the inscription recorded by Muratori (Inscript. Thef. 43. 1.) which is as follows: "Deo Marti, Belatucardus."

BELAY, on board of Ship, signifies the same as fasten. Thus they say, fasten the deck or tack, that is, fasten it to the keel, by winding it several times round a left, &c.

BELAYE, in Geography, a town of France, in the department of the Lot, and chief place of a canton, in the district of Lanzette, one league south-east of Puy l'Eveque.

BELAYING-CLEATS, in Nautical Language, are pieces of wood, which have two arms, or horns, and are nailed through the middle to the masts, or elsewhere, for the purpose of belaying ropes to them. BELAYING-PINS, are turned wooden pins, with a shoulder near the middle; the small end is driven through the rough tree rails, or racks of thin plank made on purpose. Their use is for belaying ropes to them. Iron belaying pins are round, taper from the middle to each end, and are driven in the rails, or racks, to belay the ropes to, by taking several crofs turns about them.

BELBA, in Geography, a town of Egypt, on the coast of the Mediterranean, 15 miles east of Tichf.

BELBEIS, a town of Egypt, about 35 miles north-east of Cairo, and 45 north-west of Suez. N. lat. 30° 22'. E. long. 31° 55'.

BELBEK, a river of the Crimes, which falls into the Euxine.

BELBINA, in Ancient Geography, an island of Greece, in the Saronic gulf, near the promontory of Saimum, and opposite to the Scytlanean promontory; mentioned by Pliny, Strabo, &c. Alio, a town of the Peloponnesus, in Locris, near which was a temple of Minerva.

BELBO, in Geography, a river of Italy, which rifs about 2 miles east of Cesia, and runs into the Tanaro, six miles S.W. of Alexandria.

BELDUCHE, a town of Germany, in the circle of Upper Saxony, in Pomarama, one mile N.E. of New Treptow.

BELDUCHE, and Zemunde, in Mythology, were regarded among the Vandals as the good and evil genius. The former rified the white god, and the latter the black god. They were objects of divine honours.

BELCA, in Ancient Geography, a place of ancient Gaul, between Brivodium and Genalum, where was an amphitheatre.

BELCAIRE, in Geography, a town of France, in the department of the Aude, and chief place of a canton, in the district of Quillan, 37 leagues S.W. of Quillan.

BELCANY, a town of Asia, placed by Ptolemy in the greater Armenia.

BELCASTRO, a small episcopal city of Naples, in the province of Cabilria Ultra; 10 miles N. E. of St. Severina.

BELCHER, a township of America, in the county of Hampshie, and slate of Maraffhuetts, containing 1,685 inhabitants, who subsist chiefly by farming.

BELCHERS, a cluster of islands in Hudson's bay. N. lat. 56° 10'. W. long. 80° 33'.

BELCHIER, John, in Biography, a surgeon of eminence in London, was born at Kingdon on the Thames in 1706.
BEL

1706. After receiving a classical education at Eton, he became pupil to Mr. Chefelden, by whom he was much esteemed. In 1736, he was elected surgeon to Guy's hospital, and soon after fellow of the Royal Society. The following year, he went to the society the cale of a woman who died of a dropy of the ovarium, attended with some remarkable circumstances, and soon after, an account of the case of a man whose arm had been torn off at the shoulder, by one of the ropes of a mill. The circumstance most deserving of attention in this case was, that only a small quantity of blood was lost by the accident, while Belcher very properly attributed to the great dilatation the arteries had sustained before the limb was separated from the body. The man recovered. His next, and last communication to the society, was the result of a series of experiments and observations on the effect produced on animals, by mixing madder with their food. After continuing this diet for a few days, on killing the animals the bones were found to be tinged with the madder, but on suffering some of them, that had been so fed, to live a few days longer, the colour induced by the madder became dilute and pale, and at length totally disappeared; a proof, it was observed, that the bones are well supplied with absorber, as well as with blood vessels. See Philosophical Transactions, Nos. 423, 442, and 449. Belcher died in 1785, in the 80th year of his age, having for several years previously retired from business, and was buried in the chapel of Guy's hospital, to which he had been a zealous friend and patron. Gen. Biog. Dict.

BELCHING. See Ructation.

BELCHITE, in Geography, a small town of Spain, in the country of Arragon, seated in a fruitful soil, on the river Almonaz; 8 leagues south from Saragossa. N. lat. 41° 10', W. long. 2° 30'.

BELCIANA, in Ancient Geography, a town of Asia, in Asia. Pluton.

BELDEK, in Geography, a town of Hungary, 15 miles south of Zatmor.

BELDIRAN, a town of Asiatic Turkey, in the province of Caramania, 28 miles south of Cogni.

BELBEJ, or BELEBEEF, a town of Russia, in the government of Ufa, on the rivulet falling into the Diena, 60 miles south-west of Ufa. N. lat. 54°. E. long. 14° 14'. This is also the name of one of the nine districts, comprehended by the province of Ufa.

BELEKIS, a town of Scelavonia, 10 miles north-west of Belgrade.

BELEM, a town of Portugal, in the province of Estremadura, or in the vicinity of Lisbon, on the north side of the Tagus, in which are a considerable monastery and a royal palace. In its magnificent church, which suddenly funk in 1756, many kings and princes of the blood have been interred. Below Belém is a square tower called “Torre de Belém,” fortified with cannon, which no vessel may pass till it has been visited. Near this tower, which is near a league west from the city of Lisbon, in N. lat. 38° 40'. W. long. 9° 40', are several batteries, and a small irregular fort, commonly called San Gião, built on a rocky point, and covering the entrance of the harbour, and opposite to it is another tower called “torre vella,” or old tower, strengthened by a few cannon and soldiers.

BELEM, a town of North America, in the country of New Navarre, 180 miles north-west of Cisnolan.

BELEM, BELLEM, or BELEM, a town and district of Germany, in the circle of Weilphalia, bishopric of Osnabruck, and prefecture of Iburg; 3 miles east of Osnabruck.

BELEM, or PARA, a sea-port town of South America, in the country of Brazil, seated at the north head of the river Guama, which falls into the river of the Amazons. See PARA.

BELEM CAPA, a high steep point, on the coast of Galicia, in Spain, about N.N.E. from Cape Pintillere, between which is the projecting point of cape de Toriame, bearing south-west four leagues from Belém. The principal rock of this rugged point, appearing like a black tower, is called the Monk, or Munich.

BELEMNITAE, in Natural History, a species of Nautilus, in the tebrze order of scorpions, with an uniform, smooth, conic, and acute shell, frequent among the fossils of Europe. See the next article.

The belemnite is a fossil, which has obtained its name from the Greek βλεμνή, an arrow, on account of its resemblance to an arrow-head. Its lengthened conical or spindle shaped figure suggested a likeness to the finger, hence the name dactylus. The ignorant superstitition of some of the ancients attributed the origin of this substance to the congealed urine of the Lynx, on account of its strong smell when pounded or scraped; by others it was supposed to be one of the materials of the thunderbolt, and it has derived names from both these circumstances.

The form of the belemnite is generally intermediate between a long cylinder and a very acute-angled cone; the apex is a plain rounded point; the base is somewhat concave; at a distance between the base and apex, varying in length from one-third to one-sixth of the whole, the diameter of this fossil begins to increase towards the base in a considerably greater ratio than it did from the apex: the most correct idea, therefore, of its figure, will be formed by imagining a truncated cone terminated by another much longer and more acute-angled, rounded off at the extremity instead of coming to a sharp point. It is by no means common, however, to find belemnites thus perfect, being for the most part broken off at one extremity, and not uniformly at both. Considerable variations are observed in the form of this fossil: it is sometimes expanded and somewhat flattened at the extremity, or is nearly cylindrical, or enlarged and rounded off at the apex, so as to resemble a club. In the flattened varieties a longitudinal furrow on each side is occasionally observed. The colour of the belemnite is generally brownish yellow, with a transparency reminding alabaster. It usually consists of calcareous spar, mingled however with animal matter; for when exposed to a red heat it gives out an odour like burnt horn: sometimes it occurs converted into flint, at other times is found filled with pyrites, or even, according to Volkman, (Sedla Subterr. § 155,) with galena.

If a longitudinal section is made of a perfect belemnite, it will appear to be composed, like a cow's horn, of a number of elongated conical lamellae inserted one into the other, covering a core or alveolus, also of a conical shape, but extending never more than a third of the length from the base towards the apex. A crooked fracture of this fissile beyond the alveolus exhibits a number of rays converging from the circumference towards the centre, and as many concentric circles as there are conical lamellae.

The alveolus of the belemnite is a conoidal body, divided transversely into cells by bony parietes resembling watch glasses; the centre of each of which, according to Platt, Rohinus, Sage, &c. is perforated to receive a tube or siphunculus, which pales from the apex to the base of the alveolus, and thus communicates with all the cells, in the same manner as is observable in the nautilus, the ammonite, and orthoceratite:
tite: it is remarkable, however, that Deluc (Journal de Physique, vol. lii. p. 363.) altogether denies the existence of this phenomenon. Every parties in the alveolus serves as the base of a conoidal lamina; the number of these last, therefore, is equal to that of the cells of the alveolus.

It often happens that the alveolus of the belemnite is found detached from the other part of the fossil, and in this state it has been considered as a peculiar species of orthoceratite; while the conoidal cafe, deprived of this characteristic part, has been supposed to be a mere orthocerite, or a petrified tooth of vegetable origin.

M. Deluc, denying the perforation of the alveolus, considers the belemnite as a bone belonging to an unknown animal analogous to the cephalopoda, or cuttle-fish, apparently, however, without much reason.

The belemnite has never been met with but in a fossil state; it occurs not unfrequently in marble, limestone, and chalk strata, together with other marine remains; and detached fragments are often found in the gravel beds that cover or adjoin these strata.

The finest English specimens have been procured from the chalk pits of Oxfordshire; the quarries of Mendon near Paris contain, many perfect and beautiful varieties; but the largest species come from the Margravate of Anspach in Prussia. Philos. Trans. for 1764. Journ. de Physique, vols. li. lii.

Schröter's Lithographica s.d. var. Verallkened, &c. vol. i.

BELENUS, or BELNUS, in Mythology, a name which the Gauls gave to the sun, which they also called Mitra; and as some suppose the name with the Latinizable, and the Delus of the Allies.

Belenus, latinized by the Roman authors, according to Toland, (ubi infra) from "Beal" or "Bealan," was understood by the Gauls and their colonies to denote the sun; and according to J. Capitolineus (Maximin. c. 22), and Jervisonian (1. 8. c. 5), he was the same deity with the Apollo of the Greeks and Romans. He was actually denominated Apollo in the inscriptions found at Aquileia, where he was honored with a peculiar worship, under the figure of a young man without beard, with rays about his head, and an open wide mouth for uttering oracles. Terrullian (Apolog. c. 23), informs us, that Belenus was the idol-deity of the Norici, and among the Illyrians, Vopiscus says (Aurelian apud int.) his forms and ornaments were the same with those of the Mitra of the Orientals. The sun, indeed, seems to have been the most ancient and universal object of idolatrous worship; inasmuch that perhaps there never was any nation of idolaters which did not pay some kind of homage to this glorious luminary. Accordingly, he was worshipped by the Gauls and ancient Britons with great devotion under the various appellations of Bel, Belminus, Apollo, Graunius, &c. names which in their language were expressive of the nature and properties of that visible fountain of light and heat. To this illustrious worship, those famous circle of stones, called cairns, or cerns, of which there are not a few still remaining, seem to have been chiefly dedicated; where the Druids kept the sacred fire, the symbol of this divinity, and from whence, as they were seated on eminences, they had a full view of the heavenly bodies. The first day of May was, in the Druidical rites of worship, a great annual festival in honour of Belenus, or the sun. On this day prodigious fires were kindled in all their sacred places, and on the tops of all their cairns, and many sacrifices were offered to that glorious luminary, which now began to shine upon them with great warmth and luirtre. Of this festival there are still some vellages remaining, both in Ireland and in the highlands of Scotland, where the first of May, is called "Beltain," i.e. the fire of Bel or Belminus.

BELF, B. E.

Two such fires, says Toland, were kindled near one another on May-eve in every village of the nation, as well throughout Gaul, as in Britain, Ireland, and the adjoining islands, between which fires the men and beasts to be sacrificed were to pass; from whence came the proverb "between Bel's two fires," meaning a person in a great strait, not knowing how to extricate himself. One of the fires was on the Cairn; the other on the ground. On the eve of the first day of November there were also such fires kindled, accompanied with sacrifices and feasting. All the people of the country on this eve extinguished their own fires entirely; and every mallet of a family was religiously obliged to take a portion of the conflagrated fire home, and to kindle the fire anew in his house, which for the ensuing year was to be prosperous. The Celtic nations also kindled other fires on Midsummer eve, which are still continued, says Toland, by the Roman catholics of Ireland, making them in all their grounds, and carrying flaming brands about their corn-fields. This is done likewise in France, and in some of the Scottish isles. These Midsummer fires and sacrifices were intended for obtaining a blessing on the fruits of the earth, now ready for gathering; as those of the first of May, that they might prosperously grow; and those of the last of October were a thanksgiving for finishing their harvest. But in all of them regard was had to the several degrees of increase and decrease in the heat of the sun. "Toland's Hill. Druids in his Works, vol. i. p. 69, &c. Henry's Hill. vol. i. p. 156, &c.

BELERIUM, (Diod. Sic. i. v. c. 22.) or BELERIUM, (Ptolem. iii. lii. c. 3.) called also by Ptolemy "Antikythera" in Ancient Geography, is the promontory formed by the most western point of Britain, now known by the name of "Land's End."

BELESTA, or BLESSTAT, in Geography, a town of France, in the department of the Aude, and chief place of a canton, in the district of Quillan, 10 miles west of Quillan.

BELETTE, in Zoology, a name under which Buffon describes the common weevil, mylabius affinis of Gmelin.

BELIEZ, in Geography, a town of South America, in Terra Firme, and province of New Grenada.—Also, a river of Spain, which runs into the Mediterranean, between Barcelona and Tarragona.

BELFAST, a considerable town of Ireland, in the county of Antrim, and province of Ulster, situate at the mouth of the river Lagan, which separates it from the county of Down. The town, except a small portion of it, is not elevated more than six feet above high water mark at spring tides. Belfast lough, or the bay of Carrickfergus, into which the Lagan flows, is a spacious inlet, a great part of which is left dry every tide, which is the cafe likewise with Strangford lough, another great inlet, the nearest extremity of which is distant about 8 miles S. E. Between Belfast and Lough Neagh, which is about 12 miles west of it, there is a chain of mountains, the highest of which, called Devins, is about 1580 feet high. The roots of these mountains extend to the neighbourhood of the town. Mr. Arthur Young found them to consist of very good loam to their summits, and complain of their being neglected. As tillage, however, is improving in that neighbourhood, it may be supposed that there is no longer cause for such complaint. There was formerly a castle at Belfast, which seems to have been a post of importance, as it was twice taken and destroyed by the Earl of Kildare, lord deputy, in 1503 and 1512. After the complete reduction of Ireland at the beginning of the 17th century, Belfast became the property of Sir Arthur Chichester, afterwards lord
lord-deputy, and baron of Belfast, who exerted himself in the
settlement of Ulster. Through his influence it was made a
borough, and sent two members to the Irish parliament; and
an English gentleman, who travelled through part of Ireland
in 1635, and whose manuscript journal is in the possession
of general Vallancey, mentions that lord Chicheleher had a flately
palace at Belfast, which was the glory and beauty of the
town, and which was his chief residence. Through the
influence of this nobleman, the custom-house was removed
from Carrickfergus to Belfast by the earl of Strafford in
1638, for which a compensation of 200l. was paid to the
corporation of Carrickfergus. In 1645, Belfast was taken
possession of by brigands, and I afterwards the celebrated general
Monk, for the parliament of England. So late as 1726,
when Boate's Natural History of Ireland was re-published
by Dr. Molyneux, it was a small place of little consequence.
But situated in the centre of a populous and industrious
country, it has since become one of the most interesting ob-
jects in Ireland to the political economist. The town is
well-built, mostly of brick, and the streets are broad and
straight. The bridge over the Lagan is 2760 feet long,
with 21 arches; it was built about the time of the revolu-
tion, at the joint expense of the counties of Antrim and
Down, and cost 12,000l. Eighteen of the arches are in
the former, and three in the latter county. With regard to size
it is the fifth, and with respect to commerce, is generally
reckoned the third town in Ireland, being next to Dublin
and Cork. Vessels of 200 tons half loaded used to come to
the quay, there being about ten feet water at spring tides;
but now the water at the quays is from nine to thirteen feet
deep according to the time of the moon, having been deepened
by the exertions of the ballast corporation. Vessels which
cannot come to the quays lie two miles and a half below the
town, where there is very good anchorage. The West India
trade was considerable before the late war, and has revived
since the restoration of peace. The trade in pork and butter
has increased very much of late years; and also the American
trade. The export of linen both to England and America
is very considerable. In 1775, the gross custom, according
to Mr. Young, amounted only to 64,800l. containing the ex-
cise upon tobacco and foreign spirits. In 1797, it amounted
to 87,016l. 6s. 2d. In the following year it decreased on
account of the disturbed state of the country, but it has since
gradually risen; and in the year ending 5th April 1802,
amounted to 246,800l. 9s. 4d. The excise of Belfast in 1796,
was only 969l. 17s. 2d.; but previous to the stoppage of the
distilleries it had been to 2,161l. 3s. 6d. exclusive of
Carrickfergus and Templepatrick, which walks are included in
the same district. The duty on licences in 1801, amounted
only to 430l. Though the increase, as in other places, must be
partly attributed to the increase of duties, yet the exten-
sion of trade must also have been considerable. The population
of Belfast was taken at different periods by a gentleman who
filled the office of high constable; but not officially. In
1782, the number of inhabitants appeared to be 13,105, and
in 1791, 18,320, exclusive of 1,208 in Balymacarret, the
suburbs on the Down side of the river Lagan. There were,
in 1791, 600 looms, of which 522 were employed in the
cotton manufacture, 129 in that of cambric and linen, 28
of sateen, and 16 of rockings. There are also manufactu-
res of glafs, sugar, and earthen ware. The public build-
ings are not many; the linen-hall is large and commodious, and
there is a good assembly-room over the Exchange. There is
a barrack which contains about 800 men. The church is a
handsome structure, but is too small for the parish. Other
places of worship are, four Presbyterian meeting-houses, one
Seeding and one Methodist meeting-house; and one Roman
Catholic chapel. The charitable institutions are, a poor-houze
and infirmary, which maintains and clothes 300 of various ages,
and is conducted on the same plan as the Dublin house of indus-
try; a fever-hospital, a day-school, a charity-school for boarding girls, a day-school for boys and girls, a Sun-
day-school, and a school of industry for the blind; none of them
very extensive, but sufficiently to feed such an industrious
industry. It is probable that the Hamburgh plan, decried by Mr.
Voght, from which such unspeakable benefit has been de-
rivered, would succeed better in Belfast than in any other town
of Ireland, and from the public spirit and active disposition
of the inhabitants, it would, without doubt, be well attended
to. In such a town as Belfast, many commercial institutions
might be expected; and we accordingly find a chamber of
commerce, a ballast office corporation, two insurance offices,
&c. There are also a library society, under the title of the
Belfast Society for Promoting Knowledge and a literary so-
ciety, lately established on a plan similar to that of other
societies for philosophical and literary purposes. An academy
for the education of the higher class in this town, was found-
aded by the inhabitants in 1786, and has been hitherto under
the care of a prebyterian minister, but the advantages of it
are not confined to any sect. Belfast is situated 80 miles
north of Dublin, and sends one member to the imperial
legislature. W. long. 5° 49' N. lat. 54° 43'. Variation

Young's Tour. Dr. Beaufort's Memoir, &c. &c.
BELFORT, a township and bay of America, in Hancock
county, and district of Maine, both situate in the Waldo Pa-
tent, at the mouth of Penobscot river, and on its western side,
38 miles N. E. by E. from Hallowell, and 246 N. E. from
Bolton. The town contains 245 inhabitants. The bay,
on the north-western part of which the town stands, runs
up into the land by three short arms. In the middle of it
lies Belfast island, which forms two channels lead-
ing to the mouth of Penobscot river.
BELFORD, a market town of Northumberland, Eng-
land, is seated on the great post road from London to
Edinburgh, at the distance of 312 miles from the former.
This town, though small, is particularly neat, and its houses
are ranged on the ridge of a hill, which commands a
view of the north sea. The church was built in 1700; it
neatly the ruins of an old chapel, and at a short dis-
tance are the foss and vault of an ancient encampment.
Here are a weekly market on Tuesdays, and two annual
fairs. The number of houses in the township is 161, and
of inhabitants 692.
About four miles east from Belford, is Bambrugh cast-
tle, the origin of which is attributed to king Ida, who be-
egan his reign about the year 539. The present remains
are considerable, and appear to be wholly the relics of
Norman architecture, though our historians are decidely
of opinion that they occupy the site of a Saxon fortress
or palace. This was besieged in the year 642, by Penda,
the pagan king of the Mercians, but without success.
In the year 710, king Osred, on the death of Alfred his
father, fought refuge here, with Brithric, his tutor or guar-
dian, and after a gallant defence, repulsed Edulph and his
partizans. In the reign of Egbert, this castle was made the
prison of Kenulph, bishop of Lindisfarne, who was con-
 fined here from 750 to 780. In many subsequent peri-
 ods, during the scene of repeated sieges, and suffered
successively by the Danes, by the Normans, and by the
Yorkists.
BELFORTE, a town of Italy, in the duchy of Parma,
19 miles S.S.W. of Parma.
BELFRY, Belfredus, is used by military writers of
the middle age for a fort of tower, erected by besiegers to overlook and command the place besieged. They were all called berfried, berfried, berfried, and belfrayn. Their structure and use are described in verse by a poet of those days.

Belfray originally denoted a high tower, whereon cantilevers were placed to watch the avenues of a place, and prevent surprize from parties of the enemy, or to give notice of fires by ringing a bell. Du-Cange.

In the cities of Flanders, where there is no belfray on purpose, the tower of the chief church serves the same end. The word belfray is compounded of the Teutonic "bell" and “frei,” peace, because the bells were hung for preserving the peace.

Belfray is also used for that part of a steeple wherein the bells were hung. This is sometimes called by middle-aged writers campaile, cloaria, and trifileum. Du-Cange. This is sometimes used in Heraldry as a creel.

Belfray, more particularly used for the timber-work, which sustains the bells in a steeple; or that wooden structure, to which the bells in church-steeples are fastened.

Belfray, Great, in Ornithology, the alarum thurst of Latam, and turgus tinniens of Gmelin, le grand beffoj of Buffon, is so called by this latter naturalist, from the singular sound which it makes in the evenings and mornings, and which resembles the din of an alarum bell. The succussion of sounds is as rapid as the quick strokes of a bell, and continues about an hour. See Turgus Tinniens. "The small belfray," is the spickelled thurst of Latam, and Turgus Linnatns of Gmelin, which see.

BELGE, in Ancient Geography, were Scythians or Goths, who, advancing from Asia, drove the Cimbri or northern Celts before them; and at a long period preceding the Christian era fix'd on the north-west part of Gaul, where they acquired the provincial denomination of Belgae; and from them the country which they inhabited obtained the name of Belgie Gaul. Writers are not agreed as to the etymology of this appellation. As they were a fierce, contentious, and warlike people, and disposed to domineer over all their neighbours, according to the character which Caesar (Comment. l. ii. c. 5.) has given of them, some have suppos'd that they were called "Belge" on that account; the word "Belga" in the old Teutonic signifying "fierce" and “quarrelsome.” Others have suppos'd, that the term "Belge" is synonymous with the Celtic "Belghie," and that it signifies persons who inhabited the high or northern part. Others again have derived Belge from "Belgen" or "Velgen," signifying stranger.

Some time after their settlement in Gaul, but at an unknown period, they penetrated into Britain; and accordingly when Cesar first explored this island, he informs us (l. v. c. 10.) that the primitive inhabitants were driven into the interior parts, while the regions on the south-east were peopled by Belge colonies. The Belges may, therefore, be justly regarded as the chief ancestors of the English nation. On the continent, the Belge having taken possession of part of Gaul, and being naturally a ferocious people, wagged frequent wars with the Germans; so that these two nations continued in a state of hostility and friendship, sometimes invading each other’s territories, and at other times allying each other against the Romans. In the time of Cesar, the Belges, alarmed at the success of the Romans in their expeditions against the Germans, formed a grand alliance with the Celtes, Germans, and Gauls, in order to drive them farther from their neighbourhood. Cesar, according to his usual manner, found means to lower such divisions among them, that many of these allies submitted to him; however, the Norvii, Attrebates, and Veromandui, stood firm, and though at length defeated, it was one of the dearst victories which Caesar had ever obtained; and, in consequence of this defeat, the whole Belge nation was compelled to submit to the Roman yoke. The Belges of Britain were feated to the east of the Durants, on the same coast, and inhabited the counties now called Hampshire, Wilts, and Somersetshire. When Cesar invaded Britain, some part of this country was possessed by the Segontiaci, whose chief town was Winchelsea, called by the Britons "Caesar-segment," from the name of these, its ancient inhabitants. But these people seem to have been soon after subdued by and incorporated with the Belges, as they are never afterwards mentioned. As to the first introduction of the Belge into Britain, history is silent; but with respect to some few of the latest colonies who settled here not very long before the Roman invasion, and who inhabited the fourth parts of Britain, Caesar informs us (l. v. c. 10.) "that the sea-coast of Britain is peopled with Belgians, drawn thither by the love of war and plunder." "These folk (he says) passing over from different parts, and settling in the country, still retain the names of the several states from whence they were descended." The iste of these Belge colonies came into Britain only a few years before Caesar's invasion. This colony was conducted by Dixius, king of the Scythians, one of the most powerful of the Belge nations in Gaul; and having obtained a footing on the British coast, he continued to reign over the Belgae in this island, as well as over his ancient subjects on the continent. In his continental territories, he was succeeded by Galba, and in his British dominions by another of his sons, perhaps Segonax, who attempted to destroy Caesar’s fleet. Although the Segontiaci submitted to Caesar, we have no account of the submission of the Belge to that conqueror. The honour of subduing that British nation was referred to Vespasian, who, landing an army in those parts, A. D. 49, fought 52 battles, took more than 20 towns, subdued two very powerful nations, one of which was the Belge, and the island of Wight. After this time, the country of the Belge was much frequented by the Romans, who made it in many excellent military ways, and built several beautiful towns, which are mentioned by both Ptolemy and Antoninus. The most remarkable of these towns were Venta Belgarum, Winchelsea, famous for the imperial weavery which was there established, and Aquae Solis, Bath, even then renowned for its warm and sulphar springs. The country of the Belge was included in the Roman province, called Flavia Caesarinum, and governed by the president of that province, and his inferior officers. Henry's Hist. vol. i. p. 246. &c.

BELGRAD, or Belgrad, in Geography, a town of Germany, in the circle of Upper Saxony, and chief place of a circle to which it gives name, in the duchy of Pomerania, feated on the Perorte, and noted for its market for horses. It was a place of some distinction as early as the 11th century, for its strength and for the number and value of its inhabitants; but it has suffered much by fire and by war; particularly by the 30 years' war. By the treaty of Welfephia, it devolved to the house of Brandenburg. It has a cable and a provostship, and is the seat of a royal bailiage. N. lat. 54° 10'. E. long. 16° 51'.

BELGERN, a town of Germany, in the circle of Upper Saxony, and magnavitate of Meissen, seated on the river Elbe, 36 miles N.W. of Dredfen, and 24 N.W. of Meifen.

BELGERS, a town of Ablatic Turkey, in the province of Caramania, 78 miles west of Cogni.

BELGEVAN, a town of Aia, in Tartary, in the kingdom of Bucharia, and province of Cathand.

BELGICA, in Cenobology, a species of Sabelia, very briefly described by Omelin, as having a conic shell "tefla conica,"
conica," and is said to be found on the shores of Holl-
land—Obs. This is supposed by some to be the fabella
granulata of Linnaeus, and tubiformis of Pennant; but it
is by no means certain that even the two last are of the
same species: we think they are not; and it may admit of
equal doubt whether either of them is the species
Gmelin describes as belgica. The last mentioned author
seems to be under no small difficulty in this respect himself,
for he entirely omits taking the slightest notice of either of
species, or even amongst his synonyms. Sabella tubi-
formis of Pennant is undoubtedly different from fabella
belgica of Gmelin, according to Klein and Matzlin, to which

Belgica, in Ornithology, a species of Sculopax,
with a very straight bill, black at the tip; head, neck, and
breast ferruginous; abdomen white; back, wings, tail, and
legs black. Nozem. nedkri Vogel. t. 27. A native of Hol-
lund, and feeds on worms, &c.

Belgica Gallia, in Ancient Geography, one of Cæsar's
three divisions of Gaul, or Gallia, the other two being Aquita-
nia, and Celtica, or Gallia propria. Gallia Belgica was bounded
by the ocean to the north, by the Sequani (Secur) and Matrona
(Marne) to the west, by the Rhine to the east, and to the
south by various limits, at different times. Cæsar appro-
prised the Sequani and the Helvetii to that part of Gallia
Celtica which was afterwards called "Lugdunensis." But
Augustus, when he made a new partition of the provinces,
transferred the Sequani and Helvetii to Gallia Belgica.

According to the distribution of Ptolemy, Gallia compris-
eced four parts, viz. Aquitania, Lugdunensis, Belgica, and
Carbonennis. See Gallia. Mentelle, in the Ency-
clopedie Methodeique, divides Gallia Belgica into Belgica
prima, comprehending the Treviri, Mediomatrici, Verdun-
eniæ, and Leuci; and Belgica secunda, including the Nervi,
Morini, Ambiani, Bellovaci, Silvanètes, Vadacæs, Suf-
fiones, Veromandui, Attrebates, Remi, and Catalaei. The
capital of the Treveri, viz. Augustia or Treveri, was the
metropolis of Belgica prima. Belgica secunda contained a
great number of cities, and comprehended Lorraine and
Champagne; whilst Belgica prima contained a portion of
the isle of France, Picardy, and Artois. Belgic Gaul compris-
osed those provinces of the Netherlands now called the
Belgic provinces, which were formerly subj ect to the
house of Austria, but which have been recently annexed to
the French dominions. See Netherlands.

Belgica, Backauen, a village of Gallia Belgica, in the
country of the Ubi, between the rivers Rhine and Röer,
8 miles from Marconum, according to the itinerary of
Antonin, in Germania secunda, or Inferior, south-west of
Colonia Agrippina.

Belgium, Bingen, or Baldenau, a place of Ger-
mania prima, or Superior, a province of Gaul, at some dis-
tance to the east of Augustia Treviriurum.

Belgium, a canton of Gallia Belgica, from which it
is distinguished by Cæsar (i. v. c. 24.) as a part from the
whole; to this canton he assigns the Bellovaci, to whom
Hirtius (i. viii. c. 46 and 47.) adds the Attrebates. And
as the Ambiani were seated between the Bellovaci, and Attre-
bates, these also must be included in Belgium, which must
have extended to the sea. Thee three people, says Cellarius,
were the proper and genuine Belgæ, all the rest being adven-
titious, or foreigners. See Ambiani, Atrebati, and
Bellovaci.

Belgium, a river of Africa in Libya. Hefychius.

Belgian Sea, a town of Arabia Deserta. Ptolemy.

Belgorod, in Geography. See Belgorod, and
Asferman.

Belgrade, Aera Graecorum, a town of Euro-
pean Turkey, the capital of Servia, seated on the side of a
hill, at the conflux of the Save and the Danube. It was
formerly a very strong place, but is now defitute of fur-
nications, and it was accounted the barrier and key of
Hungary, to which it was first annexed by the emperor
Sigismund.

The number of inhabitants is now supposed to amount
to about 25,000. The suburbs are extensive, and it has
a great resort of Turkish, Jewish, Greek, Hungarian,
Armenian, Austrian, and Scelovian merchants. The streets,
in which the chief trade is carried on, are covered with
wood, as a shelter from the sun and rain; the shops are
small, and the commodities that are fold are conveyed out
of a window, as the buyers never enter them; the richest
merchandise is exposed to sale in two bazaars that cross
each other; and there are two exchanges constructed with
stone, and supported by pillars. There are likewise at
Belgrade a caravansera, or public inn, and a college for
young students. Its situation near the rivers renders it
convenient for commerce; and as the Danube falls into
the Black sea, and affords a passage to Vienna, trade is
easily extended to distant countries, so that Belgrade is a
fable town in these parts. The Armenians and Jews are
employed as factors; the former have a church, and the
latter a synagogue in this place. In the environs of
Belgrade are several small villages near one another, and alm-
most all of them inhabited by Greeks. The fields present
some degree of culture; and the whole adjacent county affords
fine cluffter or flax-fruiting oaks (quercus racemosa, Lamarck)
whose wood is very hard and very fit for ship-building. Some
few vineyards and gardens are to be seen in the vicinity of
Belgrade. The aqueducts, constructed by the emperors of the
cave for conveying water to Constantinople, attract admir-
ation. See Aqueduct. N. lat. 45° 15'. E. long. 21° 12'.

The polleffion of Belgrade has been repeatedly disputed be-
tween the Austrians and Turks. In 1521, it was taken by
the Turks, after having been attacked in vain by Amureth
II. in the preceding century, but recovered by the Imperial
army in 1688. In 1699, it fell again under the Turkiah yoke,
from which the Austrians unsuccessfally attempted to regain
it in 1663. By the treaty of Carlowitz in 1699, the Turks
remained in possession of it; but in 1716, it was beliged by
prince Eugene, and after a severe contest it was compelled to
surrender to the Imperial arms.

Belgrade is chiefly famous in the history of military op-
erations on account of the battle fought in its vicinity in
the year 1717, the resuit of which was the last great work ob-
tained under the auspices of the celebrated prince Eugene,
and which decided the event of the war then depending be-
tween the German and Ottoman empires.

The Turks, notwithstanding the losses they had sustaine-
during the campaign of 1716, determined to make the most
vigorous efforts for the preservation of their Hungarian ac-
quitions. The Imperialists were equally devious of ter-
minaling the war by some important action. Prince Eu-

genue, having concentrated the Austrian forces in the bannat,
on the 15th of June effected the passage of the Danube in
boats with 40,000 of his troops without the loss of a man,
in prudence of some Turkish corps stationed on the southern
bank, who, without attempting an opposition, threw them-
sehems into Belgrade. A bridge of boats was immediately
constructed for the passage of the rem of the army,
the horse, and artillery, and by the 15th of the same
month, Belgrade was completely invested.

The first care of prince Eugene, who foresew that the
Turks would venture a battle to relieve the place, was to
fortify his camp in such a manner as might enable him to
cope
cope with an army much superior in number to his own. He accordingly began to cut up lines of circumvallation and contravallation, strengthening them with entrenchments, redoubts, and other field works of the necessary description. Within these lines the army encamped to the south of Belgrade; its front towards the open country, its left resting upon the Danube, its right extending towards the Save. A bridge of boats was thrown across the latter river, and, as well as that already constructed on the Danube, fenced by strong têtes de pont. The line of contravallation, looking towards Semedria, consisted of a ditch, fifteen feet wide, of proportional depth, and defended by a strong parapet. The proper openings were left for the troops to issue and form in order of battle without confusion, covered in front by ravelins and redans; and upon the right, a large fleck, or redoubt, was erected for the purpose of commanding a hollow ground, which the Turks might otherwise have found serviceable in their approaches. The field pieces of all the different battalions, planted at regular distances along the front of the contravallation, secured it from any sudden assault. As, however, the army was not sufficiently numerous to occupy the whole extent of ground between the two rivers, croft entrenchments were formed, connecting the principal lines on the right and left, and still preferring a communication with the different bridges.

As the Turkish garrison consisted of between twenty and thirty thousand regular troops, and had also a strong flotilla on the Danube, prince Eugene found it absolutely necessary to maintain two flying camps: one of several thousand men at Semlin, to keep up a communication with Peterwaradin, from whence the Imperialists derived their supplies of provisions, under Count de Hauben; and another of five battalions and some cavalry to cover the head of the bridge over the Danube. Four ships of war protected the navigation of that river, and watched the motions of the Turkish flotilla. But a violent storm which happened on the 12th of July, had nearly rendered abortive the projects of the besiegers. The bridges of the Danube and Save were broken by the force of the tempest. Several vessels, detached from the rest, were carried floating at random down the stream, and the Turks took advantage of this accident to make a failure on the Save, and attack the redoubt which covered the head of the bridge. The gallant defence of a captain and 64 men, who alone garrisoned the post, preferred it, together with that part of the bridge which remained on the north side of the river, from falling into the hands of the enemy. To prevent such forties in future, the camp of Semlin was strongly reinforced, and the command entrusted to Count Martiguy. More serious operations commenced: and during the night of the 18th, trenches were opened against Belgrade to the north of the Save by 1,200 pioneers, covered by a large detachment under general Marfigny. The Turks, however, the following morning, opened a dreadful fire upon them from all the batteries of the place, the flotilla on the Danube, and the islands in that river, and making a sortie with 4,500 men in boats, assaulted so furiously the head of the trenches, that if prince Eugene had not animated the troops by his personal presence and bravery, in repulsing the attack, a total defeat must have ensued. As it was, general Marfigny, with twenty other officers of note, and 400 soldiers, perished in this affair. It became necessary to augment the guard of the trenches to nine battalions, and construct new lines. In six days a complete chain of works was established from the bridge along the Save to its influx with the Danube, and from thence ascending the course of the latter river to the camp of Semlin, defended with redoubts, and well provided with artillery; insomuch, that from the moment of their completion, the garrison attempted no farther Father.

On the 23d of July, the cannonade and bombardment commenced from all the Austrian batteries, with dreadful effect, and by the 30th, Belgrade resembled, towards the sea, a heap of ruins. But the excellent state of their fortifications on the side of the besieging camp, and expectations of approaching succours, animated the garrison to maintain a most vigorous resistance. Their expectations were not delusive. The grand vizier, having drawn the Turkish provinces of soldiers to complete his army, had already begun his march, and on the 28th his advanced parties appeared in fight, and began to skirmish with the Austrian out-post. The number of these marauders daily increased, and on the last of July, the vizir with his whole army arrived in presence of the Imperialists. But instead of attacking prince Eugene as the latter expected, he encamped upon the heights above the Austrian camp with all his forces, supporting his right flank by the Danube, and stretching his left towards the Save. The following days were spent in preparing batteries, throwing up entrenchments, and making approaches against the works of the Imperialists, as if they had literally been a town besieged. Eugene found himself compelled, by this mode of attack, to adopt new dispositions. He instituted additional artillery on his own lines, defended all the avenues with chevaux de frize, mined the ground before the fleck already mentioned, and called in part of his troops from the opposite bank of the Save. Nevertheless, the Turks, pursuing their projected plan of operations, pushed their approaches in spite of the dreadful havoc which the Austrian bombs and grenades incessantly made among them to within musket shot of the contravallation. Their army amounted to upwards of 200,000 men. Their works were mounted with 120 pieces of cannon and mortars. The garrison, who now sustained some repulse from the fire of the Austrian batteries, directed their own upon the tents of the besiegers, and thus situated, between two hostile armies, who from their situation commanded more or less every part of his position, Eugene found himself enfiladed by the fire of upwards of 250 pieces of artillery. His situation became seven days more precarious. The dyctery, which for the last month had done great mischief in his camp, now raged to such a degree that hundreds were buried in a day. A mortality prevailed among the horser, in consequence of which half of the cavalry were dismounted; and an army which, at the opening of the campaign, amounted to above 80,000 men, could not now muster 60,000 effective. Though no immediate scarcity of provisions or ammunition was experienced, yet the disappointment of the expectations prince Eugene had conceived, that the Turks would be obliged to retire for want of provisions, obliged him to determine without delay on some decisive measure; especially as the vizir had occupied an eminence adjoining the Save, with a considerable body of troops, and might, by sending 20 or 30,000 men across the river, have rendered a retreat, in case of defeat, impracticable to the Austrians. Under these circumstances, it was resolved, in a general council of war held on the 15th of August, to be beforehand with the enemy, by making a decisive attack on their camp. The detachments beyond the Save were immediately called in, except about 1,400 foot, and 300 horse. Seven regiments of cavalry and ten battalions, with all the dismounted horser and dragoons, were left in the lines to observe the garrison. Eleven regiments of cavalry, commanded by field marshal count Paoli, and general count March, composed two lines on the right, and marched out before midnight. The left wing, consisting of 12 regiments,
mosts marched out at the same time, commanded by general Montecuccoli and Mattigny. The infantry, under prince Alexander of Wirtenberg, in chief, was drawn up in the centre; the first line of 22 battalions, conducted by count Maximilian of Staremburg, and count Harrach; the second, of 18 battalions, by the prince of Bevern. The corps of reserve, with which marshal Seekendorf remained in the lines, ready to act as occasion should require, was composed of nine battalions. The effective force of the two lines, on whom the success of the day in a great measure depended, did not amount to more than 40,000 men; yet, notwithstanding this immense inferiority, the confidence of the soldiers in their commander was such, that they received the orders to prepare for action with the greatest cheerfulness, and marched out, as if inspired with a certainty of victory.

At one in the morning the Imperialists, favoured by a thick fog, quitted their trenches: the right advancing towards the fleete, which was assigned as its point of formation, and the left over the open ground adjoining the Danube. Two hours were spent in making the necessary preparatory movements; but the fog, which had hitherto favoured the Imperialists, increased to such a degree as to become productive of serious inconvenience. The right wing, missing its way, stumbled, instead of the fleete, upon one of the Turkifh advanced works. The surprise was equal on both sides; but a discharge which immediately opened upon the Austrian cavalry from the guard of the trenches, spread the alarm throughout the whole of the grand vizier's army. His troops hastily rushed from every part of the camp towards the scene of action, and in a few minutes count Palii became hotly engaged. The Austrians, formed in a hurry, and their battalions, through fear of losing the support of the cavalry, inclining successively to the right flank, a wide vacancy was left in the centre, and afforded the Turks an advantage of which they did not fail to profit. Meantime, the combat engaged on the right, quickly commenced on the opposite flank. Prince Eugene had intended to begin the attack with both wings at the same time; but convinced by the heavy firing he heard towards the Save, that Palii had already begun the battle, he was himself obliged to edge to already formed, before the battalions of his left wing were completely formed. It was now between four and five o'clock in the morning. The fog continued so thick as to prevent the combatants from discerning each other till they arrived about close to the muskets of their adversaries pieces; and owing to this obscurity several small detachments of Austrians, whom a desire to signalize themselves carried unawares into the thick of the enemy, were entirely cut off. The assailants nevertheless gained ground. As the darkens obliged them to march with their firelocks always presented, the fire they poured in, the moment they perceived their enemies, was so cloth, well directed, and did such prodigious execution, that the Turkish battalions, as they advanced in succession, were broken, dismayed, and precipitated headlong into their trenches, where the bayonet and sabre made dreadful havoc among them. The cavalry were not equally sucessful; the broken nature of the ground obliged them to perform frequent evolutions in order to find some passages of easier access, and the Turks, who lined the trenches, galled them with severe and incessant firings. The centre of the enemy's army too, finding nothing to oppose them, threw several battalions into the void space between the flanks of the Imperialists, and completely intercepting all communication, opened a heavy fire to right and left upon the divided forces. The battle, under the present circumstances, formed irrecoverably lost, but the fog, at this critical moment clearing up, discovered to prince Eugene the disposition of both armies, and his own perilous situation. The advance of the second line prevented his total defeat. The prince of Bevern, who commanded it, marched up to the Turks, whose successes had thrown them into disorder, and charged with such fury, that the infidels, unable to sustain the shock, fled in disorder, and were pursued up to their very trenches, leaving the space where they had been defeated covered with their dead. This success gave a new turn to affairs. No time was lost in filling up the interval that had been so usefully lost, and in forming the two flanks of the Imperialists for a new effort. The impatience of the soldiers to engage protracted the success. The right began the attack with irresistible impetuosity the batteries whose fire they had hitherto sustained, and turned the cannon against the entrenchments which protected the Turkish camp. The left experienced more opposition. The enemy had their principal forces on that side, and thefe, reinforced by several corps whom the success of count Palii had driven from the right, constituted an immense superiority. The janizaries detested themselves with great bravery, and repelled the Austrians in their first attack; but these rallying, returned to the charge, beat the Turks from their entrenchment, and pushing their advantage, advanced regularly up to the second, without firing a musket till they came within ten paces of the enemy. This work was carried in less time than the first: the Turkish entrenchments were forced one after another, as well as several confines with which their camp was defended; and notwithstanding resilliance was attempted at each of them, and the Austrians experienced everywhere a terrible fire, yet the courage and conduct of prince Eugene fumarro mounted every obstacle, and obliged victory, after a struggle of six hours, to declare in his favour. The half serious band made by the infidels, was at a grand battery mounted with 18 pieces of cannon, and defended by 20,000 janizaries, sustained by 10,000 infidels, the bravest troops in the Turkish army. It was necessary to halt and form the troops anew for this perilous attempt; but when the word to charge was given, they rushed forward with an impetus nothing was capable of resisting. The Imperial grenadiers, in defiance of the fire from the battery, bore down all opposition, mounted through the embrasures, and drove the Turks from their guns; while the rest of the army made such slaughter, that the bodies of the slain rose in heaps round the redoubt. The routed forces, driven on all sides from their entrenchments, retired into the plain, as if to form once more for the defence of their camp; but observing the Imperialists, after having gained the heights, advancing towards them in good order, they betook themselves to flight in every direction, leaving their camp, baggage, and ammunition, at the mercy of the conquerors. The victory was complete by 9 o'clock in the morning. The plunder of the infidels' camp, which resembled a large city, was given to the soldiers.

This battle, fought on the 16th of August 1717, cost the Turks 10,000 of their belt troops killed in the action, and 3,000 in the pursuit. About 5,000 were wounded, and nearly the same number made prisoners. In the Turkish camp and lines were found 131 pieces of brass cannon, 30 mortars, and an immense quantity of powder, bullets, bombs, and grenades. There were also taken 52 colours, 9 horitnals, and other military trophies. The losses on the German side, by reason of the fog, was not in proportion to the length of the fight. Their killed amounted to nearly 3,000 men, among whom were the generals count Hauben and Dalberg; and about 4,500 were wounded. Of the latter, however, only about 2,600 recovered. In consequence of this great victory,
victory, Belgrade surrendered on the 10th; the garrison still consisting of more than 25,000 men, being allowed to march out with all their effects. Its fortifications towards the land were in a most excellent state, and more than 400 pieces of cannon and mortars found on the works in the arsenals, and on board the flotilla on the Danube.

Belgrade, which the peace of Passarowitz left in possession of the Austrianrians, was unsuccessfully attacked by the Turks in 1739; but by the treaty concluded that year under the mediation of France, was restored to the Porte. Its fortifications were, however, previously demolished. In 1789, it was besieged (Sept. 12.) by an Austrian army under Marshal Lohndoh, who, in his approaches made use of the old lines of circumvallation constructed by Prince Eugene, and which the Turks, from an unaccountable negligence, had neglected to fill up. The marshal, assisted by a numerous and well-armed train of artillery, proceeded with such rapidity in his attacks, that after all the suburbs and outworks had been carried by sword in hand, the garrison, apprehensive of a storm, surrendered (Oct. 8.) upon honourable terms. Immense stores, with about 300 pieces of artillery, were found in the place. Belgrade was, however, anew given up to the Turks in 1791, at the peace of Sileova, since which time it has continued quietly in their possession.

Belgrade, a township of America, in the county of Lincoln and district of Maine, incorporated in 1756; formerly called Washington-plantation. It lies west of Sidney, and between Androscoggin and Kennebec rivers.

Belgrado, a town of the Venetian fleet of Italy, in Friuli, situated near the river Tagliamento. N. lat. 48°. E. long. 14° 9' 57''

Belhaven, the former name of Alexandria, in Fairfax county, Virginia. See Alexandria.

BELIA, in Entomology, a species of Papilio, with entire white wings; the lower ones yellow, and slightly fuscated with grey beneath. A native of Barbary. Fabricius.

Belia, in Ancient Geography, a town of hispania Tarra- gonica, is the country of the Hedetani (Plut.), coast of Bilbilis, and nearly south-east of Caesar-Augusta (D'Anville); now Belchite, which fee.

BELIAI, formed of ñ, non, nothing, and ñ, in, denoting in Hiphil, to profit, &c. unprofitable; in Scripture History, signifies a wicked, worthless person, who is refused to endure no subjection. Thus the inhabitants of Gilgal, who abused the Levite's wife, are stigmatized by the name of Belial. (Judges, ix. 22.) Hophni and Phineas, Eli's sons, are called sons of Belial (1 Sam, ii. 12.) on account of the several crimes they had committed, and their incorrupt behaviour in the temple of the Lord. Sometimes, says Calmet, the name Belial is used to denote the devil. To this purpose, he cites 2 Cor. vi. 15, where the apostle Paul says, What concord hath Christ with Belial? whence it appears, as he supposes, that in the apostle's time, the Jews, under the name of Belial, commonly understood the devil in the places where this term occurs in the Old Testament. Others are of opinion, that the heathen demons might be called Belial, either because they were of no use, or because so much wickedness entered into the idea which the Pagans entertained of them. However, it has been suggested, that there may be no reference to the heathen gods at all, whether they were defiled ghosts or not; the word Belial being often applied to living men; and it being the general delign of the apostle in this place to diffuse Christians from suffering themselves to be drawn into anything criminal by the heathens. Grot. in loc. Farmer's Demoniacs, p. 201.

The learned Bryant (Analysis Aure. Mythol. vol. ii. p. 167.) considers Belial as the title of the chief Syrian god, called Bel and Baal, and rendered by the Greeks Belas, beliar. Hence, Clemens Alex. (l. v. p. 680.) instead of saying, what agreement can there be between Christ and Belial, says, Ti &i συμφωνεῖν ἔχοντος πρὸς Belias. This Belial, or Beliar, was the same as Belorus and Otiris, who were worshiped under the ymbol of a serpent. Hence Hefeyrius explains the term Beliar by a serpent.

BELIAS, in Ancient Geography, a river of Afa, which sprung in Davaus, and discharged itself into the Embrates. Ammian. Marcell.

Belica, an episcopal town of the Gauls, in the fifth Lugdunensis.

Belicena, a town of Spain, in Grenada, 11 leagues from Grenada.

Belici, a river of Sicily, which empties itself into the sea near Bigini, in the Val de Mazzar. It resembles (says Swinburne, vol. iii. p. 374.) the Mole in Surry in size and colour; and winds very agreeably between high banks overgrown with elms, willows, and tamarisks. The vale on both sides is wide and well laid out in corn-fields, and pastures crowded with horses and horned cattle.

Belida. See Bleeda.

Belides, in Antiquity. See Danaides.

Belidor, Bernardino Forest de, in Biography, a French mathematician and engineer, was born in Carlogna, about the year 1608, and became professor-royal at the artillery school of la Fere, and provincial commissary of artillery. By various exploits, he first discovered that the proportion of gun-powder in the loading of cannon might be reduced to two-thirds of the quantity, without lessening its effect; but as he communicated this economical idea to cardinal Fleury, without previously consulting the grand-master of artillery, he lost both his places. Upon this the prince of Conti took him to Italy, and by his patronage, Belidor was again brought into notice at court. Marshal Bellelieue, the war-minister, appointed him inspector of artillery, and allotted to him apartments at the arsenal of Paris, in which he died, Sept. 8, 1761. Belidor was chosen an associate of the academy of sciences in 1751; and was the author of several useful works on civil and military architecture, hydraulics, fortification, and engineering: viz. "Sommaire d'un cours d'Architecture Militaire, civile et hydraulique," 1730, 12mo.; "Nouveau cours de Mathematiques, &c," 1725, 4to.; "La Science des Ingenieurs," 1729, 4to.; "Le Bombardier Francois," 1733, 4to.; "Architecture Hydraulique," 1737-1761, 4 vols. 4to.; "Dictionnaire portatif de l'Ingenieur," 8vo.; and "Traité des Fortifications," 4 vols. 4to. Several of his pieces are also inserted in the memoirs of the academy of sciences for the years 1737, 1750, 1753, and 1756. Nour, Dict. Hitor. Hutton's Math. Dict.

Belief, in its general and natural sense, denotes a persuasion, or a strong assent of the mind to the truth of any proposition. In which sense, belief has no relation to any particular kind of means or arguments, but may be produced by any means whatever.—Thus we are said to believe our senses, to believe our reason, to believe a writer, &c. And hence, in rhetoric, all sorts of proofs, from whatever topics deduced, are called απιστευον, because apt to produce belief, or persuasion touching the matter in hand.

Belief, in its more restrained and technical sense, invented by the schoolmen, denotes that kind of assent which is grounded only on the authority or testimony of some per-
fan or persons, professing or attesting the truth of any matter proposed. In this sense belief stands opposed to knowledge and science. We do not say we believe that snow is white, or that the whole is equal to its parts; but we see and know them to be so: that the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not said to be things credible, but scientifical; and the comprehension of such truths is not belief, but science. But when a thing proposed to us is neither apparent to our senses, nor evident to our understanding; neither certainly to be collected from any clear and necessary connection with the cause from whence it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithstanding, appears as true, not by a manifestation, but by an attestation of the truth, and moves us to assent, not of itself, but in virtue of a testimony given to it—this is said to be properly credible; and an assent to this is the proper notion of belief or faith.

A judicious writer (Price's Review of the principal questions in Morals, p. 158) is of opinion, that all the general grounds of belief or assent, may be comprehended under the three following heads: viz. 1st. Immediate confciouilities (which see), or feeling: whence we acquire the knowledge of our own existence, and of the several operations, passions, and sentiments of our own minds; and to this head may be referred the information we derive from our powers of reflection and memory; 2dly. Intuition (which see); and to this we owe our belief of all self-evident truths, our ideas of the general, abstract affections and relations of things, our moral ideas, and whatsoever else we discover, without making use of any process of reasoning; and 3dly. Argumentation or Induction. See these articles. See also Assent and Faith.

BELIENE, in Geography, a village of Egypt, depending on the grand seikik, and agreeably situated between two canals; 12 miles south of Girgé.

BELIEVERS, in Ecclesiastical History, an appellation given towards the close of the first century to those Chriftians who had been admitted into the church by baptism, and instructed in all the mysteries of religion: they had also access to all the parts of divine worship, and were authorized to vote in the ecclesiastical assemblies. They were thus called in contradistinction to the catechumens, who had not been baptized, and were debarred from these privileges.

BELILLA, in Botany. See Mussenda.

BELIM, in Geography. See Belém and Para.

BELINA, a town of European Turkey, in Bosnia, about midway between Banjaluka and Belgrade.

BELION, a name given to a river of Lusitania, called also Limus, Limax, Lethe, and the river Oblivion, in Ancient Geography, was the boundary of the expedition of Decimus Brutus. His soldiers, when they arrived at this river, refused, from motives of superstition, to cross it; upon which he snatched an ensign out of the hand of the bearer, and passed over, by which his army was encouraged to follow (Livy). He was the first Roman who ever proceeded so far, and ventured to cross. The appellation, according to Strabo, took its rise from a fedition that occurred in a military expedition between the Celtici and Turdoi after crossing this river, in which the general was slain, so that they remained divided there; and from this circumstance it was called the river of Lethe, or Oblivion. (Cellarius.) It is now called "El Limas," and runs wellward into the Atlantic, to the south of the Minho.

BELISAMA. See Belasama.

BELISAMA, or Belizama, in Mythology, a name given by the Gauls to their Minerva, or to the goddess who was the inventor of the arts. She was represented with a helmet adorned with a plume, clothed in a tunic, without sleeves, and covered with a mantle called "peplum." Her attitude, with her head leaning on her right hand, was that of a person in a profound reverence. Human victims were sacrificed on her altar.

BELISARIUS, in Biography, the Africanus of New Rome, was born, and probably educated, among the Thracian peasants; and advanced from the humble station of one of the private guards of Julian, then general of the Roman forces, and afterwards emperor, in which he had served with valour and reputation, to distinguished military command. Under the new title of General of the East, he encountered the Persian army near the fortress of Dara, on the confines of Persia, with a much inferior force, both as to the number and quality of his troops, and obtained a decisive victory. In the next campaign, A.D. 530, he halted from Dara to the relief of Syria, which was invaded by the Persians; and though he was defeated in an engagement in which the impotence of his troops had precipitated, he saved his army from the consequences of their own rashness, and the victory of the Persian commander was so dearly purchased, that it was soon followed by peace. Belisarius, on his return to Constantinople, rendered essential service to the emperor Julian, by quelling a dangerous sedition. In 533, the supreme command of the fleet and army, defined for the African war, was delegated to Belisarius, with an unlimited power of acting according to his own discretion, as if the emperor himself were present. After a voyage of three months, in which he had repeated opportunities of excelling his talents as a commander, he disembarked his troops on the African coast. Immediately upon their landing an instance of pillage occurred, which gave him occasion for inculcating the maxims of justice, moderation, and genuine policy. "When I first accepted the commission of subduing Africa, I depended much less," said the general, "on the numbers, or even the bravery of my troops, than upon the friendly disposition of the natives, and their immortal hatred to the Vandals. You alone can deprive me of this hope: if you continue to extort by rapine, what might be purchased for a little money, such acts of violence will reconcile those implacable enemies, and unite them in a just and holy league against the invaders of their country." His exhortations, accompanied by rigid discipline, produced the most salutary effect. The inhabitants, instead of deserting their homes, or hiding their corn, supplied the Romans with a fair and liberal market; the civil officers of the province continued to exercise their functions in the name of Julian; and the clergy, from motives of confidence and interest, affectionately laboured to promote the cause of a catholic emperor. In his progress towards Carthage, he defeated, with great slaughter, the formidable army collected by Gelimer, and entreated to the conduct of his brother and nephew, and reduced the king himself to the necessity of seeking his safety by a precipitate flight.

Belisarius, having taken possession of the city, restored, with incredible dispatch, its walls and ditches, which the heedsnefs and inaudience of the Vandals had suffered to decay. The defeat of Zano, the brother of Gelimer, and the pilluflerious flight of the king himself, terminated the conquest of Africa in the manner already related under the article Africa, which see. Belisarius, on his return to Conti-stantinople in 534, obtained a splendid triumph, and was created sole consul for the ensuing year. The day of his inauguration resembled the pomp of a second triumph; his
carulc chair was borne aloft on the shoulders of captive Vandals; and the spoils of war, gold cups, and rich girdles, were profusely scattered among the populace. His most distinguishing recompense, however, consisted in the faithful execution of a treaty, for which he had pledged his honour to the king of the Vandals, who received from the emperor an ample estate in the province of Gallatia, whither he retid with his family and friends to a life of peace, of affluence, and perhaps of content.

The next object to which the attention of Belisarius was directed was that of terminating the dominions of the Ostrogoths in Italy. With this view he invaded Sicily A.D. 535, and having laid siege to Palermo, which was soon reduced, and which was the only place where he met with any resistance, he soon after entered Syracuse in triumph.

In the spring of the following year he was diverted from the prosecution of his designs by a dangerous revolt of the African forces, which demanded his presence at Carthage. By an easy victory he would have restored the peace of Africa; if he had not been hastily recalled to Sicily, for the purpose of appeasing a sedition which had broken out in his own camp. Having effected this object, and sufficiently garrisoned Palermo and Syracuse, he embarked his troops at Medina, A. D. 537, and landed them, without resistance, on the opposite shores of Rhegium. From Rhegium to Naples, his fleet and army, almost always in view of each other, advanced near 300 miles along the sea-coast; and he received the submission of the inhabitants of the several countries of Bruttium, Lucania, and Campania, through which he passed. The capture of Naples, to which he laid siege both by sea and land, was for some time delayed; and he had reconciled himself to the disgrace of abandoning it, that he might march, before the winter season, against Rome and the Gothic king. But in the moment of anxious suspense a stratagem occurred of introducing, by means of the dry channel of an aqueduct, a file of armed soldiers into the heart of the city, who gained admittance to their companions, by whom the walls were scaled on all sides and the gates burst open. Belisarius, having succeeded in this enterprise, restrained the cruelty and ierulence of the Huns; and, for this purpose, he appeared alone in the streets and churches of Naples, and exerted himself in moderating the calamities of the inhabitants. "The gold and silver," he repeatedly exclaimed, "are the just rewards of your valour. But spare the inhabitants; they are Christians, they are suppliants, they are now your fellow subjects. Reform the children to their parents, the wives to their husbands; and shew them, by your generosity, of what friends they have obstinately deprived themselves." The city was thus saved by the virtue and authority of the conqueror.

From Naples, Belisarius proceeded to Rome; which, on his approach, was evacuated by the Gothic garrison, and which, after sixty years' servitude, was delivered from the yoke of the Barbarians, and surrendered, without opposition, Dec. 10, A. D. 536. The Gothic chief, who was himself a trophy of the victory, was sent with the keys of Rome to the throne of the emperor Justinian. In the following spring Vitiges, who had been elected by the Goths as the succourer of the free and depopulated Thracians, collected an army of 150,000 men, and attempted to recover the capital. On the approach of the Barbarians, Belisarius fell back to farvey their camp; but being surrounded by the enemy, he extricated himself by singular exertions of strength and valor. When the whole army of the Goths, having passed the Tiber, formed the siege of the city, which was continued above a year, before their final departure, Belisarius, aided by his wife Antonina, his confidant compliment in every expedition, made many efforts for the relief of its distressed inhabitants, and for repelling the hangers, which at length, in concurrence with a force sent by the emperor, were crowned with success; so that Rome was restored to the hostile attacks of the Gothic army, which railed the siege, and, after attempting the recovery of Rimini, took shelter within the walls of Ravenna. Upon the arrival of an army from Constan tinople, under the command of Nares, a division arose between the two generals, whose respective authority was not accurately defined; but Belisarius was appointed, by the emperor's special commission, to the supreme command. He incurred, however, considerable odium by the harsh execution of Narses, governor of Spoleto, who had committed an act of robbery; and in consequence of this measure, the two armies separated, and Nares was exorted by the leaders of the discontented faction to assume an independent and supreme command. Belisarius, by his prudence and perseverance, regained his reputation and influence, and procured the recall of Nares, and the establishment of military subordination. In the interval of discord, the Goths, aided by the Franks, captured Milan, with circumstances of aggravated cruelty. In 539, the destruction of Milan was succeeded by the invasion of Theodbert of Austrasia, the most powerful and warlike of the Merovingian kings, who, besides the succour which he afforded to the Goths, invaded the plains of Italy with an army of 100,000 barbarians, and marked his way by ruin and slaughter. The clamours of his conquering army, diminished by famine and disease, at length induced Theodbert to listen with respect to the mild exhortations of Belisarius; who, as soon as he was delivered from his foreign and domestic enemies, resolutely employed his forces in the final reduction of Italy. Having reduced Olimo and Fasile, he proceeded to invest Ravenna; and whilst he was engaged in the blockade of this city, he received from Justinian a treaty of peace, which he had actually signed without deleging to ask his counsel and concurrence. By this disgraceful and precarious treaty, Italy and the Gothic territory were divided, and the provinces beyond the Po were left with the legal title to Vitiges. Belisarius rejected the treaty of partition, and declared his firm resolution of leading Vitiges in chains to the feet of Justinian. Upon this the Goths retired with doubt and dismay, and perceiving their own disordered and perilous state, offered their arms, their treasures, and the fortifications of Ravenna to Belisarius, if he would discharge the authority of a master, accept their choice, and assume, as he had deserved, the kingdom of Italy. The Roman general, seeming to acquiesce in their proposal, flippulated the surrender of Ravenna at an appointed day; and in December 539, he entered the city without opposition, secured the royal treasures, and placed Vitiges under a guard in the royal palace. The submision of the capital was followed by that of the towns and villages in Italy; and the independent Goths, who still remained in arms at Pavia and Verona, were ambitious only to become the subjects of Belisarius. But his inflexible loyalty rejected, except as the substitute of Justinian, their oaths of allegiance; nor was he offended by the reproach of their deputies, that he rather chose to be a slave than a king. Justinian, listening to the suggestions of envy and jealousy, recalled Belisarius; who obeyed the summons, and departed for Constantinople, carrying with him the treasures of Ravenna, and the perquisites of Vitiges, his wife, and chief nobles. The emperor received him with seeming cordiality, but without granting him the well-earned honours of a victor and triumph. Belisarius, however, was the object of universal admiration and applause among the people; and by the number of followers...
BEl

diers in his private pay, and the attachment of the army, whose affection he secured by his justice and liberality, he might well be reckoned the second person in the empire. To the husbandmen he was endeared by the peace and plenty which they enjoyed under the shadow of his standard. Such had been the rigid discipline of his camp, that the country, instead of being injured by the march of the Roman armies, had been enriched by them; and not so much as an apple was gathered from a tree, nor could a path be traced in the corn fields. As to his personal conduct, he was sober and chaste to such a degree, that, in the licence of a military life, none could doubt that they had seen him intoxicated with wine, and that he was never suspected of violating the laws of conjugal fidelity. "The fopetator and huftonan of his exploits," says Gibbon, "has observed, that amidst the perils of war, he was daring without rashness, prudent without fear, slow or rapid according to the exigencies of the moment; that in the deepest distress he was animated by real or apparent hope; but that he was modest and humble in the most prosperous fortune. By these virtues he equalled or excelled the ancient masters of the military art. Victory, by sea and land, attended his arms. He subdued Africa, Italy, and the adjacent islands; led away captives, the emperors of Genficic and Theodoric; filled Constantinople with the spoils of their vanquished, and in the space of six years recovered half the provinces of the western empire. In his fame and merit, in wealth and power, he remained, without a rival, the first of the Roman subjects; the voice of envy could only magnify his dangerous importance; and the emperor might applaud his own discerning spirit, which had discovered and raised the genius of Belisarius." Nevertheless, the fame, and even the virtue of Belisarius, were polluted by the lust and cruelty of his wife Antonina. This profligate woman was the daughter of a theatrical prostitute; and in the various situations of the fortune of her parents, she became the companion, the enemy, the servant, and the favourite of the empress Theodora. Before her marriage with Belisarius, she had one husband and many lovers; and after their connubial union, the contrived to gratify her licentious passions, and to impose on the credulity of her husband, whom she dishonoured, and whom by her influence the ingatuated to transactions that fix an indecent stain on his memory.

When Syria was invaded by Chosroes king of Persia, in the year 540, and Andracic, its rich capital, destroyed, Belisarius, the conqueror of Italy, was appointed to the defence of the exit. Accordingly, in the year 541, he encamped beyond the Euphrates, within six miles of Nisibis, in order to restrain the progress of the Persian monarch on the coast of the Euxine. Having succeeded, without the support which he had reason to expect, in forcing Chosroes to return with loss and precipitation, he was recalled, at the close of the campaign, to Constantinople, by an ungrateful court; but the dangers of the ensuing spring restored his confidence and command; and the hero, almost alone, was dispatched with the speed of post-horses, to repel by his name and presence the invasion of Syria. On the banks of the Euphrates his firm attitude restrained Chosroes from advancing towards Palestine, and compelled him to repass the river: thus accomplishing his purpose by a safe and bloodless victory, more glorious than his African and Gothic triumphs, in which neither fortune, nor the valour of his soldiers, can subtract any part of the general's renown. But the danger threatened to Italy by the rapid conquests of Totila, who had been advanced to the Gothic throne, required the presence of Belisarius; and accordingly he was again recalled from the east, and in 544, he arrived at the port of Ravenna, with an inconsiderable number of ill-provided recruits. Thus supported, he was unable to impede the progress of Totila, and to prevent his laying siege even to Rome. When the city was reduced to extreme distress by the want of provisions, the supply of which had been long obstructed by the besieging army, Belisarius made a bold attempt for its relief. But his enterprise for this purpose having failed, Rome was obliged to submit to the Gothic yoke; and Belisarius could only prevail by his interposition to prevent its threatened destruction. Totila, having demolished its walls, and removed most of its inhabitants, marched into the south of Italy; upon which Belisarius took possession of it, and hastily fortified himself within its circuit; so that he was able thence to repulse the Gothic army which Totila brought against it. But whilst he was engaged in its defence, he was commanded by the emperor to leave a sufficient garrison at Rome, and to transport himself into Lucania, in order to suppress a revolt which had taken place in that province. In this war-like state he was bafely vanquished by the delay, disobedience, and cowardice of his officers; and having repulsed in his winter-quarters at Crotona, he was obliged by the rapid march of the Goths to make his escape to the coast of Sicily. At length Antonina, who had been sent to Constantinople to solicit succours, obtained, after the death of the emperors, permission for Belisarius to return. Accordingly, after failing to deliver Italy from the Goths, and wandering like a fugitive along the coast, without daring to march into the country, or to accept the bold and repeated challenge of Totila, he was recalled in September 548. The inglorious success of Narses in recovering Italy, threw a shade over the military reputation of Belisarius; though about 10 years afterwards he distinguished himself by laying the capital from an incursion of the Bulgarians, who had advanced to its long walls, about 40 miles from the city, and occasioned an universal alarm. The enemy were put to flight by the military veteran at the head of a tumultuary band; though it was necessary to purchase their return into their own country by a heavy ransom. This was the last exploit of Belisarius; and his remaining days were doomed to misfortune and disgrace. The jealousy of the emperor, increasing with his years, led him to suspect Belisarius of being concerned in a conspiracy against his crown and his life; and the veteran general, after forty years' service, and on incompetent testimony, was judged guilty, Dec. 5, A.D. 567. His life, indeed, was spared, but his fortunes were fequestrated, and he was guarded for several months, as a prisoner, in his own house. At length, July 19, A.D. 564, his innocence was acknowledged; his freedom and honour were restored; and death, which might have followed by refinement and grief, removed him from the world about eight months after his deliverance, March 13, A.D. 565. "The name of Belisarius," says Gibbon, "can never die; but instead of the funeral, the monuments, the statues, so justly due to his memory, I only read, that his treasures, the spoils of the Goths and Vandals, were immediately confiscated by the emperor. Some decent portion, however, was reserved for the use of his widow; and as Antonina had much to repent, she devoted the last remains of her life and fortune to the foundation of a convent. Such is the simple and genuine narrative of the fall of Belisarius and the ingratitude of Jutlinian. That he was deprived of his eyes, and reduced by envy to beg his bread, Give a penny to Belisarius the general, is a fiction of later times, which has obtained credit, or rather favour, as an strange example of the vicissitudes of fortune."
BEL

Belisarius in ten vulgar or political verses. (Vid. Corp. Poet. Græc. tom. ii. p. 311.)

"Εκτησις ἐξέδωκεν κράτην θαυματώδη, τοῦτον μιᾶν ἀπεκτάσατο τὸ γεγονός
Βελισαριος ὁδότης ἐν τῇ γερμανίᾳ
Ου τεχνὴ μὴ ὁδέσθη, αποτελεῖται ὁ λόγος τοῦ φαινομένου,"

This moral or romantic tale was imported into Italy with the language and manucripts of Greece; repeated before the end of the fifteenth century by Crinilus, Pontanus, and Volaterranus; attacked by Alicant for the honour of the law, and defended by Baronius for the honour of the church. Yet Tzetzes himself had read in other chronicles, that Belisarius did not lose his fight, and that he recovered his fame and fortunes. Gibbon's Hist. Decl. and Fall of the Rom. Emp. vol. vii.

The isle in the villa Borgehe, at Rome, in a fitting posture, with an open hand supplicating aloud, is commonly attributed to Belisarius; but it may be ascribed with greater propriety to Augustus, represented under the character of a mendicant, propitiating the anger of Nemesis. Suetonius (in Aug. c. 91.) informs us, that on a certain day every year, he humbled himself to the condition of a beggar, extending his open hand, and soliciting alms from the people. Winkelmann, tom. iii. p. 266.

BELISSO, in Ancient Geography, a town of Spain, near Augustilla Aforonica. Itin. Antoninii.

BELITANI, a people of Spain, according to Pliny.

BELITZ, in Geography, a town of Germany, in a prefécturate of the same name, in the circle of Zautch, and country of Middle-Mark of Brandenburg, seated on the river Neipeltitz, or Belitz, which has repeatedly suffered from fire. It is defended by old ramparts and ditches, and has a manufacture of cloth; 28 miles south-west of Berlin, and 12 south-west of Potzdam.

BELITZ, a town and district of the Russian empire, in the government of Mohilef, seated on a rivulet falling into the Sohne.

BELKANI, a town of Asiatic Turkey, in the province of Nadotia, 14 miles north of Satalia.

BELKIN, a town of Egypt, 45 miles south-west of Damietta, and 54 south-west of Cairo.

BELKOV, a river of Russia, in the government of Archangel, which runs into the Frozen sea. N. lat. 68° 30'. E. long. 58° 34'.

BELI, a popular machine, ranked by musicians among the number of musical instruments of percussion. The music of bells is altogether melody; but the pleasure arising from it consists in the variety of interchanges, and the various successions and general predominance of the confluence in the sounds produced.

The parts of a bell are the body or barrel, the clapper within side, and the ear or cannon, whereby it is hung to a large beam of wood.—Its usual matter is a kind of compound metal, called bell-metal. The thickness of its edges is usually 1/4 of the diameter, and its height twelve times its thickness. The bell-founders have a diapason, or bell-scale, with which they measure the size, thickness, weight, and tone of their bells. For the method of casting bells, see Foundry.

The found of a bell arises from a vibratory motion of the parts thereof, much like that of a musical chord. The stroke of the clapper, it is evident, must change the figure of the bell, and of round make it oval; but the metal having a great degree of ductility, that part which the stroke drove farthest from the centre will fly back again, and this even somewhat nearer to the centre than before; so that the two points, which before were the extremes of the larger diameter, now become those of the shorter. Thus, the circumstances of the bell undergo alternate changes of figure, and by means thereof gives that tremulous motion to the air, in which found conlits.

M. Perrault maintains, that the found of the same bell or chord, is a compound of the found of the several parts thereof; so that where the parts are homogeneous, and the dimensions of the figure uniform, there is such a perfect mixture of all these founds, as constitutes one uniform, smooth, even found: and the contrary circumstances produce hardship. This he proves from the bell's differing in tone according to the part you strike; and yet strike it any where, there is a motion of all the parts. He therefore considers bells as composed of an infinite number of rings; which, according to their different dimensions, have different tones, as chords of different lengths have; and when struck, the vibrations of the parts immediately struck determine the tone; being supported by a sufficient number of consonant tones in the other parts. Mr. Hawkhoe, and others, have found by experiment, that the found of a bell struck under water, is a fourth deeper than in the air: though Merfennus says, it is of the same pitch in both elements. This writer has treated largely of the different metals of which bells are formed, of their figure, consistency, and degrees of ponderosity, as they respect each other in a given series.

Bells are observed to be heard farther, placed on plains, than on hills; and still farther, in valleys, than on plains: the reason of which it will not be difficult to assign, if it be considered, that the higher the fonorous body is, the rarer is its medium: consequently the less impulsive it receives, and the less proper vehicle it has to convey it to a distance. There is a curious observation in a paper of M. Reaumur's in the Memoirs of the Paris Academy, relating to the shape most proper for bells, to give them the loudest and clearest sound. He observes, that an oval, and other vessels more immediately necessary for the service of life, where doublets made before bells, it probably happened, that the oblonging of those vessels to have a found when struck, gave occasion to making bells, intended only for found, in that form; but that it does not appear that this is the most eligible figure; for lead, a metal which is, in its common state, not at all fonorous, yet becomes greatly so on being cast into a particular form, and that very different from the common shape of bells. In melting lead for the common occasions of casting in small quantities, it is usually done in an iron ladle; and as the whole is seldom poured out, the remainder, which falls to the bottom of the ladle, cools into a mass of the shape of that bottom. This is consequently a segment of a sphere, thickest in the middle, and thinner towards the edges: nor is the ladle any necessary part of the operation, since if a mass of lead be cast in that form in a mould of earth or sand, in any of these cases it is found to be very fonorous. Now, if this shape alone can give found to a metal which in other forms is perfectly mute, how much more must it necessarily give it to other metals naturally fonorous in whatever form. It should seem that bells would much better perform their office in this than in any other form, and that it must particularly be a thing of great advantage to the small bells of common house-clocks, which are required to have a shrill note, and yet are not allowed any great size. M. Reaumur very judiciously observes, that if our fore-fathers had opportunities of being acquainted with the found of metals in this shape, we should probably have had all our bells at present of this form. Mem. Acad. Par. 1726.

With regard to the origin of bells, those of a small size are very ancient; but those of a large bulk, hung in towers and hung by ropes, were introduced at a much later period. Among the Jews, it was ordained by Moses, that the lower part of the blue robe, which was worn by the high priest in religious
religious ceremonies, should be adorned with pomegranates and gold bells intermixed at equal distances. (See Exodus, xxviii. 35, 36.) The kings of Persia are said to have had the hem of their robes adorned, like that of the Jewish high-priests, with pomegranates and gold bells. The Arabian princes wear on their legs large hollow gold rings, filled with small flints, which sound like bells, when they walk; and these, with similar appendances, give notice that the mihtrots of the house is passing, so that the servants of the family may behave with respect, and strangers may retire to avoid seeing the person who advances. Calmet supposes, that it was with some such design of giving notice that the high priest was passing, that he wore little bells at the hem of his robe; and that was also a kind of public signal that he was about to enter into the sanctuary. In the court of the king of Persia, no one entered the apartments without some warning; and thus the high priest, when he entered the sanctuary, defined permission to enter by the sound of his bells, and in so doing he escaped the punishment of death annexed to an indecent intrusion. The prophet Zachary (ch. xiv. 20.) speaks of bells of the horses, which were probably hung to the bridles or foreheads of war-horses, that they might thus be accoutumed to noise. Calmet.

Among the Greeks, those who went the nightly watch round in camps or garrisons, carried with them a little bell, which they rang at each century-box to keep the soldiers appointed to watch awake. A bell-man also walked in funeral processions, at a distance before the corpse, not only to keep off the crowd, but to advertise the flambe dialis to keep out of the way, lest he should be polluted by the sight, or by the funeral music. The priest of Proferpine at Athens, called "Hierophantus," rung a bell to call the people to sacrifice. The hour of bathing, at Rome, was announced by the sound of a bell, and hence it has been supposed they were used to mark the hours of devotion, and summon people to church. Servants in the houses of great men were called up in a morning by the sound of bells. Zoarax informs us, that bells were hung with whips on the triumphal chariots of their victorious generals, in order to remind them that they were still amenable to public justice. Bells were affixed to the necks of criminals going to execution, to warn priests to avoid to ill an omen as the sight of the executioner or condemned criminal, who was devoted and about to be sacrificed to the "di manes." To this superstitition some persons have attributed the custom in England of ringing parish bells, while a malefactor is on his way to the gallows; though others have generally supposed it was intended as a signal to all who heard it, admonishing them to pray for the passing soul. Phaedrus mentions bells annexed to the necks of brutes: "Celfa cervice eminis, clarumque, collo jactans tintinnabulam." Taking these bells away was construed by the civil law to be theft; and if the beast was thus lost, the person who took away the bells was to make satisfaction. Sheep had them tied about their necks, to frighten away wolves, or rather by way of amulet, or to direct sheepherds where to find their flocks; and since the practice of bleeding them has been introduced, they have been thought to preserve animals from epidemic diseases.

The uses of bells are summed up in the Latin dilictum: "\[1.\] Laudo Deum verum, plebem voco, congregra clerum, Defunctos ploro, pelem fugo, fella decoro." To the same purpose is the following inscription on bells, mentioned by Weeber, in his "Funeral Monuments," p. 122.

"Funera plango, falgura frange, fabbata pange, Excito leuto, dippo venitos, pace creantem."
mallets. Leo Allatius, in his Difertation on the Greek temples, proves the contrary from several ancient writers. It is his opinion that bells first began to be difused among them, after the taking of Constantiinople by the Turks; who, it seems, prohibited them, left their found shoal disturb the repose of souls, which, according to them, wandered in the air. He adds, that they still retain the use of bells in places remote from the intercourse of the Turks; particularly, very ancient ones in mount Athos. F. Simon thinks the Turks rather prohibited the Chrislrians the use of bells out of political than religious reasons; inasmuch as the ringing of bells might serve as a signal for the execution of revolts, &c. The city of Bourdeaux was deprifed of its bells for rebellion; and when it was offered to have them refored, the people refufed it, after having tafted the cafe and con- veniency of being freed "from the confant din and jangling of bells."

Matthew Paris observes, that anciently the use of bells was prohibited in the time of mourning; though, at prefent, they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient custom to ring the bells for perfonns about to expire, to advertise the people to pray for them; whence our paffing-bells. The paffing-bell anciently ferved two purpofes: one of which was engaging the prayers of all good perfonns for departing fouls; and the other was, driving away the evil fpirits which haunted the bed and houfe, and which were ready to feize their pray, or to terrify and moleft the foul in its paffage; but by the ringing of this bell, it is faid they were kept at a diftance. To this circumlfance we may probably acribe the high price demanded for tolling the largest bell of the church; which being louder, and heard at a greater dis- tance, might keep these evil fpirits more remote, and also procure for the dying man a greater number of prayers.

Lobineux observes, that the custom of ringing bells at the approach of thunder is of some antiquity; but that the defign was not fo much to shake the air, and fo dif- tribute the thunder, as to call the people to church, to pray that the parish might be preferved from mischief by it.

Whatever occafion fome catholicks may have given for the reproach, that they attribute to bells the power of driving away demons, and difpelling ftrongs; it is certain the ancient canons of the church only acribe this power very remotely to bells. Their meaning feems to be this: Satan feaf and flies from the bells, because he knows that bells summoned good people to church to pray, and he dread their prayers. It was therefore to prayer, occafioned by the ringing of bells, and not to the bells, that fuch good effects were acribed.

The custom of chriftening or fuffling bells is very ancient. The charge of baptizing bells, alleged by protestants againft the Roman catholicks, has been denied by the latter; but they allow that they bell the bells with certain ceremonies as the do all other church utencils; and that one of the ceremonies is the giving of a name to the bell, in order to diftinguifh it from others, or in honour of lome faint. It seems reasonable, therefore, to acquift them of the blame of profiliuting baptism in this cafe, and to charge them merely with confe ranation and beneficence. Before bells were hung, they were wafted, croffed, bleded, and named by the bishop. This is what fome protestants have called baptizing of them; but others fay, it might be dennominated the biftration of them, resembhng the biftration of true pets among the Romans. Cardinal Boft obferves (Reft. Liturg. I. ii. c. 22.), that the name of fome faint is given to a bell at the time of its confe ranation, that the people may think themselves fum mooned to divine fervice by the voice of the faint whose name the bell bears. Some fay that this cuftom was introduced by pope John XIII. who occupied the pontific al chair from 955 to 972, and who firft confe racted a bell in the Lateran church, and gave it the name of John the Baptist. But it is evidenly of an older fanding; there being an explicit prohibition of the practice in a capitular of Charlemain in 789: "ut cloce non baptizentur." See Hofpiman de Origine Templorum, p. 113, where there is a particular account of all the ridiculous ceremonies practiced about bells. See Dr. Franklin's Observations on confe racted Bells, and the Form in confe racting them, Experiments, Observations, &c. p. 487. ed.1769.

Nankin, a city of China, was anciently famous for the largenes of its bells; but their enormous weight having brought down the tower in which they were hung, the whole building fell to ruin, and the bells have ever since been disregarded. One of these bells is near twelve English fets high, the diameter seven and a half, and its circumference twenty-three; its firge almost cindric, except for a swelling in the middle, and the thickens of the metal about the edges, seven inches. From the dimensions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that at Erfurt, said by father Kircher to be the greattest bell in the world. These bells were cafed by the firft emperor of the preceeding dynasty, above three hundred years ago. They have each their name, the hauger,tchou, the eater cbe, the fleper cbou, the will f. Father le Compôe adds, that there are seven other bells in Pekin, each in the reign of Youlo, each of which weighs 120,000 pounds. But the sounds even of their biffest bells are very poor; being fraught with a wooden instead of an iron clapper.

The Egyptians have none but wooden bells, except one brought by the Franks into the monastery of St. Anthony.

In the churches of Ruffia their bells are numerous, and diftinguished by their enormous fize. They are hung, particular by, at Moscow, in belferies or fleelies detached from the churches, with gilt or filver cupolas or croffes; and they do not fwear like our bells, but are fixed immovably to the beams, and rung by a rope tied to the clapper, and puliled fideways. One of these bells in the belfrey of St. Ivan's church at Moscow, weighs 175,876 English pounds. It has always been efteemed a meritorious act of religion to prefent a church with bells, and the piety of the donor has been eflimated by their magnitude. According to this mode of ellimation, Boris Godmof, who gave a bell of 288,000 pounds to the cathedral of Moscow, was the moft pious fo- reign of Ruffia, until he was furpaffed by the emprefs Anne, at whofe expence a bell was cafed, weighing 432,000 pounds, which exceeds in fize every bell in the known world. Its dimensions, as ascertained by Mr. Cox (Travels in Ruffia, vol. i. p. 522.), are as follow: the height is 19 feet, the circumference at the bottom 63 feet 11 inches, and its greateft thickens 23 inches. The beam to which this vail machine was fettten, being accidentally burnt by a fire in 1737, the bell fell down, and a fragment was broken off towards the bottom, which left an aperture large enough to admit two perfonns a breath without fooping.

The ringing or flieking of the bells, though it forms no part of divine worship, as some writers have alleged, ferves, however, by the number of frokes, to inform any perfon without the church what part of the religious service is be- ginning within it. Thus, feveral frokes are fliucked just before the masses; and this is called "blagovesh," i.e. the agreeable found, as a fummons to the paffions of God. Be- fore the commencement of the liturgy, it founds three; and in the middle of it, a few frokes are given to the bell, to let the people without know that the hymn to the holy virgin is now.
All persons, on hearing this, throw aside their work, bow, and cross themselves, repeating silently the words then ringing in the church. In the same manner is regulated the fisted number of strokes at the several periods of the vespers and the matins. On some holidays they are founded throughout the whole day. Took's Hifi. of Roufia, vol. i. p. 128.

The fame writer also informs us, that ringing the bells, on church and court holidays, is a species of exercise of which the Ruffians are very fond; but they produce nothing like harmony from them. The sole excellency consists in striking the clapper the oftener.

For further particulars relating to bells, see Changes in a given number of bells, Tintinnalogia, Carillons, and Ring.

Bell Bay, in Geography, a harbour on the south-west coast of East Greenland, to the north of Horn Sound. Bell Sound, is situated on the west coast of Spitzbergen, in the icy sea. N. lat. 77° 12'. E. long. 12° 40'. Bell, bearing the. See Racing. Bells, founder of. See Foundery. Bell, diving. See Diving. Bells, electrical, are used in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, consists of three small bells suspended from a narrow plate of metal (Plates, Electricity), the two outermost by chains; and that in the middle, from which a chain passes to the floor, by a fliken string. Two small nobs of brass are also hung by fliken strings, one on each side of the bell in the middle, which serve for clappers. When this apparatus is connected with an electrified conductor, the outermost bells suspended by the chains will be charged, attract the clappers, and be struck by them. The clappers, becoming electrified likewise, will be repelled by these bells, and attracted by the middle bell; and discharge themselves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermost bells, and thus, by striking the bells alternately, occasion a ringing, which may be continued at pleasure. Flashes of light will be seen in the dark between the bells and the clappers; and if the electrification be strong, the discharge will be made without actual contact, and the ringing will cease. An apparatus of this kind, connected with one of the conductors that are erected for securing buildings from lightning, will serve to give notice of the approach and passage of an electrical cloud.

Bell-glares, in Chemistry, a convenient vessel for many chemical operations, particularly upon gaseous bodies. It has the advantage of not being easily overthrown, and is readily manageable by the knob of glass at the top. When used it is always inverted or standing with the open end downwards. See Plates in Chemistry.

Chemical bells are a sort of receptacles chiefly used in preparing the oil or spirit of sulphur, for gathering and condensing fumes into a liquor.

Bell, in Building, is used to denote the body of the Corinthian and Composite capital, by reason of its resemblance to the figure of a bell inverted. In this sense, bell is the name with what we otherwise call cufs and tambour, sometimes also corbelt. The naked of the bell is always to be even and perpendicular with the bottom of the flutings of the column.

Bell-flower, in Botany. See Campanula. Bells, hair, in Botany. See Hyacinth. Bell-metal, an important alloy, composed principally of copper and zinc. See Copper. Bell-animal, in Zoology, a name given by some of the early writers on microscopical discoveries, to creatures of the Hydra genus. The bodies of these animals are shap'd like bells, and they have very long and slender tails, by which they fasten themselves to the roots of little plants. They are usually found in great numbers together, in a fort of clusters or bunches; and all of the same branch have always the same motion, very frequently contracting themselves, and afterwards expanding all together to the full length of their tails. They usually contract instantaneously; but are more flow in the expanding themselves again. Baker's Microf. p. 90. See Hydra.

Bell-musculus, in Botany, a name given by some authors to the plant called hamin moschata, and mosch-feed. Bell-pepper. See Capsicum. Bell-poly, in Zoology, is the name applied to one particular species, the extremities of whose branches resemble bells, and which is now called Verticillium Umbellatinum. Bell-weed, an English name used by some authors for the jaca-negra, or common knap-weed, called also by many English writers Manselion.

BELLS, STEFANO DE LA, in Biography, an eminent engraver, was born at Florence in 1619, and after having been for some time employed in the business of his father, who was a goldsmith, applied to the study of engraving, and became the disciple of Santa Gallina. At first he imitated the manner of Callot, who had been a disciple of the famous master; but acquiring a facility in handling the point, he adopted that of others by his own, which is laid to have surpassed, in freedom and spirit, that of Callot. At Paris, where he removed in 1642, he formed an acquaintance with Israel Silvestre, and was much employed by Henriette, the uncle of Silvestre. Upon his return to Florence, he obtained a pension from the grand duke, and was appointed to instruct the prince Cionus, his son, in the art of design. But being habitually subject to violent pains in the head, they at length terminated his life in 1664. The free and masterly etchings of this excellent artist are well known; and his distinguishing excellence consists in the freedom of his point, and the lights and elegance of his figures. He drew correctly; and with great taste; and his works display much genius and great fertility of invention. Their lightness is compensated by their fire and animation. He is said to have engraved 1400 plates; among which are, "Six Views of Livourne;" several sets of "Shipping;" "A Holy Family;" several "Madonas;" a "View of Pont-neuf?" at Paris; "St. Propper;" a feature print; five small ovals, in which is represented "Death carrying away persons of various ages;" "Death mounted on the skeleton of a horse;" "Parallels;" and the "Rock," both fierce; "Animals;" "Diggers;" and various sets of "Hunting;" "Shipping;" "Landscapes;" "Ornaments;" &c. Strutt.

Bella Polla, or Terra Polla, in Geography, a small high island, resembling two islands with lofty round hills, to leagues N. E. by N. from cape Angelo, and 4 leagues N. W. from Gavialand; situate on the coast of the Moro in the Archipelago.

Bella, in Entomology, a species of Phalena (lambea), found in North America. The wings are yellow, with six rows of black dots: posterior wings red, with black tips. Linn. Mos. Lud. Utr.

BELLAG, in Geography, a town of France, and principal of a district, in the department of the Upper Vienne, seated on the Vircinelle. It derives its name from an old fortified castle, erected in the 10th century, and contains about 2100 inhabitants. N. lat. 45° 7'; E. long. 57'.

BELLAGDA, a town of Acha, in the province of Ducberek, 45 miles west of Rabba.

BELLODONNA ify, in Botany. See Amarvllis. BELLADONNA,
BELLADONNA, a name given by the Italians to the deadly nightshade, because the ladies make a cocain of the juice, or distilled water, which they use to make their complexion fair and white. Ray.

Others derive the name from the intoxicating quality of this plant: "Quod inominis pulcherbas offendat virgines feminique." Bod. Comment. in Theophrast. 1786. See ATROPA.

BELLADONNA, in Entomology; Papilio Cardui, is described under this name in the Fauna Bocca. Linna. t. 1, p. 778.

BELLAIRE, in Geography, a post town of America, near the centre of Harford county in Maryland, and the chief town of the county. It contains a court-house and gaol, and has but few inhabitants. Distant from Harford 6 miles, N. W. 22 N. E. from Baltimore, and 86 W. S. W. from Philadelphia.

BELLAÑO, a town of Italy, in the Milanese, 17 miles north of Como. It is situated at the foot of a lofty precipice; rent from top to bottom by a chasm, through which a furious torrent forces its way. A bridge is thrown across the chasm, from which the spectator looks down into a deep gulf, and an aqueduct is conducted along the steep sides of the rock.

BELLARGUS, in Entomology, a species of Papilio (Peb. rub.) described by Effer; and is Papilio Adamsi, Gmel., &c.

BELLMARIN, Robert, in Biography, a cardinal of Rome, and one of the most famous controversial writers of his time, was born at Monte Pulciano, a town of Tuscany, in 1542, and entered into the society of the Jesuits in 1560. He was ordained priest by Janfenuis in 1569, and in the following year advanced to the theological chair in the university of Louvain. Having remained seven years in the Low Countries, he returned to Italy, and in 1576, began to read lectures at Rome on controversial subjects; and having been honoured by three successive popes with important commissions, he was, in 1598, nominated to the cardinalate by Clement VIII., with this distinguishing eulogium: "We choose him because the church of God does not forfeit his equal in learning." In 1602, he was created archbishop of Capua; and it is supposed he would have been raised to the papal chair, if he had not been a Jesuit. In about four years he resigned his episcopal see, being recalled to Rome by pope Paul III. and here he continued his services to the church, till the year 1621, when he retired from the Vatican to a house of his order, in which he died the same year, at the age of 79. When he was visited in his last illnesses by pope Gregory XV., he expressed his profound veneration for the pontiff, as Christ's vicar on earth, by blessing him on his entrance with the words of the centurion to Christ: "Lord, I am not worthy that thou shouldest come under my roof." On the day of his funeral it was necessary to keep off the populace by a military guard, as they pressed on, either to touch his body or to procure some relic of his garments, as if he had been a saint.

Bellarmine was a very strenuous defender of the Catholic religion against the reformers; and for some years his arguments were selected by protestant divines as special objects of refutation. His famous work is "A Body of Controversy," written in Latin, and frequently reprinted; of which the best edition is that of Pragia in 1721, 4 vols. folio. The style of this work, without pretending to purity or elegance, is pathetical, prelatic, and free from scholastic barbarism. His manner is distinctive and methodical; and his statements of the opinions and objections of his adversaries are so fair and so forcible, that it has been questioned by some of his own party, whether his works were not likely to do more harm than good. In his proofs and refutations, however, he is very copious; and displays an extent of learning in scriptural criticism, in the commentaries of fathers and councils, and in the doctrine and practice of the church in all ages, becoming a controvertist, who determines every point by authority, and not by reasoning. With respect to the doctrines of predestination and efficacious grace, he is more an Augustinian than a Jesuit; nor does he adopt that lax morality which was imputed to some of his own order. Besides this principal work, he wrote "A Commentary on the Psalms;" "Sermons;" "A Tantivy on Ecclesiastical Histories;" "A Tantivy on the Temporal Authority of the Pope;" "A Treatise on the Holy Rosary;" "The Groans of the Dove;" "On the Obligations of Bishops;" and "A Hebrew Grammar." Some of his works, and particularly his book on the temporal authority of the pope, raised adversaries against him in his own communion, whilst his declaration of the right of the pontiffs to depose princes, caused it to be condemned by the parliament of Paris; his assertion of the indirect power of the popes in temporal matters, fo offended the court of Rome, that Sixtus V. caused it to be inscribed in the Index of the Inquisition. Some Protestants, by excess of zeal, injure their own cause; they circulated unfounded and malignant calumnies against his morals, &c. Joseph Scaliger has even asserted, that he did not believe a word of the doctrines he defended; whereas it is most probable that he inclined to superstition in faith, and to ferupulosity in practice. At his death he bequeathed one half of his soul to the Virgin Mary, and the other half to Jesus Christ; and, it is said, that he would not allow the vermin that infested his body to be molested; under the plea, that these animals had no other paradise than their present existence, of which it was cruel to deprive them. His right to canonization was strongly urged; and the popes were prevented from allowing his claim merely by the fear of giving offence to those sovereigns whose temporal rights he had opposed. Gen. Dict. Nouv. Dict. Hist. Mollien, Eccl. Hist. vol. iv. p. 221, &c.

BELLAIS, in Geography, a small town of Portugal, in Estremadura, containing about 1240 inhabitants.

BELLATOR, in Entomology, a species of Citha (Spotted). It is brown above, beneath yellowish; antennæ black annulated with white. Gmelin. A native of Cayenne. This is Coreus Bellator of Fabricius.

BELLATRIX, in Astronomia, a ruddy, glittering star of the second magnitude, in the left shoulder of Orion.

It takes its name from bellum, as being anciently supposed to have great influence in kindling war, and forming warriors.

BELLAY, William du, in Biography, a French general, signalized himself in the service of Francis I. by his valor as an officer, and by his talents as a negotiator. He was a valiant and successful in his efforts for inducing some of the universities of France to pronounce judgment in favor of the divorce of king Henry VIII. from his queen Catharine; and he was employed in several embassies to Germany for the purpose of conciliating the princes of the Protestant league, and evading their objections against the king his master's severity in punishing heretics. Bellay was eminently distinguished for his address in penetrating, by his spies and intrigues, into the dehns of the enemy; and he succeeded in Piedmont, whither he was sent in quality of viceroy, in taking several towns from the Imperialists. Being devious in communicating in person some important intelligence to the king, and being very informer, he ordered a litter for his conveyance; but having passed the mountains of Tarara, betwixt Lyons and Roan, he was under a necessity of hopping at St. Zaphorin.
Zaphorin, where he died January 10th 1543. He was buried in the church of Mans, and a noble monument was erected to his memory. He was the author of several works; of which the principal was "The History of his own Times," in Latin and French, which he divided into eight books, each containing eight books. Of this work some few fragments only remain, prefered by his brother Martin Du Bellay, in his "Memories from 1531 to 1543." They are written in a simple and lively manner, but are somewhat partial in favour of Francis I.

Bellay was one of the first French writers who expressed a doubt of the miraculous facts recorded of Joan of Arc. Gen. Dicr.

Bellay, John du, a cardinal, younger brother of the preceding, was born in 1492; and having made considerable proficiency in literature, was highly esteemed by Francis I. By him he was employed in several embassies, particularly in negotiating a reconciliation between Henry VIII. of England and the see of Rome; and he was advanced by him to several considerable preferments. Bellay, in the business of the Cardinal of Lorraine, and returning to Rome, he refixed his preferments in France, and was made bishop of Orléans. He was so much respected by his brother cardinals, that they had thoughts of raising him to the pontificate, when he died in 1560 at Rome, aged 65 years. Bellay was distinguished as a patron of literature; and by his advice, in concurrence with that of Budan, Francis I. founded the royal college in 1529. He was an elegant writer, both in Latin and in French. In the Latin language he wrote some harangues, and an apology for Francis I., and in the latter three books of poems, containing of elegies, odes, and epigrams, published by R. Stephens, in 1546. Gen. Dicr.

Bellay, Joachim du, a French poet, was born at Lire in Anjou, about the year 1524; and amidst various domestic misfortunes, which marked his earlier years, he directed his attention to the study of the ancient and modern poets. At length his own performances in verse made him known at court, and he became the delight of Francis I. Henry II. and Margaret queen of Navarre. He was characterized by the appellation of the "French Ovid," which seemed to have not improperly been bestowed upon him, on account, partly, of the sweetness and facility of his muse, and partly of the licentiousness of some of his pieces. In the sonnets he particularly excelled, and a rank has been assigned to him as a poet next to that of Rosanf. He followed his relation the cardinal to Rome; and on returning with him to France as his agent, he lost his favour in consequence of charges of irreligion and immorality which were alleged against him. But another relation, who was bishop of Paris, gave him a canonry in his church in 1555, and he had the prospect of further preferment; but was carried off by an apoplexy, January 3, 1561. His French poems were published in 1561, and his Latin ones in 1569. Nouv. Dicr. Hist.

BELLE DE NUIT, in Botany, a name which the French give to the flower of the Jalap.

BELLE BAY, in Geography, a harbour on the N. E. part of the great bay, called Fortune bay, on the south coast of the island of Newfoundland, in the Atlantic ocean. Also, another bay on the N. W. side of the same island, 6 or 8 leagues N. W. from the bay of Isles, and about as much S. W. from the small bay of Higournachet.

BELLE DUNE, Lo, or Handsome Town, a long projecting barren point, on the south side of Chaleur bay in North America, about 8 leagues N. N. W. of Nipisquin, where temporary cod and herring fisheries are carried on by different people; no trade being established at the place.

BELLE ISLE, Bellellefe-Mor, or Bellefe, an island in the bay of Bicifey, near the W. coast of France; about 9 miles long, and from 2 to 4 broad, surrounded by steep rocks, which, together with the fortifications, render the conquest of it difficult. It was taken by the English in 1561, but restored at the peace in 1563. The soil is various, rocky, with salt marshes, and some fertile grounds. Besides Palais, the capital, it contains three other small towns, and about twenty villages. N. lat. 47° 17' 30'. W. long. 3° 6' 30'—Also, a small island of France, in the river Loire, in the department of the Mayenne, half a league west of St. Mathurin.—Also, an island on the east side of the northern part of Newfoundland, east of Canada-head between 50° 42' and 50° 50'. N. lat. and between 55° 39' and 55° 46'. W. long.—Also, an island of North America, at the mouth of the straits of this name, between the country of the Elquimaux, or New Britain, and the north end of Newfoundland. The island is about 7 leagues in circuit, and lies 16 miles south from the nearest land on the coast of Labrador, or New Britain. On the north-west side it has a harbour for fishing vessels, or small craft, called "Lark harbour," and, on the E. point, it has another small harbour or cove, which will admit sloops. The narrow channel between Newfoundland and the coast of Labrador, called the "Strait of Belle Isle," receive several rivers from the coast of Labrador. Those straits lead into the gulf of St. Lawrence from the N. E. and are distant 5 leagues N. from Newfoundland. The point of the island is in N. lat. 51° 57', and the south point in N. lat. 51° 48' and W. long. 55° 40'.—Also, an island of Ireland in lowh Erme, in the county of Fermanagh, 6 miles S. E. of Enniskillen.

BELLE ISLE EN TERRE, a town of France, in the department of the Northern coast, and chief place of a canton, in the district of Guingamp. Situated on an island in the river Guer; 3 leagues west of Guingamp.

BELLE PLAINES, a valley of Piedmont, in the Alps, situate partly in the county of Nice, partly in the county of Tenda, a few miles N. W. of Saorgio.

BELLEFOREST, Francis du, in Biography, was born at a village called Sarzan, in the province of Gienne in 1530, and after an early education in the court of Navarre, was sent to study the law at Toulouse. But employing himself in writing panegyrics in bad verses, on all the noblest in and about Toulouse, by whom he was rewarded with praise and entertainment, he removed to the capital; and by attention and industry attained to some reputation in the reigns of Charles IX. and Henry III. So that he gained the post of historiographer-royal, which he afterwards lost for want of paying due regard to fact in his productions. He is said to have composed more than 25 works on different subjects, during a life of 53 years, as he died at Paris in 1583. 'It is related of him, that there was neither tongue nor science which he did not profane. His most fertile topic was history; and he published compilations of "Tragical Histories," and "Wonderful Histories." The only two works worth recording are, "The History of the nine Kings of France, of the Name of Charles," folio; and "The Annals of general History of France,"
BELLEGRARDE, John-Baptist Morvande, usually called the "Abbé," was born of a family of rank in the diocese of Nantes, in 1648, and entered into the society of the Jesuits. His taille and tyle were formed by father Bouhours, under whom he ranked as a disciple. Attached to the principles of Descartes, which were opposed by them, he abandoned the society of Jesuits, after continuing in it 16 or 17 years, and taking priest's orders; and entered into the world, preaching occasionally with applause, but devoting himself chiefly to the profession of an author. Under this character he wrote many books, and supported himself chiefly by the profits accruing from them, distributing to the poor every thing that exceeded a bare maintenance. Some time before his death he desisted from his literary labours, sold his books, and retired to the community of St. Francis de Sales at Paris, established for the support of poor priests, and here he died in 1734. His voluminous publications conflict chiefly of translations from the works of St. John Chrysostom, St. Basil, St. Gregory Nazianzenus, St. Ambrose, Thomas à Kempis, &c. and also from Ovid, Virgil, and other profane writers. His style is pure and elegant; but he often malicates the sense of his author, especially of the Greek fathers. The subjects of his original works aim in general, morals, and matters of taste. Those that have been most favourably received are, "Reflections on Ridicule," "Reflections on what may please and displease in the commerce of the world," and "Reflections on Elegance and Politeness of Style." These, and some other pieces, form a collection of 14 small volumes. Nouv. Dict. Hist.

BELLEGARDE, in Geography, a fortified town of France, in the department of the Aisne; it was taken by the Spaniards in 1674, and retaken the following year by marchal Schomburg. After the peace of Nimeguen, Louis XIV. built a regular fortress with five bastions to defend the Pyrenees; 5 leagues S. of Perpignan.—Also, a town of France in the department of the Loiret, and chief place of a canton, in the district of Bois-Commun, 3 miles south-east of Bois-Commun.—Also, a town of France in the department of the Creuse, and chief place of a canton, in the district of Aubusson; 2 leagues east of Aubusson.

BELLELAY, a small town or village of Germany, in the circle of the Upper Rhine, and bipherie of Bale, with a rich abbey of Benedictines. It is distant about 20 miles from Porena, in a solitary but unpleasant situation, surrounded by mountains and sheltered by forests. In this place is instituted a military academy for young nobility and gentry.

BELLEM. See Belem.

BELLEN, a town of Switzerland, in the canton of Schaffausen, 9 miles N. E. of Zug.

BELLENAVE, a town of France, in the department of the Allier, and chief place of a canton in the district of Gannat, 4 leagues N. W. of Gannat.

BELLECOMBRE, a town of France in the department of the Lower Seine, and chief place of a canton, in the district of Neufchatel; 3 leagues west of Neufchatel, and 5 S. S. E. of Dieppe.

BELLENDE, William, (Belldendus, Lat.) in Biography, a man of extensive reading and refined taste, was born in Scotland, and flourished in the beginning of the 17th century. He was professor of the Belles Lettres in the university of Paris in 1602, and continued for a considerable time in that capital, even after he was made master of the pleas or requests to king James I. of England. At Paris he published, in 1658, his "Cicero Princips," containing a body of extracts from Cicero's writings, relative to the maximum of monarchical government, and the duties of a prince. This work he dedicated to Henry, prince of Wales, and he prefixed to it a preface "De Procellarum Scriptoribus Regibus," in which there is a rich vein of philosophic sense and fervent piety. The origin of our errors in religion, and of our defects in policy and morals, is traced out with considerable accuracy and learning. But while the author commends the monarchical tenets of ancient idolatry, and the gross corruptions of philosophy, he beholds many just comimonies on the wisdom and the patriotism of some ancient legislators. In 1612, the author published a work similar to the former, under the title of "Cicero Confulum, Senatorinum Romanum," on the nature of the confideral office, and the constitution of the Roman senate. Encouraged by the reception given by the public to these works, he conceived the plan of a third work, "De Statu Prisci Orbis," which was to contain a history of the projects of government and philosophy from the Antediluvian times to their various degrees of improvement under the Hebrews, Greeks, and Romans. This work was dedicated to Charles, prince of Scotland and Wales; but when he had proceeded so far as to print a few copies of this work, in the year 1615, it was suppressed to him, that his three treatises, "De Statu Princi-ips," "De Statu Reipublica;" and "De Statu Orbis," being on similar and connected subjects, might be united in one work; accordingly they were republished in this form under the title of "Bellenendus de Statu," in 1616. Beldenend afterwards projected a more extensive work "De Tribus Luminis Romorum," in which Venetus and Plato were to be joined to Cicero; but death prevented the execution of his whole plan. He was an elegant writer, and a man of extensive knowledge and sound judgment. His Latin style is formed upon that of Cicero; and he embraces every opportunity of interchangeing the most choice and proper phraseology from the Roman orator, even whilst he is expressing his own sentiments, so that it is not always easy to distinguish the sentences cited from Cicero from his own language. The book "De Statu," was reprinted in London in 1787, 8vo. by an anonymous editor (supposed to be the learned Dr. Parr) with a Latin preface by the editor, relating to the politics and public characters of that period, and beautiful engravings of Mr. Burke, lord North, and Mr. Fox, to whom the three treatises are respectively dedicated. To preserve the memory of every composition which flowed from the pen of Bellenendus, the editor has inserted an epitaph on the marriage of Charles I. and a "pange-gyric cemen" on the embassy to Spain. These verses were found in the British Museum.

The editor owns his firm conviction that Dr. Middleton, in his celebrated history of Cicero, was much indebted to the writings of Bellenendus, although he has never mentioned his name. Pref. to Bellenendus de Statu. Monthly Review, vol. xxiv., p. 491, &c. vol. xxvii., p. 504, &c.

BELLEFOUR, in Geography, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Pont-a-Mousson; 2 leagues S.E. of Pont-a-Mousson.

BELEROPHON, in Fabulous History, the son of Glaucus, king of Ephesos or Corinth, was contemporary with Jason. Under a charge of homicide, as some say, on his own brother, he was forced to retire to the court of Pallas, king of Argos, where he was accursed by Sthenobaz, or as Homer says, Antes, the wife of Pallas, of an attempt upon her chastity. For this inult Pallas sent him to Jopatas, his father-in-law, king of Lycia, with private instructions to put
him to death. Jobates demurring against the execution of these orders, employed him in several dangerous expeditions against the Solymi; and against the Amazons, from which he returned victorious. Having thus ingratiated himself with Jobates, he obtained his daughter in marriage, and a settlement in a fertile part of Lydia, where he resigned and brought up his son. From Homer's account, which represents him as "laid by the gods, and wandering in the Abytain plain, a prey to melancholy, and avoiding all commerce with men," he seems to have become insane, and to have died in that state. To his various exploits Homer and other writers have annexed the story of his killing the triiform monster called the Chimaera, by the affluence of the flying horse Pegasis, granted him by Minerva and trained for his use. Of the numerous conjectures that have been offered for the explanation of this fable, we shall only mention that of Bucbattt, (Phaleg. l. i. c. 6.) who supposes, that in his expedition against the Solymi, he overcame them, and also their three gods, which they painted on their ensigns, in the several forms of a lion, a goat, and a dragon; and which he probably joined together on his own, in memory of his conquest; and this gave birth to the fable of his killing the monster Chimaera. Homer. ihiad. vi. Anc. Univ. Hist. vol. v. p. 97, &c.

BELLES LETTRES, considered as synonymous with polite literature, however vaguely and indefinitely these terms have been often used, properly comprehend those subjects that relate to man as a being endowed with fents of taste and imagination, which were intended to embellish his mind, and to supply him with rational and useful entertainment. In this restricted sense they include the origin, structure, and various kinds of language, or grammar, universal and particular, criticism, rhetoric, in all the extent of composition, lyric, and choral; history, in its several departments, ancient and modern, general and special, and all the different kinds of poetry. In the distribution of the Lyceum of Arts, established at Paris in 1792, the belles lettres comprehend general grammar, languages, rhetoric, geography, history, antiquities, and numismatography; whereas, those parts of learning that are of a more grave, sublime, or abstruse kind, and that are more immediately the objects of the understanding, such as logic, metaphysics, ethics, and the various branches of the mathematics and natural philosophy, are usually referred, by way of distinction, to the class of sciences. This distinction, however, is not rigidly observed, even by Rollin and others, who professedly treat of the belles lettres. In their confined and appropriate meaning, they open a field of investigation peculiar to themselves. Their province comprehends every thing that relates to beauty, harmony, grandeur, and elegance; every thing that can soothe the mind, gratify the fancy, or move the affections. They present human nature under a different aspect from that in which it assumes, when viewed by other sciences. They bring to light various springs of action, which, without their aid, might have passed unobserved; and which, though of a delicate nature, frequently exert a powerful influence on several departments of human life. Such studies have also this peculiar advantage, that they exercise our reason without fatiguing it. They lead to enquiries acute, but not painfully profound, but not dry or abstruse. They threw flowers in the path of science; and while they keep the mind bent, in some degree, and active, they relieve it at the same time from that more toilsome labour to which it must submit in the acquisition of necessary erudition, or the investigation of abstract truth. Besides, the study of polite literature furnishes an agreeable amusement for those intervals of leisure which occur in every man's life; and thus procures his being a burden to himself, or recurring to the indulgence of pernicious passions, and the pursuit of licentious pleasures. The satisfactions which this study imparts, occupy a kind of middle position between those of mere sense and those of pure intellect: they refresh the mind after the toils of intellect, and the labours of abstract study; and they gradually raise it above the attachments of sense, and prepare it for the enjoyments of virtue. Of those, whose minds in early life incline to polite literature, good hopes may be entertained, as this liberal and elegant turn is favourable to many virtues; whereas, to be entirely void of relish for eloquence, poetry, or any of the fine arts, is an unpromising symptom of youth, and furnishes suspicions of their being prone to low gratifications, or destined to drudge in the more vulgar and illiberal pursuits of life. A cultivated taste increases facility to all the tender and humane passions, by giving them frequent exercise, while it tends to weaken the more violent and fierce emotions:

"Ingenius didicisse fideliciter artes,\[ Emolit moris, nec finit elic feros.\] "Thela politi'd arts have humaniz'd mankind, Soft'en'd the rude, and calm'd the boist'rous mind."

The elevated sentiments, and high examples which poetry, eloquence, and history, are often bringing under our view, naturally tend to nourish in our minds public spirit, the love of glory, contempt of external fortune, and the admiration of what is truly illustrious and great. Although it should not be said that the improvement of taste and virtue are the same, or that they may be always expected to co-exist in an equal degree; yet it must be allowed, that the exercise of taste is, in its native tendency, moral and purifying. From reading the most admired productions of genius, in poetry or in prose, almost every one rises with some good impressions left on his mind; and though these may not always be durable, they are at least to be ranked among the means of diffusing the heart to virtue. Indeed, without possessing the virtuous affections in a strong degree, no man can attain eminence in the sublime parts of eloquence. He must feel what a good man feels, if he expects greatly to move, or to interest mankind. They are the ardent sentiments of honour, virtue, magnanimity, and public spirit, that only can kindle that fire of genius, and call up into the mind those high ideas, which attract the admiration of ages; and if this spirit be necessary to produce the most distinguished efforts of eloquence, it must be necessary also to our relishing them with proper taste and feeling. Blair's Lectures on Rhetoric, and Belles Lettres, vol. i. sect. 3. Rolfin's Method of Treating and Studying the Belles Lettres, vol. i. p. 3, &c.

BELLESME, in Geography, a town of France, and principal place of a district, in the department of the Orne, containing about 2,500 inhabitants, and distant 3 leagues south from Mortagne.

BELLEVSEVRE, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the district of Louhans, 41 leagues distant N. N. E. from Louhans.

BELLEVILLE, a town of France, in the department of Paris, and chief place of a canton, in the district of St. Denis, half a league from Paris. Allo, a town of France, in the department of the Rhone and Saone, and chief place of a canton, in the district of Villefranche, 3 leagues north of Villefranche. Allo, a town of France, in the department of Vendee, and chief place of a canton, in the district of La Roche-Fur-Yon, one league north of La Roche.

BELLEVOIS, in Biography, a painter of sea-pieces, known
known through all parts of Europe as a good painter, died in 1654. His subjects are views of hOVens, farm-ports, shores, calms, and storms at sea: but in his calms he flew his pecu-

linary excellence. His touch is light, and his colouring clear, the perspective of his farm-ports and buildings is true, and has an agreeable effect: his skies are generally bright, and judiciously managed, and his colouring is transparent. His figures are indifferent, and without much expression. His pictures occur in public fales, and some of his best fyle fetch a tolerable price. Pilkington.

BELLEY, Lat. Belta, in Geography, a town of France, and principal place of a district, in the department of the Ain, before the revolution the capital of Le Bugy, and seat of a bishop, seated among hills and small eminences, about 2 miles from the Rhone, and twelve miles east of Lyons. N. lat. 45° 45'. E. long. 5° 35'.

BELGROVE, a town of America, in Bergen county, New Jersey, on the road to Albany, within half a mile of the line that separates New York from New Jersey, which extends from Delaware river to that of Hudson; distant 24 miles N, by W, from the city of New York.

BELL, in Modern History, the name of a society or sect among the Negroes of Africa, in the interior kingdoms of Sierra Leone, which is properly a school or seminary for the education of children, renewable every 25th year by order of the king, who is visitor or superior of the college. Here the young men learn to dance, fight, fish, hunt, and above all, to chant a certain hymn, which, in the language of the college, they call "bellalung," or the praises of bell: these songs consist only of a repetition of the same kind expressions, enforced by the most indecent and lascivious passages. When a young negro is become an adept in this practice, he is ad-

mitted a fellow of the college, deemed to be qualified for all employments, temporal and spiritual, and entitled to a num-

ber of important privileges.

BELLICA column, in Antiquity, a column near the tem-

eple of Bellona, from which the confuls or feeties call javelins towards the enemy's country, by way of declaration of war.

BELLIOSUS, in Entomology, a species of Cimex, (oblongus,) that inhabits Africa. It is of a brown colour: posterior thersarched and dentated; and four spines on the abdomen. Fabricius. Gneth.

BELLIQUO or Bellirici Marini, among Naturalists, denote a species of sea-felters of an umbilical figure, sometimes of a white colour, spotted with yellow; and sometimes of a yellow, streaked with black lines, after the fall fashion.

BELLIDASTRUM, in Botany, See Dondenicum.

BELLIDIOIDES. See Chrysanthemum.

BELLIEVE, Pompea Da, in Biography, chancellor of France, born at Lyons in 1529, studied at Tou-

louge and Padua, and in 1575, became superintendent of the finances, and in 1579 president of the parliament of Paris. Having been employed in several important embassies by Charles IX, and Henry III. and IV., he was created chancel-

ler by the latter in 1599, as a recompence for his services at the peace of Vervin. In the execution of his office he was enlightened, inflexible, inclined to austerity, and, by the warmth of his temper, to occasional precipitance. He was distinguished by his learning and eloquence, as well as by his talents for business. In 1604, he left the f cells, but continued in the poits of chancellor and president of the coun-

cell; however, he used to say, regretting his los, "that a chancellor without the fells was a body without soul." He died in 1607; and several elegies were bellowed on his memory, in honour of the regard which he always tended to learning and its profefors. The grandfon of the former

was distinguished, in the reigns of Louis XIV. and XV. by his legal and diplomatic talents; and was founder of the general hospital at Paris. Nouv. Dict. Hist.

BELLIMO, in Modern History, a mode of trial, or a

kind of purgation, practiced by the Negroes in the interior countries of Africa, when persons are accused of murder or

theft, and confessing of a composition of certain herb or banks of trees, which they oblige the accused to hold in his

hand, under a fall perfonation, that, if he be guilty, billers will immediately rise upon the skin. Sometimes the bellimo

confists in obliging the accused to swallow a large glass of a liquor composed from the bark of the negro and quasi trees,

which the negroes believe to be virulent poisons. The

innocent immediately reject it by vomit; but the guilty flew a froth about the mouth, and are accordingly judged worthy of
death.

BELLING of hope, denotes their opening and expanding to their customary figure, supposed to bear some relation to that of a bell. Hops blow towards the end of July, and bell the latter end of August or the beginning of September.

BELLINGHAM, in Geography, a small town of Northumber-land, England. It has a market on Tuesday, one fair annually, and is 300 miles north of London. In 1750, this town was nearly confumed by fire, and its houses now only amount to 70, and inhabitants to 337. About four miles to the south is the village of Wark, where are the keep and some ruins of an ancient castle.

BELLINGHAM, a small farming township of America, in Norfolk county, Massachusetts, containing 735 inhabitants, 20 miles N. from Providence, and 34 S. from Boston.

BELLINI, Laurence, in Biography, a learned and in-

genious physician, was born at Florence, in 1643. He had the advantage of being educated under Manchetti, Redi, and Borelli, and profited so well by their instructions, that he was made professor in mathematics and philosophy at Pisa, when he was only twenty years of age. He was also no mean proficient in oratory, poetry, and music, but propelling to practice medicine, he was soon advanced to the chair of professor in anatomy, a post he continued to fill with reputation for near thirty years. He was one of the principal supporters of the medico-mathematic school, who attempted to explain the functions of the body, the canes of diseases, and the operations of medicines on mechanical principles. In this he was followed by Archibald Pitoun, who read his works at the schools in Edinburgh during the lifetime of Bellini, and dedicated one of his own works to him. When he was fifty years of age, he was called to Florence, by Colomo III, who appointed him his physician, and about the same time, on the recommendation of Lanefi, he was made honorary, or consulting physician to pope Clement XI. but having more imagination than judgment, and endeavour-

ing to figure his practice to his theory, he was generally unsuccessful in his treatment of diseases, and thus soon forfeited the favour, Haller says, both of his prince and the public. In his anatomical researchs he was more successful, as he was the first who accurately described the nervous pamp 

piles of the tongue, and discovered them to be the organ of taste, of which he gave an account in his "Glius Organum

novissimé Deprehensum;" Bonon. 1662, 1663: and he had before, viz. in 1662, published "De Structura Remunn," Florent. 4to, which had been well received, as containing additional information on the anatomy of that organ. These works have been frequently reprinted, though now, from the great improvements that have been made in anatomy, but little noticed. In 1681, he published "De Urinis et Pulvis;" "De Miilleone Sanguis;" and "De Morbis Ca-

X 2
but the Swifs retired with a standard taken from the enemy, and they remained masters of the town. In 1500, however, the three cantons obtained what they long contended for; the habitants of Bellinzon, vexed by the frequent changes in the Milancé, submitted to them. The French, when they had conquered the duchy, in vain claimed it; the Swifs retained possession; and the seven Italian bailiwicks, and this amongst the rest, were formally ceded to them by Maximilian Sforza, in gratitude for their having relieved them in the duel for the crown. It was likewise made an article of the perpetual peace concluded between Francis I, king of France, and the cantons. The bailiffs remain in office two years; he is nominated alternately by the three cantons, and is generally removed from Riviera the poorest, to Bellinzone, the most lucrative of the three governments. An appeal lies from his decision to the syndicate, and from that court to the three cantons: in ecclesiastical affairs, the habitants are cognizable to the bishop of Como, excepting three parishes. The inhabitants are catholics; and most of the natives understand Italian, but the language is a corrupt German. After the French revolution, Bellinzone, according to the division of 1798, became a distinct department or canton, including the bailiwicks of Bellinzone, Riviera, and Val Leventina, of which the chief town was Bellinzone. By the constitution of 1801, the Italian bailiwicks formed the 17th department or canton of Swisserland, and was empowered to send five representatives to the diet. The riches of this district consist in its pastures and cattle; the deficiency of corn is supplied by the Milancé; and the plain near Bellinzone produces good wine.

**Bellinzone, or Bellinz, Lat. Bülis, Bülisona, Belisone, or Bellinza, the capital of the above bailiwick or department, is a beautiful town, situate at the foot of mount Cenero, on a delightful plain on the east side of the Ticino, a little below its junction with the Moesa or Mafa, and about 54 British miles above the northern extremity of the lake Maggiore. The town is encircled with ancient walls and battlements in good repair; on the right are seen the majestic ruins of an ancient castle, and on the left, separately embosomed in trees, are the castles of the bailiffs of the three regent cantons, Uri, Schwertz, and Underwalden. The interior of Bellinzone is far from corresponding with its external beauty and situation; the streets being narrow, and the houses ill built. It is, however, rich in fine churches, dedicated to St. Peter, St. Stephen, St. Blaise, and St. Rock; and it has numerous convents of Anguines, Ursulines, and Recolleclés. There is also a convent, or feminary, called the "Ruddiness," lately founded for the education of youth. The valley that lies between this town and the lake is level, and laid waste by numerous torrents; the road runs along the sides of the hills through continued vineyards, bounded on the west, and also on the east, by ridges which are clothed to their summits with woods of chestnuts and walnut trees, half concealing frequent spirts and numerous hamlets. N. lat. 46° 47'. E. long. 8° 43'.**

toothed. Stem of the hermaphrodite filaments five, capillary, very short; anthers cylindrical, tubular. Pig. germ ovate; of the hermaphrodite, style simple, stigma emarginate; of the female, style filiform; stigmas two, patulous. Per. none. Calyx unchanged. Seeds solitary, obovate, compressed; down none. Rec. naked, conical.

Propagation and Culture. The garden daisies flower in April and May, and make a pretty variety when intermixed with plants of the same growth; they should be planted in a shady border and a loamy soil without dung, on which they may be preferred without withering, provided the roots are transplanted, and parted every autumn. They should be kept clean from weeds. They were formerly planted for edgings to borders; but for this purpose they are not fit, because, when fully exposed to the sun, they frequently die in large patches. Mr. Curtis, however, thinks they appear to most advantage as edgings to borders, as they serve to enliven them, and to add greatly to the gaiety of the garden. He recommends the roots to be taken up in the last week of September, or the first in October, to be divided into single plants, and to be planted three inches apart in a trench, interposing the fibres, and precluding the earth closely round them, as they will thus not be subject to be drawn out of the ground by worms. Such edgings should be replanted every autumn; otherwise they will spread too wide. Martyn's Miller's Dict. According to Mr. Curtis, the plants that remain undisturbed in the same spot, will recur to their natural state, and become single; but Mr. Miller says that he never observed them to do so.

Bellis. See Anthemis, Aster, Athenasium, Bellium, Calendula, Chrysanthemum, Cotula, Dornicum, Eclipta, Osmites, and Sapokaia.

Bellis major. See Chrysanthemum.

Bellis cerula. See Globularia.

Bellis, in Natural History, a species of Hydra, resembling the calyx of a flower, warded; tentacular retractile, and variegated. This is actinia bellis of Solander and Ellis; and is found on the coast of Cornwall.

Bellis, a species of Vorticea, of a simple hemispherical form, with a contractile margin. Müll. Hilt. Vern. Found in flagrant ditch water; somewhat resembles the flower of a daisy, but small, yellowish; peduncle long, pellucid, very thin, bifid at the end; moves with a rotary motion.

BELLISLE, in Geography. See Belle Isle.

BELLO, in Geography, a town of Italy, in the kingdom of Naples, and province of Bari. 2 miles S.S.E. of Muro.

BELLOI, Peter Laurence Buyvette du, in Biography, a French dramatic writer; was born at St. Flour, in Auvergne, in 1727, and educated for the bar at Paris. But quitting the profession for which he was designed, he left his country, and went to Ruflia in the capacity of an actor. After having exercised his literary talents in the composition of various fugitive pieces, he returned to Paris in 1758, and brought on the stage, in the "Titus," and next his "Zelmire." But his tragedy of the "Siege of Calais," exhibited in 1763, was the most popular, and contributed in the greatest degree to establish his reputation. For this performance the king presented him with a gold medal.
The Bellonarii cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are singular, that they offered their own blood, not that of other creatures, in sacrifice. In the fury and enthusiasm with which they were fed on these occasions, they ran about raging, uttering prophecies, and foretelling blood and slaughter, devotions of cities, revolutions of state, and the like; whence Martial calls them “turba enthousia Bellonarum.”

BEL. The Bellonarii celebrated feasts on the eve of the nones of June, and the ninth of the calends of April, on which occasion they chewed a plant called Bellonaria, which produced a kind of fury, and compelled them to mangle their bodies in the manner which characterized these feasts.

Species, 1. B. offera. Lin. Spec. 244. Plum. gen. 19. ic. 47. Swartz. Prodrom. 42. 2. Obs. 69. "Leaves ovate-ferrate, flowers corymbbed terminating." A thrub ten or twelve feet high, from which issue many lateral branches. This species is said to be known to the authority of Pliny. Mr. Miller says, that it is very common in several of the warm islands of America, whence he has received the seeds. 2. B. spinafo. Swartz. Prod. 42. "Thorny; leaves ovate, angular, tooth-ferrate, peduncles axillary, one-flowered."

Propagation and Culture. It is propagated by seeds, which should be sown early in the spring, in a pot filled with light fresh earth, and plunged into a hot-bed of Tanner's bark, and frequently watered. When the plants are come up half an inch high, they should be transplanted into pots filled with light fresh earth, and plunged again into the hot-bed, watered and shaded till they have taken root; then air should be admitted to them every day in warm weather, and they should be frequently watered. When the plants have filled these pots with their roots, they should be carefully shaken out of them, and their roots trimmed, and put into larger pots filled with light fresh earth, and put into the hot-bed again. In warm weather fresh air should be admitted to them every day; but in autumn they must be plunged into the bark-love, and treated like other tender exotic plants. These plants will sometimes flower in the second year, but they rarely produce good seeds in this climate. Nevertheless, they may be propagated by cuttings in the summer months, provided they are planted in light earth on a moderate hot-bed, and carefully watered.
watered and shaded till they have taken root. They must be constantly kept in the flower, and have a large share of free air in warm weather; but if they are set abroad, they will not thrive in this climate. Martyn's Miller's Dutch.

BELLORI, John Peter, in Biography, a celebrated antiquary, was a native of Rome, and derived from his uncle Francis Angeloni, under whose care he was placed, his taste for antiquities. He was appointed by Grimina, queen of Sweden, the keeper of her library and cabinet of curiosities; and by pope Clement X. antiquary of Rome. He died in 1616, above 80 years of age. His valuable cabinet was afterwards annexed to that of the king of Prussia at Berlin. Of his various works, relating to his favourite pursuits, the principal are the following: viz. "Neue in Numismata, tum Ephesius tum aliarum urbium, apibus insignita," 1658, 4to.; "Fragmenta Veltii veteris Rome," 1673, fol.; "La Colonna Trajana," fol.; "Le Picturas Antiche del Sepolcro de' Nafonis," 1680, fol.; "Le Antiche lucerni fecopolarli figurata," 1691, fol.; "Gli antichi sepolcri, overo Maffole Romani & Estruschi," 1699, fol.; "Veteres Arcas Auguriforum," 1690, fol.; "Vite di Pietorii, Scenitori, et Architelli Moderni," 1692, 4to.; "Imagines veterum Philosphorum," 1685, fol. Several treatises of this author are inserted in the 7th volume of Gronovius's Greek Antiquities. He also reprinted, in 1685, with large additions, Angeloni's "Historia Augusta," illustrated by Medals. Moret. Gen. Diog.

BELLOSTE, Augustin, a surgeon of eminence in his time, inventor of a mercural composition, called after his time, "Bellost's pill," by which he is supposed to have acquired a considerable fortune. After practicing several years at Paris, where he was born in 1634, and as an army surgeon, he was invited to Sardines, and made principal surgeon to the queen's mother, and continued to reside at Turin to the time of his death, which happened July 15th, 1739. The work by which he is principally known, is his "Chirurgien de l'Hospital," published 1695. It has passed through numerous editions, and been translated into all the European languages. In 1725, he published a continuation of it, under the title of "La fuite du Chirurgien de l'Hospital." Among other useful observations, he recommends piercing carious bones, with the view of accelerating exfoliation, a practice advised by Celsius, though long discontinued. He recomposes the custom of frequently removing the dressing of wounds, as tending to retard the cure. The work has much merit, though now little noticed, being superseded by later publications." Haller Bib. Med. Pract. et Chir.

BELLOTTI, Pietro, a painter of history and portrait, was born at Venice, in 1652, and learned the art of colouring from Michael Tornoboco, whose disciple he was. As a portrait painter, he attained the first rank, but was less eminent in the composition of his historical subjects. In the imitation of nature he was peculiarly happy; the colouring of his portraits appears to be real flesh, and the variety in the air of his heads is inconceivable; in all his attitudes there is much grace, and the disposition of his figures is natural and becoming. He died in 1725. Pilkington.

BELLOVACI, in Ancient Geography, a people of Gaul, comprised in the nation of the Belges, and seated south of the Ambiani. Their country was particularly distinguished by the name of Belgium, and corresponded to the modern Belgium; their chief city was called by the Latins Caeramagus; and Caesar speaks with commendation of their valour and their number.

BELLOWING, among Sportsmen, is used for the noise which roes make in rutting-time.

BELLOWS, a machine used to give a brisk agitation to the air, by enlarging and contracting its capacity, and thus expiring and inhaling the air by turn.

This machine is used in chambers and kitchens, in forges, furnaces, and foundries, for blowing up the fire; and it is annexed to organs and other pneumatic instruments, in order to supply them with a due degree of air. They are constructed of various forms, and furnished with different kinds of apparatus for giving them motion, and for discharging their air, according to the purposes which they are intended to serve. However, they are in general composed of two flat boards, sometimes of an oval and sometimes of a triangular figure; between these boards are placed two or more hoops, bent so as to suit their figure; on the edges of the boards is nailed a piece of leather, broad in the middle and narrow at the ends, which unite them together, and it is also affixed to the hoops of the boards, that the leather may the more easily open and fold again; to the undercroft board is fastened a pipe of iron, brass, or copper; and within is a valve, which covers the holes in the under board so as to keep in the air. Strabo informs us (Geog. i. viii. vol. i. p. 162.), from an old historian, that Anacharsis, the Scythian philosopher, who lived in the time of Solon, about 600 years before Christ, invented the bellows, as well as the anchor and potter's wheel; but this account is very doubtful, as Pliny, Seneca, Diogenes Laertius, and Suidas, who likewise speak of the inventions ascribed to that philosopher, mention only the two last, and not the bellows. It appears, however, that they were known in ancient times to the Greeks; and Virgil mentions them in the following passage (Georg. iv. 170):

"Alius tarnus follibus auras
Accepiunt, reddeuntque.
" Upon which it may be remarked that bull's leather is unfit for bellows, and ox and cow's leather only can be used for that purpose; but accuracy, in the description of a mechanical engine, is not to be expected in a poet. In modern times, wooden bellows have been introduced in metal-larged operations, instead of those of leather. The latter require careful management; the repairs of them are expensive; and they seldom last more than five or seven years. When thin leather is employed, it suffers a great deal of air to escape through it; and this evil must be guarded against by continually bemearing it with train oil, or other fat substances; and this is even necessary when thick leather is used, to prevent it from cracking in the folds. Whenever they are repaired, it is necessary again to soften the leather with oil, and this occasions a considerable loss of time. To obviate these, and similar inconveniences, and with a view to some peculiar advantages, wooden bellows have been invented in modern times, of which we shall give some account in the sequel of this article. In the oldest firemaking-houses, the bellows were moved by a handle, like those of the smith's forge; or by the puller of the foot upon a treadle, or by other means, requiring the strength of men. But since the force of water has been employed to move them, the quantity of ore run down has not only been far greater, but the separation of the metal more complete; infomuch, that great part of the iron now prepared at some considerable works, particularly in the county of Gloucester, has been no other than what had been left in the flags of cinders, for want of sufficient force of air.

The action and effect of bellows of every kind, whether leather or wooden, wrought by water or men, depend on this, that the air which enters them, and which they contain when raised, is again compressed into a narrower space when they are closed. And as the air, like all other fluids, flows to that place where it meets the least resistance, it must
of consequence by out of the pipe or aperture with a velocity proportional to the force by which it is compressed, and must therefore blow stronger or weaker, as the velocity with which the top and bottom of the bellows meet is greater or less. The blast also will last in proportion to the quantity of air that was drawn into the bellows through the valve, or wind-clap.

The action of bellows bears a near affinity to that of the lungs; and what we call blowing in the latter, affords a pertinent illustration of what is called respiring in the former. Accordingly, bellows have been employed in restoring suspended animation; and Dr. Hooke found, by renewing the interrupted action of the lungs by blowing air into them, by cutting away the ribs and diaphragm, and pericardium, &c. and laying the thorax of a dog bare, and having cut off the apera arteria below the epiglottis, and bound it on the nose of a bellows, that as he blew the dog recovered, and as he ceased became convulsive: and thus the animal remained alternately alive and dead above the space of an hour. See the methods of recovering suspended animation, under the article DROWNING.

The bellows of smiths and founders, whether single or double, are wrought by means of a rocker, with a firing or chain fastened to it, and pulled by the workman. The bellows-pipe is fitted into that of the tovel. One of the boards is fixed, so as not to play at all. By drawing down the handle of the rocker, the moveable board rides, and by means of a weight on the top of the upper board, sinks again.

The bellows of the Chinese smiths is of a very simple kind, and is composed of a square pipe of wood ABCDE (Plate XI. Pneumatics, fig. 107.) with a square board G, which exactly fits it, moved by the handle FG. At the farther end is the blast pipe HK, and on each side of it a valve in the end of the square pipe, opening inwards. The piston is sufficiently tight for their purposes without any leathering.

The bellows of forges and furnaces of mines usually receive their motion from the wheels of a water-mill; or in our large furnaces they are worked by a steam-engine. Others, as the bellows of enamellers, are wrought by means of one or more steps or treadwheels under the workman's feet.

The bellows of an organ are fixed long, and four broad: each having an aperture of four inches, that the valve may play easily. There should likewise be a valve at the nose of the bellows, that one may not take the air from the other. To blow an organ of sixteen feet, there are required four pair of these bellows.

The bellows of organs are wrought by a man called the blower; and, in small organs, by the foot of the player. See Organ.

The method of constructing wooden bellows for the purposes of metallurgy, was an important and useful invention, for which we are indebted to the Germans. This is expressly affirmed by Grignon in his "Memoires fur l'art de fabriquer le fer," Paris, 1775; and in the time of Becher, they were to be found in Germany, but not in England. Genfann, in his "Traité de la fonte des mines parle feu du charbon de terre," Paris 1779, erroneously ascribes the invention to the Switz; being probably led into this error in consequence of a Swiss having first made known these bellows in France. The name of the real inventor, however, has not been ascertained. From a catalogue of machines given to the magistrates of Nuremberg in 1550, by an artist, called Hans Lobinger, Doppelmayr conjectures, that he understood the art of making small and large bellows without leather, and entirely of wood, which could be used in melting-houses and for organs, and likewise copper bellows, that always emitted a like degree of wind. As

Lobinger made organs, Beckman (Hist. Inventions, vol. i. p. 109.) suggests, that this invention might occur to him; but he has not been able to learn in what it actually conformed, or whether it might not also have been with him. Agricola, who died in 1555, makes no mention of wooden bellows. Samuel Reyher, formerly professor at Kiel, in the improved edition of his dissertation on air, printed there in 1609, reprinted with additions at Hamburg, in 1725, and entitled "De Pneumatica, sive de Aeris et Aerometria," informs us, that "about 80 years ago a new kind of bellows, which ought to be called the pneumatic chefs, was invented in the village of Schmalehube, in the principality of Cobourg, in France," by two brothers, Martin and Nicholas Schelpers, who were millers in that village. These brothers kept the invention secret, but not so concealed as to elude conjecture. Reyher relates, how he himself formed an idea of it. Schulten, who has given a complete description and figure of these bellows in his "Unterricht von Hüttner-Werken," Brunswic, 1758, fol. ascribes the invention of them to a bishop of Bamberg; and according to his account, they were employed so early as the year 1620, in the forest of Hartz, to which they were first brought by some persons from Bamberg. "What Calvor says (according to Beckman, ubi supra) respecting the introduction of these bellows into the forest of Hartz, is much more probable; that in 1621 Lewis Pfannenschmid, from Thuringia, settled at Offfeld near Goslar, and began to make wooden bellows. The bellows-makers of that place confired therefore against him, and swore they would put him to death; but he was protected by the government. He would disclose his art to no one but his son, who, as well as his grandson, a few years ago had the making of all the bellows in the forest." From Germany, the art of making these bellows was introduced into some parts of France, and into Sweden, and became general through various parts of Europe. This kind of bellows consists of two boxes placed upon one another; the uppermost of which may be moved up and down upon the lower one, in the same manner as the lid of a snuff-box, which has a hinge, moves up and down, when it is opened or shut: but the sides of the uppermost box are so broad as to contain the lower one between them, when it is raised to its utmost extent. Both boxes are bound together, at the smallest end, where the pipe is, by a strong iron bolt. It may be readily comprehended, that when both boxes fit each other exactly, and the upper one is raised over the under one, which is at rest, the space contained by both will be enlarged; and consequently more air will rush in through the valve in the bottom of the lower one; and when the upper box is again forced down, this air will be expelled through the pipe. The only difficulty is to prevent the air, which forces its way in, from escaping anywhere else than through the pipe; for it is not to be expected, that the boxes will fit each other so closely as entirely to prevent the air from making its way between them. This difficulty, however, is obviated by the following simple and ingenious method. On the inner sides of the uppermost box there are placed moveable slips of wood, which, by means of metal springs, are pressed to the sides of the other box, and fill up the space between them. As these long slips of wood might not be sufficiently pliable to suffer themselves to be pressed close enough; and as, though placed perfectly straight at first, they would, in time, become warped in various directions, incisions are made in them across their whole length, in the distance of from 18 to 20 equal spaces from each other, so as to leave only a small space in their thickness, by which means they acquire sufficient pliability to be everywhere pressed close enough to the sides. This description may be
illustrated by a figure, (See Plate XIII. Pneumatics, fig. 108.) in which the outer box ABCPEF has its top and two sides flat or straight, and the end BALE formed into an arched or cylindrical surface, of which the line FF at the other end is the axis. This box is open below, and receives within it the hollow box KHHNNML (fig. 109.) which exactly fills it. The line PP of the one coincides with FF of the other, and along this line is a set of hinges on which the upper box turns, as it rises and sinks. The lower box is fixed to a frame fixed in the ground. A pipe, QO proceeds from the end of it, and terminates at the furnace, in a small pipe called the "tever," or "tuyere." This lower box is open above, and has in its bottom two large valves V, V, opening inwards. (See fig. 116.) The conducting pipe is sometimes furnished with a valve opening outwards, to prevent burning coals from being sucked into the bellows, when the upper box is drawn up. The joint along FF is made tight by thin leather nailed along it. The sides and ends of the fixed box are made to fit the sides and curved end of the upper box, so that this last can be raised and lowered round the joint FF without sensible friction, and yet without suffering much air to escape; but as this would not be sufficiently air-tight by reason of the shrinking and warping of the wood, a further contrivance is adopted. A slender lath of wood, divided into several joints, and covered on the outer edge with very soft leather, is laid along the upper edges of the sides and ends of the lower box. This lath is so broad, that when its inner edge is even with the inside of the box, its outer edge projects about an inch. It is kept in this position by a number of tacked wires, which are driven into the bottom of the box, and lie flat on touching the sides, as represented in fig. 111, where a b c are the wires, and e the lath, projecting over the outside of the box. By this contrivance, the laths are pressed close to the sides and curved end of the movables box, and the spring wires yield to all their inequalities. A bar of wood RS (fig. 105.) is fixed to the upper board, by which it is either raised by machinery, to sink again by its own weight, having an additional load on it, or it is forced downward by a crank or wiper of the machinery, and afterwards raised. The operation, in this case, is exactly similar to that of blowing with the chamber bellows. When the board is lifted up, the air enters by the valves V, V, (fig. 110.) and is expelled at the pipe OA by depressing the boards. These bellows are made of a very great size, AD (fig. 108.) being 16 feet, AB 5 feet, and the circular end also 5 feet. The rife, however, is but about 3 or 4 feet. They expel at each stroke about 90 cubic feet of air, and make about 8 strokes per minute. The advantages of these wooden bellows are very considerable. When they are made of clean fir wood without knots, they will last 30 or 40 years, and even longer, though continually kept in action 45 or 48 weeks every year. Some have said, that, when properly made, they will last a century. The effect produced by them is stronger, as well as more uniform, and can be moderated according to circumstances. They are worked also with greater facility. The slips of wood on their sides are apt to be damaged; but they can soon and easily be repaired. Every three or four months, however, the outer sides only of the inner box, and the bolt which keeps the boxes together, must be renewed with oil. If we calculate the price of such bellows, and the yearly expense, they will amount to about 24 dollars (about 83 shillings) or be a fifth part of those of the old leather bellows. They have, indeed, their defects, though they are less expensive and more durable than those of leather; for it is fearfully possible to make the junctures so tight as to allow no exit to the compressed air, and the friction must necessarily very be great. Some, therefore, have recourse to water, for performing

the office of the lower board of the bellows. A bellows on this principle is described by Mr. Trevisiol, engineer to his Swedish Majesty, in the Philosophical Transactions, under the name of a "water-bellows." Of bellows of wood we have one preferred in the repository of the Royal Society; and Dr. Plot describes another, that was used at the copper-works at Eltonton in Staffordshire, Nat. Hist. Staff. ch. iv. § 16. Such are the bellows in general use on the continent. In this kingdom, a different, and a preferable form is adopted; for an account of which, and other contrivances for animating the large fires of furnaces, &c. see Blowing Machine. See also FORCING.

Bellows, Apothecary, so called by the inventor M. Gorce, physician to the military hospital at Neuwiller, and denoting "re-fire of respiration," an instrument used for inflating the lungs. It is described in the "Journal de Medicine" for June 1789; and consists of a double pair of bellows BCLM (Plate XIII. Pneumatics, fig. 112.) the two different parts of which have no communication with each other. In the lower lide BM is an aperture A for a valve, constructed on the principles of those of Mr. Nairne's air-pump. It consists of a rim of copper, closed at one end by a plate of the same metal, in which plate are seven small holes placed at equal distances. This plate is covered with a piece of silk coated with elastic gum, in which are five transverse incisions of two or three lines in length. Each incision is made so as to be situated between two of the holes, and at an equal distance from each, as represented at D, (fig. 113.) The filk must be made very secure, by a thread pulling several times round the rim. It is obvious, that a stream of air applied to that side of the plate which is opposite the filk, will pass through the holes, and, lifting up the filk, escape through the incisions. On the contrary, a stream of air applied to the other side will press the filk upon the plate, and thus close the holes, so that it will be impossible for it to pass through them. This valve opens internally, so as to admit the air from without. At B is another valve, upon the same construction, but opening in a contrary direction, thus permitting the air to escape out of the lower part into the tube EF, but preventing its entrance. At C is another valve, opening internally to admit the air from the tube EF; and at D there is a fourth, opening externally to discharge the air from the upper part. The flexible tube EF, ferreved on the end CD, being introduced into one of the nostrils, whilst the mouth and the other nostril are closed by an affilist, if we separate the two handles L, M, which were close together at the introduction of the tube, it is evident, that the air in the lungs will rush into the upper part through the valve C, whilst the external air will fill the lower part through the valve A. The two handles being again brought into contact, the atmospheric air will be forced into the lungs through the valve B, and at the same time the air in the upper part will be discharged at the valve D. Thus, by the alternate play of the double bellows, the lungs will be alternately filled and emptied as in respiration. In using the instrument, care should be taken not to be too violent; as the more perfectly the natural motion of respiration is imitated, the better.

To prevent any suffusions from without injuring the valve A, D, (fig. 112.) the rim is made with a fercw B, (fig. 114.) in order to receive a cap A, A, (fig. 114.) full of small holes. This fercw has also another use. If deglyphicated air be preferred, a bladder filled with it, (fig. 115.) may, by means of the fercw A, be fastened to the valve A, (fig. 112.) and to prevent waftes, as this air may serve several times, a flexible tube may be ferreved in the valve D, (fig. 112.) communicating with the bladder by means of the opening d, (fig. 115.) Thus it may be employed as often
often as the operator thinks proper. There is a handle K to the partition in the middle, in order that, if it be at any time necessary to use either of the divisors above, the other may be confined from acting. c, t, (fig. 116.) represent the two valves to be applied at the end of the instrument CB, (fig. 112.) and (fig. 117.) is a section of the end CB, showing the valves in their proper places. It is proper to add, that the capacity of the instrument should be proportioned to the quantity of air received into the lungs by inspiration; which Dr. Goodwin has ascertained to be twelve cubical inches, or somewhat more. Each division of the instrument, therefore, should be capable of containing that quantity. (See Analytical Review, vol. iv. p. 437.) Roulland presented, and defended at a meeting of the Lyceum of Arts at Paris, in 1797, the model of a pair of bellows, constructed on this plan, intended to restore life to persons drowned and in a swoon, by drawing out the vitiated air seated in their lungs, and replacing it with ordinary air, or even with oxygen, or vital air, if necessary: at the same time producing the motion of the lungs, independently of the concurrence of the patient, to the utmost instant when his strength shall return. The experiment was submitted to public inspection; a bladder being made up to represent the lungs.

Bellows, Rome, sev. in Gerontus, occur in Herodotus for those applied by the Scythians to the genitals of mares, in order to diftend the uterus, and, by this compression, make them yield a greater quantity of milk.

Bellows, Heliou, a contrivance for driving air into a mine for the respiration of the miners. This was improved by M. Papin, who changed its cylindrical into a spiral form; and with this, by working it only with his foot, he could produce a wind to raise a weight of two pounds.

Bellows, Hydrostatic. See Hydrostatic.

Bellows, or Trumpet-bells, in Ichthyology, a name given by Ray, Witherby, &c. to the species of Centricus, Scolopax, &c.

Bellows Rocks, in Geography, rocks that lie in the Atlantic, near the west coast of Ireland, and county of Galway. N. lat. 53° 19'. W. long. 10° 4'.

Bellis, Canterbury, and Coventry, in Botany. See Campanula.

Bells, Hair. See Hyacinthus.

Bells, Man, in Geography, a settlement in North Carolina, near the Moravian settlements, at the source of Deep river, the north-westernmost branch of the north-west branch of Cape Fear, and about 50 miles west of Hillsborough.

Bells, in Heraldry, are represented as round, when fixed to the legs of a hawk; in which case the hawk is said to be bellowed.

Bellus, in Zoology, a name of the sixth order of animals in the Linnean system, including the genera of the opus, or horse, the hippopotamus, the tapir, and fai. These have obtuse truncated fore teeth, and hoofed feet.

Bellucci, Antonio, in Biography, a painter of portrait and history, was born at Venice in 1654, and manifesting an early inclination to painting, became the disciple of Dominico Zampi, from whose instructions he acquired a good manner of handling and colouring, an elegant taste of historical composition, and an exactness in painting portraits with grace and resemblance. Having established, by a variety of performances, his reputation for invention, elegance and spirit, he was invited by the emperor Joseph to his court, and appointed his principal painter. But after remaining some years at Vienna, he entered into the service of the prince Palatine, in which he long lived, much respected for his personal accomplishments as well as for his excellence in his profession. Pilkington.

Belludge, in Geography, a tribe of Arabs, inhabiting that part of Persia, which lies on the coast of the entrance into the Persian gulf, between Minan and cape Jaffa. They are masters of several vessels, and carry on a considerable trade with Belfora, and even venture as far as the coasts of India. These Arabs are Sunnites; and unity of religious sentiments has occasioned their joining the party of the Afghans in the late revolutions of Persia. Some geographers represent these Belludges as inhabiting all along the Persian coast to the mouth of the Indus, and have described them as a warlike people addicted to piracy. Niebuhr is not able to ascertain whether they are to be considered as independent, or as tributary to Persia. He thinks it probable, however, that they acknowledge no sovereign authority but that of their own sheiks.

Belluga, in Ichthyology. See Beluga.

Bellula Bos, a name given by Paulus Jovius to that species of Raja called by the old Greek and Latin writers bos marinus; the same kind which Linnaeus, and other later naturalists, name specifically Oxyrhinchus.

Belune, in Geography, a small mountainous territory of Italy, but rich in mountains of marble, forms a part of the marquisate of Treviso, and belongs to the republic of Venice. It is bounded on the north by the Cadore and part of Friuli, on the east by a large forest, which separates it from Friuli, on the south by the Trevisian and Peltun, and on the west by the bishopric of Trent.

Belluno, the capital of the Bellunese, and see of a bishop, suffragan of the archbishop of Ulm, seated on the Piava, between the town Cadore and Treviso; 43 miles N. of Venice, and 48 E. of Trent. N. lat. 46° 10'. E. long. 12° 15'.

Belly, in a general sense, denotes the whole abdomen, or that region of the body contained between the fen, partum transverse, the hypochondriac, and pubis.

Belly is also used, in a more confined sense, for the intines alone, as containing the feces. In this sense we speak of the bowels or colliquitides of the belly, &c.

Belly is also sometimes used for a pregnant woman. In this sense we are to understand the phrase among Civil Lawyers, to put the belly in possession of an estate.

Belly, also used in speaking of the bodies of animals; is synonymous with abdomen, and may be separately considered. It is variously characterized, according to their food and habits. In those which feed on vegetables, it is in general capacious, and hanging low: in the carnivorous, light, and drawn up at the flanks. In a horse, a barrel-shaped or cylindrical belly is most admired; if hanging low, he is said to be cow-bellied; if too much contracted, he is said to be tucked up at the flanks. Gras, too much water, broken wind, and in mares the gravid uterus, occasion the belly to relax and become pendulous; dry food, as oats, beans, hay, &c. and also acute pain, contract the volume of the belly. The flow moving ruminant animals, as oxen, &c. have the belly the most capacious and pendulous of all quadrupeds. This increased volume of the intestines and stomac appears to be designed for the purpose of enlarging the surface for digestion and chymification, and extracting more completely all the nutrition particles, so that a fewer quantity of food will suffice: this circumstance is particularly remarkable in the sheep, which can fatten on the short-cit graze, and almost barren globe.

In the abdomen of the horse, and other graminivorous quadrupeds, whilst its vast surface exposes it more to attack upon by changes of weather, as cold, rain, wind, &c. than in the carnivorous animals, so it has appeared to us to be also provided with a thinner and less fatty membrane, or mesentery.
fentery, to cover the intestines from their influence. Hence appears to be a caufe for the frequent indulgions in these animals, often speedily terminating in death, to which their capacity also greatly contributes by receiving too large a quantity of food at once. See the article GIBLES of Hoja.

The abdomen of the horse and ox, and other quadrupeds of this description, from its vall fixe, hangs below the patella or knee, which occasions the thig of the horse to be mostly overlooked or taken for some other part; the patella or tibie being the real termination of the thig in these animals.

In the horse, the volume of the abdomen is formed by the vall magnitude and length of the intestines, and a jugle flomach not very large; in the cow, on the contrary, the swelling bulk of the abdomen is occasioned by four large fomachs, and the intestinal canal is proportionably small and short. The sheep with four flomachs pufles also a vall length of intestine.

**Belly of a Hfele,** in Anatomy, denotes the body thereof, as contradistinguish'd from the two extremities, or tendons. From the conditions of this, muscles are divided into monogastric, or single-bellied; and digastric, or double-bellied.

Loerer will have all the muscles to be digastric, or doublebellied; in which he is fecundated by Hoffman and others.

**Belly-on-swift,** a name given in America to a species of the Ijakopha.

**Belly, Dragon's, venex draconis,** is used by some Aftro-nomers to denote the point in a planet's orbit, wherein it has its greatest latitude, or is farthest distant from the ecliptic; more frequently called its limit.

**BELMONT,** in Geography, a town of France, in the department of the Rhone and Loire, and chief place of a canton, in the district of Roanne, 14 miles north-east of Roanne.—Alfo, a town of France, in the department of the Aveyron, and chief place of a canton, in the district of St. Afrique, containing about 3000 inhabitants, 9 leagues east of Aby.

**BELMONTE,** a town of Italy, in the kingdom of Naples, and province of Calabria citra, having a cattle on an eminence near the sea, 11 miles W.S.W. of Cofenza. N. lat. 36° 27'. E. long. 16° 50'.—Alfo, a small town of Portugal, in the province of Beira, and jurisdiction of Correlção de Caffello Branco, containing about 1430 inhabitants, two churches, and a district of two parishes.

**BELO, or BELON, in Ancient Geography.** See DE

**BELOAR,** a name given by some to a flene, otherwise called Wipuris.

**BELOMANCY, BELOMANTIA,** a kind of divination by means of arrows, practised in the East, but chiefly among the Arabians, among whom it continued till Mahometanism prevailed, which absolutely forbids it. The word is of Greek origin; compounded of Bélo, arrow, and prakos, divination. Belomancy has been performed in different ways; one was, to mark a parcel of arrows, and put eleven or more of them into a bag; these were afterwards drawn out; and according as they were marked, or not, they judged of future events. Thofe arrows resembled those with which they call lots, being without heads or feathers, and were kept in the temple of some idol, in whose presence they were confulted. Seven fuch arrows were kept in the temple of Mecca. Another way was to have three arrows, upon one of which was written, "My lord hath commanded me!" on another, "My lord hath forbidden me!" and upon the third, nothing at all. These were put into a quiver, out of which they drew one of the three at random; if it happened to be that with the first inscription, the thing they confulted about was to be done; if it chance to be that with the second inscription, it was let alone; and if it proved to be that without inscription, they drew over again. These divining arrows were generally confulted before any thing of moment was undertaken; as when a man was about to marry, or to go a journey, or the like.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, chap. xxix. ver. 21. At least St. Jerome understands it so, and observes, that the practice was frequent among the Assyrians and Babylonians. Something like it is also mentioned in Heifa, chap. iv. only that arrows are there mentioned instead of arrows, which is rather rob-

**BELON, PETER, in Biography,** born in the province of Maine about the year 1518, was an industrious and ingenious naturalist, esteemed for his learning and talents by Henry II, and Charles IX. of France, and patronized by the cardinal of Tournon, at whose expense he travelled over Italy and Greece, a great part of Germany, France, England, Palestine, and Egypt, collecting and examining every where the plants, animals, and minerals proper to the places through which he journeyed. On his return, he published, in succession, the results of his observations and inquiries. The principal of his works are, "Les Observations de plusieurs singularités, et chofes memoarables trouvées en Grece, en Ate, Judee, Egypte, Arabe, &c." Paris, 1557, 4to.; an excellent work, Halleys says, and the first of the kind that had been published from actual observation; no one before him having travelled so extensively for the purpose of improving natural history. It has been frequently reprinted, and a Latin version of it given by Chiusius, in 1589. "De arborebus coniferis, reñiniferis, aliisque nonnullis tempertanis fronde viribus, &c." Paris, 1539.

The defcriptions are in general jilt; the engravings indifferent. He had seen the true cedar of Lebanon. He also gave a treatise "On the Method of embalming practised by the ancients;" "On the Defects in Agriculture;" "On the Management of Gardens," and recommends the introduction of many foreign trees into them, pointing out those most congenial to the climate of France; "On Birds;" "On Fishes;" with their figures. More he had done; but he was flabbed by a robber in 1563, being only about 45 years of age. Haller. Bib. Botan.

**BELONE, in Ichthyology,** a fpecies of eox, having both jaws long and fubulate. Linna. This is acus pisces of Salian; acus vulgarius Ray; and fus-pike, or gar-fish, of the Englifh. It is sometimes called alfo the fea-needle.

The fea-pike inhabits all great seas, and was known both to the Greeks and Romans. It keeps in deep water part of the year, and visits our coasts in immense hovels in the beginning of the summer, just before the mackerel make their appearance. The length of this fish is usually from a foot and a half to three feet; but if the relation of Renard may be depended upon, they are found of the length of eight feet in the eastern parts of the world. A fish of this species has been taken in the Mediterranean, on the coast of Lisbon, weighing fourteen pounds. In some countries the fishery for the fea-pike is very considerable; in England they are not much esteemed, although the fish is scarce-

from
which many people conclude, though very unjustly, that it cannot be a wholesome food.

All the upper part of the back and head of this fish is of a beautiful green colour; sides and belly silverly. The number of rays in the dorsal fin are about sixteen; pectoral thirteen; ventral eight; anal twenty-two; and in the tail twenty-two; but these are liable to vary in number, as in other fishes.

BELOW, or BELA. in Geography, a river of England, which runs into the Eden, 2 miles north of Kirkby Stephen, in the county of Westmorland.

BELZERO. See Belzero.

BELPHEG, a mountain of Switzerland, about 7 or 8 miles from Berne, being part of the chain of the Alps; the strata of which are full of different species of chalcedons, olivaries, globosities, selenites, fribmites, and other similar petrifications.

BELPECH, a town of France, in the department of the Aude, and chief place of a canton, in the district of Caftelnaudary, 3½ miles south west of Caftelnaudary. N. lat. 43° 12'. E. long. 1° 39'.

BELPRE, a petty town and small settlement of America, in the territory north west of the Ohio, on the north west bank of Ohio river, between the Hoochcking and Mufkingum rivers, and opposite the mouth of the little Kanimaway; about 14 miles below Marietta, and 480 miles S.W. by W. from Philadelphia.

BELSHAZZAR. See Scripture History. See Baby- lona.

BELSINUM, in Ancient Geography, a town of Hispania Tarragonensis, in the country of the Celtiberians. Pliny.

BELSUNCE, Henry-Francis-Xavier de, in Biography, denominated, by way of honourable distinction, “the good bishop of Marselles,” was the son of the marquis of Belfanche, a nobleman of Guinée. After quitting the society of the Jésuits, into which he first entered, he was in 1709 nominated to the bishopric of Marselles; where he distinguished himself by his fortitude and charity, during the dreadful plague which afflicted that city in 1720 and 1721. Such was the effect produced by his attention and liberality on occasion of this calamity, such the attachment cemented between him and his diocesan, by their gratitude and his own sympathy, that he declined accepting the bishopric of Laon, to which are annexed a peerage and a dukedom, which was offered to him by the king in 1723. He died in 1755. Nouv. Dict. Hist.

BELT, Baltheus, and among the ancient and middle age writers, zonas, cingulum, remiculum, rica, or rino, and balerillus, in Armour, a kind of military girdle, in which a sword or some other weapon is commonly hung.

That the belt, or girdle, formed a material part of the Hebrew armour, may be gathered from the expressions so frequently repeated in the sacred scriptures. The Almighty girding himself, imported not only his giving notable displays of power, but his readiness to act; and his girding others expressed the ability he had bestowed upon them to perform magnificent exploits.

The belts of the Hebrew soldiers, with which they girded on their arms, went not about their shoulders but their loins, and were supposed to strengthen them. (See Neh. iv. 18. Ezek. xxiii. 15.) They were generally valuable, especially those of commanders, and were sometimes given as rewards to soldiers. Jonathan presented his to David (1 Sam. xxvi. 4.); and Joab tells the prophet, who had seen Abifalom hanging from the tree, that if he had smitten him to the ground, he would have given him ten shekels of silver and a girdle.

The Greeks called it ζυγον, or γυρος, and they thought it so effectual to a warrior, that ζυγονία became a general term for clothing themselves in armour. Whence Agamemnon is described by Homer

“Artemis de Geryon, de ζυγονία μαχητῆς”

and which no doubt occasioned Paufanias to suppose that ζυγον had a reference to the whole armour. So Herodotus, relating the flight of Xerxes to Athens, describes him, when arrived at Abdera, and believing himself free from danger, τῷ τούτῳ ζυγόν, to have disarmed himself. (Urania, exx.)

Among the Greeks, the belt was worn very differently from the manner already described, and reached even to the thigh, whence Homer’s hero, (Odys. λ.),

——“ζυγαμιχέος ὑπὸ τριμπατίων παρά μοῦ,”

and Virgil’s Aeneas (l. x. 1. 361.)

Eripit a femore."

Foot soldiers, we are told, wore their swords on the left; horsemen, on the right side. Josephus, describing the down- fall of Jerusalem (L. iii.), expressly mentions horsemen with their swords on the right. But whether this was constantly the case, or frequently varied, as Lipius has observed of the Roman sword, cannot easily be determined.

Herodotus, mentioning the military habits of the Persians, says, they had daggers suspended to the right thigh by a belt.

Beger has given a bust of Scipio, copied by Montfaucon (vol. iv. pl. vi. f. 4.), which has an embroidered belt hanging from the right side; while a soldier on the arch of Constantine is represented in scale armour, with a belt suspended from the left shoulder. Montfaucon, vol. iv. pl. xx. f. 2.

In our own country, like those of ancient times, it was frequently ornamented in the richest style; and it is worthy of observation, that in some of the most magnificent illuminations of our ancient manuscripts, even in the same picture, the sword is represented as indiscriminately belted on the right side or the left. In later ages, the belt was given to a peron when he was raised to knighthood; whence it has also been used as a badge of the knightly order.

Belt is also a denomination applied to a sort of bandages in use among forgers, &c. Thus we meet with quicksilver belts, used for the itch. A later writer describes a belt for keeping the belly tight, and discharging the water in the operation of tapping. Med. Eff. Edim. tom. i. p. 218.

Belt, or Belts, in Ecclesiastical Writers of the Middle Age, denotes a sort of string of beads.

Belt is also a frequent disease in sheep, cured by cutting their tails off, and laying the sore bare; then calling mould on it, and applying tar and goose-grase.

BEL-TEIN, in Mythology, a superstitious cumbon, formerly observed in Scotland and Ireland; and according to Dr. Ledwich, on the authority of Wormius, in Scandinavia. Dr. O’Brien, in his Irish Dictionary, explains it Ignis Bel Dei Astatiae; and mentions, that on the first of May the Druids were used to light large fires on the summits of hills, into which they drove four-footed beasts, using at the same time certain ceremonies, to expiate the sins of the people. This pagan ceremony of lighting these fires in honour of Belus, or the sun, gave its name to the month of May, which is called Beltaine, and May-day la Bealaine. On this day all the inhabitants of Ireland quenched their fires, and kindled them again out of some part of the sacred fire. That celebrated Irish antiquarian, general Vallancey, infers from the name of this custom, that it was derived from the Parian Scythians, or Phœnicians, by whom the sun was worshiped under the same name of Belus, or Bel, and on the tops of hills also, as appears from the high places mentioned in scripture.
scripture. In Gaul also there are traces of the name fup-
poped deity being worshipped under the name Belenus. The
Irish still preserve the custom; and to this day, in many
places, fires are lighted on the first of May in the milking
yards, which the men, women, and children pass through
or leap over, and the cattle are driven through the flames of
the burning flour. In the western isles of Scotland, Mr.
Martin found a like ceremony called by the same name; and
Mr. Pennant thus particularly describes it: "It is a kind of
rural sacrifice, performed by the herdmen of every village
on the first of May. They cut a square trench on the
ground, leaving a turf in the middle; on that they make a
fire of wood, on which they drees a large cake of eggs,
butter, oatmeal, and milk; and bring, besides the ingredi-
ents of the cauldle, plenty of beer and whiskey; for each of
the company must contribute something. The rites begin
with spilling some of the cake on the ground by way of
libation: on that every one takes a cake of oatmeal, upon
which are raised nine square knobs, each dedicated to some
particular being, the fupposed preserver of their flocks and
herds, or to some particular animal, the real destroyer of
them. Each person then turns his face to the fire, breaks
off a knob, and flinging it over his shoulder, says, This
I give to thee, preserve thou my herds; this to thee, pre-
serve thou my flock; and so on. After that, they ufe the fame
ceremony to the noxious animals: This I give to thee, 0 fox!
spare thou my lambs; this to thee, o hooded crow! this to thee,
0 eagle! When the ceremony is over, they dine on the cau-
dle; and after the feast is finished, what is left is hid by two
persons deputed for the purpose; but on the next Sunday
they recollect it, and flinch the relics of the fiirt entertain-
ment." That fire was adored in Ireland, is sufficiently
proved from this celebrated festival, independently of other
circumstances; but whether it can be urged in proof of the
colonization of Ireland by the Southern Scythians or Per-
sians, is not equally clear. Dr. Ledwich says, that fire was
adored by the Celts and Northern Scythians, and mentions
from Wurmian the manner of kindling it. On the other
hand, the name bears a striking refeemblance to that of
the Athenian deity; and the early naval expeditions of the Phenici-
ans render its having been communicated by them less improba-
ble. The writer of this article has not, however, yet met with
any account of a similar practice amongst the nations in the
south of Asia, or with any attempt to explain the name from
those languages which are undoubtedly of Celtic ori-
gin. The circumstance, indeed, of all languages having had
one common source, leffens the force of those arguments
which are derived from a refeemblance in words denoting the
fame thing; and yet great fires is laid on fuch refeemblance in the
arguments for the Persian colonization of Ireland.
Coffeacio de rebus Hibernicis paliin. Pennant's Tour in
Antiquities of Ireland. See BELLUS.

BELTS, Jovitis, in Astronomy, two zones or girdles sur-
rounding Jupiter's body, more lucid than the rest, and ter-
minated by parallel lines; being sometimes broader, and
sometimes narrower, nor constantly taking up the fame places
in his disk. Dark spots have been frequently observed on
Jupiter's belts. Callini has also discovered a permanent one
in the most northern part of the most southern belt; by this
he has determined the length of Jupiter's day, that is, the
time of his revolution on his axis, which is finished in
nine hours and fifty-six minutes. Phil. Tranf. No. 10, and
vol. Ixxii. part i, N° 111, p. 73. Some astronomers take
the belts to be seas, which alternately cover and leave bare
large countries of the planet; and that the spots are gulfs
in those seas, perhaps as big as our ocean, and sometimes
full, sometimes dry. M. Azout rather imagined the spots
to be protuberances of the belts. Hist. Acad. Sc. 1706.
1692. Phil. Tranf. No. 34. 1. 15. But other astronomers
take the spots, which are transparent and moveable, for
the shadow of Jupiter's satellites. The belts of Jupiter were
first observed, and described by Huygens in his Syft, Sar-
turni. p. 7. See JUPITER.

Callini also speaks of belts of Saturn; being three dark,
flaftig, parallel bands, or foffae, on the side of that planet.
Saturn's belts do not appear to be inherent on his globe, as
those of Jupiter's are; but rather to be large dark rings at
a distance from the planet, and surrounding his body. Some
imagine them to be clouds in his atmosphere. The middle-
most seems to be the shadow of Saturn's ring. Hist. Acad.
Sc. 1715. See SATURN.

BELTS, in Geography and Navigation, denote certain fraits
near the Sound, through which ships pass from the Baltic to
the German ocean. They belong to the king of Denmark,
who exacts a toll, varying in its amount, and in some cir-
stances attending the collection of it, from all ships that pass
through them, as well as the Sound. (See SOUND.) They are
divided into the greater and the lesser. The greater belt forms a
communication between the Scagerack and Cattegat sea
and the Baltic, separating the islands of Zealand and Funen. The
lesser or little belt forms a communication between the Catte-
geat and Baltic, and separates the ifle of Funen from the
continent. The passage from Aften to Arno Sound, in
the duchy of Sleveich, across the little belt, is 9 miles.

BEL'r'UBET, a market and poft town of Ireland,
in the county of Cavan, fituate on the river Erne, 81
Irish miles north-west of Dublin. It has a navigation
through Lough Erne to Beliehe, within three miles of
Ballyhannon, where it is interrupted by confiderable falls.
The navigation from Lough Erne is open to the town,
with water enough in winter, and by reducing a few flat
might be made complefely fo in all feafons. No place in-
deed can be better fituated for trade or for improvement;
the beautiful expansion of water and picturesque views are
highly engaging, and the land is a fround limefline. Yet
the market is indifferentiy supplied, which may in great
measure be attributed to the cuftoms being taken in kind,
without any lawful ftandard or measure, fo that it is more
advantageous for the buyers and fellers to go to other mark-
ets. These cuftoms are individual property, and fet for
labor. per annum.

The town was regularly divided into compartments,
termed homesteads; each of which contains 56 square
yards, to which is annexed a proportionate quantity of
hog. Every houfholder has also a right to graze on
an extensive common belonging to the town, which was
given by the Landborough family, to which it formerly belonged,
and which seems to have fpared no expence for its improve-
ment. Another grant of two hundred acres has become the
property of the burgaffes, who divided it, and have tran-
mitted it down in their respective families. There are fome
near houses, especially thofe lately erected on the part now
belonging to lord Farnham; but in general they are mean and
thatched. There are an excellent flour-mill, a brewery, di-
illery, and malt-houfes in the town; and fome yarn is
brought to market, but no webs. Cultivation is
improved in the neighbourhood; but is yet very defcriptive.
The ma-
lain crop is wheat, which is fown in October, and
harvested in July; there is good limefline, and much of the soil
contains of deep clays which could be well reclaimed with lime, yet this is never used,
but fent by the lake to the county of Fermanagh. In the
church-yard is the vellicate of a great fortification, including
an extensive plot of ground, the balflons and falient angles
of
of which are yet perfect; they were admirably planned and of great strength. Belurbet was a borough town, and, previous to the union, sent two members to parliament.

BELTZ, or BELZ, a palatinate of that part of Poland which was formerly called Little, or Red Russia, and which included three districts, viz. Bušk, Horodňa, and Hrabowice. Its capital, bearing the same name, is a large town, seated among marshes in the confines of Volynia. N. lat. 55° 15'. E. long. 23° 50'.

BELTZ, a town of Croatia, 12 miles S. S. W. of Zagradin.

BELVEDERE, or BELVIDERE, a town of European Turkey, and capital of a province of the same name, in the Morea, which province lies on the western coast, and is the richest and most fertile in the Morea. From this province the rains called "Belvedere" derive their name. The town lies 22 miles south of Chiaurma. N. lat. 38° 5'. E. long. 22° 0'.

BELVEDERE, in Architecture. See BELVIDERE.

BELVEZ, a town of France, and principal place of a district, in the department of the Dordogne, 94 leagues S. S. E. of Perigueux. N. lat. 44° 46'. E. long. 5° 54'.

BELUGA, in Zoology, the name of Delphinus Leucus in Pennant's Quadrupeds.

BELUGA, in Natural History, the name of a calamus, or bone, found in the beluga fish. This bone is found in fish of both sexes, but most frequently in the male; and in those of all ages and sizes. It occurs, however, but seldom; whence it is inferred, that these bones are no natural part of the fish, but mere morbid connections, like the bezoar bones in the animals which produce them, or like the bone in human bladders. It is of various shapes and sizes; but its most usual figure is either globular or oval. It is of a yellowish-white colour, and of a smooth and naturally polished surface, and in size it is between a pigeon's egg and that of a goose. It is usually compact, pellucid, and solid, not friable, but requiring a strong blow to break it; however, it yields easily to the saw, which defaces its internal structure, that is naturally very elegant and regular. It consists of several concentric coats, adhering firmly to one another, and formed about a nucleus, which generally appears to be some heterogeneous substance. It differs from other bones of the same kind in its radiated structure, as it is composed of a number of regular and even fibres proceeding from the centre to the circumference, and representing, both in colour and form, the flakes of the "terra foliata tartari," or the frayed tipulae of antimony. If the bone be scraped to powder and sprinkled upon a hot iron, it gives a faint uninuous smell, and calcines into a light, insipid, greyish earth. The people about the Volga hold it in high estimation, and alerne to it great virtues. They say, it promotes delivery; and they give it in cafes of the bone, and disorders of the urinary parts, in doses of from 10 grains to a dram. Phil. Trans. vol. lxxiv. p. 2. n. 4.

BELVIDERE, or BELVIDERE, in Architecture. This word meaning beautiful view is used in Italy, to denote those edifices built for the purpose of enjoying a fine prospect; these are of two kinds, either detached buildings, or little cupolas (or, to use the expressive English term, look-outs) raised on the tops of houses which terminate them, ornamentally, and where one may enjoy the freshness of the evening and the beauties of nature.

Almost all the houses in Rome have belvederes of the last kind, the others generally belong to the palaces and pleasure grounds of the great. The most celebrated and remarkable of all is the Belvedere of the Vatican. This large edifice was originally built by Bramante, detached from the pontifical palace, to which it has since been united by two long galleries. It commands the view of the rich champaign, which surrounds the town on this side; the chain of the Apennines forms the magnificent distance of the picture, while the foreground is occupied by the city itself, which is seen in its whole extent. It is from here that one may say with Martial: "Une fievre in des domos videre montes.

Et tumem licet effinare Romanum."

Belvederes are common in France; they are generally single balconies open to the air, or enclosed with doors and windows. They are, however, sometimes composed of various apartments, vaults, balconies, cabinets, &c. Such is the Belvedere in the menagerie of Seaux. When, however, these buildings are at a considerable distance from the mansion, and contain several apartments for the purpose of entertainment, they are called Tribunes.

In England, though the name of Belvedere is not used, it may be properly applied to many of our garden-buildings. The old mansions were very commonly gloomy both in situation and in construction, but they generally possessed a summer-house, which was built in an elevated and agreeable part of the garden, where in the most genial months of the year the family might enjoy the air, the prospect, and the solace pleasures, without the ceremony of the drawing-room. In our modern villas the beauties of situation are confounded, and every idea of gloom is banished by the long windows, the French doors, and the wide extended lawn; the substantial summer-house is, therefore, unnecessary; but of the temples, cottages, objects which adorn the modern grounds, while some are merely the ornaments of the landscape, others very exactly answer the description of the Belvedere.

BELVIDERE, or BELVIDERE, in Botany. See SCOPARIA.

BELVIDERE, in Geography, a new township of America, in Franklin county, and state of Vermont.—Allo, a village in New Jersey, in the Suffix county, on the Delaware river, and at the mouth of Pequott river, 11 miles above Eaflon, in Pennsylvania.

BELVIS, a small town of Spain, in Extremadura, with a castle, seated between two mountains.

BELULCUM, a surgical instrument of various figures, contrived for extracting darts, arrows, or the like, from wounds. Hence also the denomination belulcum; quasi 2 boes: duum.

BELUNUM, in Ancient Geography, a town of Italy in Rhaetia, and the country of the Veneti, now Belona.

BELUR, in Geography, the general name given to the Alpine region, which divides the southern parts of the ancient Scythia, or Great Buccharia, from Little Buccharia, lying in about N. lat. 37° and E. long. 71°, between Kotan to the north, and Kifan to the south, and Badakhshan in Great Buccharia on the west, and Balkistan, or Little Thibet, on the south-east. Strahlerberg has introduced a town of the same name into his map, but its existence is dubious. Remnel places it at the foot of the mountain, in N. lat. 37° and E. long. 71°. He has also marked a lake near it, from whence flows the Amu, which, after its junction with several others, proceeds to Badakhshan.

BELUS ZEG, denoting, in the Mongol language, "the dark or cloudy mountains," part of that ridge of mountains which, in a nearly meridional course, terminates Great Buccharia on the east, and divides it from Little Buccharia. These mountains are covered with perpetual snow. They form a chain, supposed to be the ancient Imaus, which proceeds nearly north and south, and is continued by the mountains of Alakor Alak Oola, on the north of Little Buccharia, which join the Bogdo, and on the south is more intimately connected with the Hindoo Koh than with the northern ridges of Thibet. Thost who live at the foot of these mountains gather a great quantity of gold and silver dust in the spring.
spring, which is brought down by torrents when the snow melts.

**Belus**, in *Entomology*, a species of *Papilio*, that inhabits Surinam. The wings are greenish; inner margin of the posterior pair rather pale; beneath brown, with red lunular marks. Fabricius and Jabolchy.

**Belus**, in *Ancient Geography*, a town of Spain, situated near the columns of Hercules. Steph. Byz. This was probably the same with Belo or Belon.

**Belus**, now Kardamah, a river of Phcenicia, which flowed at the distance of two stadia south from Ptolemais. It had its source in mount Carmel, about 4 miles to the east of the Kithon, in the lake called by Pliny Cendevia. The sand of this river and its vicinity was peculiarly excellent, according to Strabo, for the manufacture of glasses; and here, according to Pliny, the manufacture of glasses was first discovered.

**Belus**, in *Ancient History and Mythology*, is supposed by some to have been the PUL of scripture; and the founder of the Assyrian monarchy; and they add, that he left his kingdom to his son Ninus, or Tiglath-Pileser, who caused him to be worshipped after his death, and erected to his honour the famous tower of Babel, or Belus, in the city of Babylon. Others conceive Belus to have been the Nimrod of Scripture, and more ancient than the Assyrian kingdom. (See Assyria and Babylon). The tower of Belus was afterwards used by the Chaldeans as an astronomical observatory; and it is said, that Belus himself promoted the study of astronomy, in order to encourage that faith in astrological predictions, which he knew how to apply to political purposes. Hence, as Belus was honoured with a place among the divinities, some have traced the origin of those fables that are found concerning him in the Grecian mythology, to this circumstance.

Belus, considered as the founder of the Assyrian and Babylonian empires, became the principal object of veneration and worship among the later Babylonians, Phcenicians, and others, over whom the descendants of his family extended the dominion he had founded. Accordingly, a temple was erected to him in the city of Babylon, and also a tower; though it is not improbable, that the honour of this temple and tower was meant to be divided between him and the true God. This building (see *Babylon*) composed of eight towers raised above one another; and in the apartments was placed a magnificent bed, with a golden table near it, but without any image; nor was any person suffered to lie here in the night, except a particular woman, who, as the priests reported, was preferred by the god to all others. In this place, according to their account, he used to come and repose himself; so that they must have regarded him as the supreme god, who either could not be represented, or not bear the presumpition in them of attempting his resemblance. Beneath this there was another temple, in which was a gigantic image of Jupiter or Belus, made of solid gold, with a table and a throne of the same metal. This Jupiter, supposed to be the great Pul, or Belus, by being placed below the great and supreme god, seems to have implied, that Belus, or Pul, divided the empire of the universe with him, and that as the former was the god of heaven, the other was at least delegated god on earth, and invested with all power by the immediate appointment of the invisible ruler of all things. Some have supposed, that the Babylonians, by their superior deity, meant the sun, which was undoubtedly a very ancient and a very general object of worship; and the appellation Belus itself might be synonymous with that of Baal, which denoted god or lord. (See *Baal*). In the Babylonian temple there were also two altars, one of gold, of a moderate size, and another much larger: on the former were sacrificed nine but sacrificing victims; and on the other none but those that were fully grown. The former seemed to have been dedicated to the supreme god, and the other to his subordinate, Jupiter. They had also sacrifices that were offered to both. Upon the whole, it seems not improbable, that by Pul, Baal, or Belus, the Babylonians understood either the sun or their deified founder Pul; but whether they transformed him into the sun, or kept the worship of this luminary, and that of their hero distinct, so as never to confound them together, is a question not easily decided. For a description of the temple of Belus, see Herodotus, lib. i. see also *Babylon*. BELUTTA, in *Botany*. See CELOSIA and CRINUM. BELY BOUGE, in *Mythology*. See *Bely Bouge*. BELZICA, in *Geography*, a town of Poland, in the province of Lublin, 14 miles S. W. of Lublin.

BELZIG, a town of Germany, in the circle of Upper Saxony, and electorate of Saxony, seated on the Welle; 30 miles E. of Magdeburg. The prefecture of which this is the chief town bears the same name.

**BEMA**, in *Antiquity*, denotes a step or pace. The bema made a kind of itinerant measure among the Greeks, whose length was equivalent to one cubit, and two thirds, or ten palms.

Whence also the term *BEMA*, to measure a road. BEMA, in *Ecclesiatical Writers*, denotes the altar-part, or sanctuary, in the ancient churches. In which sense, bema made the third or innermost part of the church, answering to the chancel among us. Bema was also used for the bishop's chair, seat, or throne, placed in the sanctuary. It was called bema, from the steps by which it was to be ascended. Bema was also used for the reader's seat.

This in the Greek church was denominated *bema προαρθων*, in the Latin church *ambo*.

BEMA is more peculiarly used for the *Manichee* altar, which was in a different place from that of the cathedrals.

Bema was also a denomination given by this sect to the anniversary of the day when *Manes* was killed, which with them was a solemn feast, and a day of rejoicing.

One of the chief ceremonies of the feast consisted in setting out and adorning their bema, or altar, with great magnificence.

**BEMBA**, or **BEMBI**, in *Geography*, a province of the kingdom of Angola in Africa, which is divided into Higher and Lower, extending on one side along the sea, and on the other dividing the kingdom of Angola from the other foreign states on the south. The country is populous, and abounds with large and small cattle, with the fat of which the inhabitants anoint their heads and bodies; and they also clothe themselves with the hides, coarsely dressed. They are addicted to the same idolatrous superstitions with other parts of the kingdom, but speak a quite different language.

The great river Lutana, or San Francisco, waters and fertilizes most part of this province; but swarms with crocodiles, fer- rous, and monstrous serpents, which not only destroy much of its fish, but do great mischief to the adjacent grounds.

**BEMBER**, a town of Hindoostan, in the direct road from Lahore to Cashmere; at the distance of 33 Abarco coffes (each coffe being 4575 yards) on a bearing of N. a little W. from Lahore. N. lat. 33°. E. long. 73° 50'.

**BEMBEX**, in *Entomology*, one of the Fabrician genus of *Pierata*, and forming, in the Linnean system, a section in the *Vespa* genus; they are distinguished by having the tongue infected, and five cleft; lip advanced, mouth involved. See *Vespa*.

**BEMBO**,
BEM, Peter, Cardinal, in Biography, an eminent re-

flower of literature, was the son of Bernardo Bembo, a Ven-

tian nobleman, and born at Venice in 1492. Having studied 

Latin and polite literature, in his early youth, under Urticlo, 

he went to Messina in 1521, to pursue the study of the Greek 

language, under Constantine Latari. At Padua, whither he 

removed in 1535, he received instructions in philosophy from 

Nicholas Leonco Temo. Upon his father's settlement 

at Ferrara in 1548, he had an opportunity of forming 

an intimate friendship with Leonceto, Tebaldeo, Sadoletto, 

and Hercules Strozzi, and he soon afterwards began to dif-

tinguish himself as a writer. His "Azolani," which were 

discourses on love, written in the Italian language, and so 

named from the castle of Azoli, where they were composed, 

became very popular throughout Italy. At this time he 

was also one of the principal ornaments of the academy, 

founded by Aldus Manutius in his native city. In 1542 he 

visited Rome, and was well received by pope Julius II. 

and by his successor Leo X. he was appointed secretary, with 

an ample salary. Although, in conformity to the licentious 

of the papal court at this time, he kept a mistress, by whom 

he had three children, he discharged the duties of his office 

to the pope's satisfaction, and was employed by him in va-

rious important embassies. In 1549, he removed to Padua, 

for the recovery of his health, where, upon the death of the 

pope, he fixed his residence, pursuing a tranquil life in the 

prosecution of his studies, and in the conversation of men of 

letters. To his house, which was richly furnished with books 

and MSS. a select collection of medals and antiquities, and 

a botanical garden, men of science reforted as to a literary 

academy. In 1559, he was nominated to the dignity of car-

dinal by pope Paul III, which with some reluctance he ac-

cepted, and he then removed to Rome. He was previously 

ordained priest; and, it is said, that he altogether changed his 

mode of life, and fulsomely devoted himself to the duties of 

his ecclesiastical functions. Although he was nominated to 

the bishopric of Gubbio in 1541, and in 1544 translated to that 

of Bergamo, he resided at Rome, and was much honoured 

by the pope, as well as respected by persons of the first cha-

racter in the court. He died Jan. 18, 1557, and was buried 

in the Dominican church, called St. Maria Alla Minerva. 

As a writer of Italian verse, cardinal Bembo formed himself 

upon the model of Petrarch, and contributed to reform and 

polish the poetry of his own country. His prose composi-

tions are written with elegance and purity of expression, but 

without any distinguishing traces of genius. In his Latin 

style, he was "Ciceronian," to the extreme of affectation; 

and on this account he was cenured and ridiculed for apply-

ing the terms "heros" to Christ, and "dea" to the Virgin 

Mary; and for using "pernafio" for faith, and for denoting 

Leo's election by "deorum immutabilis beneficis." 

Like many others of the Italian literati of that age, he seems 

to have thought lightly of his religious creed; and to have 

been more afraid of transcending with regard to his Latinity 

than with respect to the decorum which religion required. 

To this purpose, he diffused a friend from reading St. Paul's 

epistles, lest he should injure his style; and it is said that he 

would never read the briefs or breviary for fear of corrupt-

ing his own Latinity. Nevertheles his own epistles have 

been charged with gross faults, and even foeciles. Some 

compositions of his early days were licentious and obscene. 

His "History of Venice," written in classical Latin, in 12 

books, was undertaken in 1539, by the order of the council of 

ten, and is more admired for elegance of diction than for 

profundity and accuracy. His principal works are, "Epif-

tole, nomine Leoni pont. Max. lib. xvi." Venet. 1536; 

"Epil. Familiarum," lib. vi. Venet. 1572; "Le Rime" 

comprehending his poetical versets, in one volume, Rom. and 

Venet. 1548; "Le Profe," held in high estimation by the 

Italians, in allusion to which Apolloto Zeno says, that 

"Bembo was the first who explained to his countrymen the 

mechanism and construction of their native language." "Hi-

toria Remon Venetarum, lib. xii." Venet. 1551. All 

his works, both in Italian and Latin, were collected and pub-

BEMBRIDGE Point, in Geography, lies at the easter-

n extremity of the isle of Wight, in N. lat. 50° 46' 15"; and 

W. long. 1° 45', and is well known to fishermen as a ledge 

that runs more than two miles into the sea, E. N. E.

BEM-CURINI, in Botany. See JUSTICE.

BEMELA, in Geography, a town of the Netherlands, 

in the duchy of Luxemburg, seated on the eait side of the 

Mefelle: 2 miles N. E. of Graven Macheren.

BEMICARY Point and Bay, are situated between Dry 

and Milk river, about N. W. by W. from the point of Port-

land, the southern extremity of the island of Jamaica. The 

point or easter limit of the bay is in N. lat. 17° 55', and 

W. long. 77° 17'.

BEMILICUS, in Mythology, a surname of Jupiter, 

reputed young and bearded.

BEMINSTER, or Beaminster, in Geography, a town of 

confiderable antiquity in the county of Dorset, England. 

It is seated on the small river Birt, which rises near the town, 

and running southward falls into the British channel at Brid-

port harbour. This town, and two others connected with it, 

belong to two of the prebends of Salisbury cathedral. 

Though of remote origin, Beaminster does not contain any 

particular object of antiquity, and its chapel, a handsome 

large pile of building, is dependent on the parish church 

of Netherbury, which is nearly two miles distant. The town 

is large and respectable, having many manufacturers settled 

in it, and most of its inhabitants employed in making silk-

cloth, locks, copper goods, leather, &c., and some of these 

trades are greatly facilitated by the water of the river Birt, 

and the machinery operated on by it. Beaminster has suffered 

repeatedly and materially by fire, and the destructive 

arrow of civil war. These two were united on the 14th of April 

1644, when prince Maurice was quartered in the town, but 

forced to quit it on that day, as the enemy had fired it in 

five places. From the report of a person who visited it soon 

after, we are informed it was "the pitifullest spectacle that 

man can behold, hardly a house left not consumed by fire. 

There were seven fire and four dwelling-houses, besides 

barns and stables burnt," and the lofs fulfilled was estimated 

at above twenty-one thousand pounds. The inhabitants 

soon afterwards received from the parliament 2000l. with 

which, and other sums, they rebuilt the town; but in June 

1664, it was again consumed, when the los to amounted 

nearly 10,000l. In March 1781, another fire occurred here, 

and in a few hours upwards of fifty dwelling-houses, with 

several barns, stables, outbuildings, &c. were reduced to 

ruins. In spite of these calamitous events, Beaminster is now 

a populous and flourishing town, containing of 357 houses, 

and 2140 inhabitants. Its principal public buildings are 

the chapel, a free-school, an alms-house, and a market-house. 

The infirmary is on high ground at the southern side of the 

town, and consists of a body, two aisles, a chapter, a chantry, 

and a high tower. On the western front of the latter are 

some emblematical statues in niches. Within the chapel 

are some handsome monuments to the Stradies, and other families. 

The free-school was founded by Mrs. Frances Tucker, in 

1684, for the education of twenty of the poorest boys of the 

town. The Rev. Samuel Hood, father of the lords 

Hood and Bridport, was master of this school in 1777. 

The
The alms-house was built and amply endowed by Sir John Strode of Parham, knt.

In this town are one annual fair, a weekly market on Thursday, and two annual public fairs for cattle, cheese, &c.

About one mile south of Rennell is Parham, an ancient manor belonging to Sir William Oylander, bart. At East Axioller, in this neighbourhood, is a hill of the same name, whence issue three springs, which are the sources of the rivers Axe, Birl, and Simene. Hutchins's History of Dorsetshire, vol. I.

BEMMELE, William Van, in Biography, a painter of landscapes, was born at Utrecht in 1630, and after having been a disciple of Herman Aechtelen, visited Rome for the improvement of his taste and knowledge. His colouring is lively and natural, but sometimes inclining too much to green; his figures, such as boats, barges, and other vessels, introduced on the rivers or stationed near the banks, are well designed, and touched with spirit. The lights and shadows of his landscapes are distributed with singular skill, and his skies are usually clear, warm, and natural. He died in 1703. Plkington.

BENNASIR, in Geography, a town of Persia, in the province of Kerman: 140 miles S.E. of Sirjan.

BEMOLI, Fr. B. Molli. Ital. in Guido's Scale of Music, implies B flat, the 4th of the key of F natural, and the mode hexachord.

In early times of counterpart, before transfused keys were used, i.e. keys different from the authentic and plagal modes, (see Ecclesiastical Modes), the 4th of a major key, descending, and 6th of a minor key, were understood to be flat, and the 7th, ascending, sharp, without being marked. And though two of the modes are in the key of D minor, and two in F major, all which require one flat at the clef, and two in E minor, and two in G major, each requiring a sharp at the clef, they were left to the discretion of the finger, without characters of indication. See Hexachord and Mode.

The Abbé Peyton, in speaking of these mysteries, must be allowed to have exercised science and ingenuity; yet, it is to be feared, that the young student will be more puzzled and perplexed than enlightened by his subtilties in this article.

BEN POSTA, in Geography, a small town of Portugal in the province of Tras-Los-Montes, containing about 400 inhabitants.

BEN, BEEN, or BEHEN, Oil of, is a fine inodorous and insipid fixed oil, procured from the Ben nut, (Glans Unguentarius, Balanos Murepfiki) the fruit of the Guizandina Moringa.

The oil of Ben is prepared in the Levant, in Egypt, Syria, and also in Italy, by expression of the nut. Geoffroy gives the quantity of oil procured to be 305 ounces from about 8 pounds of the nut. The oil is valuable on account of its great purity, and freedom from smell and taste; hence it may be kept for a long time without altering, or becoming in any degree rancid and acrimonious. On this account it is not disposed to become drying, like so many of the other fixed oils. It is used very largely in perfumery as a base or vehicle into which the art of the perfumer is able to infuse the fine fragrant scent of various delicate flowers, that do not of themselves retain a sufficient balsam in which to fix their scent. Thus a great proportion of the oily effences of the flowers are Oliver perfumed oil of ben, and the scent matter (which is probably a very minute quantity of essential oil) may be again separated from the oil of ben, by means of alcohol. The method of preparing this perfumed oil we have described under the article Aroma.

The unalterableness of this oil would render it the most valuable substance for cutaneous or liniments in pharmacy, were it sufficiently common. It is actually employed for this purpose in many parts of Italy.

Ben Dubh, in Geography, a mountain of Ireland, situate partly in King's county, and partly in the county of Tipperary; 16 miles west of Killkenny.

Ben Cruachan, a solitary mountain of Scotland, in Argyllshire, the elevation of which is 3300 feet above the sea.

Ben Levey, a mountain of Ireland, in the county of Galway; 4 miles S. W. of Ros.

Ben Laren, Ben Ledi, Ben Lomond, Ben More, Ben Verrich. See Gramman Hills.

Ben Nevis, or Benevis, a mountain of Scotland in the Highlands, reckoned to be the highest mountain in Great Britain, being estimated at 4370 feet above the level of the sea, and yet not much above the quarter of the height of Mount Blanc. It is situated in the parish of Kinloch, Inverness-shire. This extraordinary mountain has never been sufficiently investigated by any mineralogist; but Mr. Williams says, that it conflitls mostly of porphyry, a reddish cliff, in which the pale rose, the bluish, and yellowish white colours are finely blended, and shaded through the body of the stone. Many specimens of green porphyry are also intermixed, with angular specks of white quartz. A red granite also prevails, which contains a vein of lead ore impregnated with silver. On the north-eahe side this mountain presents a precipice nearly perpendicular, and of a prodigious height, being by some accounts 1500 feet. The view from the summit is grand, exhibiting most of the western islands, from the paps of Jura to the hills of Cullen in Skye; on the east it extends to Ben Lawres in Perthshire, and the river Nafs; and the extent of view is about 83 miles. The superior half of the mountain is almost defile of vegetation. The summit is flat, with a gentle declivity. Snow remains in the crevices throughout the year; but here are no glaciers, nor other magnificent Alpine features. Drumblain, the "Dorset Britain," of the old writers, seems to be Ben Nevis, with the high defect moor of Ranaul, extending 22 miles to the head of that mountain. To the north-west of Ben-nevis is the long mountain of Corriarok, near fort Augustus, over which a military road has been formed in a zigzag direction. Near the foot of this mountain arises the rapid river Spey, and various other streams, all running to the west. Sinclair's Account of Scotland, vol. viii. William's Natural History of the Mineral Kingdom.

Ben Nevis, a mountain of Scotland in the Highlands, on the west of Ross-shire, estimated at 3720 feet in height.

Several other mountains of Scotland are distinguished by the appellation Ben, in conjunction with some other word.

Benabarri, or Benavari, a valley, and a place of the same name, seated among the Pyrenees in the province of Aragon, in Spain, on the frontiers of Catalonia. N. lat. 41° 55'. E. long. 0° 40'.

Benac, a town of France, in the department of the Ille et Vilaine, and chief place of a canton in the district of Redon; 81 leagues S. of Rennes.

Ben-Alia, a populous town of Egypt, between Menfak and Asfift, or Sicat. These three places, with Girgs, constitute the chief masts of the trade of Upper Egypt.

Benamenil, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Lunéville; 25 leagues E. of Lunéville.

Benares, a town or a province of Hindostan, bounded on the north and north-west by Oude, on the east by Bahar, and on the south and west by Allahabad. This district is about 120 miles long, and 100 broad; and contains, with its dependencies, 12764 square British miles; its soil is fertile, and
the country populous. The Zemindary of Benares, which includes also the circars of Gazypour and Chunar, constituted a part of the dominions of Oude, until the year 1775, when its tribute or quit-rent of 24,000, fixed at £640, was transferred to the English, on occasion of the cession of the province to the India Company. This Zemindary, lately in the hands of Chest Sing, occupies the principal part of the space between Bahar and Oude, so that only a small part of the territory of the latter touches Bahar on the north-west. In 1786 the clear revenue of Benares amounted to 320,000/. Almost in every village of this province, which is in a very prosperous state, a person is employed in teaching the youth to read and write; and they have a singular method of teaching reading and writing at the same time. The boys are collected upon a smooth flat of land, and with a finger or a small reed form the letters there, which they pronounce at the same time. As often as the space before each scholar is filled up with writing, it is exposed, and prepared for a new lesson: thus the expense of pens, ink, paper, and even a house is avoided. The education at Benares is chiefly instituted for the Brahmins.

Benares, the chief city of the forementioned district, is very rich, and the most completely built of any. It occupies the north bank of the Ganges, and is distant from Calcutta by the road, about 460 miles, and by Moorfieldabad 565 miles. Its ancient name was Kaff.; but there are no notices concerning it in the works of the ancient geographers. If it had existed during the time of the Syrian ambassadors, Piny would have noticed it, as he has done Methora or Matura, and Cilicutara, which lay near the Jumna river. This city is about six miles long and four wide; and may be viewed in its utmost extent from the tops of the Minarets of the mosque, erected by Aurungzebe on the foundation of an ancient Hindoo temple, and lately repaired by Mr. Hailings. It abounds in costly structures; but Mr. Forster, in his "Journey from Bengal to England," says, that the irregular and compressed manner which has been invariably adopted in forming the streets, destroys the effect which symmetry and arrangement would have bestowed on a city, entitled, from its valuable buildings, to a preference of any capital, even by him in India; and it is also very injurious to the falsity of the town. At Benares the number of Europeans is very small; a judge, regifter, collector, with a few civil servants, constitute the whole of the company's establishment there; and a few private merchants and planters make up the whole society. Of natives, however, the number is great; and many of the bankers are the principal creditors of the India company, and possess immense fortunes. The poor in Benares are still more numerous, owing to the crowd of pilgrims, who come from all parts to visit so sacred a place. Mr. Hodges, in his "Travels in India," informs us, that in examining one of the temples of Benares, he was surprised to find most of the ornamental parts of Grecian architecture in a building erected on the plains of Hindooftan. Benares has been from time immemorial the Athens of India, the residence of the moft learned Brahmins, and the seat both of science and literature. Here, it is probable, whatever remains of the ancient astronomical knowledge and discoveries of the Brahmins is still preferred. M. Berney (Voy. ii. p. 148.) law, in the year 1668, a large hall in this city filled with the works of the Indian philosophers, physicians, and poets. Sir Robert Chambers has described the observatory at Benares, which he visited in 1772. (See Observatory). He has more lately discovered in this city the "Surya Siddhanta," on the principles of which the whole Indian astronomy is founded. Several considerable extracts of this work have been translated by Samuel Davis, Esq. to whom this valuable work was communicated. It is composed in the Sanskrit language, and professed to be a divine revelation, communicated to mankind more than two millions of years ago, towards the close of the Sutty or Satty Jogue, the first of the four fabulous ages, into which the Hindoo mythologists divide the period during which they suppose the world to have existed. It appears from what is already known of this book, that independently of the fiction and romance which are blended in the account of its origin, it contains a very rational and elaborate system of astronomical calculation, and several rules and tables, for the calculation of eclipces, &c. which seems very much to favour the hypothesis adopted by M. Bailly, Dr. Robertson, and others, that affcribes a very high antiquity to the astronomy of the Brahmins. In the rules contained in this work is included a system of trigonometry, founded on certain geometrical theorems, with which, though unknown to Helonous and the Greek geometerians, modern mathematicians are well acquainted. For an account of the astronomical computations of the Hindoos, by Samuel Davis, Esq. see Asiatic Researches, vol. ii. p. 225, &c. 8vo. and for remarks on the astronomy of the Brahmins, and for an account of the principles on which the Hindoo system of trigonometry is founded, by prof. Playfair, see Edinb. Transact. vol. ii. p. 135. It appears, however, from an elaborate dissertation on the antiquity of the Surya Siddhantas by Mr. J. Bentley, published in the Asiatic Researches, vol. vi. p. 540, &c. that the system, so eagerly applauded and referred to by the above-mentioned writers to such remote antiquity, cannot be of a greater age than 731 years; or that it was composed about A.D. 1668.

Notwithstanding the science and literature that have been cultivated by the Brahmins at Benares, we discover traces of superstition, and even of inhumanity, in some of their customs, which, it is hoped, the interference of the court of justice, established there in 1783, will gradually restrain and reform. As the peron of a Brahmin is inviolate, no atonement can expiate the crime of occasioning his death. Hence originated a practice, which was formerly frequent at Benares, and which in its effects approaches the nearest to our caption, or arrest. The Brahmin, who adopts this expedient, in order to procure redress, proceeds, armed with a dagger or poion, to the door of his adversary's house; where he deliberately lets himself down, and threatens to commit suicide, if the offender should attempt to pass or molest him. He falls with inflexible rigour, to which the other party likewise submits, and periphever in his resolution until satisfaction is obtained. This practice, called sitting in "Dherna," is not confined to the male Brahmins only; for an infraction occurred at Benares in 1789, of a widow's recurring to this expedient, in order to obtain, in a litigation with her brother-in-law, that justice, which neither the award of arbitration nor the decision of the court had granted her. Both failed perniciously during thirteen days, when, worn out with hunger, her antagonist at last yielded the contest. Another infraction occurred in 1794. An inhabitant of a district in the province of Benares sat in Dherna before the house of some Rajpeets, for the purpose of obtaining the payment of a "Birt," or a charitable oblation, to which he had a claim; and in this situation destroyed himself by swallowing poison. Some of the relations of the deceased retained his corpse for two days before the house of the Rajpeets, who were thus compelled to forego taking sustenance, in order to induce them to settle the Birt on the heirs of the deceased Brahmin. This practice is not specifically pointed out by the shatter, but depends merely on the function of usage. Another practice of the Brahmins, equally...
equally angular, and more cruel, is called erecting a "Koor." Having constructed a circular pile of wood, and placed upon it a cow, or an old woman, they prepare to consume the whole together. The object of this practice is to intimidate the officers of government, or others, from urging improper demands, or levying grievances, exactings, as the effect of the sacrifice is supposed to involve in great guilt the person whose conduct obliges the contractor of the Koor to adopt this expedient. The only case of setting up a Koor, that occurred for many years, happened near Benares in 1788; but the sacrifice was prevented by the timely interposition of authority. There are a few instances of still more atrocious acts, by which the Brahmins seek to repel injuries, or to wreak their feeble vengeance; as by burning, with mutual content, their nearest and most beloved relations, from a perfusion that horror of the deed will rebound on the head of their oppressor. Sir John Shore (obi in favo) relates three shocking cases of that nature, which, to late as the years 1791 and 1793, came under his cognizance in the province of Benares. It further appears by Sir John Shore's report, that a whole family of Hindus, called the "Rajkeoomars," and resident on the frontiers of Jupoonpur, a district of the province of Benares, adjoining to the country of Oude, have been long accustomed to the favage practice of caulling mothers to flave to death their female offspring; and that the only reason assigned for this inhuman custom was the great expense of procuring fuitable matches for their daughters, if they suffered them to grow up. Measures have been taken and rigidly enforced for abolishing this barbarous practice, to which, however, there are some few exceptions; as certain families among the Rajkeoomars allow, at least, one female child to be reared, and one village furnishes a complete exception to the general custom. Among the superstitions prevailing in the province of Benares, we may mention the following circumstance relating to the sugarcane. If any of the old cane remains unemployed in the new plantation, the proprietor repays to the spot previously to the 25th of Jeyte, or 15th of June, and having sacrificed to Nagbele, the tutelar deity of that plant, he carefully sets fire to the whole; it being firmly believed by the "ryots," or husbandmen, that if a single cane should flower after that term, it would portend the most dreadful calamities to themselves and their families. We shall here add, that faith in charms, amulets, forcery, fascination, and althology, still prevails in the east. See Zoonaars. Asiatic Researches, vol. iv. p. 329, &c. 8vo. The Hindoo observatory at Benares is situated in N. lat. 25° 18' 56. E. long. 83° 16'.

BENARU, a town of Persia, in the province of Faristan, 106 miles S. S. E. of Schiras.

BENARVILLE, a town of France, in the department of the Lower Seine, 5 leagues N. E. of Montivilliers.

BENASCHI, John Baptist, in Biography, a painter and engraver, was born in Piedmont, A. D. 1636, and became a disciple of Pictor del Po. He imitated the works of Lanfranchi so successfully, that his pictures have been mistaken for the performances of that master. He is represented as a man of great genius, and the freedom and facility, which appear in his pictures, are highly commended. He died at Rome in 1693. He etched for his ammenement "A holy family," from Dominicus Cerini, his intimate friend. Strutt.

BENATKY, or BENATES, in Geography, a small town of Bohemia, with a citadel, in the circle of Boleflaw, seated on the Oder, 22 miles N. E. of Prague.

BENAVARII. See Benavari.

BENAVENTE, a town of Spain, in the country of Leon, seated on the Rio, and containing about 4000 inhabitants; 13 leagues S. of Leon.

BENAVIDIO, Marcus Muntia Benavidius, in Biography, a celebrated civilian, was born at Padua in 1492, and taught the civil and canon law in his native city for 60 years, with high reputation. He there received the honour of knighthood, vis. from the emperors Charles V. and Ferdinand I. and from pope Pius IV. He died in 1582, and was the author of several works in his own profession; among which are "Collectanea super jus Canonum;" "Observationum Legalam," lib. x. and "De Illustribus Jurisconsultis." M. reri.

BENBECULA, in Geography, is the name of one of those islands of Scotland called the Hebrides. It lies between the isles of N. and S. Uith, from the last of which it is separated by a narrow channel, nearly dry at low water. This island is rather flat, and measures only about nine miles in transverse diameter. Its soil is sandy and barren; but the quantity of sea weed constantly driven on shore, is appropriated to meliorate some portions of the land. In one part of the island is an ancient fort called Elrime Neat Rueane, and several stone monuments are found in different parts of it. It has a harbour for small fishing vessels, and several fresh water lakes, fringed with fift and fowl.

BENBRICK, a mountain of Scotland, in the county of Perth; 12 miles N. N. W. of Crieff.

BENBALBEN, mountains of Ireland, in the county of Sligo; 7 miles N. of Sligo.

BENCH. See Bang, Bank, &c.

Bench, Amicable. See Amicable.

Bench, King's. See Court of King's Bench.

Bench, free. See Free-Bench.

Bench island, in Geography, lies within the south-east point of what is called South-east bay, in the southern part of New Zealand.

Bench-widow. See Widow.

BENCHERS, in the Inns of Court, the senior members of the house, who have the government and direction thereof; and out of whom is yearly chosen a treasurer, &c.

BENCOCOLEN, in Geography, a fea-port town and fort on the south-west coast of the island of Sumatra, where the English have a settlement and a factory. This is one of the four English presidencies, or governments, to which all the other factories are subordinate; the other three are Madras, Bengal, and Bombay. Bencoolen, which is about 2 miles in compass, is known at Sea by a high tender mountain, called the "Sugar Leaf," and rising 20 miles beyond it in the country. Before the town lies an isle, within which the ships usually ride, and with this, the point of Silebar, extending 2 or 3 leagues southward of it, forms a large and commodious bay. A convenient river on its north-west side brings the pepper, of which the trade of the town chiefly consists, from the inland country: but it is shipped with inconvenience, on account of a dangerous bar at the mouth of the river. It is principally inhabited by natives, who build their houses on pillars of bamboo wood. The English, Portuguese, and Chineese, have each a separate quarter. The adjacent country is mountainous and woody, and there are many volcanos in the island. As the town stands upon a morass, the air is loaded with vapours, and the mountains are covered with thick clouds, that produce lightning, thunder, and rain. The climate of Bencoolen has proved more fickly and fatal than that of any of the other British settlements, not only to the English, but to all who have been accustomed to live in a pure air. In 1763, upon the cession of Manilla to the Spaniards, and the reparation of Bencoolen to the English, many Chinese merchants, with Z 2 their
their families, quitted Manila in order to settle under the English government at this place; but the air of this country proved so fatal, that most of those Chinese and their families died soon after their arrival. Many English have also fallen a sacrifice to the intermixture of this climate; and, indeed, few of them survived until they built a fort on a dry elevated situation, at the distance of about 3 miles from the town. This is called "Fort Marlborough," where, during the rage of sickness at Beacoonen, the garrison is sometimes very healthy. Tame buffaloes may here be had in great plenty; but fish and poultry are scarce and dear. The soil is a fertile clay, producing high grasses; but near the sea it is a morass. N. lat. 3° 49' 3". E. long. 102°. See SUMATRA.

BEND, a town of Peria, in the province of Farfian, 100 miles N. E. of Solaha.

Bend Distur, in Heraldry. The bend was a saff worn across the shoulder from the Italian l'amba; it is one of the nine ordinaries in heraldry, and occupies one-third part of the escutcheon when charged, and one-fifth when plain; it consists of two equal lines drawn diagonally from the dexter chief to the sinister base of the shield. This ordinary hath more subdivisions or diminutives than any of the others, viz. the bendlet, goutier, coticule, and ribbon, none of which diminutives can properly be charged.

Bend Sinijfer, denotes lines drawn diagonally from the sinister chief, to the dexter base of the shield; it hath not the same diminutives as those of the bend dexter; but according to some heraldic writers, is subdivided into a semea, or saurie, which is in breadth half that of the bend sinijfer; and a batton, or siffure, as Upton and Holme call it, containing half the breadth of the saurie. Here, however, arises an objection to the admitting the batton to be a diminutive of the bend sinijfer, or as any part of one of the ordinaries. According to many years practice, the batton doth not touch the extremities of the shield, nor the extremities of the quarter where the paternal arms are placed, as all the ordinaries and their diminutives constantly do; but on the contrary, is coupled, that is, cut short, and so borne as a mark of illegitimacy, and not as an ordinary or charge, or any part of the coat: for, although some instances are to be met with of ancient arms, where a batton sinijfer is passed from the sinijfer chief to the dexter base, over all; and others, where it passes from corner to corner, over the paternal quarter, and not over the other quarters; yet, in every one of those instances, the batton is used as a mark of bastardy, and not either as an ordinary or charge. Hence, therefore, we may fairly conclude, that the batton is not to be deemed as any part diminutive of the bend, but as a mark of illegitimacy; which mark or batton when granted by princes to their illegitimate children, may be of metal or fur, or both; but, when granted to any under his degree, must be of colour only.

BENDA, in Architecture. See PARCEL.

Benda, Francis, in Biographies. concert-master to the late Frederick II. king of Prussia, during the time when he was only prince of Prussia, and resided at Ruppin, before his accession to the throne.

It was by health, that this prince indulged his passion for music, during the life of his father, the late king, who had forbidden him, not only to flout and practice music, but to hear it. M. Quanz told us afterwards, that it was the late queen-mother, who at this time encouraged the prince in his favourite amusement, and who engaged musicians for his service; but so necessary was secrecy in all these negotiations, that if the king his father had discovered that he was disobeyed, all the sons of Apollo would have incurred the danger of being hanged. The prince frequently took occasion to meet his musicians a hunting, and had his concerts either in a forest or cavern.

Benda Hilt, in 1752, led the king of Prussia's band at the opera, and at his concerts; and could boast of having had the honour of accompanying his majesty, during the 40 years which he had been in his service, in near 50,000 different concerts. What an excellent economist of time must his late Prussian majesty have been; who, though his own minster, could spare two hours every day, when he was not in the field, for music!

When we heard the admirable Benda perform, it was an excellent composition of his own, which he played con for-do; his hand, he said, wanted force sufficient to play without. The gont had long enfeebled his fingers, and age, perhaps, still more. There were, however, fine remains of a great hand, though he was probably always more remarkable
able for feeling than force. His style was so truly cantabile, that a pulse could be found in his composition, which would not have been in the power of the human voice to sing; and when he was at his best, he was so very affecting a player, so truly pathetic in an adagio, that several able professors declared that he frequently drew tears from them in performing one. How he acquired this style of writing and playing, may be of some use to musical students to trace and develop. His style was not that of Tartini, Soniis, Veracini, nor that of the head of any one school or musical sect, of which we have the least knowledge: it was his own, and formed from that model which should be ever studied by all instrumental performers, good faithing.

DENDALI, in Geography, a town of Africa, lying between the confines of Darfur and Wara, the capital of Bergoo. It is inhabited by the natives of theultan of Bergoo. The people are idolaters.

DENDALI, a town of Periia, in the province of Ker-

man, 150 miles S. of Sirjan.

BENDARMALANKA, a town of Hindostan, in the ceded of Rajamundry, latitude between the branches of the river Bain, at their outlet into the ocean, 50 miles S. of Rajamundry, 50 N. E. of Mafulpattam, and 358 miles N.E. of Madras. N. lat. 16° 30'. E. long. 82° 30'.

BENDEIRG, a mountain of Scotland, in the county of Perth, 7 miles N. of Blair Athol.

BENDER, formerly called Timnin, and denoting in the Turkish language "a paws," a fortified town of European Turkey, in Baffarabia, seated on the Dinister. It is celebrated as the seat of retreat and residence of Charles XII. of Sweden, when he put himself under the protection of the Turks, after being defeated by the Ruffians at the battle of Pultowa in 1709; but upon refusing to leave their territory, he was attacked, taken prisoner, and removed to Adrianople, where, after a year's confinement, he returned secretly to his own dominions. It was besieged by the Ruffians in 1770, and after a resistance of nearly three months, surrendered to Panin, the Ruffian general; and the capture of this fortress was succeeded by the submimion of the Tartars of Budziak and Otchakof to the Ruffian tzcoptre. The siege which Bender, in 1770, sustained from the Ruffians was remarkable, on account of the desperate defence made by the garrison, the carnage which attended its reduction, and the adoption on the part of the besiegers, of that dreadful instrument of modern warfare, the globe of compression. The Ruffian army, commanded by Count Panin, opened their trenches on both sides of the river, the 30th July, after which, a furious cannonade and bombardment were begun from all quarters, and vigorously returned from the town. The garrison and inhabitants defended themselves, with the utmost bravery: in sixteen days they made seven forties, with little advantage, but great loss on both sides, and held out for more than two months with unabated courage, even when the defeat of the main army by the Ruffian general Romanzow seemed to deprive them of every hope of relief. The besiegers in the mean time pushed forward their mines (See Mine) with industry, particularly one of an improved construction lately invented by a French engineer, and which has been since denominated the globe of compression. In this labyrinth of mines, interwoven and enclosed one within another, it was maintained, that a certain quantity of gunpowder would cause a greater explosion, and throw up a greater portion of earth than in any other method. The globe of compression being brought to perfection, was charged with the amazing quantity of 16,000 lb. of powder, and the garrison continuing obstinately to refuse every proposal of surrender, count Panin prepared for a general assault to take place on the night of the 25th of Sept. The firing of the mine was to be the signal of attack, and it was hoped, that besides ruining the outworks, it might make a breach in some of the principal walls of the town, and bury the defenders in the ruins. The Ruffians themselves were apprehensive of the consequences, as it was not easy to define how far the effects of such an enormous mass of powder might extend, and the troops destined to make the assault in that quarter were stationed at a considerable distance. In fact, the globe of compression, which was blown up at 10 o'clock at night, with a most horrible concussion, shook the whole adjacent country, and, amidst the astonishment and confusion excited by this dreadful phenomenon, the attack began in three places with great fury. Nothing could restrain the impetuosity of the Ruffian soldiers, who pushed forward at the main point of assault. The double ditches before the glacis were paved and filled up the double row of palisades before the covered way destroyed; the main ditch stormed, and all the outworks carried in possession. The body of the place could not oppose an effective resistance to enemies who had already overcome such difficulties: the Ruffians got over the walls in every quarter, and a new and dreadd cont Lloyd commenced in the dark, as well among the fortifications, as in the streets, lanes, and palisades, and from the houses. The desperate resistance of the garrison and inhabitants, obliged the Ruffians to set fire to the town, which they did in several places at the same time, but the content nevertheless continued, amidst the ruins and the blazing houses, for the whole of the night, or seemed decided, but by the almost total extermination of the Turks. At eight in the morning, the feralier, with most of those that survived, retired to the citadel, which the flames had already reached. A select body of 1500 cavalry and 500 infantry, attempting to cut their way through the besiegers, were surrounded and cut off to a man. As for the feralier, after demanding in vain an honourable capitulation, the fury of the flames, which had now reached every part of the citadel, obliged him to surrender with his followers, as prisoners of war. The fire raged for three days, and could not be restrained till it had consumed the whole city. The total number of prisoners, including the inhabitants of all ages, amounted to 11,749, of whom 5,534 were Janissaries and falnus, with their commanders, besides the feralier and two bayadas. The reduce of a population of 20,000 souls, of whom one half were fodaliers, perished in the conflagration. The Ruffians found in the place a vast quantity of arms, bombs, grenades, gun-powder, and other military stores, besides above 200 pieces of hraas cannon, and 85 mortars. They also took 4,000 horse-tails, 14 batons of command, and 40 pair of colours.

Bender, hardly recovered from this blow, was again taken, but not till after a long siege, by prince Potemkin, in November 1789. It was, however, referred to Turkey by the subsequent treaty of peace in 1792. Bender is reckoned to contain between 10 and 12,000 inhabitants; and its governor is a bawhaw. It is distant 100 miles W. of Otchakof or Ozeckow, and as many miles S. E. of Jaffy. N. lat. 47°. E. long. 29° 20'.

Bender-Akuff. See Comoroon.

Bender-Congo. See Congo.

Bender-Delam, a town of Persia, in the province of Far-

sian, on the north coast of the Persian gulf; 150 miles W. of Schiras.

Bender du Ser, a town of Persia, in the province of Ker-

man, 150 miles S. of Sirjan.

Bender Ibran, a town of Persia, at the mouth of the river Ibram, in the Persian gulf.
BENINDER. Mufim, or Benjar-Musfin, the capital of a kingdom
of the same name in the southern part of the island of
Borneo, possessing a good harbour, formed by the river Benjar,
flowing from the centre of the country almost due south. S.
lat. 2° 45'. E. long. 113° 50'.

BENDER Richer, a town of Persia, on the north coast of
the Persian gulf, in the province of Farsfian; 160 miles
S.S.W. of Schiras.

BENDER Rich, a city of Persia, in the province of Ker-
man, on the north-east coast of the Persian gulf. It is en-
compassed with walls in an indistinct line, and lies north
from Abufchar and Bushehr. The petty state, of which
this is the capital, comprehends several other places in Ker-
man, which render its sovereignty in some measure dependent
upon Kerim Khan. The Arabs of this principality are
chiefly addicted to a feast-saving life; the Persians inhabiting
its back parts are husbandmen. The reigning family of
Bender Rich is of the Arabian tribe of Beni Saab, and pro-
ceds originally from Oman; but the grandfather of one
of its princes, having become a Schite, and married a Persian
lady, this family is no longer reckoned by the Arabs among
their genuine nobility. A late reigning prince of Bende-
Righ, Mir Mahenna, was notorious through the country
for his vices and cruelties, as one of the most execrable ty-
rants that ever existed. He caufed his servants to murder
his father in his own presence, because the old man had a
predilection for his eldest son. He killed his mother, be-
cause he reproached him for his crimes. He caufed his
brother, and sixteen others, to be affaffinated, be-
cause he might establish himself in the bungled possession
of the throne. He drowned two of his sisters, be-
cause a neighbouring prince had asked one of them in marriage. He
expofes all the children that happen to be born to him. In
1765, this detestable monarch was under the age of thirty
years. After having been twice captured by Kerim Khan,
he recovered his liberty, and immediately upon his return
to his own dominions began to pillage the caravans which
travelled between Schiras and Abuilchehr, and to practi-
cize piracy. Kerim Khan laid unsuccessful fieg to his capital;
and when he fent in 1765, to demand payment of the tribute
due for his poifeffions in Kermieh, Mir Mahenna malt-
treated the officer deputed for this purpofe, and caufed his
board to be flaven. Upon which Kerim Khan fent againft him
a powerful army, which conquered Bender Rich and all its ter-
ritories. Mir Mahenna, however, had previously retired with
all his troops, and fome of his fubjefts, into a defert ifle called
Khouri, where he waited till the Persian army retired
from his country. As soon as they were gone, he left the
ifland, expelled the garrison from Bender Rich, and regained
poifeffion of his dominions. The tyrant had abandoned
himfelf to drunkenefs; and had begun to exercife fuch
cruelties upon his troops, that he cut off the noses and ears
of fome of the principal officers; and yet fo attached to
him were his foldiers, that, in the period of his exile, he
took the ifle of Kurek from the Dutch. Bender Rich is
distant 132 miles W. S. W. from Schiras. N. lat. 29° 26'.
E. long. 51° 20'.

BENDIDIA, βενιδία, in Antiquity, folemn feals held by
the Athenians on the twenty-first day of the month Threr-
gelion, in honour of the goddes Diana. The word is form-
ed of βενις, a denomination of Diana, according to Strabo,
or of the moon, according to Suidas, which amounts to the
fame. The bendidia were held in the Pireus, and bore
fome refeemblance to the hachanidia.

BENDING, in a general fenfe, denotes the reduction of
a straignt body into a curve, or giving it a crooked form. M.
Bernouilli has a difcourfe on the bending of springs, or
electric bodies. (See Spring.) M. Amontons gives feveral
experiments concerning the bending of ropes. (See Rope.)
The friction of a rope bent, or wound round an immovable
and, with a very small power, to sustain very great
methods have been contrived for bending timber, in order
to supply crooked planks, and pieces for building ships.
M. Dalfene ingeniously enough propofed to have the young
tree bent, while growing in the forest. The method of
bending planks by a fand-heat, now used in the king's
yards at Deptford, was invented by captain Cumberland. Phil.

The bending of boards, and other pieces of timber for
curved works in joinery, is effected by holding them to the
fire, then giving them the figure required, and keeping them
in this figure by tools for the purpofe.

A method has been lately invented and practiced for
bending pieces of timber, fo as to make the wheels of car-
inges, without joints. See Wheel.

The ufe of flaming wood for the purpofe of bending it
is evidently to fupple it, fo as to make it capable of being
brought the more easily into the form required, as well as to
adapt it for retaining that form, after the pressure by which
it was originally reduced to that figure has been removed.
By means of flaming, heat and moifure are applied to it.
If it has already moifure enough, as in the cafe of green
wood, burning in any of the fore mentioned ways, to the
point of 80°, may be fufficient; or the effect may be produced
by heating and fetting at the same time. These modes of
fupplying by heat and moifure, have been practiced from
time immemorial in Russia, and applied to wheels, and some
other forts of wood-work. In England thefe, or similar
modes, have been applied for a long time in the dock-yards,
and also, under a patent granted to Meffrs. Jacob and Viny,
but now expired, in the conftuction of wheels; and by
Mr. Bevan, under a patent fill in force, to circular wooden
faftens, foiftens, fan-fhants, door-mouldings, and hand-rails for
flairs; and, without patent, by cabinet and chair-makers in
general. When the thicknefs required, compared with the
sharpnefs of the curvature, is fuch as to render it imprac-
ticable to bend the piece entire, it may be divided for this
purpofe into different thicknefses, in the manner propofed
by Mr. Samuel Bentham, under a patent obtained in 1793, for
methods of working wood, metals, &c. with very little,
if any, loft of strength; and if the ftrata are connected by
proper fattenings, with a degree of strength far fuperior to
what a piece of the fame dimensions would pollfé, if grain-
cut. In this mode, curvature may be given to the wood-
work of all forts of engines, and of carriages of all forts;
to all timbers designed for receiving a curved shape and em-
ployed in buildings; and to any of the timbers, that may be
ufed in the conftuction of boats or veffels, not excepting hips
of the largest clafs. Thus, it is faid, a very confiderable
faving with repect to quantity and value might be obtained,
whilft at the fame time the strength would be augmented.

In the operation of bending, care should be taken that
as falt as you force any piece to adapt itself to the curvature
of the mould to which you are bending it, you apply a
fuffrefe, by means of fcrews or wedges, &c. to that part,
and along the whole piece, particularly at its sharpeft con-
venelties; fo that the piece may not only be kept to its pro-
er curvature, but the external fibres be prevented from
flarting out. In forming ship-ribs of all shapes and fizes,
fo as to fuperfede the use of crooked-grown timber, where
that which is ftraight would be cheaper, Mr. Bentham pro-
fores to ufe one or other of the two following methods,
which, he fays, would effcctually anfwer the purpofe. Firft,
having
having formed a mould or block to the shape of the rib in question, comprehending the whole of its extent from top to top-side, that is, on both sides of the keel, bend the component parts of the rib, according to the shape of the block, and fasten them together; then, to confine the whole rib in its curvature, apply flays or crois-bars, in those parts where the form would be most apt to change, and to convey the rib, together with its flays, till it has been sufficiently confined to its curvature, by the connection given to it with the planks, beams, and other parts of the ship. Or, secondly, you may form the shell of the ship first, without timbers, beginning to build as it were by the planks, using only a few temporary moulds or false ribs, to determine the position of, and give a temporary support to, the planks. When this is done, infret the timbers afterwards, prefiling and binding the component parts securely into their places and removing the false ribs, in proportion as the real ones are put together and secured. Or, thirdly, instead of the false ribs, you may infret a sufficient number of real ribs, put together as in the first method; and then proceed with the planks and the rest of the ribs, as in the second method. As to bending, it may, in this case, be performed with or without the assistance of filing, and with or without the use of the expedient of dividing into thicknesses according to the degree of curvature may require. In clinker-work built boats, the ribs have been sometimes infreted by bending them to the planks, but this is only done in boats of the slightest class. See Ship.

Bending, in the Sea Language, denotes fastening one rope to another, or to different objects, and fastening a fast to its yard.—They lay, bend the cable, when it is to be made fast to the ring of the anchor.—To bend two cables, signifies to tie them together with a knot, through which les fere than filing, is looser done. To unbend the cable, is to loosen it from the ring of the anchor; which is done when a ship is designed to be long at sea. To bend a main fast, is to make it fast to its proper yard or flay.

BENDLET, in Heraldry, is the first diminutive of the bend, and poîciles one half of the breadth of the bend.

BENDOAN, in Geography, a small island, 5 leagues S.W. from Cape St. Martin’s, on the coast of Spain, in the Mediterranean, which lies in a fourt of the South from Vlack island. It is north-east from Alton, and forms the limit of the bay of Calp, or Carpi, of which the mount so called is the south-west limit.

BENDORAN, a mountain of Scotland, in the county of Arryile.

BENDRFF, a town of Germany, in the circle of Weißphalia, and county of Sayn, and in a prefecture of the same name, seated not far from the Rhine, into which the river Sayn empties itself at this place. It is inhabited by Roman catholics and Lutherans, each of whom enjoy the public exercise of their religion; 5 miles N. of Coblenztz.

BENDORF Road, lies on the west coast of Ireland, and is the eastermost of the roads between Ballyfannahon and the island of Murr, or Enislury, as Bundat is the most western. In both, ships may ride with safety.

BENDS, in a ship, are the same with whala, or walet, which are the outermost timbers of a ship, on which men set their feet in climbing up. They are reckoned from the water, the first, second, and third bend: they help much to strengthen the ship, and have the beams, knes, and footboaks bolted into them.

BENDS denote also the small ropes used to confine the clinch of a cable. For a common or fleet bend, pafs the end of a rope through the bight of another rope, then round and underneath the flandering part; but, to prevent its jam-
BEN

solitude, and by means of the multitude of persons that associated with him, he was enabled to build twelve monasteries, and to place in each of them twelve monks. In 528 or 529, he retired to Monte Cassino, and having cut down the grove sacred to Apollo, built a monastery, and founded his order. Being summoned to the council at Rome by Pope Boniface IV, he was carried, by his own request, at the approach of death, to the monastery of St. John the Baptist, where, during his attention to the service, he expired, in the year 542 or 543, according to Cave, or, according to others, in 542. His extraordinary miracles are recorded in the "Dialogues" of St. Gregory the Great; and by the church of Rome, he is honoured as a saint. The only genuine work of St. Benedict, according to Dupin, is the "Regula Monachorum," but other works have been ascribed to him, and they are published together in the 9th volume of the "Bibliotheca Patrum." Cave's Hist. Lit. i. p. 512. Dupin. Eccl. Hist. vol. iii. p. 44.

BENEDICT, abbot of Aniane in Languedoc, was born in 751, and educated at the court of king Pepin. Having served this prince and his successor Charles-le-Magne, he retired to a monastery in Languedoc, where he distinguished himself by his mortifications. He afterwards built a hermitage on the rivulet called Anian, which, in process of time, became a considerable monastery. Lewis the Merck employed this monk in reforming the monasteries, both in Aquitaine, and afterwards through the whole kingdom of France, and in reforming, by new and salutary laws, the monastic discipline which had been neglected and fallen into decay. In 817, he presided in the council of Aix-la-Chapelle, and subjected, by the authority of the emperor, all the monks to the rule of Benedict of Monte Cassino, preferred to them all one uniform mode of living, and thus united the various orders into one general body or society. Hence he was regarded as the second father of the western monks. He died in 821. His collection of rules for the canons and western monks, entitled, "Codex Regularum," and his concordance of monastic rules, and also a collection of homilies of the fathers, were published by Holtenius at Rome. This abbot has been beatified by the church of Rome. Moreri. Molhein's Eccl. Hist. vol. ii. p. 310.

BENEDICT, BISCAI, an English abbot of the seventh century, was born of a noble family among the English Saxons, and in the 25th year of his age devoted himself wholly to religion. Accordingly, in 653, he took a journey, in order to acquaint himself with the ecclesiastical discipline, and on his return he laboured to establish it in Britain. Upon his return from a second journey to Rome, in the course of which he received the tonsure, he assumed the government of the monastery of Canterbury, to which he had been elected during his absence. After a third journey to Rome, whence he brought back a large collection of valuable books, he returned to the court of Egfrid, king of Northumberland, who had proceeded Offa. On a tract of land, given to him by that prince, he erected a monastery, which, from its situation on the river Wans, was called "Wormemouth," in which he is said to have placed 520 Benedictine monks. The church of this convent was built of stone by artificers fetched from France, in 674; and both the church and convent were dedicated to St. Peter. From a fourth excursion to Rome, in 678, he returned laden with books, relics of the apostles and martyrs, images, and pictures. In 682, he built another monastery on the banks of the Tyne, four miles from Newcastle, called "Girwyn," or "Jarron," and dedicated to St. Paul. Soon after this establishment, he took a fifth journey to Rome, and came back enriched with a further supply of ecclesiastical ornaments. Soon after his return he was feigned with a palsy; and at length closed his life in a truly Christian and exemplary manner, in the year 693, and was buried in his monastery of Wormemouth. He wrote some works on monastic discipline and the church ritual. He was a celebrated finger; and one of his expeditions to Rome, brought with him a chanter, who introduced the Roman method of singing masses. Bong, Brit.

BENEDICT, abbot of Peterborough, in the twelfth century, was educated at Oxford, and became a monk in the monastery of Canterbury, and afterwards prior. By the influence of Henry II, he was elected abbot of Peterborough in 1177. He abdicated at the coronation of Richard III, in 1189, and was advanced to be keeper of the great seal in 1191. But death deprived him of this dignity in 1193. Bishop Nichollon says, that he died in 1200. Besides his "Life and Miracles of Archbishop Buckett," characterized by Leland as an elegant performance, but treated by Bale as a mere heap of lies and forgeries, he composed a "History of Henry II. and Richard I. from 1170 to 1192," which, says Dr. Henry, hath been much and justly esteemed by many of our greatest antiquaries, as containing one of the best accounts of the transactions of those times. A beautiful edition of this work was published at Oxford, in 2 vols. by Mr. Hearne, A. D. 1735. Henry's Hist. vol. vi. p. 143.

BENEDICT, ALEXANDER, one of the early cultivators and reformers of anatomy, was born at Verona, about the middle of the 14th century. After travelling over various parts of Greece, he returned to Italy, and was appointed to the anatomy at Padua, where his lectures were numerous and attended. In 1357, he published "Anatomicae in quinque histrorum corporis human," the first edition was dedicated to the emperor Maximilian, with whom he appears to have been in great favour. It is principally copied from Galen, but with some observations from his own practice. He is the first, Haller says, that described the concretions called gallstones. The language used by Benedict, is much purer than is found in any of the earlier anatomical writers. "De omnium a vertice ad plantam morborum signis, causis, &c. sol. 1500, taken principally from Galen, Paulus Aegin, & Orribalus, whose works he appears to have read in their own language. He also wrote, "De Pelletentia," "De Medicis Officior," and other smaller pieces. The whole of his works were collected, and published under the title of "Opera Omnia," fol. Venet. 1533. Haller. Bibl. Anat. Eloy. Dict. Hist.

BENEDICT, a name assumed by several of the popes. The first of this name, called by the Greeks Boenous, was advanced to the pontifical chair in 574, at the period when the Lom bards overran Italy, and fixed their seat in it under Alboin; and he is said to have died after four years, in consequence of the grief occasioned by their ravages. Benedict II. was elected in 663, and distinguished by his learning and virtues. He died in 685, and obtained the honour of canonization. Benedict III. was advanced to the pontificate in 855, and by the influence of the Roman clergy, supported on the papal throne in opposition to Anacletus, which he occupied with mildness, piety, and charity. In his time, Ethelwold, king of the west Saxons, visited Rome with his son Alfred. Two epitaphs of this pope are extant. Benedict IV. was raised to the papal chair about the year 900, and died with a good character in 903. Benedict V. was elected pope in 964; and although he was a man of extraordinary learning and sanctity, he was stripped of the pontifical and prievely dignity by the authority of the emperor Otto, and sentenced to be exiled; upon which he retired to Hamburg, where he died.
died in 965 or 966. *Benedict* VI. was elevated to the papacy in 972; and being seized by a faction which attacked the Lateran palace, he was imprisoned in the castle of St. Angelo, where he was either starved or famished in 974. "Benedict* VII. was elected in 975, and after a prudent government of nine years, died in 984. "Benedict* VII. was made pope in 1012, but displaced by Gregory an anti-pope, and afterwards restored. Under his pontificate Henry, king of Germany, marched to Rome; and Benedict crowned him emperor under the title of Henry II., and his queen Cunegunda, empress. In 1016, this pope, collecting his dependents, defeated the Saracens, who made a defeat at Luna in Tuscany, and put them all to the sword. He also waged war with the Greeks, who ravaged Puglia. In 1019, the emperor bestowed on him and his successors the newly erected fee of Bamburg. He died, after having approved himself a great friend to the monks, and zealous for the order and discipline of the church, in 1024. *Benedict* IX. succeeded his uncle John XIX. in 1023, in his 18th year; was expelled from his fee on account of his vices, but restored by the emperor Conrad; and after a life of various expeditions and restorations, sold or resigned the pontificate in 1044. He resumed it, however, occasionally under succeeding pontificates, and finished his scandalous career in 1054. *Benedict* X. was elected to the popedom by a party in 1058, and after holding the fee nine months and twenty days, deposed and excommunicated. *Benedict* XI. was the son of a shepherd, or of a notary, at Trevigno, in the state of Venice, became a schoolmaster, general of the Dominicans, and cardinal bishop, first of Sabina, and afterwards of Oltia, and succeeded pope Boniface VIII. in 1303. He exerted himself by various efforts for the good of the church, but death terminated his labours on the ninth month of his pontificate, A.D. 1304. This pope conducted himself with moderation, and behaved with singular respect to his mother and relations; but would not suffer any interference on their part in public affairs. He wrote commentaries on the books of Job, the Psalms, St. Matthew, and the Revelations, as well as a ritual, and some sermons. *Benedict* XII. was the son of a miller in the county of Foix, and after several subordinate ecclesiastical promotions, was advanced to the papal fee in 1334. He was skilful in law and theology, and distinguished by his probity, but little liked in politics. Wishing to reform the apostolic see to Italy, but obliged by the circumstances of the times to remain at Avignyon, he laid the foundation of a magnificent and strongly fortified palace, which, however, he did not live to finish. He observed a laudable caution in the creation of cardinals, and the appointment of benefices; and he exercised singular moderation with respect to his own relations, observing, that "James Fournier (his family name) has relations, but pope Benedict none." As he was industrious and active in reforming discipline and morals among several religious orders that were become corrupt, he incurred the ill-will and calumny of the monks. During his efforts for reconciling the kings of England and France, he was seized with an illness, which terminated his life in 1342. Among his printed works are his "Decretum de animabus separatis," and his "Constitutiones for the reforms of various religious orders." He left also sermons for the chief festivals of the year, commentaries on the Psalms, letters, and poems. *Benedict* XIII. was of a noble family, being the eldest son of the duke of Gravina, in the kingdom of Naples, and born at Rome in 1649. Against the views and wishes of his family, he took the habit of the Dominican order in 1667, and applied with diligence to the studies and duties of his office, preferring the humble life of a monk to that of a superior station. However, by the alliance of his family with that of the pope Clement X., he was promoted, against his inclination, to the cardinalate in 1672; and after several successive advancements to different fees, in which he maintained the character of an exemplary parson, he was elected to the papacy in 1724, and constrained to accept it against his own remonstrances. In the exercise of his office, he laboured incessantly in repelling the luxury of the pontifical court; and in correcting the licentiousness of the clergy; but he was thwarted in his projects by the Jefuits, on account of his attachment to the Dominican doctrine concerning grace and predestination, which left remarked theirs than that of the Jansenists. His well-meant attempt to unite all Christian saints in one church and faith, manifested a greater degree of charity, than of discernment and knowledge of the world. Avoiding all the pomp connected with his high station, and restricting the expenses of his own table to 6d. per day, in the dittoe of wine and animal food, he lived in the Vatican like a monk in his clother. Nevertheless, the doors of his palace were always open to the poor, and he was ever ready to hear their complaints, and to the utmost of his power to relieve their diftresses. Diverting himself of all the marks of sovereignty, and with even to dismiss his guards, he frequently went out in the evening in the most private manner, for the purpose of visiting the sick. He closed his pontificate of six years, in 1740, at the age of 82 years. His sermons, poems, and other writings, together with his bulls, were published at Rome in 3 vols. fol. in 1728. *Benedict* XIV. was descended of the noble family of Lamber- mii, at Bologna, and born in that city in 1675. After several previous promotions, he received a cardinal's hat in 1728; and from the archbishopric of Bologna, to which he was nominated by Clement XII. in 1731, he was advanced in 1740 to the papal fee. Poffefling a gaiety of temper, united with profound learning, an elegant taste, liberal sentiments, and great goodness of heart, he was singularly amiable; and as he diminished the number of festivals, abolished idle ceremonies, and manifested a dislike of superfluous practices and pious frauds, he was culminated by some of his enemies as a "protestant pope." As a munificent patron of literature, he founded academies at Rome, bestowed benefactions on that of Bologna, corresponded with, and rewarded learned men at home and abroad, cauited a meridian line to be drawn, reared from the dust the celebrated Egyptian obelisk, called that of Seolitore, and adorned Rome with various other monuments of antiquity. Fond of the pleasures of literary retirement, and of occasionally enjoying the mirth of the lower classes, his aversion to business was invincible, and he frequently lamented the drudgery and fatigue of his official situation. Attached to life, he dreaded the symptoms of infirmity, and, as it were, confiding in the prayers of the Jefuits for his life, he would not consent to sign the bull for the reform of their order in Portugal, till he was absolutely given over. On the king of Portugal he conferred the title of "his most faithful majesty." He governed the church with great mildness, and manifested on all occasions a strong desire of conciliating those differences with regard to doctrine by which it was divided. After a pontificate of 28 years, he died in 1758, at the age of 83 years. His works have been published at Rome in 12 vols. fol.; and they display a greater degree of professional knowledge and of application, than his levity and facetious disposition would lead one to expect. Bower's Hist. of the Popes. Moehrein's Eccl. Hist. Now. Dict. Hist.

*Benedict*, St. in Geography, a town of Hungary, seated on the Gran, with a fortified castle; 30 miles north of Gran.

*Benedict*, a town of America, in Charles county, Mary-land,
ryland, on Patuxent river; opposite Mackall's ferry; 30 miles south-east from the Federal city.

BENEDICTINS, or Benedict Order, in Ecclesiastical History, is an order of monks, who profess to follow the rule of St. Benedict, which he formed only for the Cenobites, or for those who live in a monastery under the direction of an abbot.

Having given instructions as to the qualifications and duty of the abbot, he proceeds to recommend to the monks obedience, silence, and humility; to note the hours for divine service by day and night, as well as the order and manner of performing it; and to specify the punishments that were to be inflicted on offenders. These punishments were to be excommunication, or a separation from the fellowship of the brethren, at table or at prayers; the chastisement of the more disorderly with rods; and expulsion from the monastery. He further states the mode of their admission, the defec they were to wear, and the labour in which they were to be employed. From this rule, which is still extant, we learn that it was not his intention to impose upon all the monastic societies; for he expressly excludes the anachorets, who, having learned the exercises of a monastic life in a convent, retired separately into deserts, the Sarabites, who live two or three together in a cell, and the Gyrovagi, who removed from one monastery to another without fixing anywhere. It was his purpose to form an order, whose discipline should be milder, their establishment more solid, and their manners more regular, than those of other monastic bodies; and whose members, during the course of a holy and peaceful life, were to divide their time between prayer, reading, the education of youth, and other pious and learned labours. However, in process of time, the followers of this celebrated ecclesiastical degenerated very lamentably from the pietie of their founder, and lost sight of the duties of their vocation, and the great end of their establishment. Having acquired immense riches from the devout liberality of the benedictine, they sunk into luxury, intemperance, and idleness, abandoned themselves to all sorts of vices, extended their zeal and attention to worldly affairs, took part in political cabals and court factions, made a vain augmentation of superfluous rites and ceremonies in their order, to blind the multitude, and supply the place of their expired virtue; and among other meritorious enterprises, bound the nobly to froll the arrogance, by enlarging the power and authority of the Roman pontiff.

This new order made a very rapid progress in the west, and, in a short interval of time, arrived at the most flourishing state. In Gaul, its interests were promoted by Maurus; in Sicily and Sardinia, by Placidus; in England, by Augustin and Mellitus; in Italy, and other countries, by Gregory the Great, who himself is reported to have been for some time a member of this society; and in Germany it was afterwards received by the instrumentality of Boniface. This sudden and amazing progress of the new order was ascribed by the Benedictines to the wisdom and sanctity of their discipline, and to the miracles wrought by their founder and his successors. But upon a more attentive view, the impartial observer will be convinced, that the protection of the Roman pontiffs, to the advancement of whose grandeur and authority the Benedictines were most fervently devoted, contributed much more to the lustre and influence of their order than any circumstances, nay, than all other considerations united together.

The Benedictines are chose properly called monachi, monks; the other orders are better denominated friars, or religious. In the canon law, the Benedictines are called Black Monks; being distinguished from the other orders by the colour of their habit, and not by the name of their patriarch St. Benedict. Among us they were formerly also denominated Black Friars. The Benedictines wear a coarse black gown, with wide wide sleeves, and a capuche on their heads, ending in a point behind. The lift of orders of the Benedict order is very ample; but they are acceded by Barons, and many other writers, of putting many in the list who were never of the order. For six hundred years after the erection of the Benedict order, most of the European monks were followers of this rule; whatever other names they went by, Carthusians, Cistercians, Grandmontains, Premonstrates, Cistercians, &c. they were but different branches of the Benedict, till about the year 1220, when the Dominican and Franciscan took new rules. Holpinen reckons no less than twenty-three religious orders that sprang from this one. According to the Benedictin computation, there have been of this order 24 popes, 250 cardinals, 7500 archbishops, 15,000 bishops, 15,500 abbots, 4000 friars, 40,000 confessors, above 300000 friars and apostles, who have converted 50 provinces to the Christian faith, besides emperors, kings, &c. This order has produced a great number of eminent writers and learned men.

The Benedictines, though but one order, are divided into several congregations, which have their peculiar customs and observances different from the rest. Each of these is subdivided into provinces, which have their general chapters. This order is said to have been brought into England about the year 956. The English congregation, which had subsisted from the time of the mission of St. Aulun, was destroyed under Henry VIII. and by degrees reduced to one single man, father Buckley; who, in 1607, procured a re-establishment of the congregation, at Douay, in the Netherlands, where it still subsists in a kind of dependency on that of St. Valladolid in Spain. At the general chapters they choose provinces, with their assistants, for each of the provinces of Canterbury and York, who have jurisdiction over the monasteries employed therein. They are governed by a president-general, and three definitors, chosen every three years. At their adjournment they make a fourth vow, viz. that they will go to the mission in England, and return when their superiors think fit.

**Benedictin Nuns,** are religious women, who embrace the rule of St. Benedict.

**Benediction,** in a general sense, the act of blessing, or giving praise to God, or returning thanks for his favours. Hence also benediction is still applied to the act of laying on the sick, or giving grace before or after meals. Neither the ancient Jews, nor Christians, ever laid on the sick. The Jews are obliged to rehearse a hundred benedictions per day, of which, eighty are to be spoken in the morning. Viritius, de Synag. Vet. lib. iii. Rabbi Nehemiah Baruch, in 1688, published a discourse on the manner wherein the benediction is to be pronounced. In the synagogues of Ferrara, it is rather sung than spoken. Among the ancient Jews, as well as Christians, benedictions were attended with the imposition of hands; and Christians, in process of time, added the sign of the cross, which was made with the same hand, elevated or extended. Hence, in the Roman church, benediction was used to denote the sign of the cross, made by a bishop or prelate, from an ideas that it conferred some grace on the people. The custom of receiving benediction by bowing the head before the bishops, is very ancient, and was so universal, that emperors themselves did not decline this mark of submission. Under the name benediction the Hebrews also frequently understood the presents which friends make to one another, in all probability because they are generally attended with blessings and
and compliments, both from those who give and those who receive them.

Benefiction, Notiæ, the external ceremony performed by the priest in the office of matrimony. The nuptial benediction is not essential to, but the confirmation of a marriage in the civil law.

Benefiction, Lesitic, benediction lesitica, is the viaticum given to dying persons. The pope begins all his bulls with this form: "Salutem et apostolicae beneficitionem."

Benefiction, regular, that conferred by abbots on their monks, or by a feanor monk on a junior.

Beneficia privata, to be deprived of benefiction, was a kind of punishment inflicted on monks, whereby, when the refi received the abbot's blessing, the offenders were dismissed without it.

Benefiction is also used for an ecclesiastical ceremony, whereby a thing is rendered sacred or venerable. In this sense benediction differs from consecration, as in the latter mention is applied, which is not in the former. Thus the chalice is consecrated, and the pix blessed, as the former, not the latter, is anointed; though in the common usage these two words are applied promiscuously. The spirit of piety, or rather of superfluous, has introduced into the Romish church benedictions for almost every thing. We read of forms of benedictions for wax-candles, for bouquets, for alms, for church-vessels, and ornaments; for flags or ensigns, arms, fruit-fruits, houses, ships, pheasants, eggs, clementum, or the hair-cloth of penitents, church-yards, horses, mules, &c. which are sprinkled with holy water.

Benefiction of Arms, was a sort of public consecration of the weapons and ensigns, before the entering on a war, by a formula of words, and ceremonies appointed for that purpose.

Benedictionalischer Liber, an ancient church book, containing the forms of the divers sorts of benedictions given by bishops, priests, &c. Such was the benedictionalischer Liber of Gregory the Great, described by Lambecius.

Benefictum, an epithet formerly given to lenient or gentle operating medicines, more especially rubbarks. In this sense we find, in some dispensatory writers, benedictum lascatimum used for lenitive electuary. Though in others, benedicta lascativa, or the blessed lascativa, denotes another easy purge, made up of turbith, diatrium, sparges, hemorrhaclys, anise-feeds, fenel-feeds, falh gemme, and honey. Schroder also gives the appellation aqua benedicta to his emetic; and Myndich does the same to his aqua frappul, or water of wild thyme. Some have called the philosopher's stone lapis benedictus.

Benefictum Vinum. See Vinum.

Benedictus Carduus. See Thistle.

Benedittoacco. See San Benito.

Benefica, in Geography, a town of Spain, in the province of Valencia, 10 leagues from Valencia.

Benefice, Beneficia, in the Feudal System, is a term applied to those portions of land which the kings and chief-fairs bellowed on their adherents. As long as they had no fixed property in land, they could only bestow an honore, a suit of armour, or such like recompenences, on those who in peace or war were attached to their persons, and devoted to their service. But upon their settling in the countries which they conquered, and when the value of property came to be understood among them, they conferred upon their followers the more substantial recompenence of land. Accordingly the term benefice was the primitive name, and most facile form of the feudal posessions. These grants were called "beneficia," because they were gratuitous donations; and they were also called "honoras," because they were regarded as marks of distinction. What were the services originally exacted in return for these "beneficia," cannot be determined with absolute precision; because there are no records to ancient. M. de Montesquieu (Op. of Laws, b.i. p. 156, &c. 157) considers these "beneficia" as fiefs, which originally subjected those who held them to military tenure. M. de Mably (Observ. sur l'Histoire de France, i. 356) contends, that as held them at first subjected to no other service than what was incumbent on every free man. But when it is considered, that allodial property subjected those who possessed it to serve the community, it is reasonable to conclude, that "beneficia" subjected such as held them to personal service and fidelity to him from whom they received these lands. They were granted originally only during pleasure. (See Montesqu. ubi supra, and Du-Cange voc. Beneficia and Feudum.) But the possession of beneficia did not continue long in this state. A precarious tenure during pleasure was not sufficient to satisfy those who held it, and to attach them to their superior lord; and, therefore, they soon obtained the confirmation of their beneficia during life. (Du-Cange_Gloss. voc. Beneficia.) After this it was easy to obtain or extort charters rendering "beneficia" hereditary, first in the direct line, then in the collateral, and at last in the female line. Leg. Longob. lib. iii. tit. viii. Du-Cange.

It is not easy to ascertain the precise period when each of these changes took place. M. de Mably (ubi supra, tom. i. p. 153-160, 429) conjectures, with some probability, that Charles Martel first introduced the practice of granting "beneficia" for life; and that Louis le Debonnaire was among the first who rendered them hereditary. Mahillon, however, (De Re Diplomatica, l. vi. p. 533,) has published a placitum of Louis le Debonnaire, A.D. 866, by which it appears that he still continued to grant some "beneficia" only during life. And in 889, Odo, king of France, granted lands to Riesbodo "sedi suo jure beneficiario et fundario," during his own life; and if he should die, and a son were born to him, that right was to continue during the life of his son. This was an intermediate step between fiefs merely during life, and fiefs hereditary to perpetuity. While "beneficia" continued under their first form, and were held only during pleasure, he who granted them not only exercised the "dominium," or prorogative of superior lord, but he retained the property, giving his vassal only the usufruct. But under the latter form, when they became hereditary, although feudal lawyers continued to define a "beneficia" agreeably to its original nature, the property was in effect taken out of the hands of the superior lord, and lodged in those of the vassal. At length the word "feudum" came to be substituted in the room of "beneficia," but Muratori observes (Antiq. Med. xvi. v. i. p. 594), that no influence of this kind occurs in any authentic charter previous to the eleventh century: and Dr. Robertson (Hist. Ch. v. vol. i. p. 269) informs us, that a charter of king Robert of France, A.D. 1188, is the earliest deed in which he has met with the word "feudum."

Benefice, Beneficium, in an Ecclesiastical sense, a church endowed with a revenue for the performance of divine service; or the revenue itself, assigned to an ecclesiastical person for life, in return for his performing the service of the church.

All church prebends, except bishoprics, are called benefices; but they must be given for life, not for years, or at will: and all benefices are, by the canonists, sometimes called dignities. But we now ordinarily distinguish between benefice and dignity, by applying the word dignity to bishopric.
and secular. Regular or titular benefices are those held by a religious, or a regular, who has made profession of some religious order: such are abbeys, priories conventual, &c. Or regular, regular benefice is that which cannot be conferred on any but a religious; either by its foundation, by the institution of some superior, or by prescription. For prefection, forty years possession by a religious makes the benefice regular. Secular benefices are those which are only to be given to secular priests, i.e., to such as live in the world, and are not engaged in any monastic order. All benefices are reputed secular, till the contrary is made appear. They are called "secular benefices," because held by seculars; of which kind are almost all cureis. Some benefices, regular in themselves, have been secularised by the pope's bull.

A benefice in commendam, is that, the direction and management whereof, upon a vacancy, is given or recommended to an ecclesiastic for a certain time, till it may be conveniently provided for. See Commentam.

Benefice, Possession of. See Possession.

Beneficiarius, in Roman Antiquity, denote soldiers who attended the chief officers of the army, being exempted from other duty. Beneficiarii were also soldiers discharges from the military service or duty, and provided with "beneficia" to subsist on. These were probably the same with the former, and both might be comprised in the same definition. They were old experienced soldiers, who having tired out their legal time, or received a discharge, as a particular mark of honour, were invited again to the service, where they were held in great esteem, exempted from all military drudgery, and appointed to guard the standard, &c. They, when thus recalled to service, were also denominated exvocati; and before their recall,emeriti.

Beneficio was also used for those raised to a higher rank by the favour of the tribunes, or other magistrates. The word "beneficiaricar" frequently occurs in the Roman inscriptions found in Britain, where confiatus is always joined with it; but besides beneficiarius confisatus, we find in Gruter beneficiarius tribunii, pretorii, legati, prefettii, proconfessii, &c.

Beneficiary, in a general sense, something that relates to benefices.

Beneficiary, beneficiarius, is more particularly used for a beneficed person, or him who receives and enjoys one or more benefices.

Beneficiary is more particularly used among Roman Writers, for a person exempt from public offices. In which sense, beneficiarius stands contradistinguished from municipe. It allo denotes, in Middle Age Writers, a fudatory or vassal: and it is also used for a clerk or officer, who kept the account of the beneficia, and made the writings needful for it. The same denomination was likewise given to the officers who collected the rents and duties belonging to the fiscus.

Beneficio, Suspenso d. See Suspension.

Beneficio primo ecclesiastico habedo. See Primo.

Benefield, Sebastian, in Biography, an eminent English divine, was born at Peldonbury, in Essex, in 1509, and educated at the university of Oxford, where he occupied the chair of Margaret professor of divinity for 14 years with great reputation. Towards the close of his life he retired to his rectory of Meysy-Hampton, near Fairford, in his native county, and there died in 1620. Dr. Benefield was so eminent a scholar, disputant and divine, and particularly so well versed in the fathers and schoolmen, that he had not his equal in the university. In his theological opinions he was a rigid Calvinist; and in his general conduct he was remarkable for strictness of life and sincerity.
His works, consisting of commentaries on the 1st, 2d, and 3d chapters of Amos, sermons, and lectures in divinity, are now sunk into oblivion.

**Benefit** is used for a privilege granted to some person, as of an immunity, or the like.

**Benefit of Clergy.** See Clergy.

**Benenaim**, **Benenath**, **Benenasch**, or **Benenat**, in **Africa**, the outermost far, of the second magnitude, in the tail of the *Ursa Major*.

This is sometimes also called *alatituth*.

**Benencasa, Count**, a Venetian nobleman, born in 1745, not more distinguished by his birth than talents, and knowledge in literature, is confided, by M. Labeorde, in his *Elli fur la Musique,* in 4 vols. 4to, published at Paris in 1785, to have furnished him with the chief part of his information concerning the poets, composers, musicians, and authors of Italy; and for enriching his researches. M. Labeorde acknowledges with gratitude his obligations. See vol. iii. of *Elli fur la Musique* where there are many articles concerning Italian composers and fingers with which Count Benencasa has furnished the editor, that breathe the true spirit of taste, sensibility, and knowledge. This acknowledgment has escaped us in the first period of M. Labeorde's work; but we always thought the articles concerning the Italian composers and fingers in this work, of a different colour from the rest of the book: more liberal, more enthusiastic for genius and talents, and a taste more discriminative and refined, than either that of M. Labeorde, or his guide, the Abbé Rouffer.

When the account of the commemoration of Handel was writing, the editor being very desirous to know what judicious foreigners thought of those exhibitions, particularly Italians, accustom'd to good music in their churches, as well as theatres, he applied to Count Benencasa, who was then in London, and had been present at the performance of the Messiah in Westminster-abbey, for information concerning the comparative grandeur and excellence of the band, with any other which he had heard, or of which history or tradition had preserved the memory in his own country. As they had not time for a full discussion of the subject, when it was first proposed, *videlicet* Signor Benencasa was so obliging as to honour him with his opinion in a letter, which, before his departure from England, he entreated his permission to publish, and it will not only serve as an honourable record of this fabulous exhibition, but must have been the more flattering to the projectors of the plan, as the count is an excellent judge of musick; having heard, read, mediated, and written on the subject, with a degree of feeling and intelligence, that is equally honourable to himself and the art. For this letter, see the commemoration of Handel, p. 115.

**Beneplacito**, Ital. a musical term, implying at pleasure; equivalent to *ad libitum, ad suo piaceri*, which see.

**Benermoid**, in Geography, a mountain of Scotland, in the county of Sutherland.

**Beneschau**, a town of Silisia, in the province of Oppau, 8 miles east of Troppau.

**Bensesow**, a town of Bohemia, in the circle of Kauzim, in which fairs are held.

**Bensesow**, **Benzen**, **Penzen**, or **Pansen**, a town of Bohemia, in the circle of Leutmeritz, 6 miles S. S. W. of Kamnitz; famous for the manufacture of the felt paper that is made in Bohemia.

**Benet**, a town of France, in the department of Vendee, and chief place of a canton, in the district of Fontenay le Comte, 32 leagues south-east of Fontenay.

**Benet Cape**, a bay, lying on the south side of the western peninsula of the island of St. Domingo, and forming with the line to Petit Goave on the north side, the narrowest part or isthmus. N. lat. 18° 20'. W. long. 72° 47'. The cape is the point of the west point of the bay, and cape Jacquelum the east point, nearly east and west from each other.

**Bentetto**, a river in the island of Ceylon, 2 miles south from Barbarin island, having on the south side a small fort upon a hill, under which is a good road in 15 fathoms.

**Beneven**, a mountain of Scotland, in the county of Inverness, 21 miles east of Fort William. See Ben. Nevii.

**Benevente**, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Bourganeuf; 10 miles N. N. W. of Bourganeuf. Also, a town of Spain, in the province of Leon, seated on the river Elna. N. lat. 42° 4'. W. long. 5° 5'.

**Benevento**, a city of Italy, in the kingdom of Naples, in a duchy of the same name, comprehending besides the city, a district of some miles. This capital of the Principato Ultra, or principality of Benevento, and seat of an archbishop belonging to the pope, is situated at the point of a hill, between two narrow valleys, in one of which runs the river Sabato, and in the other the Calore, near the confluence of these two streams. N lat. 41° 6'. E. long. 14° 57'.

One of the entrances into the city, is through the arch of Trajan, now called the *Porta Aures,* which is in tolerable preservation, and one of the most magnificent remains of Roman grandeur out of Rome. The architecture and sculpture are both singularly beautiful. This elegant monument was erected in the year of Christ 114, about the commencement of the Parthian war, and after the submision of Decebalus had entitled Trajan to the name of Dacicus. The order is composite; the materials, white marble; the height, 60 palms; length, 37½; and depth, 24. It consists of a single arch, the space of which is 20 palms, and the height 35. On each side of it, two fluted columns, upon a joint pedestal, support an entablature and an attic. The intercolumniations and frize are covered with bafco-relics, representing the battles and triumphs of the Dacian war. In the attic is the inscription. As the fifth year of Trajan's consulate, marked on this arch, is also to be seen on all the military columns erected by him along his new road to Brundisium, it is probable, the arch was built to commemorate so beneficial an undertaking. No city in Italy, Rome excepted, can boast of so many remains of ancient sculpture, as are to be found in Benevento. Scarcely a wall is built of anything but altars, tombs, columns, and remains of entablatures. The most considerable are in the upper town, suppos'd by Swinburne (Travels in the two Sicilies, vol. ii. p. 326) to be the site of the old one.

The cathedral is a clumsy edifice, in a style of Gothic, or rather Lombard, architecture. This church, dedicated to the Virgin Mary, was built in the sixth century, enlarged in the eleventh, and altered considerably in the thirteenth, when archbishop Roger adorned it with a new front. In the court stands a small Egyptian obelisk, of red granite, crowned with hieroglyphics. In the adjoining square, are a fountain, and a very indifferent statue of Benedict XIII., long archbishop of Benevento.

The writers of the Benedictine history fix its origin in the years immediately succeeding the Trojan war, and claim Dionysus, the Eolian chief, as its founder. Others assign it to the Samnites, who made it one of their chief towns, whether they frequently resorted for refuge, when worlied by the Romans. In their time, its name was "Maleventum," of uncertain etymology, but after the conquest of Samnium, changed.
changed by the Romans into "Beneventum," in order to introduce their colony under fortunate auspices. Near this place, in the 479th year of Rome, Pyrrhus was defeated by Curius Dentatus. In the war against Hannibal, Beneventum signified its attachment to Rome, by liberal treasures of succour, and by real service. Its reception of Gracchus after his defeat of Hannibal, is extolled by Livy, and from the gratitude of the Senate, many fold advantages acceded to the Beneventines. However, it shared the devastations of the Roman empire, attending the irruption of the northern nations. When the Lombards invaded Italy, they fixed the seat of their empire at Pavia, and left a detachment to take possession of the southern provinces. In 571, Zotto was appointed duke of Benevento, as a feudatory to the king of Lombardy, and seems to have confided his government to the city alone, from which he occasionally falled forth to seek for booty. The second duke, called Arechis, conquered almost the whole country that now constitutes the kingdom of Naples. Upon the fall of Defidius, laid king of the Lombards, the state of Benevento was not materially affected. Arechis the second kept possession, and availing himself of this favourable conjunction, affected his independence; threw off all feudal submission; assumed the title of prince; and coined money with his own image upon it; a prerogative exercised by none of his predecessors, as dukes of Benevento. Afterwards, when Radelchis and Siconulph aspired to the principality, each of them invited the Saracens to his aid. For the termination of these fatal dissensions, the dominions of these competitors were divided into two distinct sovereignties. In 857, Radelchis regained as prince at Benevento; and his adversary fixed his court, with the fame title at Salerno. From this treaty of partition, the ruin of the Lombards became inevitable; and the erection of Capua into a third principality was another destructive operation. From this time the invasions of the Saracens, and the attacks of the eastern and western emperors, together with anarchy and animosity at home, reduced the Lombards to such wretchedness, that they were able to make a very feeble resistance to the Norman arms. Benevento, however, was chiefly governed by its own dukes and sovereigns, till in the year 1053, the emperor Henry III. transferred it conditionally to pope Leo IX. From the year 1054, to this day, the Roman see, with some short interruptions of possession, has exercised temporal dominion over this city. In a plain near the city a bloody battle was fought in 1266, when Charles of Anjou defeated and killed Mainfroy, his competitor for the sovereignty of the two Sicilies. In 1705, this city suffered greatly from an earthquake.

BENEVIS. See Ben Aron.

BENEOLENCE, in Ethics, denotes a hearty desire of the good of mankind, evidencing itself, as ability and opportunity offer, in the cheerful and diligent practice of whatever may promote the well-being of all. Some have traced the origin of this affection in self-love; others again in some "inseul" or determination of our nature, antecedent to all reason from interest, which influences us to the love of others, and they have accordingly made it the foundation of universal "virtue." Others ascribe it to the intelligent constitution of human nature, and observe, that it arises not from instinct, but from the nature and necessity of things. Hutcheson's Inquiry concerning Moral Good and Evil, p. 140, &c. Price's Review, &c. chap. iii.

Benevolence of God, in Theology, denotes his disposition to do good and to communicate happiness. This perfection of the deity has been referred to the clafs of moral attributes. (See Attributes.) For the illustration and proof of divine benevolence; see Goodness.
BEN

be fairly made, and is only amusing to the imagination. If there had been more frequent rehearsals of the miseries in eight real parts by Leo, which Anfani had performed in 1781 at the Pantheon by more than forty voices, it may be supposed, from such movements as were correctly executed, that the effect of the whole would have been wonderful! but Leo lived in a more polished age, and was gifted, not only with patience, but with taste and genius.

BENFEI'D, or BENFELDEN, a town of France, and principal place of a district, in the department of the Lower Rhine, seated on the Ill; 44 leagues south of Strafsburg. N. lat. 45° 47'. E. long. 7° 45'.

BENFIO', a mountain of Scotland, in the island of Coll.

BENG, a name given among the Mahomedans to the leaves of hemp formed into pipes or conovert; the use of which, as well as opium, the more rigid Musulmans esteem to be unlawful, though not mentioned in the Koran, because they intoxicate and disturb the understanding, as wine does, and in a more extraordinary manner. These drugs, however, are now commonly taken in the East; but those who are addicted to them are generally regarded as debauchees.

BENGAL, in Geography, the most eastern province of the empire of Hindostan, lying on each side of the Ganges, and bounded by Aam, Bootan, and Bahar on the north, by Bahar, Berar, and Orissa on the west, by Orissa and the bay of Bengal on the south, and by the mountains that separate it from Caftay, Arocan, and the Birman dominions on the east and south-east. It extends from about 21° 30', to about 26° 40' N. lat.; and from about 86°, to about 92° 30' E. long.; but its boundaries are not accurately ascertained. About 50 miles beyond Tiacanigally, which is the termination of a stupendous range of mountains, that accompanies the course of the Ganges from the west, these mountains begin to form the northern boundary of Bengal on the western side of the Ganges; and from hence another range of mountains strikes from the south, but in a curve swelling westward, which terminates within sight of the sea, about 30 miles from Ballabore. To the north those mountains divide Bengal from the southern division of Bahar; and to the south they seem to be the natural separation of Bengal from Orissa. Eastward the province of Bengal extends as far as Rangamutty, a town belonging to the king of Aam, and seated on the river Darbamooter. The sea-coast of Bengal, between the mouth of the river Hoogly and that of the Ganges, extends from east to west 180 miles; and the whole is a dreary inhospitable shore, which lands and whirlpools render inaccessible to ships of burden. For several miles within land the country is intersected by numerous channels, through which both rivers disembogue themselves, by many mouths, into the ocean; and the islands formed by these channels are covered with thickets, and occupied chiefly by beasts of prey. According to Achar's division, Bengal is one of the eleven soubans, or provinces, of Hindostan proper; and its government extended to Cuttack or Cuttack, and along the river Mahanadly, as the soubah of Orissa appears not to have been formed at that time. The British nation possess, in full sovereignty, the whole soubah of Bengal, the greatest part of Bahar, and certain districts of Orissa, comprehending 149,217 square British miles, and, with the addition of Benares, 162,000 square miles, or 30,000 more than are contained in Great Britain and Ireland; and the number of inhabitants has been estimated at nearly eleven millions. But by some later computations the number has been found to be much more considerable. From actual surveys in different districts, in which the land occupied in tillage has been distinguished from that occupied by water or waste, and for which latter an allowance has been made of one-fourth of the whole surface, it appears, that the uncultivated land in Bengal amounts to about 31,331,499 acres; and that these cultivated acres require 5,265,432 tenants: adding to these the artificers and manufacturers, in the proportion of about 11 to 40, we shall have 6,718,514 hands of families, at five persons each; whence the whole number of inhabitants will be 33,590,770. By other estimates the population has been computed at more than 50 millions. If to these be added about 18 or 20 millions for the population of the British possessions in the Myfor and Cenmic, the dominions of the East India Company, will contain a number amounting, probably, to not less than 50 millions. With a due encouragement of industry, the present population is thought sufficient to bring into tillage the whole of the waste lands of Bengal and Bahar. The country of Bengal, independent of Bahar and Orissa, is somewhat larger than Great Britain. The revenue of Bengal is rated in the Ayn Achar, towards the close of the 16th century, at 149 1/2 lacs of rupees; under the Aurungzebe it is fixed by Mr. Frayer, in his Life of Nadir Shah, at 131 lacs; in Sujah Cawm's nabobship, A.D. 1727, it amounted to 142 lacs; in 1778 to 197 lacs, net revenue. The total revenue of Bengal, Bahar, Orissa, and Benares, belonging to Great Britain, together with the subsidy from the nabob of Oude, is computed by Mr. Rennell at 4,219,000l. sterling; the expense of collection, military and civil charges, &c. amounts to 2,540,000l.; whence he infers that the clear revenue is 1,670,000l. The natural situation of Bengal is singularly happy with respect to security from the attacks of foreign enemies. On the north and east it has no warlike neighbours; but it is guarded by a formidable barrier of mountains, rivers, or extensive wales, towards those quarters, if such an enemy should start up. On the south is a sea-coast guarded by shallows and impenetrable woods, and with only one port, and even that of difficult access, in an extent of 300 miles. It is only on the west that any enemy is to be apprehended; and even there the natural barrier is strong; and with its population and resources, aided by the usual proportion of British troops, in addition to the Sepoy establishment, Bengal might bid defiance to all that part of Hindostan, which might be disposed to become its enemy.

The English established a commercial intercourse with this country at an early period; and the English East India company (see Company) made a settlement on the river Ganges, in the kingdom of Bengal, probably in the former part of the 17th century. Their first factory in that kingdom was at the town of Hoogly, on a river of the same name, about 26 miles above Calcutta. About the year 1689, the company, for their greater convenience, removed to Calcutta, on the same river, where they built the fort, named Fort William, which they still possess. Their fort and garrison were designed for the protection of their vessels that came down from Patna, laden with piece-goods, raw silk, and feathers, which were the principal staple commodities of Bengal; otherwise the rajus, whose dominions lay on that river, and who were either tributaries to, or powerful governors under, the Mogul, were apt to make, and sometimes did actually make, arbitrary demands of duties for passing that way. However, it was in the reign of Ferokhfe, great-grandson of Aurungzebe, who was deposed in 1717, that the English East India company obtained the famous "firmans," or grant, by which their
their goods of export or import were exempted from duties or customs; and this was regarded as the company's commercial charter in India, while they stood in need of protection from the princes of the country. In the years 1742 and 1743, Bengal was invaded by both the Mahratta states, with armies confiding, as it is said, of 80,000 horsemen each; nor did they depart out of the provinces until the year 1744, when they had collected a vast mass of plunder, and had established the claim of the "Chout," or a fourth part of the net revenues of the provinces, as this proportion was called in the language of Hindustan. In 1753, the Barar Mahrattas obtained possession of the province of Orissa, partly by conquest and partly by cession from the Nawab of Bengal; and their proximity to Bengal, from which they were separated only by a shallow river, afforded them frequent opportunities of plundering its frontier provinces; and it was not till the year 1751, when Collin Ally, nabob of Bengal, ceded the provinces of Burdwan and Midnapore to the English, that the Mahrattas ceased to plunder them. In 1756, Alvery Cawn, nabob of Bengal, was succeeded by his grandson Surajah Dowlah, who, pretending to be irritated at the conduct of the English within his dominions, and really jealous of the rising power of Europeans in general, in other parts of India, determined to expel the English from Bengal, and accordingly took their fort at Calcutta, the chief British settlement in the province, upon which their trade depended, and compelled those among them, who were not made prisoners, to retire, and others he caused to perish by confining them in a small chamber called the "black-hole" of Calcutta. In the following year, however, an armament from Madras, under Admiral Watson and colonel Clive, not only recovered Calcutta, but brought the nabob to terms. With a view to permanent security for the future, they negotiated with Jaffier Ally Cawn, an omrah in high trust and favour with the nabob; and he engaged, on condition of affixing him in his views towards the throne, to be their future ally and confederate. The famous battle of Plaffey, fought in June 1757, and in which Jaffier aided the accomplishment of their wishes, by remaining neutral, laid the foundation of the future power of the British nation, not only in Bengal, but in Hindustan. From that time they became the arbiters of the succession of the nabobship of Bengal, which speedily led to the possession of the powers of government; for Collin Ally, who had been placed in the room of Jaffier, disliking his situation, resolved at all events to hazard a change. This brought on a war, which terminated in the expulsion of Collin, and left the Bengal provinces in the possession of the English, who restored Jaffier to the nabobship. Lord Clive, assuming the government of Bengal in 1765, seized the opportunity, afforded by the recent death of nabob Jaffier Ally, of taking possession of the Bengal provinces; and obtained from the nominal Mogul, Shah Aulum, a grant of the dummy, or administration of the revenues of Bengal, Bahar, and Orissa; on condition of paying the Mogul 26 lack of rupees (260,000l.) per annum. Thus a territory producing at that time at least a million florins per annum, after every expense was defrayed, and containing at least ten millions of inhabitants, was gained to the company, on the side of Bengal; together with the northern circars, valued at near half a million more, and for which a grant was also obtained. The Bengal provinces, which have been in our actual possession from the year 1765, have, during that whole period, enjoyed a greater share of tranquillity than any other part of India; or indeed, than those provinces had ever experienced since the days of Aurungzebe. Previous to the establishment of our influence, invasions were frequent, particularly by the Mahrattas, and one province or other was ever in rebellion; owing to a want of energy in the ruling power, an ill-paid and mutinous army, and an excess of delegated power.

The government of Bengal, and its extensive dependencies, was first vested in a governor-general and a supreme council, consisting of a president and eleven counsellors; but in 1772, they were reduced to four, with Warren Hastings, the governor-general, who were to direct all affairs, civil and military, in the provinces of Bengal, Bahar, and Orissa; and to control the inferior governments of Madras on the coast, and Bombay on the west, with Bencoolen, in the island of Sumatra. The court of judicature consisted of a chief justice; and three other judges, with civil, criminal, naval, and ecclesiastical jurisdiction. The Hindoos are governed by their own laws, nor would it be easy, if practicable, to extinguish the influence of the Brahmans, or totally to abolish the califs, to whatever degree they may contemnence and maintain fanaticism and superstition. The military establishment in Bengal is always respectable, but varies according to the situation of affairs. The British troops are supported by the sepoys, a native militia, who are accustomed to have numerous idle followers, so that the effective men seldom constitute more than a quarter of the nominal army. A force of 20,000 British soldiers might probably encounter and vanquish 200,000 blacks or Hindoos. The decisive battle of Plaffey, which secured to us the possession of those opulent provinces, was gained with an army of about 3000 men, of whom 900 only were Europeans; and at the battle of Buxar, in 1764, the whole number of combatants on the side of the British did not exceed 7000, and of these 1200 only might be Europeans.

The climate of Bengal, is reckoned by Dr. Lind, in his "Effays on diseases incident to Europeans in hot climates," as the most innoxious and fatal to Europeans of any of the British settlements in India, that of Bencoolen excepted. This is owing partly to the heat of the air, and more especially to that of the land wind, which, passing over a tract of country much heated by the sea, and consisting in various districts of extensive sandy deserts, becomes so hot and fucificating that it can scarcely be endured. These hot winds, occasionally loaded with sand, are very pernicious, particularly to persons exposed to them whilst sleeping, that they produce a kind of paralytic distemper, called the "barriers," which is attended with a total loss of the use of the limbs, and for which no relief can be obtained but by removing to some other climate. But the unhealthines of this climate is principally owing to the inundations of its rivers, and to its level or flat surface, so that the waters flagmate; and of course when, in the month of October, the flagrated waters begin to be exhaled by the heat of the sun, the air is greatly polluted by the vapours that arise from the slime and mud that are cast by the rivers, and by the putrefaction of dead fish, and other animals. Although the fulness of the climate of Bengal has been considerably improved by clearing the country of trees and jungle, by canals, and by draining the marshes, yet fogs are at this time common, very thick and very unhealthy; and excessive fogs also prevail at other seasons, and they often occur in the months of January and February. In Bengal, the hot, or dry season, begins with March, and continues to the end of May, the thermometer sometimes rising to 110°; and this intense heat is occasionally interrupted by violent thunderstorms from the north-west. The rainy season continues from June to September or October; but the three last months of the year are generally pleasant. The cold season commences in November, and lasts till the beginning of February; northerly winds are then prevalent, and the mornings, especially before sun-rise, are cold. It is also frequently very foggy.
foggy, but about 8 or 9 o'clock, when the sun begins to be powerful, the thick mist is dissipated. For the remainder of the day the sky is perfectly clear, so that no clouds appear in the air for several days together. In the months of September and October diseases rage, and chiefly attack those that are lately arrived; but here, as in all other places, sickness is more frequent and fatal in some years than in others. The most prevalent diseases are fevers, of the remitting or intermitting kind; for though sometimes they may continue for several days without any perceptible remission, yet they have in general a great tendency to it, and are commonly accompanied with violent paroxysms of rigours or flirrings, and with discharges of bile upwards and downwards. If the feaon be very fickly, some are seized with a malignant fever, of which they soon die. The body is covered with blotches of a livid colour, and the corpee in a few hours becomes quite black and corrupted. At this time fluxes prevail, which may be called bilious, or putrid, the better to distinguish them from others, which are accompanied with an inflammation of the bowels. In all these diseases at Bengal, the lance is cautiously to be used. The mode of treating fevers and bilious complaints being now well understood, they are less alarming and fatal. Dr. Lind says it is a common observation, both at Bengal and Bencoolen, that the moon or tides have a remarkable influence on intermitting fevers; and he informs us, on the testimony of a gentleman of undoubted veracity, and of great knowledge in medicine, that at Bengal he could foretell the precise time when the patient would expire; it being generally about the hour of low water. From these, and other observations, the doctor deduces an useful hint, which is, to take doses of bark at the full and change of the moon, as being the feasons most liable to an attack or relapse in these intermitting fevers.

Although the rainy seafon does not commence in the flat countries of Bengal till the latter end of the month of June, the Ganges and other rivers begin to swell in the mountains of Tibet early in April, and by the latter end of that month, when the rain-water has reached Bengal, the rivers rise here. This circumstance is accounted for partly by the melting of the snow on the mountains, but principally, as Mr. Rennell observes, by the rapid collection of vapours wasted from the fumes of the burning and fouth-wet monfoon, and suddenly stopped by the lofty ridge of mountains that runs from eait to west through Tibet. Hence it appears, that the rainy feaon must commence sooner in places that lie near the mountains than in those that are more remote. In Bengal the rivers rise by low degrees; the increase being only about an inch per day for the first fortnight. It then gradually augments to two and three inches, before any quantity of rain falls in the flat countries; and when the rain becomes general, the mean increase is about five inches per day. By the latter end of July, all the lower parts of Bengal, contiguous to the Ganges and Burrampooter, are overflowed, and form an inundation more than 100 miles wide; nothing appearing but villages and trees, excepting, very rarely, the top of an elevated spot, the artificial mound of some deferted village, appearing like an island. The inundations in Bengal are as much occasioned by the rain that falls there, as by the waters of the Ganges; in proof of which it is alleged, that the lands in general are overflowed to a considerable height long before the bed of the river is filled. It ought to be observed, that the ground adjacent to the bank of the river, to the extent of some miles, is higher than that which is at a greater distance; and thus it serves to separate the waters of the inundation from those of the river, until it overflows. This high ground is, in some feasons, covered a foot or more; but the height of the inundation within varies, of course, ac-

cording to the irregularities of the ground; and is in some places 12 feet. When the inundation becomes general, the river appears, as well by the gravs and reeds on its banks, as by its rapid and muddy stream; for the water of the inundation acquires a blackish hue, by remaining long flagrant among gravs and other vegetables; nor does it ever lose this tinge, which gives the predominancy of the rain water over that of the river; and the flow rate of the motion of the inundation, which does not exceed half a mile per hour, indicates the remarkable flatnefs of the country.

In order to guard thefe tracks of land, which, by the nature of their culture and productions, and by the lownefs of their situation, would be injured by too long an inundation, dikes or dams are raised of earth or bricks in a line with the river, in the whole of their length to more than a thousand English miles. Some of these are at the base equal to the thickness of an ordinary rampart, and yet, on account of the want of tenacity in the foil of which they are composed, they are often found ineffectual, and need frequent repairs. One particular branch of the Ganges, navigable only during the rainy seafon, and then equal to the Thames at Chelica, is conducted between two of these dykes, through an interval of 70 miles; and when it is full, the passengers in the boats look down, as from an eminence, on the adjacent country. During the fwon flate of the river, the tide becomes incapable of counteracting the fream, and in a great measure of ebbing and flowing, except near the fea. At fuch a feaon, a frong wind, that blows up the river for any continuance, swells the waters two feet above their ordinary level; and fuch accidents have occasioned the lofs of whole crops of rice. This rice is of a particular kind, for the growth of its flalk keeps pace with the increase of the flood at ordinary times, but is destroyed by too fudden a rife of the water. The harvest is often reaped in boats. There is also a kind of gravs which overtops the flood in the fame manner, and at a small distance has the appearance of a field of the richest ver- 

dure. Mr. Rennell informs us, that in the year 1763, a ftragical event happened at Luckipour, about 50 miles from the fea, by a frong gale of wind, confining with a high spring-tide, at a feaon when the periodical flood was within 1 foot of its highest pitch. The waters then rofe 6 feet above the ordinary level. On this occasion the inhabitants of a conifiderable district, with their houses and cattle, were totally swept away; and the calamity was aggravated by its happening in a part of the country which fiercely produces a single tree, to which a drowning man might escape. These inundations are traversed by every kind of embarcation; such as are bound upwards taking advantage of a direct current and still water, at a feaon when every fream rushes like a torrent. The wind too, which at this feaon blows regularly from the south-eaft, although in the gulf or bay of Bengal the monfoon blows from the S.S.W. and S.W., favours their progres in the eastern and northern parts of Bengal, where it blows from the S.E. or E.S.E.; fo that a voyage which would take up nine or ten days by the courfe of the river, when confined within its banks, may be performed in fix days. Husbandry and grazing are at this time both fuspended; and the peafant traveries in his boat those fields which, in another feaon, he was used to plough; happy, however, that the elevated flite of the riverbanks places within his reach the herbage which they afford; without which his cattle must perifh. Towards the middle of August, the inundation begins to subfide; for though great quantities of rain fall in the flat countries in August and September, yet, by the partial effuion of the rains in the mountains, the supplies fail that are necessary to keep up the inundation. However, the decrease of the inundation does
not always keep pace with that of the river, on account of the height of the banks; but after the beginning of October, when the rain has nearly ceased, the remaining inundation goes off quickly by evaporation; and the lands are left highly manured, and in a state fit for receiving the seed, after the simple operation of ploughing. For an account of the ‘bore,’ to which the rivers of Bengal are subject; see the article Bore.

From the time of the change of the monsoon in October, to the middle of March, the rivers are in a tranquil state; and then the “north-westers” begin in the eastern parts of Bengal, and last as we advance westwards; and they may be expected once in three or four days, until the commencement of the rainy season. These “north-westers,” so called from the quarter in which they usually originate, are the most formidable enemies to the inland navigation of Bengal. They are sudden and violent squalls of wind, and, though they are of no long duration, they are often attended with fatal effects, and have caused whole fleets of trading boats to sink almost instantaneously. They are more frequent in the eastern than in the western part of Bengal; and happen oftener towards the close of the day than at any other time. For some hours before they arrive, they are indicated by the rising and singular appearance of the clouds; and thus the traveller is warned to seek shelter. But in the great rivers they are truly formidable; more especially about the latter end of May, and beginning of June, when the rivers are much increased in width. After the commencement of the rainy season, which period varies, in different parts, from the middle to the end of June, tempestuous weather must be occasionally expected; but at this season places of shelter are more common than the filling of the creeks and inlets, as the river increases, and, on the other hand, the bad weather is of longer continuance, than during the feason of the “north-westers.” The inland navigation of Bengal is performed with safety, with respect to the weather, during the long interval between the end of the rainy season, and the beginning of the “north-westers.”

At this latter season peculiar attention and care are necessary. For an account of the boats that are used in this inland navigation; see Budge-row.

Bengal is a flat country, fertilized by numerous rivers and streams, and interpersed with a few ranges of hills. The triangle formed by the Cimbimbazar and Hooghly rivers to the west, by the Ganges to the east, and by the sea-coast to the south, as well as a large tract on each hand to the north of this Delta (see Delta), is as level as the lower Egypt. Such parts of this extensive plain as are not watered by the Ganges or its branches, are fertilized by many other streams from the mountains; and for the space of three months, when the sun is moly vertical, heavy rains fall every day. The periodical rains and intense heats produce a luxuriance of vegetation, almost unknown to any other country in the globe; and therefore Aurungzebe emphatically denominated Bengal “the paradise of nations,” and it has been peculiarly styled “the paradise of India.” The soil is a tritium of black vegetable mould, rich and loamy; extending to the depth of fix feet, and in some places fourteen, and even twenty feet, lying on a deep sand, and interpersed with shells and rotten wood, which indicate the land to have been overflowed, and to have been formed by materials deposited by the rivers. It is easily cultivated without manure, and bad harvests seldom occur. In this country they have two harvests; one in April, called the “little harvest,” which consists of the smaller grain; and the second, called the “grand harvest,” is only of rice. The chief grain is rice, on which the natives chiefly subsist, and which is exported from hence into other countries. Bengal produces also very good wheat; and it furnishes the inhabitants of the mountains of Cashmere, and of the elevated plains of Thibet, with both rice and wheat, in return for their shawls, gold, and musk. Upon the failure of these crops of rice, a grievous famine ensues. Of this many melancholy instances have occurred, both in Bengal and in other parts of India. One of the most deplorable of this kind occurred in the year 1770. On this occasion, the nabob, and great men of the country, distributed rice gratis to the poor; but when their own flocks began to fail, they withdrew their donations, and Calcutta was crowded with multitudes of persons who came thither to solicit relief. But the whole flock being expiended, the famine prevailed, and many thousands fell down as victims to hunger in the streets and fields; so that their bodies, mangled by dogs and vultures, corrupted the air, and seemed to threaten a plague. Many perhons were employed daily, on the company’s account, in throwing dead carcasses into the river, so that the waters were contaminated, and the fish could not be eaten without danger. Hogs, ducks, and geese, fed chiefly on the dead bodies; and the only meat which could be procured was mutton, which, on account of the dryness of the season, was so small, that a quarter of it would scarcely weigh a pound and a half. This dreadful famine was occasioned by a preternatural drought, which elapsed both the great harvest of 1769, and the little one of 1770 to fail. As a preventative from the misery attending a dry season, and as a source of supply of water for domestic purposes, the inhabited part of the country is furnished with numerous reservoirs of an oblong square shape, and of various sizes, frequently more than an acre in extent, dug in the earth, and called “tanks.”

These are filled with water in the rainy season, and afford the inhabitants, during the dry months, a supply of water of a better quality and appearance than that of the Ganges, which is always thick and muddy. In these tanks is bred a fort of fish, in taste resembling our carp. Among the other vegetable productions of Bengal, the most important of which are tobacco, fugar, indigo, cotton, mulberry, and poppy, we may enumerate the banian tree, the cocoa-nut palm, which supplies a manufacture of cordage, called “coir” (see Coir), guavas, plantains, pomelos, potatoes, lime trees, and orange trees. They have also the pifang; or banana; the furi tree, which affords, by incision of the stem, a clear and sweet juice, of an intoxicating quality, and when turned four is used as vinegar; and the mango tree, the fruit of which is preferred to all others in the country, except very fine pine-apples, and which is much used in the hot months. Mr. IV. (Voyage from India to England, &c. 4to. 1773) mentions a beautiful tree, called “chulta,” which has a flower that is at first a hard green ball, on footstalks about four inches long. When this opens, the calyx appears to be composed of five round, thick, and succulent leaves, and the corolla of the same number of many beautiful white petals. After one day the corolla falls off, and the leaf cloaks again; of these there is a succession for several months. In the walks of Bengal they have a tall tree, called “tatoon,” and near Calcutta a spreading tree, called the “ruffa,” making a fine appearance when in full bloom. In their gardens they cultivate most of the vegetables that are natives of other climates, and fit for culinary purposes. Among the animals of Bengal, we might mention the elephant, tiger, wild buffaloes, jackals, dogs, snakes, scorpions, &c., and a kind of birds, named “ar-gill,” or “hurgill,” a species of Ardea, which are very large and ravenous, and held in great veneration by the Brahmins. Game, poultry, fish, and water-fowl of all kinds, are very plentiful in Bengal. The horse bred by the Europeans in this province are either of Persian or Arabian extraction.
traction, and consequently fell at a high price. The native horse of Bengal is thin, ill-shaped, and contemptible, and even in its best shape never equals the Welsh or Highland poney, either in figure or usefulness. The cattle principally used for the team in Bengal are bullocks; and the most common vehicle among the peasants is a hackney, which fee. But Bengal is more defective in its breed of cattle than most other parts of India. The size of its fleece is small; their figure lank and thin; and the colour of three-fourths of a flock is black or dark grey. The quality of a fleece of wool in this country is worse, if possible, than its colour; as it is remarkably harsh, thin, and hairy.

The inland commerce of Bengal is very considerable; and it is carried on by means of the rivers and canals that intersect the country, and along the banks of which are many towns and villages, with pleasant fields of arable and pasture land, which diversifies the face of the country, and renders it very beautiful. Some of the canals, formed either by the hands of men, or by the operations of nature, are wide and deep enough to be navigated by large ships. One of the most considerable of these is the "Haze," or "Hare" channel, that runs straight through the country into the arm of the river that flows by Dacca. The chief articles of commerce which the country yields are silk, muslin, calicoes, cotton, and other piece-goods; opium, saltpetre, gum-lac, and indigo. Rice, wheat, &c. can only be reckoned casual branches of trade. Bengal has an inland trade with Thibet, which it supplies with cottons, besides some wine and cloths of European manufacture, receiving in exchange muslins and rubarb; and a much more extensive commerce with Agra, Delhi, and their adjacent provinces, in salt, sugar, opium, silk, silk-stuffs, and an innumerable quantity of cottons and muffins. The maritime trade of Bengal, managed by the natives of the country, has been divided into two branches, viz. that of Cattack by means of its port Balaphore with the Maldives, whither they transmit rice, coarse cottons, and fine silk stuffs, and where they receive in exchange cowries, used for money at Bengal, and sold to the Europeans. The inhabitants of Cattack also carry on a considerable trade with the country of Assam, which they supply with salt in great quantities, receiving in payment a small quantity of gold and silver, ivory, musk, eagle-wood, gum-lac, and a large quantity of silk. A more considerable branch of trade, which the Europeans carry on with the rest of India, is that of opium, which is cultivated at Patna. The Dutch send rice and sugar to the coast of Coromandel, for which they are paid in specie. They have also formerly supplied Ceylon with rice, Mahbar with cottons, and Surat with silk; whence they brought back cotton, usually employed in the coarse manufacture of Bengal. Some ships laden with rice, gum-lac, and cotton-stuffs, are sent to Baffora; and return with dried fruits, rofe-water, and gold. The rich merchandise carried to Arabia is paid for entirely in gold and silver.

The articles that are disposed of to advantage in Bengal, are all kinds of spices, Japan copper, sandal wood, and Japan wood, and also tin, lead, pewter, and other European commodities of various kinds. See East India Company, and Calcutta.

Bengal is peopled by various nations, but the principal are the Moguls, or Moors, the Gentoos, Hindoos, or Bengalees, and both the Bengalees and Moors have each a distinct language.

The Moors, or Moors, are descendents of those who between two and three centuries ago founded this kingdom, and the whole empire of Hindoostan, under their dominion. They were originally natives of Tartary. They nearly resemble the Europeans in traits and features; but differ more or less from them in colour. The Moguls are olive, though, in the Indian language, Mogul signifies white. The women are very handsome, and much alive bathing; like the men, they are of an olive colour, and different in form from the women of Europe. Their legs and thighs are long, and their bodies short. According to Thevenot, the Mogul women are chaste, very fruitful, and bring forth with so much ease, that they frequently walk the streets the very next day after delivery. Stavorinus says, that their morals are infamous bad, and that they are addicted to the most unnatural vices. The Moguls are more courageous than the Bengalees; and their "Sipahis" form good soldiers, when they are trained and commanded by European officers. Their religion is that of Mahomet; and consequently they hold in abhorrence the idolatries of the Gentoos.

The Bengalees, who are much more numerous than the Moors, do not differ much from the Europeans in stature; their colour is dark-brown; the complexion of some of them approaches to yellow; their hair black and uncurl’d; and they are generally handsome and well made. They are indolent, lascivious, and profane; and nothing but hunger or thirst moves their activity. Some of them, however, are intelligent and ingenious; and though most of them are poor, some of their bankers, or merchants, are very wealthy, and very expert in matters of trade. Their women are said to be uncommonly wanton and intriguing; prostitution is not thought by them a disgrace; and they have licenced houses, in which the law allows them, under a certain affidavit, to distribute their favours. Their artificers in gold and silver are very ingenious, and imitate any model that is set before them with great exactness. Europeans are often surprized to observe the perfection to which they have arrived in those branches of spinning cotton, and of repairing muffins that are torn, and in almost all the handicraft operations in which they are employed. The common people go almost naked. They wear nothing but a piece of linen, wrapped round the waist, and passed between the legs. Those of a higher rank have a dres of white cotton, which doubles over before as high as the shoulders, and is fastened with rings round the middle, and which hangs down to their feet. Most of them have their heads, and eradicate the hair from all parts of the body. Rich people wear turbans, and many of them wear small ear-rings. The dres of the women consists of a piece of cotton cloth thrown over the shoulders, under which they wear a kind of coat and drawers. Those who can afford it adorn their hair with gold bodkins, and their arms, legs, and toes with gold, and silver rings and bands, and also their ears and the cartilage of the nose. The inferior women wear similar ornaments, made of a sort of cowries, and called "chscaras." Their heads are bare, and their hair turned up, and fastened at the back of the head. Rice is the chief article of their food, the remainder of which consists of vegetables and milk. They eat no fish, flesh of animals, nor any thing that has had life. Their beverage is pure water.

Both the Moors and Bengalees are fond of the amusement of dancing; and for this purpose they employ young women, who are trained up from their infancy to this diversion, and who are richly decorated whenever they are engaged to perform. Dancing is accompanied with music, both vocal and instrumental. For an account of the other inhabitants of Bengal, see Gentooos and Hindoos. See also Brahmins and Faquirs. Besides these, several of the eastern nations, Persians, Armenians, and others, resort to Bengal, allured by the advantageous trade which they are enabled to pursue there.

Four European nations have established themselves in Bengal.
gal for the purpose of commerce, viz. the English, the Dutch, the French, and the Danes. The English are the principal, and their chief settlement is at Calcutta, the present capital of the country. (See CALCUTTA.) Europeans lead, in Bengal, a very easy life. The men, who are almost all in the service of the company, devote a part of the morning to business, and perfons of fortune keep in daily employment a black writer, for which he receives 20 or 25 rupees per month. They spend the remainder of their time in personal improvement or recreation. Besides the black writers, most Europeans have also one or two banyans, who note down all payments and receipts, and who adjust all pecuniary matters in buying and selling. Moorish domestics are kept for the menial services of the house, and "peons," to run before the palankeens, and to carry an umbrella, or parasol, over the head of their master, when he goes out; and every house has likewise a porter, whose sole occupation is to answer the door; and one or two fets of "berras," or palankeen bearers, together with a "harry maid," or "mata-nani," who carries out the dirt; and a great number of slaves, both male and female.

The current coins in Bengal, and in the whole extent of Hindostan, are gold and silver rupees; which see. See also MOBUR. Copper coin is not seen in Bengal. For change they make use of cowries, 6 or 7 in number which make a "poni," and 60 or 65 ponis, according to the scarcity or plenty of cowries in the country, make a rupee. However, there is great variation in the use of cowries in Bengal. Weights are calculated by the Sar, answering nearly to two pounds avoirdupois, of which 40 make a maund; which see. The measures of length are cobidos, and gefs or gofs, which see. Distances between places are measured by cofs. See COSS. The vessels used for inland navigation are burs, budgerows, and pulwahas, which see. The general conveyance of passengers by land is on foot of letters, called palankeens, which see. For an account of the manners and customs of the inhabitants of Bengal, and various other particulars; see CALCUTTA, HINDOSTAN, and INDIA. See also GENTOOS, HINDOOS, and BRAHMINS.

BENGAL, bay of, is a large gulf in the Indian ocean, between the two peninsulas of India; bounded on the north by the coast of the province of Bengal, on the east by the kingdoms of Aracan, Pegu, Siam, the peninsula of Malacca, or Malaya, and part of the island of Sumatra; on the south by the great Indian ocean, and on the west by the coasts of Orissa, Coromandel, and the island of Ceylon. The Ganges and several other rivers, discharge themselves into this gulf; it contains many islands; and it abounds with bays, harbours, and port towns. Its widest extent is about 86 leagues, and its length about 72 leagues. In a more confined view it may be said to begin at cape Palmiras.

BENGAL, Language of, or BENGALEE, is derived from the Shanferit (which see), and distinct from the Persian, Moors, and Hindostani, which are spoken in several parts of this province, and each of which has its peculiar department in the buisness of the country. Its alphabet, like that of the Shanferit, consists of 50 letters, of the form, sound, and arrangement of which Halhed has given a very particular and detailed account in his "Grammar of the Bengal Language," printed at Hoogly in Bengal in 1779. The only impediments in acquiring the knowledge of this language are the great number of letters in its alphabet, the intricate variety of their combinations, and the difficulty of pronunciation; but the grammatical part is simple, though difficult, and complete without being complex. Its rules are plain, and its anomalies few. The vowels are distributed into long and short, the latter of which are often omitted in writing, and they are invariably subjoined to the consonant with which they are uttered, and never precede them. As every consonant, therefore, inherently poiffesses the short vowel on which its utterance depends, it is plain that no two consonants could have been joined together, and succeffively pronounced in the same syllable, but that a vowel must necessarily have intervened. In order to remedy this inconvenience, a set of distinct characters was invented, called "P. holas," or adjuncts. These are certain subordinate and subsidiary figures, eleven in number, that may be attached to each of the consonants in the alphabet respectively, and thus provide against the too frequent recurrence of the internal vowel. Exclusively of these "P. holas," almost any two or three consonants may be bleffed together for supplying the omission of the internal vowel. The compound letters may be formed by placing one letter immediately under another; or by blending two letters together, so as by their union to make one character; or by making the sflit of the two consonants much smaller than the other letters, which latter mode is the most common. The genders of this language are three, and the terminations usually distinguishing the masculine are aa, and those of the feminine are ee; but it is not necessary that every noun comprehending sex should be distinguished by a particular termination, or mode of formation, expressly to denote its gender. The Bengalee has four cafes besides the vocative, and in this respect it is much inferior to the Shanferit, which comprehends eight different cafes. The Bengalee nouns have neither dual nor plural numbers; and the same form of noun serves for the singular or plural. In compositions of this language, though the sflit and second persons occur very frequently, the sflit of the pronoun of the third is very rare; and in order to avoid the application of the words he and they, the names of persons are repeated in a manner that is very tiresome and disfiguring. The second person is always ranked before the sflit, and the third before the second. The personal pronouns have seven cafes, which are very irregularly varied. The indefinite pronouns are all aptotes in Bengalee, as they are in Latin and Greek. The Shanferit, which is the parent of the Bengalee, as well as the Arabic, Greek, and Latin verbs, are furnished with a set of inflections and terminations, so comprehensive and so complete, that by their mere form they can express all the distinctions both of person and time. By their root they denote a particular act, and by their inflection they express the time when it takes place, and the number of the agents; and thus their separative qualities are perfectly united. Every Shanferit verb has a form equivalent to the middle voice of the Greek, used through all the tenses with a reflexive sense, and the former is the most extensive of the two in its use and office; because in Greek the reflexive can only be adopted intrinsically when the action of the verb depends to no extraneous subject; but in Shanferit, the verb is at the same time both reciprocal and transitive. Neither the Shanferit, nor the Bengalee, nor the Hindostani, have any word corresponding to the sflit of the verb I have, and therefore the idea is always expressed by oft mibi; and of course there is no auxiliary form in the Bengalee verb answering to I have written, but the sflit is conveyed by another mode. As the verb subjunctive to be in all languages is defective and irregular, it is called in Shanferit a "semi-verb;" and it is observed, by the ingenious writer above cited, that the present tense of this verb, both in Greek and Latin, and also in the Persian, appears evidently to be derived from the Shanferit. In the Bengalee, this verb has only two distinctions of time, the present and the past; and the terminations of the several parts of these verbs are a model for those of the same tense in all other verbs.
The Bengale verbs may be distributed into three classes, which are distinguished by their penultimate letter. The simple and most common form has an open consonant immediately preceding the final letter of the infinitive. The second is composed of those words whose final letter is preceded by another vowel or open consonant going before it. The third consists entirely of caudals, derived from verbs of the first and second conjunction. The Greek verbs in μ are formed essentially upon the same principle with the Sanscrit conjunctions, even in the minutest particular; of which instances occur in many verbs, which form from a root a new verb by adding the syllable μ, and doubling the first consonant. In forming the past tense, the Sanscrit applies a syllabic augment, like the Greek; and the future is characterized by a letter analogous to that of the same tense in the Greek, omitting the reduplication of the first consonant. Nor, indeed, is the reduplication of the first consonant always applied to the present tenses of the Sanscrit, any more than to those of the Greek. It is observed, that the natural simplicity and elegance of many of the Asiatic languages are very much debased and corrupted by the continual abuse of auxiliary verbs; and this inconvenience has evidently affected the Persian, the Hindustan, and the Bengal idioms. The infinitives of verbs, in the Sanscrit and Bengale, are always used as substantive nouns; and a similar mode of signification often occurs in the Greek. In the Sanscrit language, as well as in the Greek, certain forms of infinitives and of participles comprehend time; and there are also other branches of the verb that seem to resemble the gerunds and futures of the Latin. All the terms which serve to qualify, to distinguish, or to augment, either "substance" or "action," are clased by the Sanscrit grammarians under one head; and the word used to express it literally signifies increase or addition. According to their arrangement, a simple infinitive consists of three members, viz. the agent, the action, and the subject: which, in a grammatical sense, are reduced to two, viz. the noun and the verb. They use a particular word for specifying such terms as amplify the noun, which imports quality, and corresponds to our adjectives or epithets. Such as are applied to denote relation or connection, are expressed by another term, which may be translated "preposition." The simple adjectives in Bengale have no variation of gender, case, or number, neither is the adjective subject to inflection, but the sign of the case is confined to the substantive, with which it agrees; and its form is confined to the singular number, even when joined to a plural noun. But the above attributes, which are alternately adjectives and concrete nouns, generally preserve the distinctions of gender, which they all possess in the Sanscrit. Prepositions are substitutes for cases, which could not have been extended to the number necessary for expressing all the several relations and predicaments in which a noun may be found, without occasioning too much embarrassment in the form of a declension; therefore in the Greek language are too few, and hence refults great inconvenience. The Latin, which is less polished than the Greek, bears a nearer resemblance to the Sanscrit, in words, inflections, and terminations. The Bengalee method of computation, among the merchants, for the largest sums is by "fours," derived probably from the original mode of numbering by the fingers.

To this day the Bengalee reckon by the joints of their fingers, beginning with the lower joint of the little finger, and proceeding to the thumb, the value of which is also included as a joint; and thus the whole hand contains 15. From this method of performing numeration on the joints, arises that well known custom among the Indian merchants of settling all matters of purchase and sale by joining their hands beneath a cloth, and then touching the different joints, as they would increase or diminish their demand. See BENGALIANS.

It is a peculiarity in the Bengalee computation, that the ninth numeral of every series of ten is not specified by the term of nine, in the common order of progression, but takes its appellation from the series immediately above it, as twenty-nine is not expressed in our manner, or by what we should conceive to be its proper denomination, but by a term denoting one left than thirty.

The Sanscrit language, besides other advantages, has a great variety in the mode of arrangement; and the words are so compacted together, that every sentence appears like one complete word. When two or more words come together "in regimen," the halt of them only has the termination of a sentence; the others are known by their position; and the whole sentence, fo connected, forms but one compound word, which is called a "foot."

For further particulars relating to the language of Bengal, its grammatical construction, and the method of acquiring it, we must refer to Hallet, ubi sapra.

The verbs of the Bengalee are regulated by accent, and by the number of syllables in a line; no regard whatever being paid to quantity, but as it coincides with accent. Their poen, like those of the Arabsians and Persians, are in rhyme; and the Bengalee poets have many rules for contracting such words as are too long, and for extending those that are too short, for their metre. The Bengalee measurers are altogether borrowed from the Sanscrit, and may be divided into three species; viz. heroic, lyric, and elegiac.

In music, the Bengalee always use the minor key, and their gamut proceeds by the very small intervals of the chromatic scale. They have no idea of counterpart, and always play or sing in unison or octaves.

The natives of Bengal write with a slender and tough reed, very common in all the cast, which they shape almost like an European pen. They write with the hand closed, in which they hold the pen as the Chufhe do their writing-pen, pressing it against the ball of the thumb with the tip of the middle finger. The nib or point of the pen is turned downwards towards the writ; while the thumb pointing upwards, and lying on the pen with its whole length, keeps it firm against the middle joint of the fore-finger. As they have neither chairs nor tables, they fit upon their heels, or free-stands on their toes, whilst they are writing; and their left hand, loud open, serves as a desk on which to lay the paper on which they write, which is kept in its place by the thumb.

BENGALIENSIS, in Conchology, a species of Venus, described by Lillier. The shell is orbicular, somewhat equilateral, with thick perpendicular flize; and the beaks turned back. Inhabits Bengal.

BENGALIENSIS, in Ornithology, a species of Vultur, found in Bengal. It is of a brown colour, with the head and fore part of the neck bare of feathers, and pale cheffnut; bill lead colour, black at the tip. Latham. Gymelin.

BENGALIENSIS, a species of Otis, called by G. Edwards the Indian Bojard. The colour is black; space round the eyes brown; back, rump, and tail, shining brown. Gymelin. Inhabits Bengal, and is about twenty-three inches in length. Brisson calls this Pluviales Bengalensis major; and Buffon, Churge ou outarde moyenne des Indes. The beak and legs are whitish, tail streaked, and spotted with black. Edwards copied this bird from a drawing, and it does not appear that a specimen of it is known in any cabinet.

BENGALIENSIS, a species of Rallus, of white colour, with the head and neck black; wings and back greenish, primary quill feathers spotted with red. Gymelin. This is the
the Bengal water-rail of Albin; Totanus Benghalensis of Briffon; and Chevalier vert of Buffon. The bill, wings, and legs are yellow; crown, back of the eyes, lower part of the back and body beneath white, temples and throat black brown; primary quill feathers purple, secondaries green; tail purple, with fulvous spots.

BENGALLA, in Geography, a city of Hindoostan, which existed during the early part of the 17th century, near the eastern mouth of the Ganges, but of which no traces now remain.

BENGASI, or BERNICE, a sea-port town on the coast of Africa, in the Mediterranean. The merchants of this place usually join the caravans from Cairo to Angora in their way to Mouchank, the capital of Fezzan, and import tobacco, manufactured for chewing, and snuff, and sundry wares fabricated in Turkey. N. lat. 32° 10'. E. long. 20°.

This town is said to be the ancient Berenice, built by Ptolemy Philadelphus.

BENGEVAI, a town of Peria, in the province of Segas, 75 miles south of Zaraeg.

BENGHIUR, a town of Peria, in the province of Cabul; 32 miles north of Cabul.

BENGLO, a mountain of Scotland, in the county of Perth, the highest point of which is said to be 574.5 feet above the level of the sea; 5 miles N. E. of Blair Athol.

BENGIO, or BENGIA, a province of the kingdom of Angola in Africa, situated along the river of its name, but more commonly known by that of Mungela. It has the sea on the west, and the province of Mafate on the east. The Portuguese have cultivated large tracts of land in this province, which now abound with maize and manioc root, with which to make their bread. It produces also plenty of banana and baovia trees. It is divided into several districts, of which the chiefs are nates, though tributary to Portugal. The inhabitants are Christians, and have eight churches.

BENGORE HEAD, a cape of Ireland, on the north coast of the county of Limerick, 10 miles N. E. of Cokerain. N. lat. 55° 15'. W. long. 6° 19'.

BENGUELA, a province of Angola in Africa, retaining the name of a kingdom, bounded on the east by the river Kimba, or Cunam, on the north by the Coan, and Culogo, at about 10° 51'. S. lat. and reaching westward quite to Cape Negroe, according to the generality of geographers. But M. de Lisle extends it no farther north than old Benguela, in 9° 54'. and, according to him, it is bounded on the east by the Gaiga Cangui, or Gaigan chief, and on the south by places the province of Oyla, between the Kottotot and Benguelas, which tract is mostly inhabited by such savage nations as the Caftres and Giagins. Benguela was formerly governed by its own kings; and most parts of the kingdom were fertile and populous; but it suffered so much from the inroads of the Giagins, and its wars with neighbouring states, that, with the protection of the Portuguese, they have not been able to recover their importance. Its valuable productions are similar to those of Angola and Congo; and from the fertility of the soil they have two fruit feasons in the year. It furnishes likewise a considerable quantity of salt, though of inferior quality to that of Chifuma. The Zimba, whose shells are current as money through several parts of Africa, are caught upon its coasts, and paid in payment either by weight or measure. The country, being mostly mountainous, swarms with wild beasts, such as rhinoceroses, elephants, and wild mules. The lions, tigers, crocodiles, and other carnivorous animals, destroy great numbers of their cattle. Their cattle plow towards the sea-side furnishes produced numerous herds of cattle, both small and great, but they are now become very scarce. The air of the country is so wholesome as to affect its produce, and taint even its waters. Few Europeans have, therefore, ventured to visit it, so that it remains in a great degree unknown.

The chief towns are Old Benguela, St. Philip, or New Benguela, Mankainda, and Kafchelih. The commerce of slaves is so prevalent in this province, that the natives will sell their relations or children from mere wantonness.

BENGUELA, Old, a town of Africa, in a province so called, south of a bay of the same name, near the Atlantic ocean. The town is seated on a high mountain, where large beeves, sheep, poultry, and other provisions, have been sold in great plenty, together with elephant's teeth; all which the inhabitants have bartered for muskets, and other fire-arms. S. lat. 11° 5'. E. long. 11° 50'.

BENGUELA, New, or St. Philip, a town in the province of Benguela, seated on the south of a large bay, about 2 leagues long and 1 broad, called by the Portuguese "Bahias-das-Recas," where they have a settlement and a fort, with a small garrison. S. lat. 12° 8'. E. long. 12° 20'.

BENHADAD, or the Son of Aabad, in Scripture History, the name of several kings of Syria. Benhadad I. was the son of Tabrimon, and began his reign about the year 940 B.C. He was induced by costly preents to affift Afa, king of Judah, against Basha, king of Israel, whom he obliged to return to the succession of his own country, and to abandon Ramah, which he had undertaken to fortify. 1 Kings, xv. 18, &c. Benhadad II. was the son of the preceding, and his accession to the throne of Syria is stated to have taken place about the year 901 B.C. In his war against Ahab, king of Israel, he was totally defeated; and in the following year, renewing his attack upon the Israelites, in the plain of Aphek, he lost a great part of his army, and was reduced to the necessity of submitting to the mercy of Ahab, whom he was treated kindly, and allowed to return peaceably into his own country. In a new war for the recovery of Ramoth-Gilead, the possession of which was retained by Benhadad, Ahab, joined by Jehoahaphat, king of Judah, marched against the Syrians, and a battle ensued, in which Naaman was the general of the Syrian army, and Ahab lost his life. Benhadad having afterwards laid siege to Samaria, and failing in his attempts to reduce it, fell sick, and sent Hazael his minister, to the prophet Elifa, with presents, in order to consult him concerning the issue of his disorder. Hazael, on his return to Damascus, informed Benhadad that his health would be restored; but Elifa having predicted that Hazael would succeed to the throne of Israel, the minister accomplished the prediction by flaying Benhadad with a wet towel. Benhadad was reckoned a great prince, who contributed to advance the glory of his country, and his memory received divine honours in Syria. 1 and 2 Kings. Josephus Ant. i. viii. and ix. Benhadad III. succeeded his father Hazael on the throne of Syria, in the year 836 B.C. After having been several times defeated by Joash, king of Israel, he was expelled from all his father's conquests. 2 Kings, Jos. Ant. i. ix.

BEN-HINNON, or GHEN-HINNON, the valley of the children of Hinnom, lay in the south-east furbarbs of Jerusalem. See GEHENNA.

BENI, Paut, in Biography, a learned writer, was born in Candia, about the year 1552, and educated at Eugubio in the duchy of Urbino. In early life he entered among the Jefuits, but afterwards quitted them. He was for some time professor of theology at the college of Sapienza at Rome; of philosophy, at Perugia; and of rhetoric and belles lettres, in the university of Padua, from 1599 to the time of his death in 1625. He was more lively than judicious;
cious fond of maintaining singular opinions, and much engaged in literary controversies. He attacked the dictionary of La Cruca, in a work entitled "Anti-Cruca, &c." and defended Taffo, whom, with Anolto, he preferred to Horace and Virgil. He also wrote on the pastr-fido of Guarni. All these works were written in Italian. The most considerable of his Latin productions are, "Commentaries on the poetry and rhetoric of Aristothe," Venice, fol. 1625; "A poetical and rhetorical, extracted from the works of Plato;" 16 Commentaries on the first six books of Virgil; and on Sallust;" 17 "Difpat. de annal. Eccl. Car. Baronii;" and "De Historia Scribenda," lib. iv. Ven. 1611, 4to. All his works were printed at Venice, in 5 vols. fol. Gen. Dict. New. Dict. Hist.

**BENI Ammer**, in Geography, a district of the western province of Algiers, about N. lat. 35° 45'. E. long. 6° 30'.

**BENI Arzait**, one of the eighteen provinces in which the Turks divide Algiers, so called from its capital.

**BENI Affer**, a town of Upper Egypt, on the east side of the Nile; 2 miles north of Alina, or Elene.

**BENI Hoffan**, a town of Egypt, on the east side of the Nile, remarkable for its groves, dug in the mountains, which were formerly temples; 6 miles north of Achmoumain.

**BENI Hoffan**, called by Leo Africanus, Habat, a province of Morocco, bounded to the north by the river Mamora, and extending south to that of Sarat: 4 leagues from Rabat, to the cafl, are the provinces of Fez and Tedla, and to the west the ocean. This province is very extensive, rich, and commercial; and produces wool of a very excellent quality.

**BENI Jebit**, a town of Egypt, on the west side of the Nile, 12 miles south of Achioumain.

**BENI Headjaf**, and **BENI Hassad**, two districts of the western province of Algiers, bordering on the Mediterranean, about N. lat. 36° 30'. and E. long. 2° 12'.

**BENI Jabar**, mountains of Algiers, lying about 20 miles south of Bajeyah, or Bugia, and extending a considerable way along the coast, both in length and width, being parts of the little Atlas. They are steep and rugged, and furnish a great number of streams. They abound with fruit-trees, especially walnuts and figs, and produce plenty of barley, with which the inhabitants feed their numerous herds. The people are warlike, and have a chief of their own; and among them are excellent archers; and the whole ridge hath several villages, inhabited by the tribe or people whole name it bears.

**BENI Manar**, a town of Egypt, 9 miles south of Achmoumain.

**BENI Menafir**, a district of the western province of Algiers, about N. lat. 36° 30'. and E. long. 2° 42'.

**BENI Menchr**, a district of the eastern province of Algiers, between 32° and 33° N. lat. and from 7° to 9° 30' E. long. This district is dissected of water, except that which they draw from wells.

**BENI Mika**, a district of the western province of Algiers, N. lat. 35° 30'. E. long. 2° 12'.

**BENI Mijar**, a town of Egypt, on the west side of the Nile, 3 miles south of Abu Girc.

**BENI Mohamid il Kijar**, a town of Egypt, west of the Nile, and 6 miles south of Abu Girc.

**BENI Raffid**, a town of the western province of Algiers, north of the river Shelliff and near it. N. lat. 36° 16'. E. long. 2° 19'.

**BENI Shekir**, a town of Egypt; 6 miles N.W. of Manselout.

**BENI Smouch**, and **BENI Snnouf**, two adjoining districts of the western province of Algiers, on the confines of the Tell, about 35° N. lat. and between 0 and 1° E. long.

**BENI Zengouf**, anciently Hercynitana, a district of the western province of Algiers to the north of the Montes Chalco-grilli, and east of the river Malva, or Miluouia, about 34° 54'. N. lat. and 6° 50' W. long.

**BENI Zerwail**, a branch of mount Atlas, in the western province of Algiers.

**BENJA**, a river on the coast of Africa, 3 leagues E. N.E. from Amunia, and E. from Comenda.

**BENJAMIN**, in Biography, the youngest son of Jacob by Rachel, and one of the twelve patriarchs of Israel. He was the object of his father's peculiar affection, and reluctantly permitted to accompany his brethren to Egypt, when his return with them was made by Joseph the condition of their receiving a supply of corn. Joseph, who was his only brother by both parents, treated him kindly, and contrived a pretext for detaining him in Egypt, but he afterwards, when he discovered himself, permitted him to return to his aged father.

The tribe of Benjamin, which formed part of Judah, properly so called, lay between the tribes of Judah and Joseph, contiguous to Samaria on the north, to Jewish in the south, and to Dan on the west, which last parted it from the Mediterranean. It had not many cities and towns, but this defect was supplied by its poffessing the most considerable, and the metropolis of all, the celebrated city of Jerusalem. The other cities were Jericho, Gibeon, Bethel, Gibeah, Hai, Gilgal, Anathoth, Nebo; to which may be added the two noted villages of Bethany and Geichoamane. This tribe was at length almost exterminated by the others, in revenge of the violence offered to the concubine of a Levite, in the city of Gibeah. Genesia, Joshua, Judges.

**BENJAMIN** of Tudela, a city of Navarre, a Jewish rabbi, flourished in the 12th century. Possessed of a superstitious veneration for the law of Moses, and folicitous to visit his countrymen in the east, whom he hoped to find in such a state of power and opulence as might redound to the honour of his sect, he set out from Spain in the year 1160, and travelling by land to Constantinople, proceeded through the countries to the north of the Lusine and Caspian seas, as far as Chinese Tartary. From thence he took his route towards the south, and after traversing various provinces of the farther India, he embarked on the Indian ocean, visited several of its islands, and returned, at the end of 15 years, by the way of Egypt, to Europe, with much information concerning a large district of the globe, altogether unknown at that time to the western world. He died in 1173, not long after his return from his travels. His "Itinerary" contains a narration of his travels, intermixed with many fabulous accounts, that served to raise the credit of his nation. Caius Parvin, however, (Comment. de Script. Eccl. tom. ii. col. 1524. Lipt. 1722.) represents him as a man of fagaracy and judgment, and well skilled in the sacred laws; and says that his observations and accounts have been found upon examination to be generally exact, and that the author was remarkable for his love of truth. The first edition of the Itinerary appeared at Constantinople in 1543, with a translation from the Hebrew into Latin, by Benedict Arias Montanus; and it was printed by Plantin, at Antwerp, in 1575. 8vo. It was afterwards translated by the emperor Constantine, and his version was printed at Leyden, by Elsevir, in 1633. 8vo. A French translation of it was published by John Philip Baratier, in 1734, 2 vols. 8vo. Robertson's America, vol. i. p. 45. Gen. Dict.

**BENJAMIN** Tree, in Botany. See Laurus.

**BENJAMIN**, in Pharmacy. See Benzoin.

**BENJAR** river, in Geography. See Bendorinaissin.
BENIBOURD, a mountain of the Highlands of Scotland, probably higher than Caringorm, which is 4060 feet.

BENICARLOS, a town of Spain, in Valencia, celebrated for the wine made in its neighbourhood; 3 miles north of Penbericlos.

BENIDORME. Mount and Cape, lie about S. S. W. from Cape St. Martin, on the south point of Altea bay, projecting eastward from the town, which gives it name; to the south of which is the island Benidorma, 2 miles off; at the north-east end of Alcânt bay, on the east coast of Spain, in the Mediterranea.

BENIFAJO, a town of Spain in Valencia; 5 leagues from Valencia.

BENILET, a town of Asia, in the Arabian Trak; 145 miles N. W. of Paflova.

BENIMERINI, the denomination of an African dynasty, which succeeded that of the Almohedas, which fell.

BENIN, an extensive kingdom of west Africa, comprising the slave coast, bounded on the west by Guinea proper, or, more particularly, the Gold coast; on the north by Gago, Nigritia, and a chain of mountains; on the east by Muyacs and Makoko, and part of Congo, with the Ethiopian ocean, on the south, where it extends about one degree beyond the equinoctial line. It is commonly divided into three parts, viz. Whydah and Ardah, containing the Slave coast, and Benin proper, which has the same boundaries with the former on the north, call, and south, and is terminated on the west by part of the gulf of Guinea and the Slave coast. Its extent from west to east is about 600 miles, but from north to south it is not ascertained. From the river Lagos, where it commences, its coast forms a gulf or bay, ending at cape Lopez, in which are the trading places, or villages, seated on several rivers, of Benin, Bonny, Old and New Calabar, Camamam, and Gabon. Benin is watered by several streams, of which some are considerable rivers. Towards the sea-coast the land is low and marshy, and of course the climate unhealthy; but at a greater distance from the sea the land rises, and the air is more pure. In some districts of the country, water is so scarce, that often travellers are supplied with it for money by officers, to whose department it belongs. The rivers teem with crocodiles, sea-horses, a particular species of torpedo, and various kinds of excellent fish. The country abounds with elephants, tigers, leopards, wild boars, affes, civet and mountain-cats, hares, hawks, and hairy sheep; and among its birds the principal are paroquets, pigeons, partridges, storks, and ostriches. The soil is generally fertile, and produces a great variety of trees and plants, such as orange, lemon, and cotton trees. The pepper of this country is not so plentiful nor so good as that of the East Indies. The native negroes are in general mild and good humoured, civil to strangers, and yet revered, easily wrought upon by gentle means, but inflexible and resolute in refuting harsh treatment. In the conduct of bullfights they are expert; but attached to their ancient customs and manners, which renders them slow and tedious in their negotiations. Honest and faithful in their dealings, they seldom or ever disappoint the confidence that is reposed in them. Their trade is carried on by a kind of brokers, called mercadores, or fidadors, who treat with strangers about all merchandise; but all their contracts are made with great secrecy, through fear of exciting the jealousy or avarice of their governors; and the richest perfons exhibit the appearance of poverty, in order to escape the rapacious hands of their superiors.

The population of Benin is distributed into three classes of perfons. The first is composed of three perfons, called great lords, who attend the king, and present petitions to him. Such is the influence of these, that the supreme government may be said to be lodged with them. The next class consists of three petty princes called ares de roe, or erect kings, of whom four preide over the commerce, others over the slaves, some over military affairs, and others over every thing pertaining to cattle and the fruits of the earth. Out of this class are chosen the viceroys and governors of provinces, who are responsible to the three great lords, to whom recommendation they owe their appointment.

Each of them is presented by the king with a firing of coral as a badge of office, which he is obliged always to wear about his neck, under the penalty of degradation, and even death. The third order consist of the fadors, the mercadors, or merchants; the fulladers, or pleaders, and the veilles, or elders, all of whom are respectively distinguished by some peculiar mode of wearing the coral chain. The lowest class is formed by the plebeians, who are generally indolent and poor. The whole burden of labour, such as tilling the ground, spinning cotton, weaving cloth, and even cleaning the streets, is devolved upon the women. The chief workmen are smiths, carpenters, and leather-drovers; but in every occupation of this kind they are extremely awkward and artless. The common diet of the natives is beef, mutton, or fowls, and their bread is made of yams, beaten into a flour of cake. The manner perfons fubfill on smoked or dried fish, and bread made of yams, bananas and beans, mixed together. The drink of the poor is water, and that of the richer, water mixed with European brandy. The king, and persons of rank, support a certain number of poor, feated from the blind, lame, and infirm; the lazy, who will not labour, are fuffered to starve; and by this excellent policy, not a beggar or vagrant is to be seen. The natives of Benin are distinguished by their liberality; but in the exercife of it they are extravagantly vain and oftentations. The drefs of the natives is neat and ornamental; that of the rich, in which they appear in public, consisting of white callico, or cotton dresses, covered with another fine piece of callico plaited in the middle, and bound under a flarf, the ends of which are adorned with a handfome lace or fringe. The upper part of the body is mostly naked. The ladies of better fashion wear fine callico, beautifully chequered with various colours. The face and upper part of the body is covered with a thin veil, and the neck adorned with a ftring and chain of coral. Upon their arms and legs they wear bright copper or iron bracelets, meanly wrought. The perfons of the women are not dilatable. The children go naked till the age of ten or twelve years; their whole drefs, before this period, consisting of a few ftrings of coral tied round the wait. The men neither curl nor adorn their hair; but they form part of it into locks, to which they fufpend a bunch of coral. The women drefs their hair with great art in a variety of forms, and occasionally apply to it a kind of nut oil, which deftsroys its black colour, and in time changes it into green or yellow.

The men marry as many women as their circumstances allow; but they have scarcely any nuptial ceremonies. Jealousy is very prevalent, and adultery is severely punished; but the violation of the marriage-bed is less known in Benin than in any other country. Male infants, as soon as they are born, are prefented to the king, as rightfully belonging to him; but the females, being deemed the property of the father, are left wholly to his care and difposal. Both male and female children are circumcised, when they are about a fortnight old; and they are marked over their bodies with various incisions, that express certain figures. In some parts of Benin twin births are reckoned a happy omen; but at Aebra, they are reputed a bad omen, and both the twins and their mother
mother are put to death. The inhabitants of Benin are less afraid of death than the other natives of the same coast. Such is their attachment to their own country, that those who die in other provinces are preferred for years, till they can be conveyed for burial to their native soil. On occasions of mourning, which is usually limited to 15 or 15 days, some shave their hair, others their beard, and others but half of either. The last obsequies of their kings are performed with some very extraordinary ceremonies. When the tomb-stone is laid, they crown it with a banquet of the most delicate wines and sweetmeats, of which all are allowed to partake; and the mob, intoxicated with liquor, are guilty of the wildest excesses and riots. Those who obstruct them, as men, women, children, and even brute animals, are put to death; and having cut off their heads, they carry them to the royal sepulchre, and throw them in as offerings to the deceased king, together with all the clothes and effects of those whom they have sacrificed to his manes. Nevertheless, amid the barbarous customs, the kingdom of Benin is governed by laws, which breathe nothing but humanity, and sympathy for misfortune and distress.

As to the religion of this country, it is a strange mixture of good fane and absurdity. With some false notions of a Supreme Being they blend many absurd and idolatrous ceremonies. The "Fetish" is worshipped here, as well as in all the other countries on the western coast of Africa. To every evil they give the name of devil, and worship him from fear, and to prevent his doing them injury; and they honour both God the Creator, and the evil spirit, by sacrifices and offerings. They are believers in apparitions; and they conceive that the ghosts of their deceased ancestors walk on the earth, and occasionally appear to them in their sleep to warn them of their danger, which they endeavour to elude by sacrifices. All their houses are full of idols, and they have particular huts or temples for the residence of their gods. Their priests also are numerous; and the grand, or high priest of Locho, a town seated at the mouth of the river Formosa, is particularly famous for his skill in magic, and is never approached without the most profound veneration and awe. Besides their fasth, a day of repose which occurs every fifth day, they have many other days appropriated to religious purposes. At some of their festivals, they sacrifice not only a great variety of brutes, but likewise a number of human victims, who are usually condemned criminals, reserved for this purpose. They have one annual feast in commemoration of their ancestors; but their greatest festival is that called the coral feast, on which day alone the king appears to his people in great pomp, attended by 600 or his women. Wine and provisions are distributed on this occasion among the people, and the day ends in gluttony, drunkenness, and riot.

The government of Benin is despotic. The empire is divided into a great number of petty royalties, all of which are subject to the king of Benin, whose authority is absolute, and commands the most blind and servile obedience. The reigning monarch, when he apprehends his destruction to be approaching, commands one of his sons to fill the throne, with an injunction, under pain of death, not to reveal the secret till after his death. When this happens, the delinquent sovereign is removed to the town of Olocho, a few miles from the capital, where he remains for some time to be instructed in the art of government, and the duties of a king. Upon his return, his left ear, for securing his future tranquillity, is to murder his brothers, and thus to remove every rival to the crown. The royal revenues are very considerable; to these every governor contributes a large sum; and the inferior officers pay their taxes in cattle, fowls, cloth, and other commodities. Certain duties are also laid upon foreign trade; besides the annual taxes paid to the governor for the privilege of commerce, a fifth of which belongs to the king. It is said that the sovereign of Benin is a powerful prince, that, in one day, he can assemble an army of 20,000 men, and in a few days, 50,000 more. His troops, however, are deficient of courage and conduct, and observe neither order nor discipline; and, indeed, are merely a cowardly tumultuous rabble, which leave him exposed to the incursions of pirates and robbers, that are suffered to pillage and destroy, and sometimes to advance even to the capital. The arms used by them are swords, poniards, javelins, bows, and poisoned arrows.

The capital of this kingdom is Benin. The other principal towns, or rather villages, are Bododo, Arobo, Agaton, Awerri, and Melberg.

All the slaves purchased on this part of the African coast, except a tribe distinguished by the name of "Mocoes," are called in the West Indies "Eboes," probably from Arobo, on the river Benin. In language they differ both from the Gold coast Negroes, and those of Whydah, and in some respects from each other; and in complexion they are much more yellow than the others; but their colour is a sickly hue, and their eyes appear as if suffused with bile, even when they are in perfect health. These Eboes appear, in general, to be the lowest and the most wretched of all the nations of Africa. The great objection to them as slaves is, their constitutional timidity, and despondency of mind, which lead them very frequently to seek, in a voluntary death, a refuge from their own melancholy reflections. They require, therefore, the gentler and mildest treatment to reconcile them to their condition; but if their confidence be once gained, they manifest as great fidelity, affection, and gratitude, as are reasonably to be expected from men in a state of slavery. The females of this nation are better labourers than the men, probably from having been more hardy treated in Africa. These Eboes, notwithstanding the depression and timidity which they manifest, on their first arrival in the West Indies, and which give them an air of softness and submissiveness, forming a striking contrast to the frank and fearless temper of the Koromanyn Negroes, are in reality more savage than the people of the Gold coast; insomuch, that many tribes among them, and especially the Mocoes tribe, have been accustomed to the shocking practice of feeding on human flesh. In their religious worship, they adore certain reptiles, of which the guana, a species of lizard, is in the highest estimation, and in the worship of this animal, it is said, that they offer human sacrifices. Edw. Mtn. Hist. vol. viii. p. 172, &c. Edwards' Hist. West Ind. vol. i. p. 75.

Benin, a city of Africa, and capital of the kingdom above described. It is pleasantly seated on the river Benin, or Formosa, about 60 miles from Agaton, at the mouth of the river, and is said to be 4 miles in circumference, and to contain 50,000 long, broad, and straight streets of low houses. The streets are adorned with a variety of shops filled with European wares, as well as the commodities of the country, such as cotton, cotton, and elephants' teeth. In their markets they expose to sale, for food, dogy, of which the Negroes are fond; and also roasted monkeys, apes, and baboons. Batz, rats, lizards dried in the sun, palm-wine, and fruit, form the most luxurious entertainment, and brandy also exposed to sale in the streets. As the country affords no flax, the houses are built with mud and clay, covered with reeds or straw; and they are separated from one another by clumps and ruins, that indicate its decay. The entrance into the city is by a gate of wood, which is defended by a balustrade of mud and earth; and it is surrounded by a deep ditch 40 feet wide. A guard
BEN

is stationed at this gate to receive the tolls, duties, and im-
pacts collected from the merchandize. None but natives are
permitted to live in the city; and of these some are wealthy,
and carry on an extensive trade, which is committed to their
wives, who go to all the circumjacent villages, and traffic
in all sorts of merchandize, and who are obliged to bring the
greatest part of their gains to their husbands. A principal
part of the city is occupied by the royal palace, which is
more distinguished by the extent of its dimensions than by the
commodities or elegance of the structure. All the male
slaves in this town are foreigners; for the inhabitants cannot
be sold for slaves, and only bear the name of the king's
slaves. This is one of the European marts for the purchase
of slaves. N. lat. 6° 10'. E. long. 5° 6'.

BENIS, River of, called by Juan Alfonso de Aveiro, a
Portuguese, who is said to have first discovered the coun-
try, Formosa, on account of the verdure and beauty of its
banks; a confiderable river of Africa, in the kingdom of Be-
nin. It divides itself into several branches; and has some
towns or villages on its banks, in which Europeans, and par-
ticularly the Dutch, carry on a commerce. Notwithstanding
the beauty of its adjacent scenery, the air is noxious and
petulant on account of the vapours exhaled by the sun's
heat from its marshy banks; and it is much infested by the
mosquito flies. The entrance into this river is in N. lat. 6°
38', and E. long. 40° 47'.

BENISH DAYS, among the Egyptians, a term for three
days of the week, which are days of less ceremony in reli-
gion than the other four, and have their name from the ben-
ifis, a garment of common use, not of ceremony. In Cairo,
Cairo, on Sundays, Tuesdays, and Thursdays, they go to the
bath; and these are the general days of business. Fridays
they stay at home, and go to their mosques at noon;
though this is their day of devotion, they never abstain
from business. The three other days of the week are the
benish days, in which they throw off all business and cere-
mony, and go to their little summer-houses in the country.

BENISOUF, in Geography, a town of Egypt, on the
well side of the Nile. According to Savary, it is half a
league in circumference; and Sonini says, that of all the
places situated along the Nile, from Cairo, or for the space
of more than 30 leagues, this is the largest, as well as the
most affluent. The houses are only cottages of brick and
earth, coarsely constructed; but the lofty minarets, rising in
height with the surrounding date-trees, and discovered through
their highest branches, present an agreeable object to the
view. A manufacture of coarse carpets renders this a com-
mercial town; and the adjacent plains are fertile and pro-
ductive, so that the people who cultivate them appear less
difficult and wretched than those who live near the capi-
tal. Benisouf is the residence of a bey, or, in his absence,
of a kiafschef, who levies with an armed force his arbitrary
tribute. Over against Benisouf stands the village of
"Buindy," partly inhabited by Copts; and on the same side
of the river, and at the distance of 3 leagues, is "Belbe,"
a large village, the residence of a kiafschef, where are a mosque
and a convent of Copts. Benisouf lies in N. lat. 29° 14'.
E. long. 30° 58'.

BENTO, Sr., a small island of the north Pacific ocean,
on the north-west coast of America, surrounded with rocks
and islets. N. lat. 27° 41'. E. long. 244° 38'.

BENITO, Sr. or St. Benito, a river of Benin, in Africa,
that discharges itself 7 leagues S. by W. from the bight of
Biafra, and on the south side of the river Campo, into the
gulf of Guinea. On the north side of this river flows a
great hill, called the Hayburn. N. lat. 1° 45'. E. long.6° 10'.

BENIVIENI, Giroldo, in Biography, was born at
Florence, in 1552, and contributed, under the auspices
of Lorenzo de Medici, to reclaim the Italian poetry from its
mean and trivial rate, and to renew the style and manner
of Dante and Petrarch. The principal topic of Benivieni
was divine love, which he clothed with the sentiments of Plato-
nism, and thus obscured the poetical beauties of his works
by mysticism. He was esteemed on account of his integrity
and virtue, and employed by Pico, prince of Mirandola, as
his almoner. He died at Florence in 1552, and was buried
in the same tomb with his friend Pico. His works were
printed at Florence in 1500, and again with additions in

BENI, in Geography, a lofty mountain, being
the chief summit of the Grampian chain, near Kemnorie,
in Perthshire, Scotland. One of its sides rises from the banks
of the Tay, and affuming a conical shape, elevates its sum-
mit about 4015 feet above the level of the sea.

BENIJA, in Ichthyology, a name by which the
Swedes call the common bleak, cyprinus albatus of Linnaeus.

BENLONMOND, in Geography, a mountain of Scotland,
situated in the parish of Buchanan, in Dunbartonshire.
Though not so lofty as Beniws or Benlawers, yet its inflated
situation with respect to the neighbouring hills, and broad
lake of Loch Lomond spreading at its base, give it great magnitude
and grandeur. It is computed to be 3260 feet above
the level of the sea, and 3240 from the surface of the lake.
The form it assumes nearly resembles a truncated cone, and its
sides, particularly towards the lake, are finely mantled with
natural woods. Its north side is exceedingly steep, but
on the south-west it may be easily ascended. On the north-east
side is the source of the river Forth, which, like most moun-
tain streams, soon becomes a rapid river, and is alternately
seen expanding into a lake, or darting over some craggy pre-
cipices. Benlomond is mottly composed of granite, inter-
pered with large mafses of quartz, and near the base are
large strata of micaceous schistus, some of which is also
found at the top of the mountain. Sinclair's Statistical Ac-
count of Scotland.

BENNA, in British Antiquity, a kind of carriage,
which was used for travelling rather than for war. It contained
two or more persons, who were called "Combennones,"
from their sitting together in this machine. The name was
probably derived from the British word "Ben," or pen,
which signifies head, or chief; and these carriages might,
perhaps, have got this appellation from the high rank of
the persons who used them.

BENNAVENNA, or Bannavento, in Ancient Geogra-
phy, a town of Britain in the itinerary of Antonine, placed
by Camden, Gale, and Stukely, at Weeton, a village 6 miles west of Northampton, but by Mr. Hortley, for reasons
which he has stated, and which seem to be satisfactory, at
or near Daventry.

BENNECKSTEIN, a town of Germany, in the circle
of Upper Saxony, and county of Klettenberg, 22 miles
S.S.W. of Halberstadt.

BENCUM, in Geography, a town of Guelderland, 2
miles north of Wageningen.

BENNET, Christopher, in Biography, was born at
Raynton, in Somersetshire, about the year 1617. After
the usual school education, he was entered at Linclon college,
Oxford, in the year 1632, where he proceeded bachelor, and
then master of arts, but seems to have acquired his knowledge
of medicine at Leyden, or some other university, where he
took his degree of doctor. He then came to London, was
admitted fellow of the college of physicians, and appears to
have had a considerable share of reputation and practice. In
1690,
1696, he published "Theatrum tabidorum, seu phthisicos, atrophice, et hebetos, xenodochum," 8vo. London: a work of learning and ingenuity, but abitrufte and theoretical. He made a number of curious experiments to discover the qualities of the blood in phthisical patients. He had seen effusions of the breast, he says, relieved by discharges from the legs; and on the other hand, phthisical complaints occasioned by suppurating hemorrhage from the nostrils. He observes, that consumption not infrequently occurs in England, unattended with affections of the lungs. The work has been translated into most of the modern languages, and passed through numerous editions, though now almost forgotten. He also republished, with observations, Monfett's treatise, called "Health's Improvement." He died tabid, in April 1655, and probably had been induced to employ so much of his time and labour in acquiring a knowledge of the disease from his own sufferings. Haller. Bib. Med. Pract.

Benet, Henry, earl of Arlington, an eminent statesman, and favourite minister of king Charles II. was born of a good family in the county of Middlesex, in 1618, educated at Christ-church college, in the university of Oxford, where he distinguished himself by his application, and by his turn for English poetry; and upon the king's coming to Oxford, at the breaking out of the civil war, entered himself into his service, both as a volunteer in the royal army, and as private secretary to lord Digby, secretary of state. Upon the failure of the royal cause, he went over to the continent, and became secretary to the duke of York, and composed the full confidence and esteem of the royal family. In 1658, he received the honour of knighthood from Charles II. and was fet by him in the quality of his minister to the court of Madrid. Soon after the king's restoration, Sir Henry Benet was recalled from Madrid, and in 1662, promoted to the office of secretary of state. In 1663, he was created baron of Arlington, and at that time was considered as the king's chief minister and favoured servant. He is supposed to have been at the head of the party who procured the fall of the chancellor Clarendon. The conduct of foreign affairs was chiefly entrusted to him, and he had a great share in the first Dutch war. About this time he introduced Mr. (afterwards fr.) Wm. Temple, into public employment. He formed one of the principal characters in the ministry of that period, distinguished by the appellation of the cabal. From the collection of letters, published by John Dalrymple, it appears, that lord Arlington was one of the commissioners, who, in 1670, concluded and signed at Dover with Mont. Colbert, the French ambassador, a secret league between Charles II. of England, and Lewis XIV. of France; by which Charles agreed to declare himself a Roman catholic, and to engage in a war for the destruction of the United Provinces. By one article of this treaty it was stipulated, that his most Christian majesty was to furnish the king of England, before he declared himself a catholic, with the sum of 200,000l. sterling. In consideration probably of this service, however reproachful to those who conducted it, and degrading to the king their master, and as a recompence for other ministerial duties, lord Arlington was raised, in 1672, to the dignity of earl of Arlington, and vicount Thetford, and decorated with the order of the garter. In 1671, his conduct, and that of his colleagues in office, fell under the suspicion of the commons; and an impeachment was moved against him, which he escaped by a small majority. In that year he exchanged the office of secretary of state for the less responsible, and merely honorary one, of lord chamberlain: and soon after he was deposed, with two other commissioners, on business of importance to the prince of Orange; but not succeeding in the conduct of it, his interest at court declined. This was partly owing to his affected zeal against popery, though he had been always regarded as a secret friend to the popish party, and was in reality a convert to that religion. He retained, however, in outward appearance, the favour of the king; and after the ascension of James II. who had no affection for him, he retained the office of chamberlain. He died in July, 1683, having previously, on his death-bed, as it is said, reconciled himself to the church of Rome. By his wife, who was daughter of Lewis de Naffiu, lord of Beverwaert in Holland, he left one daughter, married to the earl of Lutfon, afterwards duke of Grafton, natural son of Charles II. The character of lord Arlington seems to have been that of a thorough courtier; accommodating, easy, artful, with the habits of the courtiers, rather than executive abilities, and the moderation of policy rather than the resolution of principle. He had little knowledge of the English constitution, and less regard to it; but he wanted firmness and resolution to take the lead in arbitrary meetings. His public letters when secretary, were published in 1671, 2 vols. 8vo." Dibb. Brit. Gen. Dibs.

Benet, Thomas, an eminent divine of the church of England, was born in the city of Salisbury in 1673, and sent for completing his education to St. John's college, Cambridge, in the beginning of the year 1688. Before he had attained the age of 21 years, he took the degrees of bachelor and master of arts; and he was chosen fellow of his college. In 1695, he wrote a copy of Hebrew verses on the death of queen Mary, printed in the Cambridge collection of verses on that occasion. In 1699, he entered into the controversy between the church and the dissenters, and published "An Answer to the dissenters' pleas for separation, or an abridgment of the London cafe." In the year 1700, he was presented to the rectory of St. James's at Colchester, where he became a very popular preacher. During his residence in this place, he published "A Confutation of Popery," several tracts of controversy with the dissenters on the subject of "Schism," and also "A Confutation of Quakers." He also published "A Pamphlete, with Annotations upon the Book of Common Prayer," with two letters relating to the same subject; and "The Rights of the Clergy of the Church of Christ." About the year 1711, he took the degree of doctor in divinity. As his popularity declined at Colchester, and his salary, which partly depended on voluntary subscriptions, was reduced from 200l. to 80l. a year, he determined to remove to London, and accordingly accepted the office of deputy chaplain to St. James's hospital; and this appointment was succeeded by the two lectureships of St. Olave's, Southwark, and St. Lawrence Jury. Before his removal to London in 1716, he published, in 1714, an 8vo. treatise, intituled "Directions for Studying," and in the following year, his "Essay on the thirty-nine articles of Religion, &c. and the case of subscription to the articles considered in point of law, history, and conscience, with a prefatory epistle to Anthony Collins, Esq." supposed to be the author of "Priestcraft in Perfection," published in London in 1709. In 1716, he published a pamphlet, entitled "The Nonjurors' separation from the church of England examined, and found to be fallacious on their own principles," and a sermon on "The Case of the Reformed Episcopal Churches in Great Poland, and Polish Prussia." Soon after, he was prefected by the dean and chapter of St. Paul's to the vicarage of St. Giles, Cripplegate, which afforded him a liberal income, amounting, after several deductions, to 400l. a year. For this preferment he was indebted to the private interference and recommendation of bishop Hoadly. After his settlement in this parish, in 1717, his tranquillity was inter-
interrupted by some law-suits in which he was engaged for recovering dues that belonged to the church. However, he published, in the same year "A Spital sermon," and in 1718, "A Discourse of the ever-blessed Trinity in Unity, with an examination of Dr. Clarke's Scripture Doctrine of the Trinity." From this time the harassed state of his mind, and the weight of parochial duties, prevented his undertaking any new work, except "An Hebrew Grammar," published at London, in 1716, 8vo., and intended for the use of such as want to learn Hebrew without the assistance of a master. He died at London of an apoplexy, in the 56th year of his age, on the 17th of October 1728, and was buried in his own church, Dr. Bennet, though a man of strong passions, and not altogether exempt from the charge of bigotry, was distinguished by his piety and integrity, by the diligence and zeal with which he devoted himself to the studies and duties of his profession, and by his extensive learning, more especially by his skill in the oriental and other learned languages. As an acute reasoner and accurate textuary, he had few equals. His talents for controversial writing, which perhaps he indulged to excess, gave him a decided advantage, particularly in his disputes with dissenters, over incompetent antagonists; but on some occasions they led him to recur to dilutions and refinements, which would not always bear examination, and which hid him open to the attacks of his adversaries. Several of his writings, as they related to temporary controversies, have been confounded to oblivion. Those which have excited attention in modern times, are his "Discourse of the Trinity," and his "Catechism of Subscription to the Articles of the Church of England." His explication of the Trinity has been charged with inclining to that heterodoxy which he wished to avoid, and which, without doubt, he sincerely abhorred: and his defence of subscription has undergone some severe criticisms by the acute and learned author of the "Confessional." It redounds much to the honour both of Dr. Bennet and bishop Hoadly, when we consider the disparity of their opinions, that the latter contributed to the preferment of the former. Gen. Dict. Bibl. Brit. BENNET, Herb. in Botany. See GEUM.

BENNEVENAGH, in Geography, a large mountain in the northern part of the county of Londonderry, province of Ulster, Ireland, about 8 miles west of Coleraine. BEN-NEVIS. See BEN-NEVIS.

BENNI, in Ichthyology, a name given by Bos after Sonnini, to the species of CYPRINUS which inhabits the river Nile, and is described by Forikul under the specific name of bynni. See BYNNI.

BENNINGTON, in Geography, a county of America, in the south-west corner of Vermont, bounded by Windham county on the east, the state of New York on the west, Rutland county on the north, and the state of Massachusetts on the south. It contains 10 townships, of which Bennington and Manchster are the chief. It has 12,254 inhabitants, including 16 towns. The mountains abound with iron ore, which employs already a furnace and two forges.

Bennington, the faire town of the above county, and the principal town in Vermont, including in the compact part of the town about 160 houses, is situated near the foot of the Green mountain, near the south-west corner of the state, 24 miles eastly from the junction of Hudson and Mohawk rivers, and about 52 miles from the south end of lake Champlain, at the confluence of the east and south bays; 55 miles from Rutland, 202 miles eastly from New York, and 300 in the same direction from Philadelphia. N. lat. 42° 42'. W. long. 74° 10'. It has a number of elegant houses, and is a flourishing town, containing 2400 inhabitants. Its public buildings are a congregational church, a court-house, and gaol. It is the oldst town in the state, having been first settled in 1764. Within the township is Mount Anthony, which rises to a great height in a conical form. The defeat of the British in two battles fought near this town, in 1777, contributed in a great measure to the subsequent surrender of general Burgoyne's army.

BENNISCH, a town of Silesia, in the principality of Jagershird.

BENOIST, St., a town of France, in the department of the Loiret, and chief place of a canton, in the district of Gien; 6 leagues south-east of Orleans.

BENOIST, St. du Saulx, a town of France, in the department of the Indre, and chief place of a canton, in the district of Argenton; 3¼ leagues S.S.W. of Argenton.

BENOIT, or BENEDECTUS, Renatus, in Biography, a famous doctor of the Sorbonne, and curate of St. Etiallus at Paris, was born at Sevenieres near Angers; and being a secret favourite of the protestant religion, he published, for the benefit of the people, a French translation of the Bible, which had been made by the reformed ministers of Geneva; but as soon as it was published, it was condemned. Benoit was appointed by Henry III. in 1587, regius professor of divinity in the college of Navarre at Paris; and some time before the death of this prince, he published a book, entitled "The Catholic Apology," the design of which was to shew that the protestant religion, professed by Henry, was no just reason for depriving him of his right of succession to the crown of France. This was followed, in 1590, by a defence of the same book. Benoit afterwards affixed to the assembly in which Henry IV. abjured the reformed religion; and he was promoted by the king, in 1597, to the bishopric of Troyes in Champagne; but he was so obnoxious to the pope, on account of his translation of the Bible, his favour to the protestants, and his frequent eruption of the liberties of the Gallican church, that he could never obtain his bull, to be installed: however, he retained the temporarilys till the year 1604, when he resigned the bishopric. He died at Paris in 1608. He was the author of several treatises, which are now not worth mentioning. Gen. Dict.

BENOIT, ELIAS, a learned French protestant minister, was born at Paris in 1640. After the revocation of the edict of Nantes, he fought refuge in Holland, and became pastor in the church at Delft, where he died in 1728. He was patient, timid, submissive, and laborious, and in his domestic connection he found ample occassion for the exercise of the virtues that distinguished his character. Of his wife he gives the following account: "I married a wifepossessed of all the faults that could torment a peaceable husband; covetous, pert, peevish, and capricious; by her unwearied spirit of contradiction, the plagued, in every possible way, her wretched mate for the space of 47 years." His only relief was incessant study, the fruits of which were the following publications, written in French, viz. "A History of and Apology for the Retreat of the Paltors on account of the Persecution in France," 12mo. 1688; "A History of the edict of Nantes," 5 vols. 4to. Delft, 1693; and "Miscellaneous Remarks, critical and historical, on Toland's two Difcursions," 8vo. 1721. New. Dict. Hist.

BENOIT, FATHER, a learned Maronite, whose Arabic name was Ambarach, was born at Gulla, in Phoenicia, of a noble family, in 1663. Having studied from the age of nine years to twenty-two, in the Maronite college at Rome, he returned
BEN

returned to the east, and was ordained priest by the Maronite patriarch of Antioch, and from thence he was sent to Rome, in order to transact some affairs relating to the church at Antioch. Previously to his proposed return, he was invited to Florence by the grand duke Cosimo III. where he was employed in arranging the types which Ferdinand de Medici had caused to be founded for printing books in the oriental languages. Under his inspection several eastern manuscripts were printed. Cosimo, in order to retain Benoît in his service, appointed him Hebrew professor at the university of Pisa, where he acquired great reputation for his character and learning among the literati of Italy. At the age of 44, he entered into the society of Jefuits, and was employed by Clement XI. as one of the correctors of the editions of the Greek fathers; and on the publication of cardinal Qirini, whom he had assisted in his studies, he published, at an advanced age, an edition of "Ephehem Syrus," the two first volumes of which, begun in 1730, were, after twelve years' labour, given to the public; but in 1743, whilst he was professing the third, and after he had advanced through one half of it, he was carried off by a severe illness in his 52nd year. This volume was completed by Affmann, in 1743. Benoît also translated part of the Greek Menology, and wrote some dissertations relating to the works of Ephehem Syrus. Moreri, Gen. Biog.

BENSON, in Geography, a town of France, in the department of the Lower Charente, and chief place of a canton, in the district of Rochefort; 52 leagues N. E. from Rochefort.

BENOY, a town of Arabia, 110 miles south-west from El-Catif.

BENOY, the capital of Lusamur, an interior kingdom of Africa, placed by Rennell in N. lat. 15° 6'. W. long. 6° 58'. See LUSAMUR.

BENZRAD, a town of Germany, in the circle of Westphalia, and duchy of Berg; 7 miles S. E. of Duffeldorp.

BENZEN. See BENSOW.

BENZBERG, a town of Germany, in the circle of Westphalia, and duchy of Berg; 7 miles east of Mulheim.

BENSERADE, ISAAC DE, in Biography, a celebrated French poet, was born at Lione, near Rouen, in Normandy, in 1612. The vivacity of his genius, and the pleasantery of his conversation, were well calculated to secure his reception at court, and to promote his advancement under the patronage of cardinals de Richelieu and Mazarin, who provided for him in a liberal manner by gifts and pensions. The poetry in which he excelled was that of the gallant and satirical kind, composed for the court-ballets, before oracles came into vogue; and in these he ingeniously adapted to the persons of acquaintance the known characters and adventures of those who represented their parts in fiction. His successes in this way induced him to make an attempt for turning all Ovid's Metamorphoses into roadsteads; but this work, though favoured by the king, and set off by all the ornaments of engraving, was ridiculed from its first appearance. As he aimed at point and conceit, the prevalence of a better taste in the age of Lewis XIV. sunk him into neglect. In 1679, he was chosen a member of the French academy. Towards the close of his life, he abandoned the court, and retired to Gentilly, where he embellished his house and gardens with a variety of ornaments that indicated his poetical genius. He was much afflicted with the stone, the excruciating pain of which he is said to have endured with fortitude and resignation. His later years were consecrated to works of piety and devotion; and he translated almost all the Psalms. He died in 1691; and after his death his works were printed in two volumes. Gen. Dict. Nouv. Dict. Hist.

BENSHAUSEN, in Geography, a town of Germany, in the circle of Franconia, and county of Heineburg; 7 miles south-east of Smalkalden.

BENSHEIM, a town of Germany, in the circle of the Upper Rhine, and archbishopric of Mayence; 20 miles north of Heidelberg.

BENSON, George, in Biography, a pleasing divine of considerable reputation for biblical learning, was born at Great Salkeld in Cumberland, on the 18th of September 1699. When he had finished his preparatory studies, he completed his education for the ministry at the university of Glasgow. At Abingdon in Berkshire, where he first settled as pastor in the year 1723, he continued for about seven years; and besides a sedulous attention to the duties of his office, he employed his time in a critical study of the sacred writings. His first work, published during his residence in this town, was, "A Defence of the Reformation of Prayer," accompanied with a translation of a discourse of Maximus Tyrius, on the same subject, together with remarks on it. A new edition of this, and of his piece on predestination, was published in 1737, under the title of "Two Letters to a Friend," &c. In 1729, he left Abingdon, and removed to the charge of a congregation in Southwark, with which he continued for eleven years. In 1731, he published "A Paraphrase and Notes on St. Paul's Epistle to Philemon," in imitation of the manner of Mr. Locke; and to this he added, "An Appendix, shewing that St. Paul could neither be an enthusiast nor an imposter, and consequently the Christian religion must be, as he has represented it, heavenly and divine." This argument was afterwards illustrated and improved in the most masterly manner by lord Lyttelton. This work, being favourably received by the public, was succeeded by Paraphrases and Notes, after the same manner, on the two epistles to the Thesalonians, the first and second epistles of Timothy, and the epistle to Titus; together with dissertations on several important subjects, particularly on inspiration. In 1735, he published, in three thin volumes, 4to. "The History of the first planting of the Christian religion, taken from the Acts of the Apostles, and their Epistles, &c." A second edition of this work, commonly bound up in one large volume, was published in 1756. In 1740, Mr. Benson was chosen pastor of the congregation of protestant dissenters, in Crouchend Friars, London, in the room of Mr. Harris; and in this connection, with the learned and candid Dr. Lardner as his assistant for some years, he continued till his death, which happened on the 6th of April, 1762. In 1743, he published his treatise "On the Reformation of the Christian Religion, as delivered in the Scriptures," and in consideration of his great abilities and learning, the university of Aberdeen conferred upon him the degree of doctor in divinity. Dr. Benfon, having finished those epistles of St. Paul, on which he intended to write Paraphrases and Notes, proceeded to explain, after the same manner, the seven epistles, viz., that of St. James, the two epistles of Peter, that of St. Jude, and the three epistles of St. John. A volume of miscellaneous sermons, in 1747, was the last of his public works. His posthumous writings, edited by Dr. Amory, appeared two years after his death, containing a life of Christ, and other theological essays. The labours of Dr. Benson in sacred literature met with a very favourable reception in foreign countries, as well as in Great Britain and Ireland, from the truly inquisitive and learned, and introduced him to a friendly acquaintance and correspondence with many persons, eminent for their literature and rank in the established church, as well as among the dissenters. Of these we may enumerate sir Peter King, lord chancellor of England; lord Barrington; archbishop Herring; bishops Hoadly,
BENTHEIM, a town of Germany, and capital of the above county, is seated partly on an eminence, and partly on a river of the same name. It contains one Calvinist, and one Roman Catholic church. The castle or palace stands on a high rock north of the town, and is surrounded with towers. Bentheim is distant 26 miles N.N.W. from Munster. N. lat. 52° 21' E. long. 6° 1'.

BENTHOORN, a town of Holland, 6 miles S.S.E. of Leyden.

BENTLYWEN, a town of Holland; 6 miles south of Leyden.

BENTINCK, William, Earl of Portland, in Biography, a favourite minister of King William III, was born in Holland, and descended from an ancient and noble family in the province of Guelderland. He accompanied the Prince of Orange to England in 1670, as gentleman of his bedchamber; and when the prince became stadtholder, he was promoted to the command of the favourite regiment of Dutch guards. In 1675, he manifested his attachment to this prince, by sleeping in the same bed with him when he had the small pox, in consequence of medical advice; and by thus exposing himself to the infection of a distemper with which he was actually seized, he laid the prince under an obligation, of which he was never unmindful. He took an active part in the preparations for the Revolution of 1688, and in the progress of that event; and upon the prince of Orange's accession to the throne, he received many marks of royal favour. Sustaining several high offices under the king's person, he was naturalized, and in 1689, he was advanced to the rank of an English nobleman, with the title of Baron Grecelcent, vicount Woodstock, and Earl of Portland. In the following year, he acted as envoy to King William at the grand congress held at the Hague. The royal favour, however, by which he was distinguished, and particularly the grant of several lordships in Denbighshire, which were part of the demesnes of the principality of Wales, occasioned, in 1695, a warm opposition in the house of commons; but though this grant was revoked, in consequence of an address to the king, the earl was compensated by other liberal grants from the crown, which constituted a great part of the present ample possessions of the family. This nobleman attended King William in his campaigns in Ireland and Flanders, and distinguished himself, as a military officer, on various occasions. After the conclusion of the peace of Ryckwick, in the negotiation of which he had a principal concern, he was nominated ambassador-extraordinary to the court of France, where he received the highest distinctions. On occasion of a jealousy, excited by the royal favour to a young Dutchman, named Keppel, afterwards Earl of Albermarle, the Earl of Portland resigned his post in the king's household, and withdrew from affairs of state; but he still retained some portion of the king's affections and confidence, and was entrusted with the administration of Scotland, and with the negotiation of the famous treaty for the cession to the crown of Spain, called the "partition-treaty," which was afterwards the subject of an impeachment of the earl by the house of commons. The king's death, in 1701, terminated the Earl of Portland's public life, and all hostilities against him. Of the attachment of his royal master, however, he had the most satisfactory evidence; when, on his death-bed, with his last words he
inquired for him, and on his approach, laid hold of his hand and pressed it to his heart. The close of the earl's life was spent in retirement at Butlerode, where he employed himself in acts of charity, and in the improvement of his fine gardens. He died Nov. 23, 1709, in the 51st year of his age, and was buried in Westminster Abbey. He left children of both sexes by his two wives, Anne, daughter of Sir Edward Villiers, and Jane, daughter of Sir John Temple.

His temper was, like that of his royal master, grave, sedate, and inclined to reserve; and his demeanour somewhat lofty, without pride. Although he was an object of jealousy and enmity, these were more political and personal than political; and his general character was that of an able and upright statesman, connected with private virtue. Biog. Brit.

BENTIVOGLIO, GUIDO, Cardinal, was born of a noble family at Ferrara in 1579; and after having studied at Padua with great reputation, he returned, in 1597, to his own country, where he displayed much dexterity in reconciling his brother, the marquis Hippolito, with cardinal Alberobrandini, the general of the church, and in concluding peace between the pope and Cæsar. Having fulfilled these transactions, he was appointed by pope Clement VIII. his private chamberlain, and allowed to complete his studies at Padua. He then settled at Rome, and by his prudence and integrity acquired general esteem. After having performed, from 1607 to 1619, the office of nuncio in Flanders, and at Antwerp till the year 1621, he was raised to the dignity of cardinal by pope Paul V. He was also appointed by Lewis XIII. protector of the French nation in Rome; which office he declined on becoming bishop of Terracina in 1641. On the death of Urban VIII. in 1644, he was thought to be the most proper person for the honour of succeeding him; but when he entered the conclave, in the hottest and most unhealthy season of the year, he was seized with a fever, which terminated in his death on the 7th of September, at the age of 65. The principal of his works, which are held in high estimation, are his "History of the Civil Wars in Flanders," written in Italian, and first published at Cologne in 1634, and since translated into foreign languages; "Memoirs" of himself, an "Account of Flanders," and a collection of "Letters," reckoned the most approved specimens of epistolary writing in the Italian language. Morei. Ger. Biog.

BENTIVOGLIO, in Geography, a small town and fortified palace of Italy, in the states of the church; 10 miles north of Bologna.

BENTLEY, RICHARD, in Biography, a very eminent critic, was born at Oulton, near Wakefield in Yorkshire, on the 27th of January 1661-2, and after receiving the rudiments of classical learning at the free school of Wakefield, was entered in his 15th year at St. John's college, Cambridge. In 1681, he left the university, and became a school-master at Spalding. From this situation he was soon removed to be preceptor to the son of Dr. Stillingfleet, dean of St. Paul's, who appointed him to be his domestic chaplain. In February 1691-2, he published his first work, which was a Latin epitome to Dr. Mill, containing "Critical Observations on Malachi's Chronicle," and about the same time he had the honour of being selected as the first performer to preach Boyle's lecture, founded for the vindication of natural and revealed religion. The subject of the eight discourses, which he delivered on this occasion, and which were afterwards published and translated into most of the modern languages of Europe, was the folly of atheism, and the refutation of this absurd and joyless system from the faculties of the soul, from the structure and origin of human bodies, and the origin and frame of the world itself. Whilst he carried on this lecture, he maintained a philosophical correspondence with Sir Isaac Newton, whose friendship he ardently cultivated, nor did he write any thing on this occasion without this illustrious philosopher's approbation. In 1692, he was installed bishop of Stillingfleet a prebend of Worcester; and in the following year he was appointed keeper of the royal library at St. James's. In 1696, he was admitted to the degree of doctor of divinity; and he delivered a discourse on the day of the public commencement from 1 Pet. iii. 15. It is said, that he was soon after admitted, "ad eundem," in the university of Oxford. His "Annotations on Callimachus," were inserted in an edition of that poet, published in 1697, by Graevius; and in the same year Dr. Bentley himself published, at the end of Watt's Reflections on Ancient and Modern learning, his "Dissertations on the Epistles of Themistocles, Socrates, Euripides, Phalaris, and the fables of Ætop." This publication was succeeded by a literary controversy, which engaged at the time a great degree of public attention. The immediate subject of this controversy was the genuineness of the epistles of Phalaris. In order to give our readers some notion of its rise, progress, and issue, we shall detail the following particulars. Soon after Dr. Bentley was made royal librarian, the honourable Mr. Boyle, who was about to publish an edition of the supposed epistles of Phalaris, applied, by means of a bookbinder in London, to Dr. Bentley, for the use of a MS. in the king's library, which, after much solicitation and delay, was at length obtained; but before the collation could be completed, and indeed, about six days after the manuscript had been delivered, it was redemanded by Dr. Bentley, with many flattering and disparaging expressions, both of Mr. Boyle, and the work. This conduct, Mr. Boyle, in the preface to his edition of Phalaris, publicly refuted; and in return, Dr. Bentley, in the above-mentioned dissertation, endeavoured to evade the spurionnature of the epistles that had been published, adding some reflections on Mr. Boyle's edition and version. In 1698, Mr. Boyle retorted, with effusions of wit and personal abuse, in a treatise entitled "Dr. Bentley's Dissertaiton on the epistles of Phalaris, and the fables of Ætop examined," and commonly known by the title of "Boyle against Bentley," a second edition of which was published in 1742. In 1699, Bentley recriminated in the same style, in a piece usually denominated "Bentley against Boyle," reprinted in 1777, by Mezzin. Bowyer and Nichols, with several notes and observations, collected from, or communicated by, bishops Warburton and Lenthall, Mr. Upton, Mr. W. Clarke, Mr. Markland, Dr. Salter, Dr. Owen, and Mr. Toup. Among the wits and critics, who united as auxiliaries of Boyle, were Swift, Pope, Garth, and Middleton; and it must be allowed, that they proceeded with an unwarrantable severity in attacking the moral character and literary acquirements of their adversary. Bentley, however, though unaided, sustained the contest with unyielding firmness, and in the event with full success, so far as the authenticity of the epistles ascribed to Phalaris is concerned. Since prejudice and passion have subsided, it has been very generally acknowledged that Bentley had not only the evident advantage with respect to learning and argument, but that he is little, if at all, inferior to his antagonist in point of wit and fineness. The reputation of Dr. Bentley, during the progress of this literary squabble, was not very materially affected; but for its complete termination, he was presented by the crown, in 1700, with the honourable and lucrative office of master of Trinity college, Cambridge; and in the following year collated archdeacon of Ely. In the former station, he introduced reform, and curtailed salaries, and thus incurred the
the ill will of some of the senior members of the college; but as he appeared to have exercised an undue authority, and to have consulted his own advantage more than the public, a charge was exhibited against him in 1759, by the vice-matron, thirty of the senior fellows, and other members of the college, for peculation, breach of the statutes, and other acts of mal-administration. The charge was presented to the bishop of Ely, as visitor of the college. But Dr. Bentley contended, that the crown was the visitor; and upon this a law-suit commenced, which was not terminated till the year 1731, when the crown affected its victorious power, but declined interfering in the present instance. It appeared afterwards, that upon the whole, the charges against the matter were well founded.

In 1710, Dr. Bentley published at Amsterdam his critical annotations on the two first comedies of Aristophanes; and, about the same time, at Rheims, his emendations of the fragments of Menander and Philemon, under the figured name of "Philoleuthenus Lipsiensis." This latter was undertaken with the view of disparaging a similar performance of Le Clerc, and thus by degrading his literary character in the public estimation, to fet afe of a scheme, which was then in agitation, for inviting him to England, by the offer of some considerable church preferment. In the year 1711, he published his long expected and much commended edition of "Horace." This correct and elegant edition of Horace, which was pronounced by Dr. Hare to be the completest work produced by criticism since the restoration of learning, was printed in 4o, and dedicated to the earl of Oxford. It was succeeded, in 1713, by some excellent remarks on Collins's discourse of free-thinking, published under the former name of "Philoleuthenus Lipsiensis," and dedicated to Dr. Hare. In 1716, Dr. Bentley was appointed regius professor of divinity; and in the same year he circulated proposals for a new edition of the Greek Testament, with St. Jerome's latin version. These proposals were the subject of severe animadversion by Dr. Middleton, who professed a serious conviction, that Dr. Bentley had neither talents nor materials proper for the work, and that religion was much more likely to receive detriment than service from it. Several pamphlets were published on the occasion; and it is much to be regretted, that a work of such importance to sacred literature and biblical criticism was abandoned. The completion of this noble undertaking was the principal employment of the latter part of Dr. Bentley's life. In the prosecution of it he had collected and collated all the MSS. of Europe to which access could be obtained; and for this purpose his nephew, Thomas Bentley, L.L.D., well known in the republic of letters, had travelled through Europe at his uncle's expense; the whole was completed for publication; but when he determined not to let it appear during his own life, the fam of 1200l., which he had received in part of the subscriptions, was returned to the subscribers. A circumstance occurred in 1717; which materially affected the doctor's reputation, and which was attended, at least for a time, with detrimental consequences to himself. Upon the creation, by royal mandate, of several doctors in divinity, Dr. Bentley demanded from each of them, besides the customary perquisite, an extraordinary fee of four guineas. In this demand they acquiesced, on condition that the money should be restored, if it should appear that Dr. Bentley had no right to enforce it. Dr. Middleton, however, some time after, obtained a decree for the repayment of the money; and in consequence of this decree, Dr. Bentley was arrested, and appeared by his proctor before the court of the vice-chancellor. On this occasion, the beadle testified on oath, that Dr. Bentley had declared, "I will not be concluded by what the vice-chancellor and two or three of his friends shall determine over a bottle;" and for this expression he was punished by the vice-chancellor, without a citation or hearing, from all his degrees, and afterwards by the caput deprived of all his privileges and honours, as well as degrees, in the university. Dr. Bentley appealed to the king, and after successive references to the council and to a committee of council, and to the court of King's bench, and many delays, the university received a mandamus in February 1718, which reversed all their proceedings, and required a restoration of Dr. Bentley to all degrees, honours, &c. of which he had been deprived. In 1726, he published an edition of "Terence and Phedrus," and in 1733, the last of his works, which was his edition of "Milton's Paradise Lost," and which made no addition to his reputation, though it has been said that many of his corrections of that poet have been unreasonably objected to by bishops Pearce and Newton. This work was undertaken at the request of queen Caroline. Dr. Bentley died on the 14th of July 1742, in the 61st year of his age, and was buried in the chapel of Trinity college. When we consider the unqualified abilities and reputation of Dr. Bentley, the fact that he exacted for several of his publications, that his literary character should have been held in much higher estimation by foreigners, than by his own countrymen. This may be partly owing to that pride, petulance, and irritability of temper, with which he, in common with many others who have excelled in verbal criticism, seems to have been chargeable; to the personal disputes in which he was engaged; and to the political differences that disquieted the period in which he lived. But, perhaps, it arose principally from his having, in the climax of his adversities, the poets and wits of the age, and from their having made him the object of their satire and ridicule. The aspers of Mr. Pope, who attacked him in the character of Aribarchus (works, vol. iii. p. 207—211) has, however, been ascribed to personal resentment. While they were both together at dinner with bishop Atterbury, Dr. Bentley was questioned as to his opinion of the English Homer; and, after some demur, being urged to speak out, he said "the verses are good verses, but the work is not Homer; it is Sondampus." Another circumstance, which contributed to degrade Dr. Bentley in the estimation of some of his contemporaries was that love of money, which he seems to have unduly indulged, and which involved him in disputes, that were dishonourable to him. As to the charge of scepticism, with respect to revelation, alleged against him by Mr. Whiston, it does not appear to have been well founded. Dr. SALTER describes him as having been a very amiable and pleasant man in private life, and as possessing much good nature, though he has been otherwise represented. Against the disparaging judgment of the learned bishop Lowth, who allows him to rank only among grammatical and verbal critics, may be controlled the encomium of Dr. Samuel Clarke, eminently distinguished by his literature and critical disecernment, who, in the Preface to his edition of Cesar's Commentaries, speaks of him as "vir in injustitii modis perficiens plane incredibile et critici omnes longe largiorque judicio et sagacitate antecedens." The judgment of poecility, more impartial than that of his contemporaries, has allowed Dr. Bentley's profound skill in the idiom of the Latin and Greek languages; and though, as a verbal critic, many of his emendations are unconfirmed by the authority of ancient MSS. they frequently approve themselves as just and reasonable, and are regarded as real improvements. It must be acknowledged, however, that these corrections of ancient and modern authors, which depend upon mere conjecture, and which suggest what might, or ought to have been written, rather than what
what they actually did write, extend the province of criticism beyond its just limits; and whilst they afford scope for the unwarrantable exercise of fancy or judgment, they should be very cautiously admitted. In this way doctor Bentley is said not have incurred the charge of temerity and presumption. The son of Dr. Bentley, who was called after his own name, was a gentleman of acknowledged ingenuity, taste and learning, and known as the author of several publications, and particularly of a tragedy, entitled "Philadæmus," published by Doddley in 1767, and cited by the late eminent poet Mr. Gray, as one of the most capital poems in the English language. His youngest daughter married a grandson of the learned Dr. Cumberland, bishop of Peterborough, whose famous book "De Legibus Naturæ" Dr. Bentley is said to have corrected upon a visit to his son-in-law, who was bishop of Kilmore in Ireland. The son of this bishop, Richard Cumberland, esq. is well known by his ingenious writings, and especially by his juttly applauded dramatic pieces. Biog. Brit.

BENVORLICH, in Geography, a mountain of Scotland, in the county of Perth; 3300 feet high. See GRAMPIAN MOUNTAIN.

BENY, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Caen, 24 leagues N.N.W. of Caen.

BENY, Le, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Vire, 75 leagues S.W. of Caen.

BENY, a small town of Hungary, in the county of Zemplin, leant on the river Bodrog, and noted for its excellent wine, not inferior to Tokay.

BENYOWSKY, Mauritius Augustus, Count de, in Geography, magistrate of the kingdoms of Hungary and Poland, a singular adventurer, was born at Verbowa, in the country of Nittia, in Hungary, in the year 1734, and educated for military service, to which he devoted himself from his youth. Being wronged in his paternal inheritance by his family, he feized by force the castle which was his father's residence; in consequence of which he was deprived of his whole property by a decree of the chancery at Vienna, and was obliged to fly for refuge into Poland. Here he engaged, in 1767, in the conspiracy against king Stanislaus, and in the course of this irregular service he was taken prisoner, first in 1768, and afterwards in 1769, by the Russians, who treated him with severity, because he had violated his parole, and because he was forming plans for the liberation of himself and his companions. The Russians conveyed him to Cazan, where he was allowed to live at large, under the notice of the garrison, as a state-prisoner; but here his enterprising disposition recommended him to a party, which was then forming a conspiracy against the Russian government, in the execution of which he was invited to concur. But the plot being discovered, he was exiled to Siberia; and after a tedious journey and voyage of twelve months, during which the count made some unsuccessful efforts for escaping, he arrived on the 23 of December 1770, at Kamtchakia, and was conducted to the town called Bolsoretskoy Oltrog, or Bolcheretik, where he and his companions in exile were informed that they might provide for themselves, and where they were furnished for this purpose with the necessary arms and implements. Diverted with this new order of living, the count soon began to concert measures with his fellow-prisoners for their escape; and in the mean time, he improved his circumstances by opening a school, in which he educated the son and three daughters of the governor, M. Nilow, or Nillof, and by his knowledge of the game of chess, at which he played with some merchants, on behalf of the Hetman of the Cossacks, who allowed him a certain proportion of the sums which he won. Having gained the confidence of the governor and the affections of Aphanasia, one of his daughters, he proceeded in maturing and accomplishing his plan of liberation; but before its execution, the secret was discovered, and the force of the settlement was employed in reducing the rascal contents. In the conflict on this occasion, the governor was killed; but the exiles at last succeeded, secured a vessel, and, accompanied by Aphanasia, who chose to follow the count, took their final leave of Kamtchakia. Their whole number, including the exiles, women, and the ship's crew, amounted to 65 persons. After enduring many naval hardships at sea, the vessel arrived at Japan; and on the 14th of August 1771, he anchored on the island of Uman Ligun, where he landed in N. lat. 29°, and which must consequently lie between Japan and the island of Leketo. This island, according to his account, is absolutely independent both of China and Japan; its inhabitants are mild, virtuous, and in a high state of civilization; and they are said to have been converted to Christianity by a Portuguese missionary Jesuit, Ignatius Salis, who arrived in the island in 1749. Upon quitting this island, whither he promised to return, he failed for Formosa, and arrived there on the 27th of August; but meeting with an opposition on his landing, he made a great slaughter among the natives. At length he opened, by means of a Spaniard, who refixed on the island, a more friendly intercourse with the inhabitants of another canton, and assisted Huspo, their prince, in a war against one of his neighbours. After a stay of about sixteen days on this island, he departed and steered for Macao, in the harbour of Canton, in China. Here his female companion, Aphanasia Nilow, died. During his stay in this place, he made some attempts for procuring leave to go to Canton; but when theee proved ineffectual, he determined to sail for Europe. Accordingly, in his way thither, he arrived at the isle of France, March 16th 1772, and having touched at the isle of Madagascar, he landed in France in July, and was well received by the French ministry.

Of the proposals made to the ministers of France by this adventurer, we have no documents; but he seems to have been regarded by them as a fit person to be employed in effectuating the settlement in the island of Madagascar. With this view they furnished him with a body of troops, in 1773; and in his way thither he touched at the isle of France, in order to solicit the co-operation of the chiefs of that island. Jealousy, and the dread of a rival settlement, prevented his obtaining their concurrence; and therefore, after some delay, he proceeded to Madagascar, and landed there in February, 1774; forming his settlement at the bottom of the bay of Antongill, at the mouth of the river Fingballe. The count made little progress in accomplishing the object of his mission, although he expended on account of the French government a sum amounting to 50,000l. and therefore, towards the end of the year 1776, commissioners were deputed to examine the state of the settlement, and to convey the count to France. In the mean time, this enterprising adventurer had contrived to raise himself to consequence in the isle by a curious stratagem. The Sambares, constituting one of the distinct nations of Madagascar, had been formerly governed by a chief, whose name was Aphanasia; and as he had left only one daughter, who had been taken prisoner and sold to foreigners, his family was supposed to be extinct. Of this circumstance the count artfully availed himself; and obtaining the testimony of an old negro woman whom he had brought with him from the isle of France, who declared that she knew him to be the Duke of...
son of Ramaši's daughter, her own companion in slavery, he succeeded in his views of being publicly acknowledged as the heir of Ramaši. Under this character he was vested with sovereignty, formed alliances with other tribes, made war and peace, and received submissions from the vanquished.

But as his European resources were with-held, he renounced the service of France, and persuaded his subjects to permit him to return to Europe, for the purpose of forming an alliance with France, or some other power, and for making commercial arrangements with a view to the improvement of a settlement on the island. Accordingly, he departed for Europe in November 1776, on board a brig which he had freighted to the Cape of Good Hope. With this event his own narrative terminates. Among his state papers, however, we find his proposal to the king of Great Britain, dated Dec. 25, 1783; of which the preliminary article is his being acknowledged sovereign of the island of Madagascar; under which character he offers terms for an offensive and defensive alliance with this country. But it appears, from a declaration prefixed to this paper, that he had previously applied, probably with similar views, to the emperor of Germany. The application to the British ministry, if it was ever made, and if it was ever the subject of discussion, as some have asserted, was not attended with success.

The count, therefore, determined to return to Madagascar with such supplies as he could obtain from individuals; and having procured goods and provisions for the voyage, he was enabled to find it difficult to get the flag of any European power to fail beyond the Cape of Good Hope, he departed for Maryland in America, in April 1784. A respectable commercial house engaged in his undertaking, and supplied him with a vessel and provisions to a considerable amount. In this vessel he failed for Madagascar; and after escaping the hazard of shipwreck on the lee shore of America, and doubling the Cape of Good Hope, he touched at Sofala, and on the 7th of July 1785, anchored in Antangara bay, 10 leagues S.W. of Cape St. Sebastian, in Madagascar, where the cargo was landed. Under an apprehension that the count had been cut off by the natives, the party on board the ship fell into the island of Joanna, and at Obo, on the opposite continent, folded the ship. The count heading a body of natives, commenced hostilities against the French by seizing their stores and Angoutzi. Here he began to build a town after the manner of the country, and from thence he detached 100 men to seize their factory at Toul Point, who defied on seeing a frigate at anchor.

In consequence of these transacts, M. de Soulac, governor of the island of France, sent a ship with sixty regulars, who landed, and attacked the count on the 23d of May 1786, in a redoubt which he had constructed, mounting two cannon, and in which he, with two Europeans, and thirty natives, waited their approach. The blacks fled, and Benyowsky, receiving a ball in his breast, fell behind the parapet, whence he was dragged by the hair, and soon expired.

Whilst none can question the ability and bravery of Count Benyowsky, the principles of his conduct are not easily extenuated. His enemies represent him as a tyrant and a robber; and his friends, on the contrary, exhibit him as distinguished by a noble, humane, and generous disposition. Mr. Nicholsoon, the editor of his "Memoirs and Travels," who had all the letters and documents before him, declares, that he has "not yet seen anything against the count, which will not bear two interpretations, or which has not been written by men who contradict each other, and had an interest in traducing him." "His conduct in Madagascar," says Waddron, in his "History of Colonization," defies no small portion of admiration, and even of respect; and, all things duly considered, I fear no reason, why a monument might not be erected to his memory, inscribed "Magnis Tamen excidit Avisa." A very different character is given of him by M. de Leleapt, in his "Travels in Kamtschatka," who represents him as perfidious and cruel, and by the Abbé Rochon, in his "Voyage a Madagascar," who says, that he aimed at the conquest of Madagascar by fire and sword, and treated the natives with such cruelty, that he was called by no other name by them than the "Wicked White." Memoirs and Travels of Count Benyowsky, written by himself. 2 vols. 4to. 1790.

BENZELIUS, Eric, a learned Swedish divine, was born in 1672, in Wetëro-Gothland, and educated at the patroonage of a rich uncle at Upfal. He was first preceptor to the sons of the count de la Gardie, chancellor of Sweden; and having completed their education, he travelled through various parts of Europe, cultivating an acquaintance with the learned, and consulting the principal libraries. Upon his return to Upfal in 1695, he was appointed professor of history and morality in the university, and afterwards promoted to the theological chair, and to a seat in the consistory. In 1673, he was made doctor in theology; in 1677, bishop of Strenges, and, in 1700, archbishop of Upfal, occupying also the vice-chancellorship of the university. He died in 1709; and the author of several dissertations on the lives of the patriarchs, and other parts of ecclesiastical history. He wrote also various theological works, and translated the whole Bible into the Swedish language. Morena.

BENZELIUS, Eric, son of the former, was born at Upfal in 1673, where he began and completed his studies. Having travelled into Germany, England, and France, he returned to Upfal in 1702, and was appointed librarian to the university, an office which he held for 22 years. In 1724, he was nominated professor of divinity; and afterwards successively created bishop of Goteborg, Lundkoping, and archbishop of Upfal. He died in 1743. Benzelius undertook, in conjunction with other learned men, a review, as well as all books published in Sweden, or by Sweden abroad, as of those works printed in other countries, which had any relation to this kingdom. This publication, containing, besides reviews, some few original acts, was denominated "Acta Literarum Sueciæ," and conducted for 10 years on this plan by a society of gentlemen, who afterwards formed the royal society of Upfal. See Society.

BENZIE ISLAND, in Geography, lies on a river of the same name, within Sierra Leone, on the coast of Africa.

BENZOÉ, in Botany. See Crotona.

BENZOE, See Labrus.

BENZOIN, Benjamin Gun, and Benzoic Acid, in Chemistry and Pharmacy.

The gum benzoine or benzoë, by some called also Aft Daluks, is a very fragrant resin, procured from a large tree found in many parts of the East Indies, Sumatra, Arabia, Peru, &c. See STYRAX Benzoe.

The resin is brought in large brittle masses of a light yellow, interpenetrated with white nodules, which last are confused as the finest, and called by some Benzoe Amygdaloides. The finefl of benzoë is extremely fragrant, especially when rubbed or heated: it has scarcely any taint, except previously diffused in spirit of wine, which it does with ease, into a yellowflint tincture. On adding water to this tincture, the resin again separates into a white pulvcrulent mass, which has received the singular name of Lac Virginale, and also Magistery of Benzoë. When gently dried, it forms a white powder, formerly in great request as a colimetic. It is at least innocent, and its fcent is one of the most agreeable. But the most striking ingredient of this resin is the

Benzoe
Benzoin Acid, which is of sufficient importance to require being described more at large. If benzoin is gently heated a little above the degree of boiling water, it melts into an adhesive mass, and at the same time sends out a very copious, dense, white fume, of an extremely fragrant, diffuse, penetrating smell, and so acid as irresistibly to excite coughing and tears in those who are in any degree exposed to it. This fume soon condenses on the first cool body, and then appears in the form of very beautiful needle-like crystals, which gradually collect into a bulky featherly mass, extremely light, and of remarkable elegance and lustre. This crystalline mass is the benzoinic acid, and its acid property is proved by redening litmus, neutralizing alkalies, and forming with them peculiar salts; in modern chemical nomenclature called Benzota. After the greater part of the acid has risen by sublimation, or before it, if the heat be at all increased, a thin yellowish oil rises slightly empyreumatic, but strongly imbued with the fragrance of the resin. On further heating, an acidulous liquor comes over, together with a thick butyrous matter; still, however, containing some of the crystallizable acid, which is not totally expelled till the end of the process.

This acid is readily soluble in alcohol, and in hot water, but so sparingly in cold water, that a hot saturated solution will deposit in crystals almost its saline contents by cooling.

Several methods have been devised for obtaining the benzoic acid. The old and most expedients is by simple sublimation. To perform any quantities of it, put benzoin in an earthen pipkin; apply to the vessel a large cone of clean white paper, patted down to the edges of the pot, and let it over an extremely low charcoal, or other fire, until sufficient to melt the benzoin. The acid will rise and crystallize upon the inside of the paper cone. However, as in this method the vapour has hardly room to condense, instead of the paper cone, another vessel inverted over that which contains the resin, and with a small hole drilled through its bottom, may be sublimated; and when full, it may be gently shaken, to detach the acid, and again applied. From nine to twelve dracontams may be thus obtained from sixteen ounces of benzoin. The remaining resin is still very aromatic, and should not be lost.

Another method has been recommended by Scheele, who in his excellent practical observations upon this acid, has treated it with that precision and ingenuity which so eminently distinguish this chemist in every subject, of greater or less importance and difficulty, which he has illustrated by his labours. He observes, that besides sublimation, the acid may be extracted by lixiviation, and with the advantage of obtaining it free from any admixture of oil, which is apt to impair its whiteness and lustre. If benzoin is boiled with water, and the solution strained while hot, and suffered to cool, most of the acid taken up by the hot water deposits when cold, and may then be collected pure. This method, however, is imperfect; for as the water does not mix with and divide the gum, this latex is very thin, and leaves down, closely adhering to the bottom of the vessel, and does not allow of the water easily to penetrate it. Hence the solution takes place only at the surface of the benzoin.

The same chemist boiled powdered chalk and benzoin in water, and filtrated the liquor. No crystals were now deposited on cooling, for the acid had dissolved part of the chalk into a benzoin of lime, which, being very soluble, remained in the liquor. But on adding some drops of vitriolic acid, the benzoic acid was again separated from the lime, and fell to the bottom in a powdery form. Substituting alkali for the chalk, the same effect took place, and the benzoic acid, as before, was precipitated by the vitriolic. But this method was still attended with the inconvenience of the benzoin concret ing together, which floated on the surface during the boiling. But on substituting quick lime this inconvenience was avoided; and it is therefore in the following method that the benzoic acid may be procured the most copiously and the purest. Upon four ounces of unflaked lime pour twelve ounces of water, and after the ebullition is over, add six pounds more of water; then put a pound of benzoin, finely powdered, into a tin pan; pour on it at first about six ounces of the above lime water; mix them well together, and then successively the rest of the lime water. By this method the resin will be prevented from running together into one mass. Boil the mixture for half an hour, with constant stirring, then let it stand, and pour off the clear liquor. On the remainder in the pan, pour more lime water, and proceed as before, adding the clear liquor to that first obtained, and also filtering the residue, to exhaust the liquor, which is now a weak solution of benzoic acid, with the lime of the lime water. Boil down this liquor (which is of a light yellow) to two pounds, and strain. When cold, add to the liquor muriatic acid gradually, and it will produce a white crystalline deposition, and continue to add the acid till the liquor is supersaturated, and taffes again. The stronger acid thus unites with the lime, and the benzoic acid, now free, being of itself fearfully soluble in cold water, falls down as a white coagulum, which should be washed with more cold water, and gently dried. To give it a crystalline appearance, diffuse it in boiling water, filter it through a cloth, and by cooling it will separate in the form of pinnacel crystals, but with some loss of the acid.

The above process of Scheele's may however be a little shortened, if the lime in sublimation be mixed with the lime water, previous to the addition of the benzoin; for by this method the solution may be at once made more concentrated, and less of the liquid will suffice, so that much of the evaporation will be saved. Any of the stronger acids will displace the benzoin from lime, but the muriatic is the most convenient.

Scheele obtained from 12 to 14 dracontams of the concrete acid from a pound of benzoin by this process.

The benzoic acid, when pure, is quite white; for if yellow, it is mixed with a small portion of the oil of the resin. Though crystallized, it is considerably clastic, and difficult to be reduced to powder. Its taste is sharp, pungent, and acidulous. It reddens tincture of litmus. When cold, it is without smell, but on applying heat it sends forth the peculiar, grateful odour by which it is characterized. Heated by itself, it chiefly sublimes, but a part is decomposed, giving an acid pulem, much oil, and carbonated hydrogen gas. It is not alterable in the air, and does not evaporate by keeping in a moderate temperature. Cold water dissolves only about 1/8 of its weight, but boiling water 1/1, and hence the copious crystallization from a hot water solution. It unites readily to most of the alkalies and earths forming benzoates, the properties of which have been but little examined.

The benzoin of lime is almost the only salt of this kind found native. It is contained in the urine of some animals, particularly the herbivorous quadrupeds, and is exacerbated by adding to this secretion some muriatic acid, by which the benzoic acid is made perceptible.

With potash, this acid forms a readily crystallizable salt, decomposable, like the rest of the benzoates, by a strong acid.

Moll of the metallic oxys are dissolved by this acid, but not the pure metals.

Mr. Hermblattt, in a series of experiments on the action of nitrous acid on the benzoic, found that the latter regularly assumed in the processe a smell like that of water distilled over th...
bitter almonds, but on the whole, this acid is but with difficulty altered in its nature by the nitrous. Distilling the nitro-benzoic acid with pure alcohol, he obtained ethereal liquor, part of which was nitrous ether, but the remainder appeared, by the smell of almonds, to be a dulcified, or ethereal benzoic acid. But these experiments require to be repeated with accuracy, as the powerful operation of the nitric acid on vegetable matter, though highly instructive, is often not a little embarrassing.

Several other substances, besides the resin of benzoin, contain more or less of this acid. The balsam of Peru, and of Styrax, appear to owe to this acid much of their fragrant smell. Ambergris, vanilla, and some of the aromatic barks, and even urine, contain a small quantity of it. When combined with an alkaline or earthy base, it is generally known by a pungent fragrant smell, and dense white smoke; on applying a heatless than is necessary to burn or decompose the substance with which it is united. When kept down by an alkaline or an earth (as in the case of urine), it is separated by a strong acid. It has been supposed, with probability, that the fragrant scent is not proper to the acid, but is owing to the presence of a portion of resin or efflent oil, combined with it so intimately as to be inseparable by any means hitherto known, without entire decompositions of the acid; and hence too may be explained the very weak affinity of this acid for all bases, which is generally superior to no acid but the carbonic.

Gum benzoin is almost diffused in medicine, though still retained in a few preparations of the London and Edinburgh pharmacopoeias. The compound tincture Tinctoria Benzois Composita, formerly Balsamum Traumaticum, contains gum benzoins, balsam of Tolu, and aloes; and the benzoic acid enters into the Edinburgh Tinctoria Opii Ammoniata, and in some other compounds of foreign diffuseness.

The fragrance of this resin has caused it to be used in fumigations of various kinds. Where the object is merely to produce a penetrating agreeable scent, it may be of considerable use; but as a corrective of foul or contagious air, its powers are very small, by no means comparable to those of the mineral acid vapours, while the irritation which it gives to the lungs is more intolerable. Scheeler's Effays. Fourcour. Hermbaldt in J. Phys. tom. 34, &c.

BEOLIPA GULF, in Geography, lies on the east side of the fruit of Dardanellas, near the opening into the sea of Marmora.

BEORI ANIMAL (Loai. Aneri), in Zoology, the Tapir Americanus of Gmelin, &c.

BEOSTER ISLAND, in Geography, one of the Shetland islands, between which and Green island, at the north end of Briffa, or Brasy found, is a good channel, that runs out into the sea.

BEOTIA, CAPE, lies within the island of Negropont, to the north of Corinth, on the north side of the peninsula, stretching south-east from Corinth.

BEQUIA, a small island of the West Indies, dependent on the government of St. Vincent, and containing 3,700 acres. It is chiefly valuable from the commodiousness of its fine harbour, called "Admiralty bay."

BER, a district of Swifterland, in the government of Ellen and canton of Bern, comprehending two parochial villages. See BERICE.

BERABZAN, a long lake in New North Wales, lying N. and S. and running gradually from its north end, till it mixes with the waters of Schecharas lake, at the south end, and where these waters form Seal river, which empties into Hudson's bay, at Churchill fort. The north end of Berabzan lies in about 60° 30' N. lat. and 93° 50' W. long.

BEREA, in Ancient Geography. See BERGA.

BERAMS, in Commerce, a coarse cloth made altogether of cotton thread, which is brought from the East Indies, and particularly from Surat.

BERAMUN, in Geography, a town of Egypt, on the Nile; 3 miles north east of Manhora.

BERARDI, ANGELO, in Biography, an Italian writer on music, who published at Bologna a considerable number of musical tracts, between the years 1681 and 1693, which, with a large portion of pedantry and common-place information, contain much curious and useful knowledge. Their titles are: "Ragionamenti Musica, Musical Dittartions," "Documenti Armonici, Harmonical Documents," "Missellaneous Musical," "Orcani Musiical," "Dialogo," and the "Perche Musica, Musical Definitions." If the whole had been compressed, methodised, and digested into a single treatise, and all the musical information dispersed through these several tracts arranged in a regular and gradual order, a more useful and practical didactic work might have been produced, than Italy seems to have afforded during the 17th century.

BERAR, in Geography, a footpath, or kingdom of Hindostan, bounded on the north by Allahabad and Malwa; on the west by Candiell and Amednagar; on the south by Tellingana and Golconda; and on the east by Orilla. It contains 13 circuses, divided into 42 sub-circuses. The western parts of this province were reduced by Achar; and its revenue under Aurungzebe, as stated by Mr. Fraer, in his "Life of Nadir Shah," amounted to 153 lacs of ruppes. The principal part of this province is possessed by the Berar or Nagpaur rajah; and the remainder is held by the Nizam, or feubah of the Deccan, who pays to the rajah a "chout," or fourth part of its clear revenues. The interior parts of Berar are less known than most other countries in Hindostan; but it is thought to be neither populous nor rich. Its present capital is Nagpaur, about midway between Bengal and Bombay. This province produces wheat, rice, poppies, and many sorts of legumes. In the southern part is found the deer, which yields the Bezer or honey; and the sheep of this province differ from the common species, their neck being lengthened, their tail very short, their ears long, and their wool not curled.

BERAS TEGUE, a mountain of Spain, in the province of Guipuzcoa, 3 leagues from Tolosa.

BERAULT, NICHOLAS, in Latin Beraldus, in Biography, one of the learned men of the sixteenth century, was either a native of Orleans, or for a long time resident in that place, where he was professor of the civil law. He was tutor to admiral de Coligny; and well acquainted with Erasmus, who, in his "Ciceronianus," speaks with commendation of his easy and flowing elocution, and who, in 1522, dedicated to him his treatise, "De Coniecturis Epistolarum." Among the Latin works of Berauld, were "A Graeco-Latin Dictionary," Paris, 1521; an "Oration on the Peace of Cambry," Paris, 1528; another "On ancient and modern jurisprudence," Lyons, 1533; and "A Dialogue on the faculty of speaking extemore," Lyons, 1534. He also wrote paraphrases on the Politics and Economics of Aristotle, and notes on the Rutilus of Politian. His comments on the Natural History of Pliny, though not mentioned by Hardoun, are much commended by Erasmus. He was esteemed for his integrity, and greatly regarded by Poncher, archbishop of Sens, a prelate distinguished in France by his patronage of literature.

BERAUN, in Geography, a royal borough of Bohemia, in a circle of the same name. The chief produce of the circle is wood and corn, and in some parts are found mines of iron.
B E R

iron. The town is seated on the river Mics or Miza; 14 miles S.W. of Prague. N. lat. 50° 2'. E. long. 14° 25'.
BEREZ, a river of European Turkey, which runs into the Birlet, near Tacevtsi, in the province of Moldavia.
BEREGAL, a town of Spain, in Aragon, 3 leagues from Balbafiro.

BERERES. See Breses.

BERERINA, in Entomology, a species of Tipula, with footy, incumbeat wings, having the base, and marginal spot white. Schreber. This insect has the thorax and abdomen red; it feeds on the barberry, and forms small frumentous excrecences on the branches.

BERERINA, in Natural History, a species of Vorticella, of a filamentous form, with a branched rigid stem, and white granulations. Gmelin. This is Vorticella capitis, floribus ovalibus mutis, thirpe ramosa, of Linn. Synth. Nat. edit. 12. It is also Brachionus berberiformis, of Pallas; and Pseudopolyopus herfornis, of Ræzel. Found in fresh water in Europe; usually in clutters.

Eff. Char. Cal. six-leafed: pet. six, with two glands at the claws; style none; berry two-seeded.

Dry. Peduncles racemcd, spina, triple. A thrub rigid to the height of 8 or 10 feet; with thorns upright and branched, smooth and slightly grooved, brittle, with a large white pith, and covered with a whitish or ash-coloured bark, yellow on the inside: stems and branches are armed with thorn thorns, commonly growing by threes; first leaves ovate, ferrate, ciliate, not jointed; stem-leaves alternate; secondary leaves in pairs, oblong and ferrate, with smaller leaves concealed between the lowermost leaves and the thorns: flowers towards the ends of the branches in pendulous racemes, with a bracte to each pedicel; corolla yellow, petals frequently ferrate about the edge, and at the base of each are two orange-coloured dots, which are probably the stigmas: anthers roundish, yellow; stigma, greenish: berries at first green, and when ripe, changing to a fine red colour; seeds, two, rarely three, fastened at bottom to a minute tumbere, oblong, smooth, of a pale tesselated colour, and hard; the seed-lobes of an elliptic form. A native of the eastern countries, and now of most parts of Europe in woods, coppices, and hedges; in England, chiefly in a chalky soil, as particularly about Saxton-Walchen in Eiffe. The flowers appear in May and June, and the fruit ripens in September.

Miller mentions three varieties of this thrub, viz. B. fine nucleo; B. fine nucleo; B. or without thorn, occasioned by the age of the plant; B. with white fruit, having leaves of a lighter green colour, and the bark whiter than the common thrub; and B. orientalis proceror fructu nigro lividillino,

Tournef. cor. differing only in the colour and flavour of the fruit. He makes the Canada barberry a distinct species, and says, that the leaves are much broader and shorter than those of the common fort, and that the fruit is black when ripe. It has been long ago observed by Linneaus, that when bees in search of honey touch the filaments of this thrub, the anthers approximate to the stigmas, and explode the pollen. This irritability is so remarkable, that if the filaments are touched near the base with the point of a pin, a sudden contraction is produced, and this may be repeated several times. Dr. Smith, who has made this property the subject of particular examination, observes (See Phil. Trans. vol. XXVII. p. 158.) that neither the outside of the filaments, nor the anther has any irritability; and that the spring of the stigmas is owing to a high degree of irritability in the side of the filament next the germ, by which, when touched, it contracts, that side becoming shorter than the other, and consequently the filament being bent towards the germ. After irritation, the stigmas will return to their original place, and on being again touched, they will contract as easily as before. The purpose which this curious contrivance of nature is designed to answer is evident. When the flamen stand in their original position, their anthers are effectually sheltered from rain by the concavity of the petals. Thus they probably remain till some infect, in order to extract honey from the base of the flower, thrusts itself between their filaments, and almost unavoidably touches them in the most irritable part; and as it is chiefly in fine sunny weather that infects are on the wing, the pollen is also in fine weather most fit for the purpose of impregnation. Another peculiarity ascribed to this thrub is, that ears of corn growing near it constantly prove abortive, and that it extends this ferile influence over the distance of 3 or 400 hundred yards across a field. Dhalen long since looked upon the mildewing power of barberry as totally void of foundation, and M. Broussonet affurred Dr. Smith, from his own observations, that the opinion, though very prevalent, was altogether groundless. Young's Annals. vol. vii. p. 188. Eng. Bot. p. 49. Withering's Bot. Arrang. vol. ii. p. 351.

The leaves of barberry are gratefully acid; the flowers are offensive to the smell when near; but at a proper distance their colour is extremely agreeable. The berries are so acid that birds will not eat them. The barberry, however, is cultivated for the sake of its thorns, which are pickled and used for garnishing dishes; and being boiled with sugar, they form an agreeable soup or jelly; they are used also as a dry sweet-meat, and in sugarpuds or comfits. They are moderately refringent, and are said to be of great use in bilious fluxes, and in all cafes where heat, acidity, and putridity of the humours prevail. On the authority of Prosper Alpinus (Med. Egypt. l. iv. c. 1.) we are informed, that the Egyptians employ them in pestilential fevers and fluxes with great success; and Simon Pauli relates, that he was cured of a malignant fever, accompanied with a bilious diarrhoea, by using these berries according to the Egyptian practice; that is, macerating the fruit for a day and a night in twelve times its quantity of water; with the addition of a little fenue seed; and then straining and sweetening the liquor, and using it as a common drink. Dr. Woodville observes, (Med. Bot. vol. iv. p. 62.) that these berries are well calculated to allay heat and thirst, and to correct a putrid tendency in the fluids; but that in this respect they seem to possess no peculiar advantage over most of the other acid fruits; hence the colleges of London and Edinburgh have extinguished this fruit from the Materia Medica, and retained only that of the currant. The bark is said to be purgative, and Ray experienced its good effects taken
taken as a decoction in the jaundice. The roots boiled in lye dye wood yellow. In Holland they dye leather of a most beautiful yellow with the bark of the root: and the inner bark of the Idem, dyed ligne of a fine yellow, with the affinity of alum. Witheing, *Ad fupera*. Rine, sheep, and goats, are said to cat this rhumb, and hordes and swine to re-

**Propagated and Culture.** The common fort is generally propagated by cutters; but as the plants thus propagated yield poor cutters in greater abundance than those which are propagated by layers, the latter method should be preferred. The best time for laying down the branches is autumn, and the young shoots of the same year are the best; which will be well rooted by the next autumn, when they may be taken off and planted where they are to remain. When this plant is cultivated for its fruit, it should be planted single, or not in hedges; and the suckers taken away every autumn, and all the grofs shoots pruned out; by this method the fruit will be fairer and more abundant. A few of these shrubs will make an agreeable variety in wildernesses or plantations of shrubs; and the fruit will be food for birds; but they should not be planted in too great quantities, or near walks that are much frequented, because their flowers emit a very strong disagreeable odour. The Canada fort may be propaga-

**BERBIL, or Berghem, Nicholas, in Geography, a town of Africa, on the Ivory coast, N.E. of Cape Palmas. N. lat. 4° 30'. W. long. 5° 34'.**

**BERBICE, the seat of a colony of Guiana in South America, formerly belonging to the Dutch, on a river of the same name, about 25 leagues N. W. by W. 1/2 N. distant from Surinam, which runs from N. to S. and discharges itself into the Atlantic ocean. The coast on each side of the river forms a bay at its entrance, nearly a mile broad, in the middle of which is a small island, called "Crab island." Opposite to this island, on the calmer shore, is a fort, with several pieces of artillery, and some soldiers; but the channel on the other side, which is navigable for ships of any burden, is undefended, and covered by the island from the guns on the opposite shore. Without the entrance of the river is a bar, which, at high tide, has seldom more than 16 feet of water; but within the water is of sufficient depth, and the river is navigable for ships of burden 200 miles from its mouth.**
very high price. Berchem died in 1684. We have several
etchings by this master, that are executed in a fine, bold,
manly style; and from these John Fülcher seems to have
formed that admirable style in which he engraved the copies
from Berchem's pictures, Piilkington and Strutt.

BERCHEM, in Geography, a town of Brabant; 4 miles
S. W. of Raveleijn.

BERCHEN, or BERGEN, a town of Germany, in the
circle of Westphalia, and duchy of Juliers; 9 miles east of
Juliers.

BERCHERT, or BERCOFT, in Cameruns, a weight
used at Archangel, and in all the Russian dominions. It is
about 364 pounds English avoirdupois.

BERCHET, Peter, in Biography, an historical painter,
was born in France, in 1659, and placed, at the age of 15,
under the care of La Fosse. So that in 5 years he was qua
lified to be employed in the royal palaces. In 1684, he came
over to England, and worked under Rambour, a French
painter of architecture. Berchet painted the ceiling in the
capel of Trinity college, Oxford, the steeple at the
duke of Schomberg's house in London, and the hammer
house at Ranelagh. His drawings in the Academy were
much approved. 'Towards the close of life he only painted
small historical pieces, the subjects of which were taken from
fabulous history; and his last performance was a Bocchana
tian picture, to which he added his name the day before he
died, in the year 1721. He occasionally amused himself
with the point. Piilkington and Strutt.

BERCHEMING, in Geography, a small town of Germany, in
the bishopric of Eichlerts, or Alschfadt, seated on the river
Salz.

BERCHORIUS, Bercheur, Peter, in Biography,
a learned divine and voluminous writer of the 14th century,
was born at the village of St. Pierre du Chemin, 3 leagues
from Poitiers in France, and was constituted grammatical
preceptor to the novices of the Benedictine monastery at
Cluny, in the year 1340. He died prior of the Benedictine
convent of St. Dii in Paris, probably at an advanced age,
in the year 1362, as we learn from his epitaph in that mon
astery. Berchorius was one of those writers, who affected
to interpret allegorically, not only texts of Scripture, but
also poetical fables and profane histories, which they arbi
trarily applied to the explication or confirmation of the mys
teries of Christiinity. His three grand printed works are,
"Reductio Morale super totam Bibliam," in 26 books,
first printed Argentorat. 1475, fol. and containing all the
incidents and stories in the Bible, reduced into allegories:
"Repertorium, or Reductio Morale," in 14 books,
which is a dictionary of things, persons, and places, all which
are supposed to be mythical, and are therefore explained in
their moral and practical sense; and "Dictionarium Mor
mire," in two parts, and seeming to be principally designed
as a moral repertory for students in theology. These pieces
were all printed at a very early period; and a folio edition
of them was printed, in 3 volumes, at Venice, in 1573.
Berchorius was also the author of a comment on a profosy,
called "Doctrinale Metricum," which was used as a school
book in France. Gellius, in his "Philologia Sacra," writ
ten about the year 1623, and of which a third edition was
printed at Francof. and Hamb. in 1653, subscribes to this
author the famous work entitled "Gella Romanorum," the
writer of which has for a long time remained unknown to
the most diligent enquirers into Gothic literature. The
learned Mr. Thomas Warton concurs in this opinion, and
thinks it amply confirmed by the general coincidence of the
plan, manner, method, and execution between the "Gella
Romanorum," and the three works of Berchorius above
mentioned. He supposes it was written about the year 1340,
with a view of rendering the exercises of his scholars, in the
monastery at Cluny, in Latin, more agreeable and easy,
by means of an entertaining Latin story-book, capable
of being readily applied to fictions of religion. This piece
operated powerfully on the general body of our old poetry,
and afforded a variety of inventions, not only to Chaucer,
Gower, and Lydgate, but to their diligent successors.
It was first printed in the Gothic letter without date, and as it
was suppos'd, before or about the year 1473, in folio; and con
tains 152 chapters. The second edition was printed in the
same or following year at Louvain, in 4to, and contains 181
chapters. Another edition was printed in folio, in 1498.
At the commencement of typography in England, a transla
tion of it in English was printed by Wynken de Worde,
and it was afterwards frequently reprinted. This work is
compiled from the obsoleto Latin chronicles of the later
Roman, or rather German story, heightened by romantic
inventions, from legends of the saints, oriental apologues,
and many of the shorter fictitious narratives, which came
into Europe with the Arabian literature, and were familiar
in the ages of ignorance and imagination. The clasifes are
sometimes cited for authorities; but these are of the lower
order, such as Valerius Maximus, Macrobius, Aulus Cel
lius, Seneca, Pliny, and Boethius. To every tale is sub
joined a moralisation, reducing it into a Christian or moral

BERCHTOLDSDORF, or PETERSDORF, in Geogra
phy, a town of Germany, in the archduchy of Austria, 6
miles south-west of Vienna.

BERCHTOLSGADEN, or BARTOLSGADEN, a pro
villfhip and principality of Germany, in the circle of Bava
ria, environed by the archbishopric of Salzburg, but exempt
from the jurisdiction of that see. It is wholly mountainous,
and contains two towns and a few villages, and also several
lakes. At Bergtolfgaden, as well as at Hallein, in the prin
cipality of Salzburg, salt is found in its fossil state. In
order to obtain it, large cavities, or chambers, are dug in
the mines, and filled with fresh water. Some of these are
so large that the water must stand in them during two years
before it is sufficiently impregnated with salt; in others, this
process does not require more than a few weeks. When the
water is saturated, it is carried through the mountain by
pipes into a reservoir, whence it is conveyed to the ca
draems. Of these there are four at Hallein, and two at Ber
tolfgaden, which are not above four leagues distant from
each other. The salt annually made at the former of these
places, amounts to 400,000 quintals, and at the latter to
160,000. Count Ranzomowski supposes (Hist. et. Mem. de
la Société des Sciences Physiques de Lautanne, vol. iii. for
1787 and 1788), that the mines at Hallein, and those at Ber
tolfgaden, are parts of the same mine of salt, which, in his
opinion, is a continuation of that at Gunzd in Austria,
about 8 leagues from Hallein; and the irregularity of the
strata seems to indicate that the connexion between the two
mines must have been broken by some violent convulsion.

BERCKEN, a town of Holland, 5 miles east of Delft.
-Allo, a river of Germany, which rises in the bishopric
of Monfort, and runs into the IJssel at Zutphen.

BERCKENBROECK, a town of Holland, 6 miles
north of Rotterdam.

BERD, a river of Siberia, which runs into the Oby,
near Omski.

BERDA, in Ichthyology, a species of Sphyru, that inha
bits the Red sea. It is of a whithch grey; lateral scales are
on the side with a single transverse brown band; dorsal
spines recurved. Fori. Fu. Arab. The body of this fish is
oval: back gibbous, with pale bands; beneath white;
scales broad, rounded, entire. The crown is naked, convex, fleshy, iridescent white; molaris large, linear, with a conic cingulum; four long, conical, incisive teeth; grinders numerous, hemispherical, those behind largest; upper lip long, protuberant; gill-covers entire; lateral line nearly booklet; fins brown, pectoral ones transparent and lanceolate; tail two-lobed. Gmelin.

BERDA, Cape, or BERDISKAYA, in Geography, the east point of a large bay of the sea of Azoph; cape Wirasonova, or Besarabonova, being the west point. Several rivers empty themselves into this bay. N. lat. 46° 42'. E. long. 56° 24'.

BERDAA, a town of Asia, in Armenia, 160 miles east of Erivan.

BERDANIEH, a town of Asiatic Turkey, in the province of Caramania; 32 miles north of Alaham.

BERDASCHIR. See BARSIR.

BERDASH, in Antiquity, was a name formerly used in England for a certain kind of neck-dress; and hence a person who made or sold such neckcloths was called a berdasher, from which is derived our word hawdasher.

BERDICHOW, in Geography, a decayed town of Poland, in the palatinate of Volhynia, 148 miles E.S.E. of Luchko, and 324 S.W. of Warsaw.

BERDIN, or BERLIN, in Conciliobulum, the name by which the limpet, or pan-shells, patella of Linn. is known on the coast of Normandy. It is also called in some places bernacle, or barnacle.

BERDOA, in Geography, a province of Africa, in the eastern division of the great desert or Sahara, constituting one of the Oases or fertile islands, which forms a part of that extensive desert that separates Egypt from Fezzan, and contains the wandering tribe of Lebata or Levata. It is situated to the north-east of Agdez, and has Kuar or Kawar to the south and east, to the north Angula, and the desert of Barca, and to the west Fezzan. It extends northward from N. lat. 25°, and lies between 20° and 25° E. long.; but its exact boundaries are not ascertained. Berdoa, its capital, lies north of the mountains of Tibefti; and, according to Rennell's map, is placed in N. lat. 26° 32'. E. long. 21° 35'.

BERKALSTON, though only a small inconvenient hamlet, in the parish of Berco-Ferris, Devonshire, has the privilege of returning two members to the English parliament. The right of election is vested in those persons who possess land in the borough, and pay three-pence acknowledgment to the lord of the manor, who varies the number of electors, according to his estimate of the number of burgage tenants. The first return of members for this borough was in the 27th of Elizabeth. In the vicinity of this place are several lead mines; but none of them produce much ore, though in the time of Edward I. they were not only very rich in this metal, but yielded a great quantity of silver. It is said that 1600 weight of the latter was obtained in the course of three years.

BERECYNTHUS, in Entomology, a species of Papilio, with entire wings, black above, with a yellow marginal band; six occellar spots on the underside of the posterior pair. Fabricius. This is papilio bercynthia of Cramer, is of a large size, and inhabits Surinam.

BERECYNTHIA REGIA, a country of Asia, towards the river Sangar. Steph. Byz.

BERECYNTHIUS TRADUS, a canton of Asia Minor, in Caria. Pliny.

BERECYNTHUS, a mountain of Asia Minor, in Phrygia, consecrated to the mother of the gods.

BERECZINA, in Geography, a river of Lithuania, which rises in the palatinate of Vilna, and runs into the Niemen, 16 miles north-east of Novogrodsk.

BEREFORD, a trading place and port of the island of Iceland.

BERegra, or Bereta, in Ancient Geography, a town of Italy, in Picenum, at a small distance north from Internam.

BEREGSZAZ, in Geography, a town of Hungary, 24 miles north of Zatmar. It gives name to a county, and derives its appellation from a Saxon colony established there; but its present inhabitants are Hungarians.

BEREIA, a town of Africa, north of Sierra Leone, at a small distance from the coast. N. lat. 8° 58'. W. long. 12° 25'.

BEREILLY, or Bareilly, a city of Hindostan; is the capital of Rohilkund, which was added to the dominions of Oude in 1774. It lies about half way between Lucknow and Delhi. N. lat. 28° 27'. E. long. 79° 45'. See BAREILLY.

BERELOS, a lake of Egypt, between Damietta and Rosetta; about 32 miles long and ten broad in the middle, but gradually contracting towards each end. It has within it several islands. Also, town of Egypt, 30 miles west of Damietta.

BEREN, an island of Asia, 40 leagues west from Corvo island in the gulf of Daffora.

BEREN, or Bieron, a town of Silefia, in the province of Ratibor; 34 miles east of Ratibor.

BERENBOURG, called also Joan Main island, an island in the north seas, near the coast of East or Old Greenland. N. lat. 71° 10'. W. long. 9° 19'.

BERENGARIA, in Ecclesiastical History, a religious sect, adhering to the opinions of Bernegarius, who, in the latter part of the eleventh century, a considerable time before Luther, opposed the doctrine of transubstantiation, and the real presence, strenuously maintained by Lanfranc and Anselm. See BERENGAR.

He is further charged by the Romanists with deceiving marriage, and maintaining the common use of all sorts of women, and affecting baptism of no effect.

His followers were divided on the head of the eucharisit: though they all agreed, that the bread and wine were not essentially changed, yet some allowed, that the body and blood of Christ were contained in them, though concealed under an impanation; others denied any change at all, and resolved the whole into figure; others again allowed a change in part; and others an entire change, with this re-"
prodigious number for the time, when the prejudice against handling or disturbing the dead was so strong. To that circumstance, aided by his known antipathy to the Spaniards, perhaps may be attributed the history of his having dissected two of the natives of that country alive, with the view of seeing the motion of the bowels, and of his being on that account obliged to fly his country. A similar history had been told of Herophilus, and was afterwards told of Vefalus. That this, however, had been done by some anatomists, or that he was accused of it, seems probable by his speaking of such a practice in his commentary on the works of Mundinus, with dignity and horror. He is with more reason said to have offended the ministers of religion by the levity and indecency of his observations on the subject of his dissections, and by the prodigality of his life; and on that account to have been obliged to quit Bononia.

By his numerous dissections, he was enabled to correct many erroneous opinions as to the structure of the interior parts of the body, which prevailed to his time, and thence to pave the way for the further improvements made by Vesalius, his immediate successor. If he was not the inventor, as Douglas calls him, he was one of the first who used mercurial friction in curing the venereal disease, by which he is said to have acquired a large fortune, which he left at his death, to the duke of Ferrara, to whose territory he retired, and where he died, about the year 1572. His works are, "Commentaria, cum amplissimis additionibus, supra anatomiam Mundinii, cum textu ejus in prenthinum notore reddito," Bononia, 1521, 4to, containing, besides numerous corrections of Mundinus, a prodigious number of anatomical facts, which bear abundant testimony to his diligence and ingenuity. "Ea omnia narrata, quae recte videt (Haller says), infinitum fori;" and further on, "Invenio apud hunc virum, tellimonium irrefragabile pro antiquo more, quorum cardinales tectis pontificis, nuper elecdi, contradictum." There are several rude engravings of the muscles of the abdomen, and of other parts, in this volume. "Izagro breves, perlucidæ et uberrime in anatomiam humanæ corporis ad usum scholasticorum praeces ad lucem editæ," Bononia, 1522, 4to. Also with plates. Both these works have passed through numerous editions. In 1664, it was published in London, with the title, "A Description of the Body of Man, being a Practical Anatomy." He also published, in 1518, 4to. Venet. "De Crani Fractura." Douglas. Bib. Anat. Hæl. B. 10. Chirurg. Berenger, Berengerius, an eminent logician and controversialist, was a native of Tours in the eleventh century, and having studied under Fulbert at Chartres, he returned to Tours, where he was made principal of the school of St. Martin, and treasurer of the church. From Tours he removed to Angers, and became archdeacon of that city. Distinguished by his acutest and subtlety genius, by his extensive learning, and by his peculiar talents for controversy, as well as by the exemplary sanctity of his life and manners, he was held in very high estimation. At length, however, he found reason to deviate from the doctrines of the church concerning the eucharist; and in 1045, he began to maintain publicly the doctrine of Scotus, in opposition to the opinions of Radbert; and he perilled in teaching that the bread and wine were not changed into the body and blood of Christ in the eucharist, but preferred their natural and essential qualities, and were merely figures and external symbols of the body and blood of our Saviour. Although the church of Rome had not, in this century, adopted any settled and decided opinion concerning the nature and manner of Christ's presence in the eucharist, the doctrine of Berenger was not only opposed by several doctors in France and Ger-

many, but attacked with peculiar vehemence and fury by the Roman pontiff Leo IX. who, in 1050, convened two councils, one at Rome, and the other at Verceil, in which it was solemnly condemned; and the book of Scotus, from which it was deduced, was committed to the flames. The council of Paris, summoned in the same year by Henry I., concurred in its condemnation, and denounced Berenger, and his numerous adherents, with all sorts of evils, both spiritual and temporal. The heresiacli was depraved by Henry of all his revenues; but he continued for some time afterwards firm and resolute in his adherence to the doctrine he had embraced, and enjoyed un molested tranquility. The prevalence of his doctrine, notwithstanding the opposition with which it encountered from the writings of its antagonists, and particularly from those of Ansfelm and Lanfranc, archbishops of Canterbury, alarmed the church; and two councils were summoned by Victor II. at Tours, in 1054, to examine this dangerous doctrine. In one of these councils, Hildebrand, afterwards pope Gregory VII., appeared as the pope's legate, and took the lead in opposing this new heresy. Berenger, who was present, was at length overpowered by threats, and not only abandoned his opinions, but solemnly abjured them, and made his peace with the church. This abjuration, however, was only an act of timidity and dissimulation; for he soon after taught the opinions he had formerly professed, though the dread of danger rendered him more circumspect and cautious. As soon as Berenger's perjury was announced to Nicholas II., the exasperated pontiff summoned him to Rome in 1058, and in a council held there the following year, he was so terrified, that he declared his readiness to embrace and adhere to the doctrines which that venerable assembly should think proper to enjoin. Accordingly, Humbert was employed by the pope and council to draw up a confession of faith, which Berenger publicly signed; and to which, by a solemn oath, he avowed his adherence. As soon as Berenger returned to France, and found himself countenanced and protected by his ancient patrons, he expressed his detestation of the doctrines which he had been obliged to profess at Rome, abjured them solemnly both in his discourses and writings, and zealously inculcated his former opinion. Pope Alexander II. attempted by soothing and friendly expostulations to regain the apostate; but his remonstrances were ineffectual; the controversy was prolonged for many years, and the followers of Berenger continually increased. As soon as Hildebrand was advanced to the papal chair, he undertook to terminate the controversy; and with this view required Berenger, in 1078, a repair to Rome. Towards the conclusion of this year, a council was held in this city, and Berenger was permitted to draw up a new confession of his faith, and to renounce that which had been composed by Humbert, and approved by Nicholas II. and a Roman council. On this occasion the perfecuted prelate made a declaration, confirmed by an oath, that he would for the future adhere to the following proposition: viz., "that the bread laid on the altar became, after consecration, the true body of Christ, which was born of the Virgin, suffered on the cross, and now sits at the right hand of the father; and that the wine placed upon the altar became, after consecration, the true blood which flowed from the side of Christ." This declaration satisfied the pontiff, but was thought by the enemies of Berenger to be too vague and equivocal. Gregory yielded to their clamours; and at a council held at Rome, in 1079, a new confession of faith was drawn up, to which Berenger, after reading and subscribing it, declared his assent by a solemn oath. This confession expressed his belief, "that the bread and wine were, by the mysterious influence of the holy prayer,
prayer, and the words of our redeemer, substantially changed into the true, proper, and vivifying body and blood of Jesus Christ;" and this was followed by a solemn declaration, "that the bread and wine, after consecration, were converted into the real body and blood of Christ, not only in quality of external signs and sacramental representations, but in their essential properties, and in fact, as reality." Gregory diffam'd him with some most honourable testimonies of his friendship and liberality, and he returned to his own country. But Berenger, not conceiving himself bound by this declaration, publicly refuted the sentiments which he had falsely advanced at Rome, and even composed an elaborate refutation of the doctrine to which he had been compelled to profess his affiet. Gregory, who seems not to have approved the last concession imposed upon Berenger, when appealed to, declined interfering, and took no measures for moulding him. From this time, Berenger observed a profound silence amidst the clamours of his incendiary adversaries, and made no reply to their bitter and repeated invective.

At length, decaying with age, overpowered by the opposition with which he had ineffectually struggled, and probably depressed with the reproaches of his own mind for the philan- lomous and dillihent part he had acted, he abandoned all his worldly concerns, and retired to the site of St. Cofme, in the neighbourhood of Tours, where, in a course of penitentiary and pious exercises, he passed the short remainder of his life; and in 1088, he was released by death. On the minds of the people, he left behind him a deep impression of his extraordinary sanctity; and an annual service is still performed for him in the church of St. Martin at Tours. His unsteady conduct was unexceptionably very disgraceful to himself; and there was reason to believe that it embittered the reflections of his retirement and closing scene. It is therefore a question of little importance, whether he abandoned his original opinion before his death, as the Roman cathoile writers maintain, or whether he adhered to it in the last period of his life, as the protestants, with greater probability, have asserted. All his works, which were numerous, have been lost; except two letters, his three prolixions of faith, and part of his treatise against one of them. Cave's Hist. Lit. tom. ii. p. 130. Molin's Eccl. Hist. vol. ii. p. 559, &c.

BERENCE, or BERENCE, a Jewish queen, the daughter of Agrippa the elder, and sister of Agrippa the younger, kings of Judæa. She was born about the year of Christ 28, and at the age of 16 married her uncle Herod, king of Chalæs. After her husband's death, A.D. 45, she was suspected of having criminal intercourse with her brother Agrippa; and in order to remove suspicions, and to silence rumours of this kind, she confined to marry Polumen, king of Pontus and part of Cilicia, on condition of his embracing Judaism. She dwelt with him, however, but a little while, and returned to her brother, with whom she lived on terms of intimacy, which subjected her to reproach. Juvenal refers to this incestuous connexion (sat. vi. v. 155):—

"Deinde Adamina notissimis, et Berenices
In digito factus preistrior; hunc dedit olum
Barbarus; inciit dicet hunc Agrippa foroni."

When Agrippa heard the discourse of St. Paul before Felix at Caeræa of Palestine, Berenece was present with him. After the commencement of the Jewish war in 67, when Agrippa was driven from Jerusalem by the sedition of the people, she remained for some time after him, and interceded for the Jews with the Roman governor Marcus, by whom she was treated with great disrespect. She afterwards accompanied Agrippa to the army of Vespasian in Syria; and contrived, by costly presents, to engage the good will of that avaricious emperor as long as he lived. Her beauty and ad-
dress had also captivated Titus; and on the death of Vespas- fian he followed him to Rome. The emperor was much attached to her, and dispensed to make her his queen; but in deference to the sentiments of the Roman people, who dis- liked the idea of a foreign queen, and who well knew that her character was not irreproachable, he dismissed her, and sent her away to her own country. What became of her afterwards history does not inform us. Jof. Antiq. i. xix. xx. De Bell. Jud. li. ii. Tacit. Hist. i. ii. Crevier. Gen. Dict.

BERENCE, was likewise the name of several Egyptian and eastern queens. One of them, the wife of Polemy Eurjetes, king of Egypt, under an apprehension of the danger to which he would be exposed in his expedition to Syria, made a vow to consecrate her hair, which was her chief ornament, in case of her safe return. When the prince returned, not only in safety, but crowned with glory and success, she immediately cut off her hair, and dedicated it to the gods in the temple which Polemy Philadelphus had built in honour of his beloved Arsinoë, under the name of the Zephyrian Venus, on the promontory of Zephyrium in Cy- prus; but this hair being lost by the negligence of the priests, Polemy was enraged, and threatened to punish them. Upon which Conon of Samos, a flattering courtier, as well as skilful mathematician, with a view to appease the king's anger, and to conciliate his favour, affirmed, that the queen's locks had been conveyed to heaven, and pointed out seven stars near the tail of the lion, which till that time had not belonged to any constellation, declaring that they were the queen's hair. Several other astronomers confirmed the affirmation of Conon; and hence "Coma Berenices," or Berenice's hair, became one of the constellations.

Callimachus, who lived at that time, and had been a great favourite of Philadelphus, wrote a hymn on the hair of Be- renice, which was afterwards translated by Catullus, whose version is extant among his other performances. Berenice, according to Plutarch (In Quæst. Græcæ) and Stephanus By- zantinus (verb. Byzæn), was formed from Φιλαδέλφη, a bearer of victory, by the Macedonians, who exchanged Ph into B.

BERENCES, in Antiquity, the name under which Cramer figures papilio crispus of Fabricius and Gmelin.

BERENICE, in Ancient Geography, the name of several cities, of which Octavius reckons nine. The principal are as follows: viz. a town of Thrace,—another of Asia Minor in Cilicia,—another of Asia, called Pella in Caer-Syria; all three mentioned by Stephanus Byzantinus; — another of Africa in Cyrenna, near the mouth of the river La- thon, or Lethon, where it discharges itself into the bay of Syris, anciently called Hesperis, and Hesperides, now Be- renice: near this town was situated the garden of Hesperides, and a wood which marks its position, in a country defiilute of trees;—another, a maritime town of Arabia Petraea, situated at the extremity of the Arabian gulf, or Red sea, the pro- montory of Heropoli, and that of Strobilus, according to Pomponius Mela; it is mentioned by Jofephus, in his account of Solomon's fleet, which, he says, was not far from the city of Jéhâlân, and that it was formerly called Aßlingaber, or Ezion-gâber, in which position of it M. d'Anville accuses:— another, a famous town of Egypt, famed from the mother of Polemy Philadelphus, who founded it on the western side of the Red sea, and nearly under the tropic, about 450 miles below Suez, in order to avoid the slow and dangerous naviga- tion of the upper part of the Red sea: this city soon became the staple of the trade with India. From Berenic the goods were transported by land, to Coptos, a city three miles dis- tant from the Nile, but which had a communication with that river by a navigable canal, of which there are still some remains, and thence carried down the stream of the Nile, and
and its canals, to Alexandria. The distance between Berenice and Canopus, according to Pliny (Nat. Hist., l. vi. c. 29.) confirmed by the itinerary of Antonine, and approved by M. d'Anville, was 258 Roman miles; and the road lay through the desert of Thebais, almost entirely delitute of water. But the attention of a powerful monarch made provision for supplying this want, by searching for springs, and wherever they were found he built fountains, or more properly, in the eastern style, caravansers, for the accommodation of merchants. See Strabo, Geog., i. xvi. p. 1157. D. 1169. In this channel the intercourse between the east and west continued to be carried on during 250 years, as long as Egypt remained an independent kingdom. Berenice continued to be the port of out-fit for the Roman East India trade, in the time of Pliny (A. D. 79.) who details, in his 6th book, the account of the navigation to India, and who informs, that the coast 50 millions of sesterces, about 440,000, every year. From Berenice it was reckoned 30 days navigation down the Red sea to Celaesus (Gella) just within the strait of Babylanand. From Celaesus to Muziris, the first port of merchandise in India, was 40 days' sail: so that as they left Berenice about Midsummer, they might arrive in India in the latter end of August, when the violence of the S. W. monsoon was abated, and the coaling navigation safe and easy. These voyages were first made by coaling along the Arabian shore, to the promontory Syraurus (now Cape Rasul.) and thence along the coast of Peria, either directly to Patalla (now Tatta,) at the head of the lower Delta of the Indies, or to some other emporion on the west coast of India. Afterwards, a shorter and safer course was discovered; and from cape Rasul great vessels sailed in a direct course to Ziserus, which, according to major Rennell, was a port on the northern part of the Malabar coast. In a subsequent period, a direct course was pursued from the outlet of the Red sea to Muziris. It has not been accurately ascertained, what were the other ports in India which the merchants from Berenice frequented, when that trade was first opened; but it is probable, that as their vessels were of small burden, and kept near the coast, their voyages were circumscribed within very narrow limits, and that under the Ptolemies, no considerable progress was made in the discovery of India. Rennell's Mem. Introd., p. 35—37. Robertson’s Hist. Diet. concerning India, p. 46, &c. — Another Berenice was a town of Africa, on the Red sea, situate more to the south than the preceding, in the country of the Troglodytes, at the entrance of the Red sea, near the strait of Babel Mandel, known by the epithet of "Epidris:" another, denominated by Pliny (l. vi. c. 29.) "Panchrypos," from the gold dug in its vicinity; and by Strabo, xvi. 2, 2, 34, justia Sabatia, on the same coast: transferred by Hardouin to Arabia Felix, but mentioned by Strabo and Pliny in connection with the country of the Troglodytes.

BERENICE'S HAIR, in Astronomy. See Berenice above, and Cosma Berenices.

BERENTHA, in Ancient Geography, a small town of Pelo-ponnesus in Arcadia, mentioned by Steph. Byz. and Paulainas. BERENTHATHE, a small river of Peloponnesus in Arcadia, that discharged itself into the Alpheus; Paulainas.

BERENTZ, in Geography, a town and castle of Hungary; 20 miles N. N. E. of Pressburg.

BERES, in Ancient Geography, a town of Thrace. Steph. Byz.

BERESKY, in Geography, a town of Poland, in the patriminate of Bracaw, 40 miles S. E. of Bracaw.

BERESNA, or BERESIN, a district and town of Tchernigof in Russia, situated on the Dvina, 24 miles N.E. of Tchernigof.

BERESOF, or BERSOW, a district of the province of Tobolsk in Russia, in the country of the Samoelicks, situated on the river Soliva, which falls into the Obby, and bounded to the north by the straits of Waygats; on the east by the Ural mountains; on the south by the river Konda, and a large bay of the Frozen ocean, which runs into the land towards the south, and separates near the 66th degree of north latitude, into two parts, one of which is called the Obiska Guba, or bay of Obby, and the other Tazofski Guba, or the bay of Tazow. Into the former the river Obby empties itself, and into the latter the Taz; and from these two rivers the bays derive their names. This district was added to the Russian empire by the czar Gabriel, in 1720, long before the other parts of Siberia were conquered. The town of Berezof is situated on the west side of the river Obby, 372 miles N. N. W. of Tobolsk. N. lat. 64°. E. long. 65° 14'. This district is famous for its gold mines, in the mineral mountains of Ural, opened in 1754, and affording annually 3, 4, 5, or 6, and in later years 7 or 8 poods of gold. From the commencement of the work, in 1754, till the year 1788, during an interval of 34 years, the quantity of about 120 pood has been generally gained, which, estimated in value, amounts to about 1,195,000 rubles, and after deducting the coals, to above 480,000 net profit. Taking the gold and silver here obtained, according to its standard in coinage, and balancing it with the expenses paid in copper money, according to its true value, a profit accrues of nearly 800,000 rubles. Tooke’s View of Russia, vol. iii. p. 256.

BEREZOF, is also a town of Russia, in the government of Olonetz. N. lat. 64° 15'. E. long. 30° 34'.

BERETELSKO, a town of Poland, in the patriminate of Volynia; 24 miles S. W. of Lucko.

BERETHALOM, or BIRTHEBEL, a spacious town of Transylvania, in the district of Weiland, which is the residence of the Protestant bishop. The church is seated on a high rock, and its vicinities produces good wine.

BERETZHAUSEN, a town of Germany, seated on the Labe, in the circle of Bavaria, and principality of Neuburg; 12 miles W. N. W. of Ratibon.

BEREWICHA, or BEREWICA, in our Old Writers, denotes a village or hamlet belonging to some town or manor, situate at a distance from it.

The word frequently occurs in Doomsday-book: Vide berewicce eipdem maneri.

BEREZIA, in Geography, a town of Poland, in the patriminate of Kiof; 30 miles W. of Biahezerskiew. —Also, a town of Lithuania, in the patriminate of Pofeia, and territory of Braszk; 50 miles E. N. E. of Braszk. In this place the Carthsians have a convent.

BEREZEC, a town of Little or Red Russia, in the patriminate of Chelm; 22 miles east of Chelm.

BEREZEN, a town which runs into the Black sea; 20 miles west of Oczakoe.

BEREZENE, a town of Poland, in the patriminate of Volynia; N. lat. 51° 45'. E. long. 25° 55'.

BEREZENUKA, a town of Russia, in the government of Saratof, on the west side of the Volga; 142 miles S. of Saratof.

BEREZINA, or BEREZYNA, a river of Lithuania, which rives in the patriminate of Polotsk, and runs into the Druce, in N. lat. 52° 18'. E. long. 50° 55'. This river has been erroneously laid down, by some modern geographers, as forming the new boundary between Russia and Poland.

BEREZINA, a town of Lithuania, in the patriminate of Mindk, near the source of the river of the same name; 44 miles N. E. of Mindk. N. lat. 54° 28'. E. long. 28° 39'.
BEREZINSKOI, a town of Siberia, on the north side of the Irift; 50 miles E. of Tobolok.

BEREZNA, a town of Russia, in the district of Kargapol, seated on the river Onega. N. lat. 65° 18'; E. long. 43° 5'.

BEREZNE, a town of Poland, in the palatinate of Volhynia, near the river Siucz. N. lat. 51° 10'; E. long. 25° 52'.

BEREZNIKI, a town of Lithuania, in the palatinate of Troki; 40 miles N. W. of Troki.

BEREZOF. See Berezor.

BEREZOV, or Berezovo, a fortress of Asiatic Russia, in the government of Orenburg, on the Uvelka, 240 miles east of Ufa, and 68 S. E. of Tschelabinsk.

BEREZOVSKI, a fortress of Asiatic Russia, in the government of Orenburg, on the Ural, 140 miles E.N.E. of Orenburg.

BER-Fisch, in Ichthyology, a name given by the Germans to the common perch.

BERG, Matthias Vanden, in Biography, a painter of portrait and history, was born at Ypres in 1615, and, as one of the disciples of Rubens, he obtained some distinction. In his drawing he was correct, and being affianced in designing after the life, and after the best models, pictures of his own invention are uncommon; although excellent copies after the finished pictures of his master are numerous. He died in 1687. Folkingston.

BERG, in Geography, a duchy of Germany, in the circle of Welfphalia, called in Latin "Ducatus Montenfis," berg and mans being synonymous, and denoting mountain or hill, is bounded on the west and south by the archbishopric of Cologne, from which it is separated by the Rhine; on the north by the duchy of Cleves; and on the east by Nassau-Siegen, the duchy of Welfphalia, and the county of Mark. It is about 72 miles long, and from 10 to 26 in breadth. The country, which upon the whole is mountainous, is, nevertheless, along the Rhine flat, very fertile, and produces corn in abundance; on the hills the inhabitants cultivate vines, and the higher tracts are covered with extensive forests; and the valleys afford excellent pasture. In this duchy there are mines of lead, iron, and coal; its principal manufactures are swords, knives, and other articles of iron and steel; and also those of cloth, ribbons, and handkerchiefs. The principal rivers are the Rhine, which flows to the exit of this country, the Wupper, the Sieg, and Ruhr. Its capital is Duffeldorf; and its other principal towns are Elberfeld, Germar, Lennep, Ratingen, and Solingen. Hcock computes the number of inhabitants to be 2,61,504. Render (Tour, vol. ii. p. 294.) says, that this duchy contains 9 cities, 8 market towns, 35,042 hearths, 202 churches, 44,646 Calvinists, 36,867 Lutherans, and 1,300 Jews; and he adds, that this duchy, and that of Juliers, contain a number of manufacturers, who are computed to be about 150,000. The duchy of Berg belonged to the elector palatine; but in the year 1705, it was entirely over-run by the French. See JULIERS.

BERG. See BERGUS.

BERG Reclingen, or Kastorperki Hertz, a royal town of Bohemia, in the circle of Prachalitz, seated on a mountain, in which are mines of silver, 20 miles W. of Prachalitz.

BERGA, a town of Norway, 60 miles E.N.E. of Christ- tana. N. lat. 50° 50'; E. long. 5° 38'.—Also, a small town of Spain, on Catalonia, seated on the river Llobregat.—Also, a town of Germany, in the circle of Neumadt, and prefecture of Weyda, seated on the Elber, 5 miles W. of Weyda.

BERGAMASCO, or Bergamo, a country of Italy, being part of Lombardy, and belonging to the states of Venice, is bounded on the north by the Valtelline, on the east by the Brecliano, on the south by the Cremasco, and on the west by the Milanese. It extends about 36 leagues from north to south, and 30 from east to west. Towards the north it is mountainous and uncultivated, but the vicinity of Bergamo, its capital, is fertile. Some of its valleys produce wine and oil; others are barren. In the mountains are mines of iron, and quarries of marble and of floures. The inhabitants are inclined to corpulency, and are subject to the goitre; nevertheless, they are industrious, and intelligent in commerce, and carry on a considerable traffic in iron, wool, carpets, and tapestry, which they manufacture; cattle, marble, and mill-flours. Their language is a very corrupt Italian. Bergamaggio now belongs to the Cisalpine republic.

Bergamo, James Philipf de, in Biography, an Augustine monk, was born at Bergamo in 1434, and wrote a "Chronicle" in Latin, from the creation of the world, to the year 1503, and "Treatise of Illustrious Women." He died at the place of his nativity in 1518. Gen. Dict.

Bergamo, anciently Bergumum, in Geography, a fortified city of Italy, and capital of Bergamasso, is seated on several hills, at the bottom of which are some handsome suburbs. Between the city and the strong castle on the mountain, is a subterraneous communication. Bergamo is the fee of a bishop, suffragan of Milan, and contains 13 parish churches, 12 convents for men, 10 for women, and about 30,000 inhabitants. The old church of mingled Gothic and Gre- cian architecture, contains several valuable pictures, and defers notice. It is a place of considerable trade, and has a large fair on St. Bartholomew's day, which is reported to by a great number of merchants from other parts of Italy, Germany, and Switzerland. The principal articles of commerce are wool and flax; and the serges and tapestry of this place have been celebrated. Their cloths equal those of Turin. The inhabitants are diligent and active, and by their industry, render fertile the sandy environs of the town. Bergamo is 25 miles N. E. of Milan, and 20 N. W. of Brescia. N. lat. 45° 42'; E. long. 9° 38'.

Bergami, a name given by the Turks to the ancient Per- gamus.

Bergamot, in Botany, cedrat or bergamot citron-tree, the Citrus melia-riofs of Lamarc, and a variety of the Citrus medica of Linnaeus. It is distinguished from the common citron-tree by its leaf, which has the odour of the rose, by its fruit, which is red, and by the pit of its flower, which is short. The fruit has a fine taste and smell; and its essential oil is in high esteem as a perfume.

Bergamot, Oil, or Essence of, is a fragrant essential oil procured from the outer rind of the bergamot orange, and prepared in a very large quantity for the table and perfumery in the south of France, and especially in Italy and Sicily. There are several other species of oranges used for this pur- pose, but the bergamot is esteemed the most fragrant.

As the oil exists pure and ready formed in the orange peel, being simply depoited in small cells, the extraction is very easy. There are two methods of procuring it, either by distillation, as with all other essential oils, (for which, see the article Oil, Essential) or by expression. The latter is in some respects the best, as the oil is not liable to be altered by heat. Sellini relates, that in Sicily, a vast quantity of the oil is procured simply by squeezing the peel in the hand, and holding a small piece of sponge to the surface, which imbues the oil as fast as it flows out; when the sponge is full, its contents are pressed out into a vessel in which the oil is collected. It is not easy to imagine a more indolent and inartificial method: but in Italy, and the south of France, the orange peels are sifted to pieces on a small machine, stuck over with nails, with the points projecting, like
like a carding mill, whereby they are entirely torn to pieces, from which much of their oil flows out on the small mill, and is conducted away by a channel cut for the purpose, leading to a large bottle, where it is collected. After this, the peel, now in a pulpy state, is strongly compressed between two plates of glass, and the remainder of the oil is forced out. This last being mixed with the other parts of the pulp, is at first turbid, but gets clear by repossession.

These expressed essential oils, or as they have sometimes been distinguished by the term effusives, are more fragrant than the oils prepared by distillation, but being mixed with a little mucilage, they are somewhat thicker, and do not keep quite so long as the distilled. The Sicilian method of preparing the essence by hand, though attended with great waste of materials, certainly affords a purer oil, than where a mill and presses are used.

If the pulp, remaining after pressure, is mixed with spirit of wine and distilled, an addition of water to the distilled spirit separates an additional quantity of the oil, and leaves the liquor highly flavoured with its exquisite scent.

Beaumé obtained two ounces of the oil by distillation, from two pounds of the peel of lemons, and probably the bergamot is yielded in somewhat similar proportion. Beaumé.—Encyc. Arts. & Met. tom. vii.

There is likewise a kind of stuff of the fame name, which is only clean tobacco, with a little of the effusiveness rubbed into it.

Bergamot, in Commerce, is also the denomination of a coarse tapestry, manufactured with flocks of silks, wool, cotton, hemp, ox., cow, or goats hair, and supposed to be invented by the people of Bergamo in Italy.

Bergander, in Ornithology, a name by which some have called the fideleke or burrough duck, a very beautiful species of duck, common on the Lancashire, and some other coasts of England; but not in much esteem for eating.

This is annus tardana of Linnaeus, which see.

Bergara, in Geography. See Vergara.

Bergase, a town of Rumania, in European Turkey, seated on the Larissa. N. lat. 41° 22'. E. long. 27° 24'.

Bergbiethem, a large market town of France, in the department of the Lower Rhine, and district of Dusseldtchien.

Bergen, Diirk Vandcn, in Biography, was born at Haarlem, and was reckoned one of the chief disciples of Adrian Vandervelde. His colouring is more glowing than that of his master; but his cattle, and other objects, are less correctly drawn. He spent some time in England; but not succeeding, returned to his own country, and for want of economy, died poor in 1689. Pilkington.

Bergen, Charles Augustus De, son of George Bergen, professor of medicine in the university of Frankfort on the Oder, was born Aug. 11, 1714. After being initiated by his father into the knowledge of anatomy and medicine, he was sent to Leyden, where he studied under Boerhaave and Albinus, and thence, to complete his education, to Paris, and to Strasbourg. In 1734, being thought qualified to assist his father, he recalled him to Frankfort, where he was made doctor, and the year succeeding, professor in medicine. On the death of his father in 1738, he was promoted to the chairs of professor of anatomy and botany. With what zeal and ability he filled those offices, his numerous, learned, and ingenious dissertations on those subjects evince. In 1744, he was appointed to succeed Geelchies as reader in therapeutics and pathology, which post he filled to the time of his death, October 7, 1760.

His works, consisting chiefly of academical dissertations, were collected by Haller, and published with his "Theofis Anatomica." The titles of a few of them follow. For the remainder, see Bib. Anat. et Botan. Haller. "De nervo intercostalis," 1731; "Icon nova ventriculorum Cerebri," 1734; "Methodus Cranii Ossa differendi, et machine hunc in forma constructae figurarum, ligno incias, delineatio," 1744; "Flora Francofurtana, facili modo elaborata, &c." 1750.

Bergen, or Bergen, in Latin Bergen, in Geography, the capital of Norway, and the province of Bergenhus, was founded in the year 1069 or 1070. It is a port-town, seated in the middle of a valley, and forming a kind of semi-circle round a small gulf of the sea, called by the inhabitants Wang. On the land side it is defended by high mountains, constantly overhung with clouds, which defend upon the town in frequent rains; and towards the sea by several fortifications. All the churches and public edifices, as well as many of the dwelling houses, are built of stone. The most remarkable buildings are the castle, and the cathedral school, founded in 1554. This city carries on a large trade in all kinds of fish, fish oil, tallow, tar, hides, and timber, which are brought from the northern parts of the kingdom, and exported from hence. The returns consist chiefly in corn and foreign commodities. Bergen was formerly connected with the Hanse towns, and enjoyed the privilege of coining till the year 1755. The origin of its commerce was owing to the merchants of the Hanseatic league; fifty-eight flower houses are still to be seen on the quays, which were established by those merchants for the convenience of their exportation of fish. They had also a particular court here, the decisions of which tended to exclude the native inhabitants from all share in the trade; but they were at length entirely expelled, chiefly by the vigour of a bailiff, Walkendorf. This city, being chiefly constructed of wood, has been subject to frequent conflagrations, as in 1428, when eleven parish churches were entirely consumed, and also in 1522, 1623, 1642, 1702, 1756, and 1771, on which last occasion, the flames, it is said, were visible in the isles of Shetland, or at least, the red reflection in the sky. It has now only four parish churches, three Danish, and one German, together with some private chapels. The population is computed at 19 or 20,000. The harbour is reckoned one of the best in Europe. Bergen poffes^ a very laudable institution for the encouragement of the useful arts. N. lat. 60° 23'. E. long. 5° 33'.

Bergen, Bergen, or Bergenhuys, the most westerly province of Norway, situate between Aggerhus and the northern ocean. It is about sixty leagues long, and 7 wide. Its capital is Bergen. This province, or diocese, is very populous, and is remarkable for having 7 marble quarries. It includes 7 voctges or districts, and the name number of provostships. The voctges are Haardanger, Sundhord-Leenh, Nord-hord-Lehn, Sogn, or Sygna-Fike, Sundford, Nordord, and Sandmon.

Bergen, a county of America, in New Jersey, on Hudson river, lies opposite to New York on the east, and was first planted by the Dutch from New York. It is a mountainous country, and its extent is about 30 miles long and 25 broad; forming part of the eastern and northern extremities of the state, and at its north-western extremity meeting the north-eastern part of Sussex county. Bergen contains 6 townships, the chief of which are Bergen and Hackinjach, and 12,601 inhabitants, including 2301 slaves. Here are 7 Dutch Calvinist churches, and 2 of Dutch Lutherans.

Bergen, the shire town of the above county, and lies surrounded by water, except on the north. It is separated by the Hudson river, from New York, at the distance of 3 miles; on the south, a narrow channel lies between it and Staten island; and on the west, it has Hackinjach river. The inhabitants are chiefly descendants of the Dutch settlers.
BERGEN Neck, is the southern extremity of the above township.

BERGEN, a town of Germany, in the circle of the Upper Rhine, and principality of Hainan Munzenberg. The environs produce excellent wine. — Albo, a town of Germany, in the circle of Upper Saxony, and capital of the 'fife of Rügen; its ancient name was Goran. It is situated in the centre of the island, where are held the tribunals of Swedish Prussia. N. lat. 54° 25', E. long. 15° 40'.

Bergen on the Rhine, a town of Germany, in Lower Saxony, and principality of Zell, 12 miles S. W. of Dammberg.

BERGENHUS. See Bergen, Jutern.

BERGEN-OP-ZOOM, a sea-port town of Dutch Brabant, built on an eminence, in the midst of a morass, near the eastern shore of Zoom, at its junction with the Scheldt. It was first surrounded by a wall in 1287; by the first lord of the town, and erected into a marquessate by the emperor Charles V. in 1533. The church, which is a beautiful structure, was made collegiate in 1442. The houses are well built, and the market places and squares handsome and spacious. It has a good track of land under its jurisdiction, with several villages, and some islands in the Scheldt. This place, naturally strong on account of the morasses that surround it, was regularly fortified in 1629, and entrenched with impregnable works. The fortifications are reckoned the master-piece of that great engineer Coehorn. It was unsuccessfully besieged by the prince of Parma in 1588, and also by the marquis of Spinola in 1622. In 1746, the marshall Saxe deputed count Lowendahl to lay siege to it with 30,000 men; and after persevering attacks, and a vigorous, obstinate defence, in which many lives were lost, it was surrendered to the French, who became masters of the whole navigation of the Scheldt. At the peace of Aix-la-Chapelle, it was restored to the Dutch. It is distant 18 miles N.N.W. from Antwerp. N. lat. 51° 32', E. long. 4° 15'.

BERGENTE, in Ornithology, one of the names of anas margin. (Scap. Dunck.) Bino, lefeb derwelvet dierf. &c.

BERGERAC, in Geography, a town of France, and principal place of a district, in the department of the Dordogne; beautifully situated in an extensive plain on the Dordogne, which divides it into two towns, called "St. Martin," and "St. Magdeleine." It is a rich, commercial, and populous town, containing about 85,000 inhabitants. In the canton are 14,140. The territorial extent comprehends 175 kilometres, and the number of the communes is 12. Before the revocation of the edict of Nantes, it is said there were 40,000 Protestants in this town and neighbourhood. N. lat. 44° 51', E. long. 0° 37'.

BERGFINK, in Ornithology, the name of fringilla montifringilla, in the Hill. Birds. Frifch, fauer naturf. &c.

BERGGSANS, (Kelke) the mountain goat, anas montana. Gmelin.

BERGGIELEZHUBEL, or BERG GIESEHUBEL, in Geography, a town of Germany, in the circle of Upper Saxony, and margraviate of Meissen, near which are warm medicinal springs, 6 miles south of Pirna.

BERGHI, or BERGHLAND, an island in the Indian sea, north of Naffau island, and south-west of the island of Sumatra. S. lat. 2° 50'. E. long. 100°.

BERGHEIM, a town of Germany, in the circle of the Upper Rhine, and county of Waldeck, and by the new French distribution, the chief place of a canton, in the department of Roor, containing 469 inhabitants, and the population of the canton is estimated at 10,365; 4 miles S. E. of Waldeck.

BERGHEIM, in Biography. See BERCHEN.

BERGHIRI, in Geography, a town of Aha, in the province of Kurdistan, 70 miles S. E. of Berlia.

BERGHOMOT, or BERGMOTE, vulgarly barmore, formed from the Saxon borg, bome; and mot, convenus, affably, or meeting. See BERGHOMT.

BERGLAX, in Ichthyology, one of the synonymous names of corophium rupestris. Strom. Sodam.

Eff. Char. Cal. five-parted; Pet. five; Calyx one, globose, with swellings, five-celled, five-valved; valves reflexing petals; Seeds very many.

BERGIER, NICHOLAS, in Biography, was born at Rheims in 1557, and became professor of the university in his native city, where he was educated for the law, and became jurist. Under this character he visited Paris, and there formed an intimate friendship with Petreife, and du Puy, by whom he was induced to execute a work which he had projected on the high roads of the empire. M. de Bellievre took him to his house, and procured him a pension, with the brevet of historiographer. He died in 1623. The principal of his works are his "Histoire des grand chemins de l'Empire Romain," first printed in 1622, 4to. and reprinted, with notes, at Bruegels, in 2 vols. 4to. in 1729. This valuable work was translated into Latin by Flemmins, and is included in the 10th volume of Gravius's Roman Antiquities. Bergier also wrote in French "A sketch of the History and Antiquities of Rheims, with curious remarks concerning the establishment of the people, and the foundation of the towns of France," 4to. 1635.

BERGIMUS, in Ancient Mythology, a deity peculiar to the inhabitants of Brefcia, in Italy, where he had a temple, and an order of priests. Gruter, Muratori, and Spon, have recorded many inscriptions relating to this deity. It is thought, that he was the god of the mountains, because berg, in Celtic, signifies a mountain.
BERGMANN, TORBERN, in Biography, professor of chemistry at Upsal, was born at Catherineberg, in West Gothland, March 20th 1735; and after having finished the first course of his education, entered at the university of Upsal. His application, particularly to the study of mathematics and natural philosophy, was so intense, that his health was endangered; and as the faculties afford no peculiar prospect of emolument, a relation, who had the charge of him, discouraged his prosecution of them, and rendered it necessary for him to conceal the books which supplied him in his favourite studies. At the close of a year his health was so much impaired, that the restoration of it required an intermission of his application, and a course of exercise, which obliged him to return to his family. His hours of relaxation were, however, occupied in the study of botany and entomology, and his discoveries in the field of these sciences were communicated to Linnaeus. As soon as his health was re-established, he returned to the university, with ample permission to pursue those studies which were most agreeable to his inclination. Besides mathematics and natural philosophy, he directed his attention to natural history, under the patronage of Linnaeus; and began with a memoir on the nature of the substance found in certain waters, and called coccus aquaticus, which he found to be the egg of a leech, including 10 or 12 young. This was followed by other memoirs on the history of insects which attack fruit-trees, and the means of preventing their ravages; and he proposed a method of classing those insects from the form of the larva, in which the destruction of noxious insects is most essential. About this time, the famous Swedish naturalist testified his esteem of Bergmann's character and talents, by giving his name to a new species of insects. In 1761, Bergmann was appointed professor of mathematics and natural philosophy in the university of Upsal; and both before and after this time he enriched the volumes of the Swedish acta with several papers on philosophical subjects. His paper, containing "A Review of the several explanations which Natural Philosophers have given of the Rainbow," was published in 1759; and in 1760, he published some thoughts on "The origin of those meteors, which are not accompanied by any sensible pound or explosion," and also on "The opinions held by Philosophers relating to the Twilight," to which is prefixed an account of Maimon's "Anticrepusculum," or that of the horizon opposite to the sun. In 1761, and in 1762, professor Bergmann wrote on the subject of electricity, in consequence of a correspondence with Mr. Wilton; and particularly on the electrical quality of iron, and double metals in general. This resulted in the publication of a paper on the tenthredo, or saw-fly, shewing how to distinguish between the caterpillars of this insect and those of the butterfly and moth, and discovering the facts in the latter to be more than 15, and those of the tenthredo always exceeding that number, were published in 1763; and the same year produced the unsatisfactory result of some electrical experiments, made with silk of various colours. In 1764, the professor wrote a paper to ascertain, from a number of observations, the height in the atmosphere at which the aurora borealis exists (see Aurora Borealis); and in 1765 and 1766, he wrote again on electrical subjects; and principally on the property and laws of electricity in the tournaih, which had been referred to his examination by the Royal Academy of Sciences at Stockholm. At this time it does not appear that the subject of chemistry had employed much of Mr. Bergmann's attention; however, in 1767, on the resignation of Walerius, he was chosen to succeed him as professor of chemistry and metallurgy. This appointment was much opposed by the party of the former professor, united with others who envied Bergmann's rising merit; and their opposition was supported by some severe criticisms on two papers, which the professor published at this time, relating to the depuration of alum, in which he recommends the use of argillaceous earth, and proposes tobacco-pipe clay, instead of alkali, to free it from the vitriol. But the prince royal of Sweden, who afterwards succeeded to the throne, and who was then chancellor of the university of Upsal, determined the dispute, and fixed him in the professor's chair. With enlarged views of the practical importance and utility of chemistry, of what had already been performed in this department of science by preceding authors, and of what yet remained to be done, Bergmann prosecuted his chemical researches, and by a combination of experimental analysis with mathematical reasoning, he extended and improved this science by a variety of valuable discoveries and observations. In order to pursue his experiments and enquiries with the greater facility, and to communicate the result with advantage to his pupils, he formed, near his laboratory, a cabinet, in which all the mineral sublunances were ranged in order, together with the products of those experiments which had ascertained their composition. Another collection exhibited all the minerals of Sweden, arranged according to the places where they are found. In a third, were exhibited models of the various machines and apparatus by means of which these sublunances were converted into useful articles, which articles were placed near the materials from which they were formed. From this systematic arrangement Bergmann derived peculiar advantage in his profession as a teacher. While he excelled as a professor of chemistry and mineralogy, and devoted much of his time to this occupation, he was actively and incessantly employed in making discoveries which have placed him in the first rank of philosophical chemists. He examined the carbonic acid, discovered by Black, and denominated fixed air, in its several properties and habits. Nickel, manganes, the magnesian earth, and barytes, which were newly discovered sublunances, were particularly investigated by Bergmann, and afforded materials for regular and pernicious treatises. The acid obtained from sugar, and many other vegetables, by the abstraction of the nitric acid, and those acids which are obtained from arsenic, molybdena, flour par, and tungsten, were discovered either by himself or some of his disciples; and to him we are indebted for leading the way in the investigation of their properties, and for ascertaining many interesting phenomena attending their combinations. From him, we learn, that iron contains a number of foreign admixtures, chiefly of a metallic nature, and that the three flates of crude iron, and malleable iron, and steel, principally depend upon the greater or less abundance of carbon. In his analysis of waters, he added, to the re-agents before used, other sublunances more effectual, and whilst he evinced the imperfection of this method, he rendered it much more accurate. He also ascertained the quantities of products, without separating them from all their combinations; and in this way he infers the quantity of metal from the weight of precipitate it affords, by the addition of an alkali, or some other known sublunace, from tables founded on former experiments. He likewise analysed the precious stones, known by the name of gems, and devised peculiar methods for separating them into the known earths in determinable proportions. Professor Bergmann evinced the necessity and utility of performing decimal calculations in the humid way, or by an analysis, in which liquid solvents are used; and he also exhibited the advantages of the process by fire, applied to materials in minute portions, by means of the blow-pipe, either upon a piece of charcoal, or in a spoon of pure silver. This mode of examining mineral sublunances, united with that of the habits which they exhibit, with a few simple re-agents, facilitated the classification of them, according to their chemical properties; a method adopted by this ingenious chemist, without
out the exclusion or disparagement of that method of investigation which regards the external character. This appears from his short essay on the forms of crystals. The subject of elective attractions engaged the particular attention of Professor Bergmann; and he engaged in the laborious undertaking of improving and extending the tables of Geoffroy, for which he received that, according to his views, no less than 30,000 experiments would be necessary. He therefore, under an apprehension that his life would not allow the completion of his plan, contented himself with publishing what appeared to him to be an imperfect work, though it was otherwise regarded by the scientific world. His table of simple affinities is the first that exhibits the laws of affinities as they are observed in the dry way; and in his scheme it is seen at once whether the operation takes place in the humid or dry way; what are the suffusions preferred to each other; their component parts and proportions; the numerical expressions of their attractions; what new compounds take place; and whether they fall down, or sublime, or remain in solution, and which of them are thus respectively affected. (See Affinity.) In this work, as well as in his work on metallic precipitates, Bergmann, not apprised of those effects of oxygen, which have been developed in later times, confers the existence of phlogiston, or a common principle of inflammability, as an acknowledged fact. He also admits of the matter of heat as a self-existent independent principle, and seems not to have apprehended that it may be a distinct modification. Accordingly, these two principles enter into many of his explanations of facts; but in all those explanations, the matter is arranged with such order and perplicity, that it is extremely easy to sublimate the abstraction of oxygen instead of the extinction of phlogiston, and the contrary effect whenever the latter imaginary principle, as it is now thought to be, is absorbed. The life of Professor Bergmann, like that of other illustrious and scientific men, admits of little variety. Attentive to the duties of his profession, he resided constantly at Upsal, and had the honour to be elected rector of the university, which in his time was divided into two parties, of theologians and civilians on one side, and of natural philosophers on the other, between whom Bergmann maintained peace and equality. The king of Prussia wished to engage the professor of Upsal to become a member of his academy, and to remove to Berlin; but attached to his office, though exhausted by it, and in a declining state of health, which might have been relieved by a warmer climate, and under obligations of gratitude to Gustavus, king of Sweden, who had been his benefactor, and who had honoured him with the order of Vasa, he declined the proposal, and remained at Upsal. The disciples of his school, of whom the celebrated Scheele, a very distinguished man and character, reflected honour on their master, who never failed to encourage their researches, and to mention their discoveries in terms of approbation and respect. How much Sir Torbern Bergmann was esteemed whilst he lived, in every part of Europe, it is needless to say; and of his works it is sufficient to observe, that, notwithstanding the rapid improvements which have taken place since his time in chemical science, they will long remain repositories of facts and reasoning, to which every philosopher must recur. When it is considered that he began this pursuit rather at a late period of life, and that he made his various discoveries in the course of 17 years, and that he died before he attained his 50th year, his death will be regretted as a premature event, by which society lost a very considerable loss. He died on the 8th of July 1784, at the baths of Medwi in Sweden. His works were very numerous; the principal of them are as follows: viz. "Opuscula physica et chemica, pleraque foemini antea edita jam ab auctore collected," published in Latin in 3 vols. 8vo, in 1779, 1780, 1783, and translated by Dr. Gullen of Dublin, in 2 vols. 8vo, with illustrations and notes by the translator. "Meditationes de syylemata foemilium naturalium," printed in the 4th volume of the Transactions at Upsal for 1784, and translated into English in 1788, in 8vo. "Physick Belkimbung oecor Jordkloter," or a physical description of the earth, in 2 vols. 8vo, under which he has given lucubrations on the structure and form of the earth; "Effay on the useful uses of Chemistry," published in Swedish in 1779, and translated into English in 1783, 8vo; two academical diffusions on the origin and progress of chemistry, intitled "De Primordii Chemici," in 1777, and "Chemis Progresfus a medio Sueci. ad medium Sueci. xviiii." in 1782; and "Sciographia Mineralis," or outlines of Mineralogy, first printed in 1782, at Leipzig and Desfau, and translated into French by M. Menzeg, and into English by Dr. Withering in 1783, 8vo. Eloge of Bergmann, inserted in the Acts of the Academy of Sciences at Paris for 1784. Coke's Travels in Sweden, &c. vol. iv. p. 228, &c. Gen. Biog. BERGMANNIA, in Entomology, a species of PHALMA (Torricz), with pale yellow wings, spotted with bright yellow; facies whitish, and the third bish; found in the gardens of Germany and northerly parts of Europe. BERGOO, in Geography, a district of Abyssinia, situate north of Darfur, and south of Bornou, between 15° and 19° of N. lat. and between about 24° and 25° 31', E. long. Its capital is Wara, in N. lat. 15° 30'. E. long. 25° 30'. Bergoo is laid to be 15 days or (allowing 12½ geographical miles per day) 187½ geographical miles in extent, from E. to W. and from N. to S. 20 days, or 250 miles. Within about a day's journey of Wara, are said to be eight large mountains, the inhabitants of each of which use a distinct language. They are Mahometans, zealously attached to the faith; and read the Koran daily. They are said to be brave, and furnish the armies of the sultan of Berroo with recruits as often as they are required. They make war by sudden incursions, traversing and laying waste a large space in a short time. On these occasions they leave their women behind, and are therefore better adapted to military operations than the people of Darfur, who never march without a host of female attendants. The people of Bergoo seldom make "felatera," i.e. an expedition to procure slaves by force. Some of the idolatrous nations, dependent upon Bergoo, are represented as conducting their wars in a very formidable manner. The combatants never retreat; and the women behind light a fire, in which they heat the heads of the spears, and exchange them for such as are cooled in the combat. They also use poisoned weapons. Mr. Browne informs us, that in a remote part of the pagan country, from which slaves are brought, the inhabitants eat the flesh of prisoners taken in war. They are also habituated to strip off the skin of the hands and faces of their slaughtered foes, which, after undergoing some preparation, is worn as an emblem of triumph. Their arms, which are a spear and a javelin, are formed of iron, wrought by themselves. Thee they make hot red, and flick the point in a tree, where they leave them till the juice is dried; and in this manner, according to report, they acquire a most deadly poison. Browne's Travels in Africa, p. 310, 486. BERGNSYLLTRA, in Ichthyology, the name under which Linnaeus mentions Labrus jullius of Lin. Suec. in 17.
contains a few small places, as Benheim, Oppenheim, and Weinheim. It has in it a highway, commanding prospects of wide extent. The best part of this continued chain of hills, is from Heidelberg to Benheim, where it is about 8 leagues long and 4 broad. On the right hand it is covered with woods near the top, and nearer the plain with vineyards. The level road is planted with rows of walnut trees, and on each side are fields and meadows that are very fertile. The walnut trees of Bergsträfs and the Odenwald, yield a consider-able profit to the country by the wood and the fruit; and the wine produced there is an inexhaustible source of supply to the inhabitants. In one year they have exported 40,000 rough made walnut tree mullet rocks, from these parts to Saxony. From the nuts they make an excellent oil, which serves the common people instead of butter, and the inferior fort is used for lamps. The almond trade, of which great quantities grow along the Bergsträfs, is very considerable. The warmth of the climate, and goodness of the soil in the Bergsträfs, are such, that after rye-barreled the land may be tawn a second time with spelt, buck-wheat, or oats, which are always reaped the same year.

BERGUES, or BER, or BERGES St. Vinois, a town of France, and principal place of a district, in the department of the North; so called from St. Vinois, a Flemish lord, who lived here. It is seated on the river Colme, at the union of several canals, which pass to Dunkirk, Gravelines, St. Omer, Furnes, &c., and contains two parishes. Berg was the last town of West Flanders which held out for the Dutch in the 16th century. It was taken by the French in 1658, and confirmed to them by the peace of the Pyrenees, in the following year. Since that time it has been fortified by new works, and the country round it may be laid under water by means of sluices; 15 league south of Dunkirk. It contains 5,085 inhabitants, and in the canton are 14,526. The territorial extent comprehends 130,000 kilometres, and 13 communes. N. lat. 50° 57', E. long. 2° 35'.

BERGUN, a small town of Switzerland, in the country of the Grisons, near a river which flows from a lake of the same name, and discharges itself into the Albul. It lies between the Albul and the Inn, about 6 miles from the latter, and 12 miles from the former. N. lat. 46° 31', E. long. 3° 22'.

BERGWERKEN, a town of Germany, in the circle of Upper Saxony, 2 miles north of Weifenfeld.

BERGWERS, a town of Hungary, 13 miles west of Steinam.

BERG-ZABERN, a town of Germany, in the circle of the Upper Rhein, and duchy of Deux Ponts, seated on the Erbach, 50 miles south-east of Deux Ponts. By the new arrangement of the French, it is the chief place of a canton in the department of the Lower Rhein, containing 10,477 inhabitants. The canton has 9,005; its extent is 150,000 kilometres, and the number of communes is 15. N. lat. 49° 7', E. long. 7° 54'.

BERLAI. BERRY, BERRY, in Middle Age Writers, denotes a large open field, and the cities and towns of England, which end with that word, are built in plain and open places, and do not derive their names from boroughs, as Sir Henry Spelman imagines. That the word "berry," which has been confounded with "bury," and "borough," is a flat wide campaign, is proved from sufficient authorities, by the learned Du Trefle, who observes, that "Beria Sia Edmund," mentioned by Matt. Paris, sub ann. 1174, is not to be taken for the town, but for the adjoining plain. Besides, many flat wide meads, and other open grounds, are called by the names of "beries," and "berry-fields;" thus the spacious meadow between Oxford and Iffley was in the reign of King Athelred called "Bery;" and the largest part of ground in Quarendon in the county of Buckingham is known by the name of "Beryfield." And though these meads have been interpreted demesne, or manor meadows, yet they were in reality any flat or open meadows, that lay adjoining to any vill or farm. (Cowell.) Hence also "berries affaire," signifies to dry or plough up heaths and downs; and hence our warrens are called "coney-berries."

BERBERIA, or BERR, in Medicine, a barbarous name, employed to denote a species of palsy, frequent in the East Indies. It is called by some British authors, who have written on the diseases of hot climates, the "barbers." According to Bontius, it comes on with great weariness, trembling, numbness, and peculiar tingling sensation of the limbs, so that the patient is rendered incapable of walking, or otherwise using them. The upper as well as lower limbs are often affected. Sometimes it is accompanied with a slathering of speech. Its attack is generally sudden. Tho' whom it afflicts are chiefly the lower clafs of people, who imprudently get chilled after being heated, by drinking cold water; but more especially by sleeping in the night air, after great fatigue or intoxication. The remedies against this oblique complaint are strong frictions, aromatic fomentations, warm-bathing, and sudorifive decoctions. According to Bontius, the moft efficacious topical application is a species of naphtha, or petroleum, from Sumatra, used as a liniment. The natives of India (fays Dr. Lind) have a method of putting the patient into a hole dug into the ground, and covering him with flood up to his neck; this is done in the middle of the day, and he remains there as long as he can bear the heat of the sun, which is considerable. Campfire, and a decoction of Guaic wood, have sometimes produced a good effect; also the expressed bitter oil of the margoofe, an Indian plant. But notwithstanding the use of the most powerful nervous medicines, the patient generally continues paralytic for some months, unless he is removed into another air.

On the Malabar coast (continues the last mentioned author) this disease is most violent and frequent, and attacks both natives and strangers, especially in the months of December, January, February, and March. During these months, the land winds blow every morning about sun-rise, from the neighbouring mountains, with remarkable coolness; and such as, being tempered by the severity of the leafoo, steep exposed to these winds, are often suddenly seized with a very painful sensatation in the perifcope of the arms and legs. In persons of a good constitution, this pain abates as the day advances; and as the air becomes warmer; but in others it continues for a considerable time, attended with a weakness of the knees, and painful sensatations in the calves of the legs and feet of the feet, especially on any attempt to walk. This is barely ever cured by medicine, till after the shifting of the monfoon, unless the patients can be moved to the coast of Coromandel, or to any place to the eastward of the Dadagat mountains, where, by the change of air, they quickly recover. See Bontius De Med. Indorini; and Lind on Diseases incidental to Europeans in Hot Climates.

BERICARIA. See BERCARIA.

BERIEZEN, in Geography. See BEREZINA.

BERIGAN, a town of Africa, in the kingdom of Algiers, and capital of the country of Beni-Mezzab. N. lat. 32° 15'; E. long. 2° 59'.

BERINBAL, a town of Egypt, on the west branch of the Nile, 7 miles S.E. of Rosetta.

BERING, in Biography and Geography. See BERING.

BERINGEN, in Geography, a town of Germany, in the circle of Westphalia, and bishopp of Liege, 18 miles N.W. of Maerlacht.

BERINGOU. See BERING's Island.

BERINSCHUL, a rocky island in the Mediterranean, near the coast of Algiers.

Vol. IV.
BERKLY, Dr. George, in Biography, the learned and ingenious bishop of Cloyne in Ireland, was born March 12, 1683, at Kilcier, near Thomaltown, in the county of Kilkenny; and having received his preparatory education at Kilkenny school, under Dr. Hinton, was admitted at the age of fifteen, a pensioner of Trinity college, Dublin, of which he became a fellow, June 9, 1707. In this year he published his first literary essay, written before he was 20 years of age, entitled "Arithmetica absque Algebra et Euclide demonstrata," and evincing his talents for those subtile metaphysical studies, by which he was afterwards so eminently distinguisht. In 1709 was published his "Theory of Vision," being the first attempt that was ever made to distinguish the immediate and natural objects of our senses from the conclusions which we have been accustomed from infancy to draw from them, and to trace the boundary that divides them. For this purpose he shews, that although habit hath connected the ideas of sight and touch, so that they are called by the same names, they have originally no such connection; insomuch that a person born blind, and suddenly made to see, would, at first, be unable to tell so much as one object that affected his sight would affect his touch, and from sight could not derive any ideas of distance or external space, but would imagine that all the objects he saw were in his eye, or rather in his mind. In proof of this assertion, the case of a young man born blind, and couched at the age of 14, by Mr. Cheffelden, mentioned at the close of his anatomy, has been adduced. This work was succeeded in the following year by the "Principles of Human Knowledge," in which Berkeley controverted Mr. Locke's account of abstract ideas and general names, and attempted to prove, that the commonly received notion of the existence of matter is false, and inconsistent with itself: that those things which are called sensible material objects are not external, but exist in the mind, and are merely impressions made upon our minds by the immediate act of God, according to certain rules, termed laws of nature, from which, in the ordinary course of his government, he never deviates; and that the steady adherence of the Supreme Spirit to these rules is what constitutes the reality of things to his creatures, and so effectually distinguishes the ideas perceived by senses from such as are the work of the mind itself, or of dreams, that there is no more danger of confounding them together on this hypothesis than on the common supposition of matter. See ABSTRACTION, BODY, EXISTENCE, and MATTER.

In the year 1712, Berkeley's attention was directed, by the perfual of Locke's "two Treatises of Government," to the doctrine of passive obedience: in support of which he printed the substance of three common-places or sermons, delivered in the college chapel. In consequence of this publication, he was represented as a Jacobite, and prevented from obtaining some prebend in the church of Ireland, to which he had been recommended; but the unfavourable impression that had been thus made on the mind of the prince of Wales, afterwards George II., was removed by Mr. Molyneux, who took occasion of introducing Berkeley to queen Caroline. In 1712, he published, in London, a farther defence of his system of immaterialism, in "Three Dialogues between Hylas and Philonous." Such was the reputation which he had now acquired by his writings, for acuteness of parts, and a beautiful imagination, that his company was courted even by those who did not embrace his opinions; and he was introduced to the acquaintance of persons of rank and learning, by two gentlemen of opposite principles, Sir Richard Steele, and Dr. Swift. For the former, he wrote several papers in the "Guardian," and at his house formed an intimacy with Mr. Pope, which lasted during his whole life. Dean Swift also introduced him to Lord Berkeley of Stratton, and to other valuable acquaintance; and procured for him the appointment of chaplain and secretary to the earl of Peterborough, who being appointed ambassador to the king of Sicily, and to the other Italian states, took Berkeley with him, in November 1713. On his return to England, in 1714, he found that his hopes of preferment had expired with the fall of queen Anne's ministry; and he therefore accepted the offer of accompanying the son of Dr. Afie, bishop of Clougher, in a tour through Europe. At Paris he visited the illustrious father Malebranche, whom he found in his cell, cooking, in a small pipkin, a medicine for an inflammation of the lungs, with which he was afflicted; and as they engaged in a conversation on Berkeley's system, Malebranche, in the heat of disputation, raised his voice so high, and indulged the natural impetuosity of his temper to such a degree, that he brought on an increase of his disorder, which carried him off a few days after, viz. October 13, 1715. During four years' absence from England, Mr. Berkeley not only profected, what is usually called by travellers, the grand tour, but he visited Apulia, Calabria, and Sicily. The materials he collected, with a view to the natural history of the latter country, were unfortunately lost in his passage to Naples; and this circumstance is the more to be regretted, as he has given to the world satisfactory specimens of his talent for lively description, in his letters to Mr. Pope and Dr. Arbuthnot. At Lyons, in his way home, he drew up a curious tract, "De Motu," which he sent to the royal academy of sciences at Paris, and which he committed to the press soon after his arrival in London, in 1721. The dilatory South Sea scheme of 1720, engaged his attention at this time, and he wrote "an Essay towards preventing the ruin of Great Britain," which was printed at London, in 1721. By his travels, his natural politeness, and his talents for conversation were so much improved, that he found easy access to the best company; and he was introduced by Mr. Pope to lord Burlington, who conceived for him a very high esteem on account of his distinguisht talents and skill in architecture, which had been the object of his particular study in Italy. By this nobleman he was recommended to the duke of Grafton, lord lieutenant of Ireland, and accompanied him thither in 1721. Having been elected senior fellow of his college, in 1715, he now took the degrees of bachelor and doctor in divinity. By the death of Mrs. Vanbrugh, the celebrated "Vanessa," to whom he was introduced by Dean Swift, in 1713, and who altered her purpose of making the dean her heir, in consequence of discovering his connection with "Stella," Dr. Berkeley became possessed of half her property, amounting to about 4000l. and in the discharge of his office, as one of her executors, committed
committed to the flames several letters that had fallen in correspondence between her and the dean, not, as he declared, because there was anything criminal in them, but because he observed a warmth in the lady's style, which delicacy required him to conceal from the public.

On the 18th of May 1724, Dr. Berkeley resigned his fellowship, and was promoted by his patron to the deanery of Derry, worth £100 per annum. Having for some time conceived the benevolent project of converting the savage Americans to Christianity, by means of a college to be erected in the Summer islands, otherwise called the isles of Bermudas, he published a proposal for this purpose at London, in 1725, and offered to resign his own opulent preferment, and to devote the remainder of his life to the instruction of youth in America, on the moderate subscription of 100l. a year. Such was the influence of his distinguished example, that three junior fellows of Trinity college, Dublin, concurred with him in his design, and proposed to exchange, for a settlement in the Atlantic ocean, at 40l. per annum, all their flattering prospects in their own country. The proposal was enforced on the attention of the ministry, not merely by considerations of national advantage, and a regard to the cause of Christianity, but by the immediate advantage likely to accrue from it to the government. Having, by diligent research, estimated the value of the lands in the island of St. Christopher's, ceded to Great Britain by France at the treaty of Utrecht, he proposed to dispose of them for the public use, and thus to raise a sum of money, part of which was to be applied to the establishment of his college. The scheme was communicated by the intervention of the abbe Guattleri, or Altieri, to king George I.; and by the royal command introduced into the house of commons by Sir Robert Walpole. A charter was granted by his majesty for erecting a college, by the name of St. Paul's college in Bermudas, which was to consist of a president and nine fellows, who were obliged to maintain and educate Indian children at the rate of 10l. per annum for each. The first president, Dr. George Berkeley, and the first three fellows named in the charter, those junior fellows of Dublin college abovementioned, were licensed to hold their preferments in these kingdoms till the expiration of one year and a half after their arrival at Bermudas. The commons, in 1726, voted an address to his majesty, praying a grant of such a sum as would effect the above purpose out of the lands of St. Christopher's, already mentioned, as his majesty might think proper. The sum of 10,000l. was furnished by the minister, and several private subscriptions were immediately raised for promoting so pious an undertaking. The dean, having, in 1728, married the eldest daughter of the right honourable John Forster, esq., speaker of the Irish house of commons, prepared to set sail for Rhone island, in the execution of his scheme, and took with him a pretty large sum of money of his own property, and a collection of books for the use of his intended library. Upon his arrival at Newport in Rhone island, he contracted for the purchase of lands on the adjoining continent, and fully expected that the purchase money would, according to grant, be immediately paid. His expectations, however, were disappointed; and after various excuses he was at length informed by bishop Gibson, at that time bishop of London, in whose diocese the whole West Indies is included, that on application to Sir Robert Walpole, he received the following honest answer: "If you put this question to me," says Sir Robert, "as a minister, I must, and can assure you, that the money shall, most undoubtedly, be paid as soon as suits with public convenience; but if you ask me as a friend, whether the dean Berkeley should continue in America, expecting the payment of 10,000l. I advise him, by all means, to return home to Eu-

rope, and to give up his present expectations." Accordingly, the dean, after having expended a great part of his private fortune, and more than seven years of his life in the prosecution of a laudable scheme, returned to Europe. Before he left Rhone island, he distributed the book he had brought with him among the clergy of that province, and upon his arrival in London, immediately returned all the private subscriptions that had been advanced for the support of his undertaking. In 1732, he published the "Minute Philosopher," a work consisting of a series of dialogues, on the model of Plato, in which he pursues the free-thinker through the various characters of atheist, libertine, enthusiastic, fanatic, critic, metaphysician, fatalist, and sceptic, and employs several new arguments from his own system. Of the company, which at this time attended the philosophical conversations that were carried on in the presence of queen Caroline, according to a practice which had commenced when she was princess of Wales, some of the principal persons were doctors Clarke, Hoadly, Berkeley, and Sherlock. The debates that occurred were chiefly conducted by Clarke and Berkeley; and Hoadly adhered to the former, as Sherlock did to the latter. Hoadly affected to consider the philosophy of Berkeley, and his Bermudas project, as the revenge of a visionary. Sherlock, on the other hand, espoused his cause; and on the publication of the "Minute Philosopher," presented a copy of it to the queen, and left it to her majesty to determine, whether such a work could have been the production of a disorderly understanding. The queen honoured Berkeley with admitting him to frequent visits, and took pleasure in his conversation on subjects relating to America; and upon a vacancy in the rich deanery of Down in Ireland, procured it for him. But as lord Burlington had neglected to give proper notice of the royal intention to the duke of Dorset, then lord-lieutenant of Ireland, and to obtain his concurrence, the duke was offended, and the appointment was not urged any farther. Upon this, her majesty declared, that since they would not suffer Dr. Berkeley to be a "dean," in Ireland, she should be a "bishop;" and accordingly, upon a vacancy in the see of Cloyne, in 1733, he was promoted by letters patent to that bishopric. In consequence of this appointment, he resided continually at Cloyne, and devoted his time and attention to the faithful discharge of all episcopal duties. He revived in his diocese the useful office of rural dean, visited often parochially, and confirmed in several parts of his see. In the prosecution of his studies, however, his diligence was unabated; and about this time he engaged in a controversy with the mathematicians of Great Britain and Ireland, on the subject of Fluxions. He was led to it by the following occurrences: Mr. Addison having visited Dr. Garth in his last illness, addressed him seriously on the necessity of preparing for his approaching dissolution; but the doctor replied, "Surely, Addison, I have good reason not to believe these things; I have a very good friend Dr. Halley, who has dealt to me in demonstration, has assured me, that the doctrines of Christianity are incomprehensible, and the religion itself an imposture." This conversation being reported by Addison to the bishop, he took up arms against this redoubtable dealer in demonstation, and addressed to him "the Analyst," with a view of shewing, that mysteries in faith are unjustly objected to by mathematicians, who admitted much greater mysteries, and even fallacies in science, of which he endeavoured to prove that the doctrine of fluxions furnished an eminent example. See Fluxion. In the course of the controversy on this subject, the bishop, in 1735, published a reply to Philalethes, suppressed by Dr. Jurin, entitled "A Defence of Free-thinking in Mathematics." From this controversy, he diverted his thoughts to Fiz...
fubsjects of more apparent utility; and printed, in 1735, his "Queries," for the good of Ireland; and in 1736, his "Diff
couces addressed to Magistrates;" and in 1752, his "Maxims
concerning Patriotism," all of which evince his knowledge
of mankind, and his zeal for the service of true religion, and
of his country. In 1745, during the Scots' rebellion, he
addressed a Letter to the Roman Catholics" of his diocese;
and in 1749, another to the clergy of that persuasion in
Ireland, under the title of "A Word to the Wise," which
was so well received by them, that they returned him their
public thanks, with expressions of marked esteem and re-
public, which describe him as "the good man, the polite
gentleman, and the true patriot." That he discovered this
character in a very eminent degree, was very generally ac-
nowledged; and particularly by lord Chichester, who as
soon as he was advanced to the government of Ireland, in
1745, offered him the fee of Clogher, then vacant, and the
value of which was double that of Cloyne. This offer he
bishops, moderate in his views, disinterred in his support of
government, and particularly attacked to his customary
place of residence at Cloyne, and to the connection and duties
attending it, respectfully declined. Towards the close of
his life he laboured under a nervous colic, the effect of
his sedentary course of living, in which he found consider-
able relief from the use of tar-water; and he therefore
communicated his thoughts on this celebrated medicine to
the public in a treatise, entitled "Siris, a Chain of Phi-
osophical Reflections and Enquiries concerning the Virtues of
Tar-water," printed a second time in 1747, and followed in
1752, by "Farther Thoughts on Tar-water," which was
his last performance.

In 1752, he removed, with his lady and family, to Oxford,
for the purpose of superintending the education of one of his
sons, who was admitted a student at Christchurch college, in
that university; but unable in a high degree of the impropriety
of non-residence, he endeavoured there to procure an exchange
of his high preferment for some canonry or headship at Ox-
ford; and failing of success, he afterwards, by a letter to the
secretary of state, requested permission to resign his bishopric,
worth at that time not less than 1400l. per annum. When
the petition for this purpose was presented to his majesty,
he declared he should die a bishop in spite of himself,
and gave him full liberty to reside wherever he pleased. Before
he left Cloyne, he signed a lease of the demesne lands in
that neighbourhood, renewable yearly at the rate of 200l.
and directed this sum to be annually distributed, until his return,
among poor house-keepers of Cloyne, Youghall, and Ag-
hadda. At Oxford, he was highly respected by the mem-
bers of the university; but his residence among them was of
no long duration. On Sunday evening, January 14th, 1753,
whilst he was surrounded by his family, and his lady was
reading to him one of Dr. Sherlock's sermons, he was sud-
denly seized with a disorder, called the palsy of the heart,
and instantaneously expired. His remains were interred at Chri-
church Oxford, and a marble monument was erected to his
memory by his widow, with a Latin inscription, drawn up
by Dr. Markham, head-master of Westminster school, and
now archbishop of York. In this inscription he is said to have
been born in 1679, and his age to be 73; whereas his bro-
ther, who furnished the particulars of his life, states the year
of his birth to have been 1684, and of course he died at the
age of 69.

The perfon of bishop Berkeley was handsome, his coun-
tenance expressive and benign, and his constitution robust,
till it was impaired by his sedentary life. At Cloyne he con-
stantly rove between three and four in the morning; and
often spent the greater part of the day in study; his favourite
author, from whom many of his notions were borrowed, was
Plato. The enthusiasm of his private character, which was
singularly excellent and amiable, entered into his literary
one: and it was manifested in his public works, as well as
in his life and conversation. Few persons were ever held,
by those who knew his worth, in higher estimation than bi-
shop Berkeley. When bishop Atterbury was introduced to
him, he lifted up his hands in astonishment, and exclaimed,
"So much understanding, so much knowledge, so much
innocence, and such humility, I did not think had been
the portion of any but Angels, till I saw this gentleman."
This testimony serves to remove the air of hyperbole
from the well-known line of his friend Mr. Pope:

To Berkeley every virtue under heaven.

In matters of speculation, his natural ardour might, pos-
sibly, have led him to imbibe some notions that are more
fanciful than just. It has been said, that towards the close
of his life, he began to doubt the solidity of metaphysical
speculations, and that he therefore turned his thoughts to
the more beneficial studies of politics and medicine. He has
been charged by some considered perfons, and particularly
by bishop Hoadly, with corrupting the native simpicity
of religion, by blending it with the falsity and obscurity of
metaphysics; and Mr. Hume afferts, that his writings form
the basis of scepticism which are to be found either
among the ancient or modern philosophers, Bayle not ex-
cepted; that "all his arguments," against Sceptics, as well
as against Atheists and Free-thinkers, says Hume, "though
otherwise intended, are, in reality, merely sceptical, appear
from this, that they admit of no answer, and produce no convic-
tion." That his knowledge extended to the minutest objects,
and included the arts and benefices of common life, is testified
by Dr. Blackwell, in his "Court of Augustus." The industry
of his research, and the acuteness of his observations, compre-
hend not only the mechanical arts, but the various departments
of trade, agriculture, and navigation; and that he possessed
poetical talents in a considerable degree, is evident from the
animated letters that are found in the collection of Pope's
Works, and also from several compositions in verse, particu-
larly the beautiful flanze written on the prospect of real-
izing his noble scheme relating to Bermuda. The classical
romance, entitled "The Adventures of Signior Gaudentio
di Lucca," has generally been attributed to him.

Besides the writings already mentioned, bishop Berkeley
published, at Dublin, in 1735, a small pamphlet relating to
the doctrine of fluxes, entitled "Reactions for not reply-
ing to Mr. Walton's full Answer," &c. His smaller pieces
were collected and printed under his inspection at Dublin in
1752, under the title of "Miscellanies." The works of
George Berkeley, D. D. late bishop of Cloyne; to which is
added an account of his life, and several letters, &c. were

BERKENHOUT, John, son of a respectable merchant
of Leeds in Yorkshire, but originally from Holland, was
born about the year 1730. Being intended by his father for
merchandize, after receiving a school education at Leeds, he was
sent to Germany, to acquire a knowledge of that language.
Having a visit to the baron de Bienicht, a relation of his
father, residing at Berlin, he was, through the influence of
that nobleman, first made a cadet, and, in proposition, a
culgyn, and afterwards a captain in the Prussian army; but
on the breaking out of a war between England and France,
he obtained his dismissal from the Prussian service, and was
preferred to the command of a company here. On the re-
turn of peace, in 1762, he went to Edinburgh, where he
enrolled himself in medicine, and after a short residence
there, he removed to Leyden, and in the year 1765, took his
degree
degree of doctor in that faculty. The thesis he wrote on this occasion is intitled, "Dissertatio medica inauguralis de podagra," and is dedicated to his relation the baron de Briel-
feldt. On his return to England, he settled at Ifford, near the Thames; and soon after published his "Pharma-
ocopra medica," which has been so much approved, as to pass through several editions. But he seems to have been of too active a disposition to remain long in the practice of medicine, in which he never made much progress. In 1778, he was
appointed by government one of the commissioners who were sent to America with a view of settling the differences be-
tween that country and England, and was the only one of
them that was permitted to go to Philadelphia, where the congress was sitting. Here he remained some time, but forsook at length the congress, not approving of the
reason, of carrying on a secret correspondence with several of the Americans, who disapproved of their proceedings, he was first sent to prison, but was soon released, and then sent to his brother commissioners at New York. On his return to
England, he received a pension from government for the
services he had to endeavour to render his country; on which,
and his own fortune, he lived as a private gentleman to the
time of his death, which happened on the 3d of April
1791.

Dr. Berkenthout was author of various works, besides those
mentioned above. In 1770, he published "Outlines of the
Natural History of Great Britain and Ireland;" a useful
manual for students in that line. In 1788, "First lines of
the theory and practice of philosophical chemistry;" which
he dedicated to Mr. Eden (lord Auckland), who had been one
of the commissioners with him to America. He also wrote
"An Essay on the bite of a mad dog;" "An Answer to Dr.
Codgans's Essay on the gut;" "A Preface to the
translation of Pomme's treatise on lyricall diffeujs." He was
also the author of "Lecturizations on ways and means," from
which he received the usual title of several of our present taxes is taken to be
present; and of "A Translation of a treatise on the late
king of Sweden." New Bpog. Dict.

BERKER's Creek, Arian, in Geography, a sand which
shuts off from the land towards the sea, to the south of
Blenk, or the south fand-hill, on the coast of Holland. It
is situated on the south of the Land Deep channel into the
Texel, the coast trending nearly N. and S. from the
Mae to the Texel.

BERKHAMSTEAD, a market town of Hertford-
shire, England, is situated in a fertile country, on the southern bank of the Bell river, or Thames, at the distance of
26 miles N.W. of London. This town and its vicinity
have been the seat of war, and noted by historians as the property and residence of some of the Saxen kings,
and other distinguished characters of that nation. After
the Norman conquest it was possessed by some princes of
the blood, and dukes of Cornwall. On the north side of the
town are the embankments, and other remains, of a consider-
able castle, which Camden supposeth was built by Robert
Moreton earl of Cornwall, who was brother to the con-
quéror, and enjoyed the manor, &c. from him. At this
place the conqueror had an interview with the English no-
bility, after his successful battle against Harold. The castle
raided by earl Moreton, was demolished in his son's time,
who was accused of rebellion, and the town and manor
forfeited to the crown. Henry II. granted the inhabi-
tants many privileges, among which was the liberty of sell-
ing their goods free of tolls and duties, either in this coun-
try or in Normandy, Aquitain, or Anjou. In Domeday-
book we find fifty-two burgesses named in this town, whose
merchandise was chiefly wool, which was manufactured into

cloth on the continent. Henry II. kept his court here,
as appears from a grant dated at this place, conferring
the church of Havering in Essex on the monks of St. Ber-
nard de Monte Jovis, to provide firing for the poor. King
John, in the 7th year of his reign, granted this castle and
honour to Geoffrey Fitzpeter earl of Essex; but two years
after his death, these places were again in the king's hands.
The dauphin of France, in concert with the barons, besieged
this fortress, which was bravely defended. The besiegers
made two successful fallies, and held out until the king sent
them orders to surrender. Previously to the second year of
Henry III. the markets were held here on a Sunday, but
in that year they were changed for Monday, which is still
the market day. This castle and lordship continued for a
long period in the possession of the earls and dukes of Cor-
wall, and was repeatedly the scene of baronial and baro-
nable contention. The castle was surrounded by a fos and wallum, including about four acres of ground, and the keep, or citadel, was placed on the north side of it; upon the dilapidation of its walls, a large house was constructed with the materials,
which was poeifieed in the rebellion by colonel Axtel.

The town is much reduced from its former confluence,
and confines of one long street, having St. Leonard's hospital
at one end, and St. James's at the other. The church, dedi-
cated to St. Peter, is a large handsome pile of building,
and has several small chapels, or oratories, included within
its walls; also some curious old monuments. Here is an
alms-house for six poor widows, who are jointly allowed 62.
1 year towards their maintenance. The town has also a chari-
ty-school and a free grammar school; the latter of which was
endowed by king Edward VI. for 144 boys, and provided
with a master and usher. Besides these charitable founda-
tions, here is another alms-house, which was endowed by
John Layner and his wife, with a legacy of 1500l. Berkham-
stead gives the title of marquis to the duke of Cumberland.
The chief trade of the place consists in the turning of bowls,
of thistles, sponges, and other articles, made of beech wood.
Here are three annual fairs, and a flat fair for the hiring of
servants, &c. The houses in the parish are 358, and the
inhabitants amount to 1690. This town is called Berk-
hamstead St. Peter's, in contradistinction to another parish
a little to the north of it, which was formerly separated from
this, and called Northchurch, or Berkhamsted St. Mary's.
Salomon's History of Hertfordshire, &c.

BERLI, a town of Athos Turkey, in the province of
Notolia, near the river Cufper; 56 miles E. of Smyrna.
N. lat. 35° 32' E. long. 25° 30' 39".

BERKELY, a county of Virginia in North America, lies
west of the Blue ridge, north of Frederick county, and se-
parated from the state of Maryland, on the north and eft
by Potomack river. This fertile county, about 42 miles
long and 20 broad, has 16,781 free inhabitants, and 2932
slaves. Its chief town is Martinburg.

BERKLEY, the name of a county and town in Charlefon
district, south Carolina, lying near Ashley and Cooper
rivers. In the census of 1791, it was called St. John's
parish, in Berkley county, and contained 752 free persons,
and 5170 slaves.

BERKLEY, a township of Bristol county in Maffachusetts,
containing 350 inhabitants; 50 miles S. of Boston.

BERKLEY, or BERKELEY, an ancient town of Gloucece-
shire, England, is distinguished in the annals of this country
for its many baronial castle, and the popular events that have
occurred within its walls. The town is scarcely ever noticed
in the page of history, whilst the castle is repeatedly mentioned,
and referred to from the Norman conquest to the disastrous
warfare in the seventeenth century. In some old records
this
the place is called Berkel, and is distinguished by the appellation of borough, though it does not appear ever to have been a town or borough until. Formerly the great public road from Bristol to Gloucester, and from the western to the northern counties, passed through the town, and consequently gave it some advantages; but this road is now converted to the use of other purposes. When is the county of Berks about Berks? And, as to the London-Bristol road, it is navigable for vessels of 40 or 50 tons. The high road, which flows round the castle gardens, and extends a short distance above them. This part of the county is distinguished by its fine pasturage land, the rich cheese made in its dairies, and the golden and London-pippin cider, obtained from its orchards. The cheese mostly made here is distinguished by the double name of Gloucester, and by the fact that it is bought up by the London factors, at a high price. (See Cheese.) The town is one of the five ancient boroughs of this county, which flourished in the time of Edward I. and though deprived of most of its ancient privileges, yet it is a borough annually elected.

The castle of Berkeley is one of the most perfect of the English baronial edifices, and has suffered less by the scourge of war and injudicious alteration, than any other English castle belonging to a subject. Some parts of the original structure are still perfect, and are interesting examples of the first Norman architecture, which was employed in constructing the baronial castles. The site of this building occupies an area of ground whose outline is nearly circular. It rises from a valley on the south and east, and its sides are guarded by embattled walls, towers, and fortified gates. The great entrance gate opens into a base court, having the keep on the left, and the domestic apartments on the right, and front. The keep, whose walls are lofty and massive, resembles the form of a Roman D, and is flanked by three semicircular towers, besides that in which the great stone stairs are contained. This is square, and has a small dark room near the top, where Edward II. was secretly murdered by the machinations of the bishop of Hereford, who invented and directed the execrable deed.

The elegant and energetic poet, Gray, notices this event in the following expressive terms:

"Mark the year, and mark the night,
When Severn shall re-echo with alarm,
The shrieks of death through Berkeley's roof to ring,
Shrieks of an agonizing king."

The hall, chapel, and most of the apartments, are fitted up and preferred merely in their ancient style, and in some of them are several curious relics of antiquity. Among them are many fine old historical portraits, and the sopha, chairs, and bedstead, which belonged to the cabin of the circumnavigator Sir Francis Drake. The hall, which is 43 feet by 33, was built in the reign of Edward III. and has a fine old raftered roof, with a gallery at one end for the accommodation of minstrels, in "days of yore." Leland mentions several parks and chases, as connected with this castle at the time he visited it; but all, except two, have been converted to the more useful purpose of farming. One of these, called Whistle-park, which is inclosed with a wall seven miles in circumference, still remains, and contains much fine forest-timber.

At Purton near this castle, the present earl of Berkeley has made a decoy pool, which is the only one in this county, and where a great number of wild-ducks are annually netted. The celebrated Dr. Jenner, the great promoter of the vaccine inoculation, was born in this parish.

To the north of the castle is the parish church, which is a large handsome structure, and contains several handsome and ancient monuments to the Berkeley family. The tower is a modern building, and constructed at a small distance from the church.

In this township are 99 houses, and 658 inhabitants. In the hundred of Berkeley there appear to be, by the population act, 3,450 inhabited houses, 9,148 males, 10,074 females, 3,968 persons employed chiefly in agriculture, 615 employed in trade, manufacture, and handicraft, and the whole number of persons amounts to 19,222. Rudge's History of Gloucestershire. Builder's History of ditto.

Berkley Point, lies on the north side of lord Egmont's island, or New Gloucester, the principal of the groups called Queen Charlotte's islands, in S. lat. 10° 34'. E. long. about 164° 10'.

Berkley Sound, so called from captain Berkley, who visited it in 1797; an inlet, or bay, on the N. W. coast of North America, being the entrance into the fopped strait of Juan de Fuca, terminated on the south by cape Flattery, and on the north by the southern part of Quadro, or Vancouver's island; about 51° 31' south-east of Nootka found. N. lat. 48° 30'. E. long. 235° 37'.

DEERS, a county of Pennsylvania in North America, has Northampton county on the N. E., Northumberland on the N. W., part of Luzerne on the N., Dauphin and Lancaster on the S. W., and Chester and Montgomery on the S. E. It is watered by Schuylkill river, and is 53 miles long, and near 29 broad, and contains 1,070,400 acres. Iron and coal, which are plentiful, supply several iron works. The northern parts are rough and hilly. Berks contains 35,177 inhabitants, of whom 65 are slaves. It has 29 townships, of which Reading is the chief.

BERKSHIRE, a county of the state of Massachusetts, is bounded on the N. by the state of Vermont, on the S. by that of Connecticut, E. by that of New Hampshire, and on the W. by the state of New York. It runs through the whole extent of the state from N. to S. and contains 26 townships; and the number of inhabitants is 63,291. White and coloured marble is found in several towns, in the rough and hilly parts of this county.

BERKSHIRE, a newly settled township of Franklin county in the state of Vermont.

BERKSHIRE, an inland county of England. Previous to, and at the period of the Roman invasion of Britain, this part of the island was inhabited by three British tribes, respectively termed Artebrates, Bibroces, or Rheini, and Segmentici. The first occupied the western part of the country, from the river Lodon on the south-east, to the Thames on the north-west; whilst the second possessed the south-eastern part of the county; and the Segmentici inhabited the remaining part on the southern side. When Constantine divided this country into Roman provinces (in 313 A.D.) Berkshire was included in the first division, called Britannia Prima. During the Saxen Heptarchy, it constituted part of the kingdom of the Saxon, or Wessex, which commenced about A.D. 519, and continued till A.D. 828, when Wessex became the only sovereignty,
for sovereignty, and its monarch, Egbert, gave the whole country the name of England. Alfred, grandson to Egbert, and a native of Wantage in this county, proceeding on the plan of his grandfather, more firmly cemented the kingdoms which Egbert had united, divided the whole into hundreds, titheings, parishes, &c. and gave this division the name of Berroc'hire, which was afterwards contracted and shortened into Berkshire.

This county is bounded on the north by the shires of Oxford and Buckingham, on the east by Northamptonshire, on the south by Hampshire, and on the west by Wilts. In the estimation of its size authors are at variance, but the most accurate statement gives its length from E. to N.W. as 48 miles, and its breadth, in the widest part, at 25 miles; though a narrow part near the centre is little more than 6 miles across. It contains about 530,000 acres of land, and is locally divided into twenty hundreds, containing 12 market towns, 140 parishes, 62 vicarages, about 670 villages and hamlets, 21,195 houses, and 100,572 inhabitants. A range of chalk hills entering this county from Oxfordshire, crosses it in a westerly direction, and forms the southern boundary of the vale of White Horse. Independent of this range of hills, the county is characterized by gentle eminences and valleys; having much rich fertile land, and abounding with picturesque and beautiful scenery. Though almost every kind of grain is cultivated in the county, yet that of barley is raised in greater quantities than either of the other species, and when made into malt, is chiefly sent to London. Many large dairy farms are found in the White Horse vale. Berkshire is well stocked with timber, particularly oak and beech in the western part, and also with numerous deciduous and exotic trees in Windfor forest and park, and in the various ornamental plantations scattered through the county.

The open commons and uncultivated fields of Berkshire are supposed to constitute nearly half the county. Of these, Windfor-forest, Maidenhead-thicket, Tylchurft, Wickham-heath, and the numerous commons and marshes, that are found in almost every parish, contain above 40,000 acres. The county derives but little advantage from manufactures, there being only a few clothiers established in the western part of it, and some pin-makers, &c. at Reading. On the banks of the river Kennet, in the vicinity of Newbury, are some large beds of peat, which furnishes the poor with fuel, and the farmer with affes to meliorate his land.

The principal rivers of Berkshire are the Thames, the Kennet, the Lamtom, the Ock, and the Loddon. The first, though it serves to irrigate and fertilize a great part of this county, does not directly belong to it, being the natural boundary line between this and the counties of Oxford and Buckingham. It enters Berkshire almost one mile south of Lechlade, and, after proceeding 62 miles onward, passes the several towns of Abingdon, Wallingford, Henley, Maidenhead, Windfor, &c. and having received the tributary waters of various streams, leaves the county near Runnymead.

The Kennet enters the county on its western side at Hungerford, and passes through a narrow boggy valley to Newbury. Flowing eastward, in nearly a direct line, it runs through the county town of Reading, and soon afterwards unites with the Thames.

The Lamtom, a tributary stream to the former river, rises near a town of its own name, and after a course of about 11 miles, falls into the Kennet at Newbury. This river has been described as a phenomenon, by many topographical writers; some of whom have asserted that its current is more powerful and copious in summer than in winter. To account for this singular occurrence, they have had recourse to various hypotheses, but had they visited the place, and there made inquiries, they would have found, that the river has no remarkable characteristic different to others, whose course is through a short tract of flat country.

The Ock rises in the vale of White Horse, near KingstonLisle, and flowing eastward, receives several other streams before it reaches the town of Abingdon, near which it unites with the Thames.

The Loddon enters the southern side of the county near Swallowfield, and running directly north, forms the western boundary to Windfor forest, and falls into the Thames near Wargrave.

Berkshire is in the diocese of Salisbury, and included in the Oxford circuit. It sends two members to parliament; two of whom are returned for the county, and two for each of the towns of Reading, Wallingford, and New Windfor. The other member is elected for the borough of Abingdon. The Lent affixes, and the Episcopacy lefions, are constantly held at Reading; the Easter feftions at Newbury; the Summer affixes at Abingdon; and the Michaelmas feftion alternately at the latter town, and at Reading.

Among the objects of antiquity in this county, is the celebrated White Horse; which the most learned antiquaries refer to Saxon origin; and Mr. Wife, who has published two quarto pamphlets on the subject, endeavours to prove that it was designed by Alfred, to commemorate a victory obtained by the Saxons over the Danes. It was formed on the side of a chalk hill, by the simple process of cutting off all the green turf within a certain line, which resembled the shape of a horse. This trophy is now nearly obliterated by the grass growing on its surface. Near the White Horse is a very large encampment, called Uffington-castle, and about one mile westward of the latter is a Druidical monument, named Wayland-Smith. It is a large cromlech on a barrow, with several smaller stones, which were formerly placed in a circle round it. Another Druidical relic is to be found at Park-place in this county. This was brought from the site of Jerfey, and all its stones were placed here in the exact position, and relative situation in which they were originally found. See Henley.

Besides several ancient encampments of different sizes and shapes, this county had two Roman stations, which are named in Antoninus's Itinerary,'Spina,' and 'Calleva,' and are found in the thirteenth Iter of that work. In the seventh Iter is another station, named Pontibus, or Pontia, which antiquaries agree in fixing near the eastern border of the county. The Roman Watling-street passed across the northern corner of Berkshire, entering it near Wallingford, and leaving it on the north-western side. Reading is the county town of Berkshire, and the castle of Windfor its greatest or nament. Camden's Britannia. Cramer's History of Reading. Horley's Britannia Romana. Beauties of England and Wales.

BERKUSSA, a town of Croatia, on the river Kulpa, 11 miles west of Petrcrza.

BERLAI, a town of Croatia, on the river Korana, 8 miles south of Split.

BERLAMONT, a town of France, in the department of the North, and chief place of a canton, in the district of le Quefnoy, 24 leagues E.S.E. of le Quefnoy. It contains 1579 inhabitants, and those of the canton amount to 5179. The territory includes 150 kilometres, and 14 communes.

BERLASREUT, a town of Germany, in the circle of Bavaria, 12 miles N. of Paffau.

BERLEBURA, a town of Germany, in the circle of the Upper Rhine, 56 miles E. of Cologne.

BERLEUX, a town of France, in the department of the Somme, and chief place of a canton, in the district of Pérone, 3 miles S.W. of Pérone.

BERLIN, a city of Germany, in the circle of Upper Saxony,
Sixty, and capital of the electorate of Brandenbourg, and of the whole Prussian dominions, is situated on the banks of the river Spree, and has been reckoned one of the most beautiful cities in Europe; as it is one of the largest and most populous in Germany. Its extent is about 45 miles in length, from the Mühlentor on the south-east, to the Oranien-burghthor on the north-west; and about 3 miles broad from the Bernavethor, on the north-east, to the Potsdam-camethor on the south-west; but within this extensive enclosure there are many gardens and corn fields. The streets are disposed with great regularity, and are of a convenient breadth. In the new town they are perfectly straight. Frederick Street, it is reckoned 25 English miles in length; and others, which intersect this at right angles, are a mile, or a mile and a half long. Some have asserted that it covers as much ground as Paris; but though this be not true, and it be allowed to occupy more than half the extent of the capital of France, its number of inhabitants is much smaller in proportion. The number of houses has been variously estimated. Reibbeck computes them at 6000; count Hertzberg states the number of buildings public and private, as amounting in 1790, to 6725; and according to Hoek, the number of houses is 6950. The number of inhabitants, according to the latest statement, is 145,000; Hoek computes them at 142,099; and Hertzberg at 150,803, being, on an average, more than 22 inhabitants to each house.

There are a few very magnificent buildings in this town; and the rest are neat houses, built according to a plan prescribed by the late and present king, who have directed their particular attention to the external decorations of the city, either of a fine white free-stone, or of bricks covered with a thin coating of plaster, painted with a light colour, and generally one, or at most two stories high. The formation of the city, in a barren sandy plain, exposes it very much to dust, which, in dry windy weather, is not only injurious to the eyes and lungs of the inhabitants, but detrimental to the beauty of the buildings, which exhibit a foiled and shabby appearance. The finishing of the houses within by no means corresponds with their external elegance; the rooms are in a ruinous condition, the furniture covered with dust and dirt, and the variety of persons of the meanest condition who inhabit them, altogether incongruous to their outward magnificence and decoration. In these handsome houses, soldiers are quartered even on the ground floor, in rooms looking out to the street; and the lowell mechanics occupy the different stories. The principal edifices are the king's royal palace, and that of the prince royal. The former is a magnificent structure of free-stone, begun by Frederick I. in 1699; but as it has been constructed at different periods, and by several architects, its fronts are not exactly regular. It consists of four stories, with large apartments, fine ceilings, and superb furniture. The state chambers are decorated with capitals painted and rich tapestry, and furnished with tables, stands, lutes, chandeliers, looking-glass frames, screens, couches, &c. of solid silver. The library, though a mean apartment, is well furnished with books; among which is a collection of 500 Bibles in different languages and editions, particularly the Bible used by our Charles I., when he was beheaded, presented as a kind of relic by Dr. Juxton to the elector of Brandenburg, and also the first Bible printed in America, and one of 1450, the first printed in the German language; and also a koran, in a character so small, and on a paper so thin, as to form only 1½ inch in bulk. The arsenal is a noble structure, forming a spacious quadrangle, and containing arms, ranged in excellent order, for 200,000 men. Over the principal gate is a portrait of the elector, William the Great, in a large model of gilt brass; and the four cardinal virtues, of a gigantic size, are placed on pedeinals on each side of the portico, and seem to look towards the picture. The folding doors of the garden amount to about 90,000. The royal stables are very magnificent, adjoining to which are grand apartments for the master of the horse, and his inferior officers; and in the rooms over the stables, may be seen the rich accoutrements of the horse on which Frederick I. rode, when he made his public entry; all the ornaments of the bridles, the breast-leather and crupper, as well as the bits and stirrups, being of gold, adorned with brilliants. The opera-house is a beautiful structure, and on the front bears this inscription, "Friedrichus rex. Apollini et Mußis." The king allows the free exercise of religion; and, accordingly, in Berlin are 25 churches, 14 of which are Lutheran, 10 Calvinists, and one Roman Catholic, which is the most elegant in the city. The churches are decorated with Mercury, Apollo, Minervas, and Cupids, "which might lead a stranger to forget," says Dr. Moore; "that the Christian religion was exploded from the Prussian dominions, and old Jupiter and his family restored to their ancient honours." Instead of fountains and crucifixes, says the same writer, Frederick III. proposed to adorn the church of Berlin with the portraits of men who have been useful to the state; those of the marshals Schwerin, Keith, Winterfield, and some others, were actually placed in the great Lutheran church before his death. We may also reckon among the public buildings and establishments of Berlin, the academy of sciences, (See Academy), another of arts and painting, an anatomical college, 5 gymnasium, 2 public libraries, and many excellent and important fabrics and manufactures of silk, woollen stuffs, and flockings, cotton, linen, lace, porcelain, &c. which supply it with a very considerable and advantageous trade, to the prosperity of which, the unlimited toleration granted to Roman Catholics, Lutherans, Calvinists, & Jews, has very much contributed. In Berlin, there are several large squares, in one of which is an equestrian stature of marshal Schwerin, holding the ensign with which he advanced at the famous battle of Prague, and which he seized from one of his officers when his troops were giving way, exclaiming, "Let all, but cowards, follow me." On the new bridge over the Spree, stands also an equestrian statue of William the Great, which is highly esteemed as a piece of fine workmanship; the man and horse in one piece, cast at the same time, and the statue weighs 3000 quintals. The suburbs are adorned with the magnificent garden of count Reuss, the beautiful house and garden called Mombijon, the houfe and garden of Belvidere, and the lately hospital of invalids, for the maintenance of about a thousand officers and soldiers. In the new Calvinist church of old Cohi, is the burying place of the royal family. At Berlin there are many public walks and gardens. The principal walk is that in the park, on the south side of the Spree, which is upwards of three miles in circuit, and reforted to by the inhabitants of the city in great crowds on a Sunday; and here they are provided with every kind of refreshment, and indulged with any sort of amusement. The most fashionable walk in the city, is that which lies in the middle of one of the streets. Before the houses at Berlin, on each side, is a caufe-way, and between these two caufe-ways, are fine gravel walks planted with lime-trees. Under these are pitchet tents, in which are sold ice, lemonade, and other refreshments. In the summer, the bands of music belonging to the regiments pratisie in this walk. In all the private houses a very rigid economy is observed; the chief article of expence is that which pertains to the drefs of the ladies, who deny themselves common indulgences, for the sake of powder and millinery. The ladies
indies of the court have much of the air of French women. There are some kinds of irregularities that prevail to a great degree in this city. Public countreans are more numerous here than in any town of Europe, in proportion to the number of its inhabitants. They appear openly at the windows, beckon to passengers as they walk in the streets, and play for employment in any way they please, without disturbancic from the magistrate. Citizens and manufacturers of the better kind are altogether among those of their own rank; and without affecting the manners of the country, or flowing to the mean branches of the communitv, maintain the decency, plainness, and honesty of the German character. Jealousy is held in equal contempt and detestation by the inhabitants of Berlin, and scandal is very little known. The environs of this city are remarkably pleasant, being interspersed with villages, vineyards, canals, pleasure-houses, and gardens. Among the palaces in the neighbourhood belonging to the royal family, Schoenhauen and Charlottenburg are the most worthy of notice. The former is situated about two miles from Berlin, on the Panko, which supplies the pond in the fumptuous garden of this palace with water. Charlottenburg also, one of the royal or electoral palaces, seated on the river Spree, was only a small village, till the electors, comfort to Frederick I. being pleased with its situation, began to build in it, and after her death the works were carried on by the elector, who gave it its name in commemoration of his wife Sophia Charlotte. This palace is one of the most considerable structures in Germany, and is adorned with a most beautiful garden.

Berlin is divided into five wards, called Berlin proper, Cob on the Spree, Frederick's Werder, Dorotheenstadt, and Fredericksburg. The proper Berlin was founded in the 12th century, by some colonists invited thither from the Netherlands, and the vicinity of the Rhine, under the margrave Albert, the Bear. The suburbs of this town are frequently called Konigstadt, and by others divided into three districts, or quarters. Berlin proper is separated by a principal arm of the Spree from Cob, over which are four bridges, three of timber, and one of stone, called the Pontneuf. Cob was probably built about the same time as Berlin; and it is formed into a kind of island by two branches of the Spree, which environ it. New Cob is now a considerable part of the old town of Cob, from which it is separated by the Spree. The suburbs of Cob were inclosed in 1736, within the outer wall. The Fredericksberg was built by the elector Frederick William, on a swampy werder, or island. This ward is separated by a rampart and ditch from the Dorotheenstadt, or Neuflad, founded by the elector Frederick William, and named after his consort, Dorothy. This new town is the most beautiful part of Berlin, and it is chiefly inhabited by the French. In a street of this town is the walk above mentioned. Fredericksstadt, founded by the elector Frederick III. immediately on his accession to the government, communicates with the new town and the Werder, and is the pleasantest ward in the whole city; the streets being spacious, straight, and planted with lime-trees. Behind this is erected a new ward, which ranges to the end of the new town, where many of the nobility have built palaces. In the suburbs, the houses are generally of timber, but so well plaited, that they seem to be of stone, and the streets are broad and straight. From this town there is a free communication, by means of canals, between the Spree and the Oder, and the Spree and the Elbe. Berlin lies in N. lat. 52° 32' 30". E. long. 13° 26" 15'. The annual average of temperature of Berlin for fifteen years, from 1769 to 1782, was, according to Mr. Bognini's observations, 49°; nor could be find that the temperature de- 

The Baltic, within 120 miles N. of it, tempers the north winds, says Kirwan (See his Estimate of the temperature of different latitudes, p. 71.) and to this is owing the moderate temperature which it enjoys. The influence of the vicinity of the Baltic must be allowed, when it is considered, that the temperature of Berlin is higher than that of Drefden, Altenburg, or Gotha, whose latitude is one degree lower, but more distant from the Baltic. Reifbeck's Travels, vol. iii. Moore's Travels through France, &c. vol. ii.

Berlin, a neat and flourishing town of America, in York county, and state of Pennsylvania, containing about 100 houses. It is regularly laid out, on the S. W. side of Conewango creek, 13 miles westerly of York town, and 101 miles of Philadelphia. N. lat. 39° 50'.—Also, a township in Orange county, Vermont, on Dog river, a branch of Onion river from the south, which last separates Berlin from Montpelier on the N. N. W. Berlin contains 134 inhabitants, and is about 93 miles north-easterly from Bennington.—Also, a township in Hartford county, Connecticut, 12 miles S. S. W. from Hartford, 32 N. W., from New London, and 26 N. N. E. from New Haven.—Also, a township in Worcester county, Massachusetts, containing 512 inhabitants, 34 miles W. from Bolton, and 15 N. E. from Worcester. Hops have been cultivated here, and promise to be a valuable article of import. —Also, a township of Somerset county, formerly in that of Bedford, Pennsylvania, which lies on a branch of Stony creek, a south water of Conewango river on the west side of the Allegheny mountain; 25 miles W. from Bedford; 23 N. W. from Fort Cumberland, in Virginia, and 200 W. from Philadelphia. Stone creek, the chief source of Kilkeminitus river, rives N. N. E. of Berlin. N. lat. 39° 54'.

Berlin, a fort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany: though some attribute the invention of it to the Italians, and derive the word from berlinia, the name given by them to a sort of flage, wherein persons are exposed to public flame. In proof of its having derived its origin, as well as its name, from Berlin, it is alleged, that Philip de Chiefe, a native of Piedmont, and descended from the Italian family of Chiefa, was a colonel and quarter-master in the service of Frederick William, elector of Brandenburg, and that he was much esteemed by the elector on account of his skill in architecture. Being one year to France on his master's business, he cau of to be constructed, for the convenience of this journey, a carriage capable of containing two persons; which in France, and every where else, was much approved, and called a berlin. This Philip de Chiefe died at Berlin in 1673.—Deekman's Hist. of Inventions, vol. i. p. 130.

The berlin is a very convenient machine to travel in, being lighter, and less apt to be overturned, than a chariot. The body of it is hung high, on shafts, by leathern braces; there being a kind of flippet, or footstool, for the convenience of getting into it: instead of side windows, some have screens to let down in bad weather, and draw up in good weather.

Berlin, in Natural History. See Berlin.

BERLINCHEN, in Geography, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg, 80 miles E. N. E. from Berlin, and 36 N. E. from Kurlin.

BERLINCEZ, a town of Poland, in the patrimates of Bracław, 52 miles W. from Bracław.

BERLOCH, a town of Bohemia, in the circle of Czazlau, 9 miles N. E. from Czazlau.

BERME, in Fortification, a small space of ground, four or five feet wide, left without the rampart, between its foot

Vol. IV.
and the side of the mast, to receive the earth that rolls down from the ramart, and prevent its falling into, and filling up the mast.

This is also called *lisier, relais, retraites, pas de fontes, foundland, &c.*

Sometimes, for greater security, the berme is palisaded.

**Bermuda Hundred,** or *City Point,* is a port of entry, and port town of America, in Chesterfield county, Virginia, seated on the point of the peninsula formed by the confluence of the Appamattox with James river, 36 miles westerly from William burg, 62 from Point Comfort, in Chesapeake bay, and 31 S.W. by S. from Philadelphia. City Point, from which it is named, lies on the southern bank of James River, 4 miles S.S.W. from this town. The town has about 40 houses, including some warehouses. It trades chiefly with the West Indies, and the different states. City Point, in James River, lies in N. lat. 37° 16'. W. long. 77° 31' 30'.

**Bermudas,** or Somers' Islands, vulgarly called *Summer Islands,* a cluster of small and rocky islands, forming the figure of a shepherd's crook, and amounting in number to about 400; situated in the Atlantic, and distant from the coast of Carolina about 200 leagues. N. lat. 32° 35'. W. long. 63° 28'.

They derived their first name from John Bermudas, a Spaniard, who discovered them in 1527; and their second appellation they owe to Sir George Somers, who was shipwrecked on these rocks in his passage to Virginia in 1609, and lived there 9 months. But he and his companions, having built a ship of cedar wood, failed from thence to Virginia. Sir George Somers, it is said, was driven a second time on these islands, and died there. But his companions, returning to England, made so favourable a report of their beauty and fertility, that the Virginia company, who, as the first discoverers, claimed the property, sold them to about 120 persons, to whom King James I. granted a charter. Accordingly, in 1612, they planted the largest of them, viz. St. George's isle, with 160 persons, and in 1619, sent thither 500 persons more; upon which they instituted an assembly, with a governor and council. It is said, that they are much incommode by want of fresh water, and by the storms, thunder, &c. to which they are subject. Shakespeare has therefore justly defribed them as ever "vexed" with storms; but the poet Waller, who refided there some time, on being condemned for a plot against the parliament in 1643, represents them as enjoying a perpetual spring. In 1725, the benevolent bishop Berkeley proposed to erect a college in these islands for the conversion of the savage Americans. See Berkeley.

This group of isles is said to consist of about 400; but the greater number seem to be mere islets and rocks, not of sufficient importance to have received a name. From the chart by Lemercier in 1797, it should seem that the largest island, called "Bermuda," resembles a hook, the great found fronting the north. The length is about 35 geographical miles, and the breadth between one and two. The other islands which have received names are St. George's, St. David's, and Somerret. The island of St. George's lies eastward of the main land, and has a capital town of the same name, containing about 500 houses. Continuous to this is St. David's, which lies parallel to the town with provision. The air is healthy, and a continual spring prevails; so that most of the productions of the West Indies might probably be cultivated in these isles.

The houses are built of a soft stone, which is fawn like timber, and seemingly resembling that of Bath; and the stone is much used in the West Indies for building water.

With regard to the supposed fertility and productiveness of these islands, it appears, from the answers of governor Brown to the inquiries of the privy council of England, that they contain from 12 to 15 thousand acres of very poor land, of which square to 10 are either uncultivated, or reserved in woods for supply of timber towards building small ships, floors, and shallows, for sale, this being the principal occupation of the inhabitants; and the vessels which they furnish, being built of cedar, are light, buoyant, and unexpensive.

Of the land in cultivation, no part was appropriated to any other purpose than that of raising Indian corn, and celfulent roots and vegetables, of which a considerable supply is sent to the West Indies, until the year 1785, when the growth of cotton was attempted, but without much success; there not being at present more than 200 acres applied to this species of culture. The number of white people of all ages in Bermudas, is 5462, and of black, 4919. The Bermudians are generally very men, and the negroes are expert mariners. In the war between Great Britain and America, there were at one time between 15 and 20 privates fitted out from hence, which were manned by negro slaves, who behaved irreproachably; and they the slave of slavery in these islands, and so much are the negroes attached to their masters, that such as were captured always returned when it was in their power. Some part of the trade of the Bermudians, consists in carrying the salt which they fetch from Turks island to America, where it sells for about £2 for provisions, or for cash. These islands are frequented by whale-shippers. The government is conducted by a governor named by the British crown, a council, and a general assembly: the religion is that of the church of England. There are nine churches under the care of 3 clergymen; and one Presbyterian church. The women of these islands are said to be handsome, and both sexes are fond of drets. Edward's Hist. of West. Ind. vol. i. p. 470.

**Bermudas Cedar,** in Botany. See Juniperus.

**Bermudiana.** See Sisyrinchium.

**Bern,** in Geography, was, before the French revolution, one of the thirteen cantons of Swiflerland, bounded on the east by the cantons of Uri, Unterwalden, Lucern, and the county of Baden; on the north by the Austrian forest-towns and the cantons of Balle and Soleure; on the west by the canton of Soleure, the county of Biene, and a part of France; and on the south by the lake of Geneva, the Valais, and the duchy of Savoy. In the year 1352, Bern acceded to the Helvetic confederacy; and pollefed such power, even at that early period, as to obtain the fecond rank among the Swifs cantons. Since the acquisition of the Pays de Vaud, the domains of this canton formed the third part of Swiflerland, and about the fourth of the actual population. It contained 28,420 square miles; its population was estimated at 374,000 souls, and its contingents amounted to 2000. At the introduction of the reformation in 1528, government acquired a large increase of revenue by secularizing the ecclesiastical.
eclesiastical offices. At the same period the whole canton followed the example of the capital; and the reformed religion was permanently established. This canton was divided into two great portions; the Pays de Vaud, and the German district. The Pays de Vaud having been conquered from the house of Savoy, and the German district from the States of the Empire, justice was administered, and taxes regulated in each by peculiar laws and customs. Each of these divisions had its treasurer and chamber of appeal resident in the capital; the chamber of appeal belonging to the Pays de Vaud judged in the last resort; but the inhabitants of the German district were allowed to appeal to the foreign council. The sovereign power of this canton resided in the great council of two hundred, which, when complete, consisted of 299 members chosen from the citizens from whom they were considered as deriving their power, and as acting by delegation. The authority with which they were invested, was in some respects the most unconditional of any among the arithocratie states of Switzerland. The great council of Bern, since the year 1682, when it was declared the sovereign, was restrained by no constitutional check, like some of the others. As a general assembly of the citizens was never convened on any occasion, the executive powers of government were delegated by this sovereign council to the senate, chosen by themselves from their own body; the former ordinarily assembled three times a week, and extraordinarily upon particular occasions; the senate, every day, Sundays and festivals excepted. The senate, comprising the two avoys or chiefs of the republic, was composed of 27 members; and from this felct body were taken the principal magistrates. On a vacancy in the senate, 26 balls, of which were golden, were put into a box, and drawn by several members; and those who drew the three golden balls, nominated three electors out of their body. In the same manner, seven members were chosen from the great council, who also nominated seven electors out of their own body. These ten electors fixed on a certain number of candidates, not exceeding ten nor less than six; and from among these candidates as had the fewest votes in the sovereign council, retired till their number was reduced to four; then four balls, two golden and two silver, were drawn by the four remaining candidates; the two who drew the former were put in nomination, and he who had the greatest number of suffrages in the sovereign council was chosen. But the candidate, in order to be eligible, must have been a member of the great council ten years, and must be either a married man or a widower. The greatest excellence of this mode of election consisted, as Mr. Planta observes, in making the chance of lots apply chiefly to the electors, and not to those who might pretend to the succession, by which the dangerous effects of cabal were in a great measure obviated, and yet a fair prospect of success was given to the meritorious, while those wholly unqualified could entertain little hopes of being preferred. The selected candidates drew lots only in one stage of the proceeding; and this when their number being reduced to only four, an even chance was given to those few to whom eminent qualifications had secured the marked approbation of their fellow-citizens; and when fortune proved unfavourable in one instance, repeated opportunities would occur, in which, unless he proved singularly unprouptious, the desired object would be ultimately obtained.

The great council was generally filled up every ten years; as within that period there was usually a deficiency of 80 members to complete the whole number of 299. When this deficiency occurred, and not before, a new election was proposed; nor could it be deferred when there was a deficiency of 100. The time of election being determined by vote, each avoyer nominated two of the new members; each elector, and each member of the senate, one; and two or three other officers of state enjoyed the same privilege. Some few persons claimed, by virtue of their office, a right of being elected, which was generally allowed. These several nominations and pretensions generally amounted, on the whole, to about 50; the remaining vacancies were supplied by the suffrages of the senate, and the electors. These electors were fifteen members of the great council, drawn yearly from the abbeyes or tribes; and the candidates were generally taken from those who had exercised the office of bailiff, and were elected by lot. They were invested with an authority similar to that of the Roman censores; and in case of maladministration, might remove any member from the great council or senate, though they have seldom exercised this power. The principal magistrates were two avoys, two treasurers, and four bailiffs; each chosen by a majority of voices in the sovereign council, and yearly confirmed in their respective offices. The avoys hold their polls for life; the treasurers, six years; and the bailiffs, four. The two treasurers, one for the Pays de Vaud, and the other for the German district, formed, in conjunction with the four bailiffs, an economical chamber or council of finance, which passed the accounts of the bailiffs, and received the revenues from those who were accountable to the government. The four bailiffs, the ex-avoyer, who was the first senator in rank, and president of the secret council, the senior treasurer, and two members of the senate, composed a committee or secret council, in which all state affairs, requiring secrecy, were discussed.

Although the form of this constitution was arithocratie, and the senate possessed a very considerable influence, yet it did not enjoy (says Mr. Cox) that almost exclusive authority which exists in many arithocratie governments. For, by several wise and well observed regulations, the sovereign council, although it delegated the most important concerns of government to the senate, yet assembled at stated times, and superintended the administration of public affairs. Mr. Burke affords, that the republic of Bern was one of the happiest, most prosperous, and best governed countries on earth.

The canton of Bern, by its old constitution, was divided into a certain number of districts, called bailiages (see Bailiages), over which bailiffs were chosen from the sovereign council. These were the most profitable posts in the disposal of government, and very eagerly pursued. They were formerly nominated by the bailiffs, but the mode of election was altered in 1712, and they were chosen by lot. The bailiffs were representatives of the sovereign power in their respective districts; whose business it was to enforce the edicts of government, to collect the public revenues, to act as judges of the peace, and to be judges in civil and criminal causes, except where there was any local jurisdiction. In civil cases, beyond a certain value, an appeal lay to the courts of Bern; in criminal affairs, the proceed underwent a revision in the Senate, and was referred to the criminal chamber, which inflicted punishments for small misdemeanours; but in capital cases, the sentence was to be confirmed by the Senate, and by the sovereign council, if the delinquent was a citizen of Bern. The bailiff delivered his accounts to the economical chamber, to which court an appeal lay in cases of execution on his part, or on the part of his officers. The profits of the bailiff's office arose from the produce of the demesnes, of the tithes, certain duties paid to government in the respective bailiages, and from the fines imposed.
for criminal offences. In some parts of the German division, the bailiff became entitled, upon the death of every peasant, to a determinate part of the inheritance, which proved in some situations an oppressive tax upon the family. The bailiff, being governor and judge in his own district, and having a magnificent chateau for his accommodation, not only possessed great power, but in the course of his administration, which lasted six years, was able to live with proper magnificence, and to lay up two or three thousand pounds without extortion or unbecoming parsimony.

In Bern, the militia was so well regulated, that government was able to assemble at a very confiderable body of men at a moment's warning. To this purpose, every male at the age of 16 was enrolled, and about a third of the whole number was formed into particular regiments, composed of footmen and dragoons; the former being lachelors, and the latter married men. Every person thus enrolled was obliged to provide, at his own expense, a uniform, a musket, and a certain quantity of powder and ball; and no man was allowed to marry, unless he produced his uniform and arms. Every year a certain number of officers, called land-majors, were elected by the council of war, to inspect the arms, to complete the regiments, and to exercise the militia. The regiments were, besides this annual review, occasionally exercised by veteran soldiers appointed for that purpose. Before the arms in the arsenal of Bern, a certain quantity is also provided in the arsenal of each bailiffage, sufficient for the militia of that district, and likewise a sum of money amounting to three months' pay, which is appropriated to the electorates in case of actual service. The dragoons were chosen from the substantial farmers, each of whom provided his horse and accoutrements. In time of peace, the avoyer out of office was president of the council of war; but during war, a general in chief was nominated for the forces of the republic. A certain number of regiments being thus always ready, signals are fixed on the highest part of each bailiffage, for assembling the militia at a particular place in each district, where they receive orders for marching. As the page of history does not exhibit a greater curiosity than what was called the "exterior state" at Bern, we shall here subjoin a brief account of it. It was a model of the sovereign council, and composed of those burghers who had not attained the age requisite for entering into that council. It had a great council, a senate, two avoyers, treasurers, bannerets, and feizeniers; all of whom were chosen in the usual manner, and with the accustomed ceremonies. The poit of avoyer in this mimic legislative community was solicited with great affinity, and sometimes obtained at a considerable expense, as the successful candidate was always admitted into the great council without any further recommendation. This body possessed 66 bailiffages, consisting of several feudal counties divided throughout the country, among which Hasburg was the principal. It had also its common treasurer, and its debts; elective in this latter respect from the actual government of Bern, which was not only free from debt, but possessed of a very considerable fund in reserve. Great honours were paid to this singular institution, as it was in fact a kind of political feminary for the youth of the canton, who were likely to arrive in some future period at the highest offices in the state. Its badge, or coat of arms, which was an ape fitting on a hobnail, and viewing itself in a mirror, was no bad emblem of its mock consequence.

The revenues of Bern, out of which were paid the salaries of the principal magistrates, which were extremely moderate, the reigning avoyer being allowed 400, each of the senators 150, and the banneret 220, and which were applied to the expenses of the government, were derived principally from the public demesnes appropriated at the time of the reformation; the titles, fequestered at the same period, and affixed to the maintenance of the clergy, public feminaries, and charitable institutions, quite independent of salt and gunpowder. The produce of the post-office; customs and tolls; duty on wine imported into the capital; and fines imposed for misdemeanors; also a tax on the alienation of landed property in the French district; the interest of money accumulated from a regular progression of savings, of which nearly 500,000l. were lodged in the English funds. The whole revenue has been chiefly by the local authorities as not exceeding 300,000 crowns, which were always more than sufficient to supply the expenditure, and to construct and support the magnificent public works. A large treasure was always referred in a vault of the capital for sudden emergencies, and the care of this vault entrusted to the principal magistrates, each of whom had a separate key, and without their concurrence, and a special order from the sovereign council, the door could not be opened. The amount of this treasure could not be accurately ascertained, but it must have been very considerable, as not less than 100,000 crowns, being deposited in the mountains of Hail and Oberland. The privilege of this treasure was one of the principal objects of the French directory, to defray the expenses of their army against Egypt. In the plunder of Bern, it is said that the French did not acquire less than 400,000l. in specie.

When the directory of France determined to revolutionize Switzerland, it directed its whole force against the canton of Bern, on the conquest or subduction of which the reduction of the country at large depended. Its hostilities were prosecuted, in 1797, by requiring Bern, and the other Helvetic cantons, to dismiss the British minister, who withdrew, and voluntarily announced the termination of his embassy in a dignified note addressed to the rulers of Bern. France, having accomplished the first part of its plan, which was that of dividing the confederate states, proceeded to the attainment of their second object, which was the subjection of Bern. With this view they secured the passes which facilitated the invasion of the Bernese territory, by seizing the Esguel and the town of Bienns. The subseqent attempt to detach the Pays de Vaud from Bern, and to erect it into a republic, under the auspices of France, was equally successful, from the pusillanimity and infatuation of the Bernese government. Bern, after some feeble and ineffectual remonstrances, relinquished its claims on the Pays de Vaud, and made overtures of conciliation to the French directory, and to Menou, their agent, in Switzerland. But these degrading measures served only to hasten the fall of the republic. At length, after some fruitless negotiations, they had recourse to arms; and the forces of Soleure and Friburg ranged themselves under the standard of Bern; and the chief command was entrusted to general d'Erlach, a member of the sovereign council, who was a veteran distinguished for military skill and undaunted courage. The combined forces of Bern, Soleure, and Friburg, amounted at this time to 25,000 men, and extended from the northern frontiers of the canton of Soleure beyond Friburg, occupied the strong position of Valay, between the lakes of Morat and Neuchatel, and pushed their advanced corps as far as the valleys of Ormond, towards the south-eastern extremity of the lake of Geneva. By this position they covered the towns of Soleure, Bern, and Friburg, and prevented all communication between the two French armies, in the Pays de Vaud, and the bishopric of Bale. Erlach, having arranged his plan of offensive operations in a masterly manner, was confident of success, and his troops were eager for the combat. In this,
this state of preparation, and whilst he was employed in distributing his instructions previously to an engagement, he received orders from Bern, which revoked the powers with which he had been intrusted, and commanded him to suspend hostilities, as a negotiation was opened with the commander in chief of the French forces, general Brune. He immediately repaired to Bern, and there found the fatal ascendency of the French party. Dissatisfied with Brune's ultimatun, the magistrates issued their orders to general Erlach to renew his plan of attack. But still timid and wavering, they renewed their negotiations, which seemed merely to subject them to fresh insult. In the mean while a spirit of disaffection was spread among the troops, which Erlach, by his fomiable interpolation, suppressed; and they again prepared for attacking the enemy. But no sooner was the order issued to this purpose, than it was again revoked, and a new conference was opened with the French general. The contradictory orders roused the indignation of the troops, ardent for an engagement; and they withdrew all confidence from their officers, whom they regarded as accomplices in the destruction of their country; and many of them indignantly quieted their standards. The army of Bern, thus dispirited by counter-orders, pretended negotiations, and the gradual advances of the enemy from one advantageous point to another, and reduced to the number of 14,000 men, determined, however, under the command of their valiant leader Erlach, to make a final effort for expiring liberty, and to encounter 40,000 veterans, flushed with conquest, and in a high state of discipline. After four desperate engagements, Erlach visited a sith attack under the walls of Bern, nor did he finally abandon the contelli till his little army, diminished to 7000 men, had left 2000 of their number, and the troops of the two French generals, Brune and Schauenbourg, were on the point of uniting, while the capital was unprepared for a siege. Bern surrendered to the first summons of general Brune, and a truce of liberty was planted in his presence. Erlach, having wonderfully escaped from the repeated attacks of the enemy, was haltering towards the mountains of Oberland, with hopes of collecting his scattered forces for another effort; but being recognized upon the high road between Bern and Thun by some straggling soldiers, he was seized, bound, and placed in a cart, in order to be conveyed to the capital; but another desperate band assailed him, and, amidst reproaches and execrations, massacred him with their bayonets and hatchets. The submission of Bern speedily decided the fate of Swifferland. Upon the dissolution of the Helvetic confederacy, in 1798, Geneva, Mulhausen, Bienne, and the bishopric of Bale, were annexed to France; the remainder of the country, except the Grisons, was modelled into a republic, one and indivisible, divided into 18 departments, and governed by a senate, a great council, and five directors, who first assembled at Aarau, and were afterwards transferred to Lucern. By the constitution now established, Bern, including the central and western part of the ancient canton, with the district of Schwabenburgh, was made one of the 18 departments, and Bern was its capital. According to this distribution, the canton of Bern is bounded on the north by that of Soleura, on the east by that of Lucern, on the south by that of Oberland, and on the west by that of Sarine and Droie. During the campaign of 1799, part of Swifferland experienced a momentary deliverance; but from the unfortunate misunderstanding between the courts of Peterburg and Vienna, the directorial government was renewed. This was succeeded by a provisional government, which was first seated at Lucern, and on the progress of the Austrians in 1799, removed to Bern. When peace was established with the emperor by the treaty of Lunecville, the French ambassador transmitted the plan of a new constitution; according to which, Swifferland, including the Grisons, was divided into 17 cantons. Accordingly, by this constitution of 1801, Bern, in its former extent, except the Pays de Vaud and Argovie, was the first of the 17 departments, or cantons, and the number of its representatives deputed to the diet was nine. The whole body consisted of 77 members, chosen by the representatives of each district, and assembled at Bern, to organise the new constitution. The legislative authority was vested in the senate, composed of two landammans and twenty-three counsellors. The executive power was lodged in a little council of four senators, in which each of the landammans preceded in turn. The landammans in office was to receive a salary of 50,000 French livres, and the other landammans and four counsellors 10,000 each. The salaries of the senators were not to exceed 6000 livres. Each canton was governed by a prefect, nominated by the landammans, and was provided with its interior administration, which approved or rejected the projects of laws presented by the senate. By the conditions of eligibility, universal suffrage was abolished; and no person admitted to any public office, unless he was proprietor of land, or exercised an independent profession, and paid a contribution to the public burdens, the amount of which was regulated by each canton. A counter-revolution afterwards took place, by which the diet was dissolved, and the provincial government established as it existed before the 29th of May 1801. But the fate of Swifferland is not yet decided. For a further account of the alterations that have taken place from this period in the constitution and government of the Swifs cantons, see HELVETIA. Cose's Travels, vol. i. & ii. Planta's Hist. of the Helvetic Confederacy, vol. i.

The canton of Bern is fertile and well cultivated; the plains produce corn and fruit; and the Alpine eminences afford excellent pasture, which supports herds of cattle and flocks of sheep, from which milk they make butter and cheese. The inhabitants of the district of Sancinland in this canton, are principally herdsmen and shepherds, who hold a middle rank between that of cultivators and wandering Tartars or Arabians. Each family changes its habitation five or six times in a year; and every week it is customary to meet the father of his household, with his wife and children, and preceding them, herds, a chef, kettles, and some wooden utensils, travelling, like an ancient patriarch, in search of a new residence. The country abounds with cattle and hovises, most of which are constructed of wood, and in such a manner as to be easily taken to pieces and removed for the convenience of their migration. In some of the valleys, the meadows are sometimes twice mowed, and thus fed. The mountain herbage for the cattle continues ten or twenty weeks, according to its height and situation. When their winter forage is finished, they remove to the lowest parts of the mountains, and having consumed their whole flock, proceed with their flocks towards the summits. Their progress is regular and majestic. The most beautiful cow of the herd, adorned with a magnificent collar and bell, takes the lead, accompanied by the master of the family. Then follow his attendants, with the rest of the flocks, shepherds and cattle are all bedecked with garlands of flowers; and every part reounds with the jingling of bells, lowing of cows, and cheerful notes of the herdsman. The smaller flocks bring up the rear, and the procession is closed with the wife and children. Towards the end of August they again descend toward the lower parts, pasture the last grass in the valleys, and at last retire to their warm retreats in the vale, to wait the return of spring and the fame pleasing migration. In this part of the country no attention is paid to the culture of the meadow land; for though they contrive
The prevailing language is the German; but the people of Furlan speak either French or Italian; and the common people in the Pays de Vaud, and in those parts that border on France and Italy, use corrupt French or Italian, or a jargon, founded on both. The established religion is Calvinism; and the ministers are divided into deacons and clergymen, and hold yearly chapters or synods. They are more independent of the civil power than in the other cantons, and are forbidden to interfere in matters of state. The nobility of Bern are accused of an extraordinary degree of pride and flatteries, and affect to keep the citizens and persons of lower rank at a great distance. As the whole power of government, and all the honourable offices of state, are in their hands, they are not permitted to engage in trade; and without the places and pensions which they enjoy, they must be poor and wretched. The lucrative offices being thus in the hands of the nobility, it might be imagined that people of the middle and lower ranks are indigent and oppressed. This, however, is by no means the case; for the citizens, i.e. the merchants and trades-people, feel in general to enjoy all the comforts and conveniences of life; and the penury is uncommonly wealthy throughout the whole canton of Bern. They puff the privilege of bearing arms, and form a very respectable body of military, that have been usually attached to the exiling government, and particularly favoured by it. The manufacturer, in this respect, feels that the peasant is less regarded; and the government of Bern has been charged with inconsiderate, or at least not zealously promoting, manufactures and commerce. Mr. Coxe informs us, that, in his first visit to Swifferland, he found the people of Bern much less informed, and more indifferent about the encouragement of literature, than those of the other cantons; their academical studies being principally directed to those branches of knowledge that fitted them for the church; and the society for the encouragement of agriculture, which was almost the only establishment tending to promote the arts and sciences, obtained little countenance from government. However, in his second journey, after an interval of about ten years, viz. in 1786, he says, that the government, refined from its former lethargy, had begun to perceive that it is the interest of every wise state to elevate and protect the sciences; and that the magistrates had lately purchased and appropriated at Bern a large mansion for the public library, increased the collection of books, and procured from England an extensive apparatus for experimental philosophy. A literary society had also been instituted for the promotion of physics, and natural history in general, and that of Swifferland in particular. In January 1788, this society confided to ten members resident at Bern, of whom several professors, and others were forming, collections agreeable to the plan of the institution. A regular correspondence was also established in various parts of Europe; and the members have been induced to satisfy the inquiries of foreign naturalists relating to the natural history of this country. The principal articles of exportation from this canton are horses, cheese, linen cloth, coarse cloth and canvas made of hemp, cloth of cotton, and woollen stuffs. It is said that 10,000 pieces of linen have been sent annually from this canton; the principal part of which has been conveyed to Lyons. At Bern they have manufactures of silk, chiefly flutes, and coloured fockings. In the western part of the mountain, the principal employment is clock-making, and the polishing of walne flutes.

The following table exhibits the height of the principal peaks in this canton.

BERN, a city of Swifferland, and capital of the canton of that name above described, derives its name, as it has been said, from a "bear," which was found there when its foundations were laid; "berne" in German signifying bears; and...
and accordingly, it bears this animal in its arms, and always maintains one. It was built by Berchtold the 5th, duke of Zuringen, and was, from its foundation, an imperial city. Upon his death in 1218, the emperor Frederic II. conferred upon the inhabitants considerable privileges, and compiled a code, which forms the basis of their present civil law. The liberty which this city enjoyed, attracted many persons from the adjacent country, who found a sure asylum from the oppression of the nobles. Although Bern, from its foundation, was engaged in perpetual wars with its neighbours, and for some time with the house of Austria, yet it continued to aggrandize itself by degrees, and considerably enlarged its territory.

This is a regular well-built town, with some air of magnificence. The principal streets are broad and long, not straight, but gently curved; the houses are built of a greyish stone upon arcades, and are mostly uniform, and of the same height. On each side are piazzas, with a wall raised four feet above the level of the street, which are very commodious in wet weather. A stream of the Aar runs in a clear current, and along a stone channel, through the middle of the streets, which furnishes several fountains not less ornamental to the place than beneficial to the inhabitants. The river Aar almost surrounds the town; winding its course over a rocky bed much below the level of the streets, and forming by its deep and craggy banks a kind of natural rampart. The stream that parallels through the town serves to keep the streets always clean; for which purpose criminals are also employed in removing rubbish, both from the streets and public walks. The more atrocious delinquents are chained to wagons, while those who are condemned for smaller crimes, are employed in sweeping the light rubbish into the rivulet, and throwing the heavier into the carts or wagons, which their more culpable companions are obliged to pull or draw along. These wretches have collars of iron round their necks, with a projecting handle in the form of a hook to each, by which on the slightest offense or mutiny, they may be seised, and are entirely at the command of the guard, whose duty it is to see them perform their work. People of both sexes are condemned to this labour for months, years, or life, according to the nature of their crimes. The public buildings at Bern, as the hospital, the granary, the guard-house, the arsenal, and the churches, are magnificent, and announce the riches and grandeur of the republic. The cathedral is a noble pile of Gothic architecture, standing upon a platform raised from the bed of the river, and commanding a most extensive view. The arsenal contains arms for 60,000 men, and a considerable quantity of cannon, which is kept in the town. The Bernese value themselves on the trophies contained in it, as well as upon the quantity, good condition, and orderly arrangement of the arms. Here is exhibited the statue of William Tell, who, with an arrow, is said to have struck off the apple placed upon his son's head by the governor Griffler, and by that means saved his life, which occasioned the beginning of the Swiss republic. The granary always contains a large provision of corn, supplied in consequence of particular treaties by France and Holland. The charitable institutions in this town are numerous, and well regulated. The hospitals are in general large, clean, and airy; and in the almshouse for the reception of 50 poor citizens, is a curious establishment similar to one at Baffe, which provides for the reception of diffused travellers who are accommodated with a meal and lodging at night, and each receives sixpence on their departure; if sick or wounded, they are maintained till their recovery. The house of correction is conducted partly on the plan of the benevolent Mr. Howard, and in consequence of his suggestion. The delinquents are separated and distributed in two houses; one called the house of correction for greater crimes, and the other the house of labour for misdemeanours. The prisoners are also discriminated by the appellations of "brown" and "blue," from the colour of their clothes; the former being appropriated to the house of correction, and the latter to the house of labour. The men and women occupy separate apartments; and both are constantly employed in cleaning the streets, and other servile occupations, and at other times in learning to read and write, and in acquiring the knowledge of various trades, which may enable them to gain a maintenance when their time of confinement expires. By these means the expense of the establishment is nearly supported, and an honest livelihood afforded to those who would otherwise prove useless or pernicious members of society. There are four tables, at which the respective feasts are made of distinction appropriated to good behaviour, and a larger or lesser share is distributed to each in proportion to their industry. After earning their food, the prisoners in the house of labour receive 10 per cent, those in the house of correction 8 per cent, for their extra-work. The torture at Bern is now formally abolished, by a public act of government; and justice is wisely and impartially administered. The solemnity used in passing capital sentence on a criminal deserves to be mentioned. When the trial is finished, the prisoner is informed of his condemnation by the "grand fautor," or lieutenant of the police, and attended by two clergymen to prepare him for death. On the day appointed for execution, a large scaffold, covered with a black canopy, is constructed in the middle of the principal street. The avoyer, with a sceptre in his hand, is seated on an elevated kind of throne between two senators, and attended by the chancellor and lieutenant of the police, holding an iron stick, called "the rod of blood," all habited in their official robes. The criminal, being brought to the foot of the scaffold, without chains, receives the sentence of condemnation, which is read aloud by the chancellor, at the close of which the avoyer commands the executioner to approach, who instantly binds the arms of the culprit, and leads him away to the place of execution.

The public library is a small, but well-chosen collection, containing 20,000 volumes, to which additions have been made by purchase, and by the liberality of private contributors; to this belong also a few antiques, a cabinet of Swiss coins and medals, some curious manuscripts, particularly of the thirteenth century, confuting of several songs and romances of the Troubadours, written in that and the preceding ages, and some other curiosities. The small figure of the priest pouring wine between the horns of a bull, is merely valuable, because it illustrates a passage of Virgil, and has been mentioned by Addison.

To the account of the public buildings of Bern, we may add that of an elegant château, built by the voluntary subscription of the nobility, furnished with accommodations for many public amusements, such as balls, concerts, and theatrical entertainments, which latter are seldom permitted in this city. The walk by the great church was formerly the only public walk, and much admired on account of the view from it, and the peculiarity of its situation; being on one side on a level with the streets, and on the other some hundred feet of perpendicular height above them. Besides this, there is now another walk on a high bank on the side of the Aar, and at some distance from the town. This walk is singularly magnificent, commands a view of the river, the town of Bern.
Bern, the country about it, and the glaciers of Switzerland.

The adjacent country is richly cultivated, and agreeably diversified with hills, lawns, wood, and water; the river flows rapidly, and, at one point, the area where the river flows, is the most picturesque.

The population of Bern is estimated at about 13,000, the society is extremely agreeable; and foreigners are received with great civility and politeness. The men do not meet in separate societies; and the women are the letters of their daily assemblies, which begin about four or five in the afternoon, and continue till eight, when the parties usually retire to their respective abodes. The inhabitants are particularly fond of dancing, which is of course a frequent amusement. This diversion commences at the hour of five in the afternoon, on account of a flitting order of government, which prohibits their continuance after eleven. There is but little trade in the capital. Some few manufactures, chiefly of linen and silk, have been established; but they are carried on only by those who have no prospect of being admitted into the friendly council, and who would think themselves degraded by commerce. But as offices of the state, those of the bailiages excepted, are neither numerous nor very profitable, many enter, as their sole resource, into foreign armies. As for the peasants, who have acquired opulence either by manufactures or commerce, they seldom quit their flatwhols, but retain the habits acquired in early life, and, however wealthy, never give their daughters in marriage to any but persons of their own description.

Of the burghers of Bern, those only are qualified for the magistracy and government of the city, who are the descendants of such as were made burgesses before the year 1635; and, besides, they must not be under 30 years of age, and must be enrolled in one of the twelve companies. The British envoy to the Swiss cantons usually resides at Bern.

Moore's View of Society, &c. in France, Switzerland, &c.

BERN-MACHINE, in Agriculture, the name of an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Switzerland.

This machine, of which there is a model in the machine-room of the Society for the encouragement of Arts, is represented in Plate III. Agriculture; and consists of three parts, the beam, the ram, and the lever. The beam ABC (N° 1.) of which only one side is seen in the figure, is composed of two flat pieces of oak, three inches thick, at least, and separated by two transverse pieces of the same wood, at A and C, about three inches thick. These planks are bored through with corresponding holes, as represented in the figure, to receive iron pins, upon which the lever acts between the two sides of the beam, and which is shifted higher and higher as the tree is raised, or rather pushed out of its place. The fides are well secured at the top and bottom by strong iron hoops. The iron pins on which the lever rests should be an inch and a half in diameter. The position of these holes is sufficiently indicated by the figure. The foot of the beam, when the machine is in action, is secured by flaks represented at G, driven into the earth. The ram D, which is made of oak, elm, or fone other strong wood, is capped with three strong iron spikes, represented at f, which take fast hold of the tree. This ram is six or eight inches square; and a flat is cut lengthwise through the middle of it, from its lower end at K to the first fork a, in order to allow room for the chain gb to play round the pulley K, which should be four inches thick, and nine inches in diameter. This ram is raised by means of the chain gb, which should be about ten feet long, with links four inches and three quarters in length, and an inch thick. One end of this chain is fastened to the top of the beam at C, while the other, after passing through the lower part of the ram, and over the pulley K, terminates in a ring or link, represented N° 2, the two ears en of which serve to keep it in a true position between the two planks of the beam. In this ring the hook P is fixed. The hook is represented in profile N° 2, where P is the part that takes hold of the ring.

But it must be observed, that the parts of this machine, represented in N° 2, 3, are drawn on a scale twice as large as the whole engine. The hook F, N° 2, should be made of very tough iron, as well as the handle D, and the arch E. This handle should be two inches thick at s, where it joins to the hook, and the thickness gradually tapers by degrees up to the arch, which need not be more than half an inch thick. On each side of the pin s, is a fenticircular notch, x, y, which rests alternately on the pins when the machine is worked. The hole D, and the arch E, serve to fix a long lever of wood EF, N° 1, by means of two iron pins; and by this contrivance the lever is either raised or depressed at pleasure, in order to render the working of the machine easy in whatever part of the beam the lever may be placed; for without this contrivance the extremity of the lever EF, would, when the handle is near the top of the beam, be much higher than men standing upon the ground could reach. It must however be remembered, that the lever is often shortened by this contrivance, and consequently its power increased.

The machine is worked in the following manner: It is placed against a tree, in the manner represented in the figure, so that the iron spikes at f may have hold of the tree, and the end of the beam A be supported by flaks represented at G. The iron handle N° 2, is placed in the opening between the two planks of the beam, and the wooden lever fixed to it, by means of the iron pins already mentioned. The hook F takes hold of the chain, and one of the iron pins is thrust into the outer row of holes, by which means the outer notch x will rest on the pin, which will now be the centre of motion; and the end of the lever E, N° 1, being pressed downwards, the other notch y, N° 2, will be raised, and at the same time the arm, and consequently the ram. The other iron pin is now to be thrust into the hole in the inner row, next above that which was before the centre of motion, and the end of the lever E elevated or pushed upwards, the latter pin on which the notch y rests now becoming the centre of motion. By this alternate motion of the lever, and shifting the pins, the chain is drawn upwards over the pulley K, and consequently the whole force of the engine exerted against the tree. There it is a small wheel at L, in order to lessen the friction of that part of the machine.

From this account the reader will very easily perceive that the machine is nothing more than a single pulley compounded with a lever of the first and second order. It must, however, be remembered, that as the pull of the engine is given in an oblique direction, it will exert a greater or lesser force against the horizontal roots of the tree, in proportion to the angle formed by the machine with the plane of the horizon; and that the angle of 45° is the maximum, or that when the machine will exert its greatest force against the horizontal roots of the tree.

BERNABEI, ErcouE, in Musical Biography, the scholar and successor of Benevoli at St. Peter's, and instructor of the abate Stefani, may be ranked among the greatest masters of harmony, in the ancient ecclesiastical style, of the 17th century. This composer being invited by the elector of Bavaria to Munich, about the year 1650, entered into the service of that court, where he continued the rest of his life. His son, Galeppi Ant. Barnabé, after following his father's steps in the study of ecclesiastical harmony, surpassed him considerably.
considerably in melody and modulation, as he lived long enough to feel a great relaxation in the rigour of ancient rules. There is a passage by this composer in the first volume of Paduca, page 158, and an excellent Agnus Dei, in P. Martini Sagg. di Contrap. II. 137, extracted from his masses, for four voices, intituled, "Lanziat cun battia, qui futils in tritilidad." After succeeding his father as cantor di capella to the elector of Bavaria, by whom he was honoured with the title of colombier allegue. and publishing several compositions for the church, replete with musical science of the first class, he lived till the year 1753, extending his existence to the great age of eighty-nine.

These masters, with many other good harmonists, in the style of the 17th century, supplied the churches of Italy with innumerable compositions, in which the chief merit consisted in pure harmony, and the contrivance of canon, fugue, and imitation on simple and often impious subjects; but to these excellencies the best moderns have added melody, a more varied modulation, and not only an attention to long and short syllables, but to the expression of words. In the 15th century almost every mass was composed upon the subject of some well-known song or ballad: but those airs being plagymodical, and a little more lively or varied than canto fermo, admitted of no greater variety of modulation than the ancient chants of the church. Among fragments of which, during the 16th and part of the 17th centuries, it was thought necessary to construct the chief part of choral music. Though the present students in counterpoint at Naples, and other parts of Italy, still exercise themselves in harmonizing canto fermo, the writing masses or motets on the subjects of these chants is seldom done but in pure pedantry, and to give an air of antiquity to dry and fanciful compositions.

The church style of composition was, however, much altered during the 17th century, not only by the imitation of dramatic music, and the introduction of instruments, but by writing in transposed keys, and supplying the deficiencies in the scales, which too often en adherence to the species of adagio, and modes of the church, had occasioned. Indeed, before this time, there was no decision of keys, either in sacred or secular music; according to our present rules of beginning and ending upon the chord major or minor, of the key note, or of some determinate note in the scale. The prohibitions were so numerous in the writings of the old theorists, that if the most regular modern compositions were tried by such rules as subsisted at the beginning of the 17th century, they would appear extremely licentious. No part was to be extended above or below the staff, or five regular lines, on which it was written; the combination of chords was never to be broken by moving to an unrelated harmony; and the intervals of the sharp seventh, the tritonus, or sharp fourth, false fifth, sharpened second, and even the major sixth, were prohibited. Indeed, an excellent composition might now be produced, merely from ancient disallowances.

BERNACCHI, Antonio, an eminent opera singer, who first arrived in England in 1716, as second man, while Nicolini was the first. Bernacchi's voice seems to have been feeble and defective; but he supplied the defects of nature by so much art, that his performance was always much more admired by profef sors than by the public in general. He flaid here at this time but one year, after which he went back to Italy; but returned in 1729. After quitting the stage, Bernacchi established a school for finging at Bologna, where he had himself been educated, under the celebrated Pilocchi, and where he formed several admirable scholars, who rendered his name and school famous. He came to England a second time in 1729, but he was now past his meridian; his voice was never good, but now little was left, except a refined taste, and an artificial manner of singings, which only
been instrumental in bringing upon Europe. He attributed its failure to the sins of the crosses, which had hindered the accomplishment of his prophecies. How far he was affected by the discomfiture and general disasters in which this experiment terminated, or by the accusations he suffered, is impossible to say. However, it is certain that he did not long survive this disastrous event; for he died at Clairvaux, in 1153, in the 63d year of his age.

Few men possessed a more extensive and uncontrollable command over the minds of men than St. Bernard; and his influence was wholly owing to his personal qualifications. But though he had an absolute command by his eloquence and writings, he seems to have been more an enthusiast than a politician, and to have wanted worldly wisdom to direct and manage the various engines which he put into motion. With good intentions he blended passion and prejudice, and the love of power. He was, without doubt, a man of distinguished piety, as well as integrity; and, considering the time in which he lived, an elegant and learned scholar. Erasmus gives the following character of him: "Christianus, et fanetac facultas, et pietas." As a writer, he was copious; his style was characterized by force, vivacity, elevation, and sweetness; and his imagination furnished him with figures of comparison and strong antitheses in great variety and abundance; so that he has been regarded as the last of the fathers formed upon the models of St. Ambrose and St. Augustine.

Bernard of Menthon, the founder of a religious community, was born in the Genevois, in 903, and defended from one of the most illustrious houses of Savoy. Having dedicated himself to the ecclesiastical profession, he retired to Aosta, a small town at the foot of the Alps, and became archdeacon of its church. Here he employed himself in missions among the unconverted Pagans, who inhabited the mountains, and professedly to Christianness. Having witnessed the hardships and dangers encountered by the French and German pilgrims, in their peregrination to Rome over the Alps, which Hannibal had anciently traversed with singular fortitude and perseverance, this benedictine monk founded two monasteries or hospitalls, for their relief, on Mont-joux, called from him "Great and Little St. Bernard." These were peopled with canonico-regular of St. Augustin, and Bernard himself became their first provost. He obtained several important privileges for his establishment from successive popes, and it acquired great popularity and large possessions. Bernard died at Novara, at the age of 85, and was canonized by the Roman church. His institution has undergone a variety of vicissitudes, and lost great part of its riches; but it still subsists, and is eminently useful. There are ordinarily between twenty and thirty monks belonging to the convent; eight of whom are usually dispensed among the Alpine parish churches, under their patronage; and ten or twelve constantly reside, being such as, from their age and health, are able to bear the keen atmosphere of the mountain. The few others, who can no longer bear it, are permitted to reside with the aged provost of the whole, in a house belonging to the convent, and situated at Martigny below. The monks of the mountain are industriously employed in the prosecution of their private studies, in the instruction of their novices, in the education of some scholars who are sent to board and lodge with them, and in managing the temporal economy of the whole. They have a prior, the deputy of the provost, and governor of the convent in his absence; a facriifiari, who takes care of their chapels; a cellarer, serving as purveyor, comptroller of the kitchen, and managing all the exterior concerns of the monastery; a chaplain, who keeps the keys, and dispenses the requisite articles to the monks and to the travellers; and an infirmari, who takes care of the sick in the apartment appropriated to them. The cellarer keeps twenty horses constantly employed during the summer in fetching the magazines of flour, bread, cheefe, liquors, and dried fruits, for themselves and their guests; and forage for the milch cows and fattening cattle, during winter. Their firewood, of which they expend a great quantity, is brought to them on the backs of mules, from the distance of four leagues, and by a steep path, that is passable only for six months in the whole year. Before the winter sets in, they send down their horses for the season to a farm which they have on the northern side of the Rhone. To a sympatizing and compassionate mind it is peculiarly pleasing to observe the solitude of these amiable monks on such days as the pails is most frequented, in personably receiving, warming, and recovering travellers, that are exhausted by their exces of fatigue, or indisposed from the severity of the air. With equal attention they receive both their own countrymen, and foreigners. They make no distinction of race, sex, or religion; and ask no questions concerning the country or the creed of the wretched. In winter and in spring, their sollicitude has a larger range of attention and activity. From this very time, in which Hannibal conducted an army over the passes of St. Bernard, and at which the Romans reckoned the general winter of Italy to commence, from the 1st of November, through the winter, to the 1st of May, a truly Alpine servant, who, as an Alpine, is denominated a Maronier, and one or two dogs of an extraordinary size accompanying him, are constantly engaged in going to meet travellers a considerable way down the defiles towards the Valtellins. These dogs possess an instinct, and receive a training, which fit them to be peculiarly useful in their employment. They point out the road to the guide and the travellors, through foggs, tempests, and snows; they have also the sagacity to discover travellers that have lost their way, that have fallen amid the drifts of snow, and that are lying upon them, wearied and exhausted. The monks themselves often accompany the guide, and aid him in administering necessary relief. Apprized of the benumbing and stupefying effect of extreme cold, they route the sleeping travellors, and exert themselves in a variety of ways in preserving and recovering them from approaching or apparent death; and in doing this, they expose themselves to great danger. In order to avoid the numbness occasioned by the cold, they carry with them short thick staves, armed at the ends with iron, and with these they continually strike their hands and feet. About three miles below the convent, on the road of Hannibal's ascent, they have built a small vaulted room, called the hospitall, which is intended for the casual refreshment of travellers benumbed, and unable to reach the convent. The truly Maronier visits it frequently, in order to meet the traveller; but principally at the approach of night, and on his return leaves bread, cheese, and wine. On extraordinary occasions, when a storm furges, he falls into this building, with his flock of wine and meat, and affists all whom he finds direfted. The monks themselves are often seen on the tops of their rocks, watching opportunities for the rescue of their humanity. When the snow just fallen is deep on the ground, they employ themselves in making roads through it, and thus, by timely vigilance prevent many fatal accidents. But notwithstanding all their charitable efforts, fearfully a winter passes in which some traveller is not brought to the convent with his limbs benumbed and frozen. The traveller is sometimes overwhelmed at once, and plunged into the body of descending snow. When he is not very deep, the dogs discover
discover him by the scent, and when they fail, the monks engage in the laborious office. They range upon the snow, and found it with long poles: and they have thus rescued many from imminent danger of being lost. Nouv. Dict. Hist. Sauvure Voy. des Alpes, vol. ii. Whittaker on the Course of Hannibal over the Alps, &c. 1794. See Bernard, in Geography.

Bernard, Andrew, a Latin scholar, and successively poet-laureat to Henry VII. and Henry VIII., was a native of Thoulouse, and an Augustin monk. He was not only the king's poet-laureat, as it is supposed, but his historiographer, and preceptor in grammar to prince Arthur. He obtained many ecclesiastical preferments in England. The pieces which he wrote under the character of poet-laureat, are in Latin. There are "An Address to Henry VIII. for the most amiable beginning of the 10th year of his reign," with an "Epithalamium on the marriage of Frances, the dauphin of France, with the king's daughter;" "A new year's gift," for the year 1515; and "Verics," wishing prosperity to his majesty's 15th year. He has left some Latin hymns; and many of his profe pieces in Latin, written as historiographer to both monarchs, are extant. Warton's Hist. Eng. Poetry, vol. ii. p. 132.

Bernard, Edward, a learned English astronomer and linguist, was born at Perry St. Paul, near Towcester, in Northamptonshire, in 1658, and educated at Merchant-Taylors' school in London, whence he was removed, in 1675, to St. John's college in Oxford. Here he applied himself with the utmost diligence to the study of history, philology, and philosophy; and acquired an accurate knowledge, not only of the Greek and Latin languages, but of Hebrew, Syriac, Arabic, and Coptic; he also directed his attention to the mathematics, which he studied under the celebrated Dr. Wallis. Having taken several academical degrees at Oxford, and engaged the esteem of all who knew him, by his distinguished talents and learning, and no less amiable temper, he removed in 1689 to Leyden, with a view of examining several oriental MSS., and particularly the Arabic version of the three lost Greek books of Apollonius Pergaeus's cone fictions, brought from the east by James Golius. These books he transcribed, with an intention of publishing them at Oxford, but his design was never executed. Upon his return to Oxford, he returned his studies with fresh vigour, and by his collaboration of the most valuable MSS. in the Bodleian library, the refult of which he was always ready to communicate with learned men of most countries. About the year 1669, he was recommended by the famous Dr. (afterwards sir Christopher) Wren, Savilian professor of astronomy at Oxford, to be his deputy, and he succeeded this eminent professor, on his resignation in 1673. He had been previously inducted to the rectory of Cheame in Surrey, and appointed chaplain to Dr. Mews, bishop of Bath and Wells. A scheme having been proposed in the university of Oxford, which was chiefly promoted and encouraged by bishop Fell, for collecting and publishing all the ancient mathematicians, Bernard, who first formed the project, affiduously engaged in accomplishing it, by collecting all the old books and MSS. in the public libraries, and drawing up a synopsis of their contents. He also printed, at his own expense, as a specimen of this noble design, a few sheets of Euclid in folio, containing the Greek text and a Latin version, with Proclus's commentary in Greek and Latin, and learned scholia and corollaries. With a view of promoting the study of astronomy, he also undertook an edition of the "Parva Synaxis Alexandrina," or "Meninge Arcaepouie," of which there is an account in the "Veterem Mathematicorum Synopsis," and in which, besides Euclid, are contained the small treatises of Theodorus, Autolycus, Menelaus, Aristarchus, and Hypsicles; but this was never published. In 1676, he was sent to France by king Charles II. as tutor to his two natural sons, by the duchess of Cleveland; but his disposition and habits not being adapted to this situation, he returned, after a year's absence, to his studious retirement at Oxford. During his stay at Paris, however, he cultivated an acquaintance with several learned persons, collated various ancient and valuable MSS., and bought many scarce and curious books for his own library. At Oxford he pursued his studies with renewed acclivity; and besides mathematics, to which he applied according to the duty of his professorship, he devoted himself from inclination to the prosecution of history, chronology, and antiquities. At this time he undertook a new edition of Josephus, which he never completed. In 1683, he visited Holland, for the purpose of attending the sale of Nicholas Heinsius's library, where he purchased many valuable books; and on this occasion he renewed, or contracted an acquaintance with several persons of eminent learning. As he experienced many civilities from the Dutch, and found that in Holland he should enjoy favourable opportunities for making great improvement in oriental learning, he seemed much inclined to settle at Leyden; but dissuaded in his expectation of being chosen professor of the oriental tongues in that university, he returned to Oxford. In 1684, he took his degree of doctor in divinity; and in 1691, he was presented to the rich rectory of Brightwell in Berkshire, which being at the distance of about 9 miles from Oxford, allowed of his occasional residence in this city. Soon after he resigned his professorship of astronomy, which had been for some time irksome and unpleasant to him, in favour of Dr. David Gregory, professor of mathematics at Edinburgh. In 1692, he superintended the preparation of a catalogue of the MSS. in the libraries of Great Britain and Ireland, and in some foreign libraries; and in the following year he married an agreeable lady in the bloom of youth, with whom he lived very happily. In 1696, he attended the sale of Gollis's MSS. in Holland; and not long after his return fell into a constitutional decline, of which he died in January 1697; and he was interred in St. John's college chapel. His widow erected a monument of white marble, in the middle of which there is carved the figure of a "heart," circumfered, according to his own direction, by these words; "Habemus Cor Bernardi." The publications of Dr. Bernard, were some astronomical papers in the Philosophical Transactions, N. S. 15, p. 167. No. 163. p. 721. and No. 164. p. 727; "A Treatise on the ancient weights and measures," first printed at the end of Dr. Pococke's Commentary on Homer, and afterwards reprinted in Latin, with great additions and alterations, Oxon. 1688, 8vo. 4; "Private Devotions, &c." Oxford, 1689, 12mo. "Orbis etlii literatura, a charace Samaritico deducta," in a large sheet of engraving, exhibiting at one view the alphabets of many nations, together with the abbreviations used by the Greeks, physicians, mathematicians, and chemists; "Etymologia Britannica," Oxon. 1689, printed at the end of Dr. Hickes's Grammatica Anglo-Saxonica, &c.; "Chronologia Samaritana Synopsis," published in the "Acta Eruditorum Lipphienda," April 1691. He was also the author of some notes and commentaries, printed in editions of learned works. He likewise aided several learned persons in their editions of books, and collated MSS. for them. Among his papers were found many MSS. of his own composition, with very large collections; which, together with several of his books, were purchased by the curators of the Bodleian library. The rest of his books were sold by auction. Of his great and extensive learning, his works are a sufficient evidence. Dr. Smith, his biographer, represents him as a man of a quick, mild, and convivial disposition, averse from content of
every kind, modest in delivering his own opinions on disputed subjects, candid in his judgment of other men’s performances, steadily attached to the established church, and at the same time liberal in his sentiments with regard to dissenters of all denominations, and detractors of peace and union. His pious was sincere and unaffected; and his devotions, both public and private, were regular and exemplary. The learned Huetius, in his “Comm. de rebus suis,” bears this concile but very honourable testimonio to his memory: “Edwards Bernardus Anglicus, quem pauci hacte atque equiparabant eruditos hodie, modellia vero pene nulli;” i.e. Edward Bernard, an Englishman, whom few in this age equalled in erudition, in modesty scarcely any. Biog. Brit. Gen. Dict.

**BERNARD, James**, was born in 1658, at Nions in Dauphine, studied at Geneva, and became pastor of the church in his native province. But being driven from France by persecution, he sought refuge first at Geneva, then at Lausanne, and afterwards in Holland, where he was employed as a penitentiary minister at Gouda. In 1705, he was chosen pastor of the Walloon church at Leyden, and soon after was appointed professor of philosophy and mathematicis at that university, and received a doctor’s degree. He elided his life of literary labour in 1718. He was the author of several political and historical works; in 1699, he undertook the compilation of Bayle’s “Novellae de la republica petrifacta,” which he continued till 1710, and refining it in 1716, continued it till his death. He also wrote a great part of the 20th to the 25th vol. of Le Clerc’s “Bibliothèque Universelle;” and a “Supplement to Moreri’s Dictionary,” in 1 vol. fol. Amst. 1714. He also published several theological and historical treatises, in the composition of which he has displayed more learning and industry than genius and skill. Nouv. Dict. Hist.

**BERNARD, Peter-Joseph**, a French poet, was the son of a sculptor at Grenoble, and born in 1708. Having been educated in the college of the Jesuits at Lyons, where he made rapid progress in literature, he rambled to Paris in pursuit of pleasure and liberty, and for two years employed himself as clerk to a notary; but here he published some light poems which attracted notice, and in 1734 he was taken to the campaign in Italy by the marquis de Pesay, and acquitted himself with honour at the battles of Parma and Guastalla. The commander in chief, the marshal de Coigne, pleased with his talents, appointed him his secretary, and procured him the post of secretary-general to the dragoons. He continued with the marshal till his death in 1758. He afterwards lived in the circle of fashion and pleasure at Paris, till the year 1777, when the loss of his memory reduced him to a mere state of vegetation, in which he continued till his death in 1776. His works are all in the easy, elegant, and voluptuous kind. His first performances consist of amours and songs, in short and playful measure, from which he obtained the appellation of “le gentil Bernard.” He afterwards wrote the opera of “Caïf and Polux,” and a ballet called “Les Surprises de l’amour.” His principal poem is “L’art d’aimer,” in three cantos, in which are several tender passages, but in point of style negligently written. His poetical tale intitled “Phroine et Melichor,” is of similar character. A collection of his works has been published, and the following lines of Voltaire are prefixed:

“Les trois Bernards.”

“Dans ce pays tous Bernards font connus;—
L’un est ce faim, ambitieux reclus;
Préceur adroit, fabricateur d’ornacles:
L’autre Bernard est l’ennfant de Plutus,
Bien plus grand faim, faisan plus grands miracles:
Et le troisième est l’ennfant de Phebus,
Gentil Bernard, dont la mule seconde

Doit faire encor les délices du monde,
Quand de premiers on ne parlera plus.”

**BERNARD of Bruge**, a painter of animals and hunting-pieces, in which he excelled, by giving to his wild animals a strong and spirited expression. He was patronized by Margaret, countess of the Netherlands, for whom he designed subjects for tapestry, and in the service of the emperor Charles V., he painted hunting-pieces, in which he introduced the portraits of the emperor and of all his attendants. In a picture of the last judgment, he covered the pannel with leaf-gold, before he laid on his colours, and thus preferred them from changing, and gave to his tints a heightened luster. This method is said to have produced a happy effect, particularly in the sky. He died in 1540; the time of his birth is not known. Pilkington.

**BERNARD, Solomon,** an ingenious engraver, was a native of France, and refuted chiefly at Lyons. He worked chiefly for the book-sellers, and his engravings were designed with spirit, and executed in a clear, neat style. He appears by his works to be a man of great genius, and fertile invention. His most esteemed performance is a set of prints for the Bible. He flourished from 1550 to 1580. Strutt.

**BERNARD, Francis,** doctor in medicine, was principal physician to king James II., and in considerable practice. He left a large collection of scarce and valuable books, which was sold, in 1698, the year after his death, for 1600L. His brother Charles, who was surgeon to the princes Anne, and who had the same passion for collecting books, left also a curious library, which was sold by auction in 1711. The “Specchio della Beffia triomfante,” by Jordano Bruno, an Italian atheist, which was in this collection, was sold, as we learn from the Speculator, No. 389, for 30l. This book was printed, Ames says, in England in 1584, by Thomas Vantolier. An English edition of it was printed in 1713. New Gen. Biog. Dict.

**BERNARD, Christopher.** This surgeon, who lived in the beginning of the 16th century, is only known as the author of two books, very popular in their time, though now in little reseult. “The present state of surgery, with some remarks on the abuses committed in it,” London, 4to. 1703. “The crafts and frauds of phyrce exploded, discovering the low prices of the field medicines,” 8vo. 1703. Haller. Bib. Med.

**BERNARD, St. in Geography,** a town of Germany, in the archdiocese of Aultria, 2 miles N.W. of Horn.—Also, an island of North America, in the lake of Nicaragua.

**BERNARD, fourth end of a small land between Southwold and Leofolt, on the coast of Suffolk, the north end of which is called “Newcoomb,” about a mile from the shore, within which small vessels may pass in good weather and a full sea.

**BERNARD RIVER,** a river on the west coast of France, which falls into the bay within the island of Belleisle.

**BERNARD’s Bay,** lies on the N.W. side of the gulf of Mexico. The passage into it, between several islands, is called Pafco de Cavallo. N. lat. 28° 30’n. W. long. 96° 16’.

**BERNARD, Great St., a mountain which is a branch of the Alps (the Alpes Pennins of ancient writers), that separates the Lower Valais from Savoy, and particularly from the duchy of Aosta, in the principality of Piedmont, and from which flows into the former country the river Drance, and into the latter, the Dore. On the summit of this mountain is the monastery of St. Bernard (see BERNARD), sup posed to be 8500 feet above the level of the Mediterranean. N. lat. 45° 48’; E. long. 7° 26’. It was by this track that Hannibal is sup posed to have conducted the Carthaginian army into Italy.
BER

Italy; and it was in the same direction that Bonaparte, the consul of France, led his army of refuge over the Alps, previously to the battle of Marengo, in the year 1815.

BERNARD, Little St., a part of the Alps (anciently Alpes Graiae), separating the duchy of Aosta from Savoy, and lying to the south-west of the former. Over this lies a road into Savoy, and upon it is a monastery or hospi tum for the convenience of travellers.

BERNARD the Herbist, in Entomology, the name by which Cancer bernardius is very commonly known. This creature is also called the hermit crab; a name indiscriminately applied to all the paraphysical species of the cancer genus; or, in other words, to all those which having no shell covering to protect the body, inhabit the shells of whelks, or other teffaceous animals. See PAGARUS FABR.

BERNARDI, STEPPANO, in Biography, was a learned theorist in Music, as well as composer of masques and madrigals of a most elaborate and correct kind. He flourished from 1611 to about 1623, and in 1623 was maestro di cappella of the Duomo, at Verona. He published a didactic work, called "Porta Musicale," the first part of which appeared at Verona, 1615; in quarto; and, as an elementary treat, it has the merit of clearness and brevity.

BERNARDI, in Botany. See ADELIA.

BERNARDIN, in Biography, a Romish saint, denominated of Sienna, was born at Maila, in Tuscany in 1350, according to Mr. Warton, but in 1353, according to M. Du Pin. After studying at Sienna, he entered into the confraternity of the hospitallers of la Scala, and distinguished himself by his attendance on those who were afflicted with the plague. In 1424 or 1425, he became a member of the Franciscan order, and afterwards an eminent preacher. Besides the natural and acquired talents which he possessed, the power of working miracles was ascribed to him both during his life and after his death. He visited Jerusalem under the character of commissary of the Holy Land, and after his return visited several cities of Italy, where he preached with great applause. Being accused to pope Martin V. for maintaining some erroneous opinions, he explained himself to the satisfaction of the pontiff, and was absolved. Such were his humility and self-denial, that he refused several bishoprics, and contented himself with the office of vicar-general of the obedience of St. Francis in Italy, and as such, reformed, or newly founded 500 monasteries. He died at Aquila in Abruzzo in 1444, and was canonized in 1450 by pope Nicholas V. He left several works, which were printed at Venice in 1571, 4 vols. 4to.; and at Paris in 1636, 2 vols. fol. They consist of religious treatises, sermons, commentaries on the Apocalypse, &c.

BERNARDIN, or BERNARDIN, in Geography, a mountain of Switzerland, being part of the Alps, separating the district of Rheinwalden from the valleys of Calanca and Maxof. In this mountain springs the river Muta, which flows down the Val Maxof, and forms a junction with the Telfina, above Bellinzona.

BERNARDINS, or BERNARDITES, in Ecclesiastical History, the name of a religious order, differing very little from the Cistercians. They derived their name and order from St. Bernard, abbot of Clairvaux, who was considered as the second parent and founder of the Cistercians. (See BERNARD.) Their usual habit is a white gown, with a black scapulary; but when they officiate, they put on a large white hood with great sleeves, and a hood of the same colour.

BERNARDO, St. in Geography, an island, or rather group of islands in the South Sea, called St. Bernardo of Mendana, and suppos'd by M. Fleurien, in his "Discoveries of the Spaniards," in 1760 and 1769, &c. to be Mr. Byron's "Isles of Danger," Mendana says, that St. Bernardo is in S. lat. 10° 30', and 1400 (Spanish) leagues from Lima, i. e. allowing Lima to be in W. long. 77° 50', and 1400 leagues in the latitude of 16° 30' to make 61° 30' of longitude, the longitude of St. Bernardo will be about 159° 20'. But the situation of St. Bernardo may be more accurately determined from that of the Marquesas, placed by Capt. Cook, in his second voyage in W. long. 150° 9'; for Figureau says, that Mendana found well 230 (Spanish) leagues from the Marquesas, before he made St. Bernardo; and 4500 Spanish leagues in the lat. of 10°, making 23° 3' difference of longitude; if this be added to 150° 9', we shall have 152° 22' W. for the longitude of St. Bernardo.

Com. Byron places the Islands of Danger in 3. lat. 10° 58', and W. long. 160° 52'; but Mr. W. B. Cary, who collated and published the astronomical observations which were made in Hawkesworth's voyages for the Board of Longitude, reduces this longitude to 165° 59', exceeding that of Mendana only by 2° 57'. Mr. Figureau joins M. Pigne (see "Memoire sur le Tramit de Venus," Paris, 1767, p. 51.) in thinking that this island is not the same with that which Quiros saw, and called St. Bernardo, in 1605; but Mr. Dalrymple thinks that they are the same; and it is probable that Quiros thought so; for in enumerating his own discoveries to Philip II. of Spain, in the memorial which he presented to that monarch (see "Dalrymple's collection," vol. i. p. 145.) he omitted this island, whence it may be inferred, that he thought it to be a discovery which belonged to another person.

BERNARDO, St. de Tarija, a town of South America, and principal of the district of Chicas, or Tarija.

BERNARDSTOWN, a township in Somerfield county, New Jersey, America, containing 2777 inhabitants, including 93 slaves.—Also, a township in Hampshire county, Massachusets, containing 561 inhabitants; distant 110 miles W. from Boston.

BERNASCONI, ANDREA, in Biography, born at Verona, but who refided chiefly at Venice, was a pleasing and graceful composer. He flourished at the same time as Hassé, and though inferior to him in force and elegance, it is said that Paullina, the wife of Hassé, used to prefer the melodies of Bernasconi. He refided long at Munich, in the service of the elector of Bavaria, where he died about the middle of the 17th century.

BERNASCONI, LA SIGNORA, daughter of the composer of that name, arrived in England 1758, as first woman at our lyric theatre, when Pacchiotti appeared there for the first time. She had gained considerable reputation as an actress at Vienna, in the part of Eurydice, when the fund with Millico in Gluck's Orfeo, which had such great success from its novelty of style, that ascribing part of this success to the Bernasconi's vocal powers, we expected more than we found.

And little is to be said of her as a performer, except that she had a neat and elegant manner of singing, though with a voice that was feeble, and in decay.

BERNAU, in Geography, a town of Germany, in the archduchy of Austria, 5 miles south of Wels.—Also, a town of Germany, in the circle of Upper Saxony, and middle mark of Brandenburg, surrounded with walls, ramparts, and ditches, containing three churches; the principal commerce of which is beer, of which large quantities are brewed in this town; 14 miles N.N.E. of Berlin.

BERNAVILLE, a town of France, in the department of the Somme, and chief place of a canton, in the district of Dourlens, 21 leagues south-west of Dourlens. The population of this town consists of 984, and that of the canton of 994 persons. The territorial extent contains 185 kilometres; and 27 communes.

BERNAVY, a town of France, and principal place of a district, in the department of the Eure; 74 leagues west of Evreux. Its population amounts to 6142, and that of the canton to 14557 persons. Its extent in kilometres is 1875.
and it contains 21 communes. N. lat. 49° 6'. E. long. 6° 56'.

BERNBURG, in Latin, Bernburgum, Artopeolis, and Ur- 
folopolis, a town of Germany, in the circle of Upper Saxony, 
the capital of Anhalt Bernburg, and the residence of the 
prince, seated on the Sela. It is divided into the Old and 
New Town, which had each its own magistracy, till they were 
united in 1562; besides which, there is a third part, called 
"Vordenburg," seated on a hill on the other side of the Sela, 
under a distinct magistracy. The church in this part serves 
for the castle and the court. The castle is one of the most 
ancient and most celebrated fortresses in the principality of 
Anhalt; 20 miles west of Dessau. N. lat. 51° 5'. E. long. 
12° 36'.

BERNCASTEL, a town of Germany, in the circle of 
the Lower Rhine, and electorate of Treves, and chief place 
of a canton in the district of Treves, and department of the 
Sarre, seated on the Moselle, and owing its privileges to the 
emperor Rodolphus 1. 8 miles E.N.E. of Treves. Its popu-
lation includes 1263, and that of the canton 11718 per-
sons. It contains 34 communes. N. lat. 50° 5'. E. long. 
6° 5'.

BERNE, a township of America, in Albany county, New 
York. According to the late census of 1796, there appear 
to be 477 electors.

BERNECK, a town of Germany, in the circle of Fran-
conia, and principality of Bayreuth.

BERNECOURT, a town of France, in the department 
of the Marne, and chief place of a canton in the district of 
Pont-a-Mousson, 5 leagues S.W. of Pont-a-Mousson.

BERNERA, or Berenay, one of the western islands 
of Scotland, is only about four miles in length, and one 
and a half in breadth. The soil of it is sandy, but when well 
manured proves extremely fertile, and produces some fine 
corn and clover pastures. It has a freshwater lake, called 
Lochbrin, which has some small islands, and abounds with 
cells. These are frequently caught in great numbers by the 
habitants, who restor in the night, with lights, to a small 
rivulet, where the cells are found going towards the sea. 
They are often caught twisted together in heaps. The tide of 
the sea often produce very singular effects round this island. 
In their ordinary course the flood runs east in the Frith, 
where Bernera lies, and the ebb runs west; the sea ebbing 
and flowing regularly for four days before, and as long after 
the full and change of the moon. The spring tides com-
monly rise to the height of 14 feet perpendicular, and the 
other proportionally; but for four days before and after 
the quarter moons, there is a singular variation; at those 
times the tide runs eastward for twelve hours successively, 
from nine o'clock in the morning till nine at night, when 
the current turns, and runs westward for the twelve following 
hours. Thus the reciprocations continue; one flood and 
ebb running eastward, and another westward, till within four 
days of the full and change of the moon, when they resume 
their ordinary course, running east during the six hours of 
flood, and west during the six hours of ebb. There is an-
other phenomenon in these tides equally remarkable. Between 
the vernal and autumnal equinoxes, the tides about the quar-
ter moons run all day to the east, and all night to the west; 
and during the other six months, their course is reversed, 
being westward in the day, and eastward in the night. The 
umber of inhabitants in Bernera and the isle of Pabbay, 
which lies between the former and Harris, was 494 in the 
year 1792. W. long. 7° 35'. N. lat. 67° 45'. The Rev. 
Mr. M'Loud's Account in Sir I. Sinclair's Statistical Histo-
ry of Scotland.—Also, a town of Scotland, in the county of 
Inverness, in which are barracks; 32 miles N.W. of 
Fort William.

BERNESCO, a town of Piedmont, in the district of Coni; 
41 miles W.N.W. of Coni.

BERNEVILLE, a town of France, in the department of 
the Straits of Calais, and chief place of a canton, in the district 
of Arras, 4 miles S.W. of Arras.

BERNEUT BAY, lies at the point of Quiberon, on the 
coast of France.

BERNEX, a town of Savoy, 24 miles N.N.E. of St. Julien.

BERNHARDUS, in Entomology, a species of Cancer, 
with heart-shaped, mutilated hand-claws; that on the right 
side larger. Inhabitats wheelks, &c. common on most 
seas. See Bernhardus Hermit.

BERNHARTS, in Geography, a town of Germany, in 
the archduchy of Austria, 7 miles E.S.E. of Feldsburg.

BERNI, or Bernia, Francis, in Biography, an Ital-
ian poet, was a defendant of a noble but bigoted family of 
Bibiena, in Tuscany, and born at Campovecchio, about the 
middle of the 15th century. He passed the first 15 years of 
his life in poverty at Florence; and though he was after-
wards patronized by cardinal Bernardo di Bibiena, Angelo, 
and Giberti, bishops of Verona, his love of unrestrained liberty, 
and inclination to pleasure and riotery, prevented his deriving 
any permanent advantage from their patronage. At Rome, 
however, he was greatly esteemed by the literati, and was 
one of the most illustrious members of the famous academy 
"De Vignauioli." At length, he retired to Florence, and 
substituted a canonry in the cathedral, under the protec-
tion of cardinal Hippolito de' Medici, and duke Alexander. 
It has been said, that he was taken off by poison, because, 
in a quarrel between these two princes, he refused to comply 
with the desire of one of them, who requested him to ad-
mire poison to the other. The year of his death, as well 
as the truth of this story, are uncertain: it has been fixed 
by some to the year 1536; but others have supposed that he 
lived to a later period. Mr. Rowe, in his "Life of Lorenzo 
de Medici," says, that he cultivated a branch of poetry (a 
kind of burlesque) with so much success, that it has from 
him obtained the name of "Berenice." The characteris-
tic of this species of poetry is an extreme simplicity, which 
the Italians denominate "idiotismo." The most extrava-
gent sentiments, the most severe strokes of satire, are ex-
pelled in a manner so natural and easy, that the author 
himself seems scarcely to be conscious of the effect of his 
own work. Perhaps the only indication, says Mr. Rowe, 
of a similar taste in this country, appears in the writings of 
the facetious Peter Pindar. Berni, though he seems to 
have blotted and corrected much, has nevertheless not been 
sufficiently careful in expunging licentious images, and free 
equivoque; and his wit is often more buffoonery. One of 
his principal performances was the recomposition of Byrds's 
"Orlando Inamorato," which he has rendered much more 
true and poetical. The best edition of it is that of Venice, 
in 1545. His other poems were collected and published, 
with those of other burlesque writers, in 1548, in 2 vols. 
8vo, and reprinted at London in 1721 and 1724, after 
the edition of Venice. Berni was a cautious satirist, and 
the avowed enemy of Peter Arctin, whose life he wrote in a 
drain of bitter invective. He excelled in Latin poetry, and 
initiated the style of Catullus with success. Gen. Biog.

BERNICIA, in British Geography, one of the kingdoms 
of the Saxon heptarchy. Although the Saxons, after the 
landing of Hengist, had been planted in Northumber-
land, their progress was slow in overcoming the obdurate 
resistance in which they were opposed, and none of their 
princes for a long time assumed the appellation of king. At 
half, in 547, Ida, a Saxon prince of great value, who claimed 
a descant, as did all the other princes of that nation, from 
Woden, brought over a reinforcement from Germany in
50 ships, which arrived at Flamborough, and enabled the Northumbrians to carry on their conquests over the Britons. He entirely subdued the country, now called Northumberland, the bithorip of Durham, as well as the counties of the Merse and the three Lothians, or the whole eastern coast of the ancient Roman province of Valentia; and assumed the crown under the title of king of Bernice. About the same time, Ella, another Saxon prince, having conquered Lancashire, and the greater part of Yorkshire, or all the country between the Humber and the Tyne, founded another little state in these parts, which was called the kingdom of “Deira,” or “Deiir.” These two kingdoms were united, not long after, in the person of Ethelfrid, grandson of Ida, who married Aeca, the daughter of Ella; and expelling her brother Edwin, established one of the most powerful of the Saxon kingdoms, by the title of Northumberland, which see. See also Heptarchy.

BERNICLE, in Conchology. See BARNACLE. BERNICLE, in Ornithology. See BARNACLE goof. BERNIER, Francis, in Biography, called the Mogul, from his long residence in the court of that prince, was born at Angers in France, about the year 1630. After receiving a liberal education, and taking his degree of doctor in medicine at Montpellier, he went, in 1650, to Palestine, and thence to Egypt. At Cairo he resided about twelve months, and having examined the pyramids, and every thing there deserving attention, he embarked at Suez for the kingdom of the Mogul, and was engaged by Aurengzebe as his physician, in which office he continued, attending that prince in his expeditions for the space of 12 years. During the whole of his life, and obtaining a title of the Mogul, he returned to France in 1670. He now employed himself in digesting and arranging the observations he had made in his travels, and published in French, in the history of the Mogul, a letter on the state of Hindostan, and memoirs and particular observations. These were collected and published together, in 1699, at Amsterdam, under the title of “Voyages de Francois Bernier, contenant la Description des pays du grand Mogul, de l’Indoufan, du royaume de Kachemire, &c.” 2 vols. 12mo. They are esteemed the most perfect account of those countries extant. Captive princes here, says he, defined to die, were compelled to take daily a preparation of poppy, which kept them in a constant state of drowsiness, until life was gradually and quietly extinguished.

To the abject and miserable state of the Indians, he attributes their freedom from gout, stone, catarrh, and quartan fever. Even the lues veneris is here, he says, less malignant than in Europe.

BERNIER, John, born at Blois, received the degree of doctor in medicine at Montpellier, in 1647. Not succeeding in his practice, and finding persons whom he esteemed less qualified, in full employment, his writings are filled with satyrical reflections on his more fortunate brethren. His principal work is, "Effais de Medicine, ou il e il traite d’Histoire de Medicine, et des Medicines, &c." Paris, 1689, 4to, to which he added a supplement in 1695. He also published "Histoire de Blois;" which is not much esteemed. Also, "Antemagiana, des Reflexions, Penfees, Bons Mots, et Anecdotes," which he signs by the name of Poppin, and a critique on the works of Rabelais, whom he severely cenures. Eloy. Dict. Hist.

BERNIER, Nicholas, an eminent French musician, was born at Montes-fur-Scine, and became music-maker of the holy chapel at Paris, and afterwards of the chapel royal. He was much esteemed and patronized by the duke of Orleans, who submitted his own compositions to his judgment. By his five books of cantatas, for one and two voices, with the words in part by Rouille and Fulcher, he acquired great reputation. He also published "Les Nuits des Sceaux," and a number of motets, which are still admired. He died in 1734. Novv. Dict. Hist.

BERNIN, in Geography, a town of France, in the department of the Iere, and chief place of a canton, in the district of Grenoble, 8 miles north of Grenoble.

BERNINI, John Lawrence, in Biography, a celebrated sculptor and architect, was the son of a sculptor, and born at Naples, in 1598. At a very early age, he manifested the inclination of his genius; and for the removal of his family to Rome, when he had attained only the age of 10 years, he shut himself up from morning till night in the Vatican, for the purpose of copying the master pieces which it contained. Having about this period wrought a head in marble, that excited great admiration, he was sent for by pope Paul V, who desired him to sketch with a pen the head of St. Paul, in his presence; upon which the young artist designed it so well, that the pontiff recommended him to the care of cardinal Matte Barberini, as one who might become the Michael Angelo of his age. Stimulated by the encouragement he had received, his application was indefatigable, and his perseverance invincible. To this purpose, it is related concerning him, that after having finished with much attention and industry a bust of Seipio Borghese, the pape’s nephew, he discovered a defect in the marble in the forehead. Upon this he immediately procured another block, and in the interval of 15 nights he executed another to his satisfaction. When the first was exhibited to Borghese, he could not avoid manifesting his chagrin; but he was agreeably surprized when the second was exposed to his view. Both these are preferred in the villa Borghese. Among the productions of his youth, we may mention his statues of St. Lawrence, and of Eneas carrying off his father at the siege of Troy; and more particularly his David and Goliah, which some have reckoned among his best works. His group of Apollo and Daphne, cut from a single block of marble, and the fuscus not more than half a foot wide, is, after the first, executed for cardinal Borghese, at the age of 18 years, has been regarded as the chef d’œuvre of sculpture. It is said, that when Bernini saw these performances of his youth 40 years afterwards, he lamented the little improvement he had made in sculpture during this long course of years. In the pontificate of Gregory XV. Bernini was created a knight of the order of Christ; whence he has been commonly distinguished by the appellation of the “Chevalier Bernini.” Upon the ascension of his patron Barberini to the pontifical chair, under the title of Urban VIII. Bernini was engaged in executing the projects which he had formed for the embellishment of Rome. The decoration of the place called the “Confession,” in St. Peter’s, employed him for 9 years, and for this exercise of his art he was liberally rewarded. He also constructed a fountain, displaying the riches of his invention, in the piazza d’Espagna; decorated the great niches of the pillars, which support the dome of St. Peter’s; and constructed a grand mausoleum for the pope, which is one of the finest ornaments of that cathedral. So much did this pope intercal himself in the welfare of Bernini, that he urged him to marry; accordingly, in 1639, he commenced a matrimonial union, which lasted 25 years, and produced a numerous family. Bernini’s reputation was not confined to Rome; but Charles I. of England, hearing of his fame, sent over...
over a fine picture of Vandyke, from which he made three busts of the king in different aspects, which gave great satisfaction, and were munificently rewarded. A bust of the queen was intended, but on account of the troubles which occurred in England, was never executed. Bernini was invited to Paris by Lewis XIII, just before the death of Urban VIII, and allure by very lucrative proposals; but the pope, upon being consulted, said, "that he was made for Rome, and Rome for him;" and this determined his stay. The grand fountain of the piazza Navona, constructed under the pontificate of Innocent X, is reckoned among his master-pieces. The fine porcic of St. Peter's was erected by this artist, under the pontificate of Alexander VII, and about this time queen Christina visited Rome, and treated him with singular respect. In 1664, he was consulted by Lewis XIV, of France, in conformance of the recommendation of Colbert, concerning the improvement of the Louvre; and at the age of 68 years yielded to an urgent invitation to visit Paris for this purpose. In his journey thither, he was honoured in various places through which he passed, by the most respectful attention; and after his arrival, he began with making a bust of the king, and while he was sketching his portrait, turned back his curls for a better discovery of his forehead, observing at the same time, with the polite cens of a courtier, "that he was a king who might freely shew his face to the whole world." This, it is said, gave rise to a French fashion, denominated "friseure à la Bernin." His design for the completion of the Louvre was not executed. He returned to Rome before winter, and as an acknowledgment of his obligations, for the civility and munificence with which he was treated by Lewis, formed a colossal equitarian statue, representing the king as supported by a rock. Upon its removal to Paris, Girardan changed it, on account of its want of sufficient resemblance to the monarch, into a Curtius leaping into the fiery gulf. Among the remaining works in which he employed himself, the most considerable was the tomb of Alexander VII. in St. Peter's. Whilk he was regaining the old chancery palace, by order of Innocent XI, he was seized with a fever, which terminated in an apoplexy, that closed his life in 1680, in the 82nd year of his age. His funeral procession to the church of St. Maria Maggare was attended by all the nobility of Rome.

The genius of Bernini was singularly fertile and comprehensive, and on a medal struck in honour of him by Leopold VII, was characterized as "figuris in figulis, in omnibus unius," i. e. singular in each, in all. Several of his pictures, painted for his amusement, amidst his other occupations, and sufficiently indicating his talents in this department of the arts, are prefered in the Florentine gallery, and the Barberini and Chigi palaces. In architecture he displayed a fine taste and rich imagination, though he is said to have departed from the rules and proportions observed by the ancients. But he owed his highest and most distinguishing reputation to sculpture. D'Argenville, however, observes, in his "Vies des Architectes et des Sculpteurs," that, whilst he wrought marble with a surpassing suppleness, admirable taste, and ingenuous grace, he often deviated from truth, and was much of a mannerist; that he abandoned the simple drapery of the Grecian statues; and that he enveloped his figures with such an affamblage of folds and doublings as to disguise and partly conceal them by the flutter and seeming agitation of their drapery. Some of his single busts, or portraits after nature, are much admired, and are said to retain the whole spirit and character of the original. His St. Theresa in ecstasy is thought to surpass all his other works for expression. His own talents he cultivated with modesty; but by an enthusiastic attachment to his art, and unwearied affinity in the exercise of it, he arrived at such eminence for which he was distinguished, and multiplied his works to such a degree as to occasion its being said, that poetry would he apt to suppohe as many Berninis as Hercules. Encyclop. Beaux Arts, t. ii. p. 1. p. 282. Gen. Biog.

BERNINO, in Geography, a mountain of Switzerland, being a branch of the Rhetic Alps, about 26 miles N. E. of Chiavenna.

BERNO, in Biography, abbot of Richenon, in the diocese of Conflantce, flourished about the year 1088, and is celebrated as a poet, rhetorician, musician, philosopher, and divine. Of his works, the principal are his treatises "De Instrumentis Musicis," "De Mensa Monasticis," and "De Musica seu Tonis," containing a summary of the doctrines of Boethius, an explanation of the ecclesiastical tones, intermingled with pious exhortations, and the application of the music to religious purposes. His learning and piety recommended him to the special favour of the emperor Henry II, and his endeavours to promote literature were so much encouraged, that his abbey of Richenon was as famous in his time as those of St. Gall, or Chumi, then the most celebrated in France. He died in 1048, and was buried in the church of his monastery.

BERNON, in Geography, a town of France, in the department of the Aube, and chief place of a canton, in the district of Ervy; 4 miles S.E. of Ervy.

BERNOULLI, James, in Biography, a celebrated mathematician, was born at Basel, December 27, 1654. His father, who was a man of rank and learning, intended him for the profession of a minister, and paid great attention to his education. Having passed through the usual course of preparatory studies, and taken his degrees in the university of Basel, he applied, in deference to his father's wishes, to divinity; but his inclination leading him to mathematics, he made great proficiency in geometry, without any collateral assistance either of teachers or of books, from the use of which his father rigorously restrained him. In reference to this restraint, he took for his device Phoebus driving the chariot of the sun, with this motto, "Invito patre fieri verbo," i. e. I traverse the flares against my father's inclination. Notwithstanding the disadvantages under which he laboured, he made such progress in mathematical studies, that he was able, before the age of 18 years, to solve a difficult problem in chronology, or to find the year of the Julian period, when the year of the Gregorian came, the golden number, and the indiction, are given. In 1675, he began his travels, and at Geneva taught a blind girl to write, and at Bourdeaux composed universal gnomonic tables. Upon his return to his own country, in 1689, he derived great pleasure from the perusal of Malbranche's "Search after Truth," and Descartes' philosophy; and predicted the return of a comet, of which he gave an account, in a short treatise written in his own language. He soon afterwards travelled into Holland, Flanders, and England; and having completed his peregrinations, he settled at Basel, in 1682, and commenced a course of public experiments in natural philosophy and mathematics. In this year he published, at Amsterdam, in Latin, his "Essay of a New System of Comets, in order to calculate their Motions and to foretell their Appearances," 8vo. and in the following year, at the same place, his "Reflections upon the Weight of the Air," Lat. 8vo. In 1684, he accepted the professorship of mathematics at Heidelberg, and devoting himself to the arduous study of those sciences, he took occasion about this time to investigate the analytical system of Leibnitz, contained in some essays on the "Calculus differentialis," or "Infinitesimae," published in the "Acta Eruditorum." The extent and beauty
beauty of which he admired, the principles of which he developed, and the utility of which he discovered, and promoted to such a degree, that this great philosopher, whilst he claimed the honour of the original invention, acknowledged that J. Bernoulli and his brother had a great share in the advantage which the public derived from it, and that no person had made a greater use of this invention than they, and the marquis de l'Hôpital. In 1687, he was unanimously chosen to succeed Peter Me格尔lin, as professor of mathematics at Basili, and he discharged the duties of his office with such reputation, that he greatly contributed to the credit of the university, and to the increase of the number of students. In 1699, he was elected a foreign member of the academy of sciences at Paris, and in 1701, of the academy of Berlin. The memoirs of both these societies were enriched by many of his communications. Several of his pieces were also published in the Acta Eruditorum, and the Journal des Scavans.

The great, brought on by unremitting application, produced a fever, which terminated his life. August 16, 1705, in the 51st year of his age. He ordered a logarithmic spiral to be engraved on his tomb, with this motto, "Eadem mutata resurgo." He left the family poor, though wealthy. He was married at the age of 35; and left one son and a daughter. By the exercise of extraordinary powers of invention, and persevering application, he made many valuable discoveries, which improved the method of analysis, the doctrine of infinite series, and the higher department of mathematical investigation; such as the quadrature of the parabola, and the geometry of curved lines, of spirals, cycloids and epicycloids.

His works, with their respective titles, are enumerated in the General Dictionary, to which we refer; and they were collected and published in 2 vols. 4to, at Geneva, in 1744. The "Ars conjectandi," or the art of forming probable conjectures concerning events that depend on chance, in which he was engaged at the time of his death, and which is not included in the above collection, was printed at Basili, in 1713, 4to. To this is added a treatise concerning infinite series. An extract from this valuable treatise, containing the best demonstration that has yet been given of Sir Isaac Newton's famous binomial theorem, in the first and simplest case of it, or that of the integral and affirmative powers of the binomial quantity $a + b$, left by his great inventor without a demonstration, is included in the 51st volume of the "Scriptores Logarithmici," for which we are indebted to baron Maferes.

Bernoulli, John, the brother of the preceding, and no less celebrated as a mathematician, was born at Basili, July 27, 1667. At the age of 15, he commenced the study of philosophy, and soon after he was sent to Neuchâtel to learn the French language, and the principles of commerce; but preferring intellectual pursuits to a mercantile profession, he returned home at the close of the year, for the prosecution of his studies, and received the degree of doctor in philosophy in 1685. Instructed by his elder brother in the first rudiments of mathematics, he afterwards, viz. in 1684, when he was only 17 years of age, continued with him in investigating and explaining the principles of Leibnitz's differential calculus. He also was one of the three mathematicians, the two others being Huygens and Leibnitz, who solved the problem of the catenary curve, proposed by his brother James. In 1690, he set out on his travels; and in the progress of them communicated the discoveries of the new analysis to Daniel le Clerc, and Patric de DuilliER, at Geneva, and to the marquis de l'Hôpital at Paris. On his return to own country, in 1692, he commenced a correspondence with Leibnitz, which lasted during the life of the latter. Having declined the professorship of mathematics at

Wolfenbuttle, which was offered him in 1693, he undertook, in 1695, a course of philosophical experiments at Groningen, and was furnished by the curators of the university with the necessary apparatus. About this time he discovered, what has been called the mercurial phosphorus, occasioned, as it is now known, by the friction of mercury against glafs, in a partial vacuum; for which Frederic I. king of Prussia, honoured him with a gold medal, and with the rank of member of the academy of sciences at Berlin. He was also a member of the royal society of London, and of other learned bodies. He succeeded his brother James at Basili, in 1705, on which occasion he delivered a discourse, "De Fatis Novae Analytico, et Geometricz Sublimitz," and continued till his death in this situation, though he was solicited to remove to Leyden, Padua, and Groningen. He collected his works in 1740, and printed them at Lausanne, in 4 vols. 4to. His correspondence was extensive, and he was much engaged in a controversy with the English mathematicians concerning the invention of fluxions; in another with Remn, concerning the manuring of ships; and in another on mathematical philosophy, with John Brook Taylor, Keil, Pemberton, Herman, and Riccati. In 1700, he gained a prize of the academy of sciences for a memoir on the elliptic figure of the planets, and the motion of their aphelion; and in 1734, he received the half prize, jointly with his son Daniel, from the same academy, for a memoir on the physical cause of the inclination of the planetary orbits.

Bernoulli died January 1, 1738, in the 81st year of his age, and left four daughters and five sons, three of whom were mathematicians. Fontenelle's Eloges. Morei.
which he incautiously divulged. At the age of 80, he retained his mental powers in their full vigour; but from this time those became decay. He died March 17, 1782.

Bernaulli, John, L. L. D. brother of the preceding, was born at Basil, May 18, 1710, and died there, July 17, 1790. He was professor of eloquence, and afterwards of mathematics at Basil, and member of the academies of Paris and Berlin.

Bernaulli, James, licentiate of law, member of the physical society at Basil, and correspondent of the royal academy of sciences at Turin, was the son of John Bernoulli last mentioned, and born at Basil, October 17, 1759. His natural talents, for which he was distinguished at an early period, were improved by long assiduous application. On his return from Neuchatel, whither he was sent to study the French language, he was admitted to the degree of master of arts, and devoted himself to the study of the law. In 1780, he made the tour of several cantons of Switzerland, of which an account was published in the third volume of the collection of travels, published at Berlin by John Bernoulli. The study of the law, however, did not divert his hereditary inclination for the mathematics; and in these sciences he made such rapid progress, that in 1788, he was thought qualified to supply the place of his uncle, whose age and infirmities rendered him incapable of continuing his lectures on experimental philosophy, though he did not succeed him in the vacant chair of professor after his death. He had also experienced a similar disappointment in his views with regard to the chair of eloquence in 1780; on which occasion he published his "Theses on the Sublime." After these disappointments, he determined to indulge his taste for travelling, and accepted the office of secretary to count de Breuner, minister of the imperial court of Vicenza to the republic of Venice. He still retained his attachment to the mathematical sciences, of which he exhibited proofs to the public in the memoirs of the royal academy of sciences and belles lettres at Berlin, and in those of the royal society of Turin; and as he wished to occupy a station in which he might make use of the knowledge he had acquired, he was recommended by his countryman Mr. Fuss to the princes of Daishof; and by his influence he was elected adjunct in the academy at Petersburg, with a salary of 600 rubles, and the promise of being promoted in the course of a year. Accordingly, he quitted Venice in 1788, and removed to Petersburg. Here he applied with unintermitting activity to physical mathematics, and was soon honoured with the title of ordinary academican. In the interval of about 2 years, he presented eight memoirs, which were inserted in the first volumes of the "Nova Acta Academiae Scientarium Imperialis Petropolitanae," which display singular acuteness in analytical calculations. In 1784, he was appointed one of the professors, who instructed the imperial corps of noble land cadets, and to the office of teaching algebra to the two first класс he devoted himself with great zeal and industry. In 1789, he married the youngest daughter of Mr. John Albert Euler; but being always of a weak and delicate constitution, he was seized with a fit of the apoplexy whilst he was bathing, on the 3d of July in the same year, which speedily terminated his life, in the 29th year of his age, very much to the regret of those who knew and valued him on account of his scientific talents, and modest, amiable disposition. Besides a variety of mathematical and philosophical pieces, which were published in the "Nova Acta, &c." "Rozier's Journal;" "Mem. de l'Acad. Royale de Berlin, Ann. 1761," "Mem. des Correspond. de l'Acad. Royale de Turin, Ann. 1784, 1785;" "Nova Acta Helvetica, tom. i." and "Leipzick Magaz., &c. Part i, 1786;" and some different treatises; he also translated "Merian's Philosophical Memoirs," from the French into German, 2 vols. Nova Acta Acad. Scient. Imper. Petropol, vol. x.

BERNOVITZKOE, in Geography, a town of Russig, in the government of Smolensko; 40 miles north of Smolensk.

BERNSTADT, a town of Silegia, in the principality of Oels, on the river Weida.

BERNSTEIN, a town of Germany, in the circle of Upper Saxony, and new mark of Brandenburg; 4 miles N. E. of Berlin;—also, a town and castle of Germany in the circle of Bavaria; 2 miles W. S. W. of Graveau.

BENSTORF, John Hirtwig Ernest, Count Von, in Biography, an eminent flateeman, was born at Hanover, May 13, 1712, and possessed distinguished talents, which were cultivated by study at the high school of Tubingen, which he entered in 1727, and by travelling through various parts of Europe, under the learned Keyser. Upon paying a visit to Denmark, Bernstorff was taken into the service of Christian VI. and employed in affairs of state from the year 1732 till the year 1737. In 1742, he was envoy to the diet of that year, and to the court of the emperor Charles VII. and from the year 1744 to 1750, he was ambassador to France. In November 1736, he received the chamberlain's key; in June 1746, he was made a knight of the order of Dannebrog; and in October 1749, he was appointed a privy-councillor. After his recall from France, he was immediately introduced into the privy-council, and entered on the office of minister for foreign affairs, and first secretary of the German chancery, and in 1752, was admitted into the order of the elephant. To Bernstorff were owing the conduct and execution of those beneficial measures which distinguished the reign of Frederick V. Upon a plan suggested by him, was established, in 1753, the hospital in Copenhagen, for the education of poor boys; and he was appointed president and governor of this patriotic and useful institution, to which he gave a donation of 4,000 rix-dollars.

In 1754, he advised the crown to purchase from the East India company all their possessions, privileges, and merchandize; and by this act he promoted the prosperity of the Danish West India islands, which had suffered from the exclusive right of the company. He also distinguished himself by his activity and zeal in promoting the manufactures of the kingdom, which the king entrusted to his management in 1752, and he thus contributed to encrease the population, and to excite a spirit of industry and emulation. He concurred in the desigms that were formed for the abolition of slavery in Denmark, by the extinction of commons, and by freeing the farmers from the burden of personal service. He was also one of the first persons in Denmark who counteracted the general prejudice against inoculation for the small-pox, and who encouraged the people to use the practice. Bernstorff was likewise indefatigable in his exertions for promoting the instruction of the poor; and he proposed a fund for the encouragement and recompense of meritorious, but poor, schoolmasters; nor was he less solicitous to extend the benefits of education, so as to furnish a supply of competent teachers, for which purpose he proposed to establish a seminary at Altona, in connection with the orphan-houses of that city; but adverse circumstances prevented the completion of his design. He also distinguished himself by the protection which he afforded to science, and

7 to
to men of letters. With this view, having been one of the first who discovered the beauties of the "Melish," he invited the young author, Klopflock, who then resided in Switzerland, to Denmark, and for several years entertained him in his own house. By his influence, Oeder was appointed professor of botany; a botanical garden was established, and the professor was sent on a tour through the Danish provinces, the result of which was the "Flora Danica," published at the king's expense. Cramer, Mallet, Schleger, and Bafedow, were also much indebted to his patronage. To Bernstorff Denmark owes the establishment of two useful societies: one, the society of the Danish language and fine arts, founded in 1762; and the other, the royal agricultural and economical society, established in 1769, of which the count himself was president. To him it was principally owing, that a society of learned men were sent, in 1761, to travel in Arabia and the east, at the king's expense, for the purpose of making useful discoveries. In consequence of the important services which he rendered, in various ways, to his sovereign and the state, he was created, in 1767, a Danish count; and he was the only minister who had the honour of attending the king, in 1768, on his tour to England. After their return, however, the count was obliged to resign all his employments, in January 1770, and the king, in acknowledgment of his past services, fetted on him an annual pension of 6000 rix-dollars. On this occasion he found it necessary to have a country to which he had devoted the service of 35 years of his life; and, accompanied by his confidents and Mr. Klopflock, he repaired, in October 1771, to Hamburg, where he spent the winter. Here he spent his time in social intercourse with his friends, but in the beginning of the year 1772, some rheumatic affections, under which he had laboured for several years, returned with an alarming violence, and terminated in a threatening fever. This fever was succeeded by a fit of apoplexy, which carried him off in a few minutes, on the 18th of February. His remains were interred, without pomp, agreeably to the instructions of his will, at the church of Siebeneichen, on one of his paternal estates. Two medals were afterwards struck in honour of him, by two societies of patriots. Bernstorff possessed a retentive memory, great penetration, and a sound judgment. Learned and accomplished himself, he was the liberal patron of literature and the arts. He was well acquainted with the Italian, French, and English languages; intimately conversant with the laws of nations in general, and attached to the rights of mankind; well informed in the ancient and modern history of different states; and not uninterested in the concerns of religion and the church. He corresponded with many learned men of different countries, and collected a valuable library of fce&8217;books. His political measures were founded on truth and justice; in his transactions with foreign states he was upright and sincere; and he combined, with a vigilant attention to the privileges of the crown, a constant regard to the rights and liberty of the subject. Gen. Biog.

Bernstorf, Andrew Peter, Count Von, the nephew of the former, was born at Gartow in Lauenburg, August 28, 1755, and at an early period acquired the knowledge of ancient and modern history, as well as of geography, mathematics, natural history, and the ancient languages. His studies were completed at Gottenburg. Several of his juvenile years were spent in travelling through England, Switzerland, France, and Italy. Having occupied, after his return, some subordinate stations, he was made a member of the privy-council in 1769; but soon dismissed along with his uncle. Towards the end of the year 1772, after the fall of Struensee, he was recalled; and about the close of the following year, he obtained the foreign department, and was at the same time appointed minifter of state, and director of the German chancery; and he was employed in negotiating with Russia the exchange of the Gotterpart of Holstein for Oldenburg and Demerhorst. In 1776, he was made a knight of the order of the elephant; and in 1780, during the American war, when an order was issued by the British government for intercepting all vessels belonging to neutral powers, laden with naval stores, and bound to any of the enemy's ports, he had an opportunity of exerting his diplomatic talents; and in a note submitted by him to the courts of the belligerent powers, the Baltic was declared a mere clafium; and it was further stated, that the king of Denmark had determined not to grant a passage through the Sound to armed ships belonging to the powers at war. It was also added, that the other northern powers had adopted and professed the same system. In a subsequent note, transmitted to the three belligerent powers, England, France, and Spain, Bernstorff expressed himself in the following terms: "An independent and neutral power never loses, by others being at war, the rights which it had before that war, since peace exists for it with all the belligerent powers without its having to receive or follow the laws of any of them. It is authorized to carry on trade, contraband excepted, in all places, where it would have a right to do so, if peace existed throughout all Europe, as it actually exists in regard to it." Soon after, Denmark and Russia entered into a treaty for the protection of their trade, to which Sweden, Prussia, and other states acceded; and the result was that league formed against Great Britain, known under the title of the "armed neutrality." Towards the end of the year 1783, Bernstorff resigned all his employments, and retired to his estates in Mellenburg, where he resided till 1784, when he was recalled, and resumed his diplomatic functions; and to his exercise of these, Denmark owed the preservation of peace, when hostilities broke out between Sweden and Russia in 1788. In 1791, Bernstorff interposed his mediation when the British ministry were preparing to afflict the Turks against the Russians, to restore and promote tranquillity, in consequence of the French revolution, his Danish majesty was invited by the courts of Prussia and Vienna to join in the treaty which had been concluded between them. To this proposal Bernstorff replied, in 1792, with considerable address; and in 1793, when his British majesty's envoy extraordinary at Copenhagen presented a note to that court, in consequence of the plan concerted by the allied powers for blockading the ports of France, Bernstorff returned an answer, which was alluded to by the marquis of Landafic in the house of lords, February 17, 1794, in the following terms: "The reply of count Bernstorff to our remonstrances was one of the boldest, wisest, and most honourable replies I have ever read. It is a flat paper which should be kept as a model by every cabinet of Europe." The conduct of Bernstorff was highly satisfactory to his fellow-citizens; various institutions were distinguished by his name; and medals were struck to perpetuate the remembrance of his services. At length, he fell a victim to the gout, to which he had been subject for many years, and which baffled all remedies, on the 21st of July, 1797; and his remains were interred with great pomp, and amidst numerous attendants, who lamented the loss of him, in Frederic's church at Christianhaven.

His figure was agreeable, and his manners were engaging, his disposition lively, and his eloquence natural. In business he was active and indefatigable; in conversation communicative and condescending,averse from flattery, and yet respectful in his behaviour; sparing of professions and promises, and punctual.
performing; prudent in his plans, and firm and zealous in executing them. His memory was tenacious, his benevolence extensive, his reverence of the Deity unfeigned, and his attachment to the Christian religion unwavering. Gen. Biog.

BERNUS, in Geography, a mountain of European Turkey in Macedonia; 10 miles S. E. of Saloniki.

BERNY, a town of France, 2 leagues south of Paris.

BERALDO, PHILIP, the Elder, in Biography, was born at Bologna in 1453, and at the age of 19, became professor of the belles lettres in his native city. He also read lectures at Parma, Milan, and Paris, and at the latter place, or, as some suppose, Perugia, he held a public school of eloquence. But, recalled by his countrymen, he received his scholastic labours at Bologna with such reputation, that he had 60 hearers at a time. To the study of polite literature, he added those of philosophy, medicine, and jurisprudence; and he also engaged in public employments assigned to him by his country. His disposition was convivial, and his conduct not exempt from the charge of licentiousness, before his marriage in 1498. By his good humour he escaped or conciliated literary contests, and maintained an uninterrupted intercourse with the greatest number of learned persons of the age in which he lived. He died in 1505. His commentaries and notes extended to all the Latin writers of eminence; and are more distinguished by their erudition, than their elegant taste and sound criticism. With the more obscure authors of antiquity, he was particularly conversant, and he took pleasure in reviving the use of words that were barbarous or obsolete. Besides his commentary on the "Golden Aes of Apuleius," printed in 1501, and affording a specimen of his manner, he published a great number of his own orations, letters, poems, and other works, of which a collection was printed at Bafil in 1513. Most of his observations on authors are contained in Gruter's Thelarnus Criticus. Morrer. Gen. Biog.

BERALDO, PHILIP, the Younger, nephew of the former, was a native of Bologna, and professor of belles lettres in the university of that city, and afterwards at the Sapienza in Rome. In 1516, he was appointed librarian of the Vatican by Leo X., but about two years after, before he took regular possession of the office, with its encomiums, he died, at the age of about 20 years. His Latin poems, by which he acquired great reputation, are published with those of his uncle, to which they are prefixed, in the first volume of the "Delpica Postarum Italorum." A collection of his elegies and epigrams, in 3 books, was published at Rome in 1550. His Latin version of an oration of Iberates, and notes on the first five books of the Annales of Tacitus, were published by order of Leo X. Nouv. Dict. Hist.

BEROE, in Entomology, the name assigned by Cramer, to the species of Papilio Europa of Fabricius and Gmelin.

BEROE, in Natural History, the name of a species, Medusa (Pilus) in A.E. Helv. Beroe with an octagonal body, and very long tentacula, Gronovius.—Beroe is also the name under which medusa infernulorum (Mull. and Fabr.) is figured and described in Brown's Hist. Jam.—Linnæus, in the tenth edition of his "Systema Naturalia," calls it medusa beroe; and in the twelfth, vol. (Beroe) evanus, anguia eli- liatis nomen.

Beroe, in Mythology, one of the nymphs, who, according to Virgil, was companion to Cyrene, the mother of Ariltes. Beroe was also the name of the nurse of Semele.

BEREA, BERRHOA, or BEREA, in Ancient Geography, Cerae-cessis, a large and populous city of Macedonia, south-
BER

plainly appears to be Noah. Pliny (H. N. i. vi. c. 57. i. vii. c. 31 and 57.) informs us, that his book contained the astro-
nomical observations of 480 years, commencing from the
era of Nabonassar. Ammianus, a monk of Viterebo, published
a work under the name of this historian, full of fables, which
obtained some credit among the learned, but was soon rec-
ognized to be a forgery. Berothus is said to have had a
dughter who uttered predictions like himself, and became
the Cumaean sibyl. Brucker's Hist. Phil. by Enfield, vol. i.
p. 34. Bryant's Analysis, vol. iii. p. 23; &c. Fabricius,

BEROSUS, in Ancient Geography, a mountain of the Tauric
Cheroneus, south of mount Trapezus. This chain of
mountains comprehends, according to M. Peyssonnel, the
mountains now called " Tehadir-dagi," the highest of the
whole peninsula, and those of "Balykhaba," and "Cabarta."

BEROTH. See BEROOTH.

BEROTHA, or BEROTH, a city situated on the northern
frontiers of Paleolion, supposed to be the fame with " Bero-
thai," one of the cities of Hadadezer, which David took,
and in which he found much brass. (2 Sam. viii. 8.)
According to some, this was Beroc of Syria, according to
others, Berutus of Phenicia, or the former that is mentioned
by Ezekiel (ch. xlvii. 16.) between Hethlon and Emesa.

BERQUET, in Commerce, a weight of 173 pounds, by
which hemp and other goods are sold in Ruffin.

BERQUIN, Louis de, in Biography, was born in Ar-
tois about 1490, and was much esteemed at the court of
France, where he obtained the title of king's counsellor.
Although he does not appear to have left the Catholic
church, or joined the Lutherans, he followed the example of
Erasimus, in declaring against the ignorance and super-
stitution of the clergy. Having incurred the charge of hereby
his publications, which were chiefly books of Erasmus,
and extracts from his works and those of others, with his
own notes, he was twice prosecuted; but in the first instance
acquitted, and in the second condemned, unless he retracted
his errors, and gave satisfaction, to be burnt. His spirit was
refoluted, and he demurred against submission; his judges,
however, defirous of faving him, deferred the execution of
the sentence; and upon the return of Francis 1. from Spain,
he was let at liberty. But Berquin, though diffused from it
by Erasmus, publicly accused his enemies, Noel, Beda,
and others, of irreligion; and upon a third prosecution, he
was sentenced to make a public recantation, and to suffer
perpetual imprisonment. Refusing to acquiesce in this
sentence, because it implied an acknowledgment on his part,
that his sentiments were erroneous, he was condemned as an
oblitrate heretic, and accordingly flanged on the Greve,
a public place near the Seine, appropriated to bonfires and
the execution of criminals, and afterwards burnt. He
suffered death with great complacency in April 1529; and
though the monk who attended him intimated that he dis-
covered some signs of abjuration at the stake, Erasmus af-
scribes the supplication to the fraud and falsehood usually
practised on such occasions. Berquin was a perfon of great
abilities, invincible fortitude, and irreproachable character.

BERRA. See BERIA.

BERRE, in Geography, a town of France, in the depart-
ment of the mouths of the Rhone, and chief place of a can-
ton, in the district of Aix, situated at the mouth of a river,
running into the lake of Martignes, called the lake of
Berre," in an unhealthy climate. It was formerly one of
the strongest towns of Provence. It was taken after a long
siege, in 1591, by Charles Emmanuel, duke of Savoy, dur-
ing the wars of the league; and when the reit of the province
submitted to Henry IV., he could not drive the Savoyards
from Berre, till it was given up in 1598, in consequence of
the peace of Verden; 44 leagues S.W. of Aix. The popu-
lation of the town is estimated at 1800, and of the canton
at 6759 persons. The territory comprehends 2571 kilome-
tres, and six communes.

BERREA, in Ancient Geography, Ber, a town of Bul-
garia, 10 or 12 leagues from Philippopolis, upon the river
Brafa.

BERRETINI, Peter, commonly called Pietro da Cor-
tona, in Biography, an eminent painter of life, x.
Arya, and landscape, was born at Cortona, in Tuscany, in
1569; and acquired the first rudiments of his art under Andrea Commodi,
and Baccio Cari. At Rome, whither he went in
his youth, he studied the antiques, in the works of Raphael, Bu-
norati, and Polidoro, with such diligence, that he attained
to great excellence as an artist. At this early period, he
was patronized and employed by the marquis Saccetti; and
in his palace, he painted the " rape of the Sabines," and the
" battle of Alexander," which were much admired for in-
vention, disposition, elevation of thought, and an excellent
tone of colour, and deemed to be equal to the performances
of the best masters. His fame was completely establisned
at Rome, by the salon of the Barberini palace, and by
four great works in the Vatican, and in some of the principal
churches of the city. For further improvement, he traveled
through Lombardy and Venice; and returning by way of
Florence, he was employed by the grand duke Ferdinand II.
in decorating some rooms in the Pitti palace, with pictures
of virtuous and heroic actions from ancient history. At
Rome, where he afterwards resided, he adorned the gallery
of the palace of Innocent X. on the piazza Navona, with
various subjects from the Aeneid: and as an architect, in
which profession he excelled, he gave designs for a number
of churches, palaces, chapels and monuments. To the
church of St. Martina, which was of his own construction, he
left a large sum for the erection of a grand altar-piece
of bronze, and of his own mausoleum. Pope Alexander VII.
was so well satisfied with the portico he built for the church
of Peace, that he made him a knight of the golden spur,
and gave him a rich cross, appendant to a gold chain. In
his more affluent and more humble condition, Berrettini dis-
played the fame equivanimity, and uniformly maintained a
repeppable character. The gout, to which he was subject,
disabled him, towards the close of life, from undertaking
any great works, and at length confined him to his bed.
He died at Rome in 1669.

As an artist, his character was rich in the arts of invention, with grace, beauty, and ability
of execution. His compositions are fine, his management
of lights good, and his ornaments and back-grounds charming;
but his drawing is incorrect; his figures defective in expre-
sion, and too much alike. His fresco paintings were
uncommonly brilliant and clear. He succeeded better in great
compositions than in small. An Italian writer has said of him,
that " he had fire in his colours, vehemence in his hands,
and fury in his pencil." Besides his capital works in the
palazzo Saccetti, the Barberini palace, and the palazzo Pitti
at Florence, there is, in the palace of the king of Sardinia
at Turin, a small sketch representing the " Annunciation of
the Virgin," which is touched with exquisite skill and spirit,
and in the palace of the prince della Torre, at Naples,
there is an incomparable picture of the " Flight into Egypt.”
The design is correct; the heads are wonderfully graceful;
the composition is extremely fine, and the colouring is ex-
cellent. Many of his works have been engraved by the best

BERRETTONI, Nicolo, an historical painter, was born
at
at Maccrata in 1617, and under Carlo Maratti, whose discipline he was, he studied design and colouring for some years, and became so distinguished as a painter, that he excited the jealousy and envy even of his master. His early works, after he quitted the school of Maratti, were in the style and taste of Guido; a circumstance, which of itself, highly recommends them. He died in 1682. Pilkington.

BERRIMA, in Ancient Geography. See BERROA.

BERRINOA, a town of Thrace, between Nicopolis of Media, and Philippopolis of Thrace. Anniimus Marcellinus speaks of it as a large city.

BERRIMAN, William, in Biography, a learned English divine, was born in London in 1688, and from Merchant Taylors' school was removed, at the age of 18, to Oriel college, Oxford, where he prosecuted his studies with great affability and success. With a view to the critical examination of the scriptures, he combined with skill, in the Greek tongue, the study of the Hebrew, together with the Chaldee, Syriac, and Arabic; and in explaining the sacred writings, he had recourse to the rules of grammar, criticism, logic, and the analogies of faith. The articles of doctrine and discipline, which he deduced from the scriptures, he traced through the primitive church, and confirmed by the evidence of the fathers, and the decisions of the more generally received councils. After he left the university, where he was graduated M. A. in 1711, he served two churches in London. His first appearance in print, was on occasion of the Trinitarian controversy, in 1719, when he published "A Factual Review of Mr. Whiston's Account of Primitive Doxologies," which was followed in the same year by "A Second Review." These performances recommended him to the patronage of Dr. Robinson, bishop of London, who, besides conferring upon him a living in the city, and appointing him his chaplain, left him at his death the fifth part of his large and valuable library. In 1722, he accumulated, at Oxford, the degrees of bachelor and doctor in divinity. In the years 1723 and 1724, he was appointed to preach lady Moyer's lecture in defence of the commonly received doctrine of the Trinity, and his eight sermons, delivered on this occasion, were published, in 1725, under the title of "An Historical Account of the Trinitarian Controversy." In consequence of this service, he was elected, in 1725, a fellow of Eton college. His "Historical Account" contained some observations relating to miracles, and drew upon him the animadversions of Dr. Conyers Middleton; under which he was accused, in 1731, "A Defence of some Passages in the Historical Account." By his "Brief Remarks on Mr. Chandler's Introduction to the History of the Inquisition," printed in 1733, and followed by a "Review of the Remarks," he incurred the charge of favouring the principles of intolerance, and in this controversy he incurred the severe strictures of that acute and learned nonconformist. His next publication was his course of sermons at Boyle's lecture, preached in the years 1730, 1731, and 1732, and given to the world in 2 vols. 8vo, in 1733. In this work he states the evidence of our religion from the O. T.; vindicates the Christian interpretation of the ancient prophecies; and points out the historical chain and connection of these prophecies. In the preface, he affirms the authority of Moses, as an inspired historian and law-giver. Besides the writings already enumerated, Dr. Berriman printed a number of occasional sermons. He departed this life at his house in London, on the 7th of February 1749-50, in the 62d year of his age, and in his funeral sermon, preached by Mr. Ridley, a great character is given of him, both as a minister of his parish, and as a private Christian. His piety was unaffected and sincere; and his benevolence extensive. In the year of his decease, two volumes of his sermons were published in 8vo., under the title of "Christian Doctrines and Duties explained and recommended," and in 1763, 19 sermons appeared in one volume, under the same title. "With respect to Dr. Berriman's practical discourses, it is allowed that they are grave, weighty, and useful, and well fitted to promote pious and virtuous dispositions; but when he treats on the power, rights, and dignity of the priesthood, or on doctrines which have been greatly disputed, different opinions will be formed, according to the different sentiments of his readers." Biog. Brit.

BERRY, Bacca, a grain, fruit, or seed, produced by several herbs, trees, and shrubs, thence called "baceiferous," for the conservation and reproduction of their kind. Some define berries as a fruit smaller than apples, growing in bunches, but not to thick or close as grapes. Others, a soft, slightly succulent fruit, having bones or kernels within them. Such are the fruits of laurels, olives, currants, and the like. The berry, or Bacca, in a strict sense, denotes a pulpy pericarpium without valves, in which the seeds are naked. See BACCA.

Berries are of various sizes, forms, properties, and uses, according to the plants whereon they grow. Some are used in medicine, as juniper-berries, buckthorn-berries, &c. — Others in dying, as French or yellow berries, &c. The yellow berry-wafli may be thus prepared: take a pound of the French berries, and put them to a gallon of water, with half an ounce of alum; boil them an hour in a pewter vessel, and filter off the fluid; put them again into the boiler, and evaporate the fluid till the colour appear of the required strength.

Berry-Bearing Alder. See RHAMNUS FRANGUL.

Berry, Avignon. See AVIGNON.

Berry, Ale. See ALE.

Berry, in Geography, a province of France, before the revolution, now comprehended under the departments of Indre and Cher, of which Bourges was the capital; bounded on the north by Orleanois, on the south by Bourbonnois and Marche, on the east by Nivernois, and on the west by Poitou. Berry was divided into the Upper and the Lower, and extended about 90 miles from north to south, and 73 from east to west; it is watered by several rivers, as the Loire, Creuge, Cher, Indre, &c. enjoys a temperate air; is fertile in corn, fruit, wine, hemp, flax, and paturage; and contains several rock quarries, and some mines of silver, iron, and ochre. Besides the trade in wine, carried on at Bourges, the principal commerce of this province consists in fat cattle sent to Paris, and the great number of sheep, which produce fine wool, manufactured in this and other parts of the kingdom. In Berry there are two kinds of manufactures; one for cloths and ferges, and the other for knit and woof stockings.

Berry Haven, lies about a mile south of the entrance into Dennygal haven, on the west coast of Ireland, and 5 miles N.N.E. from the haven of Ballyloughman.

Berry Head, a noted promontory on the south coast of Devon, being the south-west point of Torbay, and running far out south into the sea. Off this head, out of the way of the entrance into the bay, is a rock, called Berry-rock.

Berry's Islands, a small cluster of islands on the north-west point of the great Bahamas bank, in the channel of Providence. N. lat. 25° 30'. W. long. 75° 40'.

BERSABA, in Ancient Geography. See BER-SHEBA.

BERSABORD, a large, strong, and populous town of Petria.
BERSARII, in *Writers of the Middle Age*, a kind of hunters, or sportmen, who pursued wild beasts in forests and chases. The word seems derived from the barbarous Latin *berfari*, "to shoot with a bow." On which principle it should properly denote archers only, or bowmen. Or it might be derived from *berfa*, the "fence or pales of a park." In which view, it should primarily import those who hunt or poach in parks or forests.

Hincmar speaks of a kind of inferior officiers in the court of Charlemagne, under the denomination of *berfaris*, *velararii*, and *benerarar.* Spelman takes the first to denote those who hunted the wolf; the second, those who had the superintendence of the hounds for that use; and the third, those who hunted the beaver.

**Berschetz, or Berschesz, in Geography, a little town of Carniola, seated on a high rock near the Adriatic sea, and containing a small harbour. In this place is produced a thick and sweet wine, of a black red colour.**

**Bersello, or Brsello, a town of Italy, in the duchy of Modena, seated on the Po. It was taken by the imperial troops under prince Eugene in 1702, and by the French under the duke of Vendome in the following year. The emperor Otho died here, after his defeat by the army of Vitellius. The town is small, but fortified; 27 miles north-west of Modena. N. lat. 44° 55'. E. long. 10° 30'.**

**Bershek, a mountain of Peria, on the north-west side of the lake of Zorra, noted for a fire-temple, the resort of the Guebres.**

**Bersima, in *Ancient Geography*, a town of Afa, in Metopotamia, seated on the left bank of the Euphrates, south-west of Nisibum.**

**BerskoI, in *Geography*, a town of Siberia, 20 miles north-east of Kolivan.**

**Bersstadt, a small town of Moravia, in the circle of Olmutz.**

**Bert.* See *Birt.**

**Berta, John, in *Biography*, an early French poet of reputation, was born either at Caen, or at Condé, in Perche, in 1552; and being known at court by his wit, was appointed first digitizer to Catherine de Medicis, private secretary and reader to Henry III. and was much esteemed by Henry IV. in whose conversion he was eminently instrumental. In 1594, he was made abbot of Aznai, and, in 1626, bishop of Sees. After his advancement to this see, his conduct was irreproachable, though some blame attached to him; because, instead of suppressing the free poems of his youth, he published them with the pious pieces of his advanced age. He died in 1611. As a poet, he is fiated to have been more natural and clear than Ronfard, more forcible than Defoer, and more ingenious and polished than either of his contemporaries. Some of his fancies are said to polish the taste and elegance of a more refined period. His fondness for point with which his pieces abound, he seems to have derived from his attachment to Seneca. His "Poetic Works" were printed in 1620, Paris, 8vo. He left also a translation of some books of St. Ambrose, controversial tracts, sermons, and a funeral oration for Henry IV. Nouv. Dict. Hilt. Gen. Biog.**

**Bert, in *Sea Language*. See *Birt.**

**Bertaux, Charles, in *Biography*, an eminent French protestant divine, was born at Montpelier, in 1660, and after having studied philosophy and divinity, partly in France, and partly in Holland, was admitted a minister in the synod of Vigan in 1681. His first settlement was as pastor to the church at Montpelier, whence he removed to be minister of the church at Paris, which met at Charenton. Upon the revocation of the edict of Nantes, he came over to England, and in 1696, was chosen one of the ministers of the Walloon church in Threadneedle-street, London, in which capacity he officiated, with very general applause, for 44 years. He died, much regretted, in December 1732. He was distinguished by sound judgment, by a retentive memory, so that he is said never to have forgotten anything which he had seen, read, or heard, by his accurate and extensive acquaintance with ecclesiastical history, and by his eloquence as a preacher. Two volumes of his sermons have been printed in French; the first in 1712, and the second at Amsterdam, where the former was reprinted, in 1730. Gen. Dict.**

**Berttheaume, Point, in *Geography*, the west limit of the bay so called, about 44 leagues from St. Matthew's point, without the entrance into the road of Breit. Within the point, on the west side of the bay, are the castle and rock of Berttheaume.**

**Bertthevin, St., a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval, 4 of a league well of Laval.**

**Berthing, in the *Sea Language*, denotes the raising or bringing up of ship-sides. Thus they say, a clicker hath her sides berthed up before any beam is put into her.**

**Berttholz, in *Geography*, a town of Germany, in the archduchy of Austria, 5 miles W.N.W. of Zvitra.**

**Bertthoncelles, a town of France, in the department of the Orne, and chief place of a canton, in the district of Belleme, 13 miles north-east of Belleme.**

**Berti, John-Laurance, in *Biography*, an Augustin monk, was born in 1690 at Saravezza, a village in Tuscany, and upon being called to Rome by his superiors, was appointed assistant general of his order in Italy, and prefect of the angelic library. In a great work, entitled "De Diceriphis Theologici," printed at Rome, in 8 vols. 4to., he appears to have adopted the sentiments of St. Augustin, which involved him in a controversy with the Jedesits, and caused him to be denounced to pope Benedict XIV. as a disciple of Balsus and Janennis. Against this charge he defended himself in a learned apology, comprehending 2 vols. 4to. He afterwards composed in Latin an "Ecclesiastical History," in 7 vols. 4to., which was afterwards abridged in one volume, 8vo. In this work he represents the pope as supreme monarch and arbiter of all kingdoms and empires. He also wrote many other works, some of which are Italian poems, all of which were published together at Venice in folio. He was invited by Francis I. grand-duke of Tuscany, to Pisa, and received a considerable pension, with a professorship in the university, under the title of "Imperial theologit," and here he died, in 1766, much lamented by his colleagues. Nouv. Dict. Hilt.**

**Bertie, in *Geography*, a maritime county of America, in North Carolina, and Edenton district, having for its southern boundary the Roanoke, and on the east Albemarle sound. In this county is situated the ancient Indian tower of Tuscarora. It contains 12,666 persons, of whom 5,141 are slaves.**

two-celled. Seeds very many, roundish, affixed to the
perimeter.

Elf. Char. Cal. turbinate, five-toothed. Cor. tube short,
with a villose mouth; berry globose, inferior, two-celled,
many-seeded.

This is a shrub six or seven feet high, and the thickness of
the human arm, branches opposite, knotty, tormentose;
leaves opposite, ovate, acuminate, and tormentose underneath;
petioles short, convex beneath, channelled above; stipules
stem-clasping, two lobed; flowers in terminating racemes;
corolla white. Found by Aublet in the wood of Aroura,
in Guiana, flowering and fruiting in the month of June.

Martyn.

BERTIN, NICOLAS, in Biographie, an historical painter,
was born at Paris in 1667; and after studying under some
of the principal artists, and gaining, at the age of 18 years,
the prize of merit in the academy, was sent to Rome for
further improvement, where he acquired a good taste for
composition, and in Lombardy he completed his knowledge
of colouring. Some time after his return to Paris, he was
made academician in 1703, and professor in 1705. His
drawing was correct; his invention ready in all sorts of
subjects; and he painted in a strong, pleasing, and finished style.
He was much employed by Louis XIV.; and his performances
were valued and sought after by foreigners. He ex-
celled more in small works than great ones; and from this
circumstance, and some others, he was referred only to the
second rank of artists. Among his most considerable perfor-
mances we may reckon the ceiling at the chateau of Pleffis
St. Pierre, the subject of which was the adoration of the
Magi, and an historical composition, representing the bap-
tism of the enuch of the queen of Candace, by St. Philip.
His temper was reserved, and he was much addicted to reli-

BERTIN, JOSEPH, EUGÈNE, was born at Tremblay,
in the department of Rennes. June 28th 1712. Hav-
ing gone through the usual course of study, in anatomy,
physiology, and therapeutics, he was created doctor in
medicine at Paris, in 1740. The following year he pub-
lished “Non datur imaginazione maternae in factum ac-
tio,” combating an opinion, which had long prevailed, that
the imagination of the mother had the power of mark-
ing and disfiguring the fetus in utero. His next production,
which is much commended by Haller, is a treatise on “Of-
teology,” in 4 vols. 1720. The bones of the head are
described more exactly and minutely, Haller says, than in
any other work extant. About the same time, he had a long,
but not very interesting dispute, with Mont. Ferrein, on
the formation of the voice. In the year 1764, he joined Meffrs.
Le Bas, Petit, and others, in defending the cause of Ma-
dame Renné, who had been delivered of a male child ten
months and twenty days after the decease of her husband,
and who wished to get the child acknowledged as his. Ber-
tin, with his coadjutors, endeavoured to establish his prin-
ciple, that there is no fixed term for the birth of the child,
and that, according as the constitution of the parents was
more or less vigorous, a greater or less portion of time might
be required for the perfection of the fetus. A child might
be ripe, and fit for the birth, they maintained, at the end
of the seventh month, if the parties enjoyed great strength
of constitution; or in an opposite state of them, it might
require ten, eleven, twelve, or more months, to fit it for
exclusion. This doctrine was attempted to be established
by recurring to a great number of cases and observations,
and to the decisions of the courts, of which they produced
several, legitimating children, supposed to have been born in

the eleventh or twelfth month after conception. Recourse
was also had to the histories of monstrous births, to shew
the corrections of nature. These arguments and caces were
ably and judiciously opposed by M. Louis. The cases ad-
duced by his antagonists were found to be defective in evi-
dence, and though he admitted that the time of gestation
in women, as well as in animals, might be protracted for a few
days, yet he much doubted whether, in any instance, it had
been extended to the end of the tenth month, or at the most
to more than two or three days beyond that term. In sup-
port of this opinion, he cited the authority of fame of the
ablest philosophers, physicians, and lawyers; and the court,
according to this determination, declared the child to be il-
legitimate. Though the court in this decision were proba-
ably influenced by the peculiar circumstances of the case, the
husband being 76 years of age at the time of his death, and
for the left month in such a state as to be incapable of per-
forming the conjugal rites, yet the arguments and authori-
ties adduced by M. Louis, must have had great weight with
them, and well deserve to be had recourse to in deciding on
general principles, what is the utmost term to which a
woman may carry a living child. M. Bertin was author of se-
veral dissertations, principally on anatomical subjects, which
were published in the Memoirs of the Royal Academy of
Sciences, and other philosophical and medical journals and
transactions; the titles and accounts of which are given by
hall, in his Bibl. Anatom. &c.

BERTINO, in Geography, a town of Italy, in the
flats of the church, the ice of a bishop, suffragan of Ra-
venna; seated on a hill, and defended by a citadel, 15 miles
south of Ravenna.

BERTIUS, PETRUS, in Biographie, an eminent geogra-
pher, was born at Berzeen, a village in Flanders, in 1565,
and acquired the knowledge of the learned languages in
England. Having travelled through Germany, and other coun-
tries, he settled at Leyden, where he became professor of
philosophy; but after occupying this post for 26 years, he
was expelled for joining the Arminian party. Upon his ex-
pulsion, he migrated to Paris, where he abjured the protes-
tant religion in 1620, and was made cosmographer to the
king, and professor-royal extraordinary of mathematics.
He died in 1629. His principal works are “Theatrum Ge-
ographiae Veteris,” Amst. 2 vols. fol. 1618, 1619; which
is a collection of the works of almost all the ancient geo-
ographers, illustrated by notes, and esteemed a valuable publi-
lation; “Introductio in universam Geographiam;” “Com-
ment. Rerum Germanic. lib. iii.” Amst. 12mo. 1635, con-
taining a good description of Germany, and a map of the
empire of Charlemagne; “Notitia Episcopatum Galliae,”
Par. fol. 1625; “De Aggeribus et Pontibus,” Par. 8vo.
1629. The works above enumerated are held in high esti-
mation by geographers. We may add “Histoire Physique
Exil. Select. superiores facula script. vel a Belgis vel ad Bel-
gas,” 1601, 1617. Bertius also wrote several pieces in the
contrivery between the Comarris and Arminians, and pub-

BERTON ROAD, in Geography, lies within Dalky island,
at the fourth point of the entrance into Dublin bay, Ireland.

BERTONA, BERTONIA, BERTON, or BERTON,
properly denotes that part of a country farm where the
barns and other inferior offices stand, and wherein the
cattle are foddered, and other business is managed.
Berton is also used to signify a farm, as distinct from a
manor. Du-Cange. In some parts of the west of England,
they call a great farm a berton, and a small one a living.
Hence also bertonarii was anciently used for those we now
call farmers, or tenants of bertonas.
BERTONCOURT, in Geography, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Burcy, 10 miles north-east of Metz.

BERTRAM, Cornelius Bonaventure, in Biography, a learned orientalist, was born at Thouars, in Poitou, in 1531, and became professor of Hebrew at Geneva, and afterwards at Lausanne, where he died in 1594. His works are "A Dissertation on the Republic of the Hebrews," 8vo. Geneva, 1580, and Leyd. 1641; "A Revision of the French Bible of Geneva," Gen. 1588, which is more correct and liberal than the other, and is used by the Calvinists at the present time; "A new edition of Pagnin's 'Treatise of the Sacred Tongue;'

BERTHIE, a canton, 8vo. of Burgundy, measures 40 leagues long and between 50 and 54 broad.

BERVAN, a town of Asia, in Tartary, in the kingdom of Thibet, near the lake Bervan, which lake is said to be 40 leagues long and between 50 and 54 broad.

BERVIE, or Inverurie, in Geography, a royal burgh in the county of Kincardine, Scotland, N. lat. 56°24'.

Bervie, a town of the North, which is about 2 miles south, where they enjoy a more eligible situation. Fresh water has lately been brought into the town by means of pipes, and a new bridge has been recently thrown across the river Bervie. The population of the borough is about 607 persons.

BERVINE, a river of the Netherlands, which passes by Dalem, and runs into the Meuse, near Vits.

BERVICH, in Ethnology, the name by which the沔ders call the lump-fish; cyclopus lumpus of Linnaeus.

BERVILLE, Peter de, in Biography, cardinal and founder of the congregation of the fathers of the oratory in France, was born at Serilly near Troyes, in 1575, and educated with a view to the ecclesiastic profession, first among the Jesuits, and afterwards in the university of Paris, where he distinguished himself by his proficiency in literature, and by the amiability of his disposition. Such were his attainments in doctrinal and controversial divinity, that he bore a principal part in the conference at Fontainebleau, in 1600, between Cardinal du Perron on behalf of the Catholics, and the Plébans on the side of the Protestants. At this time he was almoner to king Henry IV.; and in 1624, he was employed in bringing over a colony of Carmelites from Spain, and settling them at Paris; of this order he was constituted superior-general. The first foundations of the congregation of the oratory of Jesus were laid by him in 1611, and from this institute he derived the greatest honour. See ORATORY. After the death of Henry IV., Berulle was chief of the council of the queen mother, Mary of Medicis, and he took an active part in promoting conciliatory measures between the contending parties during the minority of Louis XIII. In 1624, he was deputed on a commission to Rome, to solicit a dispensation for the marriage of the princes Henrietta Maria, to Charles I. of England; he was appointed her confessor, and accompanied her to take possession of the throne. But as he treacherously and illegally maintained her spoliated rights, he contributed to some measure to the mischief that resulted from this impolitic union, and at length incurred the reproach of a dissembler. The duke of Buckingham, as he says, complained of him to the king of having conspired against his life and fortune. On his return to France, he was active in urging the proceedings against the Calvinists at Rochelle. Having refused several rich bounties and bounties, he was nominated cardinal by Urban VIII., without his knowledge, in 1637; but he continued his able-minded and mortified mode of living; and at length, exhausted by his labours and sufferings, he died during the celebration of mass, Oct. 2, 1629. His numerous pieces in controversial theology were collected and published in three volumes, and have since appeared in several other editions. Gen. Dict.

Bervie, a town of the North, which is about 2 miles south, where they enjoy a more eligible situation. Fresh water has lately been brought into the town by means of pipes, and a new bridge has been recently thrown across the river Bervie. The population of the borough is about 607 persons.

BERUS, in Geography, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Sar-Louis, 4 miles S.S.W. of Sar-Louis.

BERUS, in Zoology. Coluber berus is the common European viper. Linnaeus, who, in describing the amphibian genera, conceived it quite sufficient to distinguish all the species of the several genera included in that order, by the number of abdominal leuta, or plates on the belly, and the scales on the tail, figures them at 146—39. Fu. Succ. Amoen. Acad. &c. The opinion entertained in this respect by that eminent naturalist, we perceive from later observations on the species he describes, was not perfectly correct. This is exemplified for instance in the common viper, in which both the abdominal plates and caudal scales are liable to vary in point of number; one writer speaks of the vipers having 148—47, Weigl, &c.; another (Scopoli) mentions 177—68, &c. Notwithstanding therefore the example of Linnaeus to the contrary, we cannot but approve of characters taken rather from the various marks, spots, and other striking particulars in the general appearance of the species in this order, as Linnaeus has done himself in the reptile tribe. Dr. Shaw seems also to prefer the latter, considering the number of plates on the belly, and scales on the tail, in a secondary point of view. He thus describes the common viper: Coluber cinereus, maculæ capitis biloba, vitæ dorall atro dentata repanda. Cineræus vipers, with a bilobate spot, and a black flexuous zigzag bend down the back.

Gmelin, in the Systema Naturae, has four varieties of coluber berus; namely, (a) a native of India, in which the spots along the back are roundish and confluent, so as to form almost one continued stripe; those spots near the tail are disposed transversely. In the island of St. Euface, another variety (b) is also found, of a subfuscous colour, with the head variegated, and the neck flocculent. (c) This inhabit India, and is distinguished by having the arch of the occiput, or hind head, intercepting a white spot. The fourth fort (c) has an aggregated spot of many parts on the head; and is a native of the Celebes. Figures of all these varieties of coluber berus are to be found in the magnificent work of Scha.

The common viper of Europe and northern Asia is the same as that found in this country. With us, the viper seldom exceeds the length of eighteen inches or two feet. Pennant tells us, he once saw a female viper almost three feet in length, observing at the same time, that the females are usually one third larger than the males. The colour, generally speaking, is of a filthy greyish, or tawny brown, paler or more vivid in different individuals, and sometimes blackish all over; but in all these varieties the spots are pretty nearly the same, the back being marked with a chain or series of rhomboidal spots connected with each other, and forming one continued indented stripe from the head to the extremity of the tail. A series of dark or dusky spots extends likewise along each side of the body; other spots appear again on the belly, which in most specimens is almost entirely black, and finely glossed with purple. The situation of the fangs proves the viper to be one of the poisonous kinds of serpents; they are situated on each side of the fore-part of the upper jaw, and are commonly two in number, with a few smaller ones near them. Petiver describes a black viper, vipera Aegyptia nigra, which is thought to be nothing more than a dark variety of the common kind, berus. This, however, is not certain, and we should hesitate in admitting it as a variety only, since Linnaeus considered it, from the description which Petiver has given, as the coluber regret of his Fauna Succia. For a further account of coluber berus, see Viper.

BERWICK, North, in Geography, a royal borough of Earl Lothian, in the county of Haddington, in Scotland. This town is of very remote antiquity, and has been a scene of considerable manufacture and commerce, but is now reduced to poverty, its inhabitants being in reversion, and a few cargoes of grain are the only exports from its quays. Its original charter was lost or destroyed, and James VI. granted it a new one, under which it has since been governed. The parish extends about three miles along the sea-coast, and confines wholly of salubrious land, except a fine conical hill called North Berwick Law. This rises immediately above the town, and forms a conspicuous landmark to the sailors who navigate the Frith of Forth. The ancient castle of Tantallonstands about two miles from this town, and is elevated on a high rock, three of whose sides are laved by the surge of the sea, and the fourth guarded by a deep foss and drawbridge. See Bass, N. lat. 56° 40'. W. long. 2°.

Berwick, commonly called Berwick-upon-Tweed, is a large respectable town, situated between England and Scotland. From its having been a frontier garrison town, long before the glorious era of the union, and from its situation on the shore of the ocean and on the bank of an unfordable river, it was considered, when in possession of the English, as a key to England, and when in possession of the Scots, as a key to their own country. This peculiarity of situation rendered it a scene of repeated siege and devastation. Berwick is pleasantly situated on the northern bank of the river Tweed, within half a mile of the German ocean; 335 miles north-west from London; and 54 miles south-east from Edinburgh. N. lat. 55° 48'. W. long. 1° 45'. The ground, on which the town stands, rises gently from the river, and from its southern aspect, is rendered cheerful by the fine, its circumference, within the present walls, is about one mile and three quarters, but the circumference of the old walls extended two miles two hundred and eighty-two yards. The town of Berwick is mentioned as a place of strength in the reign of Robert, one of the last kings of Northumberland, who died in the beginning of the ninth century. It was successively conquered and possessed by the Saxons and Danes, until the Scottish king Gregory, who was contemporary with Alfred the Great, took it by assault. It continued part of the Scotch dominions till about the year 1098, when it was given by Edgar to the see of Durham, but was again restored to the Scots. During the repeated wars between England and Scotland, this town and its castle were frequently taken and retaken by the armies of each kingdom, and in each direful conflict suffered materially. In one of these, between Alexander of Scotland and John of England, the greater part was destroyed by the latter, who made it a practice to confound the house every morning in which he had lodged the preceding night. On the 2d of August 1291, the states of England and Scotland, with Edward I., assembled at Berwick, to settle the claims of Robert Bruce and John Balliol to the Scotch crown, when the latter was appointed on the 17th of the following November. During these reigns the Scots were befought and conquered by Edward I.; and the conflict was so great, that Matthew of Westminster states the loss of the Scots to amount to 60,000 per peron. An English parliament was summoned here in 1256, when the Scotch nobility paid homage to king Edward. In the following reign, Robert Bruce collected an army of 50,000 combatants, with which he entirely routed and discomfited Edward II. and his army near Stirling castle. This battle, commencing on Midsummer day, 1314, continued several days, and it is acknowledged by most authors, that the English suffered more in this conflict than in any other since the time of William the conqueror. It was in this battle that
that the privy seal was lost; and Edward issued a proclamation from Berwick, informing his subjects of the circumstance. Berwick was afterwards a scene of great revival and rejoicings. The marriage of Joan, sister to Edward III., with David of Scotland, was performed at this place with great pomp and ostentatious solemnity. In spite of this family alliance, the two kingdoms soon returned to their former hostilities, and Berwick became the seat of many battles and destructive sieges. It was several times afterwards in the possession of each country, and never relinquished by either without a vigorous and obstinate resistance. In the reign of Richard III. of England, and James III. of Scotland, commissioners were appointed by each crown to ascertain the limits of Berwick; and it was agreed, that the ground in dispute should remain uncultivated, unbuilt, and uninhabited. But in 1502, this agreement was annulled by another, which stipulated that the town and castle should be "preferred in perpetual peace, friendship, league, and confederacy." In the same year was solemnized the marriage of Margaret, eldest daughter of Henry VII., with James IV. king of Scotland; but this circumstance did not terminate the jealoufies and animosities between the two kingdoms, as Edward VI. marched to Berwick with a large force, which was augmented by a fleet of 39 ships, 32 transports, and a galley. These lay encamped here for some time, and were destined to invade Scotland. This monarch, and Mary queen of Scotland, by treaty, made Berwick a county town, and declared it independent of both states. Queen Elizabeth fortified and inviolated it with a strong and expensive military establishment, consisting of 880 men, whose annual salaries amounted to £15,734l. 19s. 2d. All this was abandoned, and the place rendered peaceable by James VI. of Scotland, who was proclaimed at Berwick, in the year 1603, king of England, France, and Ireland. The union of the two kingdoms, in 1707, terminated the long series of hostilities, which had proved so destructive to the commerce, population and agriculture of the borders, and to this place in particular.

Berwick, though originally a Scots town, was created into an English borough, at a very early period, and its laird charter was granted by James I.; under which the burgesses claim their various privileges, immunities, &c., as well as some large territorial possessions and domains. It has an exempt jurisdiction, and is independent of the adjoining counties of Durham and Northumberland, yet it is not a county in itself. Since the union, it has been partly subject to the English laws, but is locally regulated by its own code.

The town is governed by a mayor, recorder, four bailiffs, and an indefinite number of aldermen. The first is annually elected, and receives 100l. during his majority. Two members of parliament are returned from this town, and the number of electors amounts to nearly one thousand, though not more than seven hundred have been known to vote at one election. Several manufactures are established here; the principal of which are for making of damask and diaper, faking-fail-cloth, cotton and muslins, flockings, carpets, felts, hats, boots, shoes; besides several others connected with the shipping. The coaling trade and foreign commerce of Berwick are very considerable, though about sixty years since, only two small vessels of fifty tons each were employed between this place and London. Now about 40 vessels belong to this port, whose principal lading consists of salmon and eggs. The first are mostly caught in the river Tweed, whose fisheries afford a great revenue to the proprietors, and give employ to about 300 men. The salmon fishing continues from the 10th of January till the 10th of October, during which time above 40,000 kits of these fish, besides a vast quantity of salmon trout, have been sent to London. The latter are often conveyed alive in the holds of the vessels. About 80 boats are employed on the Tweed, and the yearly rentals of all the fishing waters amount to nearly 10,000l. The article of eggs is also a curious and lucrative branch of trade: they are brought to this town in carts and pantries from all parts of the adjoining country, and mostly bartered for grocery goods. From the 10th of October 1707 to the 10th of October 1758, 5254 chests of eggs were sent hence to London. The great increase of trade at this port may be estimated from the customs-house revenue, which has risen in the last 20 years from 1000l. to 6000l. a year.

It was the universal practice, till within these few years, to boil all the salmon before it was packed up in the kits; but in 1788, a new mode was adopted, and has continued ever since. This consists in packing it with ice, which being wanted in great quantities, induced the merchants to construct several ice-houses near the town. In the year 1798, the two companies of Berwick laid in 7600 cart-loads, which cost them about 450l. There are 32 salmon coopers in this town. Four modes of catching salmon are practised here; the sweep, the fill, the bobbi, and the hanging nets. (See Saturdays.) Besides the salmon-fishery, the herring and lobster fishery employs several hands. The latter are caught in small cruises, which are three feet in length and one and a half in height. These have a hole at each end, where the lobstermen are tempted to enter for the enclosed baits.

The Public Buildings are the governor's house, the barracks, the ordnance-house, the main-guard, the town-hall, ferry-house, church, vicar's house, and the bridge; all these are constructed with stone, and the two first were built in 1719. The town hall is a handsome building of three stories, with an ornamental tower and spire at one end. It was built from the designs of Joseph Dodds, and finished in 1754. The church was built in 1632, under the direction of colonel George Fenwick; but it has neither tower nor bells: these are annexed to the town hall. The bridge over the Tweed is constructed with fine hewn stone, and has fifteen spacious arches. It extends 1164 feet in length, and 17 in width, and was finished building October 12, 1624, after a period of 24 years, 4 months, and 4 days, from the commencement.

Here are a charity school, and six free-schools, also a custom-house and excise-office. Berwick is still surrounded with fortified walls, which are mounted with 53 guns. It has four principal gates, and has a complete garrison establishment, to which Holy Island is an appendage. Among the antiquities of the town, are the remains of its ancient castle, and a pentagonal hall tower near it, a square fort in Magdalene fields, entrenchments on the top of Hallydown hill, and an old pier called queen Elizabeth's pier.

Here is one weekly market on Saturdays, and one annual fair; but the corporation has established three annual markets, called High markets, for the hiring of servants, and selling of horses, cattle, &c. Fuller's History of Berwick-upon-Tweed, Svo, 1759.

BERWICK, or Aikifhawen, a neat town of America, in York county, Pennsylvania, at the head of Conewago creek, 103 miles W. by S. of Philadelphia, 13 miles W. of York, and 26 miles S.S.W. of Harrisburg. This town is regularly laid out, and contains about 100 houses, and a German Lutheran, and Calvinist church. N. lat. 39° 54'.

BERWICK, or New Berwick, a small town of Northumberland county in Pennsylvania, on the north-western side of the calm branch of Susquehannah river, opposite Nectopeck falls and Nectopeck creek, 34 miles north-east from Nor-
thumberland and Sunbury, at the junction of the eait with the west branch of the Susquehannah, and 160 north-west of Philadelphia. N. lat. 41° 3'.

BERWICK, a township of York county, and district of Maine, containing 3894 inhabitants. It has an incorporated academy, and lies on the eait side of Salmon Fall river, 7 miles N. W. of York, and 86 E. by N. from Boston.

BERWICKSHIRE, a county of Scotland, famous in the historical annals of Britain for the many desperate battles fought between the English and Scots within its boundaries. This county formerly constituted about half of the earldom of Dunbar or March, and is generally called by the country people Merse. It is nominally divided into three districts, respectively called Lauderdale, Lammermoor, and Erse, or Marth. The latter comprehends the most beautiful subdivision, and follows the course of the Tweed, from the foot of the Eden hills to within a few miles of Berwick. Lauderdale is the valley which accompanies the river Leader, or Lauder, whose waters are celebrated in Scottii song. Lammermoor comprehends the ridge of hills, which separates this county from east Lothian, and is chiefly appropriated to the feeding of sheep and black cattle. This county is bounded on the north by Haddingtonshire, on the east by the German ocean, on the south by the river Tweed, which divides it from Northumberland in England, and on the west by the counties of Roxburgh, Peebles, and Midlothian. Its length is estimated at 32 miles, and breadth at 17 miles. It is divided into 32 parochial districts; and besides the royal borough of Lauder, has the towns of Greenlaw, Dunse, Coldstream, Coldstream, Ayton, and Eyemouth, within its limits. The chief rivers of the county are the Tweed, the Leader, the Eye, the Whiteadder, and the Blackadder. The state of agriculture in this county is highly improved within the last twenty years; and many parts that were then uncultivated, are now included and rendered profitable to the landlord and the husbandman. By way of agricultural pre-eminence, this county is often called the Norfolk of Scotland. Many farms now let at 300l. and 400l. per annum, which at no very distant period were fearfully defering of notice. This increase of prosperity enables the county to export from the ports of Berwick and Eyemouth "above 80,000 bolls of victual annually," and nearly the same quantity is conveyed to the markets of Edinburgh, Dalkeith, Haddington, and Dunbar. The minerals of this district hitherto discovered are few, and thefe not very valuable. Coal is found in small quantities near Eyemouth; freestone is abundant; and rock and shell marl are found in different places. Copper has been obtained in the vicinity of Lauder; and some few years past a mine of the same ore was discovered in the parish of Bonkle. A small quantity of iron flume is found in the parish of Mordington. The rocks, which compose the Lammermoor hills, are mostly schistus, with alternate strata of sandstone. At Eyemouth is a rock of puddingstone, which is found to contain fragments of porphyry, granite, and limestone. In the parish of Chirnside, is a species of gypsum, which is advantageously used to manure certain lands. Near Dunse is a celebrated mineral spring, which is much resorted to. Its water, somewhat similar to that of Tunbridge wells, contains iron dissolved in fixed air, with a little sea salt and bitterness; and its effects prove rather diuretic and convulsive. Among the gentlemen's mansions of the county, those of Hirst, the seat of the earl of Home, and of Marchmont, the seat of the earl of Marchmont, are the most considerable; though there are some other handsome mansions. Besides the castle and fortifications of Berwick, there are several others in different parts of the country, particularly at Lauderdale, Cockburn path, Home, and Chapelon Beach. There were also seven nunneries, two hospitals, and one Dominican convent. Among the eminent natives of this county, the following names occur: James Thomson, the poet; John Scott, or Duns Scotus, the philosopher; and John Brown, author of the Brunonian system of phjsick. Thomson, the Rhenier, or Sir Thomas Lennert, is distingiiished in the history of metrical romance. The real land- rent of this county is estimated at 118,800l. Sterling, Home's Agricultural Report of Berwickshire. Sir John Sinclair's Statistical Account of Scotland. Fuller's History of Berwick.

BERWIN, or BERWIN, a considerable range of mountains, which passes through parts of the counties of Montgomery, Merioneth, and Denbigh, in North Wales. The prospect from different spots on the summit of this ridge strikes the mind with awful astonishment. "Nature," says lord Lyttelton (Works, vol. iii. p. 337), "is in all her majesty there; but it is the majesty of a tyrant frowning over the ruins and defoliation of a country. The enormous mountains, or rather rocks, of Merionethshire, include us all around. There is not upon these mountains a tree, or shrub, or blade of grass; nor did we see any marks of habitation or culture in the whole place. Between them is a solitude fit for despair to inhabit; whereas all we had seen before in Wales, seemed to inspire the meditations of love."

BERY, BERIA, or BÉRIA, was anciently the name of the vill or site of the habitation of a noblemen, or of a dwelling or manor-house, being the chief of a manor; formed of the Saxon "bry" or "beria," which denotes a hill or castle; for noblemen's seats were formerly castles, situated on hills, of which there are still some remains. It was anciently taken for a sanctuary. See BÉRIA.

BÉRYL, or BÉRYLL, BERYLL, BERYL, or BERYLL, BERYLUS, Aquamarine of Silveria, Beryl, Germ.; Emerald, vert bloutez, Haury; flesh smaragdes beryles, Werner.

The colour of the beryl is a bluish green, passing into mountain apple, or apatargus green, and honey yellow on one side, and light blue on the other. It is almost always found crystallized in rectangular six-sided prisms, sometimes truncated on the edges and angles; the sides of the prisms are occasionally alternately broad and narrow, and sometimes convex, which gives the whole crystal a cylindrical form. It is not unfrequent for the prisms to have the appearance of having been broken across and imperfectly cemented together. Sometimes, instead of having plane faces at their extremities, they are convex or concave, like articulated bivalves. The size of the crystals varies considerably, the smallest being always the longest in proportion to their diameter; some are of no greater magnitude than a hair, while others have been found a foot long and three or four inches in diameter. The beryl has many points of resemblance with the emerald; and in particular the crystals of both are divisible parallel to the sides and extremities of a regular hexagonal prism; on which account M. Haury has comprehended them both under one species.

The beryl is externally diming, or little-shining, with a vitreous lustre. Its parallel fracture is minute-conchoidal; the crofs fracture is completely conchoidal. It is generally transparent, but sometimes is only semi-transparent or translucent. It is sufficiently hard to scratch quartz, though with some difficulty. Specific gravity of the light blue variety 2.67; of the blueish green 2.75; of the mountain green 2.65.

This mineral appears to have been first analyzed by Vaquelin, and afterwards by Rose and Schaumb. With the following results:

**Silica**.

In a common fire the beryll undergoes feirce any change of colour, but it loses its transparency, and flies to pieces. At a more intense heat it becomes opaque and milk white, but shows no signs of fusion; by the affinity, however, of oxygen gas, it melts without much difficulty. Borax is a perfect flux for it.

The beryll is found in Dzamua, upon the borders of China, near Nertchinsk, also in the granite ridge between the rivers Onon and Omoobo. It is found in rivers, accompanying rock-crystal, indurated clay, mica, flour, wulfman, and aricalal pyrites.

The beryll, when cut and polished, has a considerable lustre; but its colour is for the most part but indifferent. It is ranked among the gems, but its value is trifling when compared with the ruby, sapphire, topaz, &c. buty. Ember. Widenmann.

BERYLL, Oriental. See Corundum.
BERYLL, Brasillian. See Turmalin.

BERYLL, Beryllus, is also a name given to a kind of crystal looking-glass, superflitionally consecrated to the purposes of conjuring and divination. Hence also the term beryllifica, used for the myriological art of feigning future or distant events in such glasses.

BERYLLINA, in Entomology, a species of Crysta, found in Europe. The head is greenish blue; thorax blue, greenish in front, behind bidentated; abdomen green, changeable to rufous and blue; legs blue, with tesselate dots. Lineans, &c.

BERYLLINUS, a species of Cinex (Spinus); thorax obtusely spined, and dentated on the sides; tips of the spines and bind field of the head greenish blue. Linna.

BERYLLUS, in Biography, a learned and pious bishop of Bollia, or Bozrah, in Arabia, flourished about the year 230, and taught that Christ had no proper subjection or divinity distinct from that of the father, before his birth of Mary; or that Christ did not exist before Mary, but that a spirit issuing from God himself, and therefore superior to all human souls, as being a portion of the divine nature, was united to him at the time of his birth. Many conferences were held with Beryllus on this opinion; and at last it was so completely refuted by Origen, and so much to the satisfaction of Beryllus himself, that he gave up the cause, and returned into the bosom of the church. The acts of these conferences were long preserved, and the dialogue between Origen and Beryllus was extant in the time of Jerome. albus also refers to them. Excc. Hist. 1. vi. c. 33. Cave's Hist. Lit. vol. i. p. 12. Memo. Excc. Hist. vol. i. p. 326.

BERYLLUS, in Entomology, a species of Cinex (Rotundata), that inhabits India. It is of the middle size; pale; border of the thorax orange; wing-casps with a ferruginous spot, and marginal black lines. Fabricius.

BERTYUS, Bairout, Berout, or Beirut, a town of Phœnicia, situated about 24 miles south of Byblus. Stephanus Byz. says, that it was so called on account of its waters. Others deduce its name from Berœ, as it was sometimes called by the poets, who was a nymph of the

ocean, and the nurse of Semele. Bryant supposes it to have been derived from Baris, Baris, or Barith, the ancient name of the ark, but properly signifying a covenant; and that it was the city of the ark, where the Canaanite or Phœnician deity Baal-Berith had a temple, and where the rites of his worship were performed. This city is not much inferior to Byblus in antiquity, since it is said to have existed in the time of Cronus. The kings of Egypt had possession of it; but when Antiochus the Great subdued this province, it became subject to the kings of Syria, and remained under the suzerainty of this prince till the time of Diodotus, denominated "Tryphon," who entirely destroyed it about 140 years before the Christian era. The Romans, after the conquest of Syria, rebuilt it near the spot where the ancient city had stood. Agrippa, the grandson of Herod the Great, decorated it at an immense expense with a theatre and amphitheatre, baths, and porticoes, and established in it magnificent games, mentioned by Josephus in his "Antiquities." It was in this city that Herod the Great, by permission of Augustus, held an assembly which concluded to death his sons Alexander and Aritobulus, under the false accusation of Antipater, their elder brother, for having conspired against the life of their father. Titus, the son of Vespasian, came to Berytus, after the capture of Jerusalem, to celebrate the feast of the birth of his father; according to Josephus "de Bello," Berytus enjoyed the privilege of the "lus Italian," according to a law of the Digest. Pliny (H. N. l. c. 207) and Josephus (De Bell. Jud.) informs us, that it was a Roman colony. Under the Roman emperors, Berytus was no less famous for the study of the law in the east, than Rome was in the west; and hence it was fabled by the emperor Julianus "the mother and nurse of the laws."

The civil law was taught here in Greek, as it was at Rome in Latin. It is not certainly known by whom the academy was founded; but that it flourished long before the reign of the emperor Diocletian, is manifest from a decree of that prince. According to Heineccius (Jur. Rom. Hist. p. 351-355), the splendour of this school may be computed to have lasted from the third to the middle of the sixth century; and its institution has been ascribed to Alexander Severus. From this academy the two famous civilans Dorotheus and Anatolus were called by Julianus, that they, in concurrence with others, might be employed in comparing the Digests; and that prince would allow of no other academies, but those of Rome, Berytus, and Constantinople, to expound the laws. This city was overthrown by an earthquake in the 25th year of Julianus, A.D. 551, July 9; and as the schools of Berytus were filled with the rising spirits of the age, many youths were probably lost on this fatal occasion, who might have lived to be the counsels or guardians of their country. The metropolis of this city are bronze, gold, and silver. After it became a Roman colony, its medals had a legend, Col. Fel. Bery. i.e. "Colonia Felix Berytus," and were struck in honour of Caesar, Augustus, Tiberius, Claudius, and other Roman emperors. For the present state of Berytus, see BAIROUT. The suburbs are almost as large as the city itself, consisting of gardens, with a house for the owner in each; and theft, intermixed among the numerous fruit-trees, particularly olives and figs, which the fertile soil supports, give the whole a picturesque and beautiful appearance. European vessels, in the summer, anchor near a small point of land, which runs into the sea before the city, and is called "Beirut point;" but in the winter, they call anchor to the north, in a kind of gulf, which is sheltered from the north and east wind by the mountain, and is said to be very serene. The staple commodity of the country is raw silk, which is carried to Cairo, Damascus, and Aleppo, and part
part of it to Europe. They also fabricated a kind of jars and jugs of earthen ware, which, from the peculiar nature of the clay in the adjacent country, are highly esteemed, and carried to all parts of the coast. Brown's Travels in Africa, p. 377.

Berytus, a town of Arabia, formerly called Diospolis.

Steph. Byz.

BERZETIN, in Geography, a town of Hungary, in the district of Gomor, not far from the river Sajo, and formerly noted as the residence of many noble families.

BERZETTO, a town and abbey of Italy, in the duchy of Parma.

BERZWITZ, a town of Hungary, 12 miles N.N.E. of Leutich.

BES, or Bessis, an ancient Roman weight, containing two thirds of the as, that is, eight unciae. See As.

The bes originally weighed two asses; whence the origin of the word *quaepatibus as.* Though Scaliger conjectures it to have been formed from *dies*; as *bellum* from *duellum,* or *bunum* from *duonum.* Bes was also a linear measure of the ancient Romans. *Bes* was also a measure of capacity.

Bes was also used in the menurication of lands, to denote two thirds of a jugurum, or acre. See Measure.

Bes was also a money of account, and a current coin among the ancient Romans. See Coin, and Money.

BESA, in Ancient Geography, an ancient city of the Thebais upon the Nile, consecrated to a god of that name, but formed into a new city by Adrian, who built a temple in it in honour of Antoninus, and called it Antoniopolis; which see.

Besa, in Mythology, a deity belonging to the city of Abydos in the Thebais, mentioned by Ammianus Marcellinus in his History, lib. xiv. The mode of confuting the oracle of this deity was by writing the subjects of inquiry on sealed billets, which the priests carried into the sanctuary of the god, and to which they brought back the answers. Isaac Catarbon has suggested, in consequence of a passage occurring in the Bibliotheca of Photius (Cod. 279.), that this deity was adored at Antonia, or Antiopea; which see.

BESAILE, or BESAYLE, Fr. denoting the father of the grandfather, in the Common Law, a writ that lies where the great-grandfather or great-grandmother was selleed the day that he or she died, of any lands or tenements in fee-simple; and after his or her death, a stranger entered the same day upon him or her, and kept out the heir.

BESALU, in Geography, a town of Spain, in Catalonia, at the foot of the Pyrenees, erected by pope Benedict VIII. into an archiepiscopal, but soon after suppreffed; 7 leagues from the Mediterranean, and 5 north from Gerona.

BESANCÔN, a city of France, and before the revolution the fee of an archbishop, and capital now of Franche Comte, of the department of the Doubs. This city is surrounded by mountains, and hasted on the river Doubs, which divides it into the upper and lower town, joined by a handfome bridge. Of the former, nothing remains except the castle, or citadel, which is a large square built on a sharp rock, and commanding the city, which is defended by a wall flanked with eight towers like bastions. The latter has three long and handfome streets, which are adorned with houses built of free stone, and covered with flat; chiefly about the square called "Battan," which is ornamented with a fountain, whose water proceeds from the statue of Bacchus. The metropolitan church is built at the bottom of St. Stephen's hill, and is a handfome structure, with a high tower fleecel. In the middle of the choir is the great altar, on which they expofe at certain times, relics in silver thrones enriched with gold and jewels. Near the church of Notre Dame is a triumphal arch, erected in honour of the emperor Aurelian, on which are seen several mutilated figures of gods and animals. This serves as a gate to the cloister of St. John the Great. The great hospital of the order of St. Esprit, for foundlings, is a structure worthy of notice. The priory is remarkable for its excellent economy, and the humane attention paid to its unhappy occupants. The town-house is a large edifice with four wings, having in its front the statue of Charles V. in bronze, with a globe in one hand, and a sword in the other. The imperial eagle is raised over a large fountain, and spouts out water by both its beaks. The governor's palace is magnificent; and beyond it is a fountain, adorned with the figure of a naked woman discharging water at her nipples. Under the Romans, this was one of the most magnificent places which they had in Gaul, and many remains of their superb buildings are yet visible. After the death of Julian, it was almost destroyed by the Germans, and a second time by Attila. It afterwards became an imperial city, till the time of Lewis XIV., who, in 1674, made himself master of it, repaired its fortifications, and united it to France. The university of this city is an ancient and celebrated foundation; and in the year 1752 a literary and military society was instituted in this place. It contains 8 parishes; and the number of inhabitants, which was formerly estimated at 40,000, is now reduced to be below 30,000. The canton of north Besançon is said to contain 15,618, and that of south Besançon 16,662 persons. The territorial extent of Besançon commune is 974 square kilometres; the former canton includes 3, and the latter 4 communes. N. lat. 4° 19' 13" 45'. E. long. 6° 2' 40'.

About 20 miles from Besançon, near the abbey of "Grace Dieu," there is a natural ice-cellar, in a very romantic situation. On the highest part of a mountain, covered with a thick grove of lofty trees, is the opening of the cavern, which refembles its depth, said to be above 220 feet, and by the solemn gloom of the surrounding wood, what poets have feigned of the decent into the infernal regions. The cavern itself is 60 feet in length and height, and 40 in breadth; the bottom is covered with ice, of which vast pyramids rise from it, while others appear suspended from the arched roof, with their points opposite to those of the former. Within the cave is a hole or well, always full of water, and never frozen; and, at the entrance, some mould, which seems to have been accidentally thrown there, and adorned with primroses and other wild flowers. The ice, which in the cavern appears of a beautiful azure, is, when seen by day-light, remarkably white. From this natural repository, the ice-houses in Besançon are supplied, when the winters are too mild to freeze water in the open air. This cavern has been the subject of repeated investigation, the result of which may be seen in the "Memoirs of the Academy," for 1712 and 1726.

BESANT, or BIZANT, BIZANT, or BYZANT, a fort of coin, struck at Byzantium, in the time of the Christian emperors, and well known in England, and indeed all over Europe, for some ages before the Norman conquest. Few coins ever had a longer or more universal currency than these bessants or byzantines; having been current from the very beginning to the end of the eastern empire, not only in all its provinces, but also in all those countries which had been provinces of the western empire, and amongst others in Britain. With us gold and silver bessants were received in payments. But though they are frequently mentioned by all the historians of the crusades, they are rarely spoken of by ours. Neither are they named in Doomsday book, nor in the public acts of Henry I. or Stephen, nor in the last will of king Henry II. However, some mention is made of them in private deeds and leases, and also in the Exchequer rolls under value.
Henry II. The gold bezant was pure, or twenty-four carats fine; but writers are not generally agreed with respect to its value. Out of the Greek pound of gold, which was the same with our Tower pound, 72 byzantines were coined, each weighing 73 troy grains, and worth 40 Saxons pennies, 8 Saxons shillings, and 9 shillings and four pence halfpenny of our present money. (Henry's Hist. vol. iv. p. 275.) The silver bezant, in the 12th century, was rated at two shillings English. (Lyttonel's Hist. of Henry II. vol. i. p. 411.)

Hence the gold offered by the king at the altar, on festivals, is still called bezant, or bifant. Thirteen bezants, or bifants, were presented at the masts of the coronation of the kings of France. Henry II. had that number coined on purpose.

**Besants, in Heraldry. See Besants.**

**Besaraba, in Geography, a town of European Turkey, in the province of Bulgaria, 48 miles north of Ternova.**

**Besicicus, in Ancient Geography, a small island of the Propontis, now the land of Marona, situated between Byzantium and the mouth of the Rhodineus. This, according to Pliny (N. H. I. l. c. 8.), is one of those islands which, being first joined to the continent, were separated from it by the violence of the sea, or by earthquakes.**

**Besborough, in Geography, an island in Norton sound, on the west coast of North America. N. lat. 64° 10'. W. long. 161° 15'.**

**Bess, a river of France, in Nivernais.**

**Besergen, a town of Aziatic Turkey, in the province of Caramania; 24 miles north of Akkeria.**

**Besharrai, a village of Syria, situate among the mountains in the pachalie of Tripoli, on the road to the Cedars, and distant from them 3 leagues, which is frequently by the Europeans, and where the missionaries have a house. During the winter, many of the inhabitants leave their houses under the snow, with some peril to guard them, and remove to the sea-coast.**

**Beshetz, or Betsz, a district in the government of Tver in the Russian empire, situate on the Mologa. N. lat. 58° 30'. E. long. 34° 44'.**

**Besiegars, and Besieged, in the Military Art, denote those who lay siege to a fortified place, and those who defend it. See Siege.**

**Besisheim, in Geography. See Besisheim.**

**Besillus, in Ancient Geography, a river of Spain in Bizetia.**

**Bjestan, or Bestan, a name given to those places at Constantinople, Adrianople, and some other towns in the dominions of the Grand Seignor, where the merchants have their shops, and expose their goods to sale. A particular besfant belongs to each class of merchants and workmen. These besfants are commonly large galleries vaulted over, whose gates are shut every night. The wardens, or keepers, will sometimes be answerable for the merchandise, on being paid a moderate perquisite for each shop. See Bazar.**

**Besler, Jerom, in Biography, born at Nuremberg, Sept. 29th 1566, and created doctor in medicine at Bâle in 1592, was in such reputation for his learning, and ability in his profession, that he was seven times appointed dean of the college at Nuremberg, and inspector of the medicines used by the apothecaries there. He died November 1632.**

**Besler, Basill, brother to Jerom, was born at Nuremberg in 1561, where he settled as an apothecary. Applying to the study of botany, he soon became conspicuous in that branch of natural history. In 1613, he published "Hortus cyflettensis, five diligens et accurata omium plantarum ex variis orbis terræ partibus, fingulari studio collectarum, quae in celeberrimis viridis acceam episcopalem ibidem cingentibus, hoc tempore conpliciuntur, delineati, et ad vivum representati," Nuremb. 1613, in 4 vols. Atlas folio. The most splendid botanical work, the author says, that had then appeared. The plates, 356 in number, and delineating 1533 plants were engraved at the expense of Conrad, bishop of the diocese. The work is unequal in its execution, as besides the errors committed in the description of many of the plants, some of the delineations are fictitious, taken from fancy, or from the rude accounts of ignorant travellers. But the far greater part of them are correctly drawn, and beautifully executed. As Basill was ignorant of the Latin language, his brother Jerom furnished the preface. He also published "Fauciculæ ratorum, et adjecta dignorum varii generis, quæ cæteri incidi curavit," Norimb. 1616, 4to. Max. containing some marine plants and fruits; also, "Icones floraæ et herbarum, &c.," vol. 1622. It is a continuation of the hortus cyflettensis, which have been several times reprinted. The time of his death is not known. Haller. Bib. Bot.**
on a separate foot-stalk, and small, tubulous, of a pale yellow
colour. A native of Martinoico, Jamaica, &c. 3. B. crista/.ta.

"Pedicules simple, solitary; calyces ferrate-crimson." A
shinny plant, different in its habit from the foregoing, climbing
up trees, and adhering to them by roots issuing from the
joints; the twigs round, hirsute, and long; the leaves ovate,
acute, ferrate, hirsute, wrinkled, veined, petiolate, opposite,
two inches long; pedicules one-flowered, axillary, bent
down, almost as long as the leaves; calyx bright scarlet; cor-
olla yellow; flowers proceeding from a common membrane,
fattened to the tube of the corolla, and cleft longitudinally
at its gibbous part. Before the dispersion of the pollen, the
filaments are upright; afterwards interwoven as in Martynia. A
golden conspicuous gland embraces the germ. A native of
Martinoico, in moist mountainous woods.

B. bifloris. "Calyces bivalve, torn." Stem herbaceous, long, creeping,
hairy, round; leaves opposite, petiolate, veined, hairy, nerving,
a hand’s breadth long; pedicules lateral, opposite, shorter
than the leaves, two from each axil, one-flowered; berry oval,
with a hard two-celled nuculus; resembling the third species
in the leaves and calyx, but very different in the fruit, and in
wanting the five leaved perianth. Observed at Surinam by
Dahlberg. 5. B. biflorus. Cyrtrandia biflora, Forst. gen. 3.
n. 1. "Pediculus two-flowered; involucrum caducous, in-
flated; leaves ovate, quite entire." A native of the island
of Otaheite. 6. B. cynoph. "Pediculus cymose; pedicels
with little bracts; leaves ovate, crenate. A native of the
island of Taona.

Propagation and Culture. These plants grow naturally
in the warm parts of America. The seeds should be sown on a
hot-bed early in the spring, and the plants, when half an inch
high, transplanted each into a small pot filled with light fresh
earth, and plunged into a hot-bed of tanner’s bark, watered
and shaded till they have taken root; afterwards according to
the warmth of the season, and of the bed in which they are
placed. When the plants have filled these small pots with
their roots, they should be shaken out, and their roots trimmed
and put into large pots filled with light fresh earth, and
plunged again into the hot-bed, where they should have much
air in warm weather, and be frequently watered. Thus
managed, the plants will thrive in summer, but in winter they
must be removed into the rove, and often, but sparingly,
watered. In the second year these plants will flower; they
sometimes perfect their seeds in this country; but as they
will not live in the open air, they must be confidedly preferred
in the rove. Martyn.

BESONS ROCKS, in Geography, are two small rocks off
the western point of Cornwall, bearing W.S.W. from cape
Cornwall, and N.N.E. from the Long ships. Ships may fail
within them without danger.

BESORCH, in Commerce, a coin of tin, or of some alloyed
metal, current at Ormus, at the rate of about 24 parts of a
fartling Sterling.

BÉSOS, or BETULUS, in Geography, a river of Spain in
Catalonia, which runs into the sea not far from Barcelona
BESSAPARA, in Ancient Geography, a town of Thrace,
situate 12 miles from Philippiopolis.

BESSARABA, a town of Aila in Alyssa, rated near the
Tigris. Ptolemy.

BESSARABIA, BUDAPEST, or BOEDJAR, in Geography,
is a small country of Turkey in Europe, situate between the
north branch of the Danube and the river Donel, and
bounded on the west by Moldavia, on the south by the Da-
nube, on the east by the Black sea, and on the north by Ruff-
sia. It was anciently the country of the Gete and Pecumini;
but it is now inhabited by the independent Tartars, of whom
some have fixed habitations in their villages, and others lead a
kind of wandering life, subsisting on the flesh of their oxen
and horses, and on the milk of mares, and the cheese which
is made of it. In their religion, manners, and customs, they
resemble the Cim Tartars. When an army has fallen upon
them, they retire into the wood, and on the coast of
Bessarabia; whence it is impossible to expel them, on ac-
count of the moraines and dells. The chief towns are Bend-
er, Aserman, Kilia, and Ismail. This country, and also
Walachia, on which it borders towards the south, contain
some lakes of considerable extent, as those round Ismail, and
that to the exit of Sowza, which communicates with the Da-
nube, and forms a part of that river.

BESSARON, CARDINAL, in Biography, was born at
Trebiºfond in 1395, and educated at Constantinople, under one
of the most learned Greeks of that period. In the course of
his education, he adopted the principles of the Platonic philo-
osophy, and was more confirmed in them by the lectures of
George Gemilius Pletho, on whom he attended in the Morea.
These principles he combined with his study of Christian
theology. Having taken the religious habit of St. Baill, he
was soon advanced to the bishopric of Nicea, and employed
by the Greek church to attend on their behalf at the council
held under pope Eugenius IV. first at Ferrara, and afterwards
at Florence, in 1439; with a view of effecting an union be-
tween the Latin and Greek churches. But he incurred the
displeasure of the Greeks by inclining to the party of the
Latin, and propounding an union of the two nations, to the
preju-
dice of the former, who were required unequivocally to de-
clare that the Roman pontiff was the supreme head of the universal
church. Bessarion became unpopular in his own country,
and could not be ventured to revisit Constantinople; but remain-
ing at Rome, and subscribing the articles of the Latin church,
he was recomposed, in 1439, by a cardinal’s hat, and he was
also created titular patriarch of Constantinople. Having
performed himself in an acquaintance with the Latin language,
he was from this time employed by the popes in several con-
cerns of moment. Nicholas V. on making him to the
bishopric, first of Sabina, and afterwards of Frascati, sent
him as legate to Bologna, where he resided from the year
1450 to 1455, and contributed to revive and incrase the
reputation of the university. Upon the death of Nicholas,
the cardinals had an inclination of advancing him to the papal
see; but when they waited upon him with this view, they
were prevented from seeing him by one of his attendants, who
would not allow him to be disturbed in his studies; upon
which Bessarion, when he was informed of the fact, said to
him, "Perot, thy inconstancy has cost thee a hat, and me the
tiara." Bessarion was employed by the pope Calistus III.
and Pius II. in negotiating the wished-for league against the
Turks, and deputed for this purpose to Alphonsus, king of
Naples, and the emperor Frederic. During the pontificate of
Paul II. he lived at Rome, and distinguished himself in the
promotion of literature, by opening an academy in his palace for
the study of philosophy, and for gaining a critical know-
l edge of the Greek and Latin languages; nor was he less
liberal and active in encouraging every other branch of science,
by countenancing with his prudence and munificence those af-
femblies that were frequented by the Greeks and Italians for
the purpose of mental improvement. His library, which con-
tained many Greek MSS., is said to have cost him 30,000
crowns; and this he presented, in 1458, to the republic of
Venice, where it became the chief foundation of the library
of St. Mark. Having received from pope Sixtus IV. the
appointment of legate to France for the purpose of reconci-
iling king Lewis XI. and the duke of Burgundy, he paid his
first visit to the duke, and thus offended Lewis to such a
degree, that he treated him with rudeness, and defied him
without
without entering on the business for which he was deputed. This kind of reception affected him so much, that on his return he fell sick at Turin, and died at Ravena in 1472. He was regarded as a person of unparalleled genius and erudition; and he was the author of many works, both in Greek and Latin, some of which were printed, and others left in MS. The chief of these was his defence of Plato, against George of Trebizond, in a treatise entitled, “In calumniatorum Platonis lib. iv.” first printed without a date at Rome in 1470, and re-edited at Venice in 1523 and 1516, folio. In this publication he examines Plato’s opinions, particularly with regard to morals, and shews that they approach much nearer to the doctrines of Christianity than those of Aristotle. Others of his printed works are letters, orations, and translations of Xenophon’s Memorabilia, the metaphysic of Aristotle, and that, falsely ascribed to Theophrastus. According to Brucker, these translations are very obscure; but Huet commends Beffarian as the model of all good translators. Brucker’s Hist. Philos. by Enfield, vol. ii. p. 407. Fabr. Bibl. Græc. l. iv. c. 43. 19. tom. 10. p. 407.

BESSARION, Nova Capp., in Geography, is the west point of a bay in the sea of Azof, of which the bight point is cape Berdinskaya. N. lat. 46° 35’. E. long. 36° 45’.

BESSA-STADER, or Basse-stead, a place of Iceland, (N. lat. 64° 6’) the residence of the king’s chief. In this place is a woolen manufactury, with a fulling mill belonging to it.

BESSAY, a town of France, in the department of the Allier, and chief place of a canton in the district of Moulins, 8 miles south of Moulins.

BESSE, John, in Biography, of Percyuile, in the Rouergue, was educated under M. Cluys, at Montpellier, whole theory of fermentation he adopted. He then went to Paris, where he published, in 1700, “Recherches analytiques sur la structure du corps humain,” 8vo. He derives all the functions of the body, and even the formation of the fætus, from a due mixture of acid and alkali. He does not allow the imagination of the mother to have the power of marking or disfiguring the fætus in utero. The following year he was created doctor of physic by the faculty at Paris, and soon after was made physician to the queen dowager of Spain. In 1723, he published “Lettre critique, contre l’idée générale de l’économie animale, et les observations sur la petite verole,” in 12mo. In this work, the first part of which was written to oppose the principles laid down by Helvetius, he gives an account of a malignant fevers of small-pox, which raged in the year 1716, and speaks of the benefit accruing in these cases from bleeding, and admininistering purges, on the attack of the secondary fever, a doctrine approved by Drs. Mead and Friend. He commends the dissection of dead bodies, with the view of discovering the causes of deaths, which he frequently practiced, and mentions his having found 13 calculi in the gall-bladder of a person who died of jaundice. For other smaller papers by this writer, see Haller’s Bib. Med. Pract. He died, we are told, at Paris, at an advanced age.

Besse, in Commerce, a Persian copper coin, in value 1½d sterling.

Besse, in Geography, a town of France, and principal place of a district in the department of the Pyr-de-Dome, 6 leagues south of Clermont. The town contains 1913, and the canton 11,016 persons. Its extent comprehends 445 kilometres and 12 communes. N. lat. 45° 31’. E. long. 2° 52’—Allo, a town of France, in the department of the Var, and chief place of a canton in the district of Brignoles, 6 miles S.E. of Brignoles. The town includes 3178, and the canton 8165 persons. The territory contains 3175 kilometres and 7 communes.—Allo, a town of France, in the department of the Vol. IV.
BET

BESTAIL, or BESTIAL, in Ancient Statutes, is used for all kinds of cattle. 4 Edw. III. c. 3. It has been appropriated more anciently particularly to those that were purveyed for the king's provision.

BESTARCHIA, a dignity in the courts of the emperors of Constantinople, supposed to answer to that of the master of the horse among us.

The word bestarchia seems to have been formed from Βεσταρχια, by a change of the w into b.

BESTERTZ. See BESTRITZ.

BESTRIATI, among the Ancient Romans, those who were hired to combat with beasts, or those who were exposed to them by sentence of law.

We usually distinguish two kinds of bestarit: the first were those condemned to the beasts; either as being enemies taken prisoners, or as being slaves, and guilty of some enormous crime.—These were all exposed naked, and without defense, to the beasts; nor did it aught avail to conquer and kill the beast, fresh ones being continually let loose on them, till they were dead. But it seldom happened that two were required for the same man; on the contrary, one beast frequently dispatched several men. Cicero mentions a lion, which alone dispatched two hundred bestarit.—Those who succeeded the first were called σεβύρης, and the last σεβρεία; among the Romans, meridian.

The Christians were bestarit of this kind, even some of them who were Roman citizens; though it was the legal right of such to be exempt from it.

The second kind of bestarit, Seneca observes, confined of young men, who, to become expert in managing their arms, fought sometimes against beasts, and sometimes against one another; and of braves, who, to show their courage and dexterity, exposed themselves to this dangerous combat. Augustus encouraged this practice in young men of the first rank: Nero exposed himself to it; and it was for the killing beasts in the amphitheatre, that Commodus acquired the title of the Roman Hercules.

Vigenero to these adds two kinds of bestarit more: the first were those who made a trade of it, and fought for money; the second was where several bestarit, armed, were let loose at once, against a number of beasts.

BESTOROZIN, or BESTERENNY, in Geography, a town of Hungary, 8 miles N.N.W. of Debreczin.

BESTRITZA, or BISTRICA, a large town of Lower Hungary, on the Wág, with a castle facing it, seated on a high rock on the opposite side of the river.

pofa dië¿ . Park. par. 489. Turnip-rooted red beet. z. B. lutea major. Bauh. pin. 118. Rail hist. 204. n. 5.—lyricæ. Park. theat. 752. n. 3. Yellow-rooted beet. B. pallida virgenes major. Bauh. pin. 118. Green-leaved red beet. "Flowers heaped; leaves of the calyx toothed at the base." This species has large, thick, succulent leaves, generally of a dark red or purple colour. The roots are large and deep red, on which their goodness depends; for the larger they grow, the more tender they will be, and the deeper their colour, the more are they esteemed. A native of the seacoast of the southern parts of Europe. The variety a. has the leaves shorter than in the white beet, more or less red, and sometimes so dark, as to be called black beet; its root white. b. has leaves large and red, as is the whole of the plant, as well root as stalk, and flowers full of a purple juice, tending to redness; the midribs of the leaves are very broad and thick, like the cabbage leaf, and equal in goodness when boiled. Gerard says, that it grew with him in 1596, to the height of eight cubits, and brought forth its rough feeds very plentifully. Thefe, though taken from a plant of one colour, produce plants of many and variable colours. γ. Stem higher than the common red beet; root thick, within and without of a high blood colour. δ. Leaves paler than those of the white beet, of a greenish yellow colour; the root of a fine bright yellow, sweet and well-taile. All these are more fezial varieties. The beet is a subject to change, and to degenerate at leafs of a colder climate. It has been supposed, that the B. cida is not specifically different from the vulgaris, and that both are derived from the maritima, cultivated on a rich soil, in southern climes. The beet is said to be prejudicial to the stomach, and to yield little nourishment. Taken in quantity, it tends to loosen the belly. The juice of the root and leaves is said to be a powerful eructane, and to occasion a copious discharge of mucus, without provoking sneezing. A good sugar may be obtained from the juice of the fresh roots. This species was cultivated in 1656 by Mr. John Tradescant, jun. 2. B. cida, white garden beet. B. Hortensis. Mill. Dict. n. 2. B. vulgaris, γ. Lin. Spec. 322. B. alba. Ger. 251. n. 1. emac. 318. n. 1. Rail hist. 204. B. communis alba. Park. par. 489. 1. B. alba vel pallifrons, quæ cicla octo. Bauh. pin. 118. and B. communis viridis octo. "Flowers three-fold; leaves of the calyx unarmed at the base." The root of this sort seldom grows larger than a man's thumb; the stalks grow erect, and have oblong, spcer-shaped leaves growing close to the stalk; the flakes of flowers are axillary, long, and have narrow leaves placed between the flowers; the lower leaves are thick and fusculent, and their footstalks broad; and for the sake of thefe is cultivated. A large variety of this has been lately introduced from abroad, under the titles of "Racine de dicette," "Root of Scearity," and "Mangel Wurzel." The ancients called the white beet Caida, or rather Caida, by contraction from Cicula, Sicilian beet; as we call the Savoy-cabbage, Cifula. Mr. Miller mentions three varieties of this, viz. the white, the green, and the Swifts or sharp beet; by the last of which he probably intended the same as the modern "Mangel Wurzel." He says that they vary from one to another in culture, but that they never alter to the first or the third. 3. B. maritima, fonce. Lin. spec. 322. syft. 262. Reich. 623. Hud. 108. Wither. 277. Eng. Bot. t. 285. Smith. Flor. Brit. 115. B. sylveltris maritima. Bauh. pin. 118. Park. theat. 750. 2. Rail syn. 157. hist. 204. Ger. emac. 318. 2. Sea-Beet. Pet. H. Brit. t. 8. f. 9. "Flowers double or twin; flakes decumbent; leaves of the calyx even, not toothed." It differs from the others, according to Linnaeus, in flowering the first year; in having oblique or vertical leaves; and in the leaflets of the calyx being equal, not toothed; accord-
having a perennial root. This is probably the original parent of all the garden beets. A native of Holland and Great Britain, on the Feet-coalt, and in salt marshes; it is also found plentifully about Nottingham. It is perennial, and flowers in August. 4, Beta *scarum*, spreading beet. A. Hort. Kew. i. 315. "Flowers heaped; all the leaves linear-lanceolate; branches divaricate. "Stem short, hardly a foot high, very branching; branches long, divaricate; calyceal leaflets at the base, but not toothed." Flowers in August. A native of the island of Madeira. Introduce in 1788. Martyr.

Beta, in Gardening, comprehends several different useful euculent roots and culinary herbs of the hardy kind. as the *Beta *cicla*, or common culinary beet, which has a small, oblong, white root, producing from its crown many large, oblong, succulent leaves, on broad footstalks, and erect branching feed; from two or three feet high, garnished with close-fitting leaves, and long spikes of greenill flowers, which are succeeded by plenty of ripe feed in autumn. The varieties of which are the common green-leaved beet; large white beet; chard, or great Swift beet, having very broad leaves, with thick foot-stalks and ribs. These often vary from one to the other, the feed of one frequently producing some of each sort, though by proper care in taving it, the difference may be preferred.

The *Beta *major*, or great German beet, commonly called mangel wurzel, has a large, long, reddish, or sometimes whitish-red root; and very large, oblong, thick, succulent leaves. The varieties of which are the dark-green leaved--light green-leaved--red-veined leaved. This species has been very much recommended, on account of its vast growth and great utility both in its root and leaves; experience has, however, shown the former to have little claim to esteem for domestic uses, as it is of an inipid and unpalatable taste; but the leaves being large and succulent, are good to use occasionally, in the manner of common beet, and particularly to boil as spinach, or put into soups; and the stalks and midrib of the leaf to be fried and eaten as asparagus. Dr. Letton, who took much pains to introduce the mangel wurzel, informs us, that on his own land, which was not favourable to its growth, the roots, upon an average, weighed full ten pounds; and if the leaves were calculated at half that weight, the whole product would have filled pounds of nutritious aliment, upon every square of 18 inches.

The *Beta *rubra*, or red beet, has a large, red, eatable root, crowned by many large, oblong, reddish-dark-purple leaves; and when it shoots, feeds up erect stalks and branches, terminated by long spikes, of flowers and feed. The varieties of which are common red beet, with a large, longish, dark-red root; turnip-rooted red beet, with a short, large, dark-red root; with a red root and green leaves; with a yellow root; but the first of these varieties is most preferred for general culture, though the second is equally good, but the root is not of so good a shape as that of the former; the other two are not proper to cultivate for a crop.

Methods of Culture of the common Beet. All the varieties are propagated by seed sown annually in the spring, in February, March, or April, in the places where the plants are to remain, in order to attain proper growth for use in summer and autumn. They will continue till spring, when they shoot for feed. If the fowing be neglected in the spring, some feed may occasionally be sown in summer, any time till the beginning of August. In a moist situation, but the spring is the most eligible season for obtaining a good crop. They may be sown in any common soil, allowing each foot a separate plot or bed. The ground should be dug one spade deep in the usual way; the feed then either sown broadcast on the surface, and raked in; or, as it is a large feed, shallow drills may be drawn, at the distance of six inches for the common green and white varieties, but almost double that for the large white and chard beet, fowing the seeds thinly, and raking the earth over them, about an inch deep; then trimming the surface smooth. The plants come up in about a month, and when they have leaves an inch or two broad, they should be held, to thin and deftroy weeds, cutting out the common green and white forts to about six inches distance; but the chard beet should be allowed ten or twelve inches room every way, that their large succulent leaves may have full space to spread. They are commonly in perfection in June and July, and it is necessary to observe, in gathering them, to take the large outward leaves, the others coming in for use in their turn, an abundant successive supply rising from the root. A succulent crop must be raised every year from feed in the spring, *&c.* for although the fame crop might be occasionally continued two years,* by cutting down the feed-dens of the year-old plants, according as they advance in spring and summer; the roots abiding, produce a supply of leaves, but which are much inferior in sub stance to those of the annually-raised feedling plants; it is better, therefore, to sow every year, in order to have a good production. The large white and great chard beet are in much esteem, for the stalls and ribs of the large leaves, being divested of the leafy part and peeled, are great improvers of soup, and useful also for flowering, and to be dried and eaten as asparagus, and the leaves themselves are fine pot-herbs; for all which uses, the several varieties of this species may, as has been seen, be obtained almost the year round.

The *Mangel Wurzel* Beet. This fort has generally been reckoned a variety of the *Beta *cicla*; but some botanists have made it a distinct species, under the title of *Beta *altiflora*. It is raised from seed, annually in the spring, the same as the other sorts, in any open situation, but should generally be sown thinner, either in drills one or two feet asunder, or broad-cast on the general surface, and raked in; and when the plants are come up one, two, or three inches in growth, they should be thinned to a proportionable distance, to give room for the full expansion of their large leaves. Some, however, advise transplanting, when the young plants are of two or three inches growth, setting them in rows one or two feet asunder; this seems, however, unnecessary, especially, as they have long, downright, tap roots, which generally are the most successful when they remain where sown; the method may, however, be practiced occasionally by way of experiment. The plants generally continue to produce leaves the greatest part of the year, and the roots attain perfection for use in autumn and winter, till spring; but when it is required to have a principal crop of full-sized roots, some should be allotted for that purpose, without cutting or gathering the leaves. This fort is valued most generally for its leaves, for which it principally merits culture in the gardens; as we cannot much recommend the root, which, although it grows very large, sometimes of several pounds weight, is greatly inferior in use, both to the red beet, and that of most others of our euculent roots, for any domestic purpose. It is sometimes drenched in the manner of carrots and parsnips, &c. siced, and served up with butter, but is generally of a rawish, unpalatable relish.

The leaves, however, which, if the plants have large scope of room, grow twelve or fifteen inches broad or more, and of proportionate length, are exceedingly good, when young, to use as the common white and green beet; and the young thick, sticky stalks, divested of the leafy part, peeled or scraped,
scraped, then boiled and served up with butter, are tender and agreeably taffy; also the leaves to boil occasionally as fennel and other small greens; and of which the root is remarkably productive in quick growth, to afford frequent successional gatherings all summer and autumn, either cutting them off close, or gathering only the larger outward ones, as in either method they soon shoot up again in plentiful succession.

The Red Beet. This is raised from seed sown annually in March or April, in the place where the plants are to remain, being careful to procure that of the best dark red root. It should be allowed a light, rich, deep foil, in an open exposure. The market gardeners often sow this root thinly among their crops of onions, carrots, &c. that are to be drawn off while young; so that when these are gone, the beet commences a full crop.

It is, however, a better practice to sow the principal crop separate. The ground should be dug one spade deep at least, and well broken, the seed sown directly, which may either be broadcast on the surface, or raked well into the ground; or, as observed of the first root, in drills drawn an inch deep, and at the distance of ten or twelve inches; or you may dot or prick it, as is often practiced, with a blunt dibber, in lines at the above distance, making the holes an inch deep, and eight or ten afinder in the rows, dropping two or three seeds in each hole, though only one good plant should be left in each place. In May or June, when the plants have leaves an inch or two broad, they require thinning and cleaning from weeds, which may be performed either by hand-weeding or small hoeing; the latter is the most expedient for large crops, and it loosens the surface of the earth, to the great advantage of the young plants; carefully eradicate all weeds, and thin the plants to ten or twelve inches distance. Some of the roots will be fit to take up for use about the end of August, though they will not attain full perfection until October. In November, a quantity of the roots should be taken up, their tops trimmed off, not too close, and then laid in sand or dry earth, under shelter, to be ready for winter use.

This root of beet is highly valued for its large red root, which in the common variety, grows twelve or fifteen inches long, and three or four inches thick or more; but that of the turnip-rooted root is more shorter, and generally thicker, and of equal goodness in every respect for use; and in both of which, those that are of the largest growth and darkest red colour, are the most valuable: these roots being tender, sweet, and palatable, are boiled, sliced, and eaten cold, &c. are also sliced and scraped in salads, both as an eatable ingredient, and by way of garnish; slices of the root are also in request not only as garnish to dishes, but as a pickle: the other varieties are never cultivated for any principal crop.

Saving of Seed. In order to save seed from any of the varieties, either mark some of the beet plants in spring, to be left to run up, or transplant some of them in February or March into a convenient place, to have shelter from winds; they shoot up stalks in May; in June they must be supported with itakes; and the seed will ripen in September.

That a great quantity ofugar might be obtained from white beet, has been long known. The famous chemist Margraaf made some experiments, half a century ago (published in the year 1747) for determining the quantity of sugar contained in various European plants. He found that the white beet produced a much greater quantity than any of the other plants. The beet has of late been much cultivated, particularly in Germany, with a view to the sugar that is obtained from the root. M. Achard of Berlin, first intro-
artificial heat, taking care to prevent their being flowered or burnt. If an opportunity does not occur for filling the roots immediately after being taken out of the earth, they should be placed in cellars, and covered with straw, or put into holes in dry sandy earth, and preferred till they are wanted.

M. Achard says, that after the roots are washed and cleansed, they should be sliced by means of a machine, or ground in a mill, confining of a cylinder furnished with points, like a rasp, which turns round in a box. The roots are put in this box, and pressed, by means of a weight, against the cylinder, which, upon being turned round, soon reduces them to a kind of pulp. When the beet-roots are dry, they are ready for the extraction of their sugar. For this purpose, three wooden tubs, wide, but not deep, made of oak, ash, or willow, should be provided, or, for family use, earthen mugs. Near the bottom of the tubs, cocks or spigots should be fixed, and the tubs should be placed in a cool situation of about 52° of Fahrenheit, upon a shillage near each other, and at such a height from the ground, that smaller vessels may stand below them for receiving the liquor, when drawn off, and clear water should be at hand to be pumped into the higher vessels. When the beet-roots, thoroughly dried, have been fitted, so as to be free from the dust and loose fibres, one of the higher tubs should be half filled with them, and clear cold water poured upon them, about one-third in height above the roots. In this state they should remain for about three hours, fleeing them at different times with a wooden paddle. At the end of this time, the same number of clean dried roots should be put into the second tub; and the sweet liquor drawn from the first tub into the vessels under it, should be poured upon the roots in the second; and the third tub should be supplied with fresh water in such quantity as just to cover the roots, and the tubs should remain three hours longer, and the roots be repeatedly stirred, as before. The liquor which had been poured from the first tub to the second, will be now much absorbed by the roots in the latter tub. After standing again for three hours, the sweet liquor from the second tub must be drawn off, which, if the roots were of the red and white sort, will be of an agreeable red colour. It must then be passed through a sieve, or filtered through a flannel, and thus be rendered fit for boiling down for sugar. After this, draw the liquor from the first tub, pour it on the second, and put into the first tub more fresh water, and let it stand three hours longer. Then put into the third tub the usual quantity of dry roots, and pour on them the liquor drawn from the second tub; remove the liquor from the first to the second; and the roots in the first tub being now deprived of their saccharine matter, may be used for feeding hogs or cattle. After three hours more, the liquor should be drawn from the third tub, and filtered as before, and then boiled down for sugar. Then draw off the liquor of the second vessel, and pour it into the third; add fresh water to the second vessel, and let it remain three hours more, the roots being occasionally stirred. During this time, cleanse out the first tub, and add fresh roots, as before. After three hours, draw the liquor from the third tub, and pour it upon the fresh roots in the first; then draw the liquor from the second tub, and pour it on the third. The roots of the second tub will be now exhausted, and may be given to the cattle. After three hours, draw off the liquor from the first tub, filter it, and it will be ready for boiling down. On the contents of the first, pour the liquor of the third, and put fresh water in the third vessel; let it remain three hours, and stirred as usual, during which time clean out the second tub, and let the roots be given to the cattle. In the second tub, place again fresh roots; and proceed by extracting the saccharine matter, as before, and continue the operation, till all the dried roots have been thus freed from their sugar. By this management, the liquor becomes more charged with saccharine matter, than when the juice is pressed out of the roots, and a considerable quantity of fuel is spared. The roots from which the liquor has been extracted will have swelled much in the operation, and have lost their sweetness; their farinaceous residuum will, however, afford good food for cattle. Whenever there is a sufficient quantity of dried roots ready, the process of extracting the saccharine liquor should be continued day and night, as it is not proper to let the liquor remain longer than three, or at most four hours, before you boil it, left a dissolution of the mucilaginous particles of the roots should take place. If it be not convenient to boil down all the saccharine liquor at once to a state of crystallization, yet it should be daily boiled down to the confidence of a syrup, in order to prevent its fermentation. In boiling the liquor, the foam that arises should be carefully taken off.

The process of boiling, crystallizing, &c. the beet sugar is as follows. First boil the extracted saccharine liquors down to the confidence of a syrup; then put it into a copper, of which one-third at least is empty, and let it boil away by a moderate fire, until a phial, which holds one ounce of water, will contain eleven drops of the syrup; or until the syrup pours somewhat broad from the ladle. The foam or froth should be taken off as it arises. When the syrup is arrived at the state above mentioned, by gentle boiling, the fire must be removed from underneath the copper, and the syrup gradually run through a clean wooden cloth, placed over a wooden or stone vessel. The syrup must not cool too much before this filtration, or else it becomes very. When the filtered syrup is somewhat cool, it should be ladled into shallow wooden or stone vessels, to crystallize; for this purpose, shallow earthen vessels, such as are used to produce cream, or vessels made of tlua, are proper. These vessels, filled with syrup, must be placed in a room heated to about 65° of Fahrenheit, and care must be taken to keep them free from flies and dust. If the syrup has been of a proper confidence, crystals will soon begin to form at the bottom of the vessels; and in an interval of 18 or 21 days the crystallization will be completed. The mufs must then be put into a strong linen sack, well secured, and placed under a press, to squeeze out the liquid from the sugar which remains in the bag. The liquid matter may be fitted to crystallize a second or third time, and will yield sugar of a coarser quality. A cheese-press, or long lever, will serve for the purpose of pressure. The sugar thus obtained, may be rendered purer by mixing it with a small quantity of clear spring water, and placing it again under the press; the coloured syrup will then run out, and leave the bag in a much purer state than before. By repeating the operation, it is so far improved, that, when dried and rubbed, it becomes a fine white powder sugar. The separated syrups should be again carefully boiled, and more sugar will be obtained from them by crystallization. If the sugar procured by the first pressure be dissolved in as much clear water as will form a syrup, and placed again in a warm room to crys- 

talize, it will yield a much purer and harder sugar; the syrup may then be separated without pressure from the sugar, merely by inclining the vessel, and allowing the syrup to run off from the crystals. All the syrups thus prepared, are fit for family use, and are much superior in taste to those prepared from the juice of the raw or boiled roots. The remaining thick syrups may be used as treacle or molasses, and will serve to diffus forum or spirits. From the experiments of
of professor Lampadius of Freyberg, near Dresden, it appears, that beet-roots contain water, fibrous matter, sugar, mucilage, hair, flour, colouring matter, fibred matter, and a bitter sub stance. The water is in the proportion of from one-half to two-thirds of the weight of the roots; the fibrous matter of the roots differs, and it is considerably more in poor than in rich land; the mucilaginous particles vary from two to five per cent.; the mucilage is from three to five per cent.; and the hair, or matter resembling white of egg, is about one per cent.; the flour is in very small quantity, being only about two or three ounces in a hundred weight; the colouring matter undergoes several changes by exposure to the air, as yellowish, brown and red, and may be precipitated by acetate of lead; the fibred matter is volatile, rising in distillation of the root with water, combining closely with spirits of wine, and occasioning a peculiar con traction in the organs of taste. By boiling the beet-roots, the smell and taste are very much lessened. The bitter substance is soluable in water, and remains behind in the first syrup after the crystallization of the sugar. From other experiments of the same professor, it appears, that 110 lbs. of beet-roots, the beta cica of Linneus, or white English beet, washed, peeled, cleaned, and then grated, gave a mass which weighed 87 pounds; out of which were pressed 421/2 pounds of juice, which was boiled with 205 ounces of charcoal powder. This, when filtered and evaporated down until crystallized, produced full five pounds of a brownish yellow-grained sugar, and also five ounces of brown syrup. The above brown sugar, after being dissolved in six pounds of lime-water, mixed with one pound of blood, then boiled, filtered, and afterwards evaporated, yielded four pounds 54 ounces of purified brown sugar, and 65 ounces of syrup. The four pounds 54 ounces of sugar, thus prepared, were again dissolved in six pounds of lime-water, mixed with one pound of milk, and then boiled for a quarter of an hour; during the boiling, a small quantity of white wine vinegar, and a little more milk, were added; the mucilaginous matter was filtered, and treated as before; the product was four pounds of well-grained white powder sugar. The residue after previous, the brown syrups of the two first processes, and the remains of the filtrations, weighed, when collected, 40 pounds; they were mixed with one quart of yeast, and 80 quarts of water, boiled to 121/2 of Fahrenheit's, and after fermenting 48 hours, were distilled. They furnished, at the first distillation, 15 quarts of weak spirit, which, on a second distillation, gave eight quarts of a better; from which, when rectified, were produced 32 quarts of spirits resembling rum. From the result of this series of experiments it appeared, that after paying the farmer for the roots, and discharging all incidental expenses whatever, a profit was yielded of nearly cent. per cent. on valuing the four pounds of white powder sugar at one shilling per pound, and the three quarts and a half of rum at one shilling per quart. The produce of beet roots and their quality for yielding sugar, have, however, been variable; and of course the profit accruing from them. From M. Achard's account we learn, that 24 measures of roots, each of which weighs about 50 pounds, (in all 2160 pounds) and coals about 6d. English, produce 100 pounds of raw sugar; that is, 20 pounds of roots produce nearly one pound of sugar. One hundred pounds of raw sugar give 55 pounds of refined sugar, and 25 pounds of molasses. Another statement informs us, that 14 pounds of raw sugar gave 14 pound of lump-sugar, 13 pound of white powder sugar, and 1/3 of darker-coloured powdered sugar, and eight pounds of brown syrup; from which more sugar might have been obtained. It is computed, in M. Achard's account, that a German square mile of land, (that is, 16 square miles, English), properly cultivated, would produce white beef sufficient to furnish the whole Prussian dominions with sugar.

BETANCOS, BETANZOS, or BITANZE, in Geography, a town of Spain, in Galicia, 3 leagues from Corunna, 9 from Compostella, and 7 to Ferrol. It has a good harbour in the mouth of the river Mandeo. N. lat. 43° 15'. W. long. 7° 56'.

BETEL, in Botany, an Indian plant, in great use and esteem throughout the East, where it makes a considerable article of commerce. See PIPER.

The betel bears some resemblance to the pepper-tree. It grows like ivy, and twirls round other trees. Its leaves are long and sharp-pointed, but broad towards the stalk, and of a pale green colour. They are like those of ivy, only softer, and full of red juice, which, among the Orientals, is reputed of wonderful virtue for fortifying the teeth, and rendering the breath sweet. The Indians are continually chewing these leaves, which renders their lips red, and teeth black, a colour by them valetly preferred to the whiteness affected by the Europeans.

The consumption of betel leaves is incredible; no body, rich or poor, being without their box of betel, which they present to each other by way of civility, as we do fruits. In many places they chew the areca nut, either alone or mixed with the betel leaf and lime, and the leaves of this plant are sometimes chewed alone; but they are too sharp, and usually injure the teeth, and it is not uncommon to find men of 25 wholly toothless in this part of the world, merely from their having chewed this plant to an excessive degree. The prepared betel is a very common present among the poorer; and on taking leave of a friend, it is always the custom to make him a present of a purse of the leaves prepared for use. When the poorer first appear before the rich, they always chew a large quantity of betel, to give them a sweet breath; and the women, on certain occasions, never fail to take largely of it as a provocative. On all visits, the company is regaled with prepared betel. The principal time of using it is after dinner, at which time, they say, it prevents f digest at the stomach; and they never abate from it, except on the solemn occasions of the funerals of their relations, and their days of fasting. Moderately used, it is said to strengthen the gums, corroborate the heart and stomach, diffuse flatu lences, purge both the stomach and brain, and prevent the fev rity. If chewed after breakfast, it makes the breath sweet for the whole day. The Portuguese women are as fond of the betel as the Indians themselves, and cannot live a day without it. It is said, however, that few Europeans can accustom themselves to the use of it. On many occasions it produces tickness, and sometimes intoxication, of no long continuance. The Chinefe also use the leaves of betel, covered with quick lime, and wrapped round the nut areca, which in shape much resembles a nutmeg. They chew these leaves continually, and pretend that they strengthen the gums, comfort the brain, expel bile, nourish the glands of the throat, and serve as a preservative against the alhuma; a disease, which, from the heat of the climate, is very common in the southern provinces. They carry betel and areca (see ARECA) in boxes, and prevent it when they meet one another.

BETELGEULE, or BEDELGASE, in Astronomy, a fixed star of the first magnitude in Orion's blind shoulder.

BETESKOF, in Geography, a town of Siberia, on the west side of the Irthil, 250 miles N.E. of Tobolsk. 

BETH,
BETH, in Literary History, makes the title of a multitude of books in the Hebrew language; e. g. "beth avoth," or, the house of the fathers; "beth Elohim," or, the house of God; "beth Israel," or, the house of Israel, &c.

BETHABARA, i.e. the house of passings, in Ancient Geography, is supposed by many to be the place to which men passed over Jordan, over against Jericho, at the common ford of this river where the Israeltites passed it under Joshua. Ch. iii. 16. Lightfoot refers it to the passage at Scythopolis, out of the precincts of Judea, where the Jews dwelt among the Syro-Greeks, over against Galilee. Cellarius places it between these two, observing that there were many passages over Jordan. At this place, beyond Jordan, John is said to have baptized. Chap. i. 28. Origen found, as he tells us, in almost all his MSS. or, if we may judge from what follows, in every one of them, without exception, this verle thus written, "Thefe things were done in Bethany beyond Jordan, where John was baptizing." But he rejects this reading for the following reafon: "As I have been in that country, in order to trace the footsteps of Chrifl and his apoftles, I am persuaded that we ought not to read Bethany in this passage, but Bethabara. For Bethany, as the evagelift himself relates, was the birthplace of Lazarus, Martha, and Mary, and only 1 5 fiafa from Jerusalem; but the Jordan was at leaft, to speak in round numbers, 1 90 fiafa from that city. Nor is there any city whatsoever of the name of Bethany near to that river. But there is a city of the name of Bethabara on the banks of the Jordan, where, it is faid, John baptized." To this alteration it has been objected, that Origen grounds the reading, which he has substitute for Bethany, on no other authority than the relation of such personages as conduct travelers to the places in Palestine, which are mentioned in the facred writings. Thefe persons either had no inclination to conduct Origen to the Bethany, which lay on the other fide of the Jordan, as the journey might have been attended with danger, on account of the tribes of wandering Arabs, who fetc that country; or they were wholly ignorant of the place. Not to leaft, therefore, their profits arising from conducefing strangers, they shewed Bethabara to Origen, as the place where John baptized, and the learned father was credulous enough to believe them. Besides, if the text itself be examined, Origen's objections to the common reading will vanish. He fays, that Bethany lay near to Jerusalem, and not beyond Jordan. But it may be asked, whether there was not more than one city of that name, and whether we must necessarily suppose, that the city in question was the place where Lazarus refided. It appears, even from the expreffion used by St. John, that, whether we read Bethany, or Bethabara, there was more than one city of the name, which he mentioned. St. John mentions a circumstance by way of distinguishing it, and when he fpeaks of Bethany beyond Jordan, we are led to fuppofe, that there were two cities of that name, and that the city which he meant was different from that which was fttuate on the mount of Olives. But Origen fays, that there was no town of the name of Bethany on any part of the Jordan. To this it might be replied, that Origen hardly visited all the towns on the bank of the Jordan, as he probably took the route pointed out by his guides, or that the wars between the Jews and the Romans had so defolated, or altered the face of the country, that many towns might have extifed in the time of John the baptifh, of which no traces remained in the days of Origen. But this mode of reply is needfles, becaufe the evangelifh utes a very indeterminate expreffion, when he fays, that the place, where John baptized, was on the other fide of the Jordan; an expreffion which no means implies that the town lay on the banks of that river; for it might have been fttuated either on the Jabbok, or on fome other fream considerably to the eiftward, where John had a fufficient supply of water for the purpose of baptizing. The alteration, therefore, made by Origen, and which upon his authority, and that of Chriflotoftom and Epiphanius, is introduced into our copies, was wholly without foundation. See Michelchi's Introd. to the N. T. by Marth, vol. ii. p. 402.

BETHABARA, in Geography, the fift settlement of the Moravians in America, in the lands of Wachovia, in North Carolina, begun in 1753, 6 miles N. of Salem, fttuate on the west fide of Gravy creek, which unites with the Gar- gales, and feveral others, and falls into the Yadkin, and containing a church of the United Brethren, and about 50 dwelling houses.

BETH-ACHARA, or BETH-HACCERIM, (Jer. vi. 1.) i.e. house of the vineyard, a city fettled on an eminence, between Jerusalem and Tekoa. See Nchem. iii. 14.

BETHAGLA, or BETH-HAGLA, a town of the tribe of Benjamin, (Josh. xvii. 21.) on the northern boundary of the tribe of Judah. In the times of Jerome and Eusebius there was a village in this fttuation of the name of Agla, distant 10 miles from Ektherosips, towards Ca. 

BETHA-GARIS, now BAIT-DJARRAH, a village of Syria, about 4 of a league to the south of El-Tell; fttuated between Jerusalem and Afulon.

BETH-ANATH, house of a fong, of an enfuer, or of affection, a city of Naphtali. (Josh. xix. 38.)

BETHANO, CAPE, in Geography, lies on the coast of Chian, or Quinan, off which is Pulo, or Island Canton, which is about 9 or 10 miles from the coast. (N. lat. 16'. E. long. 108' 30'.

BETHANY, in Ancient Geography, a village at the foot of the mount of Olives, eft of Jerusalem, in the way to Jericho. It took its name from a part of ground so called from "Athenae," which signifies the dates of palm-trees, which grew there plentifully. The town of Bethany, where Lazarus and his fitters dwelt (John xi. 1.) and where he was raised from the dead, was 15 furlongs, or about 2 miles distant from Jerusalem, (John xi. 18.) but the dittrict, or track of ground, that bore that name, reached within 8 furlongs from Jerusalem, it being only a fabbath-day's journey from it (John xxiv. 50. Acts i. 12.) and then commenced the tract called "Bethphage," from the "phage," i. e. the green figs which grow upon it, extending to near Jerusalem, that the outermost street within the walls was called by that name. A charge of self-contradiction has been alledged against the evagelift Luke, from the passage above cited. In the Gospel he tells us, that Jefus ascended into heaven from Bethany, and in the Acts of the Apoftles, of which he is the reputed author, he informs us, that he ascended from Mount Olivet. This charge is founded on an ignorance of ancient geography, or mult proceed from an unwarrantable prejudice against Christianity; becaufe Bethany, as we have above observed, was not only the name of a town, but of a dittrict of Mount Olivet adjoining the town. See BETHABARA.

Bethany, or Bethania, in Geography, a Moravian settle- ment and pott town of America, in the lands of Wachovia, in North Carolina, begun in 1760, 9 miles N. W. of Salem; containing about 60 houfes and a church.

BETH-ARABAH, in Ancient Geography, a city of Judah (Josh. xv. 6.), afterwards given to Benjamin (Josh. xviii. 22.)

BETHARAMPHTHA, a town of Galilee, on the right bank
bank of the Jordan, on the western side of the lake Genesareth, at the influx of the Jordan into that lake. Light-foot places it on the left bank of the Jordan in Perea. It was fortified and ornamented by Herod the tetrarch, and called "Julias," in honour of Julia, the daughter of Augustus, and wife of Tiburtus. See Bethsaida.

BETHARAN, or Betharzai, a town of the Perea beyond Jordan, called also, by the Syrians "Betharamphiata," and by Herod "Libias," or "Livas" in honour of Livia, the wife of Augustus. Josephus calls it Julias, and confounds it with the Betharamphiata of the preceding article; but it lay more to the south, nearly, according to Ptolemy, in the same latitude with Jerusalem, in the vicinity of the Dead sea, and of the mountains Abrarim, Nebro, and Piggah, and of the city Hebron.

BETHAVEN, the house of iniquity, a name given to "Bethel" by way of derision, after the introduction of idolatry into it by Jeroboam. (Mofea iv. 15. x. 5.) Bethaven was also the name of a distant town near Bethel, and south-east of it, belonging to the tribe of Benjamin. Joff. vii. 2. xvii. 12. 1 Sam. xiii. 5.

BETH-BASI, a city of Judah, fortified by the two Macabees, Simon and Jonathan. 1 Macab. ix. 62. 63.

BETH-DAGON, a city of Asher (Joff. xix. 27.)—Also, a city of Judah (Joff. xv. 51.) so called, because it had probably a temple of Dagon, before the Israelites took possession of it.

BETHEL, the house of God, a name given to that town, which was before called Luz, on account of Jacob's vision. (Gen. xxviii. 19.) They feem, however, to be distinguished in Joff. xvi. 2., though they were contiguous places; and the name Luz might probably be lof! in that of Bethel: it was a city of Samaria, on the confines of the tribes of Benjamin and Ephraim. Eusebius says, that it was 12 miles from Jerusalem in the way to Sichem. It obtained among the prophets the name of Bethaven, on account of its idolatry.

The Mahometans believe their temple of Mecca to be founded on the stone, on which the patriarch Jacob leapt at Bethel, and hold it in great veneration. Some have supposed that the superfluous respect manifested by the ancients to their Batyll, or stones anointed and consecrated to great men, after their death, derived its origin from Jacob's pouring oil on the stone of Bethel. See BETHYLOS.

BETHEL, in Geography, a small Moravian settlement in America, on the Swetara river, in Pennsylvania, 14 miles from Mount Joy.—A township in Dauphin county.—Also, a township in Windor county, Vermont, containing 473 inhabitants, N. N. W. 6, and bounded by Stockbridge, and about 67 miles N. N. E. of Bennington. Hence rife a small branch of White-river.—Also, a township in Delaware county, Pennsylvania.

BETHENCOURT, John de, in Biography, a Norman baron, in the beginning of the 15th century, obtained a grant from Henry III. of Califle, of the Canary islands, erected into a kingdom in 1344, by pope Clement VI. Having visited these islands in 1402, Bethencourt returned to them, and by assistance from Henry, conquered them, held them under the title of king, as a feef of the crown of Califle, and transmitted the possession of them to his family for some generations. His posterity settled in Spain. Although his conquest of these islands was not complete, Bethencourt is reckoned the first Christian who subdued the Canarv islands, which before his time had been occasionally visited by freebooters. Robertson's Hist. Amer. vol. i. p. 54.

BETHENCOURT, James de, physician at Rouen, where he practiced with much reputation, towards the end of the 15th and the beginning of the 16th centuries, is now only known by his treatise on the venereal disease, published in the year 1527, under the singular title of "Nova Penetentials Quadrige- sima, nec non Purgatorium, in Morbun Galliciam, fecu Ven- nereum, una cum Dialogo aequi argenti, et egni guiaci lunctantium super dicti morbi prultrana, Opus fructific- um." Paris, 8vo. By his penitence, he means the strict regimen enjoined those who underwent the galnieum, or sweating process, for the cure of the lues, and by the pur- gatory, the pains and torments endured while under the infiation by mercury, for the same purpose. Though he treats of the method of curing by the galnieums, as well as that of mercury, yet he magnificently gives the preference to the latter mode, which is laid down by him, Atracr says, in a more judicious manner, than it had been by any preceding writer. He says the disease was unknown to the ancients, and that it made its first appearance, or was first noticed in Europe, about the year 1495. He does not con- sider it as imported from America, or the West Indies, by the Spaniards, but as procured from caifes similar to those that occasion the plague, and other infectious diseases. As true extends the work, but it has not obtained a place in Linnæus's collection of treatises on the complaint. Atrac de Murb. Gall. Haller. Bib. Med.

BETHENNABRIS, in Ancient Geography, a town of Perea, into which the Jews, who fled from Gadera after it was taken by Vespuian, retired, and which was forced by the tribune Placidus, before his complete reduction of Perea.

BETHER, MOUNTAINS OF, are mentioned in the Song of Solomon, ch. viii. 14. Some suppose Bether to be Betho- ron, called Bethel by Eusebius, and Bethara by Josephus. Bether was taken by the emperor Adrian, in the revolution of Barchoches. (See BARCHOCHES.) Others will have it to be Betharis, between Caesarea and Diospolis; and others again Bethochea, mentioned in the LXX (Joff. xv. 62.) among the cities of Judah. Calmet supposes it to be Upper Bethoron, or Betheron, between Diospolis and Caeasara. Eusebius speaks of Betharin near Diospolis, and when he mentions Bether, which was taken by Adrian, he says, it was in the neighbourhood of Jerusalem. Ec. Hist. i. iv. c. 6.

BETHESDA, the name of a pool at Jerusalem, of which we have an account in the Gospel by St. John, ch. v. 1—7. It was called in the Greek δωλοφαστον πυρβα- σες, and in the vulgar "Piscina profana," because, as some have supposed, the sheep of the sacrificies, called in Greek παρεκτικα, were washed in it; or, according to others, because the blood of the sacrificies ran into it. But neither of these suppositions is satisfactorily proved. The pool were prob- ably washed as soon as they were bought in the adjoining market, from which they were driven into this pool, which always contained a sufficient quantity of water for this pur- pose. The latter supposition could not possibly have been realized; since, in that case, the blood must have defec- cended, and afterwards ascended to this pool, as there was a drain or ditch between the pool and the temple, and a bridge over it for passing into the temple. Hence Dr. Pococke, who adopted the idea of the blood's running into the pool, was obliged to seek for lower ground on the other side of the temple, and to place it in a situation where it did not exil, as any one may satisfy himself byadvertizing to the plan of the temple at Jerusalem. The situation of the sheep-gate, near which this pool, or bath, stood, was on the south-east wall of Jerusalem, and therefore a great part of the city lay between that and the temple, as the accurate Dr. Lightfoot has shewn in his "Harmony of the Evangelists," p. 666. The appella- tion "Betheld" has therefore been erroneously derived from ἄνθετος εἰσφαστι, the ink-house, or drain.

The
The etymology, therefore, of those who derive "Bethesda" from בֵּית מַסָּד, the house of mercy, is much more tall and appropriate; because it expressed the kind design with which this building was constructed, and the salutary purposes to which it was applied. The history informs us, that this pool had five porches, porticoes, or colonnades, which might very reasonably have been the cause, not withstanding its oblong figure; one being on each hand of the entrance in the middle of one side, and three on the other sides. Dr. Lightfoot suggests, that the basin itself might be in the form of a pentagon, and that these colonnades might correspond to its five sides. Mr. Maunoir (Journey, p. 107.) who took a view of this pool, in 1696, informs us, that it is 120 paces long, 40 broad, and 8 deep; but without water; and that at the well end he found some old arches, then dammed up, which, though only three in number, were supposed to be the five porches, in which sat the lame, halt, and blind. This pool, he adds, is contiguous, on one side, to St. Stephen's gate, and on the other to the area of the temple. In these porticoes diseased and debilitated persons lay, "waiting for the moving of the water;" for at the time of a certain feast, which some have supposed to be the passover, and others the pentecost, or rather, according to the feacon, i.e. occasionally, at certain intervals of time, "an angel descended into the pool, and troubled the water;" whoever then first, after the troubling of the water, leaped in, was made whole of whatever disease he had." Some have supposed that the miraculous cure, recorded in this history, was referred to the feast of the particular feast mentioned in the first verse of the chapter; and thus they account for the silence of Philo and Josephus with regard to this miracle. But those, who imagine that these waters had a fanatic quality on other occasions, think the silence of these Jewish writers to be of little importance; as they have omitted the mention of other more important occurrences in our Lord's history, which they had an opportunity of knowing; such as the variety and multitude of signal miracles which he performed in the course of his ministry. The majority of writers have regarded the cures wrought at this place as a standing miracle among the Jews, and yet they have been suspected that Jucelphus, in particular, should omit to mention a fact so honourable to his nation. Others have, therefore, conceived, that the miraculous healing quality of these waters was a peculiar honour conferred on the personal appearance of the Son of God upon earth. To this purpose Dr. Dodridge (in loc.) after Calvin, observes, that God, to add the greater lustre to his Son's miracles, as well as to shew that his ancient people were not entirely forgotten by him, had been pleased of late to perform some supernatural cures at this place. With respect to the descent of the angel into the pool, and the effect produced by his lirring the water, different hypotheses have been proposed. Grothus thinks, that the angel is said to have descended, not because he was ever seen to do so, but because the Jews were persuaded that God brought such things to pass by the ministration of angels; so that from the violent motion of the water, and the effect produced by it, the presence of an angel was reasonably supposed. Dr. Hammond (in loc.) supposes, that the blood of the great number of faceless, wasted in this pool, communicated a salutary efficacy to the water, upon its being stirred up by an angel, or messenger, deputed for this purpose by the high-priest; which hypothesis Dr. Dodridge represents to be as unphilosophical, as it is unsupported by history and antiquity. Mr. Fleming (Chirulology, vol. i. p. 13—15.) in order to avoid the apparent difficulties of the literal interpretation, rejects the latter part of the third and the whole of the fourth verse, as a spurious addition of some ignorant monk in the 8th or 9th century; because that part is wanting in the Cambridge, or Beza's MS. and is written by a later hand in the margin of that in the French king's library, by a hand belonging to Laery in his "Harmony." But this passage is found in all the other most celebrated MSS., in the Syriac version, and in the other versions of the Polyglott. Kutter's observations, relating to the genuineness of this text, in the preface to his edition of Mill's New Testament, deferve to be considered. But with regard to the subject in dispute, it should be recollected, that the seventh verse, which none question, implies, that the water, after being troubled, had a miraculous virtue, which extended only to the first that went in, and cured his disease, whatever might be its nature. Dr. Doddridge suggests the following solution of this difficulty; that the greatest, as he acknowledges, that occurs in the history of the evangelists, and with respect to which none of the numerous writers who have replied to Mr. Woolston have given him satisfaction. He supposes this pool might be remarkable for some mineral virtue attending the water; and this circumstance, together with its being near to the temple, where a bath was so much needed for religious purposes, may account for the stately colonnades erected around it. Some time before this passover, an extraordinary commotion had been probably observed in the water; and Providence so ordered it, that the next person who accidentally bathed here, being under some great disorder, experienced an immediate and unexpected cure. The like phenomenon, in some other desperate case, was probably observed in a second commotion. These commotions and cures might happen periodically, perhaps every Sabbath, for some weeks or months. This the Jews would naturally ascribe to some angelic power, as they did afterwards the voice from heaven, (John xii. 29.) though no angel appeared. On account of their ingratitude to Christ for this miracle, and those wrought at the former passover, and in the intermediate space, this celestial visitant probably returned no more; and therefore, it may be observed, that though the evangelist speaks of the pool as still at Jerusalem, when he wrote, yet he mentions the descent of the angel, as a thing which had been, but not as still continuing. This may account for the silence of Josephus, who was not born when it happened; and who, if he heard the report of it, would oppose speculation and hypotheses to fact, and recur to some indigested and unmeaning hammeries on the unknown force of imagination; or if he secretly suspected it to be true, his dread of the marvellous, and his fear of disquieting his Pagan readers with it, might as well lead him to suppress this, as to disfigure the palliage through the Red sea, and the Divine Voice from mount Sinai, in so mean and foolish a manner, as it is known he does. Besides, the relation which this fact bore to the history of Jesus, would make him peculiarly cautious in treating upon it, as it would have been difficult to handle it at once with decency and safety. The ingenious and learned bishop Pearce, in his excellent "Vindication of Christ's Miracles," p. 68, &c. agrees with Dr. Doddridge in the most material circumstances of his hypothesis.

BETH-GAMUI, the house of the crowned, or of the camel, a city of the Moabites in the tribe of Reuben. Jer. xliii. 27.

BETH-JESHIMOTH, the house of dispersion, or, of position, or, of denomination, a city of Reuben (John. xiii. 23.) afterwards possest by the Moabites. Ezek. xxv. 9.

BETH LEBAOATH, the house of librettes, a city of Simeon, (John xix. 6.) sometimes called Lebaaith. John. xv. 32.

BETHLEHEM, the house of bread, a city of Judah, (John. xvii. 7.) generally called "Bethlehem of Judah,"
to distinguish it from another of the same name in Zebulon.

It is seated on the declivity of a hill, 6 miles south from Jerusalem, according to Eusebius and Jerom. It is likewise called "Ephratah," (Gen. xlvi. 7. Mic. v. 2.)

This city was not very considerable either for its extent or riches; but it has acquired peculiar distinction on account of its having been the place of our Saviour's nativity. It was also the city of David's nativity. In and near this city travellers are shewn the place where our Saviour was born, which is said to have been a cave south of the city, and belonging to the inn, or caravanserai, whither Joseph and Mary retired.

Jerom informs us, that Adrian, in order to erate the remembrance of the place where Christ was born, planted over the cave a grove of tall trees in honor of Jupiter, so that when the fester day of this infamous deity were celebrated, the holy grotto echoed with the lamentations made in commemoration of Venus's lover. Here is also seen a large church built by St. Helena, in the form of a cross, and so lofty as to command an extensive prospect of the adjacent country.

The roof is elevated, flat, and composed of cedar within, and leaded without. The nave is supported on both sides by two rows of marble pillars, each made of one piece, and in a row, forming as it were five naves, separated from each other by those rows of pillars, on each of which is the picture of some saint. Over the pillars the wall is covered with mosaic work, on a gold ground. The marble which formerly overlaid the walls has been removed by the Turks for adorning their mosques. The three upper ends of the crofs terminate in three semicircles, having in each an altar.

Over the chancel is a flatly eaved, covered on the outside with lead, and within adorned with mosaic work. Adjoining to the church is the monastery of the Franciscans. The gardens are defended with strong walls; and through the chapel is a passage to a square cave, in which they say the Innocents were buried. Beyond this are passages to the tombs of St. Jerom, St. Paula, and Eutychian, and of Eusebius of Cremona; and beyond these is a grotto or cell, called the school of St. Jerom, where he is said to have lodged when he translated the Bible. At the end of another vault or chapel, 12 feet wide and 40 long, whose floor is paved with tiles, and covered with white marble, and roof adorned with mosaic work, now much decayed, is an arched concavity, with an altar, having over it the picture of the nativity, and under it a vault, in the middle of which is a flat formed of many coloured slates, marking the place where they say our Saviour was born; and near this is the manger where they pretend he was laid, which is hewn out of a rock, and now flagged with white marble. See Mount CALVARY, and JERUSALEM.

Bethlehem is now called Beit-el-laban; which sec. The country in which it is situated is happy with respect to soil, air, and water. With the latter it is supplied by a low aqueduct, or stone channel, which formerly passed to Jerusalem. The "fons signatus" is an exuberant spring; it is received successively by three large cisterns, one of which is well preserved. In coming from the cisterns, and at a small distance, is seen what is termed the "delicate Solomon," a beautiful rivulet, which flows murmuring down the valley, and waters in its course some gardens of excellent soil. The bricks of this brook are adorned with a variety of herbage. The convent at this place contains, under the same roof, the different sects of Latins, Armenians, and Greeks. Brown's Travels in Africa, &c. p. 263.

We shall here observe, that no inconsiderable pains and ingenuity have been exerted to reconcile the quotation of the evangelist Matthew, ch. ii. 6, relating to Bethlehem, with the original text of the prophet Micah, ch. v. 2. The difficulty may be obviated, says an ingenious writer, or at least the appearance of incongruity removed, by a proper translation of the latter text. "And thou, Bethlehem Ephratah, art little in being among the thousands of Judah; but out of thee shall come forth unto me a ruler over Israel. That is, thou hast but little honour in being among the thousands of Judah, compared with that which will accrue to thee from giving birth to the Messiah." Thus the LXX seem to understand it. Forms of speech similar to this, worshipppers, by no means the least for the greatest, are not uncommon. (See Homer. II. A. 277. Cant. Hymn. Di. 35. Hym. Ap. 31. Eurip. Androm. St. &c.) This mode of interpretation is confirmed by Lightfoot from the Chaldee paraphrase: and seems to be preferable to that of St. Jerom, or of Dr. Coke.

The former, who has been followed by some others, is of opinion, that Matthew produced the passage in Micah historically, not as it was written by the prophet, but as it had been propounded by the priests to Herod, so that they should be accused of false reading, if that were the case. The latter in his notes on the Porta Mofis of Maimonides, thinks, that הָיוֹ, in Micah, rendered little in the English translation, has the contrary signification to its usual one of mean or little, viz. that of noble or illustrious, and for countenancing this conjecture he cites Jer. xvii. 4. and the Chaldee paraphrase upon that passage. Grotius, Olearius, and others, have proposed that the Hebrew text and the Greek LXX version should be read and translated by way of interrogation. Heb. 'Art thou, Bethlehem Ephratah, the least among the thousands of Judah? No: out of thee shall be come forth to me, &c. &c.

I will raise up him, &c. Greek LXX. 'Art thou, Bethlehem, the house of Ephratah, the least among the thousands of Judah? No: out of thee, &c. &c. The learned bishop Pearson has adopted this mode of translation; and in favour of it he urges, that the Hebrew word הָיוֹ, in Micah, rendered little, may be rendered the least, as it actually is in Judges, vi. 15. 1 Sam. ix. 21. Jerom. xix. 26. and l. 45.

He also observes, that both in the Hebrew and in the Greek of the O. and N. Test. it is not unusual for a sentence to be underlaid by way of interrogation, though there is no mark placed at the beginning of the sentence, used in either of the languages for a mark of interrogation. To this purpose he refers to the Hebrew to 2 Sam. xviii. 26. 1 Kings xxvii. 7. Job. ii. 10. xli. 1. Zech. viii. 6. and for the Greek to 2 Sam. xviii. 29. Matt. xi. 3. Mark xiv. 61. He adds further, that when words are thus used interrogatively, there is often at the end of them an answer of ἦς, or ἦς, to be supplied in the sense, though it is not expressed in the words. This is very common with those who write in the Hebrew language, or with those, who, being Hebrews, write in Greek. In the N. T. the word, ὥστε, is to be supplied in 1 Cor. x. 19. 20. The same mode of speaking is found in 1 Cor. xii. 31. Acts vii. 31. and an infallence, where ἦς is to be supplied, is to be found in 1 Cor. ix. 20.

From these remarks the learned prelate concludes, that, if this be the case, an interrogation with a ἦς to be supplied as an answer to it, is the same as a negative not put in interrogation; or, in other words, to ask whether any thing is the least, and to answer ὥστε, as the Hebrew text and LXX version do, is the same as to affirm, that it is not the least, as Matthew does. Whether of the above interpretations will effectually supercede the perplexity of St. Jerom, and the objections of Dr. Middletown, in his "Works," vol. ii. p. 59. See Wakefield's "New Translation of the Gospel of St. Matthew," p. 26. and "Pearce's Commentary," vol. i. p. 16.

BETHELEH, a town of the tribe of Zebulon, (Josh. xix. 15.) of obscure and unknown situation.
BETHELEHEM, in Geography, a town of the Netherlands, in Brabant. N. lat. 51° 2', E. long. 4° 40'.

BETHELEHEM. See Belz.

BETHELEHEM, a town of America, in Albany county, New York, fruitful in pastures, and affording large quantities of excellent butter. By the state census of 1796, 389 of the inhabitants are ecclesiastics. - Also, a township in Berkshire county, Massachusetts, containing 261 inhabitants. It lies about 10 miles S. of E. from Stockbridge, and 130 from Bolton, and borders on the Taconic and Louden. - Also, a township in Hunterdon county, New Jersey, situated at the head of the fourth branch of the Raritan river, and containing 1335 inhabitants, including 31 slaves. - Also, a township in Litchfield county, Connecticut, joining Litchfield county on the north, and Woodbury on the south. - Also, a poll town in Northampton county, Pennsylvania, which is a celebrated settlement of the United Brethren of the Protestant Episcopal church, as they term themselves. It is situated on Lehigh river, a western branch of the Delaware, 53 miles northerly from Philadelphia, and 18 southerly from the Wind Gap. The town stands partly on the lower banks of the Manakes, a fine creek, which affords trout, and other fish, in a healthful and pleasant situation, and in summer is much frequented by gentry from different parts. In 1757, there were 60 dwelling houses of stone, well-built, and 600 inhabitants. Besides the meeting-house, this place has three other public buildings, which are the following: one for the single brethren, one for the single sisters, and the other for the widows. In a house adjoining the church is a school for females, and since 1757, a boarding school for young ladies, under the direction of the minister of the place, who also superintends the boys' school, kept in a separate house. Both these schools are in high repute, and much frequented. At the lower part of the town there is an hydraulic machine of simple construction, that raises the water from a spring to a reservoir, at the height of 100 feet, whence it is conducted by pipes into the several streets of the town. In this town are also a farm, with a general assessment of goods, a large tan-yard, a grist-mill, a fulling-mill, an oil-mill, and a saw-mill, and on the banks of the Lehigh, a brewery. N. lat. 40° 37'. W. long. 75° 14'.

BETHELEHEM, Star of, in Botany. See Ornithogalum.

BETHELEMITES, or BETHELEMITES, in Church History, a sort of monks introduced into England in the year 1257, habitated like the Dominicans, except that, on their bread, they wore a flar with five rays, in memory of the star or comet which appeared over Bethlehem at the nativity of our Saviour. They were celibate at Cambridge, and had only one house in England.

There is also an order of Bethelemites still subsisting in Peru, who have convents at Lima; one called of the industrious, the other of our Lady of mount Carmel. These Bethelemites came originally from the city of Guatamala in Mexico, where they were instituted by the venerable Peter Joseph of Betzame, a native of the town of Claflin, or Villa Fuerte, on the island of Teneriff, in 1626, for the service of the poor. After his death, which happened in 1657, his congregation was approved by a bull of Clement X., in 1657, and in 1674. Innocent XI. In 1657, created it into a community of regulars. Before this time it had passed from Guatamala to Mexico, and from thence, in 1671, to Lima. In the city of St. Miguel de Piura, they took possession of the hospital of St. Ann, in 1678, and of that of St. Sebastian, in Trujillo, in 1680. Their probity and diligence in discharging their trusts induced other places to select them as directors of their hospitals, and among the rest, the city of Quito. The fathers of their order go bare-footed, and wear a habit of dark brown colour, nearly resembling that of the capuchins, whose order they alsoimitate, in not wearing their hoods. On one of their cloaks is an image of our Lady of Bethlehem. Every fifth year they meet to choose a general, which ceremony is performed alternately at Mexico and Lima.

The Bethelemites, though outwardly of great simplicity, pass for the most refined politicians; in some respects to be called the quintessence of the Carmelites and Jesuits. They are all friars. For their almoner they choose a secular priest, whom they hire, and who has no vote in the chapter.

BETHELEM, GANOR, in Biography, prince of Transylvania, was a descendant of a family of rank, but very small property, and attached to the reformed religion. By his valour he obtained the favour of Gabriel Bethani; but having ingratiated himself with the Porte, in a visit to Constantinople, he obtained a force which enabled him to expel Bethani, and to establish himself as prince or waiwode, in 1613. He was afterwards led by ambition to extend his dominions, and under the advantage of an alliance with Frederic, the elector palatine, and newly declared king of Bohemia, he made an irruption into Upper Hungary, in 1619. Having reduced this country, he received the fiefdom of Lower Hungary, and in his march towards Vienna he took Preßburg, and was acknowledged prince of Hungary. The affluence which was afforded him by the oppressed protestants, induced him to establish liberty of conscience throughout Hungary. At an assembly of the estates, he was declared king; but in consequence of a treaty concluded between him and the emperor, he renounced the title and dignity of king of Hungary, and was made in return prince of the empire, with the possession of two dukedoms in Silesia, and several castles and districts in Hungary. His refitless disposition however led him to violate the treaty, and, in 1624, he overran Hungary, till he was defeated by the imperial general, and obliged to take refuge in Caraffia. Upon this a treaty of peace was negociated, by which he renounced all pretensions to Hungary, and all connections with the enemies of the house of Austria, and was involved with several lordships in Silesia, and with authority over Transylvania during life. After this period he remained quiet; and falling into a droopy, died in 1629. He left legacies both to the emperor and grand feignor. Gabin married the daughter of John Sigismund, elector of Brandenburgh. Mod. Univ. Hist. vol. xvii. pp. 2, 80.

BETH-MAON, the house of habitation, or, of iniquity, in Ancient Geography, a city of the Moabites, in the tribe of Reuben. Jer. xlvii. 23.

BETH-MARCHEBOTH, the house of chariots, or, of bitterness extended, a city in the tribe of Simeon.

BETH-MAUS, a village of Galilee, between Seforitis and Tiberias, dilapidated, according to Josephus, 4 fides from the latter. Lightfoot supposes it to be the Bethemdon of the Talmud.

BETH-NIMRAH, the house of the leopard, or, of rebellion, or, of bitterness, a city in the tribe of Gad. Numb. xxxii. 36.

BETH-ANNABA, or BETH-HANANNABA, a town, according to Eusebius, 4 miles east from Diofpolis. The name preserves some remains of the word Nob, where the tabernacle continued for some time, in the reign of Saul. 1 Sam. xxi. 1. According to Jerom, Nob was not far from Diofpolis.

BETHOGILA, the house of the fog or dance, the name of two places: one fixed by Eusebius, 8 miles from Gaza; the other by Jerom, 2 miles from Jordan. The Bethogila of Eusebius is probably part of the tribe of Judah. Joh. xv. 6. The Bethogila of Jerom belongs to that of Beniamin. Joh. xviii. 21. M M 2 BETHOMER,
Bethone, or Bethora, was otherwise called Julian, and was the birth-place of the prophet Joel. The inhabitants of Bethome rebelled against Alexander Jannacus. The town was taken, and they were sent captives to Jerusalem.

Bethonea, or Beth-oanee, was situated 15 miles east from Caesarea, and was famous, according to Eusebius and Jerome, for its beneficial hot baths.

Betheron, a town of Samaria. The Scriptures mention two cities of this name, the Upper and Lower, both belonging to the tribe of Ephraim (Josh. xvi. 33, 54) and given by this tribe to the Levites (Josh. xxii. 22). They were both built by Sherah, grand-daughter of Ephraim (1 Chron. vii. 14) and restored by Solomon after they had fallen to decay (1 Kings ix. 17; 2 Chron. viii. 5). Their distance from one another was almost the whole breadth of the tribe of Ephraim; the Upper being in the north, and the Lower in the south of that tribe. The former was situated in the road from Conflantinople to Antioch, and the name with Betar or Betar, placed between Caesarea and Diospolis. The latter was built on a mountain, on the public road to Lydda and Caesarea, distant 100 stadia, or about 12 miles from Jerusalem; and hence it has been allotted by some to the tribe of Benjamin. Jeron says, that Pauia passed through both the Bethorons in her way from Naplous to Jerusalem. See Bethere.

Beth-Palath, or Beth-Paleth, the house of deliverance, or of expiation, a city in the most southern part of the tribe of Judah. John xv. 27; Nehem. xi. 26. This city was surrendered to the tribe of Simeon.

Beth-Pazzez, the house of division, a city in the tribe of Issachar. Josh. xix. 21.

Beth-Peor, or Beth-Pagor, the temple of Peor, a city of Moab given to the tribe of Reuben, (Deut. iv. 46) where the idol Baal-Peor was worshipped. Num. xxv. 5. It was situated on the other side of Jordan, opposite to Mount Peor, or Phagor.

Bethphage, a village at the foot of mount Olivet, between Bethany and Jerusalem, and about 15 furlongs from the latter. See Bethany.

Bethsaida, a city of the half tribe of Manasseh, near the desert of the same name. It was situated, according to Pliny, on the east, or on the Arabian shore of the lake of Gennesareth, in Batanaea, and the lower Gaulonites, according to Josephus, at the beginning of the mountainous country. It was a place of fishing, according to Bochart, and a place of hunting, says Dr Lightfoot, to called because it flood near Naphtali, where were many deer. Gen. xlix. 21. It was raised by Philip, the brother of Herod the tetrarch, from the rank of a village to the honour of a city, and called Julian, in honour of the emperor's daughter. It seems to have been different from Bethamphiathma, called also Bethsafa Julia. See Bethamphiathma. This latter Bethsaida, which was on the southern shore of the lake of Gennesareth (Mark vi. 45. viii. 22) was one of the cities against which Christ denounced a woe (Matt. vii. 21) on account of its impertinence and infidelity, after the mighty works he had performed in it. It was also the city where three apostles dwelt, viz. Philip, Andrew, and Peter. John i. 44.

Beth-shalisha, or Baal-Salisa, a town of Palestine, in the canton of Thamna, 15 miles north of Diospolis, according to Eusebius, and south-east of Antipatris.

Bethsan, or Bethsean, a town of Samaria in the half tribe of Manasseh, upon the borders of Galilee, on this side Jordan, and about half a league from it. It was the capital of a district of the same name, extending to Perea. In

2 Maccabees xii. 29. it is placed 600 stadia, or 75 miles from Jerusalem. Josephus says, that it was the largest town of the Decapolis, and that it was 120 stadia, or 15 miles from Tiberias. It was on the walls of this city that the Philistines, after the battle of Gilboa, hung the bodies of Saul and Jonathan, which were removed in the night by the inhabitants of Jabesh-Gilead, and honourably interred, under a grove of oaks near the city. (1 Sam. xxxi. 10, 11.) In process of time it was called Scythopolis, which name it derived from the Scythians, who, in the reign of Josiah, king of Judah, about 635 years before Christ, made an irruption into Palestine, and left a colony at Bethian. Steph. Byz. and Pliny call it Nysa. Bryant (Anal. Myth. vol. iii. p. 415.) deduces its name Bethem, from both, house or temple, and fan, or shan, an ancient denomination of the fun, under which he was worshipped; and he supposes, that he had a temple in this city, to the walls of which the body of Saul was fastened. Images of the fun, under the appellation of Zanes, were peculiar to Sparta. This city, according to him, was built by the Cuthite Ophite, or Lhivites, none of whom fellited in that part of Canaan, called Galilee. As Ophite, they worshipped the fun under the figure of a serpent, and they were supposed to be Helioder, or offspring of the fun. The serpent they styled fun, or shan; but as the Hebrew fun signified also a tooth, the Grecians, instead of saying that the Spart had their origin from the serpent deity, the fun, made them take their rise from the teeth of a serpent.

Beth-Shehemesh, the house of the fun, or, of service, a Levitical city in the tribe of Dan, or of Judah, for it is aligned to the one and to the other; dillant, according to Eusebius, 10 miles from Eleutheropolis, in the way to Nicosia, or Eminnus. 1 Sam. vi. 12. Josh. xv. 44. 1 Kings iv. 13. Also, a city of the tribe of Issachar. Josh. xix. 22.

Beth-hur, or Beth-zur, the house of the rock, or, of the land, a city with a strong fortify, situated on a high rock, in the tribe of Judah (Josh. xv. 38.) dillant, according to Eusebius, 20 miles from Jerusalem, on the road to Hebron. It was fortified by Roboam, to keep the Danites in awe. (2 Chron. xi. 7.) When it was besieged by Lyfias, under Antiochus, the son of Antiochus Epiphanes, with an army of 60,000 foot, and 5000 horse, Judas Maccabees came with 10,000 men to its succour, and obliged Lyfias to raise the siege, and defeated his army. B. C. 165. 1 Maccab. iv. 28. vi. 7. Bryant derives the name of this city from both, temple, and fur, a name given to the land, under which appellation he had temples and worship.

Beth-tappua, the apple or orchard house, a city of Judah (Josh. xv. 53.) said, by Eusebius, to be the last city of Palestine in the way to Egypt; 14 miles from Raphia.

Bethul, or Bethuel, a city of Galilee, belonging to the tribe of Simeon, (Josh. xix. 4.) probably the name with Bethel, represented by Sozomen in his history, as belonging to the inhabitants of Gaza, well-peopled, and adorned with several temples remarkable for their structure and antiquity; particularly a pantheon, or temple, dedicated to all the gods, seated on an eminence made of earth, which commanded the whole city. Jerom, speaking of Bethel, says, that from thence to Tepharna was a short journey of five days. Among the bishops of Palestine, we find one of Bethel. Reland, l i. c. 37. p. 268. This was probably the same with Bethulias, celebrated on account of its siege by Holofernes, at which he was killed by Judith. Judith, vi. 7.

Bethune,
BETHUNE, in Geography. See SULLY.

BETHUNE, in Geography, a town of France, and principal place of a district, in the department of the Aisne, situated on a rock in the little river Biete. The number of inhabitants in the town is estimated at 5000, and in the canton at 15,956. Its territory contains 125 kilometres, and 17 communes. It formerly belonged to the counts of Flanders, but being taken by Gaston, duke of Orleans, in 1645, it was united to France by the peace of the Pyrenees, and the fortifications were repaired under the direction of M. Vauban. In 1710, it was captured by the allied army, under Prince Eugene and the duke of Marlborough, and restored to France in 1713, at the peace of Utrecht. This city and the castle are together of a triangular figure; but the castle itself is an irregular building. The houses are mean, and the streets are ill-paved, but it contains several churches and convents, and a large handsome square. In the marshy lands, near the city, several canals are cut for the convenience of whitening linen. N. lat. 50° 32'. E. long. 2° 48'.

BETHUNE, a river of France in Upper Normandy, in the county of Caux.

BETHUNA, in Ancient Geography, a town of Aisa in Albania. Ptolemy.

BETIGOLA, in Geography, a town of Poland, in Samogitia, 10 miles S. S. E. of Rostenne.

BETIQUA, a town of Africa, in the kingdom of Congo.

BETITLO, a town of European Turkey, in the Morea, 22 miles south of Missitra.

BETLIS, a town of Asia in Curdiian, situated between two high mountains, at a cannon shot's distance from each other; the residence of a shey, who is subject neither to the king of Persia nor the Turkish emperor, and who commands an army of 20,000 or 25,000 horsemen, besides infantry. It lies on the road from Tauris to Aleppo, and the passage is so narrow, that the prince can float caravans whenever he pleases. The castle is on an eminence between the mountains, resembling a figar-leaf, and so steep that it can only be ascended by winding round it. The people in and near the town are shepherds, and are ready to take up arms at the command of their prince. It is distant about 110 miles E. of Diarbekir, and 100 N. of Mosul. N. lat. 37° 20'. E. long. 42° 40'.

BETOLA, a town of Italy, 16 miles S. of Placentia.

BETON, in Architecture. See CEMENTS, Calcareous.

Species. 1. B. officinalis, wood betony. Lin. Spec. 810. Hud. 258. With. 530. Relh. 229. Sibth. 185. Curt. Lond. fables. 3. 33. Fl. Dan. 726. Woodw. Suppl. t. 241. Varieties, B. B. alba. Bauh. pin. 235. Hall. 3. 23. Ger. 577. 2. γ. B. minima alpina helvetica. Tourn. Hall. γ. Lightf. B. Mor. f. 4. Park. 614. f. 3. Rait Hilt. 550. "Spike interrupted; helmet of the corolla entire; middle division of the lower lip emarginate; calyx smooth." The common wood betony has an upright stem, a foot high or more, not branched, or very little in its wild state, hairy, channelled, the corners rounded; root-leaves long petioles, obloment-heart-shaped, obtuse, wrinkled, entire, with few hairs, but dotted with small hollow points, the base ciliate; stem-leaves subterranean, lanceolate, serrate; bracteas numerous, lanceolate, ciliate, shorter than the calyx; flowers in spikes, composed of several whorls; calyx coloured, sessile, almost upright, villose within, having long hairs between the five long-pointed segments; the two upper teeth recurved; corollas purple, varying to flesh and rarely white; tube downy, longer than the calyx, upper lip-commonly entire, sometimes cloven at the end, lower scallolated or crenulate; filaments villose; anthers blackish. A native of woods, heaths, and pastures, among bushes; perennial, flowering in July and August. The dried leaves, by their rough hairs, excite incezing; and it has accordingly been made an ingredient in the spirituous powders. But Dr. Cullen observes, that this, as well as marjoram, seems to be only useful, by diffusing and giving an agreeable odour to the other erhines. Sheep eat it, but goats refuse it. This plant dye wooll of a very fine dark yellow colour. The leaves and tops of this betony have an agreeable but weak smell; to the taste they diffus a slight warmth, accompanied with some degree of allringency and bitterness. They yield very little essential oil. This, like many other plants formerly in general medical estimation, is at this time almost entirely disregarded. Antonius Mufa, physician to the emperor Augustus, filled a whole volume with an enumeration of its virtues, stating it as a remedy for no less than 47 disorders; and hence in Italy arose the proverbial compliments, "tu hai più di vertu che non ha betonica," i.e. you have more virtues than betony; and "vede la tumica et compra la betonica," i.e. sell your coat and buy betony. Simon Paulli aulc. refers it to powers, which may be considered as rather miraculous than natural, and which did not seem to require contradiction, from the experiments of Allton. Modern writers, however, do not allow the betony to posses any considerable efficacy, and it is omitted in the catalogues of the British dispensatories. Scopoli indeed says, that he experienced its cephalic and corroborant effects; but its febile qualities shew it to be more inert than most of the other verticillata. The roots and leaves are said to be very different in quality from the other parts of the plant; and to be nauseous, bitter, purgative, and emetic. Both this plant and eybright enter into the composition of Rowley's British herb tobacco and snuff. The variety B. is not uncommon with a white flower, in subalpine pastures. Gerard remarked it near Hampstead; and Mr. Miller says, that he often found it in Kent. The small mountainous variety γ is not infrequent with a spike, nearly globular; the leaves and flowers are smaller; but all these differences are owing to situation. 2. B. orientalis, oriental betony. "Spike entire, middle division of the lip of the corolla quite entire." The flowers are larger, and of a lighter purple than those of the common sort. It was first discovered by Tours in the Levant, and was cultivated in Kew garden by Mr. Miller in 1759. 3. B. alopecuro, fox-tail betony. Sideritis alopecuroides. Scop. Carn. n. 711. t. 28. Horinum alpinum luteum, betonica fipica. Rait hilt. 547. — minus album, &c. Bauh. pin. 239. prodr. 115. "Spike hairy at the base, helmet of the corolla bifid." The leaves are altogether heart-shaped, his- fute, and serrate; the flowers smell like elder; the corollas are pale yellow; the filaments lanuginous; and the gerns smooth and shining. A native of the mountains of Savoy, Piedmont, Austria, Carniola, Sileia, and Provence; cultivated.

Propagation and Culture. All the sorts may be propagated by seeds, or by parts of the roots: they require a shady situation and a moist soil. The best time for transplanting and separating the roots is in autumn, but the seeds should be sown in the spring upon a shaly border; and they will need no other care besides keeping them from weeds, and thinning them when they are too close. Martyn's Miller. Woodville Med. Bot. vol. ii. p. 79.

Betonica Aquatica. See Scrophularia
Betonica Pauli. See Veronica

BETONIM, in Ancient Geography, a city of Gad, towards the north of this tribe, bordering on Manasseh. Josh. xiii. 26.

BETOPOLO, in Geography, a small island in the Grecian Archipelago. N. lat. 37° 2'. E. long. 23° 37'.

BETOWKY, a town of Poland, in Samogitia, 16 miles west of Roichen.

BETSCHWOK, a town of Bohemia, in the circle of Czslau, 9 miles N.W. of Czslau.

BETSE, or BETSEFF, a town of Hungary, in the county of Beth, seated on the Theis, near its influx into the Danube.

BETROTHMENT, in Law, a mutual promise or compact between two parties for a future marriage. The word importing as much as giving one's truth; that is, true faith, or promise. Betrothement amounts to the same with what is called by civilians and canonists sponsa, or espousal; sometimes deponulaw; and by the French faux-paull. Betroth- ment is either solemn, made in the face of the church, or private, made before witnesses out of the church. To betroth by giving arbo, or earnell, is called, by Middle Age Writers, fab- barrate. In Ruffia, the betrothing is performed with eccle- siatical rites, generally eight days previous to the marriage, and is indissoluble. During this interval, the bride is only visited by the bridegroom, and the girls of her acquaintance, who amuse her with singing. On the last evening, the young women bring the bride into the hot bath, where they plait and tie up her hair, singling at the same time ballads descriptive of her future happiness. Among the ancient Jews, the betrothing was performed, either by a writing, or by a piece of silver given to the bride, or by cohabitation and consummation. This latter engagement, according to the Rabbins, was allowed by the law (Deut. xxiv. 1.), but it has been widely forbidden by the ancients, on account of the abuses that might happen, and for preventing clandestine marriages.

After the marriage was contracted, the young people had the liberty of seeing each other, which was not allowed them before. If during this time the bride should treasup against that fidelity she owed to her bridegroom, she was treated as an adulteress. (Seld. Uxor. Heb. ii. c. 1.) The nuns of the Annunziada hold an annual feast, in honour of the defonation, or betrothment of the Virgin Mary to Joseph.

BETTA, in Geography, a town of Asiatic Turkey, 70 miles S.S.W. of Erzerum.

BETTEMBOURG, the chief place of the canton, in the district of Luxembourg, and department of Forêts; containing 812 persons; the number in the canton amounts to 10,139. The territory comprehends 296 kilometres, and 12 communies.

BETTERTON, Thomas, in Biography, a famous actor, the English Rosceus of his time, was in favor of an under cook in the household of king Charles I., born in 1655, and after a tolerably liberal education, apprenticed to a bookbinder. This bookbinder, being the publisher of Sir William d'Avenant, introduced Betterton into an acquaintance with him, and by this means he was brought upon the stage, under his patronage, about the year 1656 or 1657. After the restoration, he engaged in the company called the Duke's company, formed in virtue of a patent granted to Sir William d'Avenant, which acted at the theatre in Lincoln's-inn fields. Betterton, whose talents had attracted notice, was sent to Paris, by command of Charles I., that he might acquaint himself with the French stage, and contribute on his return to the improvement of the English theatre. A new theatre was accordingly built for d'Avenant's company, in Dorset gardens, and the exhibitions conducted in it were attended with great success. In 1670, Betterton married a Mrs. Saunderon, who excelled as an actress on the same stage, and who contributed, in concurrence with his own exertions, to procure for them not only a comfortable subsistence, but such a surplus as might have served to maintain them in their advanced age. After the coalition of the two companies above mentioned, which took place about the year 1685 or 1686, the merit of Betterton shone with unrivalled fulness; and he acquired the honour of being at the head of his profession. From the account which Cibber has given of his dramatic talents, it appears that no actor entered with a more discriminating judgment into his part, or possessed a greater command over his audience. The leading style of his acting was the grave, dignified, and forcible. His voice, perform, and aspect, concurred in giving more spirit to terror than to the softer passions; and Cibber adds, in bearing ample testimony to his merit; "I never heard a line in tragedy come from Betterton, wherein my judgment, my ears, and my imagination were not fully satisfied." His powers, however, seem to have been restricted to a particular walk in tragedy; and Othello. Hamlet, Brutus, and Hotspur, are enumerated among his striking parts, "and in these the range is from calm dignity to fierce impetuosity."

With respect to his private character, we are told that it was, like his theatrical, manly, decent, and elevated. Having acquired a moderate property, he embarked it, by the advice of a friend, in a commercial project, in which it was lost; and yet that friend's daughter, when she became an orphan, was maintained by him as if she had been his own. In consequence of some disputes which occurred, he was compelled, by flagr-tyranny, to quit the company, with which he had been long engaged; and a new play-house was opened by his efforts in Lincoln's-inn fields, in 1695. The growing infirmities of advanced age made it necessary for him to withdraw from the stage, and to acquiesce, which he did with self-possession and serenity of mind, in the narrow circumstances of
his declining life. In 1709, a benefit was allowed him; and
on this occasion two eminent after-dresses, Mrs. Bracegirdle and
Mrs. Barry, who had quitted the stage, assisted him by their
appearance before the public, and Mr. Rowe contributed an
excellent epilogue. In April 1710, he performed again at
his own benefit; but the means to which he had recourse for
repelling the gout from his feet for this purpose, proved fatal
to him on the 28th of that month. He was buried in Welf-
minster abbey; and Sir Richard Steele devoted a paper of
the Tatler (No. 167) to record the event, and to honour his
memory. His veneration for Shake-speare remembred that of
his great successor, Mr. Garrick; and, like him, he derived his
principal renown from an exhibition of the characters of that
famous dramatic writer. The few pieces which Betterton
wrote for the stage, owe their chief excellence to his accurate
and expressive knowledge of theatrical effect. His widow,
with whom he had lived in uninterrupted harmony, did not
survive him more than six months; nor, indeed, did she live long
enough to enjoy the benefit of that pension which was settled
upon her by queen Anne just before her death. We shall
close this article with the relation of an anecdote recorded by
Motraye in his Travels. When Betterton was one day at
dinner with the archbishop of Canterbury, his grace expressed
to him his astonishment, that the representation of fables
on the stage should make a greater impression upon the mind
than that of truth in the sermons of the clergy; to which the
actor, having obtained leave to reply, said "May it please your grace. It is because the clergy, in reading their
sermons, pronounce them as if they were reading fables: and
we, in acting our parts, and using in them a proper delivery,
represent them like matters of fact." Biog. Brit.

BETTINGEN, in Geography, a town of Germany, in the
circle of Westphalia, and county of Blankenheim, 3 miles
north of Geroldstein.

BETTINI, Domenico, in Biography, a painter, was
born at Florence in 1624, and studied at Rome the works of
Mario da Fiori, whose paintings he indubitably copied, and
whose style and manner he acquired. He painted fruit,
flowers, insects, animals, and still life; his objects were well
depicted, and skilfully grouped, and had a strong character
of truth and nature. This artist died in 1705. Pickin-
ton.

BETTON, in Geography, a town of France, in the
department of the Ille and Vilaine, and chief place of a
canton in the district of Rennes; 14 league north of
Rennes.

BETTS, John, in Biography, born at Winchester, where
he received the rudiments of his education, was elected one
of the fellows of Christ Church Oxford, in 1632. Being of
the king's party, he was ejected from the house, in that season
of confusion and trouble, but permitted, after a time, to return,
and was made doctor in medicine, in 1654. Coming to
London, he was in much request, particularly by those of
the Romish church, of which he was a member. He was
also elected one of the fellows of the college of physicians;
and on the restoration of king Charles II. was made one of
his physicians. Betts published, in 1669, "De ortu et
natura fangiinis," which was censured by Dr. Thompson in
his True Way of preserving the blood in its integrity. He
also published an account of the defilement of Thomas Parr,
who lived to the great age of 152 years and 9 months.
This account was afterwards inserted in the works of Dr.
Harvey, who is supposed to have drawn it up. Wood's
Athen. Ox.

BETTULÀ, Alder, and Birch, in Botany. Lin. gen.
409. Gen. t. 90. Clays and Order, monosccia tetrandra
ament. Cal. ament imbricate on every side, loose, cylindric,
confiting of three-flowered scales, in each of which are two
very minute scales, placed at the sides; three equal stamens
fixed to the disk of each scale of the calyx. Perianth in each
one-leaved, small, entire, three or four-parted; divisions ovate,
obtuse. Cor. none. Stem. filaments to each four (or three,
or two), very small; anthers twin. * Female flowers in an
ament of the same plant. Cal. ament cylindric or roundish,
imbricate; with two-flowered scales. Cor. none. Pet.
merg. germ proper, ovate, compressed, very small, two-seeded; styles two,
[additional text continues]
and other northern tracts, instead of flutes and tiles; and in Sweden, the poor have even ground the bark to mingle with their bread corn. From the accounts of more modern writers we learn, that the wood of birch, which is very white, is used for women's file-heets and petticoats, and for packing-casks. It is planted along with hazle to make charcoal for forges; and in the northern parts of Lancashire, and in the vicinity of London, beoms are made with it for home consumption, and also for exportation. The twigs smeared with birdlime are also used by the fowlers; and in Norway they are given to horses, when fodder is scarce. The bark is serviceable in dying yellow wool, and in fixing fugacious colours; for which purpose it should be used dry, and trees of 18 or 20 years growth should be dibarked at the time when the sap is flowing. The Highlanders of Scotland use the bark for tanning leather, and for making ropes; and they sometimes burn the outer rind instead of candles. In Norway it is dried, ground, and mixed with meal, and boiled up with other food for swine, who thrive much upon it. The outer bark, as it escapes putrefaction in the dampell places, is employed for covering the roofs of houses, used on a layer of turf three or four inches thick. The inner bark is applied by the Norwegians for taming hides, for fishing-nets, and for wails. With the fragments dexterously braidcd the Lappanders make shoes and baskets, and they use large pieces of it for outer garments to keep off the rain. In Kamchatka, they convert it into hats and drinking cups. The wood was formerly used by the Scots Highlanders for their arrows, but it is now employed by the hoop-binders and wheelwrights, and for a variety of rullc implements. The turner uses it for trenchers, bowls, ladles, &c.; and that which is of a proper size serves for gates, rails, &c. In France it is generally used for wooden shoes. It also affords good fuel, and some of the bark charcoal, and the root is a good lamp-black for printer's ink. The small branches serve the Highlanders for hurdles, and for side-fences to their houses. Moxa is made of the yellow fungous excrences of the wood, which sometimes swell out from the fissures. The leaves afford good fodder to horses, kine, sheep, and goats. The seeds are the favourite food of the sika; and the tree supplies a variety of insects with food.

The vernal sap of the birch-tree possesses a saccharine quality, and has been used both in a fermented and unfermented state, as a wholesome diuretic wine. It was formerly in great repute against all nephritic disorders; but has been discarded from the modern practice. Van Helmont extols a drink prepared with this juice, dactus-feeds and brook-lime. Mr. Boyle says (Work, Abr. vol. i. p. 51, vol. iii. p. 338.), that he has seen extraordinary medicinal effects of the juice itself, even when other remedies failed; and accordingly he provided himself with a quantity of it every spring. He says, it may be easily preferred by pourling a little oil on the top of it, or by distillation; but the best way is to impregnate it with the fumes of sulphur. The juice has been used for wine, and also for brewing, being in the latter case employed in lieu of water; and it is said (Phil. Trans. No 46. p. 925.), that a barrel of malt will afford as much, and as good ale, as four with common water. In order to obtain this juice, let holes be bored in the bodies of the larger trees, about the beginning of March, while the sap is rising, and before the leaves shoot out, and in these holes fix a few fles of elder ficks, cleared of their pitch, placing vessels under them to receive the liquor. A large tree may be tapped in four or five places at a time; and from several trees may be drawn in this way several gallons of juice in a day.

If a sufficient quantity be not obtained in the day, what has been gained may be preserved by bottling it up closely till more be procured; but the sooner it is boiled the better. It has been observed, that in the space of 12 or 13 days as much juice may be obtained from one tree, as will overweigh the whole tree, body, and roots. And Evelyn, in his "Sylva," (Hunters edition, p. 234.) informs us, that a great difference is found between the efficacy of that liquor which diffils from the bole, or parts of the tree nearer the roots, and that part which flows from the higher branches; the former being more crude and watery, and the latter more pure and refined. When the sap is obtained, boil it as long as any leam arise, and well skim it during the operation. To every gallon of liquor add four pounds of sugar, and boil it afterwards half an hour, well skimming; then put it into an open tub to cool, and when cold turn it into a cauld. When it has done working, bung it up clofe, and keep it three months; then either bottle it off, or draw it out of the cauld, when it is a year old.

The birch, independently of the uses to which its various parts have been applied, merits culture in parks and ornamental woods for the sake of variety; its stiff branched, smooth and white bark, and neat foliage, exhibit a picturesque appearance, when properly placed here and there in the openings, so as to shew the foliage and hanging down of the twigs, or with it to display its silvery bark through the gloom; and, besides, its fragrant smell after rain, justly entitles it to a place in the wildernefs. Moreover, the birch-tree deferves cultivation, because it will grow to advantage upon barren land, where better trees will not thrive. It will flourish in moist spungy land, in dry gravel and fand, where the surface is shallow; and upon ground, producing only moles, these trees have succeeded so well, as to be fit for cutting in ten years after planting, and to yield a considerable profit at a small expense. Of this species there are several varieties. In the variety \(b\), the twigs of young trees are erect, but being slender and pliant, they are apt to become pendent with age; and hence proceeds a variety no less beautiful than the weeping willow. \(c\) is a remarkable variety found in Dalecarlia, and described as having leaves almost palmate, with the segments toothed. Other varieties of a trilling nature, with flight differences in the shape of the leaves, are mentioned by Linnaeus in his Flora Fucica.

2. B. nigra, black Virginia birch-tree. Liun. Spec. 1394. Reich. 4. 126. Geerta. fruct. 2. 54. 1. 90. Gron. Virg. 188. 146. Raim. Dendr. 12. n. 7. Ait. Hort. Kew. 3. 336. "Leaves rhomb-ovate, acute, doubly serrate, pubescent underneath, entire at the base; scales of the flabillies villosa, segments linear, equal." This species being of foreign growth, is propagated for wildernefs and ornamental plantations; but as it now begins to more common, it is to be hoped that it will soon make a figure among our forest trees. It is equally hardy with our common birch, and attains to a much greater magnitude, as it grows to upwards of 6 feet in height. The branches are spotted, and more sparingly set on the trees than those of the common fort. The leaves have their larger ferretures more deep and remote, besides several very small, fine, crowded ones; they are broader, grow out of the foot-barks, and add a dignity to the appearance of the tree. The twigs are pubescent, and the petals villosa. A native of Virginia and Canada; and introduced into Kew gardens in 1736, by Peter Collinson, Esq.

It is very desirable in pleasure-grounds, as it is the first tree in the spring which presents us with leaves, which are of a light
light and lively green. Its white bark makes a beautiful variety, when intermixed with other trees. It is said to be the most useful tree in North America for building both of houses and boats; and will grow fast in any soil, order, whether wet or dry; and it may therefore be planted in places where few other trees will thrive, and much defers cultivation. There are several varieties of this species, differing in the colour, size of the leaves, and shoots; such as the broad-leaved Virginia birch, the poplar-leaved Virginia birch, the paper birch, brown birch, &c.

3. B. dentata, Canada birch. Lin. Spec. 1834. Reich. 4. 126. Gron. Virg. 115. 146. "Leaves cordate, oblong, acuminate, serrate." The leaves are smooth, very finely and sharply serrate. The female catkins are ovate, sessile, with acuminate entire scales. This species grows to more than 60 feet in height. The liquor flowing from its wounds is used by the inhabitants of Kamtschatka without previous fermentation; with the wood, and also with the bark, which is very light, tough, and durable, they construct fedges and canoes; and they convert the latter into food by stirring it off when green, and cutting it into long narrow pieces, like vermicelli, drying it, and flowering it with their caviar. It was cultivated by Mr. Miller in Kew garden in 1759. The varieties differ in colour, and are distinguished by the names of dully Canada birch, white paper birch, poplar-leaved Canada birch, low growing Canada birch, &c.

4. B. nano, smooth dwarf birch. Lin. Spec. 1834. Reich. 4. 127. Hudf. Angl. 416. Wither. 2. 207. Hall. Hol. n. 1629. Pl. Dan. t. 91. Pallas Roll. 62. t. 40. D. - G. Fl. Lapp. t. 4. Lightf. Scot. 575. t. 25. "Leaves orbicular, crenate, or circular, falcate." An upright shrub, seldom rising more than a foot high, with its branches always trailing on the ground. The first, or long-leaved alder from America, grows to 30 feet in height, and defers a place in all plantations. The branches are slender, smooth, numerous, and dark brown or purple; the leaves are long, and free from the clamminess of the common sort; and sometimes continue on the tree even in December, so as to give it the appearance of an ever-green.

The wood of the alder is valuable for piles, pumps, slates, and in general for all works intended to be constantly under water. It is said to have been used under the Rialto at Venice; and we are told that the mariners about Ravenna were pined with this timber, in order to serve as the foundations of buildings. For this purpose it has been much cultivated in Flanders and Holland. It serves also for many domestic and rural uses, as for cart-wheels, spinning-wheels, milk-veils, boats, spoons, small trays, trowels, and other turnery ware, troughs, handles of tools, clogs, pattens, and wooden heels. The roots and knots furnish a beautiful veined wood for cabinets; and the Scots Highlanders often make chairs of it, which are very handsome, and of the colour of mahogany. The wood that has lain in bags is black like ebony. It is generally planted for copice wood, to be cut down every ninth or tenth year for poles. The branches make good charcoal.

The bark is used by tanners and leather-dressers, and also by fishermen for flaying their nets. This and also the young shoots dye yellow, and with a little copperas a yellownish grey, useful in the demi-tints and shadows of fleh in tapestry. The shoots cut in March dye a cinnamon colour, and a fine tawny, when dried and powdered. The fresh wood yields a dye of the colour of rapsce-fraff. The catkins dye green. The bark is used as a basis for blacks; an ounce of it dried and powdered, and boiled in three quarters of a pint of water, with an equal quantity of log-wood, with solution of copper, tin, and bismuth, six grains of each, and two drops of solution of iron vitriol, will dye a strong deep "boue de Paris." The leaves have been sometimes employed in tanning leather. The Laplanders chew the bark, and dye their leather garments red with their saliva. The whole tree is very fragrant.

The alder serves for hedges by the sides of streams and ditches, and in all wet and morassy soils, and keeps up the banks; but if it be planted in a low meadow, it is said that the ground about it will become boggy; whereas, if aff planted, the roots of which penetrate a great way, and run near wedge-form, very obtuse, glutinous; axils of the veins villos beneath." The common alder, which appears generally as a shrub, sometimes grows to the height of 35 or 40 feet. The bark is blackish, and in old trees full of clefts; the wood is red and brittle; the leaves are of a dark green colour, and roundish figure. Crenate, smooth, viscid to the touch; the petioles grooved above and bear an inch long, with lanceolate, blunt stipules at their base; the male catkins are cymose, appear in autumn, and continue to the spring; the females are of a short conical form, like a small fir cone. Many botanists have separated the alder from the birch; but Linneus, in his latter works, has joined them in the same genus. Gautier prefers them distinct, alleging that they differ not only in the fruit, but in the flower. A native of Europe, from Lapland to Gibraltar; and of Asia from the White Sea to mount Caucasus, in wet and boggy grounds, and on the banks of rivers; flowering with us in February, March, and April. The varieties of this tree are the long-leaved American alder, the white alder, the black alder, and the dwarf alder. The latt with a round serrate leaf, grows naturally on the Alps and Apennines; it is a humble shrub, seldom rising more than a foot high, with its branches always trailing on the ground. The first, or long-leaved alder from America, grows to 30 feet in height, and defers a place in all plantations. The branches are slender, smooth, numerous, and dark brown or purple; the leaves are long, and free from the clamminess of the common sort; and sometimes continue on the tree even in December, so as to give it the appearance of an ever-green.
near the surface, the ground will become firm and dry. The growth of grass is not materially obstructed by the shade of
alder. In the highlands of Scotland, near Dunstafford, Mr. Pennant says, the bracken cut in the summer spread over the
field, and left during the winter to rot, are found to
answer the purpose of a mulch. In March the ground is
clered of the undecayed parts, and then ploughed.
The first gathered leaves are covered with a glutinous liquor,
which some people dried on their floors to destroy fleas;
the fleas entanglement themselves in the tenacious liquor, as
birds do in bird-lime. This tree affords food to many kinds of
moths, and other insects. Horfes, cows, goats, and
sheep, eat it; but swine refuse it. The tongues of horses
who feed upon it are turned black, and some persons suppose
that it is not wholesome for them.

Hall. [71, n. 1631. Villars Dauph. s. 790. Pall. Ros. 64.
127. B. viridis. Villars Dauph. 2. 789. Altno folio
incano. Bauh. pia. 428. Rail hilt. 1410. A. incana et hir-
glaucous-leaved alder. "Leaves glaucescent beneath; petioles
red." b. B. angustata, elm-leaved alder. "Leaves green be-
neath; petioles green." 
"Peduncles branched; leaves roundish, elliptic, acute, pubescent underneath; veins of the veins naked; &
spines lanceolate." This species is totally different from the common alder, both in the structure of its
parts, and its economical uses. It never attains the size
of that, and is commonly shrubby; the trunk is scarcely
thicker than a man's arm; the wood is white, and of a
clorer texture. A native of the Alpine and Subalpine parts
of Europe, Dauphine, in eastern Siberia, in the ifands
beyond Kaschtetards, &c. Introduced into the Kew gar-
den, in 1780, by Mr. John Buch. The varieties of the
hoary alder are; the cut-leaved, the dwarf Alpine, the long-
leaved, and the rose-flowered, with petal-like bracts pro-
duced from the male catkin.

336. "Leaves deltid, drawn out to a long point, une-
quitely ferrate, very smooth; the scales of the fireblies
having roundish side lobes; petioles smooth."

337. "Leaves ovate, acuminate, doubly ferrate; veins hirufate
underneath. Both these leaf species are natives of North Ame-
cra. Cultivated in 1750 by Archibald, duke of Argyle.

337. "Leaves ovate, acute, ferrate; scales of the firebles having
the side lobes rounded; petioles pubescent, shorter than the
peduncle." A native of North America. Introduced into
Kew garden, about the year 1767, by Mr. James Gordon.

428. Varicities. a. folis oblongis, oblong-leaved Turkey
alder. b. folis ellipticis, oval-leaved Turky alder. "Pedunc-
es branched; leaves oval, obtusifl, glutinosus; the axils of
the veins naked underneath." Common in Austria and Hun-
gary, whence Mr. Miller received the seeds. Cultivated by
him in Kew garden in 1759.

3. 338. "Peduncles branched; leaves ovate, acute; veins
and their axils villosa underneath; spines oval, obtuse." A
native of Pennsylvania. Cultivated in Kew garden in
1759 by Peter Collinson, Esq.

339. "Peduncles branched; leaves ovate, acute, somewhat
waved; veins hairy underneath; axils naked; spines round-
ished." A native of Newfoundland and Hudson's bay.
Introduced into Kew garden, in 1782, by the Hudson's
bay company.

14. B. daurica. Pall. li. 3. 224. 1. 234. 4. ab. fl. 60.
t. 39. Gmel. Sib. 1. 157. & 2. "Leaves ovate, acu-
minate, ferrate, hairy on the nerve." Scearly distinguish-
able, when young, from the common birch, except by the
leaves, not growing fo tall, and the trunk not exceeding a
foot in diameter; bark gray, cleft longitudinally, and divi-
ging into brown scales, as if burnt; branches more subdivided
and upright; leaves harder, commonly smaller, on shorter
petioles; spines lanceolate, gray, pubescent, decidu-
ous; male catkins at the end of the twigs of the preceding
year, two or three together, larger than those of the common
birch; females from the same twigs lateral, thicker, with
larger, and more rounded scales; the seed larger, surroun-
ded by a narrower membrane; differing from the black Ame-
rican birch by having smaller spines, and leaves less frequently,
and never doubly ferrate. The wood is hard, yellower
than that of the common form, and in old trees marbled with
brown and gray towards the middle; tougher, and therefore
more fit for cart-timber and the use of the wheelwright; also
employed in making charcoal. A native of Aussia.

15. B. fruticosa. Pall. i. 3. App. 758. n. 133. 1. 2.
var. 3. 3. 36. f. 2. "Leaves rhomboid-ovate, equally ferrate,
smoother." Always shrubby, riling with several fronds
from the same root, in bogggy places not an inch thick,
nor higher than a man's stature, but on mountains attaining
the thicknes of the human arm, and growing to a much loftier
height; much branched from top to bottom, and of a very
different habit from the common birch; the cuticle ash-col-
oured with transverse stripes; the wood not fo white, and
waved transversely; the twigs almost covered with little
finous dots found more or less in the other species; buds
more copios and always alternate; two leaves common;
from the same bud, softer than those of the common form,
and decaying sooner; having three seeds to each scale, of
the same size and form with those of the B. nana. Abundant
in marshes and on rocky mountains, and in the cold subal-
pine regions of eastern Siberia, especially towards the lake
Balikal.

Propagation and Culture. The birch-tree may be cultivated
either by young plants procured from the woods where they
naturally grow, or by seeds carefully gathered in autumn,
as soon as the scales begin to open, otherwise they will drop
and be lost. As these seeds are small, they should not be
buried above a quarter of an inch deep in the ground. Mr.
Miller recommends autumn as the best season for sowing
them; but Mr. Boutecher directs to spread the seeds thin on
a floor till dry, to mix them with loose sand, and to keep them
in an airy place till the beginning of March, when they
should be sown on fresh light land, trenched or dug the preceding
autumn, made very loose, raked fine, and divided into beds
three feet and a half wide. It is needef to throw any earth
over them; but in dry and frosty weather, a small quantity of
peasc-haulm may be thrown over them for three or four
weeks, till the seeds begin to vegetate. The ground should
then be kept clean, and three or four gentle waterings may be
given at noon in April, and repeated to the middle of
June in midle evenings. In the following March they may
be removed into the nursery, and planted in rows two feet
and a half distant, and ten, or twelve, or eighteen inches
apart. Here they may remain two years, or, in cafes
where they make little progress, three years; cutting after
the second year's growth such as are least thriving or crook-
ed, close to the ground in March. Mr. Miller recommends
to sow the seeds in the flake, alleging that they will thus thrive better than when exposed to the full sun. In all places where are large trees, their seeds fall, and the plants spring up without any previous care. If these wild plants are taken up without any injury to the roots, they may be transplanted into any ground, with little or no preparation; where the land will admit of the plough, it will be best prepared by a crop of corn. In the spots where they are to stand, it will be sufficient to hoose the soil with a spade or mattock; and they may then be let into holes capable of receiving their roots, which should be covered with earth attached closely to them. After they have taken root, they require no other care besides being kept clear of weeds, which may be cut down two or three times in a summer for the first two years; and afterwards the plants will be strong enough to keep the weeds down, so that they can receive no injury from them. These plants may be let any time from the middle of October till the middle of March, when the ground is free from frost; but in dry land autumn is the best season, and for a moist soil the spring is preferable. The distance at which they should be placed is fix feet square, that they may soon cover the ground, and that by flaying clove, they may be had for the dressings that are much exposed, if they are not properly clove, they will not thrive well. If the plants take kindly to the ground, they will be fit for cutting in about ten years; and afterwards they may be cut every seventh or eighth year, if they are merely designed for the broom-makers; but if they are intended for hoops, they should not be cut oftener than every twelfth year.

As the birch is a native of Britain, it suits itself to all sorts of soils. It will thrive extremely well on barren land, whether it be wet or dry, sandy or stony, marly or boggy. It grows itself, and will come up in places where hardly any other tree will grow. It may be cultivated at a moderate expense; and being easily disposed of to the broom-makers, hoop-benders, turners, and for purposes of husbandry, it will yield a considerable profit.

The second and third species, or the American sorts of birch, may be propagated by seeds in the same manner as the first, and are equally hardy. Seeds sown in beds of fine mould, and covered about a quarter of an inch deep, will generally grow. They should be constantly weeded and watered in dry weather; and at the age of one or two years, according to their strength, they should be planted in rows in the nursery, in the usual manner. In summer, weeding should be observed, and in winter, digging between the rows; and when they are about three or four feet high, they will be of a good size for being transplanted into the wilder-

The fourth and fifth species, being of no use with us, are not cultivated, except in botanical gardens. The sixth species, or elder-tree, delights in a very moist soil, where few other trees will thrive, and greatly improves such lands. It may be propagated by layers, cuttings, or transplants about three feet long. The best time for planting tramceons, which is the least eligible, though perhaps the best expensive method, is in February or the beginning of March. They should be sharpened at one end, and the ground beed-<
poles; which should be taken off smooth and fine, so that the tool may not be damaged, or hindered from producing a fresh crop.

These trees will thrive exceedingly on the sides of brooks, and may be cut for poles every fifth or sixth year. They may be also planted for hedges in moor ground, and trained into such as are very close and thick, to the height of twenty feet and upwards. The banks of rivers may be secured by planting truneotheca very close, and crofs-wise. As the leaves are large and of a deep green colour; these trees, if the beauty of aquatic plantations be regarded, should be preferred to others usually planted in swampy grounds.

The seventh species, or hoary alder, growing naturally in dry sandy soils, may perhaps be cultivated with the birch, where land is of little value, as an undertwood, and may be propagated either by layers or cuttings, as well as by seeds, where they can be obtained. Martin's Miller. Hunter's Evelyn's Silva, p. 225, 240. Withering's Bot. Arr. vol. ii. p. 206.

**Betula Americana.** See *B. Dura.*

**Betulae, in Entomology,** a species of *Curculio,* entirely of a golden green colour in one sex, and blue in the other, with a spine on each side of the anterior part of the thorax of the latter. A native of Europe. Linnaeus. Donov. Brit. Inf. &c.

**Betula, a species of Cryptocerplus,** that inhabits Berlin. The colour is black; thorax somewhat orbicular and hairy; wing-cases brownish with oblique streaks. Herbst.

**Betula, a species of Astelurus,** with a black colour, with legs formed for leaping. Linn. F. Succ. This is *curculio escorrito-niger* of Degeer.

**Betula, a species of Cimex (Ananthia membranaceae),** that lives on the white alder in the north of Europe. The thorax is denticulated; head mucrinated; anterior part of the wing-cases dilated. Linn. Degeer, &c.

**Betula, a species of Papilio (Pib. Rue),** found in Europe. The wings are somewhat tailed, brown, yellowish beneath; posterior ones with two white streaks. Fabricius. Donov. Brit. Inf. &c. The larva is green, with pale oblique lines, and white on the sides; pupa glossy, and furginoul. Feeds on the alder. The male distinguished by a fulvous spot on the upper wings.

**Betula, a species of Tenthredo,** with the body red; thorax, vent, and eyes black; wings behind brown. Linn. F. Succ. This is *tenthredo ferruginea* of Degeer. Inhabits Europe.

**Betula, a species of Coccus,** found on the white alder. It is round, and of a bay colour. Gmel. &c.

**Betulineus, Sixtus,** in Biography, whose true name was Birch, was born at Memmingeren, in the year 1500, and obtained the reputation of an able grammarian, as well as a good Latin poet and philosopher. He taught the belles lettres and philosophy; and became principal of the college of Augsburgh, where he died June 16th 1554. He published several works in prose; and his dramatic pieces of Joseph, Susannah, and Judith, have been esteemed.

**Betulinus, in Ornithology,** a species of *Tetrao,* described by Scopoli. 'The tail is black, variegated with transverse Rufous spots; rump whitish, fuscated with black. Scop. Ann. Latham. This is the *urogalus minor* of Aldrovandus; and *birch grove* of Latham. The body is variegated with black and Rufous; bill and legs black; breast greyish; quill-feathers white at the tip; eyebrows not red.

**Betulus, in Botany.** See *Carpinus.*

**Betuwae, Betaw, or Bataviae, in Geography,** a tract of land, in the duchy of Guelderland, in the United Netherlands, situated between the Rhine and the Waal, and forming part of the "Infusa Batavorum," where the Batavians settled on their migration out of Germany. It has been divided into two bailiwicks, viz. the eastern or upper, and the western or lower Betuwae. The former, by a change in the course of the Rhine, has been separated from Betuwae, and removed into the duchy of Cleve, where the fortifications of the Schenken-Chanze, erected in 1586, by general Martin Schenk, have been gradually washed away by the water. The bailiwick of lower Betuwae comprehends a number of villages that lie on the Rhine. See *Bavaria.*

**Betwene decks, in Sea Language,** denotes the space contained between any two decks of a ship.

**Betwha, in Geography,** a river of Hindoostan, which runs into the Jumna, 25 miles south-east of Calpy. This river, from its source south of Bupal, to its confluence with the Jumna, descries a course of 340 miles in a north-easterly direction.

**Betz, the principal place of a canton, in the district of Sculis, and department of the Oise, containing 352 persons; the number of the canton being 9304. Its territory comprehends 2225 kilometres, and 29 communes.**

**Betzaleel, Jehuda, or Leo Frangenius, in Biography,** a Jewish doctor of Prague, in Bohemia, flourished about the middle of the 16th century, and was chief of the Moravian academies, and judge of the nation in that country. He left several learned works, among which is that entitled "The Redemption and Eternity of Israel," in which he affirms the Jews of the certainty of the Messiah's advent, and of his settling them in a state of permanent prosperity.

**Betzendorf, in Geography,** a small town or borough of Germany, in the old mark of Brandenburg.

**Betzdorf, the principal place of a canton, in the district of Luxembourg, and department of Vorts, containing 1582 inhabitants; those of the canton being 5015. Its territory comprehends 2125 kilometres and 7 communes.**

**Betzko, a town of Hungary, 16 miles west of Tolpoltzan.**

**Betzirvan, or Barsan, a town of Perfa, in the province of Aiderbeitzan; 100 miles north-east of Taurus.**

**Benvagna, the ancient *Mevania,* a small town of Italy, in the duchy of Spoleto, seated on the river Timia, or Timia.**

**Bevecum, a town of Brabant, 8 miles south-east of Louvain. N. lat. 50° 45'. E. long. 4° 50'.**

**Bevel, in Masonry, and among Joiners, a kind of square, one leg whereof is frequently straight, and the other crooked, according to the sweep of an arch or vault; being also moveable on a point, or centre, so that it may be set to any angle. The make and use of the bevel are pretty much the same as those of the common square or mitre, except that these latter are fixed; the first at an angle of ninety degrees, and the second at forty-five; whereas the bevel, being moveable, may, in some measure, supply the office of both, and yet, which it is chiefly intended for, supply the deficiencies of both, serving to let off or transfer angles, either greater or less than ninety or forty-five degrees.**

Bricklayers have also a bevel, by which they cut the under sides of the bricks of arches straight or circular, to such oblique angles as the arches require, and also for other uses.

**Bevel, Graduated, is that which has about the centre of one of its arms a semicircular groove, and divided into 180 degrees, whose diameter stands square with the sides of the same arm; so that the end of the other arm, being divided at right angles, almost to the centre, shews by its motion the number of degrees contained in the angle to be measured. This is also called reciprocangle, and pantometer.**

**Bevel**
Bevel angle is used among the workmen, to denote any other angle beside those of ninety or forty-five degrees.

The simple Bevel (see Plate II, Geometry, fig. 35.) consists of two rulers moveable on a common centre, like a carpenter’s rule, with a contrivance to keep them fixed, at any required angle. The centre C must move on a very fine axis, so as to lie in a line with the fiducial edges CB, CD of the rulers, and project as little as possible before them. The fiducial edges of the legs represent the sides of any given angle, and their intersection or centre C, its angular point. A pin, fixed in the lower ruler, and passing through a semicircular groove in the upper, serves, by a nut a, which serves upon it, to fix the rulers, or legs, when they are placed at the desired angle.

The use of this instrument may be illustrated in the following examples:

1. Let 5 points, A, B, C, be in the circumference of a circle, which is too large to be described by a pair of compasses; and let it be required to find any other number of points in the same circumference. Bring the centre of the bevel to B (fig. 36.), the middle point of the 3 given ones A, B, and C, and holding it there, open or shut the instrument till the fiducial edges of the legs lie upon the other two points, and fix them there by means of the screw A (fig. 35.); this operation is called setting the bevel to the given points. Then removing the centre of the bevel to any part between B and A or C, the legs being at the same time kept upon A and C, that centre will describe, or be always found in, the arc which passes through the given points, and will thus ascertain as many others as may be required between the limits of A and C. In order to find points without those limits, proceed in the following manner: the bevel being set, bring the centre to C, and mark the distance CB upon the left leg; remove the centre to B, and mark the distance BA upon the same leg; then placing the centre on A, bring the right leg upon B, and the first mark will fall upon a, a point in the circumference of the circle, passing through A, B, and C, whose distance from A is equal to the distance BC. Removing the centre of the bevel to the point a half found, and bringing the right leg to A, the second mark will find another point a’ in the same circumference, whose distance aa’ is equal to AB. By proceeding in this manner, any number of points may be found, whose distances on the circumference are alternately BC and BA. In the same manner, by making similar marks on the right leg, points on the other side, as at c and c’ are found, whose distances cc’, cc’’, are equal to BA, BC respectively. Intermediate points between any of the above are given by the bevel in the same manner with those between the original points.

2. Three points, A, B, and C, being given, to draw a line from any one of them, tending to the centre of the circle, which passes through them all. Set the bevel to the three given points A, B, and C (fig. 37.); lay the centre on A, and the right leg to the point C, and the other leg will give the tangent AG’. Draw AD perpendicular to AG’ for the line required. For BAE being = BCA, the angle EAC is the supplement to the angle ABC, or that to which the bevel is set; hence, when one leg is applied to C, and the centre brought to A, the direction of the other leg must be in that of the tangent G’E.

3. Three points being given as before, let it be required to draw from a fourth given point D, a line tending to the centre of a circle passing through the first three points. On D (fig. 38.), with the radius DA describe an arc AK; set the bevel to the three given points A, B, and C, and bring its centre, always keeping the legs on A and C, to fall on the arc AK, as at H; and on A and H severally, with any convenient radius, strike two arcs, crossing each other at I, and the required line DI will pass through the points I and D. For a line drawn from A to H will be a common chord to the circles AHK and ABC; and the line ID bisecting it at right angles, must pass through both their centres.

4. Three points being given as before, together with a fourth point, to find two other points, such, that a circle passing through them and the fourth point, shall be concentric to that passing through three given points. Draw AE and CE tending to the centre, by a former problem; set the bevel to the three given points A, B, and C; bring the centre of the bevel to D, and move it upon that point till its legs cut off equal parts AN, CQ, of the lines AC and CE; and N and Q will be the points required. For, with perpendiculars drawn from A to C, and from N to Q, the segments ABC and NQ will be similar ones; and consequently, the angles contained in them will be equal.

5. Two lines tending to a distant point being given, and also a point in one of them; to find two other points (one of which must be in the other given line), such, that a circle passing through these three points may have its centre at the point of intersection of the given lines. Draw EH (fig. 39.) at right angles to AB, and make, EH = FE; set the bevel to the angle GDO, and keeping its legs on the points H and E, bring its centre to the line AB, which will give the point I.

An improved bevel is exhibited in fig. 40., by which the arcs of circles of any radius, without the limits attainable by a common pair of compasses, may be described. It consists of a ruler AB, composed of two pieces riveted together near C, the centre or axis, and of a triangular part CED. The axis is a hollow socket fixed to the triangular part, about which another socket, fixed to the arm CB of the ruler AB, turns. These sockets are open in the front for part of their length upwards, as represented in the section at J, which shews the point of a tracer, or pin, fitted for sliding in the socket. The triangular part is furnished with a graduated arc DE, by which and the vernier at B, the angle DBC may be determined to a minute. In this arc is a groove, by means of which, as well as by the nut and screw at B, some similar contrivance, the ruler AB may be fixed in any required position. A scale of radii is put on the arm CB, by which the instrument may be set to describe arcs of given circles, not less than 20 inches in diameter. In order to set the instrument to any given radius, the number expressing it inches on CB, is brought to cut a fine line drawn on CD, parallel and near to the fiducial edge of it, and the arms are fastened in that position by the screw at B. Two heavy pieces of lead or brass G G, made in form of the sector of a circle, the angular parts being of fixed, and wrought to a true upright edge, as shewn at H, are used with this instrument, whose arms are made to bear against those edges when the arcs are drawn. The under sides of these sectors are furnished with fine short points to prevent them from sliding. The fiducial edges of the arms CA and CD, are each divided from the centre C into 200 equal parts. This instrument might be furnished with small calipers, like the pentagraph; but little buttons, fixed on its under side, near A, E, and D, will enable it to slide with sufficient ease.

The use of this instrument may be exemplified in the following problems:

1. To describe an arc, which shall pass through three given points.—Place the sectors G, G’, with their angular edges over the two extreme points; apply the arms of the bevel to them, and bring at the same time its centre C, that is, the point of the tracer, or pen, into the socket, to the third
third point, and there fix the arm CB; then, bringing the tracer to the left hand finger, glide the bevel, keeping the arms constantly bearing against the two factors, till it comes to the right hand factor, by which the required arc will be described by the motion of its centre C. If the arc be wanted in some part of the drawing without the given points, find by cafe 1., under simple bevel, other points in those parts where the arc is required; and thus a given arc may be lengthened as far as is necessary.

2. To describe an arc of a given radius, not less than 12 inches. Fix the arm CB so that the part of its edge, corresponding to the given radius, always reckoned in inches, may lie on the line drawn on CD for that purpose; being the centre to the point through which the arc is required to pass, and dispose the bevel in the direction in which it is intended to be drawn; place the factors G, G, exactly to the divisions 100 in each arm, and strike the arc as above described.

3. The bevel being set to strike arcs of a given radius, as in the last instance, let it be required to draw other arcs, whose radii shall have a given proportion to that of the first arc. Suppose the bevel to be set for describing arcs of 50 inches radius, and it be required to draw arcs of 60 inches radius, with the bevel fo let. Say, as 50 is to 60, 60 is the constant number 100 to 120, the number on the arms CA and CD, to which the factors must be placed, in order to describe arcs of 60 inches radius. When it is said that the bevel is set to draw arcs of a particular radius, it is always understood that the factors G, G, are to be placed at N=100 on CA and CD; when those arcs are drawn.

4. An arc ACB (fig. 41) being given, let it be required to draw other arcs concentric to it, which shall pass through given points, e.g. P. Through the extremities A and B of the given arc, draw lines AB, BE, tending to its centre, by cafe 3., under simple bevel. Take the nearest distance of the given point P from the arc, and set it from A to P, and from B to P. Hold the centre of the bevel on C, any point near the middle of the given arc, and bring its arms to pass through A and B at the same time, and fix them there. Place the factors to the points P and B, and with the bevel, set as before directed, draw an arc, which will pass through P, the given point, and be concentric to the given arc ACB.

5. Through a given point A (fig. 42.) in the given line, to strike an arc of a given radius, and whose centre shall lie in that line, produced if necessary. Set the bevel to the given radius, by cafe 2. Through A, at right angles to AB, draw CD; lay the centre of the bevel, let as above, on A, and the arm CA on the line AC, and draw a line AE along the edge CD of the other arm. Divide the angle DAE into two equal parts by the line AF, and place the bevel so that, its centre being at A, the arm CD shall lie on AF; while in this situation, place the factors at N=100 in each arm, and draw the arc.

6. An arc being given, to find the length of its radius. Place the centre of the bevel on the middle of the arc, and open or shut the arms till N=100 on CA and CD, fall upon the arc on each side of the centre; the radius will be found on CB (in inches) at that point of it, where it is cut by the line drawn on CD. If the extent of the arc be not equal to that between the two Nos. 100. make use of the N=50, in which case the radius found on CB, will be double of that sought; or the arc may be lengthened by prob. 1., till it be of a sufficient extent to admit the two Nos. 100. Adams's Geometrical and Graphical Essays, by Jones, 1797.

BEVELAND, in Geography, the name of two islands, formed by the separate branches of the Scheldt, belonging to the state of Zealand; the one, called North Beveland, is about 2 leagues long, and 12 broad; it is south of Schotten island, and on the fourth side of the channel of the exit Scheldt, that here runs into the sea; the other, called South Beveland, or Zuid, is near 8 leagues long, and 23 wide, and comprehend the town of Goes and several villages; it divides the exit from the west Scheldt, and the two points of its well end approach to the channels opposite to the ports of Arnemuid and Flushing. Both these islands have suffered much from inundations.

BEVELLING, in Ship-Building, the art of hewing timber with a proper and regular curve, according to a mould which is laid on one side of its surface.

In order to hew any piece of timber to its proper bevel, it will be very expedient to make one side fair, and out of windings; a term used to signify that the side of the timber should be a plane. Now if this side be uppermost, and placed horizontall; or upon a level, it is plain, if the timber is to be hewed square, it may be done by a plummet and line; but if the timber is not hewn square, the line will not touch both the upper and lower edge of the piece, or if a square be applied to it, there will be wood wanting either at the upper or lower side. This is called within or without a square. When the wood is sufficient at the under side, it is called under-beveling; and when it is deficient in the upper side, it is called under-beveling; and this deficiency will be more or less, according to the depth of the piece; so that before the proper bevelings of the timbers are found, it will be sometimes very convenient to aflign the breadth of the timber; nay, in most cases, it will be absolutely necessary, especially afores and abas; though the breadth of two timbers, or the timber and room, which includes the two timbers, and the space between them, may be taken without any sensible error, as far as the square body goes. For as one line represents the moulding side of two timbers, the foreside of the one being supposed to unite with the aft side of the other, the two may be considered as one entire piece of timber. For further observations on this subject, and particular instructions with respect to the mode of bevelling by ribband lines, and by water-lines, see Murray's Treatise on Ship-building, p. 166, &c. See Ship.

BEVIKSEN, commonly called Babmfen, a town of Germany, in the principality of Lueneburg-Zell, seated on the Elnenaun, not far from Medingen.

BEVER, a river of Germany, which runs into the Wefer near Beverungen, in the circle of Welfphalia. Bever Head, a cape on the south-east coast of Nova Scotia. N. lat. 44° 42' W. long. 62° 20'. BEVERA, a river of Italy, which falls by Solpello, in the county of Nice, and runs into the Ria, two miles north of Vintimiglia.

BEVERAGE, in a general sense, signifies drink. Hence nectar is said to be the beverage of the gods. In Writers of the Middle Ages, beverage, beveragrum, or liberagrum, denotes money given to an artificer or other person, to drink, or above his hire or wages. Du-Cange.

BEVERGARN, in Geography, a small town of Germany, in the circle of Welfphalia, and bishopric of Munster, situated in the midst of a moor, and having near it a salt spring; 21 miles north of Munster.

BEVERIDGE, WILLIAM, in Biography, a learned and pious prelate of the English church, was born at Barrow in Leicestershire, in 1618, and admitted in 1653 into St. John's college Cambridge, where he took his degrees of bachelor of arts in 1656, of master of arts in 1658, and of doctor of divinity in 1659. At the university he distinguished himself by his application to the learned languages, and particularly to oriental
oriental literature, in which he so much excelled, that at the age of 18 he wrote a treatise on the excellency and use of the oriental tongues, with a Syriac grammar. He was no less distinguished at college by his early piety and exemplary for- nity and integrity. Having taken orders in 1661, he was collated by Dr. Sheldon, bishop of London, to the vicarage of Ealing in Middlesex, which he resigned in 1672, upon being chosen rector of St. Peter's Cornhill, by the lord mayor and aldermen of London. In this situation, such were his zeal and fidelity in the discharge of the duties of his office, not only in the pulpit but out of it, and such was the success of the labours, that he was denounced * at the great reviver and whose work of divine power. His Canon- merit recommended him to the favour of his diocesan, bishop Henchman, who, in 1674, collated him to one of the prebends of St. Paul's; and in 1681, bishop Compton promoted him to the archdeaconry of Colchester, every parish of which he visited in person. In 1684, he was installed prebendary of Canterbury, and he also became chaplain to king William and queen Mary. Declining to accept the see of Bath and Wells, which was offered to him in 1691, he was consecrated, in 1704, bishop of St. Asaph. In this elevated station he profected, with his accustomed zeal and diligence, every practicable measure for advancing the honour and interest of religion, both among the clergy and laity; recommending to the former the duty of catechising and instructing the people committed to their charge, in the principles of the Christian religion, to the end that they might know what they were to do, in order to salvation; and furnishing them with a plain and easy "Exposition upon the Church Catechism." After having polished this new dignity for between three and four years, he died March, 5th, 1708, in the 71st year of his age, and was buried in St. Paul's cathedral. He left the greatest part of his estate to the societies for propagating the gospel, and for promoting Christian knowledge. Of his numerous works, those published by himself were: 1. "De Linguarum Orientalium, prefertim Hebraicce, Chaldæicae, Syriaca, Arabicae, et Samaritanae, praefulati et usus, cum Grammatica Syriacæ tribus libris traditur." Lond. 1698, 8vo.; 2. "Institutionum Quarumliber libri duo, ac plena totidem Aristotelis Chronologiae libellus," Lond. 1669, 1705, 4to.; and 1721, 8vo.; 3. "Tabulatione, five Pandæcea Canonum S. S. Apostolorum, et Conciliorum ab Ecclesiis Græce receptorum; necnon Canonum S. S. Patrum Epíllorun," &c.; 4. Biblia, cum numts Magalæ circuli, &c.; and 1721, 8vo.; 5. "Codex Canonum Ecclesiæ prætermissus vindicatus et illustratus," Lond. 1679, 4to. (See Canons.) 5. "The Church Catechism explained, for the use of the diocese of St. Asaph," Lond. 1704, 4to.; several times reprinted in a smaller volume. After his death, several of the bishop's works, not intended by himself for publication, and in various respects injurious to his memory, were published by his executor. These con-flict of devotional tracts, among which are his "Private Thoughts upon Religion," a great number of sermons, a system of divinity, or "Thalamus Theologicus," an "Ex- position of the 39 articles," &c. In his "Private Thoughts" the bishop has incurred animadversion; particularly with respect to his meditation upon the Trinity, in which he unreservedly adopts the famous maxim of Tertullian, "credo, quia impossibile est." The theology of bishop Beveridge was Calvinistical; his extensive learning has been universally allowed; his devotion inclined to mysticism; and as a reasoner and writer, he has been extravagantly extolled by his admirers and panegyrists, and no less severely censured by others, for the quaintness and puerility of his style, the falla-ciousness and inconclusiveness of his reasoning, and his avowed opposition to rational sentiments of religion. These re- flections, however, result from a perusal of his voluminous writings, the publication of which has been ascribed to naivete or want of judgment on the part of his executor. All have con- curred in allowing him the praise of the strictest integrity, of sincere piety, of exemplary charity, and of great zeal for religion. Bing, Brit. Gen. Dict.

BEVERLY: in Geography, a river of Germany, which runs into the Elbe, 3 miles south of Soehaufer, in the old mark of Brandenburg.

BEVERLAND, ADRIAN, in Biography, a man of genius and learning, who prostituted his talents in the composition of several obnoxious books, was a native of Middle- burgh in Zealand, about the middle of the 17th century, and studied polite literature under Volusi; and for this purpose he visited Oxford in 1672. Devoting himself to the study of the law, he became a doctor and a counsellor; and as a philologer, he made himself known to the learned world. But the subjects of his election, both for study and discourse, were principally of the impure and base kind; and of his licentious taste, he gave some specimens in his work, entitled "De jue flutato virginitatis, hebraeiis academici," Leyd. 1680, 4to.; and in a treatise "De prolhobis veterum," (in the brother's the ancients), part of which was infected by Isaac Volusi in his commentary upon Catullus; but which he was diffused by his friends from publishing. Before this time, viz. in 1678, he had rendered himself obnoxious by his book on original sin, entitled "Pecatum originale," &c.; nuncupatum philologice problematicus eleutherum a "Themis homines, &c.;" in which work he revived the notion of Cornelius Agrrippa, that Adam's sin consisted entirely in the commerce with his wife, and that original sin is nothing but the inclination of the sexes to each other. This book was condemned to be burnt by the magistrates at the Hague, and the author was committed to prison, whence he was not liberated without paying a pecuniary fine, and taking an oath, that he would never write again upon such subjects. He then removed to Utrecht, where his debauched manners exposed him to fresh odium, and obliged him to withdraw to Leyden. Here he wrote a bitter satire against the magistrates and professors under the title of "Vox clamantis in deserto," and at length, finding himself insecure in Holland, he sought an asylum in England, where Isaac Volusi is said to have procured for him a pension upon the ecclesiastical revenues, which he expended in the purchase of scarce books and medals, and of obscene pictures and prints, till he was reclaimed from his culpable mode of life by an acquaintance with the learned and worthy Dr. Edward Bernard. In token of his regret on account of his past conduct, and of the sincerity of his reformation, he wrote a treatise "De Fornicatione ex-venda admonitioni, &c.;" published, probably, first at London in 1690, with a dedicatory epistle to Dr. Bernard, and afterwards in 1698, 8vo.; in which, notwithstanding his pre- tended, or real reformation, some offensive passages occur. After the death of Volusi, he fell into extreme poverty, and into a state of mental derangement; and probably died after the year 1712, when he wandered through England, under an apprehension that 200 persons had confederated together to assassinate him, died. Gen. Dict.

BEVERLEY, or Beveri., in Geography, is a large cor- porate, borough, and principal town in that portion of York- shire which the east riding. It is seated at the foot of the Yorkshire wolds, on the banks of the river 1ull, which is rendered navigable, by means of a short canal, up to the town. This place appears to have been of some note previous to the time of Bede, whose preceptor, John of Beverley, archbishop of York,
York, founded and created a monastery here, to which he retired, and wherein he died in 1121. King Athelstan having made a vow, before he left Denmark against the Scots, instituted a college of secular canons, on his return to this town in 920, and also granted the freemen many immunities and privileges, which were allowed and confirmed by Henry I. and most of the succeeding monarchs to Queen Elizabeth. By the last charter, which contains the heads of those previously granted, the government of the town is vested in a mayor, recorder, aldermen, and other subordinate officers. Though within eight miles of Hull, this town preserves great respectability and commercial consequence, from its fairs, markets, and trade. The feffions for the east riding of Yorkshire are held here in a handsome hall, called the Hallgarth, which contains a register office for deeds and wills, that relate to any lands in this part of the county. Beverley has lent two members to parliament from the 26th of Edward I., except a few intermissions in the reigns of Edward II. and III.

Here were formerly four churches, but only two remain; one of which is a large handsome edifice, and is called the Minster. King Edward VI. and Queen Elizabeth granted certain revenues for the support and repairs of this edifice; but those revenues being improperly applied, a Mr. Moyle, M. P. for the town, presented a brief for the repair of it in 1558. His own contributions, with those from his friends, amounted to 1500l., which, with 800l. raised by the brief, were placed in the funds, and by the rite of the South Sea stock, in the year 1720, he was enabled to complete the repair and adornment of the church in his life-time. King George I. not only encouraged this work by a liberal donation of money, but gave the stone of the disdiluted monastery of St. Mary's in York towards the building; for Michael Warton also gave 500l. and bequeathed 4000l. more as a perpetual fund towards keeping it in repair. The east window contains some fine painted glasses; and the screen between the nave and choir is much admired for its ornamental workmanship. The north wall of the great cros-sail was at one period inclined from its perpendicular, but Mr. Thornton of York, invented a machine, which, by means of screws, &c. restored it to its original position. The ancient fabric was confumed by fire in September 1188. Here are several monuments for the Pierces, earls of Northumberland, who built a private chapel in the choir.

The principal trade of Beverley consists in making of malt, oatmeal, and in the tanning of leather. The clothing trade was, at a former period, an object of much consequence here, but at the time of Leland it was falling fast to decay. Connected with the borough, are four large common fields, containing nearly 1000 acres, in which every burgess or Freeman is allowed to pasture a certain number of cattle. In one of these fields is a mineral spa, which has proved serviceable in some cutaneous disorders. There are seven alm-houses in the town, and legacies left for creating two more. Here is also a free-school, whose scholars are allowed two fellowships in St. John's college Cambridge, also three scholarships and three exhibitions. Beverley is 183 miles north from London. It has weekly markets on Wednesdays and Saturdays; five fairs in the year; and annual great markets for hogs, &c. This town confisits of three parishes, called St. Martin's, St. Nichol's, and St. Mary's; and according to the official population report in 1800, included 1228 houfes, and 1501 inhabitants.

BEVERLEY, JOHN OP, in Biography, archbishop of York in the eighth century, was born at Harpham in Northumberland, and having embraced the monastic life, he became afterwards abbot of the monastery of St. Hilda. He was instructed in the learned languages by Theodore, archbishop of Canterbury, and was Julianly elected one of the best scholars of his time. Some say that he studied at Oxford, and took there the degree of master of arts; but as no degrees were then conferred in this university, this fact has been disputed. By Alfred, king of Northumberland, to whom his merit recommended him, he was advanced, in 685, to the fee of Hagaftald, or Hezlam, and in 687, translated to that of York. Beverley was tutor to the venerable Bede, and intimate with Acca and other famous Saxon doftors, several of whom he engaged in writing comments upon the Scriptures. In 704, he founded a college for secular priests at Beverley, which, in honour of his memory, was endowed by our kings, and particularly by Athelstan, with considerable immunities, so that it became an asylum, or sanctuary, for debtors and persons suspected of capital crimes. After he had governed the fee of York 34 years, being tired with the tumults and confusions of the church, he directed himself of the episcopal character, and retired to Beverley, and four years after died in the odour of sanctity, on the 7th of May, 721; and the day of his death was appointed a festival by a synod held at London in 1416. Bede, and other monkish writers, ascribes to him several miracles. Between three and four hundred years after his death, his body was taken up by Aelfric, archbishop of York, and richly enshrined. He was the author of several homilies, and other religious pieces. Bugg. Brit.

BEVERLY, in Geography, a township, and post-town of America, in Essex county, Massachusetts, separated from Salem by a handsome bridge, and distant about 20 miles east of north from Boston, and 22 south-west from Newbury port. It has two parishes, containing 3290 inhabitants. Thos of the parish north the harbour are devoted to the fishery, and the other branches of navigation. In the other part of the town, which is chiefly agricultural, is a cotton manufactory. Lat. N. 42° 31'. W. long. 7° 50'.

Beverly's Manor, or Irish tract, is a tract of land, in Virginia, in N. lat. 38° 15', at the head of Massachusetts's river, a western branch of the Shenandoah, which rises here by three branches, viz. Middle river, Lewis, and Chrilikan creeks, and lying between the Blue and the North ridge.

BEVEREN, a town of Germany, in the circle of Upper Saxony, and duchy of Brunswick, seated on the Wefer, 20 miles west of Eimbeck.

BEVERON, a river of Savoy, which runs into the Drance, 4 miles south-west of Evian.

BEVERS, LITTLE, lies to the west of point de la Hune, on the southern coast of Newfoundland island, in North America, between cape de la Hune on the east, and cape Raye on the west, being the south-west point of the island.

BEVERSTADT, a town of Germany, in the circle of Lower Saxony, and duchy of Bremen, 24 miles north of Bremen.

BEVERSTONE, a village of Gloucestershire, England, is situated about two miles west of the town of Tetbury, and is noted for the large remains of its ancient castle: This fortres is of uncertain foundation, but was undoubtedly a strong place prior to the conquest of the country, by Earl Godwin, Swane, and Harald here met under the pretence of affidaring the confessor against the Welsh in 1048, Maurice, lord Berkeley, or de Gaunt, fortified and repaired it, and in 1227 was protected by the king for doing so, without royal permission. It was purchased by Thomas lord Berkeley soon after the return of Edward III. from the battle of Poictiers. Many of the spoils and ransoms from that battle were appropriated to enlarge and beautify this castle, which was used as a manifon till the great rebellion, when it was strengthened, and held for the king, but besieged by, and surrendered to Col. Maife. Great part of the castle, with a dwelling-house within its walls, was soon afterwards destroyed.
BEU

It was originally a square building, with a tower at each corner, one of which still remains, with fragments of walls, and the greater part of a chapel. This has a beautiful arched roof, and on the right side of the altar is a shrine of tabernacle work, with a laboratory, a cloister in which is a confessional, and over it is a grill. The most surrounding the whole, was about 200 yards in circumference. At a short distance north of the castle is the parish church, which is a small plain building. Rudge's History of the County of Gloucester.

BEVERUNGEN, a town of Germany, in the circle of Wetzphalia, and bishopric of Paderborn, at the confluence of the Bever and the Welif, near which are springs of salt water, 26 miles south-east of Paderborn.

BEVERWYCK, John Van, of Beverovicius, In Biography, not more known and esteemed as a physician than as a magistrate, and member of the administration in his country, having attained to high honours in both those capacities, was born at Dordrecht in Holland, in 1594. Being of a distinguished family, he had the advantage of receiving instructions in classical literature from Gerard John Vossius, and afterwards of studying the different branches of medicine under the ablest masters in France and Italy. Returning to his own country, he took the degree of doctor in medicine at Padua, about the year 1624. His works are numerous. Some of the most deserving notice are, "Epitome quidquid, de termino vitae fatali et mobili, cum doctrinam responsa," 8vo. 1644. Dord. Whether there is a fixed term, beyond which life cannot be extended, he determines in the negative. "Montanus, Refutatio argumentorum, quibus medicinae necessitatem impugnant," 8vo. 1624. Dord.: in which he answers the cavils of the famous Montagne against physicians, and shews the necessity of the "Idea Medicinae veterum," 8vo. 1637. Leiden. A compendium of the practice of medicine, taken from the most valuable writers on the subject. "Epitome quidquid," 8vo. 1644. Rotterdam. A collection of letters on subjects pertaining to medicine, to which are added, the Elogia of Medicine by Eruinus, Cardan, and Melanchthon. His works, of which Haller has given a complete list, were published together in 4to. at Amsterdam, 1651. They have most of them passed through several editions. He died Jan. 19th, 1647, and was honoured with an epitaph by his friend Heinius. Haller Bib. Med. Gen. Biogr.

BEVERWYCK, in Geography, a town of North Holland, with a small harbour in the Wierdermeer, which is a continuation of the Ye, 3 leagues north of Haarlem.

BEUF, John Le, in Biography, a learned and laborious French writer, was born at Aixerre in 1687, and educated at Paris. After his return to his native town, he was made canon of its cathedral in 1711, and during his residence there frequently attended the deputies of the clergy at Sens, to afford them in reforming the liturgies of that diocese. In 1734, he was engaged by the archbishop of Paris in the composition of the chart in the new breviary and missal of that city; and from this time he chiefly resided at Paris. He was admitted an affiance of the academy of belles lettres and inscriptions in 1740, and twice obtained the prize of that academy, and five times that of the French academy at Sacon. He was one of the most indefatigable, intelligent, and satisfactory ecclesiastical antiquaries of France. The catalogue of his works from 1716 to 1741, fills 12 pages in folio in the Burgundy library; and his subsequent productions for the last 14 years of his life, are nearly as numerous. His "Traité sur le chant ecclésiastique" is full of curious researches, and, perhaps, the safest guide on the subject which a musical historian of the first ages of the church can consult. This prodigy of learning died in 1762.

The best known of his numerous works, besides that already mentioned, are "A Collection of various writings, tending to illustrate the history of France," 2 vols. 12mo. 1758; "Differtations on the ecclesiastical and civil history of Paris," 3 vols. 12mo.; "Memoir on the history of Auxerre," 2 vols. 4to. 1743; "History of the city and of all the diocese of Paris," 2 vols. 4to.; and more than 200 "Memoirs," or "Historical Differtations," published in the journals of the times; and a variety of differtations printed in the Memoirs of the Academy of Inscriptions. He also liberally communicated a number of original pieces which he found in his arduous research, to learned men engaged in different works. Nouv. Dict. Hist.

BEUF, Riviere au, in Geography, a river of America, that discharges itself eastward into the Mississippi River, in N. lat. 39° 4', about 48 miles by the course of the river, above the mouth of the Illinois, and 7 miles south from Riviere Ousha.

BEUF, Small Le. See Le BEUF.

BEVILLEUX, a village of Switzerland, in the government of Aigle, in that part of the Valais which belongs to the republic of Berne. Bevilleux is distant about 5 miles from the small town of Bex, and is famous for its salt springs. Mr. Coke informs us, that he went into the mountain about 3000 feet, almost horizontally. The gallery is 6 feet high, and 4 broad, and, when entered, he found himself in a black rock, veined in some places with white gypseum. The salt is procured from springs, which are found within a solid rock, perforated at a great expense; the richest source yields 28 pounds of salt per cent. and the poorest half a pound. Near these springs are several warm sources, which contain a mixture of salt, but are so strongly impregnated with sulphur, as to change when a lighted candle is put into the pipe through which they flow. No solid salt, except a few cubus, has been yet discovered, but the mountain is replete with its particles. Rocks of white gypseum, or alabaster, mixed with bluish clay, are common near the springs, in the same manner as may be observed in the pits of Northwich in Cheshire. After traveling in this subterraneous passage near three quarters of a mile, Mr. Coke observed a great wheel, 35 feet in diameter, which raises the brine from the depth of about 70 feet. From this place is a shaft 300 feet high, which is cut through the mountain to the surface, for the purpose of introducing fresh air. He noticed two reservoirs hollowed in the solid rock for holding the brine; one was 160 feet square, and 9 deep. In process of time, the workmen pierced the rock 25 feet deeper, and cut a gallery 100 feet long, and they formed a third reservoir, containing 5500 cubic feet. The brine deposited in these reservoirs is conveyed by means of 2000 pipes, about a league to Bevilleux, where the salt is extracted. The brine pits near Aigle contain only from two to one half per cent. and yield annually about a third as much as those of Bevilleux, or about 5000 quintals. The salt is much whiter and heavier than that of Bevilleux, and consequently bears a higher price. There, which are the only salt-factories in Switzerland, fearlessly yield a net yearly profit of more than 2000L, and furnish only one-twelfth of the annual consumption of the canton. The remainder is procured chiefly from France, at a moderate price, stipulated by treaty. Coke's Travels, vol. ii. p. 105.

BEUIL, in Geography, the chief place of a canton, in the district of Puget-Théniers, and department of the maritime Alps, containing 486 inhabitants; of the latter amount to 2133. Its territory comprehends 223 kilometres and 6 communes.

BEVILE', in Heraldry, denotes a thing broken, or opening like a carpenter's rule.—Thus he beareth argent a chief bevelled vert, by the name of Beverly.

BEVIN, Elway, in Biography, among our ecclesiastical compositors in the time of James I., justly deserves to be ranked
ranked with the musical luminaries of that reign. He was a scholar of Tullis, which is discoverable by his works; but it is not quite so easy to discover how it could have been at the recommendation of his master, who died 1587, that he was sworn in gentleman extraordinary of the chapel royal, in 1589, as has been said. His service in D minor, printed in Boyce's collection, has the true ancient call of modulation, the fer-
rago pretiosa upon it, which gives a dignity to its effects, for which we can now hardly account. The accents, as usual with old masters, are often erroneously placed; but if that imperfection be removed, or regarded with indulgence, the composition must be allowed, in point of harmony and modulation, to be admirable. And there are some grand effects produced by pauses and long notes without changing or infringing the original measure, that afforded us very pleasi-
ning fentations. Elway Bevin was, indeed, a man of genius; and it is to be lamented that more of his compositions have not been preferred. Besides his appointment in the chapel royal, he was organist of Bristol cathedral, and the master of Dr. Child. But notwithstanding his abilities and great age, he was dismissed from all his employments, in 1636, on being discovered to adhere to the Komsit communion.

In 1638, he published with harmonical emu-
dition, entitled " A Briefe and short instruction of the art of musicke, to teach how to make diacent of all proportions that are in use: very necessary for all such as are desirous to at-
taine to knowledge in the art: and may by practice, if they can finge, foon be able to compose three, four, and five parts: and also to compose all sorts of canons that are usuall, by these directions of two or three parts in one, upon a plain-
fong," by Elway Bevin. thin 40. of 52 pages.

This work, however useful it may be deemed now, must have been of singular service to young students in times when canons were regarded as the greatest efforts of human intellect, and the solution of these enigmas was entirely difficult with that of the most abstruse and complicated problems in Euclid. Michell Romano published a similar work at Venice, 1615, and Valentin another at Rome, 1655. See Michel, and Valentini.

BEVIO, in Geography, a small village of Swifferland, seated near the Julian Alps, upon the Little Rhine, in the high road leading to Coire. Bevio and Valnornora form one community, governed by 11 magistrates; though the number of voters, who appoint these magistrates, scarcely exceeds 400. The chief is called " Minifralre," and is confirmed every year, for which each voter receives a florin. About one-third of the merchandise from Como to Coire passes by Bevio; the greater part is sent by Spilgen.

BEUNFERSHEIM, a town of Germany, in the circle of the Upper Rhine, and bishopric of Worms, 6 miles south of Worms.

BEURATH, a town of Bohemia, in the county of Glatz.

BEURERIA, and BEURERIA, in Botany. See CALY-
cANTHUS, and ERIETIA.

BEURRE, in Geography, a town of France, in the depart-
ment of the Doubs, and chief place of a canton in the di-
strict of Besançon, 2 miles south of Besançon.

BEURRY, a town of France, in the department of the Meuse, and chief place of a canton in the district of Bar-le-Duc, 12 league west of Bar-le-Duc.

BEURS, WILLIAM, in Biography, a painter, was born at Dort in 1666, and discovering a natural genius for drawing and designing, he was placed, at the age of 18, under the in-
struction of William Drillemuller. He painted in the style and manner of his master, almost equalising him in the freedom of his hand, and the clearness of his colouring, and furnishing him in the correctness of his design. Admitting himself to

a diffolute life, he obtained neither the reputation nor the wealth which his talents, diligently exercised, might have enabled him to acquire. He painted portraits, landscapes, and flowers. Pilkington.

BEUS, in Ancient Geography, a river of Macedonia, men-
tioned by Livy and Steph. Byz., near which was a town called Beus, according to the latter.

BEUTHEN, or Nieder Beuthen, in Geography, a town of Germany, in the circle of Upper Saxony, and prin-
cipality of Carolath, on the Oder, containing two churches; 3 miles S.W. of Ziegenbruck.

BEUTHEL, Nieder, a town of Silevia on the Oder, in the
duchy of Glogau. It has suffered much by war and fire; distant 13 miles W.N.W. from Ober Glogau. N. lat. 51° 43'. E. long. 15° 51'.

BEUTHE, Ober, a town of Silevia, formerly belonging to the principality of Jagerndorf, but since to the principality of Oppeln. It had anciently a productive mine of silver; distant 40 miles E.S.E. from Oppeln. N. lat. 50° 10'. E. long. 18° 55'.

BEUTSCHEMN, a town of Poland, in the palatinate of Posen, 44 miles west of Posen.

BEUVRON, a town of France, in the department of the Calvados, and chief place of a canton in the district of Pont l'Eveque, 12 miles south of Caen. Allo, a river of France, which runs into the Loire, 2 leagues below Blois.

BEUVRY, a town of France, in the department of the Strats of Calais, and chief place of a canton in the district of Bethune, half a league east of Bethune.

BEVY, among Sportsmen, is used to signify a brood of quails. Thus also we say, a covey of partridges, a nide of pheasants, and a pack of gronse. Bevy is sometimes used among foresters to express a herd of deer, though it is much less frequently used in this sense than in the former.

BEUZEVILLE, in Geography, a town of France, in the depart-
ment of the Euro, and chief place of a canton in the district of Pont-Audemar; 12 leagues east of Pont-Aud-
emar. It contains 2457 persons, and the population of the canton amounts to 12,254. Its territory includes 1921 kilo-

meters and 20 communes.

BEWCASTLE, a parish and village of Cumberland, Eng-
land, is rendered interesting to the topographer and antiquary from the Roman relics that have been discovered within its limits, and from the irregular obelisk in the church-
yard. This parish is supposed to have included the Roman town where part of the Legio-Seconda Augusta was gar-
risoned to guard the workmen employed in erecting the famous Roman wall that separated England from Scotland. Many villages of ancient buildings are yet remaining, and numerous Roman coins, and some inscribed stones, have been found here. The obelisk, which has furnished a theme for much differtation, contains various sculptured ornaments, with a Roman inscription, and some figures in basso-relivo. The church, with the castle, are included within an intrench-
ment. The latter, now in ruins, appears to have been of a square form, and was battered down by the parliament's forces in 1641. In this parish are two schools supported by subcription, whose masters have about ten pounds each per annum, with the privilege of a whistle gate. This was a pecu-
liar custom, formerly very common in Cumberland, and the neighbouring counties, and now prevails in some villages. It is a privilege given to the master of applying to his pupils' pa-
rents in rotation, for provisions. Several thousand sheep and black cattle are fed on the hills and wattle parish. Hutchinson's History of Cumberland.

BEWLEY, a market and borough town of Worcestershire in England, is pleasantly situated on the banks of the river Severn, whose navigable stream has given prosperity to the place,
It was formerly included within the marches of Wales, but by a statute of Henry VIII. was annexed to the county of Worcester. Leland describes this place as remarkable for the "wonderful height of the trees in the adjacent forest of Wyre," for its "beautiful situation," and for the palace of Tichen-hall, which Henry VII. built to be a place of retirement for prince Arthur. The ceremony of this prince's marriage in person, with Catharine of Arragon, by proxy, was performed here on the 19th of May 1509. King Henry VI. gave the stone building the bridge across the Severn, which was erected by Edward IV. On the middle pier of this, flanks a gate-house, part of which is for the corporation's prison.

The town is in the parish of Ribbesford, where there is an ancient moated house, in which was found the manuscript copy of the life of lord Herbert of Cherbury. Here is a chapel, which was built on the site of an ancient wood structure in 1748. A new set of flannels was also erected in 1783; and the town partakes of the benefits of a free grammar school, which was founded in the latter part of queen Elizabeth's reign; also some almshouses, and a charity school. The manufactures and trades of this town were formerly very considerable, but they are now principally confined to tanning, horn-work, matting, and a few others. Bewdley seems to have been first incorporated by king Edward IV. whose charter grants the freemen great privileges and immunities by sea and land. These were confirmed by Henry VIII., and again by James I. This charter was surrendered in the time of Charles II.; but in the next reign another was granted, which on a trial in 1707, was determined to be void. A new one was therefore obtained from queen Anne, but this produced some litigation, which at length was determined in its favour. This empowers the bailiff and 12 capital burgesses to return one member to parliament. Here were formerly two weekly markets, on Wednesdays and Saturdays; but the latter is only continued, which, with three fairs, annually attract much company and trade to the town.

Bewdley is 120 miles N.W. from London. It contains 849 houses, and 3671 inhabitants. Nash's History of Worcestershire.

BEWITS, in Fauconary, denotes a piece of leather to which a hawk's bells are fastened, and buttoned to his legs.

BEX, in Geography, a small town of Swisserland, in the canton of Berne, about 4 miles S.S.E. of Aigle, and 5 miles from the fast-works at Beviex. (See Beviex.) Between Aigle and Bex is a picturesque view of the castle of St. Tryphon, on the summit of an inflected rock in the middle of the plain; it is quite surrounded with wood, and realises Milton's description of an ancient caffle, "Bofon'd high in tufted trees."

It is said to be built of marble, and probably of a beautiful black species in the vicinage. St. Tryphon was a Phrygian, and is said to have suffered martyrdom at Nice in the year 251, under the persecution of the emperor Decius.

BEXUQUILLO, in the Materia Medica, a name given to the white ippecacunya, which the Spaniards bring from Peru, as the Portu-guese do the brown from Brazil.

Bey, or Beq, denotes a governor of a country, or town, in the Turkish empire.

The Turks write the word beq or bek, but they pronounce it bêq or bêk; hence it signifies lord; but it is particularly applied to a lord of a kager, whom in the same language they call fargiaki-beq, or beq; fargiak, which among them signifies banner or standard, being the badge of him who commands in an important place of some province, having under him a considerable number of spabis, or horse.

Each province in Turkey is divided into fevew of these fargiaks, or banners, each of which qualifies a beq; and these are all commanded by the governor of the province, whom they also call beyhiler-beyi, or beyler-bey, i.e. lord of the lords, or beys of the province.

These beys are, in a great measure, the same that ban-
cocets formerly were in England.

It has already been observed, under the article DASHA,
that when the military aristocracy of the Mamoluls in Egypt was abolished by Selim, sultan of the Ottomans in 1507, he established a form of government, which was cal-
culated to preserve all the different members of the state in a condition of dependence upon himself. With this view, he appointed, besides a pasha, a divan, or council of regency, composed of the pasha and the chiefs of the seven military corps. At the time of this appointment it was agreed, that the 24 governors, or beys of the provinces, should be chosen from the Mamoluls; and to them were entrusted the care of re training the Arabs; superintending the collection of the tributes, and the whole civil government of the country; but their authority was purely passive, and they were to be considered merely as the instruments of the determinations of the council. By this institution, which is still observed in some instances, it was ordained, that the pasha should be contented to share the power of the beys, and that the du-
ration of his authority should depend on their collective will. The power of the pasha was very extensive; but it has been gradually diminished, and almost annihilated by the intrigues and ambition of the beys. His jurisdiction was rather civil than military. He was always president of the divan, which was held in the castle where he resided. But that council has, in later times, commonly assembled in the palace of one of the chief beys, except when a firmân or mandate is received from Constantinople, when the beys are summoned to the castle to hear the commands of the Porte. The few who attend, as soon as the reading is fin-
ished, answer, as it is usual, "Efman wa taâna," "we have heard, and we obey," but on leaving the castle, their general voice is "Efman wa avâma," "we have heard, and shall do obe-
by." All these beys had been Mamoluls, or military slaves, who were not natives of Egypt, but imported when very young from Georgia, Circassia, and Mingrelia, and purchased for 50, or not more than 100 sequins. Many of these are descended from Christian parents, and have been slaves from their youth. Some few have been prisoners, taken from the Aulrians and Russians, who have exchanged their religion for an establishment. When the supply ob-
tained in this way proves insufficient, or many have been expended, black slaves from Nubia, and other interior parts of Africa, are substituted in the room of the others, and if found docile, are armed and accoutred like the rest. The Mahometans in general, and the Egyptians in particular, treat their slaves with great kindness. At Cairo, when a slave is legally purchased in the market, if he feel discontented with his master, he has only to say, "carry me to the market," and the master is legally compellable to offer him for sale. The child of a female slave, begotten by her master, is "ipso facto" free, and a slave may authorize a free per son to purchase his emancipation. The Christian children, bought by the beys, and the principal inhabitants of Cairo, are educated with the same care as their own children, in every thing necessary to accomplish the character of a Mahometan lord. They are instructed in every necessary exercise of agility and strength, and they are in general dif finguished by the elegance and beauty of their persons. Some of them are excellent scribes; but many can neither read nor write. When their education is finished, they are em ploved in the army; and after emancipation, those favour ed slaves retain the most lively gratitude and affection.
affection to the generous masters, to whom they owe their fortunes, and both their political and moral exaltation; nor do they ever quit them in the hour of danger. Thus it often happens, that a master, when he finds any of his slaves possessed of extraordinary talents, and tried fidelity, spares no pains or expense to raise him to a more considerable employment than that which he himself occupied; and thus he at length acquires sovereign power. In order to attain this power, it is necessary to be a Mamlouk, that is, the native of a foreign country, as even the children of those, who rife to offices of state, do not enjoy the right of succession. Hence it happens, that as the son of a bey is not honoured with any particular consideration, the women, perhaps, procure abortions. Of 18 boys, whose history was known to Mr. Brown, only two had any children living. Volney observes, that during 550 years Mamlouks have been in Egypt, and that not one of them has left surviving issue; but all their children perished in the first or second defekt. Hence he infers, that those who are transferred from the vicinity of mount Caucatus, to the banks of the Nile, are inexcusable, by the influence of the climate, of perpetuating their progeny. To this circumstance it is owing, that the Mamlouks are replaced by slaves brought from their original country. From the time of the Mughul, this commerce has been continued on the confines of the Cuban and the Phasis, in the same manner as it is carried on in Africa, by the wars among the numerous tribes, and by the miseries of the inhabitants, who fell their own children for a subsistence.

Distinguished by favouritism or merit, the Mamlouk becomes a cahief, or kiachef, and in time a bey. The chief cachef of preference arises from political adherence to some powerful leader. The number of these bey has seldom or ever been complete; and the revenues of the vacant places were probably shared among the rest, who were actual occupants of their office. Each of these bey is nominally chosen by those that remain; but in fact appointed by one of the most powerful.

The "Yenk-techer Ahga," and several other officers, are enumerated among the 24 bey. Besides being governors of certain districts of Egypt, several of the bey receive other dignities from the Porte. Such are the "Schekil-el-bel- led," or governor of the city, which is an office merely civil, unaccompanied with any military power; the "Def- terdar," or accountant general; the "Emir el Hadji," or leader of the armed caravan; and the "Emir el Said," or governor of the Upper Egypt; which last two offices are annual. These offices have also revenues allotted them by the Porte, ill-defined, and liable to much abuse. Of the other bey, each appoints all officers and governors within his district, putting into it some flave of his own, who is compelled to render an account of the receipts; of which a part is appropriated to support the grandeur of his master. An opulent bey may have from 600 to 1000 purves annually; the revenue of Murad Bey more than double that sum. The inferior bey may have 500 purves, or 15,000. The revenues of the bey are raised by a land-tax and the produce of the customs, amounting together to near two millions sterling, of which but a small proportion reaches the coffers of the Porte. Every bey sits in judgment on cafes of equity. These personages are very obfervant of their respective jurisdictions; and no bey will imprison a man liberated by another. Although sometimes too impetuous, they nevertheless display great acutenes and knowledge of characters. This government poftesses at least every advantage of publicity, as every bey is a magistrate. But the justice of the rulers is ever liable to the eminonunt influence of gold. Each bey appoints his cafes, or lieutenants. These officers preside each over a town or village, collecting the revenues, and judging small cafes; but an appeal lies to the bey. The bey and the cafes are, from their ignorance, constrained to employ Copts as acountants in adjusting and receiving the revenues, that duty being of an intricate nature, and requiring great local knowledge. The authority of a cafe is as arbitrary as that of a bey.

The bey in Egypt have been gradually acquiring an increase of authority and influence, and reducing the power of the Ottoman Porte to a feble and degraded state. To this several circumstances have contributed; such as the unrestrained traffic of slaves, the neglect of the affairs of this power on the part of the Ottoman Porte; the extension of the power of the divan, and the restraint of that of the pachas, and the consequent uncontrollable influence of the janizaries and Arabs. To which may be added, the change that took place in the condition of the soldiers, by their becoming citizens, and by the marriages they contracted, and the change also introduced into their discipline; and, more especially, the permission granted to the chiefs of pofting distinct property, lands, and villages, dependent on the Mamlouk governors, whom it became necessary to conciliate, in order to prevent their apprehiation; and the accession acquired from that moment by the beyes over the soldiery, and increased by the great riches accruing from their governments. These riches they employed in multiplying their slaves; and, after emancipating them, advancing them in the army, and promoting them to various employments. By such means Ibrahim, one of the kiaxes or veteran colonels of the janizaries, rendered himself, in 1746, master of Egypt; for he had multiplied and advanced his freedmen, that, of the 24 bey, which should be their number, no less than eight were of his household. His influence was also the more certain, as the pachas always left vacancies in the number, in order to receive the emoluments. On the other hand, the largefies he bestowed on the officers and soldiers of his corps, attached them to his interest, and Roday, the most powerful of the Arab colonels, uniting with him, completed his power. The pacha became a phantom, and the orders of the sultan vanished before those of Ibrahim. At length, about the year 1766, Ali Bey gained a decided ascendency over his rivals, and under the titles of "Emir Hadji," and "Scheik el Belled," rendered himself absolute master of the country. (See Ali Bey.) Mohammed Bey, surnamed "Abooudabab," or father of gold, from the luxury of his tent and caparisons, who succeeded him in 1773, during a reign of two years, displayed nothing but the ferocity of a ruffian, and the banefulness of a traitor. Upon his death in 1776, Murad, a favourite of Mohammed, was advanced to the dignity of bey; but he had a formidable competitor in Ibrahim, who had been a favoy Bey the Great. The two rivals, however, adopted conciliatory measures, and entered into an agreement to divide the authority, on condition that Ibrahim should retain the title of "Scheik el Belled." This union was a prudent measure, and necessary to their safety; for since the death of Ali Bey, the bey and cafes, who owed their promotion to his house, reined at feeling all the authority transferred to a new faction; and after several intrigues and cabals, formed a confederacy, under the denomination of the house of Ali Bey. The chiefs of this confederacy were Hasan Bey, formerly governor of Djiarda, and Ismael, the only remaining bey of those created by Ibrahim himself; and they conducted their plot so well, as to oblige Murad and Ibrahim to abandon Cairo, and retire as exiles into the Said. These exiles, being reinforced by the refugees, returned, and compelled the confederates, Ismael and Hassan, to make their escape.
Ibrahim and Murad have since ruled Egypt, the former as “Sheikh el Belled,” and the latter as “Defter-dar,” though not without mutual jealousies and attempts to destroy each other. They, however, confine together to recruit the number of the Mamlouks, and to collect treasure from all quarters. In the year 1791, Salah Aga, a slave of Murad Bey, was deputed, from the government of Egypt, to negotiate their peace with the Porte. He arrived with him presents of horses, rich ruffs, &c. He was well received, and was afterwards appointed “Waquil of Sultan,” i.e. agent or attorney to the sultan in Cairo. This office was probably given him to engage him in feconding the efforts of the court for defeating the beys; but it was ineffectual. Thence had formerly experienced the evils of division, and were now united by common interest, grown rich, and well provided with slaves. It is said, that no tribute has since that time found its way to Constantinople. Ibrahim and Murad are considered as usurpers by the beys of Upper Egypt, who are favoured by the Porte. The most powerful house is that of Ibrahim, who has about 600 (according to Volney, but about 1000, says Mr. Browne,) Mamlouks. Next to him is Murad, who has not above 400 Mamlouks, says Volney; but according to Browne, they amounted, in 1796, to about 1700. He was originally a slave of Mohammed Bey, and succeeded in defeating and taking prisoner Ali Bey in the Great. He is detested by the Porte. He is described by Sonnini, as handsome and martial in his appearance; his chin is covered with a bushy black beard; his thick eye-brows describe arches of ebony over his large eyes, which sparkle with vivacity and fire. A long fear in one of his cheeks adds to the fierce cast of his countenance. To great bravery, he joins singular address and extraordinary strength. He has been known, when riding by an ox, to cut off its head with one stroke of his sword. An intrepid warrior, capable of endurance during the severest hardships, a most dexterous and powerful in the use of the faible, courageous in adversity, bold in enterprise, cool in action, but terrible in onset. Murad, with instruction, might have become a great general. His proud deportment, and magnificent dispositions, give him the dignified appearance of a sovereign; but injustice, ignorance, and cruelty, have rendered him a ferocious tyrant. Murad, says Mr. Browne, is one of those beys who can neither read nor write. Of the profusion of this bey, Sonnini has given the following account. In his camp were erected immense tents, divided into several apartments, for the accommodation of himself and his principal officers. The floors were covered with the most beautiful carpets, and the interior decorations consisted of the richest gold and silver fluffs that the manufactories of Lyons could afford. Nothing could equal the magnificence of his cavalry. Gold and silver ornaments, with the choicest embroidery on Morocco leather, glittered with a dazzling lustre in the rays of a burning sun; and the furnishings of the faddles, trimmed with a broad gold lace, were made of those handloom velvets, the small and delicate patterns of which display the elegant taste that prevails in the productions of the manufacturers of Lyons. His profusion is supplied by his rapacity. He is accustomed to have from the mint daily, for his pocket expenses, 500 half mahibs, and his wife the same. This amounts to 1500 piastres, and is only a small part of his disbursements. He is married to the widow of his master, the daughter of the celebrated Ali Bey. Next in power to Murad, is Mohammed Bey Elli, whose name imports that he was bought for 1000 patacches. His master was Murad Bey, but he is represented as quick in apprehension, and impetuous in action. His power is great and increasing; he has 800 Mamlouks. Ibrahim Bey, “el Uali,” a name derived from the second military magistracy in the city of Cairo, is a young man about the same age with the last mentioned, of a sedate, but firm character, married to the daughter of the elder Ibrahim, and attached to his interests. He has 6 or 700 Mamlouks. Aliub Bey, “el Zogheir,” or junior, is another powerful leader, distingushed by his superior capacity, and on all occasions consulted by the rest. He has not many Mamlouks; he is prudent and economical, and rarely acceded of extortion. Fatmé, now the aged daughter of the famous Ali, is held in much respect by all the beys. Even Murad, her husband, treats her with reverence. When a bey is appointed to a government, he never fails to pay a visit to this old lady, who lectures him on his duties, and will say to him, “Do not pillage the people; they were always spared by my father.”

Of the systematic capacity of the beys, the following instance is mentioned. Ibrahim Bey, at a festival occasioned by the marriage of his daughter to another powerful bey in 1792, invited to his house a famous singer, who had been employed, during the preceding day and night, in the exercise of her profession, and who had received considerable donations. She readily complied, expecting employment, and liberal recompense. The bey asked her, “How many half equins did you collect yesterday?” She replied, “about ten thousand.” “Pay me eight thousand then,” said the bey, “and I will give you a note of credit on Ibrahim Jechari, my secretary.” The money was paid, but the woman was turned out of the house without receiving any security whatever; and is said to have died of the disappointment. Volney’s Travels through Syria and Egypt, vol. i., Sonnini’s Travels in Upper and Lower Egypt, p. 424, &c. Browne’s Travels in Africa, &c. p. 471, &c. See BASHAN, and MAAMLOUK.
